Changes in CICS Transaction Server for z/OS, Version 4 Release 2 .. xiii

Part 1. Planning for installation ................... 1

Chapter 1. Introduction to CICS TS installation .............................................. 3
   Installation methods for CICS TS ...................... 3

Chapter 2. Requirements for CICS TS ...... 5
   Hardware and storage requirements for installing CICS TS .................... 5
   Software requirements for installing CICS TS .................................. 5
   z/OS UNIX file system and PDSE requirements ............................... 6

Chapter 3. CICS Explorer planning ....... 7
   CICS Explorer prerequisites ........................... 7
   CICS Explorer installation options ..................... 8

Chapter 4. CICSPlex SM planning .... 11
   CICSPlex SM setup checklist and worksheets ............... 11
   MVS installation and setup checklist .................... 11
   System worksheet .................................... 13
   CMAS worksheet .................................... 14
   MAS worksheet ..................................... 15
   WUI server worksheet ................................ 15
   IVP planning worksheet ............................. 16
   Planning for a CICSPlex SM upgrade ................... 17

Part 2. Installing CICS TS ....................... 19

Chapter 5. Installing CICS TS using CBPDO .............................................. 21
   Using the SMP/E RECEIVE, APPLY, and ACCEPT commands .................. 21
   Using DFHISTAR process ................................ 21

Chapter 6. Installing CICS TS using ServerPac ........................................ 23
   Resources to install the ServerPac ..................................... 23
   First-time user of the CustomPac dialog for ServerPac .............. 23
   Existing user of the CustomPac dialog for ServerPac .................. 23
   Summary of the ServerPac installation steps .................. 24

Chapter 7. Installing CICS TS using DFHISTAR ........................................ 25
   Editing the DFHISTAR job ................................ 25
   Specifying the CICS Transaction Server temporary installation libraries .... 29
   Specifying the JOB parameters for installation jobs ....................... 30
   Specifying the scope of the installation ................................ 30
   Specifying the type of JES to be used ................................ 31
   Specifying the utilities .................................... 31
   Specifying the prefix of CICS Transaction Server jobs ..................... 31
   Specifying the indexes of CICS Transaction Server data sets .............. 31
   Specifying extra qualifiers ................................... 32
   Specifying the CICS TS z/OS UNIX directories and data sets .......... 32
   Specifying the installation directory for Java support ...................... 33
   Specifying block sizes .................................. 34
   Specifying the disk unit for work data sets ............................. 34
   Specifying the SMS option for DASD allocations ...................... 34
   Specifying disk volumes .................................. 35
   Specifying attributes of the temporary SMP/E work data sets .......... 38
   Specifying attributes of the permanent SMP/E data sets ............... 39
   Specifying SMP/E zone attributes ................................ 40
   Specifying the distribution tape device type ............................ 43
   Specifying attributes of the CICS Transaction Server system data sets ... 44
   Specifying attributes of any additional target libraries .................. 45
   Specifying the library data set names ................................ 48
   Specifying log stream and log stream structure attributes ............. 48
   Specifying attributes specific to CICSPlex SM ......................... 49
   Creating RACF profiles for the CICS Transaction Server data sets .... 51
   Running the DFHISTAR job .................................. 52
   Checking that the output from the DFHISTAR job ...................... 52
   Checking that you are ready to run the installation jobs ............... 53
   Run times of the installation jobs ................................ 54
   Running the DFHIIHF0 job ................................... 54
   Running the DFHIIHF1 job ................................... 55
   Running the DFHISMKD job .................................. 56
   Running the DFHINST1 job ................................... 56
   Running the DFHINST2 job ................................... 56
   Running the DFHINST3 job ................................... 56

Preface

What this book is about

It contains guidance about tailoring CICS for use in your systems environment:

- Describing the content of CICS TS and the two delivery methods—ServerPac and CBPDO
- Explaining the method of installing CICS TS (with either ServerPac or CBPDO), and provides references to the required sources of information. In this book, “installing” means loading the code into the libraries in preparation for the migration and customizing tasks.
- Listing the hardware and software you must have to run the CICS TS product elements and exploit the function provided by CICS TS.
- Covering installation, and verification of that installation, for both CICS and CICSPlex® SM.
- Telling you about installing the workstation-based components of CICS TS.

The book assumes that you are upgrading to CICS TS levels of all the product elements in the Server.

Planning the migration to CICS TS requires that you understand the function provided by the CICS TS product set. You can learn about the function in the various product libraries of the individual elements that comprise the product set.

Always check the product libraries, for example, Upgrading, for changes that might affect CICS TS elements.

Who is this book for?

This book is intended for experienced CICS system programmers who are planning to migrate to CICS TS.

This book is also for system programmers who are responsible for installing and tailoring CICS and CICSPlex SM.

By “experienced”, we mean that a system programmer’s experience includes installing and managing CICS and some or all of the other elements in the CICS TS product set.

What you need to know to understand this book

To fully understand the installation information in this book, you should have experience of the IBM® MVS™ operating system, and the System Modification Program/Extended (SMP/E) licensed program needed to maintain CICS and CICSPlex SM.
To use the installation verification procedures, you should be familiar with the JCL and cataloged procedures for MVS. It also helps if you are familiar with CICS and CICSPlex SM concepts.

How to use this book

For planning

Read through the sections of this book that tell you about the products and hardware you need to support the function that comes with CICS TS and the pointers to migration and installation information that is in the product libraries that you receive with CICS TS.

Once you have identified the actions you need to take to complete your migration, write a plan describing the steps your installation will take. Include your estimate of how much time each step requires and who will do it.

Methods of delivery for installation

CICS and CICSPlex SM are available only as elements of the CICS Transaction Server, through either the ServerPac or CBPDO method of delivery.

For information about these two methods of delivery of the CICS Transaction Server, see Part 2, “Installing CICS TS,” on page 19.

To install the CICS Transaction Server using the CBPDO method, you should use the Program Directory for CICS Transaction Server for z/OS, together with the instructions contained in the Memo to Users Extension, to load the software from the tape DASD. For the ServerPac method, you follow the supplied set of ISPF dialogs and the accompanying documentation.

After you have loaded the CICS Transaction Server elements to DASD, you should then use this book to tailor CICS to your environment; that is to:

- Integrate CICS with MVS and ACF/VTAM
- Apply service to CICS (if required)
- Create the CICS data sets
- Install DB2® support (if required)
- Install MRO and ISC support (if required)
- Run the installation verification procedures (if required).

Note:

1. Table 27 on page 419 gives details of the CICS modules that are needed in, and eligible for, the MVS link pack area.

2. If you installed CICS from CBPDO, you do not need to run the DFHISTAR job again to specify the post-installation parameters. However, if you want to create several copies of the post-installation jobs (for example to create several copies of the DFHDEFDS job to define CICS data sets unique to several CICS regions), you can edit and run the DFHISTAR job as many times as required.

Some of the information in this book is also of interest if you have installed CICS Transaction Server using the ServerPac method of delivery.

In particular, you should edit and run the DFHISTAR job, specifying the keyword POST, to define parameters needed to tailor your CICS environment.
Notes on terminology

CICS is used throughout this book to mean the CICS element of the IBM CICS Transaction Server for z/OS, Version 4 Release 2.

CICSPlex SM refers to CICSPlex System Manager, an element of CICS Transaction Server.

CICS TS Version 2 region is used to refer to a CICS region running under CICS TS Version 2.

MVS is used throughout this book to mean the operating system MVS, or the Base Control Program (BCP) element of z/OS.

RACF® is used throughout this book to mean the MVS Resource Access Control Facility (RACF) or any other external security manager that provides equivalent function.

The term CICS TS 3.2 region is used to refer to a CICS region running under CICS Transaction Server for z/OS, Version 3 Release 2.

$ In the programming examples in this book, the dollar symbol ($,) is used as a national currency symbol and is assumed to be assigned the EBCDIC code point X'5B'. In some countries a different currency symbol, for example the pound symbol (£), or the yen symbol (¥), is assigned the same EBCDIC code point. In these countries, the appropriate currency symbol should be used instead of the dollar symbol.

hlq Throughout this book, the term hlq is used to denote the high-level qualifier of the CICS TS data sets; for example, CICSTS42.CICS for CICS data sets and CICSTS42.CPSM for CICSPlex SM data sets. The CICSTS42 part of the high-level qualifier is defined by the LINDEX parameter in the DFHISTAR installation job.

IMS™ library names

The IMS libraries referred to in this section are identified by IMS.libnam (for example, IMS.SDFSRESL). If you are using your own naming conventions, change the IMS prefix to match those naming conventions.

CICS system connectivity

This release of CICSPlex SM can be used to control CICS systems that are directly connected to it.

For this release of CICSPlex SM, the connectable CICS systems are:

• CICS Transaction Server for z/OS, Version 3 Release 2
• CICS Transaction Server for z/OS, Version 3 Release 1
• CICS Transaction Server for z/OS, Version 2 Release 3
• CICS Transaction Server for z/OS, Version 2 Release 2

You can use this release of CICSPlex SM to control systems running supported releases of CICS that are connected to, and managed by, your previous release of CICSPlex SM. However, if you have any directly-connectable release levels of CICS, as listed above, that are connected to a previous release of CICSPlex SM, you are strongly recommended to migrate them to the current release of CICSPlex SM.
to take full advantage of the enhanced management services. See the relevant CICS Transaction Server for z/OS Migration Guide for information on how to do this.

Table 1 shows which supported CICS systems can be directly connected to which releases of CICSPlex SM.

Table 1. Directly-connectable CICS systems by CICSPlex SM release

Changes in CICS Transaction Server for z/OS, Version 4 Release 2

For information about changes that have been made in this release, please refer to What’s New in the information center, or the following publications:

- CICS Transaction Server for z/OS What’s New
- CICS Transaction Server for z/OS Upgrading from CICS TS Version 4.1
- CICS Transaction Server for z/OS Upgrading from CICS TS Version 3.2
- CICS Transaction Server for z/OS Upgrading from CICS TS Version 3.1

Any technical changes that are made to the text after release are indicated by a vertical bar (|) to the left of each new or changed line of information.
Part 1. Planning for installation

This section discusses the steps required to plan your CICS TS installation.
Chapter 1. Introduction to CICS TS installation

With CICS Transaction Server for z/OS (CICS TS), IBM integrates CICS with a set of other supporting software, offering you a single integrated product in place of several products.

Generally, large online CICS applications run on an MVS operating system with a collection of other supporting software products, some provided by IBM and others by independent software vendors (ISVs). Functional additions include distributed CICS software on alternative platforms, enabling you to distribute transaction processing, with CICS on the MVS host acting as a large database server.

In CICS TS, the levels of all products reflect the level of the CICS TS product itself. The products that make up the base of CICS TS are called elements.

Because the elements and features of CICS TS are integrated into a single package with compatible service levels, you are expected to upgrade all elements of CICS TS at the same time.

CICS Transaction Server for z/OS does not include the CICS Universal Clients or the CICS Transaction Gateway. You require additional licenses to use these products.

Installation methods for CICS TS

You can install CICS TS using a system replace method called ServerPac or using the Custom-Built Product Delivery Option (CBPDO).

CICS TS does not have a stand-alone product tape or Custom Built Installation Process Offering (CBIPO).

Because of the overall ease of installing, choose ServerPac, if possible.

- If you order ServerPac, you receive the following items:
  - A series of tapes, each in IEBCOPY dump-by-data set format (not a physical volume dump) containing a complete generated CICS TS system. This system consists of distribution and target libraries, consolidated software inventory (CSI), and other SMP/E libraries already generated. CICS TS elements and their service are integrated into distribution and target libraries.
  - IBM has performed an IPL of the system and run all installation verification programs (IVPs) before shipment.
  - A CustomPac dialog, accessed through ISPF, that produces jobs that unload the tape to DASD. Through the dialog, you can name the data sets and place them in the catalogs you specify. The following documentation is included and tells you how to use the dialog:
    - ServerPac: Installing Your Order (customized for each customer order)
    - ServerPac: Using the Installation Dialog, SA22-7815
  - All unintegrated service, available on a service tape.
  - Sample jobs to assist with the installation of CICS TS product and service.

Through the dialog, you can do the following tasks:
– Name the data sets and place them on the volumes and in the catalogs you choose.
– Save configuration data for the next install, easing your move to the next release of CICS TS.
– Run tailored postinstallation verification jobs.

* If you order CBPDO, you receive one logically stacked SMP/E RELFILE tape that contains all the base elements. Depending on your customer profile, you receive uninstalled service. You also receive the following items:
  – Sample jobs to help you install CICS TS and service.
  – Custom-Built Offerings Plan/Install, SC23-0352; the CBPDO Memo to Users Extension; Program Directory for CICS Transaction Server for z/OS, GC33-1200, and program materials that describe your CBPDO order.

Figure 1 illustrates the content differences between the ServerPac method and the CBPDO method of installing CICS TS.

Figure 1. Contents of the ServerPac and the CBPDO Delivery
Chapter 2. Requirements for CICS TS

A major part of your planning effort involves looking at the software and hardware required for the system that you are installing.

Hardware and Storage Requirements for Installing CICS TS

Whether you choose the CBPDO method or the ServerPac method, the hardware requirement is the same. The amount of storage required for all the target and distribution data sets is detailed in the space table in the Program Directory.

You require a hardware configuration that runs the required levels of MVS, provided that the configuration has a terminal and a tape device capable of reading one of the following types of tape on which CICS TS is supplied:

- 6250 bpi 9-track reels
- 3480 cartridges
- 4MM DAT cartridges

Do not place any CICS DFHRPL libraries, such as SDFHLOAD, or CICS dynamic program LIBRARY concatenations in the extended addressing space (EAS) of an extended address volume (EAV) DASD volume. If DFHLD SVC attempts to access any DFHRPL libraries or dynamic program LIBRARY concatenations from the EAS, an IEC142I 113-44 message is issued and the request fails.

Software Requirements for Installing CICS TS

The system software requirements for installing CICS TS using the ServerPac method or the CBPDO method are the same except for the addition of SMP/E for CBPDO.

You must install z/OS, Version 1 Release 11 or a later release on the system that you use to install both the ServerPac and the CBPDO.

z/OS includes the following elements that are required for installing CICS TS:

- Interactive System Productivity Facility (ISPF)
- Time Sharing Option/Extended (TSO/E)
- DFSMS/MVS
- Language Environment®
- Two components of z/OS Communications Server: SNA and IP (previously VTAM® and TCP/IP)
- z/OS UNIX System Services

If you are installing CICS TS using the CBPDO method, you also require:

- System Modification Program/Extended (SMP/E)
- High Level Assembler/MVS & VM & VSE.

Service Note: For information about the service that you must apply to ensure that CICS TS installs correctly, see the system requirements at [http://www.ibm.com/support/docview.wss?uid=swg27020857](http://www.ibm.com/support/docview.wss?uid=swg27020857).
If you want to use web services security, you must install the free IBM XML Toolkit for z/OS v1.10. You can download it from the following site: http://www.ibm.com/servers/eserver/zseries/software/xml/ You must install version 1.10; later versions do not work with web services security in CICS. The XML toolkit includes a program directory that describes how to install it. For more information, see Prerequisites for Web Services Security.

**z/OS UNIX file system and PDSE requirements**

Some components are installed in PDSE data sets and z/OS UNIX files, which affects the installation process.

CICS TS for z/OS, Version 4.2 requires PDSE data set support for installation to complete successfully. DFSMS/MVS, which is supplied as an element of z/OS, provides this support for PDSE data sets. The components concerned are part of the CICS support for Java™ programs and for IIOP inbound-to-Java applications. For FMID JCI670D, which contains the z/OS UNIX-dependent code, the OMVS address space must be active in full-function mode, otherwise the installation of this function fails.

In the set of installation jobs, some initial jobs create the z/OS UNIX files and the directories shown in Figure 2. Run these jobs before any of the normal DFHINSTn jobs. The user ID running these jobs requires superuser authority.

```
/pathprefix

/usr1  /usr2  /usr3  /usrn
    |    |    |   
/lpp
    |    |    |   
/cicsts
    |    |    |   
/cicsts13  /cicsts22  /cicsts23  /cicsts31  /cicstsnn
```

*Figure 2. The z/OS UNIX directory structure for CICS java and IIOP files*

1. If you normally maintain additional SMP/E target zone libraries to apply service, you can also create additional directories at the /cicsts42 level to create the z/OS UNIX equivalent. See the DFHIHFSA job for more information.

2. The /pathprefix in Figure 2 is optional.
Chapter 3. CICS Explorer planning

The CICS Explorer® is a system management tool that is delivered as part of CICS Transaction Server. It is designed to provide an easy-to-use way of managing one or more CICS systems. Based on an Eclipse platform, it provides a view of some of the CICSPlex SM functions in a CICS Transaction Server and a platform for the integration of future CICS tools. You must decide how you will run the CICS Explorer in your organization before installing it.

To use the CICS Explorer with CICS TS for z/OS, Version 4.2, you must download and install CICS Explorer Version 1.1. or later.

CICS Explorer prerequisites

To install and use the CICS Explorer, you must have the correct operating system on your workstation, the correct service applied to your CICS systems, and CICS or CICSPlex SM configured to use the CICS management client interface.

The CICS Explorer prerequisites are listed on the CICS Explorer System Prerequisites web page.

**Note:** For a successful system connection, CICS Explorer must determine the CICSPlex SM topology. To determine the topology, CICS Explorer requires at least READ access to the following CICSPlex SM resource tables:
- CMAS resource table
- CICSPlex configuration definition resource table
- CICS region data operations resource table

You must ensure that your security manager configuration provides this minimum level of access to the function and type combinations CONFIG.DEF, TOPOLOGY.DEF, and OPERATE REGION for each user ID that uses the CICS Explorer.

Configuring CICS or CICSPlex SM

You must configure CICSPlex SM or your CICS regions before you can connect to them with the CICS Explorer. You can connect the CICS Explorer to the following systems:
- To a CICS TS for z/OS, Version 3 system through a CICSPlex SM WUI server. This option provides the ability only to view CICS resources in the CICSpex.
- To a CICS TS for z/OS, Version 4 system through a CICSPlex SM WUI server or a CICSPlex SM MAS. This option provides the ability to view, change, and perform actions against CICS resources in the CICSpex.
- To a single CICS TS for z/OS, Version 4 CICS region. This option provides the ability to view, change, and perform actions against CICS resources in that region.
- To a CICS TS for VSE/ESA 1.1.1 system, using the CICS management client interface (CMCI). This option provides a read-only connection. For more information about CICS TS for VSE/ESA, see z/VSE Products and Components on the IBM Systems web site.
To connect to a CICS TS for z/OS, Version 3 system through a CICSPlex SM WUI server, no setup is needed in CICSPlex SM. Follow the connection instruction in the CICS Explorer Help information.

To connect to a CICS TS for z/OS, Version 4 system, you must configure CICSPlex SM or your CICS region to use the CICS management client interface.

CICS Explorer installation options

You have several options for installing the CICS Explorer, depending on how you decide to use it in your organization. Understanding how the CICS Explorer runs, and how it stores its configuration information, will help you to decide which installation option to choose.

The CICS Explorer workspace

When the CICS Explorer is started for the first time, it creates a workspace folder. The folder contains the following configuration information:

- Connection details for connecting to CICS systems or CICSPlex SM WUI servers
- User IDs and passwords (encrypted) for accessing CICS systems or CICSPlex SM
- User-customized view and perspective information

By default, the workspace is stored in a directory on the local workstation. You can provide an option when starting the CICS Explorer so that it uses a different workspace location, but, because the workspace contains user IDs and passwords, you must ensure that the workspace can be accessed only by the owning user.

Three main options satisfy this criterion:

A local workstation
If the user has sole use of a workstation, the CICS Explorer can be saved on the local workstation in the default location.

A private USB flash drive
If the user is using a shared workstation, you can provide an option when starting CICS Explorer to save the workspace on a USB flash drive which can be removed when the user logs off.

A secure remote network drive
If a remote network drive with adequate security is available, you can provide an option when starting CICS Explorer to save the workspace in the user's area on the drive.

CICS Explorer installation options

When deciding where to install the CICS Explorer code you have three main choices. The table in this section identifies the three choices and the advantages and disadvantages of each:
<table>
<thead>
<tr>
<th>Explorer code location</th>
<th>Workspace location</th>
<th>Update method</th>
<th>Advantages/Disadvantages</th>
</tr>
</thead>
</table>
| Local on user’s workstation. | • Local  
• USB flash drive  
• Remote network drive | Users must update their own copies of the software. | Advantages:  
• Starts quickly.  
• Runs quickly.  
• No remote network drive required.  
Disadvantages:  
• Users might not get updates regularly and have problems with earlier levels of software. |
| Remote on a network drive. | • Local  
• USB flash drive  
• Remote network drive | Software is updated centrally. | Advantages:  
• CICS Explorer can be run from any workstation with network access.  
• Centrally managed software; every user at the same level.  
• Runs quickly.  
Disadvantages:  
• Slower to start; code is downloaded to user workstation before running.  
• A network failure prevents the users from saving their CICS Explorer configurations.  
• A network drive failure puts all users out of action. |
<table>
<thead>
<tr>
<th>Explorer code location</th>
<th>Workspace location</th>
<th>Update method</th>
<th>Advantages/Disadvantages</th>
</tr>
</thead>
</table>
| Remote on a server using X-windowing | Remote on shared server | Software is updated centrally | Advantages:  
- Runs quickly; software runs remotely, GUI is downloaded to user's workstation.  
- Centrally managed software; every user at the same level.  
- CICS Explorer can be run from any workstation with X-window capability.  
Disadvantages:  
- Slower to start; code is downloaded to user workstation before running.  
- A server failure puts all users out of action. |

When you have decided where to install CICS Explorer and how to manage the users's workspace, you can begin the installation.
Chapter 4. CICSPlex SM planning

CICSPlex SM requires some additional planning for installation.

CICSPlex System Manager Concepts and Planning provides an introduction to CICSPlex SM. If you are not already familiar with CICSPlex SM, read that introduction before you read these topics.

CICSPlex SM setup checklist and worksheets

Use the aids provided to help you install and setup CICSPlex SM.

Checklist

Use the checklist as a guide to your progress as you set up or revise the configuration of your CICSPlex SM components. The checklist is for use with a CICS Transaction Server for z/OS system and all of the components you can install on it.

You perform some of the tasks on the MVS checklist only once for your CICSPlex SM environment, and for other tasks perform them once for each component. See the 'Where to obtain information' column for a reference to information about how to perform each task.

The order of items in the checklist is a suggested order for performing the installation and setup steps. However, you might find that, particularly if you are modifying your CICSPlex SM environment, a different order is more practical.

Worksheets

Use the worksheets as a record of the names and locations of components and data sets. Copy the worksheets as required.

The worksheets contain, in some cases, more than one line for a type of CICSPlex SM component. You might have fewer or more than shown of that type of component.

MVS installation and setup checklist

A checklist is provided to help you to install and setup MVS.

Planning for a CICSPlex SM upgrade

CICSPlex SM can manage CICS regions running under a number of releases of CICS.

These are the following releases:
- CICS Transaction Server for z/OS, Version 3 Release 2
- CICS Transaction Server for z/OS, Version 3 Release 1
- CICS Transaction Server for z/OS, Version 2 Release 3
Part 2. Installing CICS TS

You can install CICS TS using ServerPac, CBPDO or with an IBM customized package.

IBM offers the following methods for installing CICS TS:

- ServerPac
- CBPDO, using the SMP/E RECEIVE, APPLY, and ACCEPT commands
- CBPDO, using the DFHISTAR process
- IBM customized packages

The first three of these are entitled offerings and are the subject of this information. IBM customized packages are fee-based and are not discussed except for the following summary information. Depending on the country in which you order, you can purchase one of the following customized packages:

- A SystemPac, which tailors CICS TS to your environment, such as DASD layout and naming conventions, based on information provided to IBM
- Other fee-based services and customized offerings

Both the ServerPac and CBPDO methods of delivering CICS TS come with documentation that you use when you install the product. To help you plan ahead, this section gives you a preview of some of this information, such as the information contained in the Program Directory for CICS Transaction Server for z/OS, which is available regardless of the delivery method you choose.

These topics also help you with other planning steps you must take:

- Ensuring you have the required hardware and software to install and run CICS TS; see Chapter 2, “Requirements for CICS TS,” on page 5.
- Ensuring you have enough storage space for CICS TS; see “Hardware and storage requirements for installing CICS TS” on page 5.
- Outlining the installation steps for CBPDO; see Chapter 5, “Installing CICS TS using CBPDO,” on page 21.
Chapter 5. Installing CICS TS using CBPDO

You install all the elements from the CICS TS CBPDO using a single installation process.

The CBPDO Memo to Users Extension contains information about the CBPDO you ordered and the features and service it includes. It also contains CBPDO installation information.

Read the Memo to Users Extension thoroughly before starting any of the installation tasks. If you are a new user of CBPDO, you must also read the IBM publication, MVS Custom-Built Offerings Planning and Installation, SC23-0352.

The Program Directory for CICS Transaction Server for z/OS gives a sample IEBCOPY job that you can customize to copy RELFILE(2) from the CICS TS CBPDO tape.
1. Modify the LABEL=3 parameter to reference the file number of RELFILE(2) as supplied on the CBPDO tape.
2. When you have copied RELFILE(2) to DASD, you generate a single set of installation jobs using the CICS TS job generator, DFHISTAR.
3. This generates the following set of customized installation jobs, based on the parameters you specify to DFHISTAR:
   - DFHIHFS0, DFHIHFS1, DFHIHFSA, and DFHISMKD, the z/OS UNIX-related jobs
   - DFHINST1 through DFHINST6

Using the SMP/E RECEIVE, APPLY, and ACCEPT commands

The process for using the SMP/E RECEIVE, APPLY, and ACCEPT commands is explained in the Program Directory for CICS Transaction Server.

Using DFHISTAR process

DFHISTAR provides default qualifiers for the data sets into which you install CICS TS. The DFHISTAR job provides several parameters to enable you customize your settings.

CICS TS comprises a number of elements that are installed in a single process by the DFHINSTn jobs. To ensure the element libraries are easily identified, DFHISTAR adds an element qualifier to the data set names. Using the default high-level qualifier CICSTS42, the names generated by DFHISTAR take the following form:

CICS CICSTS42.CICS.ddname
CICSplex SM CICSTS42.CPSM.ddname
REXX for CICS CICSTS42.REXX.ddname

To enable you to customize the z/OS UNIX-related jobs, the DFHISTAR job provides the following parameters:
**HFS0DSN**

The data set name of the file system to be mounted at directory
/pathprefix/usr/lpp/cicsts. Pathprefix is variable, and optional. The other parts of this directory name structure are fixed. The default data set name is OMVS.USR.LPP.CICSTS.

The DFHIHFS0 job uses this parameter.

**HFS1DSN**

The data set name of the file system to be mounted at directory
/pathprefix/usr/lpp/cicsts/ussdir, where ussdir is a variable you specify in the ussdir parameter in DFHISTAR. If you omit the ussdir parameter it defaults to the value of the TINDEX parameter in lowercase, which in turn defaults to CICSTS42, so if both defaults are taken, the full directory path resolves to /pathprefix/usr/lpp/cicsts/cicsts42.

The default data set name is OMVS.USR.LPP.CICSTS.CICSTS42.

The DFHIHFS1 job uses this parameter.

**HFSADSN**

The data set name of the file system to be mounted at directory
/pathprefix/usr/lpp/cicsts/ussdira, where ussdira is a variable you also specify in DFHISTAR. If you omit the ussdira parameter, it defaults to the value (in lowercase) of aindex, which, in turn, defaults to CICSTS42.A. The default data set name is OMVS.USR.LPP.CICSTS.CICSTS42.A.

The DFHIHFSA job uses this parameter.

"Editing the DFHISTAR job" on page 25 describes all the parameters that you can specify to customize the installation jobs, and explains the jobs that are generated.
Chapter 6. Installing CICS TS using ServerPac

A CICS TS ServerPac consists of a number of tapes, the exact number depending on whether other products are included with the CICS TS ServerPac and also on the type of tape requested.

For example, a ServerPac order can consist of the following tapes:

- A tape that contains related-installation material (RIM) files
- Three tapes that contain the CICS TS product, consisting of all the SMP/E CSI data sets and the target and distribution libraries
- A service tape

If you already have printed copies of the ServerPac manuals, use these to guide you through the installation process. If you do not have copies, download and print the manuals from the first ServerPac tape. A sample job in member PRTDOC on the RIM tape enables you to print the manuals.

Resources to install the ServerPac

You require several resources to install the CICS TS ServerPac.

- A tape drive for reading the tapes
- A TSO session for running the CustomPac dialog
- A copy of the ServerPac: Using the Installation Dialog manual, SA22-7815
- The ServerPac: Installing Your Order, customized for each customer order
- The CustomPac dialog supplied with ServerPac

First-time user of the CustomPac dialog for ServerPac

If you are installing a ServerPac for the first time, start by installing the CustomPac dialog, then invoke it.

The ServerPac: Using the Installation Dialog manual in “Chapter 2. Installing and Starting the Dialogs” describes how to install the CustomPac dialog.

The INVOCA TION topic in the ServerPac: Using the Installation Dialog manual explains how to invoke the dialog.

Existing user of the CustomPac dialog for ServerPac

If you have installed a ServerPac version of CICS TS for a previous order, use the dialog already installed. Invoke the CustomPac dialog, either from the ISPF primary options menu or by invoking the ServerPac CLIST.

As an existing user of the CustomPac dialog, you can begin at the step described in the ServerPac: Using the Installation Dialog manual, in Chapter 2. Receive a New Order.
Summary of the ServerPac installation steps

When you invoke the CustomPac dialog, you are presented with the primary option menu, which allows you to receive, install and display an order.

You can do the following tasks from the primary option menu:
• Receive the order (option R)
• Install the order (option I)

The primary menu also enables you to display information about orders.

The following tasks are described, with illustrations of the various panels, in the ServerPac: Using the Installation Dialog manual:

Receive the order
This step is described in section “6.0 Receive an Order”.

The “Order Receive” panels enable you enter your CICS TS order information and to complete the job card information required to generate the order-receive job. The final phase of this step presents you with the generated JCL in an edit session, from which you can submit the job to receive the installation material (RIM) files to your DASD.

Install orders
This step is described in section “7.0 Installation Menu”.

The “Installation Menu” panels enable you to perform the following tasks:
• Configure the order control information tables
• Define values for the installation variables used in skeleton batch jobs
• Define the names of the SMP/E zones into which you want to install CICS TS
• Modify data set profiles and DASD allocation for the order
• Define catalog data set names and the aliases associated with them
• Define system-specific aliases (where applicable)
• Select and submit the installation jobs
• Save the installation work configuration for use with future CICS TS orders
• Update the order inventory status
Chapter 7. Installing CICS TS using DFHISTAR

Use the DFHISTAR job for installing CICS TS.

This topic covers the following subjects:
- “Editing the DFHISTAR job”
- “Creating RACF profiles for the CICS Transaction Server data sets” on page 51
- “Running the DFHISTAR job” on page 52
- “Checking that you are ready to run the installation jobs” on page 53
- “Running the installation jobs” on page 53
- “Checking the output from the installation jobs” on page 59
- “Postinstallation activities” on page 59
- “Activating CICS Transaction Server” on page 64
- “Checklist for the CICS Transaction Server for z/OS installation” on page 65

Editing the DFHISTAR job

You can edit the DFHISTAR job to assign values to installation parameters for your environment.

The DFHISTAR job is in the TDFHINST library when you copy RELFILE(2) from the distribution tape. You can either edit the DFHISTAR job directly or copy the DFHISTAR job to preserve the IBM-supplied values and edit your copy.

Remember that the product is installed using cataloged data sets.

To help you look up details about a particular parameter, Table 4 lists the DFHISTAR parameters, in alphabetical order, with their predefined values. The parameters in the DFHISTAR job itself are listed in associated groups. The table also indicates whether a parameter is relevant to CICS, or CICSplex SM, or both.

The default values of the parameters are the same as the IBM-supplied values. You can use the IBM-supplied values, define your own values, or let the CICS Transaction Server installation process determine default values for you.

Enter your values for parameters of the DFHISTAR job in lowercase. Except for the z/OS UNIX parameters USSDIR, USSDIRA, and JAVADIR, the values are translated into uppercase when you run the DFHISTAR job.

**Specifying the CICS Transaction Server temporary installation libraries**

Specify your data set names for the two temporary libraries that are used to install CICS Transaction Server. If you do not want to use the default names, record your values for the TEMPLIB and LIB parameters.

**TEMPLIB library_name**

Specifies the name of the temporary installation library that contains the
skeleton installation jobs. Specify the name of the data set into which you copied RELFILE(2) from the distribution tape, described in Copy RELFILE(2) from the Distribution Tape in the Program Directory for CICS Transaction Server for z/OS.

Also specify this name on the SYSPROC DD statement of the DFHISTAR job.

**LIB library_name**

Specifies the name of the installation output library to which the jobs generated by the DFHISTAR job are added.

### Specifying the JOB parameters for installation jobs

Decide which parameters you want to use on the JOB statements of the CICS Transaction Server installation jobs and specify them on the JOB parameter.

**JOB accounting_information**

Specifies the JOB statement and accounting information that you want substituted into the jobs generated by the DFHISTAR job. Here is an example:

```
JOB //XXXXXXXX JOB 1,userid,MSGCLASS=A,MSGLEVEL=(1,1),
JOB //
JOB /*JOBPARM SYSAFF=node1
JOB /*ROUTE PRINT node2.userid
```

1. Do not change XXXXXXXX given in the sample JOB statement in the DFHISTAR job because it is the 8-character job name that is substituted by the DFHISTAR job. For example, for the installation job DFHIVPBT, the DFHISTAR job changes XXXXXXXX to DFHIVPBT.
2. Normal JCL rules for coding JOB statements apply to the JOB parameter.
3. To add a TIME parameter to the CICS Transaction Server installation jobs, sample run times are given in “Run times of the installation jobs” on page 54.
4. Delete or comment out extra lines of the JOB statement that you do not require.
5. Normal JCL rules apply when coding the JOB statement; for example, all lines except the last line must end in a comma.

### Specifying the scope of the installation

Specify the scope of the CICS Transaction Server installation on the **SCOPE** parameter.

**SCOPE ALL|BASE|POST**

Specifies whether you want to generate all the CICS Transaction Server installation and postinstallation jobs or only the postinstallation jobs. When you install CICS Transaction Server from the distribution tape, specify the default, SCOPE ALL. Code the other options, if necessary, during the postinstallation tasks.

**SCOPE ALL|BASE|POST**

Specifies whether you want to generate all the CICS Transaction Server installation and postinstallation jobs, or only the postinstallation jobs. When you install CICS Transaction Server from the distribution tape, specify the default, SCOPE ALL. Code the other options, if necessary, during postinstallation tasks.

**ALL**

Specifies that you want to generate all the CICS Transaction Server installation jobs and all the postinstallation jobs.

**BASE**

Specifies that you want to generate only the installation jobs.
(DFHINST1 through DFHINST6, DFHIHFS0, DFHIHFS1, and DFHISMKD) that you use to install CICS Transaction Server from the distribution tape.

**POST**

Specifies that you want to generate only the postinstallation jobs that you can use to create the CICS Transaction Server data sets, and run the IVPs.

**Specifying the type of JES to be used**

Specify the type of job entry subsystem (JES) that you use to install CICS Transaction Server on the JES parameter. The DFHISTAR job generates jobs with statements suitable for JES2 or JES3.

**JES JES2|2|JES3|3**

Specifies the release of JES that you are using. If you are using JES2, specify JES2 or 2. If you are using JES3, specify JES3 or 3.

**Specifying the utilities**

Specify the utilities to install CICS Transaction Server on the UTILITIES parameter.

**UTILITIES asmprog binder smpeprog copyutil**

Specifies the names of utility programs to be used when installing CICS Transaction Server elements and programs that it uses.

**asmprog**

The program name of the assembler. Specify ASMA90 for High Level Assembler/MVS and VM and VSE, which is required.

**binder**

The program name of the z/OS binder. Ensure that program IEWL references the z/OS program management binder.

**smpeprog**

The program name of the SMP/E program. The IBM-supplied name is GIMSMP.

**copyutil**

The program name of the data set copy utility program. The IBM-supplied name is IEBCOPY.

The High Level Assembler either must be in the LINKLST concatenation or you must add a STEPLIB DD statement that points to the library containing the High Level Assembler in any jobs that invoke SMP/E.

**Specifying the prefix of CICS Transaction Server jobs**

Specify the 1- to 6-character prefix to be added to the jobs generated by the DFHISTAR job. This prefix overwrites the first characters of the job name.

For example, **PREFIX USERID** changes the job name DFHINST1 to USERIDT1.

**PREFIX prefix**

The 1- to 6-character prefix to be added to the CICS jobs generated by the DFHISTAR job.

**Specifying the indexes of CICS Transaction Server data sets**

Specify the high-level indexes for the CICS Transaction Server distribution, target, and SMP/E libraries allocated by the installation process.
GINDEX `library_prefix`
Assigns a high-level index to the CICS Transaction Server SMP/E global libraries allocated by the installation process.

The `library_prefix` value must not be longer than 26 characters and the leading character must be alphabetic. If you specify more than one level of index, the names must be separated by a period; for example, GINDEX CICSTS42.TEST.

TINDEX `library_prefix`
Assigns a high-level index to the CICS Transaction Server SMP/E target libraries (except for the SDFHLINK, SDFHLPA, SEYULINK, and SEYULPA target libraries) allocated by the installation process.

1. The LINDEX parameter defines the high-level index for the SDFHLINK and SDFHLPA libraries.
2. The `dsindex` operand of the DSINFO parameter defines the high-level index for the data sets created by the DFHCOMDS and DFHDEFDS jobs.

The `library_prefix` value must not be longer than 26 characters and the leading character must be alphabetic. If you specify more than one level of index, the names must be separated by a period; for example, TINDEX CICSTS42.TEST.

DINDEX `library_prefix`
Assigns a high-level index to the CICS Transaction Server SMP/E distribution libraries allocated by the installation process.

The `library_prefix` value must not be longer than 26 characters and the leading character must be alphabetic. If you specify more than one level of index, the names must be separated by a period; for example, DINDEX CICSTS42.TEST.

LINDEX `library_prefix`
Assigns a high-level index to the SDFHLPA, SDFHLINK, SEYULINK, and SEYULPA libraries allocated by the installation process. Define the `library_prefix` value in the MVS Master Catalog.

The `library_prefix` value must not be longer than 26 characters and the leading character must be alphabetic. If you specify more than one level of index, the names must be separated by a period; for example, LINDEX SYS1.CICSTS42.CICS.TEST.

**Specifying extra qualifiers**
Specify extra qualifiers that can optionally be inserted into the data set name of the 'target', 'distribution', and 'additional' zone data sets respectively, and inserted before the last data set qualifier. For example, XTRAQUAL JDOE .. changes the name of the target zone libraries to the values set by TINDEX.CICSTS42.CICS.JDOE.SDFHLOAD.

**XTRAQUAL ..**
Three qualifiers to be used by 'target', 'distribution', and 'additional' zone data sets. If a qualifier is not required, specify a period (.)

**Specifying the CICS TS z/OS UNIX directories and data sets**
The DFHISTAR job has parameters that enable you to customize the UNIX system services z/OS UNIX directories.

**HFS0DSN**
The data set name of the file system to be mounted at directory 
/pathprefix/usr/lpp/cicsts/cicsts42.
These directory names are fixed. The default is data set name OMVS.USRLPP.CICSTS.

See “Running the DFHIHFS0 job” on page 54 for details of the job that uses this parameter.

**HFS1DSN**

The data set name of the file system to be mounted at directory /pathprefix/usr/lpp/cicsts/ussdir, where ussdir is the name of the directory specified on the ussdir parameter in the DFHISTAR job. The default is data set name OMVS.USRLPP.CICSTS.CICSTS42.

See “Running the DFHIHFS1 job” on page 55 for details of the job that uses this parameter.

**HFSADSN**

The data set name of the z/OS UNIX equivalent of the SMP/E “additional target zone”, to be mounted at directory /pathprefix/usr/lpp/cicsts/ussdira, where ussdira is the name of the directory specified on the ussdira parameter in the DFHISTAR job. The default data set name is OMVS.USRLPP.CICSTS.CICSTS42.A.

See “Creating extra sets of CICS Transaction Server target libraries (optional)” on page 62 for details of the job that uses this parameter.

**PATHPREFIX**

The name of an optional prefix to the CICS TS directory /usr/lpp/cicsts. For example:

/example/usr/lpp/cicsts

**USSDIR**

The name of the CICS TS directory under /pathprefix/usr/lpp/cicsts.

The full name is therefore /pathprefix/usr/lpp/cicsts/ussdir. Ussdir is a name that you can choose. The default for ussd is the value of the TINDEX parameter in lowercase.

The default path is:

/pathprefix/usr/lpp/cicsts/cicsts42

The name of the UNIX System Services directory after the root directory (/usr/lpp) is always /cicsts.

**USSDIRA dsname**

Specifies the name of the UNIX System Services directory for the Additional Target zone. See job DFHINSTA.

The default is the value of the AINDEX parameter in lowercase.

The UNIX System Services directory path starts /ussindex/cicsts/ussdira where ussindex is the translated value of the USSINDEX parameter, and ussd is the value of the USSDIRA parameter.

The default path is: /pathprefix/usr/lpp/cicsts/cicsts42.a. The name of the UNIX System Services directory after the root directory (/usr/lpp/) is always cicsts.

---

**Specifying the installation directory for Java support**

Specify the directory where the IBM 64-bit SDK for z/OS, Java Technology Edition is installed on z/OS UNIX. Support for the 31-bit version of the SDK is withdrawn, so you must upgrade to use the 64-bit version.
The JAVADIR parameter specifies the location of the SDK on z/OS UNIX. The supplied value java/J6.0.1_64 points to the default installation directory for Version 6.0.1 of the IBM 64-bit SDK for z/OS, Java Technology Edition. This value of this parameter is appended to /pathprefix/usr/1pp/, giving a full path name of /pathprefix/usr/1pp/javadir.

The installation directory is used in the CICS-supplied sample JVM profiles.

**Specifying block sizes**

Specify the block sizes to be used when allocating data sets during installation on the BLKFB80 and BLKU parameters.

**BLKFB80 {0|blocksize}**

The block size to be used when allocating data sets that have a fixed block record format and record length of 80 bytes.

The IBM-supplied value in DFHISTAR is 0. Leave this value specified as 0 to allow z/OS to determine the optimum block size for you.

**BLKU {32760|blocksize}**

The block size to be used when allocating data sets that have an undefined record length.

**Specifying the disk unit for work data sets**

Specify the UNIT parameter for the disk or disks on which work data sets are stored on the WORKUNIT parameter.

**WORKUNIT disktype**

A unit identifier.

**Specifying the SMS option for DASD allocations**

Specify the extent to which you want to leave the allocation of CICS TS installation data sets to SMS. You can either let SMS handle all DASD allocation, or you can use volume parameters to control the allocations that do not have to be managed by SMS.

Some CICS TS data sets are installed in PDSE data sets. These are the following data sets:

- The SMP/E SMPLTS data set.
- The distribution library, ADFJMOD.
- The target library, SDFJAUTH.

See Program Directory for CICS Transaction Server for z/OS for information about these data sets.

**SMS YES | NO**

If you specify SMS YES, the VOLUME parameter is omitted from the generated installation jobs and all data set allocations are handled by SMS.

If you specify SMS NO, the VOLUME parameter is included on the generated installation jobs, and is recognized according to your SMS configuration. The VOLUME parameters used are those specified on the ADDTVOL, DEFVOL, DISTVOL, CMACVOL, OPTVOL, SMPVOL, and TARGVOL parameters.
Specifying disk volumes

To make the best use of your disk space, you can specify your own disk volumes and device types to be used to install CICS Transaction Server.

If you intend to install CICS Transaction Server into disk space managed by the storage management subsystem (SMS) component of MVS/DFP, you do not have to specify your own disk volumes; SMS can determine device assignment. In this case, proceed to “Specifying SMP/E zone attributes” on page 40. For further information about installing system-managed storage and about planning for and migrating storage to an SMS-managed environment, see the MVS Storage Management Library: Storage Management Subsystem Migration Planning Guide, SC26-4406.

You can specify your own disk details using the following parameters:

**DEFVOL volume disktype**

Defines the default disk on which the contents of the disk volumes CMACVOL, DISTVOL, OPTVOL, SMPVOL, and TARGVOL resides if the appropriate parameter is not coded in the DFHISTAR job. For example, if you do not code the DISTVOL parameter, the CICS Transaction Server distribution libraries resides on the disk defined by DEFVOL.

- **volume**
  - The volume serial identifier, in the range 1 through 6 characters, of the default volume.
  - A period (.) if all volumes other than CMACVOL and SMPVOL that are not specifically defined by the appropriate parameter of the DFHISTAR job are put onto any available volume. The CMACVOL and SMPVOL volumes are put onto the same volume as the library specified by the TEMPLIB parameter.

- **disktype**
  - Is the UNIT parameter of the volume.

If you omit the DEFVOL parameter, all volumes that are not specifically defined by the appropriate parameter of the DFHISTAR job are put onto the same volume as the library specified by the TEMPLIB parameter.

**DISTVOL volume disktype**

Defines the disk on which the CICS Transaction Server distribution libraries resides.

- **volume**
  - The volume serial identifier, in the range 1 through 6 characters, of the volume on which the distribution libraries resides.
  - A period (.) if the CICS Transaction Server libraries are to be put onto any available volume.

- **disktype**
  - Is the UNIT parameter of the volume.

If you omit the DISTVOL parameter, the distribution libraries are put on the volume specified by the DEFVOL parameter. If the DEFVOL parameter is omitted, or if a period (.) is specified for its volume operand, the distribution libraries are put onto any available volume.
**TARGVOL volume disktype**

Specifies details of the disk containing the CICS Transaction Server target libraries.

**volume**

Is one of the following entries:

- The volume serial identifier, in the range 1 through 6 characters, of the volume on which the CICS Transaction Server target libraries are to reside.
- A period (.) if the CICS Transaction Server target libraries are to be put onto any available volume.

**disktype**

Is the UNIT parameter for the volume.

If you omit the TARGVOL parameter, the CICS Transaction Server target libraries are put onto the volume specified by the DEFVOL parameter. If the DEFVOL parameter is omitted, or if a period (.) is specified for its volume operand, the CICS Transaction Server target libraries are put onto any available volume.

**SMPVOL volume disktype**

Specifies the disk that contains the permanent, non-VSAM SMP/E data sets for CICS Transaction Server that are associated with global or distribution zones and are therefore unique.

**volume**

Is one of the following entries:

- The volume serial identifier, in the range 1 through 6 characters, of the volume on which the permanent non-VSAM SMP/E data sets are to reside.
- A period (.) if the permanent non-VSAM SMP/E data sets are to be put onto the same volume as the library specified by the TEMPLIB parameter.

**disktype**

Is the UNIT parameter for the volume.

If you omit the SMPVOL parameter, the permanent non-VSAM SMP/E data sets for CICS Transaction Server are put on the volume specified by the DEFVOL parameter. If the DEFVOL parameter is omitted, or if a period (.) is specified for its volume operand, the data sets are put onto the same volume as the library specified by the TEMPLIB parameter.

**OPTVOL volume disktype**

Specifies details of the disk onto which the optional source material is copied.

**volume**

Is one of the following entries:

- The volume serial identifier, in the range 1 through 6 characters, of the volume on which the optional source material is to reside.
- A period (.) if the optional source material is to be put on any available volume.

**disktype**

Is the UNIT parameter of the volume. This is required only if volume is specified.
If you omit the OPTVOL parameter, the optional source material is put on the volume specified by the DEFVOL parameter. If the DEFVOL parameter is omitted, or if a period (.) is specified for its volume operand, the optional source material is put onto any available volume.

**CMACVOL volume**
Defines the disk on which the VSAM KSDS, DFHCMACD, resides. This data set is used for the CICS Transaction Server messages facility (CICS-supplied transaction CMAC).

**volume**
Is one of the following entries:
- The volume serial identifier, in the range 1 through 6 characters, of the volume on which the VSAM KSDS, DFHCMACD, is to reside.
- A period (.) if the DFHCMACD data set is to be put onto the same volume as the library specified by the TEMPLIB parameter.

If you omit the CMACVOL parameter, the DFHCMACD data set is put onto the volume specified by the DEFVOL parameter. If the DEFVOL parameter is omitted, or if a period (.) is specified for its volume operand, the DFHCMACD data set is put onto the same volume as the library specified by the TEMPLIB parameter.

**When are these volumes used?**
The reference table lists the DFHISTAR volume parameters and details of their use.

<table>

1 The entries for xZONECSI parameters are also for the associated xZONE parameters.

You require the RELFILE data sets on SMPVOL during installation only.

You require SMPVOL, DISTVOL, TARGVOL, DZONE, TZONE, and GZONE when you apply service or customize your CICS Transaction Server programs. You require SMPVOL and GZONE when you apply service or customize your alternative libraries for use with the extended recovery facility.

You require SMPVOL, TARGVOL, TZONE, and GZONE when you assemble your CICS Transaction Server tables. You require SMPVOL and GZONE when you assemble CICS Transaction Server tables for the second (alternate) CICS Transaction Server region.

You require only TARGVOL to run CICS Transaction Server.
Allocating space for CICS Transaction Server disk volumes

Whether or not you use SMS-managed data sets, you still require enough disk space in which to create the CICS Transaction Server disk volumes.

The space required by the installation jobs on these volumes depends on the type of disk you intend to use. The number of tracks required on the different types of DASD are given in Table 5. The Program Directory for CICS Transaction Server for z/OS describes the size of the CICS Transaction Server distribution and target libraries.

Allow up to 15% on the values in Table 5 for servicing requirements. Secondary allocations are 10% of the primary allocations.

If you intend to store other IBM software or your own application programs in these libraries, you must modify the generated jobs accordingly.

Specifying attributes of the temporary SMP/E work data sets

You must define the attributes of the temporary SMP/E work data sets, SMPWRK1, SMPWRK2, SMPWRK3, SMPWRK4, and SMPWRK6, for the following CICS Transaction Server jobs: DFHINSTJ, DFHINST6, DFHLPUMD, DFHSMPE, and EYULPMOD.

Define the attributes of those SMP/E data sets on the SMPWORK parameter:

The CICS Transaction Server jobs used to install CICS Transaction Server for z/OS have DD statements for the SMP/E data sets that they must know about.

SMPWORK disktype

The UNIT parameter for the disk that is to contain the temporary SMP/E work data sets, SMPWRK1, SMPWRK2, SMPWRK3, SMPWRK4, and SMPWRK6, required to install CICS Transaction Server.

Do not allocate the SMPWRK6 data set to Virtual I/O (VIO). If you specify a value for disktype, ensure that SMPWRK6 cannot be allocated to VIO.

If you specify a value for disktype, or omit the SMPWORK parameter altogether, //SMPWRKn DD statements are added to the following jobs generated by the DFHISTAR job:
If you specify NO, a period (.), or a null string, CICS Transaction Server assumes that SMP/E knows about the temporary SMP/E work data sets. To define the attributes of the SMP/E work data sets, you must do one of the following tasks:

- Provide appropriate DDDEFS for the temporary SMP/E work data sets.
- Apply the SMP/E sample usermod (SMP0001) that contains superzap statements for updating the default attributes of the SMP/E data sets in the GIMMPDFDT module.

The GIMMPDFDT module, which is part of SMP/E, defines the default attributes of SMP/E data sets, and can be used to dynamically allocate data sets to be used by all zones. For more information about the entries in the GIMMPDFDT module and the sample entry values in the usermod SMP0001, see System Modification Program Extended: Reference, SA22–7772.

### Specifying attributes of the permanent SMP/E data sets

You can specify the attributes of the permanent SMP/E data sets using the SMPPTS, SMPMTS, SMPSTS, SMPSCDS and SMPLTS parameters.

Specify the attributes of the permanent SMP/E data sets on the following parameters:

- **SMPPTS dsname**
  Specifies the name of the SMP/E primary data set used to store temporarily PTF function SYSMODs or other fixes that are in RECEIVE or APPLY status; that is, PTF fixes that have not been rejected or accepted.

- **SMPMTS dsname**
  Specifies the name of the SMP/E macro temporary store (MTS) data set used to store updated versions of macros. Although required by SMP/E, CICS does not use the MTS data set.

- **SMPSTS dsname**
  Specifies the name of the SMP/E source temporary store (STS) data set used to store updated versions of source elements. Although required by SMP/E, CICS does not use the STS data set.

- **SMPSCDS dsname**
  Specifies the name of the SMP/E saved control data set (SCDS) used to store old target zone entries that have been modified by inline JCLIN processing in a SYSMOD.

- **SMPLTS dsname**
  Specifies the name of the link-edit temporary (LTS) data set used with the CALLLIBS function. This data set must always be an SMS-managed PDSE, whether or not Java is installed, unless you have installed the PTFs for z/OS UNIX and PDSE support on non-managed SMS volumes listed in Flash10007, which can be found by links from http://www.ibm.com/support/techdocs.

The CICS Transaction Server jobs that must know the attributes of the SMP/E data sets have DD statements for them.
Specifying SMP/E zone attributes

Specify the attributes of the SMP/E distribution zone, global zone, target zone, and any additional target zones.

The CICS DB2 attachment facility contains modules named with the DSN prefix. Therefore, to prevent existing DB2 modules with the same DSNxxxxx names from being overwritten, do not install CICS Transaction Server into the same target and distribution zones as DB2.

To specify SMP/E zone attributes, use the following parameters:

**GZONELOG dsname NEW|OLD**

Specifies details of the SMP/E log for the global zone CSI.

  - **dsname**
    - The name of the global zone log.
  - **NEW|OLD**
    - Specifies whether an existing global zone log is to be used. If you specify NEW, any existing global zone log with the specified dsname is deleted, and a new global zone log is allocated. If you specify OLD, an existing global zone log is used.

**TZONELOG dsname NEW|OLD**

Specifies details of the SMP/E log for the target zone CSI.

  - **dsname**
    - The name of the target zone log.
  - **NEW|OLD**
    - Specifies whether an existing target zone log is to be used. If you specify NEW, any existing target zone log with the specified dsname is deleted, and a new target zone log is allocated. If you specify OLD, an existing target zone log is used.

**DZONELOG dsname NEW|OLD**

Specifies details of the SMP/E log for the distribution zone CSI.

  - **dsname**
    - The name of the distribution zone log.
  - **NEW|OLD**
    - Specifies whether an existing distribution zone log is to be used. If you specify NEW, any existing distribution zone log with the specified dsname is deleted, and a new distribution zone log is allocated. If you specify OLD, an existing distribution zone log is used.

**GZONECSI cluster NEW|OLD volume disktype**

Specifies details of the global zone CSI.

  - **cluster**
    - The VSAM cluster name, without the qualifier '.CSI'.
  - **NEW|OLD**
    - Specifies whether an existing global zone CSI is to be used. If you specify NEW, any existing global zone CSI with the specified cluster name is deleted, and a new global zone CSI is allocated. If you specify OLD, an existing global zone CSI is used.
  - **volume**
    - Either the volume serial (volser) identifier for the volume on which the
global zone CSI is to be allocated or a period (.) if the CSI is to be put on a
volume determined by the CICS Transaction Server installation process.

**disktype**
The UNIT parameter for the volume.

**TZONECSI cluster NEW|OLD volume disktype**
Specifies details of the target zone CSI.

**cluster**
The VSAM cluster name, without the qualifier '.CSI'.

**NEW|OLD**
Specifies whether an existing target zone CSI is to be used. If you specify
NEW, any existing target zone CSI with the specified cluster name is
deleted, and a new target zone CSI is allocated. If you specify OLD, an
existing target zone CSI is used.

**volume**
Either the volume serial (volser) identifier for the volume on which the
target zone CSI is to be allocated or a period (.) if the CSI is to be put on a
volume determined by the CICS Transaction Server installation process.

**disktype**
The UNIT parameter for the volume.

**DZONECSI cluster NEW|OLD volume disktype**
Specifies details of the distribution zone CSI.

**cluster**
The VSAM cluster name, without the qualifier '.CSI'.

**NEW|OLD**
Specifies whether an existing distribution zone CSI is to be used. If you specify
NEW, any existing distribution zone CSI with the specified cluster name is
deleted, and a new distribution zone CSI is allocated. If you specify OLD, an
existing distribution zone CSI is used.

**volume**
Either the volume serial (volser) identifier for the volume on which the
distribution zone CSI is to be allocated or a period (.) if the CSI is to be put on a
volume determined by the CICS Transaction Server installation process.

**disktype**
The UNIT parameter for the volume.

**GZONE NEW|OLD options**
Specifies whether the global zone to be used already exists.

**NEW|OLD**
Specifies whether an existing global zone is to be used. The DFHISTAR job
as supplied specifies NEW. Optionally, change this to OLD to use an
existing global zone. If you specify OLD, CICS Transaction Server is
installed into an existing SMP/E global zone.

Specify NEW if you want to preserve your existing releases of CICS
Transaction Server in their current SMP/E zones and install the new
release in its own zones.

If you specify OLD, the existing SMP/E zones are used and any existing
release of the product is deleted.
If you specify OLD, but specify NEW for the GZONECSI parameter, both parameters are assigned the NEW disposition.

**options**
Specifies the name of the SMP/E options to be used on the SET BOUNDARY command.

**TZONE zonename**
Specifies the name of the target zone.

zonename
The name of the target zone to be used by SMP/E. This name must be unique to the target zone. It must not be longer than seven characters, and the leading character must be alphabetic.

**DZONE zonename**
Specifies the name of the distribution zone.

zonename
The name of the distribution zone to be used by SMP/E. This name must be unique in the global zone. It must not be longer than seven characters, and the leading character must be alphabetic.

### Specifying SMP/E zone and zone log dispositions
As supplied, the DFHISTAR job assumes that you are going to install CICS Transaction Server into new target and distribution zones. However you can specify a new or old global zone, and new or old zone logs by the disposition option NEW|OLD on the associated parameters of the DFHISTAR job.

The disposition option NEW means that the DFHINST3 job deletes any existing zone or zone log with its name specified before redefining it. For example, if you specify the following parameter:

```
GZONELOG CICSTS42.GZONE.SMPLOG NEW
```

the DFHINST3 job deletes any existing SMP/E global zone log with the name CICSTS42.GZONE.SMPLOG before defining a new SMP/E global zone log with that name.

Further, if you specify different dispositions for a zone parameter and its associated zone log parameter, they are both given the default disposition NEW, to ensure that both a zone and its zone log have the same disposition.

If you intend to install CICS Transaction Server using one new CSI for all zones, you must specify the disposition NEW on all three CSI parameters of the DFHISTAR job. For example:

```
DZONE DZONE
DZONECSI CICSTS42.SMPZONE NEW CICSTS42 SYSALLDA
DZONELOG CICSTS42.DZONE.SMPLOG NEW
GZONE NEW CICSOPT
GZONECSI CICSTS42.SMPZONE NEW CICSTS42 SYSALLDA
GZONELOG CICSTS42.GZONE.SMPLOG NEW
TZONE TZONE
TZONESNI CICSTS42.SMPZONE NEW CICSTS42 SYSALLDA
TZONELOG CICSTS42.TZONE.SMPLOG NEW
```

### Specifying the high-level qualifiers for SMP/E data sets
For each different high-level qualifier that you have specified for SMP/E zone CSIs, logs, and other SMP/E data sets, you must create an ALIAS definition in the master catalog before the data sets can be used.
Specifying the distribution tape device type

Specify the type of device that will load the CICS Transaction Server distribution tape on the TAPEUNIT parameter.

**TAPEUNIT devicetype**

Specifies the device type to be used to read the distribution tape. Use 3480 for the 3480 tape cartridge, 3400-6 for the 6250 tape, or the unit names in use in your installation.

Specifying attributes of the CICS Transaction Server system data sets

Use the DSINFO parameter to specify the attributes of the CICS Transaction Server system data sets, which are created when you run the postinstallation jobs, DFHCOMDS, DFHDEFDS, EYUCMSDS, EYUWUIDS, and EYUCSYDS

For more information about the postinstallation jobs DFHCOMDS and DFHDEFDS, see "Creating data sets common to all CICS regions, DFHCOMDS job" on page 234.

**DSINFO dsindex volume disktype qualifier**

Defines the following attributes of CICS TS system data sets:

- **dsindex**
  - Assigns a high-level index to all the data sets defined by the jobs, DFHCOMDS, DFHDEFDS, EYUCMSDS, EYUWUIDS, and EYUCSYDS.
  - The leading character of *dsindex* must be alphabetic. *dsindex* can have one or two levels of index, but each level must be no longer than eight characters. If you specify more than one level of index, the names must be separated by a period, for example, CICSTS42.CICSHTC1.

- **volume**
  - The volume identifier of the volume.

- **disktype**
  - The UNIT parameter for the volume.

- **qualifier**
  - A partial qualifier added to the index for the data sets created by the jobs DFHCOMDS, DFHDEFDS, EYUCMSDS, EYUWUIDS, and EYUCSYDS. You can specify a partial qualifier of up to four alphanumeric characters; these characters are appended to the characters CICS to make the qualifier. If you specify a period (.), no qualifier is used.

Specifying attributes of any additional target libraries

If you want to create extra copies of the CICS Transaction Server target libraries, specify the attributes of those libraries on the listed parameters.

**AINDEX library_prefix**

Assigns a high-level index to the additional set of CICS target libraries copied by a version of the DFHINSTA job.

**Note:**

1. The high-level index for the additional SDFHLINK and SDFHLPA libraries is defined by the AINDEX parameter.
2. The high-level index for the data sets created by the jobs DFHCOMDS and DFHDEFDS is defined by the *dsindex* operand of the DSINFO parameter.
The AINDEX value must be unique; for example, it must be different from the INDEX value. It must not be longer than 26 characters, and the leading character must be alphabetic. If you specify more than one level of index, the names must be separated by a period; for example, AINDEX CICSTS42.A.TEST.

**ALINDEX library_prefix**
Assigns a high-level index to the additional SDFHLPA and SDFHLINK libraries allocated by running a version of the DFHINSTA job.

The library_prefix value must not be longer than 26 characters and the leading character must be alphabetic. If you specify more than one level of index, the names must be separated by a period; for example, ALINDEX SYS1.CICSTS42.A.TEST.

**AZONELOG dsname**
Specifies details of the SMP/E log for the additional target zone CSI.

dsname
The name of the additional target zone log to be used by SMP/E.

**AZONECSI cluster**
Specifies details of the additional target zone CSI. The CSI data set is created on the volume and unit specified by the ADDTVOL parameter.

cluster
The VSAM cluster name, without the qualifier .CSI.

**AZONE zonename**
Specifies the name of the additional target zone, to be used for the set of CICS Transaction Server target libraries copied by a version of the DFHINSTA job.

zonename
The name of the additional target zone to be used by SMP/E. This name must be unique to the target zone. It must not be longer than seven characters and the leading character must be alphabetic.

**ASMPSCDS dsname**
Specifies the name of the additional zone SMP/E SCDS data set.

dsname
The name of the additional zone SMP/E SCDS data set.

**ASMPMTS dsname**
Specifies the name of the additional zone SMP/E MTS data set.

dsname
The name of the additional zone SMP/E MTS data set.

**ASMPSTS dsname**
Specifies the name of the additional zone SMP/E STS data set.

dsname
The name of the additional zone SMP/E STS data set.

**ASMPLTS dsname**
Specifies the name of the additional zone SMP/E LTS data set.

dsname
The name of the additional zone SMP/E LTS data set.

**ADDTVOL volume disktype**
Specifies the volume and unit type to contain all the additional zone data sets.

volume
The volume serial identifier of the volume.
Specifying the library data set names

Specify the data set names for the SISPLOAD, CSSLIB, SCEELKED, SCEELIB, SCEEBND2, SCEELKEX, SCEEOBJ, SCEECPP, SCLBSID, SEZARPCL, SEZACMTX, SCEECICS, SCEERUN, SCEERUN2, SCEESAMP, SDSNLOAD, SCSQLOAD, SCSQANLE, SCSQCICS, SCSQAUTH, and SCSFMOD0 libraries.

Specifying the data set names of the SISPLOAD library

Specify the full data set name, up to 44 characters, of the library that contains ISPLINK; SISPLOAD for ISPF Version 4 and above, or ISPLOAD for ISPF version 3 and below. For example, SISPLOAD SYS1.USERID.SISPLOAD changes the SISPLOAD library name to SYS1.USERID.SISPLOAD. This library is accessed, as read-only, during the installation of CICS Transaction Server.

SISPLOAD dsname

Up to 44 characters.

Specifying the data set name of the CSSLIB library

Specify the full data set name, up to 44 characters, of the CSSLIB library. For example, CSSLIB SYS1.USERID.CSSLIB changes the CSSLIB library name to SYS1.USERID.CSSLIB. This library is accessed, as read-only, during the installation of CICS Transaction Server.

CSSLIB dsname

Up to 44 characters.

Specifying the data set name of the SCEELKED library

Specify the full data set name, up to 44 characters, of the SCEELKED library. For example, SCEELKED SYS1.USERID.SCEELKED changes the SCEELKED library name to SYS1.USERID.SCEELKED. This library is accessed, as read-only, during the installation of CICS Transaction Server.

SCEELKED dsname

Up to 44 characters.

Specifying the data set names of the SCEELIB library

Specify the full data set names, up to 44 characters, of the SCEELIB library. For example, SCEELIB SYS1.USERID.SCEELIB changes the SCEELIB library name to SYS1.USERID.SCEELIB. The library is accessed, as read-only, during the installation of CICS Transaction Server.

SCEELIB dsname

Up to 44 characters.

Specifying the data set name of the SCEEBND2 library

Specify the full data set name, up to 44 characters, of the SCEEBND2 library. For example, SCEEBND2 SYS1.USERID.SCEEBND2 changes the SCEEBND2 library to SYS1.USERID.SCEEBND2. This library is accessed, as read-only, during the installation of CICS Transaction Server.
SCEEBND2 dsname
Up to 44 characters.

**Specifying the data set name of the SCEELKEX library**

Specify the full data set name, up to 44 characters, of the SCEELKEX library. For example, SCEELKEX SYS1.USERID.SCEELKEX changes the SCEELKEX library name to SYS1.USERID.SCEELKEX. This library is accessed, as read-only, during the installation of CICS Transaction Server.

SCEELKEX dsname
Up to 44 characters.

**Specifying the data set name of the SCEEOBJ library**

Specify the full data set name, up to 44 characters, of the SCEEOBJ library. For example, SCEEOBJ SYS1.USERID.SCEEOBJ changes the SCEEOBJ library name to SYS1.USERID.SCEEOBJ. This library is accessed, as read-only, during the installation of CICS Transaction Server.

SCEEOBJ dsname
Up to 44 characters.

**Specifying the data set name of the SCEECPP library**

Specify the full data set name, up to 44 characters, of the SCEECPP library. For example, SCEECPP SYS1.USERID.SCEECPP changes the SCEECPP library name to SYS1.USERID.SCEECPP. This library is accessed, as read-only, during the installation of CICS Transaction Server.

SCEECPP dsname
Up to 44 characters.

**Specifying the data set name of the SCLBSID library**

Specify the full data set name, up to 44 characters, of the SCLBSID library. For example, SCLBSID SYS1.USERID.SCLBSID changes the SCLBSID library name to SYS1.USERID.SCLBSID. This library is accessed, as read-only, during the installation of CICS Transaction Server.

SCLBSID dsname
Up to 44 characters.

**Specifying the data set names of the SEZARPCL and SEZACMTX libraries**

Specify the full data set names, up to 44 characters, of the SEZARPCL and SEZACMTX libraries. For example, SEZARPCL SYS1.USERID.SEZARPCL changes the SEZARPCL library to SYS1.USERID.SEZARPCL and SEZACMTX SYS1.USERID.SEZACMTX changes the SEZACMTX library name to SYS1.USERID.SEZACMTX. These libraries are accessed, as read-only, during the installation of CICS Transaction Server.

SEZARPCL dsname
Up to 44 characters.

SEZACMTX dsname
Up to 44 characters.
Specifying the data set names of the SCEECICS and SCEERUN libraries

Specify the full data set names, up to 44 characters, of the SCEECICS & SCEERUN libraries. For example, SCEECICS SYS1.USERID.SCEECICS changes the SCEECICS library to SYS1.USERID.SCEECICS and SCEERUN SYS1.USERID.SCEERUN changes the SCEERUN library name to SYS1.USERID.SCEERUN. These libraries are accessed, as read-only, during the installation of CICS Transaction Server.

SCEECICS dsname  
Up to 44 characters.

SCEERUN dsname  
Up to 44 characters.

Specifying the data set names of the SCEERUN2 library

Specify the full data set names, up to 44 characters, of the SCEERUN2 library. For example, SCEERUN2 SYS1.USERID.SCEERUN2 changes the SCEERUN2 library to SYS1.USERID.SCEERUN2. This library is accessed, as read-only, during the installation of CICS Transaction Server.

SCEERUN2 dsname  
Up to 44 characters.

Specifying the data set name of the SCEESAMP library

Specify the full data set name, up to 44 characters, of the SCEESAMP library. For example, SCEESAMP SYS1.USERID.SCEESAMP changes the SCEESAMP library name to SYS1.USERID.SCEESAMP. This library is accessed, as read-only, during the installation of CICS Transaction Server.

SCEESAMP dsname  
Up to 44 characters.

Specifying the data set name of the SDSNLOAD library

Specify the full data set name, up to 44 characters, of the DB2 SDSNLOAD library. For example, SDSNLOAD SYS1.USERID.SDSNLOAD changes the SDSNLOAD library name to SYS1.USERID.SDSNLOAD. This library is accessed, as read-only, during the installation of CICS Transaction Server.

The REXX for CICS element contains some modules that are link-edited against the DB2 load library, SDSNLOAD. If you do not have DB2 installed, the DFHINST6 job fails because SDSNLOAD cannot be allocated to the job. To avoid this problem, define a dummy SDSNLOAD data set, with LRECL=0 and RECFM=U, and specify the name of this empty data set on the SDSNLOAD parameter.

SDSNLOAD dsname  
Up to 44 characters.

Specifying the data set name of the SCSQLOAD library

Specify the full data set name, up to 44 characters, of the SCSQLOAD library. For example, SCSQLOAD SYS1.USERID.SCSQLOAD changes the SCSQLOAD library name to SYS1.USERID.SCSQLOAD. This library is accessed, as read-only, during the installation of CICS Transaction Server.
SCSQLOAD dsname
   Up to 44 characters.

**Specifying the data set name of the SCSQANLE library**

Specify the full data set name, up to 44 characters, of the SCSQANLE library. For example, SCSQANLE SYS1.USERID.SCSEQАНLE changes the SCSQANLE library name to SYS1.USERID.SCSEQАНLE. This library is accessed, as read-only, during the installation of CICS Transaction Server.

SCSQANLE dsname
   Up to 44 characters.

**Specifying the data set name of the SCSQCICS library**

If you want to run the WebSphere® MQ for z/OS sample programs, specify the full data set name, up to 44 characters, of the SCSQCICS library. For example, SCSQCICS SYS1.USERID.SCSEQCICS changes the SCSQCICS library name to SYS1.USERID.SCSEQCICS. This library is accessed, as read-only, during the installation of CICS Transaction Server.

SCSQCICS dsname
   Up to 44 characters.

**Specifying the data set name of the SCSQAUTH library**

Specify the full data set name, up to 44 characters, of the SCSQAUTH library. For example, SCSQAUTH SYS1.USERID.SCSEQAUTH changes the SCSQAUTH library name to SYS1.USERID.SCSEQAUTH. This library is accessed, as read-only, during the installation of CICS Transaction Server.

SCSQAUTH dsname
   Up to 44 characters.

**Specifying the data set names of the SCSFMOD0 and SIXMEXP libraries**

Specify the full data set names, up to 44 characters, of the SCSFMOD0 and SIXMEXP libraries. For example, SCSFMOD0 SYS1.SCSFMOD0 changes the SCSFMOD0 library to SYS1.SCSFMOD0. These libraries are accessed, as read-only, during the installation of CICS Transaction Server.

SCSFMO0 dsname
   Up to 44 characters.

SIXMEXP dsname
   Up to 44 characters.

**Specifying log stream and log stream structure attributes**

Specify attributes of the CICS Transaction Server log streams and the coupling facility structures that you use when you run the postinstallation jobs DFHILG1, DFHILG2, DFHILG3 and DFHILG4, on the LOGGER-INFO parameter.

For more information about these postinstallation jobs, see Chapter 33, “Defining the logger environment for CICS,” on page 185.

LOGGER-INFO strsfx logsz shuntsz jnlsz gensz sysname loghlq logmodel

Defines the following attributes of CICS Transaction Server system data sets:
strsfx
The last part of the coupling facility structure names, can be any three characters allowed in a structure name. The default is 001. It is used in DFHILG1, DFHILG2, DFHILG3, and DFHILG4.

logsz
The average buffer size for system log streams in the LOG_DFHLOG_strsfx structure. The default is 500. It is used in DFHILG1.

shuntsz
The average buffer size for shunted system log streams in the LOG_DFHSHUNT_strsfx structure. The default is 4096. It is used in DFHILG1.

jnsz
The average buffer size for unforced user journal log streams in the LOG_USERJRNAL_strsfx structure. The default is 64000. It is used in DFHILG1.

gensz
The average buffer size for forced user journal log streams and forward recovery log streams in the LOG_GENERAL_strsfx structure. The default is 2048. It is used in DFHILG1.

sysname
The MVS system name used to create model log streams for DFHLOG and DFHSHUNT. The default is MVSX. It is used in DFHILG2 and DFHILG5.

loghlq
The first qualifier of the model name for general logs and DFHLGLOG. It is used in DFHILG3, DFHILG4, DFHILG6, and DFHILG7.

logmodel
The second qualifier of the model name for general logs. It is used in DFHILG3 and DFHILG6.

Specifying attributes specific to CICSPlex SM
Use these DFHISTAR attributes to customize the postinstallation JCL for CICSPlex SM.

This JCL is used in the installation verification procedure for CICSPlex SM, as described in Part 7, “Verifying the CICSPlex SM installation,” on page 401.

All attributes specific to CICSPlex SM have defaults. If you do not want to use CICSPlex SM, you can run DFHISTAR without providing overrides for any of the following CICSPlex SM specific parameters:

CMASNAME value
Specifies the 1- to 8-character name to be allocated to a CMAS. The name can contain alphabetic, national, and numeric characters. However, the first character must be alphabetic or national. The default is CMAS01.

The name of a CMAS must be unique in the CICSPlex SM environment. It must not be the same as the name of another CMAS, a CICSPlex, a CICS system, or a CICS system group.

CMIIPORT value
Specifies the numeric identifier allocated to the TCP/IP port number for the CICS management client interface (CMCI) on the WUI server. The identifier can contain numeric characters only, in the range 1 to 65535. The default is
12346. The port number must be unique and used by only one WUI Server. The CPSM WUI Server does not support port sharing.

**CMSYSID value**
Specifies the 4-character system identifier of the CMAS. This identifier can contain alphabetic, national, and numeric characters. It must match the SYSIDNT system initialization parameter for the CMAS. The default is CM01.

**WUISYSID name**
Specifies the 1- to 4-character name allocated to a WUI system identifier. The name can contain alphabetic, national, and numeric characters. However, the first character must be alphabetic or national. The default value is WU01.

**CSYSYSID value**
Specifies the 1- to 4-character system identifier for the managed CICS system. This identifier can contain alphabetic, national, and numeric characters. The default is CS01.

**CSYSPLEX value**
Specifies the 1- to 8-character name to be allocated to a CICSplex of managed systems. This identifier can contain alphabetic, national, and numeric characters. The default is CSYPLX01.

The name of a CICSplex must be unique in the CICSPlex SM environment. It must not be the same as the name of another CICSplex, a CICS system, or a CICS system group.

**TCPIPHST**
Specifies the TCP/IP host name for the WUI server. The default is Xxxxxxxxx.xxxxxxxxx.xxxxxxxxx.xxxxxxxxx.

**TCP aller number**
Specifies the numeric identifier allocated to the TCP/IP port number for the WUI server. The identifier can contain numeric characters only, in the range 1 to 65535. The default is 12345. The port number must be unique and used by only one WUI Server. The CPSM WUI Server does not support port sharing.

**TIMEZONE code**
Specifies the time zone assigned to the data repository. This code must be a single alphabetic character in the range B through Z. See CICSPlex System Manager Administration for more information about setting the time zone. The default is B.

**WUI value**
Specifies whether to create a WUI CICSpex. This parameter is ignored if the OLDDREP parameter is specified. The default is YES if OLDDREP is not specified.

**YES**
Create a WUI CICSpex.

**NO**
Do not create a WUI CICSpex.

**WUIPLEX name**
Specifies the 1- to 8-character name allocated to a WUI CICSpex. The name can contain alphabetic, national, and numeric characters. However, the first character must be alphabetic or national. This parameter is ignored if the OLDDREP parameter is specified. The default is created from the characters WUIP, followed by the CMSYSID. For example, using the default CMSYSID, CM01, the default WUIPLEX name is WUIPCM01.
WUINAME name
Specifies the 1- to 8-character name allocated to a WUI. The name can contain alphabetic, national, and numeric characters. However, the first character must be alphabetic or national. The default is WUINCM01.

CSYSNAME name
Specifies the 1- to 8-character name to be allocated to a MAS. The name can contain alphabetic, national, and numeric characters. However, the first character must be alphabetic or national. The default is CSYS01.

The name of a MAS must be unique in the CICSPlex SM environment. It must not be the same as the name of another MAS, a CICSpelix, a CICS system, or a CICS system group.

OLDDREP dsname
Specifies an existing data repository that is being used by a previous release of CICSPlex SM. The records in the existing data repository are migrated to a new data repository for CICS TS for z/OS, Version 4.2. The existing data repository is not modified. If you do not specify this parameter, a new data repository is created.

dsname
The VSAM cluster name of the existing data repository.
The new CICS TS for z/OS, Version 4.2 data repository has the name dsinfo.EYUDREP.cmasname
Where:
dsinfo
Is the index specified with the DSINFO parameter.
cmasname
Is the name specified with the CMASNAME parameter.

Use a period (the default value) to have an empty data repository created for CICS TS for z/OS, Version 4.2.

NEWDREP dsname
Specifies a new data repository that is being used by CICSPlex SM.

dsname
The VSAM cluster name of the existing data repository.
The new CICS TS for z/OS, Version 4.1 data repository has the name:
dsinfo.EYUDREP.cmasname
Where:
dsinfo
Is the index specified with the DSINFO parameter.
cmasname
Is the name specified with the CMASNAME parameter.

Use a period (the default value) to have an empty data repository created for CICS TS for z/OS, Version 4.2.

Creating RACF profiles for the CICS Transaction Server data sets
Your Security Administrator creates appropriate RACF profiles for the CICS Transaction Server data sets.
At this stage, you require authority to access only the data set qualifiers specified on the TEMPLIB and LIB parameters of the DFHISTAR job. DFHISTAR uses a temporary sequential data set, with the high-level qualifier specified on the INDEX parameter, to resolve the parameters to be substituted into the jobs being tailored. However, consider coordinating the access authority for all the CICS Transaction Server data sets at the same time.

RACF profiles are discussed in detail in the RACF profiles in the RACF Security Guide.

Running the DFHISTAR job

Edit and save the DFHISTAR job with the values of installation parameters for your CICS Transaction Server environment. When you are ready to tailor the skeleton jobs, submit the DFHISTAR job.

The highest expected return code is 0.

When the DFHISTAR job has run, the Program Directory for CICS Transaction Server for z/OS shows, in tabular form, the non-DFHISTAR jobs that have been copied and are tailored to your CICS Transaction Server environment, and are added to the library that you specified on the LIB parameter of the DFHISTAR job. By default, this library is the CICSTS42.XDFHINST library. If necessary, the DFHISTAR job creates the library specified on the LIB parameter.

Checking the output from the DFHISTAR job

Check the output from the DFHISTAR job and, if required, edit and submit the DFHISTAR job again.

The DFHISTAR job produces a job log and, if necessary, an error code:

- The output job log lists the values that were used for the parameters of the DFHISTAR job.
- If any error occurs when running the DFHISTAR job, a warning code of 4 or an error code of 12 is returned. For error code 4, the skeleton jobs are tailored and added to the CICSTS42.XDFHINST library. For error code 12, the skeleton jobs are not tailored or copied. To resolve the cause of either error code, examine the output job log and, if necessary, edit and submit the DFHISTAR job again.

You can run the DFHISTAR job any number of times to alter the attributes of the jobs that it creates.

When running the DFHISTAR job after the first time, you can select specific jobs to be created by using the SCOPE or SELECT parameter:

**SCOPE ALL|BASE|POST**

Specifies whether you want to generate all the CICS Transaction Server installation and postinstallation jobs, or only the postinstallation jobs. When you install CICS Transaction Server from the distribution tape, specify the default, **SCOPE ALL**. Code the other options, if necessary, during postinstallation tasks.

**ALL**

Specifies that you want to generate all the CICS Transaction Server installation jobs and all the postinstallation jobs.
BASE
Specifies that you want to generate only the installation jobs (DFHINST1 through DFHINST6, DFHIHFS0, DFHIHFS1, and DFHISMKD) that you use to install CICS Transaction Server from the distribution tape.

POST
Specifies that you want to generate only the postinstallation jobs that you can use to create the CICS Transaction Server data sets, and run the IVPs.

Checking that you are ready to run the installation jobs

Check data set names, installation JCL, CSIs, and RACF authority, to make sure that you are now ready to run the installation jobs: DFHIHFS0, DFHIHFS1, DFHISMKD, DFHINST1, DFHINST2, DFHINST3, DFHINST4, DFHINST5, DFHINST6, and DFHIJVMJ.

1. Check the names of the data sets that the installation jobs create, because the jobs will delete any existing data sets with those names. If you want to keep an existing data set with a name specified in one of the installation jobs, you must change the name to be used for the new data set. For example, for the installation parameter DZONECSI dsname NEW, the data set dsname is deleted and a new distribution zone CSI called dsname is allocated.

2. The supplied CICS Transaction Server installation JCL installs CICS-supplied Transaction Server for z/OS into new target and distribution zones. If you want to install CICS Transaction Server into existing target and distribution zones, you must modify the DFHINST3 job.

Caution: If you intend to use an existing target or distribution zone that contains an earlier release of CICS Transaction Server, be aware that any earlier release of CICS Transaction Server is cleared before being replaced by CICS Transaction Server.

3. If you intend to install CICS Transaction Server using both existing and new CSIs, any new CSIs must have the same control interval size as the existing CSIs.

If your existing CSIs do not have a control interval size of 4096 bytes, you must edit the DFHINST3 job, before running it, to change the CONTROLINTERVALSIZE(4096) parameter on the commands used to create the VSAM data sets for the new CSIs, to specify the same control interval size as the existing CSIs.

For further information about allocating CSI data sets, see the System Modification Program Extended: Reference manual, SA22-7772.

4. Ensure that you have appropriate RACF authority for the CICS Transaction Server data sets.

Running the installation jobs

Check that you are ready to run the installation jobs and then submit the jobs in sequence.

Before you run the installation jobs, ensure the following settings are in place:

• The MVS image was IPLed with OMVS in full-function mode.
• The user ID under which you are running the jobs has superuser authority.
After you have run the DFHISTAR job to create the installation jobs, submit those jobs in sequence to install CICS Transaction Server. The following topics describe the CICS Transaction Server installation jobs, and give guidance on how to use them.

The CICS Transaction Server jobs are in the CICSTS42.XDFHINST library as a result of running the DFHISTAR job, which you copied from the distribution tape, as described in Copy RELFILE(2) from the Distribution Tape in the Program Directory for CICS Transaction Server for z/OS.

Run these jobs one at a time. Before you run a job, read the information about it, starting "Running the DFHIHFS0 job."

After you have run a job, check its output before proceeding to the next job. If a job ends abnormally, find out why it failed by looking at the job log, which lists the error messages produced on each run. Correct the error and then proceed as advised in the job description. Do not attempt to run the next job until the previous job has run successfully.

Run times of the installation jobs

Here are the run times for the installation jobs on an IBM 2084 D32. These figures give you an idea of expected run times.

<table>
<thead>
<tr>
<th>Job</th>
<th>Processor Time</th>
<th>CPU Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>DFHIHFS0</td>
<td>8 seconds</td>
<td>less than 1 second</td>
</tr>
<tr>
<td>DFHIHFS1</td>
<td>12 seconds</td>
<td>less than 1 second</td>
</tr>
<tr>
<td>DFHISMKD</td>
<td>1 second</td>
<td>less than 1 second</td>
</tr>
<tr>
<td>DFHINST1</td>
<td>7 seconds</td>
<td>less than 1 second</td>
</tr>
<tr>
<td>DFHINST2</td>
<td>6 seconds</td>
<td>less than 1 second</td>
</tr>
<tr>
<td>DFHINST3</td>
<td>2 seconds</td>
<td>less than 1 second</td>
</tr>
<tr>
<td>DFHINST4</td>
<td>5 seconds</td>
<td>less than 1 second</td>
</tr>
<tr>
<td>DFHINST5</td>
<td>3 minutes</td>
<td>15 seconds</td>
</tr>
<tr>
<td>DFHINST6</td>
<td>8 minutes</td>
<td>2 minutes</td>
</tr>
<tr>
<td>DFHIJVMJ</td>
<td>2 seconds</td>
<td>less than 1 second</td>
</tr>
</tbody>
</table>

These time values are suitable to run the installation jobs on an IBM 2084 D32 or bigger system. If you have a system smaller than an IBM 2084 D32, review these values.

Running the DFHIHFS0 job

This job create a file system and cicsts directory.
- Creates the cicsts directory at /pathprefix/usr/lpp/.
- Mounts the file system at directory /pathprefix/usr/lpp/cicsts.
- Owner=RWX
- Group=RWX
- Other=R-X
(In octal form: 775)
Where:
R equates to Read
W equates to Write
X equates to Execute
- equates to no permission

1. You might not need to run DFHIHFS0 if you have installed an earlier release of CICS TS or if you are re-installing CICS TS 4.1, because CICS creates the /cicsts directory that is common to all releases of CICS since CICS TS for OS/390®, Version 1.3. If you do need to run DFHIHFS0, run this job once only.

2. You must grant RACF ALTER ACCESS to the OMVS data sets before running DFHIHFS0.

3. The /cicsts directory contains only directories, each being a mount point.

4. CICS requires the MOUNT issued by DFHIHFS0 to access files stored in the file system, but the MOUNT command is lost when you re-IPL MVS. SDFHINST member DFHBPXP0 contains a MOUNT command for inclusion in a BPXPRMxx member of the SYS1.PARMLIB data set. The MOUNT command applies to the data set specified in the HFS0DSN parameter of the DFHISTAR job to be mounted at directory /pathprefix/usr/lpp/cicsts. Copy this command into a BPXPRMxx member of the SYS1.PARMLIB data set to ensure the mount is restored when MVS is IPLed.

5. All steps of DFHIHFS0 must end with return code zero for the job to be successful.

Running the DFHIHFS1 job

This job unmounts and deletes the file system, before creating and mounting a new file system as specified in DFHISTAR.

1. Unmounts the file system at directory /pathprefix/usr/lpp/cicsts/ussdir to allow the job to be rerun, and if necessary forces return code zero.

2. Deletes from /pathprefix/usr/lpp/cicsts the directory defined by the /ussdir parameter of the DFHISTAR job. This allows the job to rerun and, if necessary, forces return code zero.

3. Deletes the file system specified in the HFS1DSN parameter of the DFHISTAR job to allow the job to rerun and, if necessary, forces return code zero.

4. Creates the file system specified in the HFS1DSN parameter of the DFHISTAR job.

5. Creates the /ussdir directory at /pathprefix/usr/lpp/cicsts, where /ussdir is the name of the directory specified on the ussdir parameter.

6. Mounts the file system at directory /pathprefix/usr/lpp/cicsts/ussdir.

7. Changes the permission settings for the /ussdir directory to 775.

All steps of DFHIHFS1 must end with return code zero for the job to be successful.

CICS requires the MOUNT issued by DFHIHFS1 to access files stored in the z/OS UNIX file system, but the MOUNT command is lost when you re-IPL MVS. SDFHINST member DFHBPXP1 contains a MOUNT command for /pathprefix/usr/lpp/cicsts/ussdir, where ussdir is the name of the directory specified in the ussdir parameter in the DFHISTAR job. Copy this command into a BPXPRMxx member of the SYS1.PARMLIB data set to ensure the mount is restored when MVS is IPLed.
Running the DFHISMKD job
This job creates the UNIX System Services directories.

You must run this job before any of the other installation jobs.

The highest expected return code is 0.

Running the DFHINST1 job
This job allocates and catalogs CICS Transaction Server distribution and target libraries.

To ensure that you can rerun this job, it deletes and uncatalogs the data sets that are allocated in the second step of the job.

If the DFHINST1 job ends abnormally, examine the job log to determine the cause, correct the problem, and then rerun the job.

The highest expected return code is 0.

Running the DFHINST2 job
This job allocates the CICS Transaction Server RELFILE data sets. If you run the DFHINST2 job now, you ensure that enough space has been allocated to the RELFILE data sets to allow the DFHINST5 job to complete.

To ensure that you can rerun this job, it deletes and uncatalogs the data sets, if they exist, that it allocates later.

If the DFHINST2 job ends abnormally, examine the job log to determine the cause, correct the problem, and then rerun the job.

The highest expected return code is 0.

Running the DFHINST3 job
This job allocates the CICS Transaction Server SMP/E data sets.

Caution: If you intend to use an existing target or distribution zone that contains an earlier release of CICS Transaction Server elements, be aware that any earlier release of CICS is cleared before being replaced by CICS Transaction Server.

Before you run the DFHINST3 job, if you intend to install CICS Transaction Server using both existing and new CSIs, make sure any new CSIs have the same control interval size as the existing CSIs.

If your existing CSIs do not have a control interval size of 4096 bytes, edit the DFHINST3 job before running it to change the CONTRO INTERVALSIZE(4096) parameter on the commands used to create the VSAM data sets for the new CSIs, to specify the same control interval size as the existing CSIs.

For further information about allocating CSI data sets, see the System Modification Program Extended: Reference manual, SA22-7772.

To ensure that you can rerun this job, it deletes and uncatalogs the data sets, if they exist, that it allocates later.
This job also sets up the global, target, and distribution zones, depending on the parameters that you specified to the DFHISTAR job:

1. If you specified NEW for GZONE, the global zone is deleted and redefined.
2. The distribution zone is deleted and redefined.
3. The target zone is deleted and redefined.
4. Member GIMZPOOL from SYS1.MACLIB is copied using the REPRO command into the zones redefined in the previous steps.
5. If you specified OLD for GZONE, the entries for the DZONE and TZONE names are removed from the global zone.

If the DFHINST3 job ends abnormally, examine the job log to find the cause, correct the problem, and then rerun the job.

The highest expected return code is 0.

Running the DFHINST4 job

This job primes the global zone, target zone, and distribution zone, which are the new SMP/E zones created in DFHINST3.

If you did not run the DFHINST2 job, increase the DSSPACE values in the DFHINST4 job before submitting it.

If the DFHINST4 job ends abnormally, examine the job log to determine the cause, correct the problem, and then repeat all jobs, beginning with DFHINST1. This correction avoids SMP/E space problems, and consequent X37 stops with an abend message, during reruns of these SMP/E jobs.

The highest expected return code is 0, if you install into new zones, and 8, if you are installing into existing zones.

Running the DFHINST5 job

This job uses the RECEIVE command to receive the CICS Transaction Server software from the distribution tape into the RELFILE data sets created by the DFHINST2 job. This installation job, apart from the initial IEBCOPY job, is the only job that requires the distribution tape to be mounted.

If the DFHINST5 job ends abnormally, examine the job log to determine the cause, correct the problem, and then repeat all jobs, beginning with DFHINST1. This correction avoids SMP/E space problems, and consequent X37 stops with an abend message, during reruns of these SMP/E jobs.

The highest expected return code is 0.

Running the DFHINST6 job

This job performs the SMP/E APPLY and ACCEPT functions that install CICS Transaction Server into the target and distribution libraries respectively.

To ensure that DFHINST6 runs successfully, perform the following steps:

- Ensure that the DB2 SDSNLOAD library is available for this job. Without SDSNLOAD, DFHINST6 fails; see “Specifying the data set name of the SDSNLOAD library” on page 47.

  If you run DFHINST6 with an empty SDSNLOAD library, the APPLY step completes with return code 4, and the return code from the binder is 8. The
REXX for CICS modules, CICSQL and CICDB2, which interface with DB2, are stored in SCICLOAD without the required DB2 routines and are not usable.

- Run DFHINST6 on the same MVS image on which the z/OS UNIX file system is installed, unless you are set up for MVS sharing.
  If you have modified the other installation jobs (for example, to use existing libraries and therefore existing target and distribution zones), consider splitting the DFHINST6 job to do APPLY CHECK, APPLY, ACCEPT CHECK, and ACCEPT functions as four separate jobs.

The DFHINST6 job is the longest running of all the installation jobs; see “Run times of the installation jobs” on page 54. It produces a large amount of printed output. The region size for the DFHINST6 job is currently set to 'REGION=0M', because this job requires more memory than the other installation jobs. Adjust your JES parameters (for example, with a JES2 /*JOBPARM LINES=99 statement) to avoid a system abend 722.

If successful, this job gives a return code of 4. See the “GIM23903W - LINK SUCCESSFUL . . . ” message, listed in the report that is output by the apply job. DFHINST6 job issues messages GIM23903W and GIM23913W depending on the execution environment of the installer. Both messages are acceptable.

The binder produces IEW2454W messages during the APPLY stage for unresolved external references while some CICS Transaction Server load modules are being link-edited during installation, giving return code 4. You might also receive numerous IEW2646W and IEW2651W messages, which indicate conflicts with user-specified RMODE and AMODE modes respectively. You can ignore these IEWxxxx messages, which are produced for component object modules of executable CICS Transaction Server load modules.

Messages IEW2689W, IEW2470E, IEW2648E, and IEW2303E might be displayed. You can ignore them.

When you have run the DFHINST6 job, the following SMP/E message is produced from the job:

GIM20502I  GIMSMP PROCESSING IS COMPLETE - THE HIGHEST RETURN CODE WAS 04 -

You can ignore this SMP/E message.

If any other SMP/E messages appear, see the SMP/E: Messages & Codes manual for guidance information about their meaning and take the appropriate action.

If the DFHINST6 job finishes abnormally, examine the job log to determine the cause, correct the problem, and then repeat all the jobs, beginning with DFHINST1. This correction avoids SMP/E space problems, and consequent X37 abends, during reruns of these SMP/E jobs.

If the DFHINST6 job fails and you are using an existing global zone (that is, you specified the GZONE parameter of the DFHISTAR job with the disposition parameter OLD), perform the following steps:

1. REJECT the CICS Transaction Server base-level function SYMND.
2. Rerun the DFHINST1 job. When you rerun the installation jobs, some steps that were successfully completed in the previous run produce return codes with a value of 8.
Running the DFHIJVMJ job

The DFHIJVMJ job creates the customized sample JVM profiles that you require if you want to run a JVM program in CICS.

DFHIJVMJ reads the supplied JVM profiles from member DFHJVMEV in the partitioned data set SDFHENV. It replaces the symbol &JAVA_HOME in the files with the value you specify on the JAVADIR parameter in the DFHISTAR installation job. The extra // characters on each side of the symbol in the supplied files are removed during symbol substitution.

The customized JVM profiles are then written as z/OS UNIX files in the directories listed in “Verifying Java components checklist” on page 255.

Checking the output from the installation jobs

When you have successfully run all of the installation jobs, CICS Transaction Server is loaded.

You now have CICS Transaction Server installed on your DASD. Back up the volume on which CICS Transaction Server resides. If any errors occur during customization later, you do not have to re-run the installation jobs.

Postinstallation activities

Copy the CICS Transaction Server procedures into a cataloged procedure library, load any CICS features that you have, and tailor the CICS Transaction Server.

For information about tailoring CICS Transaction Server, see Chapter 37, “Tailoring the CICS-supplied skeleton jobs.” on page 229.

Copying the CICS Transaction Server procedures into a procedure library

CICS Transaction Server supplies procedures that can be tailored or are copied directly to your procedure library when you run the installation jobs. All procedures are described in the table.

The procedures DFHAUPLE, DFHSMPFE, DFHSTART, EYUCMASP, EYUCSYSP, and EYUWUIP are tailored to your CICS Transaction Server environment and stored in the CICSTS42.XDFHINST library when you run the DFHISTAR job. The other procedures are not modified by the DFHISTAR job and are copied into the CICSTS42.SDFHPROC library when you run the CICS Transaction Server installation jobs.

Copy all these procedures into a cataloged procedure library; for example, SYS1.PROCLIB. Before you copy the procedures, read the following instructions:

1. Your procedure library might already contain procedures, supplied with an earlier release of CICS, that have the same names as the new procedures but are, in fact, different. If so, you must find some way of selecting the right release. Here are some ways of using the new versions:
   a. For the time being, rename either set of procedures and modify the appropriate jobs to use the new names.
   b. Insert the new procedures into the job streams that use them and use the procedures as in-stream procedures. Place the inserted procedures between the JOB statement and the first EXEC statement. You must insert a // PEND
statement after the inserted procedures. When the new release becomes the production system, you can copy the new procedures into your procedure library.

c. Indicate the DDNAME of the cataloged procedure library that is to be used to convert the JCL for the job. For example, you could use the JES2 /+JOBPARAM PROCLIB=xxxxxxxx. For more information about specifying DDNAMEs in JCL, see the z/OS MVS JCL Reference.

d. Specify, in the JCLLIB statement, the name of the procedure libraries that you want to search for the named procedure or procedures. For more information about JCLLIB, see the z/OS MVS JCL Reference.

2. If service is applied to the CICS Transaction Server procedures, the versions in the libraries CICSTS42.CICS.SDFHINST and CICSTS42.CICS.SDFHPROC are updated by SMP/E. You must then copy the updated procedures into your procedure library.

3. The default for the symbolic parameter GZONE in the procedures DFHSMPE and DFHAUPLE is taken from the value that you specified by the GZONE parameter of the DFHISTAR job.

4. The default for the ZNAME symbolic parameter in the procedures DFHSMPE and DFHAUPLE is taken from the value that you specified by the TZONE parameter of the DFHISTAR job. For a description of how the ZNAME parameter is used, see the SMPCNTL DD statement in The CICS TS-supplied SMP/E procedure.

5. Change the OUTC parameter as required.

When you have read these instructions, and acted on them as necessary, copy the procedures into a cataloged procedure library. The CICS Transaction Server-supplied procedures are listed in Table 6.

CICS-supplied procedures
Alphabetical table of the CICS-supplied procedures and their descriptions. Copy the procedures from the SDFHPROC library, unless the procedure specifies a different library.

<table>
<thead>
<tr>
<th>Procedure</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DFHASMVS</td>
<td>Assembles some CICS Transaction Server programs and user-written assembler language programs.</td>
</tr>
<tr>
<td>DFHAUPLE</td>
<td>Assembles and link-edits CICS Transaction Server control tables and makes the assembly and link-edit information available to SMP/E. DFHAUPLE is installed in SDFHINST.</td>
</tr>
<tr>
<td>DFHBMSU</td>
<td>Runs the BMS load module disassemble utility program, DFHBMSUP.</td>
</tr>
<tr>
<td>DFHEBTAL</td>
<td>Translates, assembles, and link-edits assembler application programs using EXEC DLI commands in a batch environment under Language Environment.</td>
</tr>
<tr>
<td>DFHEITAL</td>
<td>Translates, assembles, and link-edits assembler application programs using the command-level interface.</td>
</tr>
<tr>
<td>DFHEXTAL</td>
<td>Translates, assembles, and link-edits assembler application programs using the external CICS Transaction Server interface.</td>
</tr>
<tr>
<td>DFHLNKVS</td>
<td>Link-edits CICS Transaction Server programs and application programs.</td>
</tr>
<tr>
<td>DFHMAPS</td>
<td>Prepares physical and symbolic maps.</td>
</tr>
<tr>
<td>DFHMAPT</td>
<td>Prepares physical and symbolic maps for C++.</td>
</tr>
<tr>
<td>DFHSMPE</td>
<td>Runs SMP/E. DFHSMPE is installed in SDFHINST.</td>
</tr>
</tbody>

For further information about using the DFHSMPE and DFHSTART procedures, see "The CICS TS-supplied SMP/E procedure" on page 222.

Creating extra sets of CICS Transaction Server target libraries (optional)

You can use the CICS Transaction Server installation job, DFHISTAR, to generate an optional installation job, DFHINSTA, which you can use to create extra copies of the CICS Transaction Server target libraries and UNIX System Services directories.

Here are some of the benefits of using multiple libraries:

- Backing out PTFs and APARs. If you apply PTFs or APARs to CICS Transaction Server and if they fail a fix-test, you can back out the changes with minimum disruption.
- DASD failure. Multiple libraries protect you against failure of the DASD on which the CICS Transaction Server load libraries reside.

Base the decision to use multiple libraries for CICS Transaction Server on the following factors:

- Your requirement for high availability. As already stated, the use of multiple libraries can protect you against CICS Transaction Server downtime caused by DASD failure or incorrect service, either from IBM-supplied PTFs or your own modifications to your CICS Transaction Server region.
- The extra DASD required. Multiple libraries require more disk space.
- Other ways of providing high availability. For example, use a CICSPlex, z/OS Communications Server persistent sessions, and MVS functions to provide restart of CICS Transaction Server regions.
- The added complexity of maintaining multiple sets of CICS Transaction Server libraries. Two or more sets of CICS Transaction Server target libraries, together with the SMP/E procedures that are required to support them, increase the complexity of maintenance. Define procedures to ensure that upgrades to the CICS Transaction Server libraries are kept under control.
- Alternative solutions. If you have already established a proven process for fix verification and for testing applications developed for your production CICS Transaction Server region, you might decide that you do not require multiple CICS Transaction Server libraries.
You can use the DFHINSTA job, generated by the DFHISTAR job, to create extra sets of CICS Transaction Server target libraries fully under the control of SMP/E. Each time you run the DFHINSTA job, you can generate only one extra set of target libraries.

To create an extra sets of target libraries, complete the following steps. You can repeat the steps to create more sets of target libraries.

1. Edit the DFHISTAR job to specify values:
   • The ADDTVOL, AINDEX, ASMPSCDS, AZONE, AZONECSI, AZONELOG, and USSDIRA parameters, for the new set of target libraries.
   • The INDEX, TZONE, TZONECSI, and TZONELOG parameters, for the primary target libraries you want to copy from. The TZONE, TZONECSI, and TZONELOG parameters must specify the target zone that contains the CICS Transaction Server target libraries defined with the high-level qualifier provided by the INDEX parameter.
   • The DZONE, DZONECSI, and DZONELOG parameters, for the distribution libraries to be associated with the new set of target libraries.
   • The SELECT parameter, to specify DFHINSTA, which you want to copy, and the member name you want the generated version of DFHINSTA to be stored as in the CICSTS42.XDFHINST library. For example, SELECT DFHINSTA INSTA111 stores the generated version of DFHINSTA into member INSTA111 of the CICSTS42.XDFHINST library when you submit the DFHISTAR job.

   Each time you copy DFHINSTA to create a new set of target libraries, specify a new name on the SELECT parameter to save each copy with a different name in case you require it again.

   For further information about editing the DFHISTAR job and about the parameters of the DFHISTAR job, see “Editing the DFHISTAR job” on page 25.

   Do not change the other parameters in the DFHISTAR job.

2. Submit the DFHISTAR job.

   When you run the DFHISTAR job, it saves the generated version of the DFHINSTA job in the CICSTS42.XDFHINST library with the member name specified on the SELECT parameter in the DFHISTAR job. The LIB parameter of the DFHISTAR job specifies the data set name of the CICSTS42.XDFHINST library.

3. Consider running the DFHIHFSA job.

   If you decide to create an additional SMP/E target zone using job DFHINSTA, run the DFHIHFSA job before running the DFHINSTA job. DFHIHFSA creates an additional SMP/E target zone for z/OS UNIX. This job performs the following steps:
   • Unmounts the z/OS UNIX file system at directory /pathprefix/usr/lpp/cicsts/ussdir to allow the job to rerun and, if necessary, forces return code 0.
   • Deletes the /ussdira directory at /pathprefix/usr/lpp/cicsts, where ussdira is the name of the directory specified on the ussdira parameter in the DFHISTAR job. This allows the job to rerun and, if necessary, forces return code 0.
   • Deletes the file system specified in the HFSADSN parameter of the DFHISTAR job to allow the job to rerun and, if necessary, forces return code 0.
   • Creates the file system specified in the HFSADSN parameter of the DFHISTAR job.
• Creates the /ussdira directory at /pathprefix/usr/lpp/cicsts, where ussdira is the name of the directory specified in the ussdira parameter in the DFHISTAR job.
• Mounts the file system at directory /pathprefix/usr/lpp/cicsts/ussdira
• Changes the permission settings for the ussdira directory to 775.

All steps of this job must end with return code zero for the job to be successful. CICS requires the MOUNT issued by DFHIHFSA to access files stored in the z/OS UNIX, but the MOUNT command is lost when you re-IPL MVS. SDFHINST member DFHBPXPXA contains a MOUNT command for @pathprefix@/uss_path_a where where uss_path_a is the name of the directory specified in the uss_path parameter in the DFHISTAR job. Copy this command into a BPXPRMxx member of the SYS1.PARMLIB data set to ensure that the mount is restored when MVS is IPLed.

4. Submit DFHINSTA.

The DFHINSTA job, or a copy of it, copies the CICS Transaction Server target libraries specified by the INDEX parameter, and creates corresponding CICS Transaction Server SMP/E data sets for them. In particular, it allocates a new SMP/E CSI data set for the extra target zone.

So that you can run the DFHINSTA job more than once, step 1 deletes previous copies of the data sets to be created. Step 3 deletes the SMP/E CSI data set. Step 6 removes the ZONEINDEX entry for the extra target zone.

The first time the DFHINSTA job is run, Step 6 gives the following messages:

GIM35701E ** ZINDEX SUBENTRY azone WAS NOT DELETED BECAUSE IT DOES NOT EXIST.
GIM25601I THE SPECIFIED ENTRY WAS NOT UPDATED BECAUSE OF AN ERROR DURING UCLIN PROCESSING.

You can ignore these messages the first time the job is run.

Loading other optional features

The sample job, DFHINSTJ, is supplied for loading other optional features.

CICS Transaction Server contains no optional features at General Availability time, but you can use the sample job if any optional features are shipped at a later date. The DFHINSTJ job is generated in the CICSTS42.XDFHINST library when you run the DFHISTAR job.

Note: optional source material is not supplied with CICS Transaction Server V4.2

In previous releases, the sample job DFH0PSRC was used to load optional source material from the distribution tapes. DFH0PSRC was generated when the DFHISTAR job was run. This is no longer available, as optional source material is not supplied.

Activating CICS Transaction Server

Perform the following steps after you have loaded CICS Transaction Server to disk.

1. Apply service; see Chapter 35, “Applying service to CICS Transaction Server for z/OS,” on page 221.
2. Integrate CICS Transaction Server with MVS; see Part 4, “Setting up the MVS environment for CICS,” on page 91.
3. Create CICS Transaction Server system data sets; see Chapter 38, “Creating the CICS data sets,” on page 233.
4. (Optional) Install CICS IMS DBCTL support; see Chapter 40, “Defining DL/I support,” on page 247.

5. (Optional) Install MRO and ISC support, see Chapter 43, “Installing MRO, IPIC, and ISC support,” on page 259.

6. (Optional) Run the installation verification procedures (IVPs); see Part 6, “Verifying the CICS installation,” on page 357.

Information about putting CICS Transaction Server into operational status is included as part of the process of verifying the installation; see Part 6, “Verifying the CICS installation,” on page 357.

---

**Checklist for the CICS Transaction Server for z/OS installation**

Use the checklist to assist with your installation.

Chapter 8. Installing the CICS Information Center

The CICS Information Center runs in an Eclipse framework, commonly known as a help system, and consists of a number of documentation plug-ins, including various tools and connectors. The information center is supplied on CD-ROM with a readme file.

The readme file contains a complete list of all the plug-ins that are provided, and you can select which plug-ins to install based on your CICS environment. If you already have an Eclipse help system, or an Eclipse-based IDE such as WebSphere Studio Enterprise Developer, you can opt to install only the CICS documentation plug-ins. You can run the information center locally on a workstation, or as a server with remote access. Before you begin to install the information center, read the following topics:

- “Requirements”
- “Installing the information center on a workstation”
- “Installing the information center on a server” on page 72
- “Installing the CICS plug-in in an Eclipse IDE or help system” on page 73

Requirements

The information center is supported on a range of platforms.

- Windows 2000
- Windows XP
- AIX® 5.2 and 5.3
- Linux RedHat Enterprise 3.0
- Linux SuSE Enterprise 3.0
- Linux RedHat Enterprise 8 and 9 for System z
- Linux SuSE Enterprise 8 and 9 for System z
- z/OS 1.11 or later

Please note that support for the information center on Linux for z Systems® and z/OS is only offered in server mode for remote access using a Web browser.

The information center uses a JRE. A JRE for each platform is provided with the information center, except for z/OS. If you want to run an information center on z/OS, you need to use the JRE provided with the operating system.

To get the best results when viewing the information center, it is recommended that you use one of the following Web browsers:

- Microsoft Internet Explorer 6.0
- Mozilla 1.7

To view PDF documents within the information center, you require Adobe Acrobat Reader 4.05 or higher installed, and the Acrobat Web plug-in installed in your Web browser.

Installing the information center on a workstation

The information center can run locally from any directory on your workstation.
If you do not have an Eclipse help system, you will need to install this first as it is required to run the information center. If you do have an Eclipse help system, see “Installing the CICS plug-in in an Eclipse IDE or help system” on page 73.

1. Select the appropriate folder for your operating system on the CD-ROM. This folder contains a zip file of the Eclipse help system.
2. Unzip the zip file to a new directory on your workstation. This creates an eclipse help system on your workstation.
3. Select the plug-ins folder on the CD-ROM. This folder contains all of the documentation plug-ins.
4. Copy the documentation plug-ins you require to the eclipse\plugins directory of the help system that you have just unzipped. The readme file contains a complete list of the plug-in names and the products they refer to. It is recommended that you copy the CICS TS plug-in com.ibm.cics.ts.doc, the CICS support plug-in com.ibm.cicsts.doc, and associated support plug-ins com.ibm.support.core.doc and com.ibm.support.core.doc.nl.
5. At the highest directory level in your Eclipse help system, execute the file IC_local_Start to start the information center on your workstation. This should automatically launch a Web browser and display the information center.

Please note that you cannot run the information center locally on z/OS 1.11 or the Linux for z/OS platforms.

---

**Installing the information center on a server**

Running the information center on a server requires you to allocate a specific port number, to allow remote access using a Web browser.

You can run the information center in server mode on any of the supported platforms listed in “Requirements” on page 71. If you already have a help system installed, see “Installing the CICS plug-in in an Eclipse IDE or help system” on page 73 for information on how to install just the CICS documentation plug-ins. To install the information center on UNIX, Linux and Windows servers, follow these steps:

1. Select the appropriate folder for your operating system on the CD-ROM. This folder contains a zip file of the Eclipse help system.
2. FTP the zip file to an appropriate directory on your server and then unzip it. This creates a help system on your server.
3. Select the plug-ins folder on the CD-ROM. This folder contains all of the documentation plug-ins.
4. Use the readme file on the CD-ROM to select which documentation plug-ins you want to install. Copy the required plug-ins to the eclipse\plugins directory of the help system that you unzipped. It is recommended that you copy the CICS TS plug-in com.ibm.cics.ts.doc, the CICS support plug-in com.ibm.cicsts.doc, and associated support plug-ins com.ibm.support.core.doc and com.ibm.support.core.doc.nl.
5. At the highest directory level in your Eclipse help system, edit the file IC_server_start to specify the port number that you want the information center to use. The default is 29127. If your company allows you to reserve ports, you can ask your TCP/IP system programmer to reserve this port or the port number of your choice.
6. Execute the file IC_server_start to start the information center in server mode.
7. To verify that you can access the information center, start up a Web browser and type the web address http:\\serverename:port, where *servername* is the
name of the server where you installed the information center and *port* is the port number that you specified in the start up file.

The information center runs in the UNIX System Services (USS) component of *z/OS*. To install the information center on *z/OS*, follow these steps:

1. Select the *z/OS* folder on the CD-ROM, which contains a tar file of the Eclipse help system.
2. FTP the tar file to a suitable *z/OS* UNIX directory in USS. Ensure you mount the *z/OS* UNIX file containing this directory through the BPXPRMxx member of SYS1.PARMLIB.
3. Un-tar the file using the command `tar -xvf filename`. This creates a help system on your server.
4. Select the plugins folder on the CD-ROM. This folder contains all of the documentation plug-ins.
5. Use the readme file on the CD-ROM to select which documentation plug-ins you want to install. FTP the required plug-ins to the eclipse\plugins directory of the help system that you unzipped. It is recommended that you copy the CICS TS plug-in `com.ibm.cics.ts.doc`, the CICS support plug-in `com.ibm.cicsts.doc`, and associated support plug-ins `com.ibm.support.core.doc` and `com.ibm.support.core.doc.nl`.
6. At the highest directory level in your Eclipse help system, edit the file `IC_server_start` to specify the directory path of a Java Runtime Environment (JRE) at 1.4.2 that you want the information center to use. You can also change the port number from the default of 29127. Use the command `vi IC_server_start.sh` to open the file to edit it, or if connected through TSO you can use the command `oedit IC_server_start.sh`. Add the following command to the beginning of the file, using the appropriate path to the JRE. For example, you could specify:
   ```
   export PATH=/u/lpp/java142/J1.4/bin:$PATH
   ```
7. Execute the start file using the command `./IC_server_start.sh &`. The & indicates that the information center should run as a background task. This means that if you log off, the information center will continue to run on the server.
8. To verify that you can access the information center, start a Web browser and type the Web address `http:\servername:port`, where `servername` is the name of the server where you installed the information center and *port* is the port number that you specified in the start file.

### Installing the CICS plug-in in an Eclipse IDE or help system

If you already have an Eclipse help system installed on your workstation or server, or if you are using any Eclipse-based product (for example, all versions of WebSphere Studio Enterprise Developer or Rational® Developer for System z®), you can install the CICS documentation and run it within your existing software.

Ensure that you shut down your help system or product before adding the CICS documentation plug-ins, otherwise Eclipse will not recognize the newly added plug-ins. Follow these steps:

1. Select the plugins folder on the CD-ROM. This folder contains all of the documentation plug-ins.
2. Use the readme file on the CD-ROM to select which documentation plug-ins you want to install. It is recommended that you copy the CICS TS plug-in

---

Chapter 8. Installing the CICS Information Center 73

3. Copy the required documentation plug-ins to the eclipse\plugins directory of the help system or Eclipse Integrated Development Environment (IDE) that you already have installed. For example, for a default installation of WebSphere Studio Enterprise Developer, you would copy the plug-ins to the directory C:\Program Files\IBM\WebSphere Studio\eclipse\plugins.

4. Start up the help system or Eclipse IDE to ensure that the CICS documentation is present.
Part 3. CICS Explorer installation

You can install the CICS Explorer in a number of places depending on the requirements of your organization. After installation, you must configure the CICS Explorer connections to your CICS or CICSPlex SM systems and you can also define where the CICS Explorer saves its workspace,
Chapter 9. Installing the CICS Explorer

You can install the CICS Explorer in a number of locations. Three locations are most suitable for the installation. Always read the CICS Explorer Release Notes before installing CICS Explorer. The Release Notes are included on the product download site, and contain the latest information, including limitations and restrictions, about the CICS Explorer.

Installing on a local workstation

You can install the CICS Explorer on a local workstation that is used by only one person.

About this task

This task describes how to install the CICS Explorer on a user's local workstation.

Procedure

1. Download the CICS Explorer .zip file (a .tar.gz file on Linux) from the download site to your local workstation.
2. Extract the contents to a new directory on your local workstation. For example, C:\Program Files\Explorer\ on a Windows operating system, or ~/Explorer/ on a Linux operating system
3. When the extract has completed, open the CICS_Explorer directory in your new Explorer directory. Locate the cicsexplorer.exe file (cicsexplorer on Linux) and create a shortcut on the desktop.

Results

The CICS Explorer is now installed on the workstation and is started by double-clicking the shortcut icon. To change the location of the CICS Explorer user workspace, see the information about switching workspaces in the CICS Explorer User Guide.

Related reference:

“CICS Explorer installation options” on page 8

You have several options for installing the CICS Explorer, depending on how you decide to use it in your organization. Understanding how the CICS Explorer runs, and how it stores its configuration information, will help you to decide which installation option to choose.

Installing on a remote network drive

You can install the CICS Explorer on a remote network drive. The software can be shared by multiple users and can be centrally managed.

About this task

This task describes how to install the CICS Explorer on a remote network drive. The person doing the installation must have write access to the network drive.
Procedure

1. Download the CICS Explorer .zip file from the download site to your local workstation.
2. Extract the contents to a new directory on the remote network drive.
3. When the extract is complete, open the CICS_Explorer directory in the new directory on the remote network drive. Locate the cicsexplorer.exe file and create a shortcut on your local workstation.
4. Right-click the shortcut and click Properties. The Target field displays the path to the CICS Explorer executable file on the remote network drive. You must distribute the shortcut to all users who will run CICS Explorer. If the path from their workstations to the remote server is different from the one already there, you must change the path in the shortcut.

Results

The CICS Explorer is now installed on the remote network drive. The users start the CICS Explorer by double-clicking the shortcut icon that you distributed. To change the location of the CICS Explorer user workspace, see the information about switching workspaces in the CICS Explorer User Guide.

Installing on a shared Linux server

You can install CICS Explorer on a shared Linux server and access it using the X Window System.

About this task

This task describes how to install CICS Explorer on a shared Linux server. The person doing the installation must have write access to the server.

Procedure

1. Download the CICS Explorer .tar.gz file from the download site to your local workstation.
2. Log in to the Linux server and create a new directory for the CICS Explorer, for example; /opt/Explorer
3. Extract the contents of the .tar.gz file to the new directory.

Results

CICS Explorer is now installed on the shared server. Users can use SSH tunnelling to access the CICS Explorer client, and display the output on the local terminal. The CICS Explorer executable file is cicsexplorer located in the CICS_Explorer directory. Using the previous example, the file path is /opt/Explorer/CICS_Explorer/cicsexplorer.

When a user starts CICS Explorer for the first time, a workspace is created on the local file system, for example; /home/username/.cicsexplorer. To change the location of the CICS Explorer user workspace, see “Changing the CICS Explorer workspace location” using the related link at the bottom of this topic.

Related reference:

“CICS Explorer installation options” on page 8

You have several options for installing the CICS Explorer, depending on how you decide to use it in your organization. Understanding how the CICS Explorer runs, and how it stores its configuration information, will help you to decide which
installation option to choose.
Chapter 10. Configuring the FTP server for CICS Explorer

CICS Explorer uses the z/OS Communications Server FTP server to gain access to data sets, z/OS hierarchical file systems such as zFS, and the JES spool. For CICS Explorer to successfully obtain the required spool files, the FTP.DATA configuration file for the Server must specify JESINTERFACELEVEL 2.

About this task

This task describes how to check the JESINTERFACELEVEL in the FTP server.

Procedure

1. Start an FTP client and run a quote stat command.
2. Check the output to determine the JESINTERFACELEVEL. For example:
   
   230 userid is logged on. Working directory is "/u/<userid>".
   
   ftp> quote stat
   211-Server FTP talking to host 10.10.10.10, port 1087
   211-User: USERID Working directory: /u/<userid>
   211-The control connection has transferred 1360 bytes
   ....
   211-Truncated records will not be treated as an error
   211-JESRECL is 80
   211-JESRECFM is Fixed
   211-JESINTERFACELEVEL is 2
   211-Server site variable JESTRAILINGBLANKS is set to TRUE
   ....
   211 *** end of status ***
   ftp> quit
   221 Quit command received. Goodbye.

3. Optional: (Optional) Change the FTP.DATA configuration file for the Server to specify JESINTERFACELEVEL 2.

What to do next

When you have configured the FTP server you can configure the CICS Explorer.
Chapter 11. Configuring the CICS Explorer

When you have installed the CICS Explorer, you must configure the way that it connects to your CICS or CICSPlex SM systems. You can also change the default location for the CICS Explorer workspace when CICS Explorer starts.

Defining connection credentials

When CICS Explorer attempts to establish a system connection it must send your credential details, that is your user ID and password or password phrase, to the system for authentication. When you have defined a credential you can use it on systems that share the credential without re-entering the details every time. You must have at least one credential before you can connect to a system.

Before you begin

Before proceeding, ensure that you have all your system connection details and that you have the correct level of authorization to connect to your system

Procedure

1. On the workbench menu bar click Window > Manage Connections. The Host Connections view opens. The following example shows the Host Connections view from the CICS Explorer, showing the CICS System Management and z/OS connection categories. The categories available depends on the Explorer being used.

2. Click Add on the Credentials section to add a new credential. The New Credentials window opens.

3. Enter your credential details and provide a credentials name. The name can be anything you like and is used only to help you distinguish between different credentials. Select the Save Password checkbox to save the password.

   Note: You might have a single user ID but use different passwords for different systems. If you have, you can define multiple credentials, each one having the same user ID but with different credential name and password or pass phrase. Alternatively you can choose to define one credential, but not to save the password or pass phrase, in which case you are required to enter them when you connect to a system.

4. Click OK to save the credential or Cancel to cancel the process and close the window without saving the new credential.
What to do next

You can now click Add in the Connections section of the Host Connections view to configure a system connection. For more information about configuring system connections see the related links, or specific Help topics in your Explorer user guide.

Related tasks:

“Configuring a CICS system connection”

Before you can view any information, you must establish a connection between CICS Explorer and your CICS systems by providing details about the system connection, its location, and authentication requirements. By default, CICS Explorer attempts to connect using the SSL protocol. If the SSL connection is not successful, the connection will be retried without SSL.

Configuring a CICS system connection

Before you can view any information, you must establish a connection between CICS Explorer and your CICS systems by providing details about the system connection, its location, and authentication requirements. By default, CICS Explorer attempts to connect using the SSL protocol. If the SSL connection is not successful, the connection will be retried without SSL.

Before you begin

If you are connecting to a CICS TS version 3 system, you must connect to a CICSPlex SM WUI server using the "CICSPlex SM Data Interface" read-only connection.

If you are connecting to a CICS version 4 or later system you can connect either to a CICSPlex SM WUI server using the "CICSPlex SM Data Interface" read-only connection, or, if you want update capability, you can use the CICS management client interface (CMCI) connection. If you are using the CMCI connection, the CICS system must be set up to use CMCI. See Setting up the CICS management client interface in the CICS Transaction Server for z/OS V4.4 product documentation for instructions on how to do this.

If you are connecting to a CICS TS for VSE/ESA 1.1.1 system, you can use the CICS management client interface (CMCI) read-only connection.

If CICS Explorer is not configured, or you want to add a connection, perform these steps:

Procedure

1. On the workbench menu bar click Window > Manage Connections. The Host Connections view is displayed. If your connections are pre-configured, you see the connections listed under the categories in the view. If not, the categories are empty. The following example screen capture shows the Host Connections view with one connection defined in each category type. Each connection is associated with a credential, with the exception of the z/OS FTP connection. The credential is shown in parenthesis after the connection name.

84 CICS TS for z/OS 4.2: Installation Guide
2. In the Connections section select the category for the connection you want to add and click Add. The Add Connection window opens. The following example shows the Add CICS Management interface Connection window.

3. Enter the TCP/IP host name of your server in the Host Name field. As you type, the characters up to the end of the first qualifier are inserted in the Name field. So if your host name is myserver.example.ibm.com then the name would display as myserver. You can type over the name to be anything you want.

4. Enter the port number. As you type, the port number is also appended to the name field, so the name is displayed something like myserver:28332. You can type over the name to change it to anything you want.

5. Click OK to save the connection. The connection is saved and is shown in the Connections section.

6. Optional: You can choose to associate a credential with the connection at this time. Right-click the connection name and hover over Set Credentials to show the credentials available. Click the credential you want to use for the connection.
What to do next

The connection and associated credential are shown in the Host Connections view. You can now connect to the system by right-clicking the connection name and clicking Connect. Alternatively select the connection name and click the Connect button. If the connection is not already associated with a credential, you can choose an existing credential or create one at this time.

Configuring an FTP system connection

You must have an FTP or z/OSMF connection to use the views in the z/OS perspective. By default, the FTP connection uses the secure forms of the protocols, FTP over TLS. If the secure connection is not successful, the connection is reattempted without security.

Before you begin

You must have at least one connection “credential” before you can configure a system connection. A credential is a repository for a user ID and password combination. See the topic "Defining connection credentials” on page 83 for further information.

Note: For z/OS Explorer to successfully obtain the required spool files, the FTPDATA configuration file for the Server must specify JESINTERFACELEVEL 2. For more information about the JESINTERFACELEVEL parameter, see your z Systems documentation.

Procedure

1. Click Window > Manage Connections from the workbench menu bar. The Host Connections view is displayed. If your connections are pre-configured, you see the connections listed under the categories in the view. If not, the categories are empty.
2. In the Connection field, either select an existing connection to an FTP port by clicking the twistie, or define a new connection of type New z/OS FTP Connection.
3. Enter the TCP/IP host name of your FTP server in the Host Name field. As you type, the characters up to the end of the first qualifier are inserted in the Name field. So if your host name is myserver.example.ibm.com then the name would appear as myserver:21. You can type over the name to be anything you want.
4. Complete the other fields as appropriate for your organization, and click OK The connection is saved and shown in the Host Connections view.
5. Optional: You can choose to associate a credential with the connection at this time. Right-click the connection name and hover over Set Credentials to show the credentials available. Click the credential you want to use for the connection.

Results

The connection and associated credential are shown in the Host Connections view. You can now connect to the system by right-clicking the connection name and clicking Connect. Alternatively select the connection name and click Connect. If the connection is not already associated with a credential, you can choose an existing credential or create one at this time.
Configuring a z/OSMF system connection

The z/OS Management Facility (z/OSMF) is a product for z/OS that provides support for a modern, Web-browser-based management console for z/OS, and extends the functionality of the z/OS Explorer. You must have a z/OSMF connection to use the features of z/OSMF. When you define a z/OSMF system, the z/OS Explorer attempts to create an FTP connection at the same time. The z/OS Explorer then chooses the connection that is most suitable for the task you are performing.

Before you begin

You should have at least one connection credential before you can configure a system connection. A credential is a repository for a user ID and password combination. For more information, see [Defining connection credentials].

Procedure

1. Click Window > Manage Connections from the workbench menu bar. The Host Connections view is displayed. If your connections are pre-configured, you see the connections listed under the categories in the view. If not, the categories are empty. The following example screen capture shows the Host Connections view in the CICS Explorer. One connection is defined in each category type. Each connection is associated with a credential, with the exception of the z/OS FTP connection. The credential is shown in parenthesis after the connection name.
2. In the Connections section select the z/OSMF category and click Add. The Add Connection window opens.

3. Enter the TCP/IP host name of your z/OSMF server in the Host Name field. As you type, the characters up to the end of the first qualifier are inserted in the Name field. So if your host name is myserver.example.ibm.com then the name would display as myserver. You can type over the name to be anything you want.

4. Enter the port number. As you type, the port number is also appended to the name field, so the name appears something like myserver:20332. You can type over the name to be anything you want.

5. By default the z/OSMF connection also sets up an FTP connection on port 21. If you previously defined a different FTP connection, you must select it from the FTP Connection list.

6. Click OK to save the connection. The connection is saved and shown in the Host Connections view.

7. Optional: You can choose to associate a credential with the connection at this time. Right-click the connection name and hover over Set Credentials to show the credentials available. Click the credential you want to use for the connection.

**Results**

The connection and associated credential are shown in the Host Connections view. You can now connect to the system by right-clicking the connection name and clicking Connect. Alternatively select the connection name and click Connect. If the connection is not already associated with a credential, you are able to choose an existing credential or create one at this time.

**Related tasks:**
You must have an FTP or z/OSMF connection to use the views in the z/OS perspective. By default, the FTP connection uses the secure forms of the protocols, FTP over TLS. If the secure connection is not successful, the connection is reattempted without security.
Part 4. Setting up the MVS environment for CICS

You must perform a number of tasks after you have loaded the elements to DASD and before you run CICS.

The information about ACF/Communications Server, MVS, RACF, and other products given is for guidance only. Always consult the current publications of these products for the latest information.

The term “RACF” is used throughout this information to mean the MVS Resource Access Control Facility (RACF) or any other external security manager that provides equivalent function.
Chapter 12. Authorizing the CICS and CICSPlex SM libraries

The SDFHAUTH, SEYUAUTH, SDFHLINK, SEYULINK, SDFHLPA and SEYULPA libraries must be APF-authorized.

1. APF-authorize these libraries by adding them to the list of APF-authorized libraries in the appropriate PROGxx or IEAAPFx member in SYS1.PARMLIB. These libraries must be APF-authorized to enable certain modules, such as DFHSIP, to run in supervisor state.

2. If your lists of APF-authorized libraries are specified in the dynamic format in a PROGxx member, refresh the APF list dynamically using the SETPROG or SET PROG=xx command.

3. If your lists of APF-authorized libraries are specified in the static format in IEAAPFx members, schedule an MVS IPL for the APF-authorization to take effect.

4. When you prepare your startup job stream, provide a STEPLIB DD statement for the SDFHAUTH and SEYUAUTH libraries. The SEYUAUTH library is not required for basic CICS functions, but it is required if you are using any CICSPlex SM or CICS Explorer functions. When you define your STEPLIB DD statement, remember that all other libraries concatenated with the SDFHAUTH and SEYUAUTH libraries must also be APF-authorized. If any of the libraries in a STEPLIB concatenation are not authorized, MVS regards all of them as unauthorized.

5. The SDFHLOAD and SEYULOAD libraries contain only programs that run in problem state, and must not be authorized. You must include the SDFHLOAD library in the CICS DFHRPL library concatenation. An example of this library DD statement is in the sample job stream in the CICS System Definition Guide.

6. If you require Java support, ensure that the SDFJAUTH library is APF-authorized. See "Authorizing the hlq.SDFJAUTH library" on page 256 for more information about that library.

Although, in general, CICS runs in problem state, the CICS initialization program, DFHSIP, must run in supervisor state for part of its execution. The CMAS startup program, EYU9XECS, also requires APF authorization.

For a module to run in supervisor state, it must be link-edited as an authorized module into a partitioned data set, which must also be defined to the operating system as APF-authorized. For CICS-supplied modules, the link-editing has been done for you. The CICS-supplied DFHSIP module is link-edited with the authorized attribute, using SETCODE AC(1), and is installed in the SDFHAUTH library.

For information about maintaining lists of APF-authorized libraries, see the z/OS MVS Initialization and Tuning Guide.

For information about authorizing access to CICS data sets, see the CICS RACF Security Guide.
Chapter 13. Authorizing CICS regions to access MVS resources

Protect your data sets, authorize your user IDs and regions and activate your RACF resource classes when you set up your security requirements to run CICS.

Grant access to the PDS libraries
Protect your data sets that use RACF. See “Protecting CICS load module data sets.”

SNA ACB
Authorize each CICS region user ID to open the SNA ACB for the region applid.

CICS system transactions
Authorize each CICS region user ID to access the CICS category 1 system transactions.

SMSVSAM server
Authorize each CICS region to open the SMSVSAM control ACB if you plan to use CICS with VSAM record-level data sharing.

System logger log streams
Authorize each CICS region user ID to access the MVS system logger log streams that are used by CICS.

z/OS UNIX
Include an OMVS segment in the CICS region user profile, specifying the UID parameter, to ensure that your CICS regions have the required access to z/OS UNIX. Failure to do so results in CICS failing to start under that region user ID with RACF message ICH408I and CICS message DFHKE002. Other messages such as DFHKE0501 and DFHDM0105 might also occur if different CICS domains fail to initialize.

RACF resource classes
Activate the appropriate RACF resource classes to enable terminal users to access CICS resources and user-defined resources.

VSAM catalogs
Give the CICS region user ID read access to each VSAM catalog that contains files, where CICS has the file definitions installed, and where these files are opened during or after CICS startup. Include the VSAM catalog for the DFHCSD file for the CICS system definition data set (CSD).

Protecting CICS load module data sets

To prevent unauthorized or accidental modification of hlq.SDFHAUTH or hlq.SDFJAUTH, you must RACF-protect these libraries.

Without protection, the integrity and security of your MVS system are at risk. Additionally, if you require protection against the unauthorized use of DFHSIP, do not place this module in the LPA and do not include hlq.SDFHAUTH in the MVS LNKLIST unless DFHSIP is RACF-protected as a controlled program with a profile in the RACF PROGRAM resource class.
You must also RACF-protect the other libraries, including hlq.SDFHLOAD, that make up the STEPLIB and DFHRPL library concatenations.

For information about authorizing access to CICS data sets, see Implementing RACF protection in a single CICS region in the RACF Security Guide.

**Authorizing access to data set services modules**

During initialization, CICS determines the availability of backup-while-open (BWO) support by linking to the callable services modules IGWAMCS2 and IGWABWO.

CICS also checks the DFSMSdss or DFDSS release level by linking to the module ADRRELVL. If access to this data set services module is controlled by means of RACF PROGRAM general resource profiles, security violation messages are issued against the CICS region user ID, unless the user ID is authorized to access ADR-prefixed module names.

You can avoid security violation messages against the CICS region user IDs, and still control access to data set services:

- If you have generic PROGRAM profiles protecting access to ADR modules, create specific PROGRAM profiles for the ADDRELVL module and ensure that your CICS region user IDs have READ access to these specific profiles.
- Instead of using PROGRAM profiles to protect access to data set services, use one of the following methods:
  - Define suitable profiles in the DASDVOL general resource class.
  - Define profiles in the FACILITY general resource class that are supported by DFSMS to control access to data set services.

For information about using DASDVOL and FACILITY class profiles to control the uses of data set services, see the DFSMS/MVS DFSMSdss Storage Administration Reference, SC26-4929, and the DFSMS/MVS DFSMSdss Storage Administration Guide, SC26-4930.

**Authorizing access to a CICS region z/OS Communications Server ACB**

You can control which users, among those who are running non-APF-authorized programs, can open the SNA ACB associated with a CICS address space (CICS region).

Control ensures that only authorized CICS regions can present themselves as z/OS Communications Server applications that provide services with this applid, thus preventing unauthorized users from impersonating real CICS regions. The CICS region user ID requires the OPEN access, not the issuer of the z/OS Communications Server SET VTAM OPEN command.

1. To enable CICS to start up with external security, authorize the CICS region user ID to open the CICS region's z/OS Communications Server ACB with the applid specified on the APPLID system initialization parameter.
2. For each applid, create an z/OS Communications Server APPL profile, and give the CICS region user ID READ access. For example:

   ```
   RDEFINE VTAMAPPL applid UACC(NONE) NOTIFY(userid)
   PERMIT applid CLASS(VTAMAPPL) ID(cics_region_userid) ACCESS(READ)
   ```
The correct CICS applid to specify in the VTAMAPPL class is the specific applid, as specified in the CICS system initialization parameters. If you are using XRF (that is, if CICS is started with XRF=YES), you must define two VTAMAPPL profiles — one each for both the active and alternate CICS region's specific applid (the second operand on the CICS APPLID startup option).

3. Ensure that the VTAMAPPL class is active and RACLISTed for this protection to be in effect; for example:

```
SETROPTS CLASSACT(VTAMAPPL) RACLIST(VTAMAPPL)
```

4. If a CICS region won't use z/OS Communications Server, do not reauthorize the CICS region user ID for the CICS applid.

5. If you do not control the opening of a CICS region's z/OS Communications Server ACB, a new z/OS Communications Server application started with the same applid as that of a running CICS region has the following effect:

- The running CICS region performs a FORCECLOSE of its SNA ACB and issues message DFHZC0101.
- The running CICS region either ends or continues, depending on your use of the XXRSTAT exit. The default is to end. If the CICS region continues, it no longer uses z/OS Communications Server.
- The new application opens the z/OS Communications Server ACB with the specified applid.
- If the first running CICS region used z/OS Communications Server persistent sessions, the new application recovers any z/OS Communications Server sessions that persist from that CICS region.

For information about creating z/OS Communications Server APPL profiles for CICS region applids, see the CICS system resource security in the RACF Security Guide. For information about the XXRSTAT exit, see Exit XXRSTAT in the Customization Guide.

---

**Authorizing the region user ID to access category 1 transactions**

To enable CICS to start up with external security, you must first have authorized the CICS region user ID to access the category 1 system transactions. If the region user ID does not have this authority at CICS startup, CICS issues message DFHXS1113 and ends.

To give the region user ID the authority to access the category 1 system transactions, edit and submit the sample job stream in Figure 3 on page 98 to run the CICS-supplied sample CLIST, DFHSCAT1. This job uses the RACF commands in the CLIST to update the RACF database.

Only a user with the RACF authority SPECIAL can run the CLIST to update the RACF database.
Authorizing access to an SMSVSAM server

If you plan to run CICS with VSAM record-level sharing (RLS), you must authorize each region that connects to an SMSVSAM server to have access to that server.

In a test environment you might wish to use the default action and allow any CICS region using VSAM RLS to connect to an SMSVSAM server. If you wish to protect this access, the RACF SUBSYSNM general resource class must be active and you must authorize each CICS region that connects to an SMSVSAM server to have access to that server. This means granting access to the appropriate profile in the RACF SUBSYSNM general resource class. You define profiles in the SUBSYSNM resource class to control access by subsystems like CICS that want to connect to SMSVSAM.

A SUBSYSNM profile name is the name by which a given subsystem, such as CICS, is known to VSAM. For CICS regions, you must use the CICS applid as the profile name in the SUBSYSNM general resource class.

When CICS attempts to register the control ACB during CICS initialization, SMSVSAM calls RACF to check that the CICS region user ID is authorized to a profile name in the SUBSYSNM class that matches the CICS applid. If the CICS region user ID does not have READ authority, the register fails.

For example, if the applid of a CICS AOR is CICSDAA1, and the CICS region user ID (shared by a number of AORs) is CICSDA# #, define and authorize the profile:

```
RDEFINE SUBSYSNM CICSDAA1 UACC(NONE) NOTIFY(userid)
PERMIT CICSDAA1 CLASS(SUBSYSNM) ID(CICSDA# # ) ACCESS(READ)
```

You can use wildcard characters on the applid to specify more than one CICS region, for example:

```
PERMIT CICSDA* CLASS(SUBSYSNM) ID(CICSDA# ) ACCESS(READ)
```

Authorizing access to MVS log streams

CICS does not control LOGSTRM security checks. To control them, the MVS security administrator activates the LOGSTRM and FACILITY general resource classes with the SETROPTS command.

Users of the IXCMIAPU administrative data utility and CICS regions both require appropriate authorizations to log streams and IXLSTR coupling facility structures.
Authorizing users of IXCMIAPU

You can create log structures and define log streams using the IXCMIAPU administrative data utility to update the LOGR data set. Your user ID must have the appropriate level of authorization.

Here are examples of levels of user ID authorization:

**Coupling facility structures**

To define and delete log structures using IXCMIAPU, you must have ALTER access to the LOGR resource profile named MVSADMIN.LOGR in the FACILITY general resource class. For example, use the following RACF command:

```
PERMIT MVSADMIN.LOGR CLASS(FACILITY) ACCESS(ALTER) ID(your_userid)
```

**Coupling facility log streams**

To define, delete, and update log streams, including log stream models, that are defined in coupling facility structures, you require these accesses:

- ALTER access to the appropriate log stream profile defined in the LOGSTRM general resource class
- UPDATE access to the coupling facility structure (IXLSTR) profile defined in the FACILITY general resource class; in this case, profile names are prefixed with IXLSTR.

For example, if the log stream and structure resource profiles are defined to RACF with the following commands:

```
RDEFINE LOGSTRM log_stream_profile UACC(NONE) [NOTIFY]
RDEFINE FACILITY IXLSTR.structure_name_a UACC(NONE) [NOTIFY]
```

Use the following RACF commands to give your user ID the required authorizations to these two profiles:

```
PERMIT log_stream_profile CLASS(LOGSTRM) ACCESS(ALTER) ID(your_userid)
PERMIT IXLSTR.structure_name_a CLASS(FACILITY) ACCESS(UPDATE) ID(your_userid)
```

**Authorizations for CICS regions**

If the LOGSTRM resource class is active, the level of authorization required depends on whether log streams are always explicitly defined to the MVS system logger.

Ensure that the CICS region user ID is authorized to write to, and create if necessary, the log streams and log stream data sets that are used for its system log and general logs. See Chapter 33, “Defining the logger environment for CICS,” on page 185. You do this by granting the appropriate access authorization to log stream profiles in the RACF LOGSTRM general resource class:

- If CICS is expected to create log streams dynamically, CICS must have **ALTER** authority to the relevant log stream (LOGSTRM) profiles, and **UPDATE** authority to the relevant coupling facility structure (IXLSTR and IXGLOGR) profiles. Here is an example:
  
  ```
  PERMIT region_userid.applid.* CLASS(LOGSTRM) ACCESS(ALTER) ID(region_userid)
  PERMIT IXLSTR.structurename CLASS(FACILITY) ACCESS(UPDATE) ID(region_userid)
  PERMIT IXGLOGR.region_userid.* CLASS(DATASET) ACCESS(UPDATE) ID(region_userid)
  ```

- If all the log streams to which CICS writes are already defined to MVS, CICS requires only **UPDATE** authority to the log stream profiles:
In the above examples, `region_userid.applid.*` is the generic profile name of the log stream resource. These examples illustrate a resource name prefixed by the region user ID and applid. `region_userid` is the CICS region user ID under which CICS is running, either as a started task or batch job.

Permit READ access to those users who read the CICS log streams. You must permit UPDATE access to those users who update journals by granting the user the appropriate authority to the log stream, in the LOGSTRM resource class, and to the JOURNALNAME in the JCICSJCT class. You must also grant access to the data set profile protecting the data set that contains the log stream.

The user ID for the JCICSJCT is the logon user ID, not the CICS region user ID. The example shows how to define it:

```
PERMIT journal_name CLASS(JCICSJCT) ACCESS(UPDATE) ID(logon_userid)
```

You can define the generic profile in the following example to cover all the log streams referenced by the CICS region identified by its region user ID and applid:

```
RDEFINE LOGSTRM region_userid.** UACC(NONE)
```

If, however, you have multiple CICS systems sharing the same region user ID, but with differing security requirements, include the applid in the generic profile:

```
RDEFINE LOGSTRM region_userid.applid.* UACC(NONE)
```

The following example allows the CICS region user ID under which CICS is running to write journal and log records to log streams in the named coupling facility structure:

```
PERMIT IXLSTR.structurename CLASS(FACILITY) ACCESS(UPDATE) ID(region_userid)
```

The following examples give access to two categories of user:

```
PERMIT region_userid.applid.* CLASS(LOGSTRM) ACCESS(READ) ID(authorized_browsers)
PERMIT region_userid.applid.* CLASS(LOGSTRM) ACCESS(UPDATE) ID(archive_userid)
```

In these examples, `archive_userid` is the user ID under which an application program runs to purge old data from CICS logs when the data is no longer required and `authorized_browsers` refers to the user IDs of users allowed to read log streams but not to purge data.

If several CICS regions share the same CICS region user ID, you can make profiles more generic by specifying * for the `applid` qualifier.

The number of profiles you define depends on the naming conventions of the logs and to what extent you can use generic profiling.
Authorizing access to z/OS UNIX System Services

CICS requires access to z/OS UNIX System Services and to directories and files in the file system. CICS facilities that require this access include TCP/IP support, Java support, CICS Web support, and task-related user exits that are enabled with the OPENAPI option, including the task-related user exit of the CICS DB2 attachment facility.

Before you begin

You must set up z/OS UNIX System Services, as described in z/OS UNIX System Services Planning.

About this task

To satisfy a CICS region request for a z/OS UNIX function for the first time, RACF does the following actions:

- Verifies that the user (the CICS region user ID) is defined as a z/OS UNIX user.
- Verifies that the user's current connect group is defined as a z/OS UNIX group.
- Initializes the control blocks required for subsequent security checks.

Follow the steps listed to ensure that each CICS region meets the security requirements:

1. Choose a RACF group that all your CICS regions can use to access z/OS UNIX and give a z/OS UNIX group identifier (GID) to this RACF group.
2. Give a z/OS UNIX user identifier (UID) to each CICS region user ID.
3. Make sure that each CICS region user ID connects to the RACF group that you chose.
4. Set up a home directory on z/OS UNIX for each of your CICS regions.

The UID and GID are numbers that can be in the range 0 to 16,777,216. 0 is a superuser ID. Give some thought to naming conventions and to any existing UIDs and GIDs in your z/OS UNIX system. z/OS UNIX System Services Planning, GA22-7800, explains how to manage the UIDs and GIDs for your z/OS UNIX system.

Note: If you are upgrading to z/OS 2.1.0 or above and have defined a BPX.DEFAULT.USER profile, please note that this is no longer supported. Instead you must define the BPX.UNIQUE.USER profile to enable the automatic assigning of UIDs and GIDs to users without an assigned OMVS segment. For more information, see Using the BPX.UNIQUE.USER profile instead of BPX.DEFAULT.USER.

To assign a z/OS UNIX UID and GID for your CICS regions and set up a home directory:

Procedure

1. Choose a RACF group that can be used by all your CICS regions. For example, you might use a RACF group that is defined as the default group of your CICS region user IDs, or you could set up a RACF group to be used only for access to z/OS UNIX System Services. When you are setting up facilities such as Java support or CICS Web support, you might want to use this RACF group for giving file access permissions on z/OS UNIX, in which case the RACF group's z/OS UNIX group identifier (GID) is associated with these directories and files.
This association means that the owner of these directories and files, and anyone who is not the owner but has to carry out operations with these files, must have this group as their group or one of their supplementary groups. The RACF profiles in the RACF Security Guide explains how RACF groups work.

2. Choose a suitable z/OS UNIX group identifier (GID) for the RACF group, and assign the GID to the RACF group. To assign a GID, specify the GID value in the OMVS segment of the RACF group profile. For example, if the RACF group is CICSTSAB, and the GID you want to assign is 9, use the command:

```
ALTGROUP CICSTSAB OMVS(GID(9))
```

3. Choose a suitable z/OS UNIX user identifier (UID) for each CICS region. The Implementing security for z/OS UNIX files in the RACF Security Guide explains how the region user ID under which CICS runs is specified when CICS is run as a started task, as a started job, or as a job.

   a. Assign your chosen UIDs to each of your CICS region user IDs. To assign UIDs, specify the UID value in the OMVS segment of the RACF user profile for each CICS region user ID.

   b. Also specify the name of a home directory for each CICS region using the HOME option. The directory name format is /u/CICS region user ID.

   The RACF security overview in the RACF Security Guide tells you how to update a RACF user profile using the ALTUSER command. For example, if the CICS region user ID is CICSHAA1, and the UID you want to assign is 2001, use the command:

```
ALTUSER CICSHAA1 OMVS(UID(2001) HOME('/u/cicshaa1'))
```

If you want to know about the other information that can be specified in an OMVS segment parameter in a user profile besides the UID and home directory, see the z/OS Security Server RACF Command Language Reference, SA22-7687. You can assign the same UID to more than one CICS region user ID. If all your CICS regions must use the same z/OS UNIX files (for example, the files required for Java support), you can give all the CICS regions the same UID, and then you can use that UID for giving file access permissions on z/OS UNIX. However, bear in mind these points:

   a. The sharing of UIDs allows each CICS region to access all of the z/OS UNIX resources that the other CICS regions with that shared UID can access, and this level of access might not be appropriate in your system.

   b. The sharing of UIDs is not normally suitable in a z/OS UNIX system.

   c. If you do choose to share UIDs, the z/OS UNIX System Services parameter MAXPROCUSER limits the maximum number of processes that a single user (that is, with the same UID) can have concurrently active. z/OS UNIX System Services Planning, GA22-7800, has more information about this parameter.

4. Set up each of the z/OS UNIX directories that you have specified as a home directory for one of your CICS regions:

   a. If you are not using an automount facility, use the `mkdir` command to create the z/OS UNIX directories. For example, issuing the UNIX command

```
mkdir /u/cicshaa1
```

Creates the z/OS UNIX directory /u/cicshaa1. If you are using the TSO command, enclose the directory name in single quotation marks.

   b. Whether or not you are using an automount facility, allocate a z/OS UNIX data set for each directory. z/OS UNIX System Services Planning, GA22-7800, tells you how to do this.
c. If you are not using an automount facility, mount the data set that you have allocated. Again, z/OS UNIX System Services Planning, GA22-7800, tells you how to do this.

The z/OS UNIX data set that you allocate for a CICS region's home directory has a finite size. If a particular CICS region is using the home directory extensively, you might have to increase the amount of space that the region has available.

5. Verify that the permission defined for the /etc directory is set to 755, so that CICS can access the files. The /etc directory provides a symbolic link to the /SYSTEM/etc directory. The /SYSTEM/etc directory is created with a permission of 700, so you need to check that the /SYSTEM/etc directory permission is set to 755.
   a. Check the permission set in the /SYSTEM/etc directory, from the Unix shell:
      
      `ls -ld /SYSTEM/etc`
   
   b. If the permission is not `drwxr-xr-x`, issue the following Unix shell command to set permission to 755:
      
      `chmod 755 /SYSTEM/etc`
      
      If permission is not set to 755, you might receive a RACF error indicating that you have insufficient authority for CICS to access the files.

6. Make sure that each of your CICS region user IDs connects to the RACF group to which you assigned a z/OS UNIX group identifier (GID). If your CICS region user IDs connect to more than one RACF group, a RACF list of groups must be active in your system.

What to do next

Your CICS regions now have access to z/OS UNIX System Services. When you set up facilities such as Java support or CICS Web support, use the UIDs or GIDs to give the CICS regions permission to access directories and files on z/OS UNIX.

To check the UID and GID details for a user, use the `id` command in the UNIX environment. For example, issuing the `id` command for our example CICS region user ID CICSHAAM1 gives the following result:

`uid=2001(CICSHAAM1) gid=9(CICSTSAB)`

For more general information about RACF facilities for controlling access to z/OS UNIX System Services, see the z/OS Security Server RACF Security Administrator's Guide, SA22-7683.

Activating RACF resource classes

Before you can use RACF for CICS resources and for user-defined resources, you must activate the associated RACF resource classes by using the RACF SETROPTS command.

To run the CICS-supplied IVPs with external security, you must activate the resource classes for CICS resources.

To use your own user-defined resources with external security in your CICS environment:

- Define resource classes for your resources.
- Activate the resource classes.
Optionally apply the RACLIST option to the resource classes to be used for QUERY SECURITY commands, to build in storage profiles for those resource classes.

For information about RACF resource classes, see the RACF classes for CICS resources in the RACF Security Guide.
Chapter 14. Defining the default CICS user ID to RACF

If you intend to use RACF to authorize terminal users to access CICS resources, define a default CICS user ID to RACF and specify it on the CICS system initialization parameter, DFLTUSER.

This default user ID assigns the security attributes to be used for all CICS terminal users who do not sign on with the CESN transaction or a user-written equivalent.

During startup, CICS tries to sign on the default user ID. If it is not signed on, perhaps because it is not defined, CICS issues message DFHSN0701 and stops CICS initialization. After the valid default CICS user ID is signed on, its security attributes are used for all CICS terminal users who do not sign on with the CESN transaction. If the default user ID is defined to RACF with a CICS segment, the operator attributes in that segment are also used for users who do not sign on.

For information about defining the user ID to RACF, see the CICS installation requirements for RACF in the RACF Security Guide.
Chapter 15. Installing CICS-required modules in the MVS linklist

There are two categories of modules that are loaded from the MVS linklist. These are CICS- and CICSPlex SM-supplied modules, and modules of other MVS products, for example, DFSMS.

Look through the subtopics in this section and select the ones that are relevant to your installation. Work through these topics to create your customized MVS linklist.

CICS- and CICSPlex SM-supplied modules required in the MVS linklist

CICS TS supplies the modules listed in the SDFHLINK and SEYULINK libraries when you install CICS TS.

The following CICS modules are in SDFHLINK:

**AMDUSREF**
- Alias of DFHTG670.

**AXMSC**
- AXM server connection routines for CICS data-sharing servers.

**AXMSI**
- AXM subsystem initialization routine for CICS data-sharing servers.

**DFHDTCV**
- Connection validation subroutine for shared data tables.

**DFHDTsvc**
- Shared data tables SVC services.

**DFHGTCNV**
- Subroutine used by LOGR subsystem interface.

**DFHLGCNV**
- Exit routine for LOGR subsystem interface.

**DFHMVRMS**
- General MVS RESMGR exit stub.

**DFHNClF**
- Named counter server interface.

**DFHNCOPT**
- Named counter server options.

**DFHPD670**
- Dump formatting routine for use with IPCS.

**DFHRPDU**
- System dump formatting routine for ONC RPC.

**DFHRPTrI**
- Trace interpretation routine for ONC RPC.

**DFHRSXSV**
- RRS domain authorized services.
DFHSNNFY
RACF CICS segment changes notification routine.

DFHSNPTO
CICS RACF dynamic parse TIMEOUT keyword print routine.

DFHSNVCL
CICS RACF dynamic parse OPCLASS validation routine.

DFHSNVID
CICS RACF dynamic parse OPIDENT validation routine.

DFHSNVPR
CICS RACF dynamic parse OPPTRY validation routine.

DFHSNVTO
CICS RACF dynamic parse TIMEOUT validation routine.

DFHSSIN
CICS subsystem that initializes the console message handling facilities.

DFHSSMGT
CICS subsystem message table that contains the text of messages for the subsystem interface modules.

DFHTG670
Link module for the CICS GTF trace printing load module DFHTRGTF.

DFHTR670
Link module for the CICS GTF trace printing load module DFHTR670.

DFHTT670
Link module used for trace interpretation. You do not have to include DFHTT670 in the MVS linklist. If it is not in the linklist, an APF authorized library in the STEPLIB concatenation of the batch job is required for every job that uses the module.

DFHXCSVC
External CICS interface (EXCI) SVC services routine.

The following CICSPlex SM modules are in SEYULINK:

EYU9D420
Dump formatting routine for use with IPCS.

EYU9X420
In each MVS image that contains a CMAS. EYU9X420 is the initialization module for the ESSS.

EYU9A420
In each MVS image that contains a CMAS where you want to run the CICSPlex SM API. EYU9A420 is the CICSPlex SM API subtask module.

EYU9T420
CICSPlex SM to Tivoli NetView Communications module.

These modules are supplied in an APF-authorized library in the MVS linklist because of the following reasons:
1. Non-CICS regions such as batch jobs or a CICS data sharing server can require them.
2. They must be consistent across several CICS regions.
3. Both CICS and non-CICS regions can require them.
4. The Security Administrator who runs the ADDUSER or ALTUSER commands under TSO requires the RACF dynamic parse routines. For information about the RACF interface routines, see the An overview of the CICSPlex SM ESm interface in the RACF Security Guide.

Ensure the modules supplied in SDFHLINK and SEYULINK are available from an APF-authorized library in the MVS linklist:

- Add these modules, as required, to an existing APF-authorized library defined in the MVS linklist
- or
- Define SDFHLINK and SEYULINK as APF-authorized libraries and include them in the MVS linklist

Compatibility with earlier CICS releases

Unless otherwise stated, the CICS Transaction Server for z/OS, Version 4 Release 2 levels of the modules in SDFHLINK are compatible with earlier releases of CICS. The CICSPlex SM modules in SEYULINK are not compatible with earlier releases. CICSPlex SM modules in SEYULINK are release specific. If you plan to run multiple releases of CICSPlex SM on the same MVS image, you must have the equivalent modules specific to the releases you are running.

DFHPD670, DFHTG670, DFHTR670, and DFHTT670 are release-dependent. If you run more than one release of CICS, ensure that the correct versions are available; for example, DFHPD630 for CICS TS for z/OS, Version 2.3.

CICS shared data tables modules for the MVS linklist

CICS supplies the following modules, for shared data tables, in hlq.SDFHLINK.

If you intend using shared data tables, ensure that these modules are available in the MVS linklist or the MVS link pack area:

- DFHDTSVC and DFHDTCV, because all regions using shared data tables must use the same level of SVC code.
- DFHVMVRMS, the RESMGR exit stub, because JOBLIB and STEPLIB data sets are unavailable at end-of-memory.

CICSPlex SM API linklist modules

In each MVS image that contains a CMAS in which you plan to run the CICSPlex SM API, ensure that these required modules are in the correct location.

These modules are supplied in the SYS1.CICSTS42.CPSM.SEYUAUTH library.

**EYU9AB00**
In either the MVS linklist or the STEPLIB concatenation of the application that calls the API, EYU9AB00 is the API batch interface module.

**EYU9XESV**
In an authorized library in either the MVS linklist or the CMAS STEPLIB concatenation. EYU9XESV is the API security exit module.

In addition, any application that calls the API must be link-edited with one of the following stub routine modules, regardless of what programming language is used:
For batch, TSO, or NetView® programs. EYU9ABSI is supplied in the SYS1.CICSTS42.CPSM.SEYUAUTH library.

For application programs running in CICS. EYU9AMSI is supplied in the SYS1.CICSTS42.CPSM.SEYULOAD library.

Installing the REXX function package

The REXX runtime interface to the API consists of a function package and host command environment.

The interface consists of a single load module that contains two entry points:

**EYU9AR00**

The function package

**EYU9AR01**

The host command

EYU9AR00 is supplied in the SYS1.CICSTS42.CPSM.SEYUAUTH library with an alias of IRXFLOC.

For a REXX program to access the function package, the module EYU9AR00, with its alternate entry point EYU9AR01, and its alias IRXFLOC, must be in an authorized library in one of these places:

- The MVS linklist
- The STEPLIB concatenation of the application that calls the API

For a REXX program to access the function package from NetView, the EYU9AR00 module must also be aliased to DSIRXLFP and placed in an authorized library in either the MVS linklist or the STEPLIB concatenation for the NetView system.

Users of the CICSPlex SM runtime interface are subject to the normal CICSPlex SM API security checks. See the information in the CICSPlex SM security in the RACF Security Guide.

The following members contain SMP/E user modification control statements that you can use to move the necessary API load modules to the SYS1.CICSTS42.CPSM.SEYULINK library. These members are supplied in CICSTS42.CPSM.SEYUSAMP.

<table>
<thead>
<tr>
<th>Member</th>
<th>Load module</th>
</tr>
</thead>
<tbody>
<tr>
<td>EYU$UM11</td>
<td>EYU9AR00</td>
</tr>
<tr>
<td>EYU$UM12</td>
<td>EYU9AB00</td>
</tr>
<tr>
<td>EYU$UM13</td>
<td>EYU9XESV</td>
</tr>
</tbody>
</table>

If you use the IRXFLOC or DSIRXLFP aliases to provide access to the REXX function package, you must place them ahead of any other IRXFLOC or DSIRXLFP modules in the STEPLIB or MVS linklist concatenation.

If you do not want to use the aliases for the REXX function package, you must modify your REXX parameter modules IRXPARMS, IRXTSPRM, and IRXISPRM. If you do this, do the following actions:
• Add the function package supplied by CICSPlex SM as a System function package, rather than a Local or User function package.
• Add a new host command entry. Here are some examples:
  – An 8-byte Command Environment name of 'CPSM'
  – An 8-byte Command Routine name of 'EYU9AR01'
  – A 16-byte Command Token of blanks

To complete installing the REXX function package:
• Increase the number of entries in the appropriate function package table.
• Add an entry to that table for EYU9AR00.

For more information about REXX function packages and host commands, see the TSO/E Version 2 REXX/MVS Reference.

---

**Modules of other MVS products in the MVS linklist**

CICS loads some DFSMS modules from the MVS linklist. This requirement either depends on the function you are using, such as backup-while-open (BWO) support, or on the release of DFSMS.

The following modules are loaded:

**IGWABWO**

CICS loads this module, supplied in the MVS callable services library SYS1.CSSLIB, from the MVS linklist if you are using BWO for files accessed in non-RLS mode. In addition to IGWABWO in the linklist, IGWAMCS2 must be installed in the LPA. CICS tests for the presence of this module in the LPA to determine that BWO support is present in the MVS image before attempting to load IGWABWO.

For files that are accessed in RLS mode, CICS does not require IGWABWO or IGWAMCS2.

**IGWARLS**

CICS loads this module, supplied in the MVS callable services library SYS1.CSSLIB, from the MVS linklist. CICS issues the following message if it cannot load IGWARLS:

```
DFHFC0116 APPLID THE LOAD OF CALLABLE
SERVICE IGWARLS HAS FAILED WITH RETURN CODE
X'EEEE'.
```

CICS initialization fails if CICS cannot load this callable services module.
Chapter 16. Defining CICS as an MVS subsystem

You define CICS as an MVS subsystem before you can use any of facilities listed.

- The console message-handling facility
- Multiregion operation (MRO)
- CICS shared data tables
- External CICS interface (EXCI).

For information about the console message-handling facility, see Operations and utilities overview in the Operations and Utilities Guide.

For information about MRO, see Multiregion operation in the Intercommunication Guide.

The definition of CICS as an MVS subsystem involves three members of the SYS1.PARMLIB partitioned data set: IEASYSxx, IEFSSNaa, and DFHSSIyy. You require only member DFHSSIyy if you want the console message-handling facility.

In an IEASYSxx member of the SYS1.PARMLIB library used for MVS initialization, include the parameter SSN=aa, where aa refers to the SYS1.PARMLIB member IEFSSNaa that contains the definitions for all subsystems required for this IPL of MVS, including the definition of CICS as an MVS subsystem.

aa,xx,yy represent suffixes that are used to distinguish different versions of members of the SYS1.PARMLIB library.

To start CICS with the START command:

- Give the MVS started task procedure a name different from the subsystem name in IEFSSNaa (default ‘CICS’),
  or
- Issue the start command with the parameter SUB=JES2 or SUB=JES3 as appropriate.

For more information about the subsystem interface, see the z/OS MVS Using the Subsystem Interface manual.

The following topics cover:

- “Noting IEASYSxx values for CICSPlex SM”
- “Specifying each CMAS correctly in IEASYSxx” on page 114
- “Coding the IEFSSNaa MVS subsystem initialization member” on page 115
- “The SYS1.PARMLIB(BPXPRMxx) parameters” on page 116
- “The console message-handling facility” on page 117
- “EXCI pipe allocation” on page 122

Noting IEASYSxx values for CICSPlex SM

Some of the MVS initialization values located in an IEASYSxx member of the SYS1.PARMLIB library are referenced during installation of CICSPlex SM address spaces.
Access the IEASYSxx member of the SYS1.PARMLIB library that is used to initialize your MVS system and make note of the values assigned to the following parameters:

**APF=** Completes the name of the parmlib member (IEAAPFxx) that contains authorized library names.

**CMD=** Completes the name of the parmlib member (COMMNDxx) that contains commands to be issued internally during master scheduler initialization.

**LNK=** Completes the name of one or more parmlib members (LNKLSTxx) that contain names of data sets that are to be concatenated to SYS1.LINKLIB.

**LNKAUTH=** Specifies that all data sets in the LNKLST concatenation will be treated as APF-authorized or that only those that are named in the APF table will be treated as APF-authorized.

**LPA=** Completes the name of one or more parmlib members (LPALSTxx) that are concatenated to SYS1.LPALIB for the purpose of building the pageable LPA (PLPA and extended PLPA).

**MAXCAD=** Specifies the maximum number of SCOPE=COMMON data spaces that will be allowed during an IPL.

**MAXUSER=** Specifies a value that the system uses, along with the RSVSTRT and RSVNONR parameter values, to limit the number of jobs and started tasks that the system can run concurrently during a given IPL.

**NSYSLX=** Specifies the number of linkage indexes (LXs), in addition to those in the system function table, that will be reserved for system linkage indexes (LXs).

**PROG=** Completes the name of the parmlib member (PROGxx) that contains authorized library names when a dynamic APF list is being used.

**RSVNONR=** Specifies the number of address space vector table (ASVT) entries that will be reserved for replacing those entries marked nonreusable for the duration of an IPL.

**RSVSTRT=** Specifies the number of ASVT entries that will be reserved for address spaces created in response to a START command.

**SYSNAME=** Specifies the name of the system being initialized.

For more information about these parameters, see the z/OS Initialization and Tuning Reference manual.

### Specifying each CMAS correctly in IEASYSxx

In every z/OS image that contains a CMAS, verify that the IEASYSxx member of the SYS1.PARMLIB library that you use for z/OS initialization includes the MAXCAD and NSYSLX parameters.
**MAXCAD=nnn**
Set or increase the value to include the number of common MVS data spaces that are required for each CMAS. Each CMAS requires a minimum of six common MVS data spaces. When setting the MAXCAD limit, allow for six common MVS data spaces for each CMAS, in addition to any common data spaces that might be in use by other products.

**NSYSLX=nnn**
Set or increase the value to include the minimum number of linkage indexes (LXs) that are required by CICSPlex SM. One LX is required for the Environment Services System Services (ESSS), so the minimum number of LXs required for use by CICSPlex SM is one.

For additional information about these parameters, see the *z/OS Initialization and Tuning Reference* manual.

---

**Coding the IEFSSNaa MVS subsystem initialization member**

To define CICS as an MVS subsystem, code an entry in the IEFSSNaa member in the SYS1.PARMLIB library.

If you want to use the console message handling facility or to change the number of pipes that can be allocated in an EXCI address space, code the entry by using one of the following methods:

- **CICS,DFHSSIN,DFHSSIyy**
- **SUBSYS SUBNAME(CICS) INITRTN(DFHSSIN) INITPARM(DFHSSIyy)**

This entry is used for every CICS region that runs under MVS that you have IPLed with this version of the IEFSSN member. You do not have to specify both DFHSSIN and DFHSSIyy, however apart from the suffix yy, you must code the entry for each parameter using the exact format given in the example. The terms have the following meanings:

- **CICS** The name of the CICS subsystem.
- **DFHSSIN** The name of the CICS subsystem routine that initializes the console message-handling facilities and the number of pipes that can be allocated in an EXCI address space. If you omit this name, CICS is defined as an MVS subsystem, but none of the console message-handling facilities are enabled, and the default number of pipes that can be allocated in an EXCI address space is used. That default is 100.
- **DFHSSIyy** The name of a SYS1.PARMLIB member in which you have defined initialization parameters for message formatting and EXCI pipe allocation for the CICS subsystem. If you specify DFHSSIN but omit DFHSSIyy, the DFHSSIN routine tries to use the parameters that are defined in member DFHSSI00.

If the DFHSSI00 member does not exist, the routine uses the default values:
• For message formatting the default values are defined in the DFHSSIN member. They are described in “Default message-formatting initialization parameters” on page 119.
• For EXCI pipe allocation, the fixed value is 100.

The IEFSSNa member in the SYS1.PARMLIB library also contains the definitions for all the other subsystems required for this IPL of MVS; for example, JES2, IRLM and DB2.

The SYS1.PARMLIB(BPXPRMxx) parameters

Use of certain CICS functions and running a large number of CICS systems in an LPAR mean that the default options, shipped in the BPXPRMxx members of SYS1.PARMLIB, are not sufficient.

You must review the default options for the following functions:
• C and C++ programs compiled using the XPLINK compiler option
• Programs that run on open TCBs and use APIs other than the CICS API
• SSL TCBs specified by the MAXSSLTCBS system initialization parameters
• JVMs and Java programs

If you use XPLINK or non-CICS APIs, you must increase the MAXPROCUSER and MAXPROCSYS values. See “Sizing MAXPROCSYS” for guidance.

If CICS is configured to use SSL, you might have to increase the MAXTHREADS and MAXTHREADTASKS values.

If CICS is configured to use JVMSERVERs, you might have to increase the total THREADLIMIT value in each JVMSERVER.

If your system uses two or more of these facilities, corresponding further increases in the values for these parameters is appropriate.

Sizing MAXPROCSYS

The z/OS MAXPROCSYS parameter specifies the maximum number of processes that can be active at the same time in the LPAR, and allows you to manage system resources by limiting the number of processes that the system is to support. If you set the MAXPROCSYS value too low, regions might abend because CICS cannot create a process when attempting to attach a TCB. However, avoid setting the MAXPROCSYS value too high because this value is shared between all the address spaces in a z/OS system.

CICS uses at least two processes for each CICS region, which means that if you have a large number of CICS regions, you must set your system limit to handle these processes. The following table explains which TCBs become processes, depending on the CICS system:

Table 8. TCBs that become processes

<table>
<thead>
<tr>
<th>TCB</th>
<th>Is the TCB always a process?</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Jobstep</td>
<td>Yes</td>
<td>The jobstep TCB is always created.</td>
</tr>
<tr>
<td>SO</td>
<td>Yes</td>
<td>The SO TCB is always created.</td>
</tr>
</tbody>
</table>
Table 8. TCBs that become processes (continued)

<table>
<thead>
<tr>
<th>TCB</th>
<th>Is the TCB always a process?</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SL</td>
<td>No</td>
<td>The SL TCB is created unless the system initialization parameter, TCPIP=NO, is specified.</td>
</tr>
<tr>
<td>QR</td>
<td>No</td>
<td>The QR TCB becomes a process when an OTE TCB is attached (that is; L8, L9, J8, J9, X8, or X9).</td>
</tr>
<tr>
<td>SP</td>
<td>No</td>
<td>The SP TCB becomes a process, and the associated S8 TCBs are created and become threads only when SSL is used.</td>
</tr>
<tr>
<td>JVM (J8 and J9)</td>
<td>No</td>
<td>The number of J8 or J9 TCBs is controlled by the MAXJVMTCBS SIT parameter. J8 and J9 TCBs running active JVMs require one process each.</td>
</tr>
<tr>
<td>JVMSERVER (TP and T8)</td>
<td>No</td>
<td>Each enabled JVM Server requires a single process regardless of how many threads it supports.</td>
</tr>
</tbody>
</table>

In summary, there is always a minimum of two processes for each CICS region, up to a minimum of seven processes for each region, depending on which additional TCBs you are running.

You can issue the following command to give you a list of the processes that are running on your system:

```
D OMVS, A=addressspaceid
```

`addressspaceid` is the address space that you want to query.

If you run this command at system startup, and again when your system has stabilized; for example, when peak J8 and J9 TCBs are running, you can calculate the most appropriate number for MAXPROCSYS.

For more information about changing BPXPRMxx parameters, monitoring system limits and calculating values for system resources, see z/OS UNIX System Services Planning.

---

The console message-handling facility

The console message-handling facility is an optional feature of the CICS subsystem that can affect the appearance of CICS messages displayed on an MVS console. It is effective when you specify FORMATMSG=YES as a parameter in the message-formatting initialization member for the CICS subsystem.

The subsystem reformating is enabled when at least one of the following applications is executing in the MVS image where the subsystem is defined:

- Any version of CICS Transaction Server
- A message automation subsystem, such as NetView, which enables the MVS subsystem console message broadcasting service

The console message-handling facility affects the messages that are displayed on MVS system consoles in the following ways:

- The subsystem tries to ensure that all console messages issued by all CICS regions have a standard format. The format is:

  `+DFHnnnn APPLID MESSAGE-TEXT`
In this message:

+DFHnnnn
  – Begins in column 1
  – The “plus” sign (+) that precedes DFHnnnn, is added by MVS to indicate that a problem-state program issued the message. It is not present when CICS issues the message while it is in supervisor state.

APPLID
  – Begins in column 13
  – The applid inserted into the message is the specific application identifier. This identifier is specified in the APPLID system initialization parameter.

MESSAGE-TEXT
  – Begins in column 22.
  • The subsystem adds route codes specified in the ROUTECODE subsystem initialization parameter, so the messages might be sent to more destinations.
  • The subsystem reformats messages for all CICS releases.
  • The subsystem does not reformat messages that are issued by a CICS region that has not yet determined its applid. These messages include those that are issued while processing the system initialization table and its overrides.
  • The subsystem routine that reformats the messages does not receive control until after the message has been recorded in the CICS job log. Therefore, the reformatting is not usually apparent in the job log.
  • Messages issued by the message domain already contain the applid. The subsystem does not insert the applid into such messages, but it might insert blank characters to cause alignment into standard locations.
  • If the original CICS message is a long one, the addition of the applid might cause the message to exceed the maximum length for an MVS console message. In this case, the original message is suppressed and does not appear on the console, and the reformatted message is issued using the MVS multiple-line console message service to split the message over several lines. Both the original message and perhaps several instances of the reformatted multiple-line message appear in the job log, but only one copy of the reformatted message is displayed on the console.
  • For some messages in which the applid normally follows a time and date stamp, the insertion of the applid in the standard position results in the applid being duplicated in the message. For these messages, the subsystem eliminates the time and date stamp, because these are available from other sources, and only one occurrence of the applid is shown.

**Specifying the DFHSSIyy message-formatting initialization member**

You can specify message-formatting initialization parameters for the CICS subsystem in a member DFHSSIyy of the SYS1.PARMLIB library, where yy is the suffix that identifies the SYS1.PARMLIB member used to define the CICS subsystem.

These parameters are FORMATMSG, HIDEPASSWORD, and ROUTECODES. Code the parameters in columns 1 through 71 of the DFHSSIyy member, like this:

```
FORMATMSG=YES,HIDEPASSWORD=YES,ROUTECODES=(1,2)
```

or with additional routecodes:
FORMATMSG=YES
HIDEPASSWORD=YES
ROUTECODES=(1,2,
3,4,
5,6)

FORMATMSG={YES|NO}
Specifies whether the CICS applid is to be inserted into all DFH console messages that do not use the CICS message domain.

YES
Insert CICS applid into messages.

NO
Do not insert CICS applid into messages.

HIDEPASSWORD={YES|NO}
Specifies whether to mask the password or password phrase from MODIFY commands used to enter the CICS sign-on transactions at an MVS console.

YES
Mask the password or password phrase.

NO
Do not mask the password or password phrase.

ROUTECODES=(n1[,n2] ....)
n1, n2... are numbers representing generic routecodes that are added to all DFH console messages issued by CICS. The routecodes 1-12 have special meanings:

1 Master console action
2 Master console information
3 Tape pool
4 Direct access pool
5 Tape library
6 Disk library
7 Unit record pool
8 Teleprocessing control
9 System security
10 System error/maintenance
11 Programmer information
12 Emulators

The status of other routecodes are listed:

13-20 Available for customer use

29-40 Reserved

41-128 Available to authorized programs only

For more information about these routing codes, see the z/OS MVS Initialization and Tuning Reference manual for your version of MVS.

Default message-formatting initialization parameters
You can define message-formatting initialization parameters for the CICS subsystem in a member DFHSSIyy of the SYS1.PARMLIB library.
To use parameters defined in a DFHSSIyy member other than the DFHSSI00 member, you must specify DFHSSIyy on the IEFSSNaa member in the SYS1.PARMLIB library used to define CICS as an MVS subsystem. If you do not specify DFHSSIyy, the DFHSSIN routine tries to use the parameters that are defined in the DFHSSI00 member. If the DFHSSI00 member does not exist, it uses the default parameters that are defined in the DFHSSIN routine.

If you specify DFHSSIyy but it does not exist, the DFHSSIN routine uses the default message-formatting initialization parameters that are defined in the DFHSSIN routine.

The default message-formatting initialization parameters defined in the DFHSSIN routine are as follows:

```plaintext
FORMATMSG=YES, HIDEPASSWORD=YES
```

(generic routecodes are not added to messages)

The default facilities:

- Insert the CICS applid into the CICS console message between the message identifier and the message text. The applid is inserted into only those console messages (starting with DFH) that do not use the CICS message domain. The CICS message domain inserts the CICS applid into all messages that it handles. If the original message is a long one, insertion of the CICS applid might cause the message to exceed the maximum length for an MVS console message. In this case, the original message is suppressed and does not appear on the console, and the reformatted message is issued using the MVS multiple-line console message service to split the message text over several lines. Both the original message and perhaps several instances of the reformatted multiple-line message appear in the job log, but only one copy of the reformatted message is displayed on the console.

- Examine each MODIFY command to see if it resembles a MODIFY CICS,CESN ... command. If the MODIFY command contains an old or new password (PS=xxxx, NEWPS=xxxx), the default facilities obliterate the password with asterisks. If the MODIFY command does not contain a password, the password you enter at the MVS console is masked.

- If your primary subsystem is JES3, the old and new passwords still appear in the JES3 hardcopy log. JES3 records the MODIFY command before the CICS message formatting subsystem can obliterate the password. (This processing does not happen when the primary subsystem is JES2.) The passwords are suppressed from the console for both JES2 and JES3. For information about the CESN transaction, and about how to prevent passwords from appearing in the hardcopy log, see the CICS Supplied Transactions manual.

If you do not specify DFHSSIN in the IEFSSNaa entry that defines CICS, the message handling facilities are not enabled. Also, if you run CICS as a started task, you cannot use the name “CICS” for the procedure name.

**Activating message formatting**

The next MVS subsystem to invoke the subsystem console message broadcasting service of MVS console support activates message-handling. Before activating message-handling, you must define CICS as an MVS subsystem with support for console message-handling, and also specify the message-formatting parameters in the DFHSSIyy member of the SYS1.PARMLIB library.
Message-handling is activated when you start a supported CICS region or if an automated-operation program, such as NetView, is active in the MVS image. See “The console message-handling facility” on page 117 for more information on console message-handling.

A newly started CICS region determines its own applid during initialization. Until the applid is known, message-formatting cannot operate. Therefore, messages issued very early in CICS initialization are not formatted.

**Modules required to use the console message-handling facilities**

To use the console message-handling facilities that are provided by the MVS subsystem functions of CICS, the CICS modules, DFHSSEN, DFHSSGC, DFHSSMGT, and DFHSSWT must be available at MVS IPL time.

**DFHSSEN**
- The module that cleans up CICS resources at end-of-memory and at end-of-task.

**DFHSSGC**
- The subsystem generic connect module that connects an active CICS region to the CICS subsystem.

**DFHSSIN**
- The CICS subsystem initialization module.

**DFHSSMGT**
- The subsystem message table that contains the text of messages for the subsystem interface modules.

**DFHSSWT**
- The subsystem interface write-to-operator (WTO) router that determines whether to route WTO calls to the appropriate CICS-dependent modules.

These modules must reside in the LPA or in an APF-authorized library in the MVS linklist:
- The modules DFHSSIN and DFHSSMGT, installed in the hlq.SDFHLINK library, must reside in an APF-authorized library in the MVS linklist.
- The DFHSSEN module, installed in the hlq.SDFHLPA library, must reside in the LPA.
- The modules DFHSSGC and DFHSSWT, installed in the hlq.SDFHLPA library, must reside either in the LPA or in an APF-authorized library in the MVS linklist.

The LINDEX parameter in the DFHISTAR installation job defines hlq.

The current versions of these modules are compatible with earlier CICS releases that support console message handling.

For information about adding modules that are installed in the hlq.SDFHLINK library to the MVS linklist, see Chapter 15, “Installing CICS-required modules in the MVS linklist,” on page 107.

For information about adding modules installed in the hlq.SDFHLPA library to the LPA, see Chapter 21, “Installing CICS modules in the MVS link pack area,” on page 145.
Coexistence with automation programs and other CICS releases

If you are using automated-operation programs or multiple CICS releases, then you must plan for them to coexist with the CICS message-handling facilities.

If your automation system must see the console messages before they are reformatted by CICS, place its subsystem definition in IEFSSNXX before the definition for CICS. But, if your automation system must see the reformatted messages, its definition must come after that of CICS. Consult the documentation of your automation package to determine which applies to you.

If you have defined the message-handling facility has been defined to MVS (by the CICS entry in the IEFSSNaa member of the SYS1.PARMLIB library), CICS regions running earlier releases of CICS in the same MVS image have the full benefit of the message handling that has been defined if either of the following cases is true:

- An automated-operation program, such as NetView, is active in the MVS image.
- A CICS region that supports message handling (see “The console message-handling facility” on page 117 for a list) is running in the same MVS image.

A consequence of the standard format console messages is that they no longer include date, time, and informational messages or information. If you use this kind of information as a token, you must make a change to the code so that it looks for a different token.

EXCI pipe allocation

The external CICS interface is an application programming interface that enables a non-CICS program (a client program) running in MVS to call a program (a server program) running in a CICS region and to pass and receive data by means of a communications area.

The CICS application is invoked as though it is linked to by another CICS application program.

This programming interface allows a user to allocate and open sessions or pipes which operate in "half-duplex", flip-flop” mode, to a CICS region and to pass distributed program link requests over them. The multiregion operation facility of CICS interregion communication supports these requests, and each pipe maps onto one MRO session, in which the client program represents the sending process and the CICS server region represents the receiving process. A default limit of 100 pipes for each EXCI address space applies.

Specifying the EXCI pipe allocation limit

Specify the EXCI pipe allocation limit for the CICS subsystem in a member DFHSSIyy of the SYS1.PARMLIB library, where yy is the suffix that identifies the SYS1.PARMLIB member used to define the CICS subsystem. The parameter is LOGONLIM.

Code the parameter in columns 1 through 71 of the DFHSSIyy member, like this:

```
LOGONLIM=200
```
LOGONLIM=nn

The minimum and maximum values that can be specified for nn are 100 and 250.

If you omit the parameter or the value specified lies outside the allowed range, CICS assumes a limit of 100.

The EXCI pipe allocation limit

CICS publishes the limit if it is determined during subsystem initialization, by creating a system-level name token pair formatted like this:

| Name: input, fixed length 16 byte type |
| Bytes 0-7: The character string 'DFHIRP' |
| Bytes 8-15: The character string 'LOGONLIM' |
| Token: output, fixed length 16 byte type |
| Bytes 0-3: The logon limit, held as fullword binary file |
| Bytes 4-15: Reserved, set to nulls |

You can use the callable service, IEANTRT, to retrieve the token. Invoke IEANTRT with level IEANT_SYSTEM_LEVEL (EQU 4). The return code is interpreted in the following way:

0  The name and token pair exists and the token has been retrieved. The logon limit can be extracted from the token.
4  The name and token pair does not exist. The logon limit is assumed to be 100.

Any other value indicates that the callable service has detected an error.

Default EXCI pipe allocation limit initialization parameter

Define the EXCI pipe allocation limit parameter for the CICS subsystem in a member DFHSSIyy of the SYS1.PARMLIB library.

To use parameters defined in any DFHSSIyy member except the DFHSSI00 member, specify DFHSSIyy in the IEFSSNa member in the SYS1.PARMLIB library used to define CICS as an MVS subsystem. For more information on IEFSSNa, see “Coding the IEFSSNa MVS subsystem initialization member” on page 115.

- If you do not specify DFHSSIyy, the DFHSSIN routine tries to use the parameters that are defined in the DFHSSI00 member.
- If the DFHSSI00 member does not exist, the DFHSSIN routine uses the default parameters that are defined in the DFHSSIN routine.
- If you specify DFHSSIyy but it does not exist, the DFHSSIN routine uses the default parameters that are defined in the DFHSSIN routine.

The default EXCI pipe allocation initialization parameter defined in the DFHSSIN routine is LOGONLIM=100.
Chapter 17. Installing the CICS SVCs

Install the current level of the CICS Type 3 SVC, DFHCSVC, and the HPO SVC before you attempt to start a region. If the Type 3 SVC is changed by IBM; for example, at a new release or because of a service update, then you must reinstall the current level of the CICS Type 3 SVC into the LPA and perform an IPL with the CLPA option.

To install the CICS Type 3 SVC, define the CICS SVCs to MVS, install the DFHCSVC module into the LPA and specify the DFHCSVC number on the CICSSVC system initialization parameter.

Defining the CICS SVCs to your MVS

1. Define both the CICS Type 3 SVC and the HPO SVC to your MVS system by specifying SVCPARM statements. You define the CICS SVCs in an IEASVCxx member of the SYS1.PARMLIB library, using SVCPARM statements. See the z/OS MVS Initialization and Tuning Guide and z/OS MVS Initialization and Tuning Reference manuals for a description of the SVCPARM statements.

2. If you are using the default SVC numbers, the following CICS entries are shown:

   SVCPARM 216,REPLACE,TYPE(3),EPNAME(DFHCSVC)
   SVCPARM 215,REPLACE,TYPE(6),EPNAME(DFHHPSVC)  [Only required for HPO]

   For the current SVC modules, you specify the EPNAME parameters as in the sample CICS entries.

3. If you have a version of the DFHHPSVC module from an earlier release of CICS already link-edited into your MVS nucleus, you do not have to replace it with the latest version. Versions of the DFHHPSVC module from earlier releases of CICS are compatible with the current release. The version of the DFHHPSVC module from the current release of CICS is compatible with earlier releases of CICS. The CSECT name (EPNAME) of the version of the DFHHPSVC module from earlier releases is IGC215 or IGCnnn, if SRBSVC=nnn was used as a CICS system generation parameter in the earlier release.

4. If you are not using the default SVC numbers, change the values 215 and 216 to the SVC numbers you have chosen.

5. Select the required IEASVCyy member by coding the SVC parameter (SVC=yy) in a SYS1.PARMLIB member (IEASYSxx) which you use to perform an IPL of your MVS. When you code new SVC numbers, they do not come into effect until you next perform an IPL of your MVS.

Installing the DFHCSVC module into the LPA

You must follow these guidelines when you install the DFHCSVC module into the LPA

1. Do not change DFHCSVC attributes.

2. Do not relink-edit the DFHCSVC module to install it into the LPA. The term install means move or copy a module into the LPA by using SMP/E, or a copying method that reblocks the copied modules when the target data set has a smaller block size than the data set you are copying from.

3. The DFHCSVC module, as supplied, has the attributes AMODE(31) and RMODE(ANY); do not change these attributes.
For further information about installing the DFHCSVC module in the LPA, see Chapter 21, “Installing CICS modules in the MVS link pack area,” on page 145.

Specifying the DFHCSVC number on the CICSSVC system initialization parameter

The current version of the CICS SVC module is compatible with all earlier releases of CICS, which enables you to run your earlier CICS regions with current regions in the same MVS image.

CICS contains a test to verify that it is using the correct level of the CICS DFHCSVC module. If CICS calls an SVC module using the SVC number specified on the CICSSVC system initialization parameter and that module is not at the current level, CICS issues message DFHKE0104. As a result of this message, CICS either abends with a system dump or prompts the operator to enter an alternative SVC number, depending on the option specified on the PARMERR system initialization parameter.

Using more than one version of the CICS Type 3 SVC

You might have to use more than one version of the CICS Type 3 SVC; for example, to test service applied to the DFHCSVC module while using the current version in a production system.

You can run several CICS regions, at different release levels, in the same MVS image, with each region using its own version of the CICS SVC. However, if some of those regions use MRO, all regions that use MRO must use the latest CICS Type 3 SVC (DFHCSVC module) and the latest DFHIRP module. For information about using the latest SVC with earlier releases of CICS, see “MRO between different CICS releases with a changed SVC number” on page 127 and a pre-Version 3 Installation Guide.

To use more than one version of the CICS SVC, rename the new SVC module in the LPA, and then respecify the SVC in the SVCPARM statements, as outlined in Chapter 17, “Installing the CICS SVCs,” on page 125. To rename the new CICS SVC module, use the renaming facility of ISPF or IEBCOPY or the TSO command RENAME, renaming the module to a unique name of your choice. Use SMP/E to rename the CICS SVC module in the SDFHLPA library. Use the SMP/E RENAME command to inform SMP/E of the change to the name of the CICS SVC module. Therefore, if you later use SMP/E to apply service to that module, the service is applied to the renamed module in the LPA, and not the DFHCSVC module.

For example, you might want to use an SVC number 255 for a test CICS region, and the default CICS SVC number 216 for your production system:

1. Create and apply an SMP/E USERMOD to rename the new CICS SVC module:
   ```plaintext
   ++USERMOD(umod1) .
   ++VER(C150) FMID(HCI6700) .
   ++RENAME (DFHCSVC) TONAME(newname) .
   ```

2. Specify the number 255 for the new CICS SVC version by adding an appropriate statement to the list of SVCPARM statements. That list then reads:
   ```plaintext
   SVCPARM 216,REPLACE,TYPE(3),EPNAME(DFHCSVC)
   SVCPARM 215,REPLACE,TYPE(6),EPNAME(DFHHPSVC) [Only required for HPO]
   SVCPARM 255,REPLACE,TYPE(3),EPNAME(newname) [New CICS SVC version]
   ```

   The EPNAME parameter for the new CICS SVC specifies the module name, not the CSECT name, for the new CICS SVC module.
All the SVCPARM statements apply to the same IEASVCxx member of the SYS1.PARMLIB library.

3. Perform another IPL of MVS to enable all the SVC versions specified in the SVCPARM statements. After you perform another IPL of MVS, you can use both versions of the CICS SVC, provided that both regions do not use MRO concurrently. If both systems use MRO, only the new, latest version of the SVC and the latest DFHIRP module are used by both regions.

4. In your production system, specify the number of the current CICS SVC in the CICSSVC system initialization parameter. Similarly, in the test system, specify the number of the new CICS SVC version.

### MRO between different CICS releases with a changed SVC number

If a CICS TS 4.2 region, and other CICS regions from earlier releases, in the same MVS image use MRO, all the regions must use the CICS TS 4.2 SVC module.

If, when you install the CICS TS 4.2 SVC in the LPA, you give the SVC a number different from the number defined to the earlier CICS regions, you must respecify the SVC number. On each CICS region from an earlier release that will use the CICS TS 4.2 SVC, specify the new SVC number on the CICSSVC system initialization parameter.
Chapter 18. Defining EYU9XENF as a TSO/E authorized command

Define the EYU9XENF command during set up to streamline problem diagnosis later, if required.

About this task

Defining EYU9XENF as a TSO/E authorized command will allow you to use the Environment Services System Services (ESSS) information display utility, should you be requested to do so by customer support when diagnosing problems with MVS systems.

For more detailed information about the ESSS information display utility, see Using the ESSS Information Display Utility (EYU9XENF).

Procedure

1. Add EYU9XENF to the 'AUTHCMD NAMES' section of the IKJTSOxx SYS1.PARMLIB member used by the MVS image.
2. Issue from TSO a 'PARMLIB UPDATE(xx)' command to implement the changes made to the IKJTSOxx member.
3. Ensure that CPSM320.SEYUAUTH is in the TSO users STEPLIB concatenation.

Results

EYU9XENF is now an authorized TSO/E command, and will be available for use should it be necessary in later problem diagnosis.
Chapter 19. Selecting the high-performance option

The high-performance option (HPO) is for users whose top priority is to optimize terminal response times and maximize transaction throughput. HPO improves performance by reducing the transaction path length; that is, the number of instructions required to service each request.

Use of HPO potentially allows CICS application programs to bypass all MVS integrity controls. If you decide to use HPO, ensure that the application programs used on your CICS system meet your own installation’s integrity requirements. The code to support the SNA authorized path feature of HPO, which is the improved path through SNA, is in CICS.

Defining DFHHPsvc to MVS

Define the DFHHPsvc module to MVS as a Type 6 SVC; the default HPO SVC number defined in the DFHSIT module is 215.

To change the default Type 6 SVC number:

1. Define the new number to MVS. See Chapter 17, “Installing the CICS SVCs,” on page 125.
2. Define the new number to CICS by using the SRBSVC system initialization parameter.

If you are not using HPO, do not load the DFHHPsvc module into the MVS nucleus. You choose to use HPO explicitly by coding HPO=YES in the system initialization table.

Loading module DFHHPsvc

Before you can use HPO, ensure that the HPO SVC module is included in the MVS nucleus.

Use one of the following methods:

• Copy the DFHHPsvc module into SYS1.NUCLEUS, renaming it to IGC215 or the appropriate name if you are not using the default, and specify it on an INCLUDE statement in the NUCLStxx member of the SYS1.PARMLIB library. You must also specify the name of the NUCLStxx member on the NUCLSt statement of the LOADxx member of the SYS1.PARMLIB library. The NUCLStxx method provides you with greater flexibility in customizing the MVS nucleus than the NMLDEF method described in the second method.

For further information about coding a NUCLStxx member and about a comparison with the NMLDEF macro, see the z/OS MVS Initialization and Tuning Guide.

• Copy the DFHHPsvc module into SYS1.NUCLEUS and specify it in a nucleus module list (NML) for CICS, created using the NMLDEF macro shown in the sample job. This NML selects the CICS members in SYS1.NUCLEUS that are to be loaded into the MVS nucleus, and eliminates the requirement for the MVS nucleus to be re-link-edited for the DFHHPsvc module or any other module in the MVS nucleus.
For information about coding an NMLDEF macro, see z/OS MVS Programming: Authorized Assembler Services Reference Vol 3. The sample job stream loads the CICS Type 6 SVC into the MVS nucleus:

```
//LOADSVC JOB 'accounting info',MSGCLASS=A,CLASS=A
//NMLDEF EXEC ASMHCL
//C.SYSIN DD *
IEANcnnn NMLDEF NUCL=DFHHPsvc
//L.SYSLMOD DD DSN=SYS1.NUCLEUS,UNIT=3380,DISP=OLD
//L.SYSIN DD *
   NAME IEANcnnn
/*
```

`nnn` is the number of the CICS NML, in the range 001 through 256. Choose the value of `nnn` to be unique in your MVS nucleus.

**Removing existing DFHHPsvc modules from the MVS nucleus**

If you have a version of the DFHHPsvc module from an earlier release of CICS already installed in your MVS nucleus, you do not have to replace it with the latest version. Versions of the DFHHPsvc module from earlier releases of CICS are compatible with the current release. The version of the DFHHPsvc module from the current release of CICS is compatible with earlier releases of CICS.

However, you can remove a link-edited version of the DFHHPsvc module from the MVS nucleus by running a link-edit job to replace the existing version of the nucleus with one that does not contain the module to be removed, in one of the following ways:

- If the existing nucleus-resident DFHHPsvc module is known to SMP/E, use the SMP/E UCLIN statement to remove the module entry.
- You must link-edit the nucleus module, IEANUc0x, with the scatter (SCTR) attribute. If you do not do this, MVS enters a non-restartable wait state at system initialization.
Chapter 20. Defining CICS regions as applications to SNA

To use SNA LUs with CICS, ensure that your CICS regions are defined to SNA before you attempt to run them.

To define your CICS regions to SNA as SNA application programs:

1. Define SNA application program minor nodes for your CICS regions, by specifying APPL definition statements in a member of the SYS1.VTAMLST library or your own user.VTAMLST library.
2. Issue a VARY ACT command to activate the APPL definitions and enable the CICS regions to connect to SNA.
3. Ensure that you have properly defined your SNA LUs for connection to CICS. You must do so if you intend using CICS autoinstall. For those LUs for which you want to use autoinstall, code LOGON mode table entries that match the model TYPETERM and TERMINAL definitions that CICS uses. You can either code your own autoinstall models, or use the CICS-supplied model definitions that are generated for you when you initialize the CICS system definition data set.

For further information about defining SNA resources, see the z/OS Communications Server: SNA Network Implementation and z/OS Communications Server: SNA Resource Definition Reference manuals.

The following topics provide more detailed information on defining your CICS regions to SNA.

Defining specific APPL definitions and APPL parameters to SNA

To define a CICS region to SNA, specify the minor node name to be used for the CICS region on the SNA APPL definition statement. Include specific parameters on the SNA APPL statement.

Defining specific CICS APPL statements to SNA

For example, you might use the following definition for the CICS region to be identified as CICSHTH1:

```
**********************************************************************
* Specific APPL definition for CICS region CICSHTH1
**********************************************************************
CICSHTH1 APPL AUTH=(ACQ,VPACE,PASS),VPACING=0,EAS=5000,PARSESS=YES X
SONSCIP=YES,LUAPFX=XX
**********************************************************************
```

- Code CICSHTH1 on the CICS system initialization parameter APPLID to define the SNA application identifier to CICS.
- See “Naming conventions” on page 234 for information about the naming convention that is used for the CICSHTH1 applid.

SNA APPL parameters for CICS regions

ACBNAME=acbname

 Specifies the minor node name (acbname) that is assigned to this application.
This name must be unique in the domain. If you do not specify this parameter, the name of the SNA APPL statement is taken.

**AUTH=(ACQ,VPACE[,PASS])**

Allows CICS to acquire LUTYPE 6 sessions. VPACE allows pacing of the intersystem flows. Specify PASS if you intend to use the `EXEC CICS ISSUE PASS` command to pass existing terminal sessions to other SNA applications.

**EAS=number**

Specifies the number of network-addressable units. The number must include the total number of parallel sessions for this CICS system.

**HAVAIL=YES**

Indicates that the application supports XRF sessions and can initiate XRF sessions.

**LOGMODE=name**

(For CICS-to-CICS APPC systems.) Defines the name of the MODE table that contains the LU6.2 MODEENT for the secondary sessions.

**LUAPFX=string**

Specifies the prefix characters of the LU alias to be assigned when a dynamically generated cross-network CDRSC with `NQNAME=NQNAME` is created for a session with CICS. SNA concatenates the characters specified with the next sequential number available to form an SNA-generated LUALIAS name for the cross-network dynamic CDRSC.

**string**

Indicates the two characters to be used as the prefix for all dynamically generated LUALIAS names for dynamic cross-network CDRSCs in session with the CICS region defined by the APPL statement. Take into account the SNA naming conventions when choosing this prefix. For CICS information about specifying the LU alias string, see “Choosing an LUAPFX value” on page 138.

SNA deletes a dynamically generated LU alias after a terminal session is closed, or the last session of an APPC parallel sessions connection is closed, and the CDRSTI-specified timeout interval has expired. The permitted range of timeout values is 1 second to 7 days, but generally the default of 8 minutes is acceptable in most situations. The CDRSTI timer does not start until no more sessions that involve the resource represented by a CDRSC remain.

For more information about CICS support for the SNA dynamic LU alias facility, see “SNA LU alias facility” on page 136.

**PARSESS=YES**

Specifies LUTYPE 6 parallel session support.

**PERSIST=MULTI**

Indicates that the application supports Multi Node Persistent Sessions. For further information, see the z/OS Communications Server: SNA Network Implementation.

**SONSCIP=YES**

Specifies session outage notification (SON) support. SON enables CICS, in certain cases, to recover a session after session failure without operator intervention.
VPACING=number
Specifies the maximum number of normal-flow requests that another logical unit can send on an intersystem session before waiting to receive a pacing response. Start with a value of 5.

SNA version and release level indicator

The terminal control modules in CICS are assembled against z/OS Communication Server.

You can use any release of z/OS Communication Server. For details of the minimum level of products that you can use with the current release, see http://www.ibm.com/software/htp/cics/tserversysreqs/

CICS can communicate with different levels of z/OS Communication Server. It can find out which level you are using and the level of function that is available. So you can upgrade CICS and z/OS Communication Server at different times. CICS finds out whether extra function is available when a new version of z/OS Communication Server is installed, and produces a message if the function is not being exploited fully.

Message DFHZC3473 on opening the z/OS Communications Server ACB

If the master terminal operator opens the z/OS Communications Server ACB for the first time, using the z/OS Communications Server command CEMT SET VTAM OPEN, but CICS is not using all available z/OS Communications Server function, message DFHZC3473 is sent to the transient data destination called CSNE.

The same message is sent there if the ACB is opened automatically during initialization, rather than by CEMT.

Defining cross-domain services when using SNA

If you want to use SNA services to access a CICS region on another MVS image, you must ensure that the required cross-domain services are defined to the SNAs involved.

For example, to be able to use an SNA APPC connection between a CICS region (applid CICSHTH1) on MVS image MVSH and a CICS region (applid CICSHAJ1) on MVS image MVSJ:

1. Define the cross-domain services (CDRSC) for accessing CICSHAJ1 in a member of the SYS1.VTAMLIST library, or your own user.VTAMLIST library, for MVSH.
2. Issue a VARY ACT command on MVSH to activate the CDRSC definition for accessing CICSHAJ1.
3. Define the cross-domain services (CDRSC) for accessing CICSHTH1 in a member of the SYS1.VTAMLIST library, or your own user.VTAMLIST library, for MVSJ.
4. Issue a VARY ACT command on MVSJ to activate the CDRSC definition for accessing CICSHTH1.

Here is an example:
1. Create the following CDRSC definition in a member of the VTAMLST library on MVSH:

```
CDIDHAJ1 VBUILD TYPE=CDRSC
******************************************************************************
* CDRSC for access to applid CICSHAJ1 on MVSH
******************************************************************************
CICSHAJ1 CDRSC CDRM=IYAMCDRM MVSH
```

2. Issue the following command on MVSH to activate the cross-domain services to CICSHAJ1 on MVSH:

```
/V NET,ACT,ID=CDIDHAJ1
```

3. Create the following CDRSC definition in a member of the VTAMLST library on MVSJ:

```
CDIDHTH1 VBUILD TYPE=CDRSC
******************************************************************************
* CDRSC for access to applid CICSHTH1 on MVSJ
******************************************************************************
CICSHTH1 CDRSC CDRM=IYALCDRM MVSJ
```

4. Issue the following command on MVSJ to activate the cross-domain services to CICSHTH1 on MVSH:

```
/V NET,ACT,ID=CDIDHTH1
```

---

**SNA LU alias facility**

Specifying a prefix string on the LUAPFX parameter of the CICS APPL statement indicates that SNA is to generate LUALIAS names for dynamic cross-network CDRSCs in session with the CICS region defined by the APPL statement.

In this way, CICS can use an LU alias for autoinstalled terminals and workstations and ensure unique names in a CICSpex comprising terminal-owning and application-owning regions. SNA generates the LUALIAS names dynamically.

CICS supports both the predefined and dynamic forms of the SNA alias function only where shown in the following table:

<table>
<thead>
<tr>
<th></th>
<th>CICS-to-CICS APPC connections (APPL definitions)</th>
<th>APPC devices (LU definitions)</th>
<th>Terminals</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Synclevel 1</td>
<td>Synclevel 1</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Predefined alias only</td>
<td>Predefined alias</td>
<td>Dynamic alias</td>
</tr>
<tr>
<td></td>
<td>Predefined alias</td>
<td>Predefined alias</td>
<td>Dynamic alias</td>
</tr>
<tr>
<td></td>
<td>Synclevel 2</td>
<td>Synclevel 2</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Predefined alias</td>
<td>Predefined alias</td>
<td>Dynamic alias</td>
</tr>
<tr>
<td></td>
<td>Predefined alias</td>
<td>Predefined alias</td>
<td>Dynamic alias</td>
</tr>
</tbody>
</table>

- The LU alias is used as the NETNAME for terminals and workstations that log on to a CICS region.
- CICS does not support LU alias for synclevel 2 connections (LUTYPE 6.1 and 6.2), ignores any LU alias for these LU types, and continues to use the network name defined in the SNA APPL statement.

**Dynamic LU alias support**

CICS supports the use of a dynamic LU alias for CICS terminals and workstations that are autoinstalled only.
You enable dynamic LU alias support by specifying LUAPFX on the SNA APPL definition for any CICS terminal-owning region that can receive duplicate netnames. Also, when starting SNA, specify the following options on the SNA START command:

- NQNMODE=NQNAME.
- CDRSCTI=n to specify the length of time that the session name lasts after the last session has logged off.

1. Make the time specified on CDRSCTI long enough to cover any time interval specified on CICS START commands that are issued against a terminal resource that uses a dynamic LU alias. This requirement applies to STARTS with a delay that run on both a TOR or AOR. If the CDRSCTI time is not long enough, a resource can log off and then log back on again with a different network name and thus a different TERMID.

2. Also, the CDRSCTI time interval must be greater than that specified on the CICS AILDELAY system initialization parameter. However, if your applications have no dependency on the network name or TERMID, you can disregard CDRSCTI or set it to 1.

SNA generates a dynamic LU alias only if LUAPFX is specified on the CICS APPL statement and the resource comes from another network. That is, it has a different network name from the network to which the CICS region belongs.

**When to use dynamic LU alias**

Use dynamic LU alias when you are using autoinstalled cross-network terminals or duplicate network names. For example, in the following circumstances:

- Your cross-network terminals and workstations that log on to CICS are mainly autoinstalled.

  The CICS region receives logons from terminals and synlevel 1 connections (both parallel and single sessions) and those logons (or binds) are from cross-network resources that might have duplicate network names.

  However, be aware that synlevel 1 connections can become synlevel 2 in the future. For example, if you have a connection between a TXSeries and CICS TS, the connection is synlevel 1; but, if you change to using TXSeries with a PPC gateway, synlevel 2 is used. CICS does not support dynamic LU aliases for synlevel 2 APPC connections.

- An AOR receives shipped terminals or connections with duplicate network names from different TORs.

**Predefined LU alias support**

CICS supports the use of a predefined LU alias for CICS terminals and workstations that are explicitly defined and those that are autoinstalled.

You can also use a predefined LU alias for CICS regions that communicate using CICS intersystem communication. You enable predefined alias support by specifying LUALIAS=alias on any cross-domain resource (CDRSC) that requires a specific alias. A terminal or APPC synlevel 1 workstation that is defined to CICS on an explicit resource definition (that is, it is not autoinstalled) and is in a different network, requires a CDRSC definition with a specific alias on the LUALIAS parameter. This alias overrides the dynamic generation of an alias where LUAPFX is specified on the CICS region's APPL statement. To ensure that CICS can match the SNA LU alias with the installed terminal definition, the LUALIAS value must match the NETNAME specified on the CICS TERMINAL resource definition.
An LUALIAS option in the CDRSC is effective if the resource comes from another SNA domain. That is, it is not used if the resource comes from the same MVS image, but is used if the resource comes from another MVS image regardless of whether it is from the same sysplex, another sysplex in the same network, or from a different sysplex. If an LU alias is predefined, a dynamic LU alias is not generated.

**When to use predefined LU alias**

Use predefined LU alias where you do not have dynamic LU alias enabled or where you want to override dynamic LU aliases.

- Dynamic LU alias is in operation in a CICS region and your terminals or workstations are explicitly defined on CICS terminal resource definitions with explicit terminal identifiers. In this case, you use predefined LU aliases to override the generation of dynamic LU aliases, which CICS fails to match with any installed resource definition.
- Dynamic LU alias is not in operation in a CICS region, to avoid any conflict with duplicate network names.

**Cross-network resources that require predefined LU alias**

If the following SNA cross-network resources are to be connected to a CICS region that is defined to SNA, with LUAPFX specified on its APPL statement, they must each have a CDRSC LUALIAS=netname entry.

- CICS RDO-defined terminals connected from another network, including SNA LUs that cannot be autoinstalled:
  - Pipeline terminals
  - Automatic teller machines (3614 and 3624)
  - Devices for which CICS does not receive logons, such as printers.
- LUTYPE 6.2 syncllevel 1 connections that might be bound using limited resources.

  Like other LUTYPE 6.2 connections, limited resource connections release their dynamic LU alias when CDRSCTI ends after the last session is unbound. However, these sessions are unbound whenever they are not in use, and, if they rebind after the dynamic LU alias is released, CICS installs another connection, potentially with a different LU alias.

- CICS RDO-defined work stations (LUTYPE 6.2 syncllevel 1 connections) connected from another network.
- Resources that require an LU name in a RACF profile definition or resources for which prior knowledge of the LU name is required.

**Choosing an LUAPFX value**

When you choose an LUAPFX value, consider the scope of this parameter in the CICSplox, and also consider its scope in the sysplex in which your CICS regions operate.

A predefined LUALIAS name is supplied to CICS for cross-domain and cross-network resources. All the CICS regions in an MVS image share the same SNA and are in the same domain. A CICS region in a different MVS image uses a different SNA and is thus in a different domain. Resources coming from one SNA to another, but which share the name NETID, are cross-domain resources.

A dynamic LUALIAS name is supplied to CICS only for cross-network resources. A resource is a cross-network resource if it has a different network id. SNA ensures
that all the dynamic LUALIAS names assigned in one MVS image are unique. However, CICS requires network names to be unique across MVS images so that there are no network name clashes in AORs.

It is important that all CICS regions across all connected networks use unique APPLIDs. This requirement is true whether or not dynamic LUALIASs are used; it is more important with dynamic LUALIASs.

To ensure that all SNA resources in a CICSpex have unique network names, use the LUAPFX prefix:

- Specify LUAPFX on terminal-owning regions (TORs) only.
- Use the same LUAPFX value for all the CICS TORs in the same MVS image (that is, for all the TORs that are connected to the same SNA), but ensure the LUAPFX is different in each MVS image in the sysplex.

  If the LUAPFX values are not the same throughout an MVS image, you risk one resource having two different network names in the CICS regions in that image.

  If the LUAPFX values are not unique to each MVS image in the sysplex, you risk two resources attempting to install in a TOR with the same dynamic LUALIAS, or having two resources with the same network name in an AOR.

  To ensure the uniqueness of the LU prefix in each MVS, use model APPL definitions, and in these use an MVS system symbol (&SYSCLONE) as suggested in the z/OS Communications Server: SNA Resource Definition Reference. If you use SNA generic resources and your CICS TORs are spread across different MVS images, be aware that if a resource with a dynamically allocated LU alias logs off and then logs on again, and SNA switches the resource to an SNA in another MVS image, a different LUALIAS is assigned because of the different LUAPFX value.

- Avoid using an LUAPFX value that corresponds to the first two characters of CICS RDO-defined terminal names or connection names installed in the CICSpex.

Using LU aliases

Factors to consider when you are planning to use SNA LU aliases with CDRSC resources.

Predictable TERMIDs

If your autoinstalled terminal resources must have a predictable and reproducible TERMID for such things as temporary storage queue names and START requests, you can modify your autoinstall user-replaceable module (URM) to select a reproducible TERMID from the network qualified name, NQNAME, supplied in the CINIT or the BIND.

The sample autoinstall URM contains an example of such code (commented-out), which extracts the network qualified name from the CINIT and BIND. The example illustrates how to create a TERMID from the last nonblank character of the NETID and the last 3 nonblank characters of the real network name (NETNAME).

MVS workload management

If your MVS workload policies specify LU name classifications, remove the LU name for any cross-network resources that are autoinstalled by CICS.

Recovery and persistent sessions support

Resources for which CICS uses any SNA LU alias, predefined or dynamic, and which come from a different network are not cataloged by a CICS region that
is not using a persistent session. Therefore, the terminal sessions for the resources cannot be recovered during an emergency restart.

Resources for which CICS uses any SNA LU alias, predefined or dynamic, and which come from a different network are catalogued if CICS is using persistent sessions, so CICS can restore resource terminal session information from the CICS catalog pending recovery of the session from SNA. However, if the resource does not persist, the resource is deleted during an emergency restart.

This action is necessary because SNA might have been restarted, causing dynamic LU aliases to be reissued to different sessions. CICS cannot recognize if SNA has been restarted and CICS cannot differentiate between a predefined and a dynamic LU alias.

**CLSDST PASS**

If you ISSUE PASS (CLSDST PASS) for a terminal that uses a dynamic LU alias to pass control to another CICS region in another MVS image, the resource is known by a different network name in the receiving CICS. This condition is true if the APPL statement of only one or both the CICS regions specify LUAPFX to activate dynamic LU alias.

**Generic resources**

If a number of generic resource TORs are in two different MVS images, a terminal or work station that logs on to one image is assigned a different network name if it logs off and logs on to a TOR in another image.

**FEPI**

FEPI front end systems are not supported by SNA LU alias.

---

**Defining SNA requirements for CICSPlex SM**

You require ACF/SNA definitions to identify each CMAS used by CICSPlex SM. You must create z/OS Communications Server application definitions and, optionally, cross-domain resource management definitions. There are a number of steps to perform to create z/OS Communications Server application definitions and cross-domain resource management definitions for a CMAS.

1. **Before you perform these steps, specify the sizes of the SNA buffers.**
   - For the SNA-to-NCP connection, specify:
     - `MAXDATA ≥ 4096`
   - For the NCP-to-SNA connection, specify:
     - `MAXBFRU * IOBUF ≥ 4096`
     - `MAXBFRU * UNITSZ ≥ 4096`
   - For the NCP-to-NCP connection, specify:
     - `TRANSFR * BFRS = RUSIZE ≥ 4096`

Specify the size as 36 bytes smaller than the smallest MAXDATA value in any NCP through which the link might pass. The 36 bytes allow for the headers that are required for SNA. For more information about the requirements for the SNA-to-NCP connection, refer to the SNA Resource Definition Reference manual for your level of SNA. For more information about the requirements for the NCP-to-SNA and the NCP-to-NCP connections, refer to the NCP Resource Definition Reference manual for your level of NCP.

If you require help determining or modifying your z/OS Communications Server buffer specifications, discuss with the z/OS Communications Server system programmer at your enterprise.
2. Depending on your SNA conventions, you might have to modify the procedures that are described in this section:
   - Change references to the SYS1.VTAMLST library if you do not keep your definitions in the default z/OS Communications Server list.
   - Modify the APPL and CDRSC statements if you want to add these statements to existing members, rather than create new ones.
3. Use the sample SNA APPL statements in the SEYUDEF library members, EYUDVTIA and EYUDVTIB. You can modify these samples to fit your requirements.

**Step 1: Creating a z/OS Communications Server application definition for a CMAS**

To establish a z/OS Communications Server for SNA application definition for a CMAS, either create a new member (*major node*) or access an existing member in the SYS1.VTAMLST library.

Add the following APPL statement to the member:

```
VBUILD TYPE=APPL
name APPL ACBNAME=acbname, AUTH=(VPACE, ACQ, SPO, PASS),
     EAS=10, PARESS=YES, SONSCIP=YES, APPC=NO,
     VPACING=number
```

where:

- **name** A 1-character to 8-character unique name.
- **acbname** The node name of this CMAS. This name must be unique in the domain. If you omit this parameter, the name of the SNA APPL statement is used.
- **vpacing** The maximum number of normal-flow requests that another logical unit can send on an intersystem session before waiting to receive a pacing response. Start with a value of five.

For example, to create a z/OS Communications Server application definition for the CMAS on SYSA, you might create a member APCMAS1 in the SYS1.VTAMLST library that contains the APPL statement:

```
VBUILD TYPE=APPL
CMS1 APPL ACBNAME=CMS1, AUTH=(VPACE, ACQ, SPO, PASS),
     EAS=10, PARESS=YES, SONSCIP=YES, APPC=NO,
     VPACING=5
```

You require the same type of definition for each CMAS you use.

**Step 2: Defining cross-domain resources for a CMAS**

Define cross-domain resources (CDRSCs) when a CMAS that is to communicate with another CMAS cannot take advantage of adjacent CDRSCs or you want to minimize the effort involved in using adjacent CDRSCs.

To establish a CDRSC definition, you must either create a new member or access an existing member in the SYS1.VTAMLST library. In the new or existing member, specify the following CDRSC statement for each CMAS that you want to communicate with:

```
VBUILD TYPE=CDRSC
name CDRSC CDRM=cdrm
```
where:

**name**  The name you assigned to a CMAS in Step 1.

**cdrm**  The name of the MVS image previously identified as the cross-domain resource manager (CDRM).

For example, to allow the CMAS on SYSA to communicate with the CMASs on SYSB and SYSC, you might create the member CDRCMS1 in the SYS1.VTAMLST library, that contains the CDRSC statements:

```
VBUILD TYPE=CDRSC
CMS2  CDRSC CDRM=VTAMB
CMS3  CDRSC CDRM=VTAMC
```

where VTAMB and VTAMC are the cross-domain resource manager names that are assigned to SYSB and SYSC respectively.

You also require the same types of definitions for the CMASs on SYSB and SYSC. That is, for the CMAS on SYSB, you might create a member CDRCMS2, that contains the CDRSC statements:

```
VBUILD TYPE=CDRSC
CMS1  CDRSC CDRM=VTAMA
CMS3  CDRSC CDRM=VTAMC
```

**Note:** VTAM is now z/OS Communications Server.

### Step 3: Updating the configuration list for a CMAS

If, in Step 1 or 2, you created new members in the SYS1.VTAMLST library, you must update the SNA configuration list for each MVS image. When SNA starts, it automatically activates the new members.

To make these updates, add the new member names to the end of the configuration list in the appropriate ATCCONxx member of the SYS1.VTAMLST library. To find the suffix of the ATCCONxx member:

- Get the suffix of the COMMDNDxx member from the CMD= parameter in the IEASYSxx member in SYS1.PARMLIB.
- Get the suffix of the ATCSTRRxx member from the LIST= parameter on the command that is used to start SNA in the COMMDNDxx member in SYS1.PARMLIB. If you do not start SNA from the COMMDNDxx member, get the suffix from the LIST= parameter of the command that you use to start SNA.
- Get the suffix of the ATCCONxx member from the CONFIG= parameter in the ATCSTRRxx member in SYS1.VTAMLST.

As an illustration, the examples shown in Steps 1 and 2 assume that the members APCMAS1 and CDRCMS1 exist. To add these members to the end of the configuration list in ATCCONxx, specify:

```
APCMAS1,  x
CDRCMS1
```

If you added the CMAS and cross-domain definitions to existing members, ATCCONxx already contains these member names.

### Step 4: Activating the major nodes for a CMAS

You can activate the definitions that are created in Steps 1 and 2 either by restarting the z/OS Communications Server for each system or by manually activating the definitions.
To manually activate a major node, you can issue the following commands, where name identifies a major node that was created or modified in Steps 1 and 2:

- Deactivate the major node if it is currently active by issuing this command:
  
  \texttt{VARY NET,INACT,ID=\textit{name}}

- Activate or reactivate the major node by issuing this command:
  
  \texttt{VARY NET,ACT,ID=\textit{name}}

To ensure that the major node has been activated, issue this command:

\texttt{D NET,ID=\textit{name}}

For example, to activate the member APCMAS1 and then ensure that it has been activated, issue these commands:

\begin{verbatim}
VARY NET,INACT,ID=APCMAS1
VARY NET,ACT,ID=APCMAS1
D NET,ID=APCMAS1
\end{verbatim}

Perform the preceding steps for each CMAS you are using.
Chapter 21. Installing CICS modules in the MVS link pack area

How to define the CICS LPA library to your MVS, and how to install and use the CICS modules.

Preparing to install CICS modules in the MVS link pack area

Before you install modules in the MVS link pack area, you need to understand the benefits, the scope, service level implications, and the modules required in the MVS link pack area.

- “Benefits of using the MVS link pack area”
- “What is meant by the MVS link pack area?”
- “Which modules must be installed in the MVS link pack area?” on page 146
- “Which modules can be in the MVS link pack area?” on page 148
- “Mismatch of service levels” on page 146

Benefits of using the MVS link pack area

There are several benefits of placing code in the MVS link pack area.

- You protect the code from possible corruption by user applications. Because the MVS link pack area is in protected storage, it is virtually impossible to modify the contents of these programs.
- You can improve the performance, and reduce the demand for real storage, if you use the MVS link pack area for program modules. If more than one copy of the same release of CICS is running in multiple address spaces of the same processor, each address space requires access to the CICS nucleus modules. These modules can either be loaded into each of the address spaces or shared in the MVS link pack area. If they are shared in the MVS link pack area, the working set and, therefore, the demand for real storage (paging) can be reduced.
- You can decrease the storage requirement in the private area by careful allocation of the unused storage in the MVS link pack area created by rounding to the next segment.

If you know the amount of space that you require in the LPA, and from that the total size of the MVS common area above the CICS private storage, you can determine the 1 MB segment on which the boundary between the two areas lies. This calculation might indicate some space in the MVS common area is left unused, which you can use for CICS LPA-eligible modules. By moving more modules from CICS private storage to the LPA, you decrease the space that is required for modules in CICS private storage.

What is meant by the MVS link pack area?

The MVS link pack area comprises several areas, both above and below 16 MB. In these topics, the term MVS link pack area refers to the pageable link pack areas above and below 16 MB where modules that are used from the MVS link pack area are normally installed.

The MVS link pack area has both pageable and fixed parts. Although you can install CICS modules into the fixed parts, use the pageable areas for performance reasons.
The term LPA specifically refers to the MVS link pack area below 16 MB, and the term ELP specifically refers to the area above 16 MB. A module that is link-edited with the RMODE(ANY) attribute is loaded into the ELP.

If you install a module into the LPA or ELP, that module will not be retrieved from the MVS link pack area until you re-IPL your MVS with CLPA specified. To use the new module and avoid an IPL, you can use the MVS dynamic LPA in one of the following ways:

- With the SETPROG LPA command
- With an LPA statement in a PROGxx member of PARMLIB, which specifies the SET PROG=xx command

Note that apart for DFH99SVC, dynamic LPA should not be used with the 8 CICS modules that must be installed in the MVS link pack area.

Mismatch of service levels

If you use modules with mismatching service levels, you can cause unpredictable results. To be safe, do not use the LPA version of a module if it differs from the version in the CICS libraries that you are using.

Load modules used from the LPA might be at a lower service level than the rest of your CICS region in any of these circumstances:

- You are running CICS from libraries that belong to a target zone currently at a higher service level than the LPA zone.
- You have applied service to the LPA zone since the last IPL of MVS.
- You are not using the MLPA to replace service-updated load modules, but have applied service to the LPA zone since the last IPL of MVS for which CLPA (create link pack area) was specified.

Thus, if you have applied service to a load module in your CICS libraries, you must also apply the service to the LPA version of the module, if one exists, so that the MVS link pack area always contains tested load modules.

Use the SMP/E RESTORE function to remove the USERMOD before the LPA zone is updated or copied. Then apply the USERMOD again.

If you have used a copy of the CICS-supplied USERMODs to install modules into the MVS link pack area, and the original USERMOD is serviced, you can reflect the changes in your version of the USERMOD.

Although it is possible for CICS PTFs to make changes to the CICS modules which must reside in the MVS link pack area, in reality it is a fairly rare event. The modules have to be downwardly compatible with lower releases, and applies to any code changes made to them by PTFs, as well as to the code at base level.

Which modules must be installed in the MVS link pack area?

The CICS modules that must be in the MVS link pack area are listed.

Table 9. CICS modules required in the MVS link pack area

<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
<th>When required in LPA</th>
<th>See notes after this table</th>

1. The module can be used only from the MVS link pack area and you must install it there before CICS can be started.
2. You must always install the latest service level of the modules DFHCSVC, DFHIRP (if required), and DFHSSEN.
3. The version of this module that is supplied with the current release is downward-compatible with earlier releases of CICS. It works correctly with CICS regions running earlier releases. Therefore, if you are running different releases of CICS on the same MVS image, use the latest version of this module.
4. You must define the DFHCSVC module to MVS as a Type 3 SVC. The default SVC number is 216. If you use a nondefault SVC number, you must define it to CICS on the CICSSVC system initialization parameter.

**Moving DFHCSVC into the MVS link pack area:**

Do not use the link editor to install the CICS SVC module into a library in the MVS link pack area. To copy or move the module from the hlq.SDFHAUTH library to the nominated library in the MVS link pack area, use either a suitable copy utility program, such as IEBCOPY, or an SMP/E USERMOD with ++MOVE statements.

5. If you are running earlier releases of CICS with the latest version, ensure that the latest version of the DFHDSPEX module is installed in the MVS link pack area. The DFHDSPEX module must be in the MVS link pack area for integrity reasons, but the postexit routine, DFHDSAUT, can be either in the MVS link pack area or in the CICS address space. This choice enables you to use different levels of the DFHDSAUT module in different CICS regions running in the same MVS image, because the DFHDSAUT module might not be compatible between CICS versions.

6. To communicate by MRO, all CICS regions in the same MVS image must use the latest level of the modules DFHCSVC, DFHIRP, and DFHSSEN in the MVS link pack area.
If a region detects that DFHIRP is at a lower level when it attempts to open interregion communication, it issues message DFHIR3799 and interregion communication fails to open.

7. To use console message-handling, these modules must be either in the MVS link pack area or in an APF-authorized library in the MVS linklist.

If an LPA module is only ever referred to by name, then refreshing it in the LPA is valid. That is, if each time it is used, a new reference to it is obtained by using an MVS LOAD macro. However, most references to LPA modules do not work this way. The address of an LPA module could be saved into a control block after the initial LOAD of the module. The implication is that this address remains unchanged without a CLPA IPL. If dynamic LPA is used to pick up a change to an LPA module, then the address saved in the control block is no longer valid. Of the 8 CICS modules which must be installed in the LPA, only DFH99SVC is eligible to be refreshed in this way.

**Which modules can be in the MVS link pack area?**

A number of CICS modules and user application program modules are available from the MVS link pack area.

**CICS modules**

These CICS modules can be installed in the MVS link pack area:

- Modules that can reside above 16 MB (for example, the CICS message table, DFHMGT). You can also install these modules in the extended link pack area (ELPA).
- Modules that are optionally installed in the MVS link pack area; that is, a module that is not required in the MVS link pack area can be used only by the release of CICS to which it relates.
- Modules that are eligible to be used from the MVS link pack area are listed in the CICS-supplied USERMODs. The USERMOD member for base CICS modules is DFH$UMOD, which is in the hlq.SDFHSAMP library. Details of these modules are in Table 27 on page 419 to help you select the CICS modules that you want to install in the MVS link pack area.

**User application programs**

You can use user application programs from the MVS link pack area if they are read-only and meet one of these criteria:

- They are written in COBOL, do not overwrite WORKING STORAGE, and are compiled using VS COBOL II, or a later version. The CICS translator generates a CBL statement with the required compiler options.
- They are written in PL/I (so they do not overwrite STATIC storage) and are compiled using one of the versions of PL/I for z/OS listed in High-level language support. The CICS translator inserts the required REENTRANT option into the PROCEDURE statement.
- They are written in C/370, compiled with the RENT option, and link-edited with the RENT option.
- They are written in assembler language, assembled with the RENT option, and link-edited with the RENT and REFR options.
Command-level user application programs compiled using a Language Environment-conforming compiler, or written in assembler language or C/370, can be loaded above 16 MB. For information about installing application programs, see the CICS Application Programming Guide.

A read-only module that can be above 16 MB is also eligible for the ELPA.

**Space requirements for CICS modules in the MVS link pack area**

Allow enough space in the MVS link pack area for you to install those CICS modules that you intend using from there.

To find out how much space you require:

- Review the sizes of the modules that you want to install in the MVS link pack area, as given in Table 27 on page 419.
- Review the module index of a system dump for the CICS region started with the system initialization parameter LPA=NO.
- Calculate the module sizes that are given for each module in the listing of modules that is provided by the IEHLIST utility program.

Remember also to allow space for any of your user application programs that you intend using from the MVS link pack area. The total space required depends on how the operating system packages the modules into the MVS link pack area.

When you have determined the space you require in the MVS link pack area, create a library with enough space and define it to your MVS. See “Defining the CICS LPA library to your MVS” for more information.

**Defining the CICS LPA library to your MVS**

CICS supplies the library hlq.SDFHLPA. This library contains the modules that must be in the LPA. You can also use this library to install other CICS modules or application programs that you want to use from the LPA.

You can give the hlq.SDFHLPA library your own index, but, if you do, you must specify the new index on the LINDEX parameter of the DFHISTAR job.

Add the full name of the hlq.SDFHLPA library to an LPALSTxx member of SYS1.PARMLIB. You must then IPL the system with the CLPA option to ensure that the library contents are loaded into the PLPA. Set the CLPA option by specifying it as an IEASYSxx member of SYS1.PARMLIB or in response to message IEA101A. Include IEASYSxx as the SYSPARM value in the LOADxx member.

RACF-protect the hlq.SDFHLPA library, to prevent unauthorized or accidental modification of this library. For information about protecting the CICS libraries, see the CICS installation requirements for RACF in the RACF Security Guide.

You can install into the hlq.SDFHLPA library the CICS modules to be used from the MVS link pack area. See “Installing CICS modules in the LPA.”

**Installing CICS modules in the LPA**

A procedure is explained for installing modules into the MVS link pack area by using SMP/E.
In the context of the LPA, install means to move or copy a module into a suitable LPA library, by using SMP/E or by using a copying method that re-blocks the copied modules when the target data set has a smaller block size than the data set you are copying from. For example, use the COPYMOD function of the IEBCOPY program.

Do not relink-edit the modules to put them into the LPA library. CICS modules as supplied have the necessary attributes that cause MVS to load them automatically above the line into the ELPA.

To install modules in the CICS LPA library, and to ensure that SMP/E can continue to service them, complete the following steps, which are explained in more detail in the next topics:

1. Select those modules that you want to use from the MVS link pack area and specify them in the SMP/E USERMOD to be used to install the modules in the MVS link pack area. Table 27 on page 419 lists the CICS-supplied modules eligible for the MVS link pack area, and gives descriptions and other information to help you select those CICS modules that you want to use from the MVS link pack area.

To install modules in the MVS link pack area:

a. Use an SMP/E USERMOD that contains ++MOVE statements for only the modules to be installed in the MVS link pack area.

   CICS supplies an SMP/E USERMOD called DFHUMOD in member DFHSUMOD in the hlq.SDFHSAMP library. This USERMOD contains ++MOVE statements for all CICS modules, in the hlq.SDFHAUTH and hlq.SDFHLOAD libraries, that are eligible for the MVS link pack area. The USERMOD also indicates whether each module is LPA- or ELPA-eligible.

   You can choose which of the modules to install in the MVS link pack area by creating your own version of the USERMOD. Include modules in the working set of the installation.

   or

b. Use your own version of a USERMOD. Your version can include ++MOVE statements from both CICS-supplied USERMODs.

   If you intend changing a CICS-supplied USERMOD, to choose modules to install in the MVS link pack area, take a copy of the USERMOD and update the copy only. If you have copied the hlq.SDFHSAMP library, for instance, when changing user-replaceable programs, you already have copies of the CICS-supplied USERMODs. If the original hlq.SDFHSAMP library is serviced, and the USERMOD is modified, you can reflect the changes in your version.

2. Choose which read-only modules to install in the MVS link pack area and edit your copy of the SMP/E USERMOD.

a. Comment out the ++MOVE statements for the modules that you do not want to install in the LPA.

b. Move the remaining ++MOVE statements for the modules that you do want to install in the LPA one column to the left, so that the ++MOVE statements start in column one of the USERMOD module.

c. Add ++MOVE statements for your user application program modules that you want to install in the LPA, with the ++MOVE statements starting in column one of the DFHSUMOD module.
3. Receive the USERMOD into the CICS global zone. SMP/E moves those load modules you have specified from the named CICS target library (hlq.SDFHLOAD or hlq.SDFHAUTH) into the CICS LPA library.

To receive and apply the CICS-supplied sample USERMODs in DFH$UMOD, you can use the associated job DFHLPUMD, which is tailored to your CICS environment and stored in the hlq.XDFHINST library when you run the DFHISTAR job.

4. Apply the USERMOD to the LPA zone. When you apply the USERMOD, you also update the corresponding LMOD entries in the target zone SMPCSI.

5. To enable CICS to use the modules that you have installed in the MVS link pack area, re-IPL your MVS with CLPA specified.

   Also, specify that CICS uses modules from the MVS link pack area. You can also control which modules are used from the MVS link pack area in several ways. See “Controlling the use of modules from the MVS link pack area” for more information.

---

**Controlling the use of modules from the MVS link pack area**

Using customizable options, CICS allows you to control which of the eligible modules are executed from the MVS link pack area.

The methods for controlling the use of modules from the MVS link pack area do not apply to the modules DFHCSCV, DFHDSPEX, and DFHIRP. These modules are used only from the MVS link pack area.

**Modules in the MVS link pack area from hlq.SDFHAUTH**

CICS uses standard MVS load facilities for modules installed in the MVS link pack area from the CICS APF-authorized library, hlq.SDFHAUTH.

That is, such a module is used from the first of the following locations where it is found:

1. STEPLIB concatenation
2. MVS link pack area
3. MVS LNKLST

To use any of the CICS modules installed in the MVS link pack area from the hlq.SDFHAUTH library, you must remove any version of the module from the hlq.SDFHAUTH library or any other library in the STEPLIB concatenation.

You can prevent CICS using modules installed in the MVS link pack area from the hlq.SDFHAUTH library by installing versions of those modules in a library in the STEPLIB concatenation.

CICS then uses the versions of the modules from the STEPLIB concatenation into the CICS address space, rather than any versions that might be in the MVS link pack area.

**Modules in the MVS link pack area from hlq.SDFHLOAD**

CICS system initialization parameters and resource definitions control the use of CICS modules installed in the MVS link pack area from the hlq.SDFHLOAD library.
The hlq.SDFHLOAD library is used for non-nucleus CICS modules, and some CICS nucleus modules. You can also use the library for your own user application programs.

**Using modules from the MVS link pack area**

You must follow these steps to use the CICS modules installed in the MVS link pack area from the hlq.SDFHLOAD library:

- Copy the modules into a CICS LPA library. That is, you do not have to remove them from the hlq.SDFHLOAD library.
- Specify the system initialization parameter LPA=YES. CICS then uses the following search order:
  1. MVS link pack area
  2. DFHRPL DD concatenation
- For a non-nucleus CICS module or user application program, specify USELPACOPY(YES) on the associated PROGRAM resource definition. These modules are identified in the CICS-supplied USERMODs by this statement:
  ```
  /* Not loaded from LPA unless USELPACOPY is set to Y in the CSD */
  ```
  For each CICS-supplied LPA-eligible module that requires USELPACOPY(YES) specified in its associated PROGRAM resource definition, you must create your own resource definition with USELPACOPY(YES) specified, and use it instead of the CICS-supplied resource definition, because you cannot modify the CICS-supplied resource definitions. For example, you can use the DFHCSDUP utility program for these purposes:
  1. Copy the CICS-supplied resource groups that contain the module definitions to new resource groups.
  2. For each module that requires USELPACOPY(YES), change the PROGRAM resource definition in the new resource groups to specify USELPACOPY(YES).
  3. Add your new resource groups to a new group list; that is, at the start of the list.
  4. Append the CICS-supplied group list DFHLIST, or your own equivalent of that group list, to your group list. Alternatively, include DFHLIST on the GRPLIST system initialization parameter as well as your group list.
  5. Remove the CICS-supplied groups that you have copied.

When the program definitions have been changed on the CSD, perform the following steps:

- Reinitialize the CICS catalogs if you have been using modules not in the MVS link pack area, and now want to use those modules from the MVS link pack area
- Specify your new group list (and DFHLIST if your group list does not include the list of resource groups provided in DFHLIST) on the GRPLIST system initialization parameter.

A sample DFHCSDUP job for all CICS LPA-eligible jobs is in “Sample DFHCSDUP job to specify USELPACOPY(YES)” on page 155. In the above example, instead of steps 3 and 4 you can use the CEDA transaction for these tasks:

- Copy your group list to create a new group list.
- Add the new (USELPACOPY(YES)) groups to the new group list in the same place as the original, CICS-supplied, groups.
- CICS uses eligible modules installed in the MVS link pack area, if the following criteria are met:
– You have not specified the name of the module on the CICS system initialization parameter PRVMOD.
– The module has not already been loaded from the DFHRPL concatenation.

• If CICS cannot find an eligible module in the MVS link pack area, it loads the private (non-shared) version into the CICS address space from the DFHRPL concatenation, after issuing the message DFHLD0109I to warn you that the module is not in the MVS link pack area. See page "Handling the module-not-found warning message, DFHLD0109I" on page 155 for more information about this message.

• CICS assumes that the PL/I modules, IBMBPSLA and IBMBPSMA, are installed in the MVS link pack area and issues message DFHLD0109I if it fails to find them there. If you want your PL/I application programs to run with the PL/I shared library, ensure that the modules IBMBPSLA and IBMBPSMA are installed in the MVS link pack area, in the hlq.SDFHLOAD library or in another library in the CICS DFHRPL library concatenation.

• You must place program list tables (PLTs) must be placed in the DFHRPL concatenation. However, before PROGRAM resource definitions for phase one PLTPI programs and PLTSD programs are installed (for example, early in CICS initialization) CICS scans the MVS link pack area for those programs and issues message DFHLD0109I if it cannot find such a program there.

• Similarly, before PROGRAM resource definitions for global and task-related user exit programs are installed (for example, early in CICS initialization) CICS scans the MVS link pack area for those programs, and issues message DFHLD0109I if it cannot find such a program there.

Specifying USELPACOPY(YES)

For every non-nucleus CICS module or user application program that you have moved to the MVS link pack area, that is, have removed from the DFHRPL concatenation, ensure that you have specified USELPACOPY(YES) on the associated PROGRAM resource definition. Otherwise, CICS cannot find the module and might fail to start up successfully. See "Sample DFHCSDUP job to specify USELPACOPY(YES)" on page 155 for a sample job to specify USELPACOPY(YES).

Using modules from DFHRPL

You can prevent CICS from using modules installed in the MVS link pack area from the hlq.SDFHLOAD library by specifying the NO option on the LPA system initialization parameter or by specifying the name of the module on the PRVMOD system initialization parameter.

• Specify NO on the LPA system initialization parameter.
  The NO option prevents CICS from using any modules installed into the MVS link pack area from the hlq.SDFHLOAD library. CICS tries to load the modules from libraries in the DFHRPL concatenation.

  You might use this option when you want to run CICS to test a lot of LPA-eligible modules before installing them in the MVS link pack area. For example, you can add the hlq.SDFHLPA library to the DFHRPL concatenation while testing CICS modules for the MVS link pack area. When you have verified the use of those modules from the MVS link pack area, specify the LPA=YES system initialization parameter and remove the hlq.SDFHLPA library from the DFHRPL concatenation.

• Specify the name of the module on the PRVMOD system initialization parameter.

  PRVMOD=(name|{(name1,name2,...)})
Specifying the module name prevents CICS from using the specified modules from the MVS link pack area for only the run of CICS on which the PRVMOD parameter is specified. You might use the PRVMOD parameter when you want to run CICS to test a new version of an LPA-eligible module before replacing the version already in the MVS link pack area.

Specify the full module name on the PRVMOD parameter, including any suffix; for example, DFHMCP1$. If only one module is named, the parentheses are optional. The PRVMOD parameter can span input lines. However, do not split module names across lines, because CICS system initialization adds a comma at the end of every input line that does not already end with a comma. The only validity check performed on a module name is to ensure that it does not exceed eight characters.

You cannot code the PRVMOD parameter in the DFHSIT module; you specify it in the PARM parameter, in the SYSIN data set, or through the system console.

- For a non-nucleus CICS module or user application program, specify USELPACOPY(NO), the default, on the associated PROGRAM resource definition. These modules are identified in the CICS-supplied USERMODs by the statement:

```
/* Not loaded from LPA unless USELPACOPY is set to Y in the CSD */
```

You might use the USELPACOPY(NO) option of the PROGRAM resource definition for a more permanent exclusion of an LPA-resident module than for the single run of CICS control provided by the PRVMOD system initialization parameter.

### Verifying modules for the MVS link pack area

When verifying new versions of modules to be installed into the MVS link pack area, you can use any of the following options to instruct a CICS region to use the new versions from the DFHRPL concatenation.

- The LPA=NO system initialization parameter
- The PRVMOD system initialization parameter
- The USELPACOPY(NO) option of the associated PROGRAM resource definition (where applicable)

For further information about these options, see “Using modules from DFHRPL” on page 153

In all cases, you must install the new versions of the modules into the hlq.SDFHLOAD library or another library in the DFHRPL concatenation.

If you are verifying many CICS LPA-eligible modules, you might choose to add the hlq.SDFHLPA library to the DFHRPL concatenation, allowing you to check that the modules you have installed in the MVS link pack area are being loaded from there.

The CICS-supplied USERMODs use SMP/E to move CICS LPA-eligible modules into the hlq.SDFHLPA library. Similarly, if you use SMP/E to apply service to any of those modules, the versions in the hlq.SDFHLPA library are updated. The updated versions of the modules are used from the MVS link pack area after you next re-IPL your MVS with CLPA specified. Until then, if you add the hlq.SDFHLPA library to the DFHRPL concatenation of your CICS region, and specify that CICS is not to use the version of the modules in the MVS link pack area, the updated versions of the modules are used from the DFHRPL concatenation.
After you have installed and verified the use of modules from the MVS link pack area, remove the versions of the modules from the DFHRPL concatenation of your CICS startup job.

You can find out whether CICS is loading modules from the MVS link pack area or the DFHRPL concatenation by reviewing the index of a system dump for the CICS region started with the system initialization parameter LPA=YES. Modules loaded from the MVS link pack area have the dump option LD=3.

**Handling the module-not-found warning message, DFHLD0109I**

CICS issues message DFHLD0109I if it searches the MVS link pack area for a module installed there from hlq.SDFHLOAD and fails to find it.

If you see the module-not-found warning message, check that you have specified USELPACOPY(YES) on the associated PROGRAM resource definition, if applicable. For further information about using modules loaded in the MVS link pack area from the hlq.SDFHLOAD library, see “Modules in the MVS link pack area from hlq.SDFHLOAD” on page 151.

CICS uses console routing code 11 for this particular message, which allows you to control the output of this message. For example, you can perform these actions:

1. Exclude, as required, routing code 11 from specific MVS console definitions in the CONSOLxx member of SYS1.PARMLIB.
2. Use the MVS VARY command to prevent this message from appearing on specified consoles by omitting route code 11 from a VARY command that defines which routing codes go to specified devices:

   ```
   VARY devnum,CONSOLE,ROUT=(rtcode,rtcode,....)
   ```

   Alternatively, you can remove route code 11 from those already defined by using the following VARY command:

   ```
   VARY devnum,CONSOLE,DROUT=(11)
   ```

3. Use the MVS message processing facility (MPF) to inhibit the message. To use MPF, code an entry specifying the CICS message number in the MPFLSTxx member of SYS1.PARMLIB.

   CICS assumes that the following PL/I modules are LPA eligible and issues message DFHLD0109I if it fails to find them there:

   - IBMPSLA
   - IBMPSMA

---

**Sample DFHCSDUP job to specify USELPACOPY(YES)**

The standard IBM-supplied program definitions in the CSD all specify USELPACOPY(NO). If you copy or move to the LPA the IBM programs defined by definitions in the CSD, the next step is to modify the USELPACOPY attribute to ensure that CICS uses the LPA copy.

To simplify this task:

- IBM supplies, in the DFH$ULPA member of the SDFH$SAMP library, an alternate set of DEFINE statements for all the IBM-supplied programs. All the programs defined in DFH$ULPA specify USELPACOPY(YES).
- If you do not want all the programs to be defined for LPA use, edit the member to remove the programs that are to remain as USELPACOPY(NO).
• The USELPACOPY(YES) versions are all defined in one new group called DFHSULPA. Change this group name if you want to use your own name.

• Run the sample DFHCSDUP job shown in Figure 4 to add the DFHSULPA versions of the definitions to your CSD.

• You do not have to remove the standard definitions from DFHLIST. If you specify your group list after DFHLIST on the GRPLIST system initialization parameter, you ensure that the modified definitions override the standard definitions.

```
//LPAMODS  JOB (account_details),MSGCLASS=A,MSGLEVEL=(1,1),
  //                 CLASS=A,NOTIFY=userid
//DEFULPA  EXEC   PGM=DFHCSDUP
//STEPLIB       DD   DSN=CICSTS42.CICS.SDFLOAD,DISP=SHR
//SYSPRINT     DD   SYSOUT=*
//DFHCSD       DD   DSN=user.CICSTS42.CICS.DFHCSD,DISP=OLD
//SYSSIN       DD   DSN=CICSTS42.CICS.SDFHSAMP(DFHSULPA),DISP=SHR
/*
//
```

Figure 4. Sample DFHCSDUP job for all CICS LPA-eligible modules
Chapter 22. Installing CICSPlex SM modules in the MVS link pack area

There are benefits and points to consider if you use the MVS link pack area (LPA).

Benefits of using the LPA include:

- **Sharing** – Two or more CICS regions in the same MVS image can share modules in the LPA, giving an overall reduction in the total working set.
- **Integrity** – the LPA is page-protected, even against key 0 programs, so all modules placed there are automatically protected against overwriting by other programs such as CICS applications. This integrity feature applies equally to a single CICS system in the processor.

Every CICSPlex SM module installed in the LPA can be used only by the release of CICSPlex SM to which it relates.

CICSPlex SM supplies prebuilt SMP/E USERMODs as members in the CICSTS42.CPSM.SEYUSAMP library. The USERMOD is:

```
EYUSUM01 - Local MAS modules
```

These USERMODs contain ++MOVE statements for each module that is eligible for the extended link pack area (ELPA). A read-only module that can reside above 16 MB is eligible for the ELPA.

CICSPlex SM allocates an empty library for your use, called SYS1.CICSTS42.CPSM.SEYULPA. You can use SYS1.CICSTS42.CPSM.SEYULPA as the LPA library or you can add the modules to another LPA library.

If you are going to use SYS1.CICSTS42.CPSM.SEYULPA, verify that you have already authorized this library, described in Chapter 12, “Authorizing the CICS and CICSPlex SM libraries,” on page 93, and that you have applied appropriate security. You can give the SYS1.CICSTS42.CPSM.SEYULPA library your own high-level index. If you do, you must specify the new index on the LINDEX parameter of the DFHISTAR job.

**Space requirements**

Allow enough space in the link pack area for the installation of the selected CICSPlex SM modules.

The total space depends on how the modules are packaged into the link pack area by the operating system. A local MAS requires approximately 2034 KB.

**Installing CICSPlex SM modules into the LPA**

In this context, the term *install* means to move or copy a module to the SYS1.CICSTS42.CPSM.SEYULPA library by using SMP/E, or by using a copying method that reblocks the copied modules when the target data set has a smaller block size than the data set you are copying from; for example, by using the COPYMOD function of the IEBCOPY program.
CICSPlex SM modules that are eligible for inclusion in the link pack area are listed in Appendix B, “CICSPlex SM modules eligible for the MVS link pack area,” on page 439.

CICSPlex SM creates default definitions for the LPA-eligible modules specifying USELPACOPY(YES). So you do not have to modify these definitions to be able to search the LPA. You can, however, specify that the LPA is searched by using the CICS system initialization parameters LPA and PRVMOD. Specify LPA=YES for CICS to search the LPA for these programs. If you specify LPA=NO, which is the default, the LPA is not searched for these programs.

If you specify LPA=YES but have not moved the modules to the LPA, message DFHLD0109I is issued for each module. If you specify LPA=YES and have moved these modules to the LPA, you can use the PRVMOD system initialization parameter to control which modules are to be used from the LPA. See “Using modules from DFHRPL” on page 153 for more information.

Do not relink-edit the modules to put them into the SYS1.CICSTS42.CPSM.SEYULPA library. CICSPlex SM modules, as supplied, have the necessary attributes that cause MVS to load them automatically above 16 MB (into the ELPA).

The MVS link pack area has both pageable and fixed areas. Although you can install CICSPlex SM modules into the fixed areas, for performance reasons, use the pageable areas.

Modules to be loaded into the MVS pageable link pack area (PLPA) must have been link-edited with the RENT attribute. The library that contains these modules must be named in an LPALSTxx member of the SYS1.PARMLIB library.

To install modules in the CICSPlex SM LPA library, and to ensure that SMP/E can continue to service them, complete the following steps for one or both of the CICSPlex SM-supplied USERMODs:

1. Receive the USERMOD into the CICSPlex SM global zone and apply it to the CICSPlex SM target zone.
2. Define the SYS1.CICSTS42.CPSM.SEYULPA library to your MVS.

Receiving and applying the USERMOD

To receive and apply the CICSPlex SM-supplied USERMOD, in EYU$UM01, you can use the sample job EYULPMOD, which is tailored by DFHISTAR and stored in the CICSTS42.XDFHINST library when you run the DFHISTAR job.

Receive the USERMOD into the CICSPlex SM global zone and apply it to the CICSPlex SM target zone. This causes SMP/E to move those load modules you have specified from the named CICSPlex SM target library (either CICSTS42.CPSM.SEYUAUTH or CICSTS42.CPSM.SEYULOAD) into the SYS1.CICSTS42.CPSM.SEYULPA library.

When the USERMOD is applied, the corresponding LMOD entries in the target zone SMP CSI are updated. Either or both USERMODs can be applied depending on your enterprise’s requirements.

Do not accept the USERMOD into the distribution zone, and, for the time being, do not apply it to any other target zone.
Defining the SYS1.CICSTS42.CPSM.SEYULPA library to your MVS

Add the full name of the SYS1.CICSTS42.CPSM.SEYULPA library to an LPALSTxx member of SYS1.PARMLIB to ensure that the library contents are loaded into the PLPA at the next IPL of your system when CLPA is specified.

When you have defined the SYS1.CICSTS42.CPSM.SEYULPA library to MVS, re-IPL your MVS with CLPA specified so that the modules in the SYS1.CICSTS42.CPSM.SEYULPA library can be used from the LPA.

Use the USERMOD EYU$UM01, supplied in the SEYUSAMP library, to move the LPA-eligible modules into the SEYULPA library. These modules are listed in Appendix B, “CICSPlex SM modules eligible for the MVS link pack area,” on page 439.

Applying maintenance to LPA modules

Use the SMP/E RESTORE function to back off the USERMOD before modules in the LPA are updated or copied. Afterwards, you can reapply the USERMOD.
Chapter 23. Defining CICS IPCS exit control data to MVS

If you use the MVS interactive problem control system (IPCS) to format and analyze CICS system dumps, ensure that the release-specific CICS formatting routines are defined and available to MVS.

The formatting routine for use under IPCS has the release identifier as part of its name; that is, DFHPD670. You define this formatting routine to IPCS when formatting system dumps. The CICS formatting routine is release-specific, so, if you run more than one release of CICS, ensure that you use the correct version for the system dump you are formatting.

The DFHIPCSP CICS exit control data

IPCS provides an exit control table with imbed statements to enable other products to supply exit control information.

The IPCS default table, BLSCECT, normally in the SYS1.PARMLIB library, has the following entry for CICS:

```
IMBED MEMBER(DFHIPCSP) ENVIRONMENT(ALL) /* CICS */
```

Ensure that your IPCS job can find the CICS-supplied DFHIPCSP module. The DFHIPCSP module is in the hlq.SDFHPARM library. You can either copy the DFHIPCSP module into SYS1.PARMLIB, so that it is in the same default library as BLSCECT, or provide an IPCSPARM DD statement to specify the library containing the IPCS control tables:

```
//IPCSPARM DD DSN=SYS1.PARMLIB,DISP=SHR For BLSCECT
//DD DSN=CICSTS42.CICS.SDFHPARM,DISP=SHR For DFHIPCSP
```

The following code example shows the release-specific entries that are specified in DFHIPCSP.
To use the DFHIPCSP member as it is, rename the CICS-supplied version of DFHPDX for earlier releases to the names that are shown in the table.

For information about using IPCS to format CICS system dumps, see the CICS Operations and Utilities Guide.

**Implementing changes**

Re-IPL MVS to bring the changes that are described here into effect before you attempt to run the IVPs.
Chapter 24. Preparing to use the CICSPlex SM IPCS tools

The interactive problem control system (IPCS) provides MVS users with interactive diagnostics of software failures. Before using IPCS, you must update BLSCECT, update library allocations and set SDUMP options.

You can use IPCS to format and analyze SDUMPs produced by CICSPlex SM or stand-alone dumps obtained while CICSPlex SM was active in the system being dumped. You can either view the dumps at your terminal or print them.

CICSPlex SM provides a dump formatting routine that you can use with the VERBEXIT subcommand to format CMAS, MAS, WUI server, or SMSS dumps.

- For more information about IPCS, see the MVS Interactive Problem Control System: User’s Guide.
- For information about using IPCS to format CICSPlex SM system dumps, see the CICS Operations and Utilities Guide.
- For information about displaying and formatting dumps with IPCS, see the CICSPlex System Manager Problem Determination guide.

Updating BLSCECT

IPCS provides an exit control table, BLSCECT, which is normally in SYS1.PARMLIB. This table contains imbed statements that you can update to enable other products to supply exit control information.

Perform the following steps to update BLSCECT:

1. Update the BLSCECT table with the following IMBED statement:

   ```
   IMBED MEMBER(EYUIPCSP) ENVIRONMENT(ALL)
   EYUIPCSP identifies the CICSPlex SM formatting routine as EYU9D420 with a VERB name of CPSM420.
   ```

2. Make sure EYUIPCSP can be found by your IPCS job by doing one of the following steps:
   - Copy EYUIPCSP from the CICSTS42.CPSM.SEYUPARM library into the same library as BLSCECT, usually SYS1.PARMLIB.
   - Provide an IPCSPARM DD statement to specify the library that contains the IPCS control tables. For example, the DD statement for a batch TSO session might look like this:

     ```
     //IPCSPARM DD DSN=SYS1.PARMLIB,DISP=SHR for BLSCECT
     //       DSN=CICSTS42.CPSM.SEYUPARM,DISP=SHR for EYUIPCSP
     ```

   For more information about SYS1.PARMLIB library members related to IPCS, see the MVS Interactive Problem Control System (IPCS): Customization manual.

Updating library allocations

If CICSTS42.CPSM.SEYULINK is not in the linklist, include the EYU9D420 IPCS user exit routine.
Make sure that the EYU9D420 IPCS user exit routine is in a library in the linklist or a library that is accessed by the JOBLIB, STEPLIB, or TASKLIB option of the IPCS command, during the IPCS session. To accomplish this, perform one of these actions:

- Allocate CICSTS42.CPSM.SEYULINK to the desired DD statement.
- Copy CICSTS42.CPSM.SEYULINK (EYU9D420) to an appropriate library.
- Invoke IPCS, using the TASKLIB keyword to allocate CICSTS42.CPSM.SEYULINK.

For example, issue the TSO COMMAND:

IPCS NOPARM TASKLIB('CICSTS42.CPSM.SEYULINK ')
Chapter 25. MVS Program properties table entries

You can optionally define some CICS properties to MVS in the MVS program properties table (PPT).

Figure 6 is an example of a CICS PPT entry in the SCHEDxx member of SYS1.PARMLIB.

```
/*********************************************************************************/
/* Program Properties table addition */
/* for the CICS program, DFHSIP */
/* */
/* The following defaults apply to this CICS entry: */
/* */
/* No affinity to a particular processor (AFF(NONE)) */
/* Can be canceled (CANCEL) */
/* Requires data set integrity (DSI) */
/* Not a privileged job (NOPRIV) */
/* Password protection is required (PASS) */
/* Not a system task (NOSYST) */
/* Protection key 8 (KEY(8)) */
/* */
PPT PGMNAME(DFHSIP) /* Add program name DFHSIP to the PPT*/
  NOSWAP /* Non-swappable */
  NOPREF /* No preferred storage required */
/* */
```

Figure 6. Sample CICS PPT entry

For information about defining options in the PPT, see the z/OS MVS Initialization and Tuning Guide.

RACF password checking

If your installation has an MVS program properties table (PPT) entry for the DFHSIP program, ensure that the NOPASS option is not set in the PPT because this option bypasses password and RACF authorization checking.

For information about defining PPT entries for CICS in the SCHEDxx member of the SYS1.PARMLIB library, see the z/OS MVS Initialization and Tuning Reference manual.

Non-swappable CICS regions

For performance reasons, consider making your CICS regions nonswappable by specifying the NOSWAP option of the PPT entry in the SCHEDxx member of SYS1.PARMLIB. If you specify NOSWAP on the PPT entry in the SCHEDxx member of SYS1.PARMLIB, PPTNSWP is set to ON in the PPT internal control block.

If you specify NOPASS on the MVS PPT entry in the SCHEDxx member of SYS1.PARMLIB, PTNPAS is set to ON in the PPT internal control block.

MVS protection key for CICS

To use the storage protection facility of CICS, you must specify the system initialization parameter STGPROT=YES and must have the required hardware and
software. If you operate CICS with storage protection, CICS observes the storage keys and execution keys that you specify in various system and resource definitions. For information about hardware and software that is required by CICS storage protection, see the Program Directory for CICS Transaction Server for z/OS.
Chapter 26. MVS performance definitions

You can use MVS workload management to manage sysplex resources across MVS subsystems, in parallel with the existing system resource management facilities.

For information about MVS workload management, see the z/OS MVS Planning: Workload Management manual.

The following topics discuss how you can implement workload management on the MVS images that the CICS workload is to run on, and how to ensure that CICS performance parameters correspond to the policies defined for MVS workload management.

Implementing MVS workload management

Implementing MVS workload management is part of the overall task of planning and installing MVS.

Implementing MVS workload management generally involves the following steps:
1. Establish your workloads.
2. Set your business priorities.
3. Understand your performance objectives.
4. Define critical work.
5. Define performance objectives based on current business requirements
6. Get agreement for your workload performance objectives.
7. Specify a service level agreement or performance objectives.
8. Specify an MVS WLM service definition that uses the information from the previous step. Record your service definition in a form that helps you to enter it into the MVS workload manager ISPF application. Use the worksheets provided in the z/OS MVS Planning: Workload Management manual, SA22-7602.
9. Install MVS.
10. Set up a sysplex with a single MVS image and run in workload manager compatibility mode.
11. Upgrade your existing XCF couple data set.
12. Start the MVS workload manager ISPF application and use it in the following steps.
13. Allocate and format a new couple data set for workload management. Do this from the ISPF application.
14. Define your service definition.
15. Install your service definition on the couple data set for workload management.
16. Activate a service policy.
17. Switch the MVS image into goal mode.
18. Start up a new MVS image in the sysplex; that is, attach the new MVS image to the couple data set for workload management and link it to the service policy.
19. Switch the new MVS image into goal mode.
20. Repeat the previous two steps for each new MVS image in the sysplex.
Note:

- Support for MVS workload manager is initialized automatically during CICS startup.
- All CICS regions and other MVS subsystems running on an MVS image with MVS workload management are subject to the effects of workload manager.

Matching CICS performance parameters to service policies

Ensure that the CICS performance parameters are compatible with the workload manager service policies used for the CICS workload.

In general, define CICS performance objectives to the MVS workload manager first and observe the effect on CICS performance. When the MVS workload manager definitions are working correctly, then consider tuning the CICS parameters to further enhance CICS performance. However, use CICS performance parameters as little as possible.

Consider using these performance attributes:

- Transaction priority, passed on dynamic transaction routing. The priority assigned by the CICS dispatcher must be compatible with the task priority that is defined to MVS workload manager.
- Maximum number of concurrent user tasks for the CICS region.
- Maximum number of concurrent tasks in each transaction class.
Chapter 27. Implementing MVS automatic restart management

You can exploit MVS automatic restart management to implement a sysplex-wide integrated automatic restart mechanism.

To use the MVS automatic restart manager facility, follow these steps:
1. Implement automatic restart management on the MVS images on which the CICS workload is to run.
2. Ensure that CICS startup JCL used to restart CICS regions is suitable for MVS automatic restart management.
3. Specify appropriate CICS START options.
4. Specify appropriate MVS workload policies.

Implementing MVS automatic restart management for CICS generally involves the following steps:
• Ensure that the MVS images available for automatic restarts have access to the databases, logs, and program libraries required for the workload.
• Identify those CICS regions for which you want to use automatic restart management.
• Define restart processes for the candidate CICS regions.
• Define ARM policies for the candidate CICS regions. Allow the RESTART_ORDER_LEVEL to default to 2. CICS regions are generally level 2 in the ARM restart order, after DB2 and DBCTL.

For information about MVS automatic restart management, see Automatic restart management in the Recovery and Restart Guide and z/OS MVS Setting Up a Sysplex.
Chapter 28. MVS cross-system MRO definitions

You can use CICS interregion communication (IRC) for multiregion operation (MRO) between CICS regions across MVS images in a sysplex.

IRC exploits the cross-system coupling facility (XCF) of MVS and removes the need for z/OS Communications Server to communicate between MVS images in the same sysplex.

In a sysplex, you must install DFHIRP from the highest release of CICS running in that MVS image.

Sysplex overview

A sysplex consists of multiple MVS systems, coupled together by hardware elements and software services. In a sysplex, MVS provides a platform of basic multisystem services that multisystem applications like CICS can use. As the workload grows, you can add MVS systems to the sysplex to meet the requirements of the greater workload.

To use XCF to communicate in a sysplex, you specify the XCF group name to CICS using the SIT XCFGROUP parameter. The default name is DFHIR000. If you specify a different group name, only members that specify that same group name can communicate using XCF. For more information about XCFGROUP, see XCFGROUP system initialization parameter in the System Definition Guide.

MVS XCF for MRO

When you format the primary and alternate couple data sets used by the XCF component of MVS, make sure that the following conditions are met:

- The value specified for the MAXMEMBER parameter must be large enough to handle the number of CICS regions and users of the EXCI in the CICS XCF group.

  In a single sysplex, a theoretical maximum number of 1023 CICS regions can participate in XCF/MRO using the same XCF group. However, the maximum size of the XCF group is reduced if you set the MVS MAXMEMBER parameter, used to define XCF couple data sets, to a lower limit. When you calculate the maximum number of members in the CICS XCF group, allow one member for each of these items:
  - Each CICS region to run on an MVS image in the sysplex.
  - Each pipe that is allocated by a user of the external CICS interface (EXCI). For information about EXCI users and pipes, see The EXCI CALL interface.

To list the members in the CICS XCF group, you can use the MVS DISPLAY command. The name of the CICS group is always DFHIR000, so you can use this MVS command:

```
DISPLAY XCF, GROUP, DFHIR000, ALL
```

- The value specified for the MAXGROUP parameter must be large enough for the CICS XCF group to be established.
Chapter 29. PR/SM policy for handling MVS failures

If you are running CICS under MVS in a Processor Resource/Systems Manager™ (PR/SM™) environment, you must define to MVS the preferred XCF PR/SM policy for handling MVS failures in a PR/SM environment.

You must also define to PR/SM the authorization for each LPAR to cause reset or deactivation of another LPAR.
Chapter 30. MVS ASREXIT - SYMREC Authorization Exit

A CICS program might call the first failure symptoms component. This component uses the MVS SYMREC macro to write symptom records to the MVS SYS1.LOGREC data set, in addition to, or instead of, a job log.

The SYMREC authorization exit, ASREXIT, must be in effect to allow CICS to use the SYMREC macro call; otherwise, the call fails with return code 12, reason code 3868 (XF1C').

When SYMREC is called by CICS, the ASREXIT routine issues a return code that permits the SYMREC to be successfully written.

The MVS sample exit programs ASREXT0 and ASREXT1, supplied in SYS1.SAMPLIB, are suitable for this purpose. For further information about these exits, see z/OS MVS Installation Exits. The ASREXIT routine can determine whether CICS is the caller by testing EPLPNAME for the value 'DFHSIP', except in the following circumstances:

- When DFHSIP is renamed, in which case EPLPNAME contains the new name.
- When DFHSIP is the subject of an MVS LINK, in which case EPLPNAME contains the name of the program issuing the MVS LINK, unless it too is the subject of an MVS LINK.

If you choose this method, code your ASREXIT routine to allow for these exceptions.

An alternative method of coding the ASREXIT routine is shown in Figure 7 on page 176. This method is not affected by the exceptions that are listed previously.
Figure 7. An example of coding the ASREXIT routine.
Chapter 31. Setting up VSAM RLS support

These topics provide an overview of each task you need to perform if you want to use VSAM RLS to enable CICS regions to share VSAM data sets.

Defining the master coupling facility lock structure

VSAM RLS support requires the coupling facility to define a master lock structure, IGWLOCK00, for cross-system locking.

See the z/OS DFSMSdfp Storage Administration Reference manual for information about calculating the size you require for the lock structure.

The amount of coupling facility space required depends on several characteristics of your hardware configuration and the applications that you run:

- The number of processors you have
- The power of your processors
- Your ratio of nonupdate activity to update activity
- Your ratio of recoverable updates to nonrecoverable updates
- Your ratio of sequential requests to direct requests

You define the lock structure in the CFRM policy with the IXCMIAPU utility.

Defining coupling facility cache structures and cache sets

VSAM RLS support requires the coupling facility to define cache structures for cross-system buffer invalidation. You determine the number and size of cache structures you require.

The number you require depends on factors such as these:

- The number of coupling facilities you have
- The amount of space in each coupling facility
- The amount of data that is accessed through each coupling facility

See the z/OS DFSMSdfp Storage Administration Reference manual for information about calculating the amount of space you require for the cache structures. If you have previously used data sets in LSR mode, the total amount of coupling facility space allocated to cache structures will not be less than the amount of storage you were using for LSR pools, including any hiperspace buffers.

To achieve performance benefits:

- Make the size of the cache larger
- Divide cache structures appropriately across coupling facilities

You define cache structures in the CFRM policy with the IXCMIAPU utility.
Defining cache sets

You define cache sets with the ISMF control data set (CDS) application. A cache set maps onto one or more cache structures. If you specify more than one cache set, the data sets can be rebound to another cache structure in the set if a cache structure fails.

See the z/OS DFSMSdfp Storage Administration Reference manual for more information about cache sets.

Preparing for RLS access

You need to define SMS storage classes and alter data set attributes to prepare for VSAM RLS access.

Defining SMS storage classes for RLS access

Before you can use VSAM RLS, you require one or more storage classes that specify a non-blank cache set name. Use the ISMF storage class application to specify a cache set name when you define or alter a storage class, together with weighting parameters for tuning, such as CF DIRECT WEIGHT and CF SEQUENTIAL WEIGHT. See the z/OS DFSMSdfp Storage Administration Reference manual for more information about defining SMS storage classes.

Altering data set attributes for RLS access

Before you can use a data set in RLS access mode, you must ensure that it is eligible.

To be eligible for RLS:

- Data sets must reside in SMS managed storage.
- Data sets must specify a storage class that has a nonblank cache set name.
- Data set recoverability attributes must be defined in the ICF catalog and not in the CICS file control resource definition, where they are ignored for RLS.

You can specify a data set’s attributes using the Access Method Services (AMS) DEFINE CLUSTER or ALTER CLUSTER commands.

Specifying a LOG parameter of NONE, UNDO, or ALL ensures that the recoverability of the data set is defined. You cannot open files in RLS mode if the LOG parameter of the associated data set is UNDEFINED. If you specify LOG(ALL), you must also specify a forward recovery log stream on the LOGSTREAMID parameter.

To use backup while open (BWO) for an RLS-accessed sphere, specify the BWO parameter. Specifying BWO(TYPECICS) means that backup while open can be used. All other values for BWO, including undefined, mean that backup while open is not allowed. BWO(TYPECICS) is valid only if LOG(ALL) and LOGSTREAMID are also specified.

- Data sets must not specify the IMBED attribute.

If you have some data sets that specify IMBED, you must remove the IMBED option before you can use the data sets in RLS mode. Redefine a new data set without IMBED and use the AMS REPRO function to copy the old data set to the new data set.

Note that RLS supports the REPLICATE cluster attribute. It does not provide any performance benefit. Removing RLS might save storage space.
Defining sharing control data sets

VSAM RLS requires sharing control data sets. These are used to maintain data integrity in the sharing environment. The sharing control data set is used sysplex-wide by all the SMSVSAM servers, and is always duplexed.

Two active, and at least one spare, sharing control data sets must be available at all times.

The size of these data sets depends on the number of MVS images in the sysplex and on the number of files that are expected to be open concurrently. The z/OS DFSMSdfp Storage Administration Reference manual gives information about calculating the amount of space that is required for the sharing control data sets.

Sharing control data sets are VSAM linear data sets that must be on volumes that have global connectivity. The data sets can have multiple extents, but only on the same volume. You define them using standard techniques for defining data sets. The names must have SYS1.DFPSHCDS as the first and second qualifiers. See the z/OS DFSMSdfp Storage Administration Reference manual for other rules relating to the definition of sharing control data sets.

You must not issue RESERVEs on any volumes that contain sharing control data sets. Convert any such RESERVEs to enqueues.

You can check that the data sets are available to the sysplex with the MVS DISPLAY SMS command, on any MVS image:
D SMS,SHCDS

This command shows the names of the two active data sets and the spare data set as shown in the following example:

<table>
<thead>
<tr>
<th>Name</th>
<th>Size</th>
<th>%UTIL</th>
<th>Status</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACTIVE1.VP2SS03 7920KB</td>
<td>7920KB</td>
<td>74%</td>
<td>Good</td>
<td>ACTIVE</td>
</tr>
<tr>
<td>ACTIVE2.VP2SS03 7920KB</td>
<td>7920KB</td>
<td>74%</td>
<td>Good</td>
<td>ACTIVE</td>
</tr>
<tr>
<td>SPARE.VP2SS03 7920KB</td>
<td>7920KB</td>
<td>74%</td>
<td>Good</td>
<td>SPARE</td>
</tr>
</tbody>
</table>

The DISPLAY command shows only the third and fourth qualifiers of the sharing control data set names; the first and second qualifiers are always SYS1.DFPSHCDS.

The first time an SMSVSAM server is started in the sysplex, you vary online the sharing control data sets with this command for the active data sets:
V SMS,SHCDS,NEW

Use this command for the spare data set or data sets.
V SMS,SHCDS,NEWSPARSE

for the spare data set (or data sets). The server cannot start properly if you do not issue these commands.

Authorizing CICS user IDs for VSAM RLS support

Authorize each CICS user ID that is to use VSAM RLS support to have read access to a profile in the SUBSYSNM class that matches the APPLID.

See “Authorizing access to an SMSVSAM server” on page 98 for more information.
You can restrict user access to the access method services SHCDS subcommands, AMS SHCDS LIST and REMOVE. The z/OS DFSMS: Access Method Services for ICF manual gives information about using these commands.

### Adding new parameters to SYS1.PARMLIB(IGDSMSxx)

To include RLS support in your system, specify the required parameters in the IGDSMSxx member of SYS1.PARMLIB.

- Specify RLSINIT(YES); otherwise, SMSVSAM does not initialize automatically when you IPL MVS. Alternatively, you can start SMSVSAM using the VARY SMS, SMSVSAM, ACTIVE command.
- Specify a value for the deadlock detection interval with the DEADLOCK_DETECTION parameter.
- Specify time intervals for the creation and synchronization of VSAM RLS SMF records with the CF_TIME and SMF_TIME parameters.
- Specify the maximum size of the SMSVSAM local buffer pool with the RLS_MAX_POOL_SIZE parameter.

See the z/OS DFSMSdfp Storage Administration Reference manual for information about these parameters.

### Establishing new procedures for VSAM RLS support

You might require new operational procedures in a number of areas as a result of using VSAM RLS support, including integrity of data and management of coupling facilities and structures, use of RESERVES, switching to non-RLS mode and forward recovery management.

- Integrity of data in coupling facility caches
  To make sure that non-IBM products or user programs do not compromise the integrity of data in coupling facility caches when they modify the data on a volume, either vary the volume offline to each system in the sysplex, or CF-quiessce the volume using the V SMS, CFVOL(volid), QUIESCE command before running such programs
- Management of the coupling facility and coupling facility structures
- Use of RESERVES on volumes that contain sharing control data sets.
  Make sure that RESERVES are not used. Convert RESERVES on other volumes into enqueuees.
- Switching to non-RLS mode to run batch update jobs against recoverable data sets.
- Management of forward recovery and your forward recovery logs.
  Forward recovery differs from forward recovery for non-RLS access:
  - The forward recovery log stream must be in the ICF catalog.
  - All forward recovery log records for a data set merge into the same log stream.
  - Your forward recovery procedure must use the SHCDS FRSETRR, FRUNBIND, FRBIND, and FRRESETRR commands. CICS VSAM Recovery for z/OS automatically issues these commands.

Refer to the DFSMS/MVS documentation for more details.
Activating the coupling facility structures

After you have defined the coupling facility structures in the CFRM policy, activate the structures using the SETXCF START POLICY command, specifying a TYPE of CFRM and the policy name.
Chapter 32. Console messages

The message domain supports the use of MVS message routing codes in the range 1 to 16 for those messages that are sent to the console.

By default, if the issuing module specifies only CONSOLE (without a qualifying number) as the destination, CICS routes the message with MVS route codes 2 and 11. This support is available for all domain-type messages of the form DFHxxnnnn, where xx is the domain code and nnnn is the message number.

CICS issues other messages (of the form DFHnnnn) with either no route code or route codes other than 2 and 11.

The physical destination of these messages is controlled by the ROUTECODE parameter on the MVS console entries in a SYS1.PARMLIB member, CONSOLEnn. For further information about MVS console definitions, see the z/OS MVS Initialization and Tuning Guide.
Chapter 33. Defining the logger environment for CICS

CICS uses the MVS system logger for all its logging and journaling requirements. Using services provided by the MVS system logger, the CICS log manager supports these logs:

- The CICS system log, which is used for these purposes:
  - Dynamic transaction backout
  - Warm and emergency restarts
  - Cold starts, but only if the log contains information required for resynchronizing indoubt units of work
- Forward recovery logs, autojournals, and user journals.

The MVS system logger is a component of MVS. It provides a programming interface to access records on a log stream. For information about the MVS system logger, see the following MVS publications:

- z/OS MVS Setting Up a Sysplex for:
  - General information about the MVS system logger.
  - Information about defining and formatting the LOGR couple data set.
  - Information about how to plan the system logger configuration, plan and set up a system logger application, and plan for recovery for system logger applications.
- z/OS MVS Programming: Assembler Services Reference, Volume 1 and z/OS MVS Programming: Assembler Services Reference, Volume 2 for the syntax of system logger services.
- z/OS MVS Initialization and Tuning Reference for information about the COUPLEExx PARMLIB member.

Requirements planning and checklist for the logger environment

The requirements and the procedure to set up the CICS logging environment are outlined.

The procedure includes tasks for MVS system programmers, CICS system programmers, and security administrators, and close cooperation between all groups is required.

- Plan the logger environment.
  Consider the possible storage options, and choose which of the three available hardware options to use:
  - Non-volatile coupling facility, where log stream data is duplexed in the MVS logger data space. Non-volatile storage involves the use of battery backup or an uninterruptible power supply (UPS):
    - When using a UPS, you use a hardware console command to update coupling facility status.
    - When using battery backup, batteries must be online and charged.
  - Volatile coupling facility, where log stream data is duplexed to a staging data set.
  - DASD-only, where log stream data is duplexed in the MVS logger data space.
See “Coupling facility or DASD-only?” on page 192 to help you decide on one of these or a combination of both.

Make the following planning decisions:

– Determine the number CICS regions that require logger support and hence system log streams.
– Determine the number of user journals and autojournals that your regions use.
– Determine the number of forward recovery logs required for VSAM data sets.
– Determine whether any user journal or forward recovery log streams are to be shared between regions (to create merged data automatically). The system log streams, DFHLOG and DFHSHUNT, cannot be shared.

DASD-only log streams can be shared only in the same MVS image.
– Decide on the number and sizes of the coupling facilities to be used.

For information about types of coupling facility, see z/OS MVS Setting Up a Sysplex. The minimum level of coupling facility supported by the MVS system logger is CFLEVEL=1, with the appropriate service level of the coupling facility control code that supports CFLEVEL=1.

– Determine the log stream sizes:
  - For coupling facility log streams, see “Coupling facility log streams” on page 193.
  - For DASD-only log streams, see “DASD-only log streams” on page 211.

• Apply any maintenance updates.

Ensure that all maintenance affecting the MVS system logger, and the CICS log manager and its utilities, is applied.
– Logger serviceability APARs that relate to the MVS system logger are identified with the LOGRSERVICE keyword.
– APARs that relate to the CICS log manager are identified with the CICSLOGR keyword.

• Create and format the LOGR couple data sets.

You need to know the number of log streams and, for coupling facility log streams, the number of structures. Each CICS region requires two system log streams and the following optional log streams:
– A log stream for the log of logs.
– One or more log streams for forward recovery logs.
– One or more log streams for autojournals.
– One or more log streams for user journals.

In consultation with your MVS system programmer, complete the following steps:
– Use MVS utility IXCL1DSU to create and format the primary and alternate LOGR couple data sets.
– Identify the LOGR couple data sets to the sysplex in the COUPLEExx member in SYS1.PARMLIB.
– Make the LOGR couple data set available to the sysplex.

For more information, see “Format the LOGR Couple Data Set and Make it Available to the Sysplex” in z/OS MVS Setting Up a Sysplex.
• Define the coupling facility structures.
If you are using the coupling facility for some or all of your log streams, update your CFRM policy and your LOGR couple data set with the required structure definitions. See “Defining coupling facility structures” on page 193 for details, including a sample job.

- Establish the required security authorizations
  Ensure that all the user IDs that are involved with running the system logger, or defining or accessing logger resources, are authorized, and that the required profiles are defined in the LOGSTRM general resource class.
  - If the MVS system logger address space (IXGLOGR) is not given SAF privileged or trusted status, ensure that you give the required authorization to the user ID that runs IXGLOGR. For example, if the user ID that runs IXGLOGR (defined in the RACF started procedures table (ICHRIN03), or defined in the RACF STARTED class profile) is SYSTASK:
    - SYSTASK requires ALTER access to IXLSTR structure profiles in the FACILITY general resource class for access to log stream coupling facility structures.
    - SYSTASK requires ALTER access to the data set profiles (hlq.data_set_name) in the DATASET general resource class, for each DASD log stream and staging data set.
  - To use the MVS system logger IXCMIAPU utility to define, update and delete entries in the LOGR couple data set, you must have appropriate authorizations to the relevant RACF profiles in the LOGSTRM and FACILITY general resource classes. See “Authorizing users of IXCMIAPU” on page 99 for information and examples of how to do this.
  - To enable CICS to create log streams dynamically, and to write to log streams, ensure that the CICS region user ID has the required authorizations. See “Authorizations for CICS regions” on page 99 for information and examples of how to do this.

Ensure that all the user IDs that are involved with running the system logger, or defining or accessing logger resources, are authorized, and that the required profiles are defined in the LOGSTRM general resource class. For more information about authorizations for the system logger, see z/OS MVS Setting Up a Sysplex.

- Check the sysplex definition in PARMLIB.
  To use the MVS system logger, each MVS image must be a member of a sysplex. Ensure your sysplex definition, in PARMLIB member IEASYSxx, specifies either PLEXCFG(MONOPLEX), for a single-member sysplex, or PLEXCFG(MULTISYSTEM), for a multi-member sysplex. Also ensure that you define a COUPLExx, member in PARMLIB. The value specified on the SYSPLEX parameter in COUPLExx, forms part of DASD-only and staging data set names.

- Activate the LOGR subsystem.
  Ensure that the LOGR subsystem is active so that the CICS log manager batch utility, DFHJUP, can format and print log data. The LOGR subsystem is defined by the following entry in IEFSSNxx PARMLIB member:
  SUBSYS SUBNAME(LOGR) INITRTN(IXGSSINT)

- Plan staging data set requirements.
  Staging data sets are used for both DASD-only and coupling facility log streams, and if specified are dynamically allocated by the MVS system logger:
  - For DASD-only log streams, staging data sets are the primary (interim) storage.
– For coupling facility log streams, staging data sets are allocated by the system logger to safeguard log data in the event of the log data being in a volatile configuration; that is:
- There is a loss of the coupling facility battery backup
- A structure failure that results in the only copy of log data being in MVS local storage buffers.

Review the following parameters:

– STG_DUPLEX(YES) and DUPLEXMODE(COND) to cause the system logger to use staging data sets if the coupling facility is not failure independent (see “Staging data sets for coupling facility logstreams” on page 210 for more information).

– STG_MGMTCLAS to specify the System Managed Storage (SMS) management class to be used for staging data set allocation (valid only when STG_DUPLEX(YES) or DASDONLY(YES) is specified)

– STG_STORCLAS to specify the SMS storage class to be used for staging data set allocation (valid only when STG_DUPLEX(YES) or DASDONLY(YES) is specified).

– STG_SIZE to specify the size of staging data sets.

– SHAREOPTIONS(3,3) for log stream data sets and staging data sets (see “VSAM Share Options for System Logger” in z/OS MVS Setting Up a Sysplex).

• Plan DASD space and SMS environment for logger secondary storage.

System logger secondary storage comprises all log stream (offload) data sets. See “Managing secondary storage” on page 216 for information about size parameters and other attributes that relate to secondary storage.

• Define log streams and log stream models.

Define the specific log streams, and log stream models for dynamic creation of log streams, in the LOGR policy. Ensure that you complete the following steps:

– Set HIGHOFFLOAD no higher than 80% so that the offload function can be activated before structures reach the 90% level and to provide a buffer so that CICS can continue to write records without filling the logstream before offload completes.

– Set LOWOFFLOAD for DFHLOG and DFHSHUNT in the range 40–60%. For user journals and the log of logs, specify LOWOFFLOAD as 0.

– Specify HLQ for the high level qualifier for offload data sets. It is not part of the CICS log stream name. The default is IXGLOGR.

– Specify STG_DUPLEX(YES) and DUPLEXMODE(COND) for log streams in the coupling facility to ensure that staging data sets are used automatically if the coupling facility is volatile or failure dependent.

– Set STG_SIZE to control the size, in 4KB blocks, of staging data sets allocated by the system logger. For coupling facility log streams, the staging data set must hold at least as much data as the log stream in the structure, so that offloads are not triggered by the staging data sets. See “Sizing coupling facility log streams” on page 200 and “Sizing for DASD-only log streams” on page 212.

– Specify LS_DATAACLAS and LS_SIZE, for the SMS data class and the number of 4KB allocation blocks respectively for log stream off load data sets.

– Specify MODEL(YES) to indicate that a log stream definition is a model only and not an actual log stream. See SDFHINST members DFHILG2 (coupling facility) and DFHILG5 (DASD-only) for samples of model log streams.

Use AUTODELETE(YES) with a suitable retention period (RETPD) for general logs but not for CICS system logs (DFHLOG and DFHSHUNT). See “Defining
Define JOURNALMODEL resource definitions.

Define JOURNALMODEL resource definitions in the CICS CSD to enable CICS to map CICS journal names to MVS system logger log stream names. See the CICS Resource Definition Guide for information about JOURNALMODEL resource definitions.

Review the AKPFREQ system initialization parameter.

This parameter represents the number of write operations (log records) by CICS log manager to the log stream buffer before an activity keypoint is taken, whereas under the old journal control program it specifies the number of consecutive blocks written to the system log data set.

The parameter has a significant effect on the size of system logger primary (interim) storage, affecting the log tail management that takes place during activity keypoint (AKP) processing. The system logger acts as follows:

- It deletes records that are no longer of interest to CICS
- It moves records to DFHSHUNT for those tasks that wrote log records in the last ACP.

Evaluate the results after implementation.

After you implemented the procedure to use the MVS system logger for CICS log streams and journals, evaluate the results on a continual basis. You can use the following:

- CICS interval statistics. You can collect these at specified intervals and end-of-day to obtain CICS log manager statistics. You can also collect statistics using the DFH0STAT sample program.
- SMF Type 88 records. These are produced by the MVS system logger, and can be printed using IXGRPT1, which is supplied in SYS1.SAMPLIB. You can also print these records using IXGRPT1J and IXGRPT1L.

“Coupling facility or DASD-only?” on page 192

The CICS log manager supports the DASD-only option of the MVS system logger. Individual CICS log streams can use either coupling facility log structures or DASD-only logging.

“Coupling facility log streams” on page 193

If you use a coupling facility, the most suitable environment is provided by two or more non-volatile coupling facilities that are failure-independent from any of the exploiting MVS images, using dedicated processor resources.

“DASD-only log streams” on page 211

The CICS log manager supports the DASD-only option of the MVS system logger.

“Managing secondary storage” on page 216

Use System Managed Storage (SMS) to manage log stream data sets.

Setting up the environment for CICS log manager

CICS system programmers must consult with their MVS system programmers to plan for the storage that is required by the log streams required by the many CICS log managers operating in the sysplex.

Each log stream is a sequence of blocks of data, which the MVS system logger internally partitions over three different types of storage:
1. Primary storage, which holds the most recent records that were written to the log stream. Primary storage can consist of either of these areas:
   a. A structure in a coupling facility. Log data written to the coupling facility is also copied to either a data space or a staging data set.
   b. A data space in the same MVS image as the system logger. Log data written to the data space is also copied to a staging data set.

2. Secondary storage. When the primary storage for a log stream becomes full, the older records automatically spill into secondary storage, which consists of data sets managed by the storage management subsystem (SMS). Each log stream, identified by its log stream name (LSN), is written to its own log data sets.

3. Tertiary storage. A form of archive storage that is used as specified in your hierarchical storage manager (HSM) policy. Optionally, older records can be migrated to tertiary storage, which can be either DASD data sets or tape volumes.

See the different levels of log stream storage in Figure 8 on page 191 and Figure 9 on page 192.
Figure 8. The types of storage used by the MVS system logger. This diagram shows a log stream that uses a coupling facility. Primary storage consists of space in a structure in the coupling facility and either space in a staging data set or a data space in the same MVS image as the system logger. Secondary storage consists of a series of data sets on disk storage to which the elements of the log structure in the coupling facility are mapped. Tertiary storage is the DFHSM storage, holding older levels of the secondary storage data sets.
**Coupling facility or DASD-only?**

The CICS log manager supports the DASD-only option of the MVS system logger. Individual CICS log streams can use either coupling facility log structures or DASD-only logging.

Take the following points into account when deciding which log streams you define to use the coupling facility and which to use DASD-only:

- A coupling facility log stream must be used if you want to allow simultaneous access from CICS regions running in different MVS images. (Simultaneous access to a DASD-only log stream is limited to CICS regions in the same MVS image.)

For example, assume that you are using RLS and have several CICS application-owning regions (AORs) running on different MVS images. Because the forward recovery log must be accessible from all the AORs, it must be...
defined as a coupling facility log stream. A CICS system log, on the other hand, is accessed only by a single CICS region, and can therefore always be defined as a DASD-only log stream.

Without a coupling facility, you cannot share general log streams across MVS images.

- Do not define all your CICS log streams to use structures in a single coupling facility. See "Coupling facility log streams" for more information.
- DASD-only log streams are easier to define and administer than coupling facility log streams.
- The CPU cost of a log write to a DASD-only log stream is greater than that of a write to a coupling facility log stream.
- If the amount of available coupling facility space is limited, you might want to define some DASD-only log streams to minimize the amount of space allocated to log structures.

Note that you can define a single-system sysplex, which must use a sysplex couple data set, with PLEXCFG=MONOPLEX. This definition is required for stand-alone MVS systems that use MVS system logger facilities. Also, define sysplexes that have two or more MVS images with PLEXCFG=MULTISYSTEM.

**Coupling facility log streams**

If you use a coupling facility, the most suitable environment is provided by two or more non-volatile coupling facilities that are failure-independent from any of the exploiting MVS images, using dedicated processor resources.

If one coupling facility fails, or requires maintenance, in such an environment, the system logger can rebuild its data in another coupling facility and continue. CICS systems that are running are minimally affected.

If you cannot devote two coupling facilities for the purposes of the MVS system logger, the next most robust environment is provided by one dedicated coupling facility for normal logger and lock structure use, with a coupling facility LPAR. This environment has the same advantages of rebuilding and affects running CICS systems only minimally. Furthermore, MVS detects that the LPAR coupling facility is not in a failure-independent domain, and causes the system logger to write log stream data to staging data sets for extra security.

Do not run with a single coupling facility because its failure can cause the MVS system logger, and any other users of the coupling facility, to suspend normal operation until access to the coupling facility is restored. CICS is effectively unusable in such a situation.

Unless you specify that the system logger is to use staging data sets, the recovery of log stream data depends on the MVS images remaining active so that the system loggers can use copies of log records held in storage to repopulate the coupling facility when it is again available. If you must run with a single coupling facility, specify DUPLEXMODE(UNCOND) to force the use of staging data sets.

**Defining coupling facility structures**

If you use a coupling facility for your CICS log streams, define the coupling facility structures you require for the log streams in your CFRM policy, in the CFRM data set, and in the LOGR policy, in the LOGR data set.

**Updating the CFRM policy**
Coupling facility space is divided into structures using the coupling facility resource management (CFRM) policy defined in the CFRM data set. The CFRM policy allows you to define how MVS is to manage coupling facility resources, and you update this policy using the IXCMIAPU utility. See Figure 10 on page 195 for a sample job to define coupling facility structures in the CFRM policy data set.

Updating the LOGR policy

You define structures in the MVS system logger LOGR policy in the system logger couple data sets using the DEFINE STRUCTURE specification of the IXCMIAPU utility. See Figure 11 on page 196 for a sample job to define coupling facility structures in the LOGR policy data set.

Before attempting to run any of the IXCMIAPU jobs, ensure that the MVS system logger, IXGLOGR, is running. If IXGLOGR is not running, for example, if MVS is running in LOCAL mode, logstream definition jobs fail with rc=0814.
Figure 10. Sample policy job to define logger structures to CFRM 1/2
Multiple log streams can write data to a single coupling facility structure. The log data is not merged; the log data stays segregated according to log stream. You can specify the number of log streams that use the resources of a single coupling facility structure using the LOGSNUM parameter on the IXCMIAPU service to define a structure.

Each log stream is allocated a proportion of the structure space based on the number of currently connected log streams, up to the limit specified in LOGSNUM.

For example, you might define a structure to contain a maximum of, say, 30 log streams. If only 10 log streams are connected, each log stream can use one tenth of the space in the structure. As other log streams are connected and disconnected, the MVS system logger adjusts the proportion of space to be used by each log stream.

You must plan carefully before specifying a value for LOGSNUM, because this parameter determines how much storage space in the structure is available to each log stream. A number in the range 10 to 20 is optimum in many environments.

The JCL in [Figure 11] defines log stream coupling facility structures to the MVS system logger. It is meant for guidance only and you must substitute values appropriate to your requirements.

```jcl
//DEFSTRUC JOB ...
//POLICY EXEC PGM=IXCMIAPU
//STEPLIB DD DSN=SYS1.MIGLIB,DISP=SHR
//SYSPRINT DD SYSOUT=*

//*********************************************************************
//******** Define log stream coupling facility structures to the MVS logger *******
//*********************************************************************

//SYSIN DD *

/* System logs */
DEFINE STRUCTURE NAME(LOG_DFHLOG_001) LOGSNUM(10)
   MAXBUFSIZE(64000) AVGBUFSIZE(500)

/* Secondary system logs */
DEFINE STRUCTURE NAME(LOG_DFHSHUNT_001) LOGSNUM(10)
   MAXBUFSIZE(64000) AVGBUFSIZE(4096)

/* User journals with unforced writes */
DEFINE STRUCTURE NAME(LOG_USERJRN_001) LOGSNUM(10)
   MAXBUFSIZE(64000) AVGBUFSIZE(64000)

/* Fwd recovery logs and user jnls that are forced */
DEFINE STRUCTURE NAME(LOG_GENERAL_001) LOGSNUM(10)
   MAXBUFSIZE(64000) AVGBUFSIZE(2048)

Figure 11. Sample JCL to define coupling facility structures to MVS system logger

See the z/OS MVS Programming: Assembler Services Guide for information on planning coupling facility configurations.
```
Planning for the number of log structures

There are a number of points to consider when planning the definition of your coupling facility structures.

- The CFRM policy allows a maximum of 255 structures for all purposes.
- Allow a maximum of 20 log streams per structure.
- Smaller structures are more quickly allocated, rebuilt, and recovered than larger ones.
- It is good practice to keep the log streams for test CICS systems and other systems not in regular use in structures separate from the structures holding the log streams of production CICS systems. This separation avoids the structure space available to production CICS systems being affected by structure usage of the test CICS systems.
- It is good practice to keep the log streams for terminal-owning regions (TORs) in structures separate from those accommodating log streams for application-owning regions (AORs). In addition, keep log streams for file-owning regions in structures separate from those accommodating log streams for TORs and AORs.
- Share structures between MVS images. If an MVS image or logger address space fails, and a surviving MVS image is using the same log stream structures, although not necessarily the same log streams, the surviving image is notified of the failure and can initiate immediate log stream recovery for the failing MVS. Recovery, otherwise, is delayed until the next time that a system attempts to connect to a log stream in the affected structures, or until the logger address space of the failing system is restarted.

For example, in a 4-way sysplex comprising MVSA, MVSB, MVSC, and MVSD, you might have the CICS regions that normally run on MVSA and MVSB use structure LOG_DFHLOG_001, and the regions that run on MVSC and MVSD use structure LOG_DFHLOG_002. Thus, each MVS image has a partner to recover its log streams if MVS fails. If a structure fails, the two MVS images using the other structure can take over the workload. Also, if you have more than one coupling facility, allocate the system log structures to different coupling facilities. See Figure 12 for an illustration of this example.

![Figure 12. Sharing system logger structures between MVS images](image-url)
Use the appropriate buffer size. The average buffer size (AVGBUFSIZE) defined for a structure must be close to the actual buffer size of the log streams using the structure. If it is not, usable space might be exhausted long before the structure is full.

**Important:**
1. z/OS dynamically tunes the element and entry ratio, so the value you specify for AVGBUFSIZE is less important than it was on earlier releases of MVS.
2. You cannot update AVGBUFSIZE, like other structure definition attributes such as MAXBUFSIZE and LOGSNUM, unless you first delete the log streams in the structure definition.

Set MAXBUFSIZE to slightly less than 64 KB; for example, 64 000 is suitable. This number allows CICS to write the maximum size user record and allows coupling facility storage to be allocated in 256-byte units. If you allow MAXBUFSIZE to default, coupling facility storage is allocated in 512-byte units. This size can be wasteful of storage.

If you set MAXBUFSIZE lower than 64 000 you gain no significant advantage as far as the use of storage is concerned.

Set a low value for the REBUILDPERCENT parameter in the CFRM policy for log structures used for CICS system logs.

**Log structure naming conventions**

Adopt a naming convention for your coupling facility structures that helps to identify the purpose of the structure.

Use a format such as LOG_purpose_nnn:
- `purpose` identifies the type of use of the structure.
- `nnn` is a sequence number to allow for more than one structure for each purpose.

Here are some examples:

**LOG_DFHLOG_001**
For the CICS primary system log. The structure must be large enough to avoid writing data to DASD. The average buffer size is small. See the sizing calculations in “Structure size for system log usage” on page 202.

**LOG_DFHSHUNT_001**
For the CICS secondary system log. The structure must be small, but requires a large buffer size. A structure of 150 KB per log stream might be sufficient.

**LOG_USERJRNL_001**
For user journals where block writes are not forced. The average and maximum buffer sizes of these structures must be the same.

**LOG_GENERAL_001**
For forward recovery logs and user journals in which block writes are forced periodically.

See also “Develop a naming convention for system logger resources” in the z/OS MVS Setting Up a Sysplex manual.
Defining coupling facility log streams

Use the MVS IXCMIAPU utility to define coupling facility log streams to the LOGR couple data set.

The following code sample shows the basic syntax to define a coupling facility log stream:

```plaintext
DEFINE LOGSTREAM NAME(log_stream_name)
   STRUCTNAME(structure_name)
   LOWOFFLOAD(low_offload) HIGHOFFLOAD(high_offload)
   STG_DUPLEX(YES|NO) DUPLEXMODE(COND|UNCOND)
```

For detailed information about the full range of log stream attributes, see the z/OS MVS Setting Up a Sysplex manual.

Figure 13 shows example definitions for a pair of coupling facility log streams associated with a CICS system log. The definitions are for the CICS primary and secondary system log streams. The region_userid value is the RACF user ID under which the CICS address space is running. The applid value is the z/OS Communications Server APPL name of the CICS region (taken from the APPLID system initialization parameter).

The primary and secondary log streams are placed in different structures because of the large disparity in data volumes written to the primary and secondary system logs.

```plaintext
//DEFLOGS JOB ...
//LOGDEFN EXEC PGM=IXCMIAPU
//STEPLIB DD DSN=SYS1.MIGLIB,DISP=SHR
//SYSPRINT DD SYSOUT=*
//******************************************************************
//*
//* Define coupling facility log streams for CICS system log.  *
//* The LOWOFFLOAD value is for illustration only --  *
//* substitute a value appropriate for your environment.  *
//******************************************************************
//SYSIN DD *
DATA TYPE(LOGR) REPORT(NO)
DEFINE LOGSTREAM NAME(region_userid.applid.DFHLOG)
   STRUCTNAME(LOG_DFHLOG_001)
   LOWOFFLOAD(40) HIGHOFFLOAD(80)
   STG_DUPLEX(YES) DUPLEXMODE(COND)
DEFINE LOGSTREAM NAME(region_userid.applid.DFHSHUNT)
   STRUCTNAME(LOG_DFHSHUNT_001)
   LOWOFFLOAD(40) HIGHOFFLOAD(80)
   STG_DUPLEX(YES) DUPLEXMODE(COND)

Figure 13. Example definitions of coupling facility log streams.

Using model log streams

To avoid defining explicitly each log stream used by each of your CICS regions, you can use model log stream definitions.

Using models, log streams are defined to MVS dynamically, on their first usage. Figure 14 on page 200 shows an example of coupling facility model definitions for CICS primary and secondary system log streams.
For detailed information about using model log streams, see Model log streams for CICS general logs. For information about the mapping of CICS journal definitions to log stream names, see Mapping of general log streams.

When using model log streams, note these points:

- For coupling facility log streams, a model log stream definition determines the coupling facility structure in which the new log streams are created. On an MVS image that runs both CICS production and CICS test regions, take care that the system logs for the production regions are kept separate from the system logs for the test regions.
- You must take into account recovery when using model log streams to define CICS system logs. See Recovery considerations for more information.

### Sizing coupling facility log streams

You must work out the sizes of the CICS primary and secondary system log streams, forward recovery logs, and user journals and autojournals.

- **Primary system log stream.**
  
  Use the following guidelines when you size CICS primary system log stream, DFHLOG:
  
  - Minimize the amount of data that is offloaded to secondary storage.

  The MVS system logger begins the offload process when the high offload threshold (HIGHOFFLOAD) of the log stream is reached. The offload process has two steps:

  1. The MVS logger physically deletes the data in the log stream that the CICS log tail deletion process has marked for deletion.
  2. The MVS logger calculates how much data must be offloaded to secondary storage, based on the difference between HIGHOFFLOAD and LOWOFFLOAD, less the amount of data that was deleted since the last offload event. To minimize the amount of data offloaded from the CICS primary system log:
- Define a suitably sized coupling facility structure.
- Ensure that the log tail deletion process is working effectively. For detailed information about the log tail deletion process, see "Log tail deletion in the Recovery and Restart Guide".
- Avoid structure full events.
  
  A structure full event occurs when the structure space of a log stream becomes full before the offloading of data has completed. For information about monitoring and avoiding structure full events, see "Logging and journaling in the CICS Performance Guide".

• Secondary log stream.
  
  You must size the secondary system log stream, DFHSHUNT, to avoid structure full events. However, typically some data is offloaded from DFHSHUNT to secondary storage.

• General logs.
  
  You must size forward recovery logs, user journals, and autojournals to avoid structure full events. However, because CICS does not delete data from these log streams, data is typically offloaded to secondary storage.

### Setting attribute values for structure, log stream and system definitions

You can use the z Systems Coupling Facility Structure Sizer tool (CFSizer) to calculate storage requirements for coupling facility log streams. CFSizer is a web-based application that communicates with a coupling facility at a current CFLEVEL to calculate storage requirements. See http://www.ibm.com/systems/support/z/cfsizer/.

You can use the CFSizer tool to calculate the following values:

- INITSIZE
- SIZE

For more information, see "Structure size for system log usage".

For information about the CPC support for different CFLEVELs and the function in each CFLEVEL, see "CF levels". For more information about the storage increments for different CFLEVELs, see the information about coupling facility control code support in System z10 Processor Resource/Systems Manager Planning Guide.

You can use the formulas provided in "Structure size for system log usage" to calculate the following values:

- INITSIZE
- AVGBUFSIZE
- SIZE
- LOWOFFLOAD

You can use the formula provided in "Staging data set size calculation" to calculate the following value:

- STG_SIZE

You must base your calculations on the journaling requirements of your applications.
Table 10 summarizes how you decide on the values for various attributes on the structure definition, log stream definition, and system definition.

Table 10. How to decide on the values of attributes

Startup might take longer than you experienced when using earlier releases. This is partly caused by the allocation and formatting of the staging data sets. Increased startup time depends on factors that include the following:

- Size of staging data set (STG_SIZE)
- DASD speed
- DASD contention

You can reduce startup time by avoiding large staging data sets.

Structure size for system log usage

You can use the z Systems Coupling Facility Structure Sizer tool (CFSizer), or the formulas provided, to calculate storage requirements for the primary system log, DFHLOG, and the secondary system log, DFHSHUNT.

The CFSizer calculations assume that the coupling facility is at the current CFLEVEL. The formulas provided assume the coupling facility is at CFLEVEL 11.

You use the results of these calculations to set the coupling facility resource manager (CFRM) INITSIZE and SIZE parameters in the CRFM policy.

The primary and secondary log streams must be placed in different structures because of the large disparity in data volumes written to the primary and secondary system logs.

Generally, the volume of data that CICS keeps in the primary system log at any one time is slightly greater than the amount written during one activity keypoint interval. This volume is determined by the activity keypoint frequency, which is measured in the number of write requests to the CICS system logstream output.
buffer, and defined on the AKPFREQ system initialization parameter. When you plan coupling facility structure sizes, review the value specified for the AKPFREQ parameter.

**Using CFSizer to determine structure size**

CFSizer is a web-based application that communicates with a coupling facility at a current CFLEVEL to calculate storage requirements. For primary and secondary system logs, it calculates suitable values for the INITSIZE and SIZE parameters. See http://www.ibm.com/systems/support/z/cfsizer/.

To use CFSizer to calculate storage requirements for system logs, enter the following information:

**Maximum buffer size**

The size, in bytes, of the largest log block that can be written to a logstream. The value must be between 1 and 65532. This value corresponds to the MAXBUFSIZE value in the definition of the logstream coupling facility structure. See “Defining coupling facility structures” on page 193.

**Average buffer size**

The average size in bytes of log blocks written to all logstreams. This input is used to determine the initial entry to element ratio of the list structure. This value corresponds to the AVGBUFSIZE value in the definition of the logstream coupling facility structure. See “Defining coupling facility structures” on page 193.

Also, this value is available in the system logger reports produced by IXGRPT1 and IXGRPT1J. See “Analyzing system logger data (SMF Type 88 records)” on page 215.

**Highoffload**

The high offload threshold of the logstream. When this percentage of the coupling facility structure is full, the system logger begins to offload data from primary storage to offload data sets. For CICS logstreams, this value is usually between 80 and 85. See Checking logstream status and LOWOFFLOAD and HIGHOFFLOAD parameters on log stream definition in CICS Performance Guide.

For more information about the offload threshold parameter, see z/OS MVS Setting Up a Sysplex.

**Number of write requests per interval**

The number of log blocks written to the logstream (the total from all systems that use the logstream) during the data collection interval. This value is available in the CICS statistics reports. See Logstream statistics and Logstreams reports in CICS Performance Guide.

Also, this value is available in the #WRITES INVOKED data in the system logger reports produced by IXGRPT1 and IXGRPT1J. See “Analyzing system logger data (SMF Type 88 records)” on page 215.

**Length of interval in seconds**

The time interval in seconds over which the number of writes was collected. This value is available in the CICS statistics reports. See Statistics domain: Summary global statistics in CICS Performance Guide.

**Longest running task in seconds**

The duration in seconds of the longest running transaction during the data collection interval. This is not the average response time.
Log tail deletes

The number of times CICS performed log tail deletion during the data collection interval. This value is available in the CICS statistics reports. See delete requests, stream deletes or logstream deletes in Logstream statistics and Logstreams reports in CICS Performance Guide. You can also determine this value by using joblog of the region and counting the number of DFHLG0743 messages that were issued during the interval.

Calculating INITSIZE for DFHLOG

To calculate the INITSIZE value to use in the CFRM policy for the primary system log, use the following formula:

\[
\text{INITSIZE} = 310 + (\text{LOGSNUM} \times A \times B / 1024)
\]

where:
- \( A = 2000 + (\text{number_of_entries} + 5) \)
- \( B = (\text{AVGBUFSIZE} \times 1.1289) + 195 \)

To calculate a value for \( \text{number_of_entries} \), use the following formula:

\[
\text{number_of_entries} = \left( (\text{apkintvl} + \text{trandur}) \times \text{writespersec} \right) / 0.9
\]

where:
- \( \text{apkintvl} \) is the interval between activity key points, which varies with workload. Calculate it as follows:
  \[
  \text{apkintvl} = \frac{\text{AKPFREQ}}{((\text{N1} \times \text{R1}) + (\text{N2} \times \text{R2}) + (\text{Nn} \times \text{Rn}))}
  \]
  where:
  - \( \text{N1}, \text{N2} \ldots \text{Nn} \) is the transaction rate for each transaction (transactions per second).
  - \( \text{R1}, \text{R2} \ldots \text{Rn} \) is the number of log records written by each transaction.
  - \( \text{trandur} \) is the execution time (between sync points) of the longest-running transaction that runs as part of the normal workload.

If this duration is longer than the \( \text{apkintvl} \) value, you have the following choices:
- Increase the value of the \( \text{AKPFREQ} \) parameter, thus increasing the value of \( \text{apkintvl} \), provided that the value does not result in an unacceptably large coupling facility structure size.
- Change the application logic to cause more frequent sync points.
- Calculate a structure size based on a shorter transaction duration, and accept that DASD offloading occurs when the long-running transaction is used.

\( \text{writespersec} = \text{lesser of 25 or } ((\text{N1} \times \text{R1}) + \ldots (\text{Nn} \times \text{Rn})), \) where:
- \( \text{N1}, \text{N2} \ldots \text{Nn} \) are the transaction frequencies (transactions per second) of the most frequently run transactions.
- \( \text{R1}, \text{R2} \ldots \text{Rn} \) is the number of log records written by each transaction.

To calculate the value of \( \text{AVGBUFSIZE} \) for the primary system log, DFHLOG, you can use the weighted average of the data logged by the most frequently run transactions in the system:

\[
\text{AVGBUFSIZE} = \left( \frac{\text{bytespersec}}{\text{writespersec}} \right) + 48
\]

where:
- \( \text{bytespersec} = (\text{N1} \times \text{D1}) + (\text{N2} \times \text{D2}) + \ldots (\text{Nn} \times \text{Dn}) \)
- N1, N2 .... Nn are the transaction frequencies (transactions per second) of the most frequently run transactions.
- D1, D2 .... Dn are the bytes of data logged by each transaction.

You can calculate the amount of data (Dn) written to the system log for each transaction:

\[ D_n = N_s \times \text{syncreclen} + N_{fc} \times (\text{fcrechdr} + \text{fcreclen}) + N_{ts} \times (\text{tsrechdr} + \text{tsreclen}) + N_{td} \times (\text{tdrechdr} + \text{tdreclen}) + N_{ur} \times (\text{urrechdr} + \text{urreclen}) \]

where:
- \( N_s \) is the number of sync points per transaction; usually 1.
- \( \text{syncreclen} \) is the sync point record length.
- \( N_{fc}, \text{fcrechdr}, \text{fcreclen} \) are the number of recoverable updates made, the length of the record headers, and the length of the records for file control, respectively.
  Count only READ UPDATE and WRITE ADD records. \( \text{fcrechdr} \) is 144 (136 bytes of record header plus 8 bytes of file name).
- \( N_{ts}, \text{tsrechdr}, \text{tsreclen} \) are for recoverable temporary storage updates.
  Count only TS PUT and TS UPDATE records. For TS PUT records, \( \text{tsrechdr} \) is 108, and \( \text{tsreclen} \) is 88. For TS UPDATE records, \( \text{tsrechdr} \) is 108, and \( \text{tsreclen} \) is 52.
- \( N_{td}, \text{tdrechdr}, \text{tdreclen} \) are for recoverable transient data updates.
  \( \text{tdrechdr} \) is 108, and \( \text{tdreclen} \) is 380.
- \( N_{ur}, \text{urrechdr}, \text{urreclen} \) are for user records written to DFHLOG.
  \( \text{urrechdr} \) is 125.

* See [Writes per second calculation](#) for details of how to calculate writespersec.

If the result of the calculation shows a value for AVGBUFSIZE that is greater than the value defined for MAXBUFSIZE, the value defined for MAXBUFSIZE is taken as the value for AVGBUFSIZE, and writespersec is calculated as follows:

\[ \text{writespersec} = \frac{\text{bytespersec}}{(\text{MAXBUFSIZE} - 48)} \]

Round the final result of the INITSIZE formula up to the next multiple of 256.

### Calculating SIZE for DFHLOG

To calculate the SIZE value to use in the CFRM policy for the primary system log, use the following formula:

\[ \text{SIZE} = 480 + (\text{LOGSNUM} \times A \times B / 1024) \]

where:
- \( A = 2500 + (\text{number_of_entries} + 5) \)
- \( B = (\text{AVGBUFSIZE} \times 1.6821) + 289 \)

To calculate a value for \( \text{number_of_entries} \), see [number of entries calculation](#).

Round the final result of the SIZE formula up to the next multiple of 256. The formula for SIZE gives a result that is approximately fifty percent greater than the INITSIZE value.
Calculating LOWOFFLOAD for DFHLOG

You can calculate a suitable value for LOWOFFLOAD for DFHLOG using one of the following formulas:

- \( \text{LOWOFFLOAD} = \frac{\text{trandur} \times 90}{\text{akpintvl} + \text{trandur}} + 10 \) (where RETPD=0 specified)
- \( \text{LOWOFFLOAD} = \frac{\text{trandur} \times 90}{\text{akpintvl} + \text{trandur}} \) (where RETPD=dddd specified)

where:

- \( \text{akpintvl} \) is the interval between activity key points. See activity key point interval calculation.
- \( \text{trandur} \) is the execution time, between sync points, of the longest-running transaction that runs as part of the normal workload.

If this duration is longer than \( \text{akpintvl} \) value, you have the following choices:

- Increase the value of the AKPFREQ parameter, thus increasing the value of \( \text{akpintvl} \), provided that this value does not result in an unacceptably large coupling facility structure size.
- Change the application logic to cause more frequent sync points.
- Calculate a structure size based on a shorter transaction duration, and accept that DASD offloading occurs when the long-running transaction is used.

For a description of the low offload threshold for a logstream, see LOWOFFLOAD and HIGHOFFLOAD parameters on log stream definition in CICS Performance Guide.

Calculating INITSIZE and SIZE for DFHSHUNT

Generally, the secondary system logstream is only a fraction of the size of the primary logstream. To calculate coupling facility space for DFHSHUNT, use the following formulas:

- \( \text{INITSIZE} = (150 \times \text{LOGSNUM}) + 310 \)
- \( \text{SIZE} = (230 \times \text{LOGSNUM}) + 480 \)

where \( \text{LOGSNUM} \) is number of logstreams that can write data to the secondary logstream.

Structure size for forward recovery log usage

You can merge the forward recovery logs written by many CICS regions onto the same log stream. You can also use the same log stream for forward recovery data for multiple data sets.

You can calculate a value for number of entries for the INITSIZE and SIZE attributes in the following way:

\[ \text{no. entries} = \text{writespersec} \times 12.5 \]

where:

\[ \text{writespersec} = \text{lesser of 25 or } (N1 + \ldots \ldots + Nn) \]

where \( N1 \ldots Nn \) is the number of transactions per second writing to each data set.

You can calculate AVGBUFSIZE in the following way:

\[ \text{AVGBUFSIZE} = \left( \frac{\text{bytespersec}}{\text{writespersec}} \right) + 36 \]
where:
- \( \text{bytespersec} = (N_1 \times W_{r1} \times (D_1 + \text{rechdr}) + \ldots + (N_n \times W_{rn} \times (D_n + \text{rechdr}))) \)
- \( \text{writespersec} = \text{lesser of 25 or } (N_1 + \ldots + N_n) \), where:
  - \( N_1 \ldots N_n \) is the number of transactions per second writing to each data set.
  - \( W_{r1} \ldots W_{rn} \) is the number of write requests per transaction.
  - \( D_1 \ldots D_n \) is the average record length for each data set.
- \( \text{rechdr} \) is the record header length of each record.

If the records are WRITE ADD, WRITE ADD COMPLETE, or WRITE ADD DELETE records, \( \text{rechdr} \) is 84 and is followed by the record key and the record data (including its key).

If the result of the calculation shows a value for AVGBUF_SIZE that is greater than the value defined for MAXBUF_SIZE, the value defined for MAXBUF_SIZE is taken as the value for AVGBUF_SIZE, and \( \text{writespersec} \) is calculated:
\[
\text{writespersec} = \frac{\text{bytespersec}}{(\text{MAXBUF_SIZE} - 36)}
\]

**Structure size for user journal and autojournal usage**

You can use the z Systems Coupling Facility Structure Sizer tool (CFSizer), or the formulas provided, to calculate storage requirements for the user journal and autojournal.

The CFSizer calculations assume that the coupling facility is at the current CFLEVEL. The formulas provided assume the coupling facility is at CFLEVEL 11.

**Using CFSizer to determine structure size**

CFSizer is a web-based application that communicates with a coupling facility at a current CFLEVEL to calculate storage requirements. For the user journal and autojournal, it calculates suitable values for the INIT_SIZE and SIZE parameters. See [http://www.ibm.com/systems/support/z/cfsizer/](http://www.ibm.com/systems/support/z/cfsizer/).

To use CFSizer to calculate storage requirements for the user journal and autojournal, enter the following information:

**Writes per second**

The number of log blocks written to the log stream per second from a single system. This value is available in the CICS statistics reports. See Logstreams reports in CICS Performance Guide.

**Maximum buffer size**

The size, in bytes, of the largest log block that can be written to a logstream. The value must be between 1 and 65532. This value corresponds to the MAXBUF_SIZE value in the definition of the logstream coupling facility structure. See “Defining coupling facility structures” on page 193.

**Average buffer size**

The average size in bytes of log blocks written to all logstreams. This input is used to determine the initial entry to element ratio of the structure. This value corresponds to the AVGBUF_SIZE value in the definition of the logstream coupling facility structure. See “Defining coupling facility structures” on page 193.
Number of logstreams

The number of logstreams allocated to a structure. This must be a value from 0 to 512. In a CICS environment, the number of logstreams should be between 10 and 20.

For the user journal and autojournal, CFSizer uses the following default values:

**Highoffload**
80

**Lowoffload**
0

Using formulas to calculate structure size

Calculate values for the INITSIZE and SIZE attributes. See "Calculating INITSIZE for DFHLOG" on page 204 and “Calculating SIZE for DFHLOG” on page 205.

To calculate a value for number_of_entries, use the following formula:

\[
\text{number_of_entries} = \text{writespersec} \times 12.5
\]

See the explanation of writespersec later in this topic.

For journals with log blocks that are not forced to the log stream, the average block size tends to be slightly less than the MAXBUFSIZE value defined for the coupling facility structure.

For journals with log blocks that are forced to the log, using the EXEC CICS WAIT JOURNALNAME or EXEC CICS WAIT JOURNALNUM commands, or using the WAIT option of the EXEC CICS WRITE JOURNALNAME or EXEC CICS WRITE JOURNALNUM commands, you can calculate AVGBUFSIZE from the weighted average of the data logged for each journal logging to the same log stream for a given CICS system.

\[
\text{AVGBUFSIZE} = \frac{\text{bytespersec}}{\text{writespersec}} + 36
\]

where:

- \( \text{bytespersec} = (N1 \times \text{Wr1} \times (D1 + \text{rechdr}) + \ldots + (Nn \times \text{Wrn} \times (Dn + \text{rechdr}))) \)
- \( \text{writespersec} = \text{lesser of 25 or } ((N1 \times \text{Wa1}) + \ldots + (Nn \times \text{Wan})) \) where:
  - \( N1, \ldots, Nn \) is the number of transactions per second writing to the journal.
  - \( \text{Wr1} \ldots \text{Wrn} \) is the number of write requests per transaction.
  - \( \text{Wa1} \ldots \text{Wan} \) is the number of wait requests per transaction.
  - \( D1 \ldots Dn \) is the average record length of each journal record.
  - \( \text{rechdr} \) is the record header length of each record.

Autojournal records are issued from file control. They might be DATA SET NAME records, which consist of a 204-byte record header, and no further data. Alternatively, they might be READ ONLY, READ UPDATE, WRITE UPDATE, WRITE ADD, or WRITE ADD COMPLETE records. In this case, \( \text{rechdr} \) is 84 bytes and is followed by the file control record itself.

User journal records consist of a 68-byte record header, followed by the user prefix and the user data.

If the result of the calculation shows a value for AVGBUFSIZE that is greater than the value defined for MAXBUFSIZE, the value defined for MAXBUFSIZE is taken as the value for AVGBUFSIZE, and writespersec is calculated as follows:
writespersec = bytespersec / (MAXBUFSIZE - 36)

Coupling facility requirements in an RLS environment

When you move to an RLS environment from an environment where multiple AORs accessed data sets in an FOR, the logging activity of the FOR is distributed across the AORs. Therefore, the coupling facility structure size required by each AOR increases.

Calculating increased AOR coupling facility storage requirements

Use the following formulae to calculate the avgbufsize, number of entries and akpintvl values for the AORs in the new RLS environment.

Calculate the AOR AVGBUFSIZE value required by the INITSIZE and SIZE formulae:

\[
AOR\ AVGBUFSIZE = \left( AOR\_bytes + \frac{FOR\_bytes}{\text{no. of AORs}} \right) / (\text{intvlen} \times 25)
\]

where:
- AOR_bytes is the number of bytes written to the system log by an AOR in the sampling interval.
- FOR_bytes is the number of bytes written to the system log by an FOR in the sampling interval.
- no of AORs is the number of cloned AORs using the FOR.
- intvlen is the length in seconds of the sampling interval.

Calculate the AOR no. entries value required by the INITSIZE and SIZE formulae:

\[
AOR\ no.\ entries = (AOR\_akpintvl + \text{trandur}) \times 25) / 0.9
\]

where:
- AOR_akpintvl = \left( \frac{AKPFREQ \times \text{intvlen}}{AOR\_recs + \frac{FOR\_recs}{\text{no. of AORs}}} \right)

where:
  - intvlen is the length in seconds of the sampling interval.
  - AOR_recs is the number of records written to the system log by an AOR in the sampling interval.
  - FOR_recs is the number of records written to the system log by an FOR in the sampling interval.
  - no of AORs is the number of cloned AORs using the FOR.
  - trandur is the execution time between sync points of the longest-running transaction that runs as part of the normal workload.

If this value is greater than AOR_akpintvl, use AOR_akpintvl as the duration or consider increasing AKPFREQ.

After you calculate the values for AOR AVGBUFSIZE and AOR no. entries, determine the values of INITSIZE and SIZE, as described in “Structure size for system log usage” on page 202.

Use the reports produced from the log stream statistics from CICS Transaction Server for z/OS that occur in a reporting interval for the AORs and the FOR to calculate the values:
• The number of log write operations
• The amount of data written

**Staging data sets for coupling facility logstreams**

MVS usually keeps a second copy of the data written to the coupling facility in a data space, for use when rebuilding a coupling facility log if an error occurs.

This backup is satisfactory if the coupling facility is failure-independent from MVS; that is, in a separate CPC and non-volatile.

When the coupling facility is in the same CPC, or uses volatile storage, the MVS system logger supports staging data sets for copies of logstream data that might otherwise be vulnerable to failures that affect both the coupling facility and the MVS images.

When defining logstreams, consider the following tasks:

• Define STG_DUPLEX(YES) and DUPLEXMODE(COND) for those logstreams that are associated with the system log. These definitions ensure that the MVS system logger automatically copies to staging data sets if it detects that the coupling facility is not failure-independent and is a single point of failure, and is therefore vulnerable to permanent log data loss.

  A connection to a logstream contains a single point of failure if the coupling facility is volatile or it resides on the same CPC as the MVS system connecting to it. For example, if there are two CPCs, CPC1 and CPC2, and CPC1 has an MVS LPAR and a coupling facility, but CPC2 has only MVS LPARs, the connections from the MVS LPAR in CPC1 to the coupling facility are failure-dependent. If you lose CPC1, you lose both MVS and its local buffers and the coupling facility. However, the connections from CPC2 are failure-independent, because the system logger local storage and buffers are in a physically separate CPC from the coupling facility, and the data is lost only if both fail. With DUPLEXMODE(COND), failure-dependent connections result in staging sets, but failure-independent connections are not allocated staging data sets.

• If you are operating with only a single coupling facility, define STG_DUPLEX(YES) and DUPLEXMODE(UNCOND) for those logstreams associated with the system log.

• Define STG_DUPLEX(YES) and DUPLEXMODE(COND) for those logstreams associated with forward recovery logs. If you do not, and a failure causes loss of data from the logstream, you need to take a new image copy of the associated VSAM data sets. For the consequent period of time until this operation is complete, the data sets are not fully protected.

• If you operate a nonvolatile, stand-alone coupling facility for normal logging, with a PR/SM LPAR configured as a coupling facility acting as backup, define all logstreams with STG_DUPLEX(YES) and DUPLEXMODE(COND).

• Define each staging data set to be at least the same size as the logstream share of the coupling facility, but round the average block size up to 4 KB.

For example, you can calculate the staging data set size that corresponds to the basic coupling facility space requirement for each CICS system logstream (DFHLOG) by using the following formula:

\[
\text{staging data set size} = \text{number of entries} \times \text{rnd-avg-buf} / 4096
\]

where \( \text{rnd-avg-buf} = \text{avgbufsize} \) (rounded up to 4K)

To calculate a value for \( \text{number of entries} \), see [number of entries calculation](#).
DASD-only log streams

The CICS log manager supports the DASD-only option of the MVS system logger.

Individual CICS log streams can use either coupling facility log structures or DASD-only logging. You might define a log stream to use DASD-only logging for these reasons:

- You do not have a coupling facility.
- You want to preserve coupling facility space for other uses.
- You do not require the log stream to be shared across MVS systems. (The CICS system log can never be shared.)

See Setting up the environment for CICS log manager for advice about defining individual log streams to use coupling facility or DASD-only logging, based on their usage.

Defining DASD-only log streams

Use the MVS IXCMIAPU utility to define DASD-only log streams to the LOGR couple data set.

The following code sample shows the basic syntax to define a DASD-only log stream:

```plaintext
DEFINE LOGSTREAM NAME(log_stream_name)
   DASDONLY(YES)
   MAXBUFSIZE(max_bufsize)
   STG_SIZE(stg_size)
   HIGHOFFLOAD(high_offload)
   LOWOFFLOAD(low_offload)
```

Figure 15 shows example definitions for a pair of log streams associated with a DASD-only system log.

```
//DEFLOGS JOB ...
//LOGDEFN EXEC PGM=IXCMIAPU
//STEPLIB DD DSN=SYS1.MIGLIB,DISP=SHR
//SYSPRINT DD SYSOUT=*
//******************************************************************
//**** Define DASD-only log streams for CICS system log. **********
//******************************************************************
//** only -- substitute values appropriate for your environment. **
//******************************************************************
//SYSIN DD *
DATA TYPE(LOGR) REPORT(NO)
DEFINE LOGSTREAM NAME(region_userid.applid.DFHLOG)
   DASDONLY(YES)
   MAXBUFSIZE(64000) STG_SIZE(3000)
   LOWOFFLOAD(40) HIGHOFFLOAD(80)
DEFINE LOGSTREAM NAME(region_userid.applid.DFHSHUNT)
   DASDONLY(YES)
   MAXBUFSIZE(64000) STG_SIZE(500)
   LOWOFFLOAD(40) HIGHOFFLOAD(80)
```

Figure 15. Example definitions of DASD-only log streams. The definitions are for the CICS primary and secondary system log streams. The value region_userid is the RACF user ID under which the CICS address space is running; applid is the CICS region's SNA APPL name, taken from the APPLID system initialization parameter.
Using model log streams
To avoid defining explicitly each log stream used by each of your CICS regions, you can use model log stream definitions.

Using models, log streams are defined to MVS dynamically, on their first usage. Figure 16 shows example DASD-only model definitions for CICS primary and secondary system log streams.

```
//DEFLOGS JOB ...
//LOGDEFN EXEC PGM=IXCMIAPU
//STEPLIB DD DSN=SYS1.MIGLIB,DISP=SHR
//SYSPRINT DD SYSOUT=*
//******************************************************************************
//** Define DASD-only model log streams for CICS system log. **
//** The LOWOFFLOAD and STG_SIZE values are for illustration **
//** only -- substitute values appropriate for your environment. **
//******************************************************************************
//SYSGIN DD *
DATA TYPE(LOGR) REPORT(NO)
DEFINE LOGSTREAM NAME(sysname.DFHLOG.MODEL)
  MODEL(YES)
  DASDONLY(YES)
  MAXBUFSIZE(64000)
  STG_SIZE(3000)
  LOWOFFLOAD(40) HIGHOFFLOAD(80)
DEFINE LOGSTREAM NAME(sysname.DFHSHUNT.MODEL)
  MODEL(YES)
  DASDONLY(YES)
  MAXBUFSIZE(64000)
  STG_SIZE(500)
  LOWOFFLOAD(40) HIGHOFFLOAD(80)
```

Figure 16. Example model definitions for DASD-only system log streams. The value sysname is the sysid of the MVS image in which the CICS region or regions are running.

For information about the mapping of CICS journal definitions to log stream names, see Setting up CICS log streams in the System Definition Guide.

When using model log streams, note that, if you specify a STG_SIZE on the model definition, all new log streams created from the model have the same-sized staging data set.

Sizing for DASD-only log streams
You must work out the sizes of the CICS primary and secondary system log streams, forward recovery logs, and user journals and autojournals.

Sizing DFHLOG
To size the CICS primary system log stream, DFHLOG:

- Minimize the amount of data that is offloaded to secondary storage
  The MVS system logger begins the offload process when the high offload threshold (HIGHOFFLOAD) of the log stream is reached. The offload process consists of two steps:
  1. The MVS logger physically deletes the data in the log stream that has been marked for deletion by the CICS log-tail deletion process.
2. The MVS logger calculates how much data must be offloaded to secondary storage, based on the difference between HIGHOFFLOAD and LOWOFFLOAD, less the amount of data that has been deleted since the last offload event.

To minimize the amount of data offloaded from the CICS primary system log, you must:

- Define a suitably sized staging data set. You can alter the size of a staging data set without deleting the log stream. To do so, use the UPDATE LOGSTREAM request of the MVS IXCMIAPU utility to change the value of the STG_SIZE parameter.
- Ensure that the log-tail deletion process is working effectively. For detailed information about the log-tail deletion process, see Log-tail deletion.

- **Avoid “staging-data-set-full” events**
  
  A staging-data-set-full event occurs when a log stream’s staging data set becomes full before the offloading of data has completed.

  For advice on monitoring and avoiding staging-data-set-full events, see Monitoring the logger environment.

**Sizing DFHSHUNT**

You must size the secondary system log stream, DFHSHUNT, to avoid staging-data-set-full events. However, typically some data is offloaded from DFHSHUNT to secondary storage.

**Sizing general logs**

You must size forward recovery logs, user journals, and autojournals to avoid staging-data-set-full events. However, because CICS does not delete data from these log streams, data is typically offloaded to secondary storage.

**Setting attribute values for log stream and system definitions**

Table 11 summarizes how you decide on the values for various attributes on the log stream definition, and system definition.

<table>
<thead>
<tr>
<th>Facility</th>
<th>Attribute</th>
<th>Method or Value</th>
</tr>

</tbody>
</table>

Startup might take longer than you experienced when using earlier releases. This is caused in part by the allocation and formatting of the staging data sets. Increased startup time depends on factors like these:

- Size of staging data set (STG_SIZE)
- DASD speed
- DASD contention

You can reduce startup time by avoiding large staging data sets.

**Sizing your DASD log streams**

If you are capacity planning for new applications, you must calculate your space requirements.

The formulae provided help you to calculate values for LOWOFFLOAD and STG_SIZE.

You must base your calculations on the journaling requirements of your applications. These requirements provide the starting point for the following formulae.

You can calculate LOWOFFLOAD for DFHLOG using the following formula:

\[
\text{LOWOFFLOAD} = \frac{(\text{trandur} \times 90)}{(\text{akpintvl} + \text{trandur})} + 10 \quad (\text{where RETPD}=0 \text{ specified})
\]

or

\[
\text{LOWOFFLOAD} = \frac{(\text{trandur} \times 90)}{(\text{akpintvl} + \text{trandur})} \quad (\text{where RETPD} dddd \text{ specified})
\]

where:

- apkintvl is the interval between activity key points. Calculate it using the following formula:
  \[
  \text{apkintvl} = \frac{\text{AKPFREQ}}{(N1 \times R1) + (N2 \times R2) + (Nn \times Rn)}
  \]
  where:
  - \(N1, N2 \ldots Nn\) is the transaction rate for each transaction (transactions per second).
  - \(R1, R2 \ldots Rn\) is the number of log records written by each transaction.
  - \(\text{trandur}\) is the execution time (between sync points) of the longest-running transaction that runs as part of the normal workload.

If this duration is longer than the \(\text{apkintvl}\) value, you have these choices:

- Increase the value of \(\text{AKPFREQ}\), thus increasing the value of \(\text{apkintvl}\), provided that this value does not result in an unacceptably large staging data set size.
– Change the application logic to cause more frequent sync points.
– Calculate a staging data set size based on a shorter transaction duration, and accept that offloading to secondary storage occurs when the long-running transaction is used.

You can calculate STG_SIZE for DFHLOG using the following formula:

\[
\text{Staging DS size} = (\text{AKP duration}) \times \text{No. of log writes per second for system log (no. of 4k blocks)}
\]

where AKP duration = (CICS TS 390 AKPFREQ)/(No. buffers per second)

You can take the values for the number of log writes per second and buffer puts per second from your statistics. The value for log writes per second must not exceed 30.

**Converting a DASD-only log stream to use a coupling facility**

You can upgrade a DASD-only log stream to use a coupling facility structure, without having to delete and redefine the log stream.

1. Make sure that there are no connections, neither active nor failed, to the log stream.
2. Use the UPDATE LOGSTREAM request of the MVS IXCMIAPU utility. Specify the STRUCTNAME keyword, and let the DASDONLY keyword default to NO. For example:

```verbatim
//LOGUPDT JOB ...
//LOGUPDT EXEC PGM=IXCMIAPU
//SYSPRINT DD SYSOUT=A,DCB=RECFM=FBA
//****************************************************************
// Convert DASD-only log stream to coupling facility log stream.
//****************************************************************
//SYSSIN DATA TYPE(LOGR) REPORT(NO)
UPDATE LOGSTREAM NAME(region_userid.applid.DFHLOG)
   STRUCTNAME(LOG_DFHLOG_001)
   STG_DUPLEX(YES) DUPLEXMODE(COND)
Figure 17. Converting a DASD-only log stream to use a coupling facility structure. This example shows the CICS primary system log stream. The value `region_userid` is the RACF user ID under which the CICS address space is running; `applid` is the CICS region's SNA APPL name, taken from the APPLID system initialization parameter.

1. To upgrade a DASD-only log stream to a coupling facility log stream that does not use a staging data set, you must explicitly specify STG_DUPLEX(NO), because the DASD-only log stream by definition uses a staging data set; unless you specify STG_DUPLEX(NO), this storage data set is retained by the coupling facility log stream.
2. You cannot use UPDATE LOGSTREAM to convert a log stream that uses a coupling facility structure to one that uses DASD-only. To do that, you must delete and redefine the log stream.

**Analyzing system logger data (SMF Type 88 records)**

When you review the output from the system logger reports produced by IXGRPT1, IXGRPT1J, and IXGRPT1L, look at the following key fields for CICS system logs.

Check the following key fields:
• The number of bytes deleted from primary storage is close to the number of bytes written.
• The number of bytes deleted from the system log after writing to offload data sets is usually very low:
  – If this number is high, resources are being used to move data to the offload data set only to be later deleted.
  – This number is a key indicator that log-tail deletion is not working effectively.
  – Check the MVS system log for any DFHRM0205 and DFHLG0743 messages from the affected CICS region.
  – Look for long-running tasks (using CICS monitoring data or a system monitoring package), or check if AKPFREQ is too high.
• In general offloads are acceptable, but offloads triggered by NTRY FULL indicators are not a good sign:
  – NTRY FULL indicates that the entry-to-element ratio is too high.
  – Such offloads are probably the result of unlike logstream defined in the same structure.
  – The offloads are being triggered by all the entries being used rather than triggered by the HIGHOFFLOAD value.
• TYPE3 I/O counts must not appear in the statistics for coupling facility log streams, because they indicate that I/O is being initiated when over 90% of the elements for the log stream are in use.
• Average buffer size is important for these reasons:
  – If over 4 KB, the writes are asynchronous, rather than synchronous.
  – Buffer size is used to determine the entry to element ratio.
  – If MAXBUFSIZE specified on the log stream definition is lower than 65 532-bytes, the element size is 256-bytes.
  – If MAXBUFSIZE is 65 532-bytes, the element size is 512-bytes.
  – The entry-to-element ratio is calculated as (average-buffer-size plus 4 divided by 4).

Managing secondary storage

Use System Managed Storage (SMS) to manage log stream data sets.

Managing log data sets

You can specify the SMS characteristics of log data sets in a number of ways, depending on your installation.

Using automatic class selection (ACS) routines

You can use installation-written automatic class selection (ACS) routines to assign log data sets to SMS classes.

Using the LOGR policy

When you define or update a log stream definition in the LOGR policy, you can assign the SMS storage class, data class, and management class for both the DASD log data sets and staging data sets.

• Use LS_DATAACLAS to specify the SMS data class to be used for log stream data set allocation.
• Use LS_STORACLAS to specify the SMS storage class to be used for log stream data set allocation.
Use LS_SIZE to specify the size, in 4 KB blocks, of the log stream DASD data sets. Specify a size so that each data set can contain multiple offloads of the primary storage: this capability is particularly important if all the data is offloaded for a log stream, as in the case of user journals and forward recovery logs. The MVS system logger issues message IXG256I if you specify less than 64 KB.

If you omit the size parameter, the size is taken from the ALLOCxx member of PARMLIB. The default is 2 tracks, which leads to a high number of new data set allocations. Specify a size that is large enough to avoid a high frequency of new data set allocations; aim for a new data set to be allocated less frequently than once an hour.

SHAREOPTIONS(3,3)
Always define logger data sets with SHAREOPTIONS(3,3), whether the system is a part of a multiple-member sysplex or a monoplex. The common symptom of not having SHAREOPTIONS(3,3) is return code 84A or 403 from the logger.

For more information about managing log data sets, see the z/OS MVS Setting Up a Sysplex manual.

Managing the system log
CICS manages the system log by deleting records, for completed units of work, during activity keypoint processing (log-tail deletion). With an appropriately sized log stream, the system log data remains in primary storage, thus avoiding data spilling to DASD.

Note that:
- The CICS system log must be used only for short-lived data required for recovery purposes. For example, do not write audit trail user records to the system log.
- Allow CICS to manage the size of the system log.

However, if historically you have used the system log for such things as audit trails, you might want to preserve system log data beyond the time it is typically deleted by CICS. You can use the RETPD MVS parameter to preserve system log data. Define DFHLOG and DFHSHUNT to MVS with AUTODELETE(NO) and RETPD(dddd). The default values are AUTODELETE(NO) and RETPD(0). By specifying AUTODELETE(NO), CICS, rather than MVS, retains control of the log-tail trimming process; dddd is the number of days for which data is to be retained. In this way, the MVS logger physically deletes an entire log data set when all of the data in the data set has been marked for deletion by the CICS log-tail trimming process and is older than the retention period specified for the log stream.

You can view log data that has been marked for deletion by CICS, but not yet physically deleted by MVS, with the DFHJUP utility program or the VIEW=ALL option of the MVS IXGBRWSE macro.

Managing general logs
The number of data sets per log stream recognized by the MVS logger is several million. Therefore, in general, do not be concerned about the limit being reached. You can cause redundant data to be deleted from log streams automatically, after a specified period. To arrange deletion for general log streams, define the logs to MVS with AUTODELETE(YES) and RETPD(dddd), where dddd is the number of
days for which data is to be retained. This definition causes the MVS system logger to delete an entire log data set when all the data in it is older than the retention period (RETPD) specified for the log stream.
Chapter 34. Enabling Unicode data conversion by z/OS

z/OS can provide support for the conversion of Unicode data (either UTF-8 or UTF-16) to any of the EBCDIC CCSIDs currently supported by CICS.

To make use of this support, you must enable the z/OS conversion services and install a conversion image that specifies the conversions that you want CICS to perform.

You must activate z/OS Support for Unicode before you start CICS.

For information about how to set up your system and configure a suitable conversion image, see z/OS Support for Unicode: Using Conversion Services.

If z/OS conversion services are not enabled, CICS issues a message to tell you. You can suppress that message if you do not require these services.

If the message is encountered when starting a CICS region that is expected to make use of these services, then an IPL is necessary to enable the z/OS conversion services.

To discover the status of z/OS conversion services after an IPL, use one of these commands from an MVS console:

- **D UNI** To show whether z/OS conversion services were enabled.
- **D UNI,ALL** To show whether z/OS conversion services were enabled, and which conversions are supported by the system.

If you want to enter the command from SDSF, add a / to the beginning of the command.

**Selecting conversion images**

CICS supports character conversions by means of the z/OS conversion services. Appendix F in z/OS Support for Unicode: Using Conversion Services lists the supported conversions. The conversions entries that you select must not specify type ER.

The z/OS conversion services support big-endian byte ordered data (UTF-16BE). They do not support little-endian byte ordered data (UTF-16LE). When asked to convert UTF-16LE source data to some other CCSID, CICS transforms the data to the big-endian form of UTF-16 before calling the z/OS conversion services. When the target data is identified as UTF-16 (CCSID 1200), CICS receives the converted data from the z/OS services in big-endian byte order, and returns it in this form.

There are three CCSIDs for UTF data:

- CCSID 1202 indicates UTF-16LE.
- CCSID 1201 indicates UTF-16BE.
- CCSID 1200, which indicates that the data carries a byte order marker which must be examined to see if the following form is big-endian or little-endian.
When handling CCSID 1200, CICS respects the byte order marker for inbound conversions, but cannot retain that information when handling a related outbound conversion. All outbound data for CCSID 1200 is UTF-16BE. Application programmers must know about this CCSID restriction, and perform their own BE to LE conversions if necessary.
Chapter 35. Applying service to CICS Transaction Server for z/OS

Service material for CICS Transaction Server for z/OS is distributed as APAR fixes and PTFs.

An APAR (Authorized Program Analysis Report) is raised when you and your IBM programming service representative agree that a CICS problem exists. You might be given an APAR fix. When the problem has been analyzed, all users are sent a PTF (Program Temporary Fix) to correct the problem permanently on the current release. PTFs are incorporated into any future CICS release. Both types of change are called SYSMODs (system modifications).

Using SMP/E control statements, you can process SYSMODs in three stages:

1. The RECEIVING control statement moves the SYSMOD into the PTF temporary store (PTS) data set. This operation is reversed by the REJECT control statement.
2. The APPLYING control statement moves the SYSMOD into the target libraries. This operation is reversed by the RESTORE control statement.
   At this point you can test the modified system.
3. The ACCEPT control statement moves the SYSMOD into the distribution libraries. This operation is not easily reversed.

When you are dealing with APAR fixes, apply the SYSMOD, but do not accept it. If you later obtain a PTF that solves the problem in a different way, you might be asked to restore (that is, remove) the APAR fix and apply the PTF instead.

When you are dealing with PTFs, apply the SYSMOD and then test it. Afterwards you can accept it.

For background information about SMP/E operations, see the System Modification Program Extended: General Information manual. For more detailed information, see the System Modification Program Extended: Reference manual.

Load library secondary extents

CICS supports load library secondary extents that are created while CICS is running.

If you define libraries in the DFHRPL or dynamic LIBRARY concatenation with primary and secondary extents, and secondary extents are added while CICS is running, as a result of link-editing into the load library, the CICS loader detects the occurrence and closes and then reopens the library. In this way, you can introduce new versions of programs by using the CEMT NEWCOPY command, even if the new copy of the program has caused a new library extent.

However, do not attempt to apply service to data sets that are used by CICS TS components that are running.
The CICS TS-supplied SMP/E procedure

DFHSMPE is a CICS TS-supplied procedure for applying service to the CICS and CICSPlex SM components of CICS TS.

This procedure is tailored to your environment and stored in the hlq.XDFHINST library when you run the DFHISTAR job.

For information about how to apply corrective service with SMP/E, see the System Modification Program Extended: User’s Guide.

Whenever you do any SMP/E processing on CICS or CICSPlex SM software, and you use any of the examples quoted in the System Modification Program Extended: User’s Guide, specify DFHSMPE as the name of the SMP/E procedure on the EXEC statement; that is, in place of SMPPROC, as used in the examples. The DFHSMPE procedure includes the following DD statement for supplying SMP/E control statements:

```plaintext
//SMPCNTL DD DSN=&&SETBDY,DISP=(OLD,DELETE)
// DD DDNAME=DFHSMPIN
```

The ZNAME parameter of the DFHSMPE procedure generates a SET BDY command for the zone that is identified by the parameter. The command is stored in the temporary data set, SETBDY. The ZNAME parameter is set to the value of zonename that you specify for the TZONE parameter. If you do not specify any value for zonename for the TZONE parameter of the DFHISTAR job, zonename and the ZNAME value default to TZONE.

The ZNAME parameter also generates a SET BDY command in DFHAUPLE, the CICS TS procedure supplied for assembling and link-editing CICS control tables.

If you supply an override SMPCNTL DD statement in the job that runs DFHSMPE, it must come before any DD statements that are additional to the procedure. Furthermore, if you provide an override, you receive the following MVS system message:

```
IEF686I DDNAME REFERRED TO ON DDNAME KEYWORD IN PRIOR STEP WAS NOT RESOLVED
```

You receive this message because the DD statement for DFHSMPIN is missing because of the SMPCNTL DD override. However, the message is not a JCL error, and does not prevent the step from running successfully with a return code of 0.

If you supply any SMP/E control statements in your job using the DFHSMPIN ddname, they are prefixed by a SET BDY command for the zone that you specify on the ZNAME parameter. If you run SMP/E with a command that does not require this SET BDY statement, the way your job runs is not affected.

APARs and PTFs

An APAR is a temporary fix created for individual customers. PTFs are intended for all users to install to avoid possible problems.

**APARs**

Generally, do not ACCEPT APAR fixes into distribution libraries. Subsequent PTFs might not include the APAR fix, and you might be required to reapply the APAR fix.
If two APAR fixes depend on each other, and each is a prerequisite of the other, you must apply them both in the same SMP/E APPLY processing step.

PTFs

A PTF can contain fixes for several different problems, so several APAR fixes reported in RETAIN might be superseded by the more permanent PTF:

- A PTF provides card-image changes that are functionally equivalent to those in the APAR fix.
- A PTF contains object-module replacements for preassembled CICS TS programs.

For further information about using SMP/E to apply service, see the *System Modification Program Extended: User’s Guide*.

Applying service to CICS modules

If you use the CICS TS-supplied SMP/E usermod to install a module into the LPA (for example, into the hlq.SDFHLPA library), and later apply service to that module, the LPA-resident version of the module is serviced. If you have not used the SMP/E usermod to install the module into the LPA, the original version in the hlq.SDFHAUTH library or hlq.SDFHLOAD library is serviced.

After you have installed CICS, and before you start the postinstallation tasks, change the TEMPLIB parameter and the SYSPROC DD statement of the DFHISTAR job to refer to the hlq.SDFHINST library. This reference ensures that, if you apply service to any of the skeleton jobs, the changes applied to the hlq.SDFHINST library are used in subsequent runs of DFHISTAR. In any such subsequent runs of DFHISTAR, you can use the SELECT parameter to select any jobs that are affected by service.

1. If DFHISTAR is serviced, add the service changes to your DFHISTAR module in the hlq.TDFHINST library to preserve your current installation parameters, or respecify your current installation parameters in the serviced DFHISTAR module, which you can copy from the hlq.SDFHINST library to the hlq.TDFHINST library.

2. Linkage editor messages IEW0461, IEW2454, IEW2646, IEW2651, and IEW2689 are produced during the APPLY stage for unresolved external references. These messages are issued, giving a return code of 4, when some CICS load modules are link-edited during PTF installation. You can ignore these IEWxxxx messages because they are produced for component object modules of executable CICS load modules.

3. JCI670D and JCI670E PTFs to ship Java service are often significantly larger than those for the base CICS product and might require more system resources during APPLY processing. To avoid errors caused by insufficient storage, do not restrict the region size for the SMP/E APPLY step for such PTFs. If a region size limit is used and the APPLY fails with errors relating to insufficient storage, it might be necessary to increase or remove the limit for the SMP/E job. In some cases, you might require a region size of 500 MB or more.
Chapter 36. Applying service to CICSPlex SM

Service material for CICSPlex SM is distributed as corrective or preventive service.

Both types of changes are called system modifications (SYSMODs). SYSMODs are processed using SMP/E control statements.

For background information on SMP/E operations, see the System Modification Program Extended: General Information. For more detailed information, see the System Modification Program Extended: Reference. For information about how to apply corrective service using SMP/E, see the System Modification Program Extended: User’s Guide.

CICS Transaction Server for z/OS-supplied SMP/E procedure

For all CICS Transaction Server regions, the procedure for applying service is DFHSMPE.

You can customize this procedure with the DFHISTAR job that is stored in the CICSTS42.CICS.XDFHINST library.

For full details about applying service to the CICSPlex SM component of CICS TS, see Chapter 35, “Applying service to CICS Transaction Server for z/OS,” on page 221.

Applying PTFs to CICSplices running CICS Transaction Server for z/OS, Version 3 Release 2 and later

Use this procedure if the PTF modifies a CICSPlex SM resource table. If any CMAS in your CICSplice is running CICS TS or an earlier release of CICSPlex SM, consult the documentation that comes with the PTF for advice on how to proceed.

Use this procedure if the PTF modifies a CICSPlex SM resource table:

- First apply the PTF to the maintenance point for the CICSplice.
- If the PTF modifies a repository record, upgrade the repository at the maintenance point before restarting the maintenance point CMAS.
- After the maintenance point CMAS is restarted, apply the PTF to any local MASs connected to the maintenance point CMAS. You can restart these local MASs one at a time. You do not have to restart them all together.
- After the maintenance point CMAS is restarted, apply the PTF to any other CMASs in the CICSplice. You can do this at the same time as the MASs connected to the maintenance point are being updated. You can update the non-maintenance point CMASs one at a time and you do not have to restart them all together.
- If the PTF modifies a repository record, upgrade the repository for the non-maintenance point CMAS before restarting it.
- After a non-maintenance point CMAS is restarted, you can apply the PTF to any local MASs connected to that CMAS and restart them. You can restart these local MASs one at a time. You do not have to restart them all together.
To summarize, update the maintenance point CMAS first, then the other CMASs, and update a MAS only after its owning CMAS has been updated.

A PTF might contain additional documentation, giving further instructions specific to that PTF.

If you have multiple CMASes connected together in a network with more than one CMAS being a Maintenance Point for different CICSplexes, you must apply PTFs to all CMASes simultaneously which function as a Maintenance Point.

For example, consider the following configuration:

- CMAS1 is an MP for PLEX1
- CMAS2 is an MP for PLEX2
- CMAS3 helps manage PLEX1 and PLEX2
- CMAS4 helps manage PLEX2

There are CMAS-to-CMAS connections between each of the above listed CMASes.

If you are applying PTF maintenance to CMAS1, you must also apply it to CMAS2 at the same time, because both CMASes function as MPs for various CICSplexes. Failure to do so results in CMAS isolation.

### Applying service CICSPlex SM modules

If you use the CICS TS-supplied SMP/E USERMOD to install modules into the LPA (for example, into the CICSTS42.CPSM.SEYULPA library), and later apply service to that module, the LPA-resident version of the module is serviced. If you have not used the SMP/E USERMOD to install the module into the LPA, the original version in the CICSTS42.CPSM.SEYUAUTH library or CICSTS42.CPSM.SEYULOAD library is serviced.

After you have applied CICSPlex SM service, ensure that all CICSPlex SM regions are running with a consistent set of CICSPlex SM libraries. Failure to do so can cause unpredictable results.

For more information about applying service to CICSPlex SM, see “CICS Transaction Server for z/OS-supplied SMP/E procedure” on page 225.
Part 5. Getting ready to run CICS

Before you can run CICS, you must tailor the CICS TS supplied skeleton jobs, apply service to CICS and create the CICS data sets.

In addition, you can use DL/I support with CICS, include MRO and ISC in your CICS region, and use the CICS TS installation verification procedures (IVPs) to confirm that CICS TS is operational.
Chapter 37. Tailoring the CICS-supplied skeleton jobs

You tailor the CICS-supplied skeleton jobs to your CICS TS environment.

If you used CBPDO or the ServerPac to install CICS TS, edit and run DFHISTAR to tailor the CICS-supplied skeleton jobs that create the CICS TS data sets and run the CICS TS IVPs.

If you used the distribution tape to install CICS TS, as described in the Program Directory for CICS Transaction Server for z/OS, you have typically tailored the skeleton jobs already, and you can now start Chapter 38, “Creating the CICS data sets,” on page 233.

Whichever method you used to install CICS TS, you can edit and run DFHISTAR several times, to create different copies of the skeleton jobs or subsequently change them. For example, to create several copies of DFHDEFDS to define data sets unique to several CICS regions, or if you have to apply service to any of the installation-related jobs. In this way, you can tailor the jobs to your CICS environment after you have loaded the CICS software into the SMP/E-supported CICS libraries.

The CICS installation libraries

When you use CBPDO to install CICS TS, you use the TDFHINST, XDFHINST, ADFHINST, and SDFHINST installation libraries.

Figure 18. Installation libraries for this release

The names of the CICS installation libraries in Figure 18 and their use is explained in the following notes which refer to the numbers in the figure:

1. Skeleton installation-related jobs are copied from data set HCI 640.F2 on the distribution tape into hlq.TDFHINST. hlq.TDFHINST is used to store the DFHISTAR that you edit and run to tailor the skeleton installation-related jobs.
to your CICS environment. Until you have installed the CICS software into the
SMP/E-supported CICS libraries, this library also stores the skeleton jobs to be
tailored.

2. You edit DFHISTAR in the hlq.TDFHINST library, to specify CICS installation
parameters specific to your CICS environment.

3. When you run DFHISTAR, the tailored copies of the skeleton jobs are copied
from the hlq.TDFHINST library to the hlq.XDFHINST library. hlq.XDFHINST is
used to store the tailored, executable, copies of the skeleton jobs that are to be
run.

4. To install CICS, you run the tailored copies of the CICS-supplied installation
jobs to transfer the CICS software from the distribution tape to the
hlq.ADFHINST and hlq.SDFHINST libraries..hlq.ADFHINST is the
SMP/E-supported distribution installation library. hlq.SDFHINST is the
SMP/E-supported target installation library. After you have installed the CICS
software into this library and other SMP/E-supported libraries, named
SFHxxxxx and ADFHxxxxx, the skeleton jobs that you use on any later runs of
DFHISTAR are stored in the SDFHINST library.

The names of the TDFHINST and XDFHINST libraries, and the prefix for those
and other CICS libraries, are defined in DFHISTAR, which you edit as described in
this topic.

Running DFHISTAR

When you have edited DFHISTAR with the values for installation parameters for
your CICS environment, submit DFHISTAR.

When you run DFHISTAR, it tailors the skeleton jobs selected by the SCOPE or
SELECT parameter in the DFHISTAR input to your environment and adds them to
the library that you specified on the LIB parameter (by default, hlq.XDFHINST). If
necessary, DFHISTAR creates the library that is specified on the LIB parameter.

A table in the Program Directory for CICS Transaction Server for z/OS lists those
skeleton jobs installed in the hlq.SDFHINST library that you can tailor by running
DFHISTAR.

You must specify the full name of the installation library from which the skeleton
jobs are obtained, on the TEMPLIB parameter and SYSPROC DD statement of
DFHISTAR (by default, hlq.TDFHINST). For the postinstallation tasks that are
described, specify TEMPLIB SDFHINST.

DFHISTAR produces a job log and, if necessary, an error code:

- The output job log lists the values that were used for the parameters of
  DFHISTAR.
- If an error occurs when running DFHISTAR, an error code of 4 or 12 is returned.
  For error code 4, the skeleton jobs are tailored and added to the hlq.XDFHINST
  library. For error code 12, the skeleton jobs are not tailored or copied. To resolve
  the cause of the error, examine the output job log and, if necessary, edit and
  submit DFHISTAR again.

CICSPlex SM postinstallation members

A number of CICSPlex SM postinstallation members are delivered, as skeletons, in
the TDFHINST library. When you run DFHISTAR, the postinstallation members are
customized and saved in the XDFHINST library.
Use these members to create a basic CICSPlex SM configuration that consists of a CMAS, a WUI, and a managed CICS system (MAS).

Postinstallation members are split into three areas as shown in Table 12, Table 13, and Table 14.

**Table 12. Postinstallation members for a CMAS**

<table>
<thead>
<tr>
<th>Member</th>
<th>Description</th>

Chapter 37. Tailoring the CICS-supplied skeleton jobs 231
For more information on managed CICS system customization, see "Creating and customizing MAS data sets" on page 308.
Chapter 38. Creating the CICS data sets

After you have installed CICS, and applied any necessary service, you can run the DFHCOMDS, DFHDEFDS, DFHCMACI, DFH0JCUS, and DFH0JHLP jobs to create the CICS data sets.

The data sets created by these jobs are required by the IVPs described in Part 6, “Verifying the CICS installation,” on page 357.

VSAM data sets

The supplied level of DFSMS changes the way that the index control interval size (CISIZE) is calculated for those VSAM data sets that have index components. As a result, expect a large default CISIZE, which can cause open errors during CICS startup.

The change in CISIZE applies to both CICS data sets and your own application data sets.

The following jobs perform these functions:

DFHCOMDS
Deletes and re-creates data sets common to all CICS regions.

DFHDEFDS
Deletes and re-creates copies of data sets that are used only by one CICS region. You run a separate copy of this job to create the data sets for each CICS region.

DFHCMACI
Deletes and re-creates the CICS messages data set, dsindex.DFHCMACD, and loads it with the data from the CICS-supplied file, DFHCMACD, in the hlq.SDFHMSGS target library.

DFH0JCUS
Deletes and re-creates the sample applications details data set, dsindex.SAMPLE.DFHCTCUS and its associated alternate index and path, and loads it with the data from the CICS-supplied file, DFH0DCUS, in the hlq.ADFHAPD2 library.

DFH0JHLP
Deletes and re-creates the sample applications help data set, dsindex.SAMPLE.DFHCTHLP, and loads it with the data from the CICS-supplied file, DFH0DHLP, in the hlq.ADFHAPD1 library.

When you run DFHISTAR, these jobs are tailored to your environment and stored in the library that you specify on the LIB parameter of DFHISTAR (by default, hlq.XDFHINST). If you have not yet run DFHISTAR, do so before running any of the CICS postinstallation jobs.

You can generate several copies of these jobs by rerunning DFHISTAR, selecting the jobs that you want to copy. To generate new copies of these jobs, edit
DFHISTAR to specify new values for the DSINFO and SELECT parameters. Only those jobs that you name in the SELECT parameter are regenerated.

**Naming conventions**

No restrictions apply to the data set names you choose for CICS data sets, other than MVS constraints.

In the examples in this information, *hilq* is the high-level qualifier, and the DD name is the lowest level. If you are running multiple CICS regions, you can use the CICS APPLID as a third-level qualifier.

Use the CTGI naming convention is an example of a naming convention that you can use for CICS 4-character names, and is based on the 4-character CTGI symbol:

- **C** identifies an entire CICSpool.
- **T** identifies the type of region.
- **G** identifies a group of regions.
- **I** identifies iterations of regions in a group.

Use the CTGI naming convention. For example, if CICSHTH1 is the APPLID, the following data set name for the CSD is correct:

```plaintext
dfhcscdd  dd  dsn=cicsts42.cics.cicshth1.dfhcscdd,disp=shr
```

Where names are allowed to be up to eight characters long, as for CICS APPLIDs, the letters CICS are used for the first four characters, particularly for production regions.

**Creating data sets common to all CICS regions, DFHCOMDS job**

Use the DFHCOMDS job to delete and re-create the data sets common to all CICS regions.

The following data sets are common to all CICS regions:

- **DFHCSD**
  - CICS system definition.
- **SYSIN**
  - SYSIN data set.

The CICS-supplied DFHCOMDS job creates one of each of these data sets common to all CICS regions. If you use separate copies of any of these data sets for each CICS region, move and edit the appropriate statements into the DFHDEFDS job. For further information about creating multiple copies of these data sets, see "Creating several copies of the DFHCSD and SYSIN data sets" on page 235.

The DFHCOMDS job comprises five job steps:

1. **DELETE** deletes the data sets.
2. **DEFCSD** defines the VSAM cluster for the CICS system definition data set, `dsindex.DFHCSD`, where `dsindex` is defined by the DSINFO parameter of DFHISTAR.
3. **INITCSD** initializes the CICS system definition data set.
4. **DEFRPIDC** defines the VSAM cluster for ONC RPC.
5. DEFSYSIN creates the SYSIN PDS and copies the following modules from the 
*hlq*.SDFHSAMP library:

- DFHSSIIPA
- DFHSSIIPD
- DFHSSIPI
- DFHSSIPT
- DFHSSIIP1
- DFHSSIIP2
- DFHSSIIP5
- DFHRCNO
- DFHRCYES

### Creating several copies of the DFHCSD and SYSIN data sets

The CICS-supplied DFHCOMDS job creates one of each of the DFHCSD and 
SYSIN data sets common to all CICS regions.

To use separate copies of any of these data sets for each CICS region:

- Move the statements that define the data set from the DFHCOMDS job to the 
  DFHDEFDS job.
- Edit the statements in the DFHDEFDS job to specify the symbol &REGNAME 
  for the region qualifier in the name of the data set.

Move and edit the appropriate data set statements before you create copies of the 
DFHDEFDS job for each CICS region. When you run DFHISTAR to create the new 
copies of the DFHDEFDS job, it substitutes your values for the CICS region 
qualifier (&REGNAME) and index (&INDEX) into the data set names.

**For example:** If you intend using a copy of the DFHCSD data set for each CICS 
region, copy the job steps DELCSD, DEFCSD, and INITCSD from the DFHCOMDS 
job to the DFHDEFDS job. Also, add the symbol &REGNAME for the qualifier to 
the name of the DFHCSD data set to give &DSINDEX.CICS&REGNAME.DFHCSD. If you 
edit DFHISTAR to select the DFHDEFDS job to be copied, and specify the 
following DSINFO parameter:

```
DSINFO userid.CICSTS42.CICS H3P060 3390 IDA.
```

when you run the DFHDEFDS job, it creates the DFHCSD data set called 
userid.CICSTS42.CICS.CICSIDA.DFHCSD for the CICS region identified by the 
qualifier IDA. If you change the SELECT and DSINFO parameters of DFHISTAR, 
to specify an appropriate new job name and qualifier for another CICS region, you 
can create several copies of the DFHDEFDS job to create DFHCSD and SYSIN data 
sets for each CICS region.

### Creating data sets unique to each CICS region, DFHDEFDS job

You can use the DFHDEFDS job to delete and re-create copies of these data sets for 
each CICS region.

Use **DFHISTAR** to create a copy of the **DFHDEFDS** job for each CICS region. Edit **DFHISTAR**, specifying the parameters **DSINFO** and **SELECT**, and run it once for each region.

In **DFHISTAR**, specify the following parameters:

- **SELECT DFHDEFDS newname** to specify the new name by which the copy of the **DFHDEFDS** job is to be known.
- **DSINFO** to specify the following details of the data sets for each CICS region:
  - The high-level index (**dsindex**)  
  - The serial number of the volume (**volume**)  
  - The unit type of the volume (**disktype**)  
  - The region qualifier (**qualifier**)  

The format of the data set names is:
```
dsindex.CICSSqualifier.dsname
```

- **dsindex**: Is the high-level index for the data sets, specified on the **DSINFO** parameter of **DFHISTAR**. The default is **hlq**.
- **qualifier**: Is the region qualifier for the data sets that are used by this CICS region, specified on the **DSINFO** parameter of **DFHISTAR**. The default is no qualifier.
- **dsname**: Is the name of the data set being defined.

For example, the default name for the CICS local catalog is **hlq.CICS.DFHLCD**.

The **DFHDEFDS** job comprises the following job steps:

1. **DELETE** deletes any existing copies of the data sets.
2. **DEFINE** defines the clusters for the data sets.
3. **INITDP** initializes the debugging profiles base data set.
4. **DEFLALT** defines the alternate index for the debugging profiles data set.
5. **BLDDP** builds the alternate index for the debugging profiles data set.
6. **INITGCD** initializes the CICS global catalog.
7. **INITLCD** initializes the CICS local catalog.
8. **DEFTRACE** defines the trace data sets.
9. **DEFDUMP** defines the dump data sets.
10. **DEFHTML** defines the CICS default HTML data set.
11. **LOADFILE** loads the sample data into the FILEA data set.
12. **LOADHTML** loads HTML templates for supplied transactions.

---

**Creating the CICS messages data set, DFHCMACI job**

You can use the DFHCMACI job to delete and re-create the CICS messages data set DFHCMACD. This data set is used by the CICS messages facility (CICS-supplied transaction CMAC).

The DFHCMACI job comprises the following job steps:

1. **CMACDEF** deletes any existing copies of the DFHCMACD data set and defines the VSAM cluster for the CICS message data set dsindex.DFHCMACD, where dsindex is defined by the DSINFO parameter of DFHISTAR.
2. **CMACLOAD** loads the CICS message data set with data from the CICS-supplied file, DFHCMACD, in the hlq.SDFHMSGS target library.

**Defining the DFHCMACD file and associated CICS resources**

You can use the CICS messages facility to provide the CICS messages and codes descriptions online. Before you can use this facility to access the DFHCMACD data set, you must define the resources that the facility requires, and make them available to your CICS region.

The file DFHCMACD, managed by CICS file control, accesses the DFHCMACD data set. You must create a definition for this file in the CSD. The CICS-supplied definition for the DFHCMACD file and other resources that the CICS messages facility requires are in the CSD group DFHCMAC. The CICS startup procedure, DFHSTART, has a DD statement for the DFHCMACD file, but for dynamic allocation copy the supplied resource definition for the DFHCMACD file and add the DSNAME option.

To use the CICS messages facility in your CICS region, you must create your own CSD group lists to include the DFHCMAC group for the CICS messages facility and any other groups of resources that your CICS region requires. Specify your new group lists on the GRPLIST system initialization parameter when you start up your CICS region. If the DFHLIST of resource groups is not included in your new group lists, you must specify DFHLIST on the GRPLIST system initialization parameter as well as your group lists. For example, GRPLIST=(DFHLIST,MYLIST,CICSHT#1), where MYLIST and CICSHT#1 are customer-created group lists.

Specify the DFHCMAC group of resources for the CICS messages facility only in those CICS regions that use the facility; for example, on some terminal-owning regions, but perhaps not on data-owning regions.
The DFHCMACD file is not updated by PTFs that are applied to CICS. For the latest message updates, see the descriptions in CICS messages and codes overview in Messages and Codes Vol 1 and CICS messages and codes overview in Messages and Codes Vol 2.

Defining the sample applications data sets

CICS provides a range of samples that you can use to help develop your own applications and test various CICS functions; for example, as an aid to verifying that CICS has installed correctly.

These programs are in the CICS 4.1 Sample Applications Guide and the Designing and Programming CICS Applications.

Before you can use some of these samples, you must create the data sets that they use, and make them available to your CICS region, as described in these topics. Do not create these data sets, unless you intend using the associated sample applications.

The CUA text-level application

You can use this sample application to demonstrate BMS support for the Common User Access (CUA) interface. The application uses an action bar, with associated pull-downs, pop-ups, and help panels.

The application programs demonstrate how to code COBOL programs to display, overlay, and remove CUA style windows.

Creating the data sets for the CUA text-level application

To create the data sets that the CUA text-level application requires, submit the DFH0JCUS and DFH0JHLP jobs, which are installed in the hlq.XDFHINST library.

Making the data sets available to CICS

You can cause CICS to dynamically allocate the files for these data sets and open them after CICS initialization by installing the sample resource definitions in the group DFH$CTXT.

If no DD statement exists for these data sets in the CICS startup job stream, the files are allocated to the data sets with DSNAMEs that are specified in the resource definitions: hlq.SAMPLE.DFHCTCUS, hlq.SAMPLE.DFHCTHLP, and hlq.SAMPLE.DFHCTAIX, for the data sets and the alternate index. Alternatively, you can add DD statements for the data sets to your CICS startup job, which causes CICS to use the DSNAMEs specified on the DD statements instead of those in the resource definitions.

For information about this sample application, see the CICS Sample Applications Guide.

The FILEA sample application programs

The FILEA sample application programs comprise four sets of command-level application programs that operate on the sample VSAM file, FILEA.

Each of the four programming languages that are supported (Assembler, C, COBOL, and PL/I) has its own set. These programs show basic functions, such as
inquire, browse, add, and update, that can serve as a framework for your own first programs. They were written before publication of the Common User Access guidelines.

Creating the data set for FILEA

When you submit the DFHDEFDS job, a copy of the data set that the FILEA application requires is created. This data set is installed in the hlq.XDFHINST library.

Making the data set available to CICS

When you tailor the CICS installation-related jobs, a DD statement for the FILEA data set is added to the CICS IVP jobs and the DFHSTART procedure. If you want CICS to dynamically allocate the data set and open the file, remove the DD statement and install a FILE resource definition with an appropriate DSNAME; for example, as supplied in the group DFH$FILA. For more information about CICS installation-related jobs, see Chapter 37, “Tailoring the CICS-supplied skeleton jobs,” on page 229.

The CICS Application Programming Primer sample application

You can use this sample application to demonstrate the design and programming of a standard CICS application.

It provides online inquiry and maintenance for a sample customer credit file in a department store. The application uses VSAM files and 3270 display and printer terminals. It was written before publication of the Common User Access guidelines, and provides similar function, without CUA support, as the CUA sample application.

Creating the data sets for the Primer application

To create the data sets that the Primer sample application requires, edit and submit the sample job.
Making the data sets available to CICS

You can cause CICS to dynamically allocate the files for these data sets and open them on first reference by installing the sample resource definitions in the group DFH$ACCT.

Making the data sets available to CICS

You can cause CICS to dynamically allocate the files for these data sets and open them on first reference by installing the sample resource definitions in the group DFH$ACCT.
If no DD statement exists for these data sets in the CICS startup job stream, the files are allocated to the data sets with DSNAMEs that are specified in the resource definitions: hlq.ACCTFILE and hlq.ACIXFILE. Alternatively, you can add DD statements for the data sets to your CICS startup job, which causes CICS to use the DSNAMEs specified on the DD statements instead of those in the resource definitions.

For information about this sample application, see the CICS Application Programming Primer.
Chapter 39. CICS resource definitions for CICSPlex SM

You must review or change some definitions when you upgrade the CSD for CICSPlex SM.

Dynamic creation of CICS resource definitions

CICS can dynamically define the CICS resource definitions required to allow the CICSPlex SM CMAS, MAS agent, or WUI server to be started.

This includes the COLM and COVC transactions. If these transactions are invoked, or the equivalent CPSMCONN system initialization parameter is set, CICSPlex SM dynamically creates further definitions as required.

The dynamically created resource definitions and their attributes can be found in the following members of the SEYUSAMP sample library:

- EYU$CDEF contains the default resource definitions for a CMAS.
- EYU$MDEF contains the default resource definitions for a MAS.
- EYU$WDEF contains the default resource definitions for a WUI server.

If the dynamically created CICS resource definitions need to be changed, see “Overriding the dynamically created CICS resource definitions for CICSPlex SM.”

The CSD in use needs to be appropriate for the release of CICS in use. For example, upgrade the CSD to the latest release and depending on the CICS release of the region, add the CICS DFHCOMPx CSD compatibility groups to the CICS group list as necessary. See the appropriate CICS Upgrading documentation for details.

Overriding the dynamically created CICS resource definitions for CICSPlex SM

You do not have to update your CSD to obtain the default resource definitions supplied by CICSPlex SM.

You do not typically run user transactions in a CMAS. However, if you do choose to define your own transactions to the CMAS, be aware that transaction IDs used by CICSPlex SM in the CMAS have no specific format. To avoid conflict between your names and those that are used by CICSPlex SM, review the transactions that are defined in EYU$CDEF. For a list of these transactions, see Appendix C, “Default CICS resource definitions for CICSPlex SM,” on page 441.

If you do want to modify a definition, you can do so using the required definition from the EYU$CDEF (CMAS), or EYU$WDEF (WUI) samples.

For MAS definitions use the following:

- EYU$M640: This sample includes the default CICS resource definitions used for a MAS agent at the CICS TS 4.2 level and the CICS region at CICS R640.
- EYU$M650: This sample includes the default CICS resource definitions used for a MAS agent at the CICS TS 4.2 level and the CICS region at CICS R650.
• EYUSM660: This sample includes the default CICS resource definitions used for a MAS agent at the CICS TS 4.2 level and the CICS region at CICS R660.

• EYUSMDEF: This sample includes the default CICS resource definitions used for a MAS agent at the CICS TS 4.2 level and the CICS region at CICS R670.

Copy the required definitions from the appropriate sample into a DFHCSDDUP job, and make the required changes, including specifying a CSD group. Specify this CSD group in an appropriate GRPLIST for the CMAS, MAS, or WUI server. The region is then COLD or INITIAL started, as required, to process the change.

Some CICS resource definitions are enforced. If an inappropriate definition is found, a message is produced during CICSPlex SM initialization. If CICSPlex SM cannot dynamically correct the error, CICSPlex SM initialization can fail.

You can update the CSD for CICSPlex SM if CMAS journaling is required; see “CMAS journaling” on page 300.

Another reason you might want to update the CSD for CICSPlex SM is if your WUI servers require additional import or export TDQs to make copying WUI view or menu definitions easier. You can use the COVI and COVE definitions from EYUSWDEF as a model. For example, if the WUI servers can access the same MVS data sets, make your updates in this way:

1. Copy the COVI and COVE definitions from EYUSWDEF into a DFHCSDD job.
2. Rename the COVE TDQ; for example, to MYEX. This TDQ definition must have the data set name specified. Also, this data set must be preallocated using data set characteristics.
3. Include the MYEX definition in a group that is to be used by the exporting WUI.
4. Install the MYEX TDQ, after the definition has been made on the CSD in one of these ways:
   • A COLD start of the exporting WUI, if the group is in the exporting WUI's group list, or
   • CEDA INSTALL, if the WUI server is running.
5. Rename the COVI TDQ; for example, to MYIM. This TDQ definition must have the same data set name specified on the MYEX TDQ definition.
6. Include the MYIM definition in a group that is to be used by the importing WUI.
7. Install the MYIM TDQ, after the definition has been made on the CSD in one of these ways:
   • A COLD start of the importing WUI, if the group is in the importing WUI's group list, or
   • CEDA INSTALL, if the WUI server is running.
8. Use COVC, on the exporting WUI, to export the required definitions to the MYEX TDQ. Wait for the Export to complete.
9. Use COVC, on the importing WUI, to import the required definitions to the MYIM TDQ.

If the WUI servers cannot access the same data sets, the export data set must be copied from the exporting system (after the COVC Export is complete) to the importing system (before the COVC Import is run).

The following DFHCSDDUP SYSIN control statements contain the default definitions, copied from EYUSWDEF, with the modification to the default
definitions, to allow the same data set to be used to export to a copy of the COVE output TD queue and the COVI input TD queue to import into another WUI. The modification is in bold type.

```
//CSDUP EXEC PGM=DFHCSDUP
//STEPLIB DD DSN=cics.index.SDFHLOAD,DISP=SHR
//DFHCSD DD DSN=cics.dfhcsd,DISP=SHR
//SYSPRINT DD SYSOUT=*  
//SYSIN DD *

*---------------------------------------------------------------------*
* Create TDQUEUE definitions for import/export                          *
*---------------------------------------------------------------------*
DELETE GROUP(group_name)
DEFINE TDQUEUE(MYIM) GROUP(group_name)
DESCRIPTION(CPSM WUI IMPORT DATASET)
  TYPE(EXTRA) DATABUFFERS(1) DDNAME(EYUCOVI) DSNAME(hlq.wui.screens)
  ERROROPTION(IGNORE) OPENTIME(DEFERRED) TYPEFILE(INPUT)
  RECORDSIZE(32000) BLOCKSIZE(0) RECORDFORMAT(VARIABLE)
  BLOCKFORMAT(BLOCKED) DISPOSITION(SHR)
*
DEFINE TDQUEUE(MYEX) GROUP(group_name)
DESCRIPTION(CPSM WUI EXPORT DATASET)
  TYPE(EXTRA) DATABUFFERS(1) DDNAME(EYUCOVE) DSNAME(hlq.wui.screens)
  ERROROPTION(IGNORE) OPENTIME(DEFERRED) TYPEFILE(OUTPUT)
  RECORDSIZE(32000) BLOCKSIZE(0) RECORDFORMAT(VARIABLE)
  BLOCKFORMAT(BLOCKED) DISPOSITION(SHR)
ADD GROUP(group_name) LIST(list_name)

where:

STEPLIB
  Identifies cics.index.SDFHLOAD as the CICS load library that contains the DFHCSDUP module.

DFHCSD
  Identifies cics.dfhcsd as the CICS CSD file to be updated.

SYSIN
  Shows the SYSIN input for import and export transient data queues.

group_name
  Identifies the name of your group.

list_name
  Identifies the name of a CSD list, which you include on the GRPLIST system initialization parameter for WUI server WUI A.

For information about TD queue definitions see "Transient data queue definitions for the WUI" on page 335.

A return code of 4 is expected from this run of DFHCSDUP because, before adding the designated group to the CSD, the job attempts to delete any group with the same name.

You can amend the supplied definitions for a CMAS and MAS in the same way. Run DFHCSDUP including the modified resource definition from the sample EYUS$CDEF, for a CMAS, or EYUS$MDEF, for a MAS, in a CSD list that you use when starting your system.
Amending log stream names in a CMAS

If the log stream names used by the CICS-supplied DFHLGMOD group are not appropriate for your environment, copy group DFHLGMOD to a new group, where you can make your amendments. Add the new group to a CSD list and ensure that the list is included for your CMAS, using the SIT GRPLIST system initialization parameter.

See Chapter 33, “Defining the logger environment for CICS,” on page 185 for details on how to define log streams.

Do not operate the CMAS with log streams that are defined as DUMMY. Dummy log streams can cause problems when recovering the CSD or CICSPlex SM data repository (EYUDREP). See “CMAS journaling” on page 300 for details about the various CMAS journaling options that you can activate.
Chapter 40. Defining DL/I support

CICS can provide DL/I database support by using the IBM IMS Database Manager.

For information about appropriate versions and releases, see the CICS IMS Database Control Guide. As they become available, versions of IMS newer than those versions listed are also compatible.

You can use DL/I support with CICS through these methods:
- Database control (DBCTL)
- CICS remote DL/I support, also known as function shipping

The IMS libraries referred to in the job streams are identified by IMS.libnam; for example, IMS.PGMLIB. If you use your own naming convention for IMS libraries, rename the IMS libraries accordingly.

CICS provides a CICS-DBCTL interface which enables DBCTL, IMS, or IMS DM/TM to satisfy DL/I requests that are issued from the CICS region. This method is simpler to install than local DL/I and provides additional function. Details of installing and using DBCTL are in Installing and generating DBCTL in the IMS Database Control Guide.

CICS support for access to DL/I databases using the IBM Information Management System (IMS) product is included in the base product. No specific installation is required.

For more information about storage protection, see Storage protection.

For information about adding system and resource definitions for use with DBCTL, see the CICS IMS Database Control Guide.

Program specification blocks (PDIR)

A directory of program specification blocks (PDIR) is a list of program specification blocks (PSBs) that define, for DL/I, the use of databases by application programs.

Your CICS region requires a PDIR to access a database owned by a remote CICS region. Your CICS region does not require a PDIR to access a DL/I database owned by DBCTL. For information about accessing DL/I databases owned by DBCTL, see the CICS IMS Database Control Guide.

The modules that provide remote DL/I support are automatically loaded by CICS during startup when a DL/I PSB directory is specified with the PDIR= system initialization parameter.

Adding remote DL/I support

Remote DL/I support is included in CICS Transaction Server for z/OS, and works with one of the supported levels of IMS.
For information about appropriate IMS versions and releases, see the IMS Database Control (DBCTL) overview in the IMS Database Control Guide.

Usually, you use remote DL/I support, with either MRO or ISC connections, to access databases owned by another CICS region. You can also use CICS remote DL/I support to access, through another CICS region connected to DBCTL, databases owned by DBCTL. CICS regions accessing databases owned by DBCTL (that is, connected to DBCTL) must be running on the same MVS image as the DBCTL system. An overview is given in Figure 20.

![Figure 20. Using CICS remote DL/I support to access DBCTL databases](image)

1. CICSB uses remote DL/I to access, through CICSA, databases owned by DBCTL 1 in MVS image 1. This support is only required if CICSB is not connected to DBCTL 1.
2. CICSB uses remote DL/I to access, through CICSC, databases owned by DBCTL 2 in MVS image 2.

For information about accessing DL/I databases owned by DBCTL, see the CICS IMS Database Control Guide.

To add support in CICS for remote database access:
1. Code, assemble, and link-edit a program specification blocks directory (PDIR).
2. Code the PDIR CICS system initialization parameter for remote DL/I support.

**Defining a PSB directory**

You code entries in a program specification block directory (PDIR), to indicate the identity of the remote CICS region, or regions, to which you want CICS to function ship DL/I requests.

You do this by coding the SYSSIDNT parameter in DFHDLPSB TYPE=ENTRY macros, which you assemble and link-edit to create a PDIR. You must also code the MXSSASZ parameter. You can, optionally, code the RMTNAME parameter to define the name by which the PSB is known in the remote CICS region. For information about creating PDIRs, see the CICS Resource Definition Guide.

**Coding CICS system initialization parameters for remote DL/I support**

The following summary of the DL/I parameters specifies the parameters that you can, or must, code as CICS system initialization parameters:

- PDIR=\{YES\|xx\} Suffix of PSB directory (mandatory for remote DL/I)
- PSBCHECK=\{NO\|YES\} Security check on remote terminals starting transactions
Global user exits for DL/I

You can invoke global user exits, XDLIPRE, XDLIPOST, XRMIIIN and XRMIOUT, if enabled, when you have DL/I applications.

**XDLIPRE and XDLIPOST**

These exits follow the issue of an EXEC DLI command or DL/I call; XDLIPRE before the request is processed and XDLIPOST after the request is processed. If you are running CICS with remote DL/I support, these exits are invoked in both the CICS region running the DL/I transactions (the AOR), and the CICS region to which the DL/I requests are function shipped (the DOR). However, restrictions apply to the actions that can be performed by an exit program running at exit point XDLIPRE or XDLIPOST when running in a DOR.

**XRMIIIN and XRMIOUT**

You can use these exits to monitor activity across the resource manager interface (RMI). For example, you can monitor control being passed to and from DFHEDP for EXEC DLI requests, DFHDBAT for DBCTL requests, or DSN2EXT1 for DB2 commands. XRMIIIN is invoked immediately before control is passed from the RMI to a task-related user exit. XRMIOUT is invoked immediately after control is passed back to the RMI.

For programming information about these exits, see [Global user exit points (by function)](#).
Chapter 41. Adding CICS support for programming languages

You must add runtime support for the programming languages used with the CICS command level (EXEC) programming interface before you can install your application programs.

About this task

To write CICS application programs that request CICS services through the command-level application programming interface (API), you can use Assembler language, C and C++, COBOL, or PL/I.

CICS provides the support required to run application programs written in Assembler language, and Language Environment provides the required support for all the other languages.

The programming guidance documentation expects that your CICS system is using the services of Language Environment, which provides a common runtime environment for IBM implementations of Assembler and those high-level languages (HLLs) supported by CICS, namely COBOL, PL/I, C, and C++. Supported compilers are listed in What’s New.

Runtime support for OS/VS COBOL programs has been removed. OS/VS COBOL programs must be upgraded to a supported level of COBOL.

Installing Language Environment support

Language Environment support is provided by runtime libraries that establish a common runtime environment for application programs compiled by high-level languages. All programs compiled by a high-level language, whether by a Language Environment-conforming compiler or not, must be run under CICS-Language Environment support.

About this task

The CICS-Language Environment interface is initialized automatically when CICS performs these tasks:

1. Loads the Language Environment interface modules, CEECCICS, CEEPPI, and CEECTCB, from STEPLIB.
2. Successfully calls the CEECCICS module to initialize the interface.

Language Environment initialization takes place during CICS startup, when CICS issues the message DFHAP1203I applid Language Environment is being initialized. The CEECCICS module is loaded, followed by a partition initialization call, before the start of second phase PLT processing. If Language Environment cannot successfully complete the initialization of all languages supported by CICS, or can only initialize some of them, it issues messages to the MVS console. If Language Environment initialization fails completely, it might be because the CEECCICS module was not loaded, or something failed during the loading of a particular language routine.
Installing CICS support for Language Environment

To enable Language Environment support to be installed correctly by CICS, specify storage requirements and ensure that you have the required modules and resource definitions.

1. Specify enough storage for the extended read-only dynamic storage area (ERDSA) to run CICS and Language Environment together. They require a minimum of 3500 KB. To this minimum, add an amount of storage sufficient for your own requirements.

2. Ensure the CICS-Language Environment interface module, CEECCICS, and the Language Environment modules CEEPIPI and CEECTCB are installed in an APF-authorized library defined in the STEPLIB concatenation in the CICS startup JCL. You can do this by including the Language Environment SCEERUN library in an APF-authorized library in the STEPLIB concatenation of your CICS startup job, for example, in the CICSTS42.CICS.SDFHAUTH library, or in an APF-authorized library in the MVS LNKLSTnn concatenation.

3. Ensure that the program resource definitions for the Language Environment language interface modules have been added to the CICS CSD. These definitions are in the CEE group.
   The CEE group is added automatically to the CSD and to the grouplist DFHLIST during CICS installation, as part of the DFHCOMDS job.
   The definitions are also supplied as DEFINE statements in the CEECCSD and CEECCSDX members of the SCEESAMP library. You use CEECCSDX if you are using the XPLINK compiler option for C/C++ modules.
   You can add the CEE group to any CICS startup group list named in the GRPLIST system initialization parameter.

4. Define the Language Environment transient data destinations, CESE and CESO (DD names CEEMSG and CEEOUT). The CICS-supplied resource definition group DFHDCGTG, in the CSD, contains entries for CESE and CESO.
   For information about the attributes required for Language Environment transient data destinations, see the IBM Language Environment for MVS & VM Programming Guide, SC26-4818.

5. Define the Language Environment runtime libraries on the CICS STEPLIB and DFHRPL DD statements:
   • Add the SCEERUN library, which contains CEECCICS and CEECTCB, and the SCEERUN2 library, which contains support that is required for the IBM Java Virtual Machine (JVM) and also support for other programming languages, to STEPLIB or to a library in the MVS LNKLSTnn concatenation.
     Both the libraries, SCEERUN and SCEERUN2, must be APF-authorized.
   • Add the SCEECICS, SCEERUN2, and SCEERUN libraries to DFHRPL.

For example:

```c
// CICS APF-authorized libraries
//STEPLIB  DD DSN=hlq.CICS.SDFHAUTH,DISP=SHR
//         DD DSN=hlq.LE.SCEERUN2,DISP=SHR
//         DD DSN=hlq.LE.SCEERUN,DISP=SHR
// CICS load libraries
//DFHRPL   DD DSN=hlq.CICS.SDFHLOAD,DISP=SHR
//         DD DSN=hlq.LE.SCEECICS,DISP=SHR
//         DD DSN=hlq.LE.SCEERUN2,DISP=SHR
//         DD DSN=hlq.LE.SCEERUN,DISP=SHR
```

Use only these Language Environment runtime libraries for all your high-level language application programs.
Language Environment support for COBOL

Language Environment is a prerequisite for application programs written in COBOL.

For information about Language Environment, see the z/OS Language Environment Customization manual.

Support for OS/VS COBOL programs is now withdrawn. You must upgrade OS/VS COBOL programs to Language Environment conforming COBOL, and recompile against a level of COBOL compiler supported by CICS. Programming languages and Language Environment in CICS Application Programming provides assistance with the conversion of OS/VS COBOL programs to Language Environment conforming COBOL.

To run COBOL application programs:
- Install support for Language Environment, ensuring that CICS can initialize the Language Environment environment during startup.
- Install resource definitions for your programs with the LANGUAGE attribute specified as LANGUAGE(COBOL), or leave the language blank.

For your application programs, CICS can create and install program resource definitions automatically, or you can create them specifically in the CSD, and install them by using the GRPLIST system initialization parameter or CEDA INSTALL command. For more information about installing program resource definitions, see Resource definition installation in the Resource Definition Guide.

Language Environment support for C and C++

Language Environment is a prerequisite for application programs compiled using IBM C/C++ for MVS or SAA AD/Cycle C/370 compilers. Language Environment incorporates the runtime libraries required for both these C language compilers.

For information about Language Environment, see the z/OS Language Environment Customization manual.

To run C application programs in CICS:
- Install support for Language Environment, ensuring that CICS can initialize the Language Environment environment during startup.
- Install resource definitions for your programs with the LANGUAGE attribute specified as LANGUAGE(C) or leave the language blank.

For information about installing program resource definitions, see Resource definition installation in the Resource Definition Guide.

CICS supports application programs written in C++ that meet these requirements:
- Are compiled using the IBM C/C++ for MVS compiler (5655-121)
- Run with the Language Environment runtime libraries

If you use Version 3 Release 2, or later, of the C/C++ compiler to compile a C++ program, specify the CXX parameter when options are passed to the compiler; otherwise, the C compiler is invoked. Do not specify CXX if a C program is to be compiled. See the C/C++ for MVS Compiler and Run-Time Migration Guide Version 3 Release 2 for further information.
Language Environment support for PL/I

Language Environment is a prerequisite for application programs compiled using IBM PL/I for MVS or SAA AD/Cycle PL/I compilers. Language Environment incorporates the runtime libraries required for both these PL/I compilers.

For information about Language Environment, see the z/OS Language Environment Customization manual.

PL/I support is also required if you use the Web services support in CICS; in particular, it is required if you use the CICS-supplied SOAP 1.1 and SOAP 1.2 message handler programs.

To run CICS PL/I application programs:

- Install support for Language Environment, ensuring that CICS can initialize the Language Environment environment during startup.
- Install resource definitions for the programs with the LANGUAGE attribute specified as LANGUAGE(PLI) or leave blank.

For information about installing program resource definitions, see Resource definition installation in the Resource Definition Guide.

Language Environment support for Java

Language Environment is a prerequisite for Java programs that run in JVMs in CICS. However, unlike the other languages, Java programs do not require the CICS-Language Environment interface.

Java programs run with Language Environment support using MVS services, not CICS services. Java programs require the Language Environment support provided by the SCEERUN and SCEERUN2 libraries only, which can either be defined in the CICS STEPLIB or included in the MVS linklist. The SCEERUN and SCEERUN2 libraries must also be added to DFHRPL.
Chapter 42. Verifying your Java components

The CICS components required to support Java applications are included in the base product. You must also install the IBM 64-bit SDK for z/OS, Java Technology Edition, on z/OS UNIX, to provide Java support. Before you begin to set up and configure Java support in your CICS regions, verify that the Java components are correctly installed on your system.

Procedure

1. Ensure that all of the required Java components are installed in the correct locations on your CICS system. You can use the checklist in “Verifying Java components checklist.”

2. Authorize the hlq.SDFJAUTH library as described in “Authorizing the hlq.SDFJAUTH library” on page 256.

What to do next

When you have verified that your Java components are correctly installed, set up your Java environment for CICS as described in “Setting up Java support in Java Applications in CICS.”

Verifying Java components checklist

Check that the IBM 64-bit SDK for z/OS, Java Technology Edition is installed and that the CICS-supplied files have been created.

IBM 64-bit SDK for z/OS, Java Technology Edition installation

Check that the IBM 64-bit SDK for z/OS, Java Technology Edition is installed in z/OS UNIX. CICS Transaction Server for z/OS, Version 4 Release 2 uses Version 6.0.1 of the IBM 64-bit SDK for z/OS, Java Technology Edition for Java support. CICS TS for z/OS, Version 4.2 supports only the 64-bit version of the SDK and not the 31-bit version.

The JAVADIR parameter of the DFHISTAR installation job for CICS specifies the location for the IBM SDK for z/OS. This parameter is used to customize the CICS-supplied sample JVM profiles and Java security policy, so that they point to the SDK installation. The value in the JVM profiles determines the SDK that is used for Java support in a CICS region.

The default for the JAVADIR parameter is java/J6.0.1_64. This value is appended to /pathprefix/usr/lpp/ to specify the default location for Version 6.0.1 of the IBM 64-bit SDK for z/OS, Java Technology Edition.

CICS-supplied files

The following components are unloaded from the distribution tapes during the standard installation process described in the Program Directory for CICS Transaction Server for z/OS. Confirm that they are all present in the specified locations.

Note that z/OS UNIX System Services must be active in full function mode during the installation process to enable files to be stored in its file system.
In all of the directory paths shown here, cicsts42 is a user-defined value, specified on the USSDIR parameter in the DFHISTAR installation job. This value determines the installation directory for CICS files on z/OS UNIX. This value is passed to the uss_path variable used by the DFHIJVMJ job, which creates the customized sample JVM profiles and Java security policy as z/OS UNIX files in the directories listed in the following table.

Table 15. Java components checklist

<table>
<thead>
<tr>
<th>Java component</th>
<th>Location</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>Directory containing CICS-supplied JAR files</td>
<td>z/OS UNIX directory: /pathprefix/usr/lpp/cicsts/cicsts42/lib</td>
<td>This directory is on the base library path and class path for all JVMs in CICS.</td>
</tr>
<tr>
<td>Sample programs</td>
<td>z/OS UNIX directory: /pathprefix/usr/lpp/cicsts/cicsts42/samples</td>
<td>The sample programs demonstrate the use of output redirection, the JCICS classes, connectors, JDBC, pipelines, and Web services.</td>
</tr>
<tr>
<td>JVM profiles</td>
<td>z/OS UNIX directory: /pathprefix/usr/lpp/cicsts/cicsts42/JVMProfiles</td>
<td>JVM profiles specify options used in creating JVMs. These sample JVM profiles are customized for your system during the installation process. You can edit them using any text editor. The JVM profiles and any associated JVM properties files must always be available to CICS.</td>
</tr>
<tr>
<td>Java security policy file</td>
<td>z/OS UNIX directory: /pathprefix/usr/lpp/cicsts/cicsts42/lib/security/dfjejbpl.policy</td>
<td>A sample Java security policy. It defines security properties that are suitable for JVMs that are used by enterprise beans. It is customized during the installation process.</td>
</tr>
<tr>
<td>hlq.SDFJAUTH library</td>
<td>MVS PDSE libraries</td>
<td>Contains components of the SJ domain. See &quot;Authorizing the hlq.SDFJAUTH library&quot; for more information.</td>
</tr>
</tbody>
</table>

Note: From CICS Transaction Server Version 4 Release 1 onwards JVM properties files are optional and samples are not supplied.

For all z/OS UNIX files, including JVM profiles, JVM properties files, and the sample security policy, case is important. CICS does not automatically convert the name of these files to uppercase. When you use the name of a JVM profile, JVM properties file, or security policy, anywhere in CICS, you must enter it using the same combination of uppercase and lowercase characters that is present in the z/OS UNIX file name.

Authorizing the hlq.SDFJAUTH library

This library is the partitioned data set extended (PDSE) version of SDFHAUTH, and it contains some of the components of the SJ domain. The SDFJAUTH library is required for Java support.
A separate library is required because these components are built using XPLINK (Extra Performance Linkage).

As for the SDFHAUTH library, to authorize SDFJAUTH:
1. APF-authorize the SDFJAUTH library by adding it to the list of APF-authorized libraries in the appropriate PROGxx (or IEAAPFx) member in SYS1.PARMLIB.
2. Provide a STEPLIB DD statement for the hlq.SDFJAUTH library in your startup job stream.

The procedure for authorizing the SDFHAUTH library is described in [Chapter 12, “Authorizing the CICS and CICSPlex SM libraries,” on page 93]. Follow the same procedure to authorize the SDFJAUTH library.
Chapter 43. Installing MRO, IPIC, and ISC support

You include MRO, IPIC, or ISC support in your CICS region.

- Multiregion operation (MRO); see “Installing MRO support.”
- IP interconnectivity (IPIC); see “Activating IP interconnectivity (IPIC) connections” on page 268.
- Intersystem communication (ISC); see “Activating intersystem communication over z/OS Communications Server” on page 263.

The information about ACF/SNA and z/OS that is given in these topics is for guidance only. Always consult the current ACF/SNA or z/OS publications for the latest information.

Installing MRO support

CICS multiregion operation (MRO) enables CICS regions that are running in the same z/OS image, or in the same z/OS sysplex, to communicate with each other. MRO does not support communication between a CICS system and a non-CICS system such as IMS.

The external CICS interface (EXCI) uses a specialized form of MRO link to support DCE remote procedure calls to CICS programs, and communication between z/OS batch programs and CICS.

MRO does not require ACF/Communications Server or SNA networking facilities. The CICS support that enables region-to-region communication is called interregion communication (IRC). IRC is implemented in three ways:

1. Through support in CICS terminal control management modules and by use of a CICS-supplied interregion program, DFHIRP, loaded in the z/OS link pack area. DFHIRP is invoked by a type 3 supervisory call (SVC).
2. By z/OS cross-memory services, which you can select as an alternative to the CICS type 3 SVC mechanism. Here, DFHIRP only opens and closes the interregion links.
3. By the cross-system coupling facility (XCF) of z/OS. XCF/MRO is required for links between CICS regions in different z/OS images of an z/OS sysplex. CICS selects XCF/MRO dynamically for such links, if available.

For information about the design and implementation of interregion communication, and about the benefits of cross-system MRO, see the Intercommunication concepts and facilities topic in the CICS Intercommunication Guide.

To install support for MRO, complete the following steps:

1. Define CICS as a z/OS subsystem. Multiregion operation with CICS requires z/OS Subsystem Interface (SSI) support. To obtain this support, you define CICS as an operating system subsystem.
2. Install the current versions of the DFHIRP and DFHCSVC modules in the LPA.
3. Specify appropriate system initialization parameters to enable MRO for each CICS region startup. To help you get started with MRO, a CICS job and a CICS startup procedure are supplied on the CICS distribution volume. For each MRO region, you must also create the CICS system data sets needed.

To use cross-system MRO (XCF/MRO):
4. Install the required sysplex hardware and software.

5. Define the z/OS images as systems in an XCF sysplex.
   To use the MRO support:

6. Define and install the MRO connections appropriate to your CICS environment.

Provided you complete these steps, you can use MRO to communicate with all supported levels of CICS.

If MRO is used to communicate between different releases of CICS, the function provided on any connection is that of the lower-level release.

**Installing the modules DFHIRP and DFHCSVC in the LPA**

You must install the DFHIRP and DFHCSVC modules to enable your regions to communicate by MRO.

1. Install the current versions of the DFHIRP and DFHCSVC modules into the LPA, as described in Chapter 21, “Installing CICS modules in the MVS linkpack area,” on page 145. If you are running CICS with MRO at different release levels, all communicating CICS regions must use the latest DFHIRP module and the latest SVC module, DFHCSVC, on the same z/OS image. Do not use the dynamic LPA function to replace DFHIRP for upgrading to a new CICS release, because it can cause incompatibility between control blocks, resulting in abends.

   Multiregion operation requires the CICS interregion communication modules to run in supervisor state to transfer data between different regions. CICS achieves this by using a normal supervisor call to this startup SVC routine, which is in the pregenerated system load library (CICSTS42.CICS.SDFHLOAD).

2. Define the SVC module, DFHCSVC, to z/OS, as described in Chapter 17, “Installing the CICS SVCs,” on page 125.

**Installation requirements for XCF/MRO**

For MVS images to communicate using MRO between CICS regions on different z/OS images, the z/OS images must be joined in a sysplex.

The hardware and software that are required for z/OS systems in a sysplex are in the Program Directory for CICS Transaction Server for z/OS.

A sysplex consists of multiple MVS images, coupled together by hardware elements and software services. In a sysplex, MVS images provide a platform of basic services that multisystem applications like CICS can exploit. As an installation's workload grows, additional MVS images can be added to the sysplex to enable the installation to meet the needs of the greater workload.

Usually, a specific function (one or more modules/routines) of the MVS application subsystem (such as CICS) is joined as a member (a member resides on one MVS image in the sysplex), and a set of related members is the group (a group can span one or more of the MVS images in the sysplex). A group is a complete logical entity in the sysplex. To use XCF to communicate in a sysplex, each CICS region joins an XCF group as a member, using services provided by DFHIRP.

For information about installing and managing MVS systems in a sysplex, see MVS/ESA Setting Up a Sysplex, GC28-1449.

**Generating XCF/MRO support**

There are a number of steps you must complete to generate XCF/MRO support.
About this task

1. Depending on the versions of CICS installed in the MVS images participating in XCF/MRO, the versions of DFHIRP installed in the images can be different. For all the MVS images containing CICS systems to be linked, ensure that the version of DFHIRP in the extended link pack area (ELPA) is at the required level. The DFHIRP module should be that from the most current CICS release in the image, or higher.

   The CICS TS for z/OS, Version 4.2 DFHIRP module, which is required for multiple XCF group support, can be used only with z/OS, Version 1 Release 11 or later.

2. Ensure that each CICS APPLID is unique within the sysplex.

3. Ensure that the value of the MAXMEMBER MVS parameter, used to define the XCF couple data sets, is high enough to cater for the largest CICS XCF group.

   The maximum size of any XCF group within a sysplex is limited by this value. The theoretical maximum size of any XCF group is 2047 members.

   External CICS interface (EXCI) users that use an XCF/MRO link also join an XCF group. You should therefore set the value of MAXMEMBER high enough to allow all CICS regions and EXCI XCF/MRO users in the largest CICS XCF group to join the group concurrently.

   To list the CICS regions and EXCI users in an XCF group, use the MVS DISPLAY command. For example, to list the CICS regions and EXCI users in the DFHIR001 XCF group, use the command:

   ```
   DISPLAY XCF,GROUP,DFHIR001,ALL
   ```

   Do not rely on the default value of MAXMEMBER, which may be too low to allow all the CICS regions and EXCI users in the largest XCF group to join the group. This is especially important if you have only a few CICS XCF groups.

   Likewise, do not set a value much larger than you need, because this will result in large couple data sets for XCF. The larger the data set, the longer it will take to locate entries.

   Make the value of MAXMEMBER 10-15 greater than the combined number of CICS regions and EXCI users in the largest CICS XCF group.

Each CICS region joins an XCF group when it logs on to DFHIRP. Its member name is its APPLID (NETNAME) used for MRO partners. The XCF group name is specified on the XCFGROUP system initialization parameter. If XCFGROUP is not specified, the XCF group name defaults to DFHIR000.

At connect time, CICS invokes the IXCQUERY macro to determine whether the CICS region being connected to resides in the same MVS image. If it does, CICS uses IRC or XM as the MRO access method, as defined in the connection definition. If the partner resides in a different MVS image, CICS uses XCF as the access method, regardless of the access method defined in the connection definition.

CICS regions can use MRO or XCF/MRO to communicate only with regions in the same XCF group. Members of different XCF groups cannot communicate using MRO, or XCF/MRO, even if they are in the same MVS image.

Defining z/OS images as systems in an XCF sysplex

To use XCF/MRO, you define all participating z/OS images as part of the same sysplex.
In a parallel sysplex, where MRO communication between z/OS images is by XCF/MRO, the DFHIRP programs installed in the different z/OS images can be at different release levels. However, DFHIRP must be installed from the highest release of CICS running in an z/OS image. For example, a CICS TS for z/OS, Version 3.2 DFHIRP can communicate with another DFHIRP across XCF/MRO, but the CICS regions running in the z/OS with the CICS TS for z/OS, Version 3.2 DFHIRP cannot be later than CICS TS for z/OS, Version 3.2.

For more information, see Chapter 28, “MVS cross-system MRO definitions,” on page 171.

**Defining MRO connections**

Before you can use MRO, you must define and install connections with attributes appropriate to your CICS environment.

**Related information:**

[CONNECTION attributes in the Resource Definition Guide](#)

**Enabling MRO for CICS startup**

For each CICS region that is to use MRO, you must specify ISC=YES to include the intersystem communication program, DFHISP.

If you want a CICS region to establish MRO communication during startup, also specify YES on the IRCSTART system initialization parameter.

Alternatively, after your CICS region is running, you can establish MRO communication by using the CEMT SET IRC OPEN command or the EXEC CICS SET IRC OPENSTATUS(cvda) command.

Either method establishes MRO communication with every CICS region that meets the following criteria:

1. The MRO connection is currently active.
2. The MRO connection is defined to your region by CONNECTION and SESSIONS definitions that are installed from the CSD. To establish MRO communication between two CICS regions, the installed CONNECTION definition must specify INSERVICE(YES) in both regions.

**Adding communications support between systems**

You can include communications to other systems in a CICS region by using either ISC over SNA or IP interconnectivity (IPIC).

MRO can be used only for CICS-to-CICS connections in the same z/OS image or z/OS sysplex. If you connect CICS to both CICS and non-CICS systems, and the remote systems can be inside or outside the local z/OS sysplex, CICS offers intersystem communication over SNA (ISC over SNA) and intersystem communication over TCP/IP. Intersystem communication over TCP/IP is known as IP interconnectivity (IPIC).

Unlike MRO, no special z/OS operating system requirements apply to these methods of communication.
Activating intersystem communication over z/OS Communications Server

To provide the necessary protocols to support communication between CICS regions that are in different z/OS images, or in different z/OS sysplexes, ISC over SNA uses the ACF/Communications Server access method.

You can also use ISC over SNA in the same CPC, through the application-to-application facilities of ACF/Communications Server.

You must include the following management programs in your CICS regions, by specifying the system initialization parameters that are given in parentheses:
- DFHISC – the intersystem communication program (ISC=YES).
- DFHTCP – the terminal control program (TCP=YES is the default).

Establishing ISC over SNA

Intersystem communication over SNA requires z/OS Communications Server support. CICS regions cannot communicate until they have established the z/OS Communications Server connection.

Specify VTAM=YES as a system initialization parameter.

If the z/OS Communications Server is running during CICS initialization, CICS opens the z/OS Communications Server ACB.

If the z/OS Communications Server is started after CICS, opening the z/OS Communications Server ACB fails, and you must open it using the z/OS Communications Server CEMT SET VTAM OPEN command when the z/OS Communications Server is available.

ACF/SNA definition for CICS

When you define your CICS system to ACF/SNA, you need to include a number of operands in the SNA APPL statement.

About this task

MODETAB=1ogon-mode-table-name
This operand names the SNA logon mode table that contains your customized logon mode entries. See "ACF/Communications Server LOGMODE table entries for CICS" on page 264 for more information. You can omit this operand if you choose to add your MODEENT entries to the IBM default logon mode table, without renaming it.

AUTH=(ACQ, SPO, VPACE[, PASS])
ACQ is required to allow CICS to acquire LU type 6 sessions. SPO is required to allow CICS to issue the MVS MODIFY snaname USERVAR command. VPACE is required to allow pacing of the intersystem flows.
PASS is required if you intend to use the EXEC CICS ISSUE PASS command, which passes existing terminal sessions to other SNA applications.

VPACING=number
This operand specifies the maximum number of normal-flow requests that another logical unit can send on an intersystem session before waiting to receive a pacing response.
Take care when selecting a suitable pacing count. Too low a value can lead to poor throughput because of the number of line turnarounds required. Too high a value can lead to excessive storage requirements.

**EAS=number**
This operand specifies the number of network-addressable units that CICS can establish sessions with. The number must include the total number of parallel sessions for this CICS system.

**PARSESS=YES**
This option specifies LU type 6 parallel session support.

**SONSCIP=YES**
This operand specifies session outage notification (SON) support. SON enables CICS, in particular cases, to recover a failed session without requiring operator intervention.

**APPC=NO**
APPC=NO is required for CICS. This setting is the default. If you do not use APPC=NO, you receive message DFHZC2400E, referencing the SNA return code 1013.

For more information about the SNA APPL statement, refer to the z/OS Communications Server: SNA Resource Definition Reference.

### ACF/Communications Server LOGMODE table entries for CICS:

For APPC sessions, you can use the `MODENAME` option of the CICS `DEFINE SESSIONS` command to identify a z/OS Communications Server logmode entry that in turn identifies the required entry in the z/OS Communications Server class-of-service table.

Every modename that you supply, when you define a group of APPC sessions to CICS, must be matched by a z/OS Communications Server LOGMODE name. You need to create entries in the z/OS Communications Server LOGMODE table using the following format:

```
MODEENT LOGMODE=modename
MODEEND
```

An entry is also required for the LU services manager modeset (SNASVCMG):

```
MODEENT LOGMODE=SNASVCMG
MODEEND
```

If you plan to use autoinstall for single-session APPC terminals, additional information is required in the `MODEENT` entry.

For CICS-to-IMS links that are cross-domain, you must associate the IMS LOGMODE entry with the CICS APPLID, using the `DLOGMOD` or `MODETAB` parameters.

### ACF/SNA definition for IMS

When the IMS system is defined to SNA, the following operands should be included on the SNA APPL statement.

### About this task

**AUTH=(ACQ, VPACE)**
ACQ is required to allow IMS to acquire LU type 6 sessions. VPACE is required to allow pacing of the intersystem flows.
VPACING=number
This operand specifies the maximum number of normal-flow requests that another logical unit can send on an intersystem session before waiting to receive a pacing response. An initial value of 5 is suggested.

EAS=number
The number of network addressable units must include the total number of parallel sessions for this IMS system.

PARSESS=YES
This operand specifies LU type 6 parallel session support.

For more information, see z/OS Communications Server: SNA Programming.

ACF/SNA LOGMODE table entries for IMS:

IMS allows the user to specify some BIND parameters in a z/OS Communications Server logmode table entry. The CICS logmode table entry must match that of the IMS system.

IMS uses, in order of priority, the mode table entry specified in the following places:
1. The MODETBL parameter of the TERMINAL macro
2. The mode table entry specified in CINIT
3. The DLOGMODE parameter in the VTAMLST APPL statement or the MODE parameter in the IMS /OPNDST command
4. The ACF/SNA defaults.

Figure 21 shows an IMS logmode table entry:

```
LU6NEGPS MODEENT LOGMODE=LU6NEGPS,
    NEGOTIABLE BIND
    PRIMARY SEND PACING COUNT
    SECONDARY RECEIVE PACING COUNT
    SECONDARY SEND PACING COUNT
    NEGOTIABLE
    FM PROFILE 18
    TS PROFILE 4
    PRIMARY PROTOCOLS
    SECONDARY PROTOCOLS
    COMMON PROTOCOLS
    RU SIZES 256
    PSERVIC=X'060038000003800000000000'
    SYMSG/Q MODEL
MODEEND
```

Figure 21. Example IMS logmode table entry

**IMS system definition for intersystem communication**

The IMS ISC-related macros that are used in IMS system definition are the COMM, NAME, SUBPOOL, TERMINAL, TYPE, and VTAMPOOL macros.

The **COMM macro**:

The COMM macro identifies the IMS system.

**APPLID=name**

Specifies the APPLID of the IMS system. This APPLID is usually the name that you specify on the NETNAME option of DEFINE CONNECTION when you define the IMS system to CICS.

However, consider the following points:
• If APPLID on the COMM macro is coded as NONE, the CICS NETNAME option should specify the label on the EXEC statement of the IMS startup job.

• If the IMS system is started as a started task, NETNAME should specify the started task name.

• For an IMS system with XRF, the CICS NETNAME option should specify the USERVAR (that is, the generic applid) that is defined in the DFSHSBxx member of IMS.PROCLIB, not the applid from the COMM macro.

**RECANY=(number,size)**

Specifies the number and size of the IMS buffers that are used for SNA “receive any” commands. For ISC sessions, the buffer size has a 22-byte overhead. It must therefore be at least 22 bytes larger than the CICS buffer size specified in the SENDSIZE option of DEFINE SESSIONS.

This size applies to all other ACF/SNA terminals attached to the IMS system, and must be large enough for input from any terminal in the IMS network.

**EDTNAME=name**

Specifies an alias for ISCEDT in the IMS system. For CICS-to-IMS ISC, an alias name must not be longer than four characters.

The **NAME macro**:

The NAME macro defines the logical terminal names associated with the subpool. Multiple LTERMS can be defined per subpool.

**COMPT={1|2|3|4}**

Specifies the output component associated with this session. The component specified determines the protocol that IMS ISC uses to process messages. An output component defined as SINGLE1 is strongly recommended.

**ICOMPT={1|2|3|4}**

Specifies the input component associated with this session. When IMS receives a message, it determines the input source terminal by finding the NAME macro that has the matching input component number. A COMPT1 input component must be defined for each session that CICS uses to send START commands.

**EDIT=[{NO|YES}][,{ULC|UC}]**

The first parameter specifies whether the user-supplied logical terminal edit routine (DFSCNTEO) is to be used.

The second parameter specifies whether the output is to be translated to uppercase (UC) or not (ULC) before transmission.

The **SUBPOOL macro**:

A SUBPOOL macro is required for each session to the remote system.

**NAME=subpool-name**

Specifies the IMS name for this session. A CICS-to-IMS session is identified by a “session-qualifier pair” formed from the CICS name for the session and the IMS subpool name.

The CICS name for the session is specified in the SESSNAME option of the DEFINE SESSIONS command for the session.

The IMS subpool name is specified to CICS in the NETNAMEQ option of the DEFINE SESSIONS command.
The TERMINAL macro:

The TERMINAL macro identifies the remote CICS system to IMS. It is comparable to DEFINE CONNECTION in CICS.

**NAME{name}**

Identifies the CICS node to IMS. It must be the same as the APPLID of the CICS system.

**OUTBUF{number}**

Specifies the size of the IMS output buffer. It must be equal to or greater than 256, and should include the size of any function management headers sent with the data. It must not be greater than the value specified in the RECEIVESIZE option of the DEFINE SESSIONS commands for the intersystem sessions.

**SEGSIZE{number}**

Specifies the size of the work area that IMS uses for deblocking incoming messages. We recommend that you use the size of the longest chain that CICS may send. However, if IMS record mode (VLVB) is used exclusively, you could specify the largest record (RU) size.

**MODETBL{name}**

Specifies the name of the z/OS Communications Server mode table entry to be used. You must omit this parameter if the CICS system resides in a different SNA domain.

**OPTIONS{[NOLTWA|LTWA]}**

Specifies whether Log Tape Write Ahead (LTWA) is required. For LTWA, IMS logs session restart information for all active parallel sessions before sending a syncpoint request. LTWA is recommended for integrity reasons, but it can adversely affect performance. NOLTWA is the default.

**OPTIONS{[SYNCESS|FORCCESS]}**

Specifies the message resynchronization requirement following an abnormal session termination. SYNCESS is the default. It requires both the incoming and the outgoing sequence numbers to match (or CICS to be cold-started) to allow the session to be restarted. FORCCESS allows the session to be restarted even if a mismatch occurs. SYNCESS is recommended.

**OPTIONS{[TRANSRESP|NORESP|FORCRESP]}**

Specifies the required response mode.

**TRANSRESP**

Specifies that the response mode is determined on a transaction-by-transaction basis. This is the default.

**NORESP**

Specifies that response-mode transactions are not allowed. In CICS terms, this means that a CICS application cannot initiate an IMS transaction by using a SEND command, but only with a START command.

**FORCRESP**

Forces response mode for all transactions. In CICS terms, this means that a CICS application cannot initiate an IMS transaction by using a START command, but only by means of a SEND command.

TRANSRESP is recommended.
OPTIONS=[OPNDST|NOPNDST]
   Specifies whether sessions can be established from this IMS system. OPNDST
   is recommended.

{COMPT1|COMPT2|COMPT3|COMPT4}={SINGLEn|MULTn}
   Specifies the IMS components for the IMS ISC node. Up to four components
   can be defined for each node. The input and output components to be used for
   each session are then selected by the ICOMPT and COMPT parameters of the
   SUBPOOL macro.

The following types of component can be defined:

SINGLE1
   Used by IMS for asynchronous output. One output message is sent for
   each SNA bracket. The message may or may not begin the bracket, but it
   always ends the bracket.

SINGLE2
   Each message is sent with the SNA change-direction indicator (CD).

MULT1
   All asynchronous messages for a given LTERM are sent before the bracket
   is ended. The end bracket (EB) occurs after the last message for the LTERM
   is acknowledged and dequeued.

MULT2
   The same as MULT1, but CD is sent instead of EB.

SESSION=number
   Specifies the number of parallel sessions for the link. Each session is
   represented by an IMS SUBPOOL macro and by a CICS DEFINE SESSIONS
   command.

EDIT=[{NO|YES}][,{NO|YES}]
   Specifies whether user-supplied physical output and input edit routines are to
   be used.

The TYPE macro:

The TYPE macro specifies the terminal type. Parameters of the TERMINAL macro
can also be specified in the TYPE macro if they are common to all the terminals
defined for this type.

UNITYYPE=LUTYPE6
   Must be specified for ISC.

The VTAMPOOL macro:

The VTAMPOOL macro heads the list of SUBPOOL macros that define the
individual sessions to the remote system.

Defining ISC over SNA connections
Before you can use ISC over SNA, you must define and install connections with
attributes appropriate to your CICS and SNA environment.

Related information:
   CONNECTION attributes in the Resource Definition Guide

Activating IP interconnectivity (IPIC) connections
   IP interconnectivity requires CICS TCP/IP services to be activated.
**System initialization parameters**

To activate IPIC at CICS startup, specify TCPIP=YES and ISC=YES as system initialization parameters. The default value of the TCPIP and ISC parameters is NO.

**Defining IPIC connections**

Before you can use IPIC, you must:

- Define and install IPCONNs with attributes appropriate to your CICS environment.
- Define and install a TCPIPSERVICE definition with the PROTOCOL attribute set to IPIC.
- Review your MAXSOCKETS system initialization parameter settings. Ensure that you allocate enough sockets to support IPIC connections and other traffic that requires IP sockets.

**Related information:**

- TCPIP system initialization parameter in the System Definition Guide
- IPCONN resources in the Resource Definition Guide
- TCPIPSERVICE resources in the Resource Definition Guide
- MAXSOCKETS system initialization parameter in the System Definition Guide
Chapter 44. Enabling TCP/IP in a CICS region

The CICS sockets domain provides TCP/IP support, with network services supplied by z/OS.

About this task

The sockets domain provides listener support and outbound sockets support.

The listener

The listener monitors specified TCP/IP ports for incoming requests. You configure the listener with a TCPIPSERVICE resource definition to listen on a specific TCP/IP port and to attach a specified request receiver transaction to handle each connection. When the connection has been established between a client program and a particular request receiver, all subsequent requests from the client program over that connection flow to the same request receiver. The listener supports user applications initiated by TCP/IP services for the following protocols:

External Call Interface (ECI)

The ECI allows client applications to use a TCP/IP connection directly to a CICS region. The External Presentation Interface (EPI) and External Security Interface (ESI) are not supported.

See [Using CICS Transaction Gateway resource adapters to call CICS server programs](#) for information about the External Call Interface.

Hypertext Transfer Protocol (HTTP)

HTTP messages are received and sent over the Internet, using CICS Web support. See [HTTP request and response processing for CICS(r) as an HTTP client](#) for information about the transmission of HTTP messages on the Web.

Internet InterORB Protocol (IIOP)

IIOP messages are sent between client and server applications that conform to the Common Object Request Broker Architecture (CORBA). See [IIOP support in CICS](#) for information about IIOP messages.

IP interconnectivity protocol (IPIC)

IPIC supports the following types of intercommunication functions for their respective product releases:

- Distributed program link (DPL) calls between CICS TS 3.2 or later regions.
- Distributed program link (DPL) calls between CICS TS and TXSeries Version 7.1 or later.
- Asynchronous processing of EXEC CICS START, START CHANNEL, and CANCEL commands, between CICS TS 4.1 or later regions.
- Transaction routing of 3270 terminals, where the terminal-owning region (TOR) is uniquely identified by an APPLID between CICS TS 4.1 or later regions.
• Enhanced method of routing transactions that are invoked by EXEC CICS START commands between CICS TS 4.2 or later regions.

• ECI requests from CICS Transaction Gateway Version 7.1 or later.

• Function shipping of all file control, transient data, and temporary storage requests between CICS TS 4.2 or later regions. Function shipping of file control and temporary storage requests using IPIC connectivity are threadsafe.

• Threadsafe processing for the mirror program and the LINK command in CICS TS 4.2 or later regions to improve performance for threadsafe applications.

Outbound sockets

Outbound socket support allows CICS to open sockets and communicate using one of the supported TCP/IP networking protocols, for example, HTTP, IPIC or RMI/IIOP.

Using TCP/IP in a CICS region

To use TCP/IP in a CICS region, install Communications Server, set and define system initialization parameters, and provide resource definitions. You have additional tasks if you use SSL authentication or DNS connection optimization.

1. Install Communications Server. Make ports belonging to Communications Server available for use by the CICS region involved.

2. Set the TCPIPP system initialization parameter to YES.

3. Provide TCPIPSERVICE resource definitions for each active port and the type of service associated with it. The CICS TCP/IP listener is activated for the specified ports when the TCPIPSERVICE is installed, if you also specify TCPIP(YES).

4. If Secure Sockets Layer (SSL) authentication is used, you must define the KEYRING system initialization parameter, to identify the RACF key ring containing the keys and X.509 certificates used in the SSL handshake.

5. When using DNS connection optimization, you configure the CICS listener regions to communicate with the same name server that the z/OS Workload Manager is configured to use. Therefore, you can reconfigure the DNS server that CICS uses to resolve host names, because CICS must resolve its own host name, using a call to the gethostbyaddr function, using the DNS server configured for connection optimization in the sysplex. This server might not be the system-configured name server if the sysplex is already configured for TCP/IP operation. The system name server might not be on z/OS or on any of the systems in the sysplex.

You can change the resolver configuration of CICS either by altering system TCP/IP configuration files or by adding or changing the DD name SYSTCPD in the CICS startup JCL. In this way, you set the RESOLVER_CONFIG environment variable to the MVS data set that you specified. This file is described in the z/OS IBM Communications Server: IP Configuration Guide, SC31-8775. It contains a reference to the DNS server IP address.

At a minimum, you must specify the following entry:

NSINTERADDR n.n.n.n

where n.n.n.n is the dotted decimal address of the name server to be used.

If you do not include the DD name in the startup JCL, a number of system files are searched until one is found.
The TCPIPSERVICE resource definitions are for use only with the CICS-provided TCP/IP services, and are not related to the z/OS Communications Server IP CICS Sockets interface. The TCP/IP Socket Interface for CICS is supplied with z/OS Communications Server, which is an integral part of z/OS and does not use the CICS Sockets domain.

A TCPIPSERVICE supports either one specific IP address or all IP addresses (INADDR_ANY). Therefore, if two CICS regions are required to listen on the same port at the same IP address, you must use a form of network load balancing, for example, TCP/IP port sharing.

TCP/IP connection balancing, for example, TCP/IP port sharing, is not supported using IPIC and can produce unexpected results when attempting to acquire an IPIC connection.

[TCPIPSERVICE attributes in the Resource Definition Guide]
Chapter 45. Enabling REXX for CICS

The REXX Development System for CICS and the REXX Runtime Facility for CICS are two program products collectively referred to as REXX for CICS. With REXX for CICS, you can write and run REXX programs in a CICS region.

These programs have access to most EXEC CICS commands, the CICS CEDA and CEMT transactions, and DB2 databases through the EXEC SQL interface.

The next topics explain how you can customize your information for REXX and configure your CICS system to provide the facilities of REXX for CICS.

Customization information for REXX

To customize your REXX configuration, review your commands and settings before modifying your resource definitions to add REXX entries.

Modifying your RDO definitions to add required entries

The CICRDOR job, for the Runtime Facility, or the CICRDOD job, for Development System, in the CICSTS42.REXX.SCICJCL data set adds the entries that the product requires, including REXX/CICS profiles, VSAM files, programs, transactions, and transient data queues.

The transient data queues are used for REXX/CICS IMPORT and EXPORT commands. The jobs also contain the definitions for the REXX/CICS SQL interface that authorize the transactions to the DB2 plan.

1. Review “Changing supplied CICS transaction codes” if you plan to modify the transaction IDs and also review “Defining RFS filepools” on page 276 if you plan to change the REXX file system (RFS) pool names or the number of pools to install.

2. Edit the JCL, ensuring that you uncomment the entries as explained in comments at the beginning of the JCL, and run the job.

A return code of 4 is acceptable.

Verifying the installation

When you have completed these steps, you can verify that the installation has been successful, by entering CALL CIC1VP1 from the interactive REXX environment. The exec indicates what is happening.

Changing supplied CICS transaction codes

There are three transaction IDs supplied by the product, REXX, EDIT, and FLST. You can change these supplied transaction IDs.

The functions of REXX, EDIT, and FLST

REXX, EDIT, and FLST perform these functions:

REXX  Is the default transaction ID.
• If no additional operands are supplied, the CICRXTRY exec starts. CICRXTRY allows the user to interactively enter REXX instructions and run them.

• If REXX is entered and is followed by a string, separated from REXX by blanks, the string is interpreted as a REXX exec name followed by operands that are passed to the named REXX exec. This action causes the named exec to run.

When the REXX exec ends, control is returned to CICS.

EDIT

Is the transaction ID associated with the REXX Development System editor.
• If no additional operands are supplied, the CICEDIT exec starts and the file "NONAME" in the user's current RFS directory is opened for editing.

• If EDIT is entered with an additional operand, separated from the transaction ID with a blank, the operand is interpreted as the name of a particular file in the user's current directory, which is to be opened for editing.

When the EDIT session ends, control is returned to CICS.

FLST

Is the transaction ID associated with the REXX Development System file list exec, CICFLST.
• If no additional operands are supplied, the CICFLST exec starts and the contents of the user's current RFS directory are displayed.

• If FLST is entered with an additional operand separated from the transaction ID with a blank, the operand is interpreted as the name of a particular RFS directory the contents of which are to be listed.

When the FLST session ends, control is returned to CICS.

Changing the supplied transaction IDs

You can change the names of the supplied transaction IDs, and you can add additional transactions that call your own EXEC commands.

• The DEFTRNID commands in the CICSTART member, in the CICSTS42.REXX.SCICEXEC data set, define the supplied transaction IDs REXX, EDIT, and FLST, and associate them with their EXEC commands.

If you choose to change the supplied entries, make sure that you update the resource definitions to match your changes. If you do not want users to call the editor or file list EXEC commands directly from CICS, you can delete the DEFTRNID commands, for either or both of them, from CICSTART and also from the resource definitions. Users are not allowed access to these commands directly from CICS. Ensure that you do not remove the DEFTRNID statement for the CICRXTRY command.

• If you want to add additional transactions that call your own EXEC commands directly from CICS, add resource definitions for the transaction IDs and add further DEFTRNID commands to your CICSTART command. Your newly defined transactions become available to your users when you restart your CICS system. An authorized user can enter the DEFTRNID command directly to give immediate availability, but, until the CICSTART member is changed, these definitions are lost when CICS is restarted.

Defining RFS filepools

The supplied member, CICVSAM, in CICSTS42.REXX.SCICJCL, creates the VSAM data sets for two RFS filepools. You can change the names for these VSAM data sets to match your installation standards.
If you do change these names, you must also make matching changes to the CICRDOD member. Because the resource definitions supplied contain the data set names, DD statements are not required in the CICS startup job. You can use this technique to add additional files to an RFS pool or to add additional RFS filepools without restarting your CICS system.

The FILEPOOL DEFINE commands in CICSTART member in the CICSTS42.REXX.SCICEXEC data set have two purposes. The first is to define the names of the supplied filepools. They are: POOL1 and POOL2. You can modify these names to your installation standards. They can be from 1 to 8 characters. Do not use special characters, “.” or “\”. The second purpose is to associate the filepool IDs to the resource definitions for the VSAM data set used for its directory and the first VSAM file used for data storage.

If you want to add additional RFS filepools to your system, you must add resource definitions and add FILEPOOL DEFINE commands to your CICSTART member. If you intend to allow users to add RFS files to the new filepool, you must define the filepool to include a \$\$\$ directory.

To make these new filepools available for use, restart CICS. However, you can also add filepools while your CICS system is active:
1. Add the RDS definitions for the new files and define them using a batch job.
2. Get an authorized user to enter the FILEPOOL DEFINE command and the FILEPOOL FORMAT command.
3. Modify CICSTART or you will lose your new definitions when you restart your CICS system.

You receive a condition code of 8 for the delete control statements if the VSAM data sets do not exist. You receive a condition code of 0 for the define cluster control statements if the job runs correctly.

Modifying TD queues for IMPORT and EXPORT commands

The REXX Development System uses dynamic allocation to IMPORT members from a partitioned data set or to EXPORT RFS files to a partitioned data set.

The CICRDOD member in the CICSTS42.REXX.SCICJCL data set defines three transient data entries used as input for IMPORT and three transient data entries for output for EXPORT, so that three users can concurrently IMPORT and three users can concurrently EXPORT from and to partitioned data sets.

Modify the number of TDQ entries to suit your requirements, but allow for at least one input and one output entry. The TDQUEUE NAME must begin with REX and be suffixed with a valid character. Do not have other applications using TDQUEUE names that begin with REX, because IMPORT and EXPORT use them and can cause files to become corrupted.

Modifying SQL definitions used for authorizing transactions to use DB2

The CICRDOD member in the CICSTS42.REXX.SCICJCL data set authorizes the REXX, EDIT, FLST, and DXB0 transactions to use the DB2 plan.

The first three of these transactions are REXX for CICS transactions and the DXB0 transaction is added if you have OfficeVision/MVS and want to use DB2 interface
calls that might run under the OV/MVS transaction ID. If you choose to modify the supplied transactions for the REXX Development System, you must modify the DB2 entry definitions also.

If you implement new transactions that use the DB2 interface code, also add these DB2 entry definitions to your resource definition group.

**Binding the CICSQL program to your DB2 plan**

The CICBIND job in the CICSTS42.REXX.SCICJCL data set binds CICSQL to the correct DB2 package. Edit and run the job.

You might receive condition code 4 for the job depending on the level of DB2 being used.

**Concatenating special exec data sets used by the REXX Development System**

The REXX Development System uses three data set concatenations that do not have resource definitions in CICS. They are the CICCMDS, CICEXEC, and CICUSER DD names. These data sets are partitioned data sets and are accessed using MVS facilities.

**CICCMDS**

The CICCMDS DD name concatenation starts by referencing the CICSTS42.REXX.SCICCMDS data set. This data set contains the execs that implement REXX Development System authorized commands. Only authorized users or execs authorized to use authorized commands can access these execs. If you choose to extend the REXX Development System with your own authorized commands, concatenate your data set to this DD name concatenation.

**CICEXEC**

The CICEXEC DD name concatenation starts by referencing the CICSTS42.REXX.SCICEXEC data set. This data set contains the execs that are supplied by the REXX Development System that use authorized commands. If you choose to extend the REXX Development System with your own execs that use authorized commands, concatenate your data set to this DD name concatenation.

**CICUSER**

The CICUSER DD name concatenation starts by referencing the CICSTS42.REXX.SCICUSER data set. This data set contains the execs that are supplied by the REXX Development System that do not use authorized commands. If you choose to extend the REXX Development System with your own execs that do not use authorized commands, concatenate your data set to this DD name concatenation.

The facilities used to access these data set concatenations use CICS WAIT EXTERNAL capabilities to avoid placing the CICS region into a wait.

**Adding DD statements to your CICS startup job**

Add the following DD statements to your CICS startup job:

```
//CICAUTH DD DSN=CICSTS42.REXX.SCICCMDS,DISP=SHR
//CICEXEC DD DSN=CICSTS42.REXX.SCICEXEC,DISP=SHR
//CICUSER DD DSN=CICSTS42.REXX.SCICUSER,DISP=SHR
```
A DD statement for the REXX data sets must also be added to the DFHRPL concatenation.

//DFHRPL DD DSN=CICSTS42.REXX.SCICLOAD,DISP=SHR

**Identifying special user IDs and their usage**

Use external security in the CICS environment. External security is required because individual user's information is maintained by the REXX Development System by the user ID designation.

Each user must be uniquely identified and each user must be signed on to the REXX Development System only once. Two users with the same user ID operating at the same time can create unusual results.

If a user is not signed on to the CICS region, then the special user ID of "*RCUSER*" is used to access the RLS and RFS facilities.

Authorized users are identified to the REXX Development System through the AUTHUSER command. This command is an authorized command and can be used only by an authorized user or an exec that is authorized to use authorized commands. CICSTART is such an exec because it is in the CICEXEC DD name concatenation.

Modify the CICSTART member, in the supplied data set CICSTS42.REXX.SCICEXEC, to contain an AUTHUSER statement to identify at least one user ID that is an authorized user. Add the AUTHUSER statement after the existing AUTHUSER statement for RCUSER. For example:

```
'AUTHUSER RCUSER' IF RC = 0 THEN EXIT RC 'AUTHUSER your-userid' IF RC = 0 THEN EXIT RC
```

You can also call another exec, in the CICEXEC concatenation, which can contain the user IDs of the authorized users.

**Customizing the CICSTART member**

The CICSTART member, in CICSTS42.REXX.SCICEXEC data set, contains default definitions for the REXX Development System. CICSTART runs when the first transaction that uses the CICREXD program is issued, after the CICS system starts. Update the CICSTART member with any changes in customization, if those changes are required across CICS executions.

With the REXX Development System, you can run programs in either pseudo-conversational or conversational mode. The system default for conversational mode is specified by the SETSYS PSEUDO statement in the CICSTART member, in the CICSTS42.REXX.SCICEXEC data set. The default supplied allows you to use the pseudo-conversational mode. CICSTART must run in conversational mode because the system has not yet been fully initialized to ensure correct operation.

The CICSTART member also contains EXECLOAD commands that are commented as shipped. Execs using EXECLOAD reduce the amount of storage used by the REXX Development System because users share the same exec. Performance might improve because these execs are not loaded into CICS memory each time they are run. Execs using EXECLOAD are always used before other execs. Name your programs carefully because, if you have two execs with the same name, one which resides in your RFS current directory, and one of which uses EXECLOAD, you
cannot run your RFS copy. The authorization associated with special DD names is maintained when execs are loaded using EXECLOAD from DD name concatenations.

**Formatting the RFS filepools**

Follow the steps to format the RFS filepools.

1. Prepare the filepools for use by entering the command: `'FILEPOOL FORMAT pool1'`, where `pool1` is substituted by the filepool name you specified in the CICSTART exec. The command is entered as shown, including the apostrophes. The interactive environment echoes each command at the next available line on the screen and any requested output is also displayed. The `FILEPOOL FORMAT` command does not display any information. To determine whether the `FILEPOOL FORMAT` command worked successfully, enter "SAY RC". If a "0" is displayed on the next available line, the `FILEPOOL FORMAT` command was successful.

2. Continue this process until all RFS filepools have been formatted. You have to format the filepool only when a new filepool has been defined or if you delete and redefine the clusters for an existing filepool.

3. Optional: If, in the process of formatting the filepools or interactively running REXX or REXX/CICS commands and instructions, you fill the screen, a "MORE" indicator appears at the bottom-right corner. To clear the screen, press the ENTER key. To clear the screen of data, press the CLEAR key. To exit from the interactive environment, press the F3 key, which simulates the entering of the "EXIT" REXX instruction. You can also enter the "EXIT" instruction.

4. Optional: The interactive environment also provides for the recall of previously entered commands. Press the RETRIEVE key. The system has a default setting for this key of F12. You can customize this setting by using the SETSYS RETRIEVE command. Pressing the RETRIEVE key causes the previously entered line to be redisplayed at the input location. You can then modify this area if required and rereun the instruction by pressing ENTER. Pressing the RETRIEVE key multiple times brings the next previously entered command to the input area.

**Activating the online HELP facility and accessing documentation**

You can use an online HELP facility as an example of the REXX/CICS panel. It allows you to search and display the LIST3270 manual that is supplied with the product. Perform the following steps sequentially to activate the online help.

In these steps, if PTF maintenance has been applied that affects data sets for this procedure, use the target library. Otherwise, use the distribution library.

1. Modify the CICSTART member in the CICSTS42.REXX.SCICEXEC data set to reflect the correct RFS filepool and path where the online help files are. If you choose to use the default, no changes to CICSTART are necessary.

2. Copy the supplied CICSTS42.REXX.SCICDOC data set to a data set with a highest level data set qualifier that matches the user ID of the user who runs the CICHPREP exec. The reason for this is that the supplied security exit for the REXX/CICS IMPORT and EXPORT commands checks the highest level qualifier and it must match the user ID for the user who issues the IMPORT command.

3. Copy the supplied CICSTS42.REXX.SCICPNL data set to a data set with a highest level data set qualifier that matches the user ID of the user who runs
the CICHPREP exec. This data set contains the panel definitions that are used by the online help. They must be IMPORTed into the RFS filepool and path defined for the online help.

4. Sign onto REXX/CICS using the REXX transaction ID. If you have changed the default transactions, this transaction ID is the one associated with the CICRXTRY exec. Issue the EXEC CICHPREP command. Follow the instructions issued by the exec. This exec reads the LIST3270 format of the manual from the data set you name into the RFS directory specified in CICSTART. It also splits the manual into multiple files for use by the online help. Additionally, the panels used by the online help are imported into the RFS system.

The online HELP facility is now ready for use.

The user can access the online HELP in several ways:

- Enter 'HELP' on the command line from the interactive environment to display a table of contents. You can also enter this command from the command line of the REXX/CICS editor or the REXX/CICS filelist.
- Enter 'HELP xxxxx' to search the INDEX of the manual for the xxxxx entry. If found, you are taken directly to that section of the manual.
- Use a HELP key defined for the editor and the filelist. It is defined in the customizing macros for the editor and the filelist. The supplied default for this key is F1. You can choose to modify the supplied default by modifying these profiles.

**Accessing the supplied softcopy documentation**

The supplied CICSTS42.REXX.SCICDOC data set contains two members:

- The CICR3270 member contains the manual in LIST3270 format, a format that has an 80-character record length. CICR3270 is used as input by the online help facility.
- The CICR3820 member contains the manual in LIST3820 format. The CICBPRNT job in the CICSTS42.REXX.SCICJCL data set contains a sample job, that prints the manual to a device that supports LIST3820 formatted data.
Chapter 46. Setting up a CICSPlex SM address space (CMAS)

Perform these steps to make a CICSPlex SM address space (CMAS) operational.

For a summary of the CMAS setup tasks that you use while performing them, see “CICSPlex SM setup checklist and worksheets” on page 111.

Before you set up a CMAS

Check your initialization values, changes between releases, release level compatibility and maintenance you might need to apply to your system.

Check the IEASYSxx member of SYS1.PARMLIB that you use for MVS initialization and make note of the initialization values that are referenced during installation. For details about the initialization values, see “Noting IEASYSxx values for CICSPlex SM” on page 113.

If you are converting your CICSPlex SM system or systems from a previous release to CICSPlex SM for CICS TS for z/OS, Version 4.2, read the upgrading information for your level of CICSPlex SM.

A CICSPlex SM CMAS runs only in a CICS system at the same release level. For example, a CICS TS 4.2 CMAS runs only in a CICS TS 4.2 region. During startup, the CMAS checks the CICS release level and ends with message EYUXL0142 if the releases do not match. Managed CICS CICS systems do not have the same restriction.

For details about applying corrective or preventive maintenance to CICSPlex SM, see Chapter 35, “Applying service to CICS Transaction Server for z/OS,” on page 221.

Take note of the information in CICSPlex SM address space (CMAS) about appropriate uses of a CMAS.

CICSPlex SM auxiliary storage usage

When a CMAS is initialized, up to nine MVS data spaces are created.

CICSPlex SM uses these dataspaces to allow quick access to data from a CMAS and the MASs attached to it. Although the data spaces are logically owned by the CMAS, they are physically owned by the ESSS address space (EYUX420). The data spaces are deleted when the CMAS, which logically owns the data spaces, and all local MASs that are attached to that CMAS are stopped. The data spaces are re-created when the CMAS is initialized again.

The size of the data spaces depends on the amount of work (such as end-user interface, workload management, MAS resource monitoring, and real-time analysis processing) that the CMAS is performing and the number of MASs connected to the CMAS. The size ranges from 20 MB of storage in a relatively idle CICSPlex SM configuration to well over 100 MB of storage in a configuration that is complex in both the number of MASs and the amount of work requested. If you do not prepare for such an increase in storage usage, you might encounter auxiliary storage shortages when you first start to use CICSPlex SM.
As an effort to prevent such auxiliary storage shortages, ensure that your auxiliary storage can handle an increase of 100 MB of storage in the environment. Additionally, you can monitor CICSPlex SM’s dataspace use by using an external monitor package to determine the amount of storage the EYUX420 job uses.

If you contact IBM support personnel because of auxiliary storage shortages, you might be asked to use CICSPlex SM online debugging transactions (COD0 and CODB) to evaluate the storage use of EYUX420. For information about the COD0 and CODB transactions, see [Using the interactive debugging transactions (COD0 and CODB)](#).

If auxiliary storage shortages do occur, you can alleviate the problem by either dynamically increasing your auxiliary storage capability or by causing CICSPlex SM to free the allocated data spaces:

1. To dynamically increase auxiliary storage capacity, allocate an additional page data set, and then use the MVS console command PAGEADD to make the new page data set available.
2. To cause CICSPlex SM to free the allocated data spaces, first stop the CICSPlex SM agent in all local MASs connected to the CMAS. To stop the agent, use the COSH transaction for each MAS or, if the MAS is a WUI server, use the COVC and COSH transactions.
   
   If a local MAS is acting as a CICSPlex SM WLM TOR, and the DTR program is specified as EYU9XLOP for that MAS, you must change the DTR program from EYU9XLOP before you can use the COSH transaction against that MAS. For example, you can change it to the IBM default program DFHDYP.
3. After the CICSPlex SM agent is stopped in all local MASs, stop the CMAS itself using the COSD transaction.
4. After the auxiliary storage capability is increased, you can restart the CMAS. To reconnect any local MASs that remained active after the CICSPlex SM agent was stopped, run the COLM transaction in those CICS regions.

You can run COLM using a modify command from the CONSOLE.

---

**Preparing to transmit generic alerts to IBM Tivoli NetView**

You can have the real-time analysis (RTA) component of CICSPlex SM transmit generic alerts to an IBM Tivoli NetView system when one or more user-defined conditions occur during analysis.

To be sure that an IBM Tivoli NetView system is ready to receive the alerts, use the NPDA command:

```
DFILTER AREC
```

This command verifies that the Event Type record IMPD is being passed to the IBM Tivoli NetView database in the IBM Tivoli NetView system.

The resulting list shows an ACTION of PASS for ETYPES of IMPD and RSLV.

If you need to add these record types to the filter, you can issue the following NPDA commands:

```
SRFILTER AREC PASS E IMPD
SRFILTER AREC PASS E RSLV
```

If the name of the IBM Tivoli NetView Alert Receiver has been changed from the default value (NETVALRT), you can use the CICSPlex SM system parameter
Preparing to start a CMAS

You can start a CICSPlex SM address space (CMAS) during the IPL of an MVS system, from the system console, or as a batch job.

- To start a CMAS during the IPL of an MVS system, complete the following steps:
  - Verify that the CMAS startup procedure is in a system procedure library, such as SYS1.PROCLIB.
  - Verify that the CMAS startup procedure is in the 'Started Tasks' table of the external security manager (ESM).
  - Change the COMMNDaa member that is referenced by the IEASYSxx member of SYS1.PARMLIB, as described in "Noting IEASYSxx values for CICSPlex SM" on page 113, to include a START command for the CMAS.
  - The START command to be included is described in "START command for a CMAS" on page 299.

- To start a CMAS from the system console, complete the following steps:
  - Verify that the CMAS startup procedure is in a system procedure library, such as SYS1.PROCLIB.
  - Verify that the CMAS startup procedure is in the 'Started Tasks' table of the external security manager (ESM).
  - Have the operator issue the START command described in "START command for a CMAS" on page 299.

- To start a CMAS as a batch job, complete the following steps:
  - Verify that the CMAS startup procedure is in a system procedure library, such as SYS1.PROCLIB.
  - Construct a job stream to invoke the CMAS procedure.
  - Submit the job to invoke a CMAS.

Whichever method you use to start a CMAS, you must verify that the procedure references the appropriate parameters:

- CICS SIT parameters, as described in "CMAS-related CICS system initialization parameters" on page 293.
- CICSPlex SM startup parameters, as described in Chapter 49, "CICSPlex SM system parameters," on page 341.

The purpose of the CMAS is to manage a managed application system (MAS), so it is important that the CMAS runs at a higher dispatching priority than any MAS in the sysplex. The CMAS communicates with other CMASs that it is connected to; these CMASs need to run at an equal dispatching priority, so that a CMAS on one LPAR does not process and send information out faster than other CMASs that need to receive that data. Therefore, define the CMAS jobs to the MVS service class SYSSTC. Failure to do so can result in severe performance problems for CICSPlex SM.

After you start a CMAS for the first time, you must configure the CMAS to your environment. This configuration includes establishing the CICSPlexes that the CMAS is to manage, and any communication links that are required between this CMAS and another CMAS.
A sample procedure that you can use to start a CMAS is supplied in the EYUCMASP member. This member was generated when you ran the DFHISTAR job. The member is stored in the library that you specified on the LIB parameter of the DFHISTAR job.

You must create the data sets for this CICS region. JCL to create the CICS region data sets for the CMAS is supplied in the EYUCMSDS member of CICSTS42.CPSM.XDFHINST. This member was generated when you ran the DFHISTAR job.

Figure 22 illustrates segments of the EYUCMASP procedure that highlight the additional CICSPlex SM requirements.

```
//EYUCMASP PROC DSN=CICSTS42.CPSM.CMAS01.DFHCSD, CSD Data Set name
//       DSN=CMAS01.DFHCSD, CMAS Data Set name
//       DSN=DSN.CICSTS42.CPSM.RGNLOAD, CICS Table Module library
//       RGNHLO=DICSTS42.CPSM.CMAS01, CICS Region DSN qualifier
//       CICSRLQ=DSICSTS42.CICSC, CICS Resource Definition Table library
//       CPSMRLQ=DSICSTS42.CPSM, CICS Resource Definition Table library
//       PRMLIB=DSICSTS42.XDFHINST, CICS Resource Definition Table library
//       CICSPRM=EYUCMSSP, CICS Parameters
//       CPSMPRM=EYUCMS0P, CICS Parameters
//       CICSHLQ=CICSTS42.CICS, CICS Library
//       CPSMHLO=CICSTS42.CPSM, CICS Library
//       CMAS EXEC PGM=EYU9XECS, CMAS Startup program
//       PARM='SYSIN', CICS Parameters Location
//       REGION=0K, Region Size
//*
//STEPLIB DD DISP=SHR,DSN=CICSTS42.CPSM.SEYUAUTH
//DD DISP=SHR,DSN=CICSTS42.CPSM.SEYULOAD
//DFHRPL DD DISP=SHR,DSN=CICSTS42.CPSM.SEYULOAD
//DD DISP=SHR,DSN=CICSTS42.CPSM.SEYULOAD
//SYSIN DD DISP=SHR,DSN=CICSTS42.CPSM.SEYULOAD
//EYULOG DD SYSOUT=* EYULOG DD
//EYUDREP DD DISP=SHR,DSN=CICSTS42.CPSM.EYUDREP.cmasname
//EYUPARM DD DISP=SHR,DSN=CICSTS42.CPSM.EYUPARM
```

Figure 22. CMAS-specific JCL requirements

Review the following statements in the sample JCL that are illustrated in Figure 22. Verify that the JCL has been modified as follows:

**EXEC PGM=EYU9XECS statement**
Starts the CMAS and either verifies the existence of, or creates, the ESSS. EYU9XECS, the CMAS startup program, must be run so that the CMAS initializes.

**STEPLIB DD statement**
Includes the CICSTS42.CPSM.SEYUAUTH authorized load library.

**DFHRPL DD statement**
Includes the CICSTS42.CPSM.SEYULOAD load library. Include the load library that contains the CICS resource definition table load modules. These must be link-edited into a user-supplied load library, which you specify in the DFHRPL concatenation.

Do not include application load libraries in the DFHRPL concatenation.

**SYSIN DD statement**
Identifies the library member that contains the CICS system initialization override parameters.
**EYULOG DD statement**
Identifies the log to which messages from the CMAS and its associated managed application systems (MASs) are to be directed.

When you are using a sequential data set for the EYULOG, allocate three primary cylinders and one secondary cylinder.

**EYUDREP DD statement**
Identifies the library to be used as the data repository by the CMAS, where cmasname is the name you specified for the CMASNAME parameter on the DFHISTAR job. The CMASNAME value is used by EYU9XDUT to create the CICSp lex SM data repository.

**EYUPARM DD statement**
Identifies the library that contains the CICSp lex SM system parameters.

---

**Creating and managing the CICSp lex SM data repository**

Use the EYUCMSDS postinstallation job to create the CICSp lex SM data sets. The EYUCMSDS job is generated when you run the DFHISTAR job.

“CICSp lex SM postinstallation members” on page 230 describes how to create a simple CICSp lex SM configuration. The EYUCMSDS job is stored in the library that you specified on the LIB parameter of the DFHISTAR job.

The alternate data repository file definition, EYUDREPN, is used by the CMAS in situations where logging are not needed. The current functions that bypass logging are importing or adding a CICSp lex, and removing or deleting a CICSp lex. In these situations, no backout is necessary, therefore no logging is required. Do not modify the recovery attributes of the EYUDREPN file definition.

The EYUDREP file definition is created dynamically during PLTPI by EYU9XLC in the CMAS and specifies attribute LSRPOOLID(1). The CMAS does not create LSRPOOL 1, and if it does not exist, CICS file control DFHFCL calculates the size of LSRPOOL 1 and dynamically creates it when the EYUDREP is first opened in the CMAS. You can choose instead to define your own specifications for LSRPOOL 1 in the DFHCSD. If you choose to define your own LSRPOOL 1, monitor LSRPOOL 1 usage statistics to ensure adequate performance for the CMAS.

---

**Creating the CICSp lex SM data repository**

The CMAS-related data set is the data repository. Each CMAS must have a unique data repository associated with it. The data repository contains the CICSp lex SM administration definitions applicable to its associated CMAS.

The data repository is a critical component of CICSp lex SM system management. You must take regular backups that are associated with each CMAS in your environment.

The data repository is defined to CICS as being a recoverable file that participates in SYNCPOINT and SYNCPOINT ROLLBACK operations. The CMAS must have a CICS system log so that these operations work correctly. Do not, therefore, run a CMAS with a system log that is defined as type DUMMY because you will compromise data integrity on the CICSp lex SM data repository.

To create the data set that contains the data repository, you can use the EYUCMSDS postinstallation job.
If you are running multiple CMASs in the same MVS image, you must create a data repository for each CMAS. You can edit and resubmit the DFHISTAR job, which generates the EYUCMSDS postinstallation job.

To ensure that you do not overwrite your existing customized jobs, you can use the SELECT parameter, as described in Chapter 46, “Setting up a CICSPlex SM address space (CMAS),” on page 283. Alternatively, if you prefer not to resubmit DFHISTAR, you can edit the EYUCMSDS job, giving the SYSIDNT and CMASNAME parameters unique names each time you run the job.

The EYUCMSDS job includes the following steps relating to the creation of the data repository:

**DELDREP**
- This step deletes the data repository set. It allows you to resubmit the job.

**DEFDREP**
- This step allocates the VSAM KSDS cluster for the data repository data set:
  
  `dsindex.EYUDREP.cmasname`

  - *dsindex* is defined by the DSINFO parameter of the DFHISTAR job.
  - *cmasname* is defined by the CMASNAME parameter of the DFHISTAR job.

  CICSPlex SM does not support VSAM records that span control intervals. Make sure that the IDCAMS job that you use to create a CICSPlex SM data repository does not specify the SPANNED parameter. Accept the IDCAMS default of nonspanned records.

**DREPINIT**
- This step is used to set up the data repository for a CICS TS for z/OS, Version 4.2 CMAS.

  The DREPINIT step is generated in the EYUCMSDS job if you did not specify a value with the OLDDREP parameter when you ran the DFHISTAR job. This step runs EYU9XDUT to initialize the new data repository that was allocated by step DREPALLOC. The new data repository does not contain any records from a previous version of CICSPlex SM. The EYU9XDUT utility uses the following parameters for step DREPINIT:

  **CMASNAME=xxxxxxxx**
  - You cannot change this name after the data repository is initialized.
  - This name must be unique in the CICSPlex SM environment. Do not use the same name as that of another CMAS, a CICSPlex, a CICS system, or a CICS system group.
  - Position 1 must be alphabetic or national, and cannot be numeric.
  - Positions 2 through 8 can be alphabetic, national, or numeric.

  **SYSID=xxxx**
  - You cannot change this identifier after the data repository is initialized.
  - This value must match the SYSIDNT (SIT parameter) for the CMAS; see “CMAS-related CICS system initialization parameters” on page 293.
This value must not be the same as the SYSID for any other CMAS or CICS system that is defined to CICSPlex SM.

Positions 1 through 4 can be alphabetic, national, or numeric.

**TIMEZONE=x**

x must be a single alphabetic character (B through Z), representing one of the Greenwich time zone codes.

**ZONEOFFSET=nn**

nn must be a two-digit numeric value (00 through 59), representing an adjustment (offset) to the TIMEZONE.

**DAYLIGHT=x**

x must be a single character (Y or N), representing daylight saving time.

The DREPINIT step requires a DD statement for EYUXDPRM, which sets up the WUI parameters:

**WUI=YES|NO**

The default of **WUI=YES** creates the CICSPlex SM resource definitions required to start a WUI server and its CICSp lex. This parameter allows you to create the resource definitions required to start a WUI server and its CICSp lex when you create the data repository. To add a WUI to an existing system, use the EYU9XDBT or BATCHREP utilities.

**WUIAPPLID=xxxxxxxx**

xxxxxxxx must be alphabetic, national, or numeric characters, specifying the APPLID allocated to a WUI. The first character must be alphabetic or national. This parameter is mandatory if **WUI=YES** is specified.

**WUINAME=xxxxxxxx**

xxxxxxxx must be alphabetic, national, or numeric characters, specifying the name allocated to a WUI. The first character must be alphabetic or national. If **WUINAME** is not specified, it takes the value specified for **WUIAPPLID**.

**WUIPLEX=xxxxxxxx**

xxxxxxxx must be alphabetic, national, or numeric characters, specifying the name allocated to a WUI CICSp lex. The first character must be alphabetic or national. The default is created from the characters WUIP, followed by the CMSSYSID. For example, using the default CMSSYSID, CM01, the default WUIPLEX name is WUIPCM01.

**WUISYSID=xxxx**

xxxx must be alphabetic, national, or numeric characters, specifying the name allocated to a WUI system identifier. The first character must be alphabetic or national. This parameter is mandatory if **WUI=YES** is specified.

**DREPCNVT**

This step is generated if you specified the name of an existing data repository on the OLDDREP parameter. This step runs EYU9XDUT to convert existing data repository records from a previous release of CICSp lex SM for use by CICSp lex SM for CICS TS for z/OS, Version 4.2. All the records from the input data repository specified on the OLDDREP parameter are added to the new data repository that was allocated by step...
DREPALLOC. The input data repository is not modified. The EYU9XDUT utility uses the following parameter for step DREPNCVT:

TARGETVER=0420

0420 represents the version of the new output data repository.

See “Converting the CICSPlex SM data repository”

Populating the CICSPlex SM data repository

You can use the CICSPlex SM-supplied extract routine EYU9BCSD to generate CICSPlex SM resource definition records for each CSD record identified in your input file.

The output from EYU9BCSD is used to populate the data repository.

For more information about EYU9BCSD, see Output from EYU9BCSD.

Converting the CICSPlex SM data repository

Run the EYU9XDUT utility to upgrade the data repository to the current release of CICSPlex SM.

The conversion is controlled by the TARGETVER parameter and the DD statements that you use to run EYU9XDUT. To convert between a previous release and CICSPlex SM for CICS Transaction Server for z/OS, Version 4 Release 2 requires the EYUDREP, NEWREP, and BYPASS DD statements in the JCL. The EYUDREP statement must reference an existing input data repository, and the NEWREP statement must reference the output data repository.

CRESxxxx is a CICSPlex SM Topology Manager object that describes instances of a resource in a CICS system. All CRESxxxx resource table objects are deleted during the conversion process. These deleted records are rebuilt the first time that the MAS connects or joins to the CMAS. The following message is then sent to the SYSPRINT DD statement with a count of how many records were not converted:

EYUXD0708I CRESxxxx Resource Table nnnnn records not converted.

Shut down the CMAS that is using EYUDREP before running EYU9XDUT, otherwise, X’A8’ is returned when the data set is opened.

EYU9XDUT Return codes:

0 Execution completed normally. This return code is accompanied by message: EYUXD0702I Repository successfully converted. This message can also be preceded by the message: EYUXD0708I CRESxxxx Resource Table nnnnn records not converted

4 Some records could not be converted. This return code is accompanied by message: EYUXD0706W DDNAME NEWREP nnnnn records were bypassed, indicating the repository was successfully converted but some records were bypassed and not written to the new repository. These records are written to the BYPASS DD statement. This message can also be preceded by message: EYUXD0708I CRESxxxx Resource Table nnnnn records not converted

8 EYU9XDUT has failed. Check the joblog for error messages that indicate the cause of the error. For example, DD statement missing, or invalid NEWREP data set.
Use JCL similar to that in Figure 23 to convert from CICS TS 4.1 of CICSPlex SM to CICSPlex SM for CICS TS for z/OS, Version 4.2. This sample JCL assumes that you have already allocated the VSAM cluster that is referenced by the NEWREP DD statement. The file that is identified by the NEWREP DD statement must be an empty file.

```plaintext
//DREPCNVNT EXEC PGM=EYU9XDUT,PARM=('TARGETVER=0420')
//STEPLIB DD DISP=SHR,DSN=CICSTS42.CPSM.SEYUAUTH
//EYUDREP DD DISP=SHR,DSN=CPSM420.EYUDREP.cmasname
//NEWREP DD DISP=OLD,DSN=CICSTS42.CPSM.EYUDREP.cmasname
//BYPASS DD SYSOUT=*
//SYSPRINT DD SYSOUT=*  
```

In the JCL, use a value for TARGETVER that indicates the release to which you are converting. For example:

```
To convert to... Use:
CICSPlex SM for CICS Transaction Server for z/OS, Version 3 Release 2
TARGETVER=0320
CICSPlex SM for CICS Transaction Server for z/OS, Version 4 Release 1
TARGETVER=0410
CICSPlex SM for CICS Transaction Server for z/OS, Version 4 Release 2
TARGETVER=0420
```

When the data repository is updated from a previous release to the current release, information stored in the earlier version is carried over to the current version of the data repository:

- When the data repository reverts back from the current release to a previous release, and the record in which information is changed is identical in both releases, the changes are carried back to the earlier version.
- Likewise, if a field in a record exists in both releases, later changes to the information in a field are carried back to the earlier version.
- However, when the data repository is converted from the current release to a previous release and either the record or a field in it did not exist in the previous release, the information contained in the later version is permanently lost.

For more information about the data repository, see “Creating the CICSPlex SM data repository” on page 287 and “Expanding the CICSPlex SM data repository.”

### Expanding the CICSPlex SM data repository

The CICSPlex SM data repository might fill up and require expansion. To expand the CICSPlex SM data repository, use the IDCAMS utility REPRO function. An example of the JCL to do this is in the EYUJXDRP member of the CICSTS42.CPSM.SEYUSAMP library.

In that JCL, on the RECORDS(xx,yy) statement, specify a primary (xx) and a secondary (yy) value that are appropriate for your environment. The initial values are 500 and 3000.

### Taking backups of the CICSPlex SM data repository

The CICSPlex SM data repository is defined to CICS as a VSAM file called EYUDREP. Because the data set is accessed using CICS File Control, all the normal
CICS methods of taking backups of VSAM data sets for disaster recovery purposes are available for use with the data repository.

You can use the following techniques for taking copies of the data repository and for restoring the data repository after a data set failure.

- Use HSM, or DSS, or other utilities to take copies while the associated CMAS is not running, possibly using the Concurrent Copy technique to reduce the time during which the repository is unavailable.
- Use HSM or DSS to take copies while the associated CMAS is running using the Backup While Open technique, and possibly also using the Concurrent Copy technique, which improves the ease of use of Backup While Open. This procedure requires a forward recovery log; see "Defining a forward recovery log for the data repository."
- Use HSM or DSS to restore the data set after a data set failure.
- Use a Forward Recovery product, such as CICS VSAM Recovery (CICS/VR), to reapply updates that were made to the data set after the most recent copy was taken. This procedure requires a forward recovery log.
- Use remote site recovery techniques if you require an up-to-date copy of the data set at a remote site for disaster recovery purposes. This requires a forward recovery log.

The CICS Recovery and Restart Guide provides information on all the terms referred to above. In particular, it provides information about forward recovery logs, forward recovery, the CICS/VR product, Backup While Open, Concurrent Copy and its associated hardware prerequisites, taking backups of data sets, restoring data sets from backup copies, and remote site recovery.

### Defining a forward recovery log for the data repository

You define the data repository in the CMAS as a VSAM file called EYUDREP.

CICSPlex SM provides a default definition that defines this file without an associated forward recovery log, and therefore as not eligible for forward recovery.

If you use forward recovery, you require a journal logstream. Defining and setting up CICS log streams is described in Planning log streams for use by your forward recovery logs.

If you want to use forward recovery, Backup While Open, or remote site recovery, change the definition of EYUDREP. Specify the following keywords on the definition of EYUDREP to define it as having a forward recovery log:

```plaintext
RECOVERY(ALL)
FWDRECOVLOG(nn)
```

**nn** is a number between 1 and 99.

See "Overriding the dynamically created CICS resource definitions for CICSPlex SM" on page 243 for an example of how to do this.

The default definition of EYUDREP also does not define the repository as being eligible for Backup While Open. To make the repository eligible for Backup While Open, specify the following keywords:

```plaintext
RECOVERY(ALL)
FWDRECOVLOG(nn)
BACKUPTYPE(DYNAMIC)
```
where \( nn \) is a number between 1 and 99.

The RECOVERY, FWDRECOVLOG, and BACKUPTYPE parameters of DEFINE FILE are described in Define File attributes in the Resource Definition Guide.

1. Do not change any keywords on the EYUDREP definition other than RECOVERY, FWDRECOVLOG, and BACKUPTYPE. In addition, you must not set RECOVERY(NONE). Setting RECOVERY(NONE) causes repository corruption after transaction or CMAS failures.

2. Do not change the recovery options of the EYUDREPN FILE definition. This definition is used when CPSM determines that Data Repository file operations do not require logging. It is usual to receive LSR pool messages for EYUDREPN during CMAS initialization and ignore them. Make sure that the CICS JCL does not have a DD statement for EYUDREPN, and do not associate EYUDREPN with a data set name.

3. If CPSM Data Repository initialization fails (as reported by message EUIXD0105E) because the EYUDREP data set requires Batch Backout (for example, CICS issues message DFHFC0921), you must recover the EYUDREP data set and then delete and redefine the CMAS Local and Global catalogs in order to reset the CICS backout required status for the data set.

4. Requesting Backup While Open for the CICSPlex SM data repository data set using the IDCAMS DEFINE CLUSTER definition in the ICF catalog is not supported.

**Editing CICSPlex SM system parameters**

The EYUCMS00 member, in the CICSTS42.CPSM.XDFHINST or TDFHINST data set, contains sample parameters for a CMAS; you must edit this member.

Chapter 49, “CICSPlex SM system parameters,” on page 341 gives a detailed description of each parameter.

When the CMAS is to connect to a MAS for which security is active (the CICS system initialization parameter for the MAS is SEC=YES), the CMAS must have CICSPlex SM security active. When CICSPlex SM security is not activated in the CMAS, the connection between the CMAS and the MAS cannot be established. If the connection is attempted, the following message is issued to the console, the CMAS joblog, and the CMAS EYULOG:

EYUCR0007E Security mismatch between CMAS cmasname and MAS masname. Connection terminating.

To activate CICSPlex SM security in the CMAS, specify the CICSPlex SM system parameter SEC=YES. The default is SEC(NO). For more information about the SEC parameter, see Chapter 49, “CICSPlex SM system parameters,” on page 341.

Specifying SEC=YES in the CICS system initialization parameters for the CMAS does not affect CICSPlex SM security.

**CMAS-related CICS system initialization parameters**

The EYUCMSSP member is supplied, uncustomized, in TDFHINST and, customized by DFHISTAR, in XDFHINST. This contains the CICS system initialization parameters for a CMAS.

Table 16 on page 294 identifies the CMAS-related CICS system initialization parameters and their default settings.
1. When the second column in the table contains an asterisk, before you start a CMAS supply your own value for the parameter listed in the first column.

2. When the second column of the table does not contain an asterisk, do not change the value of the parameter in the first column.

</table>

Controlling tasks in a CMAS

Many operations in a CMAS are run by multiple asynchronous tasks, in particular a number of tasks that are performed between CMASs in a CMAS network.

Operations such as data repository synchronization, workload management state sharing and single system image can result in a number of interdependent asynchronous tasks being established or used to run the request. The number of tasks that can be used is based on other factors, such as the size of a CMAS network, how many MASs are being managed, how many CICSpexes are defined, how much API activity is performed, the scope of WUI/API/RTA requests and all the major functions offered by CICSpex SM.

Although a CMAS can self-regulate its tasking model and has tolerance of delayed requests and responses through timeout mechanisms, maximum user tasks (MXT) does not apply to controlling an interdependent multitasked asynchronous tasking model. Set inappropriately, you might also experience WUI hanging for long durations if one or more of the asynchronous tasks required to run the requested function is delayed waiting for an MXT slot. Set MXT to avoid delays in task attachment.

As task usage in a CMAS grows with the additional requirements that are placed on it, for example, increased use of the API, more CMASs, more MASs, and new function use, set the MXT value to a level that continues to avoid MXT delays.
Monitor any MXT value for its relationship against the task activity in each CMAS at regular intervals. If the CMAS is starting to experience MXT delays, adjust the MXT value to avoid these delays.

To monitor the tasking activity in an individual CMAS, collect and study the statistics generated by the CICS system that underlies the CMAS that it hosts. CICS transaction manager global statistics contain information on the effect the MXT value has on task attachment.

**Creating and customizing CMAS data sets**

DFHISTAR allows you to create and customize your CMAS data sets, according to the parameters you set when you submit the DFHISTAR job.

**DFHISTAR postinstallation members for a CMAS**

When you run DFHISTAR, with a SCOPE of POST or ALL, it creates the following postinstallation members for a CMAS in the XDFHINST library:

- EYUCMSDS – creates and initializes all the data sets for a CMAS. EYUCMSDS includes steps to delete the data sets so that you can rerun the job, if required. These deletions are expected to fail the first time you run the job. EYUCMSDS contains the following steps:
  1. DELDREP and DEFDREP delete and define a new CMAS data repository.
  2. DREPINIT is included if you do not specify the DFHISTAR OLDDREP parameter. It initializes the new CMAS data repository using the EYU9XDUT utility. EYU9XDUT creates records on the data repository to define the CMAS and, by default, a WUI CICSPlex. A WUI CICSPlex is not created if you specify the DFHISTAR WUI=NO option.
  3. DREPCNVT is included if you specify the name of an existing data repository using the DFHISTAR OLDDREP parameter. It copies all the records from the existing repository to the new data repository, upgrading them to a format suitable for the CICS TS for z/OS, Version 4.2 release.
  4. DELREGDS deletes the CICS data sets.
  5. DEFTSTD defines the CICS auxiliary temporary storage data set, DFHTEMP.
  6. DEFINTD defines the CICS intrapartition transient data set, DFHINTRA.
  7. DEFDMPS defines the CICS transaction dump data sets, DFHDMPA and DFHDMPB.
  8. DELLCSD deletes the CICS DFHCSD data set.
• EYUCMSSP – CICS system initialization overrides for a CMAS.
• EYUCMS0P – EYUPARM parameters for a CMAS.
• EYUCMASP – starts a CMAS.
• EYUCMASJ – JCL to start a CMAS. It runs EYUCMASP.

If you use the default values for the CICSPlex SM parameters, the EYUCMASP PROC statement is shown in the following code sample:

```
EYUCMASP PROC DSNCSD='CICSTS42.CPSM.CMAS01.DFHCSD',
    RGNHLQ='CICSTS42.CPSM.CMAS01',
    CICSHLQ='CICSTS42.CICS',
    CPSMHLQ='CICSTS42.CPSM',
    PRMLIB='CICSTS42.XDFHINST'
    CICSPRM=EYUCMSSP, CICS Parameters
    CPSMPRM=EYUCMS0P  CPSM Parameters
```

**Customizing postinstallation jobs using DFHISTAR**

You can use DFHISTAR to generate copies of the CMAS postinstallation jobs for a different CMAS. DFHISTAR has a SELECT parameter that allows you to specify a new name for a copy of a postinstallation job. It has the format:

```
SELECT jobname newname
```

<table>
<thead>
<tr>
<th>jobname</th>
<th>Is the name of the job you want to regenerate.</th>
</tr>
</thead>
<tbody>
<tr>
<td>newname</td>
<td>Is the name for the new copy.</td>
</tr>
</tbody>
</table>

You can specify more than one SELECT parameter to select multiple jobs to be regenerated in a single run of the DFHISTAR job. When you include a SELECT parameter in the DFHISTAR job, only those jobs specified by the SELECT are generated.

For a CMAS with the name CMAS02 and a CICS system identifier of CM02, you can change your DFHISTAR parameters to specify the following values:

```
CMASNAME CMAS02
CMSSYSID CM02
WUI YES
WUIPLEX WUIPC02
WUINAME WUINC02
WUISYSID WU02
SELECT EYUCMSDS CM02CMDS  JCL to create the data sets for CMAS02
SELECT EYUCMSSP CM02CMS0P  CICS SIT overrides for CMAS02
SELECT EYUCMS0P CM02CM0P  CICSPlex SM EYUPARM parameters for CMAS02
```

Using these parameters, CM02CMDS includes a step to initialize the CMAS data repository with the definitions for a WUI called WUINC02, in a CICSpelix called WUIPC02. You can then start CMAS CMAS02, using the procedure EYUCMASP, to specify these parameters:

```
START EYUCMASP, DSNCSD='CICSTS42.CPSM.CMAS02.DFHCSD',
    RGNHLQ='CICSTS42.CPSM.CMAS02', CICSHLQ='CICSTS42.CICS',
    CPSMHLQ='CICSTS42.CPSM', PRMLIB='CICSTS42.XDFHINST'
    CICSPRM=CM02CMSP, CPSMPRM=CM02CM0P
```

If you are using EYUCMASJ to start the WUI, edit it to specify these values:

```
CICSPRM=CM02CMSP, CPSMPRM=CM02CM0P
```
Controlling CICS storage in a CMAS

A CICSPlex SM address space (CMAS) uses both MVS dataspace storage and storage provided by the CICS system that hosts the CMAS. You must set the EDSALIM value and monitor the CICS storage use in a CMAS to ensure that the CMAS operates effectively.

A CMAS is a special application dedicated to the management and control of managed application systems (MASs). A CMAS does not have a typical tasking model and uses MVS dataspace storage extensively. However, it also uses the storage provided by the CICS system that hosts the CMAS.

With an interdependent multitasked asynchronous tasking model, a CMAS relies on shared storage to communicate between the tasks and the functions being performed. Also, depending on the requirements of a CMAS, it relies heavily on shared storage to buffer requests and responses to be transmitted using CMAS-to-CMAS and CMAS-to-MAS links. The CICS system that hosts the CMAS manages this shared storage.

CICS storage use in a CMAS grows with the additional requirements that are placed on it. For example, CICS storage use increases with increased use of the API, more CMASs, more MASs, increased CMAS-to-CMAS network traffic, and new function uses.

The overall limit for the extended dynamic storage area (EDSA) is specified by the EDSALIM value. Set EDSALIM to a value that provides the CMAS with enough storage to operate unimpeded. In particular, sufficient storage for CMAS-to-CMAS and CMAS-to-MAS network traffic is critical to WUI response times, because large amounts of data might be awaiting shipment on any of the links on which a CMAS communicates.

Monitor any EDSALIM value for its effect on the storage use in each CMAS at regular intervals. If the CMAS experiences short on storage (SOS) conditions or storage fragmentation, or there is a trend towards such conditions, consider increasing the EDSALIM value to meet the storage requirements of the CMAS. Storage fragmentation below a largest free area of 64 KB can adversely affect throughput and response times.

To monitor the storage use in an individual CMAS, collect and study the statistics generated by the CMAS CICS system. CICS storage manager global statistics contain information about the overall usage of CICS storage by the CMAS that it hosts.

START command for a CMAS

The syntax of the command that you can use to start a CMAS is explained.

procname
Is the 1- to 8-character name of the procedure. EYUCMASP is the name of the sample procedure. It is supplied, uncustomized, in the TDFHINST library and, customized by DFHISTAR, in the XDFHINST library.

DSNCSD=dsn
Specifies the name of the data set that contains the CSD file for the CMAS.
RGNHLQ=idx
Specifies the high-level qualifier that is used with the DFHxxxx data sets that are unique to this CMAS.

CICSHLQ=idx
Specifies the high-level qualifier that is used with the SDFHAUTH and SDFHLOAD libraries.

CPSMHLQ=idx
Specifies the high-level qualifier that is used with the SEYUAUTH and SEYULOAD libraries.

PRMLIB=idx
Specifies the name of the library containing the members identified by CICSPRM and CPSMPRM.

CICSPRM=mem
Identifies the member that contains the CICS system initialization parameters. The EYUCMSSP sample is supplied, uncustomized, in the TDFHINST library and, customized by DFHISTAR, in the XDFHINST library.

CPSMPRM=mem
Identifies the member that contains the CICSplex SM system parameters. The EYUCMS0P sample is supplied, uncustomized, in the TDFHINST library and, customized by DFHISTAR, in the XDFHINST library.

---

**CMAS journaling**

A CMAS can produce CICS journal records to track a variety of activities in the CICSplex. These journal records provide an audit trail that can aid in the recovery of data or the reconstruction of events that affected the CICSplex.

A journal record can be written under these circumstances:
- A definition in the data repository is added, removed, or updated.
- An operations action is issued against a MAS.
- A real-time analysis event is generated.

The journal records are stored in a 32 KB buffer and are flushed to the corresponding log streams when the buffer becomes full or when a normal shutdown of the CICS region is initiated.

To force the buffer to be flushed to a log stream when the CICS region is still active, you can specify the WAIT option on the WRITE JOURNALNAME command using EXEC CICS or the CECI transaction.

To request one or more of the record types, specify the appropriate CICSplex SM system parameters in the startup JCL of a CMAS:

- **JRNLDEFCH(YES)**
  For data repository definition changes
- **JRNLACT(YES)**
  For operations actions
- **JRNLRTAEV(YES)**
  For real-time analysis events
For more information on these parameters, see Chapter 49, “CICSPlex SM system parameters,” on page 341.

If you do not want to use the default log stream name of EYUJRNL, define a JOURNALMODEL resource in the CSD that has the desired log stream name.

- To make the JOURNALMODEL resource definition available during CMAS initialization, include the JOURNALMODEL resource definition in a CSD group list. Include this group list in your CMAS startup using the system initialization GRPLIST parameter.
- To add the JOURNALMODEL resource to the CSD, either edit and run the JCL contained in sample member CICSTS42.CPSM.SEYUSAMP(EYUJRNE$) to run batch utility DFHCSDUP or use the CICS CEDA transaction.
- You must also update the CICS system initialization parameters used to start the CMAS by setting the GRPLIST parameter to reference the new group list.

The journal records produced by a CMAS contain data mapped by a DSECT called EYUBCPJR. Each record consists of a standard prefix and a variable data area. The contents of the data area are specific to the type of journal record being written.

Figure 24 on page 303 shows the format of EYUBCPJR.

**Shutting down a CMAS**

You can shut down a CMAS using the WUI shutdown action button or the COSD transaction.

You can use the CMASSTOP command of the CODB system-level debugging transaction to shut down the CMAS, but CODB is restricted and must be used only at the request of IBM customer support personnel. Do not attempt to shut down a CMAS in these ways:

- Issue the CEMT PERFORM SHUTDOWN command against a CMAS
- Cancel the CMAS job from MVS

If you take either of these actions, the CMAS cannot shut itself down properly.
If you shut down more than one CMAS at the same time, you might receive message EYUCP0205S. In this situation, the message does not indicate a problem, and CICSPlex SM does not produce a diagnostic SVC dump as it normally would when this message is issued. You can avoid the message by staggering your CMAS shutdowns.

Using the Shutdown button

1. From the main menu, click CICSPlex SM operations views > CMASs known to local CMAS to open the CMASs known to local CMAS tabular view.
   - Select the record check box beside the CMAS and click Shutdown.... The Shutdown confirmation view is displayed.
   - Click Yes to confirm. The CMASs known to local CMAS tabular view is displayed again, showing a status of INACTIVE for that CMAS.

2. From the main menu, click CICSPlex SM operations views > MASs known to CICSpix to display the MASs known to CICSpix tabular view.
   - Click the CMAS name to display the CMAS detail view.
   - Click Shutdown.... The Shutdown confirmation view is displayed.
   - Click Yes to confirm. The MASs known to CICSpix tabular view is displayed again.

Using the COSD transaction

You can issue the transaction ID, COSD, from any terminal, including an MVS console:

COSD

Restarting a CMAS

A CMAS that was shut down normally, using the COSD transaction or WUI SHUTDOWN button, can usually be restarted with a system initialization parameter of START=AUTO.

However, you must specify START=COLD in these circumstances:

- If you have modified any of the CICS resource definitions that are used by the CMAS.
- If you have added or removed CMAS-to-CMAS (CMTCMDEF) connection definitions.

If a CMAS ends abnormally (that is, through any means other than the COSD transaction or WUI SHUTDOWN button), you must perform an emergency restart to allow CICS to perform backout processing. You can accomplish an emergency restart of a CMAS in one of two ways:

- If the CMAS is registered with the MVS automatic restart manager (ARM), an emergency restart occurs automatically.
- If the CMAS is not registered with ARM, specify START=AUTO in the CMAS CICS system initialization override parameters.

A CMAS initializes and functions properly after an emergency restart, provided that you have made no changes to the CICS resource definitions or CICSPlex SM connection definitions.
If you have made any such changes since the last run of the CMAS (that is, the one that ended abnormally), the CMAS might not function properly. In that case, shut down the CMAS using the COSD transaction or WUI SHUTDOWN button and restart it, specifying START=COLD. For information about shutting down a CMAS, see “Shutting down a CMAS” on page 303.
Chapter 47. Setting up a CICS managed application system (MAS)

There are a number of steps you must perform so that a CICS system can be known as a managed application system (MAS) to CICSPlex SM.

A CICS TS MAS is referred to as an MVS MAS.

Before you set up a MAS

Check your initialization values, changes between releases and maintenance you might need to apply to your system.

Check the IEASYSxx member of SYS1.PARMLIB that you use for MVS initialization and note the initialization values that are referenced during installation. For details about initialization values, see "Noting IEASYSxx values for CICSPlex SM" on page 113.

If you are converting your CICSPlex SM system or systems from a previous release to CICSPlex SM for CICS Transaction Server for z/OS, Version 4 Release 2, read the upgrading information for your level of CICSPlex SM.

Using CICS global user exits and user-replaceable modules

You can use CICS global user exits and the user replaceable module, DTRPROG to monitor a MAS.

The way these exits are used by CICSPlex SM conforms to the standard described in Customizing overview in the Customization Guide. CICSPlex SM uses these exits only to acquire information; the application environment is not altered.

The XMNOUT and XSTOUT exits are used when monitoring services are enabled for a managed application system (MAS):

- The XMNOUT exit obtains task and CICS monitoring data. XMNOUT is used only with a local MAS.
- The XSTOUT exit obtains statistical data before the data is reset by CICS.

These exits obtain monitoring and statistics information and always return a "continue processing" return code. They are not available when a shutdown request for the MAS is received.

The XMEOUT, XDUREQ, XDUREQC, XRSINDI, XSNOFF, and XDUOUT exits are used when topology requests are enabled for a local MAS:

- The XMEOUT exit detects short-on-storage events.
- The XDUREQ exit detects system dump and transaction dump events.
- The XDUREQC exit detects the completion of dump action.
- The XRSINDI exit detects topology resource changes.
- The XSNOFF exit detects user sign-off events.
- The XDUOUT exit detects transaction dump events.
CICSPlex SM uses the dynamic routing program user replaceable module (DTRPROG) as part of workload balancing.

**Controlling the use of modules from the LPA**

You can control whether CICS uses modules from the LPA, either by specifying the LPA and PRVMOD CICS system initialization parameters, or by including or excluding the SYS1.CICSTS42.CPSM.SEYULPA library (defined to MVS as an LPA library) in the STEPLIB or DFHRPL concatenations.

1. A module that is link-edited with the RMODE(ANY) attribute is loaded into the ELPA.
2. It is important to remember that the LPA-resident version of a module that is usually loaded from STEPLIB is not used from the LPA if it is left in the STEPLIB DD concatenation of libraries. If a module is found in the STEPLIB concatenation, it is loaded into the private area of the address space, and the LPA version ignored. You can avoid this situation by moving the LPA-eligible modules into an LPA library, as described in “Installing CICSPlex SM modules into the LPA” on page 157.

For further information about controlling the use of LPA-eligible modules, see Chapter 22, “Installing CICSPlex SM modules in the MVS link pack area,” on page 157, taking particular note of information concerning:
- The module-not-found warning message DFHL0109I
- CICS system initialization parameters related to LPA modules

**Preparing to start a z/OS MAS**

Before you start a MAS, create your data sets, change startup JCL, activate external connections, review system initialization parameters, and prepare your logs.

Start any MASs (that is, the CICS systems the CMAS is to manage) after the CMAS, because a CICS system is unknown to CICSPlex SM until the CMAS with which the CICS system is associated is started.

**Creating and customizing MAS data sets**

Use DFHISTAR to create and customize your managed CICS system (MAS) data sets, according to the parameters that you set when you submit the DFHISTAR job.

**DFHISTAR postinstallation members for a MAS**

When you run DFHISTAR, with a SCOPE of POST or ALL, it creates the following postinstallation members for a managed CICS system (MAS) in the XDFHINST library:
- EYUCSYDS – creates and starts all the data sets for a MAS. EYUCSYDS includes steps to delete the data sets so that you can rerun the job, if required. These deletions are expected to fail the first time that you run the job. EYUCSYDS contains the following steps:
  1. DELHIST and DEFHIST delete and define CICSPlex SM history data sets EYUHISTA and EYUHISTB.
  2. HISTINIT uses the EYU9XHID utility to start the history data sets.
  3. JES3DELA and JES3DEFA are included if you specify the DFHISTAR JES=JES3 option. They delete and define the CICS local catalog, the global catalog, and the local request queue.
4. DELREGDS deletes the CICS data sets.
5. DEFTTRACE defines the CICS auxiliary trace data sets, DFHAUXT and DFHBUXT.
6. DEFHTML defines the CICS DFHTML data set.
7. DEFDMPS defines the CICS transaction dump data sets, DFHDMPA and DFHDMPB.
8. DEFTSTD defines the CICS auxiliary temporary storage data set, DFHTEMP.
9. DEFINTD defines the CICS intrapartition transient data set, DFHINTRA.
10. DEFLCD defines the CICS local catalog, DFHLCD.
11. INITLCD uses the DFHCCUTL utility to start the CICS local catalog.
12. DEFGCD defines the CICS global catalog, DFHGCD.
13. INITGCD uses the DFHRMUTL utility to start the CICS global catalog.
14. DEFLRQ defines the CICS local request queue data set, DFHLRQ.
15. JES3DEFA and JES3DELB are included if you specify the DFHISTAR JES=JES3 option. They delete and define the CICS DFHCSD data set.
16. DELCSD deletes the CICS DFHCSD data set.
17. DEFCSD defines the CICS DFHCSD data set.
18. INITCSD uses the DFHCSDUP utility to start the DFHCSD data set.

- EYUJHIST creates a pair of CICSPlex SM history data sets. EYUCSYDS includes steps to create two history data sets, EYUHISTA and EYUHISTB. You can use EYUJHIST if you want to add more history data sets (up to a maximum of 26). It contains the following steps:
  - DELHIST and DEFHIST delete and define a pair of CICSPlex SM history data sets.
  - HISTINIT uses the EYU9XHID utility to start the history data sets.
- EYULMSSSP provides CICS system initialization overrides for a managed CICS system.
- EYULMSP0P provides CICSPlex SM EYUPARM parameters for a managed CICS system.
- EYUCSYSYP starts a managed CICS system.
- EYUCSYSP starts a managed CICS system. It runs EYUCSYSJ.

If you use the default values for the CICSPlex SM parameters, the EYUCSYSYP PROC statement is shown in the following code sample:

```plaintext
EYUCSYSYP PROC DSNCSD='CICSTS42.CPSM.CSYS01.DFHCSD',
  RGNHLQ='CICSTS42.CPSM.CSYS01',
  CICSHLQ='CICSTS42.CICS',
  CPSMHLQ='CICSTS42.CPSM',
  PRMLIB='CICSTS42.XDFHINST',
  CICSPARM=EYULMSSP,
  CPSMPARM=EYULMSP0P  CICS Parameters
  CICSPARM=EYULMSSP,
  CPSMPARM=EYULMSP0P  CPSM Parameters
```

### Customizing postinstallation jobs using DFHISTAR

You can use DFHISTAR to generate copies of the managed CICS system postinstallation jobs for a different CICS region. Use the DFHISTAR SELECT parameter to specify a new name for a copy of a postinstallation job. It has this format:

```plaintext
SELECT jobname newname
```

**jobname**

Is the name of the job that you want to regenerate
newname

Is the name for the new copy.

You can specify more than one SELECT parameter to select multiple jobs to be regenerated in a single run of the DFHISTAR job. When you include a SELECT parameter in the DFHISTAR job, only those jobs specified by the SELECT are generated.

For a MAS with the name CSYS02 and a CICS system identifier of CS02, you can change your DFHISTAR parameters to specify these options:

- **CMASNAME**: name of the CMAS to which this managed system connects
- **CMSSYSID**: CICS system identifier of the CMAS to which this managed system connects
- **CSYSPLLEX**: name of the CICSPlex to which this managed system is to be associated
- **CSYSNAME**: CSYS02
- **CSYSID**: CS02
- **SELECT EYUCSYDS CS02CSDS**: JCL to create the data sets for CSYS02
- **SELECT EYULMSSP CS02CSSP**: CICS system initialization overrides for CSYS02
- **SELECT EYULMS0P CS02CS0P**: CICSPlex SM EYUPARM parameters for CSYS02

You can then start the managed CICS system, CSYS02, using the procedure EYUCSYSYP:

```
START EYUCSYSYP, DSNCSD='CICSTS42.CPSM.CSYS02.DFHCSD', RGNHLQ='CICSTS42.CPSM.CSYS02', CICSHLQ='CICSTS42.CICS', CPSMHLQ='CICSTS42.CPSM', PRMLIB='CICSTS42.XDFHINST' CICSPRM=CM02CSSP, CPSMPRM=CM02CS0P
```

If you are using EYUCSYSJ to start the WUI, edit it to specify these options:

```
CICSPRM=CS02CSSP, CPSMPRM=CS02CS0P
```

### Changing startup JCL before starting a MAS

Change the startup JCL for the system by modifying your DD statements to include the CICSPlex SM data sets and verifying that the appropriate CICS system initialization parameters are included.

The DD statements that you must modify are shown in [Figure 25](#).

**Figure 25. z/OS MAS-specific JCL requirements**

```
...  
//STEPLIB  DD  DSN=CICSTS42.CPSM.SEYUAUTH,DISP=SHR  
//DFHRPL  DD  DSN=CICSTS42.CPSM.SEYULOAD,DISP=SHR  
//EYUPARM  DD  DSN=(Any PO or PS data set with LRECL=80)  
//EYUHISTA  DD  DSN=(Optional 1st history dataset)  
//EYUHISTB  DD  DSN=(Optional 2nd history dataset)  
//EYUHISTn  DD  DSN=(Optional nth history dataset)  
...  
```

When you change these DD statements in the startup JCL for a CICS system, code these statements as follows:

**STEPLIB DD statement**

Includes the CICSTS42.CPSM.SEYUAUTH authorized load library.

**DFHRPL DD statement**

Includes the CICSTS42.CPSM.SEYULOAD load library.

**EYUPARM DD statement**

Identifies the library containing the CICSPlex SM parameters.

- Member EYULMS0P, in the CICSTS42.CPSM.SEYUPARM data set, contains sample system parameters for a local MAS; you must edit this
member. See Chapter 49, “CICSPlex SM system parameters,” on page 341 for a detailed description of each parameter. EYULMS0P is supplied, uncustomized, in TDFHINST and customized in XDFHINST.

- If you want to use Business Application Services to install CICS resources in a MAS, you must specify the CICSPlex SM system parameter MASPLTWAIT=YES for that system. This parameter suspends CICS PLT processing until all CICS resources are installed and the CICSPlex SM MAS is fully initialized.

**EYUHISTx DD statement**

Identifies the history data sets for the MAS. Each MAS must have its own set of CICSPlex SM history data sets. You allocate the data sets to the MAS region by means of DD cards in the JCL with DD names of the form EYUHISTx, where x is a character suffix taking values A through Z. Dynamic allocation is not supported. Allocate the data sets with a disposition of OLD. Use the suffix letters in ascending sequence and omit no letters. For example, if four history data sets are required, use DD names EYUHISTA, EYUHISTB, EYUHISTC, and EYUHISTD. See “Preparing the MAS for history recording” on page 314.

**Activating DB2 and Websphere MQ connections during CICS startup**

If you are using DB2 or Websphere MQ with CICS, you must make special arrangements to define and activate your connections.

**DB2 connections**

When you use CICS Transaction Server for z/OS, Version 4 Release 2 CICS systems with the CICS DB2 attachment facility, you make special arrangements when you use BAS to install a DB2 connection defined to CICSPlex SM. When BAS is used to define and then install a DB2 connection, the connection starts in NOTCONNECTED status. You can use the WUI to cause the connection to the DB2 subsystem to be activated in the following way:

1. From the WUI Main menu, click CICS operations views > DB2, DBCTL and WebSphere MQ operations views > Connections (under DB2 operations views).
2. Select the objects to change.
3. Click the Connect button.

In a test environment, you might be able to wait for the MAS to start and then install the BAS definition. Then issue a CONNECT command against the resulting DB2CONN.

However, in a production system, you might want the connection to be automatically activated when the MAS starts up, as part of the PLT processing sequence, so that the DB2 subsystem can be accessed immediately by programs and users. Specifying the CICS system initialization parameter DB2CONN=YES does not by itself activate the connection, because at the time the system initialization parameters are processed, CICSPlex SM has not yet installed any DB2CDEF objects.

Activate a DB2 connection during CICS startup in the following way:

1. Ensure that you can install an appropriate DB2CDEF resource definition for CICSPlex SM, and that the definition is set up for automatic installation.
2. Specify the MASPLTWAIT(YES) CICSPlex SM parameter, which causes the DB2CDEF resource definition (as well as all other BAS resource definitions) to be installed during PLT processing.

3. Arrange for the appropriate DB2 connect program to be started after the MAS startup program (EYU9NXLM for a local MAS).

**Websphere MQ connections**

You cannot use BAS to define and install a WebSphere MQ for z/OS connection before the CICSPlex SM environment has been initialized.

**z/OS MAS-related CICS system initialization parameters**

Verify that the sequential data set or partitioned data set member identified by the CICS SYSIN statement includes the appropriate CICS system initialization parameters.

Table 17 describes the parameters in more detail.

Review all of the listed parameters for each MAS, to ensure that the values specified are appropriate. When you specify YES for a specific resource type (XCMD, XFCT, XPCT, or XPPT), a CICSPlex SM security profile must exist for that resource type. See the CICSPlex SM security in the RACF Security Guide for information about creating security profiles.

**Note:** To get all data available for the TASK and MLOCTRAN views, MCT must have a value specified, CICS monitoring for performance classes must be activated, and you must be collecting performance class data. See the note for MCT, MONITOR, MN, and MNPER parameters in the following table.

**Table 17. CICS system initialization parameters for an z/OS MAS**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>APPLID=</td>
<td>z/OS Communications Server application ID for this CICS system. Used as MAS name when NAME(value) is not specified as a CICSPlex SM system parameter.</td>
</tr>
<tr>
<td>AIEXIT=DFHZATDX</td>
<td>z/OS Communications Server terminal autoinstall program.</td>
</tr>
<tr>
<td>AUTORESETTIME=YES</td>
<td>Time-of-day synchronization.</td>
</tr>
<tr>
<td>AUXTR=ON</td>
<td>Auxiliary trace - exception records.</td>
</tr>
<tr>
<td>AUXTRSW=NEXT</td>
<td>No continuous auxiliary trace switching.</td>
</tr>
<tr>
<td>CPSMCONN=LMAS</td>
<td>Initialize the region as a local MAS.</td>
</tr>
<tr>
<td>DFLTUSER=userid</td>
<td>Specify the user identifier that is to be used for security checking when a user is not defined to the ESM.</td>
</tr>
<tr>
<td>DSALIM=5M</td>
<td>Limit of DSA storage below 16 MB. Set this value to at least 5 MB.</td>
</tr>
<tr>
<td>EDSALIM=50M</td>
<td>Limit of EDSA storage above 16 MB. Set this value to at least 50 MB.</td>
</tr>

<tr>
<td>FCT=NO</td>
<td>A file control table is not used.</td>
</tr>
<tr>
<td>GMTEXT='CICSPlex System Manager - CICS Transaction Server for z/OS'</td>
<td>Default logon message.</td>
</tr>
</tbody>
</table>
### Table 17. CICS system initialization parameters for an z/OS MAS  (continued)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>GRPLIST=DFHLIST</td>
<td>Add group lists for your application resource definitions. See <a href="#">Chapter 39, “CICS resource definitions for CICSPlex SM,” on page 243</a> for additional information.</td>
</tr>
<tr>
<td>ICV=100</td>
<td>Region exit interval.</td>
</tr>
<tr>
<td>ICVR=5000</td>
<td>Runaway task interval.</td>
</tr>
<tr>
<td>ICVTSD=1</td>
<td>Terminal scan delay interval.</td>
</tr>
<tr>
<td>INTTR=ON</td>
<td>Activate main storage trace.</td>
</tr>
<tr>
<td>IRCSTRT=YES</td>
<td>IRC started at system initialization.</td>
</tr>
<tr>
<td>ISC=YES</td>
<td>Code YES to include the CICS programs that are required for interregion and intersystem communications.</td>
</tr>
<tr>
<td>MCT=</td>
<td>Monitoring control table. If you have CICS performance class monitoring active, you must specify a value for this parameter. You can use 2$ (the default) or an existing table. See note.</td>
</tr>
<tr>
<td>MN=ON</td>
<td>Activates CICS Monitor. See note.</td>
</tr>
<tr>
<td>MNFREQ=001500</td>
<td>Writes performance class data every 15 minutes.</td>
</tr>
<tr>
<td>MNPER=ON</td>
<td>Tells CICS to monitor performance classes. See note.</td>
</tr>
</tbody>
</table>

**Note for MCT, MONITOR, MN, and MNPER parameters:** To obtain all data available for the TASK and MLOCTRAN views, MCT must have a value specified, CICS monitoring for performance classes must be activated, and you must be collecting performance class data.

If you do not want this data written to an SMF data set, you can suppress the monitor records. See the description of the SUPPRESSCMF parameter in [Chapter 49, “CICSPlex SM system parameters,” on page 341](#).

| MXT=120       | Maximum tasks. Increase by 20 to accommodate the CICSPlex SM MAS tasks. CICSPlex SM rarely uses all 20 of these additional tasks. If you are using the MXT value alone to control application transactions, increasing this value can allow more application transactions to run concurrently. To prevent this situation from occurring, you can define a transaction class for the application. Then, set a class maximum task (CMXT) value that limits the number of concurrent transactions. |
| SEC= {YES | NO} | Indicate whether external security checking is to be performed for this CICS system:     |
| YES | When READ access is granted:     |
|     | • READ is permitted     |
|     | • UPDATE is refused.     |
|     | When UPDATE access is granted:     |
|     | • READ is permitted     |
|     | • UPDATE is permitted.     |
| NO | Security checking is not performed.     |
| 1. | For CICS security, the value specified with SEC= for a CMAS overrides the value specified with SEC= for a MAS.     |
| 2. | For CICSPlex SM security to be active, set SEC=YES for a MAS. The CMS to which it connects must have the CICSPlex SM system parameter SEC=YES. When CICSPlex SM security is not activated in the CMS, the connection between the CMAS and the MAS cannot be established. If the connection is attempted, message EYUCR0007E is issued to the console, the CMAS joblog, and the EYULOG. |

For more information about the SEC parameter for the CMAS, see [Chapter 49, “CICSPlex SM system parameters,” on page 341](#).

</tr>
</tbody>
</table>

Preparing the MAS for history recording

With CICSPlex SM, you can save and view data for completed tasks; that is, historical task data.

When an active task completes, its data is stored in a historical data store. The data store is made up of a number of VSAM KSDS data sets. You need a minimum of two data sets and a maximum of twenty six data sets.

Each MAS must have its own set of CICSPlex SM history data sets. Allocate the data sets to the MAS region by means of DD cards in the JCL with DD names of
the form EYUHISTx, where x is a character suffix taking values A through Z. Dynamic allocation is not supported. Allocate the data sets with a disposition of OLD. Use the suffix letters in ascending sequence with no letters omitted. For example, if four history data sets are required, use DD names EYUHISTA, EYUHISTB, EYUHISTC, and EYUHISTD.

Define the CICSPlex SM history data sets with the REUSE keyword. Task history recording uses the least recently used data set, or, when starting for the first time, EYUHISTA. When EYUHISTA becomes full, it switches to use EYUHISTB and so on in sequence. Each full data set remains open with its data available until the history recorder has filled all data sets and starts reusing the data sets. At this time, EYUHISTA is set closed, emptied, reopened, and reused first, followed by EYUHISTB and so on in sequence. If a data set is reused, its previous contents are destroyed.

Until the history recorder has to empty a data set to reuse it, the historical task data is available for use. The data is maintained across CMAS and MAS restarts. You do not have to define the history data sets as recoverable because unit-of-work recoverability is not required. However, the CICSPlex SM history recorder does require files to be defined as nonrecoverable to avoid unnecessary logging in the MAS region.

In addition, do not define the history data sets to use VSAM compression. The CPSM history function initializes the data sets to calculate how many records fit in the data set, so that it can safely use sequential writes to the data set, thereby reducing I/O use. Use of VSAM compression spoils that calculation and causes data to be lost when the data set becomes full and a data set switch is required.

CICSPlex SM provides a tuning aid, the HISTRECSMSG EYUPARM parameter, to determine the optimum size for history data sets. HISTRECSMSG can activate the periodic output of messages detailing how many thousand records have been written to the data set. Each completed task has one record. Because CICS file control supports extended format KSDS data sets, you can define large history data sets over 4 GB in size. However, when considering the use of very large data sets, take into account that when the CICSPlex SM history recorder reuses a data set by emptying it, a large amount of data is lost and not available for subsequent queries. An alternative approach to a small number of very large data sets is to spread the data over more data sets. For example, by having 25 data sets, each one capable of holding one hour’s worth of completed task data, at least one day’s worth of data can always be maintained. When the oldest data set is reused, only one hour’s worth of data is lost.

CICSPlex SM provides a sample job, EYUJHIST, for defining and initializing two history data sets. It is supplied, uncustomized, in SDFHINST and customized by DFHISTAR in XDFHINST.

### Stopping and restarting management of a CICS system

You can stop and restart management of a MAS in an active CICS system. You can also check that MAS shutdown processing is properly installed.

### Stopping management of a CICS system

You can stop the MAS agent code in an active CICS system in two ways:
- From the WUI Main menu, click CICSPlex SM operations views > MASs known to CICSp lex > , select the CICS systems and click Stop, or
• Run transaction COSH in the MAS. You start COSH at a 3270 terminal, at a console, or using ATI.

When you stop the MAS agent, CICSpix SM cannot access the MAS until either the CICS system is restarted (see "Preparing to start a z/OS MAS" on page 308) or the COLM or CORM transaction is issued.

When a MAS is active as a CICSpix SM workload management routing region, and the dynamic routing program is set to EYU9XLOP, the STOP command is not run. In this situation, before you issue the STOP command, you must use the WUI CICS regions operations view to change the dynamic routing program from EYU9XLOP to the CICS default dynamic routing program, DFHDYP, or another valid dynamic routing program.

**Restarting management of a CICS system**

To reactivate a running CICS system as a MAS, issue the CICS COLM transaction.

If you want a local MAS to be recognized as a workload management routing region when CICSpix SM resumes managing the system, set the dynamic routing program to EYU9XLOP. To change the dynamic routing program, use the CICS CEMT transaction before you reactivate the local MAS.

**Terminating a MAS**

To verify that the CICSpix SM MAS shutdown processing is properly installed, you can end the CICS system and check the log for the following shutdown message.

```
EYUXL0016I  MAS shutdown complete
```

To end a CICS system running the MAS agent code:

1. From the WUI Main menu click **CICS regions >**
2. Select the CICS system(s)
3. Click **Shutdown**

---

**Controlling the number of long running tasks in a MAS**

The MAS agent contains one primary long running task (LRT), which runs under transaction CONL. By default, this task handles most requests directed to the MAS through the API, WUI, and RTA. The CONL task also handles internal requests for the MAS, including collecting information on dynamically installed resources and delivering this information to the CMAS. If the LRT becomes busy handling one request, all subsequent requests directed to the MAS are delayed until the current request ends.

Alternate LRTs, which run under the CONA transaction, can be requested by specifying a non-zero value for the MASALTLRTCNT EYUPARM. If activated, the alternate LRTs handle the API, WUI, and RTA requests normally handled by the primary LRT. Only one alternate LRT is active at a given time. If the active alternate LRT becomes busy for longer than the value specified by the MASALTLRRTIM EYUPARM, subsequent API, WUI, and RTA requests directed to the MAS are directed to another CONA task.
Using alternate LRTs allows subsequent requests to be processed even though a previous request has yet to be completed. This also allows the primary LRT to process internal requests without being delayed by the processing of a WUI, API, or RTA request.

The number of alternate long running tasks (MASALTLRTCNT) can be tuned using the EYUNL0911I, EYUNL0912I, and EYUNL0913I messages issued when a MAS terminates or goes into restart mode. EYUNL0911I displays the number of active CONA tasks for this execution. EYUNL012I displays the maximum number of concurrently busy CONA tasks. If this value is less than the value displayed by EYUNL0911I, then you might want to lower the MASALTLRTCNT so that it equals the value displayed by EYUNL0912I or is one greater. If the value of EYUNL0912I is equal to the value displayed by EYUNL0911I, then the value displayed by EYUNL0913I, the number of times all active CONA tasks were busy at the same time, is non-zero. Based upon this value you can increase the value of MASALTLRTCNT.

The priority of the alternate LRTs can be controlled by the MASALTLRTPRI EYUPARM. Specifying this less than the default value of 255 can adversely affect the response time of API and WUI users, and might result in RTA EVENTS not being created or resolved in a timely manner.

Note: Specifying different values for MASALTLRTCNT for multiple WLM target regions might result in an uneven distribution of transactions to those regions because of differing long running task counts.
Chapter 48. Setting up a CICSPlex SM Web User Interface server

To use the CICSPlex SM Web User Interface, you work through a number of tasks, including specifying parameters, creating data sets, and setting security.

Preparing a CICS system to act as the Web User Interface server

High-level planning guidance and steps are provided to help you set up your CICS system to act as your Web User Interface server and to enable web support.

- The CICS system that you select to act as your Web User Interface server must be a dedicated CICS Transaction Server for z/OS, Version 4 Release 2 CICSPlex SM MAS connected to a CICS Transaction Server for z/OS, Version 4 Release 2 CMAS. For information about how to set up a MAS, see Chapter 47, “Setting up a CICS managed application system (MAS),” on page 307.

- Decide how many Web User Interface servers you require:
  - If you intend to support more than one national language, you require a Web User Interface server for every language you want to support.
  - You can have Web User Interface servers on multiple MVS images.
  - You can have more than one Web User Interface server for availability reasons.
  - The Web User Interface server creates and maintains state data when a user signs on using a web browser (or when an application using the data interface DATA/CONNECTs). Because of this state data, an affinity between the web browser or the application using the data interface and the server is created.

The use of techniques like dynamic virtual IP addresses (DVIPA) or distributed DVIPA might not be able to preserve this affinity. If this affinity is not preserved, web browsers usually redisplay the sign-on screen, or data interface applications receive a BADSTUB status.

- If the Web User Interface server has a different local IP address or name from the one used by users in their web browsers, for example, because of a firewall or another reason that causes network address translation, you can use the TCP/IPHTTPHOST Web User Interface server initialization parameter to control the way the Web User Interface server generates web addresses sent to web browsers.

To set up your CICS system to act as a Web User Interface server, follow these steps:

1. Create the CICS system and confirm that it is operational using the CICS-supplied installation verification procedures.
2. Configure a separate CICSpelix for your Web User Interface servers.
3. Ensure that the CMAS to which the Web User Interface connects is managing all CICSpelixes to which the Web User Interface server requires access, because the Web User Interface server acts as an CICSpelix SM API application. However, the CMAS, to which the Web User Interface connects, does not have to manage any of the MASs in these CICSpelixes.
If more than one CMAS is on the MVS image on which the Web User Interface server runs, consider which CMAS the Web User Interface connects to depending on which CICSpixels the CMAS is managing. You have two ways to control this connection:

- Ensure that the CICSpixel to which the Web User Interface server local MAS belongs is managed only by the CMAS or CMASs to which the Web User Interface connects, or
- Ensure that the Web User Interface server connects to a specific CMAS by specifying the CMASSYSID EYUPARM for the server local MAS.

4. Define the Web User Interface server CICS system to CICSPlex SM as a local MAS and ensure that the CICS system has been set up correctly using the CICSPlex SM installation verification procedures.

5. Consider basic monitoring of your Web User Interface servers. You can use standard CICSPlex SM monitoring because the Web User Interface server is defined as a MAS.

### Configuring CICS web support

You can configure the Web User Interface to provide web support.

1. On Web User Interface initialization, a TCPIPSERVICE resource definition is created and opened for you by the Web User Interface. However, you must create a temporary TCPIPSERVICE resource definition to run the CICS web support sample applications. Discard this temporary TCPIPSERVICE resource definition after CICS web support has been tested and before Web User Interface initialization has begun.

2. For SSL, the Web User Interface can either use the default certificate in the key database or a named certificate. However, it can only use a named certificate only if the label contains only alphanumeric characters and is a maximum of 32 characters.

[Configuring CICS web support components in the Internet Guide](#) explains how to set up the base components of CICS web support and verify its operation using the supplied sample programs.

[Configuring CICS to use SSL](#) explains the additional configuration that is required if you want to use the secure sockets layer (SSL).

### Reviewing CICS system initialization parameters for the WUI

Review these system initialization parameters when setting up a CICSPlex SM Web user Interface server to ensure that CICS is properly configured.

1. Specify the storage key for the CICS common work area (CWA) and the amount of storage required for the CWA on the CWAKEY and WRKAREA CICS system initialization parameters.

   Use the following format:

   ```
   CWAKEY=CICS
   WRKAREA=2048
   ```

2. To ensure that Web User Interface exception trace entries are written to the CICS auxtrace data set, as required to achieve first failure data capture, specify the USERTR, SYSTR, and AUXTR CICS system initialization parameters:

   ```
   USERTR=ON
   SYSTR=OFF
   AUXTR=ON
   ```
If you set AUXTR=OFF, it is overridden at startup. The Web User Interface sets auxiliary trace on to record exception trace entries if a problem occurs that does not result in an SVCDUMP.

3. Specify the CPSMCONN CICS system initialization parameter to start CICSPlex SM code automatically during CICS initialization and initialize the region as a CICSPlex SM Web User Interface server. Using the system initialization parameter is the alternative to specifying the CICSPlex SM WUI initialization and shutdown programs in initialization and shutdown program list tables (PLTPI and PLTSD).

   CPSMCONN=WUI

4. Specify the action CICS takes if, at the next local midnight, the CICS time-of-day differs from the system time-of-day by more than 30 minutes (for example, after setting clocks forward or back to adjust for Summer and Winter time):

   AUTORESETTIME=YES

   Clients continue to issue the CEMT PERFORM RESET command.

5. In addition to specifying the necessary CICS system initialization parameters for running CICSPlex SM local MAS, specify the appropriate CICS system initialization parameters to provide CICS Web Interface support, for your release of CICS.

Specifying language and code page information for the WUI

The Web User Interface requires an INITPARM system initialization parameter to specify the server language and the client code page.

Code EYU9VKEC to represent the language of the Web User Interface server and EYU9VWAN to represent the code page of the client on the INITPARM parameter.

You can select the server language and the client code page from Table 18 and specify them on the INITPARM parameter:

   INITPARM=(EYU9VKEC='xxx', EYU9VWAN='yyy')

xxx is the language identifier of the Web User Interface server and yyy is the code page identifier of the client.

Table 18. Language and code page identifiers for INITPARM

<table>
<thead>
<tr>
<th>Language</th>
<th>Language identifier (EYU9VKEC)</th>
<th>Client code page</th>
<th>Default client code page identifier (EYU9VWAN)</th>
</tr>
</thead>
<tbody>
<tr>
<td>US English</td>
<td>ENU</td>
<td>ISO-8859-1 (819)</td>
<td>ENU1</td>
</tr>
<tr>
<td>Japanese</td>
<td>JPN</td>
<td>Shift-JIS (943)</td>
<td>JPN1</td>
</tr>
<tr>
<td>Simplified Chinese</td>
<td>CHS</td>
<td>GB2312 (1381)</td>
<td>CHS1</td>
</tr>
<tr>
<td>Simplified Chinese</td>
<td>CHS</td>
<td>GB18030 (05488)</td>
<td>CHS2</td>
</tr>
</tbody>
</table>

For example, if your chosen language is English, code the INITPARM parameter:

   INITPARM=(EYU9VKEC='ENU', EYU9VWAN='ENU1')

1. You can override the code page identifier for individual user requests by placing it in the web address used to access the Web User Interface, as shown in this example:

   http://hostname:port/CICSPlexSM/codepage
hostname is the name specified on the TCPIPHOSTNAME Web User Interface server initialization parameter and port is the value specified on the TCPIPPORT Web User Interface server initialization parameter. For information about the Web User Interface server initialization parameters, see “Web User Interface server initialization parameters” on page 326.

2. If the INITPARM system initialization parameter is not specified or if a value is not specified for EYU9VKEC or EYU9VWAN, the default values are ENU for the language and ENU1 for the code page. However, operator messages are issued every time default values are used.

3. A simplified Chinese WUI server can support client Web browsers using either GB2312 (CHS1) or GB18030 (CHS2). For GB2312 clients, the server uses the EBCDIC code page, 935. For GB18030 clients, the server assumes a second EBCDIC code page, 1388, which is a superset of code page 935.

View sets and menus edited using a GB2312 client Web browser are stored in 935 and can be used in either client code page. However, if a view set or menu is edited using a GB18030 client and characters not available in 935 are used, the resulting views set or menu are not displayed correctly on GB2312 clients.

4. Some Web browsers do not support all the available client code pages. For example, many older Web browsers do not support GB18030.

Preparing the code page conversion table for the WUI

You can use the default version of DFHCNV, provided in the SDFHLOAD library, which includes the CICSPlex SM code pages automatically.

If you use your own version of the DFHCNV source module, assemble and link-edit it using the CICS procedures for maintaining conversion table load modules.

A sample copybook is provided in CICSTS42.CPSM.SEYUSAMP called EYU$CNV1, to show which entries are automatically added to DFHCNV when you assemble the table. This copybook contains an entry for every language and client code page combination that is supported:

- EYUENU1
  Entry for English

- EYUJPN1
  Entry for Japanese

- EYUCHS1
  Entry for simplified Chinese (GB2312 clients)

- EYUCHS2
  Entry for simplified Chinese (GB18030 clients)

You do not have to include a copy statement for EYU$CNV1 in the DFHCNV source.

Note: You should use the DFHCNVW $ sample not the EYU$CNV1 sample. The EYU$CNV1 sample is included just to show what the CPSM conversion definitions are, however the definitions are generated automatically by the DFHCNV macro and do not have to be explicitly added to any DFHCNV table. The DFHCNV table included with CICS also contains entries for DFHWBUD and DFHWBHH, but the only time you should modify these particular entries is when using different code pages.
Creating the Web User Interface server repository (EYUWREP)

The Web User Interface server repository, EYUWREP, contains the Web User Interface server view and menu definitions.

You can use the IDCAMS utility to create a VSAM file for these definitions:

```
DEFINE CLUSTER ( -
  NAME( dsname ) -
  VOLUMES( dsvol ) -
  RECORDS( 5000 5000 ) -
  RECORDSIZE( 8192 32000 ) -
  CONTROLINTERVALSIZE( 8192 ) -
  SPANNED -
  INDEXED -
  KEYS( 20 20 ) -
  SHAREOPTIONS( 2 ) -
 )
```

Figure 26. Sample definition to create a Web User Interface repository

By default, each Web User Interface server has its own Web User Interface server repository that is not shared with any other Web User Interface server.

Upgrade definitions using the import and export functions. For information, see the Web User Interface administration topic in the CICSPlex System Manager Web User Interface Guide.

Back up the Web User Interface server repository data as the repository is updated whenever changes are made using the View Editor or when definitions are imported using the COVC transaction. You can back up the Web User Interface repository by using IDCAMS, DFSMSdss, or an equivalent utility.

Sample JCL, EYUJWREP, creates the Web User Interface repository. The sample JCL is provided, uncustomized, in TDFHINST and customized by DFHISTAR in XDFHINST.

Sharing the Web User Interface server repository (EYUWREP) across servers

The Web User Interface server repository can be shared across WUI servers running at the same CICSPlex SM release, if the repository is accessed using VSAM RLS. Follow these steps to allow sharing of the WUI server repository:

1. Add the parameter **RLS=YES** to the DFHSIT table or when you override system initialization parameters.

2. Add the **LOG(UNDO)** parameter to the repository file definition when you use the IDCAMS facility to create the VSAM file.

During initialization, the Web User Interface server determines whether RLS should be enabled for the Web User Interface server repository and sets the appropriate attributes for the EYUWREP file and enqmodel definition.

The Web User Interface server caches objects in memory to improve performance. If a user logged on to one server creates or updates an object using the View Editor, the User Editor, or the Favorites Editor, users logged on to other servers which share the server repository might not see the changes until their local cache is reloaded. Cache is reloaded by restarting the server.
Creating and customizing the WUI data set

Use DFHISTAR to create and customize your Web User Interface (WUI) server data sets, according to the parameters that you set when you submit the DFHISTAR job.

DFHISTAR postinstallation members for a WUI

When you run DFHISTAR, with a SCOPE of POST or ALL, it creates the following postinstallation members for a CICSPlex SM Web User Interface (WUI) server in the XDFHINST library:

• EYUWUIDS – creates and starts all the data sets for a WUI. EYUWUIDS includes steps to delete the data sets so that you can rerun the job, if required. These deletions are expected to fail the first time that you run the job. EYUWUIDS contains the following steps:
  – DELWREP deletes the CICSPlex SM WUI data repository, EYUWREP.
  – DEFWREP defines the CICSPlex SM WUI data repository, EYUWREP.
  – DELCOVDS deletes the WUI import and export data sets, EYUCOVI and EYUCOVE
  – DEFCOVDS defines the WUI import and export data sets, EYUCOVI and EYUCOVE
  – JES3DELA and JES3DEFA are included if you specify the DFHISTAR JES=JES3 option. They delete and define the CICS local catalog, the global catalog, and the local request queue.
  – DELREGDS deletes the CICS data sets.
  – DEFTRACE defines the CICS auxiliary trace data sets, DFHAUXT and DFHBUXT.
  – DEFHTML defines the CICS DFHHTML data set.
  – DEFDMPs defines the CICS transaction dump data sets, DFHDMPA and DFHDMPB.
  – DEFTSTD defines the CICS auxiliary temporary storage data set, DFHTEMP.
  – DEFINTD defines the CICS intrapartition transient data set, DFHINTRA.
  – DEFLCD defines the CICS local catalog, DFHLCD.
  – INITLCD uses the DFHCCUTL utility to start the CICS local catalog.
  – DEFGCD defines the CICS global catalog, DFHGCD.
  – INITGCD uses the DFHRMUTL utility to start the CICS global catalog.
  – DEFLRQ defines the CICS local request queue data set, DFHLRQ.
  – JES3DELA and JES3DELB are included if you specify the DFHISTAR JES=JES3 option. They delete and define the CICS DFHCSD data set.
  – DELCSD deletes the CICS DFHCSD data set.
  – DEFCSD defines the CICS DFHCSD data set.
  – INITCSD uses the DFHCSDUP utility to start the DFHCSD data set.

• EYUJWREP – creates the WUI data repository, EYUWREP. EYUWUIDS includes steps to delete and define EYUWREP. You can run EYUJWREP if you want to delete and define only EYUWREP but none of the other data sets for a WUI.
  – DELWREP: delete the CICSPlex SM WUI data repository, EYUWREP.
  – DEFWREP: define the CICSPlex SM WUI data repository, EYUWREP.

• EYUWUISP – CICS system initialization parameter overrides for a WUI.
• EYUWUI0P – CICSPlex SM EYUPARM parameters for a WUI.
• EYUWUIIN – CICSPlex SM EYUWUI parameters for a WUI.
• **EYUWUIP** – starts a WUI.
• **EYUWUIJ** – invokes EYUWUIP.

If you use the default values for the CICSpex SM parameters, the EYUWUIP PROC statement is shown in the following code sample:

```
EYUWUIP PROC
DSNCSD='CICSTS42.CPSM.WUINCM01.DFHCSD',
RGNHLQ='CICSTS42.CPSM.WUINCM01',
CICSHLQ='CICSTS42.CICS',
CPSMHLQ='CICSTS42.CPSM',
PRMLIB='CICSTS42.XDFHINST',
CICSPRM=EYUWUISP,
CPSMPRM=EYUWUI0P,
WUIPRM=EYUWUIIN
```

**CICSParameters**

**CPSM Parameters**

**WUI Parameters**

---

**Customizing postinstallation jobs using DFHISTAR**

You can use DFHISTAR to generate copies of the WUI postinstallation jobs for a different CICS region. Use the DFHISTAR SELECT parameter to specify a new name for a copy of a postinstallation job. It has this format:

```
SELECT jobname newname
```

**jobname**

Is the name of the job you want to regenerate.

**newname**

Is the name for the new copy.

You can specify more than one SELECT parameter to select multiple jobs to be regenerated in a single run of the DFHISTAR job. When you include a SELECT parameter in the DFHISTAR job, only those jobs specified by the SELECT are generated.

For a WUI with the name WUINCM02 and a CICS system identifier of WU02, which connects to a CMAS with the name CMAS02 and CICS system identifier CM02, you can change your DFHISTAR parameters to specify these options:

```
CMASNAME CMAS02
CMSSYSID CM02
WUIPLEX WUIPM02
WUINAME WUINCM02
WUISYSID WU02
TCP/IP HOST tcp/ip host name for this WUI
TCP/IP PORT tcp/ip port number for this WUI
SELECT EYUWUIDS WU02WUDS JCL to create the data sets for WUINCM02
SELECT EYUWISIP WU02WUSP CICS SIT overrides for WUINCM02
SELECT EYUWUIOP WU02WU0P CICSpex SM EYUPARM parameters for WUINCM02
SELECT EYUWUIIN WU02WUIN CICSpex SM EYUWUI parameters for WUINCM02
SELECT EYUWUIJ CW02WUIJ JCL statement
SELECT EYUWUIP CW02WUIP PROC statement
```

You can then start the WUI WUINCM02, using the procedure EYUWUIP with these commands:

```
START EYUWUIP, DSNCSD='CICSTS42.CPSM.WUINCM02.DFHCSD',
RGNHLQ='CICSTS42.CPSM.WUINCM02', CICSHLQ='CICSTS42.CICS',
CPSMHLQ='CICSTS42.CPSM', PRMLIB='CICSTS42.XDFHINST',
CICSPRM=WU02WUSP, CPSMPRM=WU02WU0P, WUIPRM=WU02WUIN
```

If you are using EYUWUIJ to start the WUI, edit it to specify these values:

```
CICSPRM=WU02WUSP, CPSMPRM=WU02WU0P, WUIPRM=WU02WUIN
```
Specifying the WUI customizable view and menu help data set

The Web User Interface allows a site to provide customized help for individual views and menus.

This help takes the form of HTML documents that can be served by the Web User Interface server or by an external server. If the Web User Interface is to serve the HTML documents, you must provide a partitioned data set to contain the HTML documents.

You can use the View Editor to customize your views and menus to include a link to the customizable view and menu help data set. With the View Editor you can specify these options:

- No help to be available for this view or menu
- Member name of a help page to be served by the Web User Interface from DFHHTML
- Web address of an external help page to be served by another HTTP server

For information about the View Editor, see Customizing the Web User Interface.

The customizable view and menu help data set (DFHHTML) must be a single data set and not concatenated with any other data set.

Web User Interface server initialization parameters

Specify the Web User Interface server initialization parameters in the startup job or in a fixed block 80 data set.

See “Specifying the JCL DD statements for the WUI” on page 335 for the DD name. All of these parameters are subject to the following conditions unless otherwise stated:

- Lines with an asterisk in column 1 are comments and are ignored.
- Values must not contain lowercase characters.
- Values must be specified in parentheses immediately following the parameter.
- Values must not be greater than 32 characters.

For example:

* An EYUWUI parameter data set
  DEFAULTMENU(OURHOME)
  TCPIPHOSTNAME(MVSXX.COMPANY.COM)
  TCPIPPORT(4445)
  CMCIPORT(4446)

Required parameters for the WUI

Set the TCPIPHOSTNAME and TCPIPPORT parameters to initialize the Web User Interface server. The Web User Interface supports names up to 44 characters in length for all parameters.

TCPIPHOSTNAME(name)

Specify the TCP/IP host name of this Web User Interface server. This name is normally the host name and domain name of the MVS system; that is, a fully-qualified name, but can be a specific IP address in colon hexadecimal or dotted decimal format. The host name is normally used by the Web User Interface to construct Web addresses, depending on the client HTTP version and the value of the TCPIPHTTPHOST Web User Interface server parameter.
This value is always returned in the TCPIPHOSTNAME header of a DATA/CONNECT Web User Interface Data Interface request.

**TCPIPPORT(value)**  
Specify the TCP/IP port number of the port that you have allocated for the Web User Interface.

**Optional parameters for the WUI**  
You can specify a number of optional initialization parameters when setting up your Web User Interface server. Certain parameters are required in certain circumstances. For example, if you want to use the CICS management client interface (CMCI) with CICSPlex SM, you must set the CMCIPORT parameter.

**Additional TCP/IP options**  
You can specify additional TCP/IP options to configure your TCP/IP connections. The Web User Interface supports names up to 44 characters in length for all options:

**CMCIPORT(value)**  
Specifies the TCP/IP port number allocated to the CICS management client interface (CMCI). This parameter is required so that you can use CMCI in a CICSPlex SM environment. Specify a number in the range 1 - 65535 but do not use the same port number as specified for the WUI in the TCPIPPORT parameter. When you set this parameter, TCPIPSERVICE and URIMAP definitions are autoinstalled to support CMCI. The level of security for CMCI is derived from the SEC CICS system initialization parameter and the TCPIPSSSL WUI server initialization parameter.

**TCPIPADDRESS(name | INADDR_ANY)**  
Specifies the dotted decimal or colon hexadecimal IP address on which the Web User Interface listens for incoming requests. If INADDR_ANY is specified (the default), the Web User Interface listens on any of the addresses known to the TCP/IP for z/OS host.  
You do not normally have to specify the TCPIPADDRESS option unless the z/OS host has multiple TCP/IP addresses.

**TCPIPHHTTPHOST( NO | YES)**  
Indicates whether you require the TCP/IP host name used to construct Web addresses to be generated based on the incoming HTTP request for HTTP version 1.1 requests or later.

This option has no effect on HTTP requests sent before 1.1 to the Web User Interface server. The Web User Interface server always constructs Web addresses using the host name specified in the TCPIPHOSTNAME Web User Interface server parameter for HTTP 1.0 (and earlier) requests.

**NO**  
For HTTP 1.1 (or later) requests, the host name used in Web addresses constructed by the Web User Interface server is based on the value specified in the TCPIPHOSTNAME Web User Interface server parameter.

**YES**  
For HTTP 1.1 (or later) requests, the host name used in Web addresses constructed by the Web User Interface server is based on the incoming URI or HTTP ‘Host’ header, according to the HTTP 1.1 specification.

When HTTP 1.1 clients are used with a Web User Interface server running TCPIPHHTTPHOST(YES), the IP address or name used on the server, does not
have to be the same as that used by the HTTP 1.1 client. In this way the Web User Interface can be used when name address translation (NAT) is performed, perhaps because of a firewall.

If TCPIPSSL(YES) is used with TCPIPHTTPHOST(YES) and HTTP 1.1 clients are used with different IP address names, you might receive SSL certificate warnings because of host name mismatches.

**TCPIPSSL(YES | NO)**
Indicates whether you require data encryption between your Web User Interface server and web browser. If you select YES, specify the appropriate system initialization parameters to enable SSL support in the CICS Web Interface. For information, see [SSL with CICS web support in the Internet Guide](#).

**TCPIPSSLCERT(name)**
Specifies, the label for the SSL certificate that is to be used for the connection between the Web User Interface and the web browser. If you specify an explicit certificate, the label must be no longer than 44 characters.

The default is the default certificate in the key ring. This field is case-sensitive and is not converted to uppercase.

**TCPIPSSLCIPHERS(cipher_list)**
Specifies a string of up to 44 hexadecimal digits that is interpreted as a list of up to 22 2-digit cipher suite codes. The cipher suite codes are used to describe the set of algorithms that are supported by the Web User Interface server for SSL communications. If the TCPIPSSLCIPHERS parameter is not specified, the cipher suite is set using the ENCRYPTION system initialization option that the Web User Interface server is using. For more details about specifying cipher suites, see [Cipher suites](#).

### Import options

The import options allow you to automatically import WUI data repository definitions from the Web User Interface. The WUI data repository includes view sets and menus, WUI map objects, user objects, and user group profiles. Definitions can be imported from a specified transient data queue or a data set, or both.

Auto-import is an alternative to the import function of the COVC transaction. When you use auto-import, you can use all three parameters to specify a transient data queue and a data set. When using COVC, you are restricted to specifying either a transient data queue or a data set in one import operation.

**AUTOIMPORTDSN(dsn_name)**
Specifies the name of the data set containing IBM-supplied view and menu definitions. The data set cannot be longer than 31 characters. Currently, the supplied set of WUI view and menu definitions is in the SEYUVIEW data set. If you specify an AUTOIMPORTDSN name, you must specify the name of a data set member using the AUTOIMPORTMEM parameter.

Use the AUTOIMPORTDSN and AUTOIMPORTMEM parameters when you want to import specific IBM-supplied view set and menu definitions as a result of service (by a PTF).

**AUTOIMPORTMEM(member_name)**
Specifies the name of the data set member containing the specific IBM-supplied view and menu definitions that you want to import. You can use an asterisk at the end of the name to specify a group of data set members that begin with
the same characters. For example, specifying AUTOIMPORTMEM(EYUEA*) with the IBM-supplied SEYUVIEW data set in AUTOIMPORTDSN imports all of the members beginning with the characters EYUEA.

Use the AUTOIMPORTDSN and AUTOIMPORTMEM parameters when you want to import specific IBM-supplied view set and menu definitions as a result of service (by a PTF).

AUTOIMPORTTDQ(*tdq_name*)

Specifies the name of the CICS extrapartition transient data queue from which you want the server to import a complete set of WUI data repository definitions during server initialization. To use this option, you enter a value explicitly. There is no automatic default; however, queue name COVI (DD name EYUCOVI) is defined as shown in sample EYU£WDEF.

You use the AUTOIMPORTTDQ parameter when starting a WUI server for the first time or if you are already a CICSPlex SM user and want to import other data repository definitions, including your own customized definitions, into an existing data set. Avoid using this parameter at other times because of the resources required to perform the import operation.

Data formatting options

These options determine how data appears on Web User Interface displays.

CVDASTYLE(MIXED | UPPER)

Indicates whether the CVDAs and EYUDAs are displayed in uppercase or mixed case characters.

MIXED

Mixed case text, that is, the first character uppercase and the rest lowercase, for example, ‘Enabled’.

UPPER

Text is displayed in uppercase only.

DATEFORMAT (format)

Specifies the format to be used to display the date on Web User Interface displays:

YYMMDD
DDMMYY
MMDDYY
YYYYMMDD
DDMMYYYY
MMDDYYYY

where:

DD is the day.
MM is the month.
YY and YYYY are the year in two-digit or four-digit format, respectively.

DATESEPARATOR(character | / )

 Specifies the character to be used to separate the date elements on Web User Interface displays.
**DECIMALSEPARATOR(character | . )**

Specifies the character to be used to denote the decimal point on Web User Interface displays.

**GMMTXMSG (NO | YES | BEFORE | AFTER)**

Specifies how the CICS "good morning" message is handled.

- **NO** The message is not issued
- **YES** The message is issued before and after sign-on.
- **BEFORE** The message is issued before sign-on only.
- **AFTER** The message is issued after sign-on only.

**MSGCASE (MIXED | UPPER)**

Indicate whether messages destined for the operator or EYULOGs should be displayed in mixed case or upper case characters.

- **MIXED** Mixed case text is displayed, that is, the first character uppercase and the rest lowercase, for example, 'Enabled'.
- **UPPER** Text is displayed in upper case only.

Note that while MSGCASE(MIXED) is the default, it takes effect after all the EYUWUI parameters have been read. Certain EYUWUI parameters such as TCPIPSSLCERT may contain values that are in mixed case. They will be echoed back in the EYULOG in upper case unless MSGCASE(MIXED) is the first parameter in the EYUWUI input stream.

**THOUSNDSEPARATOR(character | , )**

Specifies the character to be used to separate thousands on Web User Interface displays, when required. For example, 100 000 is displayed as 100,000 if the default is used.

1. The space character (hex 40) is a valid THOUSNDSEPARATOR value, allowing digits to be grouped by a space.
2. Use 0 (zero) to suppress the THOUSNDSEPARATOR value.
3. The THOUSNDSEPARATOR value is used only when required by the individual view definition.

**TIMESEPARATOR(character | : )**

Specifies the character to be used to separate hours, minutes, and seconds on Web User Interface displays.

**Environment options**

These options specify the context and scope values, the home menu and navigation frame, default map objects, and the appearance of newly opened maps.

**AUTOREFRESH(YES | NO)**

Disables the automatic refresh option for a WUI server. The default setting, YES, displays automatic refresh control, based on the view definition. When NO is specified, automatic refresh control is not displayed, even if automatic
refresh control is set on the view definition. See the CICSPlex System Manager Web User Interface Guide for more information about the automatic refresh option.

**DEFAULTCMSCTXT(name | EYUCMS1A)**
- Specifies the CMAS context that is set when the user signs on to the Web User Interface.

**DEFAULTCONTEXT(name | EYUPLX01)**
- Specifies the context that is set when the user signs on to the Web User Interface.

**DEFAULTMAPBAS(name | EYUSTARTMAPBAS)**
- Specifies the name of the map object used to generate maps of business application services definitions.

**DEFAULTMAPCOLL(value | 0)**
- Specifies the number of rows in a generated map below which a map opens in the expanded state. If the number of rows to be displayed is above this number, the map opens in a fully collapsed state. The default value of 0 means that in every generated map all of the rows are visible when opened.

**DEFAULTMAPMON(name | EYUSTARTMAPMON)**
- Specifies the name of the map object used to generate maps of monitoring definitions.

**DEFAULTMAPRTA(name | EYUSTARTMAPRTA)**
- Specifies the name of the map object used to generate maps of real-time-analysis definitions.

**DEFAULTMAPWLM(name | EYUSTARTMAPWLM)**
- Specifies the name of the map object used to generate maps of workload management definitions.

**DEFAULTMENU(name | EYUSTARTMENU)**
- Specifies the name of the menu that is presented to users after sign-on to the Web User Interface.

**DEFAULTNAVIGATE(name | EYUSTARTNAVIGATE)**
- Specifies the name of the navigation frame that is presented to users after sign-on to the Web User Interface.

**DEFAULTSCOPE(name | EYUPLX01)**
- Specifies the scope that is set when the user signs on to the Web User Interface.

**DEFAULTWARNCNT(value)**
- Specifies the number of records required to trigger the record count warning mechanism. This integer value is in the range of 0 to 99999999, the default value is 0 meaning that no warnings are issued. This option affects the behavior of both the WUI and the CICS management client interface (CMCI).

For the WUI only, you can also set a record count warning value applying to a group of users when setting up a WUI user group; setting DEFAULTTWARNCNT in a user group applies to the WUI only if the WUI is running with security switched on. A value set in a user group takes precedence over a value set in the DEFAULTTWARNCNT parameter for the users in that group.

**GLOBALPREFILTER(YES | NO)**
- Specifies filter parameters the first time that a view is displayed; that is, before data is collected. You can also specify this parameter when setting up a WUI
user group if the WUI is running with security enabled. A value set in a user group takes precedence, for users in that group, over the value set in the GLOBALPREFILTER parameter.

RESOURCELIMIT(WARNING | FAIL)
Specifies whether a warning or failure is issued when the resource limit is reached. The default setting, WARNING, issues message EYUVC1258W, and the user can select OK to bypass the warning threshold. Specify FAIL to issue message EYUVC1267E and to deny the new resource request. The WUI server can be used to change the RESOURCELIMIT filter, however the WUI server cannot be used to bypass the warning threshold.

Operation options

These options name the default view set to be used if the Web User Interface receives an external request that does not specify a view set name but specifies an object name. The view sets that you name in these options must represent the objects that can be specified. For more information, see the Providing access to WUI views and menus topic in the CICSPlex System Manager Web User Interface Guide.

You can ignore these parameters if you do not intend to launch Web User Interface displays in this manner.

DEFAULTCICSplex(name | EYUSTARTCICSplex)
Specifies the name of the default CICSpex view set.

DEFAULTCICSRGN(name | EYUSTARTCICSRGN)
Specifies the name of the default CICS region view set.

DEFAULTCONNECT(name | EYUSTARTCONNECT)
Specifies the name of the default connection view set.

DEFAULTCSYSGRP(name | EYUSTARTCSYSGRP)
Specifies the name of the default CICS system group view set.

DEFAULTDB2SS(name | EYUSTARTDB2SS)
Specifies the name of the default DB2 subsystem view set.

DEFAULTEJCOBEAN(name | EYUSTARTEJCOBEAN)
Specifies the name of the default Enterprise Bean in a CorbaServer view set.

DEFAULTEJDJBEAN(name | EYUSTARTEJDJBEAN)
Specifies the name of the default Enterprise Bean in a CICS-deployed JAR file view set.

DEFAULTEVENT(name | EYUSTARTEVENT)
Specifies the name of the default event view set.

DEFAULTLOCFILE(name | EYUSTARTLOCFILE)
Specifies the name of the default local file view set.

DEFAULTLOCTRAN(name | EYUSTARTLOCTRAN)
Specifies the name of the default local transaction view set.

DEFAULTPROGRAM(name | EYUSTARTPROGRAM)
Specifies the name of the default program view set.

DEFAULTREMFILE(name | EYUSTARTREMFILE)
Specifies the name of the default remote file view set.

DEFAULTREMTRAN(name | EYUSTARTREMTRAN)
Specifies the name of the default remote transaction view set.
DEFAULTTASK(name | EYUSTARTTASK)
   Specifies the name of the default task view set.

User options

These options specify user settings that you can configure.

INACTIVITYTIMEOUT(value | 30)
   Specifies the period, in minutes, after which inactive user sessions are ended. The maximum period allowed is 10080 minutes (7 days).

MAXUSERS(value | 20)
   Specifies the maximum number of concurrent users of the Web User Interface. The maximum number of concurrent users allowed is 50.

SIGNONPANEL(BASIC | ENHANCED)
   Specifies, if the Web user Interface server has CICS security active (SEC=YES in the system initialization parameter), whether the Web User Interface sign on panel takes one of the following actions:
   • Displays a GROUP option
   • Saves previously used USER and GROUP values
   • Positions the cursor in the sign-on field requiring input

When the default value, ENHANCED, is specified, the GROUP option is displayed on the sign-on screen and the following events occur:
   • If the user enters a value, sign on proceeds and if:
     - The user ID is connected to the specified group, the group is used for the WUI user group profile
     - The user ID is not connected to the specified group or the group name is not valid, sign on continues, but the WUI group profile is set to the default group of the user, and message EYUVCI227W is issued to the WUI user after sign on is complete. Message EYUVS0024W is written to the WUI server's EYULOG.
   • If the user does not enter a value, the user group profile is set to the default group of the user

The GROUP option does not change the current connect group of the user being signed on. The security environment built by the WUI is always based on the default group of the user. The group option on the WUI sign-on screen specifies which WUI user group profile the user should be associated with and does not change any security decisions that might be made by the External Security Manager.

When the SIGNONPANEL(ENHANCED) option is set and JavaScript is enabled in the web browser, the sign-on process performs the following actions:
   • Saves the user ID and group values in a cookie, so that when the sign-on process next runs, the form is filled with previously entered values
   • Positions the cursor to the sign-on field requiring input

When the value, BASIC, is specified, the GROUP option is not displayed on the sign-on screen, and the user group profile is set to the default group of the user. Values are not saved and the cursor is not positioned on the sign-on panel.
Whether the Web User Interface user group profile is set based on the default group, or specified on the GROUP option, if no matching Web User Interface group profile is found, the values usually set using a user group profile are set to the system default.

The SIGNONPANEL option is ignored if the Web User Interface server is running with CICS Security inactive (SEC=NO in the system initialization parameter).

**Accessibility options**

These options specify the default colors for the Web User Interface displays.

The accessibility options are not normally changed as they affect all users of the Web User Interface server. If you want to change these options for reasons of accessibility, take care to ensure that the Web User Interface displays do not become unreadable.

Each option specifies a color as six hexadecimal digits. Each pair of digits describes the red, green, and blue components of the color, respectively. For example, FFFFFF represents white, 000000 represents black, FF0000 represents bright red, 00FF00 represents bright green, and 0000FF represents bright blue.

- **COLORPAPER(color)**
  - Main work frame background color.
- **COLORPAPERHEAVY(color)**
  - Navigation and assistance frame background color.
- **COLORPAPERLIGHT(color)**
  - Background color used for many interface items; for example, information messages, table column headings, detail view labels, view selection and refresh area.
- **COLORPAPERWARN(color)**
  - Background color for warning messages.
- **COLORPAPERERROR(color)**
  - Background color for error messages.
- **COLORPAPERALT(color)**
  - Background color for alternate rows on tabular displays.
- **COLORPAPERRULE(color)**
  - Background color for assistance frame bar containing the navigation and help icons.
- **COLORINK(color)**
  - Main work frame text color.
- **COLORINKBANNER(color)**
  - Navigation and assistance frame text color.
- **COLORINKLINK(color)**
  - Unvisited link text color.
- **COLORINKVLINK(color)**
  - Visited link text color.
Problem determination option

This option allows you to specify the level of tracing you require for the Web User Interface server.

Attention: Only activate trace at the request of IBM Support Center personnel.

**WUITRACE(trace levels)**

Specifies the level of tracing for the Web User Interface server.

The trace levels that you specify must be separated by a comma, as shown in this example:

WUITRACE(8,11,13,15,18)

You can define a range of trace levels as shown in these examples:

WUITRACE(1:5)  
activates trace levels 1 through 5

WUITRACE(1:5,13,28:31)  
activates trace levels 1 through 5, 13, and 28 through 31

---

**Transient data queue definitions for the WUI**

You require definitions for the COVP, COLG, COVI and COVE transient data queues (TDQs).

**COVP**  The Web User Interface server initialization parameters data set, EYUWUI.  
This data set is a fixed block 80 input data set.

**COLG**  The CICSPlex SM output log, EYULOG. This data set is a variable-length output data set.

**COVI**  Sample definition for the Web User Interface import data set, EYUCOVI.  
This data set is a variable-length input data set.

**COVE**  Sample definition for the Web User Interface export data set, EYUCOVE.  
This data set is a variable-length output data set.

**CICS Transaction Server definitions**

The transient data queue (TDQ) definitions are provided in the EYU$WDEF sample, which is supplied in the SEYUSAMP library. COVI and COVE are provided as samples that can be used to create additional import and export transient data queues.

---

**Specifying the JCL DD statements for the WUI**

Add DD statements to the Web User Interface server for the EYUWUI, EYUWREP, EYULOG, DFHHTML, EYUCOVI and EYUCOVE data sets.

**EYUWUI**  
The Web User Interface server initialization parameters data set. See “Web User Interface server initialization parameters” on page 326.

**EYUWREP**  
The Web User Interface server repository data set. See “Creating the Web User Interface server repository (EYUWREP)” on page 323.

**EYULOG**  
The CICSPlex SM output log.
DFHHTML
The customizable view and menu help data set. See “Specifying the WUI customizable view and menu help data set” on page 326. This statement is optional.

EYUCOVI
The Web User Interface server import data set. For more information, see “Transient data queue definitions for the WUI” on page 335. This statement is optional.

EYUCOVE
The Web User Interface server export data set. For more information see “Transient data queue definitions for the WUI” on page 335. This is statement optional.

Here is an example:

/*
//DFHHTML DD DISP=SHR,DSN=data set name
//EYUWREP DD DISP=SHR,DSN=data set name
//EYUCOVI DD DISP=SHR,DSN=data set name
//EYULOG DD SYSOUT=* 
//EYUWUI DD *
DEFAULTMENU(OURHOME)
TCPIPHOSTNAME(MVSXX.COM/ANY.COM)
TCPPIPPORT(4445)
*/

Web User Interface security

You can set Web User Interface security requirements for CICS security, Secure Sockets Layer (SSL) support, and access to MVS data sets.

User security access summary

Table 19 summarizes the security accesses required by users of the Web User Interface.

<table>
<thead>
<tr>
<th>User Roles</th>

</tbody>
</table>

CICS security in your Web User Interface server region

If your Web User Interface server region is running with CICS security active, you must define the security access required for the CICS Web Support, by the administrator and by the users of the View Editor.
You can use CICS transaction security to limit the users who are allowed to control the Web User Interface server using the COVC transaction.

See Security considerations in the CPSM WUI Guide for information about how to control users of the Web User Interface and to limit what resources they are allowed to access.

Security access for the CICS Web Interface

If CICS transaction security is in use, the CICS DFLTUSER must be given access to the COVP, COVU, and COVE transactions.

Security access for the administrator

The user ID that starts the Web User Interface (the terminal user of COVC or PLTPIUSR, if started automatically using PLTPI) must have access to the COVC and COVG transactions. If CICS surrogate user security checking is active in the Web User Interface server region, the user ID that started the Web User Interface (the terminal user of COVC or PLTPIUSR, if started automatically using PLTPI) must have READ access to wui-userid.DFHSTART in the SURROGAT class for all Web User Interface users.

Security access for users of the View Editor

Users of the Web User Interface require access to the COVA transaction and CICSPlex SM. Users of the View Editor require access to the COVA transaction, CICSPlex SM, and the View Editor profile. For more information about access to the View Editor, see Security considerations in the CPSM WUI Guide.

All users who are successfully signed on to the Web User Interface have access to all of the customizable view and menu help pages, if the customizable view and menu help is served by the Web User Interface.

Secure Sockets Layer support

You can provide secure connections by using the Secure Sockets Layer (SSL) support to provide encryption on the connection. For information about SSL support, see “Web User Interface server initialization parameters” on page 326 for information about the TCPIPSSL and TCPIPSSLCERT Web User Interface server initialization parameters that you must specify for SSL support and for more guidance on SSL, see Configuring CICS to use SSL.

Web User Interface SSL support uses server authentication only. User authentication is by the external security manager (ESM) user ID and password.

Authorizing access to MVS data sets

In addition to standard CICS and CICSPlex SM requirements, the CICS region user ID must have the authority to access the data sets associated with the DD names described in the table.

<table>

<td>READ</td>
</tr>
</tbody>
</table>
Starting and stopping the Web User Interface

After you have set up the Web User Interface you must complete some additional tasks.

**Submitting startup JCL**

Submit the startup JCL for the Web User Interface server to start it for the first time.

Messages on the job log are displayed to confirm that the Web User Interface server has started successfully.

```
08.52.33 JOB03331 +EYUVS0001I IYCQCTA5 CICSPLEX SM WEB USER INTERFACE INITIALIZATION STARTED.
08.52.37 JOB03331 +EYUVS0002I IYCQCTA5 CICSPlex SM Web User Interface initialization complete.
```

If you choose not to start the Web User Interface server during PLTPI processing, you can start it using the COVC transaction Start command.

**Checking the web browser connection**

Check the connection between the Web User Interface and the web browser by typing in the web address: http://hostname:port/CICSPlexSM.

*hostname* is the name specified on the TCPIPHOSTNAME Web User Interface server initialization parameter and *port* is the value specified on the TCPIPPORT Web User Interface server initialization parameter.

For information about the Web User Interface server initialization parameters, see "Web User Interface server initialization parameters" on page 326. You are presented with the Web User Interface server Welcome panel containing a Begin Signon button.

**Obtaining view and menu definitions**

When the Web User Interface has been started, you can obtain some view and menu definitions. You can obtain these views in two ways:

- Log in to the CICS terminal and run the COVC transaction. Use the Import option of the COVC transaction to import the starter set views and menus. The starter set views and menus are provided in CICSTS42.CPSM.SEYUVIEW. For information about the COVC transaction, see **The Web User Interface transaction (COVC)**.
- Use the View Editor, which is described in **The view editor**.

**Shutting down the Web User Interface server**

You can shut down the Web User Interface server by shutting down the CICS system in which the Web User Interface server is running, or by using the COVC
transaction. For more information about the COVC transaction, see The Web User Interface transaction (COVC).
Chapter 49. CICSPlex SM system parameters

There are a number of system parameters that you can use to identify or alter CICSPlex SM attributes. An extrapartition transient data queue called COPR specifies these parameters.

You can assign these parameters to a DD * file, sequential data set, or a partitioned data set member. The DD name for the extrapartition transient data queue is EYUPARM.

Code the system parameters as 80-byte records. You can specify multiple system parameters on a single record if they are separated by commas and do not exceed a total of 71 characters in length. The format of the system parameters is as follows:

**keyword**(v)

- **keyword** is the name of a CICSPlex SM system parameter.
- **v** is an alphanumeric data value that you can specify with the system parameter.

Table 21 identifies the CICSPlex SM parameters used in the CMAS and MAS and indicates whether these parameters are required or optional.

For CMASs, MASs, and WUI servers, the following members of the TDFHINST and XDFHINST libraries contain samples of these parameters:

**EYUCMS0P**

- CMAS parameters

**EYULMS0P**

- Local MAS parameters

EYUCMS0P and EYULMS0P are supplied uncustomized in TDFHINST and customized in XDFHINST. Before using these members to start a CMAS, MAS, or WUI server, remove the comments from the samples and supply the appropriate values.

**Table 21. CICSPlex SM parameters used in CMAS, MAS, and WUI servers.**

**Note:** Support for the WLMLOADCOUNT and WLMLOADTHRSN Eyluparm values is discontinued in CICS TS for z/OS, Version 4.1. For more information, see [Upgrading CICSPlex SM workload management in Upgrading](#).

**ALERTRCVR(NETVALRT | name)**
Identifies the 1-8 character name of the NetView Alert Receiver to be used by the CMAS if the CMAS sends NetView Generic Alerts to NetView.

**ALERTVER( 0 | 1 )**
Identifies the version of the CPSM generic alert record that the CMAS sends to NetView. See [Generic alert and resolution structures in CPSM Managing Resource Usage](#) for details about the generic alert Records that CICSPlex SM sends to NetView.

ALERTVER is relevant only for a CMAS that is named in an ACTNDEF as a CMAS that sends generic alerts to NetView.
APISIGNMSG(YES | NO)
Indicates whether the successful sign-on and sign-off message,
EYUXD0807I, is issued when a CICSPlex SM API user connects to, or
disconnects (TERMINATE) from, the CICSPlex SM API.

BASASSOCBLK(value | 14301)
Specifies the number of BAS association blocks that can be acquired from a
single association element. The default EYUPARM value creates an
association segment size requiring approximately 1.2 MB of storage. If you
specify the maximum value of 114597 blocks-per-segment is specified, then
the resultant segment size is just over 8 MB.

BASLOGMSG(YES | NO)
Indicates whether CICS resources defined using BAS must have their
definitions logged to the CSDL Transient Data Queue of the MAS when
they are installed.
If the CICS version used by the MAS does not support the LOGMESSAGE
option of the EXEC CICS CREATE command, BASLOGMSG has no effect.

CICSPLEX(name)
Identifies the 1- to 8-character name of the CICSPlex to which the local
MAS is to be associated.
The name of a CICSPlex must not be the same as the name of a CMAS, a
CICS system, or a CICS system group.

CMASSYSID(name)
Identifies the 1- to 4-character name of the CMAS to which a MAS is to be
attached.
You can also use this parameter when a local MAS is to attach to a specific
CMAS in the same MVS image.
Note: This parameter is optional. However, for a specific release of
CICSPlex SM, if you do not specify a value for the CMASSYSID parameter
and you have multiple CMASs on an MVS system, a local MAS will
connect to the last CMAS initialized on the MVS system that manages the
CICSPlex specified by the CICSPLEX parameter.

CMTCMLNKACQ(ALWAYS | RECONN)
Specifies whether you want the CMAS to attempt to reacquire LU6.2
CMAS to CMAS links (CMTCMLNKs) if the initial acquire attempt made
by CICS fails. The initial acquire attempt is made by CICS when a CMAS
is started, a z/OS Communications Server ACB is opened, or a CMAS to
CMAS definition (CMTCMDEF) is installed. If the initial acquire attempt
fails, CICSPlex SM network surveillance might attempt to re-acquire the
LU6.2 CMAS to CMAS links depending on the value of CMTCMLNKACQ:
• If CMTCMLNKACQ is set to ALWAYS, the CMAS attempts to acquire
CMTCMLNKs, independent of whether the links were established in the
current CMAS run.
• If CMTCMLNKACQ is set to RECONN, the CMAS attempts to
re-acquire CMTCMLNKs only where CMTCMLNKs were established in
the current CMAS run.
If the CMTCMLNKs were not acquired in the current CMAS run and the
initial acquire attempts fail, CMTCMLNK must manually be acquired.
Depending on the CMTCMLNKACQ option that you are using, repeated failed acquire attempts can produce messages DFHZC3437, DFHZC3462 and DFHZC2405 and z/OS Communications Server IST663 and IST664.

CMTCMLNKACQ can be dynamically changed in a CMAS using the COD0 SET command.

**COHTASKPRI(value | 200)**
Specifies the CICS task priority for the MAS COHT task. COHT is invoked in a MAS when an API or Web User Interface query for completed task history records (HTASK records) is directed to the MAS. Use this parameter to tune the priority of HTASK requests so that a resource-intensive query does not affect the performance of other tasks in the MAS.

**COIRTASKPRI(value | 200)**
Specifies the task priority of COIR, in the range 0 - 255. COIR is a CICSPlex SM task that you can use to process evaluation definitions, EVALDEFs, independent of the MAS.

For each EVALDEF that requests a separate task, an instance of COIR is started at the specified priority. If you specify a priority of 0, no separate COIR tasks are started; all EVALDEFs are processed by the MAS long running task (LRT).

**COMMTSBLOCKS((value | 512/128)**
Specifies the number of sets of control blocks allocated at CMAS or MAS startup for CPSM Communications Transport Services. These control blocks are used when data must be shipped between a CMAS or MAS and other CMASs or MASs.

The default and minimum values for this parameter are 512 in a CMAS and 128 in a MAS. The maximum value is 8192 in either a CMAS or MAS.

Each set requires 1204 bytes of storage allocated in ESDSA in the CMAS or MAS. If the defaults are used, this amount of total storage is allocated:

- **CMAS** - 512 * 1204 = 616,448 bytes
- **MAS** - 128 * 1204 = 154,112 bytes

If the maximum value is specified, this amount of total storage is allocated:

- **CMAS** - 8192 * 1204 = 9,863,168 bytes
- **MAS** - 8192 * 1204 = 9,863,168 bytes

If a shortage occurs while running a CMAS or MAS, message EYUCT0105E is issued. At termination of the CMAS or MAS, message EYUCT0106W is issued. The later message includes a value equal to the highest concurrent shortage of sets (high watermark). Increase the COMMTSBLOCKS parameter for the CMAS or MAS by at least the amount specified by the EYUCT0106W message before restarting the CMAS or MAS.

**HISTORYONLY( YES | NO)**
Specifies whether history data is collected without collecting normal CICSPlex SM monitoring data as well. For example, if MLOCTRAN and MREMTRAN data is not required set HISTORYONLY(YES) to prevent this data from being collected.

**HISTRECSMSG( value | 0)**
Specifies that message EYUNL0179I 'Task History Recorder data set EYUHISTx has accrued nnnn records' is produced each time 'value' thousand records are written to the history data sets. The maximum
allowed value is 1000 which specifies that a message is produced every
time 1 million records are written to the history data sets.

The message is an aid to determining the optimum size of the history data
sets. A value of 0 means that no EYUNL0179I messages are to be
produced.

**HISTSECS( value | 30)**

Specifies the number of seconds to use as the default when API or Web
User Interface users specify a parameter of RECENT(HISTSECS) when
requesting completed task (HTASK) resource table records. The maximum
allowed value is 86400 seconds (24 hours).

**JRLDEFCY(YES | NO)**

Causes a journal record to be written for each data repository add, delete,
and update operation.

**JRNLCPACT(YES | NO)**

Causes a journal record to be written for each successful action command
issued against a MAS or CMAS.

**JRLRTAEV(YES | NO)**

Causes a journal record to be written each time a real-time analysis (RTA)
event is generated.

**MASALTLRTCNT(0 - 5 | 0)**

Indicates the number of alternate long-running tasks (CONA) started in the
MAS during MAS agent initialization. These tasks remain active until the
MAS agent stops or goes into restart mode and handles all API, WUI, or
RTA requests normally handled by the CONL task, allowing the CONL
task to perform other processing in the MAS. At any time, only one of the
CONA tasks processes requests. If the CONA task that is currently
processing requests becomes busy (as determined by the value of the
MASALTLRTCNT EYPARM), subsequent requests are directed to another
CONA task.

If you specify zero (0), no CONA tasks are started and the CONL task
services the API, WUI or RTA requests that are normally directed to the
long running task. Specifying different values for MASALTLRTCNT for
multiple WLM target regions, you might cause an uneven distribution of
transactions to those regions because of differing long-running task counts.

**MASALTLRT6PRI(0 - 255 | 255)**

Specifies the priority given to the CONA transaction for running the
current MAS. If you specify this value as less than 255 you might
adversely affect the response time of API and WUI users and stop RTA
EVENTs from being created or resolved in a timely manner.

**MASALTLRTTTIM(1 - 3600 | 10)**

Specifies the amount of time in seconds for which a CONA task can be
busy before subsequent requests are directed to another active CONA task.

**MASINITTIME(value | 10)**

Specifies the number of minutes, from 5 to 59, that CICSPlex SM waits for
the MAS to initialize.

- If you specify MASPLTWAIT(YES), the MASINITTIME value is the
  maximum length of time that PLT processing can be suspended for MAS
  initialization. (By suspending PLT processing, the chance of completing
  MAS initialization in a specified time is increased, because you are
  asking for less work to be done in a given time interval and thereby
  reducing the scope for contention during that time).
• If you specify MASPLTWAIT(NO), the MASINITTIME value is the maximum length of time that can elapse before MAS initialization is halted if it does not complete.

MASPLTWAIT(YES | NO)

Indicates whether CICSPlex SM suspends all PLT processing until the MAS is fully initialized and connected to the CMAS.

• When you specify MASPLTWAIT(YES), no CICS applications can be started and no users can sign on to the system until CICSPlex SM completes the installation of resources and resumes PLT processing.

• If CICSPlex SM does complete the installation of resources and resume PLT processing in the time interval specified by MASINITTIME, message EYUTS0003I is issued.

• If it does not complete in the time interval specified by MASINITTIME, one of two messages will be issued:
  - EYUNL0090W is issued when MAS initialization is halted and PLT processing resumes to allow the region to function as a CICS region without CICSPlex SM control.
  - EYUXL0090W is issued when MAS initialization is halted and PLT processing resumes to allow the region to function as a CICS region without CICSPlex SM control, but the MAS agent continues to wait for the CICSpex to be registered with the ESSS subsystem by a starting CMAS. When a CMAS registers the CICSpex, MAS agent initialization will continue.

• MAS initialization can be retried by entering the COLM transaction manually.

• When you specify MASPLTWAIT(NO), CICSPlex SM still observes the MASINITTIME value waiting for the MAS agent to complete the topology connect.

• If CICSPlex SM does not complete the topology connect in the time interval specified by MASINITTIME or its default value, message EYUNL0090W is issued, the MAS initialization is halted, and the PLT processing resumes to allow the region to function as a CICS region without CICSPlex SM control.

• MAS initialization can be retried by entering the COLM transaction manually.

If you are using Business Application Services (BAS) to automatically install resources at CICS system initialization, specify MASPLTWAIT(YES) for that system. If you are using Business Application Services (BAS) to automatically install a DB2 connection, and you want the connection to be activated during CICS startup, see the information in "Activating DB2 and Websphere MQ connections during CICS startup" on page 311.

MASTASKPROT (YES | NO)

Controls whether the CPSM API, Web User Interface (WUI), and CICS Management Client Interface (CMCI) are allowed to perform actions or set attribute values for CPSM MAS agent tasks with transaction IDs COIE, COI0, CONA, or CONL.

• If you specify MASTASKPROT(NO), the default, users of the CPSM API, WUI, and CMCI are allowed to FORCEPURGE or modify attribute values for CPSM MAS agent tasks.

• If you specify MASTASKPROT(YES), CPSM validates the transaction ID of all tasks before allowing actions to be performed, or attribute values
to be modified for active tasks. If the transaction ID indicates that the
        task runs as part of the CPSM MAS agent, the request is not processed,
        and a CICS response is set as follows:

        - RESP = TASKIDERR
        - RESP2 = 2 (The task is protected by CICS and is not eligible for
          modification with this command.)

        The function code (EIBFN) is null, to indicate that the response is
        simulated and not set by the CICS SPI.

**MAXAUXCPSTM(value | 50)**

Specifies the percent of total auxiliary storage that can be committed to
each CMAS, in the range of 0 to 99. A value of 0 stops CPSM from
checking the amount of space used.

**Important:** Setting a value of 0 might result in a shortage of auxiliary
storage, requiring an IPL of the MVS system.

Each CMAS requires 24,160 4 KB pages (94 MB) of cache storage at
initialization. If a request for additional cache storage would cause the
CMAS to exceed the MAXAUXCPSTM threshold, an SDUMP is taken and
the CMAS is terminated. If the threshold is exceeded during CMAS
initialization, the CMAS was unable to acquire the initial allocations for all
required component data cache areas. Either increase the value of
MAXAUXCPSTM, or increase the total amount of auxiliary storage by
adding or expanding external page data sets. If this threshold is reached
during an attempt to create or extend a data cache after CMAS
initialization has completed, the automatic restart mechanism (ARM) is
invoked to attempt to restart the CMAS.

**MAXAUXTOTL(value | 70)**

Specifies the maximum total auxiliary storage use at which the CMAS
allows a request for additional cache storage to be made, in the range of 0
to 99. A value of 0 stops CPSM from checking the amount of space used.

**Important:** Setting a value of 0 might result in a shortage of auxiliary
storage, requiring an IPL of the MVS system.

Setting a nonzero value for MAXAUXTOTL prevents the CMAS from
requesting an amount of cache storage that would cause the MVS system
to enter a state of auxiliary storage shortage. If a request for additional
cache storage causes the CMAS to exceed this threshold, an SDUMP is
taken and the CMAS is terminated. This parameter can cause a CMAS to
shut down even though the CMAS is not the largest user of auxiliary
storage. If such a shutdown occurs during CMAS initialization, the CMAS
was unable to acquire the initial allocations for all required component
data cache areas. You must increase the total amount of auxiliary storage
available by adding or expanding external page data sets. If this threshold
is reached during an attempt to create or extend a data cache after CMAS
initialization has completed, the automatic restart mechanism (ARM) is
invoked to attempt to restart the CMAS.

**MAXHISTRECS( value | 1)**

Specifies a value in thousands, in the range 1 to 50. This value is a limit on
the number of records returned on a completed task query from the MAS.
You can limit the amount of data in a request for completed task (HTASK)
resource table records. When this limit is reached, the CICSplex SM API
GET request receives a WARNING response and MAXRECORDS reason.
**MSGBUCKETS(value | 1024)**

Specifies a value in the range 1 - 32768. This value specifies the number of buffers to be allocated for Topology data collection in the MAS. Each buffer is 64 bytes long. The buffer pool, allocated in the MAS cache data space, is used by CICSPlex SM XMEOUT and XRSINDI global user exits and by the MAS Heartbeat task. The number of buffers must equal or exceed the total number of connections, DSNAMEs, GLUEs, TRUEs, and FEPI connections defined in the MAS. If the number of buffers is not sufficient for the Topology mapped resources in the MAS, a trace record with debug text XDATLOST is written at every other heartbeat interval when MAS Topology resource data is collected. Without sufficient buffers, resources are missing from Topology Resource Maps for the MAS in all CMASes in the CICSp lex, and query or action requests entered from the WUI or API for specific resources can fail because the target resources are not known to Topology.

**NAME(name)**

Identifies the 1- to 8-character name of the CMAS or local MAS that is to be started. If you do not specify this parameter, the default is the z/OS Communications Server application ID.

**RESSTATUS(NOTIFY | MSG | CONMSG)**

Indicates how the CMAS is to respond when a CICS resource that is being reported to the resource status facility has a change in operational state:

- **NOTIFY**
  - Issues event notifications in the form of ERESSTAT resource table records.
  - You can monitor these event notifications by using the LISTEN command of the CICSPlex SM API. For more information, see `cpsm.api.listen`.

- **MSG**
  - Writes external messages to EYULOG.
  - If you specify MSG, event notifications are produced in addition to the messages.

- **CONMSG**
  - Writes external messages to the job log, console, and EYULOG.
  - If you specify CONMSG, event notifications are produced in addition to the messages. Use this option with care. It can cause many messages to be sent to the console.

**SEC(YES | NO)**

For a CMAS, indicates whether the CMAS is to perform security checking of CICSPlex SM requests directed to the CICS systems it manages.

- If you specify NO, all security-related parameters are ignored.
- If a CMAS manages any CICS regions that are running with security active (SEC=YES specified as a system initialization parameter), the CMAS must include SEC=YES in EYUPARM. If you do not activate CICSPlex SM security in the CMAS, a connection cannot be established to a CICS system that specifies SEC=YES. If a connection is attempted, the following message is issued to the console, the CMAS job log, and the CMAS EYULOG:

```
EYUCR0007E Security mismatch between CMAS cmasname and MAS masname. Connection terminating.
```
If a CMAS that is started with SEC(NO) connects directly or indirectly to a CMAS started with SEC(YES), any request sent to the SEC(YES) CMAS fails.

- If the request originates from the CICSPlex SM API connected to the SEC(NO) CMAS, the API request receives: RESPONSE 1031 NOTPERMIT REASON 1345 USRID
- If the request originates from the CICSPlex SM Web User Interface server connected to a SEC(NO) CMAS, the Web browser receives the message EYUVC1220E

SECLOGMSG(NO | YES | ALL)
Controls whether CICSPlex SM issues message EYUCR0009I to the CMAS EYULOG to record security failures.

When you specify NO, the default, message EYUCR0009I is not issued.
Specify YES, or ALL, to cause message EYUCR0009I to be issued.
SECLOGMSG(YES) can be useful if the External Security Manager (ESM) does not issue messages when it cannot make a decision or when a failure occurs.

When you specify SECLOGMSG(YES), EYUCR0009I is issued only for requests that are to be logged to the ESM.
SECLOGMSG(ALL) causes EYUCR0009I to be issued even when the ESM permits access to the resource. The ALL operand can produce many EYUCR0009I messages and must normally be used only under the direction of IBM Support.

You can change SECLOGMSG dynamically in a CMAS with the COD0 SET command.

SECRPTLVL (NONE | RESPONSE | DETAIL)
Controls the level of detail available to a client API task when a response of NOTPERMIT with reason USRID is returned by a request.

When you specify NONE, all indications of a security validation exception are suppressed. A response of OK or NODATA, as appropriate, is returned to the client API task.

Specifying the default, RESPONSE, causes the original API response of NOTPERMIT and reason of USRID to be returned to the client task.
Specifying DETAIL causes a result set of MASQRYER resources to be built, identifying the regions in which the requesting user was denied access to a resource. MASQRYER resources can be retrieved by running a FETCH command, passing the QUERYERROR parameter.

Note: The SECRPTLVL parameter controls the response from the CMAS in which it is processed even though the API request might have originated in a different CMAS. Thus a CMAS which manages MASes containing sensitive resources can be started with SECRPTLVL(NONE), while other CMASes managing MASes with lower sensitivity can be started with SECRPTLVL(RESPONSE) or SECRPTLVL(DETAIL).

SECTIMEOUT(value | 30)
Specifies the time in minutes, in the range of 1 through 1440 (1 day), that idle user IDs are to remain signed on in the CMAS before being considered for timeout.
You can also use this value to control how often the CMAS checks for idle users to timeout. For example, with the default value of 30, the CMAS checks every 30 minutes for users who have not used the CMAS for 30 minutes. However, because the times are not synchronized the user ID might not be timed out for up to double the SECTIMEOUT value. Setting a low value increases the number of calls to the External Security Manager (ESM). Setting a high value means that users might have to wait a long time before automatically picking up security changes that affect the user ID (for example, adding the user to a new group).

You can use the CMAS or CMASLIST PURGE request, available from the API and WUI, to force a CMAS to check for users to time out immediately.

You can use the CMAS or CMASLIST RESET USERID request, available from the API and WUI, to force the CMAS to rebuild the user's security information the next time it is used. This request is used after adding or removing a user ID to or from a group, and the user does not want to wait to be timed out to pick up the change.

SPOOLCLASS(class | P)

Specifies a SYSOUT class value, from A to Z or 0 to 9, that identifies where CICSPlex SM spool output is to be sent.

Spool output can be generated by these CICSPlex SM functions:

- The online utility transaction COLU
- The PRINT and CAPTURE commands of the interactive debugging transaction COD0

STALLxxxCNT

xxx represents a CICSPlex SM suspend class. The values for xxx are shown in Table 22.

Identifies the number of consecutive occurrences of an entry in the suspend class required for CICSPlex SM to report a STALL. The value can be 0 - 999. Use 0 to indicate that STALL detection for the xxx suspend class is not active. The default value for each task is shown in Table 21 on page 341.

STALLxxxTSK

xxx represents a CICSPlex SM suspend class. The values for xxx are shown in Table 22.

Identify the minimum number of concurrent tasks required to enter the suspend class. The value can be 0 - 999. Use 0 to indicate that STALL detection for the xxx suspend class is not active. The default value for each task is shown in Table 21 on page 341.

EYUPNxxxx messages are issued when a stall condition occurs that generates a real-time analysis system availability monitoring (SAM) event.

**SUPPRESSCMF(YES | NO)**

For a local MAS, indicates whether the records collected by the CICS Monitor Facility are written to SMF.

The parameter suppresses only CICS type 3 performance class records. Type 4 exception records and type 5 transaction resource records are not suppressed. The type 3 performance records are suppressed only if the CICS region has an active CICSPlex SM monitor definition installed for the MTRAN monitoring class. You can verify which CICS regions have active
monitoring for the MTRAN class by using the WUI Active monitor specifications (POLMON) tabular view.

**TOBATCHREQ(value | 0)**

Specifies the time in seconds before a batch request directed to a MAS is timed out. This time includes RTA requests and API requests initiated from non-CICS programs. Specify zero or a value in the range 10 - 1800.

- If you specify zero, the default value of 240 seconds (4 minutes) is applied. This value is then doubled when the request is transmitted to the MAS.
- If you specify a non-zero value in the range 10 - 1800, that value is used.
- If you specify a non-zero value less than 10, TOBATCHREQ is set to 10.

Depending on the value specified for TOBATCHREQ, more timeouts can be received. You can check in the following ways:

**RTA requests**

No data is processed for any MAS that times out and no external message is displayed. This occurrence might mean that an event is not created or might lead to premature termination of existing events.

**API requests initiated from non-CICS programs**

All API requests initiated from non-CICS programs receive a RESPONSE of ENVIRONERROR (1030) and REASON of REQTIMEOUT (1342) and no data records are returned, regardless of the CONTEXT and SCOPE of the request.

**TOONLINEREQ(value | 0)**

Specifies the time in seconds before an online request directed to a MAS is timed out, including WUI requests and API requests initiated from CICS programs. Specify zero, or a value in the range 10 - 1800.

- If you specify zero, the default value of 240 seconds (4 minutes) is applied. This value is then doubled when a CMAS-to-CMAS link is crossed. For example, you might have a WUI connected to CMAS-1 and MAS-2 is connected to CMAS-2. If you inquire from the WUI to MAS-2, the TOONLINEREQ default value of 240 seconds is doubled to 480 seconds because the request is transmitted from CMAS-1 to CMAS-2.
- If you specify a non-zero value in the range 10 - 1800, that value is used.
- If you specify a non-zero value less than 10, TOONLINEREQ is set to 10.

Depending on the value specified for TOONLINEREQ, more timeouts can be received. You can check in the following ways:

**WUI requests**

All WUI requests receive the following message and no data records are displayed, regardless of the CONTEXT and SCOPE of the request.

```
EYUV1220E
CICSPlex SM API command (GET) failed. (Environerror, Reqtimeout)
```

**API requests initiated from CICS programs**

All API requests initiated from CICS programs receive a RESPONSE of ENVIRONERROR (1030) and REASON of REQTIMEOUT (1342) and no data records are returned, regardless of the CONTEXT and SCOPE of the request.
TOPOLLINT(value | 300)

Specifies the time in seconds that a CMAS delays between checking all requests to check if they exceed their timeout time. Because polling is used to check when to timeout a request, more reliable timeouts occur if this value is set less than or equal to both TOBATCHREQ and TOONLINEREQ.

When a request is directed to a MAS that is not connected to the originating CMAS, it is transmitted from the originating CMAS to the remote CMAS to which the MAS is connected. In this case, the remote CMAS performs the timeout processing, based on the TOBATCHREQ and TOONLINEREQ values specified in the originating CMAS and the TOPOLLINT value specified in the remote CMAS. For this reason, timeout processing is more consistent if all CMASes in the network have the same TOPOLLINT value.
Part 6. Verifying the CICS installation

After you have installed CICS and applied any necessary service, you can use the DFHIVPBT and DFHIVPOL CICS-supplied installation verification procedures (IVPs) to confirm that CICS is operational.

Before you run the IVP jobs, prepare your system. The steps to do this are described in Chapter 50, “Preparing to run the IVPs,” on page 359.
Chapter 50. Preparing to run the IVPs

You must perform a number of tasks to prepare CICS for running the CICS installation verification procedures.

Creating and defining activities for the IVP jobs

In preparation for running the IVP jobs, create the CICS data sets, install the CICS SVC, define and activate the CICS applids, and define log streams.

Creating the CICS data sets for the IVP jobs

Before you can run any of the CICS-supplied IVP jobs, create the data sets that they use. For further information about creating the data sets for the IVP jobs, see Chapter 38, “Creating the CICS data sets,” on page 233.

Installing the CICS SVC for the IVP jobs

All the IVP jobs require the CICS Type 3 SVC, which must be installed in the LPA.

If you have not already installed the CICS SVC in the LPA, described in Chapter 21, “Installing CICS modules in the MVS link pack area,” on page 145, do so now before you attempt to run any of the IVP jobs. The IVP jobs do not use the Type 6 SVC (DFHPSVC).

Defining and activating the CICS applids

If you want to use SNA with a CICS region started by any of the CICS IVP jobs, create and activate an SNA APPL definition for the CICS region application identifier (applid).

The applid defined to SNA must match the applid that is specified on the APPLID system initialization parameter that is used by the IVP job. For example, to be able to log on to the CICS region that is started by the DFHIVPOL job, you must perform one of the following actions:

- Create and activate an APPL definition for your own applid, which you specify on the APPLID parameter of the DFH$SIP1 member of the SYSIN data set.
- Define and activate an APPL definition for the default applid DBDCCICS, which you specify on the APPLID parameter of the DFH$SIP1 member of the SYSIN data set.

For more information about creating and activating SNA APPL definitions for CICS, see Chapter 20, “Defining CICS regions as applications to SNA,” on page 133 and “Naming conventions” on page 234.

Further, if you want to use SNA cross-domain services to communicate between CICS regions on separate MVS images, you must create and activate SNA CDRSC definitions in both MVS images involved in the communication. For more information about creating and activating SNA CDRSC definitions for CICS, see “Defining cross-domain services when using SNA” on page 135.
Defining log streams

CICS automatically attempts to connect to its system log stream, unless you define a journal model resource definition to define the log stream as TYPE(DUMMY). You decide whether you want to run the IVPs with system logs or to run with dummy logging.

If you decide to run with real log streams, see Chapter 33, “Defining the logger environment for CICS,” on page 185 for information about defining log streams.

Alternatively, you can define a CICS JOURNALMODEL resource definition with TYPE(DUMMY) to avoid having to define log streams. To run the IVPs with the minimum effort:

- Define JOURNALMODEL resource definitions in the CSD for the primary and secondary system logs, DFHLOG and DFHSHUNT respectively, specifying TYPE(DUMMY); see Figure 27 for a sample job.

- Add the CSD group that contains your dummy system log journal models to your own group list, and include your group list on the GRPLIST system initialization parameter.

Note that your group list must follow the IBM-supplied list DFHLIST. DFHLIST includes group DFHLGMD, which contains DFHLOG and DFHSHUNT JOURNALMODEL definitions. Concatenating your list after DFHLIST ensures that your DUMMY definitions replace the IBM definitions.

```
//CSDUP EXEC PGM=DFHCSDUP,REGION=1M,PARM='CSD(READWRITE)'  
//STEPLIB DD DSN=CICSTS42.SDFHLOAD,DISP=SHR  
//DFHCSD DD DSN=CICSTS42.DFHCSD,DISP=SHR  
//SYSPRINT DD SYSOUT=*  
//SYSABEND DD SYSOUT=*  
//SYSDUMP DD SYSOUT=*  
//SYSSIN DD *  
* DEFINE JOURNAL MODELS FOR CICS LOG STREAMS AS DUMMY  
DEFINE JOURNALMODEL(DFHLOG) GROUP(LOGTEST)  
DESCRIPTION(DEFINE SYSTEM LOG AS DUMMY)  
JOURNALNAME(DFHLOG) TYPE(DUMMY)  
ADD GROUP(LOGTEST) LIST(mylist)  
/*

Figure 27. Sample job to define DUMMY JOURNALMODELs for CICS system logs
```

Reviewing and defining IVP security

You can run the IVP jobs with or without external security. To run the IVP jobs with external security, you must define to RACF an IVP default CICS user ID that has authority to run the transactions used as part of the IVP jobs.

Reviewing security requirements

As supplied, the system initialization parameters specify that external security is on. However, the IVP jobs have been set up with SEC=NO, indicating that external security is not on. The system initialization parameters also specify that the IVP jobs are subject to transaction security (XTRAN=YES), resource security (Xyyyy=YES), and command security (XCMD=YES).

As supplied, the DFHSSIP2 member of the SYSIN data set used by the DFHIVPBT job specifies SEC=NO, so that you can run this job without external security.
To run the IVP jobs with external security:

1. Define CICS resource profiles to RACF.
2. Define an IVP default CICS user ID to RACF.
3. Specify the IVP user ID on the DFLTUSER=userid system initialization parameter.

You must also give the IVP user ID sufficient authority to use transactions and resources that are required to run the IVP jobs:

1. Authorize the IVP user ID to run the transactions that are used as part of the IVP jobs. (See Table 23 on page 362) To do so, add the IVP user ID, with READ access, to the access list of the RACF profiles for the transaction member class (TCICSTRN) or the transaction group class (GCICSTRN).
2. If you define the transactions as prefixed resources, you must also specify the system initialization parameter SECPRFX={YES | prefix} for the IVP jobs.
3. Authorize the IVP user ID to access the resources that are used by the transactions. To do so, you add the IVP user ID, with appropriate authority, to the access list for the resource class profiles.
4. Authorize the IVP user ID to issue SP-type commands using the CEMT master terminal transaction. To do so, you add the IVP user ID, with appropriate authority, to the access list of the RACF profiles for the resource member class (CCICSCMD) or the resource group class (VCICSCMD). You must give the IVP user ID UPDATE access for the SHUTDOWN resource class; otherwise, the user ID cannot end the IVP jobs. Give the IVP user ID UPDATE access for the DUMPDS and SYSTEM resource classes, if the DFHIVPBT job is to be run with external security.

For information about implementing external security, see RACF security overview in the RACF Security Guide. Alternatively, you can run the IVP jobs with limited security, for example:

- Without command security (XCMD=NO), the IVP user ID runs the IVP jobs without requiring authority to use the CEMT SP-type commands and the resources that they access.
- With transaction security only (Xyyy=NO including XCMD=NO), the IVP user ID runs the IVP jobs if authorized to use only the transactions used as part of the IVP jobs.

**Authorizing the IVP user ID**

To run the IVP jobs with external security, you must define to RACF an IVP default CICS user ID that has authority to run the transactions used as part of the IVP jobs.

These transactions include the CICS-supplied transactions that are listed in Table 23 on page 362. The level of authority that is required by the IVP user ID depends on the security that you want to use for the IVP jobs. On a production system, the default user must not have access to any CICS-supplied transactions except those that you require in your CICS environment. Make the resource access authorizations that you give to the default user clearly limited to those resources that you intend to be universally available, and therefore not restricted in any way.

For information about the security requirements for CICS-supplied transactions, and about CICS security in general, see Security for CICS-supplied transactions in the RACF Security Guide.

Specifying system initialization parameters for the IVP jobs

All the IVP jobs use the system initialization parameters that are specified in the associated DFH$SIPn member of the SYSIN data set.

The DFH$SIPn members, as supplied by CICS, use system initialization defaults, and the resources defined to CICS are adequate only for a basic CICS region. For example, in the case of the DFHIVPOL job, the resources defined limit the number of terminals you can use.

The DFH$SIPn members of the SYSIN data set also contain some system initialization parameters to exclude CICS resources that are not required by the IVP jobs, or to include some not specified by the default system initialization parameters.

One such parameter is TCT=5$, specifying the CICS sample LU control table, in the hlq.SDFHLOAD library. This LU control table defines the pair of sequential input and output devices, CARDIN and PRINTER. (These are the only devices that are defined in DFHTCT5$.)

You can edit the DFH$SIPn members of the SYSIN data set to make these changes:

- The default SVC number is 216. To use a different SVC number, specify CICSSVC=nnn in the appropriate DFH$SIPn member. For more information about defining CICS SVCs, see Chapter 17, “Installing the CICS SVCs,” on page 125.
- The IVP jobs do not require the Type 6 SVC.
- The applid used is CICSIVP1. To use a different applid, change the APPLID=CICSIVP1 system initialization parameter in the appropriate DFH$SIPn member.
- The IVP jobs have external security switched off. To run with security (SEC=YES), define a suitable default user ID (for example, IVPUSER) with the required authority to run the IVP transactions. Add DFLTUSER=IVPUSER in the
appropriate DFH$SIPn member. For more information about defining the IVP user ID, see “Reviewing and defining IVP security” on page 360.

You can define transactions as prefixed resources by using the IVP user ID, IVPUSER, or any other prefix, as the prefix (for example, IVPUSER.CEMT or prefix.CEMT). To do so, add SECPRFX=YES or SECPRFX=prefix in the appropriate DFH$SIPn member for the IVP job.

The use of a prefix enables transactions to be run as part of the IVP jobs without affecting other CICS regions. For example, when the DFH$BTCH batch stream is run, CICS sends authorization requests to RACF for the transactions and identifies them as IVPUSER.xxxx, where xxxx is the transaction ID (for example, CWTO or CEMT).

- CICS provides Language Environment support, for all the high-level language sample programs. For the Language Environment modules, CICS requires either predefined CSD definitions to be installed or program autoinstall to be active.

The IVP jobs include as comments the required DD statements for the Language Environment libraries.

- The IVP jobs run with auxiliary trace switched on (AUXTR=ON), and the auxiliary trace data set switching facility is set to switch once only (AUXTRSW=NEXT).

- TCT=NO is specified as a system initialization override, which causes CICS to use the dummy LU control table, DFHTCTDY. This dummy LU control table contains only the CICS and SNA control blocks for use with SNA LUs but no LU entries.

### Resources for the CICS messages facility, CMAC

You can use the CICS messages facility, the CICS-supplied transaction CMAC, to provide the messages and codes descriptions online. Before you can use CMAC, you must create and initialize the CICS messages data set DFHCMACD, define the resources required by the facility, and make them available to your CICS region.

For information about creating and initializing the DFHCMACD data set, see “Creating the CICS messages data set, DFHCMACI job” on page 237.

The file DFHCMACD, managed by CICS file control, accesses the DFHCMACD data set. You must create a definition for this file in the CSD. The CICS-supplied definition for the DFHCMACD file and other resources that are required by the CICS messages facility are in the CSD group DFHCMAC. The CICS startup procedure (in the IVP jobs) has a DD statement for the CMAC file, but for dynamic allocation copy the supplied resource definition for the DFHCMACD file and add the DSNAME option.

Specify the DFHCMAC group of resources for the CICS messages facility only in those CICS regions that use the facility; for example, on some terminal-owning regions, but perhaps not on data-owning regions.

### The CICS startup procedure, DFHSTART

All the IVP jobs include a procedure to start up CICS. You can use this procedure as a basis for your own CICS startup procedures.

The DFHSTART procedure comprises the following steps:

1. CICSCNTL: determine whether CICS is to be started.
2. DTCNTL: determine whether dump and trace analysis is to be performed.
3. CICS: run CICS.
4. PRTDMPA: print any contents of the CICS DFHDMPA dump data set.
5. PRTDMPB: print any contents of the CICS DFHDMPB dump data set.
6. PRTAUXT: print any contents of the auxiliary trace DFHAUXT data set.
7. PRTBUXT: print any contents of the auxiliary trace DFHBUXT data set.

When you run the DFHISTAR job, it overrides the default values in the IVP jobs with the values you specified in the DFHISTAR job.

The following symbolic parameters are defined in the IVP jobs:

INDEX1(hlg)
   Is the high-level index of the CICS runtime data sets, as specified on the DSINFO parameter of the DFHISTAR job.

INDEX2(hlg)
   Is the high-level index of the CICS load libraries, as specified on the INDEX parameter of the DFHISTAR job.

REGNAM(TR)
   Is the REGION name for a single or MRO region.

REG(80M)
   Defines the MVS region size for the step to run CICS.

START(AUTO)
   Is the type of CICS startup to be performed.

DUMPTR(YES)
   Specifies whether dump and trace analysis is required. The steps PRTDMPA, PRTDMPB, DFHAUXT, and DFHBUXT are run only if you specify DUMPTR=YES.

RUNCICS(YES)
   Specifies whether CICS is to be started. The step to run CICS runs only if you code RUNCICS=YES (the default). To perform dump and trace analysis without starting CICS, code RUNCICS=NO.

OUTC(*)
   Is the output print class.

SIP(T)
   Is the suffix of the DFH$SIP member (in the SYSIN data set) to be used during CICS startup.

**DD statements for CICS data sets**

The startup job step, DFHSTART, contains DD statements for the CICS data sets.

The IVP jobs include as comments the required DD statements for the Language Environment libraries.

### Verify batch job, DFHIVPBT

The CICS-supplied verify batch job, DFHIVPBT, is tailored to your CICS environment and stored in the hlq.XDFHINST library when you run the DFHISTAR job.

For more information about installing CICS using DFHISTAR, see Installing CICS TS using DFHISTAR.

DFHIVPBT starts up CICS, specifying a pair of sequential input and output devices (CARDIN and PRINTER) to be used instead of an ordinary terminal. It
then runs a number of CICS transactions that are read from CARDIN. The last transaction in the input stream shuts down CICS.

This IVP comprises the following job steps:

1. Job step GENINPT unloads the member DFH$BTCH from the hlq.SDFHSAMP library into the CARDIN data set, using the MVS utility program, IEBGENER.

2. Job step DFHSTART invokes the CICS initialization program, DFHSIP, to start up CICS. The DFHSIP program reads startup system initialization parameters from the DFH$SIP2 member of the SYSIN data set.

The DFH$BTCH data set, as described in Figure 28, is used as terminal input, and produces a printout similar to the sample output shown in Output from the DFHIVPBT job on page 369.

![Sample job log for the DFHIVPBT job](image)

When you run the DFHIVPBT job, your job log looks similar to the example shown.
Chapter 50. Preparing to run the IVPs

Enterprise Java domain initialization has started. Java is a trademark of Oracle.
16.24.19 J0835409 +DFHMM2004 CICSIVP1 There are no indoubt, commit-failed or backout-failed UOWs.
For information about the system initialization parameters used by the IVP jobs, see “Specifying system initialization parameters for the IVP jobs” on page 362. See also 2 below.

2. The DFHSM0122 and DFHSM0123 messages show the limits available for the dynamic storage areas below 16 MB, and above 16 MB but below 2 GB. For information about these storage areas, see . Storage for the extended read-only DSA, ERDSA, is obtained from read-only key 0 protected storage, because the default system initialization parameter is RENTPGM=PROTECT.

3. The DFHIVPBT job was run without external security active, because SEC=NO is specified as a system initialization override parameter.

4. The default group list, DFHLIST, is used for this run of the DFHIVPBT job. Non-default functions (for example, the CICS online messages facility) are not available, because their CICS resources are not defined in this group list.

5. These messages are issued when CICS is initialized and the log streams do not exist. CICS issues a request to create the log stream dynamically using MVS define log stream services.

6. If system log initialization fails, CICS abends. See also 1 in “Output from the DFHIVPBT job.”

7. If you want COBOL, C, C++, and PL/I languages, remove the comment marks from the SCEERUN and SCEERUN2 libraries, and increase the memory size for the job.

Note: VTAM is now z/OS Communications Server.

Output from the DFHIVPBT job

Output from the DFHIVPBT job includes CICS messages written to one of the extrapartition destinations, responses to the transactions in the DFH$BTCH data set, and an auxiliary trace.

372 CICS TS for z/OS 4.2: Installation Guide
1. CICS messages issued when the log stream is created.
2. This message is sent to the CRDI destination.

**Verify interactive job, DFHIVPOL**

The verify interactive job, DFHIVPOL, is tailored to your CICS environment and stored in the `hlq.XDFHINST` library when you run the DFHISTAR job.

You can use the DFHIVPOL job to start up a CICS region to try out some functions, for example:

- Use the master LU transaction, CEMT. You can also use CEMT from the MVS system console. For information about CEMT, see .
- Use the resource definition online transaction, CEDA. For information about using CEDA, see `Resource management transaction CEDA commands in the Resource Definition Guide`.
- Use the sample application transaction AMNU, to access the sample VSAM file, FILEA.

You require either an IBM 3270 Information Display System LU or a console device, or both.
If you use an IBM 3270 Information Display System LU with this IVP, you can try CEDA, CEMT, and the sample applications.

From a console device, the CEDA transaction can be used only to INSTALL resource definitions. The sample programs cannot be run from a console device.

**Defining an SNA LU for the online IVP**

You can define an SNA LU by using one of these methods:

- Use the autoinstall facility to avoid defining LUs to CICS explicitly before they can be used, see "Autoinstalling for an SNA LU."
- Define a LU explicitly in the CSD, using the DEFINE command of DFHCSDUP (the batch utility for updating the CSD), see "Defining an SNA LU in the CSD" on page 375.

**Autoinstalling for an SNA LU**

With autoinstall, the resource definitions you create using RDO can act as models or templates for many resources of the same type. You then leave CICS to match real resources with one of the models. CICS installs table entries for these real resources dynamically, as and when they are required.

When using autoinstall, be aware that when CICS processes an autoinstall request, it uses data from the SNA logmode table. Be aware of this important consideration. An autoinstall request succeeds only when the logmode data, which is passed to CICS in the BIND image, matches one of the model terminal definitions recorded in the autoinstall model table (AMT) from the CSD. Before attempting to start CICS and autoinstall a LU for this IVP, check your SNA definitions with those given in Coding entries in the z/OS Communications Server LOGON mode table. If CICS fails to match model and logmode data, you receive message DFHZC6987I.

The CSD is defined and initialized for all the IVP jobs when you run the DFHCOMDS job and includes some IBM-supplied definitions for use with autoinstall. These definitions are defined in the following groups:

**DFHTERM**

Model LU definitions for use with autoinstall. For example, two of the TERMINAL definitions are 3270 and LU2.

**DFHTYPE**

Partial LU definitions (TYPETERMs) defining common LU properties, or attributes. For example, two of the TYPETERM definitions are DFH3270 (to define a non-SNA 3270 LU) and DFHLU2E2 (to define an SNA 3270 model 2 LU). The DFHLU2E2 resource definition matches the SNA-supplied logmode SNX32702.

The DFHTERM and DFHTYPE groups are included in the CICS-defined group list called DFHLIST, which is defined in the GRPLIST operand. If the CICS-supplied definitions are not suitable for your installation, you can create additional TYPETERM and model TERMINAL definitions in the CSD, but without a LU you must do this offline, using the DFHCSDUP utility program. For information about autoinstall definitions, see Autoinstall in the Resource Definition Guide.

Autoinstall also requires a user program to assign LU identifiers, and, if necessary, to control access to the system. When you run the online IVP, you are unlikely to have any special requirements for LU identifiers, or to control access, in which case
you can use the IBM-supplied autoinstall user program, DFHZATDX. If you are using autoinstall for APPC connections and LUs, the sample autoinstall user program is called DFHZATDY.

**Defining an SNA LU in the CSD**

If you want to use an explicitly defined LU, rather than allow CICS to autoinstall a LU, define it offline using the DFHCSDUP utility program.

The normal way to create resource definitions in the CSD is to use the CEDA DEFINE command from a CICS master LU, but without a LU you can only do this using the DFHCSDUP utility program. For an example of a DFHCSDUP job to define an SNA LU in the CSD, see [Figure 31](#).

```
//DEFTERM JOB (accounting information),MSGCLASS=A,  
//      MSGLEVEL=(1,1),CLASS=A,NOTIFY=userid  
//VTAMDEF EXEC PGM=DFHCSDUP  
//STEPLIB DD DSN=CICSTS42.CICS.SDFHLOAD,DISP=SHR  
//DFHCSD DD DSN=CICSTS42.CICS.DFHCSD,DISP=SHR

*  
LIST LIST(yourlist) OBJECTS  
*/  
```

*Figure 31. Defining a LU by using the DFHCSDUP utility program*

**GROUP(name)**

Code a unique name for the group to which the LU resource definition is to belong.

**NETNAME(name)**

Code the 8-character SNA name that identifies this LU to your SNA system.

**TERMINAL(name)**

Code a unique 4-character LU identifier as the name by which CICS is to know the LU.

**TO(yourlist) and LIST(yourlist)**

Code a unique name for yourlist. If your new group list does not include all the CICS-supplied resources as well as your own, you must specify DFHLIST and yourlist on the GRLIST system initialization parameter of your CICS startup job.

**TYPETERM(name)**

Specify a unique name to identify the resource definition that matches the properties of the type of LU you are using. For example, to define an SNA 3270 model 2 LU, specify the CICS-supplied TYPETERM definition DFHLU2E2.

To include the CICS-supplied list of resources in a new group list, create a new list by copying the CICS-supplied list, DFHLIST, using the APPEND command. The
CICS-supplied group list, DFHLIST, is a protected group that you cannot modify. You can then add your resource definition groups to the new list. Before you run the IVP, define your new group list to CICS, by adding a system initialization override to the SYSIN data set in the DFHIVPOL job stream.

**Defining the CICS APPLID to SNA**

Ensure that either SNA knows the CICS application identifier (APPLID) or you change the CICS APPLID to one that is already known to your SNA system.

If you use the default APPLID (DBDCCICS), define this to SNA as described in “Defining specific APPL definitions and APPL parameters to SNA” on page 133, before starting the DFHIVPOL job.

**Communicating with CICS from an MVS console or a TSO session**

If you want to communicate with CICS from an MVS console, you must define a console in the CSD before starting the IVP. You cannot define a console in the TCT. For more information about defining consoles, see [Defining console devices to CICS in the Resource Definition Guide](#).

If you want to communicate with CICS from a TSO session, you must define the TSO user as a console device in the CSD before starting the IVP. For more information, see [Defining console devices to CICS in the Resource Definition Guide](#).

**Running the DFHIVPOL job**

The DFHIVPOL job includes a procedure, DFHSTART, that calls the CICS initialization program, DFHSIP, to start up CICS.

When you have successfully logged on to CICS, you can carry out any of the interactive operations described in “Verifying SNA LU operations” on page 379.

While logged on to CICS, perform a CEMT SET DUMPDS SWITCH to ensure that both dump data sets are initialized, before the dump utility program is run when you shut down CICS.

Finally, you can shut down CICS.

**Sample job log for the DFHIVPOL job**

When you run the DFHIVPOL job, your job log looks similar to the sample log shown.

Chapter 50. Preparing to run the IVPs 377
CICS TS for z/OS 4.2: Installation Guide

378
Verifying SNA LU operations

You can perform a number of activities to verify that CICS is working properly, for example, logging on, using transactions, running sample programs, and shutting CICS down.

Logging on to a SNA LU

When the DFHVIVPOL job displays the console message CONTROL IS BEING GIVEN TO CICS, you can log on to CICS using an IBM 3270 Information Display system terminal.

Use the CICS application identifier that you specified when you started CICS to log on through your SNA LU. For example, unless you changed the APPLID as specified as at system initialization (CICSNV1), enter LOGON APPLID(CICSNV1).

If you are using autoinstall, your logon request is passed to CICS and, if all the autoinstall requirements described in Autoinstall in the Resource Definition Guide have been met, CICS installs your LU. It does so by creating a TCT terminal entry (TCTTE) using the model definitions defined in the group list, DFHLIST, and the LU identifier returned by the autoinstall user program (DFHZATDX in this case).

**Note:** VTAM is now z/OS Communications Server.

1. For information about the system initialization parameters that the IVP jobs use, see "Specifying system initialization parameters for the IVP jobs” on page 362. See also 2 and 3.

2. For more information about defining an APPLID for the CICS IVP jobs, see Chapter 20, “Defining CICS regions as applications to SNA,” on page 133. An APPLID of CICSIVP1 is used in Figure 32.

3. The DFHSM0122 and DFHM0123 messages inform you of the limits available for the dynamic storage areas below 16 MB, and above 16 MB but below 2 GB. For information about these storage areas, see CICS dynamic storage areas in the Performance Guide. Storage for the extended read-only DSA, ERDSA, is obtained from read-only key 0 protected storage, because the default system initialization specifies RENTPGM=PROTECT.

4. The DFHTM1715 message is issued because the CICS region was shut down by the terminal user, with netname IYCWT30, issuing a CEMT PERFORM SHUTDOWN command.

5. If you want COBOL, C, C++, and PL/I languages, remove the comment marks from the SCEERUN and SCEERUN2 libraries, and increase the memory size for the job.

Chapter 50. Preparing to run the IVPs  379
If you are using a LU defined in the CSD explicitly, and included in the group list specified in the startup job stream, CICS identifies the installed resource definitions by the SNA net name and creates the required TCTTE.

When you log on to CICS, your LU can display a “good morning” message as specified on the GMTRAN system initialization parameter. The default transaction, CSGM, displays a welcome message as defined by the GMTEXT system initialization parameter.

**Using CICS provided transactions through a terminal**

After you have started CICS with the DFHIVPOL job, you can use the CICS provided transactions to try out various functions of CICS to help you verify that CICS is working properly. You can use the transactions at a CICS terminal, for example, CEMT and, if you defined one, the system console.

For information about the CICS transactions that you can try with the DFHIVPOL job, and about the message-switching responses to those transactions, see [Supplied transaction overview in CICS Supplied Transactions](#).

(Send the message 'HELLO' to your terminal)  
MRS OK MESSAGE HAS BEEN ROUTED  
(briefly at lower right of screen)  
HELLO  
(at upper left of screen)

You can enter your CEMT input in either uppercase or lowercase, because the master terminal transaction translates all input to uppercase. Use the CLEAR key and the F3 key as indicated.

If you enter the CETR transaction, CICS displays the status of the various trace options.

You can alter the status of any of the trace options by over typing the current value, indicated by ====> on the CETR display.

Using the CEDA transaction

When DFHIVPOL starts up CICS, system initialization specifies GRPLIST=DFHLIST, which causes all the CICS resource definitions that are required for normal running to be installed.

You can see which resources are included in DFHLIST by using the CEDA transaction; for example, by using the CEDA EXPAND LIST(DFHLIST) command.

Press F8 to see the continuation of the list. If you started the DFHIVPOL job with your own group list specified instead of the DFHLIST group list, specify the name of your list in the CEDA EXPAND command. The CICS-defined groups all begin with “DFH”. For information about CEDA and the interactions for a typical sequence of CEDA commands, see the CICS Resource Definition Guide.
The DFHLIST group list does not include any of the sample applications groups, the group names of which all begin with “DFH$”. To use the sample programs, therefore, you must first install the resource definitions for the required samples. For example, to use the FILEA sample application:

1. Install the sample programs that are required for the FILEA applications. Use this command:
   
   CEDA INSTALL GROUP(DFH$AFLA)

2. Make the FILEA data set available to CICS, by performing one of the following tasks:
   
   • Install a FILE resource definition for the FILEA data set:
     
     CEDA INSTALL GROUP(DFH$FILA)
   
   • Provide a DD statement for the FILEA data set in your CICS startup JCL. For example,
     
     //FILEA DD DISP=SHR,DSN=CICSTS42.CICS.CICSHTH1.FILEA

To end the CEDA session, press F3.

**Invoking and running sample programs**

To try the assembly language version of the FILEA sample application, install group DFH$AFLA and then enter the AMNU transaction.

**Using transactions from a console device**

You can invoke CICS transactions other than CECI from a console device, and other CICS operators can communicate with the console operator. In particular, you can use the console device for CICS master terminal functions to control CICS terminals or to control several CICS regions with multiregion operation.

Normal operating-system use of the console device is not inhibited, and CICS supports multiple console devices where present.

• The CEDA transaction can be used from a console device only to INSTALL resource definitions.

• The CECI transaction and the sample programs cannot be used from a console device.

If you issue the MVS command d consoles, a list of console devices is displayed. This list identifies the console devices by name.

You can use a console device to submit MODIFY commands from your job stream if you define a console device in your CSD as CONSNAME(INTERNAL).

For further information about defining consoles, see [Defining console devices to CICS in the Resource Definition Guide](#).

To enter a command, use:

\{MODIFY\|F\} jobname,\['\]command,\['\]

where:

**jobname**

Is the region identifier for the CICS region. This identifier is either the name of the job being used to run CICS, for example, DFHIVPOL, or the name of a procedure if CICS was initiated as a started task.

382  CICS TS for z/OS 4.2: Installation Guide
command
Is a string of data, starting with a CICS transaction identifier. If the transaction requires further input, the operator is prompted in the same way as any normal terminal operator. The message from CICS contains a reply number that must be quoted in the reply.

You can use the commands shown in Figure 33 to verify the CEMT and CEOT transactions from the MVS console.

**Entering commands from TSO**

A TSO user can enter CICS commands after invoking the TSO command CONSOLE, in either of two formats.

```
CONSOLE {MODIFY|F} cicsid,[']command[']

CONSOLE
{MODIFY|F} cicsid,[']command[']
END
```

When the TSO CONSOLE command is used, TSO checks the user for authority to issue console commands. Further, if console operator command security is active, the TSO user must be specifically authorized to issue MODIFY cicsid.

The TSO user can interact with an alternate CICS by using the command CONSOLE MODIFY altcics,CEBT.

You can also use TSO CLIST processing to issue sequences of CICS commands.

*Figure 33. Using an MVS console for master terminal operations*

**Stopping CICS**

To stop CICS, enter CEMT P SHUT from the SNA LU or MVS console. CEMT P SHUT is a short form of CEMT PERFORM SHUTDOWN.

The system responds with message DFH1713 and following messages as shown in the sample job log shown in Figure 32 on page 379.
Chapter 51. Verifying shared data tables support

You can verify that shared data tables can be used in a number of ways.

1. Start up a CICS region on which you have installed support for shared data tables. To use shared data tables, you must install the DFHDTsvc, DFHDTcv, and DFHMVRms modules in either an authorized system library in the MVS linklist (LNKLST concatenation of the MVS system) or in the LPA. When you install CICS, these modules are installed into the hlq.SDFHLINK library, which you usually include in the MVS linklist.

2. Define and install a user-maintained data table.

3. Try a generic read command on your data table, using the CECI transaction. Generic reads of user-maintained data tables are allowed only with shared data tables. If shared data tables is operational, you see a normal response. If shared data tables is not operational, you see an INVREQ response. This verification process uses user-maintained data tables throughout, because the behavior of CICS-maintained data tables is not apparent to their users. For example, a normal response is returned for a generic read of a CICS-maintained data table, regardless of whether or not shared data tables is operational.

To verify that the cross-memory services of shared data tables are working:

1. Start up a second CICS region (the requester) that has an interregion communication connection to the first CICS region (the server, which contains the user-maintained data table and source data set).

2. On the requester CICS region, do the following tasks:
   a. Define and install a remote file referring to (associated with) the user-maintained data table on the server CICS region.
   b. Close the interregion communication connection between the two CICS regions so that function shipping is impossible; that is, only the cross-memory services of shared data tables can be used to access the shared data table from the requester CICS region. To close the connection, you can enter the command:
      ```
      CEMT SET IRC CLOSED
      ```
      To verify that function shipping cannot work, try a remote READ of a file (not a data table) on the server CICS region; you get a SYSIDERR response.
   c. Try a generic read command on your data table, using the CECI transaction. If the cross-memory services of shared data tables can be used, you see a normal response.

3. To restore interregion communication between the two CICS regions, open the connection again. To do this, you can enter the command:
   ```
   CEMT SET IRC OPEN
   ```

Example verification of shared data tables

This example shows the steps to perform to verify the shared data tables for the CICS shared data tables environment.

1. A CICS region, CICSIDC, is started. CICSIDC is the server CICS region in this example.

2. On CICSIDC, the following steps are completed:
The user-maintained data table, MYSDT, is defined and installed. The MYSDT data table is based on the sample data set, hlq.CICSIDC.FILEA, installed on that region.

The following generic READ command is entered at a terminal:

```
CECI READ FILE(MYSDT) RIDFLD(00092) KEYLENGTH(5) GE GTEQ
```

Figure 35 on page 387 shows the initial response (LOADING), and Figure 36 on page 388 shows the subsequent response when the command is repeated after the data table has completed loading.

The following steps were completed to verify the cross-memory services of shared data tables:

1. A second CICS region, CICSIDA, is started with support for shared data tables. CICSIDA is the requester CICS region in this example.

2. The following IRC connections and sessions are defined and installed on the associated CICS regions:

<table>
<thead>
<tr>
<th>Region</th>
<th>CONNECTION</th>
<th>SESSION</th>
</tr>
</thead>
<tbody>
<tr>
<td>CICSIDA</td>
<td>CICA</td>
<td>ATOC</td>
</tr>
<tr>
<td>CICSIDC</td>
<td>CICC</td>
<td>CTOA</td>
</tr>
</tbody>
</table>

See Figure 39 on page 389 and Figure 40 on page 390 for the CICA and ATOC resource definitions attributes. The attributes for the CICC and CTOA resource definitions are similar.

3. On CICSIDA, the following steps are completed:

a. The file, REMSDT, is defined and installed as remote, referring to the MYSDT data table on CICSIDC. See Figure 41 on page 390 for the parameters used for the REMSDT resource definition.

b. The file, REMFIL, is defined and installed as remote, referring to the FILEA sample file on CICSIDC.

c. The CEMT SET IRC CLOSED command is used to close the IRC connection to CICSIDC.

d. The following generic READ command is entered at a terminal:

```
CECI READ FILE(REMfil) RIDFLD(00092) KEYLENGTH(5) LENGTH(80) GE GTEQ
```

Figure 37 on page 388 shows the SYSIDERR response, because the remote file cannot be accessed by function-shipping. You also see this response for the remote data table, REMSDT, if the IRC connection is closed.

e. The following generic READ command is entered at a terminal:

```
CECI READ FILE(REMSDT) RIDFLD(00092) KEYLENGTH(5) LENGTH(80) GE GTEQ
```

Figure 38 on page 389 shows the NORMAL response. You receive a NORMAL response only if MYSDT is already open on CICSIDC, as achieved in step 2b.

Chapter 52. Verifying the CICS-DBCTL interface

You can use the installation verification procedure, DFHIVPDB, to verify that the CICS-DBCTL interface can be used successfully.

To run the DFHIVPDB job successfully:

1. Tailor the DFHIVPDB job to your CICS and IMS environment.
   You can tailor DFHIVPDB as part of the process of tailoring all CICS sample postinstallation jobs, as described in Chapter 40, “Defining DL/I support,” on page 247. When you run the DFHISTAR job as part of the CICS installation process, the DFHIVPDB job is installed in the hlq.XDFHINST library. Change the prefix of the IMS.SDFSRESL library, previously called IMS.RESLIB, in the DFHIVPDB job to the prefix that you use for your IMS libraries.

2. Create the data sets required by the CICS region used by the DFHIVPDB job.
   To create the data sets, you can tailor and run copies of the following CICS sample jobs:
   - **DFHCOMDS**
     This job creates the CICS data sets common to all CICS regions.
   - **DFHDEDFS**
     This job creates the data sets required for each CICS region.
     When you run the DFHISTAR job as part of the CICS installation process, these jobs are installed in the hlq.XDFHINST library.

3. Run the IMS installation verification procedures, as outlined in “The IMS installation requirements for the DFHIVPDB job.”

The IMS installation requirements for the DFHIVPDB job

The DFHIVPDB job depends on running the IMS installation verification procedures, as part of the INSTALL/IVP process described in the IMS Installation Guide.

The following assumptions about the IMS INSTALL/IVP process are made:

1. The IMS sample database, DI21PART, has been successfully defined. This database comprises two data sets:
   - DI21PART
   - DI21PARO

2. The DI21PART database has been loaded with the IMS-supplied sample data.

3. The following IMS-supplied procedures have been installed in an executable procedure library:
   - ACBGEN
   - PSBGEN

4. The sample DRA startup table, DFSPZPIV, has been built and installed in the IMS.SDFSRESL library, previously called IMS.RESLIB.

5. The sample DBCTL system, IVP3, is available.

For information about installing IMS, the INSTALL/IVP process, and running the IMS IVPs, see the IMS Installation Guide.
The DFHIVPDB job steps

The DFHIVPDB job consists of the GEN and CICS job steps.

1. **GEN.** This step unloads the member DFH$DBAN from the hlq.SDFHSAMP library into a temporary sequential data set called CARDIN. This member contains the transactions to invoke the assembler versions of the DL/I sample applications that CICS reads from CARDIN as soon as initialization is complete. The sequential data set CARDIN is defined in the sample terminal control table, DFHTCT5$, as a simulated terminal.

   The COBOL version, DFH$DBCB, and the PL/I version, DFH$DBPL, of the sample DL/I transactions are also in the hlq.SDFHSAMP library. If you want to run the COBOL or PL/I versions, modify this job step to load CARDIN with the appropriate member.

   Output generated by the transactions is sent to a similar device; a sequential data set defined as PRINTER.

2. **CICS.** This job step issues the DFHSTART procedure to start up CICS, with the CICS-supplied resource group list DFH$IVPL. CICS attempts to connect to the DBCTL system IVP3, run the sample DLI transactions, and then shut down the CICS region. If the DBCTL system, IVP3, is not running, the sample DLI transactions stop with an abend message.

If you want to examine the sample members used by this IVP, here is a list of them, indicating where you can find each one:

**DFHIVPDB**

This IVP contains some explanatory comments, and was installed in the hlq.XDFHINST library when you ran the DFHISTAR job. For details of the DFHISTAR job, see Chapter 37, “Tailoring the CICS-supplied skeleton jobs,” on page 229.

**DFH$SIP5**

DFH$SIP5 is the member of the hlq.SYSIN data set that contains the system initialization parameter overrides specific to the DFHIVPDB job. You can specify other system initialization parameters (for example, APPLID, CICSSVC, and DFLTUSER) for the DFHIVPDB job; the DFH$SIP5 member of the hlq.SYSIN data set is a convenient place to do so.

**DFHTCT5$**

DFHTCT5$ is the sample TCT that specifies the sequential devices that CICS uses in this IVP as a simulated terminal, with a terminal name of SAMA. The source statements are in the DFH$TCTS member of the hlq.SDFHSAMP library.

### Running the DFHIVPDB job

Before you submit the DFHIVPDB job, run the DFHRMUTL program to reset the global catalog control record to perform an INITIAL start on the next CICS startup.

Here is an example of the DFHRMUTL program:

```
//DFHRMUTL JOB 24116475, 'DFHRMUTL',
// CLASS=A, MSGCLASS=M, NOTIFY=userid
//*
//-- reset global catalog control record to initial start */
//-- -------------------------------------------------------
//DFHRMUTL EXEC PGM=DFHRMUTL, REGION=1M
//STEPLIB DD DSN=CICSTS42.CICS.SDFHLOAD, DISP=SHR
//SYSPRINT DD SYSOUT=*  
```
When you are satisfied that you have made all the necessary preparations, and that all the prerequisite jobs have been run, submit the DFHIVPDB job. The job loads the DL/I transactions into CARDIN. CICS reads the transactions, and sends the output to the PRINTER sequential data set. The process is as follows:

- The first transaction copied from the DFH$DBAN member of the hlq.SDFHSAMP library to CARDIN is CDBC CONNECT SUFFIX(IV). This transaction connects CICS to DBCTL, using the sample DRA startup table, DFSIPZPIV.

- The final transaction copied from the DFH$DBAN member of the hlq.SDFHSAMP library to CARDIN is CEMT PERFORM SHUT.

- If you want to use some commands online before CICS shuts down, delete the CEMT command before you run the job. You can then issue CEMT, CEDA, and other CICS-supplied transactions, and initiate a shutdown either from a CICS terminal or through an MVS console.

- If you want to communicate with CICS through an MVS console, you must define a console to CICS before you start DFHIVPDB, as described in Defining console devices to CICS in the Resource Definition Guide.

- If you want to enter MODIFY commands from terminals connected to TSO, you must define the TSO users as console devices, as described in Defining console devices to CICS in the Resource Definition Guide.

A sample job log from a run of the DFHIVPDB job is given in Figure 42 on page 395. The results you get from the transaction processing are similar to those shown in Figure 42 on page 395, Figure 43 on page 396, and Figure 44 on page 396.
CICS TS for z/OS 4.2: Installation Guide

394
**Figure 42. Sample job log output from the DFHVIVPDB job**

- The DFHVIVPDB job uses some system initialization parameters included in the DFHSSIP5 member of the SYSIN data set, to override default system initialization parameters. Further, the DFHSSIP5 member was edited to specify other system initialization parameters to create the DFHVIVPDB job log shown. For information about these extra system initialization parameters used by the IVP jobs, see “Specifying system initialization parameters for the IVP jobs” on page 362.

- If you want COBOL, C, C++, and PL/1 languages, remove the comment marks from the SCEERUN and SCEERUN2 libraries, and increase the memory size for the job.

You see messages similar to those in Figure 43 on page 396 at the end of the MSGUSER section of the job output.
You see messages similar to those in Figure 44 in the Printer section of the job output.

**Note:** VTAM is now the z/OS Communications Server.

**Figure 43. Sample job log output from the end of the MSGUSER section of the DFHIVPDB job**

You see messages similar to those in Figure 44 in the Printer section of the job output.

**Figure 44. Sample job log output from the Printer section of the output of the DFHIVPDB job**
Chapter 53. Testing the CICS DB2 environment

Use Phase 5 of the DB2 installation verification procedure to test the CICS DB2 environment.

To use the DB2 installation verification procedure, and Phase 5 in particular, see the DB2 administration documentation, which gives information about the procedure and describes the steps involved.

Running DB2 jobs DSNTEJ5C and DSNTEJ5P

To prepare the sample applications to be used in a CICS DB2 environment, run the DSNTEJ5C and DSNTEJ5P jobs supplied with DB2.

DSNTEJ5C installs the sample application transactions in COBOL and prepares the organization application. DSNTEJ5P installs the transactions in PL/I and prepares the organization, project, and phone applications.

Both these jobs perform the following functions:
- Compile and link-edit the CICS online applications.
- Bind the CICS online applications.
- Create the BMS maps for the online applications.

Starting a DB2 organization or project application

After logging on to CICS, you can start an organization or project application by entering one of the CICS transaction codes: D8PP, D8PS, or D8CS.
- D8PP starts the PL/I project version
- D8PS starts the PL/I organization version
- D8CS starts the COBOL organization version

If you enter one of these transaction codes, the panels shown in Figure 45 or Figure 46 on page 398 are displayed.

Figure 45. Initial panel for the DB2 project application in CICS

© Copyright IBM Corp. 1989, 2014
For detailed information about running the organization and project applications, see [DB2 overview in the DB2 Guide](#).

### Starting the DB2 phone application

To start the phone application, clear the screen and type in the transaction code DB8PT. You can change the transaction codes when you install DB2. Check with your system administrator to find out if they have been changed from those shown.
Chapter 54. Running the EJB "Hello World" sample

Run the EJB "Hello World" sample as part of your Installation Verification procedures.

For a description of this procedure, see Java Applications in CICS.
Part 7. Verifying the CICSplex SM installation

Use the installation verification procedure for CICSplex SM to confirm that the installation was successful.
After you have installed CICSPlex SM, you can verify that the installation has worked correctly by setting up a CICSPlex SM environment using the samples generated by running the DFHISTAR job.

CICSPlex SM postinstallation members are stored in the TDFHINST library. You can customize CICSPlex SM postinstallation members by running a tailored DFHISTAR job. Customized postinstallation members are saved in the XDFHINST library. The members used to start the CMAS (EYUCMASP), WUI (EYUWUIP), and managed CICS system (EYUCSYS01) contain EYUPARM, EYUWUI, and SYSIN parameters. These parameters are held in members also stored in the XDFHINST library.

The samples generated by running DFHISTAR do not have security activated. Details of implementing RACF security for CICSPlex SM are in Implementing CICSPlex SM security in the CICS RACF Security Guide.

As part of the installation verification procedure, define a separate CICSpex for the WUI server.

© Copyright IBM Corp. 1989, 2014
Checking the MVS environment

Before you begin, check that your MVS environment is correctly defined to support CICSPlex SM.

About this task

To record information about the installation and setup of your CICSPlex SM environment, you can use the checklists and worksheets in "CICSPlex SM setup checklist and worksheets" on page 11.

Procedure

1. Ensure that the CICSPlex SM SEYUAUTH library is defined to MVS as an APF-authorized library.
2. Ensure that the CICSPlex SM SEYULINK library is included in the MVS link list.
3. The number of linkage indexes increases by 1 for CICSPlex SM. Define it with the MVS NSYSLX parameter in IEASYSxx, which increases by one.
4. The number of common MVS data spaces increases by adding 6 for each CMAS. Define it with the MVS MAXCAD parameter in IEASYSxx.
5. Check the IEASYSxx member of SYS1.PARMLIB that you use for MVS initialization and make a note of the initialization values. These values are referenced during the installation of a CMAS. For a detailed description of these values, see "Noting IEASYSxx values for CICSPlex SM" on page 113.
6. Ensure that enough MVS auxiliary storage is available to support the data spaces used by each CMAS. A CMAS uses up to nine MVS data spaces, which can increase auxiliary storage by as much as 100 MB. For details on how to increase auxiliary storage, see the z/OS Initialization and Tuning Guide.
7. Assign an SNA APPLID and SYSID for each of the CMAS, MAS, and Web User Interface regions. The SEYUDEF library members, EYUDVTIA and EYUDVTIB, contain sample SNA APPL statements that you can use and modify. See Chapter 20, “Defining CICS regions as applications to SNA,” on page 133 for more information about SNA and CICS. You can record the APPLID and SYSID values on the planning worksheet.
8. Reserve a TCP/IP port for the Web User Interface server. You can record the port number on the planning worksheet.

Generating samples using the DFHISTAR job

You can tailor the DFHISTAR job to generate samples that suit your environment.

About this task

The minimum subset of parameters to tailor are shown in the following steps, but you can tailor any of the parameters mentioned on the IVP planning worksheet. You can record your values in the IVP planning worksheet; see "IVP planning worksheet" on page 16.

Procedure

1. Edit the LIB parameter to specify where you want to add the customized members generated by the DFHISTAR job. You can specify a 1- to 44-character name of a library. The default is CICSTS42.XDFHINST.
2. Edit the SCOPE parameter to specify POST.
3. Edit the **TCPIPHST** parameter to specify the address of the host server; for example, MVSXX.COMPANY.COM.

4. Edit the **TCPIPPRT** parameter to specify the port number to be used by the Web User Interface server.

5. Edit the **CMCIPORT** parameter to specify the port number to be used by the CICS management client interface (CMCI).

6. Edit the **TIMEZONE** parameter to specify which time zone is used for the data repository. For a full list of time zones, see **CICSPlex SM Administration**.

7. Run the tailored DFHISTAR job.

**Results**

- DFHISTAR creates the high-level qualifiers for the CICS and CICSPlex SM load libraries using two parameters:
  - **TINDEX** provides the highest-level index.
  - **XTRAQUAL** is an optional lower-level index.
- The index ‘CICS’ or ‘CPSM’ appears after the TINDEX and before the XTRAQUAL.
- DFHISTAR uses the same parameter for the system name and the applid.

See “**CICSPlex SM postinstallation members**” on page 230 for a complete list of samples generated by running DFHISTAR.

### Defining the data sets

The samples generated by DFHISTAR include members to create the CICS and CICSPlex SM data sets for a CMAS, WUI server, and MAS.

**About this task**

Run the following jobs:

**Procedure**

1. **EYUCMSDS.** This job creates the CICS and CICSPlex SM data sets for a CMAS. By default, DFHISTAR customizes the DREPINIT job step, in EYUCMSDS, to create a CMAS data repository and add definitions for the CMAS, a WUI server, and a CICSpex for that WUI server.

2. **EYUWUIDS.** This creates the CICS and CICSPlex SM data sets for a WUI server.

3. **EYUCSYDS.** This creates the CICS and CICSPlex SM data sets for a MAS.

### Creating a CICSPlex SM address space (CMAS)

To create a CMAS, perform these tasks.

**About this task**

The sample member, EYUCMS0P, generated by DFHISTAR, contains customized data for this CICSPlex SM parameter:

**NAME(CMAS01) CMAS Name (Default is APPLID)**

For a complete list of CICSPlex SM parameters, see Chapter 49, “**CICSPlex SM system parameters**,” on page 341.
Procedure

1. Review and edit the EYUCMSSP sample member system initialization parameter. Edit the CICS SVC number (CICSSVC) if you use a number other than the CICS default SVC number.

2. Run the EYUCMASJ sample member to start the CMAS.

Results

The CICS region starts and the CMAS initializes. Check the job log for message: EYUXL0010I applid CMAS initialization complete

Creating a CICSPlex SM Web User Interface server

The sample member, EYUWUI0P, generated by DFHISTAR, contains customized data for a number of CICSPlex SM parameters.

About this task

A WUI server region runs as a MAS and is managed by the CMAS. Its operation is controlled by the CICSPlex SM parameters that are required for a MAS and the WUI server initialization parameters.

**NAME(WUINC01)** WUI Name (Default is APPLID)
**CICSPLEX(WUIPCM01)** CICSPlex to which the WUI connects
**CMASSYSID(CM01)** CMAS to which the WUI connects

For a complete list of CICSPlex SM parameters, see Chapter 49, “CICSPlex SM system parameters,” on page 341.

The sample member, EYUWUIIN, generated by DFHISTAR, contains customized data for the following WUI server initialization parameters:

- TCPIPHOSTNAME(@tcpiphst@) TCP/IP host name of this WUI Server
- TCPIPPORT(@tcpipprt@) TCP/IP port number
- DEFAULTCMSCTX(@cmasname@) CMAS context - CMAS name
- DEFAULTCONTEXT(@wuplex@) Context - CICSPlex name
- DEFAULTSCOPE(@wuplex@) Scope - CICSPlex, CICS group or MAS name

* AUTOIMPORTDSN is required only when importing view sets from
* a data set. Use it when starting the WUI for the first time
* or when importing new or modified view sets.
* The SEYUVIEW data set contains the IBM-supplied menus and view sets.
* To import menus and view sets for languages other than English,
* change AUTOIMPORTMEM to:
* EYUSA+ for Chinese
* EYUKA+ for Japanese

For a complete list of Web User Interface server initialization parameters, see “Web User Interface server initialization parameters” on page 326.

To create a CICSPlex SM Web User Interface server:
Procedure

1. Review and edit the WUI-related CICS system initialization parameters in sample member EYUWUIISP.
   - Edit the CICS SVC number (CICSSVC) if you use a number other than the CICS default SVC number.
   - The optional INITPARM parameter is set to the default of English. INITPARM sets the language and code page for the WUI. If you want to use another language, specify the value for INITPARM using this format:
     \[\text{INITPARM}=(\text{EYU9VKEC}='xxx',\text{EYU9VWAN}='yyy')\]
     where xxx represents the language of the Web User Interface server and yyy represents the code page of the client. For example, if your chosen language is Japanese, code:
     \[\text{INITPARM}=(\text{EYU9VKEC}='JPN',\text{EYU9VWAN}='JPN1')\].
     For a list of language and code page identifiers, see [”Specifying language and code page information for the WUI” on page 321].

2. Prepare the code page conversion table DFHCNV, described in [”Preparing the code page conversion table for the WUI” on page 322].

3. Run the EYUWUIJ sample member to start the WUI.

Results

EYUWUIJ automatically imports the Web User Interface views into the server repository. Check the EYULOG for messages:

- EYUVS0002I CICSPlex SM Web User Interface initialization complete.
- EYUVS0010I Server connected to CMAS, SYSID(sysid).

Testing your Web User Interface

After the WUI views have been imported and WUI initialization has completed, you can test that your Web User Interface is running.

About this task

Procedure

1. Enter the following web address: http://hostname:portnumber
   - hostname is the TCP/IP host name on the TCPIPHOSTNAME parameter in the EYUWIIN member (specified as TCPIPHST for DFHISTAR).
   - portnumber is the TCP/IP port number on the TCPIPPORT parameter in the EYUWUIIN member (specified as TCPIPPRT for DFHISTAR).
   After you have signed on to your system, you see the main menu for the Web User Interface.

2. From the main menu, select the CICS regions option. Details of the WUI server region are displayed. By default, DFHISTAR customizes EYUWUIIN to set the DEFAULTCONTEXT and DEFAULTSCOPE to the name of the CICSplex defined for the WUI.

Using the Web User Interface to define a CICSpex and a MAS

Before starting the MAS, use the WUI to define a CICSpex and a MAS.
About this task

Procedure

1. Define a CICSpex for your MAS, starting from the WUI main menu:
   - Click Administration views > CMAS configuration administration views > CICSpex definitions
   - Create a CICSpex definition:
     - Click Create.
     - Specify CICSpex using the name specified in the CICSPLEX parameter in the EYULMS0P member. You can leave the default values in the other fields.
     - Click Yes.

2. Add a MAS to your newly defined CICSpex, starting from the WUI main menu:
   - Change the Context and Scope fields to the name of the CICSpex and click Set. The name matches the CICSPLEX parameter in the EYULMS0P member.
   - Click CICSpex SM operations views > CICS system definitions.
   - Click Create to create a CICS system definition.
   - Set the CICS system definition name using the NAME parameter from EYULMS0P.
   - Set the Primary CMAS name using the NAME parameter from EYUCMS0P.
   - You can leave the Period definition name blank. A PERIODEF is required to set time periods for the CICSpex SM system availability resource monitoring (SAM). SAM is not activated in this IVP.
   - Set the MAS Application ID using the APPLID parameter from EYULMSSP.
   - Set the MAS System ID using the SYSIDNT parameter from EYULMSSP.

Creating a CICSpex SM managed CICS system (MAS)

To create a MAS, perform these tasks.

About this task

The sample member, EYULMS0P, generated by DFHISTAR contains customized data for the following CICSpex SM parameters:

- NAME(CSYS01): MAS Name (Default is APPLID)
- CICSPLEX(CSYPLX01): CICSpex to which the MAS is associated with
- CMASSYSID(CM01): CMAS to which the MAS connects

For a complete list of CICSpex SM system parameters, see Chapter 49, “CICSpex SM system parameters,” on page 341.

Procedure

1. Review and edit the MAS-related CICS system initialization parameters in the EYULMSSP sample member. Edit the CICS SVC number (CICSSVC) if you use a number other than the CICS default SVC number.

2. Run the EYUCSYSJ sample member to start the MAS.

Results

The CICS region starts and the MAS initializes. Check the MAS job log for these messages:
EYUNL0099I LMAS LRT initialization complete.

EYUTS0003I Topology event for sysname Complete - APPLID (applid) CICSpex (plexname)

Check the CMAS job log for this message:
EYUTS0003I Topology event for sysname Complete - APPLID (applid) CICSpex (plexname)

---

**Verifying that the IVP is complete using the WUI**

Verify that the IVP is complete by completing these tasks.

**About this task**

**Procedure**

1. Click **CICS regions** from the WUI main menu. Ensure the **Context** and **Scope** fields are set to the CICSpex name used as the CICSPLEX parameter in EYULMS0P. Details of your managed CICS system are displayed.

2. Click **Administration views > CMAS configuration administration > CICSpex definitions**. Two CICSpexes are shown, one created by the EYU9XDUT step in the EYUCMSDS job and the other by you using the WUI.

**Results**

The IVP is now complete.

---

**Shutting down the MAS, WUI server, and CMAS**

When the IVP has completed, you can shut down the MAS, WUI server, and CMAS.

**Procedure**

- To shut down the MAS, see "Stopping and restarting management of a CICS system" on page 315.
- To shut down the WUI server, see "Starting and stopping the Web User Interface" on page 338.
- To shut down the CMAS, see "Shutting down a CMAS" on page 303.
Chapter 56. Setting up a more complex configuration

To set up a more complex configuration and thereby increase availability, you can have several WUIs, however each CMAS does not require a unique WUI.

About this task

You can continue to define more managed CICS systems and add them to your CICSpexit. In a larger configuration, you might have several CMASs. A CMAS that is specified as the context when you create a CICSpexit definition is the maintenance point CMAS for that CICSpexit. When applying service to CICSpexit SM, you must apply some PTFs to the maintenance points first, before the other regions are updated. For this reason, keep the number of maintenance point CMASs to a minimum.

When you connect a WUI to a CMAS, you can link the CMAS to others in your network. After building your CMAS-to-CMAS links, you can remove the WUIs and their CICSpexit definitions from some of your CMASs to reduce the number of maintenance point CMASs.
Part 8. Appendixes
Appendix A. Information about modules eligible for the MVS link pack area

The column headings for the tables that detail LPA-eligible and LPA-required modules are given.

The tables that list this information are provided in Table 26 on page 418 and Table 27 on page 419. Some of the information applies only to the modules listed in Table 27 on page 419.

Name The name of the module.

Description A brief description of the module. This gives some clues to the associated function, useful if the module does not have a controlling CICS option.

Library Table 27 on page 419 only. The library in which the module is installed:

Library

<table>
<thead>
<tr>
<th>DS name</th>
</tr>
</thead>
<tbody>
<tr>
<td>AUTH</td>
</tr>
<tr>
<td>hlq.SDFHAUTH</td>
</tr>
<tr>
<td>LOAD</td>
</tr>
<tr>
<td>hlq.SDFHLOAD</td>
</tr>
<tr>
<td>LINK</td>
</tr>
<tr>
<td>SYS1.hlq.SDFHLINK</td>
</tr>
</tbody>
</table>

You can use the CICS-supplied usermods to move the modules from these libraries to the hlq.SDFHLPA library.

LPA/ELPA Table 27 on page 419 only. In this column, the terms LPA and ELPA are used to indicate whether a module is loaded into the part of the MVS link pack area that is below (LPA) or above (ELPA) 16MB.

Priority Table 27 on page 419 only. A nominal “priority” to help you decide whether a module is in the MVS link pack area and to choose between modules if your MVS link pack area is short on space. The following list shows the priority of the modules eligible for the LPA:

1. Must be in the MVS link pack area. Information about these modules, installed in the hlq.SDFHLPA library, is given in Table 26 on page 418.
2. Generally a good candidate for inclusion in the MVS link pack area. Include these modules in the LPA to support the associated option.
3. A good candidate for inclusion in the MVS link pack area. Include these modules in the MVS link pack area if you are a heavy user of the associated function.

Size The size of the module. The module sizes are taken from the latest information available at the time of publishing, but might be different in your CICS environment depending on the options selected and if any PTFs applied affect the modules.

The sizes are given to help you plan the amount of storage that you require for the modules that you want to install in the MVS link pack area.
You can get the actual sizes for these modules from a directory listing of
the modules or from the module index provided at the back of a formatted
SDUMP taken with the LPA=NO system initialization parameter specified.

Option/Note
Identifies one or more notes about the use of the module from the MVS
link pack area and any associated CICS options to be specified for the
function that uses the module. See "Option/Note column of the
LPA-required and LPA-eligible modules tables" for further information.

Option/Note column of the LPA-required and LPA-eligible modules
tables

This column of the LPA-required and LPA-eligible modules tables identifies CICS
options associated with the use of the module from the MVS link pack area, or
refers to a note in the following list for additional information, or both.

1. The program is used from the MVS link pack area only if you set the
   USELPACOPY option of its program resource definition to YES.

2. You must always install the latest service level of the CICS SVC module,
   DFHCSVC. Install the DFHCSVC module into the MVS link pack area before
   you run the CICS installation verification procedures.
   You must define the DFHCSVC module in an IEASVCxx member of the
   SYS1.PARMLIB library with SVCPARM statements. You select the required
   IEASVCxx member by coding the SVC parameter (SVC=xx) in a
   SYS1.PARMLIB member (IEASYyy), which you use to IPL your MVS.
   You can run several CICS regions, at different release levels, in the same MVS
   image. Each region uses its own version of the DFHCSVC module. If some of
   those regions use MRO, all regions that use MRO must use the latest
   DFHCSVC module and the latest DFHIRP module.
   If some regions use the DFHCSVC module, and you allocate to the SVC a
   number different from the SVC number used by the regions, you must
   generate a new version of the DFHCRC program on the regions.
   For more information about the DFHCSVC module, see the Program Directory
   for CICS Transaction Server for z/OS.

3. All LPA-required modules are compatible with earlier releases of CICS. If you
   are running earlier releases of CICS, you must ensure that the correct version
   is installed in the LPA. The module must be in the LPA for integrity reasons,
   but the post exit routine itself can stay in the LPA or in the CICS address
   space. You can then use different versions of the DFHDSAUT module in
different CICS regions running in the same MVS image, because the
DFHDSAUT module might not be compatible with all releases.

4. You can set the system tracing status by coding appropriate system
   initialization parameters, and you can also set it dynamically by using the
   CETR transaction.
   The system initialization parameters that you can use are:

   Parameter
   Use
   AUXTR
   Activate auxiliary trace.
   AUXTRSW
   Define the auxiliary switch status.
GTFTR
Enable CICS to use MVS GTF tracing.

INTTR
Activate CICS internal tracing.

TRTABSZ
Specify the size of the internal trace table.

USERTR
Set the master user trace flag on or off.

For information about using CICS trace and controlling the tracing status with the CETR transaction see CICS Problem Determination Guide.

5. The DFHIRP module must be in the MVS link pack area only if you are using MRO, CICS shared database, or the console message-handling facility. If you install the DFHIRP module in the MVS link pack area, you must also install DFHSSEN if you are using the console message-handling facility. You must always install the latest service level of the DFHIRP (if required) and DFHSSEN.

If you are running CICS with MRO at different release levels, all regions in the same MVS image must use the latest DFHIRP module.

6. To use the console message formatting facility of the MVS subsystem interface, you must install the modules DFHSSGC and DFHSSWT either in the MVS link pack area or in an APF-authorized library in the MVS link list. These modules are used by the subsystem interface and not directly by CICS. Therefore, the use of these modules from the MVS link pack area is not controlled by CICS parameters or options.

For information about enabling the console message-formatting facility, and about the other modules it requires, see “Modules required to use the console message-handling facilities” on page 121.

7. CICS requires the following load modules, supplied with CICS, to use data table services:
   - DFHDTINT
   - DFHDTOC
   - DFHDTLD
   - DFHDTRD
   - DFHDTES

The modules are all eligible for the MVS link pack area, but DFHDTRD and DFHDTES are probably the only ones which are used sufficiently frequently to be worth considering.

8. BMS=STANDARD
9. BMS=FULL
10. BMS=MINIMUM
11. DTRPGM=DFHDYP
12. SPOOL=YES
13. FCT=YES/xx
14. ISC=YES/xx
15. VTAM=YES
16. XRF=YES/xx
17. AUXTR=ON
18. TST=YES/xx
The Option/Note column also gives any associated options that you must specify to use the function associated with the LPA-eligible module. Unless otherwise stated, the options are specified by system initialization parameters as defined in CICS System Definition Guide.

**Related information:**

“LPA-required and LPA-eligible modules”

The LPA-required modules and LPA-eligible modules are listed in tables to provide information on each module in the MVS link pack area, as supplied in hlq.SDFHLPA. The tables do not list the aliases that might be used by CICS for some of the modules.

### LPA-required and LPA-eligible modules

The LPA-required modules and LPA-eligible modules are listed in tables to provide information on each module in the MVS link pack area, as supplied in hlq.SDFHLPA. The tables do not list the aliases that might be used by CICS for some of the modules.

For specific information about the Option/Note column of each tables, see “Option/Note column of the LPA-required and LPA-eligible modules tables” on page 416.

Appendix B. CICSPlex SM modules eligible for the MVS link pack area

CICSPlex SM modules that are eligible for installation in the MVS link pack area (LPA) are specified in the CICSPlex SM supplied USERMOD, EYU$UM01.

You must allow enough space in the link pack area for the installation of the selected CICSPlex SM modules. The total space you require depends on how the modules are packaged into the link pack area by the operating system and a local MAS requires approximately 2034KB.

All CICSPlex SM modules are installed in the LOAD library and loaded in the ELP.

The following table lists the CICSPlex SM modules that are eligible for inclusion in the LPA. The versions of these modules with the prefixes CJA, CJB, CJC, and CJD, in place of the prefix EYU, are also eligible for inclusion in the LPA. For example, modules CJA9BA01, CJB9BA01, CJC9BA01, and CJD9BA01, as well as EYU9BA01, are eligible. The prefix relates to the CICS release specific agent code of the underlying module.

Table 28. CICSPlex SM modules eligible for the LPA
Appendix C. Default CICS resource definitions for CICSPlex SM

These tables describe the default CICS resource definitions supplied for CICSPlex SM to start a CMAS, MAS, and WUI.

Default CICS resource definitions for a CMAS

The default CICS resource definitions supplied for CICSPlex SM to start a CMAS, MAS, and WUI. These are supplied in samples EYU$CDEF, EYU$MDEF, and EYU$WDEF in the SEYUSAMP library.

On an INITIAL start of a CMAS, CICSPlex SM uses the default CICS resource definitions supplied in sample EYU$CDEF. Table 29 lists these definitions.

**Important:** Do not change the recovery options of the EYUDREPN FILE definition. This definition is used when CPSM determines that Data Repository file operations do not require logging. It is usual to receive LSR pool messages for EYUDREPN during CMAS initialization and ignore them. Make sure that the CICS JCL does not have a DD statement for EYUDREPN, and do not associate EYUDREPN with a data set name.

Default CICS resource definitions for a MAS

On an INITIAL start of a MAS, or if a MAS is started by the COLM transaction, CICSPlex SM uses the default CICS resource definitions supplied in sample EYUSMDEF. Table 31 lists these definitions.

**Default CICS resource definitions for a WUI**

On an INITIAL start of a WUI, or if a WUI is started by the COVC transaction, CICSPlex SM uses the default CICS resource definitions supplied in sample EYU$WDEF. Table 32 lists these definitions. As a WUI server is a MAS, CICSPlex SM also uses the default CICS resource definitions supplied in sample EYU$MDEF, and listed in Table 31 on page 445.

Accessibility

Accessibility features help a user who has a physical disability, such as restricted mobility or limited vision, to use software products successfully.

You can perform most tasks required to set up, run, and maintain your CICS system in one of these ways:

- using a 3270 emulator logged on to CICS
- using a 3270 emulator logged on to TSO
- using a 3270 emulator as an MVS system console

IBM Personal Communications provides 3270 emulation with accessibility features for people with disabilities. You can use this product to provide the accessibility features you need in your CICS system.
