Installation Guide

Version 3  Release 1
Installation Guide

Version 3  Release 1
Contents

Preface ........................................................................... xv
What this book is about ................................................... xv
Who is this book for? ....................................................... xv
What you need to know to understand this book .......... xvi
How to use this book for planning ................................... xvi
     for installation ......................................................... xvi
Notes on terminology ...................................................... xvi
CICS system connectivity ................................................ xvi

Summary of changes ....................................................... xix
Changes for CICS Transaction Server for z/OS, Version 3 Release 1 xix
Changes for CICS Transaction Server for z/OS Version 2 Release 3 xix
Changes for CICS Transaction Server for z/OS Version 2 Release 2 xx
Changes for CICS Transaction Server for z/OS, Version 2 Release 1 xx
Changes for CICS Transaction Server for OS/390 Version 1 Release 3 xxi
     CICSPlex SM installation and setup ........................... xxi
Changes for CICS Transaction Server for OS/390 Version 1 Release 2 xxi
Changes for CICS Transaction Server for OS/390 Version 1 Release 1 xxi

Part 1. Planning for Installation ........................................ 1

Chapter 1. Introduction .................................................. 3
Overview of CICS TS ....................................................... 3
     Packaging ............................................................... 3
CICS TS elements and features ........................................ 4
     Exclusive and non-exclusive elements and features ....... 4
What you receive with CICS TS ........................................ 4
     Documentation ......................................................... 5
Summary of elements in CICS TS ....................................... 6
The CICS Clients and The CICS Transaction Gateway ....... 7
Installing CICS TS ......................................................... 7

Chapter 2. Installing CICS TS ........................................... 9
Requirements for CICS TS .............................................. 9
     Hardware requirements for installing CICS TS ......... 9
     Software requirements for installing CICS TS ......... 10
DASD storage requirements for CICS TS ......................... 11
Installing CBPDO ......................................................... 11
     using the SMP/E RECEIVE, APPLY, and ACCEPT commands 11
     using the DFHISTAR process ................................. 12
Installing ServerPac ...................................................... 13
     What you need to install the ServerPac ................. 14
     Summary of the ServerPac installation steps .......... 14
The next step .............................................................. 15

Chapter 3. Installing CICS TS using DFHISTAR .................. 17
Edit the DFHISTAR Job. ................................................. 17
     Specify the CICS Transaction Server Temporary Installation Libraries 20
     Specify the JOB Parameters for Installation Jobs .......... 20
     Specify the Scope of the Installation ....................... 21
     Specify the Type of JES to be Used ......................... 21
     Specify the Utilities to be used ............................... 21
Specify the Prefix of CICS Transaction Server Jobs .................. 22
Specify the Indexes of CICS Transaction Server Data Sets .......... 22
Specify the CICS TS HFS Directories and Data Sets ............... 23
Specify extra qualifiers ........................................... 24
Specify Block Sizes ................................................. 24
Specify the Disk Unit for Work Data Sets .................................. 24
Specify SMS Option for DASD Allocations .......................... 24
Specify Disk Volumes .................................................. 25
Allocate the Space for CICS Transaction Server Disk Volumes .... 28
Specify Attributes of the Temporary SMP/E Work Data Sets ....... 28
Specify Attributes of the Permanent SMP/E Data Sets ............. 29
Specify SMP/E Zone Attributes ...................................... 30
Specify the High-level Qualifiers for SMP/E Data Sets ............ 33
Specify the distribution tape device type ............................ 33
Specify Attributes of the CICS Transaction Server system Data Sets ........................................... 33
Specify Attributes of any additional target Libraries ............ 34
Specify the Data Set Name of the SISPLOAD Library ............... 35
Specify the Data Set Name of the CSSLIB Library .................. 35
Specify the Data Set Name of the SCEECPP Library .................. 35
Specify the Data Set Name of the SCEELKED Library ................. 36
Specify the Data Set Name of the SCEELKEX Library ............... 36
Specify the Data Set Name of the SCEEOBJ Library ................. 36
Specify the Data Set Name of the SCEESAMP Library ............... 36
Specify the Data Set Name of the SCLBSID Library ................. 36
Specify the Data Set Name of the SCSQLOAD Library ............... 36
Specify the Data Set Name of the SCSQANLE Library ............... 37
Specify the Data Set Name of the SCSQCICS Library ............... 37
Specify the Data Set Name of the SCSQAUTH Library ............... 37
Specify the Name of the Java directory ........................... 37
Specify the Data Set Name of the SDSNLOAD Library ............... 37
Specify the Data Set Name of the SEZARPC1 and SEZACMTX libraries ........................................... 37
Specify the Data Set Name of the SCEECICS & SCEERUN libraries ........................................... 38
Specify the Data Set Name of the SCEERUN2 & SCEELIB libraries ........................................... 38
Specify the Data Set Name of the SCEEBND2 library ................ 38
Specify Log stream and Log stream Structure Attributes ........ 38
Create RACF Profiles for the CICS Transaction Server Data Sets ........................................... 39
Run the DFHISTAR Job .................................................. 39
Run the DFHISTAR Job .................................................. 40
Check the Output from the DFHISTAR Job .......................... 40
Check that You Are Ready to Run the Installation Jobs .......... 41
Run the installation Jobs .............................................. 42
Run Times of the Installation Jobs ................................ 42
The DFHIIHFS0 Job ................................................... 43
The DFHIIHFS1 Job ................................................... 43
The DFHISMKD Job .................................................... 44
The DFHINST1 Job ..................................................... 44
The DFHINST2 Job ..................................................... 44
The DFHINST3 Job ..................................................... 45
The DFHINST4 Job ..................................................... 46
The DFHINST5 Job ..................................................... 46
The DFHINST6 Job ..................................................... 46
The DFHIJVMJ Job ..................................................... 47
Check the Output from the Installation Jobs ........................ 47
What next? .............................................................. 48
Copy the CICS Transaction Server Procedures into a Procedure Library ........................................... 48
Create Extra Sets of CICS Transaction Server Target Libraries (Optional) ........................................... 50
Load the CICS Transaction Server Source Material (Optional) ........................................... 52
Modules needed to use the console message-handling facilities .................. 89
Coexistence considerations .......................................................... 90
EXCI pipe allocation ................................................................. 91
The DFHSSly initialization member .............................................. 91
The EXCI pipe allocation limit ...................................................... 91
Default EXCI pipe allocation limit initialization parameter ............. 91

Chapter 11. Installing the CICS Type 3 SVC ...................................... 93
Defining the CICS SVCs to your MVS .............................................. 93
Using more than one version of the CICS Type 3 SVC ...................... 94
MRO between different CICS releases with a changed SVC number ...... 95

Chapter 12. Selecting the high-performance option ............................. 97
Defining DFHHPSVC to MVS ....................................................... 97
Loading module DFHHPSVC ....................................................... 97
Removing existing DFHHPSVC modules from the MVS nucleus .......... 98

Chapter 13. Defining CICS regions as applications to VTAM ............... 99
Defining specific CICS APPL statements to VTAM ........................... 99
VTAM APPL parameters for CICS regions ..................................... 99
VTAM version and release level indicator ..................................... 101
Message DFHZC3473 on opening the VTAM ACB ......................... 101
Cross-domain considerations .................................................... 101
VTAM LU alias facility ............................................................. 101

Chapter 14. Installing CICS modules in the MVS link pack area .......... 107
Preparing to install CICS modules in the MVS link pack area .......... 107
Benefits of using the MVS link pack area ..................................... 107
What is meant by the MVS link pack area? .................................. 108
Which modules must be in the MVS link pack area ...................... 108
Which modules can be in the MVS link pack area ...................... 109
Service considerations .............................................................. 110
How to use modules in the MVS link pack area ............................. 111
Space requirements for CICS modules in the MVS link pack area ..... 111
Defining the CICS LPA library to your MVS .................................. 111
Installing CICS modules in the LPA ............................................ 112
Selecting modules for the MVS link pack area .............................. 112
The CICS-supplied SMP/E USERMOD, DFHUMOD ................. 113
Changing a CICS-supplied USERMOD ....................................... 113
Preparing the USERMOD ......................................................... 113
Receiving and applying the USERMOD ....................................... 113
Controlling the use of modules from the MVS link pack area .......... 114
Modules in the MVS link pack area from hlq.SDFHAUTH ............ 114
Modules in the MVS link pack area from hlq.SDFHLOAD ............ 114
Sample DFHCSDUP job to specify USELPACOPY(YES) ............... 118

Chapter 15. Defining CICS IPCS exit control data to MVS ............... 121
The DFHIPCSP CICS exit control data ....................................... 121

Chapter 16. MVS Program properties table entries ........................ 123
RACF password checking .......................................................... 123
Non-swappable CICS regions ..................................................... 123
MVS protection key for CICS .................................................... 124

Chapter 17. MVS performance definitions ..................................... 125
Implementing MVS workload management .................................... 125

Part 3. Getting ready to run CICS

Chapter 27. Tailoring the CICS-supplied skeleton jobs
The CICS installation libraries
What you should do
Running DFHISTAR

Chapter 28. Creating the CICS data sets
Naming conventions
Creating data sets common to all CICS regions, DFHCOMDS job
Creating several copies of the DFHCSD and SYSIN data sets
Creating data sets unique to each CICS region, DFHDEFDS job
Creating the CICS messages data set, DFHCMACI job
Defining the DFHMACD file and associated CICS resources
Defining the sample applications data sets
The CUA text level application.
The FILEA sample application programs
The CICS Application Programming Primer sample application

Chapter 29. Defining DL/I support
PDIRs
Adding remote DL/I support
Defining a PSB directory
Coding CICS system initialization parameters for remote DL/I support
Global user exits for DL/I.

Chapter 30. Adding CICS support for programming languages
Installing Language Environment support
Installing CICS support for Language Environment
Language Environment support for COBOL
Language Environment support for C and C++
Language Environment support for PL/I
Language Environment support for CICS JVM programs

Chapter 31. Verifying your Java components installation
Verifying Java components checklist
Java Virtual Machine sample definition files
JVM profiles
JVM properties files
Java 2 security policy for EJBs
Authorizing the hlq.SDFJAUTH library
The hlq.SDFJLPA library
Amending parameters in SYS1.PARMLIB(BPXPRMxx).

Chapter 32. Installing MRO and ISC support
Installing MRO support
Defining CICS as an MVS subsystem
Installing the modules DFHIRP and DFHC SVC in the LPA
Installing required hardware and software for XCF/MRO
Defining MVS images as systems in an XCF sysplex
Enabling MRO for CICS startup
Adding ISC support ................................ 213
Running a CICS region with ISC ................ 213

Chapter 33. Enabling TCP/IP in a CICS region .... 215
Using TCP/IP in a CICS region ..................... 215

Chapter 34. Enabling REXX for CICS .............. 217
Step 1--Modify your RDO definitions to add required entries ........................................ 217
Step 2--Create the RFS filepools ..................... 217
Step 3--BIND the CICSQL program to your DB2 plan ........................................................ 218
Step 4--Add DD statements to your CICS startup job ...................................................... 218
Step 5--Modify member CICSTART ..................... 218
Step 6--Format the RFS filepools ..................... 218
Step 7--Verifying the installation ..................... 219
Step 8--Accessing the supplied softcopy documentation .................................................. 219
Customization information for REXX ................ 219
Changing supplied CICS transaction codes ...... 220
RFS filepool definitions .................. 221
TD queues needed for IMPORT and EXPORT commands .................................................. 221
SQL definitions used for authorizing transactions to use DB2 ....................................... 221
Special exec data sets used by the REXX Development System .................................... 222
Special USER ids and their usage ..................... 222
Other considerations ......................... 223
Online HELP facility .................. 223

Part 4. CICS verification .............................. 225

Chapter 35. Running the installation verification procedures ........................................... 227
Preparation for running the IVPs ...................... 227
Create the CICS data sets for the IVP jobs .......... 227
Install the CICS SVC for the IVP jobs ............ 227
Define and activate the CICS applids ............. 228
Authorize the IVP userid .......................... 228
Review security requirements for the IVP jobs ... 229
Define log streams .......................... 230
Specify system initialization parameters for the IVP jobs ............................................ 231
Resources for the CICS messages facility, CMAC .................................................. 232
The CICS startup procedure, DFHSTART ............ 232
DD statements for CICS data sets ................... 233
Verify batch job, DFHIVPBPT .................. 234
Sample job log for the DFHIVPBPT job .......... 235
Output from the DFHIVPBPT job ................... 238
Verify interactive job, DFHIVPOL ................ 241
Defining a terminal for the online IVP .......... 242
Defining the CICS APPLID to VTAM ............ 244
Defining an MVS console ................ 244
Defining a TSO user as a console device .......... 245
Running the DFHIVPOL job ....................... 246
Logging on at a VTAM terminal ................... 249
Using CICS-supplied transactions through a terminal .................................................. 250
Using the CEDA transaction ...................... 252
Invoking and executing sample programs ............. 253
Using transactions from a console device ............ 253
Terminating CICS ................................ 255
Verifying shared data tables support ............. 255
Example verification of shared data tables .......... 256
Part 5. CICSPlex SM installation and setup .......................... 269

Chapter 36. CICSPlex SM setup checklist and worksheets .......... 271
Installation checklist ............................................. 272
MVS installation and setup checklist .............................. 272
System worksheet ................................................. 275
CAS worksheet .................................................. 276
CMAS worksheet ................................................. 277
Local MAS worksheet .......................................... 279

Chapter 37. Setting up the MVS environment ....................... 281
Noting IEASYSxx values ........................................... 281
Updating IEASYSxx (CAS) ........................................ 282
Updating IEASYSxx (CMAS) ..................................... 282
Authorizing libraries ............................................. 283
Updating the MVS linklist ....................................... 284
Preparing to use the CICSPlex SM API .......................... 284
Installing the REXX function package ............................ 285
Using CICSPlex SM modules in the MVS link pack area ......... 286
Space requirements .............................................. 286
Installing CICSPlex SM modules into the LPA .................... 287
Applying maintenance to LPA modules ......................... 288

Chapter 38. VTAM requirements ..................................... 289
Defining VTAM requirements (CAS) .............................. 289
  Step 1: (Optional) Creating a mode table .................... 289
  Step 2: Creating a VTAM application definition (CAS) ..... 291
  Step 3: Defining cross-domain resources (CAS) ............. 292
  Step 4: Updating the configuration list (CAS) ............... 292
  Step 5: Activating the major nodes (CAS) ................... 293
Defining VTAM requirements (CMAS) ............................ 293
  Step 1: Creating a VTAM application definition (CMAS) .... 294
  Step 2: Defining cross-domain resources (CMAS) .......... 295
  Step 3: Updating the configuration list (CMAS) .......... 296
  Step 4: Activating the major nodes (CMAS) .................. 296

Chapter 39. Generating post-installation members .................. 297

Chapter 40. Creating and managing CICSPlex SM data sets ......... 299
CAS-related data sets ........................................... 299
Creating the CICSPlex SM data repository ....................... 299
Populating the CICSPlex SM data repository ..................... 302
Converting the CICSPlex SM data repository ..................... 302
Expanding the CICSPlex SM data repository ..................... 304
Taking backups of the CICSPlex SM data repository ............. 304
  Defining a forward recovery log for the data repository ... 304
Chapter 41. Upgrading the CSD and macro definitions ........ 307
Creating CICS resource definition tables for CMASs ........ 307
Updating the CSD files using DFHCSDUP (CMAS) ........ 307
Journalmodel considerations in a CICS TS z/OS CMAS .... 308
Considerations when upgrading the CSD release (CMAS) ... 309
Considerations when sharing the CSD (CMAS) ........... 309
Updating CICS resource definition tables for MASs ....... 310
Updating CSD files using DFHCSDUP (MVS MAS) .......... 311
Considerations when upgrading the CSD release (MVS MAS) . 312
Considerations when sharing the CSD (MVS MAS) ......... 312

Chapter 42. Preparing user access to CICSPlex SM ........... 313

Chapter 43. Setting up a coordinating address space (CAS) .... 315
Preparing to start a CAS .................................. 315
  START command for a CAS ................................ 316
  Identifying and connecting to a CAS ..................... 318
Setting the CAS system communication information ...... 318
Preparing to stop a CAS ................................... 318
  Stopping a CAS ......................................... 318

Chapter 44. Setting up a CICSPlex SM address space (CMAS) ... 321
Before you begin ......................................... 321
CICSPlex SM auxiliary storage usage ..................... 321
Preparing to transmit generic alerts to NetView .......... 322
Preparing to start a CMAS ................................ 323
  Editing CICSPlex SM system parameters ................. 325
  CMAS-related CICS SIT parameters ..................... 326
  Controlling tasks in a CMAS ......................... 328
  Controlling CICS storage in a CMAS ................. 329
  START command for a CMAS .......................... 330
Setting the VTAM APPLID for a CMAS ..................... 330
Shutting down a CMAS ................................... 330
  Using the SHutdown command .......................... 331
  Using the COSD transaction .......................... 331
Restarting a CMAS ...................................... 331

Chapter 45. Setting up a CICS managed application system (MAS) . 333
Before you begin ......................................... 333
Using CICS global user exits and user-replaceable modules .. 333
  Controlling the use of modules from the LPA .......... 334
Preparing to start an MVS MAS .......................... 334
  Activating DB2 connections during CICS startup .... 335
  MQSeries connections ................................ 336
  MVS MAS-related CICS SIT parameters ................. 336
Preparing the MAS for history recording ................ 338
Stopping and restarting management of a CICS system ...... 339
  Stopping management of a CICS system ............... 339
  Restarting management of a CICS system ............. 339
  Terminating a MAS .................................... 340
  Controlling the number of long running tasks in a MAS . 340

Chapter 46. Setting up a CICSPlex SM Web User Interface server ... 341
Preparing a CICS system to act as the Web User Interface server .... 341
  Configure CICS Web support .......................... 342
  Review CICS system initialization parameters ........ 343
Chapter 53. CICSPlex SM installation verification procedures .............................. 407
If the IVPs do not work as described ................................................................. 407
The stages of IVP1 and IVP2 ............................................................................... 407
The IVP samples libraries ................................................................................. 408

Chapter 54. Installation verification procedure 1 (IVP1) ................................. 411
Setting up the CICSPlex SM environment on system A ..................................... 411
Starting up and verifying CICSPlex SM components on system A .................. 413
1: Start the CAS EYUCAS1A ........................................................................... 413
2: Start the CMAS EYUCMS1A ....................................................................... 414
3: Define a CICSPlex to CICSPlex SM ............................................................ 415
4: Run the batched repository update facility on system A ............................. 418
5: Start the MAS EYUMAS1A ......................................................................... 419
Testing CICSPlex SM functions ...................................................................... 420
  Test the operations functions on system A ...................................................... 420

Chapter 55. Installation verification procedure 2 (IVP2) ................................. 425
Setting up the CICSPlex SM environment on system B ..................................... 426
Starting up and verifying CICSPlex SM components on system B .................. 427
1: Create CAS definitions ............................................................................... 428
2: Start the CAS EYUCAS1B ........................................................................... 432
3: Checking CAS-to-CAS connections ............................................................. 433
4: Start the CMAS EYUCMS1B ....................................................................... 434
5: Run the batched repository update facility on system B ............................. 435
6: Enable EYUCMS1B to manage EYUPLX01 ............................................. 436
7: Start the MAS EYUMAS1B ......................................................................... 439
Testing CICSPlex SM functions ...................................................................... 440
  Test the operations functions on system B ...................................................... 440
Customizing the installation verification procedures ........................................ 443

Part 7. Appendixes ............................................................................................. 445

Appendix. CICS modules eligible for the MVS link pack area ......................... 447
CICS modules required in the MVS link pack area ............................................ 447
CICS modules eligible for the MVS link pack area ............................................ 447
Information about modules eligible for the MVS link pack area ...................... 447
  Priority ........................................................................................................... 448
  Size ............................................................................................................... 448

Preface

What this book is about

This book describes CICS® Transaction Server for z/OS®, Version 3 Release 1 (CICS TS). It takes you through the necessary planning and helps you install CICS Transaction Server for z/OS, Version 3 Release 1. It contains guidance about tailoring CICS for use in your systems environment. It:

- Describes the content of CICS TS and the two delivery methods—ServerPac and CBPDO
- Explains the method of installing CICS TS (with either ServerPac or CBPDO), and provides references to the required sources of information. In this book, “installing” means loading the code into the libraries in preparation for the migration and customizing tasks.
- Lists the hardware and software you must have to run the CICS TS product elements and exploit the function provided by CICS TS.
- Covers installation, and verification of that installation, for both CICS and CICSPlex® SM.
- Tells you about installing the workstation-based components of CICS TS.

The book assumes that you are upgrading to CICS TS levels of all the product elements in the Server.

Planning the migration to CICS TS requires that you understand the function provided by the CICS TS product set. You can learn about the function in the various product libraries of the individual elements that comprise the product set.

Always check the product libraries (for example, in the CICS Transaction Server for z/OS Migration from CICS TS Version 2.3) for changes that might affect CICS TS elements.

Who is this book for?

This book is intended for experienced CICS system programmers who are planning to migrate to CICS TS.

This book is also for system programmers who are responsible for installing and tailoring CICS and CICSPlex SM.

By “experienced”, we mean that a system programmer’s experience includes installing and managing CICS and some or all of the other elements in the CICS TS product set.

What you need to know to understand this book

To fully understand the installation information in this book, you should have experience of the IBM® MVS™ operating system, and the System Modification Program/Extended (SMP/E) licensed program needed to maintain CICS and CICSPlex SM. To use the installation verification procedures, you should be familiar with the JCL and cataloged procedures for MVS. It also helps if you are familiar with CICS and CICSPlex SM concepts.
How to use this book

for planning

Read through the sections of this book that tell you about:

- The products and hardware you need to support the function that comes with CICS TS.
- The pointers to migration and installation information that is in the product libraries that you receive with CICS TS.

Once you have identified the actions you need to take to complete your migration, write a plan describing the steps your installation will take. Include your estimate of how much time each step requires and who will do it.

for installation

CICS and CICSPlex SM are available only as elements of the CICS Transaction Server, through either the ServerPac or CBPDO method of delivery. For information about these two methods of delivery of the CICS Transaction Server, see Chapter 2, “Installing CICS TS,” on page 9.

To install the CICS Transaction Server using the CBPDO method, you should use the CICS Transaction Server for z/OS Program Directory, together with the instructions contained in the Memo to Users Extension, to load the software from the tape DASD. For the ServerPac method, you follow the supplied set of ISPF dialogs and the accompanying documentation.

After you have loaded the CICS Transaction Server elements to DASD, you should then use this book to tailor CICS to your environment; that is to:

- Integrate CICS with MVS and ACF/VTAM
- Apply service to CICS (if required)
- Create the CICS data sets
- Install DB2 support (if required)
- Install MRO and ISC support (if required)
- Run the installation verification procedures (if required).

Notes:

1. “CICS modules eligible for the MVS link pack area,” on page 447 gives details of the CICS modules that are needed in, and eligible for, the MVS link pack area.

2. If you installed CICS from CBPDO, you do not need to run the DFHISTAR job again to specify the post-installation parameters. However, if you wish to create several copies of the post-installation jobs (for example to create several copies of the DFHDEFDS job to define CICS data sets unique to several CICS regions), you can edit and run the DFHISTAR job as many times as required.

Some of the information in this book is also of interest if you have installed CICS Transaction Server using the ServerPac method of delivery.

In particular, you should edit and run the DFHISTAR job, specifying the keyword POST, to define parameters needed to tailor your CICS environment.

Notes on terminology

CICS is used throughout this book to mean the CICS element of the IBM CICS Transaction Server for z/OS, Version 3 Release 1.
CICSPlex SM refers to CICSPlex System Manager, an element of CICS Transaction server.

CICS TS Version 2 region is used to refer to a CICS region running under CICS TS Version 2, in contrast, for example, to a CICS/ESA 4.1 region.

MVS is used throughout this book to mean the operating system MVS, or the Base Control Program (BCP) element of z/OS.

RACF® is used throughout this book to mean the MVS Resource Access Control Facility (RACF) or any other external security manager that provides equivalent function.

The term CICS TS 3.1 region is used to refer to a CICS region running under CICS TS Version 3 Release 1, in contrast, for example, to a CICS/ESA 4.1 region.

$ In the programming examples in this book, the dollar symbol ($) is used as a national currency symbol and is assumed to be assigned the EBCDIC code point X’5B’. In some countries a different currency symbol, for example the pound symbol (£), or the yen symbol (¥), is assigned the same EBCDIC code point. In these countries, the appropriate currency symbol should be used instead of the dollar symbol.

hlq Throughout this book, the term hlq is used to denote the high-level qualifier of the CICS TS data sets; for example, CICSTS31.CICS for CICS data sets and CICSTS31.CPSM for CICSPlex SM data sets. The CICSTS31 part of the high-level qualifier is defined by the LINDEX parameter in the DFHISTAR installation job.

IMS™ library names

The IMS libraries referred to in this chapter are identified by IMS.libnam (for example, IMS.SDFSRESL). If you are using your own naming conventions, change the IMS prefix to match those naming conventions.

CICS system connectivity

This release of CICSPlex SM can be used to control CICS systems that are directly connected to it.

For this release of CICSPlex SM, the connectable CICS systems are:

- CICS Transaction Server for z/OS 3.1
- CICS Transaction Server for z/OS 2.3
- CICS Transaction Server for z/OS 2.2
- CICS Transaction Server for OS/390® 1.3

You can use this release of CICSPlex SM to control systems running supported releases of CICS that are connected to, and managed by, your previous release of CICSPlex SM. However, if you have any directly-connectable release levels of CICS, as listed above, that are connected to a previous release of CICSPlex SM, you are strongly recommended to migrate them to the current release of CICSPlex SM, to take full advantage of the enhanced management services. See the [CICS Transaction Server for z/OS Migration from CICS TS Version 2.3](#) for information on how to do this.
Table 1 shows which supported CICS systems can be directly connected to which releases of CICSPlex SM.

Summary of changes

This part lists briefly the changes that have been made for the following recent releases:

Changes for CICS Transaction Server for z/OS, Version 3 Release 1

The more significant changes for this edition are:

• Technical changes:
  – A new topic, Chapter 25, “Enabling Unicode data conversion by z/OS,” on page 177
  – There are changes to Chapter 5, “Installing the CICS Information Center,” on page 61
  – In CICSPlex SM, support for the CICS NT remote MAS is removed, and the corresponding topic in the section about CICSPlex SM verification is deleted.
  – References to HFS directories now show the optional pathprefix, see, for example, “Specify the CICS TS HFS Directories and Data Sets” on page 23

• Structural changes:
  – Chapter 3, “Installing CICS TS using DFHISTAR,” on page 17 is a collection of topics which used to appear in the CICS Transaction Server for z/OS Program Directory
  – Chapter 46, “Setting up a CICSPlex SM Web User Interface server,” on page 341 is a topic which used to appear in the CICSPlex System Manager Web User Interface Guide

Changes for CICS Transaction Server for z/OS Version 2 Release 3

The more significant changes for this edition are:

• Technical changes:
  – In CICSPlex SM, support for the CICS OS/2 remote MAS is removed, and the corresponding topic in the section about CICSPlex SM verification is deleted.
  – New or revised topics include:
    - “Java Virtual Machine sample definition files” on page 207
    - “Authorizing the hlq.SDFJAUTH library” on page 210
    - “Populating the CICSPlex SM data repository” on page 302
    - “CMAS-related CICS SIT parameters” on page 326
    - “Preparing the MAS for history recording” on page 338

• Structural changes:
  – Chapter 5, “Installing the CICS Information Center,” on page 61 has been moved from the back of the book. It is now in Part 1, “Planning for Installation,” on page 1.
Changes for CICS Transaction Server for z/OS Version 2 Release 2

The more significant changes for this edition are:

- Technical changes:
  - In support of the new CICSPlex SM remote MAS agent for Windows, two chapters have been added:
    - Setting up a CICSPlex SM remote MAS agent for Windows
    - Installation verification procedure 6 (IVP6)
  - Chapter 50, “CICSPlex SM system parameters,” on page 383 has been updated with several new security-related parameters.

- Structural changes:
  - The former Appendix A, dealing with “Disk space needed for CICS”, has been removed. This information is available from the CICS Transaction Server for z/OS Program Directory. As a consequence, the former Appendix B is now Appendix A.

Changes for CICS Transaction Server for z/OS, Version 2 Release 1

The more significant changes for this edition are:

- This book has a new PART Part 1, “Planning for Installation,” on page 1, which replaces the Planning for Installation manual of earlier releases.
- Information has been added to Chapter 7, “Authorizing CICS regions to access MVS resources,” on page 69 describing “Authorizations for users of IXCMIAPU” on page 72.
- In Chapter 24, “Defining the logger environment for CICS journaling,” on page 143, suggested values for HIGHOFFLOAD and LOWOFFLOAD have been revised, and new sections “Requirements planning and checklist” on page 143 and “Analyzing SMF Type 88 records” on page 173 have been added.
- Chapter 29, “Defining DL/I support,” on page 197 is significantly changed.
- Chapter 30, “Adding CICS support for programming languages,” on page 201 is new.
- Chapter 31, “Verifying your Java components installation,” on page 205, replaces the previous “Java” support chapter.
- Chapter 33, “Enabling TCP/IP in a CICS region,” on page 215 is new.
- CICPlex SM for this release of CICS Transaction Server does not support CICS systems running under VSE/ESA. The chapters: “Setting up a CICS/VSE remote managed application system (MAS)” and “Installation verification procedure 3 (IVP3)”, (of the previous release) are removed.

For most items in each of the lists above, there is a reference to the part of the book where there is more detail.
Changes for CICS Transaction Server for OS/390 Version 1 Release 3

- Post-installation, addition to chapter on authorizing CICS regions
- VTAM® definitions required for CICS: PERSIST=MULTI
- Defining an MVS console
- Java support

CICSPlex SM installation and setup

To support the inclusion of CICSPlex SM as an element of CICS Transaction Server for OS/390, Version 1 Release 3, and the consequent revised installation processes, a new part, Part 5, “CICSPlex SM installation and setup,” on page 269 has been added to explain how to install the CICSPlex SM element. This information was previously available in the CICSPlex SM Setup book at the previous release. It contains the following chapters:

- Chapter 36, “CICSPlex SM setup checklist and worksheets,” on page 271
- Chapter 43, “Setting up a coordinating address space (CAS),” on page 315
- Chapter 44, “Setting up a CICSPlex SM address space (CMAS),” on page 321
- Chapter 45, “Setting up a CICS managed application system (MAS),” on page 333
- Chapter 47, “Configuring the Starter Set,” on page 361
- Chapter 48, “Applying service to CICSPlex SM,” on page 371
- Chapter 53, “CICSPlex SM installation verification procedures,” on page 407
- Chapter 55, “Installation verification procedure 2 (IVP2),” on page 425
- Chapter 49, “Using the EYUINST EXEC to tailor skeleton jobs,” on page 373
- Chapter 50, “CICSPlex SM system parameters,” on page 383
- Chapter 51, “CMAS journaling,” on page 397
- Chapter 52, “Preparing to use the IPCS tools,” on page 401

Changes for CICS Transaction Server for OS/390 Version 1 Release 2

The major changes to CICS that affect CICS Transaction Server for OS/390, Version 1 Release 2 are:

- Chapter 24, “Defining the logger environment for CICS journaling,” on page 143 has been rewritten, to include information about DASD-only log streams.
- The chapter discussing the installation of DB2 support has been removed. Information about CICS DB2 is available in the CICS DB2 Guide.
- A new section Chapter 7, “Authorizing CICS regions to access MVS resources,” on page 69 to explain how to authorize CICS region userids to z/OS UNIX System Services.

Changes for CICS Transaction Server for OS/390 Version 1 Release 1

The major changes to CICS Transaction Server for OS/390 Release 1 that affect this book are:

- Support for the MVS logger
- The removal of journal control
- Support for VSAM RLS.

Other changes made to this book include:

- The removal of information relating to XRF, including information for the DFHALTDS and DFHIVPAL jobs
• The removal of information relating to the CICSplex IVPs.
Part 1. Planning for Installation

This part discusses planning considerations prior to Installation. It contains the following chapters:

- Chapter 1, “Introduction,” on page 3
- Chapter 2, “Installing CICS TS,” on page 9
- Chapter 3, “Installing CICS TS using DFHISTAR,” on page 17
- Chapter 4, “Post-installation requirements,” on page 55
- Chapter 5, “Installing the CICS Information Center,” on page 61
Chapter 1. Introduction

Generally, large online CICS applications run on an MVS operating system together with a collection of other supporting software products, some provided by IBM and others by independent software vendors (ISVs). Functional additions include distributed CICS software on alternative platforms, enabling you to distribute transaction processing, with CICS on the MVS host acting as a large database server. IBM recognizes that customers traditionally run these products at various release levels—a piecemeal or mix-and-match approach.

CICS TS, together with other z/OS Software Servers, is designed to make it easier to install and operate the mix of software you need to run your business.

Overview of CICS TS

With CICS Transaction Server for z/OS (CICS TS), IBM continues to integrate CICS with a set of other supporting software, offering you a single product in place of several products. You order an entire set of software, integrated into one licensed product, instead of having to order new levels of some products but not others.

CICS TS is a member of the z/OS family of MVS-based software servers, and is separately orderable as a single part number.

Within CICS TS, the levels of all products reflect the level of the CICS TS product itself. Even the word “product” has new meaning; for this reason the products that make up the base of CICS TS are called elements. CICS TS marks a significant change from the former piecemeal approach to the way you order and install CICS and its related software.

Getting all the elements in CICS TS installed and running is the subject of this book. Because the elements and features of CICS TS are integrated into a single package with compatible service levels, it is expected that you will migrate all elements and features of CICS TS at the same time.

Packaging

The packaging of CICS TS into a number of elements is similar to the packaging of z/OS. For its operating system environment, CICS TS requires z/OS, Version 1 Release 4. As you prepare to install CICS TS, keep in mind that you gain the benefits of a comprehensively tested environment when you install CICS TS.

In summary, the concept of CICS TS is to integrate a range of transaction server functions into a single product that delivers the function previously provided by a number of individual IBM software products. CICS TS consists of several base elements. The intent is that IBM ships, and you run, all elements at the single release level that IBM has subjected to comprehensive system testing.

Migrating from one release of CICS TS to the next is relatively simple, and the transition from your current systems to CICS TS should also be straightforward.
CICS TS elements and features

CICS TS consists of base elements that deliver essential transaction server functions. When you order CICS TS, you receive all the base elements, described in Table 2 on page 6.

Two methods of installing CICS TS come free with your license:
1. A system replace method called ServerPac
2. The Custom-Built Product Delivery Option (CBPDO).

Exclusive and non-exclusive elements and features

Some elements and features contain new function that is available only within CICS TS. This book labels such an element or feature exclusive: new function is exclusive to CICS TS. If an element or feature is exclusive, you receive new function only through CICS TS. That is, while prior levels continue to be available, future functional enhancements occur only within CICS TS.

Other elements, however, exist both within CICS TS and also as separately orderable products. These are non-exclusive.

IBM’s direction is to make functional enhancements only within CICS TS.

What you receive with CICS TS

Because the elements of CICS TS are integrated into a single package, you are expected to install the entire product.

You can install CICS TS using one of several IBM packages. Two of these packages are available at no additional charge when you license CICS TS: (1) ServerPac, the system replace deliverable, or (2) CBPDO.

There is no stand-alone product tape for CICS TS, and there is no Custom Built Installation Process Offering (CBIPO).

Because of the overall ease of installing, IBM recommends that you choose ServerPac, if possible.

If you order the ServerPac offering, you receive:
- A series of tapes, each in IEBCOPY dump-by-dataset format (not a physical volume dump) containing a complete generated CICS TS system. This consists of distribution and target libraries, consolidated software inventory (CSI) and other SMP/E libraries already generated. CICS TS elements and their service are integrated into distribution and target libraries.
  IBM has IPLed the system and executed all installation verification programs (IVPs) prior to shipment.
- A CustomPac dialog, accessed through ISPF, that produces jobs that unload the tape to DASD. Through the dialog, you can name the data sets and place them in the catalogs you specify. The following accompanying documentation tells you how to use the dialog:
  - ServerPac: Installing Your Order (customized for each customer order)
  - ServerPac: Using the Installation Dialog, SA22-7815
- All unintegrated service, available on a service tape.
- Sample jobs to assist with the installation of CICS TS product and service.

Through the dialog, you can:
- Name the data sets and place them on the volumes and in the catalogs you choose
- Save configuration data for the next install, easing your move to the next release of CICS TS
- Run tailored post-installation verification jobs.

- **If you order CBPDO**, you receive one logically stacked SMP/E RELFILE tape that contains all the base elements. Depending on your customer profile, you receive uninstalled service. You also receive:
  - Sample jobs to help you install CICS TS and service.
  - *Custom-Built Offerings Plan/Install*, SC23-0352; the CBPDO Memo to Users Extension; CICS TS *Program Directory*, GC33-1200, and program materials that describe your CBPDO order.

![](Figure 1 illustrates the content differences between the ServerPac method and the CBPDO method of installing CICS TS.

**Documentation**

Regardless of whether you use ServerPac or CBPDO, you receive:
• The CICS TS Program Directory and other installation information for the elements, in hardcopy and softcopy.
• Essential hardcopy books to help you with installation.
• All the publications for CICS Transaction Server for z/OS in softcopy as part of the CICS Information Center. This is supplied on a CD-ROM, Installation instructions for the CICS Information Center can be found in Chapter 5, “Installing the CICS Information Center,” on page 61.

For details of all the publications available, see “Bibliography” on page 467.

Summary of elements in CICS TS

This section lists all the elements and features in CICS Transaction Server for z/OS. Most of the elements are products that have been available for some time; you may already be running some of them.

Table 2 lists all elements that are in the CICS TS base. The table tells you:

Name
   The short name of the element used in this book.

Excl.
   Whether the element is exclusive. In the Excl. column, Yes indicates an exclusive element, and No indicates a non-exclusive element that is also available as a stand-alone product.

Function Level
   The latest CICS TS release in which the element changed (that is, was added to CICS TS or had new function added). For non-exclusive elements, this column also gives the release level of the stand-alone product.

Note: To ensure compatibility with previous releases, the CICS base element maintains its own level (identification) number. Each time new function is added to CICS and shipped with the CICS Transaction Server product, the CICS level number is incremented. The CICS level number no longer implies a specific version and release number, because CICS is no longer a separate product.

The CICS level number in CICS TS is 0640. This number is returned in the RELEASE parameter of the INQUIRE SYSTEM command. The 0640 number also appears in other forms such as 6.4.0 in offline utilities such as statistics and dump formatters to identify the level of utility being used, and as the suffix in module names such as DFHPD640.

Comments

### The CICS Clients and The CICS Transaction Gateway

CICS Transaction Server for z/OS does not include the CICS Universal Clients or the CICS Transaction Gateway. To use the CICS Universal Client V5 or the CICS Transaction Gateway V5, licenses for these products are required.

### Installing CICS TS

[Chapter 2, “Installing CICS TS,” on page 9](#) tells you about installing the CBPDO delivery version of CICS TS.
Chapter 2. Installing CICS TS

IBM offers the following methods for installing CICS TS:
- ServerPac
- CBPDO, using the SMP/E RECEIVE, APPLY, and ACCEPT commands
- CBPDO, using the DFHISTAR process
- IBM customized packages.

The first three of these are entitled offerings, and are the subject of this book, but IBM customized packages are fee-based and are not discussed except for the following summary information. Depending on the country in which you order, you can purchase one of the following customized packages:
- A SystemPac, which tailors CICS TS to your environment, such as DASD layout and naming conventions, based on information provided to IBM.
- SoftwareXcel Installation Express (SIE), which tailors CICS TS to your specification and provides services that perform the actual install for you.
- Other fee-based services and customized offerings.

Both the ServerPac and CBPDO methods of delivering CICS TS come with a set of documentation that you use when you install the product. To help you plan ahead, this chapter gives you a preview of some of this information, such as the information contained in the Program Directory, which is shipped regardless of the delivery method you choose.

Note: The Program Directory is available in hardcopy only with the product—it cannot be ordered separately. A softcopy version is available on the CICS TS CD-ROM product kit, and also on the Transaction Processing and Data Collection Kit, SK2T-0730. The Program Directory is also available on the CBPDO and ServerPac tapes.

This chapter also helps you with other planning steps you must take:
- Ensuring you have the required hardware and software to install and run CICS TS; see "Requirements for CICS TS."
- Ensuring you have enough DASD storage space for CICS TS; see "DASD storage requirements for CICS TS" on page 11.
- Outlining the install steps for CBPDO; see "Installing CBPDO" on page 11.

Requirements for CICS TS

A major part of your planning effort involves looking at the software and hardware required for the system that you are installing.

Hardware requirements for installing CICS TS

Whether you choose the CBPDO method or the ServerPac method, the hardware requirement is the same.

Hardware requirements are more fully described in the CICS Transaction Server for z/OS Release Guide

You need a hardware configuration that runs the required levels of MVS, provided the configuration has a terminal and a tape device capable of reading one of the following types of tape on which CICS TS is supplied:
- 6250 bpi 9-track reels
Software requirements for installing CICS TS

The system software requirements for installing CICS TS using the ServerPac method or the CBPDO method is the same except for the addition of SMP/E for CBPDO.

Software requirements are more fully described in the CICS Transaction Server for z/OS Release Guide.

The products shown in Table 3 must be installed on the system you use to install both the ServerPac and the CBPDO.

Table 3. Program products required on the installing system for ServerPac and CBPDO

<table>
<thead>
<tr>
<th>Program Product</th>
<th>Minimum Level</th>
</tr>
</thead>
<tbody>
<tr>
<td>z/OS (5694-A01)</td>
<td>Version 1 Release 4.</td>
</tr>
</tbody>
</table>

z/OS includes the following elements that are required for installing CICS TS:
- Interactive System Productivity Facility (ISPF)
- Time Sharing Option/Extended (TSO/E)
- DFSMS/MVS
- Language Environment®
- Two components of eNetwork Communications Server: SNA and IP (previously VTAM and TCP/IP).
- z/OS UNIX system services (see "HFS and PDSE requirements" for more information.

If you are installing CICS TS using the CBPDO method, you also need:
- System Modification Program/Extended (SMP/E)
- High Level Assembler/MVS & VM & VSE.

Service note:: See the CICS Transaction Server for z/OS Program Directory for information about the service which should be applied on z/OS Version 1 Release 4 to ensure that CICS TS installs correctly.

HFS and PDSE requirements

Some components of CICS TS are installed in PDSE data sets and HFS files. CICS TS for z/OS, Version 3.1 requires PDSE data set support for installation to complete successfully. DFSMS/MVS, which is supplied as an element of z/OS, provides this support for PDSE data sets. The components concerned are part of the CICS support for Java programs and for IIOP inbound to Java applications. For FMID JCI640D, which contains the HFS-dependent code, the OMVS address space must be active in full-function mode, otherwise the install of this function fails.

In the set of installation jobs, there are some new initial jobs to create the HFS files and the directories shown in Figure 2 on page 11. You run these jobs before any of the normal DFHINSTn jobs. Note that the user ID running these jobs requires superuser authority.
Notes:

1. If you normally maintain additional SMP/E target zone libraries for the purpose of applying service, you can also create additional directories at the /cicsts31 level to create the HFS equivalent. See the DFHIHFSA job for more information.

2. The pathprefix in Figure 2 is optional.

DASD storage requirements for CICS TS

The amount of storage required for all the target and distribution data sets is detailed in the space table in the CICS Transaction Server for z/OS: Program Directory.

Installing CBPDO

You install all the elements from the CICS TS CBPDO using a single installation process. The CBPDO Memo to Users Extension contains information about the CBPDO you ordered, and the features and service it includes. It also contains CBPDO installation information.

The first planning task is to read the Memo to Users Extension thoroughly before starting any of the install tasks. If you are a new user of CBPDO, you should also read the IBM publication, MVS Custom-Built Offerings Planning and Installation, SC23-0352.

The CICS Transaction Server for z/OS: Program Directory gives a sample IEBCOPY job that you can customize to copy RELFILE(2) from the CICS TS CBPDO tape. Modify the LABEL=3 parameter to reference the file number of RELFILE(2) as supplied on the CBPDO tape. When you have copied RELFILE(2) to DASD, you generate a single set of install jobs using the CICS TS job generator, DFHISTAR. This generates the following set of customized install jobs, based on the parameters you specify to DFHISTAR:

- DFHIHFS0, DFHIHFS1, DFHIHFSA, and DFHISMKD, the HFS-related jobs
- DFHINST1 through DFHINST6

using the SMP/E RECEIVE, APPLY, and ACCEPT commands

The CICS Transaction Server for z/OS: Program Directory describes this process and tells you when to return to the CICS Transaction Server for z/OS Installation Guide to continue.
using the DFHISTAR process

"Edit the DFHISTAR Job" on page 17 describes all the parameters that you can specify to customize the install jobs, and explains the jobs that are generated.

One of the most significant parameters you are asked to specify is the high-level qualifier for the data sets into which the jobs install the product. CICS TS comprises a number of elements that are installed in a single process by the DFHINSTn jobs. To ensure the element libraries are easily identified, DFHISTAR adds an element qualifier to the data set names. Using the default high-level qualifier CICSTS31, the names generated by DFHISTAR take the following form:

- **CICS**
  - CICSTS31.CICS.ddname
- **CICSPlex SM**
  - CICSTS31.CPSM.ddname
- **Application Migration Aid**
  - CICSTS31.AMA.ddname
- **REXX for CICS**
  - CICSTS31.REXX.ddname

To enable you to customize the HFS-related jobs, the following parameters are provided in the DFHISTAR job:

- **HFS0DSN**
  - The data set name of the HFS to be mounted at directory \texttt{/pathprefix/usr/lpp/}
  - \texttt{cicsts}. Pathprefix is variable, and optional, The other parts of this directory name structure are fixed. The default data set name is OMVS.USR.LPP.CICSTS.
  
  This parameter is used by job DFHIHFS0.

- **HFS1DSN**
  - The data set name of the HFS to be mounted at directory \texttt{/pathprefix/usr/lpp/}
  - \texttt{cicsts/ussdir}, where \texttt{ussdir} is a variable you specify in the \texttt{ussdir} parameter in DFHISTAR. If you omit the \texttt{ussdir} parameter it defaults to the value of the TINDEX parameter in lowercase, which in turn defaults to CICSTS31, so if both defaults are taken, the full directory path resolves to \texttt{/pathprefix/usr/lpp/cicsts/cicsts31}.
  
  The default data set name is OMVS.USR.LPP.CICSTS.CICSTS31.
  
  This parameter is used by job DFHIHFS1.

- **HFSADSN**
  - The data set name of the HFS to be mounted at directory \texttt{/pathprefix/usr/lpp/}
  - \texttt{cicsts/ussdir}, where \texttt{ussdir} is a variable you also specify in DFHISTAR. If you omit the \texttt{ussdir} parameter it defaults to the value (in lower case) of AINDEX, which in turn defaults to CICSTS31.A. The default data set name is OMVS.USR.LPP.CICSTS.CICSTS31.A.
  
  This parameter is used by job DFHIHFSA.

**Running the install jobs**

Run the install jobs as follows:

1. Run the HFS-related jobs to create the HFS directories down to the /cicsts31 level:

   **DFHIHFS0 (required once only)**
   
   This job creates the HFS specified on the HFS0DSN parameter and also the /cicsts directory at /pathprefix/usr/lpp.
   
   This job is required once only, the first time you install CICS TS, and can be skipped in subsequent releases.
Note: When you install a new release of z/OS, directories down to the
/pathprefix/usr/lpp level are replaced, effectively losing the /cicsts
and lower directories. Issue the make directory command (mkdir
/pathprefix/usr/lpp/cicsts) to recreate mount point
/pathprefix/usr/lpp/cicsts for the HFS defined in DFHIHFS0
(OMVS.USR.LPP.CICSTS). The mount command should already be
in the PARMLIB member BPXPRMxx, copied from the DFHBPX0
member of SDFHINST.

DFHIHFS1 (required)
This job creates, at /pathprefix/usr/lpp/cicsts, the HFS specified on the
HFS1DSN parameter and also the directory specified on the parameter
(default name /cicsts31).

DFHIHFSA (optional)
This job creates, at /usr/lpp/cicsts, the alternate HFS specified on the
HFSADSN parameter and also the directory specified on the ussdira
parameter (default name /cicsts31.a).

2. Run DFHISMKD to create the directories and HFS under /pathprefix/usr/lpp/
cicsts/cicsts31, required for FMID JCI640D, to contain the Java and IIOP
classes, samples, and so on, that have to reside in HFS.

3. Run the DFHINST1 through DFHINST4 jobs as described in the Program
Directory

4. Run the CBPDO-supplied SMP/E RECEIVE job, RCVPDO, located in the
CBPDO RIMLIB dataset (this replaces the DFHINST5 job described in the
Program Directory).

5. Run the DFHINST6 job.

Note: This job must run in the same MVS image in which you ran the
DFHISMKD job to create the HFS directories. DFHINST6 uses the
CICS TS HFS directories and data sets, and these are accessible only
in the MVS in which you created them.

There is more detailed information about all these jobs in the CICS TS
Transaction Server for z/OS Program Directory and also in the comments at the
start of each job.

On completion of the installation jobs, you have all the elements installed. Note that
there is no provision within the DFHISTAR job generator, or in the generated jobs,
to exclude an element from the install process. When you run the jobs, SMP/E
installs all the elements included on the CICS TS CBPDO tape.

By default, SMP/E installs CICS TS in new SMP/E global, target, and distribution
zones. The DFHINST3 job creates a new CSI data set for each zone. If you want to
vary this default SMP/E configuration, see the CICS Transaction Server for z/OS
Program Directory for information about the parameters that control the SMP/E
zones and the disposition of the CSI data sets.

Installing ServerPac

A CICS TS ServerPac consists of a number of tapes, the exact number depending
on whether other products are included with the CICS TS Serverpac, and also on
the type of tape requested. For example, a ServerPac order can comprise the
following:
• A tape that contains related-installation material (RIM) files.
Three tapes that contain the CICS TS product, consisting of all the SMP/E CSI data sets, and the target and distribution libraries.

- A service tape.

If you already have printed copies of the ServerPac manuals that you need to install the ServerPac, use these to guide you through the installation process. If you don’t have copies, download and print the manuals from the first ServerPac tape. There is a sample job, in member PRTDOC, on the RIM tape, that you can use to print the manuals.

### What you need to install the ServerPac

You need the following resources to install the CICS TS ServerPac:

- A tape drive for reading the tapes.
- A TSO session for running the CustomPac dialog.
- The ServerPac: Installing Your Order, customized for each customer order.
- The CustomPac dialog supplied with ServerPac.

#### First-time user of the CustomPac dialog for ServerPac

If you are installing a ServerPac for the first time, start by installing the CustomPac dialog, as described in the ServerPac: Using the Installation Dialog manual in “Chapter 2. Installing and Starting the Dialogs”.

When you have installed the dialog, invoke the dialog as directed in the ServerPac: Using the Installation Dialog manual under the INVOCATION topic.

#### Existing user of the CustomPac dialog for ServerPac

If you have installed a ServerPac version of CICS TS for a previous order, use the dialog already installed. Invoke the CustomPac dialog, either from the ISPF primary options menu, or by invoking the ServerPac CLIST.

As an existing user of the CustomPac dialog, you can begin at the step described in the ServerPac: Using the Installation Dialog manual, in “Chapter 2. Receive a New Order”.

### Summary of the ServerPac installation steps

When you invoke the CustomPac dialog, you are presented with the primary option menu, from which you can:

- Receive the order (option R)
- Install the order (option I).

**Note:** The primary menu also enables you to display information about orders.

The following tasks are described, with illustrations of the various panels, in the ServerPac: Using the Installation Dialog manual:

#### Receive the order

This step is described in section “6.0 Receive an Order”.

The “Order Receive” panels enable you to enter your CICS TS order information, and complete the job card information needed to generate the order-receive job. The final phase of this step presents you with the generated JCL in an edit session, from which you can submit the job to receive the installation material (RIM) files to your DASD.
Install orders
This step is described in section “7.0 Installation Menu”.

The “Installation Menu” panels enable you to:
• Configure the order control information tables.
• Define values for the installation variables used in skeleton batch jobs.
• Define the names of the SMP/E zones into which you want to install CICS TS.
• Modify data set profiles and DASD allocation for the order.
• Define catalog data set names and the aliases associated with them.
• Define system-specific aliases (where applicable)
• Select and submit the installation jobs
• Save the installation work configuration for use with future CICS TS orders
• Update the order inventory status.

The next step

After you have completed the basic installation process using one of these methods, the next step is to test the two main elements, CICS and CICSPlex SM. In general, this means running the CICS installation verification procedures (IVPs) and the CICSPlex SM starter set.

These post-installation steps are discussed in Chapter 4, “Post-installation requirements,” on page 55.
Chapter 3. Installing CICS TS using DFHISTAR

IBM offers the DFHISTAR process for those who prefer to use it for installation. This topic covers the following subjects:

- "Edit the DFHISTAR Job"
- "Create HACF Profiles for the CICS Transaction Server Data Sets" on page 39
- "Run the DFHISTAR Job" on page 39
- "Check that You Are Ready to Run the Installation Jobs" on page 41
- "Run the installation Jobs" on page 42
- "Check the Output from the Installation Jobs" on page 47
- "What next?" on page 48
- "Activating CICS Transaction Server" on page 53
- "Checklist for the CICS Transaction Server for z/OS Installation" on page 53

Edit the DFHISTAR Job

Edit the DFHISTAR job, to assign values to installation parameters for your environment. The DFHISTAR job is in the TDFHINST library when you copy RELFILE(2) from the distribution tape. You can either edit the DFHISTAR job directly, or copy the DFHISTAR job (to preserve the IBM-supplied values) and edit your copy.

Remember that the product is installed using cataloged data sets.

This topic describes the process of editing the parameters in the DFHISTAR job. It contains the following sub-topics in an order that corresponds to the order of parameters in the DFHISTAR job:

- "Specify the CICS Transaction Server Temporary Installation Libraries" on page 20
- "Specify the JOB Parameters for Installation Jobs" on page 20
- "Specify the Scope of the Installation" on page 21
- "Specify the Type of JES to be Used" on page 21
- "Specify the Utilities to be used" on page 21
- "Specify the Prefix of CICS Transaction Server Jobs" on page 22
- "Specify the Indexes of CICS Transaction Server Data Sets" on page 22
- "Specify the CICS TS HFS Directories and Data Sets" on page 23
- "Specify extra qualifiers" on page 24
- "Specify Block Sizes" on page 24
- "Specify the Disk Unit for Work Data Sets" on page 24
- "Specify SMS Option for DASD Allocations" on page 24
- "Specify DiskVolumes" on page 25
- "Allocate the Space for CICS Transaction Server Disk Volumes" on page 28
- "Specify Attributes of the Temporary SMP/E Work Data Sets" on page 28
- "Specify Attributes of the Permanent SMP/E Data Sets" on page 29
- "Specify SMP/E Zone Attributes" on page 30
- "Specify the High-level Qualifiers for SMP/E Data Sets" on page 33
- "Specify the distribution tape device type" on page 33
- "Specify Attributes of the CICS Transaction Server system Data Sets" on page 33
- "Specify Attributes of any additional target Libraries" on page 34
To help you look up details about a particular parameter, Table 4 lists the DFHISTAR parameters, in alphabetical order, with their predefined values. (The parameters in the DFHISTAR job itself are listed in associated groups.)

The default values of the parameters are the same as the IBM-supplied values.

You can use the IBM-supplied values, define your own values, or let the CICS Transaction Server installation process determine default values for you.

**Note:** You can enter your values for parameters of the DFHISTAR job in lowercase; except for the HFS-related parameters (USSDIR, USSDIRA, and JAVADIR), the values are translated into uppercase when you run the DFHISTAR job.

Specify the CICS Transaction Server Temporary Installation Libraries

Specify the data set names you want to use for the two temporary libraries that will be used to install CICS Transaction Server. If you do not want to use the default names, record your values for the TEMPLIB and LIB parameters.

**TEMPLIB library_name**

This specifies the name of the temporary installation library that contains the skeleton installation jobs. Specify the name of the data set into which you copied RELFILE(2) from the distribution tape (in the topic *Copy RELFILE(2) from the Distribution Tape* in the *Program Directory*).

Also specify this name on the SYSPROC DD statement of the DFHISTAR job.

**LIB library_name**

Specifies the name of the installation output library to which the jobs generated by the DFHISTAR job are added.

Specify the JOB Parameters for Installation Jobs

Decide what parameters you want to use on the JOB statements of the CICS Transaction Server installation jobs, and specify them on the JOB parameter:

**JOB accounting_information**

Specifies the JOB statement and accounting information that you want substituted into the jobs generated by the DFHISTAR job. For example:

```plaintext
JOB //XXXXXXXX JOB 1,userid,MSGCLASS=A,MSGLEVEL=(1,1),
JOB // CLASS=A,NOTIFY=userid
JOB /*JOBPARM SYSAFF=node1
JOB /*ROUTE PRINT node2.userid
```

**Notes:**

1. Do not change `XXXXXXXX` given in the sample JOB statement in the DFHISTAR job. This is the 8-character job name that is substituted by the DFHISTAR job. For example, for the installation job DFHPBTP, the DFHISTAR job changes `XXXXXXXX` to `DFHPBTP`.
2. Normal JCL rules for coding JOB statements apply to the JOB parameter.
3. If you want to add a TIME parameter to the CICS Transaction Server installation jobs, sample run times are given in "Run Times of the Installation Jobs" on page 42.
4. Delete (or comment out) extra lines of the JOB statement that you do not need.

5. Normal JCL rules apply when coding the JOB statement (for example, all lines except the last line must end in a comma).

Specify the Scope of the Installation

Specify the scope of the CICS Transaction Server installation on the SCOPE parameter:

```
SCOPE ALL|BASE|POST
```

Specifies whether you want to generate all the CICS Transaction Server installation and post-installation jobs, or only the post-installation jobs. When installing CICS Transaction Server from the distribution tape, you would normally specify SCOPE ALL (the default). You would normally code the other options, if necessary, during some post-installation tasks, as described in Chapter 4, “Post-installation requirements,” on page 55.

- **ALL**
  - Specifies that you want to generate all the CICS Transaction Server installation jobs and all the post-installation jobs.

- **BASE**
  - Specifies that you want to generate only the installation jobs (DFHINST1 through DFHINST6, DFHIHFS0, DFHIHFS1, and DFHISMKD) that you use to install CICS Transaction Server from the distribution tape.

- **POST**
  - Specifies that you want to generate only the post-installation jobs, that you can use to create the CICS Transaction Server data sets, and run the IVPs.

Specify the Type of JES to be Used

Specify the type of job entry subsystem (JES) that you intend to use to install CICS Transaction Server on the JES parameter: This enables the DFHISTAR job to generate jobs with statements suitable for JES2 or JES3.

```
JES JES2|2|JES3|3
```

Specifies the release of JES that you are using. If you are using JES2, specify JES2 or 2. If you are using JES3, specify JES3 or 3.

Specify the Utilities to be used

Specify the utilities to be used to install CICS Transaction Server on the UTILITIES parameter:

```
UTILITIES asmprog binder smpeprog copyutil
```

Specifies the names of utility programs to be used when installing CICS Transaction Server elements and programs that it uses.

- **asmprog**
  - is the program name of the assembler. Specify ASMA90, for High Level Assembler/MVS & VM & VSE, which is required.

- **binder**
  - is the program name of the OS/390 binder. Ensure that program IEWL references the OS/390 program management binder.

- **smpeprog**
  - is the program name of the SMP/E program. The IBM-supplied name is GIMSMP.
copyutil
is the program name of the data set copy utility program. The IBM-supplied name is IECOPY.

Note: The High Level Assembler must be either in the LINKLST concatenation or you must add a STEPLIB DD statement that points to the library containing the High Level Assembler in any jobs that invoke SMP/E.

Specify the Prefix of CICS Transaction Server Jobs
Specify the prefix, as one through six characters, to be added to the jobs generated by the DFHISTAR job. This prefix overwrites the first characters of the job name. For example, PREFIX USERID changes the job name DFHINST1 to USERIDT1.

PREFIX prefix
One through six characters.

Specify the Indexes of CICS Transaction Server Data Sets
Specify the high-level indexes for the CICS Transaction Server distribution, target, and SMP/E libraries allocated by the installation process.

DINDEX library_prefix
Assigns a high-level index to the CICS Transaction Server SMP/E distribution libraries (except for the SDFHLINK and SDFHLPA target libraries) allocated by the installation process.

The library_prefix value must not be longer than 26 characters, and the leading character must be alphabetic. If you specify more than one level of index, the names must be separated by a period (for example, DINDEX CICSTS31.TEST).

GINDEX library_prefix
Assigns a high-level index to the CICS Transaction Server SMP/E global libraries (except for the SDFHLINK and SDFHLPA target libraries) allocated by the installation process.

The library_prefix value must not be longer than 26 characters, and the leading character must be alphabetic. If you specify more than one level of index, the names must be separated by a period (for example, GINDEX CICSTS31.TEST).

LINDEX library_prefix
Assigns a high-level index to the SDFHLPA, SDFHLINK, SDFJLPA, SEYULINK and SEYULPA libraries allocated by the installation process. The library_prefix value must be defined in the MVS Master Catalog.

The library_prefix value must not be longer than 26 characters, and the leading character must be alphabetic. If you specify more than one level of index, the names must be separated by a period (for example, LINDEX SYS1.CICSTS31.CICS.TEST).

TINDEX library_prefix
Assigns a high-level index to the CICS Transaction Server SMP/E target libraries (except for the SDFHLINK, SDFHLPA, SDFJLPA, SEYULINK, and SEYULPA target libraries) allocated by the installation process.

Notes:
1. The high-level index for the SDFHLINK and SDFHLPA libraries is defined by the LINDEX parameter.
2. The high-level index for the data sets created by the jobs DFHCOMDS and DFHDEFDS is defined by the dsindex operand of the DSINFO parameter.
The library_prefix value must not be longer than 26 characters, and the leading character must be alphabetic. If you specify more than one level of index, the names must be separated by a period (for example, TINDEX CICSTS31.TEST).

**Specify the CICS TS HFS Directories and Data Sets**

The DFHISTAR job has parameters that enable you to customize the UNIX system services HFS directories.

**Note:** When discussing HFS Directory names, this topic and the Program Directory use different methods to show fixed and variable names, as follows:

<table>
<thead>
<tr>
<th>This topic uses:</th>
<th>the Program Directory uses:</th>
<th>to show:</th>
</tr>
</thead>
<tbody>
<tr>
<td>/variable</td>
<td>/@variable@</td>
<td>a variable value</td>
</tr>
<tr>
<td>/constant</td>
<td>/constant</td>
<td>a fixed value</td>
</tr>
</tbody>
</table>

**pathprefix**

The name of an optional prefix to the CICS TS directory /usr/lpp/cicsts. For example:

/example/usr/lpp/cicsts

**ussdir**

The name of the CICS TS directory under /pathprefix/usr/lpp/cicsts.

The full name is therefore /pathprefix/usr/lpp/cicsts/ussdir. Ussdir is a name that you can choose. The default for ussdirdir is the value of the TINDEX parameter in lowercase.

The default path is:

/pathprefix/usr/lpp/cicsts/cicsts31

**Note:** The name of the UNIX System Services directory after the root directory (/usr/lpp) is always /cicsts.

**HFS0DSN**

The dataset name of the HFS to be mounted at directory /pathprefix/usr/lpp/cicsts/cicsts31.

Note that these directory names are fixed. The default is data set name OMVS.USR.LPP.CICSTS.

See ["The DFHIHFS0 Job" on page 43](#) for details of the job that uses this parameter.

**HFS1DSN**

The dataset name of the HFS to be mounted at directory /pathprefix/usr/lpp/cicsts/ussdir, where ussdirdir is the name of the directory specified on the ussdirdir parameter in the DFHISTAR job. The default is data set name OMVS.USR.LPP.CICSTS.CICSTS31.

See ["The DFHIHFS1 Job" on page 43](#) for details of the job that uses this parameter.

**HFSADSN**

The dataset name of the HFS equivalent of the SMP/E “additional target zone”, to be mounted at directory /pathprefix/usr/lpp/cicsts/ussdirdir, where ussdirdir is the name of the directory specified on the ussdirdir parameter in the DFHISTAR job. The default data set name is OMVS.USR.LPP.CICSTS.CICSTS31.A.
See the list step about running DFHIFSA on page [DFHIFSA](#) for details of the job that uses this parameter.

**Specify extra qualifiers**

Specify extra qualifiers that can optionally be inserted into the data set name of the 'target', 'distribution' and 'additional' zone data sets respectively, and inserted before the last data set qualifier. For example, XTRAQUAL JDOE... changes the name of the target zone libraries to the values set by TINDEX.CICSTS31.CICS.JDOE.SDFHLOAD.

**XTRAQUAL**...

Three qualifiers to be used by 'target', 'distribution' and 'additional' zone data sets. If a qualifier is not required, specify a period (.)

**Specify Block Sizes**

Specify the block sizes to be used when allocating data sets during installation on the BLKFB80 and BLKU parameters:

**BLKFB80** {0|blocksize}

The block size to be used when allocating data sets that have a fixed block record format and record length of 80 bytes.

The IBM-supplied value in DFHISTAR is 0. You are recommended to leave this value specified as 0 to allow OS/390 to determine the optimum block size for you.

**BLKU** {32760|blocksize}

The block size to be used when allocating data sets that have an undefined record length.

**BLKISPF** {3200|blocksize}

The block size to be used when allocating data sets in CICSPlex System Manager that are intended to be used by ISPF.

**Specify the Disk Unit for Work Data Sets**

Specify the UNIT parameter for the disk or disks on which work data sets are stored on the WORKUNIT parameter:

**WORKUNIT** disktype

a unit identifier.

**Specify SMS Option for DASD Allocations**

Specifies the extent to which you want to leave the allocation of CICS TS installation data sets to SMS. You can either let SMS handle all DASD allocation, or you can opt to use volume parameters to control the allocations that do not have to be SMS-managed.

**Note:** Some CICS TS data sets are installed in PDSE data sets. These are:

- The SMP/E SMPLTS data set.
- The distribution library, ADFJMOD.
- The target libraries SDFJLOAD, SDFJLPA, and SDFJAUTH.

See the topic *DASD Storage Requirements* in the *Program Directory* for information about these data sets.
SMS Y N
If you specify SMS Y, the VOLUME parameter is omitted from the generated installation jobs, and all data set allocations are handled by SMS.

If you specify SMS N, the VOLUME parameter is included on the generated installation jobs, and will be honored according to your SMS configuration. The VOLUME parameters used are those specified on the ADDTVOL, DEFVOL, DISTVOL, CMACVOL, OPTVOL, SMPVOL, and TARGVOL parameters.

Specify Disk Volumes
If you intend installing CICS Transaction Server into disk space managed by the storage management subsystem (SMS) component of MVS/DFP, you do not need to specify your own disk volumes; device assignment can be determined by SMS. In this case, proceed to “Specify SMP/E Zone Attributes” on page 30.

To allow you to make the best use of your disk space, you can specify your own disk volumes and device types to be used to install CICS Transaction Server. You can specify your own disk details on the following parameters:

DEFVOL volume disktype
Defines the default disk on which the contents of the disk volumes CMACVOL, DISTVOL, OPTVOL, SMPVOL, and TARGVOL will reside if the appropriate parameter is not coded in the DFHISTAR job. For example, if you do not code the DISTVOL parameter, the CICS distribution libraries will reside on the disk defined by DEFVOL.

volume
is one of the following:
• The volume serial identifier, in the range 1 through 6 characters, of the default volume.
• A period (.) if all volumes other than CMACVOL and SMPVOL that are not specifically defined by the appropriate parameter of the DFHISTAR job will be put onto any available volume. The CMACVOL and SMPVOL volumes will be put onto the same volume as the library specified by the TEMPLIB parameter.

disktype
is the UNIT parameter of the volume.

If you omit the DEFVOL parameter altogether, all volumes that are not specifically defined by the appropriate parameter of the DFHISTAR job will be put onto the same volume as the library specified by the TEMPLIB parameter.

DISTVOL volume disktype
Defines the disk on which the CICS Transaction Server distribution libraries will reside.

volume
is one of the following:
• The volume serial identifier, in the range 1 through 6 characters, of the volume on which the distribution libraries will reside.
• A period (.) if the CICS Transaction Server libraries are to be put onto any available volume.

1. For further information about installing system-managed storage, and about planning for and migrating storage to an SMS-managed environment, see the MVS Storage Management Library: Storage Management Subsystem Migration Planning Guide, SC26-4406.
**disktype**

is the UNIT parameter of the volume.

**Note:** If you omit the DISTVOL parameter, the distribution libraries will be put on the volume specified by the DEFVOL parameter. If the DEFVOL parameter is omitted, or if a period (.) is specified for its volume operand, the distribution libraries will be put onto any available volume.

**TARGVOL volume disktype**

Specifies details of the disk containing the CICS Transaction Server target libraries.

**volume**

is one of the following:

- The volume serial identifier, in the range 1 through 6 characters, of the volume on which the CICS Transaction Server target libraries are to reside.
- A period (.) if the CICS Transaction Server target libraries are to be put onto any available volume.

**disktype**

is the UNIT parameter for the volume.

**Note:** If you omit the TARGVOL parameter, the CICS Transaction Server target libraries will be put onto the volume specified by the DEFVOL parameter. If the DEFVOL parameter is omitted, or if a period (.) is specified for its volume operand, the CICS Transaction Server target libraries will be put onto any available volume.

**SMPVOL volume disktype**

 Specifies the disk that contains the permanent, non-VSAM SMP/E data sets for CICS Transaction Server that are associated with global or distribution zones, and are therefore unique.

**volume**

is one of the following:

- The volume serial identifier, in the range 1 through 6 characters, of the volume on which the permanent non-VSAM SMP/E data sets are to reside.
- A period (.) if the permanent non-VSAM SMP/E data sets are to be put onto the same volume as the library specified by the TEMPLIB parameter.

**disktype**

is the UNIT parameter for the volume.

**Note:** If you omit the SMPVOL parameter, the permanent non-VSAM SMP/E data sets for CICS Transaction Server will be put on the volume specified by the DEFVOL parameter. If the DEFVOL parameter is omitted, or if a period (.) is specified for its volume operand, the data sets will be put onto the same volume as the library specified by the TEMPLIB parameter.

**OPTVOL volume disktype**

Specifies details of the disk onto which the optional source material is copied.

**volume**

is one of the following:
- The volume serial identifier, in the range 1 through 6 characters, of the volume on which the optional source material is to reside.
- A period (.) if the optional source material is to be put on any available volume.

**disktype**

is the UNIT parameter of the volume. This is needed only if *volume* is specified.

**Note:** If you omit the OPTVOL parameter, the optional source material will be put on the volume specified by the DEFVOL parameter. If the DEFVOL parameter is omitted, or if a period (.) is specified for its *volume* operand, the optional source material will be put onto any available volume.

**CMACVOL volume**

Defines the disk on which the VSAM KSDS, DFHCMACD, will reside. This data set is used for the CICS Transaction Server messages facility (CICS-supplied transaction CMAC).

**volume**

is one of the following:

- The volume serial identifier, in the range 1 through 6 characters, of the volume on which the VSAM KSDS, DFHCMACD, will reside
- A period (.) if the DFHCMACD data set is to be put onto the same volume as the library specified by the TEMPLIB parameter.

**Note:** If you omit the CMACVOL parameter, the DFHCMACD data set will be put onto the volume specified by the DEFVOL parameter. If the DEFVOL parameter is omitted, or if a period (.) is specified for its *volume* operand, the DFHCMACD data set will be put onto the same volume as the library specified by the TEMPLIB parameter.

**When Are These Volumes Used?**

<table>

</table>

¹ The entries for xZONECSI parameters are also for the associated xZONE parameters.

**During installation:** The RELFILE data sets on SMPVOL are needed during installation only.
Applying Service or Customizing CICS Transaction Server: SMPVOL, DISTVOL, TARGVOL, DZONE, TZONE, and GZONE are needed whenever you apply service or customize your CICS Transaction Server programs.

SMPVOL and GZONE are needed whenever you apply service or customize your alternative libraries for use with the extended recovery facility.

Assembling CICS Transaction Server Tables: SMPVOL, TARGVOL, TZONE, and GZONE are needed whenever you assemble your CICS Transaction Server tables.

SMPVOL and GZONE are needed whenever you assemble CICS Transaction Server tables for the second (alternate) CICS Transaction Server region.

Running CICS Transaction Server: Only TARGVOL is needed to run CICS Transaction Server.

Allocate the Space for CICS Transaction Server Disk Volumes

Whether or not you use SMS-managed data sets, you still need enough disk space in which to create the CICS Transaction Server disk volumes.

The space required by the installation jobs on these volumes depends on the type of disk you intend to use. The number of cylinders required on the different types of DASD are given in Table 6. The size of the CICS Transaction Server distribution and target libraries are given in the topic DASD Storage Requirements in the Program Directory.

Table 6. DASD storage requirements for CICS Transaction Server

</tbody>
</table>

Allow up to 15% on the values in Table 6 for servicing requirements. Secondary allocations are 10% of the primary allocations.

If you intend to store other IBM software or your own application programs in these libraries, then you must modify the generated jobs accordingly.

Specify Attributes of the Temporary SMP/E Work Data Sets

You must define the attributes of the temporary SMP/E work data sets (SMPWRK1, SMPWRK2, SMPWRK4, and SMPWRK6): for the following CICS Transaction
Server jobs: DFHINSTJ, DFHLPJPN, DFHLPUMD, and DFHSMEP. You define the attributes of those SMP/E data sets on the SMPWORK parameter:

The CICS Transaction Server jobs used to install CICS Transaction Server for z/OS have DD statements for the SMP/E data sets that they need to know about.

**SMPWORK disktype**

This is the UNIT parameter for the disk that is to contain the temporary SMP/E work data sets (SMPWRK1, SMPWRK2, SMPWRK4, and SMPWRK6) needed to install CICS Transaction Server.

If you specify a value for **disktype**, or omit the SMPWORK parameter altogether, //SMPWRKn DD statements are added to the following jobs generated by the DFHISTAR job:

```
DFHINSTJ
DFHLPUMD
DFHSMEP
```

If you specify NO, a period (.), or a null string, CICS Transaction Server assumes that SMP/E knows about the temporary SMP/E work data sets. To define the attributes of the SMP/E work data sets, you must do one of the following:

- Provide appropriate DDDEFS for the temporary SMP/E work data sets.
- Have applied the SMP/E sample usermod (SMP0001) that contains superzap statements for updating the default attributes of the SMP/E data sets in the GIMMPDFT module.

The GIMMPDFT module, which is part of SMP/E, defines the default attributes of SMP/E data sets, and can be used to dynamically allocate data sets to be used by all zones. The usermod is in member GIMZPDT in the SYS1.SAMPLIB library. You can use this usermod as a model, change it to meet your needs, or install it as supplied. For further information about the entries in the GIMMPDFT module and the sample entry values in the usermod SMP0001, see the System Modification Program Extended: Reference manual, SA22–7772.

**Notes:**

1. The SMPWRK6 data set must not be allocated to Virtual I/O (VIO). If you specify a value for **disktype**, ensure that this cannot happen.

### Specify Attributes of the Permanent SMP/E Data Sets

Specify the attributes of the permanent SMP/E data sets on the following parameters:

**SMPPTS dname**

Specifies the name of the SMP/E primary data set used to store temporarily PTF function SYSMODs or other fixes that are in RECEIVE or APPLY status; that is, PTF fixes that have not been rejected or accepted.

**SMPMTS dname**

Specifies the name of the SMP/E macro temporary store (MTS) data set used to store updated versions of macros. Although required by SMP/E, this MTS data set is not used by CICS.

**SMPSTS dname**

Specifies the name of the SMP/E source temporary store (STS) data set used to store updated versions of source elements. Although required by SMP/E, this STS data set is not used by CICS.
**SMPSCDS** dsname
Specifies the name of the SMP/E saved control data set (SCDS) used to store old target zone entries that have been modified by inline JCLIN processing in a SYSMOD.

**SMPLTS** dsname
Specifies the name of the linkedit temporary (LTS) data set used with the CALLLIBS function. This dataset must always be an SMS-managed PDSE, whether or not Java is installed unless you have installed the PTFs for HFS and PDSE support on non-managed SMS volumes listed in Flash10007 which can be found by links from:

http://www.ibm.com/support/techdocs

The CICS Transaction Server jobs that need to know the attributes of the SMP/E data sets have DD statements for them.

### Specify SMP/E Zone Attributes
Specify the attributes of the SMP/E distribution zone, global zone, target zone, and any additional target zones.

**Note:** The CICS-DB2 attachment facility contains modules named with the DSN prefix. Therefore, to prevent existing DB2 modules with the same DSNxxxxx names from being overwritten, you should not install CICS Transaction Server into the same target and distribution zones as DB2.

To specify SMP/E zone attributes, use the following parameters:

**GZONELOG** dsname NEW|OLD
Specifies details of the SMP/E log for the global zone CSI.

dname is the name of the global zone log.

NEW|OLD
Specifies whether an existing global zone log is to be used. If you specify NEW, any existing global zone log with the specified dsname is deleted, and a new global zone log is allocated. If you specify OLD, an existing global zone log is used.

**TZONELOG** dsname NEW|OLD
Specifies details of the SMP/E log for the target zone CSI.

dname is the name of the target zone log.

NEW|OLD
Specifies whether an existing target zone log is to be used. If you specify NEW, any existing target zone log with the specified dsname is deleted, and a new target zone log is allocated. If you specify OLD, an existing target zone log is used.

**DZONELOG** dsname NEW|OLD
Specifies details of the SMP/E log for the distribution zone CSI.

dname is the name of the distribution zone log.

NEW|OLD
Specifies whether an existing distribution zone log is to be used. If you
specify NEW, any existing distribution zone log with the specified dsname is deleted, and a new distribution zone log is allocated. If you specify OLD, an existing distribution zone log is used.

**GZONECSI cluster NEW|OLD volume disktype**

Specifies details of the global zone CSI.

- **cluster**
  - is the VSAM cluster name, minus the qualifier `.CSI`.

- **NEW|OLD**
  - Specifies whether an existing global zone CSI is to be used. If you specify NEW, any existing global zone CSI with the specified cluster name is deleted, and a new global zone CSI is allocated. If you specify OLD, an existing global zone CSI is used.

- **volume**
  - is either the volume serial (volser) identifier for the volume on which the global zone CSI is to be allocated or a period (.) if the CSI is to be put on a volume determined by the CICS Transaction Server installation process.

- **disktype**
  - is the UNIT parameter for the volume.

**TZONECSI cluster NEW|OLD volume disktype**

Specifies details of the target zone CSI.

- **cluster**
  - is the VSAM cluster name, minus the qualifier `.CSI`.

- **NEW|OLD**
  - Specifies whether an existing target zone CSI is to be used. If you specify NEW, any existing target zone CSI with the specified cluster name is deleted, and a new target zone CSI is allocated. If you specify OLD, an existing target zone CSI is used.

- **volume**
  - is either the volume serial (volser) identifier for the volume on which the target zone CSI is to be allocated or a period (.) if the CSI is to be put on a volume determined by the CICS Transaction Server installation process.

- **disktype**
  - is the UNIT parameter for the volume.

**DZONECSI cluster NEW|OLD volume disktype**

Specifies details of the distribution zone CSI.

- **cluster**
  - is the VSAM cluster name, minus the qualifier `.CSI`.

- **NEW|OLD**
  - specifies whether an existing distribution zone CSI is to be used. If you specify NEW, any existing distribution zone CSI with the specified cluster name is deleted, and a new distribution zone CSI is allocated. If you specify OLD, an existing distribution zone CSI is used.

- **volume**
  - is either the volume serial (volser) identifier for the volume on which the distribution zone CSI is to be allocated or a period (.) if the CSI is to be put on a volume determined by the CICS Transaction Server installation process.
**disktype**

is the UNIT parameter for the volume.

**GZONE NEW|OLD options**

Specifies whether the global zone to be used already exists.

**NEW|OLD**

Specifies whether an existing global zone is to be used. The DFHISTAR job as supplied specifies NEW. Optionally change this to OLD if you want to use an existing global zone. If you specify OLD, CICS Transaction Server is installed into an existing SMP/E global zone.

**Note:** Specify NEW if you want to preserve your existing releases of CICS Transaction Server in their current SMP/E zones and install the new release in its own zones.

If you specify OLD, the existing SMP/E zones are used and any existing release of the product is deleted.

If you specify OLD, but specify NEW for the GZONECSI parameter, both parameters are assigned the NEW disposition.

**options**

Specifies the name of the SMP/E options (on the SET BOUNDARY command) to be used.

**TZONE zonename**

Specifies the name of the target zone.

**zonename**

is the name of the target zone to be used by SMP/E. This name must be unique to the target zone. It must not be longer than 7 characters, and the leading character must be alphabetic.

**DZONE zonename**

Specifies the name of the distribution zone.

**zonename**

is the name of the distribution zone to be used by SMP/E. This name must be unique within the global zone. It must not be longer than 7 characters, and the leading character must be alphabetic.

**SMP/E Zone and Zone Log Dispositions**

As supplied, the DFHISTAR job assumes that you are going to install CICS Transaction Server into new target and distribution zones. However you can specify a new or old global zone, and new or old zone logs by the disposition option NEW|OLD on the associated parameters of the DFHISTAR job. The disposition option NEW means that the DFHINST3 job deletes any existing zone or zone log with name specified before redefining it. For example, if you specify the parameter GZONELOG CICSTS31.GZONE.SMPLOG NEW

the DFHINST3 job deletes any existing SMP/E global zone log with the name CICSTS31.GZONE.SMPLOG before defining a new SMP/E global zone log with that name.

Further, if you specify different dispositions for a zone parameter and its associated zone log parameter, they are both given the default disposition NEW. This is to ensure that both a zone and its zone log have the same disposition.
If you intend installing CICS Transaction Server using one new CSI for all zones, you must specify the disposition NEW on all three CSI parameters of the DFHISTAR job. For example:

```
DZONE           DZONE
DZONECSI        CICSTS31.SMPZONE NEW CICS31 SYSALLDA
DZONELOG       CICSTS31.DZONE.SMPLOG NEW
GZONE           NEW CICSOPT
GZONECSI        CICSTS31.SMPZONE NEW CICS31 SYSALLDA
GZONELOG       CICSTS31.GZONE.SMPLOG NEW
TZONE           TZONE
TZONECSI        CICSTS31.SMPZONE NEW CICS31 SYSALLDA
TZONELOG       CICSTS31.TZONE.SMPLOG NEW
```

Specify the High-level Qualifiers for SMP/E Data Sets

For each different high-level qualifier that you have specified for SMP/E zone CSIs, logs, and other SMP/E data sets, you must create an ALIAS definition in the master catalog before the data sets can be used.

Specify the distribution tape device type

Specify the type of device that is to be used to load the CICS Transaction Server distribution tape on the TAPEUNIT parameter:

```
TAPEUNIT devicetype
```

Specifies the device type to be used to read the distribution tape. Use 3480 for the 3480 tape cartridge, 3400-6 for the 6250 tape, or the unit names in use in your installation.

Specify Attributes of the CICS Transaction Server system Data Sets

Specify attributes of the CICS Transaction Server system data sets, to be created when you run the post-installation jobs DFHCOMDS and DFHDEFDS jobs, on the DSINFO parameter:

```
DSINFO dsindex volume disktype qualifier
```

Defines the following attributes of CICS system data sets:

- **dsindex**
  - Assigns a high-level index to all the data sets defined by the jobs, DFHCOMDS and DFHDEFDS.
  - The leading character of `dsindex` must be alphabetic. `dsindex` can have one or two levels of index, but each level must be no longer than eight characters. If you specify more than one level of index, the names must be separated by a period (for example, CICSTS31.CICSHTC1).

- **volume**
  - is the volume identifier of the volume.

- **disktype**
  - is the UNIT parameter for the volume.

- **qualifier**
  - is a partial qualifier added to the index for the data sets created by the jobs DFHCOMDS and DFHDEFDS. You can specify a partial qualifier of up to four alphanumeric characters; these characters are appended to the characters CICS to make the qualifier. If you specify a period (.) no qualifier is used.

---

2. For more information about the post-installation jobs DFHCOMDS and DFHDEFDS jobs, see Creating data sets common to all CICS regions, DFHCOMDS job on page 191.
Specify Attributes of any additional target Libraries

If you want to create extra copies of the CICS Transaction Server target libraries, specify the attributes of those libraries on the following parameters:

**AINDEX library_prefix**
Assigns a high-level index to the additional set of CICS target libraries copied by a version of the DFHINSTA job.

**Notes:**
1. The high-level index for the additional SDFHLINK and SDFHLPA libraries is defined by the ALINDEX parameter.
2. The high-level index for the data sets created by the jobs DFHCOMDS and DFHDEFDS is defined by the `dsindex` operand of the DSINFO parameter.

The AINDEX value must be unique (for example, it must be different from the INDEX value), it must not be longer than 26 characters, and the leading character must be alphabetic. If you specify more than one level of index, the names must be separated by a period (for example, AINDEX CICSTS31.A.TEST).

**ALINDEX library_prefix**
Assigns a high-level index to the additional SDFHLPA and SDFHLINK libraries allocated by running a version of the DFHINSTA job.

The library_prefix value must not be longer than 26 characters, and the leading character must be alphabetic. If you specify more than one level of index, the names must be separated by a period (for example, ALINDEX SYS1.CICSTS31.A.TEST).

**AZONELOG dsname**
Specifies details of the SMP/E log for the additional target zone CSI.

dsname is the name of the additional target zone log to be used by SMP/E.

**AZONECSI cluster**
Specifies details of the additional target zone CSI. The CSI data set is created on the volume and unit specified by the ADDTVOL parameter.

cluster is the VSAM cluster name, minus the qualifier .CSI.

**AZONE zonename**
Specifies the name of the additional target zone, to be used for the set of CICS Transaction Server target libraries copied by a version of the DFHINSTA job.

zonename is the name of the additional target zone to be used by SMP/E. This name must be unique to the target zone. It must not be longer than seven characters, and the leading character must be alphabetic.

**ASMPSCDS dsname**
Specifies the name of the additional zone SMP/E SCDS data set.

dsname is the name of the additional zone SMP/E SCDS data set.

**ASMPMTS dsname**
Specifies the name of the additional zone SMP/E MTS data set.

dsname is the name of the additional zone SMP/E MTS data set.
**ASMPSTS** **dsname**
Specifies the name of the additional zone SMP/E STS data set.

*dsname*

  is the name of the additional zone SMP/E STS data set.

**ASMLTS** **dsname**
Specifies the name of the additional zone SMP/E LTS data set.

*dsname*

  is the name of the additional zone SMP/E LTS data set.

**ADDTVOL** **volume** **disktype**
Specifies the volume and unit type to contain all the additional zone data sets.

*volume*

  is the volume serial identifier of the volume.

*disktype*

  is the UNIT parameter for the volume.

**USSDIRA** **dsname**
Specifies the name of the UNIX System Services directory for the Additional Target zone. See job DFHINSTA.

The default is the value of the AINDEX parameter in lowercase.

The UNIX System Services directory path will start /ussindex/cicsts/ussdira where ussindex is the translated value of the USSINDEX parameter, and ussdira is the value of the USSDIRA parameter.

The default path will be: /pathprefix/usr/lpp/cicsts/cicsts31.a

**Note:** The name of the UNIX System Services directory after the root directory (/usr/lpp/) is always **cicsts**.

---

**Specify the Data Set Name of the SISPLOAD Library**

Specify the full data set name, up to 44 characters, of the library that contains ISPLINK (SISPLOAD for ISPF Version 4 and above, or ISPLOAD for ISPF version 3 and below). For example, SISPLOAD SYS1.USERID.SISPLOAD changes the SISPLOAD library name to SYS1.USERID.SISPLOAD. This library is accessed, as read-only, during the installation of CICS Transaction Server.

**SISPLOAD** **dsname**

Up to 44 characters.

---

**Specify the Data Set Name of the CSSLIB Library**

Specify the full data set name, up to 44 characters, of the CSSLIB library. For example, CSSLIB SYS1.USERID.CSSLIB changes the CSSLIB library name to SYS1.USERID.CSSLIB. This library is accessed, as read-only, during the installation of CICS Transaction Server.

**CSSLIB** **dsname**

Up to 44 characters.

---

**Specify the Data Set Name of the SCEECPP Library**

Specify the full data set name, up to 44 characters, of the SCEECPP library. For example, SCEECPP SYS1.USERID.SCEECPP changes the SCEECPP library name to SYS1.USERID.SCEECPP. This library is accessed, as read-only, during the installation of CICS Transaction Server.
Specify the Data Set Name of the SCEELKED Library

Specify the full data set name, up to 44 characters, of the SCEELKED library. For example, SCEELKED SYS1.USERID.SCEELKED changes the SCEELKED library name to SYS1.USERID.SCEELKED. This library is accessed, as read-only, during the installation of CICS Transaction Server.

Specify the Data Set Name of the SCEELKEX Library

Specify the full data set name, up to 44 characters, of the SCEELKEX library. For example, SCEELKEX SYS1.USERID.SCEELKEX changes the SCEELKEX library name to SYS1.USERID.SCEELKEX. This library is accessed, as read-only, during the installation of CICS Transaction Server.

Specify the Data Set Name of the SCEEOBJ Library

Specify the full data set name, up to 44 characters, of the SCEEOBJ library. For example, SCEEOBJ SYS1.USERID.SCEEOBJ changes the SCEEOBJ library name to SYS1.USERID.SCEEOBJ. This library is accessed, as read-only, during the installation of CICS Transaction Server.

Specify the Data Set Name of the SCEESAMP Library

Specify the full data set name, up to 44 characters, of the SCEESAMP library. For example, SCEESAMP SYS1.USERID.SCEESAMP changes the SCEESAMP library name to SYS1.USERID.SCEESAMP. This library is accessed, as read-only, during the installation of CICS Transaction Server.

Specify the Data Set Name of the SCLBSID Library

Specify the full data set name, up to 44 characters, of the SCLBSID library. For example, SCLBSID SYS1.USERID.SCLBSID changes the SCLBSID library name to SYS1.USERID.SCLBSID. This library is accessed, as read-only, during the installation of CICS Transaction Server.

Specify the Data Set Name of the SCSQLOAD Library

Specify the full data set name, up to 44 characters, of the SCSQLOAD library. For example, SCSQLOAD SYS1.USERID.SCSQLOAD changes the SCSQLOAD library name to SYS1.USERID.SCSQLOAD. This library is accessed, as read-only, during the installation of CICS Transaction Server.
Specify the Data Set Name of the SCSQANLE Library

Specify the full data set name, up to 44 characters, of the SCSQANLE library. For example, SCSQANLE SYS1.USERID.SCSQANLE changes the SCSQANLE library name to SYS1.USERID.SCSQANLE. This library is accessed, as read-only, during the installation of CICS Transaction Server.

SCSQANLE dsname
Up to 44 characters.

Specify the Data Set Name of the SCSQCICS Library

Specify the full data set name, up to 44 characters, of the SCSQCICS library. For example, SCSQCICS SYS1.USERID.SCSQCICS changes the SCSQCICS library name to SYS1.USERID.SCSQCICS. This library is accessed, as read-only, during the installation of CICS Transaction Server.

SCSQCICS dsname
Up to 44 characters.

Specify the Data Set Name of the SCSAUTH Library

Specify the full data set name, up to 44 characters, of the SCSAUTH library. For example, SCSAUTH SYS1.USERID.SCSAUTH changes the SCSAUTH library name to SYS1.USERID.SCSAUTH. This library is accessed, as read-only, during the installation of CICS Transaction Server.

SCSAUTH dsname
Up to 44 characters.

Specify the Name of the Java directory

Specify the name of the Java directory for use by CICS JVM application programs.

JAVADIR directory name
This parameter is appended to /pathprefix/usr/lpp/, giving a full path name of /pathprefix/usr/lpp/javadir.

Specify the Data Set Name of the SDSNLOAD Library

Specify the full data set name, up to 44 characters, of the DB2 SDSNLOAD library. For example, SDSNLOAD SYS1.USERID.SDSNLOAD changes the SDSNLOAD library name to SYS1.USERID.SDSNLOAD. This library is accessed, as read-only, during the installation of CICS Transaction Server.

Note: The REXX for CICS element contains some modules that are link-edited against the DB2 load library, SDSNLOAD. If you do not have DB2 installed, the DFHINST6 job fails because SDSNLOAD cannot be allocated to the job. To avoid this, define a dummy SDSNLOAD data set, with LRECL=0 and RECFM=U, and specify the name of this empty data set on the SDSNLOAD parameter.

SDSNLOAD dsname
Up to 44 characters.

Specify the Data Set Name of the SEZARPCL and SEZACMTX libraries

Specify the full data set names, up to 44 characters, of the SEZARPCL and SEZACMTX libraries. For example, SEZARPCL SYS1.USERID.SEZARPCL changes the SEZARPCL library to SYS1.USERID.SEZARPCL and SEZACMTX
SYS1.USERID.SEZACMTX changes the SEZACMTX library name to SYS1.USERID.SEZACMTX. These libraries are accessed, as read-only, during the installation of CICS Transaction Server.

**Specify the Data Set Name of the SCEECICS & SCEERUN libraries**

Specify the full data set names, up to 44 characters, of the SCEECICS & SCEERUN libraries. For example, SCEECICS SYS1.USERID.SCEECICS changes the SCEECICS library to SYS1.USERID.SCEECICS and SCEERUN SYS1.USERID.SCEERUN changes the SCEERUN library name to SYS1.USERID.SCEERUN. These libraries are accessed, as read-only, during the installation of CICS Transaction Server.

**Specify the Data Set Name of the SCEERUN2 & SCEELIB libraries**

Specify the full data set names, up to 44 characters, of the SCEERUN2 & SCEELIB libraries. For example, SCEERUN2 SYS1.USERID.SCEERUN2 changes the SCEERUN2 library to SYS1.USERID.SCEERUN2 and SCEELIB SYS1.USERID.SCEELIB changes the SCEELIB library name to SYS1.USERID.SCEELIB. These libraries are accessed, as read-only, during the installation of CICS Transaction Server.

**Specify the Data Set Name of the SCEEBND2 library**

Specify the full data set name, up to 44 characters, of the SCEEBND2 library. For example, SCEEBND2 SYS1.USERID.SCEEBND2 changes the SCEEBND2 library to SYS1.USERID.SCEEBND2. This library is accessed, as read-only, during the installation of CICS Transaction Server.

**Specify Log stream and Log stream Structure Attributes.**

Specify attributes of the CICS Transaction Server log streams and the coupling facility structures that you will use when you run the post-installation jobs DFHILG1, DFHILG2, DFHILG3 and DFHILG4 jobs, on the LOGGER-INFO parameter:

```
LOGGER-INFO strsfx logsz shuntsz jnlsz gensz sysname loghlq logmodel
```

Defines the following attributes of CICS Transaction Server system data sets:

3. For more information about the post-installation jobs DFHILG1, DFHILG2, DFHILG3 and DFHILG4 jobs, see Chapter 24, “Defining the logger environment for CICS journaling,” on page 143.
strsf
The last part of the coupling facility structure names, can be any three characters allowed in a structure name. Default 001. Used in DFHILG1, DFHILG2, DFHILG3 and DFHILG4.

logsz
The Avgbufsize for system log streams in the LOG_DFHLOG_strsf structure. Default 500. Used in DFHILG1.

shuntsz
The Avgbufsize for shunted system log streams in the LOG_DFHSHEUNT_strsf structure. Default 4096. Used in DFHILG1.

jnlsz
The Avgbufsize for unforced user journal log streams in the LOG_USERJRNAL_strsf structure. Default 64000. Used in DFHILG1.

gensz
The Avgbufsize for forced user journal log streams and forward recovery log streams in the LOG_GENERAL_strsf structure. Default 2048. Used in DFHILG1.

sysname
The MVS system name used to create model log streams for DFHLOG and DFHSHUNT. Default MVSX. Used in DFHILG1.

loghlq
The first qualifier of the model name for general logs and DFHLGLOG. Used in DFHILG3 and DFHILG4.

logmodel
The second qualifier of the model name for general logs. Used in DFHILG3.

Create RACF Profiles for the CICS Transaction Server Data Sets

Liaise with your Security Administrator to create appropriate RACF profiles for the CICS Transaction Server data sets, as described in the CICS RACF Security Guide.

At this stage, you need authority to access only the data set qualifiers specified on the TEMPLIB, LIB, and INDEX parameters. (The DFHISTAR job uses a temporary sequential data set, with the high-level qualifier specified on the INDEX parameter, to resolve the parameters to be substituted into the jobs being tailored.) However, it is worth coordinating the access authority for all the CICS Transaction Server data sets at the same time.

Run the DFHISTAR Job

When you have edited the DFHISTAR job with the values of installation parameters for your CICS Transaction Server environment, save it.

When you are ready to tailor the skeleton jobs, submit the DFHISTAR job.

In addition to the UNIX system services HFS jobs, there are three other HFS-related members supplied in SDFHINST. These are DFHBXP0, DFHBXP1, and DFHBXPXA.

DFHBXP0
This member contains a MOUNT command for inclusion in a BPXPRMxx member of the SYS1.PARMLIB dataset. The MOUNT command applies to the...
HFS dataset specified in the HFS0DSN parameter of the DFHISTAR job to be mounted at directory /pathprefix/usr/lpp/cicsts.

Add this mount command to the BPXPRMxx PARMLIB member after you have run the DFHIHFS0 job.

DFHBPX1
This member contains a MOUNT command for inclusion in a BPXPRMxx member of the SYS1.PARMLIB dataset. The MOUNT command applies to the HFS dataset specified in the HFS1DSN parameter of the DFHISTAR job to be mounted at directory /pathprefix/usr/lpp/cicsts/ussdir, where ussdir is the name of the directory specified in the ussdir parameter in the DFHISTAR job.

Add this mount command to the BPXPRMxx PARMLIB member after you have run the DFHIHFS1 job.

DFHBPXPA
This member contains a MOUNT command for inclusion in a BPXPRMxx member of the SYS1.PARMLIB dataset. The MOUNT command is for HFS dataset specified in the HFSADSNI parameter of the DFHISTAR job to be mounted at directory /pathprefix/usr/lpp/cicsts/ussdira, where ussdira is the name of the directory specified in the ussdira parameter in the DFHISTAR job.

Add this mount command to the BPXPRMxx PARMLIB member after you have run the DFHIHFS1 job.

When the DFHISTAR job has run, the jobs listed in the topic Skeleton jobs in RELFILE(2) copied to the TDFHINST library in the Program Directory (apart from the DFHISTAR job) are tailored to your CICS Transaction Server environment and added to the library that you specified on the LIB parameter of the DFHISTAR job (by default, the CICSTS31.XDFHINST library). If necessary, the DFHISTAR job creates the library specified on the LIB parameter.

The highest expected return code is 0.

Check the Output from the DFHISTAR Job
Check the output from the DFHISTAR job, and if needed, edit and submit the DFHISTAR job again.

The DFHISTAR job produces a job log and, if necessary, an error code:

- The output job log lists the values that were actually used for the parameters of the DFHISTAR job.
- If any error occurs when running the DFHISTAR job, an error code of 4 or 12 is returned. For error code 4, the skeleton jobs are tailored and added to the CICSTS31.XDFHINST library. For error code 12, the skeleton jobs are not tailored or copied. To resolve the cause of either error code, examine the output job log and, if necessary, edit and submit the DFHISTAR job again.

You can run the DFHISTAR job any number of times to alter the attributes of the jobs that it creates.

When running the DFHISTAR job after the first time, you can select specific jobs to be created, by using the SCOPE or SELECT parameter:

SCOPE ALL|BASE|POST
Specifies whether you want to generate all the CICS Transaction Server installation and post-installation jobs, or only the post-installation jobs. When installing CICS Transaction Server from the distribution tape, you would
normally specify SCOPE ALL (the default). You would normally code the other options, if necessary, during some post-installation tasks, as described in Chapter 4, “Post-installation requirements,” on page 55.

**ALL**

Specifies that you want to generate all the CICS Transaction Server installation jobs and all the post-installation jobs.

**BASE**

Specifies that you want to generate only the six installation jobs DFHINST1 through DFHINST6 that you can use to install CICS Transaction Server from the distribution tape.

**POST**

Specifies that you want to generate only the post-installation jobs, that you can use to create the CICS Transaction Server data sets, and run the IVPs.

**SELECT jobname newname**

Specifies the new name for a copy of a post-installation job to be generated when you run the DFHISTAR job. You can specify several SELECT parameters to select several post-installation jobs to be regenerated in one run of the DFHISTAR job. The SELECT parameter overrides the POST parameter; that is, if you use the SELECT parameter in the DFHISTAR job, only those jobs specified by SELECT are generated.

**Note:** If you are using the SELECT parameter to generate copies of the post-installation jobs for a new CICS Transaction Server region, you should also change the DSINFO parameter to specify details of the data sets for the new CICS region.

For example, to create copies of the jobs DFHDEFDS and DFHIVPOL for the CICS Transaction Server region CICSINS you could specify the DSINFO and SELECT parameters of the DFHISTAR job:

```
DSINFO userid.CICSTS31 H3P061 SYSALLDA INS
SELECT DFHDEFDS INSDEFDS
SELECT DFHIVPOL INSIVPOL
```

If you then run the DFHISTAR job, it would create the INSDEFDS job as a copy of the DFHDEFDS job, and the INSIVPOL job as a copy of the DFHIVPOL job, substituting the values that you specified on DSINFO into the new jobs.

You could then change the DSINFO and SELECT parameters, and run the DFHISTAR job to create other copies of the post-installation jobs for another CICS Transaction Server region.

---

**Check that You Are Ready to Run the Installation Jobs**

Check that you are now ready to run the installation jobs:

1. Check the names of the data sets to be created by these jobs, because any existing data sets with those names are deleted by the installation jobs. If you want to keep an existing data set with a name specified in one of the installation jobs, you must change the name to be used for the new data set. For example, for the installation parameter DZONECSI dsname NEW the data set dsname is deleted and a new distribution zone CSI called dsname is allocated.

2. The CICS Transaction Server-supplied installation JCL will install CICS Transaction Server for z/OS into new target and distribution zones. If you want to install CICS Transaction Server into existing target and distribution zones, you must modify the DFHINST3 job.
Caution: If you intend using an existing target or distribution zone that contains an earlier release of CICS Transaction Server, be aware that any earlier release of CICS Transaction Server will be cleared before being replaced by CICS Transaction Server.

3. If you intend installing CICS Transaction Server using both existing and new CSIs, any new CSIs must have the same control interval size as the existing CSIs.

   If your existing CSIs do not have a control interval size of 4096 bytes, you must edit the DFHINST3 job (before running it) to change the CONTROlINTERVALSIZE(4096) parameter on the commands used to create the VSAM data sets for the new CSIs, to specify the same control interval size as the existing CSIs.

   For further information about considerations for allocating CSI data sets, see the System Modification Program Extended: Reference manual, SA22–7772.

4. Ensure that you have appropriate RACF authority for the CICS Transaction Server data sets. For more information, see your Security Administrator and the CICS RACF Security Guide.

Run the installation Jobs

**OMVS requirement**

Before running the installation jobs:
- Ensure the MVS image was IPLed with OMVS in full-function mode.
- Ensure the userid under which you are running the jobs has superuser authority.

After you have run the DFHISTAR job to create the installation jobs, submit those jobs in sequence to install CICS Transaction Server. This § describes the CICS Transaction Server installation jobs, and gives considerations that may affect how you use them.

The CICS Transaction Server jobs are in the CICSTS31.XDFHINST library as a result of running the DFHISTAR job, which you copied from the distribution tape, as described in the topic Copy RELFILE(2) from the Distribution Tape in the Program Directory.

These jobs should be run one at a time. Before you run a job, read the information about it (starting on page "DFHIHFS0" on page 43).

After you have run a job, check its output before proceeding to the next job. If a job terminates abnormally, find out why it failed (the job log lists the error messages produced on each run). Correct the error, and then proceed as advised in the job description. In any case, do not attempt to run the next job until the previous job has run successfully.

Run Times of the Installation Jobs

To give you an idea what run times to expect, we ran the installation jobs on an IBM 9672 RX5 using a single LPAR. The run times were:

<table>
<thead>
<tr>
<th>Job</th>
<th>Processor Time</th>
<th>Elapsed Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>DFHIHFS0</td>
<td>1 second</td>
<td>7 seconds</td>
</tr>
<tr>
<td>Job</td>
<td>Processor Time</td>
<td>Elapsed Time</td>
</tr>
<tr>
<td>------------</td>
<td>----------------</td>
<td>--------------</td>
</tr>
<tr>
<td>DFHIHFS1</td>
<td>1 second</td>
<td>7 seconds</td>
</tr>
<tr>
<td>DFHISMKD</td>
<td>1 second</td>
<td>1 second</td>
</tr>
<tr>
<td>DFHINST1</td>
<td>3 seconds</td>
<td>30 seconds</td>
</tr>
<tr>
<td>DFHINST2</td>
<td>3 seconds</td>
<td>30 seconds</td>
</tr>
<tr>
<td>DFHINST3</td>
<td>1 second</td>
<td>15 seconds</td>
</tr>
<tr>
<td>DFHINST4</td>
<td>1 second</td>
<td>15 seconds</td>
</tr>
<tr>
<td>DFHINST5</td>
<td>1 minute</td>
<td>11 minutes</td>
</tr>
<tr>
<td>DFHINST6</td>
<td>24 minutes</td>
<td>49 minutes</td>
</tr>
</tbody>
</table>

These time values are suitable to run the installation jobs on an IBM 9672 RX5 or bigger system. If you have a system smaller than an IBM 9672 RX5, you may need to review these values.

The DFHIHFS0 Job

This job:
- Creates the HFS specified on the HFS0DSN parameter of the DFHISTAR job
- Creates the *cicsts* directory at `/pathprefix/usr/lpp/`
- Mounts the HFS at directory `/pathprefix/usr/lpp/cicsts`
- Changes the permission settings for the `/cicsts` directory to:
  - Owner=RWX
  - Group=RWX
  - Other=R-X
(In octal form: 775)
Where:
- R equates to Read
- W equates to Write
- X equates to Execute
- - equates to no permission

Notes:
1. DFHIHFS0 only ever needs to be run *once*.
2. RACF ALTER ACCESS to the OMVS data sets must be granted before running this DFHIHFS0.
3. The `/cicsts` directory is common to all releases of CICS TS from 1.3 onwards.
4. The `/cicsts` directory contains only directories, each being a mount point.
5. CICS requires the MOUNT issued by DFHIHFS0 to access files stored in the HFS, but the MOUNT command is lost when you re-IPL MVS. SDFHINST member DFHBPXP0 contains a MOUNT command for `/pathprefix/usr/lpp/cicsts`. Copy this command into a BPXPRMxx member of the SYS1.PARMLIB dataset to ensure the mount is restored when MVS is IPLed.
6. All steps of DFHIHFS0 must end with return code zero for the job to be successful.

The DFHIHFS1 Job

This job:
• Unmounts the HFS at directory `/pathprefix/usr/lpp/cicsts/ussdir` to allow the job to be rerun, and if necessary forces return code zero.
• Deletes from `/pathprefix/usr/lpp/cicsts` the directory defined by the `ussdir` parameter of the DFHISTAR job. This is to allow the job to rerun, and if necessary forces return code zero.
• Deletes the HFS specified in the HFS1DSN parameter of the DFHISTAR job to allow the job to rerun, and if necessary forces return code zero.
• Creates the HFS specified in the HFS1DSN parameter of the DFHISTAR job.
• Creates the `ussdir` directory at `/pathprefix/usr/lpp/cicsts`, where `ussdir` is the name of the directory specified on the `ussdir` parameter.
• Mounts the HFS at directory `/pathprefix/usr/lpp/cicsts/ussdir`
• Changes the permission settings for the `ussdir` directory to 775.

All steps of DFHIHFS1 must end with return code zero for the job to be successful.

CICS requires the MOUNT issued by DFHIHFS1 to access files stored in the HFS, but the MOUNT command is lost when you re-IPL MVS. SDFHINST member DFHBXPX1 contains a MOUNT command for `/pathprefix/usr/lpp/cicsts/ussdir`. Copy this command into a BPXPRMxx member of the SYS1.PARMLIB dataset to ensure the mount is restored when MVS is IPLed.

**The DFHISMKD Job**

This job creates the UNIX System Services directories.

This job **must** be run before any of the other installation jobs.

The highest expected return code is 0.

**The DFHINST1 Job**

This job allocates and catalogs CICS Transaction Server distribution and target libraries.

To ensure that this job can be rerun, it deletes (and uncatalogs) the data sets that are allocated in the second step of the job.

If the DFHINST1 job terminates abnormally, examine the job log to determine the cause, correct the problem, then rerun the job.

The highest expected return code is 0.

**The DFHINST2 Job**

This job allocates the CICS Transaction Server RELFILE data sets. If you run the DFHINST2 job now, you ensure that enough space has been allocated to the RELFILE data sets to allow the DFHINST5 job to complete.

To ensure that the job can be rerun, it deletes (and uncatalogs) the data sets (if they exist) that it allocates later.

If the DFHINST2 job terminates abnormally, examine the job log to determine the cause, correct the problem, then rerun the job.

The highest expected return code is 0.
DFHINST3 and DFHINST4 jobs.

DFHINST3 is a job that should be run if you have decided to allocate new SMP/E zones.

Be aware that the default specified in DFHISTAR is for the allocation of new zones. This is recommended, to ensure that existing releases of CICS Transaction Server are not deleted.

DFHINST4 is a job that will prime new SMP/E zones created in DFHINST3.

The DFHINST3 Job

This job allocates the CICS Transaction Server SMP/E data sets.

Before you run the DFHINST3 job

If you intend installing CICS Transaction Server using both existing and new CSIs, any new CSIs must have the same control interval size as the existing CSIs.

Caution: If you intend using an existing target or distribution zone that contains an earlier release of CICS Transaction Server elements, be aware that any earlier release of CICS will be cleared before being replaced by CICS Transaction Server.

If your existing CSIs do not have a control interval size of 4096 bytes, you must edit the DFHINST3 job (before running it) to change the CONTROLINTERVALSIZE(4096) parameter on the commands used to create the VSAM data sets for the new CSIs, to specify the same control interval size as the existing CSIs.

For further information about considerations for allocating CSI data sets, see the System Modification Program Extended: Reference manual, SA22–7772.

To ensure that the job can be rerun, it deletes (and uncatalogs) the data sets (if they exist) that it allocates later.

This job also sets up the global, target, and distribution zones, depending on the parameters that you specified to the DFHISTAR job, as follows:

1. If you specified NEW for GZONE, the global zone is deleted and redefined.
2. The distribution zone is deleted and redefined.
3. The target zone is deleted and redefined.
4. Member GIMZPOOL from SYS1.MACLIB is REPROed into the zones redefined in the previous steps.
5. If you specified OLD for GZONE, the entries for the DZONE and TZONE names are removed from the global zone.

If the DFHINST3 job terminates abnormally, examine the job log to find the cause, correct the problem, then rerun the job.

The highest expected return code is 0.
The DFHINST4 Job
This job primes the global zone, target zone, and distribution zone.

**Before you run the DFHINST4 job**
If you did not run the DFHINST2 job, increase the DSSPACE values in the DFHINST4 job, before submitting it.

If the DFHINST4 job terminates abnormally, examine the job log to determine the cause, correct the problem, then repeat all jobs, beginning with DFHINST1. This avoids SMP/E space problems, and consequent X37 abends, during reruns of these SMP/E jobs.

**The highest expected return code is 0, if you install into new zones and 8 if you are installing into existing zones.**

The DFHINST5 Job
This job RECEIVEs the CICS Transaction Server software from the distribution tape into the RELFILE data sets created by the DFHINST2 job. It is the only installation job (apart from the initial IEBCOPY job) that requires the distribution tape to be mounted.

If the DFHINST5 job terminates abnormally, examine the job log to determine the cause, correct the problem, then repeat all jobs, beginning with DFHINST1. This avoids SMP/E space problems, and consequent X37 abends, during reruns of these SMP/E jobs.

**The highest expected return code is 0.**

The DFHINST6 Job
This job performs the SMP/E APPLY and ACCEPT functions needed to install CICS Transaction Server into the target and distribution libraries respectively.

**Before you run the DFHINST6 job**
- Ensure the DB2 SDSNLOAD library is available for this job. Without SDSNLOAD, DFHINST6 fails; see "Specify the Data Set Name of the SDSNLOAD Library" on page 37.

  If you run DFHINST6 with an empty SDSNLOAD library, the APPLY step completes with return code 4, and the return code from the binder is 8. The REXX for CICS modules, CICSQL and CICDB2, which interface with DB2, are stored in SCICLOAD without the required DB2 routines and are not usable.

- **DFHINST6 must be run on the same MVS image on which the HFS is installed.**

  If you have modified the other installation jobs (for example, to use existing libraries and therefore existing target and distribution zones), consider splitting the DFHINST6 job to do APPLY CHECK, APPLY, ACCEPT CHECK, and ACCEPT functions as four separate jobs.

The DFHINST6 job is the longest running of all the installation jobs (see "Run Times of the Installation Jobs" on page 42), and produces a large amount of printed
output. The region size for the DFHINST6 job is currently set to 'REGION=0M'. This is because this job requires more memory than the other install jobs. You may need to adjust your JES parameters (for example, with a JES2 /*JOBPARM LINES=99 statement) to avoid a system abend 722.

**This job gives a return code of 4 when all is well. (See the “GIM23903W - LINK SUCCESSFUL . . ” message, listed in the report that is output by the apply job.) DFHINST6 job may issue messages GIM23903W and GIM23913W depending on the execution environment of the installer. Both these messages are acceptable.**

The binder produces IEW2454W messages during the APPLY stage for unresolved external references while some CICS Transaction Server load modules are being link-edited during installation, giving return code 4. You may also receive numerous IEW2646W and IEW2651W messages, which are conflicts with user-specified RMODE and AMODEs respectively. You can ignore these IEWxxxx messages, which are output for component object modules of executable CICS Transaction Server load modules.

Messages IEW2689W, IEW2470E, IEW2648E and IEW2303E might be displayed, and can also be ignored.

When you have run the DFHINST6 job, you should see the following SMP/E message in the output from the job:

```
GIM20502I GIMSMP PROCESSING IS COMPLETE - THE HIGHEST RETURN CODE WAS 04 -
```

This SMP/E message can be ignored.

If any other SMP/E messages appear, see the **SMP/E: Messages & Codes** manual for guidance information about their meaning, and take the appropriate action.

If the DFHINST6 job terminates abnormally, examine the job log to determine the cause, correct the problem, then repeat all the jobs, beginning with DFHINST1. This avoids SMP/E space problems, and consequent X37 abends, during reruns of these SMP/E jobs.

**Note:** If the DFHINST6 job fails and you are using an existing global zone (that is, you specified the GZONE parameter of the DFHISTAR job with the disposition parameter OLD), you must first REJECT the CICS Transaction Server base-level function SYMOSM before rerunning the DFHINST1 job. When you rerun the installation jobs, some steps that were successfully completed in the previous run will produce return codes with a value of ‘8’.

---

**The DFHIJVMJ Job**

This job is provided to create a customized version of member DFHJVMEV from the SDFHENV data set. This dataset contains the JVM environment variables that are needed if you want to run a JVM program in CICS. Information about the JVM environment variables is given in the **CICS System Definition Guide**.

---

**Check the Output from the Installation Jobs**

When you have successfully run all of the installation jobs described in this chapter, CICS Transaction Server will have been loaded.
You now have CICS Transaction Server installed on your DASD. Back up the volume on which CICS Transaction Server resides. This avoids the need to re-run the installation jobs if any errors occur during customization later.

What next?

You should next copy the CICS Transaction Server procedures into a cataloged procedure library, load any CICS features that you have, and tailor the CICS Transaction Server to your needs. For information about copying the CICS Transaction Server procedures, and loading the CICS Transaction Server features, see the following topics:
- “Copy the CICS Transaction Server Procedures into a Procedure Library” on page 50
- “Create Extra Sets of CICS Transaction Server Target Libraries (Optional)” on page 50
- “Load the CICS Transaction Server Source Material (Optional)” on page 52
- “Load Other Optional Features” on page 53

For information about tailoring CICS Transaction Server to your needs, see Chapter 27, “Tailoring the CICS-supplied skeleton jobs,” on page 185.

Copy the CICS Transaction Server Procedures into a Procedure Library

CICS Transaction Server supplies the procedures listed in Table 7.

Table 7. CICS Transaction Server-supplied procedures

<table>
<thead>
<tr>
<th>Procedure</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DFHASMVS</td>
<td>Assembles some CICS Transaction Server programs and user-written assembler language programs.</td>
</tr>
<tr>
<td>DFHAUPLE</td>
<td>Assembles and link-edits CICS Transaction Server control tables, and makes the assembly and link-edit information available to SMP/E. Note: DFHAUPLE is installed in SDFHINST.</td>
</tr>
<tr>
<td>DFHBMSU</td>
<td>Runs the BMS load module disassemble utility program, DFHBMSUP.</td>
</tr>
<tr>
<td>DFHEBTAL</td>
<td>Translates, assembles, and link-edits assembler application programs using EXEC DLI commands in a batch environment under Language Environment.</td>
</tr>
<tr>
<td>DFHEITAL</td>
<td>Translates, assembles, and link-edits assembler application programs using the command-level interface.</td>
</tr>
<tr>
<td>DFHEXTAL</td>
<td>Translates, assembles, and link-edits assembler application programs using the external CICS Transaction Server interface.</td>
</tr>
<tr>
<td>DFHLNKVS</td>
<td>Link-edits CICS Transaction Server programs and application programs.</td>
</tr>
<tr>
<td>DFHMAPS</td>
<td>Prepares physical and symbolic maps.</td>
</tr>
<tr>
<td>DFHMAPT</td>
<td>Prepares physical and symbolic maps for C++.</td>
</tr>
<tr>
<td>DFHSMPE</td>
<td>Executes SMP/E. Note: DFHSMPE is installed in SDFHINST.</td>
</tr>
<tr>
<td>DFHSTART</td>
<td>Starts CICS. Note: DFHSTART is installed in SDFHINST.</td>
</tr>
<tr>
<td>DFHUPDVS</td>
<td>Updates.</td>
</tr>
<tr>
<td>DFHYBTPL</td>
<td>Translates, compiles, and link-edits PL/I application programs using EXEC DLI commands in a batch environment under Language Environment.</td>
</tr>
<tr>

**Note:**

For further information about using the CICS Transaction Server-supplied procedures, see:

- The [CICS Operations and Utilities Guide](SC34-6431) for information about DFHCRST
- "The CICS TS-supplied SMP/E procedure" on page 179 for information about DFHSMPE and DFHSTART
- The [CICS System Definition Guide](SC34-6428) for information about the other procedures.

The procedures DFHAUPLE, DFHSMPE, and DFHSTART are tailored to your CICS Transaction Server environment and stored in the CICSTS31.XDFHINST library when you run the DFHISTAR job. The other procedures are **not** modified by the DFHISTAR job and are copied into the CICSTS31.SDFHPROC library when you run the CICS Transaction Server installation jobs.
You should copy all these procedures into a cataloged procedure library (for example, SYS1.PROCLIB). Before you copy the procedures, read the following:

1. Your procedure library may already contain procedures, supplied with an earlier release of CICS, that have the same names as the new procedures but are, in fact, different. If so, you must find some way of selecting the right release. Here are some ways of using the new versions:
   a. For the time being, rename either set of procedures, and modify the appropriate jobs to use the new names.
   b. Insert the new procedures into the job streams that use them, and use the procedures as in-stream procedures. The inserted procedures should be placed between the JOB statement and the first EXEC statement. You must insert a //PEND statement after the inserted procedures. When the new release becomes the production system, you can copy the new procedures into your procedure library.
   c. Indicate the DDNAME of the cataloged procedure library that is to be used to convert the JCL for the job. For example, you could use the JES2 /*JOBPARM PROCLIB=xxxxxxxx. For further information about specifying DDNAMEs in JCL, see the MVS/ESA JCL Reference manual.

2. If service is applied to the CICS Transaction Server procedures, it is the versions in the libraries CICSTS31.CICS.SDFHINST and CICSTS31.CICS.SDFHPROC that will be updated by SMP/E. You must then copy the updated procedures into your procedure library.

3. The default for the symbolic parameter GZONE in the procedures DFHSMPE and DFHAUPLE is taken from the value that you specified by the GZONE parameter of the DFHISTAR job.

4. The default for the ZNAME symbolic parameter in the procedures DFHSMPE and DFHAUPLE is taken from the value that you specified by the TZONE parameter of the DFHISTAR job. For a description of how the ZNAME parameter is used, see the SMPCNTL DD statement in "The CICS TS-supplied SMP/E procedure" on page 180.

5. Change the OUTC parameter as required.

When you have read these notes, and acted on them as necessary, copy the procedures into a cataloged procedure library.

Create Extra Sets of CICS Transaction Server Target Libraries
(Optional)

You can use the CICS Transaction Server installation job, DFHISTAR, to generate an optional installation job, DFHINSTA, which you can use to create extra copies of the CICS Transaction Server target libraries and UNIX System Services directories.

Some of the benefits of using multiple libraries are:

- **Backing out PTFs and APARs** - if you apply PTFs or APARs to CICS Transaction Server and if they fail a fix-test, you can back out the changes with minimum disruption.

- **DASD failure** - multiple libraries protect you against failure of the DASD on which the CICS Transaction Server load libraries reside.

Base the decision to use multiple libraries for CICS Transaction Server on the following factors:
Your need for high availability - as already stated, the use of multiple libraries can protect you against CICS Transaction Server downtime due to DASD failure or incorrect service (either from IBM-supplied PTFs or your own modifications to your CICS Transaction Server region).

The extra DASD needed - multiple libraries require more disk space.

Other ways of providing high availability; for example, use of a CICSPlex, VTAM persistent sessions, and MVS functions to provide restart of CICS Transaction Server regions.

The added complexity of maintaining multiple sets of CICS Transaction Server libraries - two or more sets of CICS Transaction Server target libraries, together with the SMP/E procedures needed to support them, increase the complexity of maintenance. You will need to define procedures to ensure that upgrades to the CICS Transaction Server libraries are kept under control.

Alternative solutions - if you have already established a proven process for fix verification and for testing applications developed for your production CICS Transaction Server region, you may decide you don't need multiple CICS Transaction Server libraries.

You can use the DFHINSTA job, generated by the DFHISTAR job, to create extra sets of CICS Transaction Server target libraries fully under the control of SMP/E. Each time you run the DFHINSTA job, you can only generate one extra set of target libraries.

To create an extra sets of target libraries, you should complete the following steps. You can repeat the steps to create more sets of target libraries.

1. Edit the DFHISTAR job to specify values for:
   a. The ADDTVOL, AINDEX, ASMPSCDS, AZONE, AZONECSI, AZONELOG, and USSDIRA parameters, for the new set of target libraries.
   b. The INDEX, TZONE, TZONECSI, and TZONELOG parameters, for the primary target libraries you want to copy from. (The TZONE, TZONECSI, and TZONELOG parameters must specify the target zone that contains the CICS Transaction Server target libraries defined with the high-level qualifier provided by the INDEX parameter.)
   c. The DZONE, DZONECSI, and DZONELOG parameters, for the distribution libraries to be associated with the new set of target libraries.
   d. The SELECT parameter, to specify DFHINSTA (that you want to copy) and the member name you want the generated version of DFHINSTA to be stored as in the CICSTS31.XDFHINST library. For example,

   ```
   SELECT DFHINSTA INSTA111
   ```

   will store the generated version of DFHINSTA into member INSTA111 of the CICSTS31.XDFHINST library when you submit the DFHISTAR job.

   Each time you copy DFHINSTA (to create a new set of target libraries), you should specify a new name on the SELECT parameter (to save each copy with a different name in case you need it again in the future).

   For further information about editing the DFHISTAR job, and about the parameters of the DFHISTAR job, see "Edit the DFHISTAR Job" on page 17. The other parameters in the DFHISTAR job should not be changed.

2. Submit the DFHISTAR job

   When you run the DFHISTAR job, it saves the generated version of the DFHINSTA job in the CICSTS31.XDFHINST library with the member name
specified on the SELECT parameter in the DFHISTAR job. The data set name of the CICSTS31.XDFHINST library is specified in the LIB parameter of the DFHISTAR job.

3. Consider running the DFHIHFSA job

If you decide to create an additional SMP/E target zone using job DFHINSTA, run the DFHIHFSA job first before running the DFHINSTA job. DFHIHFSA creates an additional SMP/E target zone for HFS. This job:

- Unmounts the HFS at directory /pathprefix/usr/lpp/cicsts/ussdir to allow the job to rerun, and if necessary forces return code 0.
- Deletes the /ussdira directory at /pathprefix/usr/lpp/cicsts, where ussdira is the name of the directory specified on the ussdira parameter in the DFHISTAR job. This allows the job to rerun, and if necessary forces return code 0.
- Deletes the HFS specified in the HFSADSN parameter of the DFHISTAR job to allow the job to rerun, and if necessary forces return code 0.
- Creates the HFS specified in the HFSADSN parameter of the DFHISTAR job
- Creates the /ussdira directory at /pathprefix/usr/lpp/cicsts, where ussdira is the name of the directory specified in the ussdira parameter in the DFHISTAR job
- Mount the HFS at directory /pathprefix/usr/lpp/cicsts/ussdira
- Changes the permission settings for the ussdira directory to 775

All steps of this job must end with return code zero for the job to be successful. CICS requires the MOUNT issued by DFHIHFSA to access files stored in the HFS, but the MOUNT command is lost when you re-IPL MVS. SDFHINST member DFHBPXPA contains a MOUNT command for /pathprefix/usr/lpp/cicsts/ussdira. Copy this command into a BPXPRMxx member of the SYS1.PARMLIB dataset to ensure the mount is restored when MVS is IPLed.

4. Submit DFHINSTA

The DFHINSTA job (or a copy of it) copies the CICS Transaction Server target libraries specified by the INDEX parameter, and creates corresponding CICS Transaction Server SMP/E data sets for them. In particular, it allocates a new SMP/E CSI data set for the extra target zone.

So that DFHINSTA job can be run more than once, step 1 deletes previous copies of the data sets to be created. Step 3 deletes the SMP/E CSI data set. Step 6 removes the ZONEINDEX entry for the extra target zone.

The first time the DFHINSTA job is run, Step 6 will give the following messages:

- GIM35701E ** ZINDEX SUBENTRY azone WAS NOT DELETED BECAUSE IT DOES NOT EXIST.
- GIM25601I THE SPECIFIED ENTRY WAS NOT UPDATED BECAUSE OF AN ERROR DURING UCLIN PROCESSING.

You can ignore these messages the first time the job is run.

Load the CICS Transaction Server Source Material (Optional)

You can use the sample job, DFHOPSRC, to load the optional CICS Transaction Server source from the distribution tapes. The DFHOPSRC job is generated in the CICSTS31.XDFHINST library when you run the DFHISTAR job.

The DFHOPSRC job runs the MVS IEBCOPY utility program to load the optional source data sets from the tapes into a single DASD data set.

For further information about the IEBCOPY program, see the MVS/ESA Data Administration: Utilities Manual (SC26-4516).
Note: The DFHOPSRC job loads the tape files to a DASD device of your choice, using a BLKSIZE parameter of 6160. You can specify a different BLKSIZE parameter on the DCB and SPACE statements if you want, in which case the space allocation should be reviewed (It may need to be changed.).

Load Other Optional Features
The sample job, DFHINSTJ, is supplied to be used to load other optional features that may be supplied. CICS Transaction Server V2R3 contains no optional features at General Availability time, but the sample job may be used if any optional features are shipped at a later date. The DFHINSTJ job is generated in the CICSTS31.XDFHINST library when you run the DFHISTAR job.

Activating CICS Transaction Server
After you have loaded CICS Transaction Server to disk, you should perform the following steps:
1. (If needed) Apply service, see Chapter 26, “Applying service to CICS Transaction Server for z/OS,” on page 179
2. Integrate CICS Transaction Server with MVS, see Part 2, “Setting up the MVS environment for CICS,” on page 65
3. Create CICS Transaction Server system data sets, see Chapter 28, “Creating the CICS data sets,” on page 189
4. (Optional) Install CICS-DATABASE 2 support, see Chapter 29, “Defining DL/I support,” on page 197
5. (Optional) Install MRO and ISC support, see Chapter 32, “Installing MRO and ISC support,” on page 211
6. (Optional) Run the installation verification procedures (IVPs), see Chapter 35, “Running the installation verification procedures,” on page 227

Information about how to get CICS Transaction Server into operational status, is also included as part of the process of verifying the installation, see Chapter 35, “Running the installation verification procedures,” on page 227.

Chapter 4. Post-installation requirements

The main task after installing CICS TS is to prepare the z/OS environment so that you can run the CICS and CICSPlex SM installation verification procedures (IVPs). These procedures start a CICS test region and the CICSPlex SM starter-set of regions. For example, you cannot bring up a CICS TS region unless you install the required CICS modules in the MVS link pack area (LPA) and include others in the MVS linklist.

This chapter outlines the main steps and points you to where you can find more information to help you complete these tasks.

Implementing changes in your z/OS environment for CICS

If you are an existing CICS user and are planning to migrate to CICS Transaction Server for z/OS, Version 3 Release 1 in an established z/OS environment, most of the tasks described here will already have been done. In this case, review the following steps to check whether you need to make any changes. If you are setting up a new z/OS environment, perhaps on new hardware, you need to ensure that the required support for CICS is in place.

The following is a summary of the steps to follow to enable your z/OS environment to support CICS:

APF-authorize SDFHAUTH
Define the CICSTS31.CICS.SDFHAUTH library as an APF-authorized library. See "APF-authorizing CICS SDFHAUTH library" on page 56 for details.

Authorize CICS regions userids
Authorize to RACF each CICS region userid to permit access to the required MVS resources. See "Authorizing CICS region userids to RACF" on page 56 for details.

Note: It is assumed that the CICS TS libraries you have installed, and other MVS resources, are protected by RACF, or an equivalent external security manager (ESM).

Add SDFHLINK to LNKLST
Include the CICS linklist library, CICSTS31.CICS.SDFHLINK, in the MVS LNKLST concatenation.

Define CICS as a subsystem
Define CICS as an MVS subsystem if you intend using multiregion operation (MRO), the CICS console message-handling facility, or MVS workload management.

Define and install the CICS Type 3 SVC
Define the DFHCSVC module to MVS.
Schedule an IPL to install the CICS SVC routine, DFHCSVC, and other CICS-required modules in the MVS link pack area (LPA).

Review requirement for HPO
Ensure the DFHHPSVC module is included in the MVS nucleus if you are going to use the VTAM high-performance option (HPO), and ensure the HPO SVC is defined as a Type 6 SVC in the appropriate MVS IEASVCxx PARMLIB member.

Define VTAM APPLs for CICS TQRs
Define to VTAM each CICS region that requires VTAM support (for example, all
your terminal-owning regions) and also ensure that any VTAM terminal
definitions are properly specified for connection to CICS.

Defining VTAM APPL definitions for CICS application-owning regions (AORs) is
optional.

**Define log streams**
Define the minimum logging environment for CICS system logs.

**Install ASR exit for SYMREC macro support**
Install an MVS ASR exit to enable CICS to use the SYMREC macro call.

Each of these tasks is discussed in more detail in the following sections.

There are also some optional tasks that you may need to perform at a later stage,
but these are not essential to the initial install and operation of a basic CICS
system. These tasks are connected with facilities such as VSAM record-level
sharing, MVS automatic restart management, and MVS performance.

**APF-authorizing CICS SDFHAUTH library**
Add the CICS SDFHAUTH library to the list of APF-authorized libraries in the
appropriate PROGxx (or IEAAPFx) member in SYS1.PARMLIB. The SDFHAUTH
library must be APF-authorized to enable certain CICS modules, such as DFHSIP,
to run in supervisor state.

If your list(s) of APF-authorized libraries are specified in the dynamic format (in a
PROGxx member), refresh the APF list dynamically using the SETPROG or SET
PROG=xx command.

If your list(s) of APF-authorized libraries are specified in the static format (in
IEAAPFx members), schedule an MVS IPL for the APF-authorization to take effect.

For information about maintaining lists of APF-authorized libraries, see the [z/OS
MVS Initialization and Tuning Reference](#).

**Authorizing CICS region userids to RACF**
Ensure each CICS region userid (the userid under which a CICS region runs) has
the required authority (READ, UPDATE, CONTROL, or ALTER) to access the
various protected resources it needs to use. These include load libraries and other
data sets, coupling facility structures, the VTAM ACB, and so on.

The resources for which you need to ensure access are:

**Load libraries**
The CICS load libraries, CICSTS31.CICS.SDFHAUTH and
CICSTS31.CICS.SDFHLOAD. All CICS regions should have READ
authorization to these data sets.

**VTAM ACB**
A VTAMAPPL general resource class profile protects a CICS region's APPLID.
Each region userid should have READ authorization to its own VTAMAPPL
profile.

**SMSVSAM servers**
A SUBSYSNM general resource class profile protects an SMSVSAM server.
Each CICS region that opens an SMSVSAM control ACB during initialization
must have READ authorization to a SUBSYSNM profile named with its own
CICS APPLID.
MVS log streams
A LOGSTRM general resource class profile protects an MVS log stream. Each
CICS region requires at least UPDATE authorization to its own system log
LOGSTRM profile. If you expect a CICS region to create dynamically its log
stream, it needs ALTER authority.

Data set services module ADRRELVL
A PROGRAM general resource class profile may be used to protect access to
the DFSMSdss module, ADDRELVL. CICS links to this ADR module during
initialization as part of its check on backup-while-open (BWO) support. Ensure
CICS has READ access to this module if it is a protected resource in your MVS
environment.

CICS category 1 transactions
The general resource class GCICSTRN (or TCICSTRN) protect all transactions,
including CICS system transactions. Each CICS region requires READ
authorization to the list of category 1 transactions as defined in member
DFH$CAT1 in the CICS SDFHSAMP samples library.

When you have defined the required authorizations for CICS regions in the RACF
data base, activate the various resource classes with the RACF SETROPTS
command.

Adding SDFHLINK to the MVS LNKLST
CICS provides a number of modules that are intended for use from the MVS
LNKLST. These are supplied in the SDFHLINK library, and are in two categories:
1. CICS-supplied modules used by non-CICS jobs
2. Modules that must be consistent across several CICS regions.

Add the CICS SDFHLINK library to the MVS LNKLST concatenation. Note that
many of the modules in SDFHLINK can only be used from an APF-authorized
library, and therefore SDFHLINK also needs to be APF-authorized.

Note: CICS also loads some non-CICS modules, and these should also be made
available through a library included in the LNKLST.

Defining CICS as an MVS subsystem
Define CICS as an MVS subsystem in an IEFSSNxx member of SYS1.PARMLIB if
you plan to use any of the following CICS facilities:
• Multiregion operation (MRO)
• The console message-handling facility
• MVS workload management.

Defining and installing the CICS Type 3 SVC
Install the CICS TS Version 2 level of the CICS Type 3 SVC module, DFHCSVC,
before you attempt to start a CICS region. To make the CICS Type 3 SVC ready for
use:
1. Define the CICS SVC as a Type 3 SVC in the appropriate MVS IEASVCxx
PARMLIB member. For example, to use the CICS default SVC number, add the
following statements to the IEASVCxx:
   SVC Parm 216, REPLACE, TYPE(3), EPNAME(DFHCSVC)
2. Include the CICS LPA library, SDFHLPA, in the MVS LPALST concatenation.
3. If you define to MVS an SVC number other than the default (216), specify the
   SVC number to CICS on the CICSSVC system initialization parameter.
CICS contains a test to verify that it is using the correct release level of the CICS DFHCSVC module. If CICS calls an SVC module using the SVC number specified on the CICSSVC system initialization parameter, and the module is not at the current level, CICS issues message DFHKE0104.

**Reviewing the high-performance option**

The high-performance option (HPO) is provided for users who want to optimize terminal response times and maximize transaction throughput. This option requires the CICS Type 6 SVC module, DFHHPSVC, to be included in the MVS nucleus. To help you decide on the use of HPO, see the CICS Performance Guide. If you decide to use this option, follow the steps described in Chapter 12, “Selecting the high-performance option,” on page 97.

**Defining CICS regions as applications to VTAM**

Define each CICS terminal-owning region to VTAM as a VTAM application— that is, as a VTAM application program major node (APPL). To do this, add the required APPL definition statements to a member of SYS1.VTAMLST. For example:

```plaintext
* APPL definition for CICS region CICSHTH1
**********************************************************************
CICSHTH1 APPL AUTH=(ACQ,VPACE,PASS),VPACING=0,EAS=5000,PARSESS=YES X
SONSCIP=YES
********************************************************************
```

**Note:** Specify the VTAM APPL name to CICS on a CICS APPLID system initialization parameter.

Also ensure that your VTAM terminals are properly defined for connection to CICS. This is particularly important if you intend using the CICS autoinstall function. For those terminals for which you want to use autoinstall, code VTAM LOGON mode table entries that correspond to the model TYPETERM/TERMINAL definitions defined to CICS. You can either code your own autoinstall models, or use the CICS-supplied model definitions that are generated for you when you initialize the CICS system definition data set (CSD).

For programming information about matching VTAM LOGMODE definitions with CICS model definitions, see the CICS Customization Guide.

For information about defining model and VTAM terminal definitions to CICS, see the CICS Resource Definition Guide.

**Defining log streams**

CICS automatically connects to its system log stream, unless you define a journal model resource definition to define the log stream as TYPE(DUMMY).

Each CICS region has only one system log, which is implemented as two MVS system logger log streams. These are used by CICS as the primary and secondary system log streams and together these form a single logical log stream. Thus, as a default each CICS region requires a minimum of two log streams.

Initially, you are recommended to define to the MVS system logger some model log streams, and let CICS create the system log streams dynamically. If you plan to use a coupling facility for CICS logging, you must also define the log structures required for the log streams. To get you started, however, using DASD-only log streams is
quicker and easier to define. Later, when you have more information available, you can plan to define coupling facility log structures with explicit log streams tailored to your requirements.

Define MVS model log streams using the naming convention that enables CICS to create log streams dynamically. Model names should be of the form `mvs_sysid.DFHLOG.MODEL` and `mvs_sysid.DFHSHUNT.MODEL`, where `mvs_sysid` is the system name of the MVS image in which the CICS region runs.

Example: If a CICS region, running in an MVS image with a sysid of MV10, issues a create log stream request for its primary log stream, the system logger requires a model log stream named MV10.DFHLOG.MODEL.

Running without a system log
You can define a CICS JOURNALMODEL resource definition with TYPE(DUMMY) to avoid having to define log streams. If you want to run the IVPs with the minimum effort, here's what to do:

- Define JOURNALMODEL resource definitions in the CSD for the primary and secondary system logs, DFHLOG and DFHSHUNT respectively, specifying TYPE(DUMMY); see Figure 3 for a sample job.
- Add the CSD group containing your dummy system log journal models to your own group list, and include your group list on the GRPLIST system initialization parameter.

Note that your group list must follow the IBM-supplied list, DFHLIST. DFHLIST includes group DFHLGMOD (which contains DFHLOG and DFHSHUNT JOURNALMODEL definitions) but concatenating your list after DFHLIST ensures that your DUMMY definitions replace the IBM definitions.

```bash
//CSDLGSTR JOB 1,BELL,MSGCLASS=A,MSGLEVEL=(1,1),CLASS=A
//CSDUP EXEC PGM=DFHCSDUP,REGION=1M,PARM='CSD(READWRITE)' /*
//STEPLIB DD DSN=CICSTS31.CICS.SDFHLOAD,DISP=SHR
//DFHCSD DD DSN=CICSTS31.CICS.CICSH###.DFHCSD,DISP=SHR
//SYSPRINT DD SYSOUT=* /*
//SYSABOUT DD SYSOUT=* /*
//SYSAABEND DD SYSOUT=* /*
//SYSDUMP DD SYSOUT=* /*
//SYSDUMP DD SYSOUT=* /*

* DEFINE JOURNAL MODELS FOR CICS LOG STREAMS AS DUMMY *
* DEFINE JOURNALMODEL(DFHLOG) GROUP(LOGTEST)
  DESCRIPTION(DEFINE SYSTEM LOG AS DUMMY)
  JOURNALNAME(DFHLOG)
  TYPE(DUMMY)
* DEFINE JOURNALMODEL(DFHSHUNT) GROUP(LOGTEST)
  DESCRIPTION(DEFINE SYSTEM LOG AS DUMMY)
  JOURNALNAME(DFHSHUNT)
  TYPE(DUMMY)
/*
//

Figure 3. Sample job to define DUMMY JOURNALMODELS for CICS system logs
```

MVS ASR exit
A CICS program may call the first failure symptoms (FFS) component. This uses the MVS SYMREC macro to write a symptom record to the MVS SYS1.LOGREC dataset.
Install an MVS ASR exit to enable CICS to use the SYMREC macro call, otherwise the FFS call fails. For more information, see the z/OS MVS Installation Exits manual.

**Planning for CICSPlex SM**

CICSPlex SM provides both some basic IVPs and a CICSPlex SM starter set:

- See the CICSPlex SM Concepts and Planning manual, SC34-6459, for details of the CICSPlex SM starter set.
- See Part 6, “CICSPlex SM verification,” on page 405 for details of the IVPs.

You are recommended to run the basic IVPs and the CICSPlex SM starter set before moving into a test environment.

**Planning for CICSPlex SM migration**

If you are already a CICSPlex SM user, plan and complete your migration to CICSPlex SM before migrating your CICS regions.

CICS TS Version 3 CICSPlex SM can manage CICS regions running under the following releases of CICS:

- CICS Transaction Server for z/OS Version 3
- CICS Transaction Server for z/OS Version 2
- CICS Transaction Server for OS/390 Version 1
- IBM CICS for MVS/ESA Version 3.3 and later
- IBM CICS for VSE/ESA Version 2.2 and later
- IBM CICS for OS/2 Version 2.0.1 and Version 3.0
- CICS/MVS Version 2.1.2

For detailed information about migrating to the CICS Transaction Server for z/OS Version 3 level of CICSPlex SM, see the CICS Transaction Server for z/OS Migration from CICS TS Version 2.3.

**Parallel Sysplex considerations**

Although a coupling facility is not required to operate CICS TS, you may want to install CICS TS in a Parallel Sysplex® environment. For information about the hardware and software requirements for a Parallel Sysplex, see the z/OS MVS Setting Up a Sysplex SA22-7625.
Chapter 5. Installing the CICS Information Center

The CICS Information Center runs in an Eclipse framework, commonly known as a help system, and consists of a number of documentation plug-ins, including various tools and connectors. The information center is supplied on CD-ROM with a readme. The readme file contains a complete list of all the plug-ins that are provided, and you can select which plug-ins to install based on your CICS environment. If you already have an Eclipse help system, or an Eclipse-based IDE such as WebSphere® Studio Enterprise Developer, you can opt to install only the CICS documentation plug-ins. You can run the information center locally on a workstation, or as a server with remote access. Before you begin to install the information center, read the following topics:

- “Requirements”
- “Installing the information center on a workstation”
- “Installing the information center on a server” on page 62
- “Installing the CICS plug-in in an Eclipse IDE or help system” on page 63

Requirements

The information center is supported on the following platforms:

- Windows 2000
- Windows XP
- AIX® 5.2 and 5.3
- Linux RedHat Enterprise 3.0
- Linux SuSE Enterprise 3.0
- Linux RedHat Enterprise 8 and 9 for zSeries
- Linux SuSE Enterprise 8 and 9 for zSeries
- z/OS 1.4 or later

Please note that support for the information center on Linux for zSeries and z/OS is only offered in server mode for remote access using a browser.

The information center uses a JRE. A JRE for each platform is provided with the information center, except for z/OS. If you want to run an information center on z/OS, you need to use the JRE provided with the operating system.

To get the best results when viewing the information center, it is recommended that you use one of the following browsers:

- Microsoft Internet Explorer 6.0
- Mozilla 1.7

To view PDF documents within the information center, you require Adobe Acrobat Reader 4.05 or higher installed, and the Acrobat Web plug-in installed in your browser.

Installing the information center on a workstation

The information center can run locally from any directory on your workstation. If you do not have an Eclipse help system, you will need to install this first as it is required to run the information center. If you do have an Eclipse help system, see “Installing the CICS plug-in in an Eclipse IDE or help system” on page 63.
1. Select the appropriate folder for your operating system on the CD-ROM. This folder contains a zip file of the Eclipse help system.

2. Unzip the zip file to a new directory on your workstation. This creates an eclipse help system on your workstation.

3. Select the plug-ins folder on the CD-ROM. This folder contains all of the documentation plug-ins.

4. Copy the documentation plug-ins you require to the eclipse\plugins directory of the help system that you have just unzipped. The readme contains a complete list of the plug-in names and the products they refer to. It is recommended that you copy the CICS TS plug-in com.ibm.cics.ts.doc, the CICS support plug-in com.ibm.cicsts.doc, and associated support plug-ins com.ibm.support.core.doc and com.ibm.support.core.doc.nl.

5. At the highest directory level in your Eclipse help system, execute the file IC_local_Start to start the information center on your workstation. This should automatically launch a browser and display the information center.

Please note that you cannot run the information center locally on z/OS 1.4 or the Linux for z/OS platforms.

---

**Installing the information center on a server**

Running the information center on a server requires you to allocate a specific port number, to allow remote access using a browser. You can run the information center in server mode on any of the supported platforms listed in "Requirements" on page 61. If you already have a help system installed, see "Installing the CICS plug-in in an Eclipse IDE or help system" on page 63 for information on how to install just the CICS documentation plug-ins. To install the information center on UNIX, Linux and Windows servers, follow these steps:

1. Select the appropriate folder for your operating system on the CD-ROM. This folder contains a zip file of the Eclipse help system.

2. FTP the zip file to an appropriate directory on your server and then unzip it. This creates a help system on your server.

3. Select the plug-ins folder on the CD-ROM. This folder contains all of the documentation plug-ins.

4. Use the readme on the CD-ROM to select which documentation plug-ins you want to install. Copy the required plug-ins to the eclipse\plugins directory of the help system that you unzipped. It is recommended that you copy the CICS TS plug-in com.ibm.cics.ts.doc, the CICS support plug-in com.ibm.cicsts.doc, and associated support plug-ins com.ibm.support.core.doc and com.ibm.support.core.doc.nl.

5. At the highest directory level in your Eclipse help system, edit the file IC_server_start to specify the port number that you want the information center to use. The default is 29127.

6. Execute the file IC_server_start to start the information center in server mode.

7. To verify that you can access the information center, start up a browser and type the URL http://servername:port, where servername is the name of the server where you installed the information center and port is the port number that you specified in the start up file.

The information center runs in the UNIX System Services (USS) component of z/OS. To install the information center on z/OS, follow these steps:

1. Select the z/OS folder on the CD-ROM, which contains a tar file of the Eclipse help system.
2. FTP the tar file to a suitable HFS directory in USS.

3. Un-tar the file using the command `tar -xvf filename`. This creates a help system on your server.

4. Select the plug-ins folder on the CD-ROM. This folder contains all of the documentation plug-ins.

5. Use the readme on the CD-ROM to select which documentation plug-ins you want to install. FTP the required plug-ins to the `eclipse\plugins` directory of the help system that you unzipped. It is recommended that you copy the CICS TS plug-in `com.ibm.cics.ts.doc`, the CICS support plug-in `com.ibm.cics.ts.doc`, and associated support plug-ins `com.ibm.support.core.doc` and `com.ibm.support.core.doc.nl`.

6. At the highest directory level in your Eclipse help system, edit the file `IC_server_start.sh` to specify the directory path of a JRE at 1.4.2 that you want the information center to use. You can also change the port number from the default of 29127. Use the command `vi IC_server_start.sh` to open the file to edit it, or if connected through TSO you can use the command `oedit IC_server_start.sh`. Add the following command to the beginning of the file, using the appropriate path to the JRE For example, you could specify:

   ```
   export PATH=/u/lpp/java142/j1.4/bin:$PATH
   ```

7. Execute the start file using the command `./IC_server_start.sh &`. The `&` indicates that the information center should run as a background task. This means that if you log off, the information center will continue to run on the server.

8. To verify that you can access the information center, start up a browser and type the URL `http:\servername:port`, where `servername` is the name of the server where you installed the information center and `port` is the port number that you specified in the start up file.

---

**Installing the CICS plug-in in an Eclipse IDE or help system**

If you already have an Eclipse help system installed on your workstation or server, or if you are using an Eclipse-based product such as WebSphere Studio Enterprise Developer, you can install the CICS documentation and run it within your existing software. Ensure that you shut down your help system or product before adding the CICS documentation plug-ins. Otherwise Eclipse will not recognize the newly added plug-ins. Follow these steps:

1. Select the plug-ins folder on the CD-ROM. This folder contains all of the documentation plug-ins.

2. Use the readme on the CD-ROM to select which documentation plug-ins you want to install. It is recommended that you copy the CICS TS plug-in `com.ibm.cics.ts.doc`, the CICS support plug-in `com.ibm.cicsts.doc`, and associated support plug-ins `com.ibm.support.core.doc` and `com.ibm.support.core.doc.nl`.

3. Copy the required documentation plug-ins to the `eclipse\plugins` directory of the help system or Eclipse IDE that you already have installed. For example, for a default installation of WebSphere Studio Enterprise Developer, you would copy the plug-ins to the directory `C:\Program Files\IBM\WebSphere Studio\eclipse\plugins`.

4. Start up the help system or Eclipse IDE to ensure that the CICS documentation is present.
Part 2. Setting up the MVS environment for CICS

The information about ACF/VTAM, MVS, RACF and other products given in this part is for guidance only. Always consult the current publications of the other products for the latest information. See “Books from related libraries” on page 469.

Note: “RACF” is used throughout this book to mean the MVS Resource Access Control Facility (RACF) or any other external security manager that provides equivalent function. The advice about using RACF applies only if you have security active in your system. If so, you must use an external security manager (such as RACF).

This part discusses what you should do after you have loaded the CICS Transaction Server elements to DASD, and before you run CICS. It contains the following chapters:

- Chapter 6, “Authorizing the hlq.SDFHAUTH library,” on page 67.
- Chapter 7, “Authorizing CICS regions to access MVS resources,” on page 69.
- Chapter 8, “Defining the default CICS userid to RACF,” on page 77.
- Chapter 9, “Installing CICS-required modules in the MVS linklist,” on page 79.
- Chapter 10, “Defining CICS as an MVS subsystem,” on page 83.
- Chapter 11, “Installing the CICS Type 3 SVC,” on page 93.
- Chapter 12, “Selecting the high-performance option,” on page 97.
- Chapter 13, “Defining CICS regions as applications to VTAM,” on page 99.
- Chapter 14, “Installing CICS modules in the MVS link pack area,” on page 107.
- Chapter 15, “Defining CICS IPCS exit control data to MVS,” on page 121.

The following chapters discuss the MVS definitions required for optional CICS functions.

- Chapter 16, “MVS Program properties table entries,” on page 123.
- Chapter 17, “MVS performance definitions,” on page 125.
- Chapter 18, “MVS automatic restart management definitions,” on page 127.
- Chapter 19, “MVS cross-system MRO definitions,” on page 129.
- Chapter 21, “MVS ASREXIT - SYMREC Authorization Exit,” on page 133.
- Chapter 22, “Definitions required for VSAM RLS support,” on page 135.
- Chapter 23, “Console messages,” on page 141.
- Chapter 24, “Defining the logger environment for CICS journaling,” on page 143.
- Chapter 25, “Enabling Unicode data conversion by z/OS,” on page 177.
Chapter 6. Authorizing the hlq.SDFHAUTH library

These instructions apply to the hlq.SDFHAUTH library, but if you require Java support, you should authorize the hlq.SDFJAUTH library in the same way. See “Authorizing the hlq.SDFJAUTH library” on page 210 for more information about that library.

Although, in general, CICS runs in problem state, the CICS initialization program, DFHSIP, needs to run in supervisor state for part of its execution.

For a module to be able to run in supervisor state, it must be link-edited as an authorized module into a partitioned data set, which must also be defined to the operating system as APF-authorized. For CICS-supplied modules, the link-editing has been done for you. The CICS-supplied DFHSIP module is link-edited with the authorized attribute (using SETCODE AC(1)), and is installed in the hlq.SDFHAUTH library.

APF-authorize the hlq.SDFHAUTH library by adding it to the list of APF-authorized libraries in the appropriate PROGxx (or IEAAPFx) member in SYS1.PARMLIB. The hlq.SDFHAUTH library must be APF-authorized to enable certain CICS modules, such as DFHSIP, to run in supervisor state.

If your list(s) of APF-authorized libraries are specified in the dynamic format (in a PROGxx member), refresh the APF list dynamically using the SETPROG or SET PROG=xx command.

If your list(s) of APF-authorized libraries are specified in the static format (in IEAAPFx members), schedule an MVS IPL for the APF-authorization to take effect.

For information about maintaining lists of APF-authorized libraries, see the z/OS MVS Initialization and Tuning Guide.

When you prepare your startup job stream, provide a STEPLIB DD statement for the hlq.SDFHAUTH library. When you define your STEPLIB DD statement, remember that all other libraries concatenated with the hlq.SDFHAUTH library must also be APF-authorized. This is because, if any of the libraries in a STEPLIB concatenation are not authorized, MVS regards all of them as unauthorized.

The hlq.SDFHLOAD library contains only programs that run in problem state, and should not be authorized. The hlq.SDFHLOAD library must be included in the CICS DFHRPL library concatenation. There is an example of this library DD statement in the sample job stream provided in the CICS System Definition Guide.

For information about authorizing access to CICS data sets, see the CICS RACF Security Guide.
You should consider authorizing access to the following when planning your security requirements to run CICS:

**CICS PDS libraries**
Protect your CICS data sets that use RACF. See "Protecting CICS load module data sets."

**VTAM ACB**
Authorize each CICS region userid to OPEN the VTAM ACB for the region's specified APPLID. See "Authorizing access to a CICS region's VTAM ACB" on page 70.

**CICS system transactions**
Authorize each CICS region userid to access the CICS category 1 system transactions. See "Authorizing the region userid to access category 1 transactions" on page 71.

**SMSVSAM server**
Authorize each CICS region to open the SMSVSAM control ACB if you plan to use CICS with VSAM record-level data sharing. See "Authorizing access to an SMSVSAM server" on page 71.

**System logger log streams**
Authorize each CICS region userid to access the MVS system logger log streams that are used by CICS. See "Authorizing access to MVS log streams" on page 72.

**z/OS UNIX System Services**
Include an OMVS segment in the CICS region's user profile, specifying the UID parameter, to ensure that your CICS regions have the required access to z/OS UNIX system services. See "Authorizing CICS region userids to z/OS UNIX System Services" on page 74.

**RACF resource classes**
Activate the appropriate RACF resource classes to enable terminal users to access CICS resources and user-defined resources. See "Activating RACF resource classes" on page 75.

### Protecting CICS load module data sets

To prevent unauthorized or accidental modification of hlq.SDFHAUTH or hlq.SDFJAUTH, you should RACF-protect these libraries. Without such protection, the integrity and security of your MVS system are at risk. Additionally, if you require protection against the unauthorized use of DFHSIP, do not place this module in the LPA and do not include hlq.SDFHAUTH in the MVS LNKLST unless DFHSIP is RACF-protected as a controlled program with a profile in the RACF PROGRAM resource class.

You should also RACF-protect the other libraries (including hlq.SDFHLOAD) that make up the STEPLIB and DFHRPL library concatenations.

For information about authorizing access to CICS data sets, see "CICS RACF Security Guide"
Authorizing access to data set services modules

During initialization, CICS determines the availability of backup-while-open (BWO) support by linking to the callable services modules IGWAMCS2 and IGWABWO. CICS also checks the DFSMSdss (or DFDSSE) release level by linking to the module ADRRELVL. If access to this data set services module is controlled by means of RACF PROGRAM general resource profiles, security violation messages are issued against the CICS region userid, unless the userid is authorized to access ADR-prefixed module names.

You can avoid security violation messages against the CICS region userids, and still control access to data set services, as follows:

- If you have generic PROGRAM profiles protecting access to ADR modules, create a specific PROGRAM profile for the ADRRELVL module, and ensure your CICS region userids have READ access to this specific profile.
- Instead of using PROGRAM profiles to protect access to data set services, use one of the following methods:
  - Define suitable profiles in the DASDVOL general resource class.
  - Define profiles in the FACILITY general resource class that are supported by DFSMS to control access to data set services.

For information about using DASDVOL and FACILITY class profiles to control the uses of data set services, see the DFSMS/MVS DFSMSdss Storage Administration Reference, SC26-4929, and the DFSMS/MVS DFSMSdss Storage Administration Guide, SC26-4930.

Authorizing access to a CICS region’s VTAM ACB

You can control which users, among those who are running non-APF-authorized programs, can OPEN the VTAM ACB associated with a CICS address space (CICS region). This ensures that only authorized CICS regions can present themselves as VTAM applications that provide services with this APPLID, thus preventing unauthorized users from impersonating real CICS regions. (Note that the CICS region userid needs the OPEN access, not the issuer of the SET VTAM OPEN command.)

To enable CICS to start up with external security, you must first have authorized the CICS region userid to open the CICS region’s VTAM ACB with the applid specified on the APPLID system initialization parameter.

For each APPLID, create a VTAMAPPL profile, and give the CICS region userid READ access. For example:

```
RDEFINE VTAMAPPL applid UACC(NONE) NOTIFY(userid)
PERMIT applid CLASS(VTAMAPPL) ID(cics_region_userid) ACCESS(READ)
```

The correct CICS APPLID to specify in the VTAMAPPL class is the specific APPLID, as specified in the CICS system initialization parameters. If you are using XRF (that is, if CICS is started with XRF=YES in effect), you must define two VTAMAPPL profiles — one each for both the active and alternate CICS region’s specific APPLID (the second operand on the CICS APPLID startup option).

Notes:

1. The VTAMAPPL class must be active and RACLISTed for this protection to be in effect; for example:

   ```
   SETROPTS CLASSACT(VTAMAPPL) RACLIST(VTAMAPPL)
   ```
2. If a CICS region is not to use VTAM, you do not need to authorize the CICS region userid for the CICS applid.

3. If you do not control the opening of a CICS region’s VTAM ACB, a new VTAM application started with the same applid as that of a running CICS region has the following effect:
   - The running CICS region performs a FORCECLOSE of its VTAM ACB and issues message DFHZC0101.
   - The running CICS region either terminates or continues, depending on your use of the XXRSTAT exit. (The default is to terminate.) If the CICS region continues, it no longer uses VTAM.
   - The new application opens the VTAM ACB with the specified applid.
   - If the first running CICS region used VTAM persistent sessions, the new application recovers any VTAM sessions that persist from that CICS region.

For information about creating VTAMAPPL profiles for CICS region applids, see the CICS RACF Security Guide. For information about the XXRSTAT exit, see the CICS Customization Guide.

### Authorizing the region userid to access category 1 transactions

To enable CICS to start up with external security, you must first have authorized the CICS region userid to access the category 1 system transactions. If the region userid does not have this authority at CICS startup, CICS issues message DFHXS1113, and terminates.

To give the region userid the authority to access the category 1 system transactions, edit and submit the sample job stream in Figure 4 to execute the CICS-supplied sample CLIST, DFH$CAT1. This job uses the RACF commands in the CLIST to update the RACF database.

**Note:** Only a user with the RACF authority SPECIAL can execute the CLIST to update the RACF database.

```
//RACFMIG JOB 'accounting information',
  // CLASS=A, USER=userid, PASSWORD=password
//DEFINE EXEC PGM=IKJEFT01
//SYSPRINT DD SYSOUT=A
//SYSTSRT DD SYSOUT=A
//SYSUDUMP DD SYSOUT=A
//SYSTSPRT DD SYSOUT=A
EXEC 'CICSTS31.CICS.SDFHSAMP(DFH$CAT1)' LIST
/*

Figure 4. Batch job to execute the sample CLIST, DFH$CAT1
```

For information about category 1 transactions and about determining the CICS region userid, see the CICS RACF Security Guide.

### Authorizing access to an SMSVSAM server

In a test environment you might wish to use the default action and allow any CICS region using VSAM RLS to connect to an SMSVSAM server. If you wish to protect this access, the RACF SUBSYSNM general resource class must be active and you must authorize each CICS region that connects to an SMSVSAM server to have access to that server. This means granting access to the appropriate profile in the
RACF SUBSYSNM general resource class. You define profiles in the SUBSYSNM resource class to control access by subsystems like CICS that want to connect to SMSVSAM.

A SUBSYSNM profile name is the name by which a given subsystem, such as CICS, is known to VSAM. For CICS regions, you must use the CICS applid as the profile name in the SUBSYSNM general resource class.

When CICS attempts to register the control ACB during CICS initialization, SMSVSAM calls RACF to check that the CICS region userid is authorized to a profile name in the SUBSYSNM class that matches the CICS applid. If the CICS region userid does not have READ authority, the register fails.

For example, if the applid of a CICS AOR is CICSDAA1, and the CICS region userid (shared by a number of AORs) is CICSDA#, define and authorize the profile as follows:

RDEFINE SUBSYSNM CICSDAA1 UACC(NONE) NOTIFY(userid)
PERMIT CICSDAA1 CLASS(SUBSYSNM) ID(CICSDA#) ACCESS(READ)

You can use wildcard characters on the applid to specify more than one CICS region, for example:

PERMIT CICSD%%% CLASS(SUBSYSNM) ID(CICSDGRP) ACCESS(READ)

### Authorizing access to MVS log streams

There is no facility within CICS for controlling LOGSTRM security checks. This is controlled by the MVS security administrator activating the LOGSTRM and FACILITY general resource classes by means of the SETROPTS command.

Users of the IXCMIAPU administrative data utility and CICS regions both require appropriate authorizations to log streams and IXLSTR coupling facility structures.

### Authorizations for users of IXCMIAPU

You create log structures and define log streams using the IXCMIAPU administrative data utility to update the LOGR data set. To do this, your userid needs the appropriate level of authorization, as shown in the following examples:

**Coupling facility structures**

To define and delete log structures using IXCMIAPU, you need ALTER access to the LOGR resource profile named MVSADMIN.LOGR in the FACILITY general resource class. For example, use the following RACF command:

PERMIT MVSADMIN.LOGR CLASS(FACILITY) ACCESS(ALTER) ID(your_userid)

**Coupling facility log streams**

To define, delete, and update log streams (including log stream models) that are defined in coupling facility structures, you need:

- ALTER access to the appropriate log stream profile defined in the LOGSTRM general resource class
- UPDATE access to the coupling facility structure (IXLSTR) profile defined in the FACILITY general resource class (in this case, profile names are prefixed with IXLSTR).

For example, if the log stream and structure resource profiles are defined to RACF with the following commands:
use the following RACF commands to give your userid the required authorizations to these two profiles:

PERMIT log_stream_profile CLASS(LOGSTRM) ACCESS(ALTER) ID(your_userid)
PERMIT IXLSTR.structure_name_a CLASS(FACILITY) ACCESS(UPDATE) ID(your_userid)

Authorizations for CICS regions

If the LOGSTRM resource class is active, the level of authorization required depends on whether log streams are always explicitly defined to the MVS system logger.

Ensure that the CICS region userid is authorized to write to (and create if necessary) the log streams that are used for its system log and general logs (see Chapter 24, “Defining the logger environment for CICS journaling,” on page 143.) You do this by granting the appropriate access authorization to log stream profiles in the RACF LOGSTRM general resource class:

- If CICS is expected to create log streams dynamically, CICS must have ALTER authority to the relevant log stream (LOGSTRM) profiles, and UPDATE authority to the relevant coupling facility structure (IXLSTR) profiles. For example:

  PERMIT region_userid.applid.* CLASS(LOGSTRM) ACCESS(ALTER)
  ID(region_userid)
  PERMIT IXLSTR.structurename CLASS(FACILITY) ACCESS(UPDATE)
  ID(region_userid)

- If all the log streams that CICS writes to are already defined to MVS, CICS needs only UPDATE authority to the log stream profiles. For example:

  PERMIT region_userid.applid.* CLASS(LOGSTRM) ACCESS(UPDATE)
  ID(region_userid)

Note: In the above examples, region_userid.applid.* is the generic profile name of the log stream resource. These examples illustrate a resource name prefixed by the region userid and applid. region_userid is the CICS region userid under which CICS is running, either as a started task or batch job.

Permit READ access to those users who need to read the CICS log streams. You must permit UPDATE access to those users who need to update journals by granting the user the appropriate authority to the log stream (in the LOGSTRM resource class) and to the JOURNALNAME (in the JCICSJCT class).

The generic profile in the following example could be defined to cover all the log streams referenced by the CICS region identified by its region userid and applid:

RDEFINE LOGSTRM region_userid.** UACC(NONE)

If, however, you have multiple CICS systems sharing the same region userid, but with differing security requirements, include the applid in the generic profile, as follows:

RDEFINE LOGSTRM region_userid.applid.** UACC(NONE)

The following example allows the CICS region userid under which CICS is running to write journal and log records to log streams in the named coupling facility structure:

PERMIT IXLSTR.structurename CLASS(FACILITY) ACCESS(UPDATE)
  ID(region_userid)
The following examples give access to two categories of user:

\[
\text{PERMIT region_userid.applid.* CLASS(LOGSTRM) ACCESS(READ)}
\]

\[
\text{ID(authorized_browsers)}
\]

\[
\text{PERMIT region_userid.applid.* CLASS(LOGSTRM) ACCESS(UPDATE)}
\]

\[
\text{ID(archive_userid)}
\]

In these examples, \textit{archive_userid} is the userid under which an application program runs to purge old data from CICS logs when the data is no longer needed, and \textit{authorized_browsers} refers to the userids of users allowed to read log streams, but cannot purge data.

If several CICS regions share the same CICS region userid, you can make profiles more generic by specifying \textasteriskcenter{} for the \textit{applid} qualifier.

The number of profiles you define depends on the naming conventions of the logs, and to what extent you can use generic profiling.

### Authorizing CICS region userids to z/OS UNIX System Services

Some CICS facilities require access to z/OS UNIX System Services. These facilities are:

- CICS TCP/IP support provided by the CICS sockets domain when you specify TCPIP=YES as a system initialization parameter. This support is required if you are planning to use HTTP, IOP, and ECI services.
- The Java Virtual Machine (JVM). CICS JVM support is required for Java programs that specify JVM(YES) in their program resource definitions.
- EJB deployment.
- Using task-related user exits that are enabled with the OPENAPI option to exploit the CICS open transaction environment. This includes the task-related user exit of the CICS-DB2 attachment facility when CICS is connected to DB2 6.1 or later.

To ensure your CICS regions have the required access to z/OS UNIX system services, authorize the region userids by including an OMVS segment in the CICS region's user profile, specifying the UID parameter. In the OMVS segment, UID specifies the numeric user identifier.

When you are creating a new user profile for a CICS region userid:

- Add an OMVS segment with the UID parameter specified.
- Assign a home directory for the CICS region in the OMVS segment using the HOME parameter. For example, if the home directory is \texttt{/u/cicsht##}, specify:

\[
\text{HOME('/u/cicsht##')}\]

- Add a GID to the RACF group profile for the RACF group that is to be defined as the default group of the CICS region userid.
- Connect the CICS region's user ID to the RACF group that has the required GID.

For CICS region userids that already exist, add the OMVS segment information using the ALTUSER command. For example:

\[
\text{ALTUSER CICSHAA1 OMVS( UID(4127) HOME('/u/cicshaa1'))}\]

where CICSHAA1 is the CICS region userid of a CICS AOR that is initialized with TCP/IP support, 4127 is the UNIX System Services numeric user identifier of the CICS region, and \texttt{/u/cicshaa1} is the home directory.
For information about defining OMVS segment parameters in a user profile, see the `z/OS Security Server RACF Command Language Reference`, SA22-7687.

For information about defining UNIX system services users, see the `z/OS UNIX System Services Planning`.

### Activating RACF resource classes

Before you can use RACF for CICS resources and for user-defined resources, you must activate the associated RACF resource classes by using the RACF SETROPTS command.

To run the CICS-supplied IVPs with external security, you must activate the resource classes for CICS resources.

To use your own user-defined resources with external security in your CICS environment, you must:

- Define resource classes for your resources.
- Activate the resource classes.
- Optionally RACLIST resource classes to be used for QUERY SECURITY commands. This builds in-storage profiles for those resource classes.

For information about RACF resource classes, see the `CICS RACF Security Guide`.
Chapter 8. Defining the default CICS userid to RACF

If you intend using RACF to authorize terminal users to access CICS resources, you should define a default CICS userid to RACF and specify it on the CICS system initialization parameter, DFLTUSER. This default userid assigns the security attributes to be used for all CICS terminal users who do not sign on with the CESN transaction (or a user-written equivalent).

During startup, CICS tries to sign on the default userid. If it is not signed on (for example, if not defined), CICS issues message DFHSN0701 and terminates CICS initialization. After the valid default CICS userid is signed on, its security attributes are used for all CICS terminal users who do not sign on with the CESN transaction. If the default userid is defined to RACF with a CICS segment, the operator attributes in that segment are also used for users who do not sign on.

For information about defining the userid to RACF, see the CICS RACF Security Guide.

Chapter 9. Installing CICS-required modules in the MVS linklist

There are two categories of modules that CICS loads from the MVS linklist:
1. CICS-supplied modules
2. Modules of other MVS products (for example, DFSMS)

CICS-supplied modules required in the MVS linklist

CICS supplies the modules listed below in the hlq.SDFHLINK library, where hlq is defined by the LINDEX parameter in the DFHISTAR installation job.

- **AMDUSREF**: Alias of DFHTG640.
- **AXMSC**: AXM server connection routines for CICS data sharing servers.
- **AXMSI**: AXM subsystem initialization routine for CICS data sharing servers.
- **DFHDTCV**: Connection validation subroutine for shared data tables.
- **DFHDTSCVC**: Shared data tables SVC services.
- **DFHGTCNV**: Subroutine used by LOGR subsystem interface.
- **DFHLGCNV**: Exit routine for LOGR subsystem interface.
- **DFHMVRMS**: General MVS RESMGR exit stub.
- **DFHNCIF**: Named counter server interface.
- **DFHNCOPT**: Named counter server options.
- **DFHPD640**: Dump formatting routine for use with IPCS.
- **DFHRPDUF**: System dump formatting routine for ONC RPC.
- **DFHRPTPI**: Trace interpretation routine for ONC RPC.
- **DFHRXSVC**: RRS domain authorized services.
- **DFHSNDFY**: RACF CICS segment changes notification routine.
- **DFHSNPTO**: CICS RACF dynamic parse TIMEOUT keyword print routine.
- **DFHSNVCL**: CICS RACF dynamic parse OPCLASS validation routine.
- **DFHSNVID**: CICS RACF dynamic parse OPIDENT validation routine.
- **DFHSNVPR**: CICS RACF dynamic parse OPPTRY validation routine.
- **DFHSNVTO**: CICS RACF dynamic parse TIMEOUT validation routine.
- **DFHSSIN**: CICS subsystem that initializes the console message handling facilities.
- **DFHSSMGT**: CICS subsystem message table that contains the text of messages for the subsystem interface modules.
- **DFHTG640**: Link module for the CICS GTF trace printing load module DFHTRGTF.
- **DFHTR640**: Link module for the CICS GTF trace printing load module DFHTR640.
- **DFHTT640**: Link module used for trace interpretation.
**Note:** It is not essential that DFHTT640 be included in the MVS Linklist, although it is recommended for the reasons given at the end of this list. If it is not in the linklist, an APF authorized library in the STEPLIB concatenation of the batch job is needed for every job which needs the module.

**DFHXCSVC**  
External CICS interface (EXCI) SVC services routine.

These modules are supplied in an APF-authorized library in the MVS linklist because:
1. They can be required by non-CICS regions such as batch jobs or a CICS data sharing server.
2. They must be consistent across several CICS regions.
3. They can be required by both CICS and non-CICS regions.
4. The RACF dynamic parse routines are required by the Security Administrator who executes the ADDUSER or ALTUSER commands under TSO. For information about the RACF interface routines, see the *CICS RACF Security Guide*.

These modules are in the *hlq.SDFHLINK* library when you install CICS.

Ensure the modules supplied in SDFHLINK are available from an APF-authorized library in the MVS linklist by:
- Adding these modules, as required, to an existing APF-authorized library defined in the MVS linklist, or
- Defining SDFHLINK itself as an APF-authorized library and including it in the MVS linklist.

---

**Compatibility with earlier CICS releases**

Unless otherwise stated, the CICS Transaction Server for z/OS, Version 3 Release 1 levels of the modules in SDFHLINK are compatible with earlier releases of CICS. The CICSPlex SM modules in SEYULINK are not compatible with earlier releases. CICSPlex SM modules in SEYULINK are release specific. See "Updating the MVS linklist" on page 284 for more information about CICSPlex SM linklist modules.

**Note:** DFHPD640, DFHTG640, DFHTR640, and DFHTT640 are release dependant. If you run more than one release of CICS, ensure the correct versions are available (for example, DFHPD630 for CICS TS for z/OS, Version 2.3, DFHTG530 for CICS TS OS/390, Version 1 Release 3).

**CICS shared data tables modules for the MVS linklist**

CICS supplies the following modules, for the shared data tables facility, in the *hlq.SDFHLINK*. If you intend using the shared data tables facility, ensure that these modules are available in the MVS linklist or the MVS link pack area:
- DFHDT SVC and DFHDTCV, because all regions using shared data tables must use the same level of SVC code
- DFHMVRMS, the RESMGR exit stub, because CICS JOBLIB/STEPLIB data sets are unavailable at end-of-memory
There are some DFSMS modules that CICS loads from the MVS linklist. This requirement is either dependent on the function you are using (such as backup-while-open (BWO) support), or on the release of DFSMS. The modules are:

**IGWABWO**

This module, supplied in the MVS callable services library, SYS1.CSSLIB, is loaded by CICS from the MVS linklist if you are using BWO for files accessed in non-RLS mode.

**Note:** In addition to IGWABWO being in the linklist, IGWAMCS2 must be installed in the LPA. CICS tests for the presence of this module in the LPA to determine that BWO support is present in the MVS image before attempting to load IGWABWO.

For files that are accessed in RLS mode, CICS does not require IGWABWO or IGWAMCS2.

**IGWARLS**

CICS loads this module, supplied in the MVS callable services library SYS1.CSSLIB, from the MVS linklist. CICS issues the following message if it can not load IGWARLS:

```plaintext
DFHFC0116 APPLID THE LOAD OF CALLABLE SERVICE IGWARLS HAS FAILED WITH RETURN CODE X'EEEE'.
```

CICS initialization fails if CICS cannot load this callable services module.
Chapter 10. Defining CICS as an MVS subsystem

CICS must be defined as an MVS subsystem before you can use any of following facilities:
- The console message-handling facility
- Multiregion operation (MRO)
- CICS shared data tables
- External CICS interface (EXCI).
- Extended restart facility (XRF)

Also, if you are running CICS with XRF in a multi-MVS environment or a two-CPC (central processing complex) configuration, defining CICS as an MVS subsystem can reduce operator intervention during takeover if MVS or a CPC fails while more than one CICS is running.

For information about the console message-handling facility see "The console message-handling facility" on page 86.

For information about MRO, see the CICS Intercommunication Guide.

Defining CICS as an MVS subsystem involves three members of the SYS1.PARMLIB partitioned data set: IEASYSxx, IEFSSNaa, and DFHSSIyy. You only need member DFHSSIyy if you want the console message-handling facility.

Note: aa,xx,yy represent suffixes that are used to distinguish different versions of members of the SYS1.PARMLIB library.

Note that if you intend to start CICS with the START command you must either:
- Give the MVS started task procedure a name different from the subsystem name in IEFSSNaa (default 'CICS'), or
- Issue the start command with the parameter SUB=JES2 or SUB=JES3 as appropriate.

For more information about the subsystem interface, see the z/OS MVS Using the Subsystem Interface.

The following topics cover:
- "The IEASYSxx MVS initialization member"
- "The IEFSSNaa MVS subsystem initialization member" on page 84
- "The SYS1.PARMLIB(BPXPRMxx) parameters" on page 84
- "The console message-handling facility" on page 86
- "EXCI pipe allocation" on page 91

The IEASYSxx MVS initialization member

In an IEASYSxx member (of the SYS1.PARMLIB library) used for MVS initialization, include the parameter SSN=aa, where aa refers to the SYS1.PARMLIB member IEFSSNaa that contains the definitions for all subsystems needed for this IPL of MVS, including the definition of CICS as an MVS subsystem.
The IEFSSNa MVS subsystem initialization member

To define CICS as an MVS subsystem, code an entry in the IEFSSNa member in the SYS1.PARMLIB library. If you want to use the console message handling facility, or to change the number of pipes that can be allocated in an EXCI address space, code the entry by using one of the following methods:

CICS,DFHSSIN,DFHSSIyy

or

SUBSYS SUBNAME(CICS)
INITRTN(DFHSSIN)
INITPARM(DFHSSIyy)

This entry is used for every CICS region, that you have IPLed with this version of the IEFSSN member, that runs under MVS. You do not have to specify both DFHSSIN and DFHSSIyy, however apart from the suffix yy, you must code the entry for each parameter using the exact format given in the example. The meanings of the terms are as follows:

**CICS** is the name of the CICS subsystem.

**DFHSSIN** is the name of the CICS subsystem routine that initializes the console message-handling facilities, and the number of pipes that can be allocated in an EXCI address space. If you omit this name, CICS is defined as an MVS subsystem, but none of the console message-handling facilities are enabled, and the default number of pipes, that can be allocated in an EXCI address space will be used.

That default is 100.

**DFHSSIyy** is the name of a SYS1.PARMLIB member, described below, in which you have defined initialization parameters for message-formatting and EXCI pipe allocation for the CICS subsystem. If you specify DFHSSIN but omit DFHSSIyy, the DFHSSIN routine tries to use the parameters that are defined in member DFHSSI00.

If the DFHSSI00 member does not exist, the routine uses the default values.

- For message formatting these are defined in the DFHSSIN member. They are described in "Default message-formatting initialization parameters" on page 88.

- For EXCI pipe allocation, this is the fixed default value, 100.

The IEFSSNa member in the SYS1.PARMLIB library also contains the definitions for all the other subsystems needed for this IPL of MVS, for example JES2, IRLM, and DATABASE 2 (DB2).

The SYS1.PARMLIB(BPXPRMxx) parameters

Use of certain CICS functions and running a large number of CICS systems in an LPAR mean that the default options, shipped in the BPXPRMxx members of SYS1.PARMLIB, are not sufficient. You must review the default options for the following functions:

- C and C++ programs compiled using the XPLINK compiler option.
- Programs that run on open TCBs and use APIs other than the CICS API.
- SSL TCBs specified by the MAXSSLTCBS SIT parameters.
- Java or JVM programs
Both the use of XPLINK and of non-CICS APIs require some increase to the MAXPROCUSER and MAXPROCSYS values. If CICS is configured to use SSL, you might need to increase the MAXTHREADS and MAXTHREADTASKS values. These should exceed the MAXSSLTCBS SIT parameter.

If your system uses two or more of these facilities, corresponding further increases in the values for these parameters is appropriate.

The z/OS MAXPROCSYS parameter specifies the maximum number of processes that can be active at the same time, and allows you to manage system resources by limiting the number of processes that the system is to support. If you set the MAXPROCSYS value too low, regions might abend because CICS cannot create a process when attempting to attach a TCB. However, avoid setting the MAXPROCSYS value too high because this value is shared between all the address spaces in a z/OS system.

CICS uses at least two processes for each CICS region, which means that if you have a large number of CICS regions, you must set your system limit to handle these processes. The following table explains which TCBs become processes, depending on the CICS system:

<table>
<thead>
<tr>
<th>TCB</th>
<th>Is the TCB always a process?</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Jobstep</td>
<td>Yes</td>
<td>The jobstep TCB is always created.</td>
</tr>
<tr>
<td>SO</td>
<td>Yes</td>
<td>The SO TCB is always created.</td>
</tr>
<tr>
<td>SL</td>
<td>No</td>
<td>The SL TCB is created unless the system initialization parameter, TCPIP=NO, is specified.</td>
</tr>
<tr>
<td>QR</td>
<td>No</td>
<td>The QR TCB becomes a process when an OTE TCB is attached (that is; L8, L9, J8, J9, X8, or X9).</td>
</tr>
<tr>
<td>SP</td>
<td>No</td>
<td>The SP TCB becomes a process, and the associated S8 TCBs are created and become threads only when SSL is used.</td>
</tr>
<tr>
<td>JVM (J8 and J9)</td>
<td>No</td>
<td>The number of J8 or J9 TCBs is controlled by the MAXJVMTCBS SIT parameter. J8 and J9 TCBs running active JVMs require one process each.</td>
</tr>
</tbody>
</table>

In summary, there is always a minimum of two processes for each CICS region, up to a minimum of seven processes for each region, depending on which additional TCBs you are running.
You can issue the following command to give you a list of the processes that are running on your system:

```
D OMVS, A=addressspaceid
```

*addressspaceid* is the address space that you want to query.

If you run this command at system startup, and again when your system has stabilized; for example, when peak J8 and J9 TCBs are running, you can calculate the most appropriate number for MAXPROCSYS.

For more information about changing BPXPRMxx parameters, monitoring system limits and calculating values for system resources, see *z/OS Unix System Services Planning*.

**The console message-handling facility**

The console message handling facility is an optional feature of the CICS subsystem that can affect the appearance of CICS messages displayed on an MVS console. It is effective when you specify FORMATMSG=YES as an initialization parameter for the CICS subsystem. The subsystem reformatting is enabled when at least one of the following is executing in the MVS image where the subsystem is defined:

- Any version of CICS Transaction Server
- Any earlier version of CICS since CICS/MVS version 2 release 1.2
- A message automation subsystem (such as NetView®) which enables the MVS subsystem console message broadcasting service

When this facility is used, it affects the messages that are displayed on MVS system consoles in the following ways:

- The subsystem tries to ensure that all console messages issued by all CICS regions have a standard format. The format is:
  
  ```
  +DFHnnnn APPLID MESSAGE-TEXT
  ```

  In this message:

  - **+DFHnnnn**
    - begins in column 1
    - The “plus” sign (+) which preceeds **DFHnnnn**, is added by MVS to indicate that a problem-state program issued the message. It is not present when CICS issues the message while it is in supervisor state.

  - **APPLID**
    - begins in column 13
    - The applid inserted into the message is the specific application identifier. This is the identifier that is specified in the system initialization parameter APPLID. It is the only operand when XRF=NO is also specified, or the second operand when XRF=YES is also specified.

  - **MESSAGE-TEXT**
    - begins in column 22.

- The subsystem adds routecodes specified in the ROUTECODE subsystem initialization parameter, so the messages might be sent to more destinations.

- The subsystem reformats messages for all CICS releases, even those issued by CICS/OS/VS version 1.
• The subsystem does not reformat messages that are issued by a CICS region that has not yet determined its applid. This includes messages that are issued while processing the system initialization table and its overrides.

• The subsystem routine that reformats the messages does not receive control until after the message has been recorded in the CICS job log. Therefore, the reformatting is not usually apparent in the job log.

• Messages issued by the message domain already contain the applid. The subsystem does not insert the applid into such messages, but it might insert blank characters to cause alignment into standard locations.

• If the original CICS message is a long one, adding the applid might cause the message to exceed the maximum length for an MVS console message. In this case, the original message is suppressed (does not appear on the console), and the reformatted message is issued using the MVS multiple-line console message service to split the message over several lines. Both the original message and perhaps several instances of the reformatted multiple-line message appear in the job log, but only one copy of the reformatted message is displayed on the console.

• For some messages where the applid normally follows a time and date stamp, inserting the applid in the standard position would have resulted in the applid being duplicated within the message. For these messages, the subsystem eliminates the time and date stamp, because these are available from other sources, and only one occurrence of the applied is shown.

The DFHSS1yy message-formatting initialization member

You can specify message-formatting initialization parameters for the CICS subsystem in a member DFHSS1yy of the SYS1.PARMLIB library, where yy is the suffix that identifies the SYS1.PARMLIB member used to define the CICS subsystem. These parameters, described in this section, are FORMATMSG, HIDEPASSWORD, and ROUTECODES. Code the parameters in columns 1 through 71 of the DFHSS1yy member, for example:

```
FORMATMSG=YES,HIDEPASSWORD=YES,ROUTECODES=(1,2)
```

or

```
FORMATMSG=YES
HIDEPASSWORD=YES
ROUTECODES=(1,2,3,4,5,6)
```

```
FORMATMSG={YES|NO}
```

Specifies whether the CICS applid is to be inserted into all DFH console messages that do not use the CICS message domain.

YES

Insert CICS applid into messages.

NO

Do not insert CICS applid into messages.

```
HIDEPASSWORD={YES|NO}
```

Specifies whether to mask the password from MODIFY commands used to enter the CICS signon transaction at an MVS console.

YES

Mask the password.

NO

Do not mask the password.
ROUTECODES=(n1 [,n2] ....)

n1, n2... are numbers representing generic routecodes that are added to all DFH console messages issued by CICS. The routecodes 1-12 have special meanings:

1 Master console action.
2 Master console information.
3 Tape pool.
4 Direct access pool.
5 Tape library.
6 Disk library.
7 Unit record pool.
8 Teleprocessing control.
9 System security.
10 System error/maintenance.
11 Programmer information.
12 Emulators.

The status of other routecodes is as follows:

13-20 Available for customer use.
29-40 Reserved.
41-128 Available to authorized programs only.

For more information about these routing codes, see the z/OS MVS Initialization and Tuning Reference manual for your version of MVS.

Default message-formatting initialization parameters

You can define message-formatting initialization parameters for the CICS subsystem in a member DFHSSIyy of the SYS1.PARMLIB library.

To use parameters defined in a DFHSSIyy member other than the DFHSSI00 member, you must specify DFHSSIyy on the IEFSSNaa member in the SYS1.PARMLIB library used to define CICS as an MVS subsystem. If you do not specify DFHSSIyy, the DFHSSIN routine tries to use the parameters that are defined in the DFHSSI00 member. If the DFHSSI00 member does not exist, it uses the default parameters that are defined in the DFHSSIN routine.

If you specify DFHSSIyy but it does not exist, the DFHSSIN routine uses the default message-formatting initialization parameters that are defined in the DFHSSIN routine.

The default message-formatting initialization parameters defined in the DFHSSIN routine are:

FORMATMSG=YES, HIDEPASSWORD=YES
(generic routecodes are not added to messages)

The default facilities:

- Insert the CICS applid into the CICS console message between the message identifier and the message text. The applid is inserted into only those console messages (starting with DFH) that do not use the CICS message domain. The CICS message domain inserts the CICS applid into all messages that it handles.

If the original message is a long one, inserting the CICS applid might cause the message to exceed the maximum length for an MVS console message. In this case, the original message is suppressed (that is, does not appear on the console), and the reformatted message is issued using the MVS multiple-line console message service to split the message text over several lines. Both the...
original message and perhaps several instances of the reformatted multiple-line message appear in the job log, but only one copy of the reformatted message is displayed on the console.

- Examine each MODIFY command to see if it resembles a MODIFY CICS,CESN ... command. If the MODIFY command contains an old or new password (PS=xxxx,NEWPS=xxxx), the default facilities obliterate the password with asterisks. If the MODIFY command does not contain a password, the password you enter at the MVS console is masked.

**Note:** If your primary subsystem is JES3, the old and new passwords still appear in the JES3 hardcopy log. JES3 records the MODIFY command before the CICS message formatting subsystem can obliterate the password. (This does not happen when the primary subsystem is JES2.) The passwords are suppressed from the console for both JES2 and JES3. For information about the CESN transaction, and about how to prevent passwords from appearing in the hardcopy log, see the [CICS Supplied Transactions Manual](#). If you do not specify DFHSSIN in the IEFSSNaa entry that defines CICS, the message handling facilities are not enabled. Also, if you run CICS as a started task, you cannot use the name "CICS" for the procedure name.

### Activating message formatting

After you have defined CICS as an MVS subsystem with support for the console message-handling facility (and have specified the message-formatting parameters in the DFHSSIyy member of the SYS1.PARMLIB library), the message-handling facility is activated by the next MVS subsystem to invoke the subsystem console message broadcasting service of MVS console support. This occurs when you start up a supported CICS region (see "The console message-handling facility" on page 86 for a list) or if an automated-operation program, such as NetView, is active in the MVS image.

A newly-started CICS region determines its own applid during initialization. Until the applid is known, the message-formatting facility cannot operate. Therefore, messages issued very early in CICS initialization are not formatted.

### Modules needed to use the console message-handling facilities

To use the console message-handling facilities that are provided by the MVS subsystem functions of CICS, the following CICS modules must be available at MVS IPL time:

**DFHSSEN**

The module that cleans up CICS resources at end-of-memory and at end-of-task.

**DFHSSGC**

The subsystem generic connect module that connects an active CICS region to the CICS subsystem.

**DFHSSIN**

The CICS subsystem initialization module.

**DFHSSMGT**

The subsystem message table that contains the text of messages for the subsystem interface modules.

**DFHSSWT**

The subsystem interface write-to-operator (WTO)
router that determines whether WTO calls should be routed to the appropriate CICS-dependent modules.

These modules must reside in the LPA or in an APF-authorized library in the MVS linklist, as follows:

- The modules DFHSSIN and DFHSSMGT, installed in the hlq.SDFHLINK library, must reside in an APF-authorized library in the MVS linklist.
- The DFHSSEN module installed in the hlq.SDFHLPA library, must reside in the LPA.
- The modules DFHSSGC and DFHSSWT, installed in the hlq.SDFHLPA library, must reside either in the LPA or in an APF-authorized library in the MVS linklist.

Note: hlq is defined by the LINDEX parameter in the DFHISTAR installation job.

The current versions of these modules are compatible with earlier CICS releases that support console message handling.

For information about adding modules that are installed in the hlq.SDFHLINK library to the MVS linklist, see Chapter 9, “Installing CICS-required modules in the MVS linklist,” on page 79.

For information about adding modules installed in the hlq.SDFHLPA library to the LPA, see Chapter 14, “Installing CICS modules in the MVS link pack area,” on page 107.

Coexistence considerations
To use the message-handling facilities for CICS, you should note the following coexistence considerations:

Automated-operation programs
If your automation system needs to see the console messages before they are reformatted by CICS, its subsystem definition should be placed in IEFSSNXX before the definition for CICS. But if your automation system needs to see the reformatted messages, its definition must come after that of CICS. Consult the documentation of your automation package to determine which applies to you.

Other CICS releases
If the message-handling facility has been defined to MVS (by the CICS entry in the IEFSSNaa member of the SYS1.PARMLIB library), CICS regions running earlier releases of CICS in the same MVS image have the full benefit of the message handling that has been defined if either of the following is true:

- An automated-operation program, such as NetView, is active in the MVS image.
- A CICS region that supports message handling (see "The console message-handling facility" on page 86 for a list) is running in the same MVS image.

Note: A consequence of console messages now having a standard format is that they no longer include date, time and informational messages. If you use these as a token, you must make a change to the code so that it looks for a different token.
EXCI pipe allocation

The external CICS interface is an application programming interface that enables a non-CICS program (a client program) running in MVS to call a program (a server program) running in a CICS region and to pass and receive data by means of a communications area. The CICS application is invoked as though it is linked to by another CICS application program.

This programming interface allows a user to allocate and open sessions or pipes, which operate in "half-duplex", flip-flop mode, to a CICS region and to pass a distributed program link (DPL) requests over them. The multiregion operation (MRO) facility of CICS interregion communication (IRC) supports these requests, and each pipe maps onto one MRO session, where the client program represents the sending process and the CICS server region represents the receiving process. There is a default limit of 100 pipes for each EXCI address space.

The DFHSSlyy initialization member

You can specify the EXCI pipe allocation limit for the CICS subsystem in a member DFHSSlyy of the SYS1.PARMLIB library, where yy is the suffix that identifies the SYS1.PARMLIB member used to define the CICS subsystem. The parameter, described in this section, is LOGONLIM. Code the parameter in columns 1 through 71 of the DFHSSlyy member, for example:

```
LOGONLIM=200
```

LOGONLIM=nn

The minimum and maximum values that can be specified for nn are 100 and 250.

If the parameter is omitted, or the value specified lies outside the allowed range, then CICS will assume a limit of 100. You should code the parameter only if you want to increase the limit from the default value of 100.

The EXCI pipe allocation limit

CICS will publish the limit if it is determined during subsystem initialization. It will do so by creating a system level name token pair formatted as follows:

```
Name: input, fixed length 16 byte type
Bytes 0-7: The character string 'DFHIRP '
Bytes 8-15: The character string 'LOGONLIM'
Token: output, fixed length 16 byte type
Bytes 0-3: The logon limit, held as fullword binary
Bytes 4-15: Reserved, set to nulls
```

You can use the callable service, IEANTRT, to retrieve the token. To do this, invoke IEANTRT with level IEANT_SYSTEM_LEVEL (EQU 4). The return code is interpreted as follows:

```
0 The name/token pair exists and the token has been retrieved. The logon limit can be extracted from the token.
4 The name/token pair does not exist. The logon limit is assumed to be 100.
```

Any other value indicates that the callable service has detected an error.

Default EXCI pipe allocation limit initialization parameter

You can define the EXCI pipe allocation limit parameter for the CICS subsystem in a member DFHSSlyy of the SYS1.PARMLIB library.
To use parameters defined in DFHSSIyy member other than the DFHSSI00 member, you must specify DFHSSIyy in the IEFSSNaa member in the SYS1.PARMLIB library used to define CICS as an MVS subsystem.

- If you do not specify DFHSSIyy, the DFHSSIN routine tries to use the parameters that are defined in the DFHSSI00 member.
- If the DFHSSI00 member does not exist, it uses the default parameters that are defined in the DFHSSIN routine.
- If you specify DFHSSIyy but it does not exist, the DFHSSIN routine uses the default parameters that are defined in the DFHSSIN routine.

The default EXCI pipe allocation initialization parameter defined in the DFHSSIN routine is LOGONLIM=100. You should code the parameter only if you want to increase the limit from the default of 100.
Chapter 11. Installing the CICS Type 3 SVC

Install the current level of the CICS Type 3 SVC, DFHC SVC, before you attempt to start a region. To install the CICS Type 3 SVC:

1. Define the DFHC SVC module to MVS. (See "Defining the CICS SVCs to your MVS.")
2. Install the DFHC SVC module into the LPA.

   **Do not change DFHC SVC attributes**

   Do *not* relink-edit the DFHC SVC module in order to install it into the LPA. The term *install* means move or copy a module into the LPA by using SMP/E, or a copying method that re-blocks the copied modules when the target data set has a smaller block size than the data set you are copying from.

   The DFHC SVC module, as supplied, has the attributes AMODE(31) and RMODE(ANY); do *not* change these attributes.

For further information about installing the DFHC SVC module in the LPA, see Chapter 14, "Installing CICS modules in the MVS link pack area," on page 107.

3. Specify the DFHC SVC number on the CICSSVC system initialization parameter.

   The current version of the CICS SVC module is compatible with all earlier releases of CICS, which enables you to run your earlier CICS regions with current regions in the same MVS image.

   CICS contains a test to verify that it is using the correct level of the CICS DFHC SVC module. If CICS calls an SVC module using the SVC number specified on the CICSSVC system initialization parameter, and the module is not at the current level, CICS issues message DFHKE0104. As a result of this message, CICS either abends with a system dump, or prompts the operator to enter an alternative SVC number, depending on the option specified on the PARMERR system initialization parameter.

**Defining the CICS SVCs to your MVS**

You define both the CICS Type 3 SVC and the HPO SVC to your MVS system by specifying SVCPARM statements.

You must define the CICS SVCs in an IEASVCxx member of the SYS1.PARMLIB library, using SVCPARM statements. See the [z/OS MVS Initialization and Tuning Guide] and [z/OS MVS Initialization and Tuning Reference] manuals for a description of the SVCPARM statements. If you are using the default SVC numbers, the CICS entries are as follows:

```
SVCPARM 216,REPLACE,TYPE(3),EPNAME(DFHC SVC)  
SVCPARM 215,REPLACE,TYPE(6),EPNAME(DFHHPSVC)  [Only required for HPO]
```

For the current SVC modules, you must specify the EPNAME parameters as in the sample CICS entries.

**Note:** If you have a version of the DFHHPSVC module from an earlier release of CICS already link-edited into your MVS nucleus, you do not need to replace it with the latest version. Versions of the DFHHPSVC module from earlier
releases of CICS are compatible with the current release. The CSECT name (EPNAME) of the version of the DFHHP SVC module from earlier releases is IGC215 (or IGCnnn, if SRBSVC=nnn was used as a CICS system generation parameter in the earlier release).

If you are not using the default SVC numbers, change the values 215 and 216 to the SVC numbers you have chosen.

You select the required IEASVCyy member by coding the SVC parameter (SVC=yy) in a SYS1.PARMLIB member (IEASYSxx) which you use to IPL your MVS. When you code new SVC numbers, they do not come into effect until you next IPL your MVS.

Using more than one version of the CICS Type 3 SVC

You may need to use more than one version of the CICS Type 3 SVC, for example to test service applied to the DFHCSVC module while using the current version in a production system.

You can run several CICS regions, at different release levels, in the same MVS image, with each region using its own version of the CICS SVC. However, if some of those regions use MRO, all regions that use MRO must use the latest CICS Type 3 SVC (DFHCSVC module) and the latest DFHIRP module. For information about using the latest SVC with earlier releases of CICS, see “MRO between different CICS releases with a changed SVC number” on page 95 and a pre-Version 3 Installation Guide.

To use more than one version of the CICS SVC, rename the new SVC module in the LPA, then respecify the SVC in the SVCPARM statements, as outlined in “Defining the CICS SVCs to your MVS” on page 93. To rename the new CICS SVC module, use the renaming facility of ISPF or IEBCOPY, or the TSO command RENAME, renaming the module to a unique name of your choice. We recommend that you use SMP/E to rename the CICS SVC module in the SDFHLPA library. Use the SMP/E RENAME command to inform SMP/E of the change to the name of the CICS SVC module. Therefore, if you later use SMP/E to apply service to that module, the service is applied to the renamed module in the LPA, not the DFHCSVC module.

For example, you might want to use an SVC number 255 for a test CICS region, as well as the default CICS SVC number 216 for your production system:

1. Create and apply an SMP/E USERMOD to RENAME the new CICS SVC module:
   
   ```
   ++USERMOD(umod1).
   ++VER(CICS) FMID(HCI16400).
   ++RENAME (DFHCSVC) TONAME(newname).
   ```

2. You could then specify the number 255 for the new CICS SVC version by adding an appropriate statement to the list of SVCPARM statements. That list would then read:

   ```
   SVCPARM 216,REPLACE,TYPE(3),EPNAME(DFHCSVC)
   SVCPARM 215,REPLACE,TYPE(6),EPNAME(DFHHP SVC)  [Only required for HPO]
   SVCPARM 255,REPLACE,TYPE(3),EPNAME(newname)   [New CICS SVC version]
   ```

   **Note:** The EPNAME parameter for the new CICS SVC specifies the module name, not the CSECT name, for the new CICS SVC module.
All the SVCPARM statements apply to the same IEASVCxx member of the SYS1.PARMLIB library.

3. Re-IPL MVS to enable all the SVC versions specified in the SVCPARM statements. After you re-IPL MVS, you can use both versions of the CICS SVC, as long as both regions do not use MRO concurrently. If both systems use MRO, only the new, latest, version of the SVC (and the latest DFHIRP module) is used by both regions.

4. In the system initialization table (SIT) for your production system, specify (by the system initialization parameter CICSSVC) the number of the current CICS SVC. Similarly, in the SIT for your test system, specify the number of the new CICS SVC version.

---

**MRO between different CICS releases with a changed SVC number**

If a CICS TS region, and other CICS regions from earlier releases, in the same MVS image use MRO, all the regions must use the CICS TS SVC module. If when you install the CICS TS SVC in the LPA, you give the SVC a number different from the number defined to the earlier CICS regions, you must respecify the SVC number. On each earlier release CICS region to use the CICS TS SVC, specify the new SVC number on the CICSSVC system initialization parameter.
Chapter 12. Selecting the high-performance option

The high-performance option (HPO) is for users whose top priority is to optimize terminal response times and maximize transaction throughput. HPO improves performance by reducing the transaction path length; that is, the number of instructions needed to service each request.

Note: Use of HPO potentially allows CICS application programs to bypass all MVS integrity controls. If you decide to use HPO, ensure that the application programs used on your CICS system meet your own installation's integrity requirements.

The code to support the VTAM authorized path feature of HPO (the improved path through VTAM) is in CICS.

Defining DFHHPSVC to MVS

The DFHHPSVC module must be defined to MVS as a Type 6 SVC; the default HPO SVC number defined in the DFHSIT module is 215. If you want to change the default Type 6 SVC number:

1. Define the new number to MVS. (See Defining the CICS SVCs to your MVS on page 93.)
2. Define the new number to CICS by using the SRBSVC system initialization parameter.

If you are not using HPO, you should not load the DFHHPSVC module into the MVS nucleus. You choose to use HPO explicitly by coding HPO=YES in the system initialization table (SIT).

Loading module DFHHPSVC

Before you can use HPO, ensure that the HPO SVC module is included in the MVS nucleus by one of the following methods:

1. Copy the DFHHPSVC module into SYS1.NUCLEUS, renaming it to IGC215 or the appropriate name if you are not using the default, and specify it on an INCLUDE statement in the NUCLSTxx member of the SYS1.PARMLIB library. (You must also specify the name of the NUCLSTxx member on the NUCLST statement of the LOADxx member of the SYS1.PARMLIB library.) The NUCLSTxx method provides you with greater flexibility in customizing the MVS nucleus than the NMLDEF method described in the method 2.

2. Copy the DFHHPSVC module into SYS1.NUCLEUS and specify it in a nucleus module list (NML) for CICS, created using the NMLDEF macro shown in the sample job in Figure 5 on page 98. This NML selects the CICS members in SYS1.NUCLEUS that are to be loaded into the MVS nucleus, and eliminates the need for the MVS nucleus to be re-link-edited for the DFHHPSVC module (or any other module needed in the MVS nucleus).

For further information about coding a NUCLSTxx member, and about a comparison with using the NMLDEF macro, see the z/OS MVS Initialization and Tuning Guide. For information about coding an NMLDEF macro, see the z/OS MVS Programming: Authorized Assembler Services Reference Vol 3 manual.
Removing existing DFHHPsvc modules from the MVS nucleus

You can remove a link-edited version of the DFHHPsvc module (for an earlier release of CICS) from the MVS nucleus by running a link-edit job to replace the existing version of the nucleus with one that does not contain the module to be removed.

Notes:

1. If the existing nucleus-resident DFHHPsvc module is known to SMP/E, use the SMP/E UCLIN statement to remove the module entry.
2. You must link-edit the nucleus module, IEANUC0x, with the scatter (SCTR) attribute. If you do not do this, MVS enters a non-restartable wait state at system initialization.
3. If you have a version of the DFHHPsvc module from an earlier release of CICS already installed in your MVS nucleus, you do not need to replace it with the latest version. Versions of the DFHHPsvc module from earlier releases of CICS are compatible with the current release.

Figure 5. Sample job stream to load the CICS Type 6 SVC into the MVS nucleus

```plaintext
//LOADSVC JOB 'accounting info',MSGCLASS=A,CLASS=A
//NMLDEF EXEC ASMHCL
//C.SYSIN DD *
IEANCnnn NMLDEF NUCL=DFHHPsvc
//L.SYSLMOD DD DSN=SYS1.NUCLEUS,UNIT=3380,DISP=OLD
//L.SYSIN DD *
/* NAME IEANCnnn
/*

where nnn is the number of the CICS NML, in the range 001 through 256. Choose the value of nnn to be unique within your MVS nucleus.

Figure 5. Sample job stream to load the CICS Type 6 SVC into the MVS nucleus
Chapter 13. Defining CICS regions as applications to VTAM

To use VTAM terminals with CICS, ensure that your CICS regions are defined to VTAM before you attempt to run them.

To define your CICS regions to VTAM (as VTAM application programs):

1. Define VTAM application program minor nodes for your CICS regions, by specifying APPL definition statements in a member of the SYS1.VTAMLST library (or your own user.VTAMLST library). See "Defining specific CICS APPL statements to VTAM."

2. Issue a VARY ACT command to activate the APPL definitions, and enable the CICS regions to connect to VTAM.

3. Ensure that you have properly defined your VTAM terminals for connection to CICS. This is particularly important if you intend using the CICS autostart function. For those terminals for which you want to use autostart, code LOGON mode table entries that match the model TYPETERM/TERMINAL definitions that CICS uses. You can either code your own autostart models, or use the CICS-supplied model definitions that are generated for you when you initialize the CICS system definition data set (CSD).

   For information about defining model and terminal resource definitions to CICS, see the CICS Resource Definition Guide.

   For programming information about matching VTAM LOGMODE definitions with CICS model definitions, see the CICS Customization Guide.

For further information about defining VTAM resources, see the z/OS V1R4.0 Communications Server: SNA Resource Definition Reference and z/OS Communications Server: SNA Network Implementation manuals.

---

Defining specific CICS APPL statements to VTAM

To define a CICS region to VTAM, specify the minor node name to be used for the CICS region on the VTAM APPL definition statement.

For example, you could use the following definition for the CICS region to be identified as CICSHTH1:

```plaintext
**********************************************************************
* Specific APPL definition for CICS region CICSHTH1
**********************************************************************
CICSHTH1 APPL AUTH=(ACQ,VPACE,PASS),VPACING=0,EAS=5000,PARSESS=YES X
SONSCIP=YES,LUAPFX=XX
**********************************************************************
```

Notes:

1. Code CICSHTH1 on the CICS system initialization parameter APPLID, to define the VTAM application identifier to CICS.

2. See "Naming conventions" on page 190 for information about the naming convention that is used for the CICSHTH1 applid.

---

VTAM APPL parameters for CICS regions

When you define your CICS system to ACF/VTAM, include the following parameters on the VTAM APPL statement:

**ACBNAME=acbname**

Specifies the minor node name (*acbname*) that is assigned to this application.
This name must be unique within the domain. If you do not specify this parameter, the name of the VTAM APPL statement is taken.

**AUTH=(ACQ, VPACE[, PASS])**
ACQ allows CICS to acquire LUTYPE 6 sessions. VPACE allows pacing of the intersystem flows. You need PASS if you intend using the EXEC CICS ISSUE PASS command to pass existing terminal sessions to other VTAM applications.

**EAS=**number
Specifies the number of network-addressable units. The number must include the total number of parallel sessions for this CICS system.

**HAVAIL=YES**
Indicates that the application supports XRF sessions and can initiate XRF sessions.

**LOGMODE=**name
(For CICS-to-CICS APPC systems.) Defines the name of the MODE table that contains the LU6.2 MODEENT for the secondary sessions.

**LUAPFX=**string
specifies the prefix characters of the LU alias to be assigned when a dynamically generated cross-network CDRSC (with NQNMODE=NQNAME) is created for a session with CICS. VTAM concatenates the characters specified with the next sequential number available to form a VTAM-generated LUALIAS name for the cross-network dynamic CDRSC.

string
indicates the two characters to be used as the prefix for all dynamically generated LUALIAS names for dynamic cross-network CDRSCs in session with the CICS region defined by the APPL statement. Remember to take into account the VTAM naming conventions when choosing this prefix. For CICS considerations when specifying the LU alias string, see "Choosing an LUAPFX value" on page 104.

**Note:** VTAM deletes a dynamically-generated LU alias after a terminal session is closed, or the last session of an APPC parallel sessions connection is closed, and the CDRSCTI-specified timeout interval has expired. The permitted range of timeout values is 1 second to 7 days, but generally the default of 8 minutes is acceptable in most situations. The CDRSCTI timer doesn't start until there are no more sessions involving the resource represented by a CDRSC.

For more information about CICS support for the VTAM dynamic LU alias facility, see "VTAM LU alias facility" on page 102.

**PARSESS=YES**
Specifies LUTYPE 6 parallel session support.

**PERSIST=MULTI**
Indicates that the application supports Multi Node Persistent Sessions (MNPS).

For further information, see the [z/OS Communications Server: SNA Network Implementation](#).

**SONSCIP=YES**
Specifies session outage notification (SON) support. SON enables CICS, in certain cases, to recover a session after session failure without operator intervention.
VPACING=number

Specifies the maximum number of normal-flow requests that another logical unit can send on an intersystem session before waiting to receive a pacing response. Start with a value of 5.

**VTAM version and release level indicator**

The terminal control modules in CICS are assembled against z/OS, 1.4 Communication Server. You can use any release of Communication Server VTAM from z/OS, 1.4, or a later, compatible release. For details of the minimum level of products that you can use with the current release, see [the CICS Transaction Server for z/OS Release Guide](https://www.ibm.com/docs/en/cics-ts).

CICS can communicate with different levels of VTAM. It can find out which level you are using, and hence what level of function is available. This means that you can upgrade CICS and SecureWay Communication Server VTAM at different times. CICS finds out whether extra function is available when a new version of VTAM is installed, and produces a message if the facilities are not being exploited fully.

**Message DFHZC3473 on opening the VTAM ACB**

If the master terminal operator opens the VTAM ACB for the first time, using the command CEMT SET VTAM OPEN, but CICS is not using all available VTAM function, message DFHZC3473 is sent to the transient data destination called CSNE. The same message is sent there if the ACB is opened automatically during initialization, rather than by CEMT.

**Cross-domain considerations**

If you want to use VTAM services to access a CICS region on another MVS image, you must ensure that the required cross-domain services are defined to the VTAMs involved.

For example, to be able to use a VTAM APPC connection between a CICS region (applid CICSHTH1) on MVS image MVSH and a CICS region (applid CICSHAJ1) on MVS image MVSJ:

1. Define the cross-domain services (CDRSC) for accessing CICSHAJ1 in a member of the SYS1.VTAMLST library (or your own user.VTAMLST library) for MVSH.
2. Issue a VARY ACT command on MVSH to activate the CDRSC definition for accessing CICSHAJ1.
3. Define the cross-domain services (CDRSC) for accessing CICSHTH1 in a member of the SYS1.VTAMLST library (or your own user.VTAMLST library) for MVSJ.
4. Issue a VARY ACT command on MVSJ to activate the CDRSC definition for accessing CICSHTH1.

For example, you could:

1. Create the following CDRSC definition in a member of the VTAMLST library on MVSH:

```plaintext
CDIDHAJ1 VBUILD TYPE=CDRSC
*********************************************
* CDRSC for access to applid CICSHAJ1 on MVSJ
* CDRSC for access to applid CICSHTH1 on MVSJ
*********************************************
CICSHAJ1 CDRSC CDRM=IYAMCDRM MVSH
CICSHTH1 CDRSC CDRM=IYAMCDRM MVSJ
```
2. Issue the following command on MVSH to activate the cross-domain services to CICSHAJ1 on MVSJ:
/V NET,ACT,ID=CDIDHAJ1

3. Create the following CDRSC definition in a member of the VTAMLST library on MVSJ:
   CDIDHTH1 VBUILD TYPE=CDRSC
   ****************************************************
   * CDRSC for access to applid CICSHTH1 on MVSH
   *****************************************************
   CICSHTH1 CDRSC CDRM=IYALCDRM MVSH

4. Issue the following command on MVSJ to activate the cross-domain services to CICSHTH1 on MVSH:
   /V NET,ACT,ID=CDIDHTH1

VTAM LU alias facility

Specifying a prefix string on the LUAPFX parameter of the CICS APPL statement indicates that VTAM is to generate LUALIAS names for dynamic cross-network CDRSCs in session with the CICS region defined by the APPL statement. This enables CICS to use an LU alias for autoinstalled terminals and work stations and thus ensure unique names in a CICSplex comprising terminal-owning and application-owning regions (TORs and AORs). VTAM generates the LUALIAS names dynamically.

CICS supports both forms of the VTAM alias function—predefined and dynamic—only where shown in the following table:

<table>
<thead>
<tr>
<th>CICS-to-CICS APPC connections (APPL definitions)</th>
<th>APPC devices (LU definitions)</th>
<th>Terminals</th>
</tr>
</thead>
<tbody>
<tr>
<td>Synclevel 1</td>
<td>Synclevel 2</td>
<td>Synclevel 1</td>
</tr>
<tr>
<td>VTAM</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>CICS</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

Notes:
1. The LU alias is used as the NETNAME for terminals and work stations that logon to a CICS region.
2. CICS does not support LU alias for synclevel 2 connections (LUTYPE 6.1 and 6.2) and ignores any LU alias for these LU types, and continues to use the network name defined in the VTAM APPL statement.

Dynamic LU alias support

CICS supports the use of a dynamic LU alias for CICS terminals and workstations that are autoinstalled only. You enable dynamic LU alias support by specifying LUAPFX on the VTAM APPL definition for any CICS terminal-owning region that could receive duplicate netnames. Also, when starting VTAM, specify the following options on the VTAM START command:

- NQNMODE=NQNAME
- CDRSCTI=n to specify the length of time that the session name should last after the last session has logged off.
Notes:

1. Make the time specified on CDRSCTI long enough to cover any time interval specified on CICS START commands that are issued against a terminal resource that uses a dynamic LU alias. This applies to STARTS with a delay that run on both a TOR or AOR. If the CDRSCTI time is not long enough, a resource could log off and then log back on again with a different network name and thus a different TERMID.

2. The CDRSCTI time interval should also be greater than that specified on the CICS AILDELAY system initialization parameter. However, if your applications have no dependency on the network name or termid, you can disregard CDRSCTI or set it to 1.

VTAM generates a dynamic LU alias only if LUAPFX is specified on the CICS APPL statement and the resource comes from another network. That is, it has a different network name from the network to which the CICS region belongs.

When to use dynamic LU alias: Use dynamic LU alias where:

- Your cross-network terminals and workstations that logon to CICS are mainly autoinstalled.

  The CICS region receives logons from terminals and synclevel 1 connections (both parallel and single sessions) and those logons (or binds) are from cross-network resources that might have duplicate network names.

  However, be aware that synclevel 1 connections could become synclevel 2 in the future. For example, if you have a connection between a TXSeries CICS and CICS TS it is synclevel 1, but if you change to using TXSeries CICS with a PPC gateway, synclevel 2 is used. CICS does not support dynamic LU aliases for synclevel 2 APPC connections.

- An AOR receives shipped terminals or connections with duplicate network names from different TORs.

Predefined LU alias support

CICS supports the use of a predefined LU alias for CICS terminals and workstations that are explicitly defined and those that are autoinstalled. You can also use a predefined LU alias for CICS regions that communicate using CICS intersystem communication (ISC). You enable predefined alias support by specifying LUALIAS=alias on any cross-domain resource (CDRSC) that needs a specific alias.

Note: A terminal or APPC sync level 1 work station that is defined to CICS on an explicit resource definition (that is, it is not autoinstalled) and is in a different network, requires a CDRSC definition with a specific alias on the LUALIAS parameter. This overrides the dynamic generation of an alias where LUAPFX is specified on the CICS region's APPL statement. To ensure that CICS can match the VTAM LU alias with the installed terminal definition, the LUALIAS value must match the NETNAME specified on the CICS TERMINAL resource definition.

An LUALIAS option in the CDRSC is effective if the resource comes from another VTAM domain (or network). That is, it is not used if the resource comes from the same MVS image, but is used if the resource comes from another MVS image regardless of whether it is from the same sysplex, another sysplex in the same network, or from a different sysplex. If an LU alias is predefined, a dynamic LU alias is not generated.

When to use predefined LU alias: Use predefined LU alias where:
• Dynamic LU alias is in operation in a CICS region and your terminals or
workstations are explicitly defined on CICS terminal resource definitions with
explicit terminal identifiers. In this case, you use predefined LU aliases to
override the generation of dynamic LU aliases, which CICS would fail to match
with any installed resource definition.
• Dynamic LU alias is not in operation in a CICS region, to avoid any conflict with
duplicate network names.

Cross-network devices that need predefined LU alias: If the following VTAM
cross-network resources are to be connected to a CICS region that is defined to
VTAM with LUAPFX specified on its APPL statement, they must each have a
CDRSC LUALIAS=netname entry:
• CICS RDO-defined terminals connected from another network. These include
VTAM terminals that cannot be autoinstalled:
  – Pipeline terminals
  – Automatic teller machines (3614 and 3624)
  – Devices for which CICS does not receive logons, such as printers.
• LUTYPE 6.2 synlevel 1 connections that may be bound using limited resources.
  Like other LUTYPE 6.2 connections limited resource connections release their
dynamic LU alias when CDRSCTI expires after the last session is unbound.
  However, these sessions are unbound whenever they are not in use, and if they
rebind after the dynamic LU alias is released, CICS would install another
connection, potentially with a different LU alias.
• CICS RDO-defined work stations (LUTYPE 6.2 synlevel 1 connections)
  connected from another network.
• Resources that require an LU name in a RACF profile definition, or resources for
  which prior knowledge of the LU name is required.

Choosing an LUAPFX value
When choosing an LUAPFX value, consider the scope of this parameter within the
CICSpex, and also consider its scope within the sysplex in which your CICS
regions operate.

A predefined LUALIAS name is supplied to CICS for cross-domain and
cross-network resources. All the CICS regions in an MVS image share the same
VTAM and are in the same domain. A CICS region in a different MVS image uses a
different VTAM and is thus in a different domain. Resources coming from one VTAM
to another, but which share the name NETID, are cross-domain resources

A dynamic LUALIAS name is only supplied to CICS for cross-network resources. A
resource is a cross-network resource if it has a different network id (NETID). VTAM
ensures that all the dynamic LUALIAS names assigned in one MVS image are
unique. However, CICS needs network names to be unique across MVS images so
that we do not get network name clashes in AORs.

It is important that all CICS regions across all connected networks use unique
APPLIDs. This is true whether or not dynamic LUALIASs are used—it just makes it
more important.

To ensure that all VTAM resources in a CICSpex have unique network names, use
the LUAPFX prefix as follows:
• Specify LUAPFX on terminal-owning regions (TORs) only.
• Use the same LUAPFX value for all the CICS TORs in the same MVS image (that is, for all the TORs that are connected to the same VTAM), but ensure the LUAPFX is different in each MVS image in the sysplex.

If the LUAPFX values are not the same throughout an MVS image, you risk one resource having two different network names in the CICS regions in that image.

If the LUAPFX values are not unique to each MVS image in the sysplex, you risk two resources attempting to install in a TOR with the same dynamic LUALIAS, or having two resources with the same network name in an AOR.

To ensure the uniqueness of the LU prefix in each MVS, IBM recommends that you use model APPL definitions, and within these use an MVS system symbol (&SYSCLONE) as suggested in the z/OS V1R4.0 Communications Server: SNA Resource Definition Reference.

**Note:** If you use VTAM generic resources and your CICS TORs are spread across different MVS images, be aware that if a resource with a dynamically allocated LU alias logs off and then logs on again, and VTAM switches the resource to a VTAM in another MVS image, a different LUALIAS is assigned because of the different LUAPFX value.

• Avoid using an LUAPFX value that corresponds to the first two characters of CICS RDO-defined terminal names or connection names installed in the CICSpex.

### Other considerations when using LU aliases

The following are some other factors to consider when you are planning to use VTAM LU aliases with CDRSC resources:

**Predictable termids**

If you need autoinstalled terminal resources to have a predictable and reproducible TERMID for such things as temporary storage queue names and START requests, you may need to modify your autoinstall user-replaceable module (URM) to select a reproducible TERMID from the network qualified name (NQNAME) supplied in the CINIT or the BIND.

There is an example of such code (commented-out) in the sample autoinstall URM, which extracts the network qualified name from the CINIT and BIND. The example illustrates how to create a TERMID from the last non-blank character of the NETID and the last 3 non-blank characters of the real network name (NETNAME).

**MVS workload management**

If your MVS workload policies specify LU name classifications, remove the LU name for any cross-network resources that are autoinstalled by CICS.

**Recovery and persistent sessions support**

Resources for which CICS uses any VTAM LU alias (predefined or dynamic) and which come from a different network are not cataloged by a CICS region that is not using persistent session. This means the terminal sessions for the resources cannot be recovered during an emergency restart.

Resources for which CICS uses any VTAM LUALIAS (predefined or dynamic) and which come from a different network are catalogued if CICS is using persistent sessions. This enables CICS to restore resource terminal session information from the CICS catalog pending recovery of the session from VTAM. However, if the resource does not persist, the resource is deleted during an emergency restart.
This action is necessary because VTAM may have been restarted, which would cause dynamic LU aliases to be reissued to different sessions. CICS is unable to tell if VTAM has been restarted, and CICS cannot tell the difference between a predefined and a dynamic LU alias.

**CLSDST PASS**

If you ISSUE PASS (CLSDST PASS) for a terminal that uses a dynamic LU alias to pass control to another CICS region in another MVS image, the resource is known by a different network name in the receiving CICS. This is true if the APPL statement of only one or both the CICS regions specify LUAPFX to activate dynamic LU alias.

**Generic resources**

If a number of generic resource TORs are in two different MVS images, a terminal or work station that logs on to one image is assigned a different network name if it logs off and logs on to a TOR in another image.

**FEPI**

FEPI front end systems are not supported by VTAM LU alias.
Chapter 14. Installing CICS modules in the MVS link pack area

This section describes:

- What you should consider before you install modules in the MVS link pack area.
  This is in "Preparing to install CICS modules in the MVS link pack area."
- What you should do to use CICS modules in the MVS link pack area. This is in
  "How to use modules in the MVS link pack area" on page 111, which provides
  specific information about the following:
    - "Space requirements for CICS modules in the MVS link pack area" on page 111
    - "Defining the CICS LPA library to your MVS" on page 111
    - "Installing CICS modules in the LPA" on page 112
    - "Controlling the use of modules from the MVS link pack area" on page 114

Preparing to install CICS modules in the MVS link pack area

Before you install modules in the MVS link pack area, you should consider the following points, described in subsequent topics:

- "Benefits of using the MVS link pack area"
- "What is meant by the MVS link pack area?" on page 108
- "Which modules must be in the MVS link pack area" on page 108
- "Which modules can be in the MVS link pack area?" on page 109
- "Service considerations" on page 110

Benefits of using the MVS link pack area

The benefits of placing code in the MVS link pack area are:

- It is protected from possible corruption by user applications. Because the MVS link pack area is in protected storage, it is virtually impossible to modify the contents of these programs.
- Performance can be improved, and the demand for real storage reduced, if you use the MVS link pack area for program modules. If more than one copy of the same release of CICS is running in multiple address spaces of the same processor, each address space requires access to the CICS nucleus modules. These modules may either be loaded into each of the address spaces or shared in the MVS link pack area. If they are shared in the MVS link pack area, this can reduce the working set and therefore, the demand for real storage (paging).
- You can decrease the storage requirement in the private area by judicious allocation of the unused storage in the MVS link pack area created by rounding to the next segment.

If you know the amount of space that you need in the LPA, and from that the total size of the MVS common area above the CICS private storage, you can determine which 1MB segment the boundary between the two areas lies on. This may indicate that there is some space in the MVS common area that is left unused, which you could use for CICS LPA-eligible modules. By moving more modules from CICS private storage to the LPA, you decrease the space that is needed for modules in CICS private storage.
What is meant by the MVS link pack area?

The MVS link pack area comprises several areas, both above and below 16 MB. In this publication, the term MVS link pack area refers to the pageable link pack areas above and below 16MB where modules that are used from the MVS link pack area are normally installed.

Note: The MVS link pack area has both pageable and fixed parts. Although you can install CICS modules into the fixed parts, we recommend that you use the pageable areas for performance reasons.

The term LPA specifically refers to the MVS link pack area below 16 MB, and the term ELPA specifically refers to the area above 16MB. A module that is link-edited with the RMODE(ANY) attribute is loaded into the ELPA.

If you install a module into the LPA or ELPA, that module will not be retrieved from the until you re-IPL your MVS with CLPA specified. To use the new module and avoid an IPL, you can use the MVS dynamic LPA in one of the following ways:

- With the SETPROG LPA command
- With an LPA statement in a PROGxx member of PARMLIB, which specifies the SET PROG=xx command

Note that dynamic LPA must not be used with DFHIRP.

Which modules must be in the MVS link pack area

The CICS modules listed in Table 10 must be in the MVS link pack area for the reasons that are given in the notes after the table.

Table 10. CICS modules required in the MVS link pack area

<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
<th>When needed in LPA</th>
<th>See notes after this table</th>
</tr>
</thead>
<tbody>
<tr>
<td>DFHCSVC</td>
<td>CICS Type 3 SVC</td>
<td>Always</td>
<td>1, 2, 3, 4, and 6</td>
</tr>
<tr>
<td>DFHDSPRX</td>
<td>CICS post exit stub</td>
<td>Always</td>
<td>1, 2, 3, and 5</td>
</tr>
<tr>
<td>DFHDUMPX</td>
<td>SDUMPX IEASDUMP QUERY exit</td>
<td>Always</td>
<td>1 and 3</td>
</tr>
<tr>
<td>DFHIRP</td>
<td>Interregion communication program</td>
<td>To use MRO, CICS shared database, or the console message-handling facility</td>
<td>1, 2, 3, and 6</td>
</tr>
<tr>
<td>DFHSSEN</td>
<td>Subsystem interface end-of-memory / end-of-task clean up routine</td>
<td>To use the console message-handling facility</td>
<td>1, 2, 3, and 6</td>
</tr>
<tr>
<td>DFHSSGC</td>
<td>Subsystem generic connect module</td>
<td>To use the console message-handling facility</td>

<td>Subsystem interface WTO router</td>
<td>To use the console message-handling facility</td>
<td>3 and 7</td>
</tr>
<tr>
<td>DFH99SVC</td>
<td>Dynamic allocation - SVC services</td>
<td>Always</td>
<td>1 and 3</td>
</tr>
</tbody>
</table>

Notes:
1. Can be used only from the MVS link pack area, and must be installed there before CICS can be started.
2. You must always install the latest service level of the modules DFHCSVC, DFHIRP (if needed) and DFHSSEN.

3. The version of this module that is supplied with the current release, is downward-compatible with earlier releases of CICS. It works correctly with CICS regions running earlier releases. Therefore, if you are running different releases of CICS on the same MVS image, you should use the latest version of this module.

4. The DFHCSVC module must be defined to MVS as a Type 3 SVC (default SVC number is 216), and if you use a non-default SVC number, you must define it to CICS on the CICSSVC system initialization parameter.

---

### Moving DFHCSVC into the MVS link pack area

Do not use the linkage editor to install the CICS SVC module into a library in the MVS link pack area. To copy or move the module from the hlq.SDFHAUTH library to the nominated library in the MVS link pack area, you should use either a suitable copy utility program, such as IEBCOPY, or an SMP/E USERMOD with +++MOVE statements.

5. If you are running earlier releases of CICS with the latest version, you must ensure that the latest version of the DFHDSPEX module is installed in the MVS link pack area. The DFHDSPEX module must be in the MVS link pack area for integrity reasons, but the post exit routine, DFHDSAUT, can reside either in the MVS link pack area, or in the CICS address space. This enables you to use different levels of the DFHDSAUT module in different CICS regions running in the same MVS image, because the DFHDSAUT module may not be compatible between CICS versions.

6. To communicate by MRO, all CICS regions in the same MVS image must use the latest level of the modules DFHCSVC, DFHIRP, and DFHSSEN in the MVS link pack area.

   If a region detects that DFHIRP is at a lower level, when attempting to open interregion communication, it issues message DFHIR3799, and interregion communication fails to open.

7. To use the console message-handling facility, these modules must reside either in the MVS link pack area or in an APF-authorized library in the MVS linklist.

### Which modules can be in the MVS link pack area?

Besides those CICS modules that must be in the MVS link pack area, other CICS modules and user application program modules are available from the MVS link pack area.

#### CICS modules

A CICS module optionally installed in the MVS link pack area (that is, not a module required in the MVS link pack area) can be used only by the release of CICS to which it relates.

Those CICS modules that can reside above 16MB (for example, the CICS message table, DFHMGT), are loaded above 16MB. Such modules can also be installed in the extended link pack area (ELPA).

CICS modules eligible to be used from the MVS link pack area are listed in the CICS-supplied USERMODs, DFH$UMOD (for base CICS modules), which is in the hlq.SDFHSAMP library. Details of LPA-eligible modules are in [CICS modules](#).
eligible for the MVS link pack area,” on page 447, to help you select those CICS modules that you want to install in the MVS link pack area.

**User application programs**
User application programs can be used from the MVS link pack area if they are read-only and:

- Written in COBOL, do not overwrite WORKING STORAGE, and are compiled using VS COBOL II, or later version. (The CICS translator generates a CBL statement with the required compiler options.)
- Written in PL/I (do not overwrite STATIC storage) and compiled using one of the versions of PL/I listed in the [CICS Transaction Server for z/OS Release Guide](#) or later. (The CICS translator inserts the required REENTRANT option into the PROCEDURE statement.)
- Written in C/370, compiled with the RENT option, and link-edited with the RENT option.
- Written in Assembler language, assembled with the RENT option, and link-edited with the RENT and REFR options.

Command-level user application programs compiled using a Language Environment-conforming compiler, or written in Assembler language or C/370, may be loaded above 16MB. (For information about installing application programs, see the [CICS Application Programming Guide](#).)

A read-only module that may reside above 16MB is also eligible for the extended link pack area (ELPA).

**Service considerations**
Using modules with mismatching service levels can cause unpredictable results. To be safe, do not use the LPA version of a module if it differs from the version in the CICS libraries that you are using.

Load modules used from the LPA might be at a lower service level than the rest of your CICS region in any of the following circumstances:

- You are running CICS from libraries which belong to a target zone currently at a higher service level than the LPA zone.
- You have applied service to the LPA zone since the last IPL of MVS.
- You are not using the MLPA to replace service-updated load modules, but have applied service to the LPA zone since last IPL of MVS for which CLPA (create link pack area) was specified.

Thus, if you have applied service to a load module in your CICS libraries, you should also apply the service to the LPA version of the module, if one exists. This stipulation is there so that the MVS link pack area always contains tested load modules.

Use the SMP/E RESTORE function to back off the USERMOD before the LPA zone is updated or copied. Then apply the USERMOD again.

If you have used a copy of the CICS-supplied USERMODs to install modules into the MVS link pack area, and the original USERMOD is serviced, you may like to reflect the changes in your version of the USERMOD.
How to use modules in the MVS link pack area

To use CICS modules in the MVS link pack area:
1. Check that you have enough space for the selected modules.
2. Install the modules in the MVS link pack area.
3. Control the usage of modules from the MVS link pack area.

Space requirements for CICS modules in the MVS link pack area

Allow enough space in the MVS link pack area for you to install those CICS modules that you intend using from there. You can find out how much space you need by:

- Reviewing the sizes of the modules that you want to install in the MVS link pack area, as given in "CICS modules eligible for the MVS link pack area," on page 447.
- Reviewing the module index of a system dump for the CICS region started with the system initialization parameter LPA=NO.
- Calculating the module sizes that are given for each module in the listing of modules that are provided by the IEHLIST utility program.

Remember also to allow space for any of your user application programs that you intend using from the MVS link pack area.

Note: The total space needed depends on how the operating system packages the modules into the MVS link pack area.

What next?

Once you have determined the space needed in the MVS link pack area, you must next create a library with enough space and define it to your MVS. This is in the topic "Defining the CICS LPA library to your MVS."

Defining the CICS LPA library to your MVS

CICS supplies the library hlq.SDFHLPA. This library contains the modules that must be in the LPA. You can also use this library to install other CICS modules or application programs which you want to use from the LPA.

You can give the hlq.SDFHLPA library your own index, but if you do, you must specify the new index on the LINDEX parameter of the DFHISTAR job.

Add the full name of the hlq.SDFHLPA library to an LPALSTxx member of SYS1.PARMLIB. This ensures that the library contents are loaded into the PLPA at the next IPL of your system when CLPA is specified. Also APF-authorize the hlq.SDFHLPA library, by adding its name to an IEAAPFxx member of the SYS1.PARMLIB library.

For more information about this see Chapter 31, “Verifying your Java components installation,” on page 205.

You should also RACF-protect the hlq.SDFHLPA library, to prevent unauthorized or accidental modification of this library. For information about protecting the CICS libraries, see [the CICS RACF Security Guide]
What next?

During migration to the current release use of the MVS link pack area, you may like to add a DD statement for the hlq.SDFHLPA library to the DFHRPL concatenation of your CICS startup job stream.

You can install into the hlq.SDFHLPA library the CICS modules to be used from the MVS link pack area. This is in "Installing CICS modules in the LPA."

Installing CICS modules in the LPA

By install, we mean move or copy a module into a suitable LPA library, by using SMP/E, or by using a copying method that re-blocks the copied modules when the target data set has a smaller block size than the data set you are copying from (for example, use the COPYMOD function of the IEBCOPY program). A procedure for installing modules into the MVS link pack area by using SMP/E is in this section.

You should not relink-edit the modules in order to get them into the LPA library. CICS modules as supplied have the necessary attributes that cause MVS to load them automatically above the line (into the ELPA).

To install modules in the CICS LPA library, and to ensure that SMP/E can continue to service them, complete the following steps:

1. Select those modules that you want to use from the MVS link pack area, and specify them in the SMP/E USERMOD to be used to install the modules in the MVS link pack area.
   
   You can use the CICS-supplied USERMOD, LPAMODS, or create and use your own version.
   
   If you use your own version of a USERMOD, this can include +++MOVE statements from both CICS-supplied USERMODs.

2. Receive the USERMOD into the CICS global zone.

3. Apply the USERMOD to the LPA zone.

   Note: When you have installed all your modules into the CICS LPA library (and defined it to MVS), you should re-IPL your MVS with CLPA specified to enable the modules to be used from the CICS LPA library.

These steps are in the following sections.

Selecting modules for the MVS link pack area

You should install in the MVS link pack area only those modules that you want to use from the MVS link pack area. "CICS modules eligible for the MVS link pack area," on page 447 lists the CICS-supplied modules eligible for the MVS link pack area, and gives descriptions and other information to help you select those CICS modules that you want to use from the MVS link pack area.

To install modules in the MVS link pack area, you should use an SMP/E USERMOD that contains +++MOVE statements for only the modules to be installed in the MVS link pack area.
The CICS-supplied SMP/E USERMOD, DFHUMOD

CICS supplies an SMP/E USERMOD called DFHUMOD (in member DFH$UMOD in the hlq.SDFHSAMP library). This USERMOD contains ++MOVE statements for all CICS modules, in the hlq.SDFHAUTH and hlq.SDFHLOAD libraries, that are eligible for the MVS link pack area. The USERMOD also indicates whether each module is LPA- or ELPA-eligible. You can choose which of the modules to install in the MVS link pack area by creating your own version of the USERMOD. Your selection is generally include modules in the working set of the installation.

Changing a CICS-supplied USERMOD

If you intend changing a CICS-supplied USERMOD, to choose modules to install in the MVS link pack area, take a copy of the USERMOD and update the copy only. If you have copied the hlq.SDFHSAMP library, for instance when changing user-replaceable programs, then you already have copies of the CICS-supplied USERMODs. If the original hlq.SDFHSAMP library is serviced, and the USERMOD is modified, you may like to reflect the changes in your version.

Preparing the USERMOD

To choose which read-only modules to install in the MVS link pack area, edit your copy of the SMP/E USERMOD to:

1. Comment out the ++MOVE statements for the modules that you do not want to install in the LPA, and
2. Move the remaining ++MOVE statements (for the modules that you do want to install in the LPA) one column to the left, so that the ++MOVE statements start in column one of the USERMOD module.
3. Add ++MOVE statements for your user application program modules that you want to install in the LPA, with the ++MOVE statements starting in column one of the DFH$UMOD module.

Receiving and applying the USERMOD

Receive the USERMOD into the CICS global zone and apply it to the LPA target zone. This causes SMP/E to move those load modules you have specified from the named CICS target library (hlq.SDFHLOAD or hlq.SDFHAUTH) into the CICS LPA library. Applying the USERMOD also updates the corresponding LMOD entries within the target zone SMPCSI.

Do not accept the USERMOD into the distribution zone, and for the time being, do not apply it to any other target zone.

To receive and apply the CICS-supplied sample usermods in DFH$UMOD, you can use the associated job DFHLPUMD which is tailored to your CICS environment and stored in the hlq.XDFHINST library when you run the DFHISTAR job.
What next?

To enable CICS to use the modules that you have installed in the MVS link pack area, re-IPL your MVS with CLPA specified.

Also specify to CICS that it is to use modules from the MVS link pack area. You can also control which modules are used from the MVS link pack area in several ways. This is in the topic “Controlling the use of modules from the MVS link pack area.”

Controlling the use of modules from the MVS link pack area

This topic describes what you must do to enable CICS to use modules from the MVS link pack area, and what you can do to specify that CICS is not to use eligible modules from the MVS link pack area.

The methods for controlling the use of modules from the MVS link pack area do not apply to the modules DFHCSVC, DFHDSPEX, and DFHIRP. These modules can be used only from the MVS link pack area.

Modules in the MVS link pack area from hlq.SDFHAUTH

CICS uses standard MVS load facilities for modules installed in the MVS link pack area from the CICS APF-authorized library, hlq.SDFHAUTH. That is, such a module is used from the first of the following locations that it is found in:

1. STEPLIB concatenation
2. MVS link pack area
3. MVS LNKLST

Using modules from the MVS link pack area

To use any of the CICS modules installed in the MVS link pack area from the hlq.SDFHAUTH library you must remove any version of the module from the hlq.SDFHAUTH library (or any other library in the STEPLIB concatenation).

Using modules from the STEPLIB

You can prevent CICS using modules installed in the MVS link pack area from the hlq.SDFHAUTH library by installing versions of those modules in a library in the STEPLIB concatenation. CICS then uses the versions of the modules from the STEPLIB concatenation into the CICS address space, rather than any versions that may be in the MVS link pack area.

Modules in the MVS link pack area from hlq.SDFHLOAD

The use of CICS modules installed in the MVS link pack area from the hlq.SDFHLOAD library is controlled by CICS system initialization parameters and resource definitions.

The hlq.SDFHLOAD library is used for non-nucleus CICS modules, and some CICS nucleus modules. You can also use the library for your own user application programs.

Using modules from the MVS link pack area

To use any of the CICS modules installed in the MVS link pack area from the hlq.SDFHLOAD library:
• Copy the modules into a CICS LPA library. (That is, you do not have to remove them from the hlq.SDFHLOAD library.)

• Specify the system initialization parameter LPA=YES. CICS then uses the following search order:
  1. MVS link pack area
  2. DFHRPL DD concatenation

• For a non-nucleus CICS module or user application program, specify USELPACOPY(YES) on the associated PROGRAM resource definition. These modules are identified in the CICS-supplied USERMODs by the statement:
  /* Not loaded from LPA unless USELPACOPY is set to Y in the CSD */

For each CICS-supplied LPA-eligible module that needs USELPACOPY(YES) specified in its associated PROGRAM resource definition, you must create your own resource definition with USELPACOPY(YES) specified, and use it instead of the CICS-supplied resource definition. This is because you cannot modify the CICS-supplied resource definitions. For example, you could use the DFHCS Dup utility program to:

1. Copy the CICS-supplied resource groups that contain the module definitions to new resource groups.
2. For each module that needs USELPACOPY(YES), change the PROGRAM resource definition in the new resource groups to specify USELPACOPY(YES).
3. Add your new resource groups to a new group list (that is, at the start of the list).
4. Append the CICS-supplied group list DFHLIST (or your own equivalent of that group list) to your group list. Alternatively, include DFHLIST on the GRPLIST system initialization parameter as well as your group list.
5. Remove the CICS-supplied groups that you have copied.

Once the program definitions have been changed on the CSD you should:

– Reinitialize the CICS catalogs if you have been using modules not in the MVS link pack area, and now want to use those modules from the MVS link pack area
– Specify your new group list (and DFHLIST if your group list does not include the list of resource groups provided in DFHLIST) on the GRPLIST system initialization parameter.

A sample DFHCS Dup job for all CICS LPA-eligible jobs is in Figure 6 on page 119.

Note: In the above example, instead of steps 3 and 4, you could use the CEDA transaction to:

– Copy your group list to create a new group list.
– Add the new (USELPACOPY(YES)) groups to the new group list in the same place as the original, CICS-supplied, groups.

Notes:
1. CICS uses eligible modules installed in the MVS link pack area, if:
   • You have not specified the name of the module on the CICS system initialization parameter PRVMOD.
   • The module has not been already loaded from the DFHRPL concatenation.
2. If CICS cannot find an eligible module in the MVS link pack area, it loads the private (non-shared) version into the CICS address space from the DFHRPL concatenation, after issuing the message DFHLD0107I to warn you that the
module is not in the MVS link pack area. (See page "The module-not-found warning message (DFHLD0107I)" on page 118 for more information about this message.)

3. CICS assumes that the PL/I modules, IBMBPSLA and IBMBPSMA, are installed in the MVS link pack area and issues message DFHLD0107I if it fails to find them there. If you want your PL/I application programs to run with the PL/I shared library facility, you must ensure that the modules IBMPSLA and IBMPSMA are installed in the MVS link pack area, or in the hlq.SDFHLOAD library (or another library in the CICS DFHRPL library concatenation).

4. Program list tables (PLTs) must be placed in the DFHRPL concatenation. However, before PROGRAM resource definitions for phase one PLTPI programs and PLTSD programs are installed (for example, early in CICS initialization) CICS scans the MVS link pack area for those programs, and issues message DFHLD0107I if it cannot find such a program there.

5. Likewise, before PROGRAM resource definitions for global and task-related user exit programs are installed (for example, early in CICS initialization) CICS scans the MVS link pack area for those programs, and issues message DFHLD0107I if it cannot find such a program there.

---

### Specifying USELPACOPY(YES)

For every non-nucleus CICS module or user application program that you have moved to the MVS link pack area (that is, have removed from the DFHRPL concatenation), ensure that you have specified USELPACOPY(YES) on the associated PROGRAM resource definition. Otherwise, CICS is not be able to find the module, and may fail to start up successfully.

---

### Using modules from DFHRPL

You can prevent CICS using modules installed in the MVS link pack area from the hlq.SDFHLOAD library by either:

- **Specifying NO on the LPA system initialization parameter.**

  This prevents CICS from using any modules installed into the MVS link pack area from the hlq.SDFHLOAD library. CICS tries to load the modules from libraries in the DFHRPL concatenation.

  You might use this option when you want to run CICS to test a lot of LPA-eligible modules before installing them in the MVS link pack area. For example, you could add the hlq.SDFHLPA library to the DFHRPL concatenation while testing CICS modules for the MVS link pack area. Once you have verified the use of those modules from the MVS link pack area, you should specify the LPA=YES system initialization parameter, and remove the hlq.SDFHLPA library from the DFHRPL concatenation.

- **Specifying the name of the module on the PRVMOD system initialization parameter:**

  `PRVMOD={name}({name1,name2,...})`

  This prevents CICS from using the specified modules from the MVS link pack area for only the run of CICS on which the PRVMOD parameter is specified. You might use the PRVMOD parameter when you want to run CICS to test a new version of an LPA-eligible module before replacing the version already in the MVS link pack area.

  Specify the full module name on the PRVMOD parameter, including any suffix (for example, DFHMCIP1$). If only one module is named, the parentheses are optional. The PRVMOD parameter may span input lines. However, do not split
module names across lines, because CICS system initialization adds a comma at the end of every input line that does not already end with a comma. The only validity check performed on a module name is to ensure that it does not exceed eight characters.

You cannot code the PRVMOD parameter in the DFHSIT module; you can specify it in the PARM parameter, in the SYSIN data set, or through the system console.

- For a non-nucleus CICS module or user application program, specifying USELPACOPY(NO), the default, on the associated PROGRAM resource definition. These modules are identified in the CICS-supplied USERMODs by the statement:

  /* Not loaded from LPA unless USELPACOPY is set to Y in the CSD */

  You might use the USELPACOPY(NO) option of the PROGRAM resource definition for a more permanent exclusion of an LPA-resident module than for the single run of CICS control provided by the PRVMOD system initialization parameter.

**Verifying modules for the MVS link pack area**

While verifying new versions of modules to be installed into the MVS link pack area, you can instruct a CICS region to use the new versions from the DFHRPL concatenation by any of the following options:

- The LPA=NO system initialization parameter
- The PRVMOD system initialization parameter
- The USELPACOPY(NO) option of the associated PROGRAM resource definition (where applicable)

For further information about these options, see "Using modules from DFHRPL" on page 116

In all cases, you must install the new versions of the modules into the hlq.SDFHLOAD library, or another library in the DFHRPL concatenation.

If you are verifying many CICS LPA-eligible modules, you might like to add the hlq.SDFHLPA library to the DFHRPL concatenation. This allows you to check that the modules you have installed in the MVS link pack area are being loaded from there.

**Note:** The CICS-supplied userrmod use SMP/E to move CICS LPA-eligible modules into the hlq.SDFHLPA library. Similarly, if you use SMP/E to apply service to any of those modules, the versions in the hlq.SDFHLPA library is updated. The updated versions of the modules are used from the MVS link pack area after you next re-IPL your MVS with CLPA specified. Until then, if you add the hlq.SDFHLPA library to the DFHRPL concatenation of your CICS region, and specify that CICS is not to use the version of the modules in the MVS link pack area, the updated versions of the modules are used from the DFHRPL concatenation.

After you have installed and verified the use of modules from the MVS link pack area, you should remove the versions of the modules from the DFHRPL concatenation of your CICS startup job.

You can find out whether CICS is loading modules from the MVS link pack area or the DFHRPL concatenation by reviewing the index of a system dump for the CICS.
region started with the system initialization parameter LPA=YES. Modules loaded from the MVS link pack area have the dump option LD=3.

**The module-not-found warning message (DFHLD0107I)**

CICS issues message DFHLD0107I if it searches the MVS link pack area for a module installed there from hlq.SDFHLOAD and fails to find it.

If you encounter this message, check that you have specified USELPACOPY(YES) on the associated PROGRAM resource definition (if applicable). For further information about using modules loaded in the MVS link pack area from the hlq.SDFHLOAD library, see "Modules in the MVS link pack area from hlq.SDFHLOAD" on page 114.

CICS uses console routing code 11 for this particular message, which allows you to control the output of this message. For example, you can:

1. Exclude, as required, routing code 11 from specific MVS console definitions in the CONSOLxx member of SYS1.PARMLIB.

2. Use the MVS VARY command to prevent this message from appearing on specified consoles by omitting route code 11 from a VARY command that defines which routing codes go to specified devices. For example:

   ```
   VARY devnum,CONSOLE,ROUT=(rtcode,rtcode,.....)
   ```

   Alternatively, you can remove route code 11 from those already defined by using the following VARY command:

   ```
   VARY devnum,CONSOLE,DROUT=(11)
   ```

3. Use the MVS message processing facility (MPF) to inhibit the message. To use this facility, code an entry specifying the CICS message number in the MPFLSTxx member of SYS1.PARMLIB.

CICS assumes that the following PL/1 modules are LPA eligible and issues message DFHLD0107I if it fails to find them there:

- IBMBPSLA
- IBMBPSMA

**Sample DFHCSDUP job to specify USELPACOPY(YES)**

The standard IBM-supplied program definitions in the CSD all specify USELPACOPY(NO). If you copy, or move, to the LPA some (or all) of the IBM programs defined by definitions in the CSD, the next step is to modify the USELPACOPY attribute to ensure CICS uses the LPA copy.

To simplify this task:

- IBM supplies, in the DFH$ULPA member of the SDFHSAMP library, an alternate set of DEFINE statements for all the IBM-supplied programs. All the programs defined in DFH$ULPA specify USELPACOPY(YES).
- If you don't want all the programs to be defined for LPA use, edit the member to remove the programs that are to remain as USELPACOPY(NO).
- The USELPACOPY(YES) versions are all defined in one new group called DFH$ULPA. Change this group name if you want to use your own name.
- The last statement in DFH$ULPA adds the group to a startup list. Edit this to specify your own group list.
- Run the sample DFHCSDUP job shown in Figure 6 on page 119 to add the DFH$ULPA versions of the definitions to your CSD.
There is no need to remove the standard definitions from DFHLIST. Specifying your group list after DFHLIST on the GRPLIST system initialization parameter ensures that the modified definitions override the standard definitions.

```
//LPAMODS JOB (account_details),MSGCLASS=A,MSGLEVEL=(1,1),
   //   CLASS=A,NOTIFY=userid
//DEFULPA EXEC PGM=DFHCSDUP
//STEPLIB DD DSN=CICSTS31.CICS.SDFHLOAD,DISP=SHR
//SYSPRINT DD SYSOUT=*  
//DFHCSD DD DSN=user.CICSTS31.CICS.DFHCSD,DISP=OLD
//SYSIN DD DSN=CICSTS31.CICS.SDFHSAMP(DFH$ULPA),DISP=SHR
/*
/**
```

*Figure 6. Sample DFHCSDUP job for all CICS LPA-eligible modules*
Chapter 15. Defining CICS IPCS exit control data to MVS

If you use the MVS interactive problem control system (IPCS) to format and analyze CICS system dumps, you should ensure that the release-specific CICS formatting routines are defined and available to MVS.

The formatting routine for use under IPCS has the release identifier as part of its name; that is, DFHPD640. This is the formatting routine you must define to IPCS when formatting system dumps. The CICS formatting routine is release-specific, so if you run more than one release of CICS, ensure that you use the correct version for the system dump you are formatting.

The DFHIPCSP CICS exit control data

IPCS provides an exit control table with imbed statements so that other products can supply exit control information. The IPCS default table, BLSCECT, normally in the SYS1.PARMLIB library, has the following entry for CICS:

```
IMBED MEMBER(DFHIPCSP) ENVIRONMENT(ALL) /* CICS */
```

Ensure that your IPCS job can find the CICS-supplied DFHIPCSP module. The DFHIPCSP module is in the hlq.SDFHPARM library. You can either copy the DFHIPCSP module into SYS1.PARMLIB (so that it is in the same default library as BLSCECT) or provide an IPCSPARM DD statement to specify the library containing the IPCS control tables. For example:

```
//IPCPARM DD DSN=SYS1.PARMLIB,DISP=SHR For BLSCECT
// DD DSN=CICSTS31.CICS.SDFHPARM,DISP=SHR For DFHIPCSP
```

Figure 7 shows the release-specific entries that are specified in DFHIPCSP.

```
EXIT EP(DFHPD212) VERB(CICS212) ABSTRACT(+
  'CICS Version 2 Release 1.2 analysis')
EXIT EP(DFHPD321) VERB(CICS321) ABSTRACT(+
  'CICS Version 3 Release 2.1 analysis')
EXIT EP(DFHPD330) VERB(CICS330) ABSTRACT(+
  'CICS Version 3 Release 3 analysis')
EXIT EP(DFHPD410) VERB(CICS410) ABSTRACT(+
  'CICS Version 4 Release 1 analysis')
EXIT EP(DFHPD510) VERB(CICS510) ABSTRACT(+
  'CICS Transaction Server for OS/390 Release 1 analysis')
EXIT EP(DFHPD520) VERB(CICS520) ABSTRACT(+
  'CICS Transaction Server for OS/390 Release 2 analysis')
EXIT EP(DFHPD530) VERB(CICS530) ABSTRACT(+
  'CICS Transaction Server for OS/390 Release 3 analysis')
EXIT EP(DFHPD610) VERB(CICS610) ABSTRACT(+
  'CICS Transaction Server for z/OS V2 R1 analysis')
EXIT EP(DFHPD620) VERB(CICS620) ABSTRACT(+
  'CICS Transaction Server for z/OS V2 R2 analysis')
EXIT EP(DFHPD630) VERB(CICS630) ABSTRACT(+
  'CICS Transaction Server for z/OS V3 R1 analysis')
EXIT EP(DFHPD640) VERB(CICS640) ABSTRACT(+
  'CICS Transaction Server for z/OS V3 R2 analysis')
```

Figure 7. Release-specific entries in DFHIPCSP for DFHPDnnn routines.

To use the DFHIPCSP member as it is, rename the CICS-supplied version of DFHPDX for earlier releases to the names that are shown in the table.

For information about using IPCS to format CICS system dumps, see the CICS Operations and Utilities Guide.
**Implementing changes**

Re-IPL MVS to bring the changes that are described in this chapter into effect before you attempt to run the IVPs.
Chapter 16. MVS Program properties table entries

There are some CICS properties that you can optionally define to MVS. These are in the following section.

You can define entries for CICS in the MVS program properties table (PPT).

Figure 8 is an example of a CICS PPT entry in the SCHEDxx member of SYS1.PARMLIB.

Figure 8. Sample CICS PPT entry

PPT PGMNAME(DFHSIP) /* Add program name DFHSIP to the PPT*/
NOSWAP /* Non-swappable */
NOPREF /* No preferred storage required */

For information about defining options in the PPT, see the z/OS MVS Initialization and Tuning Guide

RACF password checking

If your installation has a PPT entry for the DFHSIP program, you should ensure that the PPTNOPAS option is not set in the PPT because this bypasses password and RACF authorization checking. However, you should consider making your CICS regions non-swappable by specifying the PPTNSWP option in the PPT. For information about defining CICS PPT entries in the SCHEDxx member of the SYS1.PARMLIB library, see the z/OS MVS Initialization and Tuning Reference manual.

Non-swappable CICS regions

For performance reasons, you should consider making your CICS regions non-swappable, by specifying the NOSWAP option in the PPT. However, you should be aware that the use of certain functions causes CICS regions to be made non-swappable automatically, regardless of what is specified in the PPT (for example, regions using cross-memory services for MRO).
MVS protection key for CICS

CICS can run only in MVS protection key 8 (the default). You must not define any other protection keys for CICS.

If you want to use the storage protection facility of CICS, you must specify the system initialization parameter STGPROT=YES, and must have the required hardware and software. If you operate CICS with storage protection, CICS observes the storage keys and execution keys that you specify in various system and resource definitions. For information about the CICS storage protection facility and how it affects the storage allocation for the dynamic storage areas, see the CICS System Definition Guide. For information about hardware and software that is required by the CICS storage protection facility, see the CICS Transaction Server for z/OS Program Directory.
Chapter 17. MVS performance definitions

You can use the MVS workload management facility to manage sysplex resources across MVS subsystems, in parallel with the existing system resource management facilities.

For information about MVS workload management, see the z/OS MVS Planning: Workload Management manual.

If you want to use the MVS workload manager facility, you should:

1. Implement workload management on the MVS images that the CICS workload is to run on, as outlined in "Implementing MVS workload management."
2. Ensure that CICS performance parameters correspond to the policies defined for MVS workload management, as outlined in "Matching CICS performance parameters to service policies" on page 126.

Implementing MVS workload management

The task of implementing MVS workload management is part of the overall task of planning for, and installing, MVS.

Implementing MVS workload management generally involves the following steps:

1. Establishing your workloads.
2. Setting your business priorities.
3. Understanding your performance objectives.
4. Defining critical work.
5. Defining performance objectives based on current business needs.
6. Get agreement for your workload performance objectives.
7. Specify a service level agreement or performance objectives.
8. Specify an MVS WLM service definition that uses the information from step 7.

Note: It is helpful at this stage to record your service definition in a form that helps you to enter it into the MVS workload manager ISPF application. You are recommended to use the worksheets provided in the z/OS MVS Planning: Workload Management manual, SA22-7602.

9. Install MVS.
10. Set up a sysplex with a single MVS image, and run in workload manager compatibility mode.
11. Upgrade your existing XCF couple data set.
12. Start the MVS workload manager ISPF application, and use it in the following steps.
13. Allocate and format a new couple data set for workload management. (You can do this from the ISPF application.)
14. Define your service definition.
15. Install your service definition on the couple data set for workload management.
16. Activate a service policy.
17. Switch the MVS image into goal mode.
18. Start up a new MVS image in the sysplex. (That is, attach the new MVS image to the couple data set for workload management, and link it to the service policy.)
19. Switch the new MVS image into goal mode.
20. Repeat steps 18 and 19 for each new MVS image in the sysplex.

Notes:
1. Current release support for MVS workload manager is initialized automatically during CICS startup.
2. All CICS regions (and other MVS subsystems) running on an MVS image with MVS workload management are subject to the effects of workload manager.

Matching CICS performance parameters to service policies

You must ensure that the CICS performance parameters are compatible with the workload manager service policies used for the CICS workload.

In general, you should define CICS performance objectives to the MVS workload manager first, and observe the effect on CICS performance. Once the MVS workload manager definitions are working correctly, you can then consider tuning the CICS parameters to further enhance CICS performance. However, you should use CICS performance parameters as little as possible.

Performance attributes that you might consider using are:
• Transaction priority, passed on dynamic transaction routing. (Use prioritization carefully, if at all.) The priority assigned by the CICS dispatcher must be compatible with the task priority that is defined to MVS workload manager.
• Maximum number of concurrent user tasks for the CICS region.
• Maximum number of concurrent tasks in each transaction class.
Chapter 18. MVS automatic restart management definitions

You can exploit the MVS automatic restart management facility that is provided by MVS to implement a sysplex-wide integrated automatic restart mechanism.

If you want to use the MVS automatic restart manager facility, you should:
1. Implement automatic restart management on the MVS images that the CICS workload is to run on.
2. Ensure that CICS startup JCL used to restart CICS regions is suitable for MVS automatic restart management.
3. Specify appropriate CICS START options.
4. Specify appropriate MVS workload policies.

If you do not wish to use the MVS automatic restart management facility, you can use XRF to provide restart of failed CICS regions. For information about XRF, see the CICS/ESA 3.3 XRF Guide.

Implementing MVS automatic restart management

The task of implementing MVS automatic restart management is part of the overall task of planning for and installing MVS. For information about MVS automatic restart management, see the z/OS MVS Setting Up a Sysplex manual.

Implementing MVS automatic restart management for CICS generally involves the following steps:

- Ensure that the MVS images available for automatic restarts have access to the databases, logs, and program libraries required for the workload.
- Identify those CICS regions for which you want to use automatic restart management.
- Define restart processes for the candidate CICS regions.
- Define ARM policies for the candidate CICS regions.
- Ensure that the system initialization parameter XRF=NO is specified for CICS startup.

For further information on implementing automatic restart management, see the CICS Recovery and Restart Guide.
Chapter 19. MVS cross-system MRO definitions

You can use the CICS interregion communication (IRC) facility for multiregion operation (MRO) between CICS regions across MVS images in a sysplex. This exploits the cross-system coupling facility (XCF) of MVS, and makes it unnecessary to use VTAM to communicate between MVS images within the same sysplex.

Within a sysplex, DFHIRP must be installed from the highest release of CICS running in that MVS image.

Sysplex overview

A sysplex consists of multiple MVS systems, coupled together by hardware elements and software services. In a sysplex, MVS provides a platform of basic multisystem services that multisystem applications like CICS can exploit. As an installation's workload grows, additional MVS systems can be added to the sysplex to enable the installation to meet the needs of the greater workload.

To use XCF to communicate in a sysplex, each CICS region joins an XCF group called DFHIR000 by invoking the MVS IXCJOIN macro using services that are provided by the DFHIRP module. The member name for each CICS region is always the CICS APPLID (NETNAME on the CONNECTION resource definition) used for MRO partners. Each CICS APPLID must be unique within any sysplex regardless of the MVS levels that are involved. Within the sysplex, CICS regions can communicate only with members of the CICS XCF group (DFHIR000).

MVS XCF considerations for MRO

Ensure that when you format the primary and alternate couple data sets used by the XCF component of MVS:

- The value specified for the MAXMEMBER parameter is large enough to handle the number of CICS regions and users of the EXCI in the CICS XCF group.

Each XCF group is limited to 2047 members, which is therefore the theoretical maximum number of CICS regions that can participate in XCF/MRO in a single sysplex. However, the maximum size of the XCF group is reduced if you set the MVS MAXMEMBER parameter, used to define XCF couple data sets, to a lower limit. When calculating the maximum number of members in the CICS XCF group, allow one member for:
  - Each CICS region to run on an MVS image in the sysplex.
  - Each pipe that is allocated by a user of the external CICS interface (EXCI).
  
For information about EXCI users and pipes, see the *CICS External Interfaces Guide* manual.

To list the members in the CICS XCF group, you can use the MVS DISPLAY command. The name of the CICS group is always DFHIR000, so you could use the MVS command:

```
DISPLAY XCF, GROUP, DFHIR000, ALL
```

- The value specified for the MAXGROUP parameter is large enough for the CICS XCF group to be established.
Chapter 20. PR/SM policy for handling MVS failures

If you are running CICS under MVS in a Processor Resource/Systems Manager™ (PR/SM™) environment, you should define to MVS the preferred XCF PR/SM policy for handling MVS failures in a PR/SM environment, and define to PR/SM the authorization for each LPAR to cause reset or deactivation of another LPAR.

XCF PR/SM policy

The function that enables MVS images to take over the resources of other MVS images in the same sysplex. This function is also known as the PR/SM automatic reconfiguration facility (ARF).
A CICS program may call the first failure symptoms (FFS) component. This uses the MVS SYMREC macro to write symptom records to the MVS SYS1.LOGREC data set, in addition to, or instead of, a job log.

The SYMREC authorization exit, ASREXIT, must be in effect to allow CICS to use the SYMREC macro call, otherwise the call fails with return code 12, reason code 3868 (X’F1C’).

When SYMREC is called by CICS, the ASREXIT routine issues a return code that permits the SYMREC to be successfully written.

The MVS sample exit programs ASREXT0 and ASREXT1, supplied in SYS1.SAMPLIB, are suitable for this purpose. For further information about these exits, see the z/OS MVS Installation Exits manual. The ASREXIT routine can determine if CICS is the caller by testing EPLPNAME for the value 'DFHSIP' except:

- When DFHSIP is renamed, in which case EPLPNAME contains the new name.
- When DFHSIP is the subject of an MVS LINK, in which case EPLPNAME contains the name of the program issuing the MVS LINK (unless it too is the subject of an MVS LINK).

If you choose this method, you may wish to code your ASREXIT routine to allow for these exceptions.

An alternative method of coding the ASREXIT routine is in Figure 9. This method is not affected by the exceptions that are mentioned above.

```
TITLE 'SYMREC SAMPLE EXIT'
ASREPL
PRINT NOGEN
IHAPSA
IKJTCB
PRINT GEN
DFHAFCD
EJECT
ASREXIT CSECT
ASREXIT AMODE 31
```

Figure 9. An example of coding the ASREXIT routine. (Part 2 of 2)
Chapter 22. Definitions required for VSAM RLS support

If you plan to use VSAM RLS to enable CICS regions to share VSAM data sets, carry out the following steps:

1. Define the master coupling facility lock structure.
2. Define coupling facility cache structures and cache sets.
3. Define SMS storage classes for RLS access.
4. Alter data set characteristics, if necessary, to make data sets eligible for RLS access.
5. Define sharing control data sets.
6. Establish new authorization that is required by the VSAM RLS support.
7. Add new parameters to SYS1.PARMLIB.
8. Establish new procedures for VSAM RLS support.
9. Activate the coupling facility structures.

An overview of each of these steps follows.

Defining the master coupling facility lock structure

VSAM RLS support requires the coupling facility to define a master lock structure, IGWLOCK00, for cross system locking.

See the z/OS DFSMSdfp Storage Administration Reference manual for information about calculating the size you need for the lock structure.

The amount of coupling facility space required depends on several characteristics of your hardware configuration and the applications that you run, such as:

- The number of processors you have
- The power of your processors
- Your ratio of non-update activity to update activity
- Your ratio of recoverable updates to non-recoverable updates
- Your ratio of sequential requests to direct requests

You define the lock structure in the CFRM policy with the IXCMIAPU utility.

Defining coupling facility cache structures and cache sets

VSAM RLS support requires the coupling facility to define cache structures for cross system buffer invalidation. You need to determine the number and size of cache structures you require.

The number needed depends on factors such as:

- The number of coupling facilities you have
- The amount of space in each coupling facility
- The amount of data that is accessed through each coupling facility

See the z/OS DFSMSdfp Storage Administration Reference manual for information about calculating the amount of space you will need for the cache structures. If you have previously used data sets in LSR mode, the total amount of coupling facility space allocated to cache structures should not be less than the amount of storage you were using for LSR pools, including hiperspace buffers (if used).
You can achieve performance benefits by:
- Making the size of the cache larger
- The way in which you divide cache structures across coupling facilities
You define cache structures in the CFRM policy with the IXCMIAPU utility.

**Defining cache sets**
You define cache sets with the ISMF control data set (CDS) application.
A cache set maps on to one or more cache structures. If more than one cache set is specified, the data sets can be re-bound to another cache structure in the set in the event of a cache structure failure.

See the [z/OS DFSMSdfp Storage Administration Reference](#) manual for more information about cache sets.

**Defining SMS storage classes for RLS access**
Before you can use VSAM RLS, you need one or more storage classes which specify a non-blank cache set name.
The ISMF storage class application allows you to specify a cache set name when defining or altering a storage class, together with weighting parameters for tuning, such as CF DIRECT WEIGHT and CF SEQUENTIAL WEIGHT. See the [z/OS DFSMSdfp Storage Administration Reference](#) manual for more information about defining SMS storage classes.

**Altering data set attributes for RLS access**
Before you can use a data set in RLS access mode, you must ensure that it is eligible. To be eligible for RLS:
- Data sets must reside in SMS managed storage.
- Data sets must specify a storage class that has a non-blank cache set name.
- Data set recoverability attributes must be defined in the ICF catalog (not in the CICS file control resource definition, where they are ignored for RLS).
You can specify a data set's attributes using the Access Method Services (AMS) DEFINE CLUSTER or ALTER CLUSTER commands.
Specifying a LOG parameter of NONE, UNDO or ALL ensures that the recoverability of the data set is not undefined. You cannot open files in RLS mode if the LOG parameter of the associated data set is UNDEFINED. If you specify LOG(ALL), you must also specify a forward recovery log stream on the LOGSTREAMID parameter.
To use backup while open (BWO) for an RLS-accessed sphere, specify the BWO parameter. Specifying BWO(TYPECICS) means that backup while open can be used. All other values for BWO (including undefined) mean backup while open is not allowed. BWO(TYPECICS) is only valid if LOG(ALL) and LOGSTREAMID are also specified.
- Data sets must not specify the IMBED attribute.
If you have some data sets that specify imbed, you must remove the IMBED option before you can use the data sets in RLS mode. Redefine a new data set without IMBED and use the AMS REPRO function to copy the old data set to the new data set.
Note: RLS supports the REPLICATE cluster attribute. It does not provide any performance benefit, and removing it could save DASD space.

**Defining sharing control data sets**

VSAM RLS requires sharing control data sets. These are used to maintain data integrity in the sharing environment. The sharing control data set is used sysplex-wide by all the SMSVSAM servers, and is always duplexed.

Two active (and at least one spare) sharing control data sets must be available at all times.

The size required depends on the number of MVS images in the sysplex, and on the number of files that are expected to be open concurrently. The [z/OS DFSMShsm Storage Administration Reference](http://www.ibm.com/support/docview.wss?uid=ssg1S100198) manual gives information about calculating the amount of space that is needed for the sharing control data sets.

Sharing control data sets are VSAM linear data sets that must reside on volumes which have global connectivity. The data sets may have multiple extents, but only on the same volume. You define them using standard techniques for defining data sets. The names must have SYS1.DFPSHCDS as the first and second qualifiers. See the [z/OS DFSMShsm Storage Administration Reference](http://www.ibm.com/support/docview.wss?uid=ssg1S100198) manual for other rules relating to the definition of sharing control data sets.

You must not issue RESERVEs on any volumes on which sharing control data sets reside. Convert any such RESERVEs to enqueues.

You can check that the data sets are available to the sysplex with the MVS DISPLAY SMS command, on any MVS image, as follows:

```
D SMS,SHCDS
```

This command shows the names of the two active, and the spare data set as in the following example:

<table>
<thead>
<tr>
<th>Name</th>
<th>Size</th>
<th>%UTIL</th>
<th>Status</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACTIVE1.VP2SS03 7920KB</td>
<td>7920KB</td>
<td>74%</td>
<td>Good</td>
<td>ACTIVE</td>
</tr>
<tr>
<td>ACTIVE2.VP2SS03 7920KB</td>
<td>7920KB</td>
<td>74%</td>
<td>Good</td>
<td>ACTIVE</td>
</tr>
<tr>
<td>SPARE.VP2SS03 7920KB</td>
<td>7920KB</td>
<td>74%</td>
<td>Good</td>
<td>SPARE</td>
</tr>
</tbody>
</table>

Note: The DISPLAY command shows only the third and fourth qualifiers of the sharing control data set names; the first and second qualifiers are always SYS1.DFPSHCDS.

The first time an SMSVSAM server is started in the sysplex, the sharing control data sets need to be varied online using

```
V SMS,SHCDS,NEW
```

for the active data sets, and

```
V SMS,SHCDS,NEWSPARE
```

for the spare data set (or data sets). The server cannot come up properly if this is not done.
Authorizing CICS userids for VSAM RLS support

Authorize each CICS userid that is to use VSAM RLS support to have read access to a profile in the SUBSYSNUM class which matches the applid. See "Authorizing access to an SMSVSAM server" on page 71 for more information.

You may want to restrict access to the AMS SHCDS LIST and REMOVE commands. The DFSMS/MVS Access Method Services for ICF manual gives information about using these commands.

Adding new parameters to SYS1.PARMLIB(IGDSMSxx)

To include RLS support in your system, specify the required parameters in the IGDSMSxx member of SYS1.PARMLIB, as follows:

- Specify RLSINIT(YES), otherwise SMSVSAM will not initialize automatically when you IPL MVS. Alternatively, you can start SMSVSAM using the VARY SMS,SMSVSAM,ACTIVE command.
- Specify a value for the deadlock detection interval with the DEADLOCK_DETECTION parameter.
- Specify time intervals for the creation and synchronization of VSAM RLS SMF records with the CF_TIME and SMF_TIME parameters.
- Specify the maximum size of the SMSVSAM local buffer pool with the RLS_MAX_POOL_SIZE parameter.

See the z/OS DFSMSdftp Storage Administration Reference manual for information about these parameters.

Establishing new procedures for VSAM RLS support

New operational procedures may be needed in a number of areas as a result of using VSAM RLS support. Areas to consider include:

- Integrity of data in coupling facility caches
  To make sure that non-IBM products or user programs do not compromise the integrity of data in coupling facility caches when they modify the data on a volume, you should either vary the volume offline to each system in the sysplex, or CF-quiesce the volume using the V SMS,CFVOL(volid),QUIESCE command before running such programs.

- Management of the coupling facility and coupling facility structures

- Use of RESERVEs on volumes which contain sharing control data sets
  Make sure that this does not happen. You should convert RESERVEs on other volumes into enqueues.

- Switching to non-RLS mode in order to run batch update jobs against recoverable data sets
  This subject is in greater detail in the CICS Recovery and Restart Guide.

- Management of forward recovery and your forward recovery logs
  The differences from forward recovery for non-RLS access are:
  - The forward recovery log stream must be in the ICF catalog.
  - All forward recovery log records for a data set merge into the same log stream.
– Your forward recovery procedure needs to use the SHCDS FRSETRR, FRUNBIND, FRBIND, and FRRESETRR commands (CICSVR version 2 release 3 automatically issues these commands).
Refer to the DFSMS/MVS Version 1 Release 3 documentation for more details.

### Activating the coupling facility structures

Once defined in the CFRM policy, the coupling facility structures must be activated using the SETXCF START POLICY command, specifying a TYPE of CFRM and the policy name.
Chapter 23. Console messages

The message domain supports the use of MVS message routing codes in the range 1 to 16 for those messages that are sent to the console. By default, if the issuing module specifies only CONSOLE (without a qualifying number) as the destination, CICS routes the message with MVS route codes 2 and 11 (for the master console – information). This support is available for all domain-type messages of the form DFHxxnnnn, where xx is the domain code, and nnnn is the message number.

CICS issues other messages (of the form DFHnnnn) with either no route code, or route codes other than 2 and 11.

The physical destination of these messages is controlled by the ROUTECODE parameter on the MVS console entries in a SYS1.PARMLIB member, CONSOLENn. For further information about MVS console definitions, see the z/OS MVS Initialization and Tuning Guide.
Chapter 24. Defining the logger environment for CICS journaling

CICS uses the MVS system logger for all its logging and journaling requirements. Using services provided by the MVS system logger, the CICS log manager supports:

- The CICS system log, which is used for:
  - Dynamic transaction backout
  - Warm and emergency restarts
  - Cold starts, but only if the log contains information required for resynchronizing in-doubt units-of-work
- Forward recovery logs, auto-journals, and user journals.

The MVS system logger is a component of MVS. It provides a programming interface to access records on a log stream. For information about the MVS system logger, see the following MVS publications:

- z/OS MVS Setting Up a Sysplex for:
  - General information about the MVS system logger
  - Information about defining and formatting the LOGR couple data set
  - Information about how to plan the system logger configuration, plan and set up a system logger application, and plan for recovery for system logger applications.
- z/OS MVS Programming: Assembler Services Reference, Volume 1 and z/OS MVS Programming: Assembler Services Reference, Volume 2 for the syntax of system logger services
- z/OS MVS Initialization and Tuning Reference for information about the COUPLExx PARMLIB member.

Requirements planning and checklist

This section summarizes the requirements, and the steps that you need to follow, to set up the CICS logging environment. Some of the steps listed have a pointer to sections that provide more detailed information. These steps cover both MVS and CICS system programmer tasks and some security administrator tasks, and close cooperation between all groups is needed:

Planning

Consider the possible storage options, and choose which of the 3 available hardware options you want to use:

- **Non-volatile coupling facility**, where log stream data is duplexed in the MVS logger data space. Non-volatile storage involves the use of battery backup or an uninterruptible power supply (UPS):
  - When using a UPS, you use a hardware console command to update coupling facility status
  - When using battery backup, batteries must be online and charged.
- **Volatile coupling facility**, where log stream data is duplexed to a staging data set.
- **DASD-only**, where log stream data is duplexed in the MVS logger data space.
As part of the planning phase:

- Determine the number CICS regions that require logger support and hence system log streams.
- Determine the number of user journals and autojournals that your regions use.
- Determine the number of forward recovery logs required for VSAM data sets.
- Determine whether any user journal or forward recovery log streams are to be shared between regions (to create merged data automatically).

**Note:** The system log streams, DFHLOG and DFHSHUNT, cannot be shared.

DASD-only log streams can be shared only within the same MVS image.

- Decide on the number and sizes of the coupling facilities to be used.
- Determine the log stream sizes:
  - For coupling facility log streams, see “Coupling facility log streams” on page 151.
  - For DASD-only log streams, see “DASD-only log streams” on page 167.

For information about types of coupling facility, see the *z/OS MVS Setting Up a Sysplex* manual. Note that the minimum level of coupling facility supported by the MVS system logger is CFLEVEL=1, with the appropriate service level of the coupling facility control code that supports CFLEVEL=1.

**Maintenance**

Ensure that all maintenance affecting the MVS system logger, and the CICS log manager and its utilities, is applied:

- Logger serviceability APARs relating to the MVS system logger are identified with the LOGRSERVICE keyword.
- APARs relating to the CICS log manager are identified with the CICSLOGR keyword.

**Run DFHLSCU**

If you are migrating from CICS Version 3 or Version 4, run this log stream sizing utility using one or more CICS journal data sets as input:

- Use CICS journal data sets taken from periods of heavy production use.
- In each run of DFHLSCU, use only journal data sets that are to be migrated to the same MVS log stream.

See “The log stream sizing utility, DFHLSCU” on page 160 for more information.

**Create and format the LOGR couple data sets**

In consultation with your MVS system programmer:

- Use MVS utility IXCL1DSU to create and format the primary and alternate LOGR couple data sets.
- Identify the LOGR couple data sets to the sysplex in the COUPLExx member in SYS1.PARMLIB.
- Make the LOGR couple data set available to the sysplex.

See “Format the LOGR Couple Data Set and Make it Available to the Sysplex” in the *z/OS MVS Setting Up a Sysplex* manual for information about these steps.
Notes:

1. For this task you need know the number of log streams and, for coupling facility log streams, the number of structures. Each CICS region needs two system log streams and, optionally:
   - A log stream for the log of logs
   - One or more log streams for forward recovery logs
   - One or more log streams for autojournals
   - One or more log streams for user journals

2. If you are migrating from a release of OS/390, before release 3, (to meet the z/OS minimum requirement level for CICS TS), you must reformat your LOGR data sets, because logging enhancements introduced in OS/390 Release 3 required LOGR couple data set of the sysplex to be formatted using OS/390 Release 3 or later.

   The removal of the 168 data set limit (described in "General logs" on page 175) also requires the LOGR data set to be formatted with DSEXTENT(nnnnn). This does not apply to LOGR couple data sets formatted for DASD-only logging.

Define coupling facility structures

If you are using the coupling facility for some or all of your log streams, update your CFRM policy and your LOGR couple data set with the required structure definitions.

See "Defining coupling facility structures" on page 152 for details, including a sample job.

Establish the required security authorizations

Ensure that all the userids that are involved with running the system logger, or defining or accessing logger resources, are authorized, and that the required profiles are defined in the LOGSTRM general resource class:

   • If the MVS system logger address space (IXGLOGR) is not given SAF privileged or trusted status, ensure you give the required authorization to the userid that runs IXGLOGR. For example, if the userid that runs IXGLOGR (defined in the RACF started procedures table (ICHRIN03), or defined in the RACF STARTED class profile) is SYSTASK:
     - SYSTASK requires ALTER access to IXLSTR structure profiles in the FACILITY general resource class for access to log stream coupling facility structures.
     - SYSTASK requires ALTER access to the data set profiles (hlq.data_set_name) in the DATASET general resource class, for each DASD log stream and staging data set.

   • To use the MVS system logger IXCMIAPU utility to define, update and delete entries in the LOGR couple data set, you need appropriate authorizations to the relevant RACF profiles in the LOGSTRM and FACILITY general resource classes. See "Authorizations for users of IXCMIAPU" on page 72 for information and examples of how to do this.

   • To enable CICS to create log streams dynamically, and to write to log streams, ensure that the CICS region userid has the required authorizations. See "Authorizations for CICS regions" on page 73 for information and examples of how to do this.

For more information about authorizations for the system logger, see the z/OS MVS Setting Up a Sysplex manual.
Check sysplex definition in PARMLIB

To use the MVS system logger, each MVS image must be a member of a sysplex. Ensure your sysplex definition, in PARMLIB member IEASYSxx, specifies either PLEXCFG(MONOPLEX), for a single-member sysplex, or PLEXCFG(MULTISYSTEM), for a multi-member sysplex. Also ensure that you define a COUPLExx member in PARMLIB.

**Note:** The value specified on the SYSPLEX parameter in COUPLExx forms part of DASD-only and staging data set names.

Activate the LOGR subsystem

Ensure the LOGR subsystem is active to enable the CICS log manager batch utility, DFHJUP, to format and print log data. The LOGR subsystem is defined by the following entry in IEFSSNxx PARMLIB member:

```
SUBSYS SUBNAME(LOGR) INITRTN(IXGSSINT)
```

Plan staging data set requirements

Staging data sets are used for both DASD-only and coupling facility log streams, and if specified are dynamically allocated by the MVS system logger:

- For DASD-only log streams, staging data sets are the primary (interim) storage.
- For coupling facility log streams, staging data sets are allocated by the system logger to safeguard log data in the event of the log data being in a volatile configuration; that is:
  - There is a loss of the coupling facility battery backup
  - A structure failure that results in the only copy of log data being in MVS local storage buffers.

Consider the following parameters:

- STG_DUPLEX(YES) and DUPLEXMODE(COND) to cause the system logger to use staging data sets if the coupling facility is not failure independent (see "Staging data sets for coupling facility log streams" on page 166 for more information)
- STG_MGMTCLAS to specify the System Managed Storage (SMS) management class to be used for staging data set allocation (valid only when STG_DUPLEX(YES) or DASDONLY(YES) is specified)
- STG_STORCLAS to specify the SMS storage class to be used for staging data set allocation (valid only when STG_DUPLEX(YES) or DASDONLY(YES) is specified)
- STG_SIZE to specify the size of staging data sets
- SHAREOPTIONS(3,3) for log stream data sets and staging data sets (see “VSAM Share Options for System Logger” in z/OS MVS Setting Up a Sysplex)

Plan DASD space and SMS environment for logger secondary storage

System logger secondary storage comprises all log stream (offload) data sets. See "Managing secondary storage" on page 174 for information about size parameters and other attributes relating to secondary storage

Define log streams and log stream models

Define the specific log streams, and log stream models for dynamic creation of log streams, in the LOGR policy.

In particular, consider the following when defining your log streams:
• Set HIGHOFFLOAD no higher than 80% to allow the offload function to be activated before structures reach the 90% level and provide a buffer to enable CICS to continue writing records without filling the log stream before offload completes.

• Set LOWOFFLOAD for DFHLOG and DFHSHUNT in the range 40–60%.
  For user journals and the log of logs, specify LOWOFFLOAD as 0.

• Specify HLQ for the high level qualifier for offload data sets—it is not part of the CICS log stream name. The default is IXGLOGR.

• Specify STG_DUPLEX(YES) and DUPLEXMODE(COND) for log streams in the coupling facility to ensure that staging data sets are used automatically if the coupling facility is volatile or failure dependent.

• Set STG_SIZE to control the size, in 4K blocks, of staging data sets allocated by the system logger. For coupling facility log streams, the staging data set must hold at least as much data as the log stream in the structure, so that offloads are not triggered by the staging data sets. See The log stream sizing utility, DFHLSCU on pages 160 and 171 (for DASD-only).

• Specify LS_DATACLAS and LS_SIZE, for the SMS data class and the number of 4K allocation blocks respectively for log stream off load data sets (see “Managing log data sets” on page 174).

• Specify MODEL(YES) to indicate that a log stream definition is a model only and not an actual log stream. See SDFHINST members DFHILG2 (coupling facility) and DFHILG5 (DASD-only) for samples of model log streams.

**Note:** Use AUTODELETE(YES) with a suitable retention period (RETPD) for general logs but not for CICS system logs (DFHLOG and DFHSHUNT).

See “Defining coupling facility log streams” on page 156 for some sample IXCMiAPU jobs, and see z/OS MVS Setting Up a Sysplex for general information about updating LOGR policies.

**Define JOURNALMODEL resource definitions**

Define JOURNALMODEL resource definitions in the CICS CSD to enable CICS to map CICS journal names to MVS system logger log stream names. See the CICS Resource Definition Guide for information about JOURNALMODEL resource definitions.

**Remove JCT definitions**

When migrating a CICS region from a CICS/ESA 4.1 region (or earlier), remove all references to journal control tables (JCTs), and any DD statements for CICS journal data sets, from startup JCL.

See the CICS Transaction Server for z/OS Migration from CICS TS Version 2.3 for CICS TS Version 1 Releases 1 and 2 for information about obsolete parameters and function relating to the old CICS journal control function and other migration information.

**Review AKPFREQ system initialization parameter**

When migrating a CICS region from a CICS/ESA 4.1 region (or earlier), review the value specified for AKPFREQ.

This parameter now represents the number of write operations (log records) by CICS log manager to the log stream buffer before an activity keypoint is taken, whereas under the old journal control program it specifies the number of consecutive blocks written to the system log data set.

The parameter has a significant impact on the size of system logger primary (interim) storage, affecting the log tail management that takes place during activity keypoint (AKP) processing. The system logger:
• Deletes records that are no longer of interest to CICS
• Moves records to DFHSHUNT for those tasks that wrote log records within the last ACP.

Update JCL of batch jobs
When migrating a CICS region from a CICS/ESA 4.1 region (or earlier), update DFHJUP batch job JCL. To process log streams, these jobs require the SUSBSYS keyword on DD statement for the log stream being processed.

Evaluate results after implementation
After you have implemented the steps necessary to use the MVS system logger for CICS log streams and journals, evaluate the results on a continual basis. The following are aids that you can use:
• CICS interval statistics. You can collect these at specified intervals and end-of-day to obtain CICS log manager statistics. You can also collect statistics using the DFH0STAT sample program.
• SMF Type 88 records. These are produced by the MVS system logger, and can be printed using IXGRPT1, which is supplied in SYS1.SAMPLIB. You can also print these records using IXGRPT1J and IXGRPT1L.

The following sections provide more detailed information to help you with the above steps:
• “Coupling facility or DASD-only?” on page 150
• “Coupling facility log streams” on page 151, which contains:
  – “Defining coupling facility structures” on page 152
  – “Planning considerations for the number of log structures” on page 155
  – “Log structure naming conventions” on page 156
  – “Defining coupling facility log streams” on page 156
  – “Sizing considerations for coupling facility log streams” on page 158
  – “Coupling facility requirements in an RLS environment” on page 165
  – “Staging data sets for coupling facility log streams” on page 166
• “DASD-only log streams” on page 167, which contains:
  – “Defining DASD-only log streams” on page 168
  – “Sizing considerations for DASD-only log streams” on page 168
  – “Converting a DASD-only log stream to use a coupling facility” on page 172
• “Managing secondary storage” on page 174

Setting up the environment for CICS log manager
CICS system programmers need to consult with their MVS system programmers to plan for the storage that is required by the log streams needed by the many CICS log managers operating in the sysplex.

Each log stream is a sequence of blocks of data, which the MVS system logger internally partitions over three different types of storage:

1. Primary storage, which holds the most recent records that were written to the log stream. Primary storage can consist of either:
   a. A structure within a coupling facility. Log data written to the coupling facility is also copied to either a data space or a staging data set.
   b. A data space in the same MVS image as the system logger. Log data written to the data space is also copied to a staging data set.
2. Secondary storage—when the primary storage for a log stream becomes full, the older records automatically spill into secondary storage, which consists of
data sets managed by the storage management subsystem (SMS). Each log stream, identified by its log stream name (LSN), is written to its own log data sets.

3. Tertiary storage—a form of archive storage that is used as specified in your hierarchical storage manager (HSM) policy. Optionally, older records can be migrated to tertiary storage, which can be either DASD data sets or tape volumes.

See the different levels of log stream storage in Figure 10 and Figure 11 on page 150.

Figure 10. The types of storage used by the MVS system logger. This diagram shows a log stream that uses a coupling facility. Primary storage consists of space in a structure within the coupling facility, and either space in a staging data set or a data space in the same MVS image as the system logger. Secondary storage consists of a series of data sets on disk storage to which the elements of the log structure in the coupling facility are mapped. Tertiary storage is the DFHSM storage holding older levels of the secondary storage data sets.
Coupling facility or DASD-only?

The CICS log manager supports the DASD-only option of the MVS system logger. This means that individual CICS log streams can use either coupling facility log structures or DASD-only logging.

Take the following points into account when deciding which log streams should be defined to use the coupling facility and which to use DASD-only:

- A coupling facility log stream must be used if you want to allow simultaneous access from CICS regions running in different MVS images. (Simultaneous access to a DASD-only log stream is limited to CICS regions in the same MVS image.)

For example, assume that you are using RLS and have several CICS application-owning regions (AORs) running on different MVS images. Because the forward recovery log must be accessible from all the AORs, it must be
defined as a coupling facility log stream. A CICS system log, on the other hand, is only ever accessed by a single CICS region, and can therefore always be defined as a DASD-only log stream.

Without a coupling facility, you cannot share general log streams across MVS images.

- Defining all your CICS log streams to use structures within a single coupling facility is not recommended—see "Coupling facility log streams."
- DASD-only log streams are easier to define and administer than coupling facility log streams.
- The CPU cost of a log write to a DASD-only log stream is greater than that of a write to a coupling facility log stream. For more information, see the CICS [Performance Guide].
- If the amount of available coupling facility space is limited, you may want to define some DASD-only log streams in order to minimize the amount of space allocated to log structures.

Notes:

1. Define a single-system sysplex (which must use a sysplex couple data set) with PLEXCFG=MONOPLEX. This is required for stand-alone MVS systems that use MVS system logger facilities.
2. Define sysplexes that have two or more MVS images with PLEXCFG=MULTISYSTEM.

Coupling facility log streams

If you use a coupling facility, the ideal environment is provided by two or more non-volatile coupling facilities that are failure-independent from any of the exploiting MVS images, using dedicated processor resources.

Should one coupling facility fail, or require maintenance, in such an environment, the system logger can rebuild its data in another coupling facility and continue. Running CICS systems would experience only minimal impact.

If you are unable to devote two coupling facilities for the purposes of the MVS system logger, the next most robust environment is provided by one dedicated coupling facility for normal logger and lock structure use, plus a coupling facility LPAR. This environment has the same advantages of rebuilding with minimal impact to running CICS systems. Furthermore, MVS detects that the LPAR coupling facility is not in a failure-independent domain, and causes the system logger to write log stream data to staging data sets for extra security.

Running with a single coupling facility is not recommended since its failure would cause the MVS system logger, and any other users of the coupling facility, to suspend normal operation until access to the coupling facility were restored. CICS would, effectively, be unusable in such a situation.

Unless you specify that the system logger is to use staging data sets, the recovery of log stream data depends on the MVS images remaining active so that the system loggers can use copies of log records held in storage to repopulate the coupling facility when it is again available. If you must run with a single coupling facility, you are recommended to specify DUPEXMODE(UNCOND) to force the use of staging data sets.
Defining coupling facility structures

If you use a coupling facility for your CICS log streams, define the coupling facility structures needed for the log streams in your CFRM policy (in the CFRM data set), and in the LOGR policy (in the LOGR data set).

Updating the CFRM policy

Coupling facility space is divided into structures using the coupling facility resource management (CFRM) policy defined in the CFRM data set. The CFRM policy allows you to define how MVS is to manage coupling facility resources, and you update this using the IXCMIAPU utility. See Figure 12 on page 153 for a sample job to define coupling facility structures in the CFRM policy data set.

Updating the LOGR policy

You define structures in the MVS system logger LOGR policy in the system logger couple data sets using the DEFINE STRUCTURE specification of the IXCMIAPU utility. See Figure 13 on page 154 for a sample job to define coupling facility structures in the LOGR policy data set.

Remember

Before attempting to run any of the IXCMIAPU jobs, ensure that the MVS system logger (IXGLOGR) is running. If IXGLOGR is not running (for example if MVS is running in LOCAL mode), logstream definition jobs fail with rc=0814.
Multiple log streams can write data to a single coupling facility structure. This does not mean that the log data is merged; the log data stays segregated according to

Figure 12. Sample policy job to define logger structures to CFRM 1/2
log stream. You can specify the number of log streams that use the resources of a single coupling facility structure using the LOGSNUM parameter on the IXCMIA PU service to define a structure.

Each log stream is allocated a proportion of the structure space based on the number of currently connected log streams (up to the limit specified in LOGSNUM).

For example, a structure may be defined to contain a maximum of, say, 30 log streams. If only 10 log streams are connected, each log stream can use one tenth of the space in the structure. As other log streams are connected and disconnected, the MVS system logger adjusts the proportion of space to be used by each log stream.

It is important to plan carefully before specifying a value for LOGSNUM, because this parameter determines how much storage space in the structure is available to each log stream. A number in the range 10 to 20 is optimum in many environments.

The JCL in Figure 13 defines log stream coupling facility structures to the MVS system logger. It is meant for guidance only and you should substitute values appropriate to your requirements.

Figure 13. Sample JCL to define coupling facility structures to MVS system logger

See the z/OS MVS Programming: Assembler Services Guide for information on planning coupling facility configurations.
Planning considerations for the number of log structures

Bear in mind the following points when planning the definition of your coupling facility structures:

- The CFRM policy allows a maximum of 255 structures for all purposes.
- Allow a maximum of 20 log streams per structure.
- Smaller structures are more quickly allocated, rebuilt, and recovered than larger ones.
- It is good practice to keep the log streams for test CICS systems (and other systems not in regular use) in structures separate from the structures holding the log streams of production CICS systems. This avoids the structure space available to production CICS systems being affected by structure usage of the test CICS systems.
- It is good practice to keep the log streams for terminal-owning regions (TORs) in structures separate to those accommodating log streams for application-owning regions (AORs). In addition, keep log streams for file-owning regions in structures separate to those accommodating log streams for TORs and AORs.
- Share structures between MVS images. If an MVS image or logger address space fails, and a surviving MVS image is using the same log stream structures (although not necessarily the same log streams), the surviving image is notified of the failure and can initiate immediate log stream recovery for the failing MVS. Recovery would, otherwise, be delayed until the next time that a system attempts to connect to a log stream in the affected structures, or until the logger address space of the failing system is restarted.

For example, in a 4-way sysplex comprising MVSA, MVSB, MVSC, and MVSD, you might have the CICS regions that normally run on MVSA and MVSB use structure LOG_DFHLOG_001, and the regions that run on MVSC and MVSD use structure LOG_DFHLOG_002. Thus each MVS image has a partner to recover its log streams in the event of an MVS failure. If a structure fails, the two MVS images using the other structure can take over the workload. Also, if you have more than one coupling facility, allocate the system log structures to different coupling facilities. See Figure 14 for an illustration of this example.

Figure 14. Sharing system logger structures between MVS images
- Use the appropriate buffer size. The average buffer size (AVGBUFSIZE) defined for a structure should be reasonably close to the actual buffer size of the log streams using the structure. If it is not, there is a risk that usable space will be exhausted long before the structure is actually full.

**Important:**
1. OS/390 (since Release 3) dynamically tunes the element/entry ratio, so the value you specify for AVGBUFSIZE is less important than it was on earlier releases of MVS.
2. AVGBUFSIZE, like other structure definition attributes such as MAXBUFSIZE and LOGSNUM, cannot be updated unless you first delete the log streams in the structure definition.
3. Set MAXBUFSIZE to slightly less than 64K - say, 64000. This allows CICS to write the maximum size user record and allows coupling facility storage to be allocated in 256-byte units. If you allow MAXBUFSIZE to default, coupling facility storage is allocated in 512-byte units. This can be wasteful of storage. There is no significant advantage in setting MAXBUFSIZE lower than 64000 as far as the utilization of storage is concerned.
4. Set a low value for the REBUILDPERCENT parameter in the CFRM policy for log structures used for CICS system logs.

**Log structure naming conventions**

It is sensible to adopt a naming convention for your coupling facility structures that help to identify the purpose of the structure. A format such as LOG_purpose_nnn is recommended, where:

- **purpose** identifies the type of use of the structure.
- **nnn** is a sequence number to allow for more than one structure for each purpose.

Some examples are:

**LOG_DFHLOG_001**

For the CICS primary system log. The structure should be large to avoid the need to write data to DASD. The average buffer size would be small. See the sizing calculations in "Structure size for system log usage" on page 161.

**LOG_DFHSHUNT_001**

For the CICS secondary system log. The structure should be small but requires a large buffer size. A structure of 150K per log stream may well be sufficient.

**LOG_USERJRNL_001**

For user journals where block writes are not forced. The average and maximum buffer sizes of these structures should be the same.

**LOG_GENERAL_001**

For forward recovery logs and user journals where block writes are forced periodically.

See also the section “Develop a naming convention for system logger resources” in the z/OS MVS Setting Up a Sysplex manual.

**Defining coupling facility log streams**

Use the MVS IXCMIAPU utility to define coupling facility log streams to the LOGR couple data set. The basic syntax to define a coupling facility log stream is as follows:
DEFINE LOGSTREAM NAME(log_stream_name)
   STRUCTNAME(structure_name)
   LOWOFFLOAD(low_offload) HIGHOFFLOAD(high_offload)
   STG_DUPLEX(YES|NO) DUPLEXMODE(COND|UNCOND)

For detailed information about the full range of log stream attributes, see the OS/390 Setting Up a Sysplex manual. Figure 15 shows example definitions for a pair of coupling facility log streams associated with a CICS system log.

Figure 15. Example definitions of coupling facility log streams. The definitions are for the CICS primary and secondary system log streams. The value region_userid is the RACF userid under which the CICS address space is running; applid is the CICS region’s VTAM APPL name (taken from the APPLID system initialization parameter).

Using model log streams
To avoid having to define explicitly each log stream used by each of your CICS regions, you can use model log stream definitions. Using models, log streams are defined to MVS dynamically, on their first usage. Figure 16 on page 158 shows an example of coupling facility model definitions for CICS primary and secondary system log streams.
For detailed information about using model log streams, see the CICS Recovery and Restart Guide. For information about the mapping of CICS journal definitions to log stream names, see the CICS System Definition Guide.

When using model log streams, you need to bear the following in mind:

- For coupling facility log streams, a model log stream definition determines the coupling facility structure in which the new log streams are created. On an MVS image that runs both CICS production and CICS test regions, take care that the system logs for the production regions are kept separate from the system logs for the test regions.
- There are recovery considerations when using model log streams to define CICS system logs—see the CICS Recovery and Restart Guide.

Sizing considerations for coupling facility log streams

This section discusses how to size the following types of coupling facility log stream:
- The CICS primary and secondary system log streams
- Forward recovery logs
- User journals and autojournals.

Sizing DFHLOG

For the CICS primary system log stream (DFHLOG), it is important to:

- Minimize the amount of data that is offloaded to secondary storage:
  The MVS system logger begins the offload process when the high offload threshold (HIGHOFFLOAD) of the log stream is reached. The offload process consists of two steps:
  1. The MVS logger physically deletes the data in the log stream that has been marked for deletion by the CICS log-tail deletion process.
2. The MVS logger calculates how much data needs to be offloaded to secondary storage, based on the difference between HIGHOFFLOAD and LOWOFFLOAD, less the amount of data that has been deleted since the last offload event.

To minimize the amount of data offloaded from the CICS primary system log:
- Define a suitably-sized coupling facility structure. For advice, see "Recommendations."
- Ensure that the log-tail deletion process is working effectively. For detailed information about the log tail deletion process, see the CICS Recovery and Restart Guide.

**Avoid “structure-full” events:**

A structure-full event occurs when a log stream’s structure space becomes full before the offloading of data has completed.

For advice on monitoring and avoiding structure-full events, see the CICS Performance Guide.

**Sizing DFHSHUNT**

It is important to size the secondary system log stream (DFHSHUNT) to avoid structure-full events. However, it is normal for some data to be offloaded from DFHSHUNT to secondary storage.

**Sizing general logs**

It is important to size forward recovery logs, user journals, and autojournals to avoid structure-full events. However, because CICS does not delete data from these log streams, it is normal for data to be offloaded to secondary storage.

**Recommendations**

Table 11 summarizes how you should decide on the values for various attributes on the structure definition, log stream definition, and system definition.

**Note:** Startup may take longer than you experienced when using earlier releases. This is due in part to the allocation and formatting of the staging data sets. The increased time that startup takes is dependent on such things as:

- Size of staging data set (STG_SIZE)
- DASD speed
- DASD contention

It can be reduced by avoiding the use of unnecessarily large staging data sets.

**The log stream sizing utility, DFHLSCU**

If you are migrating from CICS/ESA 3.3 or CICS/ESA 4.1, you are strongly recommended to use the CICS-supplied utility program, DFHLSCU, to help you calculate your space requirements. DFHLSCU takes as input “old-style” (pre-CICS Transaction Server for OS/390, Version 1 Release 1-format) journal records, and analyzes them to establish values for:

**AVGBUFSIZE**

The average buffer size, in bytes, of a log stream structure in the coupling facility. Although it is important, that the value you specify for AVGBUFSIZE reflects as accurately as possible the real size of most log blocks written to the structure. This leads to efficient use of the space in the coupling facility and minimum DASD offloading frequency. However OS/390 (since release 3) performs some dynamic tuning, reducing the importance of the value you specify for AVGBUFSIZE.

You define this attribute in your DEFINE STRUCTURE job.

**INITSIZE**

The initial amount of space, in kilobytes, to be allocated for the log stream structure in the coupling facility. You define this attribute in your CFRM policy.

**HIGHOFFLOAD**

The point in primary storage (that is, in either the coupling facility structure or the staging data set), as a percentage of space consumed, where the MVS system logger starts its offload process. You define this attribute in your DEFINE LOGSTREAM job.

**LOWOFFLOAD**

The point in primary storage, as a percentage of space consumed, where the MVS system logger stops offloading data from primary storage to log stream DASD data sets. You define this attribute in your DEFINE LOGSTREAM job.

**SIZE**

The maximum size, in kilobytes, of the log stream structure in the coupling facility. You define this attribute in your CFRM policy. The value of the SIZE attribute is approximately 50% greater than the value of the INITSIZE attribute. You can dynamically increase the log stream structure size up to the value of the SIZE attribute.

**STG_SIZE**

The size, as a number of 4K blocks, of the staging data set for the log
stream. A coupling facility log stream may or may not use a staging data set. For advice on the use of staging data sets with coupling facility log streams, see "Staging data sets for coupling facility log streams" on page 166.

You define this attribute in the DEFINE LOGSTREAM statements of your IXCMIAPU job. If you are using a staging data set and do not specify STG_SIZE, the MVS logger determines the size from

- The STG_SIZE parameter of the log stream defined on the LIKE parameter
- Uses the maximum coupling facility structure size for the structure to which the log stream is defined. This value is obtained from the SIZE parameter of the structure in the CFRM policy.

For details on how to use DFHLSCU, see the CICS Operations and Utilities Guide.

If DFHLSCU is inappropriate for use in your environment

If it is inappropriate for you to use DFHLSCU to help you size your coupling facility structures and log streams (perhaps you have no CICS Version 4 or Version 3 journal records to use as input to DFHLSCU, or you are capacity planning for new applications), the following sections help you to calculate your space requirements.

The formulae provided help you to calculate values for:

- INITSIZE
- AVGBUFSIZE
- SIZE
- LOWOFFLOAD
- STG_SIZE

You must base your calculations on the journaling requirements of your applications. This provides the starting point for the following formulae.

Structure size for system log usage: You are recommended not to place the primary and secondary log streams in the same structure due to the large disparity in data volumes written to the primary and secondary system logs.

Generally, the volume of data that CICS keeps in the primary system log at any one time is slightly greater than the amount written during one activity keypoint interval. This volume is determined by the activity keypoint frequency, which is measured in the number of write requests to the CICS system log stream output buffer, and defined on the AKPFREQ system initialization parameter. Review the value specified on the AKPFREQ system initialization parameter when planning coupling facility structure sizes.

The INITSIZE value to be supplied in the CFRM policy can be calculated as follows:

\[
\text{INITSIZE} = 310 + \left( \frac{\text{LOGSNUM} \times A \times B}{1024} \right)
\]

where

\[
A = 2000 + (\text{no. entries} + 5)
\]

and

\[
B = (\text{AVGBUFSIZE} \times 1.1289) + 195
\]

Figure 17. INITSIZE calculation

The value for the number of entries (no. entries) can be calculated as follows:

\[
\text{no. entries} = \left( \frac{((\text{akpintvl} + \text{trandur}) \times \text{writespersec})}{0.9} \right)
\]

where:
akpintvl is the interval between activity keypoints which varies with workload. It can be calculated as follows:

\[ akpintvl = \frac{AKPFREQ}{((N_1 \times R_1) + (N_2 \times R_2) + (N_n \times R_n))} \]

where:
- \(N_1, N_2 \ldots N_n\) is the transaction rate for each transaction (transactions per second).
- \(R_1, R_2 \ldots R_n\) is the number of log records written by each transaction.

trandur is the execution time (between syncpoints) of the longest-running transaction that runs as part of the normal workload.

If this duration is longer than akpintvl value, you can either:
- Increase the value of AKPFREQ, so increasing the value of akpintvl (as long as this does not result in an unacceptably large coupling facility structure size).
- Change the application logic to cause more frequent syncpoints.
- Calculate a structure size based on a shorter transaction duration, and accept that DASD offloading occurs when the long-running transaction is used.

writespersec = lesser of 25 or \((N_1 \times R_1) + \ldots (N_n \times R_n)\), where:
- \(N_1, N_2 \ldots N_n\) are the transaction frequencies (transactions per second) of the most frequently executed transactions.
- \(R_1, R_2 \ldots R_n\) is the number of log records written by each transaction.

You can calculate AVGBUFSIZE for DFHLOG from the weighted average of the data logged by the most frequently executed transactions in the system:

\[ AVGBUFSIZE = \frac{\text{bytespersec}}{\text{writespersec}} + 48 \]

where:
- \(\text{bytespersec} = (N_1 \times D_1) + (N_2 \times D_2) + \ldots (N_n \times D_n)\), where:
  - \(N_1, N_2 \ldots N_n\) are the transaction frequencies (transactions per second) of the most frequently executed transactions.
  - \(D_1, D_2 \ldots D_n\) are the bytes of data logged by each transaction.

You can calculate the amount of data (\(D_n\)) written to the system log for each transaction:

\[ D_n = N_s \times \text{syncreclen} + \\
N_{fc} \times (fcrechdr + fcreclen) + \\
N_{ts} \times (tsrechdr + tsreclen) + \\
N_{td} \times (tdrechdr + tdreclen) + \\
N_{ur} \times (urrechdr + urreclen) \]

where:
- \(N_s\) is the number of syncpoints per transaction - usually 1.
- \(\text{syncreclen}\) is the syncpoint record length.
- \(N_{fc}, fcrechdr, fcreclen\) are, respectively, the number of recoverable updates made, the length of the record headers, and the length of the records for file control.
  Count only READ UPDATE and WRITE ADD records. \(fcrechdr\) is 144 (136 bytes of record header plus 8 bytes of file name).

Similarly:
- \(N_{ts}, tsrechdr, tsreclen\) are for recoverable temporary storage updates.
  Count only TS PUT and TS UPDATE records.
For TS PUT records, tsrechdr is 108, and tsreclen is 88.
For TS UPDATE records, tsrechdr is 108, and tsreclen is 52.
- Ntd, tdrechdr, tdreclen are for recoverable transient data updates.
  tdrechdr is 108, and tdreclen is 380.
- Nur, nrrechdr, nrreclen are for user records written to DFHLOG.
  nrrechdr is 125.

- See page "Writes per second calculation" on page 162 for details of how to calculate writespersec.

If the result of the calculation shows a value for AVGBUFSIZE that is greater than the value defined for MAXBUFSIZE, then the value defined for MAXBUFSIZE is taken as the value for AVGBUFSIZE, and writespersec is calculated as follows:

\[
\text{writespersec} = \frac{\text{bytespersec}}{(\text{MAXBUFSIZE} - 48)}
\]

Round the final result of the INITSIZE formula up to the next multiple of 256.

The SIZE value to be supplied in the CFRM policy can be calculated as follows:

\[
\text{SIZE} = 480 + \left( \frac{\text{LOGSNUM} \times A \times B}{1024} \right)
\]

where

\[
A = 2500 + (\text{no. entries} + 5)
\]

and

\[
B = (\text{AVGBUFSIZE} \times 1.6821) + 289
\]

Figure 18. SIZE calculation

Calculate the value for the number of entries as in the INITSIZE formula.

Round the final result of the SIZE formula up to the next multiple of 256. The formula for SIZE gives a result that is approximately fifty percent greater than the INITSIZE value.

Generally, the secondary system log stream needs to be only a fraction of the size of the primary log stream. Use the following formulae to calculate coupling facility space for DFHSHUNT:

\[
\text{INITSIZE} = (150 \times \text{LOGSNUM}) + 310
\]

\[
\text{SIZE} = (230 \times \text{LOGSNUM}) + 480
\]

You can calculate a suitable value for LOWOFFLOAD for DFHLOG using the following formula:

\[
\text{LOWOFFLOAD} = \frac{(\text{trandur} \times 90)}{(\text{akpintvl} + \text{trandur}) + 10} \quad (\text{where RETPD=0 specified})
\]

or

\[
\text{LOWOFFLOAD} = \frac{(\text{trandur} \times 90)}{(\text{akpintvl} + \text{trandur})} \quad (\text{where RETPD=dddd specified})
\]

where:

- akpintvl is the interval between activity keypoints. See page 161 for the formula to calculate it.
- trandur is the execution time (between syncpoints) of the longest-running transaction that runs as part of the normal workload.

If this duration is longer than akpintvl value, you can either:
- Increase the value of AKPFREQ, so increasing the value of akpintvl (as long as this does not result in an unacceptably large coupling facility structure size).
- Change the application logic to cause more frequent syncpoints.
- Calculate a structure size based on a shorter transaction duration, and accept that DASD offloading occurs when the long-running transaction is used.

**Structure size for forward recovery log usage:** You can merge the forward recovery logs written by many CICS regions onto the same log stream. You can also use the same log stream for forward recovery data for multiple data sets.

See [Figure 17 on page 161](#) and [Figure 18 on page 163](#) for the formulae to calculate values for the `INITSIZE` and `SIZE` attributes.

Calculate a value for number of entries as follows:

\[
\text{no. entries} = \text{writespersec} \times 12.5
\]

where:

\[
\text{writespersec} = \text{lesser of 25 or } (N_1 + \ldots + N_n)
\]

where \(N_1 \ldots N_n\) is the number of transactions per second writing to each data set.

You can calculate `AVGBUFSIZE` as follows:

\[
\text{AVGBUFSIZE} = \left(\frac{\text{bytespersec}}{\text{writespersec}}\right) + 36
\]

where:

1. \(\text{bytespersec} = (N_1 \times W_1 \times (D_1 + \text{rechdr}) + \ldots \times (N_n \times W_n \times (D_n + \text{rechdr})))\)
2. \(\text{writespersec} = \text{lesser of 25 or } (N_1 + \ldots + N_n)\), where:
   - \(N_1 \ldots N_n\) is the number of transactions per second writing to each data set.
   - \(W_1 \ldots W_n\) is the number of write requests per transaction.
   - \(D_1 \ldots D_n\) is the average record length for each data set.
3. \(\text{rechdr}\) is the record header length of each record.

If the records are WRITE ADD, WRITE ADD COMPLETE, or WRITE ADD DELETE records, \(\text{rechdr}\) is 84 and is followed by the record key, and the record data (including its key).

If the result of the calculation shows a value for `AVGBUFSIZE` that is greater than the value defined for `MAXBUFSIZE`, then the value defined for `MAXBUFSIZE` is taken as the value for `AVGBUFSIZE`, and `writespersec` is calculated as follows:

\[
\text{writespersec} = \frac{\text{bytespersec}}{(\text{MAXBUFSIZE} - 36)}
\]

**Structure size for user journal and autojournal usage:** See [Figure 17 on page 161](#) and [Figure 18 on page 163](#) for the formulae to calculate values for the `INITSIZE` and `SIZE` attributes.

Calculate a value for number of entries as follows:

\[
\text{no. entries} = \text{writespersec} \times 12.5
\]

See the explanation of `writespersec` below.

For journals where the log blocks are not forced to the log stream, the average block size tends to be slightly less than the `MAXBUFSIZE` value defined for the coupling facility structure.

For journals where the log blocks are forced to the log, (via the EXEC CICS WAIT JOURNALNAME or EXEC CICS WAIT JOURNALNUM commands, or via the WAIT
option of the EXEC CICS WRITE JOURNALNAME or EXEC CICS WRITE JOURNALNUM commands), you can calculate AVGBUFSIZE from the weighted average of the data logged for each journal logging to the same log stream for a given CICS system.

\[ AVGBUFSIZE = \left( \frac{\text{bytespersec}}{\text{writespersec}} \right) + 36 \]

where:

- \( \text{bytespersec} = (N_1 \times W_1 \times (D_1 + \text{rechdr}) + \ldots + (N_n \times W_n \times (D_n + \text{rechdr}))) \)
- \( \text{writespersec} = \text{lesser of 25 or } ((N_1 \times W_1) + \ldots + (N_n \times W_n)) \)
  - \( N_1, \ldots, N_n \) is the number of transactions per second writing to the journal.
  - \( W_1, \ldots, W_n \) is the number of write requests per transaction.
  - \( W_1, \ldots, W_n \) is the number of wait requests per transaction.
  - \( D_1, \ldots, D_n \) is the average record length of each journal record.
  - \( \text{rechdr} \) is the record header length of each record.

Autojournal records are issued from file control. They may be DATA SET NAME records which consist of a 204-byte record header, and no further data. Alternatively, they may be READ ONLY, READ UPDATE, WRITE UPDATE, WRITE ADD, or WRITE ADD COMPLETE records. In this case, \( \text{rechdr} \) is 84 and is followed by the file control record itself.

User journal records consist of a 68-byte record header, followed by the user prefix, and the user data.

If the result of the calculation shows a value for AVGBUFSIZE that is greater than the value defined for MAXBUFSIZE, then the value defined for MAXBUFSIZE is taken as the value for AVGBUFSIZE, and writespersec is calculated as follows:

\[ \text{writespersec} = \frac{\text{bytespersec}}{\text{MAXBUFSIZE} - 36} \]

**Coupling facility requirements in an RLS environment**

When you move to an RLS environment from an environment in which multiple AORs have been accessing data sets in an FOR, the logging activity of the FOR is distributed across the AORs. As a consequence, the coupling facility structure size required by each AOR increases.

You can use the formulae for INITSIZE and SIZE, given in Figure 17 on page 161 and Figure 18 on page 163. However, you need to calculate values for:

- \( \text{avgbufize} \)
- \( \text{number of entries} \)
- \( \text{akpintvl} \)

using formulae which are different to those already described.

Use either reports produced by DFHLSCU for the CICS/ESA 4.1 AOR and FOR system logs, or log stream statistics from CICS Transaction Server for z/OS, to calculate:

- The number of log write operations, and
- The amount of data written

in a reporting interval for the AORs and the FOR.
Calculating increased AOR coupling facility storage requirements

Use the following formulae to calculate:

- `avgbufize`
- number of entries
- `akpintvl`.

for the AORs in the new RLS environment.

Calculate the AOR AVGBUFSIZE value required by the INITSIZE and SIZE formulae as follows:

\[
\text{AOR AVGBUFSIZE} = \left( \frac{\text{AOR}_{\text{bytes}} + (\text{FOR}_{\text{bytes}} / \text{no. of AORs})}{\text{intvlen} \times 25} \right)
\]

where:

- `AOR_{\text{bytes}}` is the number of bytes written to the system log by an AOR in the sampling interval.
- `FOR_{\text{bytes}}` is the number of bytes written to the system log by an FOR in the sampling interval.
- `no of AORs` is the number of cloned AORs using the FOR.
- `intvlen` is the length (in seconds) of the sampling interval (statistics or DFHLSCU).

Calculate the AOR 'number of entries' value required by the INITSIZE and SIZE formulae as follows:

\[
\text{AOR no. entries} = \left( \frac{(\text{AOR}_{\text{akpintvl}} + \text{trandur}) \times 25}{0.9} \right)
\]

where:

- `AOR_{\text{akpintvl}} = \left( \frac{\text{AKPFREQ} \times \text{intvlen}}{(\text{AOR}_{\text{recs}} + (\text{FOR}_{\text{recs}} / \text{no. of AORs})} \right)

where:

- `intvlen` is the length (in seconds) of the sampling interval (statistics or DFHLSCU).
- `AOR_{\text{recs}}` is the number of records written to the system log by an AOR in the sampling interval.
- `FOR_{\text{recs}}` is the number of records written to the system log by an FOR in the sampling interval.
- `no of AORs` is the number of cloned AORs using the FOR.
- `trandur` is the execution time (between syncpoints) of the longest-running transaction that runs as part of the normal workload.

If this is longer than `AOR_{\text{akpintvl}}`, use `AOR_{\text{akpintvl}}` as the duration or consider increasing AKPFREQ.

Once you have calculated the values for AOR AVGBUFSIZE and AOR no. entries, use the formulae for INITSIZE and SIZE, as described in Figure 17 on page 161 and Figure 18 on page 163.

Staging data sets for coupling facility log streams

MVS normally keeps a second copy of the data written to the coupling facility in a data space, for use when rebuilding a coupling facility log in the event of an error. This is satisfactory as long as the coupling facility is failure-independent (in a separate CPC and non-volatile) from MVS.
Where the coupling facility is in the same CPC, or uses volatile storage, the MVS system logger supports staging data sets for copies of log stream data that would otherwise be vulnerable to failures that impact both the coupling facility and the MVS images.

The following recommendations are for guidance when defining log streams:

- Define STG_DUPLEX(YES) and DUPLEXMODE(COND) for those log streams associated with the system log. This ensures that the MVS system logger automatically copies to staging data sets if it detects that the coupling facility is not failure-independent and a single point of failure, and is therefore vulnerable to permanent log data loss.

A connection to a log stream contains a single point of failure if the coupling facility is volatile or if it resides on the same CPC as the MVS system connecting to it. For example, if you have two CPCs, CPC1 and CPC2, and CPC1 has an MVS LPAR and a coupling facility, while CPC2 has only MVS LPARs, the connections from the MVS LPAR in CPC1 to the coupling facility are failure dependent—if you lose CPC1 you lose both MVS and its local buffers and the coupling facility. On the other hand, the connections from CPC2 are failure independent, because the system logger local storage and buffers are in a physically separate CPC from the coupling facility, and you would have to lose both to lose data. With DUPLEXMODE(COND), failure dependent connections result in staging sets, while failure independent connections are not allocated staging data sets.

- If you are operating with only a single coupling facility, you should define STG_DUPLEX(YES) and DUPLEXMODE(UNCOND) for those log streams associated with the system log.

- Define STG_DUPLEX(YES) and DUPLEXMODE(COND) for those log streams associated with forward recovery logs. If you do not, and there is a failure which causes loss of data from the log stream, you would need to take a new image copy of the associated VSAM data sets. There would be a consequent period of time until this was complete when the data sets would not be fully protected.

- If you operate a non-volatile, stand-alone coupling facility for normal logging, with a PR/SM LPAR configured as a coupling facility acting as backup, define all log streams with STG_DUPLEX(YES) and DUPLEXMODE(COND).

- Define each staging data set to be at least the same size as the log stream share of the coupling facility, but round the average block size up to 4K.

For example, the staging data set size corresponding to the basic coupling facility space requirement for each CICS system log stream (DFHLOG) can be calculated by the following formula:

\[
\text{staging data set size} = \text{entries} \times \frac{\text{rnd-avg-buf}}{4096}
\]

where:

\[
\text{rnd-avg-buf} = \text{avgbufsize (rounded up to 4K)}
\]

See page "number of entries calculation" on page 161 for the formula to calculate no. entries.

---

**DASD-only log streams**

The CICS log manager supports the DASD-only option of the MVS system logger. Individual CICS log streams can use either coupling facility log structures or DASD-only logging. Reasons for defining a log stream to use DASD-only logging include:

- You do not have a coupling facility.
- You want to preserve coupling facility space for other uses.
You do not need to share the log stream across MVS systems. (The CICS system log can never be shared.)

See page "Setting up the environment for CICS log manager" on page 150 for advice about defining individual log streams to use coupling facility or DASD-only logging, based on their usage.

## Defining DASD-only log streams

Use the MVS IXCMIAI PU utility to define DASD-only log streams to the LOGR couple data set. The basic syntax to define a DASD-only log stream is as follows:

```
DEFINE LOGSTREAM NAME(log stream_name)
   DASDONLY(YES)
   MAXBUFSIZE(max_bufsize)
   STG_SIZE(stg_size)
   HIGHOFFLOAD(high_offload)
   LOWOFFLOAD(low_offload)
```

For detailed information about the full range of log stream attributes, see the OS/390 Setting Up a Sysplex manual. Figure 19 shows example definitions for a pair of log streams associated with a DASD-only system log.

```
//DEFLOGS JOB ...
//LOGDEFN EXEC PGM=IXCMIAI PU
//STEPLIB DD DSN=SYS1.MIGLIB,DISP=SHR
//SYSPRINT DD SYSOUT=* 
//******************************************************************

DATA TYPE(LOGR) REPORT(NO)
DEFINE LOGSTREAM NAME(region_userid.applid.DFHLOG)
   DASDONLY(YES)
   MAXBUFSIZE(64000) STG_SIZE(3000)
   LOWOFFLOAD(40) HIGHOFFLOAD(80)
DEFINE LOGSTREAM NAME(region_userid.applid.DFHSHUNT)
   DASDONLY(YES)
   MAXBUFSIZE(64000) STG_SIZE(500)
   LOWOFFLOAD(40) HIGHOFFLOAD(80)
```

Figure 19. Example definitions of DASD-only log streams. The definitions are for the CICS primary and secondary system log streams. The value `region_userid` is the RACF userid under which the CICS address space is running; `applid` is the CICS region’s VTAM APPL name (taken from the APPLID system initialization parameter).

## Using model log streams

To avoid having to define explicitly each log stream used by each of your CICS regions, you can use model log stream definitions. Using models, log streams are defined to MVS dynamically, on their first usage. Figure 20 on page 169 shows example DASD-only model definitions for CICS primary and secondary system log streams.
For information about the mapping of CICS journal definitions to log stream names, see the [CICS System Definition Guide](#).

When using model log streams, bear in mind that, if you specify a STG_SIZE on the model definition, all new log streams created from the model have the same-sized staging data set.

**Sizing considerations for DASD-only log streams**

This section discusses how to size the following types of DASD-only log stream:

- The CICS primary and secondary system log streams
- Forward recovery logs
- User journals and autojournals.

**Sizing DFHLOG**

For the CICS primary system log stream (DFHLOG), it is important to:

- **Minimize the amount of data that is offloaded to secondary storage:**

  The MVS system logger begins the offload process when the high offload threshold (HIGHOFFLOAD) of the log stream is reached. The offload process consists of two steps:

  1. The MVS logger physically deletes the data in the log stream that has been marked for deletion by the CICS log-tail deletion process.
  2. The MVS logger calculates how much data needs to be offloaded to secondary storage, based on the difference between HIGHOFFLOAD and LOWOFFLOAD, less the amount of data that has been deleted since the last offload event.

  To minimize the amount of data offloaded from the CICS primary system log, you must:

  - Define a suitably-sized staging data set. For advice, see [Recommendations](#) on page 170.
Note: It is possible to alter the size of a staging data set without deleting the log stream. To do this, use the UPDATE LOGSTREAM request of the MVS IXCMIAPU utility to change the value of the STG_SIZE parameter.

- Ensure that the log-tail deletion process is working effectively. For detailed information about the log tail deletion process, see the CICS Recovery and Restart Guide.

• Avoid “staging-data-set-full” events:
  A staging-data-set-full event occurs when a log stream’s staging data set becomes full before the offloading of data has completed.
  For advice on monitoring and avoiding staging-data-set-full events, see the CICS Performance Guide.

Sizing DFHSHUNT
It is important to size the secondary system log stream (DFHSHUNT) to avoid staging-data-set-full events. However, it is normal for some data to be offloaded from DFHSHUNT to secondary storage.

Sizing general logs
It is important to size forward recovery logs, user journals, and autojournals to avoid staging-data-set-full events. However, because CICS does not delete data from these log streams, it is normal for data to be offloaded to secondary storage.

Recommendations
Table 12 summarizes how you should decide on the values for various attributes on the log stream definition, and system definition.

Note: Startup may take longer than you experienced when using earlier releases. This is due in part to the allocation and formatting of the staging data sets. The increased time that startup takes is dependent on such things as:
  • Size of staging data set (STG_SIZE)
• DASD speed
• DASD contention

It can be reduced by avoiding the use of unnecessarily large staging data sets.

The log stream sizing utility, DFHLSCU
If you are migrating from CICS/ESA 3.3 or CICS/ESA 4.1, you are strongly recommended to use the CICS-supplied utility program, DFHLSCU, to help you define your DASD-only log streams. DFHLSCU takes as input “old-style” (pre-CICS Transaction Server for OS/390, Version 1 Release 1-format) journal records, and analyzes them to produce a sample log stream definition containing suggested values for:

DASDONLY(YES)
  Specifies that this log stream is not to be associated with a coupling facility list structure, but is to use DASD-only logging. If you specify DASDONLY(YES), you cannot use the STRUCTNAME(log_structure_name) keyword. The default is DASDONLY(NO).

HIGHOFFLOAD(high_offload)
  Specifies the point in primary storage, as a percentage of space consumed, at which the MVS system logger starts its offload process.

LOWOFFLOAD(low_offload)
  Specifies the point in primary storage, as a percentage of space consumed, at which the MVS system logger stops offloading data to secondary storage.

MAXBUFSIZE(max_bufsize)
  Specifies the size, in bytes, of the largest block of data that can be written to the log stream. The value must be in the range 1–65532. The default value is 65532.

STG_SIZE(stg_size)
  Specifies, as a number of 4K blocks, the size of the staging data set for the log stream. A DASD-only log stream, by definition, always uses a staging data set as part of its primary storage.

If you do not specify STG_SIZE for a DASD-only log stream, the MVS system logger does one of the following, in the order listed, to allocate space for staging data sets:

1. Uses the STG_SIZE of the log stream specified on the LIKE parameter, if LIKE is specified
2. Uses the size defined in the SMS data class for the staging data sets
3. If SMS is not available, uses dynamic allocation rules for allocating data sets.

For more information about managing staging data sets for DASD-only log streams, see the Setting Up a Sysplex manual.

For details on how to use DFHLSCU, see the CICS Operations and Utilities Guide.

If DFHLSCU is inappropriate for use in your environment
If it is inappropriate for you to use DFHLSCU to help you size your log streams (perhaps you have no CICS Version 4 or Version 3 journal records to use as input to DFHLSCU, or you are capacity planning for new applications), the following sections help you to calculate your space requirements.

The formulae provided help you to calculate values for:
• LOWOFFLOAD
• STG_SIZE

You must base your calculations on the journaling requirements of your applications. This provides the starting point for the following formulae.

**Primary system log (DFHLOG):** You can calculate LOWOFFLOAD for DFHLOG using the following formula:

\[
\text{LOWOFFLOAD} = \frac{\text{trandur} \times 90}{\text{akpintvl} + \text{trandur}} + 10 \quad \text{(where RETPD=0 specified)}
\]

or

\[
\text{LOWOFFLOAD} = \frac{\text{trandur} \times 90}{\text{akpintvl} + \text{trandur}} \quad \text{(where RETPD=dddd specified)}
\]

where:

• \( \text{akpintvl} \) is the interval between activity keypoints. It can be calculated as follows:

\[
\text{akpintvl} = \frac{\text{AKPFREQ}}{(N1 \times R1) + (N2 \times R2) + (Nn \times Rn)}
\]

where:

– \( N1, N2 \ldots Nn \) is the transaction rate for each transaction (transactions per second).
– \( R1, R2 \ldots Rn \) is the number of log records written by each transaction.
– \( \text{trandur} \) is the execution time (between syncpoints) of the longest-running transaction that runs as part of the normal workload.

If this duration is longer than \( \text{akpintvl} \) value, you can either:

– Increase the value of \( \text{AKPFREQ} \), so increasing the value of \( \text{akpintvl} \) (as long as this does not result in an unacceptably large staging data set size).
– Change the application logic to cause more frequent syncpoints.
– Calculate a staging data set size based on a shorter transaction duration, and accept that offloading to secondary storage occurs when the long-running transaction is used.

You can calculate STG_SIZE for DFHLOG using the following formula:

\[
\text{Staging DS size} = \frac{(\text{AKP duration}) \times \text{No. of log writes per second}}{\text{No. of 4k blocks}}
\]

where \( \text{AKP duration} = \frac{(\text{CICS TS 390 AKPFREQ})}{\text{(No. buffers per second)}} \)

The values for the number of log writes per second and buffer puts per second can be taken from your CICS/ESA 4.1 statistics. (The value for log writes per second should not exceed 30.)

**Converting a DASD-only log stream to use a coupling facility**

You can upgrade a DASD-only log stream to use a coupling facility structure, without having to delete and redefine the log stream. To do this:

1. Make sure that there are no connections (neither active nor failed) to the log stream.
2. Use the UPDATE LOGSTREAM request of the MVS IXCMIAPU utility. Specify the STRUCTNAME keyword, and let the DASDONLY keyword default to 'NO'. For example:
Analyzing SMF Type 88 records

When reviewing the output from the system logger reports produced by IXGRPT1, IXGRPT1J, and IXGRPT1L, look at the following key fields for CICS system logs:

- The number of bytes deleted from primary storage should be close to the number of bytes written.
- The number of bytes deleted from the system log after writing to offload data sets should be very low:
  - If this number is high, overhead is being incurred to move data to the offload data set only to be later deleted.
  - This is a key indicator that log tail deletion is not working as effectively as it should.
  - Check the MVS system log for any DFHRM0205 and DFHLG0743 messages from the affected CICS region.
  - Look for long running tasks (using CICS monitoring data or a system monitoring package), or check if AKPFREQ is too high.
- In general offloads are acceptable, but offloads triggered by NTRY FULL indicators are not a good sign:
  - NTRY FULL indicates that the entry to element ratio is too high.
  - It is probably the result of having unlike logstreams defined in the same structure.
  - The offloads are being triggered by all the entries being used rather than triggered by the HIGHOFFLOAD value.
- TYPE3 I/O counts should not appear in the statistics for coupling facility log streams, because these indicate that I/O is being initiated when over 90% of the elements for the log stream are in use.
- Average buffer size is important because:
– If over 4K, the writes are asynchronous, with a greater overhead, rather than synchronous.
– Buffer size is used to determine the entry to element ratio.
– If MAXBUFSIZE specified on the log stream definition is less than 65532 bytes, the element size is 256 bytes.
– If MAXBUFSIZE is 65532 bytes, the element size is 512 bytes.
– The entry to element ratio is calculated as (average-buffer-size plus 4 divided by 4)

Managing secondary storage

This section contains advice on how to manage secondary storage—that is, log stream data sets.

Managing log data sets

You are recommended to use System Managed Storage (SMS) to manage log stream data sets. You can specify the SMS characteristics of log data sets in a number of ways, depending on your installation:

Using automatic class selection (ACS) routines

You can use installation-written automatic class selection (ACS) routines to assign log data sets to SMS classes.

Using the LOGR policy,

When you define or update a log stream definition in the LOGR policy, you can assign the SMS storage class, data class, and management class for both the DASD log data sets and staging data sets.

- Use LS_DATACLAS to specify the SMS data class to be used for log stream data set allocation.
- Use LS_STORCLAS to specify the SMS storage class to be used for log stream data set allocation.
- Use LS_SIZE to specify the size, in 4K blocks, of the log stream DASD data sets. Specify a size so that each data set can contain multiple offloads of the primary storage: this is particularly important where all the data is offloaded for a log stream, as in the case of user journals and forward recovery logs. The MVS system logger issues message IXG256I is you specify less than 64K.

If you omit the size parameter, the size is taken from the ALLOCxx member of PARMLIB (the default is 2 tracks, which leads to a high number of new data set allocations). Specify a size that is large enough to avoid a high frequency of new data set allocations—aim for a new data set to be allocated less often than once an hour.

SHAREOPTIONS(3,3)

Always define logger data sets with SHAREOPTIONS(3,3), whether the system is a part of a multiple-member sysplex or a monoplex. The common symptom of not having SHAREOPTIONS(3,3) is return code 84A or 403 from the logger.

For more information about managing log data sets, see the z/OS MVS Setting Up a Sysplex manual.
Log tail management

Redundant data should be deleted from log streams periodically, to conserve storage, and because the MVS system logger imposes a limit on the number of data sets per log stream.

The system log
CICS manages the system log by deleting records, for completed units of work, during activity keypoint processing (log-tail deletion). With an appropriately sized log stream, the system log data remains in primary storage, so avoiding the overhead of data spilling to DASD.

Note that:

- The CICS system log should be used only for short-lived data required for recovery purposes. You should not write user records for such things as audit trails to it.
- You should allow CICS to manage the size of the system log.

However, if historically you have used the system log for such things as audit trails, you may need to preserve system log data beyond the time it would normally be deleted by CICS. You can use the RETPD MVS parameter to preserve system log data. Define DFHLOG and DFHSHUNT to MVS with AUTODELETE(NO) and RETPD(dddd). The default values are AUTODELETE(NO) and RETPD(0).

Specifying AUTODELETE(NO) means that CICS, rather than MVS, retains control of the log-tail trimming process; dddd is the number of days for which data is to be retained. This causes the MVS logger to physically delete an entire log data set when all of the data in the data set:

1. Has been marked for deletion by the CICS log-tail trimming process
2. Is older than the retention period specified for the log stream.

You can view log data that has been marked for deletion by CICS but not yet physically deleted by MVS, using the DFHJUP utility program or the VIEW=ALL option of the MVS IXGBRWSE macro.

General logs
The number of data sets per log stream recognized by the MVS logger is several million. This means that, in general, you do not need to be concerned about the limit being reached.

You can cause redundant data to be deleted from log streams automatically, after a specified period. To arrange this for general log streams, define the logs to MVS with AUTODELETE(YES) and RETPD(dddd), where dddd is the number of days for which data is to be retained. This causes the MVS system logger to delete an entire log data set when all the data in it is older than the retention period (RETPD) specified for the log stream.

Note: Support for the removal of the 168 data set limit, which applied only in early releases of OS/390, and support for the AUTODELETE and RETPD parameters, requires the sysplex's LOGR couple data set to have been formatted using OS/390 Release 3 or later. The removal of the 168 data set limit also requires the LOGR data set to have been formatted with DSEXTENT(nnnnn).
Chapter 25. Enabling Unicode data conversion by z/OS

z/OS can provide support for the conversion of Unicode data (either UTF-8 or UTF-16) to any of the EBCDIC CCSIDs, currently supported by CICS. If you intend to make use of this capability, you must enable the z/OS conversion services and install a conversion image which specifies the conversions that you want CICS to perform. See "Selecting conversion images" for more information.

Important
z/OS Support for Unicode must be activated before you start CICS.

Refer to the instructions in the z/OS manual Support for Unicode: Using Conversion Services SA22–7649. (Level –02 of that publication relates to z/OS release 1.4), to find out the steps needed to set up your system and configure a suitable conversion image.

If z/OS conversion services are not enabled, a message is issued by CICS to indicate this. That message can be suppressed if you do not need these services.

• If the message is encountered when starting a CICS region that is expected to make use of these services, then an IPL is necessary to enable the z/OS conversion services.

To discover the status of z/OS conversion services after an IPL, use one of these commands:

/D UNI To show whether z/OS conversion services were enabled.
/D UNI,ALL To show whether z/OS conversion services were enabled, and which conversions are supported by the system.

from an MVS console. For details of this, see the z/OS Support for Unicode: Using Conversion Services manual SA22-7649

Selecting conversion images

Appendix F of the z/OS Support for Unicode: Using Conversion Services manual, SA22 -7649, records those conversions which are supported though these services. CICS now supports any of these character conversions by making use of the z/OS conversion services.

The conversions entries that you select must not specify type ER.

The z/OS conversion services support big endian byte ordered data (UTF-16BE), they do not support little endian byte ordered data (UTF-16LE). When asked to convert UTF-16LE source data to some other CCSID, CICS transforms the data to the big-endian form of UTF-16 before calling the z/OS conversion services. When the target data is identified as UTF-16 (CCSID 1200), CICS receives the converted data from the z/OS services in big-endian byte order, and returns it in this form.

There are 3 CCSIDs for UTF data,

• CCSID 1202 and CCSID 1201 indicate UTF-16LE and UTF16-BE respectively,
• CCSID 1200 indicates that the data carries a byte order marker which must be examined to see if what follows is big-endian or little-endian.
When handling CCSID 1200, CICS respects the byte order marker for inbound conversions, but is not able to retain that information when handling a related outbound conversion. All outbound data for CCSID 1200 is UTF16-LE. Application programmers need to know about this and perform their own LE to BE conversions if they so require.
Chapter 26. Applying service to CICS Transaction Server for z/OS

Service material for CICS Transaction Server for z/OS is distributed as APAR fixes and PTFs. Both types of change are called SYSMODs (SYStem MODifications).

Using SMP/E control statements, you can process SYSMODs in three stages:
1. The RECEIVE control statement moves the SYSMOD into the PTF temporary store (PTS) data set. This operation is reversed by the REJECT control statement.
2. The APPLY control statement moves the SYSMOD into the target libraries. This operation is reversed by the RESTORE control statement.

At this point you can test the modified system.
3. The ACCEPT control statement moves the SYSMOD into the distribution libraries. This operation is not easily reversed.

When you are dealing with APAR fixes, you should APPLY the SYSMOD, but not accept it. If you later obtain a PTF that solves the problem in a different way, you may be asked to RESTORE (that is, remove) the APAR fix and APPLY the PTF instead.

When you are dealing with PTFs, you should APPLY the SYSMOD, then test it. Afterwards you can ACCEPT it.

For background information about SMP/E operations, see the System Modification Program Extended: General Information manual. For more detailed information, see the System Modification Program Extended: Reference manual.

Load library secondary extents

CICS supports load library secondary extents that are created while CICS is executing. If you define libraries in the DFHRPL concatenation with primary and secondary extents, and secondary extents are added while CICS is running, as a result of link-editing into the DFHRPL library, the CICS loader detects the occurrence and closes then reopens the library. This means that you can introduce new versions of programs by using the CEMT NEWCOPY command, even if the new copy of the program has caused a new library extent.

However, you should not attempt to apply service to data sets that are used by executing CICS TS components.

The CICS TS-supplied SMP/E procedure

There is a CICS TS-supplied procedure for applying service to the CICS and CICSPlex SM components of CICS TS, called DFHSMPE. This procedure is tailored to your environment and stored in the hlq.XDFHINST library when you run the DFHISTAR job.

4. An APAR (Authorized Program Analysis Report) is raised when you and your IBM programming service representative agree that there is a CICS problem. You may then be given an APAR fix. When the problem has been analyzed, all users are sent a PTF (Program Temporary Fix) to correct the problem permanently on the current release. PTFs are incorporated into any future CICS release.
For information about how to apply corrective service with SMP/E, see the *System Modification Program Extended: User's Guide*.

Whenever you do any SMP/E processing on CICS or CICSPlex SM software, and you use any of the examples quoted in the *System Modification Program Extended: User's Guide*, you should specify DFHSMPE as the name of the SMP/E procedure on the EXEC statement (that is, in place of SMPPROC, as used in the examples). The DFHSMPE procedure includes the following DD statement for supplying SMP/E control statements:

```
//SMPCNTL DD DSN=&SETBDY,DISP=(OLD,DELETE)  
// DD DDNAME=DFHSMPIN
```

The ZNAME parameter of the DFHSMPE procedure generates a SET BDY command for the zone that is identified by the parameter. The command is stored in the temporary data set, SETBDY. The ZNAME parameter is set to the value of zonename that you specify for the TZONE parameter. If you do not specify any value for zonename for the TZONE parameter of the DFHISTAR job, zonename (and the ZNAME value) defaults to TZONE.

**Note:** The ZNAME parameter also generates a SET BDY command in DFHAUPLE, the CICS TS procedure supplied for assembling and link-editing CICS control tables.

If you supply an override SMPCNTL DD statement in the job that executes DFHSMPE, remember that it must come before any DD statements that are additional to the procedure. Furthermore, if you provide an override, you will get the following MVS system message:

```
IEF686I DDNAME REFERRED TO ON DDNAME KEYWORD IN PRIOR STEP WAS NOT RESOLVED
```

You receive this message because the DD statement for DFHSMPIN is missing as a result of the SMPCNTL DD override. However, the message is not a JCL error, and does not prevent the step from running successfully with a return code of 0.

If you supply any SMP/E control statements in your job via the DFHSMPIN ddname, they are prefixed by a SET BDY for the zone that you specify on the ZNAME parameter. It does not matter if you are running SMP/E with a command that does not need this SET BDY statement; it does not affect the execution of your job.

### APAR fixes

Generally, you should **not** ACCEPT APAR fixes into distribution libraries. Subsequent PTFs may not include the APAR fix, and you may need to reapply the APAR fix.

If two APAR fixes are dependent on one another, and each is a prerequisite of the other, you must apply them both in the same SMP/E APPLY processing step.

### PTFs

PTFs are intended for all users to install to avoid possible problems.

A PTF may contain fixes for several different problems. This means that several APAR fixes reported in RETAIN® may all be superseded by the more permanent PTF, which:
• Provides card-image changes that are functionally equivalent to those in the APAR fix.
• Contains object-module replacements for preassembled CICS TS programs.

For further information about using SMP/E to apply service, see the System Modification Program Extended: User’s Guide.

CICS service considerations

If you use the CICS TS-supplied SMP/E usermod to install a module into the LPA (for example, into the hlq.SDFHLPA library), and later apply service to that module, it is the LPA-resident version of the module that is serviced. If you have not used the SMP/E usermod to install the module into the LPA, it is the original version in the hlq.SDFHAUTH library or hlq.SDFLOAD library that is serviced.

Once you have installed CICS, and before you start the post-installation tasks described in this book, you should change the TEMPLIB parameter and the SYSPROC DD statement of the DFHISTAR job to refer to the hlq.SDFHINST library. This ensures that if you need to apply service to any of the skeleton jobs, the changes (applied to the hlq.SDFHINST library) are used in subsequent runs of DFHISTAR. In any such subsequent runs of DFHISTAR, you can use the SELECT parameter to select any jobs, affected by service, to be regenerated.

Notes:
1. If DFHISTAR is serviced, you should add the service changes to your DFHISTAR module in the hlq.TDFHINST library (to preserve your current installation parameters) or respecify your current installation parameters in the serviced DFHISTAR module (which you can copy from the hlq.SDFHINST library to the hlq.TDFHINST library).
2. Linkage editor messages IEW0461, IEW2454, IEW2646, IEW2651 and IEW2689 are produced during the APPLY stage for unresolved external references. These are issued, giving a return code of 4, when some CICS load modules are link-edited during PTF installation. You can ignore these IEWxxxx messages because they are produced for component object modules of executable CICS load modules.
3. JCI640D and JCI640E PTFs to ship Java service are often significantly larger than those for the base CICS product and may require more system resources during APPLY processing. To avoid errors caused by insufficient storage, it is recommended that the SMP/E APPLY step for such PTFs does not have a restricted region size. If a region size limit is used and the APPLY fails with errors relating to insufficient storage, it may be necessary to increase or remove the limit for the SMP/E job. In some cases a region size of 500M or more may be required.

CICSPlex SM service considerations

When you are preparing to run the EYUISTAR job after completing the basic installation of CICSPlex SM, you should verify that the TEMPLIB parameter and the SYSPROC DD statement of the EYUISTAR job refer to the CICSTS31.CPSM.SEYUINST library. This ensures that if you need to apply service to any of the skeleton jobs, the changes (applied to the CICSTS31.CPSM.SEYUINST library) are used in subsequent runs of the EYUISTAR job. For additional information, see "Sample JCL editing considerations" on page 373.
If you use the CICS TS-supplied SMP/E USERMOD to install modules into the LPA (for example, into the CICSTS31.CPSM.SEYULPA library), and later apply service to that module, it is the LPA-resident version of the module that is serviced. If you have not used the SMP/E USERMOD to install the module into the LPA, it is the original version in the CICSTS31.CPSM.SEYUAUTH library or CICSTS31.CPSM.SEYULOAD library that is serviced.

After applying CICSPlex SM service, ensure that all CICSPlex SM regions are running with a consistent set of CICSPlex SM libraries. Failure to do so may cause unpredictable results.

More information on applying service to CICSPlex SM can be found in “CICS Transaction Server for z/OS-supplied SMP/E procedure” on page 371.

Servicing the CICS messages data set

Some IBM-supplied service may include changes to CICS messages, and associated changes to the CICS messages data set, DFHCMMACD, used by the CICS-supplied transaction CMAC. When you have received and applied the service, you can update the CICS messages data set by running the job DFHCMMACU. DFHCMMACU is tailored to your CICS environment and stored in the hlq.XDFHINST library when you run the DFHISTAR job.

If a PTF contains an update to the DFHCMMACD data set, you will see a **++HOLD** statement during the APPLY processing of the PTF to notify you that the DFHCMMACD data set needs to be updated. The PTF will include a member called DFHxxxx, where xxxx is the APAR number that is associated with the PTF. You should amend the DFHCMMACU job so it refers to the appropriate service member of the target library hlq.SDFHMSGS (that is, DFHxxxx on the SYS01 card corresponds to the DFHxxxxx part shipped by the PTF). When you submit the DFHCMMACU job, it updates the entries in the DFHCMMACD data set for all messages that are changed by the IBM supplied service.

If you are applying more than one PTF which changes the DFHCMMACD data set, you should either run the DFHCMMACU job for each PTF, or alternatively, you may include all the PTFs within one job run, by altering the DFHCMMACU job as follows:

```
//CMACUPD EXEC PGM=IDCAMS
//SYSPRINT DD SYSOUT=*  
//AMSDUMP DD SYSOUT=*  
//SYS01 DD DSN=CICSTS31.CICS.SDFHMSGS(DFHXXXXX),DISP=SHR  
//SYS02 DD DSN=CICSTS31.CICS.SDFHMSGS(DFHYYYYY),DISP=SHR

182 CICS TS for z/OS: Installation Guide
Part 3. Getting ready to run CICS

This part describes how to tailor the CICS-supplied skeleton jobs, apply service to CICS and create the CICS data sets. It also describes how you can use DL/I support with CICS, how to include MRO and ISC in your CICS region, and how to use the CICS-supplied installation verification procedures (IVPs) to confirm that CICS is operational. It contains the following chapters:

- Chapter 27, “Tailoring the CICS-supplied skeleton jobs,” on page 185.
- Chapter 28, “Creating the CICS data sets,” on page 189.
- Chapter 30, “Adding CICS support for programming languages,” on page 201.
- Chapter 31, “Verifying your Java components installation,” on page 205.
- Chapter 32, “Installing MRO and ISC support,” on page 211.
Chapter 27. Tailoring the CICS-supplied skeleton jobs

If you used CBPDO to install CICS, edit and run DFHISTAR to tailor the CICS-supplied skeleton jobs that create the CICS data sets and run the CICS-supplied IVPs.

If you used the ServerPac to install CICS, the install job stream name is ISTAR01. ISTAR01 is produced from DFHISTAR during the ServerPac process, and placed in the SDFHINST library. DFHISTAR is not removed from the SDFHINST library by this process.

If you have used the distribution tape to install CICS, as described in the CICS Transaction Server for z/OS Program Directory, you would normally have tailored the skeleton jobs already, and should now be able to proceed to Chapter 28, "Creating the CICS data sets," on page 189.

Which ever method you used to install CICS, you can edit and run DFHISTAR several times, to create different copies of the skeleton jobs or subsequently change them. For example, to create several copies of DFHDEFDS to define data sets unique to several CICS regions, or if you have to apply service to any of the installation-related jobs. This enables you to tailor the jobs to your CICS environment after you have loaded the CICS software into the SMP/E-supported CICS libraries.

The CICS installation libraries

When you use CBPDO to install CICS TS, you use the installation libraries shown in Figure 22.
The names of the CICS installation libraries in Figure 22 on page 185 and their use is explained in the following notes which refer to the numbers in the figure:

1. Skeleton installation-related jobs are copied from data set HCI6400.F2 on the distribution tape into hlq.TDFHINST. hlq.TDFHINST is used to store the DFHISTAR that you edit and run to tailor the skeleton installation-related jobs to your CICS environment. Until you have installed the CICS software into the SMP/E-supported CICS libraries, this library also stores the skeleton jobs to be tailored.

2. You edit DFHISTAR in the hlq.TDFHINST library, to specify CICS installation parameters specific to your CICS environment.

3. When you run DFHISTAR, the tailored copies of the skeleton jobs are copied from the hlq.TDFHINST library to the hlq.XDFHINST library. hlq.XDFHINST is used to store the tailored, executable copies of the skeleton jobs that are to be run.

4. To install CICS, you run the tailored copies of the CICS-supplied installation jobs to transfer the CICS software from the distribution tape to the hlq.ADFHINST and hlq.SDFHINST libraries. hlq.ADFHINST is the SMP/E-supported distribution installation library. hlq.SDFHINST is the SMP/E-supported target installation library. After you have installed the CICS software into this and other SMP/E-supported libraries (named SDFHxxxx and ADFHxxxx), the skeleton jobs that you should use on any later runs of DFHISTAR are stored in the SDFHINST library.

Note: The actual names of the TDFHINST and XDFHINST libraries, and the prefix for those and other CICS libraries, are defined in DFHISTAR, which you edit as described in this chapter.

To tailor the skeleton jobs you must run DFHISTAR. For information on how to do this, see CICS Transaction Server for z/OS: Installation Directory. Running DFHISTAR

When you have edited DFHISTAR with the values for installation parameters or your CICS environment, submit DFHISTAR. When you run DFHISTAR, it tailors the skeleton jobs selected in the DFHISTAR input (by the SCOPE or SELECT parameter) to your environment and adds them to the library that you specified on the LIB parameter (by default, hlq.XDFHINST). If necessary, DFHISTAR creates the library that is specified on the LIB parameter.
A Table in section 6.4 of the *CICS Transaction Server for z/OS Program Directory* lists those skeleton jobs installed in the *hlq.SDFHINST* library that you can tailor by running DFHISTAR.

**Note:** You must specify the full name of the installation library from which the skeleton jobs are obtained, on the TEMPLIB parameter and SYSPROC DD statement of DFHISTAR (by default, *hlq.TDFHINST*). For the post-installation tasks that are described in this book, you should specify TEMPLIB SDFHINST.

DFHISTAR produces a job log and, if necessary, an error code:
- The output job log lists the values that were actually used for the parameters of DFHISTAR.
- If any error occurs when running DFHISTAR, an error code of 4 or 12 is returned. For error code 4, the skeleton jobs are tailored and added to the *hlq.XDFHINST* library. For error code 12, the skeleton jobs are not tailored or copied. To resolve the cause of the error, examine the output job log and, if necessary edit and submit DFHISTAR again.
Chapter 28. Creating the CICS data sets

After you have installed CICS, and applied any necessary service, you can run the DFHCOMDS, DFHDEFDS, and DFHCMACI jobs to create the CICS data sets.

CICS supports access to the following types of data sets:

- **Key-sequenced data set (KSDS).** With releases of DFSMS/MVS 1.4 and later, a data set can be greater than 4 GB in size if it is defined as extended format and extended addressability in the storage class. CICS supports, in both RL and non-RLS mode, KSDS data sets that are defined with these extended attributes.
- **Entry-sequenced data set (ESDS).** With releases of DFSMS/MVS 1.5 and later, a data set can be greater than 4 GB in size if it is defined as extended format and extended addressability in the storage class. However, CICS does not support ESDS data sets that are defined with these extended attributes. Attempts to open data sets defined with the extended attribute fail with error message DFHFC0966, codes 8504, 0008, and 0068 for non-RLS access and message DFHFC0905 for RLS access.
- **Relative record data set (RRDS).** With releases of DFSMS/MVS 1.5 and later, a data set can be greater than 4 GB in size if it is defined as extended format and extended addressability in the storage class. CICS supports access to extended RRDS or VRRDS datasets if you use an RRN that can be specified in a four-byte RRN field to access the records that reside beyond the 4 GB boundary.

<table>
<thead>
<tr>
<th>Data sets</th>
</tr>
</thead>
<tbody>
<tr>
<td>The data sets created by the jobs described in this chapter are required by the IVPs described in Chapter 35, “Running the installation verification procedures,” on page 227.</td>
</tr>
</tbody>
</table>

**VSAM Data sets and z/OS 1.3**

If you are using z/OS 1.3 or above, read Information APAR II13288.

It reports that the level of DFSMS supplied with z/OS 1.3 has changed the way that index controlintervalsize (CISIZE) is calculated for those VSAM data sets that have index components. As a result, large default CISizes can be expected, and this can cause open errors during CICS start-up.

This applies to both CICS data sets and your own application data sets.

<table>
<thead>
<tr>
<th>Job</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>DFHCOMDS</strong></td>
<td>Deletes and recreates data sets common to all CICS regions.</td>
</tr>
<tr>
<td><strong>DFHDEFDS</strong></td>
<td>Deletes and recreates copies of data sets that are used only by one CICS region. You run a separate copy of this job to create the data sets for each CICS region.</td>
</tr>
<tr>
<td><strong>DFHCMACI</strong></td>
<td>Deletes and recreates the CICS messages data set, dsindex.DFHMACD, and loads it with the data</td>
</tr>
</tbody>
</table>
from the CICS-supplied file, DFHCMACD, in the hlq.SDFHMSG target library.

**DFH0JCUS** Deletes and recreates the sample applications details data set, dsindex.SAMPLE.DFHCTCUS (and its associated alternate index and path), and loads it with the data from the CICS-supplied file, DFH0DCUS, in the hlq.ADFHAPD2 library.

**DFH0JHLP** Deletes and recreates the sample applications help data set, dsindex.SAMPLE.DFHCTHLP, and loads it with the data from the CICS-supplied file, DFH0DHLP, in the hlq.ADFHAPD1 library.

When you ran DFHISTAR, these jobs were tailored to your environment and stored in the library that you specified on the LIB parameter of DFHISTAR (by default, hlq.XDFHINST). If you have not yet run DFHISTAR, you should do so before running any of the CICS post-installation jobs.

You can generate several copies of these jobs by rerunning DFHISTAR, selecting the jobs that you want to copy. To generate new copies of these jobs, edit DFHISTAR to specify new values for the DSINFO and SELECT parameters. Only those jobs that you name by the SELECT parameter are regenerated.

### Naming conventions

There are no restrictions on the data set names you choose for CICS data sets, other than MVS constraints. In the examples in this book, hlq is the high-level qualifier, and the DD name is the lowest level. If you are running multiple CICS regions, and especially if you are running CICS with XRF, you can use the CICS APPLID as a third level qualifier.

You should use the CTGI naming convention, as in System/390 MVS Sysplex Application Migration. For example, if CICSATH1 is the APPLID, the data set name for the CSD would be:

```plaintext
DFHCSD DD DSN=CICSTS31.CICS.CICSATH1.DFHCSD,DISP=SHR
```

The CTGI naming convention is a recommended example of a naming convention that you can use for CICS 4-character names, and is based on the 4-character CTGI symbol, where:

- C identifies an entire CICSpex
- T identifies the type of region
- G identifies a group of regions
- I identifies iterations of regions within a group

Where names are allowed to be up to eight characters long, as for CICS APPLIDs, the general recommendation is that the letters CICS are used for the first four characters, particularly for production regions.

If the data set is shared between an active CICS region and an alternate CICS region, use the generic APPLID; but if the data set is unique to either the active or the alternate CICS region, use the specific APPLID. For information about actively and passively shared data sets, see the CICS System Definition Guide.
Creating data sets common to all CICS regions, DFHCOMDS job

You can use the DFHCOMDS job to delete and recreate the following data sets common to all CICS regions:

<table>
<thead>
<tr>
<th>Name</th>
<th>Data set</th>
</tr>
</thead>
<tbody>
<tr>
<td>DFHCSD</td>
<td>CICS system definition.</td>
</tr>
<tr>
<td>SYSIN</td>
<td>SYSIN data set.</td>
</tr>
</tbody>
</table>

**Note:** The CICS-supplied DFHCOMDS job creates one of each of these data sets common to all CICS regions. If you use separate copies of any of these data sets for each CICS region, you should move and edit the appropriate statements into the DFHDEFDS job. For further information about creating multiple copies of these data sets, see "Creating several copies of the DFHCSD and SYSIN data sets."

The DFHCOMDS job comprises five job steps:

1. **DELETE** deletes the data sets.
2. **DEFCSD** defines the VSAM cluster for the CICS system definition data set, dsindex.DFHCSD, where dsindex is defined by the DSINFO parameter of DFHISTAR.
3. **INITCSD** initializes the CICS system definition data set.
4. **DEFRPIDC** defines the VSAM cluster for ONC RPC.
5. **DEFSYSIN** creates the SYSIN PDS and copies the following modules from the hlq.SDFHSAMP library:

<table>
<thead>
<tr>
<th>DFH$SIPA</th>
<th>DFH$SIPT</th>
<th>DFH$SIP5</th>
<th>DFH$SIP1</th>
</tr>
</thead>
<tbody>
<tr>
<td>DFH$SIP2</td>
<td>DFH$SIPT</td>
<td>DFHRCNO</td>
<td>DFHRCYES</td>
</tr>
</tbody>
</table>

Creating several copies of the DFHCSD and SYSIN data sets

The CICS-supplied DFHCOMDS job creates one of each of the DFHCSD and SYSIN data sets common to all CICS regions. If you use separate copies of any of these data sets for each CICS region, you should:

- Move the statements that define the data set from the DFHCOMDS job to the DFHDEFDS job.
- Edit the statements in the DFHDEFDS job to specify the symbol &REGNAME for the region qualifier in the name of the data set.

You should move and edit the appropriate data set statements before you create copies of the DFHDEFDS job for each CICS region. When you run DFHISTAR to create the new copies of the DFHDEFDS job, it substitutes your values for the CICS region qualifier (&REGNAME) and index (&INDEX) into the data set names.

**For example:** If you intend using a copy of the DFHCSD data set for each CICS region, you should copy the job steps DELCSD, DEFCSD, and INITCSD from the DFHCOMDS job to the DFHDEFDS job. You should also add the symbol &REGNAME for the qualifier to the name of the DFHCSD data set to give &DSINDEX.CICS&REGNAME.DFHCSD. If you edit DFHISTAR to select the DFHDEFDS job to be copied, and specify the following DSINFO parameter:

```
DSINFO userid.CICST531.CICS H3P060 3390 IDA .
```
when you run the DFHDEFDS job, it creates the DFHCSD data set called userid.CICSTS31.CICS.CICSIDA.DFHCSD for the CICS region identified by the qualifier IDA. If you change the SELECT and DSINFO parameters of DFHISTAR (to specify an appropriate new job name and qualifier for another CICS region), you can create several copies of the DFHDEFDS job to create DFHCSD and SYSIN data sets for each CICS region.

Creating data sets unique to each CICS region, DFHDEFDS job

You can use the DFHDEFDS job to delete and recreate copies of the following data sets for each CICS region.

<table>
<thead>
<tr>
<th>Name</th>
<th>Data set</th>
</tr>
</thead>
<tbody>
<tr>
<td>DFHADEM</td>
<td>Resource manager for enterprise beans.</td>
</tr>
<tr>
<td>DFHAUXT</td>
<td>Non-VSAM auxiliary trace (A).</td>
</tr>
<tr>
<td>DFHBRNSF</td>
<td>Bridge.</td>
</tr>
<tr>
<td>DFHBUXT</td>
<td>Non-VSAM auxiliary trace (B).</td>
</tr>
<tr>
<td>DFHDMPA</td>
<td>Non-VSAM dump (A).</td>
</tr>
<tr>
<td>DFHDMPB</td>
<td>Non-VSAM (B) dump.</td>
</tr>
<tr>
<td>DFHEJDIR</td>
<td>Bridge.</td>
</tr>
<tr>
<td>DFHEJOS</td>
<td>Object store.</td>
</tr>
<tr>
<td>DFHGCD</td>
<td>Global catalog.</td>
</tr>
<tr>
<td>DFHHHTML</td>
<td>HTML template data set.</td>
</tr>
<tr>
<td>DFHINTRA</td>
<td>Intrapartition transient data.</td>
</tr>
<tr>
<td>DFHLCD</td>
<td>Local catalog.</td>
</tr>
<tr>
<td>DFHLRQ</td>
<td>Local request queue.</td>
</tr>
<tr>
<td>DFHTEMP</td>
<td>Temporary storage.</td>
</tr>
<tr>
<td>FILEA</td>
<td>Sample program data.</td>
</tr>
<tr>
<td>DFHDPFMB</td>
<td>The debugging profiles base data set.</td>
</tr>
<tr>
<td>DFHDPFMP</td>
<td>The debugging profiles path data set.</td>
</tr>
<tr>
<td>DFHDPFMX</td>
<td>The debugging profiles alternate index data set.</td>
</tr>
</tbody>
</table>

Use DFHISTAR to create a copy of the DFHDEFDS job for each CICS region. Edit DFHISTAR, specifying the parameters DSINFO and SELECT, and run it once for each region.

In DFHISTAR, specify the following parameters:

- **SELECT DFHDEFDS newname** to specify the new name by which the copy of the DFHDEFDS job is to be known.
- **DSINFO** to specify the following details of the data sets for each CICS region:
  - The high-level index (*dsindex*)
  - The serial number of the volume (*volume*)
  - The unit type of the volume (*disktype*)
  - The region qualifier (*qualifier*)
The format of the data set names is:

dsindex.CICSqualifier.dsname

dsindex  
is the high-level index for the data sets, specified on the DSINFO parameter of DFHISTAR. The default is hlq.

qualifier  
is the region qualifier for the data sets that are used by this CICS region, specified on the DSINFO parameter of DFHISTAR. The default is no qualifier.

d dbname  
is the name of the data set being defined.

For example, the default name for the CICS local catalog is hlq.CICS.DFHLCD.

The DFHDEFDS job comprises the following job steps:
1. DELETE any existing copies of the data sets
2. DEFINE defines the clusters for the data sets
3. INITDP initializes the debugging profiles base data set
4. DEFAULT defines the alternate index for the debugging profiles data set
5. BLDDP builds the alternate index for the debugging profiles data set
6. INITGCD initializes the CICS global catalog
7. INITLCD initializes the CICS local catalog
8. DEFTACE defines the trace data sets
9. DEFDUMP defines the dump data sets
10. LOADFILE loads the sample data into the FILEA data set
11. LOADHTML loads HTML templates for CICS supplied transactions.

Creating the CICS messages data set, DFHCMACI job

You can use the DFHCMACI job to delete and recreate the CICS messages data set DFHCMACD. This data set is used by the CICS messages facility (CICS-supplied transaction CMAC).

The DFHCMACI job comprises the following job steps:
1. DELETE deletes any existing copies of the DFHCMACD data set.
2. DEFINE defines the VSAM cluster for the CICS message data set dsindex.DFHCMACD, where dsindex is defined by the DSINFO parameter of DFHISTAR.
3. CMACLOAD loads the CICS message data set with data from the CICS-supplied file, DFHCMACD, in the hlq.SDFHMSGS target library.

Defining the DFHCMACD file and associated CICS resources

You can use the CICS messages facility to provide the CICS messages and codes descriptions online. Before you can use this facility (to access the DFHCMACD data set), you must define the resources needed by the facility, and make them available to your CICS region.

The file DFHCMACD, managed by CICS file control, accesses the DFHCMACD data set. You must create a definition for this file in the CSD. The CICS-supplied definition for the DFHCMACD file and other resources that are needed by the CICS messages facility are in the CSD group DFHMAC. The CICS startup procedure,
DFHSTART, has a DD statement for the DFHCMACD file, but for dynamic allocation you should copy the supplied resource definition for the DFHCMACD file and add the DSNAME option.

To use the CICS messages facility in your CICS region, you must create your own CSD group lists to include the DFHCMAC group for the CICS messages facility and any other groups of resources that your CICS region needs. You must specify your new group lists on the GRPLIST system initialization parameter when you start up your CICS region. If the DFHLIST of resource groups are not included in your new group lists, you must specify DFHLIST on the GRPLIST system initialization parameter as well as your group lists. For example, GRPLIST=(DFHLIST,MYLIST,CICSHT# 1), where MYLIST and CICSHT# 1 are customer-created group lists.

You should specify the DFHCMAC group of resources for the CICS messages facility only in those CICS regions that need to use the facility; for example on some terminal-owning regions, but perhaps not on data-owning regions.

---

**Defining the sample applications data sets**

CICS provides a range of samples that you can use to help develop your own applications, and test various CICS functions (for example, as an aid to verifying that CICS has installed correctly). These programs are in the [CICS 4.1 Sample Applications Guide](https://www.ibm.com/support/docview.wss?uid=swg27004585) and the [Designing and Programming CICS Applications](https://www.ibm.com/support/docview.wss?uid=swg27004585) book.

Before you can use some of these samples, you must create the data sets that they use, and make them available to your CICS region, as described below. You do not need to create these data sets, unless you intend using the associated sample applications.

**The CUA text level application**

You can use this sample application to demonstrate BMS support for the Common User Access (CUA) interface. The application uses an action bar, with associated pull-downs, pop-ups, and help panels. The application programs demonstrate how to code COBOL programs to display, overlay, and remove CUA style windows.

**Creating the data sets**

To create the data sets that are needed by the CUA text level application, submit the following jobs: DFH0JCUS and DFH0JHLP, installed in the hlq.XDFHINST library.

**Making the data sets available to CICS**

You can cause CICS to dynamically allocate the files for these data sets and open them after CICS initialization by installing the sample resource definitions in the group DFH$CTXT. If no DD statement exists for these data sets in the CICS startup job stream, the files are allocated to the data sets with DSNAMEs that are specified in the resource definitions: hlq.SAMPLE.DFHCTCUS, hlq.SAMPLE.DFHCTHLP, and hlq.SAMPLE.DFHCTAIX, for the data sets and the alternate index. Alternatively, you can add DD statements for the data sets to your CICS startup job, which causes CICS to use the DSNAMEs specified on the DD statements instead of those in the resource definitions.

For information about this sample application, see the [CICS 4.1 Sample Applications Guide](https://www.ibm.com/support/docview.wss?uid=swg27004585).
The FILEA sample application programs

This comprises four sets of command-level application programs that operate on the sample VSAM file FILEA. There is one set for each of the four programming languages that are supported, (Assembler, C, COBOL, and PL/I). These programs show basic functions, such as inquire, browse, add, and update, that can serve as a framework for your own first programs. They were all written before publication of the Common User Access guidelines.

Creating the data set

A copy of the data set that is needed by the FILEA application is created when you submit the DFHDEFDS job, installed in the hlq.XDFHINST library.

Making the data set available to CICS

When you tailor the CICS installation-related jobs, as described in Chapter 27, "Tailoring the CICS-supplied skeleton jobs," on page 185, a DD statement for the FILEA data set is added to the CICS IVP jobs and the DFHSTART procedure. If you want CICS to dynamically allocate the data set and open the file, you should remove the DD statement and install a FILE resource definition with an appropriate DSNAME. (For example, as supplied in the group DFH$FILA.)

For information about this sample application, see the CICS 4.1 Sample Applications Guide.

The CICS Application Programming Primer sample application

You can use this sample application to demonstrate the design and programming of a traditional CICS application. It provides online inquiry and maintenance facilities for a sample customer credit file in a department store. The application uses VSAM files, and 3270 display and printer terminals. It was written before publication of the Common User Access guidelines, and provides similar function (without CUA support) as the CUA sample application.

Creating the data sets

To create the data sets that are needed by the Primer sample application, edit and submit the sample job that is shown in Figure 23 on page 196.

Making the data sets available to CICS

You can cause CICS to dynamically allocate the files for these data sets and open them on first reference by installing the sample resource definitions in the group DFH$ACCT. If no DD statement exists for these data sets in the CICS startup job stream, the files are allocated to the data sets with DSNAMEs that are specified in the resource definitions: hlq.ACCTFILE and hlq.ACIXFILE. Alternatively, you can add DD statements for the data sets to your CICS startup job, which causes CICS to use the DSNAMEs specified on the DD statements instead of those in the resource definitions.

For information about this sample application, see the CICS Application Programming Primer.

Figure 23. Example JCL to create the Primer sample data sets
Chapter 29. Defining DL/I support

CICS can provide DL/I database support by using the IBM IMS Database Manager. For information about appropriate Versions and Releases, see the "CICS-IMS release compatibility" topic in the CICS IMS Database Control Guide. As they become available, versions of IMS newer than those listed will also be compatible.

You can use DL/I support with CICS through:
- Database control (DBCTL)
- CICS remote DL/I support, also known as function shipping

This chapter describes what you do to enable a CICS region to work with remote DL/I. For information about adding system and resource definitions for use with DBCTL, see the "Installing DBCTL, and defining CICS and IMS system resources" topic in the CICS IMS Database Control Guide.

The IMS libraries referred to in the job streams are identified by IMS.libnam (for example IMS.PGMLIB). If you use your own naming convention for IMS libraries, please rename the IMS libraries accordingly.

CICS provides a CICS-DBCTL interface which enables DBCTL, or IMS/ESA® or IMS/ESA DM/TM, to satisfy DL/I requests that are issued from the CICS region. New users should use this method because it is simpler than local DL/I to install and provides additional function. Details of installing and using DBCTL are in the CICS IMS Database Control Guide.

CICS support for access to DL/I databases using the IBM Information Management System (IMS) product is included in the base product, and no specific installation is required.

For more information about storage protection, see the "Storage protection" topic in the CICS System Definition Guide.

PDIRs

A directory of program specification blocks (PDIR) is a list of program specification blocks (PSBs) that define, for DL/I, the use of databases by application programs.

Your CICS region needs a PDIR to access a database owned by a remote CICS region (remote DL/I support). Your CICS region does not need a PDIR to access a DL/I database owned by DBCTL. For information about accessing DL/I databases owned by DBCTL, see the “Performance benefits of DBCTL” topic in the CICS IMS Database Control Guide.

The modules providing remote DL/I support are automatically loaded by CICS during startup when a DL/I PSB directory is specified via the PDIR= system initialization parameter. A PDIR is mandatory for remote DL/I support, but not required for database control support.
Adding remote DL/I support

Remote DL/I support is included in CICS Transaction Server for z/OS, and works with one of the supported levels of IMS, (see above for details of these). Usually, you use remote DL/I support, with either MRO or ISC connections, to access databases owned by another CICS region. You can also use CICS remote DL/I support to access, through another CICS region connected to DBCTL, databases owned by DBCTL. CICS regions accessing databases owned by DBCTL (that is, connected to DBCTL) must be running on the same MVS image as the DBCTL system. A simple overview is given in Figure 24.

Notes:
1. CICSB uses remote DL/I to access, through CICSA, databases owned by DBCTL 1 in MVS image 1. This is only needed if CICSB is not connected to DBCTL 1.
2. CICSB uses remote DL/I to access, through CICSC, databases owned by DBCTL 2 in MVS image 2.
3. CICSA (connected to DBCTL 1) is in the same MVS image as DBCTL 1. CICSC (connected to DBCTL 2) is in the same MVS image as DBCTL 2.

For information about accessing DL/I databases owned by DBCTL, see the CICS IMS Database Control Guide.

To add support in CICS for remote database access, you must:
1. Code, assemble, and link-edit a program specification blocks directory (PDIR).
2. Code the PDIR CICS system initialization parameter for remote DL/I support.

Defining a PSB directory

Code entries in a program specification block directory (PDIR), to indicate the identity of the remote CICS region, or regions, to which you want CICS to function ship DL/I requests. You do this by coding the SYSIDNT parameter in DFHDLPSB TYPE=ENTRY macros, which you assemble and link-edit to create a PDIR. You must also code the MXSSASZ parameter. You can, optionally, code the RMTNAME parameter to define the name by which the PSB is known in the remote CICS region. For information about creating PDIRs, see the CICS Resource Definition Guide.

Coding CICS system initialization parameters for remote DL/I support

The following is a summary of the DL/I parameters that you can, or must, code as CICS system initialization parameters:
Global user exits for DL/I

The following global user exits, if enabled, can be invoked when you have DL/I applications:

**XDLIPRE and XDLIPOST**

These exits follow the issue of an EXEC DLI command or DL/I call; XDLIPRE before the request is processed and XDLIPOST after the request is processed. If you are running CICS with remote DL/I support, these exits are invoked in both the CICS region executing the DL/I transactions (the AOR), and the CICS region to which the DL/I requests are function shipped (the DOR). However there are restrictions on what actions can be performed by an exit program running at exit point XDLIPRE or XDLIPOST when running in a DOR.

**XRMIIN and XRMIOUT**

You can use these exits to monitor activity across the resource manager interface (RMI). For example, you can monitor control being passed to and from DFHEDP for EXEC DLI requests, DFHDBAT for DBCTL requests, or DSN2EXT1 for DB2 for DB2 commands. XRMIIN is invoked just before control is passed from the RMI to a task-related user exit. XRMIOUT is invoked just after control is passed back to the RMI.

For programming information about these exits, see the [CICS Customization Guide](#).
Chapter 30. Adding CICS support for programming languages

This section describes the steps necessary to add run-time support for the programming languages used with the CICS command level (EXEC) programming interface. Complete the appropriate actions described in the following before installing your application programs.

To write CICS application programs that request CICS services through the command-level application programming interface (API), you can use assembler language, C and C++, COBOL, or PL/I.

CICS provides the support needed to run application programs written in assembler language, and Language Environment provides the required support for all the other languages. The use of Language Environment is essential in CICS Transaction Server for z/OS, Version 3 Release 1. Supported compilers are listed in the CICS Release Guide.

The CICS Transaction Server for z/OS, Version 3 Release 1 programming guidance documentation expects that your CICS system is using the services of Language Environment, which provides a common run-time environment for IBM implementations of assembler and those high-level languages (HLLs) supported by CICS, namely COBOL, PL/I, C, and C++.

Note: Runtime support for OS/VS COBOL programs has been removed. OS/VS COBOL programs cannot run under CICS Transaction Server for z/OS Version 3, and must be upgraded to a supported level of COBOL.

Installing Language Environment support

This section describes CICS support for Language Environment and what to do to install that support. The use of Language Environment is essential in CICS Transaction Server for z/OS, Version 3 Release 1.

Language Environment support is provided by run-time libraries that establish a common execution environment for application programs compiled by high-level languages. All programs compiled by a high-level language, whether by a Language Environment-conforming compiler or not, must be run under CICS-Language Environment support.

The CICS-Language Environment interface is initialized automatically when CICS can:
1. Load the Language Environment interface modules, CEECCICS, CEEPIPI, and CEECTCB, from STEPLIB.
2. Successfully call the CEECCICS module to initialize the interface.

Language Environment initialization takes place during CICS startup, when CICS issues the message DFHAP1203I applid Language Environment is being initialized. The CEECCICS module is loaded, followed by a partition initialization call, before the start of second phase PLT processing. If Language Environment cannot successfully complete the initialization of all languages supported by CICS, or can only initialize some of them, it issues messages to the MVS console. If Language Environment initialization fails completely, it may be because the CEECCICS module could not be loaded, or something went wrong during the loading of a particular language routine.
Installing CICS support for Language Environment

To enable Language Environment support to be installed correctly by CICS:

- Specify enough storage for the ERDSA to run CICS and Language Environment together. They need a minimum of 3500KB. To this minimum, add an amount of storage sufficient for your own requirements.

- Ensure the CICS-Language Environment interface module, CEECCICS, and the Language Environment modules CEEPIPI and CEECTCB are installed in an APF-authorized library defined in the STEPLIB concatenation in the CICS startup JCL. You can do this by including the Language Environment SCEERUN library in an APF-authorized library in the STEPLIB concatenation of your CICS startup job (for example, in the CICSTS31.CICS.SDFHAUTH library), or in an APF-authorized library in the MVS LNKLSTnn concatenation.

- Ensure that the program resource definitions for the Language Environment language interface modules have been added to the CICS CSD. These definitions are in the CEE group.

  The CEE group is added automatically to the CSD and to the gr ouplist DFHLIST during CICS installation, as part of the DFHCOMDS job.

  The definitions are also supplied as DEFINE statements in the CEECCSD and CEECCSDX members of the SCEESAMP library.

  You can add the CEE group to any CICS startup group list named in the GRPLIST system initialization parameter.

- Define the Language Environment transient data destinations, CESE, and CESO (DD names CEEMSG and CEEOUT). The CICS-supplied resource definition group, in the CSD, DFHDCTG, contains entries for CESE and CESO.

  For information about the attributes needed for Language Environment transient data destinations, see the *IBM Language Environment for MVS & VM Programming Guide*, SC26-4818.

- Define the Language Environment runtime libraries on the CICS STEPLIB and DFHRPL DD statements as follows:

  - Add the SCEERUN library, which contains CEECCICS and CEECTCB, and the SCEERUN2 library, which contains support that is required for the IBM Java Virtual Machine (JVM) and also support for other programming languages, to STEPLIB or to a library in the MVS LNKLSTnn concatenation.

    - Both the libraries, SCEERUN and SCEERUN2, must be APF-authorized.

  - Add the SCEECICS, SCEERUN2, and SCEERUN libraries to DFHRP. (The order of the SCEERUN and SCEERUN2 libraries in relation to each other is not important.)

For example:

```c
/* CICS APF-authorized libraries
//STEPLIB DSN=hlq.CICS.SDFHAUTH,DISP=SHR
// DD DSN=hlq.LE.SCEERUN2,DISP=SHR
// DD DSN=hlq.LE.SCEERUN,DISP=SHR
/* CICS load libraries
//DFHRPL DSN=hlq.CICS.SDFLOAD,DISP=SHR
// DD DSN=hlq.LE.SCEECICS,DISP=SHR
// DD DSN=hlq.LE.SCEERUN2,DISP=SHR
// DD DSN=hlq.LE.SCEERUN,DISP=SHR
// DD DSN=hlq.LE.SCEERUN,DISP=SHR
```

Use only these Language Environment runtime libraries for all your high-level language application programs.
Language Environment support for COBOL

Language Environment is a prerequisite for application programs written in COBOL. For information about Language Environment, see the Language Environment for OS/390 Customization manual, SC28-1941.

Support for OS/VS COBOL programs is now withdrawn. These programs, which had runtime support in CICS Transaction Server for z/OS Version 2, cannot run under CICS Transaction Server for z/OS Version 3. OS/VS COBOL programs must be upgraded to Language Environment conforming COBOL, and recompiled against a level of COBOL compiler supported by CICS. The **CICS Application Programming Guide** provides assistance with converting OS/VS COBOL programs to Language Environment conforming COBOL.

To run COBOL application programs:
- Install support for Language Environment, ensuring that CICS can initialize the Language Environment environment during startup.
- Install resource definitions for your programs with the LANGUAGE attribute specified as LANGUAGE(COBOL), or leave the language blank.

For your application programs, CICS can create and install program resource definitions automatically, or you can create them specifically in the CSD, and install them by using the GRPLIST system initialization parameter or CEDA INSTALL command. For more information about installing program resource definitions, see the **CICS Resource Definition Guide**.

For information about Language Environment support for programming languages, see the Program Directory for IBM Language Environment for MVS and VM.

Language Environment support for C and C++

Language Environment is a prerequisite for application programs compiled using IBM C/C++ for MVS or SAA AD/Cycle C/370 compilers. Language Environment incorporates the run-time libraries required for both these C language compilers. For information about Language Environment, see the Language Environment for OS/390 Customization manual, SC28-1941.

To run under CICS your C application programs:
- Install support for Language Environment, ensuring that CICS can initialize the Language Environment environment during startup.
- Install resource definitions for your programs with the LANGUAGE attribute specified as LANGUAGE(C) or leave the language blank.

For information about installing program resource definitions, see the **CICS Resource Definition Guide**.

CICS supports application programs written in C++ that:
- Are compiled using the IBM C/C++ for MVS compiler (5655-121)
- Execute with the Language Environment run-time libraries

If you use Version 3 Release 2, or late, of the C/C++ compiler to compile a C++ program, specify the CXX parameter when options are passed to the compiler, otherwise the C compiler is invoked. Do not specify CXX if a C program is to be compiled. See the IBM C/C++ for MVS/ESA Compiler and Run-Time Migration Guide Version 3 Release 2, SC33-2002, for further information.
For information about Language Environment support for programming languages, see the *Program Directory for IBM Language Environment for MVS and VM.*

**Language Environment support for PL/I**

Language Environment is a prerequisite for application programs compiled using IBM PL/I for MVS or SAA AD/Cycle PL/I compilers. Language Environment incorporates the run-time libraries required for both these PL/I compilers. For information about Language Environment, see the *Language Environment for OS/390 Customization* manual, SC28-1941.

PL/I support is also required if you use the Web services support in CICS; in particular, it is required if you use the CICS-supplied SOAP 1.1 and SOAP 1.2 message handler programs.

To run CICS PL/I application programs:

- Install support for Language Environment, ensuring that CICS can initialize the Language Environment environment during startup.
- Install resource definitions for the programs with the LANGUAGE attribute specified as LANGUAGE(PLI) or leave blank.

For information about installing program resource definitions, see *CICS Resource Definition Guide*.

For information about Language Environment support for programming languages, see the *Program Directory for IBM Language Environment for MVS and VM.*

**Language Environment support for CICS JVM programs**

Language Environment is a prerequisite for CICS JVM programs. However, unlike the other languages, JVM programs do not require the CICS-Language Environment interface. JVM programs run with Language Environment support using MVS services (not CICS services). JVM programs require the Language Environment support provided by the SCEERUN and SCEERUN2 libraries only, which can either be defined in the CICS STEPLIB, or included in the MVS linklist. The SCEERUN and SCEERUN2 libraries also need to be added to DFHRPL.
Chapter 31. Verifying your Java components installation

CICS support for Java application programs is included in the base product, and no specific installation is required. Before you begin to set up and configure Java support in your CICS system, follow the steps below to verify that the Java components are correctly installed on your system.

1. Use the supplied checklist in "Verifying Java components checklist" to ensure that all of the required Java components are installed in the correct locations on your CICS system.

2. Read about the JVM components and the supplied sample definition files in more detail in "Java Virtual Machine sample definition files" on page 207, particularly if you have not performed a default installation.

3. Authorize the hlq.SDFJAUTH library. See "Authorizing the hlq.SDFJAUTH library" on page 210 for details on how to do this.

4. Amend the default parameters in the BPXPRMxx members of SYS1.PARMLIB so use the JVM supplied with CICS. See "Amending parameters in SYS1.PARMLIB(BPXPRMxx)" on page 210 for details on which parameters to change.

When you have verified your Java installation, use the task list in Java Applications in CICS to begin setting up your Java environment.

Verifying Java components checklist

The following components are unloaded from the distribution tapes during the standard installation process described in the CICS Transaction Server for z/OS Program Directory. Note that z/OS UNIX System Services must be active in full function mode during this process to enable files to be stored in HFS.

Table 13. Java components checklist

| The library is empty after installation, but is used for CICS modules that support the Java IIOP environment. See "The hlq.SDFJLPA library" on page 210 for more information. |
Java Virtual Machine sample definition files

CICS launches a JVM to execute a Java program that specifies a JVM in its program resource definition. The JVM is created using options specified in a series of text files:

- JVM initialization options are specified in a JVM profile, which is named by the JVMPROFILE attribute of the program definition.
- Further system properties for the JVM are specified in a JVM properties file, which is named in the JVM profile.
- A Java 2 security policy can be named in the JVM properties file to specify security options, if you are using JVMs to run Enterprise JavaBeans.

CICS provides samples of all these, as described in the following sections. "Setting up JVM profiles and JVM properties files" in Java Applications in CICS has more information about these files and the relationships between them.

JVM profiles

CICS provides five sample JVM profiles in the partitioned dataset named SDFHENV. Each sample JVM profile can be used to create a different type of JVM. The sample JVM profiles are as follows:

Table 14. CICS-supplied sample JVM profiles

<table>
<thead>
<tr>
<th>JVM profile</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>DFHJVMPR</td>
<td>The default JVM profile if no other is specified on a PROGRAM resource definition. JVM is resettable. Does not use the shared class cache.</td>
</tr>
<tr>
<td>DFHJVMPC</td>
<td>JVM is resettable and uses the shared class cache.</td>
</tr>
<tr>
<td>DFHJVMPS</td>
<td>JVM is single-use. Not recommended for enterprise beans.</td>
</tr>
<tr>
<td>DFHJVMCC</td>
<td>Profile for the master JVM that initializes the shared class cache.</td>
</tr>
<tr>
<td>DFHJVMCD (reserved for the use of CICS)</td>
<td>Profile for CICS-defined programs. Do not use for your own applications. Only change as necessary.</td>
</tr>
</tbody>
</table>

In their supplied form, the JVM profiles are defined with JVMPROPS and LIBPATH parameters that use the symbols &CICS_DIRECTORY, &JAVA_HOME. These profiles are customized when you install CICS TS and run the DFHIJVMJ job, as follows:

&CICS_DIRECTORY

This symbol is replaced with the value you specify on the USSDIR parameter in the DFHISTAR installation job. The default is cicsts31, resulting, for example, in directory paths of the form /pathprefix/usr/lpp/cicsts/cicsts31/lib on LIBPATH.

&JAVA_HOME

This symbol is replaced with the value you specify on the JAVADIR parameter in the DFHISTAR installation job. The default is java142/J1.4, resulting in directory paths of the form /pathprefix/usr/lpp/java142/J1.4/bin and /pathprefix/usr/lpp/java142/J1.4/bin/classic on LIBPATH.

The string java142/J1.4 is what you should specify on JAVADIR for use with the IBM Software Developer Kit for z/OS, Java 2 Technology Edition, Version 1.4.2.

Note: The extra // characters on each side of the symbols are removed during symbol substitution.
After you have run DFHIJVMJ to substitute your own values for the symbol names, the customized profiles are written to the directory /pathprefix/usr/lpp/cicsts/cicsts31/JVMProfiles in the hierarchical file store (HFS), where cicsts31 is the value that you chose for the CICS_DIRECTORY variable used by the DFHIJVMJ job during CICS installation. Because the JVM profiles are stored in HFS, CICS requires access to z/OS UNIX System Services, and to directories and files in HFS, in order to create JVMs. "Giving CICS regions access to z/OS UNIX System Services and HFS directories and files" in Java Applications in CICS explains how to give CICS the access it requires.

"Setting up JVM profiles and JVM properties files" in Java Applications in CICS tells you how to enable CICS to locate the JVM profiles, how to choose an appropriate JVM profile for your Java programs, and how to customize the supplied sample JVM profiles to your system’s requirements. In particular, if you place the JVM profiles in a location other than the default directory /pathprefix/usr/lpp/cicsts/cicsts31/JVMProfiles, or if you choose a different name during CICS installation for this directory, you need to change the system initialization parameter JVMPROFILEDIR to specify the correct directory, or use UNIX soft links to link to the JVM profiles from the default directory. You also need to ensure that CICS has access to the HFS directory where the JVM profiles are stored.

Note that the JVM profiles DFHJVMPR and DFHJVMCD, and their associated JVM properties files, must always be available to CICS. DFHJVMPR is used if a Java program is defined as using a JVM but no JVM profile is specified, and it is used for sample programs. DFHJVMCD is used by CICS-defined programs, including the default request processor program (DFJIIRP) and the program that CICS uses to publish and retract deployed JAR files (DFJIIRQ, the CICS-key equivalent of DFJIIRP). Both these JVM profiles must therefore either be present in the directory that is specified by JVMPROFILEDIR, or linked to by means of UNIX soft links from that directory, and they must be configured correctly so that they can be used in your CICS region.

You can edit the JVM profiles with any text editor to customize them for your system. "Choosing a JVM profile and JVM properties file" in Java Applications in CICS tells you about some options that you might want to change, and the CICS System Definition Guide has the full lists of options that you can specify using JVM profiles and JVM properties files. For single-use JVMs (that is, with a JVM profile that specifies the option REUSE=NO or the older option Xresettable=NO), instead of customizing the JVM profile, you can override the options in it, using the user-replaceable program DFHJVMAT. Normally, a JVM profile provides sufficient flexibility to configure a JVM as required. If you find that you need to make unusual modifications, the CICS Customization Guide has more information about using DFHJVMAT.

As JVM profiles and JVM properties files are HFS files, case is important. CICS does not automatically convert the name of a JVM profile or JVM properties file to upper case. When you use the name of a JVM profile or JVM properties file anywhere in CICS, you must enter it using the same combination of upper and lower case characters that is present in the HFS file name.

**JVM properties files**

You use the JVMPROPS option in a JVM profile to specify the full path of the JVM properties file that is associated with the profile. CICS provides five sample JVM properties files in the SDFHENV partitioned data set, which are designed to support their corresponding JVM profile:
Table 15. CICS-supplied sample JVM properties files

<table>
<thead>
<tr>
<th>JVM profile</th>
<th>Associated JVM properties file</th>
</tr>
</thead>
<tbody>
<tr>
<td>DFHJVMPR</td>
<td>dfjjvmpr.props</td>
</tr>
<tr>
<td>DFHJVMPC</td>
<td>dfjjvmpc.props</td>
</tr>
<tr>
<td>DFHJVMPS</td>
<td>dfjjvmps.props</td>
</tr>
<tr>
<td>DFHJVMCC</td>
<td>dfjjvmcc.props</td>
</tr>
<tr>
<td>DFHJVMCD (reserved for the use of CICS)</td>
<td>dfjjvmcd.props</td>
</tr>
</tbody>
</table>

The sample JVM properties files are defined with the &CICS_DIRECTORY symbol, which is replaced with your own value when you run the DFHIJVMJ installation job. When the symbol substitution is complete, the customized JVM properties files are copied to the HFS directory /pathprefix/usr/lpp/cicsts/cicsts31/props/, where cicsts31 is the value that you chose for the CICS_DIRECTORY variable used by the DFHIJVMJ job during CICS installation.

The JVMPROPS option on a JVM profile references a JVM properties file by using its full path name. The CICS-supplied sample JVM profiles reference the sample JVM properties files as follows:

```
JVMPROPS=/pathprefix/usr/lpp/cicsts/cicsts31/props/dfjjvmpx.props
```

where dfjjvmpx.props is the name of the sample JVM properties file that matches with the sample JVM profile. If you change the name or location of a JVM properties file, or create your own JVM properties file, you need to change the JVMPROPS option to specify the correct path name in all the JVM profiles that reference that JVM properties file. You also need to ensure that CICS has access to the HFS directory where the JVM properties file is stored.

As for the JVM profiles, you can edit the JVM properties files with any text editor to customize them for your system. 

"Choosing a JVM profile and JVM properties file" in Java Applications in CICS tells you about some options that you might want to change, and the CICS System Definition Guide has the full lists of options that you can specify using JVM properties files. Remember that CICS does not automatically convert the name of a JVM properties file to upper case, so when you use the name of a JVM profile or JVM properties file anywhere in CICS, you must enter it using the same combination of upper and lower case characters that is present in the HFS file name.

**Java 2 security policy for EJBs**

CICS provides a sample Java 2 security policy that you can use, or modify to suit your own requirements. The sample policy is named dfjejbpl.security, and it defines security properties that are suitable for JVMs that are used by enterprise beans. The sample policy is supplied on the distribution tape in SDFHENV. During the installation process, the policy is customized and written to /pathprefix/usr/lpp/cicsts/cicsts31/lib/security/dfjejbpl.policy, where cicsts31 is a user-defined value specified on the USSDIR parameter in the DFHISTAR installation job. "Protecting Java applications in CICS" in Java Applications in CICS tells you what changes you need to make to the sample JVM properties files to enable Java 2 security, how to set up a security policy file, and about the CICS-supplied sample security policy file dfjejbpl.policy.
Authorizing the hlq.SDFJAUTH library

This library is the partitioned data set extended (PDSE) version of SDFHAUTH, and it contains some of the components of the SJ domain. A separate library is needed because these components are now built using XPLink (Extra Performance Linkage). The SDFJAUTH library is required for Java support, and as for the SDFHAUTH library, you need to:

1. APF-authorize the SDFJAUTH library by adding it to the list of APF-authorized libraries in the appropriate PROGxx (or IEAAPFxx) member in SYS1.PARMLIB.
2. Provide a STEPLIB DD statement for the hlq.SDFJAUTH library in your startup job stream.

The procedure for authorizing the SDFHAUTH library is described in Chapter 6, “Authorizing the hlq.SDFJAUTH library,” on page 67. Follow the same procedure to authorize the SDFJAUTH library.

The hlq.SDFJLPA library

This library is currently empty, but is supplied to allow those CICS modules that support the Java IIOP environment, and that are LPA eligible, to be included in the LPA. There are no CICS-supplied Java IIOP modules that must reside in the LPA, therefore the library is empty following the installation of CICS TS.

Note: The library SDFJLPA is a partitioned data set extended (PDSE). PDSEs cannot be loaded into the LPA at MVS IPL time, because MVS nucleus initialization processing does not recognize them. You can use the MVS SETPROG command after an IPL to dynamically add members of a PDSE into the LPA.

Amending parameters in SYS1.PARMLIB(BPXPRMxx)

The default options, shipped in the BPXPRMxx members of SYS1.PARMLIB are not sufficient for use with the JVM supplied in CICS. In particular, the values for IPCSEMNSEMS, MAXPROCSYS, MAXPROCUSER, MAXUIDS, MAXASSIZE, MAXFILEPROC, MAXPTYS, MAXTHREADS, MAXTHREADTASKS, and MAXCPPUTIME are too low for CICS usage - increase them.

Recommendation:
Start by using the following values. Tailor them to your system's needs as you gain experience:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>IPCSEMNSEMS</td>
<td>1000</td>
</tr>
<tr>
<td>MAXPROCSYS</td>
<td>500</td>
</tr>
<tr>
<td>MAXPROCUSER</td>
<td>512</td>
</tr>
<tr>
<td>MAXUIDS</td>
<td>500</td>
</tr>
<tr>
<td>MAXASSIZE</td>
<td>2000000000</td>
</tr>
<tr>
<td>MAXFILEPROC</td>
<td>512</td>
</tr>
<tr>
<td>MAXPTYS</td>
<td>256</td>
</tr>
<tr>
<td>MAXTHREADS</td>
<td>10000</td>
</tr>
<tr>
<td>MAXTHREADTASKS</td>
<td>5000</td>
</tr>
<tr>
<td>MAXCPPUTIME</td>
<td>2147483647</td>
</tr>
</tbody>
</table>

For full details, see z/OS UNIX System Services Planning, GA22-7800, in section 14.8, “Customizing the BPXPRMxx parmlib members”, and z/OS MVS Initialization and Tuning Reference, SA22-7592, in section 9.0, “BPXPRMxx (z/OS UNIX System Services parameters)”. 
Chapter 32. Installing MRO and ISC support

This chapter describes what you have to do to include the following communication facilities in your CICS region:

- Multiregion operation (MRO)
- Intersystem communication (ISC)

The information about ACF/VTAM and MVS that is given in this chapter is for guidance only. Always consult the current ACF/VTAM or MVS publications for the latest information. See "Books from related libraries" on page 469.

Installing MRO support

This section describes how to install support for multiregion operation (MRO) in your CICS regions.

CICS multiregion operation (MRO) enables CICS regions that are running in the same MVS image, or in the same MVS sysplex, to communicate with each other. MRO does not support communication between a CICS system and a non-CICS system such as IMS.

MRO does not require ACF/VTAM or SNA networking facilities. The support within CICS that enables region-to-region communication is called interregion communication (IRC). IRC is implemented in three ways:

1. Through support in CICS terminal control management modules and by use of a CICS-supplied interregion program, DFHIRP, loaded in the MVS link pack area. DFHIRP is invoked by a type 3 supervisory call (SVC).
2. By MVS cross-memory services, which you can select as an alternative to the CICS type 3 SVC mechanism. Here, DFHIRP only opens and closes the interregion links.
3. By the cross-system coupling facility (XCF) of MVS. XCF/MRO is required for links between CICS regions in different MVS images of an MVS sysplex. CICS selects XCF/MRO dynamically for such links, if available.

For information about the design and implementation of interregion communication, and about the benefits of cross-system MRO, see the CICS Intercommunication Guide.

To install support for MRO, complete the following steps (outlined in more detail in this chapter):

1. Define CICS as an MVS subsystem.
2. Install the current versions of the DFHIRP and DFHCSVC modules in the LPA.
3. If you give the SVC a new number, and you have CICS Version 1 or Version 2 regions that use MRO, regenerate the CICS modules DFHCRC and DFHDRPA for those CICS versions, specifying the SVC number.
4. Specify appropriate system initialization parameters to enable MRO for each CICS region startup.

If you intend using cross-system MRO (XCF/MRO) you must also:

---
5. The external CICS interface (EXCI) uses a specialized form of MRO link to support DCE remote procedure calls to CICS programs, and communication between MVS batch programs and CICS.
5. Install the required sysplex hardware and software.
6. Define the MVS images as systems in an XCF sysplex.

To use the MRO support, you must also:
7. Define and install the MRO connections appropriate to your CICS environment.

Provided you complete the above steps, you can use MRO to communicate with all
levels of CICS from CICS/ESA Version 4.1 onwards.

Should MRO be used to communicate between different releases of CICS, the
function provided on any connection is that of the lower-level release.

**Defining CICS as an MVS subsystem**
Multiregion operation with CICS requires MVS Subsystem Interface (SSI) support,
and to obtain this you must define CICS as an operating system subsystem, as
described in [Chapter 10, “Defining CICS as an MVS subsystem,” on page 83](#).

**Installing the modules DFHIRP and DFHCSVC in the LPA**
To enable your regions to communicate by MRO, you must:

1. Install the current versions of the DFHIRP and DFHCSVC modules into the LPA,
as described in [Chapter 14, “Installing CICS modules in the MVS link pack
area,” on page 107](#).

   **Note:** If you are running CICS with MRO at different release levels, all
   communicating CICS regions must use the latest DFHIRP module and
   the latest SVC module, DFHCSVC, on the same MVS image. Do not use
   the dynamic LPA function to replace DFHIRP for migration between
   releases, as this can cause incompatibility between control blocks,
   resulting in abend situations.

2. Define the SVC module, DFHCSVC, to MVS, as described in [Chapter 11,
   “Installing the CICS Type 3 SVC,” on page 93](#).

**Installing required hardware and software for XCF/MRO**
To be able to use the cross-systems MRO to communicate between CICS regions
on different MVS images, those MVS images must be running with appropriate
hardware and software. The hardware and software that are required for MVS
systems in a sysplex are in the [CICS Transaction Server for z/OS Program
Directory](#).

**Defining MVS images as systems in an XCF sysplex**
To use XCF/MRO, all participating MVS images must be defined as part of the
same sysplex, as in [Chapter 19, “MVS cross-system MRO definitions,” on page
129](#).

**Note:** Within a parallel sysplex, where MRO communication between MVS images
is by XCF/MRO, the DFHIRP programs installed in the different MVS images
can be at different release levels. However, DFHIRP must be installed from
the highest release of CICS running in an MVS image. For example, a CICS
Version 4 DFHIRP can communicate with a DFHIRP across XCF/MRO, but
the CICS regions running in the MVS with the Version 4 DFHIRP cannot be
later than CICS/ESA Version 4.
Defining MRO connections
Before you can use MRO, you must define and install connections with attributes appropriate to your CICS environment. For information about defining connections, see the CICS Intercommunication Guide.

Enabling MRO for CICS startup
For each CICS region that is to use MRO, you must specify ISC=YES to include the intersystem communication program DFHISP.

If you want a CICS region to establish MRO communication during startup, you should also specify YES on the IRCSTART system initialization parameter.

Alternatively, once your CICS region is running, you can establish MRO communication by using the CEMT SET IRC OPEN command or the EXEC CICS SET IRC OPENSTATUS(cvda) command.

Either method establishes MRO communication with every CICS region that is:
1. Currently active.
2. Defined to your region by CONNECTION and SESSIONS definitions that are installed from the CSD. (To establish MRO communication between two CICS regions, the installed CONNECTION definition must specify INSERVICE(YES) in both regions.)

Adding ISC support
For communication between CICS regions that are in different MVS images, you can use a SNA access method, such as ACF/VTAM, to provide the necessary communication protocols. This form of communication between regions through SNA is called intersystem communication (ISC). (You can also use ISC in the same CPC, through the application-to-application facilities of ACF/VTAM.)

This section outlines how to include ISC in a CICS region.

For information about the design and implementation of intersystem communication facilities, see the CICS Intercommunication Guide.

Unlike MRO, there are no special MVS operating system requirements for CICS intersystem communication.

Running a CICS region with ISC
You must include the following management programs in your CICS regions, (by specifying the system initialization parameters that are given in parentheses):
- DFHISC – the intersystem communication program (ISC=YES).
- DFHTCP – the terminal control program (TCP=YES is the default).

Establishing ISC
Intersystem communication requires VTAM support, and you must specify VTAM=YES as a system initialization parameter. If VTAM is running during CICS initialization, CICS opens the VTAM ACB. If VTAM is started after CICS, opening the VTAM ACB fails, and you must open it using the CEMT SET VTAM OPEN command when VTAM is available. CICS regions cannot communicate until they have established the VTAM connection.
Defining ISC connections
Before you can use ISC, you must define and install connections with attributes appropriate to your CICS (and VTAM) environment. If you intend using APPC for your ISC communications, you can take advantage of the autoinstall for APPC connections function. For information about defining connections, and about using the autoinstall for APPC connections function, see the CICS Resource Definition Guide.
Chapter 33. Enabling TCP/IP in a CICS region

TCP/IP support is provided by the CICS sockets domain, with network services supplied by z/OS. The sockets domain provides support for:

**The listener**

The listener monitors specified TCP/IP ports for incoming requests. It is configured by a TCPIPSERVICE resource definition to listen on a specific TCP/IP port and to attach a specified request receiver transaction to handle each connection. Once the connection has been established between a client program and a particular request receiver, all subsequent requests from the client program over that connection flow to the same request receiver. The listener supports user applications initiated by TCP/IP services for the following protocols:

**External Call Interface (ECI)**

The External Call Interface (ECI) allows client applications to use TCP/IP directly to CICS regions without any intervening products such as protocol-mapping software. The External Call Interface (ECI) is supported, but not the External Presentation Interface (EPI).

See [the CICS Family: Communicating from CICS on System/390® manual](1) for information about the External Call Interface.

**Hypertext Transfer Protocol (HTTP)**

HTTP messages are received and sent over the Internet, using CICS Web support. See [the CICS Internet Guide](2) for information about the transmission of HTTP messages on the Web.

**Internet InterORB Protocol (IIOP)**

IIOP messages are sent between client and server applications that conform to the Common Object request Broker Architecture (CORBA). See [the Java Applications in CICS manual](3) for information about IIOP messages.

**Outbound socket support**

This allows CICS to initiate an IP connection. Sockets can be created by one task, shared by other tasks, and remain active after task termination, for re-use by another task.

---

Using TCP/IP in a CICS region

To use TCP/IP in a CICS region, you must provide the following:

- Communications Server must be installed in the z/OS system (in earlier OS/390 releases this is called eNetwork Communications Server, or Secureway Communications Server). Ports belonging to Communications Server must be made available for use by the CICS region involved.
- The CICS system initialization parameter TCPIP must be set to YES.
- TCPIPSERVICE resource definitions must be provided to define each active port and the type of service associated with it. The CICS TCP/IP listener is activated for the specified ports when the TCPIPSERVICE is installed, if TCPIP (YES) has also been specified.
- If Secure Sockets Layer (SSL) authentication is used, you must define the KEYRING system initialization parameter, to identify the RACF key ring containing the keys and X.509 certificates used in the SSL handshake.
- The CICS listener regions need to be configured to talk to the same nameserver on z/OS that the MVS Workload Manager is configured to use. This means that
you may need to reconfigure the DNS server that CICS uses to resolve hostnames, because CICS needs to resolve its own hostname (using a call to the _gethostbyaddr_ function) using the DNS server configured for the connection optimization in the sysplex. This may not be the system configured name server if the sysplex is already configured for TCP/IP operation. The system name server may not even be on z/OS or on any of the systems in the sysplex.

You can change the resolver configuration of CICS either by altering system TCP/IP configuration files, or by adding or changing the DD name SYSTCPD in the CICS start-up JCL. This sets the RESOLVER_CONFIG environment variable to the MVS dataset you have specified. This file is described in the _z/OS IBM Communications Server: IP Configuration Guide_, SC31-8775. It contains a reference to the DNS server's IP address.

You must specify at least the following:

```plaintext
NSINTERADDR n.n.n.n
```

where `n.n.n.n` is the dotted decimal address of the name server to be used.

If the DD name is not included in the startup JCL, a number of system files are searched until one is found.

**Note:** The TCPIPSERVICE resource definitions are for use only with the CICS-provided TCP/IP services, and have nothing to do with the z/OS Communications Server IP CICS Sockets interface. The TCP/IP Socket Interface for CICS is supplied with z/OS Communications Server, which is an integral part of z/OS and does not use the CICS SO domain.
Chapter 34. Enabling REXX for CICS

The REXX Development System for CICS and the REXX Runtime Facility for CICS—two program products collectively referred to as REXX for CICS—provide improved productivity for a wide range of CICS activities.

REXX for CICS enables you to write and execute REXX programs in a CICS region. These programs have access to most EXEC CICS commands, the CICS CEDA and CEMT transactions, and DB2 databases through the EXEC SQL interface.

To enable your CICS system to provide the facilities of REXX for CICS, perform the following steps:

- **Step 1--Consider your customization needs for REXX**, see "Customization information for REXX" on page 219.
  
  You might prefer to familiarize yourself with the procedure at the first reading by ignoring customization. (We intentionally show this step at the beginning and again at the end of the list to cater for those working through the list who need it first, and those reading it for the first time who would benefit from covering the topic last.)

- **Step 2--Modify your RDO definitions to add required entries.**
- **Step 3--Create the RFS filepools.**
- **Step 4--BIND the CICSQL program to your DB2 plan** on page 218.
- **Step 5--Add DD statements to your CICS startup job** on page 218.
- **Step 6--Modify member CICSTART** on page 218.
- **Step 7--Format the RFS filepools** on page 218.
- **Step 8--Verifying the installation** on page 219.
- **Step 9--Accessing the supplied softcopy documentation** on page 219.
- **Step 10--Customization information for REXX** on page 219 (if you choose to skip step 1).

---

### Step 1--Modify your RDO definitions to add required entries

Job CICRDOR (for Runtime Facility) or job CICRDOD (for Development System) in data set CICSTS31.REXX.SCICJCL adds the entries needed by the product, including REXX/CICS profiles, VSAM files, programs, transactions, and transient data queues. The transient data queues are used for REXX/CICS IMPORT and EXPORT commands. The jobs also contains the definitions for the REXX/CICS SQL interface that authorize the transactions to the DB2 plan. Review "Changing supplied CICS transaction codes" on page 220 if you plan to modify the transaction IDs and also review "RFS filepool definitions" on page 221 if you plan to change the REXX file system (RFS) pool names or the number of pools to install. Edit the JCL (ensuring that you uncomment the entries as explained in comments at the beginning of the JCL) and run the job.

A return code of 4 is acceptable.

---

### Step 2--Create the RFS filepools

Job CICVSAM in data set CICSTS31.REXX.SCICJCL defines the clusters needed to create the VSAM data sets needed for the RFS filepools. See "RFS filepool definitions" on page 221 for customizing information about RFS filepools.

© Copyright IBM Corp. 1989, 2010
You receive a condition code of 8 for the delete control statements if the VSAM data sets do not exist. You receive a condition code of 0 for the define cluster control statements if the job runs correctly.

**Step 3--BIND the CICSQL program to your DB2 plan**

Job CICBIND in data set CICSTS31.REXX.SCICJCL binds CICSQL to the correct DB2 plan. Edit and run the job.

You might receive condition code 4 for the job depending upon the level of DB2 being used.

**Step 4--Add DD statements to your CICS startup job**

You need to add the following DD statements to your CICS startup job. See "Special exec data sets used by the REXX Development System" on page 222 for more information.

```
//CICAUTH DD DSN=CICSTS31.REXX.SCICCMDS,DISP=SHR
//CICEXEC DD DSN=CICSTS31.REXX.SCICEXEC,DISP=SHR
//CICUSER DD DSN=CICSTS31.REXX.SCICUSER,DISP=SHR
```

Additionally a DD statement for CICSTS31.REXX.SCICLOAD must be added to the DFHRPL concatenation.

**Step 5--Modify member CICSTART**

Modify member CICSTART in data set CICSTS31.REXX.SCICEXEC. See "Customization information for REXX" on page 219 for more information.

**Step 6--Format the RFS filepools**

Bring up the CICS region and sign onto the CICS region with a userid defined as an authorized user. Enter REXX, the default transaction id associated with the CICRXTRY exec. You should see the following line at the top of the screen, "Enter a REXX command or EXIT to quit" and a "READ" in the lower right hand corner. The cursor is in the lower left hand corner. You have now entered the supplied exec which allows the execution of REXX and REXX/CICS commands interactively.

You may now prepare the filepools for use by entering the command: `FILEPOOL FORMAT pool1` where `pool1` should be substituted by the filepool name you specified in the CICSTART exec.

**Note:** The command should be entered as shown, including the apostrophes.

The interactive environment will echo each command at the next available line on the screen and any requested output will also be displayed. The FILEPOOL FORMAT command does not display any information. To determine whether the FILEPOOL FORMAT command worked successfully, enter "SAY RC". If a "0" is displayed on the next available line, the FILEPOOL FORMAT command was successful.

Continue this process until all RFS filepools have been formatted. You only have to format the filepool when a new filepool has been defined, or if you delete and redefine the clusters for an existing filepool.

If, in the process of formatting the filepools or interactively executing REXX or REXX/CICS commands and instructions, you fill the screen, a "MORE" indicator will
appear at the bottom right hand corner. To clear the screen, press the ENTER key. Any time you want to clear the screen of data, you may press the CLEAR key. To exit from the interactive environment, you may press the PF3 key which simulates the entering of the "EXIT" REXX instruction. You may also enter the "EXIT" instruction yourself.

The interactive environment also provides for recalling previously entered commands. This is done by pressing the RETRIEVE key. The system has a default setting for this key of PF12. This may be customized using the SETSYS RETRIEVE command. Pressing the RETRIEVE key causes the previously entered line to be re-displayed at the input location. You can then modify this area if required and re-execute the instruction by pressing ENTER. Pressing the RETRIEVE key multiple times will continue to bring the next previously entered command to the input area.

---

**Step 7--Verifying the installation**

To verify the installation has been successful, three execs have been supplied. From the interactive REXX environment, enter, CALL CICIVP1. The exec will indicate what should occur.

---

**Step 8--Accessing the supplied softcopy documentation**

The REXX Development System for CICS/ESA and the REXX Runtime Facility for CICS/ESA Guide and Reference manual is included on the distribution tape in three different softcopy formats.

The supplied data set CICSTS31.REXX.SCICDOC contains two members.

Member CICR3270 contains the manual in LIST3270 format, a format that has an 80-character record length. CICR3270 is used as input by the online help facility which is described in [Online HELP facility on page 223](#).

Member CICR3820 contains the manual in LIST3820 format. Job CICBPRNT in data set CICSTS31.REXX.SCICJCL contains a sample job, which may be modified and executed, that prints the manual to a device which supports LIST3820 formatted data.

The supplied data set CICSTS31.REXX.SCICBOOK contains one member, CICRBOOK. It contains the manual in BookManager/read format. If you have BookManager® installed you may use this data set to view the manual.

---

**Customization information for REXX**

This section provides customizing information. It should be reviewed prior to performing the steps listed in [Step 1--Modify your RDO definitions to add required entries on page 217](#). It covers the following topics:

- “Changing supplied CICS transaction codes” on page 220
- “RFS filepool definitions” on page 221
- “TD queues needed for IMPORT and EXPORT commands” on page 221
- “SQL definitions used for authorizing transactions to use DB2” on page 221
- “Special exec data sets used by the REXX Development System” on page 222
- “Special USER ids and their usage” on page 222
- “Other considerations” on page 223
- “Online HELP facility” on page 223
Changing supplied CICS transaction codes

There are three transaction ids supplied by the product. They are: REXX, EDIT, and FLST. You can change these supplied transaction ids.

The functions of REXX, EDIT, and FLST
The functions of REXX, EDIT, and FLST are:

**REXX** is the default transaction id.
- If no additional operands are supplied the CICRXTRY exec starts. CICRXTRY allows the user to interactively enter REXX instructions and execute them.
- If REXX is entered and is followed by a string (separated from REXX by blanks), the string is interpreted as a REXX exec name followed by operands that are passed to the named REXX exec. This action causes the named exec to execute.

When the REXX exec ends, control is returned to CICS.

**EDIT** is the transaction id associated with the REXX Development System editor.
- If no additional operands are supplied the CICEDIT exec starts and the file "NONAME" in the user's current RFS directory is opened for editing.
- If EDIT is entered with an additional operand separated from the transaction id with a blank, the operand is interpreted as the name of a particular file in the user's current directory which is to be opened for editing.

When the EDIT session ends, control is returned to CICS.

**FLST** is the transaction id associated with the REXX Development System file list exec, CICFLST.
- If no additional operands are supplied, the CICFLST exec starts and the contents of the user's current RFS directory are displayed.
- If FLST is entered with an additional operand separated from the transaction id with a blank, the operand is interpreted as the name of a particular RFS directory whose contents are to be listed.

When the FLST session ends, control is returned to CICS.

Changing the supplied transaction ids
You can change the names of the supplied transaction ids, and you can add additional transactions which will call your own execs.

- The DEFTRNID commands in the member, CICSTART, in data set CICSTS31.REXX.SCICEXEC define the supplied transaction ids REXX, EDIT, and FLST, and associate them with their execs.

  If you choose to change the supplied entries make sure that you update the RDO definitions to match your changes. If you do not want users to call the editor or file list execs directly from CICS, you can delete the DEFTRNID commands, for either or both of them, from CICSTART and also from the RDO definitions. Users will not be allowed access to these directly from CICS. Ensure that you do not remove the DEFTRNID statement for the CICRXTRY exec.

- If you want to add additional transactions which call your own execs directly from CICS, add RDO definitions for the transaction ids and add further DEFTRNID commands to your CICSTART exec. Your newly defined transactions become available to your users when you restart your CICS system. An authorized user
can enter the DEFTRNID command directly to give immediate availability, but
until the CICSTART member is changed, these definitions are lost when CICS is
restarted.

**RFS filepool definitions**

The supplied member, CICVSAM in CICSTS31.REXX.SCICJCL, creates the VSAM
data sets for two RFS filepools. The names for these VSAM data sets can be
toggled to your installation standards. If you do change these names make
sure to make matching changes to the member, CICRDOD, as well. Since the RDO
definitions supplied contain the data set names, DD statements are not needed in
the CICS startup job. This technique can be used to add additional files to an RFS
pool or to add additional RFS filepools without restarting your CICS system.

The FILEPOOL DEFINE commands in member, CICSTART in data set
CICSTS31.REXX.SCICEXEC have two purposes. The first is to define the names of
the supplied filepools. They are: POOL1 and POOL2. You can modify these names
to your installation standards. They can be from 1 to 8 characters. They should not
contain special characters, “:” or “\”. The second purpose is to associate the filepool
ids to the FCT definitions for the VSAM data set used for its directory and the first
VSAM file used for data storage.

If you want to add additional RFS filepools to your system you need to add RDO
definitions and add FILEPOOL DEFINE commands to your CICSTART member. If
you intend to allow users to add RFS files to the new filepool you must define the
filepool to include a ‘\USERS directory.

To make these new filepools available for use, you must restart CICS. However,
you can also add filepools while your CICS system is active as follows:
- add the RDS definitions for the new files and define them using a batch job
- then get an authorized user to enter the FILEPOOL DEFINE command and the
  FILEPOOL FORMAT command
- be sure to modify CICSTART or your new definitions are lost when you restart
  your CICS system

**TD queues needed for IMPORT and EXPORT commands**

The REXX Development System uses dynamic allocation to IMPORT members
from a partitioned data set or to EXPORT RFS files to a partitioned data set. The
member CICRDOD in data set CICSTS31.REXX.SCICJCL defines three Transient
Data entries used as input for IMPORT and 3 Transient Data entries for output for
EXPORT. This allows three users to concurrently IMPORT and three users to
concurrently EXPORT from and to partitioned data sets.

Modify the number of TDQ entries to suit your needs, but you should allow for at
least one input and one output entry. The TDQUEUE NAME must begin with REX
and be suffixed with a valid character. Ensure there are no other applications using
TDQUEUE names that begin with REX because IMPORT/EXPORT will use them
and may cause files to become corrupted.

**SQL definitions used for authorizing transactions to use DB2**

The member CICRDOD in data set CICSTS31.REXX.SCICJCL authorizes the
transactions, REXX, EDIT, FLST, and DXB0 to use the DB2 plan. The first three of
these transactions are REXX for CICS transactions and the DXB0 transaction is
added if you have OfficeVision/MVS and want to use DB2 interface calls which may
run under the OV/MVS transaction id. If you choose to modify the supplied
transactions for the REXX Development System, you need to modify the DB2 entry
definitions also.

If you implement new transactions which use the DB2 interface code then you
should also add these DB2 entry definitions to your RDO group.

Special exec data sets used by the REXX Development System

There are three data set concatenations which are used by the REXX Development
System which have no FCT entries. They are the DD names, CICCMDS, CICEXEC,
and CICUSER. These data sets are partitioned data sets and are accessed using
MVS facilities.

CICCMDS
The CICCMDS DD name concatenation should start by referencing the data
set CICSTS31.REXX.SCICCMDS. This data set contains those execs which
implement REXX Development System authorized commands. Only
authorized users or execs authorized to use authorized commands may
access these execs. If you choose to extend the REXX Development
System with your own authorized commands, you should concatenate your
data set to this DD name concatenation.

CICEXEC
The CICEXEC DD name concatenation should start by referencing the data
set CICSTS31.REXX.SCICEXEC. This data set contains those execs which
are supplied by the REXX Development System that use authorized
commands. If you choose to extend the REXX Development System with
your own execs which use authorized commands then you should
concatenate your data set to this DD name concatenation.

CICUSER
The CICUSER DD name concatenation should start by referencing the data
set CICSTS31.REXX.SCICUSER. This data set contains those execs which
are supplied by the REXX Development System that do not use authorized
commands. If you choose to extend the REXX Development System with
your own execs which do not use authorized commands then you should
concatenate your data set to this DD name concatenation.

The facilities used to access these data set concatenations use CICS WAIT
EXTERNAL capabilities to avoid placing the CICS region into a wait.

Special USER ids and their usage

It is recommended that external security be used in the CICS environment. This is
needed because individual user’s information is maintained by the REXX
Development System by the user’s userid designation. Each user should have his
own identification and there should not be two users signed on to the REXX
Development System with the same userid at the same time. Two users with the
same userid operating at the same time could have unusual results.

If a user is not signed on to the CICS region then the special userid of “*RCUSER*”
is used to access the RLS and RFS facilities.

Authorized users are identified to the REXX Development System through the
AUTHUSER command. This command is an authorized command and can only be
used by an authorized user or an exec which is authorized to use authorized commands. CICSTART is such an exec because it resides in the CICEXEC DD name concatenation.

The member, CICSTART in the supplied data set CICSTS31.REXX.SCICEXEC then should be modified to contain an AUTHUSER statement to identify at least one userid which should be an authorized user. It is important to add the AUTHUSER statement after the existing AUTHUSER statement for RCUSER. For example:

```plaintext
'AUTHUSER RCUSER'
IF RC = 0 THEN EXIT RC
'AUTHUSER your-userid'
IF RC = 0 THEN EXIT RC
```

You could also call another exec of your choosing, within the CICEXEC concatenation, which could contain the userids of those users who should be authorized users.

**Other considerations**

The member, CICSTART in data set CICSTS31.REXX.SCICEXEC, contains default definitions for the REXX Development System. It is executed when the first user who executes a transaction that uses the CICREXD program after the CICS system has been started. This exec should be updated with any changes in customization if those changes are required to be effective across CICS executions.

The REXX Development System provides the capability to execute execs in either pseudo-conversational or conversational mode. The system default for conversational mode is specified with the SETSYS PSEUDO statement in the member, CICSTART in the data set CICSTS31.REXX.SCICEXEC. The default supplied provides for pseudo-conversational to be used. CICSTART must run in conversational mode because the system has not yet been initialized enough to ensure correct operation.

The CICSTART member also contains EXECLOAD commands which are commented as shipped. EXECLOADing execs will reduce the amount of storage used by the REXX Development System because users will then share the same exec. Also performance may be increased because these execs will not have to be loaded into CICS memory each time they are executed. EXECLOADed execs are used before any other execs. Therefore, if you EXECLOAD an exec "TEST.EXEC" and you have an exec in your RFS current directory by the same name, you will not be able to execute your RFS copy. Care should then be used both in the naming or your execs and EXECLOADing them. The authorization associated with the special DD names is maintained when execs are EXECLOADed from those DD name concatenation.

**Online HELP facility**

An online HELP facility is provided which may be used as an example of the REXX/CICS panel facility. It provides the means to search and display the LIST3270 manual which is supplied with the product. There are several steps which must be done in order to activate the online help.

**Note:** If PTF maintenance has been applied that affects data sets for the procedure outlined below, then you should use the target library; otherwise, the distribution library should be used.
First, modify member CICSTART in the data set CICSTS31.REXX.SCICEXEC to reflect the correct RFS filepool and path where the online help files should be. If you choose to use the default no changes to CICSTART are necessary.

Next copy the supplied data set CICSTS31.REXX.SCICDOC to a data set whose highest level data set qualifier matches the userid of the user who will be executing the CICHPREP exec. The reason for this is the supplied security exit for the REXX/CICS IMPORT and EXPORT commands checks the highest level qualifier and it must match the userid for the user who issues the IMPORT command.

Next copy the supplied data set CICSTS31.REXX.SCICPNL to a data set whose highest level data set qualifier matches the userid of the user who will be executing the CICHPREP exec. This data set contains the panel definitions which are used by the online help. They must be IMPORTed into the RFS filepool and path defined for the online help.

Next sign onto REXX/CICS using the REXX transaction id. If you have changed the default transactions, this is the transaction id associated with the CICRXTRY exec. Issue the command, 'EXEC CICHPREP'. Follow the instructions issued by the exec. This exec will reads the LIST3270 format of the manual from the data set you name, into the RFS directory specified in CICSTART. It also splits the manual into multiple files for usage by the online help. Additionally, the panels used by the online help are IMPORTed into the RFS system.

The online HELP facility is now ready for use.

There are several ways the user may access the online HELP.

Enter 'HELP' on the command line from the interactive environment and a table of contents is displayed. You also may enter this command from the command line of the REXX/CICS editor or the REXX/CICS filelist facilities.

Entering 'HELP xxxxx' searches the INDEX of the manual for the xxxxx entry. If found you are taken directly to that section of the manual.

There also is a HELP key defined for the editor and the filelist facility. It is defined in the customizing macros for the editor and the filelist facilities. The supplied default for this key is PF1. You may choose to modify the supplied default by modifying these profiles.
Part 4. CICS verification

This part describes the processes and procedures you should follow to run the installation verification procedures for CICS. It contains the following chapters:

- Chapter 35, “Running the installation verification procedures,” on page 227.
Chapter 35. Running the installation verification procedures

After you have installed CICS, and applied any necessary service, you can use the CICS-supplied installation verification procedures (IVPs) to confirm that CICS is operational.

There are two IVP jobs:

1. **DFHIVPBT (verify batch)**
   This job starts up CICS, specifying a pair of sequential input and output devices (CARDIN and PRINTER) to be used instead of an ordinary terminal. It then executes a number of CICS transactions that are read from CARDIN. The last transaction in the input stream shuts down CICS.

2. **DFHIVPOL (verify online)**
   This job can run CICS with either XRF=NO, or XRF=YES. It is generated with XRF=NO specified as an override, which you change when you are ready to verify CICS with XRF.

   You can use this CICS region to automatically install (autoinstall) an IBM 3270 Information Display System terminal, with which you can:
   - Use the master terminal transaction, CEMT. You can also use CEMT from the MVS system console. For information about using CEMT, see the [CICS Supplied Transactions](#) manual.
   - Use the resource definition online transaction, CEDA. For information about using CEDA, see the [CICS Resource Definition Guide](#).
   - Use the sample application transaction AMNU, to access the sample VSAM file, FILEA. For a description of the FILEA sample applications, see the [CICS 4.1 Sample Applications Guide](#).

Before you run the IVP jobs, you will need to prepare your system. The steps you need to perform are described in "Preparation for running the IVPs."

### Preparation for running the IVPs

Perform the following steps:
- Create the CICS data sets for the IVP jobs
- Install the CICS SVC for the IVP jobs
- Define and activate the CICS applids
- Authorize the IVP userid
- Review security requirements for the IVP jobs
- Define log streams
- Specify system initialization parameters for the IVP jobs

### Create the CICS data sets for the IVP jobs

Before you can run any of the CICS-supplied IVP jobs, create the data sets that they use. For further information about creating the data sets for the IVP jobs, see Chapter 28, “Creating the CICS data sets,” on page 189.

### Install the CICS SVC for the IVP jobs

All the IVP jobs require the CICS Type 3 SVC, which must be installed in the LPA.

If you have not already installed the CICS SVC in the LPA (as described under
Define and activate the CICS applids

If you want to use VTAM with a CICS region started by any of the CICS IVP jobs, create and activate a VTAM APPL definition for the CICS region’s application identifier (applid). The applid defined to VTAM must match the applid that is specified on the APPLID system initialization parameter that is used by the IVP job. For example, to be able to logon to the CICS region that is started by the DFHIVPOL job, you must do one of the following:

- Create and activate an APPL definition for your own applid, which you specify on the APPLID parameter of the DFH$SIP1 member of the SYSIN data set.
- Define and activate an APPL definition for the default applid DBDCCICS, which you specify on the APPLID parameter of the DFH$SIP1 member of the SYSIN data set.

For more information about creating and activating VTAM APPL definitions for CICS, see Chapter 13, “Defining CICS regions as applications to VTAM,” on page 99 and “Naming conventions” on page 190.

Further, if you want to use VTAM cross-domain services to communicate between CICS regions on separate MVS images, you must create and activate VTAM CDRSC definitions in both MVS images involved in the communication. For more information about creating and activating VTAM CDRSC definitions for CICS, see “Cross-domain considerations” on page 101.

Authorize the IVP userid

To run the IVP jobs with external security, you must define to RACF an IVP default CICS userid that has authority to run the transactions used as part of the IVP jobs. These transactions include the CICS-supplied transactions that are listed in Table 16. The level of authority that is required by the IVP userid depends on what security you want to use for the IVP jobs. For more information, see “Review security requirements for the IVP jobs” on page 229.

Note: On a production system the default user should not have access to any CICS-supplied transactions except those you need in your CICS environment. The resource access authorizations that you give to the default user should clearly be limited to those resources that you intend to be universally available, and therefore not restricted in any way.

For information about the security requirements for CICS-supplied transactions, and about CICS security in general, see the CICS RACF Security Guide.

Table 16. Transactions used as part of the IVP jobs

</tbody>
</table>
Review security requirements for the IVP jobs

You can run the IVP jobs with or without external security.

As supplied, the system initialization table, DFHSIT, used by the IVP jobs, specifies that external security is on. However, the IVP jobs have been set up with SEC=NO, indicating that external security is not on. DFHSIT also specifies that the IVP jobs are subject to transaction security (XTRAN=YES), resource security (Xyy=NO), and command security (XCMD=YES).

Note: As supplied, the DFH$SIP2 member of the SYSIN data set used by the DFHIVPBT job specifies the SIT override SEC=NO, so that you can run this job without external security.

If you choose to run the IVP jobs with external security, you must:

- Define CICS resource profiles to RACF.
- Define an IVP default CICS userid to RACF.
- Specify the IVP userid on the DFLTUSER=userid system initialization parameter.

You must also give the IVP userid sufficient authority to use transactions and resources that are needed to run the IVP jobs. That is, you must:

- Authorize the IVP userid to run the transactions that are used as part of the IVP jobs. (See Table 16 on page 228.) To do this you must add the IVP userid, with READ access, to the access list of the RACF profiles for the transaction member class (TCICSTRN) or the transaction group class (GCICSTRN).

If you define the transactions as prefixed resources, you must also specify the system initialization parameter SECPRFX={YES |prefix} for the IVP jobs.

- Authorize the IVP userid to access the resources that are used by the transactions. To do this you must add the IVP userid, with appropriate authority, to the access list for the resource class profiles.

- Authorize the IVP userid to issue SP-type commands using the CEMT master terminal transaction. To do this, you must add the IVP userid, with appropriate authority, to the access list of the RACF profiles for the resource member class (CCICSCMD) or the resource group class (VCICSCMD). You must give the IVP userid UPDATE access for the SHUTDOWN resource class, otherwise the userid will not be able to terminate the IVP jobs. You should also give the IVP userid UPDATE access for the DUMPDS and SYSTEM resource classes, if the DFHIVPBT job is to be run with external security.

For information about implementing external security, see the CICS RACF Security Guide. Alternatively, you can run the IVP jobs with limited security, for example:
Without command security (XCMD=NO), the IVP userid would be able to run the IVP jobs without the need for authority to use the CEMT SP-type commands and the resources that they access.

With only transaction security (Xyy=NO including XCMD=NO), the IVP userid would be able to run the IVP jobs if authorized only to use the transactions used as part of the IVP jobs.

**Define log streams**

CICS automatically attempts to connect to its system log stream, unless you define a journal model resource definition to define the log stream as TYPE(DUMMY). This means that you need to decide whether you want to run the IVPs with system logs, or to run with dummy logging.

If you decide to run with actual log streams, see Chapter 24, “Defining the logger environment for CICS journaling,” on page 143 for information about defining log streams.

Alternatively, you can define a CICS JOURNALMODEL resource definition with TYPE(DUMMY) to avoid having to define log streams. If you want to run the IVPs with the minimum effort:

- Define JOURNALMODEL resource definitions in the CSD for the primary and secondary system logs, DFHLOG and DFHSHUNT respectively, specifying TYPE(DUMMY); see Figure 25 for a sample job.
- Add the CSD group that contains your dummy system log journal models to your own group list, and include your group list on the GRPLIST system initialization parameter.

Note that your group list must follow the IBM-supplied list DFHLIST. DFHLIST includes group DFHLMOD (which contains DFHLOG and DFHSHUNT JOURNALMODEL definitions) Concatenating your list after DFHLIST ensures that your DUMMY definitions replace the IBM definitions.

```
Figure 25. Sample job to define DUMMY JOURNALMODELs for CICS system logs
```
Specify system initialization parameters for the IVP jobs

All the IVP jobs use the system initialization parameters that are specified in the associated DFH$SIPn member of the SYSIN data set. The DFH$SIPn members, as supplied by CICS, default to the unsuffixed SIT, DFHSIT, and the resources defined to CICS are adequate only for a basic CICS region. For example, in the case of the DFHIVPOL job, the resources defined limit the number of terminals you can use.

The DFH$SIPn members of the SYSIN data set also contain some system initialization parameters to exclude CICS resources not required by the IVP jobs, or to include some not specified by the default SIT.

One such parameter is TCT=5$, specifying the CICS sample terminal control table, in the *hlq*.SDFHLOAD library. This TCT defines the pair of sequential input and output devices, CARDIN and PRINTER. (These are the only devices that are defined in DFHTCT5$.)

The DFH$SIPn members of the SYSIN data set may need to be edited for:

- The default SVC number is 216. To use a different SVC number, specify CICSSVC=nnn in the appropriate DFH$SIPn member. For more information about defining CICS SVCs, see "Defining the CICS SVCs to your MVS" on page 93.
- The IVP jobs do not require the Type 6 SVC.
- The applid used is CICSIVP1. To use a different applid, change the system initialization parameter (APPLID=CICSIVP1) in the appropriate DFH$SIPn member.
- The IVP jobs had external security switched off. To run with security (SEC=YES), define a suitable default userid (for example, IVPUSER) with the required authority to run the IVP transactions. Add DFLTUSER=IVPUSER in the appropriate DFH$SIPn member. For more information about defining the IVP userid, see "Authorize the IVP userid" on page 228.

Transactions can be defined as prefixed resources by using the IVP userid, IVPUSER or any other prefix, as the prefix (for example, IVPUSER.CEMT or prefix.CEMT). To do this, add SECPRFX=YES, or SECPRFX=prefix in the appropriate DFH$SIPn member for the IVP job.

This enables transactions to be run as part of the IVP jobs without affecting other CICS regions. For example, when the DFHBATCH batch stream is run, CICS sends authorization requests to RACF for the transactions and identifies them as IVPUSER.xxxx, where xxxx is the transaction ID (CWTO, CEMT, and so on).

- Language Environment support, for all the high-level language sample programs, was added as described in the CICS System Definition Guide. CICS requires either pre-defined CSD definitions, for the Language Environment modules, to be installed or Program autoinstall to be active.

The IVP jobs include the required DD statements for the Language Environment libraries as comments.

- The resources for the CICS messages facility were defined, as described in "Resources for the CICS messages facility, CMAC" on page 232, and the DFHCMAC resource group added to a group list used for the IVP jobs.
- The IVP jobs run with auxiliary trace switched on (AUXTR=ON), and the auxiliary trace data set switching facility set to switch once only (AUXTRSW=NEXT).

Other notes about changes to the system initialization parameters for the IVP jobs, and about the IVP jobs generally, are in the sections that describe the IVP jobs.
If you want to use system initialization parameters to modify or enhance the scope of the IVP jobs, see the CICS System Definition Guide for details about the parameters.

Resources for the CICS messages facility, CMAC

You can use the CICS messages facility (CICS-supplied transaction CMAC) to provide the messages and codes descriptions online. Before you can use this facility, you must create and initialize the CICS messages data set DFHCMACD, define the resources needed by the facility, and make them available to your CICS region.

For information about creating and initializing the DFHCMACD data set, see “Creating the CICS messages data set, DFHCMACI job” on page 193.

The file DFHCMACD, managed by CICS file controle, accesses the DFHCMACD data set. You must create a definition for this file in the CSD. The CICS-supplied definition for the DFHCMACD file and other resources that are needed by the CICS messages facility are in the CSD group DFHCMAC. The CICS startup procedure (in the IVP jobs) has a DD statement for the CMAC file, but for dynamic allocation you should copy the supplied resource definition for the DFHCMACD file and add the DSNAME option.

You should specify the DFHCMAC group of resources for the CICS messages facility only in those CICS regions that need to use the facility; for example on some terminal-owning regions, but perhaps not on data-owning regions.

The CICS startup procedure, DFHSTART

All the IVP jobs include a procedure to start up CICS. You can use this procedure as a basis for your own CICS startup procedures. This procedure, DFHSTART, comprises the following steps:

1. CICSCNTL—determine whether CICS is to be started
2. DTCNTL—determine whether dump and trace analysis is to be performed
3. CICS—execute CICS
4. PRTDMPA—print any contents of the CICS DFHDMPA dump data set
5. PRTDMPB—print any contents of the CICS DFHDMPB dump data set
6. PRTAUXT—print any contents of the auxiliary trace DFHAUXT data set
7. PRTBUXT—print any contents of the auxiliary trace DFHBUXT data set.

The following symbolic parameters are defined in the IVP jobs:

INDEX1 is the high-level index of the CICS run-time data sets, as specified on the DSINFO parameter of the DFHISTAR job. Default: INDEX1=hlq

INDEX2 is the high-level index of the CICS load libraries, as specified on the INDEX parameter of the DFHISTAR job. Default: INDEX2=hlq

REGNAM is the REGION name for a single or MRO region. Default: REGNAM=TR

REG defines the MVS region size for the CICS step. Default: REG=32M

START is the type of CICS startup to be performed. Default: START=AUTO
DUMPTR specifies whether dump and trace analysis is required. **Default:** DUMPTR=YES

RUNCICS specifies whether CICS is to be started. **Default:** RUNCICS=YES

OUTC is the output print class. **Default:** OUTC='*'

SIP is the suffix of the DFH$SIP member (in the SYSIN data set) to be used during CICS startup. **Default:** SIP=T

**Notes:**
1. The step CICS (to start up CICS) is executed only if you code RUNCICS=YES (the default). Code RUNCICS=NO if you want to perform dump and trace analysis without starting CICS.
2. The steps PRTDMPA, PRTDMPB, DFHAUXT, and DFHBUXT are executed only if you specify DUMPTR=YES (the default).
3. When you run the DFHISTAR job, it overrides the default values in the IVP jobs with the values you specified in the DFHISTAR job.

**DD statements for CICS data sets**

The startup job step contains DD statements for the CICS data sets that are listed in the table below.

<table>
<thead>
<tr>
<th>DDname</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SYSIN</td>
<td>SYSIN data set, containing the DFH$SIPn members that specify system initialization parameter overrides.</td>
</tr>
<tr>
<td>DFHCMACD</td>
<td>Messages data set, needed for the CICS messages transaction, CMAC.</td>
</tr>
<tr>
<td>FILEA</td>
<td>Sample VSAM data set, needed by the FILEA sample applications.</td>
</tr>
<tr>
<td>DFHTEMP</td>
<td>Auxiliary temporary storage data set, needed by the FILEA sample applications.</td>
</tr>
<tr>
<td>DFHINTR A</td>
<td>Transient data intrapartition data set, needed by the FILEA sample applications.</td>
</tr>
<tr>
<td>DFHAUXT</td>
<td>First auxiliary trace (A) data set.</td>
</tr>
<tr>
<td>DFHBUXT</td>
<td>Second auxiliary trace (B) data set.</td>
</tr>
<tr>
<td></td>
<td>The auxiliary trace data sets, DFHAUXT and DFHBUXT, are needed because the IVP jobs run with auxiliary trace switched on, and the auxiliary trace data set switching facility set to switch once only.</td>
</tr>
<tr>
<td>DFHLCD</td>
<td>(Mandatory) CICS local catalog data set (VSAM), used by the CICS domains to save some of their information between CICS runs, and to preserve this information across a cold start.</td>
</tr>
<tr>
<td>DFHGCD</td>
<td>(Mandatory) CICS global catalog data set (VSAM), has a variety of uses, including: during a CICS run, holding resource definitions that are installed; and, during a controlled shutdown, recording part of the warm keypoint information.</td>
</tr>
<tr>
<td>DFHCXRF</td>
<td>Transient data extrapartition data set, used by CICS as the target for messages sent to any transient data destination before CICS has completed intrapartition transient data initialization. Use of this DDname is optional, but if it is not used, any messages that would have been written here are lost.</td>
</tr>
</tbody>
</table>
Table 17. DD statements for CICS data sets in the DFHSTART procedure (continued)

<table>
<thead>
<tr>
<th>DDname</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DFHLRQ</td>
<td>The local request queue data set is used to store pending BTS requests; for example, timer requests or requests to run activities. It is recoverable and used to ensure that, if CICS fails, no pending requests are lost. For more information, see the CICS Business Transaction Services.</td>
</tr>
<tr>
<td>LOGUSR</td>
<td>Data set for the extrapartition transient data destination, LOGA, used by the CICS sample programs.</td>
</tr>
<tr>
<td>MSGUSR</td>
<td>Data set for the extrapartition transient data destination, CSSL, used by a number of CICS services.</td>
</tr>
<tr>
<td>PLIMSG</td>
<td>Data set for the extrapartition transient data destinations used by PL/I application programs. This data set is the destination for PL/I statistics and messages (CPLI).</td>
</tr>
<tr>
<td>COUT</td>
<td>Data set for the extrapartition transient data destinations used by C/370 application programs. This data set is the destination for the C/370 output data streams, stdout (CCSO) and, indirectly, stderr (CCSE).</td>
</tr>
<tr>
<td>DFHDMPA</td>
<td>First transaction dump (A) data set. Second transaction dump (B) data set. The dump data sets are included because CICS always tries to open a transaction dump data set, and issues a warning message if it is unable to do so for any reason.</td>
</tr>
<tr>
<td>DFHDM PB</td>
<td></td>
</tr>
<tr>
<td>DFHCSD</td>
<td>(Mandatory) CICS system definition data set (VSAM).</td>
</tr>
</tbody>
</table>

Verify batch job, DFHIVPBT

The CICS-supplied verify batch job, DFHIVPBT, is tailored to your CICS environment and stored in the hlq.XDFHINST library when you run the DFHISTAR job.

**Note:** Before submitting the DFHIVPDB job, run the DFHRMUTL program to reset the global catalog control record to perform an INITIAL start on the next CICS startup.

This IVP comprises the following job steps:

**1. Job step GENINPT** unloads the member DFH$BTCH from the hlq.SDFHSAMP library into the CARDIN data set (using the MVS utility program, IEBGENER).

**2. Job step DFHSTART** invokes the CICS initialization program, DFHSIP, to startup CICS. The DFHSIP program reads startup system initialization parameters from the DFH$SIP2 member of the SYSIN data set.

The DFH$BTCH data set (see Figure 26 on page 235) is used as terminal input, and this should produce a printout similar to the sample output shown in Figure 28 on page 238.
Sample job log for the DFHIVPBT job

When you run the DFHIVPBT job, your job log should look similar to the example shown in [Figure 27]

```
    16.24.15 JOB35409 ---- TUESDAY, 18 JAN 2005 ----

[Figure 27. Sample job log for the DFHIVPBT job (Part 1 of 3)]
Figure 27. Sample job log for the DFHIVPBT job (Part 2 of 3)
For information about the system initialization parameters used by the IVP jobs, see page 231. (See also 2 below.)

2 The DFHSMO122 and DFHSMO123 messages inform you of the limits available for the dynamic storage areas below and above 16MB. For information about these storage areas, see the CICS System Definition Guide.

Note: Storage for the extended read-only DSA, ERDSA, is obtained from read-only key 0 protected storage, because the default SIT specifies RENTPGM=PROTECT.

3 The DFHIVPBT job was run without external security active, because SEC=NO is specified as a SIT override parameter.

4 The default group list, DFHLIST, is used for this run of the DFHIVPBT job. Non-default functions (for example, the CICS online messages facility) are not available, because their CICS resources are not defined in this group list.
These messages are issued when CICS is initialized and the log streams do not exist. CICS issues a request to create the log stream dynamically using MVS define log stream services.

If system log initialization fails, CICS abends. (See also \[Figure 28\] in Figure 28.)

If you want COBOL, C, C++ and PL/I languages, remove the comment marks from the SCEERUN and SCEERUN2 libraries, and increase the memory size for the job.

Output from the DFHIVPBT job

Output from the DFHIVPBT job (see Figure 28) includes CICS messages written to one of the extrapartition destinations, responses to the transactions in the DFH$BTCH data set, and an auxiliary trace.

DFHPG0101 01/18/2005 16:24:20 CICSIVP1 CICSUSER CSSY PPT entry for DFHWBLT has been added.

Figure 28. Sample job log for the DFHIVPBT job (Part 3 of 4)
Verify interactive job, DFHIVPOL

The verify interactive job, DFHIVPOL, is tailored to your CICS environment and stored in the hlq.XDFHINST library when you run the DFHISTAR job. You can use the DFHIVPOL job to start up a CICS region and try out the current facilities; for example you can use the master terminal transaction, CEMT, and the resource definition transaction, CEDA. You can also run some CICS sample application programs (for example, the FILEA applications).

You need either an IBM 3270 Information Display System terminal or a console device You can use both if you wish.

If you use an IBM 3270 Information Display System terminal with this IVP, you can try CEDA, CEMT and the sample applications.

From a console device, the CEDA transaction can be used only to INSTALL resource definitions. The sample programs cannot be executed from a console device.

Figure 28. Sample job log for the DFHIVPBT job (Part 4 of 4)

Notes:

1. CICS messages issued when the log stream is created.

2. This message is sent to the CRDI destination.
If you want to communicate with CICS from an MVS console, you must define a console in the CSD before starting the IVP. (You cannot define a console in the TCT.) For more information, see "Defining an MVS console" on page 244.

If you want to communicate with CICS from a TSO session, you must define the TSO user as a console device in the CSD before starting the IVP. For more information, see "Defining a TSO user as a console device" on page 245.

The DFHIVPOL job invokes the CICS initialization program DFHSIP to start up CICS. The DFHSIP program reads system initialization parameters from the DFH$SIP1 member of the SYSIN data set.

TCT=NO is specified as a SIT override which causes CICS to use the dummy terminal control table, DFHTCTDY. This dummy TCT contains only the CICS and VTAM control blocks that you need for use with VTAM terminals: there are no terminal entries.

For information about system initialization parameters specified as overrides for the run of the DFHIVPOL job, see "Specify system initialization parameters for the IVP jobs" on page 231.

**Defining a terminal for the online IVP**

You can define a VTAM terminal by either of the following two methods:

1. Use the autoinstall facility, which is the recommended method, avoiding the need to define terminals to CICS explicitly before they can be used.
2. Define a terminal explicitly in the CSD, using the DEFINE command of DFHCSDUP, the batch utility for updating the CSD.

**Using autoinstall for a VTAM terminal**

If you use the autoinstall function of CICS, you avoid the need for each VTAM terminal that requires access to CICS being explicitly defined in the CSD. With autoinstall, the resource definitions you create using RDO can act as models or templates for many resources of the same type. You then leave CICS to match real resources with one of the models. CICS installs table entries for these real resources dynamically, as and when they are needed.

When using autoinstall, you should be aware that when CICS processes an autoinstall request, it uses data from the VTAM logmode table. This is an important consideration. An autoinstall request will succeed only when the logmode data (which is passed to CICS in the BIND image) matches one of the model terminal definitions recorded in the autoinstall model table (AMT) from the CSD. For programming information about the LOGMODE definitions that match the CICS-supplied model definitions for autoinstall, see the [CICS Customization Guide](CICS Customization Guide). Before attempting to start CICS and autoinstall a terminal for this IVP, check your VTAM definitions with those given in the [CICS Customization Guide](CICS Customization Guide). If CICS fails to match model and logmode data, you receive message DFHZC6987I. For information about the suggested course of action if you receive message DFHZC6987I, see the [CICS Messages and Codes](CICS Messages and Codes) manual.

**CSD resource definitions for autoinstall:** The CSD is defined and initialized for all the IVP jobs when you run the DFHCOMDS job (see Chapter 28, "Creating the CICS data sets," on page 189), and includes some IBM-supplied definitions for use with autoinstall. These are defined in the following groups:
Group Name | Description
---|---
**DFHTERM** | Model terminal definitions for use with the autoinstall facility. For example, two of the TERMINAL definitions are 3270 and LU2.

**DFHTYPE** | Partial terminal definitions (TYPETERMs) defining common terminal properties, or attributes. For example, two of the TYPETERM definitions are DFH3270 (to define a non-SNA 3270 terminal) and DFHLU2E2 (to define a SNA 3270 model 2 terminal). The DFHLU2E2 resource definition matches the VTAM-supplied logmode SNX32702.

The DFHTERM and DFHTYPE groups are included in the CICS-defined group list called DFHLIST, which is defined in the GRPLIST operand in the sample SIT. If the CICS-supplied definitions are not suitable for your installation, you can create additional TYPETERM and model TERMINAL definitions in the CSD, but without a terminal you will have to do this offline, using the DFHCSDUP utility program. For information about autoinstall definitions, see the [CICS Resource Definition Guide](#).

Autoinstall also requires a user program to assign terminal identifiers, and, if necessary, to control access to the system. When you run the online IVP, you are unlikely to have any special requirements for terminal identifiers, or to control access, in which case you can use the IBM-supplied autoinstall user program, DFHZATDX. (If you are using autoinstall for APPC connections and terminals, the sample autoinstall user program is called DFHZATDY.)

**Defining a VTAM terminal in the CSD**

If you want to use an explicitly defined terminal, rather than let CICS autoinstall a terminal, you will need to define it offline using the DFHCSDUP utility program. The normal way to create resource definitions in the CSD is to use the CEDA DEFINE command from a CICS master terminal, but without a terminal you can only do this using the DFHCSDUP utility program. For an example of a DFHCSDUP job to define a VTAM terminal in the CSD, see Figure 29. For information about the keywords and operands of the DFHCSDUP DEFINE commands, see the [CICS Resource Definition Guide](#).

```
//DEFTERM JOB (accounting information),MSGCLASS=A, // MSGLEVEL=(1,1),CLASS=A,NOTIFY=userid //VTAMDEF EXEC PGM=DFHCSDUP //STEPLIB DD DSN=CICSTS31.CICS.SDFHLOAD,DISP=SHR //DFHCSD DD DSN=CICSTS31.CICS.DFHCSD,DISP=SHR //SYSPRINT DD SYSOUT=* //SYSPRINT DD SYSOUT=* DEFINE TERMINAL(trmidnt) NETNAME(vtamname) GROUP(grpname) TYPETERM(name) INSERVICE(NO) AUTINSTMODEL(NO) * APPEND LIST(DFHLIST) TO(yourlist) * ADD GROUP(grpname) LIST(yourlist) * LIST LIST(yourlist) OBJECTS /* */
```

*Figure 29. Defining a terminal by using the DFHCSDUP utility program*

You must substitute your own values for the operands that are coded in lowercase in the DEFTERM job shown in Figure 29.
TYPETERM
Specify a unique name to identify the resource definition that matches the properties of the type of terminal you are using. For example, to define a SNA 3270 model 2 terminal, specify the CICS-supplied TYPETERM definition DFHLU2E2. For a list of the CICS-supplied TYPETERM definitions, or for information about creating your own definitions, see the CICS Resource Definition Guide.

GROUP
Code a unique name for the group to which the terminal resource definition is to belong.

TERMINAL
Code a unique 4-character terminal identifier as the name by which CICS is to know the terminal.

NETNAME
Code the 8-character VTAM name that identifies this terminal to your VTAM system.

TO(yourlist) and LIST(yourlist)
Code a unique name for yourlist. If your new group list does not include all the CICS-supplied resources as well as your own, you must specify DFHLIST and yourlist on the GRPLIST system initialization parameter of your CICS startup job.

To include the CICS-supplied list of resources in a new group list, create a new list by copying the CICS-supplied list, DFHLIST, using the APPEND command. (The CICS-supplied group list, DFHLIST, is a protected group that you cannot modify.) You can then add your resource definition groups to the new list. Before you run the IVP, make sure you define your new group list to CICS, by adding a SIT override to the SYSIN data set in the DFHIVPOL job stream.

Defining the CICS APPLID to VTAM
You must ensure that either:
- VTAM knows the CICS application identifier (APPLID)
  or
- You change the CICS APPLID to one that is already known to your VTAM system.

If you use the default APPLID (DBDCCICS), define this to VTAM as described in “VTAM APPL parameters for CICS regions” on page 99, before starting the DFHIVPOL job.

Defining an MVS console
If you want to use an MVS console with the DFHIVPOL job, CICS requires an installed definition for the console. You can achieve this using one of the following:
- An autoinstall model definition, in conjunction with autoinstall support for consoles. The model definition can specify any CONSNAME value, and references a TYPETERM definition that specifies DEVICE(CONSOLE).
- A predefined TERMINAL resource definition for a console, which specifies the console name on the CONSNAME attribute, and references a TYPETERM definition that specifies DEVICE(CONSOLE).

You define these resources using the DFHCSDUP utility program. The CICS-supplied TYPETERM group, DFHTYPE, contains a typeterm definition called
DFHCONS, which is predefined with the required console properties. The DFHTERM group, however, does not contain any corresponding terminal entries for MVS consoles. You identify the console by the CONSNAME(name) attribute, even if the TERMINAL definition is an autoinstall model (the console name on an autoinstall model is a dummy value, and replaced by the real console name at install-time).

For an example of the DEFINE command required to define a console, see Figure 30 on page 246.

For information about defining MVS consoles to CICS, see the CICS System Definition Guide.

Defining a TSO user as a console device

A TSO user can enter MODIFY commands from terminals logged on to TSO, using either the TSO CONSOLE command or from SDSF. MVS activates a console using, by default, the user's TSO user ID as the console name. To CICS, the console name passed on the MODIFY command is treated like an MVS system console, and requires an entry in the CICS system definition (CSD) file.

As in the case of the MVS system console, you can achieve this using one of the following:

- An autoinstall model definition, in conjunction with autoinstall support for consoles. The model definition can specify any CONSNAME value, and references a TYPETERM definition that specifies DEVICE(CONSOLE)
- A predefined TERMINAL resource definition for a console, which specifies the console name on the CONSNAME attribute, and references a TYPETERM definition that specifies DEVICE(CONSOLE).

You are recommended to define consoles to CICS with preset terminal security, using the USERID attribute on the TERMINAL definition. This avoids the TSO user having to sign on using the CESN transaction. Otherwise, the TSO user's CICS signon password is displayed when entered on the CESN transaction.

For an example of a DEFINE command to define a TSO user, see Figure 30 on page 246.
**Running the DFHIVPOL job**

The DFHIVPOL job includes a procedure, DFHSTART, to start up CICS. When you have successfully logged on to CICS, you can carry out any of the interactive operations described on page 250.

While logged on to CICS, you should perform a CEMT SET DUMPDS SWITCH to ensure that both dump data sets are initialized before DFHUD640 is run when you shut down CICS.

Finally, you can shut down CICS.

**Sample job log for the DFHIVPOL job**

When you run the DFHIVPOL job, your job log should look similar to the sample log shown in Figure 31 on page 247.
Figure 31. Sample job log for the DFHVIVPOL job (Part 1 of 2)
Figure 31. Sample job log for the DFHVIVPOL job (Part 2 of 2)

Notes:
1. For information about the system initialization parameters used by the IVP jobs, see page 231 (See also 2 and 3 below.)
For more information about defining an applid for the CICS IVP jobs, see Chapter 13, “Defining CICS regions as applications to VTAM,” on page 99. An applid of CICSIVP1 has been used in Figure 31 on page 247.

The DFHSM0122 messages inform you of the limits available for the dynamic storage areas below and above 16MB. For information about these storage areas, see the *CICS System Definition Guide*.

**Note:** Storage for the extended read-only DSA, ERDSA, is obtained from read-only key 0 protected storage, because the sample SIT specifies RENTPGM=PROTECT (the default).

The DFHTM1715 message is issued because the CICS region was shut down by the terminal user (with netname IYCWTSC30) issuing a CEMT PERFORM SHUTDOWN command.

If you want COBOL, C, C++ and PL/I languages, remove the comment marks from the SCEERUN and SCEERUN2 libraries, and increase the memory size for the job.

**Logging on at a VTAM terminal**

When the DFHIVPOL job displays the console message CONTROL IS BEING GIVEN TO CICS, you can log on to CICS using an IBM 3270 Information Display system terminal. Use the CICS application identifier that you specified when you brought up CICS to log on through your VTAM terminal. For example, unless you changed the APPLID specified as a SIT override parameter, (it is CICSIVP1), enter LOGON APPLID(CICSIVP1).

If you are using autoinstall, your logon request is passed to CICS and, provided all the autoinstall requirements described in “Using autoinstall for a VTAM terminal” on page 242 have been met, CICS installs your terminal. It does this by creating a TCT terminal entry (TCTTE) using the model definitions defined in the group list, DFHLIST, and the terminal identifier returned by the autoinstall user program (DFHZATDX in this case).

If you are using a terminal defined in the CSD explicitly, and included in the group list specified in the startup job stream, CICS identifies the installed resource definitions by the VTAM net name, and creates the required TCTTE.

When you log onto CICS, your terminal can display a “good morning” message, by the transaction specified on the GMTRAN system initialization parameter. The default transaction, CSGM, displays the message shown in Figure 32 on page 250 as defined by the GMTEXT system initialization parameter.
Using CICS-supplied transactions through a terminal

After you have started CICS with the DFHIVPOL job, you can use the CICS-supplied transactions to try out various functions of CICS, to help you verify that CICS is working properly. You can use the transactions at a CICS terminal and, if you defined one, the system console.

Table 18 on page 251 shows some typical terminal interactions, including use of the CEMT transaction. For information about the CICS transactions that you can try with the DFHIVPOL job, and about the message-switching responses to those transactions, see the CICS Supplied Transactions manual.

</tr>
</tbody>
</table>

You may enter your CEMT input in either uppercase or lowercase, because the master terminal transaction translates all input to uppercase. Use the CLEAR key and the PF3 key as indicated.

If you enter the CETR transaction, CICS displays the status of the various trace options. The screen layout in Figure 33 on page 252 shows what the CETR display looks like. For information about the CETR transaction, and the other information panels available by using specified PF keys, see the *CICS Supplied Transactions* section.
You can alter the status of any of the trace options by overtyping the current value, indicated by `===>` on the CETR display.

### Using the CEDA transaction

When DFHIVPOL starts up CICS, it uses the unsuffixed SIT, DFHSIT. This system initialization table specifies GRPLIST=DFHLIST, causing all the CICS resource definitions that are needed for normal running to be installed. You can see which resources are included in DFHLIST by using the CEDA transaction. For example, `CEDA EXPAND LIST(DFHLIST)` gives a screen similar to that in Figure 34 on page 253.

Press PF8 to see the continuation of the list. If you started the DFHIVPOL job with your own group list specified instead of the DFHLIST group list, specify the name of your list in the CEDA EXPAND command. The CICS-defined groups all begin with DFH. For information about CEDA and the interactions for a typical sequence of CEDA commands, see the CICS Resource Definition Guide.

---

**Figure 33. Screen layout for the CETR transaction**

You can alter the status of any of the trace options by overtyping the current value, indicated by `===>` on the CETR display.
The DFHLIST group list does not include any of the sample applications groups, the group names of which all begin with DFH$. To use the sample programs, therefore, you must first install the resource definitions for the required samples. For example, to use the FILEA sample application:

1. Install the sample programs that are needed for the FILEA applications. You can do this by the command:
```
CEDA INSTALL GROUP(DFH$AFLA)
```

2. Make the FILEA data set available to CICS. You can do this by one of the following:
   - Install a FILE resource definition for the FILEA data set. You can do this by the command:
     ```
     CEDA INSTALL GROUP(DFH$FILA)
     ```
   - Provide a DD statement for the FILEA data set in your CICS startup JCL. For example,
     ```
     //FILEA DD DISP=SHR,DSN=CICSTS31.CICS.CICSHTH1.FILEA
     ```

To end the CEDA session, press PF3.

### Invoking and executing sample programs

To try the assembler-language version of the FILEA sample application, install group DFH$AFLA then enter the AMNU transaction.

For information about the CICS sample application programs, see [CICS 4.1 Sample Applications Guide](#).

### Using transactions from a console device

CICS transactions (other than CECl) can be invoked from a console device, and other CICS operators can communicate with the console operator. In particular, you
can use the console device for CICS master terminal functions, to control CICS terminals or to control several CICS regions in conjunction with multiregion operation. Normal operating-system use of the console device is not inhibited, and CICS supports multiple console devices where present.

**Notes:**
1. The CEDA transaction can be used from a console device only to INSTALL resource definitions.
2. The CECI transaction and the sample programs cannot be used from a console device.

If you issue the MVS command `d consoles`, this displays a list of console devices. This list identifies the console devices by name.

You can use a console device to submit MODIFY commands from your job stream if you define a console device in your CSD as CONSNAME(INTERNAL).

For further information about defining consoles, see "Defining an MVS console" on page 244. For further information about defining TSO users as consoles, see "Defining a TSO user as a console device" on page 245.

To enter a command, use:

```
{MODIFY|F}  jobname,'[command]' 
```

where:

**jobname**

is the region identifier for the CICS region. This is either the name of the job being used to execute CICS (for example, DFHIVPOL) or the name of a procedure if CICS was initiated as a started task.

**command**

is a string of data, starting with a CICS transaction identifier. If the transaction requires further input, the operator is prompted in the same way as any normal terminal operator. The message from CICS contains a reply number that must be quoted in the reply.

You can use the commands shown in Figure 35 on page 255 to verify the CEMT and CEOT transactions from the MVS console. (For information about these transactions, see the [CICS Supplied Transactions] manual.)

**Entering commands from TSO**

A TSO user can enter CICS commands as above after invoking the TSO command CONSOLE, in either of the following formats:

```
CONSOLE {MODIFY|F} cicsid,'[command]' 
```

When the TSO command CONSOLE is used, TSO checks the user for authority to issue console commands. Further, if console operator command security is active, the TSO user must be specifically authorized to issue MODIFY cicsid.

The TSO user can interact with an alternate CICS by using the command CONSOLE MODIFY altcics,CEBT.
You can also use TSO CLIST processing to issue sequences of CICS commands.

### Operator Input  System Response

- `f dfhivpol,'cemt i terminal'` Displays a list of terminals attached to CICS
- `f dfhivpol,'cemt i dump'` Displays status of transaction dump data sets
- `f dfhivpol,'cemt p statistics'` CICS writes statistics to SMF data sets
- `f dfhivpol,'cemt i ta'` Displays number and types of tasks currently running
- `f dfhivpol,'cemt p dump'` CICS invokes SDUMP macro for system dump to be taken
- `f dfhivpol,'cemt i prog(dfhpep)'` Displays details of DFHPEP module
- `f dfhivpol,'ceot'` Displays details of operator console
- `f dfhivpol,'cemt i journalname'` Displays status of CICS logs

*Figure 35. Using an MVS console for master terminal operations*

### Terminating CICS

To terminate CICS, enter: `CEMT P SHUT` from the VTAM terminal or MVS console. (This is a short form of `CEMT PERFORM SHUTDOWN`.) The system responds with message `DFH1713`, and those that follow, as shown in the sample job log shown on page 247.

### Verifying shared data tables support

To verify that the shared data tables function can be used, you can:

1. Start up a CICS region on which you have installed support for shared data tables.

   **Note:** To use shared data tables, you must install the following modules: `DFHDTsvc`, `DFHDTcv`, and `DFHMVRMS` in either an authorized system library in the MVS linklist (LNKLST concatenation of the MVS system) or in the LPA. When you install CICS, these modules are installed into the `hlq:SDFHLINK` library (which you should normally include in the MVS linklist).

2. Define and install a user-maintained data table.

3. Try a generic read command on your data table, using the `CECI` transaction. (Generic reads of user-maintained data tables are allowed only with shared data tables.) If shared data tables is operational, you should see a normal response. If shared data tables is not operational, you would see an `INVREQ` response.

   **Note:** This verification process uses user-maintained data tables throughout, because the behavior of CICS-maintained data tables is transparent to their users. For example, a normal response is returned for a generic read of a CICS-maintained data table, regardless of whether or not shared data tables is operational.

To verify that the cross-memory services of shared data tables are working:
4. Start up a second CICS region (the **requester**) that has an interregion communication (IRC) connection to the first CICS region (the **server**, which contains the user-maintained data table and source data set).

5. On the requester CICS region, do the following:
   a. Define and install a remote file referring to (associated with) the user-maintained data table on the server CICS region.
   b. Close the interregion communication connection between the two CICS regions so that function shipping is impossible; that is, only the cross-memory services of shared data tables can be used to access the shared data table from the requester CICS region. To close the connection, you can enter the command:

   ```
   CEMT SET IRC CLOSED
   ```
   To verify that function shipping cannot work, try a remote READ of a file (not a data table) on the server CICS region; you will get a SYSIDERR response.
   c. Try a generic read command on your data table, using the CECI transaction. If the cross-memory services of shared data tables can be used, you should see a normal response.

6. To restore interregion communication between the two CICS regions, open the connection again. To do this, you can enter the command:

   ```
   CEMT SET IRC OPEN
   ```

### Example verification of shared data tables

As an example verification test of shared data tables, the following steps were completed for the CICS shared data tables environment shown in [Figure 36 on page 257](#):

1. A CICS region, CICSIDC, was started. (CICSIDC is the server CICS region in this example.)

2. On CICSIDC, the following steps were completed:
   a. The user-maintained data table, MYSDT, was defined and installed. The MYSDT data table was based on the sample data set, `hlq.CICSIDC.FILEA`, installed on that region.
   b. The following generic READ command was entered at a terminal:

   ```
   CECI READ FILE(MYSDT) RIDFLD(00092) KEYLENGTH(5) GE GTEQ
   ```
   [Figure 37 on page 258](#) shows the initial response (LOADING), and [Figure 38 on page 258](#) shows the subsequent response when the command was repeated after the data table had completed loading.

The following steps were completed to verify the cross-memory services of shared data tables:

3. A second CICS region, CICSIDA, was started with support for shared data tables. (CICSIDA is the requester CICS region in this example.)
4. The following IRC connections and sessions were defined and installed on the associated CICS regions:

<table>
<thead>
<tr>
<th>Region</th>
<th>CONNECTION</th>
<th>SESSION</th>
</tr>
</thead>
<tbody>
<tr>
<td>CICSIDA</td>
<td>CICA</td>
<td>ATOC</td>
</tr>
<tr>
<td>CICSIDC</td>
<td>CICC</td>
<td>CTOA</td>
</tr>
</tbody>
</table>

See Figure 41 on page 260 and Figure 42 on page 261 for the parameters used for the CICA and ATOC resource definitions. The parameters for the CICC and CTOA resource definitions were similar.

5. On CICSIDA, the following steps were completed:

a. The file, REMSDT, was defined and installed as remote, referring to the MYSĐT data table on CICSIDC. See Figure 43 on page 261 for the parameters used for the REMSDT resource definition.

b. The file, REMFIL, was defined and installed as remote, referring to the FILEA sample file on CICSIDC.

c. The CEMT SET IRC CLOSED command was used to close the IRC connection to CICSIDC.

d. The following generic READ command was entered at a terminal:
   ```
   CECI READ FILE(REMFIL) RIDFLD(00092) KEYLENGTH(5)
   LENGTH(80) GE GTEQ
   ```
   Figure 39 on page 259 shows the response (SYSIDERR), because the remote file cannot be accessed by function-shipping. (This response would also be observed for the remote data table, REMSDT, if the IRC connection was closed.)

e. The following generic READ command was entered at a terminal:
   ```
   CECI READ FILE(REMSDT) RIDFLD(00092) KEYLENGTH(5)
   LENGTH(80) GE GTEQ
   ```
   Figure 40 on page 260 shows the response (NORMAL). This only works if MYSĐT is already open on CICSIDC, as achieved by step 2b on page 256.

Verifying the CICS-DBCTL interface

This section describes how to use the installation verification procedure, DFHIVPDB, which you can use to verify that the CICS-DBCTL interface can be used successfully.

Before you can run the DFHIVPDB job successfully, you must:

1. Tailor the DFHIVPDB job to your CICS and IMS environment.
   
   You can do this as part of the process of tailoring all CICS sample post-installation jobs, as described in Chapter 29, “Defining DL/I support,” on page 197. When you run the DFHISTAR job as part of the CICS installation process, the DFHIVPDB job is installed in the hlq.XDFHINST library.

   **Note:** Change the prefix of the IMS.SDFSRESL (previously called IMS.RESLIB) library in the DFHIVPDB job to the prefix that you use for your IMS libraries.

2. Create the data sets needed by the CICS region used by the DFHIVPDB job.
   
   To do this, you can tailor and run copies of the following CICS sample jobs:

   **DFHCOMDS**
   
   This job creates the CICS data sets common to all CICS regions.

   **DFHDEFDS**
   
   This job creates the data sets needed for each CICS region.
   
   When you run the DFHISTAR job as part of the CICS installation process, these jobs are installed in the hlq.XDFHINST library.

3. Run the IMS installation verification procedures, as outlined in “The IMS installation requirements for the DFHIVPDB job.”

The IMS installation requirements for the DFHIVPDB job

The DFHIVPDB job depends on you running the IMS installation verification procedures, as part of the INSTALL/IVP process described in the IMS Installation Guide. The following assumptions about the IMS INSTALL/IVP process are made:

1. The IMS sample database, DI21PART, has been successfully defined. This comprises two data sets:
   
   DI21PART
   
   DI21PARO

2. The DI21PART database has been loaded with the IMS-supplied sample data.

3. The following IMS-supplied procedures have been installed in an executable procedure library:

   ACBGEN
   
   PSBGEN

4. The sample DRA startup table, DFSPZPIV, has been built and installed in the IMS.SDFSRESL (previously called IMS.RESLIB).

5. The sample DBCTL system, IVP3, is available.

For information about installing IMS, the INSTALL/IVP process, and running the IMS IVPs, see the IMS Installation Guide.

The DFHIVPDB job steps

The DFHIVPDB job consists of the following job steps:
1. **GEN.** This step unloads the member DFH$DBAN from the hlq.SDFHSAMP library into a temporary sequential data set called CARDIN. This member contains the transactions to invoke the assembler versions of the DL/I sample applications that CICS reads from CARDIN as soon as initialization is complete.

   **Note:** The sequential data set CARDIN is defined in the sample terminal control table, DFHTC5$, as a simulated terminal.

   The COBOL version, DFH$DBCB, and the PL/I version, DFH$DBPL, of the sample DL/I transactions are also in the hlq.SDFHSAMP library. If you want to run the COBOL or PL/I versions, modify this job step to load CARDIN with the appropriate member.

   Output generated by the transactions is sent to a similar device – a sequential data set defined as PRINTER.

2. **CICS.** This job step executes the DFHSTART procedure to start up CICS, with the CICS-supplied resource group list DFH$IVPL. CICS attempts to connect to the DBCTL system IVP3, run the sample DL/I transactions, and then shutdown the CICS region.

   **Note:** If the DBCTL system, IVP3, is not running, the sample DL/I transactions will abend.

If you want to examine the sample members used by this IVP, here is a list of them, and where you can find each one:

**DFHIVPDB**

This IVP contains some explanatory comments, and was installed in the hlq.XDFHINST library when you ran the DFHISTAR job. For details of the DFHISTAR job, see Chapter 27, “Tailoring the CICS-supplied skeleton jobs,” on page 185.

**DFH$SIP5**

This is the member of the hlq.SYSIN data set that contains the system initialization parameter overrides specific to the DFHIVPDB job.

   **Note:** You will probably want to specify other system initialization parameters (for example, APPLID, CICSSVC, and DFLTUSER) for the DFHIVPDB job; the DFH$SIP5 member of the hlq.SYSIN data set is a convenient place to do so.

**DFHTC5$**

This is the sample TCT that specifies the sequential devices that CICS uses in this IVP as a simulated terminal, with a terminal name of SAMA. The source statements are in the member, DFH$TCTS, of the hlq.SDFHSAMP library.

**Running the DFHIVPDB job**

Before submitting the DFHIVPDB job, run the DFHRMUTL program, as shown below, to reset the global catalog control record to perform an INITIAL start on the next CICS startup.

```plaintext
//DFHRMUTL JOB 24116475,'DFHRMUTL',
//   CLASS=A,MSGCLASS=H,NOTIFY=userid
//-----------------------------------------------------------------------
//**  RESET GLOBAL CATALOG CONTROL RECORD TO INITIAL START  **
//-----------------------------------------------------------------------
//DFHRMUTL EXEC PGM=DFHRMUTL,REGION=1M
//STEPLIB DD DSN=CICSTS31.CICS.SDFHLOAD,DISP=SHR
//SYSPRINT DD SYSOUT=* 
```

Chapter 35. Running the installation verification procedures  263
When you are satisfied that you have made all the necessary preparations, and that all the prerequisite jobs have been run, submit the DFHIVPDB job. The job loads the DL/I transactions into CARDIN. CICS reads the transactions, and sends the output to the PRINTER sequential data set.

Notes:

1. The first transaction copied from the DFH$DBAN member of the hlq.SDFHSAMP library to CARDIN is CDBC CONNECT SUFFIX(IV). This connects CICS to DBCTL, using the sample DRA startup table, DFSPZP IV.

2. The final transaction copied from the DFH$DBAN member of the hlq.SDFHSAMP library to CARDIN is CEMT PERFORM SHUT. If you want to use some commands online before CICS shuts down, then delete the CEMT command before you run the job. You will then be able to issue CEMT, CEDA and other CICS-supplied transactions, and initiate a shutdown either from a CICS terminal or through an MVS console. If you want to communicate with CICS through an MVS console, you must define a console to CICS before you start DFHIVPDB, as described in "Defining an MVS console" on page 244. If you want to enter MODIFY commands from terminals connected to TSO, you must define the TSO users as console devices, as described in "Defining a TSO user as a console device" on page 245.

A sample job log from a run of the DFHIVPDB job is given in Figure 44. The results you get from the transaction processing should be similar to those shown in Figure 44, Figure 45, and Figure 46.

Figure 44. Sample job log output from the DFHIVPDB job (Part 1 of 3)
Figure 44. Sample job log output from the DFHIVPDB job (Part 2 of 3)
The DFHIVPDB job uses the unsuffixed SIT, DFHSIT, as used by all the CICS IVPs. It also uses some system initialization parameters included in the DFH$SIP5 member of the SYSIN data set, to override the parameters in DFHSIT. Further, the DFH$SIP5 member was edited to specify other system initialization parameters to create the DFHIVPDB job log shown. For information about these extra system initialization parameters used by the IVP jobs, see page 231.

If you want COBOL, C, C++ and PL/I languages, remove the comment marks from the SCEERUN and SCEERUN2 libraries, and increase the memory size for the job.

You should see messages similar to those in Figure 45 at the end of the MSGUSER section of the job output.

Figure 44. Sample job log output from the DFHIVPDB job (Part 3 of 3)

**Note:**

1. The DFHIVPDB job uses the unsuffixed SIT, DFHSIT, as used by all the CICS IVPs. It also uses some system initialization parameters included in the DFH$SIP5 member of the SYSIN data set, to override the parameters in DFHSIT. Further, the DFH$SIP5 member was edited to specify other system initialization parameters to create the DFHIVPDB job log shown. For information about these extra system initialization parameters used by the IVP jobs, see page 231.

Figure 45. Sample job log output from the end of the MSGUSER section of the DFHIVPDB job

You should see messages similar to those in Figure 46 on page 267 in the Printer section of the job output.
Testing the CICS-DB2 environment

This section outlines how you can test the CICS-DB2 environment. It uses Phase 5 of the DB2 installation verification procedure. It is intended as an overview of what is involved, and what you would expect to see.

To use the DB2 installation verification procedure, and Phase 5 in particular, see the *IBM DATABASE 2 Administration Guide*. That publication gives the latest information about the procedure, and describes the steps involved in much more detail.

Run DB2 jobs DSNTEJ5C and DSNTEJ5P

To prepare the sample applications to be used in a CICS-DB2 environment, run the jobs DSNTEJ5C and DSNTEJ5P supplied with DB2.

Job DSNTEJ5C installs the sample application transactions in COBOL and prepares the organization application. Job DSNTEJ5P installs the transactions in PL/I and prepares the organization, project, and phone applications.

Both these jobs perform the following functions:
- Compile and link-edit the CICS online applications.
- Bind the CICS online applications.
- Create the BMS maps for the online applications.

Starting a DB2 organization or project application

After logging on to CICS, you can start an organization or project application by entering one of the following CICS transaction codes:
- D8PP, which starts the PL/I project version
- D8PS, which starts the PL/I organization version
- D8CS, which starts the COBOL organization version

If you enter one of these transaction codes, the panels shown in Figure 47 on page 268 or Figure 48 on page 268 are displayed.
For detailed information about running the organization and project applications, see the *IBM DATABASE 2 Administration Guide*.

**Starting the DB2 phone application**

To start the phone application, clear the screen and type in the transaction code D8PT. You can change the transaction codes when you install DB2. Check with your system administrator to find out if they have been changed from those shown.

**Running the EJB "Hello World" sample**

You are recommended to include running the EJB "Hello World" sample in your Installation Verification procedures.

For a description of this procedure, see the *Java Applications in CICS* manual.
This part describes the processes and procedures you should follow to install CICSPlex SM. It contains the following chapters:

- Chapter 36, “CICSPlex SM setup checklist and worksheets,” on page 271.
- Chapter 37, “Setting up the MVS environment,” on page 281.
- Chapter 38, “VTAM requirements,” on page 289.
- Chapter 39, “Generating post-installation members,” on page 297.
- Chapter 40, “Creating and managing CICSPlex SM data sets,” on page 299.
- Chapter 41, “Upgrading the CSD and macro definitions,” on page 307.
- Chapter 42, “Preparing user access to CICSPlex SM,” on page 313.
- Chapter 43, “Setting up a coordinating address space (CAS),” on page 315.
- Chapter 44, “Setting up a CICSPlex SM address space (CMAS),” on page 321.
- Chapter 45, “Setting up a CICS managed application system (MAS),” on page 333.
- Chapter 46, “Setting up a CICSPlex SM Web User Interface server,” on page 341.
- Chapter 47, “Configuring the Starter Set,” on page 361.
- Chapter 48, “Applying service to CICSPlex SM,” on page 371.
- Chapter 49, “Using the EYUINST EXEC to tailor skeleton jobs,” on page 373.
- Chapter 50, “CICSPlex SM system parameters,” on page 383.
- Chapter 51, “CMAS journaling,” on page 397.
- Chapter 52, “Preparing to use the IPCS tools,” on page 401.
Chapter 36. CICSPlex SM setup checklist and worksheets

This chapter contains the following aids to your installation and setup procedures:

Checklist
To use as a guide to your progress as you set up or revise the configuration of your IBM CICSPlex System manager (CICSPlex SM) components. The checklist is for use with a CICS Transaction Server (or a CICS/ESA) system (referred to as an MVS system) and all of the components you can install on it.

Some of the items on the MVS checklist need be performed only once for your CICSPlex SM environment, while others must be performed once for each component. See the ‘Where to get information’ column for a reference to information about how to perform each task.

The order of items in the checklist is a suggested order for performing the installation and setup steps. However, you may find that, particularly if you are modifying your CICSPlex SM environment, a different order is more practical.

Worksheets
To use as a record of the names and locations of components and data sets. The worksheets can be copied as you need.

The worksheets contain, in some cases, more than one line for a type of CICSPlex SM component. You may have fewer or more than shown of that type of component.

A worksheet is provided for each of the following CICSPlex SM system components:
- The CICSPlex SM system
- A CAS
- A CMAS
- A local MAS

The checklist and worksheets are also provided on the tape on which CICSPlex SM is delivered to you. They are loaded onto your system and available in the library CICSTS31.CPSM.SEYUINST.

Table 19 lists the members by name and content. You can edit these members, filling in the information specific to your CICSPlex SM environment, so that you have an online record of the information you need about that environment.

Table 19. Checklist and worksheets in CICSTS31.CPSM.SEYUINST

Chapter 37. Setting up the MVS environment

This chapter describes the tasks you need to perform to ensure that your MVS environment is correctly defined to support CICSPlex SM. These tasks are as follows:

- “Noting IEASYSxx values”
- “Updating IEASYSxx (CMAS)” on page 282
- “Updating IEASYSxx (CAS)” on page 282
- “Updating the MVS linklist” on page 284
- “Preparing to use the CICSPlex SM API” on page 284
- “Installing CICSPlex SM modules into the LPA” on page 287

Noting IEASYSxx values

Some of the MVS initialization values located in an IEASYSxx member of the SYS1.PARMLIB library are referenced during installation of the CAS and other CICSPlex SM address spaces.

Access the IEASYSxx member of the SYS1.PARMLIB library used to initialize your MVS system and make note of the values assigned to the following parameters:

- **APF=** Completes the name of the parmlib member (IEAAPFx) that contains authorized library names.
- **CMD=** Completes the name of the parmlib member (COMMNDxx) that contains commands to be issued internally during master scheduler initialization.
- **LNK=** Completes the name of one or more parmlib members (LNKLSTxx) that contain names of data sets that are to be concatenated to SYS1.LINKLIB.
- **LNKAUTH=** Specifies whether all data sets in the LNKLST concatenation are to be treated as APF authorized or whether only those that are named in the APF table are to be treated as APF authorized.
- **LPA=** Completes the name of one or more parmlib members (LPALSTxx) that are concatenated to SYS1.LPALIB for the purpose of building the pageable LPA (PLPA and extended PLPA).
- **MAXCAD=** Specifies the maximum number of SCOPE=COMMON data spaces to be allowed during an IPL.
- **MAXUSER=** Specifies a value that the system uses (along with the RSVSTRT and RSVNONR parameter values) to limit the number of jobs and started tasks that the system can run concurrently during a given IPL.
- **NSYSLX=** Specifies the number of linkage indexes (LXs), in addition to those in the system function table, to be reserved for system linkage indexes (LXs).
- **PROG=** Completes the name of the parmlib member (PROGxx) that contains authorized library names when a dynamic APF list is being used.
RSVNONR= Specifies the number of address space vector table (ASVT) entries to be reserved for replacing those entries marked nonreusable for the duration of an IPL.

RSVSTRT= Specifies the number of ASVT entries to be reserved for address spaces created in response to a START command.

SMF= Specifies a parmlib member (SMFPRMxx) from which SMF will obtain its parameters.

You should examine the SMFPRMxx member of SYS1.PARMLIB and note the SID() value that identifies the system that will run the CAS.

SYSNAME= Specifies the name of the system being initialized.

For more information about these parameters, see the MVS Initialization and Tuning Reference manual.

Updating IEASYSxx (CAS)

In every MVS/ESA image that contains a CAS, you need to verify that the IEASYSxx member of the SYS1.PARMLIB library that you use for MVS initialization includes the parameters:

NSYSLX=nnn

Set or increase the value to include the minimum number of linkage indexes (LXs) required by CICSPlex SM. Because two LXs are required for the CAS and one LX is needed for the ESSS, the minimum number of LXs required for use by CICSPlex SM is 3.

If you are also setting up a CMAS, refer to Updating IEASYSxx (CMAS) for information about additional parameters.

For additional information about these parameters, see the MVS Initialization and Tuning Reference manual.

Updating IEASYSxx (CMAS)

In every MVS/ESA image that contains a CMAS, you need to verify that the IEASYSxx member of the SYS1.PARMLIB library that you use for MVS initialization includes the parameters:

MAXCAD=nnn

Set or increase the value to include the number of common MVS data spaces that are needed for each CMAS. Each CMAS needs a minimum of 6 common MVS data spaces. When setting the MAXCAD limit, allow for 6 common MVS data spaces per CMAS, in addition to any common data spaces that may be in use by other products.

NSYSLX=nnn

Set or increase the value to include the minimum number of linkage indexes (LXs) that are required by CICSPlex SM. Because two LXs are required for the CAS and one LX is needed for the Environment Services System Services (ESSS), the minimum number of LXs required for use by CICSPlex SM is 3.
Note: This parameter may already have been defined when you set up the CAS. (See "Updating IEASYSxx (CAS)" on page 282.)

For additional information about these parameters, see the MVS Initialization and Tuning Reference manual.

Authorizing libraries

In each MVS image containing a CAS and CICSPlex SM address space (CMAS), you must change the appropriate IEAAPFxx or PROGxx member of the SYS1.PARMLIB library to authorize CICSPlex SM libraries.

The libraries to be authorized in the IEAAPFxx or PROGxx member are:

**CICSTS31.CPSM.SEYUAUTH**
Needed to run a CAS

**SYS1.CICSTS31.CPSM.SEYULINK**
The link list data set, needed to run a CMAS (For more information about adding this data set, see “ Updating the MVS linklist” on page 284.)

If your operating system uses the parameter

```
LNKAUTH=LNKLST
```

(which is the default), you do not need to authorize the SYS1.CICSTS31.CPSM.SEYULINK library now.

**SYS1.CICSTS31.CPSM.SEYULPA**
The link pack area data set, optionally used for managed application system (MAS) LPA modules.

If you are adding the data set names to the IEAAPFxx member, the format of each entry is:

```
dsname volser
```

where dsname is the name of one of the CICSPlex SM libraries listed above and
volser is the volume serial number of the volume on which the data set is located.

If you are adding the data set names to the PROGxx member, the format of each entry is:

```
APF ADD DNAME(dsname) VOLUME(volser)
```

where dsname is the name of one of the CICSPlex SM libraries listed above and
volser is the volume serial number of the volume on which the data set is located.

For additional information about adding entries to IEAAPFxx and PROGxx, see the MVS Initialization and Tuning Reference manual. If you are running with a static APF list, you must re-IPL MVS in order for authorization to take effect.

You should use RACF (or another external security manager) to protect the CICSTS31.CPSM.SEYUAUTH, SYS1.CICSTS31.CPSM.SEYULPA, and SYS1.CICSTS31.CPSM.SEYULINK libraries, as described in the CICS RACF Security Guide.
Updating the MVS linklist

Depending on what components of CICSPlex SM you plan to run in an MVS image, ensure that the following required modules reside in an authorized library in the MVS linklist. These modules are supplied in the SYS1.CICSTS31.CPSM.SEYULINK library.

**EYU9X310**  
In each MVS image that contains a CMAS. EYU9X310 is the initialization module for the ESSS. This CICSPlex SM component provides a system address space that is started by the first CMAS to be initialized in the MVS image after an IPL. For additional information about the ESSS, see [CICSPlex System Manager Problem Determination](#) book.

**EYU9A310**  
In each MVS image that contains a CMAS where you wish to run the CICSPlex SM API. EYU9A310 is the CICSPlex SM API subtask module.

These modules are release specific and are not compatible with earlier versions. If you plan to run multiple releases of CICSPlex SM on the same MVS image, you must have the equivalent modules specific to the releases you are running.

**Note:** For information on additional modules that can be placed in the MVS linklist and if you plan to use the CICSPlex SM API, see [Preparing to use the CICSPlex SM API](#).

To add one or more of these modules to an authorized library in the linklist, perform one of the following actions:

- Add the appropriate modules to an authorized library that is already in the linklist.
- Add the SYS1.CICSTS31.CPSM.SEYULINK library to the linklist by identifying the library in a LNKLSTxx member of the SYS1.PARMLIB library.

You should use RACF (or another external security manager) to protect the SYS1.CICSTS31.CPSM.SEYULINK library, as described in the [CICS RACF Security Guide](#).

Preparing to use the CICSPlex SM API

In each MVS image that contains a CMAS where you plan to run the CICSPlex SM API, ensure that the following required modules reside in the proper location. These modules are supplied in the SYS1.CICSTS31.CPSM.SEYUAUTH library.

**EYU9AB00**  
In either the MVS linklist or the STEPLIB concatenation of the application that calls the API. EYU9AB00 is the API batch interface module.

**EYU9XESV**  
In an authorized library in either the MVS linklist or the CMAS STEPLIB concatenation. EYU9XESV is the API security exit module.

In addition, any application that calls the API must be link-edited with one of the following stub routine modules, regardless of what programming language is used:
EYU9ABSI
For batch, TSO, or NetView programs. EYU9ABSI is supplied in the SYS1.CICSTS31.CPSM.SEYUAUTH library.

EYU9AMSI
For application programs running in CICS. EYU9AMSI is supplied in the SYS1.CICSTS31.CPSM.SEYULOAD library.

Installing the REXX function package
The REXX run-time interface to the API is supplied as a function package and host command environment. The interface consists of a single load module that contains two entry points:

EYU9AR00 The function package
EYU9AR01 The host command

EYU9AR00 is supplied in the SYS1.CICSTS31.CPSM.SEYUAUTH library with an alias of IRXFLOC.

For a REXX program to access the function package, the module EYU9AR00, along with its alternate entry point, EYU9AR01, and its alias, IRXFLOC, must reside in an authorized library in one of these places:
• The MVS linklist
• The STEPLIB concatenation of the application that calls the API.

For a REXX program to access the function package from NetView, the EYU9AR00 module must also be aliased to DSIRXLFP and placed in an authorized library in either the MVS linklist or the STEPLIB concatenation for the NetView system.

Note: Users of the CICSPlex SM run-time interface are subject to the normal CICSPlex SM API security checks. See the information in the CICS RACF Security Guide.

The following members contain SMP/E user modification control statements that you can use to move the necessary API load modules to the SYS1.CICSTS31.CPSM.SEYULINK library. These members are supplied in CICSTS31.CPSM.SEYUSAMP.

<table>
<thead>
<tr>
<th>Member</th>
<th>Load module</th>
</tr>
</thead>
<tbody>
<tr>
<td>EYU$UM11</td>
<td>EYU9AR00</td>
</tr>
<tr>
<td>EYU$UM12</td>
<td>EYU9AB00</td>
</tr>
<tr>
<td>EYU$UM13</td>
<td>EYU9XESV</td>
</tr>
</tbody>
</table>

If you use the IRXFLOC or DSIRXLFP aliases to provide access to the REXX function package, they must be placed ahead of any other IRXFLOC or DSIRXLFP modules in the STEPLIB (or MVS linklist) concatenation.

If you do not want to use the aliases for the REXX function package, you must modify your REXX parameter modules (IRXPARMS, IRXTSPRM, and IRXISPRM). If you do this, the following is recommended:
• The function package supplied by CICSPlex SM should be added as a System function package, rather than a Local or User function package.
• A new host command entry like the following should be added:
  – An 8-byte Command Environment name of ‘CPSM ’
  – An 8-byte Command Routine name of ‘EYU9AR01’
As the last step in installing the REXX function package, you must:

- Increase the number of entries in the appropriate function package table.
- Add an entry to that table for EYU9AR00.

For more information about REXX function packages and host commands, see the TSO/E Version 2 REXX/MVS Reference book.

---

**Using CICSPlex SM modules in the MVS link pack area**

The benefits of using the MVS link pack area (LPA) are:

- **Sharing** – modules in the LPA can be shared by two or more CICS regions in the same MVS image, giving an overall reduction in the total working set.
- **Integrity** – the LPA is page-protected, even against key 0 programs, so all modules placed there are automatically protected against overwriting by other programs such as CICS applications. (This integrity feature applies equally to a single CICS system within the processor.)

Every CICSPlex SM module installed in the LPA can be used only by the release of CICSPlex SM to which it relates.

CICSPlex SM supplies prebuilt SMP/E USERMODs as members in the CICSTS31.CPSM.SEYUSAMP library. The USERMOD is:

```plaintext
EYU$UM01 - Local MAS modules
```

These USERMODs contain ++MOVE statements for each module that is eligible for the extended link pack area (ELPA). A read-only module that may reside above 16MB is eligible for the ELPA.

CICSPlex SM allocates an empty library for your use, called SYS1.CICSTS31.CPSM.SEYULPA. You can use SYS1.CICSTS31.CPSM.SEYULPA as the LPA library or you can add the modules to another LPA library.

If you are going to use SYS1.CICSTS31.CPSM.SEYULPA, verify that you have already authorized this library (see [Authorizing libraries](#) on page 283), and that you have applied appropriate security (see the [CICS RACF Security Guide](#)). You can give the SYS1.CICSTS31.CPSM.SEYULPA library your own high-level index. If you do, you must specify the new index on the LINDEX parameter of the EYUISTAR job.

The following sections provide information about:

- Space requirements
- Installing CICSPlex SM modules into the LPA
- Controlling the use of modules from the LPA
- Applying maintenance to LPA modules.

---

**Space requirements**

You must allow enough space in the link pack area for the installation of the selected CICSPlex SM modules.

The total space needed depends on how the modules are packaged into the link pack area by the operating system and a local MAS requires approximately 2 034KB.
Installing CICSPlex SM modules into the LPA

The term install means move or copy a module into the SYS1.CICSTS31.CPSM.SEYULPA library, by using SMP/E, or by using a copying method that reblocks the copied modules when the target data set has a smaller block size than the data set you are copying from (for example, use the COPYMOD function of the IEBCOPY program). The procedure for installing modules in the LPA by using SMP/E is described in this section.

You should not relink-edit the modules in order to get them into the SYS1.CICSTS31.CPSM.SEYULPA library. CICSPlex SM modules, as supplied, have the necessary attributes that cause MVS to load them automatically above 16MB (into the ELPA).

The MVS link pack area has both pageable and fixed areas. Although you can install CICSPlex SM modules into the fixed areas, for performance reasons you should use the pageable areas.

Modules to be loaded into the MVS pageable link pack area (PLPA) must have been link-edited with the RENT attribute. The library in which these modules reside must be named in an LPALSTxx member of the SYS1.PARMLIB library.

To install modules in the CICSPlex SM LPA library, and to ensure that SMP/E can continue to service them, complete the following steps for one or both of the CICSPlex SM-supplied USERMODs:
1. Receive the USERMOD into the CICSPlex SM global zone, and apply it to the CICSPlex SM target zone.
2. Define the SYS1.CICSTS31.CPSM.SEYULPA library to your MVS.

Note: You must also verify that the CSD referenced by the MAS contains the appropriate CICSPlex SM groups for loading modules from the LPA. For information about updating the CSD, see "Updating CSD files using DFHCSDUP (MVS MAS)" on page 311.

Receiving and applying the USERMOD

To receive and apply the CICSPlex SM-supplied USERMOD, in EYU$UM01, you can use the sample job EYULPMOD, which is tailored to your CICSPlex SM environment and stored in the CICSTS31.CPSM.XEYUINST library when you run the EYUISTAR job. Member EYULPMOD must be edited to receive and apply the desired USERMODs. Ensure that the EYUISTAR settings match the corresponding DFHISTAR settings.

Receive the USERMOD into the CICSPlex SM global zone and apply it to the CICSPlex SM target zone. This causes SMP/E to move those load modules you have specified from the named CICSPlex SM target library (either CICSTS31.CPSM.SEYUAUTH or CICSTS31.CPSM.SEYULOAD) into the SYS1.CICSTS31.CPSM.SEYULPA library.

When the USERMOD is applied, the corresponding LMOD entries within the target zone SMP CSI are updated. Either or both USERMODs may be applied depending on your enterprise's requirements.

Do not accept the USERMOD into the distribution zone, and, for the time being, do not apply it to any other target zone.
Defining the SYS1.CICSTS31.CPSM.SEYULPA library to your MVS
Add the full name of the SYS1.CICSTS31.CPSM.SEYULPA library to an LPALSTxx member of SYS1.PARMLIB. This ensures that the library contents are loaded into the PLPA at the next IPL of your system when CLPA is specified.

When you have defined the SYS1.CICSTS31.CPSM.SEYULPA library to MVS, you should re-IPL your MVS with CLPA specified to enable the modules in the SYS1.CICSTS31.CPSM.SEYULPA library to be used from the LPA.

To run DFCSDUP to add the CICSPlex SM resource definitions required for MAS execution, use the following SYSIN control statement:

```bash
//SYSIN DD *
UPGRADE USING(EYU9XXGB)
/*
```

Applying maintenance to LPA modules
Use the SMP/E RESTORE function to back off the USERMOD before modules in the LPA are updated or copied. Afterwards, the USERMOD may be reapplied.
Chapter 38. VTAM requirements

This chapter describes the VTAM requirements for each CAS, CMAS, and MAS used by CICSPlex SM.

Defining VTAM requirements (CAS)

ACF/VTAM definitions are required, if you are not using the cross-systems coupling facility (XCF) for CAS-to-CAS communication links, to identify each CAS used by CICSPlex SM. This involves creating VTAM application definitions and, optionally, cross-domain resource management definitions.

If you are also setting up a CMAS, see “Defining VTAM requirements (CMAS)” on page 293 for more information about the steps for defining the VTAM requirements for a CMAS.

To create VTAM application definitions and cross-domain resource management definitions for a CAS, you must perform the following steps:

1. Optionally, create a mode table entry.
2. Create a VTAM application definition for each CAS you will be using.
3. Define each CAS as a cross-domain resource.
4. Add the application and cross-domain resource definitions to the VTAM configuration list.
5. Activate the definitions.

Depending on your VTAM conventions, you may need to modify the procedures described in this section. Specifically:

- Change references to the SYS1.VTAMLST library if you do not keep your definitions in the default VTAM list.
- Modify the APPL and CDRSC statements if you want to add these statements to existing members, rather than create new ones.

After you have the CAS running and can access CICSPlex SM, you can define VTAM to CICSPlex SM. (See “Setting the CAS system communication information” on page 318.)

Step 1: (Optional) Creating a mode table

If you use Network Control Programs (NCPs), you may need to create a mode table with the default entry shown in Figure 49 on page 290 in order to control the VTAM RUSIZES (request unit size) parameter. If you do not create a default entry, VTAM could select a number that is too small, thus resulting in considerable system overhead.

To create a default mode table entry:
1. Define a mode table containing the following entry:
Figure 49. Sample mode table entry

where:

modename  Is a mode table name that you supply.
entryname  Is a name for an entry that you supply.

For a copy of this mode table entry, see the member EYUSMPMT in CICSTS31.CPSM.SEYUSAMP.

2. Assemble the mode table source and link-edit it into SYS1.VTAMLIB on all systems for which cross-system communication is enabled. As you do so, keep the following in mind:
   • The name you assign to the load module becomes the name of the mode table.
   • You must have access to the macro library used to assemble VTAM applications.

The JCL you use to assemble and link-edit should look like that shown in [Figure 50 on page 291](#). (The member EYUSCLMT in CICSTS31.CPSM.SEYUSAMP contains a copy of this JCL.)
Step 2: Creating a VTAM application definition (CAS)

To establish a VTAM application definition for a CAS, either create a new member (major node) or access an existing member in the SYS1.VTAMLST library. To this member, add the following APPL statement:

```
VBUILD TYPE=APPL
name APPL ACBNAME=acbname,AUTH=(ACQ), x
       PARSESS=YES,MODETAB=mode_table
```

where:

- **name** is a 1- to 8-character unique name.
- **acbname** is the node name of this CAS. This name must be unique within the domain. If you omit this parameter, the name of the VTAM APPL statement is used.
- **mode_table** is the name of the mode table that is to govern LU 6.2 conversations.

For example, to create a VTAM application definition for the CAS on SYSA, you might create a member named APPLCASA in the SYS1.VTAMLST library that contains the APPL statement:

```
Step 3: Defining cross-domain resources (CAS)

You should define cross-domain resources (CDRSCs) when:

- A CAS that is to communicate with another CAS cannot take advantage of dynamically defined CDRSCs.
- You want to minimize the overhead involved in using dynamically defined CDRSCs.

To establish a CDRSC definition, you must either create a new member or access an existing member in the SYS1.VTAMLST library. In the new or existing member, specify the following CDRSC statement for each CAS with which you want to communicate:

```
VBUILD TYPE=CDRSC
name  CDRSC CDRM=cdrm
```

where:

- **name** is the name you assigned to a CAS in Step 1.
- **cdrm** is the name of the MVS image previously identified as the cross-domain resource manager (CDRM).

For example, to allow the CAS on SYSA to communicate with the CASs on SYSB and SYSC, you might create the member CDRCASA on the SYS1.VTAMLST library, which contains the CDRSC statements:

```
VBUILD TYPE=CDRSC
CASB  CDRSC CDRM=VTAMB
CASC  CDRSC CDRM=VTAMC
```

where VTAMB and VTAMC are the cross-domain resource manager names assigned to SYSB and SYSC, respectively. The same types of definitions are also needed for the CASs on SYSB and SYSC. That is, for the CAS on SYSB, you might create a member named CDRCASB that contains:

```
VBUILD TYPE=CDRSC
CASA  CDRSC CDRM=VTAMA
CASC  CDRSC CDRM=VTAMC
```

For additional information about cross-domain resources, see the VTAM Resource Definition Reference.

Step 4: Updating the configuration list (CAS)

If, in step 2 or 3, you created new members in the SYS1.VTAMLST library, you must update the VTAM configuration list for each MVS image. This causes the new members to be automatically activated when VTAM starts.

To do this, add the new member names to the end of the configuration list in the appropriate ATCCONxx member of the SYS1.VTAMLST library. To find the suffix of the ATCCONxx member, do the following:

- Get the suffix of the COMMNDxx member from the CMD= parameter in the IEASYSxx member in SYS1.PARMLIB.
Get the suffix of the ATCSTRxx member from the LIST= parameter on the command used to start VTAM in the COMMNDxx member in SYS1.PARMLIB, or (if you do not start VTAM from the COMMNDxx member) get the suffix from the LIST= parameter of the command that you use to start VTAM.

Get the suffix of the ATCCONxx member from the CONFIG= parameter in the ATCSTRxx member in SYS1.VTAMLST.

To illustrate, the examples shown in steps 2 and 3 assume the creation of members named APPLCASA and CDRCASA. To add these members to the end of the configuration list in ATCCONxx, you would specify:

```
APPLCASA,
CDRCASA
```

**Note:** If you added the CAS and cross-domain definitions to existing members, ATCCONxx should already contain these member names.

### Step 5: Activating the major nodes (CAS)

You can activate the definitions created in steps 1 and 2 by either restarting VTAM for each system, or manually activating the definitions.

To manually activate a major node, you can issue the following commands, where `name` identifies a major node created (or modified) in steps 2 and 3:

- Deactivate the major node if it is currently active by issuing the command:
  ```
  VARY NET,INACT,ID=name
  ```
- Activate (or reactivate) the major node by issuing the command:
  ```
  VARY NET,ACT,ID=name
  ```

To ensure that the major node has been activated, issue the command:

```
D NET,ID=name
```

For example, to activate the member APPLCASA and then ensure that it has been activated, you would issue the commands:

```
VARY NET,INACT,ID=APPLCASA
VARY NET,ACT,ID=APPLCASA
D NET,ID=APPLCASA
```

To dynamically load a mode table that you have updated, issue the command:

```
F NET,TABLE,OPTION=LOAD,NEWTAB=name
```

If you do not do this after updating and relinking a mode table with a new logmode entry, the entry is unavailable until you have stopped and restarted VTAM. Note that you do not need to issue this command when you create a mode table with a single logmode entry.

The preceding steps need to be performed for each CAS you may be using.

---

### Defining VTAM requirements (CMAS)

ACF/VTAM definitions are required to identify each CMAS used by CICSPlex SM. This involves creating VTAM application definitions and, optionally, cross-domain resource management definitions.
Note: You may already have defined the VTAM requirements for a CAS (see "Defining VTAM requirements (CAS)" on page 289). The steps for defining the VTAM requirements for a CMAS are different.

To create VTAM application definitions and cross-domain resource management definitions for a CMAS, you must perform the following steps:

1. Create a VTAM application definition for each CMAS you will be using.
2. Define each CMAS as a cross-domain resource.
3. Add the application and cross-domain resource definitions to the VTAM configuration list.
4. Activate the definitions.

Notes:

1. Before you perform these steps, be sure to specify the size of the VTAM buffers.
   - For the VTAM-to-NCP connection, specify MAXDATA ≥ 4096
   - For the NCP-to-VTAM connection, specify MAXBFRU * IOBUF ≥ 4096
     MAXBFRU * UNITSZ ≥ 4096
   - For the NCP-to-NCP connection, specify TRANSFR * BFRS = RUSIZE ≥ 4096

   The size specified should be 36 bytes less than the smallest MAXDATA value in any NCP through which the link may pass. The 36 bytes allow for the headers that are required for VTAM. For more information about the requirements for the VTAM-to-NCP connection, refer to the VTAM Resource Definition Reference manual for your level of VTAM. For more information about the requirements for the NCP-to-VTAM and the NCP-to-NCP connections, refer to the NCP Resource Definition Reference manual for your level of NCP.

   If you need help determining or modifying your VTAM buffer specifications, confer with the VTAM system programmer at your enterprise.

2. Depending on your VTAM conventions, you may need to modify the procedures that are described in this section. Specifically:
   - Change references to the SYS1.VTAMLST library if you do not keep your definitions in the default VTAM list.
   - Modify the APPL and CDRSC statements if you want to add these statements to existing members, rather than create new ones.

Once CMAS is running, you can access CICSPlex SM and define VTAM to CICSPlex SM. (See "Setting the VTAM APPLID for a CMAS" on page 330.)

Step 1: Creating a VTAM application definition (CMAS)

To establish a VTAM application definition for a CMAS, either create a new member (major node) or access an existing member in the SYS1.VTAMLST library. Then add the following APPL statement:

```
VBUILD TYPE=APPL
name      APPL ACBNAME=acronym,AUTH=(VPACE,ACQ,SPO,PASS),
EAS=10,PARSNESS=YES,SONSCIP=YES,APPC=NO,
VPACING=number
```

where:
name Is a 1- to 8-character unique name.

acbnname Is the node name of this CMAS. This name must be unique within the domain. If you omit this parameter, the name of the VTAM APPL statement is used.

vpacing Is the maximum number of normal-flow requests that another logical unit can send on an intersystem session before waiting to receive a pacing response. Start with a value of 5.

For example, to create a VTAM application definition for the CMAS on SYSA, you might create a member (APCMAS1) in the SYS1.VTAMLST library that contains the APPL statement:

```
VBUILD TYPE=APPL
CMS1 APPL ACBNAME=CMS1, AUTH=(VPACE, ACQ, SPO, PASS),
      EAS=10, PARSESS=YES, SONSCIP=YES, APPC=NO,
      VPACING=5
```

The same type of definition is needed for each CMAS you use.

**Step 2: Defining cross-domain resources (CMAS)**

You should define cross-domain resources (CDRSCs) when:

- A CMAS that is to communicate with another CMAS cannot take advantage of adjacent CDRSCs.
- You want to minimize the overhead involved in using adjacent CDRSCs.

To establish a CDRSC definition, you must either create a new member or access an existing member in the SYS1.VTAMLST library. In the new or existing member, specify the following CDRSC statement for each CMAS that you want to communicate with:

```
VBUILD TYPE=CDRSC
name CDRSC CDRM=cdrm
```

where:

- **name** Is the name you assigned to a CMAS in Step 1.
- **cdrm** Is the name of the MVS image previously identified as the cross-domain resource manager (CDRM).

For example, to allow the CMAS on SYSA to communicate with the CMASs on SYSB and SYSC, you might create the member CDRCMS1, in the SYS1.VTAMLST library, which contains the CDRSC statements:

```
VBUILD TYPE=CDRSC
CMS2 CDRSC CDRM=VTAMB
CMS3 CDRSC CDRM=VTAMC
```

where VTAMB and VTAMC are the cross-domain resource manager names that are assigned to SYSB and SYSC respectively.

The same types of definitions are also needed for the CMASs on SYSB and SYSC. That is, for the CMAS on SYSB, you could create a member (CDRCMS2), which contains the CDRSC statements:

```
VBUILD TYPE=CDRSC
CMS1 CDRSC CDRM=VTAMA
CMS3 CDRSC CDRM=VTAMC
```
Step 3: Updating the configuration list (CMAS)

If, in Step 1 or 2, you created new members in the SYS1.VTAMLST library, you must update the VTAM configuration list for each MVS image. When VTAM starts, it automatically activates the new members.

To do this, add the new member names to the end of the configuration list in the appropriate ATCCONxx member of the SYS1.VTAMLST library. To find the suffix of the ATCCONxx member:

- Get the suffix of the COMMNDxx member from the CMD= parameter in the IEASYSxx member in SYS1.PARMLIB.
- Get the suffix of the ATCSTRxx member from the LIST= parameter on the command that is used to start VTAM in the COMMNDxx member in SYS1.PARMLIB. If you do not start VTAM from the COMMNDxx member, get the suffix from the LIST= parameter of the command that you use to start VTAM.
- Get the suffix of the ATCCONxx member from the CONFIG= parameter in the ATCSTRxx member in SYS1.VTAMLST.

To illustrate, the examples shown in Steps 1 and 2 assume that the members APCMAS1 and CDRCMS1 exist. To add these members to the end of the configuration list in ATCCONxx, you would specify:

APCMAS1, x
CDRCMS1

Note: If you added the CMAS and cross-domain definitions to existing members, ATCCONxx should already contain these member names.

Step 4: Activating the major nodes (CMAS)

You can activate the definitions that are created in Steps 1 and 2 by either restarting VTAM for each system, or manually activating the definitions.

To manually activate a major node, you can issue the following commands, where name identifies a major mode that was created (or modified) in Steps 1 and 2:

- Deactivate the major node if it is currently active by issuing the command:
  VARY NET,INACT,ID=name
- Activate (or reactivate) the major node by issuing the command:
  VARY NET,ACT,ID=name

To ensure that the major node has been activated, issue the command:

D NET,ID=name

For example, to activate the member APCMAS1 and then ensure that it has been activated, you would issue the commands:

VARY NET,INACT,ID=APCMAS1
VARY NET,ACT,ID=APCMAS1
D NET,ID=APCMAS1

The preceding steps need to be performed for each CMAS you may be using.
Chapter 39. Generating post-installation members

A number of skeleton post-installation members are distributed with CICSPlex SM. You can customize and generate these post-installation members.

When you do this, the members identified in Table 20 are produced. These members can be customized, using EYUISTAR, if you perform the actions described in this section.

Table 20. Post-installation members

<table>
<thead>

<td>EYUCAS</td>
<td>A sample JCL procedure that you can use to start a CAS, as described on page 315</td>
</tr>
<tr>
<td>EYUCMAS</td>
<td>A sample JCL procedure that you can use to start a CMAS, as described on page 323</td>
</tr>
</tbody>
</table>
| EYUDEFDS | Sample JCL that you can use to create the data, screen, and parameter repositories. For additional information about creating a:  
  • Data repository, see page 299  
  • Screen and parameter repository, see page 299 |
| EYUDFHDS | Sample JCL that you can use to create the CICS region data sets for the CMAS region. |
| EYULPMOD | Sample JCL that you can use to apply SMP/E USERMODs that move MAS modules to the SEYULPA library. |
| EYUTSODS | A REXX EXEC, described on page 313, that you can use to invoke the TSO interface. |

Members EYUCAS, EYUDEFDS, and EYUTSODS are used in setting up a CAS. Members EYUCMAS, EYUDFHDS, and EYUDEFDS (for the data repository), are used in setting up a CMAS. Skeleton member, EYULPMOD, is used in setting up a MAS.

To customize and then generate the post-installation members, use the job distributed in the member EYUISTAR of the CICSTS31.CPSM.SEYUINST library.

• Tailor the job in the EYUISTAR member of the CICSTS31.CPSM.SEYUINST library using the parameters identified in Table 21.
  Use the SCOPE and ENVIRONMENT parameters to qualify the specific members that are to be generated. That is, use SCOPE to identify the type of members to be generated and ENVIRONMENT to indicate whether those members are to apply to a MAS-only environment or a CMAS environment. For additional information, see “EYUINST EXEC parameters” on page 375.

• Run the EYUISTAR job to produce the post-installation members. The resulting members, listed in Table 20, are stored in the library you specified on the LIB parameter of the EYUISTAR job. See “Sample JCL execution considerations” on page 382 for further information.

For detailed information about the EYUISTAR job, see Chapter 49, “Using the EYUINST EXEC to tailor skeleton jobs,” on page 373.

Chapter 40. Creating and managing CICSPlex SM data sets

This chapter describes the following:

- "CAS-related data sets"
- "Creating the CICSPlex SM data repository"
- "Populating the CICSPlex SM data repository" on page 302
- "Converting the CICSPlex SM data repository" on page 302
- "Expanding the CICSPlex SM data repository" on page 304
- "Taking backups of the CICSPlex SM data repository" on page 304

You can use the post-installation job EYUDEFDS to create the CICSPlex SM data sets. The EYUDEFDS job is generated when you run the EYUISTAR job, as described in Chapter 39, "Generating post-installation members," on page 297. The job is stored in the library you specified on the LIB parameter of the EYUISTAR job.

CAS-related data sets

The CAS-related data sets, which may be shared by multiple CASs, are:

- A screen repository. This optional data set contains the screen configuration definitions created by individuals using CICSPlex SM. If you do not create this data set, users will not be able to save their CICSPlex SM screen configurations. (For additional information about creating and using screen configurations, see the CICSPlex System Manager User Interface Guide.)
- A parameter repository data set. This required data set contains communications definitions used by the CAS. (See the CICSPlex System Manager Administration manual for information about creating and maintaining these definitions.)

The EYUDEFDS job includes the following steps related to the CAS data sets:

- SDEFDEL, which deletes any existing screen repository data set having the same name, and SDEFALOC, which creates a new one. These steps are generated only when you specify a disposition of NEW with the EYUSDEF parameter of the EYUISTAR job. If you specified OLD with the EYUSDEF parameter, the existing screen repository data set is referenced by the EYUCAS procedure.
- IPRMDEL, which deletes any existing parameter repository data set having the same name, and IPRMALOC, which creates a new one. These steps are generated only when you specify a disposition of NEW with the EYUIPRM parameter of the EYUISTAR job. If you specified OLD with the EYUIPRM parameter, the existing parameter repository data set is referenced by the EYUCAS procedure.

Creating the CICSPlex SM data repository

The CMAS-related data set is the data repository. Each CMAS must have a unique data repository associated with it. The data repository contains the CICSPlex SM administration definitions applicable to its associated CMAS.

Note: The data repository is a critical component of CICSPlex SM system management. It is imperative that you take regular backups that are associated with each CMAS in your environment.
It is defined to CICS as being a recoverable file which participates in 
SYNCPOINT and SYNCPOINT ROLLBACK operations. The CMAS must 
have a CICS system log in order for these operations to operate correctly. 
Do not, therefore, run a CMAS with a system log that is defined as type 
DUMMY as this would compromise data integrity on the CICSPlex SM data 
repository.

To create the data set that contains the data repository, you can use the 
post-installation job EYUDEFDS.

If you will be running multiple CMASs in the same MVS image, you must create a 
data repository for each CMAS. You can edit and resubmit the EYUISTAR job (as 
described in Chapter 49, “Using the EYUIINST EXEC to tailor skeleton jobs,” on 
page 373), which generates the EYUDEFDS post-installation job. You may want to 
use the SELECT parameter to generate only the EYUDEFDS post-installation job. 
Once this job exists, you can edit it to make sure that the names specified with the 
SYSIDNT and CMASNAME parameters are unique each time you run the job.

Note: If you have already run the EYUDEFDS job (when creating the CAS data 
sets), be sure to delete the following steps before you rerun EYUDEFDS:

- SDEFDELD
- SDEFALOC
- IPRMDEL
- IPRMALOC

These steps create new screen and parameter repositories, deleting those 
already in existence. For more information about creating the screen and 
parameter repository data sets, see “CAS-related data sets” on page 299.

The EYUDEFDS job includes the following steps related to the creation of the data 
repository:

**DREPALOC**

This step allocates the VSAM KSDS cluster for the data repository data set:

dsindex.EYUDREP.cmasname

where:

dsindex
- Is defined by the DSINFO parameter of the EYUISTAR job.

cmasname
- Is defined by the CMASNAME parameter of the EYUISTAR job.

Note: CICSPlex SM does not support VSAM records that span control 
intervals. Make sure that the IDCAMS job that you use to create a 
CICSPlex SM data repository does not specify the SPANNED 
parameter. You should accept the IDCAMS default of nonspanned 
records.

**DREPINIT or DREPCNVT**

One of these two steps is used to setup the data repository for a CICS 
Transaction Server for z/OS, Version 3 Release 1 CMAS. The step that is 
generated in job EYUDEFDS depends on the OLDDREP parameter you 
specified when you ran the EYUISTAR job.

Step DREPINIT is generated if you did not specify a value with the 
OLDDREP parameter. This step executes EYU9XDUT to initialize the new 
data repository that was allocated by step DREPALOC. The new data
The repository does not contain any records from a previous version of CICSPlex SM. The EYU9XDUT utility uses the following parameters for step DREPINIT:

**CMASNAME=xxxxxxxx**
- You cannot change this name after the data repository is initialized.
- This name must be unique within the CICSPlex SM environment. It should not be the same as the name of another CMAS, a CICSPlex, a CICS system, or a CICS system group.
- Position 1 must be alphabetic or national, and cannot be numeric.
- Positions 2 through 8 can be alphabetic, national, or numeric.

**SYSID=xxxx**
- You cannot change this identifier after the data repository is initialized.
- This value must match the SYSIDNT (SIT parameter) for the CMAS; see "CMAS-related CICS SIT parameters" on page 326.
- This value must not be the same as the SYSID for any other CMAS or CICS system that is defined to CICSPlex SM.
- Positions 1 through 4 can be alphabetic, national, or numeric.

**TIMEZONE=x**
- Where x must be a single alphabetic character (B through Z), representing one of the Greenwich time zone codes (see CICSPlex System Manager Administration).

**ZONEOFFSET=nn**
- Where nn must be a two-digit numeric value (00 through 59), representing an adjustment (offset) to the TIMEZONE.

**DAYLIGHT=x**
- Where x must be a single character (Y or N), representing daylight saving time.

For information about defining the TIMEZONE, ZONEOFFSET, and DAYLIGHT parameters, see CICSPlex System Manager Administration.

Step DREPCNVT is generated if you specified the name of an existing data repository on the OLDDREP parameter. This step executes EYU9XDUT to convert existing data repository records from a previous release of CICSPlex SM for use by CICSPlex SM for CICS Transaction Server for z/OS, Version 3 Release 1. All the records from the input data repository specified on the OLDDREP parameter are added to the new data repository that was allocated by step DREPALOC. The input data repository is not modified. The EYU9XDUT utility uses the following parameter for step DREPCNVT:

**TARGETVER=0310**
- Where 0310 represents the version of the new output data repository.
Populating the CICSPlex SM data repository

You can use the CICSPlex SM-supplied extract routine EYU9BCSD to generate CICSPlex SM resource definition records for each CSD record identified in your input file.

The output from EYU9BCSD is used to populate the data repository.

For more information about EYU9BCSD see CICSPlex System Manager Managing Business Applications.

Converting the CICSPlex SM data repository

You can run the EYU9XDUT utility to convert the CICSPlex SM data repository from any release of CICSPlex SM to this release, and back again. That is, you can upgrade the data repository to the current release of CICSPlex SM, and you can convert it back to a previous release. For example, after you have upgraded to CICSPlex SM for CICS Transaction Server for z/OS, Version 3 Release 1, you can convert the data repository back to CICSPlex SM for CICS Transaction Server for z/OS Release 2.3 for use with a CMAS running the that level of CICSPlex SM code.

The conversion is controlled by the TARGETVER parameter and the DD statements you use to execute EYU9XDUT. To convert between a previous release and CICSPlex SM for CICS Transaction Server for z/OS, Version 3 Release 1 requires the EYUDREP, NEWREP, and BYPASS DD statements in the JCL. The EYUDREP statement must reference an existing input data repository, and the NEWREP statement must reference the output data repository.

CRESxxxx is a CICSPlex SM Topology Manager object that describes instances of a resource within a CICS system. All CRESxxxx resource table objects are deleted during the conversion process. These deleted records are rebuilt the first time the MAS connects or joins to the CMAS. The following message is then output to the SYSPRINT DD statement with a count of how many records were not converted:

EYUXD0708I CRESxxxx Resource Table nnnnn records not converted

EYU9XDUT Return codes:

0 execution completed normally. This return code is accompanied by message:

EYUXD0702I Repository successfully converted

indicating the repository was successfully converted. This message may also be preceded by the message:

EYUXD0708I CRESxxxx Resource Table nnnnn records not converted

4 some records could not be converted. This return code is accompanied by message:

EYUXD0706W DDNAME NEWREP nnnnn records were bypassed

indicating the repository was successfully converted but some records were bypassed and not written to the new repository. These records are written to the BYPASS DD statement. This message can also be preceded by message:

EYUXD0708I CRESxxxx Resource Table nnnnn records not converted
EYU9XDUT has failed. Check the joblog for error messages that indicate the cause of the error. For example, DD statement missing, or invalid NEWREP dataset.

Note: Shutdown the CMAS that is using EYUDREP before running EYU9XDUT, otherwise, X’A8’ is returned when the dataset is opened.

Use JCL similar to that in Figure 51 to convert from Release 2 of CICSPlex SM to CICSPlex SM for CICS Transaction Server for z/OS, Version 3 Release 1. This sample JCL assumes that you have already allocated the VSAM cluster that is referenced by the NEWREP DD statement. The file identified by the NEWREP DD statement must be an empty file.

In the JCL, use a value for TARGETVER that indicates the release you are converting to. For example:

To convert to.. | Use:
---|---
Release 3 | TARGETVER=0130
CICSPlex SM for CICS TS Release 3 | TARGETVER=0140
CICSPlex SM for CICS Transaction Server for z/OS Release 2.1 | TARGETVER=0210
CICSPlex SM for CICS Transaction Server for z/OS Release 2.2 | TARGETVER=0220
CICSPlex SM for CICS Transaction Server for z/OS Release 2.3 | TARGETVER=0230
CICSPlex SM for CICS Transaction Server for z/OS Release 3.1 | TARGETVER=0310

When the data repository is updated from a previous release to the current release, information stored in the earlier version is carried over to the current version of the data repository. When the data repository reverts back from the current release to a previous release, and the record in which information is changed is identical in both releases, the changes are carried back to the earlier version. Likewise, if a field in a record exists in both releases, later changes to the information in a field are carried back to the earlier version. However, when the data repository is converted from the current release to a previous release and either the record or a field in it did not exist in the previous release, the information contained in the later version is permanently lost.

(For more information about the data repository, see “Creating the CICSPlex SM data repository” on page 299 and “Expanding the CICSPlex SM data repository” on page 304.)
Expanding the CICSPlex SM data repository

The CICSPlex SM data repository may fill up and require expansion. To expand the CICSPlex SM data repository, use the IDCAMS utility REPRO function. An example of the JCL to do this is in member EYUJXDRP of the CICSTS31.CPSM.SEYUSAMP library.

In that JCL, on the RECORDS(xx,yy) statement. You should specify a primary (xx) and a secondary (yy) value that are appropriate for your environment. The initial values are 500 and 3000.

Taking backups of the CICSPlex SM data repository

The CICSPlex SM data repository is defined to CICS as a VSAM file called EYUDREP. As the data set is accessed via CICS File Control, all the normal CICS methods of taking backups of VSAM data sets for disaster recovery purposes are available for use with the data repository.

You may use the following techniques for taking copies of the data repository, and for restoring the data repository after a data set failure.

- Use HSM, or DSS, or other utilities to take copies while the associated CMAS is not running, possibly using the Concurrent Copy technique to reduce the time during which the repository must be unavailable.
- Use HSM or DSS to take copies while the associated CMAS is running using the Backup While Open technique, and possibly also using the Concurrent Copy technique, which improves the ease of use of Backup While Open. This requires a forward recovery log (see "Defining a forward recovery log for the data repository").
- Use HSM or DSS to restore the data set after a data set failure.
- Use a Forward Recovery product, such as CICS VSAM Recovery (CICS/VR), to reapply updates that were made to the data set after the most recent copy was taken. This requires a forward recovery log.
- Use remote site recovery techniques if you need an up-to-date copy of the data set at a remote site for disaster recovery purposes. This requires a forward recovery log.

The CICS Recovery and Restart Guide provides information on all the terms referred to above. In particular, it provides information about forward recovery logs, forward recovery, the CICS/VR product, Backup While Open, Concurrent Copy and its associated hardware prerequisites, taking back ups of data sets, restoring data sets from backup copies, and remote site recovery.

Defining a forward recovery log for the data repository

The data repository is defined in the CMAS as a VSAM file called EYUDREP. CICSPlex SM provides a default definition that defines this file as not having an associated forward recovery log, and therefore as not being eligible for forward recovery.

If you use forward recovery, you require a journal logstream. Defining CICS log streams is described in the CICS System Definition Guide, and setting up a journal logstream is described in the CICS System Definition Guide.
If you wish to use Forward Recovery, Backup While Open, or Remote Site Recovery, you will need to change the definition of EYUDREP. You will need to specify the following keywords on the definition of EYUDREP to define it as having a forward recovery log:

```
RECOVERY(ALL)
FWDRECOVLOG(nn)
```

where \( nn \) is a number between 1 and 99.

The default definition of EYUDREP also does not define the repository as being eligible for Backup While Open. To make the repository eligible for Backup While Open, you should specify the following keywords:

```
RECOVERY(ALL)
FWDRECOVLOG(nn)
BACKUPTYPE(DYNAMIC)
```

where \( nn \) is a number between 1 and 99.

The RECOVERY, FWDRECOVLOG, and BACKUPTYPE parameters of DEFINE FILE are described fully in the *CICS Resource Definition Guide*.

**Notes:**

1. You should not change any keywords on the EYUDREP definition other than RECOVERY, FWDRECOVLOG and BACKUPTYPE. In addition, you must never set RECOVERY(NONE). Setting RECOVERY(NONE) would cause repository corruption after transaction or CMAS failures.

2. You should not change the recovery options of the EYUDREPN FILE definition. This definition is used when CPSM determines that Data Repository file operations do not require logging. It is normal to receive LSR pool messages for EYUDREPN during CMAS initialization and you should ignore them. There should be no DD statement in the CICS JCL for EYUDREPN and EYUDREPN should not be associated with a data set name.

3. If CPSM Data Repository initialization fails (as reported by message EUIXD0105E) and the cause is due to the EYUDREP data set requiring Batch Backout (for example CICS issues message DFHFC0921), you must recover the EYUDREP data set and then delete and redefine the CMAS Local and Global catalogs in order to reset the CICS backout required status for the data set.

4. Requesting Backup While Open for the CICSPlex SM data repository data set via the IDCAMS DEFINE CLUSTER definition within the ICF catalog is not supported.
Chapter 41. Upgrading the CSD and macro definitions

Appropriate resource definitions must be added to the CICS tables and the CICS system definition (CSD) file for each CMAS and MAS you are using.

This chapter describes the following:
- "Creating CICS resource definition tables for CMASs"
- "Updating the CSD files using DFHCSDUP (CMAS)"
- "Journalmodel considerations in a CICS TS z/OS CMAS" on page 308
- "Considerations when upgrading the CSD release (CMAS)" on page 309
- "Considerations when sharing the CSD (CMAS)" on page 309
- "Updating CICS resource definition tables for MASs" on page 310
- "Updating CSD files using DFHCSDUP (MVS MAS)" on page 311
- "Considerations when upgrading the CSD release (MVS MAS)" on page 312
- "Considerations when sharing the CSD (MVS MAS)" on page 312

Creating CICS resource definition tables for CMASs

For each CMAS, you must create resource definition table load modules that are required to run a CMAS. Assemble and link-edit the tables with the CICS procedures for installing resource definition table load modules. The tables need to be link edited into a user-supplied load library, which needs to be specified in the DFHRPL concatenation. Library CICSTS31.CPSM.SEYUSAMP must be included in the SYSLIB concatenation for the Assembler step of the procedure used to assemble and link-edit the CICS tables.

These tables do not need modification for CICSPlex SM to function properly.

Note: CICS used to supply sample PLT and SRT tables. APARs modified releases CICS TS 1.3, CICS TS 2.2 and CICS TS 2.3 so that they no longer need either a PLTP program or a special system recovery table.

CICS TS 3.1 does not supply sample PLT and SRT tables.
- Instead of a PLT, specify CPSMCN=CMAS
- For the SRT specify the default SRT=1$.

Updating the CSD files using DFHCSDUP (CMAS)

The resource definitions you must add to the CSD file for each CICS CMAS are distributed in the EYU964G0 modules of the CICSTS31.CPSM.SEYULOAD library, where nn represents the CICS level.

Sample JCL that you can use to include the definitions is in the member EYUJCGL0 in the CICSTS31.CPSM.SEYUSAMP library. You can edit this JCL, as in Figure 52 on page 308 to:
1. Define the CMAS group of resource definitions to the appropriate CSD file.
2. Add the CMAS group list to the CSD.
Modify the sample JCL to provide the following information:

```plaintext
//CSDUP   EXEC  PGM=DFHCSDUP
//STEPLIB DD  DSN=cics.index.SDFHLOAD,DISP=SHR
//          DSN=cpsm.index.SEYULOAD,DISP=SHR
//DFHCSD DD  DSN=cics.dfhcsd,DISP=SHR
//SYSPRINT DD  SYSOUT=*  
//SYSLIB DD  SYSOUT=*  
UPGRADE USING(group_load_module)  
/*
Figure 52. Sample JCL to run DFHCSDUP
```

Modify the sample JCL to provide the following information:

**STEPLIB**
- Identify: cics.index.SDFHLOAD as the CICS load library that contains the DFHCSDUP module
- Identify: cpsm.index.SEYULOAD as the CICSPlex SM load library that contains the definition modules.

**DFHCSD**
- Identify: cics.dfhcsd as the CICS CSD file to be updated.

**SYSIN**
- You must identify the load module (EYU9nnG0) that contains the resource definitions group that is required to run the CMAS (EYU310G0).

A return code of 4 is expected from this run of DFHCSDUP. This is because, before adding the designated group to the CSD, the job attempts to delete any group with the same name.

**Note:** You should not normally run user transactions in a CMAS. However, if you do choose to define your own transactions to the CMAS, you should be aware that transaction IDs used by CICSPlex SM in the CMAS have no specific format. To avoid conflict between your names and those that are used by CICSPlex SM, you should review the transactions that are defined in the CSD group EYU310G0. For a list of these transactions, see the CICS RACF Security Guide.

### Journalmodel considerations in a CICS TS z/OS CMAS

The CMAS grouplists for CICS Transaction Server for z/OS include the CICS-supplied group, DFHLGMOD. If the log stream names used by the DFHLGMOD group are not appropriate for your environment, copy group DFHLGMOD to a new group, where you can make your amendments. Finally, add the new group to the CMAS grouplist.

See Chapter 24, “Defining the logger environment for CICS journaling,” on page 143 for details on how to define log streams.

**Note:** Do not operate the CMAS with log streams that are defined as DUMMY. This may cause problems when recovering the CSD or CICSPlex SM data repository (EYUDREP).

See Chapter 51, “CMAS journaling,” on page 397 for details about the various CMAS journaling options that you can activate.
Considerations when upgrading the CSD release (CMAS)

When the CSD is upgraded to a new CICS release, you must install the CICSPlex SM group definitions for the new release into the upgraded CSD. For example, when the CSD is upgraded to CICS Transaction Server for z/OS, use the following SYSIN to install the CICSPlex SM CMAS resource definitions for CICS Transaction Server for z/OS Release 3.1.

```plaintext
//SYSIN DD *
UPGRADE USING(EYU964G0)
/*

For information about the resource group definitions that are distributed with CICSPlex SM, see “Updating the CSD files using DFHCSDUP (CMAS)” on page 307.

Considerations when sharing the CSD (CMAS)

Before the CSD can be shared by multiple releases of CICS, the CSD must be upgraded by installing the CICSPlex SM resource definitions for the current CICS release. For information about doing so, see “Considerations when upgrading the CSD release (CMAS).”

If you are running a CMAS under a previous release of CICS that is accessing resource definitions in a CSD that has been upgraded to the current CICS release, you must update the CMAS group list. Because the CMAS group list definitions are secured against updates, you must create a copy of the CMAS group list and update the copy.

For example, to run DFHCSDUP to create a copy of the CMAS group list and add the CICS compatibility groups (DFHCOMP4, DFHCOMP5, DFHCOMP6, DFHCOMP7, DFHCOMP8, DFHCOMP9, and DFHCOMPA) that are required for a CICS/ESA 4.1 CMAS to access resource definitions in a CICS Transaction Server for z/OS Release 3.1 CMAS; use the following SYSIN control statements:

```plaintext
//SYSIN DD *
UPGRADE USING(EYU964G0)
APPEND LIST(EYU310L0) TO(EYUE41L0)
ADD GROUP(DFHCOMPA) LIST(EYUE41L0)
ADD GROUP(DFHCOMP9) LIST(EYUE41L0)
ADD GROUP(DFHCOMP8) LIST(EYUE41L0)
ADD GROUP(DFHCOMP7) LIST(EYUE41L0)
ADD GROUP(DFHCOMP6) LIST(EYUE41L0)
ADD GROUP(DFHCOMP5) LIST(EYUE41L0)
ADD GROUP(DFHCOMP4) LIST(EYUE41L0)
/*
```

Figure 53. Sample JCL to update CMAS group list

The control statements in Figure 53 perform the following functions:

**UPGRADE USING(EYU964G0)**

Replaces the previous CICS/ESA, CICS TS for OS/390 or CICS Transaction Server for z/OS release CMAS group definitions with CICS Transaction Server for z/OS Release 3.1 group definitions. The CICS Transaction Server for z/OS Release 3.1 group definitions can be used to run a CICS/ESA 4.1, CICS TS for OS/390 or a CICS Transaction Server for z/OS Version 2 CMAS.
APPEND LIST(EYU310L0) TO(EYUE41L0)
   Creates the unprotected copy of list EYU310L0.

ADD GROUP(DFHCOMPA) LIST(EYUE41L0)
   Adds CICS Transaction Server for z/OS Release 2.2 compatibility group
   DFHCOMPA to the list EYUE41L0.

ADD GROUP(DFHCOMP9) LIST(EYUE41L0)
   Adds CICS TS for OS/390 Release 3 compatibility group DFHCOMP9 to
   the list EYUE41L0.

ADD GROUP(DFHCOMP8) LIST(EYUE41L0)
   Adds CICS TS for OS/390 Release 3 compatibility group DFHCOMP8 to
   the list EYUE41L0.

ADD GROUP(DFHCOMP7) LIST(EYUE41L0)
   Adds CICS TS for OS/390 Release 2 compatibility group DFHCOMP7 to
   the list EYUE41L0.

ADD GROUP(DFHCOMP6) LIST(EYUE41L0)
   Adds CICS TS for OS/390 Release 1 compatibility group DFHCOMP6 to
   the list EYUE41L0.

ADD GROUP(DFHCOMP5) LIST(EYUE41L0)
   Adds CICS/ESA 4.1 compatibility group DFHCOMP5 to the list EYUE41L0.

This JCL completes with a return code of 04 when group or list that is referenced
by the UPGRADE statements is installed for the first time. This occurs because the
processing of the UPGRADE statements attempts to delete list EYU310L0 and
group EYU310G0 before these resources are defined.

After this job is completed successfully, you can start a CICS/ESA 4.1 CMAS by
referencing group list EYUE41L0; you can start a CICS TS for OS/390 Release 3
CMAS by referencing group list EYU310L0.

To start a CICS Transaction Server for z/OS Release 2.3CMAS, you can define an
additional group list in a CICS TS for OS/390 CSD. Such a group list will include
CICS compatibility group DFHCOMP8.

To start a CICS/ESA 4.1 CMAS, you can define an additional group list in a CICS
TS for OS/390 CSD. Such a group list will include CICS compatibility groups
DFHCOMPA, DFHCOMP9, DFHCOMP8, DFHCOMP7, DFHCOMP6, and
DFHCOMP5, in that order.

For more information about upgrading the CICS CSD with compatibility group
definitions, see the “Sharing the CSD between different releases of CICS’ topic in
the CICS Transaction Server for z/OS Migration from CICS TS Version 2.3 Guide.

---

**Updating CICS resource definition tables for MASs**

For each MAS, some of your CICS resource definition tables must be updated to
reference the CICSPlex SM copy books that contain entries for those control
tables. When you have updated the tables for each MAS, assemble and link-edit
them using the CICS procedures for maintaining resource definition table load
modules.

The process used to assemble and link-edit the CICS resource definition table load
modules must have library CICSTS31.CPSM.SEYUSAMP in the SYSLIB.
concatenation of the assembler step, or the copy book member must be inserted into the table source member in place of the COPY statement.

## Updating CSD files using DFHCSDUP (MVS MAS)

The resource definitions you must add to the CSD file for each managed CICS system are distributed in CSD upgrade load modules in CICSTS31.CPSM.SEYULOAD.

The names of the load modules, the environment for which they are used, and the name of the resource group (created using the definitions the load modules contain) are:

<table>
<thead>
<tr>
<th>Load module</th>
<th>EYU9nnG1, where nn represents the CICS level (for example, 63 refers to the CICS element in CICS TS for z/OS Version 2.3, and 64 refers to the CICS element in CICS TS for z/OS Version 3.1).</th>
</tr>
</thead>
<tbody>
<tr>
<td>Environment</td>
<td>MAS - USELAPCOPY(NO)</td>
</tr>
<tr>
<td>Resource group</td>
<td>EYU310G1</td>
</tr>
</tbody>
</table>

Sample JCL that you can use to include the definitions is supplied in the member EYUJCLGN in the CICSTS31.CPSM.SEYUSAMP library. You can edit this JCL, as shown in Figure 54, to:

1. Define a group of resource definitions to the appropriate CSD file.
2. Add the group name to the CSD list referenced by the CICS system initialization table (SIT) parameter GRPLIST.

```
//CSDUP EXEC PGM=DFHCSDUP
//STEPLIB DD DSN=cics.index.SDFHLOAD,DISP=SHR
//                  DSN=cpsm.index.SEYULOAD,DISP=SHR
//DFHCSD DD DSN=cics.dfhcsd,DISP=SHR
//SYSPRINT DD SYSOUT=*
//SYSIN DD *
UPGRADE USING(group_load_module)
ADD GROUP(EYU310G1) LIST(list_name)
/*
```

**Figure 54. Sample JCL to run DFHCSDUP for MVS MAS**

Modify the sample JCL to provide the following information:

**STEPLIB**

Identify:

- cics.index.SDFHLOAD as the CICS load library containing the DFHCSDUP module
- cpms.index.SEYULOAD as the CICSPlex SM load library containing the group definition module.

**DFHCSD**

Identify cics.dfhcsd as the CICS CSD file to be updated.

**SYSIN**

Identify:

- The load module containing the resource definition group
- The group name contained within the load module
- The group list used to start the MAS.
To avoid your transaction names clashing with those used by CICSPlex SM, you should review the names of the transactions defined in the appropriate EYU310Gn group in the CSD. The CICSPlex SM MAS transaction names are all of the form COxx.

A return code of 4 is expected from this run of DFHCSDUP. This is because, before adding the designated group to the CSD, the job attempts to delete any group with the same name.

To run the MAS using an USELPACOPY(YES) group, the appropriate load modules must be moved to the SYS1.CICSTS31.CPSM.SEYULPA data set. For additional information, see “Using CICSPlex SM modules in the MVS link pack area” on page 286.

Considerations when upgrading the CSD release (MVS MAS)

When the CSD is upgraded to a new CICS release, you must install the CICSPlex SM group definitions for the new release into the upgraded CSD. For example, when the CSD is upgraded from CICS/ESA 4.1 to the CICS Transaction Server for z/OS, use the following SYSIN statement to install the CICSPlex SM local MAS resource definitions for the CICS Transaction Server for z/OS 3.1:

```plaintext
//SYSIN DD *
  UPGRADE USING(EYU964G1)
/*/n
```

For information about the resource group definitions distributed with CICSPlex SM, see “Updating CSD files using DFHCSDUP (MVS MAS)” on page 311.

Considerations when sharing the CSD (MVS MAS)

Before the CSD can be shared by multiple releases of CICS, the CSD must be upgraded by installing the CICSPlex SM resource definitions for the current CICS release. For information about doing so, see “Considerations when upgrading the CSD release (MVS MAS).”
Chapter 42. Preparing user access to CICSPlex SM

To permit users to select CICSPlex SM as an application from an ISPF menu:

1. If your enterprise uses an external security manager (ESM), which contains a list of TSO command processors that can be executed by users, include the following names in the table:
   - BBM3API
   - BBM9TC20
   - BBM9TC23

2. Insert the following line in the existing list of menu options on one or more of the ISPF menu panels defined as members in the ISPPLIB library:
   id,'PANEL(EYUDEZZZ) NEWAPPL(EYUD) PASSLIB'

   where id is any appropriate, unique menu option id, such as CP.

3. Add the following libraries to the signon procedure for each individual who might access CICSPlex SM during a TSO session:

<table>
<thead>
<tr>
<th>DD name</th>
<th>Data set name</th>
</tr>
</thead>
<tbody>
<tr>
<td>BBILINK</td>
<td>CICSTS31.CPSM.SEYUAUTH</td>
</tr>
<tr>
<td>BBSDEF</td>
<td>CICSTS31.CPSM.EYUSDEF</td>
</tr>
<tr>
<td>ISPLLIB</td>
<td>CICSTS31.CPSM.SEYUAUTH</td>
</tr>
<tr>
<td>ISPMLIB</td>
<td>CICSTS31.CPSM.SEYUMLIB</td>
</tr>
<tr>
<td>ISPPLIB</td>
<td>CICSTS31.CPSM.SEYUPLIB</td>
</tr>
<tr>
<td>ISPTLIB</td>
<td>CICSTS31.CPSM.SEYUTLIB</td>
</tr>
</tbody>
</table>

   These library names should be placed after the user's data set names and before any other system data set names.

If you are creating a new screen repository, you must run job EYUDEFDS before adding the CICSTS31.CPSM.EYUSDEF data set to a TSO session.

You can also access CICSPlex SM by running a REXX EXEC from within ISPF. A sample EXEC, called EYUTSODS, is generated when you run the EYUISTAR job, as described in Chapter 39, “Generating post-installation members,” on page 297. EYUTSODS is stored in the library you specified on the LIB parameter of the EYUISTAR job.

The EYUTSODS EXEC performs the following functions:

- Allocates the required CICSPlex SM data sets to a user's TSO session. The data sets are concatenated ahead of any data sets already allocated to the referenced DD name.
- Invokes the CICSPlex SM ISPF end-user interface via the command:
  ISPEXEC SELECT PANEL(EYUDEZZZ) NEWAPPL(EYUD) PASSLIB
- Restores the original allocation when the user exits CICSPlex SM.
Chapter 43. Setting up a coordinating address space (CAS)

This chapter describes the steps you must perform in order to make a coordinating address space (CAS) operational. These steps consist of:

- "Preparing to start a CAS"
- "Setting the CAS system communication information" on page 318
- "Preparing to stop a CAS" on page 318.

For a summary of the CAS setup tasks that you can refer to while performing them, see Chapter 36, “CICSPlex SM setup checklist and worksheets,” on page 271.

If you are converting your CICSPlex SM system or systems from a previous release to CICSPlex SM for CICS Transaction Server for z/OS, Version 3 Release 1, you should read the CICS Transaction Server for z/OS Migration from CICS TS Version 2.3.

For details on applying corrective or preventive maintenance to CICSPlex SM, see Chapter 48, “Applying service to CICSPlex SM,” on page 371.

Preparing to start a CAS

There are several ways you can start a CAS. You can start a CAS:

- At MVS IPL time.
  This is the recommended method for starting a CAS. To use this method:
  – Verify that the CAS startup procedure is in a system procedure library, such as SYS1.PROCLIB.
  – Verify that the CAS startup procedure is in the 'Started Tasks' table of the external security manager (ESM).
  – Include the START command, as described on page 316, in the COMMNDaa member of SYS1.PARMLIB that contains the automatic operator commands.

- From the system console.
  To start a CAS from the system console:
  – Verify that the CAS startup procedure is in a system procedure library, such as SYS1.PROCLIB.
  – Verify that the CAS startup procedure is in the 'Started Tasks' table of the external security manager (ESM).
  – Have the operator issue the START command, as described on page 316.

- As a batch job.
  To start a CAS as a batch job:
  – Verify that the CAS startup procedure is in a system procedure library, such as SYS1.PROCLIB.
  – Construct a job stream to invoke the CAS procedure.
  – Submit the job to invoke a CAS.

A sample procedure that you can use to start a CAS is supplied in the member EYUCAS and is illustrated in Figure 55 on page 316. This member was generated when you ran the EYUISTAR job, as described in Chapter 39, "Generating post-installation members," on page 297. The member is stored in the library you specified on the LIB parameter of the EYUISTAR job.
EXEC statement

- Identifies the program that performs basic initialization tasks (PGM=BBM9ZA00).
- Provides unlimited processing time for the CAS (TIME=1440).
- Designates the size of the private region required by the CAS (REGION=4096K). Do not define a region smaller than 4096K.

STEPLIB DD statement

Identifies the CICSTS31.CPSM.SEYUAUTH authorized load library.

BBACTDEF DD statement

Defines the library that contains the SMP-installed CICSPlex SM action and view tables, that are shared by multiple systems.

BBVDEF DD statement

Defines the library that contains all SMP-installed CICSPlex SM views. A CAS is responsible for retrieving the views associated with PlexManager.

BBIPARM DD statement

Defines the library that contains the cross-system definitions created by CICSPlex SM users.

BBSECURE DD statement

Defines the library that contains member BBMTSS00, which contains overrides to the CICSPlex SM global security parameters. See the CICS RACF Security Guide.

START command for a CAS

The syntax of the command you can use to start a CAS is:

```
START procname [,SSID=ssid][,XDM=Y|N][,SPCF=Y|N][,CONVXCF=Y|N][,COLD=Y|N][,DUMP=Y|N][,ALL]
```

where:

**procname**

- Is the 1- to 8-character name of the procedure. (EYUCAS is the name of the distributed sample procedure.)

**SSID=ssid**

- Identifies the 4-character name that uniquely identifies the CAS subsystem. Please note that:
1. Subsystem names must be unique within the MVS image.
2. Subsystems are created without being predefined.

The distributed sample startup JCL uses CPSM as the default subsystem identifier. (EYUX is used as the subsystem identifier for the Environment Services System Services (ESSS) and, therefore, cannot be used as a CAS subsystem ID.)

Make sure that you use this subsystem ID with the CASNAME parameter, described on page "CASNAME(name)" on page 386.

If your enterprise has more than one CAS, make sure your TSO users know the subsystem ID of each CAS. In the Subsystem ID field on the Session Control Parameters panel, they can specify a different CAS than the one they first connect to. (The Session Control Parameters panel is described in the CICSPlex System Manager User Interface Guide)

XDM=Y|N
Indicates whether the CAS should execute in extended diagnostic mode (XDM).

XDM, which is described in the CICSPlex System Manager Problem Determination manual, should be activated only when requested by IBM Support Personnel. Specifying XDM=Y disables certain error recovery mechanisms and issues extensive diagnostic messages to the console.

SPCF=Y|N
Indicates whether the sysplex coupling facility (SPCF) should be initialized.

CONVXCF=Y|N
Indicates whether XCF Conversations are to be allocated for CAS-to-CAS connections. If CONVXCF=Y is specified in the startup command for all CASes in a sysplex, it is not necessary to provide a VTAM applid for each CAS in its CASDEF record. If CONVXCF=Y is specified SPCF=Y must also be specified.

COLD=Y|N
Indicates whether the CAS should be cold started.

When the CAS is initialized, several control blocks are built in common storage. Most of these blocks are freed when the CAS terminates. However, some blocks (with a total of less than 4KB of CSA) are retained to permit the reuse of previously allocated system resources—in particular, MVS system linkage indexes (LXs).

When you reinitialize the CAS with COLD=N, the control blocks from the preceding invocation of the CAS are used—rather than building new ones—and, thus, do not consume additional common storage or valuable LXs. By contrast, COLD=Y causes new control blocks to be built. This means that all previously built control blocks continue to occupy common storage until the system is IPLed.

Specify COLD=Y only when requested to do so by IBM Support Personnel in an attempt to clear an error condition.

DUMP=Y|N|ALL
Indicates whether system dumps (SDUMPs) are to be taken when the CAS subsystem recovery manager intercepts an unexpected abend.

When DUMP=ALL is in effect, an SDUMP is attempted for all unexpected abends.
If you specify DUMP=Y, the recovery manager attempts to take an SDUMP only when the failing function is running in supervisor state. If you specify DUMP=N, the recovery manager does not take an SDUMP for any abend, regardless of the PSW state at the time of the failure.

Identifying and connecting to a CAS

The first time a user accesses CICSPlex SM, CPSM is used as the default CAS subsystem ID. If this is not the appropriate subsystem ID, the user's profile must be changed. To do this, the user must select option 0 from the CICSPlex SM entry panel. Then select suboption 1 and change CPSM to the appropriate subsystem ID.

When the user displays the CICSPlex SM entry panel, the names of the context and scope that are to be in effect for the user's CICSPlex SM session are shown. When the user selects either option 1 or 2, CICSPlex SM establishes connection between the CAS and the CMAS responsible for managing the CICSplex identified as the context.

If, after a CAS connection has been established, the user decides to use option 0.1 to identify a different CAS, the user must use the END command to exit ISPF to FREE the current BBILINK allocations. From the TSO READY prompt, the user must restart the CICSPlex SM session in order to establish a connection to the new CAS.

Setting the CAS system communication information

Next, use the PlexManager CASDEF view to specify the CAS system communication information to establish direct CAS-to-CAS communication links. The CASDEF view is described in the CICSPlex SM Administration manual.

Note: The CASDEF view will not be available until you have a CAS running and can access the CICSPlex SM ISPF end-user interface.

Preparing to stop a CAS

Before you stop a CAS, you should ensure that the MAXUSER, RSVNONR, and RSVSTRT parameters in IEASYSxx contain values that, in combination, will not allow the system to run out of usable ASIDs. To conserve overhead, you may want to limit the value specified for MAXUSER and use values for RSVNONR and RSVSTRT that allow for replacement of nonreusable address spaces when the value at MAXUSER has been exceeded.

The total number specified for MAXUSER and RSVNONR should be greater than zero. The sum of the values specified for MAXUSER, RSVNONR, and RSVSTRT cannot be greater than 32767, which is also the maximum for MAXUSER. For more information about the MAXUSER, RSVNONR, and RSVSTRT parameters, see the MVS/ESA Initialization and Tuning Reference manual.

Stopping a CAS

Once a CAS is running, you should not need to stop it unless you want to change its operating parameters.

If you want to stop a CAS, whether it is running as a started task or as a batch job, do the following:
1. Optionally, stop any CMASs that are connected to the CAS.
The CMASs can continue to run without a CAS, but you cannot access them through either the ISPF end-user interface or the application programming interface (API). You may want to leave the CMASs running if either of the following is true:

- You plan to restart the CAS immediately after stopping it.
- The CMAS is involved in workload management for a CICSplex.

Any CMAS that is running when you restart the CAS automatically reconnects to the CAS.

2. From the operator console, issue the MVS purge command:

   ```
P casname
   ```

   where `casname` identifies the CAS you want to stop.

3. Look for the following console message to verify that the CAS has been stopped:

   ```
   BBMZA999I CAS(ssid) Shutdown Complete - CC=nn
   ```

   where `ssid` identifies the CAS that was stopped and `nn` is the completion code.

**Notes:**

1. When the CAS is run as a batch job and you CANCEL the job, the initiator is purged.
2. When the CAS is run as a started task and you PURGE the task, the address space is no longer available for other processing.
Chapter 44. Setting up a CICSPlex SM address space (CMAS)

This chapter describes the steps you must perform in order to make a CICSPlex SM address space (CMAS) operational. These steps consist of:

- "Before you begin"
- "CICSPlex SM auxiliary storage usage"
- "Preparing to transmit generic alerts to NetView" on page 322
- "Preparing to start a CMAS" on page 323
- "CMAS-related CICS SIT parameters" on page 326
- "Shutting down a CMAS" on page 330
- "Restarting a CMAS" on page 331.

For a summary of the CMAS setup tasks that you can refer to while performing them, see Chapter 36, “CICSPlex SM setup checklist and worksheets,” on page 271.

Before you begin

Before you begin, check the IEASYSxx member of SYS1.PARMLIB that you use for MVS initialization and make note of the initialization values that are referenced during installation. For details about these values, see "Noting IEASYSxx values" on page 281.

If you are converting your CICSPlex SM system or systems from a previous release to CICSPlex SM for CICS Transaction Server for z/OS, Version 3 Release 1, you should read the CICS Transaction Server for z/OS Migration from CICS TS Version 2.3.

In CICS Transaction Server for z/OS, Version 3 Release 1 a CICSPlex SM CMAS will run only in a CICS system at the same release level. For example, a CICS TS 3.1 CMAS runs only in a CICS TS 3.1 region. During startup the CMAS checks the CICS release level and terminates with message EYUXL0142 if the releases do not match.

Note: These changes have no effect on the managed CICS systems.

For details on applying corrective or preventive maintenance to CICSPlex SM, see Chapter 26, “Applying service to CICS Transaction Server for z/OS,” on page 179.

Take note of the information in CICSPlex System Manager Concepts and Planning about appropriate uses of a CMAS.

CICSPlex SM auxiliary storage usage

When a CMAS is initialized, up to 9 MVS dataspaces are created. These dataspaces are used by CICSPlex SM to allow quick access to data from a CMAS and the MASs attached to it. Although the dataspaces are logically owned by the CMAS, they are physically owned by the ESSS address space (EYUX310). The dataspaces are deleted when the CMAS (that logically owns the dataspaces) and all local MASs that are attached to that CMAS are terminated. The dataspaces are recreated when the CMAS is initialized again.

The size of the dataspaces is dependent upon the amount of work (end-user interface, workload management, MAS resource monitoring, and real-time analysis
processing) the CMAS is performing and the number of MASs connected to the CMAS. The size may range from 20MB of storage in a relatively idle CICSPlex SM configuration to well over 100MB of storage in a configuration that is complex in both the number of MASs and the amount of work requested. If you do not prepare for such an increase in storage usage, you may encounter auxiliary storage shortages when you first start to use CICSPlex SM.

As an effort to prevent such auxiliary storage shortages, you should ensure that your auxiliary storage capabilities can handle an increase of 100MB of storage within the environment. Additionally, you can monitor CICSPlex SM's dataspace usage by using an external monitor package to determine the amount of storage the EYUX310 job uses.

**Note:** If you contact IBM support personnel because of auxiliary storage shortages, they may ask you to use the CICSPlex SM online debugging transactions (COD0 and CODB) to evaluate the storage use of EYUX310. For information about the COD0 and CODB transactions, refer to the CICSPlex System Manager Problem Determination manual.

If auxiliary storage shortages do occur, you can alleviate the problem by either dynamically increasing your auxiliary storage capability or by causing CICSPlex SM to free the allocated dataspaces, as follows:

- To dynamically increase auxiliary storage capacity, allocate an additional page data set, then use the MVS console command PAGEADD to make the new page data set available.
- To cause CICSPlex SM to free the allocated dataspaces, first terminate the CICSPlex SM agent in all local MASs connected to the CMAS. To do this, you must use the MAS view STOp action.
  
  If a local MAS is acting as a CICSPlex SM WLM TOR, and the DTR program is specified as EYU9XLOP for that MAS, you must change the DTR program from EYU9XLOP before you can use the MAS view STOp action against that MAS. (For example, you can change it to the IBM default program DFHDYP.)
  
  After the CICSPlex SM agent is terminated in all local MASs, terminate the CMAS itself.

  After the auxiliary storage capability is increased, you can restart the CMAS. To reconnect any local MASs that remained active after the CICSPlex SM agent was stopped, execute the COLM transaction within those CICS regions.

  You can execute CORM or COLM using a modify command from the CONSOLE.

### Preparing to transmit generic alerts to NetView

You can have the real-time analysis (RTA) component of CICSPlex SM transmit generic alerts to an IBM NetView system when one or more user-defined conditions occur during analysis.

For information about how to prepare CICSPlex SM to send the generic alerts to NetView, see the discussions of the ACTNDEF view, in CICSPlex System Manager Managing Resource Usage and the CMASD view, in the CICSPlex System Manager Operations Views Reference manual.

To be sure that a NetView system is ready to receive the alerts, use the NPDA command

DFILTER AREC
to verify that the Event Type record IMPD is being passed to the NetView database in the NetView system.

The resulting list should show an ACTION of PASS for ETYPES of IMPD, and RSLV.

If it is necessary to add these record types to the filter, you can issue the following NPDA commands:

```
SRFILTER AREC PASS E IMPD
SRFILTER AREC PASS E RSLV
```

If the name of the NetView Alert Receiver has been changed from the default value (NETVALRT), the CMAS only CICSPlex SM system parameter ALERTRCVR may be used to specify the required name. See Chapter 50, “CICSPlex SM system parameters,” on page 383 for details of the ALERTRCVR parameter.

---

### Preparing to start a CMAS

There are several ways to start a CMAS.

You can start a CMAS:

- **When an MVS system is IPLed.**
  To use this method:
  - Verify that the CMAS startup procedure is in a system procedure library, such as SYS1.PROCLIB.
  - Verify that the CMAS startup procedure is in the ‘Started Tasks’ table of the external security manager (ESM).
  - Change the COMMNDaa member that is referenced by the IEASYSxx member of SYS1.PARMLIB (as in Noting IEASYSxx values on page 281), to include a START command for the CMAS.
  The START command to be included is described in START command for a CMAS on page 330.
- **From the system console.**
  To start a CMAS from the system console:
  - Verify that the CMAS startup procedure is in a system procedure library, such as SYS1.PROCLIB.
  - Verify that the CMAS startup procedure is in the ‘Started Tasks’ table of the external security manager (ESM).
  - Have the operator issue the START command described on page 330.
- **As a batch job.**
  To start a CMAS as a batch job:
  - Verify that the CMAS startup procedure is in a system procedure library, such as SYS1.PROCLIB.
  - Construct a job stream to invoke the CMAS procedure.
  - Submit the job to invoke a CMAS.

No matter which method you use to start a CMAS, be sure to verify that the procedure references the appropriate:

- CICS SIT parameters, as described on page 326
- CICSPlex SM startup parameters, as described on page 383
Notes:

1. Because the job of the CMAS is to manage a MAS, it is important that the CMAS have the ability to process data with a higher priority than the MAS. Therefore, when the MVS image is running in workload management goal mode, the CMAS jobs should be defined to the MVS service class, SYSSTC, for optimal performance. Failure to do so may result in severe performance problems for CICSPlex SM.

2. After starting a CMAS for the first time, you must configure the CMAS to your environment. This includes establishing the CICSplesxes it is to manage and any communication links that are needed between this CMAS and another CMAS. For additional information about this, see [CICSPlex System Manager Administration](#).

A sample procedure that you can use to start a CMAS is supplied in the member EYUCMAS. This member was generated when you ran the EYUISTAR job, as described in [Chapter 39, "Generating post-installation members," on page 297](#). The member is stored in the library you specified on the LIB parameter of the EYUISTAR job.

You must create the data sets for this CICS region. JCL to create the CICS region data sets for the CMAS is supplied in member EYUDFHDS of CICSTS31.CPSM.XEYUINST. This member was generated when you ran the EYUISTAR job.

Figure 56 illustrates segments of the EYUCMAS procedure that are unique to CICSPlex SM.

```
//EYUCMAS PROC DSNCSD=CICSTS31.CPSM.DFHCSD, CSD Data Set name
// DSNtbl=CICSTS31.CPSM.RGNLOAD, CICS Table Module library
// RGNHLQ=CICSTS31.CPSM, CICS Region DSN qualifier
// CICSPRM=EYUCnI0, CICS Parameters
// CPSMPRM=EYUCMS0P CPSM Parameters
//*
//CICS EXEC PGM=EYU9XECS, CMAS Startup program
// PARM='SYSIN', CICS Parameters location
// REGION=0K Region Size
//*
//STEPLIB DD DISP=SHR,DSN=CICSTS31.CPSM.SDFHAUTH
// DD DISP=SHR,DSN=CICSTS31.CPSM.SEYUAUTH
//DFHRPL DD DISP=SHR,DSN=CICSTS31.CPSM.SEYULOAD
// DD DISP=SHR,DSN=CICSTS31.CPSM.CICS.SDFHLOAD
// DD DISP=SHR,DSN=CICSTS31.CPSM.CICS.SDFHLOAD
// DD DISP=SHR,DSN=6DSNTBL
;
//EYULOG DD SYSDUT=*
//DFHJ25A DD DISP=SHR,DSN=CICSTS31.CPSM.SDFHJ25A
//DFHJ25B DD DISP=SHR,DSN=CICSTS31.CPSM.SDFHJ25B
;
//EYUDREP DD DISP=SHR,DSN=CICSTS31.CPSM.EYUDREP.cmasname
//EYUPARM DD DISP=SHR,DSN=CICSTS31.CPSM.SEYUDEF(&CPSMPRM)
//BBACTDEF DD DISP=SHR,DSN=CICSTS31.CPSM.SEYUDEF
//BBVDEF DD DISP=SHR,DSN=CICSTS31.CPSM.SEYUDEF
//BBIPARM DD DISP=SHR,DSN=CICSTS31.CPSM.EYUIPRM

Figure 56. CMAS-specific JCL requirements
```

Review the following statements in the sample JCL that are illustrated in Figure 56. Verify that the JCL has been modified so that the:
EXEC PGM=EYU9XECS statement
Starts the CMAS and either verifies the existence of, or creates, the ESSS.
EYU9XECS, the CMAS startup program, must be run in order for a CMAS
to initialize.

STEPLIB DD statement
Includes the CICSTS31.CPSM.SEYUAUTH authorized load library.

DFHRPL DD statement
Includes the CICSTS31.CPSM.SEYULOAD load library. Include the load
library that contains the CICS resource definition table load modules. These
need to be link edited into a user-supplied load library, which needs to be
specified in the DFHRPL concatenation. See "Creating CICS resource
definition tables for CMASs" on page 307 for more information.
You should not include application load libraries in the DFHRPL
concatenation.

EYULOG DD statement
Identifies the log to which messages from the CMAS and its associated
managed application systems (MASs) are to be directed.
When you are using a sequential data set for the EYULOG, allocate 3
primary cylinders and 1 secondary cylinder.

EYUDREP DD statement
Identifies the library to be used as the data repository by the CMAS, where:
cmasname
Is the name you specified for the CMASNAME parameter on the
EYUISTAR job. The CMASNAME value is used by EYU9XDUT in
order to create the CICSPlex SM data repository. (See "Creating the CICSPlex SM data repository" on page 299.)

EYUPARM DD statement
Identifies the library that contains the CICSPlex SM system parameters.

BBACTDEF DD statement
Defines the data set that contains the SMP-installed CICSPlex SM action
and view tables. These tables help the CAS determine which view names
and actions are valid within a given context.

BBVDEF DD statement
Defines the library that contains all SMP-installed CICSPlex SM views.

BBIPARM DD statement
Identifies the library containing the CICSPlex SM system parameters.

Editing CICSPlex SM system parameters
Member EYUCMS0P, in the CICSTS31.CPSM.SEYUPARM data set, contains
sample parameters for a CMAS; this member must be edited. (See Chapter 50,
"CICSPlex SM system parameters," on page 383 for a detailed description of each
parameter.)

When the CMAS is to connect to a MAS for which security is active (the CICS SIT
parameter for the MAS is SEC=YES), the CMAS must have CICSPlex SM security
active. When CICSPlex SM security is not activated in the CMAS, the connection
between the CMAS and the MAS cannot be established. If this is attempted, the
following message is issued to the console, the CMAS joblog, and the CMAS
EYULOG:
EYUCR0007E Security mismatch between CMAS cmasname and MAS masname. Connection terminating.

To activate CICSPlex SM security in the CMAS, you must specify the CICSPlex SM system parameter SEC(YES). The default is SEC(NO). (For more information about the SEC parameter, see Chapter 50, “CICSPlex SM system parameters,” on page 383.) Specifying SEC=YES in the CICS SIT parameters for the CMAS does not affect CICSPlex SM security.

**CMAS-related CICS SIT parameters**

The CICSTS31.CPSM.SEYUPARM library contains CICS system initialization table (SIT) parameters that should be included in the sequential data set or partitioned data set member EYUC6410 as identified by the CICS SYSIN statement.

Table 22 identifies the CMAS-related CICS SIT parameters.

**Notes:**

1. When the second column in the table contains an asterisk, before you start a CMAS you should supply your own value for the parameter listed in the first column.
2. When the second column of the table does not contain an asterisk, do not change the value of the parameter in the first column.

Table 22. CICS SIT parameters for a CMAS (continued)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Your value</th>
<th>Explanation</th>
</tr>
</thead>
</table>
| START=AUTO | You can normally specify START=AUTO and let CICS initialization decide the type of start to perform. The first time you start a CMAS, ensure the CICS global and local catalog data sets are newly initialized. Use DFHRMUTL and DFHCCUTL respectively, with AUTOINIT on the SET_AUTO_START parameter of DFHRMUTL. This makes sure that the CMAS performs an initial start, which installs the necessary CICS resource definitions and establishes CMAS-to-CMAS connections.
|            | Subsequently, you can manipulate the type of start for a CMAS by resetting the global catalog data set, using DFHRMUTL to specify either AUTOINT or AUTOCOLD. For more information, see "Restarting a CMAS" on page 331. |
| STGPROT=NO | No storage protection. | |
| SUBTSKS=1  | Use additional concurrent mode TCB. | |
| SYSIDNT=   | * CICS System Id. **Note:** The SYSIDNT value must match the EYU9XDUT SYSID parameter value used to initialize the data repository being referenced by the EYUDREP DD statement. | |
| SYSTR=OFF  | No system activity trace. | |
| TCT=NO     | No TCT needed. | |
| TRANISO=NO | No transaction isolation. | |
| TRTABSZ=2048 | Kilobytes for trace table. | |
| TS=COLD    | Cold start temporary storage. | |
| TST=NO     | No temporary storage table required. | |
| USERTR=ON  | Enable user trace facility. | |
| WRKAREA=2048 | Bytes for Common Work Area. | |
| XRF=NO     | No XRF support. **Note:** The extended recovery facility (XRF) is not supported because of the way in which a CMAS uses MVS data spaces. | |

Controlling tasks in a CMAS

Many operations within a CMAS are achieved by multiple asynchronous tasks. This is especially true of operations that are performed between CMASs in a CMAS network, such as data repository synchronisation, workload management state sharing and single system image. Any of these operations, and others, can result in a number of interdependent asynchronous tasks being established or used to execute the request. The number of tasks that can be used is based on other factors, such as the size of a CMAS network, how many MASs are being managed, how many CICSplexes are defined, how much API activity is performed, the scope of EUI/WUI/API/RTA requests and so on for all the major functionality offered by CPSM.

Even though a CMAS can self regulate its tasking model and has tolerance of delayed requests and responses through timeout mechanisms, MXT is a concept...
that is not applicable to controlling an interdependent multitasked asynchronous
tasking model. Set inappropriately, you may also experience EUI and WUI hang' for
long durations if one or more of the asynchronous tasks required to execute the
requested function are delayed waiting for an MXT slot. It is therefore strongly
recommended that MXT should be set to avoid any delays in task attachment.

As task usage within a CMAS grows with the additional requirements that are
placed upon it, such as but not limited to, increased use of the API, more CMASs,
more MAS's, new function use, and so on, you should set the MXT value to a level
that continues to avoid MXT delays.

It is recommended that you monitor any MXT value for its relationship against the
task activity within each CMAS at regular intervals. If the CMAS is starting to
experience MXT delays, you should adjust the MXT value to avoid these delays.

To monitor the tasking activity within an individual CMAS, it is recommended that
you collect and study the statistics generated by the CICS system that underlies the
CMAS that it hosts. CICS transaction manager global statistics contain information
on the effect the MXT value has on task attachment. For more information and
guidance on using CICS statistics see the [CICS Performance Guide](#).

**Controlling CICS storage in a CMAS**

A CMAS is a special application dedicated to the task of managing and controlling
MASs. Even though a CMAS does this with an atypical tasking model and with
extensive use of MVS dataspace storage, it still has major uses of the storage
provided by the CICS system that hosts the CMAS. With an interdependent
multitasked asynchronous tasking model there is a reliance on shared storage to
perform the communication between the tasks and the functions being performed.
Also, according to the requirements that are placed upon a CMAS, there is a large
reliance on shared storage to perform the buffering of requests and responses to be
transmitted via CMAS to CMAS and CMAS to MAS links. The shared storage to
support such operational characteristics is managed by the CICS system that hosts
the CMAS.

As CICS storage usage within a CMAS grows with the additional requirements that
are placed upon it, such as, increased use of the API, more CMASs, more MASs,
increased CMAS to CMAS network traffic and new function use, you should set the
EDSALIM value to a level that provides the CMAS with the amount of storage it
needs to perform its operations unimpeded. CMAS to CMAS and CMAS to MAS
network traffic, in particular, is critical to EUI and WUI response times because
large amounts of data may be awaiting shipment on any of the links that a CMAS
communicates on.

It is recommended that you monitor any EDSALIM value for its effect on the storage
usage within each CMAS at regular intervals. If the CMAS is experiencing short on
storage (SOS) or storage fragmentation or trending towards such conditions, you
should consider increasing the EDSALIM value to meet the storage requirements of
the CMAS. Storage fragmentation below a largest free area of 64KB will begin to
adversely effect throughput and response times.

To monitor the storage usage within an individual CMAS, it is recommended that
you collect and study the statistics generated by the CICS system that underlies the
CMAS that it hosts. CICS storage manager global statistics contain information on
the overall usage of CICS storage by the CMAS that it hosts. For more information
and guidance on using CICS Statistics see the [CICS Performance Guide](#).
START command for a CMAS

The syntax of the command you can use to start a CMAS is:

```
START procname [,DSNCSD=dsn] [,DSNTBL=dsn] [,RGNHLQ=idx]
[,CICSPRM=mem] [,CPSMPRM=mem]
```

where:

- **procname**
  - Is the 1- to 8-character name of the procedure. (EYUCMAS is the name of the distributed sample procedure.)

- **DSNCSD=dsn**
  - Specifies the name of the data set that contains the CSD file that has been modified to include the necessary CICSPlex SM resource definitions.

- **DSNTBL=dsn**
  - Specifies the name of the data set that contains the CICS table modules that have been modified for CICSPlex SM. These need to be link edited into a user-supplied load library, which needs to be specified in the DFHRPL concatenation. See "Creating CICS resource definition tables for CMASs" on page 307 for more information.

- **RGNHLQ=idx**
  - Specifies the high-level qualifier that is used with the DFHxxxx data sets that are unique to this CMAS.

  The EYUINST EXEC parameter CINDEX establishes the high-level qualifier that is used with CICS data sets that are shared between systems.

- **CICSPRM=mem**
  - Identifies the member in the CICST31.CPSM.SEYUPARM library that contains the CICS SIT parameters.

- **CPSMPRM=mem**
  - Identifies the member in the CICST31.CPSM.SEYUPARM library that contains the CICSPlex SM system parameters.

Setting the VTAM APPLID for a CMAS

The last step is to use the CMTCMDEF view to set the VTAM APPLID for the target CMAS, to establish direct CMAS-to-CMAS communication links. The CMTCMDEF view is described in the CICSPlex System Manager Administration manual.

The CMTCMDEF view is not available until you have a CMAS that can access CICSPlex SM itself.

Shutting down a CMAS

You can shut down a CMAS using:

- The **SHUTDOWN** command
- The **COSD** transaction.

It is also possible to use the **CMASSSTOP** command of the CODB system-level debugging transaction to shut down the CMAS, but CODB is restricted and should be used only at the request of IBM customer support personnel.

**Note:** You should not attempt to:
Issue the CEMT PERFORM SHUTDOWN command against a CMAS. Cancel the CMAS job from MVS.

If you take either of these actions, the CMAS cannot shut itself down properly.

**Using the SHUTDOWN command**

You can issue the `SHUTDOWN` command from either the CMAS view or the CMASD view.

**From the CMAS view**

Issue the action command:

```sh
SHUTDOWN cmas
```

where `cmas` identifies the CMAS to be shut down.

**From the CMASD view**

Issue the action command:

```sh
SHUTDOWN
```

**Using the COSD transaction**

You can issue from any terminal, including an MVS console, the transaction id:

```sh
COSD
```

You should see an information message that indicates whether or not the CMAS is shut down. For details of these messages, see CICSPlex System Manager Messages and Codes.

**Restarting a CMAS**

A CMAS that was shut down normally (using the CICSPlex SM SHUTDOWN action command) can usually be restarted with a SIT parameter of `START=AUTO`. However, you must specify `START=COLD` if you have:

- Modified any of the CICS resource definitions that are used by the CMAS.
- Added or removed CMAS-to-CMAS (CMTCMDEF) connection definitions.

If a CMAS terminates abnormally (that is, through any means other than the CICSPlex SM SHUTDOWN action command), you must perform an emergency restart to allow CICS to perform backout processing. You can accomplish an emergency restart of a CMAS in one of two ways:

- If the CMAS is registered with the MVS automatic restart manager (ARM), an emergency restart occurs automatically.
- If the CMAS is not registered with ARM, specify `START=AUTO` in the CMAS startup procedure.

A CMAS should initialize and function properly after an emergency restart, provided you have made no changes to the CICS resource definitions or CICSPlex SM connection definitions.

If you have made any such changes since the last run of the CMAS (that is, the one that terminated abnormally), the CMAS may not function properly. In that case, you should shut down the CMAS with the CICSPlex SM SHUTDOWN action command and restart it, specifying `START=COLD`. For an illustration of the SHUTDOWN action command, see “Shutting down a CMAS” on page 330.
Chapter 45. Setting up a CICS managed application system (MAS)

This chapter describes the steps you must perform so that a CICS TS system can be known as a managed application system (MAS) to CICSPlex SM. (Throughout the rest of this chapter, a CICS TS MAS is referred to as an MVS MAS.) The following levels of CICS under MVS can connect directly to, and be managed by, CICSPlex SM:

- CICS Transaction Server for z/OS, Version 2 Release 3
- CICS Transaction Server for z/OS, Version 2 Release 2
- CICS Transaction Server for OS/390, Version 1 Release 3

The information you need is in the following sections:

- "Before you begin"
- "Using CICS global user exits and user-replaceable modules"
- "Controlling the use of modules from the LPA" on page 334
- "Preparing to start an MVS MAS" on page 334
- "Stopping and restarting management of a CICS system" on page 339

For a summary of the MAS setup tasks that you can refer to while performing them, see Chapter 36, “CICSPlex SM setup checklist and worksheets,” on page 271.

Before you begin

Before you begin, check the IEASYSxx member of SYS1.PARMLIB that you use for MVS initialization and make note of the initialization values that are referenced during installation. For details about these values, see "Noting IEASYSxx values" on page 281.

If you are converting your CICSPlex SM system or systems from a previous release to CICSPlex SM for CICS Transaction Server for z/OS, Version 3 Release 1, you should read the CICS Transaction Server for z/OS Migration from CICS TS Version 2.3 Guide.

For details on applying corrective or preventive maintenance to CICSPlex SM, see Chapter 26, "Applying service to CICS Transaction Server for z/OS," on page 179.

Using CICS global user exits and user-replaceable modules

This section describes the CICS global user exits (GLUE) and user replaceable modules that are used by CICSPlex SM.

The way these exits are used by CICSPlex SM conforms to the standard described in the CICS Customization Guide. CICSPlex SM uses these exits only to acquire information; the application environment is not altered.

CICSPlex SM uses the dynamic routing program user replaceable module (DTRPROG) as part of workload balancing.

The XMNOUT and XSTOUT exits are used when monitoring services are enabled for a managed application system (MAS).

- The XMNOUT exit is used to get task and CICS monitoring data. XMNOUT is used only with a local MAS.
- The XSTOUT exit is used to get statistical data before the data is reset by CICS.
These exits are used to obtain monitoring and statistics information and always return a “continue processing” return code. They are disabled when a shutdown request for the MAS is received.

The XMEOUT, XDUREQ, XDUREQC, XRSINDI and XDUOUT exits are used when topology requests are enabled for a local MAS. The XMEOUT exit is used to detect short on storage sick and well health events.
- The XRSINDI exit is used to detect topology resource changes.
- The XDUREQ exit is used to detect system dump and transaction dump sick health events.
- The XDUREQC exit is used to detect the completion of dump action.
- The XDUOUT exit is used to detect transaction dump well health events.
- The XSNOFF exit is used to detect user signoff events.

Controlling the use of modules from the LPA

You can control whether CICS uses modules from the LPA, by specifying the LPA and PRVMOD CICS system initialization parameters or by including or excluding the SYS1.CICSTS31.CPSM.SEYULPA library (defined to MVS as an LPA library) in the STEPLIB or DFHRPL concatenations.

Notes:
1. A module that is link-edited with the RMODE(ANY) attribute is loaded into the ELPA.
2. It is important to remember that the LPA-resident version of a module usually loaded from STEPLIB is not used from the LPA if it is left in the STEPLIB DD concatenation of libraries. If a module is found in the STEPLIB concatenation, it is loaded into the private area of the address space, and the LPA version ignored. This situation can be avoided by moving the LPA-eligible modules into an LPA library, as described in "Installing CICSPlex SM modules into the LPA" on page 287.

For further information about controlling the use of LPA-eligible modules, see Chapter 14, “Installing CICS modules in the MVS link pack area,” on page 107, taking particular note of information concerning:
- The module-not-found warning message (DFHLD0107I)
- CICS SIT parameters related to LPA modules.

Preparing to start an MVS MAS

Note: Because a CICS system is unknown to CICSPlex SM until the CMAS with which the CICS system is associated is started, you should start the CMAS before any of the MASs (that is, the CICS systems the CMAS is to manage).

CMAS links can fail if you have high priority jobs running alongside your CICS regions. For example, if a MAS holding a lock cannot be dispatched because of a priority conflict, the CMAS links can fail.

In order for a CICS system to be managed by CICSPlex SM, you must:
- Define the system to CICSPlex SM, as described in the CICSPlex System Manager Administration
- Change the startup JCL for that system by:
- Modifying the DD statements shown in Figure 57 to include the CICSplex SM data sets
- Verifying that the appropriate CICS SIT parameters are included

```
//STEPLIB DD DSN=CICSTS31.CPSM.SEYUAUTH,DISP=SHR
//DFHRPL DD DSN=CICSTS31.CPSM.SEYULOAD,DISP=SHR
//EYUPARM DD DSN=(Any PO or PS data set with LRECL=80)
//EYUHISTA DD DSN=(Optional 1st history dataset)
//EYUHISTB DD DSN=(Optional 2nd history dataset)
//EYUHISTn DD DSN=(Optional nth history dataset)
```

*Figure 57. MVS MAS-specific JCL requirements*

When changing these DD statements in the startup JCL for a CICS system make sure that the:

**STEPLIB DD statement**
Includes the CICSTS31.CPSM.SEYUAUTH authorized load library.

**DFHRPL DD statement**
Includes the CICSTS31.CPSM.SEYULOAD load library.

**EYUPARM DD statement**
Identifies the library containing the CICSplex SM parameters.

**Notes:**

1. Member EYULMS0P in the CICSTS31.CPSM.SEYUPARM data set, contains sample system parameters for a local MAS; this member must be edited. See Chapter 50, "CICSplex SM system parameters," on page 383 for a detailed description of each parameter.

2. If you want to use Business Application Services to install CICS resources in a MAS, you must specify the CICSplex SM system parameter MASPLTWAIT(YES) for that system. This parameter suspends CICS PLT processing until all CICS resources are installed and the CICSplex SM MAS is fully initialized.

**EYUHISTx DD statement**
Identifies the history data sets for the MAS. Each MAS must have its own set of CICSplex SM history data sets. The data sets must be allocated to the MAS region by means of DD cards in the JCL with DD names of the form EYUHISTx, where x is a character suffix taking values A through Z. Dynamic allocation is not supported. The data sets must be allocated with a disposition of OLD. The suffix letters must be used in ascending sequence and no letter should be omitted. For example, if four history data sets are required, use DD names EYUHISTA, EYUHISTB, EYUHISTC, and EYUHISTD. See "Preparing the MAS for history recording" on page 338.

**Activating DB2 connections during CICS startup**
This section applies to CICS Transaction Server for z/OS, Version 3 Release 1 CICS systems with the CICS-DB2 attachment facility.

Special considerations apply when BAS is used to install a DB2 connection defined to CICSplex SM via a DB2CDEF resource definition.

When BAS is used to define and then install a DB2 connection (via a DB2CDEF) the connection starts out in NOTCONNECTED status. You can then issue a
CONNect command on the DB2CONN view against an installed connection, to cause the connection to the DB2 subsystem to be activated.

In a test environment, it might be acceptable to wait for the MAS to start and then install the BAS definition, and issue a CONNECT command against the resulting DB2CONN.

However, in a production system, you might want the connection to be automatically activated when the MAS starts up, as part of the PLT processing sequence, so that the DB2 subsystem can be accessed immediately by programs and users.

Specifying the CICS SIT parameter DB2CONN=YES does not by itself achieve this, because at the time this and other SIT parameters are processed, CICSPlex SM has not yet installed any DB2CDEF objects.

The way to activate a DB2 connection during CICS startup is as follows:
1. Ensure there is an appropriate DB2CDEF resource definition for CICSPlex SM to install, and that the definition is set up for automatic installation.
2. Specify CICSPlex SM parameter MASPLTWAIT(YES). This causes the DB2CDEF resource definition (as well as all other BAS resource definitions) to be installed during PLT processing.
3. Arrange for the appropriate DB2 connect program to be started after the MAS startup program (EYU9NXLM for a local MAS).

**MQSeries connections**

You cannot use BAS to define and install an MQSeries® connection before the CICSPlex SM environment has been initialized.

**MVS MAS-related CICS SIT parameters**

You should verify that the sequential data set or partitioned data set member identified by the CICS SYSIN statement includes the appropriate CICS system initialization table (SIT) parameters, as described in Table 23.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>APPLID=</td>
<td>VTAM application ID for this CICS system. Used as MAS name when NAME(value) is not specified as a CICSPlex SM system parameter.</td>
</tr>
<tr>
<td>AUTORSETTIME={YES</td>
<td>NO}</td>
</tr>
<tr>
<td>CPSMCONN=LMAS</td>
<td>Initialize the region as a local MAS.</td>
</tr>
<tr>
<td>DFLTUSER=userid</td>
<td>Specify the user identifier that is to be used for security checking when a user is not defined to the ESM.</td>
</tr>
<tr>
<td>DSALIM=</td>
<td>Limit of DSA storage below 16MB. Should be set to at least 4MB.</td>
</tr>
<tr>
<td>EDSALIM=</td>
<td>Limit of EDSA storage below 16MB. Should be set to at least 50MB.</td>
</tr>
<tr>
<td>GRPLIST=</td>
<td>Identify the name of the group list containing the CICSPlex SM group added to the CSD file for the MAS. (See “Updating CSD files using DFHCSDUP (MVS MAS)” on page 311 for additional information.)</td>
</tr>
<tr>
<td>ISC=YES</td>
<td>Code YES to include the CICS programs required for interregion and intersystem communications.</td>
</tr>
<tr>
<td>MCT=</td>
<td>Monitoring control table. If you have CICS performance class monitoring active, then you must specify a value for this parameter. You can use 2$ (the default) or an existing table. (See Note below.)</td>
</tr>
</tbody>
</table>
Table 23. CICS SIT parameters for an MVS MAS (continued)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>MN=ON</td>
<td>Activates CICS Monitor. (See Note below.)</td>
</tr>
</tbody>
</table>
| MNFREQ=001500 | Writes performance class data every 15 minutes.  
Note: Set only for local MAS. |
| MNPER=ON    | Tells CICS to monitor performance classes. (See Note below.) |

**Note for MCT, MONITOR, MN, and MNPER parameters:** To get all data available for the TASK and MLOCTRAN views, MCT must have a value specified, CICS monitoring for performance classes must be activated, and you must be collecting performance class data.

If you do not want this data written to an SMF data set, you can suppress the monitor records. See the description of the SUPPRESSCMF parameter in [Chapter 50, “CICSPlex SM system parameters,” on page 383.]

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Explanation</th>
</tr>
</thead>
</table>
| MXT=        | Maximum tasks. Increase by 25 to accommodate the CICSPlex SM MAS tasks.  
Note: CICSPlex SM rarely uses all 25 of these additional tasks. If you are using the MXT value alone to control application transactions, increasing this value can allow more application transactions to run concurrently. To prevent this from occurring, you can define a transaction class for the application and set the MAXACTIV task value to limit the number of concurrent transactions. |
| SEC= {YES|NO} | Indicate whether external security checking is to be performed for this CICS system. Specify:  
YES When READ access is granted:  
- READ is permitted  
- UPDATE is refused.  
When UPDATE access is granted:  
- READ is permitted  
- UPDATE is permitted.  
NO Security checking is not performed.  
Notes:  
1. For CICS security, the value specified with SEC= for a CMAS overrides the value specified with SEC= for a MAS. (For more information about this parameter, see the [CICS RACF Security Guide](#).)  
2. For CICSPlex SM security to be active, you must set SEC=YES for a MAS, and the CMAS to which it connects must have the CICSPlex SM system parameter SEC(YES). When CICSPlex SM security is not activated in the CMAS, the connection between the CMAS and the MAS cannot be established. If this is attempted, message EYUCR0007E is issued to the console, the CMAS joblog, and the EYULOG.  
(For more information about the SEC parameter for the CMAS, see [Chapter 50, “CICSPlex SM system parameters,” on page 383.](#)) |
| SECPRFX={YES|NO |prefix} | Specify whether the user ID is used as the prefix that is added to the beginning of all resource names to distinguish this CICS system from other CICS systems. |
| SYSIDNT=    | Indicate the id of the CICS system. This name should be unique within a CICSpex. |
| XCMD= {YES|name|NO} | Indicate whether EXEC CICS system commands are to be included in security checking. Specify YES or NO. For more information about CICSPlex SM transaction security requirements, see the CICS RACF Security Guide. |

Preparing the MAS for history recording

CICSPlex SM provides the ability to save and view data for completed tasks, that is historical task data. When an active task completes, its data is stored in a historical data store. The data store is made up of a number of VSAM KSDS data sets. There must be a minimum of two data sets and a maximum of twenty six data sets.

Each MAS must have its own set of CICSPlex SM history data sets. The data sets must be allocated to the MAS region by means of DD cards in the JCL with DD names of the form EYUHISTx, where x is a character suffix taking values A through Z. Dynamic allocation is not supported. The datasets must be allocated with a disposition of OLD. The suffix letters must be used in ascending sequence and no letters should be omitted. For example, if four history data sets are required use DD names EYUHISTA, EYUHISTB, EYUHISTC, and EYUHISTD.

The CICSPlex SM history data sets must be defined with the REUSE keyword.

Task history recording uses the least recently used data set, or when starting for the first time EYUHISTA. When EYUHISTA becomes full, it switches to use EYUHISTB and so on in sequence. Each full data set remains open with its data available until the history recorder has filled all data sets and needs to start reusing the data sets. At this time EYUHISTA is set closed, emptied, re-opened, and reused first, followed by EYUHISTB and so on in sequence. If a data set is reused its previous contents are destroyed.

Until the history recorder requires to empty a data set in order to reuse it, the historical task data is available for use. The data is maintained across CMAS and MAS restarts. The history data sets need not be defined as recoverable, as unit of work recoverability is not required. However, the CICSPlex SM history recorder facility does require files to be defined as non-recoverable to avoid unnecessary logging in the MAS region.

In addition, the history data sets must not be defined to use VSAM compression. The CPSM history function initializes the data sets in order to calculate how many records fit in the data set, so that it can safely use sequential writes to the data set, thereby reducing the I/O overhead. Use of VSAM compression invalidates that calculation and cause data to be lost when the data set becomes full and a data set switch is required.
CICSPlex SM provides a tuning aid in the form of a EYUPARM called HISTRECSMSG to determine the optimum size for history data sets. HISTRECSMSG can activate the periodic output of messages detailing how many thousand records have been written to the data set. There is one record for each completed task. Since CICS file control supports extended format KSDS data sets, large history data sets over 4GB in size can be defined. However when considering using very large data sets, take into account that when the CICSPlex SM history recorder reuses a data set by emptying it, a large amount of data is lost and not available for subsequent queries. An alternative approach to having a small number of very large data sets, is to spread the data over more data sets. For example, by having twenty five data sets each one capable of holding one hours worth of completed task data, at least one days worth of data can always be maintained. When the oldest data set is reused, only one hours worth of data is lost.

CICSPlex SM provides a sample job called EYUJHIST in SEYUINST for defining and initializing two history data sets.

### Stopping and restarting management of a CICS system

This section tells you how to:
- Stop management of a CICS system
- Restart management of a CICS system
- Terminate a CICS system.

#### Stopping management of a CICS system

To stop the MAS agent code in an active CICS system, either:
- Issue the STOP action command from the MAS view, or
- Run transaction COSH in the MAS. COSH can be started at a 3270 terminal, at a console, or via ATI.

Stopping the MAS agent prevents CICSPlex SM from accessing the MAS until either the CICS system is restarted (see page 334) or the COLM or CORM transaction is issued (see "Restarting management of a CICS system").

**Note:** When a MAS is active as a CICSPlex SM workload management routing region, and the dynamic routing program is set to EYU9XLOP, the STOP command is not honored. In this situation, before you issue the STOP command you must use the CICSRGND view to change the dynamic routing program from EYU9XLOP to the CICS default dynamic routing program, DFHDYP, or another valid dynamic routing program.

#### Restarting management of a CICS system

To reactivate a running CICS system as a MAS, issue the CICS transaction:

```
COLM  For a local MAS
```

**Note:** If you want a local MAS to be recognized as a workload management routing region when CICSPlex SM resumes managing the system, make sure the dynamic routing program is set to EYU9XLOP. To change the dynamic routing program, use the CICS CEMT transaction before you reactivate the local MAS.
Terminating a MAS

To verify that the CICSpedia SM MAS shutdown processing is properly installed, you can terminate the CICS system and check the log for the following shutdown message:

EYUXL0016I MAS shutdown complete

To terminate a CICS system running the MAS agent code, use the CICSRGN view to issue the desired shutdown command. For more information about the CICSRGN view, see the CICSPedia System Manager Operations Views Reference manual.

# Controlling the number of long running tasks in a MAS

The MAS agent contains one primary long running task (LRT), which runs under transaction CONL. By default, this task handles most requests directed to the MAS through the EUI, API, WUI, and RTA. The CONL task also handles internal requests for the MAS, including collecting information on dynamically installed resources and delivering this information to the CMAS. If the LRT becomes busy handling one request, all subsequent requests directed to the MAS are delayed until the current request ends.

Alternate LRTs, which run under the CONA transaction, can be requested by specifying a non-zero value for the MASALTLRTCNT EYUPARM. If activated, the alternate LRTs handle the EUI, API, WUI, and RTA requests normally handled by the primary LRT. Only one alternate LRT is active at a given time. If the active alternate LRT becomes busy for longer than the value specified by the MASALTLRTTIM EYUPARM, subsequent EUI, API, WUI, and RTA requests directed to the MAS are directed to another CONA task.

Using alternate LRTs allows subsequent requests to be processed even though a previous request has yet to be completed. This also allows the primary LRT to process internal requests without being delayed by the processing of an EUI, WUI, API, or RTA request.

The number of alternate long running tasks (MASALTLRTCNT) can be tuned using the EYUNL0911I, EYUNL0912I, and EYUNL0913I messages issued when a MAS terminates or goes into restart mode. EYUNL0911I displays the number of active CONA tasks for this execution. EYUNL0912I displays the maximum number of concurrently busy CONA tasks. If this value is less than the value displayed by EYUNL0911I, then you might want to lower the MASALTLRTCNT so that it equals the value displayed by EYUNL0912I or is one greater. If the value of EYUNL0912I is equal to the value displayed by EYUNL0911I, then the value displayed by EYUNL0913I, the number of times all active CONA tasks were busy at the same time, is non-zero. Based upon this value you can increase the value of MASALTLRTCNT.

The priority of the alternate LRTs can be controlled by the MASALTLRTPRI EYUPARM. Specifying this less than the default value of 255 can adversely affect the response time of EUI, API, and WUI users, and might result in RTA EVENTs not being created or resolved in a timely manner.

Note: Specifying different values for MASALTLRTCNT for multiple WLM target regions might result in an uneven distribution of transactions to those regions because of differing long running task counts.
Chapter 46. Setting up a CICSPlex SM Web User Interface server

This chapter describes the steps you must perform to use the CICSPlex SM Web User Interface. These steps consist of:

- "Preparing a CICS system to act as the Web User Interface server"
- "Configure CICS Web support" on page 342
- "Review CICS system initialization parameters" on page 343
- "Specify language and codepage" on page 344
- "Prepare codepage conversion table" on page 345
- "Generate the Program Load Table (PLT)" on page 345
- "Create the Web User Interface server repository (EYUWREP)" on page 346
- "Specify the customizable view and menu help data set" on page 346
- "Specify the Web User Interface server initialization parameters" on page 347
- "Update CICS CSD definitions" on page 355
- "Specify the JCL DD statements" on page 356
- "Security considerations" on page 357
- "Additional tasks" on page 359

Preparing a CICS system to act as the Web User Interface server

You should consider the following before you set up your CICS system to act as your Web User Interface server:

- The CICS system that you select to act as your Web User Interface server must be a dedicated CICS Transaction Server for z/OS, Version 3 Release 1 CICSPlex SM MAS connected to a CICS Transaction Server for z/OS, Version 3 Release 1 CMAS. For information about how to set up a MAS, see the [CICS Transaction Server for z/OS Installation Guide]
- Decide how many Web User Interface servers you need. For example:
  - If you intend to support more than one national language you need a Web User Interface server for every language you want to support.
  - You may want to have Web User Interface servers on multiple MVS images.
  - You may want to have more than one Web User Interface server for availability reasons.
  - The Web User Interface server creates and maintains state data when a user signs on via a web browser (or when an application using the data interface DATA/CONNECTs). Because of this state data, an affinity between the web browser (or application using the data interface) and server is created.
    The use of techniques like dynamic virtual IP addresses (DVIPA) or distributed DVIPA may not be able to honor this affinity. If this affinity is not honored, the usual result is for web browsers to redisplay the sign on screen or for data interface applications to receive a BADSTUB status.
    If a the Web User Interface server has a different local IP address or name to the one used by users in their web browsers, for example due to a firewall or another reason that causes network address translation (NAT), the TCPIPHTTPHOST Web User Interface server initialization parameter may be used to control the way the Web User Interface server generates URLs sent to web browsers. See [348] for details.
To set up your CICS system you should:

1. Create the CICS system and confirm that it is operational using the CICS-supplied installation verification procedures (IVPs). For information about the CICS IVPs, see the CICS Transaction Server for z/OS Installation Guide.

2. Configure CICSPlexes for your Web User Interface servers. We suggest that you configure a separate CICSPlex for your Web User Interface servers. For information, see the CICS Transaction Server for z/OS Installation Guide.

3. Ensure that the CMAS to which the Web User Interface connects is managing all CICSPlexes that the Web User Interface server needs access to. This is because the Web User Interface server acts as an CICSPlex SM API application. However, it is not necessary for the CMAS, to which the Web User Interface connects, to be managing any of the MASs in these CICSPlexes. For information, see the CICS Transaction Server for z/OS Installation Guide.

   If there is more than one CMAS on the MVS image, that the Web User Interface server will run on, you need to consider which CMAS the Web User Interface should connect to depending on which CICSPlexes the CMAS is managing. To control this connection you can either:
   - Ensure the CICSPlex to which the Web User Interface server local MAS belongs is only managed by the CMAS or CMASs that the Web User Interface should connect to, or
   - Ensure that the Web User Interface server connects to a specific CMAS by specifying the CMASSYSID EYUPARM for the server local MAS.

4. Define the Web User Interface server CICS system to CICSPlex SM as a local MAS (for information, see the CICS Transaction Server for z/OS Installation Guide) and ensure that the CICS system has been set up correctly using the CICSPlex SM installation verification procedures (IVPs).

5. Consider basic monitoring of your Web User Interface servers. You can use standard CICSPlex SM monitoring because the Web User Interface server is defined as a MAS.

### Configure CICS Web support

You should always use a CICS Transaction Server for z/OS, Version 3 Release 1 system to act as your Web User Interface server. In order to configure CICS web support you should:

- Include the CICS resource definition group, DFHWEB, in the group list referenced by the GRPLIST system initialization parameter of your CICS system.
- Run the CICS Web support sample application, DFH$WB1A, to ensure that CICS Web support has been set up correctly.

For more information about specifying CICS system initialization parameters and defining resources to CICS for CICS Web support, see the CICS Internet Guide.

If you wish to use the secure sockets layer (SSL) you should also:

- Create a key database containing a certificate
- Specify the appropriate system initialization parameters
- Install the appropriate resource definitions

For more information about SSL, see the CICS Internet Guide.

**Notes:**

1. You do not need to write your own Analyzer or Converter programs as these are provided with the Web User Interface.
2. On the Web User Interface initialization the TCPIPSERVICE is created and opened for you by the Web User Interface. You do, however, need to create a temporary TCPIPSERVICE definition to run the CICS Web support sample application. This temporary TCPIPSERVICE definition should be discarded after CICS Web support has been tested and before Web User Interface initialization has begun.

3. The Web User Interface can either use the default certificate in the key database or a named certificate. However, it can only use a named certificate provided that the label contains only alphanumeric characters and is a maximum of 32 characters.

4. The use of pre-CICS Transaction Server for z/OS, Version 3 Release 1 systems as Web User Interface servers is not supported.

---

### Review CICS system initialization parameters

You need to specify the storage key for the CICS common work area (CWA), and the amount of storage required for the CWA on the CWAKEY and WRKAREA CICS system initialization parameters as follows:

```plaintext
CWAKEY=CICS
WRKAREA=2048
```

To ensure that Web User Interface exception trace entries are written to the CICS auxtrace data set, as required to achieve first failure data capture, you should specify the USERTR, SYSTR, and AUXTR CICS system initialization parameters as follows:

```plaintext
USERTR=ON
SYSTR=OFF
AUXTR=ON
```

**Note:** If you set AUXTR=OFF, this is overridden at startup. The Web User Interface sets auxiliary trace on in order to record exception trace entries in the event of a problem that does not result in a SVCDUMP.

You should specify the CPSMCONN CICS system initialization parameter to invoke CICSPlex SM code automatically during CICS initialization and initialize the region as a CICSPlex SM Web User Interface server. This is the recommended alternative to specifying the CICSPlex SM WUI initialization and shutdown programs in initialization and shutdown program list tables (PLTPI and PLTSD):

```plaintext
CPSMCONN=WUI
```

You should specify the action CICS should take if, at the next local midnight, the CICS time-of-day differs from the system time-of-day by more than 30 minutes (for example, after setting clocks forward or back to adjust for Summer and Winter time) as follows:

```plaintext
AUTORESETTIME=YES
```

Clients should continue to issue the CEMT PERFORM RESET command.

In addition to specifying the necessary CICS system initialization parameters for CICSPlex SM local MAS execution, specify the appropriate CICS system initialization parameters to enable CICS Web Interface support, for your release of CICS. For example, TCPIP=YES for CICS Transaction Server for OS/390 version 1.3 or later.

For information about these parameters see the [CICS System Definition Guide](#).
Specify language and codepage

In addition to specifying CICS system initialization parameters for the CICS Web Interface and CICSPlex SM local MAS execution, the Web User Interface requires an INITPARM system initialization parameter to specify the server language and the client codepage. You need to code EYU9VKEC to represent the language of the Web User Interface server and EYU9VWAN to represent the codepage of the client on the INITPARM parameter.

You can select the server language and the client codepage from Table 24 and specify them on the INITPARM parameter as follows:

\[
\text{INITPARM}=(\text{EYU9VKEC}='xxx', \text{EYU9VWAN}='yyyy')
\]

where \(xxx\) is the language identifier of the Web User Interface server and \(yyyy\) is the codepage identifier of the client.

### Table 24. Language and codepage identifiers for INITPARM

<table>
<thead>
<tr>
<th>Language</th>
<th>Language identifier (EYU9VKEC)</th>
<th>Client codepage</th>
<th>Default client codepage identifier (EYU9VWAN)</th>
</tr>
</thead>
<tbody>
<tr>
<td>US English</td>
<td>ENU</td>
<td>ISO-8859-1 (819)</td>
<td>ENU1</td>
</tr>
<tr>
<td>Japanese</td>
<td>JPN</td>
<td>Shift-JIS (943)</td>
<td>JPN1</td>
</tr>
<tr>
<td>Simplified Chinese</td>
<td>CHS</td>
<td>GB2312 (1381)</td>
<td>CHS1</td>
</tr>
<tr>
<td>Simplified Chinese</td>
<td>CHS</td>
<td>GB18030 (05488)</td>
<td>CHS2</td>
</tr>
</tbody>
</table>

For example, if your chosen language was English you would code the INITPARM parameter as follows:

\[
\text{INITPARM}=(\text{EYU9VKEC}='ENU', \text{EYU9VWAN}='ENU1')
\]

**Notes:**

1. The codepage identifier can be overridden for individual user requests by placing it in the URL used to access the Web User Interface. For example:

   \[http://hostname:port/CICSPlexSM/codepage\]

   where \(hostname\) is the name specified on the TCPIPHOSTNAME Web User Interface server initialization parameter and \(port\) is the value specified on the TCPIPPORT Web User Interface server initialization parameter. For information about the Web User Interface server initialization parameters see “Specify the Web User Interface server initialization parameters” on page 347.

2. If the INITPARM system initialization parameter is not specified or if a value is not specified for EYU9VKEC or EYU9VWAN, the default values are ENU for the language and ENU1 for the codepage. However, operator messages are issued every time default values are used.

3. A simplified Chinese web user interface server can support client browsers using either GB2312 (CHS1) or GB18030 (CHS2). For GB2312 clients, the server uses the EBCDIC codepage, 935. For GB18030 clients, the server assumes a second EBCDIC codepage, 1388, which is a superset of codepage 935. View sets and menus edited using a GB2312 client browser are stored in 935 and can be used in either client codepage. However, if a view set or menu is edited using a GB18030 client and characters not available in 935 are used, the resulting views set or menu are not displayed correctly on GB2312 clients. Note that all supplied messages and starter set views and menus, and view
sets and menus customized using CICS TS 2.2 or earlier, use the 935
codepage and can be displayed on either client codepage.

4. Some web browsers do not support all the available client code pages. For
example, many older browsers do not support GB18030.

---

**Prepare codepage conversion table**

You need to create or modify the DFHCNV table for data conversion to allow the
Web User Interface to deal with incoming requests.

A sample copybook is provided in CICSTS31.CPSM.SEYUSAMP called
EYU$CNV1. This contains an entry for every language and client codepage
combination that is supported as follows:

- **EYUENU1**
  - Entry for English
- **EYUJPN1**
  - Entry for Japanese
- **EYUCHS1**
  - Entry for simplified Chinese (GB2312 clients).
- **EYUCHS2**
  - Entry for simplified Chinese (GB18030 clients)

You should include a copy statement for EYU$CNV1 in the DFHCNV source, for
example, the CICS Web Interface sample, DFHCNVWS. For information about the
definitions required for the CICS Web Interface, see the [CICS Internet Guide](#).

Once you have updated your DFHCNV source module, you should assemble and
link-edit it using the CICS procedures for maintaining conversion table load
modules.

The process used to assemble and link-edit the CICS conversion table load
modules must have library CICSTS31.CPSM.SEYUSAMP in the SYSLIB
concatenation of the assembler step, or the copy book member must be inserted
into the table source member in place of the COPY statement.

---

**Generate the Program Load Table (PLT)**

The following paragraphs contain instructions for generating the PLT. However for
CICS TS systems there is no need to specify the WUI initialization and shutdown
programs in initialization and shutdown program list tables (PLTPI and PLTSD). The
recommended alternative is to specify the CPSMCONN=WUI CICS system
initialization parameter which will invoke CICSPlex SM code automatically during
CICS initialization to initialize the region as a CICSPlex SM Web User Interface
server.

```
# Update your WUI PLTPI and PLTSD initialization and shutdown program list tables
# with the following:
#  DFHPLT TYPE=ENTRY,PROGRAM=EYU9VKIT
```

**Note:** This should be placed after the DFHDELIM for PLTPI and before the
DFHDELIM for the PLTSD. An example of the DFHDELIM for PLTPI is as
follows:
When you have updated your PLT CICS resource definition table, assemble and link-edit it using the CICS procedures for maintaining resource definition table load modules.

### Create the Web User Interface server repository (EYUWREP)

The Web User Interface server repository (EYUWREP) contains the Web User Interface server's view and menu definitions. You can use the IDCAMS utility to create a VSAM file for these definitions as follows:

```sql
DEFINE CLUSTER ( -
   NAME( dsn ) -
   VOLUMES( dsvol ) -
   RECORDS( 5000 5000 ) -
   RECORDSIZE( 8192 32000 ) -
   CONTROLINTERVALSIZE( 8192 ) -
   SPANNED -
   INDEXED
   KEYS( 20 20 )
   SHAREOPTIONS( 2 ) -
)
```

*Figure 58. Sample definition to create Web User Interface repository*

Each Web User Interface server must have its own Web User Interface server repository that cannot be shared with any other Web User Interface server.

You can copy the Web User Interface server repository from one Web User Interface server to another using IDCAMS, DFSMSdss or equivalent utility. For example, you may wish to copy the Web User Interface server repository from your test system to your production system.

You should migrate definitions using the import and export functions. For information, see the [CICSPlex System Manager Web User Interface Guide](#).

It is recommend that you back up the Web User Interface server repository data as the repository is updated whenever changes are made using the View Editor or when definitions are imported using the COVC transaction. You can back up the Web User Interface repository by using IDCAMS, DFSMSdss or equivalent utility.

Sample JCL to create the Web User Interface repository is provided, called EYUJWREP, in SEYUINST.

### Specify the customizable view and menu help data set

The Web User Interface allows a site to provide customized help for individual views and menus. This help takes the form of HTML documents that can be served by the Web User Interface server or by an external server. If the Web User Interface is to serve the HTML documents, you must provide a partitioned data set to contain the HTML documents.

You can use the View Editor to customize your views and menus to include a link to the customizable view and menu help data set. The View Editor gives you the option of specifying:

- No help to be available for this view or menu
For information about the View Editor, see the CICSPlex System Manager Web User Interface Guide.

The Web User Interface server uses the CICS Web Interface template manager to serve the customized view and menu help. For more information, see the CICS Internet Guide.

**Note:** The customizable view and menu help data set (DFHHTML) must be a single data set and should not be concatenated with any other data set.

### Specify the Web User Interface server initialization parameters

You can specify the Web User Interface server initialization parameters in the start-up job or in a fixed block 80 data set. See “Specify the JCL DD statements” on page 356 for the DDname. All of these parameters are subject to the following conditions unless otherwise stated:

- Lines with an asterisk in column 1 are comments and are ignored.
- Values must not contain lower case characters.
- Values must be specified in parenthesis immediately following the parameter.
- Values must not be greater than 32 characters.

For example:

```
* An EYUWUI parameter data set
DEFAULTMENU(OURHOME)
TCPIPHOSTNAME(MVSXX.COMPANY.COM)
TCPIPPORT(4445)
```

A description of the Web User Interface server initialization parameters follows with default values for the parameters underlined.

### Required parameters

The Web User Interface server has some required initialization parameters. If you do not specify a required parameter the Web User Interface server initialization fails. The Web User Interface server initialization also fails if any of the specified parameters are invalid.

The required Web User Interface server initialization parameters are:

**TCPIPHOSTNAME(name)**

- Specify the TCP/IP host name of this Web User Interface server. This is normally the host name and domain name of the MVS system (that is, a fully-qualified name). This host name is normally used by the Web User Interface to construct URLs, depending on the client's HTTP version and the value of the TCPITHHTTPHOST Web User Interface server parameter.
- This value is always returned in the TCPIPHOSTNAME header of a DATA/CONNECT Web User Interface Data Interface request.
- The Web User Interface does not support names longer than 32 characters. If required, you may use the address of the server using the dotted decimal notation. For example, '127.0.0.1'.
TCPIPPORT(value)
Specify the TCP/IP port number of the port that you have allocated for the Web
User Interface to run on.

The value specified in this parameter must correspond to the port number given
on the CWBC transaction, if you are using a pre-CICS Transaction for OS/390
version 1.3 CICS system.

Optional parameters
You might also want to consider the following Web User Interface server
initialization parameters:

# AUTOREFRESH(YES|NO)
# Disable the automatic refresh option for a WUI server. When YES is specified
# (the default), the automatic refresh control is displayed, based on the view
definition. When NO is specified, the automatic refresh control is not displayed,
even if automatic refresh is set on the view definition. For additional information
on the automatic refresh option, see the CICSPlex SM Web User Interface
Guide (SC34-6841).

# RESOURCENAME(WARNING|FAIL)
# Specifies the action when the default warning count threshold is reached. When
# WARNING is specified (the default), message EYUVC1258W is issued and the
# user can select OK to ignore the warning threshold. When FAIL is specified,
# message EYUVC1267E is issued and the resource request is denied. The filter
can be changed, but users of the WUI server will not be able to click OK to
bypass a warning count.

Additional TCP/IP parameters
You can specify the following TCP/IP parameters only if you are using a CICS
Transaction Server for OS/390 version 1.3 or later CICS system.

TCPIPPADDRESS(name | INADDR_ANY)
Specify the dotted decimal IP address on which the Web User Interface will
listen for incoming requests. If name is specified, it must be of the form
nnn.nnn.nnn.nnn where nnn is 0 through 255. If INADDR_ANY is specified (the
default), the Web User Interface will listen on any of the addresses known to
the TCP/IP for OS/390 host.

You do not normally need to specify the TCPIPPADDRESS option unless the
OS/390 host has multiple TCP/IP addresses.

TCPIPPHOSTNAME(NO|YES)
Indicate whether you require the TCP/IP host name used to construct URLs to
be generated based on the incoming HTTP request for HTTP version 1.1
requests or later.

This option has no effect on pre HTTP 1.1 requests sent to the Web User
Interface server. The Web User Interface server will always construct URLs
using the host name specified in the TCPIPPHOSTNAME Web User Interface
server parameter for HTTP 1.0 (and earlier) requests.

NO For HTTP 1.1 (or later) requests, the host name used in URLs
    constructed by the Web User Interface server is based on the value
    specified in the TCPIPPHOSTNAME Web User Interface server
    parameter.

YES For HTTP 1.1 (or later) requests, the host name used in URLs
    constructed by the Web User Interface server is based on the incoming
    URI or HTTP 'Host' header according to the HTTP 1.1 specification.
When HTTP 1.1 clients are used with a Web User Interface server running TCPIPHTTPHOST(YES), the IP address or name used on the server does not need to be the same as that used by the HTTP 1.1 client. This can allow the Web User Interface to be used when name address translation (NAT) is performed (for example due to a firewall).

If TCPIPSSL(YES) is used with TCPIPHTTPHOST(YES) and HTTP 1.1 clients are used along with different IP address names, you may receive SSL certificate warnings due to host name mismatches.

TCPIPSSL(YES | NO)
Indicate whether you require data encryption between your Web User Interface server and web browser. If you select YES, you must have specified the appropriate system initialization parameters to enable SSL support in the CICS Web Interface. For information see the CICS Internet Guide.

TCPIPSSLCERT(name)
Specify (in upper case characters) the label for the SSL certificate that is to be used for the connection between the Web User Interface and the web browser. If you specify an explicit certificate, the label must be no longer than 32 characters.

The default is the default certificate in the key database or key ring. as applicable.

Note: The names of all SSL certificates to be used with the WUI server must be upper case.

Import option
You can specify the following parameter if you want the Web User Interface server to import automatically menus and view sets from a specified TD queue. This is an alternative to using to import function of the COVC transaction.

AUTOIMPORTTDQ(tdq_name)
Specifies the name of the CICS extrapartition transient data queue from which you want the server to import menu and view sets automatically during server initialization. In order to use this option, you need to enter a value explicitly. There is no automatic default, however, queue name COVI (DD name EYUCOVI) is defined in the CICSPlex SM CSD group EYU

Note: Include this parameter in the Web User Interface initialization parameters for the following occasions only:
• When starting the Web User Interface server for the first time.
• When starting the Web User Interface server after the view sets have been replaced or modified as a result of service (by a PTF).
• If you are already a CICSPlex SM user and want to import other view sets into your existing EYUWREP data set.

Avoid using this parameter at other times because of the overhead involved in performing the import operation.

Data formatting options
These options determine how data will appear on Web User Interface displays.

CVDASTYLE(MIXED | UPPER)
Indicate whether the CVDA, EYUDAs, and so on should be displayed in upper case or mixed case characters.
**MIXED**
Mixed case text, that is, the first character upper case and the rest lower case, for example, 'Enabled'.

**UPPER**
Text is displayed in upper case only.

**DATEFORMAT (format)**
Specify the format to be used to display the date on Web User Interface displays as follows:
- **YYMMDD**
- **DDMMYY**
- **MMDDYY**
- **YYYYMMDD**
- **DDMMYYYY**
- **MMDDYYYY**

where:
- **DD** is the day.
- **MM** is the month.
- **YY** and **YYYY** are the year in two-digit or four-digit format, respectively.

**DATESEPARATOR(character | / )**
Specify the character to be used to separate the date elements on Web User Interface displays.

**DECIMALSEPARATOR(character | . )**
Specify the character to be used to denote the decimal point on Web User Interface displays.

**GMTEXTMSG( NO | YES | BEFORE | AFTER)**
Specify how the CICS "good morning" message is handled.
- **NO** The message is not issued
- **YES** The message is issued before and after signon.
- **BEFORE** The message is issued before signon only.
- **AFTER** The message is issued after signon only.

**MSGCASE (MIXED | UPPER)**
Indicate whether messages destined for the operator or EYULOGs should be displayed in mixed case or upper case characters.

**MIXED**
Mixed case text is displayed.
- If you specify MIXED, output may be displayed incorrectly on Katakana display terminals, where lower case characters are displayed as Katakana symbols.

**UPPER**
Text is displayed in upper case only.
THOUSNDSEPARATOR(character | ,)
Specify the character to be used to separate thousands on Web User Interface
displays, when required. For example, 100000 is displayed as 100,000 if the
default is used.

Notes:
1. The space character (hex 40) is a valid THOUSNDSEPARATOR value,
   allowing digits to be grouped by a space.
2. Use 0 (zero) to suppress the THOUSNDSEPARATOR value.
3. The THOUSNDSEPARATOR value is used only when required by the
   individual view definition.

TIMESEPARATOR(character | :)
Specify the character to be used to separate hours, minutes, and seconds on
Web User Interface displays.

Environment options
These specify the context and scope values, and the home menu and navigation
frame, used by the Web User Interface unless overridden.

AUTOREFRESH(YES | NO)
Disable the automatic refresh option for a WUI server. The default setting, YES,
displays automatic refresh control, based on the view definition. When NO is
specified, automatic refresh control is not displayed, even if automatic refresh
control is set on the view definition. See the CICSPlex SM Web User Interface
Guide for more information on the automatic refresh option.

DEFAULTCMASCTX(name | EYUCMS1A)
Specify the CMAS context that is set when the user signs onto the Web User
Interface.

DEFAULTCONTEXT(name | EYUPLX01)
Specify the context that is set when the user signs onto the Web User Interface.

DEFAULTMAPCOLL(value | 0)
Specify the number of rows in a generated map below which a map opens in
the expanded state. If the number of rows to be displayed is above this number,
the map opens in a fully collapsed state. The default value of 0 means that in
every generated map all of the rows are visible when opened.

DEFAULTMENU(name | EYUSTARTMENU)
Specify the name of the menu that is be presented to users after sign onto the
Web User Interface.

DEFAULTNAVIGATE(name | EYUSTARTNAVIGATE)
Specify the name of the navigation frame that is presented to users after sign
onto the Web User Interface.

DEFAULTSCOPE(name | EYUPLX01)
Specify the scope that is set when the user signs onto the Web User Interface.

DEFAULTWARNCNT(value)
Specify the number of records required to trigger the record count warning
mechanism before opening a view. This can take an integer value in the range
of 0 to 99999999. The default value is 0 meaning no warnings are issued.

Note: You can also set a record count warning value applying to a group of
users when setting up a WUI user group (this applies only if the WUI is
running with security switched on). A value set in a user group takes precedence over a value set in the DEFAULTWARNCNT parameter for the users in that group.

GLOBALPREFILTER(YES | NO)
Specify whether to filter parameters the first time a view is displayed (before data is collected).

Note: You can also specify this parameter when setting up a WUI user group (this applies only if the WUI is running with security switched on). A value set in a user group takes precedence (for users in that group) over the value set in the GLOBALPREFILTER parameter.

RESOURCEREGION(WARNING | FAIL)
Specify whether a warning or failure is issued when the resource limit is reached. The default setting, WARNING, issues message EYUV1258W and the user can select OK to bypass the warning threshold. Specify FAIL to issue message EYUV1267E and to deny the new resource request. The WUI server can be used to change the RESOURCEREGION filter, however the WUI server cannot be used to bypass the warning threshold.

Operation options
These options name the default view set to be used if the Web User Interface receives an external request that does not specify a view set name but specifies an object name. The view sets that you name in these options must represent the objects that may be specified. For more information see the CICSPlex System Manager Web User Interface Guide.

These parameters can be ignored if you do not intend to launch Web User Interface displays in this manner.

DEFAULTCICSPLEX(name | EYUSTARTCICSPLEX)
Specify the name of the default CICSpex view set.

DEFAULTCICSRGN(name | EYUSTARTCICSRGN)
Specify the name of the default CICS region view set.

DEFAULTCONNECT(name | EYUSTARTCONNECT)
Specify the name of the default connection view set.

DEFAULTCSYSGRP(name | EYUSTARTCSYSGRP)
Specify the name of the default CICS system group view set.

DEFAULTDB2SS(name | EYUSTARTDB2SS)
Specify the name of the default DB2 subsystem view set.

DEFAULTTEJCOBEAN(name | EYUSTARTTEJCOBEAN)
Specify the name of the default Enterprise Bean in a CorbaServer view set.

DEFAULTTEJDBJBEAN(name | EYUSTARTTEJDBJBEAN)
Specify the name of the default Enterprise Bean in a CICS-deployed JAR file view set.

DEFAULTEVENT(name | EYUSTARTEVENT)
Specify the name of the default event view set.

DEFAULTLOCFILE(name | EYUSTARTLOCFILE)
Specify the name of the default local file view set.

DEFAULTLOCTRAN(name | EYUSTARTLOCTRAN)
Specify the name of the default local transaction view set.
DEFAULTPROGRAM(name | EYUSTARTPROGRAM)
Specify the name of the default program view set.

DEFAULTREMFILE(name | EYUSTARTREMFILE)
Specify the name of the default remote file view set.

DEFAULTREMTRAN(name | EYUSTARTREMTRAN)
Specify the name of the default remote transaction view set.

DEFAULTTASK(name | EYUSTARTTASK)
Specify the name of the default task view set.

User options

INACTIVETIMEOUT(value | 30)
Specify the period, in minutes, after which inactive user sessions are
terminated. The maximum period allowed is 10080 minutes (7 days).

MAXUSERS(value | 20)
Specify the maximum number of concurrent users of the Web User Interface.
The maximum number of concurrent users allowed is 50.

SIGNONPANEL(BASIC | ENHANCED)
Specifies, if the Web user Interface server has CICS security active (SEC=YES
in the system initialization parameter), whether the Web User Interface sign on
panel takes one of the following actions:
• Displays a GROUP option
• Saves previously used USER and GROUP values
• Positions the cursor in the sign on field requiring input

When the default value, BASIC, is specified, the GROUP option is not displayed
on the sign on screen and the user group profile is set to the default group of
the user. Values are not saved and the cursor is not positioned on the sign on
panel.

When the value, ENHANCED, is specified, the GROUP option is displayed on
the sign on screen and the following events occur:
• If the user enters a value, sign on proceeds and if:
  • The user ID is connected to the specified group, the group is used for the
    WUI user group profile
  • The user ID is not connected to the specified group or the group name is
    not valid, sign on continues, but the WUI group profile is set to the default
    group of the user, and message EYUV1227W is issued to the WUI user
    after sign on is complete. Message EYUVS0024W is written to the WUI
    server's EYULOG.
  • If the user does not enter a value, the user group profile is set to the default
    group of the user

The GROUP option does not change the current connect group of the user
being signed on. The security environment built by the WUI is always based on
the default group of the user. The group option on the WUI signon screen
specifies which WUI user group profile the user should be associated with and
does not change any security decisions that might be made by the External
Security Manager.

When the SIGNONPANEL(ENHANCED) option is set and JavaScript is enabled
in the web browser, the sign on process performs the following actions:
• Saves the user ID and group values in a cookie, so that when the signon
  process next runs, the form is filled with previously entered values
• Positions the cursor to the sign on field requiring input

Whether the Web User Interface user group profile is set based on the default group, or specified on the GROUP option, if no matching Web User Interface group profile is found, the values usually set using a user group profile are set to the system default.

The SIGNONPANEL option is ignored if the Web User Interface server is running with CICS Security inactive (SEC=NO in the system initialization parameter).

Accessibility options

These parameters specify the default colors for the Web User Interface displays.

These parameters should not normally be changed as they effect all users of the Web User Interface server. If you want to change these parameters for reasons of accessibility, take care to ensure that the Web User Interface displays do not become unreadable.

Each parameter specifies a color as six hexadecimal digits. Each pair of digits describes the red, green and blue components of the color, respectively. For example, FFFFFF represents white, 000000 represents black, FF0000 represents bright red, 00FF00 represents bright green, and 0000FF represents bright blue.

COLORPAPER(color)
Main work frame background color.

COLORPAPERHEAVY(color)
Navigation and assistance frame background color.

COLORPAPERMID(color)
Background color used for many interface items (for example, messages, table column headings, detail view labels, view selection and refresh area).

COLORPAPERWARN(color)
Background color for warning messages.

COLORPAPERERROR(color)
Background color for error messages.

COLORPAPERALT(color)
Background color for alternate rows on tabular displays.

COLORPAPERRULE(color)
Background color for assistance frame bar containing the navigation and help icons.

COLORINK(color)
Main work frame text color.

COLORINKBANNER(color)
Navigation and assistance frame text color.

COLORINKLINK(color)
Unvisited link text color.

COLORINKVLINK(color)
Visited link text color.
Problem determination option

**WUITRACE(trace levels)**

Specifies the level of tracing for the Web User Interface server.

The trace levels that you specify must be separated by a comma. For example:

```
WUITRACE(8,11,13,15,18)
```

You can define a range of trace levels, for example:

```
WUITRACE(1:5)
```

activates trace levels 1 through 5

```
WUITRACE(1:5,13,28:31)
```

activates trace levels 1 through 5, 13, and 28 through 31

**Attention:** It is recommended that you only activate trace at the request of IBM Support Center personnel.

Update CICS CSD definitions

The resource definitions that you must add to the CSD file for the Web User Interface are distributed in CSD upgrade load modules in CICSTS31.CPSM.SEYULOAD.

The names of the load modules are EYU9nnG1, where nn represents the CICS level (for example, 64 refers to CICS Transaction Server for z/OS Version 3 Release 1, and 63 refers to the CICS element of CICS Transaction Server for z/OS Version 2 Release 3). The name of the resource group (created using the definitions the load modules contain) is EYU310GW.

**Note:** EYU9nnG1 also contains LMAS group EYU310G1.

You can use the sample JCL shown in Figure 59 to:

- Define a group of resource definitions to the appropriate CSD file
- Add the group name to the CSD list referenced by the CICS system initialization parameter GRPLIST

```
//CSDUP EXEC PGM=DFHCSDUP
//STEPLIB DD DSN=cics.index.SDFHLOAD,DISP=SHR
// DD DSN=cpism.index.SEYULOAD,DISP=SHR
//DFHCSD DD DSN=cics.dfhcsd,DISP=SHR
//SYSPRINT DD SYSOUT=* 
//SYSIN DD *
UPGRADE USING(group_load_module)
ADD GROUP(EYU310GW) LIST(list_name)
/*
```

**Figure 59. Sample JCL to upgrade CSD to include Web User Interface group**

Modify the sample JCL to provide the following information:

- **cics.index.SDFHLOAD**
  - Is the CICS load library that contains the DFHCSDUP module.

- **cpism.index.SEYULOAD**
  - Is the CICSPlex SM load library that contains the group definition modules EYU9nnG1.

- **cics.dfhcsd**
  - Is the CICS CSD file that is to be updated.
group_load_module
Is the load module, EYU9nnG1, that contains the resource definition group, EYU310GW, appropriate for the level of CICS being used.

list_name
Is the group list that is used to start the Web User Interface server.

Transient data queue definitions
You need definitions for the following transient data queues (TDQs):

COVP  The Web User Interface server initialization parameters data set, EYUWUI. This is a fixed block 80 input data set.

COLG  The CICSPlex SM output log, EYULOG. This is a variable length output data set.

COVI  Sample definition for the Web User Interface import data set, EYUCOVI. This is a variable length input data set.

COVE  Sample definition for the Web User Interface export data set, EYUCOVE. This is a variable length output data set.

CICS Transaction Server definitions
If you are using the CICS element of CICS Transaction Server for z/OS, the transient data queue (TDQ) definitions are provided in resource group EYU310GW.

COVI and COVE are provided as samples that can be used to create additional import and export transient data queues.

For more information about the COVI and COVE TDQs see the CICSPlex System Manager Web User Interface Guide.

Temporary storage models
TSMODELs and TSMDEFs should not be installed into a Web User Interface (WUI) server.

Specify the JCL DD statements
Additional DD statements should be added to the Web User Interface server for the following data sets:

EYUWUI  The Web User Interface server initialization parameters data set. See “Specify the Web User Interface server initialization parameters” on page 347.

EYUWREP  The Web User Interface server repository data set. See “Create the Web User Interface server repository (EYUWREP)” on page 346.

EYULOG  The CICSPlex SM output log.

DFHHTML  The customizable view and menu help data set. See “Specify the customizable view and menu help data set” on page 346. This is optional.
The Web User Interface server import data set. For more information see "Transient data queue definitions" on page 356 and the CICSPlex System Manager Web User Interface Guide. This is optional.

The Web User Interface server export data set. For more information see "Transient data queue definitions" on page 356 and the CICSPlex System Manager Web User Interface Guide. This is optional.

For example,

```csh
//DFHHTML DD DISP=SHR,DSN=data set name
//EYUWREP DD DISP=SHR,DSN=data set name
//EYUCOVI DD DISP=SHR,DSN=CICSTS31.CPSM.SEYUVIEW(EYUEVX01)
//EYULOG DD SYSOUT=* 
//EYUWUI DD *
DEFAULTMENU(OURHOME)
TCPIPHOSTNAME(MVSXX.COMPANY>COM)
TCPPIPPORT(4445)
/*
```

Security considerations

This section describes the Web User Interface security requirements for CICS security, Secure Sockets Layer (SSL) support, and access to MVS data sets.

CICS security considerations

If your Web User Interface server region is running with CICS security active, you need to define the security access required:

- For the CICS Web Interface
- By the administrator
- By the end-user and users of the View Editor

Table 25 on page 358 summarizes the access required by the various userids.

You may wish to use CICS transaction security (see the CICS RACF Security Guide) to limit the users who are allowed to control the Web User Interface server via the COVC transaction.

See the CICSPlex System Manager Web User Interface Guide for information about how to control users of the Web User Interface and to limit what resources they are allowed to access.

Security access for the CICS Web Interface

If CICS transaction security is in use the CICS DFLTUSER (for a CICS Transaction Server for OS/390 version 1.3 or later system) or the CWBM transaction userid (for a pre-CICS Transaction Server for OS/390 version 1.3 system) must be given access to the COVP, COVU, and COVE transactions.

Security access for the administrator

The userid that starts the Web User Interface (terminal user of COVC or PLTPIUSR, if started automatically via PLTPI) must have access to the COVC and COVG transactions.

If CICS surrogate user security checking is active in the Web User Interface server region, the userid that started the Web User Interface (terminal user of COVC or
PLTPIUSR, if started automatically via PLTPI) must have READ access to wui-userid.DFHSTART in the SURROGAT class for all Web User Interface users.

**Security access for the end-user and users of the View Editor**

The Web User Interface end-user needs access to the COVA transaction and CICSPlex SM.

Users of the View Editor need access to the COVA transaction, CICSPlex SM and the View Editor profile. For more information about access to the View Editor, see the *CICSPlex System Manager Web User Interface Guide*.

All users who are successfully signed onto the Web User Interface have access to all of the customizable view and menu help pages, if the customizable view and menu help is served by the Web User Interface.

**Summary**

Table 25 summarizes the security accesses required by users of the Web User Interface.

<table>
<thead>
<tr>
<th>User Roles</th>
<th>CICS Web Interface</th>
<th>Administrator</th>
<th>End-user</th>
<th>View Editor</th>

<td></td>
<td>As appropriate for individual users</td>
</tr>
</tbody>
</table>

**Secure Sockets Layer support**

If you are using a CICS Transaction Server for OS/390 version 1.3 or later system, you can provide secure connections by using the Secure Sockets Layer (SSL) support to provide encryption on the connection. For information about SSL support, see the *CICS Internet Guide*. Also, see “Specify the Web User Interface server initialization parameters” on page 347 for information about the TCPIPSSL and TCPIPSSLCERT, Web User Interface server initialization parameters, that you need to specify for SSL support.

**Note:** Web User Interface SSL support uses server authentication only. User authentication is by the external security manager (ESM) user ID and password.

**Authorizing access to MVS data sets**

In addition to standard CICS and CICSPlex SM requirements, the CICS region userid must have the authority to access the data sets associated with the DDNames described in Table 26.

<table>

Additional tasks

After you have set up the Web User Interface you need to:

Submit start-up JCL

You should submit the start-up JCL for the Web User Interface server to start it for the first time. To confirm that the Web User Interface server has started successfully, you should ensure that the following messages are displayed on the job log:

```
08.52.33 JOB03331 +EYUVS0001I IYCQCTA5 CICSPlex SM Web User Interface initialization started.
08.52.37 JOB03331 +EYUVS0002I IYCQCTA5 CICSPlex SM Web User Interface initialization complete.
```

If you chose not to start the Web User Interface server during PLTPI processing, you can start it using the COVC transaction Start command.

Check browser connection

You should check the connection between the Web User Interface and the web browser by typing in the following URL:

```
http://hostname:port/CICSPlexSM
```

where `hostname` is the name specified on the TCPIPHOSTNAME Web User Interface server initialization parameter and `port` is the value specified on the TCPIPPORT Web User Interface server initialization parameter. For information about the Web User Interface server initialization parameters see "Specify the Web User Interface server initialization parameters" on page 347. You should be presented with the Web User Interface server Welcome panel containing a Begin Signon button.

Obtain view and menu definitions

Once the Web User Interface has been started, you should obtain some view and menu definitions. You can do this by either:

- Logging onto the CICS terminal and running the COVC transaction. The Import option of the COVC transaction enables you to import the starter set views and menus. The starter set views and menus are provided in CICSTS31.CPSM.SEYUVIEW. For information about the COVC transaction, see the CICSPlex System Manager Web User Interface Guide.
- Using the View Editor. For information about the View Editor see the CICSPlex System Manager Web User Interface Guide.

Shutdown the Web User Interface server

You can shutdown the Web User Interface server by:
• Shutting down the CICS system in which the Web User Interface server is running.
• Using the COVC transaction. For more information about the COVC transaction see the CICSPlex System Manager Web User Interface Guide.
Chapter 47. Configuring the Starter Set

The CICSPlex SM Starter Set establishes a sample CICSPlex SM environment of
 eight managed CICS systems (MASs) across two MVS images, which are referred
to as system A and system B. This chapter describes:

- "The Starter Set samples libraries"
- "Creating the Starter Set environment" on page 364
- "Deleting the Starter Set" on page 368
- "Using the Starter Set as a model" on page 368.

For a description of the structure and purpose of the Starter Set, see the CICSPlex System Manager Concepts and Planning manual.

The Starter Set samples libraries

The Starter Set is in two samples libraries that are installed automatically when
CICSPlex SM itself is installed. The libraries are:

- CICSTS31.CPSM.SEYUJCL, which contains sample JCL for creating, starting,
  and deleting the Starter Set components
- CICSTS31.CPSM.SEYUDEF, which contains definitions, such as CICS tables
  and VTAM definitions, required by the Starter Set

The contents of the data sets CICSTS31.CPSM.SEYUJCL and
CICSTS31.CPSM.SEYUDEF are described in the remainder of this section.

JCL in CICSTS31.CPSM.SEYUJCL for creating the Starter Set

Table 27 and Table 28 identify the JCL supplied in CICSTS31.CPSM.SEYUJCL for
creating the Starter Set.

Table 27. JCL for creating the system A components of the Starter Set

<td>Creates all data sets for CMAS EYUCMS1B</td>
</tr>
<tr>
<td>EYUJDRPB</td>
<td>Creates the data repository for CMAS EYUCMS1B</td>
</tr>
<tr>
<td>EYUJCSDB</td>
<td>Creates DFHCSD data set for MASs and CMAS</td>
</tr>
</tbody>
</table>

To create those components of the Starter Set belonging to CICSpelx EYUPLX01
only, you must run both the system A JCL and the system B JCL.
To create those components of the Starter Set belonging to CICSplex EYUPLX02 only, you must run the system B JCL.

JCL in CICSTS31.CPSM.SEYUJCL for running the Starter Set

Table 29 and Table 30 list and describe the JCL supplied in CICSTS31.CPSM.SEYUJCL for running the Starter Set.

Table 29. JCL for running the system A components of the Starter Set

<table>
<thead>
<tr>
<th>Sample name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EYUJCS1A</td>
<td>Starts CAS EYUCAS1A</td>
</tr>
<tr>
<td>EYUJCSSA</td>
<td>Starts CAS EYUCAS1A as a started task</td>
</tr>
<tr>
<td>EYUJCM1A</td>
<td>Starts CMAS EYUCMS1A</td>
</tr>
<tr>
<td>EYUJMS1A</td>
<td>Starts MAS EYUMAS1A</td>
</tr>
<tr>
<td>EYUJMS2A</td>
<td>Starts MAS EYUMAS2A</td>
</tr>
<tr>
<td>EYUJMS3A</td>
<td>Starts MAS EYUMAS3A</td>
</tr>
<tr>
<td>EYUJMS4A</td>
<td>Starts MAS EYUMAS4A</td>
</tr>
</tbody>
</table>

Table 30. JCL for running the system B components of the Starter Set

<table>
<thead>
<tr>
<th>Sample name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EYUJCS1B</td>
<td>Starts CAS EYUCAS1B</td>
</tr>
<tr>
<td>EYUJCSSB</td>
<td>Starts CAS EYUCAS1B as a started task</td>
</tr>
<tr>
<td>EYUJCM1B</td>
<td>Starts CMAS EYUCMS1B</td>
</tr>
<tr>
<td>EYUJMS1B</td>
<td>Starts MAS EYUMAS1B</td>
</tr>
<tr>
<td>EYUJMS2B</td>
<td>Starts MAS EYUMAS2B</td>
</tr>
<tr>
<td>EYUJMS3B</td>
<td>Starts MAS EYUMAS3B</td>
</tr>
<tr>
<td>EYUJMS4B</td>
<td>Starts MAS EYUMAS4B</td>
</tr>
</tbody>
</table>

To run those components belonging to CICSplex EYUPLX01 only, you use both the system A JCL and the system B JCL.

To run those components belonging to CICSplex EYUPLX02 only, you use only the system B JCL.

Definitions in CICSTS31.CPSM.SEYUDEF for the Starter Set environment

Table 31 and Table 32 on page 363 identify the supplied Starter Set definitions that are required on system A and system B.

Table 31. Starter Set definitions in CICSTS31.CPSM.SEYUDEF for system A

<td>ISPF primary option panel</td>
</tr>
</tbody>
</table>

CICSplex EYUPLX01 uses both the system A and the system B definitions.

CICSplex EYUPLX02 uses the system B definitions.

The Starter Set naming convention

The CICSplex SM components of the Starter Set are named according to the following convention:

Table 33. Starter Set naming convention: CICSplex SM resources

<table>
<thead>
<tr>
<th>CICSplex SM resource</th>

</tr>
</tbody>
</table>

Creating the Starter Set environment

To configure the Starter Set on any MVS image, you must have access on that MVS image to:

- The Starter Set data sets CICSTS31.CPSM.SEYUDEF and CICSTS31.CPSM.SEYUJCL
- CICS load libraries
- CICS table-assembly JCL
- SYS1.PARMLIB and SYS1.VTAMLST (or be able to add definitions to SYS1.PARMLIB and SYS1.VTAMLST)
- The MVS console log via TSO SDSF.

Selecting the Starter Set configuration

The complete Starter Set is installed across two MVS images and comprises two CICSplices, EYUPLX01 and EYUPLX02. You can install the complete Starter Set, or you can install a specific subset of it. That is, you can install:

- The system A components only
- The system B components only
- EYUPLX01 only (which comprises the system A components and the system B components)
- EYUPLX02 only (which comprises the system B components).

When you have identified those parts of the Starter Set you want to install, locate the appropriate tables of JCL and definitions in this chapter. For example, to define and start the system A components only, you will:
• Run the JCL described in Table 27 on page 361
• Run the JCL described in Table 29 on page 362
• Use the definitions described in Table 31 on page 362

When you have identified the JCL and sample definitions you will be using, follow the procedure described in "Defining the Starter Set environment."

### Defining the Starter Set environment

This section describes the tasks you must perform to incorporate the Starter Set in your MVS environment.

**Notes:**

1. If you have already run an IVP (as described in Chapter 53, "CICSPlex SM installation verification procedures," on page 407) on the MVS image on which you are planning to configure the Starter Set, you will already have performed most of the steps described below. You do not need to repeat those steps, unless the Starter Set components created during the IVP have been deleted.
2. The Starter Set MAS JCL and the CSD update job do not support languages other than assembler. If you require support for other languages, please make appropriate changes to DFHRPL (for the MAS JCL) and to DFHCSDup.

Carry out the following steps as appropriate:

1. Versions of CICS in CICS Transaction Server for OS/390 and CICS Transaction Server for z/OS use MVS log streams for their system logs and require appropriate MVS and CICS definitions to be in place. If you already have CICS TS levels of CICS installed, and if you use the default naming convention of userid.applid.DFHLOG and userid.applid.DFHSHUNT for the system log streams, you can proceed to the next step without taking any further action. However, you might want to review the coupling facility space implications of creating new CICS system logs.
   
   If you do not use the default naming convention for your system logs, or you have never previously brought up a CICS Transaction Server level of CICS, you should seek assistance from your CICS and MVS system programmers to set up the logger definitions for the sets of system logs that you require. For a full description of how to create the required MVS and CICS definitions for MVS log streams, see Chapter 24, "Defining the logger environment for CICS journaling," on page 143 and the CICS System Definition Guide.

   Whichever naming convention you adopt, do not define the CICS system log as type DUMMY, as this would compromise data integrity on the CICSPlex SM data repository.

2. Run the EYUISTRT job to tailor the Starter Set JCL for your environment. EYUISTRT runs the EYUINST EXEC to tailor the Starter Set members. For more information about using EYUISTRT, see Chapter 49, "Using the EYUINST EXEC to tailor skeleton jobs," on page 373. Table 35 identifies those EYUINST EXEC parameters that are applicable to the Starter Set.

<table>

<tr>
<td>WORKVOL</td>
<td>Yes</td>
<td>Yes</td>
<td></td>
</tr>
</tbody>
</table>

3. Add VTAM definitions for the CAS, CMAS, and MASs (as appropriate) to the VTAM table. For example, for the system A Starter Set components, the relevant VTAM definitions are in members EYUDVTMA, EYUDCDMA, and EYUDCDSA of CICSTS31.CPSM.SEYUDEF.

Note: If you use Advanced Communications Function (ACF) Network Control Programs (NCPs), you may need to create a mode table, using the sample entry shown in EYUMDTAB, in order to control the VTAM RUSIZE (request unit size) parameter.

4. Run the JCL EYUJBBIx to define the CAS data sets.
5. Run the JCL EYUJCMSx to define the CMAS data sets.
6. Run the JCL EYUJCICx to define the MAS data sets.
7. Run the JCL EYUJDRPx to define the CMAS data repository.
8. Run the JCL EYUJCSDx to define, initialize, and load the CSD.
9. Make any necessary site-specific changes to the CSD. For example, you might need to add TYPETERMs, TERMINALs, or AUTOINSTALL MODELs.
10. Assemble the sample CICS tables (EYUTxxxx) into a load library.
11. Update ISPF to reflect the addition of CICSPlex SM. A sample of the changes required is in EYU@ISPF and EYU@PRIM in CICSTS31.CPSM.SEYUDEF.

Starting the Starter Set components

Before you can use the Starter Set, you must:
- Start the CAS
- Start the CMAS
- Add definitions to the CMAS data repository
- Start the MASs.

These steps must be performed on system A or system B (or both).
Start EYUCAS1A or EYUCAS1B
To start the CAS, you submit JCL EYUJCSx or EYUJCSSx (to start the CAS as a started task). For example, to start EYUCAS1B as a started task, you use JCL EYUJCSS2.

Start EYUCMS1A or EYUCMS1B
Check the SIT parameters in JCL EYUJCM1A or EYUJCM1B (as appropriate), in particular the SVC numbers and the default user, to ensure that they are suitable for your environment. To start the CMAS, submit JCL EYUJCM1x. For example, to start CMAS EYUCMS1B, you submit JCL EYUJCM1B.

Add definitions to the data repository
You define CICSpex EYUPLX01 or EYUPLX02, or both, via the CICSpex SM user interface. Then you use the batched repository update facility to load the remaining Starter Set definitions.

Note: If you have run an IVP on the target MVS image (system A or system B), and have not deleted the IVP components from that image, you must run step 4 and step 7 in the section “Defining the Starter Set environment” on page 365 before continuing with steps 1 through 4 below.

1. On system A, define CICSpex EYUPLX01, specifying EYUCMS1A as the maintenance point CMAS. Also on system A, identify EYUCMS1B as a secondary CMAS for EYUPLX01 if you are planning to define the system B components of the Starter Set. For more information about defining CICSplexes, see [the CICSpex System Manager Administration manual](#). (Alternatively, you can follow the instructions in “Starting up and verifying CICSpex SM components on system A” on page 413.)

2. If you are installing the system B components, define EYUPLX02 on system B; EYUCMS1B is the maintenance point CMAS.

3. If you have defined both EYUCAS1A and EYUCAS1B, you must define a link from EYUCAS1A to EYUCAS1B, and from EYUCAS1B to EYUCAS1A. For information about defining CAS-to-CAS links, see [the CICSpex System Manager Administration manual](#). (Alternatively, you can follow the instructions in "3: Checking CAS-to-CAS connections" on page 433.)

4. To add the Starter Set CICSpex SM definitions to the data repository on system A or system B (or both), you run the batched repository update facility. Definitions to be added to the data repository on system A are in member EYUDDRP1 of CICSTS31.CPSM.SEYUDEF, and those to be added to the data repository on system B are in member EYUDDRPB of CICSTS31.CPSM.SEYUDEF. For information about the batched repository update facility, see [the CICSpex System Manager Administration manual](#). (Alternatively, see the instructions for using the batched repository update facility during the IVPs in Chapter 53, “CICSpex SM installation verification procedures,” on page 407.)

Start the MASs
To start the MASs, submit the JCL EYUJMSnx. For example, to start MAS EYUMNS2B, submit the JCL EYUJMS2B. JCL for starting the MASs is identified in Table 29 on page 362 and Table 30 on page 362. The CICSpex SM Starter Set is now ready to use.
If errors occur while defining or using the Starter Set

If errors occur while you are setting up the Starter Set or while you are using it, one or more error messages might be issued. Please refer to the CICSPlex System Manager Messages and Codes manual for a detailed description of any CICSPlex SM error message.

Deleting the Starter Set

CICSPlex SM provides sample JCL (in data set CICSTS31.CPSM.SEYUJCL) that you can run to delete the Starter Set components from one or more of the MVS images on which it is installed. Table 36 and Table 37 list the supplied deletion JCL and identify, for each sample, the components that it deletes. For example, if you want to delete the Starter Set components on system B only, you run the deletion samples EYUJBBDB, EYUJCIDA, EYUJDRDB, EYUJCDDA, and EYUJCMDB on system B. When you have deleted the Starter Set components, you must also remove the relevant VTAM definitions.

Table 36. JCL in CICSTS31.CPSM.SEYUJCL for deleting the Starter Set from system A

<table>
<thead>
<tr>
<th>Sample name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EYUJBBDAA</td>
<td>Deletes the CAS data sets EYUSDEF and EYUIPRM</td>
</tr>
<tr>
<td>EYUJCIDOA</td>
<td>Deletes the MAS data sets</td>
</tr>
<tr>
<td>EYUJRDRA</td>
<td>Deletes the data repository</td>
</tr>
<tr>
<td>EYUJCDDOA</td>
<td>Deletes the DFHCSD dataset</td>
</tr>
<tr>
<td>EYUJCMDA</td>
<td>Deletes the CMAS data sets</td>
</tr>
</tbody>
</table>

Table 37. JCL in CICSTS31.CPSM.SEYUJCL for deleting the Starter Set from system B

<table>
<thead>
<tr>
<th>Sample name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EYUJBBDDB</td>
<td>Deletes the CAS data sets EYUSDEF and EYUIPRM</td>
</tr>
<tr>
<td>EYUJCIDB</td>

</tr>
<tr>
<td>EYUJCMDB</td>
<td>Deletes the CMAS data sets</td>
</tr>
</tbody>
</table>

To delete those components belonging to CICSpex EYUPLX01, you must run both the system A deletion JCL and the system B deletion JCL.

To delete those components belonging to CICSpex EYUPLX02, you must run the system B deletion JCL.

Using the Starter Set as a model

The CICSpex SM Starter Set is provided primarily as instructional material. However, you can copy many of the Starter Set definitions, and use them as a basis for your own configuration, as follows:

1. Examine the Starter Set definitions and identify candidates for inclusion in your own configuration.
2. In the CICSTS31.CPSM.SEYUDEF members EYUDDRPA and EYUDDRPA (as appropriate), locate the statements that the batched repository update facility uses to create the definitions you want to use.
3. Copy those statements into your own PDS member and provide a valid CONTEXT statement.
4. Load those definitions into your own data repository by running the batched repository update facility and specifying the maintenance point CMAS as the context.

For more information about the batched repository update facility, see the CICSPlex System Manager Administration manual.
Chapter 48. Applying service to CICSPlex SM

This section contains information about the service material for CICSPlex SM that is distributed as corrective or preventive service. Both types of changes are called system modifications (SYSMODs). SYSMODs are processed using SMP/E control statements.

For background information on SMP/E operations, see the System Modification Program Extended: General Information book. For more detailed information, see the System Modification Program Extended: Reference book. For information about how to apply corrective service using SMP/E, see the System Modification Program Extended: User's Guide.

CICS Transaction Server for z/OS-supplied SMP/E procedure

For all CICS/ESA and CICS Transaction Server systems, the procedure for applying service is called DFHSMPE. This procedure is customized by the DFHISTAR job stored in the CICSTS31.CICS.XDFHINST library.

For full details about applying service to the CICSPlex SM component of CICS TS, see Chapter 26, "Applying service to CICS Transaction Server for z/OS," on page [179].

Applying PTFs to CICSPlexes running CICS Transaction Server for z/OS, Version 3 Release 1 and later

Only use the procedure described below if all CMASs in your CICSPlex are running CICS Transaction Server for z/OS, Version 3 Release 1 or a later release of CICSPlex SM. If any CMAS in your CICSPlex is running CICS TS or an earlier release of CICSPlex SM, please consult the documentation that comes with the PTF for advice on how to proceed.

Some PTFs modify CICSPlex SM resource tables. The documentation will tell you if this is the case. Use the procedure described below if the PTF modifies a CICSPlex SM resource table:

- First apply the PTF to the maintenance point for the CICSPlex.
- If the PTF modifies a repository record, upgrade the repository at the maintenance point before restarting the maintenance point CMAS.
- After the maintenance point CMAS has been restarted, apply the PTF to any local MASs connected to the maintenance point CMAS. You can restart these local MASs one at a time. There is no need to restart them all together.
- After the maintenance point CMAS has been restarted, apply the PTF to any other CMASs in the CICSPlex. You can do this at the same time as the MASs connected to the maintenance point are being updated. You can update the non-maintenance point CMASs one at a time and there is no need to restart them all together.
- If the PTF modifies a repository record, upgrade the repository for the non-maintenance point CMAS before restarting it.
- Once a non-maintenance point CMAS has been restarted, you can apply the PTF to any local MASs connected to that CMAS and restart them. You can restart these local MASs one at a time. There is no need to restart them all together.
In other words, update the maintenance point CMAS first, then the other CMASs, and only update an LMAS after its owning CMAS has been updated.

A PTF might contain additional documentation, giving further instructions specific to that PTF.
Chapter 49. Using the EYUINST EXEC to tailor skeleton jobs

This section describes how you can use the sample JCL members to execute the EYUINST EXEC that customizes skeleton jobs provided by CICSPlex SM.

The following sample members are provided to execute the EYUINST EXEC:

- Member EYUISTRT, in the library CICSTS31.CPSM.SEYUJCL, is provided to customize the Starter Set jobs.
- Member EYUISTAR, in the library CICSTS31.CPSM.SEYUINST, is provided to customize the post-installation jobs.

For a description of the Starter Set jobs, see Chapter 47, “Configuring the Starter Set,” on page 361.

You can edit and run the sample JCL members multiple times. For example, the EYUISTAR job can be used to select and edit skeleton member EYUDEFDS to create a unique data repository for each CMAS. In addition, you can subsequently change the skeleton jobs when, for example, you have to apply service to any of those jobs. This allows you to tailor the skeleton jobs to your environment after you have loaded the CICSPlex SM software into the SMP/E-supported CICSPlex SM libraries.

The following sections provide information about:

- “Sample JCL editing considerations”
- “EYUINST EXEC parameters” on page 375
- “Sample JCL execution considerations” on page 382.

Sample JCL editing considerations

To tailor the sample EYUISTAR or EYUISTRT members, you can either directly modify the contents of the member in the SMP/E target library or copy the member (to preserve the CICSPlex SM-supplied values) and then change the copy.

When you edit the EYUISTAR member, do the following:

- Set the SCOPE parameter to indicate that post-installation jobs are to be generated.
- Set the TEMPLIB parameter to identify the installation library CICSTS31.CPSM.SEYUINST, which contains the skeleton jobs.
- In the SYSPROC DD statement, identify the library that contains the EYUINST EXEC. To ensure that you are using the most current version of these jobs, identify the library as CICSTS31.CPSM.SEYUINST.

When you edit the EYUISTRT member, do the following:

- Set the TEMPLIB parameter to identify the Starter Set library CICSTS31.CPSM.SEYUJCL, which contains the skeleton jobs.
- In the SYSPROC DD statement, identify the library which contains the EYUINST EXEC. To ensure that you are using the most current version of these jobs, identify the library as CICSTS31.CPSM.SEYUINST.

If the sample JCL members are serviced, you must perform one of the following actions:

- To preserve your current installation parameters, add the service changes to the previously edited sample JCL member.
• Respecify your current installation parameters in the serviced sample JCL members in the SMP/E target library. These members are EYUISTAR in the library CICSTS31.CPSM.SEYUINST and EYUISTRT in the library CICSTS31.CPSM.SEYUJCL.

The CICSPlex SM installation libraries are identified in Table 38.

When a parameter has a default value, as indicated in Table 39 on page 375, you can use the default value by:
• Omitting the parameter.
• Omitting the last value with a parameter supporting multiple values.
• Using a period in place of a value, where either of the following:

  UTILITIES . LKED .

  UTILITIES . LKED

  is the same as specifying:

  UTILITIES ASMA90 LKED GIMSMP

If your disk space is managed by the storage management subsystem (SMS) component of MVS/DFP, the unit and volume parameters may be omitted from the generated JCL by specifying the value SMS for any of the UNIT or VOLUME operands of the EYUINST EXEC parameters. For example, to omit UNIT and VOLUME values from the JCL generated by EYUINST EXEC parameters which obtain their default value from the DEFVOL parameter, specify:

  DEFVOL SMS SMS

For the other parameters that have unit and volume specifications and that are to obtain the default from DEFVOL, use a period (which represents the default to SMS).

Table 38. Installation libraries for CICSPlex SM

<table>
<thead>
<tr>
<th>Library</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>SEYUINST</td>
<td>The SMP/E-supported target installation library. After you have installed the CICSPlex SM software into this and other SMP/E-supported libraries (named SEYUxxxx and AEYUxxxx), this library stores the skeleton jobs you should use on any later runs of the EYUISTAR job.</td>
</tr>
<tr>
<td>XEYUINST</td>
<td>To store the tailored, executable, copies of the skeleton jobs that are to be run.</td>

</tr>
<tr>
<td>SEYUJCL</td>
<td>The SMP/E-supported target library that contains EYUISTRT and the other Starter Set members.</td>
</tr>
</tbody>
</table>

Note: The name of the XEYUINST library and the high-level index for the other CICSPlex SM libraries are determined by the EYUINST EXEC parameters used in the EYUISTAR and EYUISTRT jobs. These parameters are described in “EYUINST EXEC parameters” on page 375.
EYUINST EXEC parameters

Table 39 identifies all of the EYUINST EXEC parameters (supplied in the EYUISTAR and EYUISTRT members) and, when appropriate, their default values. The term None indicates that the parameter has no default. Lowercase characters indicate the source of the default value. Except as noted with the following parameter descriptions, you may specify your own values for any of these parameters.

The headings POST and STARTER, which also represent values you can specify with the SCOPE parameter, indicate the type of skeleton jobs you can tailor and generate, where:

- POST identifies parameters used to generate customized post-installation jobs.
- STARTER identifies parameters used to generate customized Starter Set jobs.

The subheadings of CMAS and MAS indicate the environment to which the parameter applies.

</table>

The EYUINST EXEC parameters are:

**BLKU blocksize**
- Indicates the block size to be used when allocating data sets that have an UNDEFINED record length.
- The default is 6144.
CINDEXnnn library_prefix

Where nnn represents a CICS Transaction Server for z/OS release

(Required.) The value of nnn must correspond to the release level specified
for the CRELEASE parameter. That is:

- CINDEX620 library_prefix specifies the high-level indexes assigned to
  the CICS TS for z/OS Release 2.2 libraries.
- CINDEX630 library_prefix specifies the high-level indexes assigned to
  the CICS TS for z/OS Release 2.3 libraries.
- CINDEX640 library_prefix specifies the high-level indexes assigned to
  the CICS TS for z/OS Release 3.1 libraries.

The index value must not exceed 26 characters in length, and the leading
character must be alphabetic. If you specify more than one level of index,
the names must be separated by a period (as in CINDEX CICS.TEST) The
index is used for the following data sets:

- cindex.SDFHAUTH
- cindex.SDFLOAD

One or more CINDEXnnn parameters must be specified as required by the
CRELEASE parameter values.

No default is assumed.

CMASNAME name

(Required when you specify CMAS with the ENVIRONMENT parameter.)

For POST, identifies a 1- to 8-character name that is to be assigned to a
CMAS.

For STARTER, designates the Starter Set environment to be created so
that the appropriate subset of members are selected from the library you
identify via the TEMPLIB parameter.

The name of a CMAS must be unique within the CICSPlex SM
environment. It should not be the same as the name of another CMAS, a
CICSPlex, a CICS system, or a CICS system group.

EYUCMS1A

Indicates that all of the Starter Set jobs associated with System A
are to be created.

EYUCMS1B

Indicates that all of the Starter Set jobs associated with System B
are to be created.

No default is assumed.

CRELEASE value1 value2 value3 value4 value5

Identifies the CICS release level for each CICS region referenced by this
run of EYUINST. From one to five values may be defined.

When SCOPE=STARTER, this identifies the CICS release level for each
CICS region installed for one of the three MVS/ESA images associated with
the Starter Set. When the SCOPE parameter is not equal to STARTER,
only the first value is used. Valid values are 5.3.0, 6.2.0, 6.3.0 and 6.4.0.

The default is 6.4.0 for all five regions.

Table 40 on page 377 shows the Starter Set CICS region that is assigned
the values entered for the CRELEASE parameter. The EYUINST EXEC
must be run three times in order to edit the Starter Set members for the
three MVS images. For example, when the EYUINST EXEC is run to edit
the Starter Set members for System B, the second value entered on the CRELEASE parameter determines the CICS release level assigned to the MAS1B CICS region.

### Table 40. Starter Set CICS regions assigned values by the CRELEASE parameter

<table>
<thead>
<tr>
<th>MVS Image</th>

<td>CMS1A</td>
</tr>
<tr>
<td>System B</td>
<td>CMS1B</td>
</tr>
</tbody>
</table>

**DEFVOL volume disktype**

Defines the default disk on which the CICSPlex SM libraries are to reside if the appropriate parameter is not coded in the job used to run the EYUINST EXEC. For example, if you do not code the DISTVOL parameter, the CICSPlex SM distribution libraries will reside on the disk defined using the DEFVOL parameter.

- **volume**
  
  Is the volume serial identifier (volser) of the volume.

  Use a period to specify the volser allocated in the SYSPROC DD statement of the job used to run the EYUINST EXEC.

- **disktype**
  
  Is the UNIT parameter of the volume.

  Use a period to specify the UNIT parameter of the volume allocated in the SYSPROC DD statement.

If both DEFVOL parameters are defined as SMS, then other statements including VOLUME and DISK values specified with a period, default also to SMS.

The defaults are the volser and unit specified with the SYSPROC DD statement.

**DSINFO dsindex volume disktype**

Defines details of the data sets to be created when you run either the post-installation jobs or the Starter Set jobs.

- **dsindex**
  
  Is a high-level index that is to be assigned to all CICSPlex SM data sets defined by either the post-installation jobs or Starter Set jobs.

  You can specify a multilevel index, where the leading character is alphabetic, each level does not exceed eight characters in length, and the total length of the data set name does not exceed 17 characters. If you specify more than one level of index, the names must be separated by a period (for example, data.set.index).

  Use a period to specify the high level index associated with the INDEX parameter.

- **volume**
  
  Is the volser of the data sets to be created.

  Use a period to specify the volser associated with the DEFVOL parameter.

- **disktype**
  
  Is the UNIT parameter for the volume.
Use a period to specify the UNIT parameter associated with both DEFVOL parameters.

The defaults are the high-level index specified with the INDEX parameter and the volser and unit specified with the DEFVOL parameter. If you are using SMS, and values other than the DFHVOL defaults, you must code SMS for each of these values.

**ENVIRONMENT CMASIMAS**
(Required.) Identifies the type of environment that is to be supported in the MVS image into which CICSPlex SM is installed.

CMAS Indicates that the MVS image is to have one or more CMASs and MASs.

MAS Indicates that the MVS image is to have only one or more MASs, and no CMASs.

No default is assumed.

**EYUIPRM dsname NEW|OLD**
Defines details of the CICSPlex SM cross-system definitions repository.

dsname
Is the data set name of the parameter repository.

Use a period to specify dsinfo.EYUIPRM, where dsinfo is the index specified with the DSINFO parameter.

NEW|OLD Indicates whether an existing parameter repository is to be used. With NEW, any existing file with the specified name is deleted and a new parameter repository is allocated. With OLD, an existing parameter repository is used.

The default is NEW.

The defaults are index.EYUIPRM NEW.

**EYUSDEF dsname NEW|OLD**
Defines details of the CICSPlex SM screen repository.

dsname
Is the data set name of the screen repository.

Use a period to specify dsinfo.EYUSDEF, where dsinfo is the index specified with the DSINFO parameter.

NEW|OLD Indicates whether an existing screen repository is to be used. With NEW, any existing file with the specified name is deleted and a new screen repository is allocated. With OLD, an existing screen repository is used.

The default is NEW.

The defaults are index.EYUSDEF NEW.

**GZONECSI cluster NEW|OLD volume disktype**
Specifies details of the global zone CSI. Ensure that the values specified correspond to the values used for GZONECSI for DFHISTAR.

cluster
Is the VSAM cluster name, minus the qualifier .CSI.
Use a period to specify index.GLOBAL, where index is the value associated with the INDEX parameter.

**NEW|OLD**

Specifies whether an existing global zone CSI is to be used. With NEW, any existing global zone CSI with the specified cluster name is deleted and a new global zone CSI is allocated. With OLD, an existing global zone CSI is used.

Use a period to specify OLD.

**volume**

Is the volser identifier for the volume on which the global zone CSI is to be allocated.

Use a period to specify the volser associated with the SMPVOL parameter.

**disktype**

Is the UNIT parameter for the volume.

Use a period to specify the UNIT parameter associated with the SMPVOL parameter.

The disposition, volume, and unit values are ignored when the SCOPE is POST.

**INDEX library_prefix**

Assigns a high-level index to the CICSpLex SM distribution, target and SMP/E libraries.

The index value must not exceed 26 characters in length, and the leading character must be alphabetic. If you specify more than one level of index, the names must be separated by a period (as in INDEX CICSTS31.CPSM.LEVEL2).

The default is the data set name, without the lowest level qualifier, specified with the SYSPROC DD statement in the EYUISTAR job.

**JOB accounting_information**

Specifies the JOB statement and JES information that you want substituted into the jobs generated by the job used to run the EYUINST EXEC. To do this, edit the sample JOB statement in the job used to run the EYUINST EXEC to specify the appropriate information, as in:

```
JOB //XXXXXXXX JOB 1,userid,MSGCLASS=A,MSGLEVEL=(1,1),
JOB // CLASS=A,NOTIFY=userid
JOB /*JOBPARM SYSAFF=node1,LINES=99
JOB /*ROUTE PRINT node2.userid
```

Normal JCL rules for coding JOB statements apply to the JOB parameter.

The default is //XXXXXXXX JOB.

The job name is ignored. The name is the input member name after it is altered by the PREFIX parameter.

**LIB library_name**

Specifies the 1- to 44-character name of the library to which the customized members generated by the EYUISTAR program are to be added.

The default is the data set name specified with the SYSPROC DD statement in the job used to run the EYUINST EXEC, where the lowest level qualifier is replaced with XEYUINST, as in
OLDDREP dname
Identifies an existing data repository that is being used by a previous release of CICSPlex SM. The records in the existing data repository are migrated to a new data repository for CICS TS for z/OS, Version 3.1. The existing data repository is not modified.

dname
Is the VSAM cluster name of the existing data repository.

The new CICS TS for z/OS, Version 3.1 data repository will have the name:

dsinfo.EYUDREP.cmasname

where:

dsinfo Is the index specified with the DSINFO parameter.

cmasname  Is the name specified with the CMASNAME parameter.

Use a period to have an empty data repository created for CICS TS for z/OS, Version 3.1.

PREFIX prefix
Defines the 1- to 7-character prefix that is to be added to the jobs generated by the job used to run the EYUINST EXEC. This prefix overwrites up to seven characters of the job name. For example, PREFIX XYZ changes the name of the job EYUDEFDS to XYZDEFDS.

The default is EYU.

SCEESAMP data set name
Specifies the name of the Language Environment library that contains the CEECCSD and CEECCSDX members. The default is SYS1.SCEESAMP.

SCOPE POST|STARTER
Indicates which group of jobs you want to generate. Specify:

POST  Generates only the post-installation jobs.

STARTER  Generates only the Starter Set jobs.

The SELECT parameter overrides the SCOPE parameter; that is, if you use both SCOPE and SELECT in the job used to run the EYUINST EXEC, only the job identified by SELECT is generated.

The default is for EYUISTAR is POST.

SELECT jobname1 [newname1]
Identifies the member containing the post-installation or Starter Set job you want to generate. To generate multiple jobs, specify a separate SELECT parameter for each.

jobname
Is the name of the member containing the job to be generated.

newname
Is a new 1- to 8-character name that is to be assigned to the member containing the job.
The SELECT parameter overrides the SCOPE parameter; that is, if you use both SCOPE and SELECT in the job used to run the EYUIST EXEC, only the job identified by SELECT is generated.

No default is assumed.

**SYSIDNT value**
(Required when you specify CMAS with the ENVIRONMENT parameter.)
Specifies the 4-character system identifier used with the CICS TS for z/OS system initialization table (SIT) parameter SYSIDNT for the CMAS. This value is assigned to the data repository created by the EYUDEFDS post-installation job.

If you are setting up more than one CMAS, you must create a separate data repository for each CMAS.

No default is assumed.

**TEMPLIB library_name**
Identifies the 1- to 44-character name of the library containing the input members to be edited, when SCOPE is set to:

- **POST** - this is the name of the library from which the post-installation skeleton jobs can be obtained. You should specify CICSTS31.CPSM.SEYUIST.
- **STARTER** - this is the name of the library from which the Starter Set skeleton jobs can be obtained. You should specify CICSTS31.CPSM.SEYUJCL.

Using the suggested SMP/E target data sets of CICSTS31.CPSM.SEYUIST or CICSTS31.CPSM.SEYUJCL ensure that subsequent runs of the job used to run the EYUIST EXEC will use the updated version of the input members after maintenance is applied.

The default is the data set name specified with the SYSPROC DD statement in the job used to run the EYUIST EXEC.

**TIMEZONE code**
Required when you specify CMAS with the ENVIRONMENT parameter.
Specifies the time zone assigned to the data repository initialized by post-installation job EYUDEFDS for use by the CMAS named using the CMASNAME parameter.

For additional information about how CICSPlex SM uses the time zone codes, see the [CICSPlex System Manager Administration manual](#).

**TZONE zonename**
Specifies the name of the target zone to be used by SMP/E. This name must be unique to the target zone. It must not be longer than seven characters and the leading character must be alphabetic.

Use the same name as that specified for TZONE for DFHISTAR.

The default is TZONE.

**UTILITIES asmprog lkedprog smpeprog**
Specifies the names of the utility programs to be used when installing CICSPlex SM and programs that it uses.

**asmprog**
Is the program name of the assembler.

Use a period to specify ASMA90.
**Ikedprog**

Is the program name of the linkage editor.

Use a period to specify IEWL.

**Smpeprog**

Is the program name of the SMP/E program.

Use a period to specify GIMSMP.

The defaults are ASMA90 IEWL GIMSMP.

**WORKUNIT**

Specifies the UNIT parameter for the disk or disks on which work data sets are stored. If SMS is active, a value of NO may be used to prevent EYUINST from specifying a UNIT on the allocation of the work data sets.

The default is SYSDA.

**WORKVOL**

Optionally specifies the VOLUME parameter to be used by the work data sets allocated on the WORKUNIT unit.

- If WORKUNIT is set to NO, WORKVOL has no effect.
- If WORKVOL is a period, the VOLUME parameter is not used for the allocation.

The default is a period.

---

**Sample JCL execution considerations**

After you have edited the EYUISTAR or EYUISTRT job, submit the job.

The job log produced by the EYUINST EXEC lists the parameter values used for the job.

Should the EYUINST EXEC end with a return code of 04, review the warning message to ensure that the job ran as you intended.

When the EYUINST EXEC ends with a return code of 08 or 12, the skeleton jobs are not tailored or copied. To resolve the cause of either of these errors, examine the output job log, correct the problem, and submit the EYUINST EXEC again.

The output from the EYUINST EXEC depends on the ENVIRONMENT and SCOPE you set, and consists of the customized jobs identified in Table 20 on page 297. These jobs are added to the library used to run the EYUINST EXEC.
Chapter 50. CICSPlex SM system parameters

This chapter describes the system parameters that you can use to identify or alter CICSPlex SM attributes.

These parameters are specified by means of an extrapartition transient data queue. The transient data queue name is COPR. The parameters may be assigned to a DD * file, sequential data set or a partitioned data set member. The DD name for the extrapartition transient data queue is EYUPARM.

The system parameters are coded as 80-byte records. Multiple system parameters may be specified on a single record as long as they are separated by commas and do not exceed a total of 71 characters in length. The format of the system parameters is:

```
keyword(v)
```

where:

- **keyword** is the name of a CICSPlex SM system parameter.
- **v** is an alphanumeric data value that may be specified with the system parameter.

Table 41 identifies the CICSPlex SM parameters used in the CMAS and MAS and indicates whether these parameters are required or optional.

For CMASs and CICS/ESA, CICS Transaction Server for OS/390, and CICS Transaction Server for z/OS MASs, members of the CICSTS31.CPSM.SEYUPARM library containing samples of these parameters are:

- **EYUCMS0P**
  - CMAS parameters
- **EYULMS0P**
  - Local MAS parameters

**Note:** Before using these members to start a CMAS or MAS, remove the comments from the samples and supply the appropriate values.

ALERTRCVR(NETVALRT | name)
Identifies the 1-8 character name of the NetView Alert Receiver to be used by the CMAS if NetView Generic Alerts are to be sent by the CMAS to NetView.

ALERTVER(0 | 1 )
Identifies the version of the CPSM generic alert record that the CMAS will send to NetView. See Appendix B of the CICSpex System Manager Managing Resource Usage manual for details on the generic alert Records CPSM may send to NetView.

ALERTVER is only relevant for a CMAS which is named in an ACTNDEF as sending generic alerts to NetView.

APISIGNMSG(YES | NO)
Indicate whether the successful signon / signoff message, EYUXD0807I, is to be issued when a CICSpex SM API user CONNECTs to, or DISCONNECTs (TERMINATEs) from, the CICSpex SM API.

BASASSOCBLK(value | 14301)
Specify the number of BAS association blocks that can be acquired from a single association element. The default EYUPARM value creates an association segment size requiring approximately 1.2 mB of storage. If the maximum value of 114597 blocks-per-segment is specified, then the resultant segment size will be just over 8 mB.

BASLOGMSG(YES | NO)
Indicate whether CICS resources defined using BAS should have their definitions logged to the CSDL Transient Data Queue of the MAS when they are installed.
If the CICS version used by the MAS does not support the LOGMESSAGE option of the EXEC CICS CREATE command, BASLOGMSG will have no effect.

**CASNAME(name)**

Identify the 4-character name of the CAS subsystem with which the CMAS is to be associated.

This name must match the CAS subsystem ID identified in the CAS startup JCL and also specified with the SSID parameter of the START command.

If this parameter is omitted, the CMAS does not attempt to connect with a CAS. It is not necessary to start a CAS on the MVS system on which the CMAS runs.

**Note:** You should ensure that every CMAS connects to a CAS. The connection allows a TSO user signed on to any MVS image to access the CPSM EUI. It also provides Single System Image (SSI) function for requests directed at resources accessed under a CMAS context. If you start a CMAS without a CASNAME, you need not start a CAS on that MVS image. However, if it later becomes necessary to connect to the EUI with the context set to that CMAS, you must bring down the CMAS and restart it with the CASNAME parameter identifying the SSID of a CAS running on the same MVS image.

**CICSPLEX(name)**

Identify the 1- to 8-character name of the CICSpex to which the local MAS is to be associated.

The name of a CICSpex should not be the same as the name of a CMAS, a CICS system, or a CICS system group.

**CMASSYSID(name)**

Identify the 1- to 4-character name of the CMAS to which a MAS is to be attached.

You can also use this parameter when a local MAS is to attach to a specific CMAS in the same MVS image.

**CMTCMLNKACQ( ALWAYS | RECONN)**

Specify whether you want the CMAS to attempt to reacquire LU6.2 CMAS-to-CMAS links (CMTCMLNKs) if the initial acquire attempt made by CICS fails. The initial acquire attempt is made by CICS at CMAS startup, VTAM ACB open, or CMTCMDEF (CMAS-to-CMAS definition) install.

If the initial acquire attempts fail, CICSpex SM network surveillance may attempt to reacquire the LU6.2 CMAS-to-CMAS links, depending on the value of CMTCMLNKACQ:

**ALWAYS**

The CMAS will attempt to acquire CMTCMLINKs even if they have never been established in the current CMAS run.

**RECONN**

The CMAS will attempt to reacquire only those CMTCMLNKs that were previously established in the current CMAS run. Note that if the CMTCMLNKs were not previously used in the current CMAS run and the initial acquire attempts fail, you must acquire the CMTCCLNK manually, using one of the following methods:
• using the ACQUIRE action in the EYUSTARTCMTCLINK Web User Interface view.
• using the ACQUIRE action of the CMTCLNK resource table in a user-written CICSplex SM API program.
• using CEMT to manually acquire the CICS connection used by the CMTCLNK.

**Note:** Depending on the CMTCLNKACQ option in use, the repeated acquire attempts may cause multiple error messages from CICS (DFHZC3437, DFHZC3462 and DFHZC2405) and VTAM (IST663, and IST664) logging the connection ACQUIRE attempt if the requests continue to fail.

CMTCLNKACQ can be dynamically changed in a CMAS via the COD0 SET command. See the *Problem Determination Guide* for details.

**COHTASKPRI**(value | 200)
Specify the CICS task priority for the MAS COHT task. COHT is invoked in a MAS when an API or web user interface query for completed task history records (HTASK records) is directed to the MAS. Use this parameter to tune the priority of HTASK requests so that a resource intensive query does not impact the performance of other tasks in the MAS.

**COIRTASKPRI**(value | 200)
Specify the task priority of COIR, in the range 0 to 255. COIR is a CICSp lex SM task that can be used to process evaluation definitions (EVALDEFS) independent of the MAS.

For each EVALDEF that requests a separate task, an instance of COIR is started at the specified priority. If you specify a priority of 0, no separate COIR tasks are started; all EVALDEFs are processed by the MAS long running task (LRT).

**Note:** This parameter does not apply to CICS for Windows.

**COMMTSBLOCKS**(value | 512/128)
This is the number of sets of control blocks allocated at CMAS or MAS startup for CPSM Communications Transport Services. These control blocks are used when data must be shipped between a CMAS or MAS and other CMASs or MASs.

The default and minimum values for this parm are 512 in a CMAS and 128 in a MAS. The maximum value is 8192 in either a CMAS or MAS.

Each set requires 1204 bytes of storage allocated in ESDSA in the CMAS or MAS. If the defaults are used, the following total storage is allocated:

- **CMAS** - 512 * 1204 = 616,448 bytes
- **MAS** - 128 * 1204 = 154,112 bytes

If the maximum value is specified, the following total storage is allocated:

- **CMAS** - 8192 * 1204 = 9,863,168 bytes
- **MAS** - 8192 * 1204 = 9,863,168 bytes

If a shortage occurs during the execution of a CMAS or MAS, message EYUCT0105E is issued. At termination of the CMAS or MAS, message EYUCT0106W is issued. The later message will include a value equal to the highest concurrent shortage of sets (High water mark). It is
recommended that the COMMTSBLOCKS parm for the CMAS or MAS be increased by at least the amount specified by the EYUCT0106W message before restarting the CMAS or MAS.

**HISTORYONLY( YES | NO)**
Specify whether history data should be collected without collecting normal CICSpex SM monitoring data as well. For example, if MLOCTRAN and MREMTTRAN data is not required set HISTORYONLY(YES) to prevent this data from being collected.

**HISTRCSMSG( value | 0)**
Specify that message EYUNL0179I 'Task History Recorder dataset EYUHISTx has accrued nnnn records' should be output each time 'value' thousand records are written to the history data sets. The maximum allowed value is 1000 which means output a message every time 1 million records are written to the history data sets.

The message can be used as an aid to determining the optimum size of the history data sets. A value of 0 means no EYUNL0179I messages are to be produced.

**HISTSECS( value | 30)**
Specify the number of seconds to use as the default when API or web user interface users specify a parameter of RECENT(HISTSECS) when requesting completed task (HTASK) resource table records. The maximum allowed value is 86400 seconds (24 hours).

**JRNLDEFCH(YES | NO)**
Causes a journal record to be written for each data repository add, delete, and update operation.

**JRNLOPACT(YES | NO)**
Causes a journal record to be written for each successful action command issued against a MAS or CMAS.

**JRNLRTAEV(YES | NO)**
Causes a journal record to be written each time an real-time analysis (RTA) event is generated.

**MASALTLRTCNT(0 - 5 | 0)**
The number of alternate long running tasks (CONA) started in the MAS during MAS agent initialization. These tasks remain active until the MAS agent terminates or goes into restart mode, and handles all EUI/API/WUI/RTA normally handled by the CONL task, allowing the CONL task to perform other processing in the MAS. At any time, only one of the CONA tasks processes requests. If the CONA task that is currently processing requests becomes busy (as determined by the value of the MASALTLRTTIM EYUPARM), subsequent requests are directed to another CONA task.

If zero (0) is specified, no CONA tasks are started and the CONL task services the EUI/API/WUI/RTA requests that are normally directed to the long running task.

**Note:** Specifying different values for MASALTLRTCNT for multiple WLM target regions might result in an uneven distribution of transactions to those regions because of differing long running task counts.

**MASALTLRTPRI(0 - 255 | 255)**
The priority given to the CONA transaction for the current execution of the MAS.
Note: Specifying this value less than 255 can adversely affect the response time of EUI, API, and WUI users, and might result in RTA EVENTS not being created or resolved in a timely manner.

**MASALTLRTTIM(1 - 3600 | 10)**

The amount of time in seconds for which a CONA task can be busy before subsequent requests are directed to another active CONA task.

**MASINITTIME(value | 10)**

Specifies the number of minutes, from 5 to 59, that CICSPlex SM should wait for the MAS to initialize.

- If you specify MASPLTWAIT(YES), the MASINITTIME value is the maximum length of time that PLT processing can be suspended for MAS initialization. (By suspending PLT processing the chance of completing MAS initialization within a specified time is increased, because you are asking for less work to be done in a given time interval, and reducing the scope for contention, during that time).
- If you specify MASPLTWAIT(NO), the MASINITTIME value is the maximum length of time that can elapse before MAS initialization is aborted if it does not complete.

**MASPLTWAIT(YES | NO)**

Indicates whether CICSPlex SM should suspend all PLT processing until the MAS is fully initialized and connected to the CMAS.

- When you specify MASPLTWAIT(YES), no CICS applications can be started and no users can sign on to the system until CICSPlex SM completes the installation of resources and resumes PLT processing. If CICSPlex SM does not complete the installation of resources and resume PLT processing within the time interval specified by MASINITTIME, message EYUTS0003I is issued. If it does not complete within the time interval specified by MASINITTIME, message EYUNL0090W is issued, the MAS initialization is aborted and the PLT processing resumes to allow the region to function as a CICS region without CICSPlex SM control. MAS Initialization can be retried by entering the COLM transaction manually.
- When you specify MASPLTWAIT(NO), CICSPlex SM still observes the MASINITTIME value waiting for the MAS agent to complete the topology connect. If CICSPlex SM does not complete the topology connect within the time interval specified by MASINITTIME (or its default value), message EYUNL0090W is issued, the MAS initialization is aborted and the PLT processing resumes to allow the region to function as a CICS region without CICSPlex SM control. MAS Initialization can be retried by entering the COLM transaction manually.

If you are using Business Application Services (BAS) to automatically install resources at CICS system initialization, you should specify MASPLTWAIT(YES) for that system.

**Note:** If you are using Business Application Services (BAS) to automatically install a DB2 connection, and you want the connection to be activated during CICS startup, see the information on page 335.

**MAXAUXCPSM(value | 50)**

Specify the percent of total auxiliary storage which may be committed to each CMAS, in the range of 1 to 99. Note that each CMAS will require 24,160 4kB pages (94 mB) of cache storage at initialization. If a request for additional cache storage would cause the CMAS to exceed this threshold,
an SDUMP is taken and the CMAS is terminated. If this occurs during CMAS initialization, it means that the CMAS was unable to acquire the initial allocations for all required component data cache areas. Either the value of MAXAUXCPSM must be increased, or the total amount of auxiliary storage must be increased by adding or expanding external page data sets. If this threshold is reached during an attempt to create or extend a data cache after CMAS initialization has completed, ARM is invoked to attempt to restart the CMAS.

**MAXAUXTOTL(value | 70)**
This value is the maximum total auxiliary storage usage at which the CMAS allows a request for additional cache storage to be made, in the range of 1 to 99. This prevents the CMAS from requesting an amount of cache storage which would cause the MVS system to enter a state of auxiliary storage shortage. If a request for additional cache storage would cause the CMAS to exceed this threshold, an SDUMP is taken and the CMAS is terminated. This parameter can cause a CMAS to shut down even though the CMAS is not the largest user of auxiliary storage. If this occurs during CMAS initialization, it means that the CMAS was unable to acquire the initial allocations for all required component data cache areas. The total amount of auxiliary storage available must be increased by adding or expanding external page data sets. If this threshold is reached during an attempt to create or extend a data cache after CMAS initialization has completed, ARM is invoked to attempt to restart the CMAS.

**MAXHISTRECS( value | 1)**
Specify a limit, in the range 1 to 50, on the number of records returned on a completed task query from the MAS to 'value' thousand records. This can be used to limit the amount of data in a request for completed task (HTASK) resource table records. When this limit is reached, the CICSPlex SM API GET request will receive a WARNING response and MAXRECORDS reason.

**MSGBUCKETS(value | 1024)**
Specify a value in the range 1 to 32768. This value specifies the number of buffers to be allocated for Topology data collection in the MAS. Each buffer is 64 bytes long. The buffer pool, allocated in the MAS cache data space, is used by CPSM's XMEOUT and XRSINDI Global User Exits and by the MAS Heartbeat task. The number of buffers must equal or exceed the total number of connections, DSNAMEs, GLUEs, TRUEs, and FEPI connections defined in the MAS. If the number of buffers is not sufficient for the Topology mapped resources in the MAS, a trace record with debug text XDATLOST is written at every other heartbeat interval when MAS Topology resource data is collected. If this occurs, resources will be missing from Topology Resource Maps for the MAS in all CMASes in the CICSpex, and query or action requests entered from the EUI or API for specific resources may fail because the target resources are not known to Topology.

**MSGCASE(MIXED | UPPER)**
Indicate whether the following types of output should be displayed in mixed case or upper case:
- Messages issued by Message Services to the console, joblog, and EYULOG
- Batched repository-update facility output
- Diagnostic output from the CODB, COD0, and COLU transactions.
You can specify:
**MIXED**

Mixed case text is displayed as is.

If you specify MIXED, output may be displayed incorrectly on Katakana display terminals, where lower case characters are displayed as Katakana symbols.

**UPPER**

Mixed case text is displayed in upper case only.

**NAME(name)**

Identify the 1- to 8-character name of the CMAS or local MAS that is to be started. If you do not specify this parameter, the default is the VTAM application ID.

**RESSTATUS(NOTIFY | MSG | CONMSG)**

Indicate how the CMAS is to respond when a CICS resource that is being reported to the resource status facility has a change in operational state:

**NOTIFY**

Issues event notifications in the form of ERESSTAT resource table records.

These event notifications can be monitored by using the LISTEN command of the CICSPlex SM API. For more information, see the

*CICSPlex System Manager Application Programming Guide*

**MSG**

Writes external messages to EYULOG.

If you specify MSG, event notifications are produced in addition to the messages.

**CONMSG**

Writes external messages to the job log, console, and EYULOG.

If you specify CONMSG, event notifications are produced in addition to the messages.

**SEC(YES | NO)**

For a CMAS, indicate whether the CMAS is to perform security checking of CICSPlex SM requests directed to the CICS systems it manages.

When NO all security-related parameters are ignored.

If a CMAS manages any CICS regions that are running with security active (SEC=YES specified as a system initialization parameter), the CMAS must include SEC=YES in EYUPARM. If you do not activate CICSPlex SM security in the CMAS, a connection cannot be established to a CICS system that specifies SEC=YES. If a connection is attempted, the following message is issued to the console, the CMAS job log, and the CMAS EYULOG:

EYUCR0007E Security mismatch between CMAS cmasname and MAS masname. Connection terminating.

**Note:** Use this option with care. It could cause a large number of messages to be sent to the console.

If a CMAS starts with SEC(NO) connects directly or indirectly to a CMAS started with SEC(YES), any request sent to the SEC(YES) CMAS will fail.

- If the request originates from the TSO EUI, the TSO user will receive message EYUEI0586E
If the request originates from the CICSPlex SM API connected to the SEC(NO) CMAS, the API request will receive: RESPONSE 1031 NOTPERMIT REASON 1345 USRID

If the request originates from the CICSPlex SM Web User Interface server connected to a SEC(NO) CMAS, the browser will receive message: EYUVC1220E

SECLOGMSG(NO | YES | ALL)

Controls whether CICSPlex SM should issue message EYUCR0009I to the CMAS EYULOG, to record security failures.

When NO is specified, the default, message EYUCR0009I is not issued.
Specify YES, or ALL, to cause message EYUCR0009I to be issued.
SECLOGMSG(YES) can be useful if the External Security Manager (ESM) does not issue messages when it cannot make a decision, or when a failure occurs.

Note: When SECLOGMSG(YES) is specified, EYUCR0009I will be issued only for requests which are to be logged to the ESM.
SECLOGMSG(ALL) causes EYUCR0009I to be issued even when the ESM permits access to the resource. The ALL operand can produce a large number of EYUCR0009I messages and should normally be used only under the direction of IBM Support.
SECLOGMSG can be dynamically changed in a CMAS with the COD0 SET command. See the CICS Problem Determination Guide for details.

SECPREFIX(YES | prefix userid)

Indicate whether the user ID is used as the prefix that is added to the beginning of all resource names to distinguish this CICS system from other CICS systems.

SECTIMEOUT(value | 30)

Specifies the time in minutes, in the range of 1 through 1440 (1 day), that idle userids are to remain signed on within the CMAS before being considered for timeout.

The value is also used to control how often the CMAS checks for idle users to timeout. For example, with the default value of 30, the CMAS will check every 30 minutes for users who have not used the CMAS for 30 minutes. However, as the times are not synchronized it may mean that the userid will not be timed out for up to double the SECTIMEOUT value. Setting this value low will increase the number of calls to the External Security Manager (ESM). Setting this value high means that users may have to wait a long time before automatically picking up security changes that affect the userid (for example, adding the user to a new group).

The CMAS or CMASLIST PURGE request (available from the EUI, API and WUI) can be used to force a CMAS to check for users to timeout immediately.

The CMAS or CMASLIST RESET USERID request (available from the API and WUI) can be used to force the CMAS to rebuild the user's security information the next time it is used. This request would typically be used after adding or removing a userid to, or from, a group, and the user does not want to wait to be timed out to pick up the change.

6. For a CMAS or local MAS only
SPOOLCLASS(class | P)

Specify a SYSOUT class value, from A to Z, that identifies where CICSPlex SM spool output is to be sent.

Spool output can be generated by these CICSPlex SM functions:

- The online utility transaction (COLU)
- The PRINT and CAPTURE commands of the interactive debugging transaction (COD0).

STALLxxxTSK

Where xxx represents a CICSPlex SM suspend class. The values for xxx are shown in Table 42.

Identify the minimum number of concurrent tasks required to enter the suspend class. The value may be between 0 and 999. The default value for each task is shown in Table 41 on page 383. Use 0 to indicate STALL detection for the xxx suspend class is not active.

STALLxxxCNT

Where xxx represents a CICSPlex SM suspend class. The values for xxx are shown in Table 42.

Identify the number of consecutive occurrences of an entry in the suspend class required for CICSPlex SM to report a STALL. The value may be between 0 and 999. The default value for each task is shown in Table 41 on page 383. Use 0 to indicate STALL detection for the xxx suspend class is not active.

*Note:* EYUPNxxxx messages are issued when a stall condition occurs that generates a real-time analysis system availability monitoring (SAM) event.

---

**SUPPRESSCMF(YES | NO)**

For a local MAS, indicates whether the records collected by the CICS Monitor Facility are written to SMF.

The parameter only suppresses CICS type 3 performance class records. Type 4 exception records and type 5 transaction resource records are not suppressed. The type 3 performance records are only suppressed if the CICS region has an active CICSPlex SM monitor definition installed for the MTRAN monitoring class. You can verify which CICS regions have active monitoring for the MTRAN class by issuing the MONACTV view from the TSO End User Interface.

---

**TOBATCHREQ(value | 0)**

**APAR**

PK05183 added TOBATCHREQ, TOONLINEREQ, and TOPOLLINT

The time in seconds before a batch request directed to a MAS is timed out. This includes RTA requests and API requests initiated from non-CICS programs. Specify zero, or a value in the range 10 to 1800.

- If you specify zero, the default value of 240 seconds (4 minutes) is applied. This value is then doubled when the request is transmitted to the MAS.
- If you specify a non-zero value in the range 10 to 1800, that value is used.
- If you specify a non-zero value less than 10, TOBATCHREQ is set to 10.

Depending upon the value specified for TOBATCHREQ more time outs may be received. This may be noticed in the following ways:

**RTA requests**

No data will be processed for any MAS that times out and no external message will be displayed. This may cause an event to not be created, or lead to premature termination of existing events.

**API requests initiated from non-CICS programs**

All API requests initiated from non-CICS programs will receive a REPSONSE of ENVIRONERROR (1030) and REASON of REQTIMEOUT (1342) and no data records will be returned, regardless of the CONTEXT and SCOPE of the request.

**TOONLINEREQ(value | 0)**

The time in seconds before an online request directed to a MAS is timed out.
This includes EUI and WUI requests and API requests initiated from CICS programs. Specify zero, or a value in the range 10 to 1800.

- If you specify zero, the default value of 240 seconds (4 minutes) is applied. This value is then doubled when the request is transmitted to the MAS.
- If you specify a non-zero value in the range 10 to 1800, that value is used.
- If you specify a non-zero value less than 10, TOONLINEREQ is set to 10.

Depending upon the value specified for TOONLINEREQ more time outs may be received. This may be noticed in the following ways:

### EUI requests

If all systems that are part of the CONTEXT and SCOPE time out, the following messages are returned to the EUI display:

- **EYUEI0591E**
  - Communications to `<masname>` timed out
- **BBMXBD15I**
  - There is no data that satisfies your request
- **BBMXBD23I**
  - 0 records presented by the product

If at least one of the systems that are part of the CONTEXT and SCOPE do not time out, the records for that system (or those systems) will be displayed and no error messages will be displayed.

### WUI requests

All WUI requests will receive the following message and no data records will be displayed, regardless of the CONTEXT and SCOPE of the request:

- **EYUVC1220E**
  - CICSPlex SM API command (GET) failed. (Environerror, Reqtimeout)

### API requests initiated from CICS programs

All API requests initiated from CICS programs will receive a RESPONSE of ENVIRONERROR (1030) and REASON of REQTIMEOUT (1342) and no data records will be returned, regardless of the CONTEXT and SCOPE of the request.

### TOPOLLINT(value | 300)

The time in seconds that a CMAS delays between checking all requests to determine if they exceed their time out time. Since polling is used to determine when to time out a request, more reliable time outs will occur if this value is set less than or equal to both TOBATCHREQ and TOONLINEREQ.

When a request is directed to a MAS that is not connected to the originating CMAS, it is transmitted from the originating CMAS to the remote CMAS to which the MAS is connected. When this occurs, the remote CMAS performs the time out processing, based upon the TOBATCHREQ and TOONLINEREQ values specified in the originating CMAS and the TOPOLLINT value specified in the remote CMAS. For this reason, time out processing will be more consistent if all CMASes in the network have the same TOPOLLINT value.
**WLMLOADCOUNT(ALLQUEUED | MXTQUEUED)**

For a local MAS, indicates which queued tasks should be included in the WLM task load count for the MAS.

Specify ALLQUEUED to include tasks queued for both maxtask and tranclass.

Specify MXTQUEUED to include tasks queued only for maxtask.

**WLMLOADTHRSH(65 | 1 - 100)**

For a local MAS that is defined as a CPSM WLM routing region, indicates what task load percentage ((active tasks/maxtask) *100) should be used as part of the determination as to when the routing region should route to target regions on other CECs.

For example, if the default value of 65 is used, then all target regions on the CEC where this routing region resides must have a task load of 65% or higher before the routing region routes to target regions on other CECs, if all other health factors (for example, short-on-storage) for the routing regions are similar. As soon as all target regions on other CECs achieve a task load of 65% or higher, the routing region resumes routing to the target regions on the local CEC again. When a local target region's task load drops below 65%, the routing region resumes routing to that target region regardless of the task load in target regions on remote CECs.

Specifying this value lower than the default probably decreases the delay in routing to target regions on remote CECs. Take care not to set this value so low that the threshold is met by long-running tasks in the target regions.

Specifying this value higher than the default probably increases the delay in routing to target regions on remote CECs.

Note that the effectiveness of this parameter is increased as the characteristics (for example, maxtask value or number of long-running tasks) of the target regions become similar.
Chapter 51. CMAS journaling

A CICSPlex SM address space (CMAS) is capable of producing CICS journal records to track a variety of activities in the CICSPlex. These journal records provide an audit trail that can aid in the recovery of data or the reconstruction of events that affected the CICSPlex. A journal record can be written when:

- A definition in the data repository is added, removed, or updated
- An operations action is issued against a MAS
- A real-time analysis event is generated.

For example, when a CMAS serves as the temporary maintenance point, it temporarily stores in its data repository any definitions that you add, update, or remove. When the maintenance point CMAS resumes operation, the temporary information is removed. You can obtain journal records of what is added to and deleted from the data repository for the temporary maintenance point.

The journal records are stored in a 32KB buffer and are flushed to the corresponding log streams when the buffer becomes full or when a normal shutdown of the CICS region is initiated.

To force the buffer to be flushed to a log stream when the CICS region is still active, you could specify the WAIT option on the WRITE JOURNALNAME command using EXEC CICS or the CECI transaction.

To request one or more of the record types, specify the appropriate CICSPlex SM system parameters in the startup JCL of a CMAS:

- **JRNLDEFCH(YES)** For data repository definition changes
- **JRNLOPACT(YES)** For operations actions
- **JRNLRTAEV(YES)** For real-time analysis events

For more information on these parameters, see Chapter 50, “CICSPlex SM system parameters,” on page 383.

If you do not want to use the CICSPlex SM default log stream name of EYUJRNL, you must define a JOURNALMODEL resource in the CSD that has the desired log stream name. The distributed CMAS resource definition group and group list are protected from modification. Thus, to make the JOURNALMODEL resource definition available during CMAS initialization, you must create a new CMAS group list that includes the group containing the JOURNALMODEL resource definition. To add the JOURNALMODEL resource to the CSD, either edit and run the JCL contained in sample member CICSTS31.CPSM.SEYUSAMP(EYUJRNE$) to execute batch utility DFHCSDUP or use the CICS CEDA transaction. Performing either of these steps does the following:

- Appends the protected EYU310L0 group list to a new unprotected group list.
- Defines the desired JOURNALMODEL for EYUJRNL in an unprotected group.
- Adds the unprotected group to the new, unprotected group list.

You must also update the CICS system initialization (SIT) parameters used to start the CMAS by setting the GRPLIST parameter to reference the new group list.

The journal records produced by a CMAS contain data mapped by a DSECT called EYUBCPJR. Each record consists of a standard prefix and a variable data area. The contents of the data area are specific to the type of journal record being written.
Figure 60 shows the format of EYUBCPJR.

Figure 60. The EYUBCPJR DSECT (Part 1 of 2)
For information on writing a program to access and format CICS journal records, refer to the [CICS Customization Guide](#).
Chapter 52. Preparing to use the IPCS tools

The interactive problem control system (IPCS) provides MVS users with an interactive facility for diagnosing software failures. You can use IPCS to format and analyze SDUMPs produced by CICSPlex SM or stand-alone dumps obtained while CICSPlex SM was active in the system being dumped. You can either view the dumps at your terminal or print them.

Note: The CICSPlex SM IPCS tools are available only for CASs, CMASs, or MASs running in an MVS image.

CICSPlex SM provides two types of IPCS tools:

- A set of panels (driven by a corresponding set of CLISTs) that allow you to display:
  - The data in a coordinating address space (CAS) dump
  - The names and locations of control blocks and areas of a CAS dump
  - Subsystem information
  - Address space-related control blocks
  - Modules loaded by CICSPlex SM
  - Tasks created by CICSPlex SM
  - Storage subpools managed by CICSPlex SM
  - BBC LU 6.2 communication information
- A dump formatting routine that can be used with the VERBEXIT subcommand to format CMAS or MAS dumps

For more information about:
- IPCS, see the MVS Interactive Problem Control System: User's Guide.
- Using IPCS to format CICSPlex SM system dumps, see the CICS Operations and Utilities Guide.
- Displaying and formatting dumps with IPCS, see the CICSPlex System Manager Problem Determination manual.

Before you can use the CICSPlex SM IPCS tools, you must make the preparations described in:

- "Updating BLSCECT"
- "Updating library allocations" on page 402
- "SDUMP options" on page 402

Updating BLSCECT

IPCS provides an exit control table called BLSCECT; it normally resides in SYS1.PARMLIB. This table contains imbed statements to enable other products to supply exit control information. You must perform the following steps:

1. Update the BLSCECT table for either a MAS-only environment or for a CMAS environment.
   - When the EYUINST ENVIRONMENT parameter of MAS was used to install CICSPlex SM, then the following IMBED statement is required:
     IMBED MEMBER(EYUIPCSP) ENVIRONMENT(ALL)
   - When the EYUINST ENVIRONMENT parameter of CMAS was used to install CICSPlex SM, then the following IMBED statements are required:
     IMBED MEMBER(EYUIPCSP) ENVIRONMENT(ALL)
     IMBED MEMBER(BBM3IPCS) ENVIRONMENT(ALL)
BBM3IPCS defines the CICSPlex SM main panel as CPSMSSDA, and adds an entry for the panel to the IPCS MVS component menu. EYUIPCSP identifies the CICSPlex SM formatting routine as EYU9D310 with a VERB name of CPSM310.

2. Make sure the required parameter member(s) can be found by your IPCS job by doing one of the following:
   - Copy the required parameter member(s) from the CICSTS31.CPSM.SEYUPARM library into the same library as BLSCECT (usually SYS1.PARMLIB).
   - Provide an IPCSPARM DD statement to specify the library that contains the IPCS control tables. For example, the DD statement for a batch TSO session might look like this:

   ```
   //IPCSPARM DD DSN=SYS1.PARMLIB,DISP=SHR for BLSCECT
   //   DD DSN=CICSTS31.CPSM.SEYUPARM,DISP=SHR for BBM3IPCS/EYUIPCSP
   ```

   For more information about SYS1.PARMLIB library members related to IPCS, see the MVS Interactive Problem Control System (IPCS): Customization manual.

Updating library allocations

To update the library allocations, you must do the following:

- Update the CLIST or REXX EXEC that invokes IPCS at your enterprise to include the following data set allocations:

  **ISPPLIB**  CICSTS31.CPSM.SEYUPLIB
  Contains panels that allow you to view data structures.

  **SYSPROC**  CICSTS31.CPSM.SEYUCLIB
  Contains CLISTs that obtain information from a dump and display it. These CLISTs also create a set of IPCS symbol equates to help you locate data while browsing a dump outside of the panels.

  **ISPMLIB**  CICSTS31.CPSM.SEYUMLIB
  Contains messages issued by the CLISTs.

- Make sure that the EYU9D310 IPCS user exit routine is in a library in the linklist or a library that is accessed by the JOBLIB, STEPLIB, or TASKLIB option of the IPCS command, during IPCS session. To accomplish this, do one of the following:
  - Allocate CICSTS31.CPSM.SEYULINK to the desired DD statement.
  - Copy CICSTS31.CPSM.SEYULINK (EYU9D310) to an appropriate library.
  - Invoke IPCS, using the TASKLIB keyword to allocate CICSTS31.CPSM.SEYULINK.
  For example, issue the TSO COMMAND:

    `IPCS NOPARM TASKLIB('CICSTS31.CPSM.SEYULINK ')`

SDUMP options

Make sure the following SDUMP options are in effect at the time the dump is taken:

- **CSA**  Common service area
- **LPA**  Link pack area modules
- **LSQA**  Local system queue area
- **NUC**  Non-page-protected areas of the DAT-on nucleus

Part 6. CICSPlex SM verification

This part describes the processes and procedures you should follow to run the installation verification procedures for CICSPlex SM. It contains the following chapters:

- Chapter 53, “CICSPlex SM installation verification procedures,” on page 407
- Chapter 54, “Installation verification procedure 1 (IVP1),” on page 411
- Chapter 55, “Installation verification procedure 2 (IVP2),” on page 425
Chapter 53. CICSPlex SM installation verification procedures

This chapter describes how to run the CICSPlex SM installation verification procedures (IVPs) to confirm that CICSPlex SM has been installed successfully. It is recommended that you run the IVPs before you complete the setup and configuration tasks for your environment.

There are two IVPs for the installation of CICSPlex SM on MVS, IVP1 and IVP2:
- IVP1 verifies the installation of CICSPlex SM on the first or only MVS image.
- IVP2 verifies the installation of CICSPlex SM on the second and subsequent MVS images.

IVP1 and IVP2 are largely the same, except that IVP2 incorporates tests of links to and from the CICSPlex SM components established by IVP1.

Please note the following:
- While you are running the IVPs, you will encounter the CICSPlex SM term view. A view is simply a formatted display of data relating to one or more CICS resources or CICSPlex SM definitions.
- You enter commands throughout the IVPs by typing the command name in the COMMAND field of the current view and pressing Enter. However, if any particular command is assigned to a PF key, you may use the PF key instead of typing the command name.

For general information about the CICSPlex SM ISPF user interface, see the CICSPlex System Manager User Interface Guide.

If the IVPs do not work as described

You run the IVPs to verify that CICSPlex SM has been installed successfully. Therefore, the failure of an IVP is likely to mean that either the installation of CICSPlex SM has not succeeded, or preceding steps of the IVP have failed. Error messages may be issued at any stage of the IVPs: please refer to the CICSPlex System Manager Messages and Codes manual for detailed descriptions of CICSPlex SM error messages.

The stages of IVP1 and IVP2

During the course of performing the tasks of IVP1 and IVP2, you install a subset of the CICSPlex SM Starter Set that is sufficient to test all major components and functions of CICSPlex SM. The structure and purpose of the Starter Set are described in the CICSPlex System Manager Concepts and Planning manual. How to configure the Starter Set for use in your enterprise is described in Chapter 47, "Configuring the Starter Set," on page 361.

The main stages of IVP1 and IVP2 are:
1. Setting up the CICSPlex SM environment
2. Starting the CICSPlex SM components
   a. Starting the CAS
   b. Starting the CMAS
   c. Defining a CICSpelix
   d. Loading definitions using the batched repository update facility
   e. Starting the MAS
3. Testing the CICSPlex SM operations functions

When you have defined your own CICSPlex SM configuration, you might want to rerun IVP1 and IVP2 using your own CASs, CMASs, and MASs rather than those of the Starter Set. Instructions for running IVP1 and IVP2 with your own configuration are supplied in "Customizing the installation verification procedures" on page 443.

The IVP samples libraries

The JCL and sample definitions you need to run IVP1 and IVP2 are in the Starter Set samples libraries CICSTS31.CPSM.SEYUJCL and CICSTS31.CPSM.SEYUDEFINE. The library CICSTS31.CPSM.SEYUJCL includes sample JCL for creating, running, and deleting the Starter Set components created during IVP1 and IVP2. The library CICSTS31.CPSM.SEYUDEFINE includes samples such as VTAM definitions and CICS tables. Table 43, Table 44, Table 45, and Table 46 on page 409 identify the JCL and definitions used during IVP1 and IVP2.

**Note:** When you have run IVP1 and IVP2, you might want to use the JCL listed in Table 46 to delete the Starter Set components you have created. However, if you are planning to configure the Starter Set for use on an MVS image on which you have run an IVP, keeping the IVP components might save you some effort at a later stage. See Chapter 47, “Configuring the Starter Set,” on page 361 for more information.
Chapter 54. Installation verification procedure 1 (IVP1)

It is recommended that you run IVP1 on the first or only MVS image on which you install CICSPlex SM. Before you begin, ensure that the CICSPlex SM data sets are authorized as described in "Authorizing libraries" on page 283. On the MVS image on which you run IVP1 (which is referred to in the remainder of this section as "system A") you must have access to:

- The CICSPlex SM samples data sets CICSTS31.CPSM.SEYUDEF and CICSTS31.CPSM.SEYUJCL
- CICS load libraries
- CICS table-assembly JCL
- The CEDA transaction on MAS EYUMAS1A
- The MVS console log via TSO SDSF.

Figure 61 shows those components of the CICSPlex SM Starter Set that are defined during IVP1.

Figure 61. Starter Set components for IVP1. Shaded components—EYUCAS1A, EYUCMS1A, and EYUMAS1A—are used during IVP1

Setting up the CICSPlex SM environment on system A

Perform the following steps to prepare the MVS environment on system A for CICSPlex SM:
1. Run EYUISTRT on system A to tailor the skeleton jobs for the Starter Set (and thereby for the IVPs). EYUISTRT runs the EYUINST EXEC to tailor the Starter Set members. For more information about EYUISTRT, see Chapter 49, “Using the EYUINST EXEC to tailor skeleton jobs,” on page 373. Table 47 identifies those EYUINST EXEC parameters that are applicable to the Starter Set.

Table 47. EYUINST EXEC parameters required for the Starter Set

Note: For more information about TEMPLIB, see “EYUINST EXEC parameters” on page 375.

2. Add VTAM definitions for EYUCAS1A, EYUCMS1A, and EYUMAS1A to the VTAM table on system A. An example of the VTAM definitions for these three CICSPlex SM components is provided in sample EYUDVTIA.

You need not add the VTAM definitions now to system B if you plan to not run IVP2. (Remember that IVP2 should be run when you will have CMAS-to-CMAS communication links.)

EYUDVTIA is a subset of the VTAM definitions required on system A for the complete Starter Set. It holds the basic definitions required to run IVP1.

Note: The sample VTAM definitions use MODETAB(EYUMDTAB). The source of this is in CICSTS31.CPSM.SEYUDEF, member EYUMDTAB. If you use the starter set VTAM definitions, you must assemble this table and put it into the VTAMLST library.

If you use Network Control Programs (NCP), you may need to create a mode table, using the sample entry shown in EYUMDTAB, in order to control the VTAM RUSIZE (request unit size) parameter.

3. Run the JCL EYUIBBIA, which defines the BBIPARM data set for CAS EYUCAS1A.

4. Run the JCL EYUICMSA, which defines all data sets required by CMAS EYUCMS1A.

5. Run the JCL EYUICICA, which defines all data sets required by MAS EYUMAS1A.
6. Run the JCL EYUIDRPA, which defines the CICSPlex SM data repository on system A.

   **Note:** This data repository can be used with the Starter Set on system A: it does not need to be recreated after the IVPs have been run.

7. Run the JCL EYUICSDA, which defines, initializes, and loads the CSD to be used by both EYUCMS1A and EYUMAS1A.

8. Make any necessary site-specific changes to the CSD created in step 7. For example, you might need to add TYPETERMs, TERMINALs or AUTOINSTALL MODELS.

9. Assemble the following sample CICS tables into a load library:
   - EYUTPLTC (PLT for EYUCMS1A)
   - EYUTPLTL (PLT for EYUMAS1A)
   - EYUTSRTS (SRT)

   **Notes:**
   a. Ensure that you have a model installed for the system log stream. The default naming convention is userid.applid.DFHLOG and userid.applid.DFHSHUNT for a system log stream, and userid.applid.DFHJnn (where nn is 01 through 99) for a user journal. See Chapter 24, “Defining the logger environment for CICS journaling,” on page 143 and the CICS System Definition Guide for more information about creating log streams.
   b. TDQ definitions are added to the CSD when the CSD is created or upgraded.
   c. For details on assembling CICS control tables, see the CICS/ESA System Definition Guide.

10. Update ISPF on system A to reflect the addition of CICSPlex SM. You can find an example of the required changes in EYU@ISPF and EYU@PRIM. Note that any changes you make to ISPF are generally applicable on system A and are not confined to IVP1 only. Therefore, you should try to make a permanent change at this stage so that you don’t have to repeat this step later. For more information, see Chapter 42, “Preparing user access to CICSPlex SM,” on page 313.

### Starting up and verifying CICSPlex SM components on system A

When the system A environment for CICSPlex SM is established, you are ready to:

1. Start the CAS EYUCAS1A
2. Start the CMAS EYUCMS1A
3. Define a CICSpex
4. Run the batched repository update facility
5. Start the MAS EYUMAS1A

### 1: Start the CAS EYUCAS1A

1. Log on to system A and start the CAS using either JCL EYUICS1A or (to start the CAS as a started task) JCL EYUICSSA. When you start the CAS, output similar to this appears in the JES2 job log:
2. Look for message number BBMZA001I in the output to confirm that the CAS EYUCAS1A is started.

2: Start the CMAS EYUCMS1A

1. Check the CICS Transaction Server for z/OS system initialization table (SIT) parameters in JCL EYUICM1A, in particular the SVC numbers and the default user, to ensure that they are suitable for your environment.

2. Submit JCL EYUICM1A. The output from EYUICM1A is similar to this:
3. In the output from EYUICM1A, look for messages EYUXL0009I and EYUXL0008I to confirm that the CMAS EYUCMS1A is started.

3: Define a CICSp1ex to CICSp1ex SM

During this stage, you define a CICSp1ex to CICSp1ex SM via the CICSp1ex SM end-user interface.

1. Log on to TSO on system A and select the CICSp1ex SM option from the main ISPF panel; the CICSp1ex SM option is CP if you are using the supplied samples. Ensure that “EYUA” is specified as the subsystem ID. (This can be changed using option 0.1 from the main ISPF panel.) The CICSp1ex System Manager entry panel is displayed:

3. In the output from EYUICM1A, look for messages EYUXL0009I and EYUXL0008I to confirm that the CMAS EYUCMS1A is started.

3: Define a CICSp1ex to CICSp1ex SM

During this stage, you define a CICSp1ex to CICSp1ex SM via the CICSp1ex SM end-user interface.

1. Log on to TSO on system A and select the CICSp1ex SM option from the main ISPF panel; the CICSp1ex SM option is CP if you are using the supplied samples. Ensure that “EYUA” is specified as the subsystem ID. (This can be changed using option 0.1 from the main ISPF panel.) The CICSp1ex System Manager entry panel is displayed:
2. Select CICSPlex SM by typing the value “2” in the OPTION field. Before pressing Enter, ensure that both the Context field and the Scope field contain the name of the CMAS, which is EYUCMS1A. The MENU menu is displayed:

```
--------------------------- CICSPlex System Manager ----------------------------
OPTION ===>
0 PROFILE - User Session Parameters
1 PLEXMGR - List of Service Points
2 CPSM - CICSPlex SM

Default Criteria for CPSM:
Context ===> EYUCMS1A
Scope ===> EYUCMS1A
Warning Record Count ===> 0 0 for no checking
Require Set ===> YES YES, NO

Licensed Materials - Property of IBM
5697-E93 (C) Copyright IBM Corp. 1994, 2011.
All Rights Reserved. U.S. Government Users
Restricted Rights - Use, Duplication or Disclosure
restricted by GSA ADP Schedule Contract with IBM Corp.
```

3. From the MENU menu, select ADMCONFIG. You can select ADMCONFIG in one of three ways. You can:
   - Type ADMCONFIG in the COMMAND field and press Enter.
   - Move the cursor down to the ADMCONFIG line, type S (for select) in the C column, and press Enter.
   - Move the cursor to the ADMCONFIG value or its description and press Enter.
Note: You can select any view from a menu of views using any of these methods.

The ADMCONFIG menu is displayed:

27FEB2005 13:38:28 ------------ INFORMATION DISPLAY --------------------------------------------------
COMMAND ==> SCROLL ==> PAGE
CURR WIN ==> 1 ALT WIN ==>
W1 =MENU=ADMCONFIG=EYUCMS1A=EYUCMS1A=27FEB2005=13:38:28=CPSCM=6==
CMD Name Description
--- -------------------------------
ADMCONFIG CMAS Configuration Administration Views
BATCHREP Batched Repository Updates
CPLEXDEF CICSpex Definitions
CPLEXMAS CMAS in CICSpex Definitions
CMTCMDEF CMAS-to-CMAS Link Definitions
CMTPMDEF CMAS-to-RMAS Link Definitions

4. From the ADMCONFIG menu, select CPLEXDEF. The CPLEXDEF view is displayed:

27FEB2005 13:39:00 ------------ INFORMATION DISPLAY --------------------------------------------------
COMMAND ==> SCROLL ==> PAGE
CURR WIN ==> 1 ALT WIN ==>
W1 =CPLEXDEF;;;;;;;;;;;;;;;;EYUCMS1A=EYUCMS1A=27FEB2005=13:38:28=CPSCM=6==
BBMXBD15I There is no data which satisfies your request

The CPLEXDEF view contains message BBMXBD15I because, at this stage, there are no CICSpexes defined to CMAS EYUCMS1A.

5. To create a CICSpex definition, type CRE in the COMMAND field of the CPLEXDEF view and press Enter. The Create CICSpex input panel is displayed:

-------------------------------------------- Create CICSpex for EYUCMS1A --------------------------------------------
COMMAND ==> 
CICSpex name ==> 
Description ==> 
Monitor Interval ==> 480 Performance interval duration (15-1440 min)
Daylight Savings Time ==> NO YES or NO
Time Zone ==> B Time zone for interval (B-Z)
Time Zone Adjustment ==> 0 Offset from time zone (0-59)
Populate In Resource ==> Monitored by the resource
Status Facility ==> NO status facility
CICS Command Checking ==> NO Simulated CICS Command Checks
CICS Resource Checking ==> NO Simulated CICS Resource Checks
Exemption Checking ==> NO Check for Exempt Users

Press ENTER to create CICSpex. Type END or CANCEL to cancel without creating.

In the CICSpex Name field, type the value EYUPLX01, and supply a brief description (for example, “IVP 1 CICSpex”) in the Description field. Leave all other fields to default and press Enter. The CPLEXDEF view is redisplayed:
The CPLEXDEF view now contains an entry for CICSpex EYUPLX01.

6. Return to the CICSpex SM MENU menu by typing MENU in the COMMAND field of the CPLEXDEF view and pressing Enter.

4: Run the batched repository update facility on system A

During this stage you load several definitions into the data repository of CMAS EYUCMS1A using the batched repository update facility.

1. From the CICSpex SM MENU menu, select ADMCONFG. From the ADMCONFG menu, select BATCHREP. The BATCHREP view is displayed:

2. To submit a job to update the data repository, type the value SUB in the COMMAND field of the BATCHREP view and press Enter. The Start Batch Run input panel is displayed:

    Complete the Start Batch Run screen as shown above and press Enter. The supplied sample data repository definitions are loaded into the data repository of EYUCMS1A.

    Note: The Print Class, Print Node, and Output Userid values are site specific. Consult your MVS administrator for valid values for these fields. Be
aware, however, that the Print Class value should identify a HELD output class so that the results of the batch run may be validated.

3. Verify that the batched repository update facility has created the definitions by examining the JOBLOG of EYUICM1A, which is in the HELD output queue. Look for message EYUXU0218I to verify this.

5: Start the MAS EYUMAS1A

1. Check the SIT parameters in JCL EYUIMS1A, in particular the SVC numbers and the default user, to ensure that they are suitable for your environment.
2. Submit JCL EYUIMS1A from TSO. Output similar to this appears in the job log:
3. Look for messages EYUXL0004I and EYUXL0007I to confirm that MAS EYUMAS1A is started.

Testing CICSPlex SM functions

During this part of IVP1, you test the operations function of CICSPlex SM on system A.

Test the operations functions on system A

During this stage of IVP1 you:

- Change the value of a CICS resource via CICSPlex SM
- Test the CICSPlex SM help facility.

1. From the CICSPlex SM MENU menu, check that the context and scope are still set to EYUPLX01 by looking at the window information line, which is the fourth line down from the top of the display. Following the two occurrences of the menu name (MENU) are the context (EYUPLX01) and scope (EYUPLX01) values.

From the MENU menu, select OPERATE. The OPERATE menu is displayed:
2. From the OPERATE menu, enter CICSRGN to display details of CICS systems belonging to EYUPLX01. From the CICSRGN view, display a detailed view of data for region EYUMAS1A by moving the cursor to the entry for EYUMAS1A and pressing Enter.

**Note:** It is not sufficient to tab to the desired line on the display, the cursor must be placed under one of the letters of the name of the region, for example EYUMAS1A.

3. The CICSRGN3 view for EYUMAS1A is displayed. Move the cursor to the Current Tasks field and press Enter. The CICSRGN3 view is displayed.

4. Verify that the CICSPlex SM help function is working by typing HEL in the COMMAND field of the CICSRGN3 view, moving the cursor to the MAxtasks field, and pressing Enter. A pop-up panel in which the MAxtasks field is described, overwrites the CICSRGN3 view.

5. Type END in the COMMAND field of the help panel and press Enter to return to the CICSRGN3 view.

6. From a second display, and following your local procedure, log on to CICS system EYUMAS1A. Type CEMT INQUIRE SYSTEM and press Enter. A summary of current values for CICS system EYUMAS1A is displayed:

---

7. If you are using a version of ISPF prior to Version 3 Release 1, all help information is provided in full-screen panels.
Take a note of the current MAxtasks value.

7. Return to the CICSPlex SM session where the CICSRGN3 view is displayed. Tab the cursor to the left of the first field in the first row of data, type the word SET, then move the cursor to the MAxtasks field, change the current value to 60, and press Enter. The MAxtasks value changes to 60:

8. To verify that the value has been changed in the CICS system itself, return to the CICS (EYUMAS1A) session and enter the CEMT INQUIRE SYSTEM command again. The MAxtasks value is 60:
End the CICS session using CESF LOGOFF and return to the CICSPlex SM session.

9. Type TRAN in the COMMAND field of the CICSRGN3 view and press Enter.

   The TRAN view, showing general information about transactions within EYUPLX01, is displayed. Move the cursor to the Tran ID CONL and press Enter. The LOCTRAND view, showing details of local transaction CONL in EYUMAS1A, is displayed.

10. Return to the CICSPlex SM MENU menu by typing MENU in the COMMAND field of the LOCTRAND view and pressing Enter.

---

**IVP1 is complete**

If you are planning to run CICSPlex SM on multiple MVS images, you should now run IVP2. However, before you begin IVP2, you must stop EYUCAS1A, EYUCMS1A, and EYUMAS1A on system A. If you do not stop these system A components, you will have difficulty running IVP2.
Chapter 55. Installation verification procedure 2 (IVP2)

It is recommended that you run IVP2 on the second and subsequent MVS images on which you install CICSPlex SM. Throughout this chapter, the MVS image on which you are running IVP2 is referred to as “system B”.

In order to run IVP2, you must have:

- Two physically connected MVS/ESA images (system A and system B) on which CICSPlex SM has been installed
- On both systems, access to:
  - The CICSPlex SM samples data sets, CICSTS31.CPSM.SEYUDEF and CICSTS31.CPSM.SEYUJCL
  - CICS load libraries
  - CICS table-assembly JCL
  - SYS1.PARMLIB and SYS1.VTAMLST (or be able to add definitions to SYS1.PARMLIB and SYS1.VTAMLST)
- Access to the CEDA transaction on EYUMAS1B
- Access to the MVS console log via TSO SDSF.

Before you can run IVP2, you must have run IVP1 successfully and stopped EYUCAS1A, EYUCMS1A, and EYUMAS1A.

Figure 62 on page 426 shows those components of the CICSPlex SM Starter Set that are defined during IVP2.
Perform the following tasks to prepare the MVS environment on system B for CICSPlex SM.

1. Run EYUISTRT on system B to tailor the skeleton jobs for the Starter Set (and thereby for the IVPs). EYUISTRT runs the EYUINST EXEC to tailor the Starter Set members. For more information about EYUISTRT, see Chapter 49, “Using the EYUINST EXEC to tailor skeleton jobs,” on page 373.

2. Add VTAM definitions for EYUCAS1B, EYUCMS1B, and EYUMAS1B to the VTAM table on system B. An example of the VTAM definitions for these three CICSPlex SM components is provided in sample EYUDVTIB.

Notes:

a. EYUDVTIB is a subset of the VTAM definitions required on system B for the complete Starter Set.

b. If you use Network Control Programs (NCP), you may need to create a mode table, using the sample entry shown in EYUMDTAB, in order to control the VTAM RUSIZE (request unit size) parameter.
3. Run the JCL EYUIBBIB, which defines the EYUIPRM data set for CAS EYUCAS1B. If you are using shared DASD, this will already have been defined during IVP1.

4. Run the JCL EYUICMSB, which defines all data sets required by CMAS EYUCMS1B.

5. Run the JCL EYUICICB, which defines all data sets required by MAS EYUMAS1B.

6. Run the JCL EYUIDRPB, which defines the CICSPlex SM data repository on system B.

   **Note:** This data repository can be used with the Starter Set on system B: it does not need to be recreated after the IVPs have been run.

7. Run the JCL EYUICSDB, which defines, initializes, and loads the CSD to be used by both EYUCMS1B and EYUMAS1B.

8. Make any necessary site-specific changes to the CSD created in step\(^7\) For example, you might need to add TYPETERMs, TERMINALs or AUTOINSTALL MODELS.

9. Assemble the following sample CICS tables into a load library:
   
   EYUTPLTC (PLT for EYUCMS1B)
   EYUTPLTL (PLT for EYUMAS1B)
   EYUTSRTS (SRT)

   **Notes:**
   
a. Ensure that you have a model installed for the system log stream. The default naming convention is userid.applid.DFHLOG and userid.applid.DFHSHUNT for a system log stream, and userid.applid.DFHJnn (where nn is 01 through 99) for a user journal. See [Chapter 24, “Defining the logger environment for CICS journaling,” on page 143 and the CICS System Definition Guide](#) for more information about creating log streams.

b. When using CICS TS releases, TDQ definitions are added to the CSD when the CSD is created or upgraded.

c. For details on assembling CICS control tables, see the CICS/ESA System Definition Guide.

10. Update ISPF on system B to reflect the addition of CICSPlex SM. You can find an example of the required changes in EYU@ISPF and EYU@PRIM. Note that any changes you make to ISPF are generally applicable on system B and are not confined to IVP2 only. Therefore, you should try to make a permanent change at this stage so that you don’t have to repeat this step later. For more information, see [Chapter 42, “Preparing user access to CICSPlex SM,” on page 313](#).

### Starting up and verifying CICSPlex SM components on system B

When the system B environment for CICSPlex SM is established, you are ready to:

1. Create CAS definitions
2. Start the CAS EYUCAS1B
3. Checking CAS-to-CAS connections
4. Start the CMAS EYUCMS1B
5. Run the batched repository update facility
6. Enable EYUCMS1B to manage EYUPLX01
7. Start the MAS EYUMAS1B
1: Create CAS definitions

1. Before you can start the CAS on system B, you must restart the CAS on system A (EYUCAS1A) and create CAS definitions for CAS EYUA and EYUB. For information about starting EYUCAS1A, see "1: Start the CAS EYUCAS1A" on page 413.

2. Log on to TSO on system A and select the CICSPlex SM option from the main ISPF panel. (This is option CP if you are using the supplied samples.) The CICSPlex System Manager entry panel is displayed:

```
--------------------------- CICSPlex System Manager ----------------------------
OPTION ===> 
   0 PROFILE - User Session Parameters
   1 PLEXMGR - List of Service Points
   2 CPSM - CICSPlex SM

Default Criteria for CPSM:
Context ===> EYUCMS1A
Scope ===> EYUCMS1A
Warning Record Count ===> 0 0 for no checking
Require Set ===> YES YES, NO
```

3. Type 1 in the OPTION field of the CICSPlex System Manager entry panel and press Enter. (The values in the Context and Scope fields are ignored.) The PLEXOVER view is displayed.

The remainder of this stage varies according to whether you are using the same EYUIPRM data set on shared DASD for both CASs. If you are using shared DASD, follow the steps in "CAS data set EYUIPRM on shared DASD" If you are not using shared DASD, follow the steps in "CAS data set EYUIPRM not on shared DASD" on page 429.

CAS data set EYUIPRM on shared DASD

1. In the COMMAND field of the PLEXOVER view, type CASDEF and press Enter. The CASDEF view is displayed:

```
27FEB2005 14:17:33 ----------- INFORMATION DISPLAY ---------------------------
COMMAND ===> SCROLL ===> PAGE
CURR WIN ===> 1 ALT WIN ===> 
>WL <CASDEF============EYUA=====*========(00 BROWSE )=PLEXMGR=======1===
CMD CAS Cur Description Status VTAM
--- Name---- Sys ----------- ---------------- ApplName
MV26 Yes Use CASDEF to update INSTALLED +NONE*
```

The first time you display the CASDEF view (that is, before you have added any CAS definitions), information for a default definition is displayed (MV26 in the
CASDEF view shown in Figure 63 on page 428. Throughtout this example CAS name EYUA and EYUB are used. We will now create the definitions.

2. In the COMMAND field of the CASDEF view, type EDIT and press Enter.
3. In the COMMAND field, type ADD EYUA and press Enter. Alternatively, move the cursor to the CMD field, type ADD and press Enter. The ADD CAS SYSTEM DEFINITION input panel is displayed:

```
-------- ADD CAS SYSTEM DEFINITION -------------------------------
COMMAND ==>
CAS System Name ===> EYUA (Recommended same as MVS System Name)
Description ===> SYSTEM A CAS

System Identification Information:
MVS System Name ===> EYUA
SysPlex Name ===> EYUB

System Communication Information:
VTAM Appl Name ===> EYUCAS1A
XCF Group Name ===> EYUGR310
```

Enter END to add the CAS System Definition.
Enter CANCEL to leave without adding.

4. Complete the ADD CAS SYSTEM DEFINITION input panel (displayed in Figure 64) then press Enter. (See the CICSPlex System Manager Administration for a description of the fields on this panel). If the panel is displayed as a result of typing ADD in the CMD field, the System Identification Information is already completed with your own system defaults.

Enter END in the COMMAND field to add the definition. The CASDEF view is displayed again, this time showing an entry for CAS EYUA.

Repeat Steps 3 and 4 for CAS EYUB (subsystem ID EYUB and VTAM Application name EYUCAS1B).

Enter DEL in the CMD field next to the default entry (MV26 in this example) to schedule this entry for deletion the next time the CAS is recycled.

5. Enter SAVE in the COMMAND field to save the definitions.

6. Return to the CICSPlex System Manager entry panel by typing RETURN in the COMMAND field of the CASDEF view and pressing Enter. If you do not return to the CICSPlex System Manager entry panel, system A will have the shared file locked.

7. Shut down the CAS on system A.

**CAS data set EYUIPRM not on shared DASD**

1. In the COMMAND field of the PLEXOVER view, type CASDEF and press Enter. The CASDEF view is displayed:

```
-------- ADD CAS SYSTEM DEFINITION -------------------------------
COMMAND ==>
CAS System Name ===> EYUA
Description ===> SYSTEM A CAS

System Identification Information:
MVS System Name ===> EYUA
SysPlex Name ===> *

System Communication Information:
VTAM Appl Name ===> EYUCAS1A
XCF Group Name ===> EYUGR310
```

Enter END to add the CAS System Definition.
Enter CANCEL to leave without adding.
The first time you display the CASDEF view (that is, before you have added any CAS definitions) information for a default definition is displayed (MV26 in the CASDEF view shown in Figure 65 on page 429). Throughout this example CAS name EYUA and EYUB are used. We will now create the definitions.

2. In the COMMAND field of the CASDEF view, type EDIT and press Enter.

3. In the COMMAND field, type ADD EYUA and press Enter. Alternatively, move the cursor to the CMD field, type ADD and press Enter. The ADD CAS SYSTEM DEFINITION input panel is displayed:

![Figure 66. ADD CAS system definition input panel](image)

4. Complete the ADD CAS SYSTEM DEFINITION input panel (displayed in the example above) then press Enter. (See the CICSPlex System Manager Administration for a description of the fields on this panel). If the panel is displayed as a result of typing ADD in the CMD field, the System Identification Information is already completed with your own system defaults. Enter END in the COMMAND field to add the definition. The CASDEF view is displayed again, this time showing an entry for CAS EYUA.

Repeat Steps 3 and 4 for CAS EYUB (subsystem ID EYUB and VTAM Application name EYUCAS1B).

Enter DEL in the CMD field next to the default entry (MV26 in this example) to schedule this entry for deletion the next time the CAS is recycled.

The CASDEF view is displayed again, this time showing entries for CAS EYUA and CAS EYUB:
5. In the COMMAND field of the CASDEF view, type SAVE and press Enter.
6. Return to the CICSPlex System Manager entry panel by typing RETURN in the COMMAND field of the CASDEF view and pressing Enter.
7. Shut down the CAS on system A.
8. Start CAS EYUCAS1B on system B using JCL EYUICS1B or JCL EYUICSSB (to start the CAS as a started task). Look for message number BBMZA001I in the output to confirm that the CAS EYUCAS1B is started.
9. Log on to TSO on System B and select the CICSPlex SM option from the main ISPF panel. (The CICSPlex SM option is CP if you are using the supplied samples.) The CICSPlex System Manager entry panel is displayed:

The default definition for system B in this example is MV29. You now need to add definitions for EYUA and EYUB and delete the default definition on system B.
12. In the COMMAND field, type ADD EYUB and press Enter. Alternatively, move the cursor to the CMD field, type ADD and press Enter. The ADD CAS SYSTEM DEFINITION input panel is displayed:

```
--------------------- ADD CAS SYSTEM DEFINITION -------------------------------
COMMAND ===> 
CAS System Name ===> EYUB (Recommended same as MVS System Name)
Description ===> 

System Identification Information:
MVS System Name ===> EYUB SMF ID ===> *
SysPlex Name ===> * Subsystem ID ===> *

System Communication Information:
VTAM Appl Name ===> EYUCAS1B
XCF Group Name ===> EYUGROUP
```

Enter END to add the CAS System Definition.
Enter CANCEL to leave without adding.

13. Complete the ADD CAS SYSTEM DEFINITION input panel (displayed in Figure 67) then press Enter. (See the CICSpHlex System Manager Administration for a description of the fields on this panel). If the panel is displayed as a result of typing ADD in the CMD field, the System Identification Information is already completed with your own system defaults.

Enter END in the COMMAND field to add the definition. The CASDEF view is displayed again, this time showing an entry for CAS EYUB.

Repeat Steps 3 and 4 for CAS EYUA (subsystem ID EYUA and VTAM Application name EYUCAS1A).

Enter DEL in the CMD field next to the default entry (MV29 in this example) to schedule this entry for deletion the next time the CAS is recycled.

The CASDEF view is displayed again, this time showing entries for CAS EYUB and CAS EYUA.

```
27FEB2005 14:17:33 ----------- INFORMATION DISPLAY ---------------------------
COMMAND ===> SCROLL ===> PAGE
CURR WIN ==> 1 ALT WIN ===> 
>WI <CASDEF=================EYUB=================O0 EDIT MOD PLEXMGR======2===
CMD CAS Cur Description Status VTAM
--- Name---- Sys ---------------- ApplName
EYUA NO SYSTEM A CAS UNINSTALLED EYUCAS1A
EYUB YES SYSTEM B CAS UNINSTALLED EYUCAS1B
```

14. In the COMMAND field of the CASDEF view, type SAVE and press Enter.

15. Return to the CICSpHlex System Manager entry panel by typing RETURN in the COMMAND field of the CASDEF view and pressing Enter.

16. Shut down the CAS on system B.

2: Start the CAS EYUCAS1B

1. Before you can start the CAS on system B, you must restart the CAS on system A (EYUCAS1A). For information about starting EYUCAS1A, see 1: Start the CAS EYUCAS1A on page 413.
2. You can start CAS EYUCAS1B using JCL EYUICS1B or (to start the CAS as a started task) JCL EYUICSSB. When you start the CAS, output similar to this appears in the JES2 job log.

```
BBMYA62I Default system values used for CAS definition
BBMXCL41I Default system values used for target definition
BBMXCL40W SSI Context Definition member 00 not found in BBIPARM
BBMXB117I Default security parameters used
BBMXB126I Default security resource properties used
BBMXCL36I Default security resource definition used for COMMON resources
BBMSOSOII Security - ESMTYPE(RACF) SUBSYS(EYUB) REQSTOR(asis) APPL(EYUB)
BBMZA001I CAS(EYUB) SSID(EYUB) INITIALIZATION COMPLETE - R3.3.8 (BPY3621)
```

3. Look for message number BBMZA001I in the output to confirm that the CAS EYUCAS1B is started.

**3: Checking CAS-to-CAS connections**

During this stage of IVP2, you check to confirm that the connection from the CAS on system A to the CAS on system B, and from the CAS on system B to the CAS on system A were installed when the CAS was started.

1. Log on to TSO on system A and select the CICSPlex SM option from the main ISPF panel. (This is option CP if you are using the supplied samples.) The CICSPlex System Manager entry panel is displayed:

```
OPTION ===>
0 PROFILE - User Session Parameters
1 PLEXMGR - List of Service Points
2 CPSM - CICSPlex SM

Default Criteria for CPSM:
Context ===> EYUCMS1A
Scope ===> EYUCMS1A
Warning Record Count ===> 0 0 for no checking
Require Set ===> YES YES, NO
```

2. Type 1 in the OPTION field of the CICSPlex System Manager entry panel and press Enter. (The values in the Context and Scope fields are ignored.) The PLEXOVER view is displayed.
3. In the COMMAND field of the PLEXOVER view, type CASDEF and press Enter. The CASDEF view is displayed:

```
27FEB2005 14:17:33 ------------ INFORMATION DISPLAY --------------------------
COMMAND ===> SCROLL ===> PAGE
CURR WIN ===> 1 ALT WIN ===> 
>W1 =CASDEF============EYUA=======*==========(00 BROWSE )=PLEXMGR========2===
CMD CAS Cur Description Status VTAM
--- Name---- Sys ----------- ---------------- ApplName
 EYUA YES SYSTEM A CAS INSTALLED EYUCAS1A
 EYUB NO SYSTEM B CAS INSTALLED EYUCAS1B
```

Both CAS entries should be installed. If they are not then place the cursor in the CMD field next to the entry and type INS.

4. Return to the CICSPlex System Manager entry panel by typing RETURN in the COMMAND field of the CASDEF view and pressing Enter.

5. If the same EYUIPRM on shared DASD is not being used, repeat Steps 1 through 4 for CAS EYUB on system B.

### 4: Start the CMAS EYUCMS1B

1. Before you can start the CMAS on system B, you must restart the CMAS on system A (EYUCMS1A). For information about starting EYUCMS1A, see "2: Start the CMAS EYUCMS1A" on page 414.

2. Check the CICS Transaction Server for z/OS system initialization table (SIT) parameters in JCL EYUICM1B, in particular the SVC parameters and the default user, to ensure that they are suitable for your environment.

3. Submit JCL EYUICM1B. The output from JCL EYUICM1B is similar to this:
4. In the output from EYUICM1B, look for messages EYUXL0009I and EYUXL0008I to confirm that CMAS EYUCMS1B is started.

5: Run the batched repository update facility on system B

During this stage of IVP2, you load several definitions into the data repository of CMAS EYUCMS1B using the batched repository update facility.

1. Log on to TSO on system B. Select the CICSpIex SM option from the main ISPF panel; the CICSpIex SM option is CP if you are using the supplied samples. Ensure that “EYUB”is specified as the subsystem ID. (This can be changed using option 0.1 from the main ISPF panel.) The CICSpIex System Manager entry panel is displayed.

2. Set the context and scope fields of the CICSpIex System Manager entry panel to EYUCMS1B, then type 2 in the OPTION field and press Enter. The MENU menu is displayed.

3. From the CICSpIex SM MENU menu, select ADMCONFG. The ADMCONFG menu is displayed. From the ADMCONFG menu, select BATCHREP. The
4. To submit a job to update the data repository of CMAS EYUCMS1B, type SUB
in the COMMAND field of the BATCHREP view and press Enter. The Start
Batch Run input panel is displayed:

```
COMMAND ===> 'CICSTS31.CPSM.SEYUDEF'
Data Set Member ===> EYUDDRIB
Data Set Name ===> 'CICSTS31.CPSM.SEYUDEF'
Print Class ===> H
Print Node ===> *
Output Userid ===> *
Run Type ===> EXECUTE

Press ENTER to Run the Job.
Type END or CANCEL to cancel without Running.
```

5. Complete the Start Batch Run screen as shown in the example above and
press Enter. Verify that the batched repository update facility has created the
definitions by examining the JOBLOG of EYUICM1B, which is in the HELD
output queue.

6. Return to the CICSpClex SM MENU menu by typing MENU in the COMMAND
field of the BATCHREP view and pressing Enter.

### 6: Enable EYUCMS1B to manage EYUPLX01

During this stage of IVP2, you define EYUCMS1B as a secondary CMAS for
CICSplex EYUPLX01. (CMAS EYUCMS1A is the primary CMAS for EYUPLX01.)

1. Log on to TSO on system A and select the CICSpClex SM option from the main
ISPF panel. (The CICSpClex SM option is CP if you are using the supplied
samples.) The CICSpClex System Manager entry panel is displayed:
2. Ensure that both the Context and the Scope fields on the CICSPlex System Manager entry panel are set to EYUCMS1A. Type 2 in the OPTION field and press Enter. The MENU menu is displayed:

```
--------- INFORMATION DISPLAY -----------
27FEB2005 14:42:11 COMMAND ===> SCROLL ===> PAGE
CURR WIN ===> 1 ALT WIN ===> W1 
WI MENU = EYUCMS1A=EYUCMS1A=27FEB2005==14:42:11=CPSM=14= 
CMD Name Description

ADMTOPO Topology Administration Views
ADMWLM Workload Manager Administration Views
ADMAS Business Application Services Administration Views
ADMRSE Business Application Services Resource Views
```

3. Select ADMCONFG from the MENU menu. The ADMCONFG menu is displayed:
4. From the ADMCONFG menu, select CPLEXDEF. The CPLEXDEF view is displayed:

5. Move the cursor to the EYUPLX01 entry, type ADD in the CMD field, and press Enter. The Add CMAS to CICSPlex input panel is displayed:

6. In the CMAS Name field of the Add CMAS to CICSPlex input panel, type EYUCMS1B and press Enter. The CPLEXDEF view is redisplayed.

7. To verify that the data repository on system B has been updated with the definition of EYUPLX01, you must change the current context and scope to EYUCMS1B. To change the context and scope, type SET in the COMMAND field of the CPLEXDEF view and press Enter. Complete the SET WINDOW, CONTEXT, PRODUCT, SCOPE, AND VIEW panel and press Enter.

8. Enter CMASPLEX in the COMMAND field of the CPLEXDEF view. The CMASPLEX view, showing CICSplices managed by EYUCMS1B, is displayed:
An entry for EYUPLX01 appears in the CMASPLEX view.

9. Return to the CICSplex SM MENU menu by typing MENU in the COMMAND field of the CMASPLEX view and pressing Enter.

7: Start the MAS EYUMAS1B

1. Before you can start the MAS on system B, you must restart the MAS on system A (EYUMAS1A). For information about starting EYUMAS1A, see “5: Start the MAS EYUMAS1A” on page 419.

2. Check the SIT parameters in JCL EYUIMS1B, in particular the SVC numbers and the default user, to ensure that they are suitable for your environment.

3. Submit JCL EYUIMS1B from TSO. Output similar to this appears in the job log:

```
27FEB2005 14:43:38 ---------- INFORMATION DISPLAY -----------------------------
COMMAND ===> SCROLL ===> PAGE
CURR WIN ===> 1 ALT WIN ===> 
W1 =CMASPLEX==============EYUCMS1B=EYUCMS1B=27FEB2005==14:43:38=CPSM==============1===
CMD CICSpIx MP
--- -------- ---
EYUPLX01 NO
```

Chapter 55. Installation verification procedure 2 (IVP2) 439
4. Look for messages EYUXL0004I and EYUXL0007I in the output to confirm that the MAS is active.

Testing CICSPlex SM functions

During this part of IVP2, you test the operations and functions of CICSPlex SM on system B.

Test the operations functions on system B

During this stage of IVP2 you:

- Change the value of a CICS resource via CICSPlex SM
- Test the CICSPlex SM help facility
- Test the CMAS-CMAS links.

1. From the CICSPlex SM MENU menu on system A, change the context and scope to EYUPLX01 then select the OPERATE option. The OPERATE menu is displayed:
2. From the OPERATE menu, enter CICSRGN to display details of CICS regions in EYUPLX01. From the CICSRGN view, display a detailed view of data for region EYUMAS1B by moving the cursor to the entry for EYUMAS1B and pressing Enter. The CICSRGND view for EYUMAS1B is displayed.

3. Move the cursor to the Current Tasks field and press Enter. The CICSRGN3 view is displayed. Verify that the help function is working by typing HEL in the COMMAND field of the CICSRGN3 view, moving the cursor to the MAxtasks field, and pressing Enter. A pop-up panel, in which the MAxtasks field is described, overwrites the CICSRGN3 view.

Type END in the COMMAND field of the help panel and press Enter to return to the CICSRGN3 view.

4. From a second display screen, and following your local procedure, log on to CICS system EYUMAS1B. Type CEMT INQUIRE SYSTEM and press Enter. A summary of current values for CICS system EYUMAS1B is displayed:

---

<table>

27FEB2005 13:48:12 ----------- INFORMATION DISPLAY ------------------------------
COMMAND ==> SCROLL ==> PAGE
CURR WIN ==> 1 ALT WIN ==>
WI =OPERATE==========EYUPLX01=EYUPLX01=27FEB2005==13:48:12=CPSM==========15===

2. From the OPERATE menu, enter CICSRGN to display details of CICS regions in EYUPLX01. From the CICSRGN view, display a detailed view of data for region EYUMAS1B by moving the cursor to the entry for EYUMAS1B and pressing Enter. The CICSRGND view for EYUMAS1B is displayed.

3. Move the cursor to the Current Tasks field and press Enter. The CICSRGN3 view is displayed. Verify that the help function is working by typing HEL in the COMMAND field of the CICSRGN3 view, moving the cursor to the MAxtasks field, and pressing Enter. A pop-up panel, in which the MAxtasks field is described, overwrites the CICSRGN3 view.

Type END in the COMMAND field of the help panel and press Enter to return to the CICSRGN3 view.

4. From a second display screen, and following your local procedure, log on to CICS system EYUMAS1B. Type CEMT INQUIRE SYSTEM and press Enter. A summary of current values for CICS system EYUMAS1B is displayed:

---

If you are using a version of ISPF prior to Version 3 Release 1, all help information is provided in full-screen panels.
Take a note of the current MAxtasks value.

5. Return to the CICSPlex SM terminal session, move the cursor to any field to the left of the first column of data and type the word SET, then move the cursor to the MAxtasks field, change the current value to 60, and press Enter. The MAxtasks value changes to 60:

6. To verify that the value has been changed in the CICS system itself, return to the CICS (EYUMAS1B) session and enter the CEMT INQUIRE SYSTEM command again. The MAxtasks value is 60:
End the CICS terminal session using CESF LOGOFF and return to the CICSPlex SM terminal session.

7. Type the command TRAN in the COMMAND field of the CICSRGN3 view and press Enter. The TRAN view, which shows all transactions currently installed in the CICSpex, is displayed. Scroll down and move the cursor to the CONL entry for EYUMAS1B, then press Enter. The LOCTRAND view, which shows details of local transaction CONL in EYUMAS1B, is displayed.

8. Return to the CICSPlex SM MENU menu by typing MENU in the COMMAND field of the LOCTRAND view and pressing Enter.

**IVP2 is complete**

It is recommended that you repeat IVP2 on the third and subsequent MVS images on which you install CICSPlex SM.

### Customizing the installation verification procedures

When you have finished configuring CICSPlex SM to manage your CICS systems, you can run IVP1 and IVP2 again, but using your own CASs, CMASs, and MASs, to ensure that your configuration is working.

To run IVP1 and IVP2 with your own CICSPlex SM components, you need to change the supplied IVP definitions:

1. Ensure that your CMAS uses the IVP1 data repository (CICSTS31.CPSM.SAMPLES.SYSTEMA.EYUDREP) on system A.
2. Ensure that your CMAS uses the IVP2 data repository (CICSTS31.CPSM.SAMPLES.SYSTEMB.EYUDREP) on system B.
3. Delete and redefine the data repositories using the supplied JCL EYUIDRPA and EYUIDRPB.
4. Throughout the IVP definitions, change all references to EYUA and EYUB to the two subsystem IDs of your CASs.
5. Your CMAS EYUPARM NAME(xxxxxxxx) must refer to EYUCMS1A on system A and EYUCMS1B on system B.

6. Your MAS EYUPARM NAME(xxxxxxxx) must refer to EYUMAS1A on system A and EYUMAS1B on system B.

When you run IVP1 and IVP2 with your own configuration, you can omit the steps described in "Setting up the CICSPlex SM environment on system A" on page 411 and in "Setting up the CICSPlex SM environment on system B" on page 426.
Part 7. Appendixes
Appendix. CICS modules eligible for the MVS link pack area

This topic provides information about the CICS modules that are required in the MVS link pack area, and other CICS modules that are eligible for the MVS link pack area. This information is intended to help you plan for and install CICS modules in the MVS link pack area, for the functions that your CICS regions use.

The following terms are used in this appendix:

<table>
<thead>
<tr>
<th>Term</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>MVS link pack area</td>
<td>The MVS link pack area generally.</td>
</tr>
<tr>
<td>LPA</td>
<td>The area of the MVS link pack area below 16MB.</td>
</tr>
<tr>
<td>ELPA</td>
<td>The area of the MVS link pack area above 16MB.</td>
</tr>
</tbody>
</table>

For further information about installing CICS modules into the MVS link pack area, and about controlling their use from the MVS link pack area, see "Default message-formatting initialization parameters" on page 88.

CICS modules required in the MVS link pack area

CICS modules that are required in the MVS link pack area are loaded into the hlq.SDFHLPA library when you install CICS. Details of these modules is given in Table 48 on page 451. These modules are not affected by any CICS parameters or options, and CICS does not use the standard MVS search order for them. For further information about these modules, see "The IEASYSxx MVS initialization member" on page 83.

CICS modules eligible for the MVS link pack area

Other CICS modules that are eligible for installation in the MVS link pack area are specified in the CICS-supplied USERMODs: DFHSUMOD (for base CICS modules). Details of these modules is given in Table 49 on page 451.

Information about modules eligible for the MVS link pack area

The following information is provided in Table 48 on page 451 and Table 49 on page 451. Some of the information applies only to the modules listed in Table 49.

<table>
<thead>
<tr>
<th>Name</th>
<th>The name of the module.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>A brief description of the module. This gives some clues to the associated function, useful if the module does not have a controlling CICS option.</td>
</tr>
<tr>
<td>Library</td>
<td>(Table 49 only.) The library in which the module is installed:</td>
</tr>
<tr>
<td>Library</td>
<td>DS name</td>
</tr>
<tr>
<td>AUTH</td>
<td>hlq.SDFHAUTH</td>
</tr>
<tr>
<td>LOAD</td>
<td>hlq.SDFLOAD</td>
</tr>
<tr>
<td>LINK</td>
<td>SYS1.hlq.SDFHLINK</td>
</tr>
</tbody>
</table>

You can use the CICS-supplied usermods to move the modules from these libraries to the hlq.SDFHLPA library.

LPA/ELPA | (Table 49 only.) In this column, the terms LPA and ELPA are used
to indicate whether a module is loaded into the part of the MVS link pack area that is below (LPA) or above (ELPA) 16MB.

**Priority**
Table 49 only.) A nominal “priority” to help you decide whether a module should be in the MVS link pack area and to choose between modules if your MVS link pack area is short on space.

**Size**
The size of the module.

**Option/Note**
Identifies one or more notes about the use of the module from the MVS link pack area and any associated CICS options to be specified for the function that uses the module.

Some of these information categories are described in more detail in the following sections.

### Priority

The priority of the modules eligible for the LPA are as follows:

1. Must be in the MVS link pack area. Information about these modules, installed in the *hlq.SDFHLPA* library, is given in Table 48 on page 451.

2. Generally a good candidate for inclusion in the MVS link pack area. You should include these modules in the LPA to support the associated option.

3. A good candidate for inclusion in the MVS link pack area. You should include these modules in the MVS link pack area if you are a heavy user of the associated function.

### Size

The module sizes were taken from the latest information available at the time of publishing, but may be different in your CICS environment depending on the options selected and if any PTFs applied affect the modules. The sizes are given here to help you plan the amount of storage that you need for the modules that you want to install in the MVS link pack area. You can get the actual sizes for these modules from a directory listing of the modules or from the module index provided at the back of a formatted SDUMP taken with the LPA=NO system initialization parameter specified.

### Option/Note

This column identifies any CICS options associated with the use of the module from the MVS link pack area, or refers to a note in the following list for additional information, or both.

#### Notes:

1. The program is used from the MVS link pack area only if you set the USELPACOPY option of its program resource definition to YES.

2. You must always install the latest service level of the CICS SVC module, DFHCSVC. You should install the DFHCSVC module into the MVS link pack area before you run the CICS installation verification procedures.

   You must define the DFHCSVC module in an IEASVCxx member of the SYS1.PARMLIB library, using SVPARM statements. You select the required IEASVCxx member by coding the SVC parameter (SVC=xx) in a SYS1.PARMLIB member (IEASYSy), which you use to IPL your MVS.

   You can run several CICS regions, at different release levels, in the same MVS image, with each region using its own version of the DFHCSVC module. However, if some of those regions use MRO, then all regions that use MRO must use the latest DFHCSVC module and the latest DFHIRP module.
If you have some regions that are to use the DFHCSVC module, and you give the SVC a number different from the SVC number used by the regions, you must generate a new version of the DFHCRC program on the regions. For information about defining and using the DFHCSVC module, see the CICS Transaction Server for z/OS Program Directory.

3. If your batch region is sharing the database with a CICS/OS/VS 1.7 region or a CICS/MVS Version 2 region, you can continue to use the batch region controller program, DFHDRP, from before CICS/ESA Version 3. (The CICS/ESA Version 3 DFHIRP program supports earlier levels of the DFHDRP program.) However, if your batch region is sharing the database with a CICS TS for z/OS, Version 3.1 region, you are recommended to install the CICS TS for z/OS, Version 3.1 DFHDRP module in SYS1.LINKLIB, or another suitable APF-authorized library in the MVS linklist.

4. All LPA-required modules are downward-compatible with earlier releases of CICS. If you are running earlier releases of CICS, you must ensure that the correct version is installed in the LPA. The module must be in the LPA for integrity reasons, but the post exit routine itself can reside either in the LPA, or in the CICS address space. This enables you to use different versions of the DFHDSAUT module in different CICS regions running in the same MVS image, because the DFHDSAUT module may not be compatible from release to release.

5. The use of this pre-CICS/ESA Version 3 programmable interface to the master terminal program, DFHEMTA, is supported for compatibility reasons only. You are strongly recommended to use the equivalent EXEC CICS INQUIRE and ISET commands instead. The documentation for this interface is available only in the CICS libraries for the releases prior to CICS/ESA Version 3.

6. You can set the system tracing status by coding appropriate system initialization parameters, and you can also set it dynamically by using the CETR transaction.

   The system initialization parameters that you can use are:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>AUXTR</td>
<td>Activate auxiliary trace.</td>
</tr>
<tr>
<td>AUXTRSW</td>
<td>Define the auxiliary switch status.</td>
</tr>
<tr>
<td>GTFTR</td>
<td>Enable CICS to use MVS GTF tracing.</td>
</tr>
<tr>
<td>INTTR</td>
<td>Activate CICS internal tracing.</td>
</tr>
<tr>
<td>TRTABSZ</td>
<td>Specify the size of the internal trace table.</td>
</tr>
<tr>
<td>USERTR</td>
<td>Set the master user trace flag on or off.</td>
</tr>
</tbody>
</table>

   For information about using CICS trace, and using the CETR transaction to control the tracing status, see the CICS Problem Determination Guide.

7. The DFHIRP module needs to be in the MVS link pack area only if you are using MRO, CICS shared database, or the console message-handling facility. If you install the DFHIRP module in the MVS link pack area, you must also install DFHSSEN if you are using the console message-handling facility. You must always install the latest service level of the DFHIRP (if needed) and DFHSSEN.

   If you are running CICS with MRO at different release levels, all regions in the same MVS-image must use the latest DFHIRP module.

8. To use the console message formatting facility of the MVS subsystem interface, you must install the modules DFHSSGC and DFHSSWT either in the MVS link pack area or in an APF-authorized library in the MVS linklist. These
modules are used by the subsystem interface and not directly by CICS. Therefore, the use of these modules from the MVS link pack area is not controlled by CICS parameters or options.

For information about enabling the console message-formatting facility, and about the other modules it requires, see “Modules needed to use the console message-handling facilities” on page 89.

9. CICS needs the following load modules, supplied with CICS, to use data table services:
   - DFHDINT
   - DFHDTOC
   - DFHDTLD
   - DFHDTRD
   - DFHDTES

The modules are all eligible for the MVS link pack area, but DFHDTRD and DFHDTES are probably the only ones which are used sufficiently frequently to be worth considering.

10. The following modules, used by the Shared Data Tables facility, are eligible for the MVS link pack area:
    - DFHDTAM
    - DFHDTAOR
    - DFHDTCV
    - DFHDTFOR
    - DFHDTsvc
    - DFHDTSVC
    - DFHDTSVC
    - DFHDTXS
    - DFHMVRMS

All these modules, except for DFHMVRMS, are listed in the usermod, DF$UMOD, supplied with CICS. Only DFHDTAM, DFHDTAOR, DFHDTFOR, and possibly DFHDTCV are used sufficiently frequently to be worth considering for the MVS link pack area.

The following modules, installed in the hlq.SDFHLINK library, must be installed in the MVS linklist, or in the MVS link pack area:
    - DFHDTsvc
    - DFHDTCV
    - DFHMVRMS

11. BMS=STANDARD
12. BMS=FULL
13. BMS=MINIMUM
14. DTRPGM=DFHDYP
15. SPOOL=YES
16. FCT=YES/xx
17. ISC=YES/xx
18. VTAM=YES
19. XRF=YES/xx
20. AUXTR=ON
21. TST=YES/xx
22. TCP=YES/xx
23. This module is installed into SDFJAUTH and is copied to SDFJLPA.

This column also gives any associated options that you must specify to use the function associated with the LPA-eligible module. Unless otherwise stated, the options are specified by system initialization parameters as defined in the CICS
System Definition Guide. Any special information about a particular module is given in a note in the list starting on page "Option/Note" on page 448.

Glossary of SMP/E terms used in this book

ACCEPT (function of SMP/E) . SMP/E control statement that controls the placement (installing) of SYSMODs into the distribution libraries. Processing is similar to that during APPLY except that the distribution zone is updated, not the target zone, and JCLIN data is not processed by ACCEPT.

If the installing is successful, any entries in the SCDS created by APPLY are deleted, as are temporary libraries created by RECEIVE. Therefore, after a SYSMOD is accepted, it can no longer be removed by SMP/E.

APAR (authorized program analysis report) . IBM-supplied fixes of a temporary corrective nature to elements of IBM-supplied function SYSMODs. APAR fixes are intended to cure problems currently being experienced by an installation. The APAR fix is usually in the form of either a modification to a load module or an update to card-image data. It is intended as a temporary arrangement until a PTF is issued to fix the problem permanently. This PTF will supersede the APAR fix, and indeed specifies this relationship on its ++VER statement.

To get an APAR SYSMOD accepted into the distribution libraries, the APARS keyword must be specified in the ACCEPT control statement, which protects against inadvertent updating of distribution libraries that are to be kept free of temporary fixes.

The ++VER statement in the APAR SYSMOD must specify the FMID of the function that “owns” the elements being updated.

++APAR(API2345) ++VER(C150) FMID(HCI6400)

You should not accept APARs into the distribution library, however, because the relevant PTF will become available in due course as a more permanent form of service.

APPLY (function of SMP/E) . SMP/E control statement that applies SYSMODs to the CICS target libraries, where they can be tested. If the tests are not satisfactory, you can remove all or selected SYSMODs using the RESTORE function. If the test is successful, you can use the ACCEPT function to store the elements from the SYSMOD into the distribution libraries.

During JCLIN processing, every affected entry in the target zone is saved in the SCDS, in case the target system libraries and the target zone have to be restored to their original status.

CSI (consolidated software inventory) . A keyed VSAM data set, logically divided by SMP/E into zones. For further information on the CSI and the logical structure of zones, see the System Modification Program Extended: User’s Guide.

Distribution zone . Describes the structure and contents of a set of distribution libraries.

Function SYSMOD . An IBM-supplied product that can be installed with SMP/E. CICS Transaction Server for z/OS, Version 3 Release 1 is packaged as a function SYSMOD on a distribution tape. This contains distribution libraries and JCLIN data which SMP/E uses to create the target libraries.

FMID (keyword of CICS SYSMODs) . Keyword identifying the release and option to which a SYSMOD is applicable. For CICS Transaction Server for z/OS, Version 3 Release 1, it is always HCI6400.

Global zone . Logical division of the SMP/E consolidated software inventory (CSI), containing such information as:
- Definitions of all other related zones
- Descriptions of the SYSMODs present in the PTS
- Descriptions of the system utilities to be invoked during SMP/E processing
- DD definition entries for use by dynamic allocation

load module . In the context of SMP/E, an executable load module in a target library (such as hlq.SDFHLOAD). The standard SMP/E abbreviation for a load module is LMOD.

PTF (program temporary fix) . IBM-supplied fixes to elements of IBM-supplied function SYSMODs. PTFs are intended for installation by all users to avoid possible problems.

A PTF may contain fixes for several different problems. This means that several APAR fixes reported in RETAIN may all be superseded by the more permanent PTF, which:
- Provides card-image changes that are identical to those in the APAR fix
- Contains object-module replacements for preassembled CICS programs

Every PTF is introduced by a ++PTF header statement, and contains the FMID keyword on its ++VER modification control statement, identifying CICS (HCI6400) as the owner of the modules being serviced.

For example:
++PTF(API2345) ++VER(C150) FMID(HCI6400)

PTS (PTF temporary store) . SMP/E primary data set used to store temporarily SYSMODs that are in RECEIVE or APPLY status; that is, they have not been rejected or accepted.

RECEIVE (function of SMP/E) . SMP/E control statement that initiates processing of a SYSMOD.
RECEIVE reads the SYSMODs from the SMPPTFIN data set. Each SYSMOD must have been received before any other function can be executed.

RECEIVE updates the SMPPTS data set and performs syntax checking on input. Before any SYSMOD for CICS can be received, the global zone must have been initialized with a global zone entry.

Service SYSMODs can be received into the (PTS) before the function to which it applies has been received, and can be maintained there until the function is received. This allows all service for a product such as CICS to be installed with the base product.

REJECT (function of SMP/E). SMP/E control statement that removes SYSMODs from the PTS data set and deletes any temporary libraries that SMP/E may have allocated when the SYSMOD was received (RELfiles). If the SELECT or EXCLUDE option is not coded on the REJECT control statement, all SYSMODs not applied or accepted are removed from the PTS. This is called a mass rejection. All other SYSMOD processing functions (RECEIVE, APPLY, RESTORE, and ACCEPT) can have SELECT or EXCLUDE specified, or may default to mass-processing mode.

RESTORE (function of SMP/E). SMP/E control statement that removes SYSMODs from the target system libraries after they have been applied, and restores the target libraries to their status prior to application of the SYSMODs. If necessary, RESTORE reconstructs the target zone entries from the SCDS. If you select “mass restore”, all SYSMODs that have been applied but not accepted are removed from the target libraries.

Target zone. Describes the structure and contents of a set of target system libraries.

UCLN (function of SMP/E). SMP/E control statement that can be used to manipulate the various data sets that make up the SMP/E data base. The most common use of this function is to initialize the SMP/E database before the first attempt to use it. For CICS, this initialization is performed during installation, when DFHINST4 is run.

USERMOD (user modification). User-supplied modifications to elements of IBM-supplied function SYSMODs. USERMODs are similar to APAR fixes, but are supplied by the user and not by IBM. They may be:
- A local fix to bypass a problem until an official IBM fix is available
- A user modification to add or alter function within CICS

The decision to modify CICS, either to add or to alter function, should be taken with caution, because it greatly increases the amount of research you must do before installing PTFs, and may also increase the installation time for PTFs. Furthermore, USERMODS will cause difficulty when you want to install future release of CICS.
The CICS Transaction Server for z/OS library

The published information for CICS Transaction Server for z/OS is delivered in the following forms:

The CICS Transaction Server for z/OS Information Center
The CICS Transaction Server for z/OS Information Center is the primary source of user information for CICS Transaction Server. The Information Center contains:
- Information for CICS Transaction Server in HTML format.
- Licensed and unlicensed CICS Transaction Server books provided as Adobe Portable Document Format (PDF) files. You can use these files to print hardcopy of the books. For more information, see "PDF-only books."
- Information for related products in HTML format and PDF files.

One copy of the CICS Information Center, on a CD-ROM, is provided automatically with the product. Further copies can be ordered, at no additional charge, by specifying the Information Center feature number, 7014.

Licensed documentation is available only to licensees of the product. A version of the Information Center that contains only unlicensed information is available through the publications ordering system, order number SK3T-6945.

Entitlement hardcopy books
The following essential publications, in hardcopy form, are provided automatically with the product. For more information, see "The entitlement set."

The entitlement set
The entitlement set comprises the following hardcopy books, which are provided automatically when you order CICS Transaction Server for z/OS, Version 3 Release 1:
- Memo to Licensees, GI10-2559
- CICS Transaction Server for z/OS Program Directory, GI10-2586
- CICS Transaction Server for z/OS Installation Guide, GC34-6426
- CICS Transaction Server for z/OS Licensed Program Specification, GC34-6608

You can order further copies of the following books in the entitlement set, using the order number quoted above:
- CICS Transaction Server for z/OS Release Guide
- CICS Transaction Server for z/OS Installation Guide
- CICS Transaction Server for z/OS Licensed Program Specification

PDF-only books
The following books are available in the CICS Information Center as Adobe Portable Document Format (PDF) files:

CICS books for CICS Transaction Server for z/OS

Determining if a publication is current
IBM regularly updates its publications with new and changed information. When first published, both hardcopy and BookManager softcopy versions of a publication are usually in step. However, due to the time required to print and distribute hardcopy books, the BookManager version is more likely to have had last-minute changes made to it before publication.

Subsequent updates will probably be available in softcopy before they are available in hardcopy. This means that at any time from the availability of a release, softcopy versions should be regarded as the most up-to-date.

For CICS Transaction Server books, these softcopy updates appear regularly on the Transaction Processing and Data Collection Kit CD-ROM, SK2T-0730-xx. Each reissue of the collection kit is indicated by an updated order number suffix (the -xx part). For example, collection kit SK2T-0730-06 is more up-to-date than SK2T-0730-05. The collection kit is also clearly dated on the cover.
Updates to the softcopy are clearly marked by revision codes (usually a # character) to the left of the changes.
Accessibility

Accessibility features help a user who has a physical disability, such as restricted mobility or limited vision, to use software products successfully.

You can perform most tasks required to set up, run, and maintain your CICS system in one of these ways:
- using a 3270 emulator logged on to CICS
- using a 3270 emulator logged on to TSO
- using a 3270 emulator as an MVS system console

IBM Personal Communications provides 3270 emulation with accessibility features for people with disabilities. You can use this product to provide the accessibility features you need in your CICS system.

Sending your comments to IBM

If you especially like or dislike anything about this book, please use one of the methods listed below to send your comments to IBM.

Feel free to comment on what you regard as specific errors or omissions, and on the accuracy, organization, subject matter, or completeness of this book.

Please limit your comments to the information in this book and the way in which the information is presented.

To ask questions, make comments about the functions of IBM products or systems, or to request additional publications, contact your IBM representative or your IBM authorized remarketer.

When you send comments to IBM, you grant IBM a nonexclusive right to use or distribute your comments in any way it believes appropriate, without incurring any obligation to you.

You can send your comments to IBM in any of the following ways:

• By mail, to this address:
  IBM United Kingdom Limited
  User Technologies Department (MP095)
  Hursley Park
  Winchester
  Hampshire
  SO21 2JN
  United Kingdom

• By fax:
  – From outside the U.K., after your international access code use 44–1962–816151
  – From within the U.K., use 01962–816151

• Electronically, use the appropriate network ID:
  – IBMLink: HURSLEY(IDRCF)
  – Internet: idrcf@hursley.ibm.com

Whichever you use, ensure that you include:
• The publication title and order number
• The topic to which your comment applies
• Your name and address/telephone number/fax number/network ID.
