Preface

What this manual is about

This manual contains messages unique to CICS® Transaction Server for z/OS®, Version 3 Release 1 and is intended for use as a quick reference. It is closely linked with the CICS Problem Determination Guide which should also be consulted if a message indicates that there is a CICS problem.

Who this manual is for

This manual is for anybody who needs to understand and respond to CICS messages, including system operators, system programmers, and certain terminal users.

What you need to know to understand this manual

You can refer to this manual for the meaning of a message without understanding the manual as a whole. Your understanding of CICS Transaction Server for z/OS, Version 3 Release 1, however, will be enhanced by a knowledge of the types of message CICS produces, the different places it sends messages, and the different audiences it intends to reach.

How to use this manual

When you are using CICS as a system operator or terminal user, or scanning a queue containing CICS messages, use this manual as a reference. If you want to suggest a change to the contents of a message or an abend code, please contact your IBM branch instead of raising an RCF.

Online Messages and Codes

CICS Transaction Server for z/OS, Version 3 Release 1 messages and abend code descriptions documented in this manual (with the exception of AXM messages, a small number of numeric abends and Transaction Dump Codes) are available online using the CICS transaction CMAC. For guidance on using CMAC, see the CICS Supplied Transactions manual.

Notes on terminology

The following terminology is used:

- CICS used without any qualification refers to the CICS element of IBM® CICS Transaction Server for OS/390®
- MVS™ refers to the operating system, which can either be an element of OS/390, or MVS/Enterprise System Architecture System Product (MVS/ESA SP).
- DL/I refers to IMS/ESA® DL/I (Data Language/I)
- VTAM® refers to ACF/VTAM
- TCAM refers to the DCB interface of ACF/TCAM.
- APPC is used throughout this manual to refer to LTYPE6.2 (LU6.2).

“Module” is used in this manual to refer to a program unit that is discrete and identifiable with respect to the input or output from an assembler or compiler. For the purposes of this manual, a module is the minimal serviceable object.
Book structure

This book contains:

**Chapter 1, "DFH messages," on page 1**
Describes CICS Transaction Server for z/OS, Version 3 Release 1 messages in alphanumeric order. These messages are identified by the prefix “DFH”.

**Chapter 2, "AXM server environment messages," on page 1193**
Describes authorized cross-memory server environment messages in alphanumeric order. These messages are identified by the prefix “AXM”.

**Chapter 3, "Transaction abend codes," on page 1205**
Describes CICS Transaction Server for z/OS, Version 3 Release 1 transaction abend codes in alphanumeric order.

**Chapter 4, "System abend and dump codes," on page 1393**
Describes CICS Transaction Server for z/OS, Version 3 Release 1 transaction dump codes in alphanumeric order.
Summary of changes

This book is based on the CICS Transaction Server for z/OS, Version 2 Release 3 edition, GC33-1694-02. It has been updated to incorporate changes made for CICS Transaction Server for z/OS, Version 3 Release 1. Changes since the last edition are indicated by vertical bars to the left of the changes.
Chapter 1. DFH messages

While CICS is running, it can produce several types of messages.

- Console messages advise the system operator of execution progress, or request a decision.
- Certain CICS-supplied support programs communicate directly with terminal operators.
- CICS management modules and support programs log significant events and error occurrences to transient data destinations; for example, to the control system master terminal (CSMT), or to the CICS database control log (CDBC) for the CICS-DBCTL interface.
- The CICS message switching program (DFHMSP) generates message switching responses (described in the [CICS Supplied Transactions] manual).
- CICS directs informational macro notes (mnotes) to programmers. These are not documented.
- Messages produced by CICS utility programs such as DFH£MOLS and DFHMNDUP. These messages are self-explanatory and are not documented.

With the exception of the AXM messages, a small number of numeric abends and the Transaction Dump Codes, the messages described in this book can also be viewed online using the CICS transaction CMAC. For guidance on using CMAC, see the [CICS Supplied Transactions] manual.

CICS DFH message Identifiers

Message identifiers are of two types.

**DFHnnnn identifiers**

These consist of the prefix “DFH” followed by a four digit message number. “DFH” is the IBM assigned identifier for CICS modules. The first two digits are the CICS module reference code as follows:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>01</td>
<td>DFHSSIN</td>
</tr>
<tr>
<td>42</td>
<td>DFHZCNR</td>
</tr>
<tr>
<td>51</td>
<td>DFHCS Dup</td>
</tr>
<tr>
<td>52</td>
<td>DFHCS Dup</td>
</tr>
<tr>
<td>55</td>
<td>DFHCS Dup</td>
</tr>
<tr>
<td>56</td>
<td>DFHCS Dup</td>
</tr>
<tr>
<td>7x</td>
<td>Command-level translators</td>
</tr>
</tbody>
</table>

The last two digits are assigned by CICS to identify the message or group of messages within an assembled program.

**DFHccnnnn identifiers**

These consist of the prefix “DFH” followed by a two-letter component identifier (cc), and a four-digit message number (nnnn). The component identifier shows the domain or the component which issues the message. Here is a list of component identifiers with associated domains and components:

<table>
<thead>
<tr>
<th>Domain</th>
<th>Component</th>
</tr>
</thead>
<tbody>
<tr>
<td>AC</td>
<td>The abnormal condition program component</td>
</tr>
<tr>

</tbody>
</table>
Thus the CICS message DFHAP0002 is issued from the application domain, identified by the two-character identifier AP.

**Action codes**

Certain messages (for example, DFHDB8208D) include an action code after the message identifier. Action codes give guidance to the operator of the type of action needed when the message appears on the system console. The following action codes are used:

- **A** Immediate action (for example, mount a tape)
- **D** Immediate decision (reply to a request, for example, enter “GO” or “CANCEL”)
- **E** Eventual – action is required, but does not have to be taken immediately
- **I** No action required (If issued via the message domain, these messages can be suppressed by specifying MSGLVL=0 as a system initialization override.)

**Severity codes**

Certain messages, especially those associated with messages to terminal operators and messages which come from CICS utilities, have a severity code. (DFHST0210 I, is an example.) A severity code indicates to the operator whether a message is associated with an error, and if so, how serious it is. The following severity codes are used:
E  Error. Something has gone wrong and action is required of the user before
CICS processing can continue.

I  Information only. No action is required.

W  Alert. Something may have gone wrong, a program loop for example, but
CICS processing continues.

S  Severe error. Something serious has gone wrong and immediate action is
required. CICS processing is suspended until action has been taken.

Format of information

Information about each message is presented in the following format:

- **Message identifier** – in the form DFHnnnn or DFHccnnnn
- **Message text** – the words and inserts which make up the message as displayed
  in CICS
- **Explanation** – the events leading to or following the production of the message
- **System action** – the action that has been or will be taken by CICS
- **User response** – the action recommended for the user (the console or terminal
  operator or system programmer)
- **Destination** – the device or log to which the message is sent. This is one of the
  following:
  - Console – refers to a terminal type attached to CICS. (Route codes are 2 and
    11 unless otherwise stated.)
  - Terminal end user
  - TERMCDBC – terminals running the CDBC transaction.
  - SYSPRINT (System printer)
  - One of the following transient data queues:
    **CADL**  VTAM resource definition log
    **CADO**  CICS Development Deployment Tool messages
    **CAIL**  Autoinstall terminal model manager (AITM) log
    **CCPI**  Common programming interface for communications (CPI
               Communications) messages
    **CCZM**  CICS classes
    **CDBC**  CICS-DBCTL interface log
    **CDB2**  CICS DB2® messages
    **CDUL**  Transaction dump messages
    **CEJL**  Java
    **CIEO**  IP ECI messages
    **CIIL**  CORBA and IIOP messages
    **CJRM**  JARS messages (Java)
    **CMIG**  Migration log for messages reporting the use of functions that are no
              longer supported
    **CPLD**  PL/I dumps
    **CPLI**  PL/I sysprint output
    **CRDI**  Log for installed resource definitions
    **CRPO**  ONC RPC messages
    **CSBA**  BA domain message queue
    **CSCC**  CICS client error log
    **CSCS**  Sign on/off security log
    **CSDH**  Document handler
    **CSDL**  CEDA command log
    **CSFL**  File allocation and related messages
    **CSKL**  Log for transaction and profile resource definitions
**CSML**  Sign on/off messages

**CSMT**  Write term errors and abends from DFHTACP and DFHACP

**CSOO**  Sockets domain message queue

**CSPL**  Log for program resource definitions

**CSQL**  TDQUEUE messages

**CSRL**  Log for partner resource definitions

**CSSH**  Scheduler services

**CSSL**  Statistics log

**CSTL**  Term I/O error messages from DFHTACP

**CSNE**  Terminal error messages issued from DFHZNAC.

**CSZL**  FEPI message queue

**CWBO**  CICS Web support messages

**CWBW**  HTTP warning headers on messages received by CICS Web support

**Note:** Destination CXRF is used by the alternate CICS system in an XRF environment until the other destinations are made available during the takeover.

- **Module(s)** – the name(s) of the module or modules that determined that the message should be sent. (This is not necessarily the module that issued the macro to write the message.)

**XMEOUT parameters** –

Messages that can drive the XMEOUT global user exit include a list of XMEOUT parameters. The XMEOUT exit allows you to suppress or reroute messages that use the message domain.

A number of console messages should not be rerouted to a transient data queue. These include all DFHTDnnnn messages and certain DFHMEXMnnnn and DFHUSnnnn messages. A note to this effect is included in the descriptions of these messages.

For programming information about the XMEOUT user exit see the [CICS Customization Guide](#).

**Route codes** –

Console messages can be sent to a number of console types. The type of console to which a particular message is sent is determined by the MVS route code. Each route code maps onto one console type. The meanings of the route codes normally used by CICS are as follows:

<table>
<thead>
<tr>
<th>Code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Master console action – indicates a change in system status demanding operator action</td>
</tr>
<tr>
<td>2</td>
<td>Master console information – indicates a change in system status (system default)</td>
</tr>
<tr>
<td>3</td>
<td>Tape pool status or other tape related information</td>
</tr>
<tr>
<td>4</td>
<td>Direct access pool status or other related information</td>
</tr>
<tr>
<td>5</td>
<td>Tape library information</td>
</tr>
<tr>
<td>6</td>
<td>Disk library information</td>
</tr>
<tr>
<td>7</td>
<td>Unit record pool information</td>
</tr>
<tr>
<td>8</td>
<td>Teleprocessing control status</td>
</tr>
<tr>
<td>9</td>
<td>System security checking</td>
</tr>
</tbody>
</table>
Note: This route code suppresses the operator's reply on the screen and on SYSLOG

10 System error or maintenance information
11 Programmer information for the MVS log

Unless otherwise stated, console messages have the route codes ‘2’ and ‘11’.

Message editing –

You can use the message editing utility to change the text or language of those CICS messages that are issued via the message domain. Messages that cannot be changed using the utility include a note to this effect before the message destination. See the [CICS Operations and Utilities Guide](#) for more information about the message editing utility.

Console message reformatting –

The “console message handling facility” is an optional feature of the CICS subsystem that can affect the appearance of CICS messages displayed on an MVS console. It is effective when you specify FORMATMSG=YES as an initialization parameter for the CICS subsystem, as described in the [CICS Transaction Server for z/OS Installation Guide](#). When this facility is used, it affects messages displayed on MVS system consoles in the following ways:

* The subsystem tries to ensure that all console messages issued by all CICS regions have a standard format. The standard format is:

```
+DFHnnnn applid message
```

The “plus” sign (+) is added by MVS to indicate that a problem-state program issued the message. It is not present when CICS issues the message while it is in supervisor state.

The applid inserted into the message is the specific application identifier. This is the identifier that is specified in the system initialization parameter APPLID. It is the only operand when the XRF=NO system initialization parameter is specified, or the second operand when XRF=YES is specified.

* The subsystem adds routecodes specified in the ROUTECODES subsystem initialization parameter, so the messages might be sent to more console destinations than those implied in the body of this book.

* The subsystem reformats messages for all CICS releases, even those issued by CICS/OS/VS Version 1.

* The subsystem does not reformat messages that are issued by a CICS region that has not yet determined its applid. This includes messages that are issued while processing the system initialization table and its overrides.

* The subsystem routine that reformats the messages does not receive control until after the message has been recorded in the CICS job’s job log. Therefore, the reformatting is not usually apparent in the job log.

* Messages issued by the message domain already contain the applid. The subsystem does not insert the applid into such messages, but it might insert blank characters to cause alignment into standard locations.

* If the original CICS message is a long one, adding the applid in the standard position might cause the message to exceed the maximum length for an MVS console message. In this case, the original message is suppressed (does not appear on the console), and a new message is issued using the MVS.
multiple-line console message service to split the message over several lines.
Both the original message and perhaps several instances of the reformatted
multiple-line message appear in the job log, but only one copy of the reformatted
message is displayed on the console.

- For some messages where the applid normally follows a time and date stamp,
  inserting the applid in the standard position would have resulted in the applid
  being duplicated within the message. For these messages, the subsystem
  eliminates the time and date stamp, since they are available from other sources,
  and only one occurrence of the applid is shown.

**Terminal identifiers –**

Some messages include a terminal identifier (termid) in the message text. This is
normally shown as a 4-character identifier. However, when CICS cannot completely
identify a terminal – for example, when intersystem communication is taking place,
the terminal identifier is prefixed by the application identification (applid) of the
system owning the terminal.

**Abend code inserts –**

The transaction abend code insert (abcode) in some CICS messages is displayed
as ‘????’ when neither the EXEC CICS ABEND request nor the DFHPC
TYPE=ABEND macro request specifies an abend code.

**Dumps –**

A dump is generally available for printing when a CICS system abend or abnormal
termination occurs, provided the relevant data set has been specified. The dump
can be used for problem determination.

**Terminology –**

The terms “abnormally terminates” and “abnormal termination” are frequently used
in a general sense to relate, as applicable, to one of the following:

- The termination of CICS as a result of an MVS ABEND macro. (The term
  “abend” may also be used.)
- The termination of a transaction (task) as a result of a CICS transaction ABEND
  macro.

**Katakana terminal devices**

Old-style Katakana terminals that support only single-byte character sets (SBCS)
cannot display lower-case Western characters. Therefore, because of the
requirement on CICS to issue certain messages in mixed-case, CICS cannot
support display or terminal devices that are restricted to the SBCS Katakana part
only of code page 930.

**MVS user abend codes**

DFH messages which accompany a CICS system, utility, or subtask abend have an
associated MVS user abend code. Where possible, the value of this code is the
numeric part of the corresponding DFH message. Thus DFH0305 has an 0305 user
abend code. If an MVS abend code is issued but not the associated CICS
message, the problem probably does not originate with CICS. See the description
of the MVS abend code in the MVS System Codes manual for further information.
The highest possible value of an MVS user abend code is 4095, therefore any DFH message with a number higher than 4095 has an MVS user abend code that does not follow the above convention. The following are lists of the abend codes for messages with numbers above 4095, in order of abend code, and in order of message number.

**Ordered by abend code**

<table>

Notes:

1. All messages which appear in the JES job log are prefixed by a time stamp and job number. Because of this, some messages will have their message text truncated. If the full message text is required, consult the MVS log as all messages in the JES log are duplicated in the MVS system log.

2. User abend 0225 is internal to CICS. It is issued by DFHDTES when, during backout, an entry in a hash table has been marked empty where it should not be possible. This causes the CICS region to be abnormally terminated. If this abend occurs, you will need help to resolve the problem. See Part 4 of the [CICS Problem Determination Guide](#) for guidance on how to proceed.
### DFH01xx CICS subsystem messages

<table>
<thead>
<tr>
<th>Message</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DFH0100</td>
<td><strong>CICS SUBSYSTEM IS NOW INITIALIZED</strong></td>
</tr>
<tr>
<td><strong>Explanation:</strong></td>
<td>The CICS subsystem identified in an entry in an IEFSSNxx member of SYS1.PARMLIB has been successfully initialized.</td>
</tr>
<tr>
<td><strong>System action:</strong></td>
<td>None.</td>
</tr>
<tr>
<td><strong>User response:</strong></td>
<td>None.</td>
</tr>
<tr>

</tbody>
</table>
**System action:** The system issues message DFH0101 and does not initialize the subsystem.

**User response:** Defer implementation of the CICS subsystem services until after the prerequisite release of MVS is installed.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Modules:** DFHSSIN

### DFH42xx (DFHZCNR) messages

**DFH4200**  jobname tranid

**Explanation:** jobname is the jobname of CICS in the MVS system. CICS transaction tranid has issued a TC READ request to the operator console.

**System action:** The transaction is suspended pending a reply.

**User response:** Enter a reply at the console.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Modules:** DFHZCNR

### DFH51xx (DFHCSDUP) messages

**DFH5100 S** SEVERE ERROR IN MODULE modname. ABEND CODE: abcode

**Explanation:** An internal error has occurred in module modname, when invoked by a CSD utility command.

**System action:** Processing terminates abnormally with an operating system dump and abend code abcode. The CSD utility attempts to:
1. Close any files previously opened internally.
2. Unload any extract exit routines that were dynamically loaded.
3. Invoke the termination exit routine (if supplied).
4. Return control to the invoker of the utility.

**User response:** See the description of abend code abcode for guidance.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCSDUP

**DFH5101 I** command COMMAND EXECUTED SUCCESSFULLY.

**Explanation:** The execution of a CSD utility command command completed successfully.

**System action:** Normal processing continues.

**User response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCSDUP

**DFH5102 I** WARNING MESSAGES ISSUED WHILE PROCESSING command COMMAND.

**Explanation:** The CSD utility issued messages during syntax-checking and execution of the command command.

**System action:** Normal utility processing continues to the end of the job.

**User response:** Review the warning messages to see how they have affected utility processing. Then decide whether you need to submit a further CSD utility job.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCSDUP

**DFH5103 I** ERROR(S) OCCURRED WHILE PROCESSING command COMMAND.

**Explanation:** The CSD utility either found a syntax error in the utility command command, or the command command failed to execute correctly.

**System action:** Utility command execution is terminated.

If commands are being read from a SYSIN data stream by the utility, then subsequent commands (except LIST) are checked for syntax only. (If the primary CSD file cannot be opened, LIST is not processed either.)

If commands are being read from a get-command exit, then DFHCSDUP attempts to process subsequent commands.

**User response:** If the command failed because of syntax errors, correct the command.

If the command failed to execute correctly, this may have been caused by a previous error. In such a situation, an associated error message, such as DFH5275, should have been issued. Refer to these error messages for further guidance.

Correct all errors before trying to open the CSD file again.
Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP

**DFH5104 W** SUBSEQUENT COMMANDS (EXCEPT LIST) ARE NOT EXECUTED BECAUSE OF ERROR(S) ABOVE.

**Explanation:** After the CSD utility program encounters an error, it ceases to execute any further commands read from a data stream (as opposed to supplied by a Put-Message exit routine). However, it continues to check the syntax of subsequent commands. The exception is the LIST command, which will still be executed if the primary CSD file can be opened.

**System action:** Subsequent CSD utility commands (except LIST) are ignored.

**User response:** Check for a syntax error in the commands used and correct it.

There should be associated error messages which identify the problem that caused DFHCSDUP to halt active processing. These messages should appear in DFHCSDUP output before. message DFH5104 is issued.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCSDUP

**DFH5105 W** command COMMAND NOT EXECUTED BECAUSE OF PREVIOUS ERROR(S).

**Explanation:** If a syntax error (or an execution error) occurred in a command read from a data stream and processed earlier, no further commands (except for LIST commands) are executed. If the primary CSD file could not be opened, the LIST command is not executed either.

**System action:** The CSD utility command is not executed.

**User response:** Check for syntax errors or execution errors in commands processed earlier.

Correct the invalid commands.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCSDUP

**DFH5107 I** COMMANDS EXECUTED SUCCESSFULLY: nn COMMANDS GIVING WARNINGS: nn COMMANDS IN ERROR: nn

**Explanation:** The CSD utility has completed input command processing. Commands giving warnings may or may not have been executed successfully.

**System action:** Normal processing continues to the end of the job.

**User response:** If any CSD utility commands in error were executed, decide if the results are what you want. If they are NOT what you want, correct them and resubmit them in another job.

If any commands were not executed, you must resubmit them. (See message DFH5108.)

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCSDUP

**DFH5108 I** COMMANDS NOT EXECUTED AFTER ERROR(S): nn

**Explanation:** The CSD utility has completed input command processing. The number of commands not executed because of errors is indicated by nn.

**System action:** Normal processing continues to the end of the job.

**User response:** Correct the commands in error and resubmit them in another job.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCSDUP

**DFH5109 I** END OF DFHCSDUP UTILITY JOB.

**HIGHEST RETURN CODE WAS:** reetcode

**Explanation:** The CSD utility job is complete.

**System action:** Control returns to the invoker, that is, either the operating system or to an invoking program.

**User response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCSDUP
DFH5110 W ERROR FOUND IN 'PARM=*
PARAMETER DATA ON EXEC JOB
STEP. THIS DATA IS IGNORED.

Explanation: The value of the PARM parameter on
the EXEC job in the JCL to run the DFHCSDUP utility is
incorrect.

System action: The PARM parameter is ignored. The
CSD is opened for read and write operations.

User response: Correct the erroneous PARM value.
The incorrect value can be found in the job step.
The CICS Operations and Utilities Guide describes how
to code the PARM parameter.

Note: This message cannot be changed with the
message editing utility.

Destination: SYSPRINT
Modules: DFHCSDUP

DFH5114 S THE (PRIMARY / SECONDARY) CSD
HAS NOT BEEN INITIALIZED.
COMMAND NOT EXECUTED.

Explanation: The primary CSD file must be initialized
before any CSD utility command (other than the
INITIALIZE or SERVICE commands) can be processed.
If a secondary CSD file is used, it must always be
initialized before this command can be processed. CICS
issues this message if you try to break either of these
rules, or if an attempt to initialize a CSD file fails to
come complete successfully

System action: The CSD utility ignores the command.

User response: Initialize the CSD file. You may first
have to determine why a previous initialization attempt
failed.

Note: This message cannot be changed with the
message editing utility.

Destination: SYSPRINT
Modules: DFHCSDUP

DFH5116 S THE PRIMARY CSD HAS BEEN
DEFINED WITH AN INVALID KEY
LENGTH. PROCESSING IS
TERMINATED.

Explanation: The CSD utility cannot initialize the CSD
file because it has been defined to VSAM with an
invalid key length.

System action: The CSD file remains uninitialized,
and no utility commands are processed.

User response: Delete the CSD file, using VSAM
Access Method Services (AMS). In the JCL defining the
CSD cluster, change the AMS control statements to
specify KEYS(22 0). Use this JCL to redefine the CSD
file, and use the CSD utility to reinitialize it.

Note: This message cannot be changed with the
message editing utility.

Destination: SYSPRINT
Modules: DFHCSDUP

DFH5117 S THE PRIMARY CSD HAS BEEN
DEFINED WITH AN INVALID RECORD
SIZE. PROCESSING IS TERMINATED.

Explanation: The CSD utility cannot initialize the CSD
file, because it has been defined to VSAM with an
invalid record length.

System action: The CSD file remains uninitialized,
and no utility commands are processed.

User response: Delete the CSD file, using VSAM
Access Method Services (AMS). In the JCL defining the
CSD cluster, change the AMS control statements to
specify RECORDSIZE(200 2000). Use this JCL to
redefine the CSD file, and use the CSD utility to
reinitialize it.

Note: This message cannot be changed with the
message editing utility.

Destination: SYSPRINT
Modules: DFHCSDUP

DFH5118 I {PRIMARY | SECONDARY} CSD
OPENED; DDNAME: ddname

Explanation: The VSAM data set specified in the JCL
has been successfully opened, and is identified as the
primary or secondary CSD file. (All utility commands
processed will use the same primary CSD file. Different
secondary CSD files may be accessed by different utility
commands.)

System action: Normal processing continues.
User response: None.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT
Modules: DFHCSDUP

DFH5121 S I/O ERROR WHILE OPENING (PRIMARY / SECONDARY) CSD; DDNAME: ddname

Explanation: An I/O error occurred when reading or writing control records of the VSAM data set identified in the JCL as the primary or secondary CSD file.

System action: The utility command is not executed.

User response: Retry the utility command that failed. If the problem persists, restore the CSD file from your own backup procedures.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT
Modules: DFHCSDUP

DFH5122 S VSAM ERROR WHILE OPENING (PRIMARY / SECONDARY) CSD; DDNAME: ddname

Explanation: A VSAM error occurred when opening the data set identified in the JCL as a primary or secondary CSD file.

System action: The utility command is not executed.

User response: Refer to the VSAM diagnostics output in message DFH5179 for further information and guidance.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT
Modules: DFHCSDUP

DFH5123 I (PRIMARY / SECONDARY) CSD CLOSED; DDNAME: ddname

Explanation: The VSAM data set used as the primary or secondary CSD file has been successfully closed, with control records updated if necessary. (The primary CSD file is closed after all the utility commands have been processed; the secondary CSD file is closed after the command for which it was opened.)

System action: Normal processing continues.

User response: None.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT
Modules: DFHCSDUP

DFH5124 S PROCESSING TERMINATED. CORRUPTED CSD CONTROL RECORD DETECTED WHILE CLOSING CSD; DDNAME: ddname

Explanation: A storage corruption is preventing the CSD control records from being updated when the CSD file is being closed.

System action: No further CSD utility commands are processed.

User response: Obtain a dump from DFHCSDUP together with a listing of the DFHCSDUP run and its JCL. Also try to obtain a print out of the CSD, using either IDCAMS or the DFHCSDUP LIST ALL option. The LIST will indicate where the errors have occurred because they do not print and are therefore easily identifiable.

Using the information available, determine the cause of the errors and correct them.

Resubmit the CSD utility commands that failed.

If you cannot resolve the problem, or if the problem persists, you will need further help from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT
Modules: DFHCSDUP

DFH5125 S ERROR OCCURRED WHILE CLOSING THE CSD. FILE IS FULL; DDNAME: ddname

Explanation: After processing the CSD utility commands, the CSD control records are updated before closing the data set.

Updating failed because data set ddname was full.

System action: Utility command processing is terminated.

User response: Initialize a new primary CSD file with a larger data set size. Then use the IDCAMS IMPORT and EXPORT commands to restore the CSD file onto a larger data set.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT
Modules: DFHCSDUP

16 CICS TS for z/OS: CICS Messages and Codes
DFH5126 S I/O ERROR WHILE CLOSING THE
(PRIMARY | SECONDARY) CSD;
DDNAME: ddname

Explanation: An I/O error occurred when reading or writing the control records of the CSD file, before closing VSAM data set ddname.

System action: No further utility commands are executed.

User response: Resubmit the utility commands that failed. If the problem persists, restore the CSD file from your own backup procedures.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP

DFH5127 S VSAM ERROR WHILE CLOSING
(PRIMARY | SECONDARY) CSD;
DDNAME: ddname

Explanation: A VSAM error occurred when closing the data set ddname in the JCL as the primary or secondary CSD file.

System action: No further CSD utility commands are executed.

User response: Refer to the VSAM diagnostics output in message DFH5179 for further information and guidance.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP

DFH5128 S PROCESSING TERMINATED.
(PRIMARY | SECONDARY) CSD ACCESSED BY
ANOTHER USER AND COULD NOT BE
SHARED. DDNAME: ddname

Explanation: An attempt to open the CSD has returned an error from VSAM because the data set is not available for the type of processing requested.

This usually means that:
• An attempt has been made to open the CSD in non-RLS access mode, but the CSD is already being accessed from elsewhere in RLS access mode.
• An attempt has been made to open the CSD in RLS access mode, but the CSD is already being accessed from elsewhere in non-RLS access mode.
• An attempt has been made to open the CSD in non-RLS access mode and the CSD is already being accessed in non-RLS access mode, but the CSD cluster has been defined with SHAREOPTIONS that restrict its concurrent use.

System action: The command is not executed.

User response: You can change the access mode in which you are trying to open the CSD.

Note: You must specify PARM=CSD(READONLY) if you wish to open a recoverable CSD in RLS access mode from the DFHCSDUP utility program.

Alternatively, wait until the CSD file is no longer being accessed in the conflicting access mode, or until it becomes available again in accordance with the SHAREOPTIONS rules defined for the cluster.

If the conflict is due to SHAREOPTIONS and LIST is the only command you want to execute, you can specify PARM=CSD(READONLY).

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP

DFH5130 E UNABLE TO LOCATE MODULE
DFHCICS. PRIMARY CSD NOT
INITIALIZED.

Explanation: The DFHCICS module is missing from the library.

System action: Processing of the INITIALIZE command is terminated.

User response: Ensure that the DFHCICS module is present in the library.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP

DFH5131 I LIST listid CREATED.

Explanation: The INITIALIZE command has created the header for an IBM-protected list.

System action: Normal processing continues.

User response: None.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP
DFH5132 S  UNABLE TO CREATE LIST listid

Explanation: The INITIALIZE command has failed when calling the CSD manager routing program, DFHDMP, to create a new list listid on the CSD file for the IBM-protected groups. The CSD file may be full or corrupt.

System action: Processing of the INITIALIZE command is terminated.

User response: Check that the data set size for the CSD file is large enough. If it is not, allocate more space.

If there is ample space and you suspect that the CSD file is corrupt, you need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP

DFH5133 S  CSD CONTAINS ONE OR MORE LISTS. NO LISTS MAY BE PRESENT ON THE CSD WHEN THE INITIALIZE COMMAND IS ISSUED.

Explanation: The CEDA transaction was used to create a list while the INITIALIZE command was executing.

System action: Processing of the INITIALIZE command is terminated.

User response: Redefine the data set and re-run the INITIALIZE command. The CEDA transaction must not be used until the initialization of the CSD file has been successfully completed.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP

DFH5134 S  ERROR OCCURRED WHILE ADDING GROUP grpname TO LIST listid

Explanation: A call to the CSD manager routing program, DFHDMP, to write the definition of group grpname to the CSD file as a member of an IBM-protected list listid created an error. The CSD file may be full or corrupt.

System action: Processing of the INITIALIZE command is terminated.

User response: Increase the data set size for the CSD file and repeat the INITIALIZE request. If this fails, you will need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP

DFH5135 I  GROUP grpname ADDED TO LIST listid

Explanation: A group definition grpname has been satisfactorily created on the CSD file in list listid.

System action: Processing continues.

User response: None.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP

DFH5136 W  GROUP grpname IS ALREADY A MEMBER OF LIST listid

Explanation: Group grpname already exists in list listid. CICS does not create a duplicate entry.

System action: Normal utility processing continues.

User response: None.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP

DFH5139 W  CONSIDER IMPLICATIONS OF MIGRATING TYPE=SHARED ENTRIES.

Explanation: The CSD utility detected a migrate of a TST TYPE=SHARED entry. A DFHTST TYPE=SHARED entry is not directly migrated. Only when a TYPE=REMOTE macro that specifies a SYSIDNT that matches a SYSID in the corresponding TYPE=SHARED macro is a TMODEL created.

System action: The CSD utility continues processing of the MIGRATE command.

User response: If SYSID is explicitly specified on the EXEC CICS request, or added by a global user exit program, and the intent of the SYSID is to direct the request to a SHARED TS pool, you must use the migrated TST in order to satisfy the request to use the pool. See the CICS Resource Definition Guide for more information.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP
Definition: SYSPRINT
Modules: DFHCSDUP

DFH5140 I TOTAL xxxxxxxx DEFINITIONS CREATED: nn
Explanation: CICS issued this message after migrating a CICS table. nn definitions of type xxxxxxxx have been created on the CSD file.
System action: Normal utility processing continues.
User response: None.
Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT
Modules: DFHCSDUP

DFH5141 S UNABLE TO CREATE NEW GROUP grpname
Explanation: The MIGRATE command failed when calling the CSD manager routing program, DFHDMP, to create a new group grpname on the CSD file for the data in the table being migrated. The CSD file may be full, corrupt, or not initialized. The group name may be invalid.
System action: Processing of the MIGRATE command is terminated.
User response: Check the group name in the TOGROUP parameter. Reinitialize the CSD file with the INITIALIZE command, providing a larger data set size if necessary.
Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT
Modules: DFHCSDUP

DFH5142 E COMMAND NOT EXECUTED. lgname WAS NOT UPDATED BECAUSE OF A PREVIOUS UPDATE FAILURE.
Explanation: The list or group lgname cannot be used because an operation to update it, using the DFHCSDUP offline utility, failed to execute to completion.
This has probably happened in a previous execution of DFHCSDUP.
System action: The command is not executed, and the execution of subsequent DFHCSDUP commands in the job stream is suppressed.
User response: Use the DFHCSDUP VERIFY command to remove the in-flight flag detected when this message is produced.
Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT
Modules: DFHCSDUP

DFH5143 I GROUP grpname CREATED.
Explanation: A new CSD group, grpname, has been created for the data in the table being migrated.
System action: Migration continues.
User response: None.
Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT
Modules: DFHCSDUP

DFH5144 E COMMAND NOT EXECUTED. lgname HAS BEEN LOCKED BY APPLID: applid, OPID:opid TO PREVENT UPDATING.
Explanation: The list or group lgname cannot be used because a user of the CEDA or CEDB transaction has enforced a LOCK command to prevent updating by other users.
System action: The command is not executed.
If commands are being read from a SYSIN data stream, then subsequent commands (except the LISTcommand) are checked for syntax only. (If the primary CSD file cannot be opened, the LIST command is not processed either.)
If commands are being read from a get-command exit, then the DFHCSDUP utility attempts to process subsequent commands.
User response: Negotiate with the user with the specified OPID and APPLID, or create a new group or list by taking a copy of the definitions in the locked one.
Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT
Modules: DFHCSDUP

DFH5145 E COMMAND NOT EXECUTED. lgname IS CURRENTLY BEING UPDATED BY APPLID:applid, OPID:opid
Explanation: The list or group lgname cannot be used because:
• A user of the CEDA or CEDB transaction is currently running a command to update it
• A previous operation to update it using CEDA or CEDB failed to execute to completion.
**System action:** The command is not executed.

If commands are being read from a SYSIN data stream, then subsequent commands (except the LIST command) are checked for syntax only. (If the primary CSD file cannot be opened, the LIST command is not processed either.)

If commands are being read from a get-command exit, then the DFHCSDUP utility attempts to process subsequent commands.

**User response:** Resubmit the utility job to retry the command that failed. Perform the subsequent commands that were suppressed.

If this fails to resolve the problem, run the DFHCSDUP VERIFY command to remove the in-flight flag detected when this message is produced.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCSDUP

**DFH5147 E COMMAND NOT EXECUTED. **

**Explanation:** The name chosen for the target group (or list) duplicates that of an existing group or list on the CSD file.

**System action:** Processing of the utility command is terminated.

**User response:** Choose a different name for the target group.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCSDUP

**DFH5148 E UNABLE TO GET STORAGE FOR (FCT | RDT | LD) TABLE NAMED table**

**Explanation:** There is insufficient storage to satisfy a GETMAIN request for table table.

**System action:** The system action depends on the table specified as follows:

**LD (language definition table)**

The CSD utility cannot process any commands, and terminates with a dump. The MVS user abend code is 0327.

**FCT and RDT**

The CSD utility cannot migrate the table, and terminates processing of the utility command.

**User response:** Allocate additional storage. If your TCT assembly and link-editing is successful, the RDT should be in the library. The LD is in the load library of the supplied pregenerated CICS system.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCSDUP

**DFH5149 E COMMAND NOT EXECUTED. xxxxxxx IS IBM-PROTECTED.**

**Explanation:** A user attempted to add a definition to an IBM-supplied group or list (groups or lists beginning with DFH). This is not allowed.

**System action:** The CSD utility does not create a definition.

**User response:** Change the input command or TCT source data to name a target group or list whose name does not begin with DFH.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCSDUP

**DFH5150 W xxxxxxx OPTION CONFLICTS WITH yyyyyyy OPTION AND IS IGNORED FOR restype resname**

**Explanation:** The options, xxxxxxx and yyyyyyy, specified for the resource type restype with name resname are mutually exclusive.

**System action:** The utility ignores option xxxxxxx.

**User response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCSDUP

**DFH5151 I RESOURCE NOT ALTERED. xxxxxxx IS IBM-PROTECTED.**

**Explanation:** During the execution of an ALTER command containing a generic group name, a matching group was found which is an IBM-supplied group and is protected.

**System action:** The CSD utility does not alter the definition in the specified group.

**User response:** None.

**Note:** This message cannot be changed with the message editing utility.
**DFH5155 W** *(TDQUEUE)* xxxxxxxx HAS SAME NAME AS AN IBM SUPPLIED DEFINITION IN GROUP *grpname*.

**Explanation:** The name of the migrated table entry, xxxxxxxx, matches the name of an IBM-supplied resource in IBM-protected group *grpname*, created by the INITIALIZE command.

**System action:** CICS migrates this entry normally.

**User response:** If necessary, rename the resource, using the CEDA transaction.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT  
**Modules:** DFHCSDUP

**DFH5156 W** *(TDQUEUE)* DID NOT MIGRATE. ITS PROPERTIES MATCH AN IBM-SUPPLIED DEFINITION IN GROUP *grpname*.

**Explanation:** The properties of the resource defined in the user’s table entry are the same as those of the IBM-supplied resource of the same name contained in IBM-protected group *grpname*.

**System action:** The entry for the user’s resource is not migrated.

**User response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT  
**Modules:** DFHCSDUP

**DFH5159 I** *resource object* DEFINED IN GROUP *grpname*

**Explanation:** The CSD utility has successfully added a resource definition to a group, where:
- *resource* is the type of resource (CONNECTION, FILE, JOURNALMODEL, LSRPOOL, MAPSET, PARTITIONSET, PARTNER, PROFILE, PROGRAM, SESSION, TDQUEUE, TERMINAL, TRANCLASS, TRANSACTION, or TYPETERM).
- *object* is the name of the object.
- *grpname* is the name of the group.

**System action:** Normal utility processing continues.

**User response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT  
**Modules:** DFHCSDUP

**DFH5161 S** TABLE *table* MUST BE LINK-EDITED WITH AMODE(24) RMODE(24).

**Explanation:** After loading the table *table*, the migration routine checks that the table being processed has been link-edited with the correct AMODE and RMODE attributes. For migration purposes, DCTs, FCTs and TCTs must be link-edited with AMODE(24) RMODE(24). RCTs must be link-edited with RMODE(24).

**System action:** The MIGRATE command is not processed.

**User response:** Relink the table with the correct attributes. For example, when migrating a DCT to your CSD include the following statement in your DCT: DFHDCT TYPE=(INITIAL,MIGRATE). For more information about migrating tables to your CSD, refer to the [CICS Resource Definition Guide](https://www.ibm.com/docs/en/cics)

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT  
**Modules:** DFHCSDUP

**DFH5164 W** NO DEFINITION OF *resource object* CREATED. THIS DUPLICATES AN EXISTING DEFINITION IN GROUP *grpname*

**Explanation:** The CSD utility detected a CSD record with a matching key before adding the definition to the CSD file, where:
- *resource* is the type of resource.
- *object* is the name of the object.
- *grpname* is the name of the group.

**System action:** The CSD utility does not migrate the resource definition to the CSD file. (If it is a transaction, a generated profile is not created either.)

**User response:** Use the CEDA transaction to define the resource with a unique name.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT  
**Modules:** DFHCSDUP
**DFH5165 S**  PROCESSING IS TERMINATED. AN ERROR OCCURRED WHILE WRITING resource object TO THE CSD.

**Explanation:** An error occurred when the CSD utility called DFHDMP to write the definition of the object object to the CSD file.

The CSD file may be full or corrupted.

resource is the type of resource.

**System action:** If the CSD is full, the CSD utility issues message DFH5176, and then terminates with a return code of 12 in message DFH5109.

If the CSD is not full, the CSD utility terminates abnormally with message DFH5175, usually accompanied by one or more of the explanatory messages, DFH5177, DFH5178, and DFH5179.

**User response:** Use the additional messages to determine the cause of the error and the appropriate user action required.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCSDUP

---

**DFH5166 E**  DISALLOWED CHARACTER IN resource NAME object

**Explanation:** The call to module DFHDMP has failed to construct a valid key for the record created on the CSD file because of an invalid character, or the resource name for the migrated table entry may be invalid. resource is the type of resource, and object is the name of the object.

**System action:** A CSD record is not created for this definition. (If it is a transaction, a generated profile is not created either.)

**User response:** Use the CEDA transaction to define the resource with a valid name.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCSDUP

---

**DFH5167 S**  THE CSECTS IN TABLE table HAVE BEEN LINK-EDITED IN THE WRONG ORDER.

**Explanation:** While processing a MIGRATE command, the CSD utility has detected that the CSECTs in table table are in the wrong order. Input to the linkage editor omitted a control statement to order the CSECTs.

**System action:** The MIGRATE command is not processed.

**User response:** Reassemble the table for the correct release of CICS.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCSDUP
DFH5174 W PROCESSING IS TERMINATED.
COMMAND CANNOT BE EXECUTED
BECAUSE ‘PARM=CSD(READONLY)’
WAS SPECIFIED.

Explanation: This command requires the CSD to be
opened for read-write access. Your job step specified
read-only access for the CSD in the DFHCSDUP utility
job stream.

System action: This command is not executed.

If commands are being read from a SYSIN data stream,
subsequent commands (except LIST) are checked for
syntax only. (If the primary CSD file cannot be opened,
LIST is not processed either.)

If commands are being read from a get-command exit,
DFHCSDUP attempts to process subsequent
commands.

User response: Amend the JCL to specify
‘PARM=CSD(READWRITE)’.

Note: This message cannot be changed with the
message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP

DFH5175 S PROCESSING IS TERMINATED.
UNEXPECTED RESPONSE FROM
function IN CSD MANAGER.

Explanation: An invocation of the CSD manager,
DFHDMP, has resulted in an error. The name of the
function that failed is function.

System action: DFHCSDUP issues additional
messages and then

• Terminates normally for CSD open/close errors, and
the CSD-full condition, or
• Terminates abnormally for all other situations.

User response: Ensure that you have set up your
CSD file correctly. If you have migrated your CSD file
from a previous release, note that you should have
increased your block size to 500. If necessary, use the
diagnostics in the additional messages.

Note: This message cannot be changed with the
message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP

DFH5176 S PROCESSING IS TERMINATED. CSD IS
FULL.

Explanation: The VSAM data set containing the CSD
file is full.

System action: Execution of the CSD utility command
is terminated.

If commands are being read from a SYSIN data stream,
then subsequent commands (except LIST commands)
are checked for syntax only. (If the primary CSD file
cannot be opened, the LIST command is not processed
either.)

If commands are being read from a get-command exit,
then the DFHCSDUP utility attempts to process
subsequent commands.

The DFHCSDUP utility leaves a system lock on the
group being created at the time of failure. This lock
prevents processing of the group by the CSD utility or
the CEDA transaction.

User response: First, use the DFHCSDUP VERIFY
process to remove the system lock on the partly-created
group. Normal RDO processing of the group should
then be possible, enabling the group (or any unwanted
definitions) to be deleted.

To recover the contents of the CSD file, define a larger
data set and use the AMS REPRO command. Usually,
you will be able to REPRO from the CSD file that
became full. If you are unable to do this, use a backup
copy. (You may be able to transfer definitions from the
CSD file that filled up by using the DFHCSDUP COPY
command with the FROMCSD option.)

Note: This message cannot be changed with the
message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP

DFH5177 S PROCESSING IS TERMINATED. CSD
I/O ERROR OCCURRED.

Explanation: An I/O error occurred when executing a
READ or WRITE of a CSD record on the primary or
secondary CSD file.

System action: DFHCSDUP issues additional
messages and terminates abnormally.

User response: Restore the CSD file to a new data
set from your own backup, or create the new CSD file
by using the INITIALIZE, COPY, and APPEND
commands to restore existing definitions.

Note: This message cannot be changed with the
message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP
DFH5178 S  PROCESSING IS TERMINATED.
SEVERE CSD ERROR OCCURRED.

Explanation:  An error occurred during execution of
the CSD manager, DFHDMP, to access the primary or
secondary CSD file.

System action:  DFHCSDUP issues additional
messages and terminates abnormally.

User response:  See the VSAM diagnostics given in
message DFH5179.

Note:  This message cannot be changed with the
message editing utility.

Destination:  SYSPRINT

Modules:  DFHCSDUP

DFH5179 S  VSAM ERROR.  RETURN CODE = nn
ERROR CODE = ddd(yy)  CONTROL
BLOCK TYPE = (RPL | ACB)

Explanation:  VSAM returned the following diagnostics
when an error occurred, where:
•  nn is the hexadecimal VSAM return code
•  yy is the hexadecimal VSAM error code (ddd is its
decimal equivalent)
•  CONTROL BLOCK TYPE points to the relevant error
code subset as follows:
  –  RPL = Request macro responses from VSAM
  –  ACB = OPEN/CLOSE responses

The error code is:
–  For CONTROL BLOCK TYPE = RPL, the reason
  code from byte 3 of the feedback word field in the
  RPL (RPLERRCD)
–  For CONTROL BLOCK TYPE = ACB, the reason
  code in the ERROR field in the ACB (ACBERFLG)

System action:  The CSD utility terminates command
processing, and in some situations, produces an
operating system dump.

User response:  For the meaning of the VSAM return
and error codes, refer to the DFSMS/MVS V1R3 Macro
Instructions for Data Sets manual.

When interpreting these diagnostics, ensure that the
data set referenced in the JCL exists.

Check the following:
•  The data set is being concurrently accessed by CICS
  running in another region.
•  You are not attempting to open a recoverable CSD
  as READWRITE if DFHCSDUP specifies RLS access
  mode. You must specify PARM=CSD(READONLY) in
  this case.
•  LOG is defined on the base cluster if RLS access
  mode is specified.

If DFHCSDUP specifies RLS access mode, a 'record
not found' error could mean that the CSD has not been
initialized.

Note:  You must use non-RLS access mode to initialize
a recoverable CSD.

Note:  This message cannot be changed with the
message editing utility.

Destination:  SYSPRINT

Modules:  DFHCSDUP

DFH5180 S  PROCESSING IS TERMINATED.  ERROR
OCCURRED WHILE CSD WAS BEING
READ BY (SETBROWSE | GETNEXT)
(SCANSETS | SCANOBJS)

Explanation:  When the LIST command invoked
DFHDMP to scan the objects on the CSD file, an error
occurred during execution of the DFHDMP function.

System action:  The CSD utility terminates with an
MVS abend 0325.

User response:  This error should be reported. You
need further assistance from IBM to resolve this
problem. See Part 4 of the CICS Problem
Determination Guide for guidance on how to proceed.

Note:  This message cannot be changed with the
message editing utility.

Destination:  SYSPRINT

Modules:  DFHCSDUP

DFH5181 W  NO MATCH FOUND FOR GENERIC
(GROUP | LIST) IDENTIFIER xxxxxxx

Explanation:  The LIST command was executed with a
generic group or list name, but no qualifying group or
list exists on the CSD file.

System action:  Normal processing continues.

User response:  None.

Note:  This message cannot be changed with the
message editing utility.

Destination:  SYSPRINT

Modules:  DFHCSDUP

DFH5182 W  (GROUP | LIST) xxxxxxxx DOES NOT
EXIST.

Explanation:  The LIST command or the DELETE
command was executed using the name of a group or
list that does not exist on the primary CSD file.

System action:  The LIST command or the DELETE
command is not processed. Subsequent commands may still be processed.

User response: Correct the LIST command or the DELETE command to use a valid group or list name.

If a CSD upgrade is being performed, no user action is required.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP

DFH5183 W (GROUP I LIST) xxxxxxx EXISTS AS A (GROUP I LIST) NAME.

Explanation: The LIST command or the DELETE command was executed using a group name that is already in use as a list name, or using a list name that is already in use as a group name.

System action: The LIST command or the DELETE command is not processed. Subsequent commands may still be processed.

User response: Correct the LIST command or the DELETE command to use a valid group or list name.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP

DFH5184 W NO RESOURCES DEFINED IN GROUP grpname OR NO GROUPS DEFINED IN LIST lstid

Explanation: In executing a LIST command, the CSD utility has found a group or list header on the CSD file for which no corresponding group or list elements exist.

System action: The utility continues to process the LIST command, but will not tabulate elements of the group or list named in the message.

User response: Run the DFHCSDUP VERIFY utility.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP

DFH5188 I (GROUP I LIST I RESERVED NAME) resource IS NOW AVAILABLE FOR USE.

Explanation: The VERIFY command discovered that the resource was not available for the CEDA transaction or offline commands. The restriction on its availability, which was due to the failure of some previous command affecting it, has now been removed.

System action: Normal processing of the VERIFY command continues.

User response: None.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP

Chapter 1. DFH messages 25
DFHS189 I CSD VERIFY PROCESS COMPLETED SUCCESSFULLY.

Explanation: The VERIFY command has been processed successfully, and any internal locks associated with groups and lists on the CSD file have been removed.

System action: Normal processing continues.

User response: None.

Note: This message cannot be changed with the message editing utility.

DFHS190 S COMMAND IS NOT EXECUTED. UNABLE TO GET STORAGE FOR SERVICE MODULE proname

Explanation: There is insufficient storage available to load the service module proname, that is to be loaded and executed by DFHCSDUP.

System action: Utility command execution is terminated.

If commands are being read from a SYSIN data stream, then subsequent commands (except LIST commands) are checked for syntax only. (If the primary CSD file cannot be opened, the LIST command is not processed either.)

If commands are being read from a get-command exit, then DFHCSDUP attempts to process subsequent commands.

User response: Ensure that there is sufficient storage allocated to load module proname.

Note: This message cannot be changed with the message editing utility.

DFHS191 I SERVICE PROGRAM proname IS RUNNING.

Explanation: The service module proname has been loaded correctly. Execution of the module has started.

System action: Normal processing continues.

User response: None.

Note: This message cannot be changed with the message editing utility.
Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP

DFH5194 I UPGRADE SERVICE STATUS OF CSD FROM LEVEL sss TO LEVEL ttt

Explanation: The loaded service module is performing the required upgrade of the CSD file from service level sss to service level ttt.

System action: Normal processing continues.

User response: None.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP

DFH5195 I EXECUTION OF SERVICE PROGRAM programe COMPLETE.

Explanation: The loaded service program programe has run to completion. Control is being transferred back to the CSD offline utility program, DFHCSDUP.

System action: Normal processing continues.

User response: None.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP

DFH5196 S COMMAND IS TERMINATED. ERROR OCCURRED WHILE READING CONTROL SECONDARY CSD RECORD.

Explanation: An I/O error has occurred on the specified CSD file.

System action: The SERVICE command is terminated.

If commands are being read from a SYSIN data stream, then subsequent commands (except LIST) are checked for syntax only. (If the primary CSD file cannot be opened, LIST is not processed either.)

If commands are being read from a get-command exit, then DFHCSDUP attempts to process subsequent commands.

User response: Check that the input and output data sets have been correctly defined, and that the DDNAME for the secondary CSD file in the JCL corresponds to the OLDCSD parameter in the SERVICE utility command.

If the problem persists, you will need further help from IBM. First, obtain a dump from DFHCSDUP together with a listing of the DFHCSDUP run and its JCL. Also try to obtain a print out of the CSD using either IDCAMS or the DFHCSDUP LIST ALL option. The LIST indicates where the errors have occurred because they do not print and are therefore easily identifiable. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP

DFH5198 I CSD RECORD MODIFIED FOR xxxxxxx

Explanation: The specified modification to a record on the CSD file has taken place.

The insert, xxxxxxx, is the element type.

System action: Normal processing continues. If the modified record is an element in a GROUP or LIST, its date-and-time field is updated when copied to the output (primary) CSD file.

User response: None.
Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP

DFH5199 W INVALID FIELD ENCOUNTERED IN EXISTING RECORD FOR xxxxxxx

Explanation: An unexpected value was found in one of the fields of a CSD record that was to be modified for element xxxxxxx.

System action: Normal processing continues, and the invalid record is left unchanged on the new (primary) CSD file.

User response: None.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP

DFH52xx (DFHCSDUP) messages

DFH5200 S COMMAND NOT EXECUTED. NO VALID LANGUAGE TABLE WAS LOADED.

Explanation: Either the CSD utility found that the RDO language table had not been loaded correctly, or that it contained invalid data.

System action: The CSD utility terminates, because it cannot process any commands.

User response: Check that the correct version of the RDO language table (DFHEITCU) is in the program library.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP

DFH5201 S command COMMAND IS NOT VALID. COMMAND NOT EXECUTED.

Explanation: The CSD utility does not recognize the command.

System action: The utility ignores the command.

User response: Correct the command.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP

DFH5202 S INCORRECT SYNTAX FOR command COMMAND. COMMAND NOT EXECUTED.

Explanation: The syntax of the command is incorrect.

System action: The CSD utility ignores the command.

User response: Correct the command.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP

DFH5203 W RIGHT PARENTHESIS ASSUMED AFTER THE VALUE OF xxx.

Explanation: The syntax of the command was incorrect. Either a right parenthesis has been omitted or a keyword value in excess of 256 bytes has been specified.

System action: The CSD utility executes the command as if the right parenthesis was present.

User response: Confirm that the correction applied by the utility generated the required command.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP

DFH5204 E COMMAND NOT EXECUTED. xxxxxx KEYWORD IS NOT VALID.

Explanation: The keyword xxxxx is not valid on this command.

System action: The utility command is ignored.

User response: Correct the command.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP

DFH5205 E COMMAND NOT EXECUTED. NO VALUE WAS SPECIFIED FOR xxx.

Explanation: The option xxx is incomplete, possibly because a value has been omitted.

System action: This CSD utility command is ignored.

User response: Correct the command.
**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT  
**Modules:** DFHCSDUP

---

**DFH5206 E** COMMAND NOT EXECUTED.  
DUPLICATE SPECIFICATION OF xxxx.  
**Explanation:** Option xxxx appears twice on a single CSD utility command.  
**System action:** The utility ignores the command.  
**User response:** Correct the command.  

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT  
**Modules:** DFHCSDUP

---

**DFH5207 E** COMMAND NOT EXECUTED.  
xxxxxxx DOES NOT REQUIRE A VALUE.  
**Explanation:** The CSD utility detected an input command coded with a value for option xxxxxxx when no value was required.  
**System action:** The utility does not process the command.  
**User response:** Correct the command.  

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT  
**Modules:** DFHCSDUP

---

**DFH5210 E** COMMAND NOT EXECUTED.  
INVALID VALUE WAS SPECIFIED FOR xxxx.  
**Explanation:** The CSD utility detected an input command coded with an invalid value for option xxxx.  
**System action:** The utility does not process the command.  
**User response:** Correct the value.  

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT  
**Modules:** DFHCSDUP

---

**DFH5211 E** COMMAND NOT EXECUTED.  
OPERAND DELIMITER x WAS MISPLACED.  
**Explanation:** The CSD utility has detected an input command coded with a misplaced option delimiter x.  
**System action:** The utility does not process the command.  
**User response:** Place the delimiter correctly.  

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT  
**Modules:** DFHCSDUP

---

**DFH5212 E** COMMAND NOT EXECUTED.  
comptype string IS NOT UNIQUELY IDENTIFIABLE.  
**Explanation:** An ambiguous DFHCSDUP command has been specified.  
• comptype is the command component type  
• string is the actual component.  
**System action:** The command is not executed. If commands are being read from a SYSIN data stream, subsequent commands (except LIST commands) are checked for syntax only. If commands are being read from a get-command exit, DFHCSDUP attempts to process subsequent commands.  
**User response:** Correct the command syntax and retry. See accompanying message DFH5213 for further details of the command failure.  

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT  
**Modules:** DFHCSDUP

---

**DFH5213 E** SPECIFIED input COULD BE INTERPRETED AS match1 OR match2.  
**Explanation:** An ambiguous DFHCSDUP command has been specified.  
• input is the ambiguous character string  
• match1 and match2 are two possible interpretations of input.  
**System action:** The command is not executed. If commands are being read from a SYSIN data stream, subsequent commands (except LIST commands) are checked for syntax only. If commands are being read from a get-command exit, DFHCSDUP attempts to process subsequent commands.  
**User response:** Correct the command syntax and retry.  

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT  
**Modules:** DFHCSDUP
DFH5214 W  keyword IS AN OBSOLETE KEYWORD. IT IS IGNORED.

Explanation: The CSD utility has detected an input command coded with an obsolete keyword. The keyword specifies an option not valid for this release of CICS, but the command can be used as input to the CSD utility for an earlier release.

System action: The utility ignores the keyword.

User response: Confirm that the resulting utility command is correct for this release of CICS.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCS DUP

DFH5215 E  COMMAND NOT EXECUTED. A CLOSING PARENTHESIS HAS BEEN OMITTED FROM A NULL VALUE SPECIFIED ON AN ALTER COMMAND.

Explanation: A closing parenthesis was not added when a null value was specified for a keyword on an ALTER command. A closing parenthesis is automatically added for keyword values other than nulls.

System action: The command is not executed. If commands are being read from a SYSIN data stream, subsequent commands (except LIST commands) are checked for syntax only. If commands are being read from a get-command exit, DFHCS DUP attempts to process subsequent commands.

User response: Correct the command syntax and retry.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCS DUP

DFH5216 E  restype resname IS NOT IN GROUP group.

Explanation: A nonexistent resource of type restype and name resname, has been specified on an ALTER command.

System action: The command is not executed. If commands are being read from a SYSIN data stream, subsequent commands (except LIST commands) are checked for syntax only. If commands are being read from a get-command exit, DFHCS DUP attempts to process subsequent commands.

User response: Correct the command syntax and retry.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCS DUP

DFH5217 E  COMMAND NOT EXECUTED. A CLOSING BRACKET HAS BEEN OMITTED FROM A xxxx KEYWORD.

Explanation: A closing bracket has been omitted from the xxx keyword on a DFHCS DUP DEFINE command.

System action: The DEFINE command is not executed.

User response: Correct the DEFINE command syntax and retry.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCS DUP

DFH5218 I  ALTERING Resource type Resourcename IN GROUP Groupname

Explanation: During the execution of a generic ALTER command, the CSD batch update utility scans the CSD file for matches to the specified generic resource name and/or GROUP keyword. For every match, the utility processes the request and informs the user of the resulting resourcename and/or groupname respectively.

System action: Normal processing continues.

User response: None.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCS DUP

DFH5219 W  NO MATCH FOUND ON CSD FILE FOR Resource type Resourcename GROUP Groupname

Explanation: The ALTER command was executed with a generic resource and/or group name, but no qualifying resource and/or group exist on the CSD file.

System action: Normal processing continues.

User response: None.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCS DUP
DFH5220 E COMMAND NOT EXECUTED. xxxxxxxx MUST BE THE FIRST COMMAND.

Explanation: The CSD utility found an INITIALIZE command after other commands.

System action: The CSD utility ignores the command.

User response: Confirm that the INITIALIZE command was misplaced.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP

DFH5225 E COMMAND NOT EXECUTED. SAME NAME SPECIFIED FOR 'TO' AND xxxxxxxx.

Explanation: This message is issued for one of the following reasons:
1. The utility COPY command has been coded with the same group name for the source and target group.
2. The APPEND command has been coded with the same list name for the source and target list.
3. The ADD command has been coded with the same group name and list name.

System action: The CSD utility or CICS ignores the command.

User response: Correct the name (or names) in error.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP

DFH5222 E COMMAND NOT EXECUTED. xxxxxxxx KEYWORD WAS OMITTED OR SPECIFIED INCORRECTLY.

Explanation: A required keyword xxxxxxxx was omitted from a CSD utility command.

System action: The utility ignores the command.

User response: Specify keyword xxxxxxxx.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP

DFH5223 E COMMAND NOT EXECUTED. xxxxxxxx KEYWORD CONFLICTS WITH xxxxxxxx KEYWORD.

Explanation: The syntax of the command is incorrect. Conflicting keywords have been specified.

System action: The utility command is ignored.

User response: Correct the command.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP

DFH5224 E COMMAND NOT EXECUTED. VALUE OF xxxxxxxx IS OUT OF VALID RANGE.

Explanation: The CSD utility detected an input command coded with a numeric value for value xxxxxxxx which was outside the valid range.

System action: The utility does not process the command.

User response: Correct the value.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP

DFH5227 E COMMAND NOT EXECUTED. USE OF GENERIC NAME CONFLICTS WITH xxxxxxxx OPTION.

Explanation: A CSD utility command used a generic name; that is, one containing asterisk (*) or plus sign (+) characters, in conjunction with an option that conflicted with the use of generic names.

System action: The utility ignores the command.

User response: Correct the command.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP

DFH5228 E COMMAND NOT EXECUTED. ONLY ONE RESOURCE-TYPE KEYWORD CAN BE SPECIFIED.

Explanation: The CSD utility detected an input command coded with more than one resource-type keyword.

System action: The utility does not process the command.

User response: Correct the command to refer to only one resource-type keyword.
**DFH5229 E COMMAND NOT EXECUTED. xxxxxxxx IS INVALID BECAUSE A RESOURCE-TYPE KEYWORD WAS SPECIFIED.**

**Explanation:** The CSD utility detected an input command coded with a resource-type keyword (for example, PROGRAM, TRANSACTION) in a situation where a resource-type keyword is invalid.

**System action:** The utility does not process the command.

**User response:** Correct the command and resubmit.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCSDUP

**DFH5230 I ERASE COMMAND IS OBSOLETE. USE THE DELETE COMMAND.**

**Explanation:** The CSD utility detected the obsolete ERASE command in its input.

**System action:** The utility processes the command as a DELETE command.

**User response:** In future, use the DELETE command instead of the ERASE command.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCSDUP

**DFH5231 E COMMAND NOT EXECUTED. xxxxxxxx IS INCOMPATIBLE WITH THE MIGRATE COMMAND FOR table-type TABLES.**

**Explanation:** An attempt has been made to execute the MIGRATE command with an invalid table type and (or) an invalid keyword specified.

**System action:** The CSD utility terminates.

**User response:** Correct the command syntax and resubmit the job.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCSDUP

**DFH5232 E COMMAND NOT EXECUTED. xxxxxxxx PARAMETER MUST NOT BEGIN WITH ‘DFH’.**

**Explanation:** In a CSD utility MIGRATE command, the xxxxxxxx parameter contained an invalid table name or group name.

**System action:** The utility does not process the command.

**User response:** Resubmit with a valid table name or group name.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCSDUP

**DFH5233 E COMMAND NOT EXECUTED. xxx TABLE TYPE IS NOT SUPPORTED BY RDO.**

**Explanation:** The CSD utility detected a TABLE parameter that referred to a CICS table type not supported by RDO.

**System action:** The utility does not process the command.

**User response:** Correct the command.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCSDUP

**DFH5234 E COMMAND NOT EXECUTED. command IS NOT SUPPORTED.**

**Explanation:** The CSD utility detected a command command in its input which is not supported by RDO.

**System action:** The utility does not process the command.

**User response:** Correct the command.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCSDUP
DFH5235 E COMMAND NOT EXECUTED. GROUP OR LIST MUST BE SPECIFIED.

Explanation: A CSD utility EXTRACT command has been submitted. A GROUP or LIST name must be specified with an EXTRACT command.

System action: The utility command is not executed. This message is followed by DFH5104.

User response: Correct the invalid command by adding a valid GROUP or LIST name and rerun the utility job.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP

DFH5236 I A USER EXIT PROGRAM HAS BEEN SPECIFIED ON THE ENTRY LINKAGE AND ON THE USERPROGRAM KEYWORD. THE PROGRAM SPECIFIED ON THE ENTRY LINKAGE HAS BEEN IGNORED.

Explanation: An EXTRACT user-exit program has been specified via the entry parameter list and on the USERPROGRAM keyword of the EXTRACT command.

System action: The program specified on the USERPROGRAM keyword is used.

User response: Ensure that the user program used is the one intended.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP

DFH5240 S PROCESSING TERMINATED. ERROR OCCURRED WHILE INPUT UTILITY COMMAND WAS BEING READ.

Explanation: The environment adaptor GETCARD utility cannot read an input utility command.

System action: The CSD utility terminates abnormally without processing the input commands.

User response: Check that the utility commands are prepared correctly and located correctly in the JCL. Check also that the DD statement defining the output data set startup job stream is correct. For JCL examples, refer to the CICS Operations and Utilities Guide.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP

DFH5241 S PROCESSING TERMINATED. INVALID RECORD LENGTH ON INPUT UTILITY COMMAND DATA STREAM.

Explanation: The CSD utility detected incorrectly formatted input in the SYSIN data stream.

System action: The CSD utility cannot process any commands. The utility attempts to:
1. Close any files previously opened internally.
2. Unload any extract exit routines that were dynamically loaded.
3. Invoke the termination exit routine (if supplied).
4. Return control to the invoker of the utility.

User response: Ensure that the output data set data stream is formatted with fixed length 80-byte records.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP

DFH5242 E COMMAND NOT PROCESSED. TOO MANY CONTINUATION RECORDS FOR INPUT UTILITY COMMAND.

Explanation: The CSD utility detected an input command that was too long and extended over too many records.

System action: The utility does not process the command.

User response: This message may be caused by an error in the rejected command or in the preceding or subsequent commands in the input stream. Correct the commands in error.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP

DFH5243 E TO(groupname) CONTAINS TOO MANY NON CONTIGUOUS "".

Explanation: During the execution of a generic COPY command, the batch update utility found the argument of the TO parameter specified too many non contiguous asterisks.

System action: Only one "" is allowed in the TO parameter during the execution of a generic copy.

User response: Correct the command.
Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT
Modules: DFHCSDUP

DFH5251 I resource object IN GROUP grpname IS REPLACED.

Explanation: A resource definition existed in both source and target groups. Based on the CSD utility commands submitted, the utility has replaced the definition in the target group with that from the source group.
• resource is the type of the resource
• object is the name of the object
• grpname is the name of the group.

System action: Normal utility processing continues.
User response: None.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT
Modules: DFHCSDUP

DFH5252 I resource object COPIED TO GROUP grpname.

Explanation: The CSD utility has correctly copied a resource definition to the specified group, where:
• resource is the type of resource
• object is the name of the object
• grpname is the name of the group.

System action: Normal utility processing continues.
User response: None.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT
Modules: DFHCSDUP

DFH5253 E GROUP grpname NOT FOUND IN CSD FILE - DDNAME: ddname

Explanation: The CSD utility has detected a COPY command that attempted to copy definitions from the non-existent group, grpname, in the CSD specified in DDNAME ddname.

System action: The utility does not process the command.
User response: Either correct the group name in the command, or make sure that the specified CSD file is the correct one.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT
Modules: DFHCSDUP

DFH5254 E resource object ALREADY EXISTS IN THE TARGET GROUP.

Explanation: The CSD utility detected a command that attempted to add a definition to a group that already contained a definition of an object with the same name, where:
• resource is the type of resource
• object is the name of the object.

System action: The CSD utility does not process the command.
User response: Change the name in the command, or alter the name of the existing definition.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT
Modules: DFHCSDUP

DFH5255 E LIST xxxxxxxx NOT FOUND IN CSD FILE - DDNAME: ddname

Explanation: The CSD utility detected an APPEND or REMOVE command that referred to a nonexistent list in the CSD file specified in DDNAME ddname.

System action: The utility does not process the command.
User response: Either correct the list name in the command, or make sure that the specified CSD file is the correct one.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT
Modules: DFHCSDUP

DFH5256 E NO RESOURCES DEFINED IN GROUP grpname.

Explanation: In executing a LIST command, the CSD utility has found a group header on the CSD file for which no group elements exist.

System action: The CSD utility continues to process the LIST command, but will not list elements of the named group.
User response: Run the DFHCSDUP VERIFY utility to verify the group.
Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT
Modules: DFHCSDUP

DFH5257 E LENGTH OF 'TO' PREFIX MUST BE LESS THAN OR EQUAL TO LENGTH OF 'GROUP' PREFIX.

Explanation: During the execution of a generic COPY command, the batch update utility found the length of the prefix of the generic group specified in the TO keyword to be greater than the length of the prefix of the generic GROUP keyword.

System action: The utility ignores the command to prevent truncation of the TO group name.

User response: Correct the command.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT
Modules: DFHCSDUP

DFH5258 I COPYING GROUP grpname1 TO grpname2

Explanation: During the execution of a generic COPY command, the CSD batch update utility scans the CSD file for matches to the generic GROUP keyword. For every match, the utility resolves the generic TO keyword, and informs the user of the resulting grpname1 and grpname2 respectively.

System action: Normal processing continues.

User response: None.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT
Modules: DFHCSDUP

DFH5259 I UNRECOGNIZED RESOURCE TYPE FOUND IN THE CSD FILE AND HAS BEEN IGNORED.

Explanation: CICS has found an unrecognized resource type code in a CSD record. The unrecognized code does not match any of the function codes in the language definition table. This can occur for one of the following reasons:
1. You are using a CICS release that does not support a type of definition that was created on the CSD file by a later CICS release.
2. The language definition table (DFHEITSP or DFHEITCU) is invalid for this CICS release.

3. The CSD manager (DFHDM) has passed an invalid CSD record buffer to DFHPUP. This is a CICS internal logic error.

System action: The resource is ignored and the operation continues.

User response: Determine which of the possible reasons caused the error. If you can eliminate reasons 1 and 2, you can assume that reason 3 applies.

Take action corresponding to the reason you have established as follows:
1. Ignore the message.
2. Ensure that the library contains versions of DFHEITSP and DFHEITCU that are valid for the CICS release you are running.
3. You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT
Modules: DFHCSDUP

DFH5260 E LENGTH OF 'TO' SUFFIX MUST BE EQUAL TO LENGTH OF 'GROUP' SUFFIX.

Explanation: During the execution of a generic COPY command, the batch update utility found the length of the suffix of the generic group specified in the TO keyword to be of different length than that of the suffix of the generic GROUP keyword.

System action: The utility ignores the command to prevent ambiguity on the TO group name.

User response: Correct the command.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT
Modules: DFHCSDUP

DFH5261 W RDT IS EMPTY. NO VTAM RESOURCES IN ASSEMBLED TABLE.

Explanation: The CSD utility detected an attempt to migrate a TCT that either contains no RDO-supported terminal or sessions definitions, or whose TYPE=INITIAL entry specifies MIGRATE=COMPLETE.

System action: The utility does not create any CSD definitions.

User response: Check the TCT source code to see if it contains any RDO-supported definitions. If it does, check that it has been correctly assembled.
(MIGRATE=YES specified) and link-edited.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT
Modules: DFHCSDUP

DFH5262 S INSUFFICIENT STORAGE TO BUILD TYPE-MATCHING CHAIN.

Explanation: During CSD utility processing, an internal error has occurred in the migration of a TCT. This is because of lack of storage for TYPETERM definitions.

System action: The utility attempts to:
1. Close any files previously opened internally.
2. Unload any extract exit routines that were dynamically loaded.
3. Invoke the termination exit routine (if supplied).
4. Return control to the invoker of the utility.

In any of the above cases, definitions that have already been migrated will remain on the CSD.

User response:
1. Run the DFHCSDUP VERIFY utility.
2. Delete the groups created by the failing MIGRATE command.
3. Allocate a larger region size in the utility JCL, and retry the command.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT
Modules: DFHCSDUP

DFH5263 S ERROR IN INPUT RDT. INCORRECT SEQUENCE OF COMMANDS.

Explanation: During CSD utility processing, an internal error has occurred in the migration of a TCT. This is because of abnormal data in the assembled table.

System action: The utility attempts to:
1. Close any files previously opened internally.
2. Unload any extract exit routines that were dynamically loaded.
3. Invoke the termination exit routine (if supplied).
4. Return control to the invoker of the utility.

Definitions that have already been migrated will remain on the CSD. The MVS user abend code is 0308.

User response:
1. Run the DFHCSDUP VERIFY utility.
2. Delete the groups created by the failing MIGRATE command.
3. Keep the assembly listing for the failing table and keep the DFHCSDUP dump, if available. You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT
Modules: DFHCSDUP

DFH5264 W RESOURCE object NOT DEFINED. GROUP grpname NOT AVAILABLE.

Explanation: During the migration of a TCT, the CSD utility could not define a resource object because the target group grpname was not available. The utility has issued a previous message indicating the reason.

System action: The utility creates no definition for resource object. Normal utility processing continues.

User response: Review the original message. If necessary, recode the TYPE=GROUP macro in the TCT source to name a suitable group.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT
Modules: DFHCSDUP

DFH5265 W ACTION REQUIRED TO FIND A SUITABLE TYPETERM FOR TERMINAL termid.

Explanation: While migrating a TCT, the CSD utility found a terminal definition for which it could not create a corresponding TYPETERM definition.

System action: The utility adds the terminal definition to the CSD file, but it refers to a TYPETERM that may be unsuitable for this device.

User response: Use the CEDA transaction to define a suitable TYPETERM and alter the TERMINAL definition to refer to the new TYPETERM.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT
Modules: DFHCSDUP

DFH5266 W SESSIONS sessions NOT DEFINED BECAUSE OF ERROR IN ASSOCIATED CONNECTION.

Explanation: An error has been detected during the migration of a TCT. When migrating a session, DFHCSDUP checks that the associated CONNECTION has been defined successfully. If it has not, DFHCSDUP abnormally terminates the session definition.
**System action:** The specified SESSIONS resource is not migrated to the CSD. DFHCSDUP continues with the migration of subsequent TCT entries.

**User response:** Use the diagnostic information in the output listing from the MIGRATE utility to determine why the CONNECTION definition has failed. You can then use RDO to DEFINE the CONNECTION and the SESSIONS to the CSD.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT  
**Modules:** DFHCSDUP

---

**DFH5270 I** (GROUP / LIST) xxxxxxxx DELETED FROM THE CSD.

**Explanation:** The CSD utility has successfully deleted a group or list from the primary CSD file.

**System action:** Normal utility processing continues.

**User response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT  
**Modules:** DFHCSDUP

---

**DFH5271 S** UNABLE TO DELETE (GROUP / LIST) xxxxxxxx FROM THE CSD.

**Explanation:** During CSD utility processing, an error in accessing the CSD file caused a delete operation to fail.

**System action:** The utility does not process the DELETE command. The group or list to be deleted remains on the CSD file.

**User response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT  
**Modules:** DFHCSDUP

---

**DFH5272 I** resource object DELETED FROM GROUP.

**Explanation:** The CSD utility successfully deleted the named resource, where:
- resource is the type of resource
- object is the name of the object.

**System action:** Normal utility processing continues.

**User response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT  
**Modules:** DFHCSDUP

---

**DFH5273 W** resource object IS NOT IS GROUP grpname.

**Explanation:** The CSD utility detected an attempt to delete a resource which did not exist in the named group, where:
- resource is the type of resource
- object is the name of the object
- grpname is the name of the group.

**System action:** The utility does not process the DELETE command.

**User response:** Check that you have coded the group and resource names correctly.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT  
**Modules:** DFHCSDUP

---

**DFH5274 W** resource object NOT MIGRATED.  
GROUP grpname IS NOT AVAILABLE.

**Explanation:** During the migration of an RCT, the CSD utility could not define the resource resource because the target group groupname was not available. The utility has issued a previous message indicating the reason why.

**System action:** The utility creates no definition for the resource named object. Normal utility processing continues.

**User response:** Review the original message. If necessary recode the TYPE=GROUP macro in the RCT source to name a suitable group.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT  
**Modules:** DFHCSDUP

---

**DFH5275 S** COMMAND NOT EXECUTED. GROUP grpname IS NOT THE MEMBER OF LIST listname.

**Explanation:** The REMOVE command being executed names a GROUP that is not a member of LIST listname.

**System action:** The command is not executed.

If commands are being read from a SYSIN data stream, then subsequent commands (except LIST commands)
are checked for syntax only. (If the primary CSD file cannot be opened, the LIST command is not processed either.)

If commands are being read from a get-command exit, then DFHCSDUP attempts to process subsequent commands.

**User response:** Correct the command and resubmit a DFHCSDUP job to execute the failing command and any subsequent commands that were suppressed.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCSDUP

---

**DFH5276 I** GROUP *grpname* REMOVED FROM LIST *listname*.

**Explanation:** The REMOVE command has successfully removed group *grpname* from LIST *listname*.

**System action:** Normal execution continues.

**User response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCSDUP

---

**DFH5277 I** LIST *list* DELETED FROM CSD.

**Explanation:** The final group has been removed from list *listname*. The list has therefore been deleted.

**System action:** Processing continues.

**User response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCSDUP

---

**DFH5280 S** PROCESSING DEFINITIONS FROM LIBRARY MEMBER *xxxxxxx*.

**Explanation:** The CSD utility has successfully loaded data from the named library member.

**System action:** Normal utility processing continues.

**User response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCSDUP

---

**DFH5281 S** DATA LOADED FROM LIBRARY MEMBER *xxxxxxx* IS INVALID.

**Explanation:** The CSD utility has found an error in data loaded from the named library member.

**System action:** The utility attempts to:
1. Close any files previously opened internally.
2. Unload any extract exit routines that were dynamically loaded.
3. Invoke the termination exit routine (if supplied).
4. Return control to the invoker of the utility.

**User response:** Obtain a dump containing the failing library member.

You need further assistance from IBM to resolve this problem. See Part 4 of the [CICS Problem Determination Guide](#) for guidance on how to proceed.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCSDUP

---

**DFH5282 E** UNABLE TO GET STORAGE FOR LIBRARY MEMBER *xxxxxxx*.

**Explanation:** There is insufficient storage available to load the library member *xxxxxxx*.

**System action:** The utility terminates processing of the command that required access to the named library member.

**User response:** Allocate a larger region size in the utility JCL and resubmit the job.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCSDUP

---

**DFH5283 S** RDL SUBCOMMAND EXCEEDS 1536 BYTES: *xxxxxxx*.

**Explanation:** The CSD utility found an internal error in the data loaded while processing the indicated (truncated) UPGRADE, INITIALIZE, or MIGRATE command.

**System action:** The CSD utility terminates abnormally.

**User response:** You need further assistance from IBM to resolve this problem. See Part 4 of the [CICS Problem Determination Guide](#) for guidance on how to proceed.

**Note:** This message cannot be changed with the message editing utility.
DFH5284 E ERROR ANALYZING RDL SUBCOMMAND: xxxxxxx.

Explanation: The CSD utility found an internal error in the data loaded while processing the indicated (truncated) UPGRADE, INITIALIZE, or MIGRATE command.

System action: The utility attempts to:
1. Close any files previously opened internally.
2. Unload any extract exit routines that were dynamically loaded.
3. Invoke the termination exit routine (if supplied).
4. Return control to the invoker of the utility.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Note: This message cannot be changed with the message editing utility.

Modules: DFHCSDUP

DFH5285 E INVALID VERB IN RDL SUBCOMMAND: xxxxxxx.

Explanation: The CSD utility found an internal error in the data loaded while processing the indicated (truncated) UPGRADE, INITIALIZE, or MIGRATE command.

System action: The utility attempts to:
1. Close any files previously opened internally.
2. Unload any extract exit routines that were dynamically loaded.
3. Invoke the termination exit routine (if supplied).
4. Return control to the invoker of the utility.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT
Modules: DFHCSDUP

DFH5286 E UNABLE TO CREATE RESOURCE DEFINITION ON CSD FILE, RDL SUBCOMMAND: xxxxxxx.

Explanation: This message is issued during the processing of the indicated (truncated) command for one of the following reasons:
1. The CSD is full (in which case, messages DFH5175 and DFH5176 accompanies this one)
2. The CSD was defined as read-only (in which case, message DFH5174 accompanies this message)
3. The TCT being migrated contained a terminal entry with a name unacceptable to RDO (in which case, message DFH5165 accompanies this message)
4. A list or group cannot be used due to the failure of a previous update operation (in which case, message DFH5142 accompanies this message)
5. The resource definition list being used to INITIALIZE or UPGRADE the CSD file contained a definition with an invalid resource name or group name
6. A logic error occurred in DFHCSDUP or an internal error was detected in the data contained in the loaded table.

System action: The system action depends on the reason the message is issued, as follows.
1. Migration of the TCT table is terminated immediately.
2. Processing of the UPGRADE or INITIALIZE command is terminated.
3. The utility attempts to:
   a. Close any files previously opened internally.
   b. Unload any extract exit routines that were dynamically loaded.
   c. Invoke the termination exit routine (if supplied).
   d. Return control to the invoker of the utility.
4. The command is not executed, and execution of further DFHCSDUP commands in the job stream is suppressed.
5. As in (3) above.
6. As in (3) above.

In ALL cases, all the definitions created by this command up to the point of failure remain on the CSD.

User response: The user response depends on the reason the message is issued, as follows.
1. See message DFH5175 and DFH5176.
2. See message DFH5174.
3. Change the name of the terminal and all references to it. Also refer to the user response for message DFH5165.
4. See message DFH5142.
5. This is a CICS logic error. See instruction for 6 below.
6. This is a CICS logic error. You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. A CICS background trace of the failure may aid them in problem diagnosis.

Note: This message cannot be changed with the message editing utility.

DFH5287 E  EXTRACT TERMINATED AT USER'S REQUEST. RC=retcode.

Explanation: A batch job has issued a CSD utility EXTRACT command. The EXTRACT command has been terminated because of a non-zero value in register 15 on return from a user exit program. Subsequent messages will indicate any further problems encountered by the utility.

System action: Execution of the utility command is terminated. This message is followed by DFH5104.

User response: Determine the cause of the error detected by the user exit program using the return code retcode provided and the relevant documentation of the user exit program.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP

DFH5288 E GET-COMMAND TERMINATED AT USER'S REQUEST. RC=xx.

Explanation: The GET-COMMAND exit has returned a value other than UERCNORM ('00'X) or UERCDONE ('04'X) indicating that the GET-COMMAND exit was unsuccessful.

System action: Execution of the utility command is terminated.

User response: Correct the operation of the GET-COMMAND user exit before re-running the utility. Consult the documentation or listing supplied with the user exit for information on how to diagnose and fix the problem.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP

DFH5289 W TABLE tabtype MACRO mactype=value IS NOT SUPPORTED. VALUE IS CHANGED TO newvalue.

Explanation: During a table tabtype migration for macro mactype, value is not supported. value has been migrated as newvalue

System action: The utility creates the definition for the resource with the changed value. Normal utility processing continues.

User response: Review the object definition to ensure that the modified definition is acceptable.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP

DFH5290 W TOTAL object DEFINITIONS SKIPPED DUE TO ERROR: number

Explanation: CICS issues this message after migrating a CICS table. number definitions of type object were not migrated. See one or more DFH5292 messages issued prior to this message.

System action: Utility processing continues.

User response: Correct the prior errors and manually define the skipped objects.

DFH5291 E UNABLE TO DEFINE OBJECT object IN GROUP group. MIGRATION IS TERMINATED.

Explanation: The DFHCSDUP migration utility could not define object in the group specified. The migration cannot continue.

System action: The utility terminates the migration of the table.

User response: Verify that the specified group is the correct group and review prior errors to determine why the migration utility could not create the definition in the group.

Note: This message cannot be changed with the message editing utility.

**DFH5508 E**  
**COMMAND NOT EXECUTED.**  
**xxxxxxx VALUE MUST BE LESS THAN OR**  
**EQUAL TO yyyyyyy VALUE.**

**Explanation:** A value has been specified that is not consistent with another. The value xxxxxxx must be less than or equal to yyyyyyy.

**System action:** The utility ignores the command.

**Destination:** SYSPRINT

**Modules:** DFHCSDUP
DFH5512 W  PROGRAM NAME BEGINS WITH 'DFH' BUT TRANSACTION NAME DOES NOT BEGIN WITH 'C'

Explanation: CICS supplies standard programs and transactions whose naming conventions you should avoid.

System action: Normal utility processing continues.

User response: Check that the resulting resource definition is as you expect.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP

DFH5513 E  COMMAND NOT EXECUTED. THE SECOND VALUE OF xxxxxxx MUST NOT BE GREATER THAN THE FIRST.

Explanation: Some keywords take pairs of values which are essentially maximum and minimum values.

System action: The utility ignores the command.

User response: Correct the command.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP

DFH5514 E  COMMAND NOT EXECUTED. WITH SESSNAME THERE CAN ONLY BE ONE COUNT AND ITS VALUE MUST BE 1.

Explanation: The use of SESSNAME in a DEFINE SESSIONS command means that a single-session, either for sending or receiving, is required.

System action: The utility ignores the command.

User response: Correct the command.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP

DFH5515 W  AUTOPAGE(NO) HAS BEEN SPECIFIED FOR A 3270 PRINT DEVICE

Explanation: A DEFINE TYPETERM command has AUTOPAGE(NO) and DEVICE(3270P) or DEVICE(LUTYPE3).

System action: Normal utility processing continues.

User response: Check that the resulting resource definition is as you expect.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP

DFH5516 W  THE VALUES OF DEVICE AND SESSIONTYPE ARE EQUIVALENT TO DEVICE(devtype) AND HAVE BEEN REPLACED

Explanation: A DEFINE TYPETERM command has a valid but obsolete DEVICE and SESSIONTYPE combination.

This DEVICE and SESSIONTYPE combination has been replaced by a simpler equivalent indicated by devtype.

System action: Normal utility processing continues.

User response: Check that the resulting resource definition is as you expect. The CICS Resource Definition Guide provides further information about device equivalents.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP

DFH5517 E  COMMAND NOT EXECUTED. xxxxxxx PFX AND COUNT TOGETHER MAKE MORE THAN 4 CHARACTERS.

Explanation: In a SESSIONS definition the receivePfx and sendPfx values are used as prefixes for the names of as many sessions as are specified in the respective counts. These names cannot be more than 4 characters long.

System action: The utility ignores the command.

User response: Correct the command.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP

DFH5518 W  XTRANIDS xxxxxxx ARE RESERVED AND MAY BE REDEFINED BY CICS

Explanation: CICS supplies programs and transactions whose names you should usually avoid.

System action: Normal utility processing continues.
**User response:** Check that the resulting resource definition is as you expect.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCSDUP

---

**DFH5519 E** COMMAND NOT EXECUTED. xxxxxxx VALUE CONTAINS AN INVALID y.

**Explanation:** All character values in DFHCSDUP commands are subject to rules which, depending on the value, disallow certain characters.

**System action:** The utility ignores the command.

**User response:** Correct the command.

The CICS Resource Definition Guide provides further information about these rules under the individual attributes for the syntax of the DFHCSDUP command.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCSDUP

---

**DFH5520 W** THE VALUE OF DEVICE IS EQUIVALENT TO xxxxxxx AND HAS BEEN REPLACED

**Explanation:** A DEFINE TYPETERM command has a valid but obsolete DEVICE value which has been replaced by a simpler equivalent.

**System action:** Normal utility processing continues.

**User response:** Check that the resulting resource definition is as you expect.

The CICS Resource Definition Guide provides further information about these simpler equivalent devices.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCSDUP

---

**DFH5521 E** COMMAND NOT EXECUTED. xxxxxxx VALUE yyyyyyy IS INVALID.

**Explanation:** A value yyyyyyy has been specified for keyword xxxxxxx which is not valid. It may for instance be non-numeric.

**System action:** The utility ignores the command.

**User response:** Correct the command.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCSDUP

---

**DFH5522 E** COMMAND NOT EXECUTED. LENGTH OF xxxxxxx VALUE IS MORE THAN ALLOWED.

**Explanation:** All character values in DEFINE commands are of limited length.

**System action:** The utility ignores the command.

**User response:** Correct the command.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCSDUP

---

**DFH5523 E** COMMAND NOT EXECUTED. FILE DFHCSD MUST BE DEFINED IN THE SIT AND NOT THE CSD.

**Explanation:** DFHCSD has been defined in the CSD rather than in the SIT. This is not allowed.

**System action:** The utility ignores the command.

**User response:** Correct the command. Define DFHCSD in the SIT.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCSDUP

**DFH5524 W** BMS ROUTE FOR CONSOLE MAY CAUSE UNPREDICTABLE RESULTS IF MAPS OR TEXT(ACCUM) USED ON DEVICE.

**Explanation:** The routing of multiline maps or accumulated text to the console is not supported.

**System action:** Normal processing continues.

**User response:** Ensure that the unsupported console operations are disabled.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCSDUP
DFH5525 W  xxxxxxxx VALUE IS NOT VALID,  
 yyyyyyyyy HAS BEEN ASSUMED  
Explanation:  The value xxxxxxxx is not valid. The value yyyyyyyyy has been assumed.  
System action:  The utility ignores the command.  
User response:  Correct the command.  
Note: This message cannot be changed with the message editing utility.  
Destination:  SYSPRINT  
Modules:  DFHCSDUP

DFH5526 E  xxxxxxxx MUST HAVE ROWS AND COLUMNS SPECIFIED  
Explanation:  xxxxxxxx must have rows and columns specified.  
System action:  The utility ignores the command.  
User response:  Correct the command.  
Note: This message cannot be changed with the message editing utility.  
Destination:  SYSPRINT  
Modules:  DFHCSDUP

DFH5527 E  REMOTE OPTIONS ARE IGNORED FOR PROGRAMS STARTING WITH DFH.  
Explanation:  CICS supplies standard programs which are not allowed to have remote attributes.  
System action:  The command is ignored.  
User response:  Correct the command by deleting the remote attributes from the program definition.  
Note: This message cannot be changed with the message editing utility.  
Destination:  SYSPRINT  
Modules:  DFHCSDUP

DFH5528 E  COMMAND NOT EXECUTED. VALUE OF keyword IS OUT OF VALID RANGE.  
Explanation:  An invalid value has been supplied for the specified keyword.  
System action:  The utility ignores the command.  
User response:  Supply a valid keyword value and retry.  
Note: This message cannot be changed with the message editing utility.  
Destination:  SYSPRINT  
Modules:  DFHCSDUP

DFH5529 E  keyword OR keyword MUST BE SPECIFIED.  
Explanation:  Neither of the indicated keywords has been specified. When defining a resource, you must specify one of these keywords.  
System action:  The utility ignores the command.  
User response:  Supply one of the indicated keywords and retry.  
Note: This message cannot be changed with the message editing utility.  
Destination:  SYSPRINT  
Modules:  DFHCSDUP

DFH5530 W  XTRANIDS ENDING WITH string ARE RESERVED AND MAY BE REDEFINED BY CICS.  
Explanation:  CICS supplies programs and transactions whose names you should usually avoid.  
System action:  Normal utility processing continues.  
User response:  Check that the resulting resource definition is as you expect.  
Note: This message cannot be changed with the message editing utility.  
Destination:  SYSPRINT  
Modules:  DFHCSDUP

DFH5531 W  XTRANIDS BEGINNING WITH string ARE RESERVED AND MAY BE REDEFINED BY CICS.  
Explanation:  CICS supplies programs and transactions whose names you should usually avoid.  
System action:  Normal utility processing continues.  
User response:  Check that the resulting resource definition is as you expect.  
Note: This message cannot be changed with the message editing utility.  
Destination:  SYSPRINT  
Modules:  DFHCSDUP

DFH5532 E  COMMAND NOT EXECUTED. AN INVALID COMBINATION OF ROWS AND COLUMNS HAS BEEN SPECIFIED FOR ALTSCREEN.  
Explanation:  One of the specified values is zero and the other is non-zero. This is an invalid combination.
System action: The utility ignores the command.

User response: Ensure that a valid combination of ALTSCREEN rows and columns is specified. See the CICS Resource Definition Guide for details of valid combinations.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP

DFH5533 W SPECIFIED keyword1 VALUE IS LESS THAN keyword2 VALUE. THE DEFAULT VALUE HAS BEEN ASSUMED.

Explanation: A value has been specified for keyword1 that is incompatible with the value for keyword2.

System action: DFHCSDUP assumes the default value for keyword1 and processes the command.

User response: Ensure that the resulting resource definition is acceptable.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP

DFH5534 W WHEN YOU CHANGE THE VALUE OF DEVICE MANY OTHER VALUES MAY BE CHANGED FOR YOU.

Explanation: When ALTERing the DEVICE in a TYPETERM resource definition, the batch update utility changes forced values that are incompatible with the new DEVICE. However, dependent default values are not changed, and may now be incompatible.

System action: Normal utility processing continues.

User response: Check that the resulting resource definition is as you expect. See the CICS Resource Definition Guide for more guidance.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP

DFH5535 E COMMAND NOT EXECUTED. restype NAME resname IS RESERVED BY CICS.

Explanation: The user specified a resource name resname for resource type restype which is reserved for use by CICS.

System action: The utility ignores the command.

User response: Specify a different resource name.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP

DFH5536 W keyword1 AND keyword2 ATTRIBUTES ARE INCONSISTENT IF DEFINITION IS BEING SHARED WITH A BACK LEVEL RELEASE.

Explanation: keyword1 has been preceded by keyword2. However, keyword1 has been kept for compatibility reasons. After updating the definition, the value specified for keyword1 has become inconsistent with the value specified for keyword2.

System action: The definition is created or updated.

User response: If sharing the CSD file with a back level release, ensure that the resulting resource definition is acceptable. Otherwise, ignore the message.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP

DFH5537 W PREFIX ALLOWED TO DEFAULT. USE OF DEFAULTS IS RECOMMENDED FOR MRO SESSIONS ONLY.

Explanation: A null value has been accepted for a send or receive prefix for an LU6.1 or MRO session. The default value '>' is supplied by CICS for send sessions and '<' for receive sessions. These values are the default prefixes for MRO session names. The use of these prefixes is allowed for LU6.1 sessions, but is not recommended if MRO session names with the same prefixes are in use because duplicate names may occur if large numbers of sessions are defined.

System action: CICS will generate session names using these prefixes.

User response: If this is an LU6.1 session it is recommended that a different prefix should be chosen.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP
DFH5538 W  resource NAMES STARTING WITH x MAY CONFLICT WITH SYSTEM SESSIONS NAMES.

Explanation: The resource resource has been given a name starting with the character x which might be used for system generated SESSIONS names.

System action: The definition is created or updated.

User response: Ensure there is no conflict with the name given to the resource and SESSIONS names.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCS DUP

DFH5539 S  keyword IS NOT VALID BECAUSE IT STARTS WITH THE RESERVED CHARACTER OR STRING string.

Explanation: The name you have given to keyword keyword is not valid because the name begins with a reserved character or string such as “c” or “dfh”.

System action: The definition is not created.

User response: Change the name of the keyword.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCS DUP

DFH5540 W  xxxxxxx VALUE IS GREATER THAN yyyyyyy VALUE. THE LOWER VALUE TAKES PRECEDENCE.

Explanation: A value has been specified that is not consistent with another. The value xxxxxxx is greater than value yyyyyyy. Value yyyyyyy takes precedence and overrides the higher value.

System action: The definition is created or updated with the two values as specified.

User response: Ensure that the two values are defined as you expect. You may decide to leave the values as specified and dynamically change the values online once the resource has been installed in the CICS system.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCS DUP

DFH5541 E  PROGRAM OR REMOTESYSTEM MUST BE SPECIFIED.

Explanation: None of the indicated keywords has been specified. When defining a transaction, you must specify one of these keywords.

System action: The utility ignores the command.

User response: Supply one of the indicated keywords and retry.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCS DUP

DFH5542 E  COMMAND NOT EXECUTED. xxxxxxx MUST BE SPECIFIED AS yyyyyyy BECAUSE A PREVIOUS VALUE IS GENERIC.

Explanation: The options, xxxxxxx, must be specified as yyyyyyy because as previous option value was specified as generic.

System action: The utility ignores the command.

User response: Correct the command.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCAP

DFH5545 W  PROGRAM SHOULD BE SPECIFIED WITH BREXIT.

Explanation: If the BREXIT option is specified, the PROGRAM option should also be specified. For compatibility with the Bridge transaction definitions in CTS 1.2, this is not mandatory, but if PROGRAM is not specified the transaction definition will not work.

System action: The transaction definition is accepted.

User response: Correct the command when migration from CTS 1.2 has been made.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCAP

DFH5546 E  COMMAND NOT EXECUTED. xxxxxxx IS NOT VALID AS A TYPE yyyyyyy PARAMETER.

Explanation: The options specified conflict. If TYPE EJB is specified, the respective ejb-type options must
be specified. The ejb-type attributes are BEANNAME and INTFACETYPE. Likewise, for TYPE CORBA, the corba-type attributes must be specified. These are MODULE and INTERFACE. For TYPE GENERIC, either attributes may be specified but they should be generic.

**System action:** The utility ignores the command.

**User response:** Correct the command.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCAP

---

DFH5547 E COMMAND NOT EXECUTED. xxxxxxx VALUE yyyyyyy IS INVALID.

**Explanation:** A value yyyyyyy has been specified for keyword xxxxxxx which is not valid. It may for instance be non-numeric.

**System action:** The utility ignores the command.

**User response:** Correct the command.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCAP

---

DFH5548 E date time applid COMMAND NOT EXECUTED. xxxxxxx OPTION IS INVALID FOR A BACK LEVEL REQUESTMODEL.

**Explanation:** The options specified conflict. If CORBASERVER name is blank and the respective previous level attributes (OMGMODULE, OMGOPERATION, and OMGINTERFACE) are specified, the use of BEANNAME, MODULE, INTERFACE and OPERATION is not allowed. It is not possible to give a back level requestmodel definition new attributes. The old requestmodel must be discarded and redefined with the new attributes if it is required to be used on this level of CICS.

**System action:** The utility ignores the command.

**User response:** Correct the command. If this requestmodel is being maintained for a back level CICS system, specify only the attributes OMGMODULE, OMGOPERATION, OMGINTERFACE and TRANSID. However, to use an old requestmodel on this level of CICS, it must be discarded and redefined with the new attributes.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCSDUP

---

DFH5549 E COMMAND NOT EXECUTED. xxxxxxx VALUE MUST NOT BE THE SAME AS yyyyyyy VALUE.

**Explanation:** The values specified for the two attributes must not be the same. For instance, SSLPORT number must be different from PORT number on CORBASERVER definitions.

**System action:** The utility ignores the command.

**User response:** Correct the command.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCSDUP

---

DFH5550 E keyword1 IMPLIES keyword2. THE DEFAULT VALUE HAS BEEN ASSUMED

**Explanation:** keyword1 has been specified with a value that is incompatible with the value for keyword2.

**System action:** DFHCSDUP changes keyword1 to set the default value and processes the command.

**User response:** Ensure that the resulting resource definition is acceptable.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCSDUP

---

DFH5551 E COMMAND NOT EXECUTED. keyword1 CANNOT BE SPECIFIED AS GENERIC UNLESS keyword2 IS ALSO GENERIC.

**Explanation:** keyword1 has been specified with a generic name containing wildcard characters (asterisks or plus signs). But this is only permitted when keyword2 is also specified as a generic name.

**System action:** The utility ignores the command.

**User response:** If it is required that keyword1 must be generic, ensure that keyword2 is also specified with a generic name.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCSDUP
DFH5552 E COMMAND NOT EXECUTED. CIPHER VALUE 'value' IS NOT IN THE VALID SET (list).

Explanation: The CIPHER attribute has been specified with an invalid value, value, which is not in the valid set of cipher values as indicated by list.

System action: The utility ignores the command.

User response: Ensure that you have defined a set of CIPHER values which are correct for this CICS address space.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP

DFH5553 E COMMAND NOT EXECUTED. field CANNOT START WITH A 'char'.

Explanation: The named attribute field, field, starts with an invalid character, char. This is commonly caused by the field starting with an '*' which is not allowed.

System action: The utility ignores the command.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP

DFH56xx (DFHCSDUP) messages

DFH5600 E UNABLE TO GET STORAGE FOR MODULE DFHCICS. PRIMARY CSD HAS NOT BEEN INITIALIZED.

Explanation: There is insufficient storage to load module DFHCICS.

System action: Processing of the INITIALIZE command is terminated.

User response: Ensure that there is sufficient storage to load the DFHCICS module.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP

DFH5601 E UNABLE TO LOAD THE (FCT | RDT | LD) TABLE NAMED table.

Explanation: Table table cannot be loaded.

System action: The system action depends on the type of table.

FCT
DFHCSDUP cannot process the command. The utility attempts to:
1. Close any files previously opened internally.
2. Unload any EXTRACT exit routines that were dynamically loaded.
3. Invoke the termination exit routine, if supplied.
4. Return control to the invoker of the utility.

RDT
The CSD utility cannot load the table, and terminates the processing of the utility command.

User response: Refer to the preceding MVS message which should specify the reason for the failure.

If your FCT or TCT assembly and link-editing is successful, the FCT or RDT should be in the library. The LD is in the load library of the supplied pregenerated CICS system.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCSDUP

DFH5602 E UNABLE TO UNLOAD THE (FCT | RDT | LD) TABLE NAMED table.

Explanation: Table table cannot be unloaded.
**System action:** The system action depends on the type of table.

**LD**
DFHCSDUP cannot process the command. The utility attempts to:
1. Close any files previously opened internally.
2. Unload any EXTRACT exit routines that were dynamically loaded.
3. Invoke the termination exit routine, if supplied.
4. Return control to the invoker of the utility.

**FCT or RDT**
The CSD utility cannot unload the table, and terminates the processing of the utility command.

**User response:** Refer to the preceding MVS message which should specify the reason for the failure.

If your FCT or TCT assembly and link-editing is successful, the FCT or RDT should be in the library. The LD is in the load library of the supplied pregenerated CICS system.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCSDUP

---

**DFH5604 E** UNABLE TO LOCATE THE (FCT | RDT | ILD | DCT) TABLE NAMED table.

**Explanation:** DFHCSDUP was unable to obtain storage for table table.

**System action:** DFHCSDUP cannot process the command.

If commands are being read from a SYSIN data stream, subsequent commands (except LIST) are checked for syntax only. (If the primary CSD file cannot be opened, LIST is not processed either.)

If commands are being read from a get-command exit, DFHCSDUP attempts to process subsequent commands.

**User response:** Increase the region size and retry the command.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCSDUP

---

**DFH5605 E** DISALLOWED CHARACTER IN GROUP OR LIST NAME object.

**Explanation:** The call to module DFHDMP has failed to construct a valid key for the record created on the CSD file. This is because the group or list name contains an invalid character.

**System action:** A CSD record is not created for this definition. (If it is a transaction, a generated profile is not created either.)

**User response:** Use the CEDA transaction to define the resource with a valid name.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCSDUP

---

**DFH5606 S** COMMAND IS NOT EXECUTED. UNABLE TO LOAD THE SERVICE MODULE progname.

**Explanation:** The service module, progname, cannot be loaded due to insufficient storage.

**System action:** Utility command execution is terminated. If commands are being read from a SYSIN data stream by the utility, then subsequent commands are checked for syntax only.
**User response:** Retry the utility command with an increased region size.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCSDUP

---

**DFH5607 S** COMMAND IS TERMINATED. AN ERROR OCCURRED WHILE READING THE FIRST SECONDARY CSD RECORD.

**Explanation:** An I/O error has occurred on the secondary CSD file.

**System action:** The SERVICE command is terminated. If commands are being read from a SYSIN data stream by the utility, then subsequent commands are checked for syntax only.

**User response:** Check that the input and output data sets have been correctly defined, and that the DDNAME for the secondary CSD file in the JCL corresponds to the FROMCSD parameter in the SERVICE utility command.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCSDUP

---

**DFH5608 S** COMMAND IS TERMINATED. AN ERROR OCCURRED WHILE READING A SECONDARY CSD RECORD.

**Explanation:** An I/O error has occurred on the secondary CSD file.

**System action:** The SERVICE command is terminated. If commands are being read from a SYSIN data stream by the utility, then subsequent commands are checked for syntax only.

**User response:** Check that the input and output data sets have been correctly defined, and that the DDNAME for the secondary CSD file in the JCL corresponds to the FROMCSD parameter in the SERVICE utility command.

If the problem persists, try to obtain a print out of the CSD, using either IDCAMS or the DFHCSDUP LIST ALL option. The LIST will indicate where errors have occurred because they will not print and are therefore easily identifiable.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCSDUP

---

**DFH5609 S** COMMAND IS TERMINATED. AN ERROR OCCURRED WHILE WRITING A PRIMARY CSD RECORD.

**Explanation:** An I/O error has occurred on the primary CSD file.

**System action:** The SERVICE command is terminated. If commands are being read from a SYSIN data stream by the utility, then subsequent commands are checked for syntax only.

**User response:** Retry the command, ensuring that a sufficiently large data set is specified for the output (primary) CSD file.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCSDUP

---

**DFH5611 E** COMMAND NOT EXECUTED. Parameter parameter MUST BEGIN WITH ‘DFH’.

**Explanation:** In a CSD utility MIGRATE command, the specified parameter contained an invalid table name or group name.

**System action:** The utility does not process the command.

**User response:** Resubmit the MIGRATE command with a valid table name or group name.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCSDUP

---

**DFH5612 I** resource object IN GROUP grpname IS UNCHANGED.

**Explanation:** A resource definition existed in both source and target groups. Based on the CSD utility commands submitted, the utility has replaced the resource definition in the target group.

**System action:** Normal utility processing continues.

**User response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCSDUP
DFH5613 E UNABLE TO LOCATE THE LIBRARY MEMBER member.
Explanation: The member is not in the libraries named in the JCL.
System action: The utility terminates processing of the command that required access to library member member.
User response: Ensure that the member is correctly link-edited into the library and resubmit the job.
Note: This message cannot be changed with the message editing utility.
Destination: SYSPRINT
Modules: DFHCSDUP

DFH5614 E UNABLE TO LOAD THE LIBRARY MEMBER member.
Explanation: DFHCSDUP could not load library member member.
System action: The utility terminates processing of the command that required access to the library member.
User response: Ensure that the member is correctly link-edited into the library and resubmit the job.
Note: This message cannot be changed with the message editing utility.
Destination: SYSPRINT
Modules: DFHCSDUP

DFH5617 S COMMAND IS TERMINATED. AN UNRECOGNIZED TYPE OF RECORD WAS ENCOUNTERED WHILE SECONDARY CSD WAS BEING READ.
Explanation: The record-type field of an input CSD record is invalid.
System action: The SERVICE command is terminated. If commands are being read from a SYSIN data stream by the utility, then subsequent commands are checked for syntax only.
User response: Check that the input and output data sets have been correctly defined, and that the DDNAME for the secondary CSD file in the JCL corresponds to the FROMCSD parameter in the SERVICE utility command.
If the problem persists, try to obtain a print out of the CSD, using either IDCAMS or the DFHCSDUP LIST ALL option. The LIST will indicate where errors have occurred because they will not print and are therefore easily identifiable.
Note: This message cannot be changed with the message editing utility.
Destination: SYSPRINT
Modules: DFHCSDUP

DFH5618 I AN ATTENTION INTERRUPT WAS REQUESTED DURING DFHCSDUP EXECUTION.
Explanation: An attention interrupt has been requested while DFHCSDUP is executing in a TSO environment.
System action: Normal utility processing continues.
User response: None.
Note: This message cannot be changed with the message editing utility.
Destination: SYSPRINT
Modules: DFHCSDUP

DFH5619 W AN INVALID VALUE OF THE PAGESIZE PARAMETER HAS BEEN SPECIFIED. THE DEFAULT VALUE OF 60 LINES PER PAGE WILL BE USED.
Explanation: A value of the PAGESIZE parameter outside the allowed range (4–9999) has been specified.
System action: The default value of 60 lines per page is taken.
User response: Ensure that a valid PAGESIZE value is specified in future.
Note: This message cannot be changed with the message editing utility.
Destination: SYSPRINT
Modules: DFHCSDUP

DFH5620 E AN ILLEGAL RETURN CODE (RC=ret-code) HAS BEEN RETURNED FROM THE (INITIALIZATION | GET-COMMAND | TERMINATION) EXIT.
Explanation: The specified user-exit routine has returned a disallowed return code.
System action: Processing of the utility command is terminated. The exit is not disabled.
User response: Investigate the specified exit routine for the cause of the illegal return code.
**DFH5621** E A NON-ZERO RETURN CODE HAS BEEN RETURNED FROM THE PUT-MESSAGE EXIT.

**Explanation:** The put-message exit routine has returned a disallowed return code.

**System action:** Processing of the utility command is terminated and the put-message exit is disabled.

**User response:** Investigate the put-message exit routine for the cause of the illegal return code.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCSDUP

---

**DFH5622** S THE SECONDARY CSD HAS BEEN CLOSED DURING CLEAN-UP PROCESSING FOLLOWING THE INTERCEPTION OF AN ABEND.

**Explanation:** An Abend has occurred during DFHCSDUP processing. The secondary CSD has been closed during post ABEND clean up processing.

**System action:** Processing of the utility command is terminated.

**User response:** Refer to prior messages for further information regarding this problem.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCSDUP

---

**DFH5623** S THE PRIMARY CSD HAS BEEN CLOSED DURING CLEAN-UP PROCESSING FOLLOWING THE INTERCEPTION OF AN ABEND.

**Explanation:** An abend has occurred during DFHCSDUP processing. The primary CSD has been closed during post ABEND clean up processing.

**System action:** Processing of the utility command is terminated.

**User response:** Refer to prior messages for further information regarding this problem.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCSDUP

---

**DFH5624** S THE EXTRACT EXIT PROGRAM HAS BEEN UNLOADED DURING CLEAN-UP PROCESSING FOLLOWING THE INTERCEPTION OF AN ABEND.

**Explanation:** An abend has occurred during the processing of an EXTRACT command. The extract exit program specified on the USERPROGRAM keyword of the EXTRACT utility command has been unloaded during post-abend clean-up processing.

**System action:** The EXTRACT command is terminated.

**User response:** Refer to prior messages for further information regarding the problem.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCSDUP

---

**DFH5625** S THE USER PROGRAM HAS PASSED AN INVALID DDNAME PARAMETER FOR ddname TO DFHCSDUP.

**Explanation:** The user program has supplied an alternative ddname as a parameter for either DFHCSD, SYSIN or SYSPRINT. The alternative ddname is invalid because it begins with a blank.

**System action:** The default DDNAME is used instead.

**User response:** Correct the invalid DDNAME parameter.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Modules:** DFHCSDUP

---

**DFH5630** W NO IBM SUPPLIED DEFINITION FOUND FOR resourcetype resourcename.

**Explanation:** While performing a SCAN command, the named resource type was not found in the CSD file on any of the IBM supplied groups. Note that compatibility groups are not used for the SCAN command.

**System action:** The utility continues.

**User response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

---

Chapter 1. DFH messages  53
DFH5631 I resourcetype resourcename IN GROUP
groupname1 MATCHES THE IBM SUPPLIED DEFINITION IN GROUP
groupname2.
Explanation: While performing a SCAN command, the resource resourcetype name resourcename was found in group groupname1 and it matches the IBM supplied definition in group groupname2.
System action: The utility continues.
User response: None.
Note: This message cannot be changed with the message editing utility.
Destination: Console
Modules: DFHCSDUP

DFH5632 I resourcetype resourcename IN GROUP
groupname1 DOES NOT MATCH THE IBM SUPPLIED DEFINITION IN GROUP
groupname2.
Explanation: While performing a SCAN command, the resource resourcetype name resourcename was found in group groupname1 and it does not match the IBM supplied definition in group groupname2.
System action: The utility continues.
User response: None.
Note: This message cannot be changed with the message editing utility.
Destination: Console
Modules: DFHCSDUP

DFH5633 I resourcetype resourcename FOUND IN GROUP groupname.
Explanation: While performing a SCAN command, the resource resourcetype name resourcename was found in group groupname. No IBM supplied definition was found to perform a compare against.
System action: The utility continues.
User response: None.
Note: This message cannot be changed with the message editing utility.
Destination: Console
Modules: DFHCSDUP

DFH5634 W resourcetype resourcename NOT FOUND IN USER GROUPS.
Explanation: While performing a SCAN command, the resource resourcetype name resourcename was not found in any user groups.
System action: The utility continues.
User response: None.
Note: This message cannot be changed with the message editing utility.
Destination: Console
Modules: DFHCSDUP
DFH7xxx (DFHExP) command-level translator diagnostic messages

Diagnostic messages may be issued by the command-level translator (DFHEAP for assembler language, DFHECP for COBOL, DFHEDP for C, and DFHEPP for PL/I) in the course of processing programs written in assembler language, COBOL, C, or PL/I.

Assembler-language messages are inserted as macro notes (MNOTES) in the translator output file and can be seen by either printing or assembling the translator output file.

COBOL, C, and PL/I messages are delivered to SYSPRINT.

The same diagnostics are issued by the command-level interpreter, by the master terminal transaction (CEMT), and by CEDA.

A diagnostic message can have three components: a message number, a severity code, and message text. Each message is of the form DFH7nnnl c line text where
- \( nnn \) is a number,
- \( l \) is the information message identifier,
- \( c \) is the severity code
- \( line \) is the line number of the error and
- \( text \) is the text of the message.

In assembler language, COBOL, C, and PL/I, diagnostic messages can be allocated a severity code. This severity code is represented by a letter that, if present, will appear in the message immediately following the message number and preceding the message text. There are five levels of severity. Those for assembler language, C and PL/I are different from those for COBOL. The meanings of the codes and the associated return codes for the languages are as follows:

<table>
<thead>
<tr>
<th>Assembler, C or PL/I</th>
<th>Return code</th>
<th>COBOL</th>
</tr>
</thead>
<tbody>
<tr>
<td>U = Unrecoverable</td>
<td>16</td>
<td>D = Disaster</td>
</tr>
<tr>
<td>S = Severe</td>
<td>12</td>
<td>E = Error</td>
</tr>
<tr>
<td>E = Error</td>
<td>8</td>
<td>C = Conditional</td>
</tr>
<tr>
<td>W = Warning</td>
<td>4</td>
<td>W = Warning</td>
</tr>
<tr>
<td>I = Information</td>
<td>0</td>
<td>I = Information</td>
</tr>
</tbody>
</table>

The message text consists of the message itself, which may or may not include inserts. The inserts are positions within the message text where, in the actual message, specific information is given on the reasons for the diagnostic message. Not all the diagnostic messages, however, require inserts.

Messages issued by the command-level translator are usually self-explanatory, and DFH7000 is an example of this type of message.

DFH7000I LISTING FILE CANNOT BE OPENED

**Explanation:** The listing data set was not opened.

**System action:** The command-level translator is abnormally terminated. A dump is produced if a SYSABEND or SYSUDUMP DD statement has been provided.

**User response:** Ensure the JCL is correct, or determine what is causing the error and preventing opening.

**Destination:** Console

**Modules:** DFHEAP (for assembler language), DFHECP (for COBOL), DFHEDP (for C), DFHEPP (for PL/I)
DFHACxxxx (DFHACP) messages

DFHAC2001  date  time applid  Transaction ‘tranid’ is not recognized. Check that the transaction name is correct.

Explanation: Either transaction tranid does not exist as an installed transaction definition, or it is disabled, or it contains invalid characters.

Note that destination CSMT is used for non-terminal transactions only.

System action:  Processing continues.
User response:  Enter a valid transaction identifier.
Destination:  CSMT and Terminal End User
Modules:  DFHACP
XMEOUT Parameters:  date, time,applid, tranid

DFHAC2002  date  time applid  To use this transaction tranid you must sign on or have the right security level.

Explanation:  You are signed on using the default userid but this userid does not have access to the requested transaction.

System action:  CICS does not initialize the invoked transaction. Other processing continues and message DFHAC2003 is sent to destination CSMT.
User response:  Sign on with an authorized userid.
Destination:  Terminal End User
Modules:  DFHACP

DFHAC2003  date  time applid  Security violation has been detected term id = termid, trans id = tranid, userid = userid.

Explanation: The operator with user ID userid has invoked a transaction tranid at terminal termid for which the operator is not authorized.

System action:  CICS does not initialize the invoked transaction. Either message DFHAC2002 or DFHAC2033 is sent to the terminal operator. Other CICS processing continues.
User response:  Refer to the userid in the preceding message, DFHXS1111 on the CSCS log, to determine the identity of the person trying to invoke transaction tranid and the reason for the attempt.
Destination:  CSMT
Modules:  DFHACP
XMEOUT Parameters:  date, time,applid, termid, tranid, userid

DFHAC2004  time applid  Transaction tranid has failed with abend AKCC. Resource backout was successful.

Explanation:  Transaction tranid is abnormally terminated with abend AKCC.

System action:  The transaction (task) is purged.
User response:  Resubmit the transaction.
Destination:  Terminal End User
Modules:  DFHTFP

DFHAC2005  time applid  Transaction tranid has failed with abend abcode.

Explanation:  Transaction tranid has been defined with INDOUBT(WAIT) or INDOUBT(COMMIT) and has been in communication with a partner APPC system. A session failure has occurred while the session was INDOUBT during an explicit or implicit syncpoint. An immediate resync was attempted but could not be completed.

System action:  The task is abnormally terminated with a transaction dump. Unless overridden, APPC resynchronization is retried when the remote system is available.
User response:  For more information, see the abend code abcode. If necessary, resubmit the transaction after the cause of the abend has been removed.
Destination:  Terminal End User
Modules:  DFHACP

DFHAC2006  date  time applid  Transaction tranid program program name abend primary abcode at termid.

Explanation:  The system was unable to execute transaction tranid. termid identifies the terminal which initiated transaction tranid. If there is no associated terminal, termid appears as “????”. Program programname is the highest level program and is taken from the installed program definition. abcode is the CICS abend code.

System action:  The task is abnormally terminated with a dump.
User response:  Refer to abend code abcode for further information and guidance on how to solve the problem. If the code is not available, it is a user code generated by an EXEC CICS ABEND ABCODE(abcode) command. This command has been issued by a user program or by an IBM program (for example, a programming language library module).
Destination:  CSMT
Modules: DFHACP

DFHAC2007 date time applid Transaction tranid cannot run as CICS shutdown is in progress.

Explanation: Transaction tranid cannot be run during system quiesce.

System action: The system is in quiesce mode.

User response: Re-enter the transaction when CICS is in normal execution mode, or place an entry for this transaction in the transaction list table (XLT).

Destination: CSMT and Terminal End User

Modules: DFHACP

DFHAC2008 date time applid Transaction tranid has been disabled and cannot be used.

Explanation: Terminal tranid has been disabled.

System action: Other processing continues.

User response: Notify the programmer responsible for this area that transaction tranid has been disabled.

Destination: CSMT and Terminal End User

Modules: DFHACP

DFHAC2009 date time applid Invalid non-terminal transaction tranid.

Explanation: Transaction tranid has been entered. No terminal is associated with this transaction. It may be that transaction tranid is a disabled transaction, or is one that cannot be run during system quiesce. Alternatively, an invalid transaction identifier may have been entered.

System action: Other processing continues.

User response: Determine and correct the reason for transaction tranid's invalidity.

Destination: CSMT

Modules: DFHACP

DFHAC2010 date time applid Transaction tranid is not executable on terminal termid.

Explanation: A conflict has been detected between the options specified for transaction tranid's definition and those specified on terminal termid's DFHTCT table entry. For example, transaction tranid is reserved for the use of VTAM terminals but the input came from a non-VTAM terminal.

System action: The input is ignored.

User response: If transaction tranid is to be entered from terminal termid, ensure that the installed transaction definition value of DVSUPRT is compatible with the DFHTCT entry.

Destination: Terminal End User

Modules: DFHACP

DFHAC2012 date time applid Remote transaction tranid cannot be run on the local system.

Explanation: Transaction tranid is specified as remote. An attempt to route the transaction to a remote system failed either because there is no MRO/ISC defined in the running CICS system, or because the remote system name specified in the definition of the transaction is the same as that of the local system.

System action: The task is abnormally terminated.

User response: Ensure that:
   • MRO/ISC support is correctly defined
   • The remote transaction definition is correct.

Destination: CSMT and Terminal End User

Modules: DFHACP

DFHAC2014 date time applid Transaction tranid is not executable because system sysid is not available.

Explanation: Transaction tranid is specified as remote. An attempt to route the transaction to a remote system failed because the link is out of service.

System action: CICS continues.

User response: Wait until the link is available.
If QUEUELIMIT and MAXQTIME are specified and this message occurs frequently then see the Intersystem Session Queue Management section in the Intercommunication Guide.

Destination: CSMT and Terminal End User

Modules: DFHACP

XMEOUT Parameters: date, time, applid, tranid, sysid

DFHAC2015  date  time  applid  Console  consname has not been defined to CICS. Input is ignored.

Explanation: The console operator at the console named consname has directed a MODIFY command to the CICS region, but no terminal definition for that console is installed in the region, and autoinstall for consoles is not enabled.

System action: The MODIFY command from the console is ignored.

User response: Notify the system programmer, who should use RDO to DEFINE and INSTALL a console definition that matches the name of the console, or enable autoinstall for consoles. The system programmer may also consider using 'pooled' consoles by defining TERMINAL definitions with a CONSNAM of DFHCONxx, or increasing the number of pooled consoles.

Destination: CSMT and Terminal End User

Modules: DFHACP, DFHZATA2

XMEOUT Parameters: date, time, applid, consname

Note that destination CSMT is used for non-terminal transactions only.

DFHAC2015  date  time  applid  Transaction  tranid cannot run because program program name is not available.

Explanation: Transaction tranid is not executable because the initial program for transaction tranid is not available. Possible reasons for this are:
1. The program is missing.
2. The installed program definition is missing.
3. The program is disabled.
4. The program name in the installed transaction definition is invalid.
5. The installed transaction has been defined as remote and therefore has no program name, but the name of the remote system is the same as that of the local system.
6. The program requires a JVM to run but JVM initialization failed.
7. The autoinstall program abended while attempting to load the program.
8. The Language Environment options specified in DFHJVMRO are too long.

User response: Determine the cause of the error using the list given in the Explanation. The response depends on the reason as follows:
1. Load the program into the CICS program library.
2. Create an installed program definition for the program.
3. Enable the program.
4. Use a valid program name in the installed transaction definition.
5. Carry out whichever of the following is appropriate:
   • Use a local version of this transaction.
   • Use the correct remote version of this transaction.
   • Logon to the correct system and retry the transaction.

6. For JVM programs check the CSMT log for further information as to why JVM initialization failed.
7. Check the job output for further information as to why the autoinstall program abended.
8. Remove any unnecessary options and abbreviate any Language Environment option keywords, where possible, in your source for DFHJVMRO.

Destination: CSMT and Terminal End User

Modules: DFHACP

XMEOUT Parameters: date, time, applid, tranid, program name

Note that destination CSMT is used for non-terminal transactions only.

DFHAC2017  date  time  applid  Transaction  tranid cannot run because terminal profile profname for the transaction is not available.

Explanation: Transaction tranid is not executable because the terminal profile for the transaction is not available. This is because it has not been defined, or it has not been installed.

User response: Notify the system programmer or system administrator.

Destination: CSMT and Terminal End User

Modules: DFHACP

XMEOUT Parameters: date, time, applid, tranid, profname
DFHAC2018  *date time applid*  An unrecognized Process Initialization Parameter (PIP) has been received in ATTACH for transaction *tranid*.

**Explanation:** CICS has received an LU type 6.2 attach header with invalid process initialization parameters (PIPs).

Note that destination CSMT is used for non-terminal transactions only.

**System action:** CICS rejects the attach request.

**User response:** Inspect the received PIP data and its associated generalized data stream (GDS) header to determine why the parameters are invalid.

**Destination:** CSMT and Terminal End User

**Modules:** DFHACP

**XMEOUT Parameters:** *date, time, applid, tranid*

---

DFHAC2019  *date time applid*  Transaction *tranid* does not support unmapped conversations.

**Explanation:** Transaction *tranid* received an attach request that required the use of the generalized data stream (GDS) to access unmapped conversations, but transaction *tranid* does not support the use of the GDS interface.

Note that destination CSMT is used for non-terminal transactions only.

**System action:** CICS rejects the attach request.

**User response:** Inspect the subsystem that sent the attach header to see if the correct transaction was requested. If the request was correct, check the CICS transaction definition.

**Destination:** CSMT and Terminal End User

**Modules:** DFHACP

**XMEOUT Parameters:** *date, time, applid, tranid*

---

DFHAC2020  *time applid*  The conversation type requested by node *netname* was not recognized.

**Explanation:** CICS received a conversation-type field in an attach header that was not TYPE=MAPPED or TYPE=UNMAPPED.

**System action:** The attach request is rejected.

**User response:** Notify the system programmer. The validity of the attach function management header (FMH) should be checked and the cause of the error identified.

**Destination:** Terminal End User

**Modules:** DFHACP

---

DFHAC2021  *time applid*  An unsupported Data Blocking Algorithm (DBA) field in the attach Function Management Header (FMH) has been received from node *netname*.

**Explanation:** The received attach header contained a value for the reserved data blocking algorithm (DBA) field.

**System action:** The attach request is rejected.

**User response:** Notify the system programmer. The validity of the attach function management header (FMH) should be checked and the cause of the error identified.

**Destination:** Terminal End User

**Modules:** DFHACP

---

DFHAC2022  *date time applid*  Transaction *tranid* has initiated an incorrect sync point level request.

**Explanation:** The requested Synclevel does not match the synclevel negotiated in the Bind request, or Synclevel 2 was requested, but Lognames were not exchanged.

Note that destination CSMT is used for non-terminal transactions only.

**System action:** The attach request is rejected.

**User response:** Notify the system programmer. The subsystem that sent the attach header should be inspected to determine that the correct transaction was requested. If it was, the CICS transaction definition should be checked.

**Destination:** CSMT and Terminal End User

**Modules:** DFHACP

**XMEOUT Parameters:** *date, time, applid, tranid*

---

DFHAC2023  *time applid*  An invalid sync point level has been requested by node *netname*.

**Explanation:** The synchronization level requested in the attach header is invalid for the session being used.

**System action:** The attach request is rejected.

**User response:** Notify the system programmer. The validity of the attach function management header (FMH) should be checked and the cause of the error identified. The value of the synchronization level in the attach header and the bind should be compared.

**Destination:** Terminal End User

**Modules:** DFHACP
DFHAC2024  date time applid A request from node netname has invalid security parameters.

Explanation: The received attach header did not match the required security parameters specified in the bind.

Note that destination CSMT is used for non-terminal transactions only.

System action: The attach request is rejected.

User response: Notify the system programmer. The validity of the attach function management header (FMH) should be checked and the cause of the error identified. The value of the ACC requirements in the attach header and the bind should be compared.

Destination: CSMT

Modules: DFHACP

XMEOUT Parameters: date, time, applid, netname

DFHAC2025  time applid An invalid Unit of Work Identification (UOWID) has been supplied by node netname.

Explanation: The received attach header contained an invalid unit of work ID (UOWID). Either the format was wrong, or no UOWID was received when the sync point level required it. This error may also be raised if no conversation correlator is supplied when it is needed.

System action: The attach request is rejected.

User response: Notify the system programmer. The validity of the attach function management header (FMH) should be checked and the cause of the error identified. The value of the UOWID/conversation correlator and the sync point level in the attach header should be compared.

Destination: Terminal End User

Modules: DFHACP

XMEOUT Parameters: date, time, applid, netname

DFHAC2026  time applid An invalid Function Management Header (FMH) has been supplied by node netname.

Explanation: The length field in the attach header was invalid.

System action: The attach request is rejected.

User response: Notify the system programmer. The validity of the attach function management header (FMH) should be checked and the cause of the error identified.

Destination: Terminal End User

Modules: DFHACP

XMEOUT Parameters: date, time, applid, netname

DFHAC2027  date time applid Transaction tranid does not support conversation restart.

Explanation: CICS will not accept LU type 6.2 attach headers with restart requested.

System action: The attach request is rejected.

User response: Notify the system programmer. The subsystem that sent the attach header should be inspected to determine why restart was requested.

Destination: CSMT and Terminal End User

Modules: DFHACP

XMEOUT Parameters: date, time, applid, tranid

DFHAC2028  date time applid Transaction tranid cannot be used and has been ignored.

Explanation: The transaction code CSAC or CESC, was entered from a terminal. This is not allowed.

System action: If the transaction is CSAC, the transaction is run with no effect. If the transaction is CESC, the transaction is abnormally terminated with abend code ATOA.

User response: Ensure that these transactions are not entered from a terminal.

Destination: CSMT and Terminal End User

Modules: DFHACP

XMEOUT Parameters: date, time, applid, tranid

DFHAC2029  date time applid Transaction tranid is not executable. The system specified by the dynamic routing program is unavailable.

Explanation: Transaction tranid is specified as remote AND dynamic. An attempt to dynamically route transaction tranid to the remote system specified by the dynamic routing program has failed because the link is out of service.

Note that destination CSMT is used for non-terminal transactions only.

System action: CICS continues.

User response: Wait until the link becomes available, then try to dynamically route the transaction again.

Destination: CSMT and Terminal End User

Modules: DFHACP

XMEOUT Parameters: date, time, applid, tranid
DFHAC2030  date time applid  All sessions are busy. Please try again.

Explanation:  Transaction tranid is specified as remote AND dynamic. An attempt to dynamically route transaction tranid to the remote system specified by the dynamic routing program has failed because no sessions are immediately available.

Note that destination CSMT is used for non-terminal transactions only.

System action:  CICS continues.

User response:  Wait until a session becomes available, then try to dynamically route the transaction again.

Destination:  CSMT and Terminal End User

Modules:  DFHACP

XMEOUT Parameters:  date, time, applid

DFHAC2031  date time applid  Automatic signon of operator of console consname has failed.

Explanation:  The console operator at the console named consname has directed a MODIFY command to the CICS region, and the console was defined with USERID(*FIRST) or USERID(*EVERY). When CICS tried to signon the operator automatically, the signon was rejected.

System action:  The MODIFY command from the console is ignored.

User response:  Contact the system programmer to give the userid in use at the console (which is identified in other messages on the log), the correct access to this console using RACF (or an equivalent External Security manager).

Destination:  CSML and Terminal End User

Modules:  DFHACP, DFHZATA2

XMEOUT Parameters:  date, time, applid, consname

DFHAC2032  date time applid  CICS autoinstall for console consname has failed.

Explanation:  The console operator at the console named consname has directed a MODIFY command to the CICS region, but no terminal definition for that console is installed in the region, and an autoinstall for it has failed.

System action:  The MODIFY command from the console is ignored.

User response:  Notify the system programmer, who should investigate the failure by looking for abends and messages on the log of the CICS system.

Destination:  CSML

DFHAC2033  time applid  You are not authorized to use transaction tranid. Check that the transaction name is correct.

Explanation:  Either an operator has attempted to execute transaction tranid while not authorized, or another transaction attempted to start transaction tranid, which was not authorized for this terminal.

System action:  Other processing continues. Message DFHAC2033 is sent to CSMT.

User response:  Either determine why the operator was trying to execute transaction tranid or enter an authorized transaction identifier.

Destination:  Terminal End User

Modules:  DFHACP

DFHAC2034  time applid  CICS Logic Error. An invalid error code has been passed to DFHACP. Transaction: tranid Terminal: termid.

Explanation:  An invalid error code has been passed to DFHACP.

System action:  Transaction tranid is terminated with a transaction dump. The dump code is AACA. Message DFHAC2035 is sent to the CSMT.

User response:  You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination:  Terminal End User

Modules:  DFHACP

DFHAC2035  date time applid  An invalid error code has been passed to DFHACP. Transaction tranid is terminated. Terminal termid.

Explanation:  An invalid error code has been passed to DFHACP.

System action:  Transaction tranid is terminated with a transaction dump. A transaction dump is taken. The dump code is AACA. Message DFHAC2034 is sent to the terminal user.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response:  You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination:  CSMT

Modules:  DFHACP
XMEOUT Parameters: date, time, applid, tranid, termid

DFHAC2036 date time applid Transaction tranid has failed with abend AKCC. Resource backout was successful.
Explanation: Transaction tranid has abended AKCC.
System action: The transaction (task) is purged.
User response: Resubmit the transaction later.
Destination: CSMT
Modules: DFHTFP
XMEOUT Parameters: date, time, applid, tranid

DFHAC2037 date time applid Transaction tranid is not executable on terminal termid.
Explanation: A conflict has been detected between the options specified for transaction tranid's definition and those specified on terminal termid's DFHTCT table entry. For example, transaction tranid is reserved for the use of VTAM terminals but the input came from a non-VTAM terminal.
System action: The input is ignored.
User response: If transaction tranid is to be entered from terminal termid, ensure that the installed transaction definition value of DVSUPRT is compatible with the DFHTCT entry.
Destination: CSMT
Modules: DFHACP
XMEOUT Parameters: date, time, applid, tranid, termid

DFHAC2038 date time applid The conversation type requested by node netname was not recognized.
Explanation: CICS received a conversation-type field in an attach header that was not TYPE=MAPPED or TYPE=UNMAPPED.
System action: The attach request is rejected.
User response: Notify the system programmer. The validity of the attach function management header (FMH) should be checked and the failing subsystem identified.
Destination: CSMT
Modules: DFHACP
XMEOUT Parameters: date, time, applid, netname

DFHAC2039 date time applid An unsupported Data Blocking Algorithm (DBA) field in the attach Function Management Header (FMH) has been received from node netname.
Explanation: The received attach header contained a value for the reserved data blocking algorithm (DBA) field.
System action: The attach request is rejected.
Message DFHME0116 is normally produced containing the symptom string for this problem.
User response: Notify the system programmer. Check the validity of the attach function management header (FMH), and identify the failing subsystem.
Destination: CSMT
Modules: DFHACP
XMEOUT Parameters: date, time, applid, netname

DFHAC2040 date time applid An invalid sync point level has been requested by node netname.
Explanation: The synchronization level requested in the attach header is invalid for the session being used.
System action: The attach request is rejected.
Message DFHME0116 is normally produced containing the symptom string for this problem.
User response: Notify the system programmer. Check the validity of the attach function management header (FMH), and identify the failing subsystem. Compare the value of the synchronization level in the attach header and the bind.
Destination: CSMT
Modules: DFHACP
XMEOUT Parameters: date, time, applid, netname

DFHAC2041 date time applid An invalid Unit of Work Identification (UOWID) has been supplied by node netname.
Explanation: The received attach header contained an invalid unit of work ID (UOWID). Either the format was wrong, or no UOWID was received when the sync point level required it. This error may also be raised if no conversation correlator is supplied when it is needed.
System action: The attach request is rejected.
Message DFHME0116 is normally produced containing the symptom string for this problem.
User response: Notify the system programmer. The validity of the attach function management header (FMH) should be checked and the failing subsystem identified. The value of the UOWID/conversation correlator and the sync point level in the attach header should be compared.
Destination: CSMT
Modules: DFHACP
XMEOUT Parameters: date, time, applid, netname

DFHAC2042 date time applid An invalid Function Management Header (FMH) has been supplied by node netname.

Explanation: The length field in the attach header was invalid.

System action: The attach request is rejected.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Notify the system programmer. Check the validity of the attach function management header (FMH), and identify the failing subsystem.

Destination: CSMT

Modules: DFHACP

XMEOUT Parameters: date, time, applid, netname

DFHAC2043 date time applid Transaction has been rejected - CICS system is being recovered. Please wait for completion of recovery.

Explanation: A request to initiate a transaction was received while the CICS system was in the process of recovering the session following an XRF takeover or persistent sessions restart. The error is detected by DFHZSUP, which then drives DFHACP to issue this message.

Note that destination CSMT is used for non-terminal transactions only.

System action: Depending upon the recovery notification requested for this terminal, the system will send either the recovery message or initiate the recovery transaction specified on the RECOVNOTIFY option of the typeterm definition for this terminal (see the CICS Resource Definition Guide for details).

User response: After the recovery notification has been received, the user is able to continue operations.

Destination: CSMT and Terminal End User

Modules: DFHACP

XMEOUT Parameters: date, time, applid

DFHAC2044 date time applid An error occurred while trying to send SYNCPOINT ROLLBACK to terminal termid.

Explanation: An attempt was made to send a SYNCPOINT ROLLBACK request. A nonzero return code was received by the sender of the request.

System action: ABORT processing is initiated for terminal termid.

User response: Notify the system programmer. Use trace to find the value of the return code from the SYNCPOINT ROLLBACK request. For IRC, the meaning of the return code can be found in the CICS Data Areas manual.

Destination: CSMT

Modules: DFHACP

XMEOUT Parameters: date, time, applid, netname

DFHAC2045 date time applid CICS autoinstall for console consname was rejected by the autoinstall control program.

Explanation: The console operator at the console named consname has directed a MODIFY command to the CICS region, but no terminal definition for that console is installed in the region, and an autoinstall for it has failed because the autoinstall program has rejected the install request.

System action: The MODIFY command from the console is ignored.

User response: Notify the system programmer, who should alter the autoinstall program to allow this console to be installed.

Destination: CSMT

Modules: DFHACP, DFHZATA2

XMEOUT Parameters: date, time, applid, consname

DFHAC2047 date applid While performing an attach for node netname a security violation was detected.

Explanation: A request to attach a remote transaction failed due to a security problem. The security fields extracted from the Attach FMH5 were passed to the Security Domain to signon the user in the remote system, but the signon call failed.

System action: The attach request is rejected.

User response: Refer to previous security messages which are written to TDQ CSCS such as DFHSN1604 for further information and guidance. If no previous messages were issued, examine the trace to determine the reason for the signon failure. Check that if the userid, password or profile are passed on the Attach FMH5, then they are valid.

Destination: CSMT and Terminal End User

Modules: DFHACP

XMEOUT Parameters: date, time, applid, netname

DFHAC2050 time applid An invalid Function Management Header (FMH) has been supplied by node netname.

Explanation: The access security information length field in the attach header is invalid.

Chapter 1. DFH messages 63
**DFHAC2051**  
*time applid*

An invalid Function Management Header (FMH) has been supplied by node *netname*.

**Explanation:**
The Access Security Information length field in the attach header was invalid.

**System action:**
An exception trace entry containing the invalid FMH is issued. The attach request is rejected.

**User response:**
Notify the system programmer. Check the validity of the attach function management header and identify the cause of the error.

**Destination:**
Terminal End User

**Modules:**
DFHACP

**XMEOUT Parameters:**
date, time, applid, netname

---

**DFHAC2052**  
*time applid*

While performing an attach for node *netname* a security violation was detected.

**Explanation:**
A password was required in the attach FMH5, but was missing. A user ID was found, however, because the attach did not specify already verified (AV) or persistent signed-on (PV1), a password should have been present.

**System action:**
An exception trace entry is issued tracing the invalid FMH5. The attach request is rejected.

**User response:**
Notify the system programmer. Check the validity of the attach function management header (FMH) and identify the failing subsystem.

**Destination:**
CSMT

**Modules:**
DFHACP

**XMEOUT Parameters:**
date, time, applid, netname

---

**DFHAC2053**  
*time applid*

While performing an attach for node *netname* a security violation was detected.

**Explanation:**
A password was required in the attach FMH5, but was missing. A user ID was found, however, since the attach did not specify already verified (AV) or persistent signed-on (PV1), a password should have been present.

**System action:**
An exception trace entry is issued tracing the invalid FMH5. The attach request is rejected. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User response:**
Notify the system programmer. Inspect the subsystem that sent the attach header to determine why the password was not sent.

**Destination:**
CSMT

**Modules:**
DFHACP

**XMEOUT Parameters:**
date, time, applid, netname

---

**DFHAC2054**

*time applid*

You are not authorized to access this system.

**Explanation:**
The attach header that was sent to the remote system did not match the required security parameters specified in the bind.

**System action:**
The attach request is rejected by the remote system and the session is unbound. The remote system issues messages DFHAC2055 on CSMT and DFHZC4946 on CSNE.

**User response:**
Inform the system programmer. Investigate the reason why the attach request failed. See messages DFHAC2055 on CSMT and DFHZC4946 on CSNE issued by the remote system for more diagnostic information.

**Destination:**
Terminal End User

**Modules:**
DFHACP

**XMEOUT Parameters:**
date, time, applid, netname

---

**DFHAC2055**

*time applid*

An attach request from node *netname* has sent BIND/FMH5 security data that is invalid.

**Explanation:**
A request to attach a task has been received across an APPC link. However, there is an error in the FMH attach parameters. An attach parameter is present that is not authorized by the bind security indicators.

**System action:**
The attach request is rejected and the session is unbound. An exception trace point (number 1737) for component TF is issued, tracing the invalid attach header (FMH type 5). Message DFHZC4946 on CSNE contains sense information to help identify the reason for the failure. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User response:**
Investigate the cause of the error which is in the remote system. Use the FMH5 in the exception trace, to determine why the remote system sent an invalid attach request.

**Destination:**
CSMT

**Modules:**
DFHACP

**XMEOUT Parameters:**
date, time, applid, netname
DFHAC2056  *time applid* You are not authorized to access this system.

**Explanation:** The attach header that was sent to the remote system did not conform to the APPC protocol.

**System action:** The attach request is rejected by the remote system and the session is unbound. The remote system will produce messages DFHAC2057 on CSMT and DFHZC4947 on CSNE.

**User response:** Inform the system programmer. Investigate the reason why the attach request failed. See messages DFHAC2057 on CSMT and DFHZC4947 on CSNE issued by the remote system for more diagnostic information.

**Destination:** Terminal End User

**Modules:** DFHACP

---

DFHAC2057  *date time applid* While performing an attach for node *netname* a security violation was detected.

**Explanation:** A request to attach a task has been received across an APPC link. However, the FMH attach parameters do not conform to the APPC protocol.

**System action:** The attach request is rejected and the session is unbound. An exception trace point (number 1737) for component TF is issued tracing the invalid attach header (FMH type 5). Message DFHZC4947 is issued. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User response:** Investigate the cause of the error which is in the remote system. Use the FMH5 in the exception trace to determine why the remote system sent an invalid attach request. See message DFHZC4947 on CSNE which contains sense information to help identify the reason for the failure.

If the remote system has an earlier release of CICS or CICS on another platform then you may need to set USEDFTUSER. See Attach Time Security and the USEDFTUSER option in the CICS RACF® Security Guide.

**Destination:** CSMT

**Modules:** DFHACP

**XMEOUT Parameters:** *date, time, applid, netname*

---

DFHAC2202  *time applid* Transaction *tranid* has lost contact with its coordinator system during syncpoint processing and has abended with code ASP0. All updates will be unilaterally committed. *condmsg*

**Explanation:** Transaction *tranid* has lost contact with its coordinator system during the critical period of syncpoint processing known as the 'indoubt window'. The transaction is abnormally terminated with abend code ASP0.

In accordance with the transaction definition (WAIT NO and ACTION COMMIT), all recoverable updates performed by the unit of work are unilaterally committed. Note that integrity of updates may be lost because the coordinator system may either commit or back out its changes.

If possible, a conditional message *condmsg* from the linked system is appended to this message.

**System action:** Message DFHAC2232 is sent to the master terminal operator (destination CSMT). Normal abend processing continues.

**User response:** None. In accordance with the transaction definition, all updates are unilaterally committed.

**Destination:** Terminal End User

**Modules:** DFHTFP
**DFHAC2203**

`time applid Transaction tranid has lost contact with its coordinator system during syncpoint processing and has abended with code ASPP. All updates will be unilaterally backed out. condmsg`

**Explanation:** Transaction `tranid` has lost contact with its coordinator system during the critical period of syncpoint processing known as the 'indoubt window'. The transaction is abnormally terminated with abend code ASPP.

In accordance with the transaction definition (WAIT NO and ACTION BACKOUT), all recoverable updates performed by the unit of work are unilaterally backed out. Note that integrity of updates may be lost because the coordinator system may either commit or back out its changes.

If possible, a conditional message `condmsg` from the linked system is appended to this message.

**System action:** Message DFHAC2233 is sent to the master terminal operator (destination CSMT). Normal abend processing continues.

**User response:** None. In accordance with the transaction definition, all updates are unilaterally backed out.

**Destination:** Terminal End User

**Modules:** DFHTFP

---

**DFHAC2204**

`time applid A commit failure has occurred during syncpoint processing for transaction tranid. condmsg`

**Explanation:** An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. Resources local to this CICS system, for example files, temporary storage, transient data, have been updated. A commit failure occurred during phase 2 of the syncpoint protocol for a local resource owner.

If possible, a conditional message `condmsg` from the linked system is appended to this message.

**System action:** Message DFHAC2234 is sent to the master terminal operator (destination CSMT). For an EXEC CICS SYNCPOINT, processing completes normally and processing continues with the next unit of work. For EXEC CICS RETURN, the transaction completes normally.

Resources affected by the commit failure remain locked and the unit of work is shunted.

**User response:** Refer to earlier messages output by the local resource owner to discover the cause of the commit failure.

**Destination:** Terminal End User

**Modules:** DFHTFP

---

**DFHAC2205**

`time applid A backout failure has occurred during syncpoint processing for transaction tranid. condmsg`

**Explanation:** An attempt to backout a unit of work has suffered a backout failure. For the local resource owner(s) that suffered the backout failure, the resources updated by the unit of work remain locked. All other resources are backed out.

If possible, a conditional message `condmsg` from the linked system is appended to this message.

**System action:** Message DFHAC2235 is sent to the master terminal operator (destination CSMT). For an EXEC CICS SYNCPOINT, processing completes normally and processing continues with the next unit of work. For EXEC CICS RETURN, the transaction completes normally.

Resources affected by the backout failure remain locked and the unit of work is shunted.

**User response:** Refer to earlier messages output by the local resource owner to discover the cause of the backout failure.

**Destination:** Terminal End User

**Modules:** DFHTFP

---

**DFHAC2206**

`time applid Transaction tranid failed with abend abcode. Updates to local recoverable resources backed out. condmsg`

**Explanation:** Transaction `tranid` is abnormally terminated with abend code `abcode`. Any changes to recoverable resources in the local system that have been performed by the current unit of work are backed out.

`abcode` is either a CICS transaction abend code or a user abend code generated by a CICS ABEND `ABCODE(abcode)` command. This command is issued either by a user program or by an IBM program (for example, a programming language library module).

If possible, a conditional message `condmsg` from the remote system will be appended to this message.

When this message is issued in the terminal owning region because a remote transaction has failed, there may be no recoverable resources to be backed out in the local system. In this case, the conditional message tells you whether or not resources in the remote system have been backed out.

**System action:** Message DFHAC2236 is sent to the master terminal operator (destination CSMT). Normal abend processing continues.

**User response:** Use the abend code, `abcode`, to diagnose the problem. In a transaction routing...
environment, the original cause of the failure is usually indicated in the conditional message. If the abend is issued by an IBM program product other than CICS, the code is documented in the library of that other product.

Resubmit the transaction after the cause of the original abend has been removed.

**Destination:** Terminal End User

**Modules:** DFHTFP

---

**DFHAC2215**  
`time applid` A CICS-generated syncpoint request has failed because a connected system has requested that the UOW be rolled back. Transaction `tranid` has been abnormally terminated with code ASPF. `condmsg`

**Explanation:** CICS has been unable to comply with an internally generated syncpoint request because a connected system has notified it that the unit of work must be rolled back. (This may also occur as a result of a session failure or a protocol error).

Transaction `tranid` is abnormally terminated with abend code ASPF. Any changes to recoverable resources that have been performed by the current unit of work are backed out.

If possible, a conditional message `condmsg` from the linked system is appended to this message.

**System action:** Message DFHAC2245 is sent to the master terminal operator (destination CSMT). Normal abend processing continues.

**User response:** Determine why the connected system sent the indication to roll back the unit of work.

Resubmit the transaction after the cause of the indication to roll back has been removed.

**Destination:** Terminal End User

**Modules:** DFHTFP

---

**DFHAC2216**  
`time applid` Transaction termination processing for transaction `tranid` has failed because a connected system has requested that the UOW be rolled back. `condmsg`

**Explanation:** A transaction has issued an EXEC CICS RETURN in backout required program state. The backout required program state is set when an application receives a backout request on a protected conversation.

Recoverable resources updated by the unit of work are backed out and locks released.

If possible, a conditional message `condmsg` from the linked system is appended to this message.

**System action:** Message DFHAC2246 is sent to the master terminal operator (destination CSMT).

**Destination:** Terminal End User

**Modules:** DFHTFP

---

**DFHAC2217**  
`time applid` Transaction `tranid` has requested rollback, but was using a type of processing for which rollback is not supported. The transaction has been abnormally terminated with code ASP8. `message`

**Explanation:** An application requested syncpoint rollback, but was using a type of processing that does not support rollback, for example LU6.1.

Transaction `tranid` is abnormally terminated with abend code ASP8. Any changes to recoverable resources that have been performed by the current unit of work will be backed out.

If possible, a conditional message `condmsg` from the linked system will be appended to this message.

**System action:** Message DFHAC2247 is sent to the master terminal operator (destination CSMT). Normal abend processing continues.

**User response:** Refer to the explanation of abend ASP8.

**Destination:** Terminal End User

**Modules:** DFHTFP

---

**DFHAC2218**  
`time applid` Transaction `tranid` has failed with abend ASP7 following the failure of a local resource owner in the prepare phase of syncpoint. Updates will be backed out. `condmsg`

**Explanation:** An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. Resources local to this CICS system, for example files, temporary storage, or transient data, have been updated, and so the local resource owners have been sent a syncpoint request. A local resource owner has replied ‘No’ to a request to ‘Prepare’, during the two phase syncpoint protocol.

Transaction `tranid` is abnormally terminated with abend code ASP7. Any changes to recoverable resources that
have been performed by the current unit of work are backed out.

If possible, a conditional message condmsg from the linked system is appended to this message.

System action: Message DFHAC2248 is sent to the master terminal operator (destination CSMT). Normal abend processing continues.

User response: Refer to the explanation of abend ASP7.

Destination: Terminal End User

Modules: DFHTFP

---

DFHAC2219  

time applid Transaction tranid has failed with abend ASP7 following the failure of a remote system in the prepare phase of syncpoint. Updates will be backed out. condmsg

Explanation: An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. Resources remote to this CICS system, for example files, temporary storage, transient data on remote CICS systems, or database managers communicating via the RMI, have been updated, and so the remote resource owners have been sent a syncpoint request. A remote resource owner has replied 'No' to a request to 'Prepare', during the two phase syncpoint protocol.

Transaction tranid is abnormally terminated with abend code ASP7. Any changes to recoverable resources that have been performed by the current unit of work are backed out.

If possible, a conditional message condmsg from the linked system is appended to this message.

System action: Message DFHAC2249 is sent to the master terminal operator (destination CSMT). Normal abend processing continues.

User response: Refer to the explanation of abend ASP7.

Destination: Terminal End User

Modules: DFHTFP

---

DFHAC2220  

time applid The coordinator system has indicated that the current unit of work is to be backed out. Transaction tranid has been abnormally terminated with abend ASP3. condmsg

Explanation: An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. The coordinator of the syncpoint is not this CICS system but is remote. During the syncpoint protocol the remote coordinator has decided that the unit of work cannot be committed and must be backed out.

Transaction tranid is abnormally terminated with abend code ASP3. Any changes to recoverable resources that have been performed by the current unit of work are backed out.

If possible, a conditional message condmsg from the linked system is appended to this message.

System action: Message DFHAC2250 is sent to the master terminal operator (destination CSMT). Normal abend processing continues.

User response: Refer to the remote coordinator system to discover the reason why the unit of work was backed out.

Destination: Terminal End User

Modules: DFHTFP

---

DFHAC2221  

time applid Transaction tranid has failed with abend ASPQ. Syncpoint commit processing has failed while communicating with a remote system. condmsg

Explanation: An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. Resources remote to this CICS system such as files, temporary storage, and transient data on remote CICS systems have been updated, and so the remote resource owners have sent a syncpoint request. A failure occurred during phase 2 of syncpoint protocol.

Transaction tranid has abnormally terminated with abend code ASPQ. Recoverable resources have successfully been committed but a subsequent error occurred.

If possible, a conditional message condmsg from the linked system is appended to this message.

System action: Message DFHAC2251 is sent to the master terminal operator (destination CSMT). Normal abend processing continues.

User response: Refer to the associated messages already issued by the communication components of CICS to determine the cause of the intersystem session problem.

Destination: Terminal End User

Modules: DFHTFP

---

DFHAC2222  

time applid Transaction tranid has lost contact with its coordinator system during syncpoint processing. No updates have been performed by this system; it has abended with code ASPR. condmsg

Explanation: An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. The coordinator of the syncpoint
is not this CICS system but is remote.

Transaction tranid has lost contact with its coordinator system during the critical period of syncpoint processing known as the 'indoubt window'. However no recoverable resources have been updated by this system, so there is no data integrity problem.

Transaction tranid is abnormally terminated with abend code ASPR.

If possible, a conditional message condmsg from the linked system is appended to this message.

System action: Message DFHAC2252 is sent to the master terminal operator (destination CSMT). Normal abend processing continues.

User response: Refer to messages on the remote system to determine if the remote resources were backed out or committed.

Destination: Terminal End User

Modules: DFHTFP

DFHAC223  

Explanation: An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. The coordinator of the syncpoint is not this CICS system but is remote.

Transaction tranid has lost contact with its coordinator system during the critical period of syncpoint processing known as the 'indoubt window'.

In accordance with the transaction definition (WAIT YES), the unit of work is not completed. It is allowed to wait for resynchronization with the coordinator system. The transaction is abnormally terminated with abend code ASP1. The unit of work is shunted to await the return of the coordinator system.

Exci Job = exci_id is added when tranid is a server transaction running on behalf of a non CICS job using the external CICS interface (EXCI). The exci_id consists of 'jobname.stepname.procname - MVSid' and identifies the EXCI client job. The stepname and procname may be omitted. The MVSid identifies the MVS system on which the EXCI client job is running. If MRO/XCF is being used, this can be different from the MVS system on which this CICS system is running. The MVSid is the SMF system identification (SID), hence the MVSid will be omitted if SMF is not active. Terminal termid represents the connection between the EXCI client and CICS rather than a real terminal.

In the case of an MRO or an ISC APPC (parallel sessions) connected system, termid is a terminal identifier (transaction routing) or a session identifier, sysid is the identifier of the linked CICS system. The display ends with the termination message condmsg issued by the linked system.

System action: If possible, message DFHAC2201 is sent to the terminal user. Normal abend processing continues.

User response: Refer to explanation of abend code ASP1.

Destination: CSMT

DFHAC2230  

Explanation: Transaction tranid could not be executed because an I/O error occurred in the start-up program on terminal termid.

System action: Transaction tranid is not executed.

User response: Correct the cause of the I/O error, which is probably due to the terminal not being powered on.

Destination: CSMT

Modules: DFHACP

XMEOUT Parameters: date, time,applid, tranid, termid, message

DFHAC2231  

Explanation: An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. The coordinator of the syncpoint is not this CICS system but is remote.

Transaction tranid has lost contact with its coordinator system during the critical period of syncpoint processing known as the 'indoubt window'.

In accordance with the transaction definition (WAIT YES), the unit of work is not completed. It is allowed to wait for resynchronization with the coordinator system. The transaction is abnormally terminated with abend code ASP1. The unit of work is shunted to await the return of the coordinator system.

Exci Job = exci_id is added when tranid is a server transaction running on behalf of a non CICS job using the external CICS interface (EXCI). The exci_id consists of 'jobname.stepname.procname - MVSid' and identifies the EXCI client job. The stepname and procname may be omitted. The MVSid identifies the MVS system on which the EXCI client job is running. If MRO/XCF is being used, this can be different from the MVS system on which this CICS system is running. The MVSid is the SMF system identification (SID), hence the MVSid will be omitted if SMF is not active. Terminal termid represents the connection between the EXCI client and CICS rather than a real terminal.

In the case of an MRO or an ISC APPC (parallel sessions) connected system, termid is a terminal identifier (transaction routing) or a session identifier, sysid is the identifier of the linked CICS system. The display ends with the termination message condmsg issued by the linked system.

System action: If possible, message DFHAC2201 is sent to the terminal user. Normal abend processing continues.

User response: Refer to explanation of abend code ASP1.

Destination: CSMT
Explanation:  Transaction *tranid* has lost contact with its coordinator system during the critical period of syncpoint processing known as the ‘indoubt window’. The transaction is abnormally terminated with abend code ASPO.

In accordance with the transaction definition (WAIT NO and ACTION COMMIT), all recoverable updates performed by the unit of work are unilaterally committed. Note that integrity of updates may be lost since the coordinator system may either commit or back out its changes.

Exci Job = *exci_id* is added when *tranid* is a server transaction running on behalf of a non CICS job using the external CICS interface (EXCI). The *exci_id* consists of *jobname.stepname.procname - MVSid* and identifies the EXCI client job. The stepname and proname may be omitted. The MVSid identifies the MVS system on which the EXCI client job is running. If MRO/XCF is being used, this can be different from the MVS system on which this CICS system is running. The MVSid is the SMF system identification (SID), hence the MVSid will be omitted if SMF is not active. Terminal *termid* represents the connection between the EXCI client and CICS rather than a real terminal.

In the case of an MRO or an ISC APPC (parallel sessions) connected system, *termid* is a terminal identifier (transaction routing) or a session identifier, *sysid* is the identifier of the linked CICS system. The display ends with the termination message *condmsg* issued by the linked system.

System action:  If possible, message DFHAC2203 is sent to the terminal user. Normal abend processing continues.

User response:  None. In accordance with the transaction definition, all updates are unilaterally backed out.

Destination:  CSMT

Modules:  DFHTFP

DFHAC2233  *date* *applid* Transaction *tranid* running program *program name* *termid* has lost contact with its coordinator system during syncpoint and has abended with code ASPO. All updates will be unilaterally backed out. *EXCI job = *exci_id*, *condmsg*

Explanation:  Transaction *tranid* has lost contact with its coordinator system during the critical period of syncpoint processing known as the ‘indoubt window’. The transaction is abnormally terminated with abend code ASPO.

In accordance with the transaction definition (WAIT NO and ACTION BACKOUT), all recoverable updates performed by the unit of work are unilaterally backed out. Note that integrity of updates may be lost since the coordinator system may either commit or back out its changes.

Exci Job = *exci_id* is added when *tranid* is a server transaction running on behalf of a non CICS job using the external CICS interface (EXCI). The *exci_id* consists of *jobname.stepname.procname - MVSid* and identifies the EXCI client job. The stepname and proname may be omitted. The MVSid identifies the MVS system on which the EXCI client job is running. If MRO/XCF is being used, this can be different from the MVS system on which this CICS system is running. The MVSid is the SMF system identification (SID), hence the MVSid will be omitted if SMF is not active. Terminal *termid* represents the connection between the EXCI client and CICS rather than a real terminal.

In the case of an MRO or an ISC APPC (parallel sessions) connected system, *termid* is a terminal identifier (transaction routing) or a session identifier, and *sysid* is the identifier of the linked CICS system. The display ends with the termination message *condmsg* issued by the linked system.

System action:  If possible, message DFHAC2203 is sent to the terminal user. Normal abend processing continues.

User response:  None. In accordance with the transaction definition, all updates are unilaterally backed out.

Destination:  CSMT

Modules:  DFHTFP

DFHAC2234  *date* *applid* A commit failure has occurred during syncpoint processing for transaction *tranid*, terminal *termid*. The transaction will be allowed to complete normally. *EXCI job = *exci_id*, *condmsg*
Exci Job =exci_id is added when tranid is a server transaction running on behalf of a non CICS job using the external CICS interface (EXCI). The exci_id consists of 'jobname.stepname.procname - MVSid' and identifies the EXCI client job. The stepname and proname may be omitted. The MVSid identifies the MVS system on which the EXCI client job is running. If MRO/XCF is being used, this can be different from the MVS system on which this CICS system is running. The MVSid is the SMF system identification (SID), hence the MVSid will be omitted if SMF is not active. Terminal termid represents the connection between the EXCI client and CICS rather than a real terminal.

termid is a terminal identifier (transaction routing) or a session identifier.

System action: If possible, message DFHAC2204 is sent to the terminal user. For an EXEC CICS SYNCPOINT, processing completes normally and processing continues with the next unit of work. For EXEC CICS RETURN, the transaction completes normally.

Resources affected by the backout failure remain locked and the unit of work is shunted.

User response: Refer to earlier messages issued by the local resource owner to determine the cause of the backout failure.

Destination: CSMT

Modules: DFHTFP

XMEOUT Parameters: date, time, applid, tranid, termid, {1=. EXCI job = }, exci_id, condmsg

DFHAC2235  date time applid A backout failure has occurred during syncpoint processing for transaction tranid, terminal termid. The transaction will be allowed to complete normally \{ EXCI job = \}exci_id, condmsg

Explanation: An attempt to back out a unit of work has suffered a backout failure. For the local resource owner(s) that suffered the backout failure, the resources updated by the unit of work remain locked. All other resources are backed out.

Exci Job =exci_id is added when tranid is a server transaction running on behalf of a non CICS job using the external CICS interface (EXCI). The exci_id consists of 'jobname.stepname.procname - MVSid' and identifies the EXCI client job. The stepname and proname may be omitted. The MVSid identifies the MVS system on which the EXCI client job is running. If MRO/XCF is being used, this can be different from the MVS system on which this CICS system is running. The MVSid is the SMF system identification (SID), hence the MVSid will be omitted if SMF is not active. Terminal termid represents the connection between the EXCI client and CICS rather than a real terminal.

termid is a terminal identifier (transaction routing) or a session identifier, and
sysid is the identifier of the linked CICS system. The display ends with the termination message condmsg issued by the linked system.

When this message is issued in the Terminal Owning region because a remote transaction has failed, there may be no recoverable resources to be backed out in the local system. In this case, the conditional message will tell you whether or not resources in the remote system have been backed out.

Program progsname will be unknown when the message is issued in a Terminal Owning region.

System action: If possible, message DFHAC2206 is sent to the terminal user. Normal abend processing continues.

User response: See the description of the abend code abcode for guidance. In a transaction routing environment, the original cause of the failure is usually indicated in the conditional message. If abcode is not a CICS abend, it is a user code, in which case you should consult the programmer responsible for this area.

XMEOUT Parameters: date, time, applid, tranid,
DFHAC2250 date time applid The coordinator system has indicated that the current unit of work is to be backed out. Transaction tranid running program program name term termid has been abnormally terminated with abend ASP3. EXCI job = exci_id, condmsg

Explanation: An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. The local unit of work is part of a larger unit of work, and is not the coordinator in the syncpoint. The coordinator is either in a remote system or is another unit of work in the local system (if the transaction is the result of a RUN SYNCHRONOUS command). During the syncpoint protocol the coordinator has decided that the unit of work cannot be committed and must be backed out.

Transaction tranid is abnormally terminated with abend code ASP3 in program prograss. Any changes to recoverable resources that have been performed by the current unit of work are backed out.

Exci Job =exci_id is added when tranid is a server transaction running on behalf of a non CICS job using the external CICS interface (EXCI). The exci_id consists of jobname.stepname.procname - MVSid and identifies the EXCI client job. The stepname and proname may be omitted. The MVSid identifies the MVS system on which the EXCI client job is running. If MRO/XCF is being used this, can be different from the MVS system on which this CICS system is running. The MVSid is the SMF system identification (SID), hence the MVSid will be omitted if SMF is not active. Terminal termid represents the connection between the EXCI client and CICS rather than a real terminal.

In the case of an MRO or an ISC APPC (parallel sessions) connected system termid is a terminal identifier (transaction routing) or a session identifier, and sysid is the identifier of the linked CICS system. The display ends with the termination message condmsg issued by the linked system.

System action: If possible, message DFHAC2220 is sent to the terminal user. Normal abend processing continues.

User response: Refer to the coordinator system to determine the reason why the unit of work was backed out.

Destination: CSMT

Modules: DFHTFP

XMEOUT Parameters: date, time,applid, tranid, program name,termid, {1=. EXCI job = }, exci_id, condmsg
**DFHAC2251** date time applid Transaction tranid running program program name term termid has failed with abend ASPQ. Syncpoint commit processing has failed while communicating with a remote system\{, EXCI job = }exci_id. condmsg

**Explanation:** An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. Resources remote to this CICS system such as files, temporary storage, and transient data on remote CICS systems have been updated, and so the remote resource owners have been sent a syncpoint request. A failure occurred during phase 2 of syncpoint protocol.

Transaction tranid is abnormally terminated with abend code ASPQ in program programe. Recoverable resources have successfully been committed but a subsequent error occurred.

**EXCI job =**exci_id is added when tranid is a server transaction running on behalf of a non CICS job using the external CICS interface (EXCI). The **exci_id** consists of **jobname.stepname.procname - MVSid** and identifies the EXCI client job. The stepname and proclname may be omitted. **MVSid** identifies the MVS system on which the EXCI client job is running. If MRO/XCF is being used, this can be different from the MVS system on which this CICS system is running. The MVSid is the SMF system identification (SID), hence the MVSid will be omitted if SMF is not active. Terminal **termid** represents the connection between the EXCI client and CICS; not a real terminal.

In the case of an MRO or an ISC APPC (parallel sessions) connected system, **termid** is a terminal identifier (transaction routing) or a session identifier, and **sysid** is the identifier of the linked CICS system, and the display ends with the termination message **condmsg** issued by the linked system.

**System action:** If possible, message DFHAC2221 is sent to the terminal user. Normal abend processing continues.

**User response:** Refer to associated messages already issued by the communication components of CICS to determine the cause of the intersystem session problem.

**Destination:** CSMT

**Modules:** DFHTFP

**XMEOUT Parameters:** date, time, applid, tranid, program name, termid, \{1=. EXCI job = \}, exci_id, condmsg

**DFHAC2252** date time applid Transaction tranid in program program name term termid has lost contact with its coordinator system during syncpoint processing. No updates have been performed by this system; it has abended with code ASPR\{, EXCI job = }exci_id. condmsg

**Explanation:** An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. The coordinator of the syncpoint is not this CICS system but is remote.

Transaction tranid has lost contact with its coordinator system during the critical period of syncpoint processing known as the 'indoubt window'. However no recoverable resources have been updated by this system and so there is no data integrity problem.

**EXCI Job =** exci_id is added when tranid is a server transaction running on behalf of a non CICS job using the external CICS interface (EXCI). The **exci_id** consists of \"jobname.stepname.procname - MVSid\" and identifies the EXCI client job. The stepname and proclname may be omitted. The MVSid identifies the MVS system on which the EXCI client job is running. If MRO/XCF is being used, this can be different from the MVS system on which this CICS system is running. The MVSid is the SMF system identification (SID), hence the MVSid will be omitted if SMF is not active. Terminal **termid** represents the connection between the EXCI client and CICS rather than a real terminal.

In the case of an MRO or an ISC APPC (parallel sessions) connected system, **termid** is a terminal identifier (transaction routing) or a session identifier, and **sysid** is the identifier of the linked CICS system. The display ends with the termination message **condmsg** issued by the linked system.

**System action:** If possible, message DFHAC2222 is sent to the terminal user. Normal abend processing continues.

**User response:** Refer to messages on the remote system to determine if the remote resources were backed out or committed.

**Destination:** CSMT

**Modules:** DFHTFP

**XMEOUT Parameters:** date, time, applid, tranid, program name, termid, \{1=. EXCI job = \}, exci_id, condmsg

**DFHAC2253** date time applid Transaction tranid running program program name term termid has failed with abend ASP2 due to the links to the remote systems being in an invalid state. Updates will be backed out\{, EXCI job = }exci_id. condmsg

**Explanation:** An application has requested syncpoint,
either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. Resources remote to this CICS system, for example files, temporary storage, transient data on remote CICS systems, or database managers communicating via the RMI, have been updated, and so the remote resource owners would be sent a syncpoint request. The links to the remote resource owners are in an invalid state to be sent the PREPARE request of the two phase syncpoint protocol.

Transaction tranid is abnormally terminated with abend code ASP2 in program progname. Any changes to recoverable resources that have been performed by the current unit of work are backed out.

Exci job =exci_id is added when tranid is a server transaction running on behalf of a non CICS job using the external CICS interface (EXCI). The exci_id consists of jobname.stepname.procname - MVSid and identifies the EXCI client job. The stepname and proname may be omitted. The MVSid identifies the MVS system on which the EXCI client job is running. If MRO/XCF is being used, this can be different from the MVS system on which this CICS system is running. The MVSid is the SMF system identification (SID), hence the MVSid will be omitted if SMF is not active. Terminal termid represents the connection between the EXCI client and CICS rather than a real terminal.

In the case of an MRO or an ISC APPC (parallel sessions) connected system, termid is a terminal identifier (transaction routing) or a session identifier and sysid is the identifier of the linked CICS system. The display ends with the termination message condmsg issued by the linked system.

System action: If possible, message DFHAC2223 is sent to the terminal user. Normal abend processing continues.

User response: See the explanation of abend code ASP2 for guidance.

Modules:  DFHACP

XMEOUT Parameters:  date, time,applid, tranid, primary abcode, program name, termid
specifically suppressed dumps in the dump table.

**Either** this is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

**Or** CICS will continue unless you have specified in the dump table that CICS should terminate. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User response:** Notify the system programmer.

Look up the MVS code `aaa`, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual.

If the `modname` insert contains the value `????`, CICS was unable to determine which module has abnormally terminated. In this case, examine the system dump to determine which area of code has caused the program check.

The user should examine other messages to determine what the module which issued this message was doing at the time the abend occurred. From these messages they can deduce which product has produced the abend code `bbbb`. If `bbbb` is identified as a CICS code, it may be either alphameric or numeric.

- If the CICS code is alphameric (for example AKEA), it is a CICS transaction abend code.
- If the CICS code is numeric (for example 1310), it refers to a CICS message (DFHTS1310 in our example).

If the user abend code is from another product (for example, IMS), refer to the appropriate messages and codes manual to determine the cause of the abend.

The entries in the appropriate manuals will give the user guidance regarding the nature of the error, and may also give some guidance concerning the appropriate user response.

**Note:** The program check may have occurred in a user program. If this is the case, the program check is usually followed by an ASRA or an ASRB transaction abend and a transaction dump.

If you want to suppress system dumps that precede ASRA and ASRB abends, you must specify this on an entry in the dump table, using either CEMT or an EXEC CICS command. Further guidance on suppressing system dumps can be found in the [CICS System Definition Guide](#).

You may need further assistance from IBM to resolve this problem. See Part 4 of the [CICS Problem Determination Guide](#) for guidance on how to proceed.

**Destination:** Console

**Modules:** DFHADxx

---

**DFHAD0201 Specified DJAR could not be found.**

**Explanation:** A CICS DJAR resource with the specified name could not be found.

**DFHAD0204 Specified DJAR is in the PENDINIT state. Please wait and retry.**

**Explanation:** The specified DJAR resource is in the PENDINIT state and cannot be used.

**System action:** The transaction continues.

**User response:** Enter the name of an INSERVICE DJAR installed in the local CICS region, or retry your request.

**Destination:** Terminal End User

**Modules:** DFHADDRM
DFHAD0205 Specified DJAR is in the
PENDRESOLVE state. Please wait and
retry.
Explanation: The specified DJAR resource is in the
PENDRESOLVE state and cannot be used.
System action: The transaction continues.
User response: Enter the name of an INSERVICE
DJAR installed in the local CICS region, or retry your
request.
Destination: Terminal End User
Modules: DFHADDRM

DFHAD0206 Specified DJAR is in the RESOLVING
state. Please wait and retry.
Explanation: The specified DJAR resource is in the
RESOLVING state and cannot be used.
System action: The transaction continues.
User response: Enter the name of an INSERVICE
DJAR installed in the local CICS region, or retry your
request.
Destination: Terminal End User
Modules: DFHADDRM

DFHAD0207 Specified DJAR is in the UNRESOLVED
state and cannot be used.
Explanation: The specified DJAR resource is in the
UNRESOLVED state and cannot be used.
System action: The transaction continues.
User response: Enter the name of an INSERVICE
DJAR installed in the local CICS region.
Destination: Terminal End User
Modules: DFHADDRM

DFHAD0208 Specified DJAR is in the UNUSABLE
state and cannot be used.
Explanation: The specified DJAR resource is in the
UNUSABLE state and cannot be used.
System action: The transaction continues.
User response: Enter the name of an INSERVICE
DJAR installed in the local CICS region.
Destination: Terminal End User
Modules: DFHADDRM

DFHAD0209 Fatal error occurred whilst reading
shelf copy of specified DJAR.
Explanation: An unknown error occurred when
DFHADJR attempted to read the shelf copy of the JAR
file for the specified DJAR resource. As a result of this
error the specified DJAR resource cannot be used by
CREA/CREC.
System action: The transaction continues.
User response: Enter the name of an INSERVICE
DJAR installed in the local CICS region, or retry your
request.
Destination: Terminal End User
Modules: DFHADDRM

DFHAD0210 Specified DJAR could not be found on
the shelf.
Explanation: DFHADJR could not find the shelf copy
of the JAR file for the specified DJAR resource. As a
result of this error the specified DJAR resource cannot
be used by CREA/CREC.
System action: The transaction continues.
User response: Enter the name of an INSERVICE
DJAR installed in the local CICS region, or retry your
request.
Destination: Terminal End User
Modules: DFHADDRM

DFHAD0211 Shelf file for specified DJAR was not a
valid JAR file.
Explanation: DFHADJR could not read the shelf copy
of the JAR file for the specified DJAR resource, since it
is not a valid JAR file. As a result of this error the
specified DJAR resource cannot be used by
CREA/CREC.
System action: The transaction continues.
User response: Check that the JAR file for the
specified DJAR is a valid JAR file and that it contains a
valid deployment descriptor. Alternatively enter the
name of an INSERVICE DJAR installed in the local
CICS region.
Destination: Terminal End User
Modules: DFHADDRM

DFHAD0212 No JNDI name was supplied for bean
lookup.
Explanation: DFHADJR could not find the name of
JNDI server to use for performing bean lookups. As a
result of this error the specified DJAR resource cannot
be used by CREA/CREC.
System action: The transaction continues.
User response: Check that a JNDI naming provider is supplied in the JVM system properties file. Retry your request or enter another DJAR name.

Destination: Terminal End User

Modules: DFHADDRM

DFHAD0213 TSQueue full error when retrieving information from specified DJAR.

Explanation: DFHADJR could not return information about the contents of the JAR file for the specified DJAR resource since the TS queue used to pass the information became full. As a result of this error the specified DJAR resource cannot be used by CREA/CREC.

System action: The transaction continues.

User response: Modify the deployment descriptor for the specified DJAR so that it contains references to one or more JAR files.

Destination: Terminal End User

Modules: DFHADDRM

DFHAD0214 The specified DJAR contains no session beans.

Explanation: DFHADJR could not find any session beans in the deployment descriptor of the JAR file related to the specified DJAR resource. As a result of this error the DJAR resource cannot be used by CREA/CREC.

System action: The transaction continues.

User response: Modify the deployment descriptor for the specified DJAR so that it contains references to one or more session beans and reinstall it into CICS.

Destination: Terminal End User

Modules: DFHADDRM

DFHAD0215 The specified DJAR contains session beans with invalid lengths.

Explanation: DFHADJR found one or more session beans listed in the deployment descriptor of the JAR file related to the specified DJAR resource that had names exceeding the 240 character limit. As a result of this error the DJAR resource cannot be used by CREA/CREC.

System action: The transaction continues.

User response: Modify the names of the session beans listed in the deployment descriptor so that no name exceeds the 240 character limit and reinstall the JAR file into CICS.

Destination: Terminal End User

Modules: DFHADDRM

DFHAD0216 An error occurred when reading the DJAR.

Explanation: An error occurred when DFHADJR attempted to generate the IDL names for methods listed in the JAR file related to the specified DJAR resource. An attempt to use the Java classloader failed as classes that were needed could not be found on the classpath. As a result the DJAR resource cannot be used by CREA/CREC.

System action: The transaction continues.

User response: Ensure that all classes required by the beans in the JAR file related to the specified DJAR resource are available on the classpath.

Destination: Terminal End User

Modules: DFHADDRM

DFHAD0231 Press Enter to confirm the change of DJAR or another key to revert.

Explanation: The name of the DJAR on the transaction ID association screen has been changed, indicating that the user wishes to work with a different DJAR.

System action: The transaction waits for the user to press the Enter key to confirm that they wish to work with a different DJAR.

User response: Press Enter to work with a different DJAR, or any other key to continue working with the current DJAR. If the DJAR name is changed again whilst this message is displayed, then the DJAR name will revert back to the original DJAR name.

Destination: Terminal End User

Modules: DFHADDRM

DFHAD0232 Error generating REQUESTMODELs - IDL errors for indicated methods.

Explanation: One or more IDL strings generated for the operation field of a REQUESTMODEL are longer than the 255 character maximum. The methods with the IDL mangled names that are causing the problems are highlighted with an asterisk (*) character.

System action: The transaction continues.

User response: Alter the transaction IDs assigned to the problematic methods such that those methods do not require their own REQUESTMODELs, but can instead be handled by a more generic REQUESTMODEL. An example of a more generic REQUESTMODEL is the REQUESTMODEL that is created for all methods on a given bean, and would therefore have ”*” in the operation field.

Destination: Terminal End User
DFHAD0261 RequestModel rmName was successfully created.

Explanation: The REQUESTMODEL was successfully created, being installed into CICS and/or written to the CSD as specified.

System action: The transaction continues.

User response: None.

Destination: Terminal End User

Modules: DFHADDRM

DFHAD0262 REQUESTMODEL could not be created.

Explanation: The REQUESTMODEL could not be created for some unknown reason.

System action: The transaction continues.

User response: Skip the REQUESTMODEL or alter the name value and try again.

If the problem persists check the trace data sets for more information. You may need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Terminal End User

Modules: DFHADDRM

DFHAD0263 No action was selected. Please select an action.

Explanation: The REQUESTMODEL can be installed into CICS and/or defined to the CSD, but no action was selected.

System action: The transaction continues.

User response: Adjust the 'Define to CSD' and/or 'Install into CICS' fields by overtyping the 'N' with a 'Y'. Alternatively skip creating the REQUESTMODEL.

Destination: Terminal End User

Modules: DFHADDRM

DFHAD0264 REQUESTMODEL could not be written to the CSD.

Explanation: The specified REQUESTMODEL could not be written to the CSD for some unknown reason.

System action: The transaction continues.

User response: Ensure that the CSD is available for write access and that there are no locks held on the group that you are attempting to write to. You can then either skip the REQUESTMODEL, or alter the name and/or group value and try again.

If the problem persists check the trace data sets for more information. You may need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Terminal End User

Modules: DFHADDRM

DFHAD0265 REQUESTMODEL could not be installed.

Explanation: The specified REQUESTMODEL could not be installed into CICS for some unknown reason. If you have selected to define the REQUESTMODEL to the CSD, then this operation will not have been performed.

System action: The transaction continues.

User response: Skip the REQUESTMODEL or alter the name value and try again.

If the problem persists check the trace data sets for more information. You may need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Terminal End User

Modules: DFHADDRM

DFHAD0266 Please specify a valid CSD group name.

Explanation: The user attempted to write the REQUESTMODEL to the CSD, but did not provide a valid name for the group the REQUESTMODEL should be written into.

System action: The transaction continues.

User response: Enter a valid name for the CSD group into which this REQUESTMODEL is to be written, or deselect the option for writing it to the CSD.

Destination: Terminal End User

Modules: DFHADDRM

DFHAD0267 A duplicate REQUESTMODEL is already installed.

Explanation: A duplicate copy of the specified REQUESTMODEL has already been installed into CICS. Since the option for replacing duplicate REQUESTMODELS ('Replace Dups') was not selected, this REQUESTMODEL has not been installed. If you have selected to define the REQUESTMODEL to the CSD, then this operation will not have been performed.

System action: The transaction continues.

User response: Either select the option for replacing duplicate REQUESTMODELS, or press PF9 (as
DFHAD0268 A duplicate REQUESTMODEL already exists in the CSD.

Explanation: A duplicate copy of the specified REQUESTMODEL has already been written to the CSD. Since the option for replacing duplicate REQUESTMODELS ('Replace Dups') was not selected, this REQUESTMODEL has not been written to the CSD. If you have selected to install the REQUESTMODEL into CICS, then this operation will be backed out.

System action: The transaction continues.

User response: Either select the option for replacing duplicate REQUESTMODELS, or press PF9 (as prompted) to replace the duplicate for this REQUESTMODEL only. You can alternatively choose to skip the REQUESTMODEL or alter the name and/or group and retry your request.

Destination: Terminal End User

Modules: DFHADDRM

DFHAD0269 An error occurred whilst discarding a duplicate REQUESTMODEL.

Explanation: Whilst attempting to discard a REQUESTMODEL from CICS (as the result of a request to replace a duplicate REQUESTMODEL), an unknown error occurred. The REQUESTMODEL has not been installed into CICS. If you have selected to define the REQUESTMODEL to the CSD, then this operation will not have been performed.

System action: The transaction continues.

User response: Skip the REQUESTMODEL or alter the name and/or group value and try again.

If the problem persists check the trace data sets for more information. You may need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Terminal End User

Modules: DFHADDRM

DFHAD0270 An error occurred whilst replacing a duplicate REQUESTMODEL.

Explanation: Whilst attempting to replace an existing REQUESTMODEL an unknown error occurred. The REQUESTMODEL has not been installed into CICS.

System action: The transaction continues.

User response: Skip the REQUESTMODEL or alter the name and/or group value and try again.

If the problem persists check the trace data sets for more information. You may need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Terminal End User

Modules: DFHADDRM

DFHAD0271 Error trying to delete a duplicate REQUESTMODEL from the CSD.

Explanation: Whilst attempting to delete a REQUESTMODEL from the CSD (as the result of a request to replace a duplicate REQUESTMODEL), an unknown error occurred. The new REQUESTMODEL has not been written to the CSD. If you have selected to install the REQUESTMODEL into CICS, then this operation will be backed out.

System action: The transaction continues.

User response: Ensure that the CSD is available for write access and that there are no locks held on the group that you are attempting to delete from. You can then either skip the REQUESTMODEL, or alter the name and/or group value and try again.

If the problem persists check the trace data sets for more information. You may need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Terminal End User

Modules: DFHADDRM

DFHAD0272 No name could be generated for this REQUESTMODEL. Range exceeded.

Explanation: No name could be generated for this REQUESTMODEL since the name for the REQUESTMODEL created previously was the maximum size allowed for a REQUESTMODEL name and had reached the upper numerical limit.

System action: The transaction continues.

User response: Enter a new REQUESTMODEL name that has not already been used. You may attempt to create a REQUESTMODEL with the name shown, but if a REQUESTMODEL with the same name already exists this will not work. Alternatively you may choose to skip this REQUESTMODEL.

Destination: Terminal End User

Modules: DFHADDRM
DFHAD0273  Please specify a valid name for this REQUESTMODEL.

Explanation:  No valid name was given for the REQUESTMODEL. Without a valid name the REQUESTMODEL cannot be created.

System action:  The transaction continues.

**DFHAIxxx messages**

---

**DFHAI0203I  date time applid Terminal Model modelname has been discarded.**

Explanation:  This is an audit log message indicating that a record of the dynamic deletion of auto-install terminal model modelname has been made in the transient data destination using the DISCARD command.

System action:  The system continues normally.

User response:  None.

Destination:  CAIL

Modules:  DFHAITM

XMEOUT Parameters:  date, time, applid, modelname
DFHAMxxxx messages

DFHAM4800 I applid New group grpname created.
Explanation: A new group grpname has been created on the CSD.
System action: Processing continues.
User response: None.
Destination: Terminal End User
Modules: DFHAMP

DFHAM4801 I applid New list lstname created.
Explanation: A new list lstname has been created on the CSD.
System action: Processing continues.
User response: None.
Destination: Terminal End User
Modules: DFHAMP

DFHAM4802 E applid name is an invalid name.
Explanation: The name name in the command is invalid.
System action: Processing continues.
User response: Specify a valid name.
Destination: Console and Terminal End User
Modules: DFHAMP

DFHAM4803 E applid Install failed because an existing definition for file filename could not be deleted.
Explanation: An attempt was made to install file filename. File filename already exists and cannot be deleted. This condition can occur if an existing file definition in an FCT or on the CSD, was installed as enabled or open.
System action: The install fails.
User response: Rectify the problem and try the install again.
Destination: Console and Terminal End User
Modules: DFHAMP

DFHAM4804 E applid Invalid LIST name lstname.
Explanation: The GRPLIST parameter of the system initialization table (SIT) specifies a list name lstname that contains characters unacceptable to RDO.
System action: CICS issues the request ‘ENTER ALTERNATIVE NAME OR CANCEL’.
User response: Enter a valid list name or enter ‘CANCEL’, correct the GRPLIST parameter in the SIT, and reinitialize CICS.
Destination: Console and Terminal End User
Modules: DFHAMP

DFHAM4805 E applid Unable to perform operation: name is locked to APPLID applid, OPID opid to prevent updating.
Explanation: An attempt has been made to lock, or update, a group or a list that is currently locked to another user.
System action: Processing continues.
User response: Reenter the command when the group or the list is not locked.
Destination: Terminal End User
Modules: DFHAMP

DFHAM4806 E applid Group name grpname exists as a LIST name.
Explanation: The system initialization table (SIT) GRPLIST parameter names a list that contains an unusable group name grpname. CICS cannot find this group because no resources are defined as belonging to it, and also because a list of the same name already exists in the CSD.
Note: A group and a list cannot coexist with the same name.
System action: CICS issues the request ‘IS START-UP TO BE CONTINUED? REPLY GO OR CANCEL’.
If you reply ‘GO’, CICS is initialized with all the valid definitions in the list.
User response: If you do not require group grpname, enter ‘GO’.
If group grpname is essential, enter ‘CANCEL’, and reinitialize CICS with a different GRPLIST name as a SIT override parameter. Then use the CEDA transaction to review and correct the faulty list.
Destination: Console and Terminal End User

XMEOUT Parameters: applid, listname

XMEOUT Parameters: applid, filename

XMEOUT Parameters: applid, name
DFHAM4808 E applid Object already exists in this group.

Explanation: An attempt has been made to define an object in a group, but an object with the same name already exists.

System action: The definition on the CSD is presented to the user to overtype.

User response: Reenter the command with a different object name, or change the existing definition.

Destination: Terminal End User

DFHAM4809 E applid Date/time fields do not match (object updated by another user).

Explanation: The definition of an object on the CSD has been changed while the user was altering the definition.

System action: Processing continues.

User response: Reenter the command.

Destination: Terminal End User

DFHAM4810 E applid Object not found (deleted by another user).

Explanation: The definition of an object on the CSD has been deleted while the user was altering the definition.

System action: Processing continues.

User response: Determine why the definition has been deleted. Recreate and update the object if necessary.

Destination: Terminal End User

DFHAM4811 E applid name1 does not contain name2.

Explanation: The required object name2 could not be found on the CSD in group name1.

System action: Processing continues.

User response: Determine why the definition cannot be found.

Destination: Console and Terminal End User

DFHAM4814 E applid List name listname exists as a group name.

Explanation: The GRPLIST parameter of the system initialization table (SIT) specifies an invalid list name listname. CICS cannot find the list because a group of the same name already exists in the CSD.

Note: A group and a list cannot coexist with the same name.

System action: CICS issues the request ‘ENTER ALTERNATIVE NAME OR CANCEL’.

User response: Enter a valid list name, or enter ‘CANCEL’, correct the GRPLIST system initialization parameter and reinitialize CICS.

Destination: Console and Terminal End User

DFHAM4815 E applid Group grpname not found in this list.

Explanation: The AFTER/BETORE name entered in the command could not be found in this list. The definition could have been deleted while the user was viewing the outcome of an EXPAND command.

System action: Processing continues.

User response: Reenter the command with a group name that exists on this list.

Destination: Terminal End User

DFHAM4816 E applid Unable to install group grpname - group not found.

Explanation: The GRPLIST parameter of the system initialization table (SIT) names a list that contains an unusable group name grpname. CICS cannot find group grpname because no resources are defined as belonging to it.

System action: CICS issues the request ‘IS START-UP TO BE CONTINUED? REPLY GO OR CANCEL’.

If you reply ‘GO’, CICS is initialized with all the valid definitions in the list.

User response: If you do not require group grpname, enter ‘GO’.

If group grpname is essential, enter ‘CANCEL’, and reinitialize CICS with a different GRPLIST name as a SIT override parameter. Then use the CEDA transaction to review and correct the faulty list.

Destination: Console and Terminal End User

Modules: DFHAMP
XMEOUT Parameters: applid, grpname

DFHAM4819 E applid Group already exists in this list.
Explanation: The group already exists in the list.
System action: Processing continues.
User response: Determine why the group exists and reenter the command, perhaps with a different group name.
Destination: Terminal End User
Modules: DFHAMP

DFHAM4820 S applid Unable to perform request - CSD full.
Explanation: The CSD file is full.
System action: Processing continues.
User response: Reenter the command when more space is available.
Destination: Terminal End User
Modules: DFHAMP

DFHAM4821 S applid Unable to perform request - I/O error to CSD.
Explanation: An error occurred while the CSD file was being accessed during CICS initialization. This may be because the disk containing the CSD file was mounted incorrectly.
System action: CICS terminates.
User response: Retry the CICS initialization. If the problem persists, a hardware fault probably exists, and you should load a backup copy of the CSD.
Destination: Console and Terminal End User
Modules: DFHAMP
XMEOUT Parameter: applid

DFHAM4822 S applid Unable to perform request - DFHCSD data set is invalid.
Explanation: This message will occur during initialization when CICS tries to open the CSD file (DFHCSD) and finds that it has an incorrect maximum record size. The CSD file should be defined with a specific maximum record size as described in the CICS System Definition Guide. Also, if the CSD data set is dynamically allocated to a running CICS system with an incorrect record size, i.e. one that is too small, CICS will fail to open it and any changes made using CEDA will not be permitted.
System action: CICS terminates.
User response: Ensure that you have defined the

DFHAM4823 S applid Unable to perform request - DFHCSD not open.
Explanation: The CSD file (DFHCSD) is not open.
System action: Other processing continues.
User response: Ask the master terminal operator to open the file. The DFHCSD is defined in the bringup JCL and/or in the SIT.
Destination: Console and Terminal End User
Modules: DFHAMP
XMEOUT Parameter: applid

DFHAM4824 S applid Unable to perform request - Insufficient function in file definition for DFHCSD.
Explanation: During initialization, CICS has found a GRPLIST parameter in the SIT, but cannot access the CSD file because of an error in the file definition entry for DFHCSD.
The most likely cause of this error is an incorrectly coded CSDACC parameter in the SIT entry for DFHCSD.
System action: CICS terminates.
User response: Before the next CICS initialization, correct the error in the system initialization parameters for DFHCSD.
Destination: Console and Terminal End User
Modules: DFHAMP
XMEOUT Parameter: applid

DFHAM4825 S applid Unable to perform request - File Control has returned an INVREQ response.
Explanation: The file control file request handler (DFHFCFR) does not have sufficient function to support the CEDA command entered.
System action: The CEDA command is ignored.
User response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Destination: Console and Terminal End User
Modules: DFHAMP
DFHAM4826 S applid Unable to perform request - CSD corrupted or not initialized.

Explanation: During initialization, CICS finds a GRPLIST parameter in the SIT, but cannot access the CSD file because:
1. The CSD file has not been initialized, or
2. CSD initialization did not complete successfully, or
3. the CSD file has been corrupted.

System action: CICS terminates.

User response: If you have not used the CSD file before, initialize it using the offline utility, DFHCSDUP, and check the output listing from the utility for successful completion.

If you have used the CSD file before, it has probably been corrupted. In this case, load a backup copy of the CSD file and use it in place of the corrupted file.

Destination: Console and Terminal End User

Modules: DFHAMP

XMEOUT Parameter: applid

DFHAM4827 S applid Unable to perform request - DFHCSD could not be installed.

Explanation: During initialization, CICS finds a GRPLIST parameter in the SIT, but cannot access the CSD file because file control failed to install it.

System action: CICS terminates.

User response: Before the next CICS initialization, ensure that you have a SIT with the correct parameters for the definition of the DFHCSD file.

Assemble a new SIT as necessary.

Destination: Console and Terminal End User

Modules: DFHAMP

XMEOUT Parameter: applid

DFHAM4828 E applid Group grpname not found.

Explanation: The group name grpname in the command could not be found.

System action: The command is ignored.

User response: Retry the command with a group name that exists.

Destination: Console and Terminal End User

Modules: DFHAMP

XMEOUT Parameters: applid, grpname

DFHAM4829 S applid Storage violation. CSD primary control record not updated.

Explanation: The in-store version of the CSD primary record was corrupted.

System action: The version on the CSD was not updated and is not necessarily affected.

User response: None.

Destination: Console and Terminal End User

Modules: DFHAMP

XMEOUT Parameter: applid

DFHAM4830 E applid restype resname already exists in the target group.

Explanation: The COPY operation could not be performed, as a duplicate has been found in the target group.

System action: The COPY command is ignored.

User response: Reenter the command with the MERGE or the REPLACE option.

Destination: Terminal End User

Modules: DFHAMP

DFHAM4831 E applid The new name name is longer than the four characters allowed for restype names.

Explanation: The specified name name is invalid because it is longer than four characters.

System action: The command is ignored.

User response: Enter a valid name.

Destination: Terminal End User

Modules: DFHAMP

DFHAM4832 E applid Unable to open TDQUEUE tdqname because the DFHINTRA data set is not open.

Explanation: An attempt to install the transient data queue tdqname on the CICS system has been rejected because the DFHINTRA data set is not open.

System action: Processing continues. The definition is not installed.

User response: It is not possible to install intrapartition definitions on a system that does not have a DFHINTRA data set defined and opened. If DFHINTRA has been defined, it may have failed to open during initialization. It is necessary to repair the data set and restart the system in order to open it.

Destination: Console and Terminal End User

Modules: DFHAMP
XMEOUT Parameters: applid, tdqname

DFHAM4833 E applid A security error has occurred while attempting to install TDQUEUE tdqname. The definition has not been installed.

Explanation: An attempt to install the transient data queue tdqname on the CICS system has been rejected because of an error encountered while performing a security check for the userid included within the definition.

System action: Processing continues. The definition is not installed.

User response: Remove one of the entries from the macro definition or RDO group so that the failure does not recur on a subsequent cold or initial start.

Destination: Console and Terminal End User

Modules: DFHAMTD

DFHAM4835 E applid Install of TDQUEUE tdqname failed because the queue has already been defined to the system, and initialization is still in progress.

Explanation: An attempt to install the transient data queue tdqname on the CICS system has failed because the queue has already been defined to the system and initialization has not completed.

It is not possible to replace a TD resource definition while CICS is still initializing. This problem only occurs during a cold or initial start of the system where both DCT macro and RDO definitions are being used, or where more than one group is being installed as part of GRPLIST processing.

System action: Processing continues. The definition is not installed.

User response: Refer to the associated messages issued by the security manager for further guidance. Reinstall the definition once the error has been corrected.

Destination: Console and Terminal End User

Modules: DFHAMTD

DFHAM4836 E applid Install of DB2CONN db2conn-name failed because a DB2CONN is already installed and in use.

Explanation: An attempt to install the DB2CONN db2conn-name on the CICs system has failed because there is an existing DB2CONN installed and it is in use by the CICS-DB2 adapter.

System action: Processing continues. The definition is not installed.

User response: Only one DB2CONN can be installed on the CICS system at a time. The install of a second DB2CONN implies the discarding of the first DB2CONN and all its associated DB2ENTRYs and DB2TRANs.

A DB2CONN definition can be replaced or discarded only when it is not in use by the CICS-DB2 adapter. Ensure that the CICS-DB2 interface has been stopped before trying to install a DB2CONN definition.

Destination: Console and Terminal End User

Modules: DFHAMTD

DFHAM4837 E applid Install of { DB2ENTRY | DB2TRAN } name failed because a DB2CONN is not installed.

Explanation: An attempt to install the DB2ENTRY or DB2TRAN name on the CICS system failed because there is no DB2CONN installed. DB2TRANs and DB2ENTRYs can be installed only after a DB2CONN has been installed.

System action: Processing continues. The definition is not installed.

User response: Install a DB2CONN definition and then retry the install of the DB2ENTRY or DB2TRAN.

Destination: Console and Terminal End User

Modules: DFHAMTD
DFHAM4838 E applid Install of DB2ENTRY

db2entry-name failed because an existing definition could not be deleted. The existing definition is not disabled.

Explanation: An attempt to install the DB2ENTRY db2entry-name on the CICS system has failed because there is an existing DB2ENTRY of the same name which is not in a disabled state.

System action: Processing continues. The definition is not installed.

User response: Existing DB2ENTRY definitions can be replaced only when the DB2ENTRY is in a disabled state. Issue a command to disable the DB2ENTRY and then retry the install.

Destination: Console and Terminal End User

Modules: DFHAMP

XMEOUT Parameters: applid, db2entry-name

DFHAM4839 E applid List listname not found.

Explanation: The system initialization table (SIT) used for CICS initialization contains a GRPLIST parameter, but CICS cannot find the list listname in the CSD file.

System action: CICS issues the request 'ENTER ALTERNATIVE NAME OR CANCEL'.

User response: Enter a valid list name.

If no suitable user-defined list exists, you can initialize a minimum-function system with GRPLIST=DFHLIST, then use the CEDA transaction to review and correct the faulty list, to install the required group, and to rebuild a suitable list. Finally, cancel CICS, correct the GRPLIST parameter in the SIT, and reinitialize CICS.

Destination: Console and Terminal End User

Modules: DFHAMP

XMEOUT Parameters: applid, listname

DFHAM4840 W applid Group grpname not appended - group already exists in target list.

Explanation: The group grpname already exists in the target list.

System action: The group definition is not appended.

User response: None.

Destination: Terminal End User

Modules: DFHAMP

DFHAM4841 E applid Install failed because definition of restype resname is in use by task no. taskno (transaction id. tranid).

Explanation: An attempt was made to install object definition restype resname on the CICS system, but the installation failed because a read lock was held on that definition by task taskno.

System action: No definitions have been installed.

User response: Try the command again later.

Destination: Console and Terminal End User

Modules: DFHAMP

XMEOUT Parameters: applid, restype,resname, taskno, tranid

DFHAM4842 E applid Install failed because restype resname is currently in use.

Explanation: An attempt was made to install object definition restype resname on the CICS system, but the installation failed because the object was in use.

System action: No definitions have been installed.

User response: Try the command again later.

Destination: Console and Terminal End User

Modules: DFHAMP

XMEOUT Parameters: applid, restype,resname

DFHAM4843 W applid ttttttt nnnnnnnn is internally locked to OPID opid APPLID applid.

Explanation: The identified group or list ttttttt is internally locked to operator opid on CICS system applid when an install is attempted. This could occur at a cold or initial start when the CSD is shared between several CICS regions and operations on that group or list are incomplete.

System action: The install continues.

User response: Check that the installed definitions correspond to your requirements.

Destination: Console and Terminal End User

Modules: DFHAMP

XMEOUT Parameters: applid, ttttttt, nnnnnnnn, opid, applid

DFHAM4844 W applid restype resname1 in group grpname1 has the same name as a restype later in group grpname2.

Explanation: The CHECK command encountered a duplicate object name.

System action: None in the CHECK command, but...
the earlier definition will be ignored when the definitions are installed, because they both belong to the same CICS table in which duplicate entries may not exist.

**User response:** Determine why the duplicate condition exists and rectify it if necessary.

**Destination:** Terminal End User

**Modules:** DFHAMP

---

**Explanation:** The CHECK command found a reference in a transaction definition to an object definition that does not exist.

**System action:** None in the CHECK command, but errors may occur if that definition is installed and used.

**User response:** Determine why the object definition cannot be found and rectify it if necessary.

**Destination:** Terminal End User

**Modules:** DFHAMP

---

**Explanation:** The CHECK command found a transaction definition with the same alias as another transaction.

**System action:** No system action occurs for the CHECK command. However, errors may occur if that definition is installed and used.

**User response:** Determine why the duplicate situation occurs and rectify it if necessary.

**Destination:** Terminal End User

**Modules:** DFHAMP

---

**Explanation:** The CHECK command found an object definition that referenced a non-RPG II program for which RELOAD=YES was specified.

**System action:** If the definition is installed, errors may occur if that definition is installed and used.

**User response:** Specify RELOAD (NO).

**Destination:** Terminal End User

**Modules:** DFHAMP

---

**Explanation:** The CHECK command, executing under CICS Transaction Server for OS/390 encountered an RPG II program definition. RPG II is not supported on CICS.

**System action:** If the definition is installed, the program language is overwritten.

**User response:** Change the language as appropriate.

**Destination:** Terminal End User

**Modules:** DFHAMP

---

**Explanation:** The CHECK command found a connection or terminal definition with a NETNAME that is the same as the NETNAME defined in another connection or terminal definition.

**System action:** None in the CHECK command. However, it is not possible to install two terminals or a terminal and a connection with the same NETNAME. Also, you cannot have two or more APPC links with the same NETNAME, an APPC link and an LUTYPE6.1 link with the same NETNAME or two or more IRC connections with the same NETNAME.

**User response:** Determine why the duplication exists and rectify the problem.

**Destination:** Terminal End User

**Modules:** DFHAMP

---

**Explanation:** An attempt to install the DB2TRAN definition has failed because the DB2ENTRY to which it refers has not been installed.

**System action:** Processing continues. The definition is not installed.

**User response:** Ensure that the name of DB2ENTRY in the DB2TRAN definition is correct. Install the necessary DB2ENTRY definition first then retry the install of the DB2TRAN.

**Destination:** Console and Terminal End User

**Modules:** DFHAMP
DFHAM4851 E applid Install of \{ DB2ENTRY | DB2TRAN | DB2CONN \} name failed because of a security error.

Explanation: An attempt to install the DB2CONN, DB2ENTRY, or DB2TRAN name on the CICS system has been rejected because of an error encountered while performing a security check.

System action: Processing continues. The definition is not installed.

User response: See the associated messages issued by the security manager for further guidance. Correct the error. Then reinstall the definition.

Destination: Console and Terminal End User

Modules: DFHAM

DFHAM4852 W applid The specified \{GROUP | LIST\} contains objtype objects but no restype found.

Explanation: The specified GROUP or LIST contains objects that need a resource type of restype but no such resource type is listed in the GROUP or LIST.

System action: Processing continues.

User response: This may not be an error, but ensure that the resource type restype is installed before installing the GROUP or LIST.

Destination: Terminal End User

Modules: DFHAM

DFHAM4853 E applid Install of DB2TRAN db2tran-name failed because another DB2TRAN is installed with the same transid.

Explanation: An attempt to install the DB2TRAN db2tran-name on the CICS system has failed because there is another DB2TRAN installed that specifies the same transid. You cannot install two DB2TRANS that specify the same transid.

System action: Processing continues. The definition is not installed.

User response: Examine the installed DB2TRAN definitions using inquire DB2TRAN commands to determine the name of the DB2TRAN specifying the same transid. If appropriate, discard that DB2TRAN and then reinstall this DB2TRAN.

Destination: Console and Terminal End User

Modules: DFHAM

DFHAM4854 W applid DVSUPRT(VTAM) must be specified for PROFILE profname referenced by transaction tranid in group grpname.

Explanation: The CHECK command found a definition for a CICS-supplied transaction tranid without DVSUPRT(VTAM) specified in profile profname.

System action: Unpredictable results occur if the definition is installed and used.

User response: Specify DVSUPRT(VTAM).

Destination: Terminal End User

Modules: DFHAM

DFHAM4855 W applid INBFMH(ALL) must be specified for PROFILE profname referenced by transaction tranid in group grpname.

Explanation: The CHECK command found a definition for a CICS-supplied transaction tranid without INBFMH(ALL) specified in profile profname.

System action: The system abnormally terminates with abend code AXFO if the definition is installed and used.

User response: Specify INBFMH(ALL).

Destination: Terminal End User

Modules: DFHAM

DFHAM4856 W applid The specified \{GROUP | LIST\} contains more than one objtype.

Explanation: The specified GROUP or LIST contains more than one resource type objtype.

System action: Processing continues.

User response: Remove the duplication.

Destination: Terminal End User

Modules: DFHAM
DFHAM4858 S  applid Unable to perform request - DFHCSD not enabled.

Explanation: The system initialization table (SIT) used for CICS initialization contains a GRPLIST parameter, but CICS cannot use the CSD file because it is disabled.

System action: CICS terminates.

User response: If you want to use the CSD file, check the system initialization parameters for DFHCSD and your JCL before the next CICS initialization.

Destination: Console and Terminal End User

Modules: DFHAMP

XMEOUT Parameter: applid

DFHAM4859 S  applid Unable to perform request - The CSDSTRNO operand in the System Initialization Table (SIT) is too small.

Explanation: Insufficient VSAM strings are available to allow CEDA to proceed.

System action: No CEDA commands may be executed.

User response: Wait until other CEDA users have terminated their sessions, or specify a CSDSTRNO value of twice the number of concurrent CEDA transactions in the SIT.

Destination: Console and Terminal End User

Modules: DFHAMP

XMEOUT Parameter: applid

DFHAM4860 W  applid The specified LIST contains DB2ENTRY or DB2TRAN definitions before a DB2CONN definition.

Explanation: The specified LIST contains DB2ENTRY and/or DB2TRAN definitions in a group containing no DB2CONN definition. No DB2CONN definition precedes it in the list.

System action: Processing continues.

User response: A DB2CONN definition must be installed before DB2ENTRY and DB2TRAN definitions can be successfully installed. Ensure a DB2CONN definition is placed in a group before all DB2ENTRY and DB2TRAN definitions in the list, or in the first group in the list containing DB2ENTRYs or DB2TRANs.

Destination: Terminal End User

Modules: DFHAMP

DFHAM4861 W  applid XTRANID of transaction tranid in group grpname duplicates transaction ID tranid in group grpname.

Explanation: The check command found a transaction tranid in group grpname whose XTRANID duplicated a previous transaction ID.

System action: No system action occurs for the CHECK command. However, the first transaction in the message is ignored if the definitions are installed.

User response: Determine why the duplication exists and rectify the problem.

Destination: Terminal End User

Modules: DFHAMP

DFHAM4862 W  applid Transaction id tranid in group grpname duplicates XTRANID of transaction tranid in group grpname.

Explanation: The check command found a transaction tranid in group grpname whose XTRANID duplicated a previous transaction ID.

System action: No system action occurs for the CHECK command. However, the first transaction in the message is ignored if the definitions are installed.

User response: Determine why the duplication exists and rectify the problem.

Destination: Terminal End User

Modules: DFHAMP

DFHAM4863 I  applid name is now locked. No group or list of that name exists.

Explanation: The LOCK command executed successfully, but no group or list of name name was found on the CSD file.

System action: The name is locked.

User response: None.

Destination: Terminal End User

Modules: DFHAMP

DFHAM4864 S  applid Unable to perform operation - DFHCSD cannot be opened.

Explanation: The system initialization table (SIT) used for CICS initialization contains a GRPLIST parameter, but CICS cannot use the CSD file for one of the following reasons:

1. The startup JCL does not contain the definition of the CSD file (DFHCSD).
2. The DDNAME or data set name of the CSD file is incorrectly coded in the startup JCL.
3. VSAM has diagnosed that the CSD file cannot be opened.
4. CICS file control cannot open DFHCSD because insufficient storage has been allocated by the job REGION= parameter.

**System action:** CICS terminates.

**User response:** The action to solve the problem depends on the cause as follows:
1. Correct the JCL.
2. Correct the JCL.
3. Check the system operator's console for VSAM messages, and correct all VSAM errors.
4. Increase the size limit of the DSAs or EDSAs.

**Destination:** Console and Terminal End User

**Modules:** DFHAMP

**XMEOUT Parameter:** applid

---

**DFHAM4865 S applid Unable to perform operation - DFHCSD currently accessed by another user.**

**Explanation:** The system initialization table (SIT) used for CICS initialization contains a GRPLIST parameter. However, CICS cannot get read access to the CSD file because another region is accessing it, and the CSD cluster is defined to VSAM with SHAREOPTIONS(1).

**System action:** CICS terminates.

**User response:** To avoid a recurrence of this problem, recreate the CSD file specifying SHAREOPTIONS(2). See the [CICS System Definition Guide](#) for further details.

**Destination:** Console and Terminal End User

**Modules:** DFHAMP

**XMEOUT Parameter:** applid

---

**DFHAM4866 E applid Unable to perform operation: name is IBM protected.**

**Explanation:** The user has attempted to change the contents of a group or list whose name begins with "DFH". These are IBM-protected.

**System action:** The command is not executed.

**User response:** You can copy from IBM-supplied groups or lists and change the copied group or list.

**Destination:** Terminal End User

**Modules:** DFHAMP

---

**DFHAM4867 E applid File name DFHCSD is reserved and must not be modified.**

**Explanation:** You cannot define the CSD on the CSD itself.

**System action:** The command is not executed.

**User response:** Define DFHCSD via SIT options.

**Destination:** Terminal End User

**Modules:** DFHAMP

---

**DFHAM4868 W applid The LSRPOOL of the LSRPOOL lsname in group grpname duplicates that of LSRPOOL lsname in group grpname.**

**Explanation:** When invoking the CEDA CHECK command, an LSRPOOL definition lsname in group grpname was found which duplicated the LSRPOOLID of another LSRPOOL.

**System action:** Processing continues.

**User response:** Determine why the duplication exists and rectify the problem.

**Destination:** Terminal End User

**Modules:** DFHAMP

---

**DFHAM4869 E applid Single resource install of restype resname in group grpname is not allowed.**

**Explanation:** The install of restype resname is not allowed via single resource install. It must be installed via group install.

**System action:** The command is not executed.

**User response:** Install group grpname via group install.

**Destination:** Terminal End User

**Modules:** DFHAMP

---

**DFHAM4870 E applid Install failed for program proname - language RPG is not supported under MVS.**

**Explanation:** The GRPLIST parameter of the system initialization table (SIT) names a list in which a group contains a program proname that was defined with LANGUAGE(RPG).

**System action:** CICS initialization continues. The definition in error is ignored.

**User response:** Redefine program proname with the correct LANGUAGE definition.

**Destination:** Console and Terminal End User

**Modules:** DFHAMP
**DFHAM4871 W** applid File filename has been installed but set filename failed.

**Explanation:** Setting DSNAMe and ENABLED takes place separately from the main part of INSTALL for a FILE, and can fail.

**System action:** The file is installed but its state is not set.

**User response:** Use the CEMT SET FILE command.

**Destination:** Console and Terminal End User

**Modules:** DFHAMP

**DFHAM4872 S** applid Unable to connect to CICS catalog.

**Explanation:** DFHAMP was unable to connect to the CICS catalog for terminal installs.

**System action:** CICS terminates.

**User response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** Console and Terminal End User

**Modules:** DFHAMP

**DFHAM4873 S** applid Unable to disconnect the CICS catalog.

**Explanation:** DFHAMP was unable to disconnect the CICS catalog for terminal installs.

**System action:** CICS terminates.

**User response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** Console and Terminal End User

**Modules:** DFHAMP

**DFHAM4874 E** applid Install of (TSMODEL | ENQMODE) rsrce-name1 failed because (PREFIX | ENQNAME) attribute-name already exists in (TSMODEL | ENQMODE) rsrce-name2.

**Explanation:** An attempt to install the resource rsrce-name1 on the CICS system has failed because the attribute attribute-name already exists in the installed resource rsrce-name2.

**User response:** If the resource being installed is an ENQMODEL, another ENQMODEL with the same or a more generic nested enqname is installed and enabled.

**Destination:** Console and Terminal End User

**Modules:** DFHAMP

**DFHAM4875 E** applid Unable to perform operation: name is currently being updated by APPLID applid OPID opid - please retry later.

**Explanation:** The command which you issued cannot be performed because another user of CEDA is currently changing the contents of the group/list to which you referred.

**System action:** The command is not executed.

**User response:** Try the command again.

**Destination:** Terminal End User

**Modules:** DFHAMP

**DFHAM4876 W** applid PARTNER partnername specifies NETNAME netname which is not found in any CONNECTION definition that specifies access method = VTAM.

**Explanation:** There is no VTAM connection within the current group for the netname referenced in the specified partner.

**System action:** Other processing continues.

**User response:** None.

**Destination:** Terminal End User

**Modules:** DFHAMP

**DFHAM4877 W** applid PARTNER partnername specifies a NETNAME and PROFILE for which there is no common implied SESSIONs definition.

**Explanation:** The netname in a partner definition implies an associated connection definition which is in turn associated with a session definition. The profile definition referenced in a partner definition specifies a modename which can be associated with a sessions definition.
Within the current group, there is no common sessions definition implied by the specified partner definition.

**System action:** Other processing continues.

**User response:** None.

**Destination:** Terminal End User

**Modules:** DFHAMP

---

**DFHAM4879 W applid (GROUP | LIST) name has been partially installed.**

**Explanation:** During the execution of an INSTALL command for the group or list name, some of the elements in the group or list installed successfully, but at least one failed.

**System action:** Messages are produced indicating why the element or elements failed to install.

**User response:** Use the messages already produced to determine why the install failed and to rectify the problem.

**Destination:** Terminal End User

**Modules:** DFHAMP

---

**DFHAM4880 S applid Unable to perform operation - not allowed by file attributes for DFHCSD.**

**Explanation:** The CSDACC parameter in the system initialization table for DFHCSD does not allow CEDA to complete the command entered. The CSDACC parameter specifies the type of access permitted to the file. This can be one of the following:

- READWRITE
- READONLY

In order for a particular command to function, the access must be set appropriately.

**System action:** The CEDA command is ignored.

**User response:** Correct the CSDACC parameter in the SIT. The DFHCSD is defined in the bringup JCL and/or in the SIT.

**Destination:** Console and Terminal End User

**Modules:** DFHAMP

**XMEOUT Parameter:** applid

---

**DFHAM4881 I applid Group name deleted.**

**Explanation:** The Group grpname has been deleted from the CSD.

**System action:** Processing continues.

**User response:** Check that the deleted group is not present on any list.

**Destination:** Terminal End User

**Modules:** DFHAMP

---

**DFHAM4882 W applid The (TPNAME | XTPNAME) of transaction tranid in group grpname duplicates the (TPNAME | XTPNAME) of transaction tranid in group grpname.**

**Explanation:** The CHECK command found a transaction whose XTPNAME matches the TPNAME of another transaction.

**System action:** No system action occurs for the CHECK command, but the XTPNAME or TPNAME for the first transaction in the message is ignored if the definitions are installed.

**User response:** Determine why the duplication exists. To rectify the problem, rename either the TPNAME or the XTPNAME.

**Destination:** Terminal End User

**Modules:** DFHAMP

---

**DFHAM4883 I applid List listname deleted.**

**Explanation:** The List listname has been deleted from the CSD.

**System action:** Processing continues.

**User response:** Ensure that the deleted list is not used at a cold or initial start as the GRPLIST DFHSIT parameter.

**Destination:** Terminal End User

**Modules:** DFHAMP

---

**DFHAM4884 S applid retype name resname is reserved by CICS.**

**Explanation:** The name resname you have selected for resource type retype is reserved by CICS and cannot be user defined.

**System action:** The command is rejected.

**User response:** Redefine resname and resubmit the command.

**Destination:** Terminal End User

**Modules:** DFHAMP

---

**DFHAM4886I applid Installing list listname which matches specified generic list genlist.**

**Explanation:** The GRPLIST parameter of the system initialization table (SIT) specifies a list name genlist that contains generic characters. While searching the CSD file, the list name listname was found to match the specified generic list.

**System action:** The list name listname is installed.

**User response:** None.
**DFHAM4887 I applid Unrecognized resource type found in the CSD file and has been ignored.**

**Explanation:** CICS has found an unrecognized resource type code in a CSD record. The unrecognized code does not match any of the function codes in the language definition table. This can occur for one of the following reasons:

1. You are using a CICS release that does not support a type of definition that was created on the CSD file by a later CICS release.
2. The language definition table (DFHEITSP or DFHEITCU) is invalid for this CICS release.
3. The CSD manager (DFHDMP) has passed an invalid CSD record buffer to DFHPUP. This is a CICS internal logic error.

**System action:** The resource is ignored and the operation continues.

**User response:** Determine which of the possible reasons caused the error. If you can eliminate reasons 1 and 2, you can assume that reason 3 applies.

Take action corresponding to the reason you have established as follows:

1. Ignore the message.
2. Ensure that the library contains versions of DFHEITSP and DFHEITCU that are valid for the CICS release you are running.
3. You need further assistance from IBM to resolve this problem. See Part 4 of the [CICS Problem Determination Guide](#) for guidance on how to proceed.

**Destination:** Console and Terminal End User

**Modules:** DFHAMP

**XMEOUT Parameters:** applid, listname, genlist

---

**DFHAM4888 I applid Group groupname removed from list listname.**

**Explanation:** During the execution of a DELETE command, the group groupname was deleted from the CSD. As a result of that, the list listname was updated to remove the deleted group from it.

**System action:** Processing continues.

**User response:** None.

**Destination:** Terminal End User

**Modules:** DFHAMP

---

**DFHAM4889 E applid Install of {JOURNALMODEL | TSMODEL | TCPIService | CORBASERVER | URIMAP} resourcename failed because attribute attname is invalid.**

**Explanation:** An attempt to install the JOURNALMODEL, TSMODEL, TCPIService, or CORBASERVER named resourcename on the CICS system failed because the attribute attname specified is not valid. If the attribute is CERTIFICATE, this may be because the specified certificate does not exist, or is not properly constructed, or does not have an associated private key, or is not connected to the key ring with a correct USAGE.

**System action:** The definition is not installed.

**User response:** Correct the invalid parameter of the resource definition.

**Destination:** Console and Terminal End User

**Modules:** DFHAMP

**XMEOUT Parameters:** applid, {1=JOURNALMODEL, 2=TSMODEL, 7=TCPIService, 8=CORBASERVER, 10=URIMAP}, resourcename, attribute, attname

---

**DFHAM4890 E applid Install of TDQUEUE tdqname failed because the TYPE has not been specified.**

**Explanation:** An attempt to install the named TDQUEUE tdqname on the local CICS system failed because it has been defined with the REMOTESYSTEM attribute and the TYPE cannot be determined.

**System action:** The definition is not installed.

**User response:** Make the definition a dual purpose one by specifying both REMOTE attributes and TYPE.

**Destination:** Console and Terminal End User

**Modules:** DFHAMP

**XMEOUT Parameters:** applid, tdqname

---

**DFHAM4891 W applid restype name resname begins with ‘C’. Such names are reserved and may be redefined by CICS.**

**Explanation:** A resource name starting with C was specified. Names starting with C are reserved and may be redefined by CICS.

**System action:** If the definition is installed, errors may occur.

**User response:** Specify a different resource name.

**Destination:** Terminal End User

**Modules:** DFHAMP
DFHAM4892 W date time applid Install for group
grpname has completed with errors.

Explanation: The install of group grpname is now complete. All resources that are valid for installation have been installed, and recorded if appropriate, on the CICS catalog. There were errors during the installation of some resources in the group and these resources have been backed-out.

System action: CICS continues. CICS issues messages identifying the cause of each installation failure.

User response: Use the associated messages, available via the messages panel if CEDA is being used, or issued to transient data queues CSMT and CADL during system startup, to determine the cause of the errors. Once the cause of the errors has been eliminated, reinstall the group to install the missing definitions.

Destination: CADL

Modules: DFHAMP

XMEOUT Parameters: date, time,applid, grpname

DFHAM4893 I date time applid Install for group
grpname has completed successfully.

Explanation: The install of group grpname is now complete. All resources that are valid for installation have been installed, and recorded if appropriate, on the CICS catalog.

System action: CICS continues

User response: None

Destination: CADL

Modules: DFHAMP

XMEOUT Parameters: date, time,applid, grpname

DFHAM4894 E applid Install of (ENQMODEL)
rsrcrename1 failed because installed
(ENQMODEL) rsrcename2 is not disabled.

Explanation: An attempt to install the resource rsrcename1 on the CICS system has failed because the resource rsrcename2 is already installed and is not disabled.

System action: Processing continues. The definition is not installed.

User response: Resource rsrcename2 must be disabled or discarded before resource rsrcename1 can be installed. Ensure that resource rsrcename2 is in the required state and then install the new definition.

Destination: Console and Terminal End User

Modules: DFHAMP

XMEOUT Parameters: applid, (3=ENQMODEL),
rsrcrename1, (3=ENQMODEL), rsrcename2

DFHAM4895 E applid Install of TMODEL
resourcename in group groupname
failed because TS was started using an
assembled TST without the MIGRATE option.

Explanation: An attempt to install the TMODEL resourcename in group groupname on the CICS system has failed because the system was started using an assembled TST without the MIGRATE option.

System action: Processing continues. The definition is not installed.

User response: If you want to install TMODELs using RDO then either start CICS with a TST assembled with the TYPE=(INITIAL,MIGRATE) option or don't specify a TST in your SIT parameters.

Destination: Console and Terminal End User

Modules: DFHAMP

XMEOUT Parameters: applid, resourcename,
grouponame

DFHAM4896 E applid Install of TDQUEUE tdqname
failed because the queue is not closed.

Explanation: An attempt to install the transient data queue tdqname on the CICS system has failed because the data set associated with this extrapartition TD queue is not closed.

System action: Processing continues. The definition is not installed.

User response: Intrapartition queues must be disabled, and extrapartition queues must be disabled and closed before they can be redefined. Ensure that the queue is in the required state and then install the new definition.

Destination: Console and Terminal End User

Modules: DFHAMP

XMEOUT Parameters: applid, tdqname

DFHAM4897 W applid The definition of (TDQUEUE
TCP/IPSERVICE) resourcename
specified (OPENTIME=INITIAL |
STATUS=OPEN) but the open failed.

Explanation: An attempt to install the resource resourcename on the CICS system has succeeded but the resource cannot be opened.

System action: The definition is installed.

User response: Determine the cause of the failure and then open the resource.

Destination: Console and Terminal End User
DFHAM4898 E applid Installation of (TDQUEUE | PROCESSTYPE) resourcename failed because of insufficient storage.

Explanation: An attempt to install the resource resourcename on the CICS system has failed because insufficient storage is available to build the entry.

System action: The definition is not installed.

User response: Inform your system programmer. See the CICS Problem Determination Guide for guidance on dealing with storage problems.

Destination: Console and Terminal End User

Modules: DFHAMP

XMEOUT Parameters: applid, {1=TDQUEUE, 2=PROCESSTYPE}, resourcename

---

DFHAM4899 E applid TDQUEUE tdqname cannot be replaced because the existing definition is for a different queue type.

Explanation: An attempt to install the transient data queue tdqname on the CICS system failed because its definition type is different from that of the definition already defined to the system.

System action: The definition is not installed.

User response: Either change the new definition so that it has the same type as the one currently installed on the system, or discard the current definition and then install the new one.

Destination: Console and Terminal End User

Modules: DFHAMP

XMEOUT Parameters: applid, tdqname

---

DFHAM4900 E applid Install of CORBASERVER | REQUESTMODEL }resourcename1 failed because it is not a valid/ CORBASERVER | REQUESTMODEL }for this level of CICS.

Explanation: An attempt to install the resource resourcename on this CICS system has failed because it did not contain the attributes required for the current level of CICS. If the resource being defined was a REQUESTMODEL, the error is that the corbaserver name was blank. Having a blank corbaserver name indicates that the requestmodel is not at the correct level for this CICS system. If the resource being defined was a CORBASERVER, the error is that the UNAUTH tcpipservice name, which is mandatory for this level of CICS, was missing from the definition.

System action: The definition of resource resourcename is not installed.

User response: Ensure that you are using the correct level CSD or redefine the resource resourcename using the new attributes as required.

Destination: Console and Terminal End User

Modules: DFHAMP, DFHAMEJ

XMEOUT Parameters: applid, {1=CORBASERVER, 2=REQUESTMODEL }, resourcename, {1=CORBASERVER, 2=REQUESTMODEL }

---

DFHAM4903 E applid Install for TCPIPSERVICE tcpipservice has failed because the service is open.

Explanation: The install of TCPIPSERVICE tcpipservice has failed because the service is open.

System action: The install fails.

User response: Close the service and retry the install.

Destination: Console and Terminal End User

Modules: DFHAMP

XMEOUT Parameters: applid, tcpipservice

---

DFHAM4904 E applid Opening TCPIPSERVICE tcpipservice has failed because port portno is already in use.

Explanation: Opening TCPIPSERVICE tcpipservice has failed because the specified port number is in use.

System action: The resource is installed but left in the closed state. Message DFHSO0109 is issued to the transient data queue CSOO.

User response: Check that the port number specified is not already in use. Refer to the description of the
message DFHSO0109 for more information.

Destination: Console and Terminal End User

Modules: DFHAMP

**XMEOUT Parameters: applid, tcpipservice, portno**

---

**DFHAM4905 E applid Install failed for resource.**

*Option opt is not available on this system.*

**Explanation:** The install of the resource resource has failed because the current CICS system has not been configured to support the specified option opt.

**System action:** The install fails.

**User response:** Reconfigure the CICS system by specifying appropriate system initialization parameters to support the specified option. Then restart CICS.

**Destination:** Console and Terminal End User

**Modules:** DFHAMDP

**XMEOUT Parameters:** applid, resource, opt

---

**DFHAM4906 E applid Opening TCPIPSERVICE**

*tcpipservice has failed because port portno is not authorized.*

**Explanation:** Opening TCPIPSERVICE tcpipservice has failed because the specified port number is not authorized.

**System action:** The resource is installed and left in the closed state. The message DFHSO0111 is written to the transient data queue CSOO.

**User response:** Select a port that is authorized. See the description of message DFHSO0111 for more information.

**Destination:** Console and Terminal End User

**Modules:** DFHAMP

**XMEOUT Parameters:** applid, tcpipservice, portno

---

**DFHAM4907 E applid Opening TCPIPSERVICE**

*tcpipservice has failed because the IP address is not known.*

**Explanation:** Opening TCPIPSERVICE tcpipservice has failed because the specified IP address is not known.

**System action:** The resource is installed but left in the closed state. The message DFHSO0110 is written to the transient data queue CSOO.

**User response:** Select an IP address which is known. Refer to the description of message DFHSO0110 for more information.

**Destination:** Console and Terminal End User

**Modules:** DFHAMP

**XMEOUT Parameters:** applid, tcpipservice, portno

---

**DFHAM4908 E applid Install of DOCTEMPLATE**

*doctemplate1 failed because TEMPLATENAME(template) already exists in DOCTEMPLATE doctemplate2.*

**Explanation:** The install of DOCTEMPLATE doctemplate1 has failed because the TEMPLATENAME selected is already in use as the full template name for document template doctemplate2.

**System action:** The install fails.

**User response:** Either select a different TEMPLATENAME for doctemplate1, or discard the document template definition for doctemplate2.

**Destination:** Console and Terminal End User

**Modules:** DFHAMDH

**XMEOUT Parameters:** applid, doctemplate1, template, doctemplate2

---

**DFHAM4909 E applid Install of DOCTEMPLATE**

*doctemplate failed. DDNAME(ddname) not found.*

**Explanation:** The install of DOCTEMPLATE doctemplate has failed because the DDNAME(ddname) selected is not the name of a Data Definition statement for a partitioned dataset in the JCL for the current CICS job. ddname should be allocated to a PDS containing document templates to be used by the Document Handler domain.

**System action:** The install fails.

**User response:** Either select a DDNAME that does exist in the JCL for the current CICS job, or stop and restart CICS with the required DD statement added.

**Destination:** Console and Terminal End User

**Modules:** DFHAMDH

**XMEOUT Parameters:** applid, doctemplate, ddname

---

**DFHAM4910 E applid Install of DOCTEMPLATE**

*doctemplate failed. MEMBER(membername) not found in ddname.*

**Explanation:** The install of DOCTEMPLATE doctemplate has failed because member membername was not found in any of the partitioned datasets specified in the ddname concatenation.

**System action:** The install fails.

**User response:** Ensure that member membername exists in one of the template libraries specified before installing the DOCTEMPLATE that references it.

**Destination:** Console and Terminal End User

**Modules:** DFHAMP

**XMEOUT Parameters:** applid, doctemplate, membername

---
**DFHAM4911 E**  
*applid Transaction tranid installed but at least one of ALIAS, TASKREQ or XTRANID failed to be replaced because it exists as a primary transaction.*

**Explanation:** Transaction *tranid* was successfully installed but at least one of the specified aliases (ALIAS, TASKREQ or XTRANID) failed to be installed because it already exists as a primary transaction.

**System action:** The resource is installed but the alias is not.

**User response:** Find out which of the aliases is conflicting with a primary transaction id and change its name.

**Destination:** Console and Terminal End User

**Modules:** DFHAMP

**XMEOUT Parameters:** applid, tranid

---

**DFHAM4912 E**  
*applid Install of resource resourcename failed because attribute is invalid for this release.*

**Explanation:** An attempt to install the resource named *resourcename* on this CICS system failed because the *attribute* specified is not valid as it is an obsolete attribute.

**System action:** The definition is not installed.

**User response:** Remove the invalid parameter of the resource definition.

**Destination:** Console and Terminal End User

**Modules:** DFHAMP

**XMEOUT Parameters:** applid, resource, resourcename, attribute

---

**DFHAM4915 E**  
*applid Install of resourcetype resourcename failed. Open for data set dsname has abended.*

**Explanation:** Resource *resourcename* cannot be installed because an abend occurred when opening the data set *dsname* that contains it.

**System action:** The resource is not installed.

**User response:** Look for an earlier IEC143I, IEC144I, IEC145I, IEC148I, IEC150I, or IEC153I message that explains why the dataset could not be opened. Correct whatever problem is described in the related message.

**Destination:** Console Routecodes 2 and 10 and Terminal End User

**Modules:** DFHAMP

---

**DFHAM4918 E**  
*applid The installation of/ CORBASERVER / TCPIPSERVICE / URIMAP / resource has failed because its requested CIPHER list was rejected.*

**Explanation:** Resource *resourcename* cannot be installed because all of the cipher codes specified for the resource have been rejected by the running system.

**System action:** The resource is not installed.

**User response:** Determine what your CIPHERS explanation: The specified resource *resourcename* was installed with a reduced set of CIPHER codes.

**System action:** The resource is installed with a reduced set of cipher codes.

**User response:** Determine whether your CIPHERS setting is acceptable.

**Destination:** Console and Terminal End User

**Modules:** DFHAMP

**XMEOUT Parameters:** applid, {1=CORBASERVER, 7=TCPIPSERVICE, 10=URIMAP},resourcename

---

**DFHAM4916 E**  
*applid TCPIPSERVICE tcpipservice has not been opened because the MAXSOCKETS limit has been reached.*

**Explanation:** TCPIPSERVICE *tcpipservice* has not been opened because the number of active sockets in the system is equal to the current MAXSOCKETS value.

**System action:** The resource is installed but left in the closed state.

**User response:** Determine whether your MAXSOCKETS setting is adequate to handle normal system loads. If it is, then this may be a transient condition caused by a peak in work that uses sockets, and you may be able to use CEMT to open the TCPIPSERVICE once the workload diminishes. If not, use CEMT SET SYSTEM to increase the number of sockets in the system.

**Destination:** Console and Terminal End User

**Modules:** DFHAMP

**XMEOUT Parameters:** applid, tcpipservice
setting should be for the current MVS system.

Destination: Console and Terminal End User

Modules: DFHAMP

XMEOUT Parameters: applid, {1=CORBASERVER, 7=TCPIPSERVICE, 10=URIMAP}, resourcename

---

DFHAM4920 E applid The installation of/
CORBASERVER | DJAR | PIPELINE | WEBSERVICE \nresourcename has failed because it is a duplicate of one which already exists.

Explanation: The installation of the specified resource resourcename has failed because the specified resource (corbaserver, djar, pipeline, orbservice) already exists.

System action: The resource is not installed.

User response: Select a different resource name which is not known to the system. For EJ resources, it is not possible to do an update (add/replace). It is necessary to delete the resource and do a re-define if you want to use the same resource name. For PI resources, the resource needs to be disabled before it can be updated.

Destination: Console and Terminal End User

Modules: DFHAMP

XMEOUT Parameters: applid, {1=CORBASERVER, 2=DJAR, 3=PIPELINE, 4=WEBSERVICE}, resourcename

---

DFHAM4921 E applid The installation of/
CORBASERVER | DJAR | PIPELINE | WEBSERVICE 
cname has failed because the specified keyword value is not valid.

Explanation: The installation of CORBASERVER cname has failed because the specified keyword value is not valid.

System action: The resource is not installed.

User response: Enter valid values for the specified keyword. Nulls are not accepted.

Destination: Console and Terminal End User

Modules: DFHAMP

XMEOUT Parameters: applid, cname, {1=CORBASERVER, 2=STATE, 3=SESSIONTIME, 4=CERTIFICATE, 5=HOST, 6=PORT, 7=SSL, 8=SSLPORT, 9=SHELF, 10=JSONPREFIX}

---

DFHAM4922 E applid The installation of/
CORBASERVER | DJAR | PIPELINE | WEBSERVICE \nresourcename has failed because the EJ resource resolution transaction, CEJR, could not attach.

Explanation: The installation of CORBASERVER or DJAR resourcename has failed because the specified EJ resource could not be resolved as the resolution transaction, CEJR, failed to attach. The transaction may have been disabled manually to stop resolution, or it may not be defined to your CICS system.

System action: The resource is not installed.

User response: Ensure that the CEJR transaction is defined and installed on your CICS system and that the program DFHEJITL is also defined and available.

Destination: Console and Terminal End User

Modules: DFHAMP

XMEOUT Parameters: applid, {1=CORBASERVER, 2=DJAR}, resourcename

---

DFHAM4923 E applid The installation of DJAR
dname has failed because the specified CORBASERVER cname does not exist.

Explanation: DJAR dname has not been installed successfully because the specified DJAR has been defined with a corbaserver which does not exist.

System action: The resource is not installed.

User response: Redefine the DJAR with a valid corbaserver name.

Destination: Console and Terminal End User

Modules: DFHAMP

XMEOUT Parameters: applid, dname, cname

---

DFHAM4924 E applid The installation of DJAR
dname has failed because the specified CORBASERVER | STATE | HFSFILE | DJAR | THE PROGRAM DFHEJITL IS NOT DEFINED.

Explanation: DJAR dname has not been installed successfully because the specified DJAR has been defined with an invalid keyword.

System action: The resource is not installed.

User response: Redefine the DJAR with valid parameters. Null values are not accepted.

Destination: Console and Terminal End User

Modules: DFHAMP

XMEOUT Parameters: applid, dname, {1=CORBASERVER, 2=STATE, 3=HFSFILE, 4=DJAR}
DFHAM4925 E applid The installation of CORBASERVER cname has failed because at least one of its associated tcpipservices has not been installed.

Explanation: The installation of CORBASERVER cname has failed because at least one of the TCPIPSERVICES specified in the CORBASERVER definition has not been previously installed. When doing an individual install of a CORBASERVER, in order for the CORBASERVER to become inservice, the required TCPIPSERVICES must already be available.

System action: The resource is not installed.

User response: Ensure that the TCPIPSERVICES specified for the UNAUTH, CLIENTCERT, and SSLUNAUTH parameters on the CORBASERVER definition are installed first before attempting to install the CORBASERVER.

Destination: Console and Terminal End User

Modules: DFHAMP

XMEOUT Parameters: applid, cname

DFHAM4926 E applid The installation of DJAR dname has failed because the specified CORBASERVER cname is not in a valid state.

Explanation: DJAR dname has not been installed successfully because the specified DJAR has been defined with a corbaserver which is in an unusable state. Valid STATE values would be anything other than UNUSABLE, UNRESOLVED or DISCARDING.

System action: The resource is not installed.

User response: Redefine the DJAR with a corbaserver which is in the correct state. CEMT can be used to inquire on corbaserver STATE values.

Destination: Console and Terminal End User

Modules: DFHAMP

XMEOUT Parameters: applid, dname, cname

DFHAM4927 E applid The installation of DJAR {CORBASERVER | DJAR }resourcename has failed because its HFSFILE is a duplicate of one which already exists.

Explanation: The installation of the specified resource resourcename has failed because the specified resource resourcename has a duplicate HFSFILE name.

System action: The resource is not installed.

User response: Determine why the HFSFILE name is duplicated.

DFHAM4928 E applid Install of (TCPIPSERVICE | CORBASERVER | URIMAP) resourcename failed because the specified certificate is unusable.

# Explanation: Resource resourcename cannot be installed because the specified certificate is unusable.
# An explanatory phrase in the message describes why:
# expired
# The date and time at which the certificate is no longer valid has already passed.
# not yet current
# The date and time at which the certificate is to become active has not yet been reached.
# not owned by this CICS
# The specified certificate belongs to a user other than the current CICS region userid. Only certificates belonging to the CICS region userid can be used by CICS.
# not trusted
# The certificate has been given the NOTRUST attribute by the security administrator. This indicates that the certificate is not to be used.

System action: The resource is not installed.

User response: Replace the certificate in the keyring with one that is usable, or specify a different certificate.

Destination: Console and Terminal End User

Modules: DFHAMP

XMEOUT Parameters: applid, {1=CORBASERVER, 2=DJAR }, resourcename

DFHAM4929 E applid {URIMAP}(resourcename) was not installed because of conflicting attributes.

Explanation: Resource resourcename cannot be installed because the specified attributes are inconsistent. This could indicate an internal problem within CICS, because attribute inconsistencies should be resolved in the RDO DEFINE command. However, for a URIMAP resource the consistency between the value specified for the HOSTCODEPAGE attribute and that specified for the CHARACTERSET attribute cannot be determined until install time.

System action: The resource is not installed.

User response: Remove the conflicting attributes.

Check that the combination of CHARACTERSET and
HOSTCODEPAGE values specified are supported by
the CICS system on which you are attempting to install
the resource resourcename.

Destination: Console and Terminal End User

Modules: DFHAMP

XMEOUT Parameters: applid, {10=URIMAP},

DFHAM4930 E applid URIMAP(urimap1) not installed
because it maps the same URI as
urimap2.

Explanation: URIMAP urimap1 cannot be installed
because it will map the same HOST and PATH (and
optional TCPIPSERVICE) as urimap2, which is already
installed. Each URIMAP must map a unique
combination of these parameters.

System action: The resource is not installed.

User response: Specify a different HOST, PATH, or
TCPIPSERVICE attribute.

Destination: Console and Terminal End User

Modules: DFHAMP

XMEOUT Parameters: applid, urimap1, urimap2

DFHAM4931 E applid The installation of WEBSERVICE
resourcename failed
because the associated {WSBIND file | PIPELINE} does not exist.

Explanation: WEBSERVICE webservice cannot be
installed because the associated PIPELINE cannot be
found.

System action: The resource is not installed.

User response: Ensure that the PIPELINE definition is
correct and the PIPELINE is installed.

Destination: Console and Terminal End User

Modules: DFHAMP

XMEOUT Parameters: applid, resourcename,

DFHAM4932 E applid The installation of {PIPELINE
|WEBSERVICE} resourcename failed
because the {hfsfile | PIPELINE} setup
was not correct.

Explanation: WEBSERVICE webservice or PIPELINE
pipeline cannot be installed because of setup errors.
Either the hfsfile does not have the correct authorization
or the PIPELINE mode is not correct.

System action: The resource is not installed.

User response: Ensure that the hfsfile definitions of
the pipeline and webservice are correct.

Destination: Console and Terminal End User

Modules: DFHAMP

XMEOUT Parameters: applid, resourcename,

DFHAM4933 E applid The installation of PIPELINE
resourcename failed because the
WSDIR file specified is not accessible.

Explanation: PIPELINE pipeline cannot be installed
because the WSDIR specified is not correct and
therefore the directory cannot be accessed.

System action: The resource is not installed.

User response: Ensure that the hfsfile definitions of
the WSDIR are correct, remembering that case is
significant.

Destination: Console and Terminal End User

Modules: DFHAMP

XMEOUT Parameters: applid, resourcename

DFHAM4934 E applid The installation of URIMAP
resourcename failed because
HOSTCODEPAGE hcodepage is not
valid in combination with
CHARACTERSET charset.

Explanation: The URIMAP resource resourcename
cannot be installed because the specified attributes are
inconsistent. Most inconsistencies are eliminated at
resource definition time. However, for a URIMAP
resource, the consistency between the value specified
for the HOSTCODEPAGE attribute and that specified for
the CHARACTERSET attribute cannot be determined
until install time.

System action: The resource is not installed.

User response: Check that the combination of
CHARACTERSET and HOSTCODEPAGE values
specified for the URIMAP is supported by the CICS
system on which you are attempting to install the
resource resourcename.

Destination: Console and Terminal End User

Modules: DFHAMP

XMEOUT Parameters: applid, resourcename,
hcodepage, charset

DFHAM4936 E applid The installation of URIMAP
resourcename failed because the value
of the USERID field userid failed
surrogate security checking against
the current user.

Explanation: The URIMAP resource resourcename
cannot be installed because the current user does not
# have surrogate authority to the User ID userid specified
# in the USERID field.

# System action: The resource is not installed.
# User response: Check that the user installing the
# URIMAP has sufficient surrogate authority to complete
# the installation, or install the URIMAP from an
# authorized user ID.

# Destination: Console and Terminal End User
# Modules: DFHAMP
# XMEOUT Parameters: applid, resourcename, userid

---

**DFHAPxxxx messages**

**DFHAP0001** applid An abend (code aaa/bbbb) has occurred at offset X'offset' in module modname.

**Explanation:** An abnormal end (abend) or program check has occurred in module modname. This implies that there may be an error in CICS code.

Alternatively:

- Unexpected data has been input,
- Storage has been overwritten, or
- There has been a program check within a user program.

The code aaa is, if applicable, a 3-digit hexadecimal MVS system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The 4-digit code bbbb, which follows aaa, is a user abend code produced either by CICS or by another product on the user's system.

If X'offset' contains the value X'FFFF', then module modname was in control at the time of the abend, but the program status word (PSW) was not addressing this module.

**System action:** An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

Either this is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

Or CICS will continue unless you have specified in the dump table that CICS should terminate. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User response:** Notify the system programmer.

Look up the MVS code aaa, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual.

If the modname insert contains the value ?????, then CICS was unable to determine which module has abnormally terminated. In this case, examine the system dump to determine which area of code has caused the program check.

The user should examine other messages to determine what the module which issued this message was doing at the time the abend occurred. From these messages they can deduce which product has produced the abend code bbbb. If bbbb is identified as a CICS code, it may be either alphabetic or numeric.

- If the CICS code is alphabetic (for example AKEA) then it is a CICS transaction abend code.
- If the CICS code is numeric (for example 1310), it refers to a CICS message (DFHTS1310 in our example).

If the user abend code is from another product (for example, IMS), refer to the appropriate messages and codes manual to determine the cause of the abend.

The entries in the appropriate manuals will give the user guidance regarding the nature of the error, and may also give some guidance concerning the appropriate user response.

**Note:** The program check may have occurred in a user program. If this is the case, the program check is usually followed by an ASRA or an ASRB transaction abend and a transaction dump.

If you want to suppress system dumps that precede ASRA and ASRB abends, you must specify this on an entry in the dump table, using either CEMT or an EXEC CICS command. Further guidance on suppressing system dumps can be found in the **CICS System Definition Guide**.

You may need further assistance from IBM to resolve this problem. See Part 4 of the **CICS Problem Determination Guide** for guidance on how to proceed.

**Destination:** Console

**Modules:** DFHABAB, DFHAFMT, DFHAPDM, DFHAPDN, DFHAPEX, DFHAPIQ, DFHAPJC, DFHAPNT, DFHAPSM, DFHAPST, DFHAPSI, DFHAPXM, DFHAPXME, DFHDKMR, DFHEDFE, DFHEISR, DFHICXM, DFHMRXM, DFHSAIQ, DFHSIPLT, DFHSRSP, DFHSTD, DFHSTFC, DFHSTLK, DFHSTLS, DFHSTSZ, DFHSTD, DFHSTTM, DFHSTR, DFHSTTS, DFHSUXE, DFHTDXY, DFHTMP, DFHSTSUT, DFH62XM

**XMEOUT Parameters:** applid, aaa/bbbb, X'offset', modname

**DFHAP0002** applid A severe error (code X'code') has occurred in module modname.
Explanation: An error has been detected in module modname. The code X’code’ is the exception trace point id which uniquely identifies what the error is and where the error was detected.

System action: An exception entry is made in the trace table (X’code’ in the message). A system dump is taken, unless you have specifically suppressed dumps in the dump table.

If this message is issued from DFHAPEX or DFHSUXEX, and the exit point is XDUREQ, then a system dump is not taken in order to prevent recursive dumping.

Either this is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

Or CICS will continue unless you have specified in the dump table that CICS should terminate. Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Notify the system administrator. This failure indicates a serious error in CICS. If you have not requested termination in the dump table, you may want to terminate CICS. For further information about CICS exception trace entries, see the CICS Problem Determination Guide.

You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Modules: DFHABAB, DFHAFMT, DFHAPDM, DFHAPDN, DFHAPEX, DFHAPJC, DFHAPLI, DFHAPLIJ, DFHAPS, DFHAPSIP, DFHAPSM, DFHAPST, DFHAPTI, DFHAPTIM, DFHAPTX, DFHAPXM, DFHAPXME, DFHDKMR, DFHERM, DFHEIS, DFHICXM, DFHCIPLT, DFHSTDT, DFHSTFC, DFHSTJL, DFHSTLX, DFHSTLS, DFHSTSZ, DFHSTDD, DFHSTTM, DFHSTR, DFHSTTS, DFHSUXEX, DFHSUXZ, DFHTMP, DFHDXML, DFHEVH, DFHXCPA, DFHXSWM, DFHZCUT

XMEOUT Parameters: applid, X’code’,modname

DFHAP004 applid A possible loop has been detected at offset X’offset’ in module modname.

Explanation: A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module modname at offset X’offset’. This is the offset of the instruction which was executing at the time the error was detected.

System action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

If this message is issued from DFHAPEX or DFHSUXEX, and the exit point is XDUREQ, then a system dump is not taken in order to prevent recursive dumping.

Either this is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

Or CICS will continue unless you have specified in the dump table that CICS should terminate. Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Notify the system administrator. This failure indicates a serious error in CICS. If you have not requested termination in the dump table, you may want to terminate CICS. For further information about CICS exception trace entries, see the CICS Problem Determination Guide.

You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Modules: DFHAPDM, DFHAPSIP

XMEOUT Parameters: applid, X’code’,modname

DFHAP003 applid Insufficient storage (code X’code’) in module modname.

Explanation: A CICS GETMAIN was issued by module modname, but there was insufficient storage available to satisfy the request.

The code X’code’ is the exception trace point id which uniquely identifies the place where the error was detected.

System action: An exception entry is made in the trace table (code X’code’ in the message). A system dump is taken, unless you have specifically suppressed dumps in the dump table. CICS will continue unless you have specified in the dump table that CICS should terminate.

If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message will be issued to this effect. Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Inform the system programmer.

Try increasing the size of the DSA or EDSA. See the CICS System Definition Guide or the CICS Customization Guide for further information on controlling CICS storage.

You may need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Modules: DFHABAB, DFHAFMT, DFHAPDM, DFHAPDN, DFHAPEX, DFHAPJC, DFHAPLI, DFHAPLIJ, DFHAPS, DFHAPSIP, DFHAPSM, DFHAPST, DFHAPTI, DFHAPTIM, DFHAPTX, DFHAPXM, DFHAPXME, DFHDKMR, DFHERM, DFHEIS, DFHICXM, DFHCIPLT, DFHSTDT, DFHSTFC, DFHSTJL, DFHSTLX, DFHSTLS, DFHSTSZ, DFHSTDD, DFHSTTM, DFHSTR, DFHSTTS, DFHSUXEX, DFHSUXZ, DFHTMP, DFHDXML, DFHEVH, DFHXCPA, DFHXSWM, DFHZCUT

XMEOUT Parameters: applid, X’code’,modname

DFHAP003 applid Insufficient storage (code X’code’) in module modname.

Explanation: A CICS GETMAIN was issued by module modname, but there was insufficient storage available to satisfy the request.

The code X’code’ is the exception trace point id which uniquely identifies the place where the error was detected.

System action: An exception entry is made in the trace table (code X’code’ in the message). A system dump is taken, unless you have specifically suppressed dumps in the dump table. CICS will continue unless you have specified in the dump table that CICS should terminate.

If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message will be issued to this effect. Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Inform the system programmer.

Try increasing the size of the DSA or EDSA. See the CICS System Definition Guide or the CICS Customization Guide for further information on controlling CICS storage.

You may need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Modules: DFHABAB, DFHAFMT, DFHAPDM, DFHAPDN, DFHAPEX, DFHAPJC, DFHAPLI, DFHAPLIJ, DFHAPS, DFHAPSIP, DFHAPSM, DFHAPST, DFHAPTI, DFHAPTIM, DFHAPTX, DFHAPXM, DFHAPXME, DFHDKMR, DFHERM, DFHEIS, DFHICXM, DFHCIPLT, DFHSTDT, DFHSTFC, DFHSTJL, DFHSTLX, DFHSTLS, DFHSTSZ, DFHSTDD, DFHSTTM, DFHSTR, DFHSTTS, DFHSUXEX, DFHSUXZ, DFHTMP, DFHDXML, DFHEVH, DFHXCPA, DFHXSWM, DFHZCUT

XMEOUT Parameters: applid, X’code’,modname

DFHAP004 applid A possible loop has been detected at offset X’offset’ in module modname.

Explanation: A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module modname at offset X’offset’. This is the offset of the instruction which was executing at the time the error was detected.

System action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

If this message is issued from DFHAPEX or DFHSUXEX, and the exit point is XDUREQ, then a system dump is not taken in order to prevent recursive dumping.

Either this is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

Or CICS will continue unless you have specified in the dump table that CICS should terminate. Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Notify the system programmer. If CICS has not been terminated, it will be necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of processor time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS will purge a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that the module modname will be terminated and CICS will continue.
But if you have declared ICVR=0 in the SIT and you consider that module modname has gone into a loop, you will have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module modname, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You will have to bring CICS down at a suitable time to do this permanently.

If raising the ICVR time does not solve the problem, you need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

**Modules:** DFHAFMT, DFHAPDM, DFHAPDN, DFHAPEX, DFHAPIQ, DFHAPJC, DFHAPSM, DFHAPST, DFHAPSI, DFHAPXM, DFHAPXME, DFHDKMR, DFHEDFE, DFHEISR, DFHICXM, DFHSAIQ, DFHSIPLT, DFHSTD, DFHSTFC, DFHSTJC, DFHSTLK, DFHSTLS, DFHSTSZ, DFHSTTD, DFHSTTM, DFHSTTR, DFHSTTS, DFHSUEX, DFHTDXM, DFHTSUT

**XMEOUT Parameters:** applid, X'offset', modname

DFHAP0005 applid A hardware error has occurred (module modname, code X'code'). MVS Store Clock found inoperative.

**Explanation:** A hardware error has occurred during the running of module modname. The MVS store clock facility is the timing mechanism for the operating system.

The code X'code' is the exception trace point ID which uniquely identifies the place where the error was detected.

**System action:** An exception entry (code code in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User response:** Investigate the MVS store clock to determine whether it is working properly. If this is the cause, you should take the appropriate action to have it repaired or replaced.

In the unlikely event that this is not a hardware problem, you need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

**Modules:** DFHAP0100 applid Suffix module modname cannot be loaded. Enter new suffix, 'YES'(unsuffixed), 'NONE'(dummy), or 'CANCEL'

**Explanation:** During AP domain initialization, a suffixed CICS module or table could not be loaded.

**System action:** The AP domain initialization routines wait for the operator to:
- Enter an alternative two-character suffix,
- Enter 'YES' to request the unsuffixed version,
- Enter 'NONE' to request that a dummy version of the program or table be loaded, or
- Enter 'CANCEL'. If 'CANCEL' is entered, CICS is abnormally terminated at the end of the nucleus process.

**User response:** Determine whether the suffix is correct. If it is not, enter one of the replies listed in the System Action.

If you enter 'CANCEL', correct the error by adding the module to the appropriate library and then restart CICS.

Destination: Console

**Modules:** DFHSIB1

**XMEOUT Parameters:** applid, modname

DFHAP0101 applid Suffix module modname cannot be loaded.

**Explanation:** During AP domain initialization, a suffixed CICS module or table could not be loaded. This message is issued for all suffixable modules which cannot be located after CANCEL has been specified in response to a preceding DFHAP0100 message.

**System action:** The AP domain initialization continues until the end of the nucleus load process. CICS is then abnormally terminated with a dump.

**User response:** Determine whether the suffix is correct. If it is not, either correct the SIT or name the correct suffix via an override for the next initialization of CICS. Otherwise correct the error by adding the module to the appropriate library.

Destination: Console

**Modules:** DFHSIB1

**XMEOUT Parameters:** applid, modname
DFHAP0360  date time applid An attempt to establish
security for userid userid has failed.
SAF codes are (X’safresp’, X’safreas’),
ESM codes are (X’esmresp’, X’esmreas’).

Explanation: An attempt was made to establish
security for userid userid but it was rejected by the
external security manager (ESM). Check that the userid
has been defined correctly.

System action: Security has not been established for
the userid. The attempt to start the transaction has
failed.

User response: The response and reason codes
(safresp and safreas) returned by the system
authorization facility (SAF), and the response and
reason codes (esmresp and esmreas) returned by the
external security manager (ESM) are those issued by
the RACROUTE REQUEST=VERIFY or RACROUTE
REQUEST=EXTRACT macros. These return codes are
described in the OS/390 MVS Programming: Authorized
Assembler Services Guide, and in External Security
Interface (RACROUTE) Macro Reference for MVS and
VM (SC28-1366). See these manuals for an explanation
of the codes.

There may be further messages produced by CICS or
the external security manager (ESM) which provide
more information.

Destination: CICS

Modules: DFHICXM DFHIEXM

XMEOUT Parameters: date, time, applid, userid,
X’safresp’, X’safreas’, X’esmresp’, X’esmreas’

DFHAP0501  date time applid Program programe has
issued an ADDRESS CSA command
that is no longer supported.

Explanation: The program programe has attempted
to address the CSA. This function is no longer
supported. The address returned is now fetch protected.
Any attempt to reference this address results in an
abend.

System action: CICS continues.

User response: Remove this command from the
application program. Translate and compile. Remove
any references to the address that was previously
returned.

Destination: CMIG

Modules: DFHEEI

XMEOUT Parameters: date, time, applid, programe

DFHAP0601 applid Force purge of transaction id
tranid transaction number trannum has
been deferred because the transaction
is executing post commit syncpoint
processing.

Explanation: CICS has received a request to force
purge a transaction. The target of the force purge
request is part way through processing the second
phase of a two phase syncpoint. If the purge was
accepted at this time, the target transaction would be
abended and this would cause CICS to fail with a
U0408 abend. There is no way of purging the target
transaction while it is in this state. Transactions should
only remain in this state for a short period of time. A
subsequent attempt to force purge the transaction may
preempt the deferred abend issued by the system when
this condition was detected. This would result in the
transaction being purged from the system faster than if
the deferred purge is left to take effect.

System action: CICS defers the purge until the target
transaction is no longer protected against purge.

User response: Retry the purge after a short interval
if the target transaction has not ended.

Note: Do not attempt to reroute this message to a
transient data queue.

Destination: Console

Modules: DFHAPXME

XMEOUT Parameters: applid, tranid, trannum

DFHAP0602 applid Force purge of transaction id
tranid transaction number trannum has
been deferred because the transaction
is executing transaction backout.

Explanation: CICS has received a request to force
purge a transaction. The target of the force purge
request is part way through transaction backout
processing (either as a result of an earlier transaction
abend, or a syncpoint rollback request). If the purge
was accepted at this time, the target transaction would
be abended and this would cause CICS to fail with a
U0405 abend. There is no way of purging the target
transaction while it is in this state. Transactions should
only remain in this state for a short period of time. A
subsequent attempt to force purge the transaction may
preempt the deferred abend issued by the system when
this condition was detected. This would result in the
transaction being purged from the system faster than if
the deferred purge is left to take effect.

System action: CICS defers the purge until the target
transaction is no longer protected against purge.

User response: Retry the purge after a short interval
if the target transaction has not ended.
Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Modules: DFHAPXMEX

XMEOUT Parameters: applid, tranid, trannum

DFHAP0603 applid Forcepurge of transaction ID tranid, transaction number trannum, recovery token 'X'rtoken' has been deferred because the transaction is waiting for a DLI request in DBCTL to complete.

Explanation: CICS has received a request to forcepurge a transaction. The target of the forcepurge request is waiting in DBCTL (or an IMS DC system which CICS thinks is a DBCTL) for the DLI request to complete. If the forcepurge was accepted at this time, the IMS system would fail with a U113 abend. The target transaction cannot be purged while it is in this state. Transactions should only remain in this state for a short time, unless the transaction is requesting some data or resource held by some other task in DBCTL. The recovery token may be used to identify which DBCTL thread corresponds to your task. (Issue /DIS CCTL ALL against the relevant DBCTL). One of the other active threads probably holds the resource you are waiting for. A subsequent attempt to forcepurge the transaction may preempt the deferred abend issued by the system when this condition was detected. This would result in the transaction being purged from the system faster than if the deferred purge is left to take effect.

System action: CICS defers the forcepurge until the target transaction is no longer protected against purge.

User response: Retry the forcepurge after a short interval if the target transaction has not ended. If the purge is still deferred, you will not be able to purge this transaction until the resource it is waiting for is released.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Modules: DFHAPXMEX

XMEOUT Parameters: applid, tranid, trannum, 'X'rtoken'

DFHAP0604 applid Forcepurge of transaction ID tranid, transaction number trannum, recovery token 'X'rtoken' has been deferred because the transaction is on a CICS-DB2 ready queue waiting for a thread or TCB to become available.

Explanation: CICS has received a request to forcepurge a transaction. The target of the forcepurge request is queued on a CICS-DB2 ready queue waiting for a DB2 thread or TCB to become available. The target transaction cannot be purged while it is in this state.

If the CEMT INQUIRE TASK panel shows the task with an htype value of 'CDB2TCB', this means the task is awaiting a CICS-DB2 subtask TCB to become available, meaning that the DB2CONN defined TCBLIMIT has been reached.

If the CEMT INQUIRE TASK panel shows the task with an htype value of 'CDB2CONN', this means the task is awaiting a CICS-DB2 connection to become available with which to associate with the CICS open tcb to be used for the request. This indicates that the DB2CONN defined TCBLIMIT has been reached which limits the number of open TCBs that can be used for DB2.

If the htype value is 'CDB2RDYQ', this means the task is awaiting a CICS-DB2 thread to become available, and Hvalue identifies the pool, or the particular DB2ENTRY against which it is queued.

Transactions should remain in these states only for a short time.

System action: CICS defers the forcepurge until the target transaction is no longer protected against purge.

User response: If the task is queued awaiting a CICS-DB2 subtask TCB, you can increase the value of TCBLIMIT in the DB2CONN. If the transaction is awaiting a CICS-DB2 thread, you can increase the THREADLIMIT value in the DB2ENTRY, or in the DB2CONN for the pool.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Modules: DFHAPXMEX

XMEOUT Parameters: applid, tranid, trannum, X'rtoken'

DFHAP0701 applid An abend (code abcode) has occurred in exit program progname at exit point xxxxxxx.

Explanation: An abnormal end (abend) or program check has occurred in the program progname. This implies that there is an error in the error program, that unexpected data has been input, or storage has been overwritten.

The code is a three digit hexadecimal MVS code (if applicable), followed by a four digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System action: CICS makes an exception entry in the trace table and returns a zero return code to the exit point. CICS also produces a system dump unless:...
The module producing the error message is DFHUEH, or

- You have specifically suppressed dumps in the dump table, or
- The exit point is XDUREQ. No dump is taken in order to avoid recursive dumping.

Either CICS continues unless you have specified in the dump table that CICS should terminate.

Or This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate. If this is the case, a zero return code is returned to the CICS management module.

**User response:** There might be a logic error in the user exit program `progname`. DISABLE the exit program from all exit points, by using the EXITALL operand in the EXEC CICS DISABLE, and correct the error.

For programming information about coding user exit programs see the [CICS Customization Guide](https://www.ibm.com/support/knowledgecenter/S59XYD_10.1.0/com.ibm.cics.doc/cicdoc.html).

**Destination:** Console

**Modules:** DFHSUEX, DFHUEH

**XMEOUT Parameters:** `applid, progname, xxxxxxxx`

---

**DFHAP0704** `applid` A possible loop has been detected in exit program `progname` at exit point `xxxxxxxx`

**Explanation:** The exit program `progname` was in control and the transaction has consumed more CPU time than has been specified in the ICVR. There is probably a loop.

**System action:** CICS returns a zero return code to the exit point. CICS also produces a system dump unless

- The module producing the error message is DFHUEH, or
- You have specifically suppressed dumps in the dump table, or
- The exit point is XDUREQ. No dump is taken in order to avoid recursive dumping.

**User response:** There is a probable logic error in the user exit program `progname`. DISABLE the exit program from all exit points by using the EXITALL operand in the EXEC CICS DISABLE, and correct the error.

Refer to the [CICS Customization Guide](https://www.ibm.com/support/knowledgecenter/S59XYD_10.1.0/com.ibm.cics.doc/cicdoc.html) for further information about coding user exit programs.

If you think there is no loop, you can increase the runaway task time interval in the ICVR by using CEMT. This is explained in the [CICS Supplied Transactions](https://www.ibm.com/support/knowledgecenter/S59XYD_10.1.0/com.ibm.cics.doc/cicdoc.html) manual.

**Destination:** Console

**Modules:** DFHSUEX, DFHUEH

**XMEOUT Parameters:** `applid, progname, xxxxxxxx`

---

**DFHAP0705** `date time applid` The enable of task related user exit program `progname` has caused CICS to force TASKDATALOC(BELLOW) for all transactions.

**Explanation:** Task-related user exit program `progname` has been enabled with options TASKSTART and LINKEDITMODE, and `progname` has been linkeded AMODE 24. This ensures that it is always invoked in amode 24. An amode 24 task-related user exit program can only be invoked if the calling transaction is defined with TASKDATALOC(BELLOW).

By enabling the AMODE 24 task-related user exit for task start, the user has forced CICS to force all subsequent transactions to run with TASKDATALOC(BELLOW).

**System action:** CICS continues, but for the remainder of the CICS run, CICS insists that all transactions run with TASKDATALOC(BELLOW).

**User response:** To avoid all transactions having to run with TASKDATALOC(BELLOW), modify the task-related user exit so that it is capable of running AMODE(31) when invoked for task start.

Ideally the task-related user exit should be modified so that it always runs AMODE 31 for whoever is the caller. In this case the exit program can be linkeded with the AMODE 31 attribute, and enabled with the LINKEDITMODE option. This ensures CICS always invokes it in AMODE 31.

Alternatively the task-related user exit could be modified so it is capable of being invoked in either amode. In this case the exit should be enabled without the LINKEDITMODE option. This means the exit will be invoked in the amode of its caller. For CICS calls such as task start, this will always be AMODE 31, but it does allow the exit to be invoked AMODE 24 for calls from an amode 24 application if this is desired.

See the [CICS Resource Definition Guide](https://www.ibm.com/support/knowledgecenter/S59XYD_10.1.0/com.ibm.cics.doc/cicdoc.html) for more information on the TASKDATALOC option.

See the [CICS Customization Guide](https://www.ibm.com/support/knowledgecenter/S59XYD_10.1.0/com.ibm.cics.doc/cicdoc.html) for programming information on the LINKEDITMODE option when enabling task-related user exits.

**Destination:** Console and Transient Data Queue CSMT

**Modules:** DFHUEM

**XMEOUT Parameters:** `date, time,applid, progname`
DFHAP0706 applid A probable loop has been detected in task related user exit program progname.

Explanation: The task related user exit program progname was in control and the transaction has consumed more CPU time than has been specified in the ICVR. There is probably a loop.

System action: CICS produces a system dump unless you have specifically suppressed dumps in the dump table.

User response: There is a probable logic error in the task related user exit program progname. DISABLE the exit program and correct the error.

Refer to the CICS Customization Guide for programming information about task-related user exit programs.

If there is no loop, you can avoid this problem by increasing the runaway task time interval in the ICVR using CEMT. This is explained in the CICS Supplied Transactions.

Destination: Console

Modules: DFHERM

XMEOUT Parameters: applid, progname

DFHAP0807 applid An abend (code abcode) has occurred in task related user exit program progname.

Explanation: An abnormal end (abend) or program check has occurred in the task related user exit program progname. This implies that there is an error in the exit program, that unexpected data has been input, or storage has been overwritten.

The code is a three digit hexadecimal MVS code (if applicable), followed by a four digit alphanumeric CICS code. The MVS code is a system completion code (for example, X’0C1’ or X’D37’). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System action: CICS makes an exception entry in the trace table. A system dump is produced if requested via an entry in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate.

User response: There might be a logic error in the task related user exit program progname. DISABLE the task related user exit program and correct the error.

For programming information about coding task related user exit programs see the CICS Customization Guide.

Destination: Console

Modules: DFHERM

XMEOUT Parameters: applid, abcode, progname

DFHAP0800 applid MQ support for CICS Web Services is not available.

Explanation: An attempt has been made to use Websphere MQ as the transport for CICS Web Services, but the Websphere MQ stub CSQCSTUB could not be loaded during CICS Initialization. The Websphere MQ library SCSQLOAD needs to be included in the DFHRPL concatenation to permit use of Websphere MQ as a transport for CICS Web Services.

System action: The attempt to use Websphere MQ as a transport for CICS Web Services has been rejected. Any further such attempts will also be rejected, and this message will be produced again.

User response: The Websphere MQ library has not been made available.
SCSQLOAD must be included in the DFHRPL concatenation to allow use of Websphere MQ as a transport for CICS Web Services. This is in addition to the other Websphere MQ libraries needed for MQ support in CICS.

Destination: Console

Modules: DFHPITQ1, DFHPILSQ

XMEOUT Parameter: applid

DFHAP1006 applid Resource definition recovery has failed with code X'code' in module modname.

Explanation: An error has been detected in module modname during startup. The code X'code' is the exception trace point ID which uniquely identifies the error and where it was detected.

System action: An exception entry is made in the trace table (X'code' in the message). A system dump is taken unless you have specifically suppressed dumps in the dump table.

This is a critical error and CICS is terminated even if you have specified in the dump table that CICS should not terminate.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Notify the system programmer. This failure indicates a serious error in CICS. For further information about CICS exception trace entries, see the CICS Diagnosis Reference.

Destination: Console

Modules: DFHAPRDR, DFHTCRP

XMEOUT Parameters: applid, X'code',modname

DFHAP1007 applid A GETMAIN has failed for a resource definition control block code X'code' in module modname.

Explanation: An storage request has failed in module modname. The code X'code' is the exception trace point ID which uniquely identifies the error and where it was detected.

System action: An exception entry is made in the trace table (X'code' in the message). A system dump is taken unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Notify the system administrator. This failure may indicate that you need to increase the size limits of the EDSAs. EDSA storage limits are specified by the EDSALIM system initialization parameter. See the CICS System Definition Guide for more guidance on EDSALIM. For further information about CICS exception trace entries, see the CICS Diagnosis Reference.

Destination: Console

Modules: DFHAPRDR

XMEOUT Parameters: applid, X'code',modname

DFHAP1200 applid A CICS request to the Language Environment has failed. Reason code rc.

Explanation: CICS has attempted to communicate with AD/Cycle Language Environment, but due to an error, the function requested by CICS could not be performed.

System action: If the error occurs during system initialization, then the initialization continues but without support for the Language Environment. If the error occurs in a user application program, then the transaction is abnormally terminated.

If the error occurs during system initialization, check that the Language Environment modules and the modules required for the languages supported by that environment have been correctly installed. In particular ensure that:

- The interface module CEECICS has been placed in a library concatenated to the STEPLIB DD statement of the CICS startup job stream
- The required modules in the CSD have been defined (these modules are listed in the file CEESAMP which is supplied with the sample files on the distribution tape).

Destination: Console

Modules: DFHAPL

XMEOUT Parameters: applid, rc

DFHAP1203I applid Language Environment is being initialized.

Explanation: This is an informatory message indicating that CICS is initializing support for the Language Environment.

System action: System initialization continues.

User response: None. You can suppress this message with the system initialization parameter, MSGGLVL=0.
DFHAP1206 applid CEECCICS module not found.

Explanation: This is an informatory message indicating that CICS is unable to locate the Language Environment CEECCICS module either via the BLDL mechanism or in the LPA, and consequently CICS cannot call Language Environment to initialize.

System action: System initialization continues. However it will not be possible to execute application programs written in a high level language.

User response: If you need this CICS system to support the Cobol language you should search the joblog for any messages issued by Language Environment. One possible reason is that the CEEEV005 program, which is the Language Environment interface module to the Cobol runtime, has not been defined in the CICS System Definition (CSD) file. Refer to the Language Environment for OS/390 Customization for further guidance.

Destination: Console

Modules: DFHAPLI

XMEOUT Parameter: applid

DFHAP1207 applid CEEPIPI module not found.

Explanation: This is an informatory message indicating that CICS is unable to locate the Language Environment CEEPIPI module either via the BLDL mechanism or in the LPA.

System action: System initialization continues. However it will not be possible for CICS to establish the pre-initialized environment required by CICS to support the JVM and sockets.

User response: If you need this CICS system to support the JVM and sockets, you must ensure that the CEEPIPI module, which is distributed in the Language Environment SCEERUN library, can be located either via STEPLIB or in the LPA.

Destination: Console

Modules: DFHAPLI

XMEOUT Parameter: applid

DFHAP1208 applid Language Environment cannot support the Cobol language.

Explanation: This is an informatory message indicating that Language Environment has initialized successfully but is unable to execute programs written in the Cobol language.

System action: System initialization continues. However it will not be possible for CICS to run applications written in Cobol.

User response: If you need this CICS system to support the Cobol language you should search the joblog for any messages issued by Language Environment. One possible reason is that the CEEEV010 program, which is the Language Environment interface module to the PL/I runtime, has not been defined in the CICS System Definition (CSD) file. Refer to the Language Environment for OS/390 Customization for further guidance.

Destination: Console

Modules: DFHAPLI

DFHAP1211 applid Language Environment initialization completed.

Explanation: This is an informative message indicating that Language Environment initialization has completed.

System action: System initialization continues.

User response: None. You can suppress this message with the system initialization parameter, MSGLEVEL=0.

Destination: Console
Modules: DFHAPLI
XMEOUT Parameters: applid, modname, compcode, reason

DFHAP1214 applid Language Environment global ENVAR option defined with invalid CICS program options.

Explanation: An error has been detected in the Language Environment global runtime ENVAR option. The ENVAR string contains a substring in the form 'CICSVAR=xx....xx', but 'xx....xx' is an invalid or unsupported program option. At this level of CICS, the only valid options are 'OPENAPI', 'THREADSAFE' or 'QUASIRENT'.

System action: The incorrect ENVAR substring is ignored.

User response: Refer to the CICS System Definition Guide for information on how to define program options in the ENVAR string.

Destination: Console
Modules: DFHAPLI
XMEOUT Parameter: applid

DFHAP1215 applid Invalid CICS program options found in ENVAR string in program pgmname.

Explanation: The application program contains user-defined Language Environment runtime options, and an error has been detected in the specification of the ENVAR option. The ENVAR string contains a substring in the form 'CICSVAR=xx....xx', but 'xx....xx' is an unsupported or invalid program option. At this level of CICS, the only supported options are 'OPENAPI', 'THREADSAFE' or 'QUASIRENT'.

System action: The incorrect ENVAR substring is ignored.

User response: Refer to the CICS System Definition Guide for information on how to define program options in the ENVAR string.
## CICS Messages and Codes

### DFHAP1217  date time applid Attempt to fetch user replaceable module DFHJVMAT has failed.

**Explanation:** The CICS JVM interface issued a fetch to load user replaceable module DFHJVMAT. The native C fetch request failed.

**System action:** The CICS transaction is abended with abend code AJM9.

**User response:** Ensure that C program DFHJVMAT is present in a dataset in the CICS STEPLIB concatenation. Examine messages output by language environment to determine why the fetch request failed.

**Destination:** CSMT

**Modules:** DFHAPLI

**XMEOUT Parameters:** date, time,applid

### DFHAP1218  date time applid CEEPIPI function pipifn failed with return code r15rc

**Explanation:** CICS XPLINK called CEEPIPI with one of the following function codes:

1. `init_main` to initialize a new PIPI execution environment
2. `call_main` to invoke the main program in the PIPI environment
3. `term` to terminate a PIPI execution environment
4. `add_entry` to add an entry to the PIPI PreInit Table
5. `delete_entry` to delete an entry from the PIPI PreInit Table

A non-zero return code from CEEPIPI indicates that the function failed.

**System action:** Language Environment may have written diagnostic information to the CESE destination. CICS abends the transaction with an abend code of ALX1, ALX2, ALX3, ALX4 or ALX5 depending upon the reason for the call to CEEPIPI.

**User response:** Look at SYSOUT or the CESE destination for LE messages. Look in Language Environment Programmers Guide (SC28-1939) for the CEEPIPI function and the explanation of the return code which is in Register 15.

**Destination:** CSMT

**Modules:** DFHAPLI

**XMEOUT Parameters:** date, time,applid, pipifn, r15rc

### DFHAP1226  date time applid Program program is defined as EXECKEY(USER) but transaction transaction as TASKDATAKEY(CICS): these attributes are incompatible.

**Explanation:** An attempt has been made to run a program defined as EXECKEY(USER) as part of a transaction defined as TASKDATAKEY(CICS). These attributes are incompatible. This incompatibility could occur as a result of the program definition being autoinstalled. See the CICS Customization Guide and the CICS Resource Definition Guide for more information about program autoinstall.

**System action:** The transaction will be abnormally terminated with abend code AEZD.

**User response:** Redefine and install a new definition either for the transaction with TASKDATAKEY(USER), or for the program with EXECKEY(CICS).

If this message occurs when running a CICS transaction, a possible cause is that you are not using the CICS-supplied definition for the program. If you are using your own copies of CICS-supplied program definitions, you must be defined as EXECKEY(CICS).

**Destination:** CSMT

**Modules:** DFHAPLI

**XMEOUT Parameters:** date, time,applid, program, transaction

### DFHAP1300  date time applid The JVM at address X'jvm_anchor' on thread X'thread_anchor' has encountered an error (reason code: X'reason_code') and has requested further diagnostic data from CICS. More information may be found in the stderr file: stderr.

**Explanation:** An error condition was detected by one of the JVMs in the JVMPool. The JVM invoked CICS services to capture a system dump. The JVM may recover, and continue processing, or may terminate. The JVM may write further data to the current stderr file indicated in the message.

**System action:** A system dump is taken. For critical errors in the JVM, the JVM is terminated. If a CICS program was in control at the time of the failure, the program is abended. If the failure occurred during task termination, the current transaction is rolled back. Processing continues by recreating the JVM or using other JVMs in the JVMPool.

**User response:** Examine the system dump using the JVM formatting utility. Use the address (jvm_anchor) shown in the message to identify the JVM. Optionally, use the address (thread_anchor) shown in the message to identify the thread in the JVM. The failure may be due to a JVM internal error, or to a component loaded by the JVM as a Native method or plug-in. The reason...
code given (reason_code) may be a signal handle or other code defined by the JVM. Use the information generated by the JVM in the stderr file to assist in the diagnosis of the problem.

Destination: CSMT

Modules: LIBDFHAPJVMT.SO

XMEOUT Parameters: date, time, applid, X'jvm_anchor, X'thread_anchor, X'reason_code', stderr

DFHAP1301

Date time applid Language Environment has detected a corruption of its control blocks. Transaction tranid currently executing.

Explanation: Language Environment has issued a return code 8 indicating its control blocks are corrupted.

System action: The transaction abnormally ends with abend code 0C3.

User response: Investigate the cause of the corruption of the Language Environment control blocks.

Destination: Console

Modules: DFHAPLI

XMEOUT Parameter: applid

Chapter 1. DFH messages

DFHBAxxxx messages

DFHBA0001 applid An abend (code code) has occurred at offset X'offset' in module module.

Explanation: An unexpected program check or abend occurred with abend code aaaa/bbbb.

The program status word (PSW) at the time of the program check or abend indicated that CICS was executing at offset X'offset' in module modname. This may have been caused by corruption of CICS code or control blocks.

System action: A system dump is taken and the system attempts to continue operation unless otherwise directed by entries in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Investigate the cause of the program check or abend using the system dump and any previously output diagnostic information provided by CICS, the access methods, or the operating system.

If you cannot resolve the problem, you will need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Modules: DFHBAAC, DFHBAAC1, DFHBAAC2, DFHBAAC3, DFHBAAC4, DFHBAAC5, DFHBAAC6, DFHBAAR1, DFHABAR, DFHACO1, DFHACOR, DFHADM, DFHALR1, DFHALR2, DFHALR3, DFHALR4, DFHALR5, DFHALR6, DFHALR7, DFHALR8, DFHALR9, DFHAPR, DFHAPT1, DFHASP, DFHATT, DFHBAUE, DFHAVP1, DFHAXM

DFHBA0002 applid A severe error (code X'code') has occurred in module module.

Explanation: The BA domain has received an unexpected error response from some other part of CICS. The operation requested by recovery manager is described by code X'code'.

For further information about CICS exception trace entries, refer to the CICS Problem Determination Guide.

System action: A system dump is taken and the system attempts to continue operation unless specifically inhibited by dump table entries.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Investigate the cause of the problem as follows:

1. Determine if the problem can be explained by any previous messages issued from some other CICS component.
2. Examine the symptom string.
3. Examine the dump.
If you cannot resolve the problem, you will need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** Console

**Modules:** DFHBAAC, DFHBAAC1, DFHBAAR1, DFHBAAR2, DFHBAACO1, DFHBAAR1, DFHBAAR2, DFHBAAT1, DFHBAASP, DFHBATT, DFHBAUE, DFHBAXM

**XMEOUT Parameters:** applid, X’code’, module

---

**DFHBA0101** date time applid
An error has occurred while writing an auditlog record to log logname. Logging has been suspended.

**Explanation:** The BA Write audit record request has failed.

**System action:** Normal processing continues with logging of audit records to the specified log suspended.

**User response:** Determine if the problem can be explained by any previous messages issued from some other CICS component. If the log is successfully reconnected, audit logging will be resumed, see message DFHBA0102. If you cannot resolve the problem, you will need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** Console and Transient Data Queue CSBA

**Modules:** DFHBAAR2

**XMEOUT Parameters:** date, time, applid, logname

---

**DFHBA0102** date time applid
Auditlog writing to log logname has been successfully resumed.

**Explanation:** The BA Write audit record requests has resumed after being suspended.

**System action:** Audit logging has resumed.

**User response:** None.

**Destination:** Console and Transient Data Queue CSBA

**Modules:** DFHBAAR2

**XMEOUT Parameters:** date, time, applid, logname

---

**DFHBA0103** date time applid terminal userid tranid
Processtype definition entry processtype has been deleted.

**Explanation:** This is an audit log message indicating that Processtype entry processtype has been deleted using the DISCARD command. Where:

- **terminal** is the netname or termid of the terminal associated with the transaction issuing the message.
- **userid** is the user identifier of the user associated with the transaction issuing the message.
- **tranid** is the transaction issuing the message.

**System action:** The system continues normally.

**User response:** None.

**Destination:** CSBA

---

**DFHBA0104** date time applid
The root activity of process processname of processtype has completed status ABENDED, code abendcode, TRANSID(transid) USERID(userid).

**Explanation:** This indicates that the root activity of the process processname, of processtype processtype, has completed abnormally with abendcode abendcode. Where:

- **transid** is the tranid of the activation that completed the activity.
- **userid** is the user identifier of the transaction that completed the activity.

**System action:** The root activity is marked complete abended in the BTS repository in the normal way and the system continues normally.

**User response:** None.

**Destination:** CSBA

**Modules:** DFHBATT

**XMEOUT Parameters:** date, time, applid, terminal, userid, tranid, processtype

---

**DFHBA0105** date time applid terminal userid tranid
Processtype definition entry processtype has been installed.

**Explanation:** This is an audit log message indicating that Processtype entry processtype has been added to the system or modified via the INSTALL command. Where:

- **terminal** is the netname or termid of the terminal associated with the transaction issuing the message.
- **userid** is the user identifier of the user associated with the transaction issuing the message.
- **tranid** is the transaction issuing the message.

**System action:** The system continues normally.

**User response:** None.

**Destination:** CSBA

DFHBA0206 Module module exec parameter error, invalid keyword at position position.

Explanation: An exec parameter error has been detected.
A invalid keyword has been found. The message contains the module name that detected the error and the position of the invalid keyword.

System action: The program terminates with return code 12.

User response: Correct the error and submit the job again.
If the problem cannot be determined and corrected, you will need further assistance from IBM.

Destination: Console
Modules: DFHATUP DFHBARUP

DFHBA0207 Module module exec parameter error, invalid translate field at position position.

Explanation: An exec parameter error has been detected.
An invalid translate keyword field has been located. The message contains the name of the module that detected the error and the position of the invalid keyword field.

System action: The program terminates with return code 12.

User response: Correct the error and submit the job again.
If the problem cannot be determined and corrected, you will need further assistance from IBM.

Destination: Console
Modules: DFHATUP DFHBARUP

DFHBA0208 Module module exec parameter error, duplicate translate keyword at position position.

Explanation: An exec parameter error has been detected.
A duplicate translate keyword has been found. The message contains the name of the module that detected the error and the position of the duplicate translate keyword.

System action: The program terminates with return code 12.

User response: Correct the error and submit the job again.
If the problem cannot be determined and corrected, you will need further assistance from IBM.

Destination: Console
Modules: DFHATUP DFHBARUP

DFHBA0209 Module module exec parameter error, invalid pagesize field at position position.

Explanation: An exec parameter error has been detected.
An invalid pagesize field has been found. The message contains the name of the module that detected the error and the position of the invalid field.

System action: The program terminates with return code 12.

User response: Correct the error and submit the job again.
If the problem cannot be determined and corrected, you will need further assistance from IBM.

Destination: Console
Modules: DFHATUP DFHBARUP

DFHBA0210 Module module exec parameter error, duplicate pagesize keyword at position position.

Explanation: An exec parameter error has been detected.
A duplicate pagesize keyword has been found. The message contains the name of the module that detected the error and the position of the duplicate keyword.

System action: The program terminates with return code 12.

User response: Correct the error and submit the job again.
If the problem cannot be determined and corrected, you will need further assistance from IBM.

Destination: Console
Modules: DFHATUP DFHBARUP

DFHBA0211 Module module exec parameter error, invalid NATLANG field at position position.

Explanation: An exec parameter error has been detected.
An invalid natlang field has been found. The message contains the name of the module that detected the error and the position of the invalid field.

System action: The program terminates with return code 12.
**User response:** Correct the error and submit the job again.
If the problem cannot be determined and corrected, you will need further assistance from IBM.

**Destination:** Console
**Modules:** DFHATUP DFHBARUP

---

**DFHBA0212** Module *module* exec parameter error, duplicate NATLANG keyword at position *position*.

**Explanation:** An exec parameter error has been detected.
A duplicate natlang keyword has been found. The message contains the name of the module that detected the error and the position of the duplicate keyword.

**System action:** The program terminates with return code 12.
**User response:** Correct the error and submit the job again.
If the problem cannot be determined and corrected, you will need further assistance from IBM.

**Destination:** Console
**Modules:** DFHATUP DFHBARUP

---

**DFHBA0213** Open of SYSIN failed in module *module*.

**Explanation:** An open of SYSIN failed.
The message contains the name of the module that detected the error.

**System action:** The program terminates with return code 12.
**User response:** Check if any additional system messages have been issued that may help you to determine the cause of the problem.
If the problem cannot be determined and corrected, you will need further assistance from IBM.

**Destination:** SYSPRINT
**Modules:** DFHATUP DFHBARUP

---

**DFHBA0214** Module *module* invalid keyword at position *position*.

**Explanation:** A SYSIN parameter error has been detected.
A invalid keyword has been found. The message contains the name of the module that detected the error and the position of the invalid keyword.

**System action:** The program terminates with return code 12 after all the SYSIN parameters have been processed.
**User response:** Correct the error and submit the job again.
If the problem cannot be determined and corrected, you will need further assistance from IBM.

**Destination:** SYSPRINT
**Modules:** DFHATUP DFHBARUP

---

**DFHBA0215** Module *module* invalid keyword field length at position *position*.

**Explanation:** A sysin parameter error has been detected.
An invalid keyword field length has been detected. The message contains the name of the module that detected the error and the position of the invalid field.

**System action:** The program terminates with return code 12 after all the sysin parameters have been processed.
**User response:** Correct the error and submit the job again.
If the problem cannot be determined and corrected, you will need further assistance from IBM.

**Destination:** SYSPRINT
**Modules:** DFHATUP DFHBARUP

---

**DFHBA0216** Module *module* invalid keyword field at position *position*.

**Explanation:** A sysin parameter error has been detected.
An invalid keyword field has been found. The message contains the name of the module that detected the error and the position of the invalid keyword.

**System action:** The program terminates with return code 12 after all the sysin parameters have been processed.
**User response:** Correct the error and submit the job again.
If the problem cannot be determined and corrected, you will need further assistance from IBM.

**Destination:** SYSPRINT
**Modules:** DFHATUP DFHBARUP

---

**DFHBA0217** Module *module* unexpected keyword at position *position*.

**Explanation:** A sysin parameter error has been detected.
An unexpected keyword has been found. The message contains the name of the module that detected the error.

**System action:** The program terminates with return code 12 after all the sysin parameters have been processed.
**User response:** Correct the error and submit the job again.
If the problem cannot be determined and corrected, you will need further assistance from IBM.

**Destination:** SYSPRINT
**Modules:** DFHATUP DFHBARUP
and the position of the unexpected keyword.

**System action:** The program terminates with return code 12.

**User response:** Correct the error and submit the job again.

If the problem cannot be determined and corrected, you will need further assistance from IBM.

**Destination:** SYSPRINT

**Modules:** DFHATUP DFHBARUP

---

**DFHBA0218 Module module duplicate auditlog keyword at position position.**

**Explanation:** A sysin parameter error has been detected.

A duplicate auditlog keyword has been found. The message contains the name of the module that detected the error and the position of the duplicate keyword.

**System action:** The program terminates with return code 12 after all the sysin parameters have been processed.

**User response:** Correct the error and submit the job again.

If the problem cannot be determined and corrected, you will need further assistance from IBM.

**Destination:** SYSPRINT

**Modules:** DFHATUP DFHBARUP

---

**DFHBA0219 Module module continuation not allowed.**

**Explanation:** A sysin parameter error has been detected.

A parameter card contains an invalid continuation character. The message contains the name of the module that detected the error.

**System action:** The program terminates with return code 12 after all the sysin parameters have been processed.

**User response:** Correct the error and submit the job again.

If the problem cannot be determined and corrected, you will need further assistance from IBM.

**Destination:** SYSPRINT

**Modules:** DFHATUP DFHBARUP

---

**DFHBA0220 Module module unexpected end of file.**

**Explanation:** A sysin parameter error has been detected.

The last sysin card read before end of file was reached has a continuation indicator. The message contains the name of the module that detected the error.

**System action:** The program terminates with return code 12.

**User response:** Correct the error and submit the job again.

If the problem cannot be determined and corrected, you will need further assistance from IBM.

**Destination:** SYSPRINT

**Modules:** DFHATUP DFHBARUP

---

**DFHBA0221 Error opening file in module module.**

**Explanation:** An open of the auditlog has failed.

The message contains the name of the module that detected the error and the name of auditlog data set.

**System action:** The program terminates with return code 12.

**User response:** Check if any additional system messages have been issued that may help you to determine the cause of the problem.

If the problem cannot be determined and corrected, you will need further assistance from IBM.

**Destination:** SYSPRINT

**Modules:** DFHATUP DFHBARUP

---

**DFHBA0222 Module module terminated because of errors, check SYSPRINT for details.**

**Explanation:** The program has detected errors that have caused it to terminate.

Additional error messages have been output to SYSPRINT.

**System action:** The program terminates with return code 12.

**User response:** Use the additional messages output to SYSPRINT to determine the cause of the problem.

If the problem cannot be determined and corrected, you will need further assistance from IBM.

---

**DFHBA0226**  
**Message**  
Showcb failed in module *module*. R15 = X'r15val'. R0 = X'r0val'.

**Explanation:** A Vsam showcb macro call has failed.

The message contains the name of the module that issued the failed showcb and the register 15 and 0 values at the time of the error. At the time of the error register 15 contains the return code and register 0 contains the reason code. The reason code is only valid if the return code value is 4.

**System action:** The program terminates with return code 12.

**User response:** Use the return code and reason code values to determine the cause of the problem.

Check if any additional system messages have been issued that may help you to determine the cause of the problem.

If the problem cannot be determined and corrected, you will need further assistance from IBM.

**Destination:** SYSPRINT

**Modules:** DFHBARUP
DFHBA0228 Error closing file in module module.
   R15 = 'r15val' reason code = 'reasval'.

Explanation: A Vsam close macro call has failed.
The message contains the name of the data set being closed, the name of the module issuing the close, the register 15 and reason code values at the time of the error. At the time of the error register 15 contains the return code.

System action: The program continues. This may indicate a problem with the repository data set.

User response: Use the return code and reason code values to determine the cause of the problem.
Check if any additional system messages have been issued that may help you to determine the cause of the problem.
If the problem cannot be determined and corrected, you will need further assistance from IBM.

Destination: SYSPRINT

Modules: DFHBARUP

DFHBA0229 Get for file failed in module module.
   R15 = 'r15val' reason code = 'reasval'.

Explanation: A Vsam get macro call has failed.
The message contains the name of the data set that the get is being issued against, the name of the module issuing the get, the register 15 and reason code values at the time of the error. At the time of the error register 15 contains the return code.

System action: The program terminates with return code 12.

User response: Use the return code and reason code values to determine the cause of the problem.
Check if any additional system messages have been issued that may help you to determine the cause of the problem.
If the problem cannot be determined and corrected, you will need further assistance from IBM.

Destination: SYSPRINT

Modules: DFHBARUP

DFHBA0230 Point for file failed in module module.
   R15 = 'r15val' reason code = 'reasval'.

Explanation: A Vsam point macro call has failed.
The message contains the name of the data set that the point failed on, the name of the module issuing the point, the register 15 and reason code values at the time of the error. At the time of the error register 15 contains the return code.

System action: The program terminates with return code 12.

User response: Use the return code and reason code values to determine the cause of the problem.
Check if any additional system messages have been issued that may help you to determine the cause of the problem.
If the problem cannot be determined and corrected, you will need further assistance from IBM.

Destination: SYSPRINT

Modules: DFHBARUP

DFHBA0231 The set of records associated with the activity or process being read are not complete.

Explanation: The set of process or activity records being read is incomplete.

System action: The program continues processing with the next process or activity.

User response: If the repository file is being accessed by a CICS region while the DFHBARUP job is running, the CICS region or regions have deleted the set of records being processed by DFHBARUP.
If this is not the case then further investigation will be required.
If the problem cannot be determined and corrected, you will need further assistance from IBM.

Destination: SYSPRINT

Modules: DFHBARUP

DFHBA0232 No records selected by module module.

Explanation: No records have been selected for printing.
The message contains the name of the module involved.

System action: The program completes with return code 0.

User response: Check that the selection parameters are correct and the correct file is being processed.
If the problem cannot be determined and corrected, you will need further assistance from IBM.

Destination: Console

Modules: DFHATUP DFHBARUP
DFHBA0233 Module module has completed processing.

Explanation: Processing has completed. The message contains the name of the module involved.

System action: The program completes with return code 0.

User response: None

Destination: Console

Modules: DFHATUP DFHBARUP

DFHBA0234 Module module has a duplicate repository keyword at position position.

Explanation: A sysin parameter error has been detected. A duplicate repository keyword has been found. The message contains the name of the module that detected the error and the position of the duplicate keyword.

System action: The program terminates with return code 12 after all the sysin parameters have been processed.

User response: Correct the error and submit the job again.

DFHBRxxxx Bridging to 3270 Transactions messages

DFHBR0201 date time applid Transaction tranid abend abcode in bridge exit brexit bridge transaction bridge

Explanation: The Bridge exit brexit terminated abnormally with abend code abcode. abcode is either a CICS transaction abend code or a user abend code generated by a CICS ABEND ABCODE(abcode) command. This command is issued either by a user program or by an IBM program (for example, a programming language library module).

Unless the abend occurred whilst the bridge exit was processing the termination or abend call, this abend will also result in CICS issuing a ABRQ abend. In this case a DFHAC2236 abend message will follow this message. See that message for details about recoverable resources.

System action: Abend ABRQ will be issued unless the transaction is calling the bridge exit for termination or abend processing.

User response: Use the abend code abcode to diagnose the problem. If the abend is issued by an IBM program product other than CICS, the code is documented in the library of that other product.

Alternatively, there might be a logic error in the bridge exit program brexit. For programming information about coding bridge exit programs see the CICS Customization Guide.

Destination: CSBR

Modules: DFHBRIC, DFHBRMS, DFHBRSP, DFHBRTC, DFHBRXM, DFHBRRM

XMEOUT Parameters: date, time,applid, tranid, abcode, brexit, bridge

DFHBR0202 date time applid tranid Bridge facility autoinstall URM urmname has abended with code abcode. The autoinstall function has been disabled.

Explanation: The Bridge facility autoinstall URM terminated abnormally with abend code abcode. abcode is either a CICS transaction abend code or a user abend code generated by a CICS ABEND ABCODE(abcode) command.

System action: The autoinstall URM is disabled. This prevents the autoinstalling of new bridge facilities, as well as the other functions of the autoinstall exit.

User response: Use the abend code abcode to diagnose the problem. If the abend is issued by an IBM...
program product other than CICS, the code is documented in the library of that other product.

Alternatively, there might be a logic error in the autoinstall URM.

When the error has been found and the problem corrected enable the autoinstall URM to re-enabled the mechanism.

Destination: CSBR

Modules: DFHBRAI

XMEOUT Parameters: date, time, applid, userid, tranid, urmname, abcde

DFHBR0203  date time applid userid tranid Bridge facility autoinstall URM urmname could not be linked. The autoinstall function has been disabled.

Explanation: The Bridge facility autoinstall URM could not be linked.

System action: The autoinstall URM is disabled. This prevents the autoinstalling of new bridge facilities, as well as the other functions of the autoinstall exit.

User response: Unless there are other messages preceding this message indicating the cause of the problem, the probable cause is that the URM cannot be found in the DFHRPL concatenation.

When the error has been found and the problem corrected enable the autoinstall URM to re-enabled the mechanism.

Destination: CSBR

Modules: DFHBRAI

XMEOUT Parameters: date, time, applid, userid, tranid, urmname

DFHBR0204  date time applid userid tranid Bridge facility autoinstall URM urmname is disabled. The request will fail.

Explanation: The Bridge facility autoinstall URM is disabled (other than as a result of an error detected by the bridge).

System action: This prevents the autoinstalling of new bridge facilities, as well as the other functions of the autoinstall exit.

User response: The probable cause of this is either that the URM was disabled by the operator, or as a result of some action of one of the other functions of the autoinstall URM.

The mechanism can be re-started by enabling the URM. Alternatively the command SET AUTOINSTALL AIBRIDGE(AUTO) can be issued to allow autogeneration of bridge facilities.

Destination: CSBR

Modules: DFHBRAI

XMEOUT Parameters: date, time, applid, userid, tranid, urmname

DFHBR0205  date time applid userid tranid Bridge facility autoinstall URM urmname returned an invalid termid name termid. The name contains invalid characters.

Explanation: The Bridge facility autoinstall URM returned an invalid termid. See the [CICS External Interfaces Guide](https://developers.ciscosupport.com/products/cics/external/interfaces-guide) for a description of the valid character set for Bridge facility termids.

System action: The request fails. If it is using the Link3270 mechanism the request fails with a reason code of BRHRC-TERMID-INVALID. Other bridge mechanisms fail with an ABRU abend code.

User response: Correct the URM so that it generates or accepts valid termid names from clients.

Destination: CSBR

Modules: DFHBRAI

XMEOUT Parameters: date, time, applid, userid, tranid, urmname, termid

DFHBR0206  date time applid userid tranid Bridge facility autoinstall URM urmname returned an invalid netname netname. The name contains invalid characters.

Explanation: The Bridge facility autoinstall URM returned an invalid netname. See the [CICS External Interfaces Guide](https://developers.ciscosupport.com/products/cics/external/interfaces-guide) for a description of the valid character set for Bridge facility netnames.

System action: The request fails. If it is using the Link3270 mechanism the request fails with a reason code of BRHRC-TERMID-INVALID. Other bridge mechanisms fail with an ABRU abend code.

User response: Correct the URM so that it generates or accepts valid netnames from clients.

Destination: CSBR

Modules: DFHBRAI

XMEOUT Parameters: date, time, applid, userid, tranid, urmname, netname

DFHBR0207  date time applid userid tranid Bridge facility autoinstall URM urmname returned termid termid netname netname.

Explanation: The Bridge facility autoinstall URM returned termid and netname. This information is for audit purposes only.

System action: The name is used when running the user transaction.
User response: None.

Destination: CSBR

Modules: DFHBRAI

XMEOUT Parameters: date, time, applid, userid, tranid, urmname, termid, netname

DFHBR0208 date time applid userid tranid
Bridge facility autoinstall URM urname
rejected termid termid netname
netname.

Explanation: The Bridge facility autoinstall URM returned a non zero return code to reject termid and netname.

System action: The Link3270 request is rejected with a return code of brihrc_ai_rejected.

User response: None.

Destination: CSBR

Modules: DFHBRAI

XMEOUT Parameters: date, time, applid, tranid, urmname, termid, netname

DFHBR0403 date time applid Transaction tranid
definition conflicts with Bridge Link3270 routing requirements.

Explanation: The client request to execute the transaction in the BRIH cannot be routed to the AOR region because the transaction definition routing information conflicts with the routing information for the bridge facility.

The first application transaction definition that uses a bridge facility is used to determine where all transactions that use that facility are to be executed. The transaction definition of the transaction that the client has supplied in the BRIH conflicts with that definition.

All transactions that are to be executed under a bridge facility must have the same routing characteristics as the first transaction executed under the bridge facility.

System action: The BRIH returned to the client contains information to enable the client to identify the reason for the error.

User response: Ensure that the transaction definition of all transactions that are to be used by a bridge facility do not cause routing conflicts.

Destination: CSBR

Modules: DFHBRMR

XMEOUT Parameters: date, time, applid, prog

DFHBR0411 date time applid Dynamic transaction routing program prog must be AMODE=31.

Explanation: CICS has failed to link to the dynamic transaction routing program because it is not AMODE 31.

System action:
1. If making a route selection, route selection error or route notify link to the dynamic transaction routing program, the BRIH returned to the client will contain information to enable the client to identify the reason for the error.

2. If making a route terminate or route abend link to the dynamic transaction routing program, the BRIH returned to the client will not contain information about the failed link to the dynamic routing program.

User response: Recompile and link edit the dynamic transaction routing program to AMODE 31.

Destination: CSBR

Modules: DFHBRMR

XMEOUT Parameters: date, time, applid, prog

DFHBR0410 date time applid Dynamic transaction routing program prog has abended with abend code abend.

Explanation: The dynamic transaction routing program has abnormally terminated with abend code abcode.

System action:
1. If the dynamic transaction routing program was processing a route selection, a route selection error or a route notify request at the time of the abend, the BRIH returned to the client will contain information to enable the client to identify the reason for the error.

2. If the dynamic routing program was processing a route terminate or route abend request at the time of the abend, the BRIH returned to the client will not contain information about the dynamic transaction routing program abend.

User response: See the description of abend code abcode for further guidance.

If the code is not a CICS transaction abend code, it is a user abend code. Request an explanation from the programmer responsible for this area.

Destination: CSBR

Modules: DFHBRMR

XMEOUT Parameters: date, time, applid, prog
DFHBR0412  date time applid Dynamic transaction routing program prog PPT entry not found.

Explanation: CICS was unable to find a PPT entry for the dynamic transaction routing program.

System action:
1. If making a route selection, route selection error or route notify link to the dynamic routing program, the BRIH returned to the client contains information to enable the client to identify the reason for the error.
2. If making a route terminate or route abend link to the dynamic routing program, the BRIH returned to the client does not contain information about the failed link to the dynamic transaction routing program.

User response: Ensure that the dynamic routing program specified by the system initialization parameter DTRPGM=program name, or specified via the EXEC CICS SET SYSTEM DTRPROGRAM(program name) has been correctly defined to CICS.

Destination: CSBR
Modules: DFHBRMR
XMEOUT Parameters: date, time,applid, prog

DFHBR0413  date time applid Dynamic transaction routing program prog fetch failed.

Explanation: CICS was unable to load the dynamic transaction routing program.

System action:
1. If making a route selection, route selection error or route notify link to the dynamic routing program, the BRIH returned to the client contains information to enable the client to identify the reason for the error.
2. If making a route terminate or route abend link to the dynamic routing program, the BRIH returned to the client does not contain information about the failed link to the dynamic transaction routing program.

User response: Ensure that the dynamic routing program specified by the system initialization parameter DTRPGM=program name, or specified via the EXEC CICS SET SYSTEM DTRPROGRAM(program name) has been correctly defined to CICS.

Destination: CSBR
Modules: DFHBRMR
XMEOUT Parameters: date, time,applid, prog

DFHBR0414  date time applid Dynamic transaction routing program prog is disabled.

Explanation: The dynamic transaction routing program was disabled.

System action:
1. If making a route selection, route selection error or route notify link to the dynamic routing program, the BRIH returned to the client contains information to enable the client to identify the reason for the error.
2. If making a route terminate or route abend link to the dynamic routing program, the BRIH returned to the client does not contain information about the failed link to the dynamic transaction routing program.

User response: Ensure that the dynamic routing program specified by the system initialization parameter DTRPGM=program name, or specified via the EXEC CICS SET SYSTEM DTRPROGRAM(program name) has been correctly defined to CICS.

Destination: CSBR
Modules: DFHBRMR
XMEOUT Parameters: date, time,applid, prog

DFHBR0415  date time applid Dynamic transaction routing program prog is defined as remote.

Explanation: The dynamic transaction routing program was defined as remote.

System action:
1. If making a route selection, route selection error or route notify link to the dynamic routing program, the BRIH returned to the client contains information to enable the client to identify the reason for the error.
2. If making a route terminate or route abend link to the dynamic routing program, the BRIH returned to the client does not contain information about the failed link to the dynamic transaction routing program.

User response: Ensure that the dynamic routing program specified by the system initialization parameter DTRPGM=program name, or specified via the EXEC CICS SET SYSTEM DTRPROGRAM(program name) has been correctly defined to CICS.

Destination: CSBR
Modules: DFHBRMR
XMEOUT Parameters: date, time,applid, prog
DFHBR0427 date time applid The Bridge Link3270 connection for {request allocate_facility (request delete_facility (request continue_conversation (request get_more_message (request resend_message ( transaction tranid (to system )to system )sysid })has failed.

**Explanation:** The Bridge Link3270 request has been routed to a remote CICS region. An irrecoverable error occurred during the conversation with the mirror program DFHBRMP (for example, if a session fails, or the server region fails).

**System action:** The BRIH returned to the client.

**User response:** After the connection has been restored the client can issue a resend message request to determine the status of the application transaction in the AOR.

**Destination:** CSBR

**Modules:** DFHBRMR

**XMEOUT Parameters:** date, time, applid, {1=request allocate_facility (, 2=request delete_facility (, 3=request continue_conversation (, 4=request get_more_message (, 5=request resend_message (, 6=transaction } tranid (, {1=}to system , 2=to system } sysid )

DFHBR0429 date time applid Routing of the Bridge Link3270 request for transaction tranid to system sysid has failed. The dynamic transaction routing program completed with return code 8. Last attempt to route request failed because the remote system was out of service.

**Explanation:** The transaction tranid supplied by the client in the BRIH is defined as dynamic. The dynamic transaction routing program completed with return code 8. The last attempt to route the request failed because the remote system was out of service.

**System action:** The BRIH returned to the client.

**User response:** Investigate the reason for the remote system being out of service.

When the remote system is back in service the client can retry the Bridge Link3270 request.

**Destination:** CSBR

**Modules:** DFHBRMR

**XMEOUT Parameters:** date, time, applid, tranid, sysid

DFHBR0430 date time applid Routing of the Bridge Link3270 request for transaction tranid to system sysid has failed. The dynamic transaction routing program completed with return code 8. Last attempt to route request failed because the remote system could not be found in the intersystem table.

**Explanation:** The transaction tranid supplied by the client in the BRIH is defined as dynamic. The dynamic transaction routing program completed with return code 8. The last attempt to route the Bridge Link3270 request to the remote system failed because the remote system could not be found in the intersystem table.

**System action:** The BRIH returned to the client.

**User response:** Ensure that the connection definitions are correct and that the dynamic transaction routing URM supplies a valid system for the request.

**Destination:** CSBR

**Modules:** DFHBRMR

**XMEOUT Parameters:** date, time, applid, tranid, sysid

DFHBR0431 date time applid Routing of the Bridge Link3270 request for transaction tranid to system sysid has failed. The dynamic transaction routing program completed with return code 8. Last attempt to route request failed because the remote system was out of service.

**Explanation:** The transaction tranid supplied by the client in the BRIH is defined as dynamic. The dynamic transaction routing program completed with return code 8. The last attempt to route the request failed because the remote system was out of service.

**System action:** The BRIH returned to the client.

**User response:** Investigate the reason for the remote system being out of service.

When the remote system is back in service the client can retry the Bridge Link3270 request.

**Destination:** CSBR

**Modules:** DFHBRMR

**XMEOUT Parameters:** date, time, applid, tranid, sysid

DFHBR0432 date time applid Routing of the Bridge Link3270 request for transaction tranid to system sysid has failed. The dynamic transaction routing program completed with return code 8. Last attempt to route request failed because the session allocation was rejected.

**Explanation:** The transaction tranid supplied by the client in the BRIH is defined as dynamic. The dynamic transaction routing program completed with return code 8. The last attempt to route the request failed because the remote session allocation was rejected.

**System action:** The BRIH returned to the client.

**User response:** Investigate the reason for the rejection of the allocation of the session.

The transaction definition queuelimit value and global user exit XZIQUE can be used to control the size of the session queue and decide if a request is to be rejected or not. Refer to the CICS Resource Definition Guide, the CICS Customization Guide and the CICS Intercommunication Guide manuals for further information.

**Destination:** CSBR

**Modules:** DFHBRMR

**XMEOUT Parameters:** date, time, applid, tranid, sysid
XMEOUT Parameters:

**DFHBR0433**

*date time applid Routing of the Bridge Link3270 request for transaction tranid to system sysid failed.* The dynamic transaction routing program completed with return code 8. Last attempt to route request failed because the session allocation queue was purged.

**Explanation:** The transaction *tranid* supplied by the client in the BRIH is defined as dynamic. The dynamic transaction routing program completed with return code 8. The last attempt to route the request failed because the remote session allocation queue was purged.

**System action:** The BRIH returned to the client contains information to enable the client to identify the reason for the error.

**User response:** Investigate the reason for the purge of the session allocation queue.

The transaction definition queueLimit and maxQtime field values determine when the queue will be purged. Global user exit XQIUE can also be used to control the queue. Refer to the [CICS Resource Definition Guide](http://example.com/cics-guide), the [CICS Customization Guide](http://example.com/cics-guide), and the [CICS Intercommunication Guide](http://example.com/cics-guide) manuals for further information.

**Destination:** CSBR

**Modules:** DFHBRMR

**XMEOUT Parameters:** *date, time, applid, tranid, sysid*

**DFHBR0436**

*date time applid Routing of the Bridge Link3270 request for transaction tranid to system sysid failed.* The dynamic transaction routing program completed with return code 8 on the first route selection call.

**Explanation:** The transaction *tranid* supplied by the client in the BRIH is defined as dynamic. The dynamic transaction routing program completed with return code 8 during the route selection call. An attempt to route the transaction has not been made.

**System action:** The BRIH returned to the client contains information to enable the client to identify the reason for the error.

**User response:** Investigate why the dynamic transaction routing program completed with return code 8 during the route selection call.

**Destination:** CSBR

**Modules:** DFHBRMR

**XMEOUT Parameters:** *date, time, applid, tranid, sysid*

**DFHBR0434**

*date time applid Routing of the Bridge Link3270 request for transaction tranid to system sysid failed.* The dynamic transaction routing program completed with return code 8. Last attempt to route request failed because the remote system did not support the function.

**Explanation:** The transaction *tranid* supplied by the client in the BRIH is defined as remote. The dynamic transaction routing program completed with return code 8. The last attempt to route the request failed because the remote system did not support the function. The remote system did not support the function for one of the following reasons.

1. The remote system is connected via a LUTYPE 6.1 connection.
2. The remote system does not support the Bridge Link3270 function.

**System action:** The BRIH returned to the client contains information to enable the client to identify the reason for the error.

**User response:** Ensure that the connection definitions are correct and that the dynamic transaction routing program URM supplies a valid netname routing value.

**Destination:** CSBR

**Modules:** DFHBRMR

**XMEOUT Parameters:** *date, time, applid, tranid, sysid*

**DFHBR0437**

*date time applid Routing of the Bridge Link3270 request for transaction tranid to system netname 'netname' failed.* The dynamic transaction routing program completed with return code 8. Last attempt to route request failed because the remote system could not be found in the intersystem table.

**Explanation:** The transaction *tranid* supplied by the client in the BRIH is defined as dynamic. The dynamic transaction routing program completed with return code 8. The last attempt to route the Bridge Link3270 request to the remote system failed because the remote netname could not be found in the intersystem table.

**System action:** The BRIH returned to the client contains information to enable the client to identify the reason for the error.

**User response:** Ensure that the connection definitions are correct and that the dynamic transaction routing program URM supplies a valid netname routing value.

**Destination:** CSBR

**Modules:** DFHBRMR

**XMEOUT Parameters:** *date, time, applid, tranid, netname*
**DFHBR0438 date time applid Routing of the Bridge**

Link3270 request for transaction `tranid` to system `sysid` netname `netname` failed. The dynamic transaction routing program completed with return code 8. Last attempt to route request failed because the remote system and netnames do not match.

**Explanation:** The transaction `tranid` supplied by the client in the BRIH is defined as dynamic. The dynamic transaction routing program completed with return code 8. The last attempt to route the Bridge Link3270 request to the remote system failed because the remote system name and netname do not match.

**System action:** The BRIH returned to the client contains information to enable the client to identify the reason for the error.

**User response:** Ensure that the connection definitions are correct and that the dynamic transaction routing program URM supplies matching `sysid` and `netname` values.

**Destination:** CSBR

---

**DFHBR0505 date time applid Bridge facility ranges have reached percent percent of total allocation.**

**Explanation:** Bridge facilities are allocated in ranges. The allocation of the Bridge facility range has increased the number of allocated ranges above the warning threshold. The message gives the percentage of

---

**Chapter 1. DFH messages** 129
DFHBR0506  date time applid Bridge facility ranges have reduced below percent percent of total allocation.

Explanation: Bridge facilities are allocated in ranges. A release of a Bridge facility range has caused the number of available ranges to fall below a warning threshold.

System action: The user transaction continues.

User response: The number of available Bridge facility ranges is increasing.

Destination: Console and Transient Data Queue

Modules: DFHBRNS

XMEOUT Parameters: date, time, applid, percent

DFHBR0507  date time applid All Bridge facility ranges have been allocated.

Explanation: Bridge facilities are allocated in ranges. The allocation of the Bridge facility range failed because all ranges have been allocated.

System action: The BRIH returned to the client contains information to enable the client to identify the reason for the error.

User response: The request can be retried when Bridge facility ranges are available for allocation.

Destination: Console and Transient Data Queue

Modules: DFHBRNS

XMEOUT Parameters: date, time, applid

DFHBR0508  date time applid File filename is not available. Sysid sysid error.

Explanation: The attempt to access the remote file failed with a sysiderr.

System action: The file is not available. The BRIH returned to the client contains an unsuccessful return code.

User response: Investigate the error which caused the file to be made unavailable. Correct the cause of the problem and retry the failed transaction.

Destination: CSBR

Modules: DFHBRNS

XMEOUT Parameters: date, time, applid, filename, sysid

# DFHBR0509  date time applid You are approaching or have reached the maximum number of times a Link3270 bridge routing region can be started.

Explanation: The number of times that Link3270 bridge routing regions, which use the same DFHBRNSF data set, can be started is approaching or has already reached the maximum. An invalid facilitytoken is allocated if the number of times these CICS routing regions are connected (connection_number), exceeds the maximum.

This message is issued if you have exceeded 90% of the available times that routing regions can be started when using the same DFHBRNSF data set.

System action: The Link3270 bridge request continues to be processed. When CICS reaches the maximum number of times that routing regions can be started using the same DFHBRNSF data set, the request abends with abend code AEXZ.

User response: At a convenient time, stop all regions that use the Link3270 bridge routing data set, DFHBRNSF, and redefine it. Redefining the data set resets connection_number to 0. Restart your routing regions.

Destination: Console and CSBR transient data queue

Modules: DFHBRNS

XMEOUT Parameters: date, time, applid

# DFHBR0601  date time applid Bridge Link3270 security error. User userid1 attempting to use facility allocated to userid2.

Explanation: The Bridge Link3270 has detected a security error. A different userid than the one that allocated the Bridge Link3270 facility is attempting to use that facility.

System action: The request is rejected and the BRIH returned to the client contains information to enable the client to identify the reason for the error.

User response: Ensure that the same user that allocated the Bridge Link3270 facility is the only user that uses that facility.

DFHCxxxx messages

DFHCA5100 S  date time applid netname tranid
Severe error in module modname.
Abend code: abcode

Explanation: An internal error has occurred in module modname, when invoked by a CSD utility command.

System action: Processing terminates abnormally with an operating system dump and abend code abcode.

The CSD utility attempts to:
1. Close any files previously opened internally.
2. Unload any extract exit routines that were dynamically loaded.
3. Invoke the termination exit routine (if supplied).
4. Return control to the invoker of the utility.

User response: See the description of abend code abcode for guidance.

Destination: CSMT

Modules: DFHCAP

XMEOUT Parameters: date, time,applid, netname, tranid, command

DFHCA5101 I  date time applid netname tranid
command command executed successfully.

Explanation: The execution of a CSD utility command command completed successfully.

System action: Normal processing continues.

User response: None.

Destination: CSMT

Modules: DFHCAP

XMEOUT Parameters: date, time,applid, netname, tranid, command

DFHCA5102 I  date time applid netname tranid
Warning message(s) issued while processing command command.

Explanation: The CSD utility issued messages during syntax-checking and execution of the command command.

System action: Normal utility processing continues to the end of the job.

User response: Review the warning messages to see how they have affected utility processing. Then decide whether you need to submit a further CSD utility job.

Destination: CSMT

Modules: DFHCAP

XMEOUT Parameters: date, time,applid, netname, tranid, command

DFHCA5104 W  date time applid netname tranid
Subsequent commands (except LIST) are not executed because of error(s) above.

Explanation: After the CSD utility program encounters an error, it ceases to execute any further commands read from a data stream (as opposed to supplied by a put-message exit routine). However, it continues to check the syntax of subsequent commands. The exception is the LIST command, which is still executed if the primary CSD file can be opened.
**System action:** Subsequent CSD utility commands (except LIST) are ignored.

**User response:** Check for a syntax error in the commands used, and correct it.

There should be associated error messages which identify the problem that caused DFHCSDUP to halt active processing. These messages should appear in the DFHCSDUP output before message DFHCA5104 is issued.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** date, time, applid, netname, tranid

---

**DFHCA5105 W**

*date time applid netname tranid (*command* *command* not executed because of previous error(s)).*

**Explanation:** If a syntax error (or an execution error) occurred in a command read from a data stream and processed earlier, no further commands (except for LIST commands) are executed. If the primary CSD file could not be opened, the LIST command is not executed either.

**System action:** The CSD utility command is not executed.

**User response:** Check for syntax errors or execution errors in commands processed earlier.

Correct the invalid commands.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** date, time, applid, netname, tranid, command

---

**DFHCA5107 I**

*date time applid netname tranid*

*Commands executed successfully:* ns

*Commands giving warning(s):* nw

*Commands in error:* ne

**Explanation:** The CSD utility has completed input command processing. Commands giving warnings may or may not have been executed successfully.

**System action:** Normal processing continues to the end of the job.

**User response:** If any CSD utility commands in error were executed, decide if the results are what you want. If not, correct them and resubmit in another job.

If any commands were not executed, you must resubmit them. (See message DFHCA5108.)

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** date, time, applid, netname, tranid, ns, nw, ne

---

**DFHCA5108 I**

*date time applid netname tranid*

**Commands not executed after error(s):** nn

**Explanation:** The CSD utility has completed input command processing. The number of commands not executed because of errors is indicated by nn.

**System action:** Normal processing continues to the end of the job.

**User response:** Correct the commands in error and resubmit them in another job.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** date, time, applid, netname, tranid, nn

---

**DFHCA5109 I**

*date time applid netname tranid*

**End of DFHCSDUP utility job. Highest return code was:** retcode

**Explanation:** The CSD utility job is complete.

**System action:** Control returns to the invoker, that is, either to the operating system or to an invoking program.

**User response:** None.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** date, time, applid, netname, tranid, retcode

---

**DFHCA5110 W**

*date time applid netname tranid*

**Error found in 'PARM=' parameter data on EXEC job step. This data is ignored.**

**Explanation:** The value of the PARM parameter on the EXEC statement in the JCL to run the DFHCSDUP utility is incorrect.

**System action:** The PARM parameter is ignored. The CSD is opened for read and write operations.

**User response:** Correct the erroneous PARM value. The incorrect value can be found in the job control language used to execute DFHCSDUP.

The [CICS Operations and Utilities Guide](#) describes how to code the PARM parameter.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** date, time, applid, netname, tranid
DFHCA5114 S  date time applid netname tranid The
csdtype CSD has not been initialized.
Command not executed.

Explanation: The primary CSD file must be initialized
before any CSD utility command (other than the
INITIALIZE or SERVICE commands) can be processed.
If a secondary CSD file is used, it must always be
initialized before this command can be processed. CICS
issues this message if you try to break either of these
rules, or if an attempt to initialize a CSD file fails to
complete successfully.

System action: The CSD utility ignores the command.

User response: Initialize the CSD file. You may first
have to determine why a previous initialization attempt
failed.

Destination: CSMT

Modules: DFHCAP

XMEOUT Parameters: date, time,applid, netname,
tranid, csdtype

DFHCA5115 S  date time applid netname tranid The
primary CSD is already initialized.
Command not executed.

Explanation: An INITIALIZE or a SERVICE command
was encountered but the primary CSD file has already
been initialized.

System action: The INITIALIZE or SERVICE
command is ignored.

User response: Confirm that the correct CSD file was
specified.

Destination: CSMT

Modules: DFHCAP

XMEOUT Parameters: date, time,applid, netname,
tranid

DFHCA5116 S  date time applid netname tranid The
primary CSD has been defined with an
invalid key length. Processing is
terminated.

Explanation: The CSD utility cannot initialize the CSD
file because it has been defined to VSAM with an
invalid key length.

System action: The CSD file remains uninitialized,
and no utility commands are processed.

User response: Delete the CSD file, using VSAM
Access Method Services (AMS). In the JCL defining the
CSD cluster, change the AMS control statements to
specify RECORDSIZE(200 2000). Use this JCL to
redefine the CSD file, and use the CSD utility to
reinitialize it.

Destination: CSMT

Modules: DFHCAP

XMEOUT Parameters: date, time,applid, netname,
tranid, ddname

DFHCA5117 S  date time applid netname tranid The
primary CSD has been defined with an
invalid record size. Processing is
terminated.

Explanation: The CSD utility cannot initialize the CSD
file, because it has been defined to VSAM with an
invalid record length.

System action: The CSD file remains uninitialized,
and no utility commands are processed.

User response: Delete the CSD file, using VSAM
Access Method Services (AMS). In the JCL defining the
CSD cluster, change the AMS control statements to
specify RECORDSIZE(200 2000). Use this JCL to
redefine the CSD file, and use the CSD utility to
reinitialize it.

Destination: CSMT

Modules: DFHCAP

XMEOUT Parameters: date, time,applid, netname,
tranid

DFHCA5120 I  date time applid netname tranid csdtype
CSD opened; ddname: ddname

Explanation: The VSAM data set specified in the JCL
has been successfully opened, and is identified as the
primary or secondary CSD file. (All utility commands
processed will use the same primary CSD file. Different
secondary CSD files may be accessed by different utility
commands.)

System action: Normal processing continues.

User response: None.

Destination: CSMT

Modules: DFHCAP

XMEOUT Parameters: date, time,applid, netname,
tranid

DFHCA5121 S  date time applid netname tranid I/O
error while opening csdtype CSD;
ddname: ddname

Explanation: An I/O error occurred when reading or
writing control records of the VSAM data set identified in
the JCL as the primary or secondary CSD file.

System action: The utility command is not executed.

User response: Retry the utility command that failed.
If the problem persists, restore the CSD file from your
own backup procedures.

Destination: CSMT

Chapter 1. DFH messages  133
**DFHCA5122 S**  
*date* *time* *applid* *netname* *tranid*  
**VSAM error while opening** *csdtype* **CSD**;  
*ddname*: *ddname*  

**Explanation:** A VSAM error occurred when opening the data set identified in the JCL as a primary or secondary CSD file.

**System action:** The utility command is not executed.

**User response:** Refer to the VSAM diagnostics output in message DFHCA5179 for further information and guidance.

**Destination:** CSMT

**DFHCA5123 I**  
*date* *time* *applid* *netname* *tranid* *csdtype* *ddname*  
**CSD closed;**  

**Explanation:** The VSAM data set used as the primary or secondary CSD file has been successfully closed, with control records updated if necessary. (The primary CSD file is closed after all the utility commands have been processed; the secondary CSD file is closed after the command for which it was opened.)

**System action:** Normal processing continues.

**User response:** None.

**Destination:** CSMT

**DFHCA5124 S**  
*date* *time* *applid* *netname* *tranid*  
**Corrupted CSD control record detected while closing CSD;**  
*ddname*: *ddname*  

**Explanation:** A storage corruption is preventing the CSD control records from being updated when the CSD file is being closed.

**System action:** No further CSD utility commands are processed.

**User response:** Obtain a dump from DFHCSDUP together with a listing of the DFHCSDUP run and its JCL. Also try to obtain a print out of the CSD, using either IDCAMS or the DFHCSDUP LIST ALL option. The LIST will indicate where the errors have occurred because they do not print and are therefore easily identifiable.

Using the information available, determine the cause of the errors and correct them.

Resubmit the CSD utility commands that failed.

If you cannot resolve the problem, or if the problem persists, you will need further help from IBM. See Part 4 of the [CICS Problem Determination Guide](https://www.ibm.com/docs/en/cics) for guidance on how to proceed.

**Destination:** CSMT

**DFHCA5125 S**  
*date* *time* *applid* *netname* *tranid*  
**Error occurred while closing** *csdtype* **CSD.**  
*File is full;** *ddname*: *ddname*  

**Explanation:** An I/O error occurred when reading or writing the control records of the CSD file before closing VSAM data set *ddname*.

**System action:** Utility command processing is terminated.

**User response:** Resubmit the utility commands that failed. If the problem persists, restore the CSD file from your own backup procedures.

**Destination:** CSMT

**DFHCA5126 S**  
*date* *time* *applid* *netname* *tranid*  
**I/O error while closing** *csdtype* **CSD;**  
*ddname*: *ddname*  

**Explanation:** An I/O error occurred when reading or writing the control records of the CSD file before closing VSAM data set *ddname*.

**System action:** No further utility commands are executed.

**User response:** Resubmit the utility commands that failed. If the problem persists, restore the CSD file from your own backup procedures.

**Destination:** CSMT

**DFHCA5127 S**  
*date* *time* *applid* *netname* *tranid*  
**Error occurred while closing** *csdtype* **CSD;**  
*ddname*: *ddname*  

**Explanation:** A VSAM error occurred when opening the data set identified in the JCL as a primary or secondary CSD file.

**System action:** The utility command is not executed.

**User response:** Refer to the VSAM diagnostics output in message DFHCA5179 for further information and guidance.

**Destination:** CSMT
VSAM error while closing csdtype CSD; ddname: ddname

Explanation:  A VSAM error occurred when closing the data set ddname in the JCL as the primary or secondary CSD file.

System action:  No further CSD utility commands are executed.

User response:  Refer to the VSAM diagnostics output in message DFHCA5179 for further information and guidance.

Destination:  CSMT

Modules:  DFHCAP

DFHCA5130 E  date time applid netname tranid
Unable to locate module DFHCICS. Primary CSD not initialized.

Explanation:  The DFHCICS module is missing from the library.

System action:  Processing of the INITIALIZE command is terminated.

User response:  Ensure that the DFHCICS module is present in the library.

Destination:  CSMT

Modules:  DFHCAP

DFHCA5131 I  date time applid netname tranid
List listid created.

Explanation:  The INITIALIZE command has created the header for an IBM-protected list.

System action:  Normal processing continues.

User response:  None.

Destination:  CSMT

Modules:  DFHCAP

DFHCA5132 S  date time applid netname tranid
Unable to create list listid

Explanation:  The INITIALIZE command has failed when calling the CSD manager routing program, DFHDMP, to create a new list listid on the CSD file for the IBM-protected groups. The CSD file may be full or corrupt.

System action:  Processing of the INITIALIZE command is terminated.

User response:  Check that the data set size for the CSD file is large enough. If it is not, allocate more space.

If there is ample space and you suspect that the CSD file is corrupt, you need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination:  CSMT

Modules:  DFHCAP

XMEOUT Parameters:  date, time, applid, netname, tranid, listid

Note:  You must specify PARM=CSD(READONLY) if you wish to open a recoverable CSD in RLS access mode from the DFHCSDUP utility program.

Alternatively, wait until the CSD file is no longer being accessed in the conflicting access mode, or until it becomes available again in accordance with the SHAREOPTIONS rules defined for the cluster.

If the conflict is due to SHAREOPTIONS and LIST is the only command you want to execute, you can specify PARM=CSD(READONLY).

Destination:  CSMT

Chapter 1. DFH messages  135
DFHCA5133 S  date time applid netname tranid CSD contains one or more lists. No lists may be present on the CSD when the INITIALIZE command is issued.

Explanation:  The CEDA transaction was used to create a list while the INITIALIZE command was executing.

System action:  Processing of the INITIALIZE command is terminated.

User response:  Redefine the data set and rerun the INITIALIZE command. The CEDA transaction must not be used until the initialization of the CSD file has been successfully completed.

Destination:  CSMT

Modules:  DFHCAP

XMEOUT Parameters:  date, time, applid, netname, tranid

DFHCA5134 S  date time applid netname tranid Error occurred while adding group grpname to list listid

Explanation:  A call to the CSD manager routing program, DFHDMP, to write the definition of group grpname to the CSD file as a member of an IBM-protected list listid created an error. The CSD file may be full or corrupt.

System action:  Processing of the INITIALIZE command is terminated.

User response:  Increase the data set size for the CSD file and repeat the INITIALIZE request. If this fails, you will need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination:  CSMT

Modules:  DFHCAP

XMEOUT Parameters:  date, time, applid, netname, tranid

DFHCA5135 I  date time applid netname tranid Group grpname added to list listid

Explanation:  A group definition grpname has been satisfactorily created on the CSD file in list listid.

System action:  Processing continues.

User response:  None.

Destination:  CSMT

Modules:  DFHCAP

XMEOUT Parameters:  date, time, applid, netname, tranid, grpname, listid

DFHCA5136 W  date time applid netname tranid Group grpname is already a member of list listid

Explanation:  Group grpname already exists in list listid. CICS does not create a duplicate entry.

System action:  Normal utility processing continues.

User response:  None.

Destination:  CSMT

Modules:  DFHCAP

XMEOUT Parameters:  date, time, applid, netname, tranid, grpname, listid

DFHCA5139 W  date time applid netname tranid Consider implications of migrating TYPE=SHARED entries.

Explanation:  The CSD utility detected a migrate of a TST TYPE=SHARED entry. A DFHTST TYPE=SHARED entry is not directly migrated. Only when a TYPE=REMOTE macro that specifies a SYSIDNT that matches a SYSID in the corresponding TYPE=SHARED macro is a TSMODEL created.

System action:  The CSD utility continues processing of the MIGRATE command.

User response:  If SYSID is explicitly specified on the EXEC CICS request, or added by a global user exit program, and the intent of the SYSID is to direct the request to a SHARED TS pool, you must use the migrated TST in order to satisfy the request to use the pool. See the CICS Resource Definition Guide for more information.

Destination:  CSMT

Modules:  DFHCSDUP

XMEOUT Parameters:  date, time, applid, netname, tranid

DFHCA5140 I  date time applid netname tranid Total xxxxxxxx definitions created:  nn

Explanation:  CICS issued this message after migrating a CICS table. nn definitions of type xxxxxxx have been created on the CSD file.

System action:  Normal utility processing continues.

User response:  None.

Destination:  CSMT

Modules:  DFHCAP

XMEOUT Parameters:  date, time, applid, netname, tranid, xxxxxxxx, nn
Unable to create new group

**Explanation:** The MIGRATE command failed when calling the CSD manager routing program, DFHDMP, to create a new group `grpname` on the CSD file for the data in the table being migrated. The CSD file may be full, corrupt, or not initialized. The group name may be invalid.

**System action:** Processing of the MIGRATE command is terminated.

**User response:** Check the group name in the TOGROUP parameter. Reinitialize the CSD file with the INITIALIZE command, providing a larger data set size if necessary.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** `date, time, applid, netname, tranid, grpname`

Command not executed. `lgname` was not updated because of a previous update failure.

**Explanation:** The list or group `lgname` cannot be used because an operation to update it, using the DFHCSDUP offline utility, failed to execute to completion.

This has probably happened in a previous execution of DFHCSDUP.

**System action:** The command is not executed, and the execution of subsequent DFHCSDUP commands in the job stream is suppressed.

**User response:** Use the DFHCSDUP VERIFY command to remove the in-flight flag detected when this message is produced.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** `date, time, applid, netname, tranid, lgname`

Command not executed. `lgname` is currently being updated by applid: `applid opid: opid`

**Explanation:** The list or group `lgname` cannot be used because:
- A user of the CEDA or CEDB transaction is currently running a command to update it
- A previous operation to update it using CEDA or CEDB failed to execute to completion.

**System action:** The command is not executed.

If commands are being read from a SYSIN data stream, subsequent commands (except the LIST command) are checked for syntax only. (If the primary CSD file cannot be opened, the LIST command is not processed either.)

If commands are being read from a get-command exit, the DFHCSDUP utility attempts to process subsequent commands.

**User response:** Negotiate with the user with the specified OPID and APPLID, or create a new group or list by taking a copy of the definitions in the locked one.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** `date, time, applid, netname, tranid, lgname, applid, opid`

Command not executed. `lgname` has been locked by applid: `applid opid: opid`

**Explanation:** The list or group `lgname` cannot be used because a user of the CEDA or CEDB transaction has enforced a LOCK command to prevent updating by other users.

**System action:** The command is not executed.

If commands are being read from a SYSIN data stream, subsequent commands (except the LIST command) are checked for syntax only. (If the primary CSD file cannot be opened, the LIST command is not processed either.)

If commands are being read from a get-command exit, the DFHCSDUP utility attempts to process subsequent commands.

**User response:** Resubmit the utility job to retry the command that failed. Perform the subsequent commands that were suppressed.

If this fails to resolve the problem, run the DFHCSDUP VERIFY command to remove the in-flight flag detected when this message is produced.

**Destination:** CSMT

**Modules:** DFHCAP
**Destination:** CSMT  
**Modules:** DFHCAP  
**XMEOUT Parameters:** date, time, applid, netname, tranid, lgname, applid, opid

DFHCA5147 E date time applid netname tranid  
Command not executed. lgname already exists as a group-or-list  

**Explanation:** The name chosen for the target group (or list) duplicates that of an existing group or list on the CSD file.  
**System action:** Processing of the utility command is terminated.  
**User response:** Choose a different name for the target group.

DFHCA5148 E date time applid netname tranid  
Unable to get storage for tabletype table named table  

**Explanation:** There is insufficient storage to satisfy a GETMAIN request for table table.  
**System action:** The system action depends on the table specified as follows:  
**LD (language definition table)**  
The CSD utility cannot process any commands, and terminates with a dump. The MVS user abend code is 0327.  
**FCT and RDT**  
The CSD utility cannot migrate the table, and terminates processing of the utility command.  
**User response:** Allocate additional storage. If your TCT assembly and link-editing is successful, the RDT should be in the library. The LD is in the load library of the supplied pregenerated CICS system.

DFHCA5149 E date time applid netname tranid  
Command not executed. xxxxxxx is IBM-protected.  

**Explanation:** A user attempted to add a definition to an IBM-supplied group or list (groups or lists beginning with DFH). This is not allowed.  
**System action:** The CSD utility does not create a definition.  
**User response:** Change the input command or TCT source data to name a target group or list whose name does not begin with DFH.

DFHCA5151 I date time applid netname tranid  
Resource not altered. xxxxxxx is IBM-protected.  

**Explanation:** During the execution of an ALTER command containing a generic group name a matching group was found which is an IBM-supplied group and is protected.  
**System action:** The CSD utility does not alter the definition in the specified group.  
**User response:** None.

DFHCA5155 W date time applid netname tranid  
TDqueue xxxxxxx had same name as an IBM-supplied definition in group grpname  

**Explanation:** The name of the migrated table entry, xxxxxxxx, matches the name of an IBM-supplied resource in IBM-protected group grpname, created by the INITIALIZE command.  
**System action:** CICS migrates this entry normally.  
**User response:** If necessary, rename the resource, using the CEDA transaction.

DFHCA5156 W date time applid netname tranid  
TDqueue xxxxxxx did not migrate. Its properties match an IBM-supplied definition in group grpname  

**Explanation:** The properties of the resource defined in the user’s table entry are the same as those of the IBM-supplied resource of the same name contained in IBM-protected group grpname.
**System action:** The entry for the user’s resource is not migrated.

**User response:** None.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** date, time, applid, netname, tranid, TDqueue, xxxxxxx, grpname

---

**DFHCA5159 I**

**Description:** date time applid netname tranid

**Resource object defined in group**

**grpname**

**Explanation:** The CSD utility has successfully added a resource definition to a group, where:

- **resource** is the type of resource (CONNECTION, FILE, JOURNALMODEL, LSRPOOL, MAPSET, PARTITIONSET, PARTNER, PROFILE, PROGRAM, SESSION, TDQUEUE, TERMINAL, TRANCLASS, TRANSACTION, or TYPETERM).
- **object** is the name of the object.
- **grpname** is the name of the group.

**System action:** Normal utility processing continues.

**User response:** None.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** date, time, applid, netname, tranid, resource, object, grpname

---

**DFHCA5161 S**

**Description:** date time applid netname tranid

**Table table must be link-edited with AMODE(24) RMODE(24)**

**Explanation:** After loading the table, the migration routine checks that the table being processed has been link-edited with the correct AMODE and RMODE attributes. For migration purposes, DCTs, FCTs and TCTs must be link-edited with AMODE(24) RMODE(24). RCTs must be link-edited with RMODE(24).

**System action:** The MIGRATE command is not processed.

**User response:** Relink the table with the correct attributes. For example, when migrating a DCT to your CSD include the following statement in your DCT:

```
DFHDCT TYPE=(INITIAL,MIGRATE).
```

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** date, time, applid, netname, tranid, resource, object

---

**DFHCA5164 W**

**Description:** date time applid netname tranid

No definition of resource object created.

This duplicates an existing definition in group grpname

**Explanation:** The CSD utility detected a CSD record with a matching key before adding the definition to the CSD file, where:

- **resource** is the type of resource.
- **object** is the name of the object.
- **grpname** is the name of the group.

**System action:** The CSD utility does not migrate the resource definition to the CSD file. (If it is a transaction, a generated profile is not created either.)

**User response:** Use the CEDA transaction to define the resource with a unique name.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** date, time, applid, netname, tranid, resource, object, grpname

---

**DFHCA5165 S**

**Description:** date time applid netname tranid

Processing is terminated. An error occurred while writing resource object to the CSD.

**Explanation:** An error occurred when the CSD utility called DFHDMP to write the definition of the object to the CSD file. The CSD file may be full or corrupted.

**System action:** If the CSD is full, the CSD utility issues message DFHCA5176, and then terminates with a return code of 12 in message DFHCA5109.

If the CSD is not full, the CSD utility terminates abnormally with message DFHCA5175, usually accompanied by one or more of the explanatory messages, DFHCA5177, DFHCA5178, and DFHCA5179.

**User response:** Use the additional messages to determine the cause of the error and the appropriate user action required.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** date, time, applid, netname, tranid, resource, object

---

**DFHCA5166 E**

**Description:** date time applid netname tranid

Disallowed character in resource name

**Explanation:** The call to module DFHDMP has failed to construct a valid key for the record created on the CSD file because of an invalid character, or the
resource name for the migrated table entry may be invalid. resource is the type of resource, and object is the name of the object.

**System action:** A CSD record is not created for this definition. (If it is a transaction, a generated profile is not created either.)

**User response:** Use the CEDA transaction to define the resource with a valid name.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** date, time, applid, netname, tranid, resource, object

---

**DFHCA5167 S** date time applid netname tranid The CSECTs in table table have been link-edited in the wrong order.

**Explanation:** While processing a MIGRATE command, the CSD utility has detected that the CSECTs in table table are in the wrong order. Input to the linkage editor omitted a control statement to order the CSECTs.

**System action:** The CSD utility does not process the MIGRATE command.

**User response:** Use the IBM-supplied procedure, DFHAUPLK, to assemble and link-edit CICS tables. This procedure ensures the correct ordering of CSECTs within the tables.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** date, time, applid, netname, tranid, table

---

**DFHCA5168 S** date time applid netname tranid Table loaded from library member table is not a valid tabletype.

**Explanation:** After loading the table table, the migration routine checks the VMNAME field in the DFHVM expansion of the data area following the load point. This message is produced if VMNAME is not that of a valid table.

**System action:** The MIGRATE command is not processed.

**User response:**
1. Ensure that the correct table is present in the library, and that the TABLE parameter of the MIGRATE command is correct.
2. Ensure that an ORDER statement was processed in the JCL of the link-editing of the table.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** date, time, applid, netname, tranid, table, tabletype

---

**DFHCA5169 S** date time applid netname tranid Processing is terminated. Table table was assembled for CICS release rrr. Reassemble for release sss.

**Explanation:** After loading the table table, the migration routine checks the VMVERS field in the DFHVM expansion of the data area following the load point. This field indicates the CICS release (rrr) for which the table was assembled, and is invalid for the CICS system (release sss) that is running.

**System action:** The MIGRATE command is not processed.

**User response:** Reassemble the table for the correct release of CICS.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** date, time, applid, netname, tranid, table, rrr, sss

---

**DFHCA5174 S** date time applid netname tranid Processing is terminated. Command cannot be executed because `PARM=CSD(READONLY)` was specified.

**Explanation:** This command requires the CSD to be opened for read-write access. Your job step specified read-only access for the CSD in the DFHCSDUP utility job stream.

**System action:** This command is not executed.

If commands are being read from a SYSIN data stream, subsequent commands (except LIST) are checked for syntax only. (If the primary CSD file cannot be opened, LIST is not processed either.)

If commands are being read from a get-command exit, DFHCSDUP attempts to process subsequent commands.

**User response:** Amend the JCL to specify `PARM=CSD(READWRITE)`.

**Note:** If the CSD is recoverable and you are accessing it in RLS mode, you cannot specify READWRITE access. In order to perform the command, you need to access the CSD in non-RLS mode.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** date, time, applid, netname, tranid
Processing is terminated. Unexpected response from function in CSD manager.

**Explanation:** An invocation of the CSD manager, DFHDMP, has resulted in an error. The name of the function that failed is function.

**System action:** DFHCSUDP issues additional messages, then:
- Terminates normally for CSD open/close errors, and the CSD-full condition, or
- Terminates abnormally for all other situations.

**User response:** Ensure that you have set up your CSD file correctly. If you have migrated your CSD file from a previous release, note that you should have increased your block size to 500. If necessary, use the diagnostics in the additional messages.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** date, time, applid, netname, tranid, function

---

Processing is terminated. CSD is full.

**Explanation:** The VSAM data set containing the CSD file is full.

**System action:** Execution of the CSD utility command is terminated.

If commands are being read from a SYSIN data stream, subsequent commands (except LIST commands) are checked for syntax only. (If the primary CSD file cannot be opened, the LIST command is not processed either.)

If commands are being read from a get-command exit, the DFHCSUDP utility attempts to process subsequent commands.

The DFHCSUDP utility leaves a system lock on the group being created at the time of failure. This lock prevents processing of the group by the CSD utility or the CEDA transaction.

**User response:** First, use the DFHCSUDP VERIFY process to remove the system lock on the partly-created group. Normal RDO processing of the group should then be possible, enabling the group (or any unwanted definitions) to be deleted.

To recover the contents of the CSD file, define a larger data set and use the AMS REPRO command. Usually, you will be able to REPRO from the CSD file that became full. If you are unable to do this, use a backup copy.

If your CSD is a recoverable data set and you update it from CICS in RLS mode, there are additional steps to be taken when using REPRO to ensure that any retained locks remain associated with the data set.

These are explained in the CICS Recovery and Restart Guide.

You may be able to transfer definitions from the CSD file that filled up by using the DFHCSUDP COPY command with the FROMCSD option.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** date, time, applid, netname, tranid

---

Processing is terminated. CSD I/O error occurred.

**Explanation:** An I/O error occurred when executing a READ or WRITE of a CSD record on the primary or secondary CSD file.

**System action:** DFHCSUDP issues additional messages and terminates abnormally.

**User response:** Restore the CSD file to a new data set from your own backup, or create the new CSD file by using the INITIALIZE, COPY, and APPEND commands to restore existing definitions.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** date, time, applid, netname, tranid

---

Processing is terminated. Severe CSD error occurred.

**Explanation:** An error occurred during execution of the CSD manager, DFHDMP, to access the primary or secondary CSD file.

**System action:** DFHCSUDP issues additional messages and terminates abnormally.

**User response:** See the VSAM diagnostics given in message DFHCA5179.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** date, time, applid, netname, tranid

---

VSAM error. Return code = nn Error code = ddd(yy) Control block type = type

**Explanation:** VSAM returned the following diagnostics when an error occurred, where:
- nn is the hexadecimal VSAM return code
• yy is the hexadecimal VSAM error code (ddd is its decimal equivalent)

• CONTROL BLOCK TYPE points to the relevant error code subset as follows:
  – RPL = Request macro responses from VSAM
  – ACB = OPEN/CLOSE responses

The error code is:
  – For CONTROL BLOCK TYPE = RPL, the reason code from byte 3 of the feedback word field in the RPL (RPLERRCD)
  – For CONTROL BLOCK TYPE = ACB, the reason code in the ERROR field in the ACB (ACBERFLG)

**System action:** The CSD utility terminates command processing, and in some situations, produces an operating system dump.

**User response:** For the meaning of the VSAM return and error codes, refer to the DFSMS/MVS V1R3 Macro Instructions for Data Sets manual.

When interpreting these diagnostics, ensure that the data set referenced in the JCL exists.

Check the following:
• The data set is being concurrently accessed by CICS running in another region.
• You are not attempting to open a recoverable CSD as READWRITE if DFHCSDUP specifies RLS access mode. You must specify PARM=CSD(READONLY) in this case.
• LOG is defined on the base cluster if RLS access mode is specified.

If DFHCSDUP specifies RLS access mode, a ‘record not found’ error could mean that the CSD has not been initialized.

**Note:** You must use non-RLS access mode to initialize a recoverable CSD.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** date, time, applid, netname, tranid, function, subfunction

---

**DFHCA5180 S**

*date time applid netname tranid*

Processing is terminated. Error occurred while CSD was being read by function subfunction

**Explanation:** When the LIST command invoked DFHDMTP to scan the objects on the CSD file, an error occurred during execution of the DFHDMTP function.

**System action:** The CSD utility terminates with an MVS abend 0325.

**User response:** This error should be reported. You need further assistance from IBM to resolve this problem. See Part 4 of the [CICS Problem Determination Guide](#) for guidance on how to proceed.
Processing is terminated. Invalid output from DFHPUP. Cannot format data for utility listing.

Explanation: There has been an internal logic error in the DFHCSDUP utility program. The data in the back-translated output buffer is invalid. The length code may be out of range or the data fields in the wrong sequence. One or more of the data fields may be invalid.

System action: The CSD utility terminates with an MVS abend 0326.

User response: This error must be reported.

Obtain a dump from DFHCSDUP together with a listing of the DFHCSDUP run and its JCL. Also try to obtain a print out of the CSD, using either IDCAMS or the DFHCSDUP LIST ALL option. The LIST indicates where the error(s) have occurred because they do not print and are therefore easily identifiable.

You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CSMT

Modules: DFHCAP

No objects defined in grpname listid

Explanation: In executing a LIST command, the CSD utility has found a group or list header on the CSD file for which no corresponding group or list elements exist.

System action: The utility continues to process the LIST command, but will not tabulate elements of the group or list named in the message.

User response: Run the DFHCSDUP VERIFY utility.

Destination: CSMT

Modules: DFHCAP

CSD verify process completed successfully.

Explanation: The VERIFY command has been processed successfully, and any internal locks associated with groups and lists on the CSD file have been removed.

System action: Normal processing continues.

User response: None.

Destination: CSMT

Modules: DFHCAP

Command is not executed. Unable to get storage for service module progname

Explanation: There is insufficient storage available to load the service module progname, that is to be loaded and executed by DFHCSDUP.

System action: Utility command execution is terminated.

If commands are being read from a SYSIN data stream, subsequent commands (except LIST commands) are
checked for syntax only. (If the primary CSD file cannot be opened, the LIST command is not processed either.)

If commands are being read from a get-command exit, DFHCSDUP attempts to process subsequent commands.

**User response:** Ensure that there is sufficient storage allocated to load module *progname*.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** *date, time, applid, netname, tranid, progname*

---

**DFHCA5191 I** *date time applid netname tranid Service program progname is running.*

**Explanation:** The service module *progname* has been loaded correctly. Execution of the module has started.

**System action:** Normal processing continues.

**User response:** None.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** *date, time, applid, netname, tranid, progname*

---

**DFHCA5192 S** *date time applid netname tranid Command is not executed. CSD service level ttt is incompatible with current service level sss*

**Explanation:** Either the LEVEL parameter specified in the SERVICE command is wrong, or an incorrect version of the CSD file is being used as the secondary (input) CSD file.

**System action:** The SERVICE command is not executed.

If commands are being read from a SYSIN data stream, subsequent commands (except LIST commands) are checked for syntax only. (If the primary CSD file cannot be opened, the LIST command is not processed either.)

If commands are being read from a get-command exit, DFHCSDUP attempts to process subsequent commands.

**User response:** The SERVICE command may upgrade the service level of the CSD file only in increments of one. Check that the input CSD file is the intended one, and that the LEVEL parameter takes the value one higher than the current service level of the CSD file.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** *date, time, applid, netname, tranid, ttt, sss*

---

**DFHCA5193 S** *date time applid netname tranid Command is not executed. Service module progname is unable to upgrade CSD to target service level ttt*

**Explanation:** The LEVEL parameter specified in the SERVICE command is incompatible with the status of the service module *progname* being applied to the CSD file.

**System action:** The SERVICE command is not executed.

If commands are being read from a SYSIN data stream, subsequent commands (except LIST commands) are checked for syntax only. (If the primary CSD file cannot be opened, the LIST command is not processed either.)

If commands are being read from a get-command exit, DFHCSDUP attempts to process subsequent commands.

**User response:** Ensure that the service module *progname*, being applied, is correctly updated with the service fix supplied by IBM. (It should have been amended so as to be able to process SERVICE commands at the target level ttt.)

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** *date, time, applid, netname, tranid, progname, ttt*

---

**DFHCA5194 I** *date time applid netname tranid Upgrading service status of CSD from level sss to level ttt*

**Explanation:** The loaded service module is performing the required upgrade of the CSD file from service level sss to service level ttt.

**System action:** Normal processing continues.

**User response:** None.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** *date, time, applid, netname, tranid, sss, ttt*

---

**DFHCA5195 I** *date time applid netname tranid Execution of service program progname complete.*

**Explanation:** The loaded service program *progname* has run to completion. Control is being transferred back to the CSD offline utility program, DFHCSDUP.

**System action:** Normal processing continues.

**User response:** None.

**Destination:** CSMT
Modules: DFHCAP
XMEOUT Parameters: date, time, applid, netname, tranid, progrname

DFHCA5196 S date time applid netname tranid
Command is terminated. Error occurred while reading control secondary CSD record.

Explanation: An I/O error has occurred on the specified CSD file.

System action: The SERVICE command is terminated.

If commands are being read from a SYSIN data stream, subsequent commands (except LIST) are checked for syntax only. (If the primary CSD file cannot be opened, LIST is not processed either.)

If commands are being read from a get-command exit, DFHCSDUP attempts to process subsequent commands.

User response: Retry the command, ensuring that a sufficiently large data set size is specified for the output (primary) CSD file.

Destination: CSMT
Modules: DFHCAP
XMEOUT Parameters: date, time, applid, netname, tranid

DFHCA5197 S date time applid netname tranid
Command is terminated. Unrecognized control record encountered while secondary CSD was being read.

Explanation: The contents of a control record of the secondary input CSD are invalid.

System action: The SERVICE command is terminated.

If commands are being read from a SYSIN data stream, subsequent commands (except LIST) are checked for syntax only. (If the primary CSD file cannot be opened, LIST is not processed either.)

If commands are being read from a get-command exit, DFHCSDUP attempts to process subsequent commands.

User response: Check that the input and output data sets have been correctly defined, and that the DDNAME for the secondary CSD file in the JCL corresponds to the OLDCSD parameter in the SERVICE utility command.

If the problem persists, you will need further help from IBM. First, obtain a dump from DFHCSDUP together with a listing of the DFHCSDUP run and its JCL. Also try to obtain a printout of the CSD using either IDCAMS or the DFHCSDUP LIST ALL option. The LIST indicates where the errors have occurred because they do not print and are therefore easily identifiable. See Part 4 of the [CICS Problem Determination Guide](#) for guidance on how to proceed.

Destination: CSMT
Modules: DFHCAP
XMEOUT Parameters: date, time, applid, netname, tranid

DFHCA5198 I date time applid netname tranid CSD record modified for resource-type resource-name, group-or-list group-or-list-name

Explanation: The specified modification to a record on the CSD file has taken place.

System action: Normal processing continues. If the modified record is an element in a GROUP or LIST, its date-and-time field is updated when copied to the output (primary) CSD file.

User response: None.

Destination: CSMT
Modules: DFHCAP
XMEOUT Parameters: date, time, applid, netname, tranid, resource-type, resource-name, group-or-list, group-or-list-name

DFHCA5199 W date time applid netname tranid
Invalid field encountered in existing record for resource-type resource-name group-or-list group-or-list-name

Explanation: An unexpected value was found in one of the fields of a CSD record that was to be modified for element resource-name of type resource-type.

System action: Normal processing continues, and the invalid record is left unchanged on the new (primary) CSD file.

User response: None.

Destination: CSMT
Modules: DFHCAP
XMEOUT Parameters: date, time, applid, netname, tranid, resource-type, resource-name, group-or-list, group-or-list-name

DFHCA5200 S date time applid netname tranid
Command not executed. No valid language table was loaded.

Explanation: The utility found that the RDO language table had not been loaded correctly, or that it contained invalid data.

System action: The utility terminates because it
cannot process any commands.

**User response:** Check that the correct version of the RDO language table (DFHEITSP) is in the program library.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** date, time, applid, netname, tranid

---

**DFHCA5201 S**  
*date applid netname tranid command*  
command is not valid.  
Command not executed.

**Explanation:** The CSD utility does not recognize the command.

**System action:** The utility ignores the command.

**User response:** Correct the command.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** date, time, applid, netname, tranid, command

---

**DFHCA5202 S**  
*date applid netname tranid command*  
Incorrect syntax for *command* command. Command not executed.

**Explanation:** The syntax of the command is incorrect.

**System action:** The CSD utility ignores the command.

**User response:** Correct the command.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** date, time, applid, netname, tranid, command

---

**DFHCA5203 W**  
*date applid netname tranid Right parenthesis assumed after the value of 'xxxx'.*  

**Explanation:** The syntax of the command was incorrect. Either a right parenthesis has been omitted or a keyword value in excess of 256 bytes has been specified.

**System action:** The utility executes the command as if the right parenthesis was present.

**User response:** Confirm that the correction applied by the utility generated the required command.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** date, time, applid, netname, tranid, command

---

**DFHCA5204 E**  
*date applid netname tranid command*  
Command not executed. 'xxx' keyword is not valid.

**Explanation:** The keyword xxxx is not valid on this command.

**System action:** The utility command is ignored.

**User response:** Correct the command.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** date, time, applid, netname, tranid, xxxx

---

**DFHCA5205 E**  
*date applid netname tranid command*  
Command not executed. No value was specified for 'xxxx'.

**Explanation:** The option xxxx is incomplete, possibly because a value has been omitted.

**System action:** The utility command is ignored.

**User response:** Correct the command.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** date, time, applid, netname, tranid, xxxx

---

**DFHCA5206 E**  
*date applid netname tranid command*  
Command not executed. Duplicate specification of 'xxxx'.

**Explanation:** Option xxxx appears twice on a single utility command.

**System action:** The utility ignores the command.

**User response:** Correct the command.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** date, time, applid, netname, tranid, xxxx

---

**DFHCA5207 E**  
*date applid netname tranid command*  
Command not executed. 'xxxxxxx' does not require a value.

**Explanation:** The utility detected an input command coded with a value for option xxxxxxx when no value was required.

**System action:** The utility does not process the command.

**User response:** Correct the command.

**Destination:** CSMT
Chapter 1. DFH messages 147

Modules: DFHCAP

XMEOUT Parameters: date, time, applid, netname, tranid, xxxxxxx

DFHCA5210 E  date time applid netname tranid
  Command not executed. Invalid value was specified for 'xxxx'.

Explanation: The utility detected an input command coded with an invalid value for option xxxx.

System action: The utility does not process the command.

User response: Correct the value.

Destination: CSMT

Modules: DFHCAP

XMEOUT Parameters: date, time, applid, netname, tranid, xxx

DFHCA5211 E  date time applid name tranid
  Command not executed. Operand delimiter 'x' was misplaced.

Explanation: The utility has detected an input command coded with a misplaced option delimiter x.

System action: The utility does not process the command.

User response: Place the delimiter correctly.

Destination: CSMT

Modules: DFHCAP

XMEOUT Parameters: date, time, applid, netname, tranid, x

DFHCA5212 E  date time applid netname tranid
  Command not executed. comptype 'string' is not uniquely identifiable.

Explanation: An ambiguous DFHCSDUP or CREATE command has been specified.
  - comptype is the command component type
  - string is the actual component.

System action: The command is not executed. For DFHCSDUP, if commands are being read from a SYSIN data stream, subsequent commands (except LIST commands) are checked for syntax only. If commands are being read from a get-command exit, DFHCSDUP attempts to process subsequent commands.

User response: Correct the command syntax and retry. See accompanying message DFHCA5213 for further details of the command failure.

Destination: CSMT

Modules: DFHCAP

XMEOUT Parameters: date, time, applid, netname, tranid, string, comptype

DFHCA5213 E  date time applid netname tranid
  Specify input could be interpreted as match1 or match2

Explanation: An ambiguous DFHCSDUP or CREATE command has been specified.
  - input is the ambiguous character string
  - match1 and match2 are two possible interpretations of input.

System action: The command is not executed. For DFHCSDUP, if commands are being read from a SYSIN data stream, subsequent commands (except LIST commands) are checked for syntax only. If commands are being read from a get-command exit, DFHCSDUP attempts to process subsequent commands.

User response: Correct the command syntax and retry.

Destination: CSMT

Modules: DFHCAP

XMEOUT Parameters: date, time, applid, netname, tranid, input, match1, match2

DFHCA5214 W  date time applid netname tranid
  Keyword is an obsolete keyword. It is ignored.

Explanation: The utility has detected an input command coded with an obsolete keyword. The keyword specifies an option not valid for this release of CICS.

System action: The utility ignores the keyword.

User response: Confirm that the resulting utility command is correct for this release of CICS.

Destination: CSMT

Modules: DFHCAP

XMEOUT Parameters: date, time, applid, netname, tranid, keyword

DFHCA5215 E  date time applid netname tranid
  Command not executed. A closing parenthesis has been omitted from a null value specified on an ALTER command.

Explanation: A closing parenthesis was not added when a null value was specified for a keyword on an ALTER command. A closing parenthesis is automatically added for keyword values other than nulls.

System action: The command is not executed. If commands are being read from a SYSIN data stream, subsequent commands (except LIST commands) are
checked for syntax only. If commands are being read from a get-command exit, DFHCSDUP attempts to process subsequent commands.

**User response:** Correct the command syntax and retry.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** date, time, applid, netname, tranid

---

**DFHCA5216 E** date time applid netname tranid
restart resname is not in group group

**Explanation:** A nonexistent resource of type restype and name resname, has been specified on an ALTER command.

**System action:** The command is not executed. If commands are being read from a SYSIN data stream, subsequent commands (except LIST commands) are checked for syntax only. If commands are being read from a get-command exit, DFHCSDUP attempts to process subsequent commands.

**User response:** Correct the command syntax and retry.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** date, time, applid, netname, tranid, restype, resname, group

---

**DFHCA5217 E** date time applid netname tranid
Command not executed. A closing bracket has been omitted from a xxxx keyword.

**Explanation:** A closing bracket has been omitted from the xxxx keyword on a CREATE or DFHCSDUP DEFINE command.

**System action:** The command is not executed.

**User response:** Correct the command syntax and retry.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** date, time, applid, netname, tranid, restype, resname, group

---

**DFHCA5218 I** date time applid netname tranid
Altering Restorctype Resourcename in group Groupname

**Explanation:** During the execution of a generic ALTER command, the CSD batch update utility scans the CSD file for matches to the specified generic resource name and/or GROUP keyword. For every match, the utility processes the request and informs the user of the resulting resourcename and/or groupname respectively.

**System action:** Normal processing continues.

**User response:** None.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** date, time, applid, netname, tranid, Restorctype, Resourcename, Groupname

---

**DFHCA5219 W** date time applid netname tranid
No match found on CSD file for Restorctype Resourcename group Groupname

**Explanation:** The ALTER command was executed with a generic resource and/or group name, but no qualifying resource and/or group exist on the CSD file.

**System action:** Normal processing continues.

**User response:** None.

**Destination:** CSMT

**Modules:** DFHCSDUP

**XMEOUT Parameters:** date, time, applid, netname, tranid, Restorctype, Resourcename, Groupname

---

**DFHCA5220 S** date time applid netname tranid
Command not executed. ‘xxxxxxxx’ must be the first command.

**Explanation:** The CSD utility found an INITIALIZE command after other commands.

**System action:** The CSD utility ignores the command.

**User response:** Confirm that the INITIALIZE command was misplaced.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** date, time, applid, netname, tranid, xxxxxxx

---

**DFHCA5222 E** date time applid netname tranid
Command not executed. ‘xxxxxxx’ keyword was omitted or specified incorrectly.

**Explanation:** A required keyword xxxxxxxx was omitted from a CSD utility command.

**System action:** The utility ignores the command.

**User response:** Specify keyword xxxxxxxx.

**Destination:** CSMT

**Modules:** DFHCAP
XMEOUT Parameters: date, time, applid, netname, tranid, xxxxxxxx

**DFHCA5223 E**  date time applid netname tranid

Command not executed. *xxxxxxx* keyword conflicts with *xxxxxxx* keyword.

**Explanation:** The syntax of the command is incorrect. Conflicting keywords have been specified.

**System action:** The utility command is ignored.

**User response:** Correct the command.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** date, time, applid, netname, tranid, xxxxxxxx, xxxxxxxx

**DFHCA5224 E**  date time applid netname tranid

Command not executed. The value of operand is outside the valid range for keyword.

**Explanation:** A numeric value of operand was detected, which is outside the permitted range of values for the keyword keyword.

**System action:** The command is not executed.

**User response:** Correct the value.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** date, time, applid, netname, tranid, operand, keyword

**DFHCA5225 E**  date time applid netname tranid

Command not executed. Same name specified for *xxxxxxx* and *xxxxxxx*.

**Explanation:** This message is issued for one of the following reasons:
1. The utility COPY command has been coded with the same group name for the source and target group.
2. The APPEND command has been coded with the same list name for the source and target list.
3. The ADD command has been coded with the same group name and list name.

**System action:** The CSD utility or CICS ignores the command.

**User response:** Correct the name (or names) in error.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** date, time, applid, netname, tranid, xxxxxxxx, xxxxxxxx

**DFHCA5227 E**  date time applid netname tranid

Command not executed. Use of generic name conflicts with *xxxxxxx* option.

**Explanation:** A CSD utility command used a generic name; that is, one containing asterisk (*) or plus sign (+) characters, in conjunction with an option that conflicted with the use of generic names.

**System action:** The utility ignores the command.

**User response:** Correct the command.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** date, time, applid, netname, tranid, xxxxxxxx

**DFHCA5228 E**  date time applid netname tranid

Command not executed. Only one resource-type keyword may be specified.

**Explanation:** The CSD utility detected an input command coded with more than one resource-type keyword.

**System action:** The utility does not process the command.

**User response:** Correct the command to refer to only one resource-type keyword.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** date, time, applid, netname, tranid

**DFHCA5229 E**  date time applid netname tranid

Command not executed. *xxxxxxx* is invalid because a resource-type keyword was specified.

**Explanation:** The CSD utility detected an input command coded with a resource-type keyword (for example, PROGRAM, TRANSACTION) in a situation where a resource-type keyword is invalid.

**System action:** The utility does not process the command.

**User response:** Correct the command and resubmit.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** date, time, applid, netname, tranid, xxxxxxxx
DFHCA5230 I date time applid netname tranid ERASE
command is obsolete. Use the DELETE command.

Explanation: The CSD utility detected the obsolete ERASE command in its input.

System action: The utility processes the command as a DELETE command.

User response: In future, use the DELETE command instead of the ERASE command.

Destination: CSMT
Modules: DFHCAP
XMEOUT Parameters: date, time, applid, netname, tranid

DFHCA5231 E date time applid netname tranid
Command not executed. 'xxxxxxxx' is incompatible with the MIGRATE command for tabletype tables.

Explanation: An attempt has been made to execute the MIGRATE command with an invalid table type and (or) an invalid keyword specified.

System action: The CSD utility terminates.

User response: Correct the command syntax and resubmit the job.

Destination: CSMT
Modules: DFHCAP
XMEOUT Parameters: date, time, applid, netname, tranid, xxxxxxxx, tabletype

DFHCA5232 E date time applid netname tranid
Command not executed. 'xxxxxxxx' parameter must not begin with 'DFH'.

Explanation: In a CSD utility MIGRATE command, the xxxxxxxx parameter contained an invalid table name or group name.

System action: The utility does not process the command.

User response: Resubmit with a valid table name or group name.

Destination: CSMT
Modules: DFHCAP
XMEOUT Parameters: date, time, applid, netname, tranid, xxxxxxxx

DFHCA5233 E date time applid netname tranid
Command not executed. 'tabletype' table type is not supported by RDO.

Explanation: The CSD utility detected a TABLE parameter that referred to a CICS table type not supported by RDO.

RDO supports:
- Program, transaction, and terminal definitions (RDT)
- Files (FCT)
- Transient data queues (DCT).

System action: The utility does not process the command.

User response: Correct the command.

Destination: CSMT
Modules: DFHCAP
XMEOUT Parameters: date, time, applid, netname, tranid, tabletype

DFHCA5234 E date time applid netname tranid
Command not executed. 'command' command is not supported.

Explanation: The CSD utility detected a command in its input which is not supported by RDO.

System action: The utility does not process the command.

User response: Correct the command.

Destination: CSMT
Modules: DFHCAP
XMEOUT Parameters: date, time, applid, netname, tranid, command

DFHCA5235 E date time applid netname tranid
Command not executed. Group or list must be specified.

Explanation: A CSD utility EXTRACT command has been submitted. A GROUP or LIST name must be specified with an EXTRACT command.

System action: The utility command is not executed. This message is followed by DFHCA5104.

User response: Correct the invalid command by adding a valid GROUP or LIST name and rerun the utility job.

Destination: CSMT
Modules: DFHCAP
XMEOUT Parameters: date, time, applid, netname, tranid

DFHCA5236 I date time applid netname tranid
A user-exit program has been specified on the entry linkage and on the userprogram keyword. The program specified on the entry linkage has been ignored.
**Explanation:** An EXTRACT user-exit program has been specified via the entry parameter list and on the USERPROGRAM keyword of the EXTRACT command.

**System action:** The program specified on the USERPROGRAM keyword is used.

**User response:** Ensure that the user program used is the one intended.

**Destination:** CSMT
**Modules:** DFHCAP
**XMEOUT Parameters:** date, time, applid, netname, tranid

---

**DFHCA5240 S date applidx netname tranid**

Processing terminated. Error occurred while input utility command was being read.

**Explanation:** The environment adapter GETCARD utility cannot read an input utility command.

**System action:** The CSD utility terminates abnormally without processing the input commands.

**User response:** Check that the utility commands are prepared correctly and located correctly in the JCL. Check also that the DD statement defining the output data set startup job stream is correct.  For JCL examples, refer to the CICS Operations and Utilities Guide.

**Destination:** CSMT
**Modules:** DFHCAP
**XMEOUT Parameters:** date, time, applid, netname, tranid

---

**DFHCA5241 S date applidx netname tranid**

Processing terminated. Invalid record length on utility command data stream.

**Explanation:** The CSD utility detected incorrectly formatted input in the SYSIN data stream.

**System action:** The CSD utility cannot process any commands. The utility attempts to:
1. Close any files previously opened internally.
2. Unload any extract exit routines that were dynamically loaded.
3. Invoke the termination exit routine (if supplied).
4. Return control to the invoker of the utility.

**User response:** Ensure that the output data set data stream is formatted with fixed length 80-byte records.

**Destination:** CSMT
**Modules:** DFHCAP
**XMEOUT Parameters:** date, time, applid, netname, tranid

---

**DFHCA5242 E date time applid netname tranid**

Command not processed. Too many continuation records for input utility command.

**Explanation:** The CSD utility detected an input command that was too long and extended over too many records.

**System action:** The utility does not process the command.

**User response:** This message may be caused by an error in the rejected command or in the preceding or subsequent commands in the input stream. Correct the commands in error.

**Destination:** CSMT
**Modules:** DFHCAP
**XMEOUT Parameters:** date, time, applid, netname, tranid

---

**DFHCA5250 E TO(groupname) contains too many non contiguous ""**

**Explanation:** During the execution of a generic COPY command, the batch update utility found the argument of the TO parameter specified too many non contiguous asterisks.

**System action:** The utility rejects the command.

**User response:** Correct the command.

**Destination:** SYSPRINT
**Modules:** DFHCS DUP

---

**DFHCA5251 I date time applid netname tranid**

resource object in group grpname is replaced.

**Explanation:** A resource definition existed in both source and target groups. Based on the CSD utility commands submitted, the utility has replaced the definition in the target group with that from the source group.

- resource is the type of the resource
- object is the name of the object
- grpname is the name of the group.

**System action:** Normal utility processing continues.

**User response:** None.

**Destination:** CSMT
**Modules:** DFHCAP
**XMEOUT Parameters:** date, time, applid, netname, tranid, resource, object, grpname
**Explanation:** The CSD utility has correctly copied a resource definition to the specified group, where:

- `resource` is the type of resource
- `object` is the name of the object
- `grpname` is the name of the group.

**System action:** Normal utility processing continues.

**User response:** None.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** `date, time, applid, netname, tranid, resource, object, grpname`

---

**Explanation:** The CSD utility detected a command that attempted to retrieve definitions from the non-existent group, `grpname`, in the CSD specified in DDNAME `ddname`.

**System action:** The utility does not process the command.

**User response:** Either correct the group name in the command, or make sure that the specified CSD file is the correct one.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** `date, time, applid, netname, tranid, grpname, ddname`

---

**Explanation:** The CSD utility detected a command that attempted to add a definition to a group that already contained a definition of an object with the same name, where:

- `resource` is the type of resource
- `object` is the name of the object.

**System action:** The CSD utility does not process the command.

**User response:** Change the name in the command, or alter the name of the existing definition.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** `date, time, applid, netname, tranid, resource, object`

---

**Explanation:** During the execution of a generic COPY command, the batch update utility found the length of the prefix of the generic group specified in the TO keyword to be greater than the length of the prefix of the generic GROUP keyword.

**System action:** The utility ignores the command to prevent truncation of the TO group name.

**User response:** Correct the command.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** `date, time, applid, netname, tranid`
Explanation: During the execution of a generic COPY command, the CSD batch update utility scans the CSD file for matches to the generic GROUP keyword. For every match, the utility resolves the generic TO keyword, and informs the user of the resulting grpname1 and grpname2 respectively.

System action: Normal processing continues.

User response: None.

Destination: CSMT

Modules: DFHCAP

XMEOUT Parameters: date, time, applid, netname, tranid, grpname1, grpname2

Unrecognized resource type found in the CSD file and has been ignored.

Explanation: CICS has found an unrecognized resource type code in a CSD record. The unrecognized code does not match any of the function codes in the language definition table. This can occur for one of the following reasons:

1. You are using a CICS release that does not support a type of definition that was created on the CSD file by a later CICS release.
2. The language definition table (DFHEITSP or DFHEITCU) is invalid for this CICS release.
3. The CSD manager (DFHDMP) has passed an invalid CSD record buffer to DFHPUP. This is a CICS internal logic error.

System action: The resource is ignored and the operation continues.

User response: Determine which of the possible reasons caused the error. If you can eliminate reasons 1 and 2, you can assume that reason 3 applies.

Take action corresponding to the reason you have established as follows:

1. Ignore the message.
2. Ensure that the library contains versions of DFHEITSP and DFHEITCU that are valid for the CICS release you are running.
3. You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CSMT

Modules: DFHCAP

XMEOUT Parameters: date, time, applid, netname, tranid

Length of 'TO' suffix must be equal to length of 'GROUP' suffix.

Explanation: During the execution of a generic COPY command, the batch update utility found the length of the suffix of the generic group specified in the TO keyword to be of different length than that of the suffix of the generic GROUP keyword.

System action: The utility ignores the command to prevent ambiguity on the TO group name.

User response: Correct the command.

Destination: SYSPRINT

Modules: DFHCSDUP

RDT is empty. No VTAM resources in assembled table.

Explanation: The CSD utility detected an attempt to migrate a TCT that either contains no RDO-supported terminal or sessions definitions, or whose TYPE=INITIAL entry specifies MIGRATE=COMPLETE.

System action: The utility does not create any CSD definitions.

User response: Check the TCT source code to see if it contains any RDO-supported definitions. If it does, ensure that it has been correctly assembled (MIGRATE=YES specified) and link-edited.

Destination: CSMT

Modules: DFHCAP

XMEOUT Parameters: date, time, applid, netname, tranid

Insufficient storage to build types-matching chain.

Explanation: During CSD utility processing, an internal error has occurred in the migration of a TCT. This is because of lack of storage for TYPETERM definitions.

System action: The utility attempts to:

1. Close any files previously opened internally.
2. Unload any extract exit routines that were dynamically loaded.
3. Invoke the termination exit routine (if supplied).
4. Return control to the invoker of the utility.

In any of the above cases, definitions that have already been migrated remain on the CSD.

User response:

1. Run the DFHCSDUP VERIFY utility.
2. Delete the groups created by the failing MIGRATE command.
3. Allocate a larger region size in the utility JCL, and retry the command.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** date, time, applid, netname, tranid

---

**DFHCA5263** S  
Date time applid netname tranid  
Error in input RDT. Incorrect sequence of commands.

**Explanation:** During CSD utility processing, an internal error has occurred in the migration of a TCT. This is because of abnormal data in the assembled table.

**System action:** The utility attempts to:
1. Close any files previously opened internally.
2. Unload any extract exit routines that were dynamically loaded.
3. Invoke the termination exit routine (if supplied).
4. Return control to the invoker of the utility.

Definitions that have already been migrated remain on the CSD. The MVS user abend code is 0308.

**User response:**
1. Run the DFHCSDUP VERIFY utility.
2. Delete the groups created by the failing MIGRATE command.
3. Keep the assembly listing for the failing table and keep the DFHCSDUP dump, if available.
4. You need further assistance from IBM to resolve this problem. See Part 4 of the [CICS Problem Determination Guide](#) for guidance on how to proceed.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** date, time, applid, netname, tranid

---

**DFHCA5264** W  
Date time applid netname tranid  
Resource object not defined. Group grpname not available.

**Explanation:** During the migration of a TCT, the CSD utility could not define a resource object because the target group grpname was not available. The utility has issued a previous message indicating the reason.

**System action:** The utility creates no definition for resource object. Normal utility processing continues.

**User response:** Review the original message. If necessary, recode the TYPE=GROUP macro in the TCT source to name a suitable group.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** date, time, applid, netname, tranid, sessions

---

**DFHCA5265** W  
Date time applid netname tranid  
Action required to find a suitable typeterm for terminal termid.

**Explanation:** While migrating a TCT, the CSD utility found a terminal definition for which it could not create a corresponding TYPETERM definition.

**System action:** The utility adds the terminal definition to the CSD file, but it refers to a TYPETERM that may be unsuitable for this device.

**User response:** Use the CEDA transaction to define a suitable TYPETERM and alter the TERMINAL definition to refer to the new TYPETERM.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** date, time, applid, netname, tranid, termid

---

**DFHCA5266** W  
Date time applid netname tranid  
Sessions sessions not defined, because of error in associated connection.

**Explanation:** An error has been detected during the migration of a TCT. When migrating a session, DFHCSDUP checks that the associated CONNECTION has been defined successfully. If it has not, DFHCSDUP abnormally terminates the session definition.

**System action:** The specified SESSIONS resource is not migrated to the CSD. DFHCSDUP continues with the migration of subsequent TCT entries.

**User response:** Use the diagnostic information in the output listing from the MIGRATE utility to determine why the CONNECTION definition has failed. You can then use RDO to DEFINE the CONNECTION and the SESSIONS to the CSD.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** date, time, applid, netname, tranid, sessions

---

**DFHCA5270** I  
Date time applid netname tranid  
Group-or-list xxxxxxxx deleted from the CSD.

**Explanation:** The CSD utility has successfully deleted a group or list from the primary CSD file.

**System action:** Normal utility processing continues.

**User response:** None.

**Destination:** CSMT
DFHCA5271 S  date time applid netname tranid
Unable to delete group-or-list xxxxxxxx
from the CSD.

Explanation: During CSD utility processing, an error in
accessing the CSD file caused a delete operation to fail.

System action: The utility does not process the
DELETE command. The group or list to be deleted
remains on the CSD file.

User response: You need further assistance from IBM
to resolve this problem. See Part 4 of the CICS Problem
Determination Guide for guidance on how to proceed.

Destination: CSMT

DFHCA5272 I  date time applid netname tranid
resource object deleted from group
grpname

Explanation: The CSD utility successfully deleted the
named resource, where:
• resource is the type of resource
• object is the name of the object.

System action: Normal utility processing continues.

User response: None.

Destination: CSMT

DFHCA5273 W  date time applid netname tranid
resource object not defined. Group
grpname not available.

Explanation: During the migration of an RCT, the CSD
utility could not define the resource resource because
the target group grpname was not available. The
utility has already issued a message indicating the
reason.

System action: The utility creates no definition for the
resource named object. Normal utility processing
continues.

User response: Review the original message. If
necessary, recode the TYPE=GROUP macro in the
RCT source to name a suitable group.

Destination: CSMT

DFHCA5274 W  date time applid netname tranid
resource object not defined. Group
grpname not available.

Explanation: During the migration of an RCT, the CSD
utility could not define the resource resource because
the target group grpname was not available. The
utility has already issued a message indicating the
reason.

System action: The utility creates no definition for the
resource named object. Normal utility processing
continues.

User response: Review the original message. If
necessary, recode the TYPE=GROUP macro in the
RCT source to name a suitable group.

Destination: CSMT

DFHCA5275 E  date time applid netname tranid
Group
grpname is not a member of list
listname

Explanation: The REMOVE command being executed
names a GROUP that is not a member of LIST
listname.

System action: The command is not executed.

If commands are being read from a SYSIN data stream,
subsequent commands (except LIST commands) are
checked for syntax only. (If the primary CSD file cannot
be opened, the LIST command is not processed either.)

If commands are being read from a get-command exit,
DFHCSDUP attempts to process subsequent
commands.

User response: Correct the command and resubmit a
DFHCSDUP job to execute the failing command and
any subsequent commands that were suppressed.

Destination: CSMT

DFHCA5276 I  date time applid netname tranid
Group
grpname removed from list
listname

Explanation: The REMOVE command has
successfully removed group grpname from LIST
listname.

System action: Normal execution continues.

User response: None.
DFHCA5277 I date time applid netname tranid List deleted from CSD.
Explanation: The final group has been removed from list `listname`. The list has therefore been deleted.
System action: Processing continues.
User response: None.

Destination: CSMT
Modules: DFHCAP
XMEOUT Parameters: date, time, applid, netname, tranid, listname

DFHCA5280 I date time applid netname tranid Processing definitions from library member `xxxxx`
Explanation: The CSD utility has successfully loaded data from the named library member.
System action: Normal utility processing continues.
User response: None.
Destination: CSMT
Modules: DFHCAP
XMEOUT Parameters: date, time, applid, netname, tranid, list

DFHCA5281 S date time applid netname tranid Data loaded from library member `xxxxx` is invalid
Explanation: The CSD utility has found an error in data loaded from the named library member.
System action: The utility attempts to:
1. Close any files previously opened internally.
2. Unload any extract exit routines that were dynamically loaded.
3. Invoke the termination exit routine (if supplied).
4. Return control to the invoker of the utility.
User response: Obtain a dump containing the failing library member.
You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Destination: CSMT
Modules: DFHCAP
XMEOUT Parameters: date, time, applid, netname, tranid, list

DFHCA5282 E date time applid netname tranid Unable to get storage for library member `xxxxx`
Explanation: There is insufficient storage available to load the library member `xxxxx`.
System action: The utility terminates processing of the command that required access to the named library member.
User response: Allocate a larger region size in the utility JCL and resubmit the job.

Destination: CSMT
Modules: DFHCAP
XMEOUT Parameters: date, time, applid, netname, tranid, list

DFHCA5283 S date time applid netname tranid RDL subcommand exceeds 1536 bytes:
`xxxxx`.
Explanation: The CSD utility found an internal error in the data loaded while processing the indicated (truncated) UPGRADE, INITIALIZE, or MIGRATE command.
System action: The CSD utility terminates abnormally.
User response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CSMT
Modules: DFHCAP
XMEOUT Parameters: date, time, applid, netname, tranid, list

DFHCA5284 E date time applid netname tranid Error analyzing RDL subcommand: `xxxxx`.
Explanation: The CSD utility found an internal error in the data loaded while processing the indicated (truncated) UPGRADE, INITIALIZE, or MIGRATE command.
System action: The utility attempts to:
1. Close any files previously opened internally.
2. Unload any extract exit routines that were dynamically loaded.
3. Invoke the termination exit routine (if supplied).
4. Return control to the invoker of the utility.
User response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
DFHCA5285 E  date time applid netname tranid Invalid verb in RDL subcommand:  xxxxxxxxxxx....

Explanation:  The CSD utility found an internal error in the data loaded while processing the indicated (truncated) UPGRADE, INITIALIZE, or MIGRATE command.

System action:  The utility attempts to:
1. Close any files previously opened internally.
2. Unload any extract exit routines that were dynamically loaded.
3. Invoke the termination exit routine (if supplied).
4. Return control to the invoker of the utility.

User response:  You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

DFHCA5286 E  date time applid netname tranid Unable to create resource definition on CSD file:  xxxxxxxxxxx....

Explanation:  This message is issued during the processing of the indicated (truncated) command for one of the following reasons:
1. The CSD is full (in which case, messages DFHCA5175 and DFHCA5176 accompanies this one)
2. The CSD was defined as read-only (in which case, message DFHCA5174 accompanies this message)
3. The TCT being migrated contained a terminal entry with a name unacceptable to RDO (in which case, message DFHCA5165 accompanies this message)
4. A list or group cannot be used due to the failure of a previous update operation (in which case, message DFHCA5142 accompanies this message)
5. The resource definition list being used to INITIALIZE or UPGRADE the CSD file contained a definition with an invalid resource name or group name
6. A logic error occurred in DFHCSDUP or an internal error was detected in the data contained in the loaded table.

System action:  The system action depends on the reason the message is issued, as follows.
1. Migration of the TCT table is terminated immediately.
2. Processing of the UPGRADE or INITIALIZE command is terminated
3. The utility attempts to:
   a. Close any files previously opened internally.
   b. Unload any extract exit routines that were dynamically loaded.
   c. Invoke the termination exit routine (if supplied).
   d. Return control to the invoker of the utility.
4. The command is not executed, and execution of further DFHCSDUP commands in the job stream is suppressed.
5. As in (3) above.
6. As in (3) above.

In ALL cases, all the definitions created by this command up to the point of failure remain on the CSD.

User response:  The user response depends on the reason the message is issued, as follows.
1. See message DFHCA5175 and DFHCA5176.
2. See message DFHCA5174.
3. Change the name of the terminal and all references to it. Also refer to the user response for message DFHCA5165.
4. See message DFHCA5142.
5. This is a CICS logic error. See instruction for 6 below.
6. This is a CICS logic error. You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed. A CICS background trace of the failure may aid them in problem diagnosis.

DFHCA5287 E  date time applid netname tranid Extract terminated at user's request.  RC=retcode

Explanation:  A batch job has issued a CSD utility EXTRACT command. The EXTRACT command has been terminated because of a nonzero value in register 15 on return from a user exit program. Subsequent messages indicate any further problems encountered by the utility.

System action:  Execution of the utility command is terminated. This message is followed by DFHCA5104.

User response:  Determine the cause of the error detected by the user exit program, using the return code retcode provided and the relevant documentation of the user exit program.
Destination: CSMT
Modules: DFHCAP
XMEOUT Parameters: date, time, applid, netname, tranid, retcode

DFHCA5288 E  Get-command terminated at user's request. RC=retcode
Explanation: The GET-COMMAND exit has returned a value other than UERCNORM ('00'X) or UERCDONE ('04'X) indicating that the GET-COMMAND exit was unsuccessful.
System action: Execution of the utility command is terminated.
User response: Correct the operation of the GET-COMMAND user exit before re-running the utility.

Destination: SYSPRINT
Modules: DFHCAP

DFHCA5290 W  Table tabtype macro mactype=value is not supported. Value is changed to newvalue.
Explanation: During a table tabtype migration for macro mactype, value is not supported. value has been migrated as newvalue.
System action: The utility creates the definition for the resource with the changed value. Normal utility processing continues.
User response: Review the object definition to ensure that the modified definition is acceptable.

Destination: SYSPRINT
Modules: DFHCSDUP

DFHCA5291 E  Unable to define object object in group group. Migration is terminated.
Explanation: The DFHCSDUP migration utility could not define object in the group specified. The migration cannot continue.
System action: The utility terminates the migration of the table.
User response: Verify that the specified group is the correct group and review prior errors to determine why the migration utility could not create the definition in the group.

Destination: SYSPRINT
Modules: DFHCSDUP

DFHCA5292 W  Object object not defined for table item name due to previous error. Migration continues.
Explanation: The DFHCSDUP migration utility could not define object for the table item name. The migration continues.
System action: The utility continues the table migration without defining the object.
User response: Correct the prior errors and manually define the skipped objects.

Destination: SYSPRINT
Modules: DFHCSDUP

DFHCA5293 W  Total object definitions skipped due to error: number
Explanation: CICS issues this message after migrating a CICS table. number definitions of type object were not migrated. See one or more DFHCA5292 messages issued prior to this message.
System action: Utility processing continues.
User response: Correct the prior errors and manually define the skipped objects.

Destination: SYSPRINT
Modules: DFHCSDUP

DFHCA5294 E  number object-1 were not matched with a corresponding object-2.
Explanation: CICS issues this message if there are object-1 table definitions that have not been defined because the table was not defined correctly. object-1 table definitions must refer to a object-2 in the table.
System action: The migration of the table ends.
User response: Reassemble the table with the current release macro source.

Destination: SYSPRINT
Modules: DFHCSDUP

DFHCA5296 W  Table tabtype TYPE=mactype parameter does not support multiple values.
Explanation: Multiple values were specified for TYPE=mactype parameter. The migration of the tabtype table supports only one value.
System action: The migration utility ignores the additional values. The migration continues.
User response: Review the migrated definition to
ensure that the new single value is acceptable.

**Destination:** SYSPRINT

**Modules:** DFHCSDUP

---

**DFHCA5501 E**  
*date time applid netname tranid*

Command not executed. *keyword* must be specified.

**Explanation:** A *keyword* which is required in the command, has been omitted or was incorrectly specified. An earlier message identifies if the latter case is applicable.

**System action:** The utility ignores the command.

**User response:** Correct the command.

**Destination:** SYSPRINT

**Modules:** DFHCSDUP

---

**DFHCA5502 W**  
*date time applid netname tranid*

**Explanation:** The value *xxxxxxx* specified in a DEFINE or CREATE command has caused another value *yyyyyyyy*, which is not a normal default, to be assumed.

**System action:** Normal utility processing continues.

**User response:** Check that the resulting resource definition is acceptable. If you accept this default, no further action is required.

If the resultant default is not acceptable, you must decide whether to modify the definition, or to delete it and start again.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** *date, time, applid, netname, tranid, keyword*

---

**DFHCA5504 E**  
*date time applid netname tranid*

Command not executed. Use of *xxxxxxx* option implies *yyyyyyyy* option must be specified.

**Explanation:** Option *xxxxxxx* requires another value, *yyyyyyyy*.

**System action:** The utility ignores the command.

**User response:** Specify *yyyyyyyy*.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** *date, time, applid, netname, tranid, xxxxxxx, yyyyyyy*

---

**DFHCA5505 W**  
*date time applid netname tranid*

Program DFHMSP requires a TWASIZE of at least 528.

**Explanation:** A DEFINE or CREATE TRANSACTION command for the message switching program, DFHMSP, has given it a TWASIZE of less than 528 bytes. If it is to be a definition for the CICS-supplied program of that name, it will not execute correctly.

**System action:** Normal utility processing continues.

**User response:** Check that the resulting resource definition is as you expect.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** *date, time, applid, netname, tranid*

---

**DFHCA5506 E**  
*date time applid netname tranid*

Command not executed. For *xxxxxxx* many options, including *yyyyyyyy*, are meaningless.

**Explanation:** A keyword or value has been specified that is not consistent with another.

**System action:** The utility ignores the command.

**User response:** Correct the command.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** *date, time, applid, netname, tranid, xxxxxxx, yyyyyyy*

---

**DFHCA5507 E**  
*date time applid netname tranid*

Command not executed. *xxxxxxx* value must be greater than *yyyyyyyy* value.

**Explanation:** A value has been specified that is not consistent with another. *xxxxxxx* must be greater than *yyyyyyyy*.
System action: The utility ignores the command.
User response: Correct the command.
Destination: CSMT
Modules: DFHCAP
XMEOUT Parameters: date, time, applid, netname, tranid, xxxxxxx, yyyyyyy

DFHCA5508 E date time applid netname tranid
Command not executed. xxxxxxx value must be less than or equal to yyyyyyy value.

Explanation: A value has been specified that is not consistent with another. The value xxxxxxx must be less than or equal to yyyyyyy.
System action: The utility ignores the command.
User response: Correct the command.
Destination: CSMT
Modules: DFHCAP
XMEOUT Parameters: date, time, applid, netname, tranid, xxxxxxx, yyyyyyy

DFHCA5509 E date time applid netname tranid
Command not executed. xxxxxxx name must not be the same as yyyyyyy name.

Explanation: Some values in DEFINE or CREATE commands must not be the same as the name of the resource. xxxxxxx must not have the same name as yyyyyyy.
System action: The utility ignores the command.
User response: Correct the command.
Destination: CSMT
Modules: DFHCAP
XMEOUT Parameters: date, time, applid, netname, tranid, xxxxxxx, yyyyyyy

DFHCA5510 W date time applid netname tranid
Program name begins with 'DFH' but transaction name does not begin with 'C'.

Explanation: CICS supplies standard programs and transactions whose naming conventions you should avoid.
System action: Normal utility processing continues.
User response: Check that the resulting resource definition is as you expect.
Destination: CSMT
Modules: DFHCAP
XMEOUT Parameters: date, time, applid, netname, tranid, xxxxxxx, yyyyyyy

DFHCA5511 E date time applid netname tranid
Command not executed. The second value of xxxxxxx must not be greater than the first.

Explanation: Some keywords take pairs of values which are essentially maximum and minimum values.
System action: The utility ignores the command.
User response: Correct the command.
Destination: CSMT
Modules: DFHCAP
XMEOUT Parameters: date, time, applid, netname, tranid, xxxxxxx, yyyyyyy

DFHCA5512 W date time applid netname tranid
xxxxxxx name yyyyyyy is reserved and may be redefined by CICS.

Explanation: CICS supplies standard programs and transactions whose names you should usually avoid.
System action: Normal utility processing continues.
User response: Check that the resulting resource definition is as you expect.
Destination: CSMT
Modules: DFHCAP
XMEOUT Parameters: date, time, applid, netname, tranid, xxxxxxx, yyyyyyy

DFHCA5513 E date time applid netname tranid
Command not executed. With SESSNAME there can only be one COUNT and its value must be 1.

Explanation: The use of SESSNAME in a DEFINE or
CREATE SESSIONS command means that a single-session, either for sending or receiving, is required.

System action: The utility ignores the command.
User response: Correct the command.

Destination: CSMT
Modules: DFHCAP
XMEOUT Parameters: date, time, applid, netname, tranid

DFHCA5515 W date time applid netname tranid
AUTOPAGE(NO) has been specified for a 3270 print device.

Explanation: A DEFINE or CREATE TYPETERM command has AUTOPAGE(NO) and DEVICE(3270P) or DEVICE(LUTYPE3).
System action: Normal utility processing continues.
User response: Check that the resulting resource definition is as you expect.

Destination: CSMT
Modules: DFHCAP
XMEOUT Parameters: date, time, applid, netname, tranid

DFHCA5516 W date time applid netname tranid The values of DEVICE and SESSIONTYPE are equivalent to DEVICE(devtype) and have been replaced.

Explanation: A DEFINE or CREATE TYPETERM command has a valid but obsolete DEVICE and SESSIONTYPE combination. This DEVICE and SESSIONTYPE combination has been replaced by a simpler equivalent indicated by devtype.
System action: Normal utility processing continues.
User response: Check that the resulting resource definition is as you expect. The CICS Resource Definition Guide provides further information about device equivalents.

Destination: CSMT
Modules: DFHCAP
XMEOUT Parameters: date, time, applid, netname, tranid, devtype

DFHCA5517 E date time applid netname tranid prefix and COUNT together make more than four characters.

Explanation: In a SESSIONS definition, the prefix parameter (SENDPFX or RECEIPEPFX) is used to generate session names by adding numeric suffixes up to the corresponding count value (SENDCOUNT or RECEIVECOUNT). Since the session names cannot be longer than four characters, when the count of sessions exceeds 99 the prefix can only be one character.
System action: The command is not executed.
User response: Correct the command.

Destination: CSMT
Modules: DFHCAP
XMEOUT Parameters: date, time, applid, netname, tranid, prefix

DFHCA5518 W date time applid netname tranid XTRANIDS xxxxxxx are reserved and may be redefined by CICS.

Explanation: CICS supplies programs and transactions whose names you should usually avoid.
System action: Normal utility processing continues.
User response: Check that the resulting resource definition is as you expect.

Destination: CSMT
Modules: DFHCAP
XMEOUT Parameters: date, time, applid, netname, tranid, xxxxxxx

DFHCA5519 E date time applid netname tranid Command not executed. xxxxxxx value contains an invalid y.

Explanation: All character values in CREATE and DFHCSDUP commands are subject to rules which, depending on the value, disallow certain characters.
System action: The utility ignores the command.
User response: Correct the command. The CICS Resource Definition Guide provides further information about these rules under the individual attributes for the syntax of the DFHCSDUP command.

Destination: CSMT
Modules: DFHCAP
XMEOUT Parameters: date, time, applid, netname, tranid, xxxxxxx, y

DFHCA5520 W date time applid netname tranid The value of DEVICE is equivalent to xxxxxxx and has been replaced.

Explanation: A DEFINE or CREATE TYPETERM command has a valid but obsolete DEVICE value which has been replaced by a simpler equivalent.
System action: Normal utility processing continues.
User response: Check that the resulting resource definition is as you expect.

The CICS Resource Definition Guide provides further information about these simpler equivalent devices.

Destination: CSMT
Modules: DFHCAP
XMEOUT Parameters: date, time, applid, netname, tranid, xxxxxxx

DFHCA5521 E date time applid netname tranid
Command not executed. xxxxxxx value yyyyyyy is invalid.

Explanation: A value yyyyyyy has been specified for keyword xxxxxxxx which is not valid. It may for instance be non-numeric.

System action: The utility ignores the command.
User response: Correct the command.

Destination: CSMT
Modules: DFHCAP
XMEOUT Parameters: date, time, applid, netname, tranid, xxxxxxx, yyyyyyy

DFHCA5522 E date time applid netname tranid
Command not executed. Length of xxxxxxx value is more than allowed.

Explanation: A character value in a DEFINE or CREATE command is too long.

System action: The utility ignores the command.
User response: Correct the command.

Destination: CSMT
Modules: DFHCAP
XMEOUT Parameters: date, time, applid, netname, tranid, xxxxxxx

DFHCA5523 E date time applid netname tranid
Command not executed. File DFHCSD must be defined in the SIT and not the CSD.

Explanation: DFHCSD has been defined in the CSD rather than in the SIT. This is not allowed.

System action: The utility ignores the command.
User response: Correct the command. Define DFHCSD in the SIT.

Destination: CSMT
Modules: DFHCAP
XMEOUT Parameters: date, time, applid, netname, tranid, xxxxxxx

DFHCA5524 W date time applid netname tranid BMS route for console may cause unpredictable results if maps or TEXT(ACCUM) used on device.

Explanation: The routing of multiline maps or accumulated text to the console is not supported.

System action: Normal processing continues.
User response: Ensure that the unsupported console operations are disabled.

Destination: CSMT
Modules: DFHCAP
XMEOUT Parameters: date, time, applid, netname, tranid

DFHCA5525 W date time applid netname tranid
xxxxxxxx value is not valid, yyyyyyyy has been assumed.

Explanation: The value xxxxxxxx is not valid. The value yyyyyyyy has been assumed.

System action: The utility ignores the command.
User response: Correct the command.

Destination: CSMT
Modules: DFHCAP
XMEOUT Parameters: date, time, applid, netname, tranid, xxxxxxx, yyyyyyy

DFHCA5526 E date time applid netname tranid
xxxxxxxx must have rows and columns specified.

Explanation: xxxxxxxx must have rows and columns specified.

System action: The utility ignores the command.
User response: Correct the command.

Destination: CSMT
Modules: DFHCAP
XMEOUT Parameters: date, time, applid, netname, tranid, xxxxxxx

DFHCA5527 E date time applid netname tranid
Command not executed. Remote options are ignored for programs starting with DFH.

Explanation: CICS supplies standard programs which are not allowed to have remote attributes.

System action: The command is ignored.
User response: Correct the command by deleting the remote attributes from the program definition.
Chapter 1. DFH messages
**Explanation:**  When ALTERing the DEVICE in a TYPETERM resource definition, the batch update utility changes forced values that are incompatible with the new DEVICE. However, dependent default values are not changed, and may now be incompatible.

**System action:**  Normal utility processing continues.

**User response:**  Check that the resulting resource definition is as you expect. See the [CICS Resource Definition Guide](#) for more guidance.

**Destination:**  CSMT

**Modules:**  DFHCAP

**XMEOUT Parameters:**  date, time, applid, netname, tranid

---

**Explanation:**  The user specified a resource name `resname` for resource type `restype` which is reserved for use by CICS.

**System action:**  The utility ignores the command.

**User response:**  Specify a different resource name.

**Destination:**  CSMT

**Modules:**  DFHCAP

**XMEOUT Parameters:**  date, time, applid, netname, tranid, restype, resname

---

**Explanation:**  keyword1 has been preceded by keyword2. However, keyword1 has been kept for compatibility reasons. After updating or creating the resource, the value specified for keyword1 has become inconsistent with the value specified for keyword2.

**System action:**  The resource is created or updated.

**User response:**  If sharing the resource with a back level release, ensure that the resulting resource definition is acceptable. Otherwise, ignore the message.

**Destination:**  CSMT

**Modules:**  DFHCAP

**XMEOUT Parameters:**  date, time, applid, netname, tranid, resource, x

---

**Explanation:**  The name you have given to keyword keyword is not valid because it starts with the reserved character or string string.

**System action:**  The definition is not created.

**User response:**  Change the name of the keyword.

**Destination:**  CSMT

**Modules:**  DFHCAP

**XMEOUT Parameters:**  date, time, applid, netname, tranid, keyword, string
DFHCA5540 W date time applid xxxxxxx value is greater than yyyyyyy value. The lower value takes precedence.

Explanation: A value has been specified that is not consistent with another. The value xxxxxxx is greater than value yyyyyyy. Value yyyyyyy takes precedence and overrides the higher value.

System action: The definition is created or updated with the two values as specified.

User response: Ensure that the two values are defined as you expect. You may decide to leave the values as specified and dynamically change the values online once the resource has been installed in the CICS system.

Destination: CSMT

Modules: DFHCAP

XMEOUT Parameters: date, time, applid, xxxxxxx, yyyyyyy

DFHCA5544 E date time applid Command not executed. xxxxxxx must be specified as yyyyyyy because a previous value is generic.

Explanation: The options, xxxxxxx, must be specified as yyyyyyy because a previous option value was specified as generic.

System action: The utility ignores the command.

User response: Correct the command.

Destination: CSMT

Modules: DFHCAP

XMEOUT Parameters: date, time, applid, xxxxxxx, yyyyyyy

DFHCA5546 E date time applid Command not executed. xxxxxxx is not valid as a type yyyyyyy parameter.

Explanation: The options specified conflict. If TYPE EJB is specified, the respective ejb-type options must be specified. The ejb-type attributes are BEANNAME and INTFACTYPE. Likewise, for TYPE CORBA, the corba-type attributes must be specified. These are MODULE and INTERFACE. For TYPE GENERIC, either attributes may be specified but they should be generic.

System action: The utility ignores the command.

User response: Correct the command.

Destination: CSMT

Modules: DFHCAP

XMEOUT Parameters: date, time, applid, xxxxxxx, yyyyyyy

DFHCA5547 E date time applid netname tranid Command not executed. xxxxxxx value yyyyyyy is invalid.

Explanation: A value yyyyyyy has been specified for keyword xxxxxxx which is not valid. It may for instance be non-numeric.

System action: The utility ignores the command.

User response: Correct the command.

Destination: CSMT

Modules: DFHCAP

XMEOUT Parameters: date, time, applid, netname, tranid, xxxxxxx, yyyyyyy

DFHCA5548 E date time applid Command not executed. xxxxxxx option is invalid for a back level REQUESTMODEL.

Explanation: The options specified conflict. If CORBASERVER name is blank and the respective
previous level attributes (OMGMODULE, OMGOPERATION, and OMGINTERFACE) are specified, the use of BEANNAME, MODULE, INTERFACE and OPERATION is not allowed. It is not possible to give a back level requestmodel definition new attributes. The old requestmodel must be discarded and redefined with the new attributes if it is required to be used on this level of CICS.

**System action:** The utility ignores the command.

**User response:** Correct the command. If this requestmodel is being maintained for a back level CICS system, specify only the attributes OMGMODULE, OMGOPERATION, OMGINTERFACE and TRANSID. However, to use an old requestmodel on this level of CICS, it must be discarded and redefined with the new attributes.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** date, time, applid, xxxxxxx

---

**DFHCA5549 E**  
date time applid Command not executed. xxxxxxx value must not be the same as yyyyyyy value.

**Explanation:** The values specified for the two attributes must not be the same. For instance, SSLPORT number must be different from PORT number on CORBASERVER definitions.

**System action:** The utility ignores the command.

**User response:** Correct the command.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** date, time, applid, xxxxxxx, yyyyyyy

---

**DFHCA5550 W**  
date time applid netname tranid

**Explanation:** The default value has been assumed.

**System action:** The utility changes keyword1 to set the default value and processes the command.

**User response:** Ensure that the resulting resource definition is acceptable.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** date, time, applid, netname, tranid, keyword1, keyword2

---

**DFHCA5551 E**  
date time applid Command not executed. keyword1 cannot be specified as generic unless keyword2 is also generic.

**Explanation:** keyword1 has been specified with a generic name containing wildcard characters (asterisks or plus signs). But this is only permitted when keyword2 is also specified as a generic name.

**System action:** The utility ignores the command.

**User response:** Correct the command. If it is required that keyword1 must be generic, ensure that keyword2 is also specified with a generic name.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** date, time, applid, keyword1, keyword2

---

**DFHCA5552 E**  
date time applid Command not executed. CIPHER value 'value' is not in the valid set (list).

**Explanation:** The CIPHER attribute has been specified with an invalid value, value, which is not in the valid set of cipher values as indicated by list.

**System action:** The utility ignores the command.

**User response:** Ensure that you have defined a set of CIPHER values which are correct for this CICS address space.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** date, time, applid, value, list

---

```bash
# DFHCA5553 E  date time applid netname tranid  
# Command not executed. field cannot start with a 'char'.  
# Explanation: The named attribute field, field, starts with an invalid character, char. This is commonly caused by the field starting with an '*' which is not allowed.  
# System action: The utility ignores the command.  
# User response: Change the named attribute field to start with a permitted character.  
# Destination: CSMT  
# Modules: DFHCAP  
# XMEOUT Parameters: date, time, applid, netname, tranid, field, char  
```
Use of static attribute field1 forces field2.

Explanation: The Server URIMAP attribute field, field1 is within the set that returns a static response. This has forced the setting of field2. This is commonly caused by specifying MEDIATYPE, CHARACTERSET, HOSTCODEPAGE, TEMPLATENAME or HFSFILE with ANALYZER(YES) when ANALYZER(NO) is required.

System action: The utility continues.

User response: None.

Destination: CSMT

Modules: DFHCAP

XMEOUT Parameters: date, time, applid, netname, tranid, field1, field2

---

DFHCA5600 E  date time applid netname tranid
Unable to get storage for module DFHCICS. Primary CSD not initialized.

Explanation: There is insufficient storage to load module DFHCICS.

System action: Processing of the INITIALIZE command is terminated.

User response: Ensure that there is sufficient storage to load the DFHCICS module.

Destination: CSMT

Modules: DFHCAP

XMEOUT Parameters: date, time, applid, netname, tranid

---

DFHCA5601 E  date time applid netname tranid
Unable to load the tabletype table named table.

Explanation: Table table cannot be loaded.

System action: The system action depends on the type of table.

LD DFHCSDUP cannot process the command. The utility attempts to:
1. Close any files previously opened internally.
2. Unload any EXTRACT exit routines that were dynamically loaded.
3. Invoke the termination exit routine, if supplied.
4. Return control to the invoker of the utility.

FCT or RDT
The CSD utility cannot unload the table, and terminates the processing of the utility command.

User response: Refer to the preceding MVS message which should specify the reason for the failure.

If your FCT or TCT assembly and link-editing is successful, the FCT or RDT should be in the library.
The LD is in the load library of the supplied regenerated CICS system.

Destination: CSMT

Modules: DFHCAP

XMEOUT Parameters: date, time, applid, netname, tranid, tabletype, table

---

DFHCA5602 E  date time applid netname tranid
Unable to unload the tabletype table named table.

Explanation: Table table cannot be unloaded.

System action: The system action depends on the type of table.

LD DFHCSDUP cannot process the command. The utility attempts to:
1. Close any files previously opened internally.
2. Unload any EXTRACT exit routines that were dynamically loaded.
3. Invoke the termination exit routine, if supplied.
4. Return control to the invoker of the utility.

FCT or RDT
The CSD utility cannot unload the table, and terminates the processing of the utility command.

User response: Refer to the preceding MVS message which should specify the reason for the failure.

If your FCT or TCT assembly and link-editing is successful, the FCT or RDT should be in the library.
The LD is in the load library of the supplied regenerated CICS system.

Destination: CSMT

Modules: DFHCAP

XMEOUT Parameters: date, time, applid, netname, tranid, tabletype, table

---

DFHCA5603 E  date time applid netname tranid
Unable to locate the tabletype table named table.

Explanation: Table table cannot be located.

System action: The system action depends on the type of table specified.

LD DFHCSDUP cannot process the command. The utility attempts to:
1. Close any files previously opened internally.
2. Unload any EXTRACT exit routines that were dynamically loaded.
3. Invoke the termination exit routine, if supplied.
4. Return control to the invoker of the utility.

**FCT, RDT or DCT**
The CSD utility cannot locate the table, and terminates the processing of the utility command.

**User response:** Determine the reason for the failure.

- If your FCT, TCT or DCT assembly and link-editing is successful, the FCT, RDT or DCT should be in the library. The LD is in the load library of the supplied pregenerated CICS system.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** date, applid, netname, tranid, tabletype, table

---

**DFHCA5604 E**

- **date applid netname tranid**
- Unable to obtain storage for the cross-reference table named table.

**Explanation:** DFHCSDUP was unable to obtain storage for table table.

**System action:** DFHCSDUP cannot process the command.

- If commands are being read from a SYSIN data stream, subsequent commands (except LIST) are checked for syntax only. If the primary CSD file cannot be opened, LIST is not processed either.
- If commands are being read from a get-command exit, DFHCSDUP attempts to process subsequent commands.

**User response:** Increase the region size and retry the command.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** date, applid, netname, tranid, table

---

**DFHCA5605 E**

- **date applid netname tranid**
- Disallowed character in group or list name object.

**Explanation:** The call to module DFHDMP has failed to construct a valid key for the record created on the CSD file. This is because the group or list name contains an invalid character.

**System action:** A CSD record is not created for this definition. (If it is a transaction, a generated profile is not created either.)

**User response:** Use the CEDA transaction to define the resource with a valid name.

---

**DFHCA5606 S**

- **date applid netname tranid**
- Command is not executed. Unable to load the service module proiname.

**Explanation:** The service module, proiname, cannot be loaded due to insufficient storage.

**System action:** Utility command execution is terminated. If commands are being read from a SYSIN data stream by the utility, subsequent commands are checked for syntax only.

**User response:** Retry the utility command with an increased region size.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** date, applid, netname, tranid, proiname

---

**DFHCA5607 S**

- **date applid netname tranid**
- Command is terminated. An error occurred while reading the first secondary CSD record.

**Explanation:** An I/O error has occurred on the secondary CSD file.

**System action:** The SERVICE command is terminated. If commands are being read from a SYSIN data stream by the utility, subsequent commands are checked for syntax only.

**User response:** Check that the input and output data sets have been correctly defined, and that the DDNAME for the secondary CSD file in the JCL corresponds to the FROMCSD parameter in the SERVICE utility command.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** date, applid, netname, tranid

---

**DFHCA5608 S**

- **date applid netname tranid**
- Command is terminated. Error occurred while reading a secondary CSD record.

**Explanation:** An I/O error has occurred on the secondary CSD file.

**System action:** The SERVICE command is terminated. If commands are being read from a SYSIN data stream by the utility, subsequent commands are checked for syntax only.
User response: Check that the input and output data sets have been correctly defined, and that the DDNAME for the secondary CSD file in the JCL corresponds to the FROMCSD parameter in the SERVICE utility command.

If the problem persists, try to obtain a print out of the CSD, using either IDCAMS or the DFHCSDUP LIST ALL option. The LIST indicates where errors have occurred because they will not print and are therefore easily identifiable.

Destination: CSMT

Modules: DFHCAP

XMEOUT Parameters: date, time, applid, netname, tranid

---

DFHCA5609 S  date time applid netname tranid
Command is terminated. Error occurred while writing a primary CSD record.

Explanation: An I/O error has occurred on the primary CSD file.

System action: The SERVICE command is terminated. If commands are being read from a SYSIN data stream by the utility, subsequent commands are checked for syntax only.

User response: Retry the command, ensuring that a sufficiently large data set is specified for the output (primary) CSD file.

Destination: CSMT

Modules: DFHCAP

XMEOUT Parameters: date, time, applid, netname, tranid

---

DFHCA5611 E  date time applid netname tranid
Command not executed. ‘parameter’ parameter must begin with ‘DFH’.

Explanation: In a CSD utility MIGRATE command, the specified parameter contained an invalid table name or group name.

System action: The utility does not process the command.

User response: Resubmit the MIGRATE command with a valid table name or group name.

Destination: CSMT

Modules: DFHCAP

XMEOUT Parameters: date, time, applid, netname, tranid, parameter

---

DFHCA5612 I  date time applid netname tranid
resource object in group grpname is unchanged.

Explanation: A resource definition existed in both source and target groups. Based on the CSD utility commands submitted, the utility has replaced the resource definition in the target group.

System action: Normal utility processing continues.

User response: None.

Destination: CSMT

Modules: DFHCAP

XMEOUT Parameters: date, time, applid, netname, tranid, resource, object, grpname

---

DFHCA5613 E  date time applid netname tranid
Unable to locate the library member member.

Explanation: The member is not in the libraries named in the JCL.

System action: The utility terminates processing of the command that required access to library member member.

User response: Ensure that the member is correctly link-edited into the library and resubmit the job.

Destination: CSMT

Modules: DFHCAP

XMEOUT Parameters: date, time, applid, netname, tranid, member

---

DFHCA5614 E  date time applid netname tranid
Unable to load the library member member.

Explanation: DFHCSDUP could not load library member member.

System action: The utility terminates processing of the command that required access to the library member.

User response: Ensure that the member is correctly link-edited into the library and resubmit the job.

Destination: CSMT

Modules: DFHCAP

XMEOUT Parameters: date, time, applid, netname, tranid, member

---

DFHCA5617 S  date time applid netname tranid
Command is terminated. Unrecognised type of record encountered while secondary CSD was being read.
Explanation: The record-type field of an input CSD record is invalid.

System action: The SERVICE command is terminated. If commands are being read from a SYSIN data stream by the utility, subsequent commands are checked for syntax only.

User response: Check that the input and output data sets have been correctly defined, and that the DDNAME for the secondary CSD file in the JCL corresponds to the FROMCSD parameter in the SERVICE utility command.

If the problem persists, try to obtain a print out of the CSD, using either IDCAMS or the DFHCSDUP LIST ALL option. The LIST indicates where errors have occurred because they will not print and are therefore easily identifiable.

Destination: CSMT

Modules: DFHCAP

XMEOUT Parameters: date, time, applid, netname, tranid

DFHCA5618 I date time applid netname tranid An attention interrupt was requested during DFHCSDUP execution.

Explanation: An attention interrupt has been requested while DFHCSDUP is executing in a TSO environment.

System action: Normal utility processing continues.

User response: None.

Destination: CSMT

Modules: DFHCAP

XMEOUT Parameters: date, time, applid, netname, tranid

DFHCA5619 W date time applid netname tranid An invalid value of the PAGESIZE parameter has been specified. The default value of 60 lines per page will be used.

Explanation: A value of the PAGESIZE parameter outside the allowed range (4–9999) has been specified.

System action: The default value of 60 lines per page is taken.

User response: Ensure that a valid PAGESIZE value is specified in future.

Destination: CSMT

DFHCA5620 E date time applid netname tranid An illegal return code (RC=ret-code) has been returned from the exit exit.

Explanation: The specified user-exit routine has returned a disallowed return code.

System action: Processing of the utility command is terminated. The exit is not disabled.

User response: Investigate the specified exit routine for the cause of the return code.

Destination: CSMT

Modules: DFHCAP

XMEOUT Parameters: date, time, applid, netname, tranid, ret-code, exit

DFHCA5621 E date time applid netname tranid A non-zero return code has been returned from the put-message exit.

Explanation: The put-message exit routine has returned a disallowed return code.

System action: Processing of the utility command is terminated and the put-message exit is disabled.

User response: Investigate the put-message exit routine for the cause of the return code.

Destination: CSMT

Modules: DFHCAP

XMEOUT Parameters: date, time, applid, netname, tranid

DFHCA5622 S date time applid netname tranid The secondary CSD has been closed during clean-up processing following the interception of an abend.

Explanation: An abend has occurred during DFHCSDUP processing. The secondary CSD has been closed during post-ABEND cleanup processing.

System action: Processing of the utility command is terminated.

User response: Refer to prior messages for further information regarding this problem.

Destination: CSMT

Modules: DFHCAP

XMEOUT Parameters: date, time, applid, netname, tranid
**DFHCA5623** date time applid netname tranid The primary CSD has been closed during clean-up processing following the interception of an abend.

**Explanation:** An abend has occurred during DFHCSDUP processing. The primary CSD has been closed during post-ABEND cleanup processing.

**System action:** Processing of the utility command is terminated.

**User response:** Refer to prior messages for further information regarding this problem.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** date, time, applid, netname, tranid

**DFHCA5624** date time applid netname tranid The extract exit program has been unloaded during clean-up processing following the interception of an abend.

**Explanation:** An abend has occurred during the processing of an EXTRACT command. The extract exit program specified on the USERPROGRAM keyword of the EXTRACT utility command has been unloaded during post-ABEND cleanup processing.

**System action:** The EXTRACT command is terminated.

**User response:** Refer to prior messages for further information regarding the problem.

**Destination:** CSMT

**Modules:** DFHCAP

**XMEOUT Parameters:** date, time, applid, netname, tranid

**DFHCA5630** date time applid No IBM supplied definition found for resourcetype resourcename.

**Explanation:** While performing a SCAN command, the named resource type was not found in the CSD file on any of the IBM supplied groups. Note that compatibility groups are not used for the SCAN command.

**System action:** The utility continues.

**User response:** None.

**Destination:** CSMT

**Modules:** DFHCSDUP

**XMEOUT Parameters:** date, time, applid, resourcetype, resourcename

**DFHCA5631** date time applid resourcetype resourcename in group groupname1 matches the IBM supplied definition in group groupname2.

**Explanation:** While performing a SCAN command, the resource resourcetype name resourcename was found in group groupname1 and it matches the IBM supplied definition in group groupname2.

**System action:** The utility continues.

**User response:** None.

**Destination:** CSMT

**Modules:** DFHCSDUP

**XMEOUT Parameters:** date, time, applid, resourcetype, resourcename, groupname1, groupname2

**DFHCA5632** date time applid resourcetype resourcename in group groupname1 does not match the IBM supplied definition in group groupname2.

**Explanation:** While performing a SCAN command, the resource resourcetype name resourcename was found in group groupname1 and it does not match the IBM supplied definition in group groupname2.

**System action:** The utility continues.

**User response:** None.

**Destination:** CSMT

**Modules:** DFHCSDUP

**XMEOUT Parameters:** date, time, applid, resourcetype, resourcename, groupname1, groupname2

**DFHCA5633** date time applid resourcetype resourcename found in group groupname.

**Explanation:** While performing a SCAN command, the resource resourcetype name resourcename was found in group groupname. No IBM supplied definition was found to perform a compare against.

**System action:** The utility continues.

**User response:** None.

**Destination:** CSMT

**Modules:** DFHCSDUP

**XMEOUT Parameters:** date, time, applid, resourcetype, resourcename, groupname

**DFHCA5634** date time applid resourcetype resourcename not found in user groups.

**Explanation:** While performing a SCAN command, the
resource resourcetype name resourcename was not found in any user groups.

System action: The utility continues.

User response: None.

DFHCCxxxx messages

DFHCC0001 applid An abend (code aaa/bbbb) has occurred at offset X'offset' in the {local | global} catalog, module modname

Explanation: An abnormal end (abend) or program check has occurred in module modname and will have occurred in either the local (DFHLCD) or the global (DFHGCD) catalog domains. This implies that there may be an error in CICS code.

Alternatively,
• Unexpected data has been input, or
• Storage has been overwritten.

The code aaa/bbbb is a three digit hexadecimal MVS code (if applicable), followed by a four digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

During initialization, CICS may not have access to the user's applid coded in the SIT. If CICS produces this message in these circumstances, it uses the default applid value DBDCCICS.

System action: An exception entry is made in the trace table.
A system dump is taken, unless you have specifically suppressed dumps in the dump table.

This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Notify the system programmer.

You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

DFHCC0004 applid A possible loop has been detected in the {local | global} catalog at offset X'offset' in module modname

Explanation: A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module modname at offset X'offset'. This is the offset of the instruction which was executing at the time the error was detected.

During initialization, CICS may not have access to the user's applid coded in the SIT. If CICS produces this message in these circumstances, it uses the default applid value DBDCCICS.

System action: An exception entry is made in the trace table.
A system dump is taken, unless you have specifically suppressed dumps in the dump table.

This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Notify the system programmer.

You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

DFHCC0003 applid Global Catalog initialization failure. (GENERATE ACB | OPEN ACB | GENERATE RPL | OPEN, SHOWCB.)

Explanation: A VSAM error has occurred during global catalog initialization.

The VSAM codes given are explained in the OS/390 DFSMS Macro Instructions for Data Sets manual.

The possible versions of this message include the text
• “GENERATE ACB”.

172 CICS TS for z/OS: CICS Messages and Codes
• "GENERATE RPL".
  The GENCB failed with the R15 condition given in X'yy'.
  The X'zz' code is only meaningful if X'yy' is X'04' when:
  X'zz' is the error code returned by VSAM
  Register 0 in response to a GENCB macro.
• "OPEN ACB".
  OPEN has failed with the R15 condition code X'yy'.
  This was followed by a successful SHOWCB which
  has placed the OPEN error code into X'zz'. Also see
  the message that VSAM writes to the operator
  console and programmer's listing.
• "OPEN, SHOWCB".
  OPEN has failed with the R15 condition code X'yy'.
  This was followed by a SHOWCB which failed, and
  the R0 return code from the SHOWCB is given in
  X'zz'. Also see the message that VSAM writes to the
  operator console and programmer's listing.

During initialization, CICS may not have access to the
user's applid coded in the SIT. If CICS produces this
message in these circumstances, it uses the default
applid value DBDCCICS.

**System action:** A system dump is produced, then
CICS is terminated.

**Message DFHME0116** is normally produced containing
the symptom string for this problem.

**User response:** Look up the error codes in the VSAM
Programmer's Guide, correct it then retry.

If this fails, notify the system programmer. You need
further assistance from IBM to resolve this
problem. See Part 4 of the CICS Problem Determination
Guide for guidance on how to proceed.

**Note:** This message cannot be changed with the
message editing utility.

**Destination:** Console
**Modules:** DFHCCDM

DFHCC0102 applid Global Catalog data set is
already in use.

**Explanation:** The VSAM error reported in the previous
DFHCC0100 message suggests that the global catalog
is already being used, possibly by another CICS region.
The global catalog data set cannot be shared.

**System action:** CICS is terminated.

**User response:** Ensure that the DFHGCD DD
statement for this CICS specifies a different global
catalog data set from any CICS job that is already
running.

If CICS still fails, notify the system programmer. You
need further assistance from IBM to resolve this
problem. See Part 4 of the CICS Problem Determination
Guide for guidance on how to proceed.

**Destination:** Console
**Modules:** DFHCCDM

DFHCC0101 LOCAL CATALOG INITIALIZATION
ERROR. (GENERATE ACB | OPEN ACB
| GENERATE RPL | OPEN,
SHOWCB.) R15 = X'yy' VSAM ERROR
CODE = X'zz'

**Explanation:** A VSAM error has occurred during local
catalog initialization.

The VSAM codes given are explained in the OS/390
DFSM S Macro Instructions for Data Sets manual.
The possible versions of this message include the text
• "GENERATE ACB".
• "GENERATE RPL".

The GENCB failed with the R15 condition given in X'yy'.
The X'zz' code is only meaningful when X'yy' is X'04'
when: X'zz' is the error code returned by VSAM
Register 0 in response to a GENCB macro.
DFHCC0103 LOCAL CATALOG DATA SET IS ALREADY IN USE.

Explanation: The VSAM error reported in the previous DFHCC0101 message suggests that the local catalog is already being used, possibly by another CICS region. The local catalog data set cannot be shared.

System action: CICS is terminated.

User response: Ensure that the DFHLCD DD statement for this CICS specifies a different local catalog data set from any CICS job that is already running.

If CICS still fails, notify the system programmer. You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Note: This message cannot be changed with the message editing utility.

Modules: DFHCCDM

DFHCC0104 AN ABEND HAS OCCURRED DURING INITIALIZATION OF CATALOG DOMAIN IN MODULE DFHCCDM.

Explanation: DFHCCDM's recovery routine received control during pre-initialization of the local catalog (CC) domain.

System action: A system dump with dump code KERNDUMP is taken and CICS terminates.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Modules: DFHCCDM

DFHCC0200 applid VSAM error on the {local | global} catalog data set. VSAM return code in R15 = X'yy' RPL-FDBK=X'zz'.

Explanation: A catalog VSAM operation has produced the VSAM error given.

An exception trace, code CC 2B60 or GC 2B60 has also been made.

System action: A system dump is produced then CICS is terminated. This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

User response: If possible correct the VSAM error and restart CICS. For the meaning of the return codes, refer to the VSAM Programmer’s Guide GC26-3838.

Inform the system programmer because this indicates a possible error in CICS code. You may need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Note: This message cannot be changed with the message editing utility.

DFHCC0201 VSAM ERROR ON THE LOCAL CATALOG DATA SET, VSAM RETURN CODE IN R15 = X'yy' FDBK=X'zz'.

Explanation: A local catalog VSAM operation has produced the VSAM error given.

An exception trace, code CC 2B60 or GC 2B60 has also been made.

System action: A system dump is produced then CICS is terminated. This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

User response: If possible correct the VSAM error and restart CICS. For the meaning of the return codes, refer to the VSAM Programmer’s Guide GC26-3838.

Inform the system programmer because this indicates a possible error in CICS code. You may need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Modules: DFHCCCC

DFHCC0202 applid The {local | global} catalog has started to use new secondary space allocation.

Explanation: Secondary space may be specified when the catalog data sets DFHLCD and DFHGCD are defined. This message is issued when the catalog starts using an additional space allocation.

See the CICS System Definition Guide for more information on controlling CICS storage.

System action: An exception entry is made in the trace table, provided that trace is available at this time.

User response: There are two possibilities.
- The system is in a loop which involves calls to the catalog to write onto the catalog data set. This is the
most likely cause if the system suddenly starts to produce this message repeatedly.

- Insufficient primary space was allocated for the catalog when it was defined. This is the most likely cause if this message is produced either:
  - during or shortly after CICS initialization, or
  - this message is only produced infrequently (and only a few are ever produced).

Look for any other symptoms of possible looping, and act accordingly. If looping has occurred then the system programmer should redefine the catalog during the next CICS initial start.

If CICS was not looping then notify the system programmer, who should increase the primary space allocated for this data set during the next CICS initial start.

Destination: Console

Modules: DFHCCCC

XMEOUT Parameters: applid, {1=local, 2=global}

---

**DFHCC0300 DFHCCUTL ERROR REPORT. ERROR**

**OPENING DFHLCD.\!WRITING TO DFHLCD. R15 = X'yy' VSAM RPL FEEDBACK CODE = X'zz'.**

**Explanation:** The initialization of the local catalog data set, DFHLCD, has failed for the reasons given in the resulting job output.

**System action:** Job terminates.

**User response:** For the meaning of the VSAM codes, refer to the VSAM Programmer's Guide GC26-3838. Correct cause of error indicated and retry.

**Note:** This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCCUTL

---

**DFHCC0203 applid The {local / global} catalog is full.**

**Explanation:** The specified catalog data set (DFHLCD or DFHGCD) is full. There are two possible reasons for this error:

- The system is in a loop which involves calls to the catalog to write onto the catalog data set.
- Insufficient primary space was allocated for the catalog when it was defined. This is the most likely cause if this message is issued during or shortly after CICS initialization.

**System action:** If the error occurs during initialization, a system dump is produced then CICS is terminated. If the error occurs after initialization, the domain invoking the catalog services will decide what action is appropriate.

**User response:** Check for any other symptoms of looping and act accordingly.

If CICS is not looping, notify the system programmer who should increase the primary space allocated for this data set during the next CICS initial start.

If CICS is looping, this indicates an error in CICS code. You may need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Terminal End User

Modules: DFHSNP

**DFHCE3522** CICS sign-on. Please type your userid==>

Explanation: The system requests a userid.

System action: The system waits for a response.
**DFHCE3523** Please type your password.

**Explanation:** The system requests a password.

**System action:** The system waits for a response.

**User response:** Enter your password.

**Destination:** Terminal End User

**Modules:** DFHSNP

**DFHCE3524** Please type your password==>@@@@@@@@

**Explanation:** The system requests a password. 
`@@@@@@@@` represents a character string provided by CICS to prevent the password being seen.

**System action:** The system waits for a response.

**User response:** Enter your password.

**Destination:** Terminal End User

**Modules:** DFHSNP

**DFHCE3525** Your password has expired. Please type your new password.

**Explanation:** The system requires a new password.

**System action:** The system waits for a response.

**User response:** Enter a new password.

**Destination:** Terminal End User

**Modules:** DFHSNP

**DFHCE3526** Your password has expired. Please type your new password==>@@@@@@@@

**Explanation:** The system requests a new password. 
`@@@@@@@@` represents a character string provided by CICS to prevent the new password being seen.

**System action:** The system waits for a response.

**User response:** Enter a new password.

**Destination:** Terminal End User

**Modules:** DFHSNP

**DFHCE3527** Use your magnetic (OPID) card or press ENTER to cancel.

**Explanation:** A magnetic card is required.

**System action:** The system waits for an opid (magnetic) card.

**User response:** Supply badge or terminate transaction.

**Destination:** Terminal End User

**Modules:** DFHSNP

**DFHCE3528** Signon failed during SECLABEL checking.

**Explanation:** The signon request has failed because the external security manager (ESM) detected a critical error.

**System action:** The signon transaction terminates.

**User response:** Refer to message DFHSN1108 on the CSCS log for the information and actions necessary to resolve this problem.

**Destination:** Terminal End User

**Modules:** DFHSNP

**DFHCE3529** The ESM is currently not accepting signons. Please try later.

**Explanation:** The signon request has failed because the external security manager (ESM) was in a tranquil state. When in a tranquil state, only signons from special users are accepted.

**System action:** The sign on transaction terminates.

**User response:** The ESM has probably been put into a tranquil state to allow for ESM database maintenance. Determine whether maintenance is currently occurring and how long it will take. When maintenance is finished the tranquil state should be removed from the ESM which will allow you to sign on to CICS. If the ESM has not been put into a tranquil state then, refer to message DFHSN1108 on the CSCS log for the information and actions necessary to resolve this problem.

**Destination:** Terminal End User

**Modules:** DFHSNP

**DFHCE3530** Your userid is invalid. Please retype.

User response: Enter a valid card or press ENTER to cancel the signon.
Destination: Terminal End User
Modules: DFHSNP

DFHCE3537 Language is invalid. Please retype.
Explanation: The language code entered is invalid.
System action: The system waits for a response.
User response: Enter a valid language code.
Destination: Terminal End User
Modules: DFHSNP

DFHCE3538 Language is invalid. Please retype==>
Explanation: The language code entered is invalid.
System action: The system waits for a response.
User response: Enter a valid language code.
Destination: Terminal End User
Modules: DFHSNP

DFHCE3539 Please reenter the new password for verification.
Explanation: You have entered a new password in the new password field and you are now being prompted to reenter the same password to assure yourself of the new password data.
System action: The system waits for a response.
User response: Reenter the new password in the password field.
Destination: Terminal End User
Modules: DFHSNP

DFHCE3540 Ensure that passwords are entered in the correct case.
Explanation: This message is issued on systems whose External Security Manager supports mixed case passwords. It is to remind you that passwords must be entered with exactly the correct lower-case and upper-case letters.
System action: The password will not be folded to uppercase.
User response: Enter passwords in the correct case.
DFHCE3541  Security interface error (rc). Sign-on is terminated.

Explanation:  An error has been detected in an external security manager. rc is the return code from the external security manager.

System action:  Signon terminates.

User response:  For a RACF signon, rc is the return code from the RACINIT macro. See the appropriate RACF manual for details of the macro return codes. The return codes are macro specific.

Destination:  Terminal End User
Modules:  DFHSNP

DFHCE3542  Sign-on is not allowed at this terminal. Your sign-on is ignored.

Explanation:  The sign on transaction cannot be executed at the current terminal for one of the following reasons:
- The terminal is defined with a preset userid that cannot be changed by signing on
- The terminal is a surrogate of a terminal in another CICS region, but the sign on transaction is not executing within a session established by the CRTE transaction.

System action:  The sign on transaction terminates.

User response:  Do not use the sign on transaction at this terminal.

Destination:  Terminal End User
Modules:  DFHSNP

DFHCE3543  You have cancelled your sign-on request. Sign-on is terminated.

Explanation:  The user has pressed ENTER when an OPID card was requested or has entered PF3 on a 3270 terminal device.

System action:  The sign on transaction terminates.

User response:  Retry the sign on procedure.

Destination:  Terminal End User
Modules:  DFHSNP

DFHCE3544  Terminal authorization failed. Sign-on is terminated.

Explanation:  RACF has responded to a security request with 'Terminal not authorized' and RACF response code X'30'.

System action:  The sign on transaction terminates.

User response:  Inform the systems programmer, who should refer to message DFHSN1118 on the CSCS log for the relevant information and actions necessary to resolve this problem.

Destination:  Terminal End User
Modules:  DFHSNP

DFHCE3545  Application authorization failed. Sign-on is terminated.

Explanation:  RACF has responded to a security request with 'Application not authorized' and RACF response code X'34'.

System action:  The sign on transaction terminates.

User response:  Inform the systems programmer, who should refer to message DFHSN1119 on the CSCS log for the relevant information and actions necessary to resolve this problem.

Destination:  Terminal End User
Modules:  DFHSNP

DFHCE3546  Your signon {userid | group access} has been revoked. Signon is terminated.

Explanation:  The response from RACF indicates that either the userid that you use to signon to CICS, or your access to the RACF group that contains it, has been revoked by the system.

System action:  The signon transaction terminates.

User response:  Contact your RACF administrator, who can re-authorize the revoked user ID.

Destination:  Terminal End User
Modules:  DFHSNP

DFHCE3547  Security is not active. Sign-on cannot be performed.

Explanation:  A request to sign on to the CICS system was rejected because the CICS security system was not active. A user can only sign on to CICS when CICS security is active.

The CICS security system is activated using the system initialization parameter SEC=YES.

System action:  The sign on transaction terminates.

User response:  None.

Destination:  Terminal End User
Modules:  DFHSNP
**Explanation:** The sign on program, DFHSNP, is abnormally terminated due to a critical error.

The five codes indicate the cause of the error and where the error occurred.

Code 1 is an abend code. It can be one of ASNA, ASNB or ASNC.

Codes 2, 3, 4 and 5 are codes which help IBM to identify the source of the error. They are id_location, EIBFRCODE, EIBRESP and EIBRESP2.

**System action:** DFHSNP is abnormally terminated with a transaction dump. Message DFHAC2206 is normally issued, but if no terminal is associated with the task, DFHAC2236 may be issued instead.

**User response:** Refer to message DFHAC2206 or DFHAC2236. If DFHAC2236 has been issued, the absence of a terminal is probably the reason for the abend.

**System action:** DFHSNP continues with CESN transaction processing.

**User response:** Investigate whether this message is issued validly as part of the system design, in which case the message can be ignored, or is an error. Investigate the previous transaction at this terminal.

**Destination:** Terminal End User

**Modules:** DFHSNP

**XMEOUT Parameters:** date, time, applid, termid

**Explanation:** While processing a CESN transaction DFHSNP was passed a commarea that was not its own. This may be the result of an application issuing the EXEC CICS RETURN TRANSID(...) COMMAREA(...) with a transid of nulls (X'00000000'). This could be because the pointer to the transid is incorrectly set up or may be part of the system design.

**System action:** DFHSNP continues with CESN transaction processing.

**User response:** Investigate whether this message is issued validly as part of the system design, in which case the message can be ignored, or is an error. Investigate the previous transaction at this terminal.

**Destination:** CSMT

**Modules:** DFHSNP

**XMEOUT Parameters:** date, time, applid, termid

**Explanation:** The sign-off transaction cannot be executed at the current terminal for one of the following reasons:

- The terminal is defined with a preset userid that cannot be changed by signing off
- The terminal is a surrogate of a terminal in another CICS region, but the sign-off transaction is not executing within a session established by the CRTE transaction.

**System action:** The sign-off transaction terminates.

**User response:** Do not use the sign-off transaction at this terminal.

**Destination:** Terminal End User

**Modules:** DFHSFP

**Explanation:** Your group identifier is invalid.

The system requests a group identifier.

**System action:** The system waits for a response.

**User response:** Enter a valid group identifier.

**Destination:** Terminal End User

**Modules:** DFHSNP
DFHCE3571  Your groupid is invalid. Please retype==>
Explanation: Your group identifier is invalid.
The system requests a group identifier.
System action: The system waits for a response.
User response: Enter a valid group identifier.
Destination: Terminal End User
Modules: DFHSNP

DFHCE3587  You cannot signon at this terminal at this time.
Explanation: You cannot signon at this terminal at this time. The SNSCOPE initialization parameter disallows signon to more than one terminal at a time. An internal failure during SNSCOPE checking means that CICS is unable to confirm if the user is already signed on elsewhere. The failure has occurred because the limit of concurrent MVS ENQ requests has been reached.
System action: The signon transaction terminates. Message DFHUS0120 will have been written to the console. See the explanation of this message for further information.
User response: Please report this problem to your CICS systems programmer.
Destination: Terminal End User
Modules: DFHSNP

DFHCE3588  You are already signed on at another terminal. Signon cannot be performed.
Explanation: You cannot sign on at the current terminal because you are already signed on at another terminal. The SNSCOPE initialization parameter for the CICS system does not allow you to sign on to more than one terminal at a time.
System action: The sign on transaction terminates.
User response: Sign off from the other terminal before you attempt to sign on again.
Destination: Terminal End User
Modules: DFHSNP

DFHCE3589  The external security manager is inactive. Signon cannot be performed.
Explanation: You cannot sign on because the external security manager is not active.
System action: The sign on transaction terminates.
User response: Wait until the external security manager has been reactivated before attempting to sign on again.

DFHCE3590  Sign-off is complete.
Explanation: If the user issued a CESN to sign on to the system, then sign-off has been successful. If the user was not signed on, and CICS security was active (SEC=YES system initialization parameter) then message DFHUS1213 is written to the CSFS log to indicate that the user has logged off but has not been allowed to sign off.
System action: Other processing continues.
User response: Use the terminal as required for CICS transactions.
Destination: Terminal End User
Modules: DFHSFP

DFHCE3591  Sign-off is complete. LOGOFF option is invalid when using CRTE.
Explanation: The terminal is now signed off. The LOGOFF option which was specified has been ignored as it is invalid when using CRTE.
System action: The CICS system, to which the user has connected via CRTE, has been signed off.
User response: Do not use the LOGOFF option when signing off via CRTE.
Destination: Terminal End User
Modules: DFHSFP

DFHCE3592  Sign-off is complete. GOODNIGHT option is invalid when using CRTE.
Explanation: The terminal is now signed off. The GOODNIGHT option which was specified has been ignored as it is invalid when using CRTE.
System action: The CICS system, to which the user has connected via CRTE, has been signed off.
User response: Do not use the GOODNIGHT option when signing off via CRTE.
Destination: Terminal End User
Modules: DFHSFP

DFHCE3598  date time applid  Critical error has occurred in DFHSFP. Codes: 1,2,3,4,5.
Explanation: The signoff program, DFHSFP, will abnormally terminate due to a critical error.
The five codes indicate the cause of the error and where the error occurred.
Code 1 is an abend code. It can be ASFA, ASFB or ASFC.
Codes 2, 3, 4 and 5 are codes which help IBM to identify the source of the error. They are id_location (in hexadecimal), EIBFRCODE, EIBRESP and EIBRESP2.

System action: DFHSFP is abnormally terminated with a transaction dump. Message DFHAC2206 is normally issued, but if no terminal is associated with the task, DFHAC2236 may be issued instead.

User response: Refer to message DFHAC2206 or DFHAC2236. If DFHAC2236 has been issued, the absence of a terminal is probably the reason for the abend.

Use the abend code given in the message to determine the reason for the error and the course of action to take.

This will enable you to determine whether the abend was caused by user error or by an error in CICS code. (An error in CICS code is signalled by abend code ASFA.)

If you suspect an error in CICS code, you need further assistance from IBM to resolve the problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

DFHCFxxxx messages

DFHCF0101I CF data table server initialization is in progress.

Explanation: The coupling facility data table server program has started execution.

System action: Initialization continues.

User response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHCFMN

DFHCF0102I CF data table server for pool poolname is now active.

Explanation: The coupling facility data table server for the named pool has completed initialization and is now ready to accept connections.

System action: The server waits for connection requests or operator commands.

User response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHCFMN

DFHCF0103I CF data table server initialization failed because the POOLNAME parameter was not specified.

Explanation: The coupling facility data table server program needs to know the name of the associated coupling facility data table pool in order to complete initialization, but no pool name was specified in the SYSIN or PARM field parameters.

System action: The server is terminated.

User response: Ensure that the parameter POOLNAME=name is specified either in the SYSIN parameters or in the PARM field of the JCL for the server.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHCFMN

DFHCF0104I CF data table server initialization failed because program DFHCFMN is not APF authorized.

Explanation: The coupling facility data table server main program DFHCFMN cannot complete initialization because it is not running with APF authorization.

System action: The server is terminated.

User response: Ensure that the coupling facility data table server program DFHCFMN is loaded from an APF authorized library and has been link-edited with the option AC(1).

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHCFMN

DFHCF0111I CF data table server for pool poolname is terminating.

Explanation: The coupling facility data table server has started termination processing, so no further requests will be processed.

System action: Termination continues.

User response: None.

Note: This message cannot be changed with the message editing utility.
Destination: Console and SYSPRINT
Modules: DFHCFMN

DFHCF0112I CF data table server has terminated, return code retd, reason code rsnc.

Explanation: The coupling facility data table server has completed termination processing. For normal termination, the return code and reason code are both zero. If the termination was caused by an error, the return code will be 8 and the reason code will be the number of the previous DFHCFnnnn message giving the reason for termination.

System action: The coupling facility data table server program returns control (via the AXM termination routines) to MVS for job step termination.

User response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT
Modules: DFHCFMN

DFHCF0113 CF data table server completion code is cmpc, reason code rsnc.

Explanation: The coupling facility data table server has terminated after intercepting an abnormal termination (ABEND) request. If the completion code is a system completion code, it is shown as three hexadecimal digits, otherwise it is shown as four decimal digits for a user completion code. Any associated reason code is shown as a four byte hexadecimal value, which will be zero if no reason code was provided.

System action: The coupling facility data table server program returns control (via the AXM termination routines) to MVS for job step termination.

User response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT
Modules: DFHCFMN

# DFHCF0112 IXCARM REQUEST=reqtype failed, return code retd, reason code rsnc.
# Explanation: A request to the MVS automatic restart manager (ARM) gave an unexpected return code. The return code and reason code are shown in hexadecimal notation.
# System action: The server is terminated.
# User response: See the IXCARM macro in z/OS MVS Programming: Sysplex Services Reference (GC28-1772) for the explanation of the return and reason code.
# Note: This message cannot be changed with the message editing utility.
# Destination: Console and SYSPRINT

Chapter 1. DFH messages 183
**DFHCF0201 Processing type parameters**

**Explanation:** The coupling facility data table server parameter processing routine is interpreting the specified parameter string. The first word gives the type of parameter (SYSIN/PARM/SET/DISPLAY/PRINT) and the rest is the specified parameters optionally followed by descriptive comment text after one or more spaces. If the parameters start with an asterisk or a space, the whole line is taken as descriptive comments.

**System action:** Any specified parameters will be processed.

**User response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCFPR

---

**DFHCF0202 Unknown parameter keyword: keyword**

**Explanation:** This parameter keyword did not match any of the defined parameter keywords for the coupling facility data table server.

**System action:** Processing of the current parameter string (command parameter list, PARM field or SYSIN input line) is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

**User response:** Correct the parameter keyword (or remove the incorrect parameter) and reenter the command or restart the server.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHCFPR

---

**DFHCF0203 Value value for parameter keyword is incorrect. It must be a name of up to maxlen characters.**

**Explanation:** The value of this parameter should have been specified as a name containing not more than the indicated number of characters.

**System action:** Processing of the current parameter string (command parameter list, PARM field or SYSIN input line) is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

**User response:** Correct the parameter value and reenter the command or restart the server.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHCFPR

---

**DFHCF0204 Value value for parameter keyword is incorrect. It must be a decimal number.**

**Explanation:** The value of this coupling facility data table server parameter should have been specified as a decimal number but was not in a valid format. (Numeric parameters can optionally be followed by the letter K, M or G to denote the appropriate powers of 1024).

**System action:** Processing of the current parameter string (command parameter list, PARM field or SYSIN input line) is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

**User response:** Correct the parameter value and reenter the command or restart the server.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHCFPR

---

**DFHCF0205 Value value for parameter keyword is greater than the maximum allowed value maximum.**

**Explanation:** The value of this coupling facility data table server parameter exceeded the maximum allowed value, given in the message.

**System action:** Processing of the current parameter string (command parameter list, PARM field or SYSIN input line) is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

**User response:** Correct the parameter value and reenter the command or restart the server.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHCFPR

---

**DFHCF0206 Value value for parameter keyword is less than the minimum allowed value minimum.**

**Explanation:** The value of this coupling facility data table server parameter was less than the minimum allowed value, given in the message.
**System action:** Processing of the current parameter string (command parameter list, PARM field or SYSIN input line) is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

**User response:** Correct the parameter value and reenter the command or restart the server.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHCFPR

---

**DFHCF0207** Value value for parameter keyword is incorrect. It should be a time hh:mm:ss or hh:mm or a number of seconds.

**Explanation:** The value of this coupling facility data table server parameter did not conform to the correct syntax for a time interval.

**System action:** Processing of the current parameter string (command parameter list, PARM field or SYSIN input line) is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

**User response:** Correct the parameter value and reenter the command or restart the server.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHCFPR

---

**DFHCF0208** Parameter keyword keyword is not supported for command.

**Explanation:** A coupling facility data table server parameter keyword was specified in a context where it is not valid, such as an attempt to SET a parameter which can only be specified at initialization time, or to specify at initialization time a parameter which is only valid on DISPLAY.

**System action:** Processing of the current parameter string (command parameter list, PARM field or SYSIN input line) is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

**User response:** If the error occurred at initialization, remove the incorrect parameter and restart the server. If it occurred on a server command, check that the command and parameter were correctly entered.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHCFPR

---

**DFHCF0209** Parameter text contains invalid character: text

**Explanation:** The coupling facility data table server parameter processing routine found some unexpected text when attempting to process parameters.

**System action:** Processing of the current parameter string (command parameter list, PARM field or SYSIN input line) is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

**User response:** Correct the parameters (or remove the incorrect parameter) and reenter the command or restart the server.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHCFPR

---

**DFHCF0210** Parameter keyword keyword should not have a value for command.

**Explanation:** A coupling facility data table server parameter keyword was specified in the form keyword=value in a context where it was not expected, for example on a DISPLAY command.

**System action:** Processing of the current line of parameters is terminated.

**User response:** Reenter the command without specifying a value for the parameter to be displayed.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHCFPR

---

**DFHCF0211** Parameter value: keyword=value

**Explanation:** This message is issued to show the current value of a coupling facility data table server parameter setting in response to a DISPLAY or PRINT command.

**System action:** Processing continues normally.

**User response:** None.

**Note:** This message cannot be changed with the message editing utility.
**DFHCF0212** Value value for parameter keyword is incorrect. It must be one of validlist.

**Explanation:** The value of this coupling facility data table server parameter was not recognized. It should have been specified as one of the indicated list of values.

**System action:** Processing of the current parameter string (command parameter list, PARM field or SYSIN input line) is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

**User response:** Correct the parameter value and reenter the command or restart the server.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT  
**Modules:** DFHCFPR

---

**DFHCF0213** Value for parameter keyword is missing. The correct form is keyword=value.

**Explanation:** A parameter keyword was specified without an associated parameter value on a coupling facility data table server SET command or in a SYSIN or PARM parameter string. Note that the only character which should appear between the parameter keyword and its intended value is the equals sign, without any extra spaces.

**System action:** Processing of the current parameter string (command parameter list, PARM field or SYSIN input line) is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

**User response:** Reenter the parameter specification in the correct form keyword=value.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT  
**Modules:** DFHCFPR

---

**DFHCF0214** Value value for parameter keyword is incorrect. Pattern matching is not supported in this context.

**Explanation:** A parameter value containing one of the pattern matching (wild card) characters ‘*’, ‘%’ or ‘?’ was specified in a context where only a single identifier is supported.

**System action:** Processing of the current parameter string (command parameter list, PARM field or SYSIN input line) is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

**User response:** Correct the parameter value and reenter the command.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT  
**Modules:** DFHCFPR

---

**DFHCF0215** Value value for applid.uowid parameter keyword is incorrect. The APPLID part should be a name of up to 8 characters.

**Explanation:** The value of this coupling facility data table server parameter did not conform to the correct syntax for the APPLID part of a unit of work identifier.

**System action:** Processing of the current line of parameters is terminated.

**User response:** Correct the parameter value and reenter the command.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT  
**Modules:** DFHCFPR

---

**DFHCF0216** Value value for applid.uowid parameter keyword is incorrect. The UOWID part should be 16 hexadecimal digits or ‘*’.

**Explanation:** The value of this coupling facility data table server parameter did not conform to the correct syntax for a unit of work identifier.

**System action:** Processing of the current line of parameters is terminated.

**User response:** Correct the parameter value and reenter the command.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT  
**Modules:** DFHCFPR
Parameter keyword `keyword` requires a table name. It should be preceded by `TABLE=name` in the same command line.

**Explanation:** This coupling facility data table server parameter can only be set for a specific table, but it was not preceded by a `TABLE=name` parameter in the same command line.

**System action:** Processing of the current line of parameters is terminated.

**User response:** Insert the parameter `TABLE=name` before the specified keyword and reenter the command.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHCFPR

---

`TABLE=table` was specified without any table-related parameter.

**Explanation:** A coupling facility data table server SET command was issued including a parameter of the form `TABLE=name` to select a specific table, but it was not followed by any table-related parameter within the same command.

**System action:** The table name parameter is ignored.

**User response:** If a table-related parameter was to be set, ensure that it is included on the same SET command as the table name.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHCFOP

---

Console operator `consname` issued command: `command`

**Explanation:** A coupling facility data table server operator command has been issued via the MVS MODIFY or STOP command. This message identifies the console name (or TSO userid) from which the command was issued and the text of the command.

**System action:** Processing continues.

**User response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCFOP

---

Command command ignored because no valid parameters were given.

**Explanation:** A coupling facility data table server command was issued which had no valid parameters on it but was otherwise syntactically valid. The command has had no effect.

**System action:** Processing continues normally.

**User response:** Ensure that the command was entered correctly.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHCFOP

---

Command command has been processed.

**Explanation:** A coupling facility data table server command has been processed successfully.

**System action:** Processing continues.

**User response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHCFOP

---

STOP command is waiting for connections to be closed. Number of active connections = `connections`.

**Explanation:** A coupling facility data table server STOP command has been issued (either via an MVS STOP command or via an MVS MODIFY command with the text STOP) but there are still active connections to the server, so the STOP command has not yet taken effect.

**System action:** The server rejects any further attempts to establish new connections, but continues processing requests for existing connections. Each time a connection is terminated, this message will be repeated as long as there are more active connections.

**User response:** Further information about the connections which are still active may be obtained using the command `DISPLAY CONNECTIONS`.

If the server needs to be shut down without waiting for connections to be closed, issue the server `CANCEL` command. Note that this will immediately terminate any active connections, causing any further requests for that server to be given a SYSIDERR indication. (The MVS CANCEL command can also be used, but should preferably be avoided because it will prevent the server...
from producing its normal closedown statistics and reports).

Note that if a CICS region is abnormally terminated while server connect or disconnect processing is in progress, or is terminated without going through end of task processing (for example using the **FORCE** command) there is a slight chance that the server will not be notified that the connection has been terminated. In this case the server will not be able to be closed down with the server **STOP** command, but only with the server **CANCEL** command.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHCFOP

---

**DFHCF0305I  STOP command has been processed.**

**Explanation:** Processing of a coupling facility data table server **STOP** command has now been successfully completed. This means that there are no longer any active connections and the server is ready to close down.

**System action:** The coupling facility data table server starts termination processing.

**User response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHCFOP

---

**DFHCF0306I  CF data table server does not support this command: command**

**Explanation:** An operator command was addressed to the coupling facility data table server using the MVS **MODIFY** command, but the first word of the **MODIFY** parameter text is not a recognized server command (**SET**, **DISPLAY**, **PRINT**, **STOP**, **CANCEL** or an accepted abbreviation for one of these).

**System action:** The command is ignored.

**User response:** Correct and reenter the command.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHCFOP

---

**DFHCF0307I  CANCEL parm command has been processed. Number of active connections = connections.**

**Explanation:** A coupling facility data table server **CANCEL** command has been issued, either from an operator console or internally by the server in response to a severe error such as coupling facility failure. This message includes any restart parameter specified on the command and the number of active connections which may be affected by this command.

**System action:** The server terminates immediately, without waiting to close connections.

**User response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHCFOP

---

**DFHCF0308I  CF data table server does not support CICS commands. To close it down, you can use the STOP command.**

**Explanation:** An operator command which appears to be a CICS command (a four-character transaction code of the form 'CExx') was addressed to the coupling facility data table server using the MVS **MODIFY** command.

**System action:** The command is ignored.

**User response:** Correct and reenter the command. If the intention is to close down the server, use the server **STOP** or **CANCEL** command.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHCFOP

---

**DFHCF0309I  Parameter parm on CANCEL command is incorrect. The only valid parameters are RESTART=YES or RESTART=NO.**

**Explanation:** A coupling facility data table server **CANCEL** command was issued with a parameter which did not match the valid parameter keywords.

**System action:** The command is ignored.

**User response:** Correct and reenter the command.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHCFOP
DFHCF0310 Parameter parm on STOP command is incorrect. No parameters should be specified.

Explanation: A coupling facility data table server STOP command was issued with parameters, but the STOP command does not support any parameters.

System action: The command is ignored.

User response: Correct and reenter the command.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHCFOP

DFHCF0321 Pool state error, reason code reason, processing request request for table table, key key, task task, region region.

Explanation: Integrity checks during coupling facility data table request processing found that data or control information in the pool list structure was in a state that should not be possible in normal processing. The reason codes are based on the response codes returned by the internal coupling facility interface.

- Reason codes:
  2   Entry exceeds maximum data length.
  3   Entry not found.
  4   Wrong version.
  5   Wrong list authority.
  6   Maximum number of entries in list reached.
  7   No space left in structure.

All of these conditions can also occur in normal processing. This message is only issued if the condition occurs in a case where it should not occur, or when the normal retry action following the condition cannot be performed. For example, a wrong version response from the coupling facility interface normally simply indicates that an entry has changed, causing the entry to be read again, and this is only treated as a pool state error if the data or control information in the changed entry is not consistent with the expected state of the record.

System action: The request is terminated with a pool state error exception.

User response: This indicates that some data in the pool has become inconsistent or corrupted. There is no known way that this can happen unless a program other than the coupling facility data table server is used to access the pool. If this error occurs for data records in a particular table, it may be necessary to delete the table to clear up the problem. If it occurs for other control information, it may be necessary to recreate the pool.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHCFOC

DFHCF0331 Table table maximum records limit now set to maxrec (was oldmax). Current number of records is records.

Explanation: The maximum number of records allowed to be stored in the specified table has been successfully modified in response to a coupling facility data table server SET TABLE command with the MAXRECS parameter. The previous maximum number is shown, and the current number of records. The new or previous maximum number may also be shown as NOLIMIT for the special value indicating that no limit applies. (For a recoverable table with uncommitted updates, this number includes the original versions of changed records, as these are retained until syncpoint time to allow for possible backout).

System action: Processing continues using the new value for the maximum number of records. If the current number of records already exceeds this value, no further records can be added (or, for a recoverable table, updated) until enough records have been deleted to bring the current number below the limit.

User response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHCFRQ

DFHCF0332 Table table was not found.

Explanation: The table specified on a coupling facility data table server SET TABLE command was not found in the pool.

System action: The command is ignored.

User response: Ensure that the table name was entered correctly, and that the command was addressed to the correct pool server.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHCFOC

DFHCF0333 Pool state error, reason code reason, processing SET command for table table.

Explanation: The status of the table specified on a coupling facility data table server SET TABLE
command could not be modified because the control information in the list structure was in a state that should not be possible in normal processing. The reason codes are based on the response codes returned by the internal coupling facility interface.

- Reason codes:
  
  2  Entry exceeds maximum data length.
  3  Entry not found.
  4  Wrong version.
  5  Wrong list authority.
  6  Limit number of entries in list reached.
  7  No space left in structure.

All of these conditions can also occur in normal processing. This message is only issued if the condition occurs in a case where it should not occur, or when the normal retry action following the condition cannot be performed.

System action:  The command is ignored.

User response:  This indicates that some data in the pool has become inconsistent or corrupted. There is no known way that this can happen unless a program other than the coupling facility data table server is used to access the pool. If this error occurs for attempts to modify a particular table, it may be necessary to delete the table to clear up the problem. If it occurs for other control information, it may be necessary to recreate the pool.

Note:  This message cannot be changed with the message editing utility.

Destination:  Console and SYSPRINT

Modules:  DFHCFOC

DFHCF0335 Table table is now marked as available.

Explanation:  The state of the specified table has been changed from unavailable to available in response to a coupling facility data table server SET TABLE command with the option AVAILABLE=YES.

System action:  Processing continues. New OPEN requests for the table will now be allowed.

User response:  None.

Note:  This message cannot be changed with the message editing utility.

Destination:  Console and SYSPRINT

Modules:  DFHCFOC

DFHCF0336 Table table is now marked as unavailable.

Explanation:  The state of the specified table has been changed from available to unavailable in response to a coupling facility data table server SET TABLE command with the option AVAILABLE=NO.

System action:  Processing continues. New OPEN requests for the table will be rejected with an indication that the table is unavailable.

User response:  None.

Note:  This message cannot be changed with the message editing utility.

Destination:  Console and SYSPRINT

Modules:  DFHCFOC

DFHCF0337 Table table was already marked as available.

Explanation:  This is a response to the coupling facility data table server SET TABLE command with the parameter AVAILABLE=YES when the table is already marked as available.

System action:  Processing continues.

User response:  None.

Note:  This message cannot be changed with the message editing utility.

Destination:  Console and SYSPRINT

Modules:  DFHCFOC

DFHCF0338 Table table was already marked as unavailable.

Explanation:  This is a response to the coupling facility data table server SET TABLE command with the parameter AVAILABLE=NO when the table is already marked as unavailable.
DFHCF0341I Server request statistics for table *table*:

**Explanation:** This message gives table access statistics for the current coupling facility data table server, listing the total number of requests of each type handled since the previous statistics reset. It is issued in response to a DISPLAY or PRINT command which includes the TABLESTATS parameter, and may also be produced on the SYSPRINT file during interval statistics if the statistics options include print file output. Note that this message is suppressed if all statistics are zero.

The detailed message layout is as follows:

| Table: | Open | Close | Set Attr | Delete |
|--------+------|-------|----------|--------|
| Stats  | n    | n     | n        | n      |
| Record: | Point | Highest | Read | Read Del |
| Unlock | Load | Write | Rewrite | Del Mult |
| Stats  | n    | n     | n        | n      |

**User response:** The statistics are described in detail in the DFHCFS7D data area. The individual fields have the following meanings:

- **Open** | Number of successful OPEN requests for the table
- **Close** | Number of successful CLOSE requests for the table
- **Set Attr** | Number of times new table status was set
- **Delete** | Number of times the table of that name was deleted
- **Extract** | Number of times table access statistics were extracted

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHFCFCN

---

DFHCF0342I Server request statistics for all tables:

**Explanation:** This message gives overall request statistics for the current coupling facility data table server, listing the total number of requests of each type handled since the previous statistics reset. It is issued in response to a DISPLAY or PRINT command which includes the TABLESTATS parameter, and may also be produced on the SYSPRINT file during interval statistics if the statistics options include print file output.

The detailed message layout is as follows:

| Table: | Open | Close | Set Attr | Delete |
|--------+------|-------|----------|--------|
| Stats  | n    | n     | n        | n      |
| Record: | Point | Highest | Read | Read Del |
| Unlock | Load | Write | Rewrite | Del Mult |
| Stats  | n    | n     | n        | n      |

**User response:** The statistics are described in detail in the DFHCFS8D data area. The individual fields have the following meanings:

- **Open** | Number of successful OPEN requests for the table
- **Close** | Number of successful CLOSE requests for the table
- **Set Attr** | Number of times new table status was set
- **Delete** | Number of times the table of that name was deleted
- **Extract** | Number of times table access statistics were extracted
- **Point** | Number of POINT requests
- **Highest** | Number of requests for current highest key
- **Read** | Number of READ requests (including those for UPDATE)
- **Read Del** | Number of combined READ and DELETE requests
- **Unlock** | Number of UNLOCK requests
- ** Loads** | Number of records written by initial load requests
- **Write** | Number of WRITE requests for new records
- **Rewrite** | Number of REWRITE requests
- **Delete** | Number of DELETE requests
- **Del Mult** | Number of multiple (generic) delete requests

The coupling facility architecture supports some options and types of request such as combined READ and DELETE which are not currently supported by CICS File Control, but the server supports them for completeness. Server request counts for such options and request types are always zero.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHFCFCN
The coupling facility architecture supports some options and types of request such as combined READ and DELETE which are not currently supported by CICS File Control, but the server supports them for completeness. Server request counts for such options and request types are always zero.

---

**DFHCF0351I** Connection: Job jobname Applid applid Idle idletime

**Explanation:** This describes a single connection from a CICS region to the coupling facility data table server, in response to the server command `DISPLAY CONNECTIONS` or `PRINT CONNECTIONS`. The information shows the job name, the generic `APPLID` and the time in hours, minutes and seconds since the most recent table request or inquire call was issued using the connection.

**System action:** A message in this form is issued for each active connection to the current server, then message DFHCF0352I is issued to show the total number of active connections.

**User response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHCFCN

---

**DFHCF0352I** Total connections to this server: connections.

**Explanation:** This describes the total number of active connections from CICS regions to the coupling facility data table server, in response to the server command `DISPLAY CONNECTIONS` or `PRINT CONNECTIONS`.

**System action:** Processing continues.
User response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHCFCN

DFHCF0361 Table names: table1 table2 table3 table4 table5

Explanation: This message lists up to five table names in response to the coupling facility data table server command DISPLAY TABLES or PRINT TABLES.

System action: This message is issued as many times as is necessary to list all current table names, then message DFHCF0362I is issued to show the total number of tables.

User response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHCFIQ

DFHCF0362I The total number of tables in the pool is tables.

Explanation: This describes the total number of tables within the pool, in response to the coupling facility data table server command DISPLAY (or PRINT) TABLES or TABLEUSERS.

System action: Processing continues.

User response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHCFIQ

DFHCF0363I Details for table table:

Explanation: This message shows table details in response to the coupling facility data table server command DISPLAY TABLE=name or PRINT TABLE=name.

The detailed message layout is as follows:

Attributes: Recsize Keylength Max recs Upd Model
  n  n  n  n  x
  Init Load
  x

Status: Available Open mode Access Sharing
  x  x  x  x  x
  Loaded

Statistics: Users Servers Opens Records
  n  n  n  n

System action: Processing continues.

User response: The individual fields have the following meanings:

• Attributes:
  
  Recsize
  Record size specified when table was created.

  Keylength
  Key length specified when table was created.

  Max recs
  Indicates the current limit value if any which has been set on the number of records in the table, or 'NO' if there is no current limit value.

  Upd model
  Indicates the update model being used: 'CONT' or 'CONT+' for the contention model, 'LOCK' for the non-recoverable locking model, or 'RECOV' for the recoverable locking model. For a contention model table where the maximum record size is 63 or less, this usually shows 'CONT+', which indicates that access has been further optimized by storing the record data in the coupling facility entry adjunct area, instead of using separate data elements.

  Init Load
  Indicates whether initial load was required: 'YES' or 'NO'.

• Status:
  Available
  Indicates whether new opens are currently allowed: 'YES' or 'NO'.

  Open mode
  Indicates whether the table is open for read/write access, open for read-only access or not open: 'R/W', 'R/O' or 'NONE'.

  Access
  Indicates whether the table is currently open for exclusive access, or otherwise indicates shared: 'EXCL' or 'SHR'.

  Sharing
  Indicates what level of shared access is currently allowed for the table, 'R/W', 'R/O' or 'NONE'.

  Loaded
  Indicates 'YES' if the table has been loaded or if loading is not required, otherwise 'NO'.

  Statistics
**Users**
Indicates the current number of users of this table, which is normally the number of CICS regions that currently have it open. It is also possible for a CICS region to have the same table open more than once at a time using different file names.

**Servers**
Indicates the number of server regions that currently have the table open internally for recoverable access. For a non-recoverable table this is zero. For a recoverable table, this is normally the same as the number of CICS regions which have currently have the table open, but when there are unresolved recoverable changes a server may have the table open internally even when the CICS region has not explicitly opened it, or has explicitly closed it.

**Opens**
Indicates the total number of opens issued for this table since it was created.

**Records**
Indicates the current number of records in the table.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHCFIQ

---

**DFHCF0364** No table was found matching *table*.

**Explanation:** A table name specified on the coupling facility data table server command **DISPLAY** (or **PRINT**) **TABLE=** name or **TABLEUSERS=** name did not match any existing table in the pool.

**System action:** The command is ignored.

**User response:** Ensure that the table name was entered correctly, and that the command was addressed to the correct pool server.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHCFIQ

---

**DFHCF0365I** The number of tables in the pool matching *table* is *tables*.

**Explanation:** This indicates the number of matching tables within the pool for which information was displayed in response to the coupling facility data table server command **DISPLAY** (or **PRINT**) **TABLES=** name or **TABLEUSERS=** name where the table name contained one or more wild card characters.

**System action:** Processing continues.

**User response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHCFIQ

---

**DFHCF0366I** Table *table* users: *region1* *region2* *region3* *region4*

**Explanation:** This message lists the names (normally the CICS APPLIDs) of up to four regions which are currently using the named coupling facility data table, in response to the coupling facility data table server command **DISPLAY** (or **PRINT**) **TABLEUSERS**. A region is considered to be using a table if it has one or more files open for the table, or if it has one or more unresolved units of work which have made recoverable updates to the table.

**System action:** This message is issued as many times as is necessary to list all regions which are currently using the table (sorted by name). If one of the regions was in the process of loading the table, message DFHCF0367I is issued to identify that region. Finally, message DFHCF0368I is issued to show the total number of users.

**User response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHCFIQ

---

**DFHCF0367I** Table *table* is being loaded by region *region*.

**Explanation:** If a table specified on the coupling facility data table server command **DISPLAY** (or **PRINT**) **TABLEUSERS** is currently open for loading, this message is issued to identify the name (normally the CICS APPLID) of the region which is loading it. This name also appears in the list of regions using the table.

**System action:** Processing continues.

**User response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHCFIQ

---

**DFHCF0368I** Table *table* users: *region1* *region2* *region3* *region4* *region5* *region6* *region7* *region8* *region9* *region10* *region11* *region12* *region13* *region14* *region15* *region16* *region17* *region18* *region19* *region20*

**Explanation:** This message lists the names (normally the CICS APPLIDs) of up to twenty regions which are currently using the named coupling facility data table, in response to the coupling facility data table server command **DISPLAY** (or **PRINT**) **TABLEUSERS**. A region is considered to be using a table if it has one or more files open for the table, or if it has one or more unresolved units of work which have made recoverable updates to the table.

**System action:** This message is issued as many times as is necessary to list all regions which are currently using the table (sorted by name). If one of the regions was in the process of loading the table, message DFHCF0367I is issued to identify that region. Finally, message DFHCF0368I is issued to show the total number of users.

**User response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHCFIQ
DFHCF0368I The number of regions using table table is users.

Explanation: This indicates the total number of regions which are currently using the table specified on the coupling facility data table server command DISPLAY (or PRINT) TABLEUSERS.

System action: Processing continues.

User response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHCFOC

DFHCF0371I Table table has now been deleted.

Explanation: The specified table was successfully deleted in response to a coupling facility data table server DELETE TABLE=name command.

System action: Processing continues.

User response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHCFOC

DFHCF0372I Table table was not found.

Explanation: The table specified on a coupling facility data table server DELETE TABLE=name command was not found in the pool.

System action: The command is ignored.

User response: Ensure that the table name was entered correctly, and that the command was addressed to the correct pool server.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHCFOC

DFHCF0373I Table table cannot be deleted because it is in use.

Explanation: The table specified on a coupling facility data table server DELETE TABLE=name command is currently open for access, so it cannot be deleted.

System action: The command is ignored.

User response: Check that the correct table name was entered. Ensure that the table is closed from all regions which are no longer using it. The server command DISPLAY TABLE=name can be used to determine how many users currently have the table open, or whether one or more servers have it open for recoverable access.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHCFOC

DFHCF0374 Table table could not be deleted, CF access error.

Explanation: During processing of a coupling facility data table server DELETE TABLE=name command, an unexpected error response was received. This message is preceded by message DFHCF0441 giving the details of the coupling facility access error.

System action: The command is ignored.

User response: Check the system log for a preceding DFHCF0441 message and see the explanation of that message.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHCFOC

DFHCF0381I APPLID applid is connected on system.

Explanation: This message is issued in response to a successful coupling facility data table server DISPLAY APPLID command. This is issued for each recoverable connection matching the given APPLID name or pattern, or for all recoverable connections if no APPLID value was given.

System action: Processing continues.

User response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHCFSP

DFHCF0382I APPLID applid is not currently connected.

Explanation: This message is issued in response to a coupling facility data table server DISPLAY APPLID command for a single APPLID when the given APPLID does not match any active recoverable connection.

System action: Processing continues.

User response: Check that the correct APPLID was entered.
**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHCFS

**DFHC0383I** APPLID applid total connections: applids.

**Explanation:** This message is issued at the end of the responses to a coupling facility data table server DISPLAY APPLIDs command to summarize the total number of connections listed. The total is zero if no matching connections were found.

**System action:** Processing continues.

**User response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHCFS

**DFHC0384I** APPLID applid UOW status: indoubts in doubt, commits in commit, backouts in backout, active on system

**Explanation:** This message is issued in response to a coupling facility data table server DISPLAY UOWID command where the APPLID identifies a CICS region that has an active recoverable connection to the pool on the indicated MVS system. If UOWID details were requested, this message follows the details for the individual units of work. The indoubts count represents units of work which have been prepared for commit but have not yet been scheduled to be committed nor backed out. The commits count represents units of work for which commit processing has been started, and will be completed when the connection is restarted. The backouts count represents units of work for which backout processing has been started, and will be completed when the connection is restarted.

**System action:** Processing continues.

**User response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHCFS

**DFHC0385I** APPLID applid UOW status: indoubts in doubt, commits in commit, backouts in backout, not active

**Explanation:** This message is issued in response to a coupling facility data table server DISPLAY UOWID command for an APPLID which identifies a CICS region that previously established a recoverable connection to the pool and has recoverable work pending, but is not currently connected to the pool. If UOWID details were requested, this message follows the details for the individual units of work. The indoubts count represents units of work which have been prepared for commit but have not been scheduled to be committed nor backed out. These will normally be resolved by resynchronization processing when the connection is restarted. The commits count represents units of work for which commit processing has been started, and will be completed when the connection is restarted. The backouts count represents units of work for which backout processing has been started, and will be completed when the connection is restarted.

**System action:** Processing continues.

**User response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHCFS

**DFHC0386I** UOWID applid.uowid is in doubt.

**Explanation:** This message is issued in response to a coupling facility data table server DISPLAY UOWID command. The unit of work has been prepared for commit, but has been neither committed nor backed out. If the APPLID is currently inactive, the state will normally be resolved by resynchronization processing the next time it is restarted.

**System action:** Processing continues.

**User response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHCFS

**DFHC0387I** UOWID applid.uowid is being committed.

**Explanation:** This message is issued in response to a coupling facility data table server DISPLAY UOWID command. The unit of work has started the commit process. If the APPLID is currently inactive, the commit process will be completed the next time it is restarted.

**System action:** Processing continues.

**User response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHCFS
DFHC0388I UOWID applid.uowid is being backed out.

Explanation: This message is issued in response to a coupling facility data table server DISPLAY UOWID command. The unit of work has started to be backed out. If the APPLID is currently inactive, the backout process will be completed the next time it is restarted.

System action: Processing continues.

User response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHCFSF

DFHC0392 APPLID applid recovery status cannot be modified while it is connected.

Explanation: This message is issued in response to a coupling facility data table server SET command which attempted to modify recovery status for the given APPLID. This is not possible if the APPLID is already connected to the pool, on this server or another server.

System action: The requested function is ignored.

User response: Check whether the correct APPLID was entered.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHCFSF

DFHC0390I UOWID applid.uowid was not found.

Explanation: This message is issued in response to a coupling facility data table server DISPLAY UOWID command.

System action: Processing continues.

User response: Check that the correct UOWID was entered.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHCFSF

DFHC0391 APPLID applid does not have any unresolved units of work.

Explanation: This message is issued in response to a coupling facility data table server SET command which attempted to modify the recovery status of the given APPLID. There are no unresolved units of work in the pool which match the given APPLID.

System action: The requested function is ignored.

User response: Check that the correct APPLID was entered.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHCFSF

DFHC0393 APPLID applid recovery status cannot be modified because connection restart failed with reason code reason.

Explanation: This message is issued in response to a coupling facility data table server SET command which attempted to modify recovery status for the given APPLID. The attempt failed because the server was unable to establish a recoverable connection on behalf of that APPLID. The reason code from the failing internal FCCU RESTART function is included.

System action: The requested function is ignored.

User response: See the server trace file and job log for further details about the failure.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHCFSF

DFHC0394 UOWID applid.uowid is not in doubt.

Explanation: This message is issued in response to a coupling facility data table server SET command which attempted to modify the recovery status of a specific unit of work. The APPLID had one or more unresolved units of work and was successfully restarted, but the UOWID did not match any in-doubt unit of work owned by that APPLID after restart completed. Note that if the
unit of work was previously in the process of being committed or backed out, restart processing will have resolved it.

**System action:** The requested function is ignored. A further message will appear indicating whether any units of work remain unresolved after the successful restart.

**User response:** Check that the correct APPLID and UOWID were entered.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHCFSP

DFHCF0395I APPLID applid now has no unresolved units of work.

**Explanation:** This message is issued in response to a successful coupling facility data table server SET command to perform restart processing. All units of work associated with the APPLID were resolved by restart processing (which means that they must have been in commit or backout processing).

**System action:** Processing continues.

**User response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHCFSP

DFHCF0396I APPLID applid units of work remaining in doubt: indoubts.

**Explanation:** This message is issued in response to a successful coupling facility data table server SET command to perform restart processing. One or more units of work remain in doubt.

**System action:** Processing continues.

**User response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHCFSP

DFHCF0397I APPLID applid units of work now committed: commits.

**Explanation:** This message is issued in response to a successful coupling facility data table server SET command which committed one or more units of work.

**System action:** Processing continues.

**User response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHCFCF

DFHCF0398I APPLID applid units of work now backed out: backouts.

**Explanation:** This message is issued in response to a successful coupling facility data table server SET command which backed out one or more units of work.

**System action:** Processing continues.

**User response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHCFSP

DFHCF0399 UOWID applid.uowid syncpoint failed, reason code reason.

**Explanation:** This message is issued in response to a coupling facility data table server SET command which attempted to commit or backout the given UOWID but failed. The reason code from the failing internal FCCU COMMIT or BACKOUT function is included.

**System action:** The requested function is ignored.

**User response:** See the server trace file and job log for further details about the failure.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHCFSP

DFHCF0401I Connected to CF structure strname.

**Explanation:** The coupling facility data table server has successfully established a connection to the coupling facility list structure for the table pool, using the IXLCONN macro.

**System action:** Processing continues.

**User response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHCFCF
DFHCF0402I  CF structure strname was allocated by this connection.

Explanation: The coupling facility data table pool list structure did not previously exist and was allocated as part of the connection process.

System action: List structure initialization will be performed if necessary.

User response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHCFCF

DFHCF0403I Connection to CF structure strname failed, IXLCONN return code retcode, reason code rsncode.

Explanation: The IXLCONN macro to connect the coupling facility data table server to its pool list structure failed.

System action: The coupling facility data table server is terminated.

User response: See the documentation of the IXLCONN macro in OS/390 MVS Programming: Sysplex Services Reference (GC28-1772) for the explanation of the return and reason code. If the reason code is of the form xxxx0C08, indicating structure allocation failure, this message will be followed by message DFHCF0409 giving the facility reason code for each coupling facility in which allocation was attempted.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHCFCF

DFHCF0404I CF structure strname cannot be used because it has been allocated with attribute attribute.

Explanation: The coupling facility data table server has successfully connected to its pool list structure but has found that the structure has been allocated using an IXLCONN structure attribute keyword which is not supported by the server.

System action: The server is terminated.

User response: This probably indicates that the structure has been allocated or modified by some program other than the coupling facility data table server program. In this case, the incorrect structure should be deleted (using the MVS SETXCF FORCE command) so that it will be reallocated correctly when the server is restarted.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHCFCF

DFHCF0405I CF structure strname element size elemsize is incorrect. It should be a power of 2 in the range 256 to 4096.

Explanation: The list structure element size specified in the ELEMSIZE initialization parameter for the coupling facility data table server is not a power of two, or is outside the range supported by the coupling facility interface.

System action: The server is terminated (without attempting to connect to the list structure).

User response: Correct the ELEMSIZE parameter and restart the server.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHCFCF

DFHCF0406I Initialization failed for CF structure strname with response response.

Explanation: Coupling facility data table server processing to initialize the pool list structure failed with an abnormal internal response code.

System action: The server is terminated.

User response: If the response code is 8 (I/O error), it indicates that an IXLLIST macro gave an abnormal return code, in which case a previous DFHCF0441 message will have been issued giving the IXLLIST return code and reason code. If this response code is any other value, this indicates that the list structure is in a state which should not occur, probably indicating that it was allocated or modified by a program other than the coupling facility data table server. In this case the structure may need to be deleted (using the MVS SETXCF FORCE command) so that it will be reallocated when the server is restarted.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHCFCF

DFHCF0407I CF structure strname is not available for shared use.

Explanation: The coupling facility data table pool is currently locked for exclusive use by some other job such as a pool unload or reload job. (This serialization
uses an MVS ENQ with scope SYSTEMS, major name 'SYSZDFH' and minor name equal to the structure name, 'DFHCFLS_poolname').

**System action:** The server is terminated.

**User response:** Check whether a pool maintenance job is currently running. If it is, wait until it has finished before trying to start the server again. You can find out what jobs are currently using the pool using this MVS command:

```
DISPLAY GRS,RES=(SYSZDFH,'DFHCFLS_poolname')
```

Note that for this command the pool name must be exactly eight characters, padded with trailing spaces if necessary.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHCFCF

---

**DFHCF0408 CF structure strname is not available for exclusive use.**

**Explanation:** The current coupling facility data table unload or reload job requires exclusive use of the pool, but some other job is running which already has shared or exclusive use of the pool. (This serialization uses an MVS ENQ with scope SYSTEMS, major name 'SYSZDFH' and minor name equal to the structure name, 'DFHCFLS_poolname').

**System action:** The server is terminated.

**User response:** Check whether a coupling facility data table server or maintenance job is currently running. If it is, wait until it has finished before trying to run the current job again. You can find out what jobs are currently using the pool using this MVS command:

```
DISPLAY GRS,RES=(SYSZDFH,'DFHCFLS_poolname')
```

Note that for this command the pool name must be exactly eight characters, padded with trailing spaces if necessary.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHCFCF

---

**DFHCF0409 CF structure strname could not be allocated in facility dfname, reason code rsncode.**

**Explanation:** If a previous coupling facility data table server message DFHCF0403 indicated an IXLCONN failure because the structure could not be allocated, this message is issued for each coupling facility in which allocation was attempted to show the facility reason code indicating why structure allocation failed. If the reason code is known to the server, the name of the reason code is given (as defined in the MVS macro IXLYCONA, but without the 'ConaRsn' prefix), otherwise its decimal value is shown.

If the response indicates InvalidStructureSize, this means that the initial list structure size (specified on the server POOLSIZE parameter or in the CFRM policy INITSIZE parameter) is not large enough to contain the required structure control information. The size of the control information is affected by the number of list headers (determined by the server MAXTABLES parameter) and by the maximum structure size specified in the CFRM policy.

**System action:** The server is terminated.

**User response:** If further details are required, see the descriptions of the reason codes in the source of the MVS macro IXLYCONA which maps the connect answer area.

If the response was InvalidStructureSize, increase the initial structure size specification in the server POOLSIZE parameter or the CFRM policy INITSIZE parameter to ensure that there is enough space for data in addition to the structure control information. Also, check that the server MAXTABLES parameter and the maximum structure size specified in the CFRM policy are not unnecessarily large. See the CICS System Definition Guide for more information on how to estimate pool sizes.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHCFCF

---

**DFHCF0410 CF structure strname cannot be used, coupling facility maintenance level is too low.**

**Explanation:** Initialization test routines executed against the allocated list structure gave incorrect results, indicating that the coupling facility control code does not include all maintenance necessary to support coupling facility data tables.

**System action:** The server is terminated.

**User response:** Ensure that the required level of coupling facility maintenance is applied.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHCFCF
**DFHCF0411I** CF structure *strname* now has *percentage%* of entries in use.

**Explanation:** This message is issued by the coupling facility data table server when the percentage of list entries in use within the list structure increases past certain set threshold levels, or when it decreases past a threshold level after previously being at a higher level. This message is also issued immediately after a structure alter request has completed in order to show how the percentage has been affected by changes in the structure size or entry to element ratio. The percentage is calculated using information that is returned by successful coupling facility access requests, so if the message was triggered by structure alter completion and the current server has not processed any successful requests recently, the information may not be accurate.

**System action:** The warning threshold is increased to the next higher level (normally 5% higher if less than 95%, otherwise 1% higher), or decreased to the previous lower level depending on whether the usage is increasing or decreasing. If the structure usage is increasing and the structure element to entry ratio is not making full use of the available space, the server may issue an automatic IXLALTER request to adjust the ratio.

**User response:** Note that the structure may soon become full, preventing tables from being created. If the structure is currently allocated at less than its maximum size and the coupling facility has enough free space, the size of the structure can be increased dynamically using the MVS SETXCFC command with the START,ALTER option, and any active servers will be able to use the increased space immediately.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHCFCF

---

**DFHCF0413I** Issuing alter request to adjust CF structure *strname* entry/element ratio to *entries*/elements.

**Explanation:** The coupling facility data table server has determined that the ratio of free entries to free elements is significantly different from the ratio of entries to elements actually in use. It is issuing an IXLALTER macro to request the coupling facility to adjust the ratio to make better use of the coupling facility storage.

**System action:** The server continues by issuing the IXLALTER macro. A further message will be issued when the structure alter request is accepted or rejected by MVS.

**User response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHCFCF

---

**DFHCF0412I** CF structure *strname* now has *percentage%* of elements in use.

**Explanation:** This message is issued by the coupling facility data table server when the percentage of list data elements in use within the list structure increases past certain set threshold levels, or when it decreases past a threshold level after previously being at a higher level. This message is also issued immediately after a structure alter request has completed in order to show how the percentage has been affected by changes in the structure size or entry to element ratio. The percentage is calculated using information that is returned by successful coupling facility access requests, so if the message was triggered by structure alter completion and the current server has not processed any successful requests recently, the information may not be accurate.

**System action:** The server event exit will be notified by MVS when the structure alter request completes and a further message will then be issued.

**User response:** None.
Note: This message cannot be changed with the message editing utility.

Destination:  Console and SYSPRINT

Modules:  DFHCFCF

DFHCF0415I  Alter request rejected for CF structure strname, another alter request for this structure is already active.

Explanation:  The coupling facility data table server attempted to start a structure alter request using IXLALTER to change the entry to element ratio for the list structure, but this was rejected by the system because another structure alter request was already active.

System action:  The server event exit will be notified by MVS when the structure alter request completes and a further message will then be issued.

User response:  None.

Note:  This message cannot be changed with the message editing utility.

Destination:  Console and SYSPRINT

Modules:  DFHCFCF

DFHCF0416I  Alter request failed for CF structure strname, IXLALTER return code retcode, reason code rsncode.

Explanation:  The coupling facility data table server attempted to start a structure alter request using IXLALTER to change the entry to element ratio for the list structure, but this was rejected by the system with an unexpected return code.

System action:  The current structure alter attempt is abandoned. Another attempt may be made when the minimum alter interval has expired.

User response:  See the documentation of the IXLALTER macro in OS/390 MVS Programming: Sysplex Services Reference (GC28-1772) for the explanation of the return and reason code.

Note:  This message cannot be changed with the message editing utility.

Destination:  Console and SYSPRINT

Modules:  DFHCFCF

DFHCF0417I  Alter request completed normally for CF structure strname.

Explanation:  The coupling facility data table server has been notified by the system that a structure alter request has completed normally.

System action:  New values for the structure size and numbers of elements and entries are stored. This message is followed by messages DFHCF0411 and DFHCF0412 to indicate the new usage percentages.

User response:  None.

Note:  This message cannot be changed with the message editing utility.

Destination:  Console and SYSPRINT

Modules:  DFHCFCF

DFHCF0418I  Alter request ended abnormally for CF structure strname with status status.

Explanation:  The coupling facility data table server has been notified by the system that a structure alter request has ended abnormally. The two bytes of status information in this message are taken from EEPLALTERENDSTATEFLAGS in the event exit parameter list (defined in the MVS macro IXLYEEPL).

System action:  No action is taken as a result of this notification, but any problem which caused the alter request to fail may result in other related problems.

User response:  If further information is required, look for MVS messages on the system log indicating the reason for the structure alter request failure. For further information about the status flags, see the source of the MVS macro IXLYEEPL.

Note:  This message cannot be changed with the message editing utility.

Destination:  Console and SYSPRINT

Modules:  DFHCFCF

DFHCF0419I  Alter request ended normally for CF structure strname but target was not attained.

Explanation:  The coupling facility data table server has been notified by the system that a structure alter request has ended normally but that the target ratio or target size was not attained.

System action:  New values for the structure size and numbers of elements and entries are stored. This message is followed by messages DFHCF0411 and DFHCF0412 to indicate the new usage percentages.

User response:  None.

Note:  This message cannot be changed with the message editing utility.

Destination:  Console and SYSPRINT

Modules:  DFHCFCF

202  CICS TS for z/OS:  CICS Messages and Codes
DFHCF0424 Connectivity has been lost to CF structure strname. The CF data table server cannot continue.

Explanation: The coupling facility data table server has been notified by the system that connectivity has been lost to the coupling facility containing the pool list structure. If the loss of connectivity was due to an IPL of the coupling facility, all tables and data records are lost.

System action: The server issues an internal CANCEL command to terminate itself immediately.

User response: Restart the server when connectivity to the coupling facility from the current system has been reestablished. If connectivity is still available from other systems, CICS transactions which require access to the affected pool should be diverted to those systems if possible.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHCFCF

DFHCF0425 CF structure strname has failed. The CF data table server cannot continue.

Explanation: The coupling facility data table server has been notified by the system that the pool list structure has been lost due to coupling facility structure failure. All tables and data records in the pool have been lost.

System action: Each server for the affected pool issues an internal CANCEL command to terminate itself immediately.

User response: If another coupling facility is available and is included in the CFRM preference list for the failed structure, restart the servers to cause a fresh copy of the list structure to be allocated on the alternate coupling facility. If no other coupling facility is available, wait until the original coupling facility has been made available again before restarting the servers.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHCFCF

DFHCF0431I Access statistics for CF structure strname:

Explanation: This message gives a summary of coupling facility access statistics. It is issued in response to a coupling facility data table server DISPLAY or PRINT command which includes the CFSTATS parameter, and may also be produced on the SYSPRINT file during interval statistics if the statistics options include print file output.

The detailed message layout is as follows:

Requests: Reads Writes Rewrites Deletes
Table data records n n n n
Data list controls n n n n
Table index list n n n n
UOW index list n n n n
APPLID index list n n n n
Lock release msgs n n
Responses: Asynch Unavail Normal Len err Not fnd
Vers chk List chk List full Str full I/O err
n n n n n
System action: Processing continues.

User response: The statistics are described in detail in the DFHCFS6D data area. The individual fields have the following meanings:

- Table data record request counts:
  - Reads Number of data entry reads.
  - Writes Number of data entry writes.
  - Rewrites Number of data entry rewrites.
  - Deletes Number of data entry deletes.

- Data list controls request counts:
  - Reads Number of reads to check list usage (open or inquire).
  - Writes Number of times a new data list was allocated.
  - Rewrites Number of times data list controls were modified.
  - Deletes Number of times a data list was deleted for reuse.

- Table index list request counts:
  - Reads Number of table index reads.
  - Writes Number of table index writes to create new tables.
  - Rewrites Number of table index writes to update table status.
  - Delete Number of table index deletes.

- Unit of work index list request counts:
  - Reads Number of UOW list reads.
  - Writes Number of UOW list writes (usually at PREPARE).
Rewrites
Number of UOW list rewrites (usually at COMMIT).

Deletes
Number of UOW list deletes (usually after COMMIT).
- Lock release notify message request counts:

Reads
Number of lock release messages read by this server.

Writes
Number of lock release messages sent by this server.
- Response counts:

Asynch
Number of requests for which completion was asynchronous.

Normal
Number of normal responses.

Unavail
Number of times requests were deferred because the structure was temporarily unavailable, for example because system-managed rebuild was in progress.

Len error
Entry data was larger than the input buffer length, which normally results in a retry with a larger buffer.

Not fnd
The specified entry (table or item) was not found.

Vers chk
A version check failed for an entry being updated, indicating that another task had updated it first.

List chk
A list authority comparison failed, usually meaning that the table is in the process of being deleted.

List full
A table reached the maximum number of items, causing the relevant list to be marked as full.

Str full
The list structure became full.

I/O err
Some other error code was returned by IXLLIST.

Note: This message cannot be changed with the message editing utility.

| System action: | Processing continues. |

**User response:** The statistics are described in detail in the DFHCFS6D data area. Pool usage statistics are calculated from information returned by recent coupling facility requests, and are not always very accurate, especially if the relevant information has not been accessed recently by the current server. The number of tables and the number of lists are updated each time the server opens or closes a table, but are not reliably updated at other times. The element and entry counts are updated on successful completion of most types of coupling facility access request.

The individual fields have the following meanings:
- Structure:
  - Size: Current allocated size of the list structure.
  - Max size: Maximum size to which this structure could be altered.
  - Elem size: Data element size used for the structure.
- Tables:
  - Current: Number of tables currently in existence.
**Highest**  
Highest number of tables at any time (since last reset).

- **Lists:**
  - **Total**  
    Maximum number of list headers in the structure.
  - **In Use**  
    Number currently in use.
  - **Max Used**  
    Maximum number in use (since last reset).
  - **Control**  
    Number of lists in use for control information.
  - **Data**  
    Number of lists in use for table data.

- **Entries:**
  - **Total**  
    Total entries in the currently allocated structure (initially set at structure connection time and updated on completion of any structure alter request).
  - **In Use**  
    Number of entries currently in use.
  - **Max Used**  
    Maximum number in use (since last reset).
  - **Free**  
    Number of entries currently free (total minus used).
  - **Min Free**  
    Minimum number of free entries (since last reset).
  - **Reserve**  
    Number of entries reserved for rewrites and server use.

- **Elements:**
  - **Total**  
    Total data elements in the currently allocated structure (initially set at structure connection time and updated on completion of any structure alter request).
  - **In Use**  
    Number of elements currently in use.
  - **Max Used**  
    Maximum number in use (since last reset).
  - **Free**  
    Number of elements currently free (total minus used).
  - **Min Free**  
    Minimum number of free elements (since last reset).
  - **Reserve**  
    Number of elements reserved for rewrites and server use.

**DFHC0441**  
**CF structure strname request failed, IXLLIST return code retcode, reason code rsncode.**

**Explanation:** A coupling facility access request issued by the coupling facility data table server using the IXLLIST macro gave an abnormal return code.

**System action:** The failing request is given an I/O error indication, giving an IOERR condition if it originated from a CICS API request.

**User response:** See the documentation of the IXLLIST macro in OS/390 MVS Programming: Sysplex Services Reference (GC28-1772) for the explanation of the return and reason code.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHCFCF

---

**DFHC0442**  
**CF structure strname request failed, structure is full.**

**Explanation:** A coupling facility access request issued by the coupling facility data table server using the IXLLIST macro failed because there are insufficient free entries or elements to store the new data in the structure.

**System action:** The failing request is given a NOSPACE indication if it originated from a CICS API request. For reload processing, if an automatic structure alter is in progress, the request may be suspended until the outcome of the alter request is known, then retried. This message will not be issued again for further failures until the used numbers of elements and entries fall well below the warning threshold.

**User response:** Any tables which are no longer in use should be deleted so that the space can be reused. If the structure is currently allocated at less than its maximum size and the coupling facility has enough free space, the size of the structure can be increased dynamically using the MVS SETXCF command with the START,ALTER option, and any active servers will be able to use the increased space immediately. However, if this action is possible it should normally have been taken in response to earlier warning message before the structure became full.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHCFCF
DFHCF0443  CF structure strname request failed, all lists are in use.

Explanation: A coupling facility access request issued by the coupling facility data table server using the IXLLIST macro failed because all list headers defined in the structure are now in use. The number of list headers is determined by the MAXTABLES server initialization parameter when the structure is allocated.

System action: The failing request is given a NOSPACE indication if it originated from a CICS API request. This message will not be issued again for further failures while the shortage of list entries remains.

User response: Any tables which are no longer in use should be deleted to free up data lists. As the number of lists is fixed when the structure is allocated, the only way to increase the number of lists is to unload the structure, use the MVS SETXCF FORCE,STR command to delete it then reload it with a larger MAXTABLES parameter.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHCFCF

DFHCF0444I CF request has been suspended to await structure alter completion.

Explanation: A coupling facility access request issued from the coupling facility data table server address space (during reload processing) ran out of space in the list structure, but an automatic structure alter attempt to free up more space is either already active or is being started at this point. The request is therefore being suspended to await the outcome of the structure alter attempt.

System action: The request is suspended until the structure alter request completes (normally or abnormally), then message DFHCF0445I is issued and the request is retried.

User response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHCFCF

DFHCF0445I CF request is being retried after structure alter completion.

Explanation: A coupling facility data table access request which was suspended to await the completion of a structure alter request is now being retried because the alter request has either completed or failed.

System action: The suspended request will be restarted.

User response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHCFCF

DFHCF0446  CF structure strname free space is below reserve level. New records will be rejected.

Explanation: The coupling facility data table server has detected that the number of free list entries or data elements in the pool structure has fallen below the reserve levels specified on the server parameters ENTRYRESERVEMIN, ENTRYRESERVEPC, ELEMENTRESERVEMIN and ELEMENTRESERVEPC.

System action: Any request to create a new record or table in the pool will be rejected for as long as the amount of free space remains below the reserve levels. The failing request is given a NOSPACE indication if it originated from a CICS API request. If free space later increases beyond the reserve levels, requests will be allowed again, and when the amount of free space exceeds the reserve levels by a reasonable margin (based on the server ENTRYWARNINC and ELEMENTWARNINC parameters) message DFHCF0447 will be issued.

User response: Use the server command DISPLAY POOLSTATS to obtain further information about the current pool usage. Any tables which are no longer in use should be deleted so that the space can be reused. If the structure is currently allocated at less than its maximum size and the coupling facility has enough free space, the size of the structure can be increased dynamically using the MVS SETXCF command with the START,ALTER option, and any active servers will be able to use the increased space immediately. However, if this action is possible it should normally have been taken in response to earlier warning messages.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHCFCF

DFHCF0447  CF structure strname free space is no longer below reserve level.

Explanation: The coupling facility data table server issues this message after a recent shortage of free space caused message DFHCF0446 to be issued but the free space has now increased to beyond the reserve levels by a reasonable margin (based on the
server ENTRYWARNINC and ELEMENTWARNINC parameters).

System action: Processing continues.

User response: Use the server command DISPLAY POOLSTATS to obtain further information about the current pool usage. Note that even if this message is produced, the structure may still be very short of space and further action may be necessary, as described for message DFHCF0446.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHCFCF

---

DFHCF0451 Purge for CF structure strname failed, IXLPURGE return code retcode, reason code rsnencode.

Explanation: A coupling facility data table access request was terminated abnormally and the server issued an IXLPURGE macro to ensure any active IXLLIST request was purged before releasing the I/O buffer, but the IXLPURGE macro gave a non-zero return code.

System action: The error is ignored because this only occurs when a request is already being terminated abnormally.

User response: See the documentation of the IXLPURGE macro in OS/390 MVS Programming: Sysplex Services Reference (GC28-1772) for the explanation of the return and reason code.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHCFCF

---

DFHCF0461I Disconnected from CF structure strname.

Explanation: The coupling facility data table server has successfully disconnected from the pool list structure (using the IXLDISC macro) during termination.

System action: Processing continues.

User response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHCFCF

---

DFHCF0462 Disconnect from CF structure strname failed, IXLDISC return code retcode, reason code rsnencode.

Explanation: The IXLDISC macro to disconnect the coupling facility data table server from its pool list structure failed.

System action: The error is ignored, as disconnection only occurs when the server is already terminating.

User response: See the documentation of the IXLDISC macro in OS/390 MVS Programming: Sysplex Services Reference (GC28-1772) for the explanation of the return and reason code.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHCFCF

---

DFHCF0461I Waiting for structure strname to become available.

Explanation: The coupling facility data table server was unable to connect to its coupling facility structure because of an environmental error, such as the
structure being unavailable, as described in a previous DFHCF0403 message. The server is now waiting for this problem to be fixed, and will retry the connection request when it is notified via the ENF facility that the specific structure may now be available or that some change has occurred in the status of general coupling facility resources.

System action: The server waits to be notified of a relevant event.

User response: No action is required, but the waiting server can optionally be terminated using the MVS CANCEL command if it is no longer required.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHCFEN

DFHC0482I Retrying connection to structure strname.

Explanation: The coupling facility data table server has been notified via ENF that its list structure may now be available or that a change has occurred in the status of some general coupling facility resources, so it is about to make another attempt to connect to the structure.

System action: The original IXLCONN request is retried.

User response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHCFEN

DFHC0491 ENFREQ ACTION=action failed, return code retcode.

Explanation: An ENF request issued by the coupling facility data table server gave an unexpected return code.

System action: If this occurs on the ENFREQ ACTION=LISTEN request and the server is subsequently unable to connect to the list structure, the server will be terminated instead of waiting for the structure to become available.

User response: See the documentation of the ENFREQ macro in OS/390 MVS Programming: Authorized Assembler Services Reference, Volume 2 (ENFREQ-ITTFMTB) (GC28-1765) for the explanation of the return and reason code.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHCFEX

DFHC0501 External security manager was not found, table security cannot be supported.

Explanation: Table-specific security checks for coupling facility data table OPEN, SET and DELETE requests were requested in the server parameters or assumed by default, but the external security manager data areas needed by the server security interface (in particular the RCVT) were not found.

System action: The server is terminated.

User response: If these security checks are not required, specify SECURITY=NO in the server parameters, in which case each CICS region that is authorized to connect to the server will be able to open or delete any table in the pool. If table security checks are required, ensure that the external security manager is installed and active before starting the server.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHCFEX

DFHC0502 External security manager is inactive, table security cannot be supported.

Explanation: Table-specific security checks for coupling facility data table OPEN, SET and DELETE requests were requested in the server parameters or assumed by default, but the external security manager is not active.

System action: The server is terminated.

User response: If these security checks are not required, specify SECURITY=NO in the server parameters, in which case each CICS region that is authorized to connect to the server will be able to open or delete any table in the pool. If table security checks are required, ensure that the external security manager is installed and active before starting the server.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHCFEX

DFHC0503 External security manager does not support global in-storage profiles, table security cannot be supported.

Explanation: Table-specific security checks for coupling facility data table OPEN, SET and DELETE requests were requested in the server parameters or
assumed by default, but the external security manager does not support the GLOBAL option for loading security profiles (known as global RACLIST), which is required in order to support cross-memory mode security checking.

**System action:** The server is terminated.

**User response:** If these security checks are not required, specify SECURITY=NO in the server parameters, in which case each CICS region that is authorized to connect to the server will be able to open or delete any table in the pool. If table security checks are required, it will be necessary to upgrade the external security manager to a level which supports global in-storage profiles.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHCFXS

---

**DFHCF0504**  
**External security manager does not support cross-memory mode, table security cannot be supported.**

**Explanation:** Table-specific security checks for coupling facility data table OPEN, SET and DELETE requests were requested in the server parameters or assumed by default, but the external security manager does not support authorization (FASTAUTH) requests in cross-memory mode, which are required in order to perform table security checks.

**System action:** The server is terminated.

**User response:** If these security checks are not required, specify SECURITY=NO in the server parameters, in which case each CICS region that is authorized to connect to the server will be able to open or delete any table in the pool. If table security checks are required, it will be necessary to upgrade the external security manager to a level which supports cross-memory mode authorization requests.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

---

**DFHCF0507**  
**RACROUTE REQUEST=LIST, ENVIR=CREATE, CLASS='class', GLOBAL=YES gave R15=rc, SAFPRRET=retcode, SAFPRREA=rsncode.**

**Explanation:** Table-specific security checks for coupling facility data table OPEN, SET and DELETE requests were requested in the server parameters or assumed by default, but the external security manager LIST function to load the security profiles during server initialization gave an unexpected non-zero return code. This message shows the RACROUTE register 15 return code and the external security manager return and reason codes returned in the SAF request parameter list.

**System action:** The server is terminated with message DFHCF0506.

**User response:** See the preceding message DFHCF0505 for the details of the reason for the failure. If these security checks are not required, specify SECURITY=NO in the server parameters, in which case each CICS region that is authorized to connect to the server will be able to open or delete any table in the pool.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHCFXS
**System action:** The server is terminated with message DFHCF0508.

**User response:** See the documentation of the RACROUTE macro with REQUEST=LIST in OS/390 Security Server External Security Interface (RACROUTE) Macro Reference (GC28-1922) for the explanation of the return and reason codes.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHCFXS

---

**DFHCF0508** Security LIST function failed, table security cannot be supported.

**Explanation:** Table-specific security checks for coupling facility data table OPEN, SET and DELETE requests were requested in the server parameters or assumed by default, but the external security manager LIST function issued to load the security profiles during server initialization gave an unexpected return code.

**System action:** The server is terminated.

**User response:** See the preceding message DFHCF0507 for the details of the reason for the failure. If these security checks are not required, specify SECURITY=NO in the server parameters, in which case each CICS region that is authorized to connect to the server will be able to open or delete any table in the pool.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHCFXS

---

**DFHCF0511** Attempt to open table *table* was rejected because the external security manager is not available.

**Explanation:** The coupling facility data table server was attempting to perform a security check for whether the connected region was allowed to open that data table, but the external security manager was unexpectedly unavailable, even though it had been available at server initialization time.

**System action:** The table open request is rejected.

**User response:** Note that no further table open requests will succeed unless the external security manager is reactivated.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHCFXS

---

**DFHCF0521** RACROUTE REQUEST=LIST, ENVIR=DELETE, CLASS='class' gave R15=rc, SAFPRRET=retcode, SAFPRREA=rscnode.

**Explanation:** The external security manager LIST function to unload the in-storage security profiles during coupling facility data table server termination gave an
unexpected non-zero return code. This message shows the RACROUTE register 15 return code and the external security manager return and reason codes returned in the SAF request parameter list.

**System action:** Server termination processing continues.

**User response:** See the documentation of the RACROUTE macro with REQUEST=LIST in OS/390 Security Server External Security Interface (RACROUTE) Macro Reference (GC28-1922) for the explanation of the return and reason codes.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHCFXS

---

**DFHCF0601I Starting statistics collection for interval since lasttime.**

**Explanation:** The coupling facility data table server is about to collect interval, end of day or closedown statistics. This message identifies the start of the time interval to which the statistics apply, which is either the time that the server was started up or the time of the last reset, which occurs whenever interval or end of day statistics are produced. The format of the timestamp is yyyy-mm-dd hh

**System action:** The server proceeds with statistics collection.

**User response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCFST

---

**DFHCF0602I Statistics collection completed, reset performed.**

**Explanation:** Coupling facility data table server statistics have been collected and counters have been reset. This occurs for interval or end of day statistics.

**System action:** Processing continues.

**User response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCFST

---

**DFHCF0603I Statistics collection completed.**

**Explanation:** Coupling facility data table server statistics have been collected but counters have not been reset. This normally occurs at server closedown.

**System action:** Processing continues.

**User response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHCFST

---

**DFHCF0604 Timer SET failed, return code retcode, reason code rsncode.**

**Explanation:** The statistics subtask in the coupling facility data table server tried to set up a timer wait interval but failed.

**System action:** The interval statistics function is terminated with message DFHCF0606.

**User response:** Check the return code and reason code. A return code of 4 indicates an attempt to set up more than one concurrent timer interval, which indicates a logic error in the server. The reason code in this case is the MVS STIMERM identifier for the existing timer interval. A return code of 8 indicates that the MVS STIMERM macro failed, in which case the reason code indicates the return code received from STIMERM SET.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHCFST

---

**DFHCF0605 Timer CANCEL failed, return code retcode, reason code rsncode.**

**Explanation:** The statistics subtask in the coupling facility data table server tried to cancel a timer wait interval but failed.

**System action:** The interval statistics function is terminated with message DFHCF0606.

**User response:** Check the return code and reason code. A return code of 4 indicates an attempt to cancel a nonexistent timer interval, which indicates a logic error in the server. A return code of 8 indicates that the MVS STIMERM macro failed, in which case the reason code indicates the return code received from STIMERM CANCEL.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHCFST
DFHCFST Modules

DFHCF0606I Statistics collection function is no longer available.

Explanation: The statistics collection subtask in the coupling facility data table server was unable to continue processing and has terminated. The reason will have been indicated by an earlier message.

System action: The interval statistics subtask terminates and no further interval statistics or end of day statistics will be produced for this run of the server.

User response: See the earlier message indicating the reason for the termination of the subtask.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

DFHCFST Modules

DFHCF0610I Statistics written to SMF, return code was retcode.

Explanation: Coupling facility data table server statistics have been sent to SMF. The return code from the SMFEWTM macro is indicated in this message. A non-zero return code usually indicates that SMF recording was suppressed because of current SMF options or an installation exit.

System action: Processing continues.

User response: If the return code is non-zero but SMF statistics were expected to be successfully written, see the documentation of the SMFEWTM macro in OS/390 MVS System Management Facilities (SMF) (GC28-1783) for more information about return codes.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCFST

DFHCF0651I Restart processing cannot open table table, reason code reason.

Explanation: An application region has attempted to restart its connection to the coupling facility data table server, but an unresolved unit of work for that region has updated a table which cannot be opened at present, so restart processing cannot be completed. This message only occurs if the table is still in existence; if it has been deleted, the updates are simply discarded. The reason code is from the file open routine in module DFHCFOC, and indicates why the file could not be opened. In the current implementation, there are no user functions which could prevent a file from being opened by restart, so this condition should not be possible.

System action: Restart processing is terminated and recoverable tables cannot be accessed until it is successfully retried.

User response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

DFHCFST Modules

DFHCF0652I Pool state error, reason code reason, processing function request for UOWID uowid, task task, region region.

Explanation: Integrity checks during coupling facility data table server syncpoint or restart processing found that data or control information in the list structure was in a state that should not be possible in normal processing. The reason codes are based on the reason codes returned by the internal coupling facility interface.

Reason codes:
2 Entry exceeds maximum data length.
3 Entry not found.
4 Wrong version.
5 Wrong list authority.
6 Limit number of entries in list reached.
7 No space left in structure.

All of these conditions can also occur in normal processing. This message is only issued if the condition occurs in a case where it should not occur, or when the normal retry action following the condition cannot be performed. For example, a wrong version response from the coupling facility interface normally simply indicates that an entry has changed, causing the entry to be read again, and this is only treated as a pool state error if the data or control information in the changed entry is not consistent with the expected state of the record.

System action: The current syncpoint or restart operation is terminated with a pool state error exception.

User response: This indicates that some data in the pool has become inconsistent or corrupted. There is no known way that this can happen unless a program other than the coupling facility data table server is used to access the pool. If this error occurs for changes to a particular table, it may be necessary to delete the table to clear up the problem. If it occurs for other control information, it may be necessary to recreate the pool.

Note: This message cannot be changed with the message editing utility.
DFHCF0704 DFHCFUL data set for unload could not be opened.

Explanation: The data set to contain the unloaded coupling facility data table pool could not be opened.

System action: Unload processing is terminated and the server is closed down with message DFHCF0706.

User response: Check that the DFHCFUL DD statement is present in the JCL for the unload job.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHCFUL
DFHCF0721 CF data table table has been successfully unloaded, records records.

Explanation: The named coupling facility data table has been unloaded. Note that if any recoverable updates were pending, the number of table entries unloaded may be slightly larger than the number of records, as the entry for the original record is retained until syncpoint in case it is needed for backout.

System action: Unload processing continues.

User response: None.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCFUL

DFHCF0731 uowids units of work were unloaded for recoverable connection applid.

Explanation: One or more unresolved recoverable units of work were found for the specified recoverable connection identifier during coupling facility data table pool unload processing.

System action: Unload processing will include the status of those units of work in the unloaded data, to allow them to be resolved after the pool is reloaded.

User response: None.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHCFUL

DFHCF0801I CF data table pool poolname is to be reloaded.

Explanation: The coupling facility data table pool has been reloaded successfully.

System action: The server closes down normally.

User response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHCFRL

DFHCF0802I CF data table pool poolname has been successfully reloaded.

Explanation: The coupling facility data table pool has been reloaded successfully.

System action: The server closes down normally.

User response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHCFRL

DFHCF0803I Tables reloaded: tables. Tables bypassed: duplicates. Blocks read: blocks.

Explanation: This message provides additional information about the results of the coupling facility data table pool reload process. Tables on the unloaded data set are bypassed during reload processing if they already exist in the pool (for example as a result of a previous reload which could not be completed due to lack of space).

System action: Server termination processing continues.

User response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHCFRL

DFHCF0804 I DFHCFRL data set for reload could not be opened.

Explanation: The data set containing the coupling facility data table pool to be reloaded could not be opened.

System action: Reload processing is terminated and the server is closed down with message DFHCF0808.

User response: Check that the DFHCFRL DD statement is present in the JCL for the reload job.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHCFRL
DFHCF0805  Reload access to CF structure strname failed with response response.

Explanation: The coupling facility data table pool reload process failed because of a problem with coupling facility access.

System action: Reload processing is terminated and the server is closed down with message DFHCF0808.

User response: If the response code is 8, this indicates that an unexpected IXLLIST error occurred, for which a previous message DFHCF0441 will have been issued. Any other response code indicates an internal logic error.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHCFL

DFHCF0806  Unexpected end of file encountered on reload data set.

Explanation: End of file was encountered on the data set containing the unloaded coupling facility data table pool before the logical end of the unloaded data was encountered.

System action: Reload processing is terminated and the server is closed down with message DFHCF0808.

User response: This indicates that the unloaded data set is incomplete, perhaps because the unload process was abnormally terminated.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHCFL

DFHCF0807  Reload data set contains incorrect data near block block, offset offset.

Explanation: The coupling facility data table pool reload process failed because the unloaded pool data set is not in the correct format.

System action: Reload processing is terminated and the server is closed down with message DFHCF0808.

User response: Check that the correct data set is being used and that the unload process completed normally.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHCFL

DFHCF0808  Reload for CF data table pool poolname was unsuccessful.

Explanation: The coupling facility data table pool reload process could not be completed. The reason will have been described in a previous message.

System action: The program is terminated.

User response: See the previous message giving the reason for the reload failure.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHCFL

DFHCF0809  Reload for CF structure strname failed, structure is full.

Explanation: Coupling facility data table pool reload processing failed because there are insufficient free entries or elements to store the new data in the structure.

System action: Reload processing is terminated and the server is closed down with message DFHCF0808.

User response: If the structure is currently allocated at less than its maximum size and the coupling facility has enough free space, the size of the structure can be increased dynamically using the MVS SETXCF command with the START,ALTER option, and the reload job can then be run again as soon as the alter request completes, in which case it will skip over duplicate information which has already been successfully reloaded. If the structure is at its maximum size, use the MVS SETXCF FORCE command to delete the structure, then increase the SIZE and INITSIZE parameters in the current CFRM policy and activate the updated policy, and rerun the reload job. The approximate amount of information which could not be reloaded can be estimated by comparing the numbers of blocks read and tables reloaded, as described by following message DFHCF0803, with the corresponding numbers from message DFHCF0703 in the unload job.

Note: This message cannot be changed with the message editing utility.

Destination: Console and SYSPRINT

Modules: DFHCFL

DFHCF0810  Reload for CF structure strname failed, all lists are in use.

Explanation: Coupling facility data table pool reload processing failed because all list headers defined in the structure are now in use.

System action: Reload processing is terminated and
the server is closed down with message DFHCF0808.

**User response:** Use the MVS SETXCF FORCE command to delete the structure, then change the reload job [MAXTABLES parameter to a value at least as large as the number of tables in the unloaded data, preferably much larger to allow for future expansion, then rerun the reload job.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT

**Modules:** DFHCFRL

---

**DFHCF0821** CF data table `table` has been successfully reloaded, records records.

**Explanation:** The named coupling facility data table has been reloaded. Note that if any recoverable updates were pending, the number of table entries reloaded may be slightly larger than the number of records, as the entry for the original record is retained until syncpoint in case it is needed for backout.

**System action:** Reload processing continues.

**User response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCFRL

---

**DFHCF0822** CF data table `table` is already defined, reloading has been bypassed.

**Explanation:** A coupling facility data table which was being reloaded was found to have the same name as an existing table within the pool.

**System action:** Reloading of the table is bypassed, and reload processing continues with the next table.

**User response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCFRL

---

**DFHCF0831** `uowids` units of work were reloaded for recoverable connection `applid`.

**Explanation:** Coupling facility data table pool reload processing has reloaded one or more unresolved recoverable units of work for the specified recoverable connection identifier.

**System action:** Reload processing restores the status of those units of work from the unloaded data, to allow them to be resolved when the connection is next restarted.

**User response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCFULL

---

**DFHCF0832** `uowids` duplicate units of work were skipped for recoverable connection `applid`.

**Explanation:** Coupling facility data table pool reload processing found one or more resolved recoverable units of work in the unloaded data which were found to be already present in the current pool, so they were bypassed in this reload run. This should only happen if the reload job was run more than once, for example to resume reloading after increasing the pool size.

**System action:** Reload processing skips units of work which are already identified as active in the current pool.

**User response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHCFULL

Modules: DFHCFRQ

DFHCF0913I R12=prv RQ Lock status Table=table Task=tasknum region

Explanation: Coupling facility data table server request tracing is active and the state of a record lock is being traced. (This message is not used in the normal cases of reading a record whose lock is available or releasing a record when no other task expressed an interest in it).

• Record lock status values:
  
  OWNED
  The lock is already held by the same task.
  
  BUSY
  The lock is held by another active task.
  
  RETAINED
  The lock has previously been marked as retained.
  
  RETAIN
  The lock is for an inactive task and will be retained.
  
  RECLAIM
  The lock is inactive and can be reclaimed immediately.
  
  BACKOUT
  The lock will be reclaimed after backing out any change.
  
  POST
  Other tasks are being notified that a lock was released.
  
  WAIT
  The current task is being suspended to await a lock.

System action: Processing continues.

User response: This message is intended primarily for diagnostic use as advised by your IBM Support Center.

**Note:** This message cannot be changed with the message editing utility.

---

**DFHCF0941I R12=prv CF Entry**  
**request options modifiers R1=parmlist table**

**Explanation:** Coupling facility data table server tracing of coupling facility accesses is active and information from the request interface parameter list is being traced on entry to the coupling facility interface module DFHCFCF. The three-character request mnemonics used by the internal coupling facility interface consist of a two-character code indicating the type of operation followed by a one-character code indicating the type of object on which the operation is performed.

- **Coupling facility interface operations:**
  - **CRx** Create
  - **DLx** Delete
  - **INx** Inquire
  - **MDx** Modify
  - **RDx** Read
  - **RWx** Rewrite
  - **WRx** Write (new)

- **Coupling facility interface objects:**
  - **xxA** APPLID entry
  - **xxD** Data record entry
  - **xxI** Index entry
  - **xxL** List controls (for list containing data records)
  - **xxM** Message entry (for lock release notification)
  - **xxU** Unit of work entry

- The options flags may include the following hexadecimal values:

  - **80** Read key greater than or equal
  - **40** Read key less than or equal
  - **20** Compare entry version with given value
  - **10** Suppress data transfer (transfer adjunct area only)
  - **08** Access oldest entry with same key (for before-image)
  - **04** Write new entry with same key (for after-image)
  - **02** Non-increasing rewrite (so retry if structure full)

The modifier field is only used at present to specify the target connection number for a lock message, in hexadecimal form.

**System action:** Processing continues.

**User response:** This message is intended primarily for diagnostic use as advised by your IBM Support Center.

**Note:** This message cannot be changed with the message editing utility.

---

**DFHCF0942I R12=prv IXLIST Req=request Adj=adjaarea Buf=buffer List=listnum Rsn=rscendcode**

**Explanation:** Coupling facility data table server tracing for coupling facility accesses is active and the result from an IXLIST macro is being traced. The information traced includes an abbreviation of the type of request being performed, the addresses of the adjunct area and data buffer (zero when not used), the number of the list being accessed and the reason code returned by the macro. See the documentation of the IXLIST macro in OS/390 MVS Programming: Sysplex Services Reference (GC28-1772) for further details, including the explanation of the reason code.

**System action:** Processing continues.

**User response:** This message is intended primarily for diagnostic use as advised by your IBM Support Center.

**Note:** This message cannot be changed with the message editing utility.
DFHCF0943I R12=prv CF IXLLIST keyword=value

**Explanation:** Coupling facility data table server tracing for coupling facility accesses is active and an IXLLIST parameter or result value (key, authority value or version) is being traced in hex and (if relevant) character format.

DFHCPxxxx messages

DFHCP0101I applid CPI initialization has started.

Explanation: This is an informational message indicating the start of CPI initialization.

System action: Initialization continues.

User response: None. You can suppress this message with the system initialization parameter MSGLVL=0.

Destination: Console

Modules: DFHCPIN1

XMEOUT Parameter: applid
DFHCP0102I applid CPI initialization has ended.

Explanation: This is an informational message indicating that CPI initialization has completed successfully.

System action: Initialization continues.

User response: None. You can suppress this message with the system initialization parameter MSGVLVL=0.

Destination: Console

Modules: DFHCPIN1

XMEOUT Parameter: applid

DFHCP0103I applid CPI initialization has failed.

Explanation: CPI has failed to initialize successfully.

System action: Message DFHSI1522 will be issued following this message. CICS will terminate or continue initialization depending upon the operator's response to message DFHSI1522.

An exception trace entry will be written at the time the failure was detected.

Other CICS components called by CPI initialization may also issue messages or write trace entries.

User response: Decide whether CICS can continue execution without CPI support, and respond accordingly to message DFHSI1522.

You should also investigate why CPI failed to initialize.

Destination: Console

Modules: DFHC_PIN1

XMEOUT Parameter: applid

DFHCP0701I date time applid tranid program name CPI-C verb used unrecognized CONVERSATION_ID Conversation_ID.

Explanation: The application program has used an unrecognized conversation_ID on one of its calls to CPI-C. This could mean that:

- The application program has not created a conversation successfully using either the CMINIT (Initialize_Conversation) or the CMACCP (Accept_Conversation) verbs, or
- The application program has used the conversation_ID supplied to it by CPI-C incorrectly.

System action: CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response: Determine which error has occurred and amend the application program accordingly.

Destination: CCPI

Modules: DFHCPIC

XMEOUT Parameters: date, time, applid, tranid, program name, verb, Conversation_ID

DFHCP0702I date time applid tranid program name Conversation_ID CPI-C verb verb was disallowed because of the conversation state state.

Explanation: The CPI-C state machine detected a state error. This means that the conversation was in the wrong state to issue this verb.

System action: CICS returns control to the application program with return_code CM_PROGRAM_STATE_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response: Use the state machine defined in the SAA CPI Communications Reference manual, (SC26-4399), and the CICS trace information to determine the sequence of CPI-C calls issued that caused the state error. Amend the application program in accordance with the supplied guidelines.

Destination: CCPI

Modules: DFHCPIC

XMEOUT Parameters: date, time, applid, tranid, program name, Conversation_ID, verb, state

DFHCP0705I date time applid tranid program name Conversation_ID invalid conversation_type parameter (X'conv_type') supplied on the CMSCT (Set_Conversation_Type) verb.

Explanation: The application program has called CMSCT (Set_Conversation_Type) with an invalid conversation_type parameter value.

System action: CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response: Amend CMSCT in the application program to use a valid conversation_type parameter.

The SAA CPI-C Reference manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

Destination: CCPI

Modules: DFHCPICS A
XMEOUT Parameters: date, time, applid, tranid, program name, Conversation_ID, X’conv_type’

**DFHC0706I** date time applid tranid program name
conversation_ID the supplied conversation_type parameter of CM_MAPPED_CONVERSATION conflicts with the current setting of the fill characteristic CM_FILL_BUFFER.

Explanation: The application program has called CMSCT (Set_Conversation_Type) with a conversation_type parameter of CM_MAPPED_CONVERSATION when it had previously used the CMSF (Set_Fill) verb to set the fill characteristic.

This is not allowed in CPI-C.

System action: CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response: Amend the application program so that it does not use these two verbs in this invalid combination.

The SAA CPI-C Reference manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

Destination: CCPI

Modules: DFHCPCSA

XMEOUT Parameters: date, time, applid, tranid, program name, conversation_ID

---

**DFHC0707I** date time applid tranid program name
conversation_ID invalid deallocate_type parameter (X’deallocate_type’) supplied on the CMSDT (Set_Deallocate_Type) verb.

Explanation: The application program has called CMSDT (Set_Deallocate_Type) with an invalid deallocate_type parameter.

System action: CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response: Amend CMSDT in the application program to use a valid deallocate_type parameter.

The SAA CPI-C Reference manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

Destination: CCPI

Modules: DFHCPCSB

XMEOUT Parameters: date, time, applid, tranid, program name, conversation_ID, X’deallocate_type’

---

**DFHC0708I** date time applid tranid program name
conversation_ID the supplied deallocate_type parameter conflicts with the current setting of the sync_level characteristic.

Explanation: The application program has called CMSDT (Set_Deallocate_Type) with a deallocate_type of deallocate_type and with the sync_level characteristic set to sync_level.

System action: CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response: Amend the application program to remove this conflict.

The SAA CPI-C Reference manual, (SC26-4399),
provides a detailed description of all the CPI-C verbs and how they should be called.

**Destination:** CCPI

**Modules:** DFHCPCSB

**XMEOUT Parameters:** date, time, applid, tranid, program name, conversation_ID, deallocate_type, sync_level

---

**DFHCP0710I** date time applid tranid program name conversation_ID invalid error_direction parameter (X’error_direction’) supplied on the CMSED (Set_Error_Direction) verb.

**Explanation:** The application program has called CMSED (Set_Error_Direction) with an invalid error_direction parameter.

**System action:** CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

**User response:** Amend CMSED in the application program to use a valid error_direction parameter.

**Destination:** CCPI

**Modules:** DFHCPCSC

**XMEOUT Parameters:** date, time, applid, tranid, program name, conversation_ID, X’error_direction’

---

**DFHCP0711I** date time applid tranid program name conversation_ID invalid fill parameter (X’fill’) supplied on the CMSF (Set_Fill) verb.

**Explanation:** The application program has called CMSF (Set_Fill) with an invalid fill parameter.

**System action:** CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

**User response:** Amend CMSF in the application program to use a valid fill parameter.

**Destination:** CCPI

**Modules:** DFHCPCSD

**XMEOUT Parameters:** date, time, applid, tranid, program name, conversation_ID, X’fill’

---

**DFHCP0712I** date time applid tranid program name conversation_ID CMSF (Set_Fill) call conflicts with the current conversation_type of CM_MAPPED_CONVERSATION.

**Explanation:** The application program has called CMSF (Set_Fill) when the conversation_type is CM_MAPPED_CONVERSATION.

**System action:** CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

**User response:** Amend the application program to remove this conflict.

**Destination:** CCPI

**Modules:** DFHCPCSE

**XMEOUT Parameters:** date, time, applid, tranid, program name, conversation_ID

---

**DFHCP0713I** date time applid tranid program name conversation_ID CMSLD (Set_Log_Data) call conflicts with the current conversation_type of CM_MAPPED_CONVERSATION.

**Explanation:** The application program has called CMSLD (Set_Log_Data) when the conversation_type is CM_MAPPED_CONVERSATION.

**System action:** CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

**User response:** Amend the application program to remove this conflict.

**Destination:** CCPI

**Modules:** DFHCPCSD

**XMEOUT Parameters:** date, time, applid, tranid, program name, conversation_ID
**Explanation:** The application program has called CMSLD (Set_Log_Data) with a log_data_length parameter that is not in the range 0–512.

**System action:** CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

**User response:** Amend CMSLD in the application program to use a valid log_data_length parameter.

The SAA CPI-C Reference manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

**Destination:** CCPI

**Modules:** DFHCPCSE

**XMEOUT Parameters:** date, time, applid, tranid, program name, conversation_ID, log_data_length

---

**Explanation:** The application program has called CMSMN (Set_Mode_Name) with a partner.lu_name_length parameter outside the range 1–17.

**System action:** CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect on either the conversation or conversation characteristics.

**User response:** Amend CMSMN in the application program to use a valid partner.lu_name_length parameter within the range 1-17.

The SAA CPI-C Reference manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

**Destination:** CCPI

**Modules:** DFHCPCSF

**XMEOUT Parameters:** date, time, applid, tranid, program name, conversation_ID, mode_name_length

---

**Explanation:** The application program has called CMSPLN (Set_Partner_LU_Name) with a partner.lu_name_length parameter outside the range 1–17.

**System action:** CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect either on the conversation or conversation characteristics.

**User response:** Amend CMSPLN in the application program to use a partner.lu_name_length parameter within the range 1-17.

The SAA CPI-C Reference manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

**Destination:** CCPI

**Modules:** DFHCPCSG

**XMEOUT Parameters:** date, time, applid, tranid, program name, conversation_ID, partner.lu_name_length

---

**Explanation:** The application program has called CMSPTR (Set_Prepare_To_Receive_Type) with an invalid prepare_to_receive_type parameter.

**System action:** CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

**User response:** Amend CMSPTR in the application program to use a valid prepare_to_receive_type parameter.

The SAA CPI-C Reference manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

**Destination:** CCPI

**Modules:** DFHCPCSH

**XMEOUT Parameters:** date, time, applid, tranid, program name, conversation_ID, prepare_to_receive_type
The supplied prepare_to_receive_type parameter CM_PREP_TO_RECEIVE_CONFIRM is incompatible with the current setting of the sync_level characteristic CM_NONE.

**Explanation:** The application program has called CMSPTR (Set_Prepare_To_Receive_Type) with a prepare_to_receive_type parameter of CM_PREP_TO_RECEIVE_CONFIRM and with the sync_level characteristic set to CM_NONE.

**System action:** CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

**User response:** Amend the application program to remove this conflict.

The SAA CPI-C Reference manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

**Destination:** CCPI

**Modules:** DFHCPCSH

**XMEOUT Parameters:** date, time, applid, tranid, program name, conversation_ID

---

The supplied send_type parameter CM_SEND_AND_CONFIRM is incompatible with the current setting of the sync_level characteristic CM_NONE.

**Explanation:** The application program has called CMSST (Set_Send_Type) with a send_type parameter of CM_SEND_AND_CONFIRM.

**System action:** CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

**User response:** Amend CMSST in the application program to use a valid send_type parameter.

The SAA CPI-C Reference manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

**Destination:** CCPI

**Modules:** DFHCPCSK

**XMEOUT Parameters:** date, time, applid, tranid, program name, conversation_ID, X’send_type’
**Explanation:** The application program has called CMSST (Set_Send_Type) with a send_type parameter of CM_SEND_AND_CONFIRM and with the sync_level characteristic set to CM_NONE.

**System action:** CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

**User response:** Amend the application program to remove this conflict.

The SAA CPI-C Reference manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

**Destination:** CCPI

**Modules:** DFHCPCS

**XMEOUT Parameters:** date, time, applid, tranid, program name, conversation_ID

---

**Explanation:** The application program has called CMSSL (Set.Sync_Level) with an invalid sync_level parameter.

**System action:** CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

**User response:** Amend CMSSL in the application program to use a valid sync_level parameter.

The SAA CPI-C Reference manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

**Destination:** CCPI

**Modules:** DFHCPCSL

**XMEOUT Parameters:** date, time, applid, tranid, program name, conversation_ID, sync_level, deallocate_type

---

**Explanation:** The application program has called CMSSL (Set.Sync_Level) with a sync_level parameter of CM_NONE. The deallocate_type is deallocate_type.

**System action:** CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

**User response:** Amend the application program to remove this conflict.

The SAA CPI-C Reference manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

**Destination:** CCPI

**Modules:** DFHCPCSL

**XMEOUT Parameters:** date, time, applid, tranid, program name, conversation_ID, sync_level, deallocate_type

---

**Explanation:** The application program has called CMSSL (Set.Sync_Level) with a sync_level parameter of CM_NONE. The prepare_to_receive_type is CM_PREP_TO_RECEIVE_CONFIRM.

**System action:** CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

**User response:** Amend the application program to remove this conflict.

The SAA CPI-C Reference manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

**Destination:** CCPI

**Modules:** DFHCPCSL

**XMEOUT Parameters:** date, time, applid, tranid, program name, conversation_ID, sync_level, deallocate_type
System action:  CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response:  Amend the application program to remove this conflict.

The SAA CPI-C Reference manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

Destination:  CCPI

Modules:  DFHCPCSL

XMEOUT Parameters:  date, time, applid, tranid, program name, conversation_ID

DFHCP0734I  date time applid tranid program name
conversation_ID tp_name_length
parameter (tp_name_length) supplied on the CMSTPN (Set_TP_Name) verb is not in the range 1-64.

Explanation:  The application program has called CMSTPN (Set_TP_Name) with an tp_name_length parameter outside the range 1–64.

System action:  CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response:  Amend CMSTPN in the application program to use a valid tp_name_length parameter.

The SAA CPI-C Reference manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

Destination:  CCPI

Modules:  DFHCPCSL

XMEOUT Parameters:  date, time, applid, tranid, program name, conversation_ID

DFHCP0740I  date time applid tranid program name
No incoming conversation to accept.

Explanation:  The application program has called CMACCP (Accept_conversation) when there is no incoming conversation.

System action:  CICS returns control to the application program with return_code CM_PROGRAM_STATE_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response:  Ensure that there is an incoming conversation to accept.

The SAA CPI-C Reference manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

Destination:  CCPI

Modules:  DFHCPCAC

XMEOUT Parameters:  date, time, applid, tranid, program name

DFHCP0741I  date time applid tranid program name
Duplicate call to CMACCP (Accept_Conversation).

Explanation:  The application program has called CMACCP (Accept_conversation) more than once.

System action:  CICS returns control to the application program with return_code CM_PROGRAM_STATE_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response:  Amend the application program so that it only calls CMACCP once.

The SAA CPI-C Reference manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

Destination:  CCPI

Modules:  DFHCPCAC

XMEOUT Parameters:  date, time, applid, tranid, program name

DFHCP0742I  date time applid tranid program name
Session is not available for CPI-C as it is already in use by another process.

Explanation:  The application program has called CMACCP (Accept_conversation) when it was already using the session for another process, for example, EXEC Interface DTP.

System action:  CICS returns control to the application program with return_code CM_PRODUCT_SPECIFIC_ERROR.

User response:  Ensure that the application uses only CPI-C on this session.

Destination:  CCPI

Modules:  DFHCPCAC

XMEOUT Parameters:  date, time, applid, tranid, program name

DFHCP0743I  date time applid tranid program name
Unable to use CPI-C as this transaction was initiated by ATI.

Explanation:  The application program has called CMACCP (Accept_conversation) after it was started by
Automatic Transaction Initiation (ATI). This is not supported.

System action: CICS returns control to the application program with return_code CM_PRODUCT_SPECIFIC_ERROR.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response: Ensure that applications abide by this restriction.

Destination: CCPI

Modules: DFHCPCAC

XMEOUT Parameters: date, time, applid, tranid, program name

DFHCP0747I date time applid tranid program name conversation_ID CMCFM (Confirm) call conflicts with sync_level CM_NONE.

Explanation: The application program has called CMCFM (Confirm) when the sync_level is set to CM_NONE. This is not allowed.

System action: CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response: Amend the application program so this conflict no longer occurs.

The SAA CPI-C Reference manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

Destination: CCPI

Modules: DFHCPCCM

XMEOUT Parameters: date, time, applid, tranid, program name, conversation_ID

DFHCP0749I date time applid tranid program name conversation_ID CMINIT (Initialize_Conversation) call invalid requested_length parameter requested_length supplied on CMRCV (Receive).

Explanation: The application program has called CMINIT (Initialize_Conversation) with a requested_length parameter that has a value greater than 32767.

System action: CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response: Amend the application program to use a valid value for the requested_length parameter.

The CICS Resource Definition Guide explains how to use the partner resource correctly.

The SAA CPI-C Reference manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

Destination: CCPI

Modules: DFHCPIC

XMEOUT Parameters: date, time, applid, tranid, program name, profile_name, sym_dest_name

DFHCP0750I date time applid tranid program name profile_name supplied in partner resource sym_dest_name.

Explanation: The application program has called CMINIT (Initialize_Conversation). The profile found in the sym_dest_name supplied is unrecognized.

System action: CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response: Amend the application program and the partner resource definition to ensure that the sym_dest_name parameter is correct.

The SAA CPI-C Reference manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

In addition, the CICS Resource Definition Guide gives further information on partner resource definitions.

Destination: CCPI

Modules: DFHCPIC

XMEOUT Parameters: date, time, applid, tranid, program name, profile_name, sym_dest_name

DFHCP0751I date time applid tranid program name conversation_ID invalid requested_length parameter requested_length supplied on CMRCV (Receive).

Explanation: The application program has called CMRCV (Receive) with a requested_length parameter that has a value greater than 32767.

System action: CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response: Amend the application program to use a valid value for the requested_length parameter.
The SAA CPI-C Reference manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

**Destination:** CCPI

**Modules:** DFHCPCLI, DFHCPCRW

**XMEOUT Parameters:** date, time, applid, tranid, program name, conversation_ID, requested_length

---

DFHCP0752I date time applid tranid program name conversation_ID data passed on call to CMSSEND contains an invalid GDS record.

**Explanation:** The application program has called CMSSEND (Send_Data). Data passed on this call contains an invalid generalized data stream (GDS) record.

**Note:** This message is only issued on a basic conversation. That is, when conversation_type is set to CM_BASIC_CONVERSATION.

**System action:** CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

**User response:** Amend the application program to ensure that this parameter is correct.

The SAA CPI-C Reference manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called together with information about GDS records.

The CICS Distributed Transaction Programming Guide provides additional information about GDS records.

**Destination:** CCPI

**Modules:** DFHCPCLR

**XMEOUT Parameters:** date, time, applid, tranid, program name, conversation_ID

---

DFHCP0753I date time applid tranid program name conversation_ID invalid send_length parameter send_length supplied on CMSSEND (send_data).

**Explanation:** The application program has called CMSSEND (Send_Data) with a send_length parameter that is not in the range 0–32767 bytes.

**System action:** CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

**User response:** The send_length parameter should not exceed 32767 bytes. Amend CMSSEND to send data that is within the range 0–32767 bytes. This may entail sending the data in two chunks.

The SAA CPI-C Reference manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

**Destination:** CCPI

**Modules:** DFHCPCLI, DFHCPCRW

**XMEOUT Parameters:** date, time, applid, tranid, program name, conversation_ID, requested_length

---

DFHCP0754I date time applid tranid program name conversation_ID data sent so far is currently in the middle of a GDS record so cannot send CMDEAL, CMCFM or CMPTR requests.

**Explanation:** The application is using a basic conversation (that is, the conversation_type characteristic has been set to CM_BASIC_CONVERSATION). The application has not sent all the data associated with the last Generalized Data Stream (GDS) record. However, the application has tried to send one of the following requests:

- a CMDEAL (Deallocate),
- a CMCFM (Confirm), or
- a CMPTR (Prepare_to_receive).

**System action:** CICS returns control to the application program with return_code CM_PROGRAM_STATE_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

**User response:** Inspect the data sent to determine why the previous send was in error. Check if the error was caused by the application truncating the last record or if there was an error in one of the length fields which caused CPI-C to misinterpret the data-stream and amend the application program accordingly.

The SAA CPI-C Reference manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called together with information about GDS records.

The CICS Distributed Transaction Programming Guide provides additional information about GDS records.

**Destination:** CCPI

**Modules:** DFHCPCLR

**XMEOUT Parameters:** date, time, applid, tranid, program name, conversation_ID

---

DFHCP0756 date time applid tranid program name conversation_ID received an unrecognized sense_code X'sense_code' from the partner [program | program - lj_p_name].

---

Chapter 1. DFH messages 229
**Explanation:** A sense code received from the partner program on a remote system was unrecognized. This could be for one of two reasons.
- a protocol error, or
- the partner program is running on a later release and new sense codes have been added to the APPC architecture.

**System action:** CICS returns control to the application program with either return_code CM_DEALLOCATE_ABEND or CM_PROGRAM_ERROR_PURGING. This depends on whether the unrecognized sense code has been interpreted as an error or interpreted as a conversation abend.

| Note: | tp_name is present only if this message is being issued on the front-end system. |

**User response:** Use the sense code provided in the message and your knowledge of the two communicating systems to determine which of the two possible cases documented above is the error.

If the error is a protocol error, you need further assistance from IBM to resolve this problem. See Part 4 of the [CICS Problem Determination Guide](#) for guidance on how to proceed.

**Destination:** CCPI

**Modules:** DFHCPCAL

**XMEOUT Parameters:** date, time,applid, tranid, program name,conversation_ID, X‘sense_code’, mode_name, X’tp_name’

**DFHCP0758I**

**Explanation:** The allocation of a session for this conversation failed due to an unrecognized mode name mode_name.

This value is specified either in the profile named in the partner resource for the conversation, or on a CPI-C CMSMN (Set_mode_name) verb.

**System action:** CICS returns control to the application program with return_code CM_PARAMETER_ERROR.

No session is allocated.

**User response:** Amend the application program to use a recognized mode_name.

**Destination:** CCPI

**Modules:** DFHCPCAL

**XMEOUT Parameters:** date, time,applid, tranid, program name,conversation_ID, mode_name

**DFHCP0759I**

**Explanation:** The allocation of a session for conversation conversation_id failed because the transaction program (TP) specified in the conversation control block (CPC) is an SNA service TP. This is not allowed.

**System action:** CICS returns control to the application program with return_code CM_PROGRAM_ERROR.

No session is allocated.

**User response:** Amend the application program so that it uses a different TP.

**Destination:** CCPI

**Modules:** DFHCPCAL

**XMEOUT Parameters:** date, time,applid, tranid, program name,conversation_ID, X’tp_name’

**DFHCP0760I**

**Explanation:** The allocation of a session has failed. This is because the partner_lu_name specified in the conversation control block (CPC) does not conform to the following rules.

1. The partner_lu_name may take one of the following forms:
   - Netname (1-8 characters long), or
   - Network.networkname (where network and netname are EACH 1-8 characters long).
2. Netname and network both consist of the following character sets, where the first character is always alphabetic.
   - A-Z
   - a-z
   - @
   - $
   - #
   - 0-9

   Note: Lower case letters are translated to uppercase.

System action: The session is not allocated.
CICS returns control to the application program with return_code CM_PARAMETER_ERROR.

User response: Depending on the application, the partner_lu_name either comes from the partner resource (specified on the CMINIT (initialize_conversation) verb in the sym_dest_name parameter) or an optional CMSPLN (set_partner_lu_name) verb. This value needs to be changed to conform to the rules above.

Destination: CCPI
Modules: DFHCPCAL
XMEOUT Parameters: date, time, applid, tranid, program name, conversation_ID, partner_lu_name

DFHCP0761I date time applid tranid program name conversation_ID an invalid mode_name mode_name was specified for the CMALLC (Allocate) verb.

Explanation: The allocation of a session for conversation conversation_ID has failed. This is because the mode_name specified in the conversation control block (CPC) is known to the remote system, but is unknown to VTAM.

System action: No session is allocated.
CICS returns control to the application program with return_code CM_PARAMETER_ERROR.

User response: Amend the application program so that it uses a different mode_name.

Destination: CCPI
Modules: DFHCPCLR
XMEOUT Parameters: date, time, applid, tranid, program name, conversation_ID, mode_name

DFHCP0764I date time applid tranid program name conversation_ID partner_lu_name Partner Resource Manager is unavailable.

Explanation: The application program has called CMINIT (Initialize_Conversation), but the partner resource manager (which provides access to the partner resource table) is not available.

System action: CICS returns control to the application program with return_code CM_PRODUCT_SPECIFIC_ERROR.

User response: First determine whether message DFHPR0106 was issued during CICS initialization; if so, refer to the advice given for that message. Otherwise it appears that CICS-owned storage (either the static storage address list, or the PR static storage) has been overlaid. Refer to the CICS Problem Determination Guide for guidance on how to deal with storage violations.

Destination: CCPI
Modules: DFHCPCIC
XMEOUT Parameters: date, time, applid, tranid, program name

DFHCP0765I date time applid tranid program name conversation_ID CPI-C verb verb was disallowed because of the BACKOUT-REQUIRED program state.

Explanation: The CPI-C state machine has detected a state error. The verb verb cannot be issued in BACKOUT-REQUIRED program state.

System action: CICS returns control to the application program with return_code CM_PROGRAM_STATE_CHECK.

User response: Amend the application program in accordance with the supplied guidelines. See the SAA CPI-C Reference (SC26-4399), which contains a description of CPI-C verbs and how they should be called.

Destination: CCPI
DFHCQxxxx messages

DFHCQ0001 applid An abend (code aaa/bbbb) has occurred at offset X'offset' in module modname.

Explanation: An abnormal end (abend) or program check has occurred in module modname. This implies that there may be an error in CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code aaa/bbbb is a three 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; TS1310 refers to message DFHTS1310).

System action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the OS/390 MVS System Codes manual. Then look up the CICS alphanumeric code. This tells you, for example, whether the error is a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module modname is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem. If you cannot run without the full use of module modname, you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Modules: DFHCQCQ, DFHCQSY

DFHCQ0002 applid A severe error (code X'code') has occurred in module modname.

Explanation: An error has been detected in module modname. The code X'code' is the exception trace point id which uniquely identifies what the error is and where the error was detected. For further information about CICS exception trace entries, refer to the CICS Problem Determination Guide.

System action: An exception entry (code X'code' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: The severity of this error depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated.

If the message occurs once and module modname is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module modname, you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Modules: DFHCQCQ, DFHCQSY

DFHCQ0100I applid Console queue initialization has started.

Explanation: Console queue initialization has started.

System action: System initialization continues.

User response: None. The message can be
suppressed with the system initialization parameter MSGLVL=0.

**Note:** Do not attempt to reroute this message to a transient data queue.

**Destination:** Console

**Modules:** DFHCQCQ

**XMEOUT Parameter:** applid

---

**DFHCQ0101I applid Console queue initialization has ended.**

**Explanation:** Console queue initialization has completed successfully.

**System action:** System initialization continues.

**User response:** None. The message can be suppressed with the system initialization parameter MSGLVL=0.

**Note:** Do not attempt to reroute this message to a transient data queue.

**Destination:** Console

**Modules:** DFHCQSY

**XMEOUT Parameter:** applid

---

**DFHCQ0102I applid Console queue initialization has failed.**

**Explanation:** Console queue initialization has failed.

**System action:** Provided there are no subsequent serious errors which prevent further initialization of CICS, CICS issues one of two messages depending on what other errors, if any, have occurred during initialization.

If DFHSI1521 is issued, CICS initialization is terminated. If DFHSI1522 is issued, decide if CICS initialization is to be continued in degraded mode or to be terminated.

**User response:** Check previous console messages, one of which should explain why console queue initialization has failed.

**Note:** Do not attempt to reroute this message to a transient data queue.

**Destination:** Console

**Modules:** DFHCQSY

**XMEOUT Parameter:** applid

---

**DFHCQ0103I applid MVS console queue is open.**

**Explanation:** CICS sets a limit of 255, the MVS maximum, on the number of modify commands that can be queued at any time to invoke transactions, for example CEMT.

CICS also sets an internal limit of 254 on the number of modify commands that can be queued at any time to invoke transactions, for example CEMT.

If this internal limit is reached CICS will reject further modify commands unless these invoke transaction CEKL.

**System action:** System initialization continues.

**User response:** None. The message can be suppressed with the system initialization parameter MSGLVL=0.

**Note:** Do not attempt to reroute this message to a transient data queue.

**Destination:** Console

**Modules:** DFHCQSY

**XMEOUT Parameter:** applid

---

**DFHCQ0104I applid MVS console queue is closed.**

**Explanation:** CICS will not accept any modify commands from MVS.

**System action:** System termination continues.

**User response:** None. The message can be suppressed with the system initialization parameter MSGLVL=0.

**Note:** Do not attempt to reroute this message to a transient data queue.

**Destination:** Console

**Modules:** DFHCQSY

**XMEOUT Parameter:** applid

---

**DFHCQ0105I applid CICS is busy. MVS modify command has been rejected.**

**Explanation:** CICS can not accept the modify command as 254 modify commands to invoke transactions are currently queued.

**System action:** CICS rejects the modify command.

**User response:** The severity of this error depends on how many terminal definitions are being autoinstalled in your CICS system at the time you entered the modify command.

If the message recurs when you reenter the modify command you can use the CEKL INQUIRE and SET commands to identify the user tasks in your system and which, if any, should be removed from your system.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Modules:** DFHCQSY

---

Chapter 1. DFH messages 233
DFHCQ0200I applid CEKL transaction enabled.
Explanation: CICS supports CEKL INQUIRE and CEKL SET commands.
System action: CICS continues normally.
User response: You can use the CEKL INQUIRE and CEKL SET commands from a console device.
Note: Do not attempt to reroute this message to a transient data queue.
Destination: Console
Modules: DFHCQSY
XMEOUT Parameter: applid

DFHCQ0201I applid CEKL transaction enabled only for INQUIRE.
Explanation: CICS supports only CEKL INQUIRE commands.
System action: CICS continues normally.
User response: If support for kill is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to install the second PTF.
Note: Do not attempt to reroute this message to a transient data queue.
Destination: Console
Modules: DFHCQSY

DFHCQ0210I applid CEKL command ignored; input beginning input is too long.
Explanation: The CEKL command has been rejected. The input beginning input is too long; for example a transaction class name that is longer than 9 bytes.
System action: The system continues normally.
User response: Check the syntax of the CEKL command.
Note: This message cannot be changed with the message editing utility.
Destination: Console
Modules: DFHCQSY

DFHCQ0211I applid CEKL command ignored; input beginning input is too long.
Explanation: The CEKL command has been rejected. A keyword is expected but has not been specified.
System action: CICS continues normally.
User response: Check the syntax of the CEKL command.
Note: This message cannot be changed with the message editing utility.
Destination: Console
Modules: DFHCQSY

DFHCQ0212I applid CEKL command ignored; input expected.
Explanation: The CEKL command has been rejected.
System action: The system continues normally.
User response: Check the syntax of the CEKL command.
Note: This message cannot be changed with the message editing utility.
Destination: Console
Modules: DFHCQSY

DFHCQ0213I applid CEKL command ignored. Keyword, keyword is repeated.
Explanation: The CEKL command has been rejected. Keyword keyword has been specified more than once.
System action: The system continues normally.
User response: Check the syntax of the CEKL command.
Note: This message cannot be changed with the message editing utility.
Destination: Console
Modules: DFHCQSY

DFHCQ0214I applid CEKL command ignored. Keyword, invkwd is not supported.
Explanation: The CEKL command has been rejected. invkwd is not a valid keyword.
System action: The system continues normally.
User response: Check the syntax of the CEKL command.
Note: This message cannot be changed with the message editing utility.

Destination: Console

Modules: DFHCQSY

DFHCQ0215I applid CEKL command ignored; Keyword, invkwd is ambiguous.

Explanation: The CEKL command has been rejected.
Keywords can be abbreviated provided that the abbreviated keyword is unique; for example TRANSID and TRANCLASS can be abbreviated to TRANS and TRANC respectively but not to TRAN.

System action: The system continues normally.

User response: Check the syntax of the CEKL command.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Modules: DFHCQSY

DFHCQ0216I applid CEKL command ignored; invval is non-numeric.

Explanation: The CEKL command has been rejected.
A non-numeric keyword value has been specified where a numeric value is expected; for example TASK(12345) is valid, TASK(abcde) is invalid.

System action: The system continues normally.

User response: Check the syntax of the CEKL command.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Modules: DFHCQSY

DFHCQ0217I applid CEKL command ignored; invkwd is out of range.

Explanation: The CEKL command has been rejected.
A keyword value has been specified which lies outside the range of values supported for the keyword; for example task numbers must be in the range 1-99999.

System action: The system continues normally.

User response: Check the syntax of the CEKL command.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Modules: DFHCQSY

DFHCQ0220I applid CEKL INQUIRE command ignored; TASK keyword must be specified.

Explanation: The CEKL INQUIRE command has been rejected.
The TASK keyword is expected but has not been specified.

System action: The system continues normally.

User response: Check the syntax of the CEKL command.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Modules: DFHCQSY

DFHCQ0221I applid CEKL INQUIRE command ignored; keyword expected.

Explanation: The CEKL INQUIRE command has been rejected.
A keyword is expected but has not been specified.

System action: The system continues normally.

User response: Check the syntax of the CEKL command.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Modules: DFHCQSY
**DFHCQ0224I**  applid CEKL INQUIRE command ignored; keywords conflict.

**Explanation:** The CEKL INQUIRE command has been rejected. Conflicting keywords have been specified.

**System action:** The system continues normally.

**User response:** Check the syntax of the CEKL command.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Modules:** DFHCQS

---

**DFHCQ0230I**  applid CEKL SET command ignored; TASK keyword must be specified.

**Explanation:** The CEKL SET command has been rejected. The TASK keyword is expected but has not been specified.

**System action:** The system continues normally.

**User response:** Check the syntax of the CEKL command.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Modules:** DFHCQS

---

**DFHCQ0231I**  applid CEKL SET command ignored; keyword expected.

**Explanation:** The CEKL SET command has been rejected. A keyword is expected but has not been specified.

**System action:** The system continues normally.

**User response:** Check the syntax of the CEKL command.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Modules:** DFHCQS

---

**DFHCQ0232I**  applid CEKL SET command ignored; task number must be specified.

**Explanation:** The CEKL SET command has been rejected. The TASK keyword must be qualified by taskno.

**System action:** The system continues normally.

**User response:** Check the syntax of the CEKL command.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Modules:** DFHCQS

---

**DFHCQ0233I**  applid CEKL SET command ignored; PURGE or FORCEPURGE or KILL keyword must be specified.

**Explanation:** The CEKL SET command has been rejected. A keyword, PURGE or FORCEPURGE or KILL, is expected but has not been specified.

**System action:** The system continues normally.

**User response:** Check the syntax of the CEKL command.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Modules:** DFHCQS

---

**DFHCQ0234I**  applid CEKL SET command ignored; keywords conflict.

**Explanation:** The CEKL SET command has been rejected. Conflicting keywords have been specified.

**System action:** The system continues normally.

**User response:** Check the syntax of the CEKL command.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Modules:** DFHCQS

---

**DFHCQ0240I**  applid CEKL INQUIRE: task number taskno not found.

**Explanation:** Task number taskno has not been found.

**System action:** The system continues normally.

**User response:** Check the value that you specified for taskno.

If this is correct then the task has been removed from the system.
Note: This message cannot be changed with the message editing utility.

Destination: Console
Modules: DFHCQSY

DFHCQ0241I applid CEKL INQUIRE: task number taskno, found.
Explanation: Task number taskno has been found.
System action: CICS displays information about task taskno on the console and job log.
User response: 

Note: This message cannot be changed with the message editing utility.

Destination: Console
Modules: DFHCQSY

DFHCQ0242I applid CEKL INQUIRE: no tasks matched selection criteria.
Explanation: CICS has not found any tasks that match the options specified on the CEKL INQUIRE command.
System action: The system continues normally.
User response: Check the options specified on the CEKL command. For example specify a lower value for the SUSPENDED option.

Note: This message cannot be changed with the message editing utility.

Destination: Console
Modules: DFHCQSY

DFHCQ0243I applid CEKL INQUIRE: notasks task(s) matched selection criteria.
Explanation: notasks tasks have been found matching the options specified on the CEKL INQUIRE command.
System action: CICS displays information about these tasks on the console and job log.
User response: You should use the information to determine, which task, if any, should be removed from your system.
If the list of tasks is too long you may decide to invoke the CEKL INQUIRE command again specifying a different set of options.

Note: This message cannot be changed with the message editing utility.

Destination: Console
Modules: DFHCQSY

DFHCQ0250I applid CEKL SET: task number taskno not found.
Explanation: The request to remove task number taskno from the system has been rejected.
The task can not be found.
System action: The system continues normally.
User response: 

Note: This message cannot be changed with the message editing utility.

Destination: Console
Modules: DFHCQSY

DFHCQ0251I applid CEKL SET: deferred PURGE request issued for task number taskno.
Explanation: The request to remove task taskno from the system has been deferred as it has not yet been attached to the to the dispatcher; the task either belongs to a transaction class that is at its MAXACTIVE limit or the system is at its MXT limit.
System action: CICS will purge the task when it has been attached to the dispatcher.
User response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console
Modules: DFHCQSY

DFHCQ0252I applid CEKL SET: PURGE request issued for task number taskno.
Explanation: A request has been passed to the dispatcher to purge task number taskno.
System action: CICS continues normally.
User response: The CEKL INQUIRE TASK(taskno) command can be used to display the progress of the request.

Note: This message cannot be changed with the message editing utility.

Destination: Console
Modules: DFHCQSY
DFHCQ0253I applid CEKL SET: PURGE request ignored; task number taskno is being purged.
Explanation: The request to purge number taskno has been ignored.
A previous request was passed to the dispatcher to purge the task.
System action: CICS continues normally.
User response: None.
Note: This message cannot be changed with the message editing utility.
Destination: Console
Modules: DFHCQSY

DFHCQ0254I applid CEKL SET: PURGE request ignored; task number taskno is being forcepurged.
Explanation: The request to purge number taskno has been ignored.
A previous request was passed to the dispatcher to forcepurge the task.
System action: CICS continues normally.
User response: None.
Note: This message cannot be changed with the message editing utility.
Destination: Console
Modules: DFHCQSY

DFHCQ0255I applid CEKL SET: PURGE request ignored; task number taskno is being killed.
Explanation: The request to kill purge number taskno has been ignored.
A previous request was passed to the dispatcher to kill the task.
System action: CICS continues normally.
User response: None.
Note: This message cannot be changed with the message editing utility.
Destination: Console
Modules: DFHCQSY

DFHCQ0256I applid CEKL SET: FORCEPURGE request issued for task number taskno.
Explanation: A request has been passed to the dispatcher to forcepurge task number taskno.
System action: CICS continues normally.
User response: The CEKL INQUIRE TASK(taskno) command can be used to display the progress of the request.
Note: This message cannot be changed with the message editing utility.
Destination: Console
Modules: DFHCQSY

DFHCQ0257I applid CEKL SET: FORCEPURGE request ignored; task number taskno is being forcepurged.
Explanation: The request to kill forcepurge number taskno has been ignored.
A previous request was passed to the dispatcher to forcepurge the task.
System action: CICS continues normally.
User response: None.
Note: This message cannot be changed with the message editing utility.
Destination: Console
Modules: DFHCQSY

DFHCQ0258I applid CEKL SET: FORCEPURGE request ignored; task number taskno is being killed.
Explanation: The request to forcepurge number taskno has been ignored.
A previous request was passed to the dispatcher to kill the task.
System action: CICS continues normally.
User response: None.
Note: This message cannot be changed with the message editing utility.
Destination: Console
Modules: DFHCQSY

DFHCQ0259I applid CEKL SET: KILL request issued for task number taskno.
Explanation: A request has been passed to the dispatcher to kill task number taskno.
System action: CICS continues normally.
User response: The CEKL INQUIRE TASK(taskno) command can be used to display the progress of the request.

Note: This message cannot be changed with the message editing utility.
Destination: Console
Modules: DFHCQSY

**DFHCQ0260I** applid CEKL SET: KILL request ignored; task number taskno is being killed.

Explanation: The request to kill task number taskno has been ignored.
A previous request was passed to the dispatcher to kill the task.

System action: CICS continues normally.
User response: The CEKL INQUIRE TASK(taskno) command can be used to display the progress of the request.

Note: This message cannot be changed with the message editing utility.
Destination: Console
Modules: DFHCQSY

**DFHCQ0261I** applid CEKL SET: PURGE request rejected for system task number taskno.

Explanation: The request to purge task number taskno from the system has been rejected. The transaction definition specifies SPURGE(NO).

System action: The system continues normally.
User response: None.

Note: This message cannot be changed with the message editing utility.
Destination: Console
Modules: DFHCQSY

**DFHCQ0262I** applid CEKL SET: FORCEPURGE request rejected for system task number taskno.

Explanation: The request to forcepurge task number taskno has been rejected.
A request to remove the task from the system has been made and deferred as it has not yet been attached to the dispatcher; the task either belongs to a transaction class that is at its MAXACTIVE limit or the system is at its MXT limit.

System action: CICS will purge the task when it has been attached to the dispatcher.
User response: If the task can not be attached to the dispatcher because the system is under stress then
  - the CEKL INQUIRE command can be used to identify another task that is already attached to the dispatcher
  - the CEKL SET command can be used to remove that task from the system so reducing the stress

Note: This message cannot be changed with the message editing utility.
Note: This message cannot be changed with the message editing utility.

Destination: Console

Modules: DFHCQSY

DFHCQ0266I applid CEKL SET: KILL request ignored; task number taskno is being purged.

Explanation: The request to kill task number taskno has been rejected.

A request to remove the task from the system has been made and deferred as it has not yet been attached to the dispatcher; the task either belongs to a transaction class that is at its MAXACTIVE limit or the system is at its MXT limit.

System action: CICS will purge the task when it has been attached to the dispatcher.

User response: If the task can not be attached to the dispatcher because the system is under stress then
• the CEKL INQUIRE command can be used to identify another task that is already attached to the dispatcher
• the CEKL SET command can be used to remove that task from the system so reducing the stress

Note: This message cannot be changed with the message editing utility.

DFHCRxxxx messages

DFHCR4300 date time applid Transaction tranid not executed on terminal termid on system sysid. Transaction invalid on that system

Explanation: A request was made to schedule a task on remote system sysid. The request could not be executed because transaction tranid is not defined on system sysid.

System action: Other processing continues.

User response: Ensure that terminal termid and transaction tranid are defined on system sysid.

Destination: CSMT

Modules: DFHCRS

XMEOUT Parameters: date, time, applid, tranid, termid, sysid

DFHCR4301 date time applid Transaction tranid not executed on terminal termid on system sysid. Terminal invalid on that system

Explanation: A request was made to schedule a task on remote system sysid. The request could not be executed because terminal termid is not defined on system sysid.

System action: Other processing continues.

User response: Ensure that terminal termid and transaction tranid are defined on system sysid.

Destination: CSMT

Modules: DFHCRS

XMEOUT Parameters: date, time, applid, tranid, termid, sysid

DFHCR4302 date time applid Transaction tranid not executed on terminal termid on system sysid. Schedule request failed on that system

Explanation: A request was made to schedule a task on remote system sysid. The request could not be executed.

System action: Other processing continues.

User response: Check the system definition tables of the remote system to determine why schedule requests might not be honored.

Destination: CSMT

Modules: DFHCRS

XMEOUT Parameters: date, time, applid, tranid, termid, sysid

DFHCR4310 date time applid Request from system sysid to initiate transaction tranid on that system on terminal termid was not executed. Transaction invalid on this system.

Explanation: A request was received from remote system sysid to initiate transaction tranid on system sysid on terminal termid. The request could not be honored because transaction tranid is not defined in this system.

System action: Processing continues.

User response: Ensure that terminal termid and transaction tranid are defined on both systems.

Destination: CSMT

Modules: DFHCRS

XMEOUT Parameters: date, time, applid, sysid, tranid, termid
DFHCR4311  *date time applid* Request from system *sysid* to initiate transaction *tranid* on that system on terminal *termid* was not executed. Terminal invalid on this system.

**Explanation:** A request was received from remote system *sysid* to initiate transaction *tranid* on system *sysid* on terminal *termid*. The request could not be honored because terminal *termid* is not defined on this system.

**System action:** Processing continues.

**User response:** Ensure that terminal *termid* and transaction *tranid* are defined on both systems.

**Destination:** CSMT

**Modules:** DFHCRS

**XMEOUT Parameters:** *date, time, applid, sysid, tranid, termid*

---

DFHCR4312  *date time applid* Request from system *sysid* to initiate transaction *tranid* on that system on terminal *termid* was not executed. Schedule request failed

**Explanation:** A request was received from remote system *sysid* to initiate transaction *tranid* on system *sysid* on terminal *termid*. The request could not be honored because the schedule request failed.

**System action:** Processing continues.

**User response:** Check the system definition tables of the local system to determine why schedule requests might not be honored.

**Destination:** CSMT

**Modules:** DFHCRS

**XMEOUT Parameters:** *date, time, applid, sysid, tranid, termid*

---

DFHCR4314  *date time applid* Request to initiate transaction *tranid* on remotely owned terminal *termid* has been purged.

**Explanation:** A request to initiate transaction *tranid* was not delivered to system *sysid*, probably because a link to system *sysid* had not been made available.

**System action:** Processing continues.

**User response:** Ensure that a link to system *sysid* is made available between issuing the transaction initiation request and the elapse of the ATI purge delay time interval.

**Destination:** CSMT

**Modules:** DFHCRQ

**XMEOUT Parameters:** *date, time, applid, tranid, termid, sysid*

---

DFHCR4315  *date time applid* Request to initiate transaction *tranid* on remotely owned terminal *termid* has been purged. System *sysid* has not responded within the ATI purge delay time interval.

**Explanation:** A request to initiate transaction *tranid* was sent to system *sysid*. System *sysid* acknowledged the request but did not respond within the ATI purge delay time interval. If system *sysid* eventually responds, the task will not be executed.

**System action:** Processing continues.

**User response:** Determine why system *sysid* did not respond. The system did not respond because
- the task started and abnormally terminated, or
- the task failed a security check, or
- system *sysid* abnormally terminated and all details of the request were lost.

**Destination:** CSMT

**Modules:** DFHCRQ

**XMEOUT Parameters:** *date, time, applid, tranid, termid, sysid*

---

**DFHCZxxxx CICS class libraries messages**

In order to format CZ messages correctly in a DBCS environment, use the sit override MSGCASE=UPPER.

**DFHCZ0105**  *date time applid userid termid tranid* program name CICS event summary: *class::method condition="X"* (resptext) minor="X"*

**Explanation:** This message is issued whenever the method IccEvent::summary is called, and it gives the summary details of the event (CICS call).

**System action:** The system creates an exception

For further guidance, see the *CICS Family C++ OO Class Libraries*. 

Chapter 1. DFH messages  241
User response: This message is issued for information only and there is no specific user action needed in response.

Destination: CCZM

Modules: ICCEVTEC

XMEOUT Parameters: date, time, applid, userid, termid, tranid, program name, class, method, exceptno, class, method, type

DFHCZ0106 date time applid userid termid tranid
program name CICS exception
summary: exceptno class::method type=type.

Explanation: This message is issued whenever the method lccException::summary is called, and it gives the summary details of the exception.

The message related to the exception can be obtained by calling the method lccException::message.

For further guidance, see the CICS Family C++ OO Class Libraries.

System action: The system creates an exception entry in the trace table and writes this message to the TD queue CCZM.

User response: This message is issued for information only and there is no specific user action needed in response.

Destination: CCZM

Modules: ICCEXEC

XMEOUT Parameters: date, time, applid, userid, termid, tranid, program name, exceptno, class, method, condition

DFHCZ0108 date time applid userid termid tranid
program name class::method This method failed because an internal call to CICS returned the condition.

Explanation: The method reported in the message failed because an internal call to CICS returned a failure condition.

For further guidance, see the CICS Family C++ OO Class Libraries.

System action: The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

User response: You need to correct the cause of the underlying CICS failure before retrying this command. You should look at other messages and the trace log for further indication of the root cause.

If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Destination: CCZM
Modules: ICCCONEC, ICCJRNEC, ICCRIDEDEC, ICCSESEC, ICCUSREC
XMEOUT Parameters: date, time, applid, userid, termid, tranid, program name, class, method, env

---

DFHCZ0111 date time applid userid termid tranid program name class::method This constructor/operator failed because the system is configured with CICS family subset enforcement.

Explanation: The method/operator reported in the message failed because CICS has been configured to restrict its functionality to that of the CICS family subset. This method/operator is not part of this subset.

User response: If the calling program is user written, then you need to establish why this method/operators was called; and if appropriate, switch off the CICS family subset enforcement or change the program to avoid using this method/operator.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM
Modules: ICCABDEC, ICCCLKEC, ICCCONEC, ICCCTLEC, ICCSESEC, ICCSRQIC, ICCTMDEC, ICCTRMEC, ICTSKEC
XMEOUT Parameters: date, time, applid, userid, termid, tranid, program name, class, method, env

---

DFHCZ0113 date time applid userid termid tranid program name class::method This method failed because the system is configured with CICS family subset enforcement.

Explanation: The method reported in the message failed because CICS has been configured to restrict its functionality to that of the CICS family subset. This method is not part of this.

User response: If the calling program is user written, then you need to establish why this method was called, and if appropriate, switch off the CICS family subset enforcement or change the program to avoid using this method.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM
Modules: ICCABDEC, ICCCLKEC, ICCCONEC, ICCCTLEC, ICCSESEC, ICCSRQIC, ICCTMDEC, ICCTRMEC, ICTSKEC
XMEOUT Parameters: date, time, applid, userid, termid, tranid, program name, class, method

---

DFHCZ0112 date time applid userid termid tranid program name class::method This method failed because it is not supported on the current platform of env.

Explanation: The method reported in the message failed because it is not supported on the current platform (MVS).

User response: If the calling program is user written, then you need to establish why this program was running on an MVS platform, and then either change the program not to call this method or change the platform as appropriate.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM
Modules: ICCABDEC, ICCCLKEC, ICCCONEC, ICCCTLEC, ICCSESEC, ICCSRQIC, ICCTMDEC, ICCTRMEC, ICTSKEC
XMEOUT Parameters: date, time, applid, userid, termid, tranid, program name, class, method

---

DFHCZ0114 date time applid userid termid tranid program name class::method This method failed because the object being accessed was incomplete.

Explanation: The method reported in the message failed because the object being accessed was incomplete as shown below:
For further guidance, see the CICS Family C++ OO Class Libraries.

**System action:** The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

**User response:** If the calling program is user written then you need to change it so that the object being accessed is built correctly.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

| Sync level |

For further guidance, see the CICS Family C++ OO Class Libraries.

**System action:** The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

**User response:** If the calling program is user written then you need to change it so that the object being accessed, is built correctly.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** CCZM

**Modules:** ICCSESEC

**XMEOUT Parameters:** date, time, applid, userid, termid, tranid, program name, class, method

---

**DFHCZ0115**

**date time applid userid termid tranid**

**program name class::method**

This method failed because the object being accessed had a reference to an input message while the program was invoked via the remote program link.

**Explanation:** The method reported in the message failed because the object being accessed had a reference to an input message and was invoked through the use of the remote program link. This combination is not supported.

For further guidance, see the CICS Family C++ OO Class Libraries.

**System action:** The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

**User response:** If the calling program is user written then you need to change it so that the object being accessed, either does not have an input message, or the program is not invoked through the use of the remote program link.

---

**DFHCZ0116**

**date time applid userid termid tranid**

**program name class::method**

This method failed because the object being accessed was not one of the supported classes.

**Explanation:** The method reported in the message failed because the object being accessed was not one of the supported classes: IccDataQueue, IccFile, IccFileIterator, IccProgram, IccStartRequestQ, IccTempStore.

For further guidance, see the CICS Family C++ OO Class Libraries.

**System action:** The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

**User response:** If the calling program is user written then you need to change it so that the object is of the correct type before it is accessed in this way.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** CCZM

**Modules:** ICCSESEC

**XMEOUT Parameters:** date, time, applid, userid, termid, tranid, program name, class, method

---

**DFHCZ0117**

**date time applid userid termid tranid**

**program name class::method**

This method failed because the object being accessed was of type object_type.

**Explanation:** The method reported in the message failed because the object being accessed was not of the correct type.

For example the method IccSession::extractProcess() is restricted to access objects of type Back-End only.

For further guidance, see the CICS Family C++ OO Class Libraries.

**System action:** The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

**User response:** If the calling program is user written then you need to change it so that the object being accessed, is built correctly.
User response: If the calling program is user written then you need either to change it or the related CICS definitions, so that the object is of the correct type before it is accessed in this way.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM

Modules: ICCSESEC

XMEOUT Parameters: date, time, applid, userid, termid, tranid, program name, class, method, object_type

DFHCZ0118 date time applid userid termid tranid program name class::method This method failed because the object being accessed did not have a reference for the resource resource.

Explanation: The method reported in the message failed because the object being accessed did not have all the resources it needs allocated to it.

For example, the method call, IccFile::readRecord(mode, updateToken), would fail in this way if the object being accessed did not have a valid reference of a record index.

For further guidance, see the CICS Family C++ OO Class Libraries.

System action: The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

User response: If the calling program is user written then you need to change it so that it does not cause the depth of nesting to exceed 15.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM

Modules: ICCPRGEC

XMEOUT Parameters: date, time, applid, userid, termid, tranid, program name, class, method, max

DFHCZ0121 date time applid userid termid tranid program name class::method This method failed because the call is invalid for the object being accessed. The resource type of the object is resourcetype.

Explanation: The method reported in the message failed because the method is only valid for a restricted set of resource types, and is invalid for the object being accessed.

This method is valid for the following resource types; cDataQueue, cFile, cFileIterator, cProgram, cStartRequestQ, cTempStore.

For further guidance, see the CICS Family C++ OO Class Libraries.

System action: The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

User response: If the calling program is user written then you need to change it so that it does not call this method for this type of object.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.
If the error condition persists, you will need assistance from IBM. See Part 4 of the **CICS Problem Determination Guide** for guidance on how to proceed.

**Destination:** CCZM

**Modules:** ICCFILEC

**XMEOUT Parameters:** date, time, applid, userid, termid, tranid, program name, class, method, resource type

---

**DFHCZ0122**  
*date time applid userid termid tranid program name class::method*  
This method failed because the optional parameter named `pname` was set, which is invalid for the current environment of `env`.

**Explanation:** The method reported in the message failed because it detected that an optional parameter was set which is invalid for the current environment.

For further guidance, see the **CICS Family C++ OO Class Libraries**.

**System action:** The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

**User response:** If the calling program is user written then you need to establish why the optional parameter was being used, and if appropriate, change the CICS family subset enforcement or change the program to avoid using this option.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Part 4 of the **CICS Problem Determination Guide** for guidance on how to proceed.

**Destination:** CCZM

**Modules:** ICCFILEC, ICCFLIC, ICCSEMEC, ICCSESIC, ICCSRQEC, ICCSYSEC, ICCTIMEC, ICCTSKEC

**XMEOUT Parameters:** date, time, applid, userid, termid, tranid, program name, class, method, `pname`

---

**DFHCZ0125**  
*date time applid userid termid tranid program name class::method*  
This method failed because the object being accessed had a buffer containing function management headers (FMHs), which is invalid for the current environment of `env`.

**Explanation:** The method reported in the message failed because the system detected a buffer containing a function management header (FMH), which is invalid for the current environment.

FMH headers are used in SNA communication protocols and during 3270 terminal error conditions.

For further guidance, see the **CICS Family C++ OO Class Libraries**.

**System action:** The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

**User response:** If the calling program is user written then you need to establish why the object being accessed had a buffer containing FMH headers, and if appropriate, change the environment or change the program to avoid using this function.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Part 4 of the **CICS Problem Determination Guide** for guidance on how to proceed.

**Destination:** CCZM

**Modules:** ICCSRQEC

**XMEOUT Parameters:** date, time, applid, userid, termid, tranid, program name, class, method, `env`
The method reported in the message failed because the object being accessed had a buffer containing function management headers (FMHs), which is invalid because the system is configured with CICS family subset enforcement.

Explanation: The method reported in the message failed because the system detected a buffer containing a function management header (FMH), which is invalid when CICS is configured to restrict its functionality to that of the CICS family.

FMH headers are used in SNA communication protocols and during 3270 terminal error conditions.

For further guidance, see the CICS Family C++ OO Class Libraries.

System action: The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

User response: If the calling program is user written then you need to establish why the system used a buffer containing FMH headers, and if appropriate, switch off CICS family subset enforcement or change the program to avoid using this function.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM

Modules: ICCRIDE

XMEOUT Parameters: date, time, applid, userid, termid, tranid, program name, class, method, pname, length, max

---

The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

User response: If the calling program is user written then you need to check the invalid parameter on the calling statement, and if appropriate, change it.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM

Modules: ICCSEDEC

XMEOUT Parameters: date, time, applid, userid, termid, tranid, program name, class, method, pname, length, max

---

The method reported in the message failed because the value of the parameter named pname, specified as length, was not within the range 1 to max.

Explanation: This is an internal logic error.

System action: The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

User response: You will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM

Modules: ICCSEDEC

XMEOUT Parameters: date, time, applid, userid, termid, tranid, program name, class, method, pname, length, max

---

The method/operator reported in the message failed because the target object was not big enough and could not be extended to accommodate the new string.

Explanation: The method/operator reported in the message failed because the target object was not big enough and could not be extended to accommodate the new string.

User response: If the calling program is user written then you need to check the invalid parameter on the calling statement, and if appropriate, change it.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM

Modules: ICCSEDEC

XMEOUT Parameters: date, time, applid, userid, termid, tranid, program name, class, method, pname, length, max

---

The method reported in the message failed because the value passed in for the named parameter was invalid.

For example, assuming the definition, IccResource::IccResourceId(cFileId, "ABC"), the call, assign(9999, "PQRS"), would fail because the length value of 9999 is invalid.

For further guidance, see the CICS Family C++ OO Class Libraries.

System action: The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, throws an exception, and completes the request having truncated the excess data.

User response: If the calling program is user written then you need to check the invalid parameter on the calling statement, and if appropriate, change it.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM

Modules: ICCSROEC

XMEOUT Parameters: date, time, applid, userid, termid, tranid, program name, class, method

---

The method reported in the message failed because the object being accessed had a buffer containing function management headers (FMHs), which is invalid when CICS is configured to restrict its functionality to that of the CICS family.

FMH headers are used in SNA communication protocols and during 3270 terminal error conditions.

For further guidance, see the CICS Family C++ OO Class Libraries.

System action: The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, throws an exception, and completes the request having truncated the excess data.

User response: If the calling program is user written then you need to check the invalid parameter on the calling statement, and if appropriate, change it.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM

Modules: ICCSEDEC

XMEOUT Parameters: date, time, applid, userid, termid, tranid, program name, class, method, pname, length, max

The method/operator reported in the message failed because the target object was not big enough and could not be extended to accommodate the new string.

Explanation: The method/operator reported in the message failed because the target object was not big enough and could not be extended to accommodate the new string.

User response: If the calling program is user written then you need to check the invalid parameter on the calling statement, and if appropriate, change it.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM

Modules: ICCSEDEC

XMEOUT Parameters: date, time, applid, userid, termid, tranid, program name, class, method, pname, length, max

---

The method reported in the message failed because the object being accessed had a buffer containing function management headers (FMHs), which is invalid when CICS is configured to restrict its functionality to that of the CICS family.

FMH headers are used in SNA communication protocols and during 3270 terminal error conditions.

For further guidance, see the CICS Family C++ OO Class Libraries.

System action: The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, throws an exception, and completes the request having truncated the excess data.

User response: If the calling program is user written then you need to check the invalid parameter on the calling statement, and if appropriate, change it.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM

Modules: ICCSROEC

XMEOUT Parameters: date, time, applid, userid, termid, tranid, program name, class, method
**System action:** The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, throws an exception, and completes the request having truncated the excess data.

**User response:** If the calling program is user written then you need to check the invalid parameter on the calling statement, and if appropriate, change it.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Part 4 of the [CICS Problem Determination Guide](https://www.ibm.com) for guidance on how to proceed.

**Destination:** CCZM

**Modules:** ICCBUFIC

**XMEOUT Parameters:** date, time, applid, userid, termid, tranid, program name, class, method

---

**DFHCZ0130**

date time applid userid termid tranid
program name class::method This method/operator failed because the parameter pname contained a string of length length, while the maximum length allowed is max.

**Explanation:** The method reported in the message failed because one of the string parameters supplied contained a value that was too long.

For example, the method call

```
IccFileId::IccFileId("LONGFILENAME")
```

would fail because the value "LONGFILENAME" is greater than

```
IccGl::maxFileNameLength
```

For further guidance, see the CICS Family C++ OO Class Libraries.

**System action:** The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

**User response:** If the calling program is user written then you need to check the invalid parameter on the calling statement, and if appropriate, change it.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Part 4 of the [CICS Problem Determination Guide](https://www.ibm.com) for guidance on how to proceed.

**Destination:** CCZM

**Modules:** ICCRIDE, ICCTIME

**XMEOUT Parameters:** date, time, applid, userid, termid, tranid, program name, class, method, stringvalue, maxstringlength

---

**DFHCZ0132**

date time applid userid termid tranid
program name class::method This constructor failed to create an object because the parameter named pname contained an invalid string of length length while the maximum length allowed is pmaxlength.

**Explanation:** This is an internal logic error.

**System action:** The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

**User response:** You will need assistance from IBM. See Part 4 of the [CICS Problem Determination Guide](https://www.ibm.com) for guidance on how to proceed.

**Destination:** CCZM

**Modules:** ICCSESIC
### DFHCZ0134

**XMEOUT Parameters:** `date, time, applid, userid, termid, tranid, program name, class, method, pname, plength, pmaxlength`

**Explanation:** The method reported in the message failed because one of the parameters supplied was invalid. For example, the method call `IccFile::readRecord(999, updateToken)` would fail because the read mode value of 999 is not within the valid range of 70 to 74.

**System action:** The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

**User response:** If the calling program is user written then you need to check the invalid parameter on the calling statement, and if appropriate, change it.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Part 4 of the [CICS Problem Determination Guide](https://www.ibm.com) for guidance on how to proceed.

**Destination:** CCZM

**Modules:** ICCFILEC

**For further guidance, see the CICS Family C++ OO Class Libraries.**

### DFHCZ0137

**XMEOUT Parameters:** `date, time, applid, userid, termid, tranid, program name, class, method, paramName, flag1, flag2`

**Explanation:** The method reported in the message failed because the parameter named `pname` contained an invalid value of `pvalue`.

**System action:** The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

**User response:** If the calling program is user written then you need to check the invalid parameter on the calling statement, and if appropriate, change it.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Part 4 of the [CICS Problem Determination Guide](https://www.ibm.com) for guidance on how to proceed.

**Destination:** CCZM

**Modules:** ICCFILEC

**For further guidance, see the CICS Family C++ OO Class Libraries.**

### DFHCZ0136

**XMEOUT Parameters:** `date, time, applid, userid, termid, tranid, program name, class, method, paramName`

**Explanation:** The method reported in the message failed because the parameter named `param_name` contained conflicting flags specified as `flag1` and `flag2`.

This parameter of the method is restricted to a defined range, while the value supplied on the call was not within this range. For example, the constructor method call `IccJournalId::IccJournalId(987)` would fail because the journalNum value of 987 is outside the range 1 to 99.

**System action:** The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

**User response:** If the calling program is user written then you need to check the invalid parameter on the calling statement, and if appropriate, change it.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Part 4 of the [CICS Problem Determination Guide](https://www.ibm.com) for guidance on how to proceed.

**Destination:** CCZM

**Modules:** ICCRIDECE
**Explanation:** The constructor method reported in the message failed to create an object because it is a singleton class which already exists.

This parameter of the method is defined as an integer (general sense), while the value supplied on the call was not sensible for the functional content of the method. For example the method call

```
IccTerminal::sendLine(9876, buffer)
```

would fail, because the column value of 9876 is greater than the height of the screen.

For further guidance, see the [CICS Family C++ OO Class Libraries](#).

**System action:** The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

**User response:** If the calling program is user written then you need to check the invalid parameter on the calling statement, and if appropriate, change it.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Part 4 of the [CICS Problem Determination Guide](#) for guidance on how to proceed.

**Destination:** CCZM

**Modules:** ICCBUFIC ICCCONEC ICCDATEC
ICCFILIC ICCRIDEC ICCTMPEC
ICCTRMEC ICCTSKEC

**XMEOUT Parameters:** date, time, applid, userid, termid, tranid, program name, class, method

---

**Explanation:** The method reported in the message failed to create an object because the CICS task did not have a terminal as its principal facility.

Typically, the program calling this method, should be running as a terminal initiated transaction in a front end CICS region (TOR).

For further guidance, see the [CICS Family C++ OO Class Libraries](#).

**System action:** The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

**User response:** You need to change the CICS configuration definition so that the program calling this method runs in the correct environment.

If the error condition persists, you will need assistance from IBM. See Part 4 of the [CICS Problem Determination Guide](#) for guidance on how to proceed.

**Destination:** CCZM

**Modules:** ICCCTLEC ICCTMDEC ICCTRMEC

**XMEOUT Parameters:** date, time, applid, userid, termid, tranid, program name, class, method, object

---

**Explanation:** The method reported in the message failed to create an object because the CICS transaction was not defined with a terminal as its principal facility.

For further guidance, see the [CICS Family C++ OO Class Libraries](#).

**System action:** The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

**User response:** If the calling program is user written, then you need to change it so that it does not call this method more than once per transaction.

You might consider using the method instance(). All CICS singleton classes provide a method of this name or similar, which returns a reference to the unique object, creating it should it not pre-exist. This method can be safely called multiple times, each time returning the reference to the same object.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Part 4 of the [CICS Problem Determination Guide](#) for guidance on how to proceed.
**Explanation:** The method reported in the message failed to create an object because the CICS transaction was not defined with a session as its principal facility. Typically, the program calling this method would be running as a system initiated transaction relating to CICS distributed transaction processing.

For further guidance, see the CICS Family C++ OO Class Libraries.

**System action:** The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

**User response:** You need to change the CICS configuration definition so that the program calling this method runs in the correct environment.

If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** CCZM

**Modules:** ICCCTLEC

**XMEOUT Parameters:** date, time, applid, userid, termid, tranid, program name, class, method, object

---

**Explanation:** A JNI call, GetStringUTFChars(envp, profile), in code written to support Java native methods used by the JCICS Java class library has failed.

**System action:** The system writes this message to the TD queue CCZM and takes a system dump.

**User response:** If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** CCZM

**Modules:** DFJCZDTC (AttachInitiator.c)

**XMEOUT Parameters:** date, time, applid, userid, termid, tranid, program name, module

---

**Explanation:** A JNI call, GetStringUTFChars(envp, SysId), in code written to support Java native methods failed.

**System action:** The system writes this message to the TD queue CCZM and takes a system dump.

**User response:** If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** CCZM

**Modules:** DFJCZDTC (AttachInitiator.c)

**XMEOUT Parameters:** date, time, applid, userid, termid, tranid, program name, module

---

**Explanation:** A JNI call, GetStringUTFChars(envp, process)' in code written to support Java native methods failed.

**System action:** The system writes this message to the TD queue CCZM and takes a system dump.

**User response:** If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

CICS Problem Determination Guide

Chapter 1. DFH messages

DFHCZ0209 date time applid userid tranid program name JNI call

'GetStringUTFChars(envp, SysId)' in module failed.

Explanation: A JNI call, GetStringUTFChars(envp, SysId), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM

Modules: DFJCZDTC (DTCCondition.c)

XMEOUT Parameters: date, time, applid, userid, tranid, program name, module

DFHCZ0210 date time applid userid tranid program name JNI call

'GetStringUTFChars(envp, fileName, NULL)' in module failed.

Explanation: A JNI call, GetStringUTFChars(envp, fileName, NULL), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM

Modules: DFJCZDTC (DTCFile.c)

XMEOUT Parameters: date, time, applid, userid, tranid, program name, module

DFHCZ0211 date time applid userid tranid program name A null filename has been passed to a native method in module.

Explanation: A null filename has been passed to a native method used by the JCICS Java class library.

System action: The system writes this message to the TD queue CCZM and ignores the request.

User response: Ensure that a valid file name has been specified using the setName() method for each relevant file object.

If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM

Modules: DFJCZDTC (DTCFile.c)

XMEOUT Parameters: date, time, applid, userid, tranid, program name, module

DFHCZ0212 date time applid userid tranid program name JNI call

'GetStringUTFChars()' in module failed.

Explanation: A JNI call, GetStringUTFChars(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM

Modules: DFJCZDTC (DTCFile.c)

XMEOUT Parameters: date, time, applid, userid, tranid, program name, module

DFHCZ0213 date time applid userid tranid program name A null filename has been passed to a native method in module.

Explanation: A null filename has been passed to a native method used by the JCICS Java class library.

System action: The system writes this message to the TD queue CCZM and ignores the request.

User response: Ensure that a valid file name has been specified using the setName() method for each relevant file object.

If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM

Modules: DFJCZDTC (DTCFile.c)

XMEOUT Parameters: date, time, applid, userid, tranid, program name, module

Chapter 1. DFH messages 253
### DFHCZ0214

**date time applid userid termid tranid**

**program name** JNI call

`GetStringUTFChars(envp, SysId)` in module failed.

**Explanation:** A JNI call, `GetStringUTFChars(envp, SysId)`, in code written to support Java native methods used by the JCICS Java class library has failed.

**System action:** The system writes this message to the TD queue CCZM and ignores the request.

**User response:** If the error condition persists, you will need assistance from IBM. See Part 4 of the [CICS Problem Determination Guide](#) for guidance on how to proceed.

**Destination:** CCZM

**Modules:** DFJCZDTC (DTCFile.c)

**XMEOUT Parameters:** date, time, applid, userid, termid, tranid, program name, module

### DFHCZ0215

**date time applid userid termid tranid**

**program name** An attempt in module to delete records from a KSDS has failed.

**Explanation:** An attempt to delete records from a KSDS in code written to support Java native methods used by the JCICS Java class library has failed.

**System action:** The system writes this message to the TD queue CCZM. A Java exception or error will be thrown.

**User response:** Add appropriate code to the application to catch the exception or error thrown by the JCICS Java class library.

If the error condition persists, you will need assistance from IBM. See Part 4 of the [CICS Problem Determination Guide](#) for guidance on how to proceed.

**Destination:** CCZM

**Modules:** DFJCZDTC (DTCFile.c)

**XMEOUT Parameters:** date, time, applid, userid, termid, tranid, program name, module

### DFHCZ0216

**date time applid userid termid tranid**

**program name** A relative record number greater than 32767 has been specified on a DELETE command in module.

**Explanation:** A relative record number greater than 32767 has been passed to a Java native method used by the JCICS Java class library.

**System action:** The system writes this message to the TD queue CCZM and ignores the request.

**User response:** Ensure that the value specified on the relevant delete() method is valid.

If the error condition persists, you will need assistance from IBM. See Part 4 of the [CICS Problem Determination Guide](#) for guidance on how to proceed.

**Destination:** CCZM

**Modules:** DFJCZDTC (DTCFile.c)

**XMEOUT Parameters:** date, time, applid, userid, termid, tranid, program name, module

### DFHCZ0217

**date time applid userid termid tranid**

**program name** An attempt in module to delete records from an RRDS has failed.

**Explanation:** An attempt to delete records from an RRDS in code written to support Java native methods used by the JCICS Java class library has failed.

**System action:** The system writes this message to the TD queue CCZM. A Java exception or error will be thrown.

**User response:** Add appropriate code to the application to catch the exception or error thrown by the JCICS Java class library.

If the error condition persists, you will need assistance from IBM. See Part 4 of the [CICS Problem Determination Guide](#) for guidance on how to proceed.

**Destination:** CCZM

**Modules:** DFJCZDTC (DTCFile.c)

**XMEOUT Parameters:** date, time, applid, userid, termid, tranid, program name, module

### DFHCZ0218

**date time applid userid termid tranid**

**program name** JNI call `GetFieldID()` in module failed.

**Explanation:** A JNI call, `GetFieldID()`, in code written to support Java native methods used by the JCICS Java class library has failed.

**System action:** The system writes this message to the TD queue CCZM. A Java exception or error will be thrown.

**User response:** If the error condition persists, you will need assistance from IBM. See Part 4 of the [CICS Problem Determination Guide](#) for guidance on how to proceed.

**Destination:** CCZM

**Modules:** DFJCZDTC (DTCFile.c)

**XMEOUT Parameters:** date, time, applid, userid, termid, tranid, program name, module

### DFHCZ0219

**date time applid userid termid tranid**

**program name** A relative record number greater than 32767 has been specified on a DELETE command in module.

**Explanation:** A relative record number greater than 32767 has been passed to a Java native method used by the JCICS Java class library.

**System action:** The system writes this message to the TD queue CCZM and ignores the request.

**User response:** Ensure that the value specified on the relevant delete() method is valid.

If the error condition persists, you will need assistance from IBM. See Part 4 of the [CICS Problem Determination Guide](#) for guidance on how to proceed.

**Destination:** CCZM

**Modules:** DFJCZDTC (DTCFile.c)

**XMEOUT Parameters:** date, time, applid, userid, termid, tranid, program name, module
**DFHCZ0220**  
date time applid userid termid tranid  
program name JNI call  
'GetStringUTFChars()' in module failed.  

**Explanation:** A JNI call, GetStringUTFChars(), in code written to support Java native methods used by the JCICS Java class library has failed.

**System action:** The system writes this message to the TD queue CCZM and takes a system dump.

**User response:** If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** CCZM

**Modules:** DFJCZDTC (DTCFile.c)

**XMEOUT Parameters:** date, time, applid, userid, termid, tranid, program name, module

---

**DFHCZ0221**  
date time applid userid termid tranid  
program name A null filename has been passed to a native method in module.

**Explanation:** A null filename has been passed to a native method used by the JCICS Java class library.

**System action:** The system writes this message to the TD queue CCZM, and ignores the request.

**User response:** Ensure that a valid file name has been specified using the setName() method for each relevant file object.

If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** CCZM

**Modules:** DFJCZDTC (DTCFile.c)

**XMEOUT Parameters:** date, time, applid, userid, termid, tranid, program name, module

---

**DFHCZ0222**  
date time applid userid termid tranid  
program name JNI call  
'GetStringUTFChars()' in module failed.  

**Explanation:** A JNI call, GetStringUTFChars(), in code written to support Java native methods used by the JCICS Java class library has failed.

**System action:** The system writes this message to the TD queue CCZM and takes a system dump.

**User response:** If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** CCZM

**Modules:** DFJCZDTC (DTCFile.c)

**XMEOUT Parameters:** date, time, applid, userid, termid, tranid, program name, module

---

**DFHCZ0223**  
date time applid userid termid tranid  
program name A null key has been passed to a native method in module.  

**Explanation:** A null key has been passed to a native method used by the JCICS Java class library.

**System action:** The system writes this message to the TD queue CCZM and ignores the request.

**User response:** Ensure that a valid file name has been specified using the setName() method for each relevant file object.

If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** CCZM

**Modules:** DFJCZDTC (DTCFile.c)

**XMEOUT Parameters:** date, time, applid, userid, termid, tranid, program name, module

---

**DFHCZ0224**  
date time applid userid termid tranid  
program name JNI call  
'GetByteArrayElements()' in module failed.  

**Explanation:** A JNI call, GetByteArrayElements(), in code written to support Java native methods used by the JCICS Java class library has failed.

**System action:** The system writes this message to the TD queue CCZM and takes a system dump.

**User response:** If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** CCZM

**Modules:** DFJCZDTC (DTCFile.c)

**XMEOUT Parameters:** date, time, applid, userid, termid, tranid, program name, module

---

**DFHCZ0225**  
date time applid userid termid tranid  
program name A null key has been passed to a native method in module.  

**Explanation:** A null key has been passed to a Java native method used by the JCICS Java class library.

**System action:** The system writes this message to the TD queue CCZM and ignores the request.

**User response:** Ensure that all relevant reset() methods executed against KeyedFileBrowse objects specify a valid key.

If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** CCZM

**Modules:** DFJCZDTC (DTCFile.c)

**XMEOUT Parameters:** date, time, applid, userid, termid, tranid, program name, module
from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM

Modules: DFJCZDTC (DTCFile.c)

XMEOUT Parameters: date, time, applid, userid, termid, tranid, program name, module

DFHCZ0226 date time applid userid termid tranid program name JNI call 'GetStringUTFChars()' in module failed.

Explanation: A JNI call, GetStringUTFChars(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM

Modules: DFJCZDTC (DTCFile.c)

XMEOUT Parameters: date, time, applid, userid, termid, tranid, program name, module

DFHCZ0227 date time applid userid termid tranid program name A null filename has been passed to a native method in module.

Explanation: A null filename has been passed to a native method used by the JCICS Java class library.

System action: The system writes this message to the TD queue CCZM and ignores the request.

User response: Ensure that a valid file name has been specified using the setName() method for each relevant file object.

If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM

Modules: DFJCZDTC (DTCFile.c)

XMEOUT Parameters: date, time, applid, userid, termid, tranid, program name, module

DFHCZ0228 date time applid userid termid tranid program name JNI call 'GetByteArrayElements()' in module failed.

Explanation: A JNI call, GetByteArrayElements(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM

Modules: DFJCZDTC (DTCFile.c)

XMEOUT Parameters: date, time, applid, userid, termid, tranid, program name, module

DFHCZ0229 date time applid userid termid tranid program name JNI call 'GetByteArrayElements()' in module failed.

Explanation: A JNI call, GetByteArrayElements(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM

Modules: DFJCZDTC (DTCFile.c)

XMEOUT Parameters: date, time, applid, userid, termid, tranid, program name, module

DFHCZ0230 date time applid userid termid tranid program name An attempt to allocate storage in module failed.

Explanation: An attempt to obtain storage, for use as a RIDFLD parameter, in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM

Modules: DFJCZDTC (DTCFile.c)

XMEOUT Parameters: date, time, applid, userid, termid, tranid, program name, module
Chapter 1. DFH messages

DFHCZ0231  date time applid userid termid tranid
program name JNI call
'GetStringUTFChars(envp, SysId)' in module failed.

Explanation: A JNI call, GetStringUTFChars(envp, SysId), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM

Modules: DFJCZDTC (DTCFile.c)

XMEOUT Parameters: date, time,applid, userid, termid, tranid, program name, module

DFHCZ0232  date time applid userid termid tranid
program name JNI call
'GetStringUTFChars()' in module failed.

Explanation: A JNI call, GetStringUTFChars(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM

Modules: DFJCZDTC (DTCFile.c)

XMEOUT Parameters: date, time,applid, userid, termid, tranid, program name, module

DFHCZ0233  date time applid userid termid tranid
program name JNI call
'GetStringUTFChars(envp, TransId)' in module failed.

Explanation: A JNI call, GetStringUTFChars(envp, TransId), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM

Modules: DFJCZDTC (DTCFile.c)

XMEOUT Parameters: date, time,applid, userid, termid, tranid, program name, module

DFHCZ0234  date time applid userid termid tranid
program name JNI call
'GetStringUTFChars(envp, SysId)' in module failed.

Explanation: A JNI call, GetStringUTFChars(envp, SysId), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM

Modules: DFJCZDTC (DTCFile.c)

XMEOUT Parameters: date, time,applid, userid, termid, tranid, program name, module

DFHCZ0235  date time applid userid termid tranid
program name JNI call
'GetStringUTFChars(envp, SysId)' in module failed.

Explanation: A JNI call, GetStringUTFChars(envp, SysId), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM

Modules: DFJCZDTC (DTCProgram.c)

XMEOUT Parameters: date, time,applid, userid, termid, tranid, program name, module

DFHCZ0236  date time applid userid termid tranid
program name JNI call
'GetStringUTFChars(envp, TransId)' in module failed.

Explanation: A JNI call, GetStringUTFChars(envp, TransId), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM

Modules: DFJCZDTC (DTCProgram.c)

XMEOUT Parameters: date, time,applid, userid, termid, tranid, program name, module

Chapter 1. DFH messages 257
DFHCZ0237  date time applid userid termid tranid
program name JNI call 'GetFieldID()' for
'DataLength.Length' in module failed.

Explanation: A JNI call, GetFieldID(), in code written
to support Java native methods used by the JCICS
Java class library has failed.

System action: The system writes this message to
the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will
need assistance from IBM. See Part 4 of the CICS
Problem Determination Guide for guidance on how to
proceed.

Destination: CCZM
Modules: DFJCZDTC (DTCProgram.c)
XMEOUT Parameters: date, time, applid, userid, termid,
tranid, program name, module

DFHCZ0240  date time applid userid termid tranid
program name JNI call 'FindClass()' in
module failed.

Explanation: A JNI call, FindClass(), to find the class
for TransferOfControlException, in code written to
support Java native methods used by the JCICS Java
class library has failed.

System action: The system writes this message to
the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will
need assistance from IBM. See Part 4 of the CICS
Problem Determination Guide for guidance on how to
proceed.

Destination: CCZM
Modules: DFJCZDTC (DTCProgram.c)
XMEOUT Parameters: date, time, applid, userid, termid,
tranid, program name, module

DFHCZ0241  date time applid userid termid tranid
program name JNI call 'ThrowNew()' in
module failed.

Explanation: A JNI call, ThrowNew(), to throw a
TransferOfControlException, in code written to
support Java native methods used by the JCICS Java
class library has failed.

System action: The system writes this message to
the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will
need assistance from IBM. See Part 4 of the CICS
Problem Determination Guide for guidance on how to
proceed.

Destination: CCZM
Modules: DFJCZDTC (DTCProgram.c)
XMEOUT Parameters: date, time, applid, userid, termid,
tranid, program name, module

DFHCZ0242  date time applid userid termid tranid
program name JNI call 'FindClass()' in
module failed.

Explanation: A JNI call, FindClass(), to find the class
for TransferOfControlException, in code written to
support Java native methods used by the JCICS Java class library has failed.

**System action:** The system writes this message to the TD queue CCZM and takes a system dump.

**User response:** If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** CCZM

**Modules:** DFJCZDTC (DTCProgram.c)

**XMEOUT Parameters:** date, time, applid, userid, termid, tranid, program name, module

---

### DFHCZ0245  date time applid userid termid tranid program name JNI call 'ThrowNew()' in module failed.

**Explanation:** A JNI call, ThrowNew(), to throw TransferOfControlException, in code written to support Java native methods used by the JCICS Java class library has failed.

**System action:** The system writes this message to the TD queue CCZM and takes a system dump.

**User response:** If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** CCZM

**Modules:** DFJCZDTC (DTCProgram.c)

**XMEOUT Parameters:** date, time, applid, userid, termid, tranid, program name, module

---

### DFHCZ0244  date time applid userid termid tranid program name Android SUSSID command in module has failed.

**Explanation:** Code written to support Java native methods used by the JCICS Java class library has unsuccessfully attempted to issue an ASSIGN APPLID(...) SYSID(...).

**System action:** The system writes this message to the TD queue CCZM and takes a system dump.

**User response:** If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** CCZM

**Modules:** DFJCZDTC (DTCAbend.c)

**XMEOUT Parameters:** date, time, applid, userid, termid, tranid, program name, module

---

### DFHCZ0247  date time applid userid termid tranid program name A 'malloc' in module failed.

**Explanation:** A malloc in code written to support Java native methods used by the JCICS Java class library has failed.

**System action:** The system writes this message to the TD queue CCZM and takes a system dump.

**User response:** Increase the amount of heap storage available to the application.

**Destination:** CCZM

**Modules:** DFJCZDTC (DTCProgram.c)
XMEOUT Parameters: date, time, applid, userid, termid, tranid, program name, module

DFHCZ0248 date time applid userid termid tranid program name A 'malloc' in module failed.

Explanation: A malloc in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM

Modules: DFJCZDTC (DTCSupport.c)

XMEOUT Parameters: date, time, applid, userid, termid, tranid, program name, module

DFHCZ0249 date time applid userid termid tranid program name JNI call 'FindClass(envp, classname)' in module failed.

Explanation: A JNI call, FindClass(), for the named class in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM

Modules: DFJCZDTC (DTCSupport.c)

XMEOUT Parameters: date, time, applid, userid, termid, tranid, program name, module

DFHCZ0250 date time applid userid termid tranid program name JNI call 'ThrowNew()' in module failed.

Explanation: A JNI call, ThrowNew(), for the named class in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM

Modules: DFJCZDTC (DTCSupport.c)

XMEOUT Parameters: date, time, applid, userid, termid, tranid, program name, module

DFHCZ0253 date time applid userid termid tranid program name JNI call 'NewByteArray()' in module failed.

Explanation: A JNI call, NewByteArray(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM

Modules: DFJCZDTC (DTCSupport.c) DFJCZDTC (Container.c)

XMEOUT Parameters: date, time, applid, userid, termid, tranid, program name, module

DFHCZ0254 date time applid userid termid tranid program name JNI call 'FindClass()' in module failed.

Explanation: A JNI call, FindClass(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM

Modules: DFJCZDTC (DTCSupport.c)

XMEOUT Parameters: date, time, applid, userid, termid, tranid, program name, module

DFHCZ0255 date time applid userid termid tranid program name JNI call 'ThrowNew()' in module failed.

Explanation: A JNI call, ThrowNew(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
**Problem Determination Guide** for guidance on how to proceed.

**Destination:** CCZM

**Modules:** DFJCZDTC (DTCSupport.c)

**XMEOUT Parameters:** date, time, applid, userid, termid, tranid, program name, module

---

**Explanation:** A JNI call, GetFieldID(), in code written to support Java native methods used by the JCICS Java class library has failed.

**System action:** The system writes this message to the TD queue CCZM and takes a system dump.

**User response:** If the error condition persists, you will need assistance from IBM. See Part 4 of the [CICS Problem Determination Guide](#) for guidance on how to proceed.

**Destination:** CCZM

**Modules:** DFJCZDTC (DTCSupport.c)

**XMEOUT Parameters:** date, time, applid, userid, termid, tranid, program name, module

---

**Explanation:** A JNI call, GetFieldID() for setState(), in code written to support Java native methods used by the JCICS Java class library has failed.

**System action:** The system writes this message to the TD queue CCZM and takes a system dump.

**User response:** If the error condition persists, you will need assistance from IBM. See Part 4 of the [CICS Problem Determination Guide](#) for guidance on how to proceed.

**Destination:** CCZM

**Modules:** DFJCZDTC (DTCSupport.c)

**XMEOUT Parameters:** date, time, applid, userid, termid, tranid, program name, module

---

**Explanation:** A JNI call, GetMethodID() for in module failed.

**System action:** The system writes this message to the TD queue CCZM and takes a system dump.

**User response:** If the error condition persists, you will need assistance from IBM. See Part 4 of the [CICS Problem Determination Guide](#) for guidance on how to proceed.

**Destination:** CCZM

**Modules:** DFJCZDTC (DTCSupport.c)

**XMEOUT Parameters:** date, time, applid, userid, termid, tranid, program name, module

---

**Explanation:** A JNI call, GetMethodID() for in module failed.

**System action:** The system writes this message to the TD queue CCZM and takes a system dump.

**User response:** If the error condition persists, you will need assistance from IBM. See Part 4 of the [CICS Problem Determination Guide](#) for guidance on how to proceed.

Modules: DFJCDZTC (DTCTask.c)
XMEOUT Parameters: date, time, applid, userid, termid, tranid, program name, module
User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM
Modules: DFJCZDTC (DTCTask.c)
XMEOUT Parameters: date, time, applid, userid, termid, tranid, program name, module

DFHCZ0302 date time applid userid termid tranid
program name JNI call 'GetFieldID()' in
module failed.

Explanation: A JNI call, GetFieldID(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM
Modules: DFJCZDTC (DTCTask.c)
XMEOUT Parameters: date, time, applid, userid, termid, tranid, program name, module

--------------------------

DFHCZ0303 date time applid userid termid tranid
program name JNI call 'GetObjectClass()' in
module failed.

Explanation: A JNI call, GetObjectClass(), for com/ibm/cics/server/Task, in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM
Modules: DFJCZDTC (DTCTask.c)
XMEOUT Parameters: date, time, applid, userid, termid, tranid, program name, module

--------------------------

DFHCZ0305 date time applid userid termid tranid
program name JNI call 'GetStringUTFChars(envp, abcode)' in
module failed.

Explanation: A JNI call, GetStringUTFChars(envp, abcode), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM
Modules: DFJCZDTC (DTCTDQ.c)
XMEOUT Parameters: date, time, applid, userid, termid, tranid, program name, module
DFHCZ0313  date time applid userid termid tranid
        program name JNI call
        'GetStringUTFChars(envp, SysId)' in module failed.

Explanation:  A JNI call, GetStringUTFChars(envp, SysId), in code written to support Java native methods used by the JCICS Java class library has failed.

System action:  The system writes this message to the TD queue CCZM and takes a system dump.

User response:  If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination:  CCZM

Modules:  DFJCZDTC (DTCTDQ.c)

XMEOUT Parameters:  date, time, applid, userid, termid, tranid, program name, module

DFHCZ0314  date time applid userid termid tranid
        program name JNI call
        'GetStringUTFChars(envp, queueName, NULL)' in module failed.

Explanation:  A JNI call, GetStringUTFChars(envp, queueName, NULL), in code written to support Java native methods used by the JCICS Java class library has failed.

System action:  The system writes this message to the TD queue CCZM and takes a system dump.

User response:  If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination:  CCZM

Modules:  DFJCZDTC (DTCTDQ.c)

XMEOUT Parameters:  date, time, applid, userid, termid, tranid, program name, module

DFHCZ0315  date time applid userid termid tranid
        program name JNI call
        'GetStringUTFChars(envp, SysId)' in module failed.

Explanation:  A JNI call, GetStringUTFChars(envp, SysId), in code written to support Java native methods used by the JCICS Java class library has failed.

System action:  The system writes this message to the TD queue CCZM and takes a system dump.

User response:  If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination:  CCZM

DFHCZ0316  date time applid userid termid tranid
        program name JNI call
        'GetStringUTFChars(envp, queueName, NULL)' in module failed.

Explanation:  A JNI call, GetStringUTFChars(envp, queueName, NULL), in code written to support Java native methods used by the JCICS Java class library has failed.

System action:  The system writes this message to the TD queue CCZM and takes a system dump.

User response:  If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination:  CCZM

Modules:  DFJCZDTC (DTCTDQ.c)

XMEOUT Parameters:  date, time, applid, userid, termid, tranid, program name, module

DFHCZ0317  date time applid userid termid tranid
        program name JNI call
        'GetStringUTFChars(envp, SysId)' in module failed.

Explanation:  A JNI call, GetStringUTFChars(envp, SysId), in code written to support Java native methods used by the JCICS Java class library has failed.

System action:  The system writes this message to the TD queue CCZM and takes a system dump.

User response:  If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination:  CCZM

Modules:  DFJCZDTC (DTCTDQ.c)

XMEOUT Parameters:  date, time, applid, userid, termid, tranid, program name, module

DFHCZ0318  date time applid userid termid tranid
        program name JNI call
        'GetByteArrayElements()' in module failed.

Explanation:  A JNI call, GetByteArrayElements(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action:  The system writes this message to the TD queue CCZM and takes a system dump.

User response:  If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination:  CCZM

Modules:  DFJCZDTC (DTCTDQ.c)

XMEOUT Parameters:  date, time, applid, userid, termid, tranid, program name, module

DFHCZ0319  date time applid userid termid tranid
        program name JNI call
        'GetStringUTFChars(envp, queueName, NULL)' in module failed.

Explanation:  A JNI call, GetStringUTFChars(envp, queueName, NULL), in code written to support Java native methods used by the JCICS Java class library has failed.

System action:  The system writes this message to the TD queue CCZM and takes a system dump.

User response:  If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination:  CCZM

Modules:  DFJCZDTC (DTCTDQ.c)

XMEOUT Parameters:  date, time, applid, userid, termid, tranid, program name, module

DFHCZ0320  date time applid userid termid tranid
        program name JNI call
        'GetStringUTFChars(envp, SysId)' in module failed.

Explanation:  A JNI call, GetStringUTFChars(envp, SysId), in code written to support Java native methods used by the JCICS Java class library has failed.

System action:  The system writes this message to the TD queue CCZM and takes a system dump.

User response:  If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination:  CCZM

Modules:  DFJCZDTC (DTCTDQ.c)

XMEOUT Parameters:  date, time, applid, userid, termid, tranid, program name, module

DFHCZ0321  date time applid userid termid tranid
        program name JNI call
        'GetByteArrayElements()' in module failed.

Explanation:  A JNI call, GetByteArrayElements(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action:  The system writes this message to the TD queue CCZM and takes a system dump.

User response:  If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination:  CCZM

Modules:  DFJCZDTC (DTCTDQ.c)

XMEOUT Parameters:  date, time, applid, userid, termid, tranid, program name, module

DFHCZ0322  date time applid userid termid tranid
        program name JNI call
        'GetStringUTFChars(envp, queueName, NULL)' in module failed.

Explanation:  A JNI call, GetStringUTFChars(envp, queueName, NULL), in code written to support Java native methods used by the JCICS Java class library has failed.

System action:  The system writes this message to the TD queue CCZM and takes a system dump.

User response:  If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination:  CCZM

Modules:  DFJCZDTC (DTCTDQ.c)

XMEOUT Parameters:  date, time, applid, userid, termid, tranid, program name, module

DFHCZ0323  date time applid userid termid tranid
        program name JNI call
        'GetStringUTFChars(envp, SysId)' in module failed.

Explanation:  A JNI call, GetStringUTFChars(envp, SysId), in code written to support Java native methods used by the JCICS Java class library has failed.

System action:  The system writes this message to the TD queue CCZM and takes a system dump.

User response:  If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination:  CCZM

Modules:  DFJCZDTC (DTCTDQ.c)

XMEOUT Parameters:  date, time, applid, userid, termid, tranid, program name, module

DFHCZ0324  date time applid userid termid tranid
        program name JNI call
        'GetByteArrayElements()' in module failed.

Explanation:  A JNI call, GetByteArrayElements(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action:  The system writes this message to the TD queue CCZM and takes a system dump.

User response:  If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination:  CCZM

Modules:  DFJCZDTC (DTCTDQ.c)

XMEOUT Parameters:  date, time, applid, userid, termid, tranid, program name, module
need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM
Modules: DFJCZDTC (DTCTerminal.c)
XMEOUT Parameters: date, time, applid, userid, termid, tranid, program name, module

**DFHCZ0325** date time applid userid termid tranid
program name JNI call 'GetMethodID()' in module failed.

Explanation: A JNI call, GetMethodID() for the toBinary() method, in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM
Modules: DFJCZDTC (DTCTerminal.c)
XMEOUT Parameters: date, time, applid, userid, termid, tranid, program name, module

**DFHCZ0326** date time applid userid termid tranid
program name A text array passed to the SEND_TEXT() method in module was greater than 32767 bytes. The data has been truncated.

Explanation: A text array passed to the SEND_TEXT() method in code written to support Java native methods used by the JCICS Java class library was longer than 32767 bytes.

System action: The system writes this message to the TD queue CCZM and sends the first 32767 bytes in the array.

User response: Ensure that the length of text passed to the sendText() method does not exceed 32767.

Destination: CCZM
Modules: DFJCZDTC (DTCTerminal.c)
XMEOUT Parameters: date, time, applid, userid, termid, tranid, program name, module

**DFHCZ0327** date time applid userid termid tranid
program name JNI call 'GetByteArrayElements()' in module failed.

Explanation: A JNI call, GetByteArrayElements(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM
Modules: DFJCZDTC (DTCTerminal.c)
XMEOUT Parameters: date, time, applid, userid, termid, tranid, program name, module

**DFHCZ0328** date time applid userid termid tranid
program name JNI call 'GetMethodID()' in module failed.

Explanation: A JNI call, GetMethodID() for the toBinary() method, in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM
Modules: DFJCZDTC (DTCTerminal.c)
XMEOUT Parameters: date, time, applid, userid, termid, tranid, program name, module

**DFHCZ0329** date time applid userid termid tranid
program name JNI call 'GetFieldID()' in module failed.

Explanation: A JNI call, GetFieldID() for TCTUAlength, in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM
Modules: DFJCZDTC (DTCTerminal.c)
XMEOUT Parameters: date, time, applid, userid, termid, tranid, program name, module

Chapter 1. DFH messages 271
DFHCZ0330 date time applid userid termid tranid program name An attempt to allocate storage in module failed.

Explanation: An attempt to obtain storage in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM

Modules: DFJCZDTC (DTCFile.c)

XMEOUT Parameters: date, time, applid, userid, termid, tranid, program name, module

---

DFHCZ0331 date time applid userid termid tranid program name JNI call 'GetFieldID()' in module failed.

Explanation: A JNI call, GetFieldID() for TERMCODE, in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM

Modules: DFJCZDTC (DTCFile.c)

XMEOUT Parameters: date, time, applid, userid, termid, tranid, program name, module

---

DFHCZ0332 date time applid userid termid tranid program name JNI call 'GetFieldID()' in module failed.

Explanation: A JNI call, FindClass(), for com/ibm/cics/server/TerminalPrincipalFacility, in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM

Modules: DFJCZDTC (DTCTerminal.c)

XMEOUT Parameters: date, time, applid, userid, termid, tranid, program name, module

---

DFHCZ0333 date time applid userid termid tranid program name JNI call 'GetFieldID()' in module failed.

Explanation: A JNI call, GetFieldID() for TCTUAP, in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM

Modules: DFJCZDTC (DTCTerminal.c)

XMEOUT Parameters: date, time, applid, userid, termid, tranid, program name, module

---

DFHCZ0334 date time applid userid termid tranid program name JNI call 'GetStringUTFChars(envp, SysId)' in module failed.

Explanation: A JNI call, GetStringUTFChars(envp, SysId), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM

Modules: DFJCZDTC (DTCTerminal.c)

XMEOUT Parameters: date, time, applid, userid, termid, tranid, program name, module

---

DFHCZ0335 date time applid userid termid tranid program name JNI call 'GetStringUTFChars(envp, SysId)' in module failed.

Explanation: A JNI call, GetStringUTFChars(envp, SysId), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM

Modules: DFJCZDTC (DTCTerminal.c)

XMEOUT Parameters: date, time, applid, userid, termid, tranid, program name, module
Chapter 1. DFH messages

DFHCZ0336 date time applid userid termid tranid program name An invalid value for item number was passed to the READITEM() method in module. The value passed was item_no.

Explanation: An invalid value for item number was passed to the readItem() method, in code written to support Java native methods used by the JCICS Java class library.

User response: Ensure that the item number specified on the REWRITE() method of the appropriate TSQ Java object is in the range 0 - 32767.

If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM

Modules: DFJCZDTC (DTCTSQ.c)

XMEOUT Parameters: date, time, applid, userid, termid, tranid, program name, module, item_no

DFHCZ0337 date time applid userid termid tranid program name TSQ name tsqname has been truncated to 16 characters in the SETNAME() method in module.

Explanation: The Temporary Storage queue identified in the message has been truncated to 16 characters.

User response: Ensure all TS queue names used in JCICS applications are 16 characters or less in length.

Destination: CCZM

Modules: DFJCZDTC (DTCTSQ.c)

XMEOUT Parameters: date, time, applid, userid, termid, tranid, program name, tsqname, module

DFHCZ0338 date time applid userid termid tranid program name An invalid value for item number was passed to the REWRITE() method in module. The value passed was item_no.

Explanation: An invalid value for item number was passed to the REWRITE() method, in code written to support Java native methods used by the JCICS Java class library.

User response: Ensure that the item number specified on the REWRITE() method of the appropriate TSQ Java object is in the range 0 - 32767.

If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM

Modules: DFJCZDTC (StartRequest.c)

XMEOUT Parameters: date, time, applid, userid, termid, tranid, program name, module, item_no

DFHCZ0340 date time applid userid termid tranid program name JNI call 'GetByteArrayElements()' in module failed.

Explanation: A JNI call, GetByteArrayElements(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM

 Modules: DFJCZDTC (StartRequest.c)

XMEOUT Parameters: date, time, applid, userid, termid, tranid, program name, module

DFHCZ0341 date time applid userid termid tranid program name JNI call 'GetStringUTFChars()' in module failed.

Explanation: A JNI call, GetStringUTFChars(envp, transactionName), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM

Modules: DFJCZDTC (StartRequest.c)

XMEOUT Parameters: date, time, applid, userid, termid, tranid, program name, module
DFHCZ342  date time applid userid termid tranid
  program name JNI call
  'GetStringUTFChars(envp, SysId)' in module failed.

Explanation: A JNI call, GetStringUTFChars(envp, SysId), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM

Modules: DFJCZDTC (StartRequest.c)

XMEOUT Parameters: date, time,applid, userid, termid, tranid, program name, module

DFHCZ345  date time applid userid termid tranid
  program name JNI call
  'GetStringUTFChars()' in module failed.

Explanation: A JNI call, GetStringUTFChars(envp, transactionName), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM

Modules: DFJCZDTC (StartRequest.c)

XMEOUT Parameters: date, time,applid, userid, termid, tranid, program name, module

DFHCZ348  date time applid userid termid tranid
  program name JNI call
  'GetStringUTFChars(envp, terminal)' in module failed.

Explanation: A JNI call, GetStringUTFChars(envp, terminal), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM

Modules: DFJCZDTC (StartRequest.c)

XMEOUT Parameters: date, time,applid, userid, termid, tranid, program name, module

DFHCZ349  date time applid userid termid tranid
  program name JNI call
  'GetStringUTFChars(envp, SysId)' in module failed.

Explanation: A JNI call, GetStringUTFChars(envp, SysId), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM

Modules: DFJCZDTC (StartRequest.c)

XMEOUT Parameters: date, time,applid, userid, termid, tranid, program name, module

DFHCZ350  date time applid userid termid tranid
  program name JNI call
  'GetStringUTFChars()' in module failed.

Explanation: A JNI call, GetStringUTFChars(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action: The system writes this message to the TD queue CCZM and takes a system dump.

User response: If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: CCZM

**Destination:** CCZM

**Modules:** DFJCZDTC (WrapperNative.c)

**XMEOUT Parameters:** date, time, applid, userid, termid, tranid, program name, module
DFHCZ0356 date time applid userid termid tranid
program name non-CICS security
manager of class className installed.

Explanation: The Environment constructor has been
unable to install the CICS security manager because a
non-CICS security manager of class className is
installed.

System action: The system writes this message to
the TD queue CCZM.

User response: The CICS security manager ensures,
for example, that a Java program cannot issue the exit
command. Check that the security manager you have
installed is compatible with running a CICS Java
program.

Destination: CCZM

Modules: DFJCICS
(com.ibm.cics.server.Environment.java)

XMEOUT Parameters: date, time,applid, userid, termid,
tranid, program name, className

---

DFHCZ0357 date time applid userid termid tranid
program name Uncaught exception
from application.

Explanation: The _jcics Wrapper class has caught an
InvocationTargetException. This occurs when the
application throws, or doesn't catch, an exception.
Details of the application exception are given in
accompanying message DFHCZ0358.

System action: The system writes this message to
the TD queue CCZM.

User response: Correct the problem and rerun the
task.

Destination: CCZM

Modules: DFJCICS
(com.ibm.cics.server.Wrapper.java)

XMEOUT Parameters: date, time,applid, userid, termid,
tranid, program name, className

---

DFHCZ0358 date time applid userid termid tranid
program name Exception exception
occurred invoking main method in
class className.

Explanation: The _jcics Wrapper class caught
exception exception trying to invoke the main method in
class className.

System action: An exception trace entry is made and
the task is abnormally terminated.

User response: Correct the problem and rerun the
task.

Destination: CCZM

Modules: com.ibm.cics.server.Wrapper

XMEOUT Parameters: date, time,applid, userid, termid,
tranid, program name, className

---

DFHCZ0359 date time applid userid termid tranid
program name Exception exception
occurred creating object reference for
class className.

Explanation: The _GenericFactoryImpl create_object
method has caught exception exception issuing a
Class.forName(className).newInstance()

System action: A CORBA NoFactory exception is
returned to the client and the task terminates normally.

User response: Correct the problem and reissue the
request. For a ClassNotFoundException, check that a
program with an appropriate package alias is in a PDSE
available to CICS. If the program copy is refreshed to
correct an error it may be necessary to perform a CEMT
SET PROGRAM() NEWCOPY or PHASEIN command
on any program in the system to refresh cache storage.
If the error condition persists, you will need assistance
from IBM. See Part 4 of the CICS Problem
Determination Guide for guidance on how to proceed.

Destination: CCZM

Modules: DFJGFAC
(com.ibm.CosLifeCycle._GenericFactoryImpl.java)

XMEOUT Parameters: date, time,applid, userid, termid,
tranid, program name, className

---

DFHCZ0360 date time applid userid termid tranid
program name className className is
invalid.

Explanation: The class name className is invalid.
This is often caused by an erroneous leading '.' or '/'
character.

System action: An exception trace entry is made and
the task is abnormally terminated.

User response: Correct the problem and rerun the
task.

Destination: CCZM

Modules: com.ibm.cics.server.Wrapper

XMEOUT Parameters: date, time,applid, userid, termid,
tranid, program name, className

---

DFHCZ0361 date time applid The CICS Java Wrapper
class failed to find the requested
plugin plugin.

Explanation: The CICS JVM attempted to instantiate
the requested plugin class plugin but the JVM could not
find this class on the current classpath.
System action: The plugin is not loaded.
User response: Examine the value set for the classpath in the JVM profile being used from the XDFHENV dataset. The pathname for the requested plugin must be present in the classpath.
Destination: CSMT
Modules: com.ibm.cics.serverWRAPPER
XMEOUT Parameters: date, time, applid, plugin

DFHCZ0362 date time applid The CICS Java Wrapper plugin plugin has thrown exception exception.
Explanation: The CICS JVM Java Wrapper class caught an exception thrown from plugin plugin.
System action: The JVM attempts to continue processing the user application.
User response: Either contact the plugin vendor for further assistance or catch the exception in the body of your plugin.
Destination: CSMT
Modules: com.ibm.cics.server.WRAPPER
XMEOUT Parameters: date, time, applid, plugin, exception

DFHCZ0362 date time applid The CICS Java Wrapper plugin plugin has thrown exception.
Explanation: The CICS JVM Java Wrapper class caught an exception thrown from plugin plugin.
System action: The JVM attempts to continue processing the user application.
User response: Either contact the plugin vendor for further assistance or catch the exception in the body of your plugin.
Destination: CSMT
Modules: com.ibm.cics.server.WRAPPER
XMEOUT Parameters: date, time, applid, plugin, exception

DFHCZ0362 date time applid The CICS Java Wrapper plugin plugin has thrown exception.
Explanation: The CICS JVM Java Wrapper class caught an exception thrown from plugin plugin.
System action: The JVM attempts to continue processing the user application.
User response: Either contact the plugin vendor for further assistance or catch the exception in the body of your plugin.
Destination: CSMT
Modules: com.ibm.cics.server.WRAPPER
XMEOUT Parameters: date, time, applid, plugin, exception

DFHCZ0381 date time applid userid termid tranid program name JNI call 'GetByteArrayElements()' in module failed.
Explanation: A JNI call, GetByteArrayElements(), in code written to support Java native methods used by the JCICS Java class library has failed.
System action: The system writes this message to the TD queue CCZM and takes a system dump.
User response: If the error condition persists, you need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Destination: CCZM
Modules: libcom_ibm_cics_server_DTC.so
(Document.c) libcom_ibm_cics_server_DTC.so
(HttpResponse.c) libcom_ibm_cics_server_DTC.so
(Container.c)
XMEOUT Parameters: date, time, applid, userid, termid, tranid, program name, module

DFHCZ0382 date time applid userid termid tranid program name JNI call 'GetStringUTFChars()' in module failed.
Explanation: A JNI call, GetStringUTFChars(), in code written to support Java native methods used by the JCICS Java class library has failed.
System action: The system writes this message to the TD queue CCZM and takes a system dump.
User response: If the error condition persists, you need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Destination: CCZM
Modules: libcom_ibm_cics_server_DTC.so
(Document.c) libcom_ibm_cics_server_DTC.so
(HttpResponse.c) libcom_ibm_cics_server_DTC.so
(Container.c)
XMEOUT Parameters: date, time, applid, userid, termid, tranid, program name, module

DFHCZ0383 date time applid userid termid tranid program name JNI call 'NewObject()' in module failed.
Explanation: A JNI call, NewObject(), to construct a Conversation object, in code written to support Java native methods used by the JCICS Java class library has failed.
System action: The system writes this message to the TD queue CCZM and takes a system dump.
User response: If the error condition persists, you need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Destination: CCZM

(com.ibm.cics.server.Wrapper.java)

---

**DFHDBxxxx messages**

The DFHDBxxxx messages are issued by the CICS-DB2 and CICS-DBCTL interfaces. Messages for the CICS-DB2 interface are in the range 2000-2999.
CICS-DB2 messages that are documented to be output to transient data destination CDB2, are in fact output to whatever destinations are specified in the MSGQUEUE1, MSGQUEUE2 and MSGQUEUE3 parameters of the DB2CONN. MSGQUEUE1 must be specified, and its default is CDB2. This manual documents the default destination.

DFHDB2001 \textit{date time applid CICS-DB2 resynchronization with }db2id\textit{ for unit of work }X’uowid\textit{ cannot take place due to initial start of CICS.}

\textbf{Explanation:} CICS cannot resolve the disposition of unit of work (UOW) \textit{uowid} that DB2 subsystem \textit{db2id} holds from a previous connection because CICS was initial started. A CICS initial start should be avoided when resynchronization is outstanding. CICS cold, warm and emergency starts do not affect resynchronization, which occurs automatically when CICS and DB2 are connected.

\textbf{System action:} The CICS is connected to DB2 but UOW \textit{uowid} will remain indoubt in DB2.

\textbf{User response:} The UOW \textit{uowid} will have to be resolved manually using DB2 -DISPLAY THREAD and -RECOVER INDOUBT operator commands.

\textbf{Destination:} Console and Transient Data Queue CDB2

\textbf{Modules:} DFHD2EX1

\textbf{XMEOUT Parameters:} date, time, applid, db2id, X’uowid

DFHDB2003 \textit{date time applid The CICS-DB2 attachment facility is already active.}

\textbf{Explanation:} The CICS-DB2 attachment is already active and enabled to CICS.

\textbf{System action:} The CICS-DB2 attachment facility initialization does not complete.

\textbf{User response:} Only one CICS-DB2 attachment facility may be active in a CICS region.

\textbf{Destination:} CDB2 and Terminal End User

\textbf{Modules:} DFHD2STR

\textbf{XMEOUT Parameters:} date, time, applid

DFHDB2004 \textit{date time applid No threads were found for plan plan-name}

\textbf{Explanation:} This message is in response to a CICS-DB2 attachment facility DSNC DISPLAY or DISCONNECT command. No threads were found using the specified plan name \textit{plan-name}. The \textit{plan-name} may be blank if a specific plan was not requested.

\textbf{System action:} The CICS-DB2 attachment facility command is not processed.

DFHDB2005 \textit{date time applid RCT does not contain transaction tran}

\textbf{Explanation:} This message is in response to a CICS-DB2 attachment facility DSNC DISPLAY or MODIFY command. The transaction \textit{tran} specified in the command was not found in the RCT. That is, there was no DB2TRAN defined for the transid, or the DB2TRAN referred to a DB2ENTRY that does not exist, or the case of the DISPLAY command, no threads were found for the transaction.

\textbf{System action:} The CICS-DB2 attachment facility command is not processed.

\textbf{User response:} Reenter the command with the correct transaction name.

\textbf{Destination:} Terminal End User

\textbf{Modules:} DFHD2CM1

DFHDB2006 \textit{date time applid The dest destination ID is invalid.}

\textbf{Explanation:} This message is in response to a CICS-DB2 attachment facility DSNC MODIFY DESTINATION command. The destination ID \textit{dest} specified on the command to be modified is not one of the destinations currently defined in the DB2CONN as a message queue.

\textbf{System action:} The CICS-DB2 attachment facility command is not processed.

\textbf{User response:} Reenter the command with the correct destination ID.

\textbf{Destination:} Terminal End User

\textbf{Modules:} DFHD2CM1

DFHDB2007 \textit{date time applid The command verb is missing or invalid.}

\textbf{Explanation:} The CICS-DB2 attachment facility does not recognize the verb entered on the DSNC command.

\textbf{System action:} The command is not processed.

\textbf{User response:} Reenter the command with the correct syntax.

\textbf{Destination:} Terminal End User
**DFHDB2008** date time applid Keyword missing or invalid.

**Explanation:** The CICS-DB2 attachment facility DSNC command contains an unknown positional keyword or a keyword is missing.

**System action:** The command is not processed.

**User response:** Reenter the command with the correct syntax.

**Destination:** Terminal End User

**Modules:** DFHD2CM1

---

**DFHDB2009** date time applid The value in the command is invalid.

**Explanation:** The numeric value in the DSNC modify command is invalid. The error is caused by one of the following:
- The value in the command is greater than 2000.
- The value in the command is greater than the TCBLIMIT specified in the DB2CONN.
- If the pool is being changed - for example, using transaction id CEPL - the value is less than 3.

**System action:** The CICS-DB2 attachment facility command is not processed.

**User response:** Reenter the command with a correct value.

**Destination:** Terminal End User

**Modules:** DFHD2CM1

---

**DFHDB2010** date time applid tranid Transaction abended because DB2 thread tcb is unavailable.

**Explanation:** The transaction was abnormally terminated because a DB2 thread TCB was not available on which to create a thread for the transaction.

**System action:** The transaction is abnormally terminated.

**User response:** Determine if more subtask TCBs should be made available to the CICS-DB2 connection by increasing the TCBLIMIT value of the DB2CONN. The TCBLIMIT value can be altered using a SET DB2CONN command.

**Destination:** CDB2

**Modules:** DFHD2EX1

**XMEOUT Parameters:** date, time, applid, tranid

---

**DFHDB2011** date time applid tranid Transaction abended because threads are unavailable for resource resname

**Explanation:** The transaction was abnormally terminated because a thread connection to DB2 was not available for the transaction. Resname identifies the name of the DB2ENTRY or the POOL from which the thread was to be allocated. This error can occur when:
- The DB2ENTRY specifies Threadwait(no) and all threads are currently being used.
- The DB2ENTRY specified Threadwait(pool), but the pool definition within the DB2CONN specifies Threadwait(no), and all threads are currently being used both in the DB2ENTRY and the Pool.
- The transaction was using the pool directly, the pool specifies Threadwait(no) and all pool threads are currently in use.

**System action:** The transaction is abnormally terminated.

**User response:** Determine if more threads can be made available to the DB2ENTRY or the POOL by increasing the THREADLIMIT value on the DB2ENTRY or the DB2CONN respectively. The THREADLIMIT value can be increased using SET DB2ENTRY and SET DB2CONN commands.

**Destination:** CDB2

**Modules:** DFHD2EX1

---

**DFHDB2012** date time applid Stop quiesce of the CICS-DB2 attachment facility from DB2 subsystem db2-id is proceeding.

**Explanation:** A DSNC STOP command entered by the master terminal operator is being processed. CICS is disconnected from DB2 subsystem db2-id. When the disconnect is complete message DFHDB2025 is output to the terminal.

**System action:** New CICS transactions attempting to issue SQL commands is abended or receives a negative SQL reason code dependent on the CONNECTERROR setting in the DB2CONN definition.

Existing transactions using the CICS-DB2 interface are allowed to complete before the CICS-DB2 interface is stopped.

**User response:**
- If the quiesce is not completed within an acceptable time period, a DSNC STOP FORCE command should be issued from another terminal.

**Destination:** Terminal End User

**Modules:** DFHD2CM1
Display report follows for threads accessing DB2 db2-id

Explanation: A CICS-DB2 attachment display plan or display tran command was requested and the results follow this message. If not blank, db2-id is the name of the DB2 subsystem involved.

The following information is displayed for each thread:

- **DB2ENTRY**: The name of the DB2ENTRY which contains the thread.
- **S**: The thread status:
  - *: The thread is active within a unit of work and is currently executing in DB2.
  - A: The thread is active within a unit of work but is not currently executing in DB2.
  - I: The thread is inactive. It is a protected thread waiting for new work.
- **PLAN**: The current plan name.
- **PRI-AUTH**: The DB2 primary authorization ID.
- **SEC-AUTH**: The DB2 secondary authorization ID.
- **CORRELATION**: The DB2 thread correlation ID.

For active threads only:

- **TRAN**: The CICS transaction ID.
- **TASK**: The CICS task number.
- **UOW-ID**: The CICS unit-of-work ID.

System action: Processing continues normally.

User response: None.

Destination: CDB2 and Terminal End User

Modules: DFHD2CC

XMEOUT Parameters: date, time, applid, db2-id

Statistics report follows for db2conn-name accessing DB2 db2-id

Explanation: A CICS-DB2 attachment facility statistics display was requested and follows this message. The name of the DB2CONN that is currently in use is db2conn-name and db2-id, if not blank, is the name of the DB2 subsystem involved.

The statistics displayed are those that have been accumulated after the expiry of the last statistics collection interval, end of day expiry, or requested reset. These statistics represent a subset of those available as

CICS-DB2 Global and resource statistics collected via the CICS statistics spi commands.

The following information is displayed for each DB2ENTRY and for the command and pool sections of the DB2CONN:

- **DB2ENTRY**: The name of the DB2ENTRY or ‘COMMAND’ for the command section and ‘POOL’ for the pool section.
- **PLAN**: DB2 Plan name.
- **CALLS**: Total number of SQL calls made.
- **AUTHS**: Total number of sign-on invocations for transactions associated with this entry. A sign-on does not indicate whether a new thread is created or an existing thread reused. If a thread is reused a sign-on may occur dependent on the ACCOUNTREC setting of the DB2ENTRY.
- **W/P**: Number of times all available threads for this entry were busy and the transaction had to wait or the thread request was diverted to the POOL.
- **HIGH**: Maximum number of concurrent threads required by transactions associated with this DB2ENTRY at any time since the last reset.
- **ABORTS**: Total number of units of work that were rolled back.
- **COMMTS**: One of the following two fields is incremented each time a DB2 transaction associated with this DB2ENTRY takes an explicit or implicit (end of task) syncpoint.
  - **1-PHASE**: The total number of single-phase commits for transactions associated with this DB2ENTRY.
  - **2-PHASE**: The total number of two-phase commits for transactions associated with this DB2ENTRY.

System action: Processing continues normally.

User response: None.

Destination: CDB2 and Terminal End User

Modules: DFHD2CC

XMEOUT Parameters: date, time, applid, db2conn-name, db2-id
The CICS-DB2 attachment facility is in standby for DB2 subsystem db2-id

**Explanation:** The CICS-DB2 attachment facility has dropped into standby mode because DB2 subsystem db2-id has stopped and STANDBYMODE=RECONNECT was specified in the DB2CONN.

**System action:** The CICS-DB2 attachment facility waits for the DB2 subsystem to become active again, at which time it automatically reconnects. While in standby mode, all SQL requests receive a negative SQLCODE or an AEY9 abend depending on whether CONNECTERROR=SQLCODE or CONNECTERROR=ABEND was specified in the DB2CONN.

**User response:** Notify the system programmer.

**Destination:** Console and Transient Data Queue CDB2

**Modules:** DFHD2TM

**XMEOUT Parameters:** date, time, applid, db2-id

---

The connection of CICS to DB2 {subsystem | group} db2-id failed with reason X'\text{reason-code}'.

**Explanation:** The CICS-DB2 attachment facility startup cannot complete because an error occurred while connecting to DB2 sub-system or group db2-id. The response from DB2 was reason-code.

**System action:** The CICS-DB2 attachment facility initialization does not complete.

**User response:** Analyze the DB2 reason code given and any prior messages issued to the attachment error destination or CDB2 TS queues to determine the source of the error. Some possible causes include:

- incorrect DB2 subsystem or group specified
- the DB2 subsystem or group was not initialized during MVS IPL processing.
- another CICS or IMS region has connected to the DB2 coordinator with the same name as the region issuing this message. For CICS the connection name is the same as the applid.

**Destination:** CDB2

**Modules:** DFHD2STR, DFHD2CM1

**XMEOUT Parameters:** date, time, applid, {1=subsystem is not active., 2=group has no active members.}

---

Stop force of the CICS-DB2 attachment facility from db2-id is proceeding.

**Explanation:** A DSNC STOP FORCE command entered by the master terminal operator is being processed. CICS will be disconnected from DB2 subsystem db2-id. When the disconnect is complete,
message DFHDB2025 is output to the terminal.

**System action:** New CICS transactions attempting to issue SQL commands are abended or receive a negative SQL reason code dependent upon the CONNECTERROR setting in the DB2CONN definition.

Existing transactions using the CICS-DB2 interface will be force purged.

**User response:** None.

**Destination:** Terminal End User

**Modules:** DFHD2CM1

---

**DFHDB2023I**

*date time applid* The CICS-DB2 attachment has connected to DB2 subsystem *db2-id* {1= group } *db2-group*

**Explanation:** The CICS-DB2 attachment facility startup has successfully connected to DB2 subsystem. *db2-id* group *db2-group*.

**System action:** The CICS-DB2 attachment facility is active.

**User response:** If a group name does not appear then group attach is not active. You can suppress this message with the SIT parameter, MSGLVL = 0.

**Destination:** Console and Transient Data Queue

**Modules:** DFHD2STR, DFHD2CM1

**XMEOUT Parameters:** *date, time, applid, db2-id, {1=, 2= group }, db2-group*

---

**DFHDB2024I**

*date time applid* The CICS-DB2 attachment is in standby. For resync purposes only, connection has been made to DB2 restart-light subsystem *db2-id* {1= group } *db2-group*

**Explanation:** The CICS-DB2 attachment facility startup has temporarily connected to DB2 subsystem. *db2-id* group *db2-group*. The DB2 subsystem is running in restart-light mode and connection has been made purely to allow resynchronisation to take place.

**System action:** The CICS-DB2 attachment facility remains in standby for new work, but allows resynchronisation tasks to complete. The DB2 restart-light subsystem is terminated when resynchronisation is complete. If STANDBYMODE(RECONNECT) has been specified in the DB2CONN definition and when the DB2 restart-light subsystem is terminated, the CICS-DB2 attachment facility reverts to standby mode and connection to another active DB2 subsystem is made.

**User response:** If a group name does not appear, group attach is not active. You can suppress this message with the SIT parameter, MSGLVL = 0.

**Destination:** Console and Transient Data Queue

**Modules:** DFHD2CM1

---

**DFHDB2025I**

*date time applid* The CICS-DB2 attachment has disconnected from DB2 subsystem *db2-id* {1= group } *db2-group*

**Explanation:** The CICS-DB2 attachment facility has successfully disconnected from DB2 *db2-id* subsystem *db2-group*.

**System action:** The CICS-DB2 attachment facility is inactive.

**User response:** If a group name does not appear then group attach was not being used. You can suppress this message with the SIT parameter, MSGLVL = 0.

**Destination:** Console and Transient Data Queue

**Modules:** DFHD2STR, DFHD2CM1

**XMEOUT Parameters:** *date, time, applid, db2-id, {1=, 2= group }, db2-group*

---

**DFHDB2027**

*date time applid* The CICS-DB2 attachment is shutting down. DSNC DB2 commands may not be entered.

**Explanation:** The CICS-DB2 attachment facility cannot accept commands directed to DB2 during or after the termination of the CICS-DB2 attachment facility.

**System action:** The command is rejected.

**User response:** Issue the command via the DB2 console instead.

**Destination:** Terminal End User

**Modules:** DFHD2CM1

---

**DFHDB2028**

*date time applid* The user is not authorized to issue DB2 commands via DSNC.

**Explanation:** DB2 rejected the command request during sign-on of the user. Therefore, the user is assumed not to be authorized for the requested function in the command.

**System action:** The command is rejected.

**User response:** Notify the system programmer.

**Destination:** Terminal End User

**Modules:** DFHD2CM1
DFHDB2029 *date time applid* DB2 command failed with IFCARC1=rc, IFCARC2=X’reason-code’.  
**Explanation:** The DB2 command submitted by transaction received IFI return code rc and reason code reason-code.  
**System action:** The command processing stops.  
**User response:** Refer to the DB2 Messages and Codes for a description of the rc and reason-code.  
**Destination:** CDB2  
**Modules:** DFHD2CM1  
**XMEOUT Parameters:** date, time,applid, tranid, rc, X’reason-code’

DFHDB2031 *date time applid* CICS-DB2 command is invalid. No DB2CONN is installed.  
**Explanation:** A DSNC command cannot be executed as there is no DB2CONN installed. For all DSNC commands (including the STRT command) a DB2CONN definition must be installed before issuing the command. CICS no longer supports running with a macro RCT. All macro RCTs should be migrated to the CSD and the resulting definitions installed before attempting to startup the CICS-DB2 Attachment Facility. Likewise a CEMT or EXEC CICS SET DB2CONN CONNECTED command cannot be issued to startup the CICS-DB2 Attachment Facility if no DB2CONN definition is installed.  
**System action:** The command is rejected.  
**User response:** Install the necessary DB2CONN. The command can then be re-issued.  
**Destination:** CDB2 and Terminal End User  
**Modules:** DFHD2CM1, DFHD2STR  
**XMEOUT Parameters:** date, time,applid

DFHDB2032 *date time applid* Alternate destination display command complete.  
**Explanation:** The DSNC DISPLAY command to an alternate destination is complete. The output should be available at the requested destination.  
**System action:** Processing continues normally.  
**User response:** None.  
**Destination:** CDB2 and Terminal End User  
**Modules:** DFHD2CC  
**XMEOUT Parameters:** date, time,applid

DFHDB2033 *applid* Terminal termid is not supported by BMS or is invalid.  
**Explanation:** This message is issued in response to a CICS-DB2 attachment facility command, or DB2 command that requested an alternative destination for the response. CICS basic mapping support (BMS) encountered an error while routing to the requested terminal named termid.  
**System action:** Output from the command may be suppressed.  
**User response:** Ensure that the terminal ID was correctly entered. Otherwise notify the system programmer. This message may occur if the destination device is not supported by BMS, or is not defined to CICS.  
**Destination:** Console and Terminal End User  
**Modules:** DFHD2CC  
**XMEOUT Parameters:** applid, termid

DFHDB2035 *date time applid* Indoubt resolution for Unit of Work X’uowid’ is incomplete for DB2 subsystem db2id  
**Explanation:** CICS indicates that recovery should not be required for uowid but DB2 subsystem db2id is indoubt.  
**System action:** The CICS is connected to DB2 but the UOW remains indoubt in DB2.  
**User response:** The indoubt UOW will have to be resolved manually using DB2 -DISPLAY THREAD and -RECOVER INDOUBT operator commands. You need further assistance from IBM to resolve this problem. See Part 4 of the [CICS Problem Determination Guide](#) for guidance on how to proceed.  
**Destination:** Console and Transient Data Queue CDB2  
**Modules:** DFHD2EX1  
**XMEOUT Parameters:** date, time,applid, X’uowid’, db2id

DFHDB2037 *date time applid* DB2 (subsystem |group) db2-id{is not active. I has no active members.} The CICS-DB2 attachment facility is waiting.  
**Explanation:** The CICS-DB2 attachment facility is waiting for notification from DB2. For a DB2 group no active sub-systems have been found. If a DB2 sub-system was specified then that sub-system is not active. The CICS-DB2 attachment facility completes initialization after either  
- a sub-system belonging to the DB2 group  
- or  
- the specific DB2 sub-system
has been started.

**User response:** Notify the system programmer that a DB2 subsystem requires to be started according to the information supplied.

**Destination:** Console and Transient Data Queue

**Modules:** DFHD2STR,DFHD2CM1

**XMEOUT Parameters:** date, time,applid, {1=subsystem, 2=group}, db2-id, {1= is not active, 2= has no active members.}

---

**DFHDB2038** *date time applid The command is invalid while waiting for db2id*

**Explanation:** The CICS-DB2 attachment facility cannot accept commands directed to DB2 while it is waiting for the DB2 subsystem to start. The name of the DB2 subsystem that is not yet operational is *db2id*.

**System action:** The command is rejected.

**User response:** Re-issue the command when DB2 has been started and the attachment facility has connected to DB2.

**Destination:** Terminal End User

**Modules:** DFHD2CM1

---

**DFHDB2039** *date time applid The error destinations are: dest1 dest2 dest3.*

**Explanation:** This message is in response to a CICS-DB2 attachment facility DSNC MODIFY DESTINATION command and lists the currently active message destinations known to the attachment facility. Null entries show as "****" and can be modified so they identify actual destinations.

**System action:** Processing continues normally.

**User response:** None.

**Destination:** Terminal End User

**Modules:** DFHD2CM1

---

**DFHDB2040** *date time applid tranid Module modname could not be found.*

**Explanation:** During CICS-DB2 attachment facility initialization, an attempt was made to locate and load the named module, but it was not found in any of the libraries accessible to MVS through the MVS LOAd macro.

**System action:** CICS-DB2 attachment facility initialization does not complete.

**User response:** Check the CICS JOBLIB/STEPLIB and ensure that the required DB2 library is defined there and contains the named module. Alternatively, ensure the required DB2 library is in the MVS linklist.

**Destination:** CDB2 and Terminal End User

**Modules:** DFHD2STR

**XMEOUT Parameters:** date, time,applid, tranid, modname

**DFHDB2041** *date time applid No active threads found.*

**Explanation:** A DSNC DISPLAY TRANSACTION or DSNC DISPLAY PLAN command was entered, but there were no active threads found. The CICS-DB2 attachment facility might have identified and signed on some subtasks, but a create thread was not issued for any of the subtasks. Likewise, threads may have been created previously on the subtasks but were subsequently terminated when there were no more DB2 requests to service.

**System action:** Processing continues normally.

**User response:** None.

**Destination:** Terminal End User

**Modules:** DFHD2CC

---

**DFHDB2042** *date time applid Connection not authorized to db2-id*

**Explanation:** The attempt to connect to the *db2-id* DB2 subsystem or group failed because the user was not authorized to access DB2. Authorization was denied by either RACF or a user-written connection exit.

**System action:** The CICS-DB2 attachment does not connect to DB2.

**User response:** The userid specified on the CICS job was not authorized to connect to the named DB2 subsystem or group. Refer to the DB2 Administration Guide and the CICS DB2 Guide for information on how to authorize a user to access DB2.

**Destination:** CDB2

**Modules:** DFHD2STR

**XMEOUT Parameters:** date, time,applid, db2-id

---

**DFHDB2044** *date time applid Authorization parameters for resname have been corrupted.*

**Explanation:** The CICS-DB2 attachment facility detected that the AUTHTYPE or AUTHID parameters for *resname* have been corrupted since it was last installed or updated by a SET command. *Resname* is the name of the DB2ENTRY involved, or it is set to 'POOL' or 'COMMAND' if it is the pool or command thread authorizations of the DB2CONN that are involved.

**System action:** The transaction is abnormally terminated.

**User response:** If it is a DB2ENTRY involved, the
DB2ENTRY needs to be reinstalled, or the AUTHID or AUTHTYPE parameters reset using a SET command to make the DB2ENTRY usable.

For pool or command thread authorizations, a SET DB2CONN command needs to be issued to reset the AUTHID or AUTHTYPE parameters, or the DB2CONN needs to be reinstalled. Note however that a DB2CONN cannot be re-installed without stopping the CICS-DB2 attachment facility first.

**Destination:** CDB2

**Modules:** DFHD2EX1

**XMEOUT Parameters:** date, time, applid, resname

---

**DFHDB2045** date time applid Resource Manager rmi-name is unknown to the CICS-DB2 Attachment facility.

**Explanation:** The CICS-DB2 Attachment facility received a request for a resource manager with entryname rmi-name. This resource name is not known by the CICS-DB2 attachment facility.

**System action:** The transaction is abnormally terminated with abend code AD21. A CICS system dump is taken.

**User response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** CDB2

**Modules:** DFHD2EX1

**XMEOUT Parameters:** date, time, applid, rmi-name

---

**DFHDB2047I** date time applid The CICS-DB2 Attachment cannot find DB2 (subsystem | group) {db2-id | id}

**Explanation:** The CICS-DB2 attachment facility failed to connect because the DB2ID or DB2GROUPID {db2-id | id} could not be found.

**System action:** The CICS-DB2 attachment facility is inactive.

**User response:** None.

**Destination:** Console and Transient Data Queue CDB2 and Terminal End User

**Modules:** DFHD2STR

**XMEOUT Parameters:** date, time, applid, {1=subsystem, 2=group}, id

---

**DFHDB2048** date time applid Unable to interpret SQL call while formatting an EDF display for transaction transid task taskid

**Explanation:** The CICS attachment facility was unable to call its EDF processor DFHD2EDF or the CICS attachment facility was unable to decipher storage associated with an SQL statement for CICS transaction transid and task taskid. Either the SQL communications area (SQLCA) or the RDS input parameter list (RDI) storage could not be interpreted by the CICS-DB2 attachment facility.

**System action:** If the CICS attachment facility was unable to call its EDF processor DFHD2EDF and a transaction dump is taken with dump code AD22.

**User response:** For an AD22 dump, analyze the trace in the CICS transaction dump to determine why the call to DFHD2EDF failed. For an AD22 dump, analyze the CICS transaction dump of the storage in question. In this situation the information supplied by the Execution Diagnostic Facility (EDF) of CICS for SQL statements consists of:

- The EDF status: ABOUT TO EXECUTE or COMMAND EXECUTION COMPLETE
- The processing status: CALL TO RESOURCE MANAGER DSNCSQL
- The ARG values associated with this call to the CICS-DB2 attachment facility

No other information is provided about the SQL statement.

**Destination:** CDB2

**Modules:** DFHD2EX1

**XMEOUT Parameters:** date, time, applid, transid, taskid

---

**DFHDB2049** date time applid CICS-DB2 resynchronization for db2-id Unit of Work X'uowid' failed with reason code X'reason-code'

**Explanation:** A resolve indoubt request passed to DB2 from CICS for Unit of Work uowid failed with DB2 reason code reason-code. The DB2 subsystem involved is db2id.

**System action:** The UOW remains indoubt in DB2 and CICS keeps hold of the UOW disposition. A CICS system dump is taken with dumpcode 00C30003.

**User response:** Use the reason code to determine why the resolve indoubt request failed.

**Destination:** Console and Transient Data Queue CDB2

**Modules:** DFHD2EX1

**XMEOUT Parameters:** date, time, applid, db2-id, X'uowid', X'reason-code'
**DFHDB2050 date time applid tranid termid Abend**

_abcode_ has occurred in dynamic plan exit program _progname_.

**Explanation:** Dynamic plan exit program _progname_ has abnormally terminated with abend code _abcode_.

**System action:** Normal transaction abend processing continues.

**User response:** See the description of abend code _abcode_ for further guidance.

**Destination:** CDB2

**Modules:** DFHD2EX1

**XMEOUT Parameters:** date, time, applid, tranid, termid, abcode, progname

---

**DFHDB2054 date time applid tranid termid Abend**

_abcode_ in DFHD2EX1 - Link to the dynamic plan exit _progname_ failed.

**Explanation:** An unexpected return code was returned from the link to the dynamic plan exit program _progname_ by the CICS-DB2 attachment facility.

**System action:** Normal transaction abend processing continues.

**User response:** You need further assistance from IBM to resolve this problem. See Part 4 of the [CICS Problem Determination Guide](#) for guidance on how to proceed.

**Destination:** CDB2

**Modules:** DFHD2EX1

**XMEOUT Parameters:** date, time, applid, tranid, termid, abcode, progname

---

**DFHDB2055 date time applid tranid termid Abend**

Single phase commit failed with reason code X'reason-code' for transaction _transid task taskid_.

**Explanation:** CICS requested a single-phase commit from DB2, but DB2 was unable to comply. The request failed with DB2 reason code _reason-code_.

**System action:** The CICS-DB2 attachment facility abnormally terminates the transaction with abend code AD2W. CICS recovery manager will supersede the AD2W abend code with abend code ASPR.

**User response:** You need further assistance from IBM to resolve this problem. See Part 4 of the [CICS Problem Determination Guide](#) for guidance on how to proceed.

**Destination:** CDB2

**Modules:** DFHD2EX1

**XMEOUT Parameters:** date, time, applid, X'reason-code', transid, taskid

---

**DFHDB2053 date time applid tranid termid Abend**

_abcode_ in DFHD2EX1 - Dynamic plan exit program _progname_ is disabled.

**Explanation:** The CICS-DB2 attachment facility has failed to link to dynamic plan exit program _progname_ because it is not link edited AMODE 31.

**System action:** Normal transaction abend processing continues.

**User response:** Relinkedit the dynamic plan exit program AMODE 31.

**Destination:** CDB2

**Modules:** DFHD2EX1

**XMEOUT Parameters:** date, time, applid, tranid, termid, abcode, progname

---

**DFHDB2057 date time applid tranid termid Abend**

_abcode_ in DFHD2EX1 - PPT entry for dynamic plan exit program _progname_ was not found.

**Explanation:** CICS was unable to find a PPT entry for the dynamic plan exit program _progname_.

**System action:** Normal transaction abend processing continues.

**User response:** Ensure that the dynamic plan exit program _progname_ has been correctly defined to CICS.

**Destination:** CDB2

**Modules:** DFHD2EX1

**XMEOUT Parameters:** date, time, applid, tranid, termid, abcode, progname

**Chapter 1. DFH messages**

DFHDB2066  date time applid tranid termid Abend

*Explanation:* The PPT entry for the dynamic plan exit program *progname* defines the program as remote. The dynamic plan exit program must be local to this CICS system.

*System action:* Normal transaction abend processing continues.

*User response:* Correct the PPT entry to define the program as local.

*Destination:* CDB2

*Modules:* DFHD2EX1

*XMEOUT Parameters:* date, time, applid, tranid, termid, abcode, *progname*

DFHDB2067  date time applid The CICS-DB2 attachment facility is already inactive.

*Explanation:* A DSNC STOP command or an EXEC CICS SET DB2CONN NOTCONNECTED command was issued when the CICS-DB2 interface was already inactive.

*System action:* The CICS-DB2 attachment facility stop processing is ended.

*User response:* If this was unexpected, examine earlier messages to determine why the CICS-DB2 attachment facility is inactive.

*Destination:* CDB2 and Terminal End User

*Modules:* DFHD2STP

*XMEOUT Parameters:* date, time, applid

DFHDB2068  applid Send text command to terminal termid failed with eibresp 'eibresp'.

*Explanation:* While processing a DSNC command, an EXEC CICS SEND TEXT command to terminal *termid* failed with EIBRESP *eibresp*.

*System action:* Processing of the command terminates.

*User response:* Examine the eibresp value *eibresp* to determine why the SEND TEXT command failed.

*Destination:* Console and Terminal End User

*Modules:* DFHD2CC

*XMEOUT Parameters:* applid, termid, *eibresp'

DFHDB2069  applid Send page command to terminal termid failed with eibresp 'eibresp2'.

*Explanation:* While processing a DSNC command, an EXEC CICS SEND PAGE command to terminal *termid* failed with EIBRESP *eibresp2*.

*System action:* Processing of the command terminates.

*User response:* Examine the eibresp2 value *eibresp2* to determine why the SEND PAGE command failed.

*Destination:* Console and Terminal End User

*Modules:* DFHD2CC

*XMEOUT Parameters:* applid, termid, *eibresp'

DFHDB2070  date time applid Syncpoint rollback failed for transaction *transid* with eibresp2 'eibresp2'

*Explanation:* DB2 detected a deadlock and the CICS-DB2 attachment facility attempted a syncpoint rollback command for transaction *transid* because DROLLBACK(YES) was specified for the DB2ENTRY or POOL. The syncpoint rollback command failed with EIBRESP2 set to *eibresp2*.

*System action:* The transaction is abnormally terminated with abend code AD2Z.

*User response:* Examine the eibresp2 value *eibresp2* to determine why the syncpoint rollback request failed. One possible reason could be that the transaction running is a DPL server transaction which was DPLed to by a client transaction without specifying the SYNCONRETURN parameter. In this case syncpoints or syncpoint rollbacks cannot be taken by the server transaction, so DROLLBACK(YES) is invalid in this case.

*Destination:* CDB2

*Modules:* DFHD2EX1

*XMEOUT Parameters:* date, time, applid, tranid, *transid*, eibresp2

DFHDB2071  date time applid The first error destination cannot be null.

*Explanation:* This message is in response to a CICS-DB2 attachment facility DSNC MODIFY DESTINATION command. An attempt was made to nullify the first error destination by setting it to '****'. The CICS-DB2 attachment facility does not allow a null first error destination. The second and third error destinations may be nullified.

*System action:* The CICS-DB2 attachment facility command is not processed.

*User response:* Re-enter the command with a correct destination ID.
DFHDB2072 date time applid Transaction transid, task tasknum has been directed to the pool as DB2ENTRY db2ename is disabled.

**Explanation:** Transaction transid is associated with DB2ENTRY db2ename. However DB2ENTRY db2ename is disabled or disabling and the DISABLEDACT keyword on the DB2ENTRY specifies that new work should be directed to the pool.

**System action:** The transaction will use a DB2 thread from the pool.

**User response:** Determine why the DB2ENTRY has been disabled. If appropriate re-enable the DB2ENTRY.

**Destination:** CDB2
**Modules:** DFHD2EX1
**XMEOUT Parameters:** date, time,applid, transid, tasknum, db2ename

DFHDB2073 date time applid Transaction transid has been directed to the pool as DB2TRAN db2tname refers to DB2ENTRY db2ename which is not installed.

**Explanation:** Transaction transid is associated with DB2TRAN db2tname which is turn refers to DB2ENTRY db2ename. However DB2ENTRY db2ename is not installed in the CICS system. The DB2TRAN db2tname is an ‘orphan’ in that it refers to a DB2ENTRY that does not exist. A DB2TRAN cannot be installed unless its associated DB2ENTRY has been installed first. Hence either the DB2ENTRY has subsequently been discarded or the DB2TRAN modified by a SET command to refer to a non-existent DB2ENTRY.

**System action:** The transaction will use a DB2 thread from the pool.

This message is output only when an attempt is made to locate a DB2ENTRY for the transaction. Having decided to use the pool, the CICS-DB2 attachment facility will use the pool for all subsequent transactions of the same name without locating the DB2ENTRY each time. When any DB2TRAN or DB2ENTRY is installed or modified will this force a relocate of the DB2ENTRY next time the transaction is run.

**User response:** Determine why the DB2ENTRY is not installed. If appropriate re-install the DB2ENTRY.

**Destination:** CDB2
**Modules:** DFHD2EX1

DFHDB2074 date time applid CICS-DB2 Attachment facility startup cannot proceed as the currently installed DB2CONN is not useable.

**Explanation:** The CICS-DB2 Attachment facility detected that the currently installed DB2CONN is marked for discard. This implies that a previous discard of the DB2CONN did not complete successfully. A discard of a DB2CONN involves CICS discarding all DB2TRANS and DB2ENTRYs first before discarding the DB2CONN. The discard request failed before finally deleting the DB2CONN.

**System action:** Startup of the CICS-DB2 interface does not complete.

**User response:** If an RDO-defined RCT is being used, re-issue the discard for the DB2CONN. When it has been successfully discarded, re-install the required DB2CONN, DB2ENTRYs and DB2TRANs and then retry the startup of the CICS-DB2 interface.

If a macro RCT is to be used, issue a discard for the current DB2CONN and then retry the startup of the CICS-DB2 interface.

**Destination:** CDB2 and Terminal End User
**Modules:** DFHD2STR
**XMEOUT Parameters:** date, time,applid

DFHDB2100 applid Program DFHD2RP cannot be found.

**Explanation:** CICS cannot link to the CICS/DB2 restart program (DFHD2RP).

CICS cannot find DFHD2RP in any data set concatenated in the DFHRPL DD statement in the CICS startup job stream.

**System action:** CICS initialization terminates with message DFHSI1521 and a dump is taken.

**User response:** To correct this error, place DFHD2RP in a partitioned data set in the DFHRPL DD statement.

**Destination:** Console
**Modules:** DFHD2IN2
**XMEOUT Parameter:** applid

DFHDB2101 date time applid terminal userid tranid DB2CONN db2conn-name has been added.

**Explanation:** This is an audit log message indicating that DB2CONN db2conn-name has been added to the CICS system using the INSTALL command or EXEC CICS CREATE. Where:
• **terminal** is the netname or termid of the terminal associated with the transaction issuing the message. If there is no terminal associated with the transaction, the terminal name is suppressed.
• **userid** is the user identifier of the user associated with the transaction issuing the message.
• **tranid** is the transaction issuing the message.

There can be only one DB2CONN installed in the CICS system at a time. A DB2CONN is the minimum required for an RCT.

**System action:** The system continues normally.

**User response:** None.

**Destination:** CDB2

**Modules:** DFHD2TM

**XMEOUT Parameters:** date, time, applid, terminal, userid, tranid, db2conn-name

---

**DFHDB2102** date time applid terminal userid tranid DB2CONN db2conn-name has been replaced.

**Explanation:** This is an audit log message indicating that DB2CONN db2conn-name has been replaced in the RCT using the INSTALL command or EXEC CICS CREATE. Where:

- **terminal** is the netname or termid of the terminal associated with the transaction issuing the message.
- If there is no terminal associated with the transaction, the terminal name is suppressed.
- **userid** is the user identifier of the user associated with the transaction issuing the message.
- **tranid** is the transaction issuing the message.

**System action:** The system continues normally.

**User response:** None.

**Destination:** CDB2

**Modules:** DFHD2TM

**XMEOUT Parameters:** date, time, applid, terminal, userid, tranid, db2conn-name

---

**DFHDB2103** date time applid terminal userid tranid DB2CONN db2conn-name has been deleted.

**Explanation:** This is an audit log message indicating that DB2CONN db2conn-name has been deleted from the CICS system using the DISCARD command. Where:

- **terminal** is the netname or termid of the terminal associated with the transaction issuing the message.
- If there is no terminal associated with the transaction, the terminal name is suppressed.

**System action:** The system continues normally.

**User response:** None.

**Destination:** CDB2

**Modules:** DFHD2TM

**XMEOUT Parameters:** date, time, applid, terminal, userid, tranid, db2conn-name

---

**DFHDB2104** date time applid terminal userid tranid DB2ENTRY db2entry-name has been added.

**Explanation:** This is an audit log message indicating that DB2ENTRY db2entry-name has been added to the CICS system using the INSTALL command or EXEC CICS CREATE. Where:

- **terminal** is the netname or termid of the terminal associated with the transaction issuing the message.
- If there is no terminal associated with the transaction, the terminal name is suppressed.
- **userid** is the user identifier of the user associated with the transaction issuing the message.
- **tranid** is the transaction issuing the message.

**System action:** The system continues normally.

**User response:** None.

**Destination:** CDB2

**Modules:** DFHD2TM

**XMEOUT Parameters:** date, time, applid, terminal, userid, tranid, db2entry-name

---

**DFHDB2105** date time applid terminal userid tranid DB2ENTRY db2entry-name has been replaced.

**Explanation:** This is an audit log message indicating that DB2ENTRY db2entry-name has been replaced in the RCT using the INSTALL command or EXEC CICS CREATE. Where:

- **terminal** is the netname or termid of the terminal associated with the transaction issuing the message.
- If there is no terminal associated with the transaction, the terminal name is suppressed.
- **userid** is the user identifier of the user associated with the transaction issuing the message.
• `tranid` is the transaction issuing the message.

**System action:** The system continues normally.

**User response:** None.

**Destination:** CDB2

**Modules:** DFHD2TM

**XMEOUT Parameters:** `date, time, applid, terminal, userid, tranid, db2entry-name`

---

DFHDB2106 `date time applid terminal userid tranid DB2ENTRY db2entry-name has been deleted.`

**Explanation:** This is an audit log message indicating that DB2ENTRY `db2entry-name` has been deleted from the CICS system using the DISCARD command.

Where:

- `terminal` is the netname or termid of the terminal associated with the transaction issuing the message.
  - If there is no terminal associated with the transaction, the terminal name is suppressed.
- `userid` is the user identifier of the user associated with the transaction issuing the message.
- `tranid` is the transaction issuing the message.

**System action:** The system continues normally.

**User response:** None.

**Destination:** CDB2

**Modules:** DFHD2TM

**XMEOUT Parameters:** `date, time, applid, terminal, userid, tranid, db2entry-name`

---

DFHDB2107 `date time applid terminal userid tranid DB2TRAN db2tran-name has been added.`

**Explanation:** This is an audit log message indicating that DB2TRAN `db2tran-name` has been added to the CICS system using the INSTALL command or EXEC CICS CREATE. Where:

- `terminal` is the netname or termid of the terminal associated with the transaction issuing the message.
  - If there is no terminal associated with the transaction, the terminal name is suppressed.
- `userid` is the user identifier of the user associated with the transaction issuing the message.
- `tranid` is the transaction issuing the message.

**System action:** The system continues normally.

**User response:** None.

**Destination:** CDB2

**Modules:** DFHD2TM

**XMEOUT Parameters:** `date, time, applid, terminal, userid, tranid, db2tran-name`

---

DFHDB2108 `date time applid terminal userid tranid DB2TRAN db2tran-name has been replaced.`

**Explanation:** This is an audit log message indicating that DB2TRAN `db2tran-name` has been replaced in the RCT using the INSTALL command or EXEC CICS CREATE. Where:

- `terminal` is the netname or termid of the terminal associated with the transaction issuing the message.
  - If there is no terminal associated with the transaction, the terminal name is suppressed.
- `userid` is the user identifier of the user associated with the transaction issuing the message.
- `tranid` is the transaction issuing the message.

**System action:** The system continues normally.

**User response:** None.

**Destination:** CDB2

**Modules:** DFHD2TM

**XMEOUT Parameters:** `date, time, applid, terminal, userid, tranid, db2tran-name`

---

DFHDB2109 `date time applid terminal userid tranid DB2TRAN db2tran-name has been deleted.`

**Explanation:** This is an audit log message indicating that DB2TRAN `db2tran-name` has been deleted from the CICS system using the DISCARD command.

Where:

- `terminal` is the netname or termid of the terminal associated with the transaction issuing the message.
  - If there is no terminal associated with the transaction, the terminal name is suppressed.
- `userid` is the user identifier of the user associated with the transaction issuing the message.
- `tranid` is the transaction issuing the message.

**System action:** The system continues normally.

**User response:** None.

**Destination:** CDB2

**Modules:** DFHD2TM

**XMEOUT Parameters:** `date, time, applid, terminal, userid, tranid, db2tran-name`

---

DFHDB2207 `date time applid Load error rc abend-code for module modname`

**Explanation:** Error `rc` with `abend-code` occurred when the CICS-DB2 attachment facility initialization attempted to use the MVS LOAD macro to load module `modname`.

**System action:** The CICS-DB2 attachment initialization does not complete.

**User response:** Resolve the problem indicated by the...
LOAD return code and abend code.

Destination: CDB2

Modules: DFHD2STR

XMEOUT Parameters: date, time, applid, rc, abend-code, modname

DFHDB2208 date time applid Delete error rc for module modname

Explanation: Error rc occurred when the CICS-DB2 attachment facility attempted to use the MVS DELETE macro to delete module modname during shutdown of the CICS-DB2 interface.

System action: The CICS-DB2 attachment shutdown continues.

User response: Resolve the problem indicated by the DELETE return code.

Destination: CDB2

Modules: DFHD2STP

XMEOUT Parameters: date, time, applid, rc, modname

DFHDB2300 date time applid tranid DB2 command output truncated (ifcabnm bytes not shown).

Explanation: ifcabnm bytes of a DB2 command response could not be shown.

System action: The command processing completes, but the output is truncated.

User response: If you need complete command output, modify the command to reduce the amount of output. For example, specify specific databases rather than an asterisk on a DISPLAY DATABASE(****).

Destination: CDB2

Modules: DFHD2CM1

XMEOUT Parameters: date, time, applid, tranid, ifcabnm

DFHDB2301 date time applid tranid DB2 command complete.

Explanation: The DB2 command processing is complete.

System action: Control is returned to the user.

User response: None.

Destination: CDB2 and Terminal End User

Modules: DFHD2CM1

XMEOUT Parameters: date, time, applid, tranid

DFHDB8101I date applid Connection to DBCTL xxx is now complete. Startup Table Suffix used is xx.

Explanation: DBCTL has notified CICS that the CICS-DBCTL connection is complete.

System action: CICS resynchronizes any outstanding DBCTL in-doubts.
**DFHDB8102 I  date time applid Disconnection from DBCTL xxxx is now complete.**

**Explanation:** CICS has successfully disconnected from DBCTL.

**System action:** CICS has successfully disconnected from DBCTL and performed its clean up.

**User response:** None.

**Destination:** CDBC

**Modules:** DFHDBCT

**XMEOUT Parameters:** date, time,applid, xxxx, xx

---

**DFHDB8103 E  date time applid IDENTIFY request to DBCTL xxxx has failed. MVS SSI return code rc, reason code reason.**

**Explanation:** CICS has attempted to connect to DBCTL. The attempt has failed. CICS has been notified that DBCTL has rejected the identify request.

**System action:** CICS attempts to connect to DBCTL at 5 second intervals, issuing this message at each attempt, and message DFHDB8297 at 1 minute intervals, until either:

1. Disconnection is requested via the CICS supplied DBCTL support menu transaction, CDBC.
2. 10 minutes have elapsed, after which time CICS stops attempting to connect and IMS message DFS0690 is issued, requesting the operator to type in WAIT (retry the connection attempt) or CANCEL (abandon the connection attempt).

Refer to the explanation of DFHDB8297 for more information. Refer to the **IMS Messages and Codes** manual for further information on message DFS0690.

**User response:** Check why DBCTL is not running. You can cancel the connection attempts by using the CDBC transaction to issue a disconnect request. If message DFH0690 has been issued you should reply to this.

**Destination:** CDBC

**Modules:** DFHDBCT

**XMEOUT Parameters:** date, time,applid, xxxx, rc, reason

---

**DFHDB8104 E  date time applid IDENTIFY request to DBCTL xxxx has been rejected by DBCTL. {System abend code / IMS user abend code / DBCTL return code }rc.**

**Explanation:** CICS has attempted to connect to DBCTL. The attempt has failed. CICS has been notified that DBCTL has rejected the identify request.

**System action:** The attempt to connect to DBCTL is abandoned and the storage associated with the CICS-DBCTL interface is cleaned up. Message DFHDB8102 is output.

**User response:** For further information about the nonzero response code, if rc is:

- A **system abend code**, refer to the **OS/390 MVS System Codes** manual
- An **IMS user abend code**, refer to the **IMS Messages and Codes** manual
- A **DBCTL return code**, refer to the **IMS Messages and Codes** manual.

**Destination:** CDBC

**Modules:** DFHDBCT

**XMEOUT Parameters:** date, time,applid, xxxx, {1=System abend code, 2=IMS user abend code, 3=DBCTL return code }, rc

---

**DFHDB8105 W  date time applid Operator has requested cancellation of the connection to DBCTL.**

**Explanation:** DBCTL notifies CICS that the operator has replied ‘CANCEL’ to IMS message DFS0690. Refer to the **IMS Messages and Codes** manual for information on IMS message DFS0690.

**System action:** CICS cleans up the storage associated with the CICS-DBCTL interface and issues message DFHDB8102.

**User response:** None. This message is for information only.

**Destination:** CDBC

**Modules:** DFHDBCT

**XMEOUT Parameters:** date, time,applid

---

**DFHDB8106 E  date time applid The DRA has abnormally terminated. CICS is no longer connected to DBCTL id xxxx.**

**Explanation:** DBCTL has notified CICS that the database resource adapter (DRA) is abnormally terminating.

**System action:** CICS cleans up the storage associated with the CICS-DBCTL interface and disconnects from DBCTL. CICS then issues message DFHDB8102.
User response: See the CICS IMS Database Control Guide for information about problem determination. If you wish to reconnect CICS to DBCTL, use the menu transaction CDDBC.

Destination: CDDBC
Modules: DFHDBCT
XMEOUT Parameters: date, time, applid, xxxx

DFHDB8107 E date time applid DBCTL xxxx has abnormally terminated. Will attempt to reconnect.

Explanation: DBCTL notifies CICS it is about to terminate.

System action: CICS will attempt to reconnect to DBCTL.

User response: Notify the system programmer.

Look for messages output by the DBCTL system and determine why DBCTL failed. Restart DBCTL if required.

Destination: CDDBC
Modules: DFHDBCT
XMEOUT Parameters: date, time, applid, xxxx

DFHDB8108 I date time applid DBCTL xxxx has received a CHECKPOINT FREEZE command. CICS will disconnect from DBCTL.

Explanation: DBCTL notifies CICS that it is about to terminate because a CHECKPOINT FREEZE command has been issued.

System action: CICS will clean up the storage associated with the CICS-DBCTL interface and will then output message DFHDB8102.

User response: None.

Destination: CDDBC
Modules: DFHDBCT
XMEOUT Parameters: date, time, applid, xxxx

DFHDB8109 E date time applid Request to DL/I failed for transaction tranid, task taskid, recovery token X’nn’, system abend code 1, IMS user abend code 1, DBCTL return code 1, rc, DBCTL id xxxx.

Explanation: DBCTL xxxx returns a nonzero response code rc when a DL/I request is issued from an application program.

System action: The CICS transaction may be abnormally terminated.

User response: If the CICS transaction is abnormally terminated, refer to the accompanying CICS transaction abend code.

For further information about the nonzero response code, if rc is:
- A system abend code, refer to the OS/390 MVS System Codes manual
- An IMS user abend code, refer to the IMS Messages and Codes manual
- A DBCTL return code, refer to the IMS Messages and Codes manual.

For further information about the unit of recovery, refer to the CICS IMS Database Control Guide.

Destination: CDDBC
Modules: DFHDLIDP
XMEOUT Parameters: date, time, applid, tranid, taskid, X’nn’, 1=, system abend code, 2=, IMS user abend code, 3=, DBCTL return code, rc, xxxx

DFHDB8110 E date time applid Non zero return code from DFHDBAT. Return code rc for request request.

Explanation: The module DFHDBAT, which is a task related user exit forming part of the CICS-DBCTL interface, returns a nonzero return code in reply to a request issued from CICS to DBCTL.

System action: The request to DBCTL fails.

Three types of request to DBCTL can fail in this way:
1. A request to connect to DBCTL from module DFHDBCONE
2. A request to disconnect from DBCTL from module DFHDBDSC
3. A DL/I request from an application program via module DFHDLIDP

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: The return code is one of the following:

4 — CALL NOT UNDERSTOOD
   This can be returned when attempting to connect, disconnect or issue DL/I requests to DBCTL. The most likely cause is a storage overwrite. If CICS detects a storage overwrite, a dump is taken.

8 — REDUNDANT INTERFACE CALL
   This can be returned when attempting to connect or disconnect from DBCTL. The request is ignored.

16 — DISCONNECT PRE-EMPTED
   This can be returned when attempting to disconnect from DBCTL while a disconnection request is already being processed.
24 — ADAPTER NOT READY
A request has been made to the adaptor DFHDBAT but CICS is still in the process of connecting to DBCTL.

28 — ADAPTER IS DISABLED
This indicates that the CICS-DBCTL interface is not available.

Note: The DBCTL interface terminates normally after any inflight tasks accessing DBCTL complete the unit of work. Subsequently any new unit of work or ATI task can receive this return code because of a PCB schedule failure.

Destination: CDBC
Modules: DFHDBCON, DFHDBDSC, DFHDLIDP
XMEOUT Parameters: date, time, applid, rc, request

DFHDB8111 E  date time applid Connection has failed. DBCTL return code rc.
Explanation: DBCTL returns a nonzero response code when CICS is attempting to connect to it.
System action: The connection attempt is abandoned.
User response: Notify the system programmer.

For further information about the DBCTL return code, refer to the IMS Messages and Codes manual.

Destination: CDBC
Modules: DFHDBCON
XMEOUT Parameters: date, time, applid, rc

DFHDB8112 E  date time applid Unable to generate Task Token due to purge request.
Explanation: The module, DFHDBTOX, was invoked:
- To set up a task token, or
- To GETMAIN some storage.

The GETMAIN failed.
System action: Processing continues.
Message DFHME0116 is normally produced containing the symptom string for this problem.
User response: This message indicates that there is a storage management problem. You should check for other messages issued from the CICS region to the MVS console.

See the CICS Problem Determination Guide for guidance on dealing with storage problems.

Destination: CDBC
Modules: DFHDBCON
XMEOUT Parameters: date, time, applid

DFHDB8113 E  date time applid Getmain failure for storage to hold the indoubt list. Resync has not taken place.

Explanation: Connection to DBCTL has been completed, but there are some in-doubts outstanding. The GETMAIN to store the in-doubts has failed.
System action: CICS remains connected to DBCTL but the in-doubts are not resolved.

Message DFHME0116 is normally produced containing the symptom string for this problem.
User response: This message indicates that there is a storage management problem. You should check for other messages issued from the CICS region to the MVS console.

See the CICS Problem Determination Guide for guidance on dealing with storage problems.

Destination: CDBC
Modules: DFHDBCON
XMEOUT Parameters: date, time, applid

DFHDB8114 E  date time applid Connection has failed. DRA startup table with suffix xx cannot be found.

Explanation: An attempt has been made to connect CICS to DBCTL but the DRA Startup Table with the suffix xx cannot be found.
System action: The connection attempt is abandoned.
User response: If you were using the DBCTL Support Menu transaction, CDBC, check to see if you have mistyped the suffix value.

If you have not mistyped the suffix value then notify the system programmer.

Place the DRA Startup Table in a CICS STEPLIB library. For further guidance on how to do this, see the CICS IMS Database Control Guide.

Destination: CDBC
Modules: DFHDBCON
XMEOUT Parameters: date, time, applid, xx

DFHDB8115 E  date time applid Connection has failed. Module DFSPPRC0 cannot be found.

Explanation: An attempt has been made to connect CICS to DBCTL but the DRA Router module, DFSPPRC0, cannot be found.
System action: The connection attempt is abandoned.
User response: Place the module DFSPPRC0 in a CICS STEPLIB library. For further guidance on how to do this, refer to the CICS IMS Database Control Guide.
Destination: CDBC
Modules: DFHDBCON
XMEOUT Parameters: date, time, applid

DFHDB8116 I date time applid Connection to DBCTL xxxx is proceeding. Startup Table Suffix used is xx.
Explanation: The first phase of connecting CICS to DBCTL has been completed.
System action: CICS connection to DBCTL proceeds.
User response: None.

Destination: CDBC
Modules: DFHDBCON
XMEOUT Parameters: date, time, applid, xxxx, xx

DFHDB8117 W date time applid No connection to DBCTL made although the connection program is in the PLT.
Explanation: The connection program, DFHDBCON, has been placed in the program list table (PLT) but CICS was not connected when CICS last shut down.
System action: CICS will not connect to DBCTL.
User response: This is a warning message. In this case, if you wish to connect CICS to DBCTL then use the DBCTL Support Menu transaction, CDBC.

Destination: CDBC
Modules: DFHDBCON
XMEOUT Parameters: date, time, applid

DFHDB8118 E date time applid Connection to DBCTL xxxx has been rejected by CICS. Reason code rc.
Explanation: CICS has rejected the connection attempt to DBCTL for reason rc. The value in the reason code field is 4. This indicates an invalid IMS/ESA release for storage protection. That is, CICS storage protection was active, and an attempt was made to connect to a DBCTL system running a release of IMS/ESA that does not support the storage protection function.
System action: On completion of phase 2 connection processing, CICS indicates to the database resource adapter (DRA), in the control exit, that the DRA should terminate. CICS then completes cleanup of the CICS-DBCTL interface. The status of the interface is that CICS is not connected to DBCTL.
User response: Connection to this DBCTL system is only possible if CICS is run with storage protection turned off. To run with storage protection on, install a release of IMS/ESA that supports the storage protection function.

Destination: CDBC
Modules: DFHDBCT
XMEOUT Parameters: date, time, applid, xxxx, rc

DFHDB8119 I date time applid CICS is INDOUBT about the LUW with recovery token X'rectok' after issuing a single phase commit request to DBCTL, (SYSTEM ABEND CODE | IMS USER ABEND | DBCTL RETURN CODE) rc.
Explanation: CICS was attempting to syncpoint updates made to IMS databases via DBCTL for the logical unit of work (LUW) identified by unit of recovery X'rectok'. CICS has detected that updates were made to only one resource manager, DBCTL, in this LUW, and hence has issued a single-phase commit to DBCTL, in place of the normal two-phase commit process. An unexpected response to the single-phase commit has been received from DBCTL, and so CICS is INDOUBT about this LUW. CICS is unable to report whether the updates made via DBCTL have been committed or backed out. No local CICS resources are affected.
System action: The transaction terminates abnormally with abend code ADCS and a transaction dump. CICS processing continues.
User response: The unit of recovery X'rectok' output with this message can be used in conjunction with IMS message DFSxxxx output on the IMS console to determine the outcome of the LUW.

If the IMS region has failed, on restart of the IMS region, IMS will output DFSxxxx messages for each LUW that has committed using the single-phase commit protocol. The DFSxxxx message contains the same X'rectok' recovery token as output in this message. While matching up the recovery tokens, if a DFSxxxx message is found with the same recovery token, then the LUW was committed. Failure to find a relevant DFSxxxx message means that the LUW has been backed out.

Rather than the IMS region failing, if the bad response to single-phase commit was caused by an individual thread failure and the LUW has been committed, then IMS outputs a DFSxxxx message for just this LUW.

For further information on IMS message DFSxxxx, refer to the IMS Messages and Codes manual

For further information about the nonzero response code, if rc is:
- A system abend code, refer to the OS/390 MVS System Codes manual
- An IMS user abend code, refer to the IMS Messages and Codes manual
- A DBCTL return code, refer to the IMS Messages and Codes manual.

Chapter 1. DFH messages 297
For further information about the nonzero response code, if rc is:

- A **system abend code**, refer to the OS/390 MVS System Codes manual
- An **IMS user abend code**, refer to the IMS Messages and Codes manual
- A **DBCTL return code**, refer to the IMS Messages and Codes manual
- An **IMS fast path status code**, refer to the IMS Application Programming: EXEC DLI Commands manual if you were running an EXEC DLI program at the time of the message, or if you were using CALL, refer to the Application Programming: DL/I Calls.
CICS termination commenced. CICS disconnection from DBCTL failed for one of the reasons given in the message text.

**System action:** CICS shutdown continues.

**User response:** If the failure is due to a timed out condition, the message indicates that the time elapsed since CICS requested disconnection has reached the interval specified in the TIMEOUT parameter of the DRA interface without a response from DCBTL. The default interval is 60 seconds.

If failure is due to any other condition, a nonzero return code is given. If rc is:

- A system abend code, refer to the OS/390 MVS System Codes manual
- An IMS user abend code, refer to the IMS Messages and Codes manual
- A DBCTL return code, refer to the IMS Messages and Codes manual.

**Destination:** Console

**Modules:** DFHDBAT

**XMEOUT Parameters:** date, time, applid

---

DFHDB8128 W  date time applid Error linking to the CICS-DBCTL user replaceable program DFHDBUEX from module modname.

**Explanation:** An attempt was made to invoke the user replaceable module, DFHDBUEX, but the module was not available.

**System action:** CICS disregards the failure and continues execution.

**User response:** Ensure that module DFHDBUEX is available.

**Destination:** CDBC

**Modules:** DFHDBCT, DFHDBDSC.

**XMEOUT Parameters:** date, time, applid, modname

---

DFHDB8129 E  date time applid Getmain failure in the Control Exit DFHDBCTX.

**Explanation:** The MVS GETMAIN request failed in DFHDBCTX.

**System action:** The CICS-DBCTL interface remains unchanged.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User response:** This message indicates that there is a storage management problem. Check for other messages issued from the CICS region to the MVS console.

---

See the [CICS Problem Determination Guide](#) for guidance on dealing with storage problems.

**Destination:** CDBC

**Modules:** DFHDBCTX

**XMEOUT Parameters:** date, time, applid

---

DFHDB8130 E  date time applid Disconnection has failed. DBCTL return code rc.

**Explanation:** The disconnection attempt failed in DBCTL.

**System action:** CICS abandons the attempt to disconnect from DBCTL.

**User response:** For further information about the DBCTL return code, refer to the IMS Messages and Codes manual.

**Destination:** CDBC

**Modules:** DFHDBDSC

**XMEOUT Parameters:** date, time, applid, rc

---

DFHDB8131 E  date time applid The CICS-DBCTL control transaction has abnormally terminated with abend abcode.

**Explanation:** The CICS-DBCTL control transaction, CDBO, has failed.

**System action:** The CICS-DBCTL interface is no longer usable.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User response:** See the description of abend abcode for further guidance.

If you wish to use DBCTL from this CICS system again, you have to restart CICS.

**Destination:** CDBC

**Modules:** DFHDBCT

**XMEOUT Parameters:** date, time, applid, abcode

---

DFHDB8199 E  GETMAIN REQUEST FOR CICS-DBCTL CONTROL WORK ELEMENT (CWE) HAS FAILED.

**Explanation:** While notifying the CICS-DBCTL control transaction of changes to the state of the CICS-DBCTL interface a GETMAIN request for storage to hold a CICS-DBCTL control work element failed.

**System action:** CICS uses control exit storage in DBCTL global block (DGB) to notify the control transaction of the error. The control transaction issues message DFHDB8129 to transient data destination CDBC. CICS abandons the attempt to change the state of the CICS-DBCTL interface.
**User response:** This message indicates that there is a storage management problem. See any other messages issued from the CICS region to the MVS console for further guidance. You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Modules:** DFHDBCTX

---

**DFHDB8201I** The key that you pressed has no meaning on this panel.

**Explanation:** The terminal operator has pressed the wrong key when using either
- CDBI, the CICS-DBCTL support inquiry transaction (Module DFHDBIQ), or
- CDBC, the CICS-DBCTL support menu transaction (Module DFHDBME).

**System action:** CICS ignores the key pressed.

**User response:** Check the allowable keys display which appears at the bottom of the screen and try a valid key.

**Destination:** TERMCDBC

**Modules:** DFHDBIQ, DFHDBME

---

**DFHDB8202I** Selection must be one of those shown above.

**Explanation:** The terminal operator has typed in an invalid option when using CDBC, the DBCTL Support Menu Transaction.

**System action:** CICS rejects the invalid option.

**User response:** Check the allowable options that appear on the screen and choose the appropriate one.

**Destination:** TERMCDBC

**Modules:** DFHDBME

---

**DFHDB8204I** Invalid DRA startup table suffix supplied.

**Explanation:** The terminal operator has typed an invalid startup table suffix when using CDBC, the DBCTL Support Menu Transaction. The suffix must be one or two characters long consisting only of characters valid for a partitioned data set member name.

**System action:** CICS rejects the invalid Startup Table Suffix.

**User response:** Correct the startup table suffix and try again. You may need to check the suffix with your system programmer.

**Destination:** TERMCDBC

**Modules:** DFHDBME
**DFHDB8209D**  DBCTL orderly disconnection requested. Press PF5 to confirm.

**Explanation:** The terminal operator has requested that CICS should be disconnected from DBCTL in an orderly manner.

This message is not used when you are running the CDBC transaction at the console. If you are running the CDBC transaction on the console, the terminal PF5 key function (to confirm the request) is not used.

**System action:** If the PF5 key is pressed, then all tasks running in this CICS system that have already used DBCTL will complete and then CICS will disconnect from DBCTL. No new tasks running in this CICS system will be permitted to use DBCTL until CICS is connected to DBCTL again. If any other key is pressed in response to this message, CICS will not disconnect from DBCTL.

**User response:** Press the PF5 key if you wish to proceed with disconnecting CICS from DBCTL in an orderly way. If you do not wish the disconnection to proceed then press the PF3 key to terminate the transaction, or change the input data and press enter.

**Destination:** TERMCDBC

**Modules:** DFHDBME

---

**DFHDB8210D**  Connection to DBCTL is proceeding. Check CDBC TD queue.

**Explanation:** The operator has pressed PF5 in response to message DFHDB8207 or the CDBC transaction was used from the MVS operator console to connect to DBCTL. CICS issues further messages concerning the connection to the CDBC transient data destination.

**System action:** CICS proceeds with the connection attempt.

**User response:** Press PF3 to terminate the transaction. Press PF2 to refresh the status information on the screen. If you are running the CDBC transaction on the console, the PF key functions are not available. Check the CDBC transient data destination for further messages.

**Destination:** TERMCDBC

**Modules:** DFHDBME

---

**DFHDB8211D**  Orderly disconnection from DBCTL is proceeding. Check CDBC TD queue.

**Explanation:** The operator has pressed PF5 in response to message DFHDB8209. CICS issues further messages concerning the disconnection to the CDBC transient data destination. Additionally, DBCTL issues some messages to the MVS console.

**System action:** CICS proceeds with the disconnection attempt.

**User response:** You are now able to use your terminal to perform other functions. You can check to see how the disconnection attempt is proceeding by using the refresh key to refresh the CICS-DBCTL status information on the screen. In case of problems, for example, CICS does not disconnect from DBCTL, check the CDBC transient data destination.

**Destination:** TERMCDBC

**Modules:** DFHDBME

---

**DFHDB8212D**  Immediate disconnection from DBCTL is proceeding. Check CDBC TD queue.

**Explanation:** The operator has pressed PF5 in response to message DFHDB8208. CICS issues further messages concerning the disconnection to the CDBC transient data destination. Additionally, DBCTL issues some messages.

**System action:** CICS proceeds with the disconnection attempt.

**User response:** You are now able to use your terminal to perform other functions. You can check to see how the disconnection attempt is proceeding by using the refresh key to refresh the CICS-DBCTL status information on the screen. In case of problems, for example, CICS does not disconnect from DBCTL, check the CDBC transient data destination.

**Destination:** TERMCDBC

**Modules:** DFHDBME

---

**DFHDB8213**  Connection to DBCTL is already in progress. Request is ignored.

**Explanation:** The terminal operator has requested that CICS should connect to DBCTL and CICS is already trying to connect to DBCTL.

**System action:** This connection request is ignored.

**User response:** Use the PF2 key to refresh the CICS-DBCTL status information on the screen. If the “DBCTL connected and ready” message is not displayed, check the CDBC transient data destination to ensure that no errors have occurred while CICS was connecting to DBCTL. The operator should also check the MVS console as the message DFS0690 may have been issued, and be waiting for a reply.

**Destination:** TERMCDBC

**Modules:** DFHDBME
DFHDB8214 Connection to DBCTL has already been done. Request is ignored.

Explanation: The terminal operator has requested that CICS should connect to DBCTL when CICS is already connected to DBCTL.

System action: This connection request is ignored.

User response: If you did not expect DBCTL to be connected to CICS then check the CDBC transient data destination to see when CICS did connect to DBCTL (message DFHDB8101).

Destination: TERMCDBC

Modules: DFHDBME

DFHDB8215 Orderly disconnection from DBCTL in progress. Request is ignored.

Explanation: The terminal operator has either:
- Requested that CICS should disconnect from DBCTL when CICS is already disconnected from DBCTL, or
- Requested that CICS should connect to DBCTL when CICS is still disconnecting from DBCTL.

System action: This disconnection request is ignored.

User response: Use the refresh key to refresh the CICS-DBCTL status information on the screen. If the 'DBCTL not connected to CICS' message is not displayed, check the CDBC transient data destination to ensure that no errors have occurred while CICS was disconnecting from DBCTL.

Destination: TERMCDBC

Modules: DFHDBME

DFHDB8216 Immediate disconnection from DBCTL in progress. Request is ignored.

Explanation: The terminal operator has either:
- Requested that CICS should disconnect from DBCTL when CICS is already disconnected from DBCTL, or
- Requested that CICS should connect to DBCTL when CICS is still disconnecting from DBCTL.

System action: This disconnection request is ignored.

User response: Use the PF2 key to refresh the CICS-DBCTL status information on the screen. If the 'DBCTL not connected to CICS' message is not displayed, check the CDBC transient data destination to ensure that no errors have occurred while CICS was disconnecting from DBCTL.

Destination: TERMCDBC

Modules: DFHDBME

DFHDB8217 DBCTL not currently connected to CICS. Request ignored.

Explanation: The terminal operator has requested that CICS should disconnect from DBCTL when CICS is not connected to DBCTL.

System action: This disconnection request will be ignored.

User response: If you did not expect DBCTL to be disconnected from CICS then check the CDBC transient data destination to see when and why CICS did disconnect from DBCTL (message DFHDB8102). If you do not know where the CDBC destination is, then please check with your system programmer.

Destination: TERMCDBC

Modules: DFHDBME

DFHDB8218 CDBC - Please specify CONNECT or DISCONNECT.

Explanation: The terminal operator has used CDBC, the DBCTL support menu transaction, from the MVS operator console and has not selected an option.

System action: No action is taken until the operator selects an option.

User response: Select an option by typing in CDBC with a connect or disconnect option.

See the CICS Supplied Transactions for guidance on using CDBC.

Destination: TERMCDBC

Modules: DFHDBME

DFHDB8219 DBCTL connection phase 1 in progress. Request is ignored.

Explanation: The first phase of connecting CICS to DBCTL has not completed yet, but the terminal operator has requested disconnection from DBCTL.

System action: This disconnection request is ignored.

User response: Try requesting disconnection again if you wish to proceed with disconnecting CICS from DBCTL. If you still cannot disconnect then check the CDBC transient data destination to see if any messages have been issued which indicate that there are problems with the connection attempt. Also check if any messages have been issued from DBCTL.

Destination: TERMCDBC

Modules: DFHDBME
**DFHDB8220**  CICS-DBCTL connection is unusable.
Request is ignored.

**Explanation:**  A failure has occurred in the CICS-DBCTL interface.

**System action:**  Any requests to connect or disconnect from DBCTL is ignored.

**User response:**  Look for earlier messages identifying the source of the error by checking the CDBC transient data destination for any messages issued from CICS and also by checking for any messages issued from DBCTL.

**Destination:**  TERMCDBC

**Modules:**  DFHDBME

---

**DFHDB8221**  Non zero return code /rc/ from DFHDBAT. The request is ignored.

**Explanation:**  The module DFHDBAT returns a nonzero return code in reply to a request issued to DBCTL. DFHDBAT is a task-related user exit and forms part of the CICS-DBCTL interface.

**System action:**  The request to DBCTL fails.

**User response:**  See message DFHDB8110 for further guidance.

**Destination:**  TERMCDBC

**Modules:**  DFHDBME

---

**DFHDB8222**  Connection has failed. DBCTL return code is /rc/.

**Explanation:**  DBCTL rejects a request from CICS to connect to it.

**System action:**  The connection does not proceed.

**User response:**  See the IMS Messages and Codes manual for an explanation of the DBCTL return code.

**Destination:**  TERMCDBC

**Modules:**  DFHDBME

---

**DFHDB8223**  DRA startup table with suffix xx cannot be found. Request is ignored.

**Explanation:**  A connection request has been issued and the startup table with the suffix specified cannot be found.

**System action:**  The connection does not proceed.

**User response:**  If you were using the DBCTL Support Menu transaction, CDBC, check if you have mistyped the suffix value.

Place the DRA startup table in a CICS STEPLIB library. For guidance on how to do this, see the CICS IMS Database Control Guide.

**Destination:**  TERMCDBC

**Modules:**  DFHDBME

---

**DFHDB8224**  Module DFSPRRRC0 cannot be found. Connection cannot be done.

**Explanation:**  The DRA router module, DFSPRRRC0, could not be found during an attempt to connect to DBCTL.

**System action:**  The connection does not proceed.

**User response:**  Place the module DFSPRRRC0 in a CICS STEPLIB library. For guidance on how to do this, see the CICS IMS Database Control Guide.

**Destination:**  TERMCDBC

**Modules:**  DFHDBME

---

**DFHDB8225I**  applid The DBCTL ID is xxxx. The DRA Startup Table suffix is xx.

**Explanation:**  This message is issued from module DFHDBME when CDBC, the DBCTL support menu transaction, is used from the MVS operator’s console. This message is issued from module DFHDBIQ when CDBI, the DBCTL support inquiry transaction, is used from the MVS operator’s console.

**System action:**  Processing continues.

**User response:**  None.

**Destination:**  TERMCDBC

**Modules:**  DFHDBME, DFHDBIQ

---

**DFHDB8226**  There was an error starting CDBT. Disconnection from DBCTL failed.

**Explanation:**  An error has occurred, starting the disconnection transaction CDBT.

**System action:**  The disconnection attempt fails.

**User response:**  Look for earlier messages identifying the source of the error on the CDBC or CSMT transient data destinations. Check that the disconnection transaction CDBT is available. Check that the disconnection module DFHDBDSC is available.

**Destination:**  TERMCDBC

**Modules:**  DFHDBME

---

**DFHDB8227**  There was an error linking to DFHDBCON. Connection to DBCTL failed.

**Explanation:**  An attempt was made to connect to DBCTL but there was an error when linking to the connection module.

**System action:**  The connection attempt fails.

**User response:**  Look for earlier messages identifying
the source of the error on the CDBC or CSMT transient
data destinations. Check that module DFHDBCON is
available.

Destination: TERMCDDBC
Modules: DFHDBME

DFHDB8228 The period (.) and subsequent
characters have been removed.
Explanation: A comment was found at the end of the
command. The CDBM transaction has removed the
comment before sending the IMS command. Comments
start with the period character (.) and continue to the
end of the command.
System action: The IMS command is sent without the
comment.
User response: None.

Destination: Terminal End User
Modules: DFHDBMP

DFHDB8229 Spaces immediately after the CRC (/)
have been removed.
Explanation: One or more spaces were found
between the command recognition character (CRC) and
the IMS verb. The default CRC is the oblique stroke (/).
Spaces in this position would normally cause an IMS
command to fail.
System action: The CDBM transaction removes the
spaces before sending the IMS command.
User response: None. The operator should not add
spaces between the CRC and the command.

Destination: Terminal End User
Modules: DFHDBMP

DFHDB8230 The key that you pressed has no
meaning on this panel.
Explanation: The terminal operator has pressed the
wrong key.
System action: CICS ignores the key pressed.
User response: Check the display of key functions at
the bottom of the screen and try a valid key.

Destination: Terminal End User
Modules: DFHDBMP

DFHDB8231 FORCE IMS LOG END OF VOLUME
was not set to 1 or 2.
Explanation: When entering a /DBDUMP or
/DBRECOVER IMS command, the value in the FORCE
IMS LOG END OF VOLUME field must be set to either
1 or 2. If you select 1, which is the default, the
command has the NOFEOV option set; this does not
force IMS End OF LOG for this command. To override
this, select option 2; the NOFEOV option is not added.
System action: The command is not sent.
User response: Choose option 1 or 2 and press
Enter.

Destination: Terminal End User
Modules: DFHDBMP

DFHDB8232 Initial CRC (/) was not found. Reenter
the IMS command.
Explanation: The command recognition character
(CRC) is expected at the start of the command line. The
default CRC is the oblique stroke (/).
System action: The command is not sent.
User response: Reenter the command with the CRC
as the initial character.

Destination: Terminal End User
Modules: DFHDBMP

DFHDB8233 A second CRC (/) was found. Reenter
the IMS command.
Explanation: The command field can accept only one
command. A command must start with the command
recognition character (CRC). The default CRC is the
oblique stroke (/). A second CRC within the command
field is not allowed and must be removed before the
command is sent to IMS.
System action: The command is not sent.
User response: Correct the command field by
removing the second command or correcting the
command syntax.

Destination: Terminal End User
Modules: DFHDBMP

DFHDB8234 An invalid wildcard was found. Reenter
the IMS command.
Explanation: More than one database name contains
a wildcard. You can use the asterisk (*) to refer to any
number of characters, or the plus sign (+) to refer to a
single character. However, in a command you can use
wildcard characters in one database name only.
Wildcards in more than one database name are not
permitted and should be removed.
System action: The command is not sent.
User response: Remove the invalid wildcard. Either
change the first wildcard string to include the database
names matched by the second wildcard string, or
explicitly name the databases. Alternatively issue the
command with the first wildcard string, retrieve the
command by pressing F9 (Retrieve) and replace
the first wildcard string with the second. If there are other
database names within the command, you may need to
remove them before sending the command.

**Destination:** Terminal End User

**Modules:** DFHDBMP

---

**DFHDB8235** Incorrect wildcard position. Reenter
the IMS command.

**Explanation:** You can use a wildcard character in a
command only to refer to database names. In this case
a wildcard character, an asterisk (*) or plus sign (+), has
been wrongly positioned in the command.

**System action:** The command is not sent.

**User response:** Correct the command by moving the
wildcard to a position where it can refer to a database
name or names.

**Destination:** Terminal End User

**Modules:** DFHDBMP

---

**DFHDB8236** Invalid IMS command verb. Reenter
the IMS command.

**Explanation:** The command has been rejected by IMS
because the verb is not recognized as a valid IMS
operator command.

**System action:** IMS rejects the command.

**User response:** Correct the command and press
Enter.

**Destination:** Terminal End User

**Modules:** DFHDBMP

---

**DFHDB8237** Command not allowed. Enter a valid
IMS command.

**Explanation:** This command has been rejected by IMS
because it cannot be executed using the AIB
interface used by CICS.

**System action:** IMS rejects the command.

**User response:** Enter a valid IMS operator command.

**Destination:** Terminal End User

**Modules:** DFHDBMP

---

**DFHDB8238** Command not authorized. Enter a valid
IMS command.

**Explanation:** The command has been rejected by IMS
because the application or user does not have the
necessary authorization to execute the command as
entered.

**System action:** IMS rejects the command.

**User response:** Get the necessary authorization and
reissue the command.

**Destination:** Terminal End User

**Modules:** DFHDBMP

---

**DFHDB8239** aaaa call failed, AIB Return X'bbbt'
Reason X'cccc'

**Explanation:** The command has been rejected by
IMS.

**System action:** IMS rejects the command.

**User response:** For the IMS function code, examine
the AIB return code and reason code to determine the
cause of the error. See the IMS/ESA Application
Programming: Database Manager manual, SC26-8015
for an explanation of these codes.

**Destination:** Terminal End User

**Modules:** DFHDBMP

---

**DFHDB8240** DBCTL not connected. Run CDBC to
connect.

**Explanation:** CICS was unsuccessful in its attempt to
schedule the program specific block (PSB) DFHDBMP
before issuing the IMS command.

**System action:** The command is not sent.

**User response:** Ensure that the DBCTL system is
attached using the CICS supplied transaction CDBC.

**Destination:** Terminal End User

**Modules:** DFHDBMP

---

**DFHDB8241** PSB schedule unsuccessful. UIB return
codes (X'aaaa')

**Explanation:** CICS was unsuccessful in its attempt to
schedule the program specific block (PSB)
DFHDBMP before issuing the IMS command.

**System action:** The command is not sent.

**User response:** Ensure that PSB DFHDBMP is
available to your system. See the summary of abends
and return codes in the [CICS IMS Database Control
Guide](https://example.com) for an explanation of the UIB
return codes.

**Destination:** Terminal End User

**Modules:** DFHDBMP

---
Command in progress. Issue /DISPLAY command for status.

Explanation: The command sent to IMS has not returned a segment but has sent an acknowledgment.

System action: The IMS command is proceeding or has completed.

User response: Issue a /DISPLAY command to determine the status. Press F9 (Retrieve) to retrieve the IMS command and change the command to a /DISPLAY command. Alternatively press F12 (Cancel) and enter a new command to display the status.

Destination: Terminal End User

Modules: DFHDBMP

No match has been found for wildcard (aaaaaaaaa).

Explanation: CICS was unsuccessful in its attempt to match any IMS databases with the wildcard supplied.

System action: The command is not sent.

User response: Check the names of the databases required and/or the wildcard supplied.

Destination: Terminal End User

Modules: DFHDBMP

The requested command cannot be found in the command file.

Explanation: The group command entered does not exist in the command file.

System action: No action

User response: Check that the group name and command were typed correctly. A list of all available commands can be found using the browse function in the group command maintenance section of CDBM.

Destination: Terminal End User

Modules: DFHDBMP

The command file, DFHDBFK, cannot be opened.

Explanation: CDBM failed to open the command file, DFHDBFK.

System action: CDBM will not allow the user to enter the maintenance section.

User response: Determine the cause of the open failure, and correct the error. Retry selecting the maintenance option from within CDBM.

Destination: Terminal End User

Modules: DFHDBMP

An error has occurred reading the command file, DFHDBFK.

Explanation: An error occurred whilst CDBM was trying to read a record from the command file, DFHDBFK.

System action: CDBM cannot read and execute the requested group command.

User response: Determine the cause of the read failure, and correct the error. Retry issuing the group command again from within CDBM.

Destination: Terminal End User

Modules: DFHDBMP

Record not found.

Explanation: There was no record in the group command file, DFHDBFK, for the specified group and command.

System action: None.

User response: Browse the group command file to locate the correct record. If this message was issued during a browse request, clear the group and name fields and retry the browse.

Destination: Terminal End User

Modules: DFHDBMP

End of file reached during browse. Press enter to wrap.

Explanation: The end of the file was reached during a browse request on the group command file, DFHDBFK.

System action: None.

User response: Press return to browse the group command file from the beginning.

Destination: Terminal End User

Modules: DFHDBMP

A record already exists for this command in this group.

Explanation: A record with a matching group and command names already exists in the group command file, DFHDBFK.

System action: A new group command record is not added to the group command file.

User response: Check the command name is correct. If it is, use a different group name.

Destination: Terminal End User

Modules: DFHDBMP
DFHDB8250 A record must be read before updating.
Explanation: Before a record in the group command file, DFHDBFK, can be updated, it must first be read.
System action: The group command record is not updated in the group command file.
User response: Read the record and apply the changes before issuing an update request.
Destination: Terminal End User
Modules: DFHDBMP

DFHDB8251 A record must be read before deletion.
Explanation: Before a record in the group command file, DFHDBFK, can be deleted, it must first be read.
System action: The record is not deleted from the group command file.
User response: Read the record before issuing a delete request.
Destination: Terminal End User
Modules: DFHDBMP

DFHDB8252 Group and command must not be altered. Record not updated.
Explanation: The group and command fields must not be altered during a group command record update request.
System action: The record is not updated in the group command file, DFHDBFK.
User response: Add a new record with the required group and name fields. Delete the unwanted record.
Destination: Terminal End User
Modules: DFHDBMP

DFHDB8253 Group and command must not be altered. Record not deleted.
Explanation: The group and command fields must not be altered during a group command record delete request.
System action: The record is not deleted from the group command file, DFHDBFK.
User response: Read the correct record before issuing a delete request.
Destination: Terminal End User
Modules: DFHDBMP

DFHDB8254 Cannot update during browse. Read record to update.
Explanation: Before a record in the group command file, DFHDBFK, can be updated, it must first be read.
System action: The group command record is not updated in the group command file.
User response: Read the record and apply the changes before issuing an update request.
Destination: Terminal End User
Modules: DFHDBMP

DFHDB8255 Cannot delete during browse. Read record to delete.
Explanation: Before a record in the group command file, DFHDBFK, can be deleted, it must first be read.
System action: The record is not deleted from the group command file.
User response: Read the record before issuing a delete request.
Destination: Terminal End User
Modules: DFHDBMP

DFHDB8256 Both group and command must be specified.
Explanation: The group and command fields must both be specified when adding a new group command record to the group command file, DFHDBFK.
System action: A new group command record is not added to the group command file.
User response: Enter data in both the group and command fields and issue the add request.
Destination: Terminal End User
Modules: DFHDBMP

DFHDB8257 Function invalid. Must be A, B, D, R or U.
Explanation: An action requested was not valid.
System action: None.
User response: Enter a valid action letter.
Destination: Terminal End User
Modules: DFHDBMP

DFHDB8258 File [write | rewrite | delete | read | browse] failure. EIBRESP=eibresp, EIBRESP2=eibresp2.
Explanation: An unexpected error has occurred during a file operation on the group command file, DFHDBFK.
System action: The requested update to the group command file is not made.
User response: Determine the reason for the failure using the EIBRESP and EIBRESP2 values. Fix the cause of the error and retry the operation.
Destination: Terminal End User
Modules: DFHDBMP

DFHDB8259 Group command, group command, (added | updated | deleted | read | browsed).
Explanation: The operation indicated has been performed on the group command file, DFHDBFK.
System action: The group command file has been successfully modified.
User response: None.
Destination: Terminal End User
Modules: DFHDBMP

DFHDB8260 Record length exceeds screen size.
Explanation: The record read from the group command file, DFHDBFK, was found to contain more data than could be displayed on the screen.
System action: None.
User response: The data set associated with the group command file, DFHDBFK, has been created with a larger record size than allowed. Recreate the data set with the correct record size, and reload the data.
Destination: Terminal End User
Modules: DFHDBMP

DFHDB8290I DBCTL not connected to CICS.
Explanation: This message is issued when CICS is not connected to DBCTL.
If you are using the CDBC transaction, the DBCTL Support Menu transaction, then the message is issued from module DFHDBME.
If you are using the CDBI transaction, the DBCTL Support Inquiry transaction, the message is issued from module DFHDBIQ.
System action: Processing continues.
User response: None.
Destination: TERMCDBC
Modules: DFHDBME, DFHDBIQ

DFHDB8291I DBCTL connect phase 1 in progress.
Explanation: CICS is in phase 1 of connecting to DBCTL and has not yet moved into phase 2 of connection processing.
If you are using the CDBC transaction, the DBCTL Support Menu transaction, this message is issued from module DFHDBME.
If you are using the CDBI transaction, the DBCTL Support Inquiry transaction, this message is issued from module DFHDBIQ.
System action: Processing continues.
User response: Press the PF2 key to refresh the status information on the screen. Check the CDBC transient data message destination for any other messages issued from CICS concerning the CICS-DBCTL interface.
Destination: TERMCDBC
Modules: DFHDBME, DFHDBIQ

DFHDB8292I DBCTL connect phase 2 in progress.
Explanation: CICS is in phase 2 of connecting to DBCTL. (That is, phase 1 of connection has been completed and CICS has not yet heard from DBCTL that phase 2 of connection has been completed.)
If you are using the CDBC transaction, the DBCTL Support Menu transaction, this message is issued from module DFHDBME.
If you are using the CDBI transaction, the DBCTL Support Inquiry transaction, then this message is issued from module DFHDBIQ.
System action: Processing continues.
User response: Press the PF2 key to refresh the status information on the screen. Check the MVS operator console for any IMS console messages that need a reply (for example, message DFS0690).
Destination: TERMCDBC
Modules: DFHDBME, DFHDBIQ

DFHDB8293I DBCTL connected and ready.
Explanation: CICS is connected to DBCTL.
If you are using the CDBC transaction, the DBCTL Support Menu transaction, the message is issued from module DFHDBME.
If you are using the CDBI transaction, the DBCTL
Support Inquiry transaction, the message is issued from module DFHDBIQ.

**System action:** Processing continues.

**User response:** Press the PF3 key to terminate the transaction.

Press the PF2 key to refresh the status information on the screen.

Check the CDBC transient data message destination for any other messages issued from CICS concerning the CICS-DBCTL interface.

**Destination:** TERMCDBC

**Modules:** DFHDBME, DFHDBIQ

---

**DFHDB8294I DBCTL orderly disconnect in progress.**

**Explanation:** CICS is disconnecting from DBCTL in an orderly manner. (That is, all tasks using DBCTL from this CICS system will run to termination before CICS is disconnected from DBCTL.)

If you are using the CDBC transaction, the DBCTL Support Menu transaction, the message is issued from module DFHDBME.

If you are using the CDBI transaction, the DBCTL Support Inquiry transaction, the message is issued from module DFHDBIQ.

**System action:** Processing continues.

**User response:** Press the PF3 key to terminate the transaction.

Press the PF2 key to refresh the status information on the screen.

Check the CDBC transient data message destination for any other messages issued from CICS concerning the CICS-DBCTL interface.

**Destination:** TERMCDBC

**Modules:** DFHDBME, DFHDBIQ

---

**DFHDB8295I DBCTL immediate disconnect in progress.**

**Explanation:** CICS is disconnecting from DBCTL immediately. (That is, all DL/I requests issued from this CICS system and currently being processed by DBCTL will complete before CICS is disconnected from DBCTL.)

If you are using the CDBC transaction, the DBCTL Support Menu transaction, this message is issued from module DFHDBME.

If you are using the CDBI transaction, the DBCTL Support Inquiry transaction, this message is issued from module DFHDBIQ.

**System action:** Processing continues.

**User response:** Look for earlier messages identifying the source of the error by checking the CDBC transient data destination and checking any messages issued from DBCTL.

**Destination:** TERMCDBC

**Modules:** DFHDBME, DFHDBIQ

---

**DFHDB8296I DBCTL cannot be connected to CICS.**

**Explanation:** A failure has occurred in the CICS-DBCTL interface.

If you are using the CDBC transaction, the DBCTL Support Menu transaction, the message is issued from module DFHDBME.

If you are using the CDBI transaction, the DBCTL Support Inquiry transaction, the message is issued from module DFHDBIQ.

**System action:** Processing continues.

**User response:** Look for earlier messages identifying the source of the error by checking the CDBC transient data destination and checking any messages issued from DBCTL.

**Destination:** TERMCDBC

**Modules:** DFHDBME, DFHDBIQ

---

**DFHDB8297 applid CICS/DBCTL CONNECTION BEING ATTEMPTED**

**Explanation:** This message only occurs when there is no recoverable service table (RST). CICS has attempted to connect to DBCTL but has failed on one or more occasions. DBCTL may not be running, or it may be restarting after a DBCTL abend.

**System action:** CICS continues to attempt to connect every 5 seconds. This message is reissued every minute for ten minutes or until connection is made.

**User response:** Check why DBCTL is not running.

You can cancel the connection attempts using the CDBC transaction by issuing a disconnect request.
DFHDB8298  applid  An attempt has been made to connect to DBCTL via PLT phase 1. The request has been rejected.

Explanation: The attempt to connect to DBCTL has been unsuccessful.

You are using a startup PLT and the request for

DFHDBCON has been issued in PLT phase 1 processing. It can only be issued from PLT phase 2.

System action: Processing continues.

User response: Look at the source for your startup PLT. Ensure the DBCTL startup program (DFHDBCON) is after the statement specifying DFHDELIM.

Destination: Console

Modules: DFHDXAX, DFHDB8298

XMEOUT Parameter: applid

DFHDDxxxx messages

DFHDD0001  applid  An abend (code aaa/bbbb) has occurred at offset X'offset' in module modname.

Explanation: An unexpected program check or abend occurred with abend code aaa/bbbb.

The program status word (PSW) at the time of the program check or abend indicated that CICS was executing at offset X'offset' in module modname. This may have been caused by corruption of CICS code or control blocks.

System action: A system dump is taken and the system attempts to continue operation unless otherwise directed by entries in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Investigate the cause of the problem as follows:
1. Determine if the problem can be explained by any previous messages output from some other part of CICS.
2. Examine the symptom string.
3. Examine the dump.

If you cannot resolve the problem, you will need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Modules: DFHDDDM, DFHDDDI, DFHDDLO, DFHDDBR

XMEOUT Parameters: applid, aaa/bbbb, X'offset', modname

DFHDD0002  applid  A severe error (code X'code') has occurred in module modname.

Explanation: Directory Domain has received an unexpected error response from some other part of CICS. The operation requested by Directory Domain is described by code X'code'.

For further information about CICS exception trace entries, refer to the CICS Problem Determination Guide.

System action: A system dump is taken and the system attempts to continue operation unless specifically inhibited by dump table entries.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Investigate the cause of the problem as follows:
1. Determine if the problem can be explained by any previous messages output from some other part of CICS.
2. Examine the symptom string.
3. Examine the dump.

If you cannot resolve the problem, you will need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Modules: DFHDDDM, DFHDDDI, DFHDDLO, DFHDDBR

XMEOUT Parameters: applid, X'code',modname

DFHDDHxxxx messages

DFHDH0001  applid  An abend (code aaa/bbbb) has occurred at offset X'offset' in module modname.

Explanation: An abnormal end (abend) or program check has occurred in module modname. This implies that there may be an error in the CICS code.

Alternatively, unexpected data has been input, or storage has been overwritten.

The code aaa/bbbb is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not
An error has been detected in module modname.

Explanation: A severe error (code X'code') has occurred in module modname. The code X'code' is the exception trace point ID which uniquely identifies what the error is and where the error was detected.

System action: An exception entry (code X'code' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Modules: DFHDHDH, DFHDHDM, DFHDHSL

DFHME00116 Parameters: applid, X'code',modname

A possible loop has been detected at offset X'offset' in module modname.

Explanation: A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module modname at offset X'offset'. This is the offset of the instruction which was executing at the time the error was detected.

System action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Notify the system programmer. If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of processor time, this message may have been caused by a long-running function, so there may not be an error here. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the ICVR system initialization parameter, which is measured in milliseconds. This means that
module modname in the message is terminated and CICS continues.

But if you have specified ICVR=0 you consider that module modname is looping, you must terminate CICS in order to terminate the runaway function.

If CICS has terminated module modname, and you consider that it was not a runaway, you should increase the ICVR system initialization parameter. You can change the RUNAWAY time interval temporarily using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

XMEOUT Parameters: applid, X'offset', modname

---

**DFHDH0100I** applid Document domain initialization has started.

**Explanation:** This is an informational message indicating that document domain initialization has started.

**System action:** System initialization continues.

**User response:** None. The message can be suppressed with the system initialization parameter MSGLVL=0.

Destination: Console

Modules: DFHDMH

XMEOUT Parameter: applid

---

**DFHDH0101I** applid Document domain initialization has ended.

**Explanation:** This is an informational message indicating that document domain initialization has completed successfully.

**System action:** System initialization continues.

**User response:** None. The message can be suppressed with the system initialization parameter MSGLVL=0.

Destination: Console

Modules: DFHDMH

XMEOUT Parameter: applid

---

**DFHDH0105** date time applid Document template definition doctemplate has been added as {PDS-MEMBER | FILE | PROGRAM | TSQUEUE | TDQUEUE | EXITPGM | HFSFILE}(resourcename) with template name templatename.

**Explanation:** The document template definition doctemplate has been successfully added to the Document Handler domain. The template definition maps on to one of the following resources named resourcename:

- **PDS-MEMBER**
  - A member of a partitioned dataset

- **FILE**
  - A CICS file

- **PROGRAM**
  - A CICS program

- **TSQUEUE**
  - A CICS Temporary Storage queue

- **TDQUEUE**
  - A CICS Transient Data queue

- **EXITPGM**
  - A User-replaceable program that reads in a template of its own specification

- **HFSFILE**
  - A file in the z/OS UNIX System Services Hierarchical File System (HFS).

The document template is assigned a template name of templatename.

**System action:** The definition is written to the CICS global catalog and will be restored on a CICS warm start.

**User response:** Application programs can now use the template using the name templatename.

Destination: CSDH

Modules: DFHDMT

XMEOUT Parameters: date, time, applid, doctemplate, {1=PDS-MEMBER, 2=FILE, 3=PROGRAM, 4=TSQUEUE, 5=TDQUEUE, 6=EXITPGM, 7=HFSFILE}, resourcename, templatename

---

**DFHDH0106** date time applid Document template definition doctemplate has been deleted.

**Explanation:** The document template definition doctemplate has been successfully deleted from the Document Handler domain.

**System action:** The definition is removed from the CICS global catalog and will not be restored on a CICS warm start.

**User response:** Application programs can no longer use the template using the name templatename.

Destination: CSDH

Modules: DFHDMT

XMEOUT Parameters: date, time, applid, doctemplate
DFHDH0107I date time applid DD statement ddname not found. DOCTEMPLATE doctemplate is not installed.

Explanation: A document template definition specified a DDNAME value ddname, but a DD statement with that name was not present in the CICS JCL. The corresponding template data set cannot be opened.

System action: The document template doctemplate is not installed.

User response: Either restart CICS with a suitable template library allocated to DD name ddname, or use the ADYN transaction to allocate the library dynamically. The ADYN transaction is described in the CICS Customization Guide.

Destination: Console

Modules: DFHDHRP

XMEOUT Parameters: date, time, applid, ddname, doctemplate

DFHDMxxxx messages

DFHDM0001 applid An abend (code aaa/bbbb) has occurred at offset X'offset' in module modname.

Explanation: An abnormal end (abend) or program check has occurred in the module modname. This implies that there may be an error in CICS code.

Alternatively,

- Unexpected data has been input, or
- Storage has been overwritten.

The code aaa/bbbb is a three digit hexadecimal MVS code (if applicable), followed by a four digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

Either CICS will continue unless you have specified in the dump table that CICS should terminate. This action will be taken by DFHDMIQ.

Or this is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate. This action is taken by DFHDMMDM, DFHDMDS and DFHDMWQ.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Look up the MVS code, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual.

Then look up the CICS alphanumeric code in this manual. This tells you, for example, whether the error was a program check, an abend, a runaway or something else and may give you some guidance concerning user response.

You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Modules: DFHDMMDM, DFHDMEN, DFHDMENF, DFHDMIQ, DFHDMDS, DFHDMWQ

XMEOUT Parameters: applid, aaa/bbbb, X'offset', modname

DFHDM0002 applid A severe error (code X'code') has occurred in module modname.

Explanation: An error has been detected in module modname. The code code is the exception trace point ID which uniquely identifies what the error is and where the error was detected.

For further information about CICS exception trace entries, refer to the CICS Problem Determination Guide

System action: An exception entry (code code in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

Either CICS will continue unless you have specified in the dump table that CICS should terminate. This action will be taken by DFHDMIQ.
Or, this is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate. This action is taken by DFHDMDM, DFHDMDS and DFHDMWQ.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: This indicates a possible error in the CICS code. You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Modules: DFHDMDM, DFHDMEN, DFHDMENF, DFHDMIQ, DFHDMDS, DFHDMWQ

XMEOUT Parameters: applid, X'code',modname

DFHDM0003 applid Insufficient storage to satisfy GETMAIN (code X'code') in module modname.

Explanation: A CICS GETMAIN was issued by module modname, but there was insufficient storage available to satisfy the request.

The code X'code' is the exception trace point id which uniquely identifies the place where the error was detected.

This error has occurred above the 16Mb line.

System action: An exception entry is made in the trace table (code code in the message). A system dump is taken, unless you have specifically suppressed dumps in the dump table.

Either CICS continues unless you have specified in the dump table that CICS should terminate. This action is taken by DFHDMIQ.

Or this is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate. This action is taken by DFHDMDM and DFHDMWQ.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of CPU time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that the module modname is terminated and CICS continues.

But if you have declared ICVR=0 in the SIT and you consider that module modname has gone into a loop, you have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module modname and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently.

But you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM to resolve the problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Modules: DFHDMDM, DFHDMIQ, DFHDMWQ

XMEOUT Parameters: applid, X'offset', modname

DFHDM0005 applid A hardware error has occurred (module modname, code X'code'). The Time-of-Day clock is invalid.

Explanation: A hardware error has occurred during the running of module modname. The MVS Store Clock facility is the timing mechanism for the operating system.

The code code is the exception trace point id which detected in module modname at X'offset'. This is the offset of the instruction which was executing at the time the error was detected.

System action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

Either CICS continues unless you have specified in the dump table that CICS should terminate. This action is taken by DFHDMIQ.

Or this is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate. This action is taken by DFHDMDM, DFHDMDS and DFHDMWQ.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of CPU time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that the module modname is terminated and CICS continues.

But if you have declared ICVR=0 in the SIT and you consider that module modname has gone into a loop, you have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module modname and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently.

But you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM to resolve the problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Modules: DFHDMDM, DFHDMIQ, DFHDMWQ

XMEOUT Parameters: applid, X'offset', modname

DFHDM0004 applid A possible loop has been detected at offset X'offset' in module modname.

Explanation: A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module modname at X'offset'. This is the offset of the instruction which was executing at the time the error was detected.

System action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

Either CICS continues unless you have specified in the dump table that CICS should terminate. This action is taken by DFHDMIQ.

Or this is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate. This action is taken by DFHDMDM, DFHDMDS and DFHDMWQ.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of CPU time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that the module modname is terminated and CICS continues.

But if you have declared ICVR=0 in the SIT and you consider that module modname has gone into a loop, you have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module modname and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently.

But you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM to resolve the problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Modules: DFHDMDM, DFHDMIQ, DFHDMWQ

XMEOUT Parameters: applid, X'offset', modname
**unique identifies the place where the error was detected.**

**System action:** An exception entry (code code in the message) is made in the trace table. A dump is taken, unless you have specifically suppressed dumps in the dump table.

This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User response:** This is in all probability a hardware error and you should in the first instance investigate the MVS Store Clock and find out whether it is working properly. If this is the case, you should take the appropriate action to have it repaired or replaced.

In the unlikely event that this is not a hardware problem, you need further assistance from IBM to resolve the problem. See Part 4 of the [CICS Problem Determination Guide](#) for guidance on how to proceed.

**Destination:** Console

**Modules:** DFHDMDM, DFHDMWQ, DFHDMDS

**XMEOUT Parameters:** applid, modname,X'code'

**DFHDM0101I applid CICS is initializing.**

**Explanation:** This message is for information only.

CICS initialization has started. The domain (DM) manager is about to attach an initialization task for each domain defined in the local CICS catalog, DFHLCD.

**System action:** Processing continues.

**User response:** None. You can suppress this message with the system initialization parameter, MSGLVL=0.

**Destination:** Console

**Modules:** DFHDMDM

**XMEOUT Parameter:** applid

**DFHDM0102I applid CICS is quiesing.**

**Explanation:** This message is for information only.

The controlled shutdown of CICS has started. The domain (DM) manager is about to attach a quiesce task for each CICS component.

**System action:** Processing continues.

**User response:** None. You can suppress this message with the SIT parameter, MSGLVL=0.

**Destination:** Console

**Modules:** DFHDMDM

**XMEOUT Parameter:** applid

**DFHDM0103 applid Unsuccessful quiesce of domain domain. CICS will terminate.**

**Explanation:** A domain has failed to quiesce.

**System action:** CICS terminates. An exception trace and a dump are issued by the domain in error.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User response:** You need further assistance from IBM to resolve this problem. See Part 4 of the [CICS Problem Determination Guide](#) for guidance on how to proceed.

**Destination:** Console

**Modules:** DFHDMDS

**XMEOUT Parameters:** applid, domain

**DFHDM0104 applid Unsuccessful load of program domain. CICS will terminate.**

**Explanation:** The domain (DM) manager has called the loader to load a program for an initialization task but the load has failed. The module is missing from the DFHRPL concatenation, possibly because the SDFHLOAD is missing. Alternatively, if the module name given in the message is not a legitimate CICS module, the CICS catalog could be corrupted.

**System action:** CICS terminates. A system dump with dump code DM0006 is taken unless you have suppressed dumps in the dump table.

An exception trace is issued by the domain manager. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User response:** You need further assistance from IBM to resolve this problem. See Part 4 of the [CICS Problem Determination Guide](#) for guidance on how to proceed.

**Destination:** Console

**Modules:** DFHDMDM

**XMEOUT Parameters:** applid, domain

**DFHDM0105 applid Unsuccessful initialization of domain domain. CICS will terminate.**

**Explanation:** A domain has failed to initialize.

**System action:** CICS terminates.

Diagnostics are issued by the domain in error. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User response:** Review the diagnostics and take remedial action for any installation-related problems. See Part 4 of the [CICS Problem Determination Guide](#) for guidance on how to proceed.

**Destination:** Console

**Modules:** DFHDMDS

</tbody>
</table>
importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module `modname` is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module `modname`, you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** Console

**Modules:** DFHDPFM, DFHDPLM, DFHPDUM.

**XMEOUT Parameters:** `applid`, `X'code1', `modname`.

**Explanation:** A call to CICS file control from a DP domain module has received an unexpected exception response from DFHFCFR. The reason code given in the message is the reason from the FCFR parameter list on return from file control.

**System action:** The file given in the message is not usable.

The application debugging profiles manager will fail until the problem has been corrected. If the CICS supplied transaction, CADP, is being used to define debugging profiles it will fail with an ADPA abend.

The meaning of the reason code in the message is given below:

- **X'08' (FCFR_CACHE_FAILURE)**
  There has been an input/output (IO) error trying to access the debugging profiles base file, DFHDPFMB, or path file, DFHDPPFMP. Examine the console to find file control or VSAM messages that will indicate the reason for the error.

- **X'15' (FCFR_DATASET_BEING_COPIED)**
  The data set for the debugging profiles file, DFHDPFMB, is currently unavailable because it is being copied. Retry when it becomes available.

- **X'1F' (FCFR_FILE_DISABLED)**
  The file definition for the debugging profiles base data set, DFHDPFMB, or path data set, DFHDPFMP, is disabled. Enable the disabled file and retry.

- **X'20' (FCFR_FILE_NOT_OPEN)**
  The file definition for the debugging profiles base data set, DFHDPFMB, or path data set, DFHDPFMP, cannot be opened. Examine the console to find file control or VSAM messages that will indicate the reason for the error.

- **X'22' (FCFR_FILENOTFOUND)**
  A definition for the debugging profiles base file, DFHDPFMB, or path file, DFHDPFMP, could not be found. Sample definitions for these files are available and should be defined and installed before retrying.

- **X'2B' (FCFR_IO_ERROR)**
  There has been an IO error trying to access the debugging profiles base file, DFHDPFMB, or path file, DFHDPFMP. Examine the console to find file control or VSAM messages that will indicate the reason for the error.

- **X'2D' (FCFR_ISC_NOT_SUPPORTED)**
  An attempt has been made to ship a file control request but ISC=NO for the system. Determine if ISC should be YES or if the file definition should be changed so that shipping is not required and retry.

- **X'31' (FCFR_LOCKED)**
  An attempt has been made to write a record to the debugging profiles base file, DFHDPFMB, but a retained lock exists against the key of the record being written.

- **X'32' (FCFR_LOST_LOCKS)**
  There has been an IO error trying to access the debugging profiles base file, DFHDPFMB, or path file, DFHDPFMP. Examine the console to find file control or VSAM messages that will indicate the reason for the error.

- **X'33' (FCFR_LOCK_STRUCTURE_FULL)**
  There has been an IO error trying to access the debugging profiles base file, DFHDPFMB, or path file, DFHDPFMP. Examine the console to find file control or VSAM messages that will indicate the reason for the error.

- **X'37' (FCFR_NOTAUTH)**
  The user is not authorized to use the debugging profiles base file, DFHDPFMB, or path file, DFHDPFMP. If the user should have access to the files, allow access and retry.

- **X'39' (FCFR_PREVIOUS_RLS_FAILURE)**
  The debugging profiles file, DFHDPFMB, has been defined as record level sharing (RLS) but RLS is...
currently unavailable due to a failure. Investigate the reason for the RLS failure by looking for messages from file control and VSAM on the console. Retry when RLS is available.

- **X'3B' (FCFR_READ_NOT_AUTHORISED)**
  The external security manager would not allow the debugging profiles base file, DFHDPFMB, or path file, DFHDPFMP, to be accessed. If the user should have access to the files, allow access and retry.

- **X'3D' (FCFR_RECLEN_EXCEEDS_LOGGER_BFSZ)**
  A journal referenced in the definition for the debugging profiles file, DFHDPFMB, is using an MVS which in turn, is using a coupling facility structure that has been defined with a MAXBUFSIZE parameter less than the recommended 64000. Redefine the coupling facility structure that the logstream is using with a MAXBUFSIZE parameter of 64000. The journal in error can be the forward recovery log or the journal used for auto-archiving.

- **X'46' (FCFR_RLS_DISABLED)**
  The debugging profiles file, DFHDPFMB, has been defined as record level sharing(RLS) but RLS is currently disabled. Investigate why RLS is disabled by examining the console for file control and VSAM messages. Retry when RLS is available.

- **X'47' (FCFR_RLS_FAILURE)**
  The debugging profiles file has been defined as record level sharing(RLS) but RLS is currently unavailable due to a failure. Investigate the reason for the failure by examining the console for file control and VSAM messages. Retry when RLS is available.

- **X'4B' (FCFR_SERVREQ_VIOLATION)**
  The definition for the debugging profiles base file, DFHDPFMB, or path file, DFHDPFMP, does not allow all types of file request to be issued. Alter the file definitions to allow all file requests and retry.

- **X'4E' (FCFR_SUPPRESSED)**
  A user exit has suppressed the writing of records to the debugging profiles base file, DFHDPFMB, or path file, DFHDPFMP. The exit should not be allowed to suppress records being written to these files. Correct the exit and retry.

- **X'4F' (FCFR_SYSIDERR)**
  The SYSID for the file definition for the debugging profile base file, DFHDPFMB, or path file, DFHDPFMP, specifies a name that is neither the local CICS region nor a remote system defined to CICS by a CONNECTION definition. SYSIDERR can also occur if the link to the remote system is closed. Correct the SYSID or reopen the link and retry.

- **X'52' (FCFR_TIMEOUT)**
  A request to file control has timed out. Investigate the reason for the timeout by examining the console for messages.

- **X'58' (FCFR_UPDATE_NOT_AUTHORISED)**
  The external security manager would not allow the debugging profiles base file, DFHDPFMB, or path file, DFHDPFMP, to be accessed. If the user should have access to the files, allow access and retry.

- **X'59' (FCFR_VSAM_REQUEST_ERROR)**
  There has been an IO error trying to access the debugging profiles base file, DFHDPFMB, or path file, DFHDPFMP. Examine the console to find file control or VSAM messages that will indicate the reason for the error.

**User response:** Investigate and correct the error based on the reason given and retry.

**Destination:** Console

**Modules:** DFHDPFM, DFHDPLM, DFHDPUM.

**XMEOUT Parameters:** applid, X'code',modname, filename

---

**DFHDP0200** _applid_ Debug Tool is back level. LE debugging profiles may be defined but not used on this system.

**Explanation:** CICS is running with a level of Debug Tool which is older than Version 3.1.

**System action:**

- The CADP transaction and the web interface can be used to define debugging profiles and they can be activated. However, Debug Tool will not be able to use these profiles.
- **User response:** If you do not intend to perform LE debugging on this system or you only want to use CADP and the web interface to define profiles for use on another CICS region which does have Debug Tool at least at the version 3.1 level, then no action is required. If the intention is to use LE debugging profiles on this CICS, then Debug Tool version 3.1 or later must be installed.

**Destination:** Console

**Modules:** DFHDPFM

**XMEOUT Parameter:** applid

---

**DFHDP0300** _applid num_ debugging profile(s) have been inactivated.

**Explanation:** The transaction CIDP or the program DFHDPPIN has been run to inactivate all currently active debugging profiles. _num_ debugging profiles have been inactivated.

**System action:** None.

**User response:** None.

**Destination:** Console

**Modules:** DFHDPIN.

**XMEOUT Parameters:** applid, num
The file DFHDPFMB is not available. No debugging profiles have been inactivated.

**Explanation:** The transaction CIDP or the program DFHDPIN has been run to inactivate all currently active debugging profiles. It was not possible to inactivate the profiles as the CADP file DFHDPFMB was not available.

**System action:** Inactivation is canceled.

---

**DFHDSxxxx messages.**

**DFHDS0001** `applid` An abend (code `aaa/bbbb`) has occurred at offset `X'offset` in module `modname`.

**Explanation:** An abnormal end (abend) or program check has occurred in module `modname`. This implies that there may be an error in CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code `aaa/bbbb` is a three digit hexadecimal MVS code (if applicable), followed by a four digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

**System action:** An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table. CICS continues unless you have specified in the dump table that CICS should terminate.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User response:** If CICS is still running, it is necessary to decide whether to terminate CICS.

1. Look up the MVS code, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual.
2. Next, look up the CICS alphanumeric code in this manual. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.
3. If module `modname` is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.
4. If you cannot run without the full use of module `modname` you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the [CICS Problem Determination Guide](#) for guidance on how to proceed.

---

**DFHDS0002** `applid` A severe error (code `X'code'`) has occurred in module `modname`.

**Explanation:** An error has been detected in module `modname`. The code `X'code'` is the exception trace point id which uniquely identifies what the error is and where the error was detected. For further information about CICS exception trace entries, see the [CICS Problem Determination Guide](#).

**System action:** An exception entry (code `code` in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

Either CICS will continue unless you have specified in the dump table that CICS should terminate.

If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message will be issued to this effect.

Or this is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

The system action taken depends on the context.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User response:** Inform the system programmer. This indicates a possible error in CICS code. The severity of its impact will depend on the importance of the function being executed at the time of the error.

CICS may not have been terminated.

If the message occurs once and module `modname` is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

---

Chapter 1. DFH messages 319
If the message recurs or if you cannot run without the full use of module modname, you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** Console

**Modules:** DFHDSAT, DFHDSBR, DFHDSDM, DFHDSDS2, DFHDSDS3, DFHDSDS4, DFHDSIT, DFHDSE, DFHDSSM, DFHDSSR, DFHDST, DFHDSTCB, DFHDSUE

**XMEOUT Parameters:** applid, X'code', modname

---

**DFHDS0003** applid Insufficient storage (code X'code') in module modname.

**Explanation:** A CICS GETMAIN was issued by module modname but there was insufficient storage available to satisfy the request.

The code X'code' is the exception trace point id which uniquely identifies the place where the error was detected. This error has occurred above the 16M line.

**System action:** An exception entry is made in the trace table (code code in the message). A system dump is taken, unless you have specifically suppressed dumps in the dump table. CICS will continue unless you have specified in the dump table that CICS should terminate.

If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message will be issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User response:** Inform the system programmer. If CICS has not been terminated, it will be necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of CPU time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS will purge a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module modname will be terminated and CICS will continue.

But if you have declared ICVR=0 in the SIT and you consider that module modname has gone into a loop, you will have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module modname, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You will have to bring CICS down at a suitable time to do this permanently. But you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** Console

**Modules:** DFHDSAT, DFHDSBR, DFHDSDM, DFHDSDS2, DFHDSDS3, DFHDSDS4, DFHDSIT, DFHDSE, DFHDSSM, DFHDSSR, DFHDST, DFHDSTCB, DFHDSUE

**XMEOUT Parameters:** applid, X'offset', modname

---

**DFHDS0004** applid A possible loop has been detected at offset X'offset' in module modname.

**Explanation:** A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module modname at offset X'offset'. This is the offset of the instruction which was executing at the time the error was detected.

**System action:** An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table. CICS will continue unless you have specified in the dump table that CICS should terminate. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User response:** Inform the system programmer. If CICS has not been terminated, it will be necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of CPU time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS will purge a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module modname will be terminated and CICS will continue.

But if you have declared ICVR=0 in the SIT and you consider that module modname has gone into a loop, you will have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module modname, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You will have to bring CICS down at a suitable time to do this permanently. But you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** Console

**Modules:** DFHDSAT, DFHDSBR, DFHDSDM, DFHDSDS2, DFHDSDS3, DFHDSDS4, DFHDSIT, DFHDSE, DFHDSSM, DFHDSSR, DFHDST, DFHDSTCB, DFHDSUE

**XMEOUT Parameters:** applid, X'offset', modname
DFHDS0005  applid A hardware error has occurred (code X'code', module modname). The Time-of-Day clock is invalid.

Explanation:  A hardware error has occurred during the running of module module. The MVS Store Clock facility is the timing mechanism for the operating system.

The code X'code' is the exception trace point ID which uniquely identifies the place where the error was detected.

System action:  An exception entry (code code in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table. This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response:  Inform the system programmer. This is in all probability a hardware error and you should in the first instance investigate the MVS Store Clock and find out whether it is working properly. If this is the case, you should take the appropriate action to have it repaired or replaced.

In the unlikely event that this is not a hardware problem, you will need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination:  Console

Modules:  DFHDSTCB

XMEOUT Parameters:  applid, X'code',modname

---

DFHDS0006  applid Insufficient storage to satisfy GETMAIN (code X'code') in module modname. MVS code mvscode.

Explanation:  An MVS GETMAIN was issued by module modname but there was insufficient storage available to satisfy the request.

The code code is the exception trace point ID which uniquely identifies the place where the error was detected.

This error may occur either above or below the 16M line. This depends on context.

The code mvscode is the MVS GETMAIN return code.

System action:  An exception entry is made in the trace table (code code in the message). A system dump is taken, unless you have specifically suppressed dumps in the dump table.

Either CICS will continue unless you have specified in the dump table that CICS should terminate.

If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message will be issued to this effect.

Or this is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

The system action depends on the context.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response:  Inform the system programmer. If CICS has been terminated by another module, look out for the relevant termination messages (from, for example, the domain manager), and look up the user response suggested for these messages.

If CICS is still running, the problem may be a temporary one which will right itself if more storage becomes available. If you can manage without module modname, you may decide to continue and bring CICS down at a convenient time to resolve the problem. If the message recurs or if you cannot run without the full use of all CICS modules, you should bring CICS down in a controlled shutdown.

You can get diagnostic information about the MVS return code by consulting the relevant MVS codes manual which is listed in the book list at the front of this book.

Try decreasing the overall size limits of the DSAs or EDSAs. Or, try increasing the size of the whole region, if it is not already at maximum size. If CICS is not already terminated, you will need to bring CICS down to do this. See the CICS System Definition Guide or the CICS Performance Guide for more information on CICS storage.

You may need further assistance from IBM to fully resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination:  Console

Modules:  DFHDSAT, DFHDSDM, DFHDSDS2, DFHDSSR

XMEOUT Parameters:  applid, X'code',modname, mvscode

---

DFHDS0010  applid Kill request accepted for transaction id transid, transaction number tranum, userid userid.

Explanation:  A request to kill a CICS task has been accepted.

System action:  The CICS task has been marked to be killed. The kill will be actioned as soon as possible.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response:  Check for subsequent messages or abend codes to determine the state of the task when
the kill was actioned and the possible repercussions of the kill.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Modules: DFHDSAT

XMEOUT Parameters: applid, transid, tranum, userid

---

DFHDS0011 applid Kill request reaccepted for transaction id transid, transaction number tranum, userid userid.

Explanation: A request to kill a CICS task has been reaccepted. A kill has previously been accepted for this task but has not been actioned yet.

System action: The CICS task has been marked to be killed. The kill will be actioned as soon as possible. Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Check for subsequent messages or abend codes to determine the state of the task when the kill was actioned and the possible repercussions of the kill.

Note: Do not attempt to reroute this message to a transient data queue.

Destination: Console

Modules: DFHDSAT

---

DFHDUxxxx messages

DFHDU0001 applid An abend (code aaa/bbbb) has occurred at offset X’offset in module modname.

Explanation: An abnormal end (abend) or program check has occurred in module modname. This implies that there may be an error in CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code aaa/bbbb is a three digit hexadecimal MVS code (if applicable), followed by a four digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System action: An exception entry is made in the trace table.

For module DFHDUDT, a system dump is taken unless you have specifically suppressed the dumps (by a user exit program at the XDUREQ exit, in the dump table or by global system dump suppression). CICS processing continues unless you have specified in the dump table that CICS should terminate.

For module DFHUTM, a system dump is taken. This dump cannot be suppressed. CICS processing continues.

For module DFHDUDU, a system dump cannot be taken as doing so could cause CICS to loop. CICS processing continues.

For other modules, a system dump is taken. CICS processing continues.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual.

Then look up the CICS alphanumeric code in this manual. This tells you, for example, whether the error
was a program check, an abend, a runaway or a recovery percolation, and may give you some guidance concerning user response.

If module modname is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module modname, you should bring CICS down in a controlled shutdown.

If the abend occurred in modules DFHDUDT or DFHDUTM, the dump table is not available. Therefore, any EXEC API commands relating to dump codes fail and any dumps taken are processed using default information (for example, whether to terminate CICS or not) rather than information you may have put on the dump table for specific dump codes.

You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Modules: DFHDUDT, DFHDUTM

XMEOUT Parameters: applid, 'modname'

DFHDU0002 applid A severe error (code X'code') has occurred in module modname.

Explanation: An error has been detected in module modname. The code code is the exception trace point ID which uniquely identifies what the error is and where the error was detected. For further information about CICS exception trace entries, refer to the CICS Problem Determination Guide.

System action: An exception entry (code code in the message) is made in the trace table.

For module DFHDUDT, a system dump is taken unless you have specifically suppressed the dumps (by a user exit program at the XDUREQ exit, in the dump table or by global system dump suppression). CICS processing continues unless you've specified in the dump table that CICS should terminate.

For module DFHDUTM, a system dump is taken. This dump cannot be suppressed. CICS processing continues.

If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller. A message will be issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Inform the system programmer. This indicates a possible error in CICS code. The severity of its impact will depend on the importance of the function being executed at the time of the error.

CICS may not have been terminated.

If the message occurs once and module modname is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module modname you should bring CICS down in a controlled shutdown.

If the error occurred in modules DFHDUDT or DFHDUTM, the dump table may not be available. Therefore, any EXEC API commands relating to dump codes may fail and any dumps taken may be processed using default information (for example, whether to terminate CICS or not) rather than information you may have put on the dump table for specific dump codes.

You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Modules: DFHDUDT, DFHDUTM

XMEOUT Parameters: applid, 'X'code', modname

DFHDU0004 applid A possible loop has been detected at offset X'offset' in module modname.

Explanation: A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module modname at offset X'offset'. This is the offset of the instruction which happened to be executing at the time when the error was detected.

System action: An exception entry is made in the trace table.

For module DFHDUDT, a system dump is taken unless you have specifically suppressed the dumps (by a user exit program at the XDUREQ exit, in the dump table or by global system dump suppression). CICS processing continues unless you have specified in the dump table that CICS should terminate.

For module DFHDUTM, a system dump is taken. This dump cannot be suppressed. CICS processing continues.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Notify the system programmer. If CICS has not been terminated, it will be necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of CPU time, this message may have been caused by a long-running...
function. So there may not be an error here. Usually, CICS will purge a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module modname will be terminated and CICS will continue.

If you have declared ICVR=0 in the SIT and you consider that module modname has gone into a loop, you will have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module modname, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. But you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**XMEOUT Parameters:** applid, X'offset', modname

---

As the problem is in module DFHDUTM, EXEC API commands for browsing the dump tables may not work, or additions to the dump tables may not work.

You can get diagnostic information about the MVS return code by consulting the relevant MVS codes manual which is listed in the book list at the front of this book.

Try decreasing the size limit of the DSAs or EDSAs. Or, try increasing the size of the whole region, if it is not already at maximum size. If CICS is not already terminated, you need to bring CICS down to do this.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Modules:** DFHDUTM

---

**DFHDU0006** applid Insufficient storage to satisfy Getmain (code X'code') in module modname. MVS code mvscode.

**Explanation:** An MVS GETMAIN was issued module modname, but there was insufficient storage available to satisfy the request.

The code X'code' is the exception trace point id which uniquely identifies the place where the error was detected. This error has occurred above the 16M line. The code mvscode is the MVS GETMAIN return code.

**System action:** An exception entry is made in the trace table (code code in the message) and a system dump is taken. This dump cannot be suppressed. CICS processing continues.

**User response:** Inform the system programmer. If CICS has been terminated by another module, look out for the relevant termination messages (from, for example, the domain manager), and look up the user response suggested for these messages.

If CICS is still running, the problem may be a temporary one which will right itself if more storage becomes available. If you can manage without module modname, you may decide to continue and bring CICS down at a convenient time to resolve the problem. If the message recurs or if you cannot run without the full use of all CICS modules, you should bring CICS down in a controlled shutdown.

---

**DFHDU0102** applid DFHDUIO could not be loaded. Transaction dump is inoperative.

**Explanation:** CICS could not locate module DFHDUIO during initialization.

**System action:** An exception trace entry is produced, and CICS continues with the transaction dump facility inoperative.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User response:** Use the exception trace entry and any other relevant messages to determine why module DFHDUIO was not available.

**Destination:** Console

**Modules:** DFHDUDM

**XMEOUT Parameter:** applid

---

**DFHDU0103** applid An abend has occurred during initialization of dump domain in module DFHDUDM.

**Explanation:** A dump domain has failed to initialize.

**System action:** CICS terminates.

An exception trace and a kernel dump are issued by the dump domain. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** Console

**Modules:** DFHDUDU

**XMEOUT Parameter:** applid
**DFHCU0201** applid About to take SDUMP.

**Dumpcode:** dumpcode, **Dumpid:** dumpid.

**Explanation:** An error, possibly signalled by a previous message, has caused a call to the CICS dump (DU) domain. Dump domain will issue this message immediately before calling the MVS SDUMP facility if the following conditions are satisfied:
- The SIT option, DUMP=YES, for SDUMPS has been specified.
- The dump table entry for dump code dumpcode specifies that a system SDUMP is required.
- The maximum dump limit for this dump code in the dump table entry has not been exceeded.
- The user exit XDUREQ does not suppress the taking of this dump.

The dump code dumpcode is an 8-character system dump code identifying the CICS problem. However some of these characters may be blanks. A system dump code is a CICS message number with the DFH prefix removed.

The dumpid dumpid is the unique 9-character string identifying this dump.

**System action:** When the dump is complete, message number DFHCU0202 is issued.

**User response:** Inform the system programmer, who should refer to the CICS message indicated by dumpcode to resolve the problem.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Modules:** DFHUDU

---

**DFHCU0203I** date time applid A transaction dump was taken for dumpcode: dumpcode, Dumpid: dumpid.

**Explanation:** A CICS transaction has abnormally terminated, possibly signalled by a previous message, and the CICS dump (DU) domain has taken a transaction dump.

The dump code dumpcode is normally the 4-character CICS transaction abend code if the dump was requested as a result of a transaction abend. It may also be the value of the DUMPCODE operand on an EXEC CICS DUMP TRANSACTION request.

The dump ID dumpid is the unique 9-character string identifying this dump.

**System action:** A transaction dump is written to the current CICS dump data set, either DFHDMPA or DFHDMPB.

CICS may terminate if the dump table entry for the specified abend code specifically requests it.

**User response:** Print off the transaction dump if required.

**Destination:** CDUL

**Modules:** DFHUDU

*XMEOUT Parameters:* date, time,applid, dumpcode, dumpid

---

**DFHCU0205** applid A system dump for dumpcode: dumpcode was suppressed by the reason.

**Explanation:** An error, possibly signalled by a previous message, has caused a call to the CICS (DU) dump domain, which failed to take a system dump for reason reason. Reason reason indicates what has caused dump suppression.

- The XDUREQ user exit.
- The dump table option for dump code dumpcode.
- The global system dump suppression option.

The dump code dumpcode is an 8-character system dump code identifying the CICS problem. However some of these characters may be blanks. A system dump code is a CICS message number with the DFH prefix removed.

**System action:** A system dump is not produced.

However, CICS is terminated if the dump table entry for this dump code or the caller of the dump domain requests CICS termination.

**User response:** If a system dump is required for this dump code, perform the user action appropriate to the reason reason given in the message.
If the user exit XDUREQ has suppressed the dump, either inactivate this exit, or as a more permanent measure change the user exit program to suppress the dump.

If the dump table has suppressed the dump, use CEMT or CECI to browse and update the dump table entry for dump code dumpcode.

If the global system dump suppression option has suppressed the dump, specify DUMP=YES on the SIT to allow future system dumps to be taken.

The SIT DUMP option can be over-ridden by using CEMT or the system programming interface for SET SYSTEM DUMPING (NOSYSDUMP|SYSDUMP).

The user exit XDUREQ may be called before the dump is taken.

**DFHDUDU206I date time applid A transaction dump for dumpcode: dumpcode was suppressed by the reason.**

**Explanation:** A CICS transaction has abnormally terminated, possibly signalled by a previous message, and the CICS dump (DU) domain has failed to take a transaction dump for the reason reason. Reasons reason indicates the reason for dump suppression.

- XDUREQ user exit.
- Dump table option for this dump code.

The dump code dumpcode is the 4-character CICS transaction abend code.

**System action:** A transaction dump is not produced. However, CICS is terminated if the dump table entry for this dump code or the caller of the dump domain makes such a request.

**User response:** If a transaction dump is required for this dump code, perform the user action appropriate to the reason reason given in the message.

- If the user exit XDUREQ has suppressed the dump, either inactivate this exit, or as a more permanent measure change the user exit program so it does not suppress the dump.
- If the dump table has suppressed the dump, use CEMT or CECI to browse and update the dump table entry for dump code dumpcode.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Modules:** DFHDUDU

**DFHDUDU208I applid SDUMP busy - CICS will retry in five seconds.**

**Explanation:** At the time of the MVS SDUMP request issued by CICS, another address space in the same MVS system was in the process of taking an SDUMP. This caused MVS to reject the new request. A non-zero value for the DURETRY parameter on the SIT means that CICS is waiting for five seconds before reissuing the SDUMP request.

**System action:** CICS issues an MVS STIMERM macro which caused CICS to stop for five seconds. The request is reissued when the delay interval has expired.

CICS will delay and retry every five seconds for a total time equal to the number of seconds specified on the DURETRY SIT parameter.

**User response:** None.
Note: This message cannot be changed with the message editing utility.

Destination: Console

Modules: DFHDUDU

DFHDU0209 applid Retrying SDUMP.

Explanation: At the time of the MVS SDUMP request issued by CICS, another address space in the same MVS system was in the process of taking an SDUMP. This caused MVS to reject the new request. CICS has waited for five seconds (as indicated by message DFHDU0208) and is now about to reissue the SDUMP request.

System action: CICS reissues the SDUMP request.

User response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Modules: DFHDUDU

DFHDU0210 applid SDUMPX REQUEST FAILED - reason.

Explanation: An MVS SDUMPX request from CICS signalled by message DFHDU0201 has failed to complete successfully. The possible reasons, (reason), for the failure are as follows:

SDUMPX RETURN CODE X'nn' REASON X'mm'

SDUMPX BUSY

At the time of the MVS SDUMPX request issued by CICS, another address space in the same MVS system was in the process of taking an SDUMP. This causes MVS to reject the new request. If a nonzero value is specified for the DURETRY SIT parameter, CICS retries the SDUMPX request every five seconds for the specified period. This message is only issued if SDUMPX is still busy after the final retry.

SDUMPX RETURN CODE X'nn' REASON X'mm'

SDUMPX BUSY

No SYS1.DUMP data sets were available at the time the SDUMPX request was issued.

SDUMPX RETURN CODE X'nn' REASON X'mm'

MVS has rejected the SDUMPX request for some other reason than those listed above. X'nn' gives the SDUMPX return code and X'mm' gives the SDUMPX reason code.

STIMERM FAILED

In order to delay for five seconds before retrying SDUMPX after an SDUMPX BUSY condition, CICS issues an MVS STIMERM macro request. MVS has indicated that the STIMERM request has failed.

NOT AUTHORIZED IN CICS

SDUMP is not authorized for this CICS run.

INSUFFICIENT STORAGE

CICS issued an MVS GETMAIN for Subpool 253 storage during the processing of the SDUMPX request. The GETMAIN has been rejected by MVS.

DFHDUSVC FESTAE FAILED

CICS issued an MVS FESTAE request from DFHDUSVC during the processing of the SDUMPX request. The FESTAE has been rejected by MVS.

IWMWQWRK RETURN CODE X'xx' REASON X'yy'

REMOTE DUMPS NOT TAKEN

CICS issued an MVS IWMWQWRK request during the processing of the SDUMPX request for dumps of related CICS systems. The IWMWQWRK request has been rejected by MVS return code X'xx' and reason X'yy'. In this case CICS was unable to dump related CICS address spaces but has attempted to dump the local address space.

DFHDUSVC INVALID PROBDESC

The SDUMPX PROBDESC parameters, created by DFHDUSVC, contain invalid data.

System action: CICS proceeds as if the dump had been successful.

User response: The user response depends on the reason, (reason), for the failure.

SDUMPX RETURN CODE X'nn' ONLY PARTIAL DUMP.

See the OS/390 MVS Programming: Authorized Assembler Services Reference for an explanation of the SDUMPX return code X'nn'. Use MVS problem determination methods to determine why a partial dump was taken.

SDUMPX RETURN CODE X'nn' REASON X'mm'

SDUMPX BUSY

Cause the SDUMP to be reissued after, if appropriate, increasing the value of the DURETRY system initialization parameter. See the OS/390 MVS Programming: Authorized Assembler Services Reference for an explanation of the SDUMPX return code X'nn' and reason X'mm'.

SDUMPX RETURN CODE X'nn' REASON X'mm'

SDUMPX BUSY

Clear a SYS1.DUMP data set and then cause the SDUMP request to be reissued. See the OS/390 MVS Programming: Authorized Assembler Services Reference for an explanation of the SDUMPX return code X'nn' and reason X'mm'.

Chapter 1. DFH messages 327
SDUMPX RETURN CODE X'nn' REASON X'mm'

No action is required if the dump was suppressed deliberately. If the dump has failed because of an error in the MVS SDUMP routine, use MVS problem determination methods to fix the error and then cause the SDUMP request to be reissued. See the OS/390 MVS Programming: Authorized Assembler Services Reference for an explanation of the SDUMPX return code X'nn' and reason code X'mm'.

STIMERM FAILED

Use MVS problem determination methods to fix the STIMERM failure and then cause the SDUMP request to be reissued.

NOT AUTHORIZED IN CICS

This reason is unlikely to occur because SDUMPX is unconditionally authorized during CICS initialization, and should be authorized throughout the CICS run. If you do get this reason, the CICS AFCB (authorized function control block) has probably been accidentally overwritten.

INSUFFICIENT STORAGE

Ensure sufficient storage is available to MVS for subpool 253 requests.

DFHDUSVC FESTAE FAILED

Use MVS problem determination methods to fix the FESTAE failure and then cause the SDUMP request to be reissued. See the OS/390 MVS Programming: Authorized Assembler Services Reference for an explanation of the FESTAE macro.

IWMWQWRK RETURN CODE X'xx' REASON X'yy'.

CICS issued an MVS IWMWQWRK request during the processing of the SDUMPX request. The IWMWQWRK request has been rejected by MVS return code X'xx' and reason X'yy'. See the OS/390 MVS Programming: Authorized Assembler Services Reference for an explanation of the return and reason codes.

DFHDUSVC INVALID PROBDESC

The SDUMPX PROBDESC parameters, created by DFHDUSVC during the processing of the SDUMPX request, are invalid. The PROBDESC parameters have probably been accidentally overwritten.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Modules: DFHDUDU

DFHDU0211 applid THE XDUREQ USER EXIT IS NOT CALLED FOR DUMPCODE dumpcode.

Explanation: Because of a severe system error, the XDUREQ user exit (which allows you to suppress system dumps) has not been called for system dump dumpcode.

System action: The XDUREQ user exit is not called.

DFHDU0211 is followed either by message DFHDU0201, indicating that dump dumpcode was taken, or by message DFHDU0205, indicating that dump dumpcode was suppressed. Message DFHDU0201 or DFHDU0205 is followed by message DFHDU0309 if CICS terminates.

The XDUREQ user exit is called for subsequent system dumps.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Modules: DFHDUDU

DFHDU0212 applid Requested transaction dump code dumpcode is invalid.

Explanation: A requested transaction dump code has unprintable characters, or has leading or imbedded blanks.

System action: A transaction dump is produced unless suppressed by the user exit XDUREQ. However, no dump statistics are committed. The transaction dump is complete when message DFHDU0203 is issued. The invalid dump code is shown in dump domain (DU) trace points X'0600' and X'0601'.

User response: Print off the transaction dump and determine how an abend or EXEC CICS request was issued with an invalid dump code.

Destination: Console

Modules: DFHDUDU

XMEOUT Parameters: applid, dumpcode

DFHDU0213 REMOTE SDUMPX REQUEST FAILED - reason.

Explanation: A remote MVS SDUMPX request from CICS has failed to complete successfully. The possible reasons, (reason) for the failure are as follows:

DFHDUMPX AUTOMATIC STORAGE GETMAIN FAILED.

CICS issued an MVS GETMAIN for Subpool 253.

DFHDU0213 is followed either by message DFHDU0201, indicating that dump dumpcode was taken, or by message DFHDU0205, indicating that dump dumpcode was suppressed. Message DFHDU0201 or DFHDU0205 is followed by message DFHDU0309 if CICS terminates.

The XDUREQ user exit is called for subsequent system dumps.
DFHDUMPX NOT RUNNING IN THE MASTER ADDRESS SPACE.
DFHDUMPX must run in the MASTER address space. CICS stops processing the remote SDUMPX request if it detects that DFHDUMPX is running in another address space.

IWMWQWRK NOT RUNNING IN THE MASTER ADDRESS SPACE.
The MVS IWMWQWRK service found no CICS address spaces with work relating to the remote SDUMPX request. IWMWQWRK FAILED WITH AN ERROR.
CICS issued an MVS IWMWQWRK request from DFHDUMPX during the processing of the remote SDUMPX request. MVS has rejected the IWMWQWRK request with an error return code.

IWMWQWRK FAILED WITH A WARNING.
The IWMWQWRK return code and reason are included in a CICS trace entry which is written to the GTF data set. The trace entry is not written to the CICS internal trace or in the CICS auxiliary trace data set because DFHDUMPX does not execute under a CICS TCB.

IWMWQWRK FAILED WITH AN ERROR.
The IWMWQWRK return code and reason are included in a CICS trace entry which is written to the GTF data set. The trace entry is not written to the CICS internal trace or in the CICS auxiliary trace data set because DFHDUMPX does not execute under a CICS TCB.

DFHDUMPX OUTPUT WORKAREA GETMAIN FAILED
CICS issued an MVS GETMAIN for Subpool 253 storage during the processing of the SDUMPX request. The GETMAIN has been rejected by MVS.

DFHDUMPX RECOVERY ROUTINE ENTERED
An abnormal end (abend) or program check has occurred in DFHDUMPX. This implies that there is an error in CICS code.
Alternatively, unexpected data has been input, or storage has been overwritten.
CICS adds diagnostic data to the MVS SDWA and makes an entry in SYS1.LOGREC.

System action: CICS proceeds as if the dump had been successful.
User response: The user response depends on the reason, (reason), for the failure.

DFHDUMPX AUTOMATIC STORAGE GETMAIN FAILED.
Ensure sufficient storage is available to MVS for subpool 253 requests.

DFHDUMPX NOT RUNNING IN THE MASTER ADDRESS SPACE.
This reason is unlikely to occur because CICS requests that the MVS CSVDYNEX service adds DFHDUMPX as an IEASDUMP.QUERY exit in the MASTER address space.

If you do get this reason, there was probably an error during CICS initialization.
Notify the system programmer.
You will need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

IWMWQWRK FOUND NO ADDRESS SPACES TO DUMP.
This is unlikely to be an error. DFHDUMPX is invoked on all the MVS images in a SYSPLEX for a remote SDUMPX request. Some of the images may not have any CICS address spaces with work relating to the CICS system which originated the remote SDUMPX request.

IWMWQWRK FAILED WITH AN ERROR.
The IWMWQWRK return code and reason are included in a CICS trace entry which is written to the GTF data set. The trace entry is not written to the CICS internal trace or in the CICS auxiliary trace data set because DFHDUMPX does not execute under a CICS TCB.

See the OS/390 MVS Programming: Authorized Assembler Services Reference for an explanation of the IWMWQWRK return code and reason.

IWMWQWRK FAILED WITH AN ERROR.
The IWMWQWRK return code and reason are included in a CICS trace entry which is written to the GTF data set. The trace entry is not written to the CICS internal trace or in the CICS auxiliary trace data set because DFHDUMPX does not execute under a CICS TCB.

See the OS/390 MVS Programming: Authorized Assembler Services Reference for an explanation of the IWMWQWRK return code and reason.

DFHDUMPX OUTPUT WORKAREA GETMAIN FAILED
Ensure sufficient storage is available to MVS for subpool 253 requests.

DFHDUMPX RECOVERY ROUTINE ENTERED
Notify the system programmer.
To resolve the problem, collect any data from SYS1.LOGREC, any dumps and any relevant messages. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Note: This message cannot be changed with the message editing utility.

Destination: Console
Modules: DFHDUMPX
DFHDU0214 DFHDUMPX IS ABOUT TO REQUEST A REMOTE SDUMP.

Explanation: DFHDUMPX is called under the MVS IEASDUMP.QUERY exit and determines whether a remote dump should be taken.

DFHDUMPX issues this message immediately before returning to MVS if the following conditions are satisfied:
- a dump has been requested for a CICS dump code, whose dump table entry specified that related dumps are required, and DFHDUMPX has found related CICS work on this MVS image or
- the operator requested remote dumps from the console, including the CICS DFHJOBN keyword in the MVS PROBDESC parameters, and DFHDUMPX has found CICS jobs on this MVS image which match the DFHJOBN data.

System action: Processing continues.

User response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Modules: DFHDUMPX

DFHDU0215 DFHDUMPX IS ABOUT TO SUPPRESS A REMOTE SDUMP.

Explanation: DFHDUMPX is called under the MVS IEASDUMP.QUERY exit and determines whether a remote dump should be taken.

DFHDUMPX issues this message immediately before returning to MVS if it has found that a remote dump should be suppressed.

The remote dump is suppressed under the following conditions:
- A dump has been requested for a CICS dump code, whose dump table entry specified that related dumps are required, and DFHDUMPX has found no related CICS work on this MVS image or
- The operator requested remote dumps from the console, including the CICS DFHJOBN keyword in the MVS PROBDESC parameters, and DFHDUMPX has found no CICS jobs on this MVS image which match the DFHJOBN data.

The remote dump is also suppressed if an error occurred during the DFHDUMPX processing. Look for a previous DFHDU0213 message to find the reason for the error.

System action: Processing continues.

User response: To determine whether action is necessary refer to any DFHDU0213 message preceding this one.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Modules: DFHDUMPX

DFHDU0216 PROBDESC DOES NOT CONTAIN CICS DATA.

Explanation: DFHDUMPX is called under the MVS IEASDUMP.QUERY exit and determines whether a remote dump should be taken.

DFHDUMPX issues this message if it has found that the SDUMPX PROBDESC parameters do not contain CICS data. It is probable that this is not an error and that the remote dump was requested by a product other than CICS. However, if you were expecting a CICS remote dump it could be that the PROBDESC parameters were accidentally overwritten.

System action: DFHDUMPX will request that MVS suppresses the remote dump and then processing continues.

User response: You need to take the action only if you were expecting a remote CICS dump.

Notify the system programmer.

To resolve the problem, collect any data from GTF trace, any dumps and any relevant messages. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Modules: DFHDUMPX

DFHDU0217 applid SDUMPX request completed with a return code of X'04'. A complete or partial dump has been taken.

Explanation: An MVS SDUMPX request from CICS signalled by message DFHDU0201 may have resulted in a complete or partial SVC dump. Even though the request completed with an SDUMPX return code X'04', it is possible that sufficient information has been dumped to enable successful diagnosis of the problem that caused the dump to be taken. The accompanying message(s) IEA611E/IEA911E should be used to determine the suitability of the dump for successful diagnosis.

System action: CICS proceeds as if the dump had been successful.

User response: See the OS/390 MVS Programming: Authorized Assembler Services Reference for an explanation of the SDUMPX return code X'04'.
Note: This message cannot be changed with the message editing utility.

Destination: Console

Modules: DFHDUDU

# DFHDU0218 No PROBDESC parameters supplied to DFHDUMPX.

# Explanation: A remote MVS SDUMPX request has failed to complete successfully because there were no SDUMPX PROBDESC parameters supplied.

# MVS invokes DFHDUMPX under the IEASDUMP.QUERY exit and without the SDUMPX PROBDESC parameters DFHDUMPX cannot determine whether to take or suppress a remote dump.

# This is only an error if the remote SDUMPX request was made by CICS for a system dump code that included the RELATED option, or if the operator entered a remote SDUMPX request that included PROBDESC parameters. This is not an error if another non-CICS component intentionally calls DFHDUMPX without PROBDESC.

# System action: CICS proceeds as if the dump had been successful.

# User response: If you believe this is an error you will require further assistance from IBM to resolve this problem. Collect data from GTF trace, dumps, and any relevant messages. Then see Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

# Note: This message cannot be changed with the message editing utility.

# Destination: Console

# Modules: DFHDUDU

# DFHDU0302I applid Transaction Dump Data set dataset to be closed due to text-descr

Explanation: This message is output when attempting to write a record to the transaction dump data set. text-descr is one of the following:

- DCB ABEND
- TASK TIMEOUT
- TASK CANCEL

System action: None unless text-descr is DCB ABEND, in which case an exception entry is made in the trace table and a system dump is taken.

User response: Notify the system programmer.

In the case of DCB ABEND, there will normally be an accompanying MVS error message to help identify the problem with the data set.

If the problem is not due to a major corruption of CICS, successful switching of dump data sets will reinstate the transaction dump environment. Otherwise, the transaction dump environment will be available only if the XDUOUT user-exit is active.

Destination: Console

Modules: DFHDUIO

XMEOUT Parameters: applid, dataset, text-descr

DFHDU0303I applid Transaction Dump Data set dataset closed.

Explanation: This message is issued in one of the following situations:

- A request to close the dump data set is issued by the operator.
- The CICS system is shut down.
- A request to switch between dump data sets is issued by the operator.
- A transaction dump data set becomes full.

The insert dataset indicates the name of the data set being closed.

System action: Processing continues.

User response: Notify the system programmer.

In the case of DCB ABEND, there will normally be an accompanying MVS error message to help identify the problem with the data set.

If the problem is not due to a major corruption of CICS, successful switching of dump data sets will reinstate the transaction dump environment. Otherwise, the transaction dump environment will be available only if the XDUOUT user-exit is active.

Destination: Console

Modules: DFHDUSU

XMEOUT Parameters: applid, dataset

DFHDU0304I applid Transaction Dump Data set dataset opened.

Explanation: This message is output when any of the following situations occur:

- A request to open the dump data set is issued by the operator.
- The CICS system is brought up.
- A request to switch between dump data sets is issued by the operator.
- Automatic switching between dump data sets is being performed.

Dataset in the message indicates the name of the data set being opened.

System action: Processing continues.

User response: None.

Destination: Console

Modules: DFHDUSU
DFHDU305I applid Transaction Dump Data set switched to ddname

Explanation: This message is issued when one of the following situations occurs:
- A command is issued by the operator to switch dump data sets.
- Automatic switching is being performed between dump data sets due to a dump data set being full.

This message is always preceded by message DFHDU0304 and also, if the old dump data set was open, by message DFHDU0303.

ddbname in the message indicates the ddname of the active transaction dump data set (either DFHDMPA or DFHDMPB).

System action: Processing continues.

User response: Print or copy the completed dump data set, and if required, reissue the command CEMT SET DUMP AUTO.

Destination: Console

Modules: DFHDUSU

XMEOUT Parameters: applid, dataset

DFHDU306 applid Unable to open Transaction Dump Data set dataset - text-descr

Explanation: This message occurs when attempting to open a transaction dump data set.

text-descr is one of:
OPEN ERROR
An attempt was made to open the dump data set, and an abend exit was invoked. This condition is usually accompanied by MVS system messages.
INSUFFICIENT STORAGE
An MVS GETMAIN was issued to obtain storage below the 16MB line. This request was unsuccessful.

System action: An exception entry is made in the trace table.

In both cases, the transaction dump data set is not open, and unless the XDUOUT exit is active, the transaction dump is inoperative.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: See any associated MVS messages for further guidance.

Destination: Console

Modules: DFHDUIO

XMEOUT Parameters: applid, dataset, text-descr

DFHDU0307 applid Module DFHDUIO is unavailable.
Transaction dump is inoperative.

Explanation: This message is issued either when an attempt is made to open or close a dump data set, or when switching between dump data sets, to remind the user that CICS could not locate module DFHDUIO during initialization. CICS will have issued message DFHDU0102 during initialization to warn the user of this condition.

System action: CICS continues with the transaction dump facility inoperative.

User response: If necessary, refer to the user response for message DFHDU0102.

Destination: Console

Modules: DFHDUSU

XMEOUT Parameter: applid

DFHDU308I applid CICS will terminate because the Dump Table entry for the transaction dump code: dumpcode specifies shutdown.

Explanation: This message is issued when a transaction dump has been requested for the transaction dump code dumpcode and the associated dump table entry specifies that CICS should be terminated.

This message records that it was a transaction dump table entry which requested the termination of CICS.

System action: CICS is terminated.

User response: Process any transaction dump in the normal way.

On a warm or emergency start, explicitly defined dump table entries are restored from the catalog. If the dump table entry for dumpcode was explicitly defined, it can be modified to prevent CICS from terminating, if desired, using CEMT or EXEC API commands.

Implicitly defined dump table entries are not recorded on the catalog and are therefore not restored. On a cold or initial start, CICS does not restore the dump table from the catalog.

Destination: Console

Modules: DFHDUDU

XMEOUT Parameters: applid, dumpcode

DFHDU0309I applid CICS will terminate because the Dump Table entry for the system dump code: dumpcode specifies shutdown.

Explanation: This message is issued when a system dump has been requested for the system dump code dumpcode and the associated dump table entry specifies that CICS should be terminated.
This message records that it was a system dump table entry which requested the termination of CICS.

**System action:** CICS is terminated.

**User response:** Print off any system dump if required.

On a warm or emergency start, explicitly defined dump table entries are restored from the catalog. If the dump table entry for `dumpcode` was explicitly defined, it can be modified to prevent CICS from terminating using CEMT or EXEC API commands.

Implicitly defined dump table entries are not recorded on the catalog and are therefore not restored. On a cold or initial start, CICS does not restore the dump table from the catalog.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Modules:** DFHDUDU

---

**DFHDU0310 applid XDUCLSE auto-switch request overridden. Transaction dump data sets are too small.**

**Explanation:** This message is issued when

- the transaction dump is too large to fit in the current dump data set.
- a request to auto-switch between transaction dump data sets is issued by the XDUCLSE user-exit.
- the transaction dump is too large to fit in the newly opened dump data set.
- a second request to auto-switch between transaction dump data sets is issued by XDUCLSE.

**System action:** CICS can not write the transaction dump to a transaction dump data set because the data sets are too small. CICS closes the data sets and processing continues.

**User response:** Inform the system programmer.

You need to bring CICS down and increase the space allocation for the transaction dump data sets to resolve this problem.

You may decide to delay terminating CICS until a convenient time. You can issue the command CEMT SET DUMP OPEN to reinstate the transaction dump environment but you will continue to lose any dumps that are too large to be written to the data sets.

**Destination:** Console

**Modules:** DFHDUSU

**XMEOUT Parameter:** applid

---

**DFHDU1601 DATA SET READ ERROR.**

**Explanation:** The access method has indicated a read error. The dump data set may not have been opened during the most recent CICS execution.

**System action:** The record is skipped.

**User response:** Either ensure that the JCL is correct, or determine the reason for the read errors.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Modules:** DFHDU640

---

**DFHDU1602 36 CONSECUTIVE UNIDENTIFIABLE RECORDS, DUMP UTILITY TERMINATED.**

**Explanation:** An identification record has an incorrect code or format. The most common reasons for this error include the following.

- The wrong data set is being processed.
- The dump data set that the utility is trying to process has not been used in the current CICS execution.

In the latter case, the error would arise because no dumps were produced in the current execution or because the data sets had been switched.

**System action:** Records are skipped and execution is terminated with a return code of 8.

**User response:** Ensure that the correct data set is being processed. Alternatively, check for a possible error in the dump control program, DFHDCP.

If two dump data sets are being used, check that the data set being processed has been used before in the current CICS execution.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Modules:** DFHDU640

---

**DFHDU1603 NO (DUMP I PRINT) DATA SET DD CARD (DFHMPDS I DFHPRINT), DUMP UTILITY TERMINATED.**

**Explanation:** A dump or a print data set was not successfully opened.

**System action:** If it was a dump data set that failed to open successfully, the system prints the message on the print data set and terminates execution with a return code of 12.

If it was the print data set that failed to open successfully, the system terminates execution with a return code of 16.
**User response:** If the JCL is correct with the stated ddnames as in the message, determine why the data set cannot be opened. The return codes are issued by DFHDU640. They only identify whether a dump or print data set failed.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Modules:** DFHDU640

---

**DFHDU1604 END OF FILE ENCOUNTERED, LAST DUMP MAY BE INCOMPLETE.**

**Explanation:** The dump data set has been filled.

**System action:** The dump utility program DFHDU640 terminates.

**User response:** Check that the dump is complete and that no incomplete message is at the end of it. If there is an incomplete message at the end of the dump, the last dump in the data set may not contain all the information required. You should recreate the problem to try and get a complete dump. If dump data set auto-switching was active at the time the dump was taken, a complete version of the dump is present on the alternate dump data set.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Modules:** DFHDU640

---

**DFHDU1609 36 READ ERRORS ENCOUNTERED, DUMP UTILITY TERMINATED.**

**Explanation:** The access method has indicated 36 invalid records in the dump data set. The most probable cause of this problem is an invalid end-of-file marker which caused the access method to attempt to read beyond the last record in the data set. This problem may also have been caused if:

- DFHDU640 has been run with a data set that has never been accessed by CICS before. The data set may contain an invalid type of record format.
- DFHDU640 has been run with a data set that has been copied with the wrong block size and record format.

**System action:** The dump utility execution is terminated with a return code of 8 from DFHDU640.

**User response:** Determine and correct the reason for the access failure. Recreate the dump if necessary.

**Note:** This message cannot be changed with the message editing utility.
DFHDXXX messages

**DFHDX8300I applid GETMAIN REQUEST FAILED.**
**NOT ATTEMPTING TO CONNECT TO ALTERNATE SYSTEMS.**

**Explanation:** The CICS system, with specific applid given, was unable to obtain working storage to control the sequencing of DBCTL connection attempts defined in the RST. (Recovery Service Table).

**System action:** CICS attempts to connect only to the DBCTL subsystem defined in the DBCTL start-up table.

**User response:** The working storage can be above the 16MB line so the GETMAIN request is unlikely to fail for genuine lack of space. If the error is persistent it may be necessary to cancel CICS with a dump to resolve the problem.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Modules:** DFHDXAX

**DFHDX8301I applid LOAD REQUEST FAILED FOR rstname. NOT ATTEMPTING TO CONNECT TO ALTERNATE SYSTEMS.**

**Explanation:** The CICS system, with the specific applid given, was unable to load the RST rstname while looking for the names of alternative DBCTL subsystems to which to connect.

**System action:** CICS will attempt to connect only to the DBCTL subsystem defined in the DBCTL start-up table.

**User response:** Check that the RST suffix in the SIT is correct and that the RST is actually present in the authorized library.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Modules:** DFHDXAX

**DFHDX8302I applid VALIDATION FAILED FOR rstname. NOT ATTEMPTING TO CONNECT TO ALTERNATE SYSTEMS.**

**Explanation:** The CICS system, with the specific applid given, found that the RST rstname was invalid.

It is unable to use it to look for the names of alternative DBCTL subsystems to which to connect.

**System action:** CICS will attempt to connect only to the DBCTL subsystem defined in the DBCTL start-up table.

**User response:** Check why DBCTL is not restarting. You can cancel the connection using the CDBC transaction.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Modules:** DFHDXAX

**DFHDX8303 applid DELETE REQUEST FAILED FOR rstname.**

**Explanation:** The CICS system, with the specific applid given, was unable to delete the RST rstname after completing an attempt to connect to a DBCTL subsystem.

**System action:** CICS continues normally.

**User response:** If the error is persistent it may be necessary to cancel CICS with a dump to resolve the problem.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Modules:** DFHDXAX

**DFHDX8304 applid CICS/DBCTL RECONNECTION IN PROGRESS.**

**Explanation:** This message occurs in an XRF environment only. It occurs when CICS attempts to connect to DBCTL but believes that DBCTL is restarting.

The message is displayed two minutes after the attempted connection, and then after each subsequent minute.

**System action:** CICS continues to attempt to reconnect.

**User response:** Check why DBCTL is not restarting.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Modules:** DFHDXAX

**DFHDX8309 applid Unable to detach subtask during CICS termination.**

**Explanation:** CICS has detected that a subtask,
attached during CICS XRF support of DBCTL, cannot be detached during CICS termination.

System action: CICS abends with code A03.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: None. This abend occurs as a result of a previous error. Check for earlier DFHDX832x, DFHDX833x, or DFHDX834x error messages for further information and guidance.

Destination: Console

Modules: DFHAPDM

XMEOUT Parameter: applid

---

DFHDX8310I applid Initiating catch-up tasks.

Explanation: The catch-up transaction, CXCU, has received control.

System action: The catch-up transaction is about to initiate the catch-up tasks for specific functional areas.

User response: None. This is simply a “work is in progress” message. You can suppress this message with the system initialization parameter, MSG_LVL=0.

Destination: Console

Modules: DFHCXCU

XMEOUT Parameter: applid

---

DFHDX8311I applid System initialized with XRF=NO. Catch-up transaction CXCU took no action.

Explanation: The catch-up transaction, CXCU, was invoked but the CICS system specified XRF=NO. Catchup functions are not relevant.

System action: The catch-up transaction terminates normally without taking any action.

User response: None.

Destination: Console

Modules: DFHCXCU

XMEOUT Parameter: applid

---

DFHDX8312I applid Catch-up transaction failed to run program proiname. Catch-up is incomplete.

Explanation: The catch-up transaction, CXCU, running on the CICS system with specific applid given, was unable to call the specific catch-up service routine proiname. This may be either DFHDXCU (DBCTL catch-up) or DFHZXCU (terminal catch-up).

System action: The catch-up associated with routine proiname is not performed.

The active and alternate CICS systems continue, but the alternate will be less effective in the event of a takeover.

User response: Retry by entering ‘CXCU’ from a terminal. If the error persists check that the routine proiname is present in the load library.

Destination: Console

Modules: DFHCXCU

XMEOUT Parameters: applid, proiname

---

DFHDX8313I applid Catch-up transaction failed.

Explanation: The catch-up transaction, CXCU, running on the CICS system with specific applid given, has failed. CXCU runs either in response to a transaction request from an end-user, or automatically by an active CICS system in response to the appearance of an alternate CICS system. Its purpose is to inform the alternate of the active’s state regarding terminals and DBCTL connection.

System action: The CXCU transaction abends with a dump and transaction abend code ACXA.

Both active and alternate CICS systems continue, but the alternate will be less effective in the event of a takeover. For example, terminal backup sessions may not be established.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Retry by entering ‘CXCU’ from a terminal. If the error persists diagnose problem from the dump.

Modules: DFHCXCU

XMEOUT Parameter: applid

---

DFHDX8315I applid XRF DBCTL state catch-up starting.

Explanation: The catch-up transaction to transmit the active’s DBCTL state to the alternate has been started on the CICS system with specific applid named.

System action: None.

User response: None. You can suppress this message with the system initialization parameter, MSG_LVL=0.

Destination: Console

Modules: DFHCXCU

XMEOUT Parameter: applid
DFHDX8316I applid XRF DBCTL state catch-up ending.

Explanation: The catch-up transaction to transmit the active's DBCTL state to the alternate has been completed on the CICS system with specific applid given.

System action: None.

User response: None. You can suppress this message with the system initialization parameter, MSGLVL=0.

Destination: Console

Modules: DFHDXCU

XMEOUT Parameter: applid

DFHDX8317I applid XRF DBCTL state catch-up ignored for reason nn.

Explanation: The XRF DBCTL catch-up transaction has been invoked on the CICS system with the given specific applid.

Although this system has DL/I installed, and an RST has been specified in the SIT, catch-up for DBCTL has proved unnecessary for reason nn, where nn may be one of the following.

Reason Meaning

01 DBCTL has not been used yet.
02 XRF DBCTL has not been used yet.
03 There is no connection state information to send.
04 The system is running with XRF=NO.
05 There is no alternate CICS to which to send state data.

System action: None. No catch-up is needed.

User response: None. You can suppress this message with the system initialization parameter, MSGLVL=0.

Destination: Console

Modules: DFHDXCU

XMEOUT Parameters: applid, nn

DFHDX8319I applid XRF DBCTL state catch-up failed.

Explanation: The XRF DBCTL catch-up transaction has been invoked on the CICS system with the given specific applid.

The transaction has failed.

System action: The DBCTL catch-up transaction is terminated with a dump. The transaction abend code is ADXB.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Check for any other messages relating to CAVM data set problems for further information and guidance.

Destination: Console

Modules: DFHDXCU

XMEOUT Parameter: applid

DFHDX8320I applid DBCTL Restart processing completed after DBCTL failure.

Explanation: The user exit XXDFA requested a restart of DBCTL. The restart was initiated successfully.

System action: The active CICS continues normally and will attempt to reconnect to DBCTL.

User response: None. You can suppress this message with the SIT parameter, MSGLVL=0.

Destination: Console

Modules: DFHDCT

XMEOUT Parameter: applid

Chapter 1. DFH messages 337
**DFHDX8321** applid Unable to determine JES affiliation of DBCTL subsystem for reason X’nn’.

**Explanation:** CICS can offer full XRF support only if the DBCTL to which it is connected is running under the same JES as CICS itself.

**nn** may be one of the following.

<table>
<thead>
<tr>
<th>n</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X’09’</td>
<td>MVS GETMAIN failure.</td>
</tr>
<tr>
<td>X’10’</td>
<td>MVS ATTACH failure.</td>
</tr>
</tbody>
</table>

**System action:** The active CICS continues, but in the event of failure, CICS will not attempt to restart DBCTL automatically.

**User response:** None.

**Destination:** Console

**Modules:** DFHDBCT

**XMEOUT Parameters:** applid, X’nn’

**DFHDX8322** applid LOAD request failed for xxxxxxxx. DBCTL/XRF support will not be provided for this connection.

**Explanation:** CICS has been notified of a DBCTL failure, but has been unable to load the specified Recovery Service Table (RST) to determine if XRF support is required.

**System action:** CICS continues as if no XRF support had been requested for the failing DBCTL subsystem.

**User response:** Re-link-edit a valid RST into STEPLIB. DBCTL may have to be restarted manually.

**Destination:** Console

**Modules:** DFHDBCT

**XMEOUT Parameters:** applid, xxxxxxxx

**DFHDX8323** applid Unable to complete search for DBCTL alternate.

**Explanation:** CICS has been notified of a DBCTL failure, but has been unable to complete the search for a DBCTL alternate, possibly due to an unexpected return code from an IEFSSREQ request.

**System action:** CICS continues as if no DBCTL alternate had been found. An ADDI transaction dump will be produced. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Note:** It may be necessary to restart DBCTL manually.

**Destination:** Console

**Modules:** DFHDBCT

**XMEOUT Parameters:** applid, xxxxxxxx

**DFHDX8324** applid Unable to restart DBCTL xxxxxxxx for reason X’nn’.

**Explanation:** CICS was unable to restart DBCTL owing to an internal failure indicated by the value of n. n may be one of the following.

<table>
<thead>
<tr>
<th>n</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X’08’</td>
<td>An MVS GETMAIN failed.</td>
</tr>
<tr>
<td>X’09’</td>
<td>An MVS ATTACH failed.</td>
</tr>
</tbody>
</table>

**System action:** The active CICS continues but was not able to restart DBCTL automatically. However, it will attempt to reconnect to DBCTL in the normal way.

**User response:** It may be necessary to restart DBCTL manually.

**Destination:** Console

**Modules:** DFHDBCT

**XMEOUT Parameters:** applid, xxxxxxxx, X’nn’

**DFHDX8325** applid Restart command issued unsuccessfully to subsysid for reason X’xx’ X’yy’.

**Explanation:** The user exit XXDFA requested a restart of DBCTL. The restart request was issued to subsysid but was rejected with hexadecimal reason codes X’xx’ and X’yy’.

**System action:** The active CICS continues normally and will attempt to reconnect to DBCTL.

**User response:** It may be necessary to restart DBCTL manually.

**Destination:** Console

**Modules:** DFHDBCT

**XMEOUT Parameters:** applid, subsysid, X’xx’, X’yy’

**DFHDX8326** applid DBCTL state message lost owing to message services error.

**Explanation:** The active CICS system was unable to report a change of DBCTL connection status to the alternate.

**System action:** The active system writes an error entry in its CAVM status record, but otherwise continues normally.

**User response:** Check for any other messages relating to CAVM data set problems.

**Note:** Were the CICS alternate to take over now it might try to restart the wrong DBCTL. There would be no database...
integrity exposure but there might some loss of availability as well as operational inconvenience. It may be preferable to cancel the alternate and restart it, either manually or via an overseer.

**Destination:** Console  
**Modules:** DFHDBCT  
**XMEOUT Parameter:** applid

---

DFHDX8327 applid DBCTL state message lost owing to CAVM services failure.

**Explanation:** The active CICS system was unable to report a change of DBCTL connection status to the overseer.

**System action:** Processing continues.

**User response:** Check for any other CICS messages relating to CAVM data set problems (DFH66xx).

Were the overseer to oversee a takeover now it might try to restart the wrong DBCTL. There would be no database integrity exposure but there might some loss of availability as well as operational inconvenience.

If the overseer is being used to control XRF takeovers then disconnecting and reconnecting to the DBCTL will cause a re-write of the status record.

**Destination:** Console  
**Modules:** DFHDBCT  
**XMEOUT Parameters:** applid

---

DFHDX8328 applid Unable to determine Jes affiliation of (jobname, jobid).

**Explanation:** CICS can offer full XRF support only if the DBCTL to which it is connected is running under the same JES as CICS itself.

**System action:** The active CICS continues, but, in the event of failure, CICS will not attempt to restart DBCTL automatically.

**User response:** It is recommended that DBCTL should be run under the same JES as the active CICS system.

The message indicates that either a system or set-up problem has occurred. If there is a system problem then message DFHDX8321 will also be displayed.

**Destination:** Console  
**Modules:** DFHDBCT  
**XMEOUT Parameters:** applid, jobname, jobid

---

DFHDX8329 applid Restart request after DBCTL failure ignored for reason X’nn’.

**Explanation:** The user exit XXDFA requested a restart of DBCTL. This request has been ignored for the reason indicated by nn.

The reason code nn should be one of the following.

<table>
<thead>
<tr>
<th>nn</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X’09’</td>
<td>There is no alternate DBCTL to be restarted.</td>
</tr>
<tr>
<td>X’10’</td>
<td>Possibly, the DBCTL subsystem is under a different JES from the active CICS system.</td>
</tr>
<tr>
<td>X’11’</td>
<td>The DBCTL subsystem was an IMS DB/DC system.</td>
</tr>
</tbody>
</table>

**System action:** The active CICS continues as if the user exit had indicated ‘no action’.

**User response:** Check that the user exit is performing as intended and that the CICS and DBCTL systems have been set up with the correct options.

**Destination:** Console  
**Modules:** DFHDBCT  
**XMEOUT Parameter:** applid, X’nn’

---

DFHDX8330 applid IMS DB/DC region has requested XRF support.

**Explanation:** This message is produced when CICS connects to an IMS system for which the user has requested XRF support (via the RST), but which is unable to participate in XRF. For example, in an IMS/DC system without the XRF option.

**System action:** The system continues to run without XRF.

**User response:** Either enable IMS/DC for XRF, or remove SSID from RST.

**Destination:** Console  
**Modules:** DFHDBCT  
**XMEOUT Parameter:** applid

---

DFHDX8331 applid CAVM message input service error xxxxxxxx, X’nn’, xxxxxxxx.

**Explanation:** The alternate CICS system task responsible for tracking the DBCTL connection status of the active CICS has received an error response from the CAVM message input service.

**System action:** The tracking transaction terminates. No further action will be taken in response to DBCTL status changes. The global exits XXDFB and XXDTO will never be invoked and no attempt at a DBCTL restart will be made in the event of a takeover. An ADMA transaction dump is produced.

**User response:** Check for any other messages
relating to CAVM data set problems. In the event of a takeover it may be necessary to restart DBCTL manually.

**Destination:** Console  
**Modules:** DFHDBCR  
**XMEOUT Parameters:** applid, xxxxxxxx, X'nn'

---

**DFHDX8332I** applid Connection to xxxxxxxx notified after xxxxxxxx failure initiated takeover.

**Explanation:** The alternate CICS system task responsible for tracking the DBCTL connection status of the active CICS has received a message from the CAVM message input service, after a takeover decision from the global user exit XXDFB has been accepted.

This problem is usually caused by a setup or an operational error.

**System action:** The takeover continues. If the message is a notification of a successful connection, then the global user exit XXTDO may be driven.

**User response:** In order for the active CICS system to reconnect to an element of the RSE, a DBCTL must have been restarted in the active CEC. Consequently, the alternate CICS will not be able to restart an element of the RSE in the alternate CEC without terminating this new active DBCTL.

The global user exit XXTDO will be driven as part of CICS takeover processing. This exit could be used to request a takeover of the DBCTL that was restarted in the active CEC.

Locate and correct any setup or operational errors.

**Destination:** Console  
**Modules:** DFHDBCR  
**XMEOUT Parameters:** applid, xxxxxxxx, xxxxxxxx

---

**DFHDX8333** applid Unrecognized message type xxxxxxxx received by DBCTL tracking task.

**Explanation:** The alternate CICS system task responsible for tracking the DBCTL connection status of the active CICS has received an unrecognized message from the CAVM message input service.

**System action:** The tracking transaction terminates. No further action will be taken in response to DBCTL status changes. The global exits XXDFB and XXTDO will never be invoked and no attempt at a DBCTL restart will be made in the event of a takeover. An ADMB transaction dump is produced. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User response:** In the event of a takeover it may be necessary to restart DBCTL manually.
In the event of a takeover it may be necessary to restart DBCTL manually.

**Destination:** Console

**Modules:** DFHDBC

**XMEOUT Parameter:** applid

---

**DFHDX8336** applid Unable to provide DBCTL/XRF support for reason: X'nn'.

**Explanation:** The user exit XXDFB or XXDTO requested a restart of DBCTL. This request has been ignored for the reason indicated by the value of nn.

nn Meaning
---
X'46' No valid RST was found. Refer to DFHDX8334.
X'50' DBCTL subsystem is an IMS DB/DC system.
X'51' There is no alternate DBCTL to be restarted.
X'52' The DBCTL subsystem is, or may be, under a different JES from the active CICS system.
X'53' The active CICS system has already attempted a restart of DBCTL.

**System action:** The alternate CICS continues as if the user exit had indicated 'no action'.

**User response:** Check that the user exit is performing as intended and that the CICS and DBCTL systems have been set up with the correct options.

**Destination:** Console

**Modules:** DFHDBC

**XMEOUT Parameters:** applid, X'nn'

---

**DFHDX8337** applid Takeover request rejected by CAVM, reason code X'nn'.

**Explanation:** The user exit XXDFB requested a takeover as a result of a DBCTL failure, but the CAVM rejected the takeover request.

**System action:** The alternate CICS continues as if the user exit had indicated 'no action'.

**User response:** Check that the user exit is performing as intended and that the CICS and DBCTL systems have been set up with the correct options. The message indicates that a CICS internal error has occurred, normally as a result of an earlier problem. It may be necessary to initiate a manual CICS takeover.

**Destination:** Console

**Modules:** DFHDBC

**XMEOUT Parameters:** applid, X'nn'

---

**DFHDX8338** applid Unable to issue command command to subsysid for reason X'nn'.

**Explanation:** The user exit XXDFB/XXDTO issued a restart request to the DBCTL/XRF tracking task, the task was unable to process the request for the reason indicated in the message.

The issued command should either be a switch system backup command or an ERE command.

The reason code X'nn' should be one of the following.

nn Meaning
---
X'09' MVS GETMAIN failure
X'10' MVS ATTACH failure.

**System action:** The takeover continues.

**User response:** Restart the DBCTL subsystem manually.

**Destination:** Console

**Modules:** DFHDBC

**XMEOUT Parameters:** applid, command, subsysid, X'nn'

---

**DFHDX8339** applid command command issued unsuccessfully to subsysid for reason X'nn'.

**Explanation:** The DBCTL/XRF tracking task issued a restart command (either switch or ERE) to an alternate DBCTL subsystem but the request was rejected for reason nn.

XXDFB or XXDTO requested CICS takeover with DBCTL. The error was detected when the request was made.

**System action:** The takeover continues.

**User response:** Restart the DBCTL subsystem manually.

**Destination:** Console

**Modules:** DFHDBC

**XMEOUT Parameters:** applid, command, subsysid, X'nn'

---

**DFHDX8340** applid DBCTL tracking task started in an invalid environment reason X'nn'.

**Explanation:** The alternate CICS system task responsible for tracking the DBCTL connection status of the active CICS has been started in an environment which does not support DBCTL/XRF.

Reason code X'nn' may be one of the following.

nn Meaning
---
X'65' XRF=NO specified in the SIT.
X'67' CICS system is running as active.
X'69'  MVS GETMAIN failure.

**System action:**  The tracking transaction terminates. No further action will be taken in response to DBCTL status changes. The global exits XXDFB and XXDTO will never be invoked and no attempt at a DBCTL restart will be made in the event of a takeover.

**User response:**  The user response depends on the reason code issued.

For reasons X'65' and X'67', there is a possible error in CICS code. In this case you will need further assistance from IBM. See Part 4 of the [CICS Problem Determination Guide](#) for guidance on how to proceed.

For reason X'69', specify a smaller overall size limit for the EDSAs.

**Destination:**  Console

**Modules:**  DFHDBC

**XMEOUT Parameter:**  applid

---

**DFHDX834I**  applid  Takeover request accepted.

**Explanation:**  The DBCTL/XRF tracking task issued a takeover request due to a request from user exit XXDFB. The request has been accepted.

**System action:**  The takeover continues.

**User response:**  None. You can suppress this message with the system initialization parameter MSGLVL = 0.

**Destination:**  Console

**Modules:**  DFHDBC

**XMEOUT Parameter:**  applid

---

**DFHEJxxxx messages**

**Note:**  Due to messages being displayed in single columns, the text for message DFHEJ5114, in this section, does not appear exactly as it does when issued by CICS. Classes com.ibm.ejs.ns.jndi.CNInitialContextFactory and com.ibm.websphere.naming.WsnInitialContextFactory have been split to maintain column width but should be read as shown here:

```text
com.ibm.ejs.ns.jndi.CNInitialContextFactory
com.ibm.websphere.naming.WsnInitialContextFactory
```

**DFHEJ0001**  applid  An abend (code aaaa/bbbb) has occurred at offset X'offset' in module modname.

**Explanation:**  An abnormal end (abend) or program check has occurred in module modname. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code aaaa/bbbb is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

**System action:**  An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

**User response:**  Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS. Look up the MVS code, if there is one, in the relevant MVS codes manual. Next, look up the CICS alphanumeric code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module modname is not crucial to the running of your
CICS system, you may decide to continue and bring CICS down at a convenient time to resolve the problem. If you cannot continue without the full use of module modname you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Modules: DFHEJ**

XMEOUT Parameters: applid, X'offset', modname

---

**DFHEJ0002** applid A severe error (code X'code') has occurred in module modname.

Explanation: An error has been detected in module modname. The code X'code' is the exception trace point ID which uniquely identifies what the error is and where the error was detected.

System action: An exception entry (code X'code' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module modname is not crucial to the running of your CICS system, you may decide to continue and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot continue without the full use of module modname, you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Modules: DFHEJ**

XMEOUT Parameters: applid, X'code', modname

---

**DFHEJ0004** applid A possible loop has been detected at offset X'offset' in module modname.

Explanation: A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module modname at offset X'offset'. This is the offset of the instruction which was executing at the time the error was detected.

System action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Notify the system programmer. If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of processor time, this message may have been caused by a long-running function, so there may not be an error here. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module modname in the message is terminated and CICS continues.

But if you have declared ICVR=0 in the SIT and you consider that module modname has gone into a loop, you have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module modname, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently, but you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

XMEOUT Parameters: date, time,applid, JRAS_error_message

DFHEJ0701 I date time applid userid CorbaServer CorbaServer_name has been created.

Explanation: The CorbaServer CorbaServer_name has been added to the Enterprise Java domain by placing it in the chain of CorbaServer Control Blocks. However, until the CorbaServer is resolved, it is not available for use.

System action: Processing continues. The CorbaServer will be resolved at a later stage.

User response: None.

Destination: CEJL

Modules: DFHEJCG

XMEOUT Parameters: date, time,applid, userid, CorbaServer_name

DFHEJ0702 E date time applid userid CorbaServer CorbaServer_name has not been created.

Explanation: The CorbaServer CorbaServer_name was not added to the Enterprise Java domain. This error is most likely caused by an attempt to add a duplicate CorbaServer.

System action: Processing continues.

User response: Examine the exception trace entry that shows the cause of the error.

Destination: CEJL

Modules: DFHEJCG

XMEOUT Parameters: date, time,applid, userid, CorbaServer_name

DFHEJ0706 E date time applid userid The EJ Resolution Transaction transaction_name did not attach.

Explanation: After the CorbaServer has been created, it undergoes the Resolution process in a separate transaction. However, this transaction was not successfully attached. Another attachment of the Resolution Transaction will occur (if this failure does not re-occur) when the next CorbaServer is created, and hence this failure may be thereby corrected.

System action: Processing continues.

User response: Examine the exception trace entry that shows the cause of the attachment error.

Destination: CEJL

Modules: DFHEJCG

XMEOUT Parameters: date, time,applid, userid, transaction_name

DFHEJ0711 I date time applid userid CorbaServer CorbaServer_name has been deleted.

Explanation: A CorbaServer Control Block has been deleted and removed from the chain of CorbaServers held within the EJ domain. Consequently, the CorbaServer is no longer available for use.

System action: Processing continues.

User response: None.

Destination: CEJL

Modules: DFHEJCG

XMEOUT Parameters: date, time,applid, userid, CorbaServer_name
**DFHEJ0723 E**  
date time applid userid CorbaServer
CorbaServer_name has failed
Resolution during Shelf creation.

**Explanation:**  Resolution for CorbaServer
CorbaServer_name has failed. The Resolution process
was attempting to create the Shelf for this CorbaServer.

**System action:**  The CorbaServer is placed into the
DISABLED state and cannot be used.

**User response:**  Check that the CorbaServer's shelf
directory does exist and that the CICS region id has
permission to read and write to that directory. If the
problem persists you may need to use the trace facility
to determine the cause of the problem.

CorbaServer CorbaServer_name must be reenabled
before processing can continue.

**Modules:**  DFHEJCG

**XMEOUT Parameters:**  date, time,applid, userid,
CorbaServer_name

---

**DFHEJ0729 E**  
date time applid userid State updating
failed while creating the shelf during
Resolution processing for CorbaServer
CorbaServer_name.

**Explanation:**  An update to the state of CorbaServer
CorbaServer_name to record the status of the
Resolution process has failed. The Resolution process
was attempting to create the Shelf for this CorbaServer.

**System action:**  Processing continues with
CorbaServer CorbaServer in an incorrect state.

**User response:**  Ensure that the region id under which
CICS is running has write permission to the area of the
HFS directory structure in which the shelf directory
should be created. Also check that there is sufficient
free space for the directory to be created.

The CorbaServer should be discarded and reinstalled.
If the problem persists you may need to use the trace
facility to determine the cause of the problem.

**Destination:**  CEJL

**Modules:**  DFHEJCG

**XMEOUT Parameters:**  date, time,applid, userid,
CorbaServer_name
**Explanation:** The Resolution of CorbaServer CorbaServer_name involved with the Object Store file file_name has failed.

**System action:** The CorbaServer is put into the DISABLED state.

**User response:** The most likely problem is that the file definition for VSAM file file_name has not been installed or is incorrectly defined. Verify that the both the file and the file definition have been created with appropriate attributes. Check that the resource definition for the file has been installed. Sample definitions for files DFHEJDIR and DFHEJOS are available in groups DFHEJVS, DFHEJCF and DFHEJVR.

Discard and reinstall the resource. If the problem persists you may need to use the trace service to find the failing object store operation.

**Destination:** CEJL

**Modules:** DFHEJCG

**XMEOUT Parameters:** date, time,applid, userid, CorbaServer_name, file_name, store_name

---

**Explanation:** A update of CorbaServer CorbaServer_name's state to record the status of the Resolution process has failed. The Resolution process failed opening an Object Store file.

**System action:** Processing continues with the CorbaServer in an incorrect state.

**User response:** The CorbaServer should be discarded and reinstalled.

If the problem persists you may need to use the trace facility to determine the cause of the problem.

**Destination:** CEJL

**Modules:** DFHEJCG

**XMEOUT Parameters:** date, time,applid, userid, CorbaServer_name

---

**Explanation:** CORBASERVER CorbaServer_name was being installed but the TCPIPSERVICE tcpipservice named is not installed.

**System action:** The CORBASERVER is not installed. Processing continues.

**User response:** Examine the CORBASERVER definition to check that the correct TCPIPSERVICE has been named and then delete the CORBASERVER, install the TCPIPSERVICE first and then retry the install of the CORBASERVER.

The TCPIPSERVICE needs to be installed in the listener region AND where the CORBASERVER is installed (AOR) if they are separate regions. If the CORBASERVER is in a separate region, the listener needs to have IIOPLISTENER=(YES) specified in the System Initialization Table (SIT) and the AOR needs to have IIOPLISTENER=(NO) specified.

**Destination:** CEJL

**Modules:** DFHEJCG

**XMEOUT Parameters:** date, time,applid, userid, CorbaServer_name, tcpipservice

---

**Explanation:** CorbaServer CorbaServer_name was being installed but the TCPIPSERVICE TCPPIPSERVICE named does not have the same authenticate value as the TCPIPSERVICE.

**System action:** The CorbaServer is installed but becomes unusable. Processing continues.

**User response:** Examine the CORBASERVER definition to check that the correct TCPIPSERVICE has been named and then correct the authenticate parameter in the TCPIPSERVICE. Delete the CorbaServer then reinstall the TCPIPSERVICE and the CorbaServer.

**Destination:** CEJL

**Modules:** DFHEJCG

**XMEOUT Parameters:** date, time,applid, userid, CorbaServer_name, tcpipservice

---

**Explanation:** CorbaServer CorbaServer_name was being installed but the TCPIPSERVICE TCPPIPSERVICE
named for SSLUNAUTH has an SSL setting of NO. The TCPIPSERVICE named must have an SSL value of YES or CLIENTAUTH.

User response: Examine the CORBASERVER definition to check that the correct TCPIPSERVICE has been named and then change the SSL parameter in the TCPIPSERVICE to YES or CLIENTAUTH. Delete the CorbaServer then reinstall the TCPIPSERVICE and the CorbaServer.

Destination: CEJL
Modules: DFHEJCG
XMEOUT Parameters: date, time, applid, userid, CorbaServer_name, tcipipservice

DFHEJ0748 E  date time applid user id Error found during install of CorbaServer
CorbaServer_name because TCPIPSERVICE tcipipservice named in the CorbaServer for UNAUTH has SSL(YES|CLIENTAUTH) set. SSL(NO) should be set.

Explanation: CorbaServer CorbaServer_name was being installed but the TCPIPSERVICE TCPIPSERVICE named for UNAUTH has an SSL setting of YES or CLIENTAUTH. The TCPIPSERVICE named must have an SSL value of NO.

User response: Examine the CORBASERVER definition to check that the correct TCPIPSERVICE has been named and then change the SSL parameter in the TCPIPSERVICE to NO. Delete the CorbaServer then reinstall the TCPIPSERVICE and the CorbaServer.

Destination: CEJL
Modules: DFHEJCG
XMEOUT Parameters: date, time, applid, userid, CorbaServer_name, tcipipservice

DFHEJ0751 I  date time applid user id About to wait for the availability of CorbaServer
CorbaServer_name.

Explanation: A function needs to ensure that a CorbaServer is available for use, so it is going to wait until the CorbaServer becomes available (it enters the INSERVICE State).

This message will usually appear while Resolution is proceeding (or pending) for the CorbaServer. However, it can also occur after this time during consistency processing for the items associated with the CorbaServer.

System action: The transaction enters a Wait state until the CorbaServer becomes INSERVICE.

If the Wait is associated with consistency processing, it is likely that this delay will be short.

User response: None.

Destination: CEJL
Modules: DFHEJCG
XMEOUT Parameters: date, time, applid, userid, CorbaServer_name

DFHEJ0752 E  date time applid user id CorbaServer
CorbaServer_name availability wait ended in error as the CorbaServer was not defined.

Explanation: The CorbaServer was not found during the availability wait. The CorbaServer has probably been deleted via CEMT while another transaction was waiting for the CorbaServer to be available.

System action: Processing continues.

User response: None.

Destination: CEJL
Modules: DFHEJCG
XMEOUT Parameters: date, time, applid, userid, CorbaServer_name

DFHEJ0753 I  date time applid user id CorbaServer
CorbaServer_name availability wait ended successfully.

Explanation: The CorbaServer is now available and so the availability wait has successfully ended.

System action: Processing continues.

User response: None.

Destination: CEJL
Modules: DFHEJCG
XMEOUT Parameters: date, time, applid, userid, CorbaServer_name

DFHEJ0754 I  date time applid user id CorbaServer
CorbaServer_name availability wait ended in error because the CorbaServer was in the UNUSABLE state.

Explanation: The CorbaServer entered the UNUSABLE state and so will never become available for use. Consequently, the availability wait has ended with this error condition.

System action: Processing continues.

User response: None.
DFHEJ0755 I  date time applid userid CorbaServer
CorbaServer_name availability wait
ended in error because the
CorbaServer was in the DISABLED
state.

Explanation: The CorbaServer entered the DISABLED
state and so will never become available for use.
Consequently, the availability wait has ended with this
error condition.

System action: Processing continues.
User response: None.

Destination: CEJL
Modules: DFHEJCG
XMEOUT Parameters: date, time,applid, userid,
CorbaServer_name

DFHEJ0756 E  date time applid userid CorbaServer
CorbaServer_name availability wait
ended in error because an error
occurred during the wait.

Explanation: The CorbaServer availability wait ended
in error. This is probably due to the transaction being
cancelled via CEMT.

System action: Processing continues.
User response: None.

Destination: CEJL
Modules: DFHEJCG
XMEOUT Parameters: date, time,applid, userid,
CorbaServer_name

DFHEJ0762 I  date time applid userid CorbaServer
CorbaServer_name has been set to be
disabled.

Explanation: The CorbaServer has been set to be
disabled. This operation may not complete immediately.

System action: Processing continues.
User response: None.

Destination: CEJL
Modules: DFHEJCG
XMEOUT Parameters: date, time,applid, userid,
CorbaServer_name

DFHEJ0761 I  date time applid userid CorbaServer
CorbaServer_name has been set to be
enabled.

Explanation: The CorbaServer has been set to be
enabled. This operation may not complete immediately.

System action: Processing continues.
User response: None.

Destination: CEJL
Modules: DFHEJCG
XMEOUT Parameters: date, time,applid, userid,
CorbaServer_name

DFHEJ0901 I  date time applid userid DJar DJar_name
within CorbaServer CorbaServer_name
has been created.

Explanation: A DJar has been created and added to
the chain of DJars. However, it is not available for use
until it has been resolved.

System action: Processing continues. The DJar will
be resolved at a later stage.
User response: None.

Destination: CEJL
Modules: DFHEJCG
XMEOUT Parameters: date, time,applid, userid,
DJar_name, CorbaServer_name

DFHEJ0902 E  date time applid userid DJar
DJar_name within CorbaServer
CorbaServer_name was not created.

Explanation: DJar DJar_name was not created. This
error is usually caused by an attempt to create a DJar
with the same name as an already existing DJar.

System action: Processing continues.
User response: Rename the jar file and DJar
resource and retry the operation.

Destination: CEJL
Modules: DFHEJDG
XMEOUT Parameters: date, time,applid, userid,
DJar_name, CorbaServer_name

DFHEJ0906 E  date time applid userid The EJ
Resolution Transaction
transaction_name did not attach.

Explanation: After the DJar has been created, it
undergoes the Resolution process in a separate
transaction. However, this transaction was not
successfully attached. Another attachment of the
Resolution Transaction will occur if this failure does not
re-occur) when the next DJar is created, and hence this
failure may be thereby corrected.

**System action:** Processing continues.

**User response:** Examine the exception trace entry that shows the cause of the attachment error.

**Destination:** CEJL

**Modules:** DFHEJDG

**XMEOUT Parameters:** date, time, applid, userid, transaction_name

---

DFHEJ0921 I date time applid DJar DJar_name within CorbaServer CorbaServer_name was successfully discarded.

**Explanation:** The DJar was successfully deleted from the chain of DJars. The Beans contained in DJar DJar_name have also been deleted.

**System action:** Processing continues.

**User response:** None.

**Destination:** CEJL

**Modules:** DFHEJDG

**XMEOUT Parameters:** date, time, applid, userid, DJar_name, CorbaServer_name

---

DFHEJ0934 E date time applid userid DJar DJar_name within CorbaServer CorbaServer_name has failed Resolution while it was being copied to the Shelf.

**Explanation:** The Resolution for DJar DJar_name, involving copying the DJar to the Shelf, has failed.

**System action:** The DJar is put into the UNUSABLE state and cannot be used.

**User response:** Check that the CICS region id has permission to write to the HFS shelf directory and that there is sufficient free space available.

**Destination:** CEJL

**Modules:** DFHEJDG

**XMEOUT Parameters:** date, time, applid, userid, DJar_name, CorbaServer_name

---

DFHEJ0935 E date time applid userid Catalog read for update during Resolution processing for DJar DJar_name failed.

**Explanation:** The updating of the Global Catalog entry for the DJar DJar_name failed when the read for update operation, to record the fact that Resolution has occurred, was executed. The state is not updated in the Global Catalog for the DJar; so, upon the next warm restart processing will not be as expected.

**System action:** The DJar is put into the UNUSABLE state and cannot be used.

**User response:** Discard and reinstall the DJar.

**Destination:** CEJL

**Modules:** DFHEJDG

**XMEOUT Parameters:** date, time, applid, userid, DJar_name

---

DFHEJ0936 E date time applid userid DJar DJar_name Catalog Resolution processing returned bad data.

**Explanation:** The updating of the Global Catalog entry for DJar DJar_name, to record the fact that Resolution has occurred, failed when the read for update operation returned invalid data. The state is not updated in the Global Catalog for the DJar; so, upon the next warm restart processing will not be as expected.

**System action:** The DJar is put into the UNUSABLE state and cannot be used.

**User response:** Discard and reinstall the DJar.

**Destination:** CEJL

**Modules:** DFHEJDG

**XMEOUT Parameters:** date, time, applid, userid, DJar_name

---

DFHEJ0937 E date time applid userid DJar DJar_name Catalog Resolution processing returned an invalid DJar.

**Explanation:** The updating of the Global Catalog entry for DJar DJar_name, to record the fact that Resolution has occurred, failed when the read for update operation returned an invalid DJar. The state is not updated in the Global Catalog for the DJar; so, upon the next warm restart processing will not be as expected.

**System action:** The DJar is put into the UNUSABLE state and cannot be used.

**User response:** Discard and reinstall the DJar.

**Destination:** CEJL

**Modules:** DFHEJDG

**XMEOUT Parameters:** date, time, applid, userid, DJar_name

---
State updating failed while copying the DJar to the shelf during Resolution processing for DJar DJar_name.

Explanation: The updating of the state, to record the status of Resolution processing, for DJar DJar_name has failed. The Resolution process was attempting to copy the DJar to the Shelf.

System action: Processing continues with the DJar in an incorrect state.

User response: Check that the CICS region id has write permission to the HFS shelf directory and that there is sufficient space available for the write operation to succeed.

Discard and reinstall the DJar.

If the problem persists you may need to use the trace facility to determine the cause of the problem.

Destination: CEJL

Modules: DFHEJDG

XMEOUT Parameters: date, time, applid, userid, DJar_name

Beans contained within DJar DJar_name within CorbaServer CorbaServer_name are invalid and unusable.

Explanation: An error occurred while installing the Beans from DJar DJar_name during the Bean copying phase of Resolution.

The most probable reason is that an attempt was made to install a duplicate Bean twice within the scope of the CorbaServer. In other words the duplicate Bean occurs in more than one DJar.

System action: The partially processed Beans within the DJar are deleted and the DJar is put into the UNRESOLVED state.

User response: Investigate why the Beans within the DJar within the scope of the CorbaServer caused this error to occur. In the most likely case, check that the contents of the DJar are not already present within the scope of the CorbaServer (for example, copying a Bean and then using both copies).

Destination: CEJL

Modules: DFHEJDG

XMEOUT Parameters: date, time, applid, userid, DJar_name, CorbaServer_name

Deletion of Beans contained within DJar DJar_name within CorbaServer CorbaServer_name succeeded.

Explanation: Beans are being deleted due to an error in the Resolution process which was loading Beans from DJar DJar_name. This deletion has succeeded.

System action: Processing continues.

User response: A previous message should explain why the Bean failed to install.

Discard and reinstall the DJar.

If the problem persists you may need to use the trace facility to determine the cause of the problem.

Destination: CEJL

Modules: DFHEJDG

XMEOUT Parameters: date, time, applid, userid, DJar_name, CorbaServer_name

Beans contained within DJar DJar_name within CorbaServer CorbaServer_name failed.

Explanation: Beans are being deleted due to an error in the Bean Resolution process for DJar DJar_name.

However, this deletion of Beans has failed.
System action: Processing continues.
User response: A previous message should explain why the Bean failed to install.
Discard and reinstall the DJar.
If the problem persists you may need to use the trace facility to determine the cause of the problem.
Destination: CEJL
Modules: DFHEJDG
XMEOUT Parameters: date, time, applid, userid, DJar_name, CorbaServer_name

---

DFHEJ0951 E date time applid userid State updating failed while loading Beans from the DJar during Resolution processing for DJar DJar_name.

Explanation: The updating of the state, to record the status of Bean Resolution processing, for DJar DJar_name has failed. The Bean Resolution process consists of loading Beans from the DJar.
System action: Processing continues with the DJar in an incorrect state.
User response: Discard and reinstall the DJar.
If the problem persists you may need to use the trace facility to determine the cause of the problem.
Destination: CEJL
Modules: DFHEJDG
XMEOUT Parameters: date, time, applid, userid, DJar_name

---

DFHEJ0961 I date time applid userid About to wait for the availability of DJar DJar_name.

Explanation: A function needs to ensure that a DJar is available for use, so it is going to wait until this DJar becomes available by entering the INSERVICE state).
This message will usually be generated while the DJar is awaiting or undergoing Resolution Processing. However, it can also occur during consistency processing of items associated with the DJar.
System action: The transaction enters a Wait state until the DJar is INSERVICE.
If the Wait is due to consistency processing, the delay is likely to be small.
User response: None.
Destination: CEJL
Modules: DFHEJDG
XMEOUT Parameters: date, time, applid, userid, DJar_name

---

DFHEJ0962 I date time applid userid DJar DJar_name availability wait ended in error because the DJar was not defined.

Explanation: The DJar was not found during the availability wait. The DJar has probably been deleted via CEMT while another transaction was waiting for the DJar to be available.
System action: Processing continues.
User response: None.
Destination: CEJL
Modules: DFHEJDG
XMEOUT Parameters: date, time, applid, userid, DJar_name

---

DFHEJ0963 I date time applid userid DJar DJar_name availability wait ended successfully.

Explanation: The DJar is now available and so the availability wait has successfully ended.
System action: Processing continues.
User response: None.
Destination: CEJL
Modules: DFHEJDG
XMEOUT Parameters: date, time, applid, userid, DJar_name

---

DFHEJ0964 I date time applid userid DJar DJar_name availability wait ended in error because the DJar was in the UNUSABLE state.

Explanation: The DJar entered the UNUSABLE state and so will never become available for use. Consequently, the availability wait has ended with this error condition.
System action: Processing continues.
User response: None.
Destination: CEJL
Modules: DFHEJDG
XMEOUT Parameters: date, time, applid, userid, DJar_name

---

DFHEJ0965 I date time applid userid DJar DJar_name availability wait ended in error because the DJar was in the UNRESOLVED state.

Explanation: The DJar entered the UNRESOLVED state and so will never become available for use. Consequently, the availability wait has ended with this error condition.
System action: Processing continues.
User response: None.
Destination: CEJL
Modules: DFHEJGD
XMEOUT Parameters: date, time, applid, userid, DJar_name

DFHEJ0966 E date time applid userid DJar
   DJar_name availability wait ended in error because an error occurred during the wait.
   Explanation: The DJar availability wait ended in error. This is probably due to the transaction being cancelled via CEMT.
   System action: Processing continues.
User response: None.
Destination: CEJL
Modules: DFHEJGD
XMEOUT Parameters: date, time, applid, userid, DJar_name

DFHEJ0971 I date time applid userid About to wait for the availability of all Beans contained within DJars associated with CorbaServer CorbaServer_name.
   Explanation: A function needs to ensure that all the Beans contained within DJars associated with a CorbaServer are present. Thus, it is going to wait until all DJars associated with the CorbaServer have been resolved (they all enter the INSERVICE state).
   System action: The transaction enters a Wait state until the all the DJars associated with the CorbaServer enter the INSERVICE state.
User response: None.
Destination: CEJL
Modules: DFHEJGD
XMEOUT Parameters: date, time, applid, userid, CorbaServer_name

DFHEJ1101 E date time applid userid Bean Bean_name from DJar DJar_name within CorbaServer CorbaServer_name has not been created because the CorbaServer is absent.
   Explanation: The Bean contained in DJar DJar_name and associated with the named CorbaServer has not been created because the CorbaServer CorbaServer_name was not found. The CorbaServer was probably deleted via CEMT while the Bean loading phase of the DJar Resolution was in progress.
   System action: Processing continues.
User response: The owning DJar should be deleted and reinstalled when CorbaServer CorbaServer_name is present.
Destination: CEJL
Modules: DFHEJBG
XMEOUT Parameters: date, time, applid, userid, Bean_name, DJar_name, CorbaServer_name

DFHEJ1102 E date time applid userid Bean Bean_name from DJar DJar_name within CorbaServer CorbaServer_name has not been created because the CorbaServer is not in the correct state.
   Explanation: The Bean, contained in the named DJar
and associated with the named CorbaServer, has not
been created because the CorbaServer was not in the
INSERVICE state.

System action: Processing continues.

User response: The DJar should be deleted.

Destination: CEJL

Modules: DFHEJBG

XMEOUT Parameters: date, time, applid, userid,
Bean_name, DJar_name, CorbaServer_name

DFHEJ1103 E date time applid userid Bean
Bean_name from DJar DJar_name
within CorbaServer CorbaServer_name
has not been created because the DJar is absent.

Explanation: The Bean contained in the DJar
DJar_name and associated with the named
CorbaServer has not been created because the DJar
was not found. The DJar was probably deleted via
CEMT while the Bean copying phase of the DJar
Resolution was in progress.

System action: Processing continues.

User response: None.

Destination: CEJL

Modules: DFHEJBG

XMEOUT Parameters: date, time, applid, userid,
Bean_name, DJar_name, CorbaServer_name

DFHEJ1104 E date time applid userid Bean
Bean_name from DJar DJar_name
within CorbaServer CorbaServer_name
has not been created because the DJar is not in the correct state.

Explanation: The Bean, contained in the named DJar
and associated with the named CorbaServer, has not
been created because the DJar was not in the
RESOLVING state.

System action: Processing continues.

This indicates some sort of internal race condition and
should not occur.

User response: You may need to contact your IBM
service representative.

Destination: CEJL

Modules: DFHEJBG

XMEOUT Parameters: date, time, applid, userid,
Bean_name, DJar_name, CorbaServer_name

DFHEJ1105 E date time applid userid Bean
Bean_name from DJar DJar_name
within CorbaServer CorbaServer_name
has not been created because the Bean is already present.

Explanation: The Bean, contained in the named DJar
and associated with the named CorbaServer, has not
been created because the Bean was already defined.

This probably means that an attempt was being made
to process a copy of an already defined DJar.

System action: Processing continues.

User response: The DJar should be deleted.

Destination: CEJL

Modules: DFHEJBG

XMEOUT Parameters: date, time, applid, userid,
Bean_name, DJar_name, CorbaServer_name

DFHEJ1106 E date time applid userid Bean
Bean_name from DJar DJar_name
within CorbaServer CorbaServer_name
has not been created because the Bean is already present in the
namespace of the CorbaServer.

Explanation: The Bean, contained in the named DJar
and associated with the named CorbaServer, has not
been created because the Bean was already known
within the namespace of the CorbaServer.

This probably means that an attempt was being made
to process a copy of an already defined DJar.

Another possibility is that a Bean with the same name is
present within two different DJars. Within the scope of a
CorbaServer, all the Beans within all the DJars
associated with the CorbaServer must be unique.

System action: Processing continues.

User response: The DJar should be deleted.

Destination: CEJL

Modules: DFHEJBG

XMEOUT Parameters: date, time, applid, userid,
Bean_name, DJar_name, CorbaServer_name

DFHEJ1107 E date time applid userid Bean
Bean_name from DJar DJar_name
within CorbaServer CorbaServer_name
has not been created.

Explanation: The Bean, contained in the named DJar
and associated with the named CorbaServer, has not
been created.

System action: Processing continues.

User response: A prior message will usually indicate
the cause of the error. The DJar should be deleted.
DFHEJ1301  applid The elements portion of the Enterprise Java Domain did not initialize. Enterprise Java function is unavailable.

Explanation: The portion of the Enterprise Java (EJ) Domain which deals with CorbaServers, DJars and Beans has not correctly initialized. This EJ function is not available.

This message indicates a system error while creating the Elements part of the EJ Domain. This processing manipulates CorbaServers, DJars and Beans. This implies that an EJ Gate was not created or a GETMAIN for required areas failed. A failure to recover a CorbaServer or a DJar upon a warm restart is also a possibility.

System action: All EJ elements function is unavailable. However, other components of the EJ domain (such as Object Store) may be available.

User response: This is a system-related failure and an exception trace entry will indicate why the EJ domain has failed to install.

Destination: Console

Modules: DFHEJGE

XMEOUT Parameter: applid

DFHEJ1510 E  date time applid user CorbaServer CorbaServer_name previously failed Resolution and was found in the INITING state.

Explanation: A prior Resolution transaction (CEJR) failed and left a CorbaServer in the INITING state.

System action: The CorbaServer is put into the DISABLED state in order to prevent its use.

User response: A prior message should indicate the cause of the previous error.

Destination: CEJL

Modules: DFHEJIO

XMEOUT Parameters: date, time,applid, userid, CorbaServer_name

DFHEJ1518 E  date time applid user CorbaServer CorbaServer_name is UNUSABLE.

Explanation: The CorbaServer CorbaServer_name failed to complete the part of the Resolution process which involves creation of the shelf onto which components associated with the CorbaServer are placed.

System action: The CorbaServer is put into the DISABLED state.

User response: Check that the CICS region id has write permission to the shelf HFS directory structure.

The CorbaServer should be discarded and reinstalled.

If the problem persists you may have to use the trace facility to determine the cause of the problem.

Destination: CEJL

Modules: DFHEJIO

XMEOUT Parameters: date, time,applid, userid, CorbaServer_name

DFHEJ1520 I  date time applid user CorbaServer CorbaServer_name is now accessible.

Explanation: The CorbaServer CorbaServer_name has successfully completed the part of the Resolution process which involves opening CorbaServer related Object Store files. The CorbaServer CorbaServer_name is now accessible.

System action: Processing continues.

User response: None.

Destination: CEJL

Modules: DFHEJIO

XMEOUT Parameters: date, time,applid, userid, CorbaServer_name

DFHEJ1521 E  date time applid user CorbaServer CorbaServer_name is DISABLED.

Explanation: The CorbaServer CorbaServer_name failed to complete the part of the Resolution process which involves opening the CorbaServer related Object Store files.
**System action:** The CorbaServer is put into the DISABLED state.

**User response:** Discard and reinstall the CorbaServer.
If the problem persists you may need to use the trace facility to determine the cause of the problem.

**Destination:** CEJL

**Modules:** DFHEJIO

**XMEOUT Parameters:** date, time, applid, userid, CorbaServer_name

---

**DFHEJ1533 E** date time applid userid DJar
**Explanation:** A prior Resolution transaction (CEJR) failed and left a DJar in the RESOLVING state.

**User response:** A prior message will usually indicate the cause of the previous error. Discard and reinstall the DJar.
If the problem persists you may need to use the trace facility to determine the cause of the problem.

**Destination:** CEJL

**Modules:** DFHEJIO

**XMEOUT Parameters:** date, time, applid, userid, DJar_name

---

**DFHEJ1538 E** date time applid userid DJar
**Explanation:** DJar DJar_name failed to Resolve. The Resolution process failed while attempting to copy this DJar to the Shelf.

**User response:** Check that the CICS region id has permission to write to the HFS shelf directory structure.
Discard and reinstall the CorbaServer.
If the problem persists you may need to use the trace facility to determine the cause of the problem.

**Destination:** CEJL

**Modules:** DFHEJIO

**XMEOUT Parameters:** date, time, applid, userid, DJar_name

---

**DFHEJ1540 I** date time applid userid DJar
**Explanation:** The DJar has correctly Resolved. This means that the Resolution process successfully loaded all the Beans from this DJar. DJar DJar_name and all the Beans which are contained in the DJar are now accessible and ready for use. This message does not imply that the Beans have been published. If the DJar has been published then CICS is now ready to accept requests for the Beans.

**System action:** Processing continues.

**User response:** None.

**Destination:** CEJL

**Modules:** DFHEJIO

**XMEOUT Parameters:** date, time, applid, userid, DJar_name

---

**DFHEJ1541 E** date time applid userid DJar
**Explanation:** DJar DJar_name failed to Resolve. The Resolution process failed while attempting to load the Beans from this DJar because the Beans contained within the DJar were invalid.

**System action:** The DJar is put into the UNRESOLVED state.

**User response:** A prior message should describe the error in the DJar. Fix this error and then reinstall the DJar.

**Destination:** CEJL

**Modules:** DFHEJIO

**XMEOUT Parameters:** date, time, applid, userid, DJar_name
Chapter 1. DFH messages 357
```
DFHEJ5004 E date time applid userid The container encountered problems processing the contents of the HFS file referred to by DJar DJar_name.

Explanation: The container was attempting to process a .jar file, looking for enterprise beans. The container was working with the copy of the .jar file that is held on the Shelf, not the original HFS .jar file described in the DJar definition.

System action: Processing continues, but this particular DJar is not installed.

User response: Check the validity of the .jar file referred to in the DJar definition. Check it has a valid deployment descriptor and the generated code contained within the jar file is correct. The CICS deployment tooling can be used to check the deployment descriptor and perform the code generation step if it is suspected that the generated code within the jar is incorrect.

Destination: CEJL

Modules: com.ibm.cics.ejs.csi.commands.InstallDJarCommand

XMEOUT Parameters: date, time, applid, userid, DJar_name

DFHEJ5005 E date time applid userid Unable to obtain the remote reference for bean bean_name from the container.

Explanation: To publish a home IOR for a bean to JNDI, it is necessary to obtain a remote reference for that bean from the container. This message indicates there was a problem retrieving the reference from the container.

System action: Processing continues, but this particular bean does not have its home published to JNDI.

User response: Check the validity of the .jar file referred to in the DJar definition. Check it is fully deployed with an ASCII manifest file.

Destination: CEJL

Modules: com.ibm.cics.ejs.csi.commands.InstallDJarCommand

XMEOUT Parameters: date, time, applid, userid, bean_name

DFHEJ5006 I date time applid userid Creating new JNDI subcontext jndi_subcontext.

Explanation: Before publishing a home for a bean in JNDI, the subcontext hierarchy described in the CorbaServer definition must exist. This informational message indicates that part of that hierarchy does not exist and is being created.

System action: None.

User response: None.

Destination: CEJL

Modules: com.ibm.cics.ejs.csi.commands.InstallDJarCommand

XMEOUT Parameters: date, time, applid, userid, bean_name, jndi_subcontext

DFHEJ5007 I date time applid userid Destroying empty JNDI subcontext jndi_subcontext.

Explanation: After a home for a bean has been unbound from JNDI, it is possible that the namespace can be tidied up. CICS attempts to remove the hierarchy of subcontexts described in the CorbaServer definition. It only deletes a subcontext if it is empty.

System action: None.

User response: None.

Destination: CEJL

Modules: com.ibm.cics.ejs.csi.commands.InstallDJarCommand

XMEOUT Parameters: date, time, applid, userid, jndi_subcontext

DFHEJ5008 E date time applid userid Unable to write home IOR for bean bean_name to the Shelf directory shelf_partition.

Explanation: The home IOR for a bean may be written to the HFS Shelf. This message indicates that CICS had a problem in attempting to write to the Shelf.

System action: Processing continues, but this particular bean does not have its home published to the Shelf.

User response: Check the permissions of the Shelf directory. If there already exists an IOR for the bean in the Shelf directory, check its permissions. CICS must have write access to the directory and to overwrite any files that might exist.

Destination: CEJL

Modules: com.ibm.cics.ejs.csi.commands.InstallDJarCommand

XMEOUT Parameters: date, time, applid, userid, bean_name, shelf_partition

DFHEJ5009 I date time applid userid Published bean bean_name to JNDI server jndi_server at location jndi_location.

Explanation: CICS has successfully published the home for the bean in JNDI. The location where the home is bound, and hence where the home can be looked up, is also supplied in the message.
```
DFHEJ5010 I date time applid userid Publishing bean
  bean_name in the Shelf directory
  shelf_partition as file file_name.

Explanation: CICS is publishing the home for the bean on the Shelf. The location where the home is being written is supplied in the message as a directory and filename.

System action: None.
User response: None.
Destination: CEJL
Modules: com.ibm.cics.ejs.csi.commands.AdminCommand
XMEOUT Parameters: date, time, applid, userid,
  bean_name, shelf_partition, file_name

DFHEJ5011 I date time applid userid Retracted bean
  bean_name from JNDI server jndi_server
  at location jndi_location.

Explanation: CICS has successfully retracted the home for a bean from JNDI. The JNDI location that is being unbound is supplied in the message. Once this message has appeared, clients are no longer able to look up the bean home at this location.

System action: None.
User response: None.
Destination: CEJL
Modules: com.ibm.cics.ejs.csi.commands.AdminCommand
XMEOUT Parameters: date, time, applid, userid,
  bean_name, jndi_server, jndi_location

DFHEJ5012 I date time applid userid Retracting bean
  bean_name from the Shelf directory
  shelf_partition, file file_name.

Explanation: CICS is retracting the home for the bean from the Shelf. When retracting bean homes from the Shelf, retraction means deletion of the IOR file object created at publish.

System action: None.
User response: None.
Destination: CEJL

DFHEJ5013 E date time applid userid Bean
  bean_name cannot be retracted from
  JNDI as it cannot be found at location
  jndi_location.

Explanation: CICS is attempting to retract the home of a bean from JNDI. However, the home has not been found at the expected location in JNDI. This is usually due to a previous retraction having removed the home already.

System action: None.
User response: None.
Destination: CEJL
Modules: com.ibm.cics.ejs.csi.commands.AdminCommand
XMEOUT Parameters: date, time, applid, userid,
  bean_name, jndi_server, jndi_location

DFHEJ5014 E date time applid userid The HFS file
  hfs_name for DJar DJar_name exists
  but could not be opened for reading by
  CICS.

Explanation: Installation of a DJar has failed because although the HFS file referred to by the DJar definition exists, it cannot be opened for reading by CICS.

System action: Processing continues, but this particular DJar is not installed.
User response: Check the permissions on the HFS file referred to by the DJar definition. Change the permissions if necessary to enable reading by CICS.

destination: CEJL
modules: com.ibm.cics.ejs.csi.commands.InstallDJarCommand
XMEOUT Parameters: date, time, applid, userid,
  hfs_name, DJar_name

DFHEJ5015 E date time applid userid Unable to
  delete HFS file hfs_file_name which
  exists on the shelf while installing DJar
  djar_name.

Explanation: Whilst installing a DJar, CICS found a file on the shelf of the same name that it wanted to use when copying the users source deployed jar. CICS was unable to delete that file.

System action: Processing continues, but this particular DJar is not installed.
User response: Check the permissions of the shelf
Directory for the CORBASERVER and the permissions of the HFS file that the CICS message describes as already existing on the shelf. CICS should normally have the ability to read and write to all directories and files that exist under the directory defined as the CORBASERVERs shelf.

**Destination:** CEJL

**Modules:** com.ibm.cics.ejs.csi.commands.InstallDJarCommand

**XMEOUT Parameters:** date, time, applid, userid, hfs_file_name, djar_name

---

**DFHEJ5016 E**  
**date time applid userid IO exception while attempting to read hfs_file_name during install of DJar djar_name.**

**Explanation:** During install of a DJar, CICS encountered an exception reading the HFS file described in the DJar definition.

**System action:** Processing continues, but this particular DJar is not installed.

**User response:** This is a very unusual situation. The file was found to exist and CICS had read permission, but a problem occurred whilst reading it. Retry the installation.

**Destination:** CEJL

**Modules:** com.ibm.cics.ejs.csi.commands.InstallDJarCommand

**XMEOUT Parameters:** date, time, applid, userid, hfs_file_name, djar_name

---

**DFHEJ5017 E**  
**date time applid userid IO exception while attempting to write hfs_file_name to the shelf during install of DJar djar_name.**

**Explanation:** During install of a DJar, CICS encountered an exception writing the HFS file described in the DJar definition.

**System action:** Processing continues, but this particular DJar is not installed.

**User response:** This is usually due to running out of space in the filesystem. Check the size of the filesystem where the shelf is defined to exist for the CORBASERVER into which the DJar is being installed.

**Destination:** CEJL

**Modules:** com.ibm.cics.ejs.csi.commands.InstallDJarCommand

**XMEOUT Parameters:** date, time, applid, userid, hfs_file_name, djar_name

---

**DFHEJ5018 E**  
**date time applid userid EJB Classloader unable to locate class class_name.**

**Explanation:** The Java classloader responsible for loading Enterprise Beans was asked to load a class and was unable to locate it.

**System action:** Processing stops. The request processor reporting the error shuts down, returning an exception to the client.

**User response:** If the class is part of an Enterprise Bean, check the class exists in the deployed jar file you have named on the DJar definition. If it is a utility class used by an Enterprise Bean, check the utility class is on the user application classpath.

**Destination:** CEJL

**Modules:** com.ibm.cics.ejs.csi.DJarClassLoader

**XMEOUT Parameters:** date, time, applid, userid, class_name

---

**DFHEJ5019 E**  
**date time applid userid DJar djar_name contains a bean whose name contains one or more invalid characters.**

**Explanation:** CICS is only able to process beans whose names are composed of characters from a specific set. This set being a subset of those allowable in the deployment descriptor.

**System action:** Processing continues, but none of the beans from this DJar are installed.

**User response:** Check the names of your beans against the allowable character set.

**Destination:** CEJL

**Modules:** com.ibm.cics.ejs.csi.DJarClassLoader

**XMEOUT Parameters:** date, time, applid, userid, class_name

---

**DFHEJ5020 E**  
**date time applid userid A bean installed in CORBASERVER corbaserver has been incorrectly deployed for use in CICS.**

**Explanation:** This message indicates that a bean installed in CICS contains generated code at the incorrect level. This can happen if, for example, Visualage for Java has been used to fully deploy a bean for use in CICS, the generated code produced by Visualage is not of the correct level (it is EJB 1.0 level code).

**System action:** Processing against this bean stops and the initiating method request fails.

**User response:** Use the CICS deployment tool to generate code at the correct EJB level for all the beans.
Installed in the named corbaserver.

**Destination:** CEJL

**Modules:** com.ibm.cics.ejs.csi.DJarClassLoader

**XMEOUT Parameters:** date, time, applid, userid, corbaserver

---

**DFHEJ5021 E**

*date time applid userid Failed to publish bean bean_name to JNDI server jndi_server at location jndi_location.*

**Explanation:** CICS has failed to publish the home of the bean in JNDI. The location where the home was being bound, and the server which was being used are included in the message.

**System action:** None.

**User response:** Check that the JNDI server named in the message is working.

**Destination:** CEJL

**Modules:** com.ibm.cics.ejs.csi.commands.AdminCommand

**XMEOUT Parameters:** date, time, applid, userid, bean_name, jndi_server, jndi_location

---

**DFHEJ5022 E**

*date time applid userid DJar DJar contains bean bean_name which has already been installed in CorbaServer CorbaServer. The DJar will not be installed.*

**Explanation:** The HFS file named in the DJar definition contains a deployed Enterprise Bean whose name conflicts with a bean already installed in the CorbaServer.

**System action:** The DJar named in the message is not installed. None.

**User response:** Change the name of the bean in the named DJar so that it does not conflict, or install the DJar in an alternative CorbaServer.

**Destination:** CEJL

**Modules:** com.ibm.cics.ejs.csi.MethodInfoStore

**XMEOUT Parameters:** date, time, applid, userid, DJar, bean_name, CorbaServer

---

**DFHEJ5023 E**

*date time applid userid Scan for CorbaServer CorbaServer failed, the djardir djardir is not a valid HFS directory.*

**Explanation:** A CorbaServer scan failed because the djardir attribute on the CorbaServer definition is invalid. The djardir is invalid either because it is not an HFS directory or CICS does not have read access to it.

**System action:** The scan fails. There is no change to the currently installed set of DJar resources.

**User response:** Check the HFS directory exists and is accessible by CICS.

**Destination:** CEJL

**Modules:** com.ibm.cics.ejs.csi.commands.ScanCommand

**XMEOUT Parameters:** date, time, applid, userid, CorbaServer, djardir

---

**DFHEJ5024 I**

*date time applid userid Scan commencing for CorbaServer CorbaServer, directory being scanned is djardir.*

**Explanation:** A CorbaServer scan has been requested against the specified CorbaServer. This message also indicates the HFS directory that is scanned for new or updated deployed jars. When the scan has completed a summary message is produced indicating how many new DJar resources have been created and how many have been updated.

**System action:** None.

**User response:** None.

**Destination:** CEJL

**Modules:** DFHEJDG

**XMEOUT Parameters:** date, time, applid, userid, CorbaServer, newdjarcount, upddjarcount

---

**DFHEJ5025 I**

*date time applid userid Scan completed for CorbaServer CorbaServer, newdjarcount DJars created, uppdjarcount DJars updated.*

**Explanation:** A CorbaServer scan has completed against the specified CorbaServer. The message indicates how many new DJar resources have been created based on the contents of the scanned djardir. It also indicates how many DJar resources have been upgraded due to new versions of jar files being discovered in the djardir.

**System action:** None.

**User response:** None.

**Destination:** CEJL

**Modules:** DFHEJCG

**XMEOUT Parameters:** date, time, applid, userid, CorbaServer, newdjarcount, uppdjarcount
**Explanation:** During a scan operation against the specified CorbaServer, CICS discovered a subdirectory in the djardir. The subdirectory is ignored. Scan does not recurse into subdirectories when looking for deployed jars to install.

**System action:** The scan continues, simply ignoring the subdirectory.

**User response:** The subdirectory does not harm the scan operation, but it may be advisable to remove it from the djardir as the scan operation always has to look at every object (directory or file) that exists in the djardir when performing a scan.

**Destination:** CEJL

**Modules:**
com.ibm.cics.ejs.csi.commands.ScanCommand

**XMEOUT Parameters:** date, time, applid, userid, CorbaServer, subdir, djardir

**Explanation:** During a scan operation against the specified CorbaServer, CICS discovered a file that has an incorrect file suffix. The scan code is looking for candidate deployed jar files and these files are expected to have .jar as their file suffix.

**System action:** The scan continues, simply ignoring the incorrectly named file.

**User response:** If the file was meant to be installed as a DJar resource in CICS, it should be renamed such that its basename is less than 33 characters. If it is not a deployed jar file, it should be deleted since CICS examines it every time a scan is executed against this CorbaServer.

**Destination:** CEJL

**Modules:**
com.ibm.cics.ejs.csi.commands.ScanCommand

**XMEOUT Parameters:** date, time, applid, userid, CorbaServer, file, djardir

**Explanation:** During a scan operation against the specified CorbaServer, CICS discovered a file whose name contains characters that cannot be used when constructing a DJar resource. The name used for the DJar resource created in the CICS region is based on the 32 character basename of the deployed jar file discovered in the djardir.

**System action:** The scan continues, simply ignoring the file whose name contains unacceptable characters.

**User response:** If the file was meant to be installed as a DJar resource in CICS, it should be renamed such that its basename contains only valid characters. For the list of suitable characters to use in the name, see the character set restrictions for normal CEDA defined DJar resources. If it is not a deployed jar file, it should be deleted since CICS will examine it every time a scan is executed against this CorbaServer.

**Destination:** CEJL

**Modules:**
com.ibm.cics.ejs.csi.commands.ScanCommand

**XMEOUT Parameters:** date, time, applid, userid, CorbaServer, file, djardir

**Explanation:** A new deployed jar file has been discovered on HFS during a scan. A corresponding CICS DJar resource is being automatically created to represent it. The DJar resource then goes through the
normal stages of DJar resolution before it is ready for
use.

System action: None.
User response: None.
Destination: CEJL
Modules: com.ibm.cics.ejs.csi.commands.ScanCommand
XMEOUT Parameters: date, time, applid, userid, Djar,
CorbaServer

DFHEJ5031 I date time applid userid DJar Djar is
being updated during a scan against
CorbaServer CorbaServer.

Explanation: An update has been detected for a DJar
resource. CICS compares the last modification time of
the deployed jar file on HFS with the last modification
time stored in the DJar resource definition. If the
deployed jar file on HFS is newer than the currently
installed resource, the DJar resource goes through the
resolution process again, this causes the new version of
the deployed jar file on HFS to be picked up.

System action: None.
User response: None.
Destination: CEJL
Modules: com.ibm.cics.ejs.csi.commands.ScanCommand
XMEOUT Parameters: date, time, applid, userid, Djar,
CorbaServer

DFHEJ5032 I date time applid userid DJar Djar is
having its contents automatically
published to the namespace.

Explanation: When a DJar completes resolution and
becomes inservice, CICS checks the autopublish setting
for the related CorbaServer. If autopublish is set to YES,
the DJar is automatically published to the namespace.

System action: None.
User response: None.
Destination: CEJL
Modules: DFHEJDG
XMEOUT Parameters: date, time, applid, userid, Djar

DFHEJ5033 I date time applid userid Scan completed
for CorbaServer CorbaServer, no Djars
created, no DJars updated.

Explanation: A CorbaServer scan has completed
against the specified CorbaServer. The message
indicates how many new DJar resources have been
created based on the contents of the scanned djardir. It
also indicates how many DJar resources have been
upgraded due to new versions of jar files being
discovered in the djardir.

System action: None.
User response: None.
Destination: CEJL
Modules: com.ibm.cics.ejs.csi.commands.ScanCommand
XMEOUT Parameters: date, time, applid, userid,
CorbaServer, djardir

DFHEJ5034 W date time applid userid The pickup
directory for CorbaServer
CorbaServer could not be read.

Explanation: A CorbaServer scan has discovered that
the pickup directory could not be read. This may be
because the region does not have read access to the
HFS directory.

System action: The scan ends and no djar resources
are installed.
User response: Check that the directory exists and
that the read access permissions are set.
Destination: CEJL
Modules: DFHEJDG
XMEOUT Parameters: date, time, applid, userid,
CorbaServer

DFHEJ5035 W date time applid userid Scan for
CorbaServer CorbaServer is ignoring a
jar file found on djardir djardir because
the file basename is blank.

Explanation: During a scan operation against the
specified CorbaServer, CICS discovered a file whose
name had a .jar suffix but could not be installed in CICS
because it had no file basename. Everything prior to the
.jar suffix is the file basename and the basename is
used as the name of the DJar resource that represents
this jar file in the CICS system. CICS cannot install a
DJar resource with an empty name.

System action: The scan continues, simply ignoring
the file with an invalid basename.
User response: If the file was meant to be installed as
a DJar resource in CICS, it should be renamed such
that it has a suitable basename. A suitable basename is
between 1 and 32 characters in length inclusive. If it is
not a deployed jar file, it should be deleted since CICS
examines it every time a scan is executed against this
CorbaServer.
Destination: CEJL
Modules: com.ibm.cics.ejs.csi.commands.ScanCommand
XMEOUT Parameters: date, time, applid, userid,
CorbaServer, djardir

Chapter 1. DFH messages 363
CICS has failed to publish the bean for jarFileName at Line: line, Column: col

Explanation: During an attempt to process the deployment descriptor for the specified jar file an exception was generated. The message indicates the source location of the exception in the deployment descriptor.

System action: The djar fails to resolve and will have its state set to UNRESOLVED.

User response: The jar file should be opened with appropriate tools and the deployment descriptor corrected.

Destination: CEJL

Modules: com.ibm.cics.ejs.csi.ContainerUtil

XMEOUT Parameters: date, time, applid, userid, jarFileName, line, col

CICS has processed the supplied system properties and jndi properties, and it has determined the location upon the LDAP server where it attempts to place the InitialContext. The context described in the message is made up of several properties, containerdn and noderootrdn amongst them.

System action: CICS continues processing. Any subsequent namespace processing against LDAP occurs relative to the named context.

User response: No action is necessary unless the context is not as expected. If there is a problem with it, check the settings of the noderootrdn and containerdn LDAP properties, the CICS LDAP documentation and your LDAP administrator can help ensure they are set appropriately.

Destination: CEJL

Modules: com.ibm.cics.ejs.csi.commands.AdminCommand

XMEOUT Parameters: date, time, applid, userid, bean_name, jndi_server, jndi_location

CICS has failed to retract the home for the bean from the JNDI namespace. This is because at the location CICS tried to retract the bean reference a JNDI context was found. CICS is unable to overwrite a context with a bean reference. The location where CICS attempted to publish the bean is included in the message.

System action: The bean is not published. CICS continues to publish any further beans from the CorbaServer or DJar against which the publish operation was issued.

User response: It is likely that another CorbaServer is sharing the same JNDI namespace and has a JNDI prefix that clashes with the JNDI prefix of the CorbaServer whose contents are currently being published. This may be a CorbaServer in a different CICS region. In order to avoid such clashes it is advisable to have an organized structure for JNDI prefixes used by CorbaServers sharing a namespace.

This could include the machine name, region name and CorbaServer name in the JNDI prefix. Clashes usually occur because the name of a bean conflicts with a component of the JNDI prefix defined for the other CorbaServer. One of the CorbaServers must have its JNDI prefix altered to avoid this clash.

Destination: CEJL

Modules: com.ibm.cics.ejs.csi.commands.AdminCommand

XMEOUT Parameters: date, time, applid, userid, bean_name, jndi_server, jndi_location

CICS has failed to retract the home for the bean from the JNDI namespace. This is because at the location CICS tried to retract the bean reference a JNDI context was found. CICS is unable to overwrite a context with a bean reference. The location where CICS attempted to publish the bean is included in the message.

System action: The bean is not retracted. CICS attempts to retract any further beans from the CorbaServer or DJar against which the retract operation was issued.

User response: It is likely that another CorbaServer is sharing the same JNDI namespace and has a JNDI prefix that clashes with the JNDI prefix of the CorbaServer whose contents are currently being retracted. This may be a CorbaServer in another CICS region. In order to avoid such clashes, it is advisable to have an organized structure for JNDI prefixes used by CorbaServers sharing a namespace. This could include the machine name, region name and CorbaServer name in the JNDI prefix. Clashes usually occur because the name of a bean conflicts with a component of the
DFHEJS041 E    date time applid userid Djar
djar_name) is not being installed. It
contains a bean (bean_name) whose
method (method_name) has no
transaction attribute specified in the
deployment descriptor.

Explanation: The container was attempting to install a
bean which has been deployed to use container
managed transactions. The container was unable to find
a suitable transaction attribute for a bean method whilst
processing the DJar's deployment descriptor. According
to the EJB Specification, the deployment descriptor
must contain valid transaction attributes for all methods
defined on the remote interface (excluding ejbCreate
and ejbRemove methods which always run as
NotSupported). This does not imply that each individual
method must have an entry in the deployment
descriptor as it is valid to use a wildcard to give all
methods on the bean the same transactional
characteristics. The message describes which jar file,
bean and method it encountered problems with.

System action: The bean and its containing DJar fail
to install.

User response: Modify the deployment descriptor in a
suitable deployment tool to ensure that all the methods
on the remote interface have a valid transaction
attribute set.

Destination: CEJL

Modules: com.ibm.cics.ejs.csi.commands.InstallDJarCommand

XMEOUT Parameters: date, time,applid, userid,
bean_name, jndi_server, jndi_location

-----------------

DFHEJS044 E    date time applid userid Error found in
deployment descriptor for DJar
djar_name.

Explanation: CICS has failed to install a DJAR. This
is due to a problem in the EJB-Jar file's deployment
descriptor. Further information is not available.

System action: The DJAR is put in the
UNRESOLVED state.

User response: Correct the deployment descriptor. To
do this you need to use WebSphere Application
Assembly Tool (AAT) or equivalent to verify or change
the contents of the deployment descriptor for this DJAR.

Destination: CEJL

Modules: com.ibm.cics.ejs.csi.ContainerUtil

XMEOUT Parameters: date, time,applid, userid,
file_name, exception_message

-----------------

DFHEJS045 E    date time applid userid Error found in
deployment descriptor for DJar
djar_name. Duplicate element of type
element_type found with name
element_name .

Explanation: CICS has failed to install a DJAR. This
is due to a problem in the EJB-Jar file's deployment
descriptor. Specifically, an element of type element_type
has been found which duplicates a similar element with
the same name. The duplicated name is element_name.

According to the EJB 1.1 specification this element
name cannot be duplicated within the same deployment
descriptor.

System action: The DJAR is put in the
UNRESOLVED state.

User response: Correct the deployment descriptor. To
do this you need to use WebSphere Application
Assembly Tool (AAT) or equivalent to verify or change
the contents of the deployment descriptor for this DJAR.
DFHEJ5046 E  date time applid userid DJar djar_name is invalid.

Explanation: CICS has failed to install a DJAR. This is because a problem was discovered while trying to access or interpret the jar file.

User response: Ensure that the HFS file specified on the DJAR resource definition exists. Also check that CICS has read permission for this file, that the file has been transferred in binary mode and that the file conforms to the jar file format.

The HFS file attribute of the DJAR resource definition is case sensitive. Please ensure that it has been entered correctly.

Destination: CEJL

Modules: com.ibm.cics.ejs.csi.ContainerUtil

XMEOUT Parameters: date, time, applid, userid, djar_name

DFHEJ5047 E  date time applid userid Error found in the deployment descriptor for DJar djar_name. An element of type element_type and value element_value references another element that cannot be found.

Explanation: CICS has failed to install a DJAR. This is due to a problem in the EJB-Jar file's deployment descriptor. Specifically, a cross reference has been found which cannot be resolved. The reference was found in a element_type element of the deployment descriptor. The value in this element is element_value.

For example, a role-link element may have been found where the textual content of the role-link does not represent a valid security-role element from this same deployment descriptor.

System action: The DJAR is put in the UNRESOLVED state.

User response: Correct the deployment descriptor. To do this you may need to use the WebSphere Application Assembly Tool (AAT) or equivalent to verify or change the contents of the deployment descriptor for this DJAR.

Destination: CEJL

Modules: com.ibm.cics.ejs.csi.ContainerUtil

XMEOUT Parameters: date, time, applid, userid, djar_name, element_type, element_value

DFHEJ5048 E  date time applid userid Invalid Resource found in DJar djar_name. Class class_name for bean bean_name does not implement interface_name.

Explanation: CICS has failed to install a DJAR. This is because a class specified in the deployment descriptor as a home, remote or bean implementation class for bean bean_name does not extend the appropriate ejb marker interface for that class. The interface that should be extended is interface_name.

According to the EJB 1.1 specification:

The home interface class must inherit from the javax.ejb.EJBHome interface.

The remote interface class must inherit from the javax.ejb.EJBObject interface.

The session bean implementation class must implement the javax.ejb.SessionBean interface.

System action: The DJAR is put in the UNRESOLVED state.

User response: Correct the deployment descriptor and/or classes in the jar file. To do this you may need to use the WebSphere Application Assembly Tool (AAT) or equivalent to verify or change the contents of the deployment descriptor for this DJAR.

Destination: CEJL

Modules: com.ibm.cics.ejs.csi.ContainerUtil

XMEOUT Parameters: date, time, applid, userid, djar_name, class_name, bean_name, interface_name

DFHEJ5049 E  date time applid userid Error found in the deployment descriptor for DJar djar_name. Bean bean_name implements the SessionSynchronization interface but has a n incompatible deployment descriptor.

Explanation: CICS has failed to install a DJAR. This is due to a problem in the EJB-Jar file's deployment descriptor. Specifically, bean bean_name implements the javax.ejb.SessionSynchronization interface but the deployment descriptor has conflicting values specified.

According to the EJB 1.1 specification, if a session bean implements session synchronization, it must be stateful, use container managed transactions and limit itself to TxRequired, TxRequiresNew or TxMandatory transactions.

System action: The DJAR is put in the UNRESOLVED state.

User response: Correct the deployment descriptor. To do this you may need to use the WebSphere Application Assembly Tool (AAT) or equivalent to verify or change the contents of the deployment descriptor for this DJAR.
Destination: CEJL
Modules: com.ibm.cics.ejs.csi.ContainerUtil
XMEOUT Parameters: date, time, applid, userid, djar_name, bean_name

DFHEJ5050 E date time applid userid Error found in the deployment descriptor for DJar djar_name. An element of type element_type and value element_value for bean bean_name has an invalid value.

Explanation: CICS has failed to install a DJAR. This is due to a problem in the EJB-Jar file's deployment descriptor. Specifically, an XML element of type missing_element should have been found beneath any element of type parent_element. The missing element is required.

For example, the 'assembly-descriptor' subelement of the 'ejb-jar' element may be missing.

System action: The DJAR is put in the UNRESOLVED state.
User response: Correct the deployment descriptor. To do this you need to use the WebSphere Application Assembly Tool (AAT) or equivalent to verify or change the contents of the deployment descriptor for this DJAR.

Destination: CEJL
Modules: com.ibm.cics.ejs.csi.ContainerUtil
XMEOUT Parameters: date, time, applid, userid, djar_name, bean_name

DFHEJ5051 E date time applid userid DJar djar_name is not fully deployed. Class class_name cannot be found.

Explanation: CICS has failed to install a DJAR. This is because the jar file has not been fully deployed. The process of 'deploying' an ejb-jar file causes some infrastructure code to be generated. This code is required by CICS but is absent from the jar file. The class that CICS was looking for but could not find is indicated in class_name.

System action: The DJAR is put in the UNRESOLVED state.
User response: Use the WebSphere Application Assembly Tool (AAT) or equivalent to produce the deployed jar file required by CICS.

Destination: CEJL
Modules: com.ibm.cics.ejs.csi.ContainerUtil
XMEOUT Parameters: date, time, applid, userid, djar_name, class_name

DFHEJ5052 E date time applid userid Error found in the deployment descriptor for DJar djar_name. An element of type parent_element is missing a subelement of type missing_element.

Explanation: CICS has failed to install a DJAR. This is due to a problem in the EJB-Jar file's deployment descriptor. Specifically, an XML element of type missing_element should have been found beneath any element of type parent_element. The missing element is required.

For example, the 'assembly-descriptor' subelement of the 'ejb-jar' element may be missing.

System action: The DJAR is put in the UNRESOLVED state.
User response: Correct the deployment descriptor. To do this you need to use the WebSphere Application Assembly Tool (AAT) or equivalent to verify or change the contents of the deployment descriptor for this DJAR.

Destination: CEJL
Modules: com.ibm.cics.ejs.csi.ContainerUtil
XMEOUT Parameters: date, time, applid, userid, djar_name, parent_element, missing_element

DFHEJ5053 E date time applid userid Missing Resource in DJar djar_name. Resource resource_name cannot be found.

Explanation: CICS has failed to install a DJAR. This is because a class or other resource required by the DJAR cannot be found. The missing resource may be the XML deployment descriptor, the XMI bindings file or a Java class. The name of the missing resource is given in resource_name.

If the missing resource is a Java class, this class is required by either the bean's home interface or the bean's remote interface and should be present in the jar file.

System action: The DJAR is put in the UNRESOLVED state.
User response: Correct the deployment descriptor and/or classes in the jar file. To do this you may need to use the WebSphere Application Assembly Tool (AAT) or equivalent to verify or change the contents of the deployment descriptor for this DJAR.

Destination: CEJL
Modules: com.ibm.cics.ejs.csi.ContainerUtil
XMEOUT Parameters: date, time, applid, userid, djar_name, resource_name
Explanation: CICS has failed to install a DJAR. This is due to a problem in the EJB-Jar file's deployment descriptor. Specifically, an XML element has been found with an invalid value.

The bean-name and role-name elements of the deployment descriptor are defined in the EJB specification as having to conform to the lexical rules for an NMTOKEN. One of these elements was found which contained an illegal NMTOKEN character.

The full definition of an NMTOKEN can be found here:

System action: The DJAR is put in the UNRESOLVED state.

User response: Correct the deployment descriptor. To do this you need to use the WebSphere Application Assembly Tool (AAT) or equivalent to verify or change the contents of the deployment descriptor for this DJAR.

Destination: CEJL

Modules: com.ibm.cics.ejs.csi.ContainerUtil

XMEOUT Parameters: date, time, applid, userid, djar_name, element_type, element_value

Explanation: CICS has failed to install a DJAR. This is due to a problem in the EJB-Jar file's deployment descriptor. The deployment descriptor is valid but does not contain any Session beans.

A EJB-jar file must contain at least one Session bean before CICS is able to install it.

System action: The DJAR is put in the UNRESOLVED state.

User response: Correct the deployment descriptor. To do this you need to use WebSphere Application Assembly Tool (AAT) or equivalent to verify or change the contents of the deployment descriptor for this DJAR.

Destination: CEJL

Modules: com.ibm.cics.ejs.csi.ContainerUtil

XMEOUT Parameters: date, time, applid, userid, djar_name

Explanation: CICS has failed to install a DJAR. This is because an unexpected element has been found in the EJB-Jar file's deployment descriptor.

Some combinations of XML elements in the deployment descriptor are invalid. For example, if a session bean is defined to use bean managed transactions, it must not have any container-transaction elements associated with it.

System action: The DJAR is put in the UNRESOLVED state.

User response: Correct the deployment descriptor. To do this you need to use the WebSphere Application Assembly Tool (AAT) or equivalent to verify or change the contents of the deployment descriptor for this DJAR.

Destination: CEJL

Modules: com.ibm.cics.ejs.csi.ContainerUtil

XMEOUT Parameters: date, time, applid, userid, djar_name, element_type

Explanation: CICS has failed to install a DJAR. This is due to a problem in the EJB-Jar file's deployment descriptor. Specifically, an XML element has been found which contained an illegal NMTOKEN character.

The full definition of an NMTOKEN can be found here:

The bean-name and role-name elements of the deployment descriptor are defined in the EJB specification as having to conform to the lexical rules for an NMTOKEN. One of these elements was found which contained an illegal NMTOKEN character.

Explanation: CICS has failed to install a DJAR. This is because an element in the EJB-Jar file's deployment descriptor has not been bound to a JNDI lookup string.

All 'resource-ref' elements and many 'ejb-ref' elements have to be associated with a JNDI string. This is done using the WebSphere Application Assembly Tool. The JNDI bindings are stored in a separate XMI bindings file in the EJB-Jar file.

System action: The DJAR is put in the UNRESOLVED state.

User response: Add the JNDI bindings. To do this you need to use the WebSphere Application Assembly Tool (AAT) or equivalent to verify or change the contents of the XMI bindings file for this DJAR.

Destination: CEJL

Modules: com.ibm.cics.ejs.csi.ContainerUtil

XMEOUT Parameters: date, time, applid, userid, djar_name, element_type, element_value

Explanation: CICS has failed to install a DJAR. This is due to a problem in the EJB-Jar file's deployment descriptor.

Some combinations of XML elements in the deployment descriptor are invalid. For example, if a session bean is defined to use bean managed transactions, it must not have any container-transaction elements associated with it.

System action: The DJAR is put in the UNRESOLVED state.

User response: Correct the deployment descriptor. To do this you need to use the WebSphere Application Assembly Tool (AAT) or equivalent to verify or change the contents of the deployment descriptor for this DJAR.

Destination: CEJL

Modules: com.ibm.cics.ejs.csi.ContainerUtil

XMEOUT Parameters: date, time, applid, userid, djar_name
**DFHEJ5058 E**  

*date time applid userid*  

XML Parse  

failure in the deployment descriptor for  

DJar *djar_name*.  

Problem found at line  

line *number* and column  

column *number*. The XML parser returned the following exception message: *XML_message*.

**Explanation:**  

CICS has failed to install a DJAR. This is due to a problem in the EJB-Jar file's deployment descriptor. The XML parser was unable to validate the deployment descriptor or the XMI bindings file as the deployment descriptor is invalid.

The XML parser issued a message which is available in *XML_message*.

**System action:**  

The DJAR is put in the UNRESOLVED state.

**User response:**  

Use the UNRESOLVED state.

**Destination:**  

CEJL

**Modules:**  

com.ibm.cics.ejs.csi.ContainerUtil

**XMEOUT Parameters:**  

date, time, applid, userid,  

djar_name, line *number*, column *number*.  

**DFHEJ5059 W**  

*date time applid userid*  

The deployment descriptor for DJar *djar_name* contains one or more non-Session beans, which cannot be installed in CICS, as they are not EJB 2.0 local interfaces. These are not supported in CICS.

**Explanation:**  

The deployment descriptor for DJAR *djar_name* contained references to enterprise beans which cannot be installed in CICS as they are not Session beans. CICS does not support non-Session enterprise beans such as Entity beans or Message-Driven beans.

**System action:**  

The non-Session beans are ignored. Processing continues.

**User response:**  

Either remove these beans from the deployment descriptor or ignore this warning.

**Destination:**  

CEJL

**Modules:**  

com.ibm.cics.ejs.csi.ContainerUtil

**XMEOUT Parameters:**  

date, time, applid, userid,  

djar_name

**DFHEJ5060 E**  

*date time applid userid*  

A problem was found in the manifest file for DJar *djar_name*. The problem was found in the following manifest entry: *attribute*.

**Explanation:**  

CICS has failed to install a DJAR. This is due to a problem in the EJB-Jar file's manifest file. The manifest file contains an invalid entry. The entry which contained the problem is called *attribute*.

The most common cause for this problem is a Class-Path entry in the manifest file that includes absolute file locations. For more information about manifest files visit this URL: http://java.sun.com/j2se/1.4.1/docs/guide/extensions/spec.html

**System action:**  

The DJAR is put in the UNRESOLVED state.

**User response:**  

Either fix the manifest file or remove the manifest file from the jar file.

**Destination:**  

CEJL

**Modules:**  

com.ibm.cics.ejs.csi.ContainerUtil

**XMEOUT Parameters:**  

date, time, applid, userid,  

djar_name, attribute

**DFHEJ5061 E**  

*date time applid userid*  

DJar *djar_name* contains a bean whose name includes characters CICS cannot accept. The bean name is: *bean_name*.

**Explanation:**  

CICS has failed to install a DJAR. This is due to a problem in the name of one of the beans from the DJAR. CICS can only install enterprise beans with names whose characters fall in the following range: A-Z a-z 0-9 _ .

**System action:**  

The DJAR is put in the UNRESOLVED state.

**User response:**  

Either fix the bean name or remove the bean from the DJAR.

**Destination:**  

CEJL

**Modules:**  

com.ibm.cics.ejs.csi.ContainerUtil

**XMEOUT Parameters:**  

date, time, applid, userid,  

djar_name, bean_name

**DFHEJ5062 E**  

*date time applid userid*  

Error found in the deployment descriptor for DJar *djar_name*. Bean *bean_name* has EJB 2.0 local interfaces. These are not supported in CICS.

**Explanation:**  

CICS has failed to install a DJAR. This is due to a problem in the EJB-Jar file's deployment descriptor. Specifically, bean *bean_name* has EJB 2.0 local interfaces defined.

CICS does not tolerate the presence of EJB 2.0 local interfaces.

**System action:**  

The DJAR is put in the UNRESOLVED state.

**User response:**  

Remove the local interfaces. To do this you need to use the WebSphere Application Assembly Tool (AAT) or equivalent to remove the interfaces and to regenerate the EJB Jar file's deployed code.

**Destination:**  

CEJL

**Modules:**  

com.ibm.cics.ejs.csi.ContainerUtil
XMEOUT Parameters: date, time, applid, userid, djar_name, bean_name

DFHEJ5101 date time applid userid Cannot activate bean class exception.

Explanation: The EJB Container is unable to activate a bean. The bean being activated is named in the bean insert of the message. The class trying to activate the bean is named in class and the specific exception which caused the failure is given in exception.

System action: Processing of the EJB Container continues but it is unlikely that any subsequent operations on the specified bean will be possible.

User response: If the exception contains the text 'ClassNotFoundException', then check that the jar file containing the bean has been included in the classpath. Also, check that the bean does exist in the jar file. If the exception contains the text 'IOException', then this may indicate a problem with reading the serialized bean from the bean store.

Destination: CEJL

Modules:
com.ibm.ejs.container.passivator.StatefulPassivator

XMEOUT Parameters: date, time, applid, userid, bean, class, exception

DFHEJ5102 E date time applid userid Cannot passivate bean class exception.

Explanation: The EJB Container is unable to passivate a bean. The bean being passivated is named in the bean insert of the message. The class trying to passivate the bean is named in class and the specific exception which caused the failure is given in exception.

System action: Processing of the EJB Container continues but it is unlikely that any subsequent operations on the specified bean will be possible.

User response: If the exception contains the text 'IOException', then this may indicate a problem with writing the serialized bean to the bean store.

Destination: CEJL

Modules:
com.ibm.ejs.container.passivator.StatefulPassivator

XMEOUT Parameters: date, time, applid, userid, bean, class, exception

DFHEJ5103 E date time applid userid Unable to passivate enterprise bean bean class exception.

Explanation: The EJB Container is unable to passivate a bean. The bean being passivated is named in the bean insert of the message. The class trying to passivate the bean is named in class and the specific exception which caused the failure is given in exception.

System action: Processing of the EJB Container continues but it is unlikely that any subsequent operations on the specified bean will be possible.

User response: If the exception contains the text 'ClassNotFoundException', then check that the jar file containing the bean has been included in the classpath. Also, check that the bean does exist in the jar file. If the exception contains the text 'IOException', then this may indicate a problem with reading the serialized bean from the bean store.

com.ibm.ejs.container.passivator.StatefulPassivator

XMEOUT Parameters: date, time, applid, userid, bean, class, exception

DFHEJ5104 E date time applid userid Exception thrown by discard strategy element exception.

Explanation: The EJB Container is unable to evict an element from its cache. The element being evicted is named in the element insert of the message. The specific exception which caused the failure is given in exception.

System action: Processing of the EJB Container continues. As the element was being removed from the cache, then no further operations on it would be expected.

User response: None.

Destination: CEJL

Modules:
com.ibm.ejs.util.cache.Cache

XMEOUT Parameters: date, time, applid, userid, bean, class, exception

DFHEJ5105 E date time applid userid Encountered a failure in the fireAlarm method exception.

Explanation: The EJB Container has encountered a problem while firing an alarm. The specific exception which caused the failure is given in exception.

System action: Processing of the EJB Container continues.

User response: None.

Destination: CEJL

Modules: com.ibm.ejs.util.am.AlarmManager

XMEOUT Parameters: date, time, applid, userid, bean, class, exception
DFHEJ5106 E  date time applid userid Failed to get the wrapper for home: exception.

Explanation: The EJB Container is unable to locate the home wrapper for a bean object. The specific exception which caused the failure is given in exception.

System action: Processing of the EJB Container continues.

User response: None.

Destination: CEJL

Modules: com.ibm.ejs.container.BeanO

XMEOUT Parameters: date, time,applid, userid, exception

DFHEJ5109 E  date time applid userid Coordinator was not available exception.

Explanation: An unexpected exception occurred when the Container tried to get the transaction coordinator. The specific exception which caused the failure is given in exception.

System action: Processing of the EJB Container continues.

User response: None.

Destination: CEJL

Modules: com.ibm.websphere.csi.TransactionControlImpl

XMEOUT Parameters: date, time,applid, userid, exception

DFHEJ5107 E  date time applid userid LRU thread was interrupted. Terminating. exception.

Explanation: The thread within the EJB Container, which monitors elements in the cache which are potential candidates for removal, has been interrupted. The specific exception which caused the failure is given in exception.

System action: Processing of the EJB Container continues.

User response: None.

Destination: CEJL

Modules: com.ibm.ejs.util.cache.BackgroundLruEvictionStrategy

XMEOUT Parameters: date, time,applid, userid, exception

DFHEJ5108 E  date time applid userid Caught an exception during LRU sweep class exception.

Explanation: An unexpected exception occurred in the thread, within the EJB Container, which monitors elements in the cache which are potential candidates for removal. The specific exception which caused the failure is given in exception.

System action: Processing of the EJB Container continues.

User response: None.

Destination: CEJL

Modules: com.ibm.ejs.util.cache.BackgroundLruEvictionStrategy

XMEOUT Parameters: date, time,applid, userid, class, exception

DFHEJ5110 E  date time applid userid Bean bean_name has an incomplete EJB Reference. Reference is reference.

Explanation: Whilst processing the deployment descriptor for a bean, the container found an EJB reference was not fully specified. An EJB reference must have either a valid ejb-link to another EJB within the same Jar file or it must have a valid binding specified.

System action: The bean and its containing DJar fail to install.

User response: Modify the EJB reference in a suitable deployment tool and add either a valid ejb-link or binding.

Destination: CEJL

Modules: com.ibm.ejs.container.BeanMetaData

XMEOUT Parameters: date, time,applid, userid, bean_name, reference

DFHEJ5111 E  date time applid userid Bean bean_name has an incomplete EJB Resource Reference specified. Resource Reference is reference.

Explanation: Whilst processing the deployment descriptor for a bean, the container found an EJB resource reference that did not have a binding specified. A valid resource reference must have a binding specified.

System action: The bean and its containing DJar fail to install.

User response: Modify the resource reference in a suitable deployment tool and enter a suitable binding value.

Destination: CEJL

Modules: com.ibm.ejs.container.BeanMetaData
**XMEOUT Parameters:** date, time, applid, userid, bean_name, reference

**DFHEJ5112 E**  
*date time applid userid Bean*

*bean_name has an EJB environment entry with an invalid value specified.*

Environment entry is env_entry.

**Explanation:** Whilst processing the deployment descriptor for a bean, the container found an EJB environment entry whose value was null. Environment entries must have a value specified in order to be valid.

**System action:** The bean and its containing DJar fail to install.

**User response:** Modify the environment entry in a suitable deployment tool and set a value appropriate to the type of the entry.

**Destination:** CEJL

**Modules:** com.ibm.ejs.container.BeanMetaData

**XMEOUT Parameters:** date, time, applid, userid, bean_name, env_entry

**DFHEJ5113 E**  
*date time applid userid Unexpected naming problem occurred: message*

**Explanation:** An unexpected message was produced by the CICS/WebSphere JNDI code. The full text of this message should explain the problem.

**System action:** The behaviour of the system depends on the kind of naming problem. Naming problems could occur during bean publish, bean retract or bean lookup, any of these three operations may fail depending on the severity of the error.

**User response:** If unable to determine an appropriate action from the full CICS message, lookup the WebSphere naming message code (NMSVnnnn) in your WebSphere documentation.

**Destination:** CEJL

**Modules:** com.ibm.ejs.ns.* com.ibm.ws.naming.*

**XMEOUT Parameters:** date, time, applid, userid, message

**DFHEJ5114 W**  
*date time applid userid The class com.ibm.ejs.ns.jndi.CNInitialContextFactory has been deprecated as the CICS initial context factory. Class com.ibm.websphere.naming.WsnInitialContextFactory has replaced it.*

**Explanation:** The JNDI initial context factory which is specified as property java.naming.factory.initial has been set to com.ibm.ejs.nd.jndi.CNInitialContextFactory. This value specifies a deprecated class and has been replaced by com.ibm.websphere.naming.WsnInitialContextFactory.

**System action:** Depending on the kind of naming operation attempted, it may succeed or fail.

**User response:** Begin using the new initial context factory as soon as possible. This can be achieved by ensuring the java.naming.factory.initial property is set to the correct value, or by ensuring it is not set anywhere, so CICS can default appropriately. If unsure where it is being set, check the system properties file and any jndi.properties that exist on the classpath for the CICS system.

**Destination:** CEJL

**Modules:** com.ibm.ejs.ns.jndi.CNInitialContextFactory

**XMEOUT Parameters:** date, time, applid, userid

**DFHEJ6000 E**  
*date time applid userid The CICS EJB container failed to find the requested plugin plugin.*

**Explanation:** The CICS EJB container attempted to instantiate the requested plugin class plugin but the container could not find this class on the current classpath.

**System action:** The plugin is not loaded.

**User response:** Examine the value set for the classpath in the JVM profile being used from the XDFHENV dataset. The path for the requested plugin must be present in the classpath.

**Destination:** CEJL

**Modules:** com.ibm.cics.ejs.csi.CICSCContainerConfig

**XMEOUT Parameters:** date, time, applid, userid, plugin

**DFHEJ6001 E**  
*date time applid userid The CICS EJB container plugin plugin has thrown exception exception.*

**Explanation:** The CICS EJB container caught an exception thrown from plugin plugin.

**System action:** The EJB container attempts to continue processing the user application.

**User response:** Either contact the plugin vendor for further assistance or catch the exception in the body of your plugin.

**Destination:** CEJL

**Modules:** com.ibm.cics.ejs.csi.CICSCContainerConfig

**XMEOUT Parameters:** date, time, applid, userid, plugin, exception
DFHEMxxxx messages

DFHEM0001 applid An abend (code aaa/bbbb) has occurred at offset X'offset' in module modname.

Explanation: An abnormal end (abend) or program check has occurred in module modname. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code aaa/bbbb is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual.

Next, look up the CICS alphanumeric code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module modname is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module modname you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Modules: DFHEMDM, DFHEMEM.

XMEOUT Parameters: applid, X'code', modname

DFHEM0002 applid A severe error (code X'code') has occurred in module modname.

Explanation: An error has been detected in module modname. The code X'code' is the exception trace point ID which uniquely identifies what the error is and where the error was detected.

System action: An exception entry (code X'code' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module modname is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module modname, you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Modules: DFHEMDM, DFHEMEM.

XMEOUT Parameters: applid, X'code', modname

DFHEM0100I applid Event Manager initialization has started.

Explanation: This is an informational message indicating the start of event manager domain initialization.

System action: Initialization continues.

User response: None. You can suppress this message with the system initialization parameter, MSGLVL=0.

Destination: Console

Modules: DFHEMDM

XMEOUT Parameter: applid
DFHEM0101I  applid Event Manager initialization has ended.

Explanation: Event manager domain initialization has completed successfully

System action: Initialization continues.

User response: None. You can suppress this message with the system initialization parameter, MSGGLVL=0.

DFHERxxxx messages

DFHER2813I  applid Program DFHRCEX cannot be found

Explanation: CICS cannot find DFHRCEX in any data set concatenated in the DFHRPL DD statement in the CICS startup job stream.

System action: CICS terminates abnormally with a dump.

User response: To correct this error, place DFHRCEX in a partitioned data set in the DFHRPL DD statement.

Destination: Console

Modules: DFHTCBP, DFHUSBP

XMEOUT Parameter: applid

---

DFHER5730  applid User recovery beginning

Explanation: During warm or emergency restarts CICS issues this message when it is about to start processing records from the system log.

System action: If the global user exit XRCINIT is enabled, it is invoked with an indication that this is the initial call. Processing continues.

User response: None.

Destination: Console

Modules: DFHAPRC

XMEOUT Parameter: applid

---

DFHER5731  applid No active user records on the system log

Explanation: During warm or emergency restarts CICS issues this message when it has completed its scan of the system log and has found no active user journal records. Active user journal records are written by user applications that use commands such as EXEC CICS WRITE JOURNAL. They are written to the system log by one of the following:

- A unit of work that was in flight or in doubt when the preceding CICS system terminated.
- An application request in which the high order bit of the JTYPEID value was set to 1 (provided that the record lies within the compass of the restart system log scan).
- The XAKUSER global user exit during the last completed activity keypoint.

System action: If the global user exit XRCINIT is enabled, it is invoked with an indication that this is the final call. Processing continues.

User response: None.

Destination: Console

Modules: DFHAPRC

XMEOUT Parameter: applid
**DFHEXxxxx messages**

### DFHEX0001

**An abend (code aaa/bbbb) has occurred in module modname.**

**Explanation:** An unexpected program check or abend aaa/bbbb has occurred in module modname. This implies that there may be an error in external CICS interface code.

Alternatively, unexpected data has been passed on an external CICS interface call or storage has been overwritten.

The code aaa/bbbb is, if applicable, a 3-digit hexadecimal MVS system completion code aaa (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The 4-digit code bbbb, which follows aaa, is, if applicable, a user abend code produced by the external CICS interface. If the user abend code is not applicable, this field is filled with four hyphens.

**System action:** An exception entry is made in the external CICS interface internal trace table, and to the GTF trace dataset (if GTF is active), and a SYSMDUMP is taken.

The external CICS interface terminates the current request, and attempts to recover to a consistent state so that further EXCI requests can be serviced. For an application using the EXCI CALL API, a response of EXCI_SYSTEM_ERROR with a REASON of ESTAE_INVOKED is returned to the application. For an application using the EXCI EXEC API, an EXEC_RESP of LINKERR is returned to the application, together with an EXEC_RESP2 of ESTAE_INVOKED or EXEC_ESTAE_INVOKED, depending on whether the call level ESTAE routine, or the EXEC level ESTAE routine was invoked.

**User response:** Look up the MVS code aaa, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual.

If applicable, see the description of abend code bbbb for further guidance.

You may need further assistance from IBM to resolve this problem. See Part 4 of the [CICS Problem Determination Guide](#) for guidance on how to proceed.

**Modules:** DFHXCPRH, DFHXCEIP

### DFHEX0002

**A severe error (code X'code') has occurred in module modname.**

**Explanation:** An error has been detected in module modname. The code X'code' is the exception trace point ID which uniquely identifies the place where the error was detected.

**System action:** An exception entry is made in the EXCI internal trace table and to GTF if it is active, (X'code' in the message). A system dump is taken.

This is a critical error and the EXCI request is terminated. The external CICS interface attempts to recover to a consistent state so that further EXCI requests can be issued. For applications using the EXCI CALL API, the EXCI_REASON returned to the application indicates the reason for the error. For applications using the EXCI EXEC API, the reason is returned in the EXEC_RESP2 field of the RETCODE area.

**User response:** Look up the MVS GETMAIN return code rc in the relevant MVS codes manual.

If the reason is insufficient storage, try increasing the size of the region for the batch EXCI job.

You may need further assistance from IBM to resolve this problem. See Part 4 of the [CICS Problem Determination Guide](#) for guidance on how to proceed.

**Destination:** Console

**Modules:** DFHXCPRH, DFHXCEIP

### DFHEX0003

**A GETMAIN request in module modname (code X'code') has failed. Reason X'rc'.**

**Explanation:** An MVS GETMAIN was issued by module modname, but it failed with return code rc.

The code X'code' is the exception trace point ID which uniquely identifies the place where the MVS GETMAIN was issued.

**System action:** An exception entry is made in the EXCI internal trace table (code X'code' in the message). This is a critical error and the EXCI request is terminated. The external CICS interface attempts to recover to a consistent state so that further EXCI requests can be issued.

For applications using the EXCI CALL API, the EXCI_REASON returned to the application indicates the point of failure.

For applications using the EXCI EXEC API, the point of failure is returned in the EXEC_RESP2 field of the RETCODE area.

For EXCI_REASON and EXCI_RESP of 603, the EXCI module DFHXCPRH also issues abend 0410 which drives the ESTAE exit. Message DFHEX0001 is issued and a SYSMDUMP is taken.

**User response:** Look up the MVS GETMAIN return code rc in the relevant MVS codes manual.

If the reason is insufficient storage, try increasing the size of the region for the batch EXCI job.

You may need further assistance from IBM to resolve this problem. See Part 4 of the [CICS Problem Determination Guide](#) for guidance on how to proceed.

---

**DFHEX0004**  
**Jobname:** jobname, **Stepname:** stepname, **Procnme:** procnme, **Sysid in SMF:** sysid, **Applid:** applid.

**Explanation:** This message accompanies message DFHEX0001 and will provide the jobname, stepname, procnme, sysid in SMF and applid to which the EXCI job is connecting to. If an insert value is unknown or not specified then the message insert will read Unknown. For example, procnme and stepname are not mandatory in an EXCI job, if they were omitted and DFHEX0004 was issued then the inserts for procnme and stepname will read Unknown.

**System action:** Follow system action for DFHEX0001.

**User response:** Follow user response for DFHEX0001.

**Destination:** Console

**Modules:** DFHXCPRH, DFHXCEIP

---

**DFHEX0100** The installed level of CICS SVC does not support the EXCI call.

**Explanation:** The external CICS interface module DFHXCPRH detected that the level of CICS SVC (DFHCSCVC) in use does not support the external CICS interface.

**System action:** The EXCI request is terminated. An exception trace is made in the EXCI internal trace table, and if GTF is active, in the GTF trace data set. The external CICS interface module DFHXCPRH issues abend 0407 which drives the ESTAE exit. Message DFHEX0001 is issued, and a SYMSMDUMP is taken.

**User response:** Check the level of DFHCSCVC installed in the LPA. A CICS/ESA 4.1 level of DFHCSCVC is required for the external CICS interface. Generally, the latest level of DFHCSCVC must be used when running CICS and the external CICS interface. For more information about installing DFHCSCVC see the [CICS Transaction Server for z/OS Installation Guide](#).

**Destination:** Console

**Modules:** DFHXCPRH

---

**DFHEX0101** Unable to start interregion communication because DFHIRP level check failed.

**Explanation:** The call to DFHIRP to check DFHIRP's service level has failed.

**System action:** The external CICS interface issues an MVS STIMERM macro which causes it to wait for five seconds. The request is reissued when the delay interval has expired.

**User response:** None.
Destination: Console
Modules: DFHXCDMP

DFHEX0112  SDUMP request failed - reason X'nn'.
Explanation: An MVS SDUMP request issued from the external CICS interface has failed to complete successfully. The possible reasons, (reason) for the failure are as follows:

ONLY PARTIAL DUMP
The SYS1.DUMP data set to which the dump is written is not large enough to contain all of the dumped storage.

SDUMP BUSY
At the time of the MVS SDUMP request issued by the EXCI, another address space in the same MVS system was in the process of taking an SDUMP. This causes MVS to reject the new request. If a nonzero value is specified for the dump retry parameter in DFHXCOPT table, the EXCI has retried the SDUMP request every five seconds for the specified period. This message is only issued if SDUMP is still busy after the final retry.

STIMERM FAILED
In order to delay for five seconds before retrying SDUMP after an SDUMP BUSY condition, the EXCI issues an MVS STIMERM macro request. MVS has indicated that the STIMERM request has failed.

NO DATA SET AVAILABLE
No SYS1.DUMP data sets were available at the time the SDUMP request was issued.

REJECTED BY MVS, REASON = X'nn'
MVS has rejected the SDUMP request because of user action (for example, specifying DUMP=NO in the MVS IPL) or because of an I/O error or terminating error in the SDUMP routine. X'nn' is the SDUMP reason code.

NOT AUTHORIZED FOR EXCI
SDUMP is not authorized for the external CICS interface.

INSUFFICIENT STORAGE
The EXCI issued an MVS GETMAIN for subpool 253 storage during the processing of the SDUMP request. The GETMAIN has been rejected by MVS.

System action: The EXCI proceeds as if the dump had been successful.

User response: The user response depends on the reasons, (reason), for the failure.

ONLY PARTIAL DUMP
Increase the size of the SYS1.DUMP data sets and cause the SDUMP request to be reissued.

SDUMP BUSY
Cause the SDUMP to be reissued after, if appropriate, increasing the dump retry time in DFHXCOPT.

STIMERM FAILED
Use MVS problem determination methods to fix the STIMERM failure and then cause the SDUMP request to be reissued.

NO DATA SET AVAILABLE
Clear a SYS1.DUMP data set and then cause the SDUMP request to be reissued.

REJECTED BY MVS, REASON = X'nn'
No action is required if the dump is suppressed deliberately. If the dump has failed because of an error in the MVS SDUMP routine, use MVS problem determination methods to fix the error and then cause the SDUMP request to be reissued. See the OS/390 MVS Programming: Authorized Assembler Services Reference for an explanation of the SDUMP reason code X'nn'.

NOT AUTHORIZED FOR EXCI
This reason is unlikely because SDUMP is unconditionally authorized during EXCI initialization, and should be authorized throughout the EXCI run. If you do get this reason, the EXCI AFCB (authorized function control block) has probably been accidentally overwritten.

INSUFFICIENT STORAGE
Ensure sufficient storage is available to MVS for subpool 253 requests.

Destination: Console
Modules: DFHXCDMP

DFHEX0113  EXCI trace Initialization has failed.
Explanation: An attempt to initialize external CICS interface (EXCI) trace facilities during EXCI initialization has failed.

System action: The EXCI request continues without trace facilities. An earlier message identifies the cause of the failure.

User response: Refer to the earlier message to determine the cause of the failure.

Destination: Console
Modules: DFHXCTRI

DFHEX0114  Incorrect data has been passed for EXCI tracing causing a program check in DFHXCTRP.
Explanation: Some data passed to the external CICS interface (EXCI) trace module DFHXCTRP for addition to the EXCI internal trace table, or GTF trace, caused a
program check to occur when an attempt was made to access it.

The most likely cause of this error is incorrect data passed on an EXCI CALL API request that the trace program DFHXCTRP is attempting to access.

**System action:** The EXCI request is terminated and a SYSMDUMP is taken.

**User response:** Examine the dump to determine the source of the incorrect data.

You may need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** Console

**Modules:** DFHXCTRI

---

**DFHEX0115** EXCI trace services have been disabled due to a previous error.

**Explanation:** An error occurred in the external CICS interface (EXCI) trace module DFHXCTRP indicated by message DFHEX0001. In trying to recover from the error, module DFHXCTRI determined that the error was not caused by accessing incorrect data passed to DFHXCTRP, but was due to a program check in DFHXCTRP.

**System action:** The EXCI trace facilities are disabled to prevent further errors. A SYSMDUMP is taken.

**User response:** See the DFHEX0001 message and the SYSMDUMP to determine the cause of the error.

**Destination:** Console

**Modules:** DFHXCTRI

---

**DFHECxxxx messages**

**Note:** In cases where standard message inserts such as opid or termid are undefined or cannot be determined, the inserts are replaced by dashes.

DFHFC0001 applicd An abend (code aaaa/bbbb) has occurred at offset X’offset’ in module modname.

**Explanation:** An abnormal end (abend) or program check has occurred in module modname. This implies that there may be an error in CICS code.

Alternatively,

- Unexpected data has been input, or
- Storage has been overwritten.

The code aaaa/bbbb is a three digit hexadecimal MVS code (if applicable), followed by a four digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

**System action:** An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User response:** Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual.

Then look up the CICS alphanumeric code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some further guidance.

If module modname is not crucial to the running of your CICS system, you may decide to continue to run and...
bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module *modname*, you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the [CICS Problem Determination Guide](#) for guidance on how to proceed.

**Destination:** Console

**Modules:** DFHFCAT, DFHFCCA, DFHFCDN, DFHFCDTX, DFHEIFC, DFHFCES, DFHFCFL, DFHFCFR, DFHFCFS, DFHFCIR, DFHFCOR, DFHFCQI, DFHFCQR, DFHFCQS, DFHFCQI, DFHFCQR, DFHFCRS, DFHFCSD, DFHFCST, DFHFCST, DFHFCVS

**XMEOUT Parameters:** applid, aaa/bbbb, X’offset’, modname

---

**DFHFC0002 applid A severe error (code X’code’) has occurred in module modname.**

**Explanation:** An error has been detected in module *modname*. The code *code* is the exception trace point ID which uniquely identifies what the error is and where the error was detected.

To discover the cause of the problem, examine the exception trace entry and immediately preceding entries. For further information about CICS exception trace entries, see the [CICS Problem Determination Guide](#). System action: An exception entry (code *code* in the message) is made in the trace table (code *code* in the message). A system dump is taken, unless you have specifically suppressed dumps in the dump table. CICS continues unless you have specified in the dump table that CICS should terminate.

If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User response:** Inform the system programmer. If CICS has been terminated by another module, look out for the relevant termination messages (from the domain manager, for example), and look up the user response for these messages.

If CICS is still running, the problem may be a temporary one which rights itself if more storage becomes available. If you can manage without module *modname*, you may decide to continue and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of all CICS modules, you should bring CICS down in a controlled shutdown.

Try increasing the size limits of the DSAs or EDSAs. See the [CICS System Definition Guide](#) or the [CICS Performance Guide](#) for further information on CICS storage.

**Destination:** Console

**Modules:** DFHFCRP

**XMEOUT Parameters:** applid, X’code’, modname

---

**DFHFC0003 applid Insufficient storage (code X’code’) in module modname.**

**Explanation:** A CICS GETMAIN was issued by module *modname*, but there was insufficient storage available to satisfy the request.

The code *X’code’* is the exception trace point ID which uniquely identifies the place where the error was detected.

**System action:** An exception entry is made in the trace table (code *code* in the message). A system dump is taken, unless you have specifically suppressed dumps in the dump table. CICS continues unless you have specified in the dump table that CICS should terminate.

If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User response:** Inform the system programmer. If CICS has been terminated by another module, look out for the relevant termination messages (from the domain manager, for example), and look up the user response for these messages.

If CICS is still running, the problem may be a temporary one which rights itself if more storage becomes available. If you can manage without module *modname*, you may decide to continue and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of all CICS modules, you should bring CICS down in a controlled shutdown.

Try increasing the size limits of the DSAs or EDSAs. See the [CICS System Definition Guide](#) or the [CICS Performance Guide](#) for further information on CICS storage.

**Destination:** Console

**Modules:** DFHFCRP

**XMEOUT Parameters:** applid, X’code’, modname
DFHFC0004 applid A possible loop has been detected at offset X'offset' in module modname.

Explanation: A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module modname at offset X'offset'. This is the offset of the instruction which was executing at the time the error was detected.

System action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table. CICS continues unless you have specified in the dump table that CICS should terminate.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Notify the system programmer. If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of CPU time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module modname is terminated and CICS continues.

But if you have declared ICVR=0 as a system initialization parameter and you consider that module modname has gone into a loop, you have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module modname, and you consider that it was not a runaway, increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently. But you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will require further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Modules: XMEOUT Parameters: applid, modname, X'code'

DFHFC0100I applid File Control initialization has started.

Explanation: This is an informational message indicating the start of file control initialization.

System action: Initialization continues.

User response: None. You can suppress this message with the system initialization parameter, MSGVLvl=0.

Destination: Console

Modules: DFHFCRP

XMEOUT Parameter: applid

DFHFC0101I applid File Control initialization has ended.

Explanation: File control initialization has completed successfully.

System action: Initialization continues.

User response: None. You can suppress this message with the system initialization parameter, MSGVLvl=0.

Destination: Console
DFHFC0102 applid File Control initialization has failed.

Explanation: File control has failed to initialize correctly.

System action: Message DFHSI1521 is usually issued and initialization is terminated.

If the failure occurred at a critical stage during file control initialization, CICS initialization is terminated immediately with a dump, and message DFHSI1521 is not issued.

User response: The error can be identified by a trace entry, and possibly by a prior message. You should then take action that is appropriate to the error.

Destination: Console
Modules: DFHFCRP
XMEOUT Parameter: applid

DFHFC0103 applid Required module modname could not be loaded.

Explanation: Module modname is required by file control. It could not be loaded because it is missing from the DFHRPL library list.

System action: The system terminates with a system dump and code FC0103.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Ensure that module modname is in the DFHRPL library list.

If this is not the cause of the problem you will require further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console
Modules: DFHFCRP
XMEOUT Parameter: applid

DFHFC0104 applid Unexpected catalog error.

Explanation: File control issued a request to the catalog (CC) domain which failed. This is probably caused by an I/O error on the catalog.

System action: A system dump is produced with code FC0104.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Determine the cause of the error from the messages issued from the catalog domain.

Destination: Console
Modules: DFHFCIN1, DFHFCRP, DFHFCFS
XMEOUT Parameters: applid, modname

DFHFC0106 applid Insufficient storage to satisfy GETMAIN request in module modname.

Explanation: The storage (SM) domain has insufficient space to satisfy a GETMAIN request made during CICS initialization.

System action: A system dump is produced.

User response: None.

Destination: Console
Modules: DFHFCRP
XMEOUT Parameter: applid, modname

DFHFC0107D applid Unable to load File Control table DFHFCTxx. Enter either an alternative suffix, or 'YES', or 'NO'.

Explanation: The file control table, DFHFCTxx could not be found in the DFHRPL library list during a cold or initial start of CICS.

System action: File control initialization waits for a reply to this message.

User response: Reply as follows:
- With a 1 or 2 character suffix to cause file control to load DFHFCTxx, or
- YES to load an unsuffixed FCT, or
- NO to initialize file control without an FCT.

Destination: Console
Modules: DFHFCRP
XMEOUT Parameters: applid, xx

DFHFC0108 applid Invalid reply to message DFHFC0107D. A 1 or 2 character suffix, or YES or NO is required

Explanation: The reply to message DFHFC0107 was invalid. The reply may have been too long or may have contained invalid characters.

System action: Message DFHFC0107 is reissued and initialization waits for a reply.

User response: Reply to message DFHFC0107.

Destination: Console
Modules: DFHFCRP
XMEOUT Parameter: applid
DFHFC0110  applid Error, a xxxx version of DFHFCTxx has been loaded.

Explanation: DFHFCRP loaded DFHFCTxx that was assembled for CICS release xxxx. It is not valid to run CICS with an FCT assembled against a previous release.

System action: File control initialization, and hence CICS, is terminated.

User response: Reassemble DFHFCTxx for the CICS release being used. Cold start CICS.

Destination: Console

Modules: DFHFCRP

XMEOUT Parameters: applid, xxxx,DFHFCTxx

---

DFHFC0111  applid Error, CICS is attempting to initialize with release xxxx of DFP.

Explanation: DFHFCRP detected that CICS was being initialized with data facility product (DFP) level xxxx. CICS does not support this level of DFP.

System action: File control initialization, and hence CICS, is terminated.

User response: Install a level of DFP supported by this release of CICS.

Destination: Console

Modules: DFHFCRP

XMEOUT Parameters: applid, xxxx

---

DFHFC0112  applid Install of remote FCT entry filename failed. SYSID sysid, specified in the entry, is the local SYSID.

Explanation: DFHFCRP attempted to install file filename from the assembled FCT. The install failed because the file was defined as TYPE=REMOTE but the SYSIDNT specified, sysid, was the system identifier of this local system.

System action: File filename is not installed and file control initialization continues.

User response: Examine the entry for filename in the FCT and either make the entry a local entry (TYPE=FILE) or correct the SYSIDNT specified.

Destination: Console

Modules: DFHFCRP

XMEOUT Parameters: applid, filename, sysid

---

DFHFC0116  applid The load of callable service IGWARLS has failed with return code X'eeee'.

Explanation: Callable service IGWARLS is required by file control for processing files which have update SERVREQs and are using the VSAM catalog as a repository for data set recovery attributes. The load of IGWARLS requested by file control initialization has failed. This is a serious problem because CICS is using a level of VSAM that supports use of the VSAM catalog for specifying data set recovery attributes.

System action: CICS initialization fails.

User response: IGWARLS is supplied on SYS1.CSSLIB. Ensure that SYS1.CSSLIB is in the concatenation for the MVS linklist or LPA. If the failure persists, this is likely to be an internal CICS error. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Modules: DFHFCRP

XMEOUT Parameters: applid, X'eeee'

---

DFHFC0118  applid System initialization parameter requesting RLS support has been ignored because the level of VSAM does not support RLS.

Explanation: RLS=YES has been specified on CICS startup but the level of VSAM does not support RLS access.

System action: CICS initialization continues without RLS support.

User response: If you intend to use RLS access ensure that the level of VSAM is DFSMS 1.3 or later.

Destination: Console

Modules: DFHFCRP

XMEOUT Parameter: applid

---

DFHFC0150  date time applid termid tranid An attempt to release locks for unit of work X'uwoid' failed. VSAM return code X'rree' reason code X'cccc'.

Explanation: Unit of work uwoid for tranid tranid has attempted to release its RLS locks. The release locks request made to VSAM has failed because VSAM detected an error.

The IDALKREL response is rrr and the reason code is cccc.

termid identifies the terminal running this transaction.

System action: CICS continues with the completion of the unit of work.

The unit of work is shunted. The shunt reason indicates that a further release locks attempt is required.

Some records may remain locked until a successful lock release command can be processed by VSAM.

If the failure is caused by the SMSVSAM server being
unavailable, CICS automatically retries the completion of the UOW when the server becomes available.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User response:** Use the VSAM codes to determine the cause of the problem. The most likely cause of this failure is that the SMSVSAM server failed at the time of the error. For the meaning of the VSAM codes, see OS/390 V2R10.0 DFSMS Macro Instructions for Data Sets.

When the condition that caused the lock release to fail has been resolved, you may need to retry the unit of work using

CEMT SET DSNAME RETRY

or

EXEC CICS SET DSNAME(dsname) ACTION(RETRY)

If you cannot resolve the problem or the problem recurs, there may be a more severe error. In this case, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** Console and Transient Data Queue

**Modules:** DFHFCCA

**XMEOUT Parameters:** date, time, applid, termid, tranid, X'uowid', X'rrrr', X'cccc'

**DFHFC0151** date time applid termid tranid An attempt to retain locks for unit of work X'uowid' failed. VSAM return code X'rrrr' reason code X'cccc'.

**Explanation:** Unit of work uowid for transaction tranid has gone indoubt because it has lost contact with its coordinating system. Consequently CICS has attempted to convert all RLS locks owned by this unit of work into retained locks. This attempt has failed because VSAM has detected an error.

The IDARETLK macro response is rrrr and the reason code is cccc.

termid identifies the terminal running this transaction.

**System action:** CICS continues shunting this unit of work. It is possible that some locks may remain as active locks (which cause other transactions to wait until their timeout value is reached) rather than as retained locks (which cause other transactions to encounter LOCKED responses.)

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User response:** Use the VSAM codes to determine the cause of the problem. For the meaning of the VSAM codes, see OS/390 V2R10.0 DFSMS Macro Instructions for Data Sets. The most likely reason for the failure to convert locks into retained locks is that the SMSVSAM server was not available. Other VSAM codes may indicate a more severe error.

Normally no other action should be necessary. When contact is reestablished, the coordinating system instructs this system to commit or backout. At the end of commit or backout, all retained and active locks are released.

A problem that you may encounter is that some locks may have been left as active locks. This may cause slow response (and eventual failures) from transactions that wait for these locks and have to wait for their full timeout interval.

In this case, you can use the CEMT SET UOW command to force the unit of work to commit or backout, or to make a decision to commit or backout according to the ACTION attribute in the transaction definition. Alternatively, you can use the CEMT SET DSNAME command which will force all in-doubt units of work which had updated the specified data set. However, you should not normally use these commands because they can cause this CICS to become out of step with its coordinating system with consequent loss of data integrity.

If you cannot resolve the problem or the problem recurs, there may be a more severe error. In this case, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** Console and Transient Data Queue

**Modules:** DFHFCCA

**XMEOUT Parameters:** date, time, applid, termid, tranid, X'uowid', X'rrrr', X'cccc'

**DFHFC0152** date time applid termid tranid An attempt to retain locks for data set within unit of work X'uowid' failed. VSAM return code X'rrrr' reason code X'cccc'.

**Explanation:** Unit of work uowid for transaction tranid has failed backout for one of its data sets. CICS has attempted to convert all the RLS locks owned by this unit of work that are associated with the failing data set into retained locks. This attempt has failed because VSAM has detected an error.

The IDARETLK response is rrrr and the reason code is cccc.

termdir identifies the terminal running this transaction.

This message is followed by message DFHFC0312 which identifies the failing data set.

**System action:** CICS continues shunting this unit of work.
Some locks may remain as active locks (which cause other transactions to wait until their timeout value is reached) rather than as retained locks (which cause other transactions to encounter LOCKED responses).

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User response:** Use the VSAM codes to determine the cause of the problem. For the meaning of the VSAM codes, see [OS/390 V2R10.0 DFSMS Macro Instructions for Data Sets](https://www.ibm.com/support/knowledgcenter/SSSUGP_5.3.0/com.ibm.as400嗳e.datasef.irmason.en/topic/com.ibm.as400嗳e.datasef.irmason.doc/irmsec.htm).

The most likely reason for the failure to convert locks into retained locks is that the SMSVSAM server was not available. It is also possible to get a failure because the specified logical unit of work ID does not exist for the subsystem (that is, the unit of work does not hold any locks) during lost locks recovery, or after a CICS restart which specified OFFSITE=YES as a system initialization override. If you are performing RLS lost locks recovery, message DFHFC0555 will have been issued when lost locks recovery started; if you are performing RLS offsite recovery, message DFHFC0574 will have been issued during file control initialization. Other VSAM codes may indicate a more severe error.

Normally no other action is necessary. When the condition that caused the backout failure has been resolved, the backout of this unit of work is retried. If the attempt to retry the backout succeeds, all locks are released.

Message DFHFC4701 specifies the cause of the backout failure. The most common cause of backout failures is a hardware problem causing I/O errors. In this case the data set needs to be restored and forward recovered. If CICSVR (or a functionally equivalent product) is used to perform forward recovery, and the data set was being accessed in RLS mode, units of work that have failed backout for this data set are retried automatically. If the data set was quiesced, you need to unquiesce it to allow the backout to succeed. When the data set is unquiesced, CICS automatically retries the backout.

Backouts may also be retried using

```
CEMT SET DSNAME RETRY
```

```
EXEC CICS SET DSNAME(dsname) ACTION(RETRY)
```

or

The only problem that you may encounter is that some locks may have been left as active locks. This can cause a slow response (and eventual failures) from transactions that wait for these locks and have to wait for their full timeout interval.

In this case, consider releasing all locks held against this data set using the CEMT SET DSNAME RESETLOCKS command. This command should only be considered in extreme cases because it discards both the retained locks held by this CICS system against the named data set and all associated log records. The consequence is that the corresponding backout operations are never performed and data integrity is lost.

If you cannot resolve the problem or the problem recurs, there may be a more severe error. In this case, you will need assistance from IBM. See Part 4 of the [CICS Problem Determination Guide](https://www.ibm.com/support/knowledgcenter/SSSUGP_5.3.0/com.ibm.as400嗳e.datasef.irmason.en/topic/com.ibm.as400嗳e.datasef.irmason.doc/irmsec.htm) for guidance on how to proceed.

**Destination:** Console and Transient Data Queue

**Modules:** DFHFCCA

**XMEOUT Parameters:** date, time,applid, termid, tranid, X'uowid'; X'rrrr'; X'cccc'

---

**DFHFC0153**

applid The previous instance of the SMSVSAM server has failed. File control RLS access is being closed down.

**Explanation:** The SMSVSAM server is the separate VSAM address space that handles all VSAM requests made in RLS mode. The instance of this address space which CICS has been using has terminated, and CICS has just detected the failure. CICS must close down all accesses from file control to this instance of the SMSVSAM server in order to be able to register with the next server instance when the server restarts.

If message DFHFC0568 is issued before DFHFC0153, CICS did not detect the failure until the server restarted and notified CICS that a new instance was available. If message DFHFC0568 is not issued before DFHFC0153, CICS detected the failure when it tried to access the failed instance of the server.

**System action:** CICS disables all further RLS accesses, closes all files which were open in RLS mode, and attempts to unregister the RLS control ACB.

Transactions that attempt to access files previously opened in RLS mode abend. The abend code depends upon what the transaction was doing at the time of the failure.

**User response:** The SMSVSAM server address space should normally restart itself. If it does not, restart the SMSVSAM server address space manually. If the SMSVSAM server address space fails to restart, there may be a more severe error. In this case, you need assistance from IBM. See Part 4 of the [CICS Problem Determination Guide](https://www.ibm.com/support/knowledgcenter/SSSUGP_5.3.0/com.ibm.as400嗳e.datasef.irmason.en/topic/com.ibm.as400嗳e.datasef.irmason.doc/irmsec.htm) for guidance on how to proceed.

**Destination:** Console

**Modules:** DFHFCCA

**XMEOUT Parameter:** applid
DFHFC0156 applid A failure to reset the
PERMITNONRLSUPDATE state has
occurred. Vsam return code X'rrrr'
reason code X'cccc'.

Explanation: CICS has completed processing after a
PERMITNONRLSUPDATE batch override response was
returned by VSAM when CICS issued an RLS open.
The call to VSAM from CICS to reset the state so that it
is no longer in batch override status has failed.
The VSAM response is rrrr and the VSAM reason is
cccc.

This message is followed by message DFHFC0312
which identifies the failing data set.

System action: CICS takes a system dump.

User response: To resolve the problem, keep the
dump and contact your IBM Support Center.

Destination: Console

Modules: DFHFCCA

XMEOUT Parameters: applid, X'rrrr', X'cccc'

DFHFC0157 applid tranid termid userid
An I/O error has occurred on base data set
dsname accessed via file filename component
code X'code'.

Explanation: An I/O error has been reported by VSAM
after a request to update VSAM file filename.
The name of the base data set associated with the file is
dsname although the error may have been
encountered elsewhere. This is indicated by the value of
the component code X'code'. Its possible values and the
corresponding error locations are as follows.
- X'00' or X'01' - Base cluster.
- X'02' or X'03' - Alternate index.
- X'04' or X'05' - Upgrade set.

System action: The application request which
encountered the error receives an 'IOERR' response.
CICS also issues message DFHFC0158 to display the
VSAM diagnostic information for this error.

User response: Follow standard procedure for I/O
errors. No special additional action is required to
respond to this particular message although the data set
name and component code may help in identifying the problem.

Destination: Console

Modules: DFHFCRS

XMEOUT Parameters: applid, tranid,termid, userid,
dsname, filename, X'code'

DFHFC0158 applid vsam-error-data

Explanation: This message displays additional VSAM
diagnostic information that is available following I/O
errors and cache failures. The message is provided for
information only.
The format of the data contained in message
DFHFC0158 is described in OS/390 V2R10.0 DFSMS
Macro Instructions for Data Sets. in the section
describing the physical error message format. This is a
common data format used by other IBM products
following I/O errors.

This message is issued after messages DFHFC0157,
DFHFC0162 and DFHFC0163 and provides additional
information to go with those messages.

System action: Processing continues.

User response: See the description of the associated
preceeding message (DFHFC0157, DFHFC0162 or
DFHFC0163.)

Destination: Console

Modules: DFHFCRS, DFHFCVS

XMEOUT Parameters: applid, vsam-error-data

DFHFC0159 applid A request issued to cold start
the RLS subsystem has failed. VSAM
return code X'rrrr' reason code X'cccc'.

Explanation: A cold or initial start of CICS has been
requested. CICS has made a call to the RLS
component of VSAM which requested RLS to cold start
its status with respect to this CICS. This request has
failed because VSAM RLS detected an error while
performing cold start processing.

System action: CICS continues to initialize. However,
the restart of the RLS component of file control has
failed and all RLS eligible files are unusable.

No dump is taken with this message. However, file
control restart may subsequently produce message
DFHFC0001 and take a dump if the error is of a type
which should not occur during normal running.

User response: If the VSAM return code indicates
that the SMSVSAM server has failed, restart the
SMSVSAM server (if it has not already automatically
restarted). You also need to restart CICS because CICS
has been warm started with respect to RLS when the
server returns.

If the SMSVSAM server has not failed, this is probably
an error in CICS or VSAM. You should keep the dump
associated with message DFHFC0001. See Part 4 of the
CICS Problem Determination Guide for guidance on
how to proceed.

Destination: Console

Modules: DFHFCCA
XMEOUT Parameters: applid, 'rrrr', 'cccc'

DFHFC0160 applid An attempt to notify VSAM that CICS has completed lost locks processing for a data set has failed.
VSAM return code 'rrrr' reason code 'cccc'.

Explanation: Following a failure of the VSAM lock structure, VSAM has marked a data set as being in lost locks state with regard to this CICS. CICS has performed all recovery actions necessary to resolve its locks against this data set and has attempted to inform VSAM that it has completed its recovery. This attempt has failed.

The VSAM response is 'rrrr' and the VSAM reason is 'cccc'.

This message is followed by message DFHFC0312 which identifies the failing data set.

System action: If the VSAM return code does not indicate that the SMSVSAM server has failed, CICS takes a system dump.

User response: The most likely cause of this failure is that the SMSVSAM server failed at the time that CICS issued the request.

If the problem was caused by the SMSVSAM server having failed at the time that the request was issued, restart the SMSVSAM server (if it has not already automatically restarted). Otherwise, you can make CICS retry the attempt to notify VSAM of the completion of lost locks processing either by restarting CICS or by restarting the SMSVSAM server.

It is possible that your installation may have performed some action, such as deleting the data set, which would cause VSAM not to recognize the data set and therefore return an error. If this is the case for the data set named in message DFHFC0312, you need take no further action.

If the VSAM return and reason codes suggest an internal CICS or VSAM error, you will need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Modules: DFHFCCA

XMEOUT Parameters: applid, 'rrrr', 'cccc'

DFHFC0162 applid A VSAM data cache has failed.

Explanation: A data cache structure being used by VSAM RLS has failed.

System action: The application request which encountered the error receives an 'IOERR' response.

CICS also issues message DFHFC0158 to display the VSAM diagnostic information for this error. The name of the failing cache can be derived from the information displayed in the following DFHFC0158 message.

While the data cache remains unusable, all data sets bound to this cache are also unusable. Any attempt to read from or write to such a data set cause an IOERR response.

CICS issues messages DFHFC0162 and DFHFC0158 the first time that an I/O request fails because of a cache failure. To prevent flooding the console with messages, CICS does not display these messages again until it is notified that a cache has been recovered. If several caches fail, DFHFC0162 and DFHFC0158 are only displayed for the first cache to fail. However, VSAM issues messages for all failed caches.

User response: Allocate a new data cache and bring it on line to VSAM.

CICS is notified as soon as the new cache is available and is able to take appropriate recovery action.

Destination: Console

Modules: DFHFCRS

XMEOUT Parameter: applid
DFHFC0164 *applid* Request has timed out waiting for an RLS lock. There are *nn* transactions or Transactional VSAM units of recovery holding this lock.

**Explanation:** This message and the following DFHFC0165 or DFHFC0175 messages are issued to assist in problem determination when transactions abend with the AFCV or AFCW abend codes, or when application programs receive the RECORDBUSY condition.

An attempt made by transaction *tranid* with task number *trannum* to update a file which is open in VSAM RLS mode has failed because the request timed out waiting to obtain a lock on a record.

VSAM RLS has detected that a request has waited for a lock for more than the timeout interval. However, RLS was unable to detect any deadlock. Possibly there is a deadlock between VSAM RLS requests and requests to another resource manager such as DB2 or DBCTL.

When the timeout occurred there were *nn* other transactions or Transactional VSAM units of recovery holding the required lock.

**System action:** If the application request which encountered the error specified NOSUSPEND, it receives the RECORDBUSY condition and continues. If the request did not specify NOSUSPEND, it receives an AFCV abend.

CICS displays message DFHFC0164 to identify the failing transaction and the number of owners of the lock. CICS also issues message DFHFC0165 or DFHFC0175 once for each lock owner. CICS issues message DFHFC0168 instead of DFHFC0165 or DFHFC0175 in the unlikely event that VSAM RLS is unable to identify the lock owner.

**User response:** The following DFHFC0165 or DFHFC0175 messages identify the transactions that are holding the required lock and the CICS systems that they are running in or the unit of recovery holding the required lock and the Transactional VSAM instance this is running in, respectively. Examine these transactions or units of recovery to see why they are not releasing VSAM RLS locks. For example:

- They may be holding VSAM RLS locks and waiting for terminal input.
- They may be trying to access resources from both VSAM RLS and another resource manager, creating an inter-resource manager deadlock.

**Destination:** CSFL

**Modules:** DFHFCRS

**XMEOUT Parameters:** date, time, *applid*, *tranid*, *trannum*, *termid*, *userid*, *nn*

---

DFHFC0165 *date time applid tranid trannum termid userid. Transaction tranid (tasknum) unit of work X’uowid’ running in job jobname with applid applid2 in MVS mvsid holds (add to end lock | internal lock | exclusive lock on key | shared lock on key {J|X}’keyid’ in data set dsname causing {true | false} contention.

**Explanation:** This message and the preceding message DFHFC0164 or DFHFC0174 are issued to assist in problem determination when transactions abend with the AFCV or AFCW abend codes, or when applications receive the RECORDBUSY condition.

Normally this message appears after VSAM returns a timeout response to CICS. However, it may also appear after VSAM returns a deadlock response to CICS when that deadlock arises as a result of a failure to promote a lock. When this message is associated with a timeout response from VSAM, it is preceded by message DFHFC0164. When this message is associated with a...
deadlock response from VSAM it is associated with message DFHFC0174.

There is one occurrence of message DFHFC0165 for each transaction currently owning the required lock.

The name of the transaction that has failed is tranid and it has task number trannum.

The message inserts that identify the owner of the lock which caused this transaction to time out are as follows:

- **transid** is the name of the transaction running in the system that owns the lock. If the job that holds the lock is not a CICS system, this is displayed as "????."
- **tasknum** is the task number of transid. If the job that holds the lock is not a CICS system, this is displayed as "????."
- **uowid** is the unit of work ID associated with the above transaction. The unit of work ID is also used by VSAM RLS as its logical unit of work ID (luwid).
- **jobname** is the job name of the CICS system that owns the lock.
- **applid2** is the applid of the CICS system whose job name was given by the previous insert.
- **mvsid** is the name of the MVS in which this CICS is running.
- **dsname** is the name of the data set against which the lock is held.
- **keyid** identifies the key which is locked. As it is not always possible to display keys in character form, the key is displayed in hexadecimal notation. If the message indicates that the transaction is waiting for an add to end lock or an internal lock, no key information is displayed.

The message identifies whether the lock is held as an exclusive lock or a shared lock:

- A lock is exclusive if it can only have one holder. For example, exclusive locks are used to protect update operations.
- A lock is shared if it can have many holders. Shared locks are used to protect repeatable and consistent read operations.

A lock causes true contention if the request was for a lock against the locked key. A lock causes false contention if the request was for a lock against a different key but the lock requests clashed because of the RLS key hashing algorithm which is used when the key length exceeds 16 characters.

**System action:** This message is preceded by DFHFC0164 or DFHFC0174. See the description of DFHFC0164 or DFHFC0174 for a description of the system action associated with this message.

**User response:** This message is preceded by DFHFC0164 or DFHFC0174. See the description of DFHFC0164 or DFHFC0174 for a description of the user actions associated with this message.

**Destination:** CSFL

---

**DFHFC0166**  
*date time applid tranid termid userid.*  
**VSAM RLS has detected a deadlock.**  
**There are nn transactions or Transactional VSAM units of recovery in the deadlock chain.**

**Explanation:** This message and the following DFHFC0167 or DFHFC0177 messages are issued to assist in problem determination when transactions abend with AFCW abend codes.

An attempt made by transaction tranid to update a file which is open in VSAM RLS mode has failed because VSAM RLS detected that this request would have caused a deadlock with other transactions.

At the time that the timeout occurred there were nn other transactions or Transactional VSAM units of recovery in the chain which caused deadlock.

**System action:** The application request which encountered the error receives an AFCW abend.

CICS issues message DFHFC0166 to identify the failing transaction and the number of transactions or units of recovery in the deadlock chain.

CICS also issues message DFHFC0167 or DFHFC0177 once for each transaction or unit of recovery involved in the deadlock chain. DFHFC0167 and DFHFC0177 identify the resource that the transaction or unit of recovery is holding and the resource that the transaction is waiting for.

**User response:** Examine the transactions or units of recovery in the deadlock chain to determine why deadlock arose. If necessary, correct the programming logic to avoid deadlock-creating situations.

For guidance on writing programs that avoid deadlock problems, see the *CICS Application Programming Guide.*

**Destination:** CSFL

** Modules:** DFHFCRS

**XMEOUT Parameters:** *date, time, applid, tranid, trannum, termid, userid, trannum, X'uowid', jobname, applid2, mvsid, {1=add to end lock, 2=internal lock, 3=exclusive lock on key, 4=shared lock on key}, X'keyid', dsname, {1=true, 2=false}*

---

388 CICS TS for z/OS: CICS Messages and Codes
DFHFC0167  date time applid tranid termid userid.
Transaction transid(tasknum) with unit of work id X'\uowid' running in
jobname/applid2 in MVS mvsid holds
{add to end lock | internal lock | exclusive
lock on key | shared lock on key | X'key1'
on data set dsname1 and is waiting for
{add to end lock | internal lock | exclusive
lock on key | shared lock on key | X'key2'
on data set dsname2}.

Explanation:  This message and the preceding
DFHFC0166 message are issued to assist in problem
determination when transactions abend with AFCW
abend codes.

The preceding message DFHFC0166 reports that a
deadlock has been detected and includes how many
transactions exist in the deadlock chain.

Message DFHFC0167 is issued once for each
transaction in the deadlock chain and includes the
resource that transaction holds and which resource it is
waiting for.

The message inserts are as follows:

- *transid(tasknum)* is the transaction name and the
  associated task number of a transaction that owns a
  lock and is waiting for another lock. If this participant
  in the deadlock chain is not a CICS system, this will
  appear as \text{????}(?????).

- *uowid* is the unit of work ID associated with task
  *transid(tasknum)*. The unit of work is also used by
  VSAM as the logical unit of work ID (luwid).

- *jobname/applid2* is the job name and applid of the
  CICS system in which this transaction is running.

- *mvsid* is the name of the MVS in which this CICS job
  is running.

- *dsname1* is the name of the data set against which
  this transaction holds a lock.

- *key1* identifies the key which is locked. As it is not
  always possible to display keys in character form, the
  key is displayed in hexadecimal notation. If the
  message indicates that an add to end lock or an
  internal lock is held then no key information is
  displayed.

- *dsname2* is the name of the data set against which
  this transaction is attempting to acquire a lock.

- *key2* identifies the key which this transaction is
  attempting to lock. If the message indicates that the
  transaction is attempting to obtain an add to end lock
  or an internal lock then no key information is
  displayed.

The message identifies whether the lock is held as an
exclusive lock or a shared lock and whether the
transaction is attempting to acquire an exclusive or
shared lock.

- A lock is exclusive if it can only have one holder. For
  example, exclusive locks are used to protect update
  operations.

- A lock is shared if it can have many holders. Shared
  locks are used to protect repeatable and consistent
  read operations.

System action:  The application request which
encountered the error receives an AFCW abend.

User response:  See the description of message
DFHFC0166.

Destination:  CSFL

Modules:  DFHFCRS

XMEOUT Parameters:  date, time,applid, tranid, termid,
userid, transid(tasknum), X'\uowid', jobname/applid2,
mvsid, {1=add to end lock , 2=internal lock , 3=exclusive
lock on key , 4=shared lock on key },X'key1', dsname1,
{1=add to end lock , 2=internal lock , 3=exclusive lock
on key , 4=shared lock on key },X'key2', dsname2

DFHFC0168  date time applid tranid trannum termid
userid, An exclusive | A shared) lock on
key X'keyid' in data set dsname is
causing [true | false] contention but the
owner of this lock is unknown.

Explanation:  This message and the preceding
DFHFC0164 message are issued to assist in problem
determination when transactions abend with AFCV
abend codes.

Message DFHFC0168 is issued whenever VSAM RLS
is unable to determine the owner of a lock. This is an
abnormal condition. It may indicate that a processor in
the sysplex is stopped.

*dsname* is the name of the data set against which
the lock is held. *keyid* identifies the key which is locked. As
it is not always possible to display keys in character
form, the key is displayed in hexadecimal notation.

The message identifies whether the lock is held as an
exclusive lock or a shared lock.

- A lock is exclusive if it can only have one holder. For
  example, exclusive locks are used to protect update
  operations.

- A lock is shared if it can have many holders. Shared
  locks are used to protect repeatable and consistent
  read operations.

A lock causes true contention if the request was for a
lock against the locked key. A lock causes false
contention if the request was for a lock against a
different key but the lock requests clashed as a result of
hashing algorithms used in creating RLS keys.

System action:  Processing continues.

User response:  None. The message is issued to
assist in problem determination.
Destination: CSFL
Modules: DFHFCRS
XMEOUT Parameters: date, time, applid, tranid, trannum, termid, userid, (1=An exclusive, 2=A shared), X’keyid’, dsname, (1=true, 2=false)

DFHFC0169 date time applid termid userid.
Transaction tranid with transaction number trannum encountered an RLS retained lock held on data set dsname by unit of work X’uowid’ within CICS with applid applid2.

Explanation: An attempt was made to update a record which is currently held locked by a retained RLS lock.

Message inserts are as follows:

• applid2 is the applid of the CICS system which owns the lock.
• uowid is the identifier of the unit of work that owns the lock.
• dsname is the name of the data set against which the lock is held.

This message is issued to aid in problem diagnosis. It identifies the owner of the lock that is causing a request to fail with a ‘LOCKED’ response.

System action: The application request which encountered the error receives a ‘LOCKED’ response.

User response: If repeated LOCKED responses are causing a problem, note the name of the CICS system and the identifier of the unit of work and attempt to find why this unit of work is holding a retained lock. There are three reasons why a unit of work can hold a retained lock.

1. The unit of work was running in a CICS system that has failed. If this CICS system is restarted, the lock is normally released.
2. The unit of work has gone indoubt. Indoubt failures occur as a result of a failure in communication between two CICS systems, neither of which need be the CICS system that is encountering the ‘LOCKED’ response.
   From a terminal connected to the CICS system with applid applid2, issue the command

   CEMT I UOW(uowid)

   or

   CEMT I UOWDSNFAIL

   to identify the applid of the CICS system that is coordinating the distributed unit of work. Then attempt to reestablish contact between the coordinating CICS and the system that owns the lock.

3. The unit of work has failed backout. From a terminal connected to the CICS system with applid applid2, issue the command

   CEMT INQUIRE
   UOWDSNFAIL DATASET(dsname)

   to determine the reason why unit of work uowid failed backout while processing data set dsname. There are several reasons why a unit of work can fail backout, each identified by a different reason code from CEMT INQUIRE UOWDSNFAIL. See the [CICS Problem Determination Guide](https://www.ibm.com/support/knowledgecenter/SSECG28_5.5.0/com.ibm.cics.ts.5.5.doc/using/usingproblem.html) for guidance on how to resolve each of these types of backout failure.

Destination: CSFL
Modules: DFHFCRS
XMEOUT Parameters: date, time, applid, termid, userid, tranid, trannum, dsname, X’uowid’, applid2

DFHFC0170 applid An attempt to release locks which are held by RLS but unknown to CICS has failed.

Explanation: An attempt was made to release locks which are held on behalf of this CICS system by the VSAM RLS lock manager, but about which CICS has no knowledge. Such locks are known as “orphan” locks. The attempt to release the locks failed, either because the VSAM RLS server is not available or because there were no locks to release.

System action: CICS continues. The locks are automatically released after the VSAM RLS server becomes available again.

The presence of these “orphan” locks could prevent the running of non-RLS applications against the data sets which hold such locks. “Orphan” locks can also cause LOCKED responses to be returned to applications running on CICS systems which have access to an available VSAM RLS server and try to update the locked records, or try to read the records with one of the read integrity options.

Since CICS has no knowledge of “orphan” locks, it is not possible to get information about them using CICS API commands.

User response: If the failure is due to the server not being available, wait for the VSAM RLS server to restart. If it does not restart automatically, determine the reason and attempt to start it manually.

If the failure is due to there being no locks to release, this could either be a result of some user action resulting in locks being deleted such as deleting the data set, or it could indicate a severe VSAM error. If user action is not responsible, you will need further assistance from IBM. See Part 4 of the [CICS Problem Determination Guide](https://www.ibm.com/support/knowledgecenter/SSECG28_5.5.0/com.ibm.cics.ts.5.5.doc/using/usingproblem.html) for guidance on how to proceed.

Destination: Console
DFHFC0171  

**applid**  
Lost locks recovery might be  
delayed by inflight transactions.  

**Explanation:**  
A coupling facility (CF) lock structure  
failure has occurred, and SMVSAM has been unable  
to rebuild the lock structure dynamically. This has  
resulted in the loss of VSAM RLS locks. SMVSAM has  
notified CICS of this event so that CICS can perform  
lost locks recovery processing. In the course of this  
processing, CICS has attempted to purge inflight  
transactions that hold one or more of the lost locks in  
order to expedite recovery from the lost locks condition.  
However, it has not been possible to purge all of the  
transactions.  

RLS lost locks recovery cannot complete until all UOWs  
that have updated data sets in RLS mode are  
completed. It is unlikely that an inflight transaction can  
complete normally in a lost locks situation because it  
will abend at the next attempt to access RLS. CICS  
attempts to purge inflight transactions because allowing  
them to run to completion (when they will probably  
abend anyway) could take a long time. This is  
particularly the case for conversational transactions.  

**System action:**  
CICS continues.  
If the failure to purge a transaction is due to a severe  
error, message DFHFC0002 is issued and a dump is  
taken.  

**User response:**  
It may not be necessary to take any  
action because the purging of transactions is only a  
precautionary measure.  

This message indicates that there are inflight UOWs  
that have not yet completed only when there are data  
sets that return a LOSTLOCKS value of  
RECOVERLOCKS after you have resolved any failed  
units of work that had updated the data sets. (See the  
EXEC CICS INQUIRE DSNAMe(...) command for  
information about the LOSTLOCKS parameter.)  

If it is possible to identify the transactions in question,  
either ensure that they run to normal completion, or  
attempt to force purge them using the CEMT master  
terminal command. However, as this should be a rare  
situation, consider performing an immediate shutdown  
of CICS followed by an emergency restart as an  
alternative solution. This causes all inflight transactions  
to be backed out.  

**Destination:**  
Console

DFHFCCR, DFHFCFE, DFHCCV,  
DFHCFEFS  

**XMEOUT Parameter:**  
applid

---

DFHFC0172  

**applid**  
File control is unable to return to  
processing on the QR TCB because a  
change mode request has failed. CICS  
will terminate.  

**Explanation:**  
Normally most CICS functions are run  
on a TCB called the QR TCB. Exceptionally, file control  
issues OPEN and CLOSE requests on a TCB called the  
FO TCB. File control may also process VSAM read and  
write requests on a TCB called the CO TCB if  
SUBTSKS=1 has been specified in the SIT.  

After completing its work on the RO or CO TCB, file  
control must return to processing on the QR TCB. In  
order to return to the QR TCB, file control has issued a  
CHANGE_MODE call to the CICS dispatcher. This  
request has failed.  

**System action:**  
This is a severe error. CICS is unable  
to continue processing because it must be running on  
the QR TCB in order to do so. CICS is terminated with  
a dump.  

The dispatcher domain has put out messages to  
describe the failure in the CHANGE_MODE request.  

**User response:**  
See the messages issued by the  
dispatcher domain for further guidance.  

**Destination:**  
Console  

**Modules:**

DFHFCFS  

**XMEOUT Parameter:**  
applid

---

DFHFC0173  

date time applid  
VSAM has issued a  
{deadlock | timeout | locked} response  
but cannot supply problem  
determination data.  

**Explanation:**  
After certain failures, VSAM normally  
provides problem determination information which CICS  
uses to issue diagnostic messages and create  
exception trace entries.  

However, although VSAM set a return code indicating  
that a failure occurred, it is unable to provide any  
problem determination information.  

The failure detected by VSAM RLS is one of the  
following:  

- A deadlock - CICS normally issues message  
  DFHFC0166 and two or more DFHFC0167 or  
  DFHFC0177 messages.  
- A timeout - CICS normally issues message  
  DFHFC0164 and one or more DFHFC0165 or  
  DFHFC0175 messages.  
- A record locked by a retained lock - CICS normally  
  issues message DFHFC0169 or DFHFC0179.  

**System action:**  
CICS continues processing the error  
in the normal way but cannot issue any of the normal  
problem determination messages or create the usual  
exception trace entries.

---

Chapter 1. DFH messages 391
CICS does not take a dump. However, you can request a dump via the dump table in the usual way.

**User response:** This indicates an error in VSAM RLS. You may wish to take a dump of the SMSVSAM server. See the appropriate DFSMS/MVS manual for further guidance.

**Destination:** CSFL

**Modules:** DFHFCRS

**XMEOUT Parameters:** date, time, applid, tranid, trannum, termid, userid, nnn

---

**DFHFC174**

A deadlock has occurred as a result of a lock promote failure. There are nnn transactions or Transactional VSAM units of recovery holding this lock.

**Explanation:** This message and the following DFHFC0165 or DFHFC0175 messages are issued to assist in problem determination when transactions abend with the AFCW abend code or receive RECORDBUSY response as NOSUSPEND was specified.

An attempt made by transaction tranid with transaction number trannum to update a file which is open in VSAM RLS mode has failed because VSAM has detected a deadlock while attempting to promote a shared lock to become an exclusive lock.

VSAM RLS returns problem determination information to CICS to assist with debugging the deadlock. However, this type of deadlock looks to VSAM like a timeout and thus the information returned to CICS looks like the information returned after a timeout. Hence this message is followed by one or more DFHFC0165 or DFHFC0175 messages instead of the DFHFC0167 messages which follow other types of deadlocks.

When the deadlock occurred there were nnn other transactions or Transactional VSAM units of recovery holding the required lock.

**System action:** The transaction receives an AFCW abend or RECORDBUSY response.

CICS displays message DFHFC0174 to identify the failing transaction and the number of owners of the lock. CICS also issues message DFHFC0165 or DFHFC0175 once for each lock owner. CICS issues message DFHFC0168 instead of DFHFC0165 or DFHFC0175 in the unlikely event that VSAM RLS is unable to identify the lock owner.

**User response:** The following DFHFC0165 or DFHFC0175 messages identify the transactions that are holding the required lock and the CICS systems that they are running in, or the units of recovery which are holding the locks and the Transactional VSAM instances they are running in, respectively. Examine these transactions or units of recovery to determine why they are not releasing VSAM RLS locks. Examine other RLS resources they acquire to determine whether this could cause a deadlock with the failing transaction.

**Destination:** CSFL

**Modules:** DFHFCRS

**XMEOUT Parameters:** date, time, applid, tranid, trannum, termid, userid, nnn

---

**DFHFC0175**

A Transactional VSAM unit of recovery X’userid’ running in job jobname on Transactional VSAM instance TVSInstance in MVS mvsid holds [add to end lock | internal lock | exclusive lock on key] in data set dsname causing [true | false] contention.

**Explanation:** This message and the preceding message DFHFC0164 or DFHFC0174 are issued to assist in problem determination when transactions abend with the AFCV or AFCW abend codes, or when applications receive the RECORDBUSY condition.

Normally this message appears after VSAM returns a timeout response to CICS. However, it may also appear after VSAM returns a deadlock response to CICS when that deadlock arises as a result of a failure to promote a lock. When this message is associated with a timeout response from VSAM, it is preceded by message DFHFC0164. When this message is associated with a deadlock response from VSAM it is associated with message DFHFC0174.

There is one occurrence of message DFHFC0175 for each unit of recovery currently owning the required lock.

The name of the transaction that has failed is tranid and it has task number trannum.

The message inserts that identify the owner of the lock which caused this transaction to time out are as follows:

- userid is the unit of recovery id running in the Transactional VSAM instance which owns the lock.
- jobname is the job name of the CICS system that owns the lock.
- TVSInstance is the name of the Transactional VSAM instance whose job name was given by the previous insert.
- mvsid is the name of the MVS in which this Transactional VSAM instance is running.
- dsname is the name of the data set against which the lock is held.
- keyid identifies the key which is locked. As it is not always possible to display keys in character form, the key is displayed in hexadecimal notation. If the message indicates that the transaction is waiting for an add to end lock or an internal lock, no key information is displayed.
The message identifies whether the lock is held as an exclusive lock or a shared lock:

- A lock is exclusive if it can only have one holder. For example, exclusive locks are used to protect update operations.
- A lock is shared if it can have many holders. Shared locks are used to protect repeatable and consistent read operations.

A lock causes true contention if the request was for a lock against the locked key. A lock causes false contention if the request was for a lock against a different key but the lock requests clashed because of the RLS key hashing algorithm which is used when the key length exceeds 16 characters.

**System action:** This message is preceded by DFHFC0164 or DFHFC0174. See the description of DFHFC0164 or DFHFC0174 for a description of the system action associated with this message.

**User response:** This message is preceded by DFHFC0164 or DFHFC0174. See the description of DFHFC0164 or DFHFC0174 for a description of the user actions associated with this message.

**Destination:** CSFL

**Modules:** DFHFCRS

**XMEOUT Parameters:** date, time, applid, tranid, trannum, termid, userid, X'urid', jobname/TVSInstance, mvsid, {1=add to end lock, 2=internal lock, 3=exclusive lock on key, 4=shared lock on key}, X'keyid', dsname, {1=true, 2=false}

---

**DFHFC0177**

**date time applid tranid termid userid**

**Transactional VSAM unit of recovery id X'urid' running in jobname/TVSInstance in MVS mvsid holds** {add to end lock | internal lock | exclusive lock on key | shared lock on key X'keyid' on data set dsname1 and is waiting for {add to end lock | internal lock | exclusive lock on key | shared lock on key | key1' on data set dsname2.

**Explanation:** This message and the preceding DFHFC0166 message are issued to assist in problem determination when transactions abend with AFCW abend codes.

The preceding message DFHFC0166 reports that a deadlock has been detected and includes how many units of recovery exist in the deadlock chain.

Message DFHFC0177 is issued once for each unit of recovery in the deadlock chain and includes the resource that unit of recovery holds and which resource it is waiting for.

The message inserts are as follows:

- **urid** is the unit of recovery ID which owns a lock and is waiting for another lock.
- **jobname/TVSInstance** is the job name and TVS instance in which this unit of recovery is running.
- **dsname1** is the name of the data set against which this unit of recovery holds a lock.
- **key1** identifies the key which is locked. As it is not always possible to display keys in character form, the key is displayed in hexadecimal notation. If the message indicates that an add to end lock or an internal lock is held then no key information is displayed.
- **dsname2** is the name of the data set against which this unit of recovery is attempting to acquire a lock.
- **key2** identifies the key which this unit of recovery is attempting to lock. If the message indicates that the unit of recovery is attempting to obtain an add to end lock or an internal lock then no key information is displayed.

The message identifies whether the lock is held as an exclusive lock or a shared lock and whether the unit of recovery is attempting to acquire an exclusive or shared lock.

- A lock is exclusive if it can only have one holder. For example, exclusive locks are used to protect update operations.
- A lock is shared if it can have many holders. Shared locks are used to protect repeatable and consistent read operations.

**System action:** The application request which encountered the error receives an AFCW abend.

**User response:** See the description of message DFHFC0166.

**Destination:** CSFL

**Modules:** DFHFCRS

**XMEOUT Parameters:** date, time, applid, tranid, trannum, termid, userid, X'urid', jobname/TVSInstance, mvsid, {1=add to end lock, 2=internal lock, 3=exclusive lock on key, 4=shared lock on key}, X'keyid', dsname, {1=true, 2=false}

---

**DFHFC0179**

**date time applid termid userid**

**Transaction tranid with transaction number trannum encountered an RLS retained lock held on data set dsname by unit of recovery X'urid' within Transactional VSAM instance TVSInstance.

**Explanation:** An attempt was made to update a record which is currently held locked by a retained RLS lock.

Message inserts are as follows:

- **TVSInstance** is the number of the Transactional VSAM instance which owns the lock.
- **urid** is the identifier of the unit of recovery that owns the lock.
• *dsname* is the name of the data set against which the lock is held.

This message is issued to aid in problem diagnosis. It identifies the owner of the lock that is causing a request to fail with a ‘LOCKED’ response.

**System action:** The application request which encountered the error receives a ‘LOCKED’ response.

**User response:** If repeated LOCKED responses are causing a problem, note the name of the Transactional VSAM instance and the identifier of the unit of recovery and attempt to find out why the unit of recovery is holding a retained lock. The Transactional VSAM unit of recovery may have failed or suffered backout failure. If the Transactional VSAM application has failed the lock will normally be released if the application is rerun. If the Transactional VSAM application has suffered backout failure you will need to use Transactional VSAM procedures to perform backout failure retry in order to release the lock.

---

**DFHFC0205**

*date time applid terminal userid tranid SHRCTL block for LSR pool lsrpool has been updated.*

**Explanation:** This message provides a record of the updates to a SHRCTL block.

**System action:**

**User response:**

**Destination:**

**Modules:**

**XMEOUT Parameters:**

---
A SHRCTL block exists for VSAM LSR pools 1–8 and is updated by an RDO install of an LSRPOOL object.

System action: Processing continues.

User response: None.

Destination: CSFL

Modules: DFHFCRL.

XMEOUT Parameters: date, time, applid, terminal, userid, tranid, lsrpool

DFHFC0206 date time applid terminal userid tranid
AFCT entry for filename has been added.

Explanation: This message provides the system with a record of the dynamic addition of a remote file filename.

System action: Processing continues.

User response: None.

Destination: CSFL

Modules: DFHAFMT.

XMEOUT Parameters: date, time, applid, terminal, userid, tranid, filename

DFHFC0207 date time applid terminal userid tranid
AFCT entry for filename has been deleted.

Explanation: This message provides a record of the dynamic deletion of a remote file filename.

This occurs when a remote file, which already exists in the system, is being deleted using RDO.

System action: Processing continues.

User response: None.

Destination: CSFL

Modules: DFHAFMT.

XMEOUT Parameters: date, time, applid, terminal, userid, tranid, filename

DFHFC0208I applid LSR pool n is being built dynamically by CICS because all of the necessary parameters have not been supplied. Either there is no LSRPOOL definition or it is incomplete. The following are not defined: 'CISIZE' 'STRINGS' 'MAXKEYLENGTH'. A delay is possible.

Explanation: If one or more of the parameters, CI size, strings and maxkeylength are not defined for a LSR pool, either because there is no LSRPOOL definition or it is incomplete, then CICS will calculate the size by using information from the VSAM Catalog for data sets allocated to this LSR pool.

System action: CICS will issue SHOWCATS to obtain the information necessary to calculate the LSR pool size. If any data sets have been migrated the SHOWCAT could take longer than expected.

User response: If there are severe delays due to SHOWCAT processing, you will have to wait for migrated data sets to be recalled, and for the calculation of the LSR pool size to complete. If you wish to avoid similar problems in the future, consider defining the LSR pool explicitly. The missing parameters are contained in this message.

Normally, you will not experience delays, in which case no user action is required.

You can suppress this message with the system initialization parameter, MSGLEV=0.

Destination: Console

Modules: DFHFCV

XMEOUT Parameters: applid, n,'CISIZE', 'STRINGS', 'MAXKEYLENGTH'

DFHFC0300 applid (tranid termid) purge deferred due to incomplete I/O operation on VSAM file 'filename'.

Explanation: An attempt has been made to purge a transaction using FORCE. Transaction tranid is currently waiting for completion of an I/O operation on the VSAM file filename. termid identifies the terminal running this transaction. The data set name appears in message DFHFC0305 which follows this message.

System action: The transaction waits until the I/O operation is completed before the purge is allowed to take effect. This is done to avoid a risk to data integrity. After the I/O completes the transaction is terminated with transaction abend code AFCY.

User response: If the transaction does not terminate within a few seconds, it may be that the I/O wait is genuine (for example, another CEC has reserved the DASD volume). If this is the case, wait until the I/O situation is relieved before trying again.

Alternatively, there may be a system problem that warrants terminating CICS and using emergency restart to guarantee data integrity. If this is the case, terminate CICS and perform an emergency restart.

Destination: Console

Modules: DFHFCVR

XMEOUT Parameters: applid, tranid,termid, filename
DFHFC0301  applid (tranid termid) purge deferred due to incomplete I/O operation on BDAM file 'filename'.

Explanation:  An attempt has been made to purge a transaction using FORCE. Transaction tranid is currently waiting for completion of an I/O operation on the BDAM file filename. termid identifies the terminal running this transaction. The data set name appears in message DFHFC0305 which follows this message.

System action:  The transaction waits until the I/O operation is completed before the purge is allowed to take effect. This is done to avoid a risk to data integrity. After the I/O operation is completed, the transaction is terminated with transaction abend code AFCY.

User response:  If the transaction does not terminate within a few seconds, the I/O wait might be genuine (for example, another CEC has reserved the DASD volume). If this is the case, wait until the I/O situation is relieved before trying again.

Alternatively, there may be a system problem that warrants terminating CICS and using emergency restart to guarantee data integrity. If this is the case, terminate CICS and perform an emergency restart.

Destination:  Console

Modules:  DFHFCBD

XMEOUT Parameters:  applid, tranid, termid, filename

DFHFC0302  applid (tranid termid) CICS terminating. Failure while waiting for I/O operation on VSAM file 'filename'.

Explanation:  A DISASTER type error occurred when transaction tranid was waiting for the completion of an I/O operation on the VSAM file whose file name and data set name appear in message DFHFC0305 which follows this message. termid identifies the terminal running this transaction.

System action:  CICS is terminated with a system dump (dump code FC0302).

User response:  This problem was caused by an earlier error. Look for earlier messages and return codes (for example, from the dispatcher domain) and associated trace entries and dumps.

If the problem cannot be traced to an application error, you will need further assistance from IBM. See Part 4 of the [CICS Problem Determination Guide](https://www.ibm.com/support/knowledgecenter/S55GU1_8.5.0/cics.getMessage?lang=en&view=doc) for guidance on how to proceed.

Destination:  Console

Modules:  DFHFCBD

DFHFC0303  applid (tranid termid) CICS terminating. Failure while waiting for I/O operation on BDAM file 'filename'.

Explanation:  A DISASTER type error occurred when transaction tranid was waiting for the completion of an I/O operation on BDAM file filename.

termid identifies the terminal running this transaction.

System action:  CICS is terminated with a system dump (dump code FC0303).

User response:  This problem was caused by an earlier error. Look for earlier messages and return codes (for example, from the dispatcher domain) and associated trace entries and dumps.

If the problem cannot be traced to an application error, you will need further assistance from IBM. See Part 4 of the [CICS Problem Determination Guide](https://www.ibm.com/support/knowledgecenter/S55GU1_8.5.0/cics.getMessage?lang=en&view=doc) for guidance on how to proceed.

Destination:  Console

Modules:  DFHFCBD

XMEOUT Parameters:  applid, tranid, termid, filename

DFHFC0304  applid Dump taken in module_name due to a file control OPEN/CLOSE error.

Explanation:  This message is issued after DFHFCFS has made an OPEN or CLOSE request which has completed with an error. The specific error is identified by another message. In most cases the other message appears before this message, but if the error occurs during the building of a shared resources pool, the other message appears after this message.

The failure is identified as one of the following:
- An invalid request (not OPEN or CLOSE) has been sent
- There has been a subtask failure
- There has been a system failure other than "DSNAME NOT FOUND" or "VSAM CATALOG DOMAIN NOT FOUND".
- There has been a failure during shared resources pool building.

System action:  A trace entry is made and a dump is taken with dumpcode FC0304.

User response:  Locate the fault by examining the trace entry and the dump.

CICS TS for z/OS: CICS Messages and Codes
**DFHFC0305** applid Message msgno file 'filename' dsname 'dataset'.

**Explanation:** This message follows message DFHFC0300, DFHFC0302, DFHFC0307, DFHFC0308 or DFHFC0309. It identifies the VSAM data set name referred to in those messages.

If this message follows DFHFC0300 or DFHFC0302, it is issued from DFHFCVR.

If this message follows DFHFC0308 or DFHFC0309, it is issued from DFHFCRV.

If this message follows DFHFC0307, it is issued from DFHFCVS.

**System action:** Processing continues in the way specified in the preceding message from the list above, whichever is applicable.

**User response:** Find the earlier message to which this information refers and follow the user response for that message.

**Destination:** Console

**Modules:** DFHFCVR, DFHFCVS, DFHFCRV

**XMEOUT Parameters:** applid, msgno, filename, dataset

---

**DFHFC0307** applid I/O error on file 'filename', component code X'code'. File is temporarily disabled.

**Explanation:** An I/O error was reported by VSAM after a request to update VSAM file filename.

The file has been specified with LSR so VSAM has not released the buffers it assigned to process the request. Therefore, CICS must take special action to release them.

The name of the data set associated with the file is in message DFHFC0305 which follows, although the error may have been encountered elsewhere. This is indicated by the value of the component code X'code'. Its possible values and the corresponding error locations are as follows.

- X'00' or X'01'—base cluster.
- X'02' or X'03'—alternate index.
- X'04' or X'05'—upgrade set.

**System action:** Activity against the file is stopped, and the file is closed and then reopened in order to release the VSAM output buffers. Until the close has completed successfully, the file appears 'UNENABLED' to new would-be users and they receive a 'NOTOPEN' response to requests to use the file. The application request which encountered the error receives an 'IOERR' response.

**User response:** The installation should follow its standard procedure for I/O errors. No special additional action is required to respond to this particular message although the data set name and component code may help in identifying the problem.

**Destination:** Console

**Modules:** DFHFCVS

**XMEOUT Parameters:** applid, filename, X'code'

---

**DFHFC0308** applid tranid termid Purge deferred due to incomplete I/O operation on VSAM RLS file filename

**Explanation:** An attempt has been made to purge a transaction using FORCE. Transaction tranid is currently waiting for completion of an I/O operation on the VSAM RLS file filename. termid identifies the terminal running this transaction. The data set name is included in message DFHFC0305 which follows this message.

**System action:** The transaction waits until the I/O operation is completed before the purge is allowed to take effect. This is done to avoid a risk to data integrity. After the I/O operation is completed, the transaction is terminated with transaction abend code AFCY.

**User response:** If the transaction does not terminate within a few seconds, the I/O wait might be genuine (for example, another CEC has reserved the DASD volume). If this is the case, wait until the I/O situation is relieved before trying again.

Alternatively, there may be a system problem that warrants terminating CICS and using emergency restart to guarantee data integrity. If this is the case, terminate CICS and perform an emergency restart.

**Destination:** Console

**Modules:** DFHFCRV

**XMEOUT Parameters:** applid, tranid,termid, filename

---

**DFHFC0309** applid tranid termid Failure while waiting for I/O operation on VSAM RLS file filename

**Explanation:** A DISASTER type error occurred when the transaction tranid was waiting for the completion of an I/O operation on the VSAM RLS file filename

**System action:** CICS returns to VSAM who completes the wait for the I/O operation on CICS behalf. Since VSAM rather than CICS completes the wait for I/O to complete, there may be a significant degradation in CICS performance until the operation completes.

**User response:** This problem was caused by an earlier error. Look for earlier messages and return codes (for example, from the dispatcher domain) and associated trace entries and dumps.

If the problem cannot be traced to an application error, you will require further assistance from IBM. See Part 4 of the [CICS Problem Determination Guide] for guidance on how to proceed.

**Destination:** Console
DFHFC0310  applid tranid termid Purge deferred due to incomplete I/O operation on the RLS control ACB.

Explanation: An attempt has been made to purge a transaction using FORCE. Transaction tranid is currently waiting for completion of an I/O operation on the VSAM RLS control ACB.

termid identifies the terminal running this transaction.

System action: The transaction waits until the I/O operation is completed before the purge is allowed to take effect. This is done to avoid a risk to data integrity. After the I/O operation is completed, the transaction is terminated with transaction abend code AFCY.

Alternatively, there may be a system problem that warrants terminating CICS and using emergency restart to guarantee data integrity. If this is the case, terminate CICS and perform an emergency restart.

User response: If the transaction does not terminate within a few seconds, the VSAM wait might be genuine (for example, certain requests may take a fairly long time to complete). If this is the case, wait until the transaction has completed before trying again.

Destination: Console

DFHFC0311  applid tranid termid Failure waiting for I/O operation on the RLS control ACB.

Explanation: A DISASTER type error occurred when the transaction tranid was waiting for the completion of an I/O operation on the VSAM RLS control ACB.

System action: CICS returns to VSAM and VSAM completes the wait for the I/O operation on CICS behalf. Since VSAM rather than CICS completes the wait for I/O to complete, there may be a significant degradation in CICS performance until the operation completes.

User response: This problem was caused by an earlier error. Look for earlier messages and return codes (for example, from the dispatcher domain) and associated trace entries and dumps.

If the problem cannot be traced to an application error, you will require further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

DFHFC0313I  applid Message msgno data set dsname

Explanation: This message follows message DFHFC0152 or DFHFC0160. It identifies the VSAM data set name referred to in those messages.

System action: Processing continues as specified in either DFHFC0152, or DFHFC0160.

User response: Find the earlier message to which this information refers and follow the user response for that message.

Destination: Console

DFHFC0314I  applid VSAM has insufficient LSR buffers to fully backout the failed request.

Explanation: VSAM has returned an error for VSAM file filename.

An ILLOGIC response is returned to the application.

This is indicated by the value of the component code X'cc'. Its possible values and the corresponding error locations are as follows:

• X'00' or X'01'—base cluster.
• X'02' or X'03'—alternate index.
• X'04' or X'05'—upgrade set.

System action: An ILLOGIC response is returned to the application.

User response: You may need to delete, redefine and re-build your alternate indices based on this file.
buffers. You may also need to delete, redefine and re-build your alternate indices based on this file.

**Destination:** Console

**Modules:** DFHFCVS

**XMEOUT Parameter:** `applid`

---

**DFHFC0400 `applid` This CICS system is not authorized to provide shared access to data tables - reason code `X'code'`.

**Explanation:** CICS is about to open a data table but has been unable to make provision for sharing the table with other CICS systems because a security check for update access to the resource name `DFHAPPL_applid` has failed. The value of the reason code, `X'code'`, provides further information on the reason for the failure of the security check. It has the format `X'ffraaaa'` where `ff` identifies the authorization check which failed, `rr` gives the register 15 return code from SAF, and `aaaa` is the SAFPRRET value.

The values of `X'ff` are:

- `X'01'` Access was refused by an AUTH security check.
- `X'02'` Access was refused by a FASTAUTH security check.

**System action:** CICS continues normally but no other CICS systems are able to share any data tables it creates until authority is granted and a table is subsequently opened.

**User response:** Ensure that CICS has the necessary authorization to provide shared access to data tables. Refer to the description of either the AUTH or FASTAUTH macro in the RACF documentation for explanations of the values that were reported in the reason code, `X'code'`, and to determine the changes to the security definitions or setup that are required to allow the CICS system to act as a shared data table server (assuming that this is desired).

**Destination:** Console

**Modules:** DFHFCFS

**XMEOUT Parameter:** `applid`

---

**DFHFC0402 `applid` CICS cannot provide shared access to data tables because CICS is not defined as an MVS subsystem.

**Explanation:** CICS is about to open a data table but has been unable to make provision for sharing the table with other CICS systems because CICS has not been defined as an MVS subsystem.

**System action:** CICS continues normally but no other CICS systems are able to share any data tables it creates.

**User response:** CICS must be defined as an MVS subsystem in order to permit the sharing of data tables between CICS systems.

See the [CICS Shared Data Tables Guide](#) for more guidance.

**Destination:** Console

**Modules:** DFHFCFS

**XMEOUT Parameter:** `applid`

---

**DFHFC0403 `applid` CICS cannot provide shared access to remote data tables because CICS is not defined as an MVS subsystem.

**Explanation:** CICS is about to access a remote file resource. However, shared data tables cannot be used to access any remote tables because CICS has not been defined as an MVS subsystem.

If this message is issued on a CICS system at release 3.2.1, it means that the shared data tables module `DFHDTINS` is installed in the LPA or in the load library used by this CICS system, and has therefore been loaded by mistake.

**System action:** CICS continues normally and function ships this and subsequent remote file requests.

**User response:** CICS must be defined as an MVS subsystem in order to permit the sharing of data tables between CICS systems.

If the message was issued by a CICS/ESA 3.2.1 system, check where the `DFHDTINS` module is located. If `DFHDTINS` is in the load library specified by this CICS, it should be removed: shared data tables support cannot be installed on a CICS system at a lower level than 3.3. If it is in the link pack area (LPA) of this MVS system, it should be removed: the `DFHDTINS` module should not be placed in the LPA of an MVS system.
which contains any CICS regions at release 3.2.1 which might want to use data tables, unless a PTF has been applied to the CICS 3.2.1 regions.

**Destination:** Console  
**Modules:** DFHFCFS  
**XMEOUT Parameter:** applid

---

**DFHFC0405** applid This CICS system cannot provide shared access to data tables because an earlier job step has used MVS cross-memory services.

**Explanation:** CICS is prevented from using shared data tables because of the use of MVS cross-memory services by an earlier job step. CICS has attempted to create an entry table during LOGON as a shared data table server, but this has resulted in an MVS 052 ABEND because a prior jobstep owned space-switching entry tables. (MVS does not allow subsequent job steps to establish a cross-memory environment.)

**System action:** CICS continues normally but other CICS systems are unable to gain shared access to any data tables that this CICS system creates.

**User response:** In order to use the shared access to data tables feature, review the sequence of job steps in the job which includes this CICS system.

See the [CICS Shared Data Tables Guide](#) and also the explanation of system abend code 052, reason code 0314 in [MVS System Codes](#) for more guidance.

**Destination:** Console  
**Modules:** DFHFCFS  
**XMEOUT Parameters:** applid

---

**DFHFC0406** applid This CICS system is not authorized for shared access to any data tables owned by the CICS system with applid applid2 - reason code X'code'.

**Explanation:** A file request for a remote file resource is about to be passed to a CICS system with the specified applid. The remote system has registered as a shared data table server, but this system cannot access any of its tables because a security check for read access to the resource name DFHAPPL.applid2 has failed, where applid2 is the applid of the data table owning CICS system. The value of the reason code, X'code', provides further information on the reason for the failure of the bind security check. It has the format X'frraaaaa' where ff identifies the authorization check which failed, rr gives the register 15 return code from SAF, and aaaa is the SAFPRRET value.

The values of X'ff' are

- **X'01'** Access was refused by an AUTH security check.
- **X'02'** Access was refused by a FASTAUTH security check.

**User response:** If it was intended that this CICS system should be able to access data tables owned by the system applid2, refer to the description of either the AUTH or FASTAUTH macro in the RACF documentation for explanations of the values that were reported in the reason code, X'code', and to determine what changes to the security definitions or setup are required.

**System action:** CICS continues normally and function ships this and subsequent requests directed to the specified remote system until authority is granted. Access is retried after about 10 minutes.

**Destination:** Console  
**Modules:** DFHFCFS  
**XMEOUT Parameters:** applid, applid2, X'code'

---

**DFHFC0407** applid This CICS system is now authorized for shared access to data tables owned by the CICS system with applid applid2.

**Explanation:** The security check which failed earlier and was reported in message DFHFC0406, has now succeeded. This system can now attempt to access shared data tables owned by the CICS system with applid applid2.

**System action:** CICS continues normally. Subject to specific resource authorization checks, shared data tables owned by the remote CICS system can now be accessed by this system.

**User response:** None.

**Destination:** Console  
**Modules:** DFHFCFS  
**XMEOUT Parameters:** applid, applid2

---

**DFHFC0408** applid This CICS system is not authorized for shared access to remote file filename - reason code X'code'.

**Explanation:** A file request to the specified remote file resource has just been processed. The file owning region contains shared data tables. An attempt was made to connect to any data table associated with the file but the connecting region failed the security check for shared access to the file resource. However, function shipped access was not similarly prevented.

This message can be issued whether or not the remote file has an associated data table. This is because it is not possible to determine whether a table exists until cross-memory linkage has been established to the file owning region, and this is only done after a connection attempt has passed all security checks. Once cross-memory linkage has been set up, any further connection attempts can first check whether a table
exists. The shared access security check is then only needed when a data table is known to be available.

The value of the reason code, X'code', provides further information on the reason for the failure of the file security check. It has the format X'ffrraaaa'; where ff identifies the userid that was refused access, r gives the register 15 return code from SAF, and aaaaa is the SAFPRRET value.

The values of X'ff' are:

X'01' The requesting system's own userid was refused read access to the remote file filename.

X'02' The default userid of the CICS system which owns the remote file filename was used in the security check for read access to the file, and access was refused.

System action: CICS continues normally and function ships this and subsequent requests directed to the specified remote file until authority to use shared access is granted. Access is retried after about 10 minutes.

User response: Check whether shared access from this system to the specified file is intended. If it is, use the additional information provided in the reason code to determine what changes to the security definitions or set-up are required.

See the CICS Shared Data Tables Guide for an explanation of the rules determining which userid is used for a file security check.

Destination: Console

Modules: DFHEIFC

XMEOUT Parameters: applid, filename, X'code'

---

**DFHFC0409 applid This CICS system is now authorized for shared access to remote file filename.**

Explanation: The security check which failed earlier, and was reported in message DFHFC0408, has now succeeded. This system can now use shared access to the specified table.

System action: CICS continues normally.

User response: None.

Destination: Console

Modules: DFHEIFC

XMEOUT Parameters: applid, filename

---

**DFHFC0410 applid Data table cannot be opened. Data table initialization has failed for reason X'code'.**

Explanation: CICS is about to open a data table but has been unable to initialize shared data table services. The value of the reason code, X'code', provides further information about why CICS was unable to initialize shared data table services.

The format of the reason code is either: X'ffaaaaaa', in which ff is a value less than X'80' that identifies the type of failure, and aaaaaa is additional information provided for some of the failures, or when an abnormal termination (abend) has occurred, X'axxxrrr' in which a is a value greater than or equal to X'8' that categorizes the type of abend. rrr contains any register 15 abend reason code, and xxx contains the system or user completion code as three hexadecimal digits.

When X'code' < X'80000000', the values of X'ff' are:

X'01' An unexpected failure occurred. This code is reported when the data tables SVC detects an unexpected error.

X'04' An error was returned by the MVS RESMGR macro, called to establish an MVS resource manager for end-of-task processing. The first byte of the additional information, X'aa0000' contains the low order byte of the register 15 return code from the MVS RESMGR macro.

X'06' An error was returned by the CICS SVC. The first byte of the additional information, X'aa0000' is the register 15 return code from the attempt to call the CICS SVC.

X'08' An error was returned by the MVS DSPSERV macro. The additional information in the reason code consists of one byte containing the register 15 return code followed by 2 bytes containing the middle bytes from the register 0 reason code returned by DSPSERV.

X'09' An error was returned by the MVS ALESERV macro, called to create an access list entry either for the data space or for references to the primary address space. The additional information in the reason code consists of one byte containing the register 15 return code followed by two bytes containing the ALESERV function code (service type) and qualifier (options) which identify the failing request.

X'0E' An attempt to serialize the use of shared data table services (thus ensuring that only one TCB per address space can use the services) has failed. The first byte of additional information contains the ENQ return code.

When X'code' ≥ X'80000000', the values of X'aaa' are formed from combinations of:

X'8' An abend was detected.

X'4' A user abend was detected, in which case xxx contains the hexadecimal equivalent of the user completion code (otherwise, xxx contains the hexadecimal system completion code).
An abend was detected but could not be analyzed fully because no SDWA was available.

An asynchronous abend was detected (otherwise, the abend was synchronous or could not be classified because there was no SDWA).

System action: CICS continues normally. This message is followed either by message DFHFC0931 or by DFHFC0932. The following message indicates the action taken for the table involved. A system dump is taken for unexpected errors (X'ff =>X'01') and for abends (if dumps are requested for that abend code).

User response: The response depends on the reason for the failure as indicated in the first byte of the reason code:

X'01' Use the system dump to help you determine the cause of the problem.

X'04' Refer to the documentation of the MVS RESMGR macro to interpret the low-order byte of the register 15 return code reported in the reason code.

X'06' The most likely reason for a failure of the CICS SVC call is that the data tables SVC module DFHDTSVC could not be loaded, in which case the return code value is X'02'. If this is the case, check that the DFHDTSVC module is in the LPA or in an authorized library in the link list of the MVS system. If the module is in the correct location, investigate why it could not be loaded. There might be a hardware fault on the disk. Another less likely value for the return code is X'06', which implies that DFHDTSVC has been relink-edited and not marked reentrant.

X'08' Refer to the documentation of the MVS DSPSERV macro to interpret the register 0 and register 15 return codes reported in the additional information part of the reason code.

X'09' The function code (service type) and qualifier (options) reported in the reason code can be used to determine which ALESERV request was being attempted. Refer to the MVS ALESERV documentation and macro to interpret the function code, qualifier, and register 15 return code reported in the reason code.

X'0E' This might indicate that the limit on the number of ENQs per address space has been reached, or that another TCB running in this CICS address space has already initialized as a requester of shared data table services.

≥ X'80' When the reason code indicates that an abend has been detected, use the additional information provided in the reason code to find out what the abend was, and refer to information on that abend code to determine the cause.

Explanation: CICS is about to open a data table but has been unable to initialize shared data table services because of a failure to obtain storage. The value of the reason code, X'code', provides further information about the type of storage which could not be obtained.

The format of the reason code is X'tttnnnnn' in which tt identifies the type of storage and, for some of the codes, nnnnn gives the hexadecimal size in bytes of the storage which could not be obtained. For fixed-length storage blocks, the reason code does not usually report the size.

The values of X'tt' are:

X'01' Private storage from MVS subpool 230 (key 0) for a work area used by the data tables SVC

X'02' Private storage from MVS subpool 0 for the local header block used by a shared data table server

X'03' Private storage from MVS subpool 0 for a pool for data table blocks

X'04' Private storage from MVS subpool 0 for a pool for file blocks

X'08' MVS/ESA data space storage

X'09' Private storage from MVS subpool 230 (key 0) for a region anchor

X'11' Private storage from MVS subpool 0 for a dummy recovery block

X'12' Storage from MVS subpool 252 required to load the DFHDTAM load module

X'13' Private storage from MVS subpool 230 (CICS key) for a parameter list used by the data tables SVC

X'14' Private storage from MVS subpool 230 (key 0) for a new ALET list section

System action: CICS continues normally. This message is followed either by message DFHFC0931 or by DFHFC0932. The following message indicates the action taken for the table involved.

User response: The response depends on the type of storage indicated by the reason code. If it indicates private storage, you should reconsider the various
region size parameters which have been specified on the CICS job, or have been set as defaults for the system by IEFUSI or the IEFUSI installation exit. It might be necessary to take an SDUMP of the CICS job and process it using the VERBEXIT VSMDATA in order to investigate the way in which MVS storage has been allocated to the various subpools.

If it indicates data space storage, check whether the size of data spaces in this MVS system has been limited by use of the IEFUSI installation exit.

Destination: Console

Modules: DFHFCFS

XMEOUT Parameters: applid, X'code'

DFHFC0412 applid Data table cannot be opened.
Data table initialization has failed
owing to a module loading failure -
reason code X'code'.

Explanation: CICS is about to open a data table but a module loading failure has prevented the initialization of shared data table services. The value of the reason code, X'code', provides further information about which module was being loaded, and what went wrong with the attempt to load it.

The format of the reason code is X'mfrraaaa' in which m identifies the module and f is a code for the type of failure. For some failures, rr contains the register 15 return code from the failing macro call, and aaaa might contain additional information.

The value of X'm' can be:

X'1' DFHDTFOR
X'2' DFHDTAM
X'6' DFHMVRMS

The values of X'f' are:

X'1' module not found by a LOAD, BLDL or CSVQUERY macro call.
X'2' an error was returned by the MVS LOAD macro. The two bytes X'aaaa' of additional information in the reason code contain the completion code from the LOAD. X'r' is the register 15 return code.
X'3' an error was returned by the MVS CSVQUERY macro. X'r' is the register 15 return code.
X'4' an error was returned by the MVS BLDL macro. The two bytes X'aaaa' of additional information in the reason code contain the R0 reason code returned by BLDL.
X'5' the module is not reentrant.
X'6' the module had the wrong AMODE.
X'7' the module had the wrong RMODE.

Note for CICS/ESA 3.2.1 users: There is an additional code of X'08000000' which is only seen on a CICS/ESA 3.2.1 system that has DFHDITINS installed in the LPA or in its load library, and has mistakenly loaded this module.

System action: CICS continues normally. This message is followed either by message DFHFC0931 or by DFHFC0932. The following message indicates the action taken for the table involved.

User response: The response depends on the reason for the failure as indicated in the second hex digit of the reason code:

X'1' Use the first hex digit to determine which module could not be found, and ensure that it is in the correct library.
X'2' Refer to the documentation of the MVS LOAD macro to interpret the return and completion codes given in the reason code. There might also be a message from the MVS LOAD which explains the reason for the failure.
X'3' Refer to the documentation of the MVS CSVQUERY macro to interpret the return code given in the second byte of X'code'.
X'4' This indicates an I/O error or a storage allocation failure. Refer to the documentation of the MVS BLDL macro to interpret the values in the reason code X'code'.
X'5', X'6', X'7'
Use the first digit of the reason code to determine the name of the module, then check the status of that module. These errors imply that it is either not the module which was supplied with CICS or that it has become corrupted.

Note for CICS/ESA 3.2.1 users: If the reason code was X'08000000', the shared data tables module DFHDITINS has been incorrectly installed in a library which is used by this CICS/ESA 3.2.1 system. If DFHDITINS is in the load library specified by this CICS, it should be removed: shared data tables support cannot be installed on a CICS system at a lower level than 3.3. If
it is in the link pack area (LPA) of this MVS system, it should be removed: the DFHDTINS module should not be placed in the LPA of an MVS system which contains any CICS regions at release 3.2.1 which might want to use data tables, unless a PTF has been applied to the CICS 3.2.1 regions.

Destination: Console

Modules: DFHFCFS

XMEOUT Parameters: applid, X'code'

DFHFC0415 applid Remote data tables cannot be accessed. Shared data table initialization has failed for reason X'code'.

Explanation: CICS is about to access a remote file resource which may have an associated shared data table. However, shared data tables cannot be used to access any remote tables because CICS has been unable to initialize data table services. Note that if CICS finds module DFHDTINS in the STEPLIB concatenation or in the LPA it will assume that shared data tables is required and will thus try to initialize it. The value of the reason code, X'code', provides further information about why this CICS region was unable to perform the initialization required to act as a requester of shared data table services.

The format of the reason code is either: X'ffaaaaaa' in which ff is a value less than X'80' that identifies the type of failure, and aaaaaa is additional information provided for some of the failures; or, when an abnormal termination (ABEND) has occurred, X'axxxrrrr' in which a is a value greater than or equal to X'8' that categorizes the type of abend, rrr contains any register 15 abend reason code, and xxx contains the system or user completion code as three hexadecimal digits.

When X'code' < X'80000000', the values of X'ff' are:

X'01' An unexpected failure occurred. This code is reported when the data tables SVC detects an error which should never occur.

X'06' An error was returned by the CICS SVC. The first byte of the additional information, aa0000, is the register 15 return code from the attempt to call the CICS SVC.

X'0E' An attempt to serialize the use of shared data table services (thus ensuring that only one TCB per address space can use the services) has failed. The first byte of additional information contains the ENQ return code.

When X'code' ≥ X'80000000', the values of X'a' are formed from combinations of:

X'8' An abend was detected.

X'4' A user abend was detected, in which case xxx contains the hexadecimal equivalent of the user completion code (otherwise, xxx contains the hexadecimal system completion code).

X'2' An abend was detected but could not be analyzed fully because no SDWA was available.

X'1' An asynchronous abend was detected (otherwise, the abend was synchronous or could not be classified because there was no SDWA).

System action: CICS continues normally and functions this and subsequent remote file requests. Initialization is retried after about 10 minutes. A system dump is taken for unexpected errors (X'ff' =X'01') and for abends (if dumps are requested for that abend code).

User response: The response depends on the reason for the failure as indicated in the first byte of the reason code:

X'01' Use the system dump to help you determine the cause of the problem.

X'06' The most likely reason for a failure of the CICS SVC call is that the data tables SVC module DFHDTSVC could not be loaded, in which case the return code value is X'02'. If this is the case, check that the DFHDTSVC module is in the LPA or in an authorized library in the link list of the MVS system. If the module is in the correct location, then investigate why it could not be loaded; possibly there might be a hardware fault on the disk. Another less likely value for the return code is X'06', which implies that DFHDTSVC has been relink-edited and not marked reentrant.

X'0E' This might indicate that the limit on the number of ENQs per address space has been reached, or that another TCB running in this CICS address space has already initialized as a requester of shared data table services.

≥ X'80' When the reason code indicates that an abend has been detected, use the additional information provided in the reason code to find out what the abend was, and refer to information on that abend code to determine the cause.

Destination: Console

Modules: DFHFCFS
**XMEOUT Parameters:** `applid, X'code'`

**DFHFC0416** `applid` Remote data tables cannot be accessed. Shared data table initialization has failed owing to a storage failure - reason code `X'code'`.

**Explanation:** CICS is about to access a remote file resource. However, a failure to get storage has prevented CICS from initializing shared data table services. The value of the reason code, `X'code'`, provides further information about the type of storage which could not be obtained.

The format of the reason code is `X'tttttnnnn'` in which `tt` identifies the type of storage and, for some of the codes, `nnnnnn` gives the hexadecimal size in bytes of the storage which could not be obtained. For storage blocks whose length is fixed, the reason code does not usually report the size.

The values of `X'tt'` are:

- **X'01'** Private storage from MVS subpool 253 (below the 16MB line) for a work area required by module DFHQSSS
- **X'02'** Private storage from MVS subpool 0 for the shared data table header block required for this CICS to act as a data tables requester
- **X'09'** Private storage from MVS subpool 230 (key 0) for a region anchor
- **X'0A'** ECSA storage from subpool 241 (key 0) for a qualified subsystem block
- **X'0B'** ECSA storage from MVS subpool 241 (key 0) for a system anchor
- **X'0E'** Private storage from MVS subpool 230 (key 0) for a connect header block

**System action:** CICS continues normally and functions this and subsequent remote file requests. Initialization is retried after about 10 minutes.

**User response:** The response depends on the type of storage indicated by the reason code.

If it indicates private storage, you should reconsider the various region size parameters which have been specified on the CICS job or have been set as defaults for the system by IEALIMIT or the IEFUSI installation exit. It might be necessary to take an SDUMP of the CICS job and process it using the VERBEXIT VSMDATA in order to investigate the way in which MVS storage has been allocated to the various subpools.

If it indicates ECSA (extended common service area) storage, you should review the CSA size specified in system parameter list IEASYSxx, or by use of the CSA override on initialization of the MVS system. You should also review the size of the ESQA, since the system might have started to use ECSA storage if the ESQA storage is depleted.

**Destination:** Console

**Modules:** DFHFCFS

**XMEOUT Parameters:** `applid, X'code'`

**DFHFC0417** `applid` Remote data tables cannot be accessed. Shared data table initialization has failed owing to a module loading failure - reason code `X'code'`.

**Explanation:** CICS is about to access a remote file resource. However, module loading failure prevents CICS from initializing data table services.

The value of the reason code, `X'code'`, provides further information about which module was being loaded, and what went wrong with the attempt to load it.

The format of the reason code is `X'mffaaaaa'` in which `m` identifies the module and `f` is a code for the type of failure. For some failures, `rr` contains the register 15 return code from the failing macro call, and `aaaa` might contain additional information.

The value of `X'm'` can be:

- **X'3'** DFHDTAOR
- **X'4'** DFHDTCV

The values of `f` are:

- **X'1'** module not found by LOAD
- **X'2'** an error was returned by the MVS LOAD macro. The two bytes `X'aaaa'` of additional information in the reason code contain the completion code from the LOAD. `X'rr'` contains the register 15 return code
- **X'5', X'6'** the module is not reentrant.
- **X'6'** the module had the wrong AMODE.

**System action:** CICS continues normally and functions this and subsequent remote file requests. Initialization is retried after about 10 minutes.

**User response:** The response depends on the reason for the failure as indicated in the second hex digit of the reason code:

- **X'1'** Use the first hex digit to determine which module could not be found, and ensure that it is in the correct library.
- **X'2'** Refer to the documentation of the MVS LOAD macro to interpret the return and completion codes reported in the reason code. There might also be a message from the MVS LOAD which explains the reason for the failure.
- **X'5', X'6'** Use the first digit of the reason code to
determine the name of the module, then check the status of that module. This error implies that it is either not the module which was supplied with CICS or that it has become corrupted.

**Destination:** Console

**Modules:** DFHFCFS

**XMEOUT Parameters:** applid, X'code'

**DFHFC0420** applid Shared access to data tables cannot be provided by this CICS system because it has not been registered as a shared data table server - reason code X'code'.

**Explanation:** CICS is about to open a data table but has been unable to do so because this CICS system has not been registered as a shared data table server. The value of the reason code, X'code', provides further information about why this CICS system was unable to register (LOGON) as a shared data table server.

The format of the reason code is either: X'ffaaaaaa' in which ff is a value less than X'80' that identifies the type of failure, and aaaaaa is additional information provided for some of the failures; or, when an abnormal termination (ABEND) has occurred, X'axxxxrrrr' in which a is a value greater than or equal to X'8' that categorizes the type of ABEND, rrr contains any register 15 ABEND reason code, and xxx contains the system or user completion code as three hexadecimal digits.

When X'code' < X'8000000', the values of X'ff' are:

- **X'01'** This code is reported when the data tables SVC detects an unexpected error.
- **X'02'** Another region within the MVS image with the same APPLID as this region is already registered (logged on) as a shared data tables server.
- **X'03'** DFHDTRM has supplied the data tables SVC with an invalid address for the PC vector, or the PC vector specifies an invalid number of entry table entries (ETEs). In the latter case, X'aaaaaa' contains the number of ETEs that were requested.
- **X'04'** A failure occurred when attempting to establish an MVS resource manager for end-of-memory processing. The first byte of the additional information, X'aa0000' contains the low order byte of the register 15 return code from the MVS RESMGR macro.
- **X'05'** A failure occurred when attempting to make the server address space permanently non-swappable. The additional information, X'aaaaaa', contains the low order 3 bytes of the code posted in an ECB that was specified when the SYSEVENT TRANSWAP macro was issued.
- **X'06'** An error was returned by the CICS SVC. The first byte of the additional information, X'aa0000' is the register 15 return code from the attempt to call the CICS SVC.
- **X'0D'** An error occurred when issuing an MVS ENQ to ensure that, at any given time, only one server per MVS system can be active for a given APPLID. The first byte of the additional information, X'aa0000' contains the return code from ENQ.
- **X'10'** An attempt to create the environment for shared data tables connect security checks has found that the security environment has already been set up.
- **X'11'** There is a disparity between the actual version of the CICS security block and the version which was used to assemble the shared data tables module DFHDTXS.

When X'code' ≥ X'80000000', the values of X'a' are formed from combinations of:

- **X'8'** An ABEND was detected.
- **X'4'** A user ABEND was detected, in which case xxx contains the hexadecimal equivalent of the user completion code (otherwise, xxx contains the hexadecimal system completion code).
- **X'2'** An ABEND was detected but could not be analyzed fully because no SDWA was available.
- **X'1'** An asynchronous ABEND was detected (otherwise, the abend was synchronous or could not be classified because there was no SDWA).

**System action:** CICS continues normally and attempts to open the table for local use only. A system dump is taken for unexpected errors (X'ff' =X'01') and for ABENDs (if dumps are requested for that ABEND code).

**User response:** The response depends on the reason for the failure as indicated in the first byte of the reason code:

- **X'01'** Use the system dump to help you determine the cause of the problem.
- **X'02'** There cannot be more than one region with a given APPLID acting as a shared data table server within the same MVS image.
- **X'03'** This error might indicate that some corruption of the system has occurred, or that there is an error in CICS code.
- **X'04'** Refer to the documentation of the MVS.
RESMGR macro to interpret the return code reported in the additional information part of the reason code.

X'05'  Refer to the documentation of the MVS SYSEVENT macro to interpret the ECB contents reported in the additional information part of the reason code.

X'06'  Server initialization should have been completed before LOGON is issued, so CICS SVC errors associated with the loading of the data tables SVC module DFHDTsvc should not be encountered. Therefore this error probably indicates a logic problem or corruption of your system.

X'0D'  Refer to the documentation of the MVS ENQ macro to interpret the return code reported in the additional information part of the reason code.

X'10'  This error might indicate that some corruption of the system has occurred, or that there is an error in CICS code.

X'11'  This error might indicate that service has been applied which requires PTFs to both base CICS and the shared data tables code, and only one has been correctly updated, or that some corruption of the system has occurred, or that there is an error in CICS.

≥ X'80' When the reason code indicates that an ABEND has been detected, use the additional information provided in the reason code to find out what the ABEND was, and refer to information on that ABEND code to determine the cause.

Destination:  Console
Modules:  DFHFCFS
XMEOUT Parameters:  applid, 'X'code'

---

DFHFC0421 applid Shared access to data tables cannot be provided by this CICS system because a storage failure has prevented it from registering as a shared data table server - reason code X'code'.

Explanation:  CICS is about to open a data table but cannot do so because a failure to acquire storage has prevented the register of this CICS system as a shared data table server. The value of the reason code, X'code', provides further information about the type of storage which could not be obtained:

The format of the reason code is X'ttlnnnnn' in which tt identifies the type of storage and, for some of the codes, nnnnnn gives the hexadecimal size in bytes of the storage which could not be obtained. For storage blocks whose length is fixed, the reason code does not usually report the size.

The values of X'tt' are:

- X'01'  private storage from MVS subpool 253 (below the 16MB line) for a work area for module DFHQSSS or from MVS subpool 230 (key 0) for a work area used by the data tables SVC LOGON processing
- X'0A'  ECSA storage from MVS subpool 241 (key 0) for a qualified subsystem block
- X'0B'  ECSA storage from MVS subpool 241 (key 0) for a system anchor
- X'0C'  ECSA storage from MVS subpool 241 (key 0) for a server element
- X'0D'  ECSA storage from MVS subpool 241 (key 0) for a security block

System action:  CICS continues normally and attempts to open the table for local use only.

User response:  The response depends on the type of storage indicated by the reason code.

If it indicates private storage then you should probably reconsider the various region size parameters which have been specified on the CICS job, or have been set as defaults for the system by IEALIMIT or the IEFUSI installation exit. It might be necessary to take an SDUMP of the CICS job and process it using the VERBEXIT VSMDATA in order to investigate the way in which MVS storage has been allocated to the various subpools.

If it indicates ECSA (extended common service area) storage, you should review the CSA size specified in system parameter list IEASYSxx, or by use of the CSA override on initialization of the MVS system. You should also review the size of the ESQA, since the system might have started to use ECSA storage if the ESQA storage is depleted.

Destination:  Console
Modules:  DFHFCFS
XMEOUT Parameters:  applid, 'X'code'

---

DFHFC0422 applid Shared access to data tables cannot be provided by this CICS system because a module loading failure has prevented it from registering as a shared data table server - reason code X'code'.

Explanation:  CICS is about to open a data table but cannot do so because a module loading failure has prevented the register of this CICS system as a shared data table server.

The value of the reason code, X'code', provides further information about which module was being loaded, and what went wrong with the attempt to load it.

The format of the reason code is X'mffraaaad' in which m
identifies the module and f is a code for the type of failure. For some failures, rr contains the register 15 return code from the failing macro call, and aaaa might contain additional information.

The value of X'm' can be:

- X'5'  DFHDTXS

The values of X'f' are:

- X'1'  module not found by LOAD
- X'2'  an error was returned by the MVS LOAD macro. The two bytes X'aaaa' of additional information in the reason code contain the completion code from the LOAD. X'r' contains the register 15 return code.
- X'5'  the module is not reentrant.
- X'6'  the module had the wrong AMODE.

**System action:** CICS continues normally and attempts to open the table for local use only.

**User response:** The response depends on the reason for the failure as indicated in the second hex digit of the reason code:

- X'1'  Use the first hex digit to determine which module could not be found, and ensure that it is in the correct library.
- X'2'  Refer to the documentation of the MVS LOAD macro to interpret the return and completion codes given in the reason code. There might also be a message from the MVS LOAD which explains the reason for the failure.

- X'5', X'6'  Use the first digit of the reason code to determine the name of the module, then check the status of that module. This error implies that it is either not the module which was supplied with CICS or that it has become corrupted in some way.

**Destination:** Console

**Modules:** DFHFCFS

**XMEOUT Parameters:** applid, filename, X'code'

---

**DFHFC0430 applid Data table open request for file filename has failed for reason X'code'**

**Explanation:** CICS has attempted to create a data table for file resource filename but has been unable to do so owing to a failure to get storage. There is insufficient storage above the 16MB line and the value of the reason code, X'code', provides further information about the type of storage which could not be obtained.

The format of the reason code is X'ttnnnnnt' in which tt identifies the type of storage and, for some of the codes, nnnnn gives the hexadecimal size in bytes of the storage which could not be obtained. For storage blocks whose length is fixed, the reason code does not usually report the size.

The values of X'tt' are:

- X'03'  private storage from MVS subpool 0 for a data table block
- X'04'  private storage from MVS subpool 0 for a file block
- X'05'  private storage from MVS subpool 0 for a pool of backout cells (the pool is created if the file being opened is the first recoverable user-maintained table to be opened in this CICS run)
- X'06'  private storage from MVS subpool 0 for a pool of table entry descriptor blocks, or for a descriptor block to be used when loading the table
- X'07'  private storage from MVS subpool 0 for data table index storage
- X'08'  storage for a pool of data table records in the MVS/ESA data space

**System action:** CICS continues normally. This message is followed either by message DFHFC0931 or by DFHFC0932. The following message indicates the action taken for the table involved.

**User response:** The response depends on the type of storage indicated by the reason code.

If it indicates private storage then you should probably reconsider the various region size parameters which have been specified on the CICS job, or have been set as defaults for the system by IEALIMIT or the IEFUSI installation exit. It might be necessary to take an SDUMP of the CICS job and process it using the assistance from IBM to resolve this problem. See Part 4 of the [CICS Problem Determination Guide](https://www.ibm.com/docs/en/cics-6.2?topic=guide) for guidance on how to proceed.

**Destination:** Console

**Modules:** DFHFCFS

**XMEOUT Parameters:** applid, filename, X'code'
VERBEXIT VSMDATA in order to investigate the way in which MVS storage has been allocated to the various subpools.

If it indicates data space storage then check whether the size of data spaces in this MVS system has been limited by use of the IEFUSI installation exit.

**Destination:** Console

**Modules:** DFHFCFS

**XMEOUT Parameters:** applid, filename, 'X'code'

---

**DFHFC0435** applid Data table access request for remote file filename has failed for reason 'X'code'.

**Explanation:** An error has occurred while the requesting region was attempting to establish a connection to the remote file filename owned by the serving region. The value of the reason code, 'X'code', provides further information about why CICS was unable to connect to the remote file.

The format of the reason code is either: 'X'ffaaaaaa' in which 'ff' is a value less than 'X'80' that identifies the type of failure, and 'aaaaaa' is additional information provided for some of the failures; or, when an abnormal termination (ABEND) has occurred, 'X'axxrrrr' in which 'a' is a value greater than or equal to 'X'8' that categorizes the type of ABEND, 'rrr' contains any register 15 ABEND reason code, and 'xxxx' contains the system or user completion code as three hexadecimal digits.

When 'X'code' < 'X'80000000', the values of 'X'ff' are:

- **X'01'**: An unexpected failure occurred. This code is reported when the data tables SVC detects an error which should never occur.
- **X'06'**: An error was returned by the CICS SVC. The first byte of the additional information, 'aa0000', is the register 15 return code from the attempt to call the CICS SVC.
- **X'07'**: The connection index returned by the data tables SVC exceeds the maximum value supported by the calling module (2^{32} - 1).
- **X'0A'**: The scan of the chain of files owned by the serving region has failed because there is a permanently invalid entry on the chain which indicates that the chain has become damaged.
- **X'0B'**: The number of connections by this requesting CICS region to the remote file is already at the allowed maximum (2^{32} - 1).
- **X'0C'**: The vector which records details of all connections to shared data tables by this requesting CICS region needs expanding, but this would cause it to equal or exceed a size of 16MB.
- **X'0F'**: An attempt to serialize with termination of the server has failed because the number of ENQs has reached the address space limit. The first byte of the additional information, 'X'aa0000', contains the return code from the ENQ.

When 'X'code' ≥ 'X'80000000', the values of 'X'a' are formed from combinations of:

- **X'08'**: An ABEND was detected.
- **X'04'**: A user ABEND was detected, in which case 'xxx' contains the hexadecimal equivalent of the user completion code (otherwise, 'xxx' contains the hexadecimal system completion code).
- **X'02'**: An ABEND was detected but could not be fully analyzed because no SDWA was available.
- **X'01'**: An asynchronous ABEND was detected (otherwise, the abend was synchronous or could not be classified because there was no SDWA).

**System action:** CICS continues normally and functions this and subsequent remote file requests. Use of shared tables is retried after about 10 minutes. A system dump is taken for unexpected errors (X'ff' = X'01') and for ABENDs (if dumps are requested for that ABEND code).

**User response:** The response depends on the reason for the failure as indicated in the first byte of the reason code:

- **X'01'**: Use the system dump to help you determine the cause of the problem.
- **X'06'**: Requester initialization should have been completed before CONNECT is issued, so CICS SVC errors associated with the loading of the data tables SVC module DFHDTSVC should not be encountered. Therefore this error probably indicates a logic problem or corruption of your system.
- **X'07'**: Some changes to your system configuration should be made, as this requesting region is trying to access too many shared data tables owned by other regions. It is necessary either to reduce the number of remote files being used, or to split the requesting CICS region into a number of smaller regions.
- **X'0A'**: This indicates corruption of subpool 0 storage in the server region.
- **X'0B'**: This indicates that either the requesting region contains more than 2^{32} - 1 remote file definitions, all of which refer to the same file in the server region, or that storage has been corrupted.
- **X'0C'**: Same response as X'07'.
- **X'0F'**: Refer to the documentation of the MVS ENQ...
macro to interpret the return code reported in the additional information part of the reason code.

≥ X’80’ When the reason code indicates that an ABEND has been detected, use the additional information provided in the reason code to find out what the ABEND was, and refer to information on that ABEND code to determine the cause.

Destination: Console
Modules: DFHFCFS
XMEOUT Parameters: applid, filename, X’code

DFHFC0436 applid Data table access request for remote file filename has failed because of a storage failure - reason code X’code’.

Explanation: CICS has attempted to access the remote file resource filename but cannot do so because of a failure to get storage.

The value of the reason code, X’code’, provides further information about the type of storage which could not be obtained:

The format of the reason code is X’ttnnnnnn’ in which t identifies the type of storage and, for some of the codes, nnnnnn gives the hexadecimal size in bytes of the storage which could not be obtained. For storage blocks whose length is fixed, the reason code does not usually report the size.

The values of X’tt’ are:

X’01’ Private storage from MVS subpool 230 (key 0) for a work area used by module DFHDTXS or for a work area used by data tables SVC CONNECT processing.

X’06’ Private storage from MVS subpool 230 (key 0) for a connect vector

System action: CICS continues normally and function ships this and subsequent remote file requests. Use of shared tables is retried after about 10 minutes.

User response: The response depends on the type of storage indicated by the reason code.

As it indicates private storage, you should probably reconsider the various region size parameters which have been specified on the CICS job, or have been set as defaults for the system by IEALIMIT or the IEFUSI installation exit. It might be necessary to take an SDUMP of the CICS job and process it using the VERBEXIT VSMDATA in order to investigate the way in which MVS storage has been allocated to the various subpools.

Destination: Console
Modules: DFHFCFS

DFHFC0440 applid Data table close request for file filename has failed for reason X’code’.

Explanation: CICS has attempted to close a data table for file resource filename but has been unable to do so.

System action: CICS continues normally. The table is treated as having been closed.

A system dump is taken for unexpected errors (X’ff’ =X’01’) and for abends (if dumps are requested for that abend code).

User response: The response depends on the reason for the failure as indicated in the first byte of the reason code:

X’01’ Use the system dump to help you determine the cause of the problem.

X’06’ Server initialization should have been completed before LOGON is issued, so CICS SVC errors associated with the loading of the data tables SVC module DFHDTSVC should not be encountered. Therefore this error probably indicates a logic problem or corruption of your system.

X’09’ The function code (service type) and qualifier (options) reported in the reason code can be used to determine which ALESERV request was being attempted. Refer to the MVS ALESERV documentation and macro to interpret the function code, qualifier, and register 15 return code reported in the reason code.

≥ X’80’ When the reason code indicates that an ABEND has been detected, use the additional information provided in the reason code to find out what the ABEND was, and refer to information on that abend code to determine the cause.

Destination: Console
Modules: DFHFCFS
XMEOUT Parameters: applid, filename, X’code

DFHFC0441 applid Data table close request for file filename has failed owing to a storage failure - reason code X’code’.

Explanation: CICS has attempted to close a data table for file resource filename but has been unable to do so owing to a failure to release storage.

The format of the reason code is X’ttnnnnnn’ in which t identifies the type of storage and, for some of the codes, nnnnnn gives the hexadecimal size in bytes of the storage which could not be obtained. For storage
blocks whose length is fixed, the reason code does not usually report the size.

The values of X'ff' are:

\[ X'14' \text{ private storage from MVS subpool 230 (key 0) for a new ALET list section} \]

**System action:** CICS continues normally. The table is treated as having been closed.

**User response:** You should probably reconsider the various region size parameters which have been specified on the CICS job, or have been set as defaults for the system by IELIMIT or the IEFUSI installation exit. It may be necessary to take an SDUMP of the CICS job and process it using the VERBEXIT VSMDATA in order to investigate the way in which MVS storage has been allocated to the various subpools.

**Destination:** Console

**Modules:** DFHFCFS

**XMEOUT Parameters:** applid, filename, X'code'

---

**Explanation:** CICS has attempted to disconnect from the remote data table filename but has been unable to do so.

An error has occurred while the requesting region was attempting to break the connection to the remote file filename owned by the serving region. The value of the reason code, X'code', provides further information about why CICS was unable to disconnect from the remote file.

The format of the reason code is either: X'ffaaaaaa' in which ff is a value less than X'80' that identifies the type of failure, and aaaaaaa is additional information provided for some of the failures; or, when an abnormal termination (ABEND) has occurred, X'axxxrrrr' in which a is a value greater than or equal to X'8' that categorizes the type of ABEND, rrr contains any register 15 ABEND reason code, and xxx contains the system or user completion code as three hexadecimal digits.

When X'code' < X'80000000', the values of X'ff' are:

\[ X'01' \text{ An unexpected failure occurred. This code is reported when the data tables SVC detects an error which should never occur.} \]

\[ X'06' \text{ An error was returned by the CICS SVC. The first byte of the additional information, aa0000, is the register 15 return code from the attempt to call the CICS SVC.} \]

When X'code' ≥ X'80000000', the values of X'a' are formed from combinations of:

\[ X'01' \text{ An ABEND was detected, in which case xxx contains the hexadecimal equivalent of the user completion code (otherwise, xxx contains the hexadecimal system completion code).} \]

\[ X'02' \text{ An ABEND was detected but could not be analyzed fully because no SDWA was available.} \]

\[ X'04' \text{ An asynchronous ABEND was detected (otherwise, the abend was synchronous or could not be classified because there was no SDWA).} \]

**System action:** CICS continues normally. The table is treated as having been disconnected from the requesting CICS system. A system dump is taken for unexpected errors (X'ff' = X'01') and for ABENDs (if dumps are requested for that ABEND code).

**User response:** The response depends on the reason for the failure as indicated in the first byte of the reason code:

\[ X'01' \text{ Use the system dump to help you determine the cause of the problem.} \]

\[ X'06' \text{ Requester initialization should have been completed before DISCONNECT is issued, so CICS SVC errors associated with the loading of the data tables SVC module DFHDTSVC should not be encountered. Therefore this error probably indicates a logic problem or corruption of your system.} \]

\[ ≥ X'80' \text{ When the reason code indicates that an ABEND has been detected, use the additional information provided in the reason code to find out what the ABEND was, and refer to information on that ABEND code to determine the cause.} \]

**XMEOUT Parameters:** applid, filename, code

---

**Explanation:** CICS has attempted to disconnect from the remote data table filename but has been unable to do so owing to a failure to release storage.

**System action:** CICS continues normally. The table is treated as having been disconnected from the requesting CICS system.

**User response:** This indicates an in internal error or a corruption of the system. You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.
Destination: Console
Modules: DFHFCFS
XMEOUT Parameters: applid, filename, X'code'

DFHFC0490 applid Unable to use data table for file filename.

Explanation: The data set to which file filename relates has an associated data table but CICS is unable to make use of the table data owing to a lack of storage.

System action: CICS continues normally. Performance of read-only accesses to the file is degraded because records cannot be retrieved from the table.

User response: Ensure that there is sufficient storage in the CICS region outside the EDSA. See the CICS Shared Data Tables Guide for further guidance.

Destination: Console
Modules: DFHFCFS
XMEOUT Parameters: applid, filename

DFHFC0501 applid RLS OPEN of file filename failed. RLS access has been disabled.

Explanation: While CICS was opening file filename, the CICS file control open/close routine received a return code of 16 in register 15. This means that the RLS VSAM server is currently unavailable so file control has disabled RLS access.

System action: CICS continues processing with file filename closed and its state UNENABLED. Any transaction attempting to use RLS files is sent a NOTOPEN condition.

User response: None.

Destination: Console
Modules: DFHFCFS
XMEOUT Parameters: applid, filename
DFHFC0504 applid RLS OPEN of file filename failed.
The VSAM SHOWCB macro has detected a RLS VSAM server failure.
RLS access has been disabled.

Explanation: While CICS was opening file filename, the CICS file control RLS open/close routine received a return code of X'1A' in register 15. This means that the RLS VSAM server is not available so file control has disabled RLS access. The return code was returned by the SHOWCB macro when CICS was attempting to find the reason for the open failure that had just been detected.

System action: CICS continues processing with file filename closed and its state UNENABLED. Any transaction attempting to use RLS files is sent a NOTOPEN condition. CICS reenables RLS access when the RLS VSAM server restarts.

User response: None.

Destination: Console

Modules: DFHFCRO

XMEOUT Parameters: applid, filename

---------

DFHFC0508 applid RLS OPEN of file filename failed. VSAM has returned code X'AA' in register 15. RLS access has been disabled.

Explanation: While CICS was opening file filename, the CICS file control open/close routine received a return code of X'AA' in register 15. This means that the RLS VSAM server is currently unavailable so file control has disabled RLS access.

System action: CICS continues processing with file filename closed and its state UNENABLED. Any transaction attempting to use RLS files is sent a NOTOPEN condition.

User response: None.

Destination: Console

Modules: DFHFCRO

XMEOUT Parameters: applid, filename

---------

DFHFC0505 applid RLS CLOSE of file filename failed. The VSAM SHOWCB macro has detected a RLS VSAM server failure.
RLS access has been disabled.

Explanation: While CICS was closing file filename, the CICS file control RLS open/close routine received a return code which indicates that the RLS VSAM server is unavailable. Consequently file control has disabled and closed down RLS access. This does not affect the rest of the close processing. The return code is returned by the SHOWCB macro which is invoked during CICS close.

System action: CICS continues processing with file filename closed and its state UNENABLED. Any subsequent close requests for other files which are issued while the server is unavailable also receive the error return code but do not issue this message. CICS reenables RLS access when the RLS VSAM server restarts.

User response: None.

Destination: Console

Modules: DFHFCRO

XMEOUT Parameters: applid, filename

---------

DFHFC0507 applid RLS OPEN of file filename failed. Callable service IGWARLS is not present.

Explanation: Callable service IGWARLS is required by file control for processing files which have update SERVREQs and are using the VSAM catalog as a repository for data set recovery attributes. CICS expects to find IGWARLS in the LPA. IGWARLS resides in library SYS1.CSSLIB. If SYS1.CSSLIB is not in the LPA concatenation, RLS files with update SERVREQs cannot be opened.

System action: CICS continues processing with file filename closed and its state UNENABLED. Any transaction attempting to use RLS files is sent a NOTOPEN condition.

User response: If you intend to use RLS access for files with UPDATE SERVREQs, ensure that SYS1.CSSLIB is included in the LPA concatenation.

Destination: Console

Modules: DFHFCRO

XMEOUT Parameters: applid, filename

---------

DFHFC0509 applid RLS OPEN of file filename failed. This file is an extended entry-sequenced data set (ESDS). The extended file attribute is not supported in this release of CICS.

Explanation: While CICS was opening file filename, CICS received a nonzero return code from VSAM while attempting to verify that relative byte address (RBA) access is allowed. This failure indicates that filename is an extended ESDS, which is not supported in this release of CICS.

System action: CICS continues processing with file filename closed and its state UNENABLED. Any transaction that attempts to use ESDS RLS file is sent a NOTOPEN condition.
**User response:**  Redefine `filename` as a standard ESDS.

**Destination:**  Console

**Modules:**  DFHFCRO

**XMEOUT Parameters:**  `applid, filename`

---

**DFHFC0510**  `applid {RLS | Non-RLS} OPEN of file filename` failed because the data set is unavailable. Module `module`.

**Explanation:**  An attempt to open file `filename` failed because CICS has internally marked the data set as unavailable. This is the result of an earlier EXEC CICS SET DSNAME UNAVAILABLE command, or CEMT equivalent. This prevents the opening of new RLS and non-RLS files against the data set.

**System action:**  CICS continues processing with file `filename` closed and its state UNENABLED. Any transactions attempting to use the data set from this CICS region are sent a NOTOPEN condition.

**User response:**  Ensure that an EXEC CICS SET DSNAME AVAILABLE command (or the CEMT equivalent) is issued before attempting to open the file.

**Destination:**  Console

**Modules:**  DFHFCFS, DFHFCRO

**XMEOUT Parameters:**  `applid, {1=RLS, 2=Non-RLS}, filename, module`

---

**DFHFC0511**  `applid RLS OPEN of file filename` failed. This CICS has other files open for the data set (or its associated base) with non-RLS access mode. The data set name is `dsname`.

**Explanation:**  While CICS was opening file `filename`, the CICS file control RLS open/close routine detected that this region has other files open for the data set `dsname`, or its associated base data set, in non-RLS access mode. The file cannot be opened in RLS access mode until all the other non-RLS mode files have closed, even if these files are accessing the data set in read-only mode. This constraint is to ensure a consistent view of this data set from within each CICS region.

**System action:**  CICS continues processing with file `filename` closed and its state UNENABLED. Any transaction attempting to use the file is sent a NOTOPEN condition.

**User response:**  Close all the other files or change access of this file to RLS mode. Files accessing the same base data set from within a given CICS region must all have the same access mode. This includes access via a path data set.

**Destination:**  Console

**Modules:**  DFHFCFS

**XMEOUT Parameters:**  `applid, filename, dsname`

---

**DFHFC0512**  `applid Non-RLS OPEN of file filename` failed. This CICS has other files open for the data set (or its associated base) with RLS access mode. The data set name is `dsname`.

**Explanation:**  While CICS was opening file `filename`, the CICS file control non-RLS open/close routine detected that this region has other files open for the data set `dsname`, or its associated base data set, in RLS access mode. This file cannot be opened in non-RLS access mode until all the other RLS mode files have closed, even if this file is opening the data set in read-only mode. This constraint is to ensure a consistent view of this data set from within each CICS region.

**System action:**  CICS continues processing with file `filename` closed and its state UNENABLED. Any transaction attempting to use the file is sent a NOTOPEN condition.

**User response:**  Close all the other files or change access of this file to non-RLS mode. The file cannot be opened in RLS access mode until all the other RLS mode files have closed, even if these files are accessing the data set in read-only mode. This constraint is to ensure a consistent view of this data set from within each CICS region.

**System action:**  CICS continues processing with file `filename` closed and its state UNENABLED. Any transaction attempting to use the file is sent a NOTOPEN condition.

**User response:**  Use the INQUIRE UOWDSNFAIL command to investigate the RLS recovery work, and take action to resolve it. This may involve retrying backout-failed units of work and resynchronising indoubt-failed units of work. See the CICS Recovery...
**Chapter 1. DFH messages**

1. See [and Restart Guide](#) for more information on unit of work failures and their resolution.

2. **Destination:** Console
   **Modules:** DFHFCFS
   **XMEOUT Parameters:** applid, filename, dsname

   **DFHFC0520** applid (RLS | Non-RLS) OPEN of file filename failed. IGWARLS call returned codes X'rrrr', X'cccc' and problem determination X'dddddddd' to module module.

   **Explanation:** While CICS was opening file filename and retrieving information from the VSAM catalog using callable service IGWARLS, the CICS file control open/close routine in module module detected an error. The return code and reason code from IGWARLS are respectively rrr and ccc. dddddddd is any available problem determination information.

   **System action:** CICS continues processing with file filename closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

   **User response:** Use the IGWARLS reason code to determine the cause of the problem. For the meaning of the IGWARLS reason code, see OS/390 V2R10.0 DFSMSdfp Advanced Services.

   If you cannot resolve the problem or the problem recurs, there may be a more severe error. In this case, you will need assistance from IBM. See Part 4 of the CICS [Problem Determination Guide](#) for guidance on how to proceed.

3. **Destination:** Console
   **Modules:** DFHFCFS, DFHFCRO
   **XMEOUT Parameters:** applid, {1=RLS, 2=Non-RLS}, filename, X'rrrr', X'cccc', X'dddddddd', module

   **DFHFC0521** applid RLS OPEN of file filename failed. Unspecified LOG parameter is invalid for an RLS file with update type SERVREQs.

   **Explanation:** While CICS was opening file filename and retrieving information from the VSAM catalog using callable service IGWARLS, the CICS file control open/close routine detected that the LOG parameter for the sphere is undefined. LOG must be specified for a file that has RLS access type and update type servecs.

   **System action:** CICS continues processing with file filename closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

4. **Destination:** Console
   **Modules:** DFHFCFS, DFHFCRO
   **XMEOUT Parameters:** applid, filename, module

   **DFHFC0522** applid (RLS | Non-RLS) OPEN of file filename failed. IGWARLS call has returned that the LOG parameter is set to ALL but LOGSTREAMID has not been specified. Module module.

   **Explanation:** While CICS was opening file filename and retrieving information from the VSAM catalog using callable service IGWARLS, the CICS file control open/close routine in module module detected that the LOG(ALL) has been specified without LOGSTREAMID.

   **System action:** CICS continues processing with file filename closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

   **User response:** If forward recovery is required, use IDCAMS ALTER to add a LOGSTREAMID for the sphere. Otherwise, remove the forward recovery setting.

5. **Destination:** Console
   **Modules:** DFHFCFS, DFHFCRO
   **XMEOUT Parameters:** applid, {1=RLS, 2=Non-RLS}, filename, module

   **DFHFC0523** applid RLS OPEN of file filename failed. The LOGSTREAMID for forward recovery is the same as the system log. Module module.

   **Explanation:** While CICS was opening file filename, the CICS file control open/close routine in module module detected that the LOGSTREAMID for forward recovery is the same as that for the system log. The forward recovery LOGSTREAMID must be different from the system log.

   **System action:** CICS continues processing with file filename closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

   **User response:** Use IDCAMS ALTER to change the LOGSTREAMID for forward recovery for the sphere. Ensure that it is different from the system log.

   **Destination:** Console
   **Modules:** DFHFCRO
   **XMEOUT Parameters:** applid, filename, module

---

Chapter 1. DFH messages | 415
DFHFC0524  applid An attempt to write a log record failed because the record length was greater than the maximum supported by that log. Module module.

Explanation: An attempt to write a log record, as part of a file update operation, has failed because the length of the data in the record was greater than the maximum supported by the associated log stream.

System action: A trace entry is made and a dump is taken with a dumpcode of FC0524.

User response: Redefine the log stream using a structure which has a MAXBUFSIZE larger than that of the file update record size.

Destination: Console

Modules: DFHFCLJ

XMEOUT Parameters: applid, module

DFHFC0525  applid (RLS | Non-RLS) OPEN of file filename failed because the forward recovery log stream could not be opened. Module module.

Explanation: While CICS was opening file filename, the CICS file control open/close routine in module module detected that the forward recovery log stream for the sphere could not be opened. An internal call to the CICS logger has returned an error.

System action: CICS continues processing with file filename closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

User response: Check for an IXGxxxx message with the name of the logstream. Refer to the appropriate z/OS MVS System Messages manual and also the z/OS Programming: Assembler Services Reference IAR-XCT. If this does not help, you will need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Modules: DFHFCFS, DFHFCRO

XMEOUT Parameters: applid, filename, module

DFHFC0526  applid An error occurred on the request to the CICS log manager to close the forward recovery log stream for file filename. Module module.

Explanation: While CICS was processing file filename, the CICS file control open/close routine in module module detected that a request to close the forward recovery log stream for the associated sphere returned an error.

System action: Processing continues.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Modules: DFHFCFS, DFHFCRO

XMEOUT Parameters: applid, filename, module

DFHFC0527  applid Recovery attributes for file filename have been overridden by new settings found on the catalog.

Explanation: While CICS was opening file filename, the CICS file control open/close routine detected that the recovery settings for the sphere have changed.

System action: Processing continues. The new recovery settings are assumed for the sphere.

User response: Ensure that the change is as required.

Destination: Console

Modules: DFHFCRO

XMEOUT Parameters: applid, filename

DFHFC0528  applid RLS OPEN of file filename failed. Recovery attributes on the catalog have changed while there are other files still open for the sphere.

Explanation: While CICS was opening file filename and retrieving information from the VSAM catalog using callable service IGWARLS, the CICS file control open/close routine detected that the recovery attributes on the catalog have changed. There are currently other files open for the sphere which have assumed the previous recovery attributes. Further opens will fail until all files have closed or the recovery attributes are returned to their previous settings. Recovery attributes on the catalog should not be changed without first quiescing the associated sphere in all CICS systems that use it.

System action: CICS continues processing with file filename closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

User response: Quiesce the sphere and start again with the new settings.

Destination: Console

Modules: DFHFCRO

XMEOUT Parameters: applid, filename
DFHFC0529 **applid** Recovery attributes for file **filename** have been reset as there has been a switch of access type. Module **module**.

**Explanation:** While CICS was opening file **filename**, the CICS file control open/close routine in module **module** detected that the access type had been changed from RLS to non-RLS VSAM or vice versa. This has the effect of clearing out existing recovery attributes and starting again.

**System action:** Processing continues. The new recovery settings are assumed for the sphere.

**User response:** None.

**Destination:** Console

**Modules:** DFHFCRO, DFHFCFS

**XMEOUT Parameters:** applid, filename, module

---

DFHFC0530 **applid** [RLS | Non-RLS] OPEN of file **filename** failed. The automatic journal is the same stream as the system log. Module **module**.

**Explanation:** While CICS was opening file **filename**, the CICS file control open/close routine in module **module** detected that the automatic journal for the file is the same stream as that for the system log. This is not allowed so an internal call to the CICS logger has returned an error.

**System action:** CICS continues processing with file **filename** closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

**User response:** Ensure that the stream given in the FCTE for automatic journaling is different from the system log.

**Destination:** Console

**Modules:** DFHFCFS, DFHFCRO

**XMEOUT Parameters:** applid, {1=RLS, 2=Non-RLS}, filename, module

---

DFHFC0532 **applid** (RLS | Non-RLS) OPEN of file **filename** failed because the automatic journal could not be opened. Module **module**.

**Explanation:** While CICS was opening file **filename**, the CICS file control open/close routine in module **module** detected that the automatic journal for the file could not be opened. An internal call to the CICS logger has returned an error.

**System action:** CICS continues processing with file **filename** closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

**User response:** This is likely to be an internal CICS error. You need further assistance from IBM to resolve this problem. See Part 4 of the [CICS Problem Determination Guide](#) for guidance on how to proceed.

**Destination:** Console

**Modules:** DFHFCFS, DFHFCRO

**XMEOUT Parameters:** applid, {1=RLS, 2=Non-RLS}, filename, module

---

DFHFC0533 **applid** An error occurred on the request to the CICS log manager to close the automatic journal for file **filename**. Module **module**.

**Explanation:** While CICS was processing file **filename**, the CICS file control open/close routine in module **module** detected that a request to close the automatic journal returned an error.

**System action:** CICS continues processing.

**User response:** This is likely to be an internal CICS error. You need further assistance from IBM to resolve this problem. See Part 4 of the [CICS Problem Determination Guide](#) for guidance on how to proceed.

**Destination:** Console

**Modules:** DFHFCFS, DFHFCRO

**XMEOUT Parameters:** applid, filename, module

---

Chapter 1. DFH messages  417
DFHFC0534  applid Recovery attributes for file
filename previously taken from the
VSAM catalog have been overridden by
new settings from the FCTE. Module
module.

Explanation: While CICS was opening file filename,
the CICS file control open/close routine in module
module detected that the recovery settings for the
sphere have been changed to undefined. For a
non-RLS VSAM file, recovery attributes from the FCTE
now take effect.

System action: Processing continues. The new
recovery settings are assumed for the file.

User response: Ensure that this change to the
recovery attributes is correct.

Destination: Console

Modules: DFHFCFS

XMEOUT Parameters: applid, filename, module

DFHFC0535  applid Recovery attributes for file
filename previously taken from the
VSAM catalog have been overridden by
new settings from the VSAM catalog.
Module module.

Explanation: While CICS was opening file filename,
the CICS file control open/close routine in module
module detected that the recovery settings for the
sphere on the VSAM catalog have changed. The new
recovery attributes now take effect because there are
no other files open for the data set.

System action: Processing continues. The new
recovery settings are assumed for the file.

User response: Ensure that this change to the
recovery attributes is correct.

Destination: Console

Modules: DFHFCFS

XMEOUT Parameters: applid, filename, module

DFHFC0536  applid Recovery attributes for file
filename previously taken from the
FCTE have been overridden by new
settings from the VSAM catalog.
Module module.

Explanation: While CICS was opening file filename,
the CICS file control open/close routine in module
module detected that the recovery settings for the
sphere on the VSAM catalog are no longer undefined.
The new recovery attributes now take effect because there
are no other files open for the data set.

System action: Processing continues. The new
recovery settings are assumed for the file.

DFHFC0537  applid OPEN of file filename failed. The
request to write a tie up record for the
OPEN failed.

Explanation: While CICS was opening file filename, a
request to write a tie up record for the OPEN failed.
CICS has closed the file again and failed the OPEN
request.

System action: CICS continues processing with file
filename closed and its state UNENABLED. Any
transaction attempting to use this file is sent a
NOTOPEN condition.

User response: This is likely to be an internal CICS
error. You need further assistance from IBM to resolve
this problem. See Part 4 of the CICS Problem
Determination Guide for guidance on how to proceed.

Destination: Console

Modules: DFHFCFS

XMEOUT Parameters: applid, filename

DFHFC0538  applid OPEN of file filename failed. IGWARLS call has
returned that the LOG parameter is not
set to ALL but the BWO setting has
been defined as TYPECICS. Module
module.

Explanation: While CICS was opening file filename
and retrieving information from the VSAM catalog using
callable service IGWARLS, the CICS file control
open/close routine in module module detected that
BWO has been set to TYPECICS but LOG(ALL) has not
been specified.

System action: CICS continues processing with file
filename closed and its state UNENABLED. Any
transaction attempting to use this file is sent a
NOTOPEN condition.

User response: If BWO(TYPECICS) is required,
specify LOG(ALL). Alternatively, the setting BWO(NO) is
recommended.

Destination: Console

Modules: DFHFCFS

XMEOUT Parameters: applid, {1=RLS, 2=Non-RLS},
filename, module
DFHFC0540 applid The BWO setting for file filename has not been explicitly set to NO or TYPECICS and is assumed to be BWO(NO). Module module.

Explanation: While CICS was opening file filename, the CICS file control open/close routine in module module detected that the BWO setting for the sphere on the VSAM catalog had not been explicitly specified as either BWO(TYPECICS) or BWO(NO). The setting is assumed to be BWO(NO).

System action: Processing continues. The BWO(NO) setting is assumed for the file.

User response: If you require to use backup while open, use the ALTER function of access method services to set BWO(TYPECICS) for this data set. If you do not require to backup while open, you do not need to take any action, but you may wish to use the ALTER function of access method services to explicitly set BWO(NO).

Destination: Console

Modules: DFHFCFS

XMEOUT Parameters: applid, filename, module

DFHFC0541 applid RLS OPEN of file filename failed. RLS is not supported.

Explanation: While CICS was opening file filename the CICS file control open/close routine in module module detected that RLS was not supported. Either this CICS system is running with system initialization parameter RLS=NO or the level of VSAM does not support RLS.

System action: CICS continues processing with file filename closed and its state UNENABLED. Any transaction attempting to use RLS files is sent a NOTOPEN condition. Determine why RLS access is not supported.

Destination: Console

Modules: DFHFCFS

XMEOUT Parameters: applid, filename

DFHFC0542 date time applid Forward recovery log ID fwdrecovlog, journalname journalname opened for file filename is not of type MVS. Module module.

Explanation: While CICS was opening file filename, the CICS file control open/close routine in module module detected that the forward recovery log, journalname, was not of type MVS. For example, it might be a dummy log, or you might be logging to an SMF data set. This message informs you of this in case the log type is not what you intended.

fwdrecovlog is the forward recovery log ID specified in the file definition. If the forward recovery log stream is specified in the VSAM catalog rather than in the file definition, it must be of type MVS, so this message can be issued only when the forward recovery log is specified in the file definition.

System action: CICS continues processing.

User response: Correct the definition of the forward recovery log if it was not what you had intended.

Destination: CSFL

Modules: DFHFCFS

XMEOUT Parameters: date, time,applid, fwdrecovlog, journalname, filename, module

DFHFC0555 applid One or more data sets are in lost locks status. CICS will perform lost locks recovery.

Explanation: CICS had one or more data sets open in RLS access mode at the time of a failure of the coupling facility lock structure from which SMSVSAM was not able to recover transparently. As a result, the RLS locks held by CICS for those data sets have been lost.

SMSVSAM has informed CICS that one or more data sets are in a lost locks state with respect to this CICS. CICS must therefore perform lost locks recovery for those data sets.

This can occur on a CICS warm or emergency restart, and on a dynamic RLS restart. On a CICS cold or initial start, if there are any data sets with lost locks status, that status is cleared with respect to this CICS.

System action: The data sets with lost locks status are marked as being unavailable for general use. Units of work that attempt to access such data sets abend with an AFCU abend code.

CICS performs lost locks recovery for the data sets. For each data set, lost locks recovery involves waiting until all units of work that had made uncommitted updates to the data set have completed. These units of work are allowed to access the data set, in order to perform their recovery. When CICS has completed lost locks recovery for a data set, it reports this fact to SMSVSAM. When all CICS regions that had been accessing the data set have completed their lost locks recovery, the data set is made available for general use again. Note that a data set becomes available for general use as soon as its lost locks recovery has been completed; it does not have to wait for all data sets to be recovered.

CICS takes the following actions to expedite lost locks recovery:

• Backout-failed and commit-failed units of work are driven for retry
On a dynamic RLS restart, inflight transactions that had updated the data set are purged (on a warm or emergency restart, inflight units of work are automatically backed out).

**User response:** Lost locks recovery normally completes automatically without requiring any action from the user. However, if there are shunted units of work which had updated a data set with lost locks status, these prevent lost locks recovery from completing until they are resolved. Use the INQUIRE UOWDSNFAIL command to investigate these shunted units of work. See the [CICS Recovery and Restart Guide](#) for guidance on resolving shunted units of work which hold RLS retained locks.

**Destination:** Console
**Modules:** DFHFCRR
**XMEOUT Parameter:** applid

---

**DFHFC0556** applid Unexpected notification of completion of lost locks recovery for data set dsname.

**Explanation:** CICS has received a notification from SMSVSAM that lost locks recovery has completed for data set dsname, but CICS still has outstanding lost locks recovery work for that data set. This notification has therefore been issued out of sequence.

**System action:** CICS continues processing. The data set remains in a lost locks state, and CICS continues with its lost locks recovery. New file control requests against the data set will continue to be rejected with AFCU abends. When all CICS regions have completed their lost locks recovery for the data set, then a valid notification will be received and CICS will remove the data set from the lost locks state.

There will be an instance of this message on each CICS system for each data set when an unexpected notification is received.

**User response:** Lost locks recovery processing should complete normally without any user intervention.

However, this message is an indication of a probable logic error in SMSVSAM, so you should take dumps of all the SMSVSAM servers and their associated data spaces in the sysplex. See Part 4 of the [CICS Problem Determination Guide](#) for guidance on how to proceed.

**Destination:** Console
**Modules:** DFHFCRR
**XMEOUT Parameters:** applid, dsname

---

**DFHFC0560** applid The register of the RLS control ACB has failed because the SMSVSAM server is not available. VSAM macro IDAREGP return code X'rrrr', reason code X'cccc', error data X'dddd'.

**Explanation:** While CICS was initializing access to VSAM RLS, the call to VSAM to register the RLS control ACB returned an error. The codes returned mean that the SMSVSAM server address space is not available.

**System action:** CICS continues processing but all RLS access is disabled. Any transaction attempting to use RLS files is sent a NOTOPEN condition. CICS reenables RLS access when the SMSVSAM server restarts.

**User response:** The SMSVSAM server address space should restart itself. If it does not, restart the SMSVSAM server address space manually. If the SMSVSAM server address space fails to restart, there may be a more severe error. In this case, you need assistance from IBM. See Part 4 of the [CICS Problem Determination Guide](#) for guidance on how to proceed.

**Destination:** Console
**Modules:** DFHFCCA
**XMEOUT Parameter:** applid, X'rrrr',X'cccc'

---

**DFHFC0562** applid The RLS control ACB has been successfully registered by CICS.

**Explanation:** This message provides a record of the register of the RLS control ACB by CICS.

**User response:** None.

**Destination:** Console
**Modules:** DFHFCCA
**XMEOUT Parameter:** applid

---

**DFHFC0563** applid The RLS control ACB has been successfully unregistered by CICS.

**Explanation:** This message provides a record of the unregister of the RLS control ACB by CICS.

**System action:** CICS processing continues.

**User response:** None.

**Destination:** Console
**Modules:** DFHFCCA
**XMEOUT Parameter:** applid

---

**DFHFC0564** applid The register of the RLS control ACB has failed. VSAM macro IDAREGP return code X'rrrr', reason code X'cccc', error data X'dddd'.

**Explanation:** While CICS was initializing file control, the call to VSAM to register the control ACB for RLS processing returned an error. The codes returned mean that the SMSVSAM server address space is not available.

**System action:** CICS continues processing but all
RLS access is disabled. Any transaction attempting to use RLS files is sent a NOTOPEN condition.

**User response:** Use the VSAM codes to determine the cause of the problem. For the meaning of the VSAM codes, see OS/390 V2R10.0 DFSMS Macro Instructions for Data Sets.

If you cannot resolve the problem or the problem recurs, there may be a more severe error. In this case, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** Console

**Modules:** DFHFCCA

**XMEOUT Parameters:** applid, X'rrrr', X'cccc', X'dddd'

---

**DFHFC0565** applid The unregister of the RLS control ACB has failed. VSAM macro IDAUNRP return code X'rrrr', reason code X'cccc', error data X'dddd'.

**Explanation:** While CICS was quiescing RLS access, the call to VSAM to unregister the RLS control ACB returned an error.

**System action:** CICS continues processing and all RLS access is disabled. Any transaction attempting to use RLS files is sent a NOTOPEN condition.

**User response:** Use the VSAM codes to determine the cause of the problem. For the meaning of the VSAM codes, see OS/390 V2R10.0 DFSMS Macro Instructions for Data Sets.

If you cannot resolve the problem or the problem recurs, there may be a more severe error. In this case, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** Console

**Modules:** DFHFCCA

**XMEOUT Parameters:** applid, X'rrrr', X'cccc'

---

**DFHFC0568** applid File control dynamic RLS restart has started.

**Explanation:** File control dynamic RLS restart has started.

**System action:** Processing continues.

**User response:** None. You can suppress this message with the system initialization parameter, MSGLEVEL=0.

**Destination:** Console

**Modules:** DFHFCCA

**XMEOUT Parameters:** applid, X'rrrr', X'cccc'

---

**DFHFC0569** applid File control dynamic RLS restart has ended.

**Explanation:** File control dynamic RLS restart has completed successfully.

**System action:** Processing continues.
DFHFC0570 applid File control RLS access has been enabled.

Explanation: RLS access is now available.
System action: Processing continues.
User response: None.
Destination: Console
Modules: DFHFCRR.
XMEOUT Parameter: applid

DFHFC0571 applid RLS access cannot be restarted.

Explanation: An error has occurred while attempting to restart CICS access to VSAM RLS, either at startup, or during a dynamic RLS restart which took place when the VSAM RLS server became available while CICS was running. Because of this error, it may not be possible to access VSAM RLS again during this CICS run.

Access is made available again only if the VSAM RLS server in this MVS system fails causing CICS to perform dynamic RLS restart processing when it restarts, or if you choose to deliberately recycle the RLS server to trigger a dynamic restart.

System action: CICS continues, but with access to VSAM RLS disabled (unless an offsite restart is being performed). Other CICS functions, including access to non-RLS VSAM files, should continue.

At the time the error affecting RLS restart is detected, CICS issues one or more messages and takes a system dump.

This error might also affect other aspects of this CICS system, for example if it is due to the corruption of internal CICS control structures.

If an offsite restart is being performed; that is, if OFFSITE=YES was specified as a system initialization override, then CICS does not continue, but is terminated with a system dump. When RLS offsite recovery is required, then there is no value in continuing without RLS, because it will be needed in order for the offsite restart to be able to complete. Until all CICS systems complete their offsite recovery work, including this one, no other CICS system in the CICSplex will be allowed to perform new RLS work either.

User response: If you do not need access to any VSAM RLS files from this CICS system, you can allow CICS to continue. For example, this CICS system might never open files in RLS access mode, or you might prefer to continue without RLS access in order to continue this CICS run.

If you do need to access VSAM RLS files from this CICS, consider shutting CICS down and restarting it, or recycling the VSAM RLS server. However, be aware that recycling the server causes all CICS systems in this MVS to go through dynamic RLS restart processing, which implicitly closes all files that were open in RLS access mode.

To determine the cause of the original error, examine the messages and the system dump that were issued when the error was detected.

If you are performing an offsite restart, then restart CICS with OFFSITE=YES still specified as a system initialization override.

Destination: Console
Modules: DFHFCRR.
XMEOUT Parameter: applid

DFHFC0574 applid RLS offsite recovery will be performed. Normal RLS access is not allowed.

Explanation: OFFSITE=YES has been specified as a SIT override, and RLS is supported by this CICS (RLS=YES has been specified and the level of DFSMS/MVS supports RLS). This message is issued during file control initialization to indicate that RLS offsite recovery processing is to be carried out during this CICS run.

System action: RLS access is not allowed until after this CICS has performed its RLS recovery work. Only tasks performing the recovery work are allowed RLS access. Message DFHFC0575 is issued when RLS recovery has been completed by this CICS. RLS access for normal work is not allowed until this CICS has issued message DFHFC0575 and received the reply GO. The description of message DFHFC0575 explains when it is safe to reply to the message.

User response: Wait for message DFHFC0575 to be issued. If this does not happen shortly after CICS restart has completed, there are probably some backout failed or indoubt failed units of work which had updated RLS data sets, and which are now delaying the completion of RLS recovery. In this case you should use the INQUIRE UOWDSNFAIL command to determine the causes of such failures, and to resolve them.

If some of the failures cannot be resolved cleanly, you may decide to force indoubt units of work and to reset locks for backout failed units of work. See the CICS Recovery and Restart Guide for guidance on resolving RLS retained locks.

If CICS terminates for any reason before message
DFHFC0575 is issued, specify OFFSITE=YES on the restart.

OFFSITE=YES must be specified on all restarts until the offsite recovery has completed and you have responded to message DFHFC0575.

**Destination:** Console

**Modules:** DFHFCRP

**XMEOUT Parameter:** applid

---

**DFHFC0575D** applid Reply 'GO' only after all CICS regions have completed offsite recovery and issued this message.

**Explanation:** This message is issued when a CICS system is participating in an offsite recovery of a CICSplex.

The message is issued when this CICS system has completed all of its RLS recovery work. CICS has backed out or committed all units of work which had made updates to data sets open in RLS mode, and which were either inflight or shunted at the time of the disaster at the primary site (or, more exactly, which were in that state at the common point in time to which the CICS system logs have been pruned).

**System action:** CICS processing continues, but the system task which issued this message waits for your reply. RLS access is not allowed for user applications until the reply is received, after which CICS allows new RLS work to run. The User Response explains when it is safe for you to reply.

**User response:** The message indicates that RLS recovery work has been completed by a particular CICS region. Replying to it indicates that all RLS recovery for the offsite CICSplex has been completed. Do not reply until all CICS regions in the CICSplex have issued this message. When this has happened, you should reply GO. When you next restart this CICS region after having replied GO, you should revert to the default value of NO for the system initialization parameter OFFSITE.

GO is the only reply allowed. If you supply any other response, the message is reissued with a new reply number.

If you suspect that there will be a problem getting some of the CICS regions in the CICSplex to complete their RLS recovery work, and would therefore prefer to shut this CICS down in the meantime, you can use the master terminal to do so. You must specify OFFSITE=YES when you restart the CICS region because offsite recovery for the CICSplex has not been completed. Remember that OFFSITE=YES must be specified on all restarts until the offsite recovery has completed and you have responded to message DFHFC0575.

**Destination:** Console

---

**DFHFC0577** applid RLS offsite recovery is now complete. RLS access is allowed.

**Explanation:** This message is issued when a CICS system is participating in an offsite recovery of a CICSplex.

The message is issued when the reply GO has been supplied to message DFHFC0575.

**System action:** CICS allows user applications to access RLS because it is assumed that a reply of GO means that all CICS systems in the CICSplex have completed their RLS recovery work, and it is therefore safe to allow sharing of RLS data sets.

**User response:** Once you have received this message, you can recode your SIT overrides so that OFFSITE=NO is specified when this CICS is next restarted.

**Destination:** Console

**Modules:** DFHFCOR

**XMEOUT Parameter:** applid

---

**DFHFC0920** applid Open of empty file filename failed. VSAM codes - eeee, rrrr, cccc

**Explanation:** CICS file control issued an OPEN command for VSAM file filename but the command failed with VSAM return code cccc. The CICS internal error code eeee has a value of 8509 and rrr is the return code in register 15.

This failure is probably caused by the file not being loaded before use by CICS.

**System action:** CICS continues processing with file filename closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

Message DFHME0116 is normally produced containing the symptom string for this problem.

VSAM issues a console error message.

**User response:** Check whether the file has been loaded before being accessed by CICS. This condition is probably the result of a user error in passing an empty file to CICS.

For the meaning of the VSAM return code, see OS/390 V2R10.0 DFSMS Macro Instructions for Data Sets.

**Destination:** Console

**Modules:** DFHFCFS

**XMEOUT Parameters:** applid, filename, eeee, rrrr, cccc

---

Chapter 1. DFH messages 423
DFHFC0931  applid OPEN of data table name failed for reason n.

Explanation:  CICS was unable to OPEN the user-maintained data table name for reason n, where n may have one of the following values:

1  The data table support initialization module DFHDTINS could not be loaded.

2  Initialization of data table support has failed. This message is preceded by one of messages DFHFC0410, DFHFC0411 or DFHFC0412 which identifies the reason for the failure.

3  The source data set for the data table is not a KSDS base data set.

4  The data table OPEN module DFHDTST has reported an error. This message is preceded by one of messages DFHFC0430 or DFHFC0431 which identifies the error.

5  The file definition for the data table allows neither read nor browse access.

System action:  The data table remains closed and is DISABLED. CICS processing continues.

User response:  The appropriate user response depends on the reason code n as follows:

1  Check that module DFHDTINS is present in the library.

2  See the user action for the preceding message (which will be one of DFHFC0410, DFHFC0411 or DFHFC0412).

3  Check whether the data table has been associated with the intended source data set.

4  See the user action for the preceding message (which will be one of DFHFC0430 or DFHFC0431).

5  Change the SERVREQs in the file definition. There is no benefit in using data tables support for a file which cannot be read or browsed.

Destination:  Console

Modules:  DFHFCFS

XMEOUT Parameters:  applid, name,n

DFHFC0932  applid OPEN of data table name was incomplete for reason n.

Explanation:  CICS was unable to treat name as a CICS-maintained data table for reason n.

System action:  The data table's source data set is opened for access as a normal VSAM data set, and no main storage table is built. CICS processing continues.

User response:  The appropriate user response depends on the reason code n. Refer to message DFHFC0931 for a list of reason codes and their appropriate user responses.

Urgent action is probably not necessary when this message occurs, as no function has been lost. However, READ performance may be adversely affected.

Destination:  Console

Modules:  DFHFCFS

XMEOUT Parameters:  applid, name,n

DFHFC0933  applid MVS FREEMAIN failure detected during CLOSE of data table name.

Explanation:  An MVS FREEMAIN, issued while CICS was attempting to release the storage associated with data table name, returned the error response R15=4. Some storage in the CICS address space has not been freed. The error is probably the result of some earlier overwriting of data table control areas.

System action:  CICS closes data table name. CICS processing continues.

User response:  This condition does not adversely affect the data tables function. However, if the problem recurs take a system dump (SDUMP) as soon as possible after the appearance of this message. For example, by means of a CEMT PERFORM SNAP command.

Destination:  Console

Modules:  DFHFCFS

XMEOUT Parameters:  applid, name

DFHFC0935  applid SHAREOPTIONS of the source for data table name allow inconsistencies between table and source.

Explanation:  The cross region SHAREOPTION for the source data set associated with the data table name is 3 or 4, or the SHAREOPTION is 2 and the table is being opened only for read access. It is possible for another job in this MVS system to update the source without notifying CICS. The result of this is that the data table may no longer match the source data set.

System action:  Opening and loading of the data table continues normally. CICS processing continues.

User response:  Check that the SHAREOPTION is specified correctly and that the DISP parameter is correct.

Note that source data set changes are reflected in the data table only when the changes are made by the CICS system which owns the table.

Destination:  Console

Modules:  DFHFCFS
**XMEOUT Parameters:** applid, name

---

**DFHFC0936**  
**applid**  
Initiation of loading of data table **name** has failed.

**Explanation:** An attempt to initiate the table loading transaction for the data table **name** has failed.

**System action:** CICS processing continues. The effect this has is that the table always appears to be in the process of being loaded and the load completion exit, XDTLC, is not invoked.

One consequence of this is that the table is effectively **demand loaded**. This means that an entry is only made in the table when a transaction refers to it explicitly. A further consequence is that, for user maintained tables, API requests (other than READ) always result in a LOADING condition.

**User response:** Take remedial action after determining the cause of the failure from the trace of the OPEN request and from any related messages and dumps. It may be that the system action of leaving the table open, but not loaded, adversely affects your application. For example, if the application depends on being able to update a user maintained table as soon as loading is complete. If so, closing and reopening the data table may be successful as an immediate response, if the problem was simply a temporary lack of resources.

**Destination:** Console  
**Modules:** DFHFCFS

---

**DFHFC0937**  
**applid** OPEN of **name1** as a data table was not possible. The file has been opened and will use data table **name2** which has the same source.

**Explanation:** File **name1** could not be opened as a CICS-maintained data table (CMT) because another CMT **name2** is already open for the source data set specified in the file definition of **name1**. However, **name1** is still able to benefit from shared data tables support by accessing the already open CMT.

**System action:** **name1** is opened as a normal CICS file, and therefore automatically uses the existing data table **name2** whenever possible.

**User response:** This is not normally a problem, but you should ensure that the data table **name2** has the required characteristics in terms of its maximum number of records and in the behavior of any data table user exits that refer to it.

**Destination:** Console  
**Modules:** DFHFCFS

---

**DFHFC0940 I**  
**date time** applid CICS data table load has started for data table **name**.

**Explanation:** CICS file control has detected that an open request has been issued for data table **name**, and a task has been attached to load the data table.

**System action:** CICS processing continues.

**User response:** None.

**Destination:** CSFL  
**Modules:** DFHDTLX

**XMEOUT Parameters:** date, time,applid, name

---

**DFHFC0941 I**  
**date time** applid CICS data table load has completed successfully for data table **name**.

**Explanation:** The task that was attached to load the data table **name** has successfully completed loading.

**System action:** The user exit XDTLC is invoked, if enabled, with the parameter UEPDTORC set to indicate a successful load. CICS processing continues.

**User response:** None.

**Destination:** CSFL  
**Modules:** DFHDTLX

**XMEOUT Parameters:** date, time,applid, name

---

**DFHFC0942 E**  
**date time** applid CICS data table load has terminated abnormally for data table **name**, reason code = X’**xx’.

**Explanation:** The CICS task that is loading data table **name** has received a reason code X’**xx’**, where X’**xx’** has one of the following values:

- **X’FB’**  
  CICS file control has requested that the data table load be abandoned. This may occur, for example, if a close request has been made against the data table

- **X’FD’**  
  An attempt has been made to add more entries to the data table than the maximum specified in the table definition

- **X’FE’**  
  A shortage of virtual storage has been reported by the add entry (from DASD) service, due to a failure to get storage for the record.

**System action:** The user exit XDTLC is invoked, if enabled, unless file control has requested that the load be abandoned (reason code X’FB’). The value of the UEPDTORC parameter passed to the exit indicates that loading completed abnormally. No more records are loaded into the data table. The user exit may ask for the file to be closed.

If the table is CICS-maintained, provided that the user exit has NOT requested that the file be closed, those records which were not added are retrieved from the source data set to satisfy API requests.
If the table is user-maintained, requests to access any record which was not added results in a “not found” response code. If the table has been closed, then API requests result in an “unenabled” response code.

CICS processing continues.

**User response:** The appropriate user response depends on the reason code. User responses are as follows:

- **X'FB'**  
  - no action necessary

- **X'FD'**  
  - increase the size specified for the data table, either using the SIZE parameter in the FCT entry or the MAXNUMRECS field in the CEDA definition

- **X'FE'**  
  - increase the available storage above the 16MB line.

**Destination:**  
Console and Transient Data Queue

**Modules:**  
DFHDTLX

**XMEOUT Parameters:**  
`date, time, applid, name, X'xx'`

**DFHFC0943 E**  
`date time applid CICS data table load has terminated abnormally for data table name, reason code = X'xx'.`

**Explanation:** The CICS task that is loading data table name has received an unexpected return code from CICS file control while browsing the source data set. The reason code X'xx' should be one of the following.

- **X'02'**  
  - ILLOGIC—A VSAM error which does not fall into one of the other categories.

- **X'0C'**  
  - NOTOPEN—The file is CLOSED and UNENABLED, or still open and in use, but a CLOSE request has been received.

- **X'0D'**  
  - DISABLED—The file is disabled.

- **X'80'**  
  - IOERR—I/O error.

**System action:** The user exit XDTLC is invoked, if enabled, with the parameter UEPDTORC set to indicate that loading completed abnormally. No more records are loaded into the data table. The user exit may ask for the file to be closed.

If the table is CICS-maintained, provided that the user exit has NOT requested that the file be closed, those records which were not added, are retrieved from the source data set to satisfy API requests.

If the table is user-maintained, requests to access any record which was not added result in a “not found” response code. If the table has been closed, then API requests result in an “unenabled” response code.

CICS processing continues.

**User response:** Look at the system log for related CICS messages to determine the original abend detected by the loading transaction. Refer to the description of abend code AFCM for further information about the cause of the original termination.

For more information on how to determine system problems, refer to the [CICS Problem Determination Guide](#).

**Destination:**  
Console and Transient Data Queue

**Modules:**  
DFHDTLX

**XMEOUT Parameters:**  
`date, time, applid, name`

**DFHFC0945 E**  
`date time applid CICS data table load has terminated abnormally for data table name.`

**Explanation:** The special CICS transaction that was loading data table name has detected an abnormal termination.

**System action:** Depending on the cause of this abnormal termination, CICS may produce either a system dump or a transaction dump.

The user exit XDTLC is invoked, if enabled, with the parameter UEPDTORC set to indicate that loading completed abnormally. CICS then terminates the loading transaction with abend code AFCM. No more records are loaded into the data table. The user exit may ask for the file to be closed.

If the table is CICS-maintained, provided that the user exit has NOT requested that the file be closed, those records which were not added, are retrieved from the source data set to satisfy API requests.

If the table is user-maintained, requests to access any record which was not added result in a “not found” response code. If the table has been closed, then API requests result in an “unenabled” response code.

CICS processing continues.

**User response:** Investigate the reason for the return code from CICS file control. For further information about the reason code, see the description of exception conditions for the STARTBR and READNEXT commands, in the [CICS Application Programming Reference](#).

**Destination:**  
Console and Transient Data Queue

**Modules:**  
DFHDTLX

**XMEOUT Parameters:**  
`date, time, applid, name`

**DFHFC0946 E**  
`date time applid CICS data table load has terminated abnormally for data table name, a call to FCFR has failed for reason code = n.`

**Explanation:** The CICS task that is loading data table name has failed while calling file control to browse the source data set. The value of the reason code n indicates the type of failure as follows:

1. Response from FCFR was INVALID.
2. Response from FCFR was DISASTER.
3. Response from FCFR was PURGED.
4. FCFR failed for some unexpected reason.

**System action:** The user exit XDTLC is invoked, if enabled, with parameter UEPDORC set to indicate that loading has completed abnormally. CICS then terminates the loading transaction with abend code AFCM. No more records are loaded into the data table. The user exit may ask for the file to be closed.

If the table is CICS-maintained, provided that the user exit has NOT requested that the file be closed, records which were not added are retrieved from the source data set to satisfy API requests. If the table is user-maintained, requests to access any record which was not added result in a “not found” response code. If the table has been closed, API requests result in an “unenabled” response code.

CICS processing continues.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User response:** Determine the cause of the failure of the domain call using the diagnostic information provided by file control.

**Destination:** Console and Transient Data Queue CSFL

**Modules:** DFHDTLX

**XMEOUT Parameters:** date, time, applid, name, n

---

**DFHFC0947** date time applid CICS shared data table table load has terminated abnormally.
A call to DFHXMIO to retrieve the parameters for the load transaction has failed with response code = n.

**Explanation:** The CICS task to load a shared data table has failed while trying to inquire on the parameters passed to it during attach. The value of the reason code n indicates the type of failure as follows:
1. Response from XMIQ was INVALID.
2. Response from XMIQ was DISASTER.
3. Response from XMIQ was PURGED.
4. XMIQ failed for some unexpected reason.

**System action:** The user exit XDTLC is not invoked as failure to retrieve the attach parameters means the filename is not known. CICS terminates the loading transaction with abend code AFCL. No records are loaded into the data table.

Requests to access any record which was not added result in a “not found” response code.

CICS processing continues.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User response:** Determine the cause of the failure of the domain call using the diagnostic information provided by the CIS Transaction Manager.

The file should be closed so that a load may be attempted again when it is next opened.

**Destination:** Console and Transient Data Queue CSFL

**Modules:** DFHDTLX

**XMEOUT Parameters:** date, time, applid, n

---

**DFHFC0949** date time applid CICS shared data table load has failed to close data table name, a call to FCFS has failed for reason code = n.

**Explanation:** The CICS task that is loading data table name has failed while trying to close the file at the request of an exit program invoked at exit point XDTLC. The value of reason code n indicates the type of failure as follows:
1. Response from FCFS was INVALID.
2. Response from FCFS was DISASTER.
3. Response from FCFS was PURGED.
4. FCFS failed for some unexpected reason.

**System action:** CICS terminates the loading transaction with abend code AFCM.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User response:** It is unlikely that the user exit invoked at the XDTLC exit point would request that the file should be closed unless a previous problem had occurred with the load. Determine the cause of any such previous problem by checking for earlier messages which may have been issued referring to data table name. Diagnostic information provided by file control may be used to investigate the failure of the close file call.

CICS processing continues.

Report the details of the symptom string given in message DFHME0116.

**Destination:** Console and Transient Data Queue CSFL

**Modules:** DFHDTLX

**XMEOUT Parameters:** date, time, applid, name, n

---

**DFHFC0950** applid Warning. File filename Opened with VSAM SHROPT 3 or 4. CICS cannot prevent concurrent updates.

**Explanation:** VSAM share options 3 and 4 permit updating of a data set from multiple regions. Under these circumstances, CICS cannot prevent concurrent updates.

The file is being opened for update against a data set defined with share options 3 or 4, and the file has been defined with the following auto-journaling options:
Either: JREQ=WU or WN if the file is defined using the FCT macro,
Or: JNLADD = BEFORE, AFTER, OR ALL if the file is defined using RDO.

System action: The file is opened and a warning message is issued.

User response: None.

Destination: Console

Modules: DFHFCN

XMEOUT Parameters: applid, filename

DFHFC0951 applid (RLS | Non-RLS) OPEN of file
filename failed. DSNAME not available
from JCL or FCT. Module module.

Explanation:  A CICS attempt to open file filename failed because neither the JCL nor the FCT specified the data set name.

CICS file control did not open file filename, because:
1. At initialization time, the startup JCL did not include a DD statement, and
2. No user-submitted routine allocated the file dynamically, and
3. The FCT does not contain a DSNAME parameter to enable CICS to allocate the file dynamically.

System action: CICS continues processing with file filename closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

User response: Before resubmitting the transaction, you must supply the data set name in the JCL or the FCT.

Destination: Console

Modules: DFHFCFS, DFHFCRO

XMEOUT Parameters: applid, {1=RLS, 2=Non-RLS},
filename, module

DFHFC0952 applid Dynamic allocation of (RLS
|Non-RLS) file filename failed. Return
code X'rrr',X'cccc' in module module.

Explanation: While dynamically allocating file filename, CICS file control issued an MVS DYNALLOC macro. The DYNALLOC failed with return code cccc. rrr is the additional return code in register 15.

System action: CICS continues with file filename closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

User response: for the meaning of the DYNALLOC return codes, see the OS/390 MVS Programming: Authorized Assembler Services Guide.
**DFHFC0954**  applid {RLS | Non-RLS} OPEN of file filename failed. No disposition specified for dynamic allocation. Module module.

**Explanation:** CICS file control cannot open file filename, because it is not allocated. It is not allocated because:
1. At initialization time, the startup JCL did not include a DD statement, and
2. The FCT does not contain a DISP parameter to enable CICS to allocate the file dynamically.

**System action:** CICS continues processing with file filename closed and its state UNENABLED. Any transaction attempting to use this file are sent a NOTOPEN condition.

**User response:** If you want to use file filename in this run, supply the DISP parameter with the CEMT transaction or with a user transaction using the EXEC CICS SET command. When you have done this, transactions are able to access the file successfully.

The change described above is only effective for the lifetime of the CICS system. A permanent disposition definition of a file can be made either through a JCL DD statement, through a DEFINE file command, or through the DISP=operand of a macro FCT definition.

**Destination:** Console

**Modules:** DFHFCFS, DFHFCRO

**XMEOUT Parameters:** applid, {1=RLS, 2=Non-RLS}, filename, module

**DFHFC0955**  applid Associated data set is dataset. Module module.

**Explanation:** This message follows DFHFC0952 or DFHFC0510. It identifies the VSAM data set referred to in that message.

**System action:** Processing continues in the way specified in DFHFC0952 or DFHFC0510.

**User response:** Follow the user response for DFHFC0952 or DFHFC0510 as appropriate.

**Destination:** Console

**Modules:** DFHFCFS, DFHFCRO

**XMEOUT Parameters:** applid, dataset, module

**DFHFC0956**  applid {RLS | Non-RLS} OPEN of file filename failed. VSAM catalog error.
Return code - X'eeed',X'cccc' in module module.

**Explanation:** While reading the VSAM catalog to open the VSAM data set filename, CICS file control received the return code cccc from a SHOWCAT macro. The value of eeed is an error code from DFHFCN as follows:
8112 SHOWCAT for the AIX of a path failed.

8113 SHOWCAT for the data component of a base failed.
8116 SHOWCAT for the base of a path failed.
8117 SHOWCAT for an upgrade member failed.

**System action:** CICS writes a system dump, and continues processing, with file filename closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User response:** For the meaning of the SHOWCAT return code, see OS/390 V2R10.0 DFSMS Macro Instructions for Data Sets.

**Destination:** Console

**Modules:** DFHFCFS, DFHFCRO

**XMEOUT Parameters:** applid, {1=RLS, 2=Non-RLS}, filename, 'X'eeed', X'cccc', module

**DFHFC0958**  applid Non-RLS OPEN of file filename failed. VSAM resource usage conflict with open file.

**Explanation:** CICS did not open file filename because it found that its access method control block (ACB) specified a different buffer/string resource (NSR or LSR pool) from that specified by another ACB that is already open for the same base cluster.

VSAM provides integrity for different ACBs open for the same base cluster only if they use the same buffer/string resource.

**System action:** CICS writes a system dump and continues processing with file filename closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

**User response:** Determine the correct buffer/string resource and change the FCT.
Alternatively, if you specify DSNSHR=UPDATE in the FCT and open the file for read only, CICS permits the use of different buffer/string resources because no integrity exposure exists.

**Destination:** Console

**Modules:** DFHFCFS

**XMEOUT Parameters:** applid, filename

**DFHFC0960**  applid Non-RLS OPEN of file filename failed. Unable to build its LSR pool n.
Return code - cccc.

**Explanation:** CICS has requested VSAM to build the local shared resource (LSR) pool specified in the FCT entry for file filename. However, VSAM was unable to complete the request. n is the pool number, and cccc is the VSAM BLDVRP return code.
System action: CICS continues processing with file filename closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

Note: The first time this error occurs, CICS writes a system dump before continuing.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: For the meaning of the BLDVRP return code, see OS/390 V2R10.0 DFSMS Macro Instructions for Data Sets.

Destination: Console

Modules: DFHFCFS

XMEOUT Parameters: applid, filename, n, cccc

DFHFC0961 date time applid Calculation of LSR pool n parameters incomplete. Filename filename has no DSNAME.

Explanation: While dynamically calculating the parameters for the local shared resource pool (LSR) n, CICS found an FCT entry for which no DSNAME exists (either the FCT entry has no DSNAME, or no DD statement exists).

System action: CICS processing continues.

Without a DSNAME, CICS cannot use the VSAM catalog to determine the file attributes. Therefore, in the LSR calculation, CICS uses the number of strings specified in the STRNO parameter of the FCT entry but does not use the BUFFERS or KEYLEN information.

User response: Ensure that each FCT entry has either a DSNAME, or a DD statement corresponding to its DATASET name.

Exceptionally, if you use CPSM, please note that this message is normal for file EYUDREPN in a CMAS. Do not attempt to allocate a DSNAME or a DD statement for EYUDREPN in the JCL for the CMAS.

Destination: Console andTransient Data Queue CSMT

Modules: DFHFCFS

XMEOUT Parameters: date, time, applid, n, filename, cccc

DFHFC0963 applid LSR pool n not deleted. Code - cccc

Explanation: CICS requested VSAM to delete a local shared resource (LSR) pool n. During processing of the request, a VSAM DLVRP macro failed with return code cccc. (cccc is the VSAM DLVRP return code.)

System action: CICS takes a system dump and continues processing with the pool still in existence.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: For the meaning of the DLVRP return code, see the OS/390 V2R10.0 DFSMS Macro Instructions for Data Sets.

Destination: Console

Modules: DFHFCL

XMEOUT Parameters: applid, n, cccc

DFHFC0964 applid Non-RLS OPEN of file filename failed. VSAM codes - eeee, rrrr, cccc.

Explanation: CICS file control issued an open for a VSAM file, filename. The open has failed with VSAM error code, cccc. eeee has a value of 8502 and represents the CICS internal error code and rrrr is the return code in register 15.

System action: CICS continues processing, with file filename closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

Message DFHME0116 is normally produced containing the symptom string for this problem.
VSAM will have issued a console error message. Use the VSAM message and the VSAM error code in the CICS message to solve the problem.

For the meaning of the VSAM error code, see OS/390 V2R10.0 DFSMS Macro Instructions for Data Sets.

Destination: Console

Modules: DFHFCFS

XMEOUT Parameters: applic, filename, eeee, rrrr, cccc

---

**DFHFC0965**  
**applic Open of BDAM file filename failed.**

**Explanation:** CICS file control issued an open for a BDAM file, filename. The open failed.

**System action:** CICS continues processing, with file filename closed and with its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User response:** BDAM will have issued a console error message. Refer to the BDAM message for further guidance to solve the problem.

Destination: Console

Modules: DFHFCFS

---

**DFHFC0966**  
**applic Non-RLS OPEN of file filename failed. Unable to position ESDS. Error codes: eeee,rrrr,cccc**

**Explanation:** Before opening the VSAM ESDS file filename for output, CICS file control could not determine the end-of-data relative byte address (RBA) correctly. During the positioning process, CICS may perform any of the following steps, each of which can fail:

* Dynamically allocate the base cluster to DDname DFHESDS (if it is a path that is being opened)
* Open the base cluster for control interval (CI) processing
* Read the last CI in the file
* Determine the end-of-data in the file
* Close the base cluster
* Dynamically deallocate the base cluster.

The value of eeee in the message indicates the error or the failing function as follows:

- **8503**  
  Open base cluster. rrr is the VSAM return code in register 15. cccc is the error field in the VSAM ACB.

- **8504**  
  Read last control interval (CI). rrr is the VSAM return code in register 15. cccc is the FDBK field in the VSAM RPL.

- **8505**  
  Last CI middle of spanned record.

---

**DFHFC0967**  
**applic Error detected while closing {RLS | Non-RLS} file filename - VSAM codes X'rrrr',X'cccc' in module module.**

**Explanation:** CICS file control issued a close for VSAM file filename. The close failed with VSAM return code cccc. rrr is the return code in register 15.

**System action:** CICS processing continues. CICS marks file filename as closed because VSAM will have closed the access method control block (ACB).

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User response:** Use the VSAM return code, cccc and the preceding VSAM console message to determine the cause of the problem.

For the meaning of the VSAM return code, see OS/390 V2R10.0 DFSMS Macro Instructions for Data Sets.

Destination: Console

Modules: DFHFCFS, DFHFCRO

XMEOUT Parameters: applic, {1=RLS, 2=Non-RLS}, filename, X'rrrr', X'cccc', module

---

**DFHFC0968**  
**applic Close of BDAM file filename failed**

**Explanation:** CICS file control issued a close for a BDAM file, filename. The close failed.
**DFHFC0969** applid Non-RLS CLOSE of file filename failed. CICS logic error - 8799 rrrr, cccc.

**Explanation:** While attempting to close file filename, CICS detected internal logic error 8799 in the file control services program. cccc is the offset in DFHFCN at which the error occurred.

**System action:** CICS terminates the task abnormally, takes a system dump, and continues processing with the status of file filename unchanged.

**Message DFHME0116** is normally produced containing the symptom string for this problem.

**User response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** Console

**Modules:** DFHFCFS

**XMEOUT Parameters:** applid, filename, rrrr, cccc

---

**DFHFC0970** applid Recoverable non-RLS file filename opened with VSAM SHROPT 3 or 4. CICS cannot ensure integrity.

**Explanation:** While opening the recoverable VSAM file filename for update, CICS detected that it was defined with SHAREOPTION 3 or 4, which allows updating from multiple regions. CICS issues this message to warn you that it cannot ensure data integrity.

**System action:** CICS opens file filename and continues processing.

**User response:** If this integrity exposure is acceptable, no further user action is required. If this integrity exposure is unplanned and unacceptable, cancel CICS, redefine file filename with a different SHAREOPTION, and restart.

**Destination:** Console

**Modules:** DFHFCFS

**XMEOUT Parameters:** applid, filename, rrrr, cccc

---

**DFHFC0971** applid Non-RLS OPEN of file filename returned warning when positioning ESDS. Error codes: rrrr, cccc.

**Explanation:** Before opening the VSAM ESDS file filename for output, CICS file control had to determine the end-of-data relative byte address (RBA). The positioning process involved the dynamic allocation and deallocation of the base cluster to DDname DFHESDS. The deallocation failed.

The MVS DYNALLOC return code is cccc. rrrr is the additional return code in register 15.

**System action:** CICS opens the file filename and continues processing.

**Message DFHME0116** is normally produced containing the symptom string for this problem.

**User response:** You have probably specified DSNAMES incorrectly in the FCT. If DSNAMES is correct specified, see the explanation of the SHOWCAT return code cccc from the SHOWCAT macro. 8111 indicates where within CICS file control the error was detected.

**Destination:** Console

**Modules:** DFHFCFS

**XMEOUT Parameters:** applid, filename, rrrr, cccc

---

**DFHFC0972** applid (RLS | Non-RLS) OPEN of file filename failed. VSAM catalog entry not found, return code - 8111 X'cccc' in module module.

**Explanation:** While opening a VSAM file filename, CICS file control attempted to retrieve information from the VSAM catalog using the file name given in the JCL or the FCT. This initial retrieval failed with VSAM return code cccc from the SHOWCAT macro. 8111 indicates where within CICS file control the error was detected.

**System action:** CICS continues processing with file filename closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

**User response:** You have probably specified DSNAMES incorrectly in the FCT. If DSNAMES is correct specified, see the explanation of the SHOWCAT return code in OS/390 V2R10.0 DFSMS Macro Instructions for Data Sets.

**Destination:** Console

**Modules:** DFHFCFS, DFHFCRO

**XMEOUT Parameters:** applid, {1=RLS, 2=Non-RLS}, filename, X'cccc', module

---

**DFHFC0973** applid Dynamic deallocation of (RLS |Non-RLS) file filename failed. Return code - X'rrrr', X'cccc' in module module.

**Explanation:** While closing file filename, CICS file control issued the MVS macro, DYNALLOC, to
dynamically deallocate the file. Deallocation failed with the MVS return code, cccc. rrrr is the return code in register 15.

**System action:** CICS continues with the file closed, but still allocated.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User response:** If you change the DSNAME in the FCT, and then reopen the file in the same CICS run, CICS may open the original data set. For an explanation of the MVS return code, refer to the OS/390 MVS Programming: Authorized Assembler Services Guide.

**Destination:** Console

**Modules:** DFHFCFS, DFHFCRO

**XMEOUT Parameters:** applid, {1=RLS, 2=Non-RLS}, filename, X’rrrr’, X’cccc’, module

---

**DFHFC0974** date time applid Calculation of LSR pool n parameters incomplete for file filename. VSAM catalog inconsistency - oooo

**Explanation:** While dynamically calculating local shared resource (LSR) parameters for file filename, CICS found that a VSAM SHOWCAT macro gave a normal return code, but the object retrieved was logically incorrect. n is the pool number, and oooo is the VSAM object type in error.

**System action:** CICS retains the accumulated LSR parameters for file filename, and continues processing. No further attempts at calculating LSR parameters for file filename are made.

**User response:** This error indicates a corrupted VSAM catalog. If you cannot restore the catalog, you will need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** Console and Transient Data Queue CSMT

**Modules:** DFHFCFS, DFHFCRO

**XMEOUT Parameters:** date, time, applid, n, filename, oooo

---

**DFHFC0975** applid LSR pool n already exists

**Explanation:** CICS requested VSAM to build the local shared resource (LSR) pool n. However, this pool already exists.

**System action:** CICS continues processing. If the existing pool is unsuitable, subsequent file OPENs may fail.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User response:** Examine the system console log and the LSR statistical data for pool creation and deletion times, and in the case of the log, for possible pool delete failures. (The simplest and most likely reason for this error is the failure of a previous attempt to delete pool n.)

**Destination:** Console

**Modules:** DFHFCFS, DFHFCRO

**XMEOUT Parameters:** applid, n

---

**DFHFC0976** applid (RLS | Non-RLS) file filename not opened. DSNAME = NULLFILE or DD DUMMY. Module module.

**Explanation:** CICS could not open file filename, because the DSNAME was NULLFILE or the DD statement was DUMMY.

**System action:** CICS continues processing with file filename closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

**User response:** None.

**Destination:** Console

**Modules:** DFHFCFS, DFHFCRO

**XMEOUT Parameters:** date, time, applid, {1=RLS, 2=Non-RLS}, filename, module

---

**Explanation:** While CICS was opening file filename and retrieving information from the VSAM catalog, an SVC 26 (LOCATE macro) failed with return code cccc. eeee is the CICS internal return code, as follows:

- 8114 SVC 26 failed on index or data.
- 8115 SVC 26 failed on base cluster.

**System action:** CICS continues processing with file filename closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

**User response:** For the meaning of the LOCATE return code, see OS/390 V2R10.0 DFSMSdpl Advanced Services.

**Destination:** Console

**Modules:** DFHFCFS, DFHFCRO

**XMEOUT Parameters:** applid, {1=RLS, 2=Non-RLS}, filename, module
DFHFC0978  applid (RLS | Non-RLS) OPEN of file filename failed. VSAM catalog error. Return code - X'eeee' in module module.

**Explanation:** While CICS was opening file filename and retrieving information from the VSAM catalog, CICS file control open/close detected a CICS logic error. eeee is as follows:

- **8118** A VSAM catalog entry for a path does not have a base cluster or an AIX as its first association.
- **8119** In a VSAM catalog entry for an AIX, either the data association or the base cluster association is missing.
- **811A** In a VSAM catalog entry for a base cluster, the data association or the index association is missing.
- **811C** The open was requested against the data association or the index association. The base cluster, AIX or path should be specified instead.

**System action:** CICS continues processing with file filename closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

**User response:** Obtain a VSAM LISTCAT listing for file filename. You need further assistance from IBM to resolve this problem. See Part 4 of the [CICS Problem Determination Guide](https://www.ibm.com/support/knowledgecenter/en/SSLTBK_22.0.0/com.ibm.cics.ts.5.2.1_ae.doc/ps/ps_readme.html) for guidance on how to proceed.

**Destination:** Console

**Modules:** DFHFCFS, DFHFCRO

**XMEOUT Parameters:** applid, {1=RLS, 2=Non-RLS}, filename, X'eeee', module

---

**DFHFC0979** date time applid LSR pool n parameters incomplete for file filename because the DSNAME specified in the file entry could not be found on the VSAM catalog. VSAM has returned code rrr in R15.

**Explanation:** While dynamically calculating VSAM local shared resource (LSR) parameters, CICS attempted to retrieve information from the VSAM catalog using the data set name in the FCT entry for file filename. The catalog access failed with the VSAM return code rrr from the SHOWCAT macro.

**System action:** CICS continues processing, but does not use any parameters for file filename in calculations for the LSR pool.

**User response:** Ensure that you have correctly specified the JCL for the file, and that the catalog containing the file is included in the JCL. If these checks do not reveal the error, see the meaning of the SHOWCAT return code, rrr, in OS/390 V2R10.0 DFSMS Macro Instructions for Data Sets.

**Destination:** CSMT

---

**DFHFC0980** applid Non-RLS OPEN of base for file filename failed. CICS logic error eeee,cccc.

**Explanation:** While trying to open the VSAM ESDS base of a path through which a record insert has been requested for file filename, CICS has detected an internal logic error. eeee is as follows:

- **8E01** Request to DFHFCM is not OPEN or CLOSE.
- **8E99** Logic error during DFHFCM processing at offset cccc.

**System action:** CICS takes a system dump and terminates the transaction abnormally.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User response:** You need further assistance from IBM to resolve this problem. See Part 4 of the [CICS Problem Determination Guide](https://www.ibm.com/support/knowledgecenter/en/SSLTBK_22.0.0/com.ibm.cics.ts.5.2.1_ae.doc/ps/ps_readme.html) for guidance on how to proceed.

**Destination:** Console

**Modules:** DFHFCM

**XMEOUT Parameters:** applid, filename, eeee, cccc

---

**DFHFC0981** applid Dynamic allocation of base for non-RLS file filename failed. Return code rrr,cccc.

**Explanation:** While trying to open the VSAM ESDS base of a path through which a record insert has been requested for file filename, CICS file control issued an MVS DYNALLOC command which failed with the return code cccc. rrr is the return code in register 15.

**System action:** CICS takes a system dump and terminates the transaction abnormally.

**User response:** For the meaning of the DYNALLOC return codes, refer to the MVS/ESA System Programming Reference: Application Development Guide.

**Destination:** Console

**Modules:** DFHFCM

**XMEOUT Parameters:** applid, filename, rrr, cccc

---

**DFHFC0982** applid Non-RLS OPEN of base for file filename failed. VSAM codes - rrr,cccc.

**Explanation:** While trying to open the VSAM KSDS base of a path through which a record insert has been requested for file filename, CICS file control issued an OPEN which failed with the VSAM error code cccc from the ACB. rrr is the VSAM return code in register 15.

**System action:** CICS takes a system dump and...
terminates the transaction abnormally.

**User response:** VSAM issues a console error message. Use the VSAM message and the VSAM return code in the CICS message to solve the problem.

For the meaning of the VSAM return code, see the MVS/DFP Access Method Services for VSAM Catalogs.

**Destination:** Console

**Modules:** DFHFCM

**XMEOUT Parameters:** applid, filename, rrrr, cccc

---

**DFHFC0983** applid Non-RLS CLOSE of base for file filename failed. CICS logic error eeee,cccc.

**Explanation:** While trying to close the VSAM KSDS base of a path through which a record insert has been requested for file filename, CICS has detected an error. eeee is as follows:
- **8E05** Failure in DFHFCM to close VSAM base. cccc is the error code from the VSAM ACB.
- **8E07** SVC 99 dynamic deallocation in DFHFCM failed. cccc is the SVC 99 error return code.

**System action:** CICS takes a system dump and continues processing, with base left open.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** Console

**Modules:** DFHFCM

**XMEOUT Parameters:** applid, filename, eeee, cccc

---

**DFHFC0987** applid (RLS | Non-RLS) OPEN of file filename failed: Not available for type of processing. VSAM codes - 0008, 00A8 in module module.

**Explanation:** When CICS attempted to open the VSAM file filename, the OPEN failed with the VSAM return codes shown in the message text. The probable reason for the failure is that the data set is in use by another region or another ACB in the CICS region, and that the VSAM share options prohibit the level of sharing needed to permit the OPEN.

A data set may not be open in both RLS and non-RLS mode, via different files, at the same time, with one exception. It is possible for a data set to be open in non-RLS read-only mode from either another CICS region or from batch at the same time as the data set is open in RLS mode.

**System action:** CICS continues processing, with the file left closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User response:** If the data set is in use by another user, wait until it is free and then retry the OPEN.

If the problem recurs and you cannot resolve the problem, you will need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** Console

**Modules:** DFHFCFS, DFHFCRO

**XMEOUT Parameters:** applid, {1=RLS, 2=Non-RLS}, filename, module

---

**DFHFC0988** applid Non-RLS OPEN of file filename failed. This data set type is not supported by CICS.

**Explanation:** An attempt to open file filename has failed because the file referenced a data set of a type not supported by CICS.

CICS File Control supports opening VSAM KSDS, ESDS, RRDS and VRRDS data sets, paths over KSDS and ESDS data sets, and BDAM data sets. No other data set types are supported. For example, CICS does not support opening a VSAM linear data set.

**System action:** CICS continues processing with filename closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User response:** You have probably specified DSNAME incorrectly in the file definition. Correct the file definition.

**Destination:** Console

**Modules:** DFHFCFS

**XMEOUT Parameters:** applid, filename

---

**DFHFC0989I** applid Non-RLS OPEN of file filename will be delayed because the associated data set dataset is being recalled.

**Explanation:** File filename is taking longer than expected to open because the associated data set has been migrated and has to be recalled before the file open processing can complete.

**System action:** The open of file filename will be delayed until its associated data set has been recalled.

**User response:** None.

**Destination:** Console
Modules: DFHFCN

XMEOUT Parameters: applid, filename, dataset

DFHFC0990  applid (RLS | Non-RLS) OPEN of file
filename failed. Recovery specified, but
the path is not in the upgrade set.
Base data set dsname. Module module.

Explanation: An attempt was made to open a
recoverable file, associated with a VSAM path over an
alternate index, for update processing
(SERVREQ=ADD, DELETE or UPDATE set). However,
the alternate index is not in the upgrade set of the base.
CICS detects this condition and does not attempt to
open the file.

If the alternate index is not in the upgrade set of the
base, any updates made via the base are not reflected
in the alternate index and so updates made via the path
may compromise data integrity. Note the open of the
path fails if RECOVERY=ALL or
RECOVERY=BACKOUTONLY is specified on the path
FCTE entry, or on the base data set.

The base takes the recovery attributes of the first file to
open for update against it since a cold or initial start.
Those attributes remain in force on the data set, and
consistency checks are performed between the FCT
entry and the data set at file open time.

System action: CICS continues processing with file
filename closed and not enabled.

User response: Take the data set offline and redefine
the alternate index with the UPGRADE option. Run a
BLDINDEX job to bring the alternate index up to date
with the base data set and then retry the open of the
file.

Destination: Console

Modules: DFHFCFS, DFHFCRO
XMEOUT Parameters: applid, {1=RLS, 2=Non-RLS},
filename, dsname, module

DFHFC0991  applid Non-RLS OPEN of file filename
failed. Recovery attributes conflict with
those on the VSAM data set - cccc.
Base data set dsname

Explanation: An attempt was made to open a file
filename for update processing. (SERVREQ=ADD,
DELETE or UPDATE set), CICS detected that the
recovery attributes on the file were inconsistent with
those currently in force for the VSAM data set as
recorded in the CICS data set name block. The file was
not opened in order to maintain data integrity.

The data set takes the recovery attributes of the first file
to open for update against it since a cold or initial start.
Code cccc identifies the inconsistency found and takes
the following values:

- 8514 Both the file and the data set have
   RECOVERY=ALL specified, but the forward
   recovery logs specified are different.

- 8515 The data set has
   RECOVERY=BACKOUTONLY or
   RECOVERY=NONE specified, and the file is
   trying to open with RECOVERY=ALL.

- 8516 The data set has RECOVERY=NONE
   specified. The file is attempting to open with
   RECOVERY=BACKOUTONLY.

- 851B The file specified RECOVERY=NONE or
   BACKOUTONLY. The VSAM data set had
   RECOVERY=ALL specified.

- 851C The file specified RECOVERY=NONE. The
   VSAM data set had BACKOUTONLY specified.

System action: CICS continues processing with file
filename closed and not enabled.

User response: Ensure that files referencing the same
VSAM data set have the same recovery attributes
specified.

Alter the FCT entries using the CEDA ALTER FILE
command and reinstall the group.

To nullify the recovery attribute set for the base data
set, the user can issue a CEMT SET DSNAME
REMOVE or EXEC CICS SET DSNAME REMOVE
command. This deletes the base cluster block, and
leaves CICS with no record of prior recovery settings for
this VSAM data set. The first file to subsequently open
against this data set causes a new base cluster block to
be built. If the file is opened for update processing, the
recovery attributes of this file are copied into the base
cluster block.

If you want to have files referencing the same VSAM
data set with different backout recovery attributes you
should use Global User Exit XFCNREC.

Destination: Console

Modules: DFHFCFS
XMEOUT Parameters: applid, filename, cccc, dsname

DFHFC0995  applid Hiperspace allocation for LSR
pool n was incomplete or zero.

Explanation: CICS requested VSAM to provide
hiperspace buffers when building local shared resource
(LSR) pool number n, but there was insufficient
expanded storage available to satisfy the request
completely.

System action: CICS continues processing. VSAM
uses the buffers it has been able to provide.

User response: Review your installation's use of
expanded storage and use MVS facilities to adjust its
allocation, or change your RDO LSRPOOL definition or
DFHFCT TYPE=SHRCTL definition, to reduce the
DFHFC0996  applid User exit XFCNREC is causing file filename to be opened even though a file recovery inconsistency of type X'code' exists. CICS cannot guarantee data integrity for base data set dsname

Explanation:  An attempt was made to open file filename for update processing, (SERVREQ=ADD, DELETE or UPDATE set), and CICS detected that the backout recovery attribute on the file was inconsistent with that on the VSAM base data set. Normally CICS would fail the open on detection of an inconsistency. However, a program running at user exit XFCNREC has indicated that the open should continue even though an inconsistency has been detected. CICS can no longer guarantee the integrity of the data on the associated data set. Code X'code' identifies the inconsistency and can take one of the following values:

X'8516' The data set has RECOVERY=NONE specified. The file is attempting to open with RECOVERY=BACKOUTONLY.

X'851C' The file specified RECOVERY=NONE. The VSAM data set had BACKOUTONLY specified.

An INQUIRE on the RECOVSTATUS for the data set from this point onwards returns a NOTRECOVABLE response. The data set is marked as not recoverable until the next CEMT SET DSNAME REMOVE, EXEC CICS SET DSNAME REMOVE command or cold or initial start.

System action:  CICS opens file filename and continues processing using the recovery setting from the file definition to determine whether backout logging should be performed.

User response:  Ensure that it is correct for the backout recovery attribute inconsistency to be ignored for this data set.

If the backout recovery attribute inconsistency should not have been ignored, ensure that files referencing the same VSAM data set have the same recovery attributes. If they do not, either alter the FCT entries using the CEDA ALTER FILE command and reinstall the group, or alter the FCT macro definition of the file. Note that this reassembled FCT only takes effect at the next CICS cold or initial start.

To nullify the recovery attribute set for the base data set, issue a CEMT SET DSNAME REMOVE or EXEC CICS SET DSNAME REMOVE command. This deletes the base cluster block and leaves CICS with no record of prior recovery settings for this VSAM data set. The first file to subsequently open against this data set causes a new base cluster block to be built. If the file is opened for update processing, the recovery attributes of this file are copied into the base cluster block.

Destination:  Console
 Modules:  DFHFCRO

DFHFC0997I  applid RLS OPEN of file filename is delayed because the associated data set dsname is being recalled.

Explanation:  RLS file filename is taking longer than expected to open because the associated data set has been migrated and has to be recalled before the file open processing can complete.

System action:  The open of file filename is delayed until its associated data set has been recalled.

User response:  None.
 Destination:  Console
 Modules:  DFHFCRO

XMEOUT Parameters:  applid, filename, dsname

Chapter 1. DFH messages 437
DFHFC0999 applid RLS OPEN of file filename failed. 
RLS access is disabled.

Explanation: While CICS was opening file filename the CICS file control open/close routine detected that RLS access is disabled. A PREVIOUS open or record management request received a serious error from VSAM and disabled RLS access.

System action: CICS continues processing with file filename closed and its state UNENABLED. Any transaction attempting to use RLS files is sent a NOTOPEN condition.

User response: Determine why RLS access was disabled.

Destination: Console

Modules: DFHFCRO

DFHFC2813 applid Program DFHRCEX cannot be found.

Explanation: An attempt to link to program DFHRCEX during file control initialization has failed. This is a severe error.

System action: CICS startup is abnormally terminated with a dump.

User response: Find out why DFHRCEX could not be located.

Destination: Console

Modules: DFHFCRC

DFHFC3001 date time applid Record not backed out because it may have been overridden by a non-RLS batch job. Diagnostic information follows in message DFHFC3010. The record was updated by unit of work X'local-uowid' for file filename, base data set data-set-name

Explanation: A log record was presented to file control for backing out, but although the updated record was protected by a VSAM RLS lock, a non-RLS batch job had elected to override the RLS locks held on this data set. However, an exit program enabled at the XFCBOVER exit point decided that the non-RLS batch job would not have caused corruption of the record, and requested that the backout should go ahead. The update had been made to the base data set data-set-name via the CICS file filename, under the unit of work identified by local_uowid.

System action: An attempt to backout the update is made because the user exit requested that backout should go ahead. Diagnostic information is provided by this message and the subsequent message DFHFC3010.

User response: See the associated message DFHFC3010 for more information and guidance.

Destination: CSFL

Modules: DFHFCRC

DFHFC3002 date time applid Record backed out at request of user exit although it may have been overridden by a non-RLS batch job. Diagnostic information follows in message DFHFC3010. The record was updated by unit of work X'local-uowid' for file filename, base data set data-set-name

Explanation: A log record was presented to file control for backing out, but although the updated record was protected by a VSAM RLS lock, a non-RLS batch job had elected to override the RLS locks held on this data set. However, an exit program enabled at the XFCBOVER exit point decided that the non-RLS batch job would not have caused corruption of the record, and requested that the backout should go ahead. The update had been made to the base data set data-set-name via the CICS file filename, under the unit of work identified by local_uowid.

System action: An attempt to backout the update is made because the user exit requested that backout should go ahead. Diagnostic information is provided by this message and the subsequent message DFHFC3010.

User response: See the associated message DFHFC3010 for more information and guidance.

Destination: CSFL

Modules: DFHFCRC

DFHFC3003 date time applid Record not backed out because locks for a backout-failed data set have been reset. Diagnostic information follows in message DFHFC3010. The record was updated by unit of work X'local-uowid' for file filename, base data set data-set-name

Explanation: An update made by unit of work local_uowid to the base data set data_set_name via the CICS file filename was protected by a lock while awaiting successful backout, but a decision has been taken locally to reset the locks for this data set. The log record representing the update has therefore been presented to file control for the purpose of providing
diagnostic information in this and the subsequent message DFHFC3010.

**System action:** The update is not backed out and the lock is released. The implication of resetting the locks for a data set is that the backout has failed for some reason which cannot be easily corrected. Diagnostic information is provided by this message and the subsequent message DFHFC3010.

**User response:** See the associated message DFHFC3010 for more information and guidance.

**Destination:** CSFL

**Modules:** DFHFCRC

**XMEOUT Parameters:** date, time, applid, \textbackslash{}x'local-uowid', filename, data-set-name

---

**DFHFC3010**

*date time applid*

Diagnostic information for unit of work X'local-uowid' and file filename. Update was a \{read-update \| write-add\} made by transaction tranid at terminal termid under task number tasknum.

Key length key-length, data length data-length, base ESDS RBA X'base-RBA-or-zero', record key X'record-key'

**Explanation:** This message follows each DFHFC3001, DFHFC3002, DFHFC3003, or DFHFC3004 message, and provides additional information to help diagnose and correct the situation reported in the preceding message.

For any given filename and unit of work CICS normally issues messages of only one type; for example, a series of DFHFC3001 messages each followed by DFHFC3010, or a series of DFHFC3003 messages each followed by DFHFC3010.

The exception to this is when an exit program enabled at the XFCBOVER global user exit point elects to backout some updates and not to backout others. In this situation CICS might issue a combination of DFHFC3001 and DFHFC3002 messages (each followed by DFHFC3010) for the same filename and unit of work.

This message includes the following information:

- **local-uowid**
  - The local unit-of-work identifier for correlation with the preceding message.

- **filename**
  - The file name for correlation with the preceding message.

- **read-update** or **write-add**
  - The type of before-image log record presented to file control. The type is read-update if the update made to the file was either: a READ UPDATE, READNEXT UPDATE or READPREV UPDATE request (which will normally have been followed by a REWRITE or DELETE request), or a DELETE request which specified a RIDFLD. The type is write-add if the update made to the file was a WRITE request.

- **tranid**
  - The transaction under which the original update was made.

- **termid**
  - The terminal from which the transaction which made the original update was run.

- **tasknum**
  - The task number under which the transaction which made the original update was run.

- **key-length**
  - The length of the record key.
The length of the data in the before-image.

The base RBA if the update was made to an ESDS, or zero if not.

The value of the record key field, in hexadecimal.

None beyond the system action described under the preceding message.

Use the diagnostic information to determine any changes that need to be made to the data set to ensure that the contents are correct. Once you have identified the record which may not now contain the correct contents, and the transaction which originally updated it, a knowledge of your application programs should allow you to determine the necessary action.

CSFL

DFHFCRC

DFHFC4700

An unexpected | A VSAM | A length | A lock | A timeout | An unexpected delete) error has occurred during file backout. (Module DFHFCFR has returned reason code (X‘xx’), access method code (X’cccccccc’) and length error code (X’yy’).

File backout has called module DFHFCFR as part of its processing, and an error has been returned which should not be possible during backout. The message text includes the type of error that has occurred.

Additional diagnostic information is provided by: the reason code xx returned from DFHFCFR, the code cccccccc which was returned to DFHFCFR from the access method that it called, and the length error code yy.

The length error code is normally either X’00’, indicating that length errors are not applicable to the type of request which was in error, or X’01’, indicating that there was no length error. A value greater than X’01’ occurs when the message text indicates that the type of error is a length error.

An exception trace point is written, and a system dump is taken.

The error is processed as a backout failure. Unless a user exit program enabled at the XFCBFAIL exit point bypasses backout failure processing, message DFHFC4701 or DFHFC4702 follows and gives details of the file and data set involved.

Inform the system programmer. This indicates a possible error in CICS, VSAM or BDAM code. The severity of its impact depends on whether the backout can be successfully retried.

If the data set being backed out is a VSAM data set, you can retry the backout. Message DFHFC4701 names the data set, and the failed backout can be retried using SET DSNAME RETRY. If the problem is due to some transient condition which has since cleared, the backout will now succeed.

If the data set being backed out is a BDAM data set, the backout cannot be retried. The data is committed and the locks are released, unless an exit program enabled at the XFCBFAIL exit point terminates CICS, in which case data integrity can be preserved by performing an emergency restart.

If the backout cannot be successfully retried, then take action depending on the type of error indicated in the message text:

- An unexpected error
  - This probably indicates either a corruption of storage or an error within CICS code. It might also indicate an error within the access method called to process the request (VSAM or BDAM).
  - The reason code xx is the reason code from the DFHFCFR parameter list and has been included as additional documentation in case you need further help from IBM.
  - The access method code cccccccc is information returned to file control in the VSAM RPL if the error was detected by VSAM, or the BDAM DECB if the error was detected by BDAM. For VSAM, the first byte is the VSAM return code and the second byte is the VSAM reason code; the third and fourth bytes may contain additional VSAM diagnostics (for more information, see OS/390 V2R10.0 DFSMS Macro Instructions for Data Sets). For BDAM, the access method code is the 4-byte exception codes field from the DECB (for more information, see OS/390 V2R10.0 DFSMS: Using Data Sets).

- A VSAM error
  - This indicates that an error has occurred within VSAM.
  - The access method code cccccccc is information returned to file control in the VSAM RPL. The first byte is the VSAM return code and the second byte is the VSAM reason code; the third and fourth bytes may contain additional VSAM diagnostics (for more information, see OS/390 V2R10.0 DFSMS Macro Instructions for Data Sets).

- A length error
  - When a length error is reported, the length error code yy will be greater than X’01’. This normally indicates a serious error in CICS, VSAM, or BDAM processing.
If it occurs for a BDAM data set, check the FCT and DCB definitions in case there is a mismatch between, for example, the block sizes, which would result in a length error.

- A lock error
  This indicates that backout processing has encountered a LOCKED response on attempting to acquire a lock on a record which is held as a retained lock by another unit of work. This should not be possible because the record should be locked by the unit of work being backed out. If this error occurs for a file being accessed in RLS mode, then it probably indicates an error in the SMSVSAM server. If this error occurs for a file being accessed in non-RLS mode, then it probably indicates an error in CICS enqueue processing.

- A timeout error
  This indicates that backout processing has timed out attempting to acquire an RLS lock. This should not be possible during backout because the record should already be locked by the unit of work being backed out. If this error occurs then it probably indicates an error in the SMSVSAM server.

- An unexpected delete error
  This indicates that the request to be backed out was a delete request, but that the file type is one for which deletes are not supported (VSAM ESDS or BDAM). The most likely cause of this error would be some corruption of the data set, although it might also indicate an error within CICS, or a storage corruption.

You may need assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Modules: DHFCRC

XMEOUT Parameters: applid, '{1=An unexpected, 2=A VSAM, 3=A length, 4=A lock, 5=A timeout, 6=An unexpected delete}', X'xx', X'ccccccc', X'yy'

**DFHFC4701** date time applid Backout failed for transaction tranid, VSAM file filename, unit of work X'local_uowid', task task_number, base base_dsname, path path_dsname, failure code X'bfail_code'.

**Explanation:** File backout has been unable to backout an uncommitted change made to a VSAM data set via file filename, that was made by the unit of work local_uowid.

The file is associated with the data set path_dsname. This is either a base cluster data set if the path_dsname and base_dsname given in the message are the same, or is a path data set whose base cluster is the base_dsname given in the message if the two names differ.

The change that is being backed out was originally made by task task_number servicing transaction code tranid, running under the unit of work local_uowid. The current task number will differ from the original one that is given in the message if this backout is itself a retry of an earlier backout which also failed, or is a backout being carried out following resolution of an indoubt situation, and the current transaction code will differ from the original one if the transaction has been disabled.

The failure code X'bfail_code' indicates the reason for the failure.

**System action:** The system continues normally.

Backing out of the unit of work continues, but no further attempts to backout updates made by this unit of work to the base_dsname named in the message are made.

When the unit of work has been backout as far as is possible, those updates which could not be backouted are deferred (shunted) until the backout can be retried.

It is possible for other work to continue to access the base cluster data set, but the records in that data set that were changed by this unit of work are locked by retained locks. This ensures that any attempt to access these records results in a LOCKED response being returned to the application. The records must remain locked until the backout has been successfully retried in order to preserve data integrity.

If, when the backout is retried, it fails again for either the same or another reason, this message is issued again, with the failure code indicating the reason for the failure on this occasion.

**User response:** You may decide to leave the data set online for any of the errors indicated by X'bfail_code', especially if you believe that the backout failure may have been due to some transient situation, and that the backout may succeed if retried. You can manually drive retry of the backout using the SET DSNAME RETRY command, or alternatively wait until some event triggers retries of the shunted backouts in the system.

As a last resort, and at the cost of losing data integrity, you could bypass the deferred backout of uncommitted changes to this data set using the SET DSNAME RESETLOCKS command.

The user response depends on the value of the failure code X'bfail_code'.

10 The backout attempted to add a duplicate key value to a unique alternate index. The backout can never be carried out unless you can delete the existing record with this alternate key value, then retry the backout using SET DSNAME RETRY. This failure can only occur for a file being accessed in non-RLS mode.

20 The data set ran out of storage while the request was being processed. You should reallocate the data set with more space, then
retry the backout using SET DSNAME RETRY. Do not forward recover the data set. If you accessed the file in RLS mode, there are extra steps required to ensure that the retained locks remain associated with the data set. These are explained in the CICS Recovery and Restart Guide.

24 An I/O error has occurred on the data set. You should consider the possibility that the data set needs restoring, especially if there have been a large number of these messages referring to the same base cluster data set, or if there have also been I/O errors issued during request processing for that data set.

If you do decide to restore the data set, you should take the following steps:
1. Prevent access to the data set
2. Restore a backup copy and forward recover the data set (for example, using CICSVR)
3. Reallow access to the data set
4. Retry deferred backouts.

For an RLS mode data set, prevent access by issuing a SET DSNAME QUIESCED command which closes all open files throughout the sysplex and prevents further RLS opens. Reallow access by issuing a SET DSNAME UNQUIESCED command, which also retries deferred backouts automatically.

For a non-RLS mode data set, prevent access by issuing a SET DSNAME UNAVAILABLE command to prevent further non-RLS opens and issue SET FILE CLOSED commands for all open files. Reallow access by issuing a SET DSNAME AVAILABLE command, and retry deferred backouts using SET DSNAME RETRY.

40 Logical delete for an ESDS data set was not performed because the XFCLDEL exit either chose not to carry out the logical delete, or was not enabled.

41 A DFSMSdss non-BWO backup is in progress for the data set. The backout will be automatically retried when the backup completes.

B0 A deadlock was detected. This can only happen for files opened in non-RLS mode. Since this is a transient condition, you should just retry the backout using SET DSNAME RETRY.

C0 A failure of the VSAM RLS server was detected by this request. The backout is automatically retried when the server becomes available again.

C2 The VSAM RLS server has recycled (failed and restarted) whilst a record was being backed out. This is a very rare occurrence since the failure and restart must have taken place after the record to be backed out was read for update, and before it was rewritten or deleted. A retry of the backout should be successful, but because the server has already become available, backout will not be automatically retried. You should use SET DSNAME RETRY to drive backout retry.

C3 The VSAM RLS cache structure to which the data set was bound has either failed or has lost connectivity, and VSAM has been unable either to rebuild the failed cache structure, or to bind the data set to an alternative cache structure in the cache set. The backout is automatically retried when the cache structure becomes available again.

C4 VSAM has returned a response indicating that the RLS lock structure in the coupling facility is full. Allocate a larger lock structure, rebuild into it and retry the backout using set dsnname retry. See OS/390 MVS Setting up a Sysplex, (GC28-1779) and DFSMS/MVS DFSMSdfp Storage Administration Reference, (SC26-4920) for further information on how to allocate, and build into, larger lock structures.

F0 There was no space to add another alternate key value to a non-unique alternate index. You should rebuild the data set with a larger alternate index data CI size (unless you are already at the maximum), and then retry the backout using SET DSNAME RETRY. If you accessed the file in RLS mode, there are extra steps required to ensure that the retained locks remain associated with the data set. These are explained in the CICS Recovery and Restart Guide. Do not forward recover the data set.

FB An error occurred when opening the file for backout. Determine why the file would not open, and if it is possible to correct it, do so and then issue SET DSNAME RETRY to retry the backout. If the error occurred because the data set was quiesced, the backout is automatically retried when the data set is unquiesced. If the error occurred because the VSAM RLS server was not available, the backout is automatically retried when it becomes available again.

FE An error occurred which is not expected to be possible during backout. An exception trace point is written, message DFHFC4700 is issued and a system dump is taken. Use these to determine the cause of the error. It might be
worth retrying the backout, using SET
DSNAME RETRY, since the problem could
have been some transient condition which has
since cleared.

**Destination:** Console and Transient Data Queue
CSFL

**Modules:** DFHFCRC

**XMEOUT Parameters:** date, time, applid, tranid,
filename, X'local_uowid', task_number,
base_dsname, path_dsname, X'bfail_code'

---

**DFHFC4702** date time applid Backout failed for
transaction tranid, BDAM file filename,
unit of work X'local_uowid', task
task_number.

**Explanation:** File backout has been unable to backout
an uncommitted change made to a BDAM data set via
file filename, that was made by the unit of work
local_uowid.

The change that is being backed out was originally
made by task task_number servicing transaction code
tranid, running under the unit of work local_uowid.
However, if this backout is being attempted after waiting
for an indoubt situation to be resolved, the current task
number will be different from the original one given in
the message, and transaction code will be different from
the original one if the transaction has been disabled.

**System action:** The system continues normally.

Backout of the BDAM data set in the message being reissued
will continue, and any further failures to backout changes made to
this BDAM data set will result in the message being reissued.

Unless a program invoked at the backout failure exit
point, XFCBFAIL, took some action to prevent it, it is
possible for other work to continue to access the BDAM
data set, but data integrity is compromised because the
changes have not been backed out.

**User response:** Unless you are prepared to continue
using the data set in spite of the loss of data integrity,
you should take some action to correct matters, such as
closing all files that are using the data set and backing
out the uncommitted changes on the data set offline.

One possible cause of a BDAM backout failure is that a
logical delete could not be performed because the
XFCLDEL exit either chose not to carry out the logical
delete or was not enabled. If this is the case then you
may want to ensure that a suitable exit program is
enabled at the XFCLDEL exit point, so that any future
attempts at backing out writes made to BDAM data sets
will succeed.

**Destination:** Console and Transient Data Queue
CSFL

**Modules:** DFHFCRC

**XMEOUT Parameters:** date, time, applid, tranid,
DFHFC4802  date time applid  A failure has been detected on auto journal journal_name.  The associated file file_name has been closed.

Explanation:  The logger domain has detected an error on the automatic journal journal_name. As a result, the automatic journal is no longer reliable.

System action:  The associated file file_name has been set closed.

User response:  The appropriate action depends on how you use the automatic journal, and on whether you can tolerate missing information.

If you require a complete automatic journal with no missing information, you need to take some action to establish a new start point for the automatic journal. You can then correct the error causing the log stream failure, delete and redefine the log stream, issue SET JOURNALNAME RESET, and reopen the file.

If you do not require a complete automatic journal, if the log stream is still writeable, you can issue SET JOURNALNAME RESET, open the file, and continue autojournalling to the same journal. A message preceding this one reports details of the log stream failure.

Destination:  Console and Transient Data Queue CSFL

Modules:  DFHFCAT

XMEOUT Parameters:  date, time, applid, log_stream, dsname

DFHFC5802A  applid  File OPEN has failed for VSAM data set. The BWO values in the ICF catalog indicate that data set needs to be restored and forward recovered. Data set 'dsname'.

Explanation:  CICS has rejected a file open for the VSAM base data set dsname. This base data set could not be opened because the integrated catalog facility (ICF) catalog backup while open (BWO) flags indicated a corrupted data set.

This message is accompanied by message DFHFC5806 which includes the name of the file involved in the OPEN failure.

System action:  The file open for data set dsname fails. CICS continues processing but the file is closed and its state is set to UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

User response:  Carry out the following procedure:
1.  If a BWO copy of this VSAM data set is available:
   a.  Restore the BWO copy of this data set via DFHSM and/or DFDSS.
   b.  Apply the CICS forward recovery logs via a log-apply utility, such as CICS VSAM Recovery (CICSVR), to bring the data set to a point of consistency.
2.  If no BWO copy of this base data set exists but a normal quiesced copy does, apply the forward recovery logs to the data set in the normal way to bring the data set to a point of consistency.
3.  Set the ICF catalog BWO flags to indicate that the data set has been recovered to the point of failure. This can be done by issuing a CEMT SET DSNAME RECOVERED or EXEC CICS SET DSNAME RECOVERED command.
4.  Rename the data set to that of the original data set prior to the failure.
5.  Make the data set available.

Note:  Some log-apply utilities, such as CICS VSAM Recovery MVS/ESA (CICSVR MVS/ESA) Version 2, set the ICF catalog BWO flags to a RECOVERED state after the CICS forward recovery logs have been applied.

Destination:  Console

Modules:  DFHFCAT

XMEOUT Parameters:  applid, dsname
This can be done by issuing a CEMT SET DSNAME RECOVERED or EXEC CICS SET DSNAME RECOVERED command.

**Note:** Some log-apply utilities, such as CICS VSAM Recovery (CICSVR), set the ICF catalog BWO flags to a RECOVERED state after the CICS forward recovery logs have been applied.

**Destination:** Console

**Modules:** DFHFCAT

**XMEOUT Parameters:** applid, dsname

---

**DFHFC5803** applid A severe error (code X’code’) has occurred while inquiring/setting VSAM data set BWO attributes. Data set ‘dsname’ Return Code X’xxxxxxxx’ Reason Code X’yyyyyyyy’ Prob Det X’zzzzzzzzzzzzzzzz’.

**Explanation:** A severe error has been detected in DFHFCAT while inquiring or setting ICF catalog backup while open (BWO) attributes of base data set dsname. The error code is the exception trace point ID which uniquely identifies the call which has failed. The code X’code’ can take the following values:

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X’0B57’</td>
<td>A call to MVS/DFP Callable Services to inquire if a data set is known to a SMS sub-system has failed</td>
</tr>
<tr>
<td>X’0B59’</td>
<td>A call to MVS/DFP Callable Services to update the BWO flags to a forward recovered state for a data set has failed</td>
</tr>
<tr>
<td>X’0B5A’</td>
<td>A call to MVS/DFP Callable Services to update the recovery point for a data set has failed</td>
</tr>
<tr>
<td>X’0B5B’</td>
<td>A call to MVS/DFP Callable Services to update the BWO flags to a BWO disabled state for a data set has failed</td>
</tr>
<tr>
<td>X’0B5C’</td>
<td>A call to MVS/DFP Callable Services to inquire if the BWO flags for a data set were in a BWO enabled state has failed</td>
</tr>
<tr>
<td>X’0B5D’</td>
<td>A call to MVS/DFP Callable Services to update the BWO flags to a BWO enabled state for a data set has failed</td>
</tr>
</tbody>
</table>

For further information about CICS exception trace entries, see the [CICS Problem Determination Guide](#).

The values xxxxxxxx, yyyyyyyyy and zzzzzzzzzzzzzz are the BWO return code, reason code and problem determination code from the MVS/DFP Callable Services Interface call to update/inquire the ICF catalog BWO attributes.

This message is accompanied by message DFHFC5806 when a file open failure occurs or by message DFHFC5810 when a file close failure occurs.

**System action:** CICS makes an exception trace point entry and issues this message. No system dump is taken. The actions taken depend on the operation in progress at the time of the error.

If the error occurs while opening a file, the open request fails, the file is closed, and its state is set to UNENABLED.

If the error occurs while closing a file, the status of the file is unchanged.

If the error occurs during activity keypoint when updating the recovery point, CICS tries to update the recovery point on the next activity keypoint that creates a keypoint directory element (KPDE).

If the error occurs while setting the data set RECOVERED via CEMT or EXEC CICS commands, a non-OK response is returned.

**User response:** Use the return code, reason code and problem determination code to determine why the call to MVS/DFP Callable Services has failed. For further information see [MVS/DFP Callable Services](#) in the [MVS/DFP V3.2 System Programming Reference](#).

Ensure that the appropriate level of MVS/DFP is installed on the processor where CICS is running. Also ensure that the data set is SMS managed and known to the SMS subsystem.

**Destination:** Console

**Modules:** DFHFCAT

**XMEOUT Parameters:** applid, X’code’, dsname, X’xxxxxxxx’, X’yyyyyyyy’, X’zzzzzzzzzzzzzzzz’

---

**DFHFC5804** applid File CLOSE failed during CICS termination. File ‘filename’.

**Explanation:** An attempt to close file filename during orderly CICS termination has failed. This message is produced only as a warning that this file could not be closed. Data integrity has been maintained.

**System action:** CICS termination continues.

If this file was open against a base data set open for update with BACKUPTYPE=DYNAMIC specified, one of the following messages is issued on the first open for update for this base data set in the next CICS run:

- DFHFC5807
- DFHFC5808
- DFHFC5809.

**User response:** In order to avoid repetition of this...
failure, try to determine why the file was not closed from
any other DFHFCxxxx messages produced during
termination.

Destination: Console
Modules: DFHFCSD
XMEOUT Parameters: applid, filename

DFHFC5805 applid File OPEN failed. RECOVERY
attributes of VSAM data set are not
valid. File 'filename' data set 'dsname'.

Explanation: The file filename is defined as eligible for
backup while open for update
(BACKUPTYPE=DYNAMIC). An attempt to open this file
for update processing (SERVREQ=ADD, DELETE or
UPDATE set), has failed because CICS has detected
that the RECOVERY attributes have not been validated
for the VSAM base data set dsname. A data set cannot
be defined with BACKUPTYPE=DYNAMIC without
RECOVERY=ALL specified.

System action: The file open for data set dsname
fails. Processing continues but the file is closed and its
state set to UNENABLED. Any transaction attempting to
use this file is sent a NOTOPEN condition.

User response: This is probably caused by a logic
error in CICS. You should, however, check if there are
any other DFHFCxxxx messages that indicate the cause
of the error.

Destination: Console
Modules: DFHFCFS
XMEOUT Parameters: applid, filename, dsname

DFHFC5806 applid File OPEN failed. DFHCAT
returned an error response from a
BWO action on a VSAM data set. File
'filename' data set 'dsname'.

Explanation: An attempt to open file filename has
failed due to the failure of a call to MVS/DFP Callable
Services or due to an invalid state returned from a call
to MVS/DFP Callable Services for the VSAM base data
set dsname. This message is accompanied by one of
the following messages depending on the type of error
being reported:
  DFHFC0002
  DFHFC5801
  DFHFC5802
  DFHFC5803

System action: CICS fails the file open request for
data set dsname. Processing continues but the file is
closed and its state set to UNENABLED. Any
transaction attempting to use this file is sent a
NOTOPEN condition.

User response: See the accompanying message for
the appropriate action to take in resolving this error.

Destination: Console
Modules: DFHFCFS
XMEOUT Parameters: applid, filename, dsname

DFHFC5807 applid File OPEN failed. BACKUPTYPE
attributes conflict with those currently
defined for the VSAM data set. File
'filename' data set 'dsname'.

Explanation: An attempt to open file filename for
update processing, (SERVREQ=ADD, DELETE or
UPDATE set), against the VSAM base data set dsname
has failed. This is because CICS has detected an
attribute conflict between the opening CICS FCT entry
and the base data set's DSNB which was already
opened for update. An FCT entry with a
BACKUPTYPE=STATIC cannot be opened against a
DSNB which already has or had an FCT entry opened
against it with BACKUPTYPE=DYNAMIC. Similarly, an
FCT entry with a BACKUPTYPE=DYNAMIC cannot be
opened against a DSNB which already has or had an
FCT entry opened against it with
BACKUPTYPE=STATIC.

Note: A CICS base data set's DSNB cannot change
BACKUPTYPE midway through a CICS run. In
order to do this, you must destroy the DSNB and
create a new one. There are three ways of doing this:
  • CEMT SET DSNAME REMOVE
  • EXEC CICS SET DSNAME REMOVE
  • Terminate CICS and restart with a cold start.

If you respecify a DSNB with
BACKUPTYPE=DYNAMIC, where previously it
was specified with RECOVERY=NONE or
BACKOUTONLY and BACKUPTYPE=STATIC, no
forward recovery logging exists for the time that
the DSNB had RECOVERY=NONE or
BACKOUTONLY specified. Therefore you should
take a backup copy of the data set before the
change. This ensures that the data set can be
recovered to a consistent point should a failure
occur.

System action: The file open for data set dsname
fails. CICS continues processing but the file is closed
and its state set to UNENABLED. Any transaction
attempting to use this file is sent a NOTOPEN condition.

User response: Determine the correct values for the
BACKUPTYPE and RECOVERY attributes, and if
necessary, redefine them for the FCT entry via CEDA.

Alternatively, remove the old DSNB as already
described and reattempt the open.

Destination: Console
Modules: DFHFCFS
DFHFC5808 applid File OPEN warning. VSAM data set already set eligible for BWO on first open for update. File 'filename' data set 'dsname'.

Explanation: The file filename is defined as eligible for backup while open for update (BACKUPTYPE=DYNAMIC). While opening this file for update processing, (SERVREQ=ADD, DELETE or UPDATE set), against the VSAM base data set dsname, CICS detected that the ICF catalog has already defined this base data set as eligible for BWO.

If a batch job has updated this data set in a prior batch window and a DFHSM backup was scheduled for the same time, you should discard the backup produced in the batch window as it is not possible to forward recover it to a consistent point should a failure occur. This is because updates made to the data set in the batch window are not reflected in the CICS forward recovery logs.

This situation is likely to arise if CICS fails to close a file that is defined with BACKUPTYPE=DYNAMIC, during CICS termination and the file is redefined with BACKUPTYPE=STATIC on a subsequent CICS run.

System action: CICS updates the ICF catalog to indicate that the data set is no longer eligible for BWO. File open processing continues.

User response: Determine the correct value for the BACKUPTYPE attribute, and if necessary, redefine it via CEDA.

Destination: Console

Modules: DFHFCFS

XMEOUT Parameters: applid, filename, dsname

DFHFC5810 applid File CLOSE failed. DFHFcat returned an error response from a BWO action on a VSAM data set. File 'filename' data set 'dsname'.

Explanation: An attempt to close file filename has failed because of the failure of a call to MVS/DFP Callable Services for the VSAM base data set dsname. This file is defined as eligible for backup while open for update (BACKUPTYPE=DYNAMIC), and is open for update processing, (SERVREQ=ADD, DELETE or UPDATE set). This message is accompanied by message DFHFC5803 or DFHFC0002, depending on the type of error reported.

System action: The file close request for data set dsname fails. Processing continues and the file remains open.

User response: See the accompanying message for the appropriate action to take in resolving this error.

Destination: Console

Modules: DFHFCFS

XMEOUT Parameters: applid, filename, dsname

Chapter 1. DFH messages
The appropriate MVS/DFP Callable Services modules could not be loaded.

**System action:**  CICS ignores the BACKUPTYPE=DYNAMIC parameter and continues as if STATIC were specified. File open processing continues.

**User response:**  If BWO support is required, ensure that the appropriate level of MVS/DFP Callable Services is installed. If BWO support is not required, ensure that the file is defined with the BACKUPTYPE=STATIC attribute.

**Destination:**  Console

**Modules:**  DFHFCFS

**XMEOUT Parameters:**  applid, filename, dsname

---

**DFHFC5812**  applid File OPEN warning.
BACKUPTYPE=DYNAMIC has been ignored for VSAM AIX data set. STATIC has been defaulted. File filename data set dsname.

**Explanation:**  The file filename is defined as eligible for backup while open for update (BACKUPTYPE=DYNAMIC). This file is opening against the data set dsname which is a VSAM AIX. BACKUPTYPE=DYNAMIC is not a valid option for a VSAM AIX. BACKUPTYPE=STATIC has been defaulted.

**System action:**  File open processing continues.

**User response:**  Redefine this file via CEDA, specifying BACKUPTYPE=STATIC.

**Destination:**  Console

**Modules:**  DFHFCFS

**XMEOUT Parameters:**  applid, filename, dsname

---

**DFHFC5813**  applid File OPEN warning. Level of {DFHSM | DFDSS | DFHSM and DFDSS} does not support BWO.

**Explanation:**  You have opened a VSAM file for update and requested backup while open (BWO) support by specifying BACKUPTYPE=DYNAMIC in the FCT. However, CICS has detected that the software release level of DFHSM and/or DFDSS required for BWO support has not been installed on the processor on which CICS is running.

This message is issued once for the first file to open for update and be defined as eligible for BWO after a cold or initial start.

**System action:**  CICS file open processing continues. If the file open completes without error, the file is defined as eligible for BWO. However, no BWO backup facilities are available using DFHSM and/or DFDSS on the processor on which CICS is running.

**User response:**  Ensure that DFHSM and/or DFDSS, both of version 2.5.0 or later, are installed on the processor on which the BWO backup is to be made.

**Note:**  DFSMS/MVS 1.1 (DFSMShsm and DFSMSdss) supersedes DFHSM 2.5 and DFDSS 2.5.

**Destination:**  Console

**Modules:**  DFHFCAT

**XMEOUT Parameters:**  applid, {1=DFHSM, 2=DFDSS, 3=DFHSM and DFDSS}

---

**DFHFC5814**  applid An error (code X'code') has occurred while inquiring on VSAM data set attributes in the ICF catalog. (SHOWCAT | LOCATE) return code X'rcc'. Data set dsname.

**Explanation:**  While reading the ICF catalog to obtain attributes of data set dsname, CICS received return code rrrr from a VSAM SHOWCAT or LOCATE macro or detected an associated error. The error code code is the exception trace which uniquely identifies the error. It can take the following values:

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>

For further information about CICS exception trace entries, see the [CICS Diagnosis Reference](#).

**System action:**  CICS processing continues after making an exception trace entry and taking a system dump with dumpcode FC5814.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User response:**  Use the SHOWCAT or LOCATE return code if present to determine the cause of the problem. For the meaning of the SHOWCAT return code, see [OS/390 V2R10.0 DFSMS Macro Instructions for Data Sets](#). For the meaning of the LOCATE return code, see [OS/390 V2R10.0 DFSMS Macro Instructions for Data Sets](#).
code, see OS/390 V2R10.0 DFSMSdfp Advanced Services. A VSAM LISTCAT listing for the data set may also be useful.

If you cannot resolve the problem or the problem recurs, there may be a more severe error. In this case, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Modules: DFHFCAT

XMEOUT Parameters: applid, X'code', {1=SHOWCAT, 2=LOCATE}, X'rrrr', dsname

DFHFC5815 applid An error has occurred while inquiring on VSAM data set attributes in the ICF catalog. VSAM RLS codes X'rrrr', X'ccccc'. Problem determination: X'dddddddd’. Data set dsname.

Explanation: While reading the ICF catalog to obtain RLS attributes of data set dsname, CICS received reason code cccc from a VSAM IGWARLS macro. rrrr is the return code in register 15. dddddddd is any available VSAM problem determination information.

System action: CICS processing continues after making an exception trace entry and taking a system dump with dumpcode FC5815.

User response: None.

Destination: Console

Modules: DFHFCFS

XMEOUT Parameters: applid, filename, dsname

DFHFC6000 date time applid About to {quiesce | unquiesce} data set dsname

Explanation: This message is issued just before a request is made to VSAM RLS to quiesce or unquiesce base data set dsname throughout the sysplex. The quiesce or unquiesce is initiated either by an end user issuing EXEC CICS SET DSNAME QUIESCESTATE or the CEMT equivalent, or internally by CICS.

System action: The data set is quiesced or unquiesced, as indicated in the message.

User response: None.

Destination: CSFL

Modules: DFHFCQS

XMEOUT Parameters: date, time, applid, {1=quiesce, 2=unquiesce}, dsname

DFHFC6001 date time applid Data set successfully {quiesced | unquiesced} by {CICS | user}. Data set dsname

Explanation: A request to VSAM RLS to quiesce or unquiesce base data set dsname throughout the sysplex has been successfully completed.

System action: CICS processing continues. The quiesce state of the data set in the ICF catalog is set to quiesced or unquiesced, as indicated in the message.

User response: None.

Destination: Console and Transient Data Queue CSFL

Modules: DFHFCQS

XMEOUT Parameters: date, time, applid, {1=quiesced, 2=unquiesced}, {1=CICS, 2=user}, dsname

DFHFC5820 applid Any files that are still open against the base data set may need to be closed. File filename, data set dsname.

Explanation: File filename was the first file to open a dynamically allocated data set dsname. This file is being closed leaving one or more files still open against the same base data set. However, if one of these files requires secondary extents, the request will fail with a CICS ILLOGIC error (EIBRCODE X'08BA0000').

System action: Close processing completes normally.

User response: To avoid this potential problem, you are advised to close and reopen the files that remain open against the base data set. If you are unsure of the data set associations, run a LISTCAT against the above base dataset to produce a list of all associated data sets. Use CEMT INQ FILE(*) to identify which files are affected. All of these should be closed and reopened, for example, using the CEMT SET FILE(file name) CLOSE and CEMT SET FILE(file name) OPEN.

Destination: Console

Modules: DFHFCAT

XMEOUT Parameters: applid, X'code', {1=SHOWCAT, 2=LOCATE}, X'rrrr', dsname
DFHFC6003 date time applid Attempt by [CICS luser] to (quiesce | unquiesce) a data set has been rejected because (quiesce | unquiesce | non-BWO backup | BWO backup | unknown event) is in progress. Data set dsname

Explanation: This message is issued after a request to VSAM RLS to quiesce or unquiesce base data set dsname throughout the sysplex was rejected because a conflicting data set operation is in progress for that data set. The conflicting operation is specified in the message.

System action: CICS processing continues. The quiesce state of the data set in the ICF catalog remains unchanged.

User response: Wait for the conflicting data set operation to complete then retry the quiesce or unquiesce using EXEC CICS SET DSNAME or the CEMT equivalent.

Destination: Console and Transient Data Queue CSFL

Modules: DFHFCQS

XMEOUT Parameters: date, time,applid, {1=CICS, 2=user}, {1=quiesce, 2=unquiesce}, {1=quiesce, 2=unquiesce, 3=non-BWO backup, 4=BWO backup, 5=unknown event}, dsname

DFHFC6005 date time applid Attempt by [CICS luser] to quiesce a data set has failed. Quiesce was cancelled. Data set dsname

Explanation: A request to VSAM RLS to quiesce base data set dsname throughout the sysplex has been cancelled by a participating CICS region. The CICS region could be any CICS in the sysplex. The quiesce was cancelled for one of the following reasons.

- An end user issued an EXEC CICS SET DSNAME UNQUIESCED command
- User code at global exit XFCVSDS suppressed the quiesce
- User code at global exit XFCSREQ suppressed the close of a file that is open against the data set
- The quiesce would not complete and was timed out

A preceding console message in the sysplex indicates the reason. For XFCVSDS the message is DFHFC6023. For XFCSREQ the message is DFHFC6024. For timeout the message is DFHFC6020. If there is no preceding message, EXEC CICS SET DSNAME UNQUIESCED has been used.

System action: CICS processing continues. The quiesce state of the data set in the ICF catalog is set to unquiesced as a result of the cancel.

User response: The response depends on the reason for the cancellation. If a preceding message was issued, refer to the explanation for that message for background information.

If EXEC CICS SET DSNAME UNQUIESCED was the reason, determine what the desired quiesce state should really be. If it should be quiesced, issue an EXEC CICS SET DSNAME QUIESCED command or the CEMT equivalent.

If an exit suppressed the quiesce, the user code at XFCVSDS or XFCSREQ must be disabled on all CICS regions in the sysplex before the data set can be quiesced.

If the quiesce timed out, retry the quiesce using EXEC CICS SET DSNAME QUIESCED or the CEMT equivalent. If the timeout occurs again, consider using EXEC CICS SET DSNAME IMMOQUIESCED or the CEMT equivalent. This force-purges transactions accessing the data set, thereby speeding up the closing of files. Alternatively, attempt to identify any long-running transactions that are using the data set, and terminate them.

Destination: Console and Transient Data Queue CSFL

Modules: DFHFCQS

XMEOUT Parameters: date, time,applid, {1=CICS, 2=user}, dsname

DFHFC6007 date time applid Attempt by [CICS luser] to (quiesce | unquiesce) a data set failed because the SMSVSAM server is not available. Data set dsname

Explanation: A request to VSAM RLS to quiesce or unquiesce base data set dsname throughout the sysplex has failed because the SMSVSAM server address space is not available.

System action: CICS processing continues. The SMSVSAM server address space should attempt to restart automatically.

The quiesce state of the data set in the ICF catalog is unpredictable.

User response: The SMSVSAM server address space should normally restart itself. If it does not, restart the SMSVSAM server address space manually. Then issue an EXEC CICS SET DSNAME command or the CEMT equivalent to set the quiesce state in the ICF catalog to quiesced or unquiesced as desired.

If the SMSVSAM server address space fails to restart, there may be a more severe error. In this case, you need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Modules:** DFHFCQS

DFHFC6010  

**Date time applid Attempt by {CICS, user} to {quiesce | unquiesce} a data set has failed because it has been migrated. Data set dsname**

**Explanation:** A request to VSAM RLS to quiesce or unquiesce base data set dsname throughout the sysplex failed because dsname has been migrated. The data set must be recalled before the quiesce or unquiesce can take place.

**System action:** CICS processing continues.

**User response:** Recall the data set and retry the quiesce or unquiesce.

**Destination:** Console and Transient Data Queue CSFL

**Modules:** DFHFCQS

DFHFC6015  

**Date time applid About to cancel {non-BWO | BWO} backup of data set dsname**

**Explanation:** A request is about to be made to VSAM RLS to cancel a DFSMSdss-initiated backup for base data set dsname. This is performed in response to user code at global exit XFCVSDS suppressing the backup.

The message indicates whether the backup is BWO or non-BWO.

**System action:** The backup is cancelled throughout the sysplex.

**User response:** None.

**Destination:** CSFL

**Modules:** DFHFCQS

DFHFC6016  

**Date time applid (Non-BWO / BWO) backup of a data set cancelled by CICS. Data set dsname**

**Explanation:** A request to VSAM RLS to cancel a DFSMSdss-initiated backup for base data set dsname has been successful.

**System action:** CICS continues processing. The BWO or non-BWO backup is cancelled throughout the sysplex.

**User response:** None.
**DFHFC6017** date time applyid Attempt by CICS to cancel a (non-BWO | BWO) backup of a data set has been rejected because a cancel is already underway. Data set dsname

**Explanation:** A request to VSAM RLS to cancel a DFSMSdss-initiated backup for base data set dsname has been rejected because another cancel is already underway.

**System action:** CICS processing continues. The BWO or non-BWO backup is cancelled throughout the sysplex by the other cancel request.

**User response:** None.

**DFHFC6018** date time applyid Attempt by CICS to cancel a (non-BWO | BWO) backup of a data set has failed. VSAM RLS codes X’rrrr’, X’cccc’. Data set dsname

**Explanation:** A request to VSAM RLS to cancel a DFSMSdss-initiated backup for base data set dsname has failed with an unexpected error. The VSAM IDAQUIES macro failed with reason code cccc. rrrr is the return code in register 15.

**System action:** CICS processing continues after taking a system dump with dumpcode FC6019. The BWO or non-BWO backup is not cancelled.

**User response:** Use the IDAQUIES reason code to determine the cause of the problem. For the meaning of the IDAQUIES reason code, see the [OS/390 V2R10.0 DFSMSdfp Diagnosis Reference](https://www.ibm.com/servers/eserver/zseries/dfsmshsm/dfsmsdfp/library/). If you cannot resolve the problem, or the problem recurs, a more severe error is indicated. In this case, you will assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**DFHFC6020** date time applyid Timeout has occurred while quiescing a data set. Quiesce will be cancelled. Data set dsname

**Explanation:** The request made to VSAM RLS to quiesce base data set dsname throughout the sysplex has timed out. The timeout limit is given by the system initialization parameter QUIESTIM.

This is probably due to the presence of long-running transactions on a participating CICS region failing to reach syncpoint, and therefore preventing the close of files open against the data set.

**System action:** CICS cancels the quiesce throughout the sysplex by issuing an unquiesce for the data set. Depending upon the timing of the unquiesce request, one of two situations can result:

1. Normally the unquiesce is processed immediately and the quiesce request is canceled by VSAM. In this case, message DFHFC6020 is followed by messages DFHFC6000 and DFHFC6001 for the unquiesce completing.
2. Occasionally, depending on the timing of the unquiesce, the original quiesce request completes before the unquiesce request has been processed. Because the unquiesce cannot be canceled, it completes thereby canceling the original quiesce. In this case, message DFHFC6020 is followed by messages DFHFC6000, DFHFC6027, a DFHFC6001 for the quiesce completing, and another DFHFC6001 for the unquiesce completing.

**User response:** If timeouts occur regularly, the following action can be taken to resolve the problem

- Increase the QUIESTIM SIT value. This can be useful if the system is particularly busy when quiesces are likely to be issued.
- Change the long-running transaction which is holding up the request. Note that the transaction can be on any CICS in the sysplex.

The SET DSN NAME IMMQUIESCED command can be used to force purge any transaction and quiesce the data set. This should not be used regularly because force purges can occasionally abort CICS. The messages issued as part of the force purge enable the system programmer to identify the long-running transaction if no other method is available.

See also the Explanation of message DFHFC6005 for guidance.

**Destination:** Console and Transient Data Queue CSFL

**Modules:** DFHFCQI

**XMEOUT Parameters:** date, time, applid, dsname

---

**DFHFC6021 date time applid** An error has occurred while notifying VSAM RLS of the completion of CICS processing for a data set quiesce or backup. VSAM RLS codes 'X'rrrr', 'X'cccc'. Data set dsname

**Explanation:** An unexpected error occurred when CICS notified VSAM RLS that it had completed its processing for a data set quiesce, or for a BWO or non-BWO backup. The VSAM IDAQUIES macro failed with reason code cccc. rrr is the return code in register 15.

**System action:** CICS processing continues after taking a system dump is taken with dumpcode FC6021. The failure of the IDAQUIES macro may cause the data set operation to timeout or fail. Message DFHME0116 is normally produced containing the symptom string for this problem.

**User response:** Use the IDAQUIES reason code to determine the cause of the problem. For the meaning of the IDAQUIES reason code, see the OS/390 V2R10.0 DFSMSdftp Diagnosis Reference.

If the data set operation has failed, retry the data set operation once the problem has been resolved.

If you cannot resolve the problem, or the problem reoccurs, a more severe error is indicated. In this case, you will need assistance from IBM. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Destination:** Console and Transient Data Queue CSFL

**Modules:** DFHFCQI

**XMEOUT Parameters:** date, time, applid, 'X'rrrr', 'X'cccc', dsname

---

**DFHFC6022** STORAGE OBTAIN macro failure in CICS RLS quiesce exit. MVS code 'X'rrrr'

**Explanation:** The CICS RLS quiesce exit was driven by VSAM RLS to process a data set operation request. An attempt was made to get storage for the request but the STORAGE OBTAIN macro failed. rrr is the return code in register 15.

**System action:** The CICS RLS quiesce exit writes a GTF trace entry. The request is not processed by CICS. The data set operation continues throughout the sysplex.

**User response:** Use the return code to determine the cause of the problem, then refer to the Explanation of message DFHFC6030 for guidance. For the meaning of the return code, refer to the OS/390 MVS System Codes manual.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Modules:** DFHFCQX

---

**DFHFC6023 date time applid** The quiesce of a data set has been suppressed by user exit XFCVSDS. Quiesce will be cancelled. Data set dsname

**Explanation:** User code at global exit XFCVSDS has suppressed a quiesce for base data set dsname.

**System action:** CICS cancels the quiesce throughout the sysplex by issuing an unquiesce for the data set.

**User response:** See the Explanation of message DFHFC6005 for guidance.

**Destination:** Console and Transient Data Queue CSFL

**Modules:** DFHFCQU

**XMEOUT Parameters:** date, time, applid, dsname
**DFHFC6024** date time applid The quiesce of a data set has been suppressed by user exit XFCSREQ. Quiesce will be cancelled.

Data set **dsname**

**Explanation:** User code at global exit XFCSREQ has suppressed the close of a file open against base data set **dsname**. The file was being closed because the data set was being quiesced.

**System action:** CICS cancels the quiesce throughout the sysplex by issuing an unquiesce for the data set.

**User response:** See the Explanation of message DFHFC6005 for guidance.

**Destination:** Console and Transient Data Queue

**Modules:** DFHFCFS

**XMEOUT Parameters:** date, time, applid, dsname

---

**DFHFC6025** date time applid (Non-BWO | BWO) backup of a data set has been suppressed by user exit XFCVSDS. Backup will be cancelled. Data set **dsname**

**Explanation:** User code at global exit XFCVSDS has suppressed a DFSMSdss-initiated backup for base data set **dsname**.

**System action:** CICS cancels the backup throughout the sysplex.

**User response:** If the backup must take place, before it can succeed the user code at XFCVSDS must be disabled on all CICS regions in the sysplex.

**Destination:** Console and Transient Data Queue

**Modules:** DFHFCQI

**XMEOUT Parameters:** date, time, applid, {1=Non-BWO, 2=BWO}, dsname

---

**DFHFC6027** date time applid VSAM RLS has been notified of the completion of CICS processing for a quiesce or backup of data set **dsname**

**Explanation:** CICS has successfully notified VSAM RLS that it has completed its processing for a data set quiesce, or a BWO or non-BWO backup.

**System action:** CICS processing continues. The data set operation continues throughout the sysplex, until all CICS systems involved have successfully notified VSAM RLS of the completion of their processing.

**User response:** None.

**Destination:** CSFL

**Modules:** DFHFCQI

**XMEOUT Parameters:** date, time, applid, dsname

---

**DFHFC6028** date time applid File Control RLS quiesce system transaction **transid** has started.

**Explanation:** CICS system transaction CFQS or CFQR has started successfully.

CFQS and CFQR provide support for VSAM RLS data set quiesce and unquiesce operations, DFSMSdss-initiated BWO and non-BWO backups, and certain other data set related operations.

**System action:** CICS processing continues.

**User response:** None.

**Destination:** CSFL

**Modules:** DFHFCQT

**XMEOUT Parameters:** date, time, applid, transid

---

**DFHFC6026** date time applid An error has occurred while notifying VSAM RLS of the completion of CICS processing for a data set quiesce or backup. The SMSVSAM server is not available. Data set **dsname**

**Explanation:** CICS has notified VSAM RLS that it has completed its processing for a data set quiesce, or a BWO or non-BWO backup, but the SMSVSAM server address space is not available.

**System action:** CICS processing continues. The SMSVSAM server address space should attempt to restart automatically.

The data set operation may fail or succeed, depending on whether the SMSVSAM server concerned was coordinating the operation or not.

**User response:** The SMSVSAM server address space should normally restart itself. If it does not, restart the SMSVSAM server address space manually. Retry the data set operation if it has failed.

If the SMSVSAM server address space fails to restart, a more severe error is indicated. In this case, you will need assistance from IBM. See Part 4 of the CICS [Problem Determination Guide] for guidance on how to proceed.

**Destination:** Console and Transient Data Queue

**Modules:** DFHFCQI

**XMEOUT Parameters:** date, time, applid, dsname
DFHFC6029  date time applid  File Control RLS  quiesce system transaction transid has failed. Reattach will be attempted.

Explanation: CICS system transaction CFQS or CFQR has failed due to a serious error. An attempt will be made to reattach the transaction transid.

A preceding message should indicate the cause of the error.

CFQS and CFQR provide support for VSAM RLS data set quiesce and unquiesce operations, DFSMSdss-initiated BWO and non-BWO backups, and certain other data set related operations.

System action: The transaction is reattached and CICS processing continues.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Check Transient Data Queue CSFL for message DFHFC6028, indicating that the reattach of the transaction was successful. If the reattach fails, VSAM RLS data set quiesce support is lost. If this happens, CICS must be restarted.

If it is not possible to restore VSAM RLS quiesce support, a more severe error is indicated. In this case, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console and Transient Data Queue CSFL

Modules: DFHFCQT

XMEOUT Parameters: date, time,applid, transid

DFHFC6030  date time applid  The CICS RLS quiesce exit was unable to process data set operation request X'\text{type}' for (data set | cache) name

Explanation: The CICS RLS quiesce exit was driven by VSAM RLS to process data set operation request type for data set or cache name, but encountered a severe error and was unable to process the request. The error is normally caused by a STORAGE OBTAIN macro failure.

A preceding console message (normally DFHFC6022) gives more information about the error.

This message is issued by DFHFCQR on behalf of the CICS RLS quiesce exit DFHFCQX.

Note: The CICS RLS quiesce exit is used by VSAM RLS to notify CICS that processing is required for the following data set related operations. The number corresponds to type in the message.

01 The quiesce of a data set
02 The unquiesce of a data set

03 The start of a DFSMSdss non-BWO backup
04 The end of a DFSMSdss non-BWO backup
05 The start of a DFSMSdss BWO backup
06 The end of a DFSMSdss BWO backup
07 The recovery of lost locks for a data set
08 The completion of forward recovery for a data set
09 The recovery of a coupling facility cache structure.

System action: CICS continues after taking a system dump with dumpcode FC6030. The data set operation request is not processed by CICS.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Referring to the preceding console message, attempt to determine the cause of the problem.

Because CICS could not process the request, this might invalidate later processing. For example, if the request was for the quiesce of a data set, open files against the data set must be closed manually, or the quiesce retried using EXEC CICS SET DSNAME QUIESCED or the CEMT equivalent. If the request was in connection with a BWO or non-BWO backup, the backup may be invalid and should be discarded.

If you cannot resolve the problem, or the problem recurs, a more severe error is indicated. In this case, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Modules: DFHFCQS

XMEOUT Parameters: date, time, applid, {1=non-BWO, 2=BWO}, dsname

DFHFC6033 date time applid Attempt by CICS to notify VSAM RLS of the completion of CICS processing for a data set quiesce or backup of a data set failed because the SMSVSAM server detected an internal error. Data set dsname

Explanation: An attempt by CICS to notify VSAM RLS of the completion of CICS processing for a data set quiesce or backup for the base data set dsname failed because the SMSVSAM server detected an internal error.

System action: CICS continues processing. See the message from DFSMSdss and the SMSVSAM server to identify the state of the backup request.

User response: None.

Destination: Console and Transient Data Queue CSFL

Modules: DFHFCQI

XMEOUT Parameters: date, time, applid, dsname

DFHFC6034 date time applid Attempt by (CICS user) to process data set operation request (quiesce | unquiesce) failed because the user is not authorized to access the sphere. Data set dsname

Explanation: An attempt by a user to issue a quiesce function for the base data set dsname failed because the user is not authorized to access the sphere.

System action: CICS continues processing. The request is canceled throughout the sysplex.

User response: None.

Destination: Console and Transient Data Queue CSFL

Modules: DFHFCQI

XMEOUT Parameters: date, time, applid, dsname
DFHFC7000  applid The maximum records parameter(rrr) specified on OPEN of coupling facility data table dddd, poolname pppp, for file filename, differs from the current maximum records parameter(ssss) for the table.

Explanation: During OPEN of coupling facility data table dddd for file filename it has been found that the maximum records parameter rrr specified in the file definition is different from that already specified for the table on a previous OPEN or server SET command.

System action: The open continues. This is a warning message. The maximum records parameter ssss already set is the one that applies. The different maximum records parameter is ignored.

User response: Ensure that the maximum records parameter that is in use is as expected. If not, delete the table and reopen it after correcting the maximum records parameter in the file definition. Alternatively, reopen the table via another file definition that already has the correct maximum records parameter or use the coupling facility data table server SET command to change the maximum records parameter for the table.

Destination: Console

Modules: DFHFCDO

XMEOUT Parameters: applid, rrr, dddd, pppp, filename, ssss

DFHFC7002  applid OPEN of coupling facility data table dddd for file filename, poolpoolname, has failed because access is not allowed.

Explanation: The OPEN of coupling facility data table dddd for file filename, pool poolname has failed because access is not allowed. The security check for the table has failed.

A RACF message containing a return code indicating the reason for failure will have been issued prior to this message.

System action: The table cannot be opened.

User response: Set the correct table access using RACF.

Destination: Console

Modules: DFHFCDO

XMEOUT Parameters: applid, dddd, filename, poolname

DFHFC7004  applid OPEN of coupling facility data table dddd for file filename, pool poolname, has failed because the table is not yet loaded.

Explanation: The OPEN of coupling facility data table dddd for file filename, pool poolname, has failed because the table requires loading and is not already being loaded. The user has tried to open it for shared access. A shared access open will only succeed if the table is already being loaded or has completed loading.

System action: The table cannot be opened.

User response: Investigate why the table has not already been loaded or started loading. Change the file definition to make this OPEN do the load if that is appropriate.

Destination: Console

Modules: DFHFCDO

XMEOUT Parameters: applid, dddd, filename, poolname

DFHFC7005  applid OPEN of coupling facility data table dddd for file filename, pool poolname, has failed because of a shared access conflict.

Explanation: The OPEN of coupling facility data table dddd for file filename, pool poolname, has failed because of a shared access conflict. CICS either requests an EXCLUSIVE open (for the purposes of loading) or a SHARED open (for all other cases).

For a shared open request, this error means that the open mode which CICS has specified for this data table conflicts with the shared access mode which has been specified by an existing exclusive open for the data table. For an exclusive open request, this means that the shared access mode which CICS has specified on the open conflicts with one or more existing shared opens for the data table. CICS should not normally specify conflicting open or shared access modes.
**DFHFC7006** applid OPEN of coupling facility data
table dddd for file filename, pool poolname, has failed because of an exclusive access conflict.

**Explanation:** The OPEN of coupling facility data table dddd for file filename, pool poolname has failed because of an exclusive access conflict. Exclusive access to the data table is not available. This error can occur when CICS has requested an exclusive open in order to load the data table from a source data set, if another open already has exclusive access. The error can also occur on a request to delete a data table if there are any opens against the data table. CICS should not normally specify access modes which could result in an exclusive access conflict.

**System action:** The table cannot be opened.

**User response:** Investigate any other opens against the data table dddd in pool poolname, for example using a server query, to determine whether it is expected that access is denied.

**Destination:** Console

**Modules:** DFHFCDO

**XMEOUT Parameters:** applid, dddd, filename, poolname

**DFHFC7007** applid OPEN of coupling facility data
table dddd for file filename, pool poolname, has failed because one or more attributes on the file definition are incompatible with those that were set for the table when it was created.

**Explanation:** An OPEN request naming an existing table specifies one or more attributes for the table which are not compatible with those for the existing table. The coupling facility data table server has rejected the open.

**System action:** The open fails.

**User response:** Investigate why there has been no restart request by checking for CICS error messages.

**Destination:** Console

**Modules:** DFHFCDO

**XMEOUT Parameters:** applid, dddd, filename, poolname

**DFHFC7010** applid OPEN of coupling facility data
table dddd for file filename, pool poolname, has failed because recovery is not enabled.

**Explanation:** An attempt was made to open a recoverable table dddd for read/write access, but the client region has not yet issued a restart request to enable recovery support for this pool connection.

**System action:** The open fails.

**User response:** Investigate why there has been no restart request by checking for CICS error messages.

**Destination:** Console

**Modules:** DFHFCDO

**XMEOUT Parameters:** applid, dddd, filename, poolname

**DFHFC7012** applid OPEN of coupling facility data
table dddd for file filename, pool poolname, has failed because there is no space in the pool.

**Explanation:** The coupling facility list structure for the table pool has no more space available.

**System action:** The open fails.

**User response:** Investigate whether space can be
freed in the coupling facility list structure by deleting tables, or records in tables, that are no longer required.

Alternatively, use the DISPLAY POOLSTATS command to find if the structure is currently at its maximum size; and if not, increase the size using the SETXCF ALTER command.

**Destination:** Console

**Modules:** DFHFCDO

**XMEOUT Parameters:** applid, dddd, filename, poolname

---

**DFHFC7013** applid OPEN of coupling facility data table dddd for file filename, pool poolname, has failed because the maximum number of tables has been reached.

**Explanation:** A new table cannot be created because the maximum number of tables specified when the first server was started for the structure has been reached.

**System action:** The open fails.

**User response:** Investigate whether the number can be increased or whether there are any tables no longer required that could be deleted.

**Destination:** Console

**Modules:** DFHFCDO

**XMEOUT Parameters:** applid, dddd, filename, poolname

---

**DFHFC7014** applid OPEN of coupling facility data table dddd for file filename, pool poolname, has failed because there are too many users.

**Explanation:** The number of concurrent opens for table dddd has reached the maximum supported limit which is currently 1024. This means that there are already 1024 files open which all reference the same coupling facility data table in the same coupling facility data table pool.

**System action:** The open fails.

**User response:** Investigate reducing the number of concurrent users; that is, the number of files open against this coupling facility data table.

**Destination:** Console

**Modules:** DFHFCDO

**XMEOUT Parameters:** applid, dddd, filename, poolname

---

**DFHFC7015** applid OPEN of coupling facility data table dddd for file filename, pool poolname, has failed because the table has been destroyed.

**Explanation:** Table dddd in pool poolname is no longer valid. The most likely cause is that a delete request overlapped with the current request.

**System action:** The open fails.

**User response:** Investigate whether the table was deleted. This is not an error if the table is no longer required. If the table is still required, it should be recreated by opening it again.

**Destination:** Console

**Modules:** DFHFCDO

**XMEOUT Parameters:** applid, dddd, filename, poolname

---

**DFHFC7018** applid OPEN of coupling facility data table dddd for file filename, pool poolname, has failed because the table requires loading.

**Explanation:** The OPEN of file filename has failed because it requires the associated coupling facility data table dddd, which resides in coupling facility data table pool poolname, to have been pre-loaded, but the table has not yet been loaded. Automatic loading of the data table could not be initiated because there is no source data set specified for this file, either in the file definition or in the CICS startup JCL.

**System action:** The file cannot be opened.

**User response:** There are a number of possible operational errors which might have resulted in this failure:

1. The application does not require the coupling facility data table dddd to be pre-loaded. The 'load required' parameter should be removed from the file definition for file filename.

2. The application does require the coupling facility data table dddd to be pre-loaded, but it should already have been loaded before file filename was opened.

   If this is the case, then there should be at least one file definition within the sysplex that names data table dddd in pool poolname and which specifies a source data set, or for which the source data set is supplied in the CICS startup JCL. You should issue an open for one of the files which specifies the source data set, after which an open of this file should succeed.

   You may also want to put operational procedures in place which will ensure that in future this file is only opened after the data table has been loaded. Use of the data tables load complete global user exit point, XDTLC, might be one way of achieving this.

3. The application does require the coupling facility data table dddd to be pre-loaded, and it is intended that the load should be automatically initiated by opening file filename (unless the table has already been loaded).

   A source data set name should have been specified, either in the file definition for file filename or in the CICS startup JCL as a DD card for file filename,
**DFHFC7019 applid OPEN of coupling facility data table dddd for file filename, pool poolname, has failed because the table requires loading but the supplied data set is not KSDS.**

**Explanation:** The OPEN of file filename has failed because it requires the associated coupling facility data table dddd, which resides in coupling facility data table pool poolname, to have been pre-loaded, but the table has not yet been loaded. Automatic loading of the data table could not be initiated because the source data set specified for this file, either in the file definition or in the CICS startup JCL, is not a KSDS. Coupling facility data tables can only be loaded from VSAM KSDS data sets.

**System action:** The file cannot be opened.

**User response:** Investigate whether the reason for this error is that the file should not have been defined as requiring loading, or that the data set name specified is incorrect, or that no data set name should have been specified (because the data table should be pre-loaded via some other file definition before this file is opened). Correct the file definition, re-install and retry the open.

**Destination:** Console

**Modules:** DFHFCDO

**XMEOUT Parameters:** applid, dddd, filename, poolname

---

**DFHFC7032 applid CLOSE of coupling facility data table dddd for file filename, pool poolname, has failed because the table has been destroyed.**

**Explanation:** The table is no longer valid in the pool. The most likely reason is that a delete request overlapped with the current request.

**System action:** The close fails.

**User response:** Investigate whether the table was deleted. This is not an error if the table is no longer required. If the table is still required, it should be recreated by opening it again.

**Destination:** Console

**Modules:** DFHFCDO

**XMEOUT Parameters:** applid, dddd, filename, poolname

---

**DFHFC7051 applid A request to inquire on which attributes of coupling facility data table dddd, file filename, pool poolname, are incompatible has failed because the table could not be found.**

**Explanation:** Inquire for coupling facility data table dddd has failed because during the request it was found that the table could not be found. CICS File Control issued the inquire as the result of an open failure due to incompatible table attributes. The inquire was intended to provide which attributes were in error so that they could be given as part of the open failure diagnostics.

**System action:** The table open has failed due to incompatible attributes and the processing to provide more information on which attributes are incorrect has detected that the table can now not be found.

**User response:** Investigate why the table cannot be found.

**Destination:** Console

**Modules:** DFHFCDO

**XMEOUT Parameters:** applid, dddd, filename, poolname

---

**DFHFC7071 applid The request to set shared access for coupling facility data table dddd, file filename, pool poolname, at the end of a successful table load, has failed because access is not allowed.**

**Explanation:** At the end of a coupling facility data table load, the source data set is closed and CICS File Control requests the server to change the table access from the exclusive access that was required for loading, to a shared access. The server has indicated that the table is not available for access. The security check for the table has failed.

A RACF message containing a return code indicating the reason for failure will have been issued prior to this message.

**System action:** Although the table successfully opened and loaded, the load is not considered complete because the request to the server to set the access to 'shared' has not occurred. The table is closed again ready for the next open attempt which will reattempt the load. The close will still get the security error, but the CICS side of close will complete.

**User response:** Investigate why the table is not available for access. Set the required table access, if possible, using RACF.

**Destination:** Console

**Modules:** DFHFCDO

**XMEOUT Parameters:** applid, dddd, filename, poolname

---
DFHFC7072 applid The request to set shared access for coupling facility data table dddd, file filename, pool poolname, at the end of a successful table load, has failed because the table cannot be found.

Explanation: At the end of a coupling facility data table load the source data set is closed, and CICS File Control requests the server to change the table access from the exclusive access that was required for loading to shared access. The server has returned that the table cannot be found.

System action: Although the table was successfully opened and loaded, the load is not considered complete because the request to the server to set the access to shared has not occurred. The table is closed again ready for the next open attempt which will retry the load. The close will still get the error, but the CICS side of close will complete.

User response: Investigate why the table cannot be found. If it is still required open it again so that it will be recreated and reloaded.

Destination: Console

Modules: DFHFCDO

XMEOUT Parameters: applid, dddd,filename, poolname

DFHFC7073 applid The request to set shared access for coupling facility data table dddd, file filename, pool poolname, at the end of a successful table load, has failed because of a shared access conflict.

Explanation: At the end of a coupling facility data table load the source data set is closed, and CICS File Control requests the server to change the table access from the exclusive access that was required for loading to shared access. The server has returned that it cannot process the request because of a shared access conflict.

System action: Although the table successfully opened and loaded, the load is not considered complete because the request to the server to set the access to shared has not occurred. The table is closed again ready for the next open attempt which will retry the load. The close will still get the error, but the CICS side of close will complete.

User response: Investigate the access mode of other table, and what other files are open against it, to determine if there is an error. The coupling facility data table server supports commands, such as DISPLAY TABLE, which will provide you with this information.

Destination: Console

Modules: DFHFCDO

XMEOUT Parameters: applid, dddd,filename, poolname

DFHFC7079 applid The request to set shared access for coupling facility data table dddd, file filename, pool poolname, at the end of a successful table load, has failed because the table has been destroyed.

Explanation: At the end of a coupling facility data table load the source data set is closed, and CICS File Control requests the server to change the table access from the exclusive access that was required for loading to shared access. The server has returned that the request has failed because the table has been destroyed.

System action: All requests to use the table will return the same error.

User response: Investigate why the table has been destroyed. If it is still required open it again so that it will be recreated and reloaded.

Destination: Console

Modules: DFHFCDO

XMEOUT Parameters: applid, dddd,filename, poolname

DFHFC7081 applid OPEN of coupling facility data table dddd for file filename, pool poolname, has failed because the key length or record length parameter on the file definition is inconsistent with the equivalent for the source data set.

Explanation: The OPEN of coupling facility data table dddd has failed because before the call to the server to perform the actual open, CICS has found that the record length and/or keylength specified by the user on the file definition does not match that returned by VSAM when the associated source data set was opened.

System action: The table cannot be opened.

User response: Check whether the file definition is in error or whether the wrong data set has been specified. It is not necessary to specify the parameters on the file definition if there is a source data set. Clear the parameters or make them the same as the source.

Destination: Console

Modules: DFHFCDO

XMEOUT Parameters: applid, dddd,filename, poolname

DFHFC7082 applid OPEN of coupling facility data table dddd for file filename, pool poolname, has failed because the key length or record length parameter for the source data set is inconsistent with the value already set for the table.

Explanation: The OPEN of coupling facility data table dddd has failed because the values for record length
and/or key length returned for the table on the open do
not match those for the source data set specified in the
file definition.

**System action:** The table cannot be opened.

**User response:** Check whether the wrong data set
has been specified in the file definition. If the table is
opened and loaded by another user, it is not necessary
for this user to specify a source data set in the
definition.

**Destination:** Console

**Modules:** DFHFCDO

**XMEOUT Parameters:** applid, dddd,filenname, poolname

---

**DFHFC7083** applid OPEN of coupling facility data
table dddd for file filenname, pool
poolname, has failed because the key
length or record length parameter
specified on the file definition is
inconsistent with that already set for
the table.

**Explanation:** The OPEN of coupling facility data table
ddd has failed because the values for record length
and/or key length returned for the table on the open do
not match those specified in the file definition for the
table.

**System action:** The table is closed again.

**User response:** Check whether the wrong data set
has been specified in the file definition. If the table is
opened and loaded by another user, it is not necessary
for this user to specify record length and key length on
the file definition. Attention is drawn to the mismatch
rather than ignoring it in case there is an error.

**Destination:** Console

**Modules:** DFHFCDO

**XMEOUT Parameters:** applid, dddd,filenname, poolname

---

**DFHFC7084** applid OPEN of coupling facility data
table dddd for file filenname, pool
poolname, has failed because the table
cannot be found.

**Explanation:** When a coupling facility data table
server fails, all the files which were accessing tables in
that pool are marked as requiring a re-open after
connection to a new server instance. This is required so
that a valid table token is obtained for the new instance.
The re-open for coupling facility data table dddd for file
filenname, pool poolname, has failed because the table
has gone away (possibly due to a failure of the coupling
facility) since it was last opened for this file.

**System action:** The table cannot be opened. CICS
closes and enables the file so that a full open can be
tried later. The full open will recreate the table (unless
the file definition specifies that the table must already
have been recreated, in which case another file
definition which specifies it is capable of recreating and
loading the table must be opened first).

**User response:** Retry when the table is available.

**Destination:** Console

**Modules:** DFHFCDO

**XMEOUT Parameters:** applid, dddd,filenname, poolname

---

**DFHFC7085** applid On a request to process (OPEN
|CLOSE | EXTRACT STATISTCS) for
coupling facility data table dddd for file
filenname, it has been found that the
server for coupling facility data table
pool poolname, is down. The server
should be restarted.

**Explanation:** CICS has issued a request to a file
which is defined to use a coupling facility data table
which resides in the pool poolname. CICS did not
currently have a connection established to the pool, so
an attempt to connect to the pool has to be made.
Before the connect, a query is issued to check whether
the server for the pool is available. The query has failed
because the server is currently down.

A coupling facility data table server is a separate
address space which handles all requests made to
coupling facility data tables that reside in the pool which
it serves.

**System action:** If the request is an open, CICS fails
the request to the coupling facility data table.

If the request is a close, CICS can complete close
processing as normal.

If the request is to extract statistics, issued while
gathering file control statistics, the request to obtain the
statistics will fail. If the request is to extract statistics,
isssued as part of INQUIRE FILE processing in order to
return the current MAXNUMRECS limit, then the
INQUIRE FILE request can complete as normal, but the
MAXNUMRECS value returned may differ from the
current actual value.

New requests to coupling facility data tables which
reside in this pool will check whether the server is
available, and will attempt another connect if it is.

**User response:** Determine the reason for the failure.
Diagnostic messages issued by the coupling facility data
table server address space should assist you in doing
this. The most likely cause of this error is a problem
with the coupling facility. The coupling facility data table
server does not automatically restart itself, so after you
have corrected the cause of the error, you should
resubmit the job which starts the server.

**Destination:** Console

**Modules:** DFHFCDO

**XMEOUT Parameters:** applid, {1=OPEN, 2=CLOSE,
DFHFC7086  applid OPEN of coupling facility data table dddd for file filename, pool poolname, has failed because the (keylength | recordsize) of the source data set is greater than the supported maximum.

Explanation: The OPEN of file filename, associated with coupling facility data table dddd in coupling facility data table pool poolname, has failed because the key length and/or record size of the source data set specified for the file is greater than the value supported.

For a coupling facility data table, the key length must be less than or equal to 16 bytes, and the record size must be less than or equal to 32767 bytes.

The message indicates whether it was the key length or the record size which was found to be too large.

System action: The file is left closed.

User response: Check whether the wrong data set has been specified for this file (either in the file definition or in the CICS start-up JCL), and whether this data table really requires pre-loading from a source data set.

If the correct data set was specified, then this file may not be suitable for use as a coupling facility data table.

If this was because the key length was beyond the range supported for coupling facility data tables, then consider redefining the file as a user-maintained data table or as an RLS file.

If the data table does not need to be pre-loaded, then specify LOAD(NO) on the file definition, and a key length and record size which are in the supported ranges.

Destination: Console

Modules: DFHFCDO

XMEOUT Parameters: applid, dddd,filename, poolname, {1=keylength, 2=recordsize}

DFHFC7091  date time applid CICS coupling facility data table load has successfully processed all records in the source data set for table dddd, file filename, pool pool.

Explanation: The task which was attached to load coupling facility data table dddd has successfully processed all of the records in the associated source data set. The load, however, is not complete until user exit XDTLC has been called, and the table has been marked as loaded, with its access changed from EXCLUSIVE to SHARED.

System action: The user exit XDTLC is invoked, if enabled, with the parameter UEPDtorC set to indicate a successful load. The coupling facility data table server is called to mark the table as loaded and to set the access to shared. Another message (DFHFC7095) will be issued indicating that these have completed and that the load is complete. CICS processing continues.

User response: None.

Destination: CSFL

Modules: DFHFCDL

XMEOUT Parameters: date, time,applid, dddd, filename, pool

DFHFC7092  date time applid CICS data table load has terminated abnormally for coupling facility data table dddd, file filename, pool poolname, because the table has been closed.

Explanation: The CICS task that is loading coupling facility data table dddd has found that CICS file control has requested that the load be abandoned because the file has been closed.

System action: The load transaction terminates. CICS processing continues. Any records already loaded will remain in the table. The next open will start the load transaction again which will continue the load.

User response: Investigate why the file has been closed.

Destination: Console and Transient Data Queue

Modules: DFHFCDL

XMEOUT Parameters: date, time,applid, dddd, filename, poolname
**Explanation:** The CICS task that is loading coupling facility data table dddd has received a reason code X'xx', where X'xx' has one of the following values:

- X'02' ILOGIC - A VSAM error which does not fall into one of the other categories.
- X'0C' NOTOPEN - The file is CLOSED and UNENABLED, or still open and in use, but a CLOSE request has been received.
- X'0D' DISABLED - The file is DISABLED.
- X'0F' ENDFILE - The file is CLOSED and UNENABLED, or still open and in use, but a CLOSE request has been received.
- X'80' IOERR - I/O error.
- X'84' TABLE_FULL - Maximum records exceeded.
- X'85' RLSDISABLED - RLS access currently not available.
- X'86' RLSSUCCESS - The RLS server has failed.
- X'87' PREVIOUS_RLSSUCCESS - The RLS server has been recycled in this unit of work.
- X'88' CACHE_FAILURE - Cache connectivity failure.
- X'89' CFDT_POOL_FULL - No more space available in the coupling facility structure for the table pool.
- X'8A' DATASET_BEING_COPIED - DSS is performing a sharp copy

**System action:** The user exit XDTLC is invoked, if enabled, with the parameter UEPDTORC set to indicate that loading completed abnormally. The user exit may ask for the file to be closed. No more records are loaded into the coupling facility data table.

If the user exit did not request the file to be closed (or if no user exit program was enabled at the XDTLC exit point), then API requests to access records within the range of keys which has already been loaded into the data table will succeed, but requests to access any record beyond the loaded range will receive the "LOADING" condition.

If the file has been closed, then API requests will receive a "NOTOPEN" condition.

CICS processing continues.

**User response:** Investigate the reason for the return code from CICS file control. For further information about the reason code, see the description of exception conditions for the STARTBR, READNEXT and WRITE commands in the CICS Application Programming Reference.

You may be able to correct the cause of the failure, for example by explicitly enabling the file if the reason is DISABLED, or re-cycling the RLS server if it has failed.

If the error is TABLE_FULL, meaning that the number of records to be loaded into the table exceeds the MAXNUMRECS parameter, then you can increase this parameter using the coupling facility data tables server command SET TABLE=tablename,MAXRECS=n. (Note that although altering the MAXNUMRECS parameter on the file definition within CICS, using SET FILE for example, will not have any effect on the current setting for the data table, you should consider resetting it to the new value in order to avoid getting a warning message about the mismatch.) If the error is CFDT_POOL_FULL, then you can increase the size of the coupling facility data table pool that this data table resides in.

If it is possible to correct the problem which caused the load to fail, then you can complete the load of the coupling facility data table by closing the file which attempted the load (if it has not already been closed) and re-opening it, or any other file which is capable of loading the table; that is, which has access to the source data set. This will cause the load to be restarted from the point at which it failed.

**Destination:** Console and Transient Data Queue CSFL

**Modules:** DFHFCDL

**XMEOUT Parameters:** date, applid, dddd, filename, poolname, X'xx'

---

**Explanation:** The request to close the source data set at the end of load of coupling facility data table dddd has failed. The most likely cause of the failure is an error on the SET call to the coupling facility data table server to mark the table as loaded and to set the table access as shared, either because the server was down at the time of the SET or because of an error returned by file control during processing.

**System action:**

The table and source are closed, leaving the table in a state such that a subsequent open may be able to complete the load.

CICS processing continues.

**User response:** Determine the cause of the failure using the diagnostic information provided by file control.

**Destination:** Console and Transient Data Queue CSFL

**Modules:** DFHFCDL

**XMEOUT Parameters:** date, applid, dddd, filename, poolname, X'xx'

---

**Explanation:** The task that was attached to load
Chapter 1. DFH messages

1. Response from FCFR was INVALID.
2. Response from FCFR was DISASTER.
3. Response from FCFR was PURGED.
4. FCFR failed for some unexpected reason.

System action: The user exit XDTLC is invoked, if enabled, with the parameter UEPDORC set to indicate that loading completed abnormally. The user exit may ask for the file to be closed. No more records are loaded into the coupling facility data table, and CICS terminates the loading transaction with abend code ACFA.

If the user exit did not request that the file be closed (or if no user exit program was enabled at the XDTLC exit point), then API requests to access records within the range of keys which has already been loaded into the data table will succeed, but requests to access any record beyond the loaded range will receive the “LOADING” condition.

If the file has been closed, then API requests will receive a “NOTOPEN” condition.

CICS processing continues.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Determine the cause of the failure of the domain call using the diagnostic information provided by file control.

If it is possible to correct the problem which caused the browse to fail, then you can complete the load of the coupling facility data table by closing the file which attempted the load (if it has not already been closed) and re-opening it, or any other file which is capable of loading the table; that is, which has access to the source data set. This will cause the load to be restarted from the point at which it failed.

Destination: Console and Transient Data Queue

Modules: DFTFCDL

XMEOUT Parameters: date, time, applid, name, filename, poolname, n

DFHFC7101  date time applid  CICS data table load has failed to close coupling facility data table  dddd, file  filename, pool  poolname, a call to FCFR to BROWSE the source data set has failed for reason code = n.

Explanation: The CICS task that is loading coupling facility data table  dddd has failed while trying to close the file at the request of an exit program invoked at exit point XDTLC. The value of reason code  n  indicates the type of failure as follows:

1. Response from FCFR was INVALID.
2. Response from FCFR was DISASTER.
3. Response from FCFR was PURGED.
4. FCFS failed for some unexpected reason.

**System action:** CICS terminates the loading transaction with abend code ACFA.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User response:** It is unlikely that the user exit invoked at the XDTLC exit point would request that the file should be closed unless a previous problem had occurred with the load. Determine the cause of any such previous problem by checking for earlier messages which may have been issued referring to data table **dddd**. Diagnostic information provided by file control may be used to investigate the failure of the close file call.

CICS processing continues.

Report the details of the symptom string given in message DFHME0116.

**Destination:** Console and Transient Data Queue CSFL

**Modules:** DFHFCDL

**XMEOUT Parameters:** `date, time, applid, dddd, filename, poolname`

**Explanation:** The special CICS transaction that was loading coupling facility data table **dddd** has detected an abnormal termination.

**System action:** Depending on the cause of this abnormal termination, CICS may produce either a system dump or a transaction dump.

The user exit XDTLC is invoked, if enabled, with the parameter UEPDTORC set to indicate that loading completed abnormally. The user exit may ask for the file to be closed. No more records are loaded into the coupling facility data table, and CICS terminates the loading transaction with abend code ACFA.

If the user exit did not request that the file be closed (or if no user exit program was enabled at the XDTLC exit point), then API requests to access records within the range of keys which has already been loaded into the data table will succeed, but requests to access any record beyond the loaded range will receive the "LOADING" condition.

If the file has been closed, then API requests will receive a "NOTOPEN" condition.

CICS processing continues.

**User response:** Look at the system log for related CICS messages to determine the original abend detected by the loading transaction. Refer to the description of abend code ACFA for further information about the cause of the original termination.

For more information on how to determine system problems, refer to the CICS Problem Determination Guide.

If it is possible to correct the problem which caused the load to abend, then you can complete the load of the coupling facility data table by closing the file which attempted the load (if it has not already been closed) and re-opening it, or any other file which is capable of loading the table; that is, which has access to the source data set. This will cause the load to be restarted from the point at which it failed.

**Destination:** Console and Transient Data Queue CSFL

**Modules:** DFHFCDL

**XMEOUT Parameters:** `date, time, applid, dddd, filename, poolname`

**Explanation:** The task that is loading coupling facility data table **dddd** has failed while calling file control to write to the data table. The value of the reason code **n** indicates the type of failure as follows:

1. Response from FCFR was INVALID.
2. Response from FCFR was DISASTER.
3. Response from FCFR was PURGED.
4. FCFR failed for some unexpected reason.

**System action:** The user exit XDTLC is invoked, if enabled, with the parameter UEPDTORC set to indicate that loading completed abnormally. The user exit may ask for the file to be closed. No more records are loaded into the coupling facility data table, and CICS terminates the loading transaction with abend code ACFA.

If the user exit did not request that the file be closed (or if no user exit program was enabled at the XDTLC exit point), then API requests to access records within the range of keys which has already been loaded into the data table will succeed, but requests to access any record beyond the loaded range will receive the "LOADING" condition.

If the file has been closed, then API requests will receive a "NOTOPEN" condition.

CICS processing continues.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User response:** Determine the cause of the failure of
the domain call using the diagnostic information

If it is possible to correct the problem which caused the
write to fail, then you can complete the load of the
coupling facility data table by closing the file which
attempted the load (if it has not already been closed)
and re-opening it, or any other file which is capable of
loading the table; that is, which has access to the
source data set. This will cause the load to be restarted
from the point at which it failed.

**Destination:** Console and Transient Data Queue
**CSFL**

**Modules:** DFHFCDL

**XMEOUT Parameters:** *date, time, applid, dddd, filename, poolname, n*

---

**DFHFC7110** applid An attempt to connect to
 coupling facility data table pool
 poolname, issued by module
 modulename, has failed.

**Explanation:** CICS has issued a request to a file
which is defined to use a coupling facility data table
which resides in the pool poolname. CICS did not
currently have a connection established to the pool, so
an attempt to connect to the pool has been made. This
attempt has failed. The connect attempt was issued
from module modulename.

A coupling facility data table server is a separate
address space that handles all requests made to
coupling facility data tables which reside in the pool
which it serves. CICS must have a connection to the
server before it can open and access coupling facility
data tables in the pool.

**System action:** CICS fails the request to the coupling
facility data table.

New requests to coupling facility data tables which
reside in this pool will check whether the server is
available and will attempt another connect if it is.

**User response:** Determine the reason for the failure
to connect. Diagnostic messages issued by the coupling
facility data table server address space should assist
you in doing this. The most likely cause of this error is a
problem with the coupling facility. The coupling facility
data table server does not automatically restart itself, so
after you have corrected the cause of the error, you
should resubmit the job which starts the server.

**Destination:** Console

**Modules:** DFHFCDR, DFHFCD0, DFHFCDU

**XMEOUT Parameters:** applid, poolname, modulename

---

**DFHFC7112** applid Resynchronization of coupling
 facility data table pool poolname issued
 from module modulename has failed.

**Explanation:** CICS has issued a request to a file
which is defined to use a coupling facility data table
which resides in the pool poolname. CICS did not
currently have a connection established to the server for
this pool, so an attempt to connect to and resynchronize
the pool server has been made, but the
resynchronization has failed. The attempt to
resynchronize was issued from module modulename.

A coupling facility data table server is a separate
address space that handles all requests made to
coupling facility data tables which reside in the pool
which it serves. When CICS re-establishes its
connection to a coupling facility data table pool server, it
must perform resynchronization in order to complete
recovery processing for any unresolved units of work.
which had made recoverable updates to coupling facility data tables residing in the pool.

**System action:** CICS fails the request to the coupling facility data table.

Other requests to coupling facility data tables which reside in this pool will succeed if they do not require the pool to have been resynchronized, or might attempt another resynchronization if they do.

**User response:** Determine the reason for the failure to resynchronize. Diagnostic messages issued by CICS components involved in the resynchronization and by the coupling facility data table server address space should assist you in doing this.

Depending on the stage during resynchronization at which the failure occurred, any subsequent request to a recoverable file which uses a coupling facility data table in the pool might trigger an attempt to retry the resynchronization. If such requests do not trigger a retry, then you should recycle the server region for this pool (by stopping or cancelling the server region using a server command, and then restarting it).

**Destination:** Console

**Modules:** DFHFCDR, DFHFCDO, DFHFCDU

**XMEOUT Parameters:** applid, poolname, modulename

---

**Explanation:** CICS has issued a request to the coupling facility data table server for pool poolname. This request requires the pool to have been resynchronized.

Although CICS currently has a connection established to the pool server, an earlier attempt to resynchronize the pool failed, so the resynchronization has been retried. This retry has also failed. The attempt to retry resynchronization of the pool was issued from module modulename.

A coupling facility data table server is a separate address space that handles all requests made to coupling facility data tables which reside in the pool which it serves. When CICS has re-established its connection to a coupling facility data table pool server, it must perform resynchronization in order to perform recovery processing for any unresolved units of work which had made recoverable updates to coupling facility data tables residing in the pool.

Certain requests require the coupling facility data table pool to have been resynchronized before they can succeed. Such requests include:

- Open requests for files which are defined to use recoverable coupling facility data tables (open requests against non-recoverable coupling facility data tables do not require the pool to have been resynchronized).
- Syncpoint requests for units of work which have made recoverable updates to coupling facility data tables such as commit or backout requests.

These requests do not require all the units of work to have been resolved, but they do require CICS to have successfully restarted its recoverable connection to the pool server.

**System action:** CICS fails the request to the coupling facility data table pool.

Other requests to this pool server will succeed if they do not require the pool to have been resynchronized, or will attempt another resynchronization if they do.

**User response:** Determine the reason for the failure to resynchronize. Diagnostic messages issued by CICS components involved in the resynchronization and by the coupling facility data table server address space should assist you in doing this.

**Destination:** Console

**Modules:** DFHFCDO, DFHFCDU

**XMEOUT Parameters:** applid, poolname, modulename

---

**Explanation:** An attempt to retry resynchronization of coupling facility data table pool poolname issued from module modulename has failed.

**Explanation:** An attempt to force purge transaction trannum has failed. The system attempted to force purge the transaction because it had made recoverable updates to one or more coupling facility data tables residing in the coupling facility data table pool poolname, and the server for that coupling facility data table pool is undergoing resynchronization. The fact that this resynchronization is taking place is an indication that a failure has occurred which will have resulted in all recoverable updates made to the coupling facility data table pool poolname, which have not yet been committed, having been backed out. This transaction had therefore made updates which have since been backed out, so the transaction needs to be abended, in order to ensure that any updates which it made to other recoverable resources will also be backed out. However, it has not been possible to purge this transaction.

The effect of the failure to purge this transaction is that updates made to other recoverable resources may be committed, with the result that the overall unit of work will not be commit-consistent. It is also possible that the transaction will try to make subsequent updates to the coupling facility data table pool which will cause it to be abnormally terminated.

**System action:** Resynchronization of the coupling facility data table server pool continues.
User response:
If the transaction is still active, then attempt to force purge the transaction using the CEMT master terminal command. However, as this should be a rare situation, consider performing an immediate shutdown of CICS followed by an emergency restart as an alternative solution. This causes all in-flight transactions to be backed out.

Destination: Console
Modules: DFHFCDY
XMEOUT Parameters: applid, trannum, poolname

DFHFC7115 applid The coupling facility data table server for pool poolname has failed and restarted. One or more in-flight transactions which had made recoverable updates to coupling facility data tables residing in the pool will be abended.

Explanation: The coupling facility data table server for data table pool poolname is undergoing resynchronization. The fact that this resynchronization is taking place is an indication that a failure has occurred which will mean that any recoverable updates made to the coupling facility data table pool poolname that had not yet been committed will have been backed out. Any in-flight transaction which had made recoverable updates to one or more coupling facility data tables residing in data table pool poolname therefore needs to be abended, in order to ensure that any updates which it made to other recoverable resources will also be backed out.

This message is issued to inform you that one or more such in-flight transactions has been found, and that CICS will attempt to abend the transactions and cause them to back out by force purging them. You should therefore expect that one or more transactions will be abnormally terminated with an ATCH transaction abend code (or possibly, in some instances, with an AKC3 abend code).

System action: Resynchronization of the coupling facility data table server pool will complete, and one or more in-flight transactions will be abnormally terminated.

User response: None.

This message is purely informational, to indicate that transactions will be abended in order to preserve data integrity.

Destination: Console
Modules: DFHFCDY
XMEOUT Parameters: applid, poolname

DFHFC7120 applid The coupling facility data table pool poolname has an unresolved unit of work X'UOWid' for this CICS region of which CICS has no knowledge.

Explanation: CICS is resynchronizing the coupling facility data table server for pool poolname.

A coupling facility data table server is a separate address space that handles all requests made to coupling facility data tables which reside in the pool that it serves. When CICS has established its connection to a coupling facility data table pool server, it must perform resynchronization in order to perform recovery processing for any unresolved units of work which had made recoverable updates to coupling facility data tables residing in the pool. The resynchronization involves restarting the recoverable connection to the pool server, and completing any unresolved units of work known to the server for which the resolution is now known.

The server has an unresolved unit of work UOWid, but CICS has no knowledge of a link to the pool server for this unit of work. Knowledge of links will be lost when CICS performs an initial start, but in the case of unit of work UOWid there has not been a CICS initial start since the unit of work was created.

System action: CICS resolves the unit of work by backing out the updates that it made to coupling facility data tables within the pool, and completes resynchronization of the pool.

User response: Since CICS will have resolved the unit of work, you do not need to take any immediate action. This message is issued to provide diagnostic information which you may want to use to understand why CICS had no knowledge of the link.

Destination: Console
Modules: DFHFCDY
XMEOUT Parameters: applid, poolname, X'UOWid'

DFHFC7121 applid CICS coupling facility data table load has terminated abnormally. A call to DFHXMIQ to retrieve the parameters for the load transaction has failed with response code = n.

Explanation: The CICS task to load a coupling facility data table has failed while trying to inquire on the parameters passed to it during attach. The value of the reason code n indicates the type of failure as follows:
1. Response from XMIQ was INVALID.
2. Response from XMIQ was DISASTER.
3. Response from XMIQ was PURGED.
4. XMIQ failed for some unexpected reason.

System action: The user exit XDTLC is not invoked as failure to retrieve the attach parameters means the filename is not known. CICS terminates the loading
transaction with abend code ACFD. No records are loaded into the data table.

Requests to access the table result in a “loading” response code.

CICS processing continues.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Determine the cause of the failure of the domain call using the diagnostic information provided by file control.

The file should be closed so that a load may be attempted again when it is next opened.

Destination: Console

Modules: DFHFCDL

XMEOUT Parameters: applid, n

DFHFC7130 date time applid tranid trannum termid userd. Unit of work X’uowid’ running in region owner-applid in MVS system MVSid holds a lock on key X’keyid’ in coupling facility data table tablename in pool CFDTpool, which caused this request to wait.

Explanation: This message is issued to aid problem determination when a transaction that has accessed, or attempted to access, a coupling facility data table is about to terminate abnormally with an AFCY abend code.

The message is issued when a request to a coupling facility data table times out waiting on a lock. A request that requires a lock on a coupling facility data table has been issued, but was forced to wait because the record was locked by another unit of work. The wait has been purged by one of the following actions:

- The timeout time for the transaction has been exceeded.
- CICS has purged transactions in an attempt to alleviate a short-on-storage (SOS) condition.
- The transaction has been purged by an operator request.

The name of the transaction that has failed is tranid and it is running under task number trannum, at terminal termid, for user userid.

DFHFExxxx messages

DFHFE3301 Transaction complete

Explanation: The field engineering program, DFHFEP, which was called by the field engineering transaction, CSFE, has completed.

System action: Other processing continues.

User response: None.

Destination: Terminal End User

Modules: DFHFEP

DFHFE3302 Invalid debug request
Explanation: The field engineering program, DFHFEP, which was called by the field engineering transaction, CSFE, either found a syntax error in the debug request, or found that the installed transaction definition option was invalid.

System action: The task ends.

User response: Check for syntax errors or for an invalid installed transaction definition option. Correct the errors and reenter the request.

Destination: Terminal End User

Modules: DFHFEP

DFHF3303 Invalid trace option

Explanation: The field engineering program, DFHFEP, which was called by the field engineering transaction, CSFE, found a syntax error in the trace request (ZCQTRACE).

System action: The task ends.

User response: Check for syntax errors. Correct the errors and reenter the request.

Destination: Terminal End User

Modules: DFHFEP

DFHF3304 Enter PRINT for character set, END to terminate. All other data will be echoed.

Explanation: This message is sent to the terminal when the CSFE transaction is started. It asks the engineer what action is required from the field engineering program, DFHFEP.

System action: The task waits for a response.

User response: Enter PRINT to display the character set. Enter END to terminate module DFHFEP.

Destination: Terminal End User

Modules: DFHFEP

DFHF3307 Invalid option specified in request

Explanation: The field engineering program, DFHFEP, which was called by the field engineering transaction, CSFE, found an error in one of the options specified in the request. Either the specified option could not be found (for example, an invalid transaction definition) or it was an invalid type. CSFE ends without completing the request.

System action: The task ends.

User response: Correct the error and reenter the request.

Destination: Terminal End User

Modules: DFHFEP

DFHF3308 Program DFHTRAP is not available - global trap not activated

Explanation: CICS could not find the global trap exit program, DFHTRAP, during execution of the CICS field engineering transaction request, CSFE DEBUG,TRAP=ON.

System action: CICS continues with the global trap not activated.

User response: Ensure that DFHTRAP is defined in the processing program table and made available in the program library. You should use the global trap exit only in consultation with an IBM support representative.

Destination: Terminal End User

Modules: DFHFEP

DFHF3309 Global trap DFHTRAP is unusable following program check in exit

Explanation: While executing a field engineering (FE) transaction request to activate the global trap exit (CSFE DEBUG,TRAP=ON), the FE program, DFHFEP, has found that the global trap exit program, DFHTRAP, is already active but marked unusable. This is because, when the trap was last used, a program check occurred in DFHTRAP. This error is fully documented in message DFHTR1001.

System action: CICS continues with the global trap still marked unusable.

User response: Refer to DFHTR1001 for more information. To replace the currently active but unusable version of DFHTRAP by a new version from the CICS program library, issue the following commands in the sequence:

CSFE DEBUG,TRAP=OFF (to de-activate the current trap);
CEMT SET PROGRAM(DFHTRAP) NEWCOPY (to update the disk trap known to CICS);
CSFE DEBUG,TRAP=ON (to activate the new version of the trap).

You should use the global trap exit only in consultation with an IBM support representative.

Destination: Terminal End User

Modules: DFHFEP
**DFHFE3310** applid Program DFHTRAP is not available - global trap not activated.

**Explanation:** CICS could not find the global trap exit program, DFHTRAP, during execution of the CICS field engineering transaction request, CSFE DEBUG,TRAP=ON.

**System action:** CICS continues with the global trap not activated.

**User response:** Ensure that DFHTRAP is defined in the processing program table and made available in the program library. You should use the global trap exit only in consultation with an IBM support representative.

**DFHICxxxx messages**

**DFHIC0002** applid A severe error (code 'X'code') has occurred in module modname.

**Explanation:** An error has been detected in module modname. The code 'X'code' is the exception trace point ID which uniquely identifies what the error is and where it was detected.

**System action:** An exception entry (code 'X'code' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate.

**Message DFHME0116** is normally produced containing the symptom string for this problem.

**User response:** This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated.

If the message occurs once and module modname is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module modname, you will need assistance. Bring CICS down in a controlled shutdown and collect the dumps and any relevant messages sent by the module identified in the message. See Part 4 of the [CICS Problem Determination Guide](#) for guidance on how to proceed.

**Destination:** Console

**Modules:** DFHEIIC

**XMEOUT Parameters:** date, time, applid, tranid

---

**DFHIC0200** date time applid Unable to attach transaction - tranid to terminal - termid

**Explanation:** An attempt was made to start transaction tranid on terminal termid as a result of:
- a START command, or
- a DFHIC TYPE=PUT macro, or
- a DFHIC TYPE=INITIATE macro.

The attempt was rejected. The most likely cause is that, at the time the attempt was made, the terminal was unknown in the system.

This message is also issued when:
- A START command is issued in an application owning region (AOR) for a terminal that exists as a remote terminal entry in the AOR, but the destination system ID associated with the remote terminal has not been defined.
- A START command is issued against a pipeline device, or other device which is not eligible for ATI requests.

**System action:** The request is deleted from the system.

**User response:** Ensure that a valid terminal name is being specified. If the name is valid, examine the trace (if one is available) to determine why the attempt was rejected.
Destination: Console
Modules: DFHICP
XMEOUT Parameters: date, time, applid, tranid, termid

DFHIC0360  date time applid An attempt to establish security for userid userid has failed.
Transaction tranid cannot be started without a terminal. SAF codes are (X'safresp',X'safreas'). ESM codes are (X'esmresp',X'esmreas').

Explanation: An attempt was made to establish security for userid userid but it was rejected by the external security manager (ESM).

A time ordered request, such as an EXEC CICS START command, required security to be established for the userid in order to start the transaction tranid without a terminal.

System action: Security has not been established for the userid. The attempt to start the transaction has failed.

User response: The response and reason codes (safresp and safreas) returned by the system authorization facility (SAF), and the response and reason codes (esmresp and esmreas) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=VERIFY or RACROUTE REQUEST=EXTRACT macros. These return codes are described in the OS/390 MVS Programming: Authorized Assembler Services Guide, and in External Security Interface (RACROUTE) Macro Reference for MVS and VM (SC28-1366). See these manuals for an explanation of the codes.

There may be further messages produced by CICS or the external security manager (ESM) which provide more information.

Destination: CSCS
Modules: DFHICXM
XMEOUT Parameters: date, time, applid, tranid, X'safresp', X'safreas', X'esmresp', X'esmreas'

DFHIC0801 applid CICS time altered from hh.mm.sss to hh.mm.sss - date

Explanation: This console message is printed when the operating system-maintained time of day has been rolled back (for example, when the operating system clock is reset to zero at midnight). Where:
- hh.mm.sss is the time in hours minutes and tenths of a second
- dddddddd is the current date in the format specified by the DATFORM parameter in the system initialization table
- rr is the day number relative to the day CICS was started.

System action: CICS has recognized the condition and adjusted its own time of day to agree with that of the operating system.

User response: None

Destination: Console
Modules: DFHTAJP
XMEOUT Parameters: applid, hh.mm.sss, hh.mm.sss, dddddddd, rr

DFHIC0802 applid S/370 clock inoperative ... external action required

Explanation: CICS execution is dependent on the continued operation of the processor time-of-day clock. This warning message is sent to the console operator during the execution of the time adjustment program if the system detects a processor clock failure at that time. Immediate corrective action (if possible) must be taken by the console operator, if the clock has been disabled for any reason.

System action: CICS abnormally terminates itself after the condition is detected.

User response: The ability to enable or disable the time-of-day clock is under the control of the console operator. If the clock is disabled, it must be enabled immediately.

Destination: Console
Modules: DFHTAJP
XMEOUT Parameter: applid

DFHIExxxx messages

| DFHIE0001 | applid An abend (code aaa/bbbb) has occurred at offset X'offset' in module modname. |
| Explanation: An abnormal end (abend) or program check has occurred in module modname. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwitten. |
| System action: An exception entry is made in the | |

The code aaa/bbbb is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).
An error has been detected in module modname.

Explanation: An error has been detected in module modname. The code X'code' is the exception trace point ID which uniquely identifies what the error is and where the error was detected.

System action: An exception entry (code X'code' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual.

Next, look up the CICS alphanumeric code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module modname is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem. If you cannot run without the full use of module modname you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Modules: DFHIEXM

XMEOUT Parameters: applid, 'X'code',modname

DFHIE0003 applid Insufficient storage to satisfy Getmain (code X'code') in module modname.

Explanation: A CICS GETMAIN was issued by module modname, but there was insufficient storage available to satisfy the request.

The code X'code' is the exception trace point ID which uniquely identifies the place where the error was detected.

System action: An exception entry is made in the trace table (code code in the message). A system dump is taken, unless you have specifically suppressed dumps in the dump table. This is a critical error.

If DFHIEDM issues this message, CICS terminates, even if you have specified in the dump table that CICS should not terminate.

If DFHIEXM issues this message, an exception trace and a system dump is taken and CICS continues.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: If CICS has been terminated by another module, look out for the relevant termination messages (from, for example, the domain manager), and look up the user response for these messages.

If CICS is still running, the problem may be a temporary one which will right itself if more storage becomes available. If you can manage without module modname, you may decide to continue and bring CICS down at a convenient time to resolve the problem. If the message recurs or if you cannot run without the full use of all CICS modules, you should bring CICS down in a controlled shutdown.

Try increasing the size limits of the DSAs or EDSAs.
**DFHIE004**  applid A possible loop has been detected at offset X'offset' in module modname.

**Explanation:** A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module modname at offset X'offset'. This is the offset of the instruction that was executing at the time the error was detected.

**System action:** An exception entry is made in the trace table. A system dump is taken, unless you have specified in the dump table that CICS should not terminate.

**User response:** Notify the system programmer. If CICS has not been terminated, it will be necessary to decide whether the problem is serious enough to bring CICS down.

Because some CICS functions can use a lot of processor time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS will purge a CICS function that exceeds the runaway task time interval that you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that the module modname will be terminated and CICS will continue.

If you have declared ICVR=0 in the SIT and you consider that module modname has gone into a loop, you will have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module modname, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You will have to bring CICS down at a suitable time to do this permanently. However, you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you may need further assistance from IBM to resolve this problem. See Part 4 of the [CICS Problem Determination Guide](#) for guidance on how to proceed.

**Destination:** Console

**Modules:** DFHIEXM

---

**DFHIE0360**  date time applid An attempt to establish security for userid userid has failed.

**Transaction** tranid **cannot be started.**

**SAF codes are** (X'safresp',X'safreas').

**ESM codes are** (X'esmresp',X'esmreas').

**Explanation:** An attempt was made to establish security for userid userid but it was rejected by the external security manager (ESM).

A time ordered request, such as an EXEC CICS START command, required security to be established for the userid in order to start transaction tranid.

**System action:** Security has not been established for the userid. The attempt to start the transaction has failed.

**User response:** The response and reason codes (safresp and safreas) returned by the system authorization facility (SAF), and the response and reason codes (esmresp and esmreas) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=VERIFY or RACROUTE REQUEST=EXTRACT macros. These return codes are described in the OS/390 MVS Programming: Authorized Assembler Services Guide, and in External Security Interface (RACROUTE) Macro Reference for MVS and VM (SC28-1366). See these manuals for an explanation of the codes.

There may be further messages produced by CICS or the external security manager (ESM) which provide more information.

**Destination:** CSCS

**Modules:** DFHIEXM

**XMEOUT Parameters:** date, time,applid, userid, tranid, X'safresp', X'safreas', X'esmresp', X'esmreas'

**DFHIE0361**  date time applid A security error has been detected whilst processing an attach from a TCP/IP attached client.

**Explanation:** A request to attach a transaction failed due to a security problem. The security fields extracted from the Attach FMH5 were passed to the Security Domain to signon the user, but the signon call failed.

**System action:** The attach request is rejected.

**User response:** Refer to previous security messages which are written to TDQ CIEO such as DFHIE0360 for further information and guidance. If no previous messages were issued, examine the trace to determine the reason for the signon failure. Check that if the userid or password are passed on the Attach FMH5, then they are valid.

**Destination:** CIEO

**Modules:** DFHIEP
Data received from the client violated the bracket protocol.

Explanation: A mirror transaction processing an ECI request for a TCP/IP connected client has abended with the specified abend code. This is because of an error in the user program linked for the ECI request, or because of an error in CICS. The abend processing has invoked IE domain to inform the client of the failure.

System action: If the original problem was in IE domain, the appropriate error actions will already have been taken. If the problem was not in IE domain, this message will be attached as Error Log Data to an FMH7 that is sent to the client to abend the conversation.

User response: Use the messages and dumps from the transaction abend to determine the root cause of the problem.

Destination: CIEO

Modules: DFHIEIE

XMEOUT Parameters: date, time, applid, abcode

---

An attempt has been made to start transaction CIEP by something other than an attach request from sockets domain has been made. This is not allowed.

Explanation: An attempt has been made to start transaction CIEP by some method other than a transaction attach from sockets domain. Transaction CIEP is a system task and cannot be entered from a terminal.

System action: The CIEP transaction has not been started.

User response: Do not attempt to enter CIEP from a terminal or from any other device. CICS will start the transaction if an ECI request is made via a TCP/IP attached client. No user action is required.

Destination: CIEO

Modules: DFHIEP

XMEOUT Parameters: date, time, applid

---

Data received from the client violated the bracket protocol.

Explanation: Data received from the client violated the bracket protocol used in communication between the client and CICS to delimit the start and end of conversations. One of the following situations has occurred.

- A flow without Begin Bracket arrived when there was no active conversation
- A flow with Begin Bracket arrived when there was an active conversation
- An FMH7 (conversation abend) flow without End Bracket was received.

This has probably happened because a separate error has caused CICS and the client to have a different view of the current state of conversations on the connection, or because the data has been corrupted at some point in the transmission.

System action: An exception trace is written. It contains the data received from the client, and the state of any relevant conversation in CICS. The data is then ignored.

User response: If there are any other errors preceding this one, then take action to correct them and retry the client transaction. If there are no other errors apparent, restart the client connection and retry the client transaction.

Destination: CIEO

Modules: DFHIEIE

XMEOUT Parameters: date, time, applid, abcode

---

Data received from the client violated the bracket protocol.

Explanation: Data received from the client violated the bracket protocol used in communication between the client and CICS. All flows must have the Only In Chain (OIC) indicators set on.

This has probably happened because a separate error has caused the data to be corrupted at some point in the transmission.

System action: An exception trace is written. It contains the data received from the client, and the state of any relevant conversation in CICS. The data is then ignored.

User response: If there are any other errors preceding this one, then take action to correct them and retry the client transaction. If there are no other errors apparent, restart the client connection and retry the client transaction.

Destination: CIEO

Modules: DFHIEIE

XMEOUT Parameters: date, time, applid, client_ip_addr, tcpipservice

---

Data received from the client violated the bracket protocol.

Explanation: Data received from the client violated the bracket protocol used in communication between the client and CICS. All flows must have the Only In Chain (OIC) indicators set on.

This has probably happened because a separate error has caused the data to be corrupted at some point in the transmission.

System action: An exception trace is written. It contains the data received from the client, and the state of any relevant conversation in CICS. The data is then ignored.

User response: If there are any other errors preceding this one, then take action to correct them and retry the client transaction. If there are no other errors apparent, restart the client connection and retry the client transaction.

Destination: CIEO

Modules: DFHIEIE

XMEOUT Parameters: date, time, applid, client_ip_addr, tcpipservice
DFHIE1003  date time applid client_ip_addr
tcpipservice  Connection to client lost during conversation.

Explanation:  A mirror task processing work for a client was waiting to receive more data, but nothing arrived before the RTIMOUT interval had expired. The PING protocol was then used to see if the client was still active, and this also failed to receive a response.

System action:  An exception trace is written. It contains information on the current state of the client and the state of the relevant conversation in CICS. An AIEA abend is issued for the mirror task. CICS attempts to purge any active conversations for the client. The connection to the client is terminated.

User response:  Determine why the client has stopped responding. If there are any other errors preceding this one, then take action to correct them, restart the client connection and retry the client transaction. If there are no other errors apparent, restarting the client connection and retrying the client transaction may also work.

Destination:  CIEO

Modules:  DFHIEIE

XMEOUT Parameters: date, time, applid, client_ip_addr, tcpipservice

DFHIE1004  date time applid client_ip_addr
tcpipservice  Data received from the client had an invalid length field.

Explanation:  Data received from the client contains a standard header, the first four bytes of which contain the length of the rest of the data. This length was either less than the length of the standard header, or more than the maximum possible for an ECI flow. This has probably happened because a separate error has caused the data to be corrupted at some point in the transmission.

System action:  An exception trace is written. It contains the four byte length received from the client, and information describing the current state of the client in CICS. CICS attempts to purge any active conversations for the client. The connection to the client is terminated.

User response:  If there are any other errors preceding this one, then take action to correct them, restart the client connection and retry the client transaction. If there are no other errors apparent, restarting the client connection and retrying the client transaction may also work.

Modules:  DFHIEIE

XMEOUT Parameters: date, time, applid, client_ip_addr, tcpipservice

DFHIE1005  date time applid client_ip_addr
tcpipservice  ECI client install failed.

Explanation:  A CICS client attempted to connect over TCP/IP. The subsequent install processing failed due to an internal CICS error.

System action:  An exception trace is written. It contains the data received from the client in the install flow. The connection to the client is terminated. There should be messages and (possibly) dumps from a component of CICS other than IE to indicate the cause of the failure.

User response:  Proceed as recommended by the messages issued by the failing component.

Destination:  CIEO

Modules:  DFHIEIE

XMEOUT Parameters: date, time, applid, client_ip_addr, tcpipservice

DFHIE1006  date time applid client_ip_addr
tcpipservice  ECI request received before install.

Explanation:  CICS received an ECI request from a TCP/IP connected client before the client install request had arrived or been completed.

System action:  An exception trace is written. It contains the ECI request data received from the client. The connection to the client is terminated.

User response:  If there are any other errors preceding this one, then take action to correct them, restart the client connection and retry the client transaction. If there are no other errors apparent, restarting the client connection and retrying the client transaction may also work.

Destination:  CIEO

Modules:  DFHIEIE

XMEOUT Parameters: date, time, applid, client_ip_addr, tcpipservice

DFHIE1007  date time applid client_ip_addr
tcpipservice  Invalid install request.

Explanation:  CICS received a request to either install or uninstall a TCP/IP connected ECI client. The data describing the request was invalid. This is probably caused by an earlier error corrupting the data.

System action:  An exception trace is written. It contains the request data received from the client. The connection to the client is terminated.

User response:  If there are any other errors preceding this one, then take action to correct them. If the failure was while starting a client connection, then re-try the start.
**DFHIE1008**  
**date time applid client_ip_addr**  
tcpipservice **Install request received from unsupported version of the client.**

**Explanation:**  
CICS received a request to install a TCP/IP connected ECI client. The request header indicated that the client code was a version not supported by this level of CICS.

**System action:**  
An exception trace is written. It contains the request data received from the client. The connection to the client is terminated.

**User response:**  
Check which versions of the client are supported by CICS and re-install as appropriate.

date, time, applid, client_ip_addr, tcpipservice

---

**DFHIE1012**  
**date time applid client_ip_addr**  
tcpipservice **Install request from the client did not contain the client codepage.**

**Explanation:**  
An install request has been received from a CICS client. One of the parameters which must be supplied is the codepage which the CICS client intends to use. This parameter is missing.

**System action:**  
An exception trace is written. The request to install the CICS client is rejected. A response code of DISASTER and a reason code of INVALIDREQUEST is sent to the client.

**User response:**
Destination: CIEO
Modules: DFHIEIE
XMEOUT Parameters: date, time, applid, client_ip_addr, tcpipservice

DFHIE1013 date time applid client_ip_addr tcpipservice Unexpected connection level PING reply received.

Explanation: CICS received a connection level PING reply when it had not issued a request. This is probably because the client and CICS are out of step with regard to their connection state.

System action: An exception trace is written. It contains the data received from the client. The data is then ignored.

User response: Restart the client connection, if the condition repeats.

Destination: CIEO
Modules: DFHIEIE
XMEOUT Parameters: date, time, applid, client_ip_addr, tcpipservice

DFHIE1101 date time applid client_ip_addr tcpipservice Error obtaining IE domain storage. Task terminated.

Explanation: The IP ECI (IE) domain issued a storage manager getmain which did not complete successfully. This is probably because of a storage overwrite or an internal error in SM domain. This message should be preceded by an SM failure message.

System action: An exception trace is written by IE domain and the IP ECI listener task (CIEP) or the mirror task is abended.

User response: Determine the reason for the storage manager failure.

Destination: CIEO
Modules: DFHIEIE
XMEOUT Parameters: date, time, applid, client_ip_addr, tcpipservice

DFHIE1102 date time applid client_ip_addr tcpipservice Invalid parameter list passed to IE domain.

Explanation: A call was made to the IP ECI (IE) domain during the processing of a request but the parameter list was not valid. This is probably because of a storage overwrite or an internal error in the calling component.

System action: An exception trace is written by IE domain, a system dump is taken and the IP ECI listener task (CIEP) or the mirror task is abended.

User response: Use the dump to determine the fault in the calling component.

Destination: CIEO
Modules: DFHIEIE
XMEOUT Parameters: date, time, applid, client_ip_addr, tcpipservice

DFHIE1103 date time applid client_ip_addr tcpipservice Invalid request by mirror task.

Explanation: A call was made to the IP ECI (IE) domain during the processing of a request by a mirror task. The call was a receive when the conversation was in send state, or the call was a send when the conversation was in receive state. This is probably because an error on the TCP/IP connection has caused a loss of synchronization between the mirror task and the IE domain, but could be due to an internal error in IE domain.

System action: An exception trace is written by IE domain, a system dump is taken and the mirror task is abended.

User response: Use the dump to determine the fault in IE domain, or just retry the failing request if there were signs of other errors on the connection.

Destination: CIEO
Modules: DFHIEIE
XMEOUT Parameters: date, time, applid, client_ip_addr, tcpipservice

DFHIE1104 date time applid client_ip_addr tcpipservice Error attempting socket receive from ECI client.

Explanation: The IP ECI (IE) domain issued a Sockets Domain receive which did not complete successfully. This is probably because of a storage overwrite or an internal error in SO domain. This message should be preceded by an SO failure message.

System action: An exception trace is written by IE domain and the IP ECI listener task (CIEP) is abended.

User response: Determine the reason for the Sockets Domain failure.

Destination: CIEO
Modules: DFHIEIE
XMEOUT Parameters: date, time, applid, client_ip_addr, tcpipservice

Chapter 1. DFH messages
**DFHIE1105** date time applid client_ip_addr tcpipservice Error attempting socket send to ECI client.

**Explanation:** The IP ECI (IE) domain issued a Sockets Domain send which did not complete successfully. This is probably because of a storage overwrite or an internal error in SO domain. This message should be preceded by an SO failure message.

**System action:** An exception trace is written by IE domain and the IP ECI listener task (CIEP) or mirror task is abended.

**User response:** Determine the reason for the Sockets Domain failure.

**Destination:** CIEO

**Modules:** DFHIEIE

**XMEOUT Parameters:** date, time, applid, client_ip_addr, tcpipservice

---

**DFHIE1106** date time applid client_ip_addr tcpipservice Error attempting to wait for client data.

**Explanation:** The IP ECI (IE) domain issued a Dispatcher WAIT_MVS from a mirror task to await the arrival of more data from the client. The WAIT_MVS did not complete successfully. This is probably because of a storage overwrite or an internal error in DS domain. This message should be preceded by a DS failure message.

**System action:** An exception trace is written by IE domain and the mirror task is abended.

**User response:** Determine the reason for the DS Domain failure.

**Destination:** CIEO

**Modules:** DFHIEIE

**XMEOUT Parameters:** date, time, applid, client_ip_addr, tcpipservice

---

**DFHIE1107** date time applid client_ip_addr tcpipservice Error freeing IE domain storage. Task terminated.

**Explanation:** The IP ECI (IE) domain issued a storage manager freemain which did not complete successfully. This is probably because of a storage overwrite or an internal error in SM domain. This message should be preceded by an SM failure message.

**System action:** An exception trace is written by IE domain and the IP ECI listener task (CIEP) or the mirror task is abended.

**User response:** Determine the reason for the storage manager failure.

**Destination:** CIEO

**Modules:** DFHIEIE

**XMEOUT Parameters:** date, time, applid, client_ip_addr, tcpipservice

---

**DFHIE1201** date time applid client_ip_addr tcpipservice Error attaching mirror transaction id transid.

**Explanation:** The IP ECI (IE) domain issued a transaction manager attach for a mirror task to process an ECI request received from a client. The attach did not complete successfully. This is probably because of a storage overwrite or an internal error in XM domain. This message should be preceded by an XM failure message.

**System action:** An exception trace is written by IE domain. An error flow (FMH7) is sent to the client to inform it of the failure of the request.

**User response:** Determine the reason for the XM failure.

**Destination:** CIEO

**Modules:** DFHIEIE

**XMEOUT Parameters:** date, time, applid, client_ip_addr, tcpipservice, transid

---

**DFHIE1202** date time applid client_ip_addr tcpipservice ECI request timed out. Abnormal termination initiated.

**Explanation:** The conversation ping protocol was used because a current ECI conversation appeared to be inactive. The protocol confirmed that the client and CICS were both unable to continue so the decision was taken to abend the conversation. The most likely cause of this is that the user program specified in the ECI request has issued calls that have caused the mirror task to go into a prolonged wait state, so preventing a reply to the ECI request being sent to the client.

**System action:** An exception trace is written by IE domain. An attempt is made to purge the mirror task that is responsible for processing the ECI request. If this fails, the task is marked so that it will abend when it next attempts to communicate with the client.

**User response:** Determine the reason for the mirror task going into a prolonged wait state.

**Destination:** CIEO

**Modules:** DFHIEIE

**XMEOUT Parameters:** date, time, applid, client_ip_addr, tcpipservice
CICS has received data from TCP/IP on date time applid client_ip_addr

Explanation: The IP ECI (IE) domain received an attach request for the CTIN transaction, which is only used in the processing of EPI requests. EPI is not supported by CICS for TCP/IP connected clients.

System action: An exception trace is written by IE domain. A CTIN INSTALL error response is sent to the client to tell it that the install was cancelled.

User response: Do not attempt to use EPI from TCP/IP connected clients.

Destination: CIEO

Modules: DFHIEIE

XMEOUT Parameters: date, time, applid, client_ip_addr, tcpipservice

---

**DFHIE1204**

date time applid client_ip_addr
tcipservice Data lost during ECI request processing.

Explanation: The conversation ping protocol was used because a current ECI conversation appeared to be inactive. The client returned NOT_ABENDED to the conversation ping request sent by CICS, indicating that it is in RECEIVE state having sent the data that CICS timed out waiting to receive. However, CICS has not received the data. This error is probably due to other errors that occurred during the lifetime of the conversation.

System action: An exception trace is written by IE domain. An error flow (FMH7) is sent to the client indicating that the conversation is to be abended. An attempt is made to purge the mirror task that is responsible for processing the ECI request. If this fails, the task is marked so that it will abend when it next attempts to communicate with the client.

User response: Determine the reason for the loss of data by analyzing the cause of the associated errors.

Destination: CIEO

Modules: DFHIEIE

XMEOUT Parameters: date, time, applid, client_ip_addr, tcpipservice

---

**DFHIE1205**

date time applid client_ip_addr
tcipservice Unrecognizable data received from a TCP/IP connected client.

Explanation: CICS has received data from TCP/IP on a port number for which the TCPIPSERVICE specifies transaction id CIEP. This means that CICS expects it to be an ECI request or an ECI-related flow. The data was not recognizable as either of these. This error is probably due to an incorrect TCPIPSERVICE definition or to other errors related to the TCP/IP connection that have corrupted the flow sequence.

System action: An exception trace is written by IE domain. If the first part of the flow was recognizable as the header of an ECI flow then CICS may have matched it up with its state for an existing conversation. If so, an attempt is made to purge the mirror task that is responsible for processing the ECI request. If this fails, the task is marked so that it will abend when it next attempts to communicate with the client.

User response: Ensure that only ECI requests are sent in on the specified TCPIPSERVICE or determine the reason for the corrupted data by analyzing the cause of the associated errors.

Destination: CIEO

Modules: DFHIEIE

XMEOUT Parameters: date, time, applid, client_ip_addr, tcpipservice

---

**DFHIE1206**

date time applid client_ip_addr
tcipservice Mirror transaction id transid is disabled.

Explanation: The IP ECI (IE) domain issued a transaction manager attach for a mirror task to process an ECI request received from a client. The attach did not complete successfully because the specified transaction id for the mirror task has been disabled.

System action: An exception trace is written by IE domain. An error flow (FMH7) is sent to the client to inform it of the failure of the request.

User response: If the transaction id should not have been disabled then use CEMT or a similar control transaction to enable it. The ECI request can then be retried.

Destination: CIEO

Modules: DFHIEIE

XMEOUT Parameters: date, time, applid, client_ip_addr, tcpipservice, transid

---

**DFHIE1207**

date time applid client_ip_addr
tcipservice Mirror transaction id transid not found.

Explanation: The IP ECI (IE) domain issued a transaction manager attach for a mirror task to process an ECI request received from a client. The attach did not complete successfully because the specified transaction id for the mirror task is not defined on this CICS system.

System action: An exception trace is written by IE domain. An error flow (FMH7) is sent to the client to inform it of the failure of the request.
User response: Install a definition for the specified transaction id or change the client to use the correct one. The ECI request can then be retried.

Destination: CIEO
Modules: DFHIEIE
XMEOUT Parameters: date, time, applid, client_ip_addr, tcpipservice, transid

DFHIE1208  date time applid client_ip_addr
tcpipservice  Mirror transaction id transid has been disabled because CICS is shutting down.

Explanation: The IP ECI (IE) domain issued a transaction manager attach for a mirror task to process an ECI request received from a client. The attach did not complete successfully because the specified transaction id for the mirror task has been disabled by the system during shutdown.

System action: An exception trace is written by IE domain. An error flow (FMH7) is sent to the client to inform it of the failure of the request.

User response: If you wish to allow mirror tasks to run during shutdown then the transaction id must be defined as SHUTDOWN(ENABLED).

Destination: CIEO
Modules: DFHIEIE
XMEOUT Parameters: date, time, applid, client_ip_addr, tcpipservice, transid

DFHIE1209  date time applid client_ip_addr
tcpipservice  Error assigning termid to mirror task.

Explanation: The IP ECI (IE) domain issued a call to allocate a unique value to be placed in EIBTRMID for the mirror task processing an ECI request. This call failed for some internal reason or, much less likely, because all 46656 names are currently in use. This is probably because of a storage overwrite or an internal error in the DFHZGBM routine that allocates the names.
This message should be preceded by a failure message from DFHZGBM.

System action: An exception trace is written by IE domain. The mirror attach is rejected with an FMH7 flow.

User response: Determine the reason for the DFHZGBM failure.

Destination: CIEO
Modules: DFHIEIE
XMEOUT Parameters: date, time, applid, client_ip_addr, tcpipservice

DFHIE1210  date time applid client_ip_addr
tcpipservice  ECI request timed out.
Client says conversation not known.

Explanation: The conversation ping protocol was used because a current ECI conversation appeared to be inactive. The client indicated that it did not know about the specified conversation so CICS will attempt to purge the associated mirror task. The most likely cause of this is that the client program encountered an error and lost track of current requests.

System action: An exception trace is written by IE domain. An attempt is made to purge the mirror task that is responsible for processing the ECI request. If this fails, the task is marked so that it will abend when it next attempts to communicate with the client.

User response: Determine the reason for the client losing track of the conversation.

Destination: CIEO
Modules: DFHIEIE
XMEOUT Parameters: date, time, applid, client_ip_addr, tcpipservice

DFHIE1211  date time applid client_ip_addr
tcpipservice  ECI request mirror task abended because of read time out or earlier error.

Explanation: This ECI request mirror task was flagged for abend for one of the following reasons.
• There was no response within the RTIMOUT period when CICS was waiting for data from the client on this conversation.
• There was an error on the conversation and the mirror task purge request could not be completed (probably because the mirror has the recommended setting of SPURGE(NO)).

System action: An exception trace is written by IE domain. The mirror task issues a transaction abend.

User response: Determine why the client has not sent the next flow in this conversation or see the user response for the earlier IE domain message.

Destination: CIEO
Modules: DFHIEIE
XMEOUT Parameters: date, time, applid, client_ip_addr, tcpipservice

DFHIE1212  date time applid client_ip_addr
tcpipservice  Unexpected user data received from TCP/IP connected client.

Explanation: CICS has received user data (an ECI request or SYNCPOINT flow) for a mirror task that was not expecting any. This error is probably due to other errors related to the TCP/IP connection that have
An exception entry is made in the System action:

- Code 1310 refers to message DFHTS1310.

CICS message (for example, AKEA is a CICS abend CICS code is an abend code or a number referring to a code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHHTS1310).

System action: An exception trace is written by IE domain. An attempt is made to purge the mirror task that is responsible for processing the ECI request. If this fails, the task is marked so that it will abend when it next attempts to communicate with the client.

User response: Determine the reason for the corrupted data by analyzing the cause of the associated errors.

DFHIxxxx messages

DFHIxxx

DFHIIO001 applid An abend (code aaa/bbbb) has occurred at offset 'offset' in module modname.

Example: An abnormal end (abend) or program check has occurred in module modname. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code aaa/bbbb is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHHTS1310).

System action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHMEDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual.

DFHIIO002 applid A severe error (code 'X'code') has occurred in module modname.

Explanation: An error has been detected in module modname. The code 'X'code' is the exception trace point ID which uniquely identifies what the error is and where the error was detected.

System action: An exception entry (code 'X'code') in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate.
| Message: DFHME0116 is normally produced containing the symptom string for this problem.  
| **User response:** This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.  
| CICS may not have been terminated. If the message occurs once and module `modname` is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.  
| If the message recurs or if you cannot run without the full use of module `modname`, you should bring CICS down in a controlled shutdown.  
| You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.  
| **Destination:** Console  
| **Modules:** DFHIICP, DFHIIDM, DFHIIMM, DFHIIRH, DFHIIRQ, DFHIIRR, DFHIIXM  
| **XMEOUT Parameters:** `applid`, `X'offset'`, `modname`  

**DFHI0004**  
`applid` A possible loop has been detected at offset `X'offset'` in module `modname`.  
**Explanation:** A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module `modname` at offset `X'offset'`. This is the offset of the instruction which was executing at the time when the error was detected.  
**System action:** An exception entry is made in the trace table.  
A system dump is taken unless you have specifically suppressed the dump (by a user exit program at the XDUREQ exit, in the dump table or by global system dump suppression). CICS processing continues unless you have specified in the dump table that CICS should terminate.  
Message DFHME0116 is normally produced containing the symptom string for this problem.  
**User response:** If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.  
Since some CICS functions can use a lot of CPU time, this message may have been caused by a long-running function, and there may not be an error. Usually, CICS purges a CICS function which exceeds the runaway task time interval that you have specified in the ICVR system initialization parameter. This means that execution of module `modname` is terminated and CICS continues.  
If you have specified system initialization parameter `ICVR=0` and you consider that module `modname` is looping, you must terminate CICS in order to terminate the runaway function.  
If CICS has terminated module `modname`, and you consider that it was not a runaway, you should increase the value of the ICVR system initialization parameter.  
You have to close down CICS at a suitable time to do this permanently. You can change the ICVR time interval temporarily online using the CEMT transaction.  
If raising the ICVR time does not solve the problem, you may need further assistance from IBM to resolve the problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.  
**Destination:** Console

**DFHI0101**  
`date, time, applid, client_ip_addr`  
`tcpipservice The request receiver received a request with an invalid object key.`  
**Explanation:** The IIOP Request Receiver received a request with an invalid GIOP header which contains an invalid object key.  
**System action:** Trace point 020E is issued under some circumstances. Exception trace point 0127 is
The IIOP Request Receiver received a request on a connection whose TCPIPSERVICE specified AUTHENTICATE(CERTIFICATE) but no CERTIFICATE_USERID is available.

Explanation: The IIOP Request Receiver received a GIOP request; however, the TCPIPSERVICE tcpipservice specified AUTHENTICATE(CERTIFICATE) but the client has not provided a client certificate that maps to a valid userid in the external security manager. This may be for one of the following reasons:

- The client has not provided any certificate.
- The client's certificate is not installed in the external security manager's database.
- The client's certificate is not marked as TRUSTED in the external security manager's database.

System action: Exception trace point 0125 is issued. Outstanding replies are processed. A SystemException of NO_PERMISSION is sent to the client. The socket is closed and the transaction is terminated.

User response: Ensure that the client has a valid certificate. Install the certificate in the external security manager with the TRUSTED attribute and which maps to a valid userid in the external security manager. Note that this can be done with the RACDCERT command.

User response: This may be for one of the following reasons:

- The client has not provided any certificate.
- The client's certificate is not installed in the external security manager's database.
- The client's certificate is not marked as TRUSTED in the external security manager's database.

System action: Exception trace point 0125 is issued. Outstanding replies are processed. A SystemException of NO_PERMISSION is sent to the client. The socket is closed and the transaction is terminated.

User response: Ensure that the client has a valid certificate. Install the certificate in the external security manager with the TRUSTED attribute and which maps to a valid userid in the external security manager. Note that this can be done with the RACDCERT command.

User response: This may be for one of the following reasons:

- The client has not provided any certificate.
- The client's certificate is not installed in the external security manager's database.
- The client's certificate is not marked as TRUSTED in the external security manager's database.

System action: Exception trace point 0125 is issued. Outstanding replies are processed. A SystemException of NO_PERMISSION is sent to the client. The socket is closed and the transaction is terminated.

User response: Ensure that the client has a valid certificate. Install the certificate in the external security manager with the TRUSTED attribute and which maps to a valid userid in the external security manager. Note that this can be done with the RACDCERT command.

User response: This may be for one of the following reasons:

- The client has not provided any certificate.
- The client's certificate is not installed in the external security manager's database.
- The client's certificate is not marked as TRUSTED in the external security manager's database.

System action: Exception trace point 0125 is issued. Outstanding replies are processed. A SystemException of NO_PERMISSION is sent to the client. The socket is closed and the transaction is terminated.

User response: Ensure that the client has a valid certificate. Install the certificate in the external security manager with the TRUSTED attribute and which maps to a valid userid in the external security manager. Note that this can be done with the RACDCERT command.

User response: This may be for one of the following reasons:

- The client has not provided any certificate.
- The client's certificate is not installed in the external security manager's database.
- The client's certificate is not marked as TRUSTED in the external security manager's database.

System action: Exception trace point 0125 is issued. Outstanding replies are processed. A SystemException of NO_PERMISSION is sent to the client. The socket is closed and the transaction is terminated.

User response: Ensure that the client has a valid certificate. Install the certificate in the external security manager with the TRUSTED attribute and which maps to a valid userid in the external security manager. Note that this can be done with the RACDCERT command.

User response: This may be for one of the following reasons:

- The client has not provided any certificate.
- The client's certificate is not installed in the external security manager's database.
- The client's certificate is not marked as TRUSTED in the external security manager's database.

System action: Exception trace point 0125 is issued. Outstanding replies are processed. A SystemException of NO_PERMISSION is sent to the client. The socket is closed and the transaction is terminated.

User response: Ensure that the client has a valid certificate. Install the certificate in the external security manager with the TRUSTED attribute and which maps to a valid userid in the external security manager. Note that this can be done with the RACDCERT command.

User response: This may be for one of the following reasons:

- The client has not provided any certificate.
- The client's certificate is not installed in the external security manager's database.
- The client's certificate is not marked as TRUSTED in the external security manager's database.

System action: Exception trace point 0125 is issued. Outstanding replies are processed. A SystemException of NO_PERMISSION is sent to the client. The socket is closed and the transaction is terminated.

User response: Ensure that the client has a valid certificate. Install the certificate in the external security manager with the TRUSTED attribute and which maps to a valid userid in the external security manager. Note that this can be done with the RACDCERT command.

User response: This may be for one of the following reasons:

- The client has not provided any certificate.
- The client's certificate is not installed in the external security manager's database.
- The client's certificate is not marked as TRUSTED in the external security manager's database.

System action: Exception trace point 0125 is issued. Outstanding replies are processed. A SystemException of NO_PERMISSION is sent to the client. The socket is closed and the transaction is terminated.

User response: Ensure that the client has a valid certificate. Install the certificate in the external security manager with the TRUSTED attribute and which maps to a valid userid in the external security manager. Note that this can be done with the RACDCERT command.

User response: This may be for one of the following reasons:

- The client has not provided any certificate.
- The client's certificate is not installed in the external security manager's database.
- The client's certificate is not marked as TRUSTED in the external security manager's database.

System action: Exception trace point 0125 is issued. Outstanding replies are processed. A SystemException of NO_PERMISSION is sent to the client. The socket is closed and the transaction is terminated.
DFHII0106 E date time applid client_ip_addr
tcpiipservice The request receiver find request stream failed.

Explanation: The IIOP Request Receiver received a GIOP request; however, the attempt to find a Request Stream failed.

System action: Outstanding replies are processed. A systemException of COMM_FAILURE is sent to the client. The socket is closed and the transaction is terminated.

User response: Use trace and the previous DFHII0002 message to determine why program DFHIIRRH failed to find a Request Stream.

Destination: CIIL
Modules: DFHIIRR
XMEOUT Parameters: date, time, applid, client_ip_addr, tcpipservice, ur dbname

---

DFHII0107 E date time applid client_ip_addr
tcpiipservice The request receiver is unable to receive a reply from the request processor. Request ID: req_id

Explanation: The IIOP Request Receiver received a GIOP request and sent it to the ORB via a Request Stream. A reply was expected but the request receiver was unable to receive it. The failure to receive the request could be caused by a transport failure or by the failure of the Request Processor. req_id is the request ID of the request expecting the reply.

System action: Exception trace point 012D is issued. A systemException of COMM_FAILURE or INTERNAL is sent to the client. The Request Receiver attempts to continue.

User response: Use trace to determine why the RZSO RECEIVE_REPLY failed.

Data 2 in the exception trace point entry contains the first 1024 bytes of the GIOP request.

Destination: CIIL
Modules: DFHIIRR
XMEOUT Parameters: date, time, applid, client_ip_addr, tcpipservice, req_id

---

DFHII0108 E date time applid client_ip_addr
tcpiipservice The request receiver was notified that a reply could not be delivered for requestId req_id. Reason: (Request Processor ABEND. | Request Stream closed. | Timeout. | Undefined.)

Explanation: The IIOP Request Receiver request streams notify gate was called with a status that indicated that the reply was not available. The reply was for requestId req_id. The reason is set from the notify status.

System action: Exception trace point 013A is issued. A systemException of COMM_FAILURE or INTERNAL is sent to the client. The request receiver task attempts to continue.

User response: If the reason is TIMEOUT then determine why the Request Processor was unable to respond within the RTIMOUT time specified in the DFHCICSI profile. Otherwise use trace to determine why the Request Processor abended or why the Request Stream closed abnormally.

Destination: CIIL
Modules: DFHIIRR
XMEOUT Parameters: date, time, applid, client_ip_addr, tcpipservice, req_id, {1=Request Processor ABEND., 2=Request Stream closed. | Timeout. | Undefined.}

---

DFHII0109 E date time applid client_ip_addr
tcpiipservice The request receiver received a request with an OTS PropagationContext with a null coordinator.

Explanation: The IIOP Request Receiver received a GIOP request. The request handler found an OTS PropagationContext with a null coordinator in the transaction context within the request header.

System action: Exception trace point 0148 is issued. Outstanding replies are processed. A systemException of INVALID_TRANSACTION is sent to the client. The socket is closed and the transaction terminated.

User response: Trace point II 0212 data 1 contains the transaction sequence (the contents of the transaction context - for a maximum of 512 bytes).

If the transaction context originated in WebSphere Application Server Advanced Edition, you should use the WebSphere administration console to set the command line option com.ibm.ejs.jts.jts.ControlSet.nativeOnly=false for the relevant server to cause it to propagate interoperable transaction contexts.

Destination: CIIL
Modules: DFHIIRR
XMEOUT Parameters: date, time, applid, client_ip_addr, tcpipservice, req_id

---
XMEOUT Parameters: date, time, applid, client_ip_addr, tcpipservice

DFHII0110 E date time applid client_ip_addr tcpipservice The request receiver received a request with no object key. Reason(X’pointid’).

Explanation: The IIOP Request Receiver received a GIOP header with no object key in the request or locate request header. The actual problem with the request or locate header depends on the reason pointid which is the II exception trace point id issued with the message:

013C The addressing disposition value is invalid. From GIOP 1.2 the addressing disposition within the target address should be a 2 byte value of 0, 1 or 2 indicating whether a KeyAddr, ProfileAddr or ReferenceAddr follows. This means that CICS cannot find an object key.

013D The addressing disposition value is 2 but a 0 value for profile number indicates that there are no tagged profiles and thus no object key.

013E The addressing disposition value is 2 and one or more tagged profiles exist. However the object key is in the tagged internet profile (profileid = 00000000) which is not present.

System action: Exception trace point 0106 is issued. Outstanding replies are processed. A messageError is sent to the client. The socket is closed and the transaction terminated.

User response: Check the definitions in the TCPIP service and the specified transaction.

Destination: CIIL

Modules: DFHIIRR

XMEOUT Parameters: date, time, applid, client_ip_addr, tcpipservice, transaction

DFHII0201 E date time applid client_ip_addr tcpipservice The request receiver received an invalid GIOP header.

Explanation: The IIOP Request Receiver received a GIOP header with the magic field (first 4 bytes) not equal to ‘GIOP’.

System action: Exception trace point 0106 is issued. Outstanding replies are processed. A messageError is sent to the client. The socket is closed and the transaction terminated.

User response: Determine why the GIOP header was sent with an incorrect magic field.

Data 2 in the exception trace point entry contains the GIOP header.

Destination: CIIL

Modules: DFHIIRR

XMEOUT Parameters: date, time, applid, client_ip_addr, tcpipservice

DFHII0202 E date time applid client_ip_addr tcpipservice The request receiver received a GIOP header for an unsupported version. Supported version is GIOP sup_version. Received version is GIOP rec_version.

Explanation: The IIOP Request Receiver received a GIOP header with an invalid GIOP version. This CICS supports up to GIOP sup_version. The version of the received message is GIOP rec_version.

System action: Exception trace point 0108 is issued. Outstanding replies are processed. A systemException is sent to the client. The socket is closed and the transaction terminated.

User response:

If this CICS region is part of a logical server which is being upgraded from one release to another, ensure that all regions within the logical server advertise the lowest level of GIOP supported across the logical server. Please see the Migration Guide of the most recent level of CICS for further advice.

Ensure that IORs published for use with this CICS region are at GIOP version sup_version and that the client ORB is using the IOR correctly.
Data 2 in the exception trace point entry contains the GIOP header.

**Destination:** CIIL

**Modules:** DFHIIRR

**XMEOUT Parameters:** date, time, applid, client_ip_addr, tcpipservice, sup_version, rec_version

---

**DFHII0204 E**
date time applid client_ip_addr
tcpipservice The request receiver received a fragment when none was expected.

**Explanation:** The IIOP Request Receiver received a messageType of fragment; however, the 'more fragments' flag was not set in the previous message.

**System action:** Exception trace point 010F is issued.

Outstanding replies are processed. A messageError is sent to the client. The socket is closed and the transaction terminated.

**User response:** Determine why the client sent a fragment when one was not expected.

Data 2 in the exception trace point entry contains the first 1024 bytes of the GIOP request.

**Destination:** CIIL

**Modules:** DFHIIRR

**XMEOUT Parameters:** date, time, applid, client_ip_addr, tcpipservice

---

**DFHII0205 E**
date time applid client_ip_addr
tcpipservice The request receiver received a messageType of messageError.

**Explanation:** The IIOP Request Receiver received a messageType of messageError.

**System action:** Exception trace point 0120 is issued.

Outstanding replies are processed. A messageError is sent to the client. The socket is closed and the transaction terminated.

**User response:** Determine why the client sent a messageError. If it was in response to a message from the server, determine the message in error.

Data 2 in the exception trace point entry contains the GIOP Header.

**Destination:** CIIL

**Modules:** DFHIIRR

**XMEOUT Parameters:** date, time, applid, client_ip_addr, tcpipservice

---

**DFHII0206 E**
date time applid client_ip_addr
tcpipservice The request receiver received a messageType of reply or locateReply which is not supported.

**Explanation:** The IIOP Request Receiver received a messageType of reply or locateReply which is not supported by this Request Receiver.

**System action:** Exception trace point 0121 is issued.

Outstanding replies are processed. A messageError is sent to the client. The socket is closed and the transaction terminated.

**User response:** Determine why the client sent a reply.

Data 2 in the exception trace point entry contains the GIOP Header.

**Destination:** CIIL

**Modules:** DFHIIRR

**XMEOUT Parameters:** date, time, applid, client_ip_addr, tcpipservice

---

**DFHII0207 E**
date time applid client_ip_addr
tcpipservice The request receiver received a messageType of closeConnection which is not supported.

**Explanation:** The IIOP Request Receiver received a messageType of closeConnection which is not supported by this Request Receiver.

**System action:** Exception trace point 0122 is issued.

Outstanding replies are processed. A messageError is sent to the client. The socket is closed and the transaction terminated.

**User response:** Determine why the client sent a closeConnection.

Data 2 in the exception trace point entry contains the GIOP Header.

**Destination:** CIIL

**Modules:** DFHIIRR

**XMEOUT Parameters:** date, time, applid, client_ip_addr, tcpipservice

---

**DFHII0208 E**
date time applid client_ip_addr
tcpipservice The request receiver received a GIOP header with an invalid messageType.

**Explanation:** The IIOP Request Receiver received a GIOP header with an invalid message type.

**System action:** Exception trace point 0123 is issued.

Outstanding replies are processed. A messageError is sent to the client. The socket is closed and the transaction terminated.
User response: Determine why the client sent GIOP header with an unknown messageType.

Data 2 in the exception trace point entry contains the GIOP Header.

Destination: CIIL

Modules: DFHIIRR

XMEOUT Parameters: date, time, applid, client_ip_addr, tcpipservice

DFHI0209 E date time applid client_ip_addr tcpipservice The request receiver is unable to parse a request header.

Explanation: The IIOP Request Receiver received a GIOP request header which it is unable to parse correctly.

System action: Exception trace point 0214 or 0215 is issued followed by Exception trace point 0128. Outstanding replies are processed. A messageError is sent to the client. The socket is closed and the transaction terminated.

User response: Determine why the request header is apparently invalid.

If exception trace point 0214 is issued then DFHIIRR was unable to parse the service contexts in the request header.

If exception trace point 0215 is issued then DFHIIRR found a length in the request header that was greater than the length of the whole buffer. The length is contained in data 1.

Data 2 in the exception trace point 0128 contains the first 1024 bytes of the request.

Destination: CIIL

Modules: DFHIIRR

XMEOUT Parameters: date, time, applid, module, X'reason'

DFHI0210 E date time applid client_ip_addr tcpipservice The request receiver is unable to run the security URM: module. Reason(X'reason')

Explanation: The IIOP Request Receiver attempted to invoke the security URM module but failed with a code supplied as reason.

System action: Exception trace point 0209 is issued. Outstanding replies are processed. A messageError is sent to the client. The socket is closed and the transaction terminated.

User response: Possible causes of the problem and an indication of how to solve them are given in the following list of reason code meanings:

1. The user exit program should be linked with AMODE(31). Ensure that the user exit is linked to the correct AMODE.
2. The user exit program has no PPT entry. Ensure that the PPT entry for the user exit program exists and is valid.
3. The user exit program could not be loaded. Ensure that the user exit program is contained in one of the data sets concatenated in the DFHRPL DD statement and has the correct name.
4. The user exit program has abended. This is a possible error within the user exit program. Check for any abend codes that may have been issued.
5. The user exit program is not enabled. CICS may have disabled the program due to an earlier error or the program may have been defined as disabled.
6. CICS is unable to load the user exit program for some other reason. Use trace to determine why the DFHPGLU call failed.

Destination: CIIL

Modules: DFHIIRR

XMEOUT Parameters: date, time, applid, module, X'reason'

DFHI0212 E date time applid client_ip_addr tcpipservice The request receiver socket receive timed out. Replies outstanding: replies. Fragments in progress: fragments

Explanation: The IIOP Request Receiver issued a socket receive request which timed out. There are replies outstanding. There are fragments in progress.

System action: Exception trace point 010B or 010D is issued. Outstanding replies are NOT processed. A messageError is sent to the client. The socket is closed and the transaction terminated.

User response: Determine if the SOCKETCLOSE time in the TCPIP service definition is adequate and change it if necessary.

Data 2 in the exception trace point entry contains the first 1024 bytes of the request already received.

Destination: CIIL

Modules: DFHIIRR

XMEOUT Parameters: date, time, applid, client_ip_addr, tcpipservice, replies, fragments
**Explanation:** The IIOP Request Receiver request streams notify gate was driven to indicate that a reply is ready, but the task no longer exists for request_id X'req_id'.

**System action:** Exception trace point 0137 is issued.

**User response:** Determine why the resume failed.

**Destination:** CIIL

**Modules:** DFHIIRR

**XMEOUT Parameters:** date, time, applid, X'req_id'

---

**Explanation:** The IIOP Request Receiver request streams notify gate was driven to indicate that a reply is ready, but the task no longer exists for request_id X'req_id'.

**System action:** Exception trace point 0138 is issued.

**User response:** Determine why the resume failed.

**Destination:** CIIL

**Modules:** DFHIIRR

**XMEOUT Parameters:** date, time, applid, X'req_id'

---

**Explanation:** The IIOP Request Receiver request streams notify gate was driven to indicate that a reply is ready, but the task no longer exists for request_id X'req_id'.

**System action:** Exception trace point 0139 is issued.

**User response:** Determine why the task no longer exists.

**Destination:** CIIL

**Modules:** DFHIIRR

**XMEOUT Parameters:** date, time, applid, X'req_id'

---

**Explanation:** The IIOP Request Receiver issued a GIOP header with an invalid length.

**System action:** Exception trace point 0107 is issued.

**User response:** Determine why an IO error occurred.

**Destination:** CIIL

**Modules:** DFHIIRR

**XMEOUT Parameters:** date, time, applid, client_ip_addr, tcpipservice

---

**Explanation:** The IIOP Request Receiver received a GIOP header and attempted to receive the number of bytes specified in the header, however, that number of bytes was not available.

**System action:** Exception trace point 0107 is issued.

**User response:** Determine why the GIOP header was sent with an incorrect length field.

**Destination:** CIIL

**Modules:** DFHIIRR

**XMEOUT Parameters:** date, time, applid, client_ip_addr, tcpipservice

---

**Explanation:** The IIOP Request Receiver issued a GIOP header with an invalid length.

**System action:** Exception trace point 0107 is issued.

**User response:** Determine why an IO error occurred.

**Destination:** CIIL

**Modules:** DFHIIRR

**XMEOUT Parameters:** date, time, applid, client_ip_addr, tcpipservice

---

**Explanation:** The IIOP Request Receiver socket notify gate was driven but the resume for the task failed.

**System action:** Exception trace point 0137 is issued.

**User response:** Determine whether the task was purged - this can be determined by examining the DSSR RESUME exit trace point for an exception of TASK_CANCELED. If the task was not purged examine the DSSR RESUME exit trace point to see why the resume failed.

**Destination:** CIIL

**Modules:** DFHIIRR

**XMEOUT Parameters:** date, time, applid, client_ip_addr, tcpipservice

---

**Explanation:** The IIOP Request Receiver received a GIOP header with an invalid length.

**System action:** Exception trace point 0137 is issued.

**User response:** Determine why the GIOP header was sent with an incorrect length field.

**Destination:** CIIL

**Modules:** DFHIIRR

**XMEOUT Parameters:** date, time, applid, client_ip_addr, tcpipservice

---

**Explanation:** The IIOP Request Receiver socket notify gate was driven but the resume for the task failed. This would occur if the Request Receiver task was force purged.

**System action:** Exception trace point 0137 is issued.

**User response:** Determine whether the task was purged - this can be determined by examining the DSSR RESUME exit trace point for an exception of TASK_CANCELED. If the task was not purged examine the DSSR RESUME exit trace point to see why the resume failed.

**Destination:** CIIL

**Modules:** DFHIIRR

**XMEOUT Parameters:** date, time, applid, client_ip_addr, tcpipservice

---

**Explanation:** The IIOP Request Receiver received a GIOP header with an invalid length.

**System action:** Exception trace point 0137 is issued.

**User response:** Determine why the GIOP header was sent with an incorrect length field.

**Destination:** CIIL

**Modules:** DFHIIRR

**XMEOUT Parameters:** date, time, applid, client_ip_addr, tcpipservice

---

**Explanation:** The IIOP Request Receiver issued a GIOP header with an invalid length.

**System action:** Exception trace point 0137 is issued.

**User response:** Determine why the GIOP header was sent with an incorrect length field.

**Destination:** CIIL

**Modules:** DFHIIRR

**XMEOUT Parameters:** date, time, applid, client_ip_addr, tcpipservice
connection requests that are not followed by the request itself and possibly causing CICS to reach the maximum number of tasks (mxt) limit.

**System action:** Exception trace point 0144 is issued. A message Error is sent to the client. The socket is closed and the transaction terminated.

**User response:** Determine which client is sending in a connection request to a TCPIP service defined with protocol IIOP, without also sending in the request.

**Destination:** CIIL

**Modules:** DFHIIRR

**XMEOUT Parameters:** date, time, applid, tranid

date, time, applid, client_ip_addr, tcpipservice

---

**DFHI0219 E** date time applid The request handler is unable to create or join a request stream because it is unable to reach the target for transaction tranid.

**Explanation:** The IIOP request handler attempted to create or join a request stream for transaction tranid. The transaction specifies a REMOTESYSTEM which cannot be contacted. This might be because IRC is not open or the target system is unavailable.

If the caller is the Request Receiver, message DFHII0106 follows this message. DFHII0106 shows the client ip address and TCPIPSERVICE name of the client.

If tranid is specified as 'n/a' then the request handler was attempting to JOIN a request stream but the transaction id is not available to the request handler.

If the caller was a request processor and a JOIN was being attempted the request processor may attempt to send the request via an outbound TCPIP request stream.

**System action:** Exception trace point 020B is issued if create failed. Exception trace point 020A is issued if join failed. If the caller is the Request Receiver a systemError is sent to the client and the socket is closed and the transaction terminated. If the caller is the Request Processor a systemError is sent to the client and the transaction is terminated.

**User response:** Either install the relevant MRO connection or change the REMOTESYSTEM for transaction tranid to the required MRO connection that is installed.

**Destination:** CIIL

**Modules:** DFHIIRR

**XMEOUT Parameters:** date, time, applid, tranid

---

**DFHI0220 E** date time applid The request handler is unable to create or join a request stream because remote system specified in transaction tranid cannot be reached.

**Explanation:** The IIOP request handler attempted to create or join a request stream for transaction tranid. The transaction specifies a REMOTESYSTEM which cannot be found. The transaction was specified in a Request Model TRANSID parameter.

If the caller is the Request Receiver, message DFHII0106 follows this message. DFHII0106 shows the client ip address and TCPIPSERVICE name of the client.

**System action:** Exception trace point 010A is issued.

**User response:** Check for an earlier DFHSO message which describes the cause of this failure.

**Destination:** CIIL

**Modules:** DFHIIRR

**XMEOUT Parameters:** date, time, applid, client_ip_addr, tcpipservice

---

**DFHI0221 E** date time applid client_ip_addr tcpipservice The Request Receiver failed to receive a request due to a socket error.

**Explanation:** The IIOP Request Receiver attempted to receive a request from a socket, but the socket domain found an error.

**System action:** Exception trace point 010A is issued.

**User response:** Check for an earlier DFHSO message which describes the cause of this failure.

**Destination:** CIIL

**Modules:** DFHIIRR

**XMEOUT Parameters:** date, time, applid, client_ip_addr, tcpipservice

---

**DFHI0222 E** date time applid client_ip_addr tcpipservice The Request Receiver received a request which indicated that a fragment is expected. This is not supported for GIOP 1.1 and earlier.

**Explanation:** The IIOP Request Receiver received a GIOP 1.1 (or earlier) header with the 'fragment
System action: Exception trace point 0149 is issued.
User response: Find why the client is sending fragments.

Destination: CIIL
Modules: DFHIIRR
XMEOUT Parameters: date, time, applid, client_ip_addr, tcpipservice

DFHII0223 E date time applid client_ip_addr tcpipservice The Request Receiver is unable to obtain storage.
Explanation: The IIOP Request Receiver attempted to obtain storage from the storage manager domain.
System action: Exception trace point 0130 is issued.
User response: Find why the CICS system is short on storage. It may be necessary to limit the number of CIRR tasks by using the TRANCLASS mechanism on the TRANSACTION definition for CIRR or by lowering the MAXACTIVE parameter in the existing TRANCLASS. If this is not desirable then you may need to increase the EDSALIM specified in the System Initialization Table.

Destination: CIIL
Modules: DFHIIRR
XMEOUT Parameters: date, time, applid, client_ip_addr, tcpipservice

DFHII0224 E date time applid client_ip_addr tcpipservice The Request Receiver received a request. Processing cannot continue because a security check has failed.
Explanation: The IIOP Request Receiver received a request which contained a security context. The security check failed due to the reason stated in an earlier DFHII06xx message.
System action: Exception trace point 0150 is issued.
User response: Use the TCPIP service name and client ip address from this message and find the earlier DFHII06xx message to determine the cause of the failure.

Destination: CIIL
Modules: DFHIIRR
XMEOUT Parameters: date, time, applid, client_ip_addr, tcpipservice

DFHII0225 E date time applid client_ip_addr tcpipservice The Request Receiver received a request without a valid security context for TCPIPSERVICE AUTHENTICATION((none | basic | asserted | unused | certificate)).
Explanation: The IIOP Request Receiver received a request. The TCPIPSERVICE defined an authentication parameter specified in the message. However, no valid security context was found for that protocol.
System action: Exception trace point 0151 is issued.
User response: Determine whether the authentication parameter specified in the TCPIPSERVICE is wrong or whether the client sent a request with an invalid security context.
1. There might be no security context at all.
2. There might be a security context but of the wrong type.
3. There might be a security context but with an unsupported version.
4. There might be a basic authentication security context which contains a mechanism other than 'SSL' in ASCII.

Use trace to examine the request header found in trace point II 0132. There may be several of these. The GIOP Header is traced first and this is followed by the request header and body of the request. Trace level 1 traces the first 512 bytes. If the security context occurs after 512 bytes you need II trace level 1 and 2 set.

This probably occurs on the first request for the connection but may occur for subsequent requests.

Destination: CIIL
Modules: DFHIIRR
XMEOUT Parameters: date, time, applid, client_ip_addr, tcpipservice, {1=none, 2=basic, 3=asserted, 4=unused, 5=certificate}

DFHII0226 E date time applid client_ip_addr tcpipservice The Request Receiver is unable to send a reply to the client.
Explanation: The IIOP Request Receiver had received a request from the client and was attempting to send the client a reply. However the request receiver received an exception from the socket domain.
System action: Exception trace point 010E is issued.
User response: Find why the client is unable to receive the reply. This may be because the client has been turned off or because the request was cancelled by an operator action.

Destination: CIIL
Modules: DFHIIRR
The IIOP Request Receiver received a GIOP fragment with no preceeding request for requestld: requestId.

Explanation: The IIOP Request Receiver received a fragment. However no GIOP request or locateRequest has been received for the fragment with the requestld specified.

System action: Exception trace point 0152 is issued.
Outstanding replies are processed. A messageError is sent to the client. The socket is closed and the transaction terminated.

User response: Determine why the client sent a fragment with no request. In GIOP 1.2 and above fragments contain a request header that just consists of the requestId. This should be consistent for all the fragments for the request or locate request being received including the first.

Fragments can be in progress for more than one request at a time.

Data 2 in the exception trace point entry contains the first fragment's GIOP header and request header.

Destination: CIIL

Modules: DFHIIRR

XMEOUT Parameters: date, time, applid, client_ip_addr, tcpipservice, replies, fragments

DFHIi0227 E date time applid client_ip_addr
   tcpipservice The request receiver socket has been closed. Replies outstanding:
   replies, Fragments in progress:
   fragments

Explanation: The IIOP Request Receiver received a socket closed notification from the client and at least one of the requests was for GIOP 1.2 or above. There are replies outstanding from the request processor to earlier requests or locate requests.

There are fragments fragmented requests or locateRequests started.

System action: Exception trace point 014A is issued.
Outstanding replies are processed, but not sent on to the client. The transaction is terminated.

User response: Determine why the client closed the socket when there were still replies or fragments in progress.

Destination: CIIL

Modules: DFHIIRR

XMEOUT Parameters: date, time, applid, client_ip_addr, tcpipservice

DFHIi0228 E date time applid client_ip_addr
   tcpipservice The request receiver socket has been closed.

Explanation: The IIOP Request Receiver received a socket closed notification from the client and at least one of the requests was for GIOP 1.2 or above. At GIOP 1.2 or above the request receiver expects to receive a connectionClose request and not a socket close for an orderly shutdown. There are no replies outstanding.

System action: Exception trace point 014B is issued.
The transaction is terminated.

User response: Determine why the client closed the socket before sending a closeConnection request.

Destination: CIIL

Modules: DFHIIRR

XMEOUT Parameters: date, time, applid, client_ip_addr, tcpipservice

DFHIi0229 E date time applid client_ip_addr
   tcpipservice The request receiver received a GIOP fragment with no preceeding request for requestld: requestId

Explanation: The IIOP Request Receiver received a fragment. However no GIOP request or locateRequest has been received for the fragment with the requestld specified.

System action: Exception trace point 014B is issued.
Outstanding replies are processed. A messageError is sent to the client. The socket is closed and the transaction terminated.

User response: Determine why the client sent a fragment with no request. In GIOP 1.2 and above fragments contain a request header that just consists of the requestId. This should be consistent for all the fragments for the request or locate request being received including the first.

Fragments can be in progress for more than one request at a time.

Data 2 in the exception trace point entry contains the first fragment's GIOP header and request header.

Destination: CIIL

Modules: DFHIIRR

XMEOUT Parameters: date, time, applid, client_ip_addr, tcpipservice, requestId

DFHIi0230 E date time applid The request processor request streams notify gate was driven but the task no longer exists.

Explanation: The IIOP Request Processor Request Stream's notify gate was driven to indicate that a reply or request is ready, but the task no longer exists.

System action: Exception trace point 070F is issued.

User response: Determine why the task no longer exists. The task may have been purged or may not have expected a reply and so terminated.

Destination: CIIL

Modules: DFHIIRP

XMEOUT Parameters: date, time, applid

DFHIi0231 E date time applid The request processor request streams notify gate was driven but the resume for the task failed.

Explanation: The IIOP Request Processor Request Stream's notify gate attempted to resume a task when a reply or request was available, but the resume failed.

System action: Exception trace point 0710 is issued.

User response: Determine why the resume failed. The task may have been purged.

Destination: CIIL

Modules: DFHIIRP

XMEOUT Parameters: date, time, applid
The request processor is unable to receive a request from the request receiver.

Explanation: The IIOP Request Processor issued a Request Stream receive request to receive a request from the Request Receiver but the receive failed.

System action: Exception trace point 070B is issued. See the system action for the DFHII1nnn message that is issued after this message.

User response: Use trace to determine why the RZTA RECEIVE_REQUEST failed. Look for earlier Request Stream(RZ) trace and messages.

Destination: CIIL
Modules: DFHIIRP
XMEOUT Parameters: date, time,applid

The request processor is unable to receive a reply from a target ORB.

Explanation: The IIOP Request Processor attempted to receive a reply from a target ORB but the receive failed.

System action: Exception trace point 070C is issued. See the system action for the DFHII1nnn message that is issued after this message.

User response: Use trace to determine why the send request failed. Look for earlier Request Stream (RZ) trace and messages.

Destination: CIIL
 Modules: DFHIIRP
XMEOUT Parameters: date, time,applid

The request processor is unable to send a reply to the request receiver.

Explanation: The IIOP Request Processor issued a Request Stream send reply to send a reply to the Request Receiver but the send failed.

System action: Exception trace point 070A is issued. See the system action for the DFHII1nnn message that is issued after this message.

User response: Use trace to determine why the receive reply failed.

Destination: CIIL
Modules: DFHIIRP
XMEOUT Parameters: date, time,applid

The request processor is unable to send a reply or a request from a target ORB or the request receiver.

Explanation: The IIOP Request Processor attempted to await the arrival of a request from the Request Receiver or a reply from a target ORB but the attempt failed.

System action: Exception trace point 070D is issued. See the system action for the DFHII1nnn message that is issued after this message.

User response: Use trace to determine whether an RZLN LISTEN was for a reply or a request. The 3 tokens in the RZLN LISTEN request will assist in this. The RZLN LISTEN exception will identify the reason for the failure.

Destination: CIIL
Modules: DFHIIRP
XMEOUT Parameters: date, time,applid

The request handler is unable to create or join a request stream because transaction tranid is not installed.

Explanation: The IIOP request handler attempted to create or join a request stream for transaction tranid which is not installed. The transaction was specified in a Request Model TRANSID parameter.

System action: Exception trace point 020B is issued if create failed. Exception trace point 020A is issued if join failed. If the caller is the Request Receiver a systemError is sent to the client and the socket is
Closed and the transaction terminated. If the caller is the Request Processor a 
systemError is sent to the client and the transaction is terminated.

**User response:** Either add an RDO definition for `tranid` with a program name of DFJIIRP or change the matching RDO Request Model that specifies a TRANSID of `tranid` to a transaction that is defined with a program of DFJIIRP.

**Destination:** CIIL  
**Modules:** DFHIIRH  
**XMEOUT Parameters:** `date, time,applid, tranid`

---

**DFHI0238 E** `date time applid` The request processor received a request with an invalid header.

**Explanation:** The IIOP Request Processor issued a receive_request to receive data from a Request Receiver but the data received did not start with the GIOP magic characters.

**System action:** Exception trace point 0719 is issued. See the system action for the DFHII1nnn message that is issued after this message.

**User response:** Use trace to determine why a valid GIOP header was not received.

**Destination:** CIIL  
**Modules:** DFHIIRP  
**XMEOUT Parameters:** `date, time,applid`

---

**DFHI0239 E** `date time applid` A request processor request does not contain a valid cicsTaskTrackingContext.

**Explanation:** The IIOP Request Processor either received a request from the request receiver or was about to send a request. However, the request does not contain a valid cicsTaskTrackingContext.

**System action:** Exception trace point 0725 is issued if the context is missing. Exception trace point 0714 is issued if the request handler was unable to parse the request.

The transaction is abended.

**User response:** Use trace to determine whether the request had just been received from a Request Receiver (DFHIIRP RECEIVE_REQUEST) or whether it had been built by the ORB and was about to be sent (DFHIIRP INVOKE). Data3 in both trace points contain the request.

**Destination:** CIIL  
**Modules:** DFHIIRP  
**XMEOUT Parameters:** `date, time,applid`

---

**DFHI0240 E** `date time applid` The request processor received a reply with an invalid header.

**Explanation:** The IIOP Request Processor attempted to receive a reply from a target ORB but the data received did not start with the GIOP magic characters.

**System action:** Exception trace point 071B is issued. See the system action for the DFHII1nnn message that is issued after this message.

**User response:** Use trace to determine why a valid GIOP header was not received.

**Destination:** CIIL  
**Modules:** DFHIIRP  
**XMEOUT Parameters:** `date, time,applid`

---

**DFHI0241 E** `date time applid` The request processor received a reply fragment with an invalid header.

**Explanation:** The IIOP Request Processor issued a receive_reply to receive a fragment from target ORB but the data received did not start with the GIOP magic characters.

**System action:** Exception trace point 071C is issued. See the system action for the DFHII1nnn message that is issued after this message.

**User response:** Use trace to determine why a valid GIOP fragment header was not received.

**Destination:** CIIL  
**Modules:** DFHIIRP  
**XMEOUT Parameters:** `date, time,applid`

---

**DFHI0242 E** `date time applid` The request processor did not receive a reply fragment.

**Explanation:** The IIOP Request Processor issued a receive_reply to receive a fragment from target ORB but the data received did not have a GIOPMessageType of GIOPFragment.

**System action:** Exception trace point 071D is issued. See the system action for the DFHII1nnn message that is issued after this message.

**User response:** Use trace to determine why a valid GIOP fragment was not received.

**Destination:** CIIL  
**Modules:** DFHIIRP  
**XMEOUT Parameters:** `date, time,applid`
DFHII0243 E date time applid The request processor received a messageError reply.

Explanation: The IIOP Request Processor attempted to receive a reply from a target ORB but the data received had a GIOPMessageType of GIOPMessageError.

System action: Exception trace point 0720 is issued. See the system action for the DFHII1nnn message that is issued after this message.

User response: Use trace to determine why a GIOPMessageError was received.

Destination: CIIL

Modules: DFHIIRP

XMEOUT Parameters: date, time,applid

DFHII0244 E date time applid The request processor received an invalid GIOPMessageType.

Explanation: The IIOP Request Processor attempted to receive a reply from a target ORB. The data received had a known GIOPMessageType but is not valid when sent from a server.

System action: Exception trace point 0721 is issued. See the system action for the DFHII1nnn message that is issued after this message.

User response: Use trace to determine why the target ORB sent an invalid GIOPMessageType.

Destination: CIIL

Modules: DFHIIRP

XMEOUT Parameters: date, time,applid

DFHII0245 E date time applid The request processor received an unknown GIOPMessageType.

Explanation: The IIOP Request Processor attempted to receive a reply from a target ORB but the data received had an unknown GIOPMessageType.

System action: Exception trace point 0722 is issued. See the system action for the DFHII1nnn message that is issued after this message.

User response: Use trace to determine why the target ORB sent an unknown GIOPMessageType.

Destination: CIIL

Modules: DFHIIRP

XMEOUT Parameters: date, time,applid

DFHII0246 E date time applid The request processor received an unexpected GIOPFragment.

Explanation: The IIOP Request Processor attempted to receive a reply from a target ORB. The data received had a GIOPMessageType of GIOPFragment but no earlier GIOPHeader was received with the 'more fragments to follow' bit on.

System action: Exception trace point 0723 is issued. See the system action for the DFHII1nnn message that is issued after this message.

User response: Use trace to determine why the target ORB sent a GIOPFragment without sending an earlier message indicating that a fragment is to follow.

Destination: CIIL

Modules: DFHIIRP

XMEOUT Parameters: date, time,applid

DFHII0247 E date time applid The request processor is unable to receive a reply from a target ORB | request from the Request Receiver. Reason: ABEND. Request Stream closed. Timeout.

Explanation: The IIOP Request Processor attempted to await the arrival of a request from the Request Receiver or a reply from a target ORB but was notified that the data was not available. Reason is set from the notify status.

System action: Exception trace point 070E is issued. See the system action for the DFHII1nnn message that is issued after this message.

User response: Use trace to determine why the failure occurred. Trace point 070E Data 3 contains listen_data which contains the Request Stream token. The listen_data also contains the requestID of the request expecting a reply if the notification was for a reply.

A reason of ABEND indicates that the request stream detected an abend in the Request Receiver or target ORB.

A reason of Request Stream closed indicates that the Request Stream closed abnormally.

A reason of TIMEOUT when failing to receive a request, indicates that the RTIMOUT value in the profile for the Request Processor transaction has been exceeded.

A reason of TIMEOUT when failing to receive a reply, indicates that the RTIMOUT value in the DFHCICSI profile has been exceeded.

Destination: CIIL

Modules: DFHIIRP

XMEOUT Parameters: date, time,applid, {1=reply from
DFHII0248 E date time applid The request processor may have been started invalidly.

**Explanation:** The IIOP Request Processor program DFHIIRP was unable to find its current request stream. This may be because a transaction specifying DFJIIRP was initiated from the wrong place.

**System action:** See the system action for the DFHII1nnn message that is issued after this message.

**User response:** Use trace to find which transaction caused DFJIIRP to be called and find where it was initiated. If it was not initiated by the request stream domain then it may have been initiated from a terminal which is not allowed. Another possibility is that an IIOP TCPIPSERVICE definition mistakenly has a transaction parameter of CIRR where it should have CIRP or the customer equivalents. If, however, it was initiated by the request stream domain then further investigation of the trace is needed.

**Destination:** CIIL

**Modules:** DFHIIRP

**XMEOUT Parameters:** date, time,applid

DFHII0249 E date time applid The Request Processor received a reply which indicated that a fragment is expected. This is not supported for GIOP 1.1 and earlier.

**Explanation:** The IIOP Request Processor received a GIOP 1.1 (or earlier) reply header from a target ORB with the 'fragment expected' bit on. CICS does not support fragments for GIOP 1.1.

**System action:** Exception trace point 0727 is issued.

**User response:** Find why the target ORB is sending fragments.

**Destination:** CIIL

**Modules:** DFHIIRP

**XMEOUT Parameters:** date, time,applid

DFHII0250 E date time applid The request processor received an invalid reply fragment.

**Explanation:** The IIOP Request Processor issued a receive_reply to receive a fragment from target ORB but the reply header did not contain the same requestid as the first fragment.

**System action:** Exception trace point 0728 is issued. See the system action for the DFHII1nnn message that is issued after this message.

**User response:** Use trace to determine why the requestid changed. Each fragment within a reply should contain the same requestid.

**Destination:** CIIL

**Modules:** DFHIIRP

**XMEOUT Parameters:** date, time,applid

DFHII0251 E date time applid client_ip_addr tcpipservice The request receiver received a GIOP fragment whose length is not divisible by 8.

**Explanation:** The IIOP Request Receiver received a request or locate request which indicated that further fragments are to follow. However, the length of the GIOP header plus the length of the message is not divisible by 8.

**System action:** Exception trace point 0135 is issued. Outstanding replies are processed. A messageError is sent to the client. The socket is closed and the transaction terminated.

**User response:** Determine why the client sent a fragment that contained an invalid length. In GIOP 1.2 and above each fragment except the last must have a total length that is divisible by 8.

**Destination:** CIIL

**Modules:** DFHIIRR

**XMEOUT Parameters:** date, time,applid, client_ip_addr, tcpipservice

DFHII0252 E date time applid The request processor received a fragmented reply whose length is not divisible by 8.

**Explanation:** The IIOP Request Processor issued a receive_reply to receive a fragment from target ORB but the message_length plus the length of the GIOP header was not divisible by 8.

**System action:** Exception trace point 071E is issued. See the system action for the DFHII1nnn message that is issued after this message.

**User response:** Use trace to determine why the client ORB sent a fragment with an invalid length.

**Destination:** CIIL

**Modules:** DFHIIRP

**XMEOUT Parameters:** date, time,applid
**Explanation:** The CICS ORB attempted to instantiate the requested plugin class `plugin` but the ORB could not find this class on the current classpath.

**System action:** The plugin is not loaded.

**User response:** Examine the value set for the classpath in the JVM profile being used from the XDFHENV dataset. The pathname for the requested plugin must be present in the classpath.

**Destination:** CIIL

**Modules:** com.ibm.cics.iop.DebugRequestInterceptor

**XMEOUT Parameters:** `date, time, applid, plugin`

---

**Explanation:** The CICS ORB caught an exception thrown from plugin `plugin`.

**System action:** The ORB attempts to continue processing the user application.

**User response:** Either contact the plugin vendor for further assistance or catch the exception in the body of your plugin.

**Destination:** CIIL

**Modules:** com.ibm.cics.iop.DebugRequestInterceptor

**XMEOUT Parameters:** `date, time, applid, plugin`

---

**Explanation:** This is an audit log message indicating the requested plugin class `plugin` has been added to the system using the INSTALL command.

**System action:** The system continues normally.

**User response:** None.

**Destination:** CIIL

**Modules:** DFHIICC

**XMEOUT Parameters:** `date, time, applid`

---

**Explanation:** This is an audit log message indicating the requested plugin class `plugin` has been removed from the system using the DISCARD command.

**System action:** The system continues normally.

**User response:** None.
If the problem is an operational one, take the necessary steps to allow the security process to work.

User response: Use trace to examine the security context within the client causing the violation.

Message DFHII0223 contains the TCPIP service name and the client IP address.

Determine whether the source of the problem is within the client sending the context or within this CICS system.

Destination: CIIL

Modules: DFHIIRS

XMEOUT Parameters: date, time, applid, {1=the userid is too long, 2=the password is too long, 3=of an invalid msgType, 4=the sessionId already exists, 5=the sessionId is not found, 6=of a malformed context, 7=unused, 8=the version is invalid}

DFHII0602 E date time applid The request receiver received a request with a basic authentication security context. The request is rejected because (the ESM inactive | CICS security is inactive | of an unknown ESM error | the command is not authorised | the password is not authorised | the userid is undefined | the password has expired | the userid has been revoked | of a userid format error | the applid is not authorised | of an unexpected return code).

Explanation: The IIOP Request Receiver received a request which contained a basic authentication security context. DFHIIRS was processing the security context but found the error identified in the message.

System action: Exception trace point in the range II 0900-09FF is issued. Message DFHII0223 is issued. Outstanding replies are processed. A systemException containing a modified security context and a string of Marshaling or Internal is sent to the client. The socket is closed and the transaction terminated.

User response: If the problem is caused by a security violation, determine which client caused the problem.

If the problem is an operational one, take the necessary steps to allow the security process to work.

Message DFHII0223 contains the TCPIP service name and the client IP address.

Destination: CIIL

Modules: DFHIIRS

XMEOUT Parameters: date, time, applid, {1=of an invalid msgType, 2=the userid is too long, 3=of an invalid credType, 4=it contains an invalid length, 5=the version is invalid}

DFHII0604 E date time applid The request receiver received a request with an asserted identity security context. The request is rejected because (CICS security is inactive | the userid is undefined | the userid is not determined | the ESM is inactive | the ESM is not present | the command is not authorised | the XSRF resource name is not found | the XSRF class is not found | the XSRF resource name is invalid | the USAD reason is not expected | the XSRF reason is not expected).

Explanation: The IIOP Request Receiver received a request which contained an asserted identity security context. DFHIIRS was processing the security context but found the error identified in the message.

System action: Exception trace point in the range II 0900-09FF is issued. Message DFHII0223 is issued. Outstanding replies are processed. A systemException containing a modified security context and a string of Marshaling or Internal is sent to the client. The socket is closed and the transaction terminated.

User response: If the problem is caused by a security violation, determine which client caused the problem.

If the problem is an operational one, take the necessary steps to allow the security process to work.

Message DFHII0223 contains the TCPIP service name and the client IP address.
DFHII1000 E  date time applid className methodName
   internal error  desc.
Explanation:  An internal logic error  desc was detected
in method methodName of class className of the IIOP
RequestProcessor.
System action:  An II domain exception trace entry is
made and a system dump requested. The
RequestProcessor terminates abnormally.
User response:  Use the trace and dump to determine
the cause of the problem. If the problem persists you
may need to contact your IBM support representative.
Destination:  CIIL
Modules: com.ibm.cics.iip.RequestProcessor
XMEOUT Parameters:  date, time,applid, className,
   methodName,desc

DFHII1001 E  date time applid Severe error: desc,
   resulting from:  th.
Explanation:  A severe error, identified by the string
desc, was detected by the IIOP RequestProcessor. This
is usually related to a Java Throwable, th.
System action:  An II domain exception trace entry is
made and a system dump requested. The
RequestProcessor terminates abnormally.
User response:  Use the trace, dump and any
previous messages to determine the cause of the
problem. If the problem persists you may need to
contact your IBM support representative.
Destination:  CIIL
Modules: com.ibm.cics.iip.RequestProcessor
XMEOUT Parameters:  date, time,applid, className,
   methodName,desc

DFHII1002 E  date time applid Failure  e obtaining data
   for LogicalServer  serverName.
Explanation:  An EJ domain
INQUIRE_LOGICAL_SERVER command for this
RequestProcessor's LogicalServer was issued by the
setAttributesFromIILS method during RequestProcessor
initialization. The call resulted in error  e.
System action:  An II domain exception trace is issued
   and RequestProcessor initialization is terminated.
User response:  Ensure that a CORBASEVER
   definition for LogicalServer  serverName is available in
the CICS region.
Destination:  CIIL
Modules: com.ibm.cics.iip.LogicalServerImpl
XMEOUT Parameters:  date, time,applid, e, serverName

DFHII1003 E  date time applid LogicalServerPlugin
   load failure  e for class  className.
Explanation:  The LogicalServerPluginRegistry
   received exception  e attempting to instantiate
LogicalServerPlugin class  className. A possible cause
of this error is that the class is missing from the trusted
middleware classpath, TMCLASSPATH, for this
RequestProcessor program. This could be due to a
   missing, corrupt or inaccessible CICS jar file.
System action:  An II domain exception trace is made
   and RequestProcessor initialization is terminated
because the LogicalServerPlugin classes are required
for proper execution of a CICS RequestProcessor.
User response:  Use the message and/or trace to
determine the class in error and ensure that it is
available to the RequestProcessor on the
TMCLASSPATH.
Destination:  CIIL
Modules: com.ibm.cics.iip.LogicalServerPluginRegistry
XMEOUT Parameters:  date, time,applid, e, className

DFHII1004 E  date time applid Exception  e creating
   object of class  javaClassName for OMG
   interface  interfaceName.
Explanation:  The create_object method of the CICS
CosLifeCycle GenericFactory implementation
determined that an object of class  javaClassName could
implement OMG interface  interfaceName, but it failed to
   instantiate such an object.
Common causes of this message are:-
   • the named class cannot be found on the application
     CLASSPATH for this RequestProcessor program.
   • the named class does not contain a public default
    constructor.
System action:  An II domain exception trace is issued
   and a CosLifeCycle::NoFactory exception is returned to
the caller.
User response:  Correct the CLASSPATH and/or class
   implementation as necessary and/or inspect the
exception data recorded in the trace dataset.
Destination:  CIIL
Modules: com.ibm.cics.iip.cso._GenericFactoryImpl
XMEOUT Parameters: date, time, applid, e, javaClassName, interfaceName

DFHII1005 E date time applid Exception e creating object of class className.

Explanation: CorbaStatelessManager, the servant manager for CORBA stateless objects, failed to instantiate or register an object of class className due to exception e. A possible cause of this message is that the named class cannot be found on the application CLASSPATH for this RequestProcessor program.

System action: An II domain exception trace is issued and a CORBA::OBJECT_NOT_EXIST exception is returned to the caller.

User response: Correct the CLASSPATH if necessary and/or inspect the exception data recorded in the trace dataset.

Destination: CIIL

Modules: com.ibm.cics.iop.cso.CorbaStatelessManager

XMEOUT Parameters: date, time, applid, e, className

DFHII1006 E date time applid Exception e writing IOR file fileName.

Explanation: The command processor for CORBA stateless objects was invoked during a CORBA server publish operation to make the GenericFactory IOR file available. An attempt to write to file fileName from method writeToFile in class PublishLogicalServerCommand failed with exception e.

System action: An IILS_EXCEPTION with reason IILS_SHELF_ACCESS_ERROR is returned to the caller.

User response: Correct the HFS access available to the CICS job and reissue publish.

Destination: CIIL

Modules: com.ibm.cics.iop.cso.PublishLogicalServerCommand

XMEOUT Parameters: date, time, applid, e, fileName

DFHII1007 E date time applid Unknown object adapter oa in object key.

Explanation: The CICS ObjectResolver implementation, RootOAImpl, has received an ObjectKey from the ORB containing an unrecognisable ObjectAdapter name oa. This could be caused by invalid input data or a CICS code error.

System action: An II domain exception trace is made and a system dump requested. The ObjectResolver throws NoSuchObjectException to the ORB which returns CORBA::OBJECT_NOT_EXIST to the client.

User response: Use the trace and dump to determine the cause of the problem. Data-2 in the exception trace entry contains the UserKey part of the ObjectKey.

Destination: CIIL

Modules: com.ibm.cics.iop.cso.RootOAImpl

XMEOUT Parameters: date, time, applid, e, fileName

DFHII1008 E date time applid Exception e creating UserKey.

Explanation: The CICS ObjectResolver implementation, RootOAImpl, received an unexpected exception e creating a UserKey object from the input byte array. The byte array is passed to the ObjectResolver by the ORB. It is the object resolver defined part of the ObjectKey known as the UserKey. The constructor of the UserKey class was unable to map the byte array into the fields of a UserKey object. This could be caused by invalid input data or a CICS code error.

System action: An II domain exception trace is made and a system dump requested. The ObjectResolver throws NoSuchObjectException to the ORB which returns CORBA::OBJECT_NOT_EXIST to the client.

User response: Use the trace and dump to determine the cause of the problem. Data-2 in the exception trace entry contains the UserKey part of the ObjectKey.

Destination: CIIL

Modules: com.ibm.cics.iop.cso.RootOAImpl

XMEOUT Parameters: date, time, applid, e

DFHII1009 E date time applid Failure dr issuing IIRP invoke.

Explanation: An unexpected failure dr occurred issuing an IIRP invoke request on an outbound RequestStream.

System action: An II domain exception trace entry is made. For an Exception response, the CICSSourceOutputStream throws a java.io.IOException and a CORBA::COMM_FAILURE is returned to the client. For Disaster or Invalid responses, a system dump will have already been requested by IIRP. The CICSSourceOutputStream throws a

User response: Use trace and dump to determine the

---

**DFHII1017 E** date time applid Badly formed JNDI prefix: prefix in CORBASERVER serverName. The JNDI NameParser threw exception exc.

**Explanation:** An exception exc was returned during validation of the JNDI NameParser prefix defined for CORBASERVER serverName. This operation is performed during a DJAR or CORBASERVER PUBLISH operation.

**System action:** No objects are published to JNDI.

**User response:** Correct the JNDI prefix defined for the target CORBASERVER, reinstall the CORBASERVER and reissue the PUBLISH command.

**Destination:** CIIL

**Modules:** com.ibm.cics.iop.LogicalServerImpl

**XMEOUT Parameters:** date, time, applid, prefix, serverName, exc

---

**DFHII1016 E** date time applid Failure obtaining JNDI context for CORBASERVER serverName, prefix jndiPrefix at level prefixPart. Exception exc was received.
**Explanation:** An exception exc was returned by JNDI during a rebind of the CICS org.omg.CosLifeCycle GenericFactory implementation for CORBASERVER serverName to the JNDI subcontext at jndiPrefix. This operation is performed during a CORBASERVER PUBLISH operation.

**System action:** The GenericFactory object is not published to JNDI.

**User response:** Ensure the JNDI name server is available to CICS, reinstall the CORBASERVER and reissue the PUBLISH command.

**Destination:** CIIL

**Modules:**
- com.ibm.cics.iop.cso.PublishLogicalServerCommand

**XMEOUT Parameters:** date, time, applid, serverName, jndiPrefix, jndiName, exc

---

**Explanation:** An attempt to create shelf shelfName for CORBASERVER serverName failed. This operation is performed during a CORBASERVER INSTALL operation.

**System action:** The CORBASERVER is not installed.

**User response:** Ensure CICS has the required HFS access, and that a directory of this name does not already exist, and reinstall the CORBASERVER.

**Destination:** CIIL

**Modules:**
- com.ibm.cics.iop.cso.InstallLogicalServerCommand

**XMEOUT Parameters:** date, time, applid, serverName, shelfName, fileName

---

**Explanation:** An exception exc was returned by JNDI during an unbind of the CICS org.omg.CosLifeCycle GenericFactory implementation for CORBASERVER serverName from the JNDI subcontext at jndiPrefix. This operation is performed during a CORBASERVER RETRACT operation.

**System action:** The GenericFactory object is not retracted from JNDI.

**User response:** Ensure the JNDI name server is available to CICS and that the CORBASERVER has not been retracted from another AOR.

**Destination:** CIIL

**Modules:**
- com.ibm.cics.iop.cso.RetractLogicalServerCommand

**XMEOUT Parameters:** date, time, applid, serverName, jndiPrefix, jndiName, exc

---

**Explanation:** The command processor for CORBA stateless GenericFactory IOR file fileName from the shelf of CORBASERVER serverName.

**System action:** The CORBASERVER RETRACT operation completes normally.

**User response:** None.

**Destination:** CIIL

**Modules:**
- com.ibm.cics.iop.cso.RetractLogicalServerCommand

**XMEOUT Parameters:** date, time, applid, serverName, jndiPrefix, exc
stateless objects was invoked during a CORBASERVER
RETRACT operation to delete the GenericFactory IOR
file. It was unable to delete the file, named fileName.
This problem may occur if the CICS job has insufficient
HFS access.

System action: The RETRACT continues normally.

User response: Ensure CICS has sufficient HFS
access and reissue retract.

Destination: CIIL

Modules: com.ibm.cics.iop.cs0.RetractLogicalServerCommand

XMEOUT Parameters: date, time,applid, fileName,
serverName

DFHII1024 I date time applid JNDI subcontext
subcontext destroyed during
processing of CORBASERVER
serverName with prefix jndiPrefix.

Explanation: During processing of CORBASERVER
serverName, the subcontext components of the JNDI
prefix prefixName were removed from the name server.
This will occur during CORBASERVER RETRACT
processing for those parts of the subcontext that are
completely emptied by the RETRACT.

System action: Processing continues.

User response: None.

Destination: CIIL

Modules: com.ibm.cics.iop.LogicalServerImpl

XMEOUT Parameters: date, time,applid, subcontext,
serverName,jndiPrefix

DFHII1025 E date time applid Failed to delete HFS
shelf shelfName for CORBASERVER
serverName.

Explanation: An attempt to delete shelf shelfName for
CORBASERVER serverName failed. The shelf is a
directory on this region's HFS. This operation is
performed during a CORBASERVER DISCARD
operation.

System action: The CORBASERVER is discarded.

User response: If a directory of this name does not
exist on HFS, this is probably due to a previous install
failure and may be ignored. If a directory of this name
does exist, check that CICS has the required HFS
access and delete the directory manually; it will need to
be removed before the CORBASERVER can be
reinstalled.

Destination: CIIL

Modules: com.ibm.cics.iop.cs0.DeleteLogicalServerCommand

XMEOUT Parameters: date, time,applid, shelfName,
serverName

DFHII1026 E date time applid CORBASERVER
serverName not installed.

Explanation: A definition for CORBASERVER
serverName could not be found in this CICS region.
This condition can occur if an Enterprise Bean or IIOP
method request is received before the CORBASERVER
to which the target object relates is installed. Another
possible reason for the condition is that the referenced
CORBASERVER is no longer valid and an old object
reference is being used by the client.

System action: The request is rejected with a CORBA
exception.

User response: Install the CORBASERVER or update
the object reference (IOR) and retry the request.

Destination: CIIL

Modules: com.ibm.cics.iop.RequestProcessor

XMEOUT Parameters: date, time,applid, serverName

DFHII1027 I date time applid CORBA stateless
GenericFactory for CORBASERVER
serverName written to the shelf as
fileName.

Explanation: The command processor for CORBA
stateless objects was invoked during a CORBA server
PUBLISH operation to make the GenericFactory IOR file
available. The file was written to the HFS shelf of
CORBASERVER serverName as file fileName.

System action: The PUBLISH operation continues.

User response: None.

Destination: CIIL

Modules: com.ibm.cics.iop.cs0.PublishLogicalServerCommand

XMEOUT Parameters: date, time,applid, serverName,
fileName

DFHII1028 W date time applid Name server not
defined for CORBASERVER
serverName being initialized for
PROGRAM pgmName.

Explanation: No name service system properties are
defined for PROGRAM pgmName.

System action: The ORB configured for
CORBASERVER serverName in this JVM will not be
able to access JNDI. JNDI requests from objects in
CORBASERVER serverName will fail if they are issued
from a program using, or reusing, this JVM.

User response: If objects in this CORBASERVER
need to use JNDI, define the name service in the

Chapter 1. DFH messages 505
com.ibm.cics.ejs.nameserver property, or set the com.ibm.CORBA.InitialReferencesURL property in the system properties file available to PROGRAM pgmName. The system properties file is defined in the JVMPROPS parameter of the PROGRAM's JVMPROFILE. The CORBASERVER should then be DISCARDed and reINSTALLed.

Destination: CIIL
Modules: com.ibm.cics.iiop.orb.ORBFactory
XMEOUT Parameters: date, time,applid, serverName, pgmName

DFHII1029 I date time applid CORBA stateless GenericFactory file fileName deleted from the shelf of CORBASERVER serverName.

Explanation: The command processor for CORBA stateless objects was invoked during a CORBA server RETRACT operation to delete the GenericFactory IOR file. File fileName was deleted from the HFS shelf of CORBASERVER serverName.

System action: The RETRACT operation continues.
User response: None.

Destination: CIIL
Modules: com.ibm.cics.iiop.cso.RetractLogicalServerCommand
XMEOUT Parameters: date, time,applid, fileName, serverName

DFHII1030 W date time applid CORBA stateless GenericFactory for CORBASERVER serverName not found at JNDI subcontext jndiPrefix.

Explanation: During CORBASERVER RETRACT, an attempt is made to unbind the CICS org.omg.CosLifeCycle.GenericFactory implementation from the name server. When this was attempted during RETRACT of CORBASERVER serverName, the GenericFactory was not found at JNDI subcontext jndiPrefix. It is likely that the CORBASERVER has been RETRACTed from another CICS region, or the name server has been cleared, since the last CORBASERVER PUBLISH.

System action: The CORBASERVER RETRACT completes normally.
User response: None.

Destination: CIIL
Modules: com.ibm.cics.iiop.cso.RetractLogicalServerCommand
XMEOUT Parameters: date, time,applid, serverName, jndiPrefix

DFHII1031 E date time applid Unable to obtain JNDI InitialContext jndiPrefix for CORBASERVER serverName.

Explanation: CICS failed to obtain the JNDI InitialContext for CORBASERVER serverName whose jndiPrefix is defined as jndiPrefix. This can occur if the name server is unavailable or incorrectly configured.

System action: The JNDI operation fails.
User response: Ensure the name server is available to CICS and correctly configured. Attempt the operation again.

Destination: CIIL
Modules: com.ibm.cics.iiop.LogicalServerImpl
XMEOUT Parameters: date, time,applid, jndiPrefix, serverName

DFHII1032 I date time applid JNDI subcontext subContext created during processing of CORBASERVER serverName.

Explanation: During processing of CORBASERVER serverName, the sub context subcontext was created on the name server. This will occur during CORBASERVER PUBLISH processing for any parts of the subcontext that did not previously exist.

System action: Processing continues.
User response: None.

Destination: CIIL
Modules: com.ibm.cics.iiop.LogicalServerImpl
XMEOUT Parameters: date, time,applid, subContext, serverName

DFHII1033 I date time applid JNDI subcontext subContext for CORBASERVER serverName not found during RETRACT.

Explanation: JNDI sub context subContext, defined for CORBASERVER serverName, was not found on the name server during a RETRACT operation. Since the subcontext does not exist, there is nothing to retract for this CORBASERVER, so no further JNDI processing is required.

System action: RILS RETRACT processing continues.
User response: None.

Destination: CIIL
Modules: com.ibm.cics.iiop.cso.RetractLogicalServerCommand
XMEOUT Parameters: date, time,applid, subContext, serverName
### DFHII1034 E date time applid No write access to file fileName for creation of shelf shelfName.

**Explanation:** An attempt to create shelf shelfName failed because CICS is unable to modify file fileName. This operation is performed during a CORBASERVER INSTALL operation.

**System action:** Message DFHII1020 is also issued. The CORBASERVER is not installed.

**User response:** Ensure CICS has the required HFS access, and reinstall the CORBASERVER.

**Destination:** CIIL

**Modules:**

com.ibm.cics.iip.cso.AddLogicalServerCommand

**XMEOUT Parameters:** date, time, applid, fileName, shelfName

---

### DFHII1035 W date time applid GenericFactory IOR file fileName not found on the shelf of CORBASERVER serverName.

**Explanation:** The command processor for CORBA stateless objects was invoked during a CORBASERVER RETRACT operation to delete the GenericFactory IOR file. The file, named fileName, did not exist. This is probably because the CORBASERVER was not PUBLISHed from this CICS region, or had already been RETRACTed.

**System action:** The RETRACT continues normally.

**User response:** None.

**Destination:** CIIL

**Modules:**

com.ibm.cics.iip.cso.RetractLogicalServerCommand

**XMEOUT Parameters:** date, time, applid, fileName, serverName

---

### DFHII1036 W date time applid Unexpected ORB creation within the scope of CORBASERVER serverName for PROGRAM pgmName.

**Explanation:** A second or subsequent ORB is being created within a CORBASERVER environment. ORB initialization has detected that CORBASERVER serverName is currently active and, therefore, that ORB initialization is unexpected. This can occur if an application object issues ORB.init, either explicitly, or implicitly from, for example, a non-CICS JNDI initial context factory. This warning message is issued because the ORB being created will be limited to the functionality available to a CICS Java application ORB, for example:

- any interactions involving objects connected to this ORB are unable to participate in any distributed OTS transaction.
- this is a client only ORB. It has no inbound server connection; IORs exported by objects connected to this ORB are unusable.
- objects retrieved from JNDI using this ORB are handled as remote objects, even if they are from the active CORBASERVER.

**System action:** ORB initialization continues.

**User response:** If this situation has occurred inadvertently, through usage of the incorrect naming context factory, check that the javax.naming.Context.INITIAL_CONTEXT_FACTORY Property, java.naming.factory.initial, has not been overridden. It should be allowed to default to com.ibm.ejs.ns.jndi.CNInitialContextFactory. This property can be set as a system property by an authorized application, or in the system properties file available to PROGRAM pgmName. The system properties file is defined in the JVMPROPS parameter of the PROGRAM's JVMPROFILE. The Property can also be passed as a parameter to the InitialContext constructor.

If this situation has occurred inadvertently, through explicit usage of ORB.init, it would normally be preferable for an application to gain access to the ORB that has already been created for the CORBASERVER. CORBA objects can obtain such a reference using the org.omg.CORBA.portable.ObjectImpl _orb() method.

EJB objects can obtain a reference to the current ORB by issuing a JNDI lookup of 'java ORBString = "java org.omg.CORBA.ORB curORB = (org.omg.CORBA.ORB) initCtx.lookup(ORBStr);

**Destination:** CIIL

**Modules:** com.ibm.cics.iip.orb.ORB

**XMEOUT Parameters:** date, time, applid, serverName, pgmName

---

### DFHII1037 E date time applid CORBASERVER serverName has received a request with AUTHTYPE authType. The attrName attribute in the request has a value of (value1) which does not match the value (value2) configured for the CORBASERVER.

**Explanation:** A request has been received for a connection to CORBASERVER serverName with AUTHTYPE authType. However, there is a mismatch between one of the attributes in the request and the corresponding attribute of the configured CORBASERVER or TCPIPSERVICE. The attribute will be one of:

1. TCPIPSERVICE name.
2. Port number.
3. SSL type.

**System action:** An II domain exception trace entry is made, a com.ibm.cics.iop.RequestProcessorRuntimeException is thrown and the RequestProcessor terminates abnormally.

**User response:** Ensure that the attributes of the TCPIP services in the AOR region match those of the Listener region. If any attributes have changed, reinstall the changed definitions and republish the relevant DJAR/CORBASERVER to ensure that the IORs in use match the currently active CORBASERVER and TCPIPSERVICE definitions.

**Destination:** CIIL

**Modules:** com.ibm.cics.iop.LogicalServerImpl

**XMEOUT Parameters:** date, time, applid, serverName, authType, attrName, value1, value2

---

**DFHI1038 E** date time applid CORBASERVER

serverName does not have a TCPIPSERVICE configured for AUTHTYPE authType.

**Explanation:** A CICSCConnectionContext has been received which contains an authentication type for which no TCPIPSERVICE is configured for this CORBASERVER. The data in a CICSCConnectionContext is derived from the TCPIPSERVICE in the listener region, by the RequestReceiver.

**System action:** An II domain exception trace entry is made, a com.ibm.cics.iop.RequestProcessorRuntimeException is thrown and the RequestProcessor terminates abnormally.

**User response:** Ensure that a TCPIPSERVICE is configured for the appropriate authentication type. Ensure that the attributes of the TCPIP services in the AOR region match those of the Listener region. If any attributes have changed, reinstall the relevant DJAR/CORBASERVER to ensure that the IORs in use match the currently active CORBASERVER and TCPIPSERVICE definitions.

**Destination:** CIIL

**Modules:** com.ibm.cics.iop.LogicalServerImpl

---

**DFHIINxxxx (Indoubt testing tool) messages**

**DFHI1001** date time applid termid userid The indoubt tool is now active for DFHTCIND tranclass transactions.

**Explanation:** The indoubt tool is active and causes all units of work (UOWs) running under transactions defined to be in transaction class DFHTCIND to fail indoubt when they reach syncpoint.

---

**DFHI1050 W** date time applid Maximum version of GIOP has not been specified. Defaulting to GIOP 1.1 .

**Explanation:** The maximum version of the General Inter-ORB Protocol (GIOP) has not been configured or is invalid.

The maximum GIOP version is included in all CORBA object references exported by CICS. You can use the CICS Resource Manager for Enterprise Beans (RMEB) to discover which version of GIOP your published enterprise beans currently advertise.

CICS can support up to GIOP version 1.2 . GIOP support in CICS TS 2.2 was limited to a maximum of GIOP version 1.1 . If you have a distributed CorbaServer which contains both CICS TS 2.2 and newer CICS regions, it is important that the newer CICS regions do not advertise support for anything beyond GIOP 1.1 .

You can set the maximum version of GIOP that CICS will use by setting the following environment variable in the CICS JVM properties file: com.ibm.cics.iop.MaxGIOPMinorVersion=<n> where <n> is either 1 or 2 representing GIOP 1.1 or GIOP 1.2 .

It is recommended that all regions be set to use GIOP 1.2 . GIOP 1.1 should only be set as the maximum supported version of GIOP if the CICS region is participating in a CorbaServer which includes CICS TS 2.2 regions.

**System action:** CICS defaults to compatibility mode for CORBA requests; the maximum version of GIOP advertised in published object references is GIOP 1.1 .

**User response:** You can suppress this message by telling CICS the maximum GIOP version to use via the MaxGIOPMinorVersion property (see above).

**Destination:** CIIL

**Modules:** com.ibm.cics.iop.LogicalServerImpl

**XMEOUT Parameters:** date, time, applid

---

A unit of work that fails indoubt is either shunted by the recovery manager domain or is unilaterally committed or unilaterally backed out by recovery manager. A unit of work is shunted if the transaction definition under which it is running specifies WAIT(yes) as an indoubt option, and the unit of work has not accessed any resources that force a unilateral decision to be taken.
System action: CICS processing continues with the indoubt tool active.
User response: None.
Destination: CSMT and Terminal End User
Modules: DFHINDT
XMEOUT Parameters: date, time, applid, termid, userid

DFHIN1002 date time applid The indoubt tool is already active.
Explanation: A CIND ON request was issued to activate the indoubt tool but CICS has detected that the indoubt tool is already active.
System action: CICS processing continues with the indoubt tool active.
User response: None.
Destination: Terminal End User
Modules: DFHINDT

DFHIN1003 date time applid The indoubt tool is active for DFHTCIND tranclass transactions.
Explanation: A CIND INQUIRE request was issued to inquire on the status of the indoubt tool. CICS has detected that the indoubt tool is active.
System action: CICS processing continues with the indoubt tool active.
User response: None.
Destination: Terminal End User
Modules: DFHINDT

DFHIN1004 date time termid userid The indoubt tool is no longer active for DFHTCIND tranclass transactions.
Explanation: A CIND OFF request was issued to deactivate the indoubt tool. No more units of work (UOWs) running under transactions defined in tranclass DFHTCIND will fail indoubt when they reach syncpoint.
Existing transactions in the DFHTCIND tranclass that are currently running fail indoubt at syncpoint, but no new transactions in the DFHTCIND tranclass will fail indoubt.
System action: CICS processing continues with the indoubt tool inactive.
User response: None.
Destination: CSMT and Terminal End User
Modules: DFHINDT
XMEOUT Parameters: date, time, applid, termid, userid

DFHIN1005 date time applid The indoubt tool is already inactive.
Explanation: A CIND OFF request was issued to deactivate the indoubt tool but CICS has detected that the indoubt tool is already inactive.
System action: CICS processing continues with the indoubt tool inactive.
User response: None.
Destination: Terminal End User
Modules: DFHINDT

DFHIN1006 date time applid The indoubt tool is not active.
Explanation: A CIND INQUIRE request was issued to inquire on the status of the indoubt tool. CICS has detected that the indoubt tool is inactive.
System action: CICS processing continues with the indoubt tool inactive.
User response: None.
Destination: Terminal End User
Modules: DFHINDT

DFHIN1007 date time termid userid Initiation of resynchronization for units of work awaiting coordinator DFHINDSP is now complete.
Explanation: A CIND RESYNC COMMIT or CIND RESYNC BACKOUT request was issued. The indoubt tool has successfully initiated resynchronization of all units of work (UOWs) currently awaiting resynchronization with coordinator DFHINDSP.
System action: Shunted UOWs awaiting the return of coordinator DFHINDSP are unhunted by the recovery manager (RM) domain. All participants in the UOW are notified of the outcome of the unit of work. The outcome of the unit of work is defined by the user of CIND, for example, CIND RESYNC COMMIT tells the RM domain to unshunt the UOWs and commit them. Likewise, CIND RESYNC BACKOUT tells the RM domain to backout the UOWs. Message DFHIN1012 is issued to transient data for each UOW resynchronized.
For UOWs awaiting the return of coordinator DFHINDSP which were not shunted, that is, they abended before syncpoint, or a unilateral decision was taken, a CIND RESYNC command merely results in message DFHIN1012 being issued to transient data. DFHIN1012 reports on whether this CICS system and DFHINDSP are synchronized.
User response: See the associated transient data DFHIN1012 messages.
Destination: CSMT and Terminal End User

Chapter 1. DFH messages  509
**Explanation:** The CIND transaction was invoked with an invalid keyword.

**System action:** CICS processing continues and the status of the indoubt tool is unchanged.

**User response:** Reinvoke the CIND transaction with the correct keyword.

**Destination:** Terminal End User

---

**Explanation:** The indoubt tool task related user exit DFHINTRU, invoked when a transaction is first started, has detected that the transaction is part of transaction class DFHTCIND. Coordinator DFHINDSP has been added to unit of work (UOW) so that the transaction will fail indoubt when a syncpoint is issued.

**System action:** The named transaction and UOW continue processing until it reaches syncpoint when it will fail indoubt.

**User response:** None.

**Destination:** CSMT

**Modules:** DFHINTRU

---

**Explanation:** The named UOW for the named transaction and task has been resynchronized as a result of a CIND RESYNC command. The message reports the UOW status as defined by the coordinator DFHINDSP, and the unit of work status held by the recovery manager domain. The recovery manager domain also issues messages reporting whether or not the UOW is synchronized.

**System action:** CICS processing continues.

**User response:** None.

**Destination:** CSMT

**Modules:** DFHINDSP
XMEOUT Parameters: date, time, applid, X’uowid’, tranid, taskno, {1=commit., 2=backout.}, {1=commit., 2=backout., 3=heuristic commit., 4=heuristic backout.}

DFHIN1013 date time applid termid userid No units of work awaiting resynchronization with coordinator DFHINDSP were found.

Explanation: A CIND RESYNC COMMIT or CIND RESYNC BACKOUT request was issued. The indoubt tool did not find any units of work (UOWs) that were awaiting resynchronization with coordinator DFHINDSP.

System action: CICS processing continues.

User response: Before initiating resynchronization, the indoubt tool needs to be activated via command CIND ON, and transactions in tranclass DFHTCIND run to create indoubt units of work.

Destination: CSMT and Terminal End User

Modules: DFHINDT

XMEOUT Parameters: date, time, applid, termid, userid

DFHIN1014 date time applid The indoubt tool will not operate on transaction tranid task number taskno as it is an internal CICS system transaction.

Explanation: The indoubt tool task related user exit DFHINTRU, invoked when a transaction is first started, has detected that the transaction is part of transaction class DFHTCIND. However it has also detected that the transaction is an internal CICS system transaction. CIND cannot be used on internal CICS system transactions.

System action: The named transaction and task continue processing and are not forced indoubt at syncpoint time.

User response: None.

DFHIRxxxx messages

Explanation: An error occurred on an intersystem session recovery which has now been successfully recovered and resynchronized. This message is normally issued as a follow-up to message DFHRM0107, (which may have been issued at the time of the failure if the session failed at a critical time during syncpoint processing).

System action: Processing continues.

User response: None.

Destination: CSMT

Modules: DFHCRR

XMEOUT Parameters: date, time, applid, time, sysid, termid, tranid, taskno, termid, operid, uowid
DFHIR2123  *date time applid* Intersystem session recovery. Data base changes found to be out of sync. Original failure details: Time=*, Remote system=*, Intersystem terminal=*, Transaction=*, Task number=*, Operator terminal=*, Operator=*, Unit of work ID=*. 

**Explanation:** This message is issued as a follow-up to message DFHRM0107. The original failure information provides a cross-reference.

**System action:** Processing continues.

**User response:** Take user-defined action to resynchronize the local and remote databases.

**Destination:** CSMT

**Modules:** DFHCRR

**XMEOUT Parameters:** *date, time, applid, time, sysid, termid, tranid, taskno, termid, operid, uowid*

DFHIR2124  *date time applid* Intersystem session recovery. Error when data base changes may be out of sync. Original failure details: Time=*, Remote system=*, Intersystem terminal=*, Transaction=*, Task number=*, Operator terminal=*, Operator=*, Unit of work ID=*. 

**Explanation:** This message is issued as a follow-up to message DFHRM0107. During session recovery, the system was unable to determine whether database changes were out of synchronization.

**System action:** Processing continues.

**User response:** Make the necessary database enquiries to detect whether changes are synchronized. If they are not, take user-defined action to resynchronize the databases.

**Destination:** CSMT

**Modules:** DFHCRR

**XMEOUT Parameters:** *date, time, applid, time, sysid, termid, tranid, taskno, termid, operid, uowid*

DFHIR2321  *applid* MRO/IRC Communication being Terminated. Session(s) with the following Netname(s) are still Active: 

**Explanation:** CICS is attempting to close MRO/IRC communication. This message is normally followed by the netname of each session that is still active, and additionally for EXCI sessions, the jobname, stepname, procname and MVS ID of the batch program communicating on that session.

For EXCI sessions, a netname of GENERIC indicates a generic pipe. For the batch job information to appear in the message, at least one DPL request must have been issued on that session.

**Note:** In some circumstances the message is not followed by any netnames. This can occur if CICS is using the cross-system coupling facility (XCF) to communicate across CECs, and CICS is unable to deliver an earlier message to XCF because, for example, the XCF buffer is full.

**System action:** CICS issues IRC STOP IMMEDIATE to force close the remaining session(s). This message is reissued at 30 second intervals, or until the last session is closed.

**User response:** None, unless the delay in closedown appears abnormally long. If this is the case, investigate why the session(s) are still active. Take appropriate action to allow the session(s) to close. If no netnames are displayed, investigate why XCF is unable to accept a message from CICS.

**Destination:** Console

**Modules:** DFHZDSP

**XMEOUT Parameter:** *applid*

DFHIR3747  *applid* CONNECTION connid with protocol(EXCI) has been connected to by a NON-BATCH system. Connection set out of service.

**Explanation:** A CICS connection has been defined with the protocol EXCI and an attempt has been made to connect to it by a non-batch system. There are two possible explanations for this message:

- The non-batch system is attempting to communicate with the wrong target connection definition.
- The target connection definition has incorrectly been defined as an EXCI connection.

**System action:** CICS sets the connection out of service.

**User response:** Investigate and correct the relevant connection definitions and set back in service.

**Destination:** Console

**Modules:** DFHCRNP

**XMEOUT Parameters:** *applid, connid*

DFHIR3748  *date time applid* Initial start of connected system sysid, netname netname, protocol pppp was detected.

**Explanation:** A new logname was received during the MRO bind process from the connected system. This indicates that the connected system has restarted with a start type of INITIAL, since it last communicated with
If the message-issuing system has any resynchronization data relating to units of work from a previous usage of the connection, this data is kept but cannot be used by the system for automatic resynchronization.

**System action:** New MRO work for the connection is not inhibited.

**User response:** Examine the resynchronization information kept by the system from the previous usage of the connection using the EXEC CICS INQUIRE UOWLINK RESYNCSTATUS command (or the equivalent CEMT command) for the named connection in order to locate UOWLINKs with a RESYNCSTATUS of COLDSTART. You can use this information to resolve manually any indoubt units of work that existed on this system or the connected system. When the information is no longer of use, issue the EXEC CICS SET CONNECTION PENDSTATUS(NOTPENDING) command (or the CEMT equivalent) for the named connection to discard the resynchronization data relating to the previous usage. Note that any new resynchronization data generated for the newly established connection is still kept.

**Destination:** Console and Transient Data Queue

**Modules:** DFHCRR

**XMEOUT Parameters:** date, time, applid, sysid, netname, pppp

---

**DFHIR3760 applid Unable to break lines with interregion communication. (Modname: modname)**

**Explanation:** A request has been made to shut down the interregion session. This has caused module DFHZCX to issue a request to the interregion communication program to terminate the association between CICS and the interregion communication program, but the request failed because of a system error.

**System action:** Any running batch (database sharing) programs are left in the wait state, and should be canceled. Any CICS tasks (in other CICS systems) that are in communication with this system are also left in the wait state. These other CICS systems should issue CEMT SET CONNECTION(sysid) OUTSERVICE PURGE, where sysid is the CONNECTION name of the system for which DFHIR3760 was issued. Also, any attempt to restart the interregion session (in the current or any subsequent CICS session) fails.

**User response:** To run further batch CICS interregion communication, you must re-IPL. You will need further assistance to resolve the underlying problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** Console

**Modules:** DFHZIS2, DFHSTP

**XMEOUT Parameters:** applid, modname

---

**DFHIR3762 date time applid Inter-region activity now complete**

**Explanation:** A CEMT SET INTERREGION COMMUNICATION (IRC) CLOSED request was issued at the master terminal. The IRC session is now complete.

**System action:** Processing continues.

**User response:** None.

**Destination:** CSMT

**Modules:** DFHCRRNP

**XMEOUT Parameters:** date, time, applid
DFHIR3765  UNABLE TO STOP INTERREGION COMMUNICATION SESSION AFTER SYSTEM ABEND.

Explanation: A request has been received (by means of system termination, abnormal termination, or master terminal) to stop the interregion session. This request has failed.

System action: The session remains active.

User response: If the session must be stopped, you may have to re-IPL. You will need further assistance to resolve the underlying problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Modules: DFHCRC

DFHIR3767  applid The interregion startup program DFHCRSP is not present.

Explanation: Module DFHCRSP is required to start an IRC session, but is missing from the CICS program library or has no installed program definition.

System action: The IRC session is not started.

User response: Install DFHCRSP definition (group DFHISC) and/or supply module DFHCRSP

Destination: Console

Modules: DFHSIJ1

XMEOUT Parameter: applid

DFHIR3771  applid Unable to start interregion communication because (E)STAE macro failed.

Explanation: CICS issued an ESTAE macro that did not execute successfully, probably because storage for an ESTAE control block (SCB) was not available. For more information about the SCB, refer to the MVS/ESA System Programming Library: Application Development Guide.

System action: The IRC session is not started.

User response: Correct the cause of (E)STAE failure.

Destination: Console

Modules: DFHSIJ1

XMEOUT Parameter: applid

DFHIR3772  applid Error while attempting to start interregion communication.

Explanation: CICS has evidence that the IRC session has already started. This is probably because the previous session could not be stopped (see messages DFHIR3760 and DFHIR3765).

Note: The session, although apparently started, is not in a usable state.

System action: The IRC session is not started.

User response: Perform another IPL.

Destination: Console

Modules: DFHSIJ1

XMEOUT Parameter: applid

DFHIR3773  applid Unable to start interregion communication because the APPLID option has a blank value.

Explanation: Either the default value of applid (on DFHTCT TYPE=INITIAL, DFHSIT, override) must be used, or a value which is not a null value must be used.

System action: The IRC session is not started.

User response: Correct the applid value.

Destination: Console

Modules: DFHSIJ1

XMEOUT Parameter: applid

DFHIR3774  applid Error while attempting to start interregion communication.

Explanation: CICS has evidence that the IRC session has already started. This is probably because the previous session could not be stopped (see messages DFHIR3760 and DFHIR3765).

Note: The session, although apparently started, is not in a usable state.

System action: The IRC session is not started.

User response: Perform another IPL.

Destination: Console

Modules: DFHSIJ1

XMEOUT Parameter: applid

DFHIR3775  applid Unable to start interregion communication because short on storage.

Explanation: Main storage is required to start the IRC session, but the storage is not available.

System action: The IRC session is not started.

User response: Wait until the storage condition has eased, then issue CEMT SET IRC OPEN command at the master terminal.

Destination: Console

Modules: DFHSIJ1

XMEOUT Parameter: applid

DFHIR3776  applid Unable to start interregion communication because another CICS system of the same name is active.

Explanation: A CICS system is named by its applid value. If two CICS systems have the same applid value, the interregion communication SVC cannot distinguish between the systems.
Note: This situation may arise if a previous interregion communication (IRC) session could not be stopped; see message DFHIR3760. In this case, the IRC SVC would consider that the new session conflicted with the old (unstoppable) session.

System action: The IRC session is not started.

User response: Use a different generic applid for each CICS system.

Destination: Console

Modules: DFHSIJ1

XMEOUT Parameter: applid

---

DFHIR3779 applid Insufficient storage is available for interregion communication subsystem blocks.

Explanation: There is insufficient storage for the control blocks required by IRC. Storage is required from the CICS region but from outside the CICS DSA.

System action: The IRC session is not started.

User response: Ensure that sufficient storage is available. See the [CICS Performance Guide](#) for further guidance on how to determine the CICS DSA size limits in relation to the REGION size.

Destination: Console

Modules: DFHSIJ1

XMEOUT Parameter: applid

---

DFHIR3780 applid Unable to start interregion communication. Return code=X'retcode', Reason code=X'rsncode'.

Explanation: CICS attempted to establish itself as a user of the interregion communication (IRC) services, but the attempt failed.

System action: The IRC session is not started.

User response: The return code and reason code (if any) correspond to a number of possible errors. The four byte return code field displays the following information starting with the high order byte:

- One byte error qualifier (if any)
- One byte MVS return code (if any)
- Two byte IRC return code

See [Interregion Control Blocks (IRC)](#) in the CICS Data Areas manual for a complete list of return codes and error qualifiers. (The names of all the return codes and error qualifiers start with IRERR and IRERQ respectively.)

The return codes should be referenced from the documentation for the version of CICS that supplied the IRP program in use rather than the version of CICS that issued the message.

Check that the following requirements are satisfied:
- A copy of DFHIRP providing an adequate level of function is present in the link pack area (LPA).
- CICS has been defined as an operating system subsystem. The [CICS Transaction Server for z/OS Installation Guide](#) explains how to define CICS as a subsystem.
• The XCF couple data sets have been formatted with enough XCF groups and members per group to satisfy the requirements of your installation.
• The userid of the CICS job is authorized to log on to the CICS interregion program (DFHIRP) using the generic applid specified.
• The CICS region has a unique generic applid within the MVS sysplex.
• The CICS DB2 attachment has not been initialized before the first start of IRC in a CICS system that is using both of the following:
  – Multiregion operation (MRO) or CICS shared database, where any of the installed MRO or CICS shared database resource definitions specify ACCESSMETHOD(XM)
  – The DB2 CICS attachment to run DB2 applications.

If the message is issued when all of these conditions have been met, you will need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Modules: DFHSIJ1

**XMEOUT Parameters:** applid, X'retcode', X'rsncode'

---

**DFHIR3781** applid Unable to start interregion communication because task CSNC cannot be attached.

Explanation: Definitions for CSNC or DFHCRNP have not been installed, or DFHCRNP is missing from the CICS program library.

System action: The IRC session is not started.

User response: Make CSNC or DFHCRNP available.

Destination: Console

Modules: DFHSIJ1

**XMEOUT Parameter:** applid

---

**DFHIR3783** date time applid Transaction transid termid - Connected transaction abended with message xxxx

Explanation: Transaction transid was connected to a transaction in another CICS system, through an MRO link. This other transaction has abnormally terminated with the given message, causing the local transaction to abnormally terminate.

System action: The transaction abnormally terminates.

User response: Correct the cause of the abend in the connected transaction.

Destination: CSMT

---

**DFHIR3784** appl id A severe error (code X'code') has occurred in module DFHCRR. Connection conname (if non-blank) has been set out of service.

Explanation: An error has been detected in module DFHCRR. The code X'code' is the exception trace point id which uniquely identifies what the error is and where the error was detected.

System action: An exception entry is made in the trace table (X'code' in the message). A system dump is taken, unless you have specifically suppressed dumps in the dump table.

The connection conname (if any) being processed at the time of error is set out of service, to prevent the error from recurring repeatedly.

CICS will continue unless you have specified in the dump table that CICS should terminate. Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Find and fix the source of the error before setting the connection back in service.

Notify the system administrator. This failure indicates a serious error in CICS. If you have not requested termination in the dump table, you may want to terminate CICS. For further information about CICS exception trace entries, see the CICS Problem Determination Guide.

You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Modules: DFHCRR

**XMEOUT Parameters:** applid, X'code', conname

---

**DFHIR3785** appl id Interregion control task CSNC abend. Interregion activity will be abnormally terminated.

Explanation: CSNC is abnormally terminated.

System action: CSNC is abnormally terminated with a system dump. All tasks using MRO links to other systems are abnormally terminated. CICS also abends all tasks in other CICS regions (including CICS shared database batch regions) that are currently communicating with this system.

User response: You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Following this abend it is not possible to use IRC within...
this CICS system. CICS must be restarted before IRC can be used.

Destination:  Console
Modules:  DFHCRNP
XMEOUT Parameter:  applid

DFHIR3786  applid Unable to start interregion communication because module DFHSCTE could not be found.
Explanation:  The IRC module DFHIRP attempted to load DFHSCTE, but the module was not in the LPA.
System action:  The interregion communication session is not started.
User response:  Ensure that DFHSCTE is available.

Destination:  Console
Modules:  DFHSIJ1
XMEOUT Parameter:  applid

DFHIR3788  date time applid Unexpected failure (return code=X'retcode', reason code=X'rsncode') trying to establish connection to system sysid
Explanation:  CICS could not establish a link to system sysid, even though system sysid is available for communication.
The most common value of code X'retcode' returned by the interregion communication SVC is X'68'. This means that no connection to the requesting region has been defined in the target region.
The four byte return code field displays the following information starting with the high order byte:
• One byte error qualifier (if any)
• One byte MVS return code (if any)
• Two byte IRC return code
See Interregion Communication Control Blocks in the CICS Data Areas manual for a complete list of return codes and error qualifiers. (The names of all the return codes and error qualifiers start with IRERR and IRERQ respectively.)
A possible reason for this message is that the applid of the system on which the message appears does not match the NETNAME on any of the system entries defined in system sysid.
This error may also occur when connections are being created dynamically. In this case, the mismatch is transient and will eventually be resolved when the connection creation process running on the remote CICS region completes.
System action:

If the mismatch is transient, the connection is established.
If there is a definition error, the connection is not established. Any existing connections are not affected.
Message DFHME0116 is normally produced containing the symptom string for this problem.
User response:
If the mismatch is transient, a connection should be established. This can be verified by querying the connection status using CEMT.
If an applid or a NETNAME mismatch has occurred, correct the error and retry.
If a mismatch is not the cause of the error, you may need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination:  CSMT
Modules:  DFHCRNP
XMEOUT Parameters:  date, time, applid, X'retcode', X'rsncode', sysid

DFHIR3789  date time applid SEND/RECEIVE mismatch between TCT system entries for this system and system sysid
Explanation:  The number of send sessions defined in this system's TCT entry for system sysid does not equal the number of receive sessions defined in system sysid's TCT entry for this system, or the number of receive sessions defined in this system's TCT entry for system sysid does not equal the number of send sessions defined in system sysid's TCT entry for this system.
System action:  As many sessions as possible are established.
User response:  Alter one or both DFHTCT entries.

Destination:  CSMT
Modules:  DFHCRNP
XMEOUT Parameters:  date, time, applid, sysid

DFHIR3790  date time applid Unable to connect to system sysid for security reasons
Explanation:  The TYPE=SYSTEM entry in system sysid's DFHTCT entry for this system contained a SECURITYNAME operand that did not match the real external security ID of this system, or the ID was unknown to IRC.
System action:  The connection is not established.
Message DFHME0116 is normally produced containing the symptom string for this problem.

**User response:** Discuss with the system programmer responsible for system sysid.

**Destination:** CSMT  
**Modules:** DFHCRNP  
**XMEOUT Parameters:** date, time, applid, sysid

---

**DFHIR3791**  
**applid Unable to start interregion communication because ISC=NO has been specified.**

**Explanation:** IRC facilities are not available because ISC=NO has been specified.

**System action:** The interregion communication session is not started.

**User response:** Run with a value other than NO in the ISC operand of DFHSIT or system initialization overrides.

**Destination:** Console  
**Modules:** DFHSIJ1  
**XMEOUT Parameter:** applid

---

**DFHIR3793**  
**applid Unable to start interregion communication because a severe error has occurred in the recovery manager.**

**Explanation:** IRC facilities are not available because an internal request issued to recovery manager has failed.

**System action:** The interregion communication session is not started.

**User response:** You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** Console  
**Modules:** DFHSIJ1  
**XMEOUT Parameter:** applid

---

**DFHIR3794**  
**date time applid Interregion usage of MVS CSA storage has reached nnnn bytes for this IPL**

**Explanation:** The maximum number of MVS CSA bytes used so far in this IPL by the CICS interregion communication facility (for interregion buffers), is nnnn.

**System action:** Processing continues.

**User response:** None.

**Destination:** CSMT  
**Modules:** DFHZCX

---

**DFHIR3795**  
**ABNORMAL TERMINATION - STATUS CODE DHxx**

**Explanation:** The IMS high-level programming interface (HLPI) has found a condition caused by a programming error, or DL/I has returned a status code to HLPI that indicates an error. xx is the status code.

**System action:** The batch program abnormally terminates with abend code 3795.

**User response:** Correct the error and try again. See the IMS Application Programming: DL/I Calls or the Application Programming: EXEC DL/I Commands for an explanation of the IMS status code.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console  
**Modules:** DFHDRPG

---

**DFHIR3796**  
**date time applid Transaction tranid termid - A connected transaction sent issue abend with following message: xxxxxx**

**Explanation:** Transaction tranid was connected to a transaction in another CICS system via an MRO link. The other transaction sent an ISSUE-ABEND flow with a message.

**System action:** Processing continues.

**User response:** Examine the information in the included message to determine the circumstances and what action to take.

**Destination:** CSMT  
**Modules:** DFHZIS1  
**XMEOUT Parameters:** date, time, applid, tranid, termid, xxxxxx

---

**DFHIR3798**  
**applid IRC Not Started. Unable to load Interregion Communication Work Exit DFHIRW10.**

**Explanation:** As part of interregion communication initialization, an attempt is made to establish an internal work exit mechanism. This attempt has failed.

The most likely reason for the failure is that the interregion communication work exit module, DFHIRW10, cannot be loaded. This module should appear in an APF authorized library in the STEPLIB concatenation for the CICS region, in the linklist, or in the LPA.

**System action:** The attempt to initiate the interregion communication facility (via the IRCSTR RT DFHSIT or override option or via the CEMT SET IRC OPEN
Unable to start interregion communication because DFHIRP services are down level.

Explanation: The version of DFHIRP being used is at a lower level than that of the caller wishing to make use of interregion communication.

System action: The interregion communication session is not started.

User response: If IRC is required, update the level of the DFHIRP module in the LPA such that it matches the level of the latest CICS version in use. If IRC is not required, run with system initialization override option IRCSTRT=NO.

Destination: Console

Modules: DFHSIJ1, DFHDRPF

Chapter 1. DFH messages

DFHJCxxxx messages

DFHJC4522 DDNAME ddname HAD A PERMANENT I/O ERROR.

Explanation: An unrecoverable I/O error occurred while the CICS journal print utility was processing the data set defined in the DD statement ddname.

System action: If the error occurred on an output data set, and multiple output copies were specified, processing continues with the other copies. Otherwise, the journal print utility terminates abnormally.

User response: If the error occurred on an output data set, and you wish to rerun, change the DD statement to refer to a different volume, and resubmit the job. Take the original volume offline for recovery, if possible.

If the error occurred on an input data set, to be able to recover you must have a backup copy of the defective volume. You can change the DD statement to refer to the backup volume, and rerun the job. If you have a backup copy of a defective disk, you can use IBM utilities to recover the disk by flagging the defective track and pointing to an alternate track.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHJUP

DFHJC4523 PROCESSING IS BEING TERMINATED FOR THIS OPTION.

Explanation: This is an informatory message issued by the CICS journal print utility, when it completes processing for an OPTION card. The card referred to is the last OPTION card before this message on SYSPRINT.

System action: The journal print utility continues processing with the next option.

User response: If no other messages appear between the OPTION card and this message, the termination is normal. If other messages have been issued, check them to see if the termination is normal or abnormal. If abnormal termination has occurred, correct the errors notified in other message(s), and resubmit the job.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHJUP

DFHJC4524 INVALID CONTROL CARD FORMAT.

Explanation: The CICS journal print utility detected an error in an input CONTROL card. The card is displayed on SYSPRINT on the line before this message.

System action: The journal print utility ignores the invalid card, and assumes standard defaults.

User response: If the output of the run is not what you want, correct the invalid card and resubmit the job.

Note: This message cannot be changed with the message editing utility.

Destination: SYSPRINT

Modules: DFHJUP

DFHJC4525 INVALID CARD TYPE.

Explanation: The CICS journal print utility read an input card that did not contain one of the following strings starting in column 1: ‘CONTROL’, ‘OPTION’, ‘+’, or ‘END’.

The invalid card is displayed on SYSPRINT in the line before this message.

System action: The journal print utility ignores the invalid card and continues processing.
**User response:** If the job fails or the output is not what you want, correct the invalid card and resubmit the job.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHJUP

---

**DFHJC4526 INVALID OPTION CARD OR PRIOR ERROR.**

**Explanation:** The CICS journal print utility detected an error in an OPTION card or ignored it because of a previous error. The card is displayed in the line before this message.

**System action:** The journal print utility ignores the card and continues processing.

**User response:** If the job fails or the output is not what you want, correct the error and resubmit the job.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHJUP

---

**DFHJC4527 END OF JOB.**

**Explanation:** This is an end-of-job information message issued by the CICS journal print utility when it terminates normally. Errors may have been detected but none was sufficient to cause abnormal termination.

**System action:** The journal print utility terminates normally.

**User response:** Check that all options completed normally. If not, submit another job for the options that you still need.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHJUP

---

**DFHJC4528 NO OPTION CARDS SUPPLIED.**

**Explanation:** The CICS journal print utility detected that, for one CONTROL card:
1. No OPTION cards were supplied **OR**
2. All the OPTION cards contained errors (notified in previous messages).

**System action:** The journal print utility does no processing for the CONTROL card with no OPTION cards.

**User response:** Supply correct OPTION cards for the options you want and resubmit the job.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHJUP

---

**DFHJC4529 UNABLE TO OPEN INPUT FILE.**

**Explanation:** The CICS journal print utility was unable to open the input data set associated with the CONTROL card displayed before this message.

**System action:** The journal print utility continues processing with the next input card.

**User response:** Check the JCL. For a data set without a standard label, check that the data set control block (DCB) parameters are supplied. If you find a JCL error, correct it and resubmit the job.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHJUP

---

**DFHJC4530 ELEMENT LIST ERROR.**

**Explanation:** The CICS journal print utility detected an error while processing an input file.

**System action:** The journal print utility terminates processing with the MVS user abend code 0185.

**User response:** This is usually caused by a previous error, for which a message has been issued. If any previous error messages were displayed, make the necessary corrections and resubmit the job.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

** Modules:** DFHJUP

---

**DFHJC4531 END OF FILE ON INPUT.**

**Explanation:** The CICS journal print utility has reached EOF on the current input file.

**System action:** The journal print utility completes processing for the CONTROL card preceding this message on SYSPRINT.

**User response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHJUP
DFHJC4532  OPTION COMPLETE.

**Explanation:** The CICS journal print utility has completed processing for the OPTION card preceding this message on SYSPRINT.

**System action:** The journal print utility continues processing with the next OPTION card or, if there are no further options before the END card, completes processing for the current control card.

**User response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHJUP

---

DFHJC4533  UNABLE TO OPEN OUTPUT FILE.

**Explanation:** The CICS journal print utility was unable to open the output data set associated with the last CONTROL card displayed on SYSPRINT before this message.

**System action:** The journal print utility terminates processing for this CONTROL card, and continues processing with the next CONTROL card.

**User response:** Check the JCL. For a data set without a standard label, check that the data set control block (DCB) parameters are supplied. If you find a JCL error, correct it and resubmit the job.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHJUP

---

DFHJC4534  NO ELEMENT LIST ADDRESS.

**Explanation:** During CICS journal print utility processing, an error occurred in building the element list.

**System action:** The journal print utility terminates processing for this element list, and terminates abnormally with the MVS user abend code, 0184.

**User response:** This is an internal error in the journal print utility, DFHJUP. You need further assistance from IBM to resolve this problem. See Part 4 of the [CICS Problem Determination Guide](#) for guidance on how to proceed.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** SYSPRINT

**Modules:** DFHJUP

---

DFHKCxxxx messages

**DFHKC0102** date time applid terminal userid tranid

PFT entry for profname has been added.

**Explanation:** This is an audit log message indicating that profile entry profname has been added to the PFT using the INSTALL command.

**terminal** is the netname or termid of the terminal at which the INSTALL command was entered.

**userid** is the user identifier of the operator performing the INSTALL command.

**tranid** is the transaction used to perform the INSTALL command.

**System action:** The system continues normally.

**User response:** None.

**Destination:** CSKL

**Modules:** DFHKCQ

**XMEOUT Parameters:** date, time,applid, terminal, userid, tranid, profname

---

**DFHKC0104** date time applid terminal userid tranid

PFT entry for profname has been deleted.

**Explanation:** This is an audit log message indicating that profile entry profname has been deleted from the CICS profile table (PFT) using the DISCARD command.

**terminal** is the netname or termid of the terminal at which the DISCARD command was entered.
userid is the user identifier of the operator performing the DISCARD command.

tranid is the transaction used to perform the DISCARD command.

**System action:** The system continues normally.

**User response:** None.

**Destination:** CSKL

**Modules:** DFHKCQ

**XMEOUT Parameters:** date, time, applid, terminal, userid, tranid, profname

---

**Explanation:** This is an audit log message indicating that profile entry profname has been replaced in the CICS profile table PFT using the INSTALL command.

**System action:** The system continues normally.

**User response:** None.

**Destination:** CSKL

**Modules:** DFHKCQ

**XMEOUT Parameters:** date, time, applid, terminal, userid, tranid, profname

---

**Explanation:** During transaction manager initialization, CICS executes the following steps in the order in which they are listed:

1. Building the profile table (PFT) directory.
2. Purging profile definitions from the global catalog using the catalog domain.
3. Restoring profile definitions from the global catalog using the catalog domain.

The transaction manager restart has failed for reason rc, where rc indicates the job step that did not complete successfully. Subsequent steps have not been attempted.

**System action:** CICS terminates the task under which DFHKCRP is running with an AKCB abend code, and issues message DFHSI1521.

**User response:** Examine the trace in the CICS AKCB transaction dump to see the history of the task that DFHKCRP is running under for further information regarding the precise cause of the failure.

**Destination:** Console

**Modules:** DFHKCRP

**XMEOUT Parameters:** applid, rc

---

**Explanation:** An error such as a program check was detected by the operating system during the execution of a unit of work scheduled by means of a service request block (SRB). The SRB was scheduled, directly or indirectly, by CICS in order to issue a VTAM authorized path request.

A message could not be issued because the error was detected when running under an SRB.

**Diagnostics:** The error is handled by a functional recovery routine (FRR) in DFHKCSP. This FRR saves the system diagnostic work area (SDWA) if one was provided, and issues a CALLRTM to terminate the CICS TCB with user abend code 0308.

This, in turn, causes the ESTAE exit established by DFHKESTX to be taken, resulting in the storing of the CICS TCB status and provision of a dump as for abends occurring during execution under the CICS TCB.

The SDWA saved by DFHKCSP may be located in the dump by:
- Finding the module itself (look for characters "DFHKCSP").
Finding the save area (look for characters 'SRB SDWA SAVE AREA'); the SDWA follows this character string.

Analysis: The SDWA, located as described above, is a standard MVS SDWA. The principal contents of the SDWA are:

- SDWAGRSV
  General registers 0 through 15
- SDWAEC1
  Program status word (PSW) at the time of the interrupt.

In general, registers 12 and 13 will not address a TCA or the CSA.

The registers and PSW recorded in DFHKESTX represent the state of the CICS TCB when CICS was terminated by the FRR. Normally this information is not relevant to the cause of the failure, but may give clues to the environment in which the SRB was running.

System action: CICS is terminated with user abend code U0308. The system diagnostic work area (SDWA) presented at the time of error is copied into module DFHKCSP. DFHKCSP resides in protected storage and can be printed from an MVS region dump.

User response: Locate the SDWA, situated in DFHKCSP after the characters “SRB SDWA WORK AREA”. This contains the PSW and registers at the time of the error.

If the address in SDWAEC1 is in CICS code, examine the code to determine the expected register contents at this point. If this does not suggest any obvious local problem, look for a pointer to the RPL associated with the SRB mode execution. This will indicate the location of the MVS save area.

If the address in SDWAEC1 is not in CICS code (that is in MVS), try using the contents of register 13 to trace back through the save areas to the one provided by CICS. The contents of this save area will show the point of call in CICS (in DFHZHPRX), and the arguments passed to the access method, in particular the address of the RPL (register 1). Failure in an access method may be due to an incorrect RPL. Therefore check the ACB address, entry point, and I/O area address.

Note: When CICS is executing in SRB mode, it is not possible for the message to be issued. However, user abend code 308 is generated and should appear in message DFHSR0606.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Modules: DFHKCSP

---

**DFHKExxxx messages**

**DFHKE0001** applid An abend (code aaaa/bbbb) has occurred at offset X’offset’ in module modname.

**Explanation:** An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code *aaa/bbbb* is a three digit hexadecimal MVS code (if applicable), followed by a four digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHSTS1310).

During initialization, CICS may not have access to the user’s *applid* coded in the SIT. If CICS produces this message in these circumstances, it uses the default *applid* value DBDCCICS.

**System action:** An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table. CICS continues unless you have specified in the dump table that CICS should terminate.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User response:** If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in OS/390 MVS System Codes.

Next, look up the CICS alphanumeric code in this manual. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module *modname* you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Destination:** Console
DFHKE0002 applid A severe error (code X'\text{code}') has occurred in module modname.

Explanation: An error has been detected in module modname. The code code is the exception trace point id which uniquely identifies what the error is and where the error was detected.

For further information about CICS exception trace entries, see the [CICS Problem Determination Guide](https://www.ibm.com). During initialization, CICS may not have access to the user's applid coded in the SIT. If CICS produces this message in these circumstances, it uses the default applid value DBDCCICS.

System action: An exception entry (code X'\text{code}') in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS will continue unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message will be issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated.

If the message occurs once and module modname is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module modname you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the [CICS Problem Determination Guide](https://www.ibm.com) for guidance on how to proceed.

Destination: Console

**DFHKE0004 applid A possible loop has been detected at offset X'\text{offset}' in module modname.**

Explanation: A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module modname at offset X'\text{offset}'. This is the offset of the instruction which was executing at the time the error was detected.

During initialization, CICS may not have access to the user’s applid coded in the SIT. If CICS produces this message in these circumstances, it uses the default applid value DBDCCICS.

System action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Notify the system programmer. If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of CPU time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module modname is terminated and CICS continues.

But if you have declared ICVR=0 in the SIT and you consider that module modname has gone into a loop, you have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module modname and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently. However, you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM. See Part 4 of the [CICS Problem Determination Guide](https://www.ibm.com) for guidance on how to proceed.

Destination: Console

Modules: DFHKEDD, DFHKEDS, DFHKEGD, DFHKETI

**XMEOUT Parameters:** applid, X'\text{offset}', modname

**XMEOUT Parameters:** applid, X'\text{code}', modname
DFHKE0005  applid A hardware error has occurred
(module modname, code X'code'). The
MVS store clock was found
inoperative.

Explanation: A hardware error has occurred during
the running of module modname. The MVS store clock
facility is the timing mechanism for the operating
system.

The code code is the exception trace point ID which
uniquely identifies the place where the error was
detected.

During initialization, CICS may not have access to the
user’s applid coded in the SIT. If CICS produces this
message in these circumstances, it uses the default
applid value DBDCCICS.

System action: An exception entry (code code in the
message) is made in the trace table. A system dump is
taken, unless you have specifically suppressed dumps
in the dump table.

CICS continues unless you have specified in the dump
table that CICS should terminate.

User response: If CICS is still running, it is necessary
to decide whether to terminate CICS. This is probably a
hardware error and you should first investigate the MVS
store clock and find out whether it is working properly. If
this is the cause, you should take the appropriate action
to have it repaired or replaced.

In the unlikely event that this is not a hardware problem,
you will need further assistance from IBM. See Part 4 of
the CICS Problem Determination Guide for guidance on
how to proceed.

Note: This message cannot be changed with the
message editing utility.

Destination:  Console

Modules:  DFHKETI

DFHKE0006  applid Insufficient storage to satisfy
Getmain (code X'code') in module
modname. MVS code mvrcode.

Explanation: An MVS GETMAIN was issued by
module modname but there was insufficient storage
available to satisfy the request.

The code X'code' is the exception trace point ID which
uniquely identifies the place where the error was
detected.

The code mvrcode is the MVS GETMAIN return code.

During initialization, CICS may not have access to the
user’s applid coded in the SIT. If CICS produces this
message in these circumstances, it uses the default
applid value DBDCCICS.

System action: CICS will terminate with a system
dump. An exception entry is made in the trace table
(code code in the message).

Message DFHME0116 is normally produced containing
the symptom string for this problem.

User response: Inform the system programmer.

You can get diagnostic information about the MVS
return code by consulting the relevant MVS codes
manual which is listed in the book list at the front of this
book.

Try decreasing the overall size limit of the DSAs or
EDSAs. Or, try increasing the size of the whole region,
if it is not already at maximum size. If CICS is not
already terminated, you will need to bring CICS down to
do this. See the CICS System Definition Guide or the
CICS Performance Guide for further information on
CICS storage.

Destination:  Console

Modules:  DFHKEIN

XMEOUT Parameters: applid, X'code',modname,
mvrcode

DFHKE0101  applid DFHSIP IS NOT
APF-AUTHORIZED. CICS WILL
TERMINATE.

Explanation: Part of CICS initialization must be done
in an APF-authorized state. The kernel has detected
that DFHSIP is not APF-authorized.

During initialization, CICS may not have access to the
user’s applid coded in the SIT. If CICS produces this
message in these circumstances, it uses the default
applid value DBDCCICS.

System action: CICS will terminate. The CICS job
step terminates with return code 12.

User response: All libraries concatenated in the
STEPLIB concatenation should be APF-authorized, and
DFHSIP should be link-edited with an authorization
code of 1.

Note: This message cannot be changed with the
message editing utility.

Destination:  Console

Modules:  DFHKESIP

DFHKE0102  applid UNSUCCESSFUL
PRE-INITIALIZATION OF domain
DOMAIN. CICS WILL TERMINATE.

Explanation: A domain has failed to pre-initialize and
as a result the system will terminate.

During initialization, CICS may not have access to the
user’s applid coded in the SIT. If CICS produces this
message in these circumstances, it uses the default
applid value DBDCCICS.
Since this problem has occurred so early in CICS initialization, possible causes include a severe lack of storage or corruption of the local catalog.

**System action:** CICS terminates.

**User response:** Examine all earlier messages sent to the console to look for any obvious cause of the domain pre-initialisation failure.

If you cannot find the cause of the failure from the messages, inform the system programmer. If a dump is taken, investigate this problem using the exception trace which is issued by the failing domain.

You may need further assistance to resolve this problem. See Part 4 of the [CICS Problem Determination Guide](https://www.ibm.com/support/knowledgecenter/SSSC88_16.1.0/com.ibm.cics.doc/cpgm_4.htm) for guidance on how to proceed.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Modules:** DFHKETCB.

---

**DFHKE0103 applid IDENTIFY FAILED IN MODULE modname. MVS CODE mvscode. CICS WILL TERMINATE.**

**Explanation:** The kernel has issued an MVS IDENTIFY which has failed.

The code `mvscode` is the MVS IDENTIFY return code.

During initialization, CICS may not have access to the user’s `applid` coded in the SIT. If CICS produces this message in these circumstances, it uses the default `applid` value DBDCCICS.

**System action:** CICS terminates. The CICS job step terminates with return code 12.

**User response:** Inform the system programmer.

To resolve the problem, use the MVS IDENTIFY return code `mvscode` and the MVS/XA Supervisor Services and Macro Instructions manual, (GC28-1154), to determine why the IDENTIFY failed.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Modules:** DFHKEGD.

---

**DFHKE0104 applid CICS HAS BEEN SUPPLIED WITH INCORRECT SVC NUMBER svcno.**

**Explanation:** CICS has validated the SVC number `svcno`, but it does not correspond to the correct CICS Type 3 SVC for this release of CICS. CICS cannot function without the correct CICS SVC.

The SVC number `svcno` has been specified in the SIT, or as an override, by the CICSSVC= parameter.

During initialization, CICS may not have access to the user’s `applid` coded in the SIT. If CICS produces this message in these circumstances, it uses the default `applid` value DBDCCICS.

**System action:** Control is returned to the parameter manager for interaction with the operator. Further action depends upon which PARMERR= parameter has been specified.

- If PARMERR=ABEND, CICS is terminated with a system dump.
- If PARMERR=IGNORE, CICS is terminated with a system dump.
- If PARMERR=INTERACT, the operator is prompted to enter another SVC number, or to bypass entry. If the operator bypasses entry, CICS is terminated with a system dump.

**User response:** The CICS Type 3 SVC is defined to MVS in SYS1.PARMLIB member IEASVCxx. SVC `svcno` must be defined as a Type 3 SVC with an entry point equal to the entry point name specified when the SVC module was installed into SYS1.LPALIB. Ensure that this is the case.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Modules:** DFHKESIP

---

**DFHKE0105 applid CICS INITIALIZATION IS NOT SUPPORTED ON THIS LEVEL OF OPERATING SYSTEM.**

**Explanation:** The kernel has detected that the release level of the operating system is earlier than the pre-requisite release level required to run CICS.

**System action:** CICS will terminate. The CICS job step terminates with return code 12.

**User response:** Refer to the [CICS Program Directory](https://www.ibm.com/support/knowledgecenter/SSSC88_16.1.0/com.ibm.cics.doc/cpgm_4.htm) and install the pre-requisite operating system release level or higher.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Modules:** DFHKESIP

---

**DFHKE0201 applid ABOUT TO TAKE SDUMP.**

**Dumpcode:** dumpcode, **Dumpid:** dumpid, (**Module** modname).

**Explanation:** An error during pre-initialization or termination, possibly signalled by a previous message, has caused the kernel domain to take a dump, which will issue this message immediately before calling the MVS SDUMP facility.
The dump code *dumpcode* is the 8-character dump code ‘KERNDUMP’.

The dumpid *dumpid* is the string ‘0/0000’.

During initialization, CICS may not have access to the user’s *applid* coded in the SIT. If CICS produces this message in these circumstances, it uses the default *applid* value DBDCCICS.

**System action:** When the dump is complete, message number DFHKE0202 is issued.

**User response:** Inform the system programmer. See the associated dump and error messages for further guidance.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Modules:** DFHKEDD, DFHKEDS, DFHKEGD, DFHKEIN, DFHKESTX

---

**DFHKE0202 applid SDUMP COMPLETE. (MODULE modname).**

**Explanation:** This message is issued on successful completion of an SDUMP.

During initialization, CICS may not have access to the user’s *applid* coded in the SIT. If CICS produces this message in these circumstances, it uses the default *applid* value DBDCCICS.

**System action:** CICS will terminate.

**User response:** Print off the system dump if required. A previous MVS message will identify in which SYS1.DUMP data set this dump can be found.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Modules:** DFHKEDD, DFHKEDS, DFHKEGD, DFHKEIN, DFHKESTX

---

**DFHKE0208 applid SDUMP BUSY - CICS WILL RETRY IN FIVE SECONDS. (MODULE modname).**

**Explanation:** At the time of the MVS SDUMP request issued by CICS, another address space in the same MVS system was in the process of taking an SDUMP. This causes MVS to reject the new request. A nonzero value for the DURETRY parameter on the SIT means that CICS waits for five seconds before reissuing the SDUMP request.

**System action:** CICS issues an MVS STIMERM macro which causes CICS to stop for five seconds. The request is reissued when the delay interval has expired. CICS delays and retries every five seconds for a total time equal to the number of seconds specified on the DURETRY system initialization parameter.

**User response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Modules:** DFHKEDD, DFHKEDS, DFHKEGD, DFHKEIN, DFHKESTX

---

**DFHKE0209 applid RETRYING SDUMP. (MODULE modname).**

**Explanation:** At the time of the MVS SDUMP request issued by CICS, another address space in the same MVS system was in the process of taking an SDUMP. This caused MVS to reject the new request. CICS has waited for five seconds (as indicated by message DFHKE0208) and is now reissuing the SDUMP request.

**System action:** CICS reissues the SDUMP request.

**User response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Modules:** DFHKEDD, DFHKEDS, DFHKEGD, DFHKEIN, DFHKESTX

---

**SDUMP RETURN CODE X'nn' ONLY PARTIAL DUMP**

The SYS1.DUMP data set to which the dump was written was not large enough to contain all of the dumped storage.

**SDUMP RETURN CODE X'nn' REASON X'mm'**

**SDUMP BUSY**

At the time of the MVS SDUMP request issued by CICS, another address space in the same MVS system was in the process of taking an SDUMP. This caused MVS to reject the new request.

If a nonzero value has been specified for the DURETRY SIT parameter, CICS will have retried the SDUMP request every five seconds for the specified period. This message is issued if SDUMP is still busy after the final retry.
SDUMP RETURN CODE X'nn' REASON X'mm' NO DATA SET AVAILABLE
No data set is available for the SDUMP request.

SDUMP RETURN CODE X'nn' REASON X'mm'
MVS rejected the SDUMP request for some other reason than those listed above. X'nn' gives the hexadecimal SDUMP return code and X'mm' gives the hexadecimal SDUMP reason.

NOT AUTHORIZED IN CICS
SDUMP is not authorized for this CICS run.

INSUFFICIENT STORAGE
CICS issued an MVS GETMAIN for Subpool 253 storage during the processing of the SDUMP request. The GETMAIN was rejected by MVS.

STIMERM FAILED
In order to delay for five seconds before retrying SDUMP after an SDUMP busy condition, CICS issues an MVS STIMERM macro request. MVS has indicated that the STIMERM request has failed.

DFHDUSVC FESTAE FAILED
CICS issued an MVS FESTAE request from DFHDUSVC during the processing of the SDUMP request. The FESTAE has been rejected by MVS.

DFHDUSVC FUNCTION INVALID
CICS called DFHDUSVC during the processing of the SDUMP request. The function passed to DFHDUSVC was invalid.

During initialization, CICS does not have access to the user's applid coded in the SIT. If CICS produces this message in these circumstances, it uses the default applid value DBDCCICS.

System action: CICS proceeds as if the dump had been successful.

User response: The user response depends on the reason for the failure. For:

SDUMP RETURN CODE X'nn' ONLY PARTIAL DUMP
Examine the reason code that explains why the partial dump was taken. This code is contained in the MVS message IEA911E. See the OS/390 MVS System Messages, Volume 1 for a description of this reason code.

SDUMP RETURN CODE X'nn' REASON X'mm'
SDUMP BUSY
Cause the SDUMP to be reissued by increasing the DURETRY value on the SIT. See the OS/390 MVS Programming: Authorized Assembler Services Reference for an explanation of the SDUMP return code X'nn' and reason X'mm'.

SDUMP RETURN CODE X'nn' REASON X'mm' NO DATA SET AVAILABLE
Clear a SYS1.DUMP data set and then cause the SDUMP request to be reissued. See the OS/390 MVS Programming: Authorized Assembler Services Reference for an explanation of the SDUMP return code X'nn' and reason X'mm'.

SDUMP RETURN CODE X'nn' REASON X'mm'
No action is required if the dump was suppressed deliberately. If the dump failed because of an error in the MVS SDUMP routine, use MVS problem determination methods to fix the error and then cause the SDUMP request to be reissued. See the OS/390 MVS Programming: Authorized Assembler Services Reference for an explanation of the SDUMP return code X'nn' and reason X'mm'.

NOT AUTHORIZED IN CICS
This reason should not appear, because an SDUMP is unconditionally authorized during CICS initialization, and should be authorized throughout the CICS run. If you do get this reason, the CICS AFCB (Authorized Function Control Block) has probably been accidentally overwritten.

INSUFFICIENT STORAGE
Ensure sufficient storage is available to MVS for subpool 253 requests.

STIMERM FAILED
Use MVS problem determination methods to fix the STIMERM failure and then cause the SDUMP request to be reissued.

DFHDUSVC FESTAE FAILED
Use MVS problem determination methods to fix the FESTAE failure and then cause the SDUMP to be reissued. See the OS/390 MVS Programming: Authorized Assembler Services Reference for an explanation of the FESTAE macro.

DFHDUSVC FUNCTION INVALID
The CICS DAFPB (dump authorized function parameter block) has probably been accidentally overwritten.

Notify the system programmer. If CICS is still running, it will be necessary to decide whether to terminate CICS.

You may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

To resolve the problem, collect any dumps and any relevant messages and contact your IBM Support Center.

Further guidance on how to prepare information for IBM support is given in the...
**CICS Problem Determination Guide** If you are not familiar with this process, refer to the guide before contacting IBM support.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Modules:** DFHKESGM

**DFHKE0303** applid A RECURSIVE ABEND HAS BEEN DETECTED BY THE KERNEL DOMAIN.

**Explanation:** The kernel (KE) domain has detected that the current task is recursively abending while attempting to recover from an abend.

**System action:** CICS terminates abnormally with a system dump. No exception entry is made to the trace table because the trace (TR) domain may be the cause of the loop.

**User response:** Use the dump provided to investigate the kernel error table to diagnose the earlier abends for the failing task.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Modules:** DFHKERRI

**DFHKE0401** applid CICS REGISTER CALL TO AUTOMATIC RESTART MANAGER FAILED (RETURN CODES X’resp’, X’reason’).

**Explanation:** An attempt to invoke a REGISTER request against the MVS automatic restart manager (ARM) failed.

The codes resp, reason are the hexadecimal response and reason codes from ARM.

**System action:** A system dump is taken.

CICS continues, but cannot subsequently be restarted by ARM.

**User response:** It is necessary to decide whether to terminate CICS.

For problem diagnosis look up the return codes from the
DFHKE0402  applid CICS DEREGISTER CALL TO AUTOMATIC RESTART MANAGER FAILED (RETURN CODES X'\text{resp}', X'\text{reason}').

Explanation: An attempt to invoke a DEREGISTER request against the MVS automatic restart manager (ARM) failed.

The codes \text{resp}, \text{reason} are the hexadecimal response and reason codes from ARM.

System action: If the request failed during startup, a dump is taken and CICS continues.

If the request failed during shutdown, an exception entry is made in the trace table, and a system dump is taken unless you have specifically suppressed dumps in the dump table. CICS continues to shut down unless you have specified in the dump table that CICS should terminate. The DEREGISTER failed so a subsequent failure of CICS or an IMMEDIATE shutdown may result in ARM restarting CICS.

User response: If CICS is still running, it is necessary to decide whether to terminate CICS.

For problem diagnosis look up the return codes from the IXCARM macro in the OS/390 MVS Sysplex Services Reference manual.

You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Modules: DFHKEAR

DFHKE0404  applid CICS READY call to automatic restart manager failed (return codes X'\text{resp}', X'\text{reason}').

Explanation: An attempt to invoke a READY request against the MVS automatic restart manager (ARM) failed.

The codes \text{resp}, \text{reason} are the hexadecimal response and reason codes from ARM.

System action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table. CICS continues unless you have specified in the dump table that CICS should terminate. Other subsystems which are waiting for CICS are not be informed that CICS is ready for work and continue to wait until timed out.

User response: If CICS is still running, it is necessary to decide whether to terminate CICS.

For problem diagnosis look up the return codes from the IXCARM macro in the OS/390 MVS Sysplex Services Reference manual.

You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Modules: DFHKEAR
XMEOUT Parameters: applid, X'resp',X'reason'

DFHKE0405  applid CICS WAITPRED call to automatic restart manager timed out (return codes X'resp', X'reason').

Explanation: A WAITPRED request against the MVS automatic restart manager (ARM) timed out.

The codes resp, reason are the hexadecimal response and reason codes from ARM.

System action: An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. The WAITPRED request time out may result in other subsystems not being available when CICS initialization completes.

User response: If CICS is still running, it is necessary to decide whether to terminate CICS.

For problem diagnosis look up the return codes from the IXCARM macro in the OS/390 MVS Sysplex Services Reference manual.

Further information about how to use ARM can also be found in the MVS/ESA Setting Up a Sysplex manual.

You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Modules: DFHKEAR

XMEOUT Parameters: applid, X'resp',X'reason'

DFHKE0406I  applid CICS is about to wait for predecessors defined in the MVS automatic restart management policy for this region.

Explanation: CICS is about to invoke a WAITPRED request against the automatic restart manager. This may result in a delay before CICS processing continues.

System action: CICS continues.

User response: None.

Destination: Console

Modules: DFHKEAR

XMEOUT Parameter: applid

DFHKE0407  applid XRF IS INCOMPATIBLE WITH AUTOMATIC RESTART MANAGER. CICS IS TERMINATING.

Explanation: CICS has registered with the MVS automatic restart manager (ARM) after having been restarted but the restart JCL specifies XRF=YES. XRF is incompatible with ARM.

System action: CICS terminates.

User response: Ensure that the XRF=YES option in the restart JCL is correct.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Modules: DFHKEAR

DFHKE0408D  applid PLEASE SPECIFY START TYPE, 'ASIS' OR 'AUTO'.

Explanation: An attempt to REGISTER with the MVS automatic restart manager (ARM) has failed when a cold or initial start has been specified in the SIT.

When the CICS region has been restarted with JCL that specifies START=COLD or START=INITIAL, CICS relies on ARM to determine whether to override the start type and change it to AUTO. As the REGISTER has failed, CICS cannot determine whether the region is being restarted by ARM, and so does not know whether to override the start type.

System action: CICS waits until the operator supplies the START type to be used by this region.

User response: If the region is being restarted by ARM, specify AUTO. If the startup type of COLD or INITIAL in the SIT should be preserved, specify ASIS.

See the previously issued message DFHKE0401 for guidance on dealing with the underlying REGISTER failure.

Note: This message cannot be changed with the message editing utility.

Destination: Console Routecodes 1 and 11

Modules: DFHKEAR

DFHKE0410  applid CICS REGISTER CALL TO AUTOMATIC RESTART MANAGER FAILED BECAUSE THE JOB TYPE IS INVALID.

Explanation: An attempt to invoke a REGISTER request against the MVS automatic restart manager (ARM) failed because the job type is invalid to ARM.

CICS can only register with ARM if it is being run as a started task or a batch job.

System action: CICS continues, but cannot subsequently be restarted by ARM.

User response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Modules: DFHKEAR

Chapter 1. DFH messages  531
DFHKE0411  applid CICS REGISTER CALL TO AUTOMATIC RESTART MANAGER FAILED BECAUSE MAXIMUM NUMBER OF USERS WAS REACHED.

Explanation: An attempt to invoke a REGISTER request against the MVS automatic restart manager (ARM) failed because the maximum number of ARM users allowed for in the ARM couple data set has been reached. This response is never given by ARM if ARM is restarting CICS.

System action: CICS continues, but cannot subsequently be restarted by ARM.

User response: None.

Note: This message cannot be changed with the message editing utility.

Destination: Console

 Modules: DFHKEAR

DFHKE0412I  applid CICS WAITPRED call to automatic restart manager has completed.

Explanation: A WAITPRED request against the MVS automatic restart manager (ARM) has completed.

Further information about how to use ARM can also be found in the MVS/ESA Setting Up a Sysplex manual.

You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

 Modules: DFHKEAR

DFHKE0413I  applid CICS REGISTER CALL FAILURE IN MODULE DFHKESVC (RETURN CODE X'resp').

Explanation: An attempt to invoke a REGISTER request against the MVS automatic restart manager (ARM) failed in module DFHKESVC.

The code resp is the hexadecimal response from DFHKESVC and its meanings are:

- 08 - The requested function is not supported.
- 0C - The getmain for the dynamic storage failed.
- 10 - Unable to establish the recovery routine.
- 14 - The DFHAUTH CHECK failed.

System action: CICS continues, but cannot subsequently be restarted by ARM.

User response: It is necessary to decide whether to terminate CICS.

Further information about how to use ARM can also be found in OS/390 MVS Setting Up a Sysplex.

You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Note: This message cannot be changed with the message editing utility.

Destination: Console

 Modules: DFHKEAR

DFHKE0414I  BAD RETURN FROM MVS SERVICE CSRL16J.

Explanation: An attempt to invoke the MVS service CSRL16J (Load 16 and Jump) has returned to CICS with a non-zero return code. This service is called from the CICS Kernel 'Reset Address' function.

System action: CICS continues by deliberately executing a privileged instruction which causes a program exception with code 0C2 which leads to an ASRA abend. Register 4 has been loaded with the return code from the CSRL16J service.

User response: Inform the systems programmer.

Note: This message cannot be changed with the message editing utility.

Destination: Console

 Modules: DFHKERET

DFHKE0500I  applid MAXPROCUSER exceeded while executing 'service-routine'.

Explanation: The Kernel issued a call to the service-routine callable service, and received a response of EMVSINITIAL with a reason code of X'0012', indicating that the number of processes for the current CICS region userid has been exceeded.

System action: CICS initialization continues.

User response: If this error occurs frequently, consider increasing the MAXPROCUSER value in the BPXPRMxx member of SYS1.PARMLIB.

Destination: Console

 Modules: DFHKETCB

 XMEOUT Parameters: applid, service-routine

DFHKE0501I  applid The Kernel received a return value of X'value', a return code of X'rcode' and a return reason of X'reason' from the uss service-routine.

Explanation: Unix System Services has returned a non-zero return code/reason code to a service-routine
call made by the Kernel during CICS initialization.

**System action:** CICS initialization continues since it is too early to tell whether Unix System Services will be required later in the CICS run.

**User response:** Determine the reason for this response. The return code and reason code included in the message text should be described in the z/OS UNIX System Services Messages and Codes manual.

**Destination:** Console

**Modules:** DFHKETCB

**XMEOUT Parameters:** applid, X'rvalue', X'rcode', X'reason', uss

---

**DFHKE0999 applid MVS HAS CALLED DFHKESTX WITH NO SDWA. ABEND CODE X'code'.**

**Explanation:** MVS has made a call to the CICS ESTAE-type recovery routine DFHKESTX, but it supplied no system diagnostic work area (SDWA). DFHKESTX is unable to continue with the recovery.

During initialization, CICS may not have access to the user's applid coded in the SIT. If CICS produces this message in these circumstances, it uses the default applid value DBDCCICS.

**System action:** Module DFHKESTX produces a system dump and percolates the error to the next ESTAE routine. This is potentially a serious error. CICS continues processing pending the result of the error percolation.

**User response:** The abend code X'code' is the reason the CICS ESTAE was called. You need to find out which product has produced the abend. Typically it is an MVS system completion code, for example D37. However the abend may have been issued by CICS, for example abend 1596, or another product such as IMS.

Since there is little further diagnostic information in this case, look for any messages that may indicate the reason for the abend. The entry in the appropriate manual for the abend code gives user guidance regarding the error, and may also give some guidance concerning the appropriate user response.

The reason why no SDWA was passed and subsequently no recovery was attempted is probably a shortage of storage. This storage shortage may also be an influencing factor in the abend itself.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Modules:** DFHKESTX

---

**DFHKE1798 applid FO TCB FORCED TO TERMINATE.**

**Explanation:** During an immediate shutdown of CICS the file owning TCB is detached before VSAM is able to close all data sets normally.

The detaching of this TCB can cause abends during shutdown. At CICS restart VSAM may need to perform a VERIFY for any data set that is open for update when the immediate shutdown is performed, and this can cause a long delay.

During initialization, CICS may not have access to the user’s applid coded in the SIT. If this is the case CICS uses the default applid value DBDCCICS.

**System action:** The immediate shutdown of CICS continues.

**User response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Modules:** DFHKESIP

---

**DFHKE1799 applid TERMINATION OF CICS IS COMPLETE.**

**Explanation:** This message is issued when CICS has terminated.

During initialization, CICS may not have access to the user’s applid coded in the SIT. If CICS produces this message in these circumstances, it uses the default applid value DBDCCICS.

**System action:** Control is given back to the operating system.

**User response:** None.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Modules:** DFHKESIP

---

**DFHKE1800 applid ABNORMAL TERMINATION OF CICS IS COMPLETE.**

**Explanation:** CICS issues this message when it terminates abnormally.

During initialization, CICS may not have access to the user’s applid coded in the SIT. If CICS produces this message in these circumstances, it uses the default applid value DBDCCICS.
System action: The abnormal termination of CICS continues. The kernel returns control to the operating system by issuing a user 1800 abend.

The original error which caused the abnormal termination may also have produced a dump. No specific dump is produced to accompany this message.

User response: If a dump is produced, check the dump to determine the cause of the error. Use the CICS Problem Determination Guide to assist you to determine the problem.

If no dump is produced, check for other CICS and MVS messages and abend codes to help you to determine the cause of the problem.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Modules: DFHKESIP

DFHLDxxxx messages

DFHLD0001 applid An abend (code aaaa/bbbb) has occurred at offset X'offset' in module modname.

Explanation: An unexpected program check or abend occurred with abend code aaaa/bbbb.

The program status word (PSW) at the time of the program check or abend indicated that CICS was executing at offset X'offset' in module modname. This may have been caused by corruption of CICS code or control blocks.

System action: A system dump is taken and the system attempts to continue operation unless otherwise directed by entries in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Investigate the cause of the problem as follows:
1. Determine if the problem can be explained by any previous messages output from some other part of CICS.
2. Examine the symptom string.
3. Examine the dump.

Destination: Console

Modules: DFHLDDM, DFHLDDMI, DFHLDDL, DFHLDDL1, DFHLDDL2, DFHLDDL3, DFHLDN, DFHLDDST

XMEOUT Parameters: applid, X'code',modname

DFHLD0002 applid A severe error (code X'code') has occurred in module modname.

Explanation: The loader has received an unexpected error response from some other part of CICS or an operating system service. The operation requested by the loader is described by code X'code'.

For further information about CICS exception trace entries, refer to the CICS Problem Determination Guide.

System action: A system dump is taken and the system attempts to continue operation unless specifically inhibited by dump table entries.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Investigate the existence of a previous error situation which may have led to corruption of CICS control blocks or to the non-completion of an expected event. If there is no evidence of a previous error, you will need further assistance from IBM to resolve the problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Modules: DFHLDDM, DFHLDDMI, DFHLDDL, DFHLDDL1, DFHLDDL2, DFHLDDL3, DFHLDN, DFHLDDST

XMEOUT Parameters: applid, X'code',modname

DFHLD0004 applid A possible loop has been detected at offset X'offset' in module modname.

Explanation: CICS has detected what it believes to be a code execution loop. At the time execution was interrupted, the program status word (PSW) indicated the next instruction address would have been at offset X'offset' in module modname.

System action: CICS is terminated with a system dump unless dump table options specifically prevent this.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Investigate the existence of a previous error situation which may have led to corruption of CICS control blocks or to the non-completion of an expected event. If there is no evidence of a previous error, you will need further assistance from IBM to resolve the problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Modules: DFHLDDM, DFHLDDMI, DFHLDDL, DFHLDDL1, DFHLDDL2, DFHLDDL3, DFHLDN, DFHLDDST
XMEOUT Parameters: applid, X'offset', modname

DFHLD0101I applid CICS nucleus module modname not found.

Explanation: The CICS loader (LD) was unable to locate a copy of module modname in either the link pack area (LPA) in or the DFHRPL library concatenation.

System action: A system dump is taken and CICS execution continues unless specifically inhibited by a dump table entry.

User response: This message is followed by one or more messages informing the user of reduced function availability due to the missing module modname.

Ensure that there is a copy of module modname in the LPA and/or in a library within the DFHRPL concatenation.

If module was expected to be in the LPA, ensure CICS is utilizing LPA resident modules by specifying LPA=YES as a start up override.

Destination: Console

Modules: DFHLDDMI

XMEOUT Parameter: applid

DFHLD0102I applid Unable to declare gate ff for module modname.

Explanation: As part of its initialization, the CICS loader has attempted to define domain gate ff for module modname, but has received a bad response.

System action: A system dump is taken and CICS execution continues unless specifically inhibited by a dump table entry.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: This message diagnoses an internal error within CICS. Investigate whether previous errors have left CICS in a damaged state. If there is no evidence of previous serious errors, you will need further assistance from IBM to resolve the problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Modules: DFHLDDMI

XMEOUT Parameter: applid, ff,modname

DFHLD0103I applid Module Storage Compression OFF. All modules are USAGE=TRANSIENT.

Explanation: This message is normally preceded by either message DFHLD0101 or DFHLD0102 and indicates that the loader (LD) domain was unable to initialize its dynamic program storage compression facility.

System action: CICS execution continues but all nonresident application programs are treated as if they had been defined with the USAGE=TRANSIENT option. Therefore they are removed from storage the moment their use count reaches zero.

For some functions, this can lead to a performance degradation as programs may be loaded many times during the life of a transaction instead of only once.

User response: Investigate the reasons for the previous problem concerning module DFHLDNT as diagnosed by either message DFHLD0101 or DFHLD0102.

Destination: Console

Modules: DFHLDDMI

XMEOUT Parameter: applid

DFHLD0104I applid Module Statistics are not being collected.

Explanation: This message is normally preceded by either message DFHLD0101 or DFHLD0102 and indicates that the loader (LD) domain was unable to initialize it's statistics collection module.

System action: CICS execution continues but no module statistics will be collected.

User response: Investigate the reasons for the previous problem concerning module DFHLST as diagnosed by either message DFHLD0101 or DFHLD0102.

Destination: Console

Modules: DFHLDDMI

XMEOUT Parameter: applid

DFHLD0105I applid Restart of Loader Option Block (LOB) failed. System defaults in use.

Explanation: The initialization of the CICS loader has detected one or more invalid parameters in the loader option block (LOB) recovered from the local catalog.

This may indicate that corruption of the local catalog has occurred.

System action: A system dump is taken and CICS execution continues unless specifically inhibited by a dump table option.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Investigate the possibility of corruption of the local catalog. If you suspect that the local catalog is corrupt, reinitialize it and resubmit the CICS job.
Destination: Console

Modules: DFHLDDM

XMEOUT Parameter: applid

DFHLD0106 applid Bad response X'resp' returned on an OPEN of DFHRPL.

Explanation: The CICS loader has attempted to open the DFHRPL library concatenation during initialization and has received the response code resp.

System action: CICS execution continues although only link pack area (LPA) resident modules are accessible.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Ensure the DFHRPL concatenation is correctly specified in the JCL and that the libraries specified in it are operational. The response code returned may be interpreted as for a BSAM open request.

Destination: Console

Modules: DFHLDDM

XMEOUT Parameter: applid, X'resp'

DFHLD0107I applid modname1 is unable to locate module modname2 in the LPA. DFHRPL version of module will be used.

Explanation: The user has specified the system initialization parameter LPA=YES. Module modname2 is either defined as USELPACOPY=YES via RDO or is a CICS PCLASS=SYSTEM module. CICS has been unable to find module2 in the link pack area (LPA).

System action: CICS execution continues with an attempt to locate module modname2 in the CICS program library DFHRPL.

User response: carry out one of the following:

- Load module modname2 into the LPA, if this is required and the module is LPA eligible (refer to the CICS Transaction Server for z/OS Installation Guide for LPA eligibility of CICS modules).
- Code PRVMOD=modname2 as a SIT option which ensures that CICS will not search the LPA for that module.
- Code LPA=NO as a system initialization parameter. This ensures that CICS does not search the LPA for any module.
- Inhibit this message from all or selected consoles using the MVS VARY command. For more information on how to do this, refer to the CICS Transaction Server for z/OS Installation Guide.

Destination: Console Routecode 11

Modules: DFHLDDMI, DFHLDLD1

DFHLD0108I applid The maximum of 32767 entries that CICS allows on a BLDL has been exceeded.

Explanation: During a warm or emergency restart, the loader domain has detected more than 32767 modules eligible for BLDL.

System action: A BLDL macro call is issued to locate the first 32767 modules and the rest are ignored. CICS initialization continues normally.

This is not a problem because CICS attempts to locate those modules not located during initialization when the module is first used.

User response: None.

Destination: Console

Modules: DFHLDDMI

XMEOUT Parameter: applid

DFHLD0201 applid Corrupt Loader load structure detected at X'address'. Module marked as unavailable.

Explanation: During the execution of a CICS loader request, the loader detected an invalid field in the control block type tttt at storage address address.

System action: A system dump is taken and execution continues unless specifically inhibited by a dump table option.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Investigate the possibility of corruption of CICS modules or control blocks or the local or global catalogs.

Destination: Console

Modules: DFHLDLD1

XMEOUT Parameter: applid, load, X'address'

DFHLD0202 applid Loader SVC svc request failed due to shortage of free storage in the region.

Explanation: The loader domain has issued a request to its CICS SVC service routine, DFHLDSVC, but the execution of this request failed due to a lack of free storage in the MVS region. The type of request is indicated by svc.

System action: A system dump will be taken unless specifically suppressed through a dump table option and the system will continue execution. The task requesting loader services will be abnormally terminated with abend code APCT, or a PGMIDERR condition will be raised.
**User response:** Ensure there is adequate free storage in the MVS region by balancing the overall size limits of the DSAs or EDSAs with the size of the MVS region specified by the REGION parameter on the job card of the CICS job JCL.

**Destination:** Console

**Modules:** DFHLDDL1

**XMEOUT Parameters:** applid, svc

---

**DFHLDDL0203** *applid Loader SVC svc request failed due to I/O errors on library DFHRPL.*

**Explanation:** The loader domain has issued a request to its CICS SVC service routine, DFHLDSVC, but the execution of this request failed due to I/O errors on the relocatable library, DFHRPL. The type of request is indicated by *svc*.

**System action:** A system dump is taken unless specifically suppressed through a dump table entry and the system continues execution. The task requesting loader services is abnormally terminated with abend code APCT, or a PGMIDERR condition is raised.

**User response:** Investigate the possible causes of the I/O errors encountered. The MVS system console log may contain more information about the problem in the form of access method or I/O subsystem messages. The loader domain exception trace entries, from the full trace, in the system dump normally identify the module or modules for which the I/O error occurred.

A possible cause of this problem is the compression of a partition data set (PDS) within the DFHRPL concatenation.

**Destination:** Console

**Modules:** DFHLDDL1

**XMEOUT Parameters:** applid, svc

---

**DFHLDDL0204** *applid Bad Loader PDB for module modname recovered from the [Local / Global] catalog. Corruption suspected.*

**Explanation:** The loader definition record, PDB, for module *modname* has been read from either the local (DFHLCD) or the global (DFHGCD) catalog during startup and has been found to contain invalid data.

**System action:** System initialization terminates with a system dump, unless the dump is specifically suppressed. If the system dump is suppressed, the module definition is ignored.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User response:** Ensure the specified catalog data set has not been corrupted and is available to the CICS job.

**Destination:** Console

**Modules:** DFHLDDMI, DFHLDDL

**XMEOUT Parameters:** applid, modname, {1=Local, 2=Global}

---

**DFHLGxxxx messages**

**DFHLG0001** *applid An abend (code aaaa/bbbb) has occurred at offset X'offset' in module modname.*

**Explanation:** An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwriten.

The code aaaa/bbbb is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTE1310).

**System action:** An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller ( for example, the domain manager, DFHDMMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User response:** Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual.

Next, look up the CICS alphanumeric code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue and bring CICS down at a convenient time to resolve the problem.

If you cannot continue without the full use of module *modname* you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this
**DFHLG002** applid A severe error (code X'code') has occurred in module modname.

**Explanation:** An error has been detected in module modname. The code X'code' is the exception trace point ID which uniquely identifies what the error is and where the error was detected.

**System action:** An exception entry (code X'code' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User response:** This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module modname is not crucial to the running of your CICS system, you may decide to continue and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot continue without the full use of module modname, you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the [CICS Problem Determination Guide] for guidance on how to proceed.

**XMEOUT Parameters:** applid, journalname

---

**DFHLG0103** applid System log (journalname) initialization has started.

**Explanation:** This is an informational message indicating the start of system log initialization for the specified journal (either DFHLOG or DFHSHUNT).

**System action:** Initialization continues.

**User response:** None. You can suppress this message with the system initialization parameter, MSGLV=0.

**Destination:** Console

**Modules:** DFHL2SLN

**XMEOUT Parameters:** applid, journalname

---

**DFHLG0104** applid System log (journalname) initialization has ended. Log stream logstreamname is connected to structure structurename.

**Explanation:** This is an informational message indicating the end of system log initialization for the specified journal (either DFHLOG or DFHSHUNT).

The name shown as STRUCTNAME(structname) in the message is the structure name of the log stream associated with this journal. A value of "***************" implies that it has no related structure, which means that either the log stream is a dummy log or of type DASDONLY(YES).

**System action:** Initialization continues.

**User response:** None. You can suppress this message with the system initialization parameter, MSGLV=0.

**Destination:** Console

**Modules:** DFHL2SLN

**XMEOUT Parameters:** applid, journalname, logstreamname, structurename

---

**DFHLG0191** subsys-name (CONVERTER | ALLOCATION) VERIFICATION HAS FAILED BECAUSE OF A (SEVERE ERROR | SYNTAX ERROR | MUTUAL EXCLUSION FAILURE)

**Explanation:** A parse error was encountered while CICS was verifying the SUBSYS options of the application's JCL DD statement.

The message includes the following inserts:

- **subsys_name** - the installation defined subsystem name for the system logger.
- **CONVERTER** - the error was detected during MVS JCL conversion.
- **ALLOCATION** - the error was detected during MVS allocation processing.
- **SEVERE ERROR** - the parser encountered a severe error during its processing.
- **SYNTAX ERROR** - the statement failed the syntax check. MVS message ASA104I is issued specifying the keyword in error and acceptable keywords.
- **MUTUAL EXCLUSION FAILURE** - the parser encountered mutually exclusive keywords. MVS message ASA103I is issued specifying the keywords in error.

**System action:** If the error was detected during MVS JCL conversion, the job is not executed because of the JCL error.

If the error was detected during MVS allocation processing, the allocation request is rejected.

**User response:** Correct the SUBSYS= specification and resubmit the job.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console and SYSPRINT
**DFHLG0192** ERROR IN MVS LOGGER MACRO

*macro_name FOR REQUEST request_type. MVS LOGGER CODES X'X'return-code' X'X'reason-code'*

**Explanation:** The CICS subsystem exit made a call to the MVS logger to access a log. This message gives the return code and reason code for that operation. Usually this message is issued only when the return code indicates an error in the MVS logger macro.

The message includes the following inserts:
- `macro_name` MVS logger macro
- `request_type` MVS logger macro REQUEST parameter
- `return-code` MVS logger macro return code
- `reason-code` MVS logger macro reason code.

For further guidance, see the OS/390 MVS Programming: Assembler Services Reference.

**System action:** The subsystem exit terminates the logstream read, and passes a return code back to the caller. If DELETE was specified as an option on the SUBSYS keyword then it will be ignored.

**User response:** Use the `error-description` to identify the cause of the error. A possible cause is an invalid logstream or invalid entries within a valid logstream; the CICS logger and DFHJUP work only with CICS logstreams containing CICS records for the appropriate release.

If you cannot resolve the problem or the problem recurs, there may be a more severe error. In this case, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Modules:** DFHLGSI, DFHLGIGT

---

**DFHLG0193** log-stream-name

**Explanation:** This message gives the logstream referred to in the preceding DFHLG0192 message.

**System action:** See message DFHLG0192.

**User response:** See message DFHLG0192.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Modules:** DFHLGSI, DFHLGIGT

---

**DFHLG0194** ERROR DETECTED BY CICS

SUBSYSTEM. error-description X'data1' X'data2' X'data3'

**Explanation:** The CICS subsystem exit detected an unexpected error. The error is described by the `error-description` and optional hex data fields.

In some cases a dump is also produced.

**System action:** The subsystem exit terminates the logstream read, and passes a return code back to the caller. If DELETE was specified as an option on the SUBSYS keyword then it will be ignored.

**User response:** Use the `error-description` to identify the cause of the error. A possible cause is an invalid logstream or invalid entries within a valid logstream; the CICS logger and DFHJUP work only with CICS logstreams containing CICS records for the appropriate release.

If you cannot resolve the problem or the problem recurs, there may be a more severe error. In this case, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Modules:** DFHLGSI, DFHLGIGT

---

**DFHLG0195** LOG GAP WARNING UP TO BLOCKID X'data1'

**Explanation:** The CICS subsystem exit made a call to the MVS logger to access a log stream using the IXGBRWSE macro but this received a return code of IXGRSNCODEWARNING (X'04') with a reason code of lxFrsnCodeWarningGap (X'0403'). The blockid is the id of the next readable data in the log stream.

**System action:** The CICS subsystem exit continues to access the log. This message is followed by message DFHLG0196.

**User response:** For further guidance on the lxFrsnCodeWarningGap reason code see the z/OS Assembler Services Reference. Use the blockid and the timestamp reported in DFHLG0196 to investigate further if required. The warning may be the result of known activity that has deleted log data from the log.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Module(s):** DFHLGIGT

---
DFHLG0196 STCK OF BLOCK AFTER GAP (TIME FORMAT): X'data1'

Explanation: This message is issued in association with message DFHLG0195. It provides the timestamp from the block id header corresponding to the block read after the reported gap.

System action: See message DFHLG0195.

User response: See message DFHLG0195.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Module(s): DFHLGIGT

---

DFHLG0301 date time applid An error has been detected for log stream stream for journal name journalname. The journal status has been set to FAILED.

Explanation: An error has been detected for log stream stream which is used by journal journalname.

System action: An exception entry is made in the trace table.

CICS marks the journal as failed and ends the associated connection with the log stream. Applications which attempt to use the journal receive an IOERROR response and may terminate abnormally.

User response: Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

See the associated messages issued by CICS or the MVS system logger for more information and for guidance about appropriate recovery actions.

If journal journalname is not crucial to the running of your CICS system, you may decide to continue.

If the problem with the log stream can be resolved, use of the journal can be restored by issuing SET JOURNALNAME(journalname) ACTION(RESET) via the CEMT or EXEC CICS interfaces.

If you cannot continue without the full use of journal journalname you should bring CICS down in a controlled shutdown.

Destination: CSMT

Modules: DFHLGJN

XMEOUT Parameters: date, time,applid, stream, journalname

---

DFHLG0302 date time applid Journal name journalname has been installed. Journal type: (MVS | SMF | DUMMY) stream.

Explanation: Journal name journalname has been installed and is available for use. The type of journal, and for type MVS only, the log stream name stream are also shown.

System action: An event entry is made in the trace table.

User response: None

Destination: CRDI

Modules: DFHLGJN

XMEOUT Parameters: date, time,applid, journalname, {1=MVS ,2=SMF , 3=DUMMY}, stream

---

DFHLG0303 date time applid An error has been detected while connecting to log stream stream for journal name journalname. The journal status has been set to FAILED.

Explanation: An error has been detected connecting to log stream stream which is used by journal journalname.

System action: An exception entry is made in the trace table.

CICS marks the journal as failed. Applications which attempt to use the journal receive an IOERROR response and may terminate abnormally.

User response: Notify the system programmer.

See the associated messages issued by CICS or the MVS system logger for more information and for guidance about appropriate recovery actions.

If CICS is still running, it is necessary to decide whether to terminate CICS.

If journal journalname is not crucial to the running of your CICS system, you may decide to continue.

If the problem with the log stream can be resolved, use of the journal can be restored by issuing the CEMT SET JOURNALNAME(journalname) RESET or the EXEC CICS SET JOURNALNAME(journalname) RESET command.

If you cannot continue without the full use of journal journalname you should bring CICS down in a controlled shutdown.

Destination: CSMT

Modules: DFHLGJN

XMEOUT Parameters: date, time,applid, stream, journalname

---
DFHLG0304  date time applid An error has been detected writing the catalog entry for journal name journalname.

Explanation:  An error has been detected writing the global catalog entry for journal journalname.

System action:  An exception entry is made in the trace table.

The new journal entry is used for this CICS run but does not persist over a CICS restart

User response:  Notify the system programmer.

See the associated CICS messages for more information, and for guidance about appropriate recovery actions.

If you cannot continue without the full use of journal journalname, you should bring CICS down in a controlled shutdown.

Destination:  CSMT

Modules:  DFHLGJN

XMEOUT Parameters: date, time,applid, journalname

DFHLG0305  date time applid An error has been detected deleting the catalog entry for journal name journalname.

Explanation:  An error has been detected deleting the global catalog entry for journal journalname.

System action:  An exception entry is made in the trace table.

The old journal entry could not be discarded and may reappear after a CICS restart

User response:  Notify the system programmer.

See the associated CICS messages for more information, and for guidance about appropriate recovery actions.

If you cannot continue without the full use of journal journalname, you should bring CICS down in a controlled shutdown.

Destination:  CSMT

Modules:  DFHLGJN

XMEOUT Parameters: date, time,applid, journalname

DFHLG0306  date time applid Journal name journalname has been discarded.

Explanation:  Journal name journalname has been discarded and is no longer available for use.

Future attempts to use the journal name will cause it to be reinstalled using the journal model definitions active at that time.

System action:  An event entry is made in the trace table.

User response:  None.

Destination:  CRDI

Modules:  DFHLGLD

XMEOUT Parameters: date, time,applid, journalname

DFHLG0401  date time applid Journal model resource journalmodel has been installed.

Explanation:  The journal model resource entry journalmodel has been installed and is available for use.

System action:  An event entry is made in the trace table.

User response:  None.

Destination:  CRDI

Modules:  DFHLGLD

XMEOUT Parameters: date, time,applid, journalmodel

DFHLG0402  date time applid An error has been detected writing the catalog entry for journal model journalmodel.

Explanation:  An error has been detected writing the global catalog entry for journal model journalmodel.

System action:  An exception entry is made in the trace table.

The new journal model entry is used for this CICS run but does not persist over a CICS restart

User response:  Notify the system programmer.

See the associated CICS messages for more information and for guidance about appropriate recovery actions.

If you cannot continue without the full use of journal model journalmodel you should bring CICS down in a controlled shutdown.

Destination:  CSMT

Modules:  DFHLGJN

XMEOUT Parameters: date, time,applid, journalmodel

DFHLG0403  date time applid An error has been detected deleting the catalog entry for journal model journalmodel.

Explanation:  The deletion of the global catalog entry for journal model journalmodel has failed.

System action:  An exception entry is made in the trace table.

The old journal model entry could not be deleted and may reappear after a CICS restart
**User response:** Notify the system programmer.

See the associated CICS messages for more information and for guidance about appropriate recovery actions.

If you cannot continue without the full use of journal model `journalmodel` you should bring CICS down in controlled shutdown.

**Destination:** CSMT

**Modules:** DFHLGJN

**XMEOUT Parameters:** `date, time, applid, journalmodel`

---

**DFHLG0404**

`date time applid` Journal model resource `journalmodel1` has been replaced by `journalmodel2`.

**Explanation:** A journal model resource entry has been replaced because journal model `journalmodel2` has the same journal name template as `journalmodel1`.

**System action:** An event entry is made in the trace table.

**User response:** None.

**Destination:** CRDI

**Modules:** DFHLGLD

**XMEOUT Parameters:** `date, time, applid, journalmodel1, journalmodel2`

---

**DFHLG0405**

`date time applid` Journal model `journalmodel` has been discarded.

**Explanation:** Journal model `journalmodel` has been discarded and is no longer available for use.

**System action:** An event entry is made in the trace table.

**User response:** None.

**Destination:** CRDI

**Modules:** DFHLGLD

**XMEOUT Parameters:** `date, time, applid, journalmodel`

---

**DFHLG0501**

`date time applid` Log stream definition for `stream` suppressed by XLGSTREAM user exit.

**Explanation:** MVS log stream `stream` does not exist and could not be defined because the XLGSTREAM user exit suppressed automatic installation.

**System action:** An exception entry is made in the trace table.

CICS cannot define or connect to the log stream. Applications attempting to use the stream receive an error response and may terminate abnormally.

**User response:** Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Define the log stream directly to the MVS system logger.

If stream `stream` is not crucial to the running of your CICS system, you may decide to continue.

If the problem with the log stream can be resolved, use of an associated journal can be restored by issuing SET JOURNALNAME(`journalname`) ACTION(RESET) via the CEMT or EXEC CICS interfaces. If the log stream is a data set forward recovery log or autojournal, reopen the associated data sets.

If you cannot continue without the full use of log stream `stream`, you should bring CICS down in a controlled shutdown.

**Destination:** Console and Transient Data Queue CRDI

**Modules:** DFHLGST

**XMEOUT Parameters:** `date, time, applid, stream`

---

**DFHLG0502**

`date time applid` Log stream `stream` defined to MVS using model stream `model`.

**Explanation:** MVS log stream `stream` did not exist and has been successfully defined to the MVS system logger using the attributes of model log stream `model`.

**System action:** An event entry is made in the trace table.

CICS connects and uses the newly defined log stream.

**User response:** None.

**Destination:** CRDI

**Modules:** DFHLGST

**XMEOUT Parameters:** `date, time, applid, stream, model`

---

**DFHLG0503**

`date time applid` Log stream `stream`, using model stream `model`, not defined to MVS for reason `X'rc'/X'reason'`.

**Explanation:** MVS log stream `stream` does not exist and could not be defined to the MVS system logger using the attributes of model log stream `model` for reason `X'rc'/X'reason'`.

`X'rc'` is the return code from the IXGINVNT macro and `X'reason'` is the reason code returned by the IXGINVNT macro. These are described in the OS/390 MVS Programming: Assembler Services Reference and in the IXGCON macro.

**System action:** An event entry is made in the trace table. The trace entry contains additional diagnostic information from the system logger answer area (IXGANSAA).

CICS cannot define or connect to the log stream so
applications which attempt to use the stream receive an error response and may terminate abnormally.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User response:** Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

If stream `stream` is not crucial to the running of your CICS system, you may decide to continue.

You can define the log stream directly to the MVS system logger using the MVS log stream definition utility (IXCMIAPU).

If the problem with the log stream can be resolved, use of an associated journal can be restored by issuing SET JOURNALNAME(`journalname`) ACTION(RESET) via the CEMT or EXEC CICS interfaces. If the log stream is a data set forward recovery log or autojournal, reopen the associated data sets.

If you cannot continue without the full use of log stream `stream` you should bring CICS down in a controlled shutdown.

**Destination:** Console and Transient Data Queue

**Modules:** DFHLGST

**XMEOUT Parameters:** `date, time, applid, stream, model`

---

DFHLG0504 *date time applid Log stream stream using model stream model not defined to MVS due to insufficient authority.*

**Explanation:** MVS log stream `stream` does not exist and could not be defined to the MVS system logger using the attributes of model log stream `model` because of insufficient authority.

To define a log stream CICS requires the following authority:

- ALTER authority to `stream` in the LOGSTRM class,
- UPDATE authority to `model` in the LOGSTRM class,
- UPDATE authority to resource `IXLSTR.structure_name` in the FACILITY class if the `XLGSTRM` exit supplies a structure name.

**System action:** An event entry is made in the trace table.

CICS cannot define or connect to the log stream. Applications which attempt to use the stream receive an error response and may terminate abnormally.

**User response:** Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

If stream `stream` is not crucial to the running of your CICS system, you may decide to continue.

You can define the log stream directly to the MVS system logger using the MVS log stream definition utility (IXCMIAPU).

If the problem with the log stream can be resolved, use of an associated journal can be restored by issuing SET JOURNALNAME(`journalname`) ACTION(RESET) via the CEMT or EXEC CICS interfaces. If the log stream is a data set forward recovery log or autojournal, reopen the associated data sets.

If you cannot continue without the full use of log stream `stream`, you should bring CICS down in a controlled shutdown.

---

DFHLG0505 *date time applid Log stream stream using model stream model not defined to MVS because of an invalid HLQ parameter.*

**Explanation:** MVS log stream `stream` does not exist and could not be defined to the MVS system logger using the attributes of model log stream `model` because of an invalid high level qualifier (HLQ) parameter.

The HLQ parameter specifies the high level qualifier to be used for log stream data sets.

**System action:** An event entry is made in the trace table.

CICS cannot define or connect to the log stream. Applications which attempt to use the stream receive an error response and may terminate abnormally.

**User response:** Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

If stream `stream` is not crucial to the running of your CICS system, you may decide to continue.

Correct the HLQ parameter in the `model` logger definition or the `XLGSTRM` exit, or both.

You can define the log stream directly to the MVS system logger using the MVS log stream definition utility (IXCMIAPU).

If the problem with the log stream can be resolved, use of an associated journal can be restored by issuing SET JOURNALNAME(`journalname`) ACTION(RESET) via the CEMT or EXEC CICS interfaces. If the log stream is a data set forward recovery log or autojournal, the associated data sets should be reopened.

If you cannot continue without the full use of log stream `stream`, you should bring CICS down in a controlled shutdown.

---
**Explanation**: MVS log stream `stream` does not exist and could not be defined to the MVS system logger using the attributes of model log stream `model` because of insufficient space in the MVS system logger’s LOGR couple data set.

**System action**: An event entry is made in the trace table.

CICS cannot define or connect to the log stream. Applications which attempt to use the stream receive an error response and may terminate abnormally.

**User response**: Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

If stream `stream` is not crucial to the running of your CICS system, you may decide to continue.

Change the STRUCTNAME parameter in the `model` logger definition or the XLGSTRM exit to point to a structure that has room for more streams or delete unneeded streams from the current structure.

You can define the log stream directly to the MVS system logger using the MVS log stream definition utility (IXCMIAPU).

If the problem with the log stream can be resolved, you can restore the use of an associated journal by issuing SET JOURNALNAME(`journalname`) ACTION(RESET) via the CEMT or EXEC CICS interfaces. If the log stream is a data set forward recovery log or autojournal, reopen the associated data sets.

If you cannot continue without the full use of log stream `stream`, you should bring CICS down in a controlled shutdown.
You can define the log stream directly to the MVS system logger using the MVS log stream definition utility (IXCMIAPU). or you can define the model log stream to the MVS logger if there are likely to be more log streams to be defined using the same model.

If the problem with the log stream can be resolved, you can restore the use of an associated journal by issuing SET JOURNALNAME(journalname) ACTION(RESET) via the CEMT or EXEC CICS interfaces. If the log stream is a data set forward recovery log or autojournal, reopen the associated data sets.

If you cannot continue without the full use of log stream stream you should bring CICS down in a controlled shutdown.

**Destination:** Console and Transient Data Queue CSMT

**Modules:** DFHLGST

**XMEOUT Parameters:** date, time, applid, stream, model

---

DFHLG0509  
(date time applid) Log stream stream  
using model stream model not defined  
to MVS because of an invalid structure name.

**Explanation:** MVS log stream stream does not exist and could not be defined to the MVS system logger using the attributes of model log stream model because of an invalid coupling facility structure name.

**System action:** An event entry is made in the trace table.

CICS cannot define or connect to the log stream so applications which attempt to use the stream receive an error response and may terminate abnormally.

**User response:** Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

If stream stream is not crucial to the running of your CICS system, you may decide to continue.

Correct the JOURNALMODEL definition used to create the stream name and DISCARD any JOURNAL definitions which refer to the stream name or, if the stream is a VSAM forward recovery log stream, correct the stream name in the VSAM data set's catalog entry.

If the problem with the log stream can be resolved, you can restore the use of an associated journal by issuing SET JOURNALNAME(journalname) ACTION(RESET) via the CEMT or EXEC CICS interfaces. If the log stream is a data set forward recovery log or autojournal, reopen the associated data sets.

If you cannot continue without the full use of log stream stream you should bring CICS down in a controlled shutdown.

**Destination:** Console and Transient Data Queue CSMT

**Modules:** DFHLGST

**XMEOUT Parameters:** date, time, applid, stream, model

---

DFHLG0510  
(date time applid) Log stream stream  
using model stream model not defined  
to MVS because of an invalid stream name.

**Explanation:** MVS log stream stream does not exist and could not be defined to the MVS system logger using the attributes of model log stream model because stream is an invalid stream name.

**System action:** An event entry is made in the trace table.

CICS cannot define or connect to the log stream so applications which attempt to use the stream receive an error response and may terminate abnormally.

**User response:** Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

If stream stream is not crucial to the running of your CICS system, you may decide to continue.

Correct the JOURNALMODEL definition used to create the stream name and DISCARD any JOURNAL definitions which refer to the stream name or, if the stream is a VSAM forward recovery log stream, correct the stream name in the VSAM data set's catalog entry.

If the problem with the log stream can be resolved, you can restore the use of an associated journal by issuing SET JOURNALNAME(journalname) ACTION(RESET) via the CEMT or EXEC CICS interfaces. If the log stream is a data set forward recovery log or autojournal, reopen the associated data sets.

If you cannot continue without the full use of log stream stream you should bring CICS down in a controlled shutdown.

**Destination:** Console and Transient Data Queue CSMT

**Modules:** DFHLGST

**XMEOUT Parameters:** date, time, applid, stream, model

---

DFHLG0511  
(date time applid) Log stream stream  
using model stream model not defined  
to MVS because STRUCTNAME  
parameter missing in model.

**Explanation:** MVS log stream stream does not exist and could not be defined to the MVS system logger using the attributes of model log stream model because the model log stream definition does not contain the required STRUCTNAME parameter.
**System action:** An event entry is made in the trace table.

CICS cannot define or connect to the log stream. Applications which attempt to use the stream receive an error response and may terminate abnormally.

**User response:** Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

If stream `stream` is not crucial to the running of your CICS system, you may decide to continue.

Redefine the model log stream in the MVS system logger’s LOGR couple data set using the IXCMIAPU utility ensuring the model stream definition contains the `STRUCTNAME(structure_name)` parameter to indicate which coupling facility structure is to be used for the log stream. Alternatively you can use the CICS exit, XLGSTRM, to supply the structure name to the MVS system logger.

You can define the log stream directly to the MVS system logger using the MVS log stream definition utility (IXCMIAPU).

If the problem with the log stream can be resolved, use of an associated journal can be restored by issuing SET JOURNALNAME(`journalname`) ACTION(RESET) via the CEMT or EXEC CICS interfaces. If the log stream is a data set forward recovery log or autojournal, the associated data sets should be reopened.

If you cannot continue without the full use of log stream `stream`, you should bring CICS down in a controlled shutdown.

**Destination:** Console and Transient Data Queue CSMT

**Modules:** DFHLGST

**XMEOUT Parameters:** `date`, `time`, `applid`, `stream`, `model`

---

### DFHLG0513

**Message:** 
`date applid Log stream stream has failed and new connections cannot be accepted.`

**Explanation:** MVS log stream `stream` has been marked as failed by a previous error. The stream cannot be used again until all current users of the stream have disconnected and the problem that caused the failure has been resolved.

**System action:** CICS cannot connect to the log stream. Applications which attempt to use the stream receive an error response and may terminate abnormally.

CICS continues with attempting to quiesce usage of the log stream and will disconnect from the log stream.

**User response:** Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

If stream `stream` is not crucial to the running of your CICS system, you may decide to continue.

CICS should automatically quiesce usage of the log stream but if CEMT INQUIRE STREAM(`stream`) shows continued use of the log stream, you should investigate whether there are any long running transactions that are preventing the closure of files which use the log stream as a forward recovery log or autojournal.

If the problem with the log stream can be resolved, use of an associated journal can be restored by issuing the command SET JOURNALNAME(`journalname`) ACTION(RESET) via the CEMT or EXEC CICS interfaces. If the log stream is a data set forward recovery log or autojournal, the associated data sets should be reopened.

---

**Chapter 1. DFH messages** 547
If you cannot continue without the full use of log stream
stream, you should bring CICS down in a controlled
shutdown.

Destination: CSMT
Modules: DFHLGST
XMEOUT Parameters: date, time, applid, stream

DFHLG0514 date time applid Log stream stream is in
use by another CICS system.

Explanation: MVS log stream stream is in use by
another CICS region.

General log streams can be shared between CICS
regions but each CICS region must have unique system
log streams.

One of the following may have occurred:
• You are running two copies of the CICS region (same
APPLID)
• A JOURNALMODEL resource definition has resulted
in the same log stream name for a system log as for
the system log journal names (DFHLOG and
DFHSHUNT) for another CICS region.
• A JOURNALMODEL resource definition has resulted
in the same log stream name for a user journal as for
the system log journal names (DFHLOG and
DFHSHUNT).
• A system log stream name may have been specified
in the ICF catalog as the forward recovery log stream
for a VSAM data set.

System action: CICS cannot connect to the log
stream. Applications which attempt to use the stream
receive an error response and may terminate
abnormally.

User response: Notify the system programmer. If
CICS is still running, it is necessary to decide whether
to terminate CICS.

If stream stream is not crucial to the running of your
CICS system, you may decide to continue.

Use the MVS console command DISPLAY
GRS,RES=(DFHSTRM,stream) to find which other CICS
region or regions are using the log stream,

Review and correct your installed Journalmodels to
ensure that the the same log stream is not used for
system logs (DFHLOG and DFHSHUNT as for other
journals. Use the command CEMT DISCARD
JOURNALNAME() to remove any journals that have
been installed with the incorrect stream name.

Note: If you change the Journalmodel definitions which
apply to DFHLOG and DFHSHUNT, you will
need to perform an initial start.

If the ICF catalog specifies the wrong stream name, use
the IDCAMS ALTER command to correct it.

Destination: Console and Transient Data Queue
CSMT
Modules: DFHLGST
XMEOUT Parameters: date, time, applid, stream

DFHLG0730 applid A severe error (code X'code') has
occurred while opening the system log
(journalname). CICS will be terminated.

Explanation: The CICS log manager has detected a
severe error while opening the primary or secondary
system log. The nature of the error is indicated by a
previous CICS message. The code code is the
exception trace point ID which uniquely identifies the
place where the error was detected.

System action: An exception entry is made in the
trace table. A system dump is taken and CICS is
terminated immediately. CICS cannot tolerate a failure
of this nature for the system log.

Message DFHME0116 is normally produced containing
the symptom string for this problem.

User response: Using the previous message as a
guide, correct the problem and restart CICS, ensuring
that the appropriate SIT START parameter is specified
in order to maintain data integrity.

If the error condition persists, you will need assistance
from IBM. See Part 4 of the CICS Problem
Determination Guide for guidance on how to proceed.

Destination: Console
Modules: DFHL2SLN
XMEOUT Parameters: applid, X'code',journalname

DFHLG0731 applid A failure has occurred while
opening the system log (journalname). CICS will be terminated.

Explanation: The CICS log manager has detected a
failure while opening the primary or secondary system
log. The nature of the failure is indicated by a previous
CICS message.

System action: An exception entry is made in the
trace table, and CICS is terminated immediately. CICS
cannot tolerate a failure of this nature for the system
log.

User response: Using the previous message as a
guide, correct the problem and restart CICS, ensuring
that the appropriate SIT START parameter is specified
in order to maintain data integrity.

If you cannot resolve the problem, or the problem
recurs, there may be a more severe error. In this case,
you will need assistance from IBM. See Part 4 of the
CICS Problem Determination Guide for guidance on
how to proceed.

Destination: Console
DFHLG0733 applid A log stream type of SMF has been requested for the system log (journalname). This is not allowed.

Explanation: A log stream type of SMF has been specified on the JOURNALMODEL definition for either the primary or secondary system log. JOURNALMODEL definitions for the system log must have a log stream type of either MVS or DUMMY.

System action: An exception entry is made in the trace table and CICS is terminated. CICS can not operate with an SMF system log.

User response: Change the JOURNALMODEL definition so that a log stream type of either MVS or DUMMY is specified.

Destination: Console

Chapter 1. DFH messages 549
DFHLG0737  applid  A failure has occurred while writing to the system log (journalname). A log record was longer than the maximum block size for the MVS log stream. CICS will be terminated.

Explanation: The CICS log manager has detected a failure while writing to the system log. An attempt was made to write a log record longer than the maximum block size allowed for the MVS log stream. The size mismatch is indicated by a previous DFHLG0742 message written to the CSMT TD destination.

System action: An exception entry is made in the trace table, and CICS is terminated immediately. CICS cannot tolerate a failure of this nature for the system log.

User response: Using the DFHLG0742 message as a guide, define a larger block size for the MVS log stream structure that the system log will use. Then restart CICS, ensuring that the appropriate SIT START parameter is specified in order to maintain data integrity.

Destination: Console

Modules: DFHL2SLE

XMEOUT Parameters: applid, journalname

DFHLG0738  applid  A failure has occurred while reading the system log (journalname). The requested data could not be found. CICS will be terminated. Further work requires an initial start.

Explanation: The CICS log manager is unable to locate previously hardened data when reading from the system log during a restart of CICS. This implies that data on the system log has been lost. The integrity of the system log is therefore suspect.

System action: No blocks are written to the system log. CICS restart is abandoned. If the next CICS start is not an initial start, CICS will terminate before allowing user processing to begin because system log data may have been lost.

User response: Incomplete transactions will need to be recovered by other means before starting CICS again.

You may need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Modules: DFHL2SLE

XMEOUT Parameters: applid, journalname

DFHLG0739  applid  An attempt to start transaction CSQC to perform a normal shutdown of CICS has failed. Perform a normal shutdown of CICS manually.

Explanation: The CICS log manager attempted to start transaction CSQC to quiesce CICS via a normal shutdown but the attempt was unsuccessful. CICS was being quiesced because the integrity of the system log is suspect.

System action: An exception entry is made in the trace table, and a system dump is taken. CICS continues processing but any tasks that enter dynamic backout are suspended indefinitely and remain inflight.

User response: Issue CEMT PERFORM SHUTDOWN to quiesce CICS via a normal shutdown. This lets as many transactions complete as possible. Refer to the explanations for messages DFHLG0736 and DFHLG0740. Also attempt to establish why transaction CSQC failed to start, and correct the problem. If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Modules: DFHL2SLE

XMEOUT Parameter: applid

DFHLG0740  applid  While writing data to the system log (journalname), a lost data warning was received. CICS will be quiesced without logging, allowing tasks to complete. Further work requires an initial start.

Explanation: The CICS log manager received a lost data warning when writing to the system log. This means that one or more blocks of previously hardened data have been lost from the system log. The integrity of the system log is therefore suspect.

System action: No more blocks are written to the system log. CICS is quiesced via a normal shutdown to let as many tasks complete as possible. Any tasks that enter dynamic backout from this point onwards are suspended. If the next CICS start is not an initial start CICS will terminate before allowing user processing to begin because system log data may have been lost.

User response: Transactions that failed to complete before shutdown will need to be recovered by other means before starting CICS again.

You may need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Modules: DFHL2SLE
XMEOUT Parameters: applid, journalname

DFHLG0741 applid A failure to read data from the system log during dynamic backout has caused task tasknum to be suspended indefinitely. Tranid tranid, termid termid.

Explanation: Task tasknum with tranid tranid running at termid termid has been suspended indefinitely. Data required during dynamic backout could not be located on the system log. This message is preceded by message DFHLG0736.

System action: The task is suspended. CICS in the process of quiescing via a normal shutdown.

User response: Refer to the message explanation for message DFHLG0736.

Destination: Console
Modules: DFHL2SLE
XMEOUT Parameters: applid, tasknum, tranid, termid

DFHLG0742 date time applid Log record too long for block. Record size rsize bytes. Block size bsize bytes. (MVS log stream | SMF journal name).

Explanation: The CICS log manager has detected an attempt to write a log record to an MVS logger log stream or SMF journal where the log record is too long to fit in the maximum block size allowed.

The message indicates the size of the log record and the maximum size of a block for that log stream. The size of the log record includes a CICS record header (up to 200 bytes for system log, 56 bytes otherwise) and any user prefix data. There must also be enough room in the block for a CICS block header (158 bytes for SMF, 52 bytes for system log, 40 bytes otherwise).

System action: An exception entry is made in the trace table. If the log stream is part of the CICS system log and the log record was not written by a user application or exit program then CICS is terminated. Otherwise an exception is passed back to the caller.

User response: First establish whether a log record of the indicated size is expected. If the log record was written by a user application or exit program using EXEC CICS WRITE JOURNALNAME or DFHJCJCX WRITE_JOURNAL_DATA, the program could be in error.

If the log record is correct, you should increase the block size for an MVS logger log stream by defining a larger block size for the structure that the log stream will use. For an SMF journal, the block size is fixed at 32756 bytes and cannot be changed.

Destination: CSMT
Modules: DFHL2LB, DFHL2WF, DFHL2CHM

DFHLG0743 date time applid Tail of log stream lsn deleted at block id X'blockid'.

Explanation: The CICS log manager has trimmed the tail of MVS logger log stream lsn. All records that occurred before (older) the specified MVS logger block id blockid have been deleted.

This occurs during activity keypoint processing when CICS decides it no longer needs records beyond a certain age on a CICS system log log stream.

System action: CICS continues processing.

User response: None.

Destination: CSMT
Modules: DFHL2CHE
XMEOUT Parameters: date, time, applid, lsn, X'blockid'

DFHLG0744 date time applid All records in log stream lsn have been deleted.

Explanation: The CICS log manager has deleted all records from MVS logger log stream lsn.

This occurs either at CICS startup when the start type is initial, or during activity keypoint processing, when CICS decides it no longer needs any of the records currently on a CICS system log log stream.

System action: CICS continues processing.

User response: None.

Destination: CSMT
Modules: DFHL2CC, DFHL2CHE
XMEOUT Parameters: date, time, applid, lsn

DFHLG0745I applid System log full scan has started.

Explanation: The CICS log manager has started the full scan of the system log during startup.

This is a progress message.

System action: CICS continues processing.

User response: None. The message can be suppressed with the SIT parameter MSGLVL=0.

Destination: Console
Modules: DFHL2CHA
XMEOUT Parameter: applid
DFHLG0746  date time applid System log scan trim record found. Primary logstream block id X’pblock’, secondary logstream block id X’sblock’.

Explanation: The CICS log manager has encountered a trim record during the scan of the system log stream during startup. The primary logstream trim record block id is pblock, the secondary logstream trim record block id is sblock.

This is an informational message.

System action: CICS continues processing.

User response: None.

Destination: CSMT

Modules: DFHL2CHN

XMEOUT Parameters: date, time,applid, X’pblock’, X’sblock’

DFHLG0747I  applid System log scan continuing, count records processed.

Explanation: The CICS log manager has processed count records during the scan of the system log stream at a CICS restart.

The message is produced every ‘n’ records - where ‘n’ is half of AKPFREQ or 500, whichever is the greatest.

This is a progress message.

System action: CICS continues processing.

User response: None. The message can be suppressed with the SIT parameter MSGLEVEL=0.

Destination: Console

Modules: DFHL2CHN DFHL2CH4

XMEOUT Parameters: applid, count

DFHLG0748I  applid System log selective scan has started.

Explanation: The CICS log manager has started the selective scan of the system log during startup.

This is a progress message.

System action: CICS continues processing.

User response: None. The message can be suppressed with the SIT parameter MSGLEVEL=0.

Destination: Console

Modules: DFHL2CHH

XMEOUT Parameter: applid

DFHLG0749I  applid System log scan has completed.

Explanation: The CICS log manager has finished the scan of the system log stream during startup.

This is a progress message.

System action: CICS continues processing.

User response: None. The message can be suppressed with the SIT parameter MSGLEVEL=0.

Destination: Console

Modules: DFHL2CHL

XMEOUT Parameter: applid

DFHLG0750  applid Transaction CSQC has failed to perform a normal shutdown of CICS. Perform a normal shutdown of CICS manually.

Explanation: Transaction CSQC has failed to quiesce CICS via a normal shutdown because an error was detected. CICS was being quiesced because the integrity of the system log is suspect.

System action: A system dump is taken. CICS continues processing but any tasks that enter dynamic backout are suspended indefinitely and remain inflight.

User response: Issue CEMT PERFORM SHUTDOWN to quiesce CICS via a normal shutdown. This lets as many transactions complete as possible. Refer to the explanations for messages DFHLG0736 and DFHLG0740.

Attempt to establish why transaction CSQC failed to quiesce CICS, and correct the problem. If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Modules: DFHLGQC

XMEOUT Parameter: applid

DFHLG0760  date time applid Log stream isn not trimmed by keypoint processing. Number of keypoints since last trim occurred: trimnum. History point held by transaction: transid, task number: trannum.

Explanation: The CICS log manager has been unable to trim the tail of MVS logger log stream isn, during an activity keypoint.

CICS will attempt to trim the system log log streams during activity keypoint processing, to delete redundant data from the oldest end of the log stream (the tail).

Note that this message is only issued if the primary system log stream (DFHLOG) fails to be trimmed during
a keypoint operation. It is not issued if a trim does not occur for the secondary system log stream (DFHSHUNT). This is since a trim of the primary system log stream is considerably more likely to occur per keypoint, and hence failures to trim the primary system log stream should be recognized, and investigated if required.

**System action:** CICS continues processing.

**User response:** This is an informational message, but should be treated as a warning of a potential problem if the number of keypoints that have been unable to trim the primary system log stream continues to increase. Occasional keypoints that fail to trim DFHLOG are not unexpected events. However, if the message is issued by a number of sequential keypoints then this warrants further investigation.

The keypoint operation was unable to trim the tail of DFHLOG because the oldest log records on the log stream belong to a Unit Of Work (UOW) that is still required. This may be a validly long-running UOW; alternatively, it may be part of a long-running task executing an application that generates log records but does not issue syncpoint requests regularly enough.

This may be a transient phenomenon due to an atypical long-running UOW. Review the number of keypoints that have been unable to trim the log. Check what message CICS issues for log stream lsn at the next activity keypoint. Message DFHLG0743 indicates the log stream is now successfully trimmed. Another DFHLG0760 message indicates a long-running UOW still exists on the system. If the log stream still cannot be trimmed, use the CEMT INQUIRE UOW command to review the oldest UOWs on the system.

The transaction identifier and the task number of the task whose UOW relates to the oldest data on DFHLOG are also provided in the DFHLG0760 message. The CEMT INQUIRE TASK command may be used to review them.

It is also worthwhile reviewing how often CICS is performing activity keypoints (as defined by the AKPFREQ system definition parameter).

**Destination:** CSMT

**Modules:** DFHL2CHE

**XMEOUT Parameters:** date, time, applid, lsn, trimnum, transid, trannum

---

**DFHLG0770**  
applid A severe error has occurred while writing to the SMF log, which was accessed via journal jname. SMF response X'resp'.

**Explanation:** The CICS log manager has detected a severe error while writing to the SMF log. This is accessed via journal jname. SMF returns the response byte X'resp'.

**System action:** An exception entry is made in the trace table, a system dump is taken and an exception is returned to the caller.

**User response:** Using the SMF response byte, diagnose and correct the problem. If you cannot resolve the problem or the problem recurs, there may be a more severe error. In this case, you will need assistance from IBM. See Part 4 of the [CICS Problem Determination Guide](#) for guidance on how to proceed.

**Destination:** Console

**Modules:** DFHL2LB

**XMEOUT Parameters:** applid, jname, X'resp'

---

**DFHLG0771**  
date time applid A temporary error condition occurred during MVS logger operation {IXGCONN | IXGWRITE | IXGBRWSE | IXGDELET | IXGQUERY }{CONNECT | DISCONNECT | START | READCURSOR | READBLOCK | END | ALL | RANGE} for log stream lsn. MVS logger codes: X'ret', X'rsn'.

**Explanation:** The CICS log manager made a call to the MVS logger to access a log, which returned a temporary error condition. The MVS logger operation that returned the error condition is identified in the message. The return and reason codes shown are those returned by the MVS logger.

For further guidance, see the OS/390 MVS Programming: Assembler Services Reference.

# System action: The log manager automatically retries the operation while the temporary error condition persists. This message is issued every thirty seconds following the first/previous issue.

**User response:** None. This is a temporary condition.

**Destination:** CSMT

**Modules:** DFHL2HS2, DFHL2HS3, DFHL2HS4, DFHL2HS5, DFHL2HS6, DFHL2HS7, DFHL2HS8, DFHL2HS9, DFHL2HSF, DFHL2HSG, DFHL2HSJ

**XMEOUT Parameters:** date, time,applid, {1=IXGCONN, 2=IXGWRITE, 3=IXGBRWSE, 4=IXGDELET, 5=IXGQUERY}, {1=CONNECT, 2=DISCONNECT, 3=START, 4=READCURSOR, 5=READBLOCK, 6=END, 7=RANGE}, lsn, X'ret', X'rsn'
DFHLG0772  applid An error has occurred during MVS logger operation {IXGCONN | IXWRITE | IXGBRWSE | IXGDELETE | IXGQUERY } [CONNECT | DISCONNECT | START | READCURSOR | READBLOCK | END | ALL | RANGE | CHECKCONNSTATUS(YES)} for log stream lsn. MVS logger codes: X'rsn'. Log stream attributes: SYSTEMLOG({YES | NO}), DASDONLY({YES | NO}), STRUCTNAME(structname), RETPD(X'retpd'), AUTODELETE({YES | NO}).

**Explanation:** The CICS log manager made a call to the MVS logger to access a log, which returned an error condition. The MVS logger operation that returned the error condition is identified in the message, and the return and reason codes shown are those returned by the MVS logger. This is followed by some of the attributes which define the log stream. A structure name of "***************" indicates that no structure is being used by this log stream.

If the error occurred during a log stream connection, these attributes may not have been updated to the correct values for the log stream and should be ignored. These attributes are only valid following a successful connection.

This message may be followed by other CICS messages, especially if the log stream is part of the CICS system log.

This situation can occur when CICS calls the MVS logger using an obsolete log stream connection token, when the MVS logger has been restarted following either a crash or a user request. A restart of the MVS logger implicitly disconnects all connections to it.

For further guidance, see the OS/390 MVS Programming: Assembler Services Reference.

**System action:** An exception entry is made in the trace table. A system dump will have been taken by DFHLG0001. The log manager returns a disaster condition to the caller. If the log is the CICS system log, a forward recovery log or autojournal log, another message is issued. Otherwise a disaster condition is returned to the application program.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User response:** Refer to other messages following this message for more information and guidance.

If the error condition persists, you will need assistance from IBM. See Part 4 of the [CICS Problem Determination Guide](#) for guidance on how to proceed.

**Destination:** Console

**Modules:** DFHL2HS2, DFHL2HS3, DFHL2HS4, DFHL2HS5, DFHL2HS6, DFHL2HS7, DFHL2HS8, DFHL2HS9, DFHL2HSF, DFHL2HSG, DFHL2HSJ, DFHL2HB

**DFHLG0773** applid A severe error (code X’code’) has occurred while accessing {IXGCONN | IXWRITE | IXGBRWSE | IXGDELETE | IXGQUERY } [CONNECT | DISCONNECT | START | READCURSOR | READBLOCK | END | ALL | RANGE] the log stream lsn.

**Explanation:** The CICS log manager has detected a severe error while attempting to access a log. The code X’code’ is the exception trace point ID which uniquely identifies where the error was detected. This message is preceded by DFHLG0001, and usually followed by other messages.

**System action:** An exception entry is made in the trace table. A system dump will have been taken by DFHLG0001. The log manager returns a disaster condition to the caller. If the log is the CICS system log, a forward recovery log or autojournal log, another message is issued. Otherwise a disaster condition is returned to the application program.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User response:** If the MVS logger was recently restarted, AUTO start CICS. Otherwise use the MVS logger return and reason codes to diagnose the problem. If you cannot resolve the problem or the problem recurs, there may be a more severe error. In this case, you will need assistance from IBM. See Part 4 of the [CICS Problem Determination Guide](#) for guidance on how to proceed.

**Destination:** Console

**Modules:** DFHL2HS2, DFHL2HS3, DFHL2HS4, DFHL2HS5, DFHL2HS6, DFHL2HS7, DFHL2HS8, DFHL2HS9, DFHL2HSF, DFHL2HSG, DFHL2HSJ, DFHL2HB

**XMEOUT Parameters:** applid, X’code’, {1=IXGCONN, 2=IXWRITE, 3=IXGBRWSE, 4=IXGDELETE, 5=IXGQUERY}, {1=CONNECT, 2=DISCONNECT, 3=, 4=START, 5=READCURSOR, 6=READBLOCK, 7=END, 8=ALL, 9=RANGE, 10=CHECKCONNSTATUS(YES)}, lsn, X’retpd’, {1=YES, 2=NO}, structname, X’retpd’, {1=YES, 2=NO}.

**DFHLG0774** applid The MVS logger has returned an alert during operation {IXGCONN CONNECT | IXWRITE | FOR logstream lsn. The log stream data set directory is full. MVS logger codes: X’ref’ X’rsf’.

**Explanation:** The CICS log manager has detected a warning while attempting to access a log stream. The log stream’s data set directory is full.
For further guidance, see the OS/390 MVS Programming: Assembler Services Reference.

**System action:** An exception entry is made in the trace table.

CICS continues normal operation until the current data set of the log stream becomes full. When this happens message DFHLG0772 is issued.

**User response:** You should delete data from the log stream tail before the current data set fills up. You may wish to take a copy of the data before deleting it. Alternatively you could use a new log stream, but this may be too disruptive.

**Destination:** Console

**Modules:** DFHL2HS2, DFHL2HSF

**XMEOUT Parameters:** applid, {1=IXGCONN CONNECT, 2=IXGWRITE }, lsn,X'ret', X'rsn'

**Explanation:** The CICS log manager has detected a warning while attempting to access a log stream. The log stream staging data set has failed. MVS logger codes: X'ret', X'rsn'.

For further guidance, see the OS/390 MVS Programming: Assembler Services Reference.

**System action:** An exception entry is made in the trace table.

CICS continues normal operation, but the data written to the log stream structure is not being duplexed. Consequently, if the structure (or coupling facility) fails, the data cannot be recovered.

**User response:** You are recommended to shutdown CICS as soon as possible. You should investigate and fix the failing log stream, without losing the data.

If the failing log stream is the CICS system log and CICS was shutdown immediately, you should emergency restart CICS in order to recover the inflight transactions.

**Destination:** Console

**Modules:** DFHL2HSF

**XMEOUT Parameters:** applid, lsn,X'ret', X'rsn'

**Explanation:** The MVS logger has returned an alert during operation IXGBRWSE for log stream lsn. The log stream staging data set has failed. MVS logger codes: X'ret', X'rsn'.

For further guidance, see the OS/390 MVS Programming: Assembler Services Reference.

**System action:** The log manager automatically retries the operation every three seconds while the temporary error condition persists. This message is issued every ten retries following the first/previous issue.

**User response:** None. This is a temporary condition.

**Destination:** Console

**Modules:** DFHL2HS2, DFHL2HS3, DFHL2HS4, DFHL2HS5, DFHL2HS6, DFHL2HS7, DFHL2HS8, DFHL2HS9, DFHL2HSF, DFHL2HSG, DFHL2HSJ

**XMEOUT Parameters:** applid, {1=IXGCONN, 2=IXGWRITE, 3=IXGBRWSE, 4=IXGDELET, 5=IXGQUERY }, {1=CONNECT, 2=DISCONNECT, 3= , 4=START, 5=READCURSOR, 6=READBLOCK, 7=END, 8=ALL, 9=RANGE}, lsn, X'ret', X'rsn'

**Explanation:** The CICS log manager made a call to the MVS logger to access a log, which returned a temporary error condition. The MVS logger operation that returned the error condition is identified in the message. The return and reason codes shown are those returned by the MVS logger.

For further guidance, see the OS/390 MVS Programming: Assembler Services Reference.

**System action:** The log manager automatically retries the operation every three seconds while the temporary error condition persists. This message is issued every ten retries following the first/previous issue.

**User response:** None. This is a temporary condition.

**Destination:** Console

**Modules:** DFHL2HS2, DFHL2HS3, DFHL2HS4, DFHL2HS5, DFHL2HS6, DFHL2HS7, DFHL2HS8, DFHL2HS9, DFHL2HSF, DFHL2HSG, DFHL2HSJ

**XMEOUT Parameters:** applid, {1=IXGCONN, 2=IXGWRITE, 3=IXGBRWSE, 4=IXGDELET, 5=IXGQUERY }, {1=CONNECT, 2=DISCONNECT, 3= , 4=START, 5=READCURSOR, 6=READBLOCK, 7=END, 8=ALL, 9=RANGE}, lsn, X'ret', X'rsn'
DFHLG0778  applid The MVS logger has returned an error during operation IXGCONN CONNECT for log stream lsn. CICS does not have authority to perform this operation. MVS logger codes: X'ret' X'rsn'.

Explanation: The CICS log manager has detected an error while attempting to access a log stream. CICS region userid has not been defined to the MVS logger with the authority to perform this operation.

For further guidance, see the OS/390 MVS Programming: Assembler Services Reference.

System action: An exception entry is made in the trace table.

The log manager returns an exception condition to the caller. If the log is the CICS system log, a forward recovery log or an autojournal log, another message is issued. Otherwise an exception condition is returned to the application program.

User response: Refer to any messages issued subsequently for guidance. Use the MVS logger return and reason codes to further diagnose the problem.

Ensure that the CICS region userid has authority to access the log stream. For further guidance, see the CICS RACF Security Guide.

Destination: Console

Modules: DFHL2HS2

XMEOUT Parameters: applid, lsn,X'ret', X'rsn'

DFHLG0779  applid The MVS logger has returned an error during operation IXGCONN CONNECT for log stream lsn. The log stream is being deleted by another program. MVS logger codes: X'ret' X'rsn'.

Explanation: The CICS log manager has detected an error while attempting to access a log stream. The log stream is being deleted by a request from another program and CICS cannot connect to it until this program has finished.

For further guidance, see the OS/390 MVS Programming: Assembler Services Reference.

System action: An exception entry is made in the trace table.

The log manager returns an exception condition to the caller. If the log stream is the CICS system log, a forward recovery log or an autojournal log, another message is issued. Otherwise an exception condition is returned to the application program.

User response: Refer to any messages issued subsequently for guidance. Use the MVS logger return and reason codes to further diagnose the problem.

You will need to understand why another program was deleting the log stream. Either prevent such a conflict from occurring in the future, or allocate a different log stream to CICS.

Destination: Console

Modules: DFHL2HS2

XMEOUT Parameters: applid, lsn,X'ret', X'rsn'

DFHLG0780  applid The MVS logger has returned an error during operation IXGCONN CONNECT for log stream lsn. Some data previously written to this log stream has been lost. MVS logger codes: X'ret' X'rsn'.

Explanation: The CICS log manager has detected an error while attempting to access a log stream. Some of the data written to this log stream has been permanently lost.

This message is issued only if the log stream is a general log (not a CICS system log).

For further guidance, see the OS/390 MVS Programming: Assembler Services Reference.

System action: An exception entry is made in the trace table.

The log manager returns an exception condition to the caller.

User response: This log stream is a general log, therefore it must be deleted and redefined before it can be used by CICS again.

If the log stream is used as a forward recovery log, take a fresh backup of all data sets that use this log stream as soon as possible.

If the log stream is used as a user journal, the associated journal needs to be reenabled before it can be used again. To do this, issue the command SET JOURNALNAME(...) RESET

Use the MVS logger return and reason codes to further diagnose the problem.

Destination: Console

Modules: DFHL2HS2

XMEOUT Parameters: applid, lsn,X'ret', X'rsn'

DFHLG0781  applid The MVS logger has returned an error during operation IXGCONN CONNECT for log stream lsn. The maximum number of log stream connections that the MVS logger can support has been reached. MVS logger codes: X'ret' X'rsn'.

Explanation: The CICS log manager has detected an
error while attempting to access a log stream. The maximum number of log stream connections that the MVS logger can support has been reached.

For further guidance, see the OS/390 MVS Programming: Assembler Services Reference.

System action: An exception entry is made in the trace table.

The log manager returns an exception condition to the caller. If the log is the CICS system log, a forward recovery log or an autojournal log, another message is issued. Otherwise an exception condition is returned to the application program.

User response: Refer to any messages issued subsequently for guidance. Use the MVS logger return and reason codes to further diagnose the problem.

It may be possible to retry this transaction later when other work has completed and the number of concurrent transactions has reduced. Otherwise you should investigate your usage of log streams within the sysplex with a view to reducing the number of log streams that need to be connected concurrently.

Destination: Console

Modules: DFHL2HS2

XMEOUT Parameters: applid, lsn,'X'sret', 'X'rsn'

--

DFHLG0782 applid The MVS logger has returned an error during operation {IXGCONN CONNECT I IXGWRITE} for log stream lsn. The MVS logger does not have authority to access the log stream structure. MVS logger codes: 'X'sret' 'X'rsn'.

Explanation: The CICS log manager has detected an error while attempting to access a log stream. The MVS logger does not have the authority to access the log stream structure.

For further guidance, see the OS/390 MVS Programming: Assembler Services Reference.

System action: An exception entry is made in the trace table.

The log manager returns an exception condition to the caller. If the log is the CICS system log, a forward recovery log or an autojournal log, another message is issued. Otherwise an exception condition is returned to the application program.

User response: Refer to any messages issued subsequently for guidance. Use the MVS logger return and reason codes to further diagnose the problem.

Ensure that the MVS logger address space has authority to access the log stream structure.

Destination: Console

Modules: DFHL2HS2, DFHL2HSF

XMEOUT Parameters: applid, {1=IXGCONN CONNECT, 2=IXGWRITE}, lsn,'X'sret', 'X'rsn'

---

DFHLG0783 applid The MVS logger has returned an error during operation IXGCONN CONNECT for logstream lsn. CICS attempted to connect to a log stream model, which is not possible. MVS logger codes: 'X'sret' 'X'rsn'.

Explanation: The CICS log manager has detected an error while attempting to access a log stream. CICS attempted to connect to a log stream model, which is not possible.

For further guidance, see the OS/390 MVS Programming: Assembler Services Reference.

System action: An exception entry is made in the trace table.

The log manager returns an exception condition to the caller. If the log is the CICS system log, a forward recovery log or an autojournal log, another message is issued. Otherwise an exception condition is returned to the application program.

User response: Refer to any messages issued subsequently for guidance. Use the MVS logger return and reason codes to further diagnose the problem.

It is possible that a user journal definition has been defined with the wrong log stream name or that the log stream has been defined incorrectly to have the MODEL(YES) attribute. See the CICS System Definition Guide for guidance on defining user journals.

Destination: Console

Modules: DFHL2HS2

XMEOUT Parameters: applid, lsn,'X'sret', 'X'rsn'

---

DFHLG0784 applid The MVS logger has returned an error during operation IXGCONN connect for log stream lsn. You cannot connect to a DASDONLY log stream that is already connected to another MVS image. MVS logger codes: 'X'sret' 'X'rsn'.

Explanation: The CICS log manager has detected an error while attempting to access a log stream. The MVS logger rejected the connect request because the log stream is of type DASDONLY and is already connected to another MVS image.

For further guidance, see the OS/390 MVS Programming: Assembler Services Reference.

System action: An exception entry is made in the trace table.

The log manager returns an exception condition to the caller. If the log is the CICS system log, a forward recovery log or an autojournal log, another message is
The log stream was wrongly defined as being of type DASDONLY.

The possibilities are:

- The connect request is using the wrong log stream name.
- The current connection is using the wrong log stream name.
- The log stream was wrongly defined as being of type DASDONLY.

**Explanation:** The CICS log manager has detected an error while attempting to access a log stream. The MVS logger rejected the connect request because the log stream is of type DASDONLY and is not supported by the current system release level. MVS logger codes: X'rsn1' X'rsn2'.

**System action:** An exception entry is made in the trace table.

- The log manager returns an exception condition to the caller. If the log is the CICS system log, a forward recovery log or an autojournal log, another message is issued. Otherwise an exception condition is returned to the application program.

**User response:** Refer to any messages issued subsequently for guidance. Use the MVS logger return and reason codes to further diagnose the problem.

**XMEOUT Parameters:** applid, lsn, X'ret', X'rsn'

**DFHLG0786** applid The MVS logger has returned an error during operation IXGCConn CONNECT for log stream lsn. The MVS logger failed to find a suitable coupling facility for the log stream structure.

MVS logger codes: X'ret' X'rsn'.

**Explanation:** The CICS log manager has detected an error while attempting to access a log stream. The MVS logger failed to find a suitable coupling facility for the log stream structure.

For further guidance, see the OS/390 MVS Programming: Assembler Services Reference.

**System action:** An exception entry is made in the trace table.

- The log manager returns an exception condition to the caller. If the log is the CICS system log, a forward recovery log or an autojournal log, another message is issued. Otherwise an exception condition is returned to the application program.

**User response:** Refer to any messages issued subsequently for guidance. Use the MVS logger return and reason codes to further diagnose the problem.

You should investigate your usage of the coupling facility resource within the sysplex.

**Destination:** Console

**Modules:** DFHL2HS2

**XMEOUT Parameters:** applid, lsn, X'ret', X'rsn'

**DFHLG0787** applid CICS is attempting to read a blockid that does not belong to the current chain. Read blockid: X'blkid1'; Chain History Point: X'blkid2'.

**Explanation:** The requested blockid is a lower relative number than the Chain History Point blockid, which means the CICS log manager has requested a block which was written earlier than the current logical start of the chain. This indicates an internal logic error within CICS.

**System action:** An exception entry is made in the trace table and a system dump is taken, and the CICS log manager returns an exception condition.

- If the failure occurred while CICS was reading from the system log, message DFHLG0736 will follow, and a quiesce of CICS will be initiated.
User response: The logstream should be printed before CICS is restarted, using the DFHJUP utility. For guidance in using this, refer to the CICS Operations and Utilities Guide.

Note: If the failure occurred for the CICS system log, print both the primary and secondary CICS System Log logstreams before restarting CICS.

Refer to any messages issued subsequently for further guidance.

If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Modules: DFHL2BLC

XMEOUT Parameters: applid, X'blkid1', X'blkid2'

DFHLG0788 applid The System Log journals DFHLOG and DFHSHUNT have been defined on the same MVS logstream (logstream). This is invalid. CICS will terminate.

Explanation: When connecting to the DFHLOG and DFHSHUNT journals, the CICS Logger Domain has detected that both journals are defined on the same MVS logstream. This is invalid.

System action: An exception entry is made in the trace table. A system dump is taken and CICS is terminated immediately. CICS cannot tolerate a failure of this nature for the system log.

User response: Correct the JOURNALMODEL definitions used to define the DFHLOG and DFHSHUNT journals and restart the system.

Destination: Console

Modules: DFHL2SLE

XMEOUT Parameters: applid, logstream

DFHLG0800 applid The MVS logger failed to locate a blockid requested by the CICS log manager. Missing blockid: X'blkid1'; Chain History Point: X'blkid2'.

Explanation: The MVS logger has returned an IxgRsnCodeNoBlock (00000804) Reason Code to the CICS log manager. This means that the log block requested by CICS could not be located by the MVS logger.

The blockid of the requested block, and the blockid representing the Chain History Point for the log block chain in question, are shown.

System action: This is an informational message to provide the blockid of the missing block, and the blockid of the Chain History Point for the chain which should contain the requested block.

This message will have been preceded by message DFHLG0772. An exception trace was written and a system dump taken.

If the failure occurred while CICS was reading from the system log message DFHLG0736 will follow, and a quiesce of CICS will be initiated.

User response: Compare the requested blockid with the Chain History Point blockid. If the requested blockid is equal to, or a higher relative number than, the Chain History Point, the blockid represents a log block which CICS is still validly interested in and which should be available from the MVS logger.

If the requested blockid is a lower relative number than the Chain History Point blockid, then the CICS log manager has requested a block which was written earlier than the current logical start of the chain. This indicates an internal logic error within CICS.

The logstream should be printed before CICS is restarted, using the DFHJUP utility. For guidance in using this, refer to the CICS Operations and Utilities Guide. Note if the failure occurred for the CICS system log then print both the primary and secondary CICS system log logstreams before restarting CICS.

Refer to any messages issued subsequently for further guidance.

If the error condition persists, you will need assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination: Console

Modules: DFHL2BLC
DFHLMxxx messages

DFHLM0001  applid An abend (code abcode) has occurred at offset X'offset' in module modname.

Explanation:  An abnormal end (abend) or program check has occurred in module modname. This implies that there may be an error in CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code abcode is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System action:  An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response:  Notify the system programmer. This indicates a possible error in CICS code. The severity of its impact will depend on the importance of the function being executed at the time of the error.

CICS may not have been terminated.

If the message occurs once and module modname is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module modname, you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination:  Console

Modules:  DFHLMDM, DFHLMDS, DFHLMIQ, DFHLMLM

XMEOUT Parameters:  applid, abcode, offset, modname

DFHLM0002  applid A severe error (code X'code') has occurred in module modname.

Explanation:  An error has been detected in module modname. The code X'code' is the exception trace point ID which uniquely identifies what the error is and where the error was detected. For further information about CICS exception trace entries, refer to the CICS Problem Determination Guide.

System action:  An exception entry (code code in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS will continue unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message will be issued to this effect.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response:  Inform the system programmer. This indicates a possible error in CICS code. The severity of its impact will depend on the importance of the function being executed at the time of the error.

CICS may not have been terminated.

If the message occurs once and module modname is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module modname, you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Destination:  Console

Modules:  DFHLMDM, DFHLMDS, DFHLMIQ, DFHLMLM

XMEOUT Parameters:  applid, code, modname

DFHLM0004  applid A possible loop has been detected at offset X'offset' in module modname.

Explanation:  A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module modname at offset X'offset'. This is the offset of the instruction which was executing at the time the error was detected.

System action:  An exception entry is made in the
trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate.

**Message DFHME0116** is normally produced containing the symptom string for this problem.

**User response:** Notify the system programmer. If CICS has not been terminated, it will be necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of CPU time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS will purge a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module `modname` in the message will be terminated and CICS will continue.

But if you have declared ICVR=0 in the SIT and you consider that module `modname` has gone into a loop, you will have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module `modname` and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. Usually, CICS will purge a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module `modname` in the message will be terminated and CICS will continue.

But if you have declared ICVR=0 in the SIT and you consider that module `modname` has gone into a loop, you will have to terminate CICS in order to terminate the runaway function.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM. See Part 4 of the [CICS Problem Determination Guide](#) for guidance on how to proceed.

**Destination:** Console

**Modules:** DFHLMDM, DFHLMDS, DFHLMIQ, DFHLMLM

**XMEOUT Parameters:** `applid`, `X'offset'`, `modname`

---

**DFHLM0006** `applid Insufficient storage to satisfy Getmain (code X'code') in module modname. MVS code mvscode.**

**Explanation:** An MVS GETMAIN was issued by module `modname`, but there was insufficient storage available to satisfy the request. The code `X'code'` is the exception trace point id which uniquely identifies the place where the error was detected.

This error has occurred above the 16M line.

The code `mvscode` is the MVS GETMAIN return code.

**System action:** An exception entry is made in the trace table (code `code` in the message). A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS will continue unless you have specified in the dump table that CICS should terminate.

If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

**Message DFHME0116** is normally produced containing the symptom string for this problem.

**User response:** Inform the system programmer. If CICS has been terminated by another module, look out for the relevant termination messages (from, for example, the domain manager, DFHDMDM). Look up the user response suggested for these messages.

If CICS is still running, the problem may be a temporary one which will right itself if more storage becomes available. If you can manage without module `modname`, you may decide to continue and bring CICS down at a convenient time to resolve the problem. If the message recurs or if you cannot run without the full use of all CICS modules, you should bring CICS down in a controlled shutdown.

Try decreasing the overall size limits of the DSAs or EDSAs. Or, try increasing the size of the whole region, if it is not already at maximum size. If CICS is not already terminated, you will need to bring CICS down to do this. See the [CICS System Definition Guide](#) or the [CICS Performance Guide](#) for further information on CICS storage.

**Destination:** Console

**Modules:** DFHLMDM, DFHLMDS, DFHLMIQ, DFHLMLM

**XMEOUT Parameters:** `applid`, `X'code', modname, mvscode`
CICS-provided SYNAD routine generated in the terminal control table (TCT).

DFHMC40011  

```
  date time applid Error purge delay inoperative, (transid | invalid req | unexpected) error
```

**Explanation:** An error return code has been received from the interval control program (ICP) during initiation of the purge delay transaction, CSPQ.

The return code is caused by one of the following:
- A TRANSID error.
- An INVALID REQ error.
- An UNEXPECTED error.

**System action:** Purge delay does not operate for this execution of CICS. A dump is taken.

**User response:** Since the abend affects the national language modules in the message (ME) domain, CICS is not automatically terminated. However, you may decide that your system should not be allowed to run without these modules, in which case you need to bring CICS down.

Look up the MVS code, if there is one, in the relevant MVS codes manual which is detailed in the book list in this manual. Look up the CICS alphanumeric code in this manual. This code tells you, for example, whether the error was a program check, an abend, a runaway, or a recovery percolation.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

---

**DFHMExxxx messages**

**DFHME0001**  

```
applid An abend (code xxx/yyyy) has occurred at offset X'offset' in module modname.
```

**Explanation:** An abnormal end or program check has occurred in module *modname*.

The code *xxx/yyyy* is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code (for example AKEA) or a number referring to a CICS message (for example 1310 refers to CICS message DFHTS1310).

**System action:** An exception entry is made in the trace table. A dump is taken, unless you have specifically suppressed dumps in the dump table. Since this error may not be critical, CICS is not terminated, even if you have specified terminate in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User response:** Since the abend affects the national language modules in the message (ME) domain, CICS is not automatically terminated. However, you may decide that your system should not be allowed to run without these modules, in which case you need to bring CICS down.

Look up the MVS code, if there is one, in the relevant MVS codes manual which is detailed in the book list in this manual. Look up the CICS alphanumeric code in this manual. This code tells you, for example, whether the error was a program check, an abend, a runaway, or a recovery percolation.

You need further assistance from IBM to resolve this problem. See Part 4 of the *CICS Problem Determination Guide* for guidance on how to proceed.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Modules:** DFHMEDM, DFHMEME, DFHMESR

**DFHME0002**  

```
applid An error (code X'code') has occurred in module modname.
```

**Explanation:** An error has been detected in module *modname*. The code *X'code'* is the exception trace point id which uniquely identifies the place where the error was detected.

**System action:** A bad return code is sent to the caller of the message (ME) domain. If the call is made by the domain manager, DFHDMDM, CICS is terminated by the domain manager, and a message is issued to this effect. However, if the message is issued by a message domain module, CICS is allowed to continue.

An exception entry is made in the trace table. For further information about CICS exception trace entries, refer to the *CICS Problem Determination Guide*.

A dump is taken, unless you have specifically suppressed dumps in the dump table. Since this error may not be critical, CICS is not terminated immediately, even if you have specified terminate in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User response:** Inform the system programmer as this message indicates a severe error in CICS code. Its impact may or may not be severe, depending on the circumstances. For example, if it only occurs once and CICS has not been terminated by the domain manager, you may decide to continue to run and bring CICS down at a convenient time. But if the message recurs or if you cannot run without the full use of all CICS messages, you should bring CICS down in a controlled shutdown.
You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Modules:** DFHMEDM, DFHMEME, DFHMESR, DFHMEWT

---

**DFHME0004** applid A possible loop has been detected at offset X’offset’ in module modname.

**Explanation:** A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module modname at offset X’offset’. This is the offset of the instruction which was executing at the time the error was detected.

**System action:** An exception entry is made in the trace table. A dump is taken, unless you have specifically suppressed dumps in the dump table. This situation may not be an error, or if it is an error it may not be critical, so CICS is not terminated immediately, even if you have specified terminate in the dump table. CICS will purge the runaway task if you have specified this in the SIT.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User response:** This error affects message generation, and the message (ME) domain does not automatically terminate CICS. You should decide whether the problem is serious enough to bring CICS down.

Since some transactions can use a lot of CPU time, this message may have been caused by a long-running transaction. Usually, CICS terminates a task which it considers to be a runaway task. It does this termination when the task exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds).

If you have declared ICVR=0, you have to terminate the task yourself if you consider that it has gone into a loop. Purge the task using the CEMT transaction.

If CICS has purged the task and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You will have to bring CICS down at a suitable time in order to do this.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

**Note:** This message cannot be changed with the message editing utility.

---

**DFHME0006** applid Insufficient storage to satisfy GETMAIN (code X’code’) in module modname. MVS code mvscode.

**Explanation:** An MVS GETMAIN was issued by module modname, but there was insufficient storage available to satisfy the request. The code X’code’ is the exception trace point ID which uniquely identifies the place in the code where the error occurred. The code mvscode is the MVS GETMAIN return code.

**System action:** An exception entry is made in the trace table with code X’code’. A dump is taken, unless you have specifically suppressed dumps in the dump table. Since this may not be a critical error, CICS is not terminated immediately, even if you have specified terminate in the dump table. However, if this error indicates a general problem with storage, CICS could be abnormally terminated by the CICS storage manager. A message will be issued to this effect.

If the GETMAIN fails for DFHMEDM, a return code is sent to the domain manager, DFHDMDM, and CICS is terminated by the domain manager. A message is issued to this effect.

If the GETMAIN fails for the message domain DFHMEME, it could occur in one of four places. The code X’code’ indicates which GETMAIN has failed as follows:

<table>
<thead>
<tr>
<th>Code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X’0340’</td>
<td>During formatting of TD message</td>
</tr>
<tr>
<td></td>
<td>The message is not issued.</td>
</tr>
<tr>
<td>X’0341’</td>
<td>During build of message</td>
</tr>
<tr>
<td></td>
<td>The message is not issued.</td>
</tr>
<tr>
<td>X’0342’</td>
<td>While building user exit parameters</td>
</tr>
<tr>
<td></td>
<td>The message is issued to original destination.</td>
</tr>
<tr>
<td>X’0343’</td>
<td>During rebuild of message in English</td>
</tr>
<tr>
<td></td>
<td>The rebuilt English message is not issued.</td>
</tr>
</tbody>
</table>

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User response:** If CICS is terminated, look out for the relevant termination messages from the storage manager or the domain manager and the user response suggested.

Try decreasing the size limits of the DSAs or EDSAs. Or, try increasing the size of the whole region, if it is not already at maximum size. You will need to bring CICS down to do this, if it has not already been terminated.
The problem may be a temporary one which rights itself if more storage becomes available. If CICS is still running, and you can manage without the full set of CICS messages, you may decide to continue and bring CICS down at a convenient time.

You can get diagnostic information about the MVS return code by consulting the relevant MVS codes manual.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Modules: DFHMEDM, DFHMEME

**DFHME0101** applid An error (code X’code’) occurred while writing message msgno to transient data destination dest

Explanation: CICS has tried to write message msgno to the transient data destination dest. This has failed for one of the following reasons:
1. Destination dest has not been defined in the DCT.
2. Destination dest is currently disabled.
3. The transient data queue for destination dest is full.
4. An I/O error has occurred writing to destination dest.

The code X’code’ is the exception trace point ID which uniquely identifies the place where the error was detected.

System action: An exception entry is made in the trace table and CICS continues.

User response: Check that dest is defined in your DCT.

If (1), add a new entry to the DCT for destination dest. Alternatively, if msgno is a DFHDB2xxx message, refer to the installed DB2CONN object. Change any of the msgqueue1, msgqueue2 and msgqueue3 parameters of the DB2CONN that specify destination dest so that they name a valid destination defined in the DCT.

If (2), use CEMT to reset the status of the queue to ‘enabled’.

If (3), allocate more space for the queue, or reset the trigger level (if messages are being issued to a terminal or printer).

If (4), investigate and fix the cause of the I/O error.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Modules: DFHMEME

**DFHME0102** applid An error (code X’code’) has occurred in module modname while producing message msgno.

Explanation: A severe error has been detected and the message (ME) domain has been unable to produce message msgno. The code X’code’ is the exception trace point ID which uniquely identifies the place where the error was detected.

System action: A return code is sent to the caller of the message (ME) domain, but since the call was made by a message domain module, CICS is allowed to continue.

An exception entry is made in the trace table. A dump is taken, unless you have specifically suppressed dumps in the dump table. Since this may not be a critical error, CICS is not terminated immediately, even if you have specified terminate in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

User response: Inform the system programmer as this indicates a severe error in CICS code. However, its impact may not be serious. For example, if the error only occurs once and you can run without message msgno, you may continue to run and bring CICS down at a convenient time.

However, if the message recurs (and on each recurrence there is a different message number msgno), or if you cannot run without the full use of all CICS messages, you should bring CICS down in a controlled shutdown.

You need further assistance from IBM to resolve this problem. See Part 4 of the CICS Problem Determination Guide for guidance on how to proceed.

Note: This message cannot be changed with the message editing utility.

Destination: Console

Modules: DFHMEBU, DFHMEIN, DFHMEWT, DFHMEME

**DFHME0105** applid Insufficient storage to load module modname.

Explanation: An MVS load has failed. The message language module modname could not be loaded as there was insufficient storage available. The language module is defined in the SIT for messages in a particular language, or is the default language module.

The default language is always used for messages sent to transient data queues and to consoles (providing that it is not a double-byte language in which case the message is sent to the console in English). If the default language module cannot be loaded, no messages can be delivered. Terminals can have messages in the default language or in another chosen language. If the
chosen language module cannot be loaded, terminal messages use the default language instead.

**System action:** An exception entry is made in the trace table and a dump is taken, unless you have specifically suppressed dumps in the dump table. As this may not be a critical problem, CICS is not terminated unless the default language module cannot be loaded, (even if you have specified `terminate` in the dump table).

If the missing module is not the default language module, CICS uses the default language for messages to terminals. If the default language module cannot be loaded, a return code is sent to the domain manager and CICS is terminated by the domain manager.

**User response:** If the default language is in operation and this is acceptable, you need not bring CICS down. (Or you may bring CICS down at a more convenient time.)

If the default language is in operation and this is not acceptable, or if the default language module itself is missing, try decreasing the size limits of the DSAs or EDSAs. Or you could try increasing the size of the whole region, if it is not already at maximum size.

Alternatively, you may be able to get more storage space by removing unwanted language modules from storage. To do this, bring CICS down, remove the language codes you do not need from the SIT or respecify the list of language modules as an override parameter, and restart CICS.

**Note:** You should not remove the default language module from the SIT.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Modules:** DFHMEDM

---

**DFHME0106** *applid Module* modname *could not be loaded. REGISTER 1 = X’nnnnnnnn’ and REGISTER 15 = X’nnnnnnnn’*

**Explanation:** The message language module modname could not be loaded. The reason that it could not be loaded is given by the contents of registers 1 and 15, which are returned by MVS.

**System action:** If the missing module is not the default language module, CICS uses the default language for messages.

If the default language module is missing, a return code is sent to the domain manager and CICS is terminated.

An exception entry is made in the trace table and a dump is taken, unless you have specifically suppressed dumps in the dump table. As this may not be a critical problem, CICS is not terminated unless the default language module cannot be loaded (even if you have specified `terminate` in the dump table).

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User response:** If the default language is in operation and this is acceptable, you need not bring CICS down, or you may do so at some convenient time.

If the default language is in operation and this is not acceptable, or if the default language module itself is missing, consult the MVS messages and codes manual to check the return codes displayed in the message. The return codes indicate why the module could not be loaded.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Modules:** DFHMEDM

---

**DFHME0107** *applid Module* modname *cannot be found in the library.*

**Explanation:** The message load module modname was not found in the library defined in the JCL for the CICS job. This load module is a language module for messages. It is either a module which has been defined in the SIT for messages in a particular language, or it is the default language module.

The default language is always used for messages sent to transient data queues and to consoles (providing that it is not a double-byte language, in which case the message is sent to the console in English). If the default language module is missing no messages can be delivered.

Terminals can have messages in the default language or in another chosen language. If the chosen language module is missing, terminal messages use the default language instead.

**System action:** An exception entry is made in the trace table. A dump is taken, unless you have specifically suppressed dumps in the dump table. But since this may not be a critical error, CICS is not terminated immediately, even if you have specified this in the dump table, unless the default language module is missing, (even if you have specified `terminate` in the dump table).

If the missing module is not the default language module, CICS uses the default language for messages. If the default language module is missing, a return code is sent to the domain manager and CICS is terminated.

**User response:** This error could have occurred because of a problem in a library or in the SIT. If the default language is in operation and this is acceptable, you need not bring CICS down, or you may do so at some convenient time.
The missing module may have been placed in the wrong library, or the wrong or misspelled module name may have been used in the right library.

If the default language is in operation and this is NOT acceptable, link the missing module into the library defined in the JCL for your CICS job by correcting whichever of the problems has occurred. You have to bring CICS down to do this.

It is also possible that an incorrect or misspelled language code has been used in the SIT. In this case, you have to bring CICS down, reinstall your chosen language code as a system initialization parameter, and restart CICS.

If you no longer need this language module, you should remove it from the SIT at the next convenient opportunity.

If the default language module is missing, CICS is terminated by the domain manager. You need to discover whether the fault is in the library or the SIT and follow the appropriate procedure above.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Modules:** DFHMEDM

---

**DFHME0108 applid Message msgno cannot be found in module modname.**

**Explanation:** Message msgno should have been delivered, but was not found in message language module modname.

This module is the national language module specified in the SIT by the user which gives messages in a chosen language.

**System action:** An exception entry is made in the trace table. A dump is taken, unless you have specifically suppressed dumps in the dump table. Since this may not be a critical error, CICS is not terminated, even if you have specified terminate in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User response:** This indicates an error in CICS code. However, its impact may not be severe. For example, the error may only occur once, or you may decide to continue without message number msgno.

If you are using a message table which has been created using the message editing utility, ensure that all relevant PTFs have been correctly applied.

If the problem persists, you will need further assistance from IBM. See Part 4 of the [CICS Problem Determination Guide](#) for guidance on how to proceed.

**Note:** This message cannot be changed with the message editing utility.

**Destination:** Console

**Modules:** DFHMEIN

---

**DFHME0109 applid Message set setname could not be found in module modname while producing message msgno.**

**Explanation:** Message set setname was not found in the message language module modname.

The setname is the first two characters after the DFH in CICS messages (for example, LD or 21), which is followed by the message number.

**System action:** An exception entry is made in the trace table. A dump is taken, unless you have specifically suppressed dumps in the dump table. Since this may not be a critical error, CICS is not terminated, even if you have specified terminate in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User response:** This indicates an error in CICS code. However, its impact may not be severe. For example, the error may only occur once, or you may decide to continue without message number msgno.

If you are using a message table which has been created using the message editing utility, ensure that all relevant PTFs have been correctly applied.

If the problem persists, you will need further assistance from IBM. See Part 4 of the [CICS Problem Determination Guide](#) for guidance on how to proceed.

**DFHME0110 applid Optional value nn is missing from insert ii for message msgno.**

**Explanation:** Optional insert value nn was requested for insert ii on a call to the message domain but could not be found in the definition template for message msgno.

**System action:** CICS delivers the message with ?? in place of the insert ii as it cannot resolve which
optional value has been requested for the insert.

An exception entry is made in the trace table. A dump is
taken, unless you have specifically suppressed dumps
in the dump table. Since this may not be a critical error,
CICS is not terminated, even if you have specified
terminate in the dump table.

Message DFHME0116 is normally produced containing
the symptom string for this problem.

User response: This message indicates an error in
CICS code. However, its impact may not be severe. For
example, the error may only occur once, or you may
decide to continue without message msgno.

If you are using a message table which has been
created using the message editing utility, ensure that all
relevant PTFs have been correctly applied.

If the problem persists, you will need further assistance
from IBM. See Part 4 of the CICS Problem
Determination Guide for guidance on how to proceed.

Modules: DFHMEBU

DFHME0111 applid Insert ii is missing for message msgno.

Explanation: Insert ii is required for message msgno.
The insert was not found.

System action: CICS delivers the message with ???
in place of the missing insert ii.

An exception entry is made in the trace table. A dump is
taken, unless you have specifically suppressed dumps in the dump table. But since this may not be a critical error, CICS is not terminated, even if you have specified terminate in the dump table.

Message DFHME0116 is normally produced containing
the symptom string for this problem.

User response: Ensure that you have loaded the
correct message language module. That is, ensure that
you have the correct language specified in the
NATLANG system initialization parameter and that the
library concatenation accessed by your CICS job
contains the correct message language module.

This message indicates a severe error in CICS code.
However, its impact may not be serious. For example,
the error may only occur once, or you may decide to
continue without message msgno being produced.

If you are using a message table which has been
created using the message editing utility, ensure that all
relevant PTFs have been correctly applied.

If the problem persists, you will need further assistance
from IBM. See Part 4 of the CICS Problem
Determination Guide for guidance on how to proceed.

Note: This message cannot be changed with the
message editing utility.

Modules: DFHMEBU

DFHME0112 applid Insert number ii is invalid for
message msgno (code X'code').

Explanation: Insert ii, supplied on the call to the message (ME) domain, was invalid. For example, it may have been a decimal insert with a length greater than 4 bytes.

The code X'code' uniquely identifies the occurrence of
the invalid insert.

System action: CICS delivers the message with ???
in place of the invalid insert ii.

An exception entry with code X'code' is made in the
trace table. A dump is taken, unless you have
specifically suppressed dumps in the dump table. Since
this may not be a critical error, CICS is not terminated,
even if you have specified terminate in the dump table.

Message DFHME0116 is normally produced containing
the symptom string for this problem.

User response: Ensure that you have loaded the
correct message language module.

That is, ensure that
you have the correct language specified in the
NATLANG system initialization parameter and that the
library concatenation accessed by your CICS job
contains the correct message language module.

This message indicates an error in CICS code.
However, its impact may not be serious. For example,
the error may only occur once, or you may decide to
continue without message msgno being produced.

If you are using a message table which has been
created using the message editing utility, ensure that all
relevant PTFs have been correctly applied.

If the problem persists, you will need further assistance
from IBM. See Part 4 of the CICS Problem
Determination Guide for guidance on how to proceed.

DFHME0113 applid Incorrect parameters used in call
to DFHMEME for message msgno.

Explanation: A call to the message (ME) domain for
message msgno was made with an invalid combination
of parameters.

System action: An exception entry is made in the
CICS is not terminated, even if you have specified **terminate** in the dump table.

Message DFHME0116 is normally produced containing the symptom string for this problem.

**User response:** Ensure that you have loaded the correct message language module. That is, ensure that you have the correct language specified in the NATLANG system initialization parameter and that the library concatenation accessed by your CICS job contains the correct message language module.

This message indicates a severe error in CICS code. However, its impact may not be serious. For example, the error may only occur once, or you may decide to continue without message msgno.

If you are using a message table which has been created using the message editing utility, ensure that all relevant PTFs have been correctly applied.
