Version 2 Release 1

IBM Db2 Analytics Accelerator Loader for z/OS
User's Guide

IBM
Version 2 Release 1

IBM Db2 Analytics Accelerator Loader
for z/OS
User's Guide

IBM
August 29, 2019 edition

This edition applies to Version 2 Release 1 of IBM Db2 Analytics Accelerator Loader for z/OS (product number 5639-OLE) and to all subsequent releases and modifications until otherwise indicated in new editions.

US Government Users Restricted Rights – Use, duplication or disclosure restricted by GSA ADP Schedule Contract with IBM Corp.

IBM® Db2® Analytics Accelerator Loader for z/OS (also referred to as Db2 Analytics Accelerator Loader and Accelerator Loader) is a tool that you use to load data on IBM Db2 Analytics Accelerator for z/OS and on IBM Db2 for z/OS®.

These topics provide instructions for installing, configuring, and using Db2 Analytics Accelerator Loader.

These topics are designed to help database administrators, system programmers, application programmers, and system operators perform these tasks:
• Plan for the installation of Db2 Analytics Accelerator Loader
• Install and operate Db2 Analytics Accelerator Loader
• Customize your Db2 Analytics Accelerator Loader environment
• Diagnose and recover from Db2 Analytics Accelerator Loader problems
• Design and write applications for Db2 Analytics Accelerator Loader
• Use Db2 Analytics Accelerator Loader with other Db2 or IMS products

Tip: To find the most current version of this information, always use IBM Knowledge Center, which is updated more frequently than PDF books.
Chapter 1. Overview

IBM Db2 Analytics Accelerator Loader for z/OS is a tool that you can use to load data on IBM Db2 Analytics Accelerator for z/OS and on Db2 for z/OS without stopping update activity to the production tables while the data is being loaded into the accelerator.

You can load data from non-Db2 and remote Db2 sources directly to the accelerator in a single in-memory process. The source data is accessed, converted to the necessary format, and loaded to the accelerator in a single step without landing or loading the data into an intermediate file format. Accelerator Loader features provide performance and processing efficiency over the existing process in use by many z/OS installations. These features enable you to load a variety of non-Db2 data into the accelerator in a more automated manner, and enable true enterprise-wide analytics.

What's new in Db2 Analytics Accelerator Loader

This section describes recent technical changes to Db2 Analytics Accelerator Loader.

New and changed information is marked like this paragraph, with a vertical bar to the left of a change. Editorial changes that have no technical significance are not marked.

Older changes and enhancements are described in "What's new in previous editions" on page 1040.

New and changed functions

This topic summarizes the recent enhancements and changes in Db2 Analytics Accelerator Loader.

<table>
<thead>
<tr>
<th>Description</th>
<th>Related APARs</th>
</tr>
</thead>
<tbody>
<tr>
<td>For a new installation of Accelerator Loader where product repository table spaces do not exist, the repository table spaces are now created as partition-by-growth universal table spaces. This change does not impact existing installations, even after migrating to Db2 12 function level 504.</td>
<td>PH13717</td>
</tr>
<tr>
<td>The Accelerator Loader high availability (HALOAD) utility no longer requires interception of the UNLOAD utility in the DSNUTILU WLM address space. This feature requires IBM Db2 Analytics Accelerator for z/OS V7.1.7. For more information, see &quot;Using Analytics Accelerator V7.1.7, or later&quot; on page 118.</td>
<td>PH13717</td>
</tr>
<tr>
<td>The Accelerator Loader backup utility now reports the first five positive SQL codes that are encountered and processing continues. After a successful execution with only warnings and no errors, the final return code is set to 4. When a negative SQL code is encountered, the Accelerator Loader backup utility reports the error and the job terminates with return code 8. See Chapter 9, “Backing up and recovering accelerator data,” on page 295.</td>
<td>PH11526</td>
</tr>
<tr>
<td>Description</td>
<td>Related APARs</td>
</tr>
<tr>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------------</td>
</tr>
<tr>
<td>Information has been added about applying product maintenance and recustomizing Accelerator Loader using Tools Customizer. See “Applying product maintenance” on page 199.</td>
<td>None</td>
</tr>
<tr>
<td>For Consistent loads and Image Copy loads, a manually-specified input image copy on the TO_IC keyword that is an inline image copy created by the REORG or LOAD utility or an image copy of a compressed object must be sorted. By including the TO_IC_INLINE keyword, a sort will be performed on the specified input image copy. For more information, see “Syntax diagram: Consistent load and Image Copy load” on page 331 and “Syntax definitions: Consistent load and Image Copy load” on page 334.</td>
<td>None</td>
</tr>
<tr>
<td>When using the startup CLIST to start the Accelerator Loader ISPF interface, you can now specify the Db2 SSID and Server ID values to use initially on the main menu. See “Using the startup CLIST” on page 968.</td>
<td>PH09817</td>
</tr>
<tr>
<td>You can now use Tools Customizer to configure the Accelerator Loader server to access a Microsoft SQL Server database using DRDA. See “Configuring access to data in Microsoft SQL Server” on page 142.</td>
<td>PH09817</td>
</tr>
<tr>
<td>The batch utilities for Consistent load and Image Copy load now support accelerator groups. Previously, only individual accelerator names could be specified on the ACCELNAME control card in the JCL. If you specify an accelerator group, the single accelerator group name expands to its individual accelerator names when you run the job. See “Syntax definitions: Consistent load and Image Copy load” on page 334.</td>
<td>PH09817</td>
</tr>
<tr>
<td>The DISPLAY SESSIONS command has been enhanced to report the number of rows that have been loaded. See “Console commands for the Accelerator Loader started task” on page 1026.</td>
<td>PH09817</td>
</tr>
<tr>
<td>When using SMF log streams, you can use the LS_TIMESTAMP and LS_TIMESTAMP_LOCAL virtual columns to retrieve timestamp values. When used in a WHERE predicate, the timestamp is searched using the respective time zone. See “System Management File sample code” on page 257.</td>
<td>PH07675</td>
</tr>
<tr>
<td>The JDBC Gateway is an Accelerator Loader distributed application server that allows direct connectivity to JDBC data sources. See Chapter 13, “JDBC Gateway,” on page 483.</td>
<td>PH00695</td>
</tr>
<tr>
<td>A new option is provided that controls whether existing rows are deleted from the Db2 table when loading to the accelerator only and using the REPLACE option (IDAA ONLY REPLACE). Previously, when using IDAA ONLY REPLACE, existing rows were deleted from the Db2 table and data was loaded to the accelerator-shadow table only. By adding the new option ACCEL_SKIP_DB2_REPLACE to the IDAA ONLY REPLACE job syntax, existing rows are not deleted from the Db2 table and data is loaded to the accelerator-shadow table only. This new option is valid only when used with the IDAA ONLY option; it is ignored when used with the IDAA_DUAL option. See Chapter 11, “Syntax,” on page 311.</td>
<td>PH03210</td>
</tr>
<tr>
<td>Description</td>
<td>Related APAs</td>
</tr>
<tr>
<td>-------------------------------------------------------------------------------------------------------</td>
<td>----------------------------</td>
</tr>
<tr>
<td>Accelerator Loader now provides a way to monitor load processing by periodically issuing a product message &quot;HLOU5062I&quot; on page 714 that reports the number of rows that have been loaded. The interval (in rows loaded) at which the message is issued is controlled by the new parameter ACCEL_ROWS_REPORT_THRESHOLD. The parameter value is set globally in Tools Customizer using the parameter Report loaded rows threshold, and it can also be overridden for a specific job by specifying parameter ACCEL_ROWS_REPORT_THRESHOLD as part of the utility syntax for the job. See &quot;Monitoring load job progress&quot; on page 942.</td>
<td>PH03209</td>
</tr>
<tr>
<td>The ISPF interface has been updated to support discard processing when loading from an external file to the accelerator only. On the Load Accelerator(s) from External File panel, options to generate the DISCARDS and DISCARDDN keywords are now provided. See &quot;Load Accelerator(s) from External File panel&quot; on page 1009 and &quot;Syntax definitions: Load from an external file&quot; on page 350.</td>
<td>PH03042</td>
</tr>
<tr>
<td>Virtual table rule support is provided for specifying the number of tracks to read ahead (MULTACC) when reading sequential data sets for individual requests. See &quot;Reading ahead tracks for sequential file access&quot; on page 166.</td>
<td>PH01448</td>
</tr>
<tr>
<td>You can control whether native Db2 database subsystems appear in ISPF and the Accelerator Loader studio and if attempts to connect to native Db2 subsystems are allowed. See &quot;Controlling display and access for native Db2 subsystems&quot; on page 156.</td>
<td>PH00641</td>
</tr>
<tr>
<td>Virtual table rule support is provided for overriding data buffer and index buffer values for VSAM files for individual requests. See &quot;Modifying the data and index buffer values for VSAM files&quot; on page 164.</td>
<td>PH02162</td>
</tr>
<tr>
<td>Accelerator Loader now supports the IBM Db2 Analytics Accelerator for z/OS V7.1.2 interface to the SYSPROC.ACCEL_LOAD_TABLES stored procedure (SP level 66). The new interface bypasses the running of the UNLOAD utility and the intercept in the DSNUTILU WLM address space for Analytics Accelerator V7.1.2 and later versions. The HALOAD utility still requires the intercept in the DSNUTILU WLM address space, as do any Accelerator Loader jobs running against an Analytics Accelerator appliance prior to the V7.1.2 release. To use the Analytics Accelerator V7.1.2 interface, you must concatenate the Accelerator Loader product load library in the STEPLIB of the Db2 allied WLM environment that runs the SYSPROC.ACCEL_LOAD_TABLES stored procedure. See &quot;Using Analytics Accelerator V7.1.2 through V7.1.6&quot; on page 117.</td>
<td>P99095</td>
</tr>
<tr>
<td>Adabas password support has been added to the batch Data Mapping Facility (DMF). When creating Adabas virtual tables in batch using DMF, the Adabas password for the file (ADASCR) is now supported. Additionally, this password can be encoded using an ISPF panel, where you can specify the plain text password and then use the returned encoded version of the password in the batch JCL. See the following topics: &quot;Generating an encrypted Adabas password&quot; on page 220, &quot;Server Management Menu&quot; on page 1023, &quot;DMF Map Adabas Password Encryption panel&quot; on page 990.</td>
<td>PI97941</td>
</tr>
<tr>
<td>A new option is provided to map Adabas binary fields to numeric packed decimal format. See &quot;Creating virtual tables for Adabas data&quot; on page 217.</td>
<td>PI93753</td>
</tr>
<tr>
<td>Description</td>
<td>Related APARs</td>
</tr>
<tr>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>--------------</td>
</tr>
<tr>
<td>When option <strong>Load DB2 if load to accelerator fails</strong> (options module parameter <strong>ACCEL_ON_UNSUPPORTED_LOAD</strong>) is set to <strong>LOAD_DB2</strong> and the table to be loaded is not defined on the accelerator, data will be loaded into Db2 when running a dual load job (IDAA_DUAL). Previously, the load job would have failed and data would not have been loaded into the Db2 table. See “Task: Create the started task and its components (required)” on page 46.</td>
<td>PI96524</td>
</tr>
</tbody>
</table>
| Db2 Direct is a new Accelerator Loader server access method used to access Db2 data by reading the data in the underlying Db2 VSAM linear data sets directly. The Db2 data access method is specified when creating virtual tables for access to Db2 data. See the following topics:  
  - **Db2 for z/OS data access methods** on page 138  
  - **Configuring Db2 Direct** on page 140  
  - **Creating virtual tables for RDBMS data sources** on page 221 | PI95700      |
| A command-line installation method has been provided for installing the Accelerator Loader plug-in into IBM Data Studio or any supported Eclipse. This new installation method is provided in addition to the existing installation method, which uses the Eclipse GUI. See “Installing the Accelerator Loader studio (required)” on page 121. | PI94841      |
| SQL query access to Db2 unload data sets is now provided. See “Configuring access to Db2 unload data sets” on page 136 and “Accessing Db2 unload data” on page 258. | PI94345      |
| The process of creating maps to access VSAM and sequential data has been simplified by support of the following methods:  
  - Querying information in the IBM Application Discovery and Delivery Intelligence (ADDI) dictionary. See “Configuring access to ADDI” on page 182 and “Creating virtual tables for VSAM and sequential access using ADDI” on page 243.  
  - Querying information in the IBM Rational Asset Analyzer (RAA) dictionary. See “Configuring access to RAA” on page 189, “Creating virtual tables for VSAM and sequential access using RAA” on page 246 and “Metadata Discovery preferences” on page 268. | PI94344      |
| The Accelerator Loader server can now listen for ENF 55 auxiliary storage shortage signals and throttle storage utilization when an auxiliary storage shortage is signaled. The point at which the Accelerator Loader server will reject new connection attempts when an auxiliary storage shortage is signaled by the system Event Notification Facility is controlled by the server parameter **OSCLIENTAUXSTGTCUTOFF**. See “Modifying the client auxiliary storage cut-off parameter” on page 457. | PI94260      |
| When connecting from the Accelerator Loader studio to the Accelerator Loader server, password phrase authentication is supported. See “Connecting to the Accelerator Loader server” on page 212. | PI93497      |
| Accelerator Loader supports IBM Db2 Analytics Accelerator for z/OS Version 7.1. See “Set up your environment prior to customization” on page 28. | PI92661      |

</table>
| The handling of discarded records when loading from an external file using Accelerator Loader has changed, behaving more like the Db2 LOAD utility. Under some conditions, Accelerator Loader may now complete with a different return code than it would have previously.  
• When you load only the accelerator, a discard data set is now supported when running a load with a SYSREC data set. The DISCARDS keyword can also be specified to force Accelerator Loader to fail once a specified number of records are discarded.  
• The IGNORE keyword of the Db2 LOAD utility is now supported. The IGNORE keyword controls how different types of discards are handled by Accelerator Loader. Ignored discards are not written to the discard data set and do not count towards the discard limit.  
• A data conversion error will now cause Accelerator Loader to fail unless a discard data set is provided or IGNORE(CONV) is specified in the LOAD control cards. Previously, the record that caused the violation would be discarded and processing would continue.  
• Accelerator Loader will now end with RC=0 even when records are discarded, provided the associated discard reasons are being IGNOREd. Previously, any discard would cause Accelerator Loader to end with RC=4. Since loads from an Accelerator Loader server data source do not support a discard data set, these loads will complete with RC=4 any time there are discards regardless of IGNORE settings. | PI90862 |

See “Discard data set restrictions and considerations” on page 282 for more information.

The HALOAD DETECT_DATA_CHANGES option updates the REFRESH_TIME (in SYSACCEL.SYSACCELERATEDTABLES) of all tables specified on the call. | PI88521 |

When loading from an external file to the accelerator and Db2 (Dual load), if Accelerator Loader cannot determine the status of an accelerator from the ACCEL_CONTROL_ACCELERATOR stored procedure, the accelerator is considered unreachable and will be treated as offline. Previously, an unreachable accelerator would have caused the load job to fail. | PI90296 |

When performing Consistent and Image Copy loads, Accelerator Loader performs additional row data validation prior to applying redo log records. | PI88335 |

Target Unicode accelerator tables can be loaded from an Accelerator Loader server data source containing EBCDIC data. You can load EBCDIC data stored on the mainframe into target tables defined as CCSID Unicode. One of the primary use cases for this feature is compatibility between tables loaded from EBCDIC data and existing tables populated by other means. In particular, the accelerator does not support joins between Unicode and EBCDIC tables. Options CCSID and Enable Unicode Column Expansion in the Generate JCL to Load Accelerator wizard in the Accelerator Loader studio are provided for use when generating Accelerator Loader server load jobs. | PI85070 |
In the Accelerator Loader studio, when creating virtual tables for CA IDMS data, the database name can be edited. When doing discovery, the studio gets back the first database name that is found relating to a record's area name; however, it is possible for records to be defined in multiple databases for the same schema/subschema combination. With the database name being editable in the virtual table map editor for CA IDMS data in the Accelerator Loader studio, the user can modify the map to point to a different database.

Acceleration Loader can now process SMF data in zEDC-compressed log streams. The Accelerator Loader server automatically detects when SMF log stream data has been compressed, and calls zEDC services to inflate the data in the log stream buffer before processing the SMF records.

When the primary Db2 subsystem to which Accelerator Loader is connected goes down, the Accelerator Loader started task now remains active and will automatically attach to another member of the data sharing group on the same LPAR, if applicable. Previously, this condition caused the started task to terminate. See “Considerations for Db2 data sharing environments” on page 35 for more information.

If a subsystem has been in maintenance mode, you can run the following z/OS MODIFY command to update the Accelerator Loader started task so that Accelerator Loader will begin to monitor that subsystem:

```
MODIFY <started_task_name>,--REFRESH DB2
```

where started_task_name is the name of the Accelerator Loader started task. See “Console commands for the Accelerator Loader started task” on page 1026 for more information.

When loading from an external file to the accelerator and Db2, Accelerator Loader can issue a user-supplied return code when Db2 LOAD discards rows that Accelerator Loader has already delivered to the accelerator. A new Accelerator Loader started task option, RC_WHEN_DB2_DISCARDS, is provided for defining the return code. This new option does not change the return code when a row is discarded from both Db2 and the accelerator.

Accelerator Loader now offloads more CPU cycles to the IBM z Integrated Information Processor (zIIP). This additional zIIP exploitation is available only when External load does not sort the data. External load sorts data only when loading a range-partitioned or index-partitioned object from a single SYSREC data set (that is, when partition level SYSREC data sets are not used).

Accelerator Loader now provides reduced CPU usage in cases where External load must wait for Db2 LOAD to build indexes. This performance improvement can reduce CPU usage when running an IDAA_DUAL type External load to a Db2 table that has indexes. CPU reduction is limited to cases where Accelerator Loader does not sort the data. Data sorting occurs only when loading a range or index-partitioned table from a single SYSREC dataset.

When loading from an external file to the accelerator and Db2, you can optionally stop the target table space before loading a table enabled for replication. The stop drains all claimers and ensures that no updates are made to the Db2 table while the accelerator is being loaded. This behavior is controlled by the options module parameter STOP the target table space before initiating the load.

</tbody>
</table>
The following list highlights the enhancements to the Accelerator Loader server:

- AES 256-bit can now be used to encrypt the password when the driver is establishing a connection with the server.
- A new composite SMF virtual table rule replaces all existing SMF virtual table rules. The updated member hlq.SHLVXVTB(HLVSMTFT1) contains all the functionality in the previous SMF virtual table rules HLVSMTFT1, HLVSMTFT2, HLVSMTFT3, HLVSMTFT4, and HLVSMTFT5.
- MapReduce and parallelism support is now available for accessing native IMS OSAM files. IMS compression exit support is also included for all supported IMS Direct database types.
- SQL access to CA IDMS record and set information managed by CA IDMS central versions running on z/OS is now provided. Virtual tables are mapped to IDMS records and sets that can be joined using standard SQL to navigate IDMS information. MapReduce processing is supported to improve performance of large data extracts of IDMS information.
- The ability to access IBM dashDB data sources via DRDA Virtual Request Facility (VRF) using standard SQL processing is provided. DRDA VRF is a feature that is designed to access data sources which provide the DRDA protocol.
- IBM Big SQL data sources are now uniquely identified by TYPE(BIGSQL) in the DEFINE DATABASE statement.
- In the Accelerator Loader studio, when virtualizing Db2/DRDA data sources, the user can select multiple Db2/DRDA tables and run the new wizard once to generate the required virtual tables. Previously, the user was required to run the Virtual Table creation wizard multiple times for each Db2/DRDA source table.
- The user can now set the data and index buffers for VSAM files. Two new Accelerator Loader server parameters, SQLENGVSAMDATABUFF and SQLENGVSAMINDEXBUFF, have been introduced to control these settings. Previously, the values were hardcoded.
- Virtual Parallel Data (VPD) now supports Adabas files; VSAM ESDS, KSDS, and RRDS files; and IAM files.
- IMS Direct now supports Fast Path data entry databases (DEDBs).
- A batch job with sample DRDARange and IMSRange commands, which are used to populate the Accelerator Loader server metadata repository, is now provided. The job is located in hlq.SHLVCNTL(HLVRANGE). Instructions for required edits to the job are provided in the member.
- MapReduce now supports Innovation Access Method (IAM) files. IAM is a VSAM optimization product distributed by Innovation Data Processing.
- A new set of SQL preferences has been added to the Accelerator Loader studio. These settings are related to SQL query generation, the SQL Results view, and SQL metadata retrieval. These new settings can improve the performance of metadata retrieval for Db2 and DRDA tables.
- A new Accelerator Loader server parameter has been introduced which specifies to automatically map all DECFLOAT columns defined in Accelerator Loader server virtual tables to DOUBLE at runtime. DECFLOAT is not a supported data type in the accelerator.

<td>PI79298</td>
</tr>
</tbody>
</table>
Accelerator Loader now supports the new Virtual Parallel Data (VPD) feature, which lets you group multiple simultaneous requests against the same data source and run them in parallel, while performing the input and output only once. For example, using VPD, users can load several SMF record types from a virtualized data source with only a single read of the data set. Previously, the data set would have been read once for each record type.

The following list highlights the enhancements to the Accelerator Loader server:

- Distributed DRDA Data Servers (for example, Db2 LUW and Db2 Federation Servers) execute on servers that can support USERID values of various lengths. The Accelerator Loader server now supports Alternate Authentication USERID values up to 255 characters.

- Through added MapReduce and parallelism support for accessing native IMS files, the Accelerator Loader server can now access IMS data directly (a feature named “IMS Direct”), as opposed to accessing the data through IMS DLI calls. This access method is similar to how the Db2 UNLOAD utility works and provides a significant increase in performance and reduced elapsed time.

- The Accelerator Loader server can now call compression exits when reading IMS files with IMS Direct.

- The Accelerator Loader server now supports SQL access to SMF stored in log streams.

- Support has been provided for a metadata repository in the server. This repository is used for MapReduce and parallelism exploitation of DRDA and IMS data sources by gathering metadata and persisting this information across server restarts. This support applies to all DRDA-backed data sources including those accessed using the IBM Federated Server, such as Terradata and Sybase, as well as data sources supported by direct DRDA support for the server, such as Db2 LUW and Oracle.

- The Accelerator Loader server now implements SAF security in the SQL engine for virtual table access so multi-tenant environments are possible that limit both visibility and access to virtual tables between different tenants.

- The Accelerator Loader server now provides enhanced distributed DRDA VRF support for Microsoft SQL Server using HIS 2016 DRDA A5.

- The Accelerator Loader server now provides support for SQL access to zFS and HFS files.

- The Accelerator Loader server now provides consistent uniqueness to parent and child keys across virtual table joins.

The default size of the global variable file that is used by the Accelerator Loader server has been increased.

A new keyword, CHECK_DATA, has been introduced to Accelerator Loader to enable you to specify if and when to check the integrity of Db2 for z/OS data pages. This keyword is available for Consistent and Image Copy loads. This feature has been introduced under the direction of IBM Support.

The Accelerator Loader high availability load feature can be invoked as a batch job or by using a stored procedure call.

<tr>
<td>Use Accelerator Loader to load data to multiple accelerators on the same Db2 subsystem in parallel from a single LOAD utility statement. This feature is referred to as high availability load. For more information, see “Features and benefits” on page 15.</td>
<td>PI59666</td>
</tr>
<tr>
<td>When performing an External load, you can load data to an accelerator only table (AOT). VSAM objects do not exist in Db2 for AOTs; therefore, you cannot load to both Db2 and the accelerator (Dual load).</td>
<td>PI49338</td>
</tr>
</tbody>
</table>
When performing a Consistent load, you can load image copy and log data as follows:

- from a specified table into an alternate accelerator only table (AOT) on the same Db2 subsystem or an alternate target Db2 subsystem on the same LPAR
- to the accelerator table of a standard Db2/accelerator table on an alternate target Db2 subsystem

This function is especially useful when you are consolidating data from different Db2 systems into a single Db2 system that is connected to an accelerator, such as a data warehouse.

When performing an Image Copy load, you can take an image copy of a regular Db2 table and load the data into an accelerator only table (AOT) with the same columns in the same order.

When loading data from non-Db2 and remote Db2 sources, when using the Accelerator Loader studio to generate the JCL, you can specify an accelerator only table (AOT).

When performing an External load to only the accelerator, Accelerator Loader bypasses the Db2 LOAD utility when running a LOAD RESUME. This enhancement provides query access to the data while Accelerator Loader performs the load.

Accelerator Loader can load data from a remote system, enabling you to load remote data sources that are not directly accessible from the local system (not configured to the accelerator). To perform this type of load, an Accelerator Loader server must be running on the remote LPAR and the local server must be configured to communicate with that remote server.

Accelerator Loader supports IBM z Systems Data Compression (zEDC) to optimize cross-platform exchange of data by reducing network flow between the two servers when loading from a remote server.

Accelerator Loader supports Adabas as a selectable data source. To enable this feature, when customizing the product with Tools Customizer, specify the Adabas load library for the server to use to connect to the Adabas databases.

When performing a load from an external file, you can use a UNICODE SYSREC file to load data to a UNICODE TABLE.

When performing a load from an external file, you can load SYSREC data that is already in Db2 internal row format. The Db2 UNLOAD utility supports an option to unload the data from a table in FORMAT INTERNAL. This enhancement provides the benefits of reduced CPU consumption and elapsed time in both the UNLOAD and in Accelerator Loader jobs. Restrictions that the Db2 LOAD utility imposes when FORMAT INTERNAL is specified also apply to Accelerator Loader.

---

**What does Accelerator Loader do?**

Accelerator Loader provides capabilities for loading data into Db2 and IBM Db2 Analytics Accelerator for z/OS.

Accelerator Loader enables you to load data as follows:
• Use the Accelerator Loader server to load data from non-Db2 and remote Db2 sources into the accelerator in a single in-memory process, without landing or loading the data into an intermediate file format. This feature provides performance and processing efficiency over the existing process that many z/OS installations use. By enabling you to load a variety of non-Db2 data into the accelerator in a more automated manner, the product enables Analytics Accelerator to provide enterprise-wide analytics.

• Load the accelerator with data from external sources without first loading the data into Db2. This feature eliminates the CPU and storage resources spent loading the data into Db2 when it is not required.

• Load data into Db2 and the accelerator in parallel from the same external load file, reducing the process from two steps to one.

• Load the accelerator with current Db2 data or with data from a historical point in time without stopping update activity to the production Db2 tables.

• Load the accelerator with data from an image copy that you specify.

• Load the same Db2 for z/OS or non-Db2 for z/OS data into multiple accelerators at the same time.

• Load data into accelerator-only tables.

• Add data to existing accelerator-only tables using LOAD RESUME YES.

• Back up and restore data in accelerator-only tables.

Features and benefits

Accelerator Loader provides the following features.

High availability load

Use Accelerator Loader to load data to multiple accelerators in parallel from a single LOAD utility statement. This feature is referred to as high availability load. To perform a high availability load, two or more accelerators must be configured on the same Db2 subsystem. A high availability load can be performed in the following ways:

• Use the HALOAD utility program to copy table data from Db2 to multiple accelerators in parallel. Each accelerator-shadow table must be configured on a different accelerator. The utility runs as a batch job and is not invoked under the control of the DSNUTILB LOAD utility. You can also run the utility using a stored procedure call.

• Use the Accelerator Loader server to load data from a virtualized data source to up to four accelerators. The tables can be accelerator-shadow tables or accelerator-only tables.

• Use extended syntax to the DSNUTILB LOAD utility to load data from an external sequential data set to up to four accelerators. The tables can accelerator-shadow tables or accelerator-only tables.

• Use the ISPF interface to generate a batch JCL job that can load data to up to four accelerators.

• Use Consistent load and Image Copy load functionality to load into multiple accelerators.

Remote data load

Accelerator Loader can be configured to load data from a remote system, which allows for loading remote data sources that are not directly accessible from the local system. For example, you could load data from an IMS database on a remote
LPAR. This type of load requires you to have an Accelerator Loader server running on the remote LPAR and the local server must be configured to communicate with that remote server.

**Non-Db2 and DRDA data load**

Accelerator Loader allows data sources to be defined and analyzed for the purpose of extracting subsets of data from the source. It provides an interface that enables Accelerator Loader to retrieve data from a mapped source without first landing the data in a flat file.

Using the Accelerator Loader studio, a plugin to the IBM Data Studio, you can load non-Db2 data in a more streamlined manner and data from non-Db2 and remote Db2 sources into the accelerator with less effort and time. You can load data from many different sources directly to the accelerator in a single in-memory process. The source data is accessed, converted to the necessary format, and loaded to the accelerator in a single step without first landing or loading the data into an intermediate file format. This feature provides performance and processing efficiency over the existing process in use by many z/OS installations, and the ability to load a variety of non-Db2 data into the accelerator in a more automated manner, enabling enterprise-wide analytics.

**Consistent Load and Historical load**

Accelerator Loader leverages the power, speed, and efficiency of IBM FlashCopy®. Accelerator Loader enables you to create a FlashCopy consistent image copy of the data that is being loaded from Db2 into the accelerator. Accelerator Loader then uses the consistent copy to load the data into the accelerator. This feature eliminates the need to take the tables offline during the load process.

Using a valid image copy of an object on Db2, Accelerator Loader applies log records forward up to the current time, or for multiple objects, to a consistent historical time. Accelerator Loader enables you to load data from multiple related Db2 tables without having to take them offline for updates. This feature eliminates downtime that is otherwise incurred with the accelerator load process.

Accelerator Loader enables you to specify any historical point in time to load the accelerator. This feature enables you to perform analytics against historical data or data at any chosen point in time. All related tables are loaded at a consistent point in time.

**Image Copy load**

Using a Db2 image copy that you specify, Db2 Analytics Accelerator Loader loads the data for a single table into the accelerator. Specifying an end time or rolling through the logs is not required. The product uses the image copy as the content of the object to be loaded.

This type of load should not be confused with an enhanced load from an external file (see below). Db2 image copies are registered within the Db2 catalog and are therefore not considered an external source.
Enhanced load from an external file

Db2 Analytics Accelerator Loader loads the data into the accelerator and optionally to Db2 in parallel from the same input file. You can load data from the following source files:

- For Db2 data, a file that was created by the Db2 UNLOAD utility.
- For data from an external source, such as IMS™ or VSAM data, or a nonmainframe source, a file that is compatible with the Db2 LOAD utility.

When loading external data into the accelerator, Db2 Analytics Accelerator Loader does not require that you first load the data into Db2 before loading the data into the accelerator. This feature eliminates the CPU and storage resources spent loading the data into Db2 when it is not necessary. This feature can be helpful when you are building a data warehouse on Db2. In this scenario, all queries of the tables that are being loaded must be eligible for acceleration, and the data must be maintained and backed up outside Db2.

Accelerator backup and recovery

Use Accelerator Loader to back up and recover data that resides only in the accelerator. This data can be in an accelerator-only table or an accelerator-shadow table that has been loaded to the accelerator only.

Note: Because the data resides only in the accelerator, the standard Db2 COPY and RECOVER utilities cannot be used.

Backup copies can be created using either of the following methods:

- **Backup utility.** The Accelerator Loader backup utility lets you create a full copy by fetching all of the data from the accelerator table and writing out a copy. To use this method, you can generate JCL from a Backup profile.
- **Inline copy.** An accelerator only load can optionally be configured to create a backup copy as the data is loaded to the accelerator. This is the most efficient way to create a backup. This method creates a full copy when running the Accelerator Loader with the syntax LOAD REPLACE and an incremental copy when running the Accelerator Loader with the syntax LOAD RESUME. To use this method, you can generate JCL using an Accelerator only profile.

To generate recovery JCL, you can use the Recovery profile.

The backup and recovery feature supports four copy data sets: a primary and backup copy for the local site, and a primary and backup copy for the remote recovery site. Copy datasets are registered in the backup copy registration table, HLOUCOPY; each Db2 system on which Accelerator Loader is installed has its own copy of this table.

Components and interfaces

Accelerator Loader provides the following interfaces and components.

ISPF interface

Use the ISPF interface to select options for building JCL to load or refresh data on the accelerator. After you select the options, use the ISPF interface to generate JCL to execute the function. The JCL is placed in the data set that you specify.
Batch interface

The batch interface is an alternative to using the ISPF interface for loading or refreshing data on the accelerator. If your existing LOAD utility JCL meets certain requirements, you can use that JCL with only minor modifications.

Accelerator Loader studio

The Accelerator Loader studio is a plugin that you access from the IBM Data Studio. The Data Studio client, which is built on Eclipse technology, provides an integrated development environment (IDE) for database and instance administration, routine and Java™ application development, and query tuning.

Use the Accelerator Loader studio to quickly transform and load relational and non-relational data to an accelerator. You are not required to extract and write data to a separate file before transforming and loading the data. You get real-time access to the data, which is read directly from the mapped source and transformed while it is loaded into the accelerator tables.

Accelerator Loader server

The Accelerator Loader server resides on the mainframe and provides access to Db2 and non-Db2 data sources. This server enables you to map non-relational source data, such as VSAM, IBM IMS DB, and so on, to a relational table format. After you map source data, the server executes an industry-standard SQL statement to access the data to load to the accelerator. The SQL statement can select from a single data source or join data from several data sources. The server executes the SQL statement, accesses the data sources, and passes the data to a batch job that converts the data to the necessary format and loads it directly to the accelerator.

An Accelerator Loader server on one LPAR can communicate and share data with another Accelerator Loader server that is installed and configured on another LPAR in the z System.

An Accelerator Loader server started task is required if non-Db2 for z/OS data is accessed from an LPAR.

Accelerator Loader started task

The Accelerator Loader started task receives input from the interfaces through the supervisor call (SVC) and then communicates with the Db2 subsystems to load data to the accelerator. A single started task can process simultaneous requests from multiple users across the system. After you start the started task, you can perform product functions.

Tools Customizer overview

IBM Tools Customizer for z/OS (also referred to as Tools Customizer) standardizes many of the customization processes that are required to customize IBM Tools that run on z/OS.

Tools Customizer provides a consistent ISPF interface to ensure that the customization process is the same for all IBM Tools products and solution pack...
components. It also provides the ability to "discover" parameter values from products or solution pack components that you previously customized manually or by using Tools Customizer.

**Features and benefits**

Tools Customizer provides the following features:

- A single, consistent ISPF interface ensures that the customization process is the same for all IBM Tools products and solution pack components.
- A Discover EXEC discovers values for common product, LPAR, and Db2 parameters from a product or solution pack component that you previously customized manually or by using Tools Customizer. Each IBM Tools product and solution pack component has a unique Discover EXEC. The discovered parameters are stored in the data store. If the product or solution pack component that you want to customize exists in the Tools Customizer data store, Tools Customizer issues a warning before it overwrites existing values. Use the Discover EXEC by issuing the DISCOVER command on the Customizer Workplace panel.
- The data store retains discovered and manually specified parameter values. Because the parameter information is persistently stored, you have to manually specify or discover parameter values only once. Tools Customizer uses these parameter values where they are applicable.
- A metadata repository contains the members that define the following customization attributes for products and solution pack components:
  - Parameters, tasks, and steps for the product or solution pack component to be customized. Some product or solution pack parameters, tasks, and steps are required.
  - LPAR parameters for the local LPAR. All of the LPAR parameters are required.
  - Db2 parameters for the Db2 subsystem, Db2 group attach name, or Db2 data sharing member on which you will customize the product or solution pack component. All of the Db2 parameters are required.
- Multiple configurations let you save unique sets of parameter values, selected customization tasks and steps, and associated Db2 entries depending on your environment.
- Default values are provided for product parameters and solution pack component parameters, LPAR parameters, and Db2 parameters. The default values show examples of how to complete fields.

**Scenarios**

Use Accelerator Loader to address issues that apply to both frequent and occasional tasks that you perform to refresh production or application table data.

**Loading data to multiple accelerators**

You have existing Db2 table data that you need to load into multiple accelerators in parallel. To accomplish this, use the HALOAD utility. For more information, see Chapter 8, “Loading Db2 table data to multiple accelerators,” on page 289.

You need to load data from a SYSREC data set into multiple accelerators and optionally to Db2. In the syntax of your batch job, specify up to four accelerator names in the ON clause of the IDAA_DUAL or IDAA_ONLY keyword. Alternatively, use the ISPF panels to select multiple accelerators and generate JCL.
You need to load non-Db2 data from a virtualized data source through the Accelerator Loader server. In the Accelerator Loader studio, you can select multiple accelerators when generating the JCL.

**Loading data from a remote system**

You have a z System infrastructure that has multiple LPARs configured. Adabas is running on LPAR A and you need to access Adabas from LPAR B. You can use Inter Data Communications (IDC) to enable communication between the LPARs and access to data on those systems.

The Accelerator Loader server enables data processing to run on a z System Integrated Information Processor (zIIP) specialty engine for significantly reduced MIPS capacity usage. In the example, LPAR B can access Adabas data on LPAR A and use the zIIP processor to perform all processing.

**Loading data from another z/OS data source, such as IMS, VSAM, or sequential**

You want to load IMS data into the accelerator so that you can write queries to join IMS and Db2 data. You need a process to easily map this data to a relational model and load it into the accelerator. Using Accelerator Loader, map non-Db2 data to the Db2 table on the accelerator. Accelerator Loader finds data from the specified source and loads the data to the accelerator.

**Loading Db2 data from a platform other than z/OS**

You have Db2 data on another platform, such as in Linux, UNIX, or Microsoft Windows, and you want to move that data to z/OS. You map off-platform Db2 tables to the Db2 table on the accelerator. Accelerator Loader finds data from the specified source and loads the data to the accelerator.

**Loading data into IBM Db2 Analytics Accelerator for z/OS and Db2**

You want to use Analytics Accelerator to perform analytics and speed up complex queries on Db2 data. You need to load the data into the accelerator and Db2.

To accomplish this goal without Accelerator Loader, you must complete the following manual steps to first load the data into Db2, and then the accelerator. While you perform the load, the production table remains inaccessible for query acceleration or data analysis.

1. Run a Db2 LOAD utility to load the data into Db2.
2. Write a program to pass the required parameters to the stored procedure SYSPROC.ACCEL_LOAD_TABLES.
3. Use the Analytics Accelerator stored procedure SYSPROC.ACCEL_LOAD_TABLES to load the data into the Analytics Accelerator. This stored procedure first runs the Db2 UNLOAD utility and passes the data to Analytics Accelerator.

By using Accelerator Loader, you run existing LOAD utility JCL with a few modifications. Accelerator Loader loads data into both Db2 and the accelerator in parallel. By using this feature of Accelerator Loader, the DBA eliminates the manual work that is otherwise required to load data into the accelerator. This feature also saves overall elapsed time.
You have the following options to automatically load data into both Db2 and into the accelerator at the same time:

- Add a new parameter and DD statement to existing LOAD utility batch jobs.
- Use the Accelerator Loader ISPF interface to generate the LOAD utility JCL.

**Loading external data into IBM Db2 Analytics Accelerator for z/OS only**

You have non-Db2 data and you want to take advantage of the analytic capabilities of Analytics Accelerator on the data. To accomplish this goal without Accelerator Loader, you must first load non-Db2 data into Db2 tables. You must then use the Analytics Accelerator stored procedures to manually complete several tasks before you can use the analytic capabilities of Analytics Accelerator.

By using Accelerator Loader, you can load data just into Analytics Accelerator, and not into Db2 first. Accelerator Loader provides savings by reducing the overall CPU consumption, elapsed time, and DASD requirements to load non-Db2 data into the accelerator.

You have the following options to automatically load data into only the accelerator:

- Add a new parameter and DD statement to existing LOAD utility batch jobs.
- Use the Accelerator Loader ISPF interface to generate the LOAD utility JCL.

**Refreshing current data in IBM Db2 Analytics Accelerator for z/OS for a group of related objects**

You want to refresh sets of related Db2 data in an accelerator. To accomplish this goal without Accelerator Loader, you must run the stored procedure `SYSPROC.ACCEL_LOAD_TABLES` on each object within the group and specify to LOCK the tables. This action requires that you stop update activity on the set of tables during the entire load.

By using Accelerator Loader, you can accomplish the goal in the following ways.

- Accelerator Loader can create a FlashCopy image copy for each table to the current point in time for all of the objects. It can then read the FlashCopy images and load the data into IBM Db2 Analytics Accelerator for z/OS.
  
  With this option, CPU, I/O, and time required to create the image copies is nominal because the FlashCopy image copy leverages the speed and power of the storage processor to create the copies. During the entire process, the tables are available for update.

- Accelerator Loader can start with existing image copies of the objects. It then applies any log records to the image copy, and then loads a copy of the data into Analytics Accelerator to the current point in time.
  
  With this option, you can load data into IBM Db2 Analytics Accelerator for z/OS to the current point in time without taking the tables offline for the update.

You have the following options to refresh current data:

- Use the example JCL to create a batch job.
- Use the Accelerator Loader ISPF interface to generate the batch job.
Loading historical data into IBM Db2 Analytics Accelerator for z/OS

You want to load historical data into an accelerator to a point in time in the past, but the accelerator by default does not support this scenario.

By using Accelerator Loader, you can load one or more tables into Analytics Accelerator to any historical time by specifying a timestamp or an RBA/LRSN at which to load the data. Accelerator Loader constructs the table data to the specified point in time by using an image copy taken before the specific point in time, and applying log records forward to the specified point in time. During the load, tables remain online for updates.

You have the following options to load historical data:
• Use the example JCL to create a batch job.
• Use the Accelerator Loader ISPF interface to generate the batch job.

Loading a specific image copy into an object on the IBM Db2 Analytics Accelerator for z/OS

You want to load data from a specific Db2 image copy into a table on the accelerator that is either not the last registered image copy in SYSIBM.SYSCOPY, or is not registered in the SYSCOPY table at all. This scenario cannot be accomplished without the Accelerator Loader.

By using the Accelerator Loader, you can load data from a specific image copy into its corresponding table on the accelerator. With this option, the Accelerator Loader writes only the data contained within the pages of the image copy to the table on the accelerator. No log records are applied and you do not need to specify the end point. The table in Db2 remains online during the update to the accelerator.

You have the following options to refresh image copy data:
• Use the example JCL to create a batch job.
• Use the Accelerator Loader ISPF interface to generate the batch job (if the image copy has only one table).

Backing up or recovering accelerator data

You have data that resides only in the accelerator, either in an accelerator-only table or in an accelerator-shadow table that has been loaded to the accelerator only. You need to make a backup or to recover this data, but because the data resides only in the accelerator, the standard Db2 COPY and RECOVER utilities cannot be used.

To back up or recover this accelerator data, you can use features available in Accelerator Loader
• To back up accelerator data, you can make a full copy using the Accelerator Loader backup utility, or you can make full or incremental copies inline during an accelerator only load. You can generate backup JCL using the Backup profile or the Accelerator only profile, as appropriate.
• To recover accelerator data, you can generate recovery JCL using the Recovery profile.

For more information, see Chapter 9, “Backing up and recovering accelerator data,” on page 295.
Service updates and support information

Service updates and support information for this product, including software fix packs, PTFs, frequently asked questions (FAQs), technical notes, troubleshooting information, and downloads, are available from the web.

To find service updates and support information, see the following website:

Product documentation and updates

Db2 Tools information is available at multiple places on the web. You can receive updates to Db2 Tools information automatically by registering with the IBM My Notifications service.

Information on the web

The most current version of this information is available on IBM Knowledge Center:

http://www.ibm.com/support/knowledgecenter

A PDF version of this information is available on the Db2 Tools Product Documentation web page; however, IBM Knowledge Center is updated more frequently than PDF books. The Db2 Tools Product Documentation web page is located at:

IBM Redbooks® publications that cover Db2 Tools are available from the following web page:

http://www.redbooks.ibm.com

The IBM Information Management System website shows how IT organizations can maximize their investment in Db2 databases while staying ahead of today’s top data management challenges:

Receiving documentation updates automatically

To automatically receive emails that notify you when new technote documents are released, when existing product documentation is updated, and when new product documentation is available, you can register with the IBM My Notifications service. You can customize the service so that you receive information about only those IBM products that you specify.

To register with the My Notifications service:
1. Go to http://www.ibm.com/support/mysupport
2. Enter your IBM ID and password, or create one by clicking register now.
3. When the My Notifications page is displayed, click **Subscribe** to select those products that you want to receive information updates about. The Db2 Tools option is located under **Software > Information Management**.

4. Click **Continue** to specify the types of updates that you want to receive.

5. Click **Submit** to save your profile.

**How to send your comments**

Your feedback is important in helping to provide the most accurate and high-quality information. If you have any comments about this book or any other IBM product documentation, use one of the following options:

- Use the IBM Knowledge Center **Contact Us** link.
- Use the online reader comment form, which is located at [http://www.ibm.com/software/data/rcf/](http://www.ibm.com/software/data/rcf/).
- Send your comments by email to [comments@us.ibm.com](mailto:comments@us.ibm.com). Include the name of the book, the part number of the book, the version of the product that you are using, and, if applicable, the specific location of the text you are commenting on, for example, a page number or table number.

**Accessibility features**

Accessibility features help a user who has a physical disability, such as restricted mobility or limited vision, to use a software product successfully.

The major accessibility features in this product enable users to perform the following activities:

- Use assistive technologies such as screen readers and screen magnifier software. Consult the assistive technology documentation for specific information when using it to access z/OS interfaces.
- Customize display attributes such as color, contrast, and font size.
- Operate specific or equivalent features by using only the keyboard. Refer to the following publications for information about accessing ISPF interfaces:
  - z/OS ISPF User’s Guide, Volume 1
  - z/OS TSO/E Primer
  - z/OS TSO/E User’s Guide

These guides describe how to use the ISPF interface, including the use of keyboard shortcuts or function keys (PF keys), include the default settings for the PF keys, and explain how to modify their functions.
Chapter 2. Preparing to customize

Before you start to customize Db2 Analytics Accelerator Loader, determine all customization values that you must specify during the customization process, and familiarize yourself with the customization tasks.

The following tables describe each significant customization task. Use this checklist to guide you through the entire customization process. Print the checklist and the data set names and parameter values worksheets. Use the worksheets to record your values, and refer to them during the customization process.

### Migrating load profiles

A migration program copies and migrates load profiles that you created in an earlier version of the product to the format that the current version requires.

To migrate existing load profiles, during the Tools Customizer customization process, complete the following steps:

1. On the Product Parameters panel (CCQPPRD), ensure that you specify the following:
   - Create profile data sets and migrate profiles
   - Create profile data sets
   - Migrate profiles
     - High-level qualifiers for the new profile data set and the data set that contains the existing profiles.
     - (optional) The volume serial number for the profile data sets.
     - Startup CLIST1 and CLIST2. After submitting the customization jobs, CLIST2 uses the high-level qualifier for the new profile data set.

2. After specifying values on the Product Parameters panel (CCQPPRD) and the DB2 Parameters panel (CCQPDB2), generate and submit customization jobs to
   - create the new profile data set
   - migrate profiles from the exiting data set to the new one
   - generate new CLIST1 and CLIST2

### Migrating batch jobs

With this version of Analytics Accelerator Loader, you can use jobs that you created with the previous version to build profiles in batch.

To migrate existing batch jobs to be used with Accelerator Loader version 2.1, change the product libraries in the JCL to use the latest libraries.

### Set up your environment prior to customization

Ensure that your environment meets all requirements, that you have installed all prerequisite software, and that you have considered how you want to customize optional features.
Verify that your environment meets hardware requirements

Db2 Analytics Accelerator Loader can be used on any hardware environment that supports the required software.

Verify that your environment meets software requirements

z/OS requirements

Ensure that you are using one of the following versions of z/OS at the latest maintenance level:

- Version 2.1 (5650-ZOS)
  Required maintenance:
  - UA75046
  - UA75273
- Version 2.2 (5650-ZOS)
- Version 2.3 (5650-ZOS)

Db2 requirements

Ensure that you are using one of the following supported versions of Db2 for z/OS at the latest maintenance level:

- Db2 V11:
  - Db2 V11 (5615-DB2)
  - Db2 Value Unit Edition V11.1 (5697-P43)
  - Db2 Utilities Suite for z/OS, V11 (5655-W87),
  Required maintenance:
    - AI26321
    - PII0162
    - PI35818 (UI29037)
    - PI59910
    - UI24306
    - UI24308
- Db2 V12:
  - Db2 12 for z/OS (5650-DB2)
  - Db2 12 for z/OS Value Unit Edition (5770-AF3)
  - Db2 Utilities Suite for z/OS, V12 (5770-AF4),
  Required maintenance:
    - PI67007 (UI42441)
    - PI69894 (UI42440)

Accelerator requirements

Ensure that you are using a supported version of IBM Db2 Analytics Accelerator for z/OS:

- Version 3.1.0 (5697-DAA) or later for basic processing
- Version 4.1.0 (5697-DAB) with PTF-6 applied or a later version to use all product features
- Version 5.1.0 (5697-DA5)
• Version 7.1.0 (5697-DA7) with Update 7 applied to use all product features

Other software requirements

Ensure that you are using a supported version of the following software:
• ISPF V4 (5655-042) or later
• IBM SMP/E for z/OS V03.06.00 (5655-G44 ) or later
• IBM Tools Customizer for z/OS, V1.1 (5655-TC1) or later
• IBM Db2 Common Code for z/OS (FEC) V1R3 (5655-F55) or later.
  Required maintenance:
    – PK43912
    – PK76167
    – PM06651
    – UK98321
    – UK98680
    – UI21883
    – UI26834
    – UI27815

Verify that your environment meets requirements for supported interfaces and data sources

Ensure that you are using supported versions of the data sources from which you will load data at the latest maintenance level:
• Db2 for z/OS as listed in “Verify that your environment meets software requirements” on page 29
• IMS Database Control (DBCTL) Version 12.1.0 (5635-A03) or later
• VSAM with the z/OS PTFs listed in “Verify that your environment meets software requirements” on page 29
  For optimal performance, ensure that the following VSAM APARs are applied:
    OA44111
    OA45279
    OA45280
    OA44277
    OA44064
• To load data from distributed relational database architecture (DRDA) sources, one of the following products:
  – IBM Db2 Advanced Enterprise Server Edition Version 10.5.0 (5725-L47) or later. For product documentation, visit the Db2 for Linux UNIX and Windows IBM Knowledge Center
  – IBM InfoSphere® Federation Server Version 9.7.0 (5724-N97) or later. For product documentation, visit the InfoSphere Federation Server IBM Knowledge Center
  – IBM InfoSphere BigInsights® Enterprise Edition Version 1.0.0 (5725-C09) or later. For product documentation, visit the InfoSphere BigInsights IBM Knowledge Center

To load relational and non-relational data to an accelerator, ensure that you have met the following requirements:
• IBM Data Studio 4.1.x for Windows 32-bit or 64-bit is installed on your system.
• The Accelerator Loader studio plug-in is installed on your system.
• Accelerator Loader studio can connect to the z/OS mainframe instance.

**Verify that Db2 Analytics Accelerator Loader has been installed successfully**

For installation instructions, see the Program Directory for Db2 Analytics Accelerator Loader. Installation and verification jobs have been included in the customization process. Be sure you select the step to generate the IVP jobs in Tools Customizer. Then, ensure you submit each IVP job and that each completes successfully.

**Verify that Tools Customizer has been installed successfully**

Tools Customizer provides a standard approach to customizing IBM Db2 for z/OS Tools. For installation instructions, see the Program Directory for IBM Tools Customizer for z/OS.

**Verify that your environment meets minimum region size requirements**

Db2 Analytics Accelerator Loader requires a minimum TSO region size of 50000.

---

**Security requirements**

Review the security requirements for Db2 Analytics Accelerator Loader.

**Authorization requirements for the Accelerator Loader started task**

Make sure that the Accelerator Loader started task hloidPROC runs under a user ID that has the required authority.

The Accelerator Loader started task hloidPROC must run under a user ID that has

• a valid OMVS segment definition.
• one of the following authority levels:
  – SYSADM
  – SYSCTRL
  – SYSOPR with MONITOR1 (minimum)

If you use the SYSOPR with MONITOR1 authority level, you must enter that user ID in the SET CURRENT SQLID field when you use Tools Customizer.

If you use the SYSOPR with MONITOR1 authority level for the started task authid, the following GRANTS are required to BIND the Accelerator Loader plan:

• GRANT SELECT ON
  – SYSIBM.SYSPLAN
  – SYSIBM.SYSPLANDEP
  – SYSIBM.SYSPACKAGE
  – SYSIBM.SYSPACKLIST
  – SYSIBM.SYSPACKDEP
  – SYSIBM.SYSTABLES
- SYSIBM.SYSTABLESPACE
- SYSIBM.SYSINDEXES
- SYSIBM.SYSINDEXPART
- SYSIBM.SYSCOLUMNS
- SYSIBM.SYSTABLEPART
- SYSIBM.SYSRELS
- SYSIBM.SYSFOREIGNKEYS
- SYSIBM.SYSUSERRIGHT
- SYSIBM.SYSKEYS
- SYSIBM.SYSVIEWDEP
- SYSIBM.SYSSYNONYMS
- SYSIBM.SYSDATABASE
- SYSACCEL.SYSACCELERATORS
- SYSACCEL.SYSACCELERATEDTABLES
- SYSIBM.LOCATIONS
- SYSIBM.SYSCOPY
- SYSIBM.SYSEQUENCES
- SYSIBM.SYSEQUENCESDEP
- SYSIBM.DSN_QUERYINFO_TABLE
• GRANT UPDATE ON TABLE SYSACCEL.SYSACCELERATEDTABLES
• GRANT EXECUTE ON PACKAGE SYSACCEL.*
• GRANT CREATEDBC

In addition to these GRANTS, STARTDB must be granted to any database that contains a Db2, accelerator-shadow or accelerator-only table that is a target for LOAD.

**Authorization requirements for the Accelerator Loader server**

To use an external security product, such as RACF, ACF2, or Top Secret, define the *hlvidPROC* started task name to the security product and authorize the data set.

**About this task**

The following table summarizes the access requirements by data definition name:

<table>
<thead>
<tr>
<th>Data definition name</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>SHLVLOAD</td>
<td>READ, EXECUTE</td>
</tr>
<tr>
<td>SHLVRPC</td>
<td>READ, EXECUTE</td>
</tr>
<tr>
<td>SHLVEXEC</td>
<td>READ</td>
</tr>
<tr>
<td>TRACE</td>
<td>READ, WRITE</td>
</tr>
<tr>
<td>SYSCHK1</td>
<td>READ, WRITE</td>
</tr>
<tr>
<td>SHLVMAP</td>
<td>READ, WRITE</td>
</tr>
<tr>
<td>SHLVTXVTB</td>
<td>UPDATE</td>
</tr>
</tbody>
</table>

Make sure that your z/OS Security Administrator reviews the security definitions. You might need to change definitions to meet requirements at your site.
If you use SYSOPR with MONITOR1, STARTDB authority may also be required for table spaces being loaded. This authority is required to allow the IDAA stored procedures to perform an ACCESS DB command to externalize RUNSTATS. See the IDAA Installation Guide for details.

**Procedure**

To define the server and other required permissions for your security product, edit one of the following jobs that are located in the hlq.SHLVCNTL library, and submit the job:

- HLVRAVDB is for IBM Resource Access Control Facility (RACF) security.
- HLVAC2VDB is for CA ACF2 (Access Control Facility) security.
- HLVTSVDB is for CA Top Secret Security (TSS).

**Authorization requirements for utilities**

The user ID that is used to submit LOAD jobs must have a valid OMVS segment definition.

Db2 Analytics Accelerator Loader intercepts both the LOAD utility with Accelerator Loader extended syntax and the UNLOAD utility that is called by the SYSPROC.ACCEL_LOAD_TABLES stored procedure. The UNLOAD utility executes in the WLM environment that runs the DSNUTILU stored procedure. Temporary SYSOUT data sets might be allocated and opened for output in both the batch and WLM environments. The user ID that runs the batch Accelerator Loader utility job must have RACF authority to create and open temporary data sets for output.

**Authorization requirements to access data sources**

Accessing data sources requires the following authorizations:

- To access non-Db2 or remote Db2 data sources, your user ID must have READ authority to the data sources in your security product.
- To load System Management Facility (SMF) data, your user ID must have UPDATE authority to file SHLVXVTB.

**Running multiple started tasks to monitor different Db2 subsystems**

A single Accelerator Loader started task hlhidPROC is usually sufficient to handle multiple user requests from the product interfaces to perform work on one or more Db2 subsystems. However, you can run multiple started tasks if necessary.

If you have a high volume of activity, to handle the workload more efficiently, run multiple Accelerator Loader started task hlhidPROCs concurrently. Each started task monitors a different Db2 SSID. The following requirements apply when you run multiple concurrent started tasks:

- The SHLOSAMP library must contain a separate initialization options member for each started task.
- Each initialization options member must specify a unique SVC number and primary subsystem.
- Each Accelerator Loader started task must have its own set of product audit, logging, and DSNUTILB intercept tables.

Run Tools Customizer for each primary subsystem to generate the following items:
• DDL for creating the Db2 objects that the Accelerator Loader started task will use
• Statements for binding the Db2 plan and packages on the Db2 subsystems with which the Accelerator Loader started task will communicate
• The Accelerator Loader started task hlvidPROC
• The Accelerator Loader started task initialization options member
• The DSNUTILB intercept policy

A single Accelerator Loader server started task hlvidPROC is sufficient for processing a high volume of activity.

---

**WLM requirements for Accelerator Loader**

Review the Workload Manager (WLM) requirements for Db2 Analytics Accelerator Loader.

• To get optimum performance, the following Accelerator Loader components require WLM management. The component names are customized by using Tools Customizer.
  - Accelerator Loader started task hloidPROC
  - Accelerator Loader server started task hlvidPROC
  - Accelerator Loader server subsystem hlvid

• When using Analytics Accelerator V7.1.1 or earlier, to use parallelism in Accelerator Loader, the WLM environment that runs DSNUTILU must be configured for WLM management of the DSNUTILU server address space, which allows multiple DSNUTILU server address spaces to be started as needed per system.

**Setting WLM goals**

Review recommendations for Accelerator Loader process goals with respect to other WLM performance goals.

The WLM Service Class and Classification rules determine the order in which a task uses the processor in a multitasking environment. The Accelerator Loader service classes priority values must be lower than those for the Db2 subsystems that Accelerator Loader will use, but higher than those for Db2 LOAD utilities that use the Accelerator Loader process. Set the goals for these items in the following order, from highest to lowest priority:

1. Address spaces of the Db2 subsystems that Accelerator Loader will use.
2. Accelerator Loader server started task, hlvidPROC, and the server subsystem, hlvid.
3. Db2 LOAD utility that Accelerator Loader intercepts (any service class under the Accelerator Loader server started task, hlvidPROC).
4. Accelerator Loader started task, hloidPROC.

**Configuring WLM**

Perform these WLM configuration steps for Accelerator Loader.

**Procedure**

1. Define the Accelerator Loader server subsystem, hlvid, to use a medium- to high- performing WLM velocity goal as its default service class:
   a. Go to the WLM ISPF application, and select option 6 (Classification Rules).
b. Select option 1 to create a new rule.

c. Set the Subsystem Type to HLV, and provide a description.

d. Under the Class/Service Column next to DEFAULTS, set the desired default service class name. If a desired service class does not exist, then create one using option 4 (Service Classes) under the Primary WLM menu.

2. Define the Accelerator Loader started task, hloidPROC and the server started task, hlvidPROC. The goal of hlvidPROC should be equal to that of hlvid. Set a much lower, non-aggressive goal for hloidPROC.

a. Go to the WLM ISPF application, and select option 6 (Classification Rules).

b. For the STC WLM-subsystem type, select Modify.

c. Add entries for hloidPROC and hlvidPROC.

d. Add an appropriate service class for each started task and define each relative to existing workload resource management objectives.

e. Add a unique Report class for each started task.

3. Activate the new WLM policy definition.

4. Optional: When using Analytics Accelerator V7.1.1 or earlier, to use parallelism in Accelerator Loader, ensure that the WLM environment that runs DSNUTILU is configured for WLM management of the DSNUTILU server address space.

Considerations for Db2 data sharing environments

Before you deploy Accelerator Loader in a Db2 data sharing environment, review information about deployment and configuration issues for the started task hloidPROC.

A Db2 data sharing group is composed of one or more Db2 subsystems that are located on the same z/OS image or on different z/OS images. The member subsystems share a common Db2 catalog and can directly access and change the same data while maintaining data integrity.

An Accelerator Loader started task hloidPROC can perform DSNUTILB intercept processing on active subsystems within a data sharing group on the same LPAR that have a Db2 version that Accelerator Loader supports. During customization, you must define at least one member subsystem as the primary subsystem. This subsystem must contain the Accelerator Loader audit and logging tables.

All members of the data sharing group on the same LPAR share the audit and logging tables on the primary subsystem and DSNUTILB intercept worklist tables on any active subsystem in the data sharing group. You can define these objects once on any active member subsystem in the data sharing group. If you define these objects on a subsystem that is not the primary subsystem, you must also define that subsystem as an additional subsystem during customization.

All members of the data sharing group that run on the LPAR where the Accelerator Loader is running must be included in the policy. You can use wild cards in the policy when specifying the SSID. For example, if members DB1A and DB1B are running on the same LPAR, in the policy, you can specify DB1% for the SSID.

So that the started task can communicate with the subsystems in a data sharing group, set DB2_CONNECT_TO_ALL_SUBSYSTEMS initialization option for the started task to YES. If you specify NO, only Db2 subsystems defined explicitly by the subsystem name in the option parameter DB2_SSID (that is, the primary subsystem)
or implicitly by defining the Group Attach name in the option parameter `DB2_SSID` are intercepted when a corresponding definition is in the policy.

In the Accelerator Loader server started task `hlvidPROC`, each database subsystem must be defined as a DRDA endpoint. A database can be an Oracle instance, a Db2 for LUW subsystem, or a Db2 for z/OS subsystem. If the database is a Db2 LUW or Db2 for z/OS subsystem, the DRDA endpoint is customized through Tools Customizer. For other data sources, you must manually define the DRDA endpoint in data set `hlq.SHLVEXEC` member `hlvidIN00`, where `hlvid` represents the name of the Accelerator Loader server started task that was customized by using Tools Customizer.

**Customizing Accelerator Loader for data sharing groups**

If you are using a data sharing group, you can define the Accelerator Loader control file to use the group attachment name. For more information, see "Task: Create the control file, update it, or both" on page 61.

**When the primary subsystem goes down**

This section describes Accelerator Loader behavior when the primary subsystem goes down.

When the primary Db2 subsystem to which Accelerator Loader is connected goes down, the Accelerator Loader started task remains active and will automatically attach to another member of the data sharing group on the same LPAR, if applicable.

The primary Db2 subsystem is identified by the SSID or data sharing group attach name that is coded as the attribute value of the `DB2_SSID` parameter in the Accelerator Loader started task initialization options XML document. An SSID uniquely identifies the primary Db2 subsystem. A group attach name identifies a data sharing group; a member of the group that is currently up and running on the LPAR is selected by Db2 at CONNECT time and that member becomes the primary Db2 subsystem. The Accelerator Loader started task maintains a persistent connection to the primary Db2 subsystem in order to insert log and audit rows to Db2 tables.

Secondary Db2 subsystems are specified in the Accelerator Loader policy XML document (`hlvidPLCY`). These subsystems can be accessed by the Accelerator Loader started task and client applications for the purpose of loading and backing up accelerator tables in addition to other administrative functions. A persistent connection to secondary Db2 systems is not maintained by the Accelerator Loader started task. Accelerator Loader log and audit tables are not required to be defined on secondary subsystems.

The following message indicates the current primary subsystem:

```
HLOS0609I 248 12:27:10.29 TCB: 00BB4BB8 DB2 system SSID is the primary subsystem for this instance
```

Accelerator Loader behavior varies depending on the following conditions:

- `DB2_SSID` option specifies a standalone subsystem versus a data sharing group name
- Accelerator Loader started task is starting up versus already active
- Primary Db2 subsystem shuts down versus starts up
• Number of data sharing group members that are active on the LPAR is one versus multiple

The following scenarios describe the resultant behaviors depending on the conditions:

**Scenario 1: Accelerator Loader started task starts up and the primary Db2 subsystem is a standalone SSID which is not active on the LPAR**

In this scenario, the primary Db2 subsystem is a standalone Db2 subsystem; however, the same behavior would be seen if the primary subsystem was a member of a data sharing group and the only member of the group running on the LPAR when the Accelerator Loader started task is started. The Accelerator Loader started task comes up but the primary subsystem is disabled. Logging and auditing are disabled. The secondary Db2 systems will allow client connections and will perform required Accelerator Loader functions.

The following messages are issued, where RA1B is the primary Db2 subsystem:

- **HL0S0409W** 248 13:50:54.82 Cannot connect to the primary DB2 subsystem RA1B as required.
- **HL0S0002I** 248 13:50:54.82 Started task initialization is complete

The Accelerator Loader started task will detect when the primary Db2 subsystem is started and will then allow client connections to the primary subsystem and will write log and audit data to the Db2 tables.

When the primary subsystem starts up, the following messages are issued, where RA1B is the primary Db2 subsystem:

- **HL0S0607I** 254 10:56:38.79 TCB: 008C2190 DB2 subsystem RA1B startup detected.
- **HL0S0600I** 254 10:56:38.79 DSNUTILB interception for DB2 SSID=RA1B is enabled.
- **HL0S0606I** 254 10:56:38.79 DB2 SSID=RA1B has DB2 Sort Enabled=YES
- **HL0S0830I** 254 10:56:38.81 DSNUTILB Intercept Policy:
  - **HL0S0831I** 254 10:56:38.81 DB2 SSID: RA1B ACTION: LOAD_ACCELERATOR
- **HL0S0203I** 254 10:56:38.82 TCB: 008BF448 Connection to DB2 was successful. SSID=RA1B
- **HL0S0609I** 254 10:56:38.82 TCB: 008BF448 DB2 system RA1B is the primary subsystem for this instance
- **HL0S0020I** 254 10:56:38.98 Logging has been started.
- **HL0S0022I** 254 10:56:38.98 Auditing has been started.

**Scenario 2: Accelerator Loader started task is active, the primary Db2 subsystem is a standalone SSID or the only member of a data sharing group that is active on the LPAR, and the primary subsystem shuts down**

If the primary subsystem is a standalone Db2 system or is the only member of a data sharing group that is active and running on the LPAR, then the Accelerator Loader started task will disable logging and auditing and issue the following messages:

- **HL0S0409W** 254 11:03:12.11 Cannot connect to the primary DB2 subsystem RA1B as required.
- **HL0S0600I** 254 11:03:12.11 TCB: 008BF448 DB2 subsystem RA1B shutdown detected.
- **HL0S0021I** 254 11:03:12.11 Logging has been terminated.
- **HL0S0023I** 254 11:03:12.11 Auditing has been terminated.

The primary subsystem is disabled. Logging and auditing are disabled. Secondary Db2 systems will allow client connections and perform required Accelerator Loader functions.

**Scenario 3: Accelerator Loader started task is active, the primary Db2 subsystem is defined with a group attach name and there are multiple members of the data sharing group on the LPAR, and the primary subsystem shuts down**
If the primary Db2 system is a member of a data sharing group and there is another member of the group running on the LPAR, then the Accelerator Loader started task will assign primary status to that member. The member must be identified in the currently active Accelerator Loader policy member (hloidPLCY) and the group attach name must be coded as the \textbf{DB2SSID} parameter in the Accelerator Loader started task initialization options module.

The following messages are issued:

<table>
<thead>
<tr>
<th>Message ID</th>
<th>Time</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HLOS0609I</td>
<td>11:24:40.99</td>
<td>DB2 system QBB is the primary subsystem for this instance</td>
</tr>
<tr>
<td>HLOS0610I</td>
<td>11:25:11.38</td>
<td>DB2 subsystem QBB shutdown detected.</td>
</tr>
<tr>
<td>HLOS0204I</td>
<td>11:25:11.39</td>
<td>Disconnection from DB2 was successful. SSID=QBB</td>
</tr>
<tr>
<td>HLOS0201I</td>
<td>11:25:11.40</td>
<td>Connection to DB2 was successful. SSID=QBC</td>
</tr>
<tr>
<td>HLOS0609I</td>
<td>11:25:11.40</td>
<td>DB2 system QBC is the primary subsystem for this instance</td>
</tr>
<tr>
<td>HLOS0203I</td>
<td>11:25:11.41</td>

<td>Connection to DB2 was successful. SSID=QBC</td>
</tr>
</tbody>
</table>

**Scenario 4: Accelerator Loader started task is active, the primary Db2 subsystem is defined with a group attach name and there are multiple members of the data sharing group on the LPAR, and the primary subsystem shuts down for maintenance**

The primary Db2 subsystem (DB2A) is shut down and the Accelerator Loader started task rolls over to another member of the data sharing group (DB2B). DB2B is now the primary subsystem. DB2A is started with ACCESS(MAINT). The Accelerator Loader started task detects this event and attempts to connect to DB2A. This connect attempt will fail because of ACCESS(MAINT), and the Db2 system is flagged as a system in MAINT mode. Maintenance is completed on DB2A and the system is shut down and restarted in normal operational mode. Because of the prior connect failure when DB2A was started with ACCESS(MAINT), the Accelerator Loader started task cannot be notified by Db2 when the system is restarted for normal operation. As a result, the Accelerator Loader administrator must issue the following \texttt{z/OS MODIFY} command to refresh the status tracking of subsystem DB2A by the Accelerator Loader started task:

```
MODIFY <started_task_name>,--REFRESH DB2
```

where \texttt{started_task_name} is the name of the Accelerator Loader started task.

The following messages report on Db2 startup in \texttt{ACCESS(MAINT)} mode and normal startup after \texttt{ACCESS(MAINT)} mode:

<table>
<thead>
<tr>
<th>Message ID</th>
<th>Time</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HLOS0611I</td>
<td>14:34:19.68</td>
<td>DB2 subsystem DB2A is now running in \texttt{ACCESS(MAINT)} mode</td>
</tr>
<tr>
<td>HLOS0612I</td>
<td>14:37:28.33</td>
<td>ACCESS(MAINT) cleared for DB2 subsystem DB2A</td>
</tr>
</tbody>
</table>

**WTO messages for automated operations**

Accelerator Loader issues some messages as WTO messages that you can use to control the flow of automated operations in your environment.

The following messages report the beginning and end of the Accelerator Loader started task initialization and termination phases:

- HLOS0001I
- HLOS0002I
- HLOS0003I
- HLOS0004I
Worksheets: Gathering required data set names

Identify and record the data set names that will be used during the customization process and make sure that requirements for certain data sets are met.

Data set names for Tools Customizer

Identify and record the following Tools Customizer data set names.

<table>
<thead>
<tr>
<th>Data set name</th>
<th>Description</th>
<th>Your data set name</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCCQDENU</td>
<td>Metadata library for Tools Customizer</td>

<tr>
<td>SADBEXEC</td>
<td>Db2 Admin Tool EXEC library</td>
<td>Note: Used only if you choose to add the product to the Db2 Admin Launchpad.</td>
</tr>
</tbody>
</table>

Data set names of other libraries used by Tools Customizer

Identify and record the following data set names. During the customization process, you will enter the following values on the Tools Customizer Settings panel (CCQPSET).
### Data set name | Description | Your data set name
--- | --- | ---
**Product customization library**  
**Note:** You must have write access to this data set. | Contains the customization jobs that Tools Customizer generates for the product.  
To customize the product, submit the members of the data set in the order in which they are displayed on the Finish Product Customization panel. The data set naming convention is:  
$h1q, $LPAR-name$.xyzvrm  
where:  
- $h1q$ is the value of the Customization library qualifier field on the Tools Customizer Settings panel (CCQPSET)  
- $LPAR-name$ is the four-character LPAR name  
- $xyzvrm$ is the three-letter product identifier with the version, release, and modification level  
For example, the data set name might be DB2TOOLS.PRODUCT.CUST. $MVS1$.XYZ410. | **Your data set name**

**Discover output data set**  
**Note:** You must have write access to this data set. | Contains the output that is generated when you run the product Discover EXEC.  
The Discover EXEC retrieves the metadata and values for the parameters from a previous customization of the product.  
The default name of the data set is DB2TOOLS.CCQ110. DISCOVER. You can change the default value on the Tools Customizer Settings panel or the Discover Customized Product Information panel. | **Your data set name**

**Data store data set**  
**Note:** You must have write access to this data set. | Contains product, LPAR, and Db2 parameter values, and Db2 entry associations. Tools Customizer uses this data set to permanently store all information that is acquired about the product, Db2 subsystems, and LPAR when you customize products on the local LPAR.  
The default name of the data set is DB2TOOLS.CCQ110. DATASTOR. You can change the default value on the Tools Customizer Settings panel. | **Your data set name**

---

**Worksheets: Gathering parameter values for Tools Customizer**

During the customization process, you must provide parameter values for Db2 Analytics Accelerator Loader, Db2, IMS, and your LPAR.

Use the following worksheets to record the appropriate parameter settings for your purposes, and then use these worksheets during the customization process. The worksheets are organized based on the order of the customization panels in Tools Customizer.
Metadata library for Db2 Analytics Accelerator Loader

Description
Use the following worksheet to identify and record the value of the metadata library for Db2 Analytics Accelerator Loader. During the customization process, you enter this value on the Specify the Metadata Library panel (CCQPHLQ).

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Discovered?</th>
<th>Your value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Metadata library</td>
<td></td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>The default name of the metadata library after the product has been SMP/E installed is hlq.SHLODENU, where hlq is the high-level qualifier for Db2 Analytics Accelerator Loader.</td>
<td></td>
</tr>
</tbody>
</table>

Customization values for the Discover EXEC

Description
Use the following worksheet to identify and record the customization values for the Tools Customizer Discover EXEC. During the customization process, you enter these values on the Discover Customized Product Information panel (CCQPDSC).

Tip: Tools Customizer can use a control file and options module from a previous installation of Db2 Analytics Accelerator Loader to discover existing information. Specify values for Previous installation control file and Previous installation OPTS module name.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Sample or default value</th>
<th>Your value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Discover EXEC library</td>
<td>The fully qualified data set name that contains the product Discover EXEC.</td>
<td>hlq.SHLODENU</td>
</tr>
<tr>
<td>Discover EXEC name</td>
<td>The name of the Discover EXEC.</td>
<td>HLODISC</td>
</tr>
<tr>
<td>Discover output data set</td>
<td>The fully qualified name of the data set for the output from the product Discover EXEC.</td>
<td>The name that you specified in option 0 User Settings from the Tools Customizer main menu.</td>
</tr>
<tr>
<td>DB2 HLO User Indicator</td>
<td>The user indicator of Accelerator Loader. Configuration data related to the specified user indicator will be discovered in the previous installation control file. Valid values contain 1 to 3 characters.</td>
<td>HLO</td>
</tr>
<tr>
<td>Previous installation control file</td>
<td>The Db2 control file that was used with a previous installation of the Accelerator Loader. If the data set name is longer than 42 characters, you must enclose it in quotation marks.</td>
<td>DB2TOOL.V110110.CONTROL</td>
</tr>
<tr>
<td>Parameter</td>
<td>Sample or default value</td>
<td>Your value</td>
</tr>
<tr>
<td>------------------------------------------------</td>
<td>-------------------------</td>
<td>---------------------</td>
</tr>
<tr>
<td>Previous installation SHLOSAMP data set</td>
<td>HLO.V110.SHLOSAMP</td>
<td></td>
</tr>
<tr>
<td>The Accelerator Loader version 1.1 SHLOSAMP data set that contains the options module. The Discover EXEC reads the options module and populates the Product Parameters panel (CCQPPRD) with the discovered values. This process reduces the amount of time that is required to customize the product and enables you to review the values that were used previously. If the data set name is longer than 42 characters, you must enclose it in quotation marks.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Previous installation OPTS module name</td>
<td>No default.</td>
<td>Sample value: HLO1OPTS</td>
</tr>
<tr>
<td>The options module name that was used in Accelerator Loader. The Discover EXEC reads the options module and populates the Product Parameters panel (CCQPPRD) with the discovered values. The options module name pattern is hloidOPTS, where hloid is the four-character product ID that identifies your instance of Accelerator Loader.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Product to Customize section

The parameters in the Product to Customize section are read-only. They contain information that was provided on other panels, by Tools Customizer, or by the Db2 Analytics Accelerator Loader metadata data set.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Discovered?</th>
<th>Source of this value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Product metadata library</td>
<td>Yes</td>
<td>This value is specified on the Specify the Product to Customize panel (CCQPHLQ).</td>
</tr>
<tr>
<td>The library that you specified on the Specify the Product to Customize panel. This field is scrollable. Place your cursor anywhere on the field and press PF11 to view its full contents.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>LPAR</td>
<td>Yes</td>
<td>This value is supplied by Tools Customizer.</td>
</tr>
<tr>
<td>The LPAR on which you are customizing Accelerator Loader.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Product name</td>
<td>Yes</td>
<td>The default value Accelerator Loader is provided by the product metadata file.</td>
</tr>
<tr>
<td>The product that is being customized. In this example, Db2 Analytics Accelerator Loader should be displayed in this field. This field is scrollable. Place your cursor anywhere on the field and press PF11 to view its full contents.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Version</td>
<td>Yes</td>
<td>This value is provided by the product metadata file. The default value for this release is 2.1.0.</td>
</tr>
<tr>
<td>The version, release, and maintenance of the product that you are customizing in the format Vn.Rn.nn.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Parameter</td>
<td>Discovered?</td>
<td>Source of this value</td>
</tr>
<tr>
<td>-----------------------------------------------</td>
<td>-------------</td>
<td>--------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Product customization library</td>
<td>No</td>
<td>This value is derived from the user-specified customization library qualifier on the Tools Customizer Settings panel (CCQPSET).</td>
</tr>
</tbody>
</table>

### Product Parameters panel (CCQPPRD) tasks and parameters

The parameters in the Common parameters section are required for all customizations. During the customization process, you enter these values on the Product Parameters panel (CCQPPRD).

**Note:** Tools Customizer displays some parameters only after you select tasks or specify values on the Product Parameters panel (CCQPPRD). Therefore, you must first define a primary SSID on the DB2 Parameters panel (CCQPDB2), then select values on the Product Parameters panel (CCQPPRD). Return to the DB2 Parameters panel (CCQPDB2) to review options that were added as a result of your specifications on the Product Parameters panel (CCQPPRD).

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required?</th>
<th>Discovered?</th>
<th>Default value</th>
<th>Your value</th>
</tr>
</thead>
<tbody>
<tr>
<td>SYSAFF parameter for non-DB2 specific jobs</td>
<td>No</td>
<td>No</td>
<td>No default</td>
<td></td>
</tr>
<tr>
<td>The LPAR value to use in the SYSAFF parameter for those customization jobs that are not Db2-specific. This value does not override the SYSAFF parameter specified in each Db2 subsystem configuration. This value is used for those Tools Customizer customization jobs that perform tasks such as creating the product CLISTs or creating the server files.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>FEC common code high-level qualifier</td>
<td>No</td>
<td>No</td>
<td>No default</td>
<td></td>
</tr>
<tr>
<td>The HLQ for the FEC load modules. The FEC common code programs can be kept in the same library with the Accelerator Loader load modules or in their own library. If the FEC code is kept it its own set of libraries, specify the high-level qualifier.</td>

<td>HLO.V210</td>
<td></td>
</tr>
<tr>
<td>The HLQ for the product data sets, which can optionally include FEC load modules and Accelerator Loader server modules.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Staging library high-level qualifier</td>
<td>No</td>
<td>No</td>
<td>No default</td>
<td></td>
</tr>
<tr>
<td>The high-level qualifier to use for the staging libraries. Staging libraries enable you to retain customized copies of PDS members. When this parameter is specified, the staging libraries will be customized instead of the base product libraries. <strong>Note:</strong> If you previously customized staging libraries and then want to switch to using the product base libraries, you must re-customize Accelerator Loader using the base libraries.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### Task: Create Accelerator Loader files

This required task creates files for the staging libraries, load libraries, and other components that Accelerator Loader uses. During customization, enter these values on the Product Parameters panel (CCQPPRD).

#### Jobs generated

The generated jobs are based on the templates HLOLIBS, HLOOBJ, HLOVSEF, HLOUMAP, and HLODFDIV, which are generated once per LPAR. The generated jobs are stored in the Product Customization Library, which is displayed on the Finish Product Customization panel. The generated job names might vary, but the template names do not.

</table>
### Task: Configure the product CLISTs (required)

This required task configures the CLISTs that start the Accelerator Loader ISPF interface. During customization, enter these values on the Product Parameters panel (CCQPPRD).

#### Jobs generated

The generated jobs are based on the HLOCLST and HLOCLST2 templates, which are generated once per configuration. The generated jobs are stored in the Product Customization Library, which is displayed on the Finish Product Customization panel. The generated job names might vary, but the template names do not. When the jobs run, the CLISTs are stored in the product's hlq.SHLOCLST data set.

If you have an ISPTLIB that you want to use, concatenate it before the supplied ISPTLIB that is provided in the first CLIST. For more information, see the comments in HLOCLST.

</table>

### Task: Create the started task and its components (required)

This required task creates SAMPLIB members for the Accelerator Loader started task hlodPROC and creates maintenance members to clean up repository tables. During the customization process, you enter these values on the Product
Parameters panel (CCQPPRD). The step **Create PROC, PLCY, and other SAMPLIB members** must be selected on the Product Parameters panel (CCQPPRD), and the SSID on which the JCL is being generated must be defined as the primary subsystem on the DB2 Parameters panel (CCQPDB2).

**Note:** To display the Accelerator Loader started task options that are associated with this task, you must first define a subsystem and designate it as the primary subsystem.

### Jobs generated

These jobs are based on the HLOSTCJ and HLOSMPJ templates, which are generated once per configuration. The generated jobs are stored in the Product Customization Library, which is displayed on the Finish Product Customization panel. The generated job names might vary, but the template names do not. When the job is run, the members are stored in the product’s hlq.SHLOSAMP data set.

<tr>
<td><strong>SYSOUT class</strong></td>
<td>Yes</td>
<td>Yes</td>
<td>*</td>
<td></td>
</tr>
<tr>
<td>Specifies a SYSOUT class for the SYSOUT data sets that Accelerator Loader dynamically allocates during DSNUTILB interception for the SYSPRINT output for a utility job. This value can be any valid one-character JES SYSOUT class. The default value is an asterisk (<em>), which indicates that the product should use the default SYSOUT class that is specified for the job, Accelerator Loader started task, or TSO session under which DSNUTILB is running. If you have an output management product that captures and deletes SYSOUT data sets automatically, set this option to a SYSOUT class that your output management product will not delete. Otherwise, your output management product might attempt to delete the SYSOUT data sets that the product dynamically allocates and cause DSNUTILB interception errors. If you specify a value other than an asterisk (</em>), the HOLSORT data sets (which are used in sort processing for the DSNUTILB intercept) still use the default asterisk (<em>) class. <strong>Note:</strong> For JES3 environments: Customizing DYNAMIC_SYSOUT_CLASS=&quot;class&quot;; using the default value (</em>) is not recommended. Set this option to a SYSOUT class that is defined with the HOLD=TSO parameter so that the DSNUTILB intercept can recombine SYSOUT files that are produced by the product and the DSNUTILB utility. In this case, the SYSOUT will show up in the JES3 spool as multiple files. Some of the files will be named SYSPRINT, and others will have a system-generated file name such as SYSmnnn.</td>

<td></td>
<td></td>
</tr>
<tr>
<td>Work file unit</td>
<td>Yes</td>
<td>Yes</td>
<td>SYSALLDA</td>
<td></td>
</tr>
<tr>
<td>Specifies a unit name for the location where the temporary DASD data sets that are allocated by the product are stored. Specify the valid unit name of a storage device or the value NONE. You can specify the value VIO if VIO (virtual input/output) storage groups are supported on your system and you want the temporary data sets to reside entirely in paging storage to improve performance. The default value SYSALLDA indicates any available DASD device. If you specify NONE, the product does not use this parameter to determine where to store the work file data sets.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Maximum worklist table age</td>
<td>Yes</td>
<td>Yes</td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>Specifies the maximum number of days to retain rows in the DSNUTILB intercept worklist-error tables. A DSNUTILB intercept worklist contains the enhanced SYSIN information for a Db2 utility. You can use the information for restart purposes if a utility terminates. Worklist data is moved to worklist-error tables, which are used by IBM Software Support to diagnose a problem. When a row reaches this age limit, it is automatically deleted from the table the next time that a row is inserted into the table. Valid values are 0 - 32767. The default value is 0, which prevents the deletion of old rows from the worklist-error tables based on this option. If you specify 0, manually delete old rows from the table periodically to prevent the table from becoming too large. To do so, use the sample SQL that is provided in the SHLOSAMP member HLOCLNUP.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>WTO routing code</td>
<td>Yes</td>
<td>Yes</td>
<td>11</td>
<td></td>
</tr>
<tr>
<td>Specifies the routing code for write-to-operator (WTO) messages about product operations. Routing codes identify the z/OS console to which to send WTO messages and are defined when Db2 is installed. Valid values are 1 - 28.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Step or parameter</td>
<td>Required?</td>
<td>Discovered?</td>
<td>Default value</td>
<td>Your value</td>
</tr>
<tr>
<td>----------------------------------</td>
<td>-----------</td>
<td>-------------</td>
<td>---------------</td>
<td>------------</td>
</tr>
<tr>
<td><strong>Parallel load tasks</strong></td>
<td>Yes</td>
<td>Yes</td>
<td>4</td>
<td></td>
</tr>
</tbody>
</table>
| Specifies the number of partitions to load into the accelerator and optionally into Db2 in parallel when loading from an external file. Valid values are in the range 1 - 20.
|                                  |           |             |               |            |
| This value should not exceed the value of the IBM Db2 Analytics Accelerator for z/OS parameter `AQT_MAX_UNLOAD_IN_PARALLEL`, which indicates the maximum number of partitions that can be loaded in parallel. If `AQT_MAX_UNLOAD_IN_PARALLEL` is set to 2, the maximum number of partitions that can be written to the accelerator at one time is 2, regardless of the value that you specify for this parameter.
| Note: When using Analytics Accelerator V7.1.1 or earlier, to use parallelism in Accelerator Loader, you must have the WLM environment that runs DSNUTILU configured for WLM management of the DSNUTILU server address space. See “WLM requirements for Accelerator Loader” on page 34 for more information. | | | | |
| **Enable acceleration after successful load** | Yes | Yes | NO | |
| Controls whether query acceleration is enabled for the table after a successful load. If Db2 discards any rows during the load, query acceleration is not enabled. Valid values are YES and NO. | | | | |
| **Load DB2 if accelerator is offline** | Yes | Yes | FAIL | |
| Specifies the action to take when the product detects that the accelerator is unavailable. Valid values are:
| • FAIL: The load job fails.
<p>| • LOAD_DB2: Continue to load the table on Db2. No data is sent to the accelerator. The product issues message HLOU5717W and the utility step ends with RC=4. If the accelerator becomes unavailable during a load after the product determined that the accelerator was available, the job fails, regardless of the value that you specify for this option. You can rerun the job, and if the accelerator is still unavailable, then only Db2 is loaded. | | | | |</p>
<table>
<thead>
<tr>
<th>Step or parameter</th>
<th>Required?</th>
<th>Discovered?</th>
<th>Default value</th>
<th>Your value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Load DB2 if load to accelerator fails</td>
<td>Yes</td>
<td>Yes</td>
<td>FAIL</td>
<td></td>
</tr>
</tbody>
</table>
| Specifies the action to take if the load to the accelerator cannot be performed when running a dual load profile. Valid values are:  
  • FAIL: Fail the load to Db2 if the load to the accelerator cannot be performed. This action keeps the table on the accelerator and the table in Db2 in sync.  
  • LOAD_DB2: Continue to load the table in Db2 if the load to the accelerator cannot be performed or if the table does not exist on the accelerator. |           |             |                   |              |
| Optimize processing for CPU or elapsed time            | Yes       | Yes         | BEST_ELAPSED_     | BEST_ELAPSED_|
| Note: This parameter applies to the following cases:  
  • Loads that use a Dual load profile or the IDAA_DUAL extended syntax option  
  • Nonparallel processing  
  • Loads to tables that are not partitioned or are partitioned by growth  
| Specifies whether to optimize the load for elapsed time or for CPU consumption. Valid values are:  
  • BEST_ELAPSED_TIME: Reduces elapsed time.  
  • BEST_CPU_TIME: Reduces CPU consumption. |           |             | TIME           | TIME         |
| Action when DB2 LOAD discards records loaded to the accelerator | No        | Yes         | DISABLE_          | DISABLE_     |
| Controls how dual load responds when Db2 LOAD discards records that have already been loaded to the accelerator. This situation can occur, for example, when Db2 detects a unique index violation during the INDEX BUILD phase, after all data has been loaded to both the Db2 table and accelerator table. Valid values are:  
  **DISABLE_ACCELERATION**  
  Commit all data that was loaded to the accelerator (including the rows discarded from the Db2 table) and disable query acceleration for the table.  
  **ROLLBACK**  
  Roll back all data loaded to the accelerator table, leaving the accelerator with the original data intact and the query acceleration status for the table unchanged. |           |             | ACCELERATION    | ACCELERATION |
### STOP the target table space before initiating the load

Controls if the target table space is stopped before loading a table enabled for replication when performing a Dual load. YES stops the target table space (or partitions) to drain all claimers before the load starts, and occurs only when loading a table enabled for replication. After the space stops, it is started for UT access. After the load, the space is restored to its original status. With NO (default), the target table space is started for UT access before the load but is never stopped.

</tbody>
</table>

### Report loaded rows threshold

The threshold (in rows) to use when reporting the number of rows that have been loaded for a job. Message "HLOU5062I" on page 714, which includes the cumulative number of rows loaded for the job, is issued to the Accelerator Loader job SYSPRINT each time the threshold value is met. Note that message HLOU5062I will be issued when the threshold is exceeded but will contain the current row count in the loading process, which might be more than the value specified. Valid values are integers in the range 0 - 2147483647. A value of 0 specifies that no reporting messages will be issued.

This setting also affects the results of the DISPLAY SESSIONS console command, which reports the number of rows loaded for a job to the Accelerator Loader started task. When the value is set to 0, the reported number of rows loaded will be 0.

This setting applies globally to all Accelerator Loader IDAA_ONLY, IDAA_DUAL and HALOAD utility jobs that do not specify the ACCEL_ROWS_REPOR_THRESHOLD option in the job syntax.

### Task: Create the server and the server components (required)

This required task creates members for the Accelerator Loader server started task, load libraries, and other components that the Accelerator Loader server uses. During the customization process, you enter these values on the Product Parameters panel (CCQPPRD).

The steps Create the server and Create the server parameters must be selected, and The primary DB2 subsystem ID must be defined on the Product Parameters panel (CCQPPRD).
Jobs generated

These jobs are based on the templates HLOUMAP, HLODFDIV, HLOVOBJ, HLOHLVS, and HLOIN00, which are generated once per LPAR. The generated jobs are stored in the Product Customization Library, which is displayed on the Finish Product Customization panel. The generated job names might vary, but the template names do not.

**Task: Create DDL and BIND jobs (required)**

This required task creates repository objects and the BIND job, and grants EXECUTE authority on the Accelerator Loader plan name. During the customization process, enter these values on panel CCQPPRD.
Jobs generated

These jobs are based on the templates HLODROP, HLOIXDDL, HLODDL, HLORFREE, HLOVFREE, HLORBIND, HLOVBIND, HLORGRNT, and HLOVGRNT, which are generated once per subsystem or data sharing group. The generated jobs are stored in the Product Customization Library, which is displayed on the Finish Product Customization panel. The generated job names might vary, but the template names do not.

**Task: Create the control file, update it, or both**

This optional task creates the control file if it does not exist, and updates the newly created control file or an existing control file with information from the configuration. The control file contains specific information about each Db2 subsystem or data sharing group on which Db2 Analytics Accelerator Loader might run. During the customization process, you enter these values on panels CCQPPRD and CCQPDDB2.

**Jobs generated**

These jobs are based on the templates HLOCCNTL, which is generated once per configuration, and HLOUCNTL, which is generated once per subsystem or data sharing group. The generated jobs are stored in the Product Customization Library, which is displayed on the Finish Product Customization panel. The generated job names might vary, but the template names do not.

**Data sharing groups**

If you are using a data sharing group, you can update the control file with the group attachment name. The following requirements must be met:

- When specifying Tools Customizer user settings, on the Tools Customizer Settings panel (CCQPSET), **Use Db2 group attach** must be set to **YES**. See “Modifying Tools Customizer user settings” on page 76.
- When defining Db2 parameters for use with Accelerator Loader, on the Db2 Parameters panel (CCQPDDB2), **Group attach name** must contain a value for the data sharing group. See “Defining Db2 parameters” on page 104.

To include information in the control file for a Db2 member as well as the data sharing group, you must generate the customization job twice: once for the subsystem and once for the group attachment name. Use the following procedure.

1. Generate a customization job to update the control file for the data sharing group, as follows:
   a. Specify **YES** for **Use Db2 group attach** on the Tools Customizer Settings panel (CCQPSET).
   b. Specify the group attachment name for the data sharing group in **Group attach name** on the Db2 Parameters panel (CCQPDDB2).
   c. Generate the customization job. The job is based on the HLOUCNTL template. For more information, see “Generating customization jobs” on page 107.
   d. Submit the customization job. For more information, see “Submitting customization jobs” on page 107.

2. Generate a customization job to update the control file for a Db2 member, as follows:
a. Specify NO for Use Db2 group attach on the Tools Customizer Settings panel (CCQPSET).

b. Clear Group attach name on the Db2 Parameters panel (CCQPDB2).

c. Generate the customization job. The job is based on the HLOUCNTL template. For more information, see “Generating customization jobs” on page 107.

d. Submit the customization job. For more information, see “Submitting customization jobs” on page 107.

**Task: Create installation and verification jobs**

This optional task creates and customizes installation verification procedure (IVP) jobs. Run these jobs to test the configuration of Db2 Analytics Accelerator Loader.

**Jobs generated**
These jobs are based on the HLOIVP template, which is generated once per configuration. The generated jobs are stored in the Product Customization Library, which is displayed on the Finish Product Customization panel. The generated job names might vary, but the template names do not. When the job is run, the members are stored in the product’s hlq.SHLOSAMP data set and hlq.SHLVSAMP data set.

### Task: Add product to the DB2 Admin Launchpad

This optional task adds Db2 Analytics Accelerator Loader to the Db2 Administration Tool Launchpad. During customization, enter these values on panel CCQPRRD. When the job is run, the REXX EXEC is copied to the product’s hlq.SHLOSAMP data set and then run to add Accelerator Loader to the Launchpad.

### Jobs generated

This job is based on the template HLOADBI, which is generated once per configuration.

**DB2 Parameters section**

This section contains Db2 parameters. During the customization process, you enter these values on the DB2 Parameters panel (CCQPDB2). You can create a Db2 entry as the primary subsystem or secondary subsystem and associate it with Accelerator Loader. When customizing Accelerator Loader, you must define a primary subsystem before you can define product parameters.

You can customize Accelerator Loader only on Db2 entries that are associated with Accelerator Loader. The list of Db2 entries is on the Customizer Workplace panel. You can customize any associated Db2 entries for Accelerator Loader.

**Note:** Tools Customizer displays some parameters only after you have selected tasks or specified values on the Product Parameters panel. Therefore, you must first define a primary SSID on the DB2 Parameters panel, then select values on the Product Parameters panel. Return to the DB2 Parameters panel to review options that were added as a result of your specifications on the Product Parameters panel.

</table>
Chapter 3. Customizing Db2 Analytics Accelerator Loader

After you install the product by following the installation instructions in the Program Directory, you must run Tools Customizer to specify the variables for each Db2 subsystem and to customize the configuration and user parameters.

Complete the following required customization steps in the order listed:
1. Start and prepare Tools Customizer for use.
2. Identify Accelerator Loader as the product to customize.
3. Define the primary Db2 subsystem for the customization and specify Db2 parameter values (DB2 Parameters panel).
4. Specify values for Accelerator Loader parameters (Product Parameters panel).
5. Return to the DB2 Parameters panel to specify values for parameters that were enabled by your selections on the Product Parameters panel. Tools Customizer displays some Db2 parameters only after you select options or specify values on the Product Parameters panel.
6. Specify values on the LPAR parameters panel for the local LPAR that are required to customize Accelerator Loader.
7. Generate and submit the customization jobs.
8. Start and stop Accelerator Loader server.
9. Configure access to data sources.
10. Install and configure the Accelerator Loader studio.

Starting and preparing Tools Customizer for use

Use the provided REXX EXEC to start Tools Customizer. The first time that you use Tools Customizer, you must modify the settings that Tools Customizer uses to customize Db2 Analytics Accelerator Loader.

Starting Tools Customizer

Start Tools Customizer by running a REXX EXEC from the ISPF Command Shell panel.

Before you begin

Tools Customizer must be SMP/E installed. You must know the high-level qualifier of where the Tools Customizer libraries reside. The high-level qualifier is considered to be all the segments of the data set name except the lowest-level qualifier, which is SCCQEXEC.

Attention: Ensure that Tools Customizer load libraries are not APF authorized. APF authorizing Tools Customizer libraries results in an abend.

About this task

To run the REXX EXEC, you must either change the placeholder in the EXEC for the high-level qualifier of the Tools Customizer EXEC library or pass the high-level qualifier as a parameter when you run the EXEC. The REXX EXEC is in the CCQTCZ member of the EXEC library.
Procedure

1. Optional: Change the placeholder for the high-level qualifier in the REXX EXEC:
   a. Find the EXEC library data set for Tools Customizer. The name of the data set is high_level_qualifier.SCCQEXEC.
   b. Edit data set member CCQTCZ and replace the `<TCZ HLQ>` string with the high-level qualifier of the EXEC library data set. For example, if the name of the Tools Customizer EXEC library is CCQTCZ.USABSAND.SCCQEXEC, replace `<TCZ HLQ>` with CCQTCZ.USABSAND.

   You have to change the placeholder for the high-level qualifier only once. When you run the REXX EXEC, you do not have to pass the high-level qualifier as a parameter.

2. Run the REXX EXEC (CCQTCZ):
   a. From the ISPF Primary Option Menu, select option 6. The ISPF Command Shell panel is displayed.
   b. Specify the EX command to run the REXX EXEC. For example, if the Tools Customizer EXEC library is CCQTCZ.USABSAND.SCCQEXEC and you changed the placeholder for the high-level qualifier in the REXX EXEC, specify:

   ```
   EX 'CCQTCZ.USABSAND.SCCQEXEC(CCQTCZ)
   ```
   If you did not change the placeholder for the high-level qualifier in the REXX EXEC, specify:

   ```
   EX 'CCQTCZ.USABSAND.SCCQEXEC(CCQTCZ)' 'CCQTCZ.USABSAND'
   ```

   You can also specify a trace data set name and a user profile when you run the REXX EXEC.

   a. The default trace data set name is `USERID.CCQ.TRACE`. To specify a different trace data set name, append the trace data set name to the command. For example, to specify a trace data set name of CCQTCZ.MYTRACE, enter:

   ```
   EX 'CCQTCZ.USABSAND.SCCQEXEC(CCQTCZ)' 'CCQTCZ.USABSAND, CCQTCZ.MYTRACE'
   ```

   b. To specify a user profile other than your own, append the user profile name to the command. For example, to specify a user profile of SHRPROF, enter:

   ```
   CCQTCZ.USABSAND.SCCQEXEC(CCQTCZ)' 'CCQTCZ.USABSAND, CCQTCZ.SHRPROF'
   ```

   Tools Customizer will use the settings from the specified profile. This profile will be updated when you exit Tools Customizer, but your own profile will remain unchanged.

Results

The IBM Customizer Tools for z/OS main menu panel is displayed.

What to do next

If you are running Tools Customizer for the first time, you must modify the Tools Customizer user settings. If you have already set the Tools Customizer user settings, either customize or recustomize Db2 Analytics Accelerator Loader.

Modifying Tools Customizer user settings

Before you can customize Db2 Analytics Accelerator Loader with Tools Customizer, you must review the settings that Tools Customizer uses. You might have to change the default values to suit your environment. In most cases, you can change
the Tools Customizer values at any time. For example, after you have customized Db2 Analytics Accelerator Loader and are customizing a different product or solution pack, you might have to change the settings.

**Procedure**

1. On the IBM Tools Customizer for z/OS main panel (CCQPHME), specify option 0, **User settings for Tools Customizer**. The Tools Customizer Settings panel (CCQPSET) is displayed, as shown in the following figure:

   ![CCQPSET](image)

   **Figure 1. The Tools Customizer Settings panel (CCQPSET)**

   **Note**: An asterisk next to a field indicates that the field is required.

2. Review the values for the following required fields. Use the default value or specify your own value. You must have appropriate READ and WRITE access to the data sets that are specified.

   **Customization library qualifier**
   
   The high-level qualifier that is used as the prefix for the customization library. The customization library is a data set in which the generated jobs to customize Db2 Analytics Accelerator Loader are stored. WRITE access to this qualifier is required.

   For each product to be customized, the first value that is specified for the qualifier is always used, even if you change it after you have generated the customization jobs. For example, if you customize a product and then specify a new qualifier for recustomization, although the new qualifier is saved and displayed, the original value is used.

   To maintain multiple instances of Tools Customizer, specify a unique customization library qualifier for each instance of Tools Customizer. Data set names that exceed 42 characters must be enclosed in single quotation marks (').

   **Volume serial**
   
   The volume name in which the customization library will reside. If you don't specify a volume name, it will be assigned by the system.
**Use DB2 group attach**

Determines the value that is used in the CONNECT statements in the generated customization jobs. Specify YES for data sharing environments, which causes the group attach name to be used. Specifying NO, in most cases, causes the SSID to be used in the Db2 CONNECT statement.

**Important:** This field has no effect when you are customizing a product on a Db2 subsystem that is not a member of a data sharing group. In this case, the Db2 subsystem ID (SSID) is always used in the CONNECT statements in the generated customization jobs.

When you are customizing a product on a Db2 subsystem that is a member of a data sharing group, how the Db2 subsystem is defined and the value of the **Use DB2 group attach** field determines the value that is used in the CONNECT statements in the generated jobs. The following table shows whether the SSID or the group attach name is used:

**Table 2. The effect of the value of the Use DB2 group attach field in a data sharing environment**

<table>
<thead>
<tr>
<th>Db2 subsystem definition</th>
<th>Value of the Use DB2 group attach field</th>
<th>Value that is used in the CONNECT statements</th>
</tr>
</thead>
<tbody>
<tr>
<td>The Db2 subsystem is defined with an SSID.</td>
<td>Yes</td>
<td>Group attach name</td>
</tr>
<tr>
<td></td>
<td>No</td>
<td>SSID</td>
</tr>
<tr>
<td>The Db2 subsystem is not defined with an SSID.</td>
<td>Yes or No</td>
<td>Group attach name</td>
</tr>
</tbody>
</table>

**Note 1:** If you generate jobs for multiple Db2 subsystems that are defined with an SSID and belong to the same data sharing group, the SSID of the first Db2 subsystem that is selected is used.

For example, assume that on the Customizer Workplace panel, you generated jobs for the following Db2 subsystems:

- DB2C, which is a stand-alone Db2 subsystem
- DB2A, which is a Db2 subsystem that is a member of data sharing group DSG1
- A Db2 subsystem that was not defined with an SSID that is a member of data sharing group DSGA

The following figure shows how these Db2 entries might be listed on the Customizer Workplace panel:

Associated DB2 Entries and Parameter Status

| Line commands: G - Generate jobs E - Edit B - Browse C - Copy R - Remove |
|--------------------------|--------------------------|-----------------|-----------------|-----------------|
| Cmd SSD GrpAttach Lvl Mode User ID Date Status Message |
| DB2C  --  121 NFM SYSADM 2017/11/09 Ready to Customize |
| DB2A DSG1  121 NFM SYSADM 2017/11/09 Ready to Customize |
| -- DSGA  121 NFM SYSADM 2017/11/09 Ready to Customize |

The following table shows which values are used in the CONNECT statements in the generated jobs, based on the value of the **Use DB2 group attach** field.
Table 3. Value that is used in the CONNECT statements in the generated jobs

<table>
<thead>
<tr>
<th>SSID</th>
<th>GrpAttach</th>
<th>Value of the Use DB2 group attach field</th>
<th>Value that is used in the CONNECT statements</th>
</tr>
</thead>
<tbody>
<tr>
<td>DB2C</td>
<td>--</td>
<td>Yes</td>
<td>SSID</td>
</tr>
<tr>
<td></td>
<td></td>
<td>No</td>
<td>SSID</td>
</tr>
<tr>
<td>DB2A</td>
<td>DSG1</td>
<td>Yes</td>
<td>Group attach name</td>
</tr>
<tr>
<td></td>
<td></td>
<td>No</td>
<td>SSID</td>
</tr>
<tr>
<td>--</td>
<td>DSGA</td>
<td>Yes</td>
<td>Group attach name</td>
</tr>
<tr>
<td></td>
<td></td>
<td>No</td>
<td>Group attach name</td>
</tr>
</tbody>
</table>

**Tools Customizer metadata library**

The name of the data set that contains the metadata that is used to display the Db2 and LPAR parameters. The parameters that are displayed on the LPAR Parameters panel and the DB2 Parameters panel depend on the parameters that you define and the tasks and steps that you select on the Product Parameters panel for the product that you are customizing. For example, the Db2 parameters that are required, based on the selected tasks and steps, are displayed on the DB2 Parameters panel, and you can edit them. If they are not required, they are not displayed. Read access to this data set is required. Data set names that exceed 42 characters must be enclosed in single quotation marks (').

**Discover output data set**

The name of the data set in which the output from the Db2 Analytics Accelerator Loader Discover EXEC is stored. Each product has its own Discover EXEC. The Discover EXEC retrieves the product, LPAR, and Db2 parameters from a previously customized product. Write access to this data set is required. Data set names that exceed 42 characters must be enclosed in single quotation marks (').

**Volume serial**

The volume name in which the discover output data set will reside. If you don't specify a volume name, it will be assigned by the system.

**Data store data set**

The name of the data set where Tools Customizer stores information about product, LPAR, and Db2 parameter values. Information about which products are associated with which Db2 entries (Db2 subsystems, Db2 group attach names, and Db2 data sharing members) is also stored in this data set. Data set names that exceed 42 characters must be enclosed in single quotation marks ('). The specified data store data set can be used with only one invocation of Tools Customizer at a time. Data set names that exceed 42 characters must be enclosed in single quotation marks (').

**Volume serial**

The volume name in which the data store data set will reside. If you don't specify a volume name, it will be assigned by the system.

**User job card settings for customization jobs**

The job card information to be inserted into the generated jobs for customizing a product. The default value is the job statement information from the ISPF Batch Selection panel.
The first line of the job card automatically begins with the following information:

```
// JOB
```

where characters 3 - 10 are reserved by Tools Customizer for the job name and includes a blank space after JOB. This name cannot be edited. Information that you specify on the first line of the job card cannot exceed 57 characters. This character limit includes a continuation character. All other lines of the job card cannot exceed 72 characters.

3. Press End to save and exit. If the Discover output data set and the data store data set that you specified do not exist, Tools Customizer creates them.

**Important:** If the ISPF sessions unexpectedly ends before you exit Tools Customizer, the fields on the Tools Customizer Settings panel (CCQPSET) will be repopulated with default values, and you will be required to review them or specify new values again.

**Results**

The values are saved, and the IBM Tools Customizer for z/OS main menu panel (CCQPHME) is displayed again.

**What to do next**

You are ready to customize or recustomize Db2 Analytics Accelerator Loader or to change parameter settings.

**Related concepts:**

"Customizing Db2 Analytics Accelerator Loader" on page 82

Using Tools Customizer to customize Db2 Analytics Accelerator Loader consists of identifying the product to customize; defining any required Db2 Analytics Accelerator Loader, LPAR, and Db2 parameters; generating the customization jobs; and submitting the jobs.

**Changing display options**

You can choose which types of information to show on Tools Customizer panels. You can also copy your user profile to another data set so that it can be shared with other users.

**About this task**

By using the OPTIONS command, you can choose to show or hide the following information on Tools Customizer panels:

- The instructions on all panels
- The Product to Customize section on the Customizer Workplace panel (CCQPWRK)
- The Usage Notes section on the Product Parameters panel (CCQPPRD)

The OPTIONS command also allows you to copy your user profile to another data set so that it can be shared with other users. By sharing a copy of your profile, other uses can customize the same products that you initially customized or started to customize.
Procedure

1. On any Tools Customizer panel, issue the OPTIONS command. The Miscellaneous Options panel (CCQPOPT) is displayed, as shown in the following figure. By default, all panel display options are preselected with a slash (/), which means that they will be displayed.

![Panel Display Options Panel](image)

Figure 2. The Panel Display Options panel (CCQPOPT)

2. To hide the panel instructions, the Product to Customize section, or the Usage Notes section, remove the slash from the appropriate option or options.

3. To copy your user profile to another data set so that it can be shared with other users:
   a. Type a slash in the Copy user profile to another data set field and press Enter.
   b. Specify the fully qualified name of the data set into which you want to copy the current user profile. If the data set name exceeds 42 characters, enclose the name in quotation marks. ALTER or UPDATE authorization to this data set is required.
   c. Optionally specify a volume name in which the user profile data set will reside. If you don't specify a volume name, it will be assigned by the system.

4. Press Enter to save your changes.

Sorting and filtering columns

You can sort data in Tools Customizer columns by up to two columns. You can also filter the data in columns to display only the data that matches the filter criteria that you specify.

About this task

Sorting and filtering is available only on the Customizer Workplace panel, the Finish Product Customization panel, the Associate DB2 Entry for Product panel, and the Copy Associated DB2 Entry panel.

Procedure

The following instructions describe how to sort and filter data in Tools Customizer columns:

- To sort data in Tools Customizer columns, issue the SORT command.
  On the SORT command, specify up to two column names followed by the sort order: A for ascending or D for descending. If you don't specify a sort order, the default sort order is used, which can change depending on the column type.
For example, the following command sorts the column entries by SSID in ascending order, and then by GrpAttch in descending order within SSID.

```
COMMAND ==> SORT SSID A GrpAttch D
```

You cannot specify the **Cmd** column on the **SORT** command.

- To filter data in **Tools Customizer** columns, overwrite the asterisk (*) under the column names with the filtering arguments for those columns.

For example, to filter SSIDs that start with DB, overwrite the *\ under the **SSID** column with DB or DB*. When you press Enter, all the SSIDs that meet that criteria, such as DB01 and DB02, are displayed.

A filter argument in the form DB* means that only the characters up to the asterisk are considered. When you specify an asterisk in the last nonblank position of the argument, asterisks embedded in the argument are treated as data.

---

**Customizing Db2 Analytics Accelerator Loader**

Using **Tools Customizer** to customize Db2 Analytics Accelerator Loader consists of identifying the product to customize; defining any required Db2 Analytics Accelerator Loader, LPAR, and Db2 parameters; generating the customization jobs; and submitting the jobs.

Customization roadmaps describe the steps that you must complete to customize Db2 Analytics Accelerator Loader. Separate roadmaps are provided for the three most common types of customizations.

Use the following table to determine which roadmap corresponds to your environment.

**Table 4. Customization roadmaps**

<table>
<thead>
<tr>
<th>Environment description</th>
<th>Roadmap</th>
</tr>
</thead>
<tbody>
<tr>
<td>You do not have a customized version of Db2 Analytics Accelerator Loader, and you need to customize it for the first time.</td>
<td>“Roadmap: Customizing Db2 Analytics Accelerator Loader for the first time”</td>
</tr>
<tr>
<td>You have already customized a version of Db2 Analytics Accelerator Loader, and you want to use the same parameter values to customize a different version.</td>

</tr>
<tr>
<td>You have a customized version of Db2 Analytics Accelerator Loader, but you want to change one or more parameter values.</td>
<td>“Roadmap: Recustomizing Db2 Analytics Accelerator Loader” on page 85</td>
</tr>
</tbody>
</table>

**Roadmap: Customizing Db2 Analytics Accelerator Loader for the first time**

This roadmap lists and describes the steps that are required to customize Db2 Analytics Accelerator Loader for the first time.

If you are customizing a previous version of Db2 Analytics Accelerator Loader, see “Roadmap: Customizing a new version of Db2 Analytics Accelerator Loader from a previous customization” on page 84.

Before you complete these steps, ensure that the following prerequisites have been met:
• All of the product customization steps that must be done before Tools Customizer is started are complete.
• The LPAR ISPF libraries that are required to submit the jobs are known.
• Tools Customizer is started.
• The Tools Customizer settings have been reviewed or modified, and saved.

Complete the steps in the following table to customize Db2 Analytics Accelerator Loader for the first time.

Table 5. Steps for customizing Db2 Analytics Accelerator Loader for the first time

<table>
<thead>
<tr>
<th>Step</th>

</table>
Roadmap: Customizing a new version of Db2 Analytics Accelerator Loader from a previous customization

This roadmap lists and describes the steps for customizing a new version of Db2 Analytics Accelerator Loader based on the existing customization values of a previous version of the same product.

Use this roadmap even if the previous version of Db2 Analytics Accelerator Loader was not customized by using Tools Customizer.

Before you complete these steps, ensure that the following prerequisites have been met:

- All of the product customization steps that must be done before Tools Customizer is started are complete.
- Tools Customizer is started.
- The Tools Customizer settings have been reviewed or modified, and saved.

Complete the steps in the following table to customize a new version of Db2 Analytics Accelerator Loader from a previous customization.

**Table 7. Steps for customizing a new version of Db2 Analytics Accelerator Loader from a previous customization**

<table>
<thead>
<tr>

Roadmap: Recustomizing Db2 Analytics Accelerator Loader

This roadmap lists and describes the steps to change parameter values and regenerate customization jobs for Db2 Analytics Accelerator Loader after you have customized it for the first time.

The new customization jobs will replace the customization jobs that were previously generated and stored in the customization library. Part of the recustomization process includes selecting or deselecting optional tasks or steps, changing the definitions of parameters that have already been defined, or both. Use the method in this roadmap instead of deleting customization jobs from the customization library.

Before you complete these steps, ensure that the following prerequisites have been met:

- All of the product customization steps that must be done before Tools Customizer is started are complete.
- Tools Customizer is started.

Complete the steps in the following table to recustomize Db2 Analytics Accelerator Loader.

Table 9. Required steps for recustomizing Db2 Analytics Accelerator Loader

Specifying the metadata library for the product to customize

You must specify a metadata library for the product that you want to customize.

About this task

The product metadata library contains the information that determines which tasks, steps, and parameters are required to customize Db2 Analytics Accelerator Loader. This information controls what is displayed on the Product Parameters panel, the LPAR Parameters panel, and the DB2 Parameters panel.

After Db2 Analytics Accelerator Loader has been SMP/E installed, the default name of the product metadata library is `high_level_qualifier.SHLODENU`, where `high_level_qualifier` is all of the segments of the data set name except the lowest-level qualifier.

Procedure

1. Specify option 1 on the Tools Customizer for z/OS panel. The Specify the Product or Pack Metadata Library panel is displayed. This panel contains a list of the product metadata libraries that you specified most recently. If you are using Tools Customizer for the first time, this list is empty, as shown in the following figure:
2. Use one of the following methods to specify the product metadata library:
   - Type the name of a fully qualified partitioned data set (PDS) or an extended
     partitioned data set (PDSE) in the Product or pack metadata library field. Double
     quotation marks ("") cannot be used around the name. Single quotation
     marks (') can be used but are not required. If you are customizing Db2
     Analytics Accelerator Loader for the first time, you must use this
     method.
   - Place the cursor in any column of the Recent Metadata Libraries list, and
     press Enter to populate Product or pack metadata library field. Press Enter
     again to select product or pack for customization.

Results

If you are customizing Db2 Analytics Accelerator Loader for the first time, the Run
Discover EXEC panel is displayed. Otherwise, the Customizer Workplace panel is
displayed, if you have only the base configuration, or if you have multiple
configurations, the Manage Multiple Configurations of a Product panel is
displayed.

What to do next

- Complete the steps that correspond to your environment:
  
  **Customizing Db2 Analytics Accelerator Loader for the first time**
  Do not run the Db2 Analytics Accelerator Loader Discover EXEC. Press
  End. The Customizer Workplace panel is displayed. If your environment
  requires associated Db2 entries, ensure that they are created and
  associated. If your environment does not require associated Db2 entries,
  skip this step, and edit Db2 Analytics Accelerator Loader parameters.

  **Customizing Db2 Analytics Accelerator Loader from a previous or current
  customization**
  You can use the Db2 Analytics Accelerator Loader Discover EXEC to
discover information from a previous or current customization of Db2
Change Accumulation Tool V3.1. Press Enter to run the Db2 Analytics
Accelerator Loader Discover EXEC. The Discover Customized Product
Information panel is displayed. Specify the required information for
running the EXEC.
Customizing Db2 Analytics Accelerator Loader with multiple configurations that were discovered or manually defined
Select one or more configurations that you want to use.

Discovering Db2 Analytics Accelerator Loader information automatically
You can use the Db2 Analytics Accelerator Loader Discover EXEC to discover information from a previous or current customization of Db2 Analytics Accelerator Loader.

About this task

Tip: Using the Db2 Analytics Accelerator Loader Discover EXEC to discover information from a previous or current customization saves time and reduces errors that can occur when parameters are specified manually.

Db2 Analytics Accelerator Loader provides the Discover EXEC that you will run. Therefore, the information that can be discovered depends on Db2 Analytics Accelerator Loader.

Parameter values that are discovered and parameter values that are specified manually are saved in the data store. If parameter values for the product that you want to customize exist in the data store, Tools Customizer issues a warning before existing values are replaced.

Procedure
1. On the Customizer Workplace panel, issue the DISCOVER command. If you chose to run the Db2 Analytics Accelerator Loader Discover EXEC on the pop-up panel after you specified the product to customize, skip this step.

Tip: You can run any Tools Customizer primary command by using either of the following methods:
• Place the cursor on the name of the primary command, and press Enter.
• Type the primary command name in the command line, and press Enter.

The Discover Customized Product Information panel is displayed, as shown in the following figure:
2. Either accept the default values for the following input fields that Tools Customizer generates, or replace the default values with your own values:

**Discover EXEC library**
The fully qualified data set name that contains the Db2 Analytics Accelerator Loader Discover EXEC.

**Discover EXEC name**
The name of the Db2 Analytics Accelerator Loader Discover EXEC.

**Discover output data set**
The fully qualified data set where output from the Db2 Analytics Accelerator Loader Discover EXEC is stored.

3. Either accept or change the default values in the **Information for Discover EXEC** fields. These fields are generated by Db2 Analytics Accelerator Loader. They show the information that is required to run the Db2 Analytics Accelerator Loader Discover EXEC.

4. Issue the **RUN** command to run the Db2 Analytics Accelerator Loader Discover EXEC. Alternatively, save your information without running the Db2 Analytics Accelerator Loader Discover EXEC by issuing the **SAVE** command. If you issue the **RUN** command to run the Db2 Analytics Accelerator Loader Discover EXEC, the parameter information is discovered for Db2 Analytics Accelerator Loader, and the Customizer Workplace panel is displayed.

**Results**

The discovered parameter values for Db2 Analytics Accelerator Loader replace any existing values.

**What to do next**

The next step depends on your environment:

- If Db2 entries were not discovered, or if you need to customize Db2 Analytics Accelerator Loader on new Db2 entries, create and associate the entries.
• If Db2 entries were discovered and you want to customize Db2 Analytics Accelerator Loader on only these entries, define the parameters.

Related tasks:
“Creating and associating Db2 entries”
You can create new Db2 entries and associate them with Db2 Analytics Accelerator Loader.

“Defining parameters” on page 98
To customize Db2 Analytics Accelerator Loader, you must define Db2 Analytics Accelerator Loader parameters, LPAR parameters, and Db2 parameters, if your customization requires Db2 entries.

Creating and associating Db2 entries
You can create new Db2 entries and associate them with Db2 Analytics Accelerator Loader.

About this task
The list of associated Db2 entries is on the Customizer Workplace panel.

Procedure
1. Issue the ASSOCIATE command on the Customizer Workplace panel. The Associate DB2 Entry for Product panel is displayed, as shown in the following figure:

   ![Figure 5. The Associate DB2 Entry for Product panel](image)

2. Create Db2 entries. If you need to associate Db2 entries that are already in the master list, skip this step and go to step 3.
   a. Issue the CREATE command to create one Db2 entry, or issue CREATE nn to create multiple Db2 entries, where nn is the number of new entries to be created. The Create DB2 Entries panel is displayed, as shown in the following figure:
b. In the appropriate columns, specify a Db2 subsystem ID, Db2 group attach name, or Db2 data sharing member name for the Db2 entry that you want to create, and press Enter. Valid values are 1 - 4 characters. You can use symbolic characters. You cannot use blanks.

**Tips:**
- To insert multiple Db2 entries, specify the \textit{Inn} line command, where \textit{nn} is the number of Db2 entries to be inserted.
- You will define specific parameters for these new Db2 entries, such as parameters that define a subsystem as primary, on the DB2 Parameters panel. This panel is displayed after you select these new Db2 entries and issue the line command to generate the jobs, after you issue the primary command to generate the jobs for all associated Db2 entries, or when you manually edit the Db2 parameters.

The Associate DB2 Entry for Product panel is displayed, and the new Db2 entry is displayed in the master list, as shown in the following figure:

c. Repeat steps b and c for each Db2 entry that you want to create.

d. When you have created all the Db2 entries, associate them with Db2 Analytics Accelerator Loader, or press End to display the Customizer Workplace panel.

3. Associate Db2 entries.

   a. Specify \textit{A} against one or more Db2 entries in the master list, and press Enter to associate them with Db2 Analytics Accelerator Loader.
Results

The Customizer Workplace panel is displayed with the associated Db2 entries displayed in the associated list.

What to do next

Define the parameters.

Related concepts:

“Tools Customizer terminology” on page 959

Tools Customizer uses several unique terms that you should be familiar with before you begin to use Tools Customizer.

Managing multiple configurations

Db2 Analytics Accelerator Loader supports multiple configurations. A configuration is a unique set of specified parameter values, selected tasks and steps, and associated Db2 entries that you use to generate the jobs that customize Db2 Analytics Accelerator Loader.

For example, you might create unique configurations for development, test, and production environments.

You can manage multiple configurations for each metadata library. Customization jobs are generated for each configuration separately.

Topics:

• “Selecting configurations”
• “Creating configurations” on page 93
• “Copying configurations” on page 94
• “Removing configurations” on page 95
• “Editing configurations” on page 96
• “Restoring configurations” on page 97

Selecting configurations

You can select one configuration.

Procedure

1. Issue the CONFIGURATION command on the Customizer Workplace panel. The Manage Multiple Configurations of a Product panel is displayed, as shown in the following figure:
2. Specify the / line command against the configuration that you want to use. The Customizer Workplace panel is displayed, as shown in the following figure:

```
CCQPCNF    Manage Multiple Configurations of a Product Row 1 to 1 of 1
Command ===> Scoll ===> CSR

Select the configuration that you want to use, or create a new configuration.
Press Enter to continue or End to cancel.

Commands: CREATE - Create a new product configuration
Line commands: / - Select C - Copy R - Remove E - Edit

Cmd ID     Description
- ==> -------------------------------------------------------------
HLO DB2 Analytics Accelerator Loader for z/OS
---------------------------------------------------- End of Configurations

Figure 8. The Manage Multiple Configurations of a Product panel
```

2. Specify the / line command against the configuration that you want to use. The Customizer Workplace panel is displayed, as shown in the following figure:

```
CCQPWRK    Customizer Workplace: DB2 Accelerator Loader Row 1 to 1 of 1
Command ===> Scoll ===> CSR

Enter a line command under the Cmd column for each DB2 entry and press Enter.

Figure 9. The Customizer Workplace panel

Creating configurations
You can create multiple configurations in addition to your default configuration.

Procedure
1. Issue the CONFIGURATION command on the Customizer Workplace panel. The Manage Multiple Configurations of a Product panel is displayed, as shown in the following figure:

```
Chapter 3. Customizing Db2 Analytics Accelerator Loader  93
```
2. Issue the **CREATE** command. The Create a New Configuration of a Product panel is displayed, as shown in the following figure:

![Figure 10. The Manage Multiple Configurations of a Product panel](image1.png)

3. In the **ID** field, specify an ID for the configuration. The length of valid values is set by Db2 Analytics Accelerator Loader.
4. In the **Description** field, specify a description of the configuration. Valid values are 1 - 72 characters.
5. Press Enter. The Manage Multiple Configurations of a Product panel is displayed, and the new configuration is in the table.

### Copying configurations
You can copy configurations and rename them to reuse large sets of saved parameter values, selected tasks and steps, and associated Db2 entries.

### About this task
You might want to copy a configuration when you want to use most of the same values but you need to change several of them.

### Procedure
1. Issue the **CONFIGURATION** command on the Customizer Workplace panel. The Manage Multiple Configurations of a Product panel is displayed, as shown in the following figure:
2. Specify the C line command against the configuration that you want to copy. The Copy a Configuration of a Product panel is displayed, as shown in the following figure. The ID and description of the configuration from which you are copying information is in the From Configuration section.

```
CCQPCCY Copy a Configuration of a Product
Command ==> Scroll ==> CSR

Specify the ID of the configuration to which information will be copied, and specify a description of the configuration. Press Enter to continue or End to cancel.

From Configuration
ID. . . . . CI. : HLO >

To Configuration
ID. . . . . >
Description . >
```

Figure 13. The Copy a Configuration of a Product panel

3. In the ID field in the To Configuration section, specify an ID for the configuration. The length of valid values is set by Db2 Analytics Accelerator Loader.

4. In the Description field in the To Configuration section, specify a description of the configuration. Valid values are 1 - 72 characters.

5. Press Enter. The Manage Multiple Configurations of a Product panel is displayed, and the configuration that you copied is in the table.

**Removing configurations**

You can remove configurations when you do not need them.

**About this task**

You might want to remove configurations that you do not use. When you complete the following steps, configurations are removed only from the list on the Manage Multiple Configurations of a Product panel. They can be restored when you need them again.

If you remove a customized configuration, the customization jobs will be removed too.

**Restriction:** You cannot remove the configuration that you are currently using or the only configuration in the table.
Procedure

1. Issue the CONFIGURATION command on the Customizer Workplace panel. The Manage Multiple Configurations of a Product panel is displayed, as shown in the following figure:

```
CCQPCNF  Manage Multiple Configurations of a Product  Row 1 to 1 of 1
Command ====>  Scroll ====> CSR
```

Select the configuration that you want to use, or create a new configuration. Press Enter to continue or End to cancel.

Commands: CREATE - Create a new product configuration

Line commands: / - Select  C - Copy  R - Remove  E - Edit

```
Cmd ID   Description
-   ---------------
HLO     DB2 Analytics Accelerator Loader for z/OS
```

Figure 14. The Manage Multiple Configurations of a Product panel

2. Specify the R line command against the ID of the configuration that you want to remove. The Remove a Configuration of a Product panel is displayed, as shown in the following figure:

```
CCQPCRM  Remove a Customized Configuration of a Product  Scroll ====> CSR
```

The following configuration was previously customized. If you remove the configuration, it will be removed from the list, and all customization jobs for this configuration will be removed. Press Enter to remove this configuration and its customization jobs, or press End to cancel.

```
Remove Configuration
ID. . . . . . : HLO  >
Description . : New configuration  >
```

Figure 15. The Remove a Configuration of a Product panel

3. Press Enter to remove the configuration. The Manage Multiple Configurations of a Product panel is displayed, and the configuration that you removed is not in the table.

Editing configurations
You can edit the ID and description of configurations.

Procedure

1. Issue the CONFIGURATION command on the Customizer Workplace panel. The Manage Multiple Configurations of a Product panel is displayed, as shown in the following figure:
2. Specify E next to the configuration ID, and press Enter. The Edit a Configuration of a Product panel is displayed, as shown in the following figure:

![CCQPCNF Panel](image)

**Figure 16. The Manage Multiple Configurations of a Product panel**

3. Edit the configuration ID, the configuration description, or both.
   - In the ID field, edit the ID of the configuration. The length of valid values is set by Db2 Analytics Accelerator Loader.
   - In the Description field, edit the description of the configuration. Valid values are 1 - 72 characters.

4. Press Enter. The Manage Multiple Configurations of a Product panel is displayed, and the modified configuration is listed in the table.

**Restoring configurations**

You can restore configurations that you previously removed.

**About this task**

Configurations that you remove are removed only from the list on the Manage Multiple Configurations of a Product panel. They are not deleted. You can restore them when you need them again.

**Procedure**

1. Issue the CONFIGURATION command on the Customizer Workplace panel. The Manage Multiple Configurations of a Product panel is displayed, as shown in the following figure:
2. Use one of the following methods to restore configurations:
   • Issue the **CREATE** command.
   • Specify the **C** line command against a configuration ID.
3. In the **ID** field, specify the ID of the configuration that you want to restore. The length of valid values is set by Db2 Analytics Accelerator Loader.
4. In the **Description** field, specify a description of the configuration. The description can be different than the description of the original configuration. Valid values are 1 - 72 characters.
5. Press Enter. The Manage Multiple Configurations of a Product panel is displayed, and the restored configuration is in the list.

### Defining parameters

To customize Db2 Analytics Accelerator Loader, you must define Db2 Analytics Accelerator Loader parameters, LPAR parameters, and Db2 parameters, if your customization requires Db2 entries.

### About this task

You must define the Db2 Analytics Accelerator Loader parameters first for the following reasons:

• If you ran the Db2 Analytics Accelerator Loader Discover EXEC, you must review the values that were discovered.

• If you select optional tasks and steps on the Product Parameters panel that affect the Db2 entry on which you will customize Db2 Analytics Accelerator Loader, additional parameters might be displayed on the DB2 Parameters panel.

• If other steps must be completed in a specific sequence, customization notes on the Product Parameters panel will display the correct sequence.

### Defining Db2 Analytics Accelerator Loader parameters

Db2 Analytics Accelerator Loader parameters are specific to Db2 Analytics Accelerator Loader.

### About this task

If you ran the Db2 Analytics Accelerator Loader Discover EXEC, you must review the parameters that were discovered.
Procedure

1. Specify E next to the **Product parameters** field on the Customizer Workplace panel, and press Enter. The Product Parameters panel is displayed, as shown in the following figure. If other steps must be completed in a specific sequence before you define the Db2 Analytics Accelerator Loader parameters, a note labeled **Important** will display the correct sequence on this panel.
You can use the following primary commands on this panel:

**SAVE**  Saves the specified product or component parameter values.

**VERIFY / VERIFYOFF**

Use the VERIFY and VERIFYOFF commands to turn on and off parameter verification of product or component parameters. Before you
can generate customization jobs, you must verify that all required parameters are set to a valid value. The product or component parameter status of Verify Values on the Customize Workplace panel indicates that the values have not been verified.

Enter these commands either by typing them in the command field and pressing Enter or by positioning the cursor on the command and pressing Enter. When VERIFY is active, VERIFYOFF is displayed so that you can toggle between the two states. By default, verification is turned on when you display the DB2 Parameters panel, and the verification state is reset to VERIFY every time you exit the Customization Workplace panel by pressing PF3.

Turning verification off is useful when you need to exit the panel before you have entered all of the required parameters, but you want to save the parameters that you have specified. When you disable verification, it is disabled only for the Product or Component Parameters Values panel.

2. Select any required tasks and steps, and specify values for any parameters. After you select a task or step with a slash (/), put the cursor in the selected field and press Enter. If tasks, steps, and parameters are required, they are preselected with a slash (/). Otherwise, they are not preselected.

All of the required parameters have default values, which you can either accept or change.

Tips:
- In the command line, specify the KEYS command, and map EXPAND to one of the function keys.
- For a detailed description of all input fields, put the cursor in the field, and press F1 or the key that is mapped to Help.
- The following elements apply to specific fields:
  - Add is displayed when parameters can have multiple values but currently have only one value. To specify multiple values in these fields, place the cursor on Add, and press Enter. Use the displayed panel to add or delete additional values.
  - List is displayed when the complete list of valid values for the fields is too long to be displayed on the panel. To see the complete list of values, place the cursor on List, and press F1 or the key that is mapped to Help.
  - More is displayed when input fields contain multiple values. To see all of the values in the field, place the cursor on More, and press Enter.

3. Optional: Select other tasks and steps with a slash (/) and press Enter to activate the input fields. Either accept or change the default values that are displayed.

4. Press End to save your changes and exit, or issue the SAVE command to save your changes and stay on the Product Parameters panel.

Results

The Customizer Workplace panel is displayed, and the status of the product parameters is Ready to Customize.
What to do next

If the status of other parameters on the Customizer Workplace panel is Incomplete, Verify Values, or Discovered, edit these parameters.

Related tasks:

“Defining LPAR parameters”

LPAR parameters are parameters on the local LPAR that are required to customize Db2 Analytics Accelerator Loader.

You can use the following primary commands on this panel:

SAVE Saves the specified product or component parameter values.

VERIFY / VERIFYOFF

Use the VERIFY and VERIFYOFF commands to turn on and off parameter verification of LPAR parameters. Before you can generate customization jobs, you must verify that all required parameters are set to a valid value. The LPAR parameter status of Verify Values on the Customize Workplace panel indicates that the values have not been verified.

Enter these commands either by typing them in the command field and pressing Enter or by positioning the cursor on the command and pressing Enter. When VERIFY is active, VERIFYOFF is displayed so that you can toggle between the two states. By default, verification is turned on when you display the LPAR Parameters panel, and the verification state is reset to VERIFY every time you exit the Customization Workplace panel by pressing PF3.
Turning verification off is useful when you need to exit the panel before you have entered all of the required parameters, but you want to save the parameters that you have specified. When you disable verification, it is disabled only for the LPAR Parameters Values panel.

2. Specify values for all required parameters that are displayed. Many parameters have default values, which you can either accept or change.

Tips:
- In the command line, specify the KEYS command, and map EXPAND to one of the function keys.
- For a detailed description of all input fields, put the cursor in the field, and press F1 or the key that is mapped to Help.
- The following elements apply to specific fields:
  - **Add** is displayed when parameters can have multiple values but currently have only one value. To specify multiple values in these fields, place the cursor on **Add**, and press Enter. Use the displayed panel to add or delete additional values.
  - **List** is displayed when the complete list of valid values for the fields is too long to be displayed on the panel. To see the complete list of values, place the cursor on **List**, and press F1 or the key that is mapped to Help.
  - **More** is displayed when input fields contains multiple values. To see all of the values in the field, place the cursor on **More**, and press Enter.

The following LPAR parameters can contain 1 - 64 values:
- LPAR macro library
- Message library
- Panel library
- Skeleton library
- ISPF table input library
- ISPF user profile library
- File tailoring output library
- Link list library
- Command procedures library
- Macro library
- Link-edit library
- Load library
- Started task library name

3. Press End to save your changes and exit, or issue the SAVE command to save your changes and stay on the same panel.

Results

The Customizer Workplace panel is displayed, and the status of the LPAR parameters is Ready to Customize.

What to do next

If the status of other parameters on the Customizer Workplace panel is Incomplete, Verify Values, or Discovered, edit these parameters.

Related tasks:

---

**Figure 21. The DB2 Parameters panel**

You can use the following primary commands on this panel:

**SAVE** Saves the specified product or component parameter values.

**VERIFY / VERIFYOFF**

Use the VERIFY and VERIFYOFF commands to turn on and off parameter verification of Db2 parameters. Before you can generate customization jobs, you must verify that all required parameters are set to a valid value. The Db2 parameter status of Verify Values on the Customize Workplace panel indicates that the values have not been verified.
Enter these commands either by typing them in the command field and pressing Enter or by positioning the cursor on the command and pressing Enter. When VERIFY is active, VERIFYOFF is displayed so that you can toggle between the two states. By default, verification is turned on when you display the DB2 Parameters panel, and the verification state is reset to VERIFY every time you exit the Customization Workplace panel by pressing PF3.

Turning verification off is useful when you need to exit the panel before you have entered all of the required parameters, but you want to save the parameters that you have specified. When you disable verification, it is disabled only for the DB2 Parameters Values panel.

2. Specify values for all parameters that are displayed.

Tips:

- In the command line, specify the KEYS command, and map EXPAND to one of the function keys.
- For a detailed description of all input fields, put the cursor in the field, and press F1 or the key that is mapped to Help.
- The following elements apply to specific fields:
  - Add is displayed when parameters can have multiple values but currently have only one value. To specify multiple values in these fields, place the cursor on Add, and press Enter. Use the displayed panel to add or delete additional values.
  - List is displayed when the complete list of valid values for the fields is too long to be displayed on the panel. To see the complete list of values, place the cursor on List, and press F1 or the key that is mapped to Help.
  - More is displayed when input fields contains multiple values. To see all of the values in the field, place the cursor on More, and press Enter.

Many parameters have default values, which you can either accept or change.

3. Press End to save your changes and exit, or issue the SAVE command to save your changes and stay on the same panel.

Results

The status of the Db2 entries that you selected on the Customizer Workplace panel is Ready to Customize.

What to do next

If the status of other parameters on the Customizer Workplace panel is Incomplete, Verify Values, or Discovered, edit these parameters.

Related tasks:

- “Defining Db2 Analytics Accelerator Loader parameters” on page 98
Db2 Analytics Accelerator Loader parameters are specific to Db2 Analytics Accelerator Loader.

- “Defining LPAR parameters” on page 102
LPAR parameters are parameters on the local LPAR that are required to customize Db2 Analytics Accelerator Loader.
Generating customization jobs

To generate customization jobs for Db2 Analytics Accelerator Loader and any associated Db2 entries, issue the GENERATEALL command, or select one or more Db2 entries on which to customize Db2 Analytics Accelerator Loader.

Procedure

Generate the customization jobs by using one of the following methods.

- If you want to generate customization jobs at the product level and for any associated Db2 entries, issue the GENERATEALL command, and press Enter.
- If you want to generate customization jobs for specific Db2 entries, select the Db2 entries by specifying the 6 line command against them, and press Enter. The available Db2 entries are in the associated list in the Associated Db2 Entries and Parameter Status section.

Important: Regenerating customization jobs will replace any existing jobs, including jobs that you might have manually modified after they were generated.

Results

If the status is Incomplete or Discovered for Db2 Analytics Accelerator Loader parameters, LPAR parameters, or Db2 parameters, Tools Customizer automatically starts an editing session for the types of parameters that are required. The session continues until the panel for each type of required parameter has been displayed.

What to do next

If an automatic editing session is started, accept the displayed parameter values or define values for the required types of parameters, select optional parameters, tasks, or steps for your environment, and save the parameter values. Otherwise, the customization jobs are generated, and you can submit them.

Tip: If the customization jobs are generated, but you are not ready to submit them, you can see them later by issuing the JOBLIST command on the Customizer Workplace panel. The JOBLIST command displays the Finish Product Customization panel, which you can use to submit the jobs.

Submitting customization jobs

Submit the customization jobs to customize Db2 Analytics Accelerator Loader.

Before you begin

Ensure that the correct jobs are generated.

About this task

The following figure shows part of the Finish Product Customization panel. The table on this panel shows the customization jobs that are generated by Tools Customizer. They are grouped by job sequence number.
For a first-time customization, submit the jobs in the members in the order in which they apply to the DB2 entries. Otherwise, submit only the necessary jobs that were generated after changes were made. To submit jobs, browse the members and issue the TSO SUBMIT command.

The member-naming conventions depend on whether the customization jobs are for Db2 entries, and LPAR, or the product.

The `New` filed indicates if the job member is newly created/updated. It is either YES or NO. YES indicates the job member is newly created or updated, and it needs to be submitted for customization. NO indicates the job member is not newly created/updated, it does not need to be submitted for customization.

### Customization jobs for Db2 entries

The members use the following naming convention:

```
<job_sequence_number><job_ID><configuration_ID><DB2_entry_ID>
```

where

- **job_sequence_number**
  
  Two alphanumeric characters, A0 - Z9, that Tools Customizer assigns to a customization job. The number for the first template in the sequence is A0, the number for the second template is A1, and so on.

- **job_ID**
  
  Characters 4 - 5 of the template name, if the template name contains five or more characters. Otherwise, only character 4 is

Figure 22. The Finish Product Customization panel

The member-naming conventions depend on whether the customization jobs are for Db2 entries, and LPAR, or the product.
used. For example, for the XYZCRE8I template, the job ID is CR. For the XYZC template, the job ID is C. Db2 Analytics Accelerator Loader assigns the template name.

**configuration_ID**
Two alphanumeric characters, AA - 99, that Tools Customizer assigns to a configuration.

**DB2_entry_ID**
Two alphanumeric characters, AA - 99, that Tools Customizer assigns to a Db2 entry.

For example, the XYZBNDDB2_entry_ID_1 and XYZBNDDB2_entry_ID_2 jobs are generated from the XYZBNDGR template, and the XYZADB2_entry_ID_1 and XYZADB2_entry_ID_2 jobs are generated from the XYZ4 template. If the jobs are generated on two Db2 entries for two configurations, the following member names are listed sequentially: A0BNAAAA, A0BNABAB, A14AAAA, A14ABAB.

**Customization jobs for an LPAR or the product**
The members use the following naming convention:

```
<job_sequence_number><job_ID>
```

where

**job_sequence_number**
Two alphanumeric characters, A0 - Z9, that Tools Customizer assigns to a customization job. The number for the first template in the sequence is A0, the number for the second template is A1, and so on.

**job_ID**
Characters 4 - 8 of the template name, if the template name contains five or more characters. Otherwise, only character 4 is used. For example, for the XYZMAKE template, the job ID is MAKE. For the XYZM template, the job ID is M. Db2 Analytics Accelerator Loader assigns the template name, and it is displayed in the Template column.

For example, the XYZBNDGR job is generated from the XYZBNDGR template, and the XYZ4 job is generated from the XYZ4 template. The following member names are listed sequentially: A0BNDGR, A14.

**Customization jobs for configurations**
The members use the following naming convention:

```
<job_sequence_number><configuration_ID><DB2_entry_ID>
```

where

**job_sequence_number**
Two alphanumeric characters, A0 - Z9, that Tools Customizer assigns to a customization job. The number for the first template in the sequence is A0, the number for the second template is A1, and so on.

**configuration_ID**
Two alphanumeric characters, AA - 99, that Tools Customizer assigns to a configuration.
**DB2_entry_ID**

Two alphanumeric characters, AA - 99, that Tools Customizer assigns to a Db2 entry.

For example, for two configurations on the same Db2 entry, the XYZBIND job is generated from the XYZBINDGR template, and the XYZMAKE9 job is generated from the XYZ4 template. The following member names are listed sequentially: A0AAAA, A1ABAA.

**Procedure**

1. Submit the generated customization jobs by following the process that you use in your environment or by using the following method:
   a. Specify B or E against a customization job or the product customization library, and press Enter. An ISPF browsing or editing session is started.
   b. Browse the customization job or each member in the library to ensure that the information is correct.
   c. Run the TSO SUBMIT command.
2. Press End.

**Results**

Db2 Analytics Accelerator Loader is customized, and the Customizer Workplace panel is displayed. The status is Customized for the Db2 entries on which Db2 Analytics Accelerator Loader was customized.

**What to do next**

You can generate more customization jobs for other Db2 entries, view a list of customization jobs that you previously generated, or recustomize Db2 Analytics Accelerator Loader.

**Browsing parameters**

You can browse the product or component parameters, the LPAR parameters, and the Db2 parameters in read-only mode.

**Procedure**

1. On the Customizer Workplace panel, specify B next to the Product parameters field, the LPAR parameters field, or the Db2 entry that you want to browse, and press Enter. The panel that corresponds to your specification is displayed.
2. Press End to exit.

**Copying Db2 entries**

You can copy associated and not associated Db2 entries to other Db2 entries or to new Db2 entries.

**About this task**

Go to the step that applies to your environment:

- To copy an associated Db2 entry to another associated Db2 entry or to an entry that is not associated, go to step 1.
- To copy an associated Db2 entry to a new entry, go to step 2.
- To copy a Db2 entry that is not associated to a new entry, go to step 3.
Procedure

1. To copy an associated Db2 entry to another associated Db2 entry or to an entry that is not associated, complete the following steps:
   a. Specify C against a Db2 entry in the associated list of Db2 entries on the Customizer Workplace panel, and press Enter. The Copy Associated DB2 Entry panel is displayed.
   b. Select one or more Db2 entries to which information will be copied by specifying the / line command, and press Enter. The Associated column indicates whether the Db2 entry is associated.
   
   Tip: To copy information into all of the Db2 Entries in the list, issue the SELECTALL primary command, and press Enter. The Copy DB2 Parameter Values panel is displayed.
   
   c. Specify an option for copying common and product-specific Db2 parameter values. Common Db2 parameter values apply to all Db2 entries for all products that you have customized by using Tools Customizer. Product-specific Db2 parameter values apply only to the product that you are currently customizing.
      • To copy the common Db2 parameter values and the product-specific Db2 parameter values, specify option 1, and press Enter.
      • To copy only the product-specified Db2 parameter values, specify option 2, and press Enter.
   
   In some cases, the Db2 parameter values might contain the Db2 subsystem ID as an isolated qualifier in data set names. For example, in the DB01.DB01TEST.DB01.SANLOAD, data set name, the DB01 subsystem ID is isolated in the first and third qualifiers but is not isolated in the second qualifier. When the Db2 subsystem ID is an isolated qualifier in data set names, the Change DB2 Subsystem ID in DB2 Parameter Values panel is displayed. Otherwise, the Customizer Workplace panel is displayed.
   d. If the Change DB2 Subsystem ID in DB2 Parameter Values panel is displayed, specify an option for changing the subsystem IDs. Otherwise, skip this step.
      • To change the subsystem ID in isolated qualifiers in data set names, specify option 1, and press Enter.
      • To use the same subsystem ID in all values, specify option 2, and press Enter.
   
   The Customizer Workplace panel is displayed with the copied associated entry in the list.

2. To copy an associated Db2 entry to a new entry, complete the following steps:
   a. Specify C against a Db2 entry in the associated list of Db2 entries on the Customizer Workplace panel, and press Enter. The Copy Associated DB2 Entry panel is displayed.
   b. Issue the CREATE command. The Create DB2 Entries panel is displayed.
   c. Specify the SSID, the group attach name, or both in the appropriate columns for each new Db2 entry, and press Enter.
   
   Tip: To add rows for additional entries, specify the Innt line command, where n is the number of entries to be created, and press Enter. The Copy Associated DB2 Entry panel is displayed with the new entries in the list. The new entries are preselected.
d. Press Enter to complete the copy process. The Customizer Workplace panel is displayed with the copied entries in the list.

3. To copy a Db2 entry that is not associated to a new entry, complete the following steps:
   a. Issue the ASSOCIATE command on the Customizer Workplace panel. The Associate DB2 Entry for Product panel is displayed.
   b. Select one or more Db2 entries by specifying the / line command, and press Enter. The Copy a DB2 Entry panel is displayed.
   c. Specify the SSID, the group attach name, or both in the appropriate columns for the new Db2 entry, and press Enter. The Associate DB2 Entry for product panel is displayed with the copied entry in the list.
   d. If you want to associate the copied entry, specify A against it, and press Enter. The Customizer Workplace panel is displayed with the copied entries in the list.

What to do next

Edit any of the parameters or generate the jobs.

Related concepts:

"Tools Customizer terminology“ on page 959
Tools Customizer uses several unique terms that you should be familiar with before you begin to use Tools Customizer.

Removing Db2 entries

You can remove Db2 entries from the associated list.

About this task

When you remove Db2 entries from the associated list, any customization jobs for the entries are removed from the list of jobs on the Finish Product Customization panel, and they are deleted.

Procedure

On the Customizer Workplace panel, specify R next to one or more Db2 entries that you want to remove, and press Enter. The selected Db2 entries are removed from the associated list and added to the master list on the Associate DB2 Entry for Product panel, and the customization jobs are deleted.

Related concepts:

"Tools Customizer terminology“ on page 959
Tools Customizer uses several unique terms that you should be familiar with before you begin to use Tools Customizer.

Deleting Db2 entries

You can delete Db2 entries from the master list.

About this task

When you delete Db2 entries from the master list, any associations and all customization jobs for products that are customized on the entries will be deleted.
Procedure

1. On the Customizer Workplace panel, issue the ASSOCIATE command. The Associate DB2 Entry for Product panel is displayed.

2. Specify 0 next to one or more Db2 entries that you want to delete, and press Enter. If the entry is associated with any products, the Delete Associated DB2 Entry panel for the first Db2 entry that you selected is displayed. Otherwise, the Delete DB2 Entry panel is displayed.

3. To delete the Db2 entries, press Enter. If the Db2 entries are associated with any products in the table on the Delete Associated DB2 Entry panel, any associations and all customization jobs for the products that are customized on it are deleted. Otherwise, only the Db2 entries are deleted. If you selected multiple Db2 entries to delete, the next Db2 entry that you selected is displayed on either the Delete Associated DB2 Entry panel or the Delete DB2 Entry panel. Otherwise, the Associate DB2 Entry for Product panel is displayed.

What to do next

If you selected multiple Db2 entries to delete, repeat step 3 until all selected entries are deleted. Then, continue the customization process.

Displaying customization jobs

You can view a list of the members that contain the customization jobs before or after you submit the jobs.

About this task

The customization jobs that you generate for one Db2 entry are also displayed when you customize Db2 Analytics Accelerator Loader for another Db2 entry later.

Procedure

On the Customizer Workplace panel, issue the JOBLIST command. The Finish Product Customization panel is displayed. This panel shows the list of jobs that you have previously generated. They are grouped by job sequence number. Use this panel to browse or edit the generated jobs before you submit them.

Maintaining customization jobs

Instead of deleting customization jobs outside of Tools Customizer, you can maintain the correct jobs for Db2 Analytics Accelerator Loader by completing the steps for recustomization.

About this task

You cannot delete or rename customization jobs from the customization library by starting an ISPF browse or edit session from the Finish Product Customization panel. If you try to delete customization jobs by using this method, the CCQC034S message is issued. If you try to rename customization jobs, the CCQC035S message is issued.

If you delete or rename customization jobs from the customization library by using ISPF outside of Tools Customizer, Tools Customizer will not recognize that the jobs were deleted, and the Finish Product Customization panel will still display them. If you browse or edit jobs that were deleted from the library outside of Tools Customizer, the CCQC027S message is issued.
Procedure

To maintain the correct customization jobs in the customization library, complete the steps for recustomization.

Using Tools Customizer in a multiple-LPAR environment

Currently, Tools Customizer supports only the local LPAR; however, you can propagate customizations to additional LPARs by using either of two different methods.

About this task

In a multiple-LPAR environment, Tools Customizer identifies the LPAR to which you are logged on. Tools Customizer uses this LPAR name for several different parameter settings, one of which is the data store. When you use the data store during the customization of Db2 Analytics Accelerator Loader that is on a different LPAR, Tools Customizer issues message CCQD586S, which indicates that the product has already been customized based on values from the data store on the first LPAR. This message is issued to prevent the data store from becoming corrupted.

This behavior occurs in the following conditions:

- Tools Customizer is installed on a DASD device that is shared by multiple LPARs.
- After a product is customized by using Tools Customizer, the data store is copied to another LPAR.

Procedure

To customize products running against a Db2 subsystem on an LPAR where Tools Customizer is not installed, consider using one of the following methods:

Install one instance of Tools Customizer on one LPAR

If you intend to reuse the customization values for all the instances of your products on all LPARs, use this method.

1. Associate all the Db2 entries in this one instance of Tools Customizer.
   The LPARs on which the Db2 subsystems reside do not matter.
2. Generate the customization jobs for each Db2 entry.
3. Copy the generated customization jobs to the LPAR to run against the specific Db2 entries. Some LPAR-specific edits might be required. You can make these edits in the customized jobs that you copied. Note that this situation is one of the few situations where you might need to make manual changes to the jobs that are customized by Tools Customizer.

Install one instance of Tools Customizer on each LPAR

If you do not want to reuse previous customization values and you want to start new customizations, use this method.

Important: This method will likely not be the preferred approach for most organizations because most organizations tend to use similar or identical customization values for each product instance on all LPARs.
Changing the BIND JCL to ENCODING(500) (optional)

By default, the Accelerator Loader plan and packages are bound using the character set ENCODING(EBCDIC). If your Db2 subsystem is defined with an EBCDIC code page in which the quotation character is not X'7F', you must change the BIND job to bind all plans and packages with ENCODING(500).

In the customized BIND JCL, run a CHANGE ALL command to change the character set from ENCODING(EBCDIC) to ENCODING(500).

APF-authorizing the load libraries (required)

Before you run the customization jobs, APF-authorize the product load libraries.

About this task

This task makes the libraries available when you execute the customization jobs.

Procedure

Include the following libraries in the system APF-authorized list:

- hlq.SHLOLOAD
- hlq.SHOLOAD
- hlq.SFECLOAD
- hlq.SHLVRPC (Any data set allocated to ddname HLVRPCLB needs to be APF-authorized.)

The APF authorize can be done dynamically using the SETPROG APF command. For example, issue the following z/OS operator command:

```zshell
SETPROG APF,ADD,DSNAME=hlq.SHLOLOAD,VOLUME=volser
```

Where volser is the volume serial number of the DASD device where the load library resides. You can also make the authorizations permanent for the next IPL (initial program load) by updating the appropriate system PARMLIB member. Contact your system administrator if you encounter difficulties starting Db2 Analytics Accelerator Loader.

Copying the started task PROC (required)

Copy the Accelerator Loader started task PROC and server PROC to your system PROCLIB to make the started task address space available to the user interfaces for the product.

About this task

Run the job members that are associated with templates HLOSTCJ and HLOHLVS. The jobs are located in the data set that is specified in the Product Customization Library field on the Tools Customizer Finish Product Customization panel. These jobs create the hloidPROC member in the hlq.SHOLOAMP library and the hlvidPROC member in the hlq.SHLVSAMP library, where hloid and hlvid represent the names of the Accelerator Loader and Accelerator Loader server started tasks that were customized by using Tools Customizer.

These jobs are created when both of the following criteria are met:
• On the DB2 Parameters panel, the subsystem for which you are generating JCL is identified as the primary subsystem.
• You selected the Tools Customizer subtasks Create PROC, PLCY, and other SAMPLIB members and Create the server.

Procedure
1. Copy the hlloidPROC member that is created in the hlq.SHLOSAMP library to a member in the system PROCLIB.
2. Copy the hlloidPROC member that is created in the hlq.SHLVVSAMP library to a member in the system PROCLIB.
3. In the EXEC statement of both PROCs, ensure that you have specified the following settings:
   • REGION=0M to avoid storage problems.
   • TIME=1440 in hlloidPROC to allow the product to run for an unlimited amount of time.
4. Ensure that the STEPLIB and SVCLIB data sets are APF-authorized.
5. Ensure that all data sets that the PROCs reference are APF-authorized.
6. If you plan to use Accelerator Loader on multiple Db2 subsystems that have different Db2 versions, ensure that the STEPLIB concatenation of hlloidPROC specifies the earliest Db2 version as the DSNLOAD library. Otherwise, connection problems might occur when you attempt to use the product on Db2 subsystems other than the primary subsystem that contains the audit and logging tables.
7. If you plan to use the high availability load utility (HALOAD) or the backup utility, ensure that the product load library is in the JOBLIB or STEPLIB.

Copying the DSNUTILF module (required)

This customization step is required for the Accelerator Loader started task hlloidPROC to perform DSNUTILB interception services.

About this task

When the DSNUTILF module is in the load library concatenation, the DSNUTILB program can operate normally even if the Accelerator Loader started task becomes unavailable.

Procedure
1. Copy the DSNUTILF load module into one of the APF-authorized libraries in the STEPLIB or JOBLIB concatenation of the Db2 LOAD utility jobs.
2. Optional: Leave the DSNUTILF module in the Accelerator Loader LOAD library, and add it to the STEPLIB or JOBLIB concatenation of the Db2 LOAD utility jobs.

Setting up the WLM application environment (required)

Perform required steps to configure the WLM application environment for Accelerator Loader.

The customization steps depend on the Analytics Accelerator version. See the following topics:
• “Using Analytics Accelerator V7.1.1, or earlier” on page 117
• “Using Analytics Accelerator V7.1.2 through V7.1.6”
• “Using Analytics Accelerator V7.1.7, or later” on page 118

Using Analytics Accelerator V7.1.1, or earlier

Perform required steps to configure the WLM application environment when using Analytics Accelerator V7.1.1, or earlier.

About this task

This customization step is required for the Accelerator Loader started task to perform DSNUTILB interception services. An additional step is provided for using parallelism in Accelerator Loader.

Procedure

1. Place the following SHLOLOAD modules in the WLM STEPLIB concatenation for the WLM application environment for the Db2 stored procedure SYSPROC.DSNUTILU:
   - DSNUTILF
   - HLOPIPE

   Note: If Accelerator Loader and IBM Db2 Utilities Enhancement Tool must coexist at the same time in the same environment, concatenate the Accelerator Loader load library before the Db2 UET load library. This concatenation order ensures that Accelerator Loader intercepts DSNUTILB only when loading the IBM Db2 Analytics Accelerator for z/OS and Db2 UET intercepts DSNUTILB for other appropriate processing.

2. Optional: Leave the DSNUTILF in the module in the Accelerator Loader load library and add it to the STEPLIB or JOBLIB concatenation of the WLM application environment.

3. Optional: To use parallelism in Accelerator Loader, ensure that the WLM environment that runs DSNUTILU is configured for WLM management of the DSNUTILU server address space, which allows multiple DSNUTILU server address spaces to be started as needed per system. For more information, see “WLM requirements for Accelerator Loader” on page 34.

Using Analytics Accelerator V7.1.2 through V7.1.6

Perform required steps to configure the WLM application environment when using Analytics Accelerator V7.1.2 through V7.1.6.

Before you begin

The following version of the IBM Db2 Analytics Accelerator for z/OS is required:

• Version 7.1.2 (5697-DA7)

   APAR PI98213 (PTFs UI56371, UI56372 and UI56373): IBM DB2 ANALYTICS ACCELERATOR FOR Z/OS VERSION 7 GA UPDATE #2

About this task

Accelerator Loader supports the Analytics Accelerator V7.1.2 interface to the SYSPROC.ACCEL_LOAD_TABLES stored procedure (SP level 66). This interface bypasses the running of the UNLOAD utility and the intercept in the DSNUTILU WLM address space for Analytics Accelerator V7.1.2, or later.
Restrictions: When using Analytics Accelerator V7.1.2 through V7.1.6, the HALOAD utility requires the intercept in the DSNUTILU WLM address space, as do any Accelerator Loader jobs running against an Analytics Accelerator appliance prior to the V7.1.2 release.

To use the Analytics Accelerator V7.1.2 interface, you must concatenate the Accelerator Loader product load library in the STEPLIB of the Db2 allied WLM environment that runs the SYSPROC.ACCEL_LOAD_TABLES stored procedure, as described in the following procedure.

Procedure
1. Verify that the following APAR has been applied:
   APAR PI98213 (PTFs UI56371, UI56372 and UI56373)

   Note: The SYSPROC.ACCEL_LOAD_TABLES stored procedure should be at SP level 66 or later. To determine the Analytics Accelerator stored procedure level, use the following SQL:
   SELECT DSNAQT.ACCEL_GETVERSION() FROM SYSIBM.SYSDUMMY1;

2. Concatenate the APF-authorized Accelerator Loader product load library in the STEPLIB statement for the startup JCL job for the appropriate WLM environment, as follows:
   • For IDAA_ONLY, IDAA_DUAL, IDAA_CONSISTENT_LOAD, and IDAA_LOAD_IC load jobs, concatenate the Accelerator Loader load library in the startup JCL job for the WLM environment that runs SYSPROC.ACCEL_LOAD_TABLES.
   • For the HALOAD utility, concatenate the Accelerator Loader load library in the startup JCL job for the WLM environment that runs DSNUTILU.

   Note: For any accelerators that are at a level prior to V7.1.2, for all Accelerator Loader jobs, you must concatenate the APF-authorized Accelerator Loader product load library in the STEPLIB statement for the WLM environment that runs DSNUTILU.

3. Rebind Accelerator Loader packages and plans.

Using Analytics Accelerator V7.1.7, or later
Perform required steps to configure the WLM application environment when using Analytics Accelerator V7.1.7, or later.

Before you begin

The following version of the IBM Db2 Analytics Accelerator for z/OS is required:
• Version 7.1.7 (5697-DA7)
   APAR PH10050 (PTF UI62449, UI62450, or UI62451): IBM DB2 ANALYTICS ACCELERATOR FOR Z/OS VERSION 7 GA UPDATE #7

About this task
To use Accelerator Loader with Analytics Accelerator V7.1.7, you must concatenate the Accelerator Loader product load library in the STEPLIB of the Db2 allied WLM environment that runs the SYSPROC.ACCEL_LOAD_TABLES stored procedure.

Note: The high availability load (HALOAD) utility can load multiple accelerators from a single Db2 table. The target accelerators do not have to be at the same
version or maintenance level. If you will be loading to multiple accelerators using the HALOAD utility and any of the target accelerators are at a version prior to V7.1.7, you must also concatenate the APF-authorized Accelerator Loader product load library in the STEPLIB statement for the startup JCL job for the WLM environment that runs DSNUTILU.

**Procedure**

1. Verify that the following APAR has been applied:
   - APAR PH10050 (PTF UI62449, UI62450, or UI62451)
2. Concatenate the APF-authorized Accelerator Loader product load library in the STEPLIB statement for the startup JCL job for the WLM environment that runs SYSPROC.ACCEL_LOAD_TABLES.
3. Optional: If loading to multiple accelerators using the HALOAD utility and any of the target accelerators are at a version prior to V7.1.7, concatenate the APF-authorized Accelerator Loader product load library in the STEPLIB statement for the startup JCL job for the WLM environment that runs DSNUTILU.
4. Rebind Accelerator Loader packages and plans.

**Starting the started task (required)**

Start the Accelerator Loader started tasks so that you can begin using the product interfaces.

**About this task**

The variable `hlostc` in the command represents the member name of the Accelerator Loader PROC in the system PROCLIB.

Tools Customizer generated the started task name based on the value that you specified in the Tools Customizer field **Create the Started Task and its components**, and then inserted that name in the started task PROC. If you changed the started task name in the PROC, make sure that you use that new name in the `Start` command.

**Procedure**

Start the started task by using the z/OS console or the SDSF interface.

- From the z/OS console, issue the following operator command:
  ```
  S hlostc
  ```
- From the SDSF interface, issue the following command, including the forward slash:
  ```
  /S hlostc
  ```

**Required naming conventions**

You must follow the Accelerator Loader server naming conventions when configuring the server subsystem ID and the server initialization member.

The server subsystem name must follow the pattern `xLVy`, where `x` is any alphabetic character A-Z and `y` is any alphanumeric character A-Z or 0-9.
Depending on what you name the server subsystem, the server initialization member must follow the same naming convention as the server subsystem name, for example, xLVyIN00.

**Note:** The default server naming conventions used throughout this guide are hlvid for the server subsystem name and hlvidIN00 for the server initialization member.

---

### Configuring support for code pages and DBCS

You can configure the server to support Japanese code pages and double-byte character sets (DBCS).

**About this task**

To support different code pages and double-byte character sets, you must manually customize the server initialization member.

**Procedure**

1. In data set hlq.SHVEXEC, locate member hlvidIN00, where hlvid represents the name of the Accelerator Loader server started task that was customized by using Tools Customizer.
2. In the member, locate the DEFINE DATABASE statement for your subsystem, and verify that the CCSID value is set correctly for the subsystem.
3. Locate the comment Set CCSID for non-DB2 data, as shown in the following example:

   ```
   /*-------------------------------------*/
   /* Set CCSID for non-DB2 data */
   /*-------------------------------------*/
   
   if DoThis then
     do
       "MODIFY PARM NAME(SQLENGDFLTCCSID) VALUE(1047)"
     enddo
   endif
   ```
4. Change DontDoThis to DoThis to enable the parameters.
5. Update the following parameter:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Valid values</th>
</tr>
</thead>
<tbody>
<tr>
<td>SQLENGDFLTCCSID</td>
<td>Specifies the CCSID to use for SQL engine tables. All host tables except for Db2 are assumed to be stored in this CCSID. Where possible, this CCSID should match the client CCSID used when connecting.</td>
<td>CCSID value</td>
</tr>
</tbody>
</table>

   Sample values:
   - 1047 (LATIN OPEN SYS EB)
   - 931 (JAPAN MIX EBCDIC)
   - 1390 (JAPAN MIX EBCDIC)

---

### Starting and stopping the server (required)

The Accelerator Loader server runs as a z/OS started task. Under normal circumstances, the server starts at system startup and stops before the system shuts down.
Before you begin

Ensure that you have the privileges that are described in “Authorization requirements for the Accelerator Loader server” on page 32 and “Authorization requirements to access data sources” on page 33.

Procedure

1. To start the server use the following console command: $ hlvid
   Where hlvid is the name you gave the Accelerator Loader server during customization.

2. If you use an automation package to start the system, associate the START command with the VTAM® initialization complete message (IST020I), the TCP/IP initialization complete message (EZB6473I), or both messages.

3. To verify that the startup is successful, look for the following entries in the server Job Entry Subsystem (JES) log.
   - SD74391I OE stack binding port 1200 to IP address 0.0.0.0
   - SD74391I OE stack binding port 1201 to IP address 0.0.0.0
   - SD74391I OE stack binding port 1202 to IP address 0.0.0.0

What to do next

To stop the server, issue the following command, where hlvid represents the name of the Accelerator Loader server started task that was customized by using Tools Customizer:

$p hlvid

If you issue a CANCEL command, all available connections terminate with an abend, and the server shuts down immediately.

Installing the Accelerator Loader studio (required)

Use the Accelerator Loader studio to load relational and non-relational data to the accelerator. The Accelerator Loader studio provides a single, enterprise view across all mainframe integration components and automatically discovers instances of the Accelerator Loader server running on the mainframe.

Before you begin

Accelerator Loader studio is available with Db2 Analytics Accelerator Loader. You install Accelerator Loader studio as a plug-in to IBM Data Studio or an equivalent Eclipse-based application.

Note: IBM Installation Manager is not supported.

Before installing the Accelerator Loader studio, verify that all installation prerequisites are met:

<table>
<thead>
<tr>
<th>System component</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported operating systems</td>
<td>• Windows 7, 8, 10</td>
</tr>
<tr>
<td></td>
<td>• Linux – Red Hat Enterprise Linux 6.7 or higher; Ubuntu 16 or higher</td>
</tr>
<tr>
<td></td>
<td>• macOS (Sierra)</td>
</tr>
</tbody>
</table>
## System component

<table>
<thead>
<tr>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>The Accelerator Loader server must be installed and configured on IBM z/OS.</td>
</tr>
<tr>
<td>Eclipse Kepler (4.3.x) or Luna (4.4.x) is required for Accelerator Loader studio. For Windows and Linux users, it is recommended to have IBM Data Studio 4.1.x installed on the client system. <strong>Note:</strong> Updating software from IBM Data Studio can require that you log in as an administrator.</td>
</tr>
<tr>
<td>Java 1.7 or 1.8 is required.</td>
</tr>
</tbody>
</table>

## About this task

You can install the Accelerator Loader plug-in into IBM Data Studio using either of the following methods:

- **Eclipse GUI installation.** Using this method, you can use the IBM Data Studio to install the Accelerator Loader plug-in. Member hlq.SHLVBIN(HLVBIN) provides the Accelerator Loader studio plug-in files. To perform the Eclipse GUI installation, you must transfer the HLVBIN file to a local workstation, rename the file, and then perform steps in the GUI to complete the installation.

- **Command-line installation.** Using this method, you can use a script-based mechanism for installing the Accelerator Loader plug-in into IBM Data Studio or any supported Eclipse from the command line. Member hlq.SHLVBIN(HLVBINS) provides the Accelerator Loader studio plug-in files as well as the installation scripts for Windows and Linux/Mac in zipped format. To perform the command-line installation, you must transfer the HLVBINS file to a local workstation, extract the contents, and then run the script.

Use the following procedure to perform either of the installation methods.
**Procedure**

Perform one of the following methods to install the Accelerator Loader plug-in:

- **Eclipse GUI installation:**
  1. Using File Transfer Protocol (FTP) in binary mode, perform a binary transfer of installation member `hlq.SHLVBIN(HLVBIN)` to a folder on your local workstation.
  2. Rename the file to `loader.zip`.
  3. From the IBM Data Studio, click **Help > Install New Software**, and then click **Add**.
  4. On the Add Repository dialog box, click **Archive**.
  5. Locate the `loader.zip` file and click **Open**.
  6. Enter the software file name, a name for the repository, and then click **OK**.
  7. Select the check box next to **Accelerator Loader** and click **Next**.
  8. Complete the remaining installation wizard steps, and then restart IBM Data Studio when prompted.

- **Command-line installation:**
  1. Using File Transfer Protocol (FTP) in binary mode, perform a binary transfer of installation member `hlq.SHLVBIN(HLVBINS)` to your local workstation, and unzip the contents.
  2. Ensure that your Eclipse application (for example, IBM Data Studio) is not running.
  3. Perform one of the following steps:
     - **For Windows:** From a DOS prompt, navigate to the folder where the contents were extracted, and execute the `install.bat` script, passing the location of your Eclipse as an argument as in the following example:
       ```% install.bat "C:\Program Files\IBM\DS4.1.2"
       ```
       **Note:** If no argument is specified, the script will prompt you for the location. When prompted by the script, the double quotation marks must not be specified. The double quotation marks should only be used if the path name contains space characters and is being specified as a command-line argument.
     - **For Linux/Mac:** From the shell, navigate to the directory where the contents were extracted, and execute the `install.sh` script, passing the location of your Eclipse as an argument as in the following example:
       ```#/install.sh /opt/ibm/DS4.1.2
       ```
       **Note:** If no argument is specified, the script will prompt you for the location.
  4. Start your Eclipse application (for example, IBM Data Studio).
  5. Optional: To confirm that the new plug-in installed successfully, select **Help > About IBM Data Studio**, and click **Installation Details**.
     The **Installation Details** dialog shows the **Installed Software** and includes a line item for the **Accelerator Loader** with version details.
  6. Optional: Delete the `.zip` file and the extracted contents from step 1.

**What to do next**

You can now open the Accelerator Loader perspective from IBM Data Studio.
Uninstalling the Accelerator Loader studio

Use the Workbench wizard to uninstall the Accelerator Loader studio from IBM Data Studio.

Procedure

1. Click Help > About, and then click Installation Details.
2. On the Installed Software tab, select Accelerator Loader and click Uninstall.
3. Verify your selection to uninstall and click Uninstall.
4. After successfully uninstalling the software, you are prompted to restart the Workbench. Click Yes.

Configuring access to data sources (required)

Configure the Accelerator Loader server to enable access to mainframe data sources.

Configuring access to data in Adabas

Set up access to data in Software AG Adabas databases by configuring the Accelerator Loader server and verifying access to the data.

Before you begin

The Accelerator Loader server must already be installed. Use these instructions to configure the Accelerator Loader server. The Adabas load library must be APF-authorized.

About this task

To access an Adabas database, the Accelerator Loader server started task and parameter file must be configured with information about the Adabas databases to which you want to connect. Customizing these members is done using Tools Customizer. No configuration changes are necessary to Adabas.

Procedure

1. Invoke Tools Customizer for z/OS.
2. Access the Product Parameters panel.
3. Under the task ‘Create the server and the server components’, select the steps Create the server and Create the server parameters, and provide values for the following fields:

<table>
<thead>
<tr>
<th>Step or parameter</th>
<th>Required?</th>
<th>Discovered?</th>
<th>Default</th>
<th>Your value</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADABAS load library</td>
<td>No</td>
<td>No</td>
<td>No default</td>
<td></td>
</tr>
<tr>
<td>Specifies the Adabas load library that the server uses to connect to the Adabas databases. If this value is defined, the server uses Adabas as a data source. If this value is not defined, the server does not use Adabas as a data source.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

4. Generate the customization jobs. The jobs are based on the HLOHLVS and HLOIN00 templates. For more information, see “Generating customization jobs” on page 107.
5. Submit the customization jobs. For more information, see “Submitting customization jobs” on page 107.

Configuring Adabas security
Configure security to access Adabas data at a DBID or file number level.

About this task
Securing Adabas files at a DBID or file number level requires the use of the following Accelerator Loader server parameters:

- RESOURCETYPE
- SQLVTRESOURCETYPE
- ADABASSECURITY

The following sample jobs for defining Adabas security-related definitions are provided in the hlq.SHLCNTL library:

- HLVRAADA for RACF

  Note: When using job HLVRAADA, make the following changes for file ID security:

  ```
  RDEFINE FACILITY ADAxxxxx.FILyyyyy UACC(NONE)
  PERMIT ADAxxxxx.FILyyyyy CLASS(FACILITY) ID(<USERID>)
  ACCESS(aaaa)
  SETROPTS REFRESH RACLIST(FACILITY)
  ```

  - Change xxxxx to the Adabas database ID.
  - Change yyyy to the Adabas file ID.

- HLVA2ADA for CA ACF2

- HLVTSADA for CA Top Secret

Procedure
1. In data set hlq.SHLEEXEC, locate member hlvidIN00, where hlvid represents the name of the Accelerator Loader server started task that was customized by using Tools Customizer.

2. Ensure the following settings are set in the HLVIN00 file:

```
MODIFY PARM NAME(RESOURCETYPE) VALUE(RAVZ)
MODIFY PARM NAME(SQLVTRESOURCETYPE) VALUE(RAVZ)
MODIFY PARM NAME(ADABASSECURITY) VALUE(YES)
```

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Parameter description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>RESOURCETYPE</td>
<td>RESOURCE TYPE FOR RESOURCE RULES</td>
<td>For RACF: RHLV</td>
</tr>
<tr>
<td></td>
<td>Specify the name of the security server's class (or resource type for ACF2) that is</td>
<td></td>
</tr>
<tr>
<td></td>
<td>used to perform resource access authorization checks. When using RACF, the</td>
<td></td>
</tr>
<tr>
<td></td>
<td>corresponding class name within RACF must start with R, for example, RHLV.</td>
<td></td>
</tr>
<tr>
<td>Parameter name</td>

<td>------------------------</td>
</tr>
<tr>
<td>SQLVTRESOURCETYPE</td>
<td>RESOURCE TYPE FOR SQL ACCESS TO VIRTUAL TABLES</td>
<td>For RACF: RHLV</td>
</tr>
<tr>
<td></td>
<td>Specify the name of the security server’s class (or resource type for ACF2) that is used to perform authorization checks for SQL access to metadata and virtual tables in the SQL Engine. When using RACF, the corresponding class name within RACF must start with R, for example, RHLV.</td>
<td></td>
</tr>
<tr>
<td>ADABASSECURITY</td>
<td>ADABAS SECURITY ACTIVATED</td>
<td>YES</td>
</tr>
<tr>
<td></td>
<td>Set this parameter to indicate that a resource rule is to be constructed consisting of DBID and file. <strong>Note:</strong> Both RESOURCETYPE and SQLVTRESOURCETYPE must be set in order for ADABASSECURITY to be in effect.</td>
<td></td>
</tr>
</tbody>
</table>

**Configuring access to data in relational database management systems**

Configure the Accelerator Loader server to enable access to data in relational database management systems (RDBMS).

**Topics:**
- “Configuring access to IBM Db2 for z/OS”
- “Configuring access to distributed databases” on page 142
- “Controlling display and access for native Db2 subsystems” on page 156

**Configuring access to IBM Db2 for z/OS**

Configure Db2 to be accessed by the Accelerator Loader studio.

**About this task**

Using DRDA might yield a lower total cost of ownership than RRSAF because DRDA allows a higher percentage of Db2 work to run in SRB mode and offloaded to a zIIP specialty engine.

If you have a zIIP specialty engine, use DRDA. If you do not have a zIIP specialty engine, use RRSAF.

Configure access to Db2 for z/OS databases as follows.

**Procedure**

1. “Configuring security” on page 127
2. Configure for DRDA (Distributed Relational Database Architecture) or for RRSAF (Resource Recovery Services attachment facility) access method.
   - If you are using a zIIP specialty engine, enable the RDBMS access method for DRDA:
     a. “Modifying the server configuration member for DRDA” on page 128
     b. “Configuring Db2 for DRDA” on page 133
• If you are not using a zIIP specialty engine, enable the RDBMS access method for RRSAF:
  a. “Modifying the server configuration member for RRSAF” on page 134
  b. “Configuring Db2 for RRSAF” on page 135

Configuring security:

Configure security to provide user access to Db2.

About this task

If the Db2 being accessed does not have the DSNZPARM DDF option TCPALVER set to either YES or CLIENT, then a passticket is needed for certain Db2 on z/OS DRDA operations. These operations may include:
• Refreshing in-memory metadata catalog information at server startup for Db2 on z/OS defined virtual tables. Catalog information is refreshed at every server startup by the Accelerator Loader server connecting to each Db2 where virtual tables have been defined.
• Any SQL statement coming from the dsClient interface, dsSpufi or application APIs using the dsClient interface. This may also include running administrative tasks in batch using dsClient that accesses Db2 on z/OS such as updating MapReduce information using the DRDARange command.

Procedure

1. This step only applies to Db2 for z/OS. To grant users access to the Db2 subsystem and to enable passticket logon processing, you must define one RACF PTKTDATA resource for each unique DRDA APPLNAME. To define each PTKTDATA resource, customize and run the appropriate job.
   • HLVRADB2 is for IBM Resource Access Control Facility (RACF) security.
   • HLVA2DB2 is for CA ACF2 (Access Control Facility) security.
   • HLVT5DB2 is for CA Top Secret Security (TSS).
2. Assign users READ authority.
   • For DRDA, assign users READ authority to the ssid.DIST profile.

Configuring the server started task JCL:

If you use Db2 z/OS, add the Db2 load library to the server started task JCL.

Before you begin

All LOAD library data sets allocated to the Accelerator Loader server in the server started task JCL must be APF-authorized.

Procedure

Edit the JCL in the hlq.SHLVCNTL(HLV1PROC) member to include in the PROC statement the DB2LIB parameter with the Db2 library name assigned, as shown in the following example:

```
DB2LIB='DSNX10'
```

The Db2 library must contain the Db2 interface modules, such as DSNALI and DSNHLLI, and must be in uppercase and enclosed in quotation marks.
Modifying the server configuration member for DRDA:

If you are using a zIIP specialty engine, enable the RDBMS access method for Distributed Relational Database Architecture (DRDA) in the server configuration member.

About this task

Configure the server to use Distributed Relational Database Architecture (DRDA) when accessing a RDBMS.

The server configuration member hlvidIN00 is in data set hlq.SHLVEXEC, where hlvid represents the name of the Accelerator Loader server started task that was customized using Tools Customizer.

Procedure

1. Verify that the Unicode translation of the Coded Character Set Identifier (CCSID) used in the DEFINE DATABASE statement and the CCSID used by the target RDBMS are defined for your z/OS environment.
   a. You should identify the CCSID of the RDBMS.
      For example, Oracle may use ccsid1. In your DEFINE DATABASE statement in the configuration member for the RDBMS you have ccsid2. For this example, where Oracle is using ccsid1, you need to verify that you have ccsid1-ccsid2 and ccsid2-ccsid1 defined in your Unicode translation table on z/OS using the command D UNI,ALL.
   b. If the entry is not present, you need to add the entry to your Unicode translation table and refresh.
      Please refer to the IBM z/OS documentation on how to add the entry.

      **Note:** As an alternative, the Unicode table can be appended within the server by using the following statement examples in the server configuration member:
      "DEFINE CONV SOURCE(ccsid1) TARGET(ccsid2) TECH(RE)"
      "DEFINE CONV SOURCE(ccsid2) TARGET(ccsid1) TECH(RE)"

2. In the hlvidIN00 member, locate the section that contains the comment Enable DRDA access to DB2 database subsystems.

3. Enable the DRDA parameters by changing the syntax if DontDoThis to if DoThis, and then set the DRDASKIPZSERVICES parameter to YES. The following example shows the section in the configuration member to enable:

```c
/*---------------------------------------------*/
/* Enable DRDA access to DB2 database subsystems */
/*---------------------------------------------*/
if DoThis then
do
   "MODIFY PARM NAME(TRACEOEDRADAR) VALUE(YES)"
   "MODIFY PARM NAME(CLIENTMUSTSELECTORDA) VALUE(NO)"
   "MODIFY PARM NAME(DRDASKIPWLMSETUP) VALUE(NO)"
   "MODIFY PARM NAME(DRDASKIPZSERVICES) VALUE(YES)"
```

The following table describes these parameters:
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Valid values</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRACEOEDRDARW</td>
<td>If set to YES (recommended), TCP/IP communications via DRDA are traced.</td>
<td>YES</td>
</tr>
<tr>
<td></td>
<td>If set to NO, DRDA receive and send operations are not traced.</td>
<td>NO</td>
</tr>
<tr>
<td></td>
<td>Default value.</td>
<td></td>
</tr>
<tr>
<td>CLIENTMUSTELECTDRDA</td>
<td>If set to YES, JDBC clients must explicitly opt in for DRDA to be used by setting the user parameter connection variable to ‘DRDA’. Note: JDBC clients can always opt out of DRDA processing by setting the user parameter to ‘NODRDA’.</td>
<td>YES</td>
</tr>
<tr>
<td></td>
<td>If set to NO, DRDA processing is used for access all configured RDBMSs.</td>
<td>NO</td>
</tr>
<tr>
<td>DRDASKIPWLMSETUP</td>
<td>If set to YES, WLM information is not collected and sent to DRDA during JDBC logon processing. If captured, the DRDA equivalent to SET_CLIENT_ID calls is issued after logon to establish these values on the DRDA connection. If not captured, the transmission that is used to set these WLM-related values is bypassed.</td>
<td>YES</td>
</tr>
<tr>
<td></td>
<td>If set to NO, the client user ID, application name, workstation name, and accounting token that were sent in the initial client buffer are collected and sent separately after logon processing to DRDA.</td>
<td>NO</td>
</tr>
<tr>
<td></td>
<td>Default value.</td>
<td></td>
</tr>
<tr>
<td>DRDAFORLOGGINGTASK</td>
<td>If set to YES, DRDA processing is used for the Db2 on z/OS logging subtask.</td>
<td>YES</td>
</tr>
<tr>
<td></td>
<td>If set to NO, SAF or RRSAF connections are used.</td>
<td>NO</td>
</tr>
<tr>
<td></td>
<td>Note: Pass ticket support must be enabled for the target DDF server. If passticket support is not configured, set the parameter to NO.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default value.</td>
<td></td>
</tr>
</tbody>
</table>
### Parameter Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Valid values</th>
</tr>
</thead>
<tbody>
<tr>
<td>DRDASKIPZSERVICES</td>
<td>Prevents DRDA from being used for z/Service Db2 processing.</td>
<td>YES</td>
</tr>
<tr>
<td></td>
<td>If set to YES, z/Services client tasks do not use DRDA processing for Db2 requests.</td>
<td>NO Default value.</td>
</tr>
<tr>
<td></td>
<td>If set to NO, DRDA will be used when configured for a particular Db2 connection.</td>
<td>Note: PassTicket support must be enabled for all target DDF servers.</td>
</tr>
</tbody>
</table>

4. If you will need to map DECFLOAT columns defined in Accelerator Loader server virtual tables to DOUBLE, add the following statements:

```sql
*MODIFY PARM NAME(SQLENGDECFLTODBL) VALUE(YES)*
*MODIFY PARM NAME(SQLENGDRDATYPECONV) VALUE(YES)*
```

The following table describes these parameters.

### Parameter Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Valid values</th>
</tr>
</thead>
<tbody>
<tr>
<td>SQLENGDECFLTODBL</td>
<td>Forces translation of DECFLOAT fields to DOUBLE (long hex float). You can override this option using a virtual table rule.</td>
<td>YES</td>
</tr>
<tr>
<td></td>
<td>This option will convert inbound DECFLOAT columns to DOUBLE (hex float long). The data will still be presented as DECFLOAT in the metadata. In a virtual table rule, set OPTBDRDF to Y to enable the conversion, or N to disable it. Any other value in OPTBDRDF will be ignored, and the global setting will be used.</td>
<td>NO Default value.</td>
</tr>
<tr>
<td>SQLENGDRDATYPECONV</td>
<td>Allow data type conversions for DRDA columns. This option allows the data type in the map to be different from the actual data type. When this occurs, the SQL engine will convert the data, and the metadata will reflect the data type in the map. You can override this option using a virtual table rule.</td>
<td>YES</td>
</tr>
<tr>
<td></td>
<td></td>
<td>NO Default value.</td>
</tr>
</tbody>
</table>
5. Define DRDA RDBMSs by entering a definition statement. Provide your local environment values for all the parameters. The following example shows the section in the configuration member to enable:

```
"DEFINE DATABASE TYPE(type_selection)" ,
 "NAME(name)" ,
 "LOCATION(location)" ,
 "DDFSTATUS(ENABLE)" ,
 "DOMAIN(your.domain.name)" ,
 "PORT(port)" ,
 "IPADDR(1.1.1.1)" ,
 "CCSID(37)" ,
 "APPLNAME(DSN1LU)" ,
 "IDLETIME(110)" ,
```

Where `type_selection` is either GROUP, MEMBER, or ZOSDRDA.

The previous example shows only a subset of the available parameters. The following table lists all available parameters for defining DDF endpoints:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Valid values</th>
</tr>
</thead>
<tbody>
<tr>
<td>APPLNAME</td>
<td>Application name. The APPLNAME used by the target endpoint for passticket generations. (Optional)</td>
<td>A valid value is 1 - 8 characters. If APPLNAME is not specified in the definition statement, no default value is provided and passticket access is disabled. Note: APPLNAME is not required when connecting from the JDBC driver.</td>
</tr>
<tr>
<td>AUTHTYPE</td>
<td>Authentication type. This can be either DES (Diffie Hellman Encryption Standard) or AES (Advanced Encryption Standard). When AUTHTYPE is not supplied, the default is DES. To force AES, the option must be added to the DEFINE DATABASE statement. Each server can be different in what is supported as to AES/DES. For this setting to have effect, you must specify a security mechanism (SECMEC) that requests encryption.</td>
<td>DES Diffie Hellman Encryption Standard (default value) AES Advanced Encryption Standard.</td>
</tr>
<tr>
<td>CCSID</td>
<td>Specify the EBCDIC single-byte application CCSID (Coded Character Set Identifier) configured for this RDBMS subsystem on the RDBMS installation panel DSNTIPF, option 7. (Optional)</td>
<td>Refer to the RDBMS vendor documentation for a list of valid CCSID.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Valid values</td>
</tr>
<tr>
<td>------------</td>
<td>------------------------------------------------------------------------------</td>
<td>-------------------------------</td>
</tr>
</tbody>
</table>
| DDFSTATUS  | The DDF activation status can be altered online by using the ISPF 4-Db2 dialog panels. | **ENABLE** To make this DDF definition active within Accelerator Loader server.  
**DISABLE** DDF endpoint is not used. |
|            |                                                                              |                               |
| DOMAIN     | The part of a network address that identifies it as belonging to a particular domain. | No default value.            |
| IPADDR     | Specify the dot-notation IPv4 address of the DDF endpoint.                  | If this parameter is not specified, the value 127.0.0.1 (local host) is the default.  
For group director definitions, use the DVIPA IP address of the group director.  
(Optional) |
| LOCATION   | For Db2: The Db2 location name.                                              | A valid value is a string 1 - 16 characters.  
For LUW: The LUW database.  
For Oracle: The Oracle SSID as defined to the Oracle Database Provider (Gateway)  
(Required) |
| NAME       | The database name as known to the server.                                   | A valid value consists of 1 - 4 characters. Clients use this ID when they request access to a specific Db2 subsystem.  
(Required) |
| PORT       | The TCP/IP port at which the server is listening.                           | If this keyword is not entered, the default DRDA port number 443 is used.  
(Required) |
| SECMEC     | The DRDA security mechanism in force.                                       | **USERIDPWD** User ID and password are sent as is. No encryption is used.  
**USRIDONL** User ID is sent as is. No encryption is used for the user ID only (client security).  
**USRENCPWD** Encrypt the password only.  
**EUSRDPWD** Encrypt the user ID and password.  
(For GROUP and MEMBER types.) |
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>

</table>

**Configuring Db2 for DRDA:**

If you are using a zIIP specialty engine, configure Db2 to use DRDA.

**About this task**

Before you can successfully issue DRDA requests, you must bind IBM® Db2® Analytics Accelerator Loader for z/OS DBRMs into packages within each target Db2 subsystem.
Procedure

1. Set the DEFAULTDB2SUBSYS parameter in the server configuration member to a valid Db2 subsystem name.
2. Edit the HLVBINDD job that is supplied in the hlq.SHLVCNTL data set. Follow the instructions that are provided in the JCL.
3. Run the HLVBINDD job.

Modifying the server configuration member for RRSAF:

If you are not using a zIIP specialty engine, enable the RDBMS access method for Resource Recovery Services attachment facility (RRSAF) in the server configuration member.

About this task

This task is only applicable for Db2 for z/OS.

The server configuration member hlvidIN00 is in data set hlq.SHLVEXEC, where hlvid represents the name of the Accelerator Loader server started task that was customized using Tools Customizer.

Procedure

1. Verify that the Unicode translation of the Coded Character Set Identifier (CCSID) used in the DEFINE DATABASE statement and the CCSID used by the target RDBMS are defined for your z/OS environment.
   a. You should identify the CCSID of the RDBMS.
      For example, Oracle may use ccсид1. In your DEFINE DATABASE statement in the configuration member for the RDBMS you have ccсид2. For this example, where Oracle is using ccсид1, you need to verify that you have ccсид1-ccсид2 and ccсид2-ccсид1 defined in your Unicode translation table on z/OS using the command D UNI,ALL.
   b. If the entry is not present, you need to add the entry to your Unicode translation table and refresh.
      Please refer to the IBM z/OS documentation on how to add the entry.

      Note: As an alternative, the Unicode table can be appended within the server by using the following statement examples in the server configuration member:
      "DEFINE CONV SOURCE(ccsid1) TARGET(ccsid2) TECH(RE)"
      "DEFINE CONV SOURCE(ccsid2) TARGET(ccsid1) TECH(RE)"

2. Set the DEFAULTDB2SUBSYS parameter in the server configuration member hlvidIN00 to a valid Db2 subsystem name.
3. In the hlvidIN00 member, locate the comment ENABLE DB2 RRSAF SUPPORT section.
4. Enable the RRSAF parameters by changing the syntax if DontDoThis to if DoThis. The following example shows the section in the configuration member to enable:
   if DoThis then
   do
   "MODIFY PARM NAME(RRS) VALUE(YES)"
   "MODIFY PARM NAME(DB2ATTACHFACILIT) VALUE(RRS)"
The following table lists the parameters for configuring support for RRSAF:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Valid values</th>
</tr>
</thead>
<tbody>
<tr>
<td>DB2ATTACHFACILITY</td>
<td>Specifies the Db2 attach facility. The Resource Recovery Services attachment facility (RRSAF) uses the DSNRLI interface module and allows for 2-phase commit actions. The Call Attach Facility (CAF) uses the DSNALI interface module.</td>
<td>The default value is RRS. Valid values are RRS and CAF.</td>
</tr>
<tr>
<td>RRS</td>
<td>Activates RRS support. This parameter must be set to YES to activate RRS.</td>
<td>YES Default value.</td>
</tr>
<tr>
<td>TRACERSSDATA</td>
<td>Specifies whether to trace RRS data.</td>
<td>YES Default value.</td>
</tr>
<tr>
<td>TRACERSEVENTS</td>
<td>Specifies whether to trace RRS events.</td>
<td>YES Default value.</td>
</tr>
<tr>
<td>TRACERSSAF</td>
<td>Creates an entry in the server trace for each call to DSNRLI for RRSAF requests.</td>
<td>YES Default value.</td>
</tr>
</tbody>
</table>

Configuring Db2 for RRSAF:

If you are not using a zIIP specialty engine, configure RRSAF for access to local Db2.

About this task

This task only applies to Db2 for z/OS.

Procedure

1. Run the HLVBINDC member of the hlq.SHLVCNTL data set to bind the following server product plans:
   - HLVC1010 is bound using cursor stability.
   - HLVR1010 is bound using repeatable read.
   - HLVS1010 is bound using read stability.
   - HLVU1010 is bound using uncommitted read.

   Use HLVC1010 as the default server plan, and use the other product plans for operations that require those levels of isolation. To change the default plans, edit the BIND member and replace the default plan names with new names. You must run the BIND job of the hlq.SHLVCNTL data set against each Db2 subsystem that you want to access. Use the instructions in the JCL to customize the job.
2. Install the DSN3@SGN exit in the Db2 master task (normally placed in the SDSNEXIT data set). Installing this exit enables the server to use Db2 authority that was granted through secondary Db2 authorization IDs.

Verifying access to data in IBM Db2:

To verify access to Db2 data, create a connection to the Accelerator Loader server and run a query. For information, see “Connecting to the Accelerator Loader server” on page 212.

Procedure

Complete the following steps to create a Db2 query:

1. In the Server view, select SQL > Data > DB2 > Subsystems.
2. Select Subsystem_Name > Tables by Owner Where Subsystem_Name is replaced by a subsystem name for your environment.
3. Expand the Tables by Owner list, and select the table that you want to query.

   Note: You must have authorization to access the table that you select.

4. Right-click the name of the table that you want to query, and select Generate Query. The Accelerator Loader studio creates a temporary JDBC data source and creates a connection to Accelerator Loader server.
5. Click Execute to run the query. Verify that data displays in the SQL Results View.

Configuring access to Db2 unload data sets:

To be able to access a Db2 unload data set directly with an SQL query, you must configure a virtual table rule to define the Db2 unload data set name to the Db2 virtual table.

About this task

To configure access to a Db2 unload data set, you must add the Db2 unload data set name to the Db2 virtual table in a Server Event Facility (SEF) virtual table rule. With this access, you can issue SQL queries directly against Db2 unload data sets using existing Db2 virtual tables.

Switching a Db2 virtual table to read an unload data set is done by assigning a data set name to the table in a virtual table rule. The VTB variable vtb.optbdsna is used to redirect access from Db2 to reading the sequential file named in the variable. The named sequential file must contain unload data created by the Db2 UNLOAD utility. A model VTB rule, HLVMDDLDU, is provided to demonstrate redirecting a Db2 virtual table to a Db2 unload data set.

As an example, consider a virtual table named DSNA_EMPLOYEES that maps the EMPLOYEES table in Db2 subsystem DSNA. By activating the model rule HLVMDDLDU, you can query an unload sequential dataset named EMPLOYEE.UNLOAD.SEQ by issuing the following query:

```sql
SELECT * FROM MLDU_DSNA_EMPLOYEES__EMPLOYEE_UNLOAD_SEQ
```

The HLVMDDLDU rule performs the following steps:

1. Extracts the table name DSNA_EMPLOYEES and sets the VTB variable vtb.optbmtna.
2. Extracts the data set name EMPLOYEE_UNLOAD_SEQ, converts the
underscores to periods, and sets the VTB variable vtb.optbdsna.

The following restrictions and considerations apply when using this feature:
• SQL access to Db2 unload files is limited to SQL queries only.
• The columns in Db2 virtual table definition must exactly match the table
unloaded in Db2.

Use the following procedure to configure the sample rule HLVMDLDU.

Note: Sample rule HLVMDLDU is intended to be used as a model and may
require customization. When customizing this rule, additional logic may need to be
added if different unload data sets require different VTB variable settings for
CCSID or internal/external format.

Procedure
1. Customize the server configuration member (hlvidIN00) to enable virtual table
rule events by configuring the SEFVTBEVENTS parameter in the member, as
follows:
"MODIFY PARM NAME(SEFVTBEVENTS) VALUE(YES)"

2. Access the VTB rules, as follows:
   a. In the Accelerator Loader - Primary Option Menu, specify option E, Rules
      Mgmt.
   b. Specify option 2, SEF Rule Management.
   c. Enter VTB for Display Only the Ruleset Named.

3. Customize the HLVMDLDU rule, as follows:
   a. Specify $ next to HLVMDLDU to edit the rule.
   b. Find the vtb.optbdsna variable and specify the name of the Db2 unload
data set to process.
   c. Update additional rule options as needed. The following table describes the
      VTB rule options that support Db2 unload data set access.

<table>
<thead>
<tr>
<th>VTB variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vtb.optbdlcv</td>
<td>If the data was unloaded with a DELIMITED statement, set vtb.optbdlcv to 1 to declare the data is in delimited format. It may also be necessary to declare the delimiters if the default column delimiter (,) and character string delimiter (&quot;) were overridden when the data was unloaded.</td>
</tr>
<tr>
<td>vtb.optbdsna</td>
<td>Specifies the name of the sequential unload data set created by the Db2 UNLOAD utility to access.</td>
</tr>
<tr>
<td>vtb.optbduif</td>
<td>By default, the Db2 unload utility writes data in external format. If FORMAT INTERNAL is used when unloading data, vtb.optbduif must be set to 1 to declare that the data was unloaded in internal format.</td>
</tr>
<tr>
<td>vtb.optbmtna</td>
<td>Specifies the map name of the Db2 virtual table describing the unload file.</td>
</tr>
<tr>
<td>vtb.optbtbcc</td>
<td>If the table CCSID is not compatible with the CCSID defined for the SQL engine (hlvidIN00 SQLENGDFLTCCSID parameter), vtb.optbtbcc can be used to declare the CCSID of the data. This is particularly important for Unicode tables and tables containing GRAPHIC columns.</td>
</tr>
</tbody>
</table>

   d. Save your changes and exit the editor.
4. Enable the rule by specifying E next to HLVMDLDU and pressing Enter.
5. Set the rule to Auto-enable by specifying A next to HLVMDLDU and pressing Enter. Setting a rule to Auto-enable activates the rule automatically when the server is re-started.

**Db2 for z/OS data access methods:**

Db2 for z/OS data can be accessed by the Accelerator Loader server using different data access methods.

The following Db2 for z/OS data access methods are available:

- **Traditional Db2 access.** This method loads data into an accelerator using traditional Db2 APIs. This access method allows for reading and writing of the data and provides transactional integrity.
- **Db2 Direct.** This method loads data into an accelerator by reading the underlying Db2 VSAM linear data sets directly, without issuing an SQL statement against Db2 for z/OS. This access method allows read-only access to the data and provides high performance, bulk data access. As a result of using Db2 Direct, loading data into an accelerator might be faster compared to executing an SQL statement in Db2 for z/OS.

The Db2 data access method is specified when creating virtual tables in the Accelerator Loader studio for access to Db2 data.

The following topics provide more information about the Db2 for z/OS data access methods.

**Using traditional Db2 access**

Traditional Db2 access methods access Db2 data through APIs such as Distributed Relational Database Architecture (DRDA), Call Attachment Facility (CAF), and Resource Recovery Services attachment facility (RRSAF). Using traditional Db2 access allows for reading and writing of the data and provides transactional integrity.

Traditional Db2 access methods provide MapReduce and Virtual Parallel Data support. MapReduce is an algorithm that enables the Accelerator Loader server to streamline how it accesses Db2 data, thereby reducing the processing time required to virtualize Db2 data. Statistics about the Db2 database are collected and stored within a metadata repository from which the SQL engine optimizes the MapReduce process.

In order to exploit MapReduce for Db2 when using traditional Db2 access, the Accelerator Loader server must collect information about the Db2 database. This information is collected using the **DRDARange** command and is stored within the Accelerator Loader server metadata repository.

Traditional Db2 access is used automatically when Db2 Direct access is not available.

**Using Db2 Direct**

*Db2 Direct* is an Accelerator Loader server access method that loads data into an accelerator by reading the data in the Db2 VSAM linear data sets directly instead of accessing the data through traditional Db2 APIs. Using Db2 Direct, large data pulls can be performed in service request block (SRB) mode, and MapReduce and
Virtual Parallel Data features can be exploited without any prerequisite processing, such as the collection of statistics using the `DRDARange` command. Db2 Direct access provides a significant increase in performance and reduced elapsed time in processing analytical type queries.

Db2 Direct allows read-only access to the data. Db2 Direct works only if all schema changes have been materialized to all rows in the physical page set of the table space. This access method can be compared to an uncommitted read in Db2 for z/OS, because any updates that have not been flushed from the Db2 buffer pools to the underlying data set are missed. When using Db2 Direct, there is no locking involved when accessing the data, so updates may not be captured and deleted records may have been captured. Results from Db2 Direct queries may be out of sync with the current state of a Db2 table due to recent table updates not being flushed to the linear data sets.

Security is managed using Db2 table authorization.

**Restrictions and considerations:**

Consider the following points when using Db2 Direct:

- The Db2 subsystem hosting a Db2 table must be active when Db2 Direct-enabled tables are loaded or refreshed in the data server. The map build process requires Db2 system access to identify data set information in the Db2 system catalog.
- The Accelerator Loader server requires read access to the Db2 VSAM linear data sets. The linear data sets containing the Db2 rows must be available to the data server processing SQL requests for Db2 data. If the data sets are unavailable or archived, Db2 Direct will be disabled during map load or refresh for the virtual table.
- Virtual tables enabled for Db2 Direct must include all the columns defined in the base Db2 table. This is necessary because the columns describe the internal format of the Db2 data.
- If Db2 is not available or some other error occurs during map build or map refresh processing, Db2 Direct is automatically disabled for the table and a message is written to the trace log:
  ```
  DB2 direct processing disabled for map map-name
  ```
- If Db2 Direct processing is disabled, processing will continue with traditional Db2 APIs when possible.
- To determine if Db2 Direct is active, the following messages appear in the server trace:
  - At startup and map refresh, the following message is issued:
    ```
    DB2 direct processing enabled for map map-name
    ```
  - When Db2 Direct is used in a query, the following message is issued:
    ```
    Processing table map-name using DB2 direct
    ```
- If Db2 Direct table security is enabled, the Db2 subsystem must be available to check security at SQL query time.
- If Db2 Direct table security is disabled, unauthorized users who would normally receive a -551 SQLCODE attempting to access data through traditional APIs may gain access to Db2 data.
- Db2 Direct does not support tables with edit procedures or SQL statements containing joins, LOB columns, or key columns.
- If Db2 Direct security is disabled, the CCSIDs of table columns will be assumed based on the `ENCODING_SCHEME` (EBCDIC, Unicode, ASCII) of the table.
Configuring Db2 Direct:

Configure Db2 Direct options or disable Db2 Direct.

Before you begin

Review the restrictions and considerations when using Db2 Direct. See “Using Db2 Direct” on page 138.

About this task

By default, Db2 Direct is enabled in the Accelerator Loader server. Use the information in this topic to perform the following optional tasks:

- Disable the Db2 Direct feature for a virtual table by using a Virtual Table (VTB) rule.
- Define the VCATNAME for the Db2 system catalog tables (in the DSNDDB06 database) by modifying the DEFINE DATABASE statement. The VCATNAME for system catalog tables is a system bootstrap value and is not available using the data discovery query. This task is required only in the following situations:
  - Access to system catalog tables using Db2 Direct is intended.
  - The VCATNAME for database DSNDDB06 is different from the subsystem name.
- Configure Db2 Direct options, such as the number of pages to allocate for Db2 segment information, whether to enforce Db2 SQL table security authorizations, and disabling Db2 Direct for the server, by modifying server parameters.
- Specify what Db2 Direct information to display in the server trace by modifying server parameters.

Procedure

1. To disable the Db2 Direct feature for a virtual table, in a VTB rule, set the variable OPTBDIDD to 1. For additional information, see the generic sample rule HLVMDDTB.

2. To define the VCATNAME for the Db2 system catalog tables, perform the following steps:
   a. In data set hlq.SHLEXEC, locate member hlvidIN00, where hlvid represents the name of the Accelerator Loader server started task that was customized by using Tools Customizer.
   b. In the DEFINE DATABASE statement, use the SYSTEMVCAT parameter to define the VCATNAME for the system catalog tables, as shown in the following example:

   ```
   "DEFINE DATABASE TYPE(MEMBER)" ,
   "NAME(DBA9)" ,
   "LOCATION(R528DD59)" ,
   "DDFSTATUS(ENABLE)" ,
   "PORT(3725)" ,
   "IPADDR(127.0.0.1)" ,
   "CCSID(37)" ,
   "APPLNAME(DBA9DB2)" ,
   "SYSTEMVCAT(DS9)" ,
   "IDLETIME(110)"
   ```

3. To modify server parameters, perform the following steps:
   a. In data set hlq.SHLEXEC, locate member hlvidIN00, where hlvid represents the name of the Accelerator Loader server started task that was customized by using Tools Customizer.
b. Use the **MODIFY PARM** command to change a parameter value. For example, the following command disables Db2 Direct for the Accelerator Loader server:

```
*MODIFY PARM NAME(DISABLEDB2DIRECT) VALUE(YES)*
```

The parameters in the following tables are available for use with Db2 Direct.

**Table 11. SQL parameters in group PRODSQL**

<table>
<thead>
<tr>
<th>Parameter name</th>

Configuring access to distributed databases
You can configure access to data on Big SQL, dashDB, Db2 LUW (Linux, UNIX, and Windows), Microsoft SQL Server, Oracle, and QMF DRDA.

About this task
Configure access to distributed databases by modifying the configuration member, configuring Server Event Facility (SEF) rules, and optionally setting up alternate authentication information.

Procedure
Configure access to a distributed database, as follows:
- To configure access to data in a Microsoft SQL Server database, see “Configuring access to data in Microsoft SQL Server.”
- To configure access to data in an Oracle database using DRDA, see “Configuring access to data in Oracle” on page 145.
- To configure access to data in Big SQL, dashDB, Db2 LUW, and QMF DRDA Server databases, perform the following steps:
  1. Modify the server configuration member. See “Modifying the server configuration member” on page 147.
  2. Configure the Server Event Facility rules and set up authentication for the appropriate database.

Configuring access to data in Microsoft SQL Server:
Set up access to data in Microsoft SQL Server databases by configuring the Accelerator Loader server.
Before you begin

The Accelerator Loader server must already be installed.

If you are connecting to a 2016 Microsoft SQL Server database, then you must install and configure the Host Integration Server for HIS DRDA Service. For additional information, refer to the documentation on the Microsoft website.

The SYSIBM Views from Microsoft must be installed.

About this task

To access a Microsoft SQL Server database, you must configure the Accelerator Loader server parameter file with information about the SQL Server databases to which you want to connect. Customizing this member is done using Tools Customizer. No configuration changes are necessary to SQL Server.

Use these instructions to configure the Accelerator Loader server using Tools Customizer.

Procedure

1. Invoke Tools Customizer.
2. Access the Product Parameters panel.
3. Under the task ‘Create the server and the server components’, select the steps Create the server and Create the server parameters, and provide values for the following parameters:
   - MSSQL DRDA application server provider
   - MSSQL application server domain name
   - MSSQL listener alias name
   - MSSQL listener port number
4. Generate the customization jobs. The jobs are based on the templates HLOHLVS and HLOIN00. For more information, see “Generating customization jobs” on page 107.
5. Submit the customization jobs. For more information, see “Submitting customization jobs” on page 107.

Example

The values that are specified in Tools Customizer are used to generate the following section in the Accelerator Loader server parameter member hlvidIN00:

```plaintext
/*-----------------------------*/
/* The next section defines MSSQL data sources via DRDA access. */
/* The TYPE should be 'MSSQL' */
/* The NAME is the MSSQL server */
/* DOMAIN is the server domain. IPADDR may be used, but not both */
/* LOCATION is the Listener Server alias name */
/* PORT is the Listener Server Port */
/*-----------------------------*/
"DEFINE DATABASE TYPE(MSSQL)",
"NAME(name)",
"DOMAIN(domain)",
"LOCATION(location)",
"DDFSTATUS(ENABLE)",
"PORT(446)",
"SQLAM(8)",
"CCSID(37)"
```
For more information on these parameters, see “Modifying the server configuration member” on page 147.

What to do next

To configure authentication for access to Microsoft SQL Server, “Configuring rules and authentication for Microsoft SQL Server.”

Configuring rules and authentication for Microsoft SQL Server:

Configure Server Event Facility (SEF) rules and set up authentication to provide access to Microsoft SQL Server via the 2016 Host Integration Server for HIS DRDA Service.

About this task

To complete configuration for access to Microsoft SQL Server, you must activate SEF rules and optionally set up authentication.

It is common for data centers to assign different user IDs for access to z/OS and for access to SQL Server. By default, the Accelerator Loader server will attempt to log on to SQL Server with the same user ID that was presented for logon to z/OS. A facility is provided in the Accelerator Loader server to optionally change the logon credentials for a user when accessing SQL Server.

This task uses the following tools:

HLVSMSSC
An SQL rule that allows Meta discovery on SQL Server databases.

HLVDRATH
A utility that sets encrypted passwords in GLOBALU variables. You can also use this utility to list existing credential information.

HLVEMSSG
An ATH rule that switches credentials when connecting to a SQL Server database using DRDA. This rule uses AES encrypted passwords stored as GLOBALU system variables.

Procedure

1. Auto-enable the SQL rule SHLVXSQL(HLVSMSSC) to allow Accelerator Loader studio Meta discovery on SQL Server databases.
   a. On the main menu, select Server administration.
   b. On the Administer Accelerator Loader Server menu, select option 3 for Manage Rules.
   c. Select option 2 for SEF Rule Management.
   d. Enter * to display all rules, or SQL to display only SQL rules.
   e. Enable the rule by specifying E and pressing Enter.
   f. Set the rule to Auto-Enable by specifying A and pressing Enter. Setting the rule to Auto-enable activates the rule automatically when the server is restarted.

2. Optional: To define alternate authentication information, use the sample job HLVDRATH to add a global default user definition or authentication information for specific mainframe users as follows:
   a. Locate the HLVDRATH member in the hlq.SHLVCNTL data set.
b. Modify the JCL according to the instructions provided in the HLVDRATH member.
   When adding the SYSIN statements that define the alternate credentials for logging in to your Microsoft SQL Server database, as instructed in the JCL, make sure to specify the correct DBTYPE. For SQL Server databases, specify DBTYPE=MSSQL.

c. Submit the job.

d. Optional: To verify the information stored in the GLOBALU variables and list existing authentication, use the REPORT=SUMMARY statement in the HLVDRATH member and submit the job.

3. Optional: If using alternate authentication information, auto-enable the SEF ATH rule SHLVXATH(HLVEMSSG) to provide the logon credentials to each SQL Server instance. Global variables are used to define alternate authentication credential mapping for the SEF ATH rule.

a. On the main menu, select Server administration.

b. On the Administer Accelerator Loader Server menu, select option 3 for Manage Rules.

c. Select option 2 for SEF Rule Management.

d. Enter * to display all rules, or ATH to display only authentication rules.

e. Enable the rule by specifying E and pressing Enter.

f. Set the rule to Auto-Enable by specifying A and pressing Enter. Setting the rule to Auto-enable activates the rule automatically when the server is restarted.

Configuring access to data in Oracle:

Set up access to data in Oracle databases by configuring the Accelerator Loader server.

Before you begin

The Accelerator Loader server must already be installed.

Install and configure the Oracle Database Provider for DRDA. For additional information, refer to the documentation on the Oracle website.

About this task

To access data in an Oracle database, you must configure the Accelerator Loader server parameter file with information about the Oracle databases to which you want to connect. Customizing this member is done using Tools Customizer. No configuration changes are necessary to Oracle.

Procedure

1. Invoke Tools Customizer.

2. Access the Product Parameters panel.

3. Under the task ‘Create the server and the server components’, select the steps Create the server and Create the server parameters, and provide values for the following parameters:
   - Oracle DRDA application server provider
   - Oracle application server domain name
   - Oracle listener alias name
Oracle listener port number

4. Generate the customization jobs. The jobs are based on the templates HLOHLVS and HLOIN00. For more information, see “Generating customization jobs” on page 107.

5. Submit the customization jobs. For more information, see “Submitting customization jobs” on page 107.

Example

The values that are specified in Tools Customizer are used to generate the following section in the Accelerator Loader server parameter member hlvidIN00:

```c
/*----------------------------------------------------------------*/
/* The next section defines Oracle data sources via DRDA access. */
/* The TYPE should be 'ORACLE' */
/* The NAME is the Oracle server */
/* DOMAIN is the server domain. IPADDR may be used, but not both */
/* LOCATION is the Listener Server alias name */
/* PORT is the Listener Server Port */
/* DEFINE DATABASE TYPE(ORACLE)
   *NAME(name)
   *DOMAIN(domain)
   *LOCATION(location)
   *DDFSTATUS(ENABLE)
   *PORT(1521)
   *CCSID(37)
   *IDLETIME(0)

For more information on these parameters, see “Modifying the server configuration member” on page 147.

What to do next

To configure authentication for access to Oracle databases, see “Configuring rules and authentication for Oracle DRDA.”

Configuring rules and authentication for Oracle DRDA:

Configure Server Event Facility (SEF) rules and set up authentication to provide access to Oracle databases via the Oracle Database Provider for DRDA.

About this task

To complete the configuration for access to Oracle databases via the Oracle Database Provider for DRDA, you must activate SEF rules and optionally set up authentication.

It is common for data centers to assign different user IDs for access to z/OS and for access to Oracle AS. By default, the Accelerator Loader server will attempt to log on to Oracle with the same user ID that was presented for logon to z/OS. A facility is provided in the server to optionally change the logon credentials for a user when accessing Oracle.

This task uses the following tools:

HLVSORAC
An SQL rule that allows Meta discovery on Oracle databases.
HLVDRATH
A utility that sets encrypted passwords in GLOBALU variables. You can also use this utility to list existing credential information.

HLVEORAG
An ATH rule that switches credentials when connecting to an Oracle database using DRDA. This rule uses AES encrypted passwords stored as GLOBALU system variables.

Procedure
1. Auto-enable the SQL rule SHLVSQSL(HLVSORAC) to allow Accelerator Loader studio Meta discovery on Oracle databases.
   a. On the Administer Accelerator Loader Server menu, select option 3 for Manage Rules.
   b. Select option 2 for SEF Rule Management.
   c. Enter * to display all rules, or SQL to display only SQL rules.
   d. Enable the rule by specifying E and pressing Enter.
   e. Set the rule to Auto-Enable by specifying A and pressing Enter. Setting the rule to Auto-enable activates the rule automatically when the server is restarted.

2. Optional: To define alternate authentication information, use the sample job HLVDRATH to add a global default user definition or authentication information for specific mainframe users as follows:
   a. Locate the HLVDRATH member in the hlq.SHLVCNTL data set.
   b. Modify the JCL according to the instructions provided in the HLVDRATH member.
      When adding the SYSIN statements that define the alternate credentials for logging in to your Oracle database, as instructed in the JCL, make sure to specify the correct DBTYPE. For Oracle, specify DBTYPE=ORACLE.
   c. Submit the job.
   d. Optional: To verify the information stored in the GLOBALU variables and list existing authentication, use the REPORT=SUMMARY statement in the HLVDRATH member and submit the job.

3. Optional: If using alternate authentication information, auto-enable the SEF ATH rule SHLVSATH(HLVEORAG) to provide the logon credentials to each Oracle instance. Global variables are used to define alternate authentication credential mapping for the SEF ATH rule.
   a. On the Administer Accelerator Loader Server menu, select option 3 for Manage Rules.
   b. Select option 2 for SEF Rule Management.
   c. Enter * to display all rules, or ATH to display only authentication rules.
   d. Enable the rule by specifying E and pressing Enter.
   e. Set the rule to Auto-Enable by specifying A and pressing Enter. Setting the rule to Auto-enable activates the rule automatically when the server is restarted.

Modifying the server configuration member:

Configure the Accelerator Loader server to access data sources using Distributed Relational Database Architecture (DRDA).
About this task

The Accelerator Loader server is enabled for DRDA access. To access data sources using DRDA, modify the Accelerator Loader server parameter member hlvidIN00 that was configured using Tools Customizer, and define those data sources to the configuration member.

The server configuration member hlvidIN00 is in data set hlq.SHLVEXEC, where hlvid represents the name of the Accelerator Loader server started task that was customized using Tools Customizer.

Procedure

1. Verify that the Unicode translation of the Coded Character Set Identifier (CCSID) used in the DEFINE DATABASE statement and the CCSID used by the target RDBMS are defined for your z/OS environment.
   a. Identify the CCSID of the RDBMS.
      For example, Oracle may use ccsid1. In your DEFINE DATABASE statement in the configuration member for the RDBMS you have ccsid2. For this example, where Oracle is using ccsid1, you need to verify that you have ccsid1-ccsid2 and ccsid2-ccsid1 defined in your Unicode translation table on z/OS using the command D UNI,ALL.
   b. If the entry is not present, add the entry to your Unicode translation table and refresh.
      Refer to the IBM z/OS documentation on how to add the entry.

      Note: As an alternative, the Unicode table can be appended within the Accelerator Loader server by using the following statement examples in the server configuration member:
      "DEFINE CONV SOURCE(ccsid1) TARGET(ccsid2) TECH(RE)"
      "DEFINE CONV SOURCE(ccsid2) TARGET(ccsid1) TECH(RE)"

2. In the hlvidIN00 member, locate the section that contains the comment Enable DRDA access to DB2 database subsystems.

3. Define DRDA RDBMSs by entering a definition statement. Provide your local environment values for all the parameters.

   "DEFINE DATABASE TYPE(type_selection)"
   "NAME(name)"
   "LOCATION(location)"
   "DDSTATUS(ENABLE)"
   "DOMAIN(your.domain.name)"
   "PORT(port)"
   "IPADDR(1.1.1.1)"
   "CCSID(37)"
   "APPLNAME(DSN1LU)"
   "IDLETIME(110)"

   The previous example shows only a subset of the available parameters. The following table lists all available parameters for defining DDF endpoints:
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Valid values</th>
</tr>
</thead>
</table>
| TYPE      | For distributed databases:  
**BIGSQL**  
DDF endpoint is a Big SQL engine.  
**DASHDB**  
DDF endpoint is a dashDB database.  
**LUW**  
DDF endpoint is a Db2 instance or group member for Linux, UNIX, or Windows.  
**MSSQL**  
DDF endpoint is a Db2 instance or group member for Microsoft SQL Server.  
**ORACLE**  
DDF endpoint is an Oracle instance. The parameter informs DRDA AR and supportive tooling that the remote server is an Oracle Database Provider which supports DRDA AS. The Oracle DRDA AS must be in z/OS simulation mode.  
**QMFDRDA**  
DDF endpoint is a QMF DRDA AS Object Server instance. | For distributed databases:  
**BIGSQL**  
**DASHDB**  
**LUW**  
**MSSQL**  
**ORACLE**  
**QMFDRDA** |
| NAME      | The database name as known to the server. *(Required)* | A valid value consists of 1 - 4 characters. Clients use this ID when they request access to a specific Db2 subsystem. |
| LOCATION  | For Db2: The Db2 location name.  
For dashDB: This is the database name of the dashDB database or alias name for the database.  
For LUW: The LUW database.  
For Oracle: The Oracle SSID as defined to the Oracle Database Provider (Gateway). *(Required)* | A valid value is a string 1 - 16 characters. |
| DDFSTATUS | The DDF activation status can be altered online by using the ISPF 4-Db2 dialog panels. *(Required)* |  
**ENABLE**  
Make this DDF definition active.  
**DISABLE**  
DDF endpoint is not used. |
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Valid values</th>
</tr>
</thead>
<tbody>
<tr>
<td>DOMAIN</td>
<td>The part of a network address that identifies it as belonging to a particular domain. Either DOMAIN or IPADDR is required, but not both.</td>
<td>No default value.</td>
</tr>
<tr>
<td>PORT</td>
<td>The TCP/IP port at which the server is listening. <em>(Required)</em></td>
<td>A valid 1-5 numeric string.</td>
</tr>
<tr>
<td>IPADDR</td>
<td>Specify the dot-notation IPv4 address of the DDF endpoint. Either DOMAIN or IPADDR is required, but not both.</td>
<td>If this parameter is not specified, the value 127.0.0.1 (local host) is the default. For group director definitions, use the DVIPA IP address of the group director.</td>
</tr>
<tr>
<td>CCSID</td>
<td>Specify the EBCDIC single-byte application CCSID (Coded Character Set Identifier) configured for this RDBMS subsystem on the RDBMS installation panel DSNTIPF, option 7. <em>(Optional)</em></td>
<td>Refer to the RDBMS vendor documentation for a list of valid CCSIDs.</td>
</tr>
<tr>
<td>APPLNAME</td>
<td>Application name. The APPLNAME used by the target endpoint for passticket generations. <em>(Optional)</em></td>
<td>A valid value is 1 - 8 characters. If APPLNAME is not specified in the definition statement, no default value is provided and passticket access is disabled. <strong>Note:</strong> APPLNAME is not required when connecting from the JDBC driver.</td>
</tr>
<tr>
<td>IDLETIME</td>
<td>If Db2 ZPARM parameter IDTHTOIN is set to a non-zero value set IDLETIME to a value slightly lower (10 secs.) than IDTHTOIN. This will also allow product DRDA threads to become inactive. <em>(Db2 for z/OS only)</em></td>
<td>0-9999 seconds.</td>
</tr>
<tr>
<td>AUTHTYPE</td>
<td>Authentication type. This can be either DES for Diffie Hellman Encryption Standard or AES for Advanced Encryption Standard. When AUTHTYPE is not supplied, the default is DES. To force AES, the option must be added to the DEFINE DATABASE statement. Each server can be different in what is supported as to AES/DES.</td>
<td>DES Diffie Hellman Encryption Standard (default value) AES Advanced Encryption Standard.</td>
</tr>
</tbody>
</table>
### Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Valid values</th>
</tr>
</thead>
<tbody>
<tr>
<td>SQLAM</td>
<td>SQL Application Manager (SQLAM) level. Use the supported DRDA SQLAM level for your data source. For more information, refer to the vendor documentation for your data source.</td>
<td>Currently supported DRDA SQLAM level for your data source. The following default values are used by the Accelerator Loader server: 8 This is the default value for all DRDA sources except SQL Server. For SQL Server (MSSQL), this is the default value when using Microsoft Host Integration Server 2016 base support or older for DRDA Service. 9 This is the default value for SQL Server when using Microsoft Host Integration Server 2016 with Cumulative Update 1 or greater applied for DRDA Service.</td>
</tr>
</tbody>
</table>

### Configuring rules and authentication for Big SQL:

Configure Server Event Facility (SEF) rules and set up authentication to provide access to Big SQL databases.

**About this task**

To complete configuration for access to Big SQL databases, you must activate SEF rules and optionally set up authentication.

It is common for data centers to assign different user IDs for access to z/OS and for access to Big SQL. By default, the server will attempt to log on to Big SQL with the same user ID that was presented for logon to z/OS. A facility is provided in the server to optionally change the logon credentials for a user when accessing Big SQL.

This task uses the following tools:

**HLVSBIGC**

An SQL rule that allows Meta discovery on Big SQL databases.

**HLVDRATH**

A utility that sets encrypted passwords in GLOBALU variables. You can also use this utility to list existing credential information.

**HLVEBIGG**

An ATH rule that switches credentials when connecting to a Big SQL database using DRDA. This rule uses AES encrypted passwords stored as GLOBALU system variables.
Procedure

1. Auto-enable the SQL rule SHLVXSQL(HLVSBIGC) to allow Accelerator Loader studio Meta discovery on Big SQL databases.
   a. On the Administer Accelerator Loader Server menu, select option 3 for Manage Rules.
   b. Select option 2 for SEF Rule Management.
   c. Enter * to display all rules, or SQL to display only SQL rules.
   d. Enable the rule by specifying E and pressing Enter.
   e. Set the rule to Auto-Enable by specifying A and pressing Enter. Setting the rule to Auto-enable activates the rule automatically when the server is restarted.

2. Optional: To define alternate authentication information, use the sample job HLVDRATH to add a global default user definition or authentication information for specific mainframe users as follows:
   a. Locate the HLVDRATH member in the hlq.SHLVCNTL data set.
   b. Modify the JCL according to the instructions provided in the HLVDRATH member.
      When adding the SYSIN statements that define the alternate credentials for logging in to your Big SQL database, as instructed in the JCL, make sure to specify the correct DBTYPE. For Big SQL, specify DBTYPE=BIGSQL.
   c. Submit the job.
   d. Optional: To verify the information stored in the GLOBALU variables and list existing authentication, use the REPORT=SUMMARY statement in the HLVDRATH member and submit the job.

3. Optional: If using alternate authentication information, auto-enable the SEF ATH rule SHLVXATH(HLVEBIGG) to provide the logon credentials to each Big SQL instance. Global variables are used to define alternate authentication credential mapping for the SEF ATH rule.
   a. On the Administer Accelerator Loader Server menu, select option 3 for Manage Rules.
   b. Select option 2 for SEF Rule Management.
   c. Enter * to display all rules, or ATH to display only authentication rules.
   d. Enable the rule by specifying E and pressing Enter.
   e. Set the rule to Auto-Enable by specifying A and pressing Enter. Setting the rule to Auto-enable activates the rule automatically when the server is restarted.

Configuring rules and authentication for dashDB:

Configure Server Event Facility (SEF) rules and set up authentication to provide access to IBM dashDB databases.

About this task

To complete configuration for access to dashDB databases, you must activate SEF rules and optionally set up authentication.

It is common for data centers to assign different user IDs for access to z/OS and for access to dashDB. By default, the server will attempt to log on to dashDB with the same user ID that was presented for logon to z/OS. A facility is provided in the server to optionally change the logon credentials for a user when accessing dashDB.
This task uses the following tools:

**HLVSDDDBC**
An SQL rule that allows Meta discovery on dashDB databases.

**HLVDRATH**
A utility that sets encrypted passwords in GLOBALU variables. You can also use this utility to list existing credential information.

**HLVEDDBG**
An ATH rule that switches credentials when connecting to a dashDB database using DRDA. This rule uses AES encrypted passwords stored as GLOBALU system variables.

**Procedure**

1. Auto-enable the SQL rule SHLVXSQ(HLVSDDDBC) to allow Accelerator Loader studio Meta discovery on dashDB databases.
   a. On the Administer Accelerator Loader Server menu, select option 3 for Manage Rules.
   b. Select option 2 for SEF Rule Management.
   c. Enter * to display all rules, or SQL to display only SQL rules.
   d. Enable the rule by specifying E and pressing Enter.
   e. Set the rule to Auto-Enable by specifying A and pressing Enter. Setting the rule to Auto-enable activates the rule automatically when the server is restarted.

2. Optional: To define alternate authentication information, use the sample job HLVDRATH to add a global default user definition or authentication information for specific mainframe users as follows:
   a. Locate the HLVDRATH member in the hlq.SHLCNTL data set.
   b. Modify the JCL according to the instructions provided in the HLVDRATH member.
      When adding the SYSIN statements that define the alternate credentials for logging in to your dashDB database, as instructed in the JCL, make sure to specify the correct DBTYPE. For dashDB, specify DBTYPE=DASHDB.
   c. Submit the job.
   d. Optional: To verify the information stored in the GLOBALU variables and list existing authentication, use the REPORT=SUMMARY statement in the HLVDRATH member and submit the job.

3. Optional: If using alternate authentication information, auto-enable the SEF ATH rule SHLVXATH(HLVEDDBG) to provide the logon credentials to each dashDB instance. Global variables are used to define alternate authentication credential mapping for the SEF ATH rule.
   a. On the Administer Accelerator Loader Server menu, select option 3 for Manage Rules.
   b. Select option 2 for SEF Rule Management.
   c. Enter * to display all rules, or ATH to display only authentication rules.
   d. Enable the rule by specifying E and pressing Enter.
   e. Set the rule to Auto-Enable by specifying A and pressing Enter. Setting the rule to Auto-enable activates the rule automatically when the server is restarted.
Configuring rules and authentication for LUW databases:

Configure Server Event Facility (SEF) rules and set up authentication to provide access to LUW (Linux, UNIX, and Windows) databases, including databases connected via IBM Federated Server.

About this task

To complete configuration for access to LUW databases, you must activate SEF rules and optionally set up authentication.

It is common for data centers to assign different user IDs for access to z/OS and for access to LUW databases. By default, the server will attempt to log on to the LUW database with the same user ID that was presented for logon to z/OS. A facility is provided in the server to optionally change the logon credentials for a user when accessing an LUW database.

This task uses the following tools:

**HLVSLUWC**
An SQL rule that allows Meta discovery on LUW databases.

**HLVDRATH**
A utility that sets encrypted passwords in GLOBALU variables. You can also use this utility to list existing credential information.

**HLVELUWG**
An ATH rule that switches credentials when connecting to an LUW database using DRDA. This rule uses AES encrypted passwords stored as GLOBALU system variables.

Procedure

1. Auto-enable the SQL rule SHLVXSQL(HLVSLUWC) to allow Accelerator Loader studio Meta discovery on LUW databases.
   a. On the Administer Accelerator Loader Server menu, select option 3 for Manage Rules.
   b. Select option 2 for SEF Rule Management.
   c. Enter * to display all rules, or SQL to display only SQL rules.
   d. Enable the rule by specifying E and pressing Enter.
   e. Set the rule to Auto-Enable by specifying A and pressing Enter. Setting the rule to Auto-enable activates the rule automatically when the server is restarted.

2. Optional: To define alternate authentication information, use the sample job HLVDRATH to add a global default user definition or authentication information for specific mainframe users as follows:
   a. Locate the HLVDRATH member in the hlq.SHLVCTRL data set.
   b. Modify the JCL according to the instructions provided in the HLVDRATH member.
      When adding the SYSIN statements that define the alternate credentials for logging in to your LUW database, as instructed in the JCL, make sure to specify the correct DBTYPE. For LUW databases, specify DBTYPE=LUW.
   c. Submit the job.
d. Optional: To verify the information stored in the GLOBALU variables and list existing authentication, use the REPORT=SUMMARY statement in the HLVDRATH member and submit the job.

3. Optional: If using alternate authentication information, auto-enable the SEF ATH rule SHLVXATH(HLVELUWG) to provide the logon credentials to each LUW instance. Global variables are used to define alternate authentication credential mapping for the SEF ATH rule.
   a. On the Administer Accelerator Loader Server menu, select option 3 for Manage Rules.
   b. Select option 2 for SEF Rule Management.
   c. Enter * to display all rules, or ATH to display only authentication rules.
   d. Enable the rule by specifying E and pressing Enter.
   e. Set the rule to Auto-Enable by specifying A and pressing Enter. Setting the rule to Auto-enable activates the rule automatically when the server is restarted.

Configuring rules and authentication for QMF DRDA Server:

Configure Server Event Facility (SEF) rules and set up authentication to provide access to QMF DRDA Server databases.

About this task

To complete the configuration for access to QMF DRDA Server databases, you must activate SEF rules and optionally set up authentication.

It is common for data centers to assign different user IDs for access to z/OS and for access to QMF DRDA Server. By default, the Accelerator Loader server will attempt to log on to QMF DRDA Server with the same user ID that was presented for logon to z/OS. A facility is provided in the server to optionally change the logon credentials for a user when accessing QMF DRDA Server.

This task uses the following tools:

**HLVSQMFC**
An SQL rule that allows Meta discovery on Oracle databases.

**HLVDRATH**
A utility that sets encrypted passwords in GLOBALU variables. You can also use this utility to list existing credential information.

**HLVEQMFG**
An ATH rule that switches credentials when connecting to a QMF DRDA Server database using DRDA. This rule uses AES encrypted passwords stored as GLOBALU system variables.

Procedure

1. Auto-enable the SQL rule SHLVXSQL(HLVSQMFC) to allow Accelerator Loader studio Meta discovery on QMF DRDA Server databases.
   a. On the Administer Accelerator Loader Server menu, select option 3 for Manage Rules.
   b. Select option 2 for SEF Rule Management.
   c. Enter * to display all rules, or SQL to display only SQL rules.
   d. Enable the rule by specifying E and pressing Enter.
e. Set the rule to Auto-Enable by specifying A and pressing Enter. Setting the rule to Auto-enable activates the rule automatically when the server is restarted.

2. Optional: To define alternate authentication information, use the sample job HLVDRATH to add a global default user definition or authentication information for specific mainframe users as follows:
   a. Locate the HLVDRATH member in the hlq.SHLCNTL data set.
   b. Modify the JCL according to the instructions provided in the HLVDRATH member.
      When adding the SYSIN statements that define the alternate credentials for logging in to your QMF DRDA Server database, as instructed in the JCL, make sure to specify the correct DBTYPE. For QMF DRDA Server databases, specify DBTYPE=QMFDRDA.
   c. Submit the job.
   d. Optional: To verify the information stored in the GLOBALU variables and list existing authentication, use the REPORT=SUMMARY statement in the HLVDRATH member and submit the job.

3. Optional: If using alternate authentication information, auto-enable the SEF ATH rule SHLVXATH(HLVEQMFG) to provide the logon credentials to each QMF DRDA Server database. Global variables are used to define alternate authentication credential mapping for the SEF ATH Rule.
   a. On the Administer Accelerator Loader Server menu, select option 3 for Manage Rules.
   b. Select option 2 for SEF Rule Management.
   c. Enter * to display all rules, or ATH to display only authentication rules.
   d. Enable the rule by specifying E and pressing Enter.
   e. Set the rule to Auto-Enable by specifying A and pressing Enter. Setting the rule to Auto-enable activates the rule automatically when the server is restarted.

Controlling display and access for native Db2 subsystems
You can control whether native Db2 database subsystems appear in ISPF and the Accelerator Loader studio and if attempts to connect to native Db2 subsystems are allowed.

About this task

The server parameter DISABLEATTACH controls whether native Db2 database subsystems appear in the ISPF and Accelerator Loader studio applications and if attempts to connect to native Db2 subsystems are allowed.

The following table describes the settings for this parameter:
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Valid values</th>
</tr>
</thead>
<tbody>
<tr>
<td>DISABLEATTACH</td>
<td>Controls whether native Db2 database subsystems appear in the ISPF and Accelerator Loader studio applications and if attempts to connect to native Db2 subsystems are allowed.</td>
<td>YES</td>
</tr>
<tr>
<td></td>
<td>YES</td>
<td>NO</td>
</tr>
<tr>
<td></td>
<td>Only data sources defined as DRDA endpoints appear in the ISPF DB2 Interface Facility (Database Control) and the Accelerator Loader studio interface.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>An attempt to connect to a subsystem that does not have a DRDA configuration will be rejected. Trace Browse will show the following message:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>DB SUBSYSTEM xxxx IS NOT DEFINED</td>
<td></td>
</tr>
<tr>
<td></td>
<td>For an attempt to connect to a DRDA data source that is disabled, Trace Browse will show the following message:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>DB SUBSYSTEM xxxx IS NOT OPERATIONAL</td>
<td></td>
</tr>
<tr>
<td></td>
<td>NO (Default) All Db2 subsystems appear in the ISPF and Accelerator Loader studio interfaces.</td>
<td></td>
</tr>
</tbody>
</table>

The default setting for server parameter **DISABLEATTACH** is NO; however, the following statement is included in the server configuration file, which changes the setting to YES:

"MODIFY PARM NAME(DISABLEATTACH) VALUE(YES)"

If this override is omitted from the server configuration file, the setting will default to NO.

To review or update the **DISABLEATTACH** parameter setting, use the following procedure:

**Procedure**

1. In data set *hlq.SHLEXEC*, locate member *hlvidIN00*, where *hlvid* represents the name of the Accelerator Loader server started task that was customized by using Tools Customizer.
2. Review the following statement in your *hlvidIN00* member, and update the setting if necessary:

"MODIFY PARM NAME(DISABLEATTACH) VALUE(YES)"

**Configuring access to data in IBM IMS databases**

Set up access to data in IBM IMS databases by configuring the Accelerator Loader server and verifying access to the data.

**Before you begin**

The Accelerator Loader server must already be installed. Use these instructions to configure the Accelerator Loader server.
**About this task**

To access an IMS database, the Accelerator Loader server started task and parameter file must be configured with information about the IMS databases to which you want to connect. Customizing these members is done using Tools Customizer. No configuration changes are necessary to IMS.

**Procedure**

1. Invoke Tools Customizer for z/OS.
2. Access the Product Parameters panel.
3. Under the task ‘Create the server and the server components’, select the steps **Create the server** and **Create the server parameters**, and provide values for the following fields:

<table>
<thead>
<tr>
<th>Step or parameter</th>
<th>Required?</th>
<th>Discovered?</th>
<th>Default</th>
<th>Your value</th>
</tr>
</thead>
<tbody>
<tr>
<td>IMS subsystem ID</td>
<td>No</td>
<td>No</td>
<td>No default</td>
<td></td>
</tr>
<tr>
<td>IMS SDFSRESL library</td>
<td>No</td>
<td>No</td>
<td>No default</td>
<td></td>
</tr>
<tr>
<td>IMS MODBLKS library</td>

</tbody>
</table>
Define the RECON libraries that contain system information for the specified IMS subsystem. These data sets enable the server to access IMS data directly.

If an IMS subsystem is defined, you must specify a value. No No default

4. Generate the customization jobs. The jobs are based on the templates HLOHLVS and HLOIN00. For more information, see “Generating customization jobs” on page 107.

5. Submit the customization jobs. For more information, see “Submitting customization jobs” on page 107.

**IMS data access methods**

IMS data can be accessed by the Accelerator Loader server using different data access methods.

By default Accelerator Loader server will access IMS data directly using the underlying VSAM data sets. This access method, called "IMS Direct", provides both map reduce and parallelism support for accessing native IMS files. This support bypasses the requirement of having to use native IMS API calls by reading the IMS database files directly, similar to how an unload utility may work. This method provides a significant increase in performance and reduced elapsed time in processing analytical type queries.

When an IMS SQL query is run, the SQL engine for the server will determine if the request is best executed using IMS Direct (native file support) or if IMS APIs are required. The determination is based on database and file types supported as well as the size of the database. Virtual tables of the IMS segments are required.

The following types of IMS databases are currently supported by IMS Direct:
- Hierarchical direct access method (HDAM) - VSAM and OSAM
- Hierarchical indexed direct access method (HIDAM) - VSAM and OSAM
- Partitioned HDAM (PHDAM) - VSAM and OSAM
- Partitioned HIDAM (PHIDAM) - VSAM and OSAM
- Fast Path data entry database (DEDB)

When using IMS Direct, there is no locking involved when accessing the data, so updates may not be captured and deleted records may have been captured. Security is managed on the IMS native data set itself when IMS Direct is used. The user ID of the client connection must have the necessary security permissions for reading the IMS database data set(s).

When IMS Direct access is not available, the Accelerator Loader server will use DBCTL access using map reduce and parallelism support. Map reduce is an algorithm that enables the Accelerator Loader server to streamline how it accesses IMS data, thereby reducing the processing time required to virtualize IMS data. Statistics about the IMS database are collected and stored within a metadata repository from which the SQL engine optimizes the map reduce process.
In order to exploit the map reduce architecture for IMS using DBCTL as the access method, the Accelerator Loader server must collect information about the IMS database so that it can be used by the SQL engine optimizer. This information is stored within the Accelerator Loader server metadata repository for optimization and can be refreshed at regular intervals.

**Metadata repository**

The metadata repository for MapReduce stores statistics about virtual tables defined on IMS data sources that are used to enhance performance in conjunction with MapReduce. This support applies to IMS and all DRDA backend data sources, including those accessed via the IBM Federated Server (such as Terradata and Sybase), as well as data sources accessed via the Accelerator Loader server's direct DRDA support (Db2 LUW and Oracle).

This information can be collected by the following command query:

```sql
SELECT IMSRange('IMS DBD name')
```

The following sample batch job can be executed at regular intervals to populate the IMS metadata repository with fresh statistics. This sample job is provided in hlq.SHLVCTRL(HLV RANGE). Instructions for required edits to the job are provided in the member.

```plaintext
//RANGE EXEC PGM=HLVXMAPD,PARM='SSID=hlvid',MXR=30000000
//STEPLIB DD DISP=SHR,DSN=hlq.SHLVLOAD
//RPT DD SYSOUT=*  
//FMT DD SYSOUT=*,DCB=LRECL=4096 
//IN DD *
SELECT IMSRANGE('<IMS DBD NAME>');
/*

where:
- `hlvid` is the name of the Accelerator Loader server started task that was customized using Tools Customizer
- `hlq.SHLVLOAD` is the Accelerator Loader server load library
- `IMS DBD Name` is the four-character IMS subsystem name.

No additional configuration or customization is required to take advantage of either of these access methods.

**Modifying the server configuration member for IMS Direct**

To optionally configure IMS Direct, configure IMS Direct parameters in your Accelerator Loader server configuration file.

**About this task**

Use this procedure to configure optional IMS Direct parameters in your Accelerator Loader server configuration file.

IMS Direct supports access to multiple IMS subsystems and calls to compression exits and Guardium encryption and decryption exits, each of which requires additional configuration.

**Using exits**

If you use compression exits or Guardium encryption and decryption exits, you can configure the server to call these exits, providing optimization.
For compression exits, the default mode of operation is to call them in TCB mode with a serialization latch held and a PST address of 0. This can be inefficient since most of the IMS Direct processing takes place in SRB mode on a zIIP. If you know enough about your compression exit, you can optimize performance of the exit by specifying it in either the IMSDIRCMPTCBn, or IMSDIRCMPSRBn statements, which are described in the procedure below. All exits are called for INIT and TERM in TCB mode.

- Decompression calls may be made in TCB mode, without serialization by specifying the name in an IMSDIRCMPTCBn statement. This will allow parallel threads to run without serialization, improving performance.
- Decompression calls may also be made in SRB mode, without serialization, by specifying the name in an IMSDIRCMPSRBn statement. This will avoid a task switch for each compressed segment, improving performance. Note that the supplied IMS compression DFSCMPX0 exits and DFSKMPX0 will run in SRB mode.

Guardium decryption exits require a PST and PST work area. A dummy PST with a PST work area is passed to these exits when they are specified in an IMSDIRDECEXITn statement, which is described in the procedure. Guardium decryption exits can run in SRB mode, without serialization.

Procedure
1. In data set hlq.SHLVEXEC, locate member hlvidIN00, where hlvid represents the name of the Accelerator Loader server started task that was customized by using Tools Customizer.
2. In the hlvidIN00 member, locate the comment “Enable IMS Direct Map Reduce.”
3. (Optional) To access additional IMS subsystems with IMS Direct, add a DEFINE IMSDBINFO statement for each additional IMS subsystem.

```
"DEFINE IMSDBINFO",
  "IMSID(xxxx)",
  "SUFFIX(x)",
  "MODBLKS(your.MODBLKS)",
  "ACBLIB(your.ACBLIB)",
  "DFSRESLB(your.SDFSRESL)",
  "IMSDALIB(your.dynamic.allocation.lib)",
  "RECON1(your.RECON1)",
  "RECON2(your.RECON2)",
  "RECON3(your.RECON3)"
end
```

The following table lists the parameters used to define the IMS database:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Valid values</th>
</tr>
</thead>
<tbody>
<tr>
<td>IMSID</td>
<td>The IMS subsystem identification.</td>
<td>Up to 4-character ID.</td>
</tr>
<tr>
<td>SUFFIX</td>
<td>The setting of the SUF= keyword used in the IMS Control Region.</td>
<td>One character. Default value is 1.</td>
</tr>
<tr>
<td>ACBLIB</td>
<td>ACBLIB data sets contain the application control blocks (ACBs), which describe IMS applications, and data management blocks (DMBs), which describe databases and the applications that can access them.</td>
<td>your.ACBLIB</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Valid values</td>
</tr>
<tr>
<td>---------------</td>
<td>------------------------------------------------------------------------------</td>
<td>-------------------------------------------</td>
</tr>
<tr>
<td>DFSRESLB</td>
<td>Load library that contains the major IMS modules.</td>
<td>your.SDFSRESL</td>
</tr>
<tr>
<td>IMSDALIB</td>
<td>Dynamic Allocation Library for IMSDBs and RECONs.</td>
<td>your.dynamic.allocation.lib</td>
</tr>
<tr>
<td>MODBLKS</td>
<td>Used to support dynamic resource definition. Contains the APPLCTN, DATABASE,</td>
<td>your.MODBLKS</td>
</tr>
<tr>
<td></td>
<td>RTCODE, and TRANSACT macros.</td>
<td></td>
</tr>
<tr>
<td>RECON1</td>
<td>Primary RECONciliation dataset, which holds all of the resource information</td>
<td>your.RECON1</td>
</tr>
<tr>
<td></td>
<td>and event tracking information that is used by IMS.</td>
<td></td>
</tr>
<tr>
<td>RECON2</td>
<td>An active copy of RECON1.</td>
<td>your.RECON2</td>
</tr>
<tr>
<td>RECON3</td>
<td>Spare RECON to be used when RECON1 or RECON2 are not useable.</td>
<td>your.RECON3</td>
</tr>
</tbody>
</table>

4. (Optional) Add the following statements to configure additional IMS Direct parameters:

"MODIFY PARM NAME(IMSDIRECTCYLBUF) VALUE(3)"
"MODIFY PARM NAME(IMSDIRECTOSAMRECSRD) VALUE(2)"

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Valid values</th>
</tr>
</thead>
<tbody>
<tr>
<td>IMSDIRECTCYLBUF</td>
<td>Specifies the number of cylinders of data to buffer for each file processed</td>
<td>1-50. Default value is 3.</td>
</tr>
<tr>
<td></td>
<td>in an IMS Direct task.</td>
<td></td>
</tr>
<tr>
<td>IMSDIRECTOSAMRECSRD</td>
<td>Specifies the number of records to read in each OSAM I/O operation. For</td>
<td>1-50. Default value is 2.</td>
</tr>
<tr>
<td></td>
<td>random reads, a large number may lead to unnecessary blocks read. For</td>
<td></td>
</tr>
<tr>
<td></td>
<td>sequential reads, small numbers may give decreased performance.</td>
<td></td>
</tr>
</tbody>
</table>

5. To call a compression exit, perform one of the following steps as appropriate:
   - If your compression exit must be called in TCB mode but can run properly without serialization, specify your exit name in the following statement:
     "MODIFY PARM NAME(IMSDIRCMPXITTCBn) VALUE(exitname)"
     where \( n \) is a number from 1 to 10 and \( exitname \) is the name of the compression exit routine.
   - If your exit can run properly in SRB mode without serialization, specify your exit name in the following statement:
     "MODIFY PARM NAME(IMSDIRCMPXITSRBn) VALUE(exitname)"
     where \( n \) is a number from 1 to 10 and \( exitname \) is the name of the compression exit routine.
If neither of these conditions apply, do not specify the name of your compression exit.

**Note:** Review "Using exits" for more information about configuring calls to compression exits.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Valid values</th>
</tr>
</thead>
<tbody>
<tr>
<td>IMSDIRCMPXITTCBn</td>
<td>Specifies the name of a compression exit that can be safely called without serialization. Up to 10 exit names can be specified, where n is a number from 1 to 10. Since the server runs multiple threads in parallel, this feature provides optimization by eliminating the possible serialization conflicts between threads.</td>
<td>Name of compression exit routine</td>
</tr>
<tr>
<td>IMSDIRCMPXITSRBn</td>
<td>Specifies the name of a compression exit that can be safely called without serialization and in SRB mode. Up to 10 exit names can be specified, where n is a number from 1 to 10. Since multiple exit names can be called without serialization and without switching off the zIIP (SRB mode) into TCB mode (GP processor), this feature provides optimization by eliminating the need to switch tasks for each exit call. The IBM supplied compression exits DFSCMPX0 and DFSKMPX0 will run safely in SRB mode. They can be specified in IMSDIRCMPXITSRB1 and IMSDIRCMPXITSRB2.</td>
<td>Name of compression exit routine</td>
</tr>
</tbody>
</table>

6. To call Guardium encryption and decryption exits, add the following statement:

   "MODIFY PARM NAME(IMSDIRDECXITSRBn) VALUE(exitname)"

   where n is a number from 1 to 20 and exitname is the name of the Guardium exit routine.

   **Note:** Review "Using exits" for more information about configuring calls to Guardium encryption and decryption exits.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Valid values</th>
</tr>
</thead>
<tbody>
<tr>
<td>IMSDIRDECXITSRBnn</td>
<td>Specifies the name of the Guardium encryption and decryption exit routine. Up to 20 exit names can be specified, where nn is a value from 1 to 20.</td>
<td>Name of Guardium exit routine</td>
</tr>
</tbody>
</table>

### Configuring access to VSAM

Accelerator Loader server is configured as part of the customization process (Tools Customizer task Create the IVP jobs). No modifications are required to configure the SQL interface for native VSAM. However, you should verify that the server has access to VSAM. Optionally, you can control the data buffer (BUFND) and the index buffer (BUFNI) values for VSAM files either globally or for individual requests.

#### Before you begin

The server must already be installed.

#### Verifying access to native VSAM

Verify native VSAM data access by creating a sample VSAM file and a corresponding virtual table and running a query that accesses the VSAM data.

#### Procedure

1. Create the sample VSAM file on the mainframe that hosts the Accelerator Loader server. Run the `HLVGSNTF` member in the `hlq.SHLVCNTL` data set to allocate and load the sample VSAM file. The job should complete with a condition code of 0.

2. Create the `staffvsv` virtual table, and run a query that returns a result set. Run the `HLVIVVS1` member in the `hlq.SHLVCNTL` data set to perform a batch extract of the sample VSAM file listing and create a virtual table that is used to format the result set that is returned from the VSAM file. The job should complete with a condition code of 0.

3. Verify that the SQL results contained in the `HLVIVVS1` member are valid.

#### Modifying the data and index buffer values for VSAM files

You can change the data and index buffer values for VSAM files.

#### About this task

You can control the data buffer (BUFND) and the index buffer (BUFNI) values for VSAM files either globally or for individual requests, as follows:

- To change the values globally, you must add the required parameters to your Accelerator Loader server configuration file. The following table lists these parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Valid values</th>
</tr>
</thead>
<tbody>
<tr>
<td>SQLENGVSAMDATABUFF</td>
<td>Specifies the number of data buffers for VSAM files. Default: 20</td>
<td>Numeric value.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Valid values</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>----------------</td>
</tr>
<tr>
<td>SQLENGVSAMINDEXBUFF</td>
<td>Specifies the number of index buffer for VSAM files.</td>
<td>Numeric value.</td>
</tr>
<tr>
<td></td>
<td>Default: 30</td>
<td></td>
</tr>
</tbody>
</table>

- To change the values for individual requests, you can use virtual table (VTB) rules. Sample VTB rules HLVBUFND and HLVBUFNI are provided.

To override your index buffer or data buffer values, you must enable the respective rule and use the appropriate BUF prefix for table names in your SQL statement, as follows.

- **To override the data buffer (BUFND) value:**
  Use sample rule HLVBUFND. The HLVBUFND rule is invoked every time a table with the prefix BUFND_ is found in the SQL statement. The following format is expected:
  
  `BUFND_nn_virtualtablename`

  Where:
  - `nn` is the number of data buffers (BUFND) for the VSAM data sets
  - `virtualtablename` is the name of the virtual table

  For example:
  
  ```sql
  SELECT * from BUFND_30_STAFF_VSAM ;
  ```

  The following message is displayed in the Server Trace:
  
  `HLV1000I VTB.OPTBVSND set to 30`

- **To override the index buffer (BUFNI) value:**
  Use sample rule HLVBUFNI. The HLVBUFNI rule is invoked every time a table with the prefix BUFNI_ is found in the SQL statement. The following format is expected:
  
  `BUFNI_nn_virtualtablename`

  Where:
  - `nn` is the number of index buffers (BUFNI) for the VSAM data sets
  - `virtualtablename` is the name of the virtual table

  For example:
  
  ```sql
  SELECT * from BUFNI_30_STAFF_VSAM ;
  ```

  The following message is displayed in the Server Trace:
  
  `HLV1000I VTB.OPTBVSNI set to 30`

**Procedure**

1. To change the values globally, perform the following steps:
   a. In data set `hlq.SHLVEXEC`, locate member `hlvidIN00`, where `hlvid` represents the name of the Accelerator Loader server started task that was customized by using Tools Customizer.
   b. Add the following statements to your `hlvidIN00` member:
      
      ```sql
      "MODIFY PARM NAME(SQLENGVSAMDATABUFF) VALUE(20)"
      "MODIFY PARM NAME(SQLENGVSAMINDEXBUFF) VALUE(30)"
      ```

2. To change the values for individual requests, perform the following steps:
a. Customize the server configuration member (hlvidIN00) to enable virtual table rule events by configuring the SEFVTBEVENTS parameter in the member, as follows:

"MODIFY PARM NAME(SEFVTBEVENTS) VALUE(YES)"

b. Access the VTB rules, as follows:

1) In the Accelerator Loader - Primary Option Menu, specify option E, Rules Mgmt.
2) Specify option 2, SEF Rule Management.
3) Enter VTB for Display Only the Ruleset Named.

c. Enable each rule as follows:
   • Specify E next to HLVBUFND and press Enter.
   • Specify E next to HLVBUFNI and press Enter.

d. Set each rule to Auto-enable as follows:
   • Specify A next to HLVBUFND and press Enter.
   • Specify A next to HLVBUFNI and press Enter.
   Setting a rule to Auto-enable activates the rule automatically when the server is re-started.

e. Use the appropriate BUF prefix for table names in your SQL statement.

Configuring access to sequential files

No modifications are needed to configure the Accelerator Loader server to access sequential files. Optionally, you can specify the number of tracks to read ahead when reading sequential data sets for individual requests.

Reading ahead tracks for sequential file access

You can use a Server Event Facility (SEF) rule to specify the number of tracks to read ahead (MULTACC) when reading sequential data sets for individual requests.

About this task

Using a virtual table (VTB) rule, you can specify the number of tracks to read ahead (the MULTACC parameter value) for MapReduce sequential file access for individual requests. This support overrides the value in the server parameter ACIMAPREDUCETRACKS (NUMBER OF MAP REDUCE TRACKS TO READ) for individual requests. Sample VTB rule HLVMLTAC is provided.

To override the MULTACC value, you must enable the HLVMLTAC rule and use the MACC_nn_prefix for table names in your SQL statement.

The HLVMLTAC rule is invoked every time a table with the prefix MACC_nn_is found in the SQL statement. The following format is expected:

MACC_nn_virtualtablename

Where:

• nn is the number of tracks to read ahead (the MULTACC value) when reading sequential data sets
• virtualtablename is the name of the virtual table

For example:

SELECT * from MACC_15_STAFF_SSEQ;

The following message is displayed in the Server Trace:
Use the following procedure to set up the rule.

**Procedure**

1. Customize the server configuration member (hlvidIN00) to enable virtual table rule events by configuring the SEFVTBEVENTS parameter in the member, as follows:

   "MODIFY PARM NAME(SEFVTBEVENTS) VALUE(YES)"

2. Access the VTB rules, as follows:
   a. In the Accelerator Loader - Primary Option Menu, specify option E, Rules Mgmt.
   b. Specify option 2, SEF Rule Management.
   c. Enter VTB for Display Only the Ruleset Named.

3. Enable the rule by specifying E next to HLVMLTAC and pressing Enter.
4. Set the rule to Auto-enable by specifying A next to HLVMLTAC and pressing Enter.

   Setting a rule to Auto-enable activates the rule automatically when the server is re-started.

**Configuring access to IBM CICS**

For VSAM data access via the CICS Transaction Server (TS), you need to configure the server configuration member and CICS TS.

**Before you begin**

The server must already be installed.

**About this task**

The server connects to CICS TS, via the IBM EXCI (External CICS Interface).

CICS provides logging and recovery facilities that are required if VSAM updates are being applied. When accessing VSAM files that are owned by CICS TS, recovery is provided by CICS TS.

**Configuring the server started task JCL**

No modifications are required.

**Modifying the server configuration member**

Enable the VSAM data access via CICS TM parameters in the server configuration member.

**About this task**

The server configuration member hlvidIN00 is in data set hlq.SHLVEXEC, where hlvid represents the name of the Accelerator Loader server started task that was customized using Tools Customizer.

**Procedure**

1. In the hlvidIN00 member, locate the comment “ENABLE CICS TRANSACTION SERVER SUPPORT.”
2. Enable the CICS TS parameters by changing if DontDoThis to if DoThis.
if DoThis then
do
   "MODIFY PARM NAME(EXCI) VALUE(YES)"
   "MODIFY PARM NAME(EXCICONNECTIONNAME) VALUE(CICA)"
   "MODIFY PARM NAME(TRACEEXCIDPLEVENTS) VALUE(YES)"
   "MODIFY PARM NAME(CICSSENDABCODE) VALUE(YES)"
   "MODIFY PARM NAME(RRSCICS) VALUE(YES)"

The following table lists the parameters for configuring support for a CICS TS:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Valid values</th>
</tr>
</thead>
<tbody>
<tr>
<td>EXCI</td>
<td>Initialize EXCI support.</td>
<td>NO</td>
</tr>
<tr>
<td></td>
<td></td>
<td>YES</td>
</tr>
<tr>
<td></td>
<td>Default value.</td>
<td></td>
</tr>
<tr>
<td>EXCICONNECTIONNAME</td>
<td>EXCI Default Connection Name.</td>
<td>EXCW</td>
</tr>
<tr>
<td></td>
<td>Specifies the default CICS Connection Name for EXCI support.</td>
<td></td>
</tr>
<tr>
<td>TRACEEXCIDPLEVENTS</td>
<td>Trace EXCI DPL Events</td>
<td>NO</td>
</tr>
<tr>
<td></td>
<td>Default value.</td>
<td>YES</td>
</tr>
<tr>
<td>CICSSENDABCODE</td>
<td>Send ABEND Code to Clients.</td>
<td>NO</td>
</tr>
<tr>
<td></td>
<td>Controls the sending of the CICS ABEND code to the client.</td>
<td>YES</td>
</tr>
<tr>
<td></td>
<td>If set to YES, the ABEND code is returned to the client as part of the error message.</td>
<td></td>
</tr>
<tr>
<td>RRSCICS</td>
<td>Specifies whether RRS CICS support is active.</td>
<td>NO</td>
</tr>
<tr>
<td></td>
<td>Default value.</td>
<td>YES</td>
</tr>
</tbody>
</table>

3. Create a DEFINE CONNECTION statement for each CICS region. Include the following parameters in the statement:

   "DEFINE CONNECTION  NAME(CICA)",
   "GROUP(CICA)",
   "ACCESSMETHOD(IRC)",
   "NETNAME(CICADBVS)",
   "INSERVICE(YES)",
   "PROTOCOL(EXCI)",
   "APPLID(XXXXXXXX)",
   "LOADBALGROUP(LBG1)",
   "SECURITYNAME( )",
   end

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Valid values</th>
</tr>
</thead>
<tbody>
<tr>
<td>NAME</td>
<td>Specify a four-character name for the connection to the CICS region.</td>
<td>Four-character name</td>
</tr>
<tr>
<td>GROUP</td>
<td>Specify the same name as the connection name.</td>
<td>Eight-character name</td>
</tr>
<tr>
<td>ACCESSMETHOD</td>
<td>Specify IRC.</td>
<td>IRC</td>
</tr>
</tbody>
</table>
### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Valid values</th>
</tr>
</thead>
<tbody>
<tr>
<td>NETNAME</td>
<td>Specify the network name of the remote system. To identify these connections in CICS, use a name that is a combination of the connection name and the server subsystem name.</td>
<td>Eight-character name</td>
</tr>
<tr>
<td>INSERVICE</td>
<td>Specify YES to open the connection at server startup. Specify NO to open the connection manually.</td>
<td>NO Default value. YES</td>
</tr>
<tr>
<td>PROTOCOL</td>
<td>Specify EXCI.</td>
<td>EXCI</td>
</tr>
<tr>
<td>APPLID</td>
<td>Specify the VTAM APPLID of the target CICS.</td>
<td>No restriction on the APPLID name</td>
</tr>
<tr>
<td>LOADBALGROUP</td>
<td>Specify the name of the group that is used to balance the CICS workload across multiple CICS regions. Specify the same group name in each DEFINE CONNECTION statement that you create. (Optional)</td>
<td>Eight-character name</td>
</tr>
<tr>
<td>SECURITYNAME</td>
<td>Specify a valid security name from the remote system.</td>
<td>Eight-character name</td>
</tr>
</tbody>
</table>

4. Create a DEFINE SESSION statement for each CICS region. Include the following parameters in each statement:

```
"DEFINE SESSION   NAME(CICA)",
   "GROUP(CICA)",
   "CONNECTION(CICA)",
   "PROTOCOL(EXCI)",
   "RECEIVERFX(XD)",
   "RECEIVERCOUNT(0)",
   "SENDFPX(SD)",
   "SENDCOUNT(20)",
   "IOAREALEN(4096)",
end
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Valid values</th>
</tr>
</thead>
<tbody>
<tr>
<td>NAME</td>
<td>Specify the same name that you specified for the NAME when you defined the connection for this CICS region.</td>
<td>Four-character name</td>
</tr>
<tr>
<td>GROUP</td>
<td>Specify the same name that you specified for the NAME when you defined the connection for this CICS region.</td>
<td>Eight-character name</td>
</tr>
<tr>
<td>CONNECTION NAME</td>
<td>Specify the same name that you specified for the NAME when you defined the connection for this CICS region.</td>
<td>Four-character name</td>
</tr>
<tr>
<td>PROTOCOL</td>
<td>Specify EXCI.</td>
<td>EXCI</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Valid values</td>
</tr>
<tr>
<td>-------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>RECEIVEPFX</td>
<td>Not applicable.</td>
<td>This field should be blank if included to provide complete list of connection parameters.</td>
</tr>
<tr>
<td>RECEIVEDCOUNT</td>
<td>Not applicable.</td>
<td>This field should be blank if included to provide complete list of connection parameters.</td>
</tr>
<tr>
<td>SENDPFX</td>
<td>Specify a one- or two-character prefix for the session name. The session name, which is limited to four characters, is composed of the prefix and the session number. Therefore, if you define more than 99 sessions, specify a one-character prefix.</td>
<td>A one- or two-character prefix</td>
</tr>
<tr>
<td>SENTCOUNT</td>
<td>Specify the maximum number of concurrent transactions. This value should match the RECEIVEDCOUNT value minus one set in the DEFINE SESSIONS definition in the HLVCICSD job.</td>
<td>Any number up to 255</td>
</tr>
<tr>
<td>IOAREALEN</td>
<td>Specify the length, in bytes, of the terminal input/output area to use to process transmitted messages.</td>
<td>Any value up to 4096K</td>
</tr>
</tbody>
</table>

**Configuring CICS**

Configure CICS by modifying the CICS started tasks JCL, the System Initialization Table (SIT), and the DFHCSD file.

**Procedure**

1. Add the hlq.SHLVCLOD library to the DFHRPL concatenation in each CICS region that you want to connect to server.

2. Use the CEMT INQUIRE IRC command to verify that the CICS interregion communication (IRC) facility is open. To start IRC at CICS system startup, ensure that the IRCSTRT=YES parameter is in the SITPARM for the CICS region.

3. Update the DFHCSD file by performing the following steps:
   a. For each CICS region, modify and submit the HLVCICSD job that is in hlq.SHLVCNTL data set:
      - Update the DEFINE CONNECTION and DEFINE SESSION values to match the definitions that you specified in the server configuration member. The GROUP value is the CICS GROUPNAME and does not need to match the GROUP name that is defined for the server. By default, 21 sessions are defined. Set this value to the maximum number of concurrent transactions for a single instance of server. The maximum value is 250.
      - Change the name of the hlq.FILEA data set to the FILEA VSAM data set name. This VSAM file is used when you verify access to CICS data.

The member contains additional information about modifying the job.
b. Update LIST(YOURLIST) to match the startup group list for the CICS region.

c. Review more comments in the JCL notes section for additional considerations. Define all of the definitions in the hlq.SHLCNTL(HLVCICSD) member.

**Configuring security**
Configure security to provide user access to CICS TS.

**About this task**
See "CICS security" in the *Administrator’s Guide*.

**Configuring access to zFS files**
The Accelerator Loader server is already configured to support zFS files. No modifications are needed to configure access to zFS files.

**Configuring access to SMF data for IT Operational Analytics**
IT Operational Analytics (ITOA) allows you to retrieve, analyze, and report data for IT operations. System information can be logged using the IBM System Management Facility (SMF) and the native Accelerator Loader server logging feature. Logging allows you to collect various system and operations-related information.

**Before you begin**
Verify that the following IBM APARs have been applied:

- **APAR OA49263** This APAR provides real-time SMF support and is a requirement for the configuration of real-time SMF data access. (The closed date for this APAR is 2016-08-31.)

- **APAR OA48933** This APAR is required to address accessing log streams. SMF log stream configuration is required for in-memory resource support. (The closed date for this APAR 2015-11-24.)

**About this task**
Virtual tables for SMF are provided in the *hlq.SHLVMAP* data set.

The following options are available to access the SMF data:

- Reading data from SMF data sets - SMF information is recorded in MANx data sets. When a data set gets full, the data is processed via IFASMFDP. When defining global variables for accessing SMF data in data sets, the output of IFASMFDP is used.

- Reading data from log streams - SMF information is recorded in multiple log streams and data can be read directly from the log streams. Log stream recording is determined by the data set name beginning with IFASMF that is used in the VTB rule for SMF.

- Reading SMF data from in-memory (real-time) - SMF information is read directly from the system buffer. SMF information is read in real time.

When defining the global variables for SMF, the data set can be either a log stream or a SMF dump data set from IFASMFDP. The log stream data set is recommended for access to near-real-time data.
To configure access to IT Operational Analytics data, see the following topics:

- “Configuring access to System Management Facility (SMF) files”
- “Configuring access to SYSLOG files” on page 174
- “Configuring access to OPERLOG files” on page 176

Configuring access to System Management Facility (SMF) files

By default, access to System Management Facility (SMF) files is enabled in the Accelerator Loader server started task JCL and the server configuration member. To enable reading SMF data real-time using log streams, you must have the SMFPRMxx member in the system PARMLIB data set configured to use both log streams and in-memory resources. Follow the steps in this section to use SMF GDG data set names, or to use dynamic data set names.

About this task

SMF data set names are dynamic in local environments and require SEF rules enablement and optionally Global Variables set to specific values to provide data set names to the virtual tables and views when using SMF data set or log stream configurations.

You can choose either GDG data set name support or dynamic data set name support, or both, to quickly access your SMF data. These two options are provided for your convenience to help you start accessing your SMF data. Custom rules may need to be developed to use your local naming convention to access your SMF files.

Procedure

1. To enable real-time access to SMF data, add the following statements to the hlvidIN00 member after the GLOBAL PRODUCT OPTIONS statement.

   IF DoThis
   THEN DO
      "DEFINE SMF NAME(IFASMF.INMEM)",
      "BUFSIZE(500)",
      "TIME(0)"
   END

   Note: You must have the SMFPRMxx member in the system PARMLIB data set configured to use log streams and in-memory resources.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Valid values</th>
</tr>
</thead>
<tbody>
<tr>
<td>NAME</td>
<td>Specifies the name of the in-memory resource. This value must match the name of a resource defined to SMF with the INMEM parameter. If this parameter is included, the in-memory API will be read continuously and a buffer of the most recent records will be maintained.</td>
<td>This parameter must contain the name of an in-memory resource defined to SMF with the INMEM statement. The format of the name is defined by SMF configuration, which is 1-26 characters and must begin with IFASMF.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Valid values</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
<td>--------------</td>
</tr>
<tr>
<td>BUFSIZE</td>
<td>Indicates how much SMF data (megabytes) will be retained in memory for queries. If the buffer fills up, the oldest data will be discarded. In parallel, SMF is recording these records to a log stream. This parameter applies to the resource named in the NAME parameter.</td>
<td>1-10,000</td>
</tr>
<tr>
<td>TIME</td>
<td>Indicates how long (in minutes) to keep SMF data in memory. Older data will be discarded. Specifying 0 indicates no time limit and data will be retained until the buffer fills up. This parameter applies to the resource named in the NAME parameter.</td>
<td>0-1440</td>
</tr>
</tbody>
</table>

2. To use SMF data in compressed log streams, add the following statement to the hlvidIN00 member:

"MODIFY PARM NAME(ZEDCCOMPRESSION)      VALUE(YES)"

**Note:** You must have the SMFPRMxx member in the system PARMLIB data set configured to use compressed log streams, and the zEDC Express hardware feature must be installed. For more information about enabling zEDC, see "Systems Data Compression (zEDC)" on page 378.

3. To use SMF_1100P* maps, add the following statements to the hlvidIN00 member:

"MODIFY PARM NAME(ACIMAPREDUCEBUFF) VALUE(16383K)"
"MODIFY PARM NAME(ACIMAPREDUCESPACE) VALUE(64)"

4. Enable reading SMF data from GDG data sets and access to SMF data using dynamic data set names by enabling Server Event Facility rule HLVSMFT1 in the VTB ruleset. You can select from a GDG data set, any SMF dump data set, a log stream data set, or the in-memory stream. Activate your options by customizing the rule.

   a. Use the following steps to enable rule HLVSMFT1 in the VTB ruleset:

   1) On the main menu, select **Server administration**.
   2) In the Administer Accelerator Loader Server menu, specify option 3, **Manage Rules**.
   3) Specify option 2, **SEF Rule Management**.
   4) Enter VTB for **Display Only the Ruleset Named**.
   5) Enable the rule by specifying E and pressing Enter.
   6) Set the rule to Auto-enable by specifying A and pressing Enter.

   Setting the rule to Auto-enable activates the rule automatically when the server is re-started.

   b. Configure the access method using one or more of the following methods:

   - Review the information in the rule for the instructions on setting Global Variables that will be used by the rule. Navigate one screen back on the...
ISPF panel, or start over by going to option 3, Manage Rules, and then option 1, Global Variables. In the Global Variables display, perform the following steps:
1) Change Global Prefix to GLOBAL2.
2) Select SMFTBL2 by entering $ next to the SMFTBL2 data set.
3) Configure the SMF data access option. DEFAULT should have corresponding SMF dump data set names if used. This option can be used to specify the source SMF, such as GDGBASE, INMEM, and LOGSTREAM.

Note:

VTB rules and global variables may be used to reference a GDG data set, any SMF dump data set, a log stream data set, or the in-memory stream. For example:
GLOBAL2.SMFGBL2.YESTERDAY = "YOUR.DATASET.SMFDUMP(-1)"
GLOBAL2.SMFGBL2.M2 = "YOUR.DATASET.SMFDUMP(-2)"
GLOBAL2.SMFGBL2.M3 = "YOUR.DATASET.SMFDUMP(-3)"
GLOBAL2.SMFGBL2.M4 = "YOUR.DATASET.SMFDUMP(-4)"
GLOBAL2.SMFGBL2.M5 = "YOUR.DATASET.SMFDUMP(-5)"
GLOBAL2.SMFGBL2.IM = "IFASMF.INMEM"
GLOBAL2.SMFGBL2.IM2 = "IFASMF.INMEM2"
GLOBAL2.SMFGBL2.LOG = "LOGSTREAM.dataset.name"

• Pass a dynamic data set name for SMF tables using the following format for the table name in the SQL statement:
TableMapName__DataSetName
Where DataSetName is prefixed by two underscores (_ _) and the periods in the data set name are replaced with single underscores (_).
For example, SELECT * FROM SMF_01400__DATA_SET_NAME would translate into an SQL query of SELECT * FROM SMF_14000 and access the data set DATA_SET_NAME.

• Pass a dynamic data set name for SMF virtual views using the following format for the virtual view name in the SQL statement:
ViewMapName__DataSetName
Where DataSetName is prefixed by two underscores (_ _ ) and the periods in the data set name are replaced with single underscores (_).
For example, SELECT * FROM SMFV_01400__DATA_SET_NAME would translate into an SQL query of SELECT * FROM SMFV_01400 and access the data set DATA_SET_NAME.

Configuring access to SYSLOG files
The Accelerator Loader server is enabled to support access to SYSLOG files. Use these steps to enable the rule.

About this task

Virtual table rules are provided that support the processing of SYSLOG files and vary based on the type of file name used for your SYSLOG data sets. Each of the rules for SYSLOG processing requires that the table names in the SQL begin with SYSL0G. The following rules are provided:

HLVSYSLOG
This rule uses a global variable to specify the name of the data set to use for the SYSLOG data.
HLVSYSL2

This rule supports the use of generation data group (GDG) data set names. One of the following formats is expected:

- SYSLOG_GDG_nnnn

Where nnnn is a relative GDG number (between 0 and 9999) that is appended to the GDG base name value that is obtained from the GLOBAL2.SYSLOG.GDGBASE variable. For example, if the table name as specified in the SQL statement is SYSLOG_GDG_1, then the data set name returned by this rule is HLQ.SYSLOG(-1), depending on the value in GLOBAL2.SYSLOG.GDGBASE.

- SYSLOG_DSN_suffix

Where suffix is used as the last part of a global variable of the form GLOBAL2.SYSLOG.suffix in order to look up the name of the data set to be used. If this variable does not exist, the data set name specified in GLOBAL2.SYSLOG.DEF is used to read the SYSLOG records.

By using global variables, you do not need to modify the code in the rule. The following are some examples of global variables that can be set up to be used in conjunction with this rule:

<table>
<thead>
<tr>
<th>Global Prefix:</th>
<th>GLOBAL2.SYSLOG</th>
</tr>
</thead>
<tbody>
<tr>
<td>Subnode Name</td>
<td>Nodes</td>
</tr>
<tr>
<td>---------------</td>
<td>----------------</td>
</tr>
<tr>
<td>GDGBASE</td>
<td>0</td>
</tr>
<tr>
<td>DEFAULT</td>
<td>0</td>
</tr>
<tr>
<td>TODAY</td>
<td>0</td>
</tr>
<tr>
<td>YESTERDAY</td>
<td>0</td>
</tr>
</tbody>
</table>

HLVSYSL3

This rule lets you dynamically specify in your SQL the name of the data set to use when processing SYSLOG files. In the SQL, the table name must begin with the prefix SYSLOG; the rest of the table name is used by the rule to determine the actual data set name to use for processing the SYSLOG records.

The following format is expected:

SYSLOG__DatasetName

Where DatasetName is preceded by two underscores (__) and the periods in the data set name are replaced with single underscores (_). For example, SELECT * FROM SYSLOG__DATA_SET_NAME would translate into an SQL query of SELECT * FROM SYSLOG and access the data set DATA.SET.NAME.

To use one of the rules, you must enable the rule and use the prefix SYSLOG for table names in your SQL statement. The enabled rules are invoked every time a table with the prefix SYSLOG is found in the SQL statement.

Use the following procedure to set up the rules.

Procedure
1. Access the VTB rules, as follows:
   a. In the Accelerator Loader - Primary Option Menu, specify option E, Rules Mgmt.
   b. Specify option 2, SEF Rule Management.
   c. Enter VTB for Display Only the Ruleset Named.
2. For HLVSYSLG, customize the rule, as follows:
   a. Specify S next to HLVSYSLG to edit the rule.
   b. Customize the rule with the SYSLOG data set name.
   c. Save your changes and exit the editor.

   **Note:** For HLVSYSL2 and HLVSYSL3, no customization of the rule is needed.

3. Enable each rule by specifying E next to the member name and pressing Enter.
4. Set each rule to Auto-enable by specifying A next to the member name and pressing Enter.

   Setting a rule to Auto-enable activates the rule automatically when the server is re-started.

5. If global variables are needed, set up the SYSLOG global variable.

### Configuring access to OPERLOG files

No modifications are needed to configure the Accelerator Loader server to access OPERLOG data; however, OPERLOG must be active in a system logger log stream.

#### About this task

Use the following procedure to verify that OPERLOG is active in a system logger log stream.

#### Procedure

To display the active medium where messages are recorded, enter the following command:

```
D C,HC
```

The following results are expected:

```
CNZ41001 15.19.16 CONSOLE DISPLAY 056
CONSOLES MATCHING COMMAND: D C,HC
MSG:CURLR=0 LIM=9000 RPLY:CURLR=0 LIM=9999 SYS=P02 PFK=00
HARDCOPY LOG=(SYSLOG,OPERLOG) CMDLEVEL=CMDS
ROUT=(ALL)
LOG BUFFERS IN USE: 0 LOG BUFFER LIMIT: 9999
```

### Configuring access to CA IDMS data

To access CA IDMS data, you must configure the Accelerator Loader server started task JCL. You can then optionally verify access to the data.

Accelerator Loader server started task JCL changes are required to access CA IDMS software and define default CA IDMS settings.

#### Restrictions

The following restrictions and considerations apply when accessing CA IDMS data:

- SELECT-only support is provided.
- CA IDMS Logical Record Facility (LRF) is not supported. Virtual views provide many of the same capabilities as LRF and can be used in place of LRF.
- Data access uses CA IDMS network DML only. The CA IDMS SQL product is not required.

**Note:**
Server configuration parameters control the following behaviors and can be modified if necessary:

- CA IDMS run-unit management, specifically maximum run-units and a timeout value for inactive run-units
- CA IDMS access tracing

**Configuring the server started task JCL**

Modify the server started task JCL to access CA IDMS and define default CA IDMS settings.

**Before you begin**

All LOAD library data sets allocated to the Accelerator Loader server in the server started task JCL must be APF-authorized.

**About this task**

Modify the server started task JCL to access CA IDMS and define default IDMS settings.

**Procedure**

1. Add the CA IDMS load libraries to the STEPLIB, which are required for CA IDMS central version access.
2. Add the SYSCTL DD statement identifying the CA IDMS central version to access.
3. Add the SYSIDMS statement with additional environment parameters. Minimally, this data set should include a CVRETRY=OFF statement to prevent an WTO message when the CA IDMS central version is not active.
4. Add the CA IDMS system message data set to DCMSG.

**Modifying the server configuration member for CA IDMS**

To optionally configure server parameters for CA IDMS, you can update your Accelerator Loader server configuration file.

**About this task**

The CA IDMS server parameters can assist you in configuring CA IDMS data access. In most typical environments, the default settings for these parameters will not need modification.

**Procedure**

1. In data set hlq.SHLEVEXEC, locate member hlvidIN00, where hlvid represents the name of the Accelerator Loader server started task that was customized by using Tools Customizer.
2. Add the following statements to your hlvidIN00 member:

   "MODIFY PARM NAME(MAXIDMSRUNUNITS) VALUE(4)"
   "MODIFY PARM NAME(SQLENGIDMSTRIMOUT) VALUE(60)"

   The following table lists the parameters for configuring CA IDMS data access:
### Parameter Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Valid values</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAXIDMSRUNUNITS</td>
<td>Maximum IDMS max units. This parameter limits the number of concurrent IDMS run units that a server will start to access a CA IDMS central version. Limiting concurrent IDMS run units will prevent storage related user 3134 abends when creating run units with CA IDMS.</td>
<td>Positive numeric value. Default value is 4.</td>
</tr>
<tr>
<td>SQLENGIDMSRUTIMOUT</td>
<td>CA IDMS run unit inactivity timeout. Specifies the length of time in seconds to keep a run unit active for reuse by subsequent SQL queries in a client connection.</td>
<td>Positive numeric value. Default value is 60 seconds.</td>
</tr>
</tbody>
</table>

### Verifying access to CA IDMS data

To verify access to CA IDMS data, you can optionally install a set of maps to the sample database EMPDEMO and run queries using the installed maps.

#### Before you begin

The CA IDMS sample database EMPDEMO must be installed in the central version you plan to access.

#### About this task

You can customize and run the provided IVP job HLVISIV1 to install maps to the EMPDEMO database and network schema maps to the SYSTEM database.

The following maps are installed for verification testing using the sample EMPDEMO database:

#### Table 13. CA IDMS EMPDEMO database maps

<table>
<thead>
<tr>
<th>Map</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EMPSS01_EMPLOYEE</td>
<td>Enables SQL access to EMPLOYEE record.</td>
</tr>
<tr>
<td>EMPSS01_OFFICE</td>
<td>Enables SQL access to the OFFICE record.</td>
</tr>
<tr>
<td>EMPSS01_DEPARTMENT</td>
<td>Enables SQL access to the DEPARTMENT record.</td>
</tr>
<tr>
<td>EMPSS01_OFFICE_EMPLOYEE</td>
<td>Enables SQL access to the OFFICE-EMPLOYEE set for joining the EMPSS01_OFFICE and EMPSS01_EMPLOYEE tables.</td>
</tr>
<tr>
<td>EMPSS01_DEPT_EMPLOYEE</td>
<td>Enables SQL access to the DEPT-EMPLOYEE set for joining the EMPSS01_DEPARTMENT and EMPSS01_EMPLOYEE tables.</td>
</tr>
</tbody>
</table>

The network schema maps can be used for verification purposes if the EMPDEMO database is not installed in your central version. These maps access records and sets in the CA IDMS network schema IDMSNTWK, providing SQL access to...
application metadata. The following table provides a subset of the installed network schema maps that can be used for verification purposes:

Table 14. CA IDMS network schema IDMSNTWK maps

<table>
<thead>
<tr>
<th>Map</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IDMSNWKA_S_010</td>
<td>Enables SQL access to the S-010 network schema record. S-010 records describe application schemas defined to your IDMS central version.</td>
</tr>
<tr>
<td>IDMSNWKA_SS_026</td>
<td>Enables SQL access to the SS-026 network schema record. SS-026 records describe application subschemas defined to your IDMS central version.</td>
</tr>
<tr>
<td>IDMSNWKA_SSR_032</td>
<td>Enables SQL access to the SSR-032 network schema record. SSR-32 records describe application subschema records defined to your IDMS central version.</td>
</tr>
<tr>
<td>IDMSNWKA_S_SS</td>
<td>Enables SQL access to the S-SS set for joining the IDMSNWKA_S_010 and IDMSNWKA_SS_026 tables.</td>
</tr>
<tr>
<td>IDMSNWKA_SS_SSR</td>
<td>Enables SQL access to the SS-SSR set for joining the IDMSNWKA_SS_026 and IDMSNWKA_SSR_032 tables.</td>
</tr>
</tbody>
</table>

Procedure

1. Locate the HLVISIV1 member in the hlq.SHLCNTL data set.
2. Modify the JCL according to the instructions provided in the HLVISIV1 member.
3. Submit the job.
4. If the server is active, use the following instructions to refresh maps and make the maps available for use:
   a. From the Primary Option Menu, specify option D, Data Mapping, and press Enter.
   b. From the Data Mapping Facility menu, specify option 3, Map Refresh, and press Enter.

Results

HLVISIV1 installs CA IDMS EMPDEMO and network schema maps into the server map data set.

Configuring access to IBM MQ

For access to IBM MQ (MQ) data, you must modify the server started task, configure the server configuration member, and set virtual table options.

Accelerator Loader provides SQL-only query access to MQ queues using virtual tables. Data in MQ queues is described using COBOL or PLI data descriptions taken from copybooks or programs.

IBM MQ for z/OS Versions 7.5 and newer are supported.

Note: Server configuration parameters control MQ tracing and can be modified if necessary.
Configuring the server started task JCL
Modify the server started task JCL to access IBM MQ data.

Before you begin
All data sets that you add to the server started task JCL STEPLIB must be APF-authorized.

About this task
Modify the server started task JCL to access IBM MQ data. You can skip this task if the IBM MQ load module is in the z/OS linklist or link pack area.

Procedure
Add the IBM MQ load library to the server started task JCL STEPLIB.

Modifying the server configuration member for IBM MQ
To enable support for MQ data, you must update your Accelerator Loader server configuration file.

About this task
To be able to access MQ data in virtual tables, enable the feature in the server configuration file, as described in the following procedure.

Procedure
1. In data set hlq.SHLVEXEC, locate member hlvidIN00, where hlvid represents the name of the Accelerator Loader server started task that was customized by using Tools Customizer.
2. Add the following statement to your hlvidIN00 member:
   "MODIFY PARM NAME(MQACTIVE) VALUE(YES)"
   The following table describes this parameter:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Valid values</th>
</tr>
</thead>
<tbody>
<tr>
<td>MQACTIVE</td>
<td>Initialize IBM MQ support. This parameter must be set to YES to access MQ queues.</td>
<td>YES, NO (default value)</td>
</tr>
</tbody>
</table>

Configuring virtual table rules for IBM MQ
Configure Server Event Facility (SEF) rules to support IBM MQ data.

About this task
You can configure VTB rule options to control the MQ data access feature. These options control inclusion of the MQ message descriptor meta data fields in the virtual tables, how to handle truncated messages, and whether to perform destructive reads. Sample VTB rule HLVMDLMQ documents these settings.

When accessing MQ data with sample rule HLVMDLMQ (or equivalent options) enabled, tables prefixed with MDLMQ_* are filtered, and the map name is extracted by removing the MDLMQ_ prefix. For example, the following query will execute the rule and query virtual table MQ_CSQ7_TRADE:
SELECT * FROM MDLMQ_MQ_CSQ7_TRADE

Use the following procedure to configure the sample rule HLVMQLMQ.

**Note:** Sample rule HLVMQLMQ is intended to be used as a model and may require customization. When customizing this rule, additional logic may need to be added if different VTB variable settings are required for different MQ queues.

**Procedure**

1. Customize the server configuration member \( (hlvidIN00) \) to enable virtual table rule events by configuring the \( \text{SEFVTBEVENTS} \) parameter in the member, as follows:
   
   "\text{MODIFY PARM NAME(SEFVTBEVENTS) VALUE(YES)}"

2. Access the VTB rules, as follows:
   
   a. In the Accelerator Loader - Primary Option Menu, specify option E, Rules Mgmt.
   
   b. Specify option 2, SEF Rule Management.
   
   c. Enter VTB for Display Only the Ruleset Named.

3. Customize the HLVMQLMQ rule, as follows:
   
   a. Specify S next to HLVMQLMQ to edit the rule.
   
   b. Update the rule options as needed. The following table describes the VTB rule options that support MQ data access.

<table>
<thead>
<tr>
<th>VTB variable</th>
<th>Description</th>
<th>Valid values</th>
</tr>
</thead>
<tbody>
<tr>
<td>vtb.optbmqdg</td>
<td>Delete messages during retrieval. When set to 1, SQL queries will remove messages from the queue if ALL messages in the queue are successfully retrieved by the server.</td>
<td>0 (Default)</td>
</tr>
<tr>
<td></td>
<td>Retrieval of MQ messages will use non-browse (destructive) MQGET calls with syncpoint control. Once all messages are delivered to the server, they will be deleted from the queue. If a failure occurs before all messages are retrieved, an MQBACK call will be issued to restore messages to the queue that have been retrieved so far. Note that an MQCMIT will be issued and messages deleted if the IBM MQ syncpoint limit is reached. A failure after MQCMIT will not be able to restore messages as they have been permanently deleted.</td>
<td>1</td>
</tr>
<tr>
<td>vtb.optbmqim</td>
<td>When set to 1 for an MQ virtual table, the MQ Series Message Descriptor (MQMD) meta data fields will be added to the virtual table as columns and returned with each result row. These columns are prefixed with the value MQMD_.</td>
<td>0 (Default)</td>
</tr>
<tr>
<td></td>
<td></td>
<td>1</td>
</tr>
<tr>
<td>vtb.optbmqtc</td>
<td>By default, a truncation error reading an IBM MQ message will result in a query failure. When set to 1, MQ Series access ignores truncated message warnings and returns data received.</td>
<td>0 (Default)</td>
</tr>
<tr>
<td></td>
<td></td>
<td>1</td>
</tr>
</tbody>
</table>
c. Save your changes and exit the editor.

4. Enable the rule by specifying E next to HLVMVMDLMQ and pressing Enter.

5. Set the rule to Auto-enable by specifying A next to HLVMVMDLMQ and pressing Enter. Setting a rule to Auto-enable activates the rule automatically when the server is re-started.

**Configuring access to ADDI**

To use IBM Application Discovery and Delivery Intelligence (ADDI) information for creating virtual maps that access VSAM and sequential data, you must configure the server for ADDI access.

**System requirements**

The following system requirements apply:

- IBM Application Discovery Suite Version 5.0 or newer
- Microsoft Host Integration Server (HIS) 2016 or higher. The SYSIBM views that are part of the Microsoft HIS Software Development Kit must be installed as part of the HIS installation.
- Microsoft SQL Server 2012 Enterprise or Express or higher

**Restrictions**

The following restrictions and considerations apply when using ADDI to access VSAM and sequential data sets:

- Virtual table creation is restricted to data sets in the ADDI project that are processed by COBOL programs using JCL. Data sets accessed using CICS as well as other databases (such as IMS, CA IDMS, or Adabas) are not supported.
- Virtual table mapping is only supported through the Accelerator Loader studio. No batch utilities or ISPF interfaces are provided to map tables.

**Configuration steps**

The following configuration steps are required to use ADDI to access VSAM and sequential data:

1. Install virtual tables. See “Installing virtual tables and virtual target maps for ADDI access.”

2. Define ADDI project in the server configuration member. See “Modifying the configuration member for ADDI access” on page 183.

4. Define credentials for target database(s). See “Configuring authentication for ADDI” on page 188.

**Installing virtual tables and virtual target maps for ADDI access**

Install virtual tables and virtual target maps for IBM Application Discovery and Delivery Intelligence (ADDI) access.

**About this task**

The Accelerator Loader studio reads the ADDI project using virtual tables and views installed as part of server set up. The following maps are distributed in XMIT format in the SHLVSAMP member HLVIAMPD.
Virtual target system TSIAD_PROJECT1 for external subsystem named IAD1.

Virtual tables that map tables in the ADDI project. Each virtual table uses the name of the corresponding ADDI project table with the added prefix IAD_. For example, SQL Server table dbo.Variables has a virtual table name of IAD_VARIABLES.

Virtual views on the IAD_ virtual tables used by the Accelerator Loader studio to read ADDI data. These views are all prefixed with IADV_ (for example, IADV_DATASETS). All data access from the studio is performed using virtual views.

These maps are not installed by default. Use the following procedure to install these maps.

Procedure

1. Locate the HLVIAMPS member in the hlq.SHLVEXEC data set.
2. Modify the JCL according to the instructions provided in the HLVIAMPS member.
3. Submit the job. The virtual tables and virtual target maps are installed.

Modifying the configuration member for ADDI access

Enable and configure the parameters for IBM Application Discovery and Delivery Intelligence (ADDI) in the server configuration member.

About this task

The server configuration member contains a sample DATABASE definition that defines the first ADDI project. The initial definition is named IAD1 and is disabled.

When enabling the database definition for the first ADDI project, the LOCATION and IPADDR parameters must be set to the correct project name and IP address of the Microsoft HIS DRDA Provider Service for SQL Server. The LOCATION provides the name of the SQL Server project, and IPADDR(...) PORT(...) provide the TCP/IP information for the HIS DRDA Service. DOMAIN(...) can be used instead of IPADDR to provide the DNS of the HIS DRDA Service. The subsystem NAME(IAD1) should not be changed because a target subsystem map is configured to use this name for the virtual tables accessing the ADDI project.

For multiple ADDI projects, see “Adding an ADDI project” on page 186.

The server configuration member hlvidIN00 is in data set hlq.SHLVEXEC, where hlvid represents the name of the Accelerator Loader server started task that was customized using Tools Customizer.

Procedure

1. In the hlvidIN00 member, locate the comment “Sample IBM Application Discovery configuration”.
2. Enable the ADDI parameters by changing the syntax if D0tD0This to if D0tD0This. The following example shows the section in the configuration member to enable:
The following table lists the parameters for configuring support for ADDI:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Valid values</th>
</tr>
</thead>
<tbody>
<tr>
<td>TYPE</td>
<td>Database type. Because ADDI stores information in Microsoft SQL Server, this value must be MSSQL.</td>
<td>MSSQL</td>
</tr>
<tr>
<td>NAME</td>
<td>The database name as known to the server. The first definition must be IAD1 because the target system map names this as the subsystem to access for ADDI. For additional ADDI projects, subsystems can have any name since you must also create a virtual target system to point to it; however, it is recommended that the name start with IAD.</td>
<td>A valid value consists of 1 - 4 characters. For example, IAD1.</td>
</tr>
<tr>
<td>LOCATION</td>
<td>Name of the database for the ADDI project. The LOCATION parameter must be set to the correct database name of the target MSSQL server.</td>
<td>A valid value is a string 1 - 16 characters.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Valid values</td>
</tr>
<tr>
<td>------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>DDFSTATUS</td>
<td>The DDF activation status (Required)</td>
<td>ENABLE Make this DDF definition active within Accelerator Loader server. DDFSTATUS should always be ENABLE for TYPE(MSSQL).</td>
</tr>
<tr>
<td></td>
<td></td>
<td>DISABLE DDF endpoint is not used. This value disables the MSSQL database. This value should only be used if the database is off-line or otherwise not available for access.</td>
</tr>
<tr>
<td>SECMEC</td>
<td>Security mechanism. The DRDA security mechanism for authentication with the HIS DRDA Service for SQL Server. The SECMEC setting for TYPE(MSSQL) must match the HIS DRDA Service configuration.</td>
<td>USRIDPWD User ID and password USRIDONL User ID only USRENCPWD Encrypt the password only EUSRIDPWD Encrypt the user ID and password</td>
</tr>
<tr>
<td>IPADDR</td>
<td>Specify the IPV4 or IVP6 address of the target MSSQL server. Use DOMAIN instead of IPADDR to supply the DNS of the target HIS DRDA Server for SQL Server. Use DOMAIN if the IPADDR or the HIS DRDA Service Provider can change. Either DOMAIN or IPADDR is required, but not both.</td>
<td>A valid IPV4 or IVP6 address set to the correct remote IP address for the system running Microsoft SQL Server.</td>
</tr>

**Adding an ADDI project:**

Perform required configuration steps to add an ADDI project.

**About this task**

For multiple ADDI projects, you must perform configuration steps to define each additional ADDI project. The following requirements apply when maintaining multiple ADDI projects:

- For the first instance of an ADDI project:
  - The database name in the must be IAD1.
  - The target system for the name IAD1 is automatically installed with the ADDI maps, as described in [“Installing virtual tables and virtual target maps for ADDI access” on page 182](#).

- For subsequent ADDI projects:
  - It is recommended that the database name start with IAD.
  - The target system must start with TSIAD.

Perform the following procedure for each additional ADDI project.

**Procedure**

1. Repeat the database definition in the configuration member and make the following changes:
a. Change the NAME value to a unique name (for example, IAD2).
b. Change the LOCATION value to match the Microsoft SQL Server project name containing the ADDI project you need to access.

For information about the database definition parameters, see “Modifying the configuration member for ADDI access” on page 183.

2. Define a new virtual target system using the studio. The name of the virtual target system must start with TSIAD. This can be done in the Accelerator Loader studio by selecting the Create Virtual Target System in the Server tab under the SQL > Target Systems > DBMS node of the tree. The connection value in each definition must match the NAME value defined in the DATABASE definition in the configuration member.

3. If required, create authentication information using the HLVDRATH batch utility.

Configuring virtual table rules for ADDI
Configure Server Event Facility (SEF) rules to support multiple projects using common virtual table and view definitions.

About this task

To support multiple projects using common virtual table and view definitions, VTB rules HLVIADTB and HLVIADVW provide support to process tables starting with IAD_ and views starting with IADV_.

HLVIADTB
This table rule looks at the base view of a query for double underscores “__” and uses the data after the underscores to update the target subsystem for the query.

HLVIADVW
This view rule looks for the double underscores and removes them from the view name to process.

With the rules activated, the Accelerator Loader studio can suffix the view names with __SSID for all calls and process multiple ADDI projects using a single set of maps.

These rules must be activated regardless of the number of ADDI projects to be enabled.

Use the following procedure to set up these rules.

Procedure

Use the following steps to enable rules HLVIADTB and HLVIADVW in the VTB ruleset:
1. In the Accelerator Loader - Primary Option Menu, specify option E, Rules Mgmt.
2. Specify option 2, SEF Rule Management.
3. Enter VTB for Display Only the Ruleset Named.
4. Enable the rules by specifying E and pressing Enter.
5. Set the rules to Auto-enable by specifying A and pressing Enter.

Setting a rule to Auto-enable activates the rule automatically when the server is re-started.
Configuring authentication for ADDI
Configure authentication for communicating with the IBM Application Discovery and Delivery Intelligence (ADDI) project.

About this task
It is common for data centers to assign different user IDs for access to z/OS and for access to SQL Server. By default, the server will attempt to log on to SQL Server with the same user ID that was presented for logon to z/OS. A facility is provided in the server to optionally change the logon credentials for a user when accessing SQL Server.

When communicating between the Accelerator Loader server and the ADDI project, you must define what credentials to use in MSSQL connections if z/OS users are not defined as users to SQL Server. To accomplish this, the following tools are provided:

HLVDRATH
A utility that sets encrypted passwords in GLOBALU variables. Use this utility to define alternate logon information for the Accelerator Loader server started task and z/OS users. This utility places SQL Server authentication information in GLOBALU system variables for connecting to ADDI projects. You can also use this utility to list existing credential information.

HLVEMSSG
An ATH rule that swaps z/OS user information with SQL Server authentication information defined using the HLVDRATH utility. This rule uses AES encrypted passwords stored as GLOBALU system variables.

You can use any of the following options for authentication:
• Use z/OS IDs for authentication
• Add a global default user definition using sample job HLVDRATH and enable ATH rule HLVEMSSG
• Add authentication information for specific mainframe users using sample job HLVDRATH and enable ATH rule HLVEMSSG

Network administrators may need to open ports for DRDA communication between the z/OS host and the Microsoft SQL Server machine(s) hosting ADDI projects. The default port for Microsoft SQL Server access is 446.

If z/OS user IDs are not defined to Microsoft SQL Server, use the following procedure to define alternate authentication information for the started task and z/OS users requiring access to this feature:

Procedure
1. Use the sample job HLVDRATH to add a global default user definition or authentication information for specific mainframe users as follows:
   a. Locate the HLVDRATH member in the hlq.SHLVCNTL data set.
   b. Modify the JCL according to the instructions provided in the HLVDRATH member.
      When adding the SYSIN statements that define the alternate credentials for logging in to your ADDI project, as instructed in the JCL, make sure to specify the correct DBTYPE. For ADDI projects, specify DBTYPE=MSSQL.
   c. Submit the job.
d. Optional: To verify the information stored in the GLOBALU variables and list existing authentication, use the REPORT=SUMMARY statement in the HLVDRATH member and submit the job.

2. Auto-enable the SEF ATH rule SHLVXATH(HLVEMSSG) to switch credentials when connecting to ADDI using DRDA. Global variables are used to define alternate authentication credential mapping for the SEF ATH rule.
   a. On the main menu, select **Server administration**.
   b. On the Administer Accelerator Loader Server menu, select option 3 for Manage Rules.
   c. Select option 2 for SEF Rule Management.
   d. Enter * to display all rules, or ATH to display only authentication rules.
   e. Set Auto-Enable for the HLVEMSSG rule member by entering A and pressing Enter.

**Configuring access to RAA**

To use IBM Rational Asset Analyzer (RAA) information for creating virtual maps that access VSAM and sequential data, you must configure the server for RAA access.

**System requirements**

The following system requirement applies:

- IBM Rational Asset Analyzer for System z 6.1 PID5655-W57

**Restrictions**

The following restrictions and considerations apply when using RAA to access VSAM and sequential data sets:

- Virtual table creation is restricted to data sets in the RAA database that are processed by COBOL programs using JCL. Data sets accessed using CICS as well as other databases (such as IMS, CA IDMS, or Adabas) are not supported.
- Virtual table mapping is only supported through the Accelerator Loader studio. No batch utilities or ISPF interfaces are provided to map tables.

**Configuration steps**

The following configuration steps are required to use RAA to access VSAM and sequential data:

1. Install virtual tables. See "Installing virtual tables and virtual target maps for RAA access."
2. Define RAA database in the server configuration member. "Modifying the configuration member for RAA access" on page 190.

**Installing virtual tables and virtual target maps for RAA access**

Install virtual tables and virtual target maps for IBM Rational Asset Analyzer (RAA) access.
About this task

The Accelerator Loader studio reads the RAA database using virtual tables and views installed as part of server set up. The following maps are distributed in XMIT format in the SHLSAMP member HLVRAAMPD.

ZRAATSPR
Virtual target system TSRAA_PROJECT1 for external subsystem named RAA1.

ZRAAT001-ZRAAT010
Virtual tables mapping tables in the RAA database. All tables use the same name as the corresponding RAA database table with a prefix of RAA_ (for example, “DMH”.”DMH_DATA_RECORD” in Db2 has a virtual table name of RAA_DATA_RECORD).

ZRAAV001-ZRAAV003
Virtual views on the RAA_ virtual tables used by the Accelerator Loader studio to read RAA data. These views are all prefixed with RAAV_ (for example, RAAV_DATASETS). All data access from the studio is performed using virtual views.

These maps are not installed by default. Use the following procedure to install these maps.

Procedure
1. Locate the HLVRAAMPS member in the hlq.SHLVVCNTL data set.
2. Modify the JCL according to the instructions provided in the HLVRAAMPS member.
3. Submit the job. The virtual tables and virtual target maps are installed.

Modifying the configuration member for RAA access
Enable and configure the parameters for IBM Rational Asset Analyzer (RAA) in the server configuration member.

About this task

The server configuration member contains a sample DATABASE definition that defines the first RAA database.

When enabling the database definition for the first RAA instance, the LOCATION and IPADDR parameters must be set to the database information for the Db2 on z/OS subsystem hosting the RAA database. The subsystem NAME(RAA1) should not be changed because a target subsystem map is configured to use this name for the virtual tables accessing the RAA database.

For multiple RAA databases, see “Adding an RAA database” on page 192.

The server configuration member hlvidIN00 is in data set hlq.SHLVEXEC, where hlvid represents the name of the Accelerator Loader server started task that was customized using Tools Customizer.

Procedure
In the hlvidIN00 member, locate the comment “IBM Rational Asset Analyzer location”. The following example shows the section in the configuration member to locate:
The following table lists the parameters for configuring support for RAA:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Valid values</th>
</tr>
</thead>
<tbody>
<tr>
<td>TYPE</td>
<td>Database type. Because RAA stores information in Db2 for z/OS, this value must be ZOSRDRA.</td>
<td>ZOSRDRA</td>
</tr>
<tr>
<td>NAME</td>
<td>The database name as known to the server.</td>
<td>A valid value consists of 1 - 4 characters, starting with RAA. For example, RAA1.</td>
</tr>
<tr>
<td>LOCATION</td>
<td>Name of the database.</td>
<td>A valid value is a string 1 - 16 characters.</td>
</tr>
</tbody>
</table>
| DDFSTATUS  | The DDF activation status, which can be altered online by using the ISPF 4-Db2 dialog panels. (Required) | ENABLE: Make this DDF definition active within Accelerator Loader server.  

DISABLE: DDF endpoint is not used. |
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Valid values</th>
</tr>
</thead>
<tbody>
<tr>
<td>PORT</td>
<td>The TCP/IP port at which the server is listening. (Required)</td>
<td>A valid 1-5 numeric string.</td>
</tr>
<tr>
<td>IPADDR</td>
<td>Specify the dot-notation IPV4 address of the DDF endpoint. For the first RAA instance, the IPADDR parameter must be set to the database information for the Db2 on z/OS subsystem hosting the RAA database. (Optional)</td>
<td>If this parameter is not specified, the value 127.0.0.1 (local host) is the default. For group director definitions, use the DVIPA IP address of the group director.</td>
</tr>
<tr>
<td>CCSID</td>
<td>Specify the EBCDIC single-byte application CCSID (Coded Character Set Identifier) configured for this RDBMS subsystem on the RDBMS installation panel DSNTIPF, option 7. (Optional)</td>
<td>Refer to the RDBMS vendor documentation for a list of valid CCSIDs.</td>
</tr>
<tr>
<td>APPLNAME</td>
<td>Application name. The APPLNAME used by the target endpoint for passticket generations. (Optional)</td>
<td>A valid value is 1 - 8 characters. If APPLNAME is not specified in the definition statement, no default value is provided and passticket access is disabled. <strong>Note:</strong> APPLNAME is not required when connecting from the JDBC driver.</td>
</tr>
</tbody>
</table>

Adding an RAA database:

Perform required configuration steps to add an RAA database.

**About this task**

For multiple RAA databases, you must perform configuration steps to define each additional RAA database. The following requirements apply when maintaining multiple RAA databases:

- For the first instance of an RAA database:
  - The database name in the must be RAA1.
  - The target system for the name RAA1 is automatically installed with the RAA maps, as described in “Installing virtual tables and virtual target maps for RAA access” on page 189.

- For subsequent RAA databases:
  - It is recommended that the database name start with RAA.
  - The target system must start with TSRAA.

Perform the following procedure for each additional RAA database.
Procedure

1. Repeat the database definition in the configuration member and make the following changes:
   a. Change the NAME value to a unique name (for example, RAA2).
   b. Change the LOCATION value to reference the Db2 subsystem hosting the RAA database.

   For information about the database definition parameters, see “Modifying the configuration member for RAA access” on page 190.

2. If the schema (table owner) used by RAA is not ‘DMH’, update the system global variable GLOBAL2.RAA.database-name.SCHEMA to the correct schema name for the RAA database tables.

3. Define a new virtual target system using the studio. The name of the virtual target system must start with TSRAA. This can be done in the Accelerator Loader studio by selecting the Create Virtual Target System in the Server tab under the SQL > Target Systems > DBMS node of the tree. The connection value in each definition must match the NAME value defined in the DATABASE definition in the configuration member.

4. If required, create authentication information using the HLVDRATH batch utility.

Configuring virtual table rules for RAA

Configure Server Event Facility (SEF) rules to support multiple instances of the IBM Rational Asset Analyzer (RAA) schema using common virtual table and view definitions.

About this task

To support multiple instances of the RAA schema using common virtual table and view definitions, VTB rules HLVRAATB and HLVRAAVW provide support to process tables starting with RAA_ and views starting with RAAV_.

HLVRAATB

This table rule looks at the base view of a query for double underscores “__” and uses the data after the underscores to update the target subsystem for the query. This rule will also change the schema (or table owner) name of RAA tables from DMH to another value if the global system variable GLOBAL2.RAA.database-name.SCHEMA is set with an alternate schema name.

HLVRAAVW

This view rule looks for the double underscores and removes them from the view name to process.

With the rules activated, the Accelerator Loader studio can suffix the view names with _SSID for all calls and process multiple instances of the RAA schema using a single set of maps.

These rules must be activated regardless of the number of RAA databases to be enabled.

Use the following procedure to set up these rules.
Procedure

Use the following steps to enable rules HLVRAATB and HLVRAAVW in the VTB ruleset:

1. In the Accelerator Loader - Primary Option Menu, specify option E, Rules Mgmt.
2. Specify option 2, SEF Rule Management.
3. Enter VTB for Display Only the Ruleset Named.
4. Enable the rule by specifying E and pressing Enter.
5. Set the rules to Auto-enable by specifying A and pressing Enter.

Setting a rule to Auto-enable activates the rule automatically when the server is re-started.

Configuring authentication for RAA

Configure authentication for communicating with the IBM Rational Asset Analyzer (RAA) database.

About this task

Since RAA is hosted on a z/OS Db2 database, the z/OS credentials that are used to connect to Accelerator Loader should also be usable for the z/OS system where Db2 resides. By default, the Accelerator Loader server will attempt to use the same user ID that was presented for logon to z/OS for access to the RAA database. To use these credentials, the user ID must have SELECT access on the RAA tables in Db2.

If you choose to specify alternate credentials when communicating between the Accelerator Loader server and the RAA database, you must define what credentials to use. A facility is provided in the server to optionally change the logon credentials for a user when accessing the RAA database. To accomplish this, the following tools are provided:

HLVDRATH

A utility that sets encrypted passwords in GLOBALU variables. You can also use this utility to list existing credential information.

HLVEDB2G

An ATH rule that switches credentials when connecting to an RAA database using DRDA. This rule uses AES encrypted passwords stored as GLOBALU system variables.

You can use any of the following options for authentication:

• Use z/OS IDs for authentication
• Add a global default user definition using sample job HLVDRATH and enable ATH rule HLVEDB2G
• Add authentication information for specific mainframe users using sample job HLVDRATH and enable ATH rule HLVEDB2G

If z/OS user IDs and passwords used to connect to the Accelerator Loader server are not authorized for the Db2 database hosting the RAA tables, you must define the credentials to use. Use the following procedure.

Procedure

1. Use the sample job HLVDRATH to add a global default user definition or authentication information for specific mainframe users as follows:
a. Locate the HLVDRATH member in the hlq.SHLCNTL data set.

b. Modify the JCL according to the instructions provided in the HLVDRATH member.

   When adding the SYSIN statements that define the alternate credentials for logging in to your RAA database, as instructed in the JCL, make sure to specify the correct DBTYPE. For RAA databases, specify DBTYPE=ZOSDRDA.

c. Submit the job.

d. Optional: To verify the information stored in the GLOBALU variables and list existing authentication, use the REPORT=SUMMARY statement in the HLVDRATH member and submit the job.

2. Auto-enable the SEF ATH rule SHLVXATH(HLVEDB2G) to switch credentials when connecting to RAA using DRDA. Global variables are used to define alternate authentication credential mapping for the SEF ATH rule.

   a. On the main menu, select Server administration.

   b. On the Administer Accelerator Loader Server menu, select option 3 for Manage Rules.

   c. Select option 2 for SEF Rule Management.

   d. Enter * to display all rules, or ATH to display only authentication rules.

   e. Set Auto-Enable for the HLVEDB2G rule member by entering A and pressing Enter.

---

**Configuring generation data set retrieval**

You can configure the server to read only a subset of generation data sets (GDSs) by activating a VTB rule.

**About this task**

To read only a subset of generation data sets in a generation data group (GDG), you must enable virtual rule HLVGDGS1 and use the prefix GDG__ in your SQL statement.

A VTB rule is provided that allows a subset of the GDG to be read. VTB rule HLVGDGS1 is invoked by the SEF every time a table with the prefix GDG__ is found in the SQL statement.

The table name in the SQL statement must be of the form:

```
GDG__NumGens_RelGen_MapName
```

Where:

- `GDG__` is a constant indicating a generation data set request.
- `NumGens` is a required number 0 through 999 indicating the number of generations to read.
- `RelGen` is an optional number 0 through 999 indicating the relative generation at which to start reading. A value of 0 is equivalent to a suffix of (0) in a JCL allocation; a value of 1 is equivalent to (-1), and so on.
- `MapName` is the table defined in the map data set.

For example, the following request will result in generations HLQ.GDG.STAFF(-3) through HLQ.GDG.STAFF(-6) being retrieved:

```
SELECT * FROM GDG__4_3_STAFF
```
Where the STAFF table specifies a base data set name of HLQ.GDG.STAFF. In other words, with this request, four generations will be read in descending generation order beginning with relative generation 3 (that is, generations 3, 4, 5, and 6).

Use the procedure in this task to enable sample rule HLVGDBG1.

Additional details:

When a request is made to allocate a data set, it will first be determined if the data set name represents a GDG base name. If so, a CSI lookup call will be made to return the associated GDS data set names. If a VTB rule does not specify the number of generations to read and MapReduce is disabled, or if there is a single generation, the GDG will be allocated using its base data set name, and normal system concatenation of generation data sets will occur. If MapReduce is enabled and there are multiple active generation data sets, a number of I/O processing tasks will be created. The number of I/O tasks is determined as follows:
1. If VPD is in use, the number of VPD I/O threads specified.
2. If MRC is in use, the number of active Client threads defined in the MRC request.
3. If neither VPD nor MRC is in use, the number of I/O threads will be equal to the lesser of the following:
   - The number of active generation data sets in the GDG
   - The number of generations requested by a VTB rule
   - The number of MapReduce tasks specified in the ACIMAPREDUCETASKS configuration

When the number of I/O tasks is equal to or less than the number of generation data sets, each task will read one or more complete data sets. When the number of I/O tasks exceeds the number of generation data sets, some tasks will be idle.

Procedure

1. Customize the server configuration member (hlvidIN00) to enable virtual table rule events by configuring the SEFVTBEVENTS parameter in the member, as follows:
   "MODIFY PARM NAME(SEFVTBEVENTS) VALUE(YES)"
2. Access the VTB rules, as follows:
   a. In the Accelerator Loader - Primary Option Menu, specify option E, Rules Mgmt.
   b. Specify option 2, SEF Rule Management.
   c. Enter VTB for Display Only the Ruleset Named.
3. Enable the rule by specifying E next to HLVGDBG1 and pressing Enter.
4. Set the rule to Auto-enable by specifying A next to HLVGDBG1 and pressing Enter. Setting a rule to Auto-enable activates the rule automatically when the server is re-started.

Configuring delimited data support

To be able to process delimited data using virtual tables, you must configure a virtual table rule to activate delimited data processing and optionally define delimiter values.
About this task

Accelerator Loader provides the ability to process delimited data from files, MQ data, and log streams using virtual tables mapped to MQ or z/OS files. The most common form of delimited data is comma separate value files (.csv).

When delimited data processing is activated, processing occurs in column order, so the delimited data must include a value for each column in the map in the correct order to prevent errors. Data conversion errors will occur if the delimited data is not compatible with the host types of the columns. If conversion fails, diagnostic information related to the error is automatically logged for troubleshooting problems.

Delimited processing is supported through virtual table rules only. Using virtual table rule options, you can enable delimited data processing, set column and string delimiter values, and control header record processing.

A sample rule, HLVMDDLM, is provided that documents these settings. Use the following procedure to configure the sample rule.

Procedure

1. Customize the server configuration member (hlvidIN00) to enable virtual table rule events by configuring the SEFVTBEVENTS parameter in the member, as follows:

   "MODIFY PARM NAME(SEFVTBEVENTS) VALUE(YES)"

2. Access the VTB rules, as follows:
   a. In the Accelerator Loader - Primary Option Menu, specify option E, Rules Mgmt.
   b. Specify option 2, SEF Rule Management.
   c. Enter VTB for Display Only the Ruleset Named.

3. Customize the HLVMDDLM rule, as follows:
   a. Specify S next to HLVMDDLM to edit the rule.
   b. Find the vtb.optbd1cv variable and set to 1 to activate delimited processing for a map.
   c. Update additional rule options as needed. The following table describes the VTB rule options that support delimited data processing.

<table>
<thead>
<tr>
<th>VTB variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vtb.optbd1cv</td>
<td>Set to 1 to activate delimited processing for a map.</td>
</tr>
<tr>
<td>vtb.optbd1co</td>
<td>Set the column delimiter. The default value is the comma character (,). For example, if you use the colon character (:) as the column delimiter, specify vtb.optbd1co = ':'.</td>
</tr>
<tr>
<td>vtb.optbd1ch</td>
<td>Set the character field or string delimiter. The default value is the quotation mark character (&quot; ). For example, if you use the hash character (#) as the string delimiter, specify vtb.optbd1ch = '#'.</td>
</tr>
<tr>
<td>vtb.optbd1hr</td>
<td>Set to 1 to identify and remove the header record containing column names. If specified without a header prefix, the system compares the first token in each line to the first column name in the table to recognize and discard the header. The default is no header checking.</td>
</tr>
<tr>
<td>VTB variable</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>vtb.optbd1hp</td>
<td>Define prefix data that identifies the beginning of a header line to be discarded. The specified value can contain a maximum of 32 bytes. This value is compared to the beginning of each delimited line of data before any tokenization is performed. For example, vtb.optbd1hp = &quot;NAME&quot;,&quot;ADDRESS&quot;. Note: If an optbd1hp value is defined, it supersedes any optbd1hr setting and the optbd1hr value is ignored.</td>
</tr>
</tbody>
</table>

d. Save your changes and exit the editor.

4. Enable the rule by specifying E next to HLVMDDL and pressing Enter.

5. Set the rule to Auto-enable by specifying A next to HLVMDDL and pressing Enter. Setting a rule to Auto-enable activates the rule automatically when the server is re-started.

---

**Setting up accelerator groups**

Accelerator group support allows you to load multiple accelerators by specifying a single accelerator group name.

**About this task**

To use accelerator groups in Accelerator Loader, you must identify the accelerator group name to the Db2 system.

**Procedure**

To add an accelerator group name, insert a row into the SYSIBM.Locations table using the following settings:

<table>
<thead>
<tr>
<th>Table 15. SYSIBM.Locations settings for accelerator groups</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Column name</strong></td>
</tr>
<tr>
<td>LOCATION</td>
</tr>
<tr>
<td>LINKNAME</td>
</tr>
<tr>
<td>DBALIAS</td>
</tr>
</tbody>
</table>

---

**Modifying started task initialization options**

Use this task to modify a started task initialization option that is not available in Tools Customizer.

**About this task**

Started task initialization options are defined in the options module hloidOPTS, which is generated using Tools Customizer. Most options in the module are defined using Tools Customizer; however, there are exceptions. Use this procedure to add or update an option that is not available in Tools Customizer.
Important: It is recommended that you modify available started task initialization options through Tools Customizer. Use this procedure only for those parameters that are not included in Tools Customizer.

The following started task initialization option is not included in Tools Customizer:

<table>
<thead>
<tr>
<th>Option</th>
<th>Required?</th>
<th>Valid values</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>RC_WHEN_DB2_DISCARDS=&quot;rc&quot;</td>
<td>No</td>
<td>4-99</td>
<td>4</td>
</tr>
</tbody>
</table>

When performing Dual loads, this option controls the value of the return code (rc) that is issued when the Db2 LOAD utility discards rows that Accelerator Loader has already delivered to the accelerator. An example of when this type of condition occurs is when Db2 LOAD detects unique index key violations and discards rows with duplicate keys. This option applies when performing Dual loads only.

Procedure
1. Locate the hlloidOPTS member (where hlloid is the started task configuration ID) that was generated using Tools Customizer for your started task configuration.
2. Add or modify the started task initialization options as needed, and save your changes.
3. Recycle the Accelerator Loader started task hlloidPROC.

Applying product maintenance
Apply product maintenance and recustomize the product, if necessary.

About this task
To use the latest Accelerator Loader features, you must install product maintenance using the IBM SMP/E for z/OS program. If any updates to the Accelerator Loader configuration are necessary, you must also recustomize the product using Tools Customizer. The HOLD action in the APAR indicates if any recustomization steps are required.

For more information about recustomization, see “Roadmap: Recustomizing Db2 Analytics Accelerator Loader” on page 85.

Important:
- Running Tools Customizer to recustomize the product is not necessary every time maintenance is applied. It is recommended to recustomize the product only when indicated in the HOLD action in the APAR.
- Regenerating customization jobs will replace any existing jobs, including jobs that you might have manually modified after they were generated.
- When using the Accelerator Loader server, use caution when regenerating Tools Customizer jobs that update the server configuration file (hlvidIN00). This file might contain customized settings that will be overwritten by Tools Customizer. For more information about server-related customization in Tools Customizer, see “Task: Create the server and the server components (required)” on page 54.
Procedure

1. Download the latest PTFs to the z/OS system where you want to apply the PTFs.
2. Use SMP/E to apply the PTFs.
3. Review the HOLD action in the APAR and determine if any recustomization steps are required.
4. If necessary, use Tools Customizer to recustomize the product.
Chapter 4. Getting started

Review information about opening the ISPF interface and using it to specify values for product set-up options.

Prerequisites for using the product
- The product uses Db2 throughout its execution path, and therefore Db2 must be running in order for Db2 Analytics Accelerator Loader to start and run.
- You must have plan execution access on the Db2 Analytics Accelerator Loader plan for the Db2 subsystems on which you intend to run the product.
- Ensure that any table space that you attempt to load was created with DEFINE YES, or, if created with DEFINE NO, that the underlying VSAM linear data sets were created by an INSERT or a LOAD.

Task roadmap

By using the product’s ISPF interface, you can create JCL and control cards that are required to build the JCL to load data to Db2 and the accelerator. To use the ISPF interface, at a minimum, you must complete the following tasks. Complete optional tasks that are included in this section as needed.
1. Start the ISPF interface.
2. Configure at least one Db2 subsystem for use with the product.
3. Select the Db2 subsystem with which to work.

Starting the ISPF interface

Use the product’s ISPF interface to create the JCL and control cards that are required to build the JCL to load data to Db2 and the IBM Db2 Analytics Accelerator for z/OS from an external file or an image copy.

Before you begin
- Complete the customization steps.
- Ensure that the ISPF interface has the required minimum region size of 30000 KB.
- If you copied the CLISTs for running the interface to another data set or data set member, make sure that you specify the name of that data set or member in this procedure.

About this task

The menu-driven interface allows you to create load jobs with specific command parameters, and then save that information in profiles that can be used again. In addition, subsystem information can be configured once and then is available to all users of the interface.

Note: To load data from the Accelerator Loader server, use the Accelerator Loader studio instead of the ISPF interface.

Detailed information about command parameters and other valid values on the panels is provided in the help panels and the panel command topic in the
reference section. The panel fields are not described in detail in this procedure. Use
the help system or the command reference topics if you need more information.
An ISPF help panel for each product panel describes the purpose of the panel, and
lists available commands, fields, and column data. To display a help panel, enter
HELP or press PF1.

Procedure

From the z/OS console, issue the following operator command:

TSO ex 'hlq.mlq.SHLOCLST(HLOV21)'

Where hlq.mlq represents the high-level and mid-level qualifiers that you specified
during customization, and HLOV21 is the default value for the CLIST.

Note: For more information about using the startup CLIST, including passing
values to the Accelerator Loader main menu, see "Using the startup CLIST" on
page 968.

Results

The Accelerator Loader main menu, shown in the following figure, is displayed.

<table>
<thead>
<tr>

Figure 23. IBM Db2 Analytics Accelerator Loader for z/OS main menu

Note: When you start Db2 Analytics Accelerator Loader for the first time after
installing the product, verify your user settings. Select Setup and browse the
subpanels to confirm that the specified values are correct.

The following options are on the main menu:

Setup  Specify Db2 subsystem and job card information, and set your defaults.

Server administration

Opens the Accelerator Loader server Administration panel, on which you
can manage the Accelerator Loader server.

Manage Loader profiles

Work with load profiles, which you use to specify and save options for
your load jobs.

Load Accelerator(s) and Db2 from external file

Specify options for a Dual load profile.

Load Accelerator(s) from external file

Specify options for an External load profile.
Load Accelerator with consistent data
Specify options for a Consistent load profile.

Load Accelerator from a specified image copy
Specify options for an Image copy load profile.

Load Accelerator(s) from Db2 table(s)
Specify options for a Multi load profile.

Back up Accelerator table
Specify options for a Backup profile.

Recover Accelerator table(s) from a backup
Specify options for a Recovery profile.

Exit
Exit the product.

Configuring a Db2 subsystem
You must configure at least one Db2 subsystem for use with Accelerator Loader.

About this task
After you have configured a Db2 subsystem for use with Accelerator Loader, you can also follow these steps to change information about that Db2 subsystem.

Procedure
1. From the main menu, select Setup.
2. On the User Settings panel, select Db2 subsystem.
3. On the Db2 Subsystems panel, perform one of the following steps:
   • To create a new Db2 subsystem, issue the CREATE command.
   • To copy information from one subsystem to another, type C in the Cmd line next to the SSID.
4. On the New Db2 Subsystem panel, specify the new Db2 subsystem ID and press Enter.
5. On the Db2 Subsystem Parameters panel, specify plan and data set information for the Db2 subsystem, select Accelerator Loader Options, and press Enter.
6. On the Accelerator Loader Parameters panel, specify or edit Db2 subsystem-specific options that the product uses during processing:
   • The sort program to be used for internal sorts.
   • Log read and log apply preferences.
   • File allocation parameters.
   • Information for the data sets that the product creates.
   • Information for the product sort work data sets.
7. To save and return to the previous panel, press PF3.

Selecting a Db2 subsystem
After you configure a Db2 subsystem for use with Accelerator Loader, select it as the Db2 subsystem to use.

Procedure
1. From the main menu, select Setup.
2. On the User Settings panel, select Db2 subsystem.
3. In the **Cmd** line beside the SSID, type `S` and press Enter.
4. To save and return to the previous panel, press PF3.

### Specifying Db2 subsystem parameters

You can configure Db2 subsystem information in non-data sharing and data sharing environments. Db2 Analytics Accelerator Loader uses Db2 subsystem-specific options during batch processing.

**Before you begin**

Configure a Db2 subsystem and select it for use with the product.

**Procedure**

1. From the main menu, select **Setup**.
2. On the User Settings panel, select **Db2 subsystem**.
3. On the Db2 Subsystem Parameters panel, specify plan and data set information for the Db2 subsystem, select Accelerator Loader Options, and press Enter.
4. On the Accelerator Loader Parameters panel, specify or edit Db2 subsystem-specific options that the product uses during processing:
   - The sort program to be used for internal sorts.
   - Log read and log apply preferences.
   - File allocation parameters.
   - Information for the data sets that the product creates.
   - Information for the product sort work data sets.
5. To save and return to the previous panel, press PF3.

### Deleting a Db2 subsystem

If a subsystem is no longer of use, delete it from the control file.

**Procedure**

1. From the main menu, select **Setup**.
2. On the User Settings panel, select **Db2 subsystem**.
3. In the **Cmd** line beside the SSID, type `D`, and press Enter.
4. In the Confirm Action panel:
   - Optional: To turn off the display of future delete confirmation panels, type a slash character (`/`) in the field **Set item delete confirmation off**.
   - To confirm that you want to delete the subsystem, press Enter.
5. To save and return to the previous panel, press PF3.

### Specifying job card information

Define a job card to include in batch jobs.

**Procedure**

1. From the main menu, select **Setup**.
2. On the User Settings panel, select **Batch**.
3. On the Set Batch Job Card Information panel, specify how you want the batch job to be built when generating JCL with Accelerator Loader.
4. To add a line to the job card, issue the ADD command or type 1 in the Cmd field beside a line and then press Enter.

5. To delete a line from the job card, type 0 in the Cmd field beside the line and then press Enter.

6. To move a line in the job card, type M in the Cmd field beside the line and then press Enter.

7. To save and return to the previous panel, press PF3.
Chapter 5. Loading data from non-Db2, remote Db2, and remote system sources

Db2 Analytics Accelerator Loader enables you to load data from non-Db2 and from remote Db2 sources directly to the accelerator in a single in-memory process. The source data is accessed, converted to the necessary format, and loaded to the accelerator in a single step without landing or loading the data into an intermediate file format. Using the Accelerator Loader server, you can also load data from remote sources that are not directly accessible from the local system and you can load target Unicode accelerator-only tables (AOTs) from an Accelerator Loader server data source containing EBCDIC data.

Prerequisites

Before you can load data from a non-Db2 or a remote Db2 source, you must
1. Install the product (see the program directory).
2. Customize the product (see the customization checklist in Chapter 2, “Preparing to customize,” on page 25).
   During customization, you install the Accelerator Loader studio, start the Accelerator Loader server, and configure access to mainframe data sources.
3. Using the Accelerator Loader studio, prepare your system to read data from existing data sources and configure your system to transform that data to virtualized tables at run time (see the topics in this section).

Accelerator Loader server restrictions and considerations

Review the following usage restrictions and considerations before performing a load by using the Accelerator Loader server.

The following restrictions and considerations apply when you use the Accelerator Loader server.

• The RACF PassTicket must be set up to enable cross-system Db2 access with IBM Db2 Analytics Accelerator for z/OS. Sample job is provided in hlq.SHLVCNTL(HLVRADB2) for setting up RACF PassTicket to enable users to access Db2 data through the server. For more information, see the z/OS Security Server RACF Security Administrator’s Guide.
• After first loading the entire table on the accelerator that includes all partitions (as required by IBM Db2 Analytics Accelerator for z/OS), you can load selected partitions of range partitioned objects. That is, you can specify the PART clause on the LOAD statement and load a subset of the table’s partitions.
• The Accelerator Loader studio creates the target table DDL and JCL to load data to the accelerator. The generated JCL includes Accelerator Loader and Accelerator Loader server load libraries on the STEPLIB DD.
• When loading data from an external source, the following LOAD utility parameters are not supported:
  – Field specifications when loading from a Accelerator Loader server source.
    The information is provided in an SQLDA to the load process.
  – INDDN and ACCEL_CURSOR options specified together
  – ACCEL_HLV_SSID and ACCEL_HLV_GRPNAME options specified together
• Ensure that you have set up Db2 LUW authentication appropriately to use Db2 LUW as a data source.

• Target Unicode accelerator tables can be loaded from an Accelerator Loader server data source containing EBCDIC data. You can load EBCDIC data stored on the mainframe into target tables defined as CCSID Unicode. One of the primary use cases for this feature is compatibility between tables loaded from EBCDIC data and existing tables populated by other means. In particular, the accelerator does not support joins between Unicode and EBCDIC tables. Accelerator Loader automatically requests Unicode data if the AOT table is defined as Unicode.

EBCDIC-to-Unicode conversion should always be performed using virtual tables. Use of virtual tables supports the improved performance of parallelism and ensures overflow conditions in EBCDIC-to-Unicode conversion will not result in data truncation. To perform the conversion, use the CCSID and Enable Unicode Column Expansion options in the Generate JCL to Load Accelerator wizard in the Accelerator Loader studio when generating Accelerator Loader server load jobs.

• Data source and target restrictions, considerations, and limitations are as follows: Accelerator Loader fails and issues a message if it detects incompatible source and target data types. The following table lists compatible source and target column data types. The first column lists the supported data types for the source Accelerator Loader server column. The second column lists the data type of the Db2 column that you are loading on the accelerator.

<table>
<thead>
<tr>
<th>Source server column data type</th>

</tbody>
</table>

– When the product directly uses a Db2 DRDA data source (which requires no virtual tables or virtual views), then an unsupported column type message might be displayed in the Accelerator Loader studio. The generated DDL with the unsupported columns is written as comments in the generated JCL.

– The IMS source data and the target Db2 subsystem to which the accelerator is configured must reside on the same LPAR.

– The target accelerator and Db2 subsystem must reside on the same LPAR.
– The order in which the columns are specified in the server query result set must match the order in which the columns are defined in the target Db2 table.

– The number of columns that are specified in the server query result set must equal the number of columns in the target table.

– If the source column in the result set is nullable, then the corresponding target Db2 column must also be nullable.

– The scale of a decimal target Db2 column must match the decimal scale of the corresponding result set column.

– If you are loading a DATE/TIME/TIMESTAMP column from a CHAR or VARCHAR result set column, the value must be in one of the date/time formats that Accelerator Loader supports. Specifying unsupported date/time values might cause invalid data to be loaded to the accelerator.

– DECFLOAT is not a supported data type in the accelerator. Using Accelerator Loader server parameters, you can specify to automatically map all DECFLOAT columns defined in Accelerator Loader server virtual tables to DOUBLE at runtime. You can also edit the virtual tables in the Accelerator Loader studio, changing the DECFLOAT columns to another data type. For example, data could be converted to DECIMAL(x,x) or CHAR/VARCHAR. The server will then do the necessary conversions and the studio will generate the appropriate load jobs using supported accelerator data types. Therefore, if DECFLOAT, the studio will always generate DDL using a datatype of DOUBLE in the accelerator; otherwise, it will use the specified data type. The server parameters that control this feature are SQLENGDECFLTODBL and SQLENGDRDATYPECONV. For information about setting these parameters, see “Modifying the server configuration member for DRDA” on page 128.

### Getting started with the studio

Use the Accelerator Loader studio to get access to your mainframe data.

The Accelerator Loader studio is built on Eclipse technology and provides an integrated development environment for database and instance administration; routine and Java application development; and query tuning.

Use the Accelerator Loader studio to quickly transform and load relational and non-relational data to an accelerator that is connected to an IBM z/OS mainframe system. You are not required to first extract and write data to a separate file before transforming and loading the data. You get real-time access to your data because the data is read directly from the mapped source and transformed during the load process.

Depending on your business needs, you can choose the parallel-data loading feature to further optimize load performance and gain even faster access to your most critical data. For example, a credit card service bureau would benefit by using this feature because they need real-time access to transactional data that is flagged as potentially suspicious credit card activity.

Accelerator Loader also supports data joins from different data sources. Supported data sources include Db2, IMS DB, VSAM data sets, physical sequential data sets, and distributed relational database architecture (DRDA) data sources (including Oracle and Db2 LUW).
To transform mainframe data to virtualized tables at run time and load the virtualized table data to accelerator tables requires that you complete the following high-level procedures:

1. Start the Accelerator Loader studio.
2. Open the Accelerator Loader perspective.
3. Connect to the Accelerator Loader server.
4. Create a virtual source library that references data layouts on the mainframe.
5. Create a virtual table from a member within a virtual source library that represents the data that you want to access.
6. Generate and execute the SQL from a virtual table. The SQL is used to read and extract the data from the mainframe.
7. Generate and submit the JCL that is used to load the accelerator.

---

**Perspectives**

The perspective that you choose determines the views and editors that become available in the workbench.

A perspective is an arrangement of views and editors in the workbench. You use perspectives to accomplish a specific task or set of tasks. When you open a perspective, the menu items, tool bars, views, editors, and wizards that are associated with that perspective become available in the workbench.

**Opening perspectives**

From the Window menu, you can open a perspective by selecting Open Perspective and selecting the perspective that you want to use from the drop-down menu.

**Accelerator Loader Perspective**

The Accelerator Loader perspective provides the views, editors, and wizards that you use to perform tasks that are associated with getting and loading data from one or more data sources to the accelerator.

Use this perspective to perform the following tasks:
- Explore mainframe resources and view metadata.
- Create and manage data sources.
- Generate and modify SQL queries.
- Create virtual tables from SQL.
- Create virtual views for use with complex SQL queries.
- Generate, save, and submit JCL to load the accelerator.

**Views**

The Accelerator Loader perspective includes the following views:
- **Active Connections**: lists the open JDBC connections between the studio and one or more servers. The current active connection is used by the SQL Editor to issue SQL queries over that JDBC connection. You can create new or delete existing server connections.
- **Explorer views**: list data resources, stored procedures, and metadata. You can perform tasks on selected objects in the tree. Explorer views include the following tabs:
– **Client** tab: lists information that is related to data sources and application development on your local machine.
– **Server** tab: lists the Accelerator Loader server to which you want to connect, view resources, or perform tasks.
– **Network** tab: lists host and server connections within your network. You can choose to view or modify existing host and server settings.
– **Favorites** tab: lists shortcuts to the mainframe resources that you frequently access.

- **Server Trace Import**: use to import Server Trace (.isx) files.
- **Labels**: apply labels to Server Trace messages for use when searching within the **Server Trace** view.
- **Lists**: use to display details for each tree node or object that is selected in an Explorer view.
- **Search**: use to search for a text string within Server Trace results.
- **Server Trace**: use to set and gather server diagnostic information for support purposes.
- **SQL Results**: use to display the result set returned from a SQL query in the **SQL Results** tab, and resulting trace information in the **SQL Messages** tab.
- **Studio Navigator**: use to list shortcuts to key task views and editors for this plug-in.
- **Properties**: use to display the properties of a selected object on the Server, Network, or Client navigation tabs.
- **Virtualization Facility**: displays virtual table mapping details.

**Editors**

The Accelerator Loader perspective includes the following editors:

- **Data Source Editor**: use to edit connection definitions that are used to open active connections (see **Active Connections** view).
- **SQL Editor**: use to compose SQL statements and invoke queries against the server.
- **JCL Editor**: use to edit and submit JCL.
- **Virtualization Facility Editor**: use to edit meta data settings that are related to virtual tables and virtual views.

**Wizards**

This perspective includes wizards that guide you through tasks, such as:
- Setting the server connection
- Creating virtual source libraries
- Creating virtual tables
- Generating code from SQL.

**Connecting to the Accelerator Loader server**

To access data on the mainframe, connect Accelerator Loader studio to the Accelerator Loader server that is running on an z/OS mainframe instance.
Connecting to the Accelerator Loader server

Use the Accelerator Loader studio to connect to the Accelerator Loader server that is running on an instance of z/OS.

Before you begin

Before you can connect to the Accelerator Loader server, the server must be configured and started.

Procedure

1. Start the Accelerator Loader studio:
   a. Click Start > IBM DB2 Analytics Accelerator Studio 2.1.
   b. Right-click IBM DB2 Analytics Studio 2.1 and select Run as an administrator.
2. From the Accelerator Loader studio menu, click Window > Open Perspective > Accelerator Loader.
4. In the Set Server dialog box, complete the following:
   - Host: Select or enter the TCP/IP host name or IP address of the mainframe system on which the Accelerator Loader server is deployed.
   - Port: Enter the port number that the Accelerator Loader server uses. The default is 1200.
   - Userid: Enter your mainframe user ID.
   - User Password: Enter your password or password phrase for the mainframe user ID.
5. Click OK.

Completing the configuration of DRDA access to RDBMS data sources

To complete the configuration of DRDA access to RDBMS data sources, you must bind packages on the Accelerator Loader server, and grant users the authority to use those packages.

Before you begin

You must know the host name and the port number of the Accelerator Loader server and your log on credentials. Your log on credentials must have the authority to bind packages and grant privileges.

About this task

Perform the following task for each RDBMS data source that you want to access.

Procedure

1. From the Accelerator Loader studio, click Window > Open Perspective > Accelerator Loader.
2. On the Server tab, click Set Server.
3. In the Set Current Server dialog box, complete the following fields:
Option | Description
--- | ---
Host | Enter the TCP/IP host name or IP address of the mainframe system.
Port | Enter the port number that is used to communicate with the Accelerator Loader server. The default is 1200.
UserId | Enter the mainframe user ID.
User Password | Enter the password for the mainframe user ID.

4. Click **OK**.
5. On the **Server** tab, expand **SQL > Data > Other Subsystems**.
6. Right-click the subsystem and select **BIND/GRANT Packages**.
7. On the **BIND/GRANT Packages** page, complete the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Package Prefix</td>
<td>Enter the two character prefix to assign to the package. The package prefix must match the prefix that is defined on the mainframe server. If you change the default prefix (DS), you must also change it in the <code>hlq.SHLEVCX(hlv1dv1IN00)</code> file.</td>
</tr>
<tr>
<td>Number of Cursors</td>
<td>Enter the number of cursors to use to process results. The default is 200.</td>
</tr>
<tr>
<td>Collection</td>
<td>Enter the value to use to bind packages. The default is <code>NULLID</code>. This value is normally determined by the Db2 Administrator.</td>
</tr>
<tr>
<td>Table Qualifier</td>
<td>Enter the value to use to qualify unqualified SQL. This value is normally determined by the Db2 Administrator.</td>
</tr>
<tr>
<td>Owner UserId</td>
<td>Enter the user ID of the package owner. This value is normally determined by the Db2 Administrator.</td>
</tr>
<tr>
<td>Grant to</td>
<td>Set only when granting authority for the target Db2 server. The default is <code>PUBLIC</code>.</td>
</tr>
<tr>
<td>Bind Package</td>
<td>Binds the product packages. This is the default setting.</td>
</tr>
<tr>
<td>Grant Execute</td>
<td>Grants execute permissions on the package to the user ID that is specified in the <strong>Grant to</strong> field.</td>
</tr>
<tr>
<td>Replace Packages</td>
<td>Replaces an existing package for the specified subsystem. Select this option only if the package already exists.</td>
</tr>
</tbody>
</table>

8. Depending on the options that you select, additional dialog boxes and messages might be displayed.
9. Review the results in the **Results** text box and click **BIND/GRANT**.

**Locale considerations**

You can modify the data source connection definitions to use different local code pages.
Before you begin

You have the option to change the default code page (US/English IBM 1047) that the Accelerator Loader studio uses to perform character data translations between the native Java character encoding (UTF-8) and the mainframe.

Procedure

1. To configure the data source connection definition, in the Active Connections view, close all open connections.
2. On the Client tab, expand Accelerator Loader > Data Sources > JDBC > Default Config File.
3. Right-click the data source that you want to modify and click Edit.
4. In the Data Source Editor, click the Connection String tab.
5. Add or modify the Charset setting to use the appropriate EBCDIC code page. For example, Charset=IBM037.
6. If LGID=ENC exists in the connection string, delete it to avoid a conflict with the Charset setting.
7. Close the Data Source Editor.
8. When prompted, click Yes to save the data source definition.
9. To change the default Charset that the Accelerator Loader studio uses when creating connection definitions, from the Window menu select Preferences, expand Accelerator Loader > Driver.
10. In Connection Overrides, enter the new Charset setting and click OK.
12. Right-click the data source to which you want to connect and select Create Connection Definition (DSN).
13. Accept the default name that is displayed or enter a new DSN name and click OK.
14. In the Data Source Editor, click the Connection String tab and confirm that the new Charset setting displays in the connection string.

Results

When running queries using the new data source definition, the character data (including language specific glyphs) that you chose is displayed in the SQL Results view.

Creating server metadata

Using the Accelerator Loader studio, you create the server metadata that provides the information necessary to virtualize your data. Server metadata includes virtual source libraries, virtual tables, and virtual views.

Creating virtual source libraries

Virtual source libraries point to the information that Db2 Analytics Accelerator Loader needs in order to access some types of mainframe data.

Before you begin

A virtual source library is a server metadata object that references a source library that exists on the Accelerator Loader (host) server. The members of the source library contain layout information specific to a type of data, for example a COBOL
or PL/I copybook (copybook), Adabas Data Definition Module (DDM) views, IMS Database Definition (DBD) files, or IMS Program Specification Block (PSB) files. Virtual source libraries provide a reusable catalog of the host’s data source libraries.

**Note:** When creating a virtual source library, the current user must have read access to the host data source library.

**About this task**

Virtual source libraries are a prerequisite to creating virtual tables for the following types of data sources:

- Adabas
- IMS
- IBM MQ
- Sequential
- VSAM, VSAM CICS and IAM
- zFS and HFS

When creating the virtual source libraries you specify the following data set (PDS/PDSE) names based on the type of data that you want to access:

- To access Adabas data, you specify the name of the PDS/PDSE that contains the Data Definition Module (DDM) views that have been set up for the Adabas data in your environment.
- To access IMS data, you may need to create multiple virtual source libraries that reference multiple types of source libraries. You may create a separate virtual source library that references the IMS DBD files, the IMS PSB files, and the copybooks that describe the layout of each IMS segment. In each case, you specify the PDS/PDSE that is specific to the source library.
- To access IBM MQ data, you specify the name of the PDS/PDSE that contains the copybook that describes the data written to the queue.
- To access sequential data, you specify the name of the PDS/PDSE that contains the copybook that describes the structure of the sequential data records.
- To access VSAM, VSAM CICS, and IAM data, you specify the name of the PDS/PDSE that contains the copybook that describes the structure of the VSAM, VSAM CICS, and IAM data records.
- To access z/FS and HFS data, you specify the name of the PDS/PDSE that contains the copybook that describes the structure of the records in the data file.

**Procedure**

1. On the **Server** tab, expand **Admin > Source Libraries**.
2. Right-click **Create Virtual Source Library** and select **Create Virtual Source Library**.
3. Select the **Data Set** wizard and click **Next**.
4. On the **Virtual Source Library** page, complete the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique, meaningful name for the virtual source library you are creating.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter an optional description for the virtual source library.</td>
</tr>
</tbody>
</table>
### Field and Action

<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Library Name</td>
<td>Enter the name of the PDS/PDSE that contains the layout information for the data you want to access.</td>
</tr>
</tbody>
</table>

5. Click Finish.

**Results**

The new virtual source library is displayed in the Source Libraries folder.

**Creating virtual tables**

To access your data, create a virtual table or virtual view that maps to your source data and that matches the definition of the source data structure on the mainframe.

From the virtual table or virtual view, you generate the SQL that is used to read and access the mapped data from the mainframe. You create virtual tables using the **New Virtual Table Wizard** that is specific to the type of data that you want to access. Some virtual tables, including SMF virtual tables, are made available during the product installation.

The following high-level procedures must be completed prior to creating a virtual table:
- Start the Accelerator Loader studio.
- Open the Accelerator Loader perspective.
- Connect to the Accelerator Loader server.
- Run the **Create Source Library** wizard to create a virtual source library to map to your mainframe data. This procedure is not required to create virtual tables for RDBMS data.

**Virtual table tasks**

When a virtual table is selected on the Server tab, you can perform the following tasks:
- **Edit**: Edit the virtual table properties in the editor.
- **Copy and Paste**: Copy the virtual table and paste the copy under the Virtual Tables node.
- **Disable**: Disable the virtual table on this server.
- **Delete**: Delete the virtual table from the server.
- **Create Virtual View**: Create a virtual view from the virtual table.

**Key and index information**

To view a summary of key and index information for an existing virtual table, select the virtual table on the Server tab and from the Window menu, select Show View > Properties. The properties for the selected table are displayed in the Properties view.

If a virtual table includes columns that have a primary key or an index, the column is notated using the following symbols:
- Key symbol – This column is associated with a primary key.
- Superscript numeral 1 – This column is associated with a unique index, but does not have an associated primary key.
• Superscript asterisk – This column is associated with a non-unique index.

This primary key and index information is also highlighted when you browse RDBMS tables under the **Other Subsystems** tree.

You can control the identification of primary keys and indexes using settings in SQL preferences.

**Creating virtual tables for Adabas data**
Create a virtual table that maps to the Adabas data that you want to access, and from which the SQL used to access the data is generated and executed.

**Before you begin**
Have the Adabas database ID and password, the file number, and the subsystem name available.

**Procedure**
1. Expand the **SQL > Data > SSID** node, where **SSID** is the name of your server.
2. Right-click **Virtual Tables** and select **Create Virtual Table(s)**.
3. Under **Wizards**, select the **ADABAS** wizard and click **Next**.
4. On the **New Virtual Table Wizard** page, complete the following fields and click **Next**:

<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
<td>Enter a unique name. The name can contain a maximum of 50 characters. The name must consist of an uppercase letter followed by zero or more characters, each of which is an uppercase letter, a digit, or the underscore character.</td>
</tr>
<tr>
<td><strong>Metadata Library</strong></td>
<td>From the drop-down list, select the target library where the virtual table metadata will be stored (for example, hlq.USER.MAP). The target libraries are specified in the server’s started task JCL.</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Enter an optional description.</td>
</tr>
<tr>
<td><strong>Arrays Handling</strong></td>
<td>Enable one of the following array management options:</td>
</tr>
<tr>
<td></td>
<td>• Flatten arrays into a single fixed table at runtime: This relates to multiple occurring (MU) fields and periodic (PE) groups.</td>
</tr>
<tr>
<td></td>
<td>• Return arrays into separate tables at runtime: This relates to multiple occurring (MU) fields and periodic (PE) groups. A subtable is generated for each array. Subtables only support read access.</td>
</tr>
</tbody>
</table>

5. On the **ADABAS Details** page, complete the following fields and click **Next**:

<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>DB ID</strong></td>
<td>Enter the Adabas database ID.</td>
</tr>
<tr>
<td><strong>File Number</strong></td>
<td>Enter the number of the file to use.</td>
</tr>
<tr>
<td>Field</td>
<td>Action</td>
</tr>
<tr>
<td>-----------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Adabas Password</td>
<td>If the file is password-protected, enter the password. This password is stored and encrypted in the virtual table so that future queries use the same password to access the data.</td>
</tr>
<tr>
<td>SubSystem</td>
<td>Enter the name of the Adabas subsystem.</td>
</tr>
<tr>
<td>Max MU Count</td>
<td>Enter the maximum number of times to repeat the MU field. The default is 10.</td>
</tr>
<tr>
<td>Max PE Count</td>
<td>Enter the maximum number of times to repeat the PE field. The default is 10.</td>
</tr>
<tr>
<td>Create Count Field</td>
<td>Select this check box to index every MU or PE field so that the index (count) field created precedes the repeating field. This index field tells the caller how many repeating fields are being used.</td>
</tr>
<tr>
<td>Secure</td>
<td>Select this check box to choose the Adabas file ID number to be used for file name security.</td>
</tr>
<tr>
<td>DE Search only</td>
<td>Select this check box if you want the utility to generate control definitions that allow the client to only use WHERE columns that are Adabas descriptors (such as superde, subde, and hyperde).</td>
</tr>
<tr>
<td>Search by PE index</td>
<td>Select this check box to allow the client to target rows that match a particular occurrence of the PE field when searching rows using the WHERE clause. If this parameter is not specified, all rows where any occurrence of that PE field match the value specified will be targeted.</td>
</tr>
<tr>
<td>Unpacked to Packed</td>
<td>Select this check box to convert all unpacked format fields to packed format.</td>
</tr>
<tr>
<td>Binary to Integer</td>
<td>Select this check box to convert all 2-byte and 4-byte binary fields to short integer and integer formats, respectively.</td>
</tr>
</tbody>
</table>
Field | Action
--- | ---
Binary to Packed | Select this check box to map the binary fields in the Adabas file to SQL decimal columns (numeric packed decimal format) in the generated virtual table. Note the following points:

- If the precision of the Adabas binary field allows for the possibility of a numeric value that would cause data overflow when converted to SQL decimal, the column in the virtual table will be mapped to SQL binary instead. This means that Adabas fields with precision greater than 12 will continue to be mapped to SQL binary.
- If you select the Binary to Integer check box and the Binary to Packed check box, the precision of the Adabas binary field will determine if it gets mapped to an SQL integer (that is, 2-byte or 4-byte fields) or a decimal type.
- The IBM Db2 Analytics Accelerator for z/OS does not support the SQL binary type.

Advanced | When reading large volumes of data from tables, click Advanced to display and configure the MapReduce feature. The MapReduce feature enables you to divide the data into logical partitions and process those partitions in parallel using the Thread Count value. At runtime, the number of zIIP processors is verified and one thread is used for each zIIP processor; resulting in improved performance. The Thread Count value you specify overrides the default value (2) and the discovered value. To disable MapReduce, select the Disable MapReduce check box.

6. Optional: On the Data Definition Module page, if you have a Natural Data Definition Module (DDM) listing of the file, you can complete the following to get additional metadata information:

Field | Action
--- | ---
Available Source Libraries | From the list of Available Source Libraries, select the virtual source library that contains the data structure definition that you want the virtual table to use.

Source Library Members | Select the names of each virtual source library member that represents the data structure that you want to include. The green arrow next to a DDM indicates that it is a suggested member, not that it is selected.

7. On the Virtual Table Layout page, complete the following fields and click Next:
<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source</td>
<td>Expand the source file to verify that it displays the expected data layout.</td>
</tr>
<tr>
<td>Start Field</td>
<td>This field is not supported for Adabas because the entire data layout is used.</td>
</tr>
<tr>
<td>End Field</td>
<td>This field is not supported for Adabas because the entire data layout is used.</td>
</tr>
</tbody>
</table>

8. Click Finish.

**What to do next**

Use the studio to easily compose and execute SQL queries using your new virtual tables. See "Generating and executing SQL queries" on page 250.

**Important:** Use caution when using the BASE_KEY in WHERE predicates, (for example, [PARENT TABLE].BASE_KEY = [CHILD TABLE].PARENT_KEY) when joining the parent table with a child subtable, since this will result in a table scan of the entire Adabas file. It is recommended instead to use the CHILD_KEY (for example, [PARENT TABLE].CHILD_KEY = [CHILD TABLE].PARENT_KEY).

**Generating an encrypted Adabas password:**

Generate an encrypted Adabas password for use when creating Adabas virtual tables in batch.

**About this task**

When creating Adabas virtual tables in batch using the batch Data Mapping Facility (DMF), the Adabas password for the file (ADASCR) is supported. Additionally, this password can be encoded using an ISPF panel, where you can specify the plain text password and then use the returned encoded version of the password in the batch JCL.

The parameter ADABAS PASSWORD is supported on the SYSIN DD statement in the DMF batch JCL.

When creating Adabas virtual tables in batch, use the following procedure to pass the encrypted Adabas password.

**Procedure**

1. On the IBM Db2 Analytics Accelerator Loader for z/OS panel, specify option 1, Server administration.
2. On the Administer Accelerator Loader Server panel, specify option 2, Configure server.
4. On the DMF Map Adabas Password Encryption panel, in Adabas Password and Re-Enter Password, enter the plain text password (ADASCR) for your Adabas file, and press Enter. An encrypted version of the password appears in ADABAS PASSWORD.
5. Copy the following line from the DMF Map Adabas Password Encryption panel and paste it into your batch JCL SYSIN statement:
ADABAS PASSWORD = encrypted_password

where encrypted_password is the encoded version of your password.

6. Submit your JCL.

Creating virtual tables for RDBMS data sources
Create virtual tables that map to RDBMS data sources, such as Db2 for z/OS, Db2 LUW (Linux, UNIX, and Windows), Oracle, and Microsoft SQL Server.

About this task
It is recommended that you create a virtual table for each RDBMS table from which you want to access data. Creating a virtual table for each RDBMS table allows you to perform joins across data that may originate from different DRDA accessible RDBMS subsystems or to perform joins between your RDBMS data and other types of virtualized data, such as IMS or VSAM data.

This wizard allows you to create multiple virtual tables at a time if the selected source tables belong to the same RDBMS subsystem. In this wizard, a view is treated the same as a table; each table or view is mapped to a virtual table.

Db2 data access method:
When virtual tables are created for access to Db2 for z/OS data, an option is available to select the access method. Db2 Direct is an Accelerator Loader server access method that reads the data in the Db2 VSAM linear data sets directly instead of accessing the data through traditional Db2 APIs. For more information, see “Db2 for z/OS data access methods” on page 138.

Note: The data access method options are not displayed if the Accelerator Loader server does not support Db2 Direct.

Procedure
1. On the Server tab, explore the RDBMS metadata information by expanding the SQL > Data > Other Subsystems node, and then navigating down the appropriate subtree. The hierarchy begins with the subsystem, followed by the schema, and then the tables and views.
2. Select a single table or view from the tree, or use the following techniques to select multiple tables or views:
   • To select more than one individual node, hold down the Ctrl key and click each node to be included.
   • To select a range of tables (or views), click the first table in the range, and then hold the Shift key and select the last table in the range. All tables within the range will be included.
   • To select a group of nodes, click the parent node. All of the children under the parent node will be included. For example, select the Tables node to include all tables belonging to that schema. Or, select the schema node to include all tables and views under that schema.
   You can use a combination of these techniques. For example, you can select two schema nodes to create virtual tables for all tables and views belonging to those two schemas.
3. Right-click the selected items and select Create Virtual Table(s). The New Virtual Tables Wizard launches.
4. On the New Virtual Tables for DBMS access page, complete the following fields:
<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Metadata Library</td>
<td>From the drop-down list, select the target library where the virtual table metadata will be stored (for example, hlq.USER.MAP). The target libraries are specified in the server’s started task JCL.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter an optional description.</td>
</tr>
</tbody>
</table>
| Naming Pattern        | Specify the format to use for the generated virtual table names. Use the following variables to create naming patterns that are derived from the RDBMS metadata:  
  * {Subsystem}: Subsystem name  
  * {Schema}: Source schema name  
  * {Table}: Source table name                                                                                                                                                                                                                                                                 |
| Virtual Target System | Select a virtual target system from the drop-down list. A virtual target system points to the RDBMS subsystem that contains the data that you want to access using the current virtual table. If there are no virtual target systems in the drop-down list, click Create Target System to create one. By using virtual target systems, you can easily change the name of the RDBMS subsystem that is referenced in the virtual tables. For example, you create a virtual target system called TSDSN1, and specify that it will access the RDBMS subsystem DSN1. Then, you create 50 virtual tables that access data in the RDBMS source TSDSN1 (that is, pointing to DSN1). If it becomes necessary to change the name of the RDBMS source DSN1, you only have to change it in a single place by editing the virtual target system. These target systems can be located under the SQL > Target Systems > DBMS node in the server view tree.  
  * Use traditional DB2 access (read/write, transactional integrity)  
  * Use DB2-Direct access (read-only, high performance bulk data access)  

Select the access method to use when accessing Db2 for z/OS data. Choose Use traditional DB2 access (read/write, transactional integrity) to use Db2 APIs such as DRDA, CAF, and RRSAF. This is the default selection. Choose Use DB2-Direct access (read-only, high performance bulk data access) to use Db2 Direct.  

**Note:** These options are available only when creating virtual tables for access to Db2 for z/OS data and if the Accelerator Loader server supports Db2 Direct.
When reading large volumes of data from tables, click Advanced to display and configure the MapReduce feature. The MapReduce feature enables you to divide the data into logical partitions and process those partitions in parallel using the Thread Count value. At runtime, the number of zIIP processors is verified and one thread is used for each zIIP processor; resulting in improved performance. The Thread Count value you specify overrides the default value (2) and the discovered value. To disable MapReduce, select the Disable MapReduce check box.

5. In the results table, review the list of selected entries. Modify the selections as needed.

   Tip: Use the check box in the header row of the table to control the selection of all entries.

6. Click Finish.

What to do next

Use the studio to easily compose and execute SQL queries using your new virtual tables. See “Generating and executing SQL queries” on page 250.

Creating virtual tables for IMS data

Create a virtual table that maps to the IMS data that you want to access, and from which the SQL used to access the data is generated and executed.

Before you begin

The Program Specification Block (PSB) and Database Definition (DBD) source members, and the copybooks for each segment must exist in the virtual source libraries defined to the server. For details, see “Creating virtual source libraries” on page 214.

To use the IMS Direct feature, the IMSDIRECTENABLED parameter must be enabled in the hlvidIN00 file.

About this task

When an IMS SQL query is run, the SQL Engine for the server will determine if the request is best executed using IMS Direct (native file support) or if IMS APIs are required. The determination is based on the database and file types supported as well as the size of the database.

Procedure

1. Expand the SQL > Data > SSID node, where SSID is the name of your server.
2. Right-click Virtual Tables and select Create Virtual Table(s).
3. Under Wizards, select the IMS wizard and click Next.
4. On the New IMS virtual Table(s) page, create metadata for an IMS virtual table by completing the following steps:
a. Choose a DBD by doing one of the following steps:
   • Select a DBD from the drop-down list.
   • If your DBD does not appear in the drop-down list, click Extract DBD to create the requisite metadata. The New IMS DBD Metadata Wizard launches. See “Using the IMS DBD Metadata wizard.”

b. Choose a PSB by doing one of the following steps:
   • Select a PSB from the drop-down list.
   • If your PSB does not appear in the drop-down list, click Extract PSB to create the requisite metadata. The New IMS PSB Metadata Wizard launches. See “Using the IMS PSB Metadata wizard” on page 226.

c. Click Create Virtual Table to create a virtual table for an IMS segment in the selected DBD and PSB. The New Virtual Table Wizard launches. See “Using the IMS Virtual Table wizard” on page 227.

Note: Both the DBD and PSB must be defined for this button to be enabled.

5. Click Finish.

What to do next

Use the studio to easily compose and execute SQL queries using your new virtual tables. See “Generating and executing SQL queries” on page 250.

Using the IMS DBD Metadata wizard:

Use the New IMS DBD Metadata Wizard to create DBD server metadata.

About this task

This wizard is used to create server metadata containing information extracted from the selected DBD source. This DBD metadata is a prerequisite for creating IMS virtual tables. The name of each DBD map will be determined from the contents of the DBD source.

Procedure

1. On the New DBD Metadata page, complete the following fields and click Next:

<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Metadata Library</td>
<td>From the drop-down list, select the target library where the DBD metadata will be stored (for example, hlq.USER.MAP). The target libraries are specified in the server's started task JCL.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter an optional description.</td>
</tr>
</tbody>
</table>

2. On the Source Download page, complete the following fields and click Next:

<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Available Source Libraries</td>
<td>From the list of Available Source Libraries, select the virtual source library that contains the DBD source member.</td>
</tr>
</tbody>
</table>
Field | Action
---|---
Source Library Members | Select the DBD that you want to use and click Download to copy the member from the mainframe to your desktop. Use Filter patterns to filter the list.

Downloaded Source Files | Review the list of downloaded members and ensure that the check box for the DBD that you want to use has been selected.

3. On the Data Layout page, complete the following fields and click Next:

Field | Action
---|---
Source | Expand the source file to verify that it displays the expected database definition (DBD).
Start Field | Accept the default root start field, or if multiple DBD nodes are present in the source tree, you can click on one of the DBD nodes to indicate that you only want to map that one DBD.
End Field | End Field selection is disabled when extracting DBD source.

4. On the IMS Server configuration page, complete the following fields:

Field | Action
---|---
• Use IMS/DBCTL (read/write, transactional integrity) | Select the IMS protocol to use.
Choose Use IMS/DBCTL (read/write, transactional integrity) to use IMS API calls.
• Use IMS-Direct (read-only, high performance bulk data access) | Choose the default option Use IMS-Direct (read-only, high performance bulk data access) to enable IMS Direct for the DBD. To use this feature, IMS Direct must also be enabled in the hlvidIN00 file. You must select this option for the DBD to be able to enable IMS Direct for a virtual table.

IMS ID Override (used with IMS-Direct only) | Specify the IMS ID of the IMS subsystem to use when multiple IMS subsystems are defined for use with IMS Direct. This value will override the default IMS ID in the DBD map.
When reading large volumes of data from tables, click Advanced to display and configure the MapReduce feature. The MapReduce feature enables you to divide the data into logical partitions and process those partitions in parallel using the Thread Count value. At runtime, the number of zIIP processors is verified and one thread is used for each zIIP processor; resulting in improved performance. The Thread Count value you specify overrides the default value (2) and the discovered value. To disable MapReduce, select the Disable MapReduce check box.

5. Click Finish.

What to do next

Return to the New IMS Virtual Table(s) page and define the IMS PSB. See “Creating virtual tables for IMS data” on page 223.

Using the IMS PSB Metadata wizard:

Use the New IMS PSB Metadata Wizard to create PSB server metadata.

About this task

This wizard is used to create server metadata containing information extracted from the selected PSB source. This PSB metadata is a prerequisite for creating IMS virtual tables. The name of each PSB map will be determined from the contents of the PSB source.

Procedure

1. On the New PSB Metadata page, complete the following fields and click Next:

<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Metadata Library</td>
<td>From the drop-down list, select the target library where the PSB metadata will be stored (for example, hlq.USER.MAP). The target libraries are specified in the server’s started task JCL.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter an optional description.</td>
</tr>
</tbody>
</table>

2. On the Source Download page, complete the following fields and click Next:

<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Available Source Libraries</td>
<td>From the list of Available Source Libraries, select the virtual source library that contains the PSB source member.</td>
</tr>
<tr>
<td>Source Library Members</td>
<td>Select the PSB that you want to use and click Download to copy the member from the mainframe to your desktop. Use Filter patterns to filter the list.</td>
</tr>
</tbody>
</table>
3. On the **Data Layout** page, complete the following fields and click **Next**:

<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Downloaded Source Files</strong></td>
<td>Review the list of downloaded members and ensure that the check box for the PSB that you want to use has been selected.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Source</strong></td>
<td>Expand the source file to verify that it displays the expected program specification block (PSB).</td>
</tr>
<tr>
<td><strong>Start Field</strong></td>
<td>Accept the default root start field, or if multiple PSB nodes are present in the source tree, you can click on one of the PSB nodes to indicate that you only want to map that one PSB.</td>
</tr>
<tr>
<td><strong>End Field</strong></td>
<td>End Field selection is disabled when extracting DBD source.</td>
</tr>
</tbody>
</table>

4. Click **Finish**.

**What to do next**

Return to the **New IMS Virtual Table(s)** page and create the virtual table. See “Creating virtual tables for IMS data” on page 223.

Using the IMS Virtual Table wizard:

Use the **New Virtual Table Wizard** to create a new IMS virtual table.

**About this task**

This wizard is used to map an IMS segment using a copybook representation to produce a new IMS virtual table.

**Procedure**

1. On the **New IMS Virtual Table** page, complete the following fields and click **Next**:

<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
<td>Enter a unique name. The name can contain a maximum of 50 characters. The name must consist of an uppercase letter followed by zero or more characters, each of which is an uppercase letter, a digit, or the underscore character.</td>
</tr>
<tr>
<td><strong>Metadata Library</strong></td>
<td>From the drop-down list, select the target library where the virtual table metadata will be stored (for example, hlq.USER.MAP). The target libraries are specified in the server's started task JCL.</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Enter an optional description.</td>
</tr>
<tr>
<td><em><em>Convert VAR</em> fields to True VAR</em> fields**</td>
<td>This is a deprecated field and should not be selected.</td>
</tr>
</tbody>
</table>
### Arrays Handling

Select one of the following options:
- **Flatten arrays into a single fixed table at runtime (Y):** This option supports both OCCURS and OCCURS DEPENDING ON statements.
- **Return arrays into separate tables at runtime (N):** This option supports both OCCURS and OCCURS DEPENDING ON statements. A subtable is generated for each array. Subtables support SQL read access only.

2. On the **Source Download** page, complete the following fields and click **Next**:

<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Available Source Libraries</td>
<td>From the list of <em>Available Source Libraries</em>, select the virtual source library that contains the data structure definition that you want the virtual table to use.</td>
</tr>
<tr>
<td>Source Library Members</td>
<td>Select the PDS members that represent the data structures to include and click <strong>Download</strong> to copy the members from the mainframe to your desktop.</td>
</tr>
<tr>
<td>Downloaded Source Files</td>
<td>Select one or more previously downloaded members.</td>
</tr>
</tbody>
</table>

3. On the **Virtual Table Layout** page, complete the following fields and click **Next**:

<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
</table>
| Source                         | Browse the source tree to verify that it displays the expected data layout. By default, all of the fields in the tree will be included in the mapping. To include only a subset of the fields for the mapping, modify the start field value and, optionally, the end field value, as follows:  
  - For the start field, accept the default root start field, or expand the tree and select a different start field. When selecting a different start field, **Enable End Field Selection** must not be selected.  
  - For the end field, accept the default end field, or expand the tree and select a different end field. When selecting a different end field, **Enable End Field Selection** must be selected. |
| Start Field                    | Identifies the first field within the data layout that will be mapped. To change this value, make sure **Enable End Field Selection** is not selected, and select a different start field in the **Source** tree. |
Field | Action
--- | ---
Enable End Field Selection | Use this field to control selection of the start field and end field values in the **Source** tree. When this option is not selected (default), you can select the start field. When this option is selected, you can select the end field.

End Field | Identifies the last field within the data layout that will be mapped. To change this value, make sure **Enable End Field Selection** is selected, and select a different end field in the **Source** tree.

4. On the **IMS Information** page, complete the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Segment Name</strong></td>
<td>From the drop-down list, select the segment name.</td>
</tr>
</tbody>
</table>

- **Use IMS/DBCTL (read/write, transactional integrity)**
- **Use IMS-Direct (read-only, high performance bulk data access)**

<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Advanced</strong></td>
<td>When reading large volumes of data from tables, click <strong>Advanced</strong> to display and configure the <strong>MapReduce</strong> feature. The <strong>MapReduce</strong> feature enables you to divide the data into logical partitions and process those partitions in parallel using the <strong>Thread Count</strong> value. At runtime, the number of zIIP processors is verified and one thread is used for each zIIP processor; resulting in improved performance. The <strong>Thread Count</strong> value you specify overrides the default value (2) and the discovered value. To disable <strong>MapReduce</strong>, select the <strong>Disable MapReduce</strong> check box.</td>
</tr>
</tbody>
</table>

5. Click **Finish**.

**What to do next**

Return to the **New IMS Virtual Table(s)** page and if necessary create the next virtual table. See “Creating virtual tables for IMS data” on page 223.

**Creating virtual tables for IBM MQ**

Create a virtual table that maps to the IBM MQ data that you want to access, and from which the SQL used to access the data is generated and executed.
Before you begin

Before creating the virtual table, verify that the MQ queue exists and that the copybook exists in the source library. If you use delimited data, configure support for delimited data processing. See "Configuring delimited data support" on page 196.

About this task

Data in MQ queues is described using COBOL or PLI data descriptions taken from copybooks or programs.

Procedure

1. Expand the SQL > Data > SSID node, where SSID is the name of your server.
2. Right-click Virtual Tables and select Create Virtual Table(s).
3. Under Wizards, select the MQ wizard and click Next.
4. On the New Virtual Table Wizard page, complete the following fields and click Next:

<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name. The name can contain a maximum of 50 characters. The name must consist of an uppercase letter followed by zero or more characters, each of which is an uppercase letter, a digit, or the underscore character.</td>
</tr>
<tr>
<td>Metadata Library</td>
<td>From the drop-down list, select the target library where the virtual table metadata will be stored (for example, hlq.USER.MAP). The target libraries are specified in the server's started task JCL.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter an optional description.</td>
</tr>
<tr>
<td>Arrays Handling</td>
<td>Enable one of the following array management options:</td>
</tr>
<tr>
<td></td>
<td>- Flatten arrays into a single fixed table at runtime: This supports both OCCURS and OCCURS DEPENDING ON statements.</td>
</tr>
<tr>
<td></td>
<td>- Return arrays into separate tables at runtime: This supports both OCCURS and OCCURS DEPENDING ON statements. A subtable is generated for each array. Subtables only support SQL read access.</td>
</tr>
</tbody>
</table>

5. On the Source Download page, complete the following fields and click Next:

<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Available Source Libraries</td>
<td>Select the source library that contains the data structure to use.</td>
</tr>
</tbody>
</table>
### Field Library Members

**Select the PDS members that represent the data structures to include and click Download to copy the members from the mainframe to your desktop. Use Filter patterns to filter the list.**

### Downloaded Source Files

**Select one or more previously downloaded members.**

6. **On the Virtual Table Layout page, complete the following fields and click Next:**

<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
</table>
| Source                     | Browse the source tree to verify that it displays the expected data layout. By default, all of the fields in the tree will be included in the mapping. To include only a subset of the fields for the mapping, modify the start field value and, optionally, the end field value, as follows:  
  • For the start field, accept the default root start field, or expand the tree and select a different start field. When selecting a different start field, **Enable End Field Selection** must not be selected.  
  • For the end field, accept the default end field, or expand the tree and select a different end field. When selecting a different end field, **Enable End Field Selection** must be selected. |
| Start Field                | Identifies the first field within the data layout that will be mapped. To change this value, make sure **Enable End Field Selection** is not selected, and select a different start field in the Source tree. |
| Enable End Field Selection | Use this field to control selection of the start field and end field values in the Source tree. When this option is not selected (default), you can select the start field. When this option is selected, you can select the end field. |
| End Field                  | Identifies the last field within the data layout that will be mapped. To change this value, make sure **Enable End Field Selection** is selected, and select a different end field in the Source tree. |

7. **On the MQ Details page, complete the following fields:**

<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Queue Manager Name</td>
<td>Enter the IBM MQ queue manager name. The name is a four-character subsystem name.</td>
</tr>
<tr>
<td>Field</td>
<td>Action</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Queue Name</td>
<td>Enter the IBM MQ queue name. The name can contain a maximum of 48 characters and must comply with z/OS data set naming standards.</td>
</tr>
<tr>
<td>Post-Read Exit Name</td>
<td>To manipulate the data after reading it from the queue, enter the name of the post-read exit to use. This is the custom exit routine that is installed on the server and is used to perform additional processing after a record is read from the data source.</td>
</tr>
</tbody>
</table>

8. Click Finish.

**What to do next**

Use the studio to easily compose and execute SQL queries using your new virtual tables. See “Generating and executing SQL queries” on page 250.

**Creating virtual tables for VSAM, VSAM CICS, and IAM data**

Create a virtual table that maps to the VSAM, VSAM CICS, and IAM data that you want to access, and from which the SQL used to access the data is generated and executed.

**Before you begin**

You must have the VSAM or VSAMCICS cluster name available (sourcelibrary.copybook.filename).

**Procedure**

1. Expand the SQL > Data > SSID node, where SSID is the name of your server.
2. Right-click Virtual Tables and select Create Virtual Table(s).
3. Under Wizards, select the VSAM wizard and click Next.
4. On the New Virtual Table Wizard page, complete the following fields and click Next:

<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name. The name can contain a maximum of 50 characters. The name must consist of an uppercase letter followed by zero or more characters, each of which is an uppercase letter, a digit, or the underscore character.</td>
</tr>
<tr>
<td>Metadata Library</td>
<td>From the drop-down list, select the target library where the virtual table metadata will be stored (for example, hlq.USER.MAP). The target libraries are specified in the server's started task JCL.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter an optional description.</td>
</tr>
<tr>
<td>Convert VAR* fields to True VAR* fields</td>
<td>This is a deprecated field and should not be selected.</td>
</tr>
</tbody>
</table>
Arrays Handling

Enable one of the following array management options:

- Flatten arrays into a single fixed table at runtime: This supports both OCCURS and OCCURS DEPENDING ON statements.
- Return arrays into separate tables at runtime: This supports both OCCURS and OCCURS DEPENDING ON statements. A subtable is generated for each array. Subtables only support SQL read access.
- Flatten arrays now: If you select this option, you cannot change array-handling after you save the virtual table.

5. On the Source Download page, complete the following fields and click Next:

<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Available Source Libraries</td>
<td>From the list of Available Source Libraries, select the virtual source library that contains the data structure definition that you want the virtual table to use.</td>
</tr>
<tr>
<td>Source Library Members</td>
<td>Select the PDS members that represent the data structures to include and click Download to copy the members from the mainframe to your desktop.</td>
</tr>
<tr>
<td>Download Source Files</td>
<td>Select one or more previously downloaded members.</td>
</tr>
</tbody>
</table>

6. On the Virtual Table Layout page, complete the following fields and click Next:

<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
</table>
| Source      | Browse the source tree to verify that it displays the expected data layout. By default, all of the fields in the tree will be included in the mapping. To include only a subset of the fields for the mapping, modify the start field value and, optionally, the end field value, as follows:  
|             | • For the start field, accept the default root start field, or expand the tree and select a different start field. When selecting a different start field, Enable End Field Selection must not be selected.  
<p>|             | • For the end field, accept the default end field, or expand the tree and select a different end field. When selecting a different end field, Enable End Field Selection must be selected. |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Start Field</td>
<td>Identifies the first field within the data layout that will be mapped. To change this value, make sure Enable End Field Selection is not selected, and select a different start field in the Source tree.</td>
</tr>
<tr>
<td>Enable End Field Selection</td>
<td>Use this field to control selection of the start field and end field values in the Source tree. When this option is not selected (default), you can select the start field. When this option is selected, you can select the end field.</td>
</tr>
<tr>
<td>End Field</td>
<td>Identifies the last field within the data layout that will be mapped. To change this value, make sure Enable End Field Selection is selected, and select a different end field in the Source tree.</td>
</tr>
</tbody>
</table>

7. Optional: On the Virtual Table Redefines page, accept the default table redefines or expand Redefine to modify your selection, and click Next.

8. Complete the following VSAM related fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cluster Name</td>
<td>Enter the cluster name for the VSAM data set, and click Validate. The server searches the catalog on the mainframe to confirm that the data set exists. If the data set exists, a dialog displays the data set type.</td>
</tr>
<tr>
<td>Post-Read Exit Name</td>
<td>To manipulate the data after reading it from the source file, enter the name of the post-read exit to use. This is the custom exit routine that is installed on the server and is used to perform additional processing after a record is read from the data source. If your data is compressed, use the decompression routine that IBM provided to decompress your data after it has been read.</td>
</tr>
<tr>
<td>Pre-Write Exit Name</td>
<td>To manipulate the data before writing it to the source file, enter the name of the pre-exit to use. This is the custom exit routine that is installed on the server and is used to perform additional processing before a record is read from the data source.</td>
</tr>
<tr>
<td>Alternate Indexes</td>
<td>If the VSAM file has been defined to include alternate indexes, you can click Get to add index information to the virtual table, or you can click Delete to remove the information. Alternate indexes are used to improve query performance when the search criteria includes columns that are not part of the primary index. Alternate indexes have an indirect relationship to the cluster name, but they must be defined separately. If you are using a KSDS VSAM or ESDS cluster, you can specify alternative indexes that are associated with the cluster.</td>
</tr>
</tbody>
</table>
Field | Action
---|---
Advanced (VSAM only) | When reading large volumes of data from tables, click Advanced to display and configure the MapReduce feature. The MapReduce feature enables you to divide the data into logical partitions and process those partitions in parallel using the Thread Count value. At runtime, the number of zIIP processors is verified and one thread is used for each zIIP processor; resulting in improved performance. The Thread Count value you specify overrides the default value (2) and the discovered value. To disable MapReduce, select the Disable MapReduce check box.

| What to do next |
Use the studio to easily compose and execute SQL queries using your new virtual tables. See “Generating and executing SQL queries” on page 250.

### Creating virtual tables for sequential data

Create a virtual table that maps to the sequential data that you want to access, and from which the SQL used to access the data is generated and executed.

| Before you begin |
Before creating the virtual table, verify that the data set name exists and that the copybook exists in the source library.

| Procedure |
1. Expand the SQL > Data > SSID node, where SSID is the name of your server.
2. Right-click Virtual Tables and select Create Virtual Table(s).
3. Under Wizards, select the Sequential wizard and click Next.
4. On the New Virtual Table Wizard page, complete the following fields and click Next:

| Field | Action |
---|---|
Name | Enter a unique name. The name can contain a maximum of 50 characters. The name must consist of an uppercase letter followed by zero or more characters, each of which is an uppercase letter, a digit, or the underscore character. |
Metadata Library | From the drop-down list, select the target library where the virtual table metadata will be stored (for example, hlq.USER.MAP). The target libraries are specified in the server’s started task JCL. |
Description | Enter an optional description. |
Convert VAR* fields to True VAR* fields | This is a deprecated field and should not be selected. |
5. On the **Source Download** page, complete the following fields and click **Next**:

<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Available Source Libraries</strong></td>
<td>Select the source library that contains the data structure to use.</td>
</tr>
<tr>
<td><strong>Source Library Members</strong></td>
<td>Select the PDS members that represent the data structures to include and click <strong>Download</strong> to copy the members from the mainframe to your desktop.</td>
</tr>
<tr>
<td><strong>Download Source Files</strong></td>
<td>Select one or more previously downloaded members.</td>
</tr>
</tbody>
</table>

6. On the **Virtual Table Layout** page, complete the following fields and click **Next**:

<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
</table>
| **Source**  | Browse the source tree to verify that it displays the expected data layout. By default, all of the fields in the tree will be included in the mapping. To include only a subset of the fields for the mapping, modify the start field value and, optionally, the end field value, as follows:  
  - For the start field, accept the default root start field, or expand the tree and select a different start field. When selecting a different start field, **Enable End Field Selection** must not be selected.  
  - For the end field, accept the default end field, or expand the tree and select a different end field. When selecting a different end field, **Enable End Field Selection** must be selected. |
| **Start Field** | Identifies the first field within the data layout that will be mapped. To change this value, make sure **Enable End Field Selection** is not selected, and select a different start field in the **Source** tree. |
### Field

**Enable End Field Selection**

Use this field to control selection of the start field and end field values in the **Source** tree. When this option is not selected (default), you can select the start field. When this option is selected, you can select the end field.

**End Field**

Identifies the last field within the data layout that will be mapped. To change this value, make sure **Enable End Field Selection** is selected, and select a different end field in the **Source** tree.

---

7. Optional: On the **Virtual Table Redefines** page, accept the default table redefines or expand **Redefine** to modify your selection, and click **Next**.

8. On the **Data Source Details** page, complete the following data source fields and click **Next**:

<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
</table>
| **Data Set Name**  | Enter the data set name you want to use. The following data set types are supported:  
  • PDS or PDSE: Specify the partitioned data set name. This requires that you also enter a **Member** name prior to validating that the member name exists on the host.  
  • Physical sequential: Specify the sequential data set name and click **Validate** to verify that the data set name exists on the host.  
  • Generation Data Groups (GDG): Specify the GDG data set using the GDG syntax. For example: `hlq.DATASEQ(-1)`. You can also specify a base GDG name so that all generations of the GDG will potentially be accessed. Click **Validate** to verify that the data set name exists on the host. |
| **Member**         | If you selected a PDS or PDSE for the **Data Set Name**, you must also enter the member name to use. Click **Validate** to verify that the member name exists on the host. |
| **Post-Read Exit Name** | To manipulate the data after reading it from the source file, enter the name of the post-read exit to use. This is the custom exit routine that is installed on the server and is used to perform additional processing after a record is read from the data source. |
Field | Action
---|---
Advanced | When reading large volumes of data from tables, click Advanced to display and configure the MapReduce feature. The MapReduce feature enables you to divide the data into logical partitions and process those partitions in parallel using the Thread Count value. At runtime, the number of zIIP processors is verified and one thread is used for each zIIP processor; resulting in improved performance. The Thread Count value you specify overrides the default value (2) and the discovered value. To disable MapReduce, select the Disable MapReduce check box.

9. Click Finish.

What to do next

Use the studio to easily compose and execute SQL queries using your new virtual tables. See “Generating and executing SQL queries” on page 250.

Creating virtual tables for zFS and HFS file system data

Create a virtual table that maps to file data that you want to access on a zFS or HFS file system and from which the SQL used to access the data is generated and executed.

Before you begin

Before creating the virtual table, verify that the PDS members that represent the data structures for the data you want to virtualize already exist in the source library.

Procedure

1. Expand the SQL > Data > SSID node, where SSID is the name of your server.
2. Right-click Virtual Tables and select Create Virtual Table(s).
3. Under Wizards, select the zFS wizard and click Next.
4. On the New Virtual Table Wizard page, complete the following fields and click Next:

<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name. The name can contain a maximum of 50 characters. The name must consist of an uppercase letter followed by zero or more characters, each of which is an uppercase letter, a digit, or the underscore character.</td>
</tr>
<tr>
<td>Metadata Library</td>
<td>From the drop-down list, select the target library where the virtual table metadata will be stored (for example, hlq.USER.MAP). The target libraries are specified in the server's started task JCL.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter an optional description.</td>
</tr>
</tbody>
</table>
### Field Action

**Convert VAR* fields to True VAR* fields**  
This is a deprecated field and should not be selected.

**Arrays Handling**  
Enable one of the following array management options:  
- **Flatten arrays into a single fixed table at runtime**: This supports both OCCURS and OCCURS DEPENDING ON statements.  
- **Return arrays into separate tables at runtime**: This supports both OCCURS and OCCURS DEPENDING ON statements. A subtable is generated for each array. Subtables only support SQL read access.

5. On the **Source Download** page, complete the following fields and click **Next**:

<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Download Folder</td>
<td>Verify that the appropriate download folder is displayed.</td>
</tr>
<tr>
<td>Available Source Libraries</td>
<td>Select the source library that contains the data structure to use.</td>
</tr>
<tr>
<td>Source Library Members</td>
<td>Select the PDS members that represent the data structures to include and click <strong>Download</strong> to copy the members from the mainframe to your desktop.</td>
</tr>
<tr>
<td>Downloaded Source Files</td>
<td>Select one or more previously downloaded members. Selecting previously downloaded members is optional.</td>
</tr>
</tbody>
</table>

6. On the **Virtual Table Layout** page, complete the following fields and click **Next**:

<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
</table>
| Source       | Browse the source tree to verify that it displays the expected data layout. By default, all of the fields in the tree will be included in the mapping. To include only a subset of the fields for the mapping, modify the start field value and, optionally, the end field value, as follows:  
- For the start field, accept the default root start field, or expand the tree and select a different start field. When selecting a different start field, **Enable End Field Selection** must not be selected.  
- For the end field, accept the default end field, or expand the tree and select a different end field. When selecting a different end field, **Enable End Field Selection** must be selected. |
<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Start Field</td>
<td>Identifies the first field within the data layout that will be mapped. To change this value, make sure Enable End Field Selection is not selected, and select a different start field in the Source tree.</td>
</tr>
<tr>
<td>Enable End Field Selection</td>
<td>Use this field to control selection of the start field and end field values in the Source tree. When this option is not selected (default), you can select the start field. When this option is selected, you can select the end field.</td>
</tr>
<tr>
<td>End Field</td>
<td>Identifies the last field within the data layout that will be mapped. To change this value, make sure Enable End Field Selection is selected, and select a different end field in the Source tree.</td>
</tr>
</tbody>
</table>

7. On the zFS Virtual Table Details page, complete the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pathname</td>
<td>Enter the path name of the zFS file.</td>
</tr>
<tr>
<td></td>
<td>If the absolute path name of the zFS file is less than 255 characters in length, you must include the root slash &quot;/&quot; in the path name. For example, /u/tsado/data/stuff.txt.</td>
</tr>
<tr>
<td></td>
<td>If the absolute path name of the zFS file is greater than 255 characters in length, you must enter the relative path name. The relative path name starts with the name of the target system to indicate the top-level directory and does not include the leading root slash. For example, data/stuff.txt, where &quot;data&quot; is the name of the target system.</td>
</tr>
</tbody>
</table>
### Target System

If you plan to map several zFS files under the same zFS directory location, specify a target system to use.

You can click **Create** to add a new path name to use, or if a relative path name is already specified in the **Pathname** field, you must select an existing target system from the drop-down list.

If you choose to create a new target system, complete the following fields and click **Finish**:

- **Name** – Enter the name for the new target system.
- **CCSID** – Enter the CCSID of the character set in which the zFS file data is encoded. The default setting is **EBCDIC 1047**.
- **Base Pathname** – Enter the absolute path name under which the zFS file resides. Typically, this is the path name of the zFS subdirectory that contains your zFS file. At runtime, the server will determine the location of the zFS file by concatenating the path name with the value specified in the virtual table **Pathname** field. The server does not insert additional slash (/) separators when concatenating the target system path name and the virtual table path name. If the target system path name represents a complete directory name, include the trailing slash (/tmp)/.

### Advanced

When reading large volumes of data from tables, click **Advanced** to display and configure the **MapReduce** feature. The **MapReduce** feature enables you to divide the data into logical partitions and process those partitions in parallel using the **Thread Count** value. At runtime, the number of zIIP processors is verified and one thread is used for each zIIP processor; resulting in improved performance. The **Thread Count** value you specify overrides the default value (2) and the discovered value. To disable **MapReduce**, select the **Disable MapReduce** check box.

8. Click **Finish**.

**What to do next**

Use the studio to easily compose and execute SQL queries using your new virtual tables. See “Generating and executing SQL queries” on page 250.
**Creating virtual tables for CA IDMS data**

Create virtual tables that map to the CA IDMS data that you want to access and from which the SQL used to access the data is generated and executed.

**Before you begin**

The Accelerator Loader server must be configured for CA IDMS access, and the CA IDMS central version referenced by the data server SYSCTL DD statement must be active.

**About this task**

CA IDMS schema records are mapped using the CA IDMS data dictionary. Each record is mapped as a separate virtual table using the COBOL names to derive the SQL column names. In addition to records, schema sets can be mapped as well. Virtual tables created for CA IDMS sets serve as correlation tables between CA IDMS records so SQL joins can navigate the CA IDMS schema.

**Procedure**

1. On the Server tab, explore the CA IDMS metadata information by expanding the Discovery > IDMS node, and then navigating down the appropriate subtree. The hierarchy begins with the data dictionary, followed by the CA IDMS schema, the CA IDMS subschema, and then the associated records and sets.
2. Select one or more records, as follows:
   - To select individual records, hold down the Ctrl key and click each record to include.
   - To select a range of records, click the first record in the range, and then hold the Shift key and select the last record in the range. All records within the range will be included.
   - To select all child records under a parent, click the parent record.
3. Right-click the selected records and select Create Virtual Table(s). The New Virtual Tables Wizard launches.

   **Note:** You can map the relevant CA IDMS sets in the wizard.
4. On the Create IDMS virtual tables page, complete the following Common Virtual Table Settings:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Metadata Library</td>
<td>From the drop-down list, select the target library where the virtual table metadata will be stored (for example, hlq.USER.MAP). The target libraries are specified in the server's started task JCL.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter an optional description.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Arrays Handling</td>
<td>Select one of the following options:</td>
</tr>
<tr>
<td></td>
<td>• Flatten arrays into a single fixed table at runtime (Y): This option supports both OCCURS and OCCURS DEPENDING ON statements.</td>
</tr>
<tr>
<td></td>
<td>• Return arrays into separate tables at runtime (N): This option supports both OCCURS and OCCURS DEPENDING ON statements. A subtable is generated for each array. Subtables support SQL read access only.</td>
</tr>
<tr>
<td>Virtual Table Naming Patterns</td>
<td>Specify the format to use for the generated virtual table names. You can specify different patterns for records and sets. Use the following variables to create naming patterns that are derived from the IDMS metadata:</td>
</tr>
<tr>
<td></td>
<td>• {SubSchema}: Subscheme name</td>
</tr>
<tr>
<td></td>
<td>• {Record}: Record name</td>
</tr>
<tr>
<td></td>
<td>• {Set}: Set name</td>
</tr>
<tr>
<td>Prune IDMS record field suffix from column names</td>
<td>Select this option to remove the IDMS record field suffix from the column names.</td>
</tr>
</tbody>
</table>

5. In the table that lists the IDMS records, review the list of selected entries. Modify the selections as needed.

   Tip: Use the check box in the header row of the table to control the selection of all entries.

6. To map the sets, click Fetch Related IDMS Sets. The Accelerator Loader studio collects additional metadata from the server and displays the relevant items in the table that lists the IDMS sets.

7. In the table that lists the IDMS sets, review the list of selected entries. Modify the selections as needed.

8. To disable MapReduce, click Advanced and select Disable MapReduce.

9. Click Finish.

Results

The Accelerator Loader studio creates the virtual tables (the metadata maps) on the server.

What to do next

Use the studio to easily compose and execute SQL queries using your new virtual tables. See “Generating and executing SQL queries” on page 250.

Creating virtual tables for VSAM and sequential access using ADDI

Create virtual tables that map VSAM and sequential data for COBOL applications by using information made available through IBM Application Discovery and Delivery Intelligence (ADDI).
Before you begin

The Accelerator Loader server must be configured to access one or more ADDI projects hosted on Microsoft SQL Server. The studio recognizes ADDI when virtual views and target system maps are installed. Map recognition is based on target systems starting with the string TSIAD and virtual views starting with the name IADV_. For more information on configuring the server, see “Configuring access to ADDI” on page 182.

About this task

To create the virtual tables that are used to access VSAM and sequential data for COBOL applications, information is queried in the ADDI project. Information is retrieved about the z/OS data sets and the COBOL copybooks used to access the z/OS data sets.

The following restrictions and considerations apply:

- Virtual table creation is restricted to data sets in the ADDI project that are processed by COBOL programs using JCL. Data sets accessed using CICS as well as other databases (such as IMS, CA IDMS, or Adabas) are not supported.
- When retrieving data sets from the ADDI project, the studio provides a list of all data sets discovered in the ADDI project that correspond to copybook information. If the data set does not have a corresponding copybook, the data set will not be presented in the studio.
- When creating virtual tables in the studio, duplicate records may appear in the generated list. (Duplicate records have the same project and copybook record names but different ID values.) This is due to multiple copies of the same copybook existing in the ADDI project. The studio provides a feature that compares the definitions of the records and allows you to remove any duplicates.
- When mapping COBOL copybooks containing REDEFINES clauses, default mapping rules related to REDEFINES will be applied which will result in disabled columns in the maps. Editing of virtual maps may be required after generation to enable or disable generated columns.
- ADDI project names are limited to 13 characters due to location name restrictions in the z/OS server.

Procedure

1. On the Server tab, explore the ADDI metadata information by expanding the Discovery > IBM Application Discovery node, and then navigating down the appropriate subtree. The hierarchy begins with the project, followed by the data sets, and then the associated records.
2. Optional: Right-click a record and select Display Data Layout to show the copybook for the record.
3. Select one or more data sets or records to map, as follows:
   - To select individual data sets or records, hold down the Ctrl key and click each data set or record to include.
   - To select a range of data sets or records, click the first data set or record in the range, and then hold the Shift key and select the last data set or record in the range. All data sets or records within the range will be included.
   - To select all records under a data set, click the data set.
4. Right-click the selected data sets or records and select **Create Virtual Table(s)**. The **New Virtual Tables Wizard** launches, presenting a list of proposed virtual table names and the COBOL structure names that will be used as a basis to create columns for the virtual tables.

5. On the **Create virtual tables using IBM Application Discovery** page, complete the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Metadata Library</td>
<td>From the drop-down list, select the target library where the virtual table metadata will be stored (for example, hlq.USER.MAP). The target libraries are specified in the server’s started task JCL.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter an optional description.</td>
</tr>
</tbody>
</table>
| Naming Pattern         | Specify the format to use for the generated virtual table names. You can specify different patterns for the project name and records. Use the following variables to create naming patterns that are derived from the ADDI metadata:  
  - [Project]: ADDI project name  
  - [Record]: Record name                                                                                                                       |
| Arrays Handling        | Select one of the following options:                                                                                                          |
  - ** Flatten arrays into a single fixed table at runtime (Y): ** This option supports both OCCURS and OCCURS DEPENDING ON statements.  
  - ** Return arrays into separate tables at runtime (N): ** This option supports both OCCURS and OCCURS DEPENDING ON statements. A subtable is generated for each array. Subtables support SQL read access only.  
  - ** Flatten arrays now (C): ** If you select this option, you cannot change array-handling after you save the virtual table. |

6. In the table that lists the records, review the list of selected entries and perform the following steps:
   a. Optional: If duplicate target virtual table names appear, which are identified with a description in the **Errors** column, click **Remove Duplicates**. The studio compares the definitions of the records and removes any duplicates.
   b. Click **Validate** to validate each data set and determine the data set type. The studio populates the **Type** column with the correct data set type.
   c. Modify the selections to map as needed.

   **Tip:** Use the check box in the header row of the table to control the selection of all entries.

7. Optional: Click **Advanced** to display and complete the following fields:
Field Description

MapReduce (Server Parallelism Overrides) When reading large volumes of data from tables, you can use the MapReduce feature. The MapReduce feature enables you to divide the data into logical partitions and process those partitions in parallel using the Thread Count value. At runtime, the number of zIIP processors is verified and one thread is used for each zIIP processor; resulting in improved performance. The Thread Count value you specify overrides the default value (2) and the discovered value. To disable MapReduce, select the Disable MapReduce check box.

8. Click Finish.

Results

The virtual tables are created on the server and are visible under the SQL > Data > SSID > Virtual Tables tree node, where SSID is the name of your server.

What to do next

Use the studio to easily compose and execute SQL queries using your new virtual tables. See “Generating and executing SQL queries” on page 250.

Creating virtual tables for VSAM and sequential access using RAA

Create virtual tables that map VSAM and sequential data for COBOL applications by using information made available through IBM Rational Asset Analyzer (RAA).

Before you begin

The Accelerator Loader server must be configured to access one or more RAA database schemas hosted on Db2 for z/OS. The studio recognizes RAA when RAA virtual views and target system maps are installed. Map recognition is based on target systems starting with the string TSRAA and virtual views starting with the name RAAV_. For more information on configuring the server, see “Configuring access to RAA” on page 189.

The preferred method to collect COBOL information is to retrieve record layouts directly from the WebSphere Application Server that hosts RAA. The WebSphere Application Server must be configured using the Metadata Discovery preferences. For more information, see “Metadata Discovery preferences” on page 268.

About this task

To create the virtual tables that are used to access VSAM and sequential data for COBOL applications, information is queried in the RAA database and from the host. Information is retrieved about the z/OS data sets and the COBOL copybooks used to access the z/OS data sets. If the WebSphere Application Server has been configured, all access to the host for record layout information will first be attempted using the WebSphere Application Server hosting RAA. If access to the RAA host fails and the record layout is stored in a PDS, layout retrieval will be attempted using the current Accelerator Loader server.
The following restrictions and considerations apply:

- Virtual table creation is restricted to data sets in the RAA database that are processed by COBOL programs using JCL. Data sets accessed using CICS as well as other databases (such as IMS, CA IDMS, or Adabas) are not supported.
- When retrieving data sets from the RAA database, the studio provides a list of all data sets discovered in the RAA database that correspond to copybook information. If the data set does not have a corresponding copybook, the data set will not be presented in the studio.
- When creating virtual tables in the studio, duplicate records may appear in the generated list. (Duplicate records have the same database and copybook record names but different ID values.) This is due to multiple copies of the same copybook existing in the RAA database. The studio provides a feature that compares the definitions of the records and allows you to remove any duplicates.
- When mapping COBOL copybooks containing REDEFINES clauses, default mapping rules related to REDEFINES will be applied which will result in disabled columns in the maps. Editing of virtual maps may be required after generation to enable or disable generated columns.

Procedure

1. On the Server tab, explore the RAA metadata information by expanding the Discovery > IBM Rational Asset Analyzer node, and then navigating down the appropriate subtree. The hierarchy begins with the database, followed by the data sets, and then the associated records.
2. Optional: Right-click a record and select Display Data Layout to show the copybook for the record.
3. Select one or more data sets or records to map, as follows:
   - To select individual data sets or records, hold down the Ctrl key and click each data set or record to include.
   - To select a range of data sets or records, click the first data set or record in the range, and then hold the Shift key and select the last data set or record in the range. All data sets or records within the range will be included.
   - To select all records under a data set, click the data set.
4. Right-click the selected data sets or records and select Create Virtual Table(s). The New Virtual Tables Wizard launches, presenting a list of proposed virtual table names and the COBOL structure names that will be used as a basis to create columns for the virtual tables.
5. On the Create virtual tables using IBM Rational Asset Analyzer page, complete the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Metadata Library</td>
<td>From the drop-down list, select the target library where the virtual table metadata will be stored (for example, hlq.USER.MAP). The target libraries are specified in the server’s started task JCL.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter an optional description.</td>
</tr>
</tbody>
</table>
### Naming Pattern

Specify the format to use for the generated virtual table names. You can specify different patterns for the database name and records. Use the following variables to create naming patterns that are derived from the RAA metadata:

- {Database}: RAA database name
- {Record}: Record name

### Arrays Handling

Select one of the following options:

- **Flatten arrays into a single fixed table at runtime (Y):** This option supports both OCCURS and OCCURS DEPENDING ON statements.
- **Return arrays into separate tables at runtime (N):** This option supports both OCCURS and OCCURS DEPENDING ON statements. A subtable is generated for each array. Subtables support SQL read access only.
- **Flatten arrays now (C):** If you select this option, you cannot change array-handling after you save the virtual table.

6. In the table that lists the records, review the list of selected entries and perform the following steps:

   a. Optional: If duplicate target virtual table names appear, which are identified with a description in the Errors column, click **Remove Duplicates**. The studio compares the definitions of the records and removes any duplicates.

   b. Click **Validate** to validate the data set and determine the data set type. The studio populates the **Type** column with the correct data set type.

   c. Modify the selections to map as needed.

   **Tip:** Use the check box in the header row of the table to control the selection of all entries.

7. Optional: Click **Advanced** to display and complete the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>MapReduce (Server Parallelism Overrides)</strong></td>
<td>When reading large volumes of data from tables, you can use the <strong>MapReduce</strong> feature. The <strong>MapReduce</strong> feature enables you to divide the data into logical partitions and process those partitions in parallel using the <strong>Thread Count</strong> value. At runtime, the number of zIIP processors is verified and one thread is used for each zIIP processor; resulting in improved performance. The <strong>Thread Count</strong> value you specify overrides the default value (2) and the discovered value. To disable <strong>MapReduce</strong>, select the <strong>Disable MapReduce</strong> check box.</td>
</tr>
</tbody>
</table>

8. Click **Finish**.
Results

The virtual tables are created on the server and are visible under the SQL > Data > SSID > Virtual Tables tree node, where SSID is the name of your server.

What to do next

Use the studio to easily compose and execute SQL queries using your new virtual tables. See “Generating and executing SQL queries” on page 250.

Creating virtual views

Consider creating a virtual view if columns in your virtual table are missing or if you want to join columns from different virtual tables.

Before you begin

The virtual tables representing the data that you want to access or join must already exist.

About this task

A virtual view comprises the SELECT statement that contains the columns from the source data that are used to read data directly from the data source. For example, SELECT * FROM HLS_JOIN_VSAM LIMIT 1000; In some cases, creating virtual views is more convenient than regenerating and editing SQL each time you want to access the same data.

Procedure

1. In the Server View, expand SQL > Data > Accelerator Loader server > Virtual Tables.
2. Right-click the virtual table that represents the data that you want to access, and select Create Virtual View.
3. In the Name field, enter a name for the virtual view.
4. From the Target drop-down list, select the target to use for this virtual view.
5. Optional: In the Description field, enter a description.
6. Click Next.
7. In the Table Browser, expand the Virtual Tables folder, and select an existing virtual table to use to compose the SQL statement.
8. Click Next.
9. Optional: Review the resulting SQL statement and make any necessary modifications.
10. Click Validate to validate the SQL.
11. If valid, on the SQL Validation message that displays, click OK.
12. Click Finish.

Results

In the Server view, locate the new virtual view by expanding SQL > Data > Accelerator Loader server > Virtual Views.
What to do next

Use the studio to easily compose and execute SQL queries using your new virtual views. See “Generating and executing SQL queries.”

Generating and executing SQL queries

To test SQL access to your data, generate and execute a SQL query from an existing virtual table or virtual view.

Before you begin

To avoid fetching large result sets that are memory intensive, the Accelerator Loader studio provides settings related to SQL generation and retrieval that can limit the amount of data that is actually retrieved for a particular query execution. For more information, see “SQL preferences” on page 267.

Important: When writing SQL to access Adabas data, use caution when using the BASE_KEY in WHERE predicates, (for example, [PARENT TABLE].BASE_KEY = [CHILD TABLE].PARENT_KEY) when joining the parent table with a child subtable, since this will result in a table scan of the entire Adabas file. It is recommended instead to use the CHILD_KEY (for example, [PARENT TABLE].CHILD_KEY = [CHILD TABLE].PARENT_KEY).

Procedure

1. On the Server tab, right-click a virtual table and select Generate Query.
2. Choose from the following options:
   - **Execute** – Generate the SQL query in the Data Source Editor and execute the query.
   - **Cancel** – Generate the SQL query in the SQL Editor without executing the query. The generated SQL SELECT statement has all columns from the selected table. If the table contains a large number of columns, to avoid enumerating the various column names you can choose all columns using the Generate Query with * option.
3. Optional: In the SQL Editor view, modify the SQL to select only the data that you want to access. Any ANSI compliant SQL is acceptable.
4. To view or test the data that the SQL statement returns, right-click the highlighted SELECT statement and click either Execute SQL to view results in the SQL Results view, or Execute SQL and File results to save the results in a .csv file.
5. Optional: To create a virtual view of the SQL, highlight the SELECT statement, right-click and select Create a virtual view.

Results

In the SQL Results view:
- Double-click a row to view additional details about that row.
- Select the Export Result Set view option to export the SQL results to a .csv file.
- Click SQL Messages to view query-related system messages.

By default, if a result set includes 25 or more columns, each set of 25 columns are displayed incrementally as groups. You can choose which group you want to view
using the **Columns Group** field. You can set the number of columns that you want to include in each group, ranging from 25-200, in the **Columns per group** field.

To change how SQL results display in the **SQL Results** view, see [“Accelerator Loader preferences” on page 263](#).

**What to do next**

After the SQL statement is generated, you can perform any of the following tasks:

- Modify the SQL to meet your needs
- Execute the SQL to test and view the resulting data
- Create virtual views to join data or include missing columns

---

**Generating JCL**

Generate the JCL that loads the data to the accelerator from a virtual table, virtual view, or selected SQL statement.

**Before you begin**

- Have the following information available before starting this task:
  - Target server name
  - Target Db2 subsystem name
  - Db2 load library names
  - Accelerator name
  - Product data set names
  - JCL library name
  - Table creator name
  - Table name
- To enable the **Load Resume** feature, you must have IBM Db2 Analytics Accelerator for z/OS V4 PTF5 installed on the accelerator.
- If the source data is not hosted on the same LPAR as the accelerator, two accelerator servers are required:
  - The **data server** is the Accelerator Loader server that hosts the virtual table or view.
  - The **target server** is the Accelerator Loader server that has access to the target Db2 subsystem and the accelerator. The target server’s hlq/idIN00 file must contain a configuration entry for the data server. When you run the wizard to generate the JCL, the name of this configuration definition is referred to as the **Data Server Name**.

**About this task**

In the steps that follow, the information that you enter is only required the first time that you generate the JCL.

**Procedure**

1. On the **Server** tab, expand **SQL > Data**.
2. Expand **Virtual Views** or **Virtual Tables** to navigate to the virtual view or virtual table that represents the source data that you want to load.
3. Right-click the virtual view or table, and select **Generate JCL to Load Accelerator** to open the **Generate JCL to Load Accelerator** wizard.
4. On the **Source Information** page, review the source subsystem and the SQL query. If you choose to modify the SQL query, you must click **Validate** before you can proceed to the next page. If the query is not valid, an error message displays showing the source of the problem. The SQL query must be corrected before you can continue.

5. Click **Next**.

6. On the **Target Information** page, specify the following information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
</table>
| Target Server Selection| • Choose **Use Current Server** if the server that is hosting the virtual table or virtual view resides on the same LPAR as the accelerator. This is the default setting.  
  • Choose **Use Alternate Target Server** if the server that is hosting the virtual table or virtual view does not reside on the same LPAR as the accelerator. If you choose this option, use **Set Server** to select the alternate server. |
<p>| Target DB2 Subsystem    | Accept the default Db2 subsystem name or choose a different subsystem to use from the drop-down list. This name must match the data server name that is configured in the target server hlvidIN00 file. The subsystem that you choose will display as the default setting the next time that you run the wizard. |
| Table Creator          | Accept the <strong>Table Creator</strong> name that is displayed, or select a different name from the drop-down list. |
| Table Name             | Accept the <strong>Table Name</strong> that is displayed, or select a different name from the drop-down list. |
| Available Accelerators  | From the list of <strong>Available Accelerators</strong>, select the accelerators to use. If an accelerator is associated with a group, the <strong>Group</strong> label is displayed next to the accelerator name. You can select up to eight accelerators to load data simultaneously. |</p>
<table>

</tr>
</tbody>
</table>
| DB2 Dynamic SQL Program (DSNTEP2) | Enter the required details for running the DSNTEP2 sample Db2 program:  
  - DB2 Load Library (RUNLIB)  
  - Plan Name (the default is DSNTEP2) |
| JCL Settings                 | Click JCL Settings to view or modify the JCL generation preferences in the JCL Preferences dialog and click OK. This setting is optional.                                                                 |

9. Click Next.
10. On the Job Creation page, specify the following information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>JCL Library</td>
<td>Select or enter the name of the JCL library to use. The JCL library that you choose is displayed the next time you open this page. If you do not plan to save the job on the host or if you do not know the location, leave this field blank. This setting is optional.</td>
</tr>
<tr>
<td>Member Name</td>
<td>Enter the name of the member to use to store your generated JCL.</td>
</tr>
<tr>
<td>Local File Name</td>
<td>Depending on the JCL library that you chose, you can choose to enter the name of a local file to use.</td>
</tr>
<tr>
<td>Job Name</td>
<td>Accept or modify the Job Name.</td>
</tr>
</tbody>
</table>
### Field | Action
--- | ---
**Job Step Details** | Specify the following job options:
- **DROP TABLE** – Select this option to drop the existing target table definition. Do not select this option if the accelerated table does not already exist.
- **CREATE TABLE** – Select this option to create a new target table definition.
- From the **LOAD REPLACE** drop-down list, select a load option to use:
  - **LOAD REPLACE** – Replaces the data in the table. This option adds the **REPLACE** control card to the generated JCL.
  - **LOAD RESUME** – Loads new data to an existing table. This option adds the **RESUME YES** control card to the generated JCL. Selecting **LOAD RESUME** disables the **DROP TABLE** and **CREATE TABLE** options.
- **SET CURRENT SQLID** – Specify an alternate authorization ID under which the DROP TABLE and CREATE TABLE statements will be executed in the generated Accelerator Loader job. This setting is optional. If this field is set, the generated JCL will include a statement to assign a value to the DB2 CURRENT SQLID special register. This statement appears as the first line of SYSIN in both the DROP and CREATE steps of the job, as follows:
  ```
  //SYSIN DD *
  SET CURRENT SQLID = 'MYSQLID' ;
  /*
  ... */
  ```

### Additional Actions | Choose from the following actions:
--- | ---
- **Open in Editor** – Select **Open in Editor** to review the JCL in the JCL Editor.
- **Auto-run using JCL View** – Select **Auto-run using JCL View** to automatically submit the JCL after it is generated. If the JCL library is specified in the JCL view, a copy of the JCL is saved in a PDS on the host. You can use this copy for future data loads.

These settings are optional.

11. Click **Generate** to generate the JCL.

## Submitting JCL

To load data to the accelerator, submit the generated JCL. You can also save a reusable copy of the JCL in a PDS on the mainframe.
**Procedure**

1. From the Windows menu, select Show View > JCL View.
2. Optional: In the JCL view, from the JCL library pull-down, select the PDS to use or enter a new PDS. To save this location, click the + (plus sign).
3. To enable the JCL for submission, click Enable/Disable Submit.
4. To save or submit the JCL, click Play. You can also click F5 in the JCL Editor to save or submit the JCL, or right-click on the JCL and select Run using JCL View.
5. Optional: To view the JCL processing summary, click the Messages tab. To review the entire job output, click the Job tab.

---

**Accessing IT Operational Analytics data**

To access, analyze, and report IT Operational Analytics (ITOA) data, generate the SQL from ITOA virtual tables.

When you configure the Accelerator Loader server, you have the option to include pre-defined data maps that administrators can use to access the following types of ITOA data:

- IBM System Management Facilities files (SMF)
- Operations Log files (OPERLOG_SYSLOG)
- System Log files (SYSLOG)

After you have configured the Accelerator Loader server to use ITOA pre-defined data maps, you can generate the SQL that is used to access ITOA data from the ITOA virtual tables.

For information about configuring access to operational analytics data with pre-defined data maps, see "Configuring access to SMF data for IT Operational Analytics" on page 171.

**System Management File sample code**

Use SMF virtual tables to get SQL access to data in System Management Files (SMF).

**About this task**

When accessing data in SMF files, you use predefined virtual columns that are defined in the SMF virtual table map.

When using SMF log streams, you can use the following virtual columns to retrieve timestamp values:

- **LS_TIMESTAMP**
  
  Timestamp for log stream in GMT. When used in a WHERE predicate, the timestamp is searched in GMT.

- **LS_TIMESTAMP_LOCAL**
  
  Timestamp for log stream in local time zone. When used in a WHERE predicate, the timestamp is searched as local time.

To get SQL access to SMF data, complete the procedure that follows.
Procedure
1. From the Server view, expand SQL > Data > server name > Virtual Tables.
2. Right-click the SMF virtual table or view from which you want to access the data.
3. Right-click Generate Query, and then review the resulting SQL statement. If necessary, you can modify the statement to meet your needs. The following shows a sample SQL statement:

```
-- This statement will return all rows and all columns from the
-- following table:
-- Name : SMF_00000
-- Catalog : null
-- Schema : DVSQL
-- Remarks : DATA - SMFDATA
-- Tree Location: rs28/1200/SQL/Data/VDBS/Virtual Tables/SMF_00000
-- SQL statement:
SELECT SMF_LEN, SMF_ZERO, SMF_FLAG, SMF_RTY, SMF_TIME, SMF_SID, SMF_SSI,
      SMF_STY, SMF_SEQN, SMF0JWT, SMF0BUF, SMF0VST, SMF0OPT, SMF0RST,
      SMF0RSV, SMF0OSL, SMF0SYN, SMF0SYP, SMF0TZ, SMF0MSWT, SMF0MTWT
FROM SMF_00000 LIMIT 100;
```
4. Optional: Execute the SQL statement to view, test, or save the resulting data.

What to do next
Get the code to use in your programs and applications by creating a SQL class from the virtual table.

Accessing Db2 unload data
Using existing Db2 virtual table definitions, you can issue SQL queries against your Db2 sequential unload data sets.

Before you can access your Db2 unload data using your Db2 virtual tables, you must configure access to the Db2 sequential unload data set. This access is configured using a virtual table rule. VTB rule HLVMMLDUD is provided to demonstrate redirecting a Db2 virtual table to a Db2 unload data set. For information about setting up access, see “Configuring access to Db2 unload data sets” on page 136.

After you have performed the configuration steps, you can generate the SQL that is used to access the Db2 unload data using your existing Db2 virtual tables.

As an example, consider a virtual table named DSNA_EMPLOYEES that maps the EMPLOYEES table in Db2 subsystem DSNA. With the virtual table rule that specifies the Db2 unload data set enabled, you can query an unload sequential dataset named EMPLOYEE.UNLOAD.SEQ by issuing the following query:

```
SELECT * FROM MLDU_DSNA_EMPLOYEES__EMPLOYEE_UNLOAD_SEQ
```

The rule performs the necessary steps to access the unload data set directly.

The following restrictions and considerations apply when using this feature:
- SQL access to Db2 unload files is limited to SQL queries only.
- The columns in the Db2 virtual table definition must exactly match the table unloaded in Db2.

Server Trace
Use the Server Trace view to record and view server operations for troubleshooting purposes.
About this task

From the Server Trace view, you can:
- Select a server from which to record and view Server Trace messages.
- Filter messages that display based on profile settings.
- Select the columns of information and the order in which those columns display.
- Label messages to allow you to search messages using labels.
- Import and export messages, such as .1sx files.

If you encounter a problem and need to contact IBM Software Support, you must gather certain information about your Accelerator Loader system and the problem before contacting Support. Your Support representative will need this information to correctly diagnose and resolve the problem.

Starting Server Trace

Start tracing Accelerator Loader server records in the Server Trace view.

Before you begin

Before running Server Trace, you must be able to connect to the Accelerator Loader server from which you want to collect the trace information.

Procedure

1. From the Studio Navigator view, on the Common Tools tab, click Server Trace.
2. To start tracing, click Play (the blue arrow). The Server Trace table displays trace records.
3. Optional: To view message details, double-click the message and the details are displayed on the Server Trace Zoom page. You can also choose to search for specific details within the message.

Enabling Accelerator Loader studio calls in the Server Trace results

To include Accelerator Loader studio trace calls in your Server Trace results, enable the Accelerator Loader Enable Server Tracing of Studio Calls preference.

Before you begin

You must be able to connect to the Accelerator Loader server from which you want to collect trace information.

Procedure

1. From the Window menu, select Open Preferences > Accelerator Loader.
2. To enable tracing, select the Enable Server Tracing of Studio Calls check box. Enable Server Tracing of Studio Calls is enabled by default.
3. In the Accelerator Loader studio HTTP Debug Option drop-down list, select one of the following HTTP debug options:

<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Off</td>
<td>Do not collect HTTP messages. All trace activities are deactivated, including interactive tracing.</td>
</tr>
<tr>
<td>Field</td>
<td>Action</td>
</tr>
<tr>
<td>-----------</td>
<td>------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Normal</td>
<td>Commands that complete with a failure status are traced after execution, including the return codes.</td>
</tr>
<tr>
<td>All</td>
<td>All instructions are traced before execution.</td>
</tr>
<tr>
<td>Commands</td>
<td>All commands are traced before execution. Return codes are also traced for commands that complete with an error or failure status.</td>
</tr>
<tr>
<td>Error</td>
<td>Commands that complete with error status are traced after execution, including the return codes.</td>
</tr>
<tr>
<td>Failure</td>
<td>Commands that complete with a failure status are traced after execution, including the return codes.</td>
</tr>
<tr>
<td>Intermediates</td>
<td>All instructions are traced before execution. All terms, intermediate results, and substituted variable names are traced during expression evaluation. The final result of any expression that is evaluated also displays. Values assigned by <code>arg</code>, <code>parse</code>, or <code>pull</code> instructions are also traced.</td>
</tr>
<tr>
<td>Labels</td>
<td>Shows all labels when executed.</td>
</tr>
<tr>
<td>Results</td>
<td>All instructions are traced before execution. The final result of any expression that is evaluated also displays. Values assigned by <code>arg</code>, <code>parse</code>, or <code>pull</code> instructions are also traced.</td>
</tr>
</tbody>
</table>

**Filtering Server Trace results**

Use the **Profile** option to filter the records that display in the **Server Trace** view.

**Before you begin**

You must be able to connect to the Accelerator Loader server from which you want to filter trace information. You can set filtering criteria before or after you run a Server Trace. Your most current filtering selections are automatically saved as your default filtering profile.

**Procedure**

1. On the **Server Trace** view, click **Profile**.
2. On the **Server Trace Profile** page, enable the fields that you want to include in the results.
3. For each enabled field, click **Add** to further filter your results. You can either select from the values that are displayed or enter the value when prompted.
4. Click **OK** to save changes to your profile and to apply the profile to the results in the **Server Trace** table.

**What to do next**

Use the **Display** option to select and sort columns that display in the filtered table. You can also choose to export the trace results.
Using Server Trace Zoom

Use Server Trace Zoom view to view Server Trace message details.

Before you begin

Server Trace must be running before you can open the Server Trace Zoom view.

Procedure

1. In the Server Trace view, double-click the message for which you want to view details.
2. In the Server Trace Zoom view, view message details and choose from the following options:

<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Previous</td>
<td>Click Previous to search for the previous occurrence of the text string entered.</td>
</tr>
<tr>
<td>Next</td>
<td>Click Next to search for the next occurrence of the text string entered.</td>
</tr>
<tr>
<td>Search</td>
<td>Click Search and enter a search string. To search for the next occurrence of the text string, click Search again.</td>
</tr>
<tr>
<td>Close</td>
<td>Click Close to close the search dialog.</td>
</tr>
</tbody>
</table>

Searching Server Trace messages

You can search Server Trace message results for a particular text string or message ID.

Before you begin

You must start the Server Trace before you can begin searching within the resulting Server Trace messages.

Procedure

1. On the Server Trace view, click the drop-down menu, and select Search.
2. On the Search page that is displayed, in the From section, select one the following options to specify how to search within the results:

<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>First</td>
<td>Search for the first occurrence of the text string.</td>
</tr>
<tr>
<td>Last</td>
<td>Search for the last occurrence of the text string.</td>
</tr>
<tr>
<td>ID</td>
<td>Search starting from the message ID you enter.</td>
</tr>
</tbody>
</table>

3. In the For field, enter the text string to use for searching within the message control blocks. Text strings cannot include spaces or special characters, and wild card searches are not supported.
4. Select Previous to find previous occurrences of the text string, or select Next to find the next occurrence of the text string.
5. Click Search to begin the search.
What to do next

View messages that meet the search criteria in the Server Trace view.

Labeling Server Trace messages

Create labels to bookmark server trace messages that you frequently access.

Before you begin

You must start the Server Trace before you can begin labeling messages.

Procedure

1. In the Server Trace view, right-click the message that you want to label and select Add Label.
2. On the Message Label dialog, enter text for the Label and click OK.
3. Optional: In the Labels view, double-click the label to locate the message in the Server Trace view.

Exporting Server Trace messages

Use the Server Trace view to export server trace messages as either ISX or CVS files.

About this task

You can limit the number of messages that you can export into a file by setting the Server Trace export size limit on the Admin preferences page.

Procedure

1. In the Server Trace view, from the drop-down menu, select Export.
2. Under Export Type, select one of the following message export options:

<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Summary</td>
<td>Exports the following minimum message information:</td>
</tr>
<tr>
<td></td>
<td>• Message ID</td>
</tr>
<tr>
<td></td>
<td>• Date</td>
</tr>
<tr>
<td></td>
<td>• Time</td>
</tr>
<tr>
<td></td>
<td>• User ID</td>
</tr>
<tr>
<td></td>
<td>• Message text</td>
</tr>
<tr>
<td>Full</td>
<td>Exports all available message information and all data about that message including:</td>
</tr>
<tr>
<td></td>
<td>• Message ID</td>
</tr>
<tr>
<td></td>
<td>• Date</td>
</tr>
<tr>
<td></td>
<td>• Time</td>
</tr>
<tr>
<td></td>
<td>• User ID</td>
</tr>
<tr>
<td></td>
<td>• Message text</td>
</tr>
<tr>
<td></td>
<td>• Zoom</td>
</tr>
<tr>
<td>Comma Separated Format</td>
<td>Exports all table information to a CVS file. This file type cannot be imported for viewing in the Server Trace view.</td>
</tr>
</tbody>
</table>
3. Under **Export Content**, select one of the following message content options:

<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Message ID Range</td>
<td>Select a range of messages to export by entering the first message ID in <strong>From</strong>, and the last message ID to include in <strong>To</strong>.</td>
</tr>
<tr>
<td>Transaction ID</td>
<td>Exports only those messages with the RRS transaction ID value that you specify.</td>
</tr>
<tr>
<td>Global Transaction ID</td>
<td>Exports only those messages with the RRS global transaction ID that you specify.</td>
</tr>
<tr>
<td>Connection ID</td>
<td>Exports only those messages that are associated with a specific client that is currently connected to the server.</td>
</tr>
<tr>
<td>Message ID List</td>
<td>Lists message IDs. This option is only available if the <strong>Full</strong> export type option is selected.</td>
</tr>
</tbody>
</table>

4. Click **Next**.
5. On the **Export File** page, click **Browse** to specify a file name and export location.
6. Click **Finish**.

**Importing Server Trace messages**

To import and view Server Trace messages, use the **Import File Viewer** tab.

**Before you begin**

Server Trace must be running before you can import a file.

**Procedure**

1. In the **Server Trace** view, click the **Import File Viewer** tab and click **Import**.
2. Navigate to the ISX file that you want to import.
3. Double-click the ISX file. Messages and message details display on the **Import File Viewer** tab.
4. Optional: To view more details about a message, right-click on the message and select **Zoom**.
5. Optional: To change how the messages display, click **Display**.

**Accelerator Loader preferences**

Preferences allow you to customize several Db2 Analytics Accelerator Loader settings.

To view preferences, from the **Window** menu, select **Open Preferences** > **Accelerator Loader**.

**Accelerator Loader preferences**

Use **Accelerator Loader** preferences to set preferences such as general session and SQL results settings.

General **Accelerator Loader** preferences are identified and described in the table that follows.
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable Server Tracing of Studio Calls</td>
<td>Includes the Accelerator Loader studio trace calls in your server trace results. This setting is disabled by default.</td>
</tr>
<tr>
<td>Studio HTTP Debug Option</td>
<td>The Accelerator Loader studio type of debug option to be used. The default setting is <strong>Normal</strong>.</td>
</tr>
<tr>
<td>Studio Fixed Width Font</td>
<td>Determines the font, font style, and font size that displays in Accelerator Loader studio. The default setting is <strong>Courier New-regular-9</strong>.</td>
</tr>
<tr>
<td>Hex Encoding</td>
<td>Sets the Hex encoding to use. The default setting is <strong>UTF-8</strong>.</td>
</tr>
<tr>
<td>File Encoding</td>
<td>Determines the file encoding setting to use. The default setting is <strong>windows-1252</strong>.</td>
</tr>
<tr>
<td>CSV File Delimiter</td>
<td>Determines the type of file delimiter to use for CSV files. The default setting is a comma (,).</td>
</tr>
<tr>
<td>New Connection (DSN) Naming Pattern</td>
<td>Determines the naming pattern to use when new connections are made. The default setting is <strong>{SubSystem}</strong>.</td>
</tr>
<tr>
<td>Studio Connection Timeout (secs)</td>
<td>The number of seconds to wait before a server connection is determined to be unsuccessful. The default setting is 10.</td>
</tr>
<tr>
<td>Studio Operation Timeout (secs)</td>
<td>The number of seconds to wait before determining that the Accelerator Loader studio operation is unsuccessful. The default setting is 30.</td>
</tr>
<tr>
<td>Studio Remote Control Port</td>
<td>The port number that the Accelerator Loader studio uses for remote connections. The default setting is 31416.</td>
</tr>
<tr>
<td>Use UPPERCASE case logon credentials for both JDBC and HTTP connections</td>
<td>Select this check box to require that logon credentials use uppercase characters for JDBC driver and HTTP connections. This setting is enabled by default. For systems that have mixed-case password support, you must clear this check box and add the following statement to your hlq.SHLEEXEC(hlvidIN00) file: &quot;MODIFY PARM NAME(PASSWORDCASE) VALUE(ASIS)&quot;</td>
</tr>
</tbody>
</table>

### Admin preferences

Use **Admin** preferences to set the maximum number of Server Trace messages that you want to export and to enable the tracing of Accelerator Loader studio calls in the **Server Trace** view.

Admin preferences are identified and described in the table that follows.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Server Trace export size limit</td>
<td>Sets the maximum number of messages to export. The default value is 5000. Specifying a value greater than 5000 can cause a MAX CPU TIME EXCEEDED error to occur.</td>
</tr>
<tr>
<td>Enable Server Tracing of Studio Calls</td>
<td>Includes Accelerator Loader studio trace calls in your Server Trace results. This setting is disabled by default.</td>
</tr>
</tbody>
</table>
Console preferences

Use Console preferences to view or modify console display settings.

Console preferences are identified and described in the table that follows.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fixed width console</td>
<td>Enable to specify a maximum number of characters to display in the console. This setting is disabled by default.</td>
</tr>
<tr>
<td></td>
<td><strong>Maximum character width:</strong> If Fixed width console is enabled, enter the maximum number of characters to display in the console. The default is 80 characters.</td>
</tr>
<tr>
<td>Limit console output</td>
<td>Enable to limit the console buffer and entry sizes by setting the maximum number of characters permitted:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Console buffer size (characters).</strong> The default setting is 80000.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Console entry size limit (characters).</strong> The default setting is 500.</td>
</tr>
</tbody>
</table>

Dictionary preferences

Use Dictionary preferences to add or delete reserved words in dictionaries, and add or delete dictionaries based on the languages being used.

Dictionary preferences are identified and described in the table that follows.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dictionary</td>
<td>Lists the default dictionaries. You can add new dictionaries to the list or delete existing dictionaries from the list.</td>
</tr>
<tr>
<td>Reserved word</td>
<td>Lists reserved words for each dictionary. You can add new words to the list or delete existing words from the list.</td>
</tr>
</tbody>
</table>

Driver preferences

Use Driver preferences to enable JDBC driver tracing and to specify the default location of the driver configuration files.

Driver preferences are identified and described in the table that follows.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable Tracing</td>
<td>Enables tracing for the JDBC driver. If you change this option, you must restart the Accelerator Loader studio to complete the change. This setting is disabled by default.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> You can also access data sources that are stored in other configuration files, by adding those configuration files from the Client view.</td>
</tr>
<tr>
<td>Default DSN Config File</td>
<td>Specifies the default location of the DSN file. This file is used to store the JDBC connection definitions that are generated for use in the Active Connections view.</td>
</tr>
</tbody>
</table>
### JCL preferences

Use JCL preferences to specify JCL settings, such as JOB statement details and to define the trace information to include.

JCL preferences are identified and described in the tables that follows.

#### JCL

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JCL Submit/Poll Timeout (secs)</td>
<td>The number of seconds that can pass before the Accelerator Loader studio stops polling the host for a job to complete. If the host does not complete the job within that number of seconds, the job status is checked on the mainframe. The default setting is <strong>300</strong>.</td>
</tr>
</tbody>
</table>

#### Generation

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Job Name Suffix</td>
<td>Used to generate a default job name. This one-character suffix is appended to the user ID. The default setting is <strong>A</strong>.</td>
</tr>
<tr>
<td>Job Account</td>
<td>Optional accounting information that you can add to the JOB statement. The default setting is blank.</td>
</tr>
<tr>
<td>Execution Class</td>
<td>The execution class to be used in the JOB statement. The default setting is <strong>A</strong>.</td>
</tr>
<tr>
<td>Message Class</td>
<td>The message class to be used in the JOB statement. The default setting is <strong>X</strong>.</td>
</tr>
<tr>
<td>Region Size</td>
<td>The region size to be used in the JOB statement. The default setting is <strong>0M</strong>.</td>
</tr>
<tr>
<td>Temporary DASD Name</td>
<td>Generic unit name to be used in the job step for use in allocating temporary work files. The default setting is <strong>SYSDA</strong>.</td>
</tr>
</tbody>
</table>

#### Trace/Debug

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Request Status Values           | Determines the type of status values to include in the trace:  
  - **ALL**  
  - **TERSE**  
  - **VERBOSE**  
  - **NONE**  
  The default setting is **ALL**. |
Fields | Descriptions
--- | ---
**Level** | Determines the trace level to use (1, 2, 3, or 4). The default setting is 1.

**Volume** | Determines the trace volume to use (QUIET, SILENT, or NOISY). The default setting is QUIET.

**Trace Function Stems** | Enables the tracing of function stems. This setting is disabled by default.

**Dump REXX Variables** | Enables the tracing of REXX dump variables. This setting is disabled by default.

**Enable SSI Tracing** | Enables SSI tracing. This setting is disabled by default.

**Enable SSI SSOB dumps** | Enables SSI SSOB dump tracing. This setting is disabled by default.

---

**SQL preferences**

Use SQL preferences to specify settings related to SQL query generation, the SQL Results view, and SQL metadata retrieval.

SQL preferences are identified and described in the table that follows.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| **SQL Generate Query Behavior** | Determines whether you are prompted to execute SQL or if SQL executes automatically. Options include:  
- **Generate query and issue user prompt**. This is the default setting.  
- **Generate and execute query (no prompt)**  
- **Generate query but do not execute query (no prompt)** |
| **SQL Results Max Rows** | Maximum number of rows to return in the SQL Results view. The default value is 1000. |
| **SQL Results Max Bytes** | Maximum number of data bytes to return in the SQL Results view. The default value is 1000000. |
| **SQL Results values accessed as** | Specifies how data values are returned. Options include **String** or **Object**. The default setting is **String**. |
Field | Description
--- | ---
Use prepared statement to retrieve SQL column info for DB2 or DRDA tables | The Accelerator Loader studio obtains column metadata information from the server for Db2 and DRDA tables and views when you expand a table or view node under the Other Subsystems tree in the Server view, or in other situations where column information needs to be retrieved.

The Accelerator Loader studio supports two different ways of retrieving this column metadata information:

- Using a prepared statement. Typically, this server call will be faster; however, this option requires that the user have SELECT privileges to the table in the remote database. This method is the default and will be used when this preference is selected.
- Using the JDBC getColumns() API. This method is the more conventional approach; however, in some cases (for example, Oracle), the remote DRDA subsystem may take a long time to process the metadata query. This method will be used when this preference is cleared.

Fetch primary key and index information for virtual tables | If this preference is selected, then when you expand a virtual table or view in the Server view, any primary key or indexed column nodes will be identified. This identification process requires the Accelerator Loader studio to make additional metadata calls to the server. To disable these calls and the associated identifications, you can clear this preference and thus speed up the time taken to populate the column nodes. This preference is selected by default.

Fetch primary key and index information for DB2 or DRDA tables | If this preference is selected, then when you expand a table or view node under the Other Subsystems tree in the Server view, any primary key or indexed column nodes will be identified. This identification process requires the Accelerator Loader studio to make additional metadata calls to the server (and subsequently to the remote database). In some cases, these additional calls may be rather expensive (for example, Oracle). To disable these calls and the associated identifications, you can clear this preference to speed up the time taken to populate the column nodes. This preference is cleared by default.

**Metadata Discovery preferences**

Use **Metadata Discovery** preferences to define settings for the WebSphere Application Server that hosts IBM Rational Asset Analyzer (RAA).

When using RAA to access VSAM or sequential data sets for COBOL applications, complete COBOL layout information that is required to map data is not available in the Db2 database. The mapping wizard uses a RESTful HTTP query to collect record layouts when data is mapped. While this query can be done directly to the Accelerator Loader server for data in PDS files, the preferred method to collect COBOL information is to retrieve record layouts directly from the WebSphere Application Server that hosts RAA.
**Metadata Discovery** preferences are identified and described in the table that follows.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAA REST Root URL</td>
<td>Location of the RAA WebSphere Application Server. For example: https://&lt;host&gt;:&lt;port&gt;</td>
</tr>
<tr>
<td>Alternate User ID</td>
<td>User ID for the RAA WebSphere Application Server. You can leave this field blank if the credentials are the same as those used to connect to the current Accelerator Loader server (using Set Server).</td>
</tr>
<tr>
<td>Alternate Password</td>
<td>Password for the RAA WebSphere Application Server user ID. Specify a value in this field only if a user ID has been specified in the Alternate User ID field.</td>
</tr>
</tbody>
</table>

**SSL preferences**

Use SSL preferences to secure JDBC and HTTP network communications between the Accelerator Loader studio and the Accelerator Loader server.

SSL preferences are identified and described in the table that follows.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Use SSL for Studio-Server communications (JDBC and HTTP)</td>
<td>Enables secure JDBC and HTTP network communications between the Accelerator Loader studio and the Accelerator Loader server. If enabled, select the Protocol version to use for communications between the Accelerator Loader studio and the Accelerator Loader server. The default setting is <strong>TLS 1.2</strong>.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| **Server Authentication** | Select the authentication strategy to use:  
  - **Require Server Validation**: Enable to require that all Accelerator Loader server certificates be authenticated and complete the following fields:  
    - **Truststore**: The path name of the file on the local machine. The file must contain the Accelerator Loader server certificate authority (CA).  
    - **Password**: The password for the truststore file.  
    - **Type**: The truststore file type. For example, JKS, PKCS12, BKS, UBER.  
  - **Allow Self-Signed Certificates**: Enable to allow the Accelerator Loader server to use self-signed certificates and complete the following fields:  
    - **Truststore**: The path name of the file on the local machine. The file must contain the self-signed server CA (certificate authority) certificate.  
    - **Password**: The password for the truststore file.  
    - **Type**: The truststore file type. For example: JKS, PKCS12, BKS, UBER.  
  - **Trust All**: Enable to allow all Accelerator Loader server certificates. If enabled, the Accelerator Loader studio does not validate the server certificate.  

The default setting is **Require Server Validation**. |
| **Client Authentication** | To enable client authentication by the Accelerator Loader server, select **Enable Client Authentication** and complete the following fields:  
  - **Keystore**: The path name of the file on the local machine. The file must contain a client certificate which has been signed by the server CA.  
  - **Password**: The password for the keystore.  
  - **Type**: The keystore file type. For example: JKS, PKCS12, BKS, UBER.  
  - **Alias**: To confirm that the password is valid and that the alias (label) appears, click **Refresh**.  

This setting is disabled by default. |
Chapter 6. Loading data from a Db2 image copy

You can generate JCL that loads data from a Db2 image copy.

With a Consistent or Historical load, you can load multiple Db2 tables from a cataloged Db2 image copy without the need to take the tables offline for updates. You can specify any consistent or historical point in time to load the accelerator.

With an Image Copy load, you can load data for a single table into the accelerator from a Db2 image copy that you specify.

Restrictions and considerations for loading from a Db2 image copy

Review the following usage restrictions and considerations before performing a Consistent load, a Historical load, or an Image Copy load.

All loads from a Db2 image copy

The following restrictions and considerations apply when you perform any load from a Db2 image copy (Consistent load, Historical load, or Image Copy load):

The following data types are supported:

- BIGINT
- BINARY
- CHAR
- DATE
- DECIMAL
- DOUBLE
- FLOAT
- GRAPHIC
- INTEGER
- REAL
- SMALLINT
- TIME
- TIMESTAMP
- TIMESTAMP WITH TIMEZONE
- VARBINARY
- VARCHAR
- VARGRAPHIC

* This data type is loaded into only Db2.

Field procedures are not supported; however, edit procedures are supported.

The following considerations apply when you perform a parallel load:

- When you use existing image copies (that is, you do not create a new FlashCopy image copy) to perform a consistent load:
  - Partition-level image copies are required when you load from tape.
Partition-level image copies are recommended when you load from DASD. Using individual partitions allows multiple parallel tasks to open more than one data set at a time, increasing throughput.

- When using Analytics Accelerator V7.1.1 or earlier, to use parallelism in Accelerator Loader, you must have the WLM environment that runs DSNUTILU configured for WLM management of the DSNUTILU server address space. See "WLM requirements for Accelerator Loader" on page 34 for more information.

The product does not support loading many tables from a multiple-table table space. If the job specifies more than one table of a multiple-table space, the product issues an error message and stops processing. If the value of the Continue on error field on the Load Accelerator with Consistent Data panel or the Load Accelerator from Specified Image Copy panel is Yes, or the CONTINUE_ON_ERROR control card is specified, the job finishes normally, but with return code 4 instead of 0.

When the job contains the NEW_COPY keyword, the product creates a partition-level FlashCopy image copy. However, if the job does not specify the creator, table, and the PARTITION keyword, the product attempts to find and use a previous image copy, rather than using the new copy. If the table space does not have a previous DSNUM 0 image copy, the job might abend with code U0008.

Depending on the environment in which the job runs, a parallel load job might abend with system code S878, return code 10, and the product issues message HLO3601E. If this abend occurs, reduce the number of parallel log apply tasks and run the job again.

Building jobs that approach 20,000 objects requires significant resources for processing. If building with batch, use a region size of 0M, which is unlimited. If building from TSO, ensure a TSO region size of at least 30000.

The user ID that is used to run a Consistent, Historical, or Image Copy load job requires READ access to z/OS UNIX System Services.

Restrictions for loading an accelerator table or an accelerator only table (AOT) on the same or another Db2 subsystem are as follows:

- The target table must be defined with the same columns, in the same order as the table from the image copy.
- If you specify an AOT output table, then all of the objects that participate in the run must be AOT output tables.

Accelerator Loader can read tape data sets that are stored in large block interface (LBI) format. Consider using this option if the product consistently reads all log files because of overlapping SYSLOG ranges from multiple objects in a run. Bypassing the SYSLOGRANGE phase might improve overall performance if SYSLOGRANGE processing determines that all logs must be read.

Using the keyword CHECK_DATA, you can check the integrity of Db2 for z/OS data pages for Consistent and Image Copy loads. Db2 data page integrity can be checked before passing the page rows to the accelerator. You can also check data page integrity before and after each Db2 log apply operation to the image copy, as well as before passing the page rows to the accelerator.
Consistent and Historical loads only

The following restrictions apply when you perform a Consistent load or a Historical load:

- A valid full image copy of the table space must be recorded in SYSCOPY, or a valid starting point must exist in SYSCOPY for each table space.
- The product must be able to access the Db2 archive and active logs that are required to build a new image copy.
- If you use the same end point for all spaces in a batch job, place all space (...) control cards under one group (...). Do not specify one group for every space.

Accelerator only tables (AOT) do not have partitions; therefore the following requirements apply to partitioned objects:

- Within a single job, every partition is loaded to the specified AOT if you specify the target creator and name for a partitioned table and do not specify a specific partition.
- Every partition that you specify for the same source table must have a different target AOT if you specify the target creator and name for a partitioned table, and also specify the PARTITION keyword.
- When you use the ISPF interface to specify target tables, you cannot specify the same target for some partitions. You must specify one target for all partitions, or specify different targets for each partition.

Image Copy loads only

Using the ISPF interface, you can generate JCL for an Image Copy load profile when the image copy has a single table. The batch job automatically gets the translation information from the Db2 catalog. If the image copy data set has multiple tables or is not registered in the Db2 catalog, the ISPF interface cannot generate JCL. The batch job uses translation information (DBID, PSID, OBID) that is provided in the JCL, and does not perform a lookup from the Db2 catalog.

For sample JCL, see the SHLOSAMP data set.

Using the ISPF interface to create or edit a Consistent or Image Copy load profile

A load profile is a group of options for building a job to load data into an accelerator. After you create a profile, you can reuse it to perform future load jobs.

Before you begin

Review the information in “Restrictions and considerations for loading from a Db2 image copy“ on page 271.

Review information about the profile types:

- **Consistent** specifies options for loading data for multiple tables into the accelerator from a cataloged Db2 image copy.
- **Image copy** specifies options for loading data for a single table into the accelerator from a user-defined Db2 image copy.
About this task

When you add a Db2 table to the profile, you can filter on tables, views from a single base table, or aliases. The product resolves the view or alias to the base table space and includes the base table space in the generated JCL. A view that was created from a join of more than one table is not supported. The product checks for the existence of the specified Db2 table before generation. However, if you specify partitions, the product cannot validate the partitions, but uses the partitions as specified when generating JCL.

You can use an asterisk (*) in the fields Table creator like and Table name like. Case sensitivity of this field is controlled by the Case sensitive field on the Enter Table and Creator Like to Display panel. Depending on your setting, the wildcard pattern abc* might return different results from pattern A8C*.

Procedure

1. From the main menu, select Manage Loader Profiles and press Enter.
2. On the Manage Loader Profiles panel, to filter existing profiles by profile name or creator name, specify a wildcard pattern using an asterisk (*) and press Enter.
3. On the Manage Loader Profiles panel, perform one of the following steps:
   - To create a new profile, issue the CREATE command, and then on the Create Profile panel, select the type of profile to create.
   - To create a new profile by copying an existing profile, type C in the Cmd line next to the profile that you want to copy.
   - To edit an existing profile, type E in the Cmd line next to the profile.
4. On the Load Accelerator with Consistent Data panel or the Load Accelerator from Specified Image Copy panel, specify a name and processing options for the profile, as follows:
   - Utility processing options for the Db2 LOAD utility.
   - If you want to create a FlashCopy image copy, specify FlashCopy options. If you do not use FlashCopy, no image copy is created, and Db2 Analytics Accelerator Loader uses a legacy image copy.
   - To define options for a FlashCopy DSN template, complete the following steps. If you do not use a FlashCopy DSN template, the product uses the default template in DSNZPARMS.
     - In the Use FlashCopy DSN template and Update fields, specify Yes.
     - On the FlashCopy DSN Template panel, specify qualifier codes to create the data set name mask.
     - Issue the SHOW command to see the resulting template DSN.
   - Specify log read and apply options.
5. To add a Db2 table to the profile, issue the T panel command.
6. On the Db2 Table List panel, issue one of the following commands:
   - To specify an object filter, issue panel command Add. The Enter Table and Creator Like to Display panel opens.
     You can specify a table, a view, or an alias.
   - To select one or more tables on the Referentially Dependent Table Selection panel, issue line command RIS.
   - To select all related tables, issue line command RIA.
7. On the Add Db2 Tables panel, use the ALL panel command or the $ line command to select objects to add to the profile and press Enter.
8. Return to the previous panel by pressing F3.
9. To select the accelerators onto which you want to load data, issue the A panel command, and on the Db2 Analytics Accelerator Selection panel, select the accelerators or an accelerator group and press Enter.
10. To save and return to the previous panel, press PF3.

Using the batch interface to load from an image copy

You can use the batch interface to specify an image copy and load data from that image copy data set into the target table or tables on the accelerator.

About this task

For more information about the options in this procedure and example JCL, see "Consistent load and Image Copy load jobs" on page 319 in the "Db2 Analytics Accelerator Loader syntax" section.

Procedure

1. In the SHLOSAMP library, locate one of the following members to customize:
   - HLOSAMP1: Use this member to manually specify the source and target DBID/PSID/OBID numbers.
   - HLOSAMP2: Use this member to obtain translation information from the Db2 catalog by using the OBIDXLAT_CATALOG option.
2. Replace the following variables:
   - <SSID> with the subsystem ID of the target object
   - #HLQ# with the SMP/E HLO LOADLIB
   - #HLQ# with the SMP/E FEC LOADLIB
   - <CONTROL FILE> with the HLO control file data set name
3. In the SYSINHLO DD, perform the following steps:
   a. Replace the values for the CREATOR, NAME, TO_IC, and ACCELNAME options with your values.
   b. Specify translation information, if necessary.
4. Save a copy of the customized member in another library.
Chapter 7. Loading data from an external file

You can generate JCL that loads data from an external file into IBM Db2 Analytics Accelerator for z/OS and optionally into Db2.

You can add the Accelerator Loader extended syntax to an existing batch job that meets certain criteria. You can also use the ISPF interface or the batch interface to create a Dual load profile or an External load profile to generate JCL.

Accelerator Loader supports parallelism, and can process and load different partitions from the same table into Db2, the accelerator, or both in parallel.

Restrictions and considerations for loading from an external file

Review usage restrictions and considerations before loading data from an external file.

Note: In addition to the information in this section, make sure that your system meets requirements as listed in “Set up your environment prior to customization” on page 28.

Data considerations

Accelerator Loader does not verify the data in a FORMAT INTERNAL SYSREC data set. It passes the records to Db2 and the accelerator as-is.

The following data types are supported:
- BIGINT
- BINARY*
- CHAR
- DATE
- DECIMAL
- DOUBLE
- FLOAT
- GRAPHIC
- INTEGER
- REAL
- SMALLINT
- TIME
- TIMESTAMP
- TIMESTAMP WITH TIMEZONE*
- VARBINARY*
- VARCHAR
- VARGRAPHIC

* This data type is loaded into only Db2.

The following SYSIBM.SYSCOLUMNS(DEFAULT) values are supported:
- Numeric: 0
- Fixed-length character or graphic string: Blanks
- Fixed-length binary string: Hexadecimal zeros
- Varying-length string: A string length of 0
- Date: The current date
- Time: The current time
- Time stamp: `TIMESTAMP(integer) WITHOUT TIME ZONE`
- `CURRENT_TIMESTAMP(p) WITHOUT TIME ZONE` (where `p` is the corresponding time stamp precision).

### Db2 LOAD utility considerations

Accelerator Loader adheres to the Db2 LOAD utility restrictions. For more information, see *Db2 for z/OS Utility Guide and Reference* for your version of Db2. For example:

- For `FORMAT INTERNAL` data, the Db2 LOAD utility supports only one table in the LOAD utility command: `LOAD DATA INTO TABLE`. You cannot specify multiple `INTO TABLE` clauses.
- The field-specification restrictions for the Db2 LOAD utility also apply to Db2 Analytics Accelerator Loader.

### General restrictions and limitations

The following restrictions and limitations apply when loading data from an external file:

- Db2 Analytics Accelerator Loader supports nonpartitioned tables that were defined with `ORGANIZE BY HASH`. It does not support `PARTITION BY RANGE` tables that were defined with `ORGANIZE BY HASH`.
- Only EBCDIC and Unicode code pages are supported.
- Trailing spaces in object names are not supported.
- Ensure that any table space that you attempt to load was created with `DEFINE YES`, or, if created with `DEFINE NO`, that the underlying VSAM linear data sets were created by an `INSERT` or a `LOAD`.
- Columns that are defined as `GENERATED` are not supported.
- Data in `FLOAT` columns might not be converted exactly.
- The `DEFAULTIF` option is not supported for partitioning key columns.
- You can specify only one `SYSREC` data set when you use the ISPF interface. To specify multiple `SYSREC` data sets, either use templates or manually add `SYSREC` data sets to the generated JCL.

Accelerator Loader converts data from external to Db2 internal format. Accelerator Loader does not detect Db2 restrictions, and Db2 issues error messages, if necessary. For more information about Db2 restrictions, see the syntax and options of the LOAD control statement in *Db2 10 for z/OS Utility Guide and Reference*.

The following syntax cannot be processed:

- `CONTINUEIF`
- `DECFLOAT_ROUNDMODE` (Db2 restriction)
- `FORMAT SQL/DS`
- `FORMAT UNLOAD`
- `FORMAT SPANNED`
• IDENTITYOVERRIDE (Db2 restriction)
• INCURSOR (Db2 restriction)
• PRESORTED (Db2 restriction)
• ROWFORMAT
• SHRLEVEL CHANGE (Db2 restriction)
• STRIP
• TRUNCATE

**Considerations for constraint checking, duplicate key processing, and sorting**

Accelerator Loader does not check the input file for violations or referential constraints and does not perform sorting. When you load data into only the accelerator, no constraint checking is performed. This limitation includes checking for duplicate keys.

When you load data to Db2 and the accelerator, the Db2 LOAD utility performs constraint checking and does not load violating records. That is, constraint-violating records are loaded into the accelerator but are not loaded into Db2. Accelerator Loader detects when Db2 discards records that were loaded to the accelerator and disables query acceleration, making the accelerator table unavailable for queries. To correct this situation, run ACCEL_LOAD_TABLES to synchronize the accelerator table with the Db2 table, and then enable query acceleration.

You can also configure Accelerator Loader to roll back data loaded to the accelerator in cases where Db2 discards records already loaded to the accelerator. This behavior is controlled through Tools Customizer using the option **Action when DB2 LOAD discards records loaded to the accelerator** (options module parameter ACCEL_WHEN_DB2_DISCARD5).

**IBM Db2 Analytics Accelerator for z/OS considerations**

Accelerator Loader adheres to the IBM Db2 Analytics Accelerator for z/OS restrictions for tables that can be accelerated. For example:

• You cannot use Accelerator Loader to load individual partitions of a table with the IBM Db2 Analytics Accelerator for z/OS status of InitialLoadPending.
• IBM Db2 Analytics Accelerator for z/OS does not support BINARY and VARBINARY data types. Therefore, Accelerator Loader processes BINARY and VARBINARY data as follows:
  – When loading data into Db2, Accelerator Loader converts BINARY and VARBINARY data to Db2 internal format and loads it into the Db2 table.
  – When loading data into the accelerator, Accelerator Loader skips BINARY and VARBINARY data.

For more information, see the IBM Db2 Analytics Accelerator for z/OS documentation.

**Considerations for loading only the accelerator**

Accelerator Loader provides the option of loading data from an external file into only IBM Db2 Analytics Accelerator for z/OS, without loading the data into Db2 (option IDAA_ONLY). Before using this option, consider the following points:
• Do not use this option if you need the ability to update the data in Db2.

• You must set the CURRENT QUERY ACCELERATION special register to ALL to ensure that all queries against the table are directed to IBM Db2 Analytics Accelerator for z/OS. For more information, see Db2 for z/OS SQL Reference.

• When you load data from an external file to the accelerator and to Db2 (option IDAA_DUAL), Accelerator Loader relies on Db2 to detect referential integrity (RI) violations and unique index violations. When you load data to only the accelerator, these checks are bypassed. Consequently, query acceleration might be enabled after loading the accelerator with records that violate Db2 RI constraints or unique index constraints.

• When you load only the accelerator, a discard data set is supported when running a load with a SYSREC data set. The discard data set cannot be a TEMPLATE. It must be specified as a DD statement in the JCL. Use the DISCARDDN keyword to communicate the DDNAME to Accelerator Loader. The DISCARDS keyword can also be specified to force Accelerator Loader to fail once a specified number of records are discarded. The DISCARDS keyword is valid only when used with a discard data set. Discard data sets are not supported when loading data from an Accelerator Loader server data source or when loading from multiple partition-level SYSREC data sets.

• When you load only to the accelerator, you can create an inline backup copy as the data is loaded to the accelerator.

Considerations for loading the accelerator and Db2

Accelerator Loader provides the option of loading data from an external file into both the accelerator and Db2 (option IDAA_DUAL). Before using this option, consider the following point:

• When loading from an external file to the accelerator and Db2, you can optionally stop the target table space before loading a table enabled for replication. The stop drains all claimers and ensures that no updates are made to the Db2 table while the accelerator is being loaded. Once the -STOP command completes, the space is restarted for UT access to allow the Db2 LOAD utility to run. At the completion of the load, the original status of the object is restored. Accelerator Loader will wait for up to three minutes for the STOP command to complete. If at the end of three minutes the space is still in STOP PENDING status due to active claimers, Accelerator Loader will fail with message HLOU4101E.

This behavior is controlled by the Tools Customizer option STOP the target table space before initiating the load. When this parameter is set to YES, the space is stopped as described. This option only affects Dual type loads when loading an accelerator table enabled for replication. If the table is not enabled for replication, Accelerator Loader makes no changes to the table space status. When the option is set to NO (default), the object is started for UT access before the load begins, but is never stopped.

• When loading from an external file to the accelerator and Db2, Accelerator Loader can issue a user-supplied return code when Db2 LOAD discards rows that Accelerator Loader has already delivered to the accelerator. For more information, see “Discard data set restrictions and considerations” on page 282.

• When loading from an external file to the accelerator and Db2, if Accelerator Loader cannot determine the status of an accelerator from the ACCEL_CONTROL_ACCELERATOR stored procedure, the accelerator is considered unreachable and will be treated as offline. More specifically, when the ACCEL_CONTROL_ACCELERATOR stored procedure call fails with the following error, the unreachable accelerator is treated as offline:
AQT10202I: The acceleratorName accelerator cannot be contacted over the network. Treating an unreachable accelerator as offline has the following impact:

- The Accelerator Loader Dual load job will report the state of the accelerator as unreachable in message HLOU5718E.
- If more than one accelerator is included in the load and at least one of them appears to be online, the online accelerators will be loaded.
- If all accelerators appear to be offline or otherwise unavailable during a Dual load, the setting of the **Load DB2 if accelerator is offline** (ACCEL_WHEN_OFFLINE) option successfully controls whether Accelerator Loader fails or loads only Db2.

**Restrictions and considerations for adding data to a table (LOAD RESUME)**

To add data to an existing accelerator table without replacing the existing data, use the Db2 LOAD utility RESUME YES clause. When loading to only the accelerator, no data is added to the Db2 table, but any existing data in Db2 is left intact. When loading to both Db2 and the accelerator, Db2 also appends the data to the Db2 table.

- When loading a range-partitioned or index-partitioned table, you can replace data in some partitions and append data to others. However, Accelerator Loader does not support mixing of append and replace operations.
- The options RESUME YES and **ACCEL_REMOVE_AND_ADD_TABLES** are mutually exclusive.
- On restart of a failed load to both the accelerator and Db2, to determine whether the prior failed job successfully loaded the accelerator, Accelerator Loader uses the last load timestamp that the accelerator stored procedures returned. Therefore, you must restart the job or use the HLOMAINT utility to resolve the failure. Then you can run a load to the accelerator table.
- When BACKOUT YES is specified on the RESUME YES clause, Accelerator Loader recognizes when backout processing occurs and backs out the data sent to the accelerator, leaving the table with the same data it had before the load started. On an accelerator-only load, Accelerator Loader backs out the data sent to the accelerator when a data conversion error occurs.

**Parallel load restrictions and considerations**

When you load different partitions from the same table in parallel, the following additional restrictions and considerations apply:

- Before you can perform a parallel load into the accelerator, you must load the entire table to the accelerator. Then you can load selected partitions.
- Parallel load is available only for loading range-partitioned and index-partitioned table spaces. To load a partition-by-growth table space, do not define the parallel option.
- A separate SYSREC data set is required for each partition that you load, and each SYSREC data set can contain data for only one partition. Records that do not belong to the specified partition are discarded.
- The **PRESORT** option is not supported for partition-level SYSREC data sets. If PRESORT is specified in the LOAD utility statement, the utility terminates with errors and you must remove PRESORT before resubmitting the job.
- When using Analytics Accelerator V7.1.1 or earlier, to use parallelism in Accelerator Loader, you must have the WLM environment that runs DSNUTILU
configured for WLM management of the DSNUTILU server address space. See “WLM requirements for Accelerator Loader” on page 34 for more information.

Discard data set restrictions and considerations

The following restrictions and considerations apply:

- When performing a load from an external file to both the accelerator and Db2, you can provide one or more standard Db2 LOAD discard data sets.
- When you load only the accelerator, a discard data set is supported when running a load with a SYSREC data set. The discard data set cannot be a TEMPLATE. It must be specified as a DD statement in the JCL. Use the DISCARDITNN keyword to communicate the DDNAME to Accelerator Loader. The DISCARDS keyword can also be specified to force Accelerator Loader to fail once a specified number of records are discarded. The DISCARDS keyword is valid only when used with a discard data set. Discard data sets are not supported when loading data from an Accelerator Loader server data source or when loading from multiple partition-level SYSREC data sets.
- The SYSREC data set must have a record format (RECFM) of F (Fixed) or V (Variable). The product does not support spanned record formats and formats D (variable-length ISO/ANSI tape records) and U (Undefined).
- When Accelerator Loader detects invalid data in a SYSREC record, it discards the record, issues a message, continues loading any remaining records, and the job step completes with return code 4 when records are discarded.
- All discarded SYSREC records are written to the discard data sets in their original format, not in Db2 internal row format.
- Regardless of the source of the discsards (Accelerator Loader, Db2, or both), records are discarded to the appropriate discard data set, and your specified DISCARDS limits are honored.
- Accelerator Loader can optionally enable query acceleration for the table at the conclusion of a successful load. To specify this action, use the ACCEL_ON_SUCCESS_ENABLE extended syntax option or the Enable acceleration after successful load option in the options module.
- You can configure Accelerator Loader to load only Db2 when it detects that the accelerator is down. Specify this action by using the Load DB2 if accelerator is offline option in the options module.
- When the Db2 LOAD utility discards records that have already been loaded to the accelerator, you can configure Accelerator Loader to either leave the data in the accelerator or to roll back the loaded data. This type of discard situation can occur, for example, when Db2 detects unique index or referential integrity (RI) violations after the data has been loaded to both the Db2 table and the accelerator. In these situations, Db2 deletes the offending records from the table space during the discard phase of the LOAD utility.

Use the Accelerator Loader options module parameter Action when DB2 LOAD discards records loaded to the accelerator to configure the action for Accelerator Loader to perform. The selected action also impacts how Accelerator Loader responds when the Db2 LOAD utility fails.

- Query acceleration is disabled for the loaded table in the following situations.

  Note: Query acceleration is only disabled when options module parameter Action when DB2 LOAD discards records loaded to the accelerator is set to DISABLE_ACCELERATION.
  - The Db2 LOAD utility discards records after they were sent to the accelerator, leaving the accelerator-shadow table and the Db2 table out of sync. This type
of discard processing might occur if Db2 detects a unique index key violation
during the INDEX BUILD phase of the Db2 LOAD utility.

- The Db2 LOAD utility fails because it is possible that the accelerator was only
  partially loaded.

- Db2 LOAD utility discards can result in a situation where the Db2 table and the
  accelerator-shadow table have different data after rows have been added to the
  accelerated table or rolled back. This condition can occur when Db2 detects
  violations such as RI validation errors, when unique index violations are
  detected, even when no RI is defined on the table, and other violations. To get
  the tables back in sync, you can run the ACCEL_LOAD_TABLES stored
  procedure or the Accelerator Loader HALOAD utility. If multiple accelerators
  must be loaded, using HALOAD may be more efficient.

- Accelerator Loader can issue a user-supplied return code when Db2 LOAD
  discards rows that Accelerator Loader has already delivered to the accelerator.
  By default, Accelerator Loader issues return code 4 on a load when rows are
  discarded. This behavior mimics the Db2 LOAD utility which also issues return
  code 4 on discards. Using the Accelerator Loader started task option
  RC_WHEN_DB2_DISCARDS, Accelerator Loader can issue a user-supplied
  return code when Db2 LOAD discards rows that Accelerator Loader has already
  delivered to the accelerator. This option applies when performing Dual loads
  only and does not change the return code when a row is discarded from both
  Db2 and the accelerator. For information about setting this option, see
  “Modifying started task initialization options” on page 198.

- The IGNORE keyword of the Db2 LOAD utility is supported. The IGNORE
  keyword controls how different types of discards are handled by Accelerator
  Loader. Accelerator Loader can discard a record for the following reasons, each
  of which can be ignored via the IGNORE clause:

  - The record does not satisfy a WHEN clause. Specify IGNORE(WHEN) to
    ignore these discards. If a discard data set is not provided, this type of
    discard is ignored automatically.

  - The partition key for the record is out of the range of any loaded partition.
    Specify IGNORE(PART) to ignore these discards. If a discard data set is not
    provided, this type of discard is ignored automatically.

  - A data conversion error occurs when building the Db2 format internal row.
    Specify IGNORE(CONV) to ignore these discards.

Multiple reasons can be combined in the IGNORE clause, such as in the
following example:

```
IGNORE(WHEN, PART, CONV)
```

Ignored discards are not written to the discard data set and do not count
towards the discard limit. No record-level messages are generated for ignored
discards. Record-level messages are written for each non-ignored discard. These
messages identify the record number and describe why it was discarded. To
avoid flooding the spool with these record-level messages, only the first 1000
non-ignored discards are reported in this way.

**Note:** IGNORE settings VALPROC, IDERROR, and DUPKEY are ignored by
Accelerator Loader and passed to the Db2 LOAD utility.

- A data conversion error will cause Accelerator Loader to fail unless a discard
  data set is provided or IGNORE(CONV) is specified in the LOAD control cards.

- Accelerator Loader will end with RC=0 even when records are discarded,
  provided the associated discard reasons are being IGNOREd. Since loads from
an Accelerator Loader server data source do not support a discard data set, these loads will complete with RC=4 any time there are discards regardless of IGNORE settings.

**Considerations for CDC**

When you use IBM Change Data Capture for z/OS (CDC) replication, if a job fails, use the HLOMAINT utility to clear out the failed job and set the object back to read-write (RW) status.

If you try to load a table that was defined with **DATA CAPTURE NONE** and you place the table into continuous replication mode, the load ends with an error. To verify whether continuous replication is enabled for an object, run the stored procedure `SYSPROC.ACCEL_CONTROL_ACCELERATOR` with the command `getAcceleratorInfo` and look for the following setting in the result output document:

```xml
<acceleratorSetting name="CONTINUOUS_REPLICATION_ENABLED" value="true"/>
```

To load the table with Accelerator Loader, alter the table to **DATA CAPTURE CHANGES** and then run the load job.

**Considerations and restrictions for accelerator only tables**

You can perform a load to an accelerator only table (AOT) from an external file. The following considerations and restrictions apply:

- Because VSAM objects do not exist in Db2 for AOTs, loading to both Db2 and the accelerator is not supported. If you attempt to load to both Db2 and the accelerator when the target is an AOT, the product changes the load to an accelerator only load and issues message HLOU5053W.
- If you specify the `ACCEL_ADD_TABLES` or `ACCEL_REMOVE_AND_ADD_TABLES` option, the product silently ignores it.
- To add or remove an AOT from the IBM Db2 Analytics Accelerator for z/OS, use the Db2 CREATE/DROP TABLE SQL statements.
- The product does not enable or disable acceleration on the table at the conclusion of the load. An AOT is always enabled for acceleration; therefore, the stored procedure calls to enable or disable acceleration cannot be used.
- The IBM Db2 Analytics Accelerator for z/OS does not support LOAD REPLACE on an AOT; it supports only LOAD RESUME. However, Accelerator Loader provides LOAD REPLACE support by deleting all existing data from the accelerator before loading the new data. To use LOAD REPLACE, the user ID running the LOAD REPLACE utility must have DELETE authority on the AOT.

**Character conversion with SYSREC data sets**

When performing a load from an external file, Accelerator Loader can convert string data from one character set to another when data is loaded from a SYSREC data set to the accelerator, Db2, or both. For example, you can load data from an EBCDIC-encoded SYSREC data set to a Unicode Db2 table and the accelerator.

Accelerator Loader character set conversion is controlled through the standard Db2 LOAD utility control cards EBCDIC, UNICODE, ASCII, CCSID and NOSUBS. The function of these keywords is the same as for the Db2 LOAD utility. For details on these keywords, see the **Db2 Utility Guide and Reference**.

The following restrictions and considerations apply:
The EBCDIC, UNICODE, ASCII, CCSID and NOSUBS keywords are ignored when loading from an Accelerator Loader server data source. Character set conversion applies to data loaded from a SYSREC file only.

Accelerator Loader uses the system Unicode Character Conversion service to convert from one CCSID to another. Db2 uses its own internal conversion algorithms for some conversions. In some cases, the result generated by the system Unicode Character Conversion service may differ slightly from the result generated by the Db2 internal conversion algorithms.

The process of converting data from one character set to another increases elapsed time. If Accelerator Loader determines that Unicode Conversion Services are required, it issues message HLOU4094I.

**Delimited file format**

When performing a load from an external file, Accelerator Loader supports SYSREC data sets in Db2 LOAD delimited file format. When data is in delimited format, all fields in the input data set are character strings, or external numeric values. Each column in the delimited file is separated from the next column by a column delimiter character. CHAR and VARCHAR data can optionally be enclosed in a character string delimiter. This may be necessary if, for example, the character data value includes the column delimiter character. When data is in delimited format, POSITION statements in the LOAD utility field specifications are ignored by Accelerator Loader.

To use data in delimited format in your load, include the standard Db2 LOAD FORMAT DELIMITED option in the Accelerator Loader control cards, as shown in the following diagram:

```
FORMAT DELIMITED
   COLDEL 'c'
   CHARDEL 'a'
   DECPT 'd'
```

The COLDEL, CHARDEL and DECPT delimiters can be specified as either a single-byte quoted character, or as a two-digit hexadecimal value. For example, to use a comma as the column delimiter, you could specify either “COLDEL ‘,’” or “COLDEL X’6B’”.

The following considerations apply when using Accelerator Loader delimited file support options:

- When data is in delimited format, Accelerator Loader ignores POSITION statements in the LOAD utility field specifications.
- When loading a Unicode-encoded SYSREC and using Accelerator Loader control cards in EBCDIC, specify the delimiters in hexadecimal. Accelerator Loader does not perform any character conversion on the delimiters specified in the control cards.
- When using the ISPF interface to load from an external file, if you specify UNICODE as the Encoding value and a character symbol for a delimiter on the Delimiter Parameters panel, then Accelerator Loader will generate the hexadecimal value of the symbol in the Db2 LOAD control card.
- The default values for the column and decimal point delimiters are dependent on the user locale settings. For example, when a European user creates a new DUAL or ACCELERATOR ONLY profile, the decimal point will be ‘,’ (comma) and the column delimiter will be ‘;’ (semicolon).
- To use the space character as a delimiter, specify the hexadecimal value.
• If an apostrophe (') is specified as a delimiter, it will be generated as four apostrophes ("'") in the LOAD card.

Accelerator Loader support for delimited file format has the following restrictions:
• Delimited file format support is available when loading data from an external file (DUAL or ACCELERATOR ONLY profile) only.
• GRAPHIC and VARGRAPHIC data types are not supported.
• Non-Unicode MIXED CHAR and VARCHAR data is not supported.

For a complete description of the Db2 LOAD FORMAT DELIMITED clause, see the IBM Db2 Utility Guide and Reference. For more information on the delimited file format, see the appendix “Delimited file format” in the IBM Db2 Utility Guide and Reference.

### Adding syntax to an existing load job

To quickly load data from an external file into both Db2 and an accelerator, modify an existing batch job.

**Before you begin**

- You must have an existing LOAD utility batch job with a SYSREC file and a SYSPUNCH file.
- To perform a parallel load, you must have a SYSREC data set for each partition. For a parallel load, the product processes and loads different partitions from the same table in parallel.
- Review the information in “Restrictions and considerations for loading from an external file” on page 277.

**About this task**

For more information about the extended syntax options, including examples, see “Loading from an external file” on page 343.

**Procedure**

1. In the existing batch job, after the LOAD DATA parameter, add the following extended syntax:
   - To load data into only the accelerator:
     IDAA_ONLY ON accelerator_name
   - To load data into the accelerator and Db2:
     IDAA_DUAL ON accelerator_name
2. Add the following DD statement to the JCL:
   //HLODUMMY DD DUMMY
3. To perform a parallel load, complete the following steps:
   a. To control the number of partitions that are processed in parallel, specify the extended syntax option ACCEL_LOAD_TASKS in the LOAD utility statement.
   b. Include one INTO TABLE PART clause for each partition to load.
   c. For each INTO TABLE PART clause, specify the following:
      • SYSREC data set for each partition on the INDDN keyword.
      • Field specifications.
      • NUMRECS option.
If the LOAD utility statement does not provide the number of SYSREC records with a NUMRECS or a SORTKEYS clause, the product estimates the record count. Using the estimated record count, it then adds a NUMRECS clause for each INTO TABLE clause. The record count enables Db2 to size index-build sorts, and reduces the possibility of sort failures when loading to both the accelerator and Db2.

4. To enable query acceleration for the table at the conclusion of a successful load, specify the extended syntax option ACCEL_ON_SUCCESS_ENABLE YES in the LOAD utility statement.

5. Specify other extended syntax options as needed.

Using the ISPF interface to create or edit a profile to load from an external file

Dual and External load profiles are reusable groups of options for building a job to load data from an external file into Db2, an accelerator, or both. You can create a profile that saves your selections and reuse the profile to perform future loads from an external file.

Before you begin

Review the information in “Restrictions and considerations for loading from an external file” on page 277.

About this task

When you add a Db2 table to the profile, you can filter on tables, views from a single base table, or aliases. The product resolves the view or alias to the base table space and includes the base table space in the generated JCL. A view that was created from a join of more than one table is not supported. The product checks for the existence of the specified Db2 table before generation. However, if you specify partitions, the product cannot validate the partitions, but uses the partitions as specified when generating JCL.

You can use an asterisk (*) in the fields Table creator like and Table name like. Case sensitivity of this field is controlled by the Case sensitive field on the Enter Table and Creator Like to Display panel. Depending on your setting, the wildcard pattern abC* might return different results from pattern ABC*.

Procedure

1. From the main menu, select Manage Loader Profiles and press Enter.
2. On the Manage Loader Profiles panel, to filter existing profiles by profile name or creator name, specify a wildcard pattern using an asterisk (*) and press Enter.
3. On the Manage Loader Profiles panel, perform one of the following steps:
   • To create a new profile, issue the CREATE command, and then on the Create Profile panel, select the type of profile to create.
   • To create a new profile by copying an existing profile, type C in the Cmd line next to the profile that you want to copy.
   • To edit an existing profile, type E in the Cmd line next to the profile.
4. On the Load Accelerator(s) and Db2 from External File panel or the Load Accelerator(s) from External File panel, specify a name and processing options for the profile. If you want to perform a parallel load:
• For **Parallel load**, specify *Yes*.
• Specify a **Load tasks** value.
• Specify a **NUMRECS** value.

If the LOAD utility statement does not provide the number of SYSREC records with a NUMRECS or a SORTKEYS clause, the product estimates the record count. Using the estimated record count, it then adds a NUMRECS clause for each INTO TABLE clause. The record count enables Db2 to size index-build sorts, and reduces the possibility of sort failures when loading to both the accelerator and Db2.

When using the ISPF panels to generate LOAD JCL, you cannot specify a separate NUMRECS value for individual partitions. Specify either the average number of rows per partition or the largest number of records to be loaded into any single partition. The NUMRECS option will be generated once per INTO TABLE PART clause when the utility syntax is generated.

5. To add a Db2 table to the profile, issue the **T** panel command.
6. On the Enter Table and Creator Like to Display panel, specify an object creator name and object name pattern and press Enter to display matching objects. You can specify a table, a view, or an alias.
7. On the Db2 Table Selection panel, use the **S** line command to select the tables to add to the profile and press Enter.
8. Return to the previous panel by pressing **F3**.
9. To select the accelerators onto which you want to load data, issue the **A** panel command, and on the Db2 Analytics Accelerator Selection panel, select the accelerators or an accelerator group and press Enter.
10. To edit the table column definitions, issue the **C** command.
11. To define options for a template DD, complete the following steps:
   a. On the Load Accelerator(s) and Db2 from External File panel or the Load Accelerator(s) from External File panel, specify *Yes* in the **Update** field for any template DD.
   b. On the Template Specification panel, issue the **TEMPLATE** command, and edit the template data set name mask.
   c. On the DSN Template panel, specify qualifier codes to create the data set name mask.
   d. To see the resulting DSN mask, issue the **SHOW** command.
   e. To save and return to the previous panel, press **PF3**.
   f. Update the template options as needed.
   g. To save and return to the previous panel, press **PF3**.
12. To create an inline backup copy for the target table, specify data set names for the Inline copy data sets options. Inline backup copies can be created for accelerator-only tables or accelerator-shadow tables that have been loaded to the accelerator only.
Chapter 8. Loading Db2 table data to multiple accelerators

You can generate JCL that loads Db2 table data to as many as four IBM Db2 Analytics Accelerator for z/OS (accelerators) in parallel. This process is called a high availability load.

Restrictions and considerations for loading table data to multiple accelerators

Review usage restrictions and considerations before loading data from Db2 tables to multiple accelerators (high availability load).

Note: In addition to the information in this section, make sure that your system meets requirements as listed in “Set up your environment prior to customization” on page 28.

General restrictions and considerations

- Two or more accelerators must be configured on the same Db2 subsystem.
- The Multi load profile type and HALOAD utility support up to four accelerators.
- When using Analytics Accelerator V7.1.1 or earlier, to use parallelism in Accelerator Loader, you must have the WLM environment that runs DSNUTILU configured for WLM management of the DSNUTILU server address space. See “WLM requirements for Accelerator Loader” on page 34 and “Setting up the WLM application environment (required)” on page 116 for more information.
- For Analytics Accelerator V7.1.6 or earlier, the HALOAD utility requires the intercept in the DSNUTILU WLM address space. For more information, see “Setting up the WLM application environment (required)” on page 116.

Loading only tables or partitions that have changed since the last load

Using the HALOAD utility, you can load only those tables or partitions that have been updated in Db2 for z/OS since the accelerator-shadow tables were last loaded. This feature is controlled through the keyword DETECT_DATA_CHANGES on the HALOAD command. When this control card is included, only those tables listed in the FROM TABLE clause that have been changed in Db2 since the last time they were loaded into the accelerator will be loaded. In the case of partitioned tables, any partition lists specified on the command are ignored; HALOAD will determine which partitions need to be reloaded.

HALOAD relies on the same change detection mechanism as the Analytics Accelerator ACCEL_LOAD_TABLES stored procedure. HALOAD calls the ACCEL_GET_TABLESDETAILS stored procedure to retrieve the changelnformation category for the accelerator table. Tables and partitions with a changelnformation category of NONE are not loaded.

Like the ACCEL_LOAD_TABLES stored procedure, the HALOAD DETECT_DATA_CHANGES option updates the REFRESH_TIME (in
SYSACCEL.SYSACCELERATEDTABLES) of all tables specified. This is true even when a table is not loaded because of the detectChanges=“DATA” option.

When using HALOAD to load multiple accelerators, a table or partition will be reloaded on all accelerators whenever modified data is detected on any one of the accelerators.

Note: When External load is used to load both Db2 and the accelerator, the accelerator table will be left with a changeInformation category other than NONE. This means that the HALOAD utility when run with DETECT_DATA_CHANGES will load the accelerator table even though there is no changed data.

Using the ISPF interface to create or edit a high availability load (Multi) profile

You can specify options to generate JCL to load one to four accelerators from one or more Db2 tables. After specifying the options, save them as a Multi load profile.

Before you begin

Review the information in “Restrictions and considerations for loading table data to multiple accelerators” on page 289.

About this task

When you add a Db2 table to the profile, you can filter on tables, views from a single base table, or aliases. The product resolves the view or alias to the base table space and includes the base table space in the generated JCL. A view that was created from a join of more than one table is not supported. The product checks for the existence of the specified Db2 table before generation. However, if you specify partitions, the product cannot validate the partitions, but uses the partitions as specified when generating JCL.

Procedure

1. From the main menu, select Manage Loader Profiles and press Enter.
2. On the Manage Loader Profiles panel, to filter existing profiles by profile name or creator name, specify a wildcard pattern using an asterisk (*) and press Enter.
3. On the Manage Loader Profiles panel, perform one of the following steps:
   • To create a new profile, issue the CREATE command, and then on the Create Profile panel, select the type of profile to create.
   • To create a new profile by copying an existing profile, type C in the Cmd line next to the profile that you want to copy.
   • To edit an existing profile, type E in the Cmd line next to the profile.
4. On the Load Accelerator(s) from Db2 Table(s) panel, specify a name and processing options for the profile.
5. To add a Db2 table to the profile, issue the T panel command.
6. On the Enter Table and Creator Like to Display panel, specify an object creator name and object name pattern and press Enter to display matching objects. You can specify a table, a view, or an alias.
7. On the Db2 Table Selection panel, use the S line command to select the tables to add to the profile and press Enter.
8. Return to the previous panel by pressing F3.
9. To select the accelerators onto which you want to load data, issue the A panel command, and on the Db2 Analytics Accelerator Selection panel, select the accelerators or an accelerator group and press Enter.

Using a stored procedure to perform a high availability load

You can invoke the Accelerator Loader high availability load feature using a stored procedure call.

About this task

To invoke the HALOAD utility using a stored procedure, use the standard Db2 utility stored procedure DSNUTILU. Call the DSNUTILU stored procedure as you would for a Db2 utility, but specify the HALOAD utility command in place of a Db2 utility command. By using the DSNUTILU stored procedure to process the HALOAD utility, you do not need to create and maintain another stored procedure, and can simply use a stored procedure already implemented as part of Db2.

The following restrictions and considerations apply when using a stored procedure to perform a high availability load:

- If loading multiple accelerators using the HALOAD utility, all the accelerators must be configured to the same Db2. You can also use the HALOAD utility to load a single accelerator.
- The Accelerator Loader product library must be included in the STEPLIB of the procedure that runs the WLM environment for DSNUTILU. This requirement applies for all versions of the Analytics Accelerator. For more information, see “Setting up the WLM application environment (required)" on page 116.
- The HALOAD command does not use a utility ID. Because of this, an executing HALOAD command cannot be canceled by the Db2 -TERM utility command using the utility-id value passed on the stored procedure call. For more information, see “Canceling an HALOAD stored procedure call” on page 292.

The following information is specific to using the DSNUTILU stored procedure to run the HALOAD utility.

Note: For more information on using the DSNUTILU stored procedure, including a sample program and a complete description of the DSNUTILU syntax options, see the IBM Db2 Utility Guide and Reference, in Appendix B “Db2- supplied stored procedures for utility operations” or “DSNUTILU stored procedure”.

The following syntax diagram shows the SQL CALL statement for invoking the HALOAD utility as a stored procedure:

```
CALL DSNUTILU(utility-id, restart, utstmt, retcode)
```

**utility-id**

This input parameter is ignored for HALOAD. Because HALOAD does not invoke a Db2 utility, a utility ID is not used. Although this parameter is not used with HALOAD, a valid value must be provided for DSNUTILU.

**restart**

This input parameter is ignored for HALOAD. The HALOAD utility cannot be restarted. Although this parameter is not used with HALOAD, a valid value must be provided for DSNUTILU. It is recommended to specify NO for this option.
**utstmt** Specifies the HALOAD utility control statement, such as shown in the following example:

```
HALOAD ACCEL (IDAA01, IDAA02) FROM TABLE SCHEMA.TBNAME
```

*utstmt* is a required input parameter.

For more information on the syntax for loading multiple accelerators, see Chapter 8, “Loading Db2 table data to multiple accelerators,” on page 289.

**retcode** Specifies the HALOAD utility highest return code. *retcode* is a required output parameter.

**Procedure**

To perform a high availability load from within an application program, use the SQL CALL statement to invoke the DSNUTILU stored procedure, specifying the HALOAD command as the utility. For the HALOAD utility output, the calling program fetches rows from the SYSIBM.SYSPRINT temporary table, which is the same process as when calling a Db2 utility.

**Example**

The following example shows the SQL CALL statement for invoking the HALOAD utility as a stored procedure:

```
CALL SYSPROC.DSNUTILU('HALOADID',
  'NO',
  'HALOAD ACCEL (IDAA01, IDAA02) FROM TABLE SCHEMA.TBNAME',
  HALOAD_RC)
```

The following example shows the output when performing a high availability load through the DSNUTILU stored procedure. The output is the same when invoking HALOAD directly or as a stored procedure.

```
HLOU40001 08:32:00.90 Task: 03, HALOAD -TERM utility started.
HLOU40001 08:32:00.90 Task: 03, HALOAD -TERM command started.
HLOU40151 08:32:10.91 High Availability Load Execution started.
HLOU40151 08:32:10.91 High Availability Load started.
HLOU40151 08:32:10.91 High Availability Load executed successfully.
HLOU40001 08:32:11.91 HALOAD -TERM utility started.
HLOU40001 08:32:11.91 HALOAD -TERM command started.
HLOU40151 08:32:11.91 Messages from accelerator VIAACC1...
HLOUS5201 AQ7200141 The following data was transferred to the "HLO15"."HALD4BT1" table:
  Scope: Full table, number
  HALOUS5201 of rows: 8, amount of data: 0 MB, time: 10 seconds.
HLOUS5201 AQ7200141 The following data was transferred to the "HLO15"."HALD4BT2" table:
  Scope: Full table, number

HLOUS5201 AQ710001 The operation was completed successfully.
```

## Canceling an HALOAD stored procedure call

To cancel an HALOAD stored procedure call, you must use a method other than the Db2 -TERM utility command.
About this task

The HALOAD command does not use a utility ID. Because of this, an executing HALOAD utility cannot be canceled by the Db2 -TERM utility command using the utility-id value passed on the stored procedure call. Instead, use one of the methods described in the following procedure.

Procedure

To cancel the HALOAD stored procedure call, use one of the following methods:

- If the HALOAD utility is running, you can cancel the thread through which the HALOAD utility attempts to access Db2. This will result in an S04E ABEND and the stored procedure will terminate.
- If the HALOAD utility hangs in the WLM address space, canceling the thread will not terminate the stored procedure. If this occurs, you can cancel the WLM address space that is running the DSNUTILU stored procedure call for the HALOAD utility. The WLM address space ID (ASID) can be identified from the Accelerator Loader started task message HLOS0101I. This message reports the intercept session information, including the ASID as session_asid. For more information, locate the message ID in “Messages and codes” on page 503.
- In the Accelerator Loader studio, you can cancel the ACCEL_LOAD_TABLES stored procedure.
Chapter 9. Backing up and recovering accelerator data

You can use Accelerator Loader to back up and recover data that resides only in the accelerator. This data can be in an accelerator-only table or an accelerator-shadow table that has been loaded to the accelerator only.

Note: Because the data resides only in the accelerator, the standard Db2 COPY and RECOVER utilities cannot be used.

Backup copies can be created using either of the following methods:

- **Backup utility.** The Accelerator Loader backup utility lets you create a full copy by fetching all of the data from the accelerator table and writing out a copy. To use this method, you can generate JCL from a Backup profile.

- **Inline copy.** An inline copy is a backup copy of an accelerator table that is created as the data is loaded to the accelerator. An accelerator only load can optionally be configured to create an inline copy, and this is the most efficient way to create a backup. This method creates a full copy when running the Accelerator Loader with the syntax LOAD REPLACE and an incremental copy when running the Accelerator Loader with the syntax LOAD RESUME. To use this method, you can generate JCL using an Accelerator only profile.

To generate recovery JCL, you can use the Recovery profile.

**About backup copy data sets**

The Accelerator Loader backup and recovery feature supports four copy data sets: a primary and backup copy for the local site, and a primary and backup copy for the remote recovery site. You can create backups for the local site only or the recovery site only. A backup copy for either site may be created only when a primary copy is also being created for that site. You can specify data set allocation parameters within your Backup profile. The backup program determines and sets the RECFM, LRECL, and BLKSIZE.

Copy data sets are registered in the backup copy registration table, HLOUCOPY; each Db2 system on which Accelerator Loader is installed has its own copy of this table.

**Restrictions and considerations for backing up and recovering accelerator data**

Review the following restrictions and usage considerations when performing a backup or recovery of your accelerator data:

- Accelerator Loader backup and recovery features are for data that resides only in the accelerator.

- Because the data resides only in the accelerator, standard Db2 COPY and RECOVER utilities cannot be used for backup and recovery functions.

- Backup copies created by the Accelerator Loader backup feature are not in standard Db2 image copy format. Accelerator tables can be recovered using the Accelerator Loader recovery feature only.

- Removing a table from the accelerator invalidates any backup copies that have been created. If the table is removed from the accelerator and then added back, a new full backup copy should be created.
The Accelerator Loader backup utility reports the first five positive SQL codes that are encountered and processing continues. After a successful execution with only warnings and no errors, the final return code is set to 4. When a negative SQL code is encountered, the Accelerator Loader backup utility reports the error and the job terminates with return code 8.

Using the ISPF interface to back up accelerator data using the BACKUP utility

Use the ISPF interface to back up accelerator data using the BACKUP utility.

About this task

The Accelerator Loader BACKUP utility lets you create a full copy of your accelerator table by fetching all of the data from the accelerator table and writing out a copy.

To use the BACKUP utility, you can create a Backup profile from which you can generate backup JCL. A Backup profile is a reusable group of options for building jobs to back up data on an accelerator using the BACKUP utility. You can create a profile that saves your selections and reuse the profile to perform future backups of your accelerator data.

To build the JCL required to run the BACKUP utility, you must specify the accelerator table to back up and the copy data sets to create. You can specify up to four copy data sets to create: a primary and backup copy for the local site, and a primary and backup copy for the remote recovery site. You can create backups for the local site only or the recovery site only. A backup copy for either site can be created only when a primary copy is also being created for that site.

Procedure

1. From the main menu, select **Back up Accelerator table** and press Enter.
2. On the Back Up Accelerator Table panel, issue the TABLE command.
3. On the Enter Table and Creator Like to Display panel, specify a table creator and table name pattern for the accelerator tables to list, and press Enter. You can use an asterisk (*) in the fields **Table creator like** and **Table name like**. Case sensitivity of these fields is controlled by the **Case sensitive** option.
4. On the Accelerator Table Selection panel, type **S** in the **Cmd** field next to the table to back up, and press Enter. Only one table can be selected. After you select a table, an asterisk appears in the **Cmd** field.
5. Press PF3 to exit the panel.
6. Under **Copy data sets options**, specify up to four copy data sets to create, and specify **YES** in the **Update** field to specify data set parameters.
7. If you specified **YES** for **Update**, on the Copy Data Set Parameters panel for each copy data set, specify allocation parameters for the backup copy data set, and press PF3.
8. Optional: To save the Backup profile, specify a name and description for the profile, and issue the **SAVE** command.
9. To build the backup JCL, issue the **BUILD** command.
Using the ISPF interface to back up accelerator data using an inline backup

Use the ISPF interface to back up accelerator data using an inline backup.

About this task

An inline copy is a backup copy of an accelerator table that is created as the data is loaded to the accelerator. An accelerator only load can optionally be configured to create an inline copy. This method creates a full copy when running the Accelerator Loader with the syntax LOAD REPLACE and an incremental copy when running the Accelerator Loader with the syntax LOAD RESUME.

Procedure

To create an inline copy when data is loaded to the accelerator, you can use an Accelerator only profile from which you can generate JCL. To create an Accelerator only profile, use the Load Accelerator(s) from External File option from the main menu. Use the Inline copy data sets options to specify up to four copy data sets to create: a primary and backup copy for the local site, and a primary and backup copy for the remote recovery site. You can create backups for the local site only or the recovery site only. A backup copy for either site can be created only when a primary copy is also being created for that site. Specify YES in the Update field to specify data set parameters. For more information on defining the Accelerator only profile, see Chapter 7, “Loading data from an external file,” on page 277.

Using the ISPF interface to recover accelerator data

Use the ISPF interface to recover accelerator data.

About this task

To recover accelerator data, you can create a Recovery profile from which you can generate recovery JCL. A recovery profile is a reusable group of options for building jobs to recover data on an accelerator. You can create a profile that saves your selections and reuse the profile to perform any future recoveries of data.

For Accelerator Loader recovery JCL, you must provide the accelerator table to recover and the backup copy data set to use for recovery. To determine which backup copy data set to use, you must first decide the point in time to which to recover. The point in time option in the ISPF interface controls how the copy data set is selected for each table and applies to all tables selected for recovery. The following options are available for Point in time:

- CURRENT: The backup data set for each table will be chosen automatically when the recovery JCL is generated.
- TIMESTAMP: The backup data set for each table will be chosen automatically using values specified in Timestamp end point and Time zone of timestamp fields.
- SELECTED: You must manually specify a backup data set for each selected table.

Procedure

1. From the main menu, select Recover Accelerator table(s) from a backup and press Enter.
2. On the Recover Accelerator Table(s) from a Backup panel, issue the TABLES command.
3. On the Recovery Table List panel, issue the ADD command.

4. On the Enter Table and Creator Like to Display panel, specify a table creator and table name pattern for the accelerator tables to list, and press Enter. You can use an asterisk (*) in the fields Table creator like and Table name like. Case sensitivity of these fields is controlled by the Case sensitive option.

5. On the Recovery Table Selection panel, type S in the Cmd field next to a table to recover or use the ALL command to select all tables, and press Enter. After you select a table, an asterisk appears in the Cmd field.

6. Press PF3 to exit the panel.

7. To manually specify the backup copy data set to use for the recovery:

   **Note:** To use a manually-selected backup copy data set requires the SELECTED point in time recovery option, specified in a later step.
   a. On the Recovery Table List panel, type B in the Cmd field next to the table, and press Enter.
   b. On the Backup Copy Selection panel, type S next to a backup copy data set and press Enter.
   c. Press PF3 to exit the panel.

8. Press PF3 to exit the Recovery Table List panel.

9. On the Recover Accelerator Table(s) from a Backup, specify your target options:
   a. To add missing tables to the accelerator before starting the recover job, specify YES for Add table to Accelerator.
   b. To enable query acceleration for the table after a successful load, specify YES for Enable acceleration on success.

10. Specify your recovery point options, as follows. These settings apply to all tables that are selected.
    a. Specify CURRENT, TIMESTAMP or SELECTED for the Point in time to which to recover.
    b. If you specified TIMESTAMP for your point in time, specify the Timestamp end point and Time zone of timestamp values.

11. Optional: To save the Recovery profile, specify a name and description for the profile, and issue the SAVE command.

12. To build the recovery JCL, issue the BUILD command.
Chapter 10. Using and managing load profiles

You can create reusable groups of load options in a profile. You also associate profiles with an accelerator and a table. You can then reuse the profile to generate JCL for future loads, rather than specifying the options again.

The following types of profiles are available:

- **Dual** specifies options for loading table data into both the accelerator and Db2 from an external data input file.
- **Accelerator only** specifies options for loading table data into only the accelerator from an external data input file.
- **Consistent** specifies options for loading data for multiple tables into the accelerator from a cataloged Db2 image copy.
- **Image copy** specifies options for loading data for a single table into the accelerator from a user-defined Db2 image copy.
- **Multi** specifies options for loading data to one to four accelerators from one or more Db2 tables (high availability load).
- **Backup** specifies options for backing up a table defined to the accelerator.
- **Recovery** specifies options for recovering a table defined to the accelerator.

From the main menu, you can choose to manage profiles or choose to create a profile for the type of load you want to perform.

Managing profiles includes the following tasks:

- Create a profile.
- Build the JCL for a profile.
- Delete a profile.
- Edit a profile.
- Rename a profile.
- View a profile.
- Copy a profile to save with a different name.

To select load profiles for display, you can specify filter criteria:

- By default, the panel displays all profiles and creators.
- To filter the profiles and creators, in the **Profile like** and **Creator like** fields, type a few letters with the asterisk wildcard (*) and press Enter. These fields are case sensitive. The wildcard patterns abc* and ABC* return different results.
- To filter by the type of load profile, leave the default (ALL) or type an asterisk (*) in the **Profile type** field and press Enter.

If no profiles meet your selection criteria, the profiles panel remains open and displays no profiles. Specify different filter criteria and try again.

If existing profiles meet your selection criteria, the profiles panel displays those matching profiles.
Using the ISPF interface to build a load job from a profile

Use the ISPF build feature to quickly generate a Db2 Analytics Accelerator Loader job by using a load profile.

**Before you begin**

Create a load profile as described in one of the following topics:

- “Using the ISPF interface to create or edit a Consistent or Image Copy load profile” on page 273
- “Using the ISPF interface to create or edit a profile to load from an external file” on page 287

**Procedure**

1. From the main menu, select Manage Loader Profiles and press Enter.
2. In the **Cmd** field next to a profile, type B and press Enter.
3. On the Build Load JCL panel, specify the data set name, and if necessary, the member name for the generated job. The product creates this data set if it does not exist.
4. Select processing options by typing a forward slash character (/) beside the options.
5. Specify a valid job card for your site.
6. Issue the BUILD command to build the JCL, or press PF3 to save and exit.
7. To perform the load, submit the generated JCL, or add the job to your job scheduler.

Using the batch interface to build a load job from a profile

You can use the batch interface to generate JCL to load data to the accelerator and Db2.

**Before you begin**

Use the ISPF interface to create a load profile that specifies the options that you want to use. It is not necessary to specify a table when you create the profile in the ISPF interface.

**About this task**

Db2 Analytics Accelerator Loader does not validate table names, data set names, and so on.

Specify SYSIN lines in positions 1 - 72. To split long table names into multiple SYSIN lines, start a new line in position 1.

SYSIN parameter values cannot contain the following characters:

- ’ (apostrophe)
- " (quotation mark)
- & (ampersand)
- < (less-than symbol)
- > (greater-than symbol)

Use the following encoding for symbols:
For example, a table named `<MY TABLE1> TABLE "NAME"` requires the following encoding:

`<TABLE NAME>"'LT;MY TABLE1&GT; TABLE&APOS; &QUOT;NAME&QUOT;'`

When you add a Db2 table to the profile, you can filter on tables, views from a single base table, or aliases. The product resolves the view or alias to the base table space and includes the base table space in the generated JCL. A view that was created from a join of more than one table is not supported. The product checks for the existence of the specified Db2 table before generation. However, if you specify partitions, the product cannot validate the partitions, but uses the partitions as specified when generating JCL.

For a load from an external file, you can specify one SYSREC for each partition or each table if the table space is not partitioned. To specify multiple SYSREC data sets, use templates or manually add SYSREC data sets to the generated JCL. Before you can perform a parallel load to the accelerator, you must load the entire table. Then you can load selected partitions.

**Procedure**

1. Locate one of the following members in the SHLOSAMP library:
   - For a Dual or Accelerator only load profile: HLODGEN
   - For a Consistent or Image copy load profile: HLOCGEN
2. In the SYSIN statement, replace the variables in parameter values with your values. Remove the hash symbols (#) from the example JCL, but leave the quotation marks.
3. Save a copy of the customized member in another library.
4. To perform the load, submit the generated JCL, or add the job to your job scheduler.

Load profile parameter descriptions
The following table describes the load profile parameters and indicates the profile types to which the parameter applies.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Profile type</th>
<th>Required?</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;JOBPREFIX&gt;='job_name_prefix'</td>
<td>Dual, Consistent, Image copy, Accelerator only, Multi</td>
<td>No</td>
<td>HLO</td>
</tr>
</tbody>
</table>

Specifies a prefix for the member name and job name in the job card. Specify a maximum of three characters.

The product creates a separate six-character job name for each job. For example, if two jobs are generated and the default prefix of HLO is used, then all defined tables are generated into two jobs with the names HLOAAA and HLOAAB. Step names in the job begin with prefix S, followed by the job name and the step name in symbolic form. For example, the step names in the job HLOAAB are SAABAA and SAABAB.

</tbody>
</table>

Specifies whether to use partition parallelism. Valid values:
- `'YES'` - One SYSREC per table partition is generated into the JCL using a template.
- `'NO'` - One SYSREC per table is generated into the JCL.

Specifies the full path to the partitioned data set (PDS) that is to be used for the JCL generation. If the data set that you specify does not exist, the product allocates it.

Specifies the number of jobs to generate (from 1 - 17576). The tables are divided evenly among the jobs. If the maximum number of steps in a job is reached, the same job card and job name are used to add another batch job automatically.

Specifies the table definition section that follows.

(Consistent load only): Only one JCL file is generated.

(Dual load only): The number of tables divided by the number of jobs must be less than or equal to 172380.

For information about conditions that apply to the table, see the "Considerations for the table definition section" on page 309.

<tr>
<td>Specifies the number of parallel tasks to use when loading data into the accelerator. Valid values are in the range 1 - 20. In the JCL, the <code>ACCEL_LOAD_TASKS</code> value is set to <code>min(PARALLELISM, partitions count, 20)</code>. The value of this parameter should match the value of the IBM Db2 Analytics Accelerator for z/OS environment variable <code>AQT_MAX_UNLOAD_IN_PARALLEL</code>. The value of this environment variable indicates the number of partitions that can be loaded in parallel. If the value of <code>AQT_MAX_UNLOAD_IN_PARALLEL</code> is 2, the maximum number of partitions that can be written to the accelerator at one time is 2, regardless of the <code>&lt;PARALLELISM&gt;</code> value. <strong>Note:</strong> When using Analytics Accelerator V7.1.1 or earlier, to use parallelism in Accelerator Loader, you must have the WLM environment that runs DSNUTILU configured for WLM management of the DSNUTILU server address space. See &quot;WLM requirements for Accelerator Loader&quot; on page 34 for more information.</td>

<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### Considerations for the table definition section

If the table exists in the profile that you specified, the following considerations apply:

- If you omit `<PARTITION>`, then the value is obtained from the existing profile.
- If `<LOAD BY PARTITION>='No'`, then the SYSREC data set name is obtained from the existing profile.
- If you want to use the SYSREC data set from the existing profile when the **Input data set** field on the Load Accelerator(s) from External File panel or the Load Accelerator(s) and Db2 from External File panel is disabled, then you must specify a value of No in the **Parallel load** field on the Load Accelerator(s) from External File panel or the Load Accelerator(s) and Db2 from External File panel, and then specify the input data set.

If the table does not exist in the profile that you specified, the following considerations apply:

- Because there is no `<PARTITION>` value, the product assumes that the table is not partitioned. Parallel load is supported for partitioned tables only.
- To enable parallel load for the table and to use a SYSREC template, you must specify a value for `<PARTITION>`.
- To perform a non-parallel load, you must specify the name of the SYSREC data set for the table in the `<SYSREC-DSN>` parameter, or specify a value of No in the **Parallel load** field on the Load Accelerator(s) from External File panel or the Load Accelerator(s) and Db2 from External File panel.

### View load profile specifications

You can view the options that are specified in your profiles and those that other users created. Viewing a profile enables you to see the settings that have been specified and determine whether you want to copy or edit that profile.
**Procedure**

1. On the Manage Loader Profiles panel, type `V` in the **Cmd** line next to the profile that you want to view.
2. Review the specified options.
3. Press PF3 to return to the previous panel.

---

**Renaming a load profile**

You can rename your own profiles or those that other users created if the profile was created with a **Share Option** of **Update**.

**Procedure**

1. On the Manage Loader Profiles panel, type `R` in the **Cmd** line next to the profile that you want to rename. The Rename Profile panel opens.
2. In the **Profile Name** field, type the new profile name over the existing profile name.
3. Press Enter.

---

**Deleting a load profile**

If a load profile is no longer of use, delete it from the profile set.

**About this task**

You can delete all profiles that were created under your user ID, regardless of the **Share Option**. You can delete a profile created by another user if the profile was created with a **Share Option** of **Update**.

**Procedure**

1. From the main menu, select Manage Loader Profiles and press **Enter**.
2. In the **Cmd** field next to the profile that you want to delete, type `D`, and press **Enter**.
3. On the confirmation panel, confirm the deletion, and press **Enter**.
Chapter 11. Syntax

Review information about Db2 Analytics Accelerator Loader example JCL and syntax diagrams and definitions. You can customize the example JCL according to the needs of your site. Syntax diagrams provide the information necessary for constructing valid Db2 Analytics Accelerator Loader syntax.

Loading data from non-Db2, remote Db2, and remote system sources

Before you build and run a job that loads data from a non-Db2, remote Db2, or remote system source, review all reference and conceptual information for the feature, including the correct syntax, usage considerations, and examples.

Example JCL

Example: Load the accelerator with data from another Db2 subsystem

The following sample syntax shows control cards to load only the accelerator with data from another Db2 subsystem. In the example, hlvid represents the name of the Accelerator Loader server started task that was customized by using Tools Customizer.

EXEC SQL
  DECLARE HLOCSR CURSOR FOR
  SELECT * FROM USER1.SOURCE_DB2_TABLE
ENDEXEC

LOAD DATA REPLACE
  IDAA_ONLY ON UB1AACC1
  LOG NO NOCOPYPEND
  ENFORCE NO
  ACCEL_CURSOR HLOCSR
  ACCEL_SOURCE_DB2 RA1B
  ACCEL_HLV_SSID hlvid
  ACCEL_REMOVE_AND_ADD_TABLES
  ACCEL_ON_SUCCESS_ENABLE YES
  ACCEL_LOAD_TASKS 1
INTO TABLE USER1.TARGET_DB2_TABLE

The sample syntax is converted to the following Db2 LOAD statement:

LOAD DATA
  INDDN HLOREC
  REPLACE
  FORMAT INTERNAL
  INTO TABLE USER1.TARGET_DB2_TABLE

Example: Load the accelerator with data from a remote system

The following sample syntax shows control cards to load only the accelerator with source data from a remote Accelerator Loader server.

LOAD DATA
  IDAA_ONLY ON RDSBACCI
  REPLACE
  LOG NO NOCOPYPEND
  ENFORCE NO
Virtual Parallel Data (VPD) allows you to group multiple simultaneous requests against the same data source and run them in parallel, while performing the input and output (I/O) only once. A separate Accelerator Loader job must be generated and submitted for each request, and these jobs must be run concurrently. When parallelism is used, each parallel thread joins the group separately and must join the group within a specified timeout value. Threads that do not appear within the timeout time are placed in a new group, resulting in an additional read of the data set.

To use Virtual Parallel Data (VPD) when loading data to the accelerator, use the following Accelerator Loader syntax options:
- ACCEL_HLV_VPD_GROUP
- ACCEL_HLV_VPD_MEMBERS
- ACCEL_HLV_VPD_TIMEOUT
- ACCEL_HLV_VPD_IOT

As an example, to process three different SMF record types in one pass through a data set, submit three Accelerator Loader jobs, one for each record type. The following sample control cards include the VPD syntax options for this example, which would need to be included in each of the jobs:

```sql
EXEC SQL DECLARE HLVCSR CURSOR FOR
   SELECT * FROM SMF_01400
ENDEXEC

LOAD DATA
   IDAA_ONLY ON DB9AACC1
   REPLACE
   LOG NO NOCOPYPEND
   ENFORCE NO
   ACCEL_CURSOR HLVCSR
   ACCEL_HLV_SSID HLV9
   ACCEL_HLV_VPD_GROUP TESTVPD
   ACCEL_HLV_VPD_MEMBERS 3
   ACCEL_HLV_VPD_TIMEOUT 300
   ACCEL_REMOVE_AND_ADD_TABLES
   ACCEL_ON_SUCCESS_ENABLE YES
   ACCEL_LOAD_TASKS 1
   INTO TABLE "USER1"."SMF_01400"
```

**Note:** ACCEL_HLV_VPD_IOT is an optional parameter. Because this parameter is not included in the example, the default value will be used.

Submit the jobs to run concurrently. If one of the jobs fails to join the group within the specified timeout value, the other two jobs would proceed and the third job would be placed in a new group, resulting in an additional read of the data set.
For more information about using VPD, see “Generating JCL” on page 251 and “Virtual Parallel Data” on page 475.

Example: Load the accelerator and Db2 with data from a virtualized data source

The following figure contains example JCL to load both the accelerator and Db2 with source data from a virtualized data source using the Accelerator Loader server.

```plaintext
//HLOD0100 EXEC PGM=DSNUTILB,
// REGION=1024M,
// PARM=('QAA5','USER01_LOAD')
//STEPLIB DD DISP=SHR,DSN=QDS5.SDSNEXIT

 ACCEL_REMOVE_AND_ADD_TABLES
 ACCEL_ON_SUCCESS_ENABLE YES
 ACCEL_LOAD_TASKS 1
 INTO TABLE "TSADO"."RemoteLoad"
/* */
```

Customizing the JCL to load the accelerator and Db2

The following steps describe the changes you must make to customize the JCL generated by the Accelerator Loader studio to load the accelerator and Db2.
About this task

You can load data to both the accelerator and Db2 when loading data from a virtualized data source or remote DBMS using the Accelerator Loader server. To use this feature, you must manually edit the JCL generated by the Accelerator Loader studio. Before making the required changes to the generated JCL as described in the following procedure, review the details of the changes to be made, as follows:

- Update the LOAD control cards to use the IDAA_DUAL keyword. The Accelerator Loader studio includes the IDAA_ONLY keyword in the generated JCL. You must manually replace IDAA_ONLY with IDAA_DUAL to load to both the accelerator and Db2.
- Increase the Db2 utility work data set allocations to provide enough work space for the Db2 LOAD utility. The minimum space the Accelerator Loader studio provides for the utility work data sets (SYSUT1, SORTOUT, SYSMAP, SYSERR) is not sufficient for most loads. You can also replace the JCL DD statements for these work data sets with TEMPLATE statements.
- If there are indexes on the Db2 table, add the SORTDEVT (and optionally SORTNUM) Db2 LOAD control cards to the LOAD statement to provide enough SORT work space for the index builds.
- Consider adding the NUMRECS keyword to the INTO TABLE clause. NUMRECS specifies the number of records to be loaded. The Db2 LOAD utility uses the NUMRECS value to size various work data sets. If you omit the NUMRECS keyword, Accelerator Loader passes Db2 LOAD a default value of 100 million.
- If parallelism is used, review the CREATE TABLE DDL generated by the Accelerator Loader studio. Parallelism requires the Db2 table to be range-partitioned by the Accelerator Loader generated column ‘ACCEL_PARTITION KEYCOL’. If the Accelerator Loader studio has been used to generate the CREATE TABLE DDL, the table is created with the number of partitions equal to the degree of parallelism. For example, if the degree of parallelism is specified as 10, the table will be created with 10 partitions. All the loaded data must be able to fit in those 10 partitions. You may need to edit the CREATE TABLE DDL generated by the Accelerator Loader studio to ensure the VSAM data sets for the table are large enough to accommodate all the data. Consider adding the DSSIZE, COMPRESS or STOGROUP keywords to the CREATE TABLE statement.

Restriction

DISCARD data sets are not supported when loading both the accelerator and Db2 from an Accelerator Loader server data set. If DISCARD data sets are provided, Accelerator Loader will fail with the following message:

HLOP9953E Discard datasets are not supported when keyword 'ACCEL_CURSOR' is specified.

Procedure

1. Generate JCL from the Accelerator Loader studio. For more information, see “Generating JCL”.
2. In the JCL generated by the Accelerator Loader studio, make the following changes:
   a. Replace the IDAA_ONLY keyword with IDAA_DUAL.
   b. Increase the allocations for the Db2 utility work data sets (SYSUT1, SORTOUT, SYSMAP, SYSERR) to provide enough work space for the Db2
LOAD utility. Optionally, you can replace the JCL DD statements for these work data sets with TEMPLATE statements.

c. If there are indexes on the Db2 table, add the SORTDEVT (and optionally SORTNUM) Db2 LOAD control cards to the LOAD statement to provide enough SORT work space for the index builds.

d. Optional: Add the NUMRECS keyword to the INTO TABLE clause to specify the number of records to be loaded.

e. If parallelism is used, perform the following steps:

1) Review and update, if necessary, the CREATE TABLE DDL generated by the Accelerator Loader studio to ensure the VSAM data sets for the table are large enough to accommodate all the data.

2) Optional: Add the DSSIZE, COMPRESS or STOGROUP keywords to the CREATE TABLE statement.

Syntax diagram: Load from a non-Db2, remote Db2, or remote system source

Review syntax for a job that loads data from a non-Db2, remote Db2, or remote system source.

This syntax is typically generated using the Accelerator Loader studio. Some of the syntax elements in this diagram apply only when loading from a virtualized data source.

Note: Additional syntax elements are supported for other types of loads. See “Syntax diagram: Load from an external file” on page 348.
Syntax definitions: Load from a non-Db2, remote Db2, or remote system source

Review descriptions of syntax elements that are valid for loading data from a non-Db2, remote Db2, or remote system source.

**ACCEL_ADD_TABLES | ACCEL_REMOVE_AND_ADD_TABLES**
Indicates whether to add missing tables to the accelerator before starting the load job. Specify one of the following options:

**ACCEL_ADD_TABLES**
Add missing tables to the accelerator before starting the load job.

**ACCEL_REMOVE_AND_ADD_TABLES**
Remove and re-add existing tables to the accelerator before starting the load job. This option does not preserve distribution and organizing keys on the accelerator; however, a table that was enabled for replication before will be enabled for replication again.

If you omit this option, missing tables are not added to the accelerator.

**ACCEL_CURSOR cursor_name**
Specifies the Accelerator Loader server cursor that retrieves the source data. Valid cursor names are a maximum of eight characters. The cursor must be declared via the EXEC SQL utility statement before the LOAD statement that references the cursor.

**ACCEL_DATA_SERVER remote-data-server-name**
Specifies the remote Accelerator Loader server that contains the source data.
You must also specify ACCEL_CURSOR and either ACCEL_HLV_SSID or ACCEL_HLV_GRPNAME. Do not also specify ACCEL_SOURCE_DB2.

ACCEL_HLV_SSID ssid | ACCEL_HLV_GRPNAME group_name
Specify one of these options to identify the server to which Db2 Analytics Accelerator Loader connects. You can identify the server by SSID or group name.

ACCEL_HLV_VPD_GROUP group_name
Specify the eight character VPD group name. This keyword is required to use the VPD feature.

ACCEL_HLV_VPD_IOT integer
Specifies the number of I/O threads the Accelerator Loader server will create for reading the data set.

ACCEL_HLV_VPD_MEMBERS integer
Specifies the number of members in the VPD group. Each Accelerator Loader job must be counted as a group member. This keyword is optional. If this value is not provided, the Accelerator Loader server will wait until the timeout expires before closing the group and finishing the request.

ACCEL_HLV_VPD_TIMEOUT integer
Specifies the amount of time, in seconds, that members have to join the group before it closes.

ACCEL_LOAD_TASKS integer
Specifies the number of partitions to load into the accelerator and optionally into Db2 in parallel when loading from an external file. Valid values are in the range 1 - 20.

This value should not exceed the value of the IBM Db2 Analytics Accelerator for z/OS parameter AQT_MAX_UNLOAD_IN_PARALLEL, which indicates the maximum number of partitions that can be loaded in parallel. If AQT_MAX_UNLOAD_IN_PARALLEL is set to 2, the maximum number of partitions that can be written to the accelerator at one time is 2, regardless of the value that you specify for this parameter.

Note: When using Analytics Accelerator V7.1.1 or earlier, to use parallelism in Accelerator Loader, you must have the WLM environment that runs DSNUTILU configured for WLM management of the DSNUTILU server address space, which allows multiple DSNUTILU server address spaces to be started as needed per system. If you have configured your WLM environment that runs the DSNUTILU stored procedure to run as a single address space, you must set this value to 1, which disables parallelism.

ACCEL_ON_SUCCESS_ENABLE YES | NO
Controls whether query acceleration is enabled for the table after a successful load. If Db2 discards any rows during the load, query acceleration is not enabled. Valid values are YES and NO.

ACCEL_ROWS_REPORT_THRESHOLD integer
Specifies the threshold (in rows) to use when reporting the number of rows that have been loaded for the job. Message "HLOU5062I" on page 714, which includes the cumulative number of rows loaded for the job, is issued to the Accelerator Loader job SYSPRINT each time the threshold value is met. Note that the message will be issued when the threshold is exceeded but will contain the current row count in the loading process,
which might be more than the value specified. Valid values are integers in
the range 0 - 2147483647. A value of 0 specifies that no reporting messages
will be issued.

This setting overrides the value for the global parameter **Report loaded
rows threshold** that is set using Tools Customizer. If the
**ACCEL_ROWS_REPORT_THRESHOLD** parameter is not included in the
job syntax, the global value set using Tools Customizer applies.

**ACCEL_SKIP_DB2_REPLACE**
When loading to the accelerator only and using the REPLACE option
(IDAA_ONLY REPLACE), this option specifies that existing rows are not
deleted from the Db2 table and data is loaded to the accelerator-shadow
table only, replacing all data in the accelerator-shadow table. This option is
valid only when used with the IDAA_ONLY option; it is ignored when
used with the IDAA_DUAL option.

**ACCEL_SOURCE_DB2 ssid**
Specify this option only when the data source is a Db2 subsystem. Because
Db2 sources do not require server mappings, you must specify the
subsystem ID to locate the source Db2 table.

**ENFORCE YES | NO**
Specifies whether to enforce check constraints and referential constraints.

**IDAA_DUAL ON accelerator_group_name|accelerator_name,accelerator_name**
Indicates that you want to load data to up to four accelerators, and also to
Db2. Specify one accelerator group name, or up to four individual
accelerator names, separating each accelerator name with a comma.

This option is not generated by the Accelerator Loader studio. To use this
option, you must manually edit the JCL generated by the Accelerator
Loader studio. For more information, see "Customizing the JCL to load the
accelerator and Db2" on page 313.

**IDAA_ONLY ON accelerator_group_name|accelerator_name,accelerator_name**
Indicates that you want to load data to up to four accelerators, and do not
want to load to Db2. Specify one accelerator group name, or up to four
individual accelerator names, separating each accelerator name with a
comma. If the load job specifies LOAD REPLACE, existing data in the Db2
table or partition is deleted.

This keyword is the default option that is generated by the Accelerator
Loader studio.

**LOG YES | NO | NO NOCOPYPEND**
Indicates whether to enable logging.

**REPLACE | RESUME YES**
Indicates whether records are to be appended or replaced when loading
data.

**Note:** The default behavior of the Accelerator Loader **RESUME** option is not
the same as the Db2 LOAD utility **RESUME** option. Accelerator Loader does
not check for rows in the accelerator table prior to the load and will
successfully load the accelerator-shadow table even if the table is empty.

Specify one of the following control cards in your JCL:

**REPLACE**
Accelerator Loader replaces existing data rather than appending it.
When loading to only the accelerator (IDAA_ONLY), existing rows will be deleted from the Db2 table and data is loaded to the accelerator-shadow table only.

When loading to both Db2 and the accelerator (IDAA_DUAL), existing rows will be deleted from the Db2 table and data is loaded to both the Db2 and accelerator-shadow tables.

This option can be specified in the Accelerator Loader studio by using the LOAD REPLACE option in the Generate JCL to Load Accelerator wizard. See "Generating JCL" on page 251.

RESUME YES
Accelerator Loader appends data to the accelerator table rather than replacing it.

- When loading to only the accelerator (IDAA_ONLY), the Db2 table is left as is and data is appended to the accelerator-shadow table.
- When loading to both Db2 and the accelerator (IDAA_DUAL), data is appended to both the Db2 table and the accelerator-shadow table.

This option can be specified in the Accelerator Loader studio by using the LOAD RESUME option in the Generate JCL to Load Accelerator wizard. See "Generating JCL" on page 251.

The Accelerator Loader studio will add either REPLACE or RESUME YES to the generated statement. If you delete the REPLACE or RESUME YES operand from the JCL, then the load will default to the standard Db2 LOAD utility default of RESUME NO.

### Consistent load and Image Copy load jobs

Review example JCL and syntax diagrams and definitions for Consistent load and Image Copy load jobs.

Before you build and run a Consistent load and Image Copy load job, review all reference and conceptual information for the features.

#### Example JCL: Consistent load

Review JCL examples for Consistent load jobs.

**Example 1: Nonparallel consistent load**

The following JCL example loads data to the accelerator at a consistent time without parallel processing.

```plaintext
//JOBCLASS JOB USER01,CLASS=A,MSGCLASS=X,MSGLEVEL=(1,1),
// USER=&SYSUID,NOTIFY=&SYSUID,REGION=0M
//*
//*
//** * * * * * * * * * * * * * * * * * * * * * * * * * * * * * * * * * *
//*
//* Job Generated by Accelerator Loader         *
//* *                                              *
//* DB2 SSID: QAA5                                *
//* Profile: USER01.SAMPI1                       *
//* Desc: Consistent Load                        *
//* User: USER01                                 *
//* Date: Thursday 15/12/13                      *
```
Example 2: Parallel consistent load

The following JCL example shows a consistent load job with parallel processing of two 16-partition tables.

```
//JOBCARD JOB USER01,CLASS=A,MSGCLASS=X,USER=&SYSUID,NOTIFY=&SYSUID,
// REGION=0M
/*
//*/

326  Db2 Analytics Accelerator Loader User’s Guide
Example 5: Loading data to multiple accelerators using Consistent load

**Note:** The following examples use Consistent load functionality and not the HALOAD utility.

In the following example, multiple accelerators specified individually will be loaded:

```plaintext
IDAA_CONSISTENT_LOAD
{
  GROUP
  {
    SPACE
    {
      CREATOR 'USER01'
      NAME 'TBL01'
    }
    SPACE
    {
      CREATOR 'USER01'
      NAME 'TBL01'
    }
    TO_CURRENT
  }
  ACCELNAME 'IDAAS01,IDAAS02,IDAAS03'
  PARALLEL '0,4'
  LOG_COPY_PREFERENCE R1R2A1A2
  USER_INDICATOR HLO
  ACCEL_ON_SUCCESS_ENABLE NO
  CHECK_DATA WRITE
}
```

In the following example, multiple accelerators will be loaded by specifying an accelerator group. The accelerator group expands to its individual members at run time.

```plaintext
IDAA_CONSISTENT_LOAD
{
  GROUP
  {
    SPACE
    {
      CREATOR 'USER01'
      NAME 'TBL01'
    }
    SPACE
    {
      CREATOR 'USER01'
      NAME 'TBL01'
    }
    TO_CURRENT
  }
  ACCELNAME 'ACCELGRP'
  PARALLEL '0,4'
  LOG_COPY_PREFERENCE R1R2A1A2
  USER_INDICATOR HLO
  ACCEL_ON_SUCCESS_ENABLE NO
  CHECK_DATA WRITE
}
Example JCL: Image Copy load

Review JCL examples for Image Copy load jobs.

Example 1: Manually specifying object translation target ID number pairs

You can specify an image copy data set and load the data from that image copy to the accelerator.

In the following example, the OBIDXLAT and control card cluster options are used to manually specify the object translation target ID number pairs.

```jcl
//HLOSAMP1 JOB <JOB PARAMETERS>,REGION=0M
//*
//**************************************************************************
//* Licensed Materials - Property of IBM
//* 5639-OLE
//* (c) Copyright Rocket Software, Inc. 2001-2015 All Rights Reserved.*
//* US Government Users Restricted Rights - Use, duplication or
//* disclosure restricted by GSA ADP Schedule Contract with IBM Corp.*
//*
//* Purpose : Accelerator Loader
//* Product #: 5639-OLE
//* Release : 2.1
//**************************************************************************
//*
//**** PURPOSE:
//*

```

Chapter 11. Syntax  329
Example 3: Loading data to multiple accelerators using Image Copy load

Note: The following examples use Image Copy load functionality and not the HALOAD utility.

In the following example, multiple accelerators specified individually will be loaded:
```
IDAA_LOAD_IC
{
  GROUP
  {
    SPACE
      {
        CREATOR 'USER01'
        NAME 'USER01T'
        TO_IC 'RTEST.QA1A.TZ18111S2.TSHLOSTA.DB2IC1'
        OBIDXLAT_CATALOG
      }
    ACCELNAME QAIAACC1
    PARALLEL '0,1'
    LOG_COPY_PREFERENCE R1R2A1A2
    USER_INDICATOR HLO
  }
}

/*
//
```

In the following example, multiple accelerators will be loaded by specifying an accelerator group. The accelerator group expands to its individual members at run time.
```
IDAA_LOAD_IC
{
  GROUP
  {
    SPACE

Customizing the Consistent load and Image Copy load example JCL

The following steps describe the changes that you must make to customize the Consistent load and Image Copy load example JCL for your site.

About this task

Use caution when adding DD names to the job step. The product dynamically allocates commonly used reserved name DD names during processing. If you must add DD names to facilitate control card separation by data set, use uncommon DD names that include "HLO" as part of the name. For example:

```
//SYSINHLO DD DSN=<dsn>
// DD DDNAME=SYSUT1HLO
// DD *
... //SYSUT1HLO DD DSN=<dsn>
//
```

Procedure

1. Enter a valid job card for your site. If you anticipate processing a large number of log records, allocate a large REGION size to avoid out-of-memory errors.
2. In the EXEC statement, enter the subsystem ID (ssid) for the subsystem on which you run the job. For example:
   ```
   //HL0C0100 EXEC PGM=HL0HMAIN,PARM='QB1A'
   ```
3. Change the STEPLIB DD data set file names to point to the Db2 Analytics Accelerator Loader program library.
4. Specify the appropriate INFOM DD, for example:
   ```
   //INFOM DD SYSOUT**
   ```

   **Note:** Both of the following INFOM DD definitions are valid:
   ```
   //INFOM DD SYSOUT**
   //INFOM DD DUMMY
   ```
5. Optional: Include the SYSUDUMP DD statement to facilitate finding and correcting problems that occur when the job runs.
6. Specify a data set or * for the SYSOUT.
7. Specify a data set or * for messages for SORAMSGS -> SORBMSGS, for as many groups as are needed in the run.
8. Specify the VSAM control file for Db2 parameters.
9. The SYSINHLO data set holds the parameters that define the Db2 Analytics Accelerator Loader job options.
10. Modify the syntax as needed for your site.

Syntax diagram: Consistent load and Image Copy load

The following syntax diagram illustrates how to construct valid Db2 Analytics Accelerator Loader syntax for Consistent load and Image Copy load jobs.

The syntax is as follows for the Db2 Analytics Accelerator Loader Consistent load and Image Copy load control cards.
IDAA_CONSTISTENT_LOAD
IDAA_LOAD_IC(

TEMPLATE,—NAME—template_name—DSN—template_dsn—)

GROUP — (—Space Attributes — Group Attributes —)

ACCELNAME — 'accelerator_group_name'

ACCELNAME — 'accelerator_name'

USE ABOVE THE BAR — 'primary,secondary,count'

ACCEL_REMOVE_AND_ADD_TABLES
ACCEL_ADD_TABLES
NO_SYSLGRNX
CONTINUE_ON_ERROR

LOCAL_SITE
RECOVERY_SITE

TARGET_SSID — target_table_ssid

ACCEL_ON_SUCCESS_ENABLE

NO
YES
Space Attributes:

- SPACE
  - CREATOR
  - NAME
  - PARTITION

- TARGET_CREATOR
  - TARGET_TABLE_CREATOR
  - TARGET_NAME

- TO_IC
  - IMAGE_COPY_DSN
  - OBID Translation
  - TO_IC_INLINE

- TO_CURRENT
  - TO QUIESCE
  - TO_LOGPOINT
  - END_RBA
  - END_LRSN
  - TO_TIMESTAMP
  - TO_TIMESTAMP_LOCAL

- FCCOPYDDN
  - TEMPLATE_NAME

OBID Translation:

- OBIDXLAT
  - OBIDXLAT_CATALOG

Group Attributes:

- TO_CURRENT
  - TO QUIESCE
  - TO_LOGPOINT
  - END_RBA
  - END_LRSN
  - TO_TIMESTAMP
  - TO_TIMESTAMP_LOCAL

Notes:

1. Refer to Accelerator Loader syntax for details about the valid values accepted for the IMAGE_COPY_PREFERENCE control card.
2. Refer to Accelerator Loader syntax for details about the valid values accepted for the LOG_COPY PREFERENCE control card.
3. In the OBID Translation diagram, s_xxid is the source ID, and t_xxid is the target ID.
If you specify the control card at the SPACE level, you cannot also specify it at the GROUP level or vice versa. The specification of control cards at SPACE and GROUP levels is mutually exclusive.

Syntax definitions: Consistent load and Image Copy load

Db2 Analytics Accelerator Loader supports the following syntax elements (presented alphabetically) for consistent load and image copy load jobs.

**ACCEL_ADD_TABLES | ACCEL_REMOVE_AND_ADD_TABLES**

Indicates whether to add missing tables to the accelerator before starting the load job. Specify one of the following options:

- **ACCEL_ADD_TABLES**
  Add missing tables to the accelerator before starting the load job.

- **ACCEL_REMOVE_AND_ADD_TABLES**
  Remove and re-add existing tables to the accelerator before starting the load job. This option does not preserve distribution and organizing keys on the accelerator; however, a table that was enabled for replication before will be enabled for replication again.

If you omit this option, missing tables are not added to the accelerator.

This option can be specified in the ISPF interface by using the Add table(s) to Accelerator field on the Load Accelerator with Consistent Data panel or the Load Accelerator from Specified Image Copy panel.

**ACCEL_ON_SUCCESS_ENABLE YES | NO**

Controls whether query acceleration is enabled for the table after a successful load. If Db2 discards any rows during the load, query acceleration is not enabled. Valid values are YES and NO.

**ACCELNAME 'accelerator_group_name' | accelerator_name | 'accelerator_name_1,accelerator_name_2(,...)'**

Specifies the accelerators to load. Specify one accelerator group name, or one or more individual accelerator names up to ten accelerators. When specifying multiple accelerator names, you must enclose the list in single quotes and separate each accelerator name with a comma, as shown in the following example:

`ACCELNAME 'QA1AACC1,QA1AACC2,QA1AACC3'`

You can use the Accelerator(s) field on the Load Accelerator with Consistent Data panel or the Load Accelerator from Specified Image Copy panel in the ISPF interface to generate the ACCELNAME control card in the JCL.

**CHECK_DATA NO | WRITE | OPERATION**

Include this optional keyword to specify if and when you want Accelerator Loader to check the integrity of Db2 for z/OS data pages. Specify this keyword outside the delimiters of the GROUP keyword. This keyword accepts the following values:

- **NO**  Do not check data page integrity.
- **WRITE**  (Default) Check data page integrity before passing the row data in each data page to the accelerator.
- **OPERATION**  Check data page integrity before and after each Db2 log apply
operation to the image copy, as well as before passing the row data in each data page to the accelerator.

**CONTINUE_ON_ERROR**
Causes most errors to be ignored and processing to continue.

**Note:** If the CONTINUE_ON_ERROR control card is included in the JCL and errors that are higher than RC=4 are encountered, the errors are overridden. RC=4 is reported, and the job will not fail. I/O errors and other serious issues (such as out-of-memory issues) are not ignored and will still cause the job to fail.

The CONTINUE_ON_ERROR control card can be specified in the ISPF interface by using the Load Accelerator with Consistent Data panel or the Load Accelerator from Specified Image Copy panel, as follows:

```
Continue on errors = Y
CONTINUE_ON_ERROR

Continue on errors = N
omits the CONTINUE_ON_ERROR control card
```

**CREATOR 'creator_name'**
For an image copy load, specifies the creator of the target table that will be loaded in the accelerator.

**DBID 'source_dbid,target_dbid'**
For an image copy load, used with the OBIDXLAT option to specify the database IDs of the source and target DBIDs. (The source ID is only needed if the image copy is for a table space with multiple tables.)

**END_LRSN byte_string**
END_LRSN byte_string directs Db2 Analytics Accelerator Loader to read the log and to incorporate data into the image copy up to the specified LRSN. Replace byte_string with the hexadecimal value.

The END_LRSN control card can be specified in the ISPF interface by using the **RBA or LRSN end point** field on the Load Accelerator with Consistent Data panel:

```
RBA or LRSN end point byte_string
```
If a hexadecimal end point is specified in the **RBA or LRSN end point** field and the job is built in a data sharing environment, **END_LRSN 'byte_string'** will be added to the syntax.

**END_RBA byte_string**
END_RBA byte_string directs Db2 Analytics Accelerator Loader to read the log and to incorporate data into the image copy up to the specified RBA. Replace byte_string with the hexadecimal value.

**Note:**
- END_RBA is not valid in a data sharing environment.
- If the RBA value that is specified on END_RBA is a valid RBA, then Db2 Analytics Accelerator Loader will use this RBA as an end point for the Db2 Analytics Accelerator Loader image copy. If the RBA value specified is not a valid RBA, then Db2 Analytics Accelerator Loader will use the next higher valid RBA as an end point for the Db2 Analytics Accelerator Loader image copy.
The END_RBA control card can be specified in the ISPF interface by using the **RBA or LRSN end point** field on the Load Accelerator with Consistent Data panel:

**RBA or LRSN end point byte_string**

If a hexadecimal end point value is specified in the **RBA or LRSN end point** field and the job is to be built in a non-data sharing environment, END_RBA 'byte_string' is added to the syntax.

**FCCOPYDDN (template_name)**

Use the FCCOPYDDN (*template_name*) control card after the **NEW_COPY** keyword to specify the FlashCopy data set template. The template is defined by the **TEMPLATE** control card. The data set for the Flash Copy is created based on the specified **TEMPLATE DSN**.

If Use FlashCopy DSN Template N is specified, the default template in DSNZPARMs for FlashCopy Image Copy will be used.

The FCCOPYDDN (*template_name*) control card can be specified in the ISPF interface by using the **Use FlashCopy DSN Template** field on the Load Accelerator with Consistent Data panel, as follows:

**Use FlashCopy DSN Template = Y**

The FCCOPYDDN (*template_name*) control card is generated into the JCL.

**Use FlashCopy DSN Template = N**

The default template that is specified in DSNZPARMs for the FlashCopy image copy will be used.

**FLASHCOPY**

The FLASHCOPY control card can be specified in the ISPF interface by using the **Use Flashcopy** field on the Load Accelerator with Consistent Data panel:

**Use Flashcopy = Y**

The control card FLASHCOPY is generated into the JCL with either a corresponding template name, or an image copy data set name. A **NEW_COPY** keyword is also included in the JCL. A FlashCopy image copy is generated for each table space involved in the load process. Only this option causes a new Db2 image copy to be created.

**Use Flashcopy = N**

A legacy image copy is used.

**GROUP**

Use the **GROUP** keyword to enclose one or more **SPACE** keywords. You can specify multiple **GROUP** keywords in a single job, each holding one or more **SPACE** keywords. An open parenthesis must follow the **GROUP** keyword. Each **GROUP** keyword must contain one or more **SPACE** keywords.

**IDAA_CONSISTENT_LOAD**

Use the IDAA_CONSISTENT_LOAD keyword to refresh the data on the IBM Db2 Analytics Accelerator for z/OS.

This keyword works with the **Use FlashCopy** option to

1. Create a new FlashCopy image copy for a single table or a list of tables that are transactionally consistent.
2. Load the data from the new image copies into the accelerator.
3. Load the data from the consistent image copies into the accelerator.

This keyword works with the TO_CURRENT or TO_QUIESCE control cards to begin with a valid image copy of the object on Db2 and apply log records forward through time up to a specified end point.

**IDAA_LOAD_IC**

Use the IDAA_LOAD_IC keyword to load data on the IBM Db2 Analytics Accelerator for z/OS from an image copy data set (image copy load).

**IMAGE_COPY_PREFERENCE LPLBRPRBFC | IMAGE_COPY_PREFERENCE syscopyrows**

This optional item works with the LOCAL_SITE and RECOVERY_SITE control cards and causes Db2 Analytics Accelerator Loader to use the user-specified scan preference. The SYSCOPY rows output by Db2 Analytics Accelerator Loader are determined by the presence of DD cards in the JCL.

- **IMAGE_COPY_PREFERENCE** uses the user-specified scan preference. This option accepts the following options:
  - LB: Scans for LB type image copies in SYSCOPY.
  - LP: Scans for LP type image copies in SYSCOPY.
  - LPLB: Scans first for LP type image copies, then for LB type image copies (and always uses LP type image copies on identically time-stamped SYSCOPY rows).
  - RBLPLB: Allows the SYSCOPY scan program to pick an RB if it came up first while scanning SYSCOPY backwards for a starting point.
  - LPLBRPRBFC: (Default) Scans for LP, LB, RP, RB and FC type image copies (using the earlier listed image copy type on identically time-stamped SYSCOPY rows).

One to five codes in total can be entered in a packed 10-character maximum field. Valid codes are LP (local primary), LB (local backup), RP (recovery primary), RB (recovery backup), and FC (FlashCopy).

**Notes:**

1. This item is not required for the Db2 Analytics Accelerator Loader to run. If LOCAL_SITE, RECOVERY_SITE, and IMAGE_COPY_PREFERENCE are missing from the control cards, Db2 Analytics Accelerator Loader detects the operating mode Db2 is running under and automatically inserts either LOCAL_SITE, RECOVERY_SITE based on what is in ZPARM.

2. This option sets the mode in which Db2 Analytics Accelerator Loader operates. If LOCAL_SITE is coded, only local site type image copies are scanned for use. If RECOVERY_SITE is coded, only recovery site type image copies are scanned for use. If IMAGE_COPY_PREFERENCE is coded, the user-specified scanning preference is used.

The LOCAL_SITE, RECOVERY_SITE and IMAGE_COPY_PREFERENCE control cards can be specified in the ISPF interface by using the SYSCOPY Scan Operating Mode field on the Load Accelerator with Consistent Data panel:

**SYSCOPY Scan Operating Mode = L**

  LOCAL_SITE

**SYSCOPY Scan Operating Mode = R**

  RECOVERY_SITE
SYSCOPY Scan Operating Mode = Z
omits the LOCAL_SITE, RECOVER_SITE, and IMAGE_COPY_PREFERENCE control cards; uses the value found in the ZPARMs on the Db2

SYSCOPY Scan Operating Mode = U
IMAGE_COPY_PREFERENCE syscopyrowtypes

Note: If U is specified in the SYSCOPY Scan Operating Mode field, you must also specify a syscopyrows value in the SYSCOPY Selection Pref field. The default syscopyrows value is LPLBRPRBFC.

LOCAL_SITE | RECOVERY_SITE
This optional item works with the IMAGE_COPY_PREFERENCE control card and tells Db2 Analytics Accelerator Loader which SYSCOPY rows to consider when finding a starting point for processing. LOCAL_SITE uses the LP/LB rows, RECOVERY_SITE uses the RP/RB rows. The SYSCOPY rows output by Db2 Analytics Accelerator Loader are determined by the presence of DD cards in the JCL.
• LOCAL_SITE is the default setting and it refers to the LP/LB rows to find a starting point for processing. Equal priority is given to LP and LB rows, so if Db2 retrieves the LB row first, that will be used.
• RECOVERY_SITE uses the RP/RB rows to find a starting point for processing. Equal priority is given to RP and RB rows, so if Db2 retrieves the RB row first, that will be used.

Notes:
1. This item is not required for the Db2 Analytics Accelerator Loader to run. If LOCAL_SITE, RECOVERY_SITE, and IMAGE_COPY_PREFERENCE are missing from the control cards, Db2 Analytics Accelerator Loader detects the operating mode Db2 is running under and automatically inserts either LOCAL_SITE, RECOVERY_SITE based on what is in ZPARM.
2. This option sets the mode in which Db2 Analytics Accelerator Loader operates. If LOCAL_SITE is coded, only local site type image copies are scanned for use. If RECOVERY_SITE is coded, only recovery site type image copies are scanned for use. If IMAGE_COPY_PREFERENCE is coded, the user-specified scanning preference is used.

The LOCAL_SITE, RECOVERY_SITE and IMAGE_COPY_PREFERENCE control cards can be specified in the ISPF interface by using the SYSCOPY Scan Operating Mode field on the Load Accelerator with Consistent Data panel:

SYSCOPY Scan Operating Mode = L
LOCAL_SITE

SYSCOPY Scan Operating Mode = R
RECOVERY_SITE

SYSCOPY Scan Operating Mode = Z
omits the LOCAL_SITE, RECOVER_SITE, and IMAGE_COPY_PREFERENCE control cards; uses the value found in the ZPARMs on the Db2

SYSCOPY Scan Operating Mode = U
IMAGE_COPY_PREFERENCE syscopyrows
Note: If U is specified in the SYSCOPY Scan Operating Mode field, you must also specify a syscopyrows value in the SYSCOPY Selection Pref field. The default syscopyrows value is LPLBRPRBFC.

LOG_COPY_PREFERENCE R1R2A1A2 | LOG_COPY_PREFERENCE R1R2A1A2

Specifies the order in which the archive and active log lists in the BSDS are to be scanned when Accelerator Loader searches for a log to satisfy a need for log records. The value that you specify in this field must use the syntax R1 (archive log copy #1), R2 (archive log copy #2), A1 (active log #1), and A2 (active log #2). All four unique values must be specified, even if copy #2 is not used in Db2. For example:

- A1A2R1R2 - Scans the active logs before scanning the archive logs.

Note: Avoid using this setting because Db2 might attempt to open one of the active logs for output that Accelerator Loader is currently reading for input. Such an attempt might result in an open error within Db2.

- R1R2A1A2 - (Default) Scans the archive logs first and uses archive logs when the same range exists in an archive and active log.

The LOG_COPY_PREFERENCE control card can be specified in the ISPF interface by using the Log Reader Copy Preference field on the Load Accelerator with Consistent Data panel:

Log Reader Copy Preference = log_tokens

LOG_COPY_PREFERENCE log_tokens

You can change the default value in the ISPF interface by using the Log Reader Copy Preference field on the Accelerator Loader Parameters panel.

NAME 'table_name'

For an image copy load, specifies the name of the target table that will be loaded in the accelerator.

NEW_COPY

Indicates the name of the new FlashCopy data set template to be used.

The NEW_COPY FCCOPY/DDN (template_name) control card can be specified in the ISPF interface by using the Use FlashCopy DSN Template and Update fields on the Load Accelerator with Consistent Data panel.

NO_SYSLGRNX

Include this option if you want the product to skip reading SYSIBM.SYSLGRNX and read the Db2 log from the earliest object starting point to the latest object end point.

Note: Using this option might result in a significant increase in processing time due to the number of log data sets and log records read and reading the entire Db2 log.

OBID 'source_obid,target_obid'

For an image copy load, used with the OBIDXLAT option to specify the object IDs of the source and target OBIDs. Define multiple OBID pairs as necessary.

OBIDXLAT

Specifies object translation information (DBID / PSID / OBID).
The source translation numbers are first in each pair of numbers. The target numbers are for the identical row structured object into which data is being copied. Define each pair on a new line.

**OBIDXLAT CATALOG**

For an image copy load, instructs the product to collect translation target numbers from the Db2 system on which the operation runs, and populate the output data pages with those numbers.

The product takes the target numbers from the Db2 catalog of the specified object (creator.name), skips the matching process, and treats all row data in the image copy with the target number from the Db2 catalog.

**Note:** This option is valid for an image copy with only one table. If the option is specified for a multi-table image copy, or if the catalog indicates that the number of tables in the table space is greater than one, an error results. For a multi-table image copy, specify the OBIDXLAT option, along with DBID, PSID, and OBID.

**PARALLEL 'x,y'**

Indicates the number of parallel log read and log apply tasks that can run where:

- **x** (Default 0) The number of parallel log read tasks. Valid values are integers, 0-16. Specifying a value of 0 for x means that a maximum of one task per data sharing group member will run at the same time. If a nonzero value is specified for x, then that number is the maximum number of parallel tasks that can run at the same time for the log read component. If there are more logs to read than the number of parallel tasks that were specified for x, a task to read each remaining log is started as soon as a running task finishes and until all necessary logs have been read.

- **y** (Default 1)
  
The number of parallel log apply tasks. Valid values are integers, 1-10. If a value greater than 1 is specified, and there is a single GROUP(...) control card structure present, the Db2 Analytics Accelerator Loader batch process clusters and reorders partitioned objects to distribute the objects into the specified number of tasks, and load the partitions in parallel. If there are multiple GROUP(...) control card structures present, the y value is ignored, and each GROUP is assigned its own parallel task.

When partition-level image copies are on tape, and the value of y is greater than 1, the following conditions apply:

- If each image copy is on a different volume sequence, the specified number of parallel tasks will be used for log apply processing.
- If all image copies are stacked on the same volume sequence, only one log apply task will be performed.

The PARALLEL control card can be specified in the ISPF interface by using the Number of PARALLEL log read and Number of PARALLEL log apply fields on the Load Accelerator with Consistent Data panel:

**Number of PARALLEL log read = x**

**Number of PARALLEL log apply = y**

**PARALLEL 'x,y'**
The default value for the batch option is 1. However, the default value of the **Number of PARALLEL log apply** field on the Load Accelerator with Consistent Data panel is 4.

**PSID 'source_psid,target_dbid'**
For an image copy load, used with the OBIDXLAT option to specify the pageset IDs of the source and target PSIDs. (The source ID is only needed if the image copy is for a table space with multiple tables.)

**TARGET_CREATOR**
**TARGET_NAME**
The creator and name of the table that is to be loaded. If one value is specified, then both values must be specified to identify the target table.

**TARGET_SSID target_table_ssid**
The four-character Db2 subsystem ID that contains the table that is to be loaded. The TARGET_SSID (if specified) must be on the same LPAR as the SSID on which the source table resides.

**TEMPLATE**
**NAME template_name**
**DSN template_dsn**
Used to define templates that are to be used with FCCOPYDDN to specify the Flash Copy image copy data set. You can specify one or more templates.

**TOLOGPOINT byte_string**
**TOLOGPOINT byte_string** directs Db2 Analytics Accelerator Loader to read the log and to incorporate data into the image copy up to the specified log point. Replace *byte_string* with the actual log point value.

**TOLOGPOINT** is valid for both non-data sharing and data sharing runs. If **TOLOGPOINT** is used, the value will be accepted as an RBA in non-data sharing and an LRSN in data sharing.

**TO_CURRENT | TO_QUIESCE | TOLOGPOINT byte_string | END_RBA**
**byte_string | END_LRSN byte_string | TO_TIMESTAMP timestamp |**
**TO_TIMESTAMP_LOCAL timestamp**
This required choice enables you to specify the point up to which you want to make the image copy.

**Note:** Db2 Analytics Accelerator Loader enables you to specify an end point (RBA/LRSN) from SYSCOPY (START_RBA) that is of ICTYPE “Y”, “S”, or “W”.

The **TO_CURRENT** and **TO_QUIESCE** control cards can be specified in the ISPF interface by using the **Load time** field on the Load Accelerator with Consistent Data panel:

**Load time = C**
**TO_CURRENT**

**Load time = Q**
**TO_QUIESCE**

**TO_CURRENT**
Reads the log and incorporates data into the image copy up to the current point in time, which is the end of the log file.
The TO_CURRENT control card can be specified in the ISPF interface by using the Load time field on the Load Accelerator with Consistent Data panel:

\[
\text{Load time} = \text{C}
\]

TO_IC ‘image_copy_dsn’

Specifies the source image copy data set. The source data set and its associated image copy can be on the same or different Db2 subsystems. The source image copy can be a data set that you constructed, for example, from a SELECT against the SYSCOPY table on the source Db2 subsystem.

The source image copy cannot be a FlashCopy image copy.

TO_IC_INLINE

Specifies that the origin type of the input image copy is inline and is not retrieved from a SYSCOPY row. This keyword is required when the input image copy is an inline image copy created by the REORG or LOAD utility or is an image copy of a compressed object. When using these types of image copies as input, the data set name is specified directly in the TO_IC parameter instead of retrieved from a SYSCOPY row. By specifying this keyword, a sort will be performed on the specified input image copy. The determination of whether a sort is needed is made automatically by SYSCOPY row analysis; however, when the image copy data set name is specified directly, the image copy origin type must also be supplied.

TO_QUIESCE

Reads the log and incorporates data into the image copy up to the previous quiesce point.

The TO_QUIESCE control card can be specified in the ISPF interface by using the Load time field on the Load Accelerator with Consistent Data panel.

\[
\text{Load time} = \text{Q}
\]

TO_TIMESTAMP \( \text{timestamp} \)  | TO_TIMESTAMP_LOCAL \( \text{timestamp} \)

TO_TIMESTAMP\(\text{byte_string}\) directs Db2 Analytics Accelerator Loader to read the log and to incorporate data into the image copy up to the specified timestamp. Replace \(\text{byte_string}\) with the timestamp value.

Note: Timestamps are always handled in GMT/Universal time internally. If a local timestamp is presented to the process, it must conditionally be converted to GMT/Universal. TO_TIMESTAMP is a GMT/Universal timestamp (no conversion necessary), while TO_TIMESTAMP_LOCAL is a local time zone timestamp that must be converted to GMT/Universal. The time zone in which the machine operates is given at IPL time, so no user input is required for the conversion from local to GMT/Universal.

The TO_TIMESTAMP control card can be specified in the ISPF interface by using the Timestamp end point and Time zone of timestamp fields on the Load Accelerator with Consistent Data panel:

USER_INDICATOR xxx

Specifies a group of control file records for operation. The startup CLIST supplies the value for the USER_INDICATOR control card.

Notes:
1. If a USER_INDICATOR value is supplied in the batch job, a control file that has been loaded with set-up information will be necessary.

The USER_INDICATOR control card cannot be specified in the ISPF interface. The startup CLIST supplies the value for the USER_INDICATOR control card.

**USE_ABOVE_THE_BAR 'primary,secondary,count'**

Allows the use of above-the-bar memory and specifies the number of primary, secondary, and maximum segments to be allocated:

- primary - The number of segments (megabytes) of above-the-bar storage obtained initially.
- secondary - The number of segments (megabytes) of above-the-bar storage obtained when the primary segments are used up.
- count - The limit placed on the total number of segments that can be obtained. This limit stops runaway getmains by failing if the limit is reached.

---

### Loading from an external file

Accelerator Loader provides options for the Db2 LOAD utility to enhance load processing for Analytics Accelerator. These options are in addition to those that the native Db2 LOAD utility provides. The options manipulate the data in the input records for the LOAD utility before the data is loaded.

Before you build and run a job that loads from an external file, review all reference and conceptual information for the feature, including the correct syntax, usage considerations, and examples. Also ensure that you have completed the following tasks:

- In the DSNUTILB intercept policy for the Accelerator Loader started task that you will use for implementing the LOAD options, verify that the correct Db2 subsystem is specified. Use the `<DB2SYSTEM>` element within the `<POLICY>` section to specify the subsystem on which you want the enhanced LOAD processing to occur.
- In the LOAD utility statement, add the Accelerator Loader options that you want to use.
- Ensure that the DSNUTILB intercept status is enabled. To display the intercept status, issue the `DISPLAY INTERCEPT` command from the z/OS console. If the intercept is disabled, activate it by using the `ACTIVATE INTERCEPT` command.
- Ensure that the batch utility JCL contains the DD statement `HLO//DUMMY DD DUMMY`.

#### Example JCL: Loading from an external file

**Example: Nonparallel load**

The following figure contains example JCL to load data to both the accelerator and Db2 from an external file.
//JOB     JOB USER01,CLASS=A,MSGCLASS=X,MSGLEVEL=(1,1),
// USER=&SYSUID,NOTIFY=&SYSUID

Example: High availability, parallel load sample utility statement

```
LOAD DATA REPLACE
  IDAA_DUAL ON RA1BACC1, RABAS05
  ACCEL_LOAD_TASKS 2
  LOG NO
  INTO TABLE EXMTSTDB.PTB1
    PART 1 INDDN SYSR01
    NUMRECS 2000000
    ( INT_1 POSITION( 00001:00010 ) INTEGER EXTERNAL(10)
      ,CHAR_2 POSITION( 00020:00025 ) CHAR
    )
  INTO TABLE EXMTSTDB.PTB1
    PART 2 INDDN SYSR02
    NUMRECS 2000000
    ( INT_1 POSITION( 00001:00010 ) INTEGER EXTERNAL(10)
      ,CHAR_2 POSITION( 00020:00025 ) CHAR
    )
```

Figure 25. Db2 LOAD utility statement to perform a parallel load to multiple accelerators

Example: Load using input file in delimited file format

Accelerator Loader supports the standard Db2 LOAD FORMAT DELIMITED option in the control cards for Dual and Accelerator-only loads. The following example loads a Unicode data file that uses a comma (,) for the column delimiter, a double quotation mark ("), for the character string delimiter, and a period (.) for the decimal point delimiter:

```
LOAD DATA
  IDAA_DUAL ON QB1AACC1
  ACCEL_ON_SUCCESS_ENABLE NO
  INDDN 'SYSREC'
  REPLACE
  KEEPDICTIONARY
  SORTDEVT SYSALLDA SORTNUM 4
  FORMAT DELIMITED
  COLDEL X'2C'
  CHARDEL X'22'
  DECPT X'2E'
  UNICODE
  DISCARDON ISYSDISC
  ERRDON ISYSERR
  MAPDON ISYSMAP
  WORKDON(ISYSUT1,ISORTOUT)
  INTO TABLE
    "USER1"."EMP"
```

Example: Creating a backup using an inline copy

An inline copy is a backup copy of an accelerator table that is created as the data is loaded to the accelerator. This method uses an Accelerator Loader accelerator only load, as follows:

- During a LOAD REPLACE, a full copy is created.
- During a LOAD RESUME, an incremental copy is created.

To use this method, you can generate JCL using an Accelerator only profile and include values for Inline copy data sets options. The following example JCL shows an accelerator only load that includes options for an inline copy to four copy data sets.
The following example JCL shows an accelerator only load that includes options for an inline copy to four copy data sets.

Figure 26. Db2 LOAD utility statement to create a backup using an inline copy

Example: Recovering accelerator table data

To recover accelerator table data, use option Recover Accelerator table(s) from a backup from the main menu to create a new Recovery profile, from which you can generate recovery JCL. If multiple tables are selected, the generated JCL will include multiple Load steps, one for each table.

Important: Manually generating recovery JCL is not recommended. The highly recommended procedure for generating recovery JCL is to use the ISPF interface. See "Using the ISPF interface to recover accelerator data" on page 297.

Because this is a load from FORMAT INTERNAL SYSREC datasets, no field specifications are needed.
Example: Using a discard data set when loading only the accelerator

To use a discard data set when loading only the accelerator with a SYSREC data set, you must manually update your JCL to include the following items:

- A DD statement that specifies the discard data set, and the DISCARDDN keyword that specifies the DDNAME
- Optionally, the DISCARDS keyword

The following example shows sample JCL:

```plaintext
//HLQ00100 EXEC PGM=DSNUTILB,
//      REGION=0000M,
//      PARM=('UBIA')
//STEPLIB DD DISP=SHR,DSN=HLQ.PROD00010.LOADLIB
//      DD DISP=SHR,DSN=UBIA.SDSNEXIT
//      DD DISP=SHR,DSN=QNS.VB10.SDSNLOAD
//ISRECAAA DD DSN=USER1.HLO.LP,DISP=SHR
//HLQDUMMY DD DUMMY
//SYSPRINT DD SYSOUT**
//UTPRINT DD SYSOUT**
//SYSIN DD *
LOAD DATA INDDN ISRECAAA
   REPLACE
   IDAA_ONLY ON UBIAACC1
   LOG NO NOCOPYPEND
   ACCEL_REMOVE_AND_ADD_TABLES
   ACCEL_ON_SUCCESS_ENABLE NO
   FORMAT INTERNAL
   INTO TABLE
   USER1.TSTTBL
/*

Figure 27. Db2 LOAD utility statement to recover accelerator table data

Chapter 11. Syntax 347
INTO TABLE "AASRC1"."EMPPROJACT"
/*
//*

Customizing the example JCL to load from an external file

The following steps describe the changes that you must make to your existing LOAD JCL to match the example JCL. Steps are required unless otherwise noted.

Procedure
1. Enter a valid job card for your site.
2. Change the STEPLIB DD data set file names to point to the Db2 Analytics Accelerator Loader program library. If you did not copy module DSNUTILF from the product library into your Db2 load library, then this step is required.
3. Specify the SYSREC file and the SYSPUNCH file.

   Note: The SYSPUNCH file is required unless you put the LOAD utility statement into the SYSIN DD in-stream.
4. If the SYSPUNCH DD will be used instead of the control cards that are supplied in-stream, then you must edit the syntax to include the required parameter.
5. If the LOAD control cards are supplied in the JCL in-stream, then after the LOAD DATA parameter, add one of the following extended syntax options:
   • To load data into only the accelerator:
     IDAA_ONLY ON accelerator_name
   • To load data into both the accelerator and Db2:
     IDAA_DUAL ON accelerator_name
6. Add the following DD statement to the JCL:
   //HLODUMMY DD DUMMY
7. Specify a data set or * for the SYSPRINT.
8. Modify the LOAD utility syntax as needed for your site.

Syntax diagram: Load from an external file

The following syntax diagram illustrates how to construct valid Db2 Analytics Accelerator Loader syntax for a load from external job.

The syntax of the Db2 Analytics Accelerator Loader load from external control cards is as follows.
ignore-spec:

Chapter 11. Syntax  349
Syntax definitions: Load from an external file

Db2 Analytics Accelerator Loader supports the following syntax elements (presented alphabetically) when you are loading data from an external file.

**ACCEL_ADD_TABLES** | **ACCEL_REMOVE_AND_ADD_TABLES**
Indicates whether to add missing tables to the accelerator before starting the load job. Specify one of the following options:

**ACCEL_ADD_TABLES**
Add missing tables to the accelerator before starting the load job.

**ACCEL_REMOVE_AND_ADD_TABLES**
Remove and re-add existing tables to the accelerator before starting the load job. This option does not preserve distribution and organizing keys on the accelerator; however, a table that was enabled for replication before will be enabled for replication again.

If you omit this option, missing tables are not added to the accelerator.

This option can be specified in the ISPF interface by using the Add table to Accelerator field on the Load Accelerator(s) and Db2 from External File panel or the Load Accelerator(s) from External File panel.

**ACCEL_COPYDDN hlocpylp_ddname,hlocpylb_ddname**
Specifies the DD names for the backup data sets for the local site. *hlocpylp_ddname* is the DD name for local site primary copy data set, and *hlocpylb_ddname* is the DD name for the local site backup copy data set. This option is needed only when local site copies are being created.

The default DD names that are generated in the JCL are HLOCOPYLP and HLOCOPYLB; however, you can use any value for your DD names as long as they match a DD name in the JCL.

**ACCEL_LOAD_TASKS integer**
Specifies the number of partitions to load into the accelerator and optionally into Db2 in parallel when loading from an external file. Valid values are in the range 1 - 20.

This value should not exceed the value of the IBM Db2 Analytics Accelerator for z/OS parameter **AQT_MAX_UNLOAD_IN_PARALLEL**, which indicates the maximum number of partitions that can be loaded in parallel. If **AQT_MAX_UNLOAD_IN_PARALLEL** is set to 2, the maximum number of partitions that can be written to the accelerator at one time is 2, regardless of the value that you specify for this parameter.

Specify a value for NUMRECS also. For more information, see the description of the NUMRECS option.

The default value is 4.

The corresponding Tools Customizer option is **Parallel load tasks**.

This option can be specified in the ISPF interface by using the Load tasks field on the Load Accelerator(s) and Db2 from External File panel or the Load Accelerator(s) from External File panel.

**Note:** When using Analytics Accelerator V7.1.1 or earlier, to use parallelism in Accelerator Loader, you must have the WLM environment that runs DSNUTILU configured for WLM management of the DSNUTILU server address space, which allows multiple DSNUTILU server address spaces to be started as needed per system. If you have configured your
WLM environment that runs the DSNUTILU stored procedure to run as a single address space, you must set this value to 1, which disables parallelism.

**ACCEL_ON_SUCCESS_ENABLE YES | NO**
Controls whether query acceleration is enabled for the table after a successful load. If Db2 discards any rows during the load, query acceleration is not enabled. Valid values are YES and NO.

This option can be specified in the ISPF interface by using the Enable acceleration on success field on the Load Accelerator(s) and Db2 from External File panel or the Load Accelerator(s) from External File panel.

**ACCEL_OPTIMIZE_FOR BEST_ELAPSED_TIME | BEST_CPU_TIME**

Note: This parameter applies to the following cases:
- Loads that use a Dual load profile or the IDAA_DUAL extended syntax option
- Nonparallel processing
- Loads to tables that are not partitioned or are partitioned by growth

Specifies whether to optimize the load for elapsed time or for CPU consumption. Valid values are:
- BEST_ELAPSED_TIME: Reduces elapsed time.
- BEST_CPU_TIME: Reduces CPU consumption.

**ACCEL_RECOVERYDDN hlocpyrp_ddname,hlocpyrb_ddname**
Specifies the DD names for the backup data sets for the remote recovery site. hlocpyrp_ddname is the DD name for the recovery site primary copy data set, and hlocpyrb_ddname is the DD name for the recovery site backup copy data set. This option is needed only when recovery site copies are being created.

The default DD names that are generated in the JCL are HLOCPYRP and HLOCPYRB; however, you can use any value for your DD names as long as they match a DD name in the JCL.

**ACCEL_ROWS_REPORT_THRESHOLD integer**
Specifies the threshold (in rows) to use when reporting the number of rows that have been loaded for the job. Message "HLOU5062I" on page 714, which includes the cumulative number of rows loaded for the job, is issued to the Accelerator Loader job SYSPRINT each time the threshold value is met. Note that the message will be issued when the threshold is exceeded but will contain the current row count in the loading process, which might be more than the value specified. Valid values are integers in the range 0 - 2147483647. A value of 0 specifies that no reporting messages will be issued.

This setting overrides the value for the global parameter Report loaded rows threshold that is set using Tools Customizer. If the ACCEL_ROWS_REPORT_THRESHOLD parameter is not included in the job syntax, the global value set using Tools Customizer applies.

**ACCEL_SKIP_DB2_REPLACE**
When loading to the accelerator only and using the REPLACE option (IDAA_ONLY REPLACE), this option specifies that existing rows are not deleted from the Db2 table and data is loaded to the accelerator-shadow
table only, replacing all data in the accelerator-shadow table. This option is valid only when used with the IDAA_ONLY option; it is ignored when used with the IDAA_DUAL option.

ASCII Specifies that the format of the SYSREC data set is ASCII.

CCSID (integer, integer, integer) Specifies up to three coded character set identifiers (CCSIDs) for the input file. The first value specifies the CCSID for single-byte character set (SBCS) SYSREC data, the second value specifies the CCSID for mixed SYSREC data, and the third value specifies the CCSID for double-byte character set (DBCSC) data. If any of the three CCSIDs are omitted or specified as 0, the CCSID of the corresponding data type is assumed to be the same as the installation default. For example, if EBCDIC was specified, the omitted CCSIDs are assumed to be the EBCDIC installation default CCSIDs.

DATA Specifies that data is to be loaded. This keyword is optional and is used for clarity only.

DISCARDDN ddname Specifies the data set to be used for discarding data rows.

When loading the accelerator and Db2, specify the template name for the discard data set. This option can be specified in the ISPF interface by using the DISCARDDN template DD name field on the Load Accelerator(s) and Db2 from External File panel.

When loading the accelerator only, specify the DD name to be used for the discard data set. This option can be specified in the ISPF interface by using the DISCARDDN name and DISCARDDN DSN fields on the Load Accelerator(s) from External File panel.

Note: When loading the accelerator only, the discard data set cannot be a TEMPLATE.

DISCARDS integer Specifies the maximum number of source records that are to be written on the discard data set. integer can range from 0 to 2147483647. This keyword is valid only when used with a discard data set. If the discard maximum is reached, the load abnormally terminates, the discard data set is empty, and you cannot see which records were discarded. You can either restart the job with a larger limit, or terminate the utility.

DISCARDS 0 specifies that you do not want to set a maximum value. The entire input data set can be discarded. The default value is 0.

This option can be specified in the ISPF interface by using the DISCARDS field on the Load Accelerator(s) and Db2 from External File panel or the Load Accelerator(s) from External File panel.

EBCDIC (default) Specifies that the format of the SYSREC data set is EBCDIC.

ENFORCE YES | NO Specifies whether to enforce check constraints and referential constraints. Valid only with IDAA_DUAL ON accelerator_name. ENFORCE YES requires MAPDDN.

This option can be specified in the ISPF interface by using the ENFORCE field on the Load Accelerator(s) and Db2 from External File panel.
ERRDDN ddname
Specifies the template or DD name for an error processing data set. This data set is required with the ENFORCE option.

This option can be specified in the ISPF interface by using ERRDDN template DD name field on the Load Accelerator(s) and Db2 from External File panel.

FORMAT
Identifies the format of the SYSREC input data.

INTERNAL
Specifies that the input data is in Db2 internal format

DELIMITED
Specifies that the input data is in a delimited format. The following parameters specify the delimiters that are used in the input file and can be specified as either a single-byte quoted character or as a two-digit hexadecimal value:

COLDEL coldel
   Specifies the column delimiter. The default value is a comma (,).

CHARDEL chardel
   Specifies the character string delimiter. The default value is a double quotation mark (").

DECPT decpt
   Specifies the decimal point character. The default value is a period (.).

These options can be specified in the ISPF interface by using the Load Accelerator(s) and Db2 from External File panel or Load Accelerator(s) from External File panel.

IDAA_DUAL ON accelerator_group_name,accelerator_name
Indicates that you want to load data to up to four accelerators, and also to Db2. Specify one accelerator group name, or up to four individual accelerator names, separating each accelerator name with a comma.

You can specify this option and the accelerators to load by using the Load Accelerator(s) and Db2 from External File panel in the ISPF interface.

IDAA_ONLY ON accelerator_group_name,accelerator_name
Indicates that you want to load data to up to four accelerators, and do not want to load to Db2. Specify one accelerator group name, or up to four individual accelerator names, separating each accelerator name with a comma. If the load job specifies LOAD REPLACE, existing data in the Db2 table or partition is deleted.

You can specify this option and the accelerators to load by using the Load Accelerator(s) from External File panel in the ISPF interface.

IGNORE
Specifies that the load ignores records that it rejects for the specified reasons. If discarding is specified, no ignored rows are loaded or written to the DISCARD data set. If discarding is not specified, ignored records do not cause the load to terminate.
WHEN
Specifies that records that do not satisfy the WHEN clause are ignored.

PART
Specifies that records that do not satisfy any partition being loaded are ignored.

CONV
Specifies that records that cause a conversion error are ignored.

Multiple reasons can be combined in the IGNORE clause, such as in the following example:
IGNORE(WHEN, PART, CONV)

Ignored discards are not written to the discard data set and do not count towards the discard limit. No record-level messages are generated for ignored discards. Record-level messages are written for each non-ignored discard. These messages identify the record number and describe why it was discarded. To avoid flooding the spool with these record-level messages, only the first 1000 non-ignored discards are reported in this way.

Note: IGNORE settings VALPROC, IDERROR, and DUPKEY are ignored by Accelerator Loader and passed to the Db2 LOAD utility.

INDDN ddname
Include this control card in the LOAD utility command to specify the fully qualified data set name of the SYSREC data set or template that contains the data to be loaded. If the data set is a PDS, the member name is required.

The TEMPLATE ISYSREC sysrec.file.name statement and INDDN ISYSREC control card can be specified in the ISPF interface by using the Data set field under Input File Options on the Load Accelerator(s) and Db2 from External File panel or the Load Accelerator(s) from External File panel.

KEEPDICTIONARY
Indicates whether the LOAD utility is to build a new compression dictionary.

This option can be specified in the ISPF interface by using KEEPDICTIONARY=Yes on the Load Accelerator(s) and Db2 from External File panel.

LOG YES | NO | NO NOCOPYPEND
Indicates whether logging is to occur.

This option can be specified in the ISPF interface by using the LOG field on the Load Accelerator(s) and Db2 from External File panel.

MAPDDN ddname
Specifies the template or DD name for a map data set to be used for record processing. This data set is required with the ENFORCE option.

This option can be specified in the ISPF interface by using the MAPDDN template DD name field Load Accelerator(s) and Db2 from External File panel.

NUMRECS integer
Specifies the number of input records for the specified table or table partition. Valid values are integers between 1 and 109951627776, or blank.
If the LOAD utility statement does not provide the number of SYSREC records with a NUMRECS or a SORTKEYS clause, the product estimates the record count. Using the estimated record count, it then adds a NUMRECS clause for each INTO TABLE clause. The record count enables Db2 to size index-build sorts, and reduces the possibility of sort failures when loading to both the accelerator and Db2.

If the LOAD utility statement does not provide the number of SYSREC records with a NUMRECS or a SORTKEYS clause, the product estimates the record count. Using the estimated record count, it then adds a NUMRECS clause for each INTO TABLE clause. The record count enables Db2 to size index-build sorts, and reduces the possibility of sort failures when loading to both the accelerator and Db2.

This option can be specified in the ISPF interface by using the NUMRECS field on the Load Accelerator(s) and Db2 from External File panel.

NOSUBS

Controls whether Accelerator Loader accepts substitution characters. When converting from one character set to another, it is possible that a character in the source CCSID has no representation in the target CCSID. When this happens, a substitution character is placed in the converted string. When NOSUBS is specified, conversions that require the substitution character cause the SYREC record to be discarded.

REPLACE | RESUME YES

Indicates whether records are to be appended or replaced when loading data.

Note: The default behavior of the Accelerator Loader RESUME option is not the same as the Db2 LOAD utility RESUME option. Accelerator Loader does not check for rows in the accelerator table prior to the load and will successfully load the accelerator-shadow table even if the table is empty.

Specify one of the following control cards in your JCL:

REPLACE

Accelerator Loader replaces existing data rather than appending it.

- When loading to only the accelerator (IDAA_ONLY), existing rows will be deleted from the Db2 table and data is loaded to the accelerator-shadow table only.
- When loading to both Db2 and the accelerator (IDAA_DUAL), existing rows will be deleted from the Db2 table and data is loaded to both the Db2 and accelerator-shadow tables.

RESUME YES

Accelerator Loader appends data to the accelerator table rather than replacing it.

- When loading to only the accelerator (IDAA_ONLY), the Db2 table is left as is and data is appended to the accelerator-shadow table.
- When loading to both Db2 and the accelerator (IDAA_DUAL), data is appended to both the Db2 table and the accelerator-shadow table.

If you specify neither RESUME nor REPLACE in your JCL, Accelerator Loader will run as if RESUME NO would have been specified.

Note:
When using the Accelerator Loader ISPF interface to specify load options, you use the RESUME field on the Load Accelerator(s) and Db2 from External File panel or the Load Accelerator(s) from External File panel to specify this option. The following are valid values for the RESUME field on these panels:

**YES** Generates the control card RESUME YES into the JCL.

**NO** Generates the control card REPLACE into the JCL. Note that RESUME NO is not generated by the Accelerator Loader ISPF interface into the JCL.

**SORTDEVT** `device_type`

Specifies the device type to be used for temporary sort data sets. Valid values are 1 - 8 alphanumeric characters. Valid only with IDAA_DUAL ON.

This option can be specified in the ISPF interface by using the SORTDEVT field on the Load Accelerator(s) and Db2 from External File panel.

**SORTNUM** `integer`

Specifies the number of sort data sets that are to be allocated. Valid values are 2 - 255. Valid only with IDAA_DUAL ON.

This option can be specified in the ISPF interface by using the SORTNUM field on the Load Accelerator(s) and Db2 from External File panel.

**UNICODE**

Specifies that the format of the SYSREC data set is UNICODE.

**EBCDIC**

(default) Specifies that the format of the SYSREC data set is EBCDIC.

**WORKDDN** `(ddname1,ddname2)`

Specifies the DD statements for the temporary work file for sort input and sort output. Temporary work files for sort input and output are required if the LOAD involves tables with indexes.

`ddname1` is the DD name for the temporary work file for sort input. The default value is ISYSUT1. This option can be specified in the ISPF interface by using the SYSUT1 template DD name field on the Load Accelerator(s) and Db2 from External File panel or the Load Accelerator(s) from External File panel.

`ddname2` is the DD name for the temporary work file for sort output. The default value is ISORTOUT. This option can be specified in the ISPF interface by using the SORTOUT template DD name field on the Load Accelerator(s) and Db2 from External File panel.

---

**Loading data to multiple accelerators**

Before you build and run a job that loads data to up to four accelerators (high availability load), review all reference and conceptual information for the feature, including the correct syntax, usage considerations, and examples.

Load existing Db2 table data to up to four paired accelerator tables. Each accelerator table must be configured on a different accelerator. The HALOAD utility runs as a batch job and is not invoked under the control of the DSNUTILB LOAD utility.
Example JCL: Loading Db2 table data to multiple accelerators (HALOAD)

The following sample syntax shows the HALOAD command, used to perform a high availability load.

Example: Loading Db2 table data to multiple accelerators

Requirements are as follows:
- The HLOUHALO program must be specified on the EXEC card.
- The HALOAD ACCEL control card must be present in the utility syntax instead of LOAD DATA.
- The Db2 SSID must be passed on the PARM card.
- The Db2 load library and the product load library must be included on the STEPLIB or JOBLIB.
- REGION=0M must be specified on the JOB card or the EXEC card.

```
//HLOUHALO JOB ,SAMPLE HALOAD',CLASS=A,MSGCLASS=X,
// REGION=0M,NOTIFY=&SYSUID
//*
//HLOUHALO EXEC PGM=HLOUHALO,PARM='DSNA'
//STEPLIB DD DISP=SHR,DSN=HLO.PRD0210.SHLOLOAD
// DD DISP=SHR,DSN=DSN.VA10.SDSNLOAD
//*
//HLODUMMY DD DUMMY
//SYSPRINT DD SYSOUT=* 
//*
//SYSIN DD * 
HALOAD ACCEL (IDAAS01, IDAAS05)
 FROM TABLE
  HL0TEST.TABLE01
  , HL0TEST.TABLE02
  PART(1,3,9,12:15)
 ACCEL_REMOVE_AND_ADD_TABLES
 ACCEL_ON_SUCCESS_ENABLE YES
 ACCEL_LOAD_TASKS 5
/*
```

Example: Load to the accelerator only those tables that have changed

The following sample syntax includes the DETECT_DATA_CHANGES keyword. Accelerator Loader will load to the accelerator only those tables in the FROM TABLE clause that have changed in Db2 since the last load.

```
HALOAD ACCEL (QBIAACC1)
 FROM TABLE
  USER1.ACT
  ,USER1.DEPT
  ,USER1.EMP
  ,USER1.EMPPROJACT
  ,USER1.PROJ
  ,USER1.PROJACT
 ACCEL_ON_SUCCESS_ENABLE NO
 ACCEL_LOAD_TASKS 1
 ACCEL_LOCKMODE NONE
 DETECT_DATA_CHANGES
```
Syntax diagram: Loading multiple accelerators

Review syntax for a job that loads Db2 table data to up to four accelerators.

```
HALOAD ACCEL (accelerator_group_name) FROM table-spec

lockmode-spec

ACCEL_REMOVE_AND_ADD_TABLES
ACCEL_ADD_TABLES

ACCEL_ON_SUCCESS_ENABLE YES
ACCEL_LOAD_TASKS integer

DETECT_DATA_CHANGES
ACCEL_ROWS_REPORT_THRESHOLD integer
```

```
TABLE table_names part-spec
```

Part spec:
```
PART (partitions)
```

Lockmode spec:
```
ACCEL_LOCKMODE NONE
```

Syntax definitions: Loading multiple accelerators

Db2 Analytics Accelerator Loader supports the following syntax elements (presented alphabetically) when you are loading multiple accelerators.

ACCEL (accelerator_group_name) | (accelerator_name,accelerator_name)

Specifies the accelerators to load. Specify one accelerator group name, or up to four individual accelerator names, separating each accelerator name with a comma.

You can specify the accelerators to load by using the Accelerator(s) field on the Load Accelerator(s) from Db2 Table(s) panel in the ISPF interface.
ACCEL_ADD_TABLES
Add missing tables to the accelerator before starting the load job.
This option can be specified in the ISPF interface by using the Add table to Accelerator field on the Load Accelerator(s) and Db2 from External File panel or the Load Accelerator(s) from External File panel.

ACCEL_LOAD_TASKS integer
Specifies the number of partitions to load into the accelerator and optionally into Db2 in parallel when loading from an external file. Valid values are in the range 1 - 20.
This value should not exceed the value of the IBM Db2 Analytics Accelerator for z/OS parameter AQT_MAX_UNLOAD_IN_PARALLEL, which indicates the maximum number of partitions that can be loaded in parallel. If AQT_MAX_UNLOAD_IN_PARALLEL is set to 2, the maximum number of partitions that can be written to the accelerator at one time is 2, regardless of the value that you specify for this parameter.
Specify a value for NUMRECS also. For more information, see the description of the NUMRECS option.
The default value is 1.
This option can be specified in the ISPF interface by using the Load tasks field on the Load Accelerator(s) and Db2 from External File panel or the Load Accelerator(s) from External File panel.

Note: When using Analytics Accelerator V7.1.1 or earlier, to use parallelism in Accelerator Loader, you must have the WLM environment that runs DSNUTILU configured for WLM management of the DSNUTILU server address space, which allows multiple DSNUTILU server address spaces to be started as needed per system. If you have configured your WLM environment that runs the DSNUTILU stored procedure to run as a single address space, you must set this value to 1, which disables parallelism.

ACCEL_LOCKMODE
Specifies the protection level while tables on an accelerator are being loaded. The protection level ensures a consistent state of the data with respect to the specified entity. The lock mode that you specify is passed to the ACCEL_LOAD_TABLES stored procedure call. If the target table is enabled for replication, lock mode of ROW is required.
Valid value are:
• NONE: (Default) No locking at all. However, only committed data is loaded into the table because the Db2 data is unloaded with isolation level CS and SKIP LOCKED DATA.
• TABLE: Protects just the table that is currently being loaded.
• TABLESET: Protects all tables to be loaded against changes during the load operation.
• PARTITIONS: Protects the table space partition containing that part of the table that is currently being loaded. With this setting, an unpartitioned table is always locked completely.
• ROW: Protects just the row or page that is being loaded against updates. Db2 data is unloaded with isolation level CS, but in contrast to lock mode NONE, rows locked by an application are not skipped. It is the recommended choice for loads in connection with continuous incremental updates.
Note: Consider the implications of using this lock mode, especially in connection with incrementally updated tables. You can safely use it if you have enabled continuous incremental updates. For more information, see the information about enabling continuous incremental updates in the documentation for the IBM Db2 Analytics Accelerator for z/OS product.

**ACCEL_ON_SUCCESS_ENABLE** YES | NO

Controls whether query acceleration is enabled for the table after a successful load. If Db2 discards any rows during the load, query acceleration is not enabled. Valid values are YES and NO.

This option can be specified in the ISPF interface by using the Enable acceleration on success field on the Load Accelerator(s) and Db2 from External File panel or the Load Accelerator(s) from External File panel.

**ACCEL_REMOVE_AND_ADD_TABLES**

Remove and re-add existing tables to the accelerator before starting the load job. This option does not preserve distribution and organizing keys on the accelerator; however, a table that was enabled for replication before will be enabled for replication again.

This option can be specified in the ISPF interface by using the Add table to Accelerator field on the Load Accelerator(s) and Db2 from External File panel or the Load Accelerator(s) from External File panel.

**ACCEL_ROWS_REPORT_THRESHOLD** integer

Specifies the threshold (in rows) to use when reporting the number of rows that have been loaded for the job. Message "HLOU5062I" on page 714, which includes the cumulative number of rows loaded for the job, is issued to the Accelerator Loader job SYSPRINT each time the threshold value is met. Note that the message will be issued when the threshold is exceeded but will contain the current row count in the loading process, which might be more than the value specified. Valid values are integers in the range 0 - 2147483647. A value of 0 specifies that no reporting messages will be issued.

This setting overrides the value for the global parameter Report loaded rows threshold that is set using Tools Customizer. If the ACCEL_ROWS_REPORT_THRESHOLD parameter is not included in the job syntax, the global value set using Tools Customizer applies.

**DETECT_DATA_CHANGES**

Controls whether to load only those tables and partitions that have changed in Db2 since the last load into the accelerator. When this option is specified, load only the tables listed in the FROM TABLE clause that have changed in Db2 since the last load. In the case of partitioned tables, any partition lists specified on the command are ignored; HALOAD determines which partitions to reload. When this option is omitted, load all specified tables and partitions.

This option updates the REFRESH_TIME (in SYSACCEL.SYSACCELERATEDTABLES) of all tables specified. This is true even when a table is not loaded because of the detectChanges="DATA" option.

This control card can be chosen in the ISPF interface by using the Detect data changes field on the Load Accelerator(s) from Db2 Tables(s) panel.
HALOAD
Use the HALOAD keyword to load one to four accelerators from one or more Db2 tables by using the HALOAD utility.

PART (partition)
When using the HALOAD command, specify partitions as follows:
- Enclose partition numbers in parentheses.
- Specify each partition number by its one- to four-character physical partition number.
- Separate individual partition numbers by commas (,).
  Example, (1, 01, 001)
- Partition ranges:
  - Specify partition ranges in the format lesser value:larger value.
  - Separate partition ranges by a colon (:) between the range boundaries.
  - Range boundaries are inclusive.
  Example: The following partition specification would load table partitions 1,2,3,4,7,12,15,16,17,18,19, and 20:
    PART (1:4,7,12,15:20)

TABLE table_name
Specifies that you want to load data from one or more Db2 tables. Specify each table name, separating names with a comma.

Creating a backup using the BACKUP utility

Use the BACKUP utility to create a backup copy of an accelerator table.

The BACKUP utility creates a full copy by fetching all of the data from the accelerator table and writing out the copy to up to four specified data sets. To use this method, you can use the option Back up Accelerator table to create a new Backup profile, from which you can generate backup JCL.

Example JCL: Creating a backup using the BACKUP utility

The following example JCL shows the BACKUP_ACCELERATOR command, which is used to back up data for an accelerator table.

Requirements are as follows:
- The HLOUBKUP program must be specified on the EXEC card.
- The Db2 SSID must be passed on the PARM card.
- The product load library must be included on the STEPLIB or JOBLIB.
- REGION=0M is recommended on the JOB card or the EXEC card.
- SYSPRINT and HLODUMMY DD cards are required.
- DD cards must be provided for the backup copy data sets and must match the DD names in the ACCEL_COPYDDN and ACCEL_RECOVERYDDN syntax elements:
  - hlocpylp_ddname – Local site primary copy
  - hlocpylb_ddname – Local site backup copy
  - hlocpyrp_ddname – Recovery site primary copy
  - hlocpyrb_ddname – Recovery site backup copy

//HLOD0100 EXEC PGM=HLOUBKUP,
// REGION=0000M,
// PARM=('UB1A')

/*
 /*
```

Syntax definitions: Creating a backup using the BACKUP utility

Db2 Analytics Accelerator Loader supports the following syntax elements (presented alphabetically) when you are creating a backup using the BACKUP utility.

**ACCEL_COPYDDN** `hlocpylp_ddname,hlocpylb_ddname`

Specifies the DD names for the backup data sets for the local site. `hlocpylp_ddname` is the DD name for local site primary copy data set, and `hlocpylb_ddname` is the DD name for the local site backup copy data set. This option is needed only when local site copies are being created.

The default DD names that are generated in the JCL are HLOCPYLP and HLOCPYLB; however, you can use any value for your DD names as long as they match a DD name in the JCL.

**ACCEL_RECOVERYDDN** `hlocpyrp_ddname,hlocpyrb_ddname`

Specifies the DD names for the backup data sets for the remote recovery site. `hlocpyrp_ddname` is the DD name for the recovery site primary copy data set, and `hlocpyrb_ddname` is the DD name for the recovery site backup copy data set. This option is needed only when recovery site copies are being created.
The default DD names that are generated in the JCL are HLOCPYRP and HLOCPYRB; however, you can use any value for your DD names as long as they match a DD name in the JCL.

**BACKUP ACCELERATOR TABLE**
Specifies that you want to back up data for an accelerator table.

**MRF integer**
Specifies the Multi-Row Fetch value for the backup. The default value is 500. Adjusting this value to a lower number can resolve SQLCODE -246 if necessary.

**tbcreator.tbname**
Specifies the accelerator table to back up or recover.
Chapter 12. Administering the Accelerator Loader server

You can perform tasks to manage the Accelerator Loader server and work with trace and events features.

Configuring server advanced security (optional)

System programmers typically configure advanced security during Accelerator Loader server customization. Accelerator Loader server provides protection for its resources by using RACF classes, CA Top Secret classes, and CA ACF2 generalized resource rules.

The overall RACF class (or resource type for ACF2) for Accelerator Loader is specified with the server parameter RESOURCETYPE. Classes can be shared among multiple instances of servers and either share the authorization rules or keep them separate.

Important: If the RESOURCETYPE parameter is not explicitly specified, the setting defaults to NON, which disables all product authorization checking.

When a user invokes an Accelerator Loader resource, the user's ID and the class of the resource are passed to the security program for authorization. The security program uses rules that you specify to determine whether to grant access to the resource.

To expedite future authorization checks of an identical request, Accelerator Loader server keeps the results of all security checks in protected storage.

The “look-aside” security check information is saved on a Task Control Block (TCB) basis and remains in effect until the TCB terminates. If you are initially denied access, but later have your security profile that is changed to allow access, you must exit the ISPF/SDF application to terminate its TCB. Depending on the security package, you may have to take other actions. Under ACF2, for example, you must issue the ACFRESET command. All security authorization events are logged in the Server Trace facility, and if access is denied, a message is produced.

The type of access you request — ADD/ALTER, READ, or UPDATE — depends on which resource you are using. The ACF2 ADD is equivalent to the RACF ALTER. See “Access requirements” on page 367 for the type of access that is required to use Accelerator Loader facilities.

Enabling security parameters for resource rules

To enable the security parameters, change if DontDoThis to if DoThis.

if DoThis then
  do
    "MODIFY PARM NAME(RESOURCETYPE) VALUE(RHLV)"
  end
RESOURCETYPE

RESOURCE TYPE FOR RESOURCE RULES

Contains the name of the security server's class (or resource type for ACF2) that is used to perform resource access authorization checks. If not explicitly specified, this parameter defaults to NON.

Valid values:

- **NON**: Disables all product authorization checking. **Important**: If you leave generalized resource checking disabled, a security exposure may exist. Anyone with a valid TSO user ID can gain access to the Accelerator Loader ISPF control application, where they are fully authorized to perform the functions that are provided by the interface. This assumes, however, that the user has sufficient information at hand to log on to TSO/E and then gain access to the ISPF/SDF application.

  - **classname**: RACF class name or ACF2 resource type. When using RACF, the corresponding class name within RACF must start with R, for example, RHLV.

---

### List of protected resources

The following table describes the resources that are protected by the Accelerator Loader security mechanism.

**Note**: You cannot modify the resource names.

*Table 17. Protected resources*

<table>
<thead>
<tr>
<th>Resource name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACLaci-mapname</td>
<td>Access to an ACI (Advanced Communication Interface) service definition.</td>

</table>

**Defining resources to RACF**

**Procedure**

1. Use the following JCL as a model for defining a new RACF class to the RACF class descriptor table for RHLV.

```plaintext
//STEP1 EXEC ASMHCL  
//C.SYSLIB DD DSN=SYS1.MODGEN,DISP=SHR  
//C.SYSIN DD *  
RHLV ICHERCDE CLASS=RHLV,  
    ID=128,  
    MAXLNTH=39,  
    FIRST=ALPHANUM,  
```
Restart the Accelerator Loader server so that RACF recognizes the new class.

2. Perform an IPL to change the RACF class descriptor table. This procedure is necessary for RACF to recognize the new class.

3. Define all RACF resource types to class RHLV with the following command:
   
   **RDEFINE RHLV CONTROLBLOCKS UACC(NONE)**

   Repeat the RDEFINE command for each RACF resource type.

4. Provide access to the resource according to the following example:
   
   **PERMIT CONTROLBLOCKS CLASS(RHLV) ID(USERID) ACCESS(READ)**

   Where USERID is the ID of the user to whom you want to grant READ permissions access.

   If you do not want the FACILITY class to be used, the hlq.SHLCNTL(HLVRADF2) member can be used as a sample for how to define the RACF class descriptor and router table.

   You can edit and submit the job in hlq.SHLCNTL(HLVRARES) to define and add permissions for the resource required by your site.

5. Activate the class to RACF with the following command:
   
   **SETROPTS CLASSACT(RHLV)**

**What to do next**

These members must be updated every time a new security resource name such as ATHZOOM or USERS is added.

**Defining resources to CA Top Secret**

**Procedure**

1. Define an entry in the RDT, as shown in the following example:

   ```
   TSS ADDTO(RDT) RESCLASS(HLV) RESCODE(nn) -
   ATTR(LONG,PRIV,LIB,DEFFRT,GRCERIC) -
   ACLST(NONE,ALL,ALTER=1COO,UPDATE,READ) DEFACC(READ)
   ```

   Where `nn` is a hexadecimal code between 01 and 3F.

2. Add all the resources to an owner with the following commands: TSS ADDTO(owner) HLV(CONTROLBLOCKS)

   Repeat this TSS ADDTO command for all resource types.

3. Permit the resources to profiles or users as follows:

   ```
   TSS PERMIT(userid) HLV(TRACEDATA) ACC(READ)
   ```
4. You can edit and submit the job in hlq.SHLVCNTL(HLVTRESRES) to define and add permissions for the resource required by your site.

**What to do next**

These members must be updated every time a new security resource name such as ATHZOOM or USERS is added.

**Defining resources to ACF2**

**Procedure**

1. Define a generalized resource class named HLV.
2. Define resource rules for each of the resource class. Member hlq.SHLVCNTL(HLVA2RES) can be used as an example.
3. Use the following ACF2 command to allow users access to the resource rule:
   
   `ACFRULE KEY(TRACEBROWSE) TYPE(HLV) ADD(UID(*********userid) ALLOW`  

4. You can edit and submit the job in hlq.SHLVCNTL(HLVA2RES) to define and add permissions for the resource required by your site:

**Optionally restrict ISPF load modules**

If you use TSO Command to restrict access to TSO commands, you must define the IBM® Db2® Analytics Accelerator Loader for z/OS ISPF load modules to your security product.

*Table 19. IBM® Db2® Analytics Accelerator Loader for z/OS load modules*

**Information access with the TRACEDATA resource**

The TRACEDATA resource controls access to information in the trace log.

**About this task**

The two types of information that are contained within the Accelerator Loader server trace log:

- SQL source statements (the real SQL source statements, as taken from database request modules or prepared strings, which may contain objects such as table names or column names).
- Binary data that underlies the trace log.

Users who have READ authority for the TRACEDATA resource and READ authority for HLV and TRACEBROWSE can view the entire trace log. Users who do not have READ authority have only restricted access to this information.

For SQL events, if your user ID matches the user ID associated with the event, you are permitted to look at an uncensored log of the SQL event. Otherwise, you can only see a censored representation of the SQL statement. The censored version includes the SQL verb but does not include objects, such as table names or column names.

**Secure Sockets Layer (SSL)**

Secure Socket Layers (SSL) is supported by the Application Transparent Transport Layer Security (AT-TLS), an IBM TCP/IP facility.
Accelerator Loader supports connections in the following ways:

- Ports that recognize an SSL connection and automatically enable an SSL session.
- Ports that are for secure connections that always send encrypted data.

**Enabling SSL support**

**Before you begin**

Your user ID must have READ permission for the IRR.DIGTCERT.LISTRING and IRR.DIGTCERT.LIST profiles in the RACF FACILITY class. If SSLUSERID is not specified, the Accelerator Loader server address space default user ID is used.

**Procedure**

1. Use the **MODIFY PARM** command to set the following parameters that are located in the server configuration member, hlvidIN00:

   - "MODIFY PARM NAME(SSL) VALUE(YES)"
   - "MODIFY PARM NAME(SSLAUTODETECT) VALUE(NO)"
   - "MODIFY PARM NAME(SSLCLIENTAUTH) VALUE(LOCAL)"
   - "MODIFY PARM NAME(SSLCLIENTNOCERT) VALUE(ALLOW)"
   - "MODIFY PARM NAME(SSLUSERID) VALUE(USERID)"

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Valid values</th>
</tr>
</thead>
<tbody>
<tr>
<td>SSL</td>
<td>Enables SSL connections.</td>
<td>YES (default) SSL connections enabled.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>NO</td>
</tr>
<tr>
<td>SSLAUTODETECT (Optional)</td>
<td>Specifies whether the server automatically detects SSL connections that are sent on the port that is normally used for cleartext connections. Note: A separately configured SSL port accepts only SSL connections.</td>
<td>YES When set to YES, the server automatically detects SSL connections. NO (default) When set to NO, only cleartext connections can be handled on the cleartext port.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Valid values</td>
</tr>
<tr>
<td>--------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>----------------</td>
</tr>
<tr>
<td><strong>SSLCLIENTAUTH</strong></td>
<td>Specifies how SSL client certificates are authenticated. Valid values are NONE, LOCAL, and PASSTHRU. Configuration of SSL support for use in Accelerator Loader server requires that you designate the location of the certificate and keystore that the IBM-supplied SSL components use. The SSL support for the server can be configured to use a pair of native IBM SSL key database and key stash files.</td>
<td>LOCAL</td>
</tr>
<tr>
<td></td>
<td>(default) The server requests a client certificate during the SSL connection setup handshake. Certificates that are sent by the client are authenticated by using the certificate store that is designated by other SSL startup parameters. They are either a GSK SSL key database, or a RACF keyring.</td>
<td>NONE</td>
</tr>
<tr>
<td></td>
<td>The server does not make SSL client certificate processing active and does not request client certificates.</td>
<td><strong>PASSTHRU</strong></td>
</tr>
<tr>
<td></td>
<td>The server requests a client certificate during the SSL connection setup handshake. Certificates that are sent by the client are not authenticated upon receipt but are available for inspection by the transaction.</td>
<td></td>
</tr>
<tr>
<td><strong>SSLCLIENTNOCERT</strong></td>
<td>Specifies the action to take if an SSL client fails to provide a valid x501 certificate during session establishment. <strong>Note:</strong> The failure by the client to provide a certificate might be because of the lack of mutually trusted signing authority. Lack of a certificate does not prevent the SSL session from being established and used. <strong>Note:</strong> The SSL handshake at session establishment completes before application of the FAILURE action.</td>
<td><strong>ALLOW</strong></td>
</tr>
<tr>
<td><em>(Optional)</em></td>
<td></td>
<td><strong>FAIL</strong></td>
</tr>
<tr>
<td></td>
<td>(default) Allows the server to continue processing, ignoring failure by the client or in ability to provide a certificate.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>The server terminates its session with the client at the earliest possible opportunity.</td>
<td></td>
</tr>
</tbody>
</table>
SSLUSERID

Specifies the user ID under which the SSL resource manager subtask operates. If not specified, the SSL resource manager operates by using the subsystem's address-space-level user ID. This user ID must be authorized to open and read the SSL private key and certificate files. Using a separate user ID for this task prevents other transaction subtasks, and the server itself, from accessing this highly confidential information.

Null

2. To set up the ports, use the MODIFY PARM command to set the following parameters that are located in the server configuration member, hlvidIN00:

**Required Ports:**

"MODIFY PARM NAME(OEPORTNUMBER) VALUE(XXXX)"
"MODIFY PARM NAME(WSOEPORT) VALUE(XXXX)"

**Optional Ports:**

"MODIFY PARM NAME(OENLPORTNUMBER) VALUE(0)"
"MODIFY PARM NAME(OESSLPOR NUMBER) VALUE(0)"
"MODIFY PARM NAME(WSOEBALANCEDPORT) VALUE(0)"
"MODIFY PARM NAME(WSOESSLPORT) VALUE(0)"

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Valid values</th>
</tr>
</thead>
<tbody>
<tr>
<td>OEPORTNUMBER</td>
<td>Sets the port number that is used to LISTEN for, and ACCEPT all inbound TCP/IP sessions that should not be considered candidates for load balancing to a different Accelerator Loader server in the same load-balancing group. The port number should be reserved for exclusive use by the main product address space. This must be different from the main OEPORTNUMBER and the OESSLPOR number if it is used.</td>
<td>0 (default)</td>
</tr>
<tr>
<td>WSOEPOR T</td>
<td>Specifies the port number that is used to listen for all inbound Services and Accelerator Loader studio requests.</td>
<td>0 (default)</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Valid values</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>----------------</td>
</tr>
<tr>
<td>OENLPORTNUMBER (Optional)</td>
<td>Sets the port number that is used to LISTEN for, and ACCEPT all inbound TCP/IP sessions that should not be considered candidates for load balancing to a different Accelerator Loader server in the same load-balancing group. The port number should be reserved for exclusive use by the main product address space. This must be different from the main OEPORTNUMBER and the OESSLPORT number if it is used.</td>
<td>0 (default)</td>
</tr>
<tr>
<td>OESSLPORTNUMBER (Optional)</td>
<td>Sets the port number that is used to LISTEN for, and ACCEPT all inbound encrypted OE Sockets TCP/IP sessions. This port number should be reserved for use only by the main product address space. Each copy of the main product address space needs its own port number if SSL over OE Sockets is being used. There is no default value for the SSL port number if the value is not set in the initialization EXEC.</td>
<td>Null</td>
</tr>
<tr>
<td>WSOEBALANCEDPORT (Optional)</td>
<td>Specifies the port number that is used to listen for Services requests that can be balanced to group members.</td>
<td>0 (default)</td>
</tr>
<tr>
<td>WSOESSLPORT (Optional)</td>
<td>Specifies the port number that is used to listen for Services for encrypted sessions.</td>
<td>0 (default)</td>
</tr>
</tbody>
</table>

**Accessing data on a remote system**

Db2 Analytics Accelerator Loader provides Inter Data Communications to enable access to remote data sources that are not directly accessible from the local system; for example, data from an IMS database on a remote LPAR.

**Inter Data Communications**

Inter Data Communications (IDC) is a TCP/IP-based protocol that allows one Accelerator Loader server to communicate with another Accelerator Loader server. You can set up multiple Accelerator Loader servers on multiple LPARs in your z System infrastructure. Once IDC is configured, an LPAR can access data and other resources on one or more LPARs.
For example, consider a z System infrastructure that has multiple LPARs configured. If Adabas is running on one of the LPARs and you need to access Adabas from another LPAR, then you can use IDC to enable communication between the two LPARs. To use IDC, you need to install Accelerator Loader server on both the LPAR running Adabas (the target LPAR) the LPAR needing access (the source LPAR). To enable Inter Data Communications, you need to configure server parameters on both the source and the target LPARs so that communication is established between the two LPARs.

After IDC is enabled on an LPAR, the Accelerator Loader server on the LPAR can also communicate with other LPARs where Accelerator Loader server is installed.

Accelerator Loader server allows all data transformations to run on a z System Integrated Information Processor (zIIP) specialty engine for significantly reduced MIPS capacity usage. In this example, the source LPAR can access the Adabas data on the target LPAR and utilize the zIIP processor to perform data transformations.

**Configuring Inter Data Communications**

Configure Inter Data Communications by using parameters in the server configuration member hlvidIN00.

**Procedure**

1. Configure the server stored procedure.

2. Configure parameter file hlvidIN00 in data set hlq.SHLEXEC. Use `DEFINE DATABASE TYPE(SERVER)` in the local Accelerator Loader server to indicate a remote Accelerator Loader server.
   a. Identify the target server with a four-character `NAME()`.
   b. Provide the TCP/IP location with `DOMAIN()` and `PORT()`.
   c. Provide the Passticket name with `APPLNAME()`.
   d. Specify the application name for Passticket authentication. IDC uses Passtickets for authorization on the remote server, or credentials can be supplied to the DS Client.
      
      The DS Client ACI service task mimics the ODBC driver and connects to the target server’s `OEPORTNUMBER`.
      
      The configuration of the `PORT` and `APPLNAME` in the local server’s hlvidIN00 configuration member must align with the `OEPORTNUMBER` and `PASSTICKETAPPNAME` in the remote server’s hlvidIN00.

      The target server name becomes the “Db2 subsystem ID” for the DS Client request.

3. Define distributed data facility (DDF) endpoints by entering a definition statement for Inter Data Communications. Provide your local environment values for all the parameters.

   ```
   "DEFINE DATABASE TYPE(SERVER)"
   "NAME(DSN1)"
   "LOCATION(DEVIDSN1)"
   "DDFSTATUS(ENABLE)"
   "DOMAIN(ENABLE)"
   "PORT(443)"
   "APPLNAME(DBDSGRP)"
   ``

   The following table lists the parameters for defining DDF endpoints:
### Table of Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Valid values</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>APPLNAME</strong></td>
<td>Application name. The APPLNAME used by the target endpoint for passticket generations. <em>(Optional)</em></td>
<td>A valid value is 1 - 8 characters. If APPLNAME is not specified in the definition statement, no default value is provided and passticket access is disabled.</td>
</tr>
<tr>
<td><strong>DDFSTATUS</strong></td>
<td>The DDF activation status can be altered online by using the ISPF 4-Db2 dialog panels. <em>(Required)</em></td>
<td><strong>ENABLE</strong> To make this DDF definition active. <strong>DISABLE</strong> DDF endpoint is not used.</td>
</tr>
<tr>
<td><strong>DOMAIN</strong></td>
<td>The part of a network address that identifies it as belonging to a particular domain. Either DOMAIN or IPADDR is required, but not both.</td>
<td>No default value.</td>
</tr>
<tr>
<td><strong>LOCATION</strong></td>
<td>The Db2 location name. <em>(Required)</em></td>
<td>A valid value is a string 1 - 16 characters.</td>
</tr>
<tr>
<td><strong>NAME</strong></td>
<td>The Db2 subsystem ID. <em>(Required)</em></td>
<td>A valid value consists is 1 - 4 characters. Clients use this ID when they request access to a specific Db2 subsystem.</td>
</tr>
<tr>
<td><strong>PORT</strong></td>
<td>Specify the IP port number that is defined for DRDA access in this DDF endpoint. <em>(Optional)</em></td>
<td>If this keyword is not entered, the default DRDA port number 443 is used.</td>
</tr>
<tr>
<td><strong>TYPE</strong></td>
<td>If this DDF endpoint is a Db2 group director, specify GROUP. If this DDF endpoint is a Db2 instance or group member for Linux, UNIX, or Windows, specify LUW. <em>(Required)</em> If this DDF endpoint is a Db2 instance or group member for z/OS, specify MEMBER. If this DDF endpoint is a remote server, specify SERVER.</td>
<td>GROUP, LUW, MEMBER, SERVER</td>
</tr>
</tbody>
</table>

### Example

An Accelerator Loader server is set up on LPAR DEV1 to send requests to server VDBA on LPAR RS28 (whose DNS hostname is also RS28).

The local server hlvidIN00 configuration member is as follows:
"DEFINE DATABASE TYPE(SERVER)" ,
"NAME(VDBA)" ,
"LOCATION(RS28VDBA)" ,
"DDFSTATUS(ENABLE)" ,
"DOMAIN(RS28)" ,
"PORT(1260)" ,
"APPLNAME(DBDSGRP)"

The remote server hlvidIN00 configuration member must be configured as follows:
"MODIFY PARM NAME(OEPORTNUMBER) VALUE(1260)"
"MODIFY PARM NAME(PASSTICKETAPPNAME) VALUE(DBDSGRP)"

The Passticket application name must be defined to RACF on both systems in the PTKDATA class as follows:

<table>
<thead>
<tr>
<th>CLASS</th>
<th>NAME</th>
</tr>
</thead>
<tbody>
<tr>
<td>--------</td>
<td>--------</td>
</tr>
<tr>
<td>PTKDATA</td>
<td>DBDSGRP</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>LEVEL</th>
<th>OWNER</th>
<th>UNIVERSAL ACCESS</th>
<th>YOUR ACCESS</th>
<th>WARNING</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>TSSAL</td>
<td>READ</td>
<td>READ</td>
<td>NO</td>
</tr>
</tbody>
</table>

**z Systems Data Compression (zEDC)**

IBM z Systems Data Compression (zEDC) is an accelerated compression solution that provides high performance, low latency compression with minimal system overhead.

zEDC uses an industry standard compression library that provides efficient performance with large sequential files. zEDC facilitates cross-platform exchange of data.

**Enabling zEDC**

Accelerator Loader server provides support for IBM z Systems Data Compression (zEDC).

**Before you begin**

To determine the hardware and software requirements, refer to the current *IBM z Systems Data Compression* documentation.

**Procedure**

1. Set NETWORKBUFFERSIZE on both Accelerator Loader servers to a value between ZEDCMINDATASIZE and 1048512.
2. Set the following parameters in the hlvidIN00 configuration member:

```c
/*--------------------------*/
/* Enable ZEDC support. */
/*--------------------------*/
if 1 = 1 then
  do
    "MODIFY PARM NAME(ZEDCCOMPRESSION) VALUE(YES)"
    "MODIFY PARM NAME(ZEDCMINDATASIZE) VALUE(8192)"
  end
end

if 1 = 1 then
  do
    "MODIFY PARM NAME(TRACEZEDCCOMPRESSION) VALUE(NO)"
    "MODIFY PARM NAME(TRACEFULLZEDC) VALUE(NO)"
  end
```

The following table lists the parameters for enabling zEDC:
### Configuring rules and events

Using a rule, you can configure an automatic response to an event. For example, you can allow a critical application to download data any time, and allow a non-critical application to download data only during specific hours.

For example, to restrict the number of times that a user ID can log on to the server, create a LOGON rule to limit the user ID to three logons a day and to take a specific action if the user ID tries to log on more than three times.

#### Events

You can create rules for the following types of events:

- Authorization (ATH) events that occur when the server configuration performs authorization processing for a controlled resource.

---

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Valid values</th>
</tr>
</thead>
<tbody>
<tr>
<td>NETWORKBUFFERSIZE</td>
<td>Controls the size of the buffer used to receive blocks of data from the network. A failure will occur if a client application sends a buffer larger than the maximum size. This value should be raised to allow larger blocks of data to be sent to and from the client.</td>
<td>256K (default) or required size.</td>
</tr>
<tr>
<td>TRACEZEDCCOMPRESSION</td>
<td>Enables tracing of all zEDC calls to the Server Trace facility. It should only be set to YES if the user needs to trace zEDC calls for diagnostic purposes.</td>
<td>YES (enable zEDC tracing), NO (default) Do not enable zEDC tracing.</td>
</tr>
<tr>
<td>TRACEFULLZEDC</td>
<td>Traces the entire buffer, not just the first few bytes. It should only be set to YES if a minimal trace is not enough.</td>
<td>YES (enable zEDC tracing for the entire buffer), NO (default) Do not enable full zEDC tracing.</td>
</tr>
<tr>
<td>ZEDCCOMPRESSION</td>
<td>Enables or disables the use of the zEDC compression hardware device. Set to YES if you have the zEDC compression hardware and wish to use it.</td>
<td>YES (enable zEDC compression), NO (default) Do not enable zEDC compression.</td>
</tr>
<tr>
<td>ZEDCMINDATASIZE</td>
<td>Sets the minimum amount of data the server will compress with the zEDC hardware. It is recommended that testing first be done with a minimum size of 8K.</td>
<td>8192 (default) or required size.</td>
</tr>
</tbody>
</table>

3. To verify that zEDC is in use, enable zEDC tracing (TRACEZEDCCOMPRESSION) and look for ZED events in the Server Trace.
• Command (CMD) events that occur when the server configuration receives a command from a z/OS console.
• Exception (EXC) events that occur when tasks exceed limits or fail. These events are generated only when the SEFGLVENTS parameter is set to allow them.
• Global variable events (GLV) that occur when the value of a global variable is changed.
• SQL events occur before a SQL statement is run.
• Time-of-day (TOD) events occur at specific times.
• Virtual tables (VTB) rules allow you to have a single virtual table that can use to represent many data sets of the same structure.

For each event, you can create one or more rules. Within each rule, you specify an action to take in response to the event. For example, you might create two rules for the LOGON event. In one rule, you specify that if an ID attempts to log on more than three times within a 24-hour period, subsequent logon requests are rejected. In another rule, you might specify that all logs on attempts from a specific ID are rejected.

Rules and rule sets

A rule can have the following parts:
• Criterion
• Header statement
• One or more process sections
• Return values
• Variables

Managing rules and events

Use the ISPF interface to view and work with rules and events.

Procedure

1. On the main menu, select Server administration.
2. On the Administer Accelerator Loader server panel, select Manage Rules.
4. On the Event Facility (SEF) Ruleset Entry Profile panel, use Display Only the Ruleset Named to display rulesets as follows:
   • To display all rulesets, leave the asterisk and press Enter. Proceed with 6 on page 381
   • To display a specific type of ruleset, specify one of the following values and press Enter.
     - ATH for Authorization event rules
     - CMD for Command event rules
     - EXC for Exception event rules
     - SQL for SQL event rules
     - TOD for Time-of-day event rules
     - VTB for Virtual tables rules
5. On the Event Facility (SEF) Event Procedure List panel, in the S column beside a member, type a line command to take one of the following actions:
   • S: Select an event procedure for modification using the ISPF editor.
• E: Enable an event procedure
• D: Disable an event procedure.
• A: Set the Auto-Enable (AE) flag for an event procedure member.
• Z: Reset the Auto-Enable (AE) flag for an event procedure member.
• B: Set the Auto-Enable (AE) flag and enable the event procedure.
• C: Disable an event procedure and reset the Auto-Enable (AE) flag.

6. On the Event Facility Proc. Rulesets - Using SEF V4 Configuration panel, in the S column beside a ruleset, type a line command to take one of the following actions:
• S: Display the list of members within the ruleset.
• E: Enable all members of an entire ruleset.
• D: Disable all members of an entire ruleset.
• U: Display the ISPF/PDF utility panel to rename, delete, or print members.
• A: Set the Auto-Enable (AE) flag for all members of a ruleset.
• Z: Reset the Auto-Enable (AE) flag for all members of a ruleset.

**Automatic limits**

A rule can include customizable limits that control many aspects of your configuration including queries, connections, and sessions.

Rules are configured in the server configuration member that is shipped in data set member hlq.hlvidIN00.

You can view rules by selecting C (SDB Admin.) > 2 (SDB Parms) from the Primary Option Menu. To modify a rule, locate the parameter, change its value, and press Enter. This modifies the parameter for the existing Accelerator Loader session. To make the change permanent, modify the parameter in the hlvidIN00 configuration member.

During installation, a default value is specified for each of the following limits.

**Overall per session CPU limit**
When this limit is reached, the session is automatically terminated. The security product or a product parameter can provide the limit.

**Per DB2 connection CPU limit**
When this limit is reached, the current Db2 connection is automatically terminated, and all associated Db2 resources are released.

**Per SQL query CPU limit**
When this limit is reached, the current SQL query is automatically terminated, and all associated Db2 resources are released.

**Inactivity time-out**
This limit automatically terminates the session of any user that is inactive for the specified period. Use this limit to minimize security exposures and release resources that are held by inactive users.

**Maximum timer-on limit**
This limit prevents the execution of any SQL statement that exceeds a specified value. The limit prevents excessive resource utilization.

**Maximum rows limit**
This limit restricts the number of rows that a query returns.
Dropped connection detection
This mechanism detects clients that failed or are no longer connected to the network. When a dropped connection is detected, the host session is terminated, and all resources are released.

Lock control facility
This mechanism detects clients that are holding a Db2 lock (share, update, or exclusive) for an excessive period. When the limit is reached, the session is terminated, and the lock is released.

Dynamic SQL control facility
This mechanism allows dynamic SQL to be rejected on the host. Use this mechanism to enforce the use of static SQL.

Maximum concurrent users
This limit controls the maximum number of concurrent users and is enforced on the host.

Variables for rules
When you create a rule, you can use dynamic variables, global variables, temporary variables, and event-specific variables. These variables are used in REXX programming.

Dynamic variables
Dynamic variables are created when the process section of a rule references or sets the value of a simple or compound variable. Dynamic variables exist only while a rule runs and are freed when the REXX environment is deleted. Dynamic variables cannot be accessed by non-REXX procedures and functions. The following code fragment shows two simple variables, I and COUNT, and one compound variable, stemvar.I:

```
do I = 1 to COUNT
    stemvar.I = "InitValue"
end
```

Global variables
Global variables have one of the following stem values:

- GLOBAL
- GLOBALn, where n is an integer 1 - 9

Global variables can be created, modified, or managed by selecting option 3 (Manage Rules) from the Accelerator Loader - Primary Option Menu and then selecting 1 (Global Variables). To create a new global variable, enter S variable_name and press Enter.

Global variables are stored in the global variable checkpoint data set. When a global variable is referenced, the value of the variable is retrieved from the checkpoint data set. The value of a global variable persists across restarts of the product and is shared by all rules. If the SEFGLVEVENTS parameter is set to YES in the server configuration member hlvid1N00, you can create a rule to intercept the change and perform additional processing.

Temporary variables
Temporary variables, which begin with the stem value GLVEVENT, exist only during an event and are deleted when the event is over. Temporary variables are
used by high-level language (HLL) routines that create and interrogate these types of variables. To create or access a temporary variable, use the SDBVALUE API function. A rule can reference a temporary variable by name.

**Event variables**

When an event occurs, event variables are created. These variables pass information about the event to the rules for the event. For example, ATH.AUPWDBSS is an event variable for the LOGON event. The value of the ATH.AUPWDBSS variable is the Db2 subsystem name that the connection string provides. You can use this variable in a rule that restricts logons to a specific Db2 subsystem.

Most event variables are read-only; however, some can be modified. Changes to modifiable event variables are cumulative. The first rule that runs uses the original value of the variable. Each rule that later runs uses the value that the previous rule modified. Even if a rule modifies the value of a variable, all rules that are eligible to run still run.

**Authorization (ATH) events**

This section describes the types of authorization (ATH) events.

**All authorization events**

This event occurs when an authorization request is made. A rule for this event can reject, accept, or modify the request.

**Return values**

When an ATH event ends, the rule sets a return value. The server evaluates the return value and invokes z/OS security routines.

<table>
<thead>
<tr>
<th>Return value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACCEPT</td>
<td>Access to the requested resource is allowed, and additional processing by the z/OS security subsystem is not performed.</td>
</tr>
<tr>
<td>REJECT</td>
<td>Access to the requested resource is denied, and additional processing by the z/OS security subsystem is not performed. The rule can include the ATH.OPAUERMG variable, which for most authorization requests, returns an error message to the requestor.</td>
</tr>
<tr>
<td>Other value</td>
<td>If another value or no value is returned, the z/OS security subsystem performs validation checking. The security product makes the final determine to allow or deny access to the requested resource.</td>
</tr>
</tbody>
</table>
**Variables**

Values for these variables are set only when an ATH rule processes an ATH event.

<table>
<thead>
<tr>
<th>Criterion</th>
<th>Variable name</th>
<th>Contents</th>
<th>Data type</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALL (all variables)</td>
<td>ATH.OPAU13WA</td>
<td>The WAITS flag is on if the wait state is allowed and is off if wait state is not allowed. If the wait state is not allowed, actions that cause the task to enter a wait state are not allowed.</td>
<td>Character, read only</td>
</tr>
</tbody>
</table>
| ALL             | ATH.OPAUACSR   | The type of access that is being requested. The following are valid values for the access type, except for LOGON requests:  
• ADD  
• CONTROL  
• DISPLAY  
• DEFINE  
• EXECUTE  
• INFO  
• LIST  
• KILL  
• MODIFY  
• READ  
• SHOW  
• SET  
• WRITE | Character, read only |
| ALL             | ATH.OPAUERMG   | A REXX program can specify the error message to send to the client.       | Character, read-write |
| ALL             | ATH.OPAURQRC   | The request return code. The following are valid values:  
• 00: Request allowed  
• 04: Request must be modified  
• 08: Request failed  
• 12: Request abended  
• 16: Product address space is unavailable | Character, read-only |
<table>

- TRACEBROWSE: Trace browse  
- TSO: Time Share Option  
- USERS: Remote users | |
| ALL       | ATH.OPAUSRID  | The search ID, which is created by combining the request type with the access type, for example:  
- PARMSSHOW displays a product parameter  
- SEF.INFO obtains SEF information. | |
**Criterion** | **Variable name** | **Contents** | **Data type**
--- | --- | --- | ---
ALL | ATH.OPAUUSID | The user ID that is being validated (LOGON), the user ID being logged off (LOGOFF), or the user ID for the task that is requesting access to the controlled resource. **Note:** A rule for the LOGON event can change the value of the user ID so that the rule-generated user ID can be used for subsequent validation by the security product. Rules for other authorization events should not attempt to alter the ATH.OPAUUSID variable. | Character, read-only, except as noted
ALL | ATH.USER | The user area is passed to all rules that run in response to the same event. | Read-only

**Communication link events**

This event occurs when a communication link is defined, accessed, or updated. A rule for this event can accept or reject the request or allow the security product to determine if the request is allowed.

**Return values**

When a communication link event ends, the rule sets a return value. The server evaluates the return value and invokes z/OS security routines.

<table>
<thead>
<tr>
<th>Return value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACCEPT</td>
<td>Access to the requested resource is allowed, and additional processing by the z/OS security subsystem is not performed.</td>
</tr>
<tr>
<td>REJECT</td>
<td>Access to the requested resource is denied, and additional processing by the z/OS security subsystem is not performed. The rule can include the ATH.OPAUERMG variable, which for most authorization requests, returns an error message to the requestor.</td>
</tr>
<tr>
<td>Other value</td>
<td>If another value or no value is returned, the z/OS security subsystem performs validation checking. The security product makes the final determine to allow or deny access to the requested resource.</td>
</tr>
</tbody>
</table>

**Variables**

LINKS variables are used for events that pertain to defining, accessing, or updating a communication link.
<table>
<thead>
<tr>
<th>Variable name</th>
<th>Contents</th>
<th>Data type</th>
</tr>
</thead>
<tbody>
<tr>
<td>ATH.AULIHOST</td>
<td>The host name for the link. This name might be truncated. To avoid the</td>
<td>Character, read-only</td>
</tr>
<tr>
<td></td>
<td>additional processing that is required to resolve the host name, the server does not</td>
<td></td>
</tr>
<tr>
<td></td>
<td>usually obtain or provide the client host name.</td>
<td></td>
</tr>
<tr>
<td>ATH.AULIIPAD</td>
<td>The TCP/IP address in 4-byte binary form.</td>
<td>Binary, read-only</td>
</tr>
<tr>
<td>ATH.AULILU</td>
<td>The LU 6.2 name that is set only for LU 6.2 links.</td>
<td>Character, read-only</td>
</tr>
<tr>
<td>ATH.AULIMODE</td>
<td>The LU 6.2 mode name that is set only for LU 6.2 links.</td>
<td>Character, read-only</td>
</tr>
<tr>
<td>ATH.AULITYPE</td>
<td>The link type. The following are valid values:</td>
<td>Character, read-only</td>
</tr>
<tr>
<td></td>
<td>• 6: LU 6.2 link</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• T: IBM TCP/IP link</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• I Interlink TCP/IP</td>
<td></td>
</tr>
</tbody>
</table>

**Control block events**

This event occurs when a control block is accessed or updated. A rule for this event can accept or reject the request or allow the security product to determine if the request is allowed.

**Return values**

When an ATH event ends, the rule sets a return value. The server evaluates the return value and invokes z/OS security routines.

<table>
<thead>
<tr>
<th>Return value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACCEPT</td>
<td>Access to the requested resource is allowed, and additional processing by the z/OS security subsystem is not performed.</td>
</tr>
<tr>
<td>REJECT</td>
<td>Access to the requested resource is denied, and additional processing by the z/OS security subsystem is not performed. The rule can include the ATH.OPAUERMG variable, which for most authorization requests, returns an error message to the requestor.</td>
</tr>
<tr>
<td>Other value</td>
<td>If another value or no value is returned, the z/OS security subsystem performs validation checking. The security product makes the final determine to allow or deny access to the requested resource.</td>
</tr>
</tbody>
</table>

**Variables**

CONTROLBLOCk variables are used for events that pertain to accessing or updating a product control block.
### Database events

This event occurs when a database is defined, accessed, or updated. A rule for this event can accept or reject the request or allow the security product to determine if the request is allowed.

### Return values

When a database event ends, the rule sets a return value. The server evaluates the return value and invokes z/OS security routines.

<table>
<thead>
<tr>
<th>Return value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACCEPT</td>
<td>Access to the requested resource is allowed, and additional processing by the z/OS security subsystem is not performed.</td>
</tr>
<tr>
<td>REJECT</td>
<td>Access to the requested resource is denied, and additional processing by the z/OS security subsystem is not performed. The rule can include the ATH.OPAUERMG variable, which for most authorization requests, returns an error message to the requestor.</td>
</tr>
<tr>
<td>Any other value</td>
<td>If another value or no value is returned, the z/OS security subsystem performs validation checking. The security product makes the final determine to allow or deny access to the requested resource.</td>
</tr>
</tbody>
</table>

### Variables

DATABASE variables are used for events that pertain to defining, accessing, or updating a product database.

<table>
<thead>
<tr>
<th>Variable name</th>
<th>Contents</th>
<th>Data type</th>
</tr>
</thead>
<tbody>
<tr>
<td>ATH.AUDBHOST</td>
<td>The host name of the database.</td>
<td>Numeric, read-only</td>
</tr>
<tr>
<td>ATH.AUDBNAME</td>
<td>The name of the database.</td>
<td>Character, read-only</td>
</tr>
<tr>
<td>ATH.AUDBTYPE</td>
<td>The type of the database.</td>
<td>Character, read-only</td>
</tr>
</tbody>
</table>

### Global variable events

This event occurs when a global variable is defined, accessed, or updated. A rule for this event can accept or reject the request or allow the security product to determine if the request is allowed.
Return values

When an ATH event ends, the rule sets a return value. The server evaluates the return value and invokes z/OS security routines.

<table>
<thead>
<tr>
<th>Return value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACCEPT</td>
<td>Access to the requested resource is allowed, and additional processing by the z/OS security subsystem is not performed.</td>
</tr>
<tr>
<td>REJECT</td>
<td>Access to the requested resource is denied, and additional processing by the z/OS security subsystem is not performed. The rule can include the ATH.OPAUERMG variable, which for most authorization requests, returns an error message to the requestor.</td>
</tr>
<tr>
<td>Other value</td>
<td>If another value or no value is returned, the z/OS security subsystem performs validation checking. The security product makes the final determination to allow or deny access to the requested resource.</td>
</tr>
</tbody>
</table>

Variables

The following variables are available.

<table>
<thead>
<tr>
<th>Variable name</th>
<th>Contents</th>
<th>Data type</th>
</tr>
</thead>
<tbody>
<tr>
<td>ATH.AUGLDELN</td>
<td>The length of the name of the global variable.</td>
<td>Numeric, read-only</td>
</tr>
<tr>
<td>ATH.AUGLDENA</td>
<td>The name of the global variable.</td>
<td>Character, read-only</td>
</tr>
<tr>
<td>Variable name</td>
<td>Contents</td>
<td>Data type</td>
</tr>
<tr>
<td>-----------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>----------------------</td>
</tr>
<tr>
<td>ATH.AUGLOPCH</td>
<td>The operation. The following are valid values:</td>
<td>Character, read-only</td>
</tr>
<tr>
<td></td>
<td>• A: Add a global variable.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• D: Drop a global variable.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• E: Check for the existence of a global variable.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• F: Check for the existence of a global variable and obtain (return) the value.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• I: Obtain information about a global variable.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• L: List information about a global variable.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• O: Obtain a global variable.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• R: Remove a global variable.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• S: Subtree processing.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• T: Subtree information processing</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• U: Update a global variable.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• V: Value processing.</td>
<td></td>
</tr>
<tr>
<td>ATH.AUGLRQTY</td>
<td>The type of the access request. The following are valid values:</td>
<td>Character, read-only</td>
</tr>
<tr>
<td></td>
<td>• A: READ access</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• U: UPDATE access</td>
<td></td>
</tr>
</tbody>
</table>

**IMSLTERM events**

This event occurs when the IMSLTERM (IMS logical terminal) authorization event occurs. A rule for this event can accept or reject the request or allow the security product to determine if the request is allowed.

**Return values**

When an IMSLTERM event ends, the rule sets a return value. The server evaluates the return value and invokes z/OS security routines.

<table>
<thead>
<tr>
<th>Return value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACCEPT</td>
<td>Access to the requested resource is allowed, and additional processing by the z/OS security subsystem is not performed.</td>
</tr>
<tr>
<td>REJECT</td>
<td>Access to the requested resource is denied, and additional processing by the z/OS security subsystem is not performed. The rule can include the ATH.OPAUERMG variable, which for most authorization requests, returns an error message to the requestor.</td>
</tr>
</tbody>
</table>
Return value | Description
---|---
Other value | If another value or no value is returned, the z/OS security subsystem performs validation checking. The security product makes the final determine to allow or deny access to the requested resource.

**Variables**

The following variable is available. The IMSLTERM variable is used for events that pertain to IMSLTERM.

<table>
<thead>
<tr>
<th>Descriptive name</th>
<th>Variable name</th>
<th>Contents</th>
<th>Data type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Virtual table name</td>
<td>ATH.AULTNAME</td>
<td>The name of the virtual table.</td>
<td>Character, read-only</td>
</tr>
</tbody>
</table>

**Log off events**

This event occurs after the client session to the host is terminated. Therefore, no response data can be sent to the client.

A rule for this event can provide the following responses:

- Write messages to a console or to the Trace Browse. The error message variable (ATH.OPAUERMG) can also be set. This value of this variable displays in the Trace Browse if ATH messages are being traced.
- Write SMF records. The SDBINFO function can be used in addition to the ATH event variables passed to this routine.
- Access and update other resources. For example, a global variable can be modified to show that the current user is no longer connected.

**Return values**

When an log-off event ends, the rule sets a return value. The server evaluates the return value and invokes z/OS security routines.

<table>
<thead>
<tr>
<th>Return value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACCEPT</td>
<td>Access to the requested resource is allowed, and additional processing by the z/OS security subsystem is not performed.</td>
</tr>
<tr>
<td>REJECT</td>
<td>Access to the requested resource is denied, and additional processing by the z/OS security subsystem is not performed. The rule can include the ATH.OPAUERMG variable, which for most authorization requests, returns an error message to the requestor.</td>
</tr>
<tr>
<td>Any other value</td>
<td>If another value or no value is returned, the z/OS security subsystem performs validation checking. The security product makes the final determine to allow or deny access to the requested resource.</td>
</tr>
</tbody>
</table>
Variables

LOGOFF variables are used for events that pertain to writing messages to a console or Trace Browse, writing SMF records, or accessing and updating other resources.

<table>
<thead>
<tr>
<th>Descriptive name</th>
<th>Variable name</th>
<th>Contents</th>
<th>Data type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Termination code</td>
<td>ATH.AULGABCD</td>
<td>The termination code, which is a 4-byte hexadecimal string. The value is 0000 if the current thread terminated normally.</td>
<td>Character, read-only</td>
</tr>
<tr>
<td>Authorization scheme</td>
<td>ATH.AULGAUSC</td>
<td>The authorization scheme. The following are valid values:</td>
<td>Character</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• SDBECURE: The user ID was created by using the SDBECURE API.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• RA-PROXY: A RUNAUTH (proxy) user ID log off.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• BASIC: An HTTP authorization, request header scheme.</td>
<td></td>
</tr>
<tr>
<td>Cache</td>
<td>ATH.AULGCAUS</td>
<td>The user ID cache flag. The following are valid values:</td>
<td>Character, read-write</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 0 (zero): The user ID is logged off.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 1: If the user ID was previously cached and is retained in the cache.</td>
<td></td>
</tr>
<tr>
<td>Connection token</td>
<td>ATH.AULGCNTK</td>
<td>The connection token is an 8-byte hexadecimal string. To identify the terminating task, this value can be passed to the SDBINFO function. This value is only required for test (TSO) versions of the main product address space.</td>
<td>Character, read-only</td>
</tr>
<tr>
<td>CPU time</td>
<td>ATH.AULGCPTM</td>
<td>The CPU time that is used by the current task, which is specified in seconds and fractions of a second.</td>
<td>Character, read-only</td>
</tr>
<tr>
<td>Elapsed time</td>
<td>ATH.AULGELTM</td>
<td>The elapsed time of the current task, which is specified in seconds and fractions of a second.</td>
<td>Character, read-only</td>
</tr>
<tr>
<td>Descriptive name</td>
<td>Variable name</td>
<td>Contents</td>
<td>Data type</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-------------------</td>
<td>----------------------------------------------------------------------------------------------------</td>
<td>-------------------------</td>

<td>ATH.AULGLGGM</td>
<td>The GMT logon time, which is provided as a timestamp. The format is YYYY/MM/DD-HH:MM:SS.NNNNNN.</td>
<td>Character, read-only</td>
</tr>
<tr>
<td>Local logon time</td>
<td>ATH.AULGLGTM</td>
<td>The local logon time, which is provided as a timestamp. The format is YYYY/MM/DD-HH:MM:SS.NNNNNN.</td>
<td>Character, read-only</td>
</tr>
<tr>
<td>Uncompressed bytes</td>
<td>ATH.AULGWRTO</td>
<td>The total number of uncompressed bytes. It is provided by using the next field.</td>
<td>Character, read-only</td>
</tr>
<tr>
<td>Wait</td>
<td>ATH.APAU13WA</td>
<td>The WAITS flag. The following are valid values:</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 0 (zero): WAITS are not allowed.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 1: WAITS are allowed.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>If WAITS are not allowed, I/O and other services that might cause the task to enter a wait state are not allowed. Some logoff operations occur during end-of-task processing when it is important to monitor the wait-allotted flag to prevent unwanted subtask terminations.</td>
<td></td>
</tr>
</tbody>
</table>

**Log on events**

This event occurs when a logon occurs.

A rule for this event can provide the following responses:

- Set or reset all of the execution limits for the current client user ID. The default values are passed to the rule. If the default values are not changed, they are used.
- Set the return value to REJECT, and use the ATH.OPAUERMG variable to send an error message.
- Set the return value to ACCEPT. Using this return value bypasses the password validation that the security product does. Use ACCEPT only if you do not have a security product that is installed and rely on
- Modify the user ID before the security product processes it.

**Return values**

When an ATH event ends, the rule sets a return value. The server evaluates the return value and invokes z/OS security routines.
<table>
<thead>
<tr>
<th>Return value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACCEPT</td>
<td>Access to the requested resource is allowed, and additional processing by the z/OS security subsystem is not performed.</td>
</tr>
<tr>
<td>REJECT</td>
<td>Access to the requested resource is denied, and additional processing by the z/OS security subsystem is not performed. The rule can include the ATH.OPAUERMG variable, which for most authorization requests, returns an error message to the requestor.</td>
</tr>
<tr>
<td>Any other value</td>
<td>If another value or no value is returned, the z/OS security subsystem performs validation checking. The security product makes the final determine to allow or deny access to the requested resource.</td>
</tr>
</tbody>
</table>

LOGON variables are used for events that pertain to setting or resetting execution limits for the current client user ID, rejecting the current logon attempt, bypassing password validation, or modifying a user ID before it is processed by RACF/ACF2.

<table>
<thead>
<tr>
<th>Descriptive name</th>
<th>Variable name</th>
<th>Contents</th>
<th>Data type</th>
</tr>
</thead>
</table>
| Security optimization | ATH.AUPWAEC | The Security Optimization flag. The following are valid values:  
• 0 (zero): Security optimization is not active.  
• 1: Security optimization is active. | Character, read-only |
| Security optimization cache | ATH.AUPWAERT | The amount of time, in seconds, that the security optimization cache entry is retained for the user. | Character, read-only |
| Application name | ATH.AUPWAPNA | The name of the application. This value is optionally set by the ODBC application. | Character, read-write |
| Authentication scheme | ATH.AUPWAUSC | The authentication scheme for the logon. The following are valid values:  
• SDBECURE: A logon by using the SDBECURE API  
• RA-PROXY: A RUNAUTH (proxy) user ID logon  
• BASIC: An HTTP authorization, header user ID logon | Character, read-write |
<table>
<thead>
<tr>
<th>Descriptive name</th>

</table>

### MQ events

This event occurs when an IBM MQ resource is defined. A rule for this event can accept or reject the request or allow the security product to determine if the request is allowed.

### Return values

When an MQ event ends, the rule sets a return value. The server evaluates the return value and invokes z/OS security routines.
### Return value

<table>
<thead>
<tr>
<th>Return value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACCEPT</td>
<td>Access to the requested resource is allowed, and additional processing by the z/OS security subsystem is not performed.</td>
</tr>
<tr>
<td>REJECT</td>
<td>Access to the requested resource is denied, and additional processing by the z/OS security subsystem is not performed. The rule can include the ATH.OPAUERMG variable, which for most authorization requests, returns an error message to the requestor.</td>
</tr>
</tbody>
</table>

- **Any other value**
  - If another value or no value is returned, the z/OS security subsystem performs validation checking. The security product makes the final determine to allow or deny access to the requested resource.

The MQSERIES variable is used for authorization of events that pertain to defining an MQ resource.

<table>
<thead>
<tr>
<th>Descriptive name</th>
<th>Variable name</th>
<th>Contents</th>
<th>Data type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Queue manager</td>
<td>ATH.AUMQQMGR</td>
<td>The name of the queue manager. This name is set only for actions that are specific to one queue manager. This field is not set when the list of queue managers is being requested by a caller.</td>
<td>Character, read-only</td>
</tr>
</tbody>
</table>

### Parameter events

This event occurs when a parameter is updated or accessed. A rule for this event can accept or reject the request or allow the security product to determine if the request is allowed.

### Return values

When a parameter event ends, the rule sets a return value. The server evaluates the return value and invokes z/OS security routines.

<table>
<thead>
<tr>
<th>Return value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACCEPT</td>
<td>Access to the requested resource is allowed, and additional processing by the z/OS security subsystem is not performed.</td>
</tr>
<tr>
<td>REJECT</td>
<td>Access to the requested resource is denied, and additional processing by the z/OS security subsystem is not performed. The rule can include the ATH.OPAUERMG variable, which for most authorization requests, returns an error message to the requestor.</td>
</tr>
</tbody>
</table>
The PARMS variable is used for authorization of events that pertain to accessing or updating a product parameter.

| Product parameter name | ATH.AUPAPANA | The product parameter name. | Character, read-only |

SDB events
This event occurs when an attempt is made to run the SDB command. A rule for this event can accept or reject the request or allow the security product to determine if the request is allowed.

Return values
When an SDB event ends, the rule sets a return value. The server evaluates the return value and invokes z/OS security routines.

<table>
<thead>
<tr>
<th>Return value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACCEPT</td>
<td>Access to the requested resource is allowed, and additional processing by the z/OS security subsystem is not performed.</td>
</tr>
<tr>
<td>REJECT</td>
<td>Access to the requested resource is denied, and additional processing by the z/OS security subsystem is not performed. The rule can include the ATH.OPAUERMG variable, which for most authorization requests, returns an error message to the requestor.</td>
</tr>
<tr>
<td>Any other value</td>
<td>If another value or no value is returned, the z/OS security subsystem performs validation checking. The security product makes the final determine to allow or deny access to the requested resource.</td>
</tr>
</tbody>
</table>

SDB variables are used for authorization of events that pertain to execution of an SDB command.

</tr>
</tbody>
</table>
SEF events
This event occurs when an attempt is made to run the SEF (event facility) command runs. A rule for this event can accept or reject the request or allow the security product to determine if the request is allowed.

Return values
When an SEF event ends, the rule sets a return value. The server evaluates the return value and invokes z/OS security routines.

<table>
<thead>
<tr>
<th>Return value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACCEPT</td>
<td>Access to the requested resource is allowed, and additional processing by the z/OS security subsystem is not performed.</td>
</tr>
<tr>
<td>REJECT</td>
<td>Access to the requested resource is denied, and additional processing by the z/OS security subsystem is not performed. The rule can include the ATH.OPAUERMG variable, which for most authorization requests, returns an error message to the requestor.</td>
</tr>
<tr>
<td>Any other value</td>
<td>If another value or no value is returned, the z/OS security subsystem performs validation checking. The security product makes the final determine to allow or deny access to the requested resource.</td>
</tr>
</tbody>

</tbody>
</table>
### Token events

This event occurs when a token is accessed. A rule for this event can accept or reject the request or allow the security product to determine if the request is allowed.

### Return values

When a token event ends, the rule sets a return value. The server evaluates the return value and invokes z/OS security routines.

<table>
<thead>
<tr>
<th>Return value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACCEPT</td>
<td>Access to the requested resource is allowed, and additional processing by the z/OS security subsystem is not performed.</td>
</tr>
<tr>
<td>REJECT</td>
<td>Access to the requested resource is denied, and additional processing by the z/OS security subsystem is not performed. The rule can include the ATH.OPAUERMG variable, which for most authorization requests, returns an error message to the requestor.</td>
</tr>
<tr>
<td>Any other value</td>
<td>If another value or no value is returned, the z/OS security subsystem performs validation checking. The security product makes the final determine to allow or deny access to the requested resource.</td>
</tr>
</tbody>
</table>

TOKENS variables are used for authorization of events that pertain to the access of an execution token.

<table>
<thead>
<tr>
<th>Descriptive name</th>
<th>Variable name</th>
<th>Contents</th>
<th>Data type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Host name</td>
<td>ATH.AUTKHONA</td>
<td>The host name field, which contains the host name of the client that created the current token. This field is not set for multiple token fetch requests.</td>
<td>Character, read-only</td>
</tr>
<tr>
<td>ID string</td>
<td>ATH.AUTKIDSR</td>
<td>The token ID string, which contains the token ID that is being accessed or deleted. This field is not set for multiple token fetch requests.</td>
<td>Character, read-only</td>
</tr>
</tbody>
</table>
## TSO events

This event occurs when a TSO command runs. A rule for this event can accept or reject the request or allow the security product to determine if the request is allowed.

## Return values

When a TSO event ends, the rule sets a return value. The server evaluates the return value and invokes z/OS security routines.

<table>
<thead>
<tr>
<th>Return value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACCEPT</td>
<td>Access to the requested resource is allowed, and additional processing by the z/OS security subsystem is not performed.</td>
</tr>
<tr>
<td>REJECT</td>
<td>Access to the requested resource is denied, and additional processing by the z/OS security subsystem is not performed. The rule can include the ATH.OPAUERMG variable, which for most authorization requests, returns an error message to the requestor.</td>
</tr>
</tbody>
</table>

For any other value, if another value or no value is returned, the z/OS security subsystem performs validation checking. The security product makes the final determine to allow or deny access to the requested resource.

TSO variables are used for authorization of events that pertain to execution of a TSO command.

<table>
<thead>
<tr>
<th>Descriptive name</th>
<th>Variable name</th>
<th>Contents</th>
<th>Data type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Buffer length</td>
<td>ATH.AUOSBULN</td>
<td>The TSO command buffer length.</td>
<td>Character, read-only</td>
</tr>
<tr>
<td>Buffer</td>
<td>ATH.AUOSCMBU</td>
<td>The TSO command buffer.</td>
<td>Character, read-only</td>
</tr>
</tbody>
</table>
### User events
This event occurs when information about a remote user is accessed, when a remote user connection is terminated, and when a cancel Db2 thread operation occurs. A rule for this event can accept or reject the request or allow the security product to determine if the request is allowed.

### Return values
When a user event ends, the rule sets a return value. The server evaluates the return value and invokes z/OS security routines.

<table>
<thead>
<tr>
<th>Return value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACCEPT</td>
<td>Access to the requested resource is allowed, and additional processing by the z/OS security subsystem is not performed.</td>
</tr>
<tr>
<td>REJECT</td>
<td>Access to the requested resource is denied, and additional processing by the z/OS security subsystem is not performed. The rule can include the ATH.OPAUERMG variable, which for most authorization requests, returns an error message to the requestor.</td>
</tr>
<tr>
<td>Any other value</td>
<td>If another value or no value is returned, the z/OS security subsystem performs validation checking. The security product makes the final determine to allow or deny access to the requested resource.</td>
</tr>
</tbody>
</table>

### USERS variables
USERS variables are used for authorization of events that pertain to accessing or killing connections of a remote user.

<table>
<thead>
<tr>
<th>Descriptive name</th>
<th>Variable name</th>
<th>Contents</th>
<th>Data type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection ID</td>
<td>ATH.AUUSCNID</td>
<td>The connection ID, which is set only for stop or cancel operations.</td>

<td></td>
</tr>
</tbody>
</table>

**Command (CMD) events**

Command events control client/server access to the mainframe.

When the Accelerator Loader server receives a command from a z/OS console, a rule is scheduled to run. The console can be a physical console or extended software, such as System Display and Search Facility (SDSF) or CA OPS/MVS Event Management and Automation. The command consists of a command verb, followed by optional operands. The command verb string is matched against enabled CMD rules to find the rule to run.

CMD rules perform the following tasks:

- Examine the command, parse the operands, and perform necessary actions, such as read and set product parameters. This allows parameters to be displayed and changed from the z/OS console.
- Access and update REXX global variables.
- Use REXX SAY statement to communicate with the console that entered the command. All output from the SAY statement is routed to the console that entered the original command. This allows ASO products to communicate with, interrogate the status, and control the Accelerator Loader server.

**Note:** Because CMD rules can access and update any part of the product, you must control who can create, enable, and disable CMD rules.

All CMD rule processing is done by IBM® Db2® Analytics Accelerator Loader for z/OS/REXX. Processing in another programming language is not supported.
Syntax

To trigger a CMD rule, use the z/OS STOP or MODIFY command, or use a z/OS command that specifies the subsystem name. The following commands are valid:

- `MODIFY xDBy, command text`
- `xDBy command text`
- `xDBy, command text`

where `xDBy` is a specific instance of the Accelerator Loader server, which is identified by the subsystem name that was assigned during installation.

When the z/OS STOP command triggers a CMD rule, the rule can control or reject product shutdown. The criterion of the rule must be STOP or a less specific criterion that matches the STOP command. The z/OS STOP (P) command can also trigger a CMD rule that has the matching criterion of STOP.

Header statement

A CMD criterion is a string of 1 - 30 characters. To schedule the rule to run for all commands, use a single * (asterisk) as the criterion. Use a trailing * (asterisk) as a wildcard character.

Use the following format for the header statement:

/*CMD criterion

Process section

A REXX process section is required.

Return values

The following table lists the return values for CMD rules:

<table>
<thead>
<tr>
<th>Return value</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>None supplied</td>
<td>If the rule runs a RETURN command, the Accelerator Loader server sends a return code that indicates the successful completion of the rule.</td>
</tr>
<tr>
<td>ACCEPT</td>
<td>The command in the rule was successfully completed.</td>
</tr>
<tr>
<td>REJECT</td>
<td>The command in the rule was rejected. To specify why the command was rejected, you REXX SAY statements.</td>
</tr>
</tbody>
</table>

The return value for a STOP CMD rule determines how the Accelerator Loader server terminates. The following return values are valid:

<table>
<thead>
<tr>
<th>Return value</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>None supplied</td>
<td>Termination is allowed to continue.</td>
</tr>
<tr>
<td>ACCEPT</td>
<td>Termination is not allowed to continue.</td>
</tr>
<tr>
<td>REJECT</td>
<td>Termination is not allowed to continue.</td>
</tr>
</tbody>
</table>
**CMD event variables**

Values for these variables are set only when a CMD rule processes a CMD event.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Contents</th>
<th>Data type</th>
</tr>
</thead>
<tbody>
<tr>
<td>CMD.TEXT</td>
<td>Operands that are entered after the command name at the console.</td>
<td>Character, read-only</td>
</tr>
<tr>
<td>CMD.VERB</td>
<td>The command name that is entered at the console.</td>
<td>Character, read-only</td>
</tr>
</tbody>
</table>

**Exception (EXC) events**

An exception event occurs when a task exceeds a specified limit.

The EXC procedure samples that are distributed with the server contain a sample for each of the exception types. Instructions in the samples explain the following information:

- The environment in which the exception is detected.
- The operational controls that affect subsequent processing by the server.
- The valid return values.

The header statement for an EXC rule is /*EXC criterion, where criterion is one of strings in the following table. A process section is required.

<table>
<thead>
<tr>
<th>Criterion</th>
<th>Description</th>
<th>Default action</th>
</tr>
</thead>
</table>
| CPULIMIT    | A transaction task exceeded its maximum CPU time limit. This exception is detected only when multipart messages are being transmitted and only when a new message segment is being read. A rule for this event can take one or more of the following actions:  
  • Use the return value IGNORE to ignore the exception.  
  • Modify the limit for the current thread. This action prevents the exception from occurring again. Use the return value REJECT to terminate the ODBC connection, and use the EXC.OPRERXRMG variable to send an error message to the client.  
  The rule can use the SDBINFO API function and pass or not pass the connection token as the second parameter. | Terminate the transaction task.                    |
<table>
<thead>
<tr>
<th>Criterion</th>
<th>Description</th>
<th>Default action</th>
</tr>
</thead>
</table>
| CPU TIME  | A transaction task exceeded its maximum CPU time limit. This exception can be detected any time while the task is running. A rule for this event can take one or more of the following actions:  
- Use the return value IGNORE to ignore the exception.  
- Modify the limit for the current thread. This action prevents the exception from occurring again. Use the return value KILL to terminate the ODBC connection. No message is sent to the client.  
The rule can use the SDBINFO API function and must pass the connection token as the second parameter. The connection token is required to identify the task that has the exception, rather than the current task. | Terminate the transaction task. |
<p>| IMS FAIL  | An IMS task detected a failing IMS operation. This exception can occur for any type of IMS processing. The rule can use the SDBINFO function without passing the connection token as the second parameter. | Terminate the IMS operation, and reflect the error to the client task. |</p>
<table>
<thead>
<tr>
<th>Criterion</th>
<th>Description</th>
<th>Default action</th>
</tr>
</thead>
</table>
| LOCKEXCLUSIVE | A transaction task exceeded its Db2 exclusive lock limit. A rule for this event can take one of the following actions:  
• Use the return value IGNORE to ignore the exception.  
• Modify the limit for the current thread. This action prevents the exception from occurring again.  
Use the return value KILL to terminate the ODBC connection. No message is sent to the client.  
The rule can use the SDBINFO API function and must pass the connection token as the second parameter. The connection token is required to identify the task that has the exception, rather than the current task. | Terminate the transaction task. |
| LOCKSHARE   | A transaction task exceeded its Db2 share lock limit. A rule for this event can take one of the following actions:  
• Use the return value IGNORE to ignore the exception.  
• Modify the limit for the current thread. This action prevents the exception from occurring again.  
Use the return value KILL to terminate the ODBC connection. No message is sent to the client.  
The rule can use the SDBINFO API function and must pass the connection token as the second parameter. The connection token is required to identify the task that has the exception, rather than the current task. | Terminate the transaction task. |

| SESSIONFAILURE| A transaction task detected that a client task exceeded the session failure limit. This exception can be detected at any time. A rule for this event can take one of the following actions:  
  • Return the value IGNORE to ignore the exception.  
  • Modify the time limit for the current thread.  
  • Return the value KILL to terminate the ODBC connection. No message is sent to the client. | Terminate the ODBC client task.                    |
| SQLFAIL       | A transaction task detected that a SQL statement failed. When a failure occurs, a negative SQL code is set. Only SQL operations that the server runs, such as for /*EXECSQL rules, detect this exception. The exception is not detected when a user-written high-level language (HLL) program invokes a long-running SQL operation. | Returns the SQL error code to the transaction task. |
| TIMERONLIMIT  | A transaction task detected that a prepare returned a timer-on value that exceeds the limit. Only SQL operations that the server runs, such as for /*EXECSQL rules, detect this exception. The exception is not detected when a user-written high-level language (HLL) program invokes a prepare. A rule for this event can take one of the following actions:  
  • Return the value ALLOW, which allows the exception.  
  • Modify the limit.  
  • Return the value REJECT, which terminates the SQL statement, and use the EXC.OPERMG variable to return an error message to the client.  
  The rule can use the SDBINFO function without passing the connection token as the second parameter. |                                                            |
<table>
<thead>
<tr>
<th>Criterion</th>

<th>Default action</th>
</tr>
</thead>
</table>
| WAITTIME                | A transaction task exceeded the wait time limit. This exception can be detected at any time. A rule for this event can take one of the following actions:  
  • Return the value IGNORE to ignore the exception.  
  • Modify the limit.  
  • Return the value KILL to terminate the ODBC connection. No message is sent to the client.  
  The rule can use the SDBINFO API function and must pass the connection token as the second parameter. The connection token is required to identify the task that has the exception, rather than the current task. | Allow or terminate the SQL statement, which is based on the value of the SQLENGDFLTEXCACTION parameter. |
| ZSQLALLIMSSEREGMENTS    | SQL Solution determined that a SQL statement causes all IMS segments that are specified as tables to be read because the child segments that are being joined are not constrained. The query does not specify the CHILD_ID and PARENT_ID columns in the WHERE clause. | Allow or terminate the SQL statement, which is based on the value of the SQLENGDFLTEXCACTION parameter. |
| ZSQLFULLDBREAD          | SQL Solution determined that a SQL statement causes all database source records to be read because the subtable query is not constrained. The query does not specify the CHILD_KEY and PARENT_KEY columns in the WHERE clause. | Allow or terminate the SQL statement, which is based on the value of the SQLENGDFLTEXCACTION parameter. |
| ZSQLINCKEYBEGINNING     | SQL Solution determined that only the beginning of an incomplete key was specified for one of the tables in a query. This situation might occur when multiple columns comprise the key and the query that is specified only the beginning columns. This situation is acceptable for VSAM access, but it might incur additional overhead for IMS access. | Allow or terminate the SQL statement, which is based on the value of the SQLENGDFLTEXCACTION parameter. |
ZSQLINCKEYPARTIAL

SQL Solution determined that only part of an incomplete key was specified for one of the tables in the query and that the beginning portion of the key was not specified.

Default action: Allow or terminate the SQL statement, which is based on the value of the SQLENGDFLTEXCACON parameter.

ZSQLNOKEYCOLUMNS

SQL Solution determined that no key columns were specified in the WHERE clause. This situation causes the entire database to be read.

Default action: Allow or terminate the SQL statement, which is based on the value of the SQLENGDFLTEXCACON parameter.

ZSQLNOWHERECLAUSE

SQL Solution determined that no WHERE clause was provided for a table. This situation causes the entire database to be read.

Default action: Allow or terminate the SQL statement, which is based on the value of the SQLENGDFLTEXCACON parameter.

Variables for all EXC events

You can use the variables in the following table in any EXC rule:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Contents</th>
<th>Data type</th>
</tr>
</thead>
</table>
| EXC.OPEXACSR  | The action string for the current exception. This string cannot be directly changed; however, the return value from some rules can change the action string. The following are valid values:  
  • ACCEPT: Accept the current condition  
  • IGNORE: Ignore the current condition  
  • KILL: Kill the current client connection  
  • ALLOW: Allow the current exception  
  • NOACTION: Take no action  
  • REJECT: Reject the current exception  
  • TERMINATE: Terminate the current client connection | Character, read-only    |
<table>
<thead>
<tr>
<th>Variable</th>

<td>Character, read-write</td>
</tr>
<tr>
<td>EXC.EXWATMVL</td>
<td>The wait time value, which shows how long the current task has been waiting for a request from a client.</td>
<td>Character, read-only</td>
</tr>
</tbody>
</table>
SQL events

A SQL event occurs when a SQL statement is processed.

A SQL rule runs before the SQL source is prepared. If a SQL source is modified, it is prepared or passed to run immediately after the SQL rule runs. Use SQL rules for the following purposes:

**Modify a SQL source**

To modify a SQL source, add or modify a WHERE clause.

**Reject a SQL statement**

To reject a SQL statement, use the REJECT return value. You can also use the SQL.MESSAGE to send a message to the client. If the SQL statement is rejected, set the SQL.CODE variable to a negative value. Otherwise, the value -1 is used as the SQL code.

**Accept a SQL statement**

To accept a SQL statement, set the return value to ACCEPT. If the SQL statement is accepted, Db2 does not run it. Instead, the rule processes the statement. To send a warning or error message to the client, use the SQL.MESSAGE variable. For warnings, a positive value. For failures, use a negative value. If the return code is ACCEPT and a non-zero value is set for the SQL.CODE variable, a message is sent to the client. If a message is not provided, a default message is constructed and sent.

When a SQL event occurs, the system extracts information about the event and creates the following variables. These variables are instantiated when the SQL rule is scheduled to run. You can write a SQL rule that accesses the following variables:

<table>
<thead>
<tr>
<th>Criterion</th>
<th>Variable</th>
<th>Contents</th>
<th>Data type</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALL</td>
<td>SQL.CODE</td>
<td>The code to return to the client</td>
<td>Character, read-write</td>
</tr>
<tr>
<td>ALL</td>
<td>SQL.MESSAGE</td>
<td>The message to return to the client</td>
<td>Character, read-write</td>
</tr>
<tr>
<td>ALL</td>
<td>SQL.SEARCHID</td>
<td>The SQL verb that is extracted from the current SQL string</td>
<td>Character, read-only</td>
</tr>
<tr>
<td>ALL</td>
<td>SQL.TEXT</td>
<td>The actual SQL source</td>
<td>Character, read-only</td>
</tr>
<tr>
<td>ALL</td>
<td>SQL.USER</td>
<td>The user area that is passed among all rules</td>
<td>Character, read-write</td>
</tr>
</tbody>
</table>

**Time-of-day (TOD) events**

A time-of-day event occurs when the z/OS timer that is associated with a rule expires.

To specify the header statement, use the following syntax:

```sql
/*TOD todspec, interval, endspec, maxexecs
```

where:

- `todspec` is the date or time. You must specify either `todspec` or `interval`. Use one of the following formats to specify `todspec`:

  - `yyyyMMdd` (for date)
  - `hhmmss` (for time)
– **ddMMMyyyy**, where *dd* is a 2-digit integer (01 - 31) that represents the day of the month; *MMM* is a 3-character abbreviation for the month (JAN, FEB, MAR, APR, MAY, JUN, JUL, AUG, SEP, OCT, NOV, DEC); and *yyyy* is a 4-digit year.

– **yymmday**, where *yy* is a 2-digit year; *mm* is a 2-digit month; and *day* is the full name of a day of the week, for example, SUNDAY or MONDAY.

– **hh:mm:ss**, where *hh* is a 2-digit integer (00 - 23) for the hour; *mm* is a 2-digit integer (00 - 59) for the minute; and *ss* is a 2-digit integer (00 - 59) for the seconds after the minute. The *ss* value is optional.

• **interval** is the amount of time to wait before running the rule again. You must specify either **todspec** or **interval**. Use the following format to specify the **interval**:
  
  – **n units**, where *n* is an integer that represents the number of times to run the rule, and **units** is the time to wait before running the rule again. For **units**, specify one of the following: **DAY, DAYS, WEEK, WEEKS, HOUR, HOURS, MINUTE, MINUTES, SECOND, SECONDS**.

• **endspec** is the time or date after which the rule stops running. This parameter is optional.

• **maxexecs** is an integer that represents the maximum number of times to run the rule. This parameter is optional.

**Note:** If you omit any parameter, code a comma in its place.

The value that is returned from a TOD rule has no special meaning.

When a TOD event occurs, the system extracts information about the event and creates the following variables. These variables are instantiated when the rule is scheduled for execution.

<table>
<thead>
<tr>
<th>Criterion</th>
<th>Variable</th>
<th>Contents</th>
<th>Data type</th>
</tr>
</thead>
</table>
| ALL       | TOD.NEXTFIRE | A value that indicates the next time that the rule runs. The following are valid values:  

- The date and time in *yyyy/mm/dd hh:mm:ss* format.  
- NONE if the rule will not run again. | Character, read-only |
| ALL       | TOD.USER     | An 8-byte field for passing information among multiple rules. This field is initialized to binary zeroes. | Character, read-write |

**Virtual table (VTB) events**

Virtual table events are generated by the SQL Engine when a table name is found in an SQL statement. These events are only generated if the **SEVFTEVENTS** startup parameter is set to allow them. The rules allow for creating virtual tables dynamically from a Data Mapping facility (DMF) model map and for modifying certain table values.
No keywords are defined for VTB event procedures. Only the SQL engine schedules execution of enabled VTB event procedures for each table name in an SQL statement. VTB event procedures allow you to modify information in the DMF map. VTB event procedures make it possible to access multiple data sets using one DMF map by creating alias maps using a model map. Each alias map can specify a different data set name. The model map must be a map that is created by using DMF.

Only the event procedure criterion value is allowed (and *must* be present).

To specify the header statement, use the following syntax:

```sql
/*VTB criterion

where:
• criterion is the criterion value for VTB event procedures. This criterion is one of the two event types that are shown in the following table.

Each VTB event procedure has access to server-wide global variables.

In addition, VTB-specific variables are created before the VTB event procedure is invoked. The variables that are created differ depending on the criterion.

<table>
<thead>
<tr>
<th>Criterion</th>
<th>Variable</th>
<th>Contents</th>
<th>Data type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any criterion</td>
<td>VTB.USER</td>
<td>The user area is passed between all event procedures that fire for the same event.</td>
<td>Read-write</td>
</tr>
<tr>
<td>Any criterion</td>
<td>VTB.OPTBSRID</td>
<td>The search id field contains the criterion used to fire the current event procedure. The format of the criterion is the string 'MODIFYTABLE' followed by the table name found in the SQL statement.</td>
<td>Character, Read-only</td>
</tr>
<tr>
<td>Any criterion</td>
<td>VTB.OPTBTBNA</td>
<td>The 1 to 128-character table name from the SQL statement.</td>
<td>Character, Read-only</td>
</tr>
<tr>
<td>MODIFYTABLE.tablename</td>
<td>VTB.OPTBMTNA</td>
<td>Set the model table name. This is the 1 to 50-character name of a DMF map that will be used to create a virtual table with the alias name tablename</td>
<td>Character, write</td>
</tr>
<tr>

### Host commands

Use host commands to retrieve output information from a specified host environment.

**DISPLAY command**

Use the DISPLAY command to display information about all connected users.
Displaying basic information

Use the following syntax to display basic information about all connected users:
"DISPLAY REMOTE USERS(*)"

This command displays the following information about each connected user:
- ACTUAL BLOCK ADDRESS
- APPLICATION NAME
- CONNECTION ID
- DB2 SUBSYSTEM
- HOST NAME
- ICUV PATH ID
- IP ADDRESS
- LINK TYPE
- LOCAL IP PORT NUMBER
- REMOTE IP PORT NUMBER
- SOCKET NUMBER
- TRUSTED HOST
- USER ID
- TASK TCB ADDRESS
- TRUSTED HOST
- USER ID

Displaying additional information

Use the following syntax to display additional information about all connected users:
"DISPLAY REMOTE USERS(*) VERBOSE"

This command provides the following additional information about each connected user:
- ACEE SOURCE
- BUFFER FUNCTION CODE
- COMPRESSED SEND AMOUNT
- COMPRESSED TOTAL Bytes RECEIVED
- CPU TIME
- CUMULATIVE COMPRESSION
- CUMULATIVE RECEIVED COMPRESSION
- CURRENT COMPRESSED RECEIVED AMOUNT
- CURRENT RAW RECEIVED AMOUNT
- CURRENT STATE
- DB2 PLAN NAME
- DB2 REQUESTING SITE
- DB2 THREAD TOKEN
- DOMAIN NAME
- ELAPSED TASK TIME
- EXTENDED USER ID
• GENERIC USER ID
• HOST TIME
• INTERNAL NAME
• LAN USER ID
• LOCKS HELD
• MODULE NAME
• ODBC DRIVER DATE
• ODBC DRIVER VERSION
• PROGRAM NAME
• RAW BYTES RECEIVED
• RAW BYTES SENT
• RAW RECEIVED COMPRESSION
• RAW SEND AMOUNT
• RAW SEND COMPRESSION FACTOR
• SQL CODE
• SQL COUNT
• SQL CURSOR NUMBER
• SQL REASON CODE
• SQL RETURN CODE
• SQL STATEMENT NUMBER
• SQL STATEMENT TYPE
• STATE DURATION
• TELEPROCESSING TIME
• TELEPROCESSING TIME PERCENTAGE
• TOTAL RAW BYTES SENT
• USER PARAMETER
• WLM ENCLAVE COUNT
• WLM ENCLAVE CPU TIME

API functions for rules

HLVVALUE API function
Use the HLVVALUE function to manipulate global variables.

For example, use the HLVVALUE function to use compound symbols as a type of database. Use this function in a rule that performs special interrogation or serialization processing.

Under normal circumstances, you can use a REXX language statement to reference or set the value of a global variable. The following code shows an example of using a REXX statement to

SAVENAME = GLOBAL.COMPANY.NAME
GLOBAL.COMPANY.NAME = "Keroct Software"
GLVEVENT.MYDATA = "ABC"

Syntax

val = HLVVALUE(derivedname, actioncode, newval, oldvar)

where:
• *derivedname* is the name of the symbol that receives the action. When you use this parameter without quotation marks, simple symbols (case sensitive) following the stem are replaced by their values.

• *actioncode* is the action to take on the symbol.

• *newval* is the new value to assign to the symbol.

• *oldval* is the value of the symbol before the action is taken.

**Return values**

HLVVALUE returns a value from the function call, and for some action codes, places information in the external data queue.

**Action codes**

The following table describes the actions that are performed for each action code and the values that are returned.

*Table 20. Action Codes and return values*

<table>
<thead>
<tr>
<th>Action code</th>
<th>Description</th>
<th>Return value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A (Add)</td>
<td>Adds a number, which is specified by increment, to the existing compound symbol given by <em>derivedname</em>. All references to the compound symbol are serialized during the add operation, so you can use this function to increment a counter that is set by concurrent tasks.</td>
<td><code>val = HLVVALUE (derivedname'A' increment)</code></td>
<td>Returns 1 (true) if the comparison finds the pre-action value to be equal to the old value and the compound symbol was updated. Returns 0 (false) if the comparison finds unequal values and does not update the value of the compound symbol. Does not change the external data queue.</td>
</tr>
<tr>
<td>C (Compare and update)</td>
<td>Verifies the value of a compound symbol and then updates its value. Safely updates global symbols that more than one rule uses or global symbols that multiple copies of the same rule might access and update. Serializes the compare and update operations for global values.</td>
<td><code>val = HLVVALUE (derivedname,'C', newval,oldval)</code></td>
<td>Returns 1 (true) if the comparison finds the pre-action value to be equal to the old value and the compound symbol was updated. Returns 0 (false) if the comparison finds unequal values and does not update the value of the compound symbol. Does not change the external data queue.</td>
</tr>
<tr>
<td>Action code</td>
<td>Description</td>
<td>Return value</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-------------</td>
<td>--------------</td>
<td>-------------</td>
</tr>
<tr>
<td>D (Drop)</td>
<td>Drops the compound symbol that is specified by <code>derivedname</code>. Resets the compound symbol to its uninitialized value or derived name. If <code>derivedname</code> specifies a stem, all compound symbols that belong to that stem are dropped and the virtual storage that is allocated to them is released. All other references see the compound symbol as it existed before the drop operation started or as it is after the drop operations finishes.</td>
<td><code>val = HLVVALUE(derivedname,'D')</code></td>
<td>Returns the value of <code>derivedname</code>. Does not change the external queue.</td>
</tr>
</tbody>
</table>
| E (Existence) | Determines whether a global variable exists. | `val = HLVVALUE(derivedname,'E')` | Returns one of the following values for the status of the global variable:  
  * I: Initialized  
  * U: Uninitialized. The variable exists in storage, but it is uninitialized so it is set to the value of its name.  
  * N: Does not exist. The variable does not exist in storage.  
Does not change the external data queue. |
<table>
<thead>
<tr>
<th>Action code</th>
<th>Description</th>
<th>Return value</th>
<th>Description</th>
</tr>
</thead>
</table>
| F (Find)    | Determines whether a global variable exists. The maximum length for a string pulled from the external data queue is 350 bytes. Longer strings are truncated. | `val = HLVVALUE (derivedname,'F')` | Returns one of the following values for the status of the global variable:  
  - I: Initialized  
  - U: Uninitialized. The variable exists in storage, but it is uninitialized so it is set to the value of its name.  
  - N: Does not exist. The variable does not exist in storage.  
When the return value is I or U, the value of the node is returned in the external data queue. |
<table>
<thead>
<tr>
<th>Action code</th>
<th>Description</th>
<th>Return value</th>
<th>Description</th>
</tr>
</thead>
</table>
| I (Information) | Returns information about all of the immediate subnodes of the *derivedname*. | $val = \text{HLVVALUE}(\text{derivedname}, 'I')$ | For each subnode, places two lines in the external data queue. The first line contains the next segment of the *derivedname*. The second line contains the following information about the *derivedname*:

- Word 1, length 8: Number of subnodes under this node.
- Word 2, length 8: Create date, in the form yy/mm/dd.
- Word 3, length 8: Create time, in the form hh:mm:ss.
- Word 4, length 17: Create rule or program name.
- Word 5, length 8: Create job name, task name, or TSO ID.
- Word 6, length 8: Last modification date.
- Word 7, length 8: Last modification time.
- Word 8, length 17: Last modification rule or program name.

Does not return partially updated symbol names. |
<table>
<thead>
<tr>
<th>Action code</th>
<th>Description</th>
<th>Return value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>L (List)</td>
<td>Lists the derived name of each subnode of the <code>derivedname</code>.</td>
<td><code>val = HLVVALUE(derivedname,'L')</code></td>
<td>Returns the number of subnodes that are listed in the external data queue. Returns dropped symbols, but does not return removed symbols.</td>
</tr>
<tr>
<td>O (Obtain)</td>
<td>Obtains the value of a global variable.</td>
<td><code>val = HLVVALUE(derivedname,'O')</code></td>
<td>Returns the value of a global variable. If the global variable does not exist, returns an error. Does not change the external data queue.</td>
</tr>
<tr>
<td>R (Remove)</td>
<td>Removes the specified node and all of its subnodes. After a node is removed, it ceases to exist.</td>
<td><code>val = HLVVALUE(derivedname,'R')</code></td>
<td>Returns the number of subnodes that were removed. Does not change the external data queue. Does not allow other accessories of compound symbols to see partially updated symbols.</td>
</tr>
<tr>
<td>S (Subtree)</td>
<td>Lists the entire global variable name of all subnodes of the <code>derivedname</code>.</td>
<td><code>val = HLVVALUE(derivedname,'S')</code></td>
<td>Returns the entire global variable name of all of the subnodes in the external data queue. Returns the number of subnodes that exist, as listed in the external data queue. Does not return partially updated symbol names.</td>
</tr>
<tr>
<td>Action code</td>
<td>Description</td>
<td>Return value</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>------------------------------------------------------------------------------</td>
<td>----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>T (Subtree and information)</td>
<td>Lists the entire global variable name and all subnodes of the derivedname.</td>
<td>( val = \text{HLVVALUE}(\text{derivedname}, 'S') )</td>
<td>Returns the entire global variable name and two lines for each subnode in the external data queue. The first line contains the next segment of the derivedname. The second line contains the information, as described for the Information code, for each derivedname. Does not return partially updated symbol names.</td>
</tr>
<tr>
<td>U (Update)</td>
<td>Assigns newval as the value of the compound symbol that is specified by derivedname. If the compound does not exist, the compound is created and assigned the new value. Use Update to prevent others who access compound symbols from seeing partially updated symbols.</td>
<td>( val = \text{HLVVALUE}(\text{derivedname}, 'U', \text{newval}) )</td>
<td>Returns the variable that is specified by newval. Does not change the external data queue.</td>
</tr>
<tr>
<td>V (Value)</td>
<td>Returns the value of the specified compound symbol. Use Value to prevent the issuer of SDVALUE from seeing partially updated symbols.</td>
<td>( val = \text{HLVVALUE}(\text{derivedname}, 'V') )</td>
<td>Returns the current value of the node. If the node does not exist, it is created but it is not assigned a value. Instead, it is given the same value as its name. Does not change the external data queue.</td>
</tr>
</tbody>
</table>

**HLVINFO API function**

The HLVINFO function retrieves information about the Accelerator Loader server subsystem.

The syntax for the HLVINFO function is the following:

\[ \text{var}=\text{HLVINFO}(\text{arg1[,arg2]}) \]
where \textit{arg1} is a parameter from the following table, and \textit{arg2} is the connection token, which is optional.

The function always returns a return value. If the value requested is not valid for the environment, a NULL string is returned.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Return value</th>
</tr>
</thead>
<tbody>
<tr>
<td>ASID</td>
<td>Returns the address space identifier (ASID) as a 2-byte binary value when invoked using the program API. Returns the ASIDD as a 4-byte value when invoked from REXX.</td>
</tr>
<tr>
<td>BYTES</td>
<td>Returns the number of saved bytes.</td>
</tr>
<tr>
<td>CLOCK</td>
<td>Returns the current time-of-day (TOD) clock value as an 8-byte binary value. This is the unadjusted STCK value.</td>
</tr>
<tr>
<td>CONNECTID</td>
<td>Returns the unique connection ID value.</td>
</tr>
<tr>
<td>CPUDELTA</td>
<td>Returns the 8-byte task CPU time delta value.</td>
</tr>
<tr>
<td>CPUTIME</td>
<td>Returns the 8-byte task CPU time value.</td>
</tr>
<tr>
<td>DB2PLAN</td>
<td>Returns the name of the Db2 plan.</td>
</tr>
<tr>
<td>DB2SUBSYS</td>
<td>Returns the name of the Db2 subsystem.</td>
</tr>
<tr>
<td>EVENTTYPE</td>
<td>Returns the type of event that is associated with the rule or program.</td>
</tr>
<tr>
<td>HOSTDOMAIN</td>
<td>Returns the host (server) domain that is associated with the current request.</td>
</tr>
<tr>
<td>HOSTNAME</td>
<td>Returns the host name (client) associated with the current request.</td>
</tr>
<tr>
<td>IPADDRESS</td>
<td>Returns the fully formatted IP address for the current request in the form 10.17.16.164.</td>
</tr>
<tr>
<td>JOBNAME</td>
<td>Returns the z/OS job name that is related to the current primary address space.</td>
</tr>
<tr>
<td>LASTCONNECTID</td>
<td>Returns the last connection ID used on the current link.</td>
</tr>
<tr>
<td>LASTUSERID</td>
<td>Returns the last user ID used on the current link.</td>
</tr>
<tr>
<td>LINKTYPE</td>
<td>Returns the link type for the current request.</td>
</tr>
<tr>
<td>LU</td>
<td>Returns the LU name for the current request.</td>
</tr>
<tr>
<td>MAINPGM</td>
<td>Returns the name of the main REXX program or rule.</td>
</tr>
<tr>
<td>MODE</td>
<td>Returns the mode name for the current request.</td>
</tr>
<tr>
<td>ODBCDATE</td>
<td>Returns the compile date of the .NET Client (ODBC).</td>
</tr>
<tr>
<td>ODBCVERSION</td>
<td>Returns the version of the .NET Client (ODBC).</td>
</tr>
<tr>
<td>PRODUCT</td>
<td>Returns the product identification string.</td>
</tr>
<tr>
<td>PRODUCTSTATUS</td>
<td>Returns the current product status.</td>
</tr>
<tr>
<td>PROGRAM</td>
<td>Returns the name of the REXX program or rule.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Return value</td>
</tr>
<tr>
<td>---------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>ROWS</td>
<td>Returns the number of source rows.</td>
</tr>
<tr>
<td>SEFFEATURE</td>
<td>Returns a single blank if the Server Event Facility (SEF) is not enabled.</td>
</tr>
<tr>
<td>SUBSYS</td>
<td>Returns the accessed subsystem ID from the current OPMS image.</td>
</tr>
<tr>
<td>SUBSYSASID</td>
<td>Returns the ASID of the active subsystem from the real OPMS as a 2-byte binary value when invoked by the program API and as a 4-byte value when invoked from REXX.</td>
</tr>
<tr>
<td>SMFID</td>
<td>Returns the SMF ID.</td>
</tr>
<tr>
<td>TASKTYPE</td>
<td>Returns the task type.</td>
</tr>
<tr>
<td>TRANSTYPE</td>
<td>Returns the transaction program type.</td>
</tr>
<tr>
<td>USERID</td>
<td>Returns the user ID value.</td>
</tr>
<tr>
<td>USERPARAM</td>
<td>Returns the user parameter string from the client.</td>
</tr>
<tr>
<td>VERSION</td>
<td>Returns, as a string, the version of the product subsystem under which the rule or program is running.</td>
</tr>
</tbody>
</table>

**Examples**

The following call sets the REXX variable, IPA, to the fully formatted TCP/IP address of the client program:

IPA = HLVINFO(IPADDRESS)

The following call sets the variable `USER` to the user ID value of the connection that caused the exception. In this example, EXC.OPEXCNTK, which contains the connection token, is used to obtain the user ID because the exception rule runs under the OPCKLM (check limits) task, not the user connection task:

USER = HLVINFO(USERID, EXC.OPEXCNTK)

**HLVECURE API function**

The HLVECURE function performs security-authorization processing.

**Verify data set access**

To verify that the current user has authorization to access a data set, use the following syntax:

```
var = HLVECURE('D', 'dsname', 'accesstype', 'volser')
```

where:

- **dsname** is the name of the data set.
- **accesstype** is the type of data set access to verify. If you do not specify a type, READ access is the default. Valid values are:
  - A: Verify ALTER access.
  - C: Verify CONTROL access.
  - R: Verify READ access.
  - U: Verify UPDATE access.
volser is the volume serial number to validate. If you do not specify a volser, the parameter is blank, by default.

The function returns a message that indicates whether access is allowed.

**Retrieve logon ID field data**

To retrieve security subsystem information from the current user’s ACEE, use the following syntax:

```plaintext
var = HLVECURE('F','fieldname')
```

where `fieldname` is one of the fields in the following table:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Field format</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALTER</td>
<td>Alter authority flag</td>

</tr>
<tr>
<td>SURROGATEUSERID</td>
<td>Surrogate user ID</td>
<td>Character</td>
</tr>
</tbody>
</table>
### Field Description Field format

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Field format</th>
</tr>
</thead>
<tbody>
<tr>
<td>TERMINAL</td>
<td>Terminal ID</td>
<td>Character</td>
</tr>
<tr>
<td>UPDATE</td>
<td>Update authority flag</td>
<td>Bit</td>
</tr>
<tr>
<td>USERDATA</td>
<td>Contents of the user data field</td>
<td>Character</td>
</tr>
<tr>
<td>USERID</td>
<td>Contents of the ACEE user ID field</td>
<td>Character</td>
</tr>
<tr>
<td>USERNAME</td>
<td>User name field</td>
<td>Character</td>
</tr>
<tr>
<td>VERSION</td>
<td>ACEE version code</td>
<td>Binary</td>
</tr>
</tbody>
</table>

The following conversions occur, based on the field format:

- Binary fields are converted to signed decimal values without leading zeroes or blanks. The number zero is returned as 0.
- Character fields are returned as is. If a character field name exceeds the maximum allowed string length, it is truncated to the server configuration/REXX-defined maximum string length.
- Date fields are converted to the format `yyyy/mm/dd`. Leading zeros are retained so that the result is always 10 non-blank characters. A date field that contains zero is returned as `***/**/**`.
- Bit fields are converted to 0 (false or off) or 1 (true or on).
- The GROUPLIST field inquiry returns an integer that represents the number of entries in the group list. Each group name is returned as a separate entry in the external data queue.

### Request security product information

To retrieve information about the security product, use the following syntax:

```plaintext
var = HLVECURE('i', 'name')
```

where `name` is one of the values in the following table:

<table>
<thead>
<tr>
<th>Value</th>
<th>Return value</th>
</tr>
</thead>
<tbody>
<tr>
<td>MODE (Valid only for systems that run ACF2)</td>
<td>Returns one of the following ACF2 operating modes: ABORT, LOG, OFF, WARN, QUIET.</td>
</tr>
<tr>
<td>PRODUCT</td>
<td>Returns the name of the security product or the message UNKNOWN SECURITY PRODUCT.</td>
</tr>
<tr>
<td>RELEASE</td>
<td>Returns the release and version number for the security product.</td>
</tr>
</tbody>
</table>

If the information cannot be obtained, a NULL string is returned.

### Verify access to a generalized resource

To verify that the current user has access to a generalized resource, use the following syntax:

```plaintext
var = HLVECURE('R', class, resource, requestcode)
```

where:

- `class` is the generalized resource class name or for ACF2, the type name.
Note: Rules that verify access to resources use SAF processing. If you use ACF2, you must define the ACF2 resource type as a SAF class name.

- resource is the 1- to 39-byte resource entity name.
- requestcode is the type of access to verify. If you do not specify a request code, READ access is the default. The following are valid values:
  - A: Verify ALTER access.
  - C: Verify CONTROL access.
  - R: Verify READ access.
  - U: Verify UPDATE access.

If access to the resource is allowed, the string ALLOW is returned. Otherwise, an error message is returned.

Verify a user ID and password

Use the following syntax to verify the user ID and password. If the password is valid, the user is logged on to the system. This API call is valid only for ATH events.

```c
var = HVECURE('P', 'userid', 'password', 'newpassword')
```

where:
- userid is the user ID to validate.
- password is the password that is associated with the user ID.
- newpassword is the new password to associate with the user ID.

If you omit the newpassword parameter, the user ID and password are validated. If you specify the newpassword parameter, the password is changed.

If the password is correct, the return value is the string ALLOW. If the password is incorrect, an error message is returned. For ACF2, the counter for invalid password violation for the specified user ID is incremented for each failed attempt.

Use an implied password to validate a user ID

This request causes the specified user ID to be validated. If the password is valid, the user is logged on to the system. The password is not specified on the function call. Instead, the initial inbound transaction request transmits the password. Use this function to perform custom security checks without making the clear text password available to the procedure. This API call is valid only for ATH events.

Use the following syntax to use an implied password to validate a user ID:

```c
var = HVECURE('PI', 'userid', 'newpassword')
```

where:
- userid is the user ID to validate.
- newpassword is the new password to associate with the user ID.

If you omit the newpassword parameter, the function uses the implied password to validate the user ID. If you specify newpassword, the function changes the password. If the password is correct, the return value is the string ALLOW. If the password is incorrect, an error message is returned. For ACF2, the counter for invalid password violation for the specified user ID is incremented for each failed attempt.
HLVSUBMIT API function

Use the HLVSUBMIT function to submit JCL to the internal reader and return the JES2 or JES3 job ID for each submitted job.

The HLVSUBMIT function can be invoked as a function reference, which returns its result to the point of invocation, or as a REXX CALL statement. There is no corresponding TSO/E REXX or high-level language (HLL) API interface.

- The JCL statements read from the input stream can be any size; however, each individual statement is extended or truncated to be 80 bytes when submitted through the internal reader.
- In cases where the JCL input stream is ASCII or UTF-8 encoded, for example, for POSTED input, the function converts the JCL stream to IBM-1047 EBCDIC. Only rudimentary UTF-8 support is available, so avoid including double-byte characters and ASCII characters above code point 0x7F.
- The function provides no editing and imposes no restrictions on the content and format of JOB statement names in the JCL that is submitted.
- To detect job boundaries, the function scans each JCL statement. The following situations indicate a job boundary:
  - The JCL statement begins with “//”, followed by an uppercase EBCDIC Latin letter or one of the IBM 1047 EBCDIC characters “@”, “$”, or “#”.
  - The prefix is followed by 0 - 7 Latin letters or numbers or the IBM 1047 EBCDIC characters “@”, “$”, or “#”.
  - The next blank-delimited word is JOB. After this word is found, the scan stops parsing the statement.
  - The scan does not take into account quoted string boundaries that enclose continued PARM= operands and does not detect, honor, and process JCL statement continuations.
- Jobs that are submitted while a client user ID logon are in effect are given a USER attribute that matches the logon ID of the client subtask. If the JCL USER= operand of the JOB statement is present and differs from the client task logon ID and PASSWORD= is not present, RACF surrogate user attribute assignment and authorization restrictions might be imposed.
- The HLVSUBMIT function can be used only in REXX language rules. The function cannot be used in a rule that runs in cross-memory mode or one for which waiting for system services is inhibited. Areas where HLVSUBMIT cannot be used or can be used only conditionally include the following:
  - HLVSUBMIT cannot be used during enabling or disabling a rule, which occurs when the PHASE variable is not set to PROC.
  - HLVSUBMIT cannot be used in CMD, GLV, and TYP rules.
  - To determine when HLVSUBMIT can be used, an ATH rule can check the value of the ATH.OPAU13WA variable, and an EXC rule can check the value of the EXC.OPEXWAOK variable. If HLVSUBMIT can be used, the variable is preset to 1.

Use the following syntax:

```
HLVSUBMIT(arg1, arg2, arg3, arg4 )
```

or

```
CALL HLVSUBMIT(arg1, arg2, arg3, arg4 )
```

where:

- `arg1` and `arg2` specify the location of the input JCL stream.
• _arg3_ specifies the 1-character JES class to which the internal reader is allocated.

• _arg4_ is a string that specifies the type of tracing.

The following table lists the valid values for _arg1_ and _arg2_:

<table>
<thead>
<tr>
<th>Value</th>
<th>arg1: Location of the JCL input stream</th>
<th>arg2</th>
</tr>
</thead>
<tbody>
<tr>
<td>STEM</td>
<td>The JCL is in a REXX stem variable array. The 0th entry in the array contains the count of entries. Entries 1 - n contain individual JCL statements.</td>
<td>The REXX variable stem name. The name must end with a period. Length 1- 12 character.</td>
</tr>
<tr>
<td>DSN</td>
<td>The JCL is in a z/OS data set.</td>
<td>A fully qualified z/OS data set name. The name can include a PDS(E) member name. Length 1- 54 bytes.</td>
</tr>
<tr>
<td>DDN</td>
<td>The JCL is in a z/OS data set that is preallocated to a DD name.</td>
<td>The DD name. Length 1- 8 bytes.</td>
</tr>
<tr>
<td>PATH</td>
<td>The JCL is in a USS HFS file.</td>
<td>The fully qualified HFS path name of the file. Length 1 - 256 bytes.</td>
</tr>
<tr>
<td>POSTED</td>
<td>The JCL is received as a posted file entity over HTTP.</td>
<td>The index number, 1 to n, of the posted file entity in the received HTTP request. If this argument is omitted, the default value is 1.</td>
</tr>
</tbody>
</table>

_arg3_ is the 1-character JES class to which the internal reader is allocated. The character A - Z, 0 - 9, and * (asterisk) are valid. Use * to request the default job class. If you do not specify this parameter, * is the default.

_arg4_ is a string that is 1 - 5 bytes. Each character of the string must be Y or N to specify whether the corresponding trace function for that byte is enabled. The following table describes the byte positions and trace functions:

<table>
<thead>
<tr>
<th>Byte position</th>
<th>Default</th>
<th>Trace function</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Y</td>
<td>Trace JOB IDs that JES returns.</td>
</tr>
<tr>
<td>2</td>
<td>Y</td>
<td>Trace input source JCL.</td>
</tr>
<tr>
<td>3</td>
<td>Y</td>
<td>Trace the dynamic-allocation activity of the internal reader.</td>
</tr>
<tr>
<td>4</td>
<td>N</td>
<td>Trace writes to the internal reader.</td>
</tr>
<tr>
<td>5</td>
<td>N</td>
<td>Trace the decoding of posted data (conversion to EBCDIC).</td>
</tr>
</tbody>
</table>

Unless a REXX ERROR or FAILURE signal is generated because of a fault condition, _arg4_ returns one of the following numeric results:

• 0: Successful completion
- 4: Parameterization error
- 8: Environmental error
- 12: System service error
- 16: ABEND condition that is trapped
- +100: If one or more jobs are submitted before a failure, the value +100 is added to a result. To determine the failure code, subtract 100.

**JOBID. stem variables**

The function uses a REXX DROP on all JOBID. stem variables during entry-processing and presets variables to the values shown in the following table. This reset operation occurs after initial parameter validation but before JCL processing. If the reset fails, the REXX invalid symbol signal is generated. After setup, unless a REXX signal is thrown, the JOBID.RC, JOBID.REASON, JOBID.0, and JOBID.\textit{n} variables are set as described. All other JOBID. stem variables are undefined.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JOBID.RC</td>
<td>Contains the same value as the evaluated RESULT of the function call or if a problem is detected before all other JOBID. stem variables are correctly set, contains a NULL string. JOBID.RC is set to a NULL string at entry, and setting this variable to the RESULT is the last action that the function takes before exit.</td>
</tr>
<tr>
<td>JOBID.REASON</td>
<td>When the function call ends with a non-zero RESULT, contains error text. This variable is set to a NULL string when the RESULT is zero.</td>
</tr>
<tr>
<td>JOBID.0</td>
<td>Contains an integer that indicates the number of jobs that were found in the input JCL stream and successfully submitted to the internal reader. If no jobs were successfully submitted or if a system failure prevented the return of any job IDs during processing, this variable contains 0 (zero). If one or more jobs are submitted before a failure, this variable contains the number of submitted jobs for which IDs were returned.</td>
</tr>
<tr>
<td>JOBID.\textit{n}</td>
<td>Contains the job ID that is assigned to the first through \textit{n}th job in the submitted JCL stream. Valid job IDs are in the format JOBxxxx or Jxxxx, where xxxx is a system-assigned sequence number. Only the variables JOBID.1 through JOBID.\textit{n}, where \textit{n} is the numeric value that is assigned to JOBID.0 are set.</td>
</tr>
</tbody>
</table>
**Monitoring**

Accelerator Loader server provides powerful diagnostic tools that can record critical events for individual transactions. This information can be used to diagnose, debug, and correct problems.

Accelerator Loader server provides the following trace options:
- Server Trace
- Instrumentation Server (IS)
- Server Trace Archival Facility
- SQL Tracing

**Server Trace**

The Server Trace adds Accelerator Loader server trace records to a trace buffer maintained in virtual storage. When the session is finished, the trace records are automatically saved in a VSAM data set.

Trace records are written for the following actions:
- SQL operations
- IMS calls
- CICS calls
- Communication events (LU 6.2, TCP/IP, and messages)
- Thread attach and detach events
- Remote Procedure Call (RPC) events
- Message events
- Errors (abends)

A Remote Procedure Call (RPC) can add its own trace messages to the trace for diagnostic purposes.

Using Trace Browse, you can perform the following actions:
- Display formatted columns of information, such as user ID and time
- Use FIND and LOCATE commands to search for data or a specific time and date
- Use the DISPLAY command to display additional columns of information
- Use the STATUS command to display the Trace Browse status area

In general, the Server Trace can accommodate the complete record of all client/server processing for several days. However, using hierarchical storage management, you can maintain an unlimited history of data. The Server Trace data collection routines support collection of all the data required for auditing, capacity planning, and trend analysis of usage patterns. You can set security for the Server Trace filter functionality to prohibit viewing of sensitive data by a non-authorized user.

**Instrumentation Server**

Using the Instrumentation Server (IS), you can run multiple instances of the server in a sysplex and route trace information to a single repository so that you have a global view of all activity.
Server Trace Archival Facility

Use the Server Trace Archival Facility to back up, or archive, active trace information. The archive consists of a large block of virtual storage, which can be backed up by a data-in-virtual (DIV) linear data set. This block of virtual storage is sub-divided into the following parts:

- The status area occupies the first 4 KB page of the virtual storage and contains checkpoint information about the trace area and information about the most recent trace archive.
- Event blocks begin in the second 4 KB page of the virtual storage area. Each event block occupies 896 bytes of storage. Each server event is recorded in the next available slot, beginning with the first slot, continuing to the end of the event blocks, and wrapping around to the beginning of the event block.
- Vector tables each begin on a 4 KB page boundary, and are located after the event blocks in the trace storage. Each vector table contains index information that allows views of the trace to be filtered without searching through the entire virtual storage area occupied by each individual event block.

SQL Trace

The SQL Trace program provides details about all of the SQL statements that applications issue. The information that is displayed in the SQL Trace program is derived from the main log by using connection IDs as the selection criterion.

When you select an active session, the SQL Trace displays the current information. To refresh the information, press Enter.

Displaying and navigating log entries

Use the Server Trace panel to view, navigate, and manage the log entries that display.

About this task

By default, the Server Trace panel displays all log entries. To view a subset of the log entries, you can filter on the results, use labels, and create a profile. If the server configuration is running on a zIIP server, entries that are related to work that runs on the zIIP server are displayed in pink. If the server is running on a zAAP server, entries that are related to work that runs on the zAAP server are displayed in turquoise.

Procedure

1. From the Primary Option panel, enter 8 on the Option line. The Server Trace panel displays the most recent entries, which are at the end of the list. By default, the time, host name, and description of the event are displayed.
2. On the Server Trace panel, you can navigate through the trace messages in the following ways:
   - Use the UP, DOWN, RIGHT, and LEFT scroll commands (or their PF key equivalents) to navigate this panel.
   - Use the MAX or M scroll operand to scroll the maximum amount in any direction.
   - If you are at the beginning or end of the trace list (and it is full), press ENTER to scroll the list down. Messages are removed from the beginning and added to the end.
3. Optional: Perform any of the following steps:
   - To refresh the list, press Enter.
   - If you reposition the display, to see the most recent entries, issue the DOWN MAX command and then press Enter.
   - To display a different set of columns, type 0 on the command line, followed by the names of the columns to display.

**Server Trace panel columns**

Use the DISPLAY command to display specific columns on the Server Trace panel.

*Table 21. Server Trace panel columns*

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACTION</td>
<td>Displays one of the following:</td>
</tr>
<tr>
<td></td>
<td>• ACC (accept)</td>
</tr>
<tr>
<td></td>
<td>• REJ (reject)</td>
</tr>
<tr>
<td></td>
<td>• NOA (no action)</td>
</tr>
<tr>
<td>ADDRESS</td>
<td>The location in memory of the actual record.</td>
</tr>
<tr>
<td>ADDRJOB</td>
<td>The location in memory of the current record in the JOBNAME vector.</td>
</tr>
<tr>
<td>ADDRUSR</td>
<td>The location in memory of the current record in the USERID vector.</td>
</tr>
<tr>
<td>APMRC</td>
<td>The APPC/MVS return code.</td>
</tr>
<tr>
<td>ASID</td>
<td>The address space ID of the user who created the current record.</td>
</tr>
<tr>
<td>CLOCK</td>
<td>The timestamp of when the record was created.</td>
</tr>
<tr>
<td>CNID</td>
<td>The identifier assigned to each thread that is created.</td>
</tr>
<tr>
<td>CODE</td>
<td>The lowest level return code for each event.</td>
</tr>
<tr>
<td>COLOR</td>
<td>The color assigned to a Server Trace message.</td>
</tr>
<tr>
<td>COUNT</td>
<td>The number of rules that processed the event.</td>
</tr>
<tr>
<td>CPUTIME</td>
<td>The CPU time used by a particular thread. The format depends on how much CPU time the user has used:</td>
</tr>
<tr>
<td></td>
<td>• Fewer than 1000 seconds: *nnn.*nns</td>
</tr>
<tr>
<td></td>
<td>• Between 1000 seconds and 100 hours: *hh:mm:ss</td>
</tr>
<tr>
<td></td>
<td>• 100 hours or more: <em>hhhh:mm</em></td>
</tr>
<tr>
<td>CVID</td>
<td>The conversation ID that LU 6.2 assigns when a conversation starts.</td>
</tr>
<tr>
<td>DATE</td>
<td>The date when the message was created, in <em>dd:mm:yy</em> format.</td>
</tr>
<tr>
<td>ELAPSED</td>
<td>The total time that the current event used, in decimal microseconds (millionths of a second). To derive the total, the STCK (clock store) value that is taken at the beginning of processing is subtracted from the STCK value that is taken at the end of processing.</td>
</tr>
<tr>
<td>EVENT</td>
<td>The type of event that created the entry.</td>
</tr>
<tr>
<td>GTRIDTKN</td>
<td>The global transaction.</td>
</tr>
</tbody>
</table>
Table 21. Server Trace panel columns (continued)

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HLVFLAGS</td>
<td>The bits that are set by the routines that created the trace.</td>
</tr>
<tr>
<td>HOSTNAME</td>
<td>The TCP/IP host name or LU 6.2 host name.</td>
</tr>
<tr>
<td>HOSTX</td>
<td>The TCP/IP host name extended or the LU6.2 host name/mode.</td>
</tr>
<tr>
<td>IPADDR</td>
<td>The IP address, which is the TCP/IP source or target that is associated with the entry.</td>
</tr>
<tr>
<td>IPV6ADDR</td>
<td>Internet Protocol Version 6 address.</td>
</tr>
<tr>
<td>JOBNAME</td>
<td>The name of the job or address space that created the entry.</td>
</tr>
<tr>
<td>LENGTH</td>
<td>The length of the text section of the message.</td>
</tr>
<tr>
<td>LUNAME</td>
<td>The LU 6.2 source or target that is associated with the message.</td>
</tr>
<tr>
<td>MSGNO</td>
<td>The message number. When data collection begins, message 1 is the first message collected; message 2 is the second message; and so on. When there is no more room in the message area, the oldest message is discarded to make room for a new message. Therefore, the first message in the list might not be message 1.</td>
</tr>
</tbody>
</table>
| MSGORIGN     | The SIS/XCF (Instrumentation Server XCF) member name where the message originated. A message origin has the following format: SYSDALS_SSIDSISID where  
  • SYSID is the system ID.  
  • ALSSSID is the Accelerator Loader subsystem ID.  
  • SISID is the Instrumentation Server ID. |
| NODENAME     | The name of the communications node that is associated with the message. The format of each entry depends on the communication link type.          |
| OERC         | The TCP/IP return code of the OE socket.                                                                                                     |
| PATHID       | IUCV path ID.                                                                                                                              |
| PROCESS      | OE Process ID, if task is dubbed                                                                                                            |
| RC           | The highest level return code for the message.                                                                                              |
| REASON       | The second-level return code for the message.                                                                                               |
| RULESET      | The name of the first RULESET,RULE that processed an event on NONE,NONE.                                                                     |
| SECONDS      | The first four bytes of the binary timestamp, which indicates when the message was created.                                                  |
| SESSION      | The communications session that is associated with the message. The format of each entry depends on the type of communication link.             |
| SOCKET       | The socket number that is associated with the message. This column applies only to TCP/IP events.                                            |
| SQLRC        | The SQL return code.                                                                                                                         |
Table 21. Server Trace panel columns (continued)

</tr>
<tr>
<td>VCID</td>
<td>The unique virtual connection ID.</td>
</tr>
<tr>
<td>VERSION</td>
<td>The version of the product that generated the message.</td>
</tr>
<tr>
<td>VTAMRC</td>
<td>The VTAM return code.</td>
</tr>
<tr>
<td>XIDTOKEN</td>
<td>The XA token ID.</td>
</tr>
</tbody>
</table>

Filtering log entries by creating a profile

To view a subset of the log entries, create a profile. In the profile, you specify the criteria to use to select entries to display, and you select the specific events to display. The profile that you create affects only how you view log entries. Other users can create their own profiles.

Procedure

1. From the Primary Option panel, enter B on the Option line.
2. On the Server Trace panel, type PROFILE (with no operands) on the command line.
3. On the Trace Browse Profile panel, enter criteria in one or more of the following fields. If you enter multiple criteria, the values are joined with the logical AND operator. If you enter multiple values for a criterion, the values are joined with the logical OR operator. You can enter up to four values for each criterion.

Table 22. Profile filtering criteria

<table>
<thead>
<tr>
<th>Criterion</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JOBNAME</td>
<td>Limits entries to those that contain the specified value in the JOBNAME column. You can use an asterisk (*) as a wildcard character.</td>
</tr>
<tr>
<td>USERID</td>
<td>Limits entries to those that contain the specified value in the USERID column. You can use an asterisk (*) as a wildcard character.</td>
</tr>
</tbody>
</table>
### Table 22. Profile filtering criteria (continued)

<table>
<thead>
<tr>
<th>Criterion</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONNECT</td>
<td>Limits entries to those that contain the specified value in the CONNECT column.</td>
</tr>
<tr>
<td>VCID</td>
<td>Limits entries to those that contain the specified value in the VCID (virtual connection ID) column.</td>
</tr>
<tr>
<td>HOST NAME</td>
<td>Limits entries to those that contain the specified value in the HOST NAME column. You can use an asterisk (*) as a wildcard character.</td>
</tr>
<tr>
<td>TCB</td>
<td>Limits entries to those that contain the specified value in the TCB column.</td>
</tr>
<tr>
<td>SSID</td>
<td>Limits entries to those that contain the specified value in the SSID column. You can use an asterisk (*) as a wildcard character.</td>
</tr>
<tr>
<td>XIDTOKEN</td>
<td>Limits entries to those that contain the specified value in the XIDTOKEN (XA token ID) column.</td>
</tr>
<tr>
<td>GTRIDTKN</td>
<td>Limits entries to those that contain a matching GTRIDTKN (global transaction ID).</td>
</tr>
<tr>
<td>CONVTKN</td>
<td>Limits entries to those that contain a matching CONVTKN (conversation token ID).</td>
</tr>
</tbody>
</table>
| MSGORIGIN      | Limits entries to those that contain a matching MSGORIGIN (message origin). You can use an asterisk (*) as a wildcard character. Use the following format to enter the values: SYSIDALS_SSIDSISID where  
|                |  
|                | • SYSID is the system ID.  
|                | • ALSSSID is the server configuration subsystem ID.  
|                | • SISID is the Instrumentation Server ID. |

4. Enter Y or N to include or exclude the following specific types of events from the result set:

</table>

5. Press Enter to save the profile.

**Labeling and locating specific log entries**

To quickly locate significant entries in the server log, replace the message number of an entry with a label.
About this task

After you add labels to entries the trace log, use the LOCATE command to find the entries.

Procedure

1. From the Primary Option panel, enter B on the Option line.
2. On the Server Trace panel, use the DISPLAY command to display the relevant columns. For example, enter DISPLAY msgno date.
3. When you locate the entry to which you want to add a label, edit the MSGNO column and enter a label that consists of a period and up to seven alphabetic characters. For example, enter .POINTA.
4. Enter the LOCATE command, followed by the criteria. To specify criteria, use the following formats:

<table>
<thead>
<tr>
<th>Criteria</th>
<th>Format</th>
</tr>
</thead>
<tbody>
<tr>
<td>Time</td>
<td>One of the following:</td>
</tr>
<tr>
<td></td>
<td>• hh</td>
</tr>
<tr>
<td></td>
<td>• hh:mm</td>
</tr>
<tr>
<td></td>
<td>• hh:mm:ss</td>
</tr>
<tr>
<td>Date</td>
<td>One of the following:</td>
</tr>
<tr>
<td></td>
<td>• dmmm, single-digit date and current month</td>
</tr>
<tr>
<td></td>
<td>• ddmmm, date and current month</td>
</tr>
<tr>
<td></td>
<td>• ddmmmyy, date, month, and 2-digit year</td>
</tr>
<tr>
<td></td>
<td>• ddmmmyyyy, date, month, and 4-digit year</td>
</tr>
<tr>
<td>Message number</td>
<td>The specific message number</td>
</tr>
<tr>
<td>Label</td>
<td>The previously specified label that was added to an entry</td>
</tr>
</tbody>
</table>

Finding character strings in the server log

Use the FIND and RFIND commands to find a specific character string in the server log. You can find a string in a specific column or in a range of columns.

Procedure

1. From the Primary Option panel, enter B on the Option line.
2. On the Server Trace panel, enter the FIND command to find the character string. To search for a string in the USERID, EVENT, or SSID column, use the following syntax:
   
   FIND column-name string prefix direction

   Where
   
   • column-name is USERID, EVENT, or SSID.
   • string is the search string.
   • prefix specifies that the search string is generic and specifies only the prefix characters. Specify this argument when you search EVENT or SSID columns.
   • direction specifies the next match to find. Specify FIRST (default), LAST, PREV, or NEXT.

   To search for the string in a range of columns, use the following syntax:

   FIND TEXT string direction start-column end-column msgno
Where

- TEXT is an optional keyword that indicates that you are searching only the text of the entries.
- string is the search string. If the search string contains blank spaces or is identical to a FIND keyword, enclose the string in quotation marks. Enter an asterisk (*) to use the search string from the previous FIND command.
- direction specifies the next match to find. Specify FIRST (default), LAST, PREV, or NEXT.
- start-column specifies the number of the first column for the search.
- end-column specifies the number of the last column for the search.
- msgno is the maximum number of entries to search. The default is 5000.

The following FIND command searches for the string SDB1234W from the first message, beginning at column 10 and ending at column 30, for 10,000 messages:

```
F 'SDB1234W XYZ' 10 30 10000
```

3. Optional: Enter RFIND to repeat the previous FIND command.

**Capturing the entries from the server trace**

Use the P, PP, and SS commands to print server log entries to the ISPF list data set.

**About this task**

Each entry that you print contains the same columns that are displayed in the Server Trace panel and includes the entire contents of the text field. If the text field exceeds one line, the printed entry wraps to include three additional lines. Make sure that the ISPF list data set has enough space to hold the printed entries. The SS command requires more space than the PP command. The SS command prints 1 - 100 entries as they appear in the trace log, followed by the zoomed formatting for each entry, followed by the next 1 - 100 entries.

**Procedure**

On the Server Trace panel, to print log entries, perform one of the following steps:

- To print a single entry, enter P in the MESSAGENUM column.
- To print the summary information for a range of entries, enter PP in the MESSAGENUM column on the first and last entry in the range.
- To print the summary and detailed information, enter S in the MESSAGENUM column.
- To print the summary and detailed information for a range of entries, enter SS in the MESSAGENUM column on the first and last entry in the range.

**Modifying the client time out parameter**

You can change the maximum amount of time that a thread remains idle before the server closes it.

**About this task**

The Accelerator Loader server uses multiple threads to read data from the source system. If one thread becomes idle and times out, the server stops processing all threads. The maximum amount of time that a thread remains idle before the server stops processing is controlled by the DSCLIENTCONNTIMEOUT parameter. The default value of DSCLIENTCONNTIMEOUT is 20 minutes. Valid values are in the
range 1 - 1440 minutes. To change the time out value, complete the following steps.

Procedure

1. In data set hlq.SHLVEXEC, locate member hlvidIN00, where hlvid represents the
   name of the Accelerator Loader server started task that was customized by
   using Tools Customizer.
2. Use the MODIFY PARM command to change the DSCLIENTCONNTIMEOUT
   parameter value:
   "MODIFY PARM NAME(DSCLIENTCONNTIMEOUT) VALUE(10)"

Modifying the client auxiliary storage cut-off parameter

You can specify at what point the Accelerator Loader server will reject new
connection attempts when an auxiliary storage shortage is signaled by the system
Event Notification Facility.

About this task

The Accelerator Loader server listens for ENF 55 auxiliary storage shortage signals
and throttles storage utilization when an auxiliary storage shortage is signaled.

The Accelerator Loader server will perform the following actions depending on the
received ENF 55 signal:

- When signal ENF55QLF_AUX_WARNING is received:
  1. Issue the following message:
     HLV4265W Data Server Client buffer expansion disabled due to auxiliary storage
        warning
  2. Disable Accelerator Loader server buffer expansion for two hours and ten
     minutes.
  3. Issue the following message:
     HLV4266I Data Server Client services resumed
- When signal ENF55QLF_AUX_SHORTAGE is received:
  1. Disable Accelerator Loader server buffer expansion.
  2. Issue the following message:
     HLV4265W Data Server Client buffer expansion disabled due to auxiliary storage
        shortage
- When signal ENF55QLF_AUX_CRITICAL_SHORTAGE is received:
  1. Disable Accelerator Loader server buffer expansion.
  2. Issue the following message:
     HLV4265W Data Server Client buffer expansion disabled due to auxiliary storage
        critical shortage
  3. Disable new Accelerator Loader server requests.
  4. Issue the following message:
     HLV4267W Data Server Client refusing new requests due to critical auxiliary
        storage shortage.
- When signal ENF55QLF_AUX_SHORTAGE_RELIEVED is received:
  - Re-enable all Accelerator Loader server functions.
  - Issue the following message:
     HLV4266I Data Server Client services resumed.
The point at which the Accelerator Loader server will reject new connection attempts when an auxiliary storage shortage is signaled by the system Event Notification Facility is controlled by the `DSCLIENTAUXSTGCUTOFF` parameter.

To change the value, complete the following steps.

**Procedure**

1. In data set `hlq.SHLEXC`, locate member `hlvidIN00`, where `hlvid` represents the name of the Accelerator Loader server started task that was customized by using Tools Customizer.
2. Use the `MODIFY PARM` command to change the `DSCLIENTAUXSTGCUTOFF` parameter value:

   "MODIFY PARM NAME(DSCLIENTAUXSTGCUTOFF) VALUE(WARNING)"

<table>
<thead>
<tr>

**System Management Facility logging**

Using the System Management Facility (SMF), you can record system resource usage information in SMF data sets.

To enable SMF support during product customization, provide a value for the **SMF record number** product parameter. SMF logging can be used together with IBM® Db2® Analytics Accelerator Loader for z/OS logging, or separately.
The following sections include SMF record subtype information.

**Record Subtype 02: Internal Summary**

This record is used to collect session information for all users who are connected during a specific interval and the information is written at the end of each interval. All the resources that are used by all connections during that interval are recorded using this record.

**About this task**

The interval in which Subtype 02 records are written is determined by the RECORDINGINTERVAL parameter.

A sample SAS program is provided that can be used to print the fields in Subtype 02 records. The program is located in the SMFS0B02 member of the hlq.SHLVEXEC(hlvidIN00) data set.

Interval summary records are automatically written if the LOGINTERVALS parameter is set to YES in the hlq.SHLVEXEC(hlvidIN00) member. You must have LOGINTERVALS enabled in order to also record Interval records into SMF.

**Procedure**

To log interval records to the logging tables but not log interval information to SMF, in the hlq.SHLVEXEC(hlvidIN00) member, set the LOGINTERVALS parameter as follows:

"MODIFY PARM NAME(LOGLSESSIONINTVALSMF) VALUE(NO)"

Where LOGLSESSIONINTVALSMF controls whether interval type records are written to SMF. Interval records can also be written to the session log.

**Results**

The following table lists the parameters used to configure the Subtype 02 record:

<table>
<thead>
<tr>
<th>Offset</th>
<th>Field Name</th>
<th>Field Subtype or Value</th>
<th>Description</th>
</tr>
</thead>
</table>
| 1      | SMFHRCTY   | BL1                    | Header flag byte:

**Record Subtype 03: SEF Rule Disablement**

This record is created whenever an Event Facility (SEF) rule is disabled. All the resources that are used by all connections during that interval are recorded in this record.

**About this task**

These records are typically written when the Accelerator Loader server is shutdown. They are also written if a rule is manually disabled.
Procedure

To enable this record, use the MODIFY PARM command to set the parameter in the hlq.SHLVEXEC(hlvidIN00) member as follows:
"MODIFY PARM NAME(SMFRULEDISABLE) VALUE(YES)"

Where SMFRULEDISABLE indicates whether this type of SMF record should be written.

Results

The following table lists the parameters used to configure the Subtype 03 record:

Record Subtype 06: Per Transaction SMF Records

This record is used to log each inbound client request.

About this task

Each SMF transaction record contains information about all the work that is done on behalf of the client for each transaction request. The inbound client request may have caused zero, one, or more SQL operations to be run. A high number of Subtype 06 SMF records may be written in high volume environments because one SMF record is created for each transaction.

A sample SAS program is provided which can be used to print these SMF fields. The program is located in the hlq.SHLVEXEC(hlvidIN00) file data set.

Procedure

To enable this record, use the MODIFY PARM command to set the parameter in the hlq.SHLVEXEC(hlvidIN00) member as follows:
"MODIFY PARM NAME SMFTRANSACT VALUE(YES)"

Where SMFTRANSACT controls the creation of SMF transaction records. When set to YES, an SMF record is created for each inbound client request.

**Results**

The following table lists the parameters used to configure the Subtype 06 record:

**Record Subtype 09: Storage Interval Summary**

This record is used to monitor Accelerator Loader server storage usage above and below the 16 MB threshold.

**About this task**

This record is written at the end of every Accelerator Loader server storage recording interval. They are set by the `CHECKSTORAGEINTERVAL` parameter. If the `CHECKSTORAGEINTERVAL` parameter is set to 0 (the default), storage usage recording in the Accelerator Loader server is disabled.
**Procedure**

To enable this record, use the `MODIFY PARM` command to set the parameter in the hlq.SHLVEXEC(hlvidIN00) member as follows:

```
"MODIFY PARM NAME(LOGSTORAGESMF) VALUE(YES)"
```

Where LOGSTORAGESMF controls whether storage usage information should be written to SMF. Storage usage information can also be written to a Db2 table.

**Results**

The following table lists the parameters used to configure the Subtype 09 record:

*Table 30. Subtype 09 Record Information*

Record Subtype 13: Db2 SQL Errors

This record is used to record Db2 SQL errors.

About this task

This record is used for logging Db2 SQL errors. The LOGERRORSSMF parameter is used in addition to the LOGERRORS parameter, which logs Db2 SQL errors to a Db2 table.

Procedure

To enable this record, use the MODIFY PARM command to set the parameter in the hlq.SHLVEXEC(hlvidIN00) member as follows:

"MODIFY PARM NAME(LOGERRORSSMF) VALUE(YES)"

Where LOGERRORSSMF controls whether Db2 SQL error information should be written to SMF. Set the value to YES to generate SMF Subtype 13 records.
## Results

The following table lists the parameters used to configure the Subtype 13 record:

Record Subtype 17: ADABAS Command by DBID Records

This record is used to capture the number of times a ADABAS database is accessed and the number of commands that were issued against the database before each session ended.

About this task

A Subtype 17 record is written for each Database ID (DBID) referenced and each record contains the number of times that commands were issued against the database before the session ended.

Procedure

To enable this record, use the MODIFY PARM command to set the parameter in the hlq.SHLVEXEC(hlvidIN00) member as follows:

```
*MODIFY PARM NAME(ADABASDBIDSMF) VALUE(YES)*
```

Where ADABASDBIDSMF causes one SMF record to be written per DBID accessed at the end of each session. The records contain command usage statistics.

Results

The following table lists the parameters used to configure the Subtype 17 record:

Chapter 12. Administering the Accelerator Loader server
**Virtual table SAF security**

A single Accelerator Loader server environment can provide data virtualization to multiple independent tenants or application groups. The virtual table SAF (system authorization facility) security feature provides a SAF mechanism to secure virtual tables so that each tenant can only access tables authorized for members of the tenant group.

Activating this security feature will prevent using virtual table names in metadata queries (such as, `SQLENG.TABLES`, `SQLENG.COLUMNS`), as well as querying or updating application data mapped using unauthorized table names.

**Server interface parameter**

The `SQLVTRESOURCETYPE` parameter in the `PRODSECURITY` parameter group defines a security class name for virtual table resource checking. By default, this system parameter defaults to the value 'NON' indicating that security checking is disabled.

When activated with a class name, the `SQLVTRESOURCETYPE` parameter will enable SAF resource checking on metadata queries (such as, `SQLENG.TABLES`, `SQLENG.COLUMNS`) as well as virtual table queries using the resource name `resource_class.table_owner.table_name` where:

- `resource_class` is the class name define for the RESOURCETYPE parameter in the PRODSECURITY parameter group (for example, RHLV)
- `table_owner` is the SQL TABLE OWNER NAME (SQLTABLEOWNER) as defined in the PRODSQL parameter group (for example: 'DVSQL')
- `table_name` is the map (or virtual table) name as defined in the map data set

For improved performance in SAF calls, RACROUTE REQUEST=FASTAUTH provides general resource checking. A separate INTRNLONLY parameter named 'DISABLE FASTAUTH SECURITY CHECKS' disables use of FASTAUTH if security problems are encountered. Disabling FASTAUTH will switch to RACROUTE REQUEST=AUTH checking on all resource rules which can degrade query performance on metadata tables.

When securing metadata tables, READ access is required to query rows in the following tables.

- `SQLENG.COLUMNS`
- `SQLENG.COLUMNPRIVS`
- `SQLENG.ERRORMSGS`
- `SQLENG.FOREIGNKEYS`
- `SQLENG.PRIMARYKEYS`
- `SQLENG.Routines`
- `SQLENG.SPECIALCOLS`
- `SQLENG.STATISTICS`
- `SQLENG.TABLES`
- `SQLENG.TABLEPRIVS`

Securing tables using the generic profile `SQLENG.*` is also an option if preferred.

Securing specific virtual tables is also required when activating this feature. Securing virtual tables by specific or generic rules activates two security checks:
1. When querying metadata tables (SQLENG.*), users must minimally have READ access to the virtual tables in order for rows related to a table to be returned. In this case, there are no errors returned. Instead, the information about a specific table is omitted from the result set and the user has no indication that the table exists.

2. When querying virtual tables, the user must have READ access to each table in the SQL SELECT statement and UPDATE access to any table that is the target of an SQL INSERT, UPDATE, or DELETE statement.

**Restrictions and Considerations**

Virtual table authorization checking is built on general resource checking and is impacted by the following product parameter in the PRODSECURITY group:

- **ALLOWUNPROT** – The ALLOWUNPROT parameter allows access to unprotected resources. When set to YES, this parameter allows access to resource names that have no matching resource definition in the SAF database. ALLOWUNPROT should be set to NO to insure resource rules are correctly processed.

  **Note:** ALLOWUNPROT=NO will automatically activate numerous resource checks unrelated to this feature.

The `table_owner.map_name` resource name is internally restricted to 44 bytes. While internal map names larger than 44 bytes are still allowed, resource checking will only pass the first 44 bytes of the `table_owner.map_name` string in the SAF call for validation. Generic resource rules will be necessary if map names exceed this limitation.

Because all maps are limited to a single table owner as defined in the SQLENGTABLEOWNER system parameter, users should consider a standard prefix for all map names they want to secure for application groups. This simple generic resource rules can be defined to protect these names. For example, if the SQLENGTABLEOWNER is configured as 'DVSQL' and an application group uses AG01 as a prefix on all table names, a generic resource 'DVSQL.AG01*' will control access to all tables starting with AG01 as a map name.

All SQL queries are automatically secured when this feature is activated. This means that resource rules must exist to allow READ access to the metadata tables SQLENG.*.

This feature is limited to SQL access to virtual tables. Users authorized to create tables can create tables which may not be accessible due to SQL access rules implemented using this feature.

**MapReduce**

This section provides information on MapReduce features for performance enhancement.

You should also refer to Chapter 5, “Loading data from non-Db2, remote Db2, and remote system sources,” on page 207 for additional information on using MapReduce features.

**Virtual Parallel Data**

Virtual Parallel Data (VPD) allows you to group multiple simultaneous requests against the same data source and run them in parallel, while doing the input and
output (I/O) only once. VPD also allows single or multiple requests to run with asymmetrical parallelism, separately tuning the number of I/O threads and the number of client or SQL engine threads.

To use this feature you must provide a VPD group name when submitting request(s). All requests submitted to the same Accelerator Loader server with the same group name within a time period will be placed into a VPD group. One or more I/O threads will be started to read the data source and write it to a wrapping buffer. Group members will share the data in the buffer(s), without having to read the data source directly.

A group is created when the first member request arrives. The group is closed either when all members (and all their parallel MRC threads) have joined, or when a timeout has expired. The I/O threads are started as soon as the group is created, and data begins to flow to the buffer. If the buffer fills before the group is closed, the I/O thread(s) will wait. Once the group is closed and active members begin consuming data, the buffer space is reclaimed and I/O continues.

VPD supports MapReduce Client (MRC), and group members can use different levels of MRC parallelism. For example, a single VPD group might have six members, three members using 5 MRC threads, and the other three using 9 MRC threads. The group will consist of six members and 42 client threads. The number of I/O threads is determined separately. VPD supports a group of a single member, thus supporting asymmetrical parallelism for single requests when using MRC.

VPD is currently supported for the following data sources:
- Adabas files
- Physical sequential data sets on disk, tape, or virtual tape
- Log streams
- IBM MQ
- VSAM KSDS, RRDS, and ESDS files
- IAM files
- zFS/HFS files

**Configuring Virtual Parallel Data**
To configure Virtual Parallel Data, optionally configure VPD parameters in your Accelerator Loader server configuration file. To use VPD when loading data, specify a group name and appropriate parameters when generating your load JCL.

**Procedure**
1. Configure the following parameters in the hlvidIN00 member:

```bash
/* Enable Virtual Parallel Data for asymmetrical parallelism */
if DoThis then
do
"MODIFY PARM NAME(VPDGROUPTIMEOUT) VALUE(60)"
"MODIFY PARM NAME(VPDBUFFERSIZE) VALUE(40)"
"MODIFY PARM NAME(VPDTRACEDB) VALUE(NO)"
```

The following table lists the VPD parameters:
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Valid values</th>
</tr>
</thead>
<tbody>
<tr>
<td>VPBUFFERSIZE</td>
<td>Specifies the default buffer size, in megabytes above the bar, for a Virtual Parallel Data buffer.</td>
<td>Numeric value in megabytes. Default is 40.</td>
</tr>
<tr>
<td>VPDGROUPTIMEOUT</td>
<td>Specifies the maximum time, in seconds, from the time a group is formed until it is closed. Default: 60 seconds</td>
<td>Numeric value in seconds. Default is 60.</td>
</tr>
<tr>
<td>VPDTRACEDB</td>
<td>Controls whether Virtual Parallel Data processing will trace debugging messages.</td>
<td>NO Do not trace debugging messages (default).</td>
</tr>
<tr>
<td></td>
<td></td>
<td>YES Trace debugging messages.</td>
</tr>
<tr>
<td>VPDTRACEREC</td>
<td>Causes Virtual Parallel Data to trace at the record level. (Optional) Note: Setting this to YES will produce a large amount of trace output.</td>
<td>NO Do not trace record level messages (default).</td>
</tr>
<tr>
<td></td>
<td></td>
<td>YES Trace record level messages.</td>
</tr>
</tbody>
</table>

2. Supply the group name in the Generate JCL to Load Accelerator wizard in the Accelerator Loader studio.

3. Optional: Specify the number of members in the group. Although optional, this parameter is recommended. When this parameter is provided, the group is closed as soon as all members have joined. If the number is not provided, the group is not closed until the timeout expires. There is no default.

4. Optional: Specify a timeout value for the group formation. When the first group member request arrives at the Accelerator Loader server, the timer is started. If the group remains open when the request expires, it is closed. Any members/threads arriving after the timeout will be placed in a new group. The default is 60 seconds, and can be overridden in the hlvidIN00 file.

5. Optional: Specify the number of I/O threads to use when reading the data source. If this value is not provided, the number of threads is determined as follows:
   a. If the data source is a tape data set and the number of volumes can be determined, the same number of I/O threads will be started.
   b. Otherwise, if a Map Reduce thread count is provided in the data map, that number is used.
   c. Otherwise, if a value is configured for ACIMAPREDUCETASKS in the hlvidIN00 configuration member, that number is used.
   d. Otherwise, a single I/O thread will be started.

**Innovation Access Method (IAM)**

Innovation Access Method (IAM) is a VSAM optimization product distributed by Innovation Data Processing. Enable MapReduce for IAM by setting the MAPREDUCEIAMKEYMOD parameter to YES.

MapReduce is implemented by analyzing the file to be retrieved and dividing it up into parts for simultaneous parallel retrieval. For VSAM, this is done by referencing information kept by VSAM about a file. This is supported for key-sequenced data sets (KSDS), entry-sequenced data sets (ESDS), and relative
record data set (RRDS) VSAM files. For sequential files, this is done by analyzing information about the extents and volumes of the file. However, for IAM a different approach must be taken because there is no information about the internal structure of an IAM file.

To implement MapReduce for IAM, contact Innovation Data Processing and request module IAMRKTEX. This module will perform the analysis of the internal structure of the IAM file and allow implementation of MapReduce technology. This module will be provided free of charge on request to Innovation Data Processing.

**Configuring MapReduce for IAM**
Enable MapReduce for IAM by configuring the Accelerator Loader server.

**Before you begin**
The Accelerator Loader server must already be installed.

**About this task**
To enable MapReduce for IAM, you must configure the Accelerator Loader server configuration file. Customizing this member is done using Tools Customizer.

**Procedure**
1. Invoke Tools Customizer for z/OS.
2. Access the Product Parameters panel.
3. Under the task **Create the server and the server components**, select the steps **Create the server** and **Create the server parameters**, and provide a value for the following field:

<table>
<thead>
<tr>
<th>Step or parameter</th>
<th>Required?</th>
<th>Discovered?</th>
<th>Default</th>
<th>Your value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Call the interface module for IAM</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td></td>
</tr>
<tr>
<td>Specifies whether to call the interface module for IAM to analyze keys and set ranges for MapReduce. Valid values are YES and NO.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

4. Generate the customization jobs. The jobs are based on the HLOHLVS and HLOIN00 templates. For more information, see "Generating customization jobs" on page 107.
5. Submit the customization jobs. For more information, see "Submitting customization jobs" on page 107.

**Metadata repository**
The metadata repository for MapReduce stores statistics about virtual tables that are used to enhance performance in conjunction with MapReduce and parallelism. This support applies to DRDA and IMS data sources, including those accessed via the IBM Federated Server (such as Terradata and Sybase), as well as data sources accessed via direct DRDA support (Db2 LUW and Oracle) provided by the Accelerator Loader server. The gathered metadata persists across server restarts.

**Populating the metadata repository**
You can periodically run the DRDARange or IMSRange command to gather metadata repository information about the backend virtual tables.
About this task

You can run the metadata repository command for DRDA or IMS either using the ISPF panels or a batch job.

Note: When using MapReduce support, **DRDARange** is required for a relational database management system (RDBMS).

The following restrictions and considerations apply when using this feature:

- Current support does not contain any optimizer enhancements for processing complex queries or joins other than what may be used to enhance MapReduce.
- If a table does not contain enough rows to properly calculate a DRDA Range, then the following error is also returned for this condition:

  Table <schema>.<table_name> not eligible for range processing

An additional error message can be found in the tracebrowse for this error. For example:

```
22:10:53 Row count 14 too small for range processing
22:10:53 SELECT DRDARANGE('virtual_table.DBLIDX') FOR FETCH ONLY - SQLCODE 0
22:10:53 SQL ENGINE HPO OPEN-CURSOR - SQLCODE 0
22:10:53 SQL ENGINE HPO FETCH - SQLCODE 100
```

Procedure

Run the appropriate command as follows:

- Using the ISPF panels:
  - For DRDA data sources, use the SELECT statement at the virtual table level.
    
    ```
    SELECT DRDARANGE('<TABLE_NAME>',MAX_SCAN,'OPTION1','OPTION2',...);
    ```

    **Note:** It is recommended to use option PARTONLY for partitioned tables. Using this option will force the use of partition boundaries when determining parallelism.
  - For the IMS data source, use the SELECT statement at the database level.
    
    ```
    SELECT IMSRANGE('IMS database name')
    ```

- Using a batch job, which you can use to schedule the commands to refresh the statistics on a specified schedule. A sample job is provided in hlq.SHVCNTRL(HLVRANGE). Instructions for required edits to the job are provided in the member.

```
//RANGE EXEC PGM=HLVXMAPD,PARM='SSID=hlvid,MXR=30000000'
//STEPLIB DD DISP=SHR,DSN=loadlibrary
//RPT DD SYSOUT**,DCB=LRECL=4096
//FMT DD SYSOUT**,DCB=LRECL=4096
//OUT DD SYSOUT**
//IN DD *

SELECT DRDARANGE('<TABLE_NAME>',MAX_SCAN,'OPTION1','OPTION2',...);
SELECT IMSRANGE('<IMS DBD Name>');
```

Migrating maps

Use the Map Migration utility to move your virtual table maps from a development environment to a test or production environment or from one release to another.
Before you begin

Before using the Map Migration utility, make sure that the following prerequisites have been met:

- **Accelerator Loader studio requirements**
  If migrating Db2 virtual tables, target systems used by each table must be defined in the target server using one of the following definitions:
  - If you want to use the same target system name, define the target system name on the target server.
  - If you want to use a different target system name, then define the new target system name, and use the TSYS=OLD_TSYS,NEW_TSYS parameter in the HLVGNMPPM batch migration utility.

- **Accelerator Loader server requirements**
  Make sure that both the origin and destination servers have been started.

- **Accelerator Loader server security requirements**
  The following table summarizes the security permissions required to use the migration utility:

  **Table 36. Security permissions required to use the migration utility**

<table>
<thead>
<tr>
<th>JCL library</th>
<th>Map export PDS</th>
<th>Server map data set</th>
</tr>
</thead>
<tbody>
<tr>
<td>The location where the JCL resides.</td>
<td>The PDS library to which the exported metadata objects are unloaded.</td>
<td>The HLVMAPP DD data set, which must be the first data set in the concatenation if the parameter NEW MAP DSN is not set.</td>
</tr>
</tbody>
</table>

  **Batch user ID**
  - UPDATE
  - CREATE
  - READ
  - N/A

  **Server user ID**
  - N/A
  - UPDATE
  - UPDATE
  - READ

About this task

The Map Migration utility facilitates change control of the virtual table maps. Change control is the process of moving the virtual table maps defined in a development environment to a test or production environment or from one release to another.

You can use the HLVGNMPPM member located in your {hlq}.SHLVCNTL data set for migrating virtual table maps. See the HLVGNMPPM member for a list of parameters available for use when migrating virtual table maps.

You can use the HLVGNMPPM member to perform the following tasks:
- Migrate one or multiple virtual table maps from one server to another.
- Change the virtual table map definition using the optional parameters. See the comments in the sample job for more details.

Procedure

1. Customize the migration utility job, HLVGNMPPM, for the requirements at your site.
2. Submit the HLVGNMPM batch job. Utility job HLVGNMPM extracts the contents of the maps, stores the metadata objects in the map export PDS library, and creates the batch job that is used to rebuild the maps on the target server.

3. Submit the batch JCL that was created in the previous step to rebuild the maps on the target server.

**Results**

The utility extracts the content of the map export PDS and rebuilds the map on the target server.
Chapter 13. JDBC Gateway

Use the JDBC Gateway to virtualize any JDBC 4.0 compliant database.

Topics:
- "Installing the JDBC Gateway." This topic provides information about installing the JDBC Gateway component, including system requirements.
- "Using the JDBC Gateway" on page 487. This topic provides information about supported data sources and configuring access to those data sources.

Installing the JDBC Gateway

The JDBC Gateway is an Accelerator Loader distributed application server that allows direct connectivity to JDBC data sources. Install the JDBC Gateway to connect directly to JDBC data sources.

Before you begin

Before installing the JDBC Gateway, review the following points:
- For an overview of the JDBC Gateway solution, see "Using the JDBC Gateway" on page 487.
- The following terminology is used in the installation procedure:
  - JDBC Gateway server. The server is the backend component that allows communication with the Accelerator Loader server.
  - JDBC Gateway administrative console. The administrative console is the front-end web component that you use to configure your data sources. Only a single user (web client) can access the JDBC Gateway administrative console at a time. When installing the JDBC Gateway, you must specify a specific user ID for this purpose. This user ID is an internal application ID that allows access to the web user interface.
  - Port for the Web UI. This port will be used to access the Web-based administrative console and is specified during the installation procedure.

Note: The JDBC Gateway also uses another port to listen for incoming DRDA requests. This DRDA listener port is set later when configuring the JDBC Gateway.
- Before installing the JDBC Gateway, verify that all installation requirements are met, as follows:

<table>
<thead>
<tr>
<th>System component</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Permissions</td>
<td>You have appropriate user logon credentials and user privileges on your client system to install the JDBC Gateway. For example, to install and deploy the JDBC Gateway on Windows, you may need to run with administrator privileges depending on the target location.</td>
</tr>
<tr>
<td>Supported platforms</td>
<td>The JDBC Gateway is a pure Java application and therefore can be deployed on any platform that supports Java 8 or higher.</td>
</tr>
<tr>
<td>System memory</td>
<td>Minimum of 1 GB</td>
</tr>
<tr>
<td>Hard disk space</td>
<td>Minimum of 500 MB</td>
</tr>
<tr>
<td>System component</td>
<td>Requirement</td>
</tr>
<tr>
<td>------------------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| Software         | - Java 8 is required to install and deploy JDBC Gateway.  
|                  | - One of the following web browsers (with JavaScript support enabled) must be used to access the JDBC Gateway administrative console:  
|                  |   - Google Chrome browser V50.0.2661.102 or later  
|                  |   - Mozilla Firefox V47.0.1 or later  
|                  |   - Microsoft Edge V25.10586.0.0 or later  
|                  |   - Microsoft Internet Explorer V10 or later  
|                  |   - Apple Safari browser V9.0.3 or later  
|                  | - Database connectivity requires an appropriate JDBC driver for each type of data source that is accessed. |

**About this task**

Use the following procedure to install the JDBC Gateway. This installation installs the JDBC Gateway server and administrative console.

During the installation, you must specify a user ID to be used for the JDBC Gateway administrative console. When using the JDBC Gateway administrative console, only a single user can access the administrative console at a time.

As part of the installation, the following actions occur:

- The `jgate.properties` file is created, which contains the site-specific settings.
- Start and stop scripts appropriate to the platform are created. The installer creates `cmd` scripts if you are running on Windows and `sh` scripts if you are running on Unix or Linux.

**Considerations for USS installation:** For installation in USS, it is recommended that you define the following environment variables:

```bash
export IBM_JAVA_OPTIONS="-Dfile.encoding=ISO8859-1"
export _BPXK_AUTOCVT=ON
```

When the installer generates start and stop scripts, the following actions occur depending on these variables:

- If you have not set the recommended environment variables, the scripts will be generated in EBCDIC. You can run the gateway as normal for Unix using the following command: `sh startServer.sh`

- If you set the `IBM_JAVA_OPTIONS` variable, the scripts will be generated in ASCII, and you will need to use the following command: `chtag -tc ISO8859-1 <file>`. (Tagging in USS basically means `_BPXK_AUTOCVT` must be ON if you want to edit or execute the script in the shell.)

Files generated by the JDBC Gateway, such as log files and the `jgate.properties` file, will be generated in ASCII regardless of the aforementioned environment variable settings (except for `jetty.out`, which is in EBCDIC). In order to browse these files natively in USS, you must use the `chtag` command and set `_BPXK_AUTOCVT=ON`. 
Procedure

1. From the z/OS mainframe, transfer the installation member hlq.SHLVBIN(HLVBINJ) to your workstation using the File Transfer Protocol (FTP) in binary mode.

2. Rename the file to jdbc-gateway.zip.

3. On your host machine, create a directory to host the JDBC Gateway, and then extract the contents of the installation file into that directory. The extracted contents will include the JDBCGatewaySetup11.jar file.

   Note: If your host machine does not have an unzip utility, extract the contents of the installation file on a Windows workstation and copy the JDBC GatewaySetup11.jar file to the host machine.

4. At a command prompt in the directory, run the following command:

   ```
   java -jar JDBCGatewaySetup11.jar
   ```

   The installer launches.

5. Enter the following information at the prompts:

<table>
<thead>
<tr>
<th>Prompt</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>You are about to install JDBC Gateway.</td>
<td>Enter Y to continue with the installation, or enter n to cancel the installation.</td>
</tr>
<tr>
<td>Do you want to proceed? (Y/n)</td>
<td></td>
</tr>
<tr>
<td>Specify the installation directory</td>
<td>Enter the path of the directory where to install the application, or press Enter to use the default value as indicated.</td>
</tr>
<tr>
<td>(local directory\JDBCGateway):</td>
<td></td>
</tr>
<tr>
<td>Set login for JDBC Gateway admin Web page</td>
<td>Enter the user ID to be used for the JDBC Gateway administrative console, or press Enter to use the default value admin.</td>
</tr>
<tr>
<td>(admin):</td>
<td></td>
</tr>
<tr>
<td>Set password for JDBC Gateway admin Web</td>
<td>Enter the password for the administrative console user ID. The password must be at least five characters in length.</td>
</tr>
<tr>
<td>page:</td>
<td></td>
</tr>
<tr>
<td>Confirm your password:</td>
<td>Re-enter the password for the administrative console user ID.</td>
</tr>
<tr>
<td>Set port for the Web UI (8080):</td>
<td>Enter the number of an available TCP/IP port for the application, or press Enter to use the default value 8080. This port number will be used when launching the JDBC Gateway administrative console.</td>
</tr>
<tr>
<td>Installation completed. Do you want to</td>
<td>Enter Y to start the server, or enter n to exit the installation. Note: If you enter Y, the server starts within the same shell.</td>
</tr>
<tr>
<td>start the JDBC Gateway now? (Y/n)</td>
<td></td>
</tr>
</tbody>
</table>

Results

The JDBC Gateway has been installed and is ready for use. Information about the activity of the JDBC Gateway is available in the Java Console and in the log files.

If you specified to start the server, information about the startup process is displayed.

What to do next

- To start to the server, see “Starting the JDBC Gateway server” on page 486.
To launch the administrative console, see “Launching the JDBC Gateway administrative console.”

Starting the JDBC Gateway server
Start the JDBC Gateway server so that you can connect directly to JDBC data sources.

Before you begin
The JDBC Gateway must be installed. See “Installing the JDBC Gateway” on page 483.

About this task
Use the following procedure to start the JDBC Gateway server.

Information about the startup and additional activity of the JDBC Gateway is available in the Java Console and in the following log file:

/home_dir_for_user_profile/AppData/IBM/JDBC Gateway/log/jetty.out

Procedure
1. At a command prompt in the JDBC Gateway installation directory, run one of the following commands:
   - For Windows: startServer
   - For Linux or Unix: sh startServer.sh

   Information about the startup process is displayed using the following format:
   Using settings file: home_dir_for_user_profile/AppData/IBM/JDBC Gateway/Settings/jgate.properties
   Server is starting. It will be available on: http://localhost:port
   Server process ID: processID
   See home_dir_for_user_profile/AppData/IBM/JDBC Gateway/log/jetty.out for server status information.

2. Wait for the JDBC Gateway server startup process to complete, which is indicated by the following message in the jetty.out log file:
   date time : JGATE Server started and ready to accept connections on port port_number

3. Optional: To stop the JDBC Gateway server, run the following command in the JDBC Gateway installation directory:
   - For Windows: stopServer
   - For Linux or Unix: sh stopServer.sh

Results
The JDBC Gateway server has been started and is ready for use. Information about the activity of the JDBC Gateway is available in the Java Console and in the log files.

What to do next
Start the JDBC Gateway administrative console. See “Launching the JDBC Gateway administrative console.”

Launching the JDBC Gateway administrative console
Launch the JDBC Gateway administrative console so that you can configure connections to JDBC data sources.
Before you begin

The JDBC Gateway server must be installed and active. See "Installing the JDBC Gateway" on page 483 and "Starting the JDBC Gateway server" on page 486.

About this task

Use the following procedure to start the JDBC Gateway administrative console.

Only a single user (web client) can access the JDBC Gateway administrative console at a time.

Note: The JDBC Gateway does not require an external web application server. It contains its own Jetty web application server.

Procedure

1. In a web browser, launch the JDBC Gateway administrative console using the following URL:
   http://server:port

   where:
   • server is the machine name or address where the JDBC Gateway server is running
   • port is the port specified during the installation

2. Enter the Username and Password specified during installation.
   The JDBC Gateway administrative console launches.

Results

The JDBC Gateway administrative console is running and ready for use.
Information about the activity of the JDBC Gateway is available in the Java Console and in the log files.

What to do next

Configure access to data sources in the JDBC Gateway and the Accelerator Loader server. See "Configuring access to data sources using the JDBC Gateway" on page 489.

Using the JDBC Gateway

The JDBC Gateway is an Accelerator Loader distributed application server that allows direct connectivity to JDBC 4.0 data sources. The use of another federation server is not required.

Data sources

The JDBC Gateway solution is designed to work with any JDBC 4.0 compliant database. The following combinations of JDBC databases and drivers have been tested and verified to be supported by the JDBC Gateway:

• Hadoop 2.9.2 with the Hive 2.0 standalone JDBC driver
• Oracle 12 using the Oracle Thin Driver, version 6
• PostgreSQL version 11.1 using the JDBC driver version 42.2.5
Note: The degree of JDBC compliance can vary across different driver vendor implementations and versions. In some cases, there may be interoperability problems when trying to use a particular JDBC driver to access a particular DBMS.

**Getting started**

Use the following procedure to access your first data source using the JDBC Gateway:

1. Install the JDBC Gateway.
2. Start the JDBC Gateway server.
3. Launch the JDBC Gateway administrative console in a supported browser using the following URL:
   
   http://host:port

   See “Launching the JDBC Gateway administrative console” on page 486.
4. In the JDBC Gateway administrative console, perform the following steps:
   a. Determine the port that the JDBC Gateway will use for listening for incoming DRDA requests. You can review or change the port using the Server Status area of the JDBC Gateway administrative console. See “Using the JDBC Gateway administrative console.”
   b. Set up access to the data source by performing the following tasks:
      1) Locate and add JDBC driver information for the data source. See “Adding JDBC driver information for a data source” on page 489.
      2) Create a data source definition entry, specifying the location name, driver, URL and user information. See “Creating a data source definition entry” on page 492.
5. In the Accelerator Loader server, set up access to the data source by performing the following tasks:
   a. Register the connection to the JDBC Gateway by entering the location, host and the port for the data source.
   b. Enable the SEF rules and set global variables for the data source.
   
   For information about these tasks, see “Configuring the Accelerator Loader server for JDBC Gateway sources” on page 494.
6. Use the Accelerator Loader studio to create virtual tables and views from the JDBC data source, just as you do for other supported sources, such as VSAM or IMS.

**Using the JDBC Gateway administrative console**

Use the JDBC Gateway administrative console to create and manage your data source definitions.

**Before you begin**

The JDBC Gateway must be installed, the JDBC Gateway server must be active, and the JDBC Gateway administrative console must be launched. See “Installing the JDBC Gateway” on page 483.

**Procedure**

Use the JDBC Gateway administrative console to create and manage your data source definitions. The following table describes the areas of the default JDBC Gateway view:
<table>
<thead>
<tr>
<th>Field/Element</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add New Data Source</td>
<td>Click this button to add a new data source. For details, see “Creating a data source definition entry” on page 492.</td>
</tr>
<tr>
<td>Location</td>
<td>Displays a list of defined data sources. Select an entry to display properties and location information.</td>
</tr>
</tbody>
</table>
| JDBC URL                            | • **Location**: Location name of the data source.  
                               • **Note**: This value corresponds to the LOCATION parameter defined for the data source in the Accelerator Loader server.  
                               • **JDBC URL**: The URL that points to the data source.                                                                     |
| Server Status                       | Displays and controls the JDBC Gateway server status and the DRDA listener port.                                                      |
|                                     | • **Status**: JDBC Gateway server status. Click **Start** or **Stop** to control the server.                                            |
|                                     | • **Port**: The port on which the JDBC Gateway is listening for incoming DRDA requests. Click **Edit** to change the port number. This setting also allows you to control whether the server is started automatically when the JDBC Gateway startServer script is run.  
                               • **Note**: This port value will be used when adding a JGATE database definition statement to the Accelerator Loader server configuration file (hlvidIN00). |
| Location Information                | Displays the following details for selected data source entry:                                                                          |
|                                     | • **Domain**: Domain name of the JDBC Gateway.                                                                                         |
|                                     | • **Location**: Name of the target data source.                                                                                       |
|                                     | • **Port**: Port on which the JDBC Gateway is listening for incoming DRDA requests.                                                     |
|                                     | • **Note**: These values will be used when adding a JGATE database definition statement to the Accelerator Loader server configuration file (hlvidIN00). |
|                                     | Click **Test Connection** to test the connection to the data source. If you have specified any information incorrectly you will not be able to connect. |

**Configuring access to data sources using the JDBC Gateway**

Configure access to JDBC data sources that will be accessed using the JDBC Gateway.

To configure access for a data source, you must complete the following steps:

1. **Add the compliant JDBC driver for the data source to the JDBC Gateway.** See “Adding JDBC driver information for a data source.”

2. **Create the data source definition entry in the JDBC Gateway, specifying the location name, driver, URL, and user information.** See “Creating a data source definition entry” on page 492.

3. **Configure the Accelerator Loader server for the data source.** See “Configuring the Accelerator Loader server for JDBC Gateway sources” on page 494.

**Adding JDBC driver information for a data source**

Add JDBC driver information to the JDBC Gateway.
Before you begin

The JDBC Gateway must be installed, the JDBC Gateway server must be active, and the JDBC Gateway administrative console must be launched. See “Installing the JDBC Gateway” on page 483.

About this task

The JDBC Gateway requires a compliant JDBC driver for each data source to be accessed. You must locate and add JDBC driver information for each data source. The driver files must be accessible to the JDBC Gateway. The JDBC Gateway retains the defined JDBC driver information, and you would only repeat this specification process to add new drivers or make changes to the properties of an existing driver.

In preparation for this task, obtain the following driver information for the data source from the data source vendor or from the driver documentation:

- Driver class name. For example: org.postgresql.Driver
- Driver JAR files
- URL format. Each data source type has a unique URL format that is used to access the data and is specific by vendor. For example, for Postgres:
  
  jdbc:postgresql://{host}:{port}/{database}

To add JDBC driver information to the JDBC Gateway, using the JDBC Gateway administrative console, you will define the driver library for the data source, and then add the driver files to the library. Use the following procedure to add JDBC driver information for a data source.

Procedure

1. In the JDBC Gateway administrative console, select Preferences > JDBC Libraries. The following table describes the areas of the page:

<table>
<thead>
<tr>
<th>Area</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JDBC driver libraries</td>
<td>JDBC driver libraries that are already set up. Use the search bar to quickly locate information in the table.</td>
</tr>
<tr>
<td>Driver files</td>
<td>JAR files associated with selected driver library.</td>
</tr>
<tr>
<td>Details</td>
<td>Additional information about the selected driver library</td>
</tr>
</tbody>
</table>

2. Add a driver library by performing the following steps:
   a. Click the Add Driver button.
   b. In the Add New Driver Library window, provide the following information:
<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enter new library name</td>
<td>Enter a name for the library. The JDBC driver information for each type of database is organized by libraries. It is recommended that the name that you specify describes the JDBC information that will be included in the library. For example, if you are adding JDBC driver information for accessing Postgres databases, you might call the library Postgres. However, this is a descriptive field and can include any text.</td>
</tr>
<tr>
<td>Driver class name</td>
<td>Specify the actual name of the driver class that will be used. This information can be found in your JDBC driver documentation. For example: org.postgresql.Driver</td>
</tr>
<tr>
<td>URL templates</td>
<td>Optional: Specify a generic example of a correctly formatted URL that could be used to connect to the database. For example, if you are adding JDBC driver information for accessing Postgres databases, you might specify the following JDBC URL template: jdbc:postgresql://{{host}}:{{port}}/{{database}}. The generic information as specified in the template is presented when you are adding data sources, where you will replace the generic information with the specific database information.</td>
</tr>
</tbody>
</table>

**Note:** The **Validate** and **JDBC Driver Properties** options are not applicable until the driver files have been added.

c. Click **OK**.

3. Add JDBC driver files to the library by performing the following steps:
   a. Click the **Add Driver Files** button.
   b. In the **Add Files** dialog, click **Add** and specify the path to the JDBC driver files to add.
   c. Click **OK**.

4. Optional: Update JDBC driver information as follows:
   - To edit the JDBC driver library information, validate the drivers, or add connection keywords, select an existing JDBC driver library from the list and click **Edit Driver**. The **Edit Driver Library** window opens where you can make changes to the library name, class name, and URL templates. You can also use the **Validate** option to validate the driver files, and the **JDBC Driver Properties** option to enter driver-specific connection keywords.
   - To remove a JDBC driver library, select an existing JDBC driver library from the list and click **Remove Driver**. The library, including all the JAR files that it contains, is removed.
   - To remove a JAR file from a JDBC driver library, select an existing file from the list and click **Remove Driver File**. The file is removed.

5. Click **OK**.

**Results**

The JDBC driver information is saved.
**Note:** You must repeat this process for each JDBC driver that will be used to access a data source type.

**What to do next**

Create the data source definition entry, specifying the location name, driver, URL, and user information. "Creating a data source definition entry."

**Creating a data source definition entry**

Configure the JDBC Gateway for access to data sources.

**Before you begin**

The JDBC Gateway must be installed, the JDBC Gateway server must be active, and the JDBC Gateway administrative console must be launched. See "Installing the JDBC Gateway" on page 483.

Also, the compliant JDBC driver should be added to the JDBC Gateway. See "Adding JDBC driver information for a data source" on page 489.

**About this task**

Use the following procedure to create a data source definition entry. This data source definition entry is made in the JDBC Gateway administrative console and is used for access to the data source by the JDBC Gateway.

**Procedure**

1. In the JDBC Gateway administrative console, click the Add New Data Source button.
2. In the JDBC Gateway dialog, complete the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
</table>
| Location| Enter the location name. A valid value is a string 1 - 16 characters. For example: ORCL. 
  **Note:** This value must match the LOCATION value that will be specified for the corresponding data source definition in the Accelerator Loader server configuration file. |
Enter the JDBC connection information, as follows:

- **JDBC Driver**: Specify the library for the JDBC driver that will be used to access the data source. Select a library from the drop-down list, or click the ellipsis (...) option to the right of the field to open the Select JDBC Driver dialog where you can create additional JDBC driver libraries. (For more information, see “Adding JDBC driver information for a data source” on page 489.)

- **JDBC URL**: Specify the URL that points to the data source to which you want to connect. The format for the URL can be displayed in the drop-down list if a JDBC URL template was supplied when the driver was configured.
  
  **Note**: You can also use the Build URL by URL-Template dialog box to form the correct string. Click Build URL to open the Build URL by URL-Template dialog box. From the JDBC URL drop-down list, select the template. In the table, specify the server, port, and database information and click OK. The result URL string is added to the JDBC URL list. This feature is available if a JDBC URL template was provided when the driver was configured.

- **Advanced**: Click Advanced to specify any driver-specific connection string keywords and their values that will be used for the data source. The list of available advanced properties will change depending on both the type of driver being used, and the version of the driver. For information on any keywords that are required by a selected database driver, see the documentation for the driver.

Click **Set User Information** to provide authorization information used when accessing the data source. Provide the following information on the User Information dialog:

- **User ID and password are required**: Select this option to require the use of a user ID and password when accessing the data source. If the data source allows access without a user ID and password, selecting this option will override that allowance.

- **Allow users to save password**: Select this option to allow users to save passwords.

- **Allow users to change password**: Select this option to allow users to change passwords. (Note: This option is for Db2 only.)

- **User name and Password**: Specify the user ID and password that will be used to access the data source. The user ID and password that you specify when connecting to the data source are used to authorize the user.

Click **Test Connection** to test the connection to the data source. If you have specified any information incorrectly, you will not be able to connect.

3. Click **Finish**.

**Results**

The connection to the data source is validated. If successful, the data source location is added to the list of available data sources.

**What to do next**

Configure the Accelerator Loader server for the JDBC Gateway source.
Configuring the Accelerator Loader server for JDBC Gateway sources

Configure the Accelerator Loader server for use with the JDBC Gateway.

Before you begin

Configure access to the data source using the JDBC Gateway. See “Creating a data source definition entry” on page 492.

About this task

To use the JDBC Gateway to connect to your data source, the following changes must be made to the Accelerator Loader server:

- The DEFINE DATABASE TYPE value must be set, as follows:
  "DEFINE DATABASE TYPE(JGATE)"

  **JGATE**
  
  DDF endpoint is the JDBC Gateway.

- Optionally, the following utility and SEF procedure can be configured in support of TYPE(JGATE):

  **HLVDRATH**
  
  A utility that sets encrypted passwords in GLOBALU variables. You can also use this utility to list existing credential information.

  **HLVEJGAG**
  
  An ATH rule that switches credentials when connecting to a JGATE data source using DRDA. This rule uses AES encrypted passwords stored as GLOBALU system variables.

Procedure

1. In the Accelerator Loader server configuration file, register the connection to the JDBC Gateway using a definition statement, such as the following example:

   "DEFINE DATABASE TYPE(JGATE)"
   
   "NAME(name)"
   
   "LOCATION(location)"
   
   "DDFSTATUS(ENABLE)"
   
   "DOMAIN(your.domain.name)"
   
   "PORT(port)"
   
   "IPADDR(1.1.1.1)"
   
   "CCSID(37)"

   The following table lists the parameters:
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Valid values</th>
</tr>
</thead>
</table>
| AUTHTYPE   | Authentication type. This can be either DES for Diffie Hellman Encryption Standard or AES for Advanced Encryption Standard. When AUTHTYPE is not supplied, the default is DES. To force AES, the option must be added to the DEFINE DATABASE statement. Each server can be different in what is supported as to AES/DES. For this setting to have effect, you must specify a security mechanism (SECMEC) that requests encryption. | DES     Diffie Hellman Encryption Standard (default value)  
AES     Advanced Encryption Standard. |
| CCSID      | Specify the EBCDIC single-byte application CCSID (Coded Character Set Identifier) configured for this RDBMS subsystem on the RDBMS installation panel DSNTIPF, option 7. (Optional) | Refer to the RDBMS vendor documentation for a list of valid CCSIDs. |
| DDFSTATUS  | The DDF activation status can be altered online by using the ISPF 4-Db2 dialog panels. (Required) | ENABLE  Make this DDF definition active.  
DISABLE DDF endpoint is not used. |
<p>| DOMAIN     | The domain name or hostname on which the JDBC Gateway server is running. Either DOMAIN or IPADDR is required, but not both. | No default value. |
| IPADDR     | The dot-notation IPV4 address of the host on which the JDBC Gateway server is running. Either DOMAIN or IPADDR is required, but not both. If this parameter is not specified, the value 127.0.0.1 (local host) is the default. For group director definitions, use the DVIPA IP address of the group director. |  |
| LOCATION   | For JGATE: The location name specified in the JDBC Gateway data source definition entry. See &quot;Creating a data source definition entry&quot; on page 492 (Required) | A valid value is a string 1 - 16 characters. |</p>
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Valid values</th>
</tr>
</thead>
<tbody>
<tr>
<td>NAME</td>
<td>The database name as known to the server. <em>(Required)</em></td>
<td>A valid value consists of 1-4 characters. Clients use this ID when they request access to a specific downstream database server.</td>
</tr>
<tr>
<td>PORT</td>
<td>The TCP/IP port on which the JDBC Gateway server is listening. <em>(Required)</em></td>
<td>A valid 1-5 numeric string. If this keyword is not entered, the default DRDA port number 443 is used.</td>
</tr>
</tbody>
</table>
| SECMEC    | The DRDA security mechanism in force. | EUSRIDPWD  
Encrypt the user ID and password.  
USERIDPWD  
User ID and password are sent as is. No encryption is used.  
USRIDONL  
User ID is sent as is. No encryption is used for the user ID only (client security).  
USRENCPWD  
Encrypt password only. |
| TYPE      | Defines the DDF endpoint type.  
JGATE  
DDF endpoint is the JDBC Gateway. | When using the JDBC Gateway, JGATE is the valid value. |

2. Optional: To define alternate authentication information, use the sample job HLVDRATH to add a global default user definition or authentication information for specific mainframe users as follows:
   a. Locate the HLVDRATH member in the h1q.SHLVCTRL data set.
   b. Modify the JCL according to the instructions provided in the HLVDRATH member.

   When adding the SYSIN statements that define the alternate credentials for logging in to your JDBC Gateway source, as instructed in the JCL, make sure to specify the correct DBTYPE. For JDBC Gateway sources, specify DBTYPE=JGATE.
   c. Submit the job.
   d. Optional: To verify the information stored in the GLOBALU variables and list existing authentication, use the REPORT=SUMMARY statement in the HLVDRATH member and submit the job.

3. Optional: If using alternate authentication information, auto-enable the SEF ATH rule SHLVXATH(HLVEJGAG) to provide the logon credentials to each JDBC Gateway data source instance. Global variables are used to define alternate authentication credential mapping for the SEF ATH rule.
a. On the Administer Accelerator Loader Server menu, select option 3 for Manage Rules.
b. Select option 2 for SEF Rule Management.
c. Enter * to display all rules, or ATH to display only authentication rules.
d. Enable the rule by specifying E and pressing Enter.
e. Set the rule to Auto-Enable by specifying A and pressing Enter. Setting the rule to Auto-enable activates the rule automatically when the server is restarted.

4. Restart the Accelerator Loader server.

Results

The connection between the JDBC Gateway and the Accelerator Loader server for the JDBC data source has been defined.

What to do next

Use the Accelerator Loader studio to create virtual tables and views from the JDBC data source.

Example: Configuring access to Oracle data

Configure the JDBC Gateway for access to Oracle data.

Before you begin

The JDBC Gateway must be installed, the JDBC Gateway server must be active, and the JDBC Gateway administrative console must be launched. See "Installing the JDBC Gateway" on page 483.

About this task

Use the following procedure to configure access to Oracle data.

Procedure

1. Download the Oracle Thin Driver from the Oracle website. For example, ojdbc8.jar.
2. In the JDBC Gateway administrative console, select Preferences > JDBC Libraries, and then complete the following steps:
   a. Select the row for the Driver Library Name Oracle Thin Driver in the table, and click Add Driver Files.
   b. Use the Add Files dialog to add the Oracle Thin Driver file.
   c. Click OK to close the JDBC Libraries preference page.
3. Create a JDBC Gateway data source for Oracle as follows:
   a. Select File > New > Other, and then in the New wizard dialog, select Data Source and click Next.
   b. Complete the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Location</td>
<td>Enter the location name. For example, Oracle.</td>
</tr>
</tbody>
</table>
Enter the connection parameters:

- **JDBC Driver**: From the drop-down list, select Oracle Thin Driver.
- **JDBC URL**: Enter the JDBC URL as follows: `jdbc:oracle:thin:@//oracle-host:1521/ORCL`

Click **Set User Information**, and enter the credentials for accessing the Oracle database, as follows:

- **User name**: OracleUser
- **Password**: OraclePwd

C. Click **Test Connection**.

d. Click **Finish**.

4. In the Accelerator Loader server configuration file, register the connection to the JDBC Gateway data source using a definition statement, such as the following example:

```sql
"DEFINE DATABASE TYPE(JGATE)"
  "NAME(ORCL)"
  "LOCATION(Oracle)"
  "DDFSSTATUS(ENABLE)"
  "SECMEC(USRIDPWD)"
  "PORT(1527)"
  "IPADDR(10.26.4.125)"
  "CCSID(37)"
  "IDLETIME(110)"
```

For details about this statement, see “Configuring the Accelerator Loader server for JDBC Gateway sources” on page 494.

5. In the Accelerator Loader server, enable rule HLVEJGAG. For more information, see “Configuring the Accelerator Loader server for JDBC Gateway sources” on page 494.

### Results

The following connections have been established:

- The connection from the JDBC Gateway to the Oracle data source
- The connection between the JDBC Gateway and the Accelerator Loader server for the Oracle data source

### What to do next

Use the Accelerator Loader studio to create virtual tables and views to access the Oracle data.

**Example: Configuring access to Hadoop data**

Configure the JDBC Gateway for access to Hadoop data.

### Before you begin

The JDBC Gateway must be installed, the JDBC Gateway server must be active, and the JDBC Gateway administrative console must be launched. See “Installing the JDBC Gateway” on page 483.
About this task

Configuring access to Hadoop data requires both the standalone Hive 2.0 JDBC jar and the Hadoop Common jar driver files.

Use the following procedure to configure access to Hadoop data.

Procedure

1. Download the Apache Hive and Apache Hadoop driver files.
2. In the JDBC Gateway administrative console, select Preferences > JDBC Libraries, and then complete the following steps:
   a. Click Add Driver, complete the following fields, and click OK:

<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enter new library name</td>
<td>Enter HADOOP</td>
</tr>
<tr>
<td>Driver class name</td>
<td>Enter org.apache.hive.jdbc.HiveDriver</td>
</tr>
</tbody>
</table>

   b. Select the row for the Driver Library Name HADOOP in the table, and click Add Driver Files.
   c. Use the Add Files dialog to add the driver files. You need to include both the standalone Hive 2.0 JDBC jar and the Hadoop Common jar.
   d. Click OK to close the JDBC Libraries preference page.
3. Create a JDBC Gateway data source for Hadoop as follows:
   a. Select File > New > Other, and then in the New wizard dialog, select Data Source and click Next.
   b. Complete the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Location</td>
<td>Enter the location name. For example, Hadoop.</td>
</tr>
<tr>
<td>Connection Parameters</td>
<td>Enter the connection parameters:</td>
</tr>
<tr>
<td></td>
<td>• JDBC Driver: From the drop-down list, select HADOOP.</td>
</tr>
<tr>
<td></td>
<td>• JDBC URL: Enter the JDBC URL as follows: jdbc:hive2://hadoop-host:10000/default</td>
</tr>
<tr>
<td>Set User Information</td>
<td>Click Set User Information, and enter the credentials for accessing the Hadoop database, as follows:</td>
</tr>
<tr>
<td></td>
<td>• User name: HadoopUser</td>
</tr>
<tr>
<td></td>
<td>• Password: HadoopPwd</td>
</tr>
</tbody>
</table>
   c. Click Test Connection.
   d. Click Finish.
4. In the Accelerator Loader server configuration file, register the connection to the JDBC Gateway data source using a definition statement, such as the following example:

   /*-----------------------------*/
   /* HADOOP */
   /*---------------------------------*/
   "DEFINE DATABASE TYPE(JGATE)"
   "NAME(HIVE)"

Chapter 13. JDBC Gateway 499
LOCATION(Hadoop)

DDFSTATUS(ENABLE)

SECMCUSRIDPMD

PORT(1527)

IPADDR(10.26.4.125)

CCSID(37)

IDLETIME(110)

For details about this statement, see “Configuring the Accelerator Loader server for JDBC Gateway sources” on page 494.

5. In the Accelerator Loader server, enable rule HLVEJGAG. For more information, see “Configuring the Accelerator Loader server for JDBC Gateway sources” on page 494.

Results

The following connections have been established:

• The connection from the JDBC Gateway to the Hadoop data source
• The connection between the JDBC Gateway and the Accelerator Loader server for the Hadoop data source

What to do next

Use the Accelerator Loader studio to create virtual tables and views to access the Hadoop data.

Setting preferences

The Preferences dialog is used to set user preferences and add necessary drivers.

The Preferences window consists of two panes. The left pane displays the list of preferences groups and the right pane displays the page for the selected group. The following groups of preferences are displayed in the Preferences window:

• JDBC Libraries
• Log
• Output

Setting JDBC driver preferences

Use the JDBC Libraries preferences to set up and manage JDBC driver information for your data sources.

About this task

You can use the JDBC Libraries preferences page to review, define or update JDBC driver information for each type of database (such as Db2, Informix®, Oracle) that will be accessed.

Use the following procedure to access the JDBC Libraries preferences page. For details about adding new driver definitions, see “Adding JDBC driver information for a data source” on page 489.

Procedure

1. To access the JDBC Libraries page, select Preferences > JDBC Libraries. All of the JDBC driver libraries that you have already set up are listed in the JDBC driver libraries area. The JAR files associated with selected driver library are
listed in the Driver files area. Additional information about the selected driver library is displayed on the Details panel.

2. For information about adding or editing driver definitions, see “Adding JDBC driver information for a data source” on page 489.

Setting log preferences
Use the Log page of the Preferences window to activate a log file that will track JDBC Gateway processing information.

About this task
The log file information can be useful in debugging.

It is recommended to leave the log level at the default setting of error. Only increase the level at the direction of IBM Software Support.

Use the following procedure to specify the log file preferences.

Procedure
1. Click Preferences > Log.
2. Check Enable log to activate the log file for debugging purposes. If this check box is selected, the log file option fields are enabled.
3. Check one or more of the log file options to indicate what information should be gathered. It is recommended that all options remain checked. The available log file options are as follows:
   - Print stack trace for log exceptions
   - Print log class and method
   - Print log user token
4. Click Edit Log Categories to modify the category level. The following levels are available: none, emergency, alert, critical, error, warning, notice, info, debug, all.
5. Click Apply to save your preferences choices.
6. Click Restore Defaults to restore the default preference values.
7. Click OK to close the Preferences window.

Setting output preferences
You can use the Output page of the Preferences window to activate the Output view that tracks the information about errors and connections in the JDBC Gateway.

About this task
The information from the Output view can be useful for debugging. It can be delivered as a report in the Output view and automatically added to the log file.

Use the following procedure to specify the output file preferences:

Procedure
1. Click Preferences > Output.
2. On the Output page, you can specify the following options:
   - Show errors
     This option displays all error texts in the Output view.
Show connection status
   This option displays the statuses of connections to data sources in the Output view.

Automatically activate Output view
   When an error occurs or a message appears, this option automatically opens the Output view.

3. Click **Apply** to save your preferences choices.
4. Click **Restore Defaults** to restore the default preference values.
5. Click **OK** to close the Preferences window.

Troubleshooting

Collect troubleshooting data to provide to technical support.

About this task

Use the following procedure to collect troubleshooting data.

**Procedure**

1. Set the log level to debug. See "Setting log preferences" on page 501.
2. Reproduce the issue.
3. Set the log level to the previous value.
4. Select **Help > Collect Support Data**.
5. Complete the fields and click **Save Report**.
Chapter 14. Troubleshooting

Use these topics to diagnose and correct problems that you experience with Db2 Analytics Accelerator Loader.

Messages and codes

These topics contain information about the messages and codes that Tools Customizer and Accelerator Loader issue.

Tools Customizer messages

Use the information in these messages to help you diagnose and solve Tools Customizer problems.

</tbody>
</table>
CCQC001W  The jobs were customized on the Db2 entries that were selected.

System action:  None.

User response:  Press Enter to clear the message.

CCQC001W  The jobs were not generated on one or more of the selected Db2 entries. Press PF3 to check the Db2 entries that were not customized.

Explanation:  The product was not customized on one or more of the Db2 entries that were selected.

System action:  None.

User response:  Press PF3 to see the Db2 entries on which the product was not customized. The status of these Db2 entries is Errors in Customization.

CCQC002I  The edit session was started automatically because values for required parameters are missing or must be verified.

Explanation:  If product, LPAR parameters, or Db2 parameters are not defined or if parameter definitions must be verified, an editing session for the undefined or unverified parameters starts automatically.

System action:  None.

User response:  Define values for all required product, LPAR parameters, or Db2 parameters.

CCQC003W  The template_name template in the library_name metadata library does not contain any parameters.

Explanation:  The specified template does not have parameters.

System action:  None.

User response:  No action is required.

CCQC004S  The value of the "type" attribute for the template_name template in the library_name metadata library does not match the value that was previously specified. The value is value_name, and the previously specified value is value_name.

Explanation:  The value of the "type" attribute must match the value that was previously specified.

System action:  Processing stops.

CCQC005S  The template_name template exceeds the number of allowed templates for a customization sequence. The template is in the library_name metadata library.

Explanation:  The customization sequence can process only number templates. The specified template cannot be processed because the customization sequence already contains the maximum number of templates.

System action:  Processing stops.

CCQC006E  The jobs could not be generated for the group_attach_name Db2 group attach name.

Explanation:  The customization jobs could not be generated for the specified Db2 group attach name.

System action:  Processing stops.

CCQC007E  The jobs could not be generated for the subsystem_ID Db2 subsystem.

Explanation:  The customization jobs could not be generated for the specified Db2 subsystem.

System action:  Processing stops.

CCQC008E  The jobs could not be generated for the member_name Db2 member.

Explanation:  The customization jobs could not be generated for the specified Db2 member.

System action:  Processing stops.

CCQC009S  The jobs were not generated for the DB2 entries.

Explanation:  One or more errors occurred while customization jobs were being generated for the selected Db2 entries.

System action:  Processing stops.

**CCQC010S**
The *template_name* template could not be accessed in the *library_name* metadata library.

**Explanation:** The specified template could not be accessed because the user does not have RACF access to the data set, the data set has incorrect data characteristics, or the data set is not cataloged.

**System action:** Processing stops.

**User response:** Ensure that you have RACF access to the data set, that the characteristics are correct according to the specifications of the product that you are customizing, and that the data set is cataloged. If the problem persists, contact IBM Software Support.

**CCQC011S**
The *template_name* template could not be written to the *library_name* customization library.

**Explanation:** The specified template could not be accessed because the user does not have RACF access to the data set, the data set has incorrect data characteristics, or the data set is not cataloged.

**System action:** Processing stops.

**User response:** Ensure that you have RACF access to the data set, that the characteristics are correct according to the specifications of the product that you are customizing, and that the data set is cataloged. If the problem persists, contact IBM Software Support.

**CCQC012W**
The job card was generated with default values because the JOB keyword was missing.

**Explanation:** Default values were used to generate the job card because the JOB keyword was not specified in the first line of the job card.

**System action:** The job card was generated with default values.

**User response:** No action is required. To generate the job card with your own values, add the JOB keyword in the first line of the job card.

**CCQC013W**
The job card was generated with the default value for the programmer name because the specified programmer name exceeded 20 characters.

**Explanation:** Default values were used to generate the job card because the specified programmer name contained too many characters.

**System action:** The job card was generated with default values.

**User response:** No action is required. To generate the job card with your own values, add a valid programmer name in the job card. A valid programmer name is 1 - 20 characters.

**CCQC014W**
The job card was generated with default values because the JOB keyword was not followed by a space.

**Explanation:** Default values were used to generate the job card because a space did not follow the JOB keyword.

**System action:** The job card was generated with default values.

**User response:** No action is required. To generate the job card with your own values, add a space after the JOB keyword in the job card.

**CCQC01S**
The *template_name* template in the *library_name* metadata library contains the following file-tailoring control statement: *statement_name*. This control statement is not valid in a *template_type* template.

**Explanation:** The *template_type* template cannot contain the specified type of file-tailoring control statement.

**System action:** Processing stops.

**User response:** See “Gathering diagnostic information” on page 941. Contact IBM Software Support.

**CCQC016S**
The )DOT file-tailoring control statement exceeded the number of allowed occurrences for the *template_name* template in the *library_name* metadata library.

**Explanation:** The )DOT file-tailoring control statement can occur only a limited number of times in the specified template.

**System action:** Processing stops.

**User response:** See “Gathering diagnostic information” on page 941. Contact IBM Software Support.

**CCQC017S**
The nested )DOT file-tailoring control statements exceeded the number of allowed occurrences in the *template_name* template in the *library_name* metadata library.

**Explanation:** Nested )DOT file-tailoring control statements can occur only number times.

**System action:** Processing stops.

**User response:** See “Gathering diagnostic information” on page 941. Contact IBM Software Support.

---

Chapter 14. Troubleshooting 505
CCQC018S The template_name template in the library_name metadata library is not valid because it does not contain any data.

Explanation: The specified template is missing required data.
System action: Processing stops.

CCQC019S The template_name template in the library_name metadata library is not valid because an )ENDDOT file-tailoring control statement is missing.

Explanation: A )ENDDOT file-tailoring control statement is required in the specified template.
System action: Processing stops.

CCQC021S The template_name template in the library_name metadata library is not valid because the template must start with the parameter_name job card parameter.

Explanation: The specified template must start with the specified job card parameter.
System action: Processing stops.

CCQC022S The parameters used in a )DOT file-tailoring control statement exceeded the number of allowed parameters in the template_name template. The template is in the library_name metadata library. The error occurs in )DOT section section_number.

Explanation: A )DOT file-tailoring control statement can contain only a limited number of parameters.
System action: Processing stops.

CCQC023S The )DOT file-tailoring control statement must include the table-name table name in the template_name template. The template is in the library_name metadata library. The error occurs in )DOT section section_number.

Explanation: The )DOT file-tailoring control statement is missing a required table name.
System action: Processing stops.

CCQC024S ISPF file tailoring failed for the template_name template in the library_name metadata library.

Explanation: An error occurred during ISPF file tailoring for the specified template.
System action: Processing stops.
User response: Review the Tools Customizer-generated trace data set and the ISPF file tailoring trace data set. To create an ISPF file tailoring trace data set, complete the following steps:
1. Run Tools Customizer until the error is about to occur.
2. Specify the ISPFTTRC command, and press Enter.
3. Issue the Tools Customizer command that issues the error.
4. Specify the ISPFTTRC command, and press Enter. The ISPF file tailoring trace data set is created. It adheres the following naming convention: TSO_ID.ISPF.TRACE, where TSO_ID is the TSO user ID that is being used.

If the problem persists, gather the following information and contact IBM Software Support.

- A screen capture of the Tools Customizer error. Ensure that the complete error message is displayed by pressing PF1.
- The Tools Customizer trace data set. It adheres to the following naming convention: TSO_ID.CCQ.TRACE, where TSO_ID is the TSO user ID that is running Tools Customizer.
- The ISPF file tailoring trace data set.

CCQC025I Customized jobs do not exist because they have not been generated.

Explanation: The list of customized jobs cannot be displayed because the product has not been customized for any Db2 entries.
System action: None.
User response: Complete the steps to customize a product. Customized jobs are generated when all
required product, LPAR parameters, and Db2 parameters are defined and at least one Db2 entry on which to customize the product has been selected.

**CCQC026S**  The value of the "customized" attribute for the **parameter_name** parameter in the **library_name** metadata library template does not match the value that was previously specified. The value is **value_name**, and the previously specified value is **value_name**.

**Explanation:** The value for the "customized" attribute for a parameter must match the value that was previously specified.

**System action:** Processing stops.

**User response:** See "Gathering diagnostic information" on page 941. Contact IBM Software Support.

**CCQC027S**  The **job_name** customization job was not found in the **library_name** customization library.

**Explanation:** The selected customization job does not exist in the customization library.

**System action:** Processing stops.

**User response:** See "Gathering diagnostic information" on page 941. Contact IBM Software Support.

**CCQC028S**  The **library_name** customization library was not found.

**Explanation:** The customization library does not exist.

**System action:** Processing stops.

**User response:** See "Gathering diagnostic information" on page 941. Contact IBM Software Support.

**CCQC029I**  The customization jobs were generated for **Product_name**.

**Explanation:** The customization jobs were generated for the specific product.

**System action:** None.

**User response:** No action is required.

**CCQC030S**  The customization jobs cannot be generated because at least one Db2 entry must be associated with this product.

**Explanation:** The product that you are customizing requires at least one Db2 entry to be associated with it before customization jobs can be generated.

**System action:** None.

**User response:** Edit the product parameters to select one or more tasks or steps. Then, issue the G line command or the GENERATEALL command again.

**CCQC031S**  The jobs were generated for the associated DB2 entries.

**Explanation:** The customization jobs were generated for the Db2 entries that are associated with the product.

**System action:** None.

**User response:** No action is required.

**CCQC032S**  The customization jobs were not generated for **Product_name**.

**Explanation:** A severe error occurred while the jobs were being generated for the specified product.

**System action:** None.

**User response:** See "Gathering diagnostic information" on page 941. Contact IBM Software Support.

**CCQC033S**  The **customization_library_name** has no customized jobs.

**Explanation:** The specified customization library cannot be browsed or edited because it is empty.

**System action:** None.

**User response:** Generate customization jobs for the specified library, and browse or edit the library again.

**CCQC034S**  The specified operation is not allowed.

**Explanation:** Issuing commands against customization jobs from the customization library from an ISPF browse or edit session that was started on the Finish Product Customization panel is restricted.

**System action:** None.

**User response:** To make changes to customization jobs, follow the steps for recustomization.

**CCQC035E**  Before you generate customization jobs, edit the product parameters to select one or more tasks or steps, and then issue the G line command or the GENERATEALL command again.

**Explanation:** One or more tasks or steps must be selected before customization jobs can be generated.

**System action:** None.

**User response:** Edit the product parameters to select one or more tasks or steps. Then, issue the G line command or the GENERATEALL command again.
Before you exit the Product Parameters panel, you must select one or more tasks or steps to generate customization jobs or issue the CANCEL command.

**Explanation:** One or more tasks or steps must be selected to generate customization jobs or the CANCEL command must be issued before you can exit the Product Parameters panel.

**System action:** None.

**User response:** Select one or more tasks or steps, or issue the CANCEL command.

The customization information was not found.

**Explanation:** To use the JOBLIST command, the customization jobs must be regenerated by using the GENERATEALL command or the G line command.

**System action:** None.

**User response:** Issue the GENERATEALL command or the G line command to generate the customization jobs.

The customization information cannot be accessed because the customization member is being used.

**Explanation:** The customization member that was specified on NNN is currently being used.

**System action:** None.

**User response:** Determine why the customization member is in use, release it, and redo the work.

The VERIFY/VERIFYOFF command is not active in Generate mode.

**Explanation:** The VERIFY/VERIFYOFF command is not active in Generate mode because all values saved in Generate mode must already have been verified.

**System action:** None.

**User response:** No action is required.

The member_name environment index member is not valid. The PL/I XML parser issued the following exception error code: code_number.

**Explanation:** While determining if the specified environment index member is valid, the PL/I XML parser issued an exception error code.

**System action:** Processing continues.

**User response:** See the Enterprise PL/I for z/OS Programming Guide for more information about the error.

The XML structure of the member_name environment index member is not valid. The element_name element is unknown.

**Explanation:** The specified environment index member contains an unknown element.

**System action:** Processing stops.

**User response:** See “Gathering diagnostic information” on page 941. Contact IBM Software Support.

The XML structure of the member_name environment index member is not valid. Content is not allowed for the element_name element, but content was found.

**Explanation:** Content was found in an element that cannot contain content.

**System action:** Processing stops.

**User response:** See “Gathering diagnostic information” on page 941. Contact IBM Software Support.

The XML structure of the member_name environment index member is not valid. Content is required for the element_name element, but content was not found.

**Explanation:** The specified element does not contain required content.

**System action:** Processing stops.

**User response:** See “Gathering diagnostic information” on page 941. Contact IBM Software Support.

The XML structure of the member_name environment index member is not valid. The content length for the element_name element exceeds maximum_number characters.

**Explanation:**

**System action:** Processing continues.

**User response:** See the Enterprise PL/I for z/OS Programming Guide for more information about the warning.
Explanation: The specified element contains too many characters.

System action: Processing stops.

---

CCQD006S The XML structure of the member_name environment index member is not valid. The element_name element cannot occur more than maximum_number times.

Explanation: The specified element occurs too many times in the environment index member.

System action: Processing stops.

---

CCQD007S The XML structure of the member_name environment index member is not valid. The element_name element must occur at least minimum_number times.

Explanation: The specified element does not occur enough times in the environment index member.

System action: Processing stops.

---

CCQD008S The XML structure of the member_name environment index member is not valid. The attribute_name attribute in the element_name element cannot occur more than maximum_number times.

Explanation: The specified attribute occurs too many times in the environment index member.

System action: Processing stops.

---

CCQD009S The XML structure of the member_name environment index member is not valid. The attribute_name attribute in the element_name element must occur at least minimum_number times.

Explanation: The specified attribute does not occur enough times in the environment index member.

System action: Processing stops.

---

CCQD010S The XML structure of the member_name environment index member is not valid. Content is not allowed for the attribute_name attribute in the element_name element, but content was found.

Explanation: Content was found in an attribute that cannot contain content. The name of the attribute and the name of the element that contains it are indicated in the message text.

System action: Processing stops.

---

CCQD011S The XML structure of the member_name environment index member is not valid. Content is required for the attribute_name attribute in the element_name element, but content was not found.

Explanation: An attribute does not contain required content. The name of the attribute and the name of the element that contains it are indicated in the message text.

System action: Processing stops.

---

CCQD012S The XML structure of the member_name environment index member is not valid. The content length for the element_name element exceeds maximum_number characters.

Explanation: An element contains too many characters. The name of the element and the maximum number of allowed characters are indicated in the message text.

System action: Processing stops.

---

CCQD013S The XML structure of the member_name environment index member is not valid. The attribute_name attribute in the element_name element is unknown.

Explanation: The environment index member contains an unknown attribute. The name of the unknown attribute is indicated in the message text.

System action: Processing stops.

attribute and the name of the element that contains it are indicated in the message text.

**System action:** Processing stops.

**User response:** See “Gathering diagnostic information” on page 941. Contact IBM Software Support.

---

**CCQD050S** The following LPAR serial number is duplicated in the environment index member: `serial_number`.

**Explanation:** The environment index member contains duplicate LPAR serial numbers. The duplicate serial number is indicated in the message text.

**System action:** Processing stops.

**User response:** See “Gathering diagnostic information” on page 941. Contact IBM Software Support.

---

**CCQD051S** The following DB2 serial number is duplicated in the environment index member: `serial_number`.

**Explanation:** The environment index member contains duplicate DB2 serial numbers. The duplicate serial number is indicated in the message text.

**System action:** Processing stops.

**User response:** See “Gathering diagnostic information” on page 941. Contact IBM Software Support.

---

**CCQD052S** The following DB2 group attach name is duplicated in the environment index member: `group_attach_name`.

**Explanation:** The environment index member contains duplicate DB2 group attach names.

**System action:** Processing stops.

**User response:** See “Gathering diagnostic information” on page 941. Contact IBM Software Support.

---

**CCQD053S** The reference to the following DB2 subsystem for a DB2 group attach name is duplicated in the environment index member: `subsystem_ID`.

**Explanation:** The environment index member contains duplicate references to a DB2 subsystem for a DB2 group attach name.

**System action:** Processing stops.

**User response:** See “Gathering diagnostic information” on page 941. Contact IBM Software Support.

---

**CCQD054S** The reference to the following DB2 subsystem for the `LPAR_name` LPAR is duplicated in the environment index member: `subsystem_ID`.

**Explanation:** The environment index member contains duplicate references to a DB2 subsystem for an LPAR. The duplicate subsystem ID is indicated in the message text.

**System action:** Processing stops.

**User response:** See “Gathering diagnostic information” on page 941. Contact IBM Software Support.

---

**CCQD055S** The following DB2 group attach name was not found in the environment index member: `group_attach_name`.

**Explanation:** A group attach name that is referenced by a DB2 member does not exist in the environment index member.

**System action:** Processing stops.

**User response:** See “Gathering diagnostic information” on page 941. Contact IBM Software Support.

---

**CCQD056S** The following LPAR was not found in the environment index member: `LPAR_name`.

**Explanation:** The LPAR does not exist in the environment index member.

**System action:** Processing stops.

**User response:** See “Gathering diagnostic information” on page 941. Contact IBM Software Support.

---

**CCQD057S** The following LPAR is duplicated in the environment index member: `LPAR_name`.

**Explanation:** The environment index member contains duplicate LPARs. The name of the duplicate LPAR name is indicated in the message text.

**System action:** Processing stops.

**User response:** See “Gathering diagnostic information” on page 941. Contact IBM Software Support.

---

**CCQD100W** The `member_name` product index member is not valid. The PL/I XML parser issued the following exception warning code: `code_number`.

**Explanation:** While determining if the product index member is valid, the PL/I XML parser issued the specified exception warning code.

**System action:** Processing stops.

**User response:** See “Gathering diagnostic information” on page 941. Contact IBM Software Support.
System action: Processing continues.

User response: See the Enterprise PL/I for z/OS Programming Guide for more information about the specified exception warning code.

---

**CCQD101S** The member_name product index member is not valid. The PL/I XML parser issued the following exception error code: code_number.

**Explanation:** While determining if the product index member is valid, the PL/I XML parser issued the specified exception error code. Ensure that the Tools Customizer data store data set DCB is the same as the sample SCCQSAMP(CCQCDATS) data set DCB.

**System action:** Processing stops.

**User response:** See the Enterprise PL/I for z/OS Programming Guide for more information about the specified exception warning code. Ensure that the Tools Customizer data store data set DCB is the same as the sample SCCQSAMP(CCQCDATS) data set DCB.

---

**CCQD102S** The XML structure of the member_name product index member is not valid. The element_name element is unknown.

**Explanation:** The specified product index member contains an unknown element.

**System action:** Processing stops.

**User response:** See the Enterprise PL/I for z/OS Programming Guide for more information about the specified exception error code. Ensure that the Tools Customizer data store data set DCB is the same as the sample SCCQSAMP(CCQCDATS) data set DCB.

---

**CCQD103S** The XML structure of the member_name product index member is not valid. Content is not allowed for the element_name element, but content was found.

**Explanation:** Content was found for an element that cannot contain content.

**System action:** Processing stops.

**User response:** See the Enterprise PL/I for z/OS Programming Guide for more information about the specified exception error code. Ensure that the Tools Customizer data store data set DCB is the same as the sample SCCQSAMP(CCQCDATS) data set DCB.

---

**CCQD104S** The XML structure of the member_name product index member is not valid. Content is required for the element_name element, but content was not found.

**Explanation:** The specified element does not contain required content.

**System action:** Processing stops.

**User response:** See the Enterprise PL/I for z/OS Programming Guide for more information about the specified exception error code. Ensure that the Tools Customizer data store data set DCB is the same as the sample SCCQSAMP(CCQCDATS) data set DCB.

---

**CCQD105S** The XML structure of the member_name product index member is not valid. The content length for the element_name element exceeds maximum_number characters.

**Explanation:** The specified element contains too many characters.

**System action:** Processing stops.

**User response:** See the Enterprise PL/I for z/OS Programming Guide for more information about the specified exception error code. Ensure that the Tools Customizer data store data set DCB is the same as the sample SCCQSAMP(CCQCDATS) data set DCB.

---

**CCQD106S** The XML structure of the member_name product index member is not valid. The element_name element cannot occur more than maximum_number times.

**Explanation:** The specified element occurs too many times in the product index member.

**System action:** Processing stops.

**User response:** See the Enterprise PL/I for z/OS Programming Guide for more information about the specified exception error code. Ensure that the Tools Customizer data store data set DCB is the same as the sample SCCQSAMP(CCQCDATS) data set DCB.

---

**CCQD107S** The XML structure of the member_name product index member is not valid. The element_name element must occur at least minimum_number times.

**Explanation:** The specified element does not occur enough times in the product index member.

**System action:** Processing stops.

**User response:** See the Enterprise PL/I for z/OS Programming Guide for more information about the specified exception error code. Ensure that the Tools Customizer data store data set DCB is the same as the sample SCCQSAMP(CCQCDATS) data set DCB.

---

**CCQD108S** The XML structure of the member_name product index member is not valid. The attribute_name attribute in the element_name element cannot occur more than maximum_number times.

**Explanation:** An attribute occurs too many times. The name of the attribute and the element that contains it are indicated in the message text.

**System action:** Processing stops.

**User response:** See the Enterprise PL/I for z/OS Programming Guide for more information about the specified exception error code. Ensure that the Tools Customizer data store data set DCB is the same as the sample SCCQSAMP(CCQCDATS) data set DCB.
The XML structure of the member_name product index member is not valid. The attribute_name attribute in the element_name element must occur at least minimum_number times.

Explanation: The specified attribute does not occur enough times in the product index member.

System action: Processing stops.

The XML structure of the member_name product index member is not valid. Content is not allowed for the attribute_name attribute in the element_name element, but content was found.

Explanation: An attribute cannot contain content. The name of the attribute and the element that contains it are indicated in the message text.

System action: Processing stops.

The XML structure of the member_name product index member is not valid. Content is required for the attribute_name attribute in the element_name element, but content was not found.

Explanation: An attribute requires content. The name of the attribute and the name of the element that contains it are indicated in the message text.

System action: Processing stops.

The XML structure of the member_name product index member is not valid. The configuration_ID configuration ID for the configuration-name configuration name is not unique.

Explanation: The specified configuration ID could not be found in the metadata library.

System action: Processing stops.

The content of the member_name product index member is not valid. The pack ID pack_ID that is referenced by product prefix product_prefix in the metadata library library_name could not be found.

Explanation: The specified pack ID could not be found in the metadata library.

System action: Processing stops.

The specified pack contains the component_name, which was previously specified as a stand-alone product.

Explanation: The specified component of the pack was previously specified as a stand-alone product.

System action: None.

User response: No action is required.

The specified component metadata library was previously specified as part of the pack_name.

Explanation: The specified metadata library for the component was previously specified as part of a pack.

System action: None.

User response: No action is required.
CCQD123E  The customization library name library_name is being used by another product or component. Specify another customization library qualifier on the Tools Customizer Settings panel.

Explanation: A different product or component is using the specified customization library.

System action: None.

User response: Specify another customization library qualifier on the Tools Customizer Settings panel.

CCQD303S  The XML structure of the member_name product environment member is not valid. Content is not allowed for the element_name element, but content was found.

Explanation: Content was found for an element that cannot contain content.

System action: Processing stops.

User response: See “Gathering diagnostic information” on page 941 and contact IBM Software Support.

CCQD304S  The XML structure of the member_name product environment member is not valid. Content is required for the element_name element, but content was not found.

Explanation: The specified element does not contain required content.

System action: Processing stops.

User response: See “Gathering diagnostic information” on page 941 and contact IBM Software Support.

CCQD305S  The XML structure of the member_name product environment member is not valid. The content length for the element_name element exceeds maximum_number characters.

Explanation: The specified element contains too many characters.

System action: Processing stops.

User response: See “Gathering diagnostic information” on page 941 and contact IBM Software Support.

CCQD306S  The XML structure of the member_name product environment member is not valid. The element_name element cannot occur more than maximum_number times.

Explanation: The specified element occurs too many times in the product environment member.

System action: Processing stops.

User response: See “Gathering diagnostic information” on page 941 and contact IBM Software Support.

User response: See “Gathering diagnostic information” on page 941 and contact IBM Software Support.

User response: See “Gathering diagnostic information” on page 941 and contact IBM Software Support.
CCQD307S  The XML structure of the member_name product environment member is not valid. The element_name element must occur at least minimum_number times.

Explanation: The specified element does not occur enough times in the product environment member.

System action: Processing stops.

CCQD308S  The XML structure of the member_name product environment member is not valid. The attribute_name attribute in the element_name element must occur at least minimum_number times.

Explanation: The specified attribute does not occur enough times in the product environment member.

System action: Processing stops.

CCQD309S  The XML structure of the member_name product environment member is not valid. Content is required for the attribute_name attribute in the element_name element, but content was not found.

Explanation: The specified attribute requires content. The name of the attribute and the name of the element that contains it are indicated in the message text.

System action: Processing stops.

CCQD310S  The XML structure of the member_name product environment member is not valid. Content is not allowed for the attribute_name attribute in the element_name element, but content was found.

Explanation: The specified attribute cannot contain content. The name of the attribute and the element that contains it are indicated in the message text.

System action: Processing stops.

CCQD311S  The XML structure of the member_name product environment member is not valid. Content is required for the attribute_name attribute in the element_name element, but content was not found.

Explanation: The specified attribute requires content. The name of the attribute and the name of the element that contains it are indicated in the message text.

System action: Processing stops.

CCQD312S  The XML structure of the member_name product environment member is not valid. The content length for the element_name element exceeds maximum_number characters.

Explanation: The specified element contains too many characters.

System action: Processing stops.

CCQD313S  The XML structure of the member_name product environment member is not valid. The attribute_name attribute in the element_name element is unknown.

Explanation: The specified attribute in the product environment member is unknown.

System action: Processing stops.

CCQD350I  The subsystem_ID Db2 subsystem is associated with this product.

Explanation: The specified Db2 subsystem was added and saved in the Tools Customizer data store for the product to be customized.

System action: Processing continues.

User response: No action is required.

CCQD351I  The member_name Db2 member for the group_attach_name Db2 group attach name is associated with this product.

Explanation: The specified Db2 member for the group attach name was added and saved in the Tools Customizer data store for the product to be customized.
System action: Processing continues.
User response: No action is required.

CCQD352I The group_attach_name Db2 group attach name is associated with this product.
Explanation: The specified Db2 group attach name was added and saved in the Tools Customizer data store for the product to be customized.
System action: Processing continues.
User response: No action is required.

CCQD353E The subsystem_ID Db2 subsystem is already associated with this product.
Explanation: The specified Db2 subsystem cannot be added for the product to be customized because it already exists in the product environment in the data store.
System action: None.
User response: Ensure that the Db2 subsystem is specified correctly. If the problem persists, contact IBM Software Support.

CCQD354E The member_name Db2 member for the group_attach_name Db2 group attach name is already associated with this product.
Explanation: The specified Db2 member for the group attach name cannot be added for the product to be customized because it already exists in the product environment in the data store.
System action: None.
User response: Ensure that the Db2 group attach name is specified correctly. If the problem persists, contact IBM Software Support.

CCQD355E The group_attach_name Db2 group attach name is already associated with this product.
Explanation: The specified Db2 group attach name cannot be added for the product to be customized because it already exists in the product environment in the data store.
System action: Processing stops.
User response: Ensure that the Db2 group attach name is specified correctly. If the problem persists, contact IBM Software Support.

CCQD356S The library_name metadata library is already associated with the maximum number of allowed Db2 entries for this product.
Explanation: The specified metadata library cannot be associated with more Db2 entries because it is already associated with the number of Db2 entries that are allowed.
System action: Processing stops.
User response: Delete an associated Db2 entry, and associate the specified library with another Db2 entry again.

CCQD357I The subsystem_ID Db2 subsystem is unassociated with this product.
Explanation: The specified Db2 SSID was unassociated with the product that you are customizing.
System action: Processing continues.
User response: No action is required.

CCQD358I The member_name Db2 member for the group_attach_name Db2 group attach name is unassociated with this product.
Explanation: The specified Db2 member for the Db2 group attach name was unassociated with the product that you are customizing.
System action: Processing continues.
User response: No action is required.

CCQD359I The group_attach_name Db2 group attach name is unassociated with this product.
Explanation: The specified Db2 group attach name was unassociated with the product that you are customizing.
System action: Processing continues.
User response: No action is required.

CCQD360S The library_name metadata library is not associated with the specified Db2 subsystem subsystem_ID.
Explanation: The specified Db2 subsystem and metadata library are not associated with each other.
System action: None.
User response: Ensure that the Db2 subsystem and the metadata library are associated. If the problem persists, contact IBM Software Support.
<table>

</tbody>
</table>
User response: Specify a different data store data set name.

---

**CCQD510I**  The DB2 SSID and Db2 group attach name were created.

**Explanation:** The Db2 SSID and Db2 group attach name were created and saved in the data store.

**System action:** None.

**User response:** No action is required.

---

**CCQD511E**  The DB2 entry already exists in the list of Db2 entries to be associated.

**Explanation:** The Db2 entry cannot be added because it already exists in the list of Db2 entries to be associated.

**System action:** None.

**User response:** Specify a different Db2 entry.

---

**CCQD512S**  An error occurred while a DB2 entry was being created.

**Explanation:** A severe error occurred while a Db2 entry was being created.

**System action:** Processing stops.

**User response:** See "Gathering diagnostic information" on page 941. Contact IBM Software Support.

---

**CCQD513E**  The specified DB2 entry already exists and is associated with the current product on the Customizer Workplace panel.

**Explanation:** The Db2 entry cannot be added because it already exists, and it is already associated with the product to be customized.

**System action:** None.

**User response:** Press F3 to go to the Customizer Workplace panel to see the Db2 entry, or specify a different Db2 entry.

---

**CCQD514E**  A value is required for a DB2 subsystem, a Db2 group attach name, or both before they can be created.

**Explanation:** Required information is missing. A Db2 subsystem, a Db2 group attach name, or both must be specified.

**System action:** None.

**User response:** Specify a Db2 subsystem, a Db2 group attach name, or both.

---

**CCQD515E**  The specified DB2 entry already exists in the list of Db2 entries and is already associated with the current product.

**Explanation:** The Db2 entry has already been created and associated with the product that you want to customize.

**System action:** None.

**User response:** Specify a different Db2 entry.

---

**CCQD516E**  The specified DB2 entry already exists in the list of Db2 entries on the Associate DB2 Entry with Product panel but is not associated with the current product.

**Explanation:** The Db2 entry exists, but it must be associated with the product to be customized.

**System action:** None.

**User response:** On the Customizer Workplace panel, issue the ASSOCIATE command to associate the Db2 entry with the product.

---

**CCQD517S**  An error occurred while a DB2 entry was being copied.

**Explanation:** A severe error occurred while a Db2 entry was being copied.

**System action:** Processing stops.

**User response:** See "Gathering diagnostic information" on page 941. Contact IBM Software Support.

---

**CCQD518E**  A value is required for a DB2 subsystem, a Db2 group attach name, or both before they can be copied.

**Explanation:** Required information is missing. A Db2 subsystem, a Db2 group attach name, or both must be specified.

**System action:** None.

**User response:** Specify a Db2 subsystem, a Db2 group attach name, or both.

---

**CCQD519I**  The DB2 entry was copied.

**Explanation:** The Db2 entry was copied and saved in the Tools Customizer data store.

**System action:** None.

**User response:** No action is required.
The DB2 entry was copied to the list of DB2 entries but was not associated because the product is already associated with the allowed number of DB2 entries.

**Explanation:**
The DB2 entry was not completely copied because a product can be associated with only 1200 DB2 entries.

**System action:**
Processing stops.

**User response:**
Remove a DB2 entry from the list, and copy the specified DB2 entry again.

---

**CCQD521I**
*Line_command is not a valid line command.*

**Explanation:**
The specified line command is not valid. Valid line commands are on the panel.

**System action:**
Processing stops.

**User response:**
Specify a valid line command.

---

**CCQD522E**
The *subsystem_ID* DB2 subsystem ID occurs more than once in the list. Each row must be unique.

**Explanation:**
The specified DB2 subsystem ID can be used only once.

**System action:**
Processing stops.

**User response:**
Specify a different DB2 subsystem ID.

---

**CCQD523E**
The *group_attach_name* DB2 group attach name occurs more than once in the list. Each row must be unique.

**Explanation:**
The specified DB2 group attach name can be used only once.

**System action:**
Processing stops.

**User response:**
Specify a different DB2 group attach name.

---

**CCQD524E**
The *member_name* DB2 member for the DB2 group attach name occurs more than once in the list. Each row must be unique.

**Explanation:**
The specified DB2 member for the DB2 group attach name can be used only once.

**System action:**
Processing stops.

**User response:**
Specify a different DB2 member for the DB2 group attach name.

---

**CCQD525I**
The DB2 entries were created.

**User response:**
No action is required.

---

**CCQD526E**
The *subsystem_ID* DB2 subsystem ID occurs more than once in the list. Each DB2 subsystem ID must be unique.

**Explanation:**
The specified DB2 subsystem ID can be used only once.

**System action:**
Processing stops.

**User response:**
Specify a different DB2 subsystem ID.

---

**CCQD527I**
DB2 group attach names cannot be created during the copy process.

**Explanation:**
The ability to create DB2 group attach names is not available during the copy process.

**System action:**
None.

**User response:**
Create DB2 group attach names by issuing the CREATE command on the Customizer Workplace panel.

---

**CCQD528E**
The *metadata_library* metadata library is already associated with *number* DB2 entries. The maximum number of associated DB2 entries for this metadata library is 256.

**Explanation:**
A metadata library can be associated with a maximum of 256 DB2 entries. The specified metadata library is already associated with 256.

**System action:**
Processing stops.

**User response:**
Remove an existing association between the specified metadata library and a DB2 entry, and associate the specified the metadata library with another entry.

---

**CCQD529I**
At least one row is required.

---

**CCQD560E**
The *subsystem_ID* DB2 subsystem already exists and is associated with the current product on the Customizer Workplace panel.

**Explanation:**
The specified DB2 subsystem exists and is associated with the product that you are customizing.

**System action:**
None.

**User response:**
Specify another DB2 subsystem.

---

**CCQD561E**
The *member_name* DB2 member for the *group_attach_name* DB2 group attach name already exists and is associated with the current product on the Customizer Workplace panel.
**Explanation:** The specified Db2 data sharing group for the Db2 group attach name exists and is associated with the product that you are customizing.

**System action:** None.

**User response:** Specify another Db2 subsystem.

---

**CCQD562E** The `group_attach_name` Db2 group attach name already exists and is associated with the current product on the Customizer Workplace panel.

**Explanation:** The specified Db2 group attach name exists and is associated with the product that you are customizing. The subsystem is in the table on the Customizer Workplace panel.

**System action:** None.

**User response:** Specify another Db2 group attach name.

---

**CCQD563E** A value is required for a DB2 subsystem, a Db2 group attach name, or both before they can be created.

**Explanation:** A Db2 subsystem, a Db2 group attach name, or both are not specified so one or both of them cannot be created.

**System action:** None.

**User response:** Specify a value for the Db2 subsystem, the Db2 group attach name, or both.

---

**CCQD565E** The `subsystem_ID` Db2 subsystem already exists in the list of Db2 entries and is already associated with the current product.

**Explanation:** The specified subsystem is already associated.

**System action:** None.

**User response:** Specify a different Db2 subsystem.

---

**CCQD566E** The `member_name` Db2 member for the `group_attach_name` Db2 group attach name already exists in the list of Db2 entries and is already associated with the current product.

**Explanation:** The specified Db2 member is already associated.

**System action:** None.

**User response:** Specify a different Db2 member.

---

**CCQD567E** The `group_attach_name` Db2 group attach name already exists in the list of Db2 entries and is already associated with the current product.

**Explanation:** The specified Db2 group attach name is already associated.

**System action:** None.

**User response:** Specify another Db2 group attach name.

---

**CCQD568I** `product_name` is not associated with a DB2 entry.

**Explanation:** The product that you are trying to customize is not associated with a Db2 entry. Before a product can be customized, it must be associated with at least one Db2 entry.

**System action:** None.

**User response:** Associate one or more Db2 entries with the product.

---

**CCQD569I** `product_name` product configuration is not associated with a DB2 entry.

**Explanation:** The configuration for the specified product is not associated with a Db2 entry.

**System action:** None.

**User response:** Associate one or more Db2 entries with the configuration.

---

**CCQD577W** The `mode_name` Db2 mode of the `subsystem_ID` Db2 subsystem is not supported by the product.

**Explanation:** The product does not support the specified Db2 mode.

**System action:** None.

**User response:** Specify a supported Db2 mode.

---

**CCQD578W** The `mode_name` Db2 mode of the `member_name` Db2 member for the `group_name` Db2 group is not supported by the product.

**Explanation:** The product does not support the specified Db2 mode.

**System action:** None.

**User response:** Specify a supported Db2 mode.

---

**CCQD579W** The `mode_name` Db2 mode of the `group_name` Db2 group attach name is not supported by the product.

**Explanation:** The product does not support the specified Db2 mode.

**System action:** None.

**User response:** Specify a supported Db2 mode.
System action: None.
User response: Specify a supported Db2 mode.

CCQD580S The subsystem_ID Db2 subsystem was copied to the list of Db2 entries but was not associated because the product is already associated with the allowed number of Db2 entries.

Explanation: The copied Db2 subsystem was not associated with the product because the product is associated with the maximum number of Db2 entries.

System action: None.
User response: Remove an associated Db2 entry and associate the product with the copied Db2 subsystem.

CCQD581S The member_name Db2 member for the group_attach_name Db2 group attach name was copied to the list of Db2 entries but was not associated because the product is already associated with the maximum number of Db2 entries.

Explanation: The copied Db2 member for the Db2 group attach name was not associated with the product because the product is associated with the maximum number of Db2 entries.

System action: None.
User response: Remove an associated Db2 entry and associate the product with the copied Db2 member.

CCQD582S The group_attach_name Db2 group attach name was copied to the list of Db2 entries but was not associated because the product is already associated with the allowed number of Db2 entries.

Explanation: The copied Db2 group attach name was not associated with the product because the product is associated with the maximum number of Db2 entries.

System action: None.
User response: Remove an associated Db2 entry and associate the product with the copied Db2 group attach name.

CCQD583I The from_DB2 Db2 subsystem was copied to the to_DB2 subsystem.

System action: None.
User response: No action is required.

CCQD584I The member_name Db2 member for the group_attach_name Db2 group attach name is copied to the subsystem_ID Db2 subsystem.

Explanation: The specified Db2 member was copied.

System action: None.
User response: No action is required.

CCQD585I The group_attach_name Db2 group attach name cannot be copied because a Db2 member is required.

Explanation: The specified Db2 group attach name was not copied because a Db2 member was missing.

System action: None.
User response: No action is required.

CCQD586S The current LPAR is LPAR_name, but the data store contains information about the LPAR_name LPAR. You must use the LPAR_name LPAR to customize the product.

Explanation: The LPAR that is stored in the data store data set must be used to customize the product.

System action: Processing stops.
User response: Use the LPAR that is stored in the data store data set.

CCQD587W The level_number Db2 level of the subsystem_name Db2 subsystem is not supported by the product.

Explanation: The product does not support the specified Db2 level.

System action: Processing continues.
User response: Specify a supported level of Db2.

CCQD588W The level_number Db2 level of the member_name Db2 member of the group_name Db2 group is not supported by the product.

Explanation: The product does not support the specified Db2 level.

System action: Processing continues.
User response: Specify a supported level of Db2.

CCQD589W The level_number Db2 level of the group_name Db2 group attach name is not supported by the product.

Explanation: The product does not support the specified Db2 level.

System action: Processing continues.
User response: Specify a supported level of Db2.
**System action:** Processing continues.

**User response:** Specify a supported level of Db2.

---

**CCQD593I** The subsystem ID Db2 subsystem was deleted.

**User response:** No action is required.

---

**CCQD594I** The member_name Db2 for the group_attach_name Db2 group attach name was deleted.

**User response:** No action is required.

---

**CCQD595I** The group_attach_name Db2 group attach name was deleted.

**User response:** No action is required.

---

**CCQD600W** The member_name product customization member is not valid. The PL/I XML parser issued the following exception warning code: code_number.

**Explanation:** While determining if the XML structure of the product customization member is valid, the PL/I XML parser issued an exception warning code.

**System action:** Processing continues.

**User response:** See the Enterprise PL/I for z/OS Programming Guide for more information about the exception warning code.

---

**CCQD601S** The member_name product customization member is not valid. The PL/I XML parser issued the following exception error code: code_number.

**Explanation:** While determining if the XML structure of the product customization member is valid, the PL/I XML parser issued an exception error code.

**System action:** Processing stops.

**User response:** See the Enterprise PL/I for z/OS Programming Guide for more information about the exception error code.

---

**CCQD602S** The XML structure of the member_name product customization member is not valid. The element_name element is unknown.

**Explanation:** The data store member contains an unknown element.

**System action:** Processing stops.

**User response:** See the Enterprise PL/I for z/OS Programming Guide for more information about the exception error code.

---

**CCQD603S** The XML structure of the member_name product customization member is not valid. Content is not allowed for the element_name element, but content was found.

**Explanation:** The specified element cannot contain content.

**System action:** Processing stops.

**User response:** See the Enterprise PL/I for z/OS Programming Guide for more information about the exception error code.

---

**CCQD604S** The XML structure of the member_name product customization member is not valid. Content is required for the element_name element, but content was not found.

**Explanation:** The specified element is missing required content.

**System action:** Processing stops.

**User response:** See the Enterprise PL/I for z/OS Programming Guide for more information about the exception error code.
CCQD605S The XML structure of the member_name product customization member is not valid. The content length for the element_name element exceeds maximum_number characters.

Explanation: The specified element contains too many characters.

System action: Processing stops.

CCQD606S The XML structure of the member_name product customization member is not valid. The element_name element cannot occur more than maximum_number times.

Explanation: The specified element occurs too many times.

System action: Processing stops.

CCQD607S The XML structure of the member_name product customization member is not valid. The element_name element must occur at least minimum_number times.

Explanation: The specified element does not occur enough times.

System action: Processing stops.

CCQD608S The XML structure of the member_name product customization member is not valid. The attribute_name attribute in the element_name element cannot occur more than maximum_number times.

Explanation: The specified attribute occurs too many times.

System action: Processing stops.

CCQD609S The XML structure of the member_name product customization member is not valid. The attribute_name attribute in the element_name element must occur at least minimum_number times.

Explanation: The specified attribute does not occur enough times.

System action: Processing stops.

CCQD610S The XML structure of the member_name product customization member is not valid. Content is not allowed for the attribute_name attribute in the element_name element, but content was found.

Explanation: The specified attribute cannot contain content.

System action: Processing stops.

CCQD611S The XML structure of the member_name product customization member is not valid. Content is required for the attribute_name attribute in the element_name element, but content was not found.

Explanation: The specified attribute does not contain required content.

System action: Processing stops.

CCQD612S The XML structure of the member_name product customization member is not valid. The content length for the element_name element exceeds maximum_number characters.

Explanation: The specified element contains too many characters.

System action: Processing stops.

The XML structure of the member_name product customization member is not valid. The attribute_name attribute in the element_name element is unknown.

Explanation: The specified attribute in the data store member is unknown.
System action: Processing stops.

The content of the member_name product customization member is not valid. The value of the element_name element is not valid. The value is value_name.

Explanation: The specified value is not valid.
System action: Processing stops.
User response: See the Enterprise PL/I for z/OS Programming Guide for more information about the exception warning code.

The member_name Db2 data member is not valid. The PL/I XML parser issued the following exception warning code: code_number.

Explanation: While determining if the XML structure of the Db2 data member is valid, the PL/I XML parser issued an exception warning code.
System action: Processing continues.
User response: See the Enterprise PL/I for z/OS Programming Guide for more information about the exception warning code.

The member_name LPAR data member is not valid. The PL/I XML parser issued the following exception error code: code_number.

Explanation: While determining if the XML structure of the LPAR data member is valid, the PL/I XML parser issued an exception error code.
System action: Processing continues.
User response: See the Enterprise PL/I for z/OS Programming Guide for more information about the exception error code.

The value_number value in the LPAR parameter parameter_name was skipped because only maximum_number values are allowed.

Explanation: The specified value was skipped because it exceeds the number of allowed values in the LPAR parameter.
System action: Processing continues.
User response: No action is required. To stop this message from being issued, remove the extra values from the LPAR parameter.

The subsystem_ID Db2 subsystem is copied to the member_name Db2 member for the group_attach_name Db2 group attach name.

User response: No action is required.
The member_name Db2 member for the group_attach_name Db2 group attach name is copied to the member_name Db2 member for the group_attach_name Db2 group attach name.

User response: No action is required.

The member_name Db2 member for the group_attach_name Db2 group attach name is copied to multiple Db2 entries.

User response: No action is required.

The member_name product data member is not valid. The PL/I XML parser issued the following exception warning code: code_number.

Explanation: While determining if the XML structure of the product data member is valid, the PL/I XML parser issued an exception warning code.

System action: Processing continues.

User response: See the Enterprise PL/I for z/OS Programming Guide for more information about the exception warning code.

The member_name product data member is not valid. The PL/I XML parser issued the following exception error code: code_number.

Explanation: While determining if the XML structure of the product data member is valid, the PL/I XML parser issued an exception error code.

System action: Processing continues.

User response: See the Enterprise PL/I for z/OS Programming Guide for more information about the exception error code.

The value_number value in the product parameter parameter_name was skipped because only maximum_number values are allowed.

Explanation: The specified value was skipped because it exceeds the number of allowed values in the product parameter.

System action: Processing continues.

User response: No action is required. To stop this message from being issued, remove the extra values from the product parameter.

The subsystem_ID Db2 subsystem was changed to the member_name Db2 member for the group_attach_name Db2 group attach name.

User response: No action is required.

The member_name Db2 member for the group_attach_name Db2 group attach name was changed to the subsystem_ID Db2 subsystem.

User response: No action is required.

The member_name Db2 member for the group_attach_name Db2 group attach name was changed to the member_name Db2 group attach name.

User response: No action is required.

The DB2 group attach name cannot be blank when the Db2 subsystem ID is blank.

Explanation: A Db2 group attach name, Db2 subsystem ID, or both must be specified.

System action: Processing stops.

User response: Specify a Db2 group attach name, Db2 subsystem ID, or both.

The specified message field name or message message_ID was not found.

Explanation: An error occurred while displaying a message field name or the specified message.

System action: Processing stops.

User response: See "Gathering diagnostic information" on page 941 Contact IBM Software Support.

An incorrect trace level was specified. Valid trace levels are 0 - 4.

Explanation: A wrong trace level was specified. Valid trace levels are 0 - 4.

System action: Processing stops.

User response: Specify a valid trace level 0 - 4.

An asterisk was improperly specified in a filter argument.

Explanation: An asterisk, which is treated as data, is embedded in the filter arguments. A generic filter argument is specified by placing the asterisk in the last nonblank position of the argument. No rows match the
filter arguments, so all rows will be shown.

System action: Processing stops.
User response: Specify a valid filter argument.

CCQF029I  More Db2 entries are associated with the specified product. All Db2 entries are listed.

System action: None.
User response: No action is required.

CCQF080I  The customized jobs for the product that you are customizing are stored in this data set.

System action: None.
User response: No action is required.

CCQF081I  The JCL must be browsed or edited.

Explanation: You can either browse or edit the JCL.
System action: None.
User response: No action is required.

CCQF082E  The sort-command command has an invalid sort field. The valid fields are list-of-the-table-column-names.

Explanation: An invalid sort field was specified.
System action: Processing stops.
User response: Specify a valid sort field.

CCQF083E  The sort-command command has an invalid sort order. The valid orders are A (for ascending) or D (for descending).

Explanation: An invalid sort order was specified.
System action: Processing stops.
User response: Specify a valid sort order.

CCQF084E  The sort-command command has more than two sort fields specified.

Explanation: The specified sort command included more than two sort fields. The sort command can have up to two fields specified.
System action: Processing stops.
User response: Specify only one or two sort fields.

CCQF085E  A sort order was specified incorrectly in the sort-command command. A sort order can be specified only after a field name.

Explanation: Valid orders are A (for ascending) or D (for descending).
System action: Processing stops.
User response: Specify a valid sort order after a field name.

CCQF086E  The sort-command command is missing a sort field.

Explanation: A sort field must be specified.
System action: Processing stops.
User response: Specify a valid sort field.

CCQF087E  Type the search arguments to filter objects. A generic filter argument is a search argument of the form AA*.

Explanation: In a generic filter argument, only the characters up to the asterisk (*) are compared. The * must be placed in the last nonblank position of the argument. Asterisks embedded in the argument are treated as data.
System action: None.
User response: No action is required.

CCQF110I  To show the panel instructions section, specify a slash (/). To hide the panel instructions section, remove the slash.

System action: None.
User response: No is action required.
To show the Products to Customize section, specify a slash (/). To hide the Products to Customize section, remove the slash. The Product to Customize section can be shown or hidden only on the Customizer Workplace panel.

System action: None.
User response: No is action required.

To show the Usage Notes section, specify a slash (/). To hide the Usage Notes section, remove the slash. The Usage Notes section can be shown only on the Product Parameters, LPAR Parameters, and DB2 Parameters panels.

System action: None.
User response: No action is required.

The specified values have been saved.

System action: None.
User response: No action is required.

Displays the Panel Display Options panel. Use this panel to select which information to display on panels.

System action: None.
User response: No action is required.

The fully qualified name of the data set into which you want to copy the current user profile. If the data set name exceeds 42 characters, enclose the name in quotation marks. ALTER or UPDATE authorization to this data set is required.

System action: None.
User response: No action is required.

The volume name in which the data set will reside. If left blank, the volume name will be decided by the system.

System action: None.
User response: No action is required.

To show the panel instructions section, specify a slash (/). To hide the panel instructions section, remove the slash.

System action: None.
User response: No is action required.

The specified option option_name is not valid.

Explanation: The option that was specified is not a valid option on the panel.
System action: Tools Customizer stops.
User response: Specify a valid option on the panel.

Before you customize a product, verify your user settings.

Explanation: The user settings must be verified before a product can be customized.
System action: Tools Customizer stops.
User response: Verify the user settings.

Check the user settings. One or more current values are not valid.

Explanation: One or more of the values in the user settings is not valid.
System action: Tools Customizer stops.
User response: Ensure that the specified values for the user settings are valid.

Before you use Tools Customizer, you must select option 0 to verify your user settings.

Explanation: The user settings must be changed before a product can be customized.
System action: Tools Customizer stops.
User response: Change the user settings.

You must select option 0 to change your user settings.

Explanation: User settings must be changed before a product can be customized.
System action: Tools Customizer stops.
User response: Change the user settings.

The XML structure of the member_name Db2 parameter metadata member is not valid. The PL/I XML parser issued the following exception warning code: code_number.

Explanation: While determining if the Db2 parameter metadata member is valid, the PL/I XML parser issued an exception warning code.
System action: Processing continues.
User response: See the Enterprise PL/I for z/OS
CCQI001S  The XML structure of the member_name Db2 parameter metadata member is not valid. The PL/I XML parser issued the following exception error code: code_number.

Explanation: While determining if the Db2 parameter metadata member is valid, the PL/I XML parser issued an exception error code.

System action: Processing stops.

User response: See the Enterprise PL/I for z/OS Programming Guide for more information about the exception warning code.

CCQI002S  The XML structure of the member_name Db2 parameter metadata member is not valid. The element_name element is unknown.

Explanation: The specified element in the Db2 parameter metadata member is unknown.

System action: Processing stops.

CCQI003S  The XML structure of the member_name Db2 parameter metadata member is not valid. Content is not allowed for the element_name element, but content was found.

Explanation: The specified element cannot contain content.

System action: Processing stops.

CCQI004S  The XML structure of the member_name Db2 parameter metadata member is not valid. Content is required for the element_name element, but content was not found.

Explanation: The specified element requires content.

System action: Processing stops.

CCQI005S  The XML structure of the member_name Db2 parameter metadata member is not valid. The content length for the element_name element cannot exceed maximum_number characters.

Explanation: The specified element contains too many characters.

System action: Processing stops.

CCQI006S  The XML structure of the member_name Db2 parameter metadata member is not valid. The content length for the element_name element must be at least minimum_number characters.

Explanation: The specified element does not contain enough characters.

System action: Processing stops.

CCQI007S  The XML structure of the member_name Db2 parameter metadata member is not valid. The element_name element must occur at least minimum_number times.

Explanation: The specified element does not occur enough times.

System action: Processing stops.

CCQI008S  The XML structure of the member_name Db2 parameter metadata member is not valid. The attribute_name attribute in the element_name element cannot occur more than maximum_number times.

Explanation: The specified attribute occurs too many times.

System action: Processing stops.

Chapter 14. Troubleshooting
CCQI009S  The XML structure of the member_name Db2 parameter metadata member is not valid. The attribute_name attribute in the element_name element must occur at least minimum_number times.

Explanation:  The specified attribute did not occur enough times.
System action:  Processing stops.

CCQI010S  The XML structure of the member_name Db2 parameter metadata member is not valid. Content is not allowed for the attribute_name attribute in the element_name element, but content was found.

Explanation:  The specified attribute cannot have content.
System action:  Processing stops.

CCQI011S  The XML structure of the member_name Db2 parameter metadata member is not valid. Content is required for the attribute_name attribute in the element_name element, but content was not found.

Explanation:  The specified attribute is missing required content.
System action:  Processing stops.

CCQI012S  The XML structure of the member_name Db2 parameter metadata member is not valid. The content length for the element_name element cannot exceed maximum_number characters.

Explanation:  The specified element contains too many characters.
System action:  Processing stops.

CCQI013S  The XML structure of the member_name Db2 parameter metadata member is not valid. The attribute_name attribute in the element_name element is unknown.

Explanation:  The specified attribute in the Db2 parameter metadata member is unknown.
System action:  Processing stops.

CCQI014S  The content of the member_name Db2 parameter metadata member is not valid because the value of the element_name element is incorrect. The value is value_name.

Explanation:  The specified value of the element is not a valid value.
System action:  Processing stops.

CCQI015S  The content of the DB2 parameter metadata member is not valid because the value of the attribute_name attribute in the element_name element is incorrect. The value of the attribute is value_name.

Explanation:  The specified value of the attribute is not a valid value.
System action:  Processing stops.

CCQI016S  The content of the DB2 parameter metadata member is not valid because the data type of the element_name element is incorrect. The value is value_name.

Explanation:  The specified data type is not a valid data type.
System action:  Processing stops.
CCQI017S  The content of the DB2 parameter metadata member is not valid because the data type of the attribute_name attribute in the element_name element is incorrect. The value of the attribute is value_name.

Explanation:  The specified data type is not a valid data type.

System action:  Processing stops.

CCQI050S  The member_name Db2 parameter metadata member was not found in the data_set_name data set.

Explanation:  Tools Customizer could not find the specified Db2 parameter metadata member.

System action:  Processing stops.

CCQI051S  The parameter_name LPAR parameter in the template_name template does not have associated metadata in the member_name LPAR parameter metadata member.

Explanation:  The specified template does not contain metadata for an LPAR parameter. The name of the LPAR parameter metadata member, the name of the LPAR parameter, and the name of the template are indicated in the message text.

System action:  Processing stops.

CCQI052S  The parameter_name product parameter in the template_name template does not have associated metadata in the member_name product parameter metadata member.

Explanation:  The specified template does not contain metadata for a product parameter. The name of the product parameter metadata member, the name of the product parameter, and the name of the template are indicated in the message text.

System action:  Processing stops.

CCQI053E  The following metadata data set was not found: data_set_name.

Explanation:  Tools Customizer could not find the specified metadata data set.

System action:  Processing stops.

User response:  Ensure that the metadata data set is specified correctly. If the problem persists, contact IBM Software Support.

CCQI054E  The following metadata data set could not be opened: data_set_name.

Explanation:  Tools Customizer could not open the specified LPAR metadata data set.

System action:  Processing stops.

User response:  Ensure the metadata data set was specified correctly.

CCQI055S  The CCQ$$DB2 Db2 parameter metadata member was not found in the data_set_name data set.

Explanation:  Tools Customizer could not find the specified Db2 parameter metadata member in the specified Tools Customizer metadata data set.

System action:  Processing stops.

CCQI056S  The CCQ$$LPR LPAR parameter metadata member was not found in the data_set_name data set.

Explanation:  Tools Customizer could not find the specified LPAR parameter metadata member.

System action:  Processing stops.

CCQI057S  The CCQ$$SLPR LPAR parameter metadata member was not found in the data_set_name data set.

Explanation:  Tools Customizer could not find the specified LPAR parameter metadata member.

System action:  Processing stops.

| CCQI058I | Product name does not have any Db2 parameters.  
Explanation: Db2 parameters are not required to customize the specified product.  
System action: Processing continues.  
User response: No action is required. |
|---------|------------------------------------------------------------------------------------------------|
| CCQI059I | Product name does not have any LPAR parameters.  
Explanation: LPAR parameters are not required to customize the specified product.  
System action: Processing continues.  
User response: No action is required. |
| CCQI060S | The parameter name Db2 parameter in the task_description task and the step_description step does not have associated metadata in the member name Db2 parameter metadata member.  
Explanation: Associated metadata is missing for the specified Db2 parameter in a task.  
System action: Processing stops.  
| CCQI061S | The parameter name LPAR parameter in the task_description task and the step_description step does not have associated metadata in the member name LPAR parameter metadata member.  
Explanation: Associated metadata is missing for the specified LPAR parameter in a task.  
System action: Processing stops.  
| CCQI062S | The parameter name product parameter in the task_description task and the step_description step does not have associated metadata in the member name product parameter metadata member.  
Explanation: Associated metadata is missing for the specified product parameter in a task.  
System action: Processing stops.  
| CCQI063S | The parameter name Db2 parameter in the task_description task condition does not have associated metadata in the member name Db2 parameter metadata member.  
Explanation: Associated metadata is missing for the specified Db2 parameter in a task.  
System action: Processing stops.  
| CCQI064S | The parameter name LPAR parameter in the task_description task and the step_description step does not have associated metadata in the member name LPAR parameter metadata member.  
Explanation: Associated metadata is missing for the specified LPAR parameter in a task and step.  
System action: Processing stops.  
| CCQI065S | The parameter name product parameter in the task_description task and the step_description step does not have associated metadata in the member name product parameter metadata member.  
Explanation: Associated metadata is missing for the specified parameter in a task and step.  
System action: Processing stops.  
| CCQI066S | The parameter name Db2 parameter in the task_description task, step_description step, and template_name template condition does not have associated metadata in the member name Db2 parameter metadata member.  
Explanation: Associated metadata is missing for the specified Db2 parameter in a task, step, and template.  
System action: Processing stops.  
CCQI067S  The parameter_name LPAR parameter in the task_description task, step_description step, and template_name template condition does not have associated metadata in the member_name LPAR parameter metadata member.

Explanation:  Associated metadata is missing for the specified LPAR parameter in a task, step, and template.

System action:  Processing stops.

CCQI067E  The parameter_name LPAR parameter metadata member is not valid.  The default length for the parameter-element_name parameter element exceeds the length of the parameter.  The default length is default_length, and the specified length is specified_length.  The default length will be truncated accordingly.

Explanation:  The specified length cannot be shorter than the default length.

System action:  Processing stops.

CCQI068S  The parameter_name product parameter in the task_description task, step_description step, and template_name template condition does not have associated metadata in the member_name product parameter metadata member.

Explanation:  Associated metadata is missing for the specified product parameter in a task, step, and template.

System action:  Processing stops.

CCQI068E  The parameter_name product parameter metadata member is not valid.  The default length for the parameter-element_name parameter element exceeds the length of the parameter.  The default length is default_length, and the specified length is specified_length.  The default length will be truncated accordingly.

Explanation:  The specified length cannot be shorter than the default length.

System action:  Processing stops.

CCQI069S  Product metadata does not support multiple configurations, but the template_name product template contains the parameter_name parameter.  Enable multiple configurations support for this product, and try again.

Explanation:  The specified template contains a parameter for multiple configurations, but the product is not enabled to support multiple configurations.

System action:  Processing stops.

User response:  Enable multiple configurations support, and try again.

CCQI070E  The parameter_name Db2 parameter metadata member is not valid.  The default length for the parameter-element_name parameter element exceeds the length of the parameter.  The default length is default_length, and the specified length is specified_length.  The default length will be truncated accordingly.

Explanation:  The specified length cannot be shorter than the default length.

System action:  Processing stops.

CCQI074S The XML structure of the member_name LPAR parameter metadata member is not valid. The following value of the attribute_name attribute in the element_name element already exists: value_name.

Explanation: The specified value already exists for an attribute.
System action: Processing stops.

CCQI075S The XML structure of the member_name product parameter metadata member is not valid. The following value of the attribute_name attribute in the element_name element already exists: value_name.

Explanation: The specified value already exists for an attribute.
System action: Processing stops.

CCQI076S The XML structure of the member_name Db2 parameter metadata member is not valid. The parameter_name parameter refers to the section-name section. This section was not found in the Db2 parameter metadata member.

Explanation: The specified value already exists for an attribute.
System action: Processing stops.

CCQI077S The XML structure of the member_name LPAR parameter metadata member is not valid. The parameter_name parameter refers to the section-name section. This section was not found in the LPAR parameter metadata member.

Explanation: The specified parameter refers to a section that is not in the LPAR parameter metadata member.
System action: Processing stops.

CCQI078S The XML structure of the member_name product parameter metadata member is not valid. The parameter_name parameter refers to the section-name section. This section was not found in the product parameter metadata member.

Explanation: The specified parameter refers to a section that is not in the product parameter metadata member.
System action: Processing stops.

CCQI079S The XML structure of the member_name Db2 parameter metadata member is not valid because the value of the attribute_name attribute in the element_name element is incorrect. The value of the attribute is value_name.

Explanation: The specified value for an attribute in the Db2 parameter metadata member is not valid.
System action: Processing stops.

CCQI080S The content of the member_name LPAR parameter metadata member is not valid because the value of the attribute_name attribute in the element_name element is incorrect. The value of the attribute is value_name.

Explanation: The specified value for an attribute in the LPAR parameter metadata member is not valid.
System action: Processing stops.

CCQI081S The content of the member_name product parameter metadata member is not valid because the value of the attribute_name attribute in the element_name element is incorrect. The value of the attribute is value_name.

Explanation: The specified value for an attribute in the product parameter metadata member is not valid.
System action: Processing stops.

CCQI082S The content of the member_name product parameter metadata member is not valid because the value of the attribute_name attribute in the element_name element is incorrect. The value of the attribute is value_name.

Explanation: The specified value for an attribute in the product parameter metadata member is not valid.
System action: Processing stops.
The command command is not active in BROWSE mode.

Explanation: The specified command can be entered only in Edit mode.
System action: Processing continues.
User response: Put the panel in Edit mode and reissue the command.

CCQI089I  The command command is already active.
System action: Processing continues.
User response: No action required.

CCQI090S  The product-defined Db2 parameter parameter_name in the member_name parameter metadata member references the section_ID section ID, but this ID does not exist in either the parameter metadata member or the Db2 parameter metadata member.

Explanation: A section that does not exist in the parameter metadata member or the Db2 parameter metadata member is referenced by the specified Db2 parameter.
System action: Processing stops.

CCQI091S  The product-defined LPAR parameter in the member_name parameter metadata member references the section_ID section ID, but this ID does not exist in either the parameter metadata member or the LPAR parameter metadata member.

Explanation: A section that does not exist in the parameter metadata member or the LPAR parameter metadata member is being referenced by the specified LPAR parameter.
System action: Processing stops.

CCQI092S  The overridden DB2 parameter parameter_name in the member_name parameter metadata member does not exist in the Db2 parameter metadata member.

Explanation: The specified parameter does not exist.
System action: Processing stops.

CCQI093S  The overridden LPAR parameter parameter_name in the member_name parameter metadata member does not exist in the LPAR parameter metadata member.

Explanation: The specified parameter does not exist.
System action: Processing stops.

CCQI094S  The CCQ$$PRD product customization parameter metadata member was not found in the data_set_name data set.

Explanation: The specified data set must contain the CCQ$$PRD product customization parameter metadata member
System action: Processing stops.

CCQI100W  The XML structure of the member_name LPAR parameter metadata member is not valid. The PL/I XML parser issued the following exception warning code: code_number.

Explanation: While determining if the LPAR parameter metadata member is valid, the PL/I XML parser issued an exception warning code.
System action: Processing continues.
User response: See the Enterprise PL/I for z/OS Programming Guide for more information about the exception warning code.

CCQI101S  The XML structure of the member_name LPAR parameter metadata member is not valid. The PL/I XML parser issued the following exception error code: code_number.

Explanation: While determining if the LPAR parameter metadata member is valid, the PL/I XML parser issued an exception error code.
System action: Processing stops.
User response: See the Enterprise PL/I for z/OS Programming Guide for more information about the exception warning code.
CCQI102S  The XML structure of the member_name LPAR parameter metadata member is not valid. The element_name element is unknown.

Explanation: The specified element in the LPAR parameter metadata member is unknown.

System action: Processing stops.

CCQI103S  The XML structure of the member_name LPAR parameter metadata member is not valid. Content is not allowed for the element_name element, but content was found.

Explanation: The specified element cannot contain content.

System action: Processing stops.

CCQI104S  The XML structure of the member_name LPAR parameter metadata member is not valid. Content is required for the element_name element, but content was not found.

Explanation: The specified element requires content.

System action: Processing stops.

CCQI105S  The XML structure of the member_name LPAR parameter metadata member is not valid. The content length for the element_name element cannot exceed maximum_number characters.

Explanation: The specified element contains too many characters.

System action: Processing stops.

CCQI106S  The XML structure of the member_name LPAR parameter metadata member is not valid. The content length for the element_name element must be at least minimum_number characters.

Explanation: The specified element contains too many characters.

System action: Processing stops.

CCQI107S  The XML structure of the member_name LPAR parameter metadata member is not valid. The attribute_name attribute in the element_name element must occur at least minimum_number times.

Explanation: The specified attribute did not occur enough times.

System action: Processing stops.

CCQI108S  The XML structure of the member_name LPAR parameter metadata member is not valid. The attribute_name attribute in the element_name element must occur at most maximum_number times.

Explanation: The specified attribute occurs too many times.

System action: Processing stops.

CCQI109S  The XML structure of the member_name LPAR parameter metadata member is not valid. The attribute_name attribute in the element_name element cannot occur more than maximum_number times.

Explanation: The specified attribute occurs too many times.

System action: Processing stops.

CCQI110S  The XML structure of the member_name LPAR parameter metadata member is not valid. Content is not allowed for the attribute_name attribute in the element_name element, but content was found.

Explanation: The specified attribute cannot have content.

System action: Processing stops.

CCQI115S The content of the member_name LPAR parameter metadata member is not valid because the value of the attribute_name attribute in the element_name element is incorrect. The value of the attribute is value_name.

Explanation: The specified value for an attribute in the LPAR parameter metadata member is not valid.

System action: Processing stops.

CCQI116S The content of the member_name LPAR parameter metadata member is not valid because the data type of the element_name element is incorrect. The value is value_name.

Explanation: The specified data type value for an element in the LPAR parameter metadata member is not valid.

System action: Processing stops.

CCQI120S The XML structure of the member_name Db2 parameter metadata member is not valid because the value of the element_name element is incorrect. The value is value_name.

Explanation: The specified value for an element in the LPAR parameter metadata member is not valid.

System action: Processing stops.

The XML structure of the `member_name` LPAR parameter metadata member is not valid. The `element_name` element in the `parameter_name` parameter contains duplicate values for the `element_name` element. The duplicate value is `value_name`.

**Explanation:** An element contains the specified duplicate value.

**System action:** Processing stops.

**User response:** See "Gathering diagnostic information" on page 941. Contact IBM Software Support.

---

The XML structure of the `member_name` discover metadata member is not valid. The `element_name` element in the `parameter_name` parameter contains duplicate values for the `element_name` element. The duplicate value is `value_name`.

**Explanation:** An element contains the specified duplicate value.

**System action:** Processing stops.

**User response:** See "Gathering diagnostic information" on page 941. Contact IBM Software Support.

---

The XML structure of the `member_name` product customization parameter metadata member is not valid. The `element_name` element in the `parameter_name` parameter contains duplicate values for the `element_name` element. The duplicate value is `value_name`.

**Explanation:** An element contains the specified duplicate value.

**System action:** Processing stops.

**User response:** See "Gathering diagnostic information" on page 941. Contact IBM Software Support.

---

The XML structure of the `member_name` information metadata member is not valid. The PL/I XML parser issued the following exception warning code: `code_number`.

**Explanation:** While determining if the `information` metadata member is valid, the PL/I XML parser issued an exception warning code.

**System action:** Processing continues.

**User response:** See the Enterprise PL/I for z/OS Programming Guide for more information about the exception warning code.

CCQI204S The XML structure of the member_name information metadata member is not valid. Content is required for the element_name element, but content was not found.

Explanation: The specified element requires content.
System action: Processing stops.

CCQI205S The XML structure of the member_name information metadata member is not valid. The content length for the element_name element cannot exceed maximum_number characters.

Explanation: The specified element contains too many characters.
System action: Processing stops.

CCQI206S The XML structure of the member_name information metadata member is not valid. The content length for the element_name element must be at least minimum_number characters.

Explanation: The specified element does not contain enough characters.
System action: Processing stops.

CCQI207S The XML structure of the member_name information metadata member is not valid. The element_name element must occur at least minimum_number times.

Explanation: The specified element does not occur enough times.
System action: Processing stops.

CCQI208S The XML structure of the member_name information metadata member is not valid. The attribute_name attribute in the element_name element cannot occur more than maximum_number times.

Explanation: The specified attribute occurs too many times.
System action: Processing stops.

CCQI209S The XML structure of the member_name information metadata member is not valid. The attribute_name attribute in the element_name element must occur at least minimum_number times.

Explanation: The specified attribute did not occur enough times.
System action: Processing stops.

CCQI210S The XML structure of the member_name information metadata member is not valid. Content is not allowed for the attribute_name attribute in the element_name element, but content was found.

Explanation: The specified attribute cannot have content.
System action: Processing stops.

CCQI211S The XML structure of the member_name information metadata member is not valid. Content is required for the attribute_name attribute in the element_name element, but content was not found.

Explanation: The specified attribute is missing required content.
System action: Processing stops.
CCQI212S The XML structure of the member_name information metadata member is not valid. The content length for the element_name element cannot exceed maximum_number characters.

Explanation: The specified element contains too many characters.
System action: Processing stops.

CCQI213S The XML structure of the member_name information metadata member is not valid. The attribute_name attribute in the element_name element is unknown.

Explanation: The specified attribute in the information metadata member is unknown.
System action: Processing stops.

CCQI214S The content of the member_name information metadata member is not valid because the value of the element_name element is incorrect. The value is value_name.

Explanation: The specified value for an element in the information metadata member is not valid.
System action: Processing stops.

CCQI215S The content of the member_name information metadata member is not valid because the value of the attribute_name attribute in the element_name element is incorrect. The value is value_name.

Explanation: The specified value for an attribute in the information metadata member is not valid.
System action: Processing stops.

CCQI216S The content of the member_name information metadata member is not valid because the data type of the element_name element is incorrect. The value is value_name.

Explanation: The specified data type value for an element in the information metadata member is not valid.
System action: Processing stops.

CCQI217S The content of the member_name information metadata member is not valid because the data type of the attribute_name attribute in the element_name element is incorrect. The value is value_name.

Explanation: The specified data type value for an attribute in the information metadata member is not valid.
System action: Processing stops.

CCQI218S The content of the member_name information metadata member is not valid. The length of the value_name value of the attribute_name attribute is longer than the value_name value of the attribute_name attribute.

Explanation: The first specified value cannot be longer than the second specified value.
System action: Processing stops.

CCQI219S The content of the member_name information metadata member is not valid. The value_name value of the attribute_name attribute contains the value_name value.

Explanation: The first specified value cannot be longer than the second specified value.
System action: Processing stops.
CCQI220S  The XML structure of the member_name information metadata member is not valid. Content for the attribute_name attribute in the element_name element exceed maximum_number characters.

Explanation: The specified attribute contains too many characters.

System action: Processing stops.

User response: See "Gathering diagnostic information" on page 941 Contact IBM Software Support.

CCQI223S  The XML structure of the member_name information metadata member is not valid. The value that is specified for the Db2 Level already exists. The value is value_name.

Explanation: The specified value already exists.

System action: Processing stops.

User response: Specify a different Db2 level. If the problem persists, contact IBM Software Support.

CCQI224S  The XML structure of the member_name information metadata member is not valid. The value that is specified for the Db2 Mode already exists. The value is value_name.

Explanation: The specified value already exists.

System action: Processing stops.

User response: Specify a different Db2 mode. If the problem persists, contact IBM Software Support.

CCQI250S  The information metadata member was not found in the data_set_name data set.

Explanation: Tools Customizer could not find the information metadata member in the specified data set.

System action: Processing stops.

User response: If this message was issued on the Specify the Metadata Library (CCQPHELQ) panel, specify the product metadata library. The name of this library is hlq.SHLQDENU.

Do not specify the Tools Customizer metadata library, which is hlq.SCCQDENU.

If the problem persists, identify the name of the Tools Customizer trace data set and contact IBM Software Support.

CCQI251E  The member_name member was not accessible in the data_set_name data set.

Explanation: The specified member could not be accessed in the data set.

System action: Processing stops.

User response: Specify the correct metadata library.

CCQI252S  The information metadata member was not found in the library_name component metadata library that is part of the library_name pack metadata library. The name of the pack is pack_name.

Explanation: The specified component metadata library does not contain the information metadata member.

System action: Processing stops.

User response: Specify the correct metadata library.

CCQI253E  The library_name Tools Customizer metadata library is not current. Update the metadata library on the Tools Customizer Settings panel.

Explanation: The specified metadata library is not current.

System action: Processing stops.

User response: Specify a current metadata library on the Tools Customizer Settings panel.

CCQI300W  The XML structure of the member_name sequence metadata member is not valid. The PL/I XML parser issued the following exception warning code: code_number.

Explanation: While determining if the sequence metadata member is valid, the PL/I XML parser issued an exception warning code.

System action: Processing continues.

User response: See the Enterprise PL/I for z/OS Programming Guide for more information about the exception warning code.

CCQI301S  The XML structure of the member_name sequence metadata member is not valid. The PL/I XML parser issued the following exception error code: code_number.

Explanation: While determining if the sequence metadata member is valid, the PL/I XML parser issued an exception error code.

System action: Processing stops.

**System action:** Processing stops.

**User response:** See “Gathering diagnostic information” on page 941. Contact IBM Software Support.

---

**CCQI350S** The XML structure of the member_name sequence metadata member is not valid because the value of the attribute_name attribute in the element_name element is incorrect. The value is value_name.

**Explanation:** A specified value for an attribute in the sequence metadata member is not valid.

**System action:** Processing stops.

**User response:** See “Gathering diagnostic information” on page 941. Contact IBM Software Support.
CCQI351S  The member_name sequence metadata member was not found in the data_set_name metadata data set.

Explanation:  Tools Customizer could not find the specified sequence metadata member in the metadata data set.

System action:  Processing stops.

CCQI352S  The template_name product template was not found in the data_set_name metadata data set.

Explanation:  Tools Customizer could not find the specified product template in the data set.

System action:  Processing stops.

CCQI353S  The sequence metadata member was not found in the data_set_name component data set that is part of the data_set_name pack.

Explanation:  Tools Customizer could not find the sequence metadata member.

System action:  Processing stops.

CCQI360S  The XML structure of the member_name sequence metadata member is not valid. The value of the attribute_name attribute in the element_name element already exists.

Explanation:  The specified attribute contains a value that already exists.

System action:  Processing stops.

CCQI361S  The XML structure of the member_name sequence metadata member is not valid. The condition element on the level_type level already contains a relational operator.

Explanation:  A relational operator already exists for the condition element on the specified level.

System action:  Processing stops.

CCQI362S  The XML structure of the member_name sequence metadata member is not valid. The condition element on the level_type level must contain only one content string or content number element.

Explanation:  Only one content string element or content number element can be contained in the condition element on the specified level.

System action:  Processing stops.

CCQI363S  The XML structure of the member_name sequence metadata member is not valid. The condition element in the element_name element with the attribute_name attribute must contain either the content string element or the content number element.

Explanation:  Either the content string element or the content number element must be in the condition element.

System action:  Processing stops.

User response:  Contact IBM Software Support.

CCQI400W  The XML structure of the member_name parameter metadata member is not valid. The PL/I XML parser issued the following exception warning code: code_number.

Explanation:  While determining the parameter metadata member is valid, the PL/I XML parser issued an exception warning code.

System action:  Processing continues.

User response:  See the Enterprise PL/I for z/OS Programming Guide for more information about the exception warning code.

CCQI401S  The XML structure of the member_name parameter metadata member is not valid. The PL/I XML parser issued the following exception error code: code_number.

Explanation:  While determining if the parameter metadata member is valid, the PL/I XML parser issued an exception error code.
The XML structure of the member_name parameter metadata member is not valid. The element_name element is unknown.

Explanation: The specified element in the parameter metadata member is unknown.

System action: Processing stops.

User response: See the Enterprise PL/I for z/OS Programming Guide for more information about the exception warning code.

The XML structure of the member_name parameter metadata member is not valid. Content is not allowed for the element_name element, but content was found.

Explanation: The specified element cannot contain content.

System action: Processing stops.

The XML structure of the member_name parameter metadata member is not valid. Content is required for the element_name element, but content was not found.

Explanation: The specified element requires content.

System action: Processing stops.

The XML structure of the member_name parameter metadata member is not valid. The content length for the element_name element must be at least minimum_number characters.

Explanation: The specified element does not contain enough characters.

System action: Processing stops.

The XML structure of the member_name parameter metadata member is not valid. The element_name element must occur at least minimum_number times.

Explanation: The specified element does not occur enough times.

System action: Processing stops.

The XML structure of the member_name parameter metadata member is not valid. The attribute_name attribute in the element_name element cannot occur more than maximum_number times.

Explanation: The specified attribute occurs too many times.

System action: Processing stops.

The XML structure of the member_name parameter metadata member is not valid. The attribute_name attribute in the element_name element must occur at least minimum_number times.

Explanation: The specified attribute does not occur enough times.

System action: Processing stops.

CCQI420S  The XML structure of the member_name parameter metadata member is not valid. The element_name element is unknown for the overridden Db2 parameter.

Explanation:  
System action:  Processing stops.  

CCQI421S  The XML structure of the member_name parameter metadata member is not valid. The element_name element is unknown for the overridden LPAR parameter.

Explanation:  
System action:  Processing stops.  

CCQI422S  The XML structure of the member_name parameter metadata member is not valid. The attribute_name attribute in the element_name element is unknown for the overridden Db2 parameter.

Explanation:  
System action:  Processing stops.  

CCQI423S  The XML structure of the member_name parameter metadata member is not valid. The attribute_name attribute in the element_name element is unknown for the overridden LPAR parameter.

Explanation:  
System action:  Processing stops.  

CCQI450S  The member_name product parameter metadata member was not found in the data_set_name data set.

Explanation:  Tools Customizer could not find the specified product parameter metadata member.  
System action:  Processing stops.

CCQI510W  The data_set_name data store data set does not exist.

Explanation:  The specified data store data set does not exist.  
System action:  Processing continues.  
User response:  Ensure that the data store data set exists.

CCQI511S  The data_set_name data store data set cannot be opened by using the disposition_type disposition.

Explanation:  The specified data store data set could not be opened with the specified disposition.  
System action:  Processing continues.  

CCQI512S  The data_set_name data store data set cannot be opened by using the option-type option.

Explanation:  The specified data store data set was unable to be opened with the specified option.  
System action:  Processing stops.  

CCQI600W  The XML structure of the member_name product customization parameter metadata member is not valid. The PL/I XML parser issued the following exception warning code: code_number.

Explanation:  While determining if the product customization parameter metadata member is valid, the PL/I XML parser issued an exception warning code.  
System action:  Processing continues.  
User response:  See the Enterprise PL/I for z/OS Programming Guide for more information about the warning.

CCQI601S  The XML structure of the member_name product customization parameter metadata member is not valid. The PL/I XML parser issued the following exception error code: code_number.

Explanation:  While determining if the product
CCQI602S • CCQI609S

customization parameter metadata member is valid, the PL/I XML parser issued an exception error code.

System action: Processing continues.

User response: See the Enterprise PL/I for z/OS Programming Guide for more information about the warning.

---

CCQI602S  The XML structure of the member_name product customization parameter metadata member is not valid. The element_name element is unknown.

Explanation: The specified product customization parameter metadata member contains an unknown element.

System action: Processing stops.

---

CCQI603S  The XML structure of the member_name product customization parameter metadata member is not valid. Content is not allowed for the element_name element, but content was found.

Explanation: Content was found in an element that cannot contain content.

System action: Processing stops.

---

CCQI604S  The XML structure of the member_name product customization parameter metadata member is not valid. Content is required for the element_name element, but content was not found.

Explanation: The specified element does not contain required content.

System action: Processing stops.

---

CCQI605S  The XML structure of the member_name product customization parameter metadata member is not valid. The content length for the element_name element cannot exceed maximum_number characters.

Explanation: The specified element contains too many characters.

System action: Processing stops.

---

CCQI606S  The XML structure of the member_name product customization parameter metadata member is not valid. The element_name element cannot occur more than maximum_number times.

Explanation: The specified element occurs too many times in the product customization parameter metadata member.

System action: Processing stops.

---

CCQI607S  The XML structure of the member_name product customization parameter metadata member is not valid. The element_name element must occur at least minimum_number times.

Explanation: The specified element does not occur enough times in the product customization parameter metadata member.

System action: Processing stops.

---

CCQI608S  The XML structure of the member_name product customization parameter metadata member is not valid. The attribute_name attribute in the element_name element cannot occur more than maximum_number times.

Explanation: The specified attribute occurs too many times in the product customization parameter metadata member.

System action: Processing stops.

---

CCQI609S  The XML structure of the member_name product customization parameter metadata member is not valid. The attribute_name attribute in the element_name element must occur at least minimum_number times.

Explanation: The specified attribute does not occur enough times in the product customization parameter metadata member.
System action: Processing stops.

CCQI610S  The XML structure of the member_name product customization parameter metadata member is not valid. Content is not allowed for the attribute_name attribute in the element_name element, but content was found.

Explanation: Content was found in an element that cannot contain content.

System action: Processing stops.

CCQI611S  The XML structure of the member_name product customization parameter metadata member is not valid. Content is required for the attribute_name attribute in the element_name element, but content was not found.

Explanation: The specified attribute does not contain required content.

System action: Processing stops.

CCQI612S  The XML structure of the member_name product customization parameter metadata member is not valid. The content length for the attribute_name attribute in the element_name element cannot exceed maximum_number characters.

Explanation: The specified attribute contains too many characters.

System action: Processing stops.

CCQI613S  The XML structure of the member_name product customization parameter metadata member is not valid. The attribute_name attribute in the element_name element is unknown.

Explanation: The specified product customization parameter metadata member contains an unknown attribute.

System action: Processing stops.

CCQI614S  The XML structure of the member_name product customization parameter metadata member is not valid. The value of the element_name element is not valid. The value is value_name.

Explanation: The specified value of the element is not a valid value.

System action: Processing stops.

CCQI615S  The XML structure of the member_name product customization parameter metadata member is not valid. The value of the attribute_name attribute for the element_name element is not valid. The value is value_name.

Explanation: The specified value of the attribute is not a valid value.

System action: Processing stops.

CCQI616S  The XML structure of the member_name product customization parameter metadata member is not valid. The data type of the element_name element is 'not valid. The value of the element is value_name.

Explanation: The specified data type is not a valid data type.

System action: Processing stops.

CCQI617S  The XML structure of the member_name product customization parameter metadata member is not valid. The data type of the attribute_name attribute for the element_name element is not valid. The value of the attribute is value_name.

Explanation: The specified data type is not a valid data type.

System action: Processing stops.
CCQI650S • CCQI703S

Explanation: The specified value of the attribute is not a valid value.

System action: Processing stops.

CCQI700W The XML structure of the member_name solution pack metadata member is not valid. The PL/I XML parser issued the following exception warning code: code_number.

Explanation: While determining if the specified solution pack metadata member is valid, the PL/I XML parser issued an exception warning code.

System action: Processing continues.

User response: See the Enterprise PL/I for z/OS Programming Guide for more information about the warning.

CCQI701S The XML structure of the member_name solution pack metadata member is not valid. The PL/I XML parser issued the following exception error code: code_number.

Explanation: While determining if the specified solution pack metadata member is valid, the PL/I XML parser issued an exception error code.

System action: Processing stops.

User response: See the Enterprise PL/I for z/OS Programming Guide for more information about the error.

CCQI702S The XML structure of the member_name solution pack metadata member is not valid. The element_name element is unknown.

Explanation: The specified solution pack metadata member contains an unknown element.

System action: Processing stops.

User response: See the Enterprise PL/I for z/OS Programming Guide for more information about the error.

CCQI703S The XML structure of the member_name solution pack metadata member is not valid. Content is not allowed for the element_name element, but content was found.

Explanation: Content was found in an element that cannot contain content.

System action: Processing stops.
CCQI704S The XML structure of the member_name solution pack metadata member is not valid. Content is required for the element_name element, but content was not found.

Explanation: The specified element does not contain required content.

System action: Processing stops.

CCQI705S The XML structure of the member_name solution pack metadata member is not valid. The content length for the element_name element cannot exceed maximum_number characters.

Explanation: The specified element contains too many characters.

System action: Processing stops.

CCQI706S The XML structure of the member_name solution pack metadata member is not valid. The element_name element cannot occur more than maximum_number times.

Explanation: The specified element occurs too many times.

System action: Processing stops.

CCQI707S The XML structure of the member_name solution pack metadata member is not valid. The element_name element must occur at least minimum_number times.

Explanation: The specified element does not occur enough times.

System action: Processing stops.

CCQI708S The XML structure of the member_name solution pack metadata member is not valid. The attribute_name attribute in the element_name element cannot occur more than maximum_number times.

Explanation: The specified attribute occurs too many times.

System action: Processing stops.

CCQI709S The XML structure of the member_name solution pack metadata member is not valid. The attribute_name attribute in the element_name element must occur at least minimum_number times.

Explanation: The specified attribute does not occur enough times.

System action: Processing stops.

CCQI710S The XML structure of the member_name solution pack metadata member is not valid. Content is not allowed for the attribute_name attribute in the element_name element, but content was found.

Explanation: The specified attribute cannot have content.

System action: Processing stops.

CCQI711S The XML structure of the member_name solution pack metadata member is not valid. Content is required for the attribute_name attribute in the element_name element, but content was not found.

Explanation: The specified attribute is missing content.

System action: Processing stops.

The XML structure of the member_name solution pack metadata member is not valid. The content length for the attribute_name attribute in the element_name element cannot exceed maximum_number characters.

Explanation: The specified attribute contains too many characters.
System action: Processing stops.

The XML structure of the member_name solution pack metadata member is not valid. The attribute_name attribute in the element_name element is unknown.

Explanation: The specified attribute in the solution pack metadata member is unknown.
System action: Processing stops.

The XML structure of the member_name solution pack metadata member is not valid because the value of the element_name element is incorrect. The value is value_name.

Explanation: The specified value of the element is not a valid value.
System action: Processing stops.

The XML structure of the member_name solution pack metadata member is not valid because the data type of the attribute_name attribute in the element_name element is incorrect. The value of the attribute is value_name.

Explanation: The specified data type is not a valid data type.
System action: Processing stops.

The XML structure of the member_name solution pack metadata member is not valid because the data type of the element_name element is incorrect. The value of the attribute is value_name.

Explanation: The specified data type is not a valid data type.
System action: Processing stops.

The XML structure of the member_name solution pack metadata member is not valid. The msg element is required for the component_name component that is not customizable.

Explanation: The msg element is required for the specified component, which cannot be customized by using Tools Customizer.
System action: Processing stops.

The solution pack metadata member was not found in the library_name metadata library.

Explanation: Tools Customizer could not find the solution pack metadata member in the specified library.
System action: Processing stops.
CCQI751S The version in the library_name solution pack metadata library is different than the version in the library_name component metadata library. The name of the pack is pack_name, and the name of the component is component_name.

Explanation: The version in the solution pack metadata library does not match the version in the component metadata library.

System action: Processing stops.

CCQI752S The release in the library_name solution pack metadata library is different than the release in the library_name component metadata library. The name of the pack is pack_name, and the name of the component is component_name.

Explanation: The release in the solution pack metadata library does not match the release in the component metadata library.

System action: Processing continues.

CCQI753S The modification level in the library_name solution pack metadata library is different than the modification level in the library_name component metadata library. The name of the pack is pack_name, and the name of the component is component_name.

Explanation: The modification level in the solution pack metadata library does not match the modification level in the component metadata library.

System action: Processing stops.

CCQI755S The XML structure of the member_name parameter metadata member is not valid. When a default value is not specified in the metadata member, the "required" attribute with a value of "true" cannot be specified.

System action: Processing stops.

User response: Contact IBM Software Support.
CCQO004S The XML structure of the member_name discover parameter metadata member is not valid. Content is required for the element_name element, but content was not found.

Explanation: The specified element cannot contain content.
System action: Processing stops.

CCQO005S The XML structure of the member_name discover parameter metadata member is not valid. The content length for the element_name element cannot exceed maximum_number characters.

Explanation: The specified element contains too many characters.
System action: Processing stops.

CCQO006S The XML structure of the member_name discover parameter metadata member is not valid. The element_name element cannot occur more than maximum_number times.

Explanation: The specified element occurs too many times.
System action: Processing stops.

CCQO007S The XML structure of the member_name discover parameter metadata member is not valid. The element_name element must occur at least minimum_number times.

Explanation: The specified element does not occur enough times.
System action: Processing stops.

CCQO008S The XML structure of the member_name discover parameter metadata member is not valid. The attribute_name attribute in the element_name element cannot occur more than maximum_number times.

Explanation: The specified attribute occurs too many times.
System action: Processing stops.

CCQO009S The XML structure of the member_name discover parameter metadata member is not valid. The attribute_name attribute in the element_name element must occur at least minimum_number times.

Explanation: The specified attribute does not occur enough times.
System action: Processing stops.

CCQO010S The XML structure of the member_name discover parameter metadata member is not valid. Content is not allowed for the attribute_name attribute in the element_name element, but content was found.

Explanation: The specified attribute cannot contain content.
System action: Processing stops.

CCQO011S The XML structure of the member_name discover parameter metadata member is not valid. Content is required for the attribute_name attribute in the element_name element, but content was not found.

Explanation: The specified attribute requires content.
System action: Processing stops.
CCQO012S The XML structure of the member_name discover parameter metadata member is not valid. The content length for the attribute_name attribute in the element_name element in the cannot exceed maximum_number characters.

Explanation: The specified attribute contains too many characters.
System action: Processing stops.
User response: See "Gathering diagnostic information" on page 941 Contact IBM Software Support.

CCQO013S The XML structure of the member_name discover parameter metadata member is not valid. The attribute_name attribute in the element_name element is unknown.

Explanation: The specified attribute is unknown.
System action: Processing stops.
User response: See "Gathering diagnostic information" on page 941 Contact IBM Software Support.

CCQO014S The content of the member_name discover parameter metadata member is not valid because the value of the element_name element is incorrect. The value is value_name.

Explanation: A specified value for an element in the discover parameter metadata member is not valid.
System action: Processing stops.
User response: See "Gathering diagnostic information" on page 941 Contact IBM Software Support.

CCQO015S The content of the member_name discover parameter metadata member is not valid because the data type of the element_name element is incorrect. The value is value_name.

Explanation: The specified data type value for an attribute in the element_name element in the discover parameter metadata member is not valid.
System action: Processing stops.
User response: See "Gathering diagnostic information" on page 941 Contact IBM Software Support.

CCQO016S The content of the member_name discover parameter metadata member is not valid because the data type of the element_name element is incorrect. The value is value_name.

Explanation: The specified data type value for an element in the discover parameter metadata member is not valid.
System action: Processing stops.
User response: See "Gathering diagnostic information" on page 941 Contact IBM Software Support.

CCQO017S The content of the member_name product parameter metadata member is not valid because the data type of the attribute_name attribute in the element_name element is incorrect. The value is value_name.

Explanation: The specified data type value for an attribute in the product parameter metadata member is not valid.
System action: Processing stops.
User response: See "Gathering diagnostic information" on page 941 Contact IBM Software Support.

CCQO050S The data_set_name Discover REXX EXEC data set could not be initialized or was not found.

Explanation: Tools Customizer could not find or could not initialize the specified Discover REXX EXEC data set.
System action: Processing stops.
User response: Ensure that the Discover REXX EXEC is specified correctly.

CCQO051S The data_sharing_group_ID data sharing group ID cannot contain more than four characters.

Explanation: The specified data sharing group ID contains too many characters.
System action: Processing continues.
User response: Ensure that the specified data sharing group ID does not exceed four characters.

CCQO052S The REXX_EXEC_name Discover REXX EXEC was not found in the data_set_name Discover data set.

Explanation: Tools Customizer could not find the Discover REXX EXEC in the specified data set.
System action: Processing stops.
User response: Ensure that the Discover data set was specified correctly.

CCQO053W The LPAR_name LPAR name cannot contain more than eight characters.
Explanation: The specified LPAR name contains too many characters.
System action: Processing continues.
User response: Ensure that the specified LPAR name does not exceed eight characters.

CCQO054W The subsystem_ID Db2 SSID cannot contain more than four characters. The record was not processed.
Explanation: The specified Db2 SSID contains too many characters.
System action: Processing continues.
User response: Ensure that the specified Db2 SSID does not exceed four characters.

CCQO055W The parameter_name Db2 group attach name parameter in the record_name Discover record, but a Db2 group attach name was not specified. The record was not processed.
Explanation: The Discover record contains a data sharing group parameter, but a Db2 group attach name was not specified.
System action: Processing continues.
User response: Ensure that information is specified correctly on the Discover Customized Product Information panel.

CCQO056W The parameter_name Db2 parameter in the record_name Discover record did not have a Db2 group attach name or a Db2 SSID. The record was not processed.
Explanation: The Discover record did not have a Db2 group attach name or a Db2 subsystem ID in the Db2 parameter.
System action: Processing continues.
User response: Ensure that information is specified correctly on the Discover Customized Product Information panel.

CCQO057W The Discover EXEC could not find the parameter_name parameter in the metadata for the product to be customized. The record was not processed.

System action: Processing continues.

CCQO058W The parameter_name product parameter name in the record_type Discover record does not start with CCQ_LPR_, CCQ_DB2_, or CCQ_PRD_. The record was not processed.
Explanation: The parameter in the record does not start with CCQ_DB2_, CCQ_LPAR_, or CCQ_PRD_.
System action: Processing continues.

CCQO059W The parameter_name product parameter cannot contain more than 72 characters. The record was not processed.
Explanation: The specified product parameter contains too many characters.
System action: Processing continues.
User response: Ensure that the specified product parameter does not exceed 72 characters.

CCQO060W The record_name Discover record from the REXX EXEC output must start with the following record type: record_type. The record was not processed.
Explanation: A Discover record from the REXX EXEC output must start with the specified Db2 record type.
System action: Processing continues.

CCQO061I If you do not have a previously customized version of the product, do not run the Discover EXEC. Press END to go to the Customizer Workplace panel.
Explanation: This message is issued when you customize a product for the first time. It prompts you to use the Discover EXEC to discover data from a previous customization of the specified product.
System action: Processing continues.
User response:
Tip: Using the Discover EXEC saves time and reduces errors that can occur when parameters are specified manually. If you want to use the Discover EXEC, specify the required information on the Discover Customized Product Information panel. Otherwise, press End to continue without discovering data from a previous customization of the product.

**CCQO062W**  The Discover EXEC could not find the following parameter_name parameter in the Db2 metadata. The record was not processed.

**Explanation:** The specified parameter is missing in the Db2 metadata.

**System action:** Processing continues.

**User response:** If this parameter is required, contact IBM Software Support.

**CCQO064W**  The Discover record did not have a parameter name. The record was not processed.

**Explanation:** A parameter name was missing in the Discover record.

**System action:** Processing continues.

**User response:** See “Gathering diagnostic information” on page 941. Contact IBM Software Support.

**CCQO065W**  The value for the parameter_name parameter is ignored because it has more than maximum_number characters, which is the maximum length that is defined in the metadata. The value is parameter_value.

**Explanation:** The specified value exceeded the maximum allowed length, which was defined in the metadata. Tools Customizer truncated the extra characters.

**System action:** Processing continues.

**User response:** See “Gathering diagnostic information” on page 941. Contact IBM Software Support.

**CCQO066W**  The record_name Discover record from the Discover REXX EXEC output does not have a parameter value. The record was not processed.

**Explanation:** The Discover record was missing a parameter value from the Discover EXEC output.

**System action:** Processing continues.

**User response:** Ensure that information was specified correctly on the Discover Customized Product Information panel.

**CCQO067W**  The parameter_name parameter is defined in the metadata to support one value, but more than one value was found. The last value was used.

**Explanation:** The definition of the parameter in the metadata supports one value, but more than one value was specified. Only the last value was used.

**System action:** Processing continues.

**User response:** Ensure that information was specified correctly on the Discover Customized Product Information panel.

**CCQO068W**  The value of the parameter_name parameter is ignored because the parameter is defined as internal=true. The value is value_name.

**Explanation:** The specified value of the parameter is ignored because it is defined as internal=true.

**System action:** Processing continues.

**User response:** Ensure that information was specified correctly on the Discover Customized Product Information panel.

**CCQO069W**  The Discover EXEC did not find the parameter_name parameter in the LPAR metadata. The record was not processed.

**Explanation:** The specified parameter is missing from the LPAR metadata.

**System action:** Processing continues.

**User response:** Ensure that information was specified correctly on the Discover Customized Product Information panel.

**CCQO070W**  The record_type Discover record contains an incorrect delimiter between the Environment section and the Data section. The record was not processed.

**Explanation:** Tools Customizer found an incorrect delimiter between the Environment section and the Data section.

**System action:** None.

**User response:** No action is required.

**CCQO071W**  The member_name member could not be found in the data_set_name Discover data set.

**Explanation:** Tools Customizer could not find the specified Discover data set.
CCQO072S • CCQP002E

System action: None.
User response: No action is required.

CCQO072S  The member_name discover metadata member was not found in the data_set_name metadata data set.
Explanation: Tools Customizer could not find the specified metadata member in the data set.
System action: Processing stops.

CCQO073E  The member_name discover metadata member is not valid because the default length for the element_name parameter element exceeds the length of the parameter. The default length is default_length, and the specified length is specified_length. The default length will be truncated accordingly.
Explanation: The default length for the specified parameter element is longer than the parameter.
System action: Processing continues.
User response: No action is required.

CCQO074S  The content of the member_name discover metadata member is not valid. The value of the attribute_name attribute in the element_name element is not valid. The value of the attribute is value_name.
Explanation: The specified value is not valid.
System action: Processing stops.

CCQO075W  The configuration_ID configuration ID in the record_name Discover record is incorrect. The record was not processed.
Explanation: The specified configuration ID is not correct.
System action: Processing continues.
User response: No action is required.

CCQO076W  The configuration_ID configuration ID cannot contain more than maximum_number characters. The record was not processed.
Explanation: The specified configuration ID contains too many characters.
System action: Processing continues.
User response: No action is required.

CCQO077S  The discover metadata member was not found in the data_set_name component data set that is part of the data_set_name pack.
Explanation: The discover metadata member was not found in the specified component data set.
System action: Processing stops.

CCQO078I  Additional configurations were discovered and saved in the data store. All Db2 entries associated with this configuration are listed.
Explanation: Additional configurations were discovered and saved in the data store.
System action: None.
User response: No action is required.

CCQP000E  The value of the mode_nameDb2 mode is not valid for the level_nameDb2 level.
Explanation: The specified Db2 mode is not valid for the Db2 level.
System action: Processing stops.
User response: Specify a valid Db2 mode for the Db2 level.

CCQP001E  The value of the mode_nameDb2 mode is missing.
Explanation: The specified Db2 mode is not defined.
System action: Processing stops.
User response: Specify a value for the Db2 mode.

CCQP002E  The value of the mode_nameDb2 level is missing.
Explanation: The specified Db2 level is not defined.
System action: Processing stops.
User response: Specify a value for the Db2 level.
CCQP003E  The value of the level_name Db2 level is not valid.

Explanation: The specified Db2 level does not have a valid name.
System action: Processing stops.
User response: Specify a valid value for the Db2 level.

CCQP004E  The parameter_name parameter does not exist in the CCQ$$DB2 Db2 parameter metadata member.

Explanation: The CCQ$$DB2 Db2 parameter metadata member does not contain the specified parameter.
System action: Tools Customizer prompts for the correct data set name.
User response: Specify a valid data set name in the correct format.

CCQP005E  The value of the subsystem_ID Db2 SSID is missing.

Explanation: The specified Db2 SSID is not defined.
System action: Processing stops.
User response: Specify a valid value for the Db2 SSID.

CCQP006E  The value of the group_attach_name Db2 group attach name is missing.

Explanation: The specified Db2 group attach name is not defined.
System action: Processing stops.
User response: Specify a valid Db2 group attach name.

CCQQ000E  Specify a valid metadata library. Each qualifier of the library must start with an alphabetic character and must be 1-8 alphanumeric characters. The library name must be 1-44 characters.

Explanation: The metadata library was not specified in the correct format. The high-level qualifier must contain alphanumeric characters, and the first character cannot be numeric. The name cannot contain wildcard characters, such as asterisks (*) and percent signs (%).
System action: Tools Customizer prompts for the correct library name.
User response: Specify a library in the correct format.

CCQQ001E  The data_set_name data set name that was specified for the metadata library was not found.

Explanation: The data set does not exist, or the data set name was written in the incorrect format. The high-level qualifier must contain alphanumeric characters, and the first character cannot be numeric. The name cannot contain wildcard characters, such as asterisks (*) and percent signs (%).
System action: Tools Customizer prompts for an available data set.
User response: Ensure that the specified data set is available for Tools Customizer to open it.

CCQQ002E  The data_set_name data set name that was specified for the library_name metadata library cannot be opened.

Explanation: Tools Customizer could not open the data set.
System action: Tools Customizer prompts for an available data set.
User response: Ensure that the specified data set is not being used.

CCQQ003E  The data_set_name data set name that was specified for the metadata sample library is not valid. The data set must be in the following format: HLQ.SxxxSAMP.

Explanation: The specified data set name was not specified in the correct format.
System action: None.
User response: Specify the data set name in the following format: HLQ.SxxxSAMP, where xxx is the three-character prefix for the product.

CCQQ004E  The data_set_name data set is being used by another user. Try again when the data set is not being used.

Explanation: Another user is using the specified data set.
System action: None.
User response: Ensure that the specified data set is not being used.

CCQQ009E  The data_set_name data set name that was specified for the metadata library is not valid because the data set is empty.

Explanation: The specified data set is empty.
System action: Tools Customizer prompts for an available data set.
User response: Ensure that the specified data set is available for Tools Customizer to open it.

**CCQQ011E** The library_name metadata library for the component that is part of the library_name pack was not found in the catalog. The name of the pack is pack_name, and the name of the component is component_name.

Explanation: The specified metadata library is not in the catalog.

System action: None.

User response: Specify another metadata library.

**CCQQ012E** The library_name metadata library for the component that is part of the library_name pack cannot be opened.

Explanation: The specified metadata library cannot be opened.

System action: None.

User response: Ensure that the name of the library is specified correctly.

**CCQS000I** Tools Customizer is being invoked for the first time or the previous ISPF session ended before Tools Customizer was exited. In both cases, the fields on this panel are populated with default values. Review these default values or specify new values to be used to customize products or packs.

Explanation: When you customize a stand-alone product or a solution pack for the first time, or when an ISPF session unexpectedly ends before the ISPF profile is saved, you must specify or review your Tools Customizer user settings.

System action: Processing stops.

User response: Review and accept the default settings, or specify new settings.

**CCQS001E** The following command is not valid: command_name.

Explanation: The specified command is not a valid command on the panel.

System action: Processing stops.

User response: Specify a valid command.

**CCQS002W** The data_set_name Discover data set could not be found.

Explanation: Tools Customizer could not find the specified data set.

System action: The data set will be allocated, and processing continues.

User response: Ensure that the data set name is specified correctly because the data set will be allocated with this name after the values are saved.

**CCQS003W** The data_set_name Discover data set was not found so it was created.

Explanation: Tools Customizer could not find the specified data set.

System action: Processing continues.

User response: Ensure that the data set name is specified correctly.

**CCQS004I** The settings were saved.

Explanation: The settings that you changed were saved.

System action: Processing continues.

User response: No action is required.

**CCQS006W** The length of a qualifier for the data_set_name customization library data set exceeds 26 characters.

Explanation: The qualifier for the customization library data set is too long. The qualifier cannot exceed 26 characters.

System action: Processing continues.

User response: Specify a qualifier that is 26 characters or less.

**CCQS007E** The discover data set data_set_name could not be opened with the option-type option.

Explanation: The specified option could not open the Discover data set.

System action: None.

User response: Specify a data set to which you have WRITE access.

**CCQS008E** The Discover data set data_set_name exists on a different volume.

Explanation: The specified Discover data set must exist on the same volume as where it was created.

System action: Processing continues.
User response: Specify a different Discover data set name.

CCQS010E The customization library qualifier is not valid.
Explanation: The customization library qualifier that was specified is not valid.
System action: None.
User response: Specify a valid qualifier for the customization library.

CCQS011E The group attach option is not valid.
Explanation: The group attach option that was specified is not valid.
System action: None.
User response: Specify a valid option for the group attach option.

CCQS012E The Tools Customizer metadata library is not valid.
Explanation: The metadata library that was specified is not a valid data set.
System action: None.
User response: Specify a valid data set for the metadata library.

CCQS013E The Discover data set is not valid.
Explanation: The Discover data set that was specified is not a valid data set.
System action: None.
User response: Specify a valid Discover data set.

CCQS014E The data store data set is not valid.
Explanation: The data set that was specified is not a valid data set.
System action: None.
User response: Specify a valid data store data set.

CCQS015E Tools Customizer is already running.
Explanation: A session of Tools Customizer is already running in your environment. Only one Tools Customizer session is allowed.
System action: None.
User response: The trace data set is being used. Free the trace data set, and start Tools Customizer again.

CCQS018E Information on the first line of the job card exceeds 57 characters.
Explanation: The first line of the job card can contain only 57 characters. This character limit includes a continuation character.
System action: Tools Customizer clears the first line of the job card.
User response: Specify information that does not exceed 57 characters on the first line of the job card.

CCQS019E The required trace data set, data_set_name, is currently not accessible.
Explanation: The trace data set must be accessible.
System action: Processing stops.
User response: Ensure that the trace data set is accessible.

CCQS020E An error occurred while the customization library data set was being created. ALTER authority on the high-level qualifier for the customization library data set is required.
Explanation: To create the customization library data set, ALTER authority on the specified high-level qualifier must be granted.
System action: None.
User response: Ensure that ALTER authority for the specified customization library data set is granted.

CCQS021E The value value_name in the field that contains the cursor position is not valid.
Explanation: The specified value is not valid.
System action: None.
User response: Specify a valid value.

CCQS022E An error occurred while the customization library data set was being opened. UPDATE authority on the high-level qualifier for the customization library data set is required.
Explanation: To open the customization library data set, UPDATE authority on the specified high-level qualifier must be granted.
System action: None.
User response: Ensure that UPDATE authority for the specified customization library data set is granted.
CCQS023E  An error occurred while the customization library data set was being opened. UPDATE authority on the high-level qualifier for the customization library data set is required.

Explanation: To open the customization library data set, UPDATE authority on the specified high-level qualifier must be granted.

System action: None.

User response: Ensure that UPDATE authority for the specified customization library data set is granted, or specify a different high-level qualifier for the customization library data set on the Tools Customizer Settings panel.

---

CCQS024E  An error occurred while the customization library data set was being created. ALTER authority on the high-level qualifier for the customization library data set is required.

Explanation: To create the customization library data set, ALTER authority on the specified high-level qualifier must be granted.

System action: None.

User response: Ensure that ALTER authority for the specified customization library data set is granted, or specify a different high-level qualifier for the customization library data set on the Tools Customizer Settings panel.

---

CCQS025I  The display options were saved.

System action: None.

User response: No action is required.

---

CCQS026E  The customization library data set could not be opened because the requester does not have UPDATE authority on this data set.

Explanation: Users must have UPDATE authority to open the customization library data set. Users must have UPDATE authority to open the customization library data set.

System action: None.

User response: Ensure that UPDATE authority for the specified customization library data set is granted or specify a different high-level qualifier for the customization library data set on the Tools Customizer Settings panel.

---

CCQS027E  The customization library data set could not be created because the requester does not have ALTER authority on this data set.

Explanation: To create the customization library data set, ALTER authority on the data set must be granted.

System action: Processing stops.

User response: Ensure that ALTER authority for the specific customization library data set is granted, or specify a different high-level qualifier for the customization library data set on the Tools Customizer Settings panel.

---

CCQS029E  The customization library data set is not valid. Enter a valid data set name or use the Tools Customizer default: data_set_name.

Explanation: The specified data set is invalid.

System action: Processing stops.

User response: Specify a valid data set name.

---

CCQS030E  The following command is not a valid CREATE statement: command_statement.

Explanation: The specified CREATE command statement is invalid because it contains blanks or alphabetic characters.

System action: Processing stops.

User response: Specify a valid CREATE command statement. The correct syntax is CREATE nn, where nn is 1 - 99.

---

CCQS031E  The following command is not a valid CREATE statement: command_statement. The number that can be specified with the CREATE command is 1 - 99.

Explanation: The specified CREATE command statement is invalid because it contains either 0 or a number greater than 99.

System action: Processing stops.

User response: Specify a valid CREATE command statement. The correct syntax is CREATE nn, where nn is 1 - 99.

---

CCQS033E  A user profile cannot be copied into the same user profile.

Explanation: The specified data set cannot be copied into user's own user profile.

System action: Processing stops.

User response: Enter a different data set name.
The shared user profile data set `data_set_name` could not be created because the requester does not have UPDATE authority on this data set or because the data set already exists in another volume serial.

**Explanation:** To create a shared user profile data set, the requester must have update authority on the data set, and the specified data set name must be unique.

**System action:** Processing stops.

**User response:** Ensure that the requester has UPDATE authority on the data set and ensure that the data set name is unique.

The specified data set already has a user profile. Specify a different data set, or press Enter again to replace the existing user profile.

**Explanation:** Pressing Enter overwrites the previous user profile for the specified data set with user's own user profile.

**System action:** Processing stops.

**User response:** Specify a different data set name.

The customization library `data_set_name` already exists in `volume` and cannot be created in a different volume. Enter a different customization library name.

**Explanation:** The same data set name cannot exist in a different volume.

**System action:** Processing stops.

**User response:** Specify a different data set name.

The data set name was either not specified or invalid.

**Explanation:** The data set name specified does not follow the IBM data set name convention.

**System action:** Processing stops.

**User response:** Specify a valid data set name.

The specified data set cannot be used.

**Explanation:** The specified data sets contain information that supports Tools Customizer, but this data set cannot be used.

**System action:** Processing stops.

**User response:** Specify a different data set.

The specified data set has an invalid record format.

**Explanation:** The specified data set should be saved as a different record format. For example, the record format should be FB (Formated Block) but it is set to VB (Variable Block).

**System action:** Processing stops.

**User response:** Specify a valid record format.

The product configuration ID `copied_configuration_ID` was successfully copied from `configuration_ID`.

**Explanation:** The specified configuration ID was copied.

**System action:** None.

**User response:** No action is required.

The command name `command_name` line command was specified more than once, which is not allowed.

**Explanation:** The specified line command cannot be specified more than one time.

**System action:** Processing stops.

**User response:** Specify the line command only once.

The configuration ID `configuration_ID` already exists. Specify a different configuration ID.

**Explanation:** The specified configuration ID exists.

**System action:** Processing stops.

**User response:** Specify the line command only once.

The product configuration ID `configuration_ID` was created.

**Explanation:** The specified configuration ID was created.

**System action:** None.

**User response:** No action is required.

The product configuration ID `configuration_ID` was removed.

**Explanation:** The specified configuration ID was removed.

**System action:** None.

**User response:** No action is required.

Accelerator Loader messages

Look up Accelerator Loader messages to obtain information about them, including message explanations and suggested responses.

Each message has a unique message ID. The first three to four letters of an ID indicate the component for which the message was issued.

- HLO indicates the following components:
  - Messages 000 - 999 indicate the ISPF interface.
  - Messages 1000 - 9999 indicate the Consistent load batch component.
- HLOG indicates a global message that pertains to multiple components.
- HLOM indicates the maintenance utility (HLOMAINT).
- HLOP indicates a parser component. (These messages are primarily for use by Software Support.)
- HLOS indicates the Accelerator Loader started task.
- HLOU indicates the DSNUTILB intercept.
- HLV indicates the Accelerator Loader server.

All message IDs have a severity code as the last character, as follows:

- A: Action is required immediately. The associated task does not continue until the requested action is taken.
- D: Decision or action is required immediately. The associated task does not continue until the requested decision is made or action is taken.
- E: Error message. Some errors might be user-correctable. Read the User Response to determine the appropriate course of action.
- I: Information only. No user action is required.
- S: Severe error message. A severe internal or environmental error occurred. Usually, you must contact Software Support for assistance in resolving these errors.
- W: Warning message. Results might not be as expected.

In the messages output, a time stamp is often displayed after the message identifier and before the message text to indicate when the message was issued. The time stamp is composed of a Julian date followed by a time in the format HH:MM:SS:tt. The variables are defined as follows: HH is hours, MM is minutes, SS is seconds, and tt is hundredths of a second. This time stamp does not occur in messages that are issued from the ISPF interface or batch interface (HLO or HLOB messages) or in any messages that are issued as WTO messages. (The WTO messages include a system time stamp instead.)

</tbody>
</table>
User response: Contact your system administrator to increase the region size to 50000.

HLO010E  No objects match the filter.
Explanation: No objects match the specified filter criteria.
User response: Change the filter values or add new objects to the list.

HLO011I  Operation completed successfully.
Explanation: This is an informational message.
User response: No action is required.

HLO101E  ISPF error: <error_message>.
Explanation: An ISPF error occurred and caused the displayed message to be generated.
User response: Correct the error and retry the operation. If necessary, review the ISPF documentation to determine the cause of the error.

HLO102E  An invalid command was entered in the command or option line.
Explanation: Valid commands are listed on the panel.
User response: Enter a valid command.

HLO103E  Enter a valid line command as listed at the top of the panel.
Explanation: Valid line commands are listed at the top of the panel.
User response: Enter a valid line command.

HLO104E  An invalid option was entered. Enter a valid option.
Explanation: The specified option is not valid in the field.
User response: Enter another option.

HLO105E  An invalid value was entered.
Explanation: The specified value is not valid in the field.
User response: Enter a valid value in the field.

HLO106I  Move is pending.
Explanation: The M(Move) line command was entered but an A(After) or B(Before) command was not specified.
User response: Enter the A(After) or B(Before) line command to move the object after or before the position at which the line command is issued.

HLO107E  Element was not found.
Explanation: The specified element was not found.
User response: Verify the element name and reenter it.

HLO108I  No element was selected from the list.
Explanation: At least one element must be selected from the list.
User response: Select one or more elements.

HLO120E  File was not opened.
<error_message_text>.
Explanation: An error occurred while opening file.
User response: See the user's guide for the routine for an explanation of error codes. If you are unable to determine the reason for the failure from the associated z/OS messages, contact IBM Software Support.

HLO121E  File <file_name> is not a valid KSDS file.
Explanation: The file must be a valid KSDS file.
User response: Specify a valid KSDS file.

HLO122E  I/O operation cannot be performed on closed file <file_name>.
Explanation: File <file_name> is closed. I/O operations are denied for closed file.
User response: Check the file availability and retry. If you are unable to determine the reason for the failure, contact IBM Software Support.

HLO123E  Input operation cannot be performed on file <file_name> because the file was opened in read only mode.
Explanation: File <file_name> was opened in read only mode. Writing operations are denied for the file.
User response: Check the file availability and retry. If you are unable to determine the reason for the failure, contact IBM Software Support.

HLO124E  Record to be added to file <file_name> already exists.
Explanation: Records in the file must have different keys. The record to be added has the same key as an existing record.
User response: Check the file consistency and retry. If you are unable to determine the reason for the failure, contact IBM Software Support.
**HLO125E** Cannot add record to file.  
<error_message_text>.  
**Explanation:** An error occurred while adding the record to the file.  
**User response:** For an explanation of the error codes, see the documentation for the routine. If you are unable to determine the reason for the failure from the associated z/OS messages, contact IBM Software Support.

**HLO126E** Record for update in file <file_name> does not exist.  
**Explanation:** An updatable record with the specified key must exist in the file.  
**User response:** Check the file consistency and retry. If you are unable to determine the reason for the failure, contact IBM Software Support.

**HLO127E** Cannot update record in file.  
<error_message_text>.  
**Explanation:** An error occurred while updating a record in the file.  
**User response:** For an explanation of the error codes, see the documentation for the routine. If you are unable to determine the reason for the failure from the associated z/OS messages, contact IBM Software Support.

**HLO128E** Record for replace in file <file_name> does not exist.  
**Explanation:** A record with the specified key must exist in the file.  
**User response:** Check the file consistency and retry. If you are unable to determine the reason for the failure, contact IBM Software Support.

**HLO129E** Cannot replace record in file.  
<error_message_text>.  
**Explanation:** An error occurred while replacing a record in the file.  
**User response:** For an explanation of the error codes, see the documentation for the routine. If you are unable to determine the reason for the failure from the associated z/OS messages, contact IBM Software Support.

**HLO130E** Record for delete from file <file_name> does not exist.  
**Explanation:** A record with the specified key must exist in the file.  
**User response:** Check the file consistency and retry. If you are unable to determine the reason for the failure, contact IBM Software Support.

**HLO131E** Cannot delete record from file.  
<error_message_text>.  
**Explanation:** An error occurred while removing a record from the file.  
**User response:** For an explanation of the error codes, see the documentation for the routine. If you are unable to determine the reason for the failure from the associated z/OS messages, contact IBM Software Support.

**HLO132E** Cannot locate record in file.  
<error_message_text>.  
**Explanation:** An error occurred while locating a record in the file.  
**User response:** For an explanation of the error codes, see the documentation for the routine. If you are unable to determine the reason for the failure from the associated z/OS messages, contact IBM Software Support.

**HLO133E** Cannot read record from file.  
<error_message_text>.  
**Explanation:** An error occurred while reading a record from the file.  
**User response:** For an explanation of the error codes, see the documentation for the routine. If you are unable to determine the reason for the failure from the associated z/OS messages, contact IBM Software Support.

**HLO200E** <message_text>.  
**Explanation:** An internal error occurred in the DB2® control file routine or VSAM data repository routine.  
**User response:** See the user’s guide for the routine for an explanation of its error codes. If you are unable to determine the reason for the failure from the associated z/OS messages, contact IBM Software Support.

**HLO201E** Accelerator Loader repository does not exist.  
**Explanation:** The base PDS is not a repository high-level qualifier (HLQ).  
**User response:** Ensure that the high-level qualifier variable that is specified for the VSAM data repository in "CLIST" is correct. If you are unable to resolve the problem, contact IBM Software Support.
HLO202E  Accelerator Loader control file does not exist.
Explanation: The base PDS is not a Db2 control file HLQ.
User response: Ensure that the high-level qualifier variable specified for the Db2 control file in "CLIST" is correct. If you are unable to resolve the problem, contact IBM Software Support.

HLO203E  Db2 version <version_number> is not supported by this version of the product.
Explanation: The product requires Db2 10 or later.
User response: Select a Db2 subsystem with a supported Db2 version.

HLO204E  Data changes cannot be saved because the profile was opened in View mode or Share option prevents saving.
Explanation: You can save changes to a profile when the share option is Update, or you are the owner of the profile and you opened it in Edit or Build mode.
User response: Close the profile and open it again in a mode that supports saving.

HLO206E  Access method for specified data set is not supported.
Explanation: The product supports sequential and partitioned data sets.
User response: Specify either a sequential or partitioned data set.

HLO207I  No Db2 subsystem was defined in the Db2 control file.
Explanation: A Db2 subsystem must be defined in the Db2 control file.
User response: Specify a Db2 subsystem in the control file.

HLO208E  An error occurred while saving JCL file: <file_name>. Error codes: <error_codes>.
Explanation: The specified error occurred.
User response: Correct the error and retry the operation.

HLO209E  Profile repository error: <error_text>.
Explanation: The specified repository error occurred.
User response: Correct the error and run the job again.

HLO210E  <profile creator> element value is too long: element_value. It cannot exceed 8 characters.
Explanation: The specified profile creator value is not valid because it exceeds the eight-character limit.
User response: Specify a valid value up to eight characters and run the job again.

HLO211E  <profile ssid> element must be set in the SYSIN DD.
Explanation: The specified element is required.
User response: Specify a value and run the job again.

HLO212E  <profile name> element must be set in the SYSIN DD.
Explanation: The specified element is required.
User response: Specify a value and run the job again.

HLO213E  <profile creator> element must be set in the SYSIN DD.
Explanation: The specified element is required.
User response: Specify a value and run the job again.

HLO214E  The output data set for Accelerator Loader load JCL generation must be a partitioned data set (PDS). The specified data set <data_set_name> does not exist and the member is empty in profile <profile_name>.
Explanation: The <output dsn> element specifies the full path to the PDS that is to be used for the load JCL generation. If you do not specify this element, then the product uses the value from the profile. The value is defined in the Data set name field on the Build Load JCL panel.
User response: Specify the name of an existing data set or specify a value in the Data set name field on the Build Load JCL panel. After you change the data set name, run the job again.

HLO215E  The output data set for Accelerator Loader profile_type load generation must be a partitioned data set (PDS). The specified data set data_set_name is not a PDS.
Explanation: You must specify a PDS for the output JCL.
User response: Specify a PDS and run the job again.
HLO216E  <table name> subelement must be set in the <table> element in the SYSIN DD.
Explanation:  The specified subelement is required.
User response:  Specify a value and run the job again.

HLO217E  <table creator> subelement must be set in the <table> element in the SYSIN DD.
Explanation:  The specified subelement is required.
User response:  Specify a value and run the job again.

HLO218E  Output data set data_set_name does not exist. An error occurred while the product was attempting to allocate the data set.
Explanation:  The product was unable to allocate the specified data set.
User response:  Verify that the <output data set> element contains a valid value. Make corrections, if necessary, and then run the job again.

HLO219W  An error occurred while the product was setting ISPF statistics for member member_name of data set data_set_name.
Explanation:  The product was unable to set ISPF statistics for the specified member.
User response:  No action is required.

HLO220I  JCL file file_name for profile_name, profile_type, and ssid was successfully generated to data_set_name data set.
Explanation:  JCL generation was successful for the specified load profile name, type, and SSID.
User response:  No action is required.

HLO221E  The value that was specified for the <number of jobs> element is too small: Cannot create jobs job_names for specified tables table_names.
Explanation:  The number of tables divided by the number of jobs is greater than 172380.
User response:  Increase the value for <number of jobs> and run the job again.

HLO222E  The value that was specified for the <number of jobs> element is too large: specified_value. Valid values are 1 - 17576.
Explanation:  The <number of jobs> element specifies the number of jobs to generate. Valid values are 1 - 17576.
User response:  Specify a valid value and run the job again.

HLO223E  Unknown subelement element_name found in the <table> element for profile profile_type.
Explanation:  The specified subelement name is not valid in the SYSIN DD. JCL generation was stopped.
User response:  See the product documentation for valid subelements. Correct the subelement and run the job again.

HLO224E  Unknown element element_name found for profile profile_type.
Explanation:  An unknown element was specified in the SYSIN DD. JCL generation was stopped.
User response:  See the product documentation for valid elements. Correct the element and run the job again.

HLO225E  Unknown profile type found: <profile_type>. Valid values are: DUAL, CONSISTENT, ACCELERATOR ONLY, IMAGE COPY.
Explanation:  The value for the <profile_type> element is not valid. For descriptions of the profile types, see the Db2 Analytics Accelerator Loader terminology topic in the product documentation.
User response:  Specify a valid value, as shown in the message text.

HLO226E  No tables are defined for profile profile_name.
Explanation:  No <table> elements were found in the SYSIN DD for the batch JCL generator.
User response:  Specify at least one table by using the <table name> element.

HLO227E  The <profile type> element was not found.
Explanation:  The <profile type> element is required.
User response:  Specify the <profile type> element in the SYSIN DD.

HLO228E  The profile version <version_number> is not supported by this version of the product.
Explanation:  The specified profile has an unsupported version. The profile was saved with a later version of the product.
User response:  Specify another profile or run the
latest version of the product.

**HLO229E** The profile was created by an earlier version of the product. Use the ISPF interface to convert the profile to the latest version.

Explanation: The chosen profile was created with an earlier version of the product. To use the profile, it must be updated for use with the current version.

User response: To upgrade profile, use the ISPF interface to edit the profile. When the Confirm Action panel is displayed, choose to update the profile.

**HLO240E** The `<template_name>` template name must be defined for table `<table_name>`.

Explanation: The specified template name is required.

User response: Specify a valid value and run the job again.

**HLO241E** The `<data_set_name>` template data set must be defined for table `<table_name>`.

Explanation: The specified data set is required.

User response: Specify a valid value and run the job again.

**HLO242E** The `<template_name>` template disposition must be defined for table `<table_creator.table_name>`.

Explanation: For the specified template name, you must specify a valid z/OS data set disposition as documented in the *Db2 for z/OS Utility Guide and Reference*.

User response: Enter a valid DD disposition in the Data set disposition field on the DD Template Specification panel and run the job again.

**HLO243E** The SYSREC data set must be defined for table `<table_name>`.

Explanation: The SYSREC data set is required.

User response: Specify a valid value and run the job again.

**HLO244E** The accelerator name must be defined for profile `<profile_name>`.

Explanation: The accelerator name is required.

User response: Specify a valid value and run the job again.

**HLO249E** SYSIN parsing error - invalid escape sequence: `<escape_sequence>`.

Explanation: An invalid escape sequence was found. The valid values are:

- `&lt;` for less than symbol (`<`)
- `&gt;` for greater than symbol (`>`)  
- `&amp;` for ampersand (`&`)  
- `apos;` for apostrophe (`'`)  
- `quot;` for double quotation marks (`"`)  

User response: Correct the sequence.

**HLO250E** SYSIN parsing error - unexpected close tag symbol.

Explanation: The product encountered an incorrectly placed element close tag.

User response: Correct the tag and run the job again.

**HLO251E** SYSIN parsing error - value for tag is incorrectly placed.

Explanation: The product encountered an incorrectly placed value for an element.

User response: Correct the value and run the job again.

**HLO252E** SYSIN parsing error - unexpected end of SYSIN.

Explanation: The SYSIN contains an unclosed tag or invalid value.

User response: Correct the SYSIN and run the job again.

**HLO253E** `<PARTITION>` element must have a numeric value or numeric range with symbols `-`, `:`. The specified value is `partition_value`.

Explanation: You can specify a single partition by partition number, or a range of partition numbers in the format `a[:(-)b][a[:(-)b]]*`, where `a,b` are greater than 0. For example, `<PARTITION>=1-2,4:5,8` and `<PARTITION>=1`.

User response: Correct the value and run the job again.

**HLO254I** SYSREC data set supplied by profile `<profile_creator.prof_name for table table_creator.table_name`. To override this value, use element `<SYSREC-DSN>`.

Explanation: The input data set was obtained from the profile that is specified in the message.

User response: To change the SYSREC data set,
specify a value for the <SYSREC-DSN> element.

**HLO255I**  
SYSREC template DSN supplied by profile profile_creator,profile_name for table table_creator,table_name. To override this value, use element <SYSREC-TEMPLATE-DSN>.

**Explanation:** The SYSREC template data set name was obtained from the profile that is specified in the message.

**User response:** To change the SYSREC template DSN, specify a value for the <SYSREC-TEMPLATE-DSN> element.

**HLO256I**  
SYSREC template name supplied by profile profile_creator,profile_name for table table_creator,table_name. To override this value, use element <SYSREC-TEMPLATE-NAME>.

**Explanation:** The SYSREC template name was obtained from the profile that is specified in the message.

**User response:** To change the SYSREC template name, specify a value for the <SYSREC-TEMPLATE-NAME> element.

**HLO257I**  
Column info data set supplied by profile <creator>,<name> for table <table_creator>,<table_name>. To override this value, use element <FIELDSPEC-DSN>.

**Explanation:** The column info data set was obtained from the profile that is specified in the message.

**User response:** To change the column info data set, specify a value for the <FIELDSPEC-DSN> element.

**HLO258E**  
Profile <creator>,<name> created by <user-id> has NO ACCESS share option and cannot be built by <user-id>.

**Explanation:** For the specified profile, the value of Share option is No access, which means that other users cannot view or update the profile.

**User response:** Choose another profile or change the Share option value to Update or View only.

**HLO260E**  
Db2 table <table_creator>,<table_name> was not found in catalog.

**Explanation:** The specified Db2 table, view, or alias does not exist.

**User response:** Specify a valid Db2 table, view, or alias.

**HLO261E**  
Db2 object <object_creator>,<object_name> of type <object_type> is not supported.

**Explanation:** The specified Db2 object is of an unsupported type.

**User response:** Specify a valid Db2 object. Valid Db2 object types are T (table), R (archive table), V (view), A (alias), and D (accelerator-only table).

**HLO262E**  
Db2 object <object_creator>,<object_name> of type <object_type> has more than one base table.

**Explanation:** The specified Db2 object is related to more than one base table.

**User response:** Specify a valid Db2 table, view, or alias. The object can have only one base table, which must be of type T.

**HLO263E**  
Db2 object <object_creator>,<object_name> of type <object_type> has base table not of type T.

**Explanation:** The specified Db2 object is related to a base table that is not of type T.

**User response:** Specify a valid Db2 table, view, or alias. The object can have only one base table, which must be of type T.

**HLO300E**  
Db2 subsystem ID is required. Enter a valid Db2 SSID.

**Explanation:** You must specify a Db2 subsystem ID. You can enter a question mark (?) in the field to open a list of existing subsystems from which to choose.

**User response:** Choose or enter a valid Db2 SSID value.

**HLO301E**  
Db2 subsystem ID is invalid. Enter a valid Db2 SSID.

**Explanation:** You must specify a Db2 subsystem ID. You can enter a question mark (?) in the field to open a list of existing subsystems from which to choose.

**User response:** Choose or enter a valid Db2 SSID value.

**HLO302E**  
Db2 subsystem ID already exists. Enter another Db2 SSID to create.

**Explanation:** The specified Db2 subsystem is already defined in the program.

**User response:** Enter another valid value for the Db2 SSID.
HLO303E  Db2 subsystem profile has empty required fields. Select option 1 to enter Accelerator Loader parameters.
Explanation:  You cannot save the profile without specifying values for the required fields.
User response:  Select option 1 to enter the product parameters.

HLO304E  Member with specified name was not found.
Explanation:  The specified member could not be found.
User response:  Verify that you specified the correct member name.

HLO305E  Subsystem with specified SSID is not defined in the control file.
Explanation:  The specified Db2 subsystem could not be found in the Db2 control data set that is specified in the CLIST.
User response:  Enter another existing SSID value or define a new Db2 subsystem.

HLO306E  Connection program load modules DSNALI, DSNHLI2, DSNWLI2, DSNTIAR, DSNHDECP were not found in specified load libraries for Db2 subsystem.
Explanation:  The listed load modules were not found in the specified load libraries. The load library usually consists of a subsystem-specific DSNEXIT library, and the base DSNEXIT library and base DSNLOAD library for the current Db2 version.
User response:  Specify the data set that comprises the current load library concatenation for Db2 and is used during batch job processing. To do this, use the Db2 Subsystems panel and line command E (Edit).

HLO307I  Db2 subsystem <ssid> was successfully selected.
Explanation:  The specified Db2 subsystem was successfully selected.
User response:  No action is required.

HLO308E  Db2 subsystem ID is required. Enter a valid Db2 SSID.
Explanation:  You must specify a Db2 subsystem ID.
User response:  Enter a valid Db2 SSID value.

HLO309E  Db2 subsystem ID is invalid. Enter a valid Db2 SSID.
Explanation:  You must specify a Db2 subsystem ID.
User response:  Enter a valid Db2 SSID value.

HLO310E  Space units field is invalid. Specify BLKS, TRKS, CYLS, KB, MB, or BYTES.
Explanation:  The specified space units value is not valid. Valid values are BLKS, TRKS, CYLS, KB, MB, and BYTES.
User response:  Specify a valid value.

HLO311E  Primary quantity field is invalid. Specify a numeric value.
Explanation:  The field requires a numeric value.
User response:  Specify a numeric value.

HLO312E  Secondary quantity field is invalid. Specify a numeric value.
Explanation:  The field requires a numeric value.
User response:  Specify a numeric value.

HLO313E  Block size field is invalid. Specify a numeric value.
Explanation:  The field requires a numeric value.
User response:  Specify a numeric value.

HLO314E  Specified device type could not be found in MVS.
Explanation:  The device type that was specified could not be found in MVS™.
User response:  Specify another device type.

Explanation:  An attempt to perform file tailoring for utility customization failed because a file tailoring session was already in progress. File tailoring sessions cannot be performed concurrently.
User response:  Contact IBM Software Support. Have available the listing that contains this message.

HLO331E  File tailoring OPEN failed: the output file is already in use condition -- ENQ failed.
Explanation:  An attempt to access a file tailoring skeleton failed with an ENQ error (member-in-use).
User response:  Verify that all required tailoring files
are allocated, and that no other tailoring sessions are running concurrently.

| HLO332E | File tailoring OPEN returned the skeleton file or output file not allocated condition. |
| Explanation: An attempt to perform file tailoring failed because either the tailoring skeleton file or output file is not allocated. |
| User response: Ensure that the tailoring skeleton file and output file are allocated. |

| HLO333E | File tailoring OPEN returned a severe error condition. |
| Explanation: An attempt to perform file tailoring failed because a severe error condition was encountered when the file was being opened. |
| User response: Verify that all required files are allocated and accessible before performing file tailoring. |

| HLO334E | File tailoring OPEN returned an unknown code -- severe error. |
| Explanation: An attempt to perform file tailoring failed because a severe error condition was encountered on open. |
| User response: Verify that all required files are allocated and accessible before performing file tailoring. |

| HLO335E | File tailoring CLOSE returned a file not open condition -- severe error. |
| Explanation: An attempt to perform file tailoring failed because a File-Not-Open condition was encountered on close. |
| User response: Verify that all required files are allocated and accessible and that no other tailoring sessions are running concurrently with your session. |

| HLO336E | File tailoring CLOSE returned an output file in use condition. |
| Explanation: An attempt to perform file tailoring failed because an Output-File-Inuse condition was encountered on close. |
| User response: Verify that all required files are allocated and accessible and that no other tailoring sessions are running concurrently with your session. |

| HLO337E | File tailoring CLOSE returned a skeleton file or output file not allocated condition. |
| Explanation: An attempt to close file tailoring failed because either a tailoring skeleton file or output file was not allocated. |

User response: Verify that all required files are allocated and accessible and that no other tailoring sessions are running concurrently with your session.

| HLO338E | File tailoring CLOSE returned a severe error. |
| Explanation: An attempt to perform file tailoring failed because a severe error condition was encountered on close. |
| User response: Verify that all required files are allocated and accessible before performing file tailoring. |

| HLO339E | File tailoring CLOSE returned an unknown code -- severe error. |
| Explanation: An attempt to perform file tailoring failed because a severe error condition was encountered on close. |
| User response: Verify that all required files are allocated and accessible before performing file tailoring. |

| HLO340E | File tailoring CLOSE failed: an output member exists in the output library and NOREPL was specified. |
| Explanation: An attempt to perform file tailoring failed because the close process could not replace the preexisting tailored member in the output file. |
| User response: Change the output member name to a new name or ensure that the output library allows for member replacement. |

| HLO341E | File tailoring INCLUDE returned a skeleton does not exist condition. |
| Explanation: An attempt to perform file tailoring failed because the tailoring process could not locate a required tailoring skeleton. |
| User response: Verify that all required files are allocated to perform file tailoring. |

| HLO342E | File tailoring INCLUDE returned a skeleton in use -- ENQ failed condition. |
| Explanation: An attempt to access a tailoring skeleton failed with an ENQ error (member-in-use). |
| User response: Verify that all required tailoring files are allocated and that no other tailoring sessions are running concurrently. |

| HLO343E | File tailoring INCLUDE returned a data truncation, skeleton library, or output file not allocated condition. |
| Explanation: An attempt to perform file tailoring failed because data is truncated, or because the tailoring skeleton file or output file is not allocated. |
User response: Verify that data is intact and that all required files are allocated before performing file tailoring.

HLO344E File tailoring INCLUDE returned a severe error condition.
Explanation: An attempt to perform file tailoring failed because a severe error condition was encountered on an include operation.
User response: Verify that all required files are allocated and accessible before performing file tailoring.

HLO345E File tailoring INCLUDE returned an unknown condition -- severe error.
Explanation: An attempt to perform file tailoring failed because a severe error condition was encountered on an include operation.
User response: Verify that all required files are allocated and accessible before performing file tailoring.

HLO346E An error was encountered while allocating the ISPFILE DD - Process did not complete.
Explanation: An allocation error occurred while allocating the ISPFILE DD.
User response: If you cannot determine the reason for the failure from the associated z/OS messages, contact IBM Software Support. Have available the listing that contains these messages.

HLO347E Allocation Error - An error was encountered while reading the ISPFILE DD. Process did not complete.
Explanation: An allocation error was encountered while reading the ISPFILE DD.
User response: If you cannot determine the reason for the failure from the associated z/OS messages, contact IBM Software Support. Have available the listing that contains these messages.

HLO348E Device type for work files could not be found in MVS. Enter a valid device type for work files.
Explanation: The device type that was specified for work files could not be found in MVS.
User response: Enter a valid DASD or tape device.

HLO349E Device type for work files is required. Enter an existing MVS device type.
Explanation: You must specify a device type for work files.
User response: Enter an existing DASD or tape device.

HLO442E Data set type for work files is invalid. Valid data set types are BASIC and LARGE.
Explanation: The product supports data set types BASIC and LARGE for work data sets.
User response: Enter a valid value.

HLO443E Data set type for work files is required. Valid data set types are BASIC and LARGE.
Explanation: You must specify either BASIC or LARGE for the data set type for work files.
User response: Enter a valid value.

HLO444E Track or cylinders for work files is invalid. Valid values are TRK for tracks and CYL for cylinders.
Explanation: You must specify a valid allocation unit for work data sets.
User response: Specify TRK (tracks) or CYL (cylinders).

HLO445E Track or cylinders for work files is required. Valid values are TRK for tracks and CYL for cylinders.
Explanation: You must specify a valid allocation unit for work data sets.
User response: Specify TRK (tracks) or CYL (cylinders).

HLO446E Primary quantity for work files is invalid. Enter a value of 1 - 16777215.
Explanation: You must specify a primary space quantity for work data sets.
User response: Enter a value of 1 - 16777215.

HLO447E Primary quantity for work files is required. Enter a value of 1 - 16777215.
Explanation: You must specify a primary space quantity for work data sets.
User response: Enter a value of 1 - 16777215.

HLO448E Secondary quantity for work files is invalid. Enter a value of 1 - 16777215.
Explanation: You must specify a secondary space quantity for work data sets.
User response: Enter a value of 1 - 16777215.

574  Db2 Analytics Accelerator Loader User’s Guide
HLO463E  Maximum volumes for SYSPRINT is required. Enter a value of 1 - 255.

Explanation: You must specify the maximum number of volumes for SYSPRINT files.

User response: Enter a value of 1 - 255.

HLO464E  Number of DDs is invalid. Enter a value of 1 - 99 for disk or 3 - 99 for tape device.

Explanation: You must specify the number of DD statements to be used.

User response: Enter a value of 1 - 99 for disk or 3 - 99 for a tape device.

HLO465E  Number of DDs is required. Enter a value of 1 - 99 for disk or 3 - 99 for tape device.

Explanation: You must specify the number of DD statements to be used.

User response: Enter a value of 1 - 99 for disk or 3 - 99 for a tape device.

HLO466E  Primary space in sort work parameters is invalid. Enter a value of 1 - 99999.

Explanation: You must specify the primary space quantity in the sort work files parameters.

User response: Enter a value of 1 - 99999.

HLO467E  Primary space in sort work parameters is required. Enter a value of 1 - 99999.

Explanation: You must specify the primary space quantity in the sort work files parameters.

User response: Enter a value of 1 - 99999.

HLO468E  Secondary space in sort work parameters is invalid. Enter a value of 1 - 99999.

Explanation: You must specify the secondary space quantity in the sort work files parameters.

User response: Enter a value of 1 - 99999.

HLO469E  Secondary space in sort work parameters is required. Enter a value of 1 - 99999.

Explanation: You must specify the secondary space quantity in the sort work files parameters.

User response: Enter a value of 1 - 99999.

HLO4670E  Sort work unit device type is not recognized by OS/390 as a valid device type.

Explanation: You must specify the sort work file unit device to be used when Accelerator Loader generates utility JCL. Valid values are SYSCALLDA, DISK, and so on.

User response: Enter a valid device type.

HLO4671E  Sort work unit device is required. Enter the unit device (SYSDA, DISK, etc.) that you want Accelerator Loader to generate when generating sort work file DDs.

Explanation: You must specify the sort work file unit device to be used when the product generates sort work file DDs. Valid values are SYSCALLDA, DISK, and so on.

User response: Enter a valid device type.

HLO4672E  Utility REGION size is invalid. Enter the REGION size in megabytes that you want Accelerator Loader to use when generating utility JCL. Enter a value of 0 - 2047.

Explanation: You must specify the REGION size in megabytes that is to be used when the product generates utility JCL.

User response: Enter a value of 0 - 2047.

HLO4673E  Utility REGION size is required. Enter the REGION size in megabytes that you want Accelerator Loader to generate when generating utility JCL. Enter a value of 0 - 2047.

Explanation: You must specify the REGION size in megabytes that is to be used when the product generates utility JCL.

User response: Enter a value of 0 - 2047.

HLO4674E  When a tape device is used, data set type, tracks/cylinders, and primary/secondary space cannot be specified.

Explanation: Data set type, tracks/cylinders, and primary/secondary space values are valid for DASD devices only.

User response: Change the device type to a DASD device, or remove the incompatible values for the tape device.
HLO475E  Accelerator Loader Plan is required. Enter a value.

Explanation: You must specify the product plan to be used when connecting to the Db2 catalog. The value can contain up to 8 alphanumeric characters.

User response: Enter a valid plan.

HLO476E  Accelerator Loader Plan is invalid. Enter a valid value.

Explanation: You must specify a valid product plan to be used when connecting to the Db2 catalog. The value can contain up to 8 alphanumeric characters.

User response: Enter a valid plan.

HLO477E  Db2 ZPARMs member is required. Enter a value.

Explanation: You must specify the ZPARM load module member name that is generated for this Db2 subsystem. The value can contain up to 8 alphanumeric characters.

User response: Enter a valid value.

HLO478E  Db2 ZPARMs member is invalid. Enter a valid value.

Explanation: You must specify the ZPARM load module member name that is generated for this Db2 subsystem. The value can contain up to 8 alphanumeric characters.

User response: Enter a valid value.

HLO479E  Bootstrap 01 data set could not be found in the MVS catalog.

Explanation: You must specify the full data set name of the bootstrap data set that is being used by this Db2 subsystem.

User response: Enter a valid data set name.

HLO480E  Db2 Bootstrap DSN 01 is a required field. Enter the full DSN of the bootstrap data set.

Explanation: You must specify the full data set name of the bootstrap data set that is being used by this Db2 subsystem.

User response: Enter the bootstrap data set name.

HLO481E  Bootstrap 02 data set could not be found in the MVS catalog.

Explanation: You must specify the full data set name of bootstrap data set 02 that is being used by this Db2 subsystem.

User response: Enter the bootstrap data set name.

HLO482E  Db2 Loadlib1 data set could not be found in the MVS catalog.

Explanation: You must specify the full name of the data set that comprises the current load library concatenation for Db2, and is used during batch job processing; up to 47 alphanumeric characters.

User response: Enter the load library data set name.

HLO483E  Db2 Loadlib1 is a required field. Enter the DSN of the Db2 load library concatenation used during batch job processing.

Explanation: You must specify the full name of the data set that comprises the current load library concatenation for Db2, and is used during batch job processing; up to 47 alphanumeric characters.

User response: Enter the load library data set name.

HLO484E  Db2 Loadlib2 data set could not be found in the MVS catalog.

Explanation: You must specify the full name of the data set that comprises the current load library concatenation for Db2, and is used during batch job processing; up to 47 alphanumeric characters.

User response: Enter the load library data set name.

HLO485E  Db2 Loadlib2 data set could not be found in the MVS catalog.

Explanation: You must specify the full name of the data set that comprises the current load library concatenation for Db2, and is used during batch job processing; up to 47 alphanumeric characters.

User response: Enter the load library data set name.

HLO486E  Db2 Loadlib3 data set could not be found in the MVS catalog.

Explanation: You must specify the full name of the data set that comprises the current load library concatenation for Db2, and is used during batch job processing; up to 47 alphanumeric characters.

User response: Enter the load library data set name.

HLO487E  Db2 Loadlib3 data set could not be found in the MVS catalog.

Explanation: You must specify the full name of the data set that comprises the current load library concatenation for Db2, and is used during batch job processing; up to 47 alphanumeric characters.

User response: Enter the load library data set name.

HLO488E  Db2 Loadlib4 data set could not be found in the MVS catalog.

Explanation: You must specify the full name of the data set that comprises the current load library concatenation for Db2, and is used during batch job processing; up to 47 alphanumeric characters.

User response: Enter the load library data set name.

HLO489E  Db2 Loadlib5 data set could not be found in the MVS catalog.

Explanation: You must specify the full name of the data set that comprises the current load library concatenation for Db2, and is used during batch job processing; up to 47 alphanumeric characters.

User response: Enter the load library data set name.
**HLO489E** Specified data set for generated JCL could not be found in the MVS catalog.

**Explanation:** You must specify a fully qualified data set name (without quotation marks).

**User response:** Enter the data set name.

**HLO490E** Data set name for the generated JCL is required. Enter a valid data set name.

**Explanation:** You must specify the fully qualified data set name (without quotation marks) in which to save the generated job. If the data set does not exist, the product creates it.

**User response:** Enter the data set name.

**HLO491E** Member name for generated JCL is invalid.

**Explanation:** If the data set that is to hold the generated job is a PDS, you must specify a valid member name for the job output. If the member does not exist, the product creates it.

**User response:** Enter the PDS member name.

**HLO492E** Member name for generated JCL is required.

**Explanation:** If the data set that is to hold the generated job is a PDS, you must specify a valid member name for the job output. If the member does not exist, the product creates it.

**User response:** Enter a valid PDS member name.

**HLO493E** Enter either DFSORT or SYNSORT in the Sort program field. This value indicates the program to be used for sort processing.

**Explanation:** You must specify the sort program that is installed on the LPAR (DFSORT or SYNSORT).

**User response:** Enter the sort program that you want to use.

**HLO494E** Number of buffers value must be 1 - 99.

**Explanation:** The value in the Number of buffers field is invalid.

**User response:** Enter a valid value.

**HLO495E** Channel programs value must be numeric.

**Explanation:** You must specify the number of channel programs to be used by the product. Specify 0 to use a predetermined channel program setting to attempt to gain optimal performance, or specify a value of 1 - 99.

**User response:** Enter a valid value.

**HLO496E** Use Db2 Sort when possible value is invalid. Valid values are Yes and No.

**Explanation:** The Use Db2 Sort when possible field indicates whether the Db2 Sort product is to be used for internal product sorts. If you specify No, then the product uses the sort program (DFSORT or SYNSORT) that is specified in the Sort Program Installed field.

**User response:** Enter either Yes or No.

**HLO497E** An error occurred while checking <data_set_name> bootstrap data set: <message_text>.

**Explanation:** The specified bootstrap data set (BSDS) is invalid for the reason that is indicated in the message text.

**User response:** Specify a valid BSDS.

**HLO500E** Substring specification is invalid. Follow qualifier (start, length) notation with 1-based start and length.

**Explanation:** If you specify the substring qualifier code, then you must specify the starting position and length of the substring.

**User response:** Enter valid values.

**HLO501E** Substring start position exceeds the qualifier length.

**Explanation:** The substring start position exceeds the qualifier length.

**User response:** Enter a valid value.

**HLO502E** Substring end position exceeds qualifier length.

**Explanation:** The substring end position exceeds the qualifier length.

**User response:** Enter a valid value.

**HLO503E** Unknown qualifier that starts with & was specified.

**Explanation:** An unknown qualifier that starts with an ampersand was specified.

**User response:** Enter a valid value.

| HLO527E | Accelerator name is required. |
| Explanation: You must specify the name of the accelerator on which to load data. |
| User response: Enter a valid value. |

| HLO528I | Table has no referentially dependent tables |
| Explanation: The specified line command is not valid because the table has no referentially dependent tables. |
| User response: Enter a valid line command or select another table. |

| HLO532E | Member name is allowed only for partitioned data sets. |
| Explanation: If the data set to hold the generated job is a PDS, specify a member name. If the member does not exist, the product creates it. |
| User response: Remove the member name or specify a partitioned data set. |

| HLO533E | Load time is CURRENT, but an end point was specified. Change load time to SPECIFIED or delete the end point. |
| Explanation: The value CURRENT directs the product to read the log and load data up to the current point in time, which is the end of the log file. An end point value is not valid. |
| User response: Change the load time to SPECIFIED or remove the end point. |

| HLO534E | Load time is SPECIFIED. RBA end point or timestamp end point are required. |
| Explanation: The Load time value SPECIFIED directs the product to read the log and load data up to the end point that is specified in either the RBA/LRSN or the Timestamp End Point field. |
| User response: Change the load time to CURRENT or enter an RBA or time stamp end point. |

| HLO535E | RBA end point and timestamp end point cannot be specified at the same time. |
| Explanation: You cannot specify both an RBA end point and a time stamp end point. |

| HLO536E | Both primary and secondary space must be specified at the same time. |
| Explanation: You must specify values for primary space and secondary space. |
| User response: Enter values in the primary and secondary space fields. |

| HLO537E | All objects must be partitions of only one table. |
| Explanation: Partitions of multiple tables were selected. |
| User response: Select partitions of only one table. |

| HLO538W | Some partitions of this table are already selected. |
| Explanation: Partitions of this table have been selected more than once. |
| User response: Select partitions only once. |

| HLO539W | All partitions of this table are already selected. |
| Explanation: Selecting additional partitions is not necessary. |
| User response: You do not have to select any other partitions of this table. |

| HLO540E | Quiesce end point is valid only for load time = QUIESCE. |
| Explanation: A quiesce end point is valid only for the Load time value QUIESCE. |
| User response: Either remove the quiesce end point value or change the load time value. |

| HLO541E | Only quiesce end point is valid for load time = QUIESCE. |
| Explanation: With the load time value QUIESCE, only a quiesce end point is valid. |
| User response: Enter only a quiesce end point value for a Load time value of QUIESCE, or change the Load time value. |

| HLO542E | Resume and Replace are mutually exclusive options. |
| Explanation: The LOAD job cannot contain both the RESUME and the REPLACE options. |
| User response: Remove one of the options from the job. |
HLO548E  Invalid timestamp. Use YYYY-MM-DD-hh.mm.ss.nnnnnn format.
Explanation: The format of the time stamp value is invalid.
User response: Enter the time stamp in the format YYYY-MM-DD-hh.mm.ss.nnnnnn.

HLO549E  Invalid time zone. Valid values are LOCAL and GMT.
Explanation: The valid values for time zone are LOCAL and GMT.
User response: Enter a valid time zone.

HLO550E  field_value value is invalid. Valid values are YES and NO.
Explanation: Valid values for this field are YES and NO.
User response: Enter either YES or NO.

HLO551E  Invalid qualifier code. Enter a numeric value of 1 - 27.
Explanation: Valid qualifier codes are 1 - 27.
User response: Enter a valid qualifier code.

HLO552E  Specified qualifier code requires a free form literal.
Explanation: The Free Form Literal qualifier code was selected with no value entered for free form literal.
User response: Enter a value for Freeform Literal or remove the Freeform Literal qualifier code.

HLO553E  Invalid accelerator name is specified.
Explanation: The name that was specified for the accelerator is not valid.
User response: Enter a valid accelerator name.

HLO554E  FlashCopy = YES is valid only for load time = CURRENT.
Explanation: The value YES for FlashCopy can be specified only when the value in the Load time field is CURRENT.
User response: Change the FlashCopy value to NO or change the Load time value.

HLO555E  Sum of starting position and length cannot exceed 9.
Explanation: The specified value is not valid.
User response: Enter a valid value.

HLO556E  Substring starting position must be 1 - 8.
Explanation: The starting position value must be 1 - 8.
User response: Enter a valid value.

HLO557E  Substring length must be 1 - 8.
Explanation: The substring length value must be 1 - 8.
User response: Enter a valid value.

HLO558E  Substring length must be 1 - 8.
Explanation: The substring length value must be 1 - 8.
User response: Enter a valid value.

HLO559E  Invalid load time value. Valid values are CURRENT, SPECIFIED, and QUIESCE.
Explanation: The specified value is not valid.
User response: Enter a valid value.

HLO560E  RBA or LRSN end point contains invalid hexadecimal character. Valid characters are 0 - 9 and A - F.
Explanation: The specified value is not valid.
User response: Enter a valid value.

HLO561E  Timestamp end point has invalid year value. Valid values are 0000 through 9999.
Explanation: The specified value is not valid.
User response: Enter a valid value.

HLO562E  Timestamp end point has invalid month value. Valid values are 1 through 12.
Explanation: The specified value is not valid.
User response: Enter a valid value.

HLO563E  Timestamp end point has invalid day value. Valid values are 1 through last day of specified month.
Explanation: The specified value is not valid.
User response: Enter a valid value.

HLO564E  Timestamp end point has invalid hour value. Valid values are 0 through 23.
Explanation: The specified value is not valid.
User response: Enter a valid value.

HLO600I  Edited profile was saved successfully.
Explanation: This is an informational message.
User response: No action is required.

HLO601I  Created profile was saved successfully.
Explanation: This is an informational message.
User response: No action is required.

HLO602I  Renamed profile was saved successfully.
Explanation: This is an informational message.
User response: No action is required.

HLO603E  Cannot load profile description from repository.
Explanation: The product could not load the profile description from the repository.
User response: If unable to determine the reason for the failure, contact IBM Software Support. Have available the listing that contains this message.

HLO604E  Incomplete profile. Edit profile to specify required options.
Explanation: Required profile options are missing.
User response: Specify values for the required profile options.

HLO605E  Profile is inaccessible for specified action.
Explanation: The profile is not compatible with the specified action.
User response: Specify a valid action.

HLO606E  Profile with the same creator, name, and type already exists.
Explanation: Profile information must be unique.
User response: Specify unique profile information.

HLO607E  Cannot open table column info data set.
Explanation: The product cannot open the table column info data set.
User response: Make sure that the column info data set exists, and that you have the proper authority to read it.

HLO608E  Cannot open data set for JCL generation.
Explanation: The product cannot open the data set for JCL generation.
User response: Make sure that the data set for JCL generation exists, and that you have the proper authority to write to it.

HLO609E  Cannot create data set for JCL generation.
Explanation: The product cannot create the data set for JCL generation.
User response: Make sure that you have the proper authority to create the data set, and that enough space is available to allocate the data set. Check the data set allocation parameters on the Data set allocation parameters panel.

HLO610I  Job was built successfully.
Explanation: This is an informational message.
User response: No action is required.

HLO611E  Accelerators are not associated with this Db2 subsystem.
Explanation: The product received an empty list of accelerators from Db2.
User response: Select a Db2 subsystem on which Analytics Accelerator is installed, or contact your administrator to install Analytics Accelerator on the selected Db2 subsystem.

HLO612I  Profile was deleted successfully.
Explanation: This is an informational message.
User response: No action is required.

HLO613E  This table is not supported.
Explanation: The specified table is not supported. For more information about supported tables, see "Restrictions and considerations for loading from a Db2 image copy" on page 271 and "Restrictions and considerations for loading from an external file" on page 277.
User response: Select another table.

HLO614W  Profile without tables was saved successfully.
Explanation: A profile can be saved without an associated table. To use the profile to build JCL to perform the load, you must edit the profile to add a table.
User response: Specify a table before building the JCL.

HLO615E  No tables were specified in the profile.
Explanation: A profile can be saved without an associated table; however, to use the profile to build JCL to perform the load, you must add a table.
User response: Edit the profile to add a table.

HLO616E  Invalid utility ID. Valid values are blank and strings of letters, numerals, and symbols (®, $, #, !, ¬).
Explanation: The specified utility ID contains invalid symbols. For the utility ID value, you can leave the field blank or specify a string. Valid string values are letters (A - Z), numerals (0 - 9), national characters (®, $, #), exclamation point (!), and not symbol (¬).
User response: Enter a valid value.

HLO617E  Invalid parallel task value. Valid values are blank or 1 - 20.
Explanation: The specified value is not valid.
User response: Enter a valid value.

HLO618E  Invalid <template_name> DSN template. A valid template must contain the &&PART or &&PA variable.
Explanation: The specified value is not valid.
User response: Enter a valid value.

HLO619E  Input DSN template and template name are required for parallel load.
Explanation: You must specify the input DSN template and template name when parallel load is enabled.
User response: Enter valid values.

HLO620E  Number of PARALLEL log apply must be 1 - 10.
Explanation: The specified value is not valid.
User response: Enter a valid value.

HLO621E  Invalid value. Enter a number from 1 to 7.
Explanation: The specified value is not valid.
User response: Enter a valid value.

HLO622I  The profile has been converted to the current product version.
Explanation: The profile was created with an earlier version of the product. Using the Copy line command converts it to the current version. The original profile remains unchanged. You can use the following line commands with the original profile: Build, Delete, Rename, View, Copy.
User response: No action is required.

HLO624E  Invalid value. Enter a valid value (No, Add, or Refresh).
Explanation: The specified value is not valid.
User response: Enter a valid value.

HLO625E  Data server ID is required. Enter a valid data server ID.
Explanation: You must specify a data server ID.
User response: Enter a valid data server ID value.

HLO626E  Data server ID is invalid. Enter a valid data server ID.
Explanation: You must specify a data server ID.
User response: Enter a valid data server ID value.

HLO627E  Invalid value. Adding table to accelerator with refresh is denied when RESUME is enabled.
Explanation: You cannot specify both Refresh for Add table to Accelerator and Yes for Resume.
User response: Change the option values in one of the following ways:
• Resume = No
• Add table to Accelerator = No
• Add table to Accelerator = Add

HLO628E  Invalid Encoding value. Enter a valid value: UNICODE or EBCDIC.
Explanation: The specified value is not valid in the field.
User response: Enter another Encoding scheme or choose another table.
HLO630E  Column info DSN value must be empty when Format is set to Internal value.

Explanation: The field Column info DSN and the value Internal for the field Format are mutually exclusive.

User response: Remove the value in Column info DSN or specify Delimited or blank value for Format.

HLO631E  Target tables must be specified for each table being loaded if Target SSID differs from current SSID.

Explanation: Because the intended operation is being directed to an alternate SSID, the target creator and name fields must be specified for all objects that are being processed.

User response: Specify values for the target fields for all objects.

HLO632E  Target tables must be the same for all partitions or different for each partition.

Explanation: To maintain object consistency, you must follow target table naming rules for all partitions in the table. For an ordinary Db2 partitioned table to a partitioned accelerator structure, a consistent target table must be specified for all partitions. For an accelerator only table (AOT), a different target table must be specified for each partition of the Db2 source table.

User response: Specify one target table for all partitions, or specify different target tables for each partition.

HLO633E  Too many accelerators selected.
Maximum number of accelerators allowed: <max_accelerators>.

Explanation: The Accelerator Loader profile supports up to <max_accelerators> accelerators.

User response: Specify a valid number of accelerators.

HLO634E  Invalid table lockmode value. Valid values are NONE, TABLE, TABLESET, PARTITIONS, ROW.

Explanation: The specified value is not valid.

User response: Enter a valid value.

HLO635E  Invalid load tasks value. Valid values are blank or number between 1 and 30.

Explanation: The specified value is not valid.

User response: Enter a valid value.

HLO636E  Multiple accelerators for AOT table <creator>,<name> are not supported.

Explanation: The table type is accelerator only able (AOT). An AOT cannot be loaded to more than one accelerator.

User response: Specify another table or choose only one accelerator.

HLO637E  Invalid selection. Specify either exactly one group name or a list of accelerator names.

Explanation: Selecting multiple group names or a mix of group names and accelerator names is not supported.

User response: Specify either exactly one group name or a list of accelerator names.

HLO638E  Disposition is required. Enter a valid data set disposition.

Explanation: You must specify a data set disposition.

User response: Enter a valid data set disposition value.

HLO639E  Invalid disposition. See the documentation for valid syntax.

Explanation: You must specify a valid z/OS data set disposition as documented in the z/OS MVS JCL Reference for DD statement DISP parameter.

User response: Enter a valid DD disposition.

HLO640E  Space units field is invalid. Specify TRK or CYL.

Explanation: The specified space units value is not valid.

User response: Specify a valid value.

HLO641E  Expiration date is invalid. Specify a valid value.

Explanation: The expiration date value must be exactly in YYYYDDD format. The year in expiration date must be in range of 1999 and higher. The day in the expiration date must be in the range of 1 to 366.

User response: Specify a valid value.

HLO642E  Retention period date is invalid. Specify a numeric value.

Explanation: The field requires a numeric value.

User response: Specify a numeric value.
HLO643E  Data set type is invalid. Specify EXTREQ, EXTPREF, LARGE, BASIC, or blank.
Explanation: The specified data set type value is not valid.
User response: Specify a valid value.

HLO644E  At least one of local site primary, local site backup, recovery site primary, or recovery site backup copy data sets must be specified.
Explanation: All copy data set names are empty.
User response: Specify a valid value for a copy data set name.

HLO645E  A backup copy for either site may only be created when a primary copy is also being created for that site. Specify a valid primary copy data set value.
Explanation: A backup copy data set name is specified without specifying a primary copy data set name.
User response: Specify a valid primary copy data set value.

HLO646E  The retention period and expiration date fields cannot be entered at the same time.
Explanation: You entered a value in both the Expiration date and Retention period fields. This combination is not allowed.
User response: Clear the value from either the Expiration date or Retention period field.

HLO647E  The member name Db2 ZPARMs member does not exist.
Explanation: A valid Db2 ZPARMs member value is required.
User response: Specify a valid Db2 ZPARMs member on the Db2 Subsystem Parameters panel for the Db2 subsystem.

HLO648E  Load entry name entry point from DD name DD has failed. RC = code, reason = code.
Explanation: LOAD macro failed with the specified codes.
User response: Check entry_name member existence in data sets of the DD.

HLO649E  The data set name copy data set specified for creator.name Db2 table does not exist.
Explanation: The specified data set was not found in HLOUCOPY table.
User response: Specify a valid copy data set for the table on the Select Copy Data Set panel.

HLO650E  A full copy does not exist for the specified point in time for creator.name table and site type site type.
Explanation: There is no suitable full copy in HLOUCOPY table for the specified Db2 table, point in time and site type.
User response: Specify a valid point in time for the Db2 table.

HLO651E  A usable full copy does not exist for creator.name table and site type site type.
Explanation: Adding columns to the table or altering the definition of any column renders unusable all copies prior to the table change.
User response: Specify another Db2 table for recovery.

HLO652E  The most recent full copy for the specified Point in time for creator.name table is not usable.
Explanation: Adding columns to the table or altering the definition of any column renders unusable all copies prior to the table change.
User response: Specify a valid point in time or another Db2 table for recovery.

HLO653E  A backup copy data set is not specified for creator.name recovery table with Point in value set to SELECTED.
Explanation: You have specified SELECTED for the Point in time field on the Recover Accelerator Table(s) from a Backup panel. It means the recovery process will use the selected backup data set for each specified table.
User response: Specify a valid backup copy data set for the table using the B line command on the Recovery Table List panel.

HLO654E  Point in time is TIMESTAMP. The Timestamp end point value is required.
Explanation: The Point in time value TIMESTAMP directs the product to recover up to the end point that is specified in the Timestamp end point field.
User response: Change the Point in time to CURRENT or enter a Timestamp end point.
HLO655E  Invalid Point in time value. Valid values are CURRENT, TIMESTAMP, and SELECTED.

Explanation: The specified value is not valid.
User response: Enter a valid value.

HLO656E  Point in time is not TIMESTAMP, but a Timestamp end point was specified. Change Point in time to TIMESTAMP or delete the Timestamp end point value.

Explanation: The Timestamp end point value must be empty if Point in time is CURRENT or SELECTED.
User response: Change the Point in time to TIMESTAMP or remove the Timestamp end point value.

HLO657E  No usable backup copy data sets found for creator.name recovery table.

Explanation: You can choose backup copies based on full copies that were created after the table was altered only.
User response: Make a new backup copy for the table or choose another table for recovery.

HLO658E  The data set name backup copy data set for creator.name table does not exist on MVS.

Explanation: The product detected the backup copy as available for use for the table based on options specified on the Recover Accelerator Table(s) from a Backup panel.
User response: Specify another point in time to make the table recovery.

HLO659E  Invalid Check data operating mode value. Valid values are No, Write, or Operation.

Explanation: The specified value is not valid.
User response: Enter a valid value.

HLO660E  Invalid input file format value. Valid values are Internal, Delimited, and blank.

Explanation: The specified value is not valid.
User response: Enter a valid value.

HLO661I  Input file format options are available for Delimited Format value only.

Explanation: This is an informational message.
User response: No action is required.

HLO662E  Invalid delimiter character. The delimiter character can be specified as either a character or hexadecimal constant.

Explanation: The specified value is not valid. If you want to use a space character as a delimiter specify its hex-code.
User response: Enter a valid value.

HLO663E  The same character cannot be specified for more than one type of delimiter.

Explanation: The same character or hex-value was specified for more than one type of delimiter.
User response: Enter different characters for the type of delimiters.

HLO664E  Accelerator defined in group does not exist.

Explanation: The accelerator is specified in the group but not installed on the Db2 subsystem.
User response: Select another accelerator group to load.

HLO665E  Accelerator <accelerator_name> with NOT FOUND status cannot be selected for load.

Explanation: The <accelerator_name> accelerator with NOT FOUND status is selected. NOT FOUND status means that the accelerator is not installed on the Db2 subsystem at this time.
User response: Select another accelerator to load.

HLO666E  More then one accelerator with same name <accelerator_name> is selected.

Explanation: Accelerators with same name cannot be selected.
User response: Select another accelerator to load.

HLO700E  An error occurred while opening the Db2 load libraries: RC = return_code.

Explanation: The product encountered the error with the specified return code while opening the Db2 load library data sets.
User response: Make sure that the load library data sets that are specified on the Db2 Subsystem.
Parameters panel exist, and that you have the proper authority to read them.

**HLO701E** An error occurred while attaching the Db2 attachment facility subtask: RC = return_code.

**Explanation:** The product encountered the error with the specified return code while attaching the Db2 attachment facility subtask.

**User response:** See Db2 for z/OS Codes for information about the return code.

**HLO702E** The task is not running APF-authorized.

**Explanation:** The task requires load module HLOXDBT to be APF authorized.

**User response:** Set up APF authorization for load module HLOXDBT.

**HLO703S** The Db2 attachment facility subtask ended unexpectedly: RC = return_code.

**Explanation:** The product encountered the error with the specified return code.

**User response:** Make sure that the Db2 subsystem is active.

**HLO704E** The specified user ID and password are invalid.

**Explanation:** A valid user ID and password are required to establish a connection to the Db2 subsystem.

**User response:** Specify a valid user ID and password.

**HLO705E** The specified password for user ID has expired.

**Explanation:** A valid user ID and password are required to establish a connection to the Db2 subsystem.

**User response:** Contact your system administrator for a valid password.

**HLO706E** Access for the specified user ID userID has been revoked.

**Explanation:** A valid user ID and password with proper authority are required to establish a connection to the Db2 subsystem.

**User response:** Make sure that you have the proper authority to connect to the Db2 subsystem.

**HLO707E** An invalid dynamic allocation parameter was specified: code = code.

**Explanation:** The DD allocation for the Db2 load library data set failed.

**User response:** If unable to determine the reason for the failure, contact IBM Software Support. Have available the listing that contains this message.

**HLO709E** A dynamic allocation error occurred:

<table>
<thead>
<tr>
<th>info code</th>
<th>error code</th>
</tr>
</thead>
<tbody>
<tr>
<td>= infoCode</td>
<td>= errorCode</td>
</tr>
</tbody>
</table>

**Explanation:** The product encountered an error with the specified codes.

**User response:** See z/OS MVS Programming Authorized Assembler Services Guide for information about the codes. If unable to determine the cause of the error, contact IBM Software Support. Have available the listing that contains this message.

**HLO710E** Dynamic allocation query error occurred:

<table>
<thead>
<tr>
<th>info code</th>
<th>error code</th>
</tr>
</thead>
<tbody>
<tr>
<td>= infoCode</td>
<td>= errorCode</td>
</tr>
</tbody>
</table>

**Explanation:** The product encountered an error with the specified codes.

**User response:** See z/OS MVS Programming Authorized Assembler Services Guide for information about the codes. If unable to determine the cause of the error, contact IBM Software Support. Have available the listing that contains this message.

**HLO711E** Dynamic free error occurred:

<table>
<thead>
<tr>
<th>info code</th>
<th>error code</th>
</tr>
</thead>
<tbody>
<tr>
<td>= infoCode</td>
<td>= errorCode</td>
</tr>
</tbody>
</table>

**Explanation:** The product encountered an error with the specified codes.

**User response:** See z/OS MVS Programming Authorized Assembler Services Guide for information about the codes. If unable to determine the cause of the error, contact IBM Software Support. Have available the listing that contains this message.

Chapter 14. Troubleshooting 589
HLO726I  Total read profile count: 
<number_of_profiles>.

Explanation:  The product read the specified number of profiles.

User response:  No action is required.

HLO810E  Invalid CNUM parameter. Valid parameters are ON, OFF, or blank.

Explanation:  CNUM was issued with an invalid parameter. Issuing CNUM with no parameter acts as an ON/OFF toggle. ON and OFF are the only parameters that are accepted. ON turns the CNUM display on. OFF turns the CNUM display off.

User response:  Use a valid CNUM parameter (ON, OFF, or blank).

HLO811E  Invalid COLS parameter. Valid parameters are ON, OFF, or blank.

Explanation:  COLS was issued with an invalid parameter. Issuing COLS with no parameters acts as an ON/OFF toggle. ON and OFF are the only parameters that are accepted.

User response:  Specify a valid value for the COLS parameter. COLS ON turns the COLS display on, and CCOLS OFF turns the COLS display off.

HLO812I  The FIND command requires a match string

Explanation:  No parameters were specified with the FIND command. A match string must be specified.

User response:  Enter FIND parameters.

HLO813E  The RFIND key can only be used after a FIND character string is entered.

Explanation:  A repeat FIND (RFIND) command was issued before the FIND command was issued. You must issue FIND before RFIND.

User response:  Issue FIND before attempting to issue RFIND.

HLO814E  An unknown column column was specified.

Explanation:  The product does not recognize the column that was specified with the SORT command.

User response:  Verify that you correctly typed the name of the column or select another column.

HLO815E  SORT is not supported for the specified column.

Explanation:  The column that you attempted to SORT is not supported as a column on which to sort.

User response:  See the Define Sort Columns panel for a list of valid columns on which the sort can be based, and redefine the sort.

HLO816E  Max Sort Columns exceeded. Sorting first 9 columns.

Explanation:  More columns were selected for sorting than are supported. Nine columns can be sorted at a time. Under certain circumstances, the limit is less than nine, due to internal constraints.

User response:  Specify an allowable maximum number of sort columns.

HLO817E  Invalid column selection. Set cursor to valid column.

Explanation:  An invalid column was selected.

User response:  Move the cursor to a valid column.

HLO818E  Invalid command parameters.

Explanation:  Invalid command parameters were entered.

User response:  Correct the command input and resubmit.

HLO819E  Invalid location for the moved column. The source column cannot be moved to the new position.

Explanation:  The source column cannot be moved to the new position.

User response:  Correct the command input and resubmit.
HLO820E  Not enough space for scrolling unfixed columns.
Explanation: The screen has insufficient space for some unfixed columns.
User response: Leave enough space for unfixed columns on the right side of the panel.

HLO821E  Operation not valid for specified column.
Explanation: An invalid operation was entered.
User response: Enter a valid operation.

HLO822E  Fixed columns cannot be hidden.
Explanation: An attempt was made to hide a fixed column, but fixed columns cannot be hidden.
User response: Either make a selected column unfixed, or select another column to hide.

HLO823E  Invalid value entered for column size: non-numeric data.
Explanation: An invalid Cmd value was entered. The column size value must be a number between the values in the MIN and MAX fields.
User response: Either remove the invalid number or enter a valid value.

HLO824E  Invalid value entered for column size: out of range.
Explanation: An invalid Cmd value was entered. The column size value must be a number between the values in the MIN and MAX fields. MIN is the smallest acceptable value, and MAX is the largest acceptable value.
User response: Either remove the invalid number or enter a valid one.

HLO825E  SIZE is not supported for the specified column.
Explanation: An attempt was made to change the size of a column, but SIZE is not supported for that column.
User response: You can change the size of another column in which the minimum and maximum sizes are not equal.

HLO826E  View table is in use.
Explanation: The TBCREATE command was issued to create a VIEW, but it failed with a hexadecimal return code as indicated in the message.
User response: Review ISPTLIB allocation and data set characteristics. Review security controlled access to ISPTLIB data sets. For information about return codes, see the ISPF Services Guide under TBCREATE.

HLO871E  TBOPEN failed. RC= return_code.
Explanation: The TBOPEN command was issued to open an existing VIEW, but the command failed with a hexadecimal return code as indicated in the message.
User response: Review ISPTLIB allocation and data set characteristics. Review security controlled access to ISPTLIB data sets. For information about return codes, see the ISPF Services Guide under TBOPEN.

HLO872E  TBCLOSE failed. RC=return_code.
Explanation: The TBCLOSE command failed with a hexadecimal return code as indicated in the message.
User response: Review ISPTLIB allocation and data set characteristics. Review security controlled access to ISPTLIB data sets. For information about return codes, see the ISPF Services Guide under TBCLOSE.

HLO873E  TBDELETE failed. RC=return_code.
Explanation: The TBDELETE command failed with a hexadecimal return code as indicated in the message.
User response: Review ISPTLIB allocation and data set characteristics. Review security controlled access to ISPTLIB data sets. For information about return codes, see the ISPF Services Guide under TBDELETE.

HLO874E  TBMOD failed. RC= return_code.
Explanation: The TBMOD command failed with a hexadecimal return code as indicated in the message.
User response: Review ISPTLIB allocation and data set characteristics. Review security controlled access to ISPTLIB data sets. For information about return codes, see the ISPF Services Guide TBMOD.

HLO875E  TBGET failed. RC= return_code.
Explanation: The TBGET command failed with a hexadecimal return code as indicated in the message.
User response: Review ISPTLIB allocation and data set characteristics. Review security controlled access to ISPTLIB data sets. For information about return codes, see the ISPF Services Guide TBGET.

HLO876E  The scr

Chapter 14. Troubleshooting
ISPF. If you cannot determine the reason for this message, contact IBM Software Support. Have available the listing that contains this message.

HLO877E  View library not allocated.

**Explanation:** The ISPTLIB and ISPTABL DDs have not been allocated. Batch JCL generation continues but the job card rows might not be read from the skeleton file.

**User response:** Review the ISPTLIB and ISPTABL allocations. For information about ISPTLIB and ISPTABL, see the ISPF user guides for your version of ISPF. If you cannot determine the reason for this message, contact IBM Software Support. Have available the listing that contains this message.

HLO878E  TSTOP failed. RC=return_code.

**Explanation:** The TSTOP command failed with a hexadecimal return code as indicated in the message.

**User response:** Review ISPTLIB allocation and data set characteristics. Review security controlled access to ISPTLIB data sets. For information about return codes, see the ISPF Services Guide under TSTOP.

HLO879E  TBSKIP failed. RC= return_code.

**Explanation:** The TBSKIP command failed with a (hex) return code as indicated in the message.

**User response:** Review ISPTLIB allocation and data set characteristics. Review security controlled access to ISPTLIB data sets. For information about return codes, see the ISPF Services Guide under TBSKIP.

HLO940E  Invalid selection character. Valid values are "F" and "U".

**Explanation:** An invalid Cmd character was entered. Valid characters are F (FIX) and U (UNFIX).

**User response:** Either remove the invalid character or enter a valid one.

HLO941E  Column move failed: invalid location.

**Explanation:** An attempt to move a column was made, but the attempt failed because the new location was invalid. The new column number cannot be greater than the number of columns.

**User response:** Specify a column number that is less than the number of columns.

HLO942E  Invalid column size. Column size must be numeric.

**Explanation:** An invalid Cmd value was entered. Column size must be a number between the values in the MIN and MAX fields.

**User response:** Either remove the invalid number or enter a valid one.

HLO943E  Invalid column size. The specified value is out of range.

**Explanation:** An invalid Cmd value was entered. Column size must be a number between the values in the MIN and MAX fields. MIN is the smallest acceptable value. MAX is the largest acceptable value.

**User response:** Either remove the invalid number or enter a valid one.

HLO944E  Total fixed column sizes cannot exceed screen size.

**Explanation:** The Cmd values entered would have caused the sum of the FIXed column sizes to exceed the screen size. Because FIXed columns are always displayed, they must fit on the screen. The FIXed columns contain an F or P in the Fix column.

**User response:** Either change the FIXed column sizes so that the total is less than the screen size, or CANCEL to return to the previous panel.

HLO945E  Configuration request failed: at least one unfixed column would not be displayed

**Explanation:** The requested column sizes would cause at least one unfixed column to become undisplayable. The cursor is positioned on the value where the problem was detected. The unfixed area on the screen would be too small to show the column where the cursor is placed.

**User response:** To correct the problem:
1. Decrease the size of the column at which the cursor is pointing so that it can fit in the available unfixed area.
2. Set the unfixed area to its maximum size (width).
3. Decrease the size of the fixed area.
4. CANCEL to return to the previous panel.

HLO946E  Configuration request failed: the unfixed area would be too small to display this column.

**Explanation:** The requested column sizes would make the UNFIXed column at which the cursor is positioned undisplayable. The UNFIXed area on the screen would be too small to show this column.

**User response:** You can shrink the FIXed area by either unfixing columns or making FIXed columns smaller.
HLO947E  Configuration request failed: not all columns can be displayed.
Explanation: Fixing the requested columns would shrink the available area for unfixed columns so that some might not display. The cursor is placed on a row that represents one of the columns that would cause the error.
User response: To change column sizes, cancel out of the CFIX function and invoke the CSIZE function. Either cancel to exit CFIX with no change, or blank out one or more FIX selections until an allowable fixed size is reached.

HLO948E  Invalid FIXed selections. Operation would not leave enough space for this column.
Explanation: Fixing the columns as requested would make at least one unfixed column undisplayable. The cursor is positioned on the row that represents one of the unfixed columns that would cause an error where the minimum displayable size would not fit in the available screen area.
User response: To shrink the requested fixed area:
- Request fewer fixed columns.
- Unfix one or more fixed columns.
- Exit CFIX and invoke CSIZE to shrink one or more fixed columns so that all unfixed columns have the space that they require.

HLO949E  Duplicate Cmd values entered.
Explanation: Duplicate Cmd numbers were entered. The cursor points to the second instance of a Cmd value.
User response: Either change this value, clear it, or exit the CORDER function.

HLO950E  Invalid sort number. Enter a valid numeric digit.
Explanation: An invalid character was entered in the Srt column.
User response: Enter a valid character. Valid characters include the digits 1 through 9, or the number of sortable columns, whichever is less.

HLO951E  Duplicate sort sequence number.
Explanation: The same sort sequence number was entered for more than one column. The screen is positioned to the second instance.
User response: Enter a unique sort sequence number.

HLO952E  Sort sequence skips a number.
Explanation: The selected sorting sequence skips a number. The screen is positioned to a selection after the missing number in the sequence.
User response: Specify a valid sort sequence that does not skip a number.

HLO953E  Invalid Dir entered. Direction must be A (ascending) or D (descending).
Explanation: The selected sorting direction is invalid.
User response: Enter a valid value. Valid values include “A” for ascending, “D” for descending, or leave the field blank to use the default direction (ascending).

HLO954E  Dir not valid without Ord.
Explanation: A sorting direction (Dir) was selected for a column that was not selected to be sorted (Ord). Sorting direction is only a valid choice for selected columns.
User response: Specify a column to be sorted (Ord) before specifying a sort order direction.

HLO955E  Fixed columns cannot exceed screen size.
Explanation: More columns were selected to be FIXed than will fit on the screen.
User response: Remove the FIXed (F) selection character from one or more columns.

HLO956E  Invalid entry. Cmd values must be numeric.
Explanation: An invalid Cmd value was entered. Cmd values must be numeric.
User response: Either remove the invalid number or enter a valid one.

HLO957E  Invalid entry for permanent column.
Explanation: An invalid entry was made for a permanent column.
User response: Enter a valid value.

HLO958E  Invalid entry for fixed column.
Explanation: An invalid Cmd value was entered for a FIXed column. Valid selections for a FIXed column are numeric values from 1 through n, where n is the total number of fixed columns.
User response: Either remove the invalid number or enter a valid number.
HLO959E  Invalid entry for unfixed column.
Explanation: An invalid Cmd value was entered for an UNFIXed column. The number must be less than the total number of columns, and greater than the number of FIXed columns.
User response: Either remove the invalid number or enter a valid number.

HLO960E  Invalid Column Function value. Valid values: 1, 2, 3, and 4.
Explanation: An invalid character was entered in the Column Function field. Valid characters are 1, 2, 3, and 4.
User response: Correct the field or issue the CANCEL command.

HLO961E  Invalid Permanent View value. Valid values: Y, N.
Explanation: An invalid character was entered in the Permanent View field. Valid characters are Y (Yes), and N (No).
User response: Correct the field or issue the CANCEL command.

HLO962E  Invalid Reset View value. Valid values are Y, N.
Explanation: An invalid character was entered in the Reset View field. Valid characters are Y (Yes), or N (No).
User response: Correct the field or issue the CANCEL command.

HLO963E  Invalid Stop Sorting value. Valid values: Y, N.
Explanation: An invalid character was entered in the Stop Sorting field. Valid characters are Y (Yes), or N (No).
User response: Correct the field or issue the CANCEL command.

HLO964E  Invalid data set name.
Explanation: The data set name entered is syntactically incorrect. A data set name can be one name segment, or a series of joined name segments. Segments are limited to eight characters, the first of which must be alphabetic (A to Z) or special (# @ $). The remaining seven characters are either alphabetic, numeric (0 - 9), special, a hyphen (-). Name segments are separated by a period (.). Including all name segments and periods, the length of the data set name must not exceed 44 characters. Thus, a maximum of 22 name segments can make up a data set name.
User response: Enter a valid data set name.

HLO965E  Invalid member name.
Explanation: A member name can be up to eight characters long, and it can consist of the characters A-Z, 0-9, $, #, and @.
User response: Enter a valid member name.

HLO966E  Unable to allocate the report file.
Explanation: Unable to allocate the report file.
User response: No action is required.

HLO967E  Unable to open the report file.
Explanation: Unable to open the report file.
User response: No action is required.

HLO968E  Invalid selection character. Valid values: "H" and "U".
Explanation: An invalid Cmd character was entered. Valid characters are H (HIDE) and U (UNHIDE).
User response: Either remove the invalid character or enter a valid one.

HLO970E  TBCREATE failed. RC = return_code.
Explanation: The TBCREATE command was issued to create a VIEW, but it failed with a (hex) return code as indicated in the message.
User response: Review ISPTLIB allocation and data set characteristics. Review security controlled access to ISPTLIB data sets. For information about return codes, see the ISPF Services Guide under TBCREATE.

HLO971E  TBOPEN failed. RC = return_code.
Explanation: The TBOPEN command was issued to open an existing VIEW, but the command failed with a (hex) return code as indicated in the message.
User response: Review ISPTLIB allocation and data set characteristics. Review security controlled access to ISPTLIB data sets. For information about return codes, see the ISPF Services Guide under TBOPEN.

HLO972E  TBCLOSE failed. RC = return_code.
Explanation: The TBCLOSE command failed with a (hex) return code as indicated in the message.
User response: Review ISPTLIB allocation and data set characteristics. Review security controlled access to ISPTLIB data sets. For information about return codes, see the ISPF Services Guide under TBCLOSE.
**HLO973E**  
TBDELETE failed. R C= return_code.  

**Explanation:** The TBDELETE command failed with a hexadecimal return code as indicated in the message.  

**User response:** Review ISPTLIB allocation and data set characteristics. Review security controlled access to ISPTLIB data sets. For information about return codes, see the ISPF Services Guide under TBDELETE.

**HLO974E**  
TBMOD failed. RC = return_code.  

**Explanation:** The TBMOD command failed with a (hex) return code as indicated in the message.  

**User response:** Review ISPTLIB allocation and data set characteristics. Review security controlled access to ISPTLIB data sets. For information about return codes, see the ISPF Services Guide under TBMOD.

**HLO975E**  
TBGET failed. RC = return_code.  

**Explanation:** The TBGET command failed with a (hex) return code as indicated in the message.  

**User response:** Review ISPTLIB allocation and data set characteristics. Review security controlled access to ISPTLIB data sets. For information about return codes, see the ISPF Services Guide under TBGET.

**HLO976E**  
View table is in use.  

**Explanation:** The ISPTLIB and ISPTABL DDs are in use. Only temporary views will be available.  

**User response:** Review the ISPTLIB and ISPTABLE allocations. For information about ISPTLIB and ISPTABL, see the ISPF user guides for your version of ISPF. If you cannot determine the reason for this message, contact IBM Software Support. Have available the listing that contains this message.

**HLO977E**  
View library not allocated.  

**Explanation:** The ISPTLIB and ISPTABL DDs have not been allocated. Only temporary views will be available.  

**User response:** Review the ISPTLIB and ISPTABLE allocations. For information about ISPTLIB and ISPTABL, see the ISPF user guides for your version of ISPF. If you cannot determine the reason for this message, contact IBM Software Support. Have available the listing that contains this message.

**HLO9781E**  
Control file <control_file_name> not found.  

**Explanation:** The discovery process could not locate the specified product control file.  

**User response:** Enter a valid control file name.

**HLO982E**  
Configuration <configuration_ID> was not found in the control file.  

**Explanation:** The discovery process could not locate the specified configuration.  

**User response:** Enter a valid configuration ID.

**HLO983E**  
Previous installation library <installation_library_name> not found.  

**Explanation:** The discovery process could not locate the specified installation library.  

**User response:** Enter a valid installation library.

**HLO984E**  
Options module <options_module> was not found. Enter a valid previous installation location and options module name.  

**Explanation:** The discovery process could not locate the specified options module.  

**User response:** Enter a valid previous installation location and options module name.

**HLO1001A**  
The SYSOUT data set could not be opened for output.  

**Explanation:** The SYSOUT data set defined in your Db2 Analytics Accelerator Loader JCL could not be opened for output.  

**User response:** Verify that the SYSOUT data set you specified in your Db2 Analytics Accelerator Loader JCL is available for use and resubmit the Db2 Analytics Accelerator Loader job.

**HLO1002E**  
The SYSOUT DD must have a 133 byte LRECL.  

**Explanation:** The SYSOUT DD specified in your Db2 Analytics Accelerator Loader JCL does not have a 133-byte LRECL.  

**User response:** Ensure your SYSOUT DD has a 133-byte LRECL and resubmit the Db2 Analytics Accelerator Loader job.
HLO1010E  The following space is not set to LOG for a required log range.

Explanation:  The space listed in the messages is not set to LOG for a required log range.

User response:  No action is required.

HLO1012E  No valid full image copy in the SYSCOPY history was found for space(s): spaces

Explanation:  Db2 Analytics Accelerator Loader was unable to find a valid full image copy in the SYSCOPY history for the table space(s) indicated in the message. Db2 Analytics Accelerator Loader requires a full image copy registered in SYSCOPY.

User response:  Ensure the image copy is registered in SYSCOPY and that it is valid.

HLO1013E  A table update ICTYPE was found in SYSCOPY that did not log for space(s): spaces

Explanation:  There were multiple spaces being processed for which it was impossible for Db2 Analytics Accelerator Loader to process due to the fact that some operation (such as LOAD REPLACE LOG(NO), REORG LOG(NO), etc.) occurred at some point between the selected starting point and the specified end point.

User response:  No action is required.

HLO1014I  Database: database  Space: space  Partition: partition

Explanation:  This message is issued in conjunction with other Db2 Analytics Accelerator Loader messages to indicate the database, space, and partition for which other messages apply.

User response:  No action is required.

HLO1015E  Could not determine disk/tape status of unit name.

Explanation:  The device type for work data sets entered in the control file is invalid.

User response:  Enter the correct device type.

HLO1016E  The device type of the unit name from the control file could not be determined.

Explanation:  The device type for work data sets entered in the control file is invalid.

User response:  Enter the correct device type.

HLO1017E  The REPORT utility returned an unrecoverable error.

Explanation:  An internal error occurred.

User response:  Contact IBM Software Support.

HLO1018E  The FULL image copy DD CA(LP/LB/RP/RB) [1] is missing from the JCL. Each CAxnnnn DD correlates to each SPACE(...) control card group.

Explanation:  The full image copy data set is not included in your Db2 Analytics Accelerator Loader JCL.

User response:  Verify that the JCL is formatted correctly and contains the necessary information for your Db2 Analytics Accelerator Loader job.

HLO1019E  The FULL image copy DD CA [1] refers to a DSNAME already in SYSCOPY.

Explanation:  You specified a full image copy data set name that already exists in SYSCOPY.

User response:  Specify a different image copy data set name.

HLO1020I  Each CAxnnnn DD correlates to each SPACE(...) control card group.

Explanation:  Each CAxxxx DD statement must be associated with a corresponding SPACE(...) control card group.

User response:  Verify that the JCL is formatted correctly and that each CAxnnnn DD statement is associated with a SPACE(...) control card group.

HLO1021E  The TO_QUIESCE control card was specified, but no quiesce point was found.

Explanation:  The Db2 Analytics Accelerator Loader job will not run if the stop point proceeds the start point for the listed database, table space, partition.

User response:  Correct the JCL and resubmit the job.
The version of DB2 subsystem ssid is ver.

Explanation: Displays the SSID and the version of the Db2 subsystem.
User response: No action is required.

The version of DB2 group attach member_name is version.

Explanation: Displays the version of Db2 group attach that the Db2 group attach member subsystem is running.
User response: No action is required.

Control card stream process complete.
Selected space count = space count.

Explanation: This is an informational message stating that the control card scanning process has finished. The number of objects found in the control card set is indicated by the space count variable.
User response: No action is required.

Db2 Analytics Accelerator Loader will process dataset for tablespace tablespace.

Explanation: Indicates the data set name that Db2 Analytics Accelerator Loader will process.
User response: No action is required.

The image copy is of all parts.

Explanation: Indicates that the image copy is of all partitions of the table space.
User response: No action is required.

The image copy contains one partition (partition).

Explanation: Indicates the one partition that the image copy contains.
User response: No action is required.

A concurrent image copy was found in the SYSCOPY history. It cannot be used.

Explanation: The DFDSS concurrent image copy that was found cannot be read by Db2 Analytics Accelerator Loader.
User response: Select an alternative mechanism by which to recover the space.

Only partition partition within the image copy will be updated with log data and written to an individual partition copy.

Explanation: Db2 Analytics Accelerator Loader will only update the partition within the image copy with log data and will write to an individual partition image copy.
User response: No action is required.

All partitions will be updated with log data.

Explanation: Db2 Analytics Accelerator Loader will update all partitions with log data.
User response: No action is required.

A partial recovery point was found in SYSCOPY and its data set name does not match the data set name specified in the STARTING_IC control card.

Explanation: Although you specified a particular starting point, it cannot be used because a partial recovery point was found in SYSCOPY and the data set associated with it has to be used instead.
User response: You must remove the STARTING_IC control card from your Db2 Analytics Accelerator Loader syntax.

Db2 Analytics Accelerator Loader will process the log only for table space tablespace PART part.

Explanation: Db2 Analytics Accelerator Loader will process only the log for the indicated table space and partition.
User response: No action is required.

An image copy was found, but its RBA precedes the logging start point.

Explanation: This message indicates that although an image copy was found, it could not be used since its RBA precedes the logging start point.
User response: No action is required.

Db2 Analytics Accelerator Loader processing ends.

Explanation: Indicates that Db2 Analytics Accelerator Loader processing has completed.
User response: No action is required.

User response: Contact IBM Software Support.

HLO1063E Error call sysproc.accel_get_tables_details table owner.name severity severity, reason reason.

Explanation: There was an error in the call to stored procedure owner.name table. See also HLO1058I, HLO1059I, HLO1060I.

User response: Review the error codes and correct the problem.

HLO1064I Error text: text

Explanation: This message displays the error text from the stored procedure.

User response: No action is required.

HLO1065I Error description: text

Explanation: This message displays the error description from the stored procedure.

User response: No action is required.

HLO1066I Error action: text

Explanation: This message displays the error action text from the stored procedure.

User response: No action is required.

HLO1067E Error; could not parse XML output. XML output follows.

Explanation: An error was encountered parsing the XML output from the stored procedure. The XML output will be dumped after this message.

User response: Provide the output to IBM Software Support.

HLO1068I Space <database_name>,<space_name>,<partition> not loaded.

Explanation: The space load process ended abnormally. See previous messages for more information.

User response: No action is required.

HLO1069I Cannot enable acceleration for table <table_name>.

Explanation: Acceleration for the specified table could not be enabled. The table is in an error state.

User response: No action is required.

HLO1070I There is no table for which to enable acceleration.

Explanation: There is no table for which to enable acceleration.

User response: No action is required.

HLO1071I Acceleration enabled for table <table_name>.

Explanation: Acceleration has been enabled for the specified table.

User response: No action is required.

HLO1072E DB2 V12 PBR2 objects are not yet supported

Explanation: Db2 V12 PBR2 type objects are not supported at this time.

User response: Do not use PBR2 type objects in your Db2 Analytics Accelerator Loader jobs.

HLO1101E The first control card was not a request for Db2 Analytics Accelerator Loader.

Explanation: The JCL you submitted did not specify IDAA_CONSISTENT_LOAD as the first control card in the Db2 Analytics Accelerator Loader syntax.

User response: Correct the Db2 Analytics Accelerator Loader syntax. IDAA_CONSISTENT_LOAD is the main Db2 Analytics Accelerator Loader keyword. An open parenthesis must follow this keyword and the remainder of the Db2 Analytics Accelerator Loader keywords must be contained within.

HLO1103E Invalid syntax after IDAA_CONSISTENT_LOAD control card. Expected "."

Explanation: The syntax after the IDAA_CONSISTENT_LOAD control card is not valid.

User response: Ensure the Db2 Analytics Accelerator Loader control cards are enclosed in parentheses.

HLO1105E Invalid syntax after SPACE control card. Expected "."

Explanation: The syntax after the SPACE control card is not valid.

User response: Ensure the Db2 Analytics Accelerator Loader control cards are enclosed in parentheses.
HLO1106E  The data base parameter was specified but no value was found with it.
Explanation: You specified the DATA_BASE parameter but did not specify a corresponding value.
User response: Enter the 8-character database name following the DATA_BASE keyword.

HLO1107E  The table space name parameter was specified, but no value was found with it.
Explanation: You specified the SPACE_NAME parameter but did not specify a corresponding value.
User response: Enter the 8-character database name following the SPACE_NAME keyword.

HLO1108E  The partition parameter was specified, but no value was found with it.
Explanation: You specified the PARTITION parameter but did not specify a corresponding value.
User response: Enter a partition number next to the PARTITION keyword.

HLO1109E  The data base parameter is invalid.
Explanation: The DATA_BASE syntax is invalid.
User response: Verify that the DATA_BASE keyword has been properly specified in your JCL.

HLO1110E  The space name parameter is invalid.
Explanation: The SPACE_NAME syntax is invalid.
User response: Verify that the SPACE_NAME keyword has been properly specified in your JCL.

HLO1111E  The partition parameter is invalid.
Explanation: The PARTITION syntax is invalid.
User response: Verify that the PARTITION keyword has been properly specified in your JCL.

HLO1112E  The end RBA parameter was specified, but no value was found with it.
Explanation: You specified the END_RBA keyword but did not specify a corresponding value.
User response: Enter a valid value for the END_RBA keyword.

HLO1113E  Syntax error around end RBA value. Form is X’<6 byte hex value>’.
Explanation: The end RBA must be in the format X’nnnnnn’ where nnnnnn is the hexadecimal value of the end RBA.

User response: Enter the end RBA value in the correct format.

HLO1114E  The end RBA value contains an invalid hexadecimal value.
Explanation: The hexadecimal value specified for the end RBA is not valid.
User response: Correct the end RBA value.

HLO1115E  The end RBA value cannot be 0.
Explanation: The value specified for the END_RBA keyword cannot be 0.
User response: Specify a valid value for the END_RBA keyword.

HLO1116E  The end RBA value was already specified before end LRSN in a control group.
Explanation: In the Db2 Analytics Accelerator Loader JCL, the end RBA value is specified before end LRSN for the group.
User response: You can only specify end RBA or End LRSN, not both. Correct the JCL and resubmit the job.

HLO1117E  The end LRSN parameter was specified, but no value was found with it.
Explanation: The END_LRSN keyword is missing its parameter value.
User response: Enter the end LRSN following the END_LRSN keyword.

HLO1118E  Syntax error around end LRSN value. Form is X’<6 byte hex value>’.
Explanation: The end LRSN must be in the format X’nnnnnn’, where nnnnnn is the hex value of the end LRSN.
User response: Enter the end LRSN value in the correct format.

HLO1119E  The end LRSN value contains an invalid hexadecimal value.
Explanation: The hexadecimal value entered is invalid.
User response: Enter the correct value.

HLO1120E  The end LRSN value cannot be 0.
Explanation: The end LRSN cannot be 0.
User response: Enter the correct value.
**HLO1121E** The end LRSN value was already specified before end RBA in a control group.

**Explanation:** In the Db2 Analytics Accelerator Loader JCL, the end LRSN value is specified before end RBA for the group.

**User response:** You can only specify end RBA or End LRSN, not both. Correct the JCL and resubmit the job.

---

**HLO1122E** One of the following options must be specified: TO_CURRENT, TOQUIESCE, END_RBA, END_LRSN, TO_IC, TO_TIMESTAMP, TO_TIMESTAMP_LOCAL, or TOLOGPOINT.

**Explanation:** The product requires a log range end point to complete the process.

**User response:** Ensure that the control card set includes a valid end point control card or a single end point control card factored out at the group level. You can use one of the options listed in the message text.

---

**HLO1123E** Only one end point (END_RBA, END_LRSN, TO_CURRENT, TOQUIESCE, TO_TIMESTAMP, TO_TIMESTAMP_LOCAL, TO_IC, or TOLOGPOINT) can be specified.

**Explanation:** You specified more than one end point parameter.

**User response:** Specify only one end point parameter.

---

**HLO1124E** The starting image copy value has mismatched apostrophes.

**Explanation:** An apostrophe is missing from the starting image copy data set name on the STARTING_IC keyword.

**User response:** Ensure the Db2 Analytics Accelerator Loader control cards are enclosed in parentheses.

---

**HLO1125E** The starting image copy value has no contents.

**Explanation:** There is a problem with the starting image copy data set name included with the STARTING_IC keyword. Either the data set name is missing or spelled incorrectly, the data set cannot be opened, or the data set is not a valid image copy data set.

**User response:** Specify the correct data set.

---

**HLO1126E** A token value was found that was either not part of the Db2 Analytics Accelerator Loader command set or was misplaced in the Db2 Analytics Accelerator Loader control cards. The value of the invalid token is: keyword

**Explanation:** An invalid keyword appears in the control cards.

**User response:** Check the list of valid keywords and parameters, correct the keyword, and resubmit.

---

**HLO1127E** A table/index space name pair or index name pair is incomplete.

**Explanation:** One of the table/index space name pairs you specified is incomplete.

**User response:** Verify that all table/index space name pairs have been specified correctly. Edit your JCL as needed and resubmit the job.

---

**HLO1128E** The space space was not found in the DB2 catalog. Space space.

**Explanation:** The table space you specified in your Db2 Analytics Accelerator Loader JCL does not exist in the Db2 catalog.

**User response:** Correct the JCL and resubmit the job.

---

**HLO1129E** A partition was specified for {x} but the space is non-partitioned.

**Explanation:** A partition was specified but no partition is defined for that table space.

**User response:** Specify the correct table space partition information.

---

**HLO1130E** A partition was specified for {x} but the partition is not defined.

**Explanation:** A partition was specified but no partition is defined for that table space.

**User response:** Specify the correct table space partition information.

---

**HLO1131E** In a data sharing environment, specifying RBA values is not allowed.

**Explanation:** You specified an RBA value in a data sharing environment. RBA values are not available for use in data sharing environments.

**User response:** Correct the JCL and resubmit the job. If necessary use LRSN values instead of RBA values.
In a non data sharing environment, specifying LRSN values is not allowed.

**Explanation:** You are currently using a data sharing environment so the LRSN values you specified are not allowed.

**User response:** Do not use an LRSN value in your JCL or profile.

The command set must end with a close parenthesis ")".

**Explanation:** There is no close parenthesis following the Db2 Analytics Accelerator Loader input cards.

**User response:** Enter a close parenthesis following the Db2 Analytics Accelerator Loader input cards.

The command set has extra parameters after the close parenthesis.

**Explanation:** A command is outside the close parenthesis.

**User response:** Ensure the Db2 Analytics Accelerator Loader control cards are enclosed in parentheses.

The SYSINHLO DD card could not be found in the JCL.

**Explanation:** Db2 Analytics Accelerator Loader requires the SYSINHLO DD as input to the job. The SYSINHLO DD could not be found in the JCL.

**User response:** Specify this DD as instream or as a data set.

The SYSINHLO DD card could not be opened for input.

**Explanation:** The SYSINHLO DD points to a data set but that data set could not be opened for input.

**User response:** Verify that the SYSINHLO DD is not being accessed by other resources and resubmit the job.

The SYSINHLO DD input stream is empty.

**Explanation:** No control cards appear in the instream file or the input data set.

**User response:** Correct the JCL and resubmit the job.

The parsing process gave an invalid return code.

**Explanation:** There is an error in your Db2 Analytics Accelerator Loader JCL.

**User response:** Correct the JCL and resubmit the job.

The functional limit of Db2 Analytics Accelerator Loader is 20000 Space control card groups.

**Explanation:** You specified more than 20000 Db2 Analytics Accelerator Loader SPACE control card groups.

**User response:** Specify less than 20000 SPACE control card groups.

The following object is specified at least 2 times in the control cards:

**Explanation:** You specified the listed object twice or more in the control cards.

**User response:** Specify the object at most once in the control card.

Duplicate objects found in control card stream: PART part SPACE NUMB space numb.

**Explanation:** Duplicate object detected in control card stream.

**User response:** Remove the duplicate object.

The DATABASE keyword has already been coded for this space group.

**Explanation:** You specified the DATABASE parameter more than once for the SPACE group.

**User response:** Correct the JCL and resubmit the job.

The SPACE_NAME keyword has already been coded for this space group.

**Explanation:** You specified the SPACE_NAME parameter more than once for the SPACE group.

**User response:** Correct the JCL and resubmit the job.

The PARTITION keyword has already been coded for this space group.

**Explanation:** You specified the PARTITION parameter more than once for the SPACE group.

**User response:** Correct the JCL and resubmit the job.

The END_RBA keyword has already been coded for this space group.

**Explanation:** You can only specify the END_RBA once for each SPACE group.

**User response:** Correct the Db2 Analytics Accelerator Loader JCL and resubmit the job.
The END_LSRN keyword has already been coded for this space group.

Explanation: You specified the END_LSRN parameter more than once for the SPACE group.

User response: Specify the END_LSRN parameter at most once in the JCL and resubmit the job.

The TO_CURRENT keyword has already been coded for this space group.

Explanation: You specified the TO_CURRENT keyword more than once for the SPACE group.

User response: Correct the JCL and resubmit the job.

The TO_QUIESCE keyword has already been coded for this space group.

Explanation: You specified the TO_QUIESCE parameter more than once for the SPACE group.

User response: Correct the JCL and resubmit the job.

The STARING_IC keyword has already been coded for this space group.

Explanation: You specified the STARTING_IC parameter more than once for the SPACE group.

User response: Correct the JCL and resubmit the job.

The MINI_LOG_DSN_2 keyword has already been coded for this run.

Explanation: You specified the MINI_LOG_DSN_2 keyword multiple times for the Db2 Analytics Accelerator Loader GROUP keyword. Only one MINI_LOG_DSN_2 keyword can be specified for each GROUP keyword.

User response: Remove the extra MINI_LOG_DSN_2 keywords, leaving at most one.

The NO_SYSCOPY_ROW keyword has already been coded for this run.

Explanation: You specified the NO_SYSCOPY_ROW parameter more than once for the job.

User response: Correct the JCL and resubmit the job.

The RECOVERY_SITE keyword has already been coded for this run.

Explanation: You specified the RECOVERY_SITE parameter more than once for the job.

User response: Correct the JCL and resubmit the job.

The LOCAL_SITE keyword has already been coded for this run.

Explanation: You specified the LOCAL_SITE parameter more than once for the job.

User response: Correct the JCL and resubmit the job.

The SPACE(...) set involved that the error was detected in was #.

Explanation: This message indicates the SPACE set number for which the error was detected.

User response: Correct the JCL and resubmit the job.

Control card stream processed by Consistent Load follows...

Explanation: Indicates the control card stream that was processed by Db2 Analytics Accelerator Loader.

User response: No action is required.

Consistent Load processing messages follow...

Explanation: Indicates that there are Db2 Analytics Accelerator Loader messages that follow.

User response: Evaluate the message as necessary.

The MINI_LOG_DSN/ MINI_LOG_DSN_1 keyword has already been coded for this run.

Explanation: You specified the MINI_LOG_DSN or MINI_LOG_DSN_1 keywords multiple times for the Db2 Analytics Accelerator Loader GROUP keyword. Only one MINI_LOG_DSN or MINI_LOG_DSN_1 keywords can be specified for each GROUP keyword.

Note: MINI_LOG_DSN and MINI_LOG_DSN_1 are functionally identical.

User response: Code only a single MINI_LOG_DSN or MINI_LOG_DSN_1 keyword per group.

Either all groups need a mini-log data set or all groups must be without them.

Explanation: You have specified a mini log data set for some but not all groups in the JCL.

User response: Either specify a mini log data set for all groups or none of the groups.
all groups or none of the groups within the JCL.

HLO1161E Each group must have it’s own unique mini log data set name.
Explanation: The mini log data sets you specified are not all unique.
User response: Rename mini log data sets so the each have a unique name.

HLO1162E The data set dataset already exists in the Consistent Load mini log control table.
Explanation: The data set you specified in the data set name generation qualifier string already exists in the Db2 Analytics Accelerator Loader mini log control table.
User response: Specify a unique mini log data set name.

HLO1163E The specified mini log data set data_set already exists in the MVS catalog.
Explanation: The mini log data set shown in the message is not unique and already exists in the MVS catalog.
User response: Specify a unique mini log data set name.

HLO1164W The NO_SYSCOPY_ROW control card is ignored when producing mini logs.
Explanation: You used the NO_SYSCOPY_ROW control card in the JCL but this parameter is ignored when producing mini logs.
User response: Correct the JCL and resubmit the job.

HLO1165E The mini log data set value has mismatched apostrophes.
Explanation: The value you specified for MINI_LOG_DSN is not enclosed in matching apostrophes.
User response: Correct the apostrophes in your JCL and resubmit the job.

HLO1166E The mini log data set value has no contents.
Explanation: The MINI_LOG_DSN keyword has been specified without a value.
User response: Specify a valid value for the MINI_LOG_DSN keyword.
HLO1173E  The index name parameter was specified, but no value was found with it.

Explanation: You specified the INDEX_NAME parameter but no value was specified with it.

User response: Specify a value for the INDEX_NAME keyword or remove the keyword.

HLO1174E  The index name parameter is invalid.

Explanation: The specification of the INDEX_NAME parameter is not valid.

User response: Correct the INDEX_NAME parameter specification.

HLO1175E  The NAME keyword has already been coded for this space group.

Explanation: The NAME keyword was specified more than once for the space group.

User response: Remove all unnecessary NAME keywords from the space group. Only one NAME keyword can be specified for the group.

HLO1176E  The object object was not found in the DB2 catalog.

Explanation: The object indicated in the message was not found in the Db2 Catalog. Processing cannot proceed for the indicated object.

User response: Contact IBM Software Support.

HLO1177E  The value was not properly enclosed with apostrophes.

Explanation: The syntax you specified was not valid. The value must be enclosed in apostrophes but was not.

User response: Correct the syntax by enclosing the value in apostrophes.

HLO1178E  The index does not currently have COPY=YES activated in DB2.

Explanation: The index cannot be copied because COPY=YES is not specified.

User response: Specify COPY=YES for the index.

HLO1179E  The index index was mapped to indexspace indexspace Space# space#.

Explanation: This informational message displays the database name and indexspace name for the index specified in the control cards

User response: No action is required.

HLO1180E  The LOCAL_SITE and RECOVERY_SITE control cards cannot be specified together.

Explanation: LOCAL_SITE and RECOVERY_SITE control cards are mutually exclusive.

User response: Specify either LOCAL_SITE or RECOVERY_SITE but not both.

HLO1181E  The WRITE_TO_VSAM keyword has already been coded for this run.

Explanation: The WRITE_TO_VSAM control card was specified multiple times. It should be specified at most once.

User response: Correct the syntax and resubmit the job.

HLO1182E  The NO_MINILOG_CHECKPOINTS keyword has already been coded for this run.

Explanation: Multiple instances of the NO_MINILOG_CHECKPOINTS keyword have been coded in your Db2 Analytics Accelerator Loader job. This keyword can only be coded once for your run.

User response: Remove all extraneous instances of the NO_MINILOG_CHECKPOINTS keyword from your Db2 Analytics Accelerator Loader syntax.

HLO1183E  The NO_SYSCOPY_ROW control card is ignored when writing directly to VSAM.

Explanation: The NO_SYSCOPY_ROW control card is used if you want Db2 Analytics Accelerator Loader to skip updating the SYSCOPY catalog table with a new row for the new image copy. If you specify WRITE_TO_VSAM or WRITE_TO_BOTH, this is not applicable and therefore, the NO_SYSCOPY_ROW control card will be ignored and the SYSCOPY catalog table will be updated with a new row for the image copy.

User response: No action is required. If you do not want the SYSCOPY catalog table to be updated with a new row for the image copy, specify WRITE_TO_COPIES.

HLO1184E  The WRITE_TO_VSAM and MINI_LOG_DSN control cards are mutually exclusive.

Explanation: Your Db2 Analytics Accelerator Loader syntax includes both the WRITE_TO_VSAM and MINI_LOG_DSN control cards. The WRITE_TO_VSAM control card cannot be used with the MINI_LOG_DSN control card.

User response: Correct your Db2 Analytics Accelerator Loader syntax.
The control card set ended prematurely. Ensure proper continuation syntax

Explanation: The IDAA_CONSISTENT_LOAD control card set contains an error and as a result ended prematurely.

User response: Check and correct your Db2 Analytics Accelerator Loader syntax.

The WRITE_TO_COPIES keyword has already been coded for this run.

Explanation: The WRITE_TO_COPIES keyword has been specified more than once in a IDAA_CONSISTENT_LOAD run.

User response: Correct your syntax by removing any extra WRITE_TO_COPIES keywords.

The WRITE_TO_BOTH keyword has already been coded for this run.

Explanation: The WRITE_TO_BOTH keyword has been specified more than once for a single IDAA_CONSISTENT_LOAD run.

User response: Correct your syntax by removing any extra WRITE_TO_BOTH keywords.

Only one WRITE_TO_ control card can be specified per run.

Explanation: Multiple WRITE_TO_ (WRITE_TO_VSAM, WRITE_TO_COPIES, WRITE_TO_BOTH) control cards have been specified in your JCL. Only one is allowed per run.

User response: Remove all extraneous WRITE_TO_ control cards and resubmit the job. If you want to write to VSAM and to image copies, specify WRITE_TO_BOTH.

An unexpected error occurred while trying to read the ZPARM information.

Explanation: Db2 Analytics Accelerator Loader encountered an unexpected error when attempting to read ZPARM information.

User response: Contact IBM Software Support.

Mini log data set #1 must be specified if mini log data set #2 is specified.

Explanation: If you specify a secondary mini log data set, you must also specify a primary mini log data set. Thus, if you include the MINI_LOG_DSN_2 control card in your Db2 Analytics Accelerator Loader syntax, you must also include the MINI_LOG_DSN_1 control card in your Db2 Analytics Accelerator Loader syntax.

Note: If you specify a primary mini log data set, you are not required to specify a secondary mini log data set.

User response: To resolve this issue, you must do one of the following:

- remove the MINI_LOG_DSN_2 control card from your syntax
- specify both MINI_LOG_DSN_1 and MINI_LOG_DSN_2
- specify only MINI_LOG_DSN_1

The TOLOGPOINT parameter was specified, but no value was found with it.

Explanation: Your syntax includes the TOLOGPOINT control card but no value was specified. The TOLOGPOINT control card must specify a valid log point to which you want to make the image copy.

User response: Verify that the correct TOLOGPOINT syntax is specified in your syntax. Ensure that a log point value is specified for the TOLOGPOINT control card.

Syntax error around TOLOGPOINT value. Form is X’<6 byte hex value>’.

Explanation: A syntax error was detected for the TOLOGPOINT control card.

User response: Verify that the log point you specified is a six-byte hexadecimal value.

The TOLOGPOINT value contains an invalid hexadecimal value.

Explanation: The value specified for the TOLOGPOINT control card is not a valid hexadecimal value.

User response: Correct the value specified for the TOLOGPOINT control card. Ensure that you specify a valid hexadecimal value to indicate the point up to which you want to make the image copy.

The TOLOGPOINT value can not be 0.

Explanation: The value specified for the TOLOGPOINT control card is not valid. You cannot specify a value of 0.

User response: Correct the value specified for the TOLOGPOINT control card. Ensure that you specify a valid hexadecimal value that indicates the point up to which you want to make the image copy.
The TOLOGPOINT value was already specified before end LRSN in a control group.

**Explanation:** The TOLOGPOINT value overrides the specified END_LRSN control card.

**User response:** Remove the unnecessary END_LRSN control card and adjust the TOLOGPOINT value as needed or remove the TOLOGPOINT control card.

The TOLOGPOINT keyword has already been coded for this space group.

**Explanation:** The TOLOGPOINT control card need only be specified once for a space group.

**User response:** Remove the extra TOLOGPOINT control card and ensure that the TOLOGPOINT control card that remains in your syntax is set to the correct log point.

The grouping end point conflicts/duplicates a SPACE() level end point.

**Explanation:** The GROUP end point is invalid and conflicts with that of the SPACE level.

**User response:** Correct the syntax.

The FORCE_COPIES keyword has already been coded for this run.

**Explanation:** You coded the FORCE_COPIES control card multiple times for the run.

**User response:** Check your syntax and remove any unnecessarily FORCE_COPIES control cards. Only one FORCE_COPIES control card is allowed per run.

The subsystem Consistent Load was started with could not be found in JES2.

**Explanation:** The subsystem Consistent Load was started with could not be found in JES2.

**User response:** Verify that you have specified the correct subsystem.

The subsystem Accelerator Loader was started with is not active in JES2.

**Explanation:** This message indicates that the subsystem that Db2 Analytics Accelerator Loader was started with is not active in JES2.

**User response:** No action is required.

There are no active DB2 members on this machine for this data sharing group.

**Explanation:** The data sharing group you specified does not have any active Db2 members so Accelerator Loader processing cannot proceed.

**User response:** Specify a valid data sharing group attach name or a valid subsystem on which the Db2 Analytics Accelerator Loader processing can run.

DB2 subsystem is not defined to OS/390. Using group attach name instead.

**Explanation:** The Db2 subsystem you specified is not defined on OS/390®. If you use a group attach name, you will be able to connect to a Db2 subsystem that is active on OS/390.

**User response:** Edit your Db2 Analytics Accelerator Loader setup to connect to a group attach name or to connect to a Db2 subsystem that is active on OS/390.

DB2 subsystem is not active on OS/390. Using group attach name instead.

**Explanation:** The Db2 subsystem you specified is not active on OS/390. If you use a group attach name, you will be able to connect to a Db2 subsystem that is active on OS/390.

**User response:** Edit your Db2 Analytics Accelerator Loader setup to connect to a group attach name or to connect to a Db2 subsystem that is active on OS/390.

The subsystem Accelerator Loader was started with is the group attach name.

**Explanation:** This message indicates the subsystem group attach name that Accelerator Loader process is using.

**User response:** No action is required.

The following subsystems are part of the data sharing group.

**Explanation:** This message, in conjunction with message HLO1207I, provides the following information about the subsystem on which your Db2 Analytics Accelerator Loader job ran:

- Subsystem—the subsystem.
- Member ID—the member ID.
- Defined to OS/390—whether this member is defined to OS/390.
- Active—whether this member is known to this OS/390 running on OS/390.
Note: Db2 Analytics Accelerator Loader cannot detect the status of a member that is not running on this OS/390. Although a Db2 member may appear to be inactive, it may be running on another OS/390. Regardless, Db2 Analytics Accelerator Loader reads the logs and processes all of the necessary files from each member of the data sharing group.

User response: No action is required.

HLO1207I Subsystem: subsystem Member ID: memberid Defined to OS/390: system Active: status

Explanation: This message, in conjunction with message HLO1206I, provides the following information about the subsystem on which your Db2 Analytics Accelerator Loader job ran:
• The subsystem.
• The member ID.
• Whether or not this member is defined to OS/390.
• Whether or not this member is running on OS/390.

Note: Db2 Analytics Accelerator Loader cannot detect the status of a member that is not running on this OS/390. Although a Db2 member may appear to be inactive, it may be running on another OS/390. Regardless, Db2 Analytics Accelerator Loader reads the logs and processes all of the necessary files from each member of the data sharing group.

User response: No action is required.

HLO1208I ssids

Explanation: This message displays the SSIDs that accompany messages HLO1206I and HLO1207I.

User response: No action is required.

HLO1209A Accelerator Loader is not in an APF authorized concatenation. It needs to be.

Explanation: To run, Db2 Analytics Accelerator Loader requires that the target load libraries SHLOLOAD and SHLOAD are APF authorized.

User response: Include the highlevel.SHLOLOAD and highlevel.SHLOAD libraries as part of your system APF authorized list.

HLO1210A Accelerator Loader needs to run from a //STEPLIB concatenation.

Explanation: Your JCL does not specify a //STEPLIB concatenation.

User response: Correct your JCL and resubmit the job.

HLO1211A The following data set in the //STEPLIB concatenation is not APF authorized: data_set

Explanation: The data set indicated in the message requires APF authorization.

User response: APF authorize the data set indicated in the message.

HLO1212A An internal error occurred while attempting to ascertain APF authorization status.

Explanation: An internal error occurred.

User response: Contact IBM Software Support.

HLO1300I The ENQs for the spaces were successful.

Explanation: This message indicates that the ENQs for the table spaces completed successfully.

User response: No action is required.

HLO1301E The ENQ for database database PART part was not successful.

Explanation: Indicates the database and partition for which the ENQs did not complete successfully.

User response: No action is required.

HLO1400I Incremental image copy image_copy could not be allocated.

Explanation: Db2 Analytics Accelerator Loader could not open the incremental image copy you specified.

User response: Verify that the file is not in use.
The incremental image copy work file could not be opened.

Explanation: Db2 Analytics Accelerator Loader could not open the incremental image copy work file.

User response: Verify that the file is not in use and that you have the proper authority to access this file.

The incremental image copy sort input file could not be opened.

Explanation: Db2 Analytics Accelerator Loader could not open the incremental image copy sort input file.

User response: Verify that the file is not in use and that you have the proper authority to access this file.

A read request to the current incremental image copy failed.

Explanation: A request to read the current incremental image copy was not successful.

User response: Verify that the file is not in use and that you have the proper authority to access this file.

Could not allocate the sort input work file for incr. IC processing.

Explanation: Db2 Analytics Accelerator Loader was not able to allocate the sort input work file for incremental image copy processing.

User response: Verify that the file is not in use and that you have the proper authority to allocate this file.

Could not allocate the sort output work file for incr. IC processing.

Explanation: Db2 Analytics Accelerator Loader was not able to allocate the sort output work file for incremental image copy processing.

User response: Verify that the file is not in use and that you have the proper authority to allocate this file.

An invalid return code was detected from the SORT program.

Explanation: Db2 Analytics Accelerator Loader detected an invalid return code when attempting to SORT.

User response: Contact IBM Software Support.

Dynamic allocation return code =return code

Explanation: Dynamic allocation produced the return code shown in the message.

User response: Diagnose the problem using the return code. Refer to https://www.ibm.com/support/ for information about Db2 messages and codes.

The last reported incremental image copy returned an immediate EOF.

Explanation: Db2 Analytics Accelerator Loader encountered an immediate end of file for the last reported incremental image copy.

User response: No action is required.

Image copy name=image_copy RBA=rba.

Explanation: Indicates the image copy name and RBA.

User response: No action is required.

The accumulation of incremental image copies failed.

Explanation: The accumulation of incremental image copies was not successful.

User response: No action is required.

The DB2 log will be used instead of the unusable incremental image copies.

Explanation: This message indicates that the Db2 log will be used in the Db2 Analytics Accelerator Loader process since the incremental image copies are unusable.

User response: No action is required.

The sort of the incremental image copies was successful.

Explanation: This message indicates that the sort of the incremental image copies completed successfully.

User response: No action is required.

A FTR sort program could not be started.

Explanation: The SORT program could not be started.

User response: Contact IBM Software Support.

An invalid return code was detected from the SORT program (FTR).

Explanation: The SORT program ended with an error.

User response: Contact IBM Software Support.

All start points are Sharelevel Reference; checkpoint processing skipped.

Explanation: This informational message indicates that checkpoint processing has been skipped since all start
points are Sharelevel Reference.

**User response:** No action is required.

**HLO1419E** A mismatch between passed Zparm information and the JES SSCT was found.

**Explanation:** The ZPARM member for the source subsystem could not be found.

**User response:** Verify that the ZPARM information is accurate in the log apply job. Verify that the correct data sets containing the ZPARM member for the source subsystem are allocated. Contact IBM Software Support if the problem persists.

**HLO1420E** An unexpected error occurred while trying to read the ZPARM information.

**Explanation:** The ZPARM member could not be found.

**User response:** Verify that the ZPARM information is accurate in the log apply job. Verify that the correct data sets containing the ZPARM member are allocated. Contact IBM Software Support if the problem persists.

**HLO1421E** An unexpected error occurred while trying to read the bootstrap data set.

**Explanation:** The ZPARM member could not be found.

**User response:** Verify that the ZPARM information is accurate in the log apply job. Verify that the correct data sets containing the ZPARM member are allocated. Contact IBM Software Support if the problem persists.

**HLO1500I** An invalid return code was detected from the SORT program (log).

**Explanation:** Db2 Analytics Accelerator Loader encountered an invalid return log.

**User response:** Correct the JCL and resubmit the job.

**HLO1501I** The following log data set is required for processing but got an error: error.

**Explanation:** Db2 requires the log data set for processing but received the indicated error code when attempting to access the data set.

**User response:** Verify that the file is not in use and that you have the proper authority to access this file.

**HLO1502E** A gap was found in the logs needed for processing. Last usable log was:

**Explanation:** A gap found in the logs required for processing was found. Logs after the gap were not usable. Subsequent message HLO1503I indicates the log data set name of the last usable log.

**User response:** No action is required.

**HLO1503I** data_set_name

**Explanation:** This message accompanies HLO1502I and indicates the log data set name that was last usable.

**User response:** No action is required.

**HLO1504E** A desired log range cannot be found in any active/archive log.

**Explanation:** The log range is not available in any of the active or archive logs.

**User response:** No action is required.

**HLO1506W** db2_ssid The start point for log processing was not within any archive/active log range.

**Explanation:** No log records for the objects in this run were found in this db2_ssid.

**User response:** No action is required.

**HLO1510I** Error code #1:'code' #2: 'code'

**Explanation:** This message indicates an internal error that occurs when the log reader process cannot allocate an active or archive log file.

**User response:** Diagnose the problem using the return codes listed in the message. Refer to https://www.ibm.com/support/knowledgecenter/en/SSEPEK for information about Db2 messages and codes.

**HLO1512E** An unexpected error occurred while trying to read the bootstrap data set.

**Explanation:** Accelerator Loader was unable to read the bootstrap data set.

**User response:** No action is required.

**HLO1513E** An unexpected error occurred while trying to read the ZPARM information.

**Explanation:** An unexpected error occurred while trying to read the ZPARM information.

**User response:** No action is required.

**HLO1514E** An error was detected during end log processing for subsystem ssid RC=rc.

**Explanation:** Accelerator Loader encountered an error for the indicated subsystem.

**User response:** Refer to https://www.ibm.com/
HLO1515I  Log accumulated processing is beginning on subsystem ssid.
Explanation: Log accumulated processing has started on the subsystem indicated in the message.
User response: No action is required.

HLO1516I  Above the bar storage exhausted.
Explanation: The above the bar storage has been exhausted due to system or control card limits.
User response: The limit set by the maximum secondary allocation parameter has been met.

HLO1518I  Reading type log log_dataset_name.
Explanation: The ACTIVE/ARCHIVE log log_dataset_name is about to be read for log records associated with the specified objects.
User response: No action is required.

HLO1519I  Log reader operating in no consistency checking mode.
Explanation: When operating with mini log SHARELEVEL CHANGE, no consistency checks are done on uncommitted work found in the log.
User response: No action is required.

HLO1519W  Log reader operating in no consistency checking mode.
Explanation: Either mini logs are being written in SHARELEVEL CHANGE mode or a WRITE_TO_VSAM operation is taking place and all end points are TO_CURRENT.
User response: No action is required.

HLO1520I  The log reader task #task_number finished.
Explanation: This message indicates that the processing of the log reader has completed.
User response: No action is required.

HLO1521I  Issuing HRECALL for log dataset dsname
Explanation: This is an informational message indicating that the log data set needed for processing has been recalled from migration.
User response: No action is required.

HLO1600E  The file used to hold log records as input to sort could not be allocated.
Explanation: Db2 Analytics Accelerator Loader could not allocate the file used to hold log records as input to sort.
User response: Verify that the file is not in use.

HLO1601E  The file used to hold log records as input to sort could not be opened.
Explanation: Db2 Analytics Accelerator Loader could not open the file used to hold log records as input to sort.
User response: Verify that the file is not in use.

HLO1602E  The file used to hold log records after they are sorted could not be allocated.
Explanation: Db2 Analytics Accelerator Loader could not allocate the file used to hold log records after they have been sorted.
User response: Verify that the file is not currently in use or damaged.

HLO1603E  The mini log data set mini_log_dsn could not be allocated.
Explanation: Db2 Analytics Accelerator Loader could not allocate the mini log data set.
User response: Verify that the file is not currently in use or damaged.

HLO1604E  The mini log data set min_log_dsn could not be opened.
Explanation: There was a problem encountered when attempting to open the mini log data set.
User response: Verify that the file is not currently in use or damaged.

HLO1605E  Dynamic allocation return code 'rc'.
Explanation: This diagnostic message indicates data set allocation failure.

HLO1606I  The DB2 log record sort DD ddname was allocated.
Explanation: This message displays the input DDNAME. This message is output if Db2 Analytics Accelerator Loader dynamically allocates the SORTIN2/SORTOUT2 DDNAMES. If the
SORTIN2/SORTOUT2 DDNAMES are specified by the user in the step JCL, the messages does not appear and those DDs will be used as specified.

User response: No action is required.

HLO1607I The DB2 log record sort DD ddname was allocated.

Explanation: This message displays the output DDNAME. This message is output if Db2 Analytics Accelerator Loader dynamically allocates the SORTIN2/SORTOUT2 DDNAMES. If the SORTIN2/SORTOUT2 DDNAMES are specified by the user in the step JCL, the messages does not appear and those DDs will be used as specified.

User response: No action is required.

HLO1608E The mini log data set dsn could not be located for append purpose.

Explanation: The mini log data set could not be located.

User response: Ensure the mini log data set is available.

HLO1609E The mini log data set dsn could not be renamed for append purpose.

Explanation: The mini log data set could not be renamed.

User response: Ensure the mini log data set is available.

HLO1610E The sysout dataset for FTR "name" could not be allocated.

Explanation: While preparing data set for a sort in the FTR runtime context, a SYSOUT=* dynamic allocation request failed.

User response: Contact IBM Software Support.

HLO1800E The most recent full image copy could not be allocated.

Explanation: This message indicates that the most recent full image copy could not be allocated during the Db2 Analytics Accelerator Loader process.

User response: No action is required.

HLO1801E The work file for re-keying the full image copy file could not be allocated.

Explanation: Db2 Analytics Accelerator Loader encountered an invalid return code from the SORT program.

User response: No action is required.
ensure you have proper authorizations to access this file.

HLO1809E  The full image copy file returned an immediate EOF.
Explanation:  Db2 Analytics Accelerator Loader could not deallocate the full image copy.
User response:  Verify that the file is not in use or damaged. Check with your systems administrator to ensure you have proper authorizations to access this file.

HLO1810E  This error occurred during the re-key process for a full IC.
Explanation:  An error occurred during the re-key process for a full image copy.
User response:  Contact IBM Software Support.

HLO1811I  The sort of the REORG inline full image copy file was successful.
Explanation:  This message indicates that the REORG inline full image copy completed successfully.
User response:  No action is required.

HLO1812I  The sort of the re-keyed REORG inline full image copy file was successful.
Explanation:  This informational message indicates that the sort process for the re-keyed REORG inline full image copy completed successfully.
User response:  No action is required.

HLO1813I  The sort of the LOAD inline full image copy file was successful.
Explanation:  This message indicates the LOAD inline full image copy file sorted successfully.
User response:  No action is required.

HLO1814I  The sort of the re-keyed LOAD inline full image copy file was successful.
Explanation:  This message indicates that the re-keyed LOAD inline full image copy file completed successfully.
User response:  No action is required.

HLO1815E  The catalog check on the most recent image copy failed.
Explanation:  The catalog check on the most recent image copy did not complete successfully.
User response:  No action is required.

HLO1816E  Error processing was aborted by repeated error.
Explanation:  An internal error occurred.
User response:  Contact IBM Software Support.

HLO1817E  Unexpected EOF was detected while reading full IC page.
Explanation:  An internal error occurred inside the full image copy reader component.
User response:  Contact IBM Software Support.

HLO1818E  Error to Close full IC.
Explanation:  An internal error occurred inside the full image copy reader component.
User response:  Contact IBM Software Support.

HLO1819E  An invalid return code from a sequential VSAM read was detected.
Explanation:  An internal error occurred inside the full image copy reader component. In this case, a VSAM LDS file was used as the input image copy starting point.
User response:  Contact IBM Software Support.

HLO1820I  DB2Sort block mode used.
Explanation:  The Db2 Sort program returned that block mode was used.
User response:  No action is required.

HLO1821I  The sort of the COMPRESSED full image copy file was successful.
Explanation:  Normal SORT program processing on a compressed object image copy.
User response:  No action is required.

HLO1822I  The sort of the rekeyed COMPRESSED full image copy file was successful.
Explanation:  A normal sort of an 8K / 16K / 32K page-sized compressed object input copy took place.
User response:  No action is required.

HLO1823E  Error IARV64 DETACH could not release storage.
Explanation:  An internal error occurred.
User response:  Contact IBM Software Support.
Explanation: A system IO error was detected.
User response: Recreate the source image copy.

HLO1825I The $SORTPARM override DD is present in the job step JCL.
Explanation: The //SORTPARM DD was found in the job step JCL. Db2 Analytics Accelerator Loader will not attempt to allocate and load the parameter file.
User response: No action is required.

HLO1826I The $SORTPARM DD could not be loaded. Using system defaults.
Explanation: An attempt to create and load the //SORTPARM file was not successful. Installation defaults will be used instead.
User response: No action is required.

HLO1827I The $SORTPARM DD could not be allocated. Using system defaults.
Explanation: An attempt to create and load the //SORTPARM file was not successful. Installation defaults will be used instead.
User response: No action is required.

HLO1828I The $DB2PRMS override DD is present in the job step JCL.
Explanation: The //DB2PRMS DD was found in the job step JCL. Db2 Analytics Accelerator Loader will not attempt to allocate and load the parameter file.
User response: No action is required.

HLO1829I The $DB2PRMS DD could not be loaded. Using system defaults.
Explanation: An attempt to create and load the //DB2PRMS file was not successful. Installation defaults will be used instead.
User response: No action is required.

HLO1830I The $DB2PRMS DD could not be allocated. Using system defaults.
Explanation: An attempt to create and load the //DB2PRMS file was not successful. Installation defaults will be used instead.
User response: No action is required.
HLO2005E  The number of pages in the incr. image copy is inconsistent with the page size.

Explanation:  The page size you specified is not consistent with the number of pages in the incremental image copy.

User response:  Correct the number of pages specified and resubmit the job.

HLO2006E  An unexpected EOF was encountered on the sorted log records file.

Explanation:  An unexpected end of file was encountered.

User response:  Contact IBM Software Support.

HLO2007E  The selected full IC has a DBID/PSID mismatch to the DB2 catalog.

Explanation:  The DBID/PSID for the selected full image copy does not match those in the Db2 catalog.

User response:  Correct the DBID/PSID for the selected full image copy.

HLO2008I  Number of pages read from the full image copy file(s)=n.

Explanation:  This informational message indicates the number of pages that were read from the full image copy files.

User response:  No action is required.

HLO2009I  Number of pages read from the incremental image copy file(s)=n.

Explanation:  This informational message indicates the number of pages that were read from the incremental image copy data set(s).

User response:  No action is required.

HLO2010I  Number of records read from the log apply file=n.

Explanation:  This informational message indicates the number of pages that were read from the log apply file.

User response:  No action is required.

HLO2011I  Number of pages written to the new full image copy file(s)=n.

Explanation:  This informational message indicates the number of pages that were written to the new full image copy data set(s).

User response:  No action is required.

HLO2012I  Number of pages written to the table/index space file(s)=n.

Explanation:  Indicates the number of pages written to the table/index space files.

User response:  No action is required.

HLO2013I  Since no changes were found for this data set, it has been deleted: dsn

Explanation:  This message appears during dynamic allocation of an output image copy data set and no output was written to that data set. It is similar to the other message that is reported when no output is written to an output image copy data set in JCL.

User response:  No action is required.

HLO2014E  Error to start rebuild indexes thread.

Explanation:  An attempt to start the rebuild indexes process returned an error.

HLO2015E  A open failure occurred on the VSAM I/O module.

Explanation:  An open failure occurred for the VSAM I/O module.

HLO2016E  A close failure occurred on the VSAM I/O module.

Explanation:  A close failure occurred for the VSAM I/O module.

User response:  Contact IBM Software Support.

HLO2017E  A write failure occurred on the VSAM I/O module.

Explanation:  A write failure occurred for the VSAM I/O module.

User response:  Contact IBM Software Support.

HLO2018E  An open for update failure occurred on the VSAM I/O module.

Explanation:  An open failure occurred for the VSAM I/O module.

User response:  Contact IBM Software Support.
A random fetch failure occurred on the VSAM I/O module.

**Explanation:** A fetch failure occurred for the VSAM I/O module.

**User response:** Contact IBM Software Support.

A random write failure occurred on the VSAM I/O module.

**Explanation:** A write failure occurred for the VSAM I/O module.

**User response:** Contact IBM Software Support.

A random close failure occurred on the VSAM I/O module.

**Explanation:** A close failure occurred for the VSAM I/O module.

**User response:** Contact IBM Software Support.

The underlying table/index space data set could not be found in MVS.

**Explanation:** The table/index space could not be found in MVS.

**User response:** No action is required.

Dynamic allocation return code ="return_code".

**Explanation:** This diagnostic message indicates data set allocation failure.

**User response:** Diagnose the problem using the return code. Refer to IBM Knowledge Center for information about Db2 messages and codes.

Object Database=database Space Name=space_name Partition=partition will have an image copy written anyway due to control card FORCE_COPIES.

**Explanation:** Accelerator Loader will write an image copy for the object indicated in the message and override the WRITE_TO_VSAM control card, because the control card FORCE_COPIES has been specified with a value of Y.

**User response:** No action is required. If you do not want an image copy produced, specify FORCE_COPIES N.

A CELL64 free request failed.

**Explanation:** An internal error occurred.

**User response:** Contact IBM Software Support.

Rebuild indexes thread returned error.

**Explanation:** An internal error occurred.

**User response:** Contact IBM Software Support.

Log apply process cancelled by request from task manager.

**Explanation:** An internal error occurred.

**User response:** Contact IBM Software Support.

Space database.spacename Part # number will be written to DSN.

**Explanation:** SWITCH_VCAT keyword in effect, data set name dsn was generated to place WRITE_TO_VSAM result.

**User response:** None.

Data set organization is not VSAM DSN DSN.

**Explanation:** A WRITE_TO_VSAM operation to a specified data set with the REUSE option could not be completed because the data set is not VSAM.

**User response:** Check the data sets that were involved. Contact IBM Software Support.

The LP image copy spanned tape could not be freed for a device switch.

**Explanation:** The dynamic allocation of the image copy data set to the spanned tape failed because the tape could not be freed for a device switch.

**User response:** Verify that the spanned tape is available for allocation.

The initial LP image copy could not be allocated on the tape device.

**Explanation:** The allocation of the image copy data set to the tape device failed.

**User response:** Verify that the tape device is available for allocation.

The LP image copy data set to be created on tape could not be opened.

**Explanation:** The image copy data set that is to be created cannot be opened.

**User response:** Verify that the image copy data set you specified in your Db2 Analytics Accelerator Loader JCL is available for use and resubmit the Db2 Analytics Accelerator Loader job.
**HLO2034E**  The LP image copy could not be allocated to the DASD device.

**Explanation:** The dynamic allocation of the data set to the DASD device failed.

**User response:** Verify that the device name is correct and that it is available for allocation.

**HLO2035E**  The LP image copy data set to be created on DASD could not be opened.

**Explanation:** The image copy data set that is to be created cannot be opened.

**User response:** Verify that the image copy data set you specified in your Db2 Analytics Accelerator Loader JCL is available for use and resubmit the Db2 Analytics Accelerator Loader job.

**HLO2036E**  The spanned LP image copy on tape could not be opened.

**Explanation:** The image copy data set that is to be created cannot be opened.

**User response:** Verify that the image copy data set you specified in your Db2 Analytics Accelerator Loader JCL is available for use and resubmit the Db2 Analytics Accelerator Loader job.

**HLO2037E**  The LB image copy spanned tape could not be freed for a device switch.

**Explanation:** The dynamic allocation of the image copy data set to the spanned tape failed because the tape could not be freed for a device switch.

**User response:** Verify that the spanned tape is available for allocation.

**HLO2038E**  The initial LB image copy could not be allocated onto the tape device.

**Explanation:** The allocation of the image copy data set to the tape device failed.

**User response:** Verify that the tape device is available for allocation.

**HLO2039E**  The LB image copy data set to be created on tape could not be opened.

**Explanation:** The image copy data set that is to be created cannot be opened.

**User response:** Verify that the image copy data set you specified in your Db2 Analytics Accelerator Loader JCL is available for use and resubmit the Db2 Analytics Accelerator Loader job.

**HLO2040E**  The LB image copy could not be allocated to the DASD device.

**Explanation:** The dynamic allocation of the data set to the DASD device failed.

**User response:** Verify that the device name is correct and that it is available for allocation.

**HLO2041E**  The LB image copy data set to be created on DASD could not be opened.

**Explanation:** The image copy data set that is to be created cannot be opened.

**User response:** Verify that the image copy data set you specified in your Db2 Analytics Accelerator Loader JCL is available for use and resubmit the Db2 Analytics Accelerator Loader job.

**HLO2042E**  The spanned LB image copy on tape could not be opened.

**Explanation:** The image copy data set that is to be created cannot be opened.

**User response:** Verify that the image copy data set you specified in your Db2 Analytics Accelerator Loader JCL is available for use and resubmit the Db2 Analytics Accelerator Loader job.

**HLO2043E**  The RP image copy spanned tape could not be freed for a device switch.

**Explanation:** The dynamic allocation of the image copy data set to the spanned tape failed because the tape could not be freed for a device switch.

**User response:** Verify that the spanned tape is available for allocation.

**HLO2044E**  The initial RP image copy could not be allocated onto the tape device.

**Explanation:** The allocation of the image copy data set to the tape device failed.

**User response:**Verify that the tape device is available for allocation.

**HLO2045E**  The RP image copy data set to be created on tape could not be opened.

**Explanation:** The image copy data set that is to be created cannot be opened.

**User response:** Verify that the image copy data set you specified in your Db2 Analytics Accelerator Loader JCL is available for use and resubmit the Db2 Analytics Accelerator Loader job.
**HLO2046E** The RP image copy could not be allocated to the DASD device.

**Explanation:** The dynamic allocation of the data set to the DASD device failed.

**User response:** Verify that the device name is correct and that it is available for allocation.

---

**HLO2047E** The RP image copy data set to be created on DASD could not be opened.

**Explanation:** The image copy data set that is to be created cannot be opened.

**User response:** Verify that the image copy data set you specified in your Db2 Analytics Accelerator Loader JCL is available for use and resubmit the Db2 Analytics Accelerator Loader job.

---

**HLO2048E** The spanned RP image copy on tape could not be opened.

**Explanation:** The image copy data set that is to be created cannot be opened.

**User response:** Verify that the image copy data set you specified in your Db2 Analytics Accelerator Loader JCL is available for use and resubmit the Db2 Analytics Accelerator Loader job.

---

**HLO2049E** The RB image copy spanned tape could not be freed for a device switch.

**Explanation:** The dynamic allocation of the image copy data set to the spanned tape failed because the tape could not be freed for a device switch.

**User response:** Verify that the spanned tape is available for allocation.

---

**HLO2050E** The initial RB image copy could not be allocated onto the tape device.

**Explanation:** The allocation of the image copy data set to the tape device failed.

**User response:** Verify that the tape device is available for allocation.

---

**HLO2051E** The RB image copy data set to be created on tape could not be opened.

**Explanation:** The image copy data set that is to be created cannot be opened.

**User response:** Verify that the image copy data set you specified in your Db2 Analytics Accelerator Loader JCL is available for use and resubmit the Db2 Analytics Accelerator Loader job.

---

**HLO2052E** The RB image copy could not be allocated to the DASD device.

**Explanation:** The dynamic allocation of the data set to the DASD device failed.

**User response:** Verify that the device name is correct and that it is available for allocation.

---

**HLO2053E** The RB image copy data set to be created on DASD could not be opened.

**Explanation:** The image copy data set that is to be created cannot be opened.

**User response:** Verify that the image copy data set you specified in your Db2 Analytics Accelerator Loader JCL is available for use and resubmit the Db2 Analytics Accelerator Loader job.

---

**HLO2054E** The spanned RB image copy on tape could not be opened.

**Explanation:** The image copy data set that is to be created cannot be opened.

**User response:** Verify that the image copy data set you specified in your Db2 Analytics Accelerator Loader JCL is available for use and resubmit the Db2 Analytics Accelerator Loader job.

---

**HLO2055I** A volume written to and left on the system could not be found.

**Explanation:** When Accelerator Loader finishes writing to a tape data set, the tape cartridge is not rewound and ejected. It is left on the tape drive in case another data set needs to be written afterwards. Once any one data set is written, it is closed and code then goes back and reads internal MVS control blocks to get specifics about that data set. If this subsequent code cannot find the data set just written and closed, the error occurs.

**User response:** Contact IBM Software Support.

---

**HLO2057E** The following mini log data set could not be deallocated from OS/390.

**Explanation:** The mini log data set could not be deallocated from OS/390 and could therefore not be used in Db2 Analytics Accelerator Loader processing. This message is followed by HLO2060I which displays the name of the mini log data set that could not be deallocated.

**User response:** Verify that the mini log data set is available for use.
### HLO2058E
The following mini log data set could not be opened:

**Explanation:** The mini log data set could not be opened and could therefore not be used in HLO processing. This message is followed by HLO2060I which displays the name of the mini log data set that could not be opened.

**User response:** Verify that the mini log data set is available for use.

### HLO2059E
The following mini log data set could not be allocated:

**Explanation:** The mini log data set could not be allocated and could therefore not be used in Db2 Analytics Accelerator Loader processing. This message is followed by HLO2060I which displays the name of the mini log data set that could not be allocated.

**User response:** Verify that the mini log data set is available for use.

### HLO2060E
`dsname`

**Explanation:** This message displays a data set name that is associated with other messages.

**User response:** No action is required.

### HLO2061I
The mini log file `filename` has been processed.

**Explanation:** The mini log indicated in the messages has been processed.

**User response:** No action is required.

### HLO2062I
HLO will attempt to use the MINI_LOG_DSN_2 data set instead.

**Explanation:** Db2 Analytics Accelerator Loader was unable to use the MINI_LOG_DSN_1 data set so it will now attempt to use the MINI_LOG_DSN_2 data set.

**User response:** No action is required.

### HLO2063E
A corrupted row was found in the mini log control table.

**Explanation:** Db2 Analytics Accelerator Loader was unable to use the mini log control table due to a corrupted row.

**User response:** No action is required.

### HLO2064E
Both mini log data sets for this space could not be opened.

**Explanation:** Db2 Analytics Accelerator Loader attempted to open both mini log data sets for the space but was unable to do so.

**User response:** Verify that the mini log data sets are available for use.

### HLO2066E
An unexpected EOF was encountered on a merged mini log records file.

**Explanation:** Db2 Analytics Accelerator Loader encountered an unexpected EOF on a merged mini log record file.

**User response:** No action is required.

### HLO2067E
`XLAT_DSN <DSN>` will be used for `<XLAT_TARGET>`

**Explanation:** `XLAT_DSN <DSN>` was not found and there is no `XLAT_VSAM` or `XLAT_COPY` specified. `XLAT_TARGET` will be determined by format of DSN. So if DSN conforms to Db2 space name format, new VSAM data set will be allocated, if not new sequential data set will be allocated.

**User response:** No action is required.

### HLO2068E
The XML sequence number update process failed.

**Explanation:** Coordinating the internal XML sequence number during OBIDXLAT processing could not be completed.

**User response:** Contact IBM Software Support.

### HLO2069I
The space `space` resulted in the error condition.

**Explanation:** Generic message that follows many other error messages.

**User response:** No action is required.

### HLO2070E
The alternative SSID XML sequence column update program failed.

**Explanation:** Coordinating the internal XML sequence number during OBIDXLAT processing could not be completed.

**User response:** Contact IBM Software Support.

### HLO2071E
An XML update job is needed, but the XML output DSN is missing.

**Explanation:** The XML output DSN was not specified.

**User response:** Specify an XML output DSN.

### HLO2072E
An XML update job is needed, but the XML output prefix is missing.

**Explanation:** The XML output prefix was not specified.

**User response:** Specify the XML output prefix.
HLO2073E  An XML update job is needed, but the XML template DSN is missing.
Explanation: The XML template DSN was not specified.
User response: Specify an XML template DSN.

HLO4504E  The XML template data set could not be allocated.
Explanation: Unable to allocate the needed DSN.
User response: Make sure the DSN exists and is accessible.

HLO2075E  Control file loadlib information could not be obtained for ssid
Explanation: The control file is not up to date with this Db2 SSID.
User response: Update it via setup option 0.

HLO2076E  The XML template data set could not be opened.
Explanation: The data set was allocated but could not be opened.
User response: Contact IBM Software Support.

HLO2077E  The XML job output data set/member could not be allocated.
Explanation: The supplied data set could not be allocated.
User response: Make sure authority exists to allocate.

HLO2081I  The SPACE(...) set involved that the error was detected in was spaceSetnumber
Explanation: Generic message that follows many other messages.
User response: No action is required.

HLO2082E  The XML target SSID/DBname/TName control cards are missing.
Explanation: Missing control cards in the Space(...) set.
User response: No action is required.

HLO2083E  The XML target SSID/DBname/TName control cards are invalid.
Explanation: Syntax error in control cards.
User response: Correct the syntax.

HLO2084I  XML update job created for SSID='ssid'.
Explanation: The job has been created.
User response: No action is required.

HLO2085E  No references to subsystem could not be found in the JES SSCT.
Explanation: The specified Db2 SSID is not defined to z/OS.
User response: Ensure that the name is correct or contact IBM Software Support.

HLO2086E  The sorted log file could not be allocated.
Explanation: An allocation error has occurred.
User response: Verify that the proper authorization is set.

HLO2087E  The sorted log file could not be opened.
Explanation: After allocating, could not open.
User response: Ensure proper authorization exists, or contact IBM Software Support.

HLO2088E  A log record page number exceeded the extent size boundary.
Explanation: A Db2 internal error occurred. The page number encoded into the log record points beyond the number of allowable pages for a Db2 extent.
User response: Send the dump and any table space / table creation details to IBM Software Support.
**HLO2089E**  The XML template member does not exist in the PDS.

**Explanation:** The template name specified does not exist.

**User response:** Verify the PDS member names and data set names involved.

**HLO2090E**  The incoming FTRB LCB is corrupt.

**Explanation:** An internal error occurred.

**User response:** Contact IBM Software Support.

**HLO2091E**  The mini log data set minilog_dsname could not be allocated.

**Explanation:** The mini log data set could not be allocated and therefore could not be used in Db2 Analytics Accelerator Loader processing.

**User response:** Verify that the mini log data set is available for use.

**HLO2092E**  The mini log data set minilog_dsname could not be opened.

**Explanation:** The mini log data set could not be opened and therefore could not be used in Db2 Analytics Accelerator Loader processing.

**User response:** Verify that the mini log data set is available for use.

**HLO2095I**  The sort of the applicable log records was successful.

**Explanation:** This message indicates that the sort of the applicable log records completed without error.

**User response:** No action is required.

**HLO2097E**  The allocate cellpool request for accelerator buffers failed.

**Explanation:** An out of memory or internal error occurred.

**User response:** Verify region=0M on job step. Contact IBM Software Support.

**HLO2098E**  An invalid return code was detected from the SORT program.

**Explanation:** This attempt to SORT returned an error.

**User response:** Verify SORT program error messages. Contact IBM Software Support.

**HLO2099E**  Invalid image copy DSN: image_copy_dsname

**Explanation:** This message indicates that an error occurred when trying to process the image copy.

**User response:** Verify that the image copy specified in the message is available for use. If the problem persists, contact IBM Software Support.

**HLO2100I**  The following objects will not be added to the SYSCOPY DB2 table because a UNIFIED check failed, updates could not be found either in incremental image copies or the log(s), OBID translation took place on the image copy, or an error triggering a skip condition to be placed on the object:

**Explanation:** The objects listed in the message will not be added to the SYSCOPY Db2 table. A UNIFIED check failed or updates could not be located.

**User response:** No action is required.

**HLO2101I**  The following data set information was added to the SYSCOPY DB2 table:

**Explanation:** This message indicates the data set information that was added to the SYSCOPY Db2 table.

**User response:** No action is required.

**HLO2102I**  The following data set information would have been added to the SYSCOPY DB2 table but was not because of control card NO_SYSCOPY_ROW:

**Explanation:** You specified the NO_SYSCOPY_ROW in your Db2 Analytics Accelerator Loader JCL so the data set information that would have otherwise been added to the SYSCOPY Db2 table was not added.

**User response:** No action is required.

**HLO2103I**  Object: object Database database Table space table_space Partition partition ICBackup

**Explanation:** This message, in conjunction with messages HLO2100, HLO2101, or HLO2102I, indicates the database affected by the condition described in the associated message.

**User response:** No action is required.

**HLO2104I**  DSN: ICBackup ()

**Explanation:** This is a continuation of message HLO2103I.

**User response:** No action is required.
HLO2105I  Since no changes were found for this data set, it has been deleted.
Explanation: An output image copy data set (like CPLP0001) is set to catalog as normal disposition (as disp=(new,catlg,delete)), but in the course of processing, there was no reason to output the new data set (no log records, no increments). No records are written to the file, so the normal disposition for the data set is overridden to "delete".
User response: No action is required.

HLO2106I  The following partial recovery information was added to the SYSCOPY DB2 table:
Explanation: This message precedes an output of the partial recovery information that was added to the SYSCOPY DB2 table.
User response: No action is required.

HLO2107I  Even though NO_SYSCOPY_ROW was specified for this run, the following partial recovery information was added to the SYSCOPY DB2 table:
Explanation: This message precedes an output of the partial recovery information that was added to the SYSCOPY DB2 table.
User response: No action is required.

HLO2108I  Object: object Database: database Table Space: table_space Partition: partition PIT LRSN/RBA X" Starting LRSN/RBA X"
Explanation: This message indicates the object, database, table space, partition, PIT, LRSN/RBA and starting LRSN/RBA information.
User response: No action is required.

HLO2109E  The following tape data set could not be cataloged: dsn
Explanation: Normally, JCL end step disposition processing catalogs a data set, if desired. This message displays if Db2 Analytics Accelerator Loader has made a catalog attempt against a tape data set that has failed due to control card and dynamic allocation processing.
User response: No action is required.

HLO2110I  The following tape data set was cataloged: Unit (X"device_code") DSN: dsn Sequence: label#
Explanation: When the catalog attempt against a tape data set is successful, this message is displayed. The unit is the actual 8 character device on which the data set was created. The device_code is a 4-byte hexadecimal number that represents the internal MVS device designation. The dsn is the data set name cataloged. The label# is the file sequence number of the data set on the stacked tape. The volsers are reported by the tape management facility elsewhere in the job output.
User response: No action is required.

HLO2200I  The following data set information was added to the HLO mini log table:
Explanation: This informational message indicates the data set information that was added to the Db2 Analytics Accelerator Loader mini log table. This message is used in conjunction with HLO2201I, HLO2202I, HLO2203I, and HLO2204I.
User response: No action is required.

HLO2201I  Database database Table Space table_space Partition partition
Explanation: The content of this message is used in conjunction with message HLO2200I. The database, table space, and partition indicated in this message correspond to those of the data set added to the Db2 Analytics Accelerator Loader mini log table.
User response: No action is required.

HLO2202I  DSN:
Explanation: The content of this message is used in conjunction with message HLO2200I. The DSN indicated in this message correspond to those of the data set added to the Db2 Analytics Accelerator Loader mini log table.
User response: No action is required.

HLO2203I  Begin LRSN/RBA: X" End LRSN/RBA: X"
Explanation: The content of this message is used in conjunction with message HLO2200I. The begin LRSN/RBA indicated in this message corresponds to that of the data set added to the Db2 Analytics Accelerator Loader mini log table.
User response: No action is required.

HLO2204I  ()
Explanation: The content of this message is used in conjunction with message HLO2200I. The end LRSN/RBA indicated in this message corresponds to that of the data set added to the Db2 Analytics Accelerator Loader mini log table.
User response: No action is required.
HLO2205E The ENQ prior to Insert activity on the Minilog Control Table failed.

**Explanation:** Another Db2 Analytics Accelerator Loader job is running in the mini log control table update phase that has exclusive control of the minilog control table. The system could not serialize this action and aborted. No updates took place.

**User response:** Ensure that no other mini log create Db2 Analytics Accelerator Loader jobs are running and resubmit the job.

HLO2206I The following data set information was updated to the HLO mini log table:

**Explanation:** This message indicates the data set information that was added to the Db2 Analytics Accelerator Loader mini log table.

**User response:** No action is required.

HLO2300E An internal error occurred unloading a mini log data set.

**Explanation:** An internal error occurred.

**User response:** Contact IBM Software Support.

HLO2301E The following mini log data set could not be deallocated from OS/390:

**Explanation:** The specified mini log data set could not be deallocated from OS/390.

**User response:** Verify that you have specified the correct mini log data set name generation string.

HLO2302E The following mini log data set could not be opened:

**Explanation:** The specified mini log data set could not be opened.

**User response:** Verify that the file is not in use and that you have the proper authority to access this file.

HLO2303E The following mini log data set could not be allocated:

**Explanation:** The specified mini log data set could not be allocated.

**User response:** Verify that the file is not in use and that you have the proper authority to access this file.

HLO2304I *dsn*

**Explanation:** Indicates the mini log DSN. This message is issued in conjunction with message HLO2303I.

**User response:** No action is required.

HLO2305I Dynamic allocation return code = 'return_code'

**Explanation:** This diagnostic message indicates data set allocation failure.

HLO2306E The CELL64 service could not be initialized.

**Explanation:** An internal error occurred.

**User response:** Contact IBM Software Support.

HLO2307E A get cell function call failed.

**Explanation:** An internal error occurred.

**User response:** Contact IBM Software Support.

HLO2310I The mini log file: mini_log_file has been processed.

**Explanation:** This message indicates the mini log file that has been processed.

**User response:** No action is required.

HLO2311I HLO will attempt to use the MINI_LOG_DSN_2 data set instead.

**Explanation:** Db2 Analytics Accelerator Loader was unable to use the MINI_LOG_DSN_1 data set specified in your JCL so it will attempt to use the MINI_LOG_DSN_2 data set specified in your data set instead.

**User response:** No action is required.

HLO2312E A space level mini log DSN has the same name as a group level mini log DSN.

**Explanation:** Different groups of spaces in the log apply control card have the same mini log data set specified.

**User response:** Adjust the naming in the control cards.

HLO2313E Mini log data set *dsn* could not be appended because a gap is found for the object in the mini log control table.

**Explanation:** There is a gap for the object in the mini log chain in the mini log control table. For this reason, the mini log data set indicated in the message could not be appended.

**User response:** To resolve this issue, either remove the mini log DSN from the mini log control table and MVS
catalog or specify a new DSN for the mini log.

HLO2400E The accelerator conversion program could not be attached.

Explanation: A z/OS attach function for the row converter program failed.

User response: Verify the install in the STEPLIB. Contact IBM Software Support.

HLO2401E The space space PART part has an unknown space status.

Explanation: This message ensures that the indicated space is to be stopped before proceeding with the WRITE_TO_VSAM process. Db2 Analytics Accelerator Loader checks the space with a call similar to a ‘display db(dbname) spacename(tsnamed) part(0)’ to verify that the space is in ‘stop’ status. This message displays when the space comes back with a status not equal to RO, STOP, RW, or UT.

User response: Stop the indicated space before attempting to proceed with the WRITE_TO_VSAM process.

HLO2402E The stop status check for space space PART part timed out.

Explanation: This message is output when Db2 Analytics Accelerator Loader tries to start and it has to ensure that when doing WRITE_TO_VSAM processing that the spaces are indeed stopped. The stop step that is generated (prior to Db2 Analytics Accelerator Loader) to do this sends commands to Db2 to stop the data sets, but it does not wait for the spaces to actually stop. If an in-flight URID is processing against the object and the stop is done, the space changes to ‘STopp’ or stop pending until the URID finishes. It may also take Db2 some time to flush buffers. In either case, Db2 Analytics Accelerator Loader does a check on the spaces before doing any real processing. If any of the spaces do not come back ‘stop,’ it waits a few seconds and checks again. After a few checks like this, it aborts, producing this message.

User response: Diagnose why the space will not stop.

HLO2500E Fetching SYSIBM.SYSLGRNX data produced an error

Explanation: Accelerator Loader encountered an error when attempting to fetch SYSIBM.SYSLGRNX data.

User response: No action is required. The report utility’s output will be output after this message.

HLO2501E REPORT utility text follows: text

Explanation: This message is the header line for the REPORT utility output that follows on the next line.

User response: No action is required.

HLO2502I Skipping SYSIBM.SYSLGRNX processing.

Explanation: This informational message indicates that Db2 Analytics Accelerator Loader is not processing SYSIBM.SYSLGRNX because NO_SYSLGRNX was specified.

User response: No action is required.

HLO2503I Fetching SYSIBM.SYSLGRNX data by SQL produced an error. Trying to use REPORT utility.

Explanation: Db2 Analytics Accelerator Loader could not fetch object log ranges from the SYSIBM.SYSLGRNX directory table. The SYSIBM.SYSLGRNX table requires Db2 V10 NFM or above. Verify that you have the required Db2 version, so the REPORT utility can be used.

User response: It is recommended that you upgrade to Db2 V10 NFM or above. Doing so can improve performance when running jobs with many objects and log range rows.

HLO2504E Control file values could not be read. Check for a user indicator mismatch.

Explanation: Db2 Analytics Accelerator Loader could not read the control file values.

User response: Check for a user indicator mismatch.

HLO2507I No SYSLOGRANGE data present for the objects.

Explanation: This informational message is displayed in a Db2 V11 plus system when no SYSLOGRANGE data is available. Processing continues.

User response: No action is required.

HLO2600E The USER_INDICATOR parameter was specified, but no value was found with it.

Explanation: No value has been specified for the USER_INDICATOR parameter.

User response: Specify a valid parameter for the USER_INDICATOR parameter.

</tr>
</tbody>
</table>
The IMAGE_COPY_PREFERENCE parameter specified is invalid.

Explanation: The IMAGE_COPY_PREFERENCE parameter specification in your Accelerator Loader job is not valid.

User response: Specify a valid value for the IMAGE_COPY_PREFERENCE parameter.

LOCAL_SITE, RECOVERY_SITE, and IMAGE_COPY_PREFERENCE are mutually exclusive.

Explanation: Your Accelerator Loader syntax includes more than one of the following parameters: LOCAL_SITE, RECOVERY_SITE, or IMAGE_COPY_PREFERENCE. These parameters are mutually exclusive and only one can be defined.

User response: Correct your Db2 Analytics Accelerator Loader syntax.

Invalid syntax after the IC_LP control card. Must be IC_LP (...).

Explanation: The syntax that follows the IC_LP control card contains an error.

User response: Verify that the correct syntax follows the IC_LP control card. The parameters that accompany the IC_LP control card must be enclosed in parenthesis ( ).

Invalid syntax after the IC_LB control card. Must be IC_LB (...).

Explanation: The syntax that follows the IC_LB control card contains an error.

User response: Verify that the correct syntax follows the IC_LB control card. The parameters that accompany the IC_LB control card must be enclosed in parenthesis ( ).

Invalid syntax after the IC_RP control card. Must be IC_RP (...).

Explanation: The syntax that follows the IC_RP control card contains an error.

User response: Verify that the correct syntax follows the IC_RP control card. The parameters that accompany the IC_RP control card must be enclosed in parenthesis ( ).

Invalid syntax after the IC_RB control card. Must be IC_RB (...).

Explanation: The syntax that follows the IC_RB control card contains an error.

User response: Verify that the correct syntax follows the IC_RB control card. The parameters that accompany the IC_RB control card must be enclosed in parenthesis ( ).

The IC_DSN keyword has already been coded.

Explanation: You specified the IC_DSN keyword more than once for the SPACE group.

User response: Correct the JCL and resubmit the job.

Syntax error around IC_DSN value. Form is "dsn".

Explanation: The syntax defining the IC_DSN value is incorrect. The data set name must be enclosed in quotes.

User response: Verify and correct the syntax of the IC_DSN value. Ensure that the data set name is enclosed in quotes.

The IC_DSN parameter was specified, but is either empty or too long.

Explanation: You specified the IC_DSN parameter but the values specified with it is either missing or too long.

User response: Specify a valid value with the IC_DSN parameter. Ensure that the data set name value you specify is enclosed in quotes.

The IC_CATALOG keyword has already been coded.

Explanation: You specified the IC_CATALOG keyword more than once for the IC_** group (where ** is LP, LB, RP or RB).

User response: Correct the JCL and resubmit the job.

The ICDEVICE parameter was specified, but no value was found with it.

Explanation: You specified the ICDEVICE parameter but did not specify a corresponding value. The ICDEVICE parameter requires that you specify a device name (up to 8-characters).

User response: Specify a 1-8 character device name with the ICDEVICE parameter or remove the optional ICDEVICE parameter.

The ICDEVICE keyword has already been coded.

Explanation: You specified the ICDEVICE keyword more than once for the IC_** group (where ** is LP, LB, RP or RB).

<td></td>
</tr>
</tbody>
</table>
User response: Correct the JCL and resubmit the job.

HLO2642E The IC_STOR_CLASS parameter specified is invalid.
Explanation: The IC_DATA_CLASS parameter syntax contains an error.
User response: Verify that you have properly defined the IC_STOR_CLASS parameter and corresponding value.

HLO2643E The IC_EXP_DATE parameter was specified, but no value was found with it.
Explanation: You specified the IC_EXP_DATE parameter but did not specify a corresponding value. The IC_EXP_DATE parameter requires that you specify an expiration date in the format YYYYDDD.
User response: Specify an expiration date with the IC_EXP_DATE parameter or remove the optional IC_EXP_DATE parameter.

HLO2644E The IC_EXP_DATE keyword has already been coded.
Explanation: You specified the IC_EXP_DATE keyword more than once for the IC_** group (where ** is LP, LB, RP or RB).
User response: Correct the JCL and resubmit the job.

HLO2645E The IC_EXP_DATE parameter specified is invalid.
Explanation: The IC_EXP_DATE parameter syntax contains an error.
User response: Verify that you have properly defined the IC_EXP_DATE parameter and corresponding value.

HLO2646E The IC_RETPD parameter was specified, but no value was found with it.
Explanation: You specified the IC_RETP parameter but did not specify a corresponding value. The IC_RETP parameter requires that you specify a 4-digit retention period.
User response: Specify a retention period (4-digit) with the IC_RETP parameter or remove the optional IC_RETP parameter.

HLO2647E The IC_RETPD keyword has already been coded.
Explanation: You specified the IC_RETPD keyword more than once for the IC_** group (where ** is LP, LB, RP or RB).
User response: Correct the JCL and resubmit the job.

HLO2648E The IC_RETPD parameter specified is invalid.
Explanation: The IC_RETPD parameter syntax contains an error.
User response: Verify that you have properly defined the IC_RETPD parameter and corresponding value.

HLO2649E DASD and tape allocation parameters cannot be specified together.
Explanation: You specified both DASD and TAPE allocation parameters.
User response: Specify only DASD or TAPE allocation parameters but not both.

HLO2650E Five or more errors have been detected in the control cards.
Explanation: More than five errors have been identified in the control cards and Accelerator Loader processing cannot proceed.
User response: Verify the syntax of your Accelerator Loader JCL and respecify as needed to correct syntax errors.

HLO2651E The Restore Before parameter was specified but no value was found with it.
Explanation: You specified the RESTORE_BEFORE parameter but did not specify a corresponding value.
User response: Specify a byte string with the RESTORE_BEFORE parameter. Enclose the bytes string in single quotes.

HLO2652E Syntax error around Restore Before RBA value. Form is X’<6 byte hex value>’.
Explanation: The RESTORE_BEFORE parameter syntax contains an error.
User response: Verify that you have properly defined the RESTORE_BEFORE parameter and corresponding value.

HLO2653E The Restore Before RBA value contains an invalid hexadecimal value.
Explanation: The hexadecimal value you specified with the RESTORE_BEFORE parameter is not valid.
User response: Verify that you have properly defined a 6-byte hexadecimal value for the RESTORE_BEFORE parameter.
HLO2654E • HLO2665E

HLO2654E  The Restore Before RBA value cannot be 0.
Explanation: You specified a value of 0 for the RESTORE_BEFORE parameter. This is not valid.
User response: Specify a 6-byte hexadecimal value for the desired RBA or LRSN or remove the optional RESTORE_BEFORE parameter.

HLO2655E  The Restore Before RBA/LRSN value was already specified.
Explanation: You specified the RESTORE_BEFORE parameter more than once.
User response: Correct the JCL and resubmit the job.

HLO2656E  Invalid TO_QUIESCE(#nnn) control card syntax.
Explanation: The TO_QUIESCE syntax contains an error.
User response: Verify that you have properly defined the TO_QUIESCE(#nnn) parameter.

HLO2657E  The TO_QUIESCE keyword has already been coded for this group.
Explanation: The TO_QUIESCE keyword was coded more than once for the group.
User response: Remove the extra TO_QUIESCE keywords.

HLO2658E  The UNIFIED keyword has already been coded for this group.
Explanation: The UNIFIED keyword has already been coded for this group.
User response: Remove the extra UNIFIED keywords.

HLO2659E  The UNIFIED keyword has already been coded for this space group.
Explanation: You specified the UNIFIED keyword more than once for the SPACE group.
User response: Remove the extra UNIFIED keywords from the SPACE group.

HLO2660E  The NO_SYSLGNRX keyword has already been coded for this run.
Explanation: The NO_SYSLGNRX keyword was coded more than once for the run.
User response: Remove the extra NO_SYSLGNRX keywords.

HLO2661E  Mini log particulars cannot be specified at both the GROUP and SPACE levels.
Explanation: Mini log control cards are valid for specification either at the GROUP or the SPACE level, not both.
User response: Specify mini log parameters either at the GROUP or SPACE level but not both.

HLO2662E  The NO_MINILOG_CHECKPOINTS keyword is ignored when not writing minilogs.
Explanation: The NO_MINILOG_CHECKPOINTS keyword was specified but the job did not specify to write mini logs so it was ignored.
User response: No action is required.

HLO2663E  The USE_ABOVE_THE_BAR parameter was specified, but no value was found with it.
Explanation: You specified the USE_ABOVE_THE_BAR parameter but did not include a primary segments allocation, secondary segments allocation, and maximum secondary allocation values.
User response: The primary segments allocation, secondary segments allocation, and maximum secondary allocation values must be 1-4 digits and contained within single quotes and be separated by commas. Specify the appropriate segment allocations with the USE_ABOVE_THE_BAR parameter.

HLO2664E  The USE_ABOVE_THE_BAR keyword has already been coded.
Explanation: The USE_ABOVE_THE_BAR keyword should only be specified once.
User response: Check your Db2 Analytics Accelerator Loader syntax and remove the extra USE_ABOVE_THE_BAR keyword.

HLO2665E  The USE_ABOVE_THE_BAR keyword parameter specified is invalid.
Explanation: The USE_ABOVE_THE_BAR parameter syntax is invalid. The primary segments allocation, secondary segments allocation, and maximum secondary allocation values must be 1-4 digits and contained within single quotes and be separated by commas.
User response: Check your syntax and correct.
HLO2666E Use of the USE_ABOVE_THE_BAR keyword requires z/OS V1.5 or above.

Explanation: Your z/OS version is not 1.5 or above, z/OS V1/5 or above is required for you to use the USE_ABOVE_THE_BAR keyword.

User response: Remove the USE_ABOVE_THE_BAR keyword from your syntax.

HLO2667E The MINILOG_SHARELEVEL was specified, but no value was found with it.

Explanation: You specified the MINILOG_SHARELEVEL parameter but did not specify a corresponding value.

User response: Enter a valid value following the MINILOG_SHARELEVEL keyword or remove the keyword. Valid values are REFERENCE and CHANGE.

HLO2668E The MINILOG_SHARELEVEL keyword has already been coded.

Explanation: You specified the MINILOG_SHARELEVEL keyword more than once.

User response: Remove all extra occurrences of the MINILOG_SHARELEVEL keyword.

HLO2669E The MINILOG_SHARELEVEL parameter specified is invalid.

Explanation: The MINILOG_SHARELEVEL parameter specification is not valid.

User response: The MINILOG_SHARELEVEL parameter accepts either REFERENCE or CHANGE as valid values. Correct your JCL and resubmit.

HLO2670I The MINILOG_SHARELEVEL keyword is ignored when not producing mini logs.

Explanation: You included the MINILOG_SHARELEVEL keyword in your JCL indicating the type of SHARELEVEL for mini logs but did not specify the production of producing mini logs. The MINILOG_SHARELEVEL keyword is therefore ignored.

User response: No action is required.

HLO2671E The REPAIR_RECOVER_PENDING keyword has already been coded.

Explanation: You specified the REPAIR_RECOVER_PENDING keyword more than once.

User response: Correct the JCL and resubmit the job.

HLO2672W The REPAIR_RECOVER_PENDING keyword is ignored when only writing to copies.

Explanation: The REPAIR_RECOVER_PENDING keyword is specified but this parameter is ignored when writing to copies.

User response: REPAIR_RECOVER_PENDING is ignored when writing to copies so the REPAIR_RECOVER_PENDING control card can be removed.

HLO2673E The OBIDXLAT keyword group has already been coded.

Explanation: You specified the OBIDXLAT keyword more than once.

User response: Correct the JCL and resubmit the job.

HLO2675E Invalid OBIDXLAT(...) keyword syntax.

Explanation: The OBIDXLAT syntax you specified is not valid.

User response: Correct the OBIDXLAT syntax and resubmit the job.

HLO2676E The XLAT_IN_DSN keyword has already been coded.

Explanation: You specified the XLAT_IN_DSN keyword more than once.

User response: Correct the JCL and resubmit the job.

HLO2677E Invalid XLAT_IN_DSN syntax.

Explanation: The XLAT_IN_DSN syntax you specified is not valid.

User response: Correct the XLAT_IN_DSN syntax and resubmit the job.

HLO2678E The XLAT_IN_DSN parameter was specified, but no value was found with it.

Explanation: The XLAT_IN_DSN parameter requires that a dsn value be specified with it.

User response: Specify a dsn with the XLAT_IN_DSN parameter. Enclose the dsn value in single quotes.

HLO2679E Invalid OBID syntax.

Explanation: The OBID syntax you specified is not valid.

User response: OBID syntax is of the form OBID 'obid,obid'.
Note: When specifying OBID pairs, all pairs should be space separated and the source ID is listed first with the target ID listed second. Each pair should be defined on a new line. Define multiple OBID pairs as necessary.

HLO2680E  The OBID parameter was specified, but no value was found with it.

Explanation: The OBID parameter requires that you specify with it an obid pair.

User response: Correct the JCL and resubmit the job.

HLO2681E  The OBID parameter was specified, but one of the subparms was out of range.

Explanation: The OBID subparameter you specified was out of range.

User response: Verify that you specified the correct OBID pair.

HLO2682E  DB2 Sort was called for, but was not found in z/OS.

Explanation: The control file options set by the setup screens are calling for Db2 Sort. An attempt to load Db2 Sort failed.

User response: Verify the STEPLIB for Db2 Sort.

HLO2683E  Parallel log apply values greater than 1 ignored in minilog mode.

Explanation: If mini log processing is called for in multiple groups, the optimization process will be skipped.

User response: No action is required.

HLO2684E  If manual group configurations are used, parallel log apply value is ignored.

Explanation: If there are multiple GROUP(...) control card sets as input, that organization will be used for parallel task organization instead of any internal optimization of group structure based on the parallel log apply value.

User response: No action is required.

HLO2692E  The DBID keyword has already been coded.

Explanation: The DBID keyword group has already been coded.

User response: Correct the JCL and resubmit the job.

HLO2693E  Invalid DBID syntax.

Explanation: The DBID syntax you specified is not valid.

User response: Correct the DBID syntax and resubmit the job.

HLO2694E  The DBID parameter was specified, but no value was found with it.

Explanation: The DBID parameter requires that a source and target DBID pair be specified with it.

User response: Correct the DBID syntax and resubmit the job.

HLO2695E  The DBID parameter was specified, but one of the subparms was out of range.

Explanation: The DBID parameter you specified but one of the sub parameters defined with it was out of range.

User response: Verify that you specified the correct DBID pair.

HLO2696E  The PSID keyword has already been coded.

Explanation: The PSID keyword has already been coded.

User response: Correct the JCL and resubmit the job.

HLO2697E  Invalid PSID syntax.

Explanation: The PSID syntax you specified is not valid.

User response: Correct the PSID syntax and resubmit the job.

HLO2698E  The PSID parameter was specified, but no value was found with it.

Explanation: The PSID parameter requires that a source and target PSID pair be specified with it.

User response: Correct the PSID syntax and resubmit the job.
The PSID parameter was specified, but one of the subparms was out of range.

**Explanation:** The PSID subparameter was out of range.

**User response:** Verify that you specified the correct PSID pair.

A needed incremental image copy could not be allocated.

**Explanation:** A required incremental image copy could not be allocated.

**User response:** Verify that the image copy is available.

A needed incremental image copy could not be opened.

**Explanation:** Db2 Analytics Accelerator Loader processing could not proceed because an incremental image copy could not be opened.

**User response:** Verify that all necessary incremental image copies are available for use.

Dynamic allocation return code 'rc'.

**Explanation:** Dynamic allocation failed with the return code indicated in the message.

Image copy name=image_copy_name RBA='rba'.

**Explanation:** Indicates the image copy name an RBA.

**User response:** No action is required.

The catalog check on the most recent image copy failed.

**Explanation:** The catalog check failed for the most recent image copy.

**User response:** No action is required.

An internal error occurred during input incremental tape stacking processing.

**Explanation:** An internal error occurred.

**User response:** Contact IBM Software Support.

The log apply process will begin at RBA='rba'.

**Explanation:** The log apply process will start at the RBA indicated in the message.

**User response:** No action is required.
HLO2807I  The log apply process will begin at LRSN: X'\text{lrsn}'.

Explanation: The message indicates the LRSN value at which the log apply process will begin.
User response: No action is required.

HLO2812E  A mismatch between passed Zparm information and the JES SSCT was found.

Explanation: This is an internal error indicating that the Zparm array that is being passed to Db2 Analytics Accelerator Loader is inconsistent with the subsystem list found inside MVS data structures.
User response: Contact IBM Software Support.

HLO2813I  The log reader process will launch a total of nnnn tasks.

Explanation: This message indicates the total number of tasks that will be launched.
User response: No action is required.

HLO2814I  The log reader will launch total of 1 task per member.

Explanation: Indicates that processing of the log reader will launch a total of one task per member since PARALLEL has been set to 0.
User response: No action is required.

HLO2815I  The log reader process will start with PARALLEL tasks = nnnn

Explanation: The log reader process will start with the indicated maximum number of tasks.
User response: No action is required.

HLO2816I  The log reader task #task_number finished.

Explanation: Indicates that processing of the log reader finished.
User response: No action is required.

HLO2817E  The log reader task init failed. RC=X''\text{return_code}'

Explanation: The log apply processing failed to initialize a task necessary for reading logs. The reason code is specified in the error message.
User response: Contact IBM Software Support.

HLO2900I  The sorted log record file could not be opened.

Explanation: The sorted log record file could not be opened.
User response: No action is required.

HLO2901I  The mini log data set data_set could not be allocated.

Explanation: The mini log data set could not be allocated.
User response: No action is required.

HLO2902I  The mini log data set dsn could not be opened.

Explanation: Db2 Analytics Accelerator Loader was unable to open the mini log data set indicated in the message.
User response: No action is required.

HLO2903I  Dynamic allocation return code=rc

Explanation: Dynamic allocation failed with the return code listed in the message.
User response: No action is required.

HLO2904I  An unexpected EOF was encountered on the sorted log record file.

Explanation: An unexpected EOF was encountered on the sorted log record file.
User response: No action is required.

HLO2905I  The mini log dataset dsn could not be located for resort purpose.

Explanation: The data set in the control cards could not be found in the MVS catalog.
User response: Ensure the data set is correct.

HLO2906I  The mini log dataset dsn could not be renamed for resort purpose.

Explanation: An error occurred while attempting to append minilogs records to an existing minilog dataset.
User response: Ensure proper authority on the minilog data sets.

HLO2907I  The resort of the applicable space level minilog was successful.

Explanation: The resort was successful.
User response: No action is required.

specified in the User Settings option and correct any errors.

HLO3100I  Truncation error displaying panel in HLO$MAIN - return_code
Explanation:  A truncation error occurred.

HLO3101I  Severe error displaying panel in HLO$MAIN - return_code
Explanation:  An internal error has occurred.

HLO3102I  Unexpected return code from panel in HLO$MAIN - return_code
Explanation:  An unexpected return code was received.

HLO3200E  The XLAT_IN_DSN, DBID, PSID, and at least one OBID must be specified.
Explanation:  When performing an OBIDXLA, you must specify the XLAT_IN_DSN, DBID, PSID and at least one OBID in your Accelerator Loader syntax.
User response:  Specify the XLAT_IN_DSN, DBID, PSID and at least one OBID in your Accelerator Loader syntax.

HLO3201E  The CONTINUE_ON_ERROR keyword has already been coded.
Explanation:  You specified the CONTINUE_ON_ERROR keyword more than once.
User response:  Correct the JCL and resubmit the job.

HLO3202E  The XLAT_IN_DSN keyword has already been coded.
Explanation:  You specified the XLAT_IN_DSN keyword more than once.
User response:  Correct the JCL and resubmit the job.

HLO3203E  Invalid XLAT_IN_DSN syntax.
Explanation:  The XLAT_IN_DSN syntax you specified is not valid. The correct syntax is XLAT_IN_DSN 'dsn', where dsn is the fully qualified Db2 data set name of a full image copy to be used instead of reading SYSCOPY. If you specify an XLAT_IN_DSN, you must also specify an XLAT_IN_LOGPOINT for the full image copy.
User response:  Correct the XLAT_IN_DSN syntax and resubmit the job.

HLO3204E  The XLAT_IN_DSN parameter was specified, but no value was found with it.
Explanation:  The correct syntax is XLAT_IN_DSN 'dsn', where dsn is the fully qualified Db2 data set name of a full image copy to be used instead of reading SYSCOPY.
User response:  Correct the JCL and resubmit the job.

HLO3205E  OBIDXLA input override parameters found without output parameters.
Explanation:  The OBIDXLA syntax is incomplete.
User response:  Use the OBIDXLA keyword to specify object translation information (DBID / PSID / OBID) and enable recovery via WRITE_TO_VSAM of tables within an image copy to a different VSAM / table space than the one indicated in the generated logs. The variable dataset_name is the fully qualified Db2 data set name of the target table space (the data set name that is going to contain the translated image copy), valid values are up to 44 bytes. When specifying the dbid, psid, and obid pairs, you must specify the pairs of source/target IDs in that order (DBID first, PSID second, followed by all applicable OBID pairs). All pairs should be space separated and the source ID is listed first with the target ID listed second. Each pair should be defined on a new line. Define multiple OBID pairs as necessary.

HLO3206E  The XLAT_IN_LOGPOINT parameter was specified, but no value was found with it.
Explanation:  The correct syntax is XLAT_IN_LOGPOINT 'logpoint', where logpoint is the RBA/LRSN of the override full image copy data set.
User response:  Correct the JCL and resubmit the job.

HLO3207E  Syntax error around XLAT_IN_LOGPOINT value. Form is X"6-byte-hex-value"
Explanation:  The correct syntax is XLAT_IN_LOGPOINT 'logpoint', where logpoint is the 6-byte hexadecimal value of the RBA/LRSN of the
override full image copy data set.

User response: Correct the JCL and resubmit the job.

HLO3208E The XLAT_IN_LOGPOINT value contains an invalid hexadecimal value.
Explanation: The correct syntax is XLAT_IN_LOGPOINT 'logpoint', where logpoint is the 6-byte hexadecimal value of the RBA/LRSN of the override full image copy data set.

User response: Correct the JCL and resubmit the job.

HLO3209E The XLAT_IN_LOGPOINT value cannot be 0.
Explanation: The correct syntax is XLAT_IN_LOGPOINT 'logpoint', where logpoint is the 6-byte hexadecimal value of the RBA/LRSN of the override full image copy data set.

User response: Correct the JCL and resubmit the job.

HLO3210E The XLAT_IN_LOGPOINT keyword was already specified.
Explanation: You specified the XLAT_IN_LOGPOINT keyword more than once.

User response: Correct the JCL and resubmit the job.

HLO3211E The INCR_IN_LOGPOINT parameter was specified, but no value was found with it.
Explanation: The correct syntax is INCR_IN_LOGPOINT 'logpoint', where logpoint is the 6-byte hexadecimal value of the RBA/LRSN of the incremental DSN.

User response: Correct the JCL and resubmit the job.

HLO3212E The INCR_IN_DSN keyword has already been coded.
Explanation: You specified the INCR_IN_DSN keyword more than once.

User response: Correct the JCL and resubmit the job.

HLO3213E Invalid INCR_IN_DSN syntax.
Explanation: The INCR_IN_DSN syntax you specified is not valid. The correct syntax is INCR_IN_DSN 'dsn' where 'dsn' is the incremental DSN that is to be included in OBIDXLAT processing.

User response: Correct the JCL and resubmit the job.

HLO3214E The INCR_IN_DSN parameter was specified, but no value was found with it.
Explanation: The INCR_IN_DSN syntax you specified is not valid. The correct syntax is INCR_IN_DSN 'dsn' where 'dsn' is the incremental DSN that is to be included in OBIDXLAT processing.

User response: Correct the JCL and resubmit the job.

HLO3215E The INCR_IN_LOGPOINT keyword was already specified.
Explanation: You specified the INCR_IN_LOGPOINT keyword more than once.

User response: Correct the JCL and resubmit the job.

HLO3216E Syntax error around INCR_IN_LOGPOINT value. Form is X"6-byte-hex-value".
Explanation: The correct syntax is INCR_IN_LOGPOINT 'logpoint' where 'logpoint' is 6-byte hexadecimal value of RBA/LRSN for the incremental DSN.

User response: Correct the JCL and resubmit the job.

HLO3217E The INCR_IN_LOGPOINT value contains an invalid hexadecimal value.
Explanation: The correct syntax is INCR_IN_LOGPOINT 'logpoint' where 'logpoint' is 6-byte hexadecimal value of RBA/LRSN for the incremental DSN.

User response: Correct the JCL and resubmit the job.

HLO3218E The INCR_IN_LOGPOINT value cannot be 0.
Explanation: The correct syntax is INCR_IN_LOGPOINT 'logpoint' where 'logpoint' is 6-byte hexadecimal value of RBA/LRSN for the incremental DSN.

User response: Correct the JCL and resubmit the job.

HLO3219E The INCR_IN_DSN and INCR_IN_LOGPOINT must be specified together.
Explanation: You must specify the INCR_IN_DSN and INCR_IN_LOGPOINT together.

User response: Correct the JCL and resubmit the job.

</tbody>
</table>
HLO3235E  Mini log DSN dsn is not appended because corresponding dataset not found in the MVS catalog.

Explanation: The specified mini log data set cannot be found in the MVS catalog.

User response: Remove any rows with incorrect data set names from the Db2 Analytics Accelerator Loader mini log control table.

HLO3236E  Mini log data set dsn contains data for the different table space and could not be appended.

Explanation: The data set indicated in the message text contains data for a different table space and could not be appended.

User response: Verify that you have specified the correct mini log data set name.

HLO3237E  The XLAT_TARGET_SSID keyword has already been coded.

Explanation: You specified the XLAT_TARGET_SSID keyword more than once.

User response: Correct the JCL and resubmit the job.

HLO3238E  Invalid XLAT_TARGET_SSID syntax.

Explanation: The XLAT_TARGET_SSID syntax is not valid.

User response: Correct the JCL and resubmit the job.

HLO3239E  The XLAT_TARGET_SSID parameter was specified, but no value was found with it.

Explanation: You must specify a valid value with the XLAT_TARGET_SSID parameter.

User response: Correct the JCL and resubmit the job.

HLO3240E  The XLAT_TARGET_DBNAME keyword has already been coded.

Explanation: The XLAT_TARGET_DBNAME keyword was already been coded.

User response: Correct the JCL and resubmit the job.

HLO3241E  Invalid XLAT_TARGET_DBNAME syntax.

Explanation: The XLAT_TARGET_DBNAME syntax you specified is not valid.

User response: Correct the JCL and resubmit the job.

640 Db2 Analytics Accelerator Loader User's Guide
The PARALLEL keyword has already been coded.

**Explanation:** The PARALLEL keyword has already been coded.

**User response:** Correct the JCL and resubmit the job.

The REBUILD_INDEXES keyword was specified for the index space but the parent table space was not included.

**Explanation:** You specified the REBUILD_INDEXES parameter for an index space, but did not include a parent table space.

**User response:** Correct the JCL and resubmit the job.

Indexes can be rebuilt only when WRITE_TO_VSAM or WRITE_TO_BOTH is specified.

**Explanation:** You specified the REBUILD_INDEXES parameter, but not WRITE_TO_VSAM or WRITE_TO_BOTH.

**User response:** Correct the JCL and resubmit the job.

The OBIDXLAT keyword, present for the index space to rebuild, must be in line with the parent table space.

**Explanation:** You specified the index space and its parent table space with the REBUILD_INDEXES parameter, but OBIDXLAT has been specified only for one of them.

**User response:** Correct the JCL and resubmit the job.

The REBUILD_INDEXES keyword and the end point specification are mutually exclusive for index spaces.

**Explanation:** You specified the REBUILD_INDEXES parameter and an end point for the recovery process. These are mutually exclusive.

**User response:** Correct the JCL and resubmit the job.

One of TO_CURRENT, TO QUIESCE, END RBA, END LRSN, TOLOGPOINT or REBUILD_INDEXES must be specified.

**Explanation:** You did not specify one of the following required options in your JCL: TO_CURRENT, TO QUIESCE, END RBA, END LRSN, TOLOGPOINT or REBUILD_INDEXES.

**User response:** Correct the JCL and resubmit the job.

The REBUILD_INDEXES keyword has already been coded.

**Explanation:** You specified the REBUILD_INDEXES parameter more than once.

**User response:** Correct the JCL and resubmit the job.

The NO_REUSE keyword was coded multiple times for the same object.

**Explanation:** The NO_REUSE keyword was specified more than once for the same object.

**User response:** Correct the JCL and resubmit the job.

The NO_REUSE keyword is not valid in the current job environment.

**Explanation:** The NO_REUSE keyword was specified in a job type other than WRITE_TO_VSAM or WRITE_TO_BOTH.

**User response:** Correct the JCL and resubmit the job.

The CHECK_AFTER QUIESCE keyword was coded multiple times for the same object.

**Explanation:** The CHECK_AFTER QUIESCE keyword was coded more than once for the same object.

**User response:** Correct the JCL and resubmit the job.

The CHECK_AFTER QUIESCE keyword specified without TO QUIESCE.

**Explanation:** The CHECK_AFTER QUIESCE was specified but TO QUIESCE was not specified for space.

**User response:** Correct the JCL and resubmit the job.

The CHECK_AFTER QUIESCE keyword specified without TO QUIESCE.

**Explanation:** The CHECK_AFTER QUIESCE was specified but TO QUIESCE was not specified for space.

**User response:** Correct the JCL and resubmit the job.

The CHECK_AFTER QUIESCE keyword conflicts with UNIFIED check specified.

**Explanation:** The CHECK_AFTER QUIESCE keyword conflicts with the UNIFIED keyword.

**User response:** Correct the JCL and resubmit the job.

The CHECK_AFTER QUIESCE keyword conflicts with NO_SYSLGRNX keyword.

**Explanation:** The CHECK_AFTER QUIESCE keyword was specified with the NO_SYSLGRNX keyword. This is not valid.

**User response:** Correct the JCL and resubmit the job.
The TO_CONSISTENT_IC has already been coded for this space group.

Explaination: The TO_CONSISTENT_IC has already been coded for the space group.
User response: Correct the JCL and resubmit the job.

Only WRITE_TO_COPIES is supported when TO_CONSISTENT_IC is specified.

Explaination: Only WRITE_TO_COPIES is supported when TO_CONSISTENT_IC is specified.
User response: Correct the JCL and resubmit the job.

Error token: token has an empty value. Space# number

Explaination: The indicated token has an empty value.
User response: Correct the JCL and resubmit the job.

Error token: token appears more than once. Space# number

Explaination: The indicated token could not be specified more than once on current level.
User response: Correct the JCL and resubmit the job.

Error token: token has an invalid value: value. Space# number

Explaination: An invalid value was detected for token.
User response: Correct the JCL and resubmit the job.

Error token: token1 is unexpected with token: token2. Space# number.

Explaination: token1 could not be used when token2 is used.
User response: Correct the JCL and resubmit the job.

Error token: token1 using require token: token2.

Explaination: token1 could not be used without token2 specified.
User response: Correct the JCL and resubmit the job.

The FCCOPYDDN parameter was specified, but no value was found with it.

Explaination: The FCCOPYDDN parameter was specified, but no value was found with it.
User response: Correct the JCL and resubmit the job.

The FCCOPYDDN parameter specified is invalid.

Explaination: The FCCOPYDDN parameter specified is invalid.
User response: Correct the JCL and resubmit the job.

The FCCOPYDDN keyword has already been coded for this group.

Explaination: The FCCOPYDDN keyword has already been coded for this group.
User response: Correct the JCL and resubmit the job.

The FCCOPYDDN keyword can be used with NEW_COPY.

Explaination: The FCCOPYDDN keyword can be used with NEW_COPY.
User response: Correct the JCL and resubmit the job.

The NEW_COPY keyword has already been coded for this group.

Explaination: The NEW_COPY keyword has already been coded for this group.
User response: Correct the JCL and resubmit the job.

The Name parameter was specified, but no value was found with it.

Explaination: The Name parameter was specified, but no value was found with it.
User response: Correct the JCL and resubmit the job.

The NAME parameter is invalid.

Explaination: The NAME parameter is invalid.
User response: Correct the JCL and resubmit the job.

The NAME keyword has already been coded for this space group.

Explaination: The NAME keyword has already been coded for this space group.
User response: Correct the JCL and resubmit the job.

The Creator/Name specified did not match a DBNAME.TSNAME in SYSTABLES.

Explaination: The Creator/Name specified did not match a DBNAME.TSNAME in SYSTABLES.
User response: Correct the JCL and resubmit the job.

</tr>
</tbody>
</table>
The value shown in HLO3606E is that for the first object in the group, while the value shown in HLO3607E is the value for any object that does not match it. For example, if there are 10 objects in the group and three do not match the first, then one HLO3606E message will display with three HLO3607E messages (for each group).

HLO3608E  The initialization phase of DB2 Sort failed.
Explanation:  The initialization phase of Db2 Sort failed.
User response:  Contact IBM Software Support.

HLO3609E  The resource optimization phase [1\|2] of DB2 sort failed. RC="return_code"
Explanation:  Db2 Sort failed in the initialization step necessary for optimization.
User response:  Contact IBM Software Support.

HLO3610E  The terminate phase of DB2 Sort failed.
Explanation:  The terminate phase of Db2 Sort failed.
User response:  Contact IBM Software Support.

HLO3611E  There is not enough storage to perform the desired number of parallel sorts.
Explanation:  There is not enough virtual storage space to perform the number of parallel sorts specified.
User response:  Lower the number of parallel tasks specified or increase the amount of virtual memory specified available for the job, then resubmit the job.

HLO3612E  Insufficient total storage to perform the desired number of parallel sorts.
Explanation:  The amount of storage available for a sort was insufficient.
User response:  Increase your region size or reduce the number of parallel tasks, then resubmit the job.

HLO3613E  The log apply tasks ended abnormally.
Check messages.
Explanation:  One or more of the log apply tasks failed to process.
User response:  Check the accompanying error messages.

HLO3614E  Rebuild indexes task manager could not be started.
Explanation:  The rebuild indexes task manager could not be started.
User response:  Check the accompanying error messages.

HLO3615I  Log apply task manager returned an error, RC="return_code".
Explanation:  The specified error occurred during parallel log apply processing.
User response:  No action is required.

HLO3619E  The pipe mechanism initialization function returned an error.
Explanation:  An error occurred during pipe initialization.
User response:  Check the log for related errors.

HLO3620E  The pipe mechanism cleanup function returned an error.
Explanation:  An error occurred during pipe cleanup.
User response:  Check the log for related errors.

HLO3621E  The common storage name/token pair could not be found.
Explanation:  The common storage that was created at program startup could not be located, which indicates a possible error during initialization.
User response:  Contact IBM Software Support.

HLO3622E  An error occurred while calling IEANTRT to get the name/token pair.
Explanation:  An error occurred while accessing common storage via IEANTRT.
User response:  Contact IBM Software Support.

HLO3623E  A table was specified that was already being loaded.
Explanation:  A table that was included in the job was already being loaded by another job.
User response:  Wait for the first job to complete, and then rerun the second job.

HLO3624E  A table did not have a matching entry in common storage.
Explanation:  Required table information was not found in common storage. A problem might have
occurred during initialization, or the common storage might have been cleared.

**User response:** Verify that common storage was not cleared. If necessary, contact IBM Software Support.

This message provides the following information:

- SVC99 details = svc99_details
- SVC99_CODE_1
- SVC99_CODE_2
- SVC99_DDNAME = ddname
- SVC99_PIPE

User response: No action is required.

### Chapter 14. Troubleshooting

#### HLO3638E message_text

**Explanation:** This message provides the following information:

- SVC99 details = svc99_details
- SVC99_CODE_1
- SVC99_CODE_2
- SVC99_DDNAME = ddname
- SVC99_PIPE

**User response:** No action is required.

#### HLO3639I DDNAME = ddname.

**Explanation:** This message provides the DD name.

**User response:** No action is required.

#### HLO3640I This message provides SSID information.

**Explanation:** SSID = ssid.

**User response:** No action is required.

#### HLO3641I This message provides DB2 connection error information.

**Explanation:** SSID = ssid Plan name = plan_name.

**User response:** No action is required.

#### HLO3642I This message provides a return code.

**Explanation:** Return code = return_code.

**User response:** No action is required.

#### HLO3643E This message provides the message identifier and the table ID.

**Explanation:** Table information is as follows:

- BAD_TABLE_ID = table_ID
- BAD_TABLE_TEXT = table_text

**User response:** No action is required.

#### HLO3644E This message provides table partition information.

**Explanation:** Partition information is as follows:

- BAD_TABLE_PART_1 = partition_number.

**User response:** No action is required.

#### HLO3701E Error token: token unexpected end of input stream.

**Explanation:** A syntax error was detected near token.

**User response:** Verify the syntax structure of the control cards. If no syntax errors can be identified, contact IBM Software Support.

#### HLO3702E Error token: token, open or close parenthesis expected.

**Explanation:** A syntax error was detected near token.

**User response:** Verify the syntax structure of the control cards. If no syntax errors can be identified, contact IBM Software Support.

#### HLO3703E Error token: token, have no value.

**Explanation:** A syntax error was detected near token.

**User response:** Verify the syntax structure of the control cards. If no syntax errors can be identified, contact IBM Software Support.

#### HLO3704E Error token: token, invalid value.

**Explanation:** A syntax error was detected near token.

**User response:** Verify the syntax structure of the control cards. If no syntax errors can be identified, contact IBM Software Support.

#### HLO3705E Error token: token, appears more than once.

**Explanation:** A syntax error was detected near token.

**User response:** Verify the syntax structure of the control cards. If no syntax errors can be identified, contact IBM Software Support.

#### HLO3706E Error token: token, value overflow.

**Explanation:** A syntax error was detected near token.

**User response:** Verify the syntax structure of the control cards. If no syntax errors can be identified, contact IBM Software Support.

#### HLO3707E Error token: token, require token.

**Explanation:** The token control card is required in the context of the syntax.

**User response:** Verify the syntax structure of the control cards. If no syntax errors can be identified, contact IBM Software Support.

#### HLO3708E Error token: token, have no parameters.

**Explanation:** A syntax error was detected near token.

**User response:** Verify the syntax structure of the control cards. If no syntax errors can be identified, contact IBM Software Support.
The TO_TIMESTAMP parameter was specified, but no value was found with it.

**Explanation:** The TO_TIMESTAMP parameter was specified, but no value was found with it.

**User response:** Correct the JCL and resubmit the job.

Syntax error around TO_TIMESTAMP value. Form is "YYYY-MM-DD-HH.MM.SS.XXXXXX"

**Explanation:** There is a syntax error in the value of TO_TIMESTAMP. The valid format is "YYYY-MM-DD-HH.MM.SS.XXXXXX"

**User response:** Correct the JCL and resubmit the job.

The TO_TIMESTAMP value could not be converted. CONVTOD macro return code: returncode. Space#number

**Explanation:** An internal error occurred during the RBA to timestamp conversion process.

**User response:** Contact IBM Software Support.

The TO_TIMESTAMP value was already specified before end LRSN in a control group.

**Explanation:** The TO_TIMESTAMP value was already specified before end LRSN in a control group.

**User response:** Correct the JCL and resubmit the job.

The TO_TIMESTAMP keyword has already been coded for this space group.

**Explanation:** The TO_TIMESTAMP keyword has already been coded for this space group.

**User response:** Correct the JCL and resubmit the job.

Double count CREATOR keyword without NAME keyword between.

**Explanation:** The CREATOR syntax is not valid.

**User response:** Correct the JCL and resubmit the job.

Double count NAME keyword without CREATOR keyword between.

**Explanation:** The NAME and CREATOR syntax is invalid.

**User response:** Correct the JCL and resubmit the job.

Consistent Load operations require DB2 V10 or later. This DB2=dsib2_version.

**Explanation:** The attempted operation requires Db2 Version 10 or later.

**User response:** Verify that your system meets the minimum software requirements. For more information, see the topic about preparing to customize in the product documentation.

The ACCELNAME keyword has already been coded.

**Explanation:** The ACCELNAME keyword has already been coded.

**User response:** Correct the JCL and resubmit the job.
The ACCELNAME parameter is invalid.

Explanation: The ACCELNAME parameter is invalid.
User response: Correct the JCL and resubmit the job.

The ACCELNAME parameter was specified, but no value was found with it.

Explanation: The ACCELNAME parameter was specified, but no value was found with it.
User response: Correct the JCL and resubmit the job.

The pipe mechanism initialization function returned an error.

Explanation: An error occurred during pipe initialization.
User response: Check the log for related errors.

Error in checking the accelerator name.

Explanation: Db2 Analytics Accelerator Loader was unable to check the current accelerator name from the DISPLAY ACCELERATOR command output. The command output is displayed in the messages that follow.
User response: Review the command output and correct the problem.

Error accelerator name invalid state.

Explanation: The accelerator state from DISPLAY ACCELERATOR command output is not "STARTED".
User response: Review the command output and correct the problem.

Error exec -DIS ACCEL command rc = RC, rs = SQLSTATE

Explanation: An error was encountered when executing the Db2 DISPLAY ACCELERATOR command. Any available command output follows this message.
User response: Review the return code and correct the problem.

Error call sysproc.accel_get_tables_details table owner.name severity severity, reason reason.

Explanation: There was an error in the call to stored procedure owner.name table. See also HLO3740I, HLO3741I, HLO3742I.
User response: Review the error codes and correct the problem.

Error table owner.table state state type type.

Explanation: Invalid state for owner.table on accelerator detected.
User response: To resolve, delete and re-add the table to the accelerator.

Error table owner.table part number state state type type.

Explanation: Invalid state for owner.table on accelerator detected.
User response: To resolve, delete and re-add the table to the accelerator.

Warning table owner.table part number state state type type.

Explanation: Invalid state for owner.table partition NUMBER on accelerator detected.
User response: Correct problem if needed.
**HLO3747S** The global Loader intercept is not active.

**Explanation:** The Db2 Analytics Accelerator Loader started task has not been started since the last IPL.

**User response:** Start the Db2 Analytics Accelerator Loader started task. Issue the z/OS console command $prefixstc or the SDSF command /$prefixstc. The variable prefixstc represents the member name of the Db2 Analytics Accelerator Loader PROC in the system PROCLIB. For more information, see "Starting the started task" in the product documentation.

**HLO3748S** The selected DB2 system is not on the Loader started task intercept list.

**Explanation:** The DSNUTILB intercept policy for the Db2 Analytics Accelerator Loader started task must specify the Db2 system.

**User response:** Include the Db2 system in the DSNUTILB intercept policy by using the <DB2SYSTEM> element within the <POLICY> section of the DSNUTILB intercept policy as follows:

```xml
<DSNUTILB_INTERCEPT>
  <POLICY>
    <DB2SYSTEM SSID="ssid" ACTION="LOAD_ACCELERATOR">
    </DB2SYSTEM>
  </POLICY>
</DSNUTILB_INTERCEPT>
```

For more information, see the topic about the DSNUTILB intercept and the DSNUTILB intercept policy in the reference section of the product documentation.

**HLO3749S** The selected DB2 system is not configured for intercepts by the Loader.

**Explanation:** Db2 Analytics Accelerator Loader cannot connect to the Db2 system because the Db2 Analytics Accelerator Loader started task is not running.

**User response:** Start the Db2 Analytics Accelerator Loader started task. Issue the z/OS console command $prefixstc or the SDSF command /$prefixstc. The variable prefixstc represents the member name of the Db2 Analytics Accelerator Loader PROC in the system PROCLIB. For more information, see "Starting the started task" in the product documentation.

**HLO3750E** Error table table removed from processing. Multiple tables per table space unsupported.

**Explanation:** Db2 Analytics Accelerator Loader does not support the processing of multiple tables per table space.

**User response:** Correct the JCL and resubmit the job.

**HLO3751E** A mismatch between passed Zparm information and the JES SSCT was found.

**Explanation:** A mismatch between passed Zparm information and the JES SSCT was found.

**User response:** Correct the JCL and resubmit the job.

**HLO3752E** An unexpected error occurred while trying to read the bootstrap dataset.

**Explanation:** An unexpected error occurred while trying to read the bootstrap dataset.

**User response:** Contact IBM Software Support.

**HLO3753E** Could not determine RBA of TO_TIMESTAMP point.

**Explanation:** The TO_TIMESTAMP control card was used, but the RBA cannot be determined.

**User response:** Specify a timestamp that has a valid RBA.

**HLO3754E** Could not find log data set to determine RBA of TO_TIMESTAMP point.

**Explanation:** The TO_TIMESTAMP control card was used, but the specified timestamp cannot be correlated to any log data set in the bootstrap data set (BSDS). If the timestamp is no longer valid, it cannot be used.

**User response:** Specify a timestamp that is within the boundaries of the logs that are recorded in the BSDS.

**HLO3755I** Issuing HRECALL for log dataset

**Explanation:** Db2 Analytics Accelerator Loader is issuing an HRECALL for the log dataset.

**User response:** No action is required.

**HLO3756E** A desired log range can not be found in any active/archive log.

**Explanation:** The specified log range cannot be found.

**User response:** Verify and correct the specified log range.

**HLO3757E** The following log dataset is required for processing, but got an error:

**Explanation:** The specified ERROR_ARCHIVE_LOG_DSN produced an error.

**User response:** See message HLO3758I for more information.
HLO3758I  ERROR_ARCHIVE_LOG_DSN for GGC3757E message
Explanation: The specified ERROR_ARCHIVE_LOG_DSN produced an error.
User response: Specify a valid ERROR_ARCHIVE_LOG_DSN value.

HLO3759I  Table table part part state state type type.
Explanation: This message provides information to accompany other error messages.
User response: No action is required.

HLO3760E  The TO_IC keyword has already been coded for this space group.
Explanation: The space specification set contains duplicate keywords.
User response: Correct the JCL and resubmit the job.

HLO3761E  The TO_IC value has no contents.
Explanation: A syntax error was found in the control card. The data set name is required.
User response: Correct the JCL and resubmit the job.

HLO3762E  The TO_IC parameter specified is invalid.
Explanation: A syntax error was found in the control card. The data set name must be enclosed in single quotation marks and can contain up to 44 characters.
User response: Correct the JCL and resubmit the job.

HLO3763E  The selected end point is inconsistent with the run type.
Explanation: If the run type is a load to a consistent time (CONSISTENT load), the TO_IC end point control card cannot be used. If the run type is an image copy load, only the TO_IC end point can be used. End points such as TO_IC can only be used with the IDAA_LOAD_IC option. Other end points, such as TO_CURRENT, can only be used with the IDAA_CONSISTENT_LOAD option.
User response: Correct the JCL and resubmit the job.

HLO3764E  The TO IC_INLINE control card has already been specified for this object.
Explanation: A duplicate control card was found in the object specification.
User response: Correct the JCL and resubmit the job.

HLO3765E  The DBID, PSID, and at least one OBID must be specified.
Explanation: On a load operation, translation was called for, but all required fields to perform the function were not specified. All of the required options that are needed to perform the translation operation were not specified.
User response: Correct the JCL and resubmit the job.

HLO3766E  When a segmented object is loaded, OBIDXLAT information must be specified.
Explanation: The process requires that OBIDXLAT information be specified when the underlying table space is segmented, even if there is only one table currently in the table space.
User response: Specify the DBID/PSID/OBID number pairs for the object.

HLO3767E  The OBIDXLAT_CATALOG control card has already been specified for this object.
Explanation: A duplicate control card was found in the object specification.
User response: Correct the JCL and resubmit the job.

HLO3768E  Keywords OBIDXLAT and OBIDXLAT_CATALOG can not be specified at the same time.
Explanation: The specified options are mutually exclusive, and only one of the options can be specified in the syntax.
User response: Correct the JCL and resubmit the job.

HLO3769W  The DEBUG parameter has already been coded for this space group.
Explanation: A duplicate control card was found.
User response: Correct the syntax.

HLO3770E  The DEBUG keyword has already been coded for this space group.
Explanation: The DEBUG parameter has been coded more than once for the SPACE(...) group.
User response: Correct the JCL and resubmit the job.

HLO3771E  The DEBUG value has no contents.
Explanation: No value was specified for the DEBUG parameter is not valid.
User response: Correct the JCL and resubmit the job.
HLO3772E  The DEBUG parameter specified is invalid.
Explanation: The value specified for the DEBUG parameter is not valid.
User response: Correct the JCL and resubmit the job.

HLO3773E  The ACCEL_ADD_TABLES keyword has already been coded for this run.
Explanation: The ACCEL_ADD_TABLES keyword has already been coded for this run.
User response: Correct the JCL and resubmit the job.

HLO3774E  The REMOVE_AND_ADD_TABLES keyword has already been coded for this run.
Explanation: The REMOVE_AND_ADD_TABLES keyword has already been coded for this run.
User response: Correct the JCL and resubmit the job.

HLO3775E  Both the ACCEL_ADD_TABLES and ACCEL_REMOVE_AND_ADD_TABLES keywords are present.
Explanation: The ACCEL_ADD_TABLES and ACCEL_REMOVE_AND_ADD_TABLES keywords are mutually exclusive. Specify only one of these parameters.
User response: Correct the JCL and resubmit the job.

HLO3776E  Multiple TARGET_CREATOR keywords specified without required TARGET_NAME.
Explanation: More than one TARGET_CREATOR keyword was specified within the SPACE (...) set for this object. There must be a single TARGET_CREATOR and TARGET_NAME or none.
User response: Remove duplicate TARGET_CREATOR keywords.

HLO3777E  Multiple TARGET_NAME keywords specified without required TARGET_CREATOR.
Explanation: More than one TARGET_NAME keyword was specified within the SPACE (...) set for this object. There must be a single TARGET_CREATOR and TARGET_NAME or none.
User response: Remove duplicate TARGET_NAME keywords.

HLO3778E  The TARGET_SSID parameter was specified, but no value was found with it.
Explanation: The TARGET_SSID control card must have a valid Db2 subsystem ID as an argument.
User response: Update the control card to include the SSID.

HLO3779E  The TARGET_SSID parameter specified is invalid.
Explanation: The Db2 subsystem ID that is specified is not a valid name. For example, the ID contains more than four characters or contains invalid characters.
User response: Verify that the specified Db2 SSID is a valid Db2 subsystem name.

HLO3780E  The TARGET_SSID keyword has already been coded.
Explanation: The TARGET_SSID keyword was coded more than once in the control cards.
User response: Remove the extra control cards.

HLO3781E  The target control cards must be specified together or not at all.
Explanation: Both the TARGET_NAME and TARGET_CREATOR must be specified in a space( ...) set to completely identify the actual target object.
User response: Verify that both the TARGET_NAME and TARGET_CREATOR control cards are present in the space( ...) set.

HLO3782E  Mixed object types not allowed.
Explanation: Accelerator restrictions prevent processing accelerator only tables (AOT) with non-AOTs in the same job step.
User response: Remove the AOT objects or the non-AOT objects from the control cards.

HLO3783E  Internal error in determining the potential group attach name for TARGET_SSID.
Explanation: When the TARGET_SSID control card is found, the product checks the coupling facility for associated members of the data sharing group. An internal error prevented this check.
User response: Contact IBM Software Support.

HLO3802E  The Db2 Analytics Accelerator Loader row conversion program ended unexpectedly.

Explanation: An error occurred in the Db2 Analytics Accelerator Loader row conversion program.

User response: This message is accompanied by related messages that provide more information about the issue. If you cannot resolve the issue, note the job return code and contact IBM Software Support.

HLO3803E  The cellpool services get function returned an error.

Explanation: An internal error occurred during memory management operations.

User response: Contact IBM Software Support.

HLO3804E  The input image copy can only contain one table.

Explanation: The input image copy you specified contains more than one table.

User response: Correct the JCL and resubmit the job.

HLO3805E  Error start Image Copy reader.

Explanation: The image copy reader component was not found in the loadlib concatenation.

User response: Contact IBM Software Support.

HLO3806E  Error ATTACH module rc=returncode

Explanation: The DSNUTILB flashcopy function call failed.

User response: Contact IBM Software Support.

HLO3807E  Error open the DSNUTILB STEPLIB

Explanation: DSNUTILB could not be found in the STEPLIB concatenation.

User response: Verify //STEPLIB validity or contact IBM Software Support.

HLO3808I  flash copy start

Explanation: The flashcopy operation requested has begun.

User response: No action is required.

HLO3809I  flash copy complete rc=returncode

Explanation: Normal termination indication from flashcopy function call.

User response: No action is required.

HLO3810E  DSNUTILB error rc=returncode

Explanation: Error indication from DSNUTILB flashcopy function call.

User response: Contact IBM Software Support.

HLO3811I  Start flash copy result output.

Explanation: Flashcopy function call results follow.

User response: No action is required.

HLO3812I  Flash copy result output complete.

Explanation: Flashcopy operations complete.

User response: No action is required.
HLO4001E  Invalid call parameter count.
Explanation:  A program error occurred.
User response:  Contact IBM Software Support.

HLO4002E  Invalid call parameter value.
Explanation:  A program error occurred.
User response:  Contact IBM Software Support.

HLO4003E  Error to load rebuild indexes module.
Explanation:  An environment error occurred.
User response:  Verify that the product was installed correctly and that enough storage is available.

HLO4004I  Log apply thread error detected. Cancellation in process.
Explanation:  A processing error occurred.
User response:  Review the job output for errors.

HLO4005I  Starting cancel process, reason log apply thread RC = <reason_code>.
Explanation:  A processing error occurred.
User response:  Review the job output for errors.

HLO4006I  Starting cancel process, reason log apply thread RC = <reason_code>.
Explanation:  A processing error occurred.
User response:  Review the job output for errors.

HLO4007E  Program error, rebuild indexes thread not yet started. Cancellation in process.
Explanation:  A program error occurred.
User response:  Contact IBM Software Support.

HLO4008I  Rebuild indexes thread create error RC = <reason_code>.
Explanation:  An environment error occurred.
User response:  Review the job output for errors.

HLO4009E  Rebuild indexes thread failed to start RC = <reason_code>.
Explanation:  An environment error occurred.
User response:  Review the job output for errors.

HLO4010E  Unable to release rebuild indexes module.
Explanation:  An environment error occurred.
User response:  Review the job output for errors.

HLO4011E  Error, could not get temporary file name.
Explanation:  An environment error occurred.
User response:  Review the job output for errors.

HLO4012E  Error, could not create external link to key sort module.
Explanation:  An environment error occurred.
User response:  Review the job output for errors.

HLO4013E  Program error, unexpected state detected.
Explanation:  A program error occurred.
User response:  Contact IBM Software Support.

HLO4100A  Parameters with the DB2 SSID and PLAN name must be passed to Accelerator Loader.
Explanation:  There was an internal error.
User response:  Contact IBM Software Support.

HLO4101E  The table space 'db_name.ts_name' does not exist in the DB2 catalog.
Explanation:  The table space specified in the Accelerator Loader JCL does not exist in the Db2 catalog.
User response:  Correct the JCL and resubmit the job.

HLO4102E  Partition part_num was specified for 'db_name.ts_name' but the space is non-partitioned or the partition is not defined.
Explanation:  A partition was specified for a non-partitioned table space or the partition is not defined.
User response:  Correct the Accelerator Loader JCL and resubmit the job.

HLO4103E  Invalid syntax. Not allowed keyword 'word1'. Expected 'word2 word3 ...'.
Explanation:  The syntax is not valid.
User response:  Correct the JCL and resubmit the job.
HLO4104E  Invalid syntax. Keyword keyword not allowed.
Explanation: The syntax is not valid.
User response: Correct the JCL and resubmit the job.

HLO4105E  The DATA_BASE parameter is invalid.
Explanation: The DATA_BASE parameter is invalid.
User response: Verify that the DATA_BASE keyword has been properly specified in your JCL.

HLO4106E  The SPACE_NAME parameter is invalid.
Explanation: The SPACE_NAME parameter is invalid.
User response: Verify that the SPACE_NAME parameter has been properly specified in your JCL.

HLO4107E  The PARTITION parameter is invalid.
Explanation: The PARTITION parameter is invalid.
User response: Verify that the PARTITION parameter has been properly specified in your JCL.

HLO4108E  The SPACE_THREAD parameter is invalid.
Explanation: The SPACE_THREAD parameter is invalid.
User response: Verify that the SPACE_THREAD parameter has been properly specified in your JCL.

HLO4109E  The PART_THREAD parameter is invalid.
Explanation: The PART_THREAD parameter is invalid.
User response: Verify that the PART_THREAD parameter has been properly specified in your JCL.

HLO4110E  Invalid INDEX_THREAD parameter, decimal expected.
Explanation: The INDEX_THREAD parameter is invalid.
User response: Verify that the INDEX_THREAD parameter has been properly specified in your JCL.

HLO4112E  A DB.TS pair is incomplete.
Explanation: The DB.TS pair you specified is incomplete.
User response: Verify that all DB.TS pairs have been specified correctly. Correct the JCL and resubmit the job.

HLO4113E  Operations on the DB2 directory are not allowed.
Explanation: Indexes cannot be rebuilt on the Db2 directory table spaces.
User response: No action is required.

HLO4114E  Operations on the DB2 Catalog table space DSNDB06.SYSCOPY are not allowed.
Explanation: Indexes cannot be rebuilt on Db2 Catalog table spaces.
User response: No action is required.

HLO4130I  Control card stream processed by Consistent Load follows.
Explanation: Header message just before the parsed control card input is echoed to the output.
User response: No action is required.

HLO4131I  Consistent Load processing messages follow...
Explanation: Header before runtime messages.
User response: No action is required.

HLO4132I  Consistent Load processing ends.
Explanation: All processing has finished.
User response: No action is required.

HLO4133I  Consistent Load processing abnormally ends.
Explanation: All processing has ended but errors were detected.
User response: Verify the errors produced. Contact IBM Software Support.

HLO4134A  Could not allow thread to be canceled.
Explanation: An internal error occurred.
User response: Contact IBM Software Support.

HLO4140S  The subsystem ID must be a valid DB2 subsystem name.
Explanation: You specified an invalid subsystem ID.
User response: Verify the subsystem ID.

HLO4161E  Invalid string specified as job.
Explanation: An invalid string was specified.
User response: Specify a valid job string.

HLO4162E  The SYSINHLO DD card could not be opened for input.
Explanation: The SYSINHLO DD data set specified in the JCL could not be opened for input.
User response: Verify that the SYSINHLO DD is not being accessed by other resources and resubmit the job.

HLO4164E  The SYSINHLO DD input stream is empty.
Explanation: No control cards appear in the instream file or the input data set.
User response: Correct the JCL and resubmit the job.

HLO4165E  The command set must end with a close parenthesis "\)".
Explanation: There is no close parenthesis following the Accelerator Loader input cards.
User response: Enter a close parenthesis following the Accelerator Loader input cards.

HLO4166E  The parsing process gave an invalid return code.
Explanation: There is an error in your Accelerator Loader JCL.
User response: Correct the JCL and resubmit the job.

HLO4200E  A data set allocation failure occurred.
Explanation: The program could not allocate specified data set. The data set is listed in the message.
User response: The data set name is listed in message HLO4210I. The DD name is listed in message HLO4211I. Refer to messages HLO4213I for any dynamic allocation return codes and contact IBM Software Support.

HLO4202E  A data set open failure occurred.
Explanation: The program could not open specified data set. The data set is listed in the message.
User response: The data set name is listed in message HLO4210I. The DD name is listed in message HLO4211I. Contact IBM Software Support.

HLO4203E  A data set close failure occurred.
Explanation: The program could not close specified data set. The data set is listed in the message.
User response: The data set name is listed in message HLO4210I. The DD name is listed in message HLO4211I. Contact IBM Software Support.

HLO4204E  A dataset write failure occurred.
Explanation: The program could not write specified data set. The data set is listed in the message.
User response: The data set name is listed in message HLO4210I. The DD name is listed in message HLO4211I. Contact IBM Software Support.

HLO4206S  The FULL image copy DD CA(LP/LB/RP/RB) {1} refers to a DSNAME already in SYSCOPY.
Explanation: You specified a full image copy data set name that already exists in SYSCOPY.
User response: Specify a different image copy data set name.

HLO4207S  The FULL image copy DD CA(LP/LB/RP/RB) {1} is missing from the JCL.
Explanation: The full image copy data set is not included in your Accelerator Loader JCL.
User response: Verify that the JCL is formatted correctly and contains the necessary information for your Accelerator Loader job.

HLO4210I data_set_name
Explanation: This message is used to hold data set name information.
User response: No action is required.
HLO4211I  DD_name
Explanation: This message is used to hold DD name information.
User response: No action is required.

HLO4212I  Each CAxxnnnn DD correlates to each SPACE(...) control card group.
Explanation: Each CAxxxx DD statement must be associated with a corresponding SPACE(...) control card group.
User response: Verify that the JCL is formatted correctly and that each CAxxxx DD statement is associated with a SPACE(...) control card group.

HLO4213I  Dynamic allocation return codes = 'rc'.
Explanation: This diagnostic message indicates data set allocation failure.

HLO4214I  The following data set information was added to the SYSCOPY DB2 table: data set information
Explanation: A new SYSCOPY row was added to complete the image copy creation process.
User response: No action is required.

HLO4215I  Object: Database db_name Indexspace is_name Partition part_num 1CBackup 'site'
Explanation: This message, in conjunction with messages HLO2101I, HLO2102I, or HLO4216I indicates the database affected by the condition described in the associated message.
User response: No action is required.

HLO4216I  DSN: data_set_name  LRSN/RBA: X'xxxxxxxxxxxx'
Explanation: This message, in conjunction with messages HLO2101I, HLO2102I, or HLO4215I indicates the data set name affected by the condition described in the associated message.
User response: No action is required.
HLO4226E  A VSAM read failure occurred.
Explanation: The program could not read specified data set. The data set is listed in the message.
User response: The data set is listed in message HLO4236I. Contact IBM Software Support.

HLO4227E  A VSAM write failure occurred.
Explanation: The program could not write specified data set. The data set is listed in the message.
User response: The data set is listed in message HLO4236I. Contact IBM Software Support.

HLO4230E  A VSAM random read failure occurred.
Explanation: The program could not read specified data set. The data set is listed in the message.
User response: The data set is listed in message HLO4236I. Contact IBM Software Support.

HLO4232E  A VSAM fetch failure occurred.
Explanation: The program could not fetch specified data set. The data set is listed in the message.
User response: The data set is listed in message HLO4236I. Contact IBM Software Support.

HLO4233E  A VSAM update failure occurred.
Explanation: The program could not update specified data set. The data set is listed in the message.
User response: The data set is listed in message HLO4236I. Contact IBM Software Support.

HLO4236I  data_set_name
Explanation: This message is used to hold data set name information.
User response: No action is required.

HLO4237I  DD_name
Explanation: This message is used to hold DD name information.
User response: No action is required.

HLO4238I  Dynamic allocation return code = 'rc'.
Explanation: This diagnostic message indicates data set allocation failure.
User response: Diagnose the problem using the return code. For information about the dynamic allocation return codes received, see the zMVS Programming Authorized Assembler Service Guide (SA22-7608).

HLO4260E  An allocate failure occurred on the key sort module.
Explanation: The program could not allocate temporary data set.

HLO4267E  An invalid return code was detected from the SORT program.
Explanation: Db2 Analytics Accelerator Loader encountered an invalid return code from the SORT program.
User response: Contact IBM Software Support.

HLO4268E  Could not create new address space. Error code error code.
Explanation: An internal error occurred.
User response: Contact IBM Software Support.

HLO4268E  Create external link error %u
Explanation: An internal error occurred.
User response: Contact IBM Software Support.

HLO4271I  Dynamic allocation return code = 'rc'.
Explanation: This diagnostic message indicates a data set allocation failure occurred.

HLO4360E  The table space 'db_name.ts_name' partition part_num has an unknown status.
Explanation: Accelerator Loader ensures that the indicated space is stopped before proceeding with the rebuild index process by issuing a call similar to a -DISPLAY DATABASE command. This message displays when the status is not equal to 'RO', 'RW', or 'UT'.
User response: Stop the indicated space before attempting to proceed with the rebuild index process.
HLO4361E The status check for table space 
\textit{db_name.ts_name} partition part_num timed out.

**Explanation:** Before index processing can occur, Accelerator Loader must attempt to stop the spaces involved. However, if an in-flight URID is processing and the object is stopped, the status changes to ‘STOP’, or Stop Pending until the URID finishes. It may also take Db2 some time to flush the buffers. In either case, Accelerator Loader checks the spaces before beginning any index processing. If any of the spaces are not stopped, Accelerator Loader waits a few seconds and checks again. After several checks, it will abort processing and issue this message.

**User response:** Diagnose why the space will not stop.

---

HLO4362E The ENQ for table space 
\textit{db_name.ts_name} partition part_num was not successful.

**Explanation:** Indicates the database and partition for which the ENQs did not complete successfully.

**User response:** Diagnose why the space won’t enqueued.

---

HLO4363E The index space 'db_name.is_name' partition part_num has an unsupported type and will be skipped.

**Explanation:** Accelerator Loader ensures that the indicated space is stopped before proceeding with the rebuild indexes process by issuing a call similar to a -DISPLAY DATABASE command. This message displays when the status is not equal to ‘RO’, ‘RW’, or ‘UT’.

**User response:** No action is required.

---

HLO4364E The index space 'db_name.is_name' belongs to a non-partitioned index and will be skipped.

**Explanation:** A partition was specified for an index space, but it is a non-partitioned index.

**User response:** No action is required.

---

HLO4371I The table space 'db_name.ts_name' partition part_num keys are being offloaded.

**Explanation:** Accelerator Loader has finished reading the specified table space partition and generating index keys.

**User response:** No action is required.

---

HLO4373I The index space 'db_name.is_name' partition part_num is being rebuilt.

**Explanation:** Accelerator Loader has finished sorting the index keys and generating the specified index space.

**User response:** No action is required.

---

HLO4374I The table space 'db_name.ts_name' partition part_num is empty and will be skipped.

**Explanation:** The specified table space partition has no one table or index.

**User response:** No action is required.

---

HLO4375I The index space db_name.ts_name partition part_num is ICOPY pending.

**Explanation:** The specified index space partition has the informational copy pending status.

**User response:** No action is required.

---

HLO4380E The index space 'db_name.is_name' partition part_num has an unknown status.

**Explanation:** This message ensures that the indicated space is to be stopped before proceeding with the rebuild indexes process. Accelerator Loader checks the space with a call similar to a `-display db(db_name) spacenam(is_name) part(part_num)` to verify that the space is in 'stop' status. This message displays when the database comes back with a status not equal to ‘RO’, ‘RW’, or ‘UT’.

**User response:** Stop the indicated space before attempting to proceed with the rebuild indexes process.

---

HLO4381E The status check for index space 
\textit{db_name.is_name} partition part_num timed out.

**Explanation:** This message is output when HLO tries to start and it has to ensure that when doing rebuild indexes processing that the index spaces are indeed stopped. The stop step that is generated (prior to HLO) to do this sends commands to Db2 to stop the data sets, but it does not wait for the index spaces to actually stop. If an in-flight URID is processing against
the object and the stop is done, the space changes to 'STOP' or stop pending until the URID finishes. It may also take Db2 some time to flush buffers. In either case, HLO does a check on the spaces before doing any real processing. If any of the spaces don't come back 'STOP', it waits a few seconds and checks again. After a few checks like this, it aborts, producing this message.

User response: Diagnose why the space will not stop.

HLO4400E  The attempt to recreate the underlying VSAM data set returned an error.
Explanation: Db2 Analytics Accelerator Loader was unable to create the VSAM file for object specified in your Accelerator Loader job.
User response: Check the output for IDCAMS error messages and consult with your systems programmer. Contact IBM Software Support.

HLO4401E  An allocate failure occurred.
Explanation: The program could not allocate a temporary data set.

HLO4402E  An deallocate failure occurred.
Explanation: The program could not deallocate temporary data set. The data set is listed in the message.
User response: The data set is listed in messages HLO4410I. Contact IBM Software Support.

HLO4403E  An open failure occurred.
Explanation: The program could not open temporary data set. The data set is listed in the message.
User response: The data set is listed in messages HLO4410I. Contact IBM Software Support.

HLO4404E  A close failure occurred.
Explanation: The program could not close temporary data set. The data set is listed in the message.
User response: The data set is listed in messages HLO4410I. Contact IBM Software Support.

HLO4405E  A write failure occurred.
Explanation: The program could not write temporary data set. The data set is listed in the message.
User response: The data set is listed in message HLO4410I. Contact IBM Software Support.

HLO4406E  An invalid or incompatible data set name was specified.
Explanation: The specified data set name can not be used for VSAM access to Db2 data set. The data set name is listed in the message.
User response: The data set name is listed in message HLO4412I. Correct the JCL and resubmit the job.

HLO4410I  DD_name
Explanation: This message is used to hold DD name information.
User response: No action is required.

HLO4411I  Dynamic allocation return code = 'rc'.
Explanation: This diagnostic message indicates a data set allocation failure.

HLO4412I  data_set_name
Explanation: This message is used to hold data set name information.
User response: No action is required.

HLO5200I  Fallback occurred for DSN: DSN
tablespace: tablespace PART: PART
LRSN/RBA=variable
Explanation: An attempt was made to use DSN as a starting point. It could not be allocated. Fallback will not take place to an earlier point in time in SYSCOPY.
User response: No action is required.

HLO9001E  Error func OPEN input DD REPLIB rc = returncode
Explanation: An error occurred when opening the report library DD concatenation.
User response: Correct the JCL and resubmit the job.
HLO9002E  Error func CLOSE input DD REPLIB rc = returncode  
**Explanation:** An error occurred when closing the report library DD concatenation.  
**User response:** Correct the JCL and resubmit the job.

HLO9003E  Error func enumerate members input DD REPLIB rc = returncode, rsn = reasoncode.  
**Explanation:** An error occurred when enumerating load library members. Error from DESERV service.  
**User response:** The load library is unusable. Recover the load library.

HLO9004E  Error func STARTD rc = returncode , rsn = reasoncode  
**Explanation:** An error occurred when starting a dialog. Error from IEWBIND service.  
**User response:** Contact IBM Software Support.

HLO9005E  Error func ENDD rc = returncode , rsn = reasoncode  
**Explanation:** An error occurred when ending a dialog. Error from IEWBIND service.  
**User response:** Contact IBM Software Support.

HLO9006E  Error func CREATEW rc = returncode , rsn = reasoncode  
**Explanation:** An error occurred when creating a work module. Error from IEWBIND service.  
**User response:** Contact IBM Software Support.

HLO9007E  Error func DELETEW rc = returncode , rsn = reasoncode  
**Explanation:** An error occurred when deleting a work module. Error from IEWBIND service.  
**User response:** Contact IBM Software Support.

HLO9008E  Error func RESETW rc = returncode , rsn = reasoncode  
**Explanation:** An error occurred when resetting a work module. Error from IEWBIND service.  
**User response:** Contact IBM Software Support.

HLO9009E  Error func INCLUDE entry ENTRY_NAME rc = returncode , rsn = reasoncode  
**Explanation:** An error occurred when including an entry. Error from IEWBIND service.  

**User response:** The load library member might be unusable. Recovery of the load library is required.

HLO9010E  Error func GETBUF rc = returncode  
**Explanation:** An error occurred when obtaining storage. Error from IEWBIND service.  
**User response:** Contact IBM Software Support.

HLO9011E  Error func FREEBUF rc = returncode  
**Explanation:** An error occurred when freeing storage. Error from IEWBIND service.  
**User response:** Contact IBM Software Support.

HLO9012E  Error func GETN get sections entry ENTRY_NAME rc = returncode, rsn = reasoncode  
**Explanation:** An error occurred when enumerating sections in entry. Error from IEWBIND service. No sections was found.  
**User response:** The load library member might be unusable. Recovery of the load library is required.

HLO9013E  Warning func GETN no sections entry ENTRY_NAME rc = returncode , rsn = reasoncode  
**Explanation:** An error occurred when enumerating sections in entry. Error from IEWBIND service. No sections was found.  
**User response:** The load library member might be unusable. Recovery of the load library is required.

HLO9014E  Error func GETH get compile units entry ENTRY_NAME rc = returncode, rsn = reasoncode  
**Explanation:** An error occurred when enumerating compile units in entry. Error from IEWBIND service. No compile units was found.  
**User response:** The load library member might be unusable. Recovery of the load library is required.

HLO9015W  Warning func GETH no compile units entry ENTRY_NAME rc = returncode , rsn = reasoncode  
**Explanation:** An error occurred when enumerating compile units in entry. Error from IEWBIND service. No compile units was found.  
**User response:** The load library member might be unusable. Recovery of the load library is required.
HLO9016E  Error invalid buffer size SIZE, expected SIZE.
Explanation: The buffer size is too small. Too many sections were found.
User response: The load library member might be unusable. Recovery of the load library is required.

HLO9017E  Error func GETD get data
ENTRY SECTION_CALSS rc = returncode, rsn = reasoncode
Explanation: An error occurred while reading the entry section class. Error from IEWBIND service.
User response: The load library member might be unusable. Recovery of the load library is required.

HLO9018W  Warning func GETD no data
ENTRY SECTION_CALSS rc = returncode, rsn = reasoncode
Explanation: An error occurred when reading the entry section class. Error from IEWBIND service. Class have no data.
User response: The load library member might be unusable. Recovery of the load library is required.

HLO9019E  Error func CSNBOWH calc MD5 hash rc = returncode, rsn = reasoncode
Explanation: An error occurred when calculating the MD5 hash. Error from CSNBOWH service.
User response: Contact IBM Software Support.

HLO9020E  Error func GETD get RLD data
ENTRY SECTION_CALSS rc = returncode, rsn = reasoncode
Explanation: An error occurred when reading the entry section class. Error from IEWBIND service.
User response: The load library member might be unusable. Recovery of the load library is required.

HLO9021E  Warning func OPEN output DD REPORT01 rc = returncode
Explanation: An error occurred when opening the REPORT01 DD.
User response: Correct the JCL and resubmit the job.

HLO9022W  Warning Module Section Usage report skipped
Explanation: No REPORT01 DD was specified. No report was produced.
User response: Correct the JCL and resubmit the job.

HLO9023I  Module Section Usage report started
Explanation: Report generation started.
User response: No action is required.

HLO9024I  Module Section Usage report completed
Explanation: Report generation completed.
User response: No action is required.

HLO9025W  Warning func OPEN output DD REPORT02 rc = returncode
Explanation: An error occurred when opening the REPORT02 DD.
User response: Correct the JCL and resubmit the job.

HLO9026W  Warning Section MD5 Hash Usage report skipped
Explanation: No REPORT02 DD was specified. No report was produced.
User response: Correct the JCL and resubmit the job.

HLO9027I  Section MD5 Hash Usage report started
Explanation: Report generation started.
User response: No action is required.

HLO9028I  Section MD5 Hash Usage report completed
Explanation: Report generation completed.
User response: No action is required.

HLO9029W  Warning func OPEN output DD REPORT03 rc = returncode
Explanation: An error occurred when opening the REPORT03 DD.
User response: Correct your JCL and resubmit the job.

HLO9030W  Warning Section APAR Usage report skipped
Explanation: No REPORT03 DD was specified. No report was produced.
User response: Correct the JCL and resubmit the job.

HLO9031I  Section APAR Usage report started
Explanation: Report generation started.
User response: No action is required.
HLO9032I  Section APAR Usage report completed
Explanation: Report generation completed.
User response: No action is required.

HLO9033W  Warning func OPEN output DD REPORT04 rc = returncode
Explanation: An error occurred when opening the REPORT04 DD.
User response: Correct the JCL and resubmit the job.

HLO9034W  Warning APAR Section Affected report skipped
Explanation: No REPORT04 DD was specified. No report was produced.
User response: Correct the JCL and resubmit the job.

HLO9035I  APAR Section Affected report started
Explanation: Report generation has started.
User response: No action is required.

HLO9036I  APAR Section Affected report completed
Explanation: Report generation is complete.
User response: No action is required.

HLO9037I  (c) Copyright Rocket Software, Inc. 2016. All Rights Reserved.

HLO9038I  Load Library Report utility started
Explanation: Utility started.
User response: No action is required.

HLO9039I  Load Library Report utility completed rc = returncode
Explanation: Utility completed.
User response: Check the return code.

HLO9040I  Warning Entry %.s have TEST attribute set
Explanation: The TEST attribute could not be set for an entry.
User response: The load library member might be unusable. Recovery of the load library is required.

HLO9001E  Error occurred during attempt to offload to zIIP.
Explanation: The product encountered an error while trying to send work to the zIIP, and processing halted.
User response: Check the log for additional error messages.

HLO9002E  LOB header page encountered.
Explanation: The product encountered a LOB image copy while processing rows, and processing halted. The product does not support LOBs.
User response: Ensure that the filter set does not include a LOB.

HLO9003E  Edit procedure found during zIIP processing for table tableName.
Explanation: An edit procedure is defined for the specified table, and processing edit procedures cannot occur on a zIIP processor.
User response: Contact IBM Software Support.

HLO9004E  Table versioning found for table tableName.
Explanation: The specified table contains rows that use a previous version of the table. These rows cannot be processed, and processing halted.
User response: Specify only tables in which every row is in the format of the newest version.

HLO9005E  A CEL|64 free request failed.
Explanation: An attempt to free storage failed, and processing halted.
User response: Check the log for additional error messages.

HLO9006E  Process halted, memory exhausted for storageArea.
Explanation: An internal storage area was filled beyond its capacity, and processing halted.
User response: Contact IBM Software Support.

HLO9007E  Edit proc error; name: procedureName; retcode: return_code; rescde: reasonCode
Explanation: While attempting to decode the row, the specified edit procedure returned an error with the specified return and reason codes, and processing halted.
User response: Determine the meaning of the return and reason codes based on your EDITPROC. If the
error is caused by the product, contact IBM Software Support.

**HLOA008E**  
Name/token pair could not be found.  
Explanation: The common storage name/token pair is missing.  
User response: Contact IBM Software Support.

**HLOA009E**  
An error occurred while looking up a name/token pair: IENANTRreturnCode  
Explanation: Accessing the name/token pair resulted in an error. The IENANTR return code is specified.  
User response: See the IBM documentation for the IENANTR error code to determine the problem.

**HLOA010E**  
Table not found in common storage table list: tableName  
Explanation: The specified table was not found in the common storage table list.  
User response: Contact IBM Software Support.

**HLOA011E**  
The LOAD job ended before all tables were written.  
Explanation: The load to IBM Db2 Analytics Accelerator for z/OS ended before all data was written.  
User response: Check the job log for other error messages that indicate why the load ended prematurely.

**HLOA012E**  
Blocking named pipe failed. Return code: return_code; reason code: reasonCode; path name: pathName.  
Explanation: The attempt to block on the named pipe failed.  
User response: Contact IBM Software Support.

**HLOA013E**  
An error occurred while posting across address spaces. The ASID is asIDName.  
Explanation: An attempt to POST failed.  
User response: Contact IBM Software Support.

**HLOA014E**  
Opening named pipe failed. Return code: return_code; reason code: reasonCode; path name: pathName.  
Explanation: The specified path name could not be opened.  
User response: Contact IBM Software Support.
HLOA106I  HLOEDIT-RC4 attempting alt state.
Explanation: Module HLOEDIT is attempting a new path for the edit procedure.
User response: No action is required.

HLOA107I  Start HLORERD (buildLevel buildDate buildTime).
Explanation: The module HLORERD has been started. The modification level, the date, and the time of the module’s build are indicated.
User response: No action is required.

HLOA108I  HLORERD zIIP cleanup error.
Explanation: An error occurred while cleaning up the zIIP.
User response: See related error messages.

HLOA109I  Pages processed=pageCount.
Explanation: The specified number of image copy pages were processed for the run.
User response: No action is required.

HLOA110I  Stack pops=popsCount.
Explanation: The specified number of image copy pops were included in the run.
User response: No action is required.

HLOA111I  Pages per pop=pageCount.
Explanation: The specified number of image copy pages were processed per pop for the run.
User response: No action is required.

HLOA112I  Rows processed=rowCount.
Explanation: The specified number of rows were processed for IBM Db2 Analytics Accelerator for z/OS for the run.
User response: No action is required.

HLOA113I  HLOPRPG page processing error.
Explanation: HLOPRPG returned an error.
User response: See related error messages.

HLOA115E  Error occurred during error processing errorMessage.
Explanation: An error occurred while processing the specified error message.
User response: Look up the indicated error code to determine the original error condition.

HLOA116I  Exiting HLOZSCHD with RC=<error_code>.
Explanation: Module HLOZSCHD returned the specified error code.
User response: See related error messages.

HLOA117I  Opening a new pipe for tableName partitionNumber.
Explanation: A connection to the IBM Db2 Analytics Accelerator for z/OS for the specified table and partition was opened.
User response: No action is required.

HLOA118I  Closing a pipe for tableName partitionNumber.
Explanation: A connection to the IBM Db2 Analytics Accelerator for z/OS for the specified table and partition was closed.
User response: No action is required.

HLOA119I  Edit procedure found. Turning off zIIP.
Explanation: A table was found that has an edit procedure defined for it. The zIIP processor will not be used so that processing can continue.
User response: No action is required.

HLOA121I  No zIIP available.
Explanation: No zIIP processor is available for zIIP-eligible work.
User response: No action is required.

HLOA123E  log_apply_subtask_ID Bad Writes=errorCount
Explanation: A problem has occurred with pipe processing. The errorCount is the total number of times that the pipe write mechanism returned an error during the course of the run. A dump has been generated.
User response: Review the dump data to diagnose and resolve the problem. If you need assistance, contact IBM Software Support.

HLOA200E  Could not obtain SSID from input parameters.
Explanation: The subsystem ID (SSID) was not specified in the PARM.
User response: Check the job and specify the SSID.
HLOA201E  Could not open the TABLE DD.
Explanation:  The product could not open the TABLE DD.
User response:  Correct the JCL and submit the job again.

HLOA202E  Table not found in TABLE DD.
Explanation:  The TABLE DD was used but no table was specified.
User response:  Correct the JCL and submit the job again.

HLOA203E  Table owner not specified.
Explanation:  The TABLE DD was used but no table owner was specified.
User response:  Correct the JCL and submit the job again.

HLOA204E  Table name not specified.
Explanation:  The TABLE DD was used but no table name was specified.
User response:  Correct the JCL and submit the job again.

HLOA205E  Table owner too long.
Explanation:  The specified table owner is too long. The maximum number of characters for the table owner name is 128. The table owner name cannot exceed column 72; continue on the next line in column 1. No special character is needed.
User response:  Correct the JCL and submit the job again.

HLOA206E  The name/token does not exist for the subsystem.
Explanation:  The job is trying to clean common storage that does not exist on this subsystem.
User response:  Make sure that the specified subsystem value is correct.

HLOA207E  Forcing cleanup failed. IEANTDL
Explanation:  An unexpected error occurred during cleanup.
User response:  Contact IBM Software Support.

HLOA208E  Could not open the JOB DD.
Explanation:  The product could not open the JOB DD.
User response:  Correct the JCL and submit the job again.

HLOA209E  Job ID not found in JOB DD.
Explanation:  The JOB DD was used but the job ID was not specified.
User response:  Correct the JCL and submit the job again.

HLOA210E  Job name not found in JOB DD.
Explanation:  The JOB DD was used but the job name was not specified.
User response:  Correct the JCL and submit the job again.

HLOA211I  Common storage successfully cleaned.
Explanation:  All common storage for the subsystem was cleared.
User response:  No action is required.

HLOA212I  Specified table has been cleaned from storage.
Explanation:  The specified table has been cleared from the common storage.
User response:  No action is required.

HLOA213I  Specified job has been cleaned from storage.
Explanation:  All common storage related to the specified job was cleared.
User response:  No action is required.

HLOG8000S  Internal error in API <api_context>,
            RC=<api_return_code>,
            RSN=<api_reason_code>.
Explanation:  An error occurred in the Db2 Analytics Accelerator Loader internal application programming interface (API).
User response:  Contact IBM Software Support. Provide Support with the complete text of this message.

HLOG8001S  Storage release failed.
            Module=<module_name>, storage area=<storage_area_name>,
            RC=<return_code>.
Explanation:  The specified module failed while
HLOG8002S • HLOM9601E

HLOG8002S Address=storage_area_address, Length=storage_area_length, SP=storage_subpool, KEY=storage_key

Explanation: This message accompanies message HLOG8001S, which indicates a failure to release storage. This message provides additional details about the storage that could not be released.

User response: Contact IBM Software Support. Provide the support representative with the complete text of this message and message HLOG8001S.

---

HLOG8003E Storage obtain failed.
Module=<module_name>, storage area=<storage_area_name>, RC=<return_code>

Explanation: The specified module failed while attempting to obtain the specified storage area. The message HLOG8004E usually accompanies this message and contains additional information about the storage area.

User response: Increase the region size available to the Db2 Analytics Accelerator Loader program and run the product again. If the problem persists, contact IBM Software Support. Provide Support with the complete text of this message and message HLOG8004E.

---

HLOG8004E Length=storage_area_length, SP=storage_subpool, KEY=storage_key

Explanation: This message accompanies the message HLOG8003E, which indicates a failure to obtain storage. This message provides additional details about the storage that could not be obtained.

User response: Increase the region size available to the Db2 Analytics Accelerator Loader program and run the product again. If the problem persists, contact IBM Software Support. Provide Support with the complete text of this message and message HLOG8003E.

---

HLOG8005E Unable to open file. DD name=dd_name

Explanation: The file that was allocated by the specified data definition (DD) could not be opened.

User response: Check the JCL to ensure that the correct DD name was provided and that the data set was allocated using the correct file type.

---

HLOG8006E Unable to dynamically allocate data set. DD name=dd_name

Explanation: The specified data definition (DD) was not able to dynamically allocate a data set that was needed.

User response: Contact IBM Software Support.

---

HLOG8007E Unable to close file. DD name=dd_name

Explanation: The file that was allocated by the specified data definition (DD) could not be closed.

User response: If this problem persists, contact IBM Software Support.

---

HLOG8008I System=<system_name>, Job=<job_name>, Job Id=<job_id>, Step=<step_name>, Program=<program_name>, User=<user_id>

Explanation: This message displays information about the current job step.

User response: No action is required.

---

HLOG8009E The operating system or hardware do not meet minimum requirements.

Explanation: See the Product Program Directory for the minimum operating system level and hardware requirements.

User response: No action is required.

---

HLOG8010I CPU=<cpu_type>, <cpu_model>, <cpu_manufacturer>, OS=<os_name>, <os_release>, <os_version>

Explanation: This message displays information about the CPU and the operating system.

User response: No action is required.

---

HLOM9600E An invalid function was supplied to utility.

Explanation: An invalid function was specified in the HLOMAINT job for the Db2 Analytics Accelerator Loader maintenance utility.

User response: In the PARM statement of the HLOMAINT job, specify a valid function (for example, TERM_UTILITY). See the user’s guide for the functions that are valid for the HLOMAINT utility.

---

HLOM9601E API Initialization failed

Explanation: The HLOMAINT interface program failed to complete initialization. This failure occurred during the initialization of the internal API.

User response: Contact IBM Software Support.
HLOM9602E Unable to establish session with
HLOID: <identifier>

Explanation: The Db2 Analytics Accelerator Loader maintenance utility could not establish a session with the specified started task configuration.

User response: Check that the configuration ID parameter value that is specified in the maintenance utility job (HLOMAINT) is a valid configuration ID.

HLOM9603E Unable to connect to DB2 system:
<db2_ssid>

Explanation: The Db2 Analytics Accelerator Loader maintenance utility could not connect to the specified Db2 subsystem.

User response: Ensure that the Db2 SSID parameter value that is specified in the maintenance utility job (HLOMAINT) specifies a valid Db2 subsystem ID.

HLOM9604I Worklist maintenance successful for
utility id: <db2_utility_id>, function:
maint_utility_function

Explanation: The Db2 Analytics Accelerator Loader maintenance utility successfully performed the specified function for the specified Db2 utility ID in the worklist tables.

User response: No action is required.

HLOM9605W No worklist data found for UTILID:
<db2_utility_id>, function:
maint_utility_function

Explanation: The Db2 Analytics Accelerator Loader maintenance utility found no worklist data for the specified Db2 utility ID. The specified function could not be performed.

User response: No action is required.

HLOM9606E Error while accessing worklist data for
utility ID: <db2_utility_id>, function:
MAINT_function

Explanation: The Db2 Analytics Accelerator Loader maintenance utility (HLOMAINT) encountered an error while attempting to access the worklist data that is associated with the specified Db2 utility ID. The specified maintenance utility function could not be performed.

User response: In the HLOMAINT job, check that the PARM statement specifies valid values for the Db2 SSID and utility ID parameters. Also check the messages in the started task SYSPRINT log for related SQL errors.

HLOM9607E Session creation failed
RC=<return_code>, RSN=<reason_code>,
reason=<description>

Explanation: The Db2 Analytics Accelerator Loader maintenance utility (HLOMAINT) failed to complete initialization. The failure occurred during the creation of a session for HLOMAINT.

User response: To determine the cause of the failure, review the reason description in this message. Correct the problem and run the job again. If you need assistance, contact IBM Software Support.

HLOM9608E Session has been terminated by the
server.

Explanation: The utility did not complete because the session was terminated by the server.

User response: Check with the system administrator to determine the reason for the termination of the maintenance utility program.

HLOP9800E <!ATTLIST attribute_name> attribute
'attribute_value' has an invalid
enumeration value list

Explanation: While the Db2 Analytics Accelerator Loader XML parser was parsing an !ATTLIST declaration, it found an error in the enumeration value list that defines the valid values for an attribute.

User response: Correct the enumeration list and rerun.

HLOP9801E <!ATTLIST attribute_name> attribute
'attribute_value' missing enumeration
value

Explanation: While the Db2 Analytics Accelerator Loader XML parser was parsing an !ATTLIST declaration, it encountered an invalid enumeration token. Enumeration tokens must be valid XML names.

User response: Correct the enumeration list and rerun.

HLOP9802E <!ATTLIST attribute_name> attribute
'attribute_value' no closing quote for
default value

Explanation: While the Db2 Analytics Accelerator Loader XML parser was parsing an !ATTLIST declaration, it found a default value of type string, but it did not have a closing quotation mark.

User response: Correct the string definition and rerun.

HLOP9803E <!ATTLIST attribute_name> attribute
'attribute_value' enumerated type list
missing '('

Explanation: While the Db2 Analytics Accelerator Loader XML parser was parsing an !ATTLIST...
declaration, it encountered an enumeration or NOTATION list, as expected, but that list did not have an opening left parenthesis.

**User response:** Correct the enumeration list and rerun.

**HLOP9804E**  
\[
\text{<!ATTLIST attribute_name> attribute 'attribute_value' expected quoted default value}
\]

**Explanation:** While the Db2 Analytics Accelerator Loader XML parser was parsing an !ATTLIST declaration, it did not find the default value specification, as expected.

**User response:** Supply a default value for the !ATTLIST declaration and rerun.

**HLOP9805E**  
\[
\text{getAttribute(missing_attribute_name) error: attribute not defined}
\]

**Explanation:** A request was made to retrieve the value of an attribute for a given XML element, but the attribute was not defined.

**User response:** Verify that the attribute exists before requesting its value, or add the attribute to the XML document.

**HLOP9806E**  
\[
\text{<![IGNORE[ not terminated by matching ']']>}'
\]

**Explanation:** When the Db2 Analytics Accelerator Loader XML parser was parsing an <![IGNORE[ ... ]]> conditional section, it did not find the required closing character sequence.

**User response:** Correct the conditional sequence and rerun.

**HLOP9807E**  
\[
\text{<![INCLUDE[ not terminated by matching ']']>}'
\]

**Explanation:** When the Db2 Analytics Accelerator Loader XML parser was parsing an <![INCLUDE[ ... ]]> conditional section, it did not find the required closing character sequence.

**User response:** Correct the conditional sequence and rerun.

**HLOP9808E**  
\[
\text{Unable to open default input file}
\]

**Explanation:** The XML parser was not able to open the top-level default input file.

**User response:** Make sure that the file exists and the correct name is being passed to the XML parser.

**HLOP9809E**  
\[
\text{Unable to open DOCTYPE file 'DOCTYPE_file_name'}
\]

**Explanation:** A !DOCTYPE declaration was specified, but the DOCTYPE file name could not be read.

**User response:** Make sure that the DOCTYPE file exists and that the correct file name is specified in the !DOCTYPE declaration.

**HLOP9810E**  
\[
\text{Unable to open external ENTITY file 'ENTITY_file_name'}
\]

**Explanation:** An external entity file was defined, but it could not be read to resolve the entity reference.

**User response:** Make sure that the external entity file exists and that the correct file name is specified in the !ENTITY declaration.

**HLOP9811E**  
\[
\text{element <element_name> ended by <element_name_1>}
\]

**Explanation:** An incorrectly nested element definition was found. The tag defining the beginning of an element did not match the closing tag.

**User response:** Correct the nesting structure of the element definition and rerun.

**HLOP9812E**  
\[
\text{Closing tag </element_name missing '>' character}
\]

**Explanation:** When the XML parser was parsing the end tag for an element, it did not find the required closing '>', character.

**User response:** Correct the end tag and rerun.

**HLOP9813E**  
\[
\text{<!ELEMENT element_name> is already declared}
\]

**Explanation:** Only one !ELEMENT declaration can be supplied for a given element tag.

**User response:** Remove the duplicate !ELEMENT declaration and rerun.

**HLOP9814E**  
\[
\text{<!ELEMENT element_name> expecting subelement name.}
\]

**Explanation:** When the XML parser was parsing a mixed-content specification of an !ATTLIST declaration, it found an error in the list of allowable subelements.

**User response:** Correct the subelement list and rerun.

**HLOP9815E**  
\[
\text{ENTITY &entity_name; not defined}
\]

**Explanation:** An entity reference was found for which no declaration exists.

**User response:** Check the spelling of the entity.
reference name, or add the entity definition for the name and rerun.

**HLOP9816E** End-of-data encountered while parsing attribute value string

**Explanation:** When the XML parser was parsing an attribute value string, it found no closing quotation mark before the end of the file, as required.

**User response:** Correct the attribute value string and rerun.

**HLOP9817E** End-of-data encountered in a CDATA section

**Explanation:** When the XML parser was parsing a <![CDATA[ ... ]]> section, it found no ]]> characters. These characters are required to close the section before the end of the file.

**User response:** Correct the CDATA section and rerun.

**HLOP9818E** End-of-data encountered in a comment

**Explanation:** When the XML parser was parsing an XML comment, it found no `-->` characters. These characters are required to close the comment before the end of the file.

**User response:** Correct the comment and rerun.

**HLOP9819E** End-of-data encountered inside a declaration

**Explanation:** When the XML parser was parsing an XML declaration, it found no `>` character. This character is required to close the declaration before the end of the file.

**User response:** Correct the declaration and rerun.

**HLOP9820E** End-of-data encountered in DOCTYPE declaration

**Explanation:** When the Db2 Analytics Accelerator Loader XML parser was parsing a !DOCTYPE declaration, it reached the end of the file before the declaration was complete.

**User response:** Correct the !DOCTYPE declaration and rerun.

**HLOP9821E** End-of-data encountered while parsing element attributes

**Explanation:** When the Db2 Analytics Accelerator Loader XML parser was parsing the attribute list for an element, it reached the end of the file before the attribute list was complete.

**User response:** Correct the element attribute list and rerun.

**HLOP9822E** End-of-data encountered inside an <!ELEMENT ...> declaration

**Explanation:** When the XML parser was parsing an !ELEMENT declaration, it reached the end of the file before the declaration was complete.

**User response:** Correct the !ELEMENT declaration and rerun.

**HLOP9823E** End-of-data encountered in ENTITY definition

**Explanation:** When the XML parser was parsing an !ENTITY declaration, it reached the end of the file before the declaration was complete.

**User response:** Correct the !ENTITY declaration and rerun.

**HLOP9824E** End-of-data encountered in processing instruction

**Explanation:** When the XML parser was parsing an XML processing instruction, it reached the end of the file before the processing instruction was complete.

**User response:** Correct the processing instruction and rerun.

**HLOP9825E** Invalid <!ATTLIST attribute_name>

**Explanation:** A syntax error was detected while the Db2 Analytics Accelerator Loader XML parser was parsing an XML !ATTLIST declaration.

**User response:** Correct the !ATTLIST declaration and rerun.

**HLOP9826E** Invalid DOCTYPE name

**Explanation:** When the XML parser was parsing an XML !DOCTYPE declaration, it found no valid element name.

**User response:** Correct the !DOCTYPE declaration and rerun.

**HLOP9827E** Invalid !ELEMENT name

**Explanation:** When the Db2 Analytics Accelerator Loader XML parser was parsing an XML !ELEMENT declaration, it found no valid element name.

**User response:** Correct the !ELEMENT declaration and rerun.
HLOP9828E Invalid element tag

Explanation: When the Db2 Analytics Accelerator Loader XML parser was parsing an XML statement, it did not find an expected element tag.

User response: Correct the error and rerun.

HLOP9829E Invalid name in ENTITY definition

Explanation: When the Db2 Analytics Accelerator Loader XML parser was parsing an ENTITY definition, it found no valid entity name.

User response: Correct the ENTITY declaration and rerun.

HLOP9830E Invalid ENTITY reference

Explanation: When the Db2 Analytics Accelerator Loader XML parser was parsing an entity reference, it found no semicolon to terminate the entity reference. Check if an ampersand is incorrectly specified in a string as '&'. An ampersand should be specified as &amp;.

User response: Correct the entity reference and rerun.

HLOP9831E Invalid value in ENTITY definition: value

Explanation: A syntax error was encountered while the Db2 Analytics Accelerator Loader XML parser was parsing an XML ENTITY definition.

User response: Correct the ENTITY definition and rerun.

HLOP9832E typespec for <!ELEMENT element_name> not correctly ended

Explanation: A syntax error was detected while Db2 Analytics Accelerator Loader was processing the typespec parameter of an !ELEMENT declaration.

User response: Correct the !ELEMENT declaration and rerun.

HLOP9833E '<' character not legal in attribute value string

Explanation: The replacement text of any entity referred to directly or indirectly in an attribute value must not contain a '<' character.

User response: Correct the attribute value and rerun.

HLOP9834E No attributes defined for non-element node types

Explanation: An attempt was made to request an attribute for an XML element type that does not have attributes.

User response: Fix the element definition and rerun.

HLOP9835E Attribute name not found

Explanation: The XML parser was expecting an attribute name, but no valid attribute name was found.

User response: Correct the XML statement and rerun.

HLOP9836E No closing '>' for ENTITY definition: entity_name

Explanation: No closing '>' character was found to indicate the end of an ENTITY definition.

User response: Correct the ENTITY definition and rerun.

HLOP9837E No closing '<>' for DOCTYPE internal subset definition

Explanation: When the Db2 Analytics Accelerator Loader XML parser was parsing an entity definition list in an XML !DOCTYPE declaration, it found no closing '>' character. The closing character is required.

User response: Correct the !DOCTYPE declaration and rerun.

HLOP9838E No closing tag for <element_name>

Explanation: The XML parser was expecting to find a closing tag for the element but did not find it.

User response: Correct the XML element declaration and rerun.

HLOP9839E No '=' following attribute name 'attribute_name'

Explanation: While the Db2 Analytics Accelerator Loader XML parser was parsing an attribute definition, it expected an '=' sign but found something else. The XML language does not allow spaces before or after the '=' sign in an attribute definition. If these spaces exist, remove them.

User response: Correct the attribute definition and rerun.

HLOP9840E Tag does not follow '<'

Explanation: An XML element tag must immediately follow the opening '<' character of an element definition. The XML parser found a white space character following the '<' instead.

User response: Fix the element definition and rerun.
HLOP9841E  Tag does not follow '</'
Explanation: An XML element tag must immediately follow the closing '</' character of an element definition. The XML parser found a white space character following the '</' instead.
User response: Fix the element definition and rerun.

HLOP9842E  No value found for attribute 'attribute_name'
Explanation: While the Db2 Analytics Accelerator Loader XML parser was parsing an attribute definition, it expected a value to follow the '=' character but found no valid value at that location. The XML language does not allow blanks before or after the '=' character in an attribute definition. If these blanks exist, remove them.
User response: Correct the attribute definition and rerun.

HLOP9843E  parameter %parameter_name; is not defined
Explanation: An undefined parameter reference was found.
User response: Check the spelling of the parameter name, or add a definition for the parameter and rerun.

HLOP9844E  Unexpected character following DOCTYPE SYSTEM name
Explanation: The XML parser expected a '>' character to close a !DOCTYPE declaration but found something else.
User response: Correct the !DOCTYPE declaration and rerun.

HLOP9845E  Unexpected character in <!ELEMENT element_name> children
Explanation: A syntax error was detected while the XML parser was parsing the list of child elements allowed for an !ELEMENT declaration.
User response: Correct the !ELEMENT declaration and rerun.

HLOP9846E  Unexpected characters following <!ELEMENT element_name> #PCDATA
Explanation: The XML parser expected to find a closing '>' character for the #PCDATA token but found something else.
User response: Correct the !ELEMENT declaration and rerun.

HLOP9847E  Unexpected characters in <!ELEMENT element_name> contentspec
Explanation: The XML parser detected an unexpected character following the #PCDATA portion of an !ELEMENT declaration.
User response: Correct the !ELEMENT declaration and rerun.

HLOP9848E  Unexpected contentspec <!ELEMENT element_name> declaration
Explanation: A syntax error was detected in the contentspec portion of an !ELEMENT declaration.
User response: Correct the !ELEMENT declaration and rerun.

HLOP9849E  Unexpected !DOCTYPE option: option
Explanation: The XML parser detected an invalid option in a !DOCTYPE declaration.
User response: Correct the !DOCTYPE declaration and rerun.

HLOP9850E  Unexpected !DOCTYPE SYSTEM value
Explanation: The XML parser detected an invalid value in the SYSTEM portion of a !DOCTYPE declaration.
User response: Correct the !DOCTYPE declaration and rerun.

HLOP9851E  Unexpected !ENTITY SYSTEM value
Explanation: The XML parser detected an invalid value in the SYSTEM portion of a !ENTITY declaration.
User response: Correct the !ENTITY declaration and rerun.

HLOP9852E  Unexpected text in <!ELEMENT element_name>
Explanation: While the XML parser was parsing an !ELEMENT declaration, it expected to find a closing '>' character but found something else.
User response: Correct the !ELEMENT declaration and rerun.

HLOP9853E  Quotation delimiters do not match for attribute value attribute_value
Explanation: The delimiter characters around the specified attribute value in the DSNUTILB intercept policy do not match. The delimiter characters must both be either double quotation marks or single quotation marks.
User response: Correct the delimiters that enclose the
specified attribute value so that they match. Use either double quotation marks or single quotation marks. Then rerun the utility.

HLOP9854W USE_RULESET element in POLICY references an undefined ruleset. Name: ruleset_name.

Explanation: In the DSNUTILB intercept policy, a <USE_RULESET> element in the <POLICY> section references a ruleset name that has not been defined by a <RULESET> element.

User response: Ensure that the ruleset name that is specified by the <USE_RULESET> element matches a ruleset name that is defined by a <RULESET> element in the same policy. You can either correct the ruleset name that is specified by the <USE_RULESET> element or change the ruleset name that is defined by the <RULESET> element (if that ruleset is not referenced by other <USE_RULESET> elements in the policy).

HLOP9855W VRUPDATE element omitted after ACTION=VRUPDATE for DB2SYSTEM db2_ssid.

Explanation: In the DSNUTILB policy, an ACTION=VRUPDATE attribute on the DB2SYSTEM element requires a VRUPDATE child element to be included under the DB2SYSTEM element.

User response: Ensure that the VRUPDATE element is included and that the VRUPDATE element has a DSN attribute that specifies the VR UPDATE job JCL.

HLOP9856W Usage of RULE SYNONYM has been deprecated.

Explanation: In the DSNUTILB policy, a RULE SYNONYM= was encountered. The usage of RULE element SYNONYM= has been deprecated.

User response: No action is required.

HLOP9857E Invalid characters encountered in PART specification.

Explanation: The XML parser detected an invalid character in the PART specification.

User response: Correct the PART specification and rerun.

HLOP9858E USE_PRACTICE in POLICY references an undefined practice. PRACTICE =practice_name.

Explanation: In the DSNUTILB policy, a USE_PRACTICE element in the POLICY section references a PRACTICE name that has not been defined by a PRACTICE element.

User response: Ensure that the practice name that is specified by the USE_PRACTICE element matches a practice name that is defined by a practice element in the same policy. You can either correct the practice name that is specified by the USE_PRACTICE element or change the practice name that is defined by the practice element (if that practice is not referenced by other USE_PRACTICE elements in the policy).

HLOP9859E A duplicate practice name was specified in the policy. PRACTICE=<practice_name>.

Explanation: The DSNUTILB policy defined two PRACTICE elements with the same value specified for the NAME attribute. When PRACTICE elements with duplicate names are found in the policy, the PRACTICE that is coded first in the policy is used by the utility monitor.

User response: Ensure that all practice names are unique.

HLOP9860E A duplicate utility name was specified in a practice. UTILNAME=utility_name.

Explanation: The DSNUTILB policy defined two UTILITY elements with the same NAME under a practice.

User response: Ensure that all utility names are unique within a PRACTICE specification.

HLOP9861E The length of attribute is greater than 1024 characters: ATTRIBUTE=attribute_name.

Explanation: Attributes VALUE and SUBSTITUTE of the SYNTAX policy element are each restricted to 1024 characters.

User response: Correct the specified attribute.

HLOP9862E Attribute attribute_name_1 is incompatible with attribute attribute_name_2.

Explanation: The two specified attributes are mutually exclusive and cannot be used together.

User response: Correct the attribute specifications.

HLOP9863E Multiple <USE_PRACTICE> elements were specified within one <DB2SYSTEM> element, DB2 SSID: <db2_ssid>.

Explanation: In the DSNUTILB policy, multiple <USE_PRACTICE> elements were specified within one <DB2SYSTEM> element. Each <DB2SYSTEM> element can contain only one <USE_PRACTICE> element.

User response: Make sure that all <DB2SYSTEM> elements contain only one <USE_PRACTICE> element.
HLOP9864E <SUBSTITUTE> or <FAIL> attributes must be specified for <VALUE> attribute in <SYNTAX> element.

Explanation: In the DSNUTILB intercept policy, the <VALUE> attribute in the <SYNTAX> element was specified without the required <SUBSTITUTE> or <FAIL> attribute.

User response: Make sure that the <VALUE> attribute in the <SYNTAX> element was specified with the <SUBSTITUTE> or <FAIL> attribute.

HLOP9865E Attributes are not specified in <SYNTAX> element.

Explanation: In the DSNUTILB intercept policy, the <SYNTAX> element was specified with no attributes; however, at least one attribute is required.

User response: Make sure that the <SYNTAX> element contains at least one attribute. For information about the available attributes, see the section about the DSNUTILB intercept policy in the product documentation.

HLOP9866E <VALUE> attribute must be specified for <SUBSTITUTE> or <FAIL> attributes in <SYNTAX> element.

Explanation: In the DSNUTILB policy, the <SUBSTITUTE> or <FAIL> attributes in the <SYNTAX> element were specified without specifying the <VALUE> attribute.

User response: Make sure that the <SUBSTITUTE> or <FAIL> attributes are specified in the <SYNTAX> element when you specify the <VALUE> attribute.

HLOP9867E ACCEL_CURSOR, ACCEL_HLV_SSID, and ACCEL_HLV_GRPNAME are not valid on IDAA_DUAL type loads.

Explanation: When you are loading data from the server, you cannot load only the accelerator (keyword IDAAONLY). For server data sources, the product does not support loading to both Db2 and the accelerator (keyword IDAA_DUAL).

User response: Specify keyword IDAAONLY to load only the accelerator and resubmit the job.

HLOP9868E ACCEL_CURSOR requires an ACCEL_HLV_SSID or ACCEL_HLV_GRPNAME.

Explanation: The group name or SSID of the server is required when ACCEL_CURSOR is specified.

User response: Add the ACCEL_HLV_SSID or ACCEL_HLV_GRPNAME keyword to the load control cards and resubmit the job.

HLOP9869E An ACCEL_CURSOR name must be provided with ACCEL_HLV_SSID or ACCEL_HLV_GRPNAME.

Explanation: When loading data from the server, you must provide an ACCEL_CURSOR name. The cursor name must identify a cursor that was previously declared in an EXEC SQL statement.

User response: Add the ACCEL_CURSOR clause to the load statement and resubmit the job.

HLOP9870E ACCEL_HLV_SSID and ACCEL_HLV_GRPNAME are mutually exclusive. Specify only one or the other.

Explanation: When loading data from the server, you must identify the server by either subsystem ID (SSID) or group name. You cannot specify both.

User response: Remove one of the options and resubmit the job.

HLOP9871E The WHEN clause is not supported with the ACCEL_CURSOR clause.

Explanation: The WHEN clause is not supported when loading data from the Db2 Analytics Accelerator Loader Server.

User response: Remove the WHEN clause from the load control cards and rerun the job.

HLOP9872E The INDDN and INCURSOR clauses are not compatible with the ACCEL_CURSOR clause.

Explanation: When loading data from the server, you cannot also specify an INDDN or INCURSOR clause.

User response: Correct the load control cards and resubmit the job.

HLOP9873E Field specifications cannot be provided when ACCEL_CURSOR is specified.

Explanation: When loading data from the server, you cannot provide field specifications.

User response: Correct the load control cards and resubmit the job.

HLOP9874E ACCEL_SOURCE_DB2 requires ACCEL_CURSOR and either ACCEL_HLV_SSID or ACCEL_HLV_GRPNAME.

Explanation: The ACCEL_SOURCE_DB2 keyword can only be specified when you are loading data from the server. Specify ACCEL_SOURCE_DB2 only when you are loading data from another Db2 subsystem via the server.
User response: Correct the load control cards and resubmit the job.

**HLOP9875E**  **Identifier** value length error. The value must be 1 to `maximum_name_length` characters long.

Explanation: An identifier or name of the specified type has an invalid length. The identifier must be 1 to MAX_LENGTH characters long.

User response: Correct the control cards and submit the job again.

**HLOP9876E**  **KEYWORD1** `<keyword>` and **KEYWORD2** `<keyword>` are mutually exclusive keywords.

Explanation: The specified keywords are mutually exclusive. You can specify one or the other, but not both.

User response: Remove one of the keywords and resubmit the job.

**HLOP9878E** The keyword `<keyword>` is not valid as used.

Explanation: The specified keyword is not valid in the context in which it is used.

User response: Correct the load statement and resubmit the job.

**HLOP9879E** Validation error: ID 'enum_value' not found for IDREF reference

Explanation: An attribute was declared to be an IDREF, but the attribute value was not used as an ID within the XML document.

User response: Check the spelling of the IDREF value, or add a corresponding ID attribute that uses the IDREF value.

**HLOP9880E** Validation error: default 'enum_value' for attribute 'attribute_name' not a member of enumerated type

Explanation: The default value that is specified for an attribute in an !ATTLIST declaration of the Document Type Definition is not a valid value for the attribute.

User response: Correct the !ATTLIST declaration so that the default value is one of the values in the enumerated list of valid attribute values, and then rerun.

**HLOP9881E** Validation error: `<ELEMENT
...element_name> attribute value attribute_name='enum_value' is not a member of the enumerated type.

Explanation: The value that is specified for an attribute is not one of the valid values that is defined for the attribute in the Document Type Definition. When the specified value is NULL or blanks, the default value is used.

User response: Correct the attribute value and rerun the job.

**HLOP9882E** Validation error: attributes declared ID must be #REQUIRED or #IMPLIED

Explanation: An ID attribute must have a declared default of #IMPLIED or #REQUIRED.

User response: Correct the default value for the ID attribute and rerun.

**HLOP9883E** Validation error: duplicate ID ID_name='value'

Explanation: A name must not appear more than once in an XML document as an ID value. That is, ID values must uniquely identify elements.

User response: Eliminate the duplicate ID and rerun.

**HLOP9884E** Validation error: `<ELEMENT element_name EMPTY>` cannot have subelement subelement_name.

Explanation: The Document Type Definition (DTD) does not list the specified subelement as one that is valid for the element.

User response: Correct the element definition to eliminate the invalid subelement and rerun.

**HLOP9885E** Validation error: `<ELEMENT element_name EMPTY>` cannot contain text

Explanation: An element that is declared to be EMPTY in the Document Type Definition cannot contain any content.

User response: Correct the element definition to remove the content and rerun.

**HLOP9886E** Validation error: `<ELEMENT element_name> invalid attribute attribute_name='value'

Explanation: The attribute is not valid for the element according to the Document Type Definition.

User response: Correct the element definition to remove the invalid attribute and rerun.
HLOP987E validation error: <ELEMENT
  element_name> attribute
  attribute_name='attribute_value' not
  #FIXED default value 'default_value'

Explanation: The Document Type Definition specifies that the attribute must have a specific #FIXED value, but the attribute definition specifies a different value.

User response: Correct the attribute to use the #FIXED value and rerun.

HLOP988E validation error: <ELEMENT
  element_name> unexpected subelement
  subelement_name.

Explanation: The specified subelement is not valid in the element according to the Document Type Definition (DTD). This error can occur if the subelement is out-of-order with respect to other subelements, or if it is repeated an incorrect number of times.

User response: Correct the element definition so that it is consistent with the DTD.

HLOP9889E validation error: <ELEMENT
  element_name> missing required attribute
  'required_attribute'

Explanation: An attribute of the element was declared as #REQUIRED in the Document Type Definition, but the attribute is not defined in the element definition.

User response: Correct the element definition to include the required attribute and rerun.

HLOP9890E validation error: <ELEMENT
  element_name> missing required choice
  'required_choice'

Explanation: The Document Type Definition specifies that one of the valid choices defined for the specified element must appear at a specific position within the element. However, the value that was found at that position is not one of the valid choices.

User response: Correct the element definition to conform to the Document Type Definition and rerun.

HLOP9891E validation error: <ELEMENT
  element_name> missing required
  subelement subelement_name.

Explanation: The Document Type Definition (DTD) indicates that the specified subelement is required for the element. However, the subelement was not found in the element definition.

User response: Correct the element definition to supply the required subelement and rerun.

HLOP9892E validation error: An element can have only one attribute of type ID

Explanation: An element type must not have more than one ID attribute specified.

User response: Correct the !ELEMENT definition so that it has only one ID attribute and rerun.

HLOP9893E validation error: Element <element_name> has not been declared

Explanation: The element that is being defined is not declared in the Document Type Definition. Therefore, it is not permitted in the document.

User response: Eliminate the invalid element definition and rerun.

HLOP9894E XML Parser Exception: file_name
  line=line_number

Explanation: The XML parser error that was previously reported caused the parser to stop. The error occurred while the parser was processing data from the specified file at the specified line number.

User response: Correct the error and rerun.

HLOP9895E XML Parser Exception occurred while processing line=line_number

Explanation: The XML parser error that was previously reported caused the parser to stop. The error occurred while the parser was processing data from the top-level input file at the specified line number.

User response: Correct the error and rerun.

HLOP9896E XML Parser Exception

Explanation: The XML parser error that was previously reported caused the parser to stop. The error could not be attributed to a specific line in an input file.

User response: Correct the previously noted error and rerun.

HLOP9897E Allocation error for policy control block
  : enum_value

Explanation: An allocation error occurred for one of the policy control blocks.

User response: Contact IBM Software Support. Provide Support with the message number and text.
Value exceeds maximum length for
RULE: rule_name='rule_value'

Explanation: In the DSNUTILB policy, the length of the specified rule value exceeds the maximum allowable length for the rule. This message provides the first 32 bytes of the rule value that is in error.

User response: Correct the specified rule value in the DSNUTILB policy so that it does not exceed the maximum allowable length for the rule. See the Db2 Analytics Accelerator Loader for z/OS User’s Guide for information about maximum allowable rule lengths. After you make the correction, resubmit the job.

Policy parser error.

Explanation: The DSNUTILB policy parser encountered an error that caused it to stop.

User response: Look for the messages that follow this one for a more detailed description of the error. If the error is related to a policy syntax error, correct the policy and then resubmit the job.

Abnormal termination: file_name
line=line_number

Explanation: The XML parser terminated because of an internal error.

User response: Report the problem to IBM Software Support.

Error: Input buffer size (size bytes) is too small.

Explanation: The input buffer for the XML parser overflowed.

User response: The parser must be rebuilt with a larger input buffer size. Contact IBM Software Support.

Invalid value specified for IGNOREFIELDS. Valid values and YES and NO.

Explanation: An invalid value was specified for the IGNOREFIELDS option of the LOAD utility INTO TABLE statement.

User response: Correct the LOAD syntax and resubmit the job.

RESUME YES cannot be specified for some parts and RESUME NO for others.

Explanation: You must replace the data in all partitions or append data to all partitions. Db2 Analytics Accelerator Loader does not support mixing RESUME YES with RESUME NO.

User response: Correct the LOAD syntax and resubmit the job.

Keyword <RESUME YES> is incompatible with keyword <ACCEL_REMOVE_AND_ADD_TABLES>.

Explanation: The named keywords may not be used together in the same LOAD command.

User response: Correct the syntax and resubmit the job.

Invalid ACCEL_LOCKMODE value. Valid values are TABLE, TABLESET, PARTITIONS, NONE, ROW.

Explanation: The value of keyword ACCEL_LOCKMODE is not valid. Valid values for ACCEL_LOCKMODE are TABLE, TABLESET, PARTITIONS, NONE, and ROW.

User response: Correct the syntax and resubmit the job.

parsed_batch_syntax

Explanation: The Db2 Analytics Accelerator Loader batch interface writes this message to the SPRT0000 output for the thread-cancelation job. This message indicates the parameters or cancel commands that were parsed from the HLOPARMS DD in the job.

User response: No action is required.

'parsed_batch_syntax' can only occur once. Only the last occurrence is used to process the request.

Explanation: The specified parameter occurs more than once in the HLOPARMS DD of the batch thread-cancelation job. Db2 Analytics Accelerator Loader will process the last occurrence of the parameter and ignore all previous occurrences.

User response: No action is required.

'batch_parameter_value' is not a recognized value

Explanation: An invalid value was specified for a parameter in the batch thread-cancelation job. The parameter name and value have been written to the SPRT0000 output for the job.

User response: Look up the valid values for this parameter in the product documentation. Correct the parameter value in the HLOPARMS DD of the job and run the job again.
HLOP9913E  Value 'user_specified_value' must be from minimum_valid_value through maximum_valid_value

Explanation: The specified value is not within the range of valid values for this batch parameter. The parameter name and value have been written to the SPRT0000 output for the thread-cancelation job.

User response: Look up the valid values for this parameter in the product documentation. Correct the parameter value in the HLOPARMS DD of the job and run the job again.

HLOP9914E  parameter_value value can be at most maximum_length bytes

Explanation: The specified batch job parameter value is longer than the maximum length that is allowed for this parameter.

User response: Correct the parameter value in the HLOPARMS DD of the batch thread-cancelation job. Ensure that it does not exceed the maximum length that is specified in this message text. Then run the job again.

HLOP9915E  Expected value 'expected_value' not found

Explanation: Db2 Analytics Accelerator Loader expected the specified value to be in the HLOPARMS DD of the batch thread-cancelation job but did not find it there.

User response: Add the specified value to the HLOPARMS DD where appropriate. Then run the job again.

HLOP9916E  CANCEL_THREADS request is invalid because no selection criteria is specified.

Explanation: No thread-selection criteria were specified for the CANCEL_THREADS request. One of the following must be specified: the ALL_THREADS parameter, the THREAD_TOKEN parameter, or one or more of the other thread-filtering parameters.

User response: Specify a thread-selection parameter in the HLOPARMS DD of the thread-cancelation job. Then run the job again.

HLOP9917E  Initialization parameter value is unknown: parameter_name = parameter_value

Explanation: An initialization parameter for the Db2 Analytics Accelerator Loader started task has an invalid value.

User response: See the Db2 Analytics Accelerator Loader documentation to determine the valid values for the specified initialization parameter. Then correct the value in your HLOOPTS file.

HLOP9918E  Initialization parameter value beyond range: parameter_name = parameter_value

Explanation: An initialization parameter for the Db2 Analytics Accelerator Loader started task has a value that is not within the allowable range for this parameter.

User response: See the Db2 Analytics Accelerator Loader documentation to determine the set of valid values for the specified initialization parameter. Then correct the parameter value in the HLOOPTS file.

HLOP9919E  Initialization parameter value is too long: parameter_name can be at most parameter_max_length characters

Explanation: An initialization parameter for the Db2 Analytics Accelerator Loader started task is longer than the maximum length that is allowed for this parameter.

User response: Correct the parameter value in your initialization options member. Ensure that the value is not longer than the maximum length that is specified in this message text. Then run the job again.

HLOP9920E  Internal parser error: parser expected the address of the control_block_name

Explanation: An internal error occurred in the Db2 Analytics Accelerator Loader batch syntax parser or in the started task initialization options parser.

User response: Contact IBM Software Support.

HLOP9921W  Keyword syntax_keyword is unexpected. It will be ignored.

Explanation: A keyword was found in an unexpected location in the command syntax. The keyword will be ignored.

User response: Correct the syntax and run the job again.

HLOP9922E  Initialization parameter contains nonnumeric characters: parameter_name = parameter_value.

Explanation: An initialization parameter for the Db2 Analytics Accelerator Loader started task contains nonnumeric characters. Only numeric characters are allowed.

User response: Correct the value and start the Db2 Analytics Accelerator Loader started task.

HLOP9925E  Storage obtain failed.

    Module=<module_name>, storage area=<storage_area_name>,
    RC=<return_code>.

Explanation: The specified module failed while...
attempting to obtain the specified storage area.

**User response:** Increase the region size that is available to the Db2 Analytics Accelerator Loader program and run the product again. If the problem persists, contact IBM Software Support. Provide the support representative with the complete text of this message.

<td><strong>User response:</strong> Provide both operands for the DISCARDDTO keyword and resubmit the job.</td>
<td></td>
</tr>
</tbody>
</table>
HLOP9936E  An operand of the DISCARDSPACE keyword is missing and must be specified.

Explanation: The DISCARDSPACE keyword was specified in the CHECK DATA utility syntax but one of the operands was not provided. Both operands are required for this keyword.

User response: Provide both operands for the DISCARDSPACE keyword and resubmit the job.

HLOP9937E  A zero value for an operand of the DISCARDSPACE keyword was specified.

Explanation: The DISCARDSPACE keyword was specified in the CHECK DATA utility syntax and one of the operands specified is a value of zero. A zero value for either the primary or secondary quantity is not allowed.

User response: Provide a valid value for both operands of the DISCARDSPACE keyword and resubmit the job. Valid values are -1 or 1 through 4,194,304.

HLOP9938E  A value greater than the allowed maximum was specified in the DISCARDSPACE keyword.

Explanation: The DISCARDSPACE keyword was specified in the CHECK DATA utility syntax and one of the operands specified exceeded the maximum allowed.

User response: Provide a valid value for both operands of the DISCARDSPACE keyword and resubmit the job. Valid values are -1 or 1 through 4,194,304.

HLOP9939E  Keyword PRESORT is incompatible with &VARIABLE (where &VARIABLE can be one of the following values: FORMAT UNLOAD, FORMAT SQLDS, FORMAT INTERNAL, or NO FIELD SPECS).

Explanation: PRESORT is not supported with the specified criteria.

User response: Correct the syntax and resubmit the job.

HLOP9940E  Value exceeds maximum length for PRACTICE NAME <practice_name>.

Explanation: In the DSNUTILB policy, the length of the specified practice name exceeds the maximum allowable length of 32 characters. This message provides the first 32 characters of the practice name that is in error.

User response: Correct the specified practice name in the DSNUTILB policy so that it does not exceed the maximum allowable length. After making the correction, resubmit the job. For more information about the PRACTICE element, see the product documentation.

HLOP9941E  Attribute <attribute_name> is duplicated within a single element RULE.

Explanation: In the DSNUTILB policy, the attribute displayed in the message text is duplicated within a single element RULE.

User response: In the DSNUTILB policy, delete the duplicated attribute in the single element RULE, and then resubmit the job.

HLOP9942E  Invalid specification for keyword <keyword>.

Explanation: The specified partition numbers are not valid. The partition numbers must be 1 - 4096. The first value must be lower than the second value.

User response: Correct the specified partition numbers. For information about specifying partition numbers, see the product documentation. After you make the correction in the POLICY, restart the started task.

HLOP9943E  Keyword keyword1 is incompatible with keyword keyword2.

Explanation: Both of the specified keywords cannot be present in the load utility job input stream.

User response: Correct the syntax and resubmit the job.

HLOP9944E  Value length of attribute <attribute_name> is more than <attribute_length> characters.

Explanation: In the DSNUTILB policy, the length of the specified attribute value exceeds the maximum allowable length.

User response: Correct the attribute value. For more information about the attribute, see the product documentation.

HLOP9945W  Invalid operand <operand>.

Explanation: The specified operand is only valid for load processing when you are running Db2 Version 9.1 and later.

User response: Remove the specified operand and then restart the job. For more information, see the section about load processing enhancements in the product user's guide.
HLOP9946E Only one table can be specified for load processing when you use the option `<keyword_name>`.

Explanation: The specified option is not supported for multiple tables in a LOAD statement.

User response: Specify only one table and then restart the job. For more information, see the product documentation.

HLOP9947I PRESORT was forced due to KEYWORD `<keyword_name>`.

Explanation: With the specified option, if PRESORT is not specified, LOAD processing continues as though it were.

User response: No action is required.

HLOP9948E Keyword `<keyword_name>` is incompatible with keyword `<keyword_name>`.

Explanation: The specified keywords cannot be used together in the syntax.

User response: Correct the syntax and resubmit the job.

HLOP9949E Keyword IDAA_DUAL ON `<accelerator_name>` is incompatible with keyword IDAA_ONLY ON `<accelerator_name>`.

Explanation: The specified keywords cannot be used together. You can specify only one of the keywords in a job.

User response: Correct the syntax and resubmit the job.

HLOP9950E Invalid length of accelerator name.

Explanation: The accelerator name for keywords IDAA_DUAL ON `<accelerator_name>` and IDAA_ONLY ON `<accelerator_name>` is required and its length cannot exceed eight characters.

User response: Correct the syntax and resubmit the job.

HLOP9951E The ACCEL_LOAD_TASKS value is outside the supported range of 1 - `<max_value>`.

Explanation: The value that is specified for the ACCEL_LOAD_TASKS option in the LOAD utility statement is outside the range of supported values.

User response: No action is required.

HLOP9952E Field specifications are required for IDAA_DUAL and IDAA_ONLY LOADs.

Explanation: When you are loading the accelerator (option IDAA_ONLY) or the accelerator and Db2 (option IDAA_DUAL), the LOAD utility INTO TABLE clause must include field specifications.

User response: Correct the syntax and resubmit the job.

HLOP9953E The ACCEL_LOAD_TASKS value is invalid.

Explanation: Valid values for the ACCEL_LOAD_TASKS option are 1 - `<max_tasks_value>`. For best results, match the value to the setting of the IBM Db2 Analytics Accelerator environment variable AQT_MAX_UNLOAD_IN_PARALLEL.

User response: Correct the ACCEL_LOAD_TASKS value and resubmit the job.

HLOP9954E Keyword_name is only valid with IDAA_DUAL and IDAA_ONLY type LOADs.

Explanation: The indicated keyword can only be specified with the IDAA_DUAL or IDAA_ONLY keywords.

User response: Correct the LOAD utility syntax and resubmit the job.
HLOP9957E  The value specified for
ACCEL_ON_SUCCESS_ENABLE is
invalid. Valid values are: YES | NO.

Explanation: The value that was specified for the
LOAD utility option ACCEL_ON_SUCCESS_ENABLE
is invalid.

User response: Correct the
ACCEL_ON_SUCCESS_ENABLE value and resubmit
the job.

HLOP9958E  ACCEL_ON_SUCCESS_ENABLE is only
valid with IDAA_DUAL and
IDAA_ONLY type LOAD jobs.

Explanation: The ACCEL_ON_SUCCESS_ENABLE
option can only be specified when the IDAA_DUAL
option or the IDAA_ONLY option is also specified.

User response: Correct the LOAD utility syntax and resubmit
the job.

HLOP9959E  EBCDIC and UNICODE are mutually
exclusive keywords.

Explanation: To indicate the format of the SYSREC
data specify either EBCDIC or UNICODE.

User response: Correct the LOAD utility syntax and resubmit
the job.

HLOP9960E  The WHEN clause and field specs
cannot be specified with FORMAT
INTERNAL.

Explanation: The FORMAT INTERNAL option cannot
be specified in the LOAD statement with the WHEN
option or field specifications.

User response: Correct the LOAD utility syntax and resubmit
the job.

HLOP9961E  The HALOAD utility cannot be
specified with other DB2 utilities.

Explanation: A job can contain syntax for the high
availability load utility (HALOAD) or other Db2
utilities, but not both.

User response: Correct the utility syntax and resubmit
the job.

HLOP9962E  The HALOAD utility must specify the
HALOAD utility command.

Explanation: A job that specifies the high availability
load utility (HALOAD) must include the HALOAD
utility command with appropriate syntax.

User response: Correct the utility syntax and resubmit
the job.

HLOP9963E  The HALOAD utility must specify the
<keyword> clause or keyword.

Explanation: The high availability load utility
(HALOAD) control syntax must include the indicated
keyword or clause.

User response: Correct the utility syntax and resubmit
the job.

HLOP9964E  Invalid value specified for keyword
<keyword_name>

Explanation: An invalid delimiter value was specified
on the FORMAT DELIMITED clause of the LOAD
statement. The value specified for COLDEL, CHARDEL
or DECP must be a single-byte character or a
two-character hexadecimal value. For example:
COLDEL ',' or COLDEL X'6B' are both valid delimiter
values. If the SYSREC encoding scheme is Unicode, the
highest acceptable value for any delimiter is x'7F'.

User response: Enter a valid value.

HLOP9967E  Invalid delimiter value specified for
FORMAT DELIMITED

Explanation: An invalid delimiter value was specified
on the FORMAT DELIMITED clause of the LOAD
statement. The value specified for COLDEL, CHARDEL
or DECP must be unique. That is, the same value may
not be specified for multiple delimiters.

User response: Enter a valid value.

HLOS0000I  Db2 Analytics Accelerator Loader
<product_version>, FMID=<product_fmid>,
COMPONENT ID=<product_compid>.

Explanation: This message provides the following
information for your Db2 Analytics Accelerator Loader
configuration: the version and release, FMID (an
identifier for the release), and component ID. It is the
first message issued to the SYSPRINT data set for the
started task after the started task starts.

User response: No action is required.
HLOS0001I  Started task initialization is in progress  

Explanation: The initialization of the Db2 Analytics Accelerator Loader started task has begun.  

User response: No action is required.

HLOS0002I  Started task initialization is complete  

Explanation: The initialization processing for the Db2 Analytics Accelerator Loader started task has successfully completed.  

User response: No action is required.

HLOS0003I  Started task termination is in progress  

Explanation: Termination processing for the Db2 Analytics Accelerator Loader started task has begun.  

User response: No action is required.

HLOS0004I  Started task termination is complete  

Explanation: The Db2 Analytics Accelerator Loader started task successfully completed termination processing.  

User response: No action is required.

HLOS0007I  TCB: <tcb_address> <component_name> - Component initialization is complete  

Explanation: The initialization of the specified component completed successfully.  

User response: No action is required.

HLOS0009I  TCB: <tcb_address> <component_name> - Component termination is complete  

Explanation: The termination of the specified component completed successfully.  

User response: No action is required.

HLOS0010E  TCB: <tcb_address> <component_name> - Component initialization failed.  

Explanation: The initialization of the specified component was not successful.  

User response: To determine the cause of the initialization failure, see the other messages that were issued for this component.

HLOS0012S  TCB: <tcb_address> <component_name> received an unexpected post code. Post code=<post_code>.  

Explanation: An internal error occurred.  

User response: Contact IBM Software Support.

Provide Support with the complete text of this message.

HLOS0013S  TCB: <tcb_address> <component_name>  

Explanation: An internal error occurred.  

User response: Contact IBM Software Support. Provide Support with the complete text of this message.

HLOS0014I  SVC installation is complete. SVC number = <svc_number>.  

Explanation: The installation of the Db2 Analytics Accelerator Loader supervisor call (SVC) was successful.  

User response: No action is required.

HLOS0015I  Removing SVC. SVC number = <svc_number>.  

Explanation: The Db2 Analytics Accelerator Loader supervisor call (SVC) is in the process of being removed.  

User response: No action is required.

HLOS0016E  SVC installation failed. SVC number = <svc_number>, RC=<return_code>, reason=<reason_text>.  

Explanation: The installation of the Db2 Analytics Accelerator Loader supervisor call (SVC) was not successful.  

User response: For more specific information about the SVC installation failure, see the messages that accompany this one.

HLOS0017S  SVC removal failed. SVC number = <svc_number>, RC = <return_code>, Reason = <reason_text>.  

Explanation: The removal of the Db2 Analytics Accelerator Loader supervisor call (SVC) was not successful. This message provides the return code and reason for this failure.  

User response: Contact IBM Software Support. Provide Support with the complete text of this message, including the return code and reason text.

HLOS0018E  SVC installation failed. SVC number=<svc_number>, RC=<return_code>, reason=<reason_text>.  

Explanation: The installation of the Db2 Analytics Accelerator Loader supervisor call (SVC) was not successful. This message provides the return code and reason for the failure.

Chapter 14. Troubleshooting  685
User response: Contact IBM Software Support. Provide Support with the complete text of this message, including the return code and reason text.

HLOS0019I  COMX: comx_address, COMI: comi_address, SVC EP: svc_entry_point_address, MNTLEVEL: maintenance_level

Explanation: This message is issued along with another message to provide diagnostic information to Support for resolving a problem.

User response: Provide this information to IBM Software Support when a Support representative requests it.

HLOS0020I Logging has been started.

Explanation: The Db2 Analytics Accelerator Loader started task has started writing log information to the HLOG table.

User response: No action is required.

HLOS0021I Auditing has been started.

Explanation: The Db2 Analytics Accelerator Loader started task has started writing audit information to the HLOG table.

User response: No action is required.

HLOS0022I Logging has been terminated.

Explanation: The Db2 Analytics Accelerator Loader started task has stopped writing log information to the HLOG table.

User response: No action is required.

HLOS0023I Auditing has been terminated.

Explanation: The Db2 Analytics Accelerator Loader started task has stopped writing audit information to the HLOG table.

User response: No action is required.

HLOS0024I Tracing has been started.

Explanation: The Db2 Analytics Accelerator Loader started task has started writing trace information to the internal trace table.

User response: No action is required.

HLOS0025I Tracing has been terminated.

Explanation: The Db2 Analytics Accelerator Loader started task has stopped writing trace information to the internal trace table.

User response: No action is required.

HLOS0080I Product initialization parameters:

Explanation: This message introduces a list of the initialization parameters that are defined for the Db2 Analytics Accelerator Loader started task. The list is printed when the started task starts.

User response: No action is required.

HLOS0081I parm_name = parm_value_dec

Explanation: This message provides the current decimal value for the specified started task initialization option. The message is issued only for options for which a decimal value is a valid value.

User response: No action is required.

HLOS0082I parm_name = parm_value_char

Explanation: This message provides the current integer value for the specified started task initialization parameter. This message is issued only for parameters for which an integer value is a valid value.

User response: No action is required.

HLOS0083S A value for the initialization parameter 'parm_name' must be specified

Explanation: The specified started task initialization parameter is not included in the initialization parameters file, or it has a value that is composed of only blanks. This parameter is required and must have a non-blank value.

User response: Ensure that this initialization parameter is in the initialization parameters file and is set to a non-blank value.

HLOS0085W 'parm_name' must have a value from parm_min through parm_max. Parameter defaulted to: parm_def

Explanation: The value that is set for the specified Db2 Analytics Accelerator Loader started task initialization parameter is not within the allowable range of values for this parameter. As a result, the value will be changed to the default value for the parameter.

User response: Accept the default value, or specify a value that is within the allowable range of values for this parameter in the initialization options member.

HLOS0101I TCB: <tcb_address> Session created.
SESS: session_token-session_number-
session_type-session_job_name-
session_job_ID-session_asid-session_user

Explanation: The Db2 Analytics Accelerator Loader session was created. The session is identified by the information that is listed in this message after "SESS":

686  Db2 Analytics Accelerator Loader User's Guide
- **Session_token** is an internal session identifier.
- **Session_number** is a unique session identifier that is generated incrementally for each new session that is created.
- **Session_type** indicates whether the session is for a batch job (B), an ISPF user (I), the DSNUTILB intercept (U), or the HLOMAINT utility (M).
- **Session_job_name** is the name of the job that is associated with the session.
- **Session_job_ID** is the identifier for the job that is associated with the session.
- **Session_asid** is the hexadecimal address space identifier for the user type (session type).
- **Session_user** is the user ID.

**User response:** No action is required.

HLOS0103I  TCB: <tcb_address> Session terminated.  
SESS:session_token=session_number-
session_type=session_job_name-
session_job_ID=session_asid-
session_user  

**Explanation:** The Db2 Analytics Accelerator Loader session that was using the specified task control block (TCB) address space terminated. The attributes of this session are listed in this message after "SESS":

- **Session_token** is an internal session identifier.
- **Session_number** is a unique session identifier that is generated incrementally for each new session that is created.
- **Session_type** indicates whether the session is for a batch job (B), an ISPF user (I), the DSNUTILB intercept (U), or the HLOMAINT utility (M).
- **Session_job_name** is the name of the job that is associated with the session.
- **Session_job_ID** is the identifier for the job that is associated with the session.
- **Session_asid** is the hexadecimal address space identifier for the user type (session type).
- **Session_user** is the user ID.

**User response:** No action is required.

HLOS0104E  TCB: <tcb_address> Session:  
<session_token> Unicode Conversion Error. RC: <return_code> RSN: <reason_code>  

**Explanation:** An attempt by the Db2 Analytics Accelerator Loader started task to convert a default column value from UTF-8 to the table CCSID has failed. The system Unicode Character Conversion service is used for these conversions. A call to the conversion service failed with the indicated return and reason codes. This conversion was attempted on behalf of a batch load client. Refer to the failed batch job for additional information. This message is followed by messages HLOS0105E – HLOS0107 to identify the failing column, table name, and table creator respectively.

**User response:** Refer to the failed batch job for additional information.

HLOS0200E  TCB: <tcb_address> DB2 Call Attach Facility request <caf_request> failed,  
RC=<return_code>, RSN=<reason_code>.  

**Explanation:** The Db2 Call Attach Facility (CAF) returned the return code and reason code that is included in this message for the specified CAF request.

**User response:** Contact IBM Software Support. Provide Support with the return code and reason code that is included in this message.

HLOS0201S  TCB: <tcb_address> A Connect-to-DB2 request was received for db2_ssid, but a connection already exists.  

**Explanation:** A request to connect to the specified Db2 subsystem was received. However, a connection to that subsystem is already established.

**User response:** Contact IBM Software Support.

HLOS0202E  TCB: <tcb_address> db2_error_msg  

**Explanation:** An error was encountered during an SQL or Db2 instrumentation facility interface (IFI) operation. This message contains the text of the message that the Db2 DSNTIAR message formatting routine issued when the error occurred. A possible cause is that the started task does not have the proper authorization to perform the operation. The started task requires system administration authority (SYSADM) on all active subsystems in the data sharing group.

**User response:** For more information about the error, see the IBM Db2 messages documentation.

HLOS0203I  TCB: <tcb_address> Connection to DB2 was successful. SSID=dlb2_ssid  

**Explanation:** Db2 Analytics Accelerator Loader successfully connected to the specified Db2 subsystem.

**User response:** No action is required.

HLOS0204I  TCB: <tcb_address> Disconnection from DB2 was successful. SSID=dlb2_ssid  

**Explanation:** Db2 Analytics Accelerator Loader successfully disconnected from the specified Db2 subsystem.

**User response:** No action is required.
HLOS0205S  TCB: <tcb_address> STIMER SET failed.  
RC=<return_code>.  Processing continues.  
Explanation:  Db2 Analytics Accelerator Loader could not set a timing interval by using the STIMERM macro.  Processing continues.  
User response:  Contact IBM Software Support.

---

HLOS0206S  TCB: <tcb_address> STIMER CANCEL failed.  
RC=<return_code>.  Processing continues.  
Explanation:  Db2 Analytics Accelerator Loader could not cancel a timing interval by using the STIMERM macro.  Processing continues.  
User response:  Contact IBM Software Support.

---

HLOS0207E  TCB: <tcb_address> DB2 Instrumentation Facility request <ifi_request> failed,  
RC=<return_code>, SSID=<db2_ssid>.  
Explanation:  The specified request for the Db2 instrumentation facility interface (IFI) failed with the specified return code and reason code on the specified SSID.  
User response:  Contact IBM Software Support.  Provide Support with the return code and reason code that is included in this message.

---

HLOS0208I  TCB: <tcb_address> Session:  
<session_token> - CANCEL THREAD issued for thread token <thread_token>  
Explanation:  Db2 Analytics Accelerator Loader issued the CANCEL THREAD command for the thread that has the specified thread token value.  
User response:  No action is required.

---

HLOS0209E  TCB: <tcb_address> Connection to DB2 failed.  
SSID=<db2_ssid>  
Explanation:  Db2 Analytics Accelerator Loader could not connect to the Db2 subsystem that has the specified SSID.  
User response:  To determine the cause of the connection failure, see the message HLOS0202E in the message log.  If you need assistance, contact IBM Software Support.

---

HLOS0210E  TCB: <tcb_address> Fatal error while processing the DB2 trace record:  
place_marker  
Explanation:  A unrecoverable error occurred while Db2 Analytics Accelerator Loader was processing the Db2 trace record.  
User response:  Contact IBM Software Support.

---

HLOS0211I  db2_error_msg  
Explanation:  The Db2 message formatting service DSNTIAR formatted the messages that follow this one in response to an action that was performed by an SQL or IFI operation.  
User response:  No action is required.

---

HLOS0212I  TCB: <tcb_address>, Lock data returned for ace token <ace_token>.  
Explanation:  The Db2 instrumentation facility (IFI) returned lock data for the specified ace token.  
User response:  No action is required.

---

HLOS0213I  TCB: <tcb_address> Session:  
<session_token> - CANCEL THREAD NOBACKOUT was issued for thread token <thread_token>  
Explanation:  Db2 Analytics Accelerator Loader issued the CANCEL THREAD command with the NOBACKOUT option for the thread that has the specified thread token value.  
User response:  No action is required.

---

HLOS0214E  Escalated Cancel is not supported for threads executing on a remote DB2 system.  
Explanation:  The escalated cancel command is supported only for threads that are active on the Db2 system to which you connected.  Use the normal Db2 cancel command to terminate threads that are active on other Db2 subsystems that are members of the same data-sharing group.  
User response:  No action is required.

---

HLOS0215I  TCB: <tcb_address> Session:  
<session_token> - ESCALATED THREAD CANCEL was issued for thread token <thread_token>  
Explanation:  Db2 Analytics Accelerator Loader performed an escalated cancelation of the thread that has the specified thread token value.  An escalated cancelation issues a command through the operator console to terminate the process that holds the thread.  
User response:  No action is required.

---

HLOS0216E  Escalated Cancel is not supported for connection type connection_type  
Explanation:  The Escalated Cancel command is not supported for the specified connection type.
User response: No action is required.

**HLOS0217I**  ESCALATED THREAD CANCEL was issued for thread token **thread_token**

Explanation: Db2 Analytics Accelerator Loader performed an escalated cancelation of the thread that has the specified thread token value. An escalated cancelation issues a command through the operator console to terminate the process that holds the thread.

User response: No action is required.

**HLOS0218I**  CANCEL THREAD was not issued because a unit of recovery exists for token **thread_token**

Explanation: Db2 Analytics Accelerator Loader did not issue a CANCEL THREAD command for the thread that has the specified thread token value because the NO BACKOUT option was specified as the cancel type. This option prevents the cancelation from occurring when an outstanding unit-of-recovery exists for a thread.

User response: No action is required.

**HLOS0219I**  CANCEL THREAD was not issued because unit of recovery status is unknown for token **thread_token**

Explanation: Db2 Analytics Accelerator Loader did not issue a CANCEL THREAD command for the thread that has the specified thread token value because the NO BACKOUT option was specified as the cancel type. This option prevents a cancelation from occurring when no unit-of-recovery information is available.

User response: No action is required.

**HLOS0220I**  TCB: **<tcb_address>**  Session: **<session_token>**  - CANCEL THREAD requested for thread token **thread_token**

Explanation: Db2 Analytics Accelerator Loader received a CANCEL THREAD request for the thread that has the specified thread token value.

User response: No action is required.

**HLOS0221E**  TCB: **<tcb_address>**  Session: **<session_token>**  - CANCEL THREAD request failed security check for thread token **thread_token**

Explanation: Db2 Analytics Accelerator Loader received a CANCEL THREAD request for the thread that has the specified thread token value. However, the request failed because it did not pass security-exit checking.

User response: No action is required.

**HLOS0222E**  TCB: **<tcb_address>**  Session: **<session_token>**  - pre-cancel exit denied cancel request.

Explanation: Db2 Analytics Accelerator Loader received a CANCEL THREAD request for the thread that has the specified thread token value. However, the request failed because it did not pass pre-cancel exit checking.

User response: No action is required.

**HLOS0223E**  TCB: **<tcb_address>**  Session: **<session_token>**  - ESCALATED CANCEL not allowed by startup parm

Explanation: An escalated cancelation cannot be performed because a started task initialization option is specified that does not allow this type of cancelation.

User response: No action is required.

**HLOS0224E**  TCB: **<tcb_address>**  Session: **<session_token>**  - CANCEL THREAD suppressed for HLO token **thread_token**

Explanation: The Db2 CANCEL THREAD command and the escalated cancel command (z/OS operator Cancel command) is not supported for the current Db2 Analytics Accelerator Loader started task.

User response: No action is required.

**HLOS0225E**  CANCEL THREAD request failed security check for thread token **thread_token**

Explanation: Db2 Analytics Accelerator Loader received a CANCEL THREAD request for the thread that has the specified thread token value. However, the request failed because it did not pass security-exit checking.

User response: No action is required.

**HLOS0226E**  CANCEL THREAD request was denied by the pre-cancel exit for token **thread_token**

Explanation: Db2 Analytics Accelerator Loader received a CANCEL THREAD request for the thread that has the specified thread token value. However, the request failed because it did not pass pre-cancel exit checking.

User response: No action is required.

**HLOS0227E**  TCB: **<tcb_address>**  Session: **<session_token>**  Start TRACE(<trace_type>) failed on SSID: **<ssid>**. RC: **<ifca_rc_code>**  RSN: **<ifca_rsn_code>**

Explanation: Db2 Analytics Accelerator Loader
HLOS0228E  TCB: <tcb_address> Session: <session_token> Start trace failed for get_threads request

Explanation: Db2 Analytics Accelerator Loader attempted to start the Db2 monitor trace facility for a get_threads request. However, this attempt failed.

User response: Contact IBM Software Support.

HLOS0229E  TCB: <tcb_address> Session: <session_token> Start trace failed for get_thread_detail request

Explanation: Db2 Analytics Accelerator Loader attempted to start the Db2 monitor trace facility for a get_thread_detail request, but the attempt failed.

User response: Contact IBM Software Support.

HLOS0230E  DB2 CAF request <db2_ssid>, return_code>, <reason_code>,

Explanation: The Db2 Call Attach Facility (CAF) returned the return code and reason code that is included in this message for the specified CAF request.

User response: Contact IBM Software Support. Provide Support with the return code and reason code that is included in this message.

HLOS0231E  TCB: <tcb_address> Session: <session_token> Start trace failed for get_objects_referenced request

Explanation: Db2 Analytics Accelerator Loader attempted to start the Db2 monitor trace facility for a get_objects_referenced request. However, this attempt failed.

User response: Contact IBM Software Support.

HLOS0232E  TCB: <tcb_address> Session: <session_token> -IP Address conversion error. RC=<return_code>, RSN=<reason_code>, *<message_continuation_number>.*

Explanation: An internal error occurred during the conversion of a formatted IP address to a binary representation.

User response: Contact IBM Software Support. Provide Support with the full text of this message.

HLOS0233E  TCB: <tcb_address> Session: <session_token> -IP Address conversion error. RC=<return_code>, RSN=<reason_code>, *<message_continuation_number>.*

Explanation: An internal error occurred during the conversion of a formatted IP address to a binary representation.

User response: Contact IBM Software Support. Provide Support with the full text of this message.

HLOS0234E  *<message_continuation_number>* <ip_address>.

Explanation: Db2 Analytics Accelerator Loader failed to convert an IP address from an external text format to an internal binary format. The message HLOS0232E or HLOS0233E, which precedes this message, provides the return code and reason code for this error.

User response: Contact IBM Software Support.

HLOS0235W  tcb_address. Authorization check for DB2 system <db2_ssid> failed.

Explanation: The started task authorization id has not been granted the minimum necessary authorization on the specified Db2 system.

User response: Grant the required authorization to the started task authorization id. See the user’s guide for information about authorization requirements.

HLOS0236E  TCB: tcb_address. Authorization for primary DB2 system <db2_ssid> is insufficient.

Explanation: The started task authorization id has not been granted the minimum necessary authorization on the primary Db2 system.

User response: Grant the required authorization to the started task authorization id. See the user’s guide for information about authorization requirements.

HLOS0237I  TCB: <tcb_address>, Messages from stored procedure <stored_procedure_name>.

Explanation: A call to the named stored procedure returned one or more messages. See message HLOS0238I for the returned message text.

User response: For more information about the returned messages, see the Db2 Analytics Accelerator for z/OS Stored Procedures documentation.
HLOS238I  TCB: <tcb_address> MSGTEXT:  
<message_text>.

Explanation:  A stored procedure returned the message text after successful or unsuccessful completion.

User response:  For more information about the returned messages, see the Db2 Analytics Accelerator for z/OS Stored Procedures documentation.

HLOS300E  TCB: <tcb_address> IEAVRLS Pause  
Release failed, RC=<return_code>.

Explanation:  The IEAVRLS Pause Release Service failed with the specified return code.

User response:  Contact IBM Software Support.  Provide Support with the return code from this message.

HLOS301E  TCB:<tcb_address>,  
Session=<session_token>.  Unable to return result.

Explanation:  The specified Db2 Analytics Accelerator Loader session could not return the results of an operation to the user.

User response:  For more information about this error, see the other messages that were issued for the specified task control block (TCB) and session.  If you need assistance, contact IBM Software Support.

HLOS302E  TCB: <tcb_address> HLOSRSL bad  
parms, Session: <session_token>,  
FBUF=buf_address, UBUF=ubuf_address

Explanation:  An internal error occurred.  Db2 Analytics Accelerator Loader invoked the HLOSRSL results processor by using an invalid FBUF or UBUF address pointer.

User response:  Contact IBM Software Support.

HLOS303I  TCB: <tcb_address> Failure to obtain  
ALET, Session=session_token

Explanation:  An internal error occurred.  Db2 Analytics Accelerator Loader could not obtain the ALET token to facilitate cross-memory addressing.

User response:  Contact IBM Software Support.

HLOS304I  TCB: <tcb_address> STOKEN release  
failure

Explanation:  An internal error occurred.  Db2 Analytics Accelerator Loader could not release the STOKEN token, which is involved in cross-memory addressing.

User response:  Contact IBM Software Support.

HLOS305S  TCB: <tcb_address> Session failed.  
SESS:session_token csect_name/offset_value  
variable_value/variable_name

Explanation:  An internal error occurred.  Db2 Analytics Accelerator Loader failed to validate a cross-memory address.  This failure probably occurred because a client address space terminated abnormally.

User response:  Contact IBM Software Support.

HLOS306E  TCB: <tcb_address> SQL Error occurred.  
Module: module_name offset_value.

Explanation:  An SQL error occurred.

User response:  Review the information in the HLOS0202E messages that follow this one for detailed information about the error.  Also see the Db2 messages documentation to determine the reason for the error.  If you need assistance, contact IBM Software Support.  Provide Support with the TCB address and module name that is included in this message.

HLOS307E  TCB: <tcb_address> SRB Processing  
returned, RC=<return_code>,  
RSN=<reason_code>,  
RSN1=<extended_reason_code>.

Explanation:  SRB processing returned the specified error codes.

User response:  Contact IBM Software Support.

HLOS308W  TCB: <tcb_address> Unable to determine  
the index space name for DBID:  
database_id OBID: object_id

Explanation:  Db2 Analytics Accelerator Loader could not determine the index space name for the DBID and OBID that are identified in this message.

User response:  Contact IBM Software Support.

HLOS309W  TCB: <tcb_address> Unable to determine  
the table space name for DBID:  
database_id OBID: object_id

Explanation:  Db2 Analytics Accelerator Loader could not determine the table space name for the DBID and OBID that are identified in this message.

User response:  Contact IBM Software Support.

HLOS310W  TCB: <tcb_address> Unable to access  
HLOG table

Explanation:  The HLOG table was not found.  Therefore, Db2 Analytics Accelerator Loader cannot write messages to this table.  The table should have
been created on the primary subsystem during customization.

User response: Review the Db2 Analytics Accelerator Loader customization procedures. Make sure that you created the HLOG table by using the DDL member that Tools Customizer created for your primary subsystem. Also make sure that the DB2_SSID option in the your product_idOPTS member specifies the Db2 subsystem where the HLOG table is located.

HLOS0311W TCB: <tcb_address> Unable to access HLOG table

Explanation: The HLOG table was not found. Therefore, the product cannot write audit information to this table. The table should have been created on the primary subsystem during customization.

User response: Review the product customization procedures. Make sure that you created the HLOG table by using the member that Tools Customizer created for your primary subsystem. Also make sure that the DB2_SSID option in the HLOOPTS member specifies the Db2 subsystem where the HLOG table is located.

HLOS0400S Task Manager initialization failed

Explanation: The Db2 Analytics Accelerator Loader task management component failed during started task initialization. Processing will terminate.

User response: For more information about this error, see the other messages that were issued just prior to this message. If you need assistance with resolving this problem, contact IBM Software Support.

HLOS0401S Component ID=component_id Component not found in the MEPL table

Explanation: An internal error occurred.

User response: Contact IBM Software Support.

HLOS0402S Attach failed. Program=<program_name>, RC=<return_code>, RSN=<reason_code>.

Explanation: An internal error occurred.

User response: Contact IBM Software Support. Provide Support with the complete text of this message.

HLOS0403W TCB: <tcb_address>, Detach failed. RC=<return_code>, RSN=<reason_code>.

Explanation: An internal error occurred.

User response: Contact IBM Software Support. Provide Support with the complete text of this message.

HLOS0404S TCB: <tcb_address> Subtask failed.
Termination ECB: event_control_block.

Explanation: An internal error occurred.

User response: Contact IBM Software Support. Provide Support with the complete text of this message.

HLOS0405S TCB: <tcb_address> Subtask unexpectedly posted init ECB.
Initialization ECB: event_control_block.

Explanation: An internal error occurred that is related to the specified event control block (ECB).

User response: Contact IBM Software Support. Provide Support with the complete text of this message.

HLOS0406S TCB: <tcb_address> Subtask failed during initialization. Termination ECB: event_control_block.

Explanation: An internal error occurred that is related to the specified event control block (ECB).

User response: Contact IBM Software Support. Provide Support with the complete text of this message.

HLOS0407W Task manager received an unexpected command code. Command code=<command_code>

Explanation: An internal error occurred.

User response: Contact IBM Software Support. Provide Support with the complete text of this message.

HLOS0408S No DB2 task started. Processing will be terminated.

Explanation: An internal error occurred.

User response: Contact IBM Software Support.

HLOS0409W Cannot connect to the primary Db2 subsystem <db2_subsystem> as required.

Explanation: Db2 Analytics Accelerator Loader could not connect to the Db2 subsystem that is necessary for logging and auditing functions because that subsystem is not active. Processing continues; however, logging and auditing cannot be performed.

User response: Ensure that the Db2 subsystem that is specified in the initialization options member is started and available for use by Db2 Analytics Accelerator Loader.
HLOS0410E  Primary DB2 subsystem <db2_subsystem> does not exist. Processing will be terminated.

Explanation: Db2 Analytics Accelerator Loader could not connect to the Db2 subsystem that is necessary for logging and auditing functions because that subsystem does not exist.

User response: Ensure that the Db2 subsystem that is specified in the initialization options member exists and is available for use by Db2 Analytics Accelerator Loader.

HLOS0500E *message_continuation_number* User response: Object status changes.

Explanation: An attempt was made to delete information for the specified thread-blocker ID from the Db2 Analytics Accelerator Loader object status table (HLOOBJSTAT). This attempt failed because the table contained no information for that blocker ID.

User response: Make sure that the blocker ID that is specified in the PARM in the EXEC statement of the thread-blocker job step is spelled correctly.

HLOS0501E *message_continuation_number* The blocker ID specified was not found for delete.

Explanation: An attempt was made to delete a Db2 object because the blocker ID is already in use. The blocker ID specified in this message is incorrect.

User response: Specify a unique blocker ID.

HLOS0502E *message_continuation_number* Blocker ID deleted.

Explanation: The specified blocker ID was deleted from the object status table.

User response: No action is required.

HLOS0503E *message_continuation_number* No objects to reset for this blocker ID.

Explanation: Db2 Analytics Accelerator Loader failed to find any rows in the object status table (ABOBJSTAT) that matched the blocker ID.

User response: No action is required.
HLOS0509I  *message_continuation_number*  Reset status processing initiated.
Explanation:  Db2 Analytics Accelerator Loader initiated processing to reset the object status in response to a previous error condition.
User response:  No action is required.

HLOS0510I  *message_continuation_number*  Thread blocker operation is thread_blocker_operation
Explanation:  This message identifies the current thread-blocking operation.
User response:  No action is required.

HLOS0511E  *message_continuation_number*  (cancel_specification_number)  No objects could be resolved for cancel specification.
Explanation:  An attempt to resolve the database and space objects for a thread-blocking action under this cancel specification failed. The objects were not found in the Db2 catalog. Processing is terminated because the ON_FAILURE (TERMINATE) parameter was specified for the job step.
User response:  Make sure that the object names that are specified in the cancel specification are spelled correctly. If any wildcard patterns are specified, make sure that they will resolve to the correct Db2 objects.

HLOS0512E  *message_continuation_number*  Object already blocked by blocker ID blocker_id
Explanation:  Db2 Analytics Accelerator Loader failed to perform the thread-blocking operation that has the blocker ID specified in the HLOS0500I message and that was attempting to block threads on the Db2 object identified in the HLOS0502I message. Threads on that object were already being blocked by a previous thread-blocking operation. This message presents the blocker ID of the previous thread-blocking operation. The processing of the current thread-blocking operation was terminated because the ON_FAILURE (TERMINATE) parameter is specified for the job step.
User response:  Determine if the current thread-blocking operation is in conflict with the previous thread-blocking operation. If a conflict exists, wait until an ALLOW_THREADS or DELETE_BLOCKERID job step ends the previous thread-blocking operation. If a conflict does not exist, change the ON_FAILURE parameter value to CONTINUE for the current thread-blocking operation and then resubmit the job.

HLOS0513I  *message_continuation_number*  (cancel_specification_number)  DB: database_name SP: space_name PART: partition_number
Explanation:  Db2 Analytics Accelerator Loader could not change the status of the specified Db2 object because the object no longer exists. The message HLOS0500I provides the blocker ID for the thread-blocking operation.
User response:  No action is required.

HLOS0514I  *message_continuation_number*  (cancel_specification_number)  DB: database_name SP: space_name PART: partition_number
Explanation:  Db2 Analytics Accelerator Loader did not change the status of the specified Db2 object while performing a thread-blocking operation because the object was already in the desired state. The message HLOS0500I provides the blocker ID for the thread-blocking operation.
User response:  No action is required.

HLOS0515I  *message_continuation_number*  Thread blocker is suppressed for DB2 system object database_name.
Explanation:  The thread blocker operation is suppressed for the following Db2 system databases: DSNDB01, DSNDB06, and DSNDB07.
User response:  No action is required.

HLOS0516W  *message_continuation_number*  (cancel_specification_number)  DB: database_name SP: space_name PART: partition_number
Explanation:  The thread blocker operation detected an invalid partition number specification.
User response:  No action is required.

HLOS0517E  *message_continuation_number*  (cancel_specification_number)  DB: database_name SP: space_name PART: partition_number
Explanation:  The thread blocker operation detected an invalid partition number specification on a Db2 Version 7 system. The thread blocker operation cannot continue.
User response:  Correct the partition specification and rerun the job.
HLOS0518E  *message_continuation_number*  
   (cancel_specification_number)  DB:  
   database_name  SP:  space_name  PART:  
   partition_number  Partition number is invalid.

Explanation:  The thread blocker operation detected a partition number specified for a non-partitioned space. The thread blocker operation cannot continue.

User response:  Correct the partition specification and rerun the job.

HLOS0519I  Thread blocker is suppressed for Db2 Analytics Accelerator Loader configuration object  DB:  database_name  
   SP:  space_name.

Explanation:  The thread blocker operation is suppressed for the Db2 Analytics Accelerator Loader configuration database.

User response:  No action is required.

HLOS0520E  *message_continuation_number*  Userid user_id denied access to blocker operation by security exit.

Explanation:  The security exit for the Db2 Analytics Accelerator Loader configuration prevented the specified user from performing a thread-blocker operation.

User response:  To perform a thread-blocker operation, the user must be provided with the proper authority under the security exit.

HLOS0521I  Thread blocker is suppressed for the DB2 object with type TEMP or WORKFILE:  database_name

Explanation:  Because a database that is defined as WORKFILE or TEMP cannot be started in RO or UT status, thread-blocker operations must not be attempted for such an object. Therefore, the thread-blocker operation is suppressed for objects that are in a database with a value of "W" or "T" in the SYSIBM.SYSDATABASE TYPE column.

User response:  No action is required.

HLOS0601I  DSNUTILB interception for DB2 SSID=DB2_ssid is enabled.

Explanation:  DSNUTILB interception services have been enabled for the specified Db2 subsystem.

User response:  No action is required.

HLOS0602W  DSNUTILB interception for DB2 SSID=DB2_ssid not enabled.  
   Interception being performed by  
   HLOID=product_id.

Explanation:  DSNUTILB interception services were not enabled for the Db2 subsystem that is specified in this message because another Db2 Analytics Accelerator Loader system was already providing interception services for it.

User response:  Verify that the list of Db2 subsystems in the DSNUTILB interception policy is correct. Only one Db2 Analytics Accelerator Loader system can provide interception services for a specific Db2 subsystem at a time.

HLOS0603W  DSNUTILB interception for DB2 SSID=DB2_ssid not enabled, product cannot connect to the subsystem

Explanation:  DSNUTILB interception services were not enabled for the Db2 subsystem that is indicated in this message because Db2 Analytics Accelerator Loader cannot connect to that Db2 subsystem.

User response:  Verify that the list of Db2 subsystems that is specified in the DSNUTILB intercept policy is correct. Only one Db2 Analytics Accelerator Loader system can provide interception services for a specific Db2 subsystem at one time. Db2 Analytics Accelerator Loader must have a properly bound plan on the Db2 subsystem for which it will provide interception services.

HLOS0604W  DSNUTILB interception for DB2 SSID=DB2_ssid not enabled, DB2 subsystem is not active.

Explanation:  DSNUTILB interception services were not enabled for the Db2 subsystem that is indicated in this message because the subsystem is inactive.

User response:  Verify that the list of Db2 subsystems specified in the DSNUTILB interception policy is correct. Only one Db2 Analytics Accelerator Loader system can provide interception services for a specific Db2 subsystem at a time.

HLOS0605W  DSNUTILB interception for db2_ssid not enabled, insufficient authority.

Explanation:  DSNUTILB interception services were not enabled for the Db2 subsystem that is indicated in this message because Db2 Analytics Accelerator Loader
has insufficient authority on that Db2 subsystem.

User response: Grant the required authorization to the started task authorization id. See the user's guide for information about authorization requirements.

HLOS0606I  DB2 SSID=db2_ssid has DB2 Sort enabled.

Explanation: Db2 Sort is either enabled (YES) or not enabled (NO) for the specified Db2 subsystem.

User response: No action is required.

HLOS0611I  TCB: <tcb_address> DB2 subsystem <db2_ssid> is now running in ACCESS(MAINT) mode

Explanation: The Db2 Analytics Accelerator Loader started task detected that a Db2 system referenced in the policy has started in ACCESS(MAINT).

User response: No action is required.

HLOS0612I  TCB: <tcb_address> ACCESS(MAINT) cleared for DB2 subsystem <db2_ssid>

Explanation: The Db2 Analytics Accelerator Loader started task detected that a Db2 system referenced in the policy has started in normal operational mode after having been up in ACCESS(MAINT) mode.

User response: No action is required.

HLOS0700I  TCB tcb_address SESSION REPORT

message_continuation_number

Explanation: A session report has been initiated. The messages that follow represent details about currently active sessions.

User response: No action is required.

HLOS0701I  message_continuation_number SESS:

Session_token  Session_number
Session_type  Session_job_name
Session_job_ID  Session_asid  Session_user

Explanation: Details of a product session. The session is identified by the information that is displayed in this message after SESS:

• Session_token is an internal session identifier.
• Session_number is a unique session identifier that is generated incrementally for each new session that is created.
• Session_type indicates whether the session is for a batch job (B), an ISPF user (I), the DSNUTILB intercept (U), or the HLOMAINT utility (M).
• Session_job_name is the name of the job that is associated with the session.
• Session_job_ID is the identifier for the job that is associated with the session.
• Session_asid is the hexadecimal address space identifier for the user type (session type).
• Session_user is the user ID.

User response: No action is required.

HLOS0702I  message_continuation_number STATUS:

session_status

Explanation: Session status.

User response: No action is required.
HLOS0703I  message_continuation_number STARTED:

Explanation: Date and time when session was started.
User response: No action is required.

HLOS0704I  message_continuation_number No active sessions found

Explanation: No active sessions were found.
User response: No action is required.

HLOS0705I  ROWS LOADED: number_of_rows_loaded

Explanation: The number_of_rows_loaded value is the number of rows that have been loaded to the table by the job at the time the message is issued. The number_of_rows_loaded value is 0 if the parameter ACCEL_ROWS_REPORT_THRESHOLD is set to 0.
User response: No action is required.

HLOS0804W  The trace table is too small. Tracing will be disabled. Required minimum size=

trace_table_minimum_size, Requested size=

trace_table_requested_size

Explanation: The size of the trace table is too small to perform internal tracing. Tracing will be disabled, but product operations will continue.
User response: Increase the size of the trace table to at least the minimum size that is indicated in this message.

HLOS0805W  The trace table entry is larger than the trace table. Trace table size=

trace_table_size, Trace entry size=

trace_table_entry_size

Explanation: The size of the trace information entry is larger than the size of the trace table. The entry cannot be recorded in the trace table.
User response: Increase the size of the trace table. If the problem persists, contact IBM Software Support.

HLOS0806I  The user_exit_type User Exit

user_exit_name is now in use.

Explanation: The specified user exit is in use.
User response: No action is required.

HLOS0807S  A severe error occurred while attempting to load the exit_type user exit

exit_name

Explanation: Db2 Analytics Accelerator Loader started task encountered a severe error when attempting to load the specified user exit.
User response: Ensure that the following requirements are met: 1) the exit is properly assembled and linked, 2) the exit resides in a STEPLIB-concatenated load library that is accessible to the Db2 Analytics Accelerator Loader started task, and 3) the exit name is correctly specified in the started task initialization options member.

HLOS0808S  A severe error occurred within exit_type user exit exit_name, FUNC=exit_function

Explanation: The Db2 Analytics Accelerator Loader started task encountered a severe error within the specified user exit.
User response: An MVS SVC dump has been produced to help you diagnose the problem with the user exit. After you correct the problem, assemble and link the exit. Then restart Db2 Analytics Accelerator Loader.

HLOS0809S  A severe internal error occurred preparing to drive the exit_type user exit

exit_name, FUNC=exit_function

Explanation: The Db2 Analytics Accelerator Loader started task encountered a severe internal error while preparing to run the specified user exit.
User response: Contact IBM Software Support.

HLOS0810I  The user_exit_type User Exit

user_exit_name is now inactive.

Explanation: The specified user exit is no longer active.
User response: No action is required.

HLOS0811S  The <user_exit_type> user exit

user_exit_name FUNC=<user_exit_func>

RC=12. The started task is terminating.

Explanation: The Db2 Analytics Accelerator Loader started task received the return code RC=12 from the specified user exit. As a result, the started task is terminating.
User response: Identify and correct the problem that caused the user exit to issue RC=12. Then restart the Db2 Analytics Accelerator Loader started task.

HLOS0812I  MODULE LEVEL DATE TIME EPA RREPA CC F1 F2 F3 SEQ

Explanation: This message displays the fields in the Module Entry Point List (MEPL) control block.
User response: No action is required.
HLOS0813I <module_name>, <maintenance_level>, <assembly_date>, <assembly_time>, <entry_point_address>, <rr_entry_point_address>, <component_code>, <flag_byte_1>, <flag_byte_2>, <flag_byte_3>, <sequence_number>.

Explanation: This message displays the data in the fields of the Module Entry Point List (MEPL) control block.

User response: No action is required.

HLOS0814I Command issued: command_text

Explanation: This message identifies the Db2 Analytics Accelerator Loader operator command that was issued from the z/OS console.

User response: No action is required.

HLOS0815E Unrecognized command

Explanation: An unknown operator command was issued to the Db2 Analytics Accelerator Loader started task.

User response: Specify a valid Db2 Analytics Accelerator Loader command.

HLOS0816E Invalid keyword provided for command: command_name

Explanation: An invalid keyword was provided for the Db2 Analytics Accelerator Loader command that is specified in this message.

User response: Specify a valid keyword for the command. For the correct syntax, see the Db2 Analytics Accelerator Loader documentation.

HLOS0817I command_scope DSNUTILB intercept status is: dsnutilb_intercept_status

Explanation: This message indicates either the local DSNUTILB intercept status for the started task or the global DSNUTILB intercept status for the entire z/OS image.

User response: No action is required.

HLOS0818I help_text

Explanation: This message presents the output from the HELP console command that was issued for the Db2 Analytics Accelerator Loader started task. This command lists all console commands that are supported for the started task.

User response: No action is required.

HLOS0819E Trace table size is zero. Trace table display is not possible.

Explanation: A SNAP of the Db2 Analytics Accelerator Loader trace table was requested, but no trace table exists. The trace table does not exist because the trace table size option is set to zero. Therefore, the trace data cannot be displayed.

User response: If you want to be able to record Db2 Analytics Accelerator Loader internal trace data, set the trace table size to a non-zero value in the started task initialization options member.

HLOS0820W A display of the trace table is already in progress.

Explanation: A SNAP of the Db2 Analytics Accelerator Loader trace table is already in progress. Consequently, this additional request is ignored.

User response: If you want to display the Db2 Analytics Accelerator Loader internal trace table again, wait for the current display request to complete.

HLOS0821I Trace table display is complete.

Explanation: The requested display of the Db2 Analytics Accelerator Loader internal trace table has completed.

User response: No action is required.

HLOS0822I DB2SSID= db2_ssid DB2VER= db2_version

HLOID= configuration_id DSNUTILB interception is

DSNUTILB_intercept_status

Explanation: This message presents the DSNUTILB intercept status for the specified Db2 subsystem.

User response: No action is required.

HLOS0823E Address contains invalid hex digits

Explanation: An invalid address was specified in the console command. The address contained invalid characters. An address must be an 8-digit hexadecimal number that is composed of only the characters 0 through 9 and A through F.

User response: Specify a valid hexadecimal address for the command.

HLOS0824E Address is not for an active session

Explanation: The address that was specified in the TERMINATE SESSION console command does not reference an active session. The session might have already terminated, or the address might have been entered incorrectly.

User response: Verify that the session address was
entered correctly. If the session address was incorrect, reissue the TERMINATE SESSION command with a valid session address. If the address was correct, the session already terminated and you do not need to take further action.

HLOS0830I DSNUTILB Intercept Policy:
Explanation: This message introduces the DSNUTILB intercept policy. The policy details are presented in the messages that follow this one.
User response: No action is required.

HLOS0831I DB2 SSID: db2_ssid ACTION: action 1 ACTION: VRUPDATE - SUBMIT_FROM_SERVER
Explanation: This message identifies the section of the DSNUTILB intercept policy that is for the specified Db2 subsystem and defined ACTION to perform.
If SUBMIT_FROM_SERVER="NO" or is omitted from the policy, the message HLOS0831I states “HLOS0831I DB2 SSID: db2_ssid ACTION: action.”
If SUBMIT_FROM_SERVER="YES" is specified in the policy, the message HLOS0831I states “HLOS0831I DB2 SSID: db2_ssid ACTION: VRUPDATE - SUBMIT_FROM_SERVER.”
User response: No action is required.

HLOS0832I Rule type: rule_type
Explanation: This message identifies an INCLUDE or EXCLUDE rule in the DSNUTILB intercept policy.
User response: No action is required.

HLOS0833I rule_number delimiter rule_element_type delimiter rule_element_data
Explanation: This message presents a RULE element that is specified in the DSNUTILB intercept policy.
User response: No action is required.

HLOS0834I DSNUTILB intercept is inactive.
Explanation: The command was not processed because the DSNUTILB intercept was turned off in the initialization options.
User response: No action is required.

HLOS0835I Active PRACTICE: practice_name
Explanation: This message indicates the name of the active PRACTICE of the DSNUTILB intercept policy.
User response: No action is required.
HLOS0900E  The product is not APF-authorized and is terminating.

Explanation: The load library for the product started task is not APF-authorized, as required. Consequently, the product is terminating.

User response: APF-authorize the load library for the started task, and then start the product again.

HLOS0901S  RVT locate or allocate operation failed.

Explanation: The product could not locate or allocate its RVT control block.

User response: Contact IBM Software Support.

HLOS0902S  Db2 Analytics Accelerator Loader started task ESTAE entered, S<system_completion_code>, U<user_completion_code>.

Explanation: The main task of the Db2 Analytics Accelerator Loader started task encountered an error. A dump has been generated.

User response: Review the dump data to diagnose and resolve the problem. If you need assistance, contact IBM Software Support.

HLOS0903S  ESTAE processing completed

Explanation: Db2 Analytics Accelerator Loader finished generating a dump for the error that was encountered by the main task of the started task.

User response: Review the dump data to diagnose the problem. If you need assistance, contact IBM Software Support.

HLOS0904S  Started task subtask ESTAE entered, S<system_completion_code>, U<user_completion_code>.

Explanation: A subtask of the Db2 Analytics Accelerator Loader started task encountered an error. A dump has been generated.

User response: Review the dump data to diagnose and resolve the problem. If you need assistance, contact IBM Software Support.

HLOS0905S  User exit for the started task encountered an error. A dump was created. System RC=<system_completion_code>, user RC=<user_completion_code>.

Explanation: A security exit, pre-cancel exit, or post-cancel exit that you specified for the Db2 Analytics Accelerator Loader started task encountered an error when it ran. A dump has been generated for diagnostic use.

User response: Review the dump data to resolve the problem with the user exit. The names of all user exits are specified in the started task initialization options member. If you need assistance, contact IBM Software Support.

HLOS0906S  SVC removal failed

Explanation: Db2 Analytics Accelerator Loader could not remove its supervisor call (SVC) when the started task stopped.

User response: Contact IBM Software Support.

HLOS0907S  HLOGMODL Load Failed for MEPL=mepl_name.

Explanation: An internal error occurred during the initialization of the product started task.

User response: Make sure that the JCL for the started task points to the proper STEPLIB. If the problem persists, contact IBM Software Support.

HLOS0908S  HLOGMODL Load Failed for MEPL entry=mepe_name.

Explanation: An internal error occurred during the initialization of the product started task.

User response: Make sure that the JCL for the started task points to the proper STEPLIB. If the problem persists, contact IBM Software Support.

HLOS0909S  Started task subtask ESTAE entered, system RC=<system_completion_code>, user RC=<user_completion_code>.

Explanation: A subtask of the Db2 Analytics Accelerator Loader started task encountered an error. A dump will be created to help you diagnose the problem.

User response: Review the dump data to diagnose the problem. If you need assistance, contact IBM Software Support.

HLOS0910E  A job name conflict with a started task has been identified. The product is terminating.

Explanation: The job name for the Db2 Analytics Accelerator Loader started task conflicts with the job name for another started task on the z/OS system. Consequently, the product is terminating.

User response: Either change the name of the Db2 Analytics Accelerator Loader started task or the name of the started task that is in conflict, and then start Db2 Analytics Accelerator Loader again.
A job name conflict with a batch job has been identified. The product is terminating.

**Explanation:** The job name for the Db2 Analytics Accelerator Loader started task conflicts with the name of a batch job on this z/OS system. Consequently, the product is terminating.

**User response:** Either change the name of the Db2 Analytics Accelerator Loader started task or the name of the batch job that is in conflict, and then start Db2 Analytics Accelerator Loader again.

HLOID already in use. Terminating.

**Explanation:** Another Db2 Analytics Accelerator Loader started task that is running on the z/OS system has the same identifier. Each product started task must have a unique identifier. Therefore, the started task for which this message was issued is terminating.

**User response:** Make sure that every product started task that runs concurrently on your system has a unique identifier.

ESTAE SDUMPX call

**RC**=<short_system_return_code>,
**RS**=<short_system_reason_code>.

**Explanation:** During ESTAE processing, a call to the z/OS SDUMPX facility returned the displayed return code and reason code.

**User response:** If RC=08, review the reason code in the appropriate SDUMPX documentation. Then make any changes to Dump Services that are needed to obtain proper diagnostic dumps. If you need assistance, contact IBM Software Support.

DSNUTILB utility id : utility_id

**Explanation:** A DSNUTILB intercept operation was initiated for the specified DSNUTILB utility ID. The messages that follow this one identify the intercept operation and present data associated with it.

**User response:** No action is required.

DSNUTILB intercept operation is

**Explanation:** This message identifies the current DSNUTILB intercept worklist-management operation that is being performed by the started task.

**User response:** No action is required.

Unable to save worklist due to duplicate utility ID.

**Explanation:** The DSNUTILB worklist could not be saved because a worklist that has the same DSNUTILB utility ID has already been saved. Worklists cannot have duplicate utility IDs.

**User response:** No action is required.

DSNUTILB intercept operation was successful.

**Explanation:** The current DSNUTILB intercept operation completed successfully.

**User response:** No action is required.

DSNUTILB intercept operation failed

**Explanation:** The current DSNUTILB intercept operation failed.

**User response:** To determine the cause of this failure, check any SQL errors that were reported in the log prior to this error.

No worklist data found to delete for UTILID:

**Explanation:** The Db2 Analytics Accelerator Loader maintenance utility found no worklist data for the specified Db2 utility ID.

**User response:** No action is required.
HLOS5113I  *<message_continuation_number>* Worklist is in use by another utility. Owning Session: <<session_token>>

Explanation: The worklist is in use by another utility at this time. Db2 Analytics Accelerator Loader will not intercept the Db2 utility execution because a worklist for that utility ID already exists and is currently in use by another utility job. This message provides the session token value of the owning utility session. See the preceding HLOS0101I message that contains a matching session token value to determine the job name and job ID of the utility job that is currently using the worklist.

User response: You can perform any of the following actions, as appropriate: change the utility ID in the DSNUTILB utility job that you want to intercept, wait until the job that is currently using the worklist completes, or (if the other utility terminated abnormally without ending its owning session) use the TERMINATE SESSION console command to terminate the owning session.

HLOS5550E  LE preinitialization service failed.
**Operation=<operation_name>, RC=<return_code>.**

Explanation: The specified Language Environment® (LE) preinitialization service operation failed with the specified return code.

User response: Contact IBM Software Support. Have available the listing that contains this message and any applicable related messages.

HLOU4001E  Unable to load module HLOUSTUB.

Explanation: The specified module could not be loaded by the high availability load utility (HALOAD).

User response: Ensure that the specified module is in the JOBLIB or STEPLIB concatenation of HALOAD.

HLOU4002E  Error parsing partition specification for table <table_creator.table_name>.

Explanation: An error in a partition specification was detected. Each partition number must be specified by its one- to four-character logical partition number; for example, 1, 01, 001 or 0001. Partition ranges must be specified in the format lesser value:larger value. For example:

PART (1:4,7,12,15:20)

User response: Check the partition specification for the table and ensure that it conforms to the required format.

HLOU4003E  <table_name>

Explanation: An error in a partition specification was detected. Each partition number must be specified by its one- to four-character logical partition number; for example, 1, 01, 001 or 0001. Partition ranges must be specified in the format lesser value:larger value. For example:

PART (1:4,7,12,15:20)

User response: Check the partition specification for the table and ensure that it conforms to the required format.

HLOU4004I  TCB: <tcb_address>, Load completed for table <table_creator.table_name>, partition <partition>.

Explanation: The table was successfully loaded on both accelerators.

User response: No action is required.

HLOU4005I  High availability load utility execution started.

Explanation: The high availability load utility (HALOAD) has started execution.

User response: No action is required.

HLOU4006E  TCB: <tcb_address>, Error loading table <table_creator.table_name>, partition <partition>.

Explanation: Due to errors, the product was unable to load the named table.

User response: See the job log for additional error messages. If you are unable to diagnose the cause of
the failure, contact IBM Software Support.

**HLOU4007E** TCB: `<tcb_address>`. Error loading table
`<table_creator.table_name>`, partition
`<partition>`.  
Explanation: Due to errors, the product was unable to load the named table.  
User response: To determine the cause of the failure, see the job log for additional error messages. If you are unable to diagnose the cause of the failure, contact IBM Software Support.

**HLOU4008E** TCB: `<tcb_address>`. Unable to load
`<error_count>` of the accelerators. Table
`<table_creator.table_name>`, partition
`<partition>`.  
Explanation: Due to errors, the named table could not be loaded onto one or more accelerators.  
User response: See the job log for additional error messages. If you are unable to diagnose the cause of the failure, contact IBM Software Support.

**HLOU4009E** TCB: `<tcb_address>`. Invalid
`FILE_D_LIST_COUNT` from HLPIPE.
Expected `<expected_fd_count>`, got
`PIPECNT` `<fd_count>`.  
Explanation: An internal error caused the product to fail.  
User response: Contact IBM Software Support.

**HLOU4010E** TCB: `<tcb_address>`. Invalid file
descriptor from HLPIPE. FD
`<file_descriptor>`.  
Explanation: An HLPIPE API call returned an invalid file descriptor.  
User response: Contact IBM Software Support.

**HLOU4011I** TCB: `<tcb_address>`. Load started for
table `<table_creator.table_name>`, partition
`<partition>`.  
Explanation: Load processing has begun for the named table.  
User response: No action is required.

**HLOU4012E** TCB: `<tcb_address>`. HLPIPE API error.
Enter: `<entry_number>`,  
Function: `<function_code>`,  
RC: `<return_code>`.  
Explanation: An HLPIPE API call returned a non-zero return code.  
User response: Contact IBM Software Support.

**HLOU4013E** TCB: `<tcb_address>`. HLPIPE error
`parms`: `<error_parm1>`, `<error_parm2>`, `<error_parm3>`, `<error_parm4>`.  
Explanation: This message might be issued in conjunction with HLOU4012E to provide additional diagnostic information after an error in the HLPIPE API.  
User response: Contact IBM Software Support. Have available the full text of this message.

**HLOU4014E** An error occurred on accelerator
`<accelerator_name>`.  
Explanation: An error occurred while the product was communicating with the named accelerator.  
User response: See the SYSPRINT for more information. If you are unable to diagnose the problem, contact IBM Software Support.

**HLOU4015I** Messages from accelerator
`<accelerator_name>`.  
Explanation: This message is issued in conjunction with HLOU5720I. The messages identify the accelerator that generated the messages that were reported in HLOU5720I.  
User response: No action is required.

**HLOU4016E** Error processing table
`<table_creator.table_name>`.  
Explanation: An error occurred while the product was processing the named table.  
User response: See the SYSPRINT for more information. If you are unable to diagnose the cause of the failure, contact IBM Software Support.

**HLOU4017I** The tables have been removed from
accelerator `<accelerator_name>`.  
Explanation: The tables have been successfully removed from the named accelerator. If the operation completed with warnings, the warning messages that the accelerator returned are reported immediately following in message HLOU5725I.  
User response: No action is required.

**HLOU4018E** Unable to remove tables from
accelerator `<accelerator_name>`.  
Accelerator error messages follow.  
Explanation: An attempt failed to remove tables from the accelerator. The error messages that the accelerator returned are reported immediately following in message HLOU5725I.  
User response: See the IBM Db2 Analytics Accelerator
Stored Procedures reference for a description of the AQT messages reported in HLOU5725I. If you need additional assistance, contact IBM Software Support.

**HLOU4019I**

**Missing tables have been added to accelerator <accelerator_name>**.

**Explanation:** The tables were successfully added to the accelerator. If the add operation completed with warnings, the messages that the accelerator returned are reported immediately following in message HLOU5725I.

**User response:** No action is required.

**HLOU4020E**

**Unable to add tables to accelerator <accelerator_name>. Accelerator error messages follow.**

**Explanation:** An attempt failed to add tables to the accelerator. The error messages that the accelerator returned are reported immediately following in message HLOU5725I.

**User response:** See the IBM Db2 Analytics Accelerator Stored Procedures reference for a description of the AQT messages reported in HLOU5725I. If you need further assistance, contact IBM Software Support.

**HLOU4021E**

**Invalid use of PART keyword. The table is not partitioned.**

**Explanation:** The PART clause was specified on a nonpartitioned table. The PART clause is only allowed on partitioned tables.

**User response:** Remove the PART clause and resubmit the job.

**HLOU4022E**

**The table has been specified multiple times in the FROM TABLE clause.**

**Explanation:** A table can be specified only once in the FROM TABLE clause.

**User response:** Remove the duplicate table names and resubmit the job.

**HLOU4023I**

**Enabling query acceleration for tables loaded on accelerator <accelerator_name>.**

**Explanation:** After a successful load job, query acceleration was enabled as specified by the option ACCEL_ON_SUCCESS_ENABLE.

**User response:** No action is required.

**HLOU4024W**

**Disabling query acceleration for tables loaded on accelerator <accelerator_name>.**

**Explanation:** Query acceleration was disabled because of a failure during the load.

**User response:** Review the job log to diagnose the cause of the error, correct the problem and re-run the job.

**HLOU4025E**

**Accelerator only tables (AOTs) cannot be loaded with the HALOAD command.**

**Explanation:** AOTs exist only in the accelerator; therefore they cannot be loaded from the underlying Db2 table.

**User response:** Remove the AOT from the HALOAD command and re-run the job.

**HLOU4026I**

**Multi-table specification is incompatible with replication.**

**Explanation:** Only one table can be specified for high availability load (HALOAD) if any table in the table set is enabled for replication.

**User response:** Correct the syntax and resubmit the job.

**HLOU4027E**

**Load already in progress for table <table_creator.table_name>.**

**Explanation:** Another job is loading the named table. A table can only be loaded by one job at a time.

**User response:** Wait for the current table load operation to complete, then resubmit the job.

**HLOU4028I**

**None of the selected accelerators is available for loading.**

**Explanation:** The specified accelerators are currently online or not available to be loaded. The job terminates.

**User response:** When the accelerators are back online, resubmit the job.

**HLOU4029I**

**Accelerator <accelerator_name> will not be loaded.**

**Explanation:** The named accelerator is not available to be loaded and will be excluded from the load.

**User response:** If you are unable to diagnose the problem, contact IBM Software Support.

**HLOU4031E**

**HLPPIPE OPEN did not return any valid file descriptors for table partition: <partition_number>**

**Explanation:** Errors prevented the product from loading the named partition on the accelerators that were specified in the load job.

**User response:** See the job log for additional error messages. If you are unable to diagnose the cause of the error, contact IBM Software Support.
HLOU4032I None of the accelerators is accepting data.

**Explanation:** Due to errors, no more data can be loaded to the accelerators that were specified in the load job.

**User response:** See the job log for additional error messages. If you are unable to diagnose the cause of the error, contact IBM Software Support.

---

HLOU4033E The discard data set DDNAME `<ddname>` is missing from the JCL.

**Explanation:** The DDNAME specified on the DISCARDDN keyword was not specified in the JCL. When running an IDAA_ONLY load, a template cannot be used for the discard data set.

**User response:** Specify a valid discard data set in a DD statement in the JCL.

---

HLOU4034E Discard record LRECL incompatible with discard DS LRECL.

**Explanation:** A discarded SYSREC record could not be written to the discard data set because the record length exceeds the discard data set LRECL. This error can occur when the SYSREC is a concatenation of multiple data sets. The product sets the LRECL of the discard data set to the LRECL of the first SYSREC data set in the concatenation. An attempt to discard a record from a subsequent SYSREC data set with a larger LRECL will fail with this error.

**User response:** Make sure the SYSREC data set with the largest LRECL is first in the concatenation.

---

HLOU4035E The discard limit has been reached.

**Explanation:** The limit specified on the DISCARDS keyword has been reached. Db2 Analytics Accelerator Loader terminates with errors before the input data set is fully processed.

**User response:** Eliminate the DISCARDS keyword or increase the limit value, and resubmit the job.

---

HLOU4036I Number of records written to discard dataset=`<record_count>`. 

**Explanation:** This informational message indicates the number of SYSREC records that have been written to the discard data set.

**User response:** No action is required.

---

HLOU4050E Accelerator copy DDNAME `copy_ddname` is missing from the JCL.

**Explanation:** A copy DDNAME required to create a backup of an accelerator table was not specified in the JCL.

**User response:** Add the missing DDNAME to the Db2 Analytics Accelerator Loader JCL, or remove it from the ACCEL_COPYDDN or ACCEL_RECOVERDDN keywords, and then resubmit the Db2 Analytics Accelerator Loader job.

---

HLOU4051E Accelerator copy DDNAME `copy_ddname` specified for more multiple copy types.

**Explanation:** An ACCEL_COPYDDN or ACCEL_RECOVERDDN DD value was specified for multiple types of copies. The DD must be specified only once.

**User response:** Ensure each DDNAME specified on the ACCEL_COPYDDN or ACCEL_RECOVERDDN keywords is specified only once. Correct the Db2 Analytics Accelerator Loader syntax and resubmit the job.

---

HLOU4053E DEVTYPE failed. DDNAME: `copy_ddname` RC: `devtype_rc`

**Explanation:** The DEVTYPE service returned an error. The DDNAME and error RC are included in the message.

**User response:** Contact IBM Software Support. Provide support with the full output from the failed Db2 Analytics Accelerator Loader job.

---

HLOU4054E Accelerator copy datasets must reside on tape or DASD. DDNAME: `copy_ddname`

**Explanation:** An attempt was made to create an accelerator backup on a medium other than tape or DASD.

**User response:** Change the Db2 Analytics Accelerator Loader job to create the accelerator backup on tape or DASD and resubmit the job.

---

HLOU4055E Multiple datasets are concatenated to Accelerator backup DDNAME: `copy_ddname`

**Explanation:** An accelerator backup DDNAME must not refer to a concatenation of data sets.

**User response:** Correct the Db2 Analytics Accelerator Loader JCL and resubmit the job.
HLOU4056E  COPY FUNC=copy_function failed. The copy task has terminated.

Explanation: An attempt to create an accelerator backup copy has failed.

User response: Review the job log messages to determine why the copy subtask failed. If you need additional help, contact IBM Software Support.

HLOU4057E  System call failed. RC: return_code
Module: calling_module DDNAME: ddname

Explanation: The named system service failed. As a result the Db2 Analytics Accelerator Loader was unable to create or register the copy data sets.

User response: Review the job log messages for additional error messages. If you need additional help, contact IBM Software Support.

HLOU4058E  Copy registration failed. RC: return_code
RSN: reason_code

Explanation: The server was unable to register the copy data sets. A negative reason code indicates that the server encountered an SQL error. The reason code in this case is the SQLCODE.

User response: Review the server log messages for more information regarding the cause of the error. If you need additional help, contact IBM Software Support.

HLOU4059I  The following copy dataset(s) have been successfully registered:

Explanation: The requested backup copies have been created and registered in the product's copy data set registration table.

User response: No action is required.

HLOU4060E  Copy must be a physical sequential dataset. DDNAME: ddname DSORG: dataset_organization

Explanation: The named copy data set has an unsupported DSORG. Copy data sets must be physical sequential data sets. They cannot be partitioned or indexed sequential data sets.

User response: Correct the Db2 Analytics Accelerator Loader JCL and resubmit the job.

HLOU4061E  Copy registration check failed. RC: return_code RSN: reason_code

Explanation: The server was unable to verify that the requested copy data sets are not already registered in SYSIBM.SYSCOPY or HLOUCOPY. This registration check is performed before the copies are created to protect the recoverability of this and other Db2 objects.

User response: Review the server log messages for more information regarding the cause of the error. If you need additional assistance, contact IBM Software Support.

HLOU4062E  Dataset used for previous copy_type copy.
DDNAME: ddname TIME: registration_time

Explanation: A utility has been invoked to back up an accelerator table to a data set which is a duplicate of one already recorded in SYSIBM.SYSCOPY or HLOUCOPY. If the specified data set is cataloged, a matching DSNAME exists. If the specified dataset is not cataloged, a matching DSNAME, DSVOLSER and FILESEQNO exists.

User response: Change the name of the copy data set and rerun the job.

HLOU4063E  No Accelerator copy datasets have been provided in the JCL.

Explanation: An accelerator backup or inline copy has been requested, but no copy data sets were provided in the JCL.

User response: Add one or more copy data sets to the JCL. Copy data sets can be specified either by an HLOUCOPY DD statement in the JCL, or by specifying the ACCEL_RECOVERYDDN or ACCEL_COPYDDN keywords in the LOAD or BACKUP_ACCELERATOR command syntax. Correct the JCL and resubmit the job.

HLOU4064E  $HLOCOPY FUNC=PUTREC failed. RC: return_code

Explanation: Db2 Analytics Accelerator Loader encountered an error while writing to an accelerator copy data set.

User response: Check the job log for additional messages that may provide more details on the type of I/O error that occurred. If you need assistance, contact IBM Software Support.

HLOU4065E  Keyword <IDAA_ONLY> is required for inline copies.

Explanation: Inline copies were requested either by specifying the ACCEL_COPYDDN or ACCEL_RECOVERYDDN keywords, or by including the HLOUCOPY DDNAME in the JCL. The inline copy feature is available only when IDAA_ONLY is also specified in the LOAD control cards.

User response: Correct the JCL or control cards and resubmit the job.
**HLOU4066E** Inline copies are not supported on partial loads.

**Explanation:** Inline copies were requested either by specifying the ACCEL_COPYDDN or ACCEL_RECOVERYDDN keywords, or by including the HLOCOPY DNAME in the JCL. The table being loaded is index-partitioned or partitioned by range but only a subset of the table partitions are being loaded. Inline copies are only available when all partitions participate in the load.

**User response:** Correct the JCL or control cards and resubmit the job.

**HLOU4067E** Function GET_ACCEL_GROUP failed.

**RC=**return_code, **RSN=**reason_code.

**Explanation:** An error was encountered when the product tried to determine if the specified accelerator name was a group name. This failure could be caused by an SQL error. Check the started task log for additional error messages.

**User response:** If you are unable to resolve the problem, contact IBM Software Support.

**HLOU4068I** <group_name> is an accelerator group. The following members will be loaded:

**Explanation:** The specified accelerator group has been resolved to its member accelerators. All members in the group will be loaded. This message is followed by one or more HLOU4069I messages, each of which lists one member of the group.

**User response:** No action is required.

**HLOU4069I** <accelerator_name>

**Explanation:** This informational message lists a member of an accelerator group. This message is issued repeatedly in conjunction with HLOU4068I to display all of the members of an accelerator group.

**User response:** No action is required.

**HLOU4070E** SORT ended abnormally. DSNUTILB execution bypassed due to BACKOUT YES processing.

**Explanation:** An error was detected during a data SORT performed by the product. The Db2 LOAD utility will not be executed because BACKOUT YES was specified in the LOAD control cards.

**User response:** Review the messages in the job log to determine the cause of the failure. Then correct the problem and re-run the job.

**HLOU4071E** No data was loaded to the accelerator due to backout processing.

**Explanation:** The BACKOUT YES option was specified in the LOAD control cards. An error condition was detected that triggered backout processing. Any data loaded to the accelerator has been discarded.

**User response:** Review the messages in the job log to determine the cause of the failure. Then correct the problem and re-run the job.

**Explanation:** This is an informational message issued when tracing has been activated.

**User response:** No action is required.

**HLOU4073I** Accelerator Backup Utility execution started.

**Explanation:** The accelerator backup utility has started execution.

**User response:** No action is required.

**HLOU4074I** Number of rows copied=row_count

**Explanation:** This informational message indicates the number of rows that have been written to the accelerator copy data sets.

**User response:** No action is required.

**HLOU4075I** copy_type: copy_dsname

**Explanation:** This informational message is issued for each copy data set that is created and registered in the product's copy registration table. The message text includes the name of the copy data set, the site that the copy is for (local or recovery) and whether the copy is the site's primary or backup copy.

**User response:** No action is required.

**HLOU4076E** Error converting data row to DB2 internal format. Copy task terminating due to errors

**Explanation:** A data conversion error has prevented the backup utility from building a Db2 formatted row for the copy data set. The backup utility will terminate.

**User response:** Contact IBM Software Support. Provide the support representative with the full output of the failed accelerator backup job.
HLOU4077E Unsupported data type. Accelerator backup not allowed.  
**Column**=<column_name>, **Type**=<column_type>

**Explanation:** Accelerator backups are only available when the column data types of the target table are limited to: CHAR, VARCHAR, INTEGER, SMALLINT, BIGINT, FLOA, REAL, DECIMAL, DATE, TIME, TIMESTAMP, GRAPHIC, VARGRAPHIC.

**User response:** Consider dropping and recreating the table to eliminate the unsupported data types, or select a different table to back up.

HLOU4080E *db2_error_msg*

**Explanation:** An error was encountered during an SQL or Db2 instrumentation facility interface (IFI) operation. This message contains the text of the message that the Db2 DSNTIAR message formatting routine issued when the error occurred.

**User response:** For more information about the error, refer to the IBM Db2 messages documentation.

HLOU4088I The Unicode Services Information Service failed. **RC**=<return_code> **RSN**=<reason_code>

**Explanation:** An attempt to call the Unicode Services Information Service has failed.

**User response:** No action is required.

HLOU4089I Unicode character conversion service failed. **RC**=<return_code> **RSN**=<reason_code>

**Explanation:** An attempt to convert input data to the target table CCSID has failed. The system Unicode Character Conversion service is used for these conversions. A call to the conversion service failed with the indicated return and reason codes.

**User response:** No action is required.

HLOU4090I Conversion from CCSID: <source_ccsid> to CCSID: <target_ccsid> is not supported. **Column**=<column_name>

**Explanation:** The z/OS Unicode Services conversion service does not support converting data between the two named CCSIDs. As a result, the product is unable to load data to the named column. CCSID conversion is required anytime string input data is encoded in a different CCSID than a target table column.

**User response:** No action is required.

HLOU4091I Field <field_name> not convertible to column CCSID. **Record**=<record_number>

**Explanation:** Input data for the specified column is encoded in a CCSID that differs from the column CCSID. In the process of converting the data to the target CCSID, a character was found which has no representation in the target CCSID. NOSUBS was specified in the control cards, so this record will be discarded.

**User response:** No action is required.

HLOU4092I Field <field_name> contains an invalid character. **Record**=<record_number>

**Explanation:** Input data for the specified column is encoded in a CCSID that differs from the column CCSID. In the process of converting the data to the target CCSID, an invalid character was encountered. NOSUBS was specified in the control cards, so this record will be discarded.

**User response:** No action is required.

HLOU4093I Unicode character conversion service will be used for this load

**Explanation:** The CCSID of input character data differs from the CCSID of the target table. The system Unicode Character Conversion service will be used to convert input data to the target table CCSID. This may lengthen the elapsed time of the load.

**User response:** No action is required.

HLOU4094I No data was loaded to the Accelerator due to rollback processing

**Explanation:** This message indicates that no data has been loaded to the accelerator. This is because the **ACCEL_WHEN_DB2_DISCARDS** option is set to **ROLLBACK**. With this option setting, data loaded to the accelerator is rolled back anytime Db2 discards records already loaded to the accelerator, or if the Db2 LOAD fails. The discard condition can occur when Db2 detects unique index or RI violations. These conditions are detected by Db2 LOAD only after all data has been loaded to the accelerator.

**User response:** No action is required.
Unsupported data type for FORMA T DELIMITED. Field=<field_name>, Type=<data_type>

Explanation: The FORMA T DELIMITED option does not currently support SYSREC data sets that contain GRAPHIC, VARGRAPHIC or non-Unicode MIXED data.

User response: No action is required.

Only tables or partitions changed since the last load will be loaded.

Explanation: DETECT_DATA_CHANGES is specified in the HALOAD command. HALOAD will automatically detect modified data and then load only those tables or partitions that have been changed in Db2 since the last load was performed. Explicit partition lists are ignored when DETECT_DATA_CHANGES is specified. The HALOAD program will determine which partitions need to be loaded.

User response: No action is required.

No data was transferred to the accelerator. No changed tables or partitions detected.

Explanation: DETECT_DATA_CHANGES was specified, and no tables or partitions with modified data were found. As a result, no data was transferred to the accelerator.

User response: No action is required.

Partition lists will be ignored because DETECT_DATA_CHANGES was specified.

Explanation: DETECT_DATA_CHANGES was specified; as a result, any partition lists specified will be ignored. HALOAD will determine which partitions need to be loaded. Only those partitions that have changed since the last load will be loaded.

User response: No action is required.

HLORESET performed for utility id utilid_id

Explanation: The HLORESET parameter was specified on the DSNUTILB EXEC statement for the job step. Any stopped utility was terminated and the Db2 Analytics Accelerator Loader status table entries were deleted for the utility ID.

User response: No action is required.

SYSIN CONVERSION ERROR. RC=conversion_service_rc, RSN=conversion_service_rsn, TARG=target_ccsid

Explanation: Unicode conversion service failed SYSIN conversion.

User response: Contact IBM Software Support. Be prepared to provide support with the started task SYSPRINT output as well as the batch Db2 Analytics Accelerator Loader job log.

Table: table_creator table_name cannot be loaded because all partitions are archived.

Explanation: Load processing determined that all partitions have been archived by the SYSPROC.ACCEL_ARCHIVE_TABLE stored procedure.

User response: No action is required.

Db2 Analytics Accelerator Loader <product_version>, FMID=<product_fmid>, COMP_ID=<product_compid>

Explanation: This message provides the following information for your configuration: product name, version and release, FMID, and component ID.

User response: No action is required.

Initialization is complete.

Explanation: The initialization processing for the DSNUTILB intercept component of the Db2 Analytics Accelerator Loader completed successfully.

User response: No action is required.

Intercept completed.

Explanation: The Db2 Analytics Accelerator Loader DSNUTILB intercept has completed intercept processing for this Db2 utility execution.

User response: No action is required.

Analysis started. Step=step_number

Explanation: The Db2 Analytics Accelerator Loader DSNUTILB intercept has started the analysis phase for this Db2 utility command.

User response: No action is required.

Analysis completed. RC=<return_code>

Explanation: The Db2 Analytics Accelerator Loader DSNUTILB intercept has completed the analysis phase for this Db2 utility command.

User response: No action is required.
HLOU5006I  Thread cancel started. Step=step_number
Explanation: The Db2 Analytics Accelerator Loader DSNUTILB intercept has started the thread-cancel processing phase for this Db2 utility command.
User response: No action is required.

HLOU5007I  Thread cancel completed.
RC=return_code
Explanation: The Db2 Analytics Accelerator Loader DSNUTILB intercept has completed the thread-cancel processing phase for this Db2 utility command.
User response: No action is required.

HLOU5008I  Utility execution started.
Step=step_number
Explanation: The Db2 Analytics Accelerator Loader DSNUTILB intercept has started the Db2 utility execution phase for this utility command.
User response: No action is required.

HLOU5009I  Utility execution completed.
SYS=<system_abend_code>,
USR=<dsnutilb_return_code>.
Explanation: The Db2 Analytics Accelerator Loader DSNUTILB intercept has completed the utility execution phase for the Db2 utility command. This message provides the return code from the DSNUTILB program (the USR value). If the DSNUTILB program terminated abnormally with a system abend, the message also provides the system abend code (the SYS value).
User response: No action is required.

HLOU5010I  Allow threads started. Step=step_number
Explanation: The Db2 Analytics Accelerator Loader DSNUTILB intercept has started the allow-threads processing phase for this Db2 utility command.
User response: No action is required.

HLOU5011I  Allow threads completed.
RC=return_code
Explanation: The Db2 Analytics Accelerator Loader DSNUTILB intercept has completed the allow-threads processing phase for this Db2 utility command.
User response: No action is required.

HLOU5012I  Connected to started task
HLOID=product_identifier.
Explanation: The Db2 DSNUTILB job has connected to the specified Db2 subsystem through the Db2 Analytics Accelerator Loader started task.
User response: No action is required.

HLOU5013E  Unable to connect to DB2
subsystem=db2_ssid
Explanation: The Db2 DSNUTILB job could not connect to the specified Db2 subsystem starting the Db2 Analytics Accelerator Loader started task.
User response: Make sure that the required Db2 subsystem is operational.

HLOU5014I  Delete blocker ID processing started.
Step=step_number
Explanation: The DSNUTILB intercept component of the Db2 Analytics Accelerator Loader has started the delete-blocker-ID phase of thread blocker processing for the Db2 utility command. This message provides the step number of the DELETE_BLOCKER_ID step.
User response: No action is required.

HLOU5015I  Delete blocker ID processing completed.
RC=return_code
Explanation: The DSNUTILB intercept component of the Db2 Analytics Accelerator Loader has completed the delete-blocker-ID phase of thread blocker processing for the Db2 utility command. This step completed with the specified return code.
User response: No action is required.

HLOU5016E  Utility abended. SYS=<system_abend_code>,
USR=<dsnutilb_return_code>
Explanation: The Db2 Analytics Accelerator Loader DSNUTILB intercept was not able to complete the execution phase for the Db2 utility command because the DSNUTILB program terminated abnormally with a system abend. This message provides the system abend code (the SYS value) and the DSNUTILB return code (the USR value). The message is issued as a WTO message.
User response: To determine the cause of the error, look up the system abend code and the DSNUTILB return code in the appropriate IBM documentation.

HLOU5017E  SORT EXIT ERROR: error_reason
Explanation: The Db2 Analytics Accelerator Loader detected an error in a sort exit that it uses for implementing the additional options for the Db2 LOAD utility. See the error reason that is specified in this...
message for an explanation of the error.

**User response:** If the error is related to a data conversion failure, correct the data and run the LOAD utility again. If the error is related to a product internal error, contact IBM Software Support.

---

**HLOU5018I** SORT execution completed.
  
  **SYS**=system_abend_code,  
  **USR**=dsnutilb_return_code

**Explanation:** SORT has completed. This message provides the return code from the SORT program (the USR value). If the SORT program terminated abnormally with a system abend, the message also provides the system abend code (the SYS value).

**User response:** No action is required.

---

**HLOU5019E** SORT ended abnormally. DSNUTILB will be canceled with an S222 abend.

**Explanation:** SORT processing during DSNUTILB interception ended abnormally. The DSNUTILB program will be canceled with an S222 abend.

**User response:** Review the messages that were produced by the SORT program to determine the cause of the SORT failure. Then correct this problem and rerun the job. You can safely ignore the S222 abend in the DSNUTILB program.

---

**HLOU5020E** Cancel syntax member  
  **cancel_syntax_member was not found.**

**Explanation:** The HLOBMAIN cancel syntax member specified in the HLOBMAIN_CANCEL_MEMBER of the OPTIONS was not found in the parameters library.

**User response:** Make sure that the required member exists in the parameters library and is correctly specified in the options member.

---

**HLOU5021E** Global syntax member  
  **global_syntax_member was not found.**

**Explanation:** HLOBMAIN global syntax member specified in the HLOBMAIN_GLOBAL_MEMBER of the OPTIONS was not found in the parameters library.

**User response:** Make sure that the required member exists in the parameters library and is correctly specified in the options member.

---

**HLOU5022E** Subtask **module_name** terminated unexpectedly.  
  **SYS**=system_abend_code,  
  **USR**=return_code.

**Explanation:** A task that is attached by DSNUTILB interception services ended unexpectedly. If the program terminated abnormally with a system abend, the message provides the system abend code (the SYS value). The message provides the return code from the program (the USR value).

**User response:** Run the job again. If the problem persists, contact IBM Software Support.

---

**HLOU5023E** Unsupported SYSREC data set type  
  **RECFM**=record_format,  
  **DSN**=data_set,  
  **SEQNO**=data_set_sequence_number.

**Explanation:** The product encountered a SYSREC data set with an unsupported record format. The SYSREC data set must have a RECFM of F or V. Spanned record formats and RECFM=U and D are not supported.

**User response:** Run the job again with an appropriate SYSREC data set.

---

**HLOU5024W** Unable to load the accelerator due to  
  **IDENTITY column column_name.**

**Loading only DB2.**

**Explanation:** The table contains an IDENTITY column for which no values were provided. The product cannot generate IDENTITY column values, and therefore cannot perform a dual load (load data to both the accelerator and Db2). The ACCEL_ON_UNSUPPORTED_LOAD option is set to LOAD_DB2; therefore, the dual load will be converted to a Db2-only load.

**User response:** After the Db2-only load completes, run the ACCEL_LOAD_TABLES stored procedure to load the data from Db2 to the accelerator and sync the accelerator table with the Db2 table.

---

**HLOU5025E** Generation of identity column values is not supported. Col: **column_name.**

**Explanation:** The table contains an identity column that is defined as GENERATE ALWAYS, or for which no field specification was provided. The product cannot generate values for identity columns.

**User response:** If the identity column is defined as GENERATE BY DEFAULT, consider providing a field specification for the column. If the identity column is defined as GENERATE ALWAYS, the product cannot be used to load the table.

---

**HLOU5026E** Unable to load the client API module  
  **<module_names>.**

**Explanation:** The specified client API module could not be loaded into memory. Possible causes are the product is not installed correctly, or the load library is not concatenated to the batch job STEPLIB.

**User response:** Make sure that the product load library is included in the batch job’s STEPLIB or JOBLIB.
HLOU5027E  No EXEC SQL DECLARE CURSOR statement was found for ACCEL_CURSOR <cursor_name>.

Explanation: A DECLARE CURSOR statement must be provided for the cursor that is specified on the ACCEL_CURSOR clause.

User response: Add the EXEC SQL DECLARE CURSOR statement to the Db2 Analytics Accelerator Loader control cards and rerun the job.

HLOU5028E Invalid partitioning key definition for a table with data loader managed partitioning.

Explanation: The table's partitioning key includes the ACCEL_PARTITION_KEYCOL column, which indicates that product should manage partitioning in order to enable load parallelism. Data loader managed partitioning requires a partitioning key that consists of a single INTEGER type column named ACCEL_PARTITION_KEYCOL. The table's partitioning key does not satisfy this requirement.

User response: Correct the definition of the target table and rerun the job.

HLOU5029E CALLTYPE <call_type> API call failed with RC <return_code> Server <server_name>.

Explanation: A client API called failed. The job will terminate.

User response: Verify that the server is running. If you need assistance, contact IBM Software Support.

HLOU5030E RECV call failed. RC <return_code> SQLCODE <sql_code>.

Explanation: An error occurred while the product attempted to fetch data from the Db2 Analytics Accelerator Loader Server.

User response: Check the job log for additional error messages that might provide more information. Check the SQL statement to verify that it is coded correctly. If you need assistance, contact IBM Software Support.

HLOU5031E The client did not return an SQLDA.

Explanation: Db2 Analytics Accelerator Loader requires an SQLDA to load data from the Db2 Analytics Accelerator Loader Server. The client failed to return an SQLDA.

User response: Contact IBM Software Support.

HLOU5032E The source and target tables must have the same number of columns.

Explanation: When loading data from the Db2 Analytics Accelerator Loader Server, the source table must have the same number of columns as the target table on the accelerator, with the following exception: If the target table is range partitioned, then the source table cannot include the special ACCEL_PARTITION_KEYCOL column that must be part of the target Db2 and accelerator table.

User response: Correct the definition of the target table or modify the Db2 Analytics Accelerator Loader Server SQL statement, and then rerun the job.

HLOU5033E Column <column_name> is not nullable, but Db2 Analytics Accelerator Loader Server column <column_number> is.

Explanation: When a Db2 Analytics Accelerator Loader Server table column is defined as NULL, the target Db2 column must also be nullable.

User response: Correct the definition of the target Db2 table and rerun the job.

HLOU5034E DATA TYPE <data_type> COLUMN <column_name> not compatible with SQLTYPE <sql_type>, COLNO <column_number>.

Explanation: The data type of the specified target column is not compatible with the data type of the source table column.

User response: Correct the definition of the target Db2 table and rerun the job.

HLOU5035E The scale of COLUMN <column_name> does not match that of Db2 Analytics Accelerator Loader Server column <column_number>.

Explanation: The decimal scale of the target Db2 column must match the scale of the Db2 Analytics Accelerator Loader Server table column.

User response: Correct the definition of the target Db2 table and rerun the job.

HLOU5036E COLUMN <column_name> data type <column_type> is not supported with ACCEL_CURSOR.

Explanation: The data type of the specified target Db2 column is not supported when you are loading data from the Db2 Analytics Accelerator Loader Server.

User response: Correct the definition of the target Db2 table and rerun the job.
HLOU5037E  MSGTEXT <message_text>.
Explanation: The client returned the error messages after a failed RECV call.
User response: See the product job log for additional information about the error.

HLOU5046E  The version of the IBM DB2 Analytics Accelerator does not support LOAD RESUME.
Explanation: Using LOAD RESUME requires IBM Db2 Analytics Accelerator version 4.1.5 or later.
User response: Either upgrade IBM Db2 Analytics Accelerator to a supported version or change the syntax of the job to replace the data in the table.

HLOU5047I  No data was loaded to the accelerator.
Explanation: No data was loaded to the accelerator. Errors were encountered during utility execution.
User response: Correct any problems described in the SYSPRINT error messages and rerun the job.

HLOU5048E  HLOPIPE error: Function=x'10'
LOOKUP_RC=<return_code>.
Explanation: The product intercepted an UNLOAD that was running in the Workload Manager (WLM). The batch job that triggered the UNLOAD requested that the UNLOAD terminate with errors. This event indicates that the batch job encountered errors during the load process. This message is only issued in the DSNUTILU WLM address space.
User response: See the batch job output for more information.

HLOU5049E  DB2 was successfully loaded but not the accelerator. Rerun this job with the option IDAA_ONLY.
Explanation: A load job that specified IDAA_DUAL and LOAD RESUME successfully loaded the Db2 table, but was unable to load the accelerator.
User response: Correct the conditions that caused the accelerator load to fail and then rerun the job with the IDAA_ONLY keyword.

HLOU5050W  Accelerator loaded during prior failed utility execution. Only DB2 will be loaded.
Explanation: This is a restart of a failed IDAA_DUAL LOAD RESUME job. The failed utility run successfully loaded all data to the accelerator. As a result, only Db2 will be loaded during this restart.
User response: No action is required.

HLOU5051E  The target table is not defined in DB2.
Explanation: The table that is the target of the load is not defined to Db2.
User response: Correct the table name or create the table in Db2 and then rerun the job.

HLOU5052E  The target table is an accelerator only table (AOT).
Explanation: The table that is the target of the load is an accelerator only table. This means the table only exists in the accelerator.
User response: No action is required.

HLOU5053W  Accelerator only tables do not support loading to both DB2 and the accelerator (option IDAA_DUAL). Changing to accelerator only load (option IDAA_ONLY).
Explanation: The table that is the target of the load is an accelerator only table. The table only exists in the accelerator, and therefore, only the accelerator can be loaded.
User response: The load job completes with RC=4. To eliminate this warning on future loads, change the job to load only the accelerator by using the extended syntax option IDAA_ONLY.

HLOU5054E  Unable to delete existing data from target table. Module: <module_name>
offset <offset_to_SQL_call>.
Explanation: When performing a LOAD REPLACE on an accelerator only table, the product deletes the existing data in the table before loading the new data. This delete operation failed. For more information about the SQL error, see message HLOU5725E.
User response: Correct the cause of the SQL error and rerun the load job.

HLOU5055I  Existing data deleted from target table.
Explanation: When performing a LOAD REPLACE on an accelerator only table, the product deletes all existing data from the table before loading the new data. The delete operation has completed successfully.
User response: No action is required.

HLOU5056E  Accelerator only table support requires a later version of the accelerator software.
Explanation: The table that is the target of the load is an accelerator only table (AOT). The minimum version of IBM Db2 Analytics Accelerator that supports AOT is V4 with PTF 6 applied.
User response: Upgrade the IBM Db2 Analytics Accelerator software to meet the minimum required version.

Explanation: The DSNUTILB interface program failed to complete initialization. This failure occurred during initialization of the internal API.

User response: To determine the cause of the failure, review the messages in the job output that precede this message. Then correct the problem and run the job again. If you need assistance, contact IBM Software Support.

User response: No action is required.

User response: The DSNUTILB interface program failed to complete initialization. This failure occurred during initialization of the internal API.

Explanation: This is a restart of a failed LOAD RESUME utility run. The failed utility run successfully loaded all data to the named accelerator. As a result, the named accelerator will not be loaded during this restart.

User response: No action is required.

Explanation: This is a restart of a failed LOAD RESUME utility run. The failed utility run successfully loaded all data to the accelerators. As a result, the accelerators will not be loaded again.

User response: No action is required.

Explanation: This is an informational message issued when tracing has been activated.

User response: No action is required.

Explanation: This is an informational message issued when tracing has been activated.

User response: No action is required.

Explanation: This is an informational message issued when tracing has been activated.

User response: No action is required.

Explanation: This is an informational message issued when tracing has been activated.

User response: No action is required.

Explanation: The number of rows loaded is defined by the ACCEL_ROWS_REPORT_THRESHOLD setting, which has been met. The number_of_rows_loaded value is the cumulative number of rows that have been loaded by the job.

User response: No action is required.

Explanation: The product encountered an error when attempting to allocate and open temporary SYSOUT data sets for output in the WLM environment.

User response: Verify that the user ID that runs the batch Accelerator Loader utility job has the proper RACF authority to create and open temporary data sets for output.

User response: Remove any DD allocations from the DSNUTILB job step that conflict with any of the following patterns: HLO$__, HLO#__, HLO@__, $HLO__, #HLO__, and @HLO__. If the conflicting DDNAME allocations cannot be removed, contact IBM Software Support for assistance.

User response: Contact IBM Software Support.

User response: No action is required.

Explanation: The DSNUTILB interface program failed to complete initialization. This failure occurred during initialization of the internal API.

User response: To determine the cause of the failure, review the messages in the job output that precede this message. Then correct the problem and run the job again. If you need assistance, contact IBM Software Support.

User response: No action is required.

Explanation: The DSNUTILB interface program failed to complete initialization. This failure occurred during initialization of the internal API.

User response: To determine the cause of the failure, review the messages in the job output that precede this message. Then correct the problem and run the job again. If you need assistance, contact IBM Software Support.
Provide Support with the full text of this message.

**HLOU5304E** SWAREQ failed for DDNAME=dd_name, RC=return_code.

**Explanation:** The SWAREQ service returned a non-zero return code when it was called to provide the JFCB address for the specified DD name.

**User response:** Contact IBM Software Support. Provide Support with the full text of this message.

**HLOU5305E** DSNUTILB returned an error parsing the SYSIN data set.

**Explanation:** This DSNUTILB utility execution will not be intercepted because the DSNUTILB parser returned an error while parsing the SYSIN data set.

**User response:** See the error messages that were returned by DSNUTILB. Then correct the errors in the SYSIN data set and rerun the job.

**HLOU5306E** DSNUTILB syntax parser returned an error while parsing the SYSIN data set.

**Explanation:** This DSNUTILB utility execution will not be intercepted because the parser for the Db2 Analytics Accelerator Loader DSNUTILB statement returned an error while parsing the SYSIN data set.

**User response:** See the error messages that were returned by DSNUTILB. Then correct the errors in the SYSIN data set and rerun the job.

**HLOU5307E** Unable to determine restart status.

**Explanation:** This DSNUTILB utility execution will not be intercepted because Db2 Analytics Accelerator Loader could not determine the restart status for the utility ID.

**User response:** See the error messages that are related to this error in the log for the Db2 Analytics Accelerator Loader started task.

**HLOU5308I** UTILID in use by stopped utility but no worklist exists.

**Explanation:** This DSNUTILB utility execution will not be intercepted because the utility ID is in use by a stopped utility and no worklist exists in the Db2 Analytics Accelerator Loader restart tables.

**User response:** No action is required.

**HLOU5309I** Move worklist failed for utility ID=utility_ID.

**Explanation:** This DSNUTILB utility execution will not be intercepted for the following reasons: a worklist for the specified utility ID already exists; no restartable utility was found; and the worklist move operation failed.

**User response:** Manually delete the worklist, as described in the user's guide, then rerun the job.

**HLOU5310I** Restart was specified but no stopped utility was found for utility ID=utility_ID.

**Explanation:** This DSNUTILB utility execution will not be intercepted because a restart was requested and no stopped utility was found for this utility ID.

**User response:** Remove the restart parameter from the utility job, and then rerun the job.

**HLOU5311I** Save worklist failed for utility ID=utility_ID.

**Explanation:** This DSNUTILB utility execution will not be intercepted because the worklist that is required for interception processing could not be saved.

**User response:** See the error messages that are related to this error in the log for the Db2 Analytics Accelerator Loader started task.

**HLOU5312E** A running utility was found with utility ID=utility_ID.

**Explanation:** This DSNUTILB utility job will not be intercepted because another utility is already running with the same utility ID.

**User response:** Wait for the utility that is running to terminate, or specify a different utility ID for this utility job and rerun this job.

**HLOU5313E** Get next worklist step failed for utility ID=utility_ID.

**Explanation:** This DSNUTILB utility execution will not be intercepted because the next step in the worklist that is required for interception processing cannot be retrieved.

**User response:** See the error messages that are related to this error in the log for the Db2 Analytics Accelerator Loader started task.

**HLOU5314E** Update worklist status failed for utility ID=utility_ID.

**Explanation:** This DSNUTILB utility execution will not be intercepted because the worklist status cannot be updated.

**User response:** See the error messages that are related to this error in the log for the Db2 Analytics Accelerator Loader started task.
HLOU5315E  Phase 2 policy processing failed.

Explanation: This DSNUTILB utility execution will not be intercepted because phase two of intercept policy processing failed.

User response: See the error messages that are related to this error in the log for the Db2 Analytics Accelerator Loader started task.

HLOU5316E  SET worklist step failed for utility ID=utility_ID.

Explanation: This DSNUTILB utility execution will not be intercepted because the SET worklist step operation failed.

User response: See the error messages that are related to this error in the log for the Db2 Analytics Accelerator Loader started task.

HLOU5317S  Unable to locate USTI for current step UTILID=utility_ID, STEP=utility_step.

Explanation: This DSNUTILB utility execution will not be intercepted because an internal error occurred.

User response: Contact IBM Software Support.

HLOU5318E  LISTDEF expansion failed for utility ID=utility_ID.

Explanation: This DSNUTILB utility execution will not be intercepted because the LISTDEF that is specified for the utility ID cannot be expanded to determine the Db2 objects to process.

User response: Contact IBM Software Support.

HLOU5319E  Save object list failed for utility ID=utility_ID.

Explanation: This DSNUTILB utility execution will not be intercepted because the object list cannot be saved.

User response: See the error messages that are related to this error in the log for the Db2 Analytics Accelerator Loader started task.

HLOU5320E  SAPI processing failed, RC=return_code, RSN=reason_code.

Explanation: The SAPI processing service returned a non-zero return code while attempting to perform a SAPI function.

User response: Contact IBM Software Support. Provide Support with the full text of this message.

HLOU5321E  SAPI processing failed, RC=return_code, RSN=reason_code.

Explanation: The SAPI processing component returned a non-zero return code while setting up a SAPI function.

User response: Contact IBM Software Support. Provide Support with the full text of this message.

HLOU5322E  Listdef processing failed, RC=return_code, RSN=reason_code.

Explanation: The processing of the LISTDEF for the intercepted Db2 utility failed with the specified non-zero return code.

User response: Contact IBM Software Support. Provide Support with the full text of this message.

HLOU5323S  A usable temporary LISTDEF name could not be generated.

Explanation: A usable, temporary LISTDEF name could not be generated because all of the temporary LISTDEF names known to Db2 Analytics Accelerator Loader occurred in the SYSIN data set for the utility job.

User response: Contact IBM Software Support. Provide Support with the full text of this message.

HLOU5324E  Merge worklist failed for utility ID=utility_ID.

Explanation: This DSNUTILB utility execution cannot continue because the worklist that Db2 Analytics Accelerator Loader generated for utility restart purposes cannot be merged with the original worklist.

User response: See the error messages that are related to this error in the log for the Db2 Analytics Accelerator Loader started task.

HLOU5325I  Restart in progress for utility ID=utility_ID.

Explanation: The specified Db2 utility execution has been restarted at the request of the user.

User response: No action is required.

HLOU5326E  Open failed for DSN=data_set_name

Explanation: A failure occurred while Db2 Analytics Accelerator Loader was trying to open the specified data set. Additional messages provide diagnostic information about this problem.

User response: See the related messages to diagnose the problem. After you resolve the problem, rerun the utility.
HLOU5327E  Open failed. Abend code =
   systemCompletionCode, reason = reasonCode

Explanation: A failure occurred while Db2 Analytics Accelerator Loader was trying to open a data set. This message provides the completion code and reason code for this failure.

User response: Resolve the problem that is causing the error and then rerun the job.

HLOU5328E  Open failed. RC=return_code

Explanation: A failure occurred while Db2 Analytics Accelerator Loader was trying to open a data set. This message provides the return code from the OPEN macro.

User response: Resolve the problem that is causing the error and then rerun the job.

HLOU5329W  Member not found in data set
   DSN=data_set_name

Explanation: A failure occurred while Db2 Analytics Accelerator Loader was trying to open a member of the specified data set. The member was not found in the data set.

User response: Resolve the problem that is causing the error and then rerun the job.

HLOU5330I  Original DSNUTILB syntax follows:

Explanation: This message introduces the original, unmodified DSNUTILB syntax that was submitted for the utility. This syntax is presented in the message HLOU5331I, which follows this one. Db2 Analytics Accelerator Loader modifies this syntax before passing it to the DSNUTILB program.

User response: No action is required.

HLOU5331I  dsnutilb_syntax

Explanation: This message contains all or part of the original, unmodified DSNUTILB syntax that was submitted for the utility.

User response: No action is required.

HLOU5332I  End of original DSNUTILB syntax listing.

Explanation: This message indicates the end of the original, unmodified DSNUTILB syntax that was submitted for this utility and that is presented in the preceding message HLOU5331I.

User response: No action is required.

HLOU5333E  TEMPLATE data set name processing failed, RC=return_code, RSN=reason_code.

Explanation: The processing of the TEMPLATE data set name failed with the specified non-zero return code because an error occurred.

User response: Contact IBM Software Support. Provide Support with the full text of this message.

HLOU5334E  TEMPLATE expansion failed for utility ID=utility_ID.

Explanation: This DSNUTILB utility execution will not be intercepted because the TEMPLATE referenced in the LOAD utility statement could not be expanded to determine the data set name for the LOAD utility input.

User response: Contact IBM Software Support.

HLOU5335E  UFSP processing failed, RC=return_code, RSN=reason_code.

Explanation: The UFSP processing component issued a return code greater than 4 while setting up a UFSP function. The failure might occur because the table does not exist in Db2, or because the module could not obtain necessary storage space.

User response: Contact IBM Software Support. Provide the Support representative with the full text of this message.

HLOU5336E  An error was detected during DB2 catalog lookup of column column_name.

Explanation: The Db2 Analytics Accelerator Loader UFSP processing component returned a non-zero return code while looking up information in the Db2 catalog.

User response: Contact IBM Software Support. Provide the Support representative with the full text of this message and the SYSPRINT log of the Db2 Analytics Accelerator Loader started task.

HLOU5337E  The UFSP component detected an index column with an unsupported data type.

Explanation: The Db2 Analytics Accelerator Loader UFSP processing component detected an index key column with a data type that is not supported by the PRESORT option for the Db2 LOAD utility. These unsupported data types are: REAL, DOUBLE, FLOA, DECFLT, DISTINCT, BLOB, CLOB, and DBCLOB. The PRESORT option does not sort the data in input records by index key if the index key contains a column with an unsupported data type.

User response: If you want to sort the data in the input records for the LOAD utility by index key, you must do so manually.
HLOU5338E  Session has been terminated by the server.

Explanation: The DSNUTILB interception did not complete because the session was terminated by the server.

User response: Check with the system administrator to determine the reason for the termination of the DSNUTILB interception program.

HLOU5339E  Session creation failed RC=return_code, RSN=reason_code, Reason=description

Explanation: DSNUTILB interception failed to complete initialization. The failure occurred during the creation of an interception session for the Db2 utility.

User response: To determine the cause of the failure, review the reason description in this message. Correct the problem and run the job again. If you need assistance, contact IBM Software Support.

HLOU5340E  Worklist in use by another utility ID=utility_ID

Explanation: Db2 Analytics Accelerator Loader will not intercept a Db2 utility execution that is associated with the specified utility ID because a worklist for that utility ID already exists and is currently in use by another utility job. See the corresponding message HLOS5113I in the SYSPRINT data set for the started task to determine the session token of the owning utility session.

User response: Either change the utility ID in the utility job that you want to intercept, or wait until the utility job that is currently using the worklist completes. Then rerun the utility job that failed to be intercepted.

HLOU5341E  Unable to determine restart status for utility ID=utility_ID

Explanation: Db2 Analytics Accelerator Loader cannot determine whether the Db2 utility should be restarted because the status of the last utility operation within the current worklist step was not recorded in the intercept worklist tables. This situation might be caused by an unexpected system outage.

User response: Use the HLOMAINT utility to set the restart status for the utility. Specify one of these options for the utility: MARK_COMPLETE if the last utility operation completed successfully and the utility needs to be restarted from the next operation in the current worklist step, or FORCE_RESTART if the last utility operation needs to be restarted to complete its processing.

HLOU5342I  -TERM UTILITY issued by user, cleaning up utility ID=utility_ID

Explanation: The -TERM UTILITY command was issued for the specified utility ID after the utility ended in a restartable state. The utility will complete its current worklist step and then terminate. Also, Db2 Analytics Accelerator Loader will automatically delete the data that is associated with this utility ID from the intercept worklist tables. The utility will no longer be restartable.

User response: No action is required.

HLOU5343I  -TERM UTILITY issued during utility execution for utility ID=utility_ID.

Explanation: The -TERM UTILITY command was issued for the specified utility ID while the utility was running. The utility will complete its current worklist step and then terminate. Also, Db2 Analytics Accelerator Loader will automatically delete the data that is associated with this utility ID from the intercept worklist tables.

User response: No action is required.

HLOU5344E  Get discard table ROWID failed for utility ID=utility_ID

Explanation: This DSNUTILB utility execution will not be intercepted because the discard table ROWID cannot be retrieved.

User response: See the error messages that are related to this error in the log for the product started task.

HLOU5345E  Unable to dynamically allocate data set. DD name=ddname, RC=return_code, RSN=reason_code.

Explanation: The specified DD was not able to dynamically allocate a data set that was needed.

User response: Review messages in the JES job log to determine the cause of the dynamic allocation failure. Resolve the problem that is causing the error and then rerun the job.

HLOU5346E  RDJFCB failed for DDNAME=ddname, RC=return_code.

Explanation: The RDJFCB service returned a non-zero return code when it was called for the specified DD name.

User response: Contact IBM Software Support. Provide Support with the full text of this message.

Chapter 14. Troubleshooting 719
HLOU5361E  DEFAULTIF is not supported for partitioning key column column_name.

Explanation: This DSNUTILB utility execution will not be intercepted because the product detected that the DEFAULTIF keyword is used with a column that participates in the partitioning key of the table. The DEFAULTIF keyword cannot be used with partitioning key columns.

User response: Correct the syntax and resubmit the job.

HLOU5362E  Loading a DEFINE NO table space whose data sets have not been created is not supported.

Explanation: An attempt to load the accelerator (option IDAA_ONLY) or the accelerator and Db2 (option IDAA_DUAL) has failed because the Db2 table space was created with the DEFINE NO clause and its data sets have not yet been created.

User response: Either re-create the table space with DEFINE YES, or perform an action that will cause Db2 to create the table space's VSAM data sets. Running the Db2 LOAD utility or performing an INSERT will cause Db2 to create the VSAM data sets.

HLOU5363E  Field column_name not found.

Explanation: During processing of the LOAD specifications, the product detected the specified column, which does not exist in the catalog and is not used for NULLIF or DEFAULTIF conditions. Because IGNOREFIELDS NO was specified, processing of the LOAD statement was terminated.

User response: Correct the LOAD utility syntax and run the job again.

HLOU5364I  Record <record_nbr> discarded due to WHEN clause specification.

Explanation: The record was discarded because it did not satisfy any of the WHEN clause conditions that are specified in the LOAD control cards.

User response: No action is required.

HLOU5366I  Record= <record_number> discarded due to partition key value.

Explanation: The record was discarded because its partitioning key did not belong to any partition included in the load.

User response: No action is required.

HLOU5400E  Utility processing failed by policy practice practice_name.

Explanation: The utility job step was terminated because the Db2 Analytics Accelerator Loader policy specified a fail return code.

User response: Correct the utility statement and rerun the job.

HLOU5401E  Syntax denied: id=string.

Explanation: The specified utility syntax is denied by the policy.

User response: Correct the utility statement and rerun the job.

HLOU5402E  Syntax required: id=string.

Explanation: The specified utility syntax is required by the policy.

User response: Correct the utility statement and rerun the job.

HLOU5403I  Utility statement altered by policy practice practice_name.

Explanation: The utility statement syntax was dynamically changed before utility execution in accordance with the specifications in the Db2 Analytics Accelerator Loader intercept policy.

User response: No action is required.

HLOU5404E  Utility monitor encountered an error RC= return_code RSN= reason_code.

Explanation: The utility monitor encountered an error while checking for syntax modifications.

User response: Contact IBM Software Support.

HLOU5405I  Utility return code altered by policy practice practice_name.

Explanation: The utility return code was changed by policy practice practice_name.

User response: No action is required.

HLOU5406E  SQL function sql_function failed with SQLCODE= sql_code

Explanation: The started task encountered an error while executing a SQL function on behalf of the client.

User response: IBM Software Support

</table>
HLOU5501I Load pre-processing finished with
RC=return_code.

Explanation: Preliminary actions for IFDISCARDS or
SHRLEVEL REFERENCE finished with the specified
return code.

User response: No action is required.

HLOU5502I Load post-processing started.

Explanation: The main load processing phase is
complete, and additional actions will be performed for
IFDISCARDS or SHRLEVEL REFERENCE processing.

User response: No action is required.

HLOU5503I Load post-processing finished with
RC=return_code.

Explanation: Additional actions for IFDISCARDS or
SHRLEVEL REFERENCE were performed.

User response: No action is required.

HLOU5504E Storage release failed.
Module=module_name, storage
area=storage_area_name, RC=return_code.

Explanation: The specified module failed while
attempting to free the specified storage area.

User response: No action is required.

HLOU5505E Attempt to obtain storage failed.
Module=module_name, storage
area=storage_area_name, RC=return_code.

Explanation: The specified module failed while
attempting to obtain the specified storage area.

User response: Increase the region size that is
available to the Db2 Analytics Accelerator Loader and
run the job again. If the problem persists, contact IBM
Software Support. Have available the listing that
contains this message and any applicable related
messages.

HLOU5506E SQL error.

Explanation: An SQL error occurred in the started
task during load processing for the IFDISCARDS
option or the SHRLEVEL REFERENCE option. Message
HLOU5507I contains the error text.

User response: See Db2 for Z/OS Messages
documentation for information about the Db2 messages
that are displayed in HLOU5512I. If you are unable to
resolve the error, contact IBM Software Support. Have
available the listing that contains this message and any
applicable related messages.

HLOU5507I ERRORTXT=error_text.

Explanation: SQL error diagnostic information.

User response: No action is required.

HLOU5508E Insufficient authority to load data into
table space table_space_name.

Explanation: The user ID that submitted the job is not
authorized to perform a load into the specified table
space.

User response: Select another table space to load.

HLOU5509E Insufficient authority for load with
STATS into table space table_space_name.

Explanation: When the STATISTICS keyword is
specified in a load utility job, you must use a privilege
set that includes the STATS privilege.

User response: Select another table space or remove
the STATISTICS keyword.

HLOU5510E Operation operation_name on data set
data_set_name failed, error number
=error_number_value.

Explanation: The specified operation on the data set
failed.

User response: See z/OS UNIX System Services
Messages and Codes documentation for information
about the displayed error. If you are unable to resolve
the error, contact IBM Software Support. Have available
the listing that contains this message and any
applicable related messages.

HLOU5511E Data set operation failed.
RC=return_code.

Explanation: The data set operation failed with the
specified return code. Message HLOU5512I contains the
error text.

User response: See MVS System Messages
documentation for information about the messages that
are displayed in HLOU5512I. If you are unable to
resolve the error, contact IBM Software Support. Have
available the listing that contains this message and any
applicable related messages.

HLOU5512I error_text.

Explanation: Data set operation error text.

User response: No action is required.
HLOU5513E  Compilation of regular expression failed. Expression=expression_name.

Explanation:  The attempt to compile the specified regular expression failed. Message HLOU5515I contains the error text.

User response:  Contact IBM Software Support. Have available the listing that contains this message and any applicable related messages.

HLOU5514E  Matching of regular expression failed.  
Expression: expression_name.

Explanation:  The attempt to match the specified regular expression failed. Messages HLOU5515I and HLOU5516I contain the error text.

User response:  Contact IBM Software Support. Have available the listing that contains this message and any applicable related messages.

HLOU5515I  ERROR  
TXT=error_text.

Explanation:  An attempt to compile or match a regular expression pattern failed.

User response:  No action is required.

HLOU5516I  ERROR  
TXT=error_text.

Explanation:  An attempt to match the regular expression input failed.

User response:  No action is required.

HLOU5517E  Dynamic allocation error.  
DDNAME=dd_name,  
operation=operation_name,  
RC=return_code.

Explanation:  Dynamic allocation of the specified temporary DD for a Db2 utility failed with the specified return code.

User response:  See MVS Programming Authorized Assembler Services Guide for z/OS documentation for information about the reported code. If you are unable to resolve the error, contact IBM Software Support. Have available the listing that contains this message and any applicable related messages.

HLOU5518E  Invalid partition specified for table space table_space_name.

Explanation:  The specified table space partition does not exist.

User response:  Select another partition for the load job.

HLOU5519E  Service function error. Service name=service_name, RC=return_code.

Explanation:  The specified service function ended with a nonzero return code. If they are present, messages HLOU5520I and HLOU5521I contain the error text.

User response:  See Db2 for Z/OS Messages documentation for information about the messages that are displayed in HLOU5520I and HLOU5521I. If you are unable to resolve the error, contact IBM Software Support. Have available the listing that contains this message and any applicable related messages.

HLOU5520I  ERRORTXT=error_text.

Explanation:  Failed service function input statements.

User response:  No action is required.

HLOU5521I  ERRORTXT=error_text.

Explanation:  Failed service function output statements.

User response:  No action is required.

HLOU5522E  IFI error.

Explanation:  An IFI error occurred in the started task during load processing for the IFDISCARDS option or the SHRLEVEL REFERENCE option. Message HLOU5523I contains the error text.

User response:  See Db2 for Z/OS: Codes documentation for information about the messages that are displayed in HLOU5523I. If you are unable to resolve the error, contact IBM Software Support. Have available the listing that contains this message and any applicable related messages.

HLOU5523I  ERRORTXT=error_text.

Explanation:  An IFI error occurred in the started task during load processing for the IFDISCARDS option or the SHRLEVEL REFERENCE option.

User response:  No action is required.

HLOU5524I  Some input records were discarded and IFDISCARDS PAUSE was specified.

Explanation:  The load utility job paused with return code 4. The production table space was placed in read-only access mode (RO) and was not changed.

User response:  Review the discarded records, and then restart or terminate the paused load job.
HLOU5525I  Some input records were discarded, and IFDISCARDS FAIL was specified.

Explanation: The load utility job terminated with return code 8. The production table space was not changed.

User response: Review discarded records and correct the data for the load job.

HLOU5526I  Utility was restarted after IFDISCARDS PAUSE. All valid records will be committed.

Explanation: The load utility job was restarted after IFDISCARDS PAUSE. All valid records will be committed.

User response: No action is required.

HLOU5527E  Exception with RC=return_code.

Explanation: Load processing for the IFDISCARDS option or the SHRLEVEL REFERENCE option failed with the specified return code.

User response: Contact IBM Software Support. Have available the listing that contains this message and any applicable related messages.

HLOU5528E  Unexpected exception.

Explanation: A severe error occurred during load processing for the IFDISCARDS option or the SHRLEVEL REFERENCE option.

User response: Contact IBM Software Support. Have available the listing that contains this message and any applicable related messages.

HLOU5529E  Table space table_space_name has NPSI and was not loaded.

Explanation: The specified table space has a nonpartitioned secondary index (NPSI), which is not compatible with a partial load when the IFDISCARDS option or the SHRLEVEL REFERENCE option is specified.

User response: Load the entire table space (rather than partitions), or specify the INDEXDEFER option to instruct the product to ignore the NPSI.

HLOU5530E  Table space table_space_name contains versioned rows and was not loaded.

Explanation: For the specified table space, the value of the OLDEST_VERSION column is less than the value of the CURRENT_VERSION column. Versioned objects are not supported when you specify the IFDISCARDS option or the SHRLEVEL REFERENCE option with RESUME YES.

User response: Reorganize the table space to ensure that the value of the OLDEST_VERSION column equals the value of the CURRENT_VERSION column, or specify RESUME NO.

HLOU5531E  Table space table_space_name has status space_status and cannot be loaded.

Explanation: The specified table space is not in a supported access mode. The table space access mode must be read-write (RW), read-only (RO), or utility (UT).

User response: Start the object in RW, RO, or UT mode, and then submit the LOAD utility job again.

HLOU5532E  Table space table_space_name is VCAT-defined. VCAT-defined objects are not supported.

Explanation: When the IFDISCARDS option or the SHRLEVEL REFERENCE option is specified, VCAT-defined table spaces are not supported.

User response: Select another table space to load.

HLOU5533E  Table space table_space_name contains an XML column. XML objects are not supported.

Explanation: When the IFDISCARDS option or the SHRLEVEL REFERENCE option is specified, XML objects are not supported.

User response: Select another table space to load.

HLOU5534E  Table space table_space_name contains a LOB column. LOB objects are not supported.

Explanation: When the IFDISCARDS option or the SHRLEVEL REFERENCE option is specified, LOB objects are not supported.

User response: Select another table space to load.

HLOU5535I  DSCOPY_LIMIT value is limit_value.

Explanation: The DSCOPY_LIMIT parameter specifies the maximum number of concurrent data set operations for load processing when the IFDISCARDS or SHRLEVEL REFERENCE option is specified. The default value is 0, which indicates that the product is to automatically determine the limit and display it in this message.

User response: In most cases, no action is required. However, if the load utility job abnormally ends due to insufficient memory, you can modify the DSCOPY_LIMIT value. Valid values are 0 - 250.

In member HLODTDOP in data set hlq.mlq.SHLOSAMP, specify a smaller value for
DSCOPY_LIMIT than that displayed in this message, and then resubmit the load job.

**HLOU5536I**  Load prevalidation restart handler started.

**Explanation:** A load utility job that specified the SHRLEVEL REFERENCE option or the IFDISCARDS option was restarted. Additional processing for shadow objects is required.

**User response:** No action is required.

**HLOU5537I**  Load prevalidation restart handler finished with RC return_code.

**Explanation:** A load utility job that specified the SHRLEVEL REFERENCE option or the IFDISCARDS option was restarted. Additional processing for shadow objects completed with the specified return code.

**User response:** No action is required.

**HLOU5538I**  Table space table_space_name is in check pending status.

**Explanation:** The specified table space is involved in a referential relationship, and the load utility job contains the SHRLEVEL REFERENCE option or the IFDISCARDS option.

**User response:** No action is required.

**HLOU5539I**  Table space table_space_name is in check pending status.

**Explanation:** The specified table space is involved in a referential relationship, and the parent table was loaded with the REPLACE option.

**User response:** No action is required.

**HLOU5540I**  Index space index_space_name is in rebuild pending status.

**Explanation:** The specified index space contains a nonpartitioned secondary index (NPSI), and it is deferred with option INDEXDEFER.

**User response:** No action is required.

**HLOU5541I**  Table space table_space_name was altered with option ROTATE PARTITION.

**Explanation:** When the IFDISCARDS option or the SHRLEVEL REFERENCE option is specified, table spaces with rotated partitions are not supported.

**User response:** Select another table space to load.

**HLOU5542E**  Feature is not accessible in this version of DB2.

**Explanation:** The IFDISCARDS option and SHRLEVEL REFERENCE option require Db2 version 10 or later.

**User response:** Remove the unsupported option from the LOAD utility syntax.

**HLOU5543E**  Index space index_space_name has status space_status and its base table space cannot be loaded.

**Explanation:** The specified index space is not in a supported access mode. The index space access mode must be read-write (RW), read-only (RO), or utility (UT).

**User response:** Start the object in RW, RO, or UT mode, and then submit the LOAD utility job again.

**HLOU5544E**  error_text.

**Explanation:** Keyword RESUME NO cannot be specified with the IFDISCARDS and SHRLEVEL REFERENCE options.

**User response:** Specify RESUME YES or REPLACE instead.

**HLOU5545I**  Template data set was renamed.

**Explanation:** The product renamed the template data set.

**User response:** No action is required.

**HLOU5546I**  Template name: template_name.

**Explanation:** The product renamed the template data set as specified in the message text.

**User response:** No action is required.

**HLOU5547I**  Old DSN: old_data_set_name.

**Explanation:** The product renamed the template data set as specified in the message text.

**User response:** No action is required.

**HLOU5548I**  New DSN: new_data_set_name.

**Explanation:** The product renamed the template data set as specified in the message text.

**User response:** No action is required.
HLOU5549E  Requested module module_name not found.

Explanation: The requested module was not found.
User response: Ensure that module module_name exists in the STEPLIB concatenation or the linklist.

HLOU5551I  ERRORTXT error_text.

Explanation: Service function failure explanation.
User response: No action is required.

HLOU5700E  Error from call to HLOPIPE from MODNAME = module_name Function = function_code RC = return_code.

Explanation: HLOPIPE returned a nonzero return code. Reasons for this error include the following:
• The product library is not in the WLM STEPLIB.
• The pipe requires clean up.
• An HLOPIPE API call (INIT, LOOKUP, OPEN, CLOSE) failed.
• The ACCEL_LOAD_TABLES stored procedure failed.

User response:
• Function=02 RC=0A:
  – Ensure that the product library is included in the DSNUTILU/DSNUTILS WLM STEPLIB. If necessary, add it to the STEPLIB, refresh the WLM environment, and then resubmit the job. (For more information, see the section in the product documentation about setting up the WLM-managed address space.)
  – Check the job log for message HLOU5720I to see any error messages that were returned by the failed stored procedure.
• Function=01 RC=03: Another batch job might be loading the target table. If this is not the case, you might need to run job HLOPIPE to clear common storage, and then refresh the WLM environment. (For more information, see the section in the documentation about clearing common storage after a job fails.) If necessary, correct the data in the input data set and resubmit the job.

If you are unable to resolve the issue, contact IBM Software Support.

HLOU5701I  Number of records not loaded=<record_count>.

Explanation: SYSREC records were not loaded for any of the following reasons: the record did not satisfy a WHEN clause condition; the partitioning key for the record did not belong to any partition included in the load; a data conversion error occurred. The reported count of records not loaded includes ignored discards.

User response: No action is required.

HLOU5710E  Accelerator name <accelerator_name> is not valid for DB2 SSID=<ssid>.

Explanation: The IBM Db2 Analytics Accelerator name passed in the utility syntax is not a valid accelerator name for the specified Db2 subsystem.
User response: Correct the accelerator name and resubmit the job.

HLOU5711E  Target table for LOAD utility not defined on accelerator <accelerator_name>.

Explanation: The target TABLE that is specified in the LOAD utility syntax is not defined on the IBM Db2 Analytics Accelerator.
User response: Correct the TABLE name and resubmit the job.

HLOU5712E  LOAD utility partition specification includes archived partitions.

Explanation: The LOAD utility specifies loading partitions that have been archived on the IBM Db2 Analytics Accelerator.
User response: Correct the utility statement and resubmit the job.

HLOU5713E  IBM Db2 Analytics Accelerator stored procedure ACCEL_GET_TABLES_DETAILS returned an error.

Explanation: The IBM Db2 Analytics Accelerator stored procedure ACCEL_GET_TABLES_DETAILS returned an error during partition validation.
User response: See the Db2 Analytics Accelerator Loader started task SYSPRINT log for more information about the error.

HLOU5714E  Target table status conflict with detected LOAD status <load_status>.

Explanation: The target TABLE specified in the LOAD utility syntax cannot be loaded on the accelerator because the accelerator table is set to a status that is incompatible with the load process.
User response: Check the status of the table on the accelerator for more information about the error.

HLOU5715E  Unknown error during IBM DB2 Analytics Accelerator validation.

Explanation: The target table that is specified in the LOAD utility syntax cannot be loaded on the accelerator because an unknown error occurred during
validation. This can be the result of an SQL error in the Db2 Analytics Accelerator Loader started task during the validation process.

**User response:** See the Db2 Analytics Accelerator Loader started task SYSPRINT log for more information about the error.

### HLOU5716E Partial load conflict with IBM DB2 Analytics Accelerator table status of InitialLoadPending.

**Explanation:** The target table that is specified in the LOAD utility syntax cannot be loaded on the accelerator. The accelerator status of the table is InitialLoadPending and not all partitions were specified.

**User response:** Correct the LOAD syntax and resubmit the job.

### HLOU5717W The selected accelerators are unavailable. Only DB2 will be loaded.

**Explanation:** The accelerators are in a state that makes them unavailable for loading. As a result, only the Db2 table will be loaded, as specified by the option ACCEL_WHEN_OFFLINE in the product options file.

**User response:** When the accelerator is back online, rerun the job or run the ACCEL_LOAD_TABLES stored procedure to refresh the accelerator table.

### HLOU5718E The accelerator is unavailable. Accelerator state: <accelerator_state>.

**Explanation:** The accelerator is in the specified state, which makes it unavailable for loading. As a result, the accelerator-only load cannot be performed.

**User response:** After the accelerator is back online, rerun the job.

### HLOU5720E MSGTEXT=<message_text>.

**Explanation:** The IBM Db2 Analytics Accelerator stored procedure ACCEL_LOAD_TABLES returned the message text after successful or unsuccessful completion.

**User response:** See the Db2 Analytics Accelerator Loader started task SYSPRINT log for more information about the error.

### HLOU5724E The ACCEL_LOAD_TABLES stored procedure failed.

**Explanation:** The ACCEL_LOAD_TABLES stored procedure returned one or more error messages. See message HLOU5720I for messages returned by the stored procedure.

**User response:** If you cannot resolve the issue, contact IBM Software Support. Provide Support with the started task SYSPRINT output and the Db2 Analytics Accelerator Loader batch job log.

### HLOU5725I MSGTEXT=<accelerator_message_text>.

**Explanation:** An Accelerator stored procedure has returned the message text after successful or unsuccessful completion. The message that was issued just before this message identifies the Accelerator operation that generated these messages.

**User response:** If any of the messages describe an error condition, see the IBM Db2 Analytics Accelerator stored procedure reference documentation for information about the AQT error message. If you need further assistance, contact IBM Software Support.

### HLOU5726I The table was successfully added to accelerator <accelerator_name>.

**Explanation:** The table was successfully added to the accelerator. If the add operation completed with warnings, the messages returned by the accelerator are reported immediately following in message HLOU5725I.

**User response:** No action is required.

### HLOU5727E Unable to add table to accelerator <accelerator_name>. Accelerator error messages follow.

**Explanation:** An attempt to add the table to the accelerator failed. Error messages that the accelerator returned are reported immediately following in message HLOU5725I.

**User response:** See the IBM Db2 Analytics Accelerator Stored Procedures reference for a description of the AQT messages reported in HLOU5725I. If you need further assistance, contact IBM Software Support.

### HLOU5728I The table was successfully removed from accelerator <accelerator_name>.

**Explanation:** The table was successfully removed from the accelerator. If the operation completed with warnings, the warning messages that the accelerator returned are reported immediately following in message HLOU5725I.

**User response:** No action is required.

### HLOU5729E Unable to remove the table from accelerator <accelerator_name>. Accelerator error messages follow.

**Explanation:** An attempt to remove the table from the accelerator failed. Error messages that the accelerator returned are reported immediately following in message HLOU5725I.
HLOU5730E • HLOU5803E

User response: See the IBM Db2 Analytics Accelerator Stored Procedures reference for a description of the AQT messages reported in HLOU5725I. If you need further assistance, contact IBM Software Support.

HLOU5730E DB2 call attachment facility error.
   RC=<<hex_return_code>>
   RSN=<<hex_reason_code>>.

Explanation: An attempt to connect to Db2 via the call attachment facility has failed. This error message can also indicate that the product was unable to load the call attachment facility into memory.

User response: Contact IBM Software Support.

HLOU5731E Error parsing XML document returned by <stored_procedure_name> on accelerator <accelerator_name>.

Explanation: The product could not parse the XML message document returned by an accelerator stored procedure call. Therefore, the product cannot determine whether the stored procedure call succeeded. For more information, see message HLOU5725I and message HLOU5733I.

User response: Contact IBM Software Support.

HLOU5732E Unable to LOAD MODULE
   <module_name>. RC=<<hex_return_code>>
   RSN=<<hex_reason_code>>.

Explanation: An attempt to LOAD the named Db2 interface module failed. The system return code and reason code are also reported in the message.

User response: Verify that the Db2 load library is allocated in the STEPLIB or JOBLIB, and then resubmit the job. If you need further assistance, contact IBM Software Support.

HLOU5733I DOCTEXT <xml_document_text>.

Explanation: An attempt to parse the XML document reported in this message failed. Refer to messages HLOU5731E and HLOU5725I for more information on the stored procedure that returned the malformed document, and the parsing error.

User response: Contact IBM Software Support.

HLOU5734E HLOADDTB has failed with
   RC=<<return_code> on accelerator <accelerator_name>.

Explanation: An attempt to add the table to the accelerator failed.

User response: Contact IBM Software Support.

HLOU5735E Process to add tables failed due to size limit exception.

Explanation: An attempt to add many tables to the accelerator failed because the list of tables in the SYSIN exceeded the maximum variable size supported by the called Analytics Accelerator stored procedure. Multiple factors contribute to the size, including the number of tables specified and the length of the table names.

User response: Split the original job into multiple, smaller jobs, reducing the number of tables per job, and then run the new jobs.

HLOU5800W Partition discovery failed in USE15.
   Record = record_number.

Explanation: Process USE15 could not determine the partition to which the record belongs. This is probably because the record is outside the range of the LIMITKEYS.

User response: Correct the partitioning key value in the identified SYSREC record and rerun the job. If you believe the record was erroneously discarded, contact IBM Software Support.

HLOU5801E Column <column_name> DEFAULT indicator value <column_default_indicator> is not supported.

Explanation: The product does not support the default indicator for SYSIBM.SYSCOLUMNS(DEFAULT) for this column.

User response: Supply data for this column or use a supported default type for the conversion to Db2 internal format, and then resubmit the job.

HLOU5802E Default value for column <column_name> is missing.

Explanation: When a column is defined as NOT NULL, you must provide a value or use the default value.

User response: Provide a valid value for the specified column and then resubmit the job.

HLOU5803E A failure has occurred in a data conversion routine.

Explanation: While trying to convert data, routine HLOUSE15 encountered an unrecoverable error.

User response: IBM Software Support Provide Support with all output from this job, including the dump.
HLOU5804E  Unsupported column type. COLUMN <column_name> TYPE <column_type>.

Explanation: The data type for the specified column is not supported for the conversion to Db2 internal format.

User response: For information about the supported data types, see the section about load processing enhancements in the product user’s guide. Correct the error and then resubmit the job.

HLOU5805E  Unsupported row format. FORMAT <format_type>.

Explanation: The table space row format is not supported when you are converting data to Db2 internal format, or the format is an unknown type. The supported row formats are basic and reordered. SYSIBM.SYSTABLEPART(FORMAT) shows the format type.

User response: Specify a supported format for the row and then resubmit the job.

HLOU5806E  Column <column_Name> input data is too long.

Explanation: The input data that is specified for the column is longer than the length of the target column.

User response: Correct the LOAD or the table column definition, and then resubmit the job.

HLOU5806W  Column column_name data is too long. Record = record_number.

Explanation: The input data is longer than the length of the target column.

User response: Correct the LOAD or the table column definition and resubmit the job.

HLOU5807W  Column column_name has invalid data in record record_number.

Explanation: The data for the specified column is invalid.

User response: Correct the data in SYSREC and resubmit the job.

HLOU5809W  DB2 size limit exceeded for column column_name record record_number.

Explanation: The value exceeds the Db2 size limits for the data type for the column.

User response: Correct the data in SYSREC and resubmit the job.

HLOU5810W  Input numeric invalid column column_name record record_number.

Explanation: The input field contains an invalid numeric data type for the column.

User response: Correct the data in SYSREC and resubmit the job.

HLOU5811E  Unable to schedule SRB routine <srb_name>, RC=<return_code>.

Explanation: IEAMSCHD returned a nonzero return code.

User response: Contact IBM Software Support. Have available all output from this job.

HLOU5812E  IEAVPSE pause service failed. RC=<return_code>.

Explanation: The IEAVPSE pause release service failed with the specified return code.

User response: IBM Software Support Provide Support with the return code from this message.

HLOU5813E  SRB routine <srb_name> initialization failed. Reason=<reason_text>.

Explanation: A scheduled SRB routine encountered an error during initialization processing.

User response: Contact IBM Software Support. Have available all output from this job.

HLOU5814E  IEAVXFR transfer pause service failed, RC=<return_code>.

Explanation: The IEAVXFR transfer pause service failed with the specified return code.

User response: IBM Software Support Provide Support with the return code from this message.

HLOU5815E  The SYSREC encoding scheme <encoding_scheme> does not match the table encoding scheme <encoding_scheme>.

Explanation: The table encoding scheme must match the encoding scheme of the SYSREC data.

User response: Either load the data to a table that has the same encoding scheme as the SYSREC data, or convert the SYSREC data to the encoding scheme that is used by the target table and run the load job again.
HLOU5817W  

Input packed decimal invalid for 

COLNAME <column_name>. RECORD  
<record_nbr>.

Explanation: The input field contains invalid packed decimal data for the column with type DECIMAL. Because no field specifications were provided, packed decimal data is expected.

User response: Correct the data in the SYSREC file and submit the job again.

HLOU5900E  

Db2 Analytics Accelerator Loader DSNUTILB exit module is not APF-authorized and is terminating.

Explanation: The load library for the Db2 Analytics Accelerator Loader DSNUTILB module is not APF-authorized, as required. Consequently, the Db2 Analytics Accelerator Loader DSNUTILB intercept processing for the Db2 utility is terminating.

User response: APF-authorize the load library for the DSNUTILB module, and then run Db2 utility job again.

HLOU5901E  

RVT locate operation failed

Explanation: Db2 Analytics Accelerator Loader could not locate its RVT control block.

User response: Make sure that at least one Db2 Analytics Accelerator Loader system is operational and then resubmit the job.

HLOU5901S  

RVT locate operation failed.

Explanation: Db2 Analytics Accelerator Loader could not locate its RVT control block.

User response: Make sure that at least one Db2 Analytics Accelerator Loader system is operational and then resubmit the job.

HLOU5902S  

COM locate operation failed.

Explanation: Db2 Analytics Accelerator Loader could not locate its COM control block.

User response: Make sure that at least one Db2 Analytics Accelerator Loader system is operational and then resubmit the job.

HLOU5903W  

DSNUTILF exit is inoperative for 

SSID: db2_ssid.

Explanation: DSNUTILF intercept processing cannot be performed for the Db2 utility because the Db2 Analytics Accelerator Loader started task is not running or is not intercepting DSNUTILB for the specified Db2 subsystem ID (SSID). The Db2 utility job continues running.

User response: Make sure that at least one Db2 Analytics Accelerator Loader system is operational and enabled for interception. Also check for any additional messages that are related to the interception failure. After you correct any related errors and confirm that the system is ready for interception, resubmit the utility job.

HLOU5904W  

Db2 Analytics Accelerator Loader is not active.

Explanation: DSNUTILB interception cannot be performed for the Db2 utility because the Db2 Analytics Accelerator Loader started task is not running. The utility continues running.

User response: Make sure that at least one Db2 Analytics Accelerator Loader system is operational and enabled for interception. Also, start the started task if necessary. Then resubmit the Db2 utility job.

HLOU5905W  

Load library open failed.

Explanation: DSNUTILB interception is currently unavailable. The utility continues running, but DSNUTILB interception will not occur.

User response: Make sure that a Db2 Analytics Accelerator Loader started task is operational. Also, make sure that an intercept policy is defined that allows interception for the Db2 subsystem on which you are running the utility job. If the problem persists, contact IBM Software Support.

HLOU5906W  

Load failed for HLOUMAIN.

Explanation: DSNUTILB interception is currently unavailable. The utility continues running, but DSNUTILB interception will not occur.

User response: Make sure that a Db2 Analytics Accelerator Loader started task is operational. Also, make sure that an intercept policy is defined that allows interception for the Db2 subsystem on which you are running the utility job. If the problem persists, contact IBM Software Support.

HLOU5907E  

SYSPRINT DD is missing or unusable.

Explanation: SYSPRINT DD is missing, or is allocated to DUMMY or NULLFILE.

User response: Supply a valid SYSPRINT DD statement in the JCL.
IBM DB2 SOR found and will be used.

**Explanation**: IBM Db2 SOR was found and will be used for PRESORT on LOAD.

**User response**: No action is required.

---

IBM DB2 SOR cannot be utilized. Not all modules found.

**Explanation**: Not all modules for IBM Db2 SOR were found.

**User response**: Ensure that IBM Db2 SOR has been installed correctly.

---

DB2 Sort Program=program_name returned non-zero return code, RC=rc

**Explanation**: An internal error has occurred.

**User response**: Contact IBM Software Support. Provide the Support representative with the complete text of this message. Sorts will be performed by the default sort.

---

**HLOU5911I** DB2 sort program program_name abended. Default sort program will be used.

**Explanation**: The sort program abended. The default sort program will be used for sort processing.

**User response**: Contact IBM Software Support. Have available the listing that contains this message and any applicable related messages.

---

ESTAE SDUMPX call RC=return code, RS=reason code.

**Explanation**: During ESTAE processing, a call to the z/OS SDUMPX facility returned the displayed return code and reason code.

**User response**: If RC=08, review the reason code in the appropriate SDUMPX documentation. Then make any changes to Dump Services that are needed to obtain proper diagnostic dumps. If you need assistance, contact IBM Software Support.

---

LOAD PRESORT of hash table unable to proceed due to error.

**Explanation**: An error has occurred during LOAD PRESORT hash table analysis.

**User response**: Examine the job output and the Db2 Analytics Accelerator Loader Started Task to determine the cause of the error.

---

Field length not supported for LOAD PRESORT: Column = column_name.

**Explanation**: The length of the data item specified for LOAD is not supported for PRESORT.

**User response**: Correct the length in the LOAD specification for the field in error.

---

FORMAT DELIMITED is not supported for PRESORT with an ORGANIZE BY HASH table.

**Explanation**: PRESORT does not support SYSREC data that is in delimited file format where the target table is defined as ORGANIZE BY HASH.

**User response**: Provide a SYSREC that is not in delimited file format.

---

Started task encountered an SQL error=sql_code

**Explanation**: An SQL error occurred.

**User response**: To determine the reason for the error, review the HLOS0202E messages that were issued in the started task address space, and see the Db2 messages documentation. If you need assistance, contact IBM Software Support.

---

OPEN failed for SYSPRINT

**Explanation**: An OPEN macro failed for SYSPRINT.

**User response**: Review other messages issued to determine the cause.

---

Field specification missing for a PRESORT key.

**Explanation**: A field specification is required for a field that is part of a PRESORT key.

**User response**: Provide a field specification for each field that is part of the PRESORT key.

---

conversion_service FAILED. TARGET CCSID: target_ccsid REASON: system_errno, system_err_msg

**Explanation**: An attempt to convert a string from one CCSID to another has failed. The message identifies the failing system service, the target CCSID and the system returned errno and message.

**User response**: Contact IBM Software Support. Be prepared to provide support with the full batch job output as well as the started task log.
utility history collection is disabled.

**User response:** Contact IBM Software Support.

---

**HLOU9704W** BDL error encountered searching for module BBYS$NMIC. RSN=reason_code.

**Explanation:** The product encountered an error while searching for module BBYS$NMIC. Db2 Autonomics Director utility history collection is disabled.

**User response:** Contact IBM Software Support.

---

**HLOU9705W** Error encountered attempting to load module BBYS$NMIC.

**Explanation:** The product encountered an error while attempting to load module BBYS$NMIC. Db2 Autonomics Director utility history collection is disabled.

**User response:** Contact IBM Software Support.

---

**HLV0001U** desc GETMAIN failed - increase memory size

**Explanation:** Insufficient storage. The product was unable to obtain enough storage to allocate the initial program stack.

**User response:** Check the abend code to determine if the region size should be increased. Increase the region size if necessary, and restart the product.

---

**HLV0002S** parmname IS errdesc - correction

**Explanation:** This message indicates a problem with the parameter string that was passed to the main started task entry point. Execution is terminated.

**User response:** Correct the error that is indicated in the error message, and restart the product.

---

**HLV0003S** CODES BEGINNING WITH var1, NOT var2 SHOULD NOT BE USED TO SET THE %2 PARAMETER

**Explanation:** This message contains variables that are resolved at run-time and emitted by the server as it processes.

**User response:** Review the messages just before and after this message to understand the context.

---

**HLV0004S** parmname IS errdesc

**Explanation:** This message indicates a problem with the parameter string that was passed to the main started task entry point. Execution is terminated.

**User response:** Ensure that a parameter string is being passed (using PARM=) in the started task JCL. The parameter string should contain at least "INIT,ssnx" where ssnx is the 4 character subsystem name. Correct
the error and restart the product.

**HLV0005S**  
**parmname** val IS errdesc  
**Explanation:** This message indicates a problem with the parameter string that was passed to the main started task entry point. Execution is terminated.  
**User response:** Ensure that the execution option (the first parameter in PARM=) is INIT. This is the only valid value. Correct the error, and restart the product.

**HLV0006S**  
Product not APF authorized, execution terminating  
**Explanation:** This message is issued if the product detects that it is not APF authorized. The main product address space will terminate immediately.  
**User response:** Ensure that all of the STEPLIB data sets are APF authorized. Note that all of the data sets must be APF authorized, not just the data set containing the product load modules. Fix the STEPLIB data sets, and restart the product.

**HLV0007S**  
**subsys field IS errdesc**  
**Explanation:** The product tried to initialize or re-initialize a system control block (the SSCT). The system control contained a field with an invalid value. This error will cause product initialization to terminate.  
**User response:** Check for other error messages were generated along with the error message. If the combined error messages are sufficient to explain the error, take whatever corrective action is appropriate. If the problem cannot be resolved, contact Software Support.

**HLV0008S**  
Product cannot execute in batch, execution terminating  
**Explanation:** This message is issued if the product detects that it is running in batch. The main product address space will terminate immediately.  
**User response:** The product cannot run as a batch job. The product must execute as a started task. Install the product as a started task, and restart the product.

**HLV0009S**  
Execution DEQ failed - contact systems programming  
**Explanation:** Some type of error occurred while the product was releasing the execution enqueue. The execution enqueue is used to prevent more than one copy of the product from using a single subsystem ID. Multiple copies of the product can execute concurrently so long as each copy uses a different subsystem ID.  
**User response:** Check the error messages associated with this problem. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support.

**HLV0010H**  
**modnamefuncode** execution msgtext  
**Explanation:** This message is used to trace product initialization. A message is issued before and after the execution of each initialization routine.  
**User response:** There is no action for this message. This message is only used for trace and debugging purposes.

**HLV0011W**  
**STSI instruction failed with %1 - feedback = %2**  
**Explanation:** This message contains variables that are resolved at run-time and emitted by the server as it processes.  
**User response:** Review the messages just before and after this message to understand the context.

**HLV0012W**  
**CSRSI service returned RC=rcode for CPU H/W identification request - product validation may be affected.**  
**Explanation:** None.  
**User response:** Contact IBM Software Support.

**HLV0013S**  
**SSCT locate error - contact systems programming**  
**Explanation:** The product tried to find the current subsystem ID in the subsystem control block chain. A loop was found in the subsystem control block chain.  
**User response:** This is a serious error that may cause other components of the system to fail. If the system is having other problems (such as loop errors), try to resolve the other problems before restarting the product. If the product is the only component experiencing any difficulty, contact Software Support.

**HLV0014S**  
var1: var2 var3 var4 var5 var6 var7  
**Explanation:** This message contains variables that are resolved at run-time and emitted by the server as it processes.  
**User response:** Review the messages just before and after this message to understand the context.

**HLV0015S**  
%PX-fs subsystem subsys waiting for execution ENQ  
**Explanation:** Each active copy of the product must use a different subsystem ID. This restriction is enforced using the product execution enqueue. The product execution enqueue contains the current subsystem ID, so that multiple copies of the product can execute if each copy uses a different subsystem ID. A new copy
of the subsystem (subsys) has been started and is attempting to get the execution enqueue. The execution enqueue for subsystem is already held by a copy of the product.

**User response:** Either cancel the newly started subsystem that is waiting on the execution enqueue or stop the currently active copy of the subsystem. Stopping the currently active copy of the subsystem will allow the new copy of the subsystem to complete initialization and start execution. The new copy of the subsystem may have to be stopped using the ASID keyword of the CANCEL command.

**HLV0016S**  
Execution ENQ error - contact systems programming

**Explanation:** Each active copy of the product must use a different subsystem ID. This restriction is enforced using the product execution enqueue. The product execution enqueue contains the current subsystem ID, so that multiple copies of the product can execute if each copy uses a different subsystem ID. The product tried to obtain the execution enqueue. The ENQ macro failed.

**User response:** Check the error messages associated with this problem. There may be one or more ENQ/DEQ error messages referring to the current problem. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support.

**HLV0017S**  
var1 PARAMETER INVALID: var2 var3

var4 var5 var6 var7 var8.

**Explanation:** This message contains variables that are resolved at run-time and emitted by the server as it processes.

**User response:** Review the messages just before and after this message to understand the context.

**HLV0018H**  
var1 var2

**Explanation:** This message contains variables that are resolved at run-time and emitted by the server as it processes.

**User response:** Review the messages just before and after this message to understand the context.

**HLV0019I**  
var1 var2

**Explanation:** This message contains variables that are resolved at run-time and emitted by the server as it processes.

**User response:** Review the messages just before and after this message to understand the context.

**HLV0020S**  
First character of subsystem name must be an alphabetic character (A-Z).

**Explanation:** Each copy of the product must use a unique subsystem ID string. The default subsystem ID is specified in the started task procedure or in the START command used to start the product. In either case, the subsystem ID string must always be exactly four characters long, and the first characters must be one of the alphabetic characters A-Z.

**User response:** Fix the subsystem ID string used to start the product by modifying the product started task procedure or by changing the product start command. Restart the product using a valid subsystem ID string.

**HLV0021S**  
ABEND ERROR abcode REASON rsncode AT modname+offset

**Explanation:** A serious abend occurred during product initialization, execution, or termination. The abend was not recoverable, and the product was forced to terminate.

**User response:** Check the abend code and any related abend messages. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support. Note the exact contents of the above error message and any other error messages associated with the product failure.

**HLV0022S**  
Second 2 characters of subsystem name must be prodID.

**Explanation:** Each copy of the product must use a unique subsystem ID string. The default subsystem ID is specified in the started task procedure or in the START command used to start the product. In either case, the subsystem ID string must always be exactly four characters long, and the second two characters must be a valid product ID pair (prodID). For example: "DB" is for HLV and "WS" is for HTTP-API.

**User response:** Fix the subsystem ID string used to start the product by modifying the product started task procedure or by changing the product start command. Restart the product using a valid subsystem ID string.

**HLV0023S**  
Subsystem name must be four (4) characters long

**Explanation:** Each copy of the product must use a unique subsystem ID string. The default subsystem ID is specified in the started task procedure or in the START command used to start the product. In either case, the subsystem ID string must always be exactly four characters long.

**User response:** Fix the subsystem ID string used to start the product by modifying the product started task procedure or by changing the product start command. Restart the product using a valid subsystem ID string.
HLV0024S  Last character of subsystem name must be alphanumeric

Explanation: Each copy of the product must use a unique subsystem ID string. The default subsystem ID is specified in the started task procedure or in the START command used to start the product. In either case, the subsystem ID string must always be exactly four characters long. The last character can be one of the alphanumeric characters A-Z or 0-9.

User response: Fix the subsystem ID string used to start the product by modifying the product started task procedure or by changing the product start command. Restart the product using a valid subsystem ID string.

HLV0025S  %PM not prepared for execution by feature code

Explanation: This message contains variables that are resolved at run-time and emitted by the server as it processes.

User response: Review the messages just before and after this message to understand the context.

HLV0026S  ss not configured for this CPU var1, execution terminating.

Explanation: None.

User response: Contact IBM Software Support.

HLV0027S  MVS/370 not supported

Explanation: The product checked the host system and found that the host system is some version of MVS/370. The product does not support MVS/370.

User response: The product only supports z/OS. z/OS must be installed before the product can be used.

HLV0028S  Product code pcode is invalid.

Explanation: None.

User response: Contact IBM Software Support.

HLV0029S  Configuration issue detected; ss not configured for CPU var1, execution continues

Explanation: None.

User response: Contact IBM Software Support.

HLV0030S  %PM will require configuration update in <xx> days

Explanation: None.

User response: Contact IBM Software Support.

HLV0031E  %PM will require configuration update in <xx> days.

Explanation: None.

User response: Contact IBM Software Support.

HLV0032S  %PM configuration problem, execution terminating.

Explanation: None.

User response: Contact IBM Software Support.

HLV0033S  CONFIGURATION FROM 'var2' PARAM. DOES NOT SUPPORT EXECUTION OF THIS PRODUCT - TERMINATING.

Explanation: None.

User response: Contact IBM Software Support.

HLV0034S  PM feature code feature not configured.

Explanation: None.

User response: Contact IBM Software Support.

HLV0035S  subsys requires configuration update, execution continues.

Explanation: None.

User response: Contact IBM Software Support.

HLV0036S  service OF desc FAILED, RC=rcode, DETECTED AT addr

Explanation: This is a generic error message used to describe a wide variety of product initialization, execution, and termination errors. The message text provides the current operation (service) and what the current operation was trying to do, such as GETMAIN, FREEMAIN, ATTACH, and so on.

User response: Check the error messages and the return code associated with this problem. There may be one or more error messages referring to the current problem. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support.

HLV0037E  rout errdesc FAILED, RC=rcode, DETECTED AT addr, %SK

Explanation: Some type of service routine (rout) (operating system or product specific) failed. The error message identifies the service routine and the type of error.

User response: Check the full text of the error message, and fix the program that calls the application program interface, if necessary.
HLV0038S  service OF desc FAILED, RC=rcode, REASON=rnrcode, DETECTED AT addr, %SK

Explanation: This is a generic error message used to describe a wide variety of product initialization, execution, and termination errors. The message text provides the current operation (service) and what the current operation was trying to do, such as GETMAIN, FREEMAIN, ATTACH, and so on.

User response: Check the error messages and the return code associated with this problem. There may be one or more error messages referring to the current problem. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support.

HLV0039S  rout errdesc FAILED, ABEND=abcode, REASON CODE=rnrcode

Explanation: This is a generic error message used to describe a wide variety of product initialization, execution, and termination errors. The message text provides the current operation and what the current operation was trying to do.

User response: Check the error messages and the return code associated with this problem. There may be one or more error messages referring to the current problem. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support.

HLV0040S  blk CONTROL BLOCK AT addr msgtext

Explanation: This message is used to describe control block errors. The error may be an invalid tag, invalid length, or some other error. The control block (cb) could not be used because of the error.

User response: Check the error messages associated with this problem. There may be one or more error messages referring to the current problem. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support.

HLV0041I  %PX ver/lvl initializing on processor cpuid/model/modelno.manuf PCCAccount flag

Explanation: This message is issued during early start-up and displays information about the hardware on which the product is executed. This message provides information helpful to support personnel should some configuration difficulty arise.

User response: No action is required. If later messages indicate a configuration problem has been encountered, this message may aid in the swift resolution of the problem. If the problem cannot be resolved, contact IBM Software Support.

HLV0043H  msgtext

Explanation: This message is used to print out various internal control blocks, the contents of processor registers, and other hexadecimal information.

User response: If there are other messages indicating an error, use this message in conjunction with them to determine the cause of the problem. If there is a problem and you are unable to resolve it, contact Software Support.

HLV0044S  errdesc FREEMAIN FAILED

Explanation: Storage release error. The product was unable to free a section of storage.

User response: Check the abend code to determine the cause of the error. Make any needed changes to resolve the problem, and restart the product.

HLV0045S  Task or exit modname can not be executed

Explanation: A product macro cannot be used because the product control blocks are inconsistent. This macro is used to initialize a task or an exit. The task or exit will not be able to execute.

User response: This error should only occur during product termination or if the main product address space is not executing. If this error occurs at any other time, contact Software Support. The main product address space will have to be restarted if this error is reported.

HLV0046W  Initialization procedure procedure or IRXJCL ended with condition code rcode - processing continues

Explanation: IRXJCL was attached to execute the initialization procedure. The reported non-zero condition code was set after execution.

rcode (the return code) may in this case also be a condition code.

User response: Check the initialization exec for REXX-language errors which might cause the return code to be set. It may be impossible to distinguish between IRXJCL’s return code and the return code set by the procedure.

HLV0047I  DATASPACE procedure CREATED TIME = t2 BY %PM

Explanation: DSPSERV system service routine was invoked at initialization. A dataspace has been created.

User response: None required. This is an informational message.
HLV0048E  DSPSERV ERROR. RETURN CODE = rcode. t2 %PM

Explanation: DSPSERV system service routine was invoked at initialization to create a dataspace. However, it received a non-zero return. The dataspace was not created.

User response: Check the return code displayed in the message in the Auth Assembler Services Reference, and take appropriate action, if possible. If the problem cannot be resolved, contact Software Support.

HLV0049I  Dataspace added to PASN list. t2 %PM

Explanation: ALESERV system service routine was invoked at initialization to add this address space to a previously created dataspace.

User response: None required. This is an informational message.

HLV0050W  var1 configuration requires an update, certain features will need modification, execution continuing.

Explanation: None.

User response: Review the messages just before and after this message to understand the context.

HLV0052S  Configuration issue: processor model number (modelno) does not match configured model; execution continues.

Explanation: None.

User response: Contact IBM Software Support.

HLV0054H  var1 Configuration installed until var2 (var3 parameter).

Explanation: None.

User response: Contact IBM Software Support.

HLV0055E  csect not found within %PM primary load module

Explanation: During subsystem initialization, the indicated control section (CSECT) was missing from the product’s primary execution load module.

User response: Initialization of the subsystem is terminated immediately with an S0C3 abend. Contact the Software Support group.

HLV0056E  Invalid data found in csect loaded at addr ivodata

Explanation: During subsystem initialization, invalid data was detected within a control section (csect) or table loaded as part of the product’s primary execution load module.

ivodata represents a hex dump of the invalid data area.

User response: Initialization of the subsystem is terminated immediately with an S0C3 abend. Contact the Software Support group.

HLV0057W  var1 rejected for use - var2 var3.

Explanation: None.

User response: Review the messages just before and after this message to understand the context.

HLV0058W  var1 refresh required in var2 days.

Explanation: None.

User response: Contact IBM Software Support.

HLV0059S  Configuration issue: H/W processor ID var1 mismatched configuration for var2 of past var3 hours.

Explanation: None.

User response: Contact IBM Software Support.

HLV0060T  LATCH SET CREATED:
LS-NAME=lsname LATCHES=lcount
LS-TOKEN=lstoken additinfo

Explanation: Information written to trace when a new latch set is created within the address space

User response: None.

HLV0061E  LATCH ERROR: reqtype errdesc additinfo

Explanation: An error or unexpected condition was detected in a latch manager internal support routine

User response: Look for related messages indicating the cause of the error and correct the underlying problem. If the problem cannot be resolved, contact Software Support.

HLV0062T  LATCH operation: LSTOKEN=lstoken
LATCHNO=latchno LTKEN=ltoken
RQSTR=reqID additinfo

Explanation: Information written to trace when a latch is obtained, released, or purged

User response: None.

HLV0063S  z/OS Version must be at 1.13 or higher. Execution terminating.

Explanation: The product checked the host system and found that the host system is not running at z/OS
1.13 or higher. The product does not support z/OS levels below 1.13.

**User response:** The product only supports z/OS 1.13 and higher. z/OS 1.13 or higher will have to be installed before the product can be fully supported.

---

**HLV0064T** Interval summary operation, SMLH at addr1 SMLG at addr2. Tag: additinfo

**Explanation:** Interval recording encountered an internal control block error while creating an interval summary record.

**User response:** The interval record in error is discarded and summarization continues. If the problem cannot be resolved, contact Software Support.

---

**HLV0065T** Interval summary %1: %2

**Explanation:** This messages contains the number of interval summary record errors found.

**User response:** Contact Software Support.

---

**HLV0066S** Logon of the address space user ID userID failed. Detected at addr.

**Explanation:** The product failed to create a security environment for a task using the userID of the address space.

**User response:** There may be one or more additional error messages or abends referring to the problem. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact IBM Software Support.

---

**HLV0067S** LOGON of the SSLUSERID, userID, failed. Detected at addr.

**Explanation:** The product failed to create a security environment for a task using the userid specified in SSLUSERID.

**User response:** There may be one or more additional error messages or abends referring to the problem. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support.

---

**HLV0068T** Logon of user ID userID failed.

**Explanation:** Logon failed for user ID specified in Services request.

**User response:** Check whether user ID is valid or if the password was correct.

---

**HLV0069W** The severity level of message cannot be changed.

**Explanation:** None.

**User response:** Contact IBM Software Support.

---

**HLV0080E** Control block cblk could not be located

**Explanation:** The product tried to find one of several control blocks during product initialization. One of the control blocks could not be found.

**User response:** Ensure that the version of the host (MVS) operating system is supported by the product. If the host operating system version is supported by the product, check for any other error messages referring to the current problem. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, or if the host operating system version is not supported by the product, contact Software Support.

---

**HLV0081E** Unknown host operating system - prodname

**Explanation:** The product was not able to identify the host operating system by its product name.

**User response:** Ensure that the version of the host (z/OS) operating system is supported by the product. If the operating system is supported by the product, check for any other error messages that refer to the current problem. If possible, fix the problem identified by the error messages, and restart the server. If the problem cannot be resolved or if the operating system is not supported, contact Software Support.

---

**HLV0082I** count1 online CPs and count2 online zIIPs detected

**Explanation:** This informational message identifies the number of online general purpose processors (CPs) and zIIPs detected during product initialization.

**User response:** None. This message is for informational purposes only.

---

**HLV0083I** LPAR lpar, CEC MSUs: cap1. LPAR MSUs: cap2. Current avg. var

**Explanation:** This informational message identifies the LPAR and the capacity of the processors.

**var** is only relevant if z/OS is a VM guest.

**User response:** None. This message is for informational purposes only.

Version 7 Configuration required, contact Software Support.

**Explanation:** None.

**User response:** Contact IBM Software Support.

**HLV0107S**  
Server parameter required, contact Software Support.

**Explanation:** None.

**User response:** Contact IBM Software Support.

**HLV0110H**  
INITIALIZATION OF QUICKREF INTERFACE FAILED, VERIFY QUICKREF DSN AND INSTALL STATUS

**Explanation:** This message shows that the product was unable to initialize the QUICKREF interface.

**User response:** If QUICKREF is installed on this system, verify that the QUICKREF load library is either in the linklist or is allocated via the QWREFLIB DD statement in the started task JCL. If QUICKREF is not installed on the system, remove all references to QUICKREF from the started task JCL.

**HLV0111S**  
Invalid DB2 subsystem ID subsys set by LOGDB2SUBSYS parameter

**Explanation:** An invalid Db2 subsystem was specified for logging using the LOGDB2SUBSYS parameter. The specified Db2 subsystem does not exist, or has not been installed and activated on the system since the previous IPL.

**User response:** Specify a valid Db2 subsystem for logging using the LOGDB2SUBSYS parameter. If logging is not desired specify 'NONE' for LOGDB2SUBSYS. You may also leave LOGDB2SUBSYS unset in which case the default Db2 subsystem set for the server automatically or by the DEFAULTDB2SUBSYS parameter will be used, if valid. Product initialization is terminated.

**HLV0112S**  
Invalid default DB2 subsystem subsys set by DEFAULTDB2SUBSYS parameter

**Explanation:** A default Db2 subsystem ID was explicitly specified via the DEFAULTDB2SUBSYS parameter, but does not designate a valid Db2 subsystem ID. When the DEFAULTDB2SUBSYS parameter is explicitly set (to any value except 'NONE'), the target Db2 subsystem ID is verified. The ID will fail validation if the target Db2 subsystem does not exist or has never been successfully activated in the system since the last IPL.

**User response:** The product terminates if an explicitly specified ID is invalid, but will allow startup to continue if it selected the default subsystem ID automatically. (The server uses the default Db2 ID from the DSNHDECP load module or the standard string, 'DSN ', if no explicit setting is provided for the DEFAULTDB2SUBSYS parameter). Product initialization is discontinued and the server terminates. Specify a valid default Db2 subsystem for DEFAULTDB2SUBSYS or leave the parameter unset to allow an automatically assigned default value to be used.

**HLV0113W**  
DEFAULT DB2 SUBSYSTEM ID (subsys) FROM DSNHDECP IS INVALID, CONTINUING

**Explanation:** The default Db2 subsystem ID selected automatically by the server is not a valid Db2 subsystem ID. The server has selected the Db2 subsystem ID automatically because no value was set for the DEFAULTDB2SUBSYS parameter. The server uses the default Db2 ID from the DSNHDECP load module, or, if DSNHDECP cannot be loaded, uses the
standard value 'DSN' as the default ID. Db2 operations which do not explicitly send a Db2 subsystem ID will fail because the default subsystem ID is invalid. In addition, MSG0114W may be issued following this message if Db2 logging is inhibited because of its dependency upon the default Db2 subsystem ID validity.

User response: Specify a valid default Db2 subsystem ID via the startup DEFAULTDB2SUBSYS parameter, or specify 'NONE' for this parameter if Db2 should not be used. Product initialization continues. Note that the Db2 subsystem need not be active (up) when the Server is started, however, it must have been successfully installed and started on the system at least once prior to server startup.

HLV0114W  DB2 logging will not be activated - requires valid default DB2 subsystem ID

Explanation: The default Db2 subsystem ID set automatically by the server (from the DSNHDECPE load module) is not valid and no explicit value was set for the LOGDB2SUBSYS parameter. Since Db2 logging requires a valid default Db2 ID, the value 'NONE' is forced for LOGDB2SUBSYS and Db2 logging is not activated.

User response: Specify a valid Db2 subsystem ID as the default Db2 using the DEFAULTDB2SUBSYS parameter. If you do not wish to set a global default Db2 subsystem ID for all operations, but desire Db2 logging to be activated, specify a valid ID for LOGDB2SUBSYS instead. Db2 logging will not be activated during the current server startup.

HLV0115E  LE/370 INTERFACE MODULE CEEPIPI CANNOT BE LOADED - IT IS REQUIRED FOR SSL SUPPORT

Explanation: During initialization, it was determined that the MVS Language Environment interfaces are needed for execution of the subsystem. SSL support requires the use of LE/370 interfaces. The interface module, CEEPIPI, was not found in STEPLIB or the link list.

User response: Product initialization is abandoned. To restart the subsystem, ensure that either the LE/370 runtime libraries are available in STEPLIB or the link list, or turn off the SSL support option.

HLV0116W  DB2 logging cannot be activated when DB2 SUBSYS default is 'NONE', logging deactivated

Explanation: The Db2 logging feature of the product cannot be used with a default Db2 subsystem setting of 'NONE'. The DEFAULTDB2SUBSYS parameter must be set to an actual Db2 subsystem ID, or left un-specified. Since 'NONE' was set ALL DB2 PROCESSING IS INHIBITED. This message is only issued when the LOGDB2SUBSYS parameter has explicitly been set to a Db2 subsystem ID value other than 'NONE'. The LOGDB2SUBSYS parameter is ignored and reset to 'NONE' so that it matches the DEFAULTDB2SUBSYS parameter. This prevents Db2 logging activation. Product initialization continues without activating Db2 logging.

User response: Specify a valid default Db2 subsystem ID for DEFAULTDB2SUBSYS or leave that parameter unset (if unset, the default value is fetched from the DSNHDECPE load module). Product initialization continues with NONE set for both DEFAULTDB2SUBSYS and LOGDB2SUBSYS.

HLV0117S  type TCP/IP port number is invalid - type TCP/IP processing terminated

Explanation: The TCP/IP port number specified for one of the types of TCP/IP (type) supported by the product is invalid. The main product address space cannot complete initialization if an invalid TCP/IP port number has been specified for any type of TCP/IP.

User response: Specify a valid port number for the type of TCP/IP that detected the invalid port number. If the type of TCP/IP is not needed, you can also just not set the TCP/IP port number at all for the failing type of TCP/IP.

HLV0118S  Load balancing not available - VCF feature code is required.

Explanation: None.

User response: Contact IBM Software Support.

HLV0119W  Logging not available - DB2 feature code is required.

Explanation: None.

User response: Contact IBM Software Support.

HLV0120I  SEF msgtext

Explanation: The product tried to initialize SEF during product initialization. SEF initialization failed.

User response: Check the error messages and the return code associated with this problem. There may be one or more additional error messages or abends referring to the current SEF initialization problem. Check for open errors, such as security product related abends. Also, check for storage allocation errors or abends. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support.
HLV0121W  SEF - service OF desc FAILED, RC=rcode
Explanation:  The product tried to initialize or terminate SEF during product initialization or termination. An internal service routine called during SEF initialization or termination exited with a non-zero return code.
User response:  Check the error messages and the return code associated with this problem. There may be one or more additional error messages or abends referring to the current SEF initialization or termination problem. Check for open errors, such as security product related abends. Also, check for storage allocation errors or abends. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support.

HLV0122S  ABEND abcode REASON rsn OCCURRED AT modname+offset DURING SEF desc
Explanation:  The product tried to initialize or terminate SEF during product initialization or termination. The SEF initialization/termination routine abended.
User response:  Check the error messages and the abend code associated with this problem. There may be one or more additional error messages or abends referring to the current SEF initialization or termination problem. Check for open errors, such as security product related abends. Also, check for storage allocation errors or abends. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support.

HLV0123T  SEF initialization complete
Explanation:  The product has completed SEF initialization. All triggers and events will now be passed to the SEF for processing.
User response:  No action is required in response to this message. However, this message can be used to activate one or more event handling procedures.

HLV0126S  service OF desc FAILED, RC=rcode
Explanation:  This is a generic error message used to describe a wide variety of SEF execute queue initialization and termination errors. The message text provides the current operation (service) and what the current operation was trying to do.
User response:  Check the error messages and the return code associated with this problem. There may be one or more error messages referring to the current problem. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support.

HLV0127S  MAIN TASK TIMED OUT WHILE WAITING TO BE POSTED BY THE subtask SUBTASK
Explanation:  The product main task timed out while waiting to be posted by an SEF subtask. The SEF subtask has either terminated abnormally or is hung. The product may or may not be able to continue processing.
User response:  Check for other abends or product messages related to this one. If the problem cannot be resolved, contact Software Support.

HLV0128S  Dynamic definition of ddbname library failed
Explanation:  The mapping data set could not be defined properly to allow for caching of map data members.
User response:  Check for other abends or product messages related to this one, and contact Software Support.

HLV0130H  Initializing secur release rel security environment
Explanation:  This message shows that the product was able to successfully initialize the security environment for the interface between the product and ACF2 or RACF. The message shows the security product (secur) and release level (rel) to which the interface was established.
User response:  No action is required unless the customer is not running any security package and one was identified or the release level is incorrect. Contact Software Support if such an error is detected.

HLV0131S  subsysID SSCT chain scanning error
Explanation:  The SSCT chain was scanned by the security interface routines looking for ACF2 or RACF. Some error exists in the SSCT chain and the search could not be continued.
User response:  Examine the SSCT chain for an invalid chain or SSCT control blocks. If the problem cannot be resolved, contact Software Support.

HLV0132W  No security package found
Explanation:  The SSCT chain was scanned by the security interface routine looking for one of the known security packages: RACF, CA ACF2 or CA Top Secret. No known security product was found and the security package field was set to NONE.
User response:  If no security package exists on your system, this is not an error, and no further action is needed. If RACF, CA ACF2 or CA Top Secret is active...
and this message was received, contact Software Support.

HLV0133E relno release unknown, release code is relno

Explanation: The product attempted to recognize the release level (relno) of ACF2 and did not find a release level that it recognized or that is supported. As of this date, all CA-supported releases of ACF2 are supported by the product.

User response: If your release of ACF2 is supported by CA, contact Software Support to request that support be added for that release of ACF2. If the release number appears to be in error, contact Software Support for assistance.

HLV0134W RUNAUTH USERID cache initialization failed - sharing of RUNAUTH USERIDs now disabled

Explanation: During start-up, the SHARERUNAUTHACEES option was set to ON, but an error occurred while initializing the cached RUNAUTH userid table. This is likely due to a GETMAIN failure.

User response: Product initialization continues with the SHARERUNAUTHACEES option set to OFF. Examine the wraparound trace and console messages for an explanation of the error. If you are unable to locate the reason for the failure, contact Software Support.

HLV0135W Security routine failed attempting to validate the LOGUSERID userID.
RC=rcode.

Explanation: The internal security service routine failed while attempting to verify a new USERID for the logging task.

User response: Check the error messages and the return code associated with this problem. There may be additional error messages in the system log. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support.

HLV0136W LOGUSERID (userid) LOGON FAILED rcode1 rcode2 rsncode - msgtext

Explanation: An error occurred while attempting to verify a new USERID for the logging task. This is a security environment error.

This message contains two return codes; rcode1 represents the security module return code, and rcode2 represents the RACF (SAF) return code.

User response: Product logging continues with the previous USERID used for logging. Correct the value in the LOGUSERID parameter.

HLV0137S ABEND abcode REASON rsn OCCURRED AT modname+offset DURING SOM desc.

Explanation: An ABEND occurred during initialization or termination of the Security Optimization Management feature.

User response: Check the error messages and the abend code associated with this problem. There may be one or more additional error messages or abends referring to the current initialization or termination problem. Check for security product related abends and storage allocation errors or abends. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support.

HLV0138W SOM facility is not available for pkg.
Processing continues.

Explanation: Security Optimization Management (SOM) was requested, but the security package (pkg) is not RACF. SOM can only be enabled for RACF.

User response: None. This message is for informational purposes only.

HLV0139W Dynamic service services are not available

Explanation: An MVS dynamic LPA service is not available.

User response: None. This message is for informational purposes only.

HLV0140I The following catch-up rules require a final catch-up disposition

Explanation: This message is issued when there are catch-up manual rules which did not fire during the previous execution of the product. It is followed by message 0141I, which documents the unfired rules.

User response: No action is required in response to this message. However, this message can be used to activate one or more event handling procedures.

HLV0141I rule.rsnname1, rule.rsnname2 ... rule.rsnname7

Explanation: This message is issued when there are catch-up manual rules which did not fire during the previous execution of the product. It lists up to seven rules that did not fire, using the format ruleset.rule. Multiple messages may be issued so that all catch-up manual rules may be listed.

User response: No action is required in response to this message. However, this message can be used to
activate one or more event handling procedures.

HLV0142R Reply 'YES' to catch-up all rules, 'NO' to bypass catch-up, or 'MANUAL' for rule by rule prompting

Explanation: This message is issued when there are catch-up manual rules which did not fire during the previous execution of the product. It allows you to fire all catch-up manual rules, prevent all catch-up manual rules from firing, or specify the type of catch-up processing for each individual rule. It follows messages 0140I and 0141I. If more than two minutes expire while waiting for your reply or three invalid replies are made, the default action of NO will be taken.

User response: Reply YES to cause all catch-up manual rules to fire. Reply NO to prevent all catch-up manual rules from firing. Reply MANUAL and you will be prompted to specify the type of catch-up processing for each individual rule.

HLV0143R Reply 'YES' to catch-up rsname.rulename rule or 'NO' to bypass catch-up

Explanation: This message is issued when there are catch-up manual rules which did not fire during the previous execution of the product and you selected MANUAL in your reply to message 0142R. The name of the rule you are being prompted for is in the format ruleset,rulename. If more than two minutes expire while waiting for your reply or three invalid replies are made, the default action of NO will be taken.

User response: Reply YES to cause the rule to fire. Reply NO to prevent catch-up firing for the rule.

HLV0144E Invalid catch-up manual reply: reply

Explanation: An invalid reply was specified to one of the catch-up manual console messages. The message causing the error will be reissued so that you can correctly reply. After three invalid replies for the same message, default action will be taken. For a description of the default action, see the explanation of the original message.

User response: Determine the proper reply from the text of the message, and reply correctly.

HLV0145E Catch-up reply wait exceeded 2 minutes. Default used

Explanation: The product waited over two minutes for a reply to one of the catch-up manual messages. Since no response was made during that time, default action was taken.

User response: None. If a reply was desired, you will need to speed your response to the message.

HLV0146E 3 Invalid catch-up replies. Default taken

Explanation: Three invalid replies were made to a catchup manual message. Since no correct response was received, default action was taken.

User response: None. Reply as required next time.

HLV0147E Catch-up service service for variable varname failed, RC=rcode.

Explanation: An internal error was encountered during catch-up processing performing an HLVALUE or SWSVALUE function.

User response: Contact IBM Software Support.

HLV0148W Catch-up rule rsname.rulename has changed. Catch-up bypassed.

Explanation: This message is issued when a catch-up rule has been modified since the last time the rule was enabled. The rule would otherwise have fired for catch-up because either the product or z/OS was down during the last time the rule should have fired. Because the rule has changed, it will not fire for catch-up.

User response: None.

HLV0149E Catch-up rule rule global variable write failed, RC=rcode

Explanation: This message is issued when a catch-up rule attempts but fails to write a global variable describing the next time to fire. As a result, catch-up processing for the rule will fail the next time the product is restarted. This normally occurs when the GLOBALMAX startup parameter has been exceeded and it is no longer possible to create new global variables. Return code 93 indicates that GLOBALMAX has been exceeded. Additionally, every time the TOD rule fires, the internal global variable is updated, and return code 4 will be displayed in this message.

User response: Shut down the product, and allocate a larger SYSCHK1 data set. This may not be necessary if you already have a large data set but are only using a part of it due to a small GLOBALMAX value. Use the IDCAMS REPRO command to copy the existing database to the new larger one, if necessary. Increase the value assigned to the GLOBALMAX parameter in your initial parameter settings, and restart the product.

HLV0150S service OF desc FAILED, RC=rcode

Explanation: This is a generic error message used to describe a wide variety of trace initialization and termination errors. The message text provides the current operation (service) and what the current operation was trying to do.

User response: Check the error messages and the return code associated with this problem. There may be
one or more error messages referring to the current problem. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support.

HLV0151S  service OF dname FAILED, RC=rcode, REASON CODE=rsncode
Explanation: This error message describes errors that occurred during trace initialization, execution, or termination while using the DIV (Data In Virtual) system service. For a list of the return codes and reason codes from the DIV macro see the appropriate IBM documentation.
User response: Check the DIV return and reason codes associated with this problem. There may be one or more error messages referring to the current problem. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support.

HLV0152S  service OF dname FAILED, ABEND=abcde, REASON CODE=rsncode
Explanation: This error message describes an abend that occurred during trace initialization, execution, or termination while using the DIV (Data In Virtual) system service. The abend codes and reason codes from the DIV macro are documented in the IBM manual z/OS Programming: Assembler Services Reference.
User response: Check the DIV abend and reason codes associated with this problem. There may be one or more error messages referring to the current problem. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support.

HLV0153H  dname data set not allocated
Explanation: Product has detected that a TRACE DD card is not present in the JCL used to start the main product address space.
User response: Modify the JCL and specify the TRACE DD card after validating that the necessary DIV data set is allocated.

HLV0154S  Any existing Trace Browse data discarded
Explanation: Product detected this error.
User response: Contact Software Support.

HLV0155S  Please standby - upgrading Trace Browse - all data retained
Explanation: The product is upgrading the Trace Browse data area. The Trace Browse data area must be upgraded whenever messages from an earlier version of the product are detected in the Trace Browse data area. The upgraded Trace Browse data area is compatible with earlier releases of the product, as required.
User response: There is no action required in response to this message. This message should only be displayed once when you install the first release of the product that supports the upgraded data area format. You may also see this message again if a prior version of the product is used after the Trace Browse data area has been upgraded. The message will be deleted as soon as the Trace Browse data area upgrade is completed. The upgrade requires about 3 minutes for every 100,000 messages. If this message recurs, contact Software Support for additional assistance.

HLV0156S  service PASSED desc - code
Explanation: This is a generic error message used to describe a wide variety of trace initialization and termination errors. The message text provides the current operation (service) and what data (valid or invalid) was passed to the current operation.
User response: Check the error messages and the return code associated with this problem. There may be one or more error messages referring to the current problem. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support.

HLV0160S  Possible shortage of storage, bytes bytes required for Trace Browse
Explanation: This is a follow-up message to message 0150S when a GETMAIN has failed. This message indicates the size, in bytes, of the area requested by the GETMAIN.
User response: If the GETMAIN return code indicates insufficient storage to complete the GETMAIN request, please increase your available storage (above the 16MB line) by the indicated amount.

HLV0161S  Main task timed out while waiting to be posted by the TRACE subtask
Explanation: The product main task timed out while waiting to be posted by the trace subtask. The trace subtask has either terminated abnormally or is hung. The product may or may not be able to continue processing.
User response: Check for other abends or messages related to the product prior to this one, and contact Software Support for additional assistance.
HLV0162S  service OF dname FAILED,
ABEND=abcode AT modname+offset,
REASON CODE=rsncode

Explanation: This error message describes an abend that occurred during trace initialization, execution, or termination while using the DIV (Data In Virtual) system service. The abend codes and reason codes from the DIV macro are documented in the IBM manual z/OS Programming: Assembler Services Reference.

User response: Check the DIV abend and reason codes associated with this problem. There may be one or more error messages referring to the current problem. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support.

HLV0165I  SEF msgtext

Explanation: SEF subtask mapping information messages.

User response: None at this time.

HLV0166E  Unable to build process block for SEF interface, RC=rcode

Explanation: Services startup was unable to build the environment to interface to the SEF task. The return code is given.

User response: Check the return code and look for other error messages which may explain the error.

HLV0167E  Ruleset rule specifies DSN dname, should be dname for VirtualDirectory dir.

Explanation: Services startup found a Virtual Directory with a Ruleset whose dataset name did not match the existing Ruleset dataset name. This Virtual Directory (dir) is not initialized.

User response: Correct the inconsistency between rulesets and dataset names in all related virtual directories.

HLV0171S  service OF dname FAILED, RC=rcode,
REASON CODE=rsncode

Explanation: This error message describes errors that occurred during global variable initialization, execution, or termination while using the DIV (Data In Virtual) system service. For a list of the return codes and reason codes from the DIV macro see the appropriate IBM documentation.

User response: Check the DIV return and reason codes associated with this problem. There may be one or more error messages referring to the current problem. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support.

HLV0172S  service OF dname FAILED,
ABEND=abcode, REASON CODE=rsncode

Explanation: This error message describes an abend that occurred during global variable initialization, execution, or termination while using the DIV (Data In Virtual) system service. For a list of the return codes and reason codes from the DIV macro see the appropriate IBM documentation.

User response: Check the DIV abend and reason codes associated with this problem. There may be one or more error messages referring to the current problem. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support.

HLV0173W  dname data set not allocated

Explanation: The product has detected that either a SYSCHK1 or a SYSCHK2 DD card is not present in the JCL used to start the main product address space.

User response: Modify the JCL, and specify an appropriate DD card after validating that the necessary DIV data set is allocated.

HLV0174S  Any existing global variables data discarded

Explanation: The product detected this error.

User response: Contact Software Support.

HLV0175I  Global variable upgrade vartext

Explanation: Prior to version 02.01.01 of the product, global variables were maintained in a linked list. As of version 02.01.01, they are kept in an AVL tree structure for improved performance. This message indicates that the global variable pool is being upgraded to the new format. This message may also be issued as a result of setting the GLOBALREBUILD parameter to YES or when the global variable database has been corrupted.

User response: None. This message is for informational purposes only.

HLV0176S  Duplicate global variable found, name=varname

Explanation: While building/rebuilding the global variable AVL tree, an attempt was made to add a node to the tree, and the node already existed in the tree. The second value is ignored, and the tree build/rebuild continues.

User response: Report this message to Software Support. This situation has occurred due to a prior logic error.
HLV0177S  Main task timed out while waiting to be posted by the global variable checkpoint subtask

Explanation: The product main task timed out while waiting to be posted by the global variable checkpoint subtask. The global variable checkpoint subtask has either terminated abnormally or is hung. The product may or may not be able to to continue processing.

User response: Check for other abends or messages related to the product prior to this one, and contact Software Support.

HLV0178S  errdesc DETECTED IN GLOBAL VARIABLE LIST

Explanation: While building/rebuilding the global variable AVL tree, one of the following (errdesc) occurred: (1) an infinite loop was detected in the sequential list, (2) an invalid entry was detected in the sequential list, or (3) an invalid offset was detected in the sequential list. The tree rebuild is terminated at this point. The product will attempt to reconstruct the entire global variable data set. Some global variables may be discarded.

User response: Report this message to Software Support. This situation has occurred due to a prior logic error or storage overlay. The product should continue to function normally after the global variable data set has been successfully reconstructed.

HLV0179I  Global variable conversion from version varintext version

Explanation: Prior to version 02.02.00 of the product, global variables were limited to 256 bytes in size. As of version 02.02.00, this restriction is removed. Prior to version 03.02.00 of the product, the key size was limited to 50 bytes. As of version 03.02.00, the key size limit is increased to 84 bytes. This message indicates that the global variables are being converted to a new format.

User response: None. This message is for informational purposes only.

HLV0180I  GLOBAL VARIABLE CHAIN REBUILD varintext, count GLOBALS

Explanation: While doing a global variable tree rebuild, it was found that the chained list was incomplete and needed to be rebuilt. This message indicates the status of the chain rebuild process.

User response: None. This message is for informational purposes only.

HLV0181I  varintext BEING ADDED TO CHAIN

Explanation: While doing a global variable tree rebuild, it was found that the chained list was incomplete and needed to be rebuilt. This message indicates which variables were reinserted back into the global variable chain.

User response: None. This message is for informational purposes only.

HLV0182I  GLOBAL VARIABLE DATABASE BEING CONVERTED

Explanation: This is the first time version 02.02.00 of the product has processed this global variable DIV data set. The product is converting the global variable database to the new format. The converted global variable database will not be usable with older versions of the product unless the backward conversion utility is subsequently executed.

User response: Information only. No action required.

HLV0183S  ABEND abcode OCCURRED AT modname+offset DURING desc

Explanation: This error message describes an abend that occurred during global variable subtask termination processing. This may also occur during an AVL tree rebuild during startup or when the GLOBALREBUILD parameter is set to YES.

User response: There may be one or more error messages related to the current problem. In the case of the AVL tree rebuild routine, the product will attempt to recover the global variable checkpoint data set by automatically rebuilding it. In all other cases, attempt to fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support.

HLV0184S  desc storaddr1 storaddr2 storaddr3

Explanation: A logical error was encountered while validating data prior to a global variable checkpoint. The checkpoint will be aborted, and the product will be terminated to prevent incorrect data being saved. Changes to the global variable database since the previous checkpoint will be discarded.

User response: Attempt to restart the product. If the same error occurs, contact Software Support, giving them the information in this message. It may be possible to reconstruct the database by setting the GLOBALREBUILD parameter to YES prior to restarting the product. If not, the global variable data set can be recovered from a prior backup.
HLV0185W  GLOBALMAX VALUE OF \texttt{val1} IS TOO LOW. RESET TO \texttt{val2}.

\textbf{Explanation:} The GLOBALMAX parameter value is too low and would cause the global variable database to be destroyed. The value has been ignored and reset to its prior value. This scenario may have been caused by a failure in the product initialization REXX program or CLIST, which resulted in an attempt to use the default GLOBALMAX value.

\textbf{User response:} If this error was caused by a failure in the initialization REXX program or CLIST, attempt to determine the cause of failure as soon as possible. You may wish to shut down the product to prevent other problems from occurring. The GLOBALMAX value may have been defaulted due to such a failure. If you are really attempting to reduce the size of the global variable data set, you must stop the product, delete and reallocate a new DIV data set, and then restart the product.

HLV0186S  CONVERSION FAILED. INCREASE GLOBALMAX BY AT LEAST minval.

\textbf{Explanation:} The conversion of the SYSCHK1 database to the version 03.02.00 format failed because the GLOBALMAX value is not large enough to contain the converted data. The new database requires more space than the old one due to the increased key size. The database may require up to twice as much space in the worst possible case.

\textbf{User response:} Shut down the product, and allocate a larger SYSCHK1 data set. This may not be necessary if you already have a large data set but are only using a part of it due to a small GLOBALMAX value. Use the IDCAMS REPRO command to copy the existing database to the new larger one, if necessary. Increase the value assigned to the GLOBALMAX parameter in your initial parameter settings, and restart the product. Adding this value will not leave any free space in the SYSCHK1 data set. You should leave enough free space to account for growth in your system.

HLV0187I  OLD IN-USE BLOCK COUNT - minval. NEW IN-USE BLOCK COUNT - \texttt{val}.

\textbf{Explanation:} This informational message indicates how many blocks of storage were being used in the SYSCHK1 database prior to the conversion to the 03.02.00 format and how many blocks of storage will now be used following the conversion.

\textbf{User response:} Compare the new in-use block count to your GLOBALMAX value. If this value is close to the GLOBALMAX value, you may not have sufficient free space for normal operation, and you should increase the size of your SYSCHK1 database as soon as possible.

HLV0188S  INCOMPATIBLE SYSCHK1 DATABASE LEVEL \texttt{lev1}, CANNOT BE USED.

\textbf{Explanation:} The SYSCHK1 database is in a format that is incompatible with the current version of the product. This database has probably been converted to a format supported by a newer version of the product.

\textbf{User response:} Use a version of the database that is compatible with the current version of the product.

HLV0190E  SEF STARTUP ERROR: \texttt{var1, var2 ... var9}

\textbf{Explanation:} A configuration parameter or environmental error was found during SEF service task initialization. The problem is related in some way to the enhanced implementation of the System Web Interface (SWI) facility. Either parameters used to configure the SWI facility conflict, or new restrictions that this version of the Server imposes have not been met.

\textbf{User response:} SEF service task initialization ends with an error causing the server to begin shutdown processing. Determine the cause of the error and correct the problem or conflict. If the problem cannot be understood and resolved from the messages produced, contact Software Support.

HLV0191W  SWI FACILITY WARNING: \texttt{var1, var2 ... var9}

\textbf{Explanation:} A configuration parameter or environmental error was detected during activation, termination, or processing by the System Web Interface (SWI) facility. The SWI facility continues operation adjusting to the reported condition.

\textbf{User response:} Determine if the warning is anticipated or unexpected. If the warning reports an unexpected condition, correct the configuration or other problem before restarting the server.

HLV0192I  SWI FACILITY: \texttt{var1, var2 ... var9}

\textbf{Explanation:} The System Web Interface (SWI) Facility has detected a condition that might be of interest and reports it using this message number. The message MIGHT indicate a configuration problem, or runtime problem, depending upon the nature of the reported information.

\textbf{User response:} If a recoverable condition is reported, check the SWI configuration that may contribute to the condition and correct prior to the next server restart.

HLV0193W  SEFACTIVE = "NO" set - SEF rules will not be enabled during start-up.

\textbf{Explanation:} The SEFACTIVE parameter is set to "NO", so rule enablement will not be performed during server startup. You can enable rules later by manually
issuing ENABLE SEF commands against defined rulesets.

**User response:** Determine if the warning is anticipated. If not, correct the SEFACTIVE start-up parameter and restart the server.

---

**HLV0194W** SEF start-up procedure ended with special RC (8) - auto-enable of SEF rules bypassed - no SEF rules are enabled.

**Explanation:** The SxxxxINEF start-up procedure ended with RC=8, indicating rule enablement should be bypassed. The server will bypass rule enablement. You can enable rules later, manually, but until you do so, no event related processing is performed by the SEF facility.

**User response:** Determine if the warning is anticipated. If not, correct the SxxxxINEF start-up procedure and restart the server.

---

**HLV0195E** XO DATASET ERROR: var1, var2 ... var9

**Explanation:** A configuration or runtime error was found while SEF was processing an executable object (XO) dataset. XO dataset libraries contain pre-compiled SEF rules and HTX generation skeleton text files. They are used primarily to support the System Web Interface (SWI) facility distributed with the server.

**User response:** SEF terminates processing of the current operation, sometimes by generating an S0C3 ABEND if the condition is severe. If error is severe SEF may be termination of the server. Check for related messages which may aid in problem determination. For SWI, be sure the SWICNTLDSN start-up parameter is set correctly. Contact Software Support if the problem cannot be determined or corrected.

---

**HLV0196W** SEF CONFIGURATION UPDATE var1, var2 ... var9

**Explanation:** SEF is processing a configuration update, such as validating a ruleset definitions and placing the ruleset online. A problem or warning is reported in this message if the configuration update is not completed normally.

**User response:** SEF continues processing of the next configuration update unless the error is severe. Correct the original resource definition (e.g. "DEFINE RULESET" or "DEFINE FILE" in the SxxxxIN00 procedure) and resubmit the request.

---

**HLV0197S** Critical SEF resource definition error found - server startup aborting

**Explanation:** An error was detected in a critical SEF configuration resource definition. The server will begin termination processing to avoid later problems when the SEF task begins execution.

**User response:** Check the console log for DEFINE RULESET definitions entered via the SxxxxIN00 startup procedure. Those definitions which are flagged with the keyword "INITERROR(ABORT)") and the definitions for ATH, WWW-Master, and TYP rulesets are considered critical. The server will not be allowed to start if these definitions are in error. Correct the definitions and restart the server.

---

**HLV0200S** MODE SWITCH ROUTINE service FAILED RC=rcode

**Explanation:** The product attempted to either acquire storage for a below the line AMODE switch routine or free the storage used by a below the line AMODE switch routine. The storage management operation (service) failed.

**User response:** Check if the return code or any other messages provide additional information about the storage management error. Also, check if the operating system is short on storage in CSA. Start or restart the product if the storage management problem can be resolved. Contact Software Support if the problem cannot be resolved.

---

**HLV0201S** SSVT service FAILED RC=rcode

**Explanation:** The product tried to either acquire storage for a SSVT control block or free the storage used by the SSVT control block. The storage management operation (service) failed.

**User response:** Check if the return code or any other messages provide additional information about the storage management error. Also, check if the operating system is short on storage in CSA or ECSA. Start or restart the product if the storage management problem can be resolved. Contact Software Support if the problem cannot be resolved.

---

**HLV0202S** SAST UPDATE FAILED RC=rcode

**Explanation:** The product tried to update one of the subsystem interface control blocks used by the system. The update operation failed.

**User response:** Check the error messages associated with this problem. There may be one or more subsystem interface error messages referring to the current problem. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support.

---

**HLV0203S** SAST PLIST STORAGE service FAILED RC=rcode

**Explanation:** The product tried to either acquire storage for the SAST update PLIST or free the storage used by the SAST update PLIST. The storage management operation (service) failed.

**User response:** Check if the return code or any other
messages provide additional information about the storage management error. Also, check if the product region should be increased. Start or restart the product if the storage management problem can be resolved. Contact Software Support if the problem cannot be resolved.

HLV0204W  Total subsystem count was count1, reset to count2

Explanation: Many products (such as IMS) create new subsystem control blocks and add them to the subsystem control block chain. Unfortunately, these same products do not update the subsystem control block count field. The product found that the actual count of subsystem control blocks did not match the count value in the main operating system control block. The product updated the overall count value.

User response: This is not an error message, and no action is required.

HLV0206E  servout errdesc FAILED, RC=rcode, DETECTED AT addr

Explanation: Some type of service routine (operating system or product specific) failed. The error message identifies the service routine and the type of error.

User response: Check the full text of the error message, and fix the program that calls the application program interface, if necessary.

HLV0207I  JSAST TABLE ENTRY FOR subsys WAS indicator FOUND - FORCEJSASTUPDATE OPTION ACTIVE

Explanation: The FORCEJSASTUPDATE option is on. The subsystem’s ID was or was not found in the JSAST table. Updates to JESNRSS and the JSAST table will be unconditional due to the setting of FORCEJSASTUPDATE.

User response: Initialization routines force execution of the JESNRSS Update and IEFJSBLD calls.

HLV0221E  CONNECT OF SMF REAL-TIME INTERFACE FAILED FOR STREAM stream_name, RC=return_code, REASON=reason_code, DETECTED AT csect_name

Explanation: An SMF Real-Time interface function failed with the specified return code and reason code.

User response: Check the error messages and the return code associated with this problem. There may be one or more error messages referring to the current problem. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Technical Support to obtain additional assistance.

HLV0230W  SERVER’S DFHSM PENDING HRECALL TABLE IS FULL - DFHSMDRRAIN(YES) FORCED

Explanation: More than 125 outstanding asynchronous HRECALL requests remain to be posted as complete by DFHSM. The server is suspending DFHSM request processing. It automatically set the DFHSMDRRAIN product option to YES, so that no new HRECALL requests are scheduled until either (1) the number of pending HRECALL requests drops below 100 or (2) the DFHSMDRRAIN or DFHSMSTATUS options are changed manually.

User response: Check for reasons why DFHSM HRECALL processing may be delayed or disabled. Correct the DFHSM problem, and then either wait for the server to automatically set the DFHSMDRRAIN(NO) option (once 25 requests have been completed and cleared from the pending table) or manually change the DFHSMDRRAIN parameter to NO. Before manually changing DFHSMDRRAIN to NO, ensure that fewer than 125 HRECALL requests remain outstanding.

HLV0231E  DFHSM INIT/TERM ROUTINE, OPINHS, ENTERED WITH INVALID FUNCTION CODE: code

Explanation: During start-up or shutdown, the DFHSM service routine was entered with an invalid request code.

User response: This is a logic error. Contact Software Support for problem resolution.

HLV0233E  IBM-SUPPLIED DFHSM LOAD MODULE, ARCGIVER, NOT INSTALLED/LOCATED - DFHSM SUPPORT DISABLED

Explanation: During start-up, DFHSM(YES) was selected to initialize DFHSM support. However, the server cannot locate a copy of the IBM-supplied DFHSM interface module, ARCGIVER. This module must be available within the link list, LPA, or the
server’s STEPLIB load library.

**User response:** Server start-up continues, but the server resets the DFHSM option to NO, which prevents further interactions with DFSMShsm from being undertaken. Determine why the ARCGIVER module cannot be located, and make it available during server start-up. If DFSMShsm is not installed, do not attempt to set the DFHSM(YES) start-up option.

**HLV0234I** DFHSM INTERFACE DISABLED DUE TO STORAGE ALLOCATION ERROR

**Explanation:** During start-up, DFHSM(YES) was selected to initialize DFHSM support. However, a storage acquisition error has occurred which will prevent the DFHSM interface from operating.

**User response:** Server start-up continues, but the DFHSM option is reset to NO, which prevents further DFHSM operations from occurring. See preceding messages to determine the actual cause of the problem.

**HLV0235I** DFHSM support interface successfully initialized

**Explanation:** During start-up, the DFHSM(YES) was selected to enable DFHSM support. The server has pre-initialized its DFHSM support interface successfully.

**User response:** Server start-up continues. If DFHSM is not operational, the server may generate HRECALL requests throughout its operation which will immediately fail. If DFHSM is not actually installed, change the DFHSM start-up parameter to NO to prevent enablement of DFHSM Support within the server. You may set DFHSMSTATUS(OFFLINE) at any time to prevent the server from invoking DFHSM services until reset to DFHSMSTATUS(ONLINE).

**HLV0236E** ABEND DURING DFHSM service PROCESSING - CMP=cocode,RS=rsncode, AT=modname+offset

**Explanation:** An abend was trapped during DFHSM processing. Information about the abend is written to the console log.

**User response:** The DFHSM interface retries, if possible, to prevent subsystem termination or failure. Check for other messages which might indicate the cause of the problem. If the problem cannot be resolved, contact Software Support.

**HLV0237W** HRECALL PENDING for dsnname - MWE ECB at addr UNPOSTED - ORPHANED

**Explanation:** During shutdown, an incomplete asynchronous DFHSM HRECALL request was detected. The outstanding request will cause 352 bytes of below-the-line CSA storage to be orphaned. This occurs because an outstanding HRECALL request causes an MWE ECB to be allocated by DFHSM. The server is allowed to free the ECB only after DFHSM has posted this ECB, which it has not yet done; DFHSM does not automatically free this storage when the requesting address space terminates. Note that the orphaned CSA storage area actually begins some number of bytes prior to the ECB address given in this message (consult IBM to determine the exact offset).

**User response:** Processing continues and the DFHSM MWE ECB is orphaned. The server does not attempt to remember these ECB addresses across a restart of the product. To prevent this condition, consider setting the server’s DFHSMSHUTDOWNWAIT parameter to allow a longer wait time limit for DFHSM hreclal completions during shutdown. Also, ensure that the DFHSMSTATUS parameter has not been manually set to OFFLINE, which inhibits waiting and cleanup of pending HRECALL requests.

**HLV0238I** SERVER’S PENDING RECALL TABLE NO LONGER FULL - DFHSMDRRAIN(NO) RESET TO NO

**Explanation:** Earlier, the server had put DFHSMDRRAIN(YES) into effect because its pending HRECALL table was full. The table now has 25 free entries, and the server is restoring normal HRECALL processing.

**User response:** None. Normal HRECALL processing resumes.

**HLV0239I** SHUTDOWN SUSPENDING FOR UP TO sec SECONDS TO AWA IT count1 PENDING HRECALL COMPLETIONS - count2

**Explanation:** During shutdown processing, one or more pending HRECALL requests is still pending. The server will pause to wait upon DFHSM to post these pending requests complete. Shutdown processing will re-commence after pausing for DFHSM completion.

**User response:** None. The server waits the length of time specified by the DFHSMSHUTDOWNWAIT parameter for pending completions.

**HLV0240E** count PENDING DFHSM REQUESTS (AND MWE’s) ORPHANED BECAUSE rsn

**Explanation:** During shutdown processing, one or more pending HRECALL requests may remain pending. However, the server is bypassing product termination-time final recovery, checking for these requests.

**User response:** None. The server continues termination processing without attempting recovery/cleanup for pending HRECALL requests. Bypassing DFHSM final recovery is normally due to
the parameter DFHSMSTATUS(OFFLINE) having been explicitly set and left in effect during product termination. Be sure to restore DFHSMSTATUS(ONLINE) before product shutdown if DFHSM is actually online.

**HLV0250S**  
**service OF desc FAILED, RC=rcode**

**Explanation:** This is a generic error message used to describe a wide variety of IMS initialization and termination errors. The message text provides the current operation (service) and what the current operation was trying to do.

**User response:** Check the error messages and the return code associated with this problem. There may be one or more error messages referring to the current problem. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support.

**HLV0251S**  
**service PASSED desc - code**

**Explanation:** This is a generic error message used to describe a wide variety of IMS initialization and termination errors. The message text provides the current operation (service) and what data (valid or invalid) was passed to the current operation.

**User response:** Check the error messages and the return code associated with this problem. There may be one or more error messages referring to the current problem. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support.

**HLV0253S**  
**service TO desc FAILED, RC=rcode**

**Explanation:** This is a generic error message used to describe a wide variety of IMS initialization and termination errors. The message text provides the current operation (service) and what the current operation was trying to do.

**User response:** Check the error messages and the return code associated with this problem. There may be one or more error messages referring to the current problem. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support.

**HLV0254S**  
**IMS rsrc name missing**

**Explanation:** A resource (rsrc) name needed by the IMS product feature is missing. The current operation will be terminated. The message text contains the name of the missing resource.

**User response:** Check the resource name in the error message. Set the resource name using a product parameter.

**HLV0255H**  
**Build in-storage profile failed for class class rcode1 rcode2 rsncode - errmsg**

**Explanation:** The product received a non-zero return code from a build in-storage profiles request for a specific class.

The message contains two return codes; rcode1 represents the security module return code, and rcode2 represents the RACF (SAF) reason code.

**User response:** Check the security error for the class. Correct the problem, or contact your security administrator for further assistance.

**HLV0261I**  
**Server will use default filetype definitions for MIME CONTENT-TYPE mapping**

**Explanation:** FILETYPE table definitions were not provided explicitly by the initialization procedure. In the absence of ANY explicitly defined entries, the server generates a default set of definitions.

**User response:** Normally, no action in required, and you may prefer to use the built-in defaults provided by the server.

**HLV0265E**  
**IDMS support cannot be enabled - module IDMS-module-name not found**

**Explanation:** The CA IDMS load module was not found in the server started task JCL.

**User response:** Add the CA IDMS load libraries into the STEPLIB of the server started task JCL.

**HLV0270T**  
**Access to ACI feature is not configured.**

**Explanation:** None.

**User response:** Contact IBM Software Support.

**HLV0271W**  
**ACI internal service had to GETMAIN buffers**

**Explanation:** ACI internal services are supposed to use above the bar buffer pools for storage. Some ACI services were unable to obtain storage from the buffer pool configured. As a result, it had to resort to GETMAIN services for buffers.

**User response:** Examine the buffer pool statistics to determine which buffer pools need to be made larger. Also, be sure the internal services are configured to appropriate buffer pools.

**HLV0272I**  
**service errdesc, RC=rcode, RSN=rsncode, DETECTED AT addr**

**Explanation:** ACI internal services initialization was unable to get large page storage for the ACI buffer pools as requested.
User response: Allocate more storage for large pages to satisfy the buffer pool requests. Standard page storage is obtained instead.

HLV0273T additinfo1, additinfo2 ... additinfo9
Explanation: ACI tracing message. These messages will be produced when ACTRACE is set to YES.
User response: None.

HLV0280S SSL msgtext
Explanation: The product tried to initialize SSL during product initialization. SSL initialization failed.
User response: Check the error messages and the return code associated with this problem. There may be one or more additional error messages or abends referring to the current SSL initialization problem. Check for open errors, such as security product related abends. Also, check for storage allocation errors or abends. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support.

HLV0281S SSL KEY/CERTIFICATE FILE func ERROR, DD=ddname, RC=rcode
Explanation: The product tried to initialize SSL during product initialization. SSL initialization failed because an error occurred while accessing the server's private key or certificate file.
User response: Check the error messages and the return code associated with this problem. There may be one or more additional error messages or abends referring to the current SSL initialization problem. Check for open errors, such as security product related abends. Also, check for storage allocation errors or abends. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support to obtain additional assistance.

HLV0282S ABEND abcode OCCURRED AT modname+offset DURING SSL desc
Explanation: The product tried to initialize or terminate SSL during product initialization or termination. The SSL initialization/termination routine abended.
User response: Check the error messages and the abend code associated with this problem. There may be one or more additional error messages or abends referring to the current SSL initialization or termination problem. Check for open errors, such as security product related abends. Also, check for storage allocation errors or abends. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support.

HLV0283T SSL initialization complete
Explanation: The product has completed SSL initialization. All triggers and events will now be passed to the SSL for processing.
User response: No action is required in response to this message. However, this message can be used to activate one or more event handling procedures.

HLV0284S SSL user ID userID logon failed.
Explanation: The SSL manager userid specified by the SSLUSERID system parameter, or the default server address space userid failed logon processing during start-up.
User response: The HTTP-API initialization process is aborted. Ensure that the userid specified by the SSLUSERID start-up parameter is correct. Refer to message HLV2107 for more information about the failure.

HLV0285I SSL manager user ID userID logged on to server.
Explanation: The SSL manager userid specified by SSLUSERID system parameter has been logged on to the system.
User response: HTTP-API initialization processing continues.

HLV0286S service OF desc FAILED, RC=rcode
Explanation: This is a generic error message used to describe a wide variety of SEF execute queue initialization and termination errors. The message text provides the current operation (service) and what the current operation was trying to do.
User response: Check the error messages and the return code associated with this problem. There may be one or more error messages referring to the current problem. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support.

HLV0287S MAIN TASK TIMED OUT WHILE WAITING TO BE POSTED BY THE subtask SUBTASK
Explanation: The product main task timed out while waiting to be posted by an SSL subtask. The SSL subtask has either terminated abnormally or is hung. The product may or may not be able to continue processing.
User response: Check for other abends or product messages related to this one. If the problem cannot be resolved, contact Software Support.
HLV0288S  SSL SERVER PRIVATE KEY/CERTIFICATE FORMAT INVALID FOR ddname

Explanation: The SSL resource manager could not initialize because the server's private key or certificate file contains an invalid key or certificate.

User response: Check for other abends or product messages related to this one. If the problem cannot be resolved, contact Software Support.

HLV0289S  SSL SUPPORT CANNOT BE ENABLED - DDNAME ddname IS NOT ALLOCATED

Explanation: The SSL resource manager could not initialize because the server's certificate or private key file ddname is not allocated.

User response: The server will terminate. Check the start-up JCL to ensure that the certificate file and/or private key files are allocated to the correct ddnames.

HLV0290S  SSL ERROR: msgtext

Explanation: The SSL routines logged a severe error message.

User response: The SSL routines logged a severe error to trace. The message is duplicated to the operator console.

HLV0291S  SSL LDAP indicator NOT SPECIFIED

Explanation: SSL client authentication by an LDAP server was requested, but the name of the server or port (indicator) number were not specified.

User response: The server initialization process is aborted. Ensure that the correct server name and port number are specified with the SSLLDAPSERVER and SSLLDAPPORT parameters.

HLV0292I  GSK SSL SUPPORT CANNOT BE ENABLED - SSLKEYPATH PARAMETER NOT SPECIFIED, CHANGING TO SSLEAY SUPPORT

Explanation: The SSL resource manager could not initialize GSK SSL because the SSLKEYPATH parameter was not specified. GSK SSL requires this parameter. The product will attempt to use SSLEAY SSL support.

User response: The GSK SSL support will not be enabled. If possible, SSLEAY SSL support will be used. If GSK SSL is desired, code the SSLKEYPATH parameter and restart the product.

HLV0293I  A CALL TO THE SET_DUB_DEFAULT UNIX SYSTEM SERVICE FAILED.

RC=r_code RS=r_code

Explanation: Product initialization received an error return code from a call to the set_dub_default service.

User response: Product initialization is terminated. Refer to the IBM UNIX System Services Messages and Codes manual for an explanation of the return and reason codes. It is possible that an OMVS segment was not created for the product USERID. Refer to the the product Server Installation Guide for more information on creating the product USERID and the security that the USERID requires. If the problem cannot be resolved, then contact Software Support to obtain additional assistance.

HLV0302S  Subroutine subrout was found in modname1 but belongs in modname2 at offset offset

Explanation: The subroutine definition is in the wrong module.

User response: Contact Software Support to obtain assistance.

HLV0321S  Subroutine subrout at offset offset1 in module modname is out of sequence and should be offset offset2

Explanation: The subroutine is not defined in the correct position.

User response: Contact Software Support to obtain assistance.

HLV0322S  Vector and list table offsets for subroutine subrout in module modname do not match

Explanation: The offset into the vector table for the subroutine does not match the offset defined in the list table.

User response: Contact Software Support to obtain assistance.

HLV0323S  Vector at offset offset in module modname points to subrout1 but should point to subrout2

Explanation: The subroutine pointed to by the list table is not the one that was defined. The OPCOS% module vector table entries do not agree with OPSBCL.

User response: Contact Software Support to obtain assistance.
HLV0324I  service OF desc FAILED, RC=rcode, REASON=rsnrcode, DETECTED AT addr

Explanation: An attempt was made to use zEDC services for compression. If no zEDC engine was available or zEDC is not configured, this message may appear.

User response: If zEDC compression is not required, this message may be ignored. Otherwise, the return code and reason code will indicate the problem using zEDC.

HLV0325I  service OF desc SUCCEEDED, DETECTED AT addr

Explanation: A succeeded for zEDC services for compression. zEDC services are now available for use.

User response: None.

HLV0326T  additinfo1, additinfo2 ... additinfo3, PGM=%SK

Explanation: A zEDC function call was made. The results are traced.

User response: None.

HLV0334I  STOP command detected during initialization

Explanation: A STOP command has been detected by the product during early product initialization. The initialization exec (SxxxxIN00) may or may not have completed successfully. STOP commands issued after the completion of the initialization exec will not be honored until initialization has completed.

User response: None. This message is for informational purposes only.

HLV0335S  ESTAE service ERROR RC=rcode

Explanation: The product tried to create an ESTAE recovery environment. The ESTAE macro (service) failed.

User response: Check the error messages and the return code associated with this problem. There may be one or more ESTAE error messages referring to the current problem. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support.

HLV0336S  service of desc failed, RC=rcode. Detected at addr. stack: skinfo.

Explanation: This is a generic error message used to describe a wide variety of product initialization, execution, and termination errors. The message text provides the current operation (service) and what the current operation was trying to do.

User response: Check the error messages and the return code associated with this problem. There may be one or more error messages referring to the current problem. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact IBM Software Support.

HLV0337E  desc service ERROR RC=rcode

Explanation: Some type of process block pool error occurred during product initialization or product termination. The message text provides the current operation (service) and what the current operation was trying to do.

User response: Check the error messages and the return code associated with this problem. There may be one or more error messages referring to the current problem. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support.

HLV0338S  INVALID desc LOCATED AT addr TAG IS tag

Explanation: The product found an invalid control block during product termination. The control block tag (tag) contained an invalid character string.

User response: Check the error messages associated with this problem. There may be one or more error messages referring to the current problem. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support to obtain additional assistance.

HLV0339E  count process block(s) still in use

Explanation: The product uses a pool of stack control blocks to process messages and other events. The stack blocks are obtained and released as required by a variety of product routines. In some cases, a product routine may fail to release a process block.

User response: No action is required to resolve this problem. The product will release all of the space used by the stack control blocks even if they appear to still be in use. If the problem cannot be resolved, contact Software Support.

HLV0340I  msgtext

Explanation: This message is not an error message. The current message is used to display the output from the product initialization exec (SxxxxIN00) on the system consoles.

User response: Although the current message is not an error message, the output from the product initialization exec is only sent to the product consoles if the initialization exec terminates with a non-zero return code. The exec messages should be carefully checked.
for any error messages. Restart the product, if necessary. Contact Software Support if the problem (non-zero exec termination code) recurs.

HLV0341T %PM feature codes are not set - contact Software Support for assistance
Explanation: Review the messages just before and after this message to understand the context.
User response: Contact IBM Software Support.

HLV0342T %PM is running on an unconfigured CPU.
Explanation: None.
User response: Contact IBM Software Support.

HLV0343T %PM configuration will need refresh in x days.
Explanation: None.
User response: Contact IBM Software Support.

HLV0344T %PM configuration needs refresh on this system.
Explanation: None.
User response: Contact IBM Software Support.

HLV0345S DD allocation required in start-up JCL for proper execution of TSO/E REXX procedures.
Explanation: The server is attempting to intercept output from a TSO/E REXX procedure but could not open the output data set to which TSO/E REXX routes SAY statement and other output messages are directed. The most likely cause is that a site modification has been made to IRXPARMS that specifies that TSO/E REXX should use a non-standard ddname for output. SYSTSPRT, the IBM default, is assumed if the server is unable to load and check the IBM-supplied load module, IRXPARMS.
User response: Ensure that the ddname indicated in the message is pre-allocated by the server's start-up JCL. (The product-supplied sample JCL contains a SYSTSPRT DD statement which can be used as a model for pre-allocating this data set.) If a DD statement is already present in the start-up JCL, ensure that this ddname has not been released through the use of an MVS DYNALLOC dynamic allocation request. This condition, if encountered while processing the SW5xIN00 parameterization procedure, will not result in server termination. However, any errors encountered while executing this procedure cannot be successfully reported.

HLV0346I NETWORKBUFFERSIZE value inadequate for SQLMaxColumns value, raised to tail
Explanation: The NETWORKBUFFERSIZE must be adequate to hold an SQLDA with the maximum number of columns allowed, as specified by SQLMaxColumns. The exact formula is: NETWORKBUFFERSIZE >= SQLMaxColumns * 44 + 16
User response: The NETWORKBUFFERSIZE is raised to the size computed by the above formula and then rounded to a 1K (1024) byte boundary.

HLV0347I DSNREXX DB2 REXX INTERFACE NOT FOUND, ADDRESS DSNREXX SUPPORT NOT ACTIVATED
Explanation: The load module DSNREXX for REXX interface to Db2 was not found. Support for this API is not activated. Initialization continues normally.
User response: Support for ADDRESS DSNREXX is not enabled. This is not necessarily an error, unless DSNREXX support is needed.

HLV0348S Invalid registry block ivdata found in logstream logstream
Explanation: The Registry Logstream contained a block which did not pass validation (ivdata). The record is dropped, and will be deleted at the next update.
User response: Make a copy of the next Offload dataset for this logstream and send it to Software Support.

HLV0349I regtype REGISTRY LOGSTREAM logstream action
Explanation: The Registry Logstream was created, deleted, or connected (action) to as part of initialization.
User response: None, this is normal processing.

HLV0350S service OF desc FAILED, RC=rcode
Explanation: This is a generic error message used to describe a wide variety of CICS initialization and termination errors. The message text provides the current operation (service) and what the current operation was trying to do.
User response: Check the error messages and the return code associated with this problem. There may be one or more error messages referring to the current problem. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support.
HLV0351S service PASSED desc - code

Explanation: This is a generic error message used to describe a wide variety of CICS initialization and termination errors. The message text provides the current operation (service) and what data (valid or invalid) was passed to the current operation.

User response: Check the error messages and the return code associated with this problem. There may be one or more error messages referring to the current problem. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support.

HLV0352W modname is not REENTRANT

Explanation: The product found that the EXCI options module DFHXCOPT or its alias DFHXCOPE is not REENTRANT. This will cause some EXCI related product parameters to be ignored - for example the TIMEOUT parameter.

User response: Relink the module with the RENT option.

HLV0353S service TO desc FAILED, RC=rcode

Explanation: This is a generic error message used to describe a wide variety of CICS initialization and termination errors. The message text provides the current operation (service) and what the current operation was trying to do.

User response: Check the error messages and the return code associated with this problem. There may be one or more error messages referring to the current problem. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support.

HLV0354S CICS rsr NAME MISSING

Explanation: A resource (rsr) name needed by the CICS product feature is missing. The current operation will be terminated. The message text contains the name of the missing resource.

User response: Check the resource name in the error message. Set the resource name using a product parameter.

HLV0355I CICS support terminating

Explanation: This is an informational message that is issued when the product terminates its CICS support. If the CICS support is being terminated due to a fatal error condition, this message will have been preceded by error messages which depict the exact error condition encountered.

User response: Follow the course of action recommended for the error messages which preceded this error message, and if the product CICS support continues to terminate due to a fatal error condition, contact Software Support for further assistance.

HLV0356I CICS support activated

Explanation: This message is issued when the product CICS server has received a notification that the connection(s) to the CICS region(s) have been established successfully.

User response: No action required. This is an informational message only.

HLV0357I EXCI support terminating

Explanation: This is an informational message that is issued when the product terminates its EXCI support. If the EXCI support is being terminated due to a fatal error condition, this message will have been preceded by error messages which depict the exact error condition encountered.

User response: Follow the course of action recommended for the error messages which preceded this error message, and if the product EXCI support continues to terminate due to a fatal error condition, contact Software Support for further assistance.

HLV0358I EXCI support activated

Explanation: This message is issued when the product EXCI server has received a notification that the connection(s) to the EXCI region(s) have been established successfully.

User response: No action required. This is an informational message only.

HLV0359T msgtext

Explanation: This is a general purpose message that may or may not indicate some type of EXCI error.

User response: Read the message text carefully. Some messages produced under this message ID are actually error messages. If the message indicates an error, check for any associated EXCI-produced error messages. If the problem cannot be resolved, contact Software Support.

HLV0360S No matching CONNECTION name rsr for DEFINE SESSION

Explanation: A DEFINE SESSION statement in the initialization exec specified a CONNECTION name for which there is no corresponding DEFINE CONNECTION statement. The message text contains the name of the erroneous DEFINE SESSION name.

User response: Check the session name in the error message. Correct the DEFINE SESSION statement.
HLV0361I • HLV0389E

HLV0361I  %I of %2 sessions connected to %3
Explanation: This message specifies the number of active sessions to the specified CICS.
User response: None. This message is for informational purposes only.

HLV0362I  No active session to %l
Explanation: This message specifies that there is currently no active session to the specified CICS.
User response: None. This message is for informational purposes only.

HLV0363T  Acquisition of session to %l failed
Explanation: Acquisition of a session failed. This may not be an error.
User response: Review the messages just before and after this message to understand the context.

HLV0364I  SDCITRU IS STARTED AND ENABLED
Explanation: The CICS Task Related User Exit For Broker is started and enabled in the CICS region.
User response: None. This message is for informational purposes only.

HLV0371E  func ROUTINE ERROR - error additinfo1, additinfo2 ... additinfo7
Explanation: An error or unexpected condition was detected in an Actional support facility routine (func).
User response: For initialization error, the server will terminate. For termination time errors, server shutdown continues. Look for related messages indicating the cause of the error and correct the underlying problem. Contact Software Support if the problem cannot be found or corrected.

HLV0372E  CSQCAPX %l
Explanation: An error occurred in the CSQCAPX CICS MQSERIES API Crossing Exit for Actional Agent connector.
User response: The exit should have disabled itself. Contact IBM Software Support.

HLV0373E  SDAITRUE %l
Explanation: An error occurred in module SDAITRUE, the CICS TRUE for Actional Agent connector.
User response: The exit should have disabled itself. Contact IBM Software Support.

HLV0380T  ABEND IN REXXTOOLS DYNALLOC INTERCEPT CMP=code, RS=rsncode, SVC-99-PLIST=addr
Explanation: An unexpected abend has occurred within the REXXtools dynamic allocation interception/screening routine.
User response: The abend is percolated for handling by REXXtools.

HLV0381T  ADD REXX VARIABLE NAME FAILED WITH RETURN CODE rcode, REASON CODE rsncode FOR NAME varname
Explanation: An error occurred when attempting to create a variable name for a REXX procedure. This will be followed by an S03S abend.
User response: Check the variable name to be sure it is valid, or increase the workspace for this REXX procedure.

HLV0388I  It contains additional diagnostic information about the failure.
Explanation: This message provides information to help you diagnose the problem.
User response: Check the error messages and the return code associated with this problem. There may be one or more error messages referring to the current problem. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support.

The variable fields of the message text are: request request type func function that failed rc function return code rsncode function reason code

HLV0388E  DYNAMIC LPA reqtype SERVICE FAILED FOR modname. RETURN CODE=rcode. REASON CODE=rsncode.
Explanation: An error occurred when attempting to use MVS dynamic LPA services, CSVDYLP. The request type, return code and reason code associated with this failure are listed in this message.
User response: Check the error messages and the return code associated with this problem. There may be one or more error messages referring to the current problem. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support.

HLV0389E  DYNAMIC LPA reqtype FUNCTION=func RB=rcode RS=rsncode
Explanation: This message is a continuation of message
User response: No action is required.
HLV0390E NAMED-TOKEN service SERVICE ERROR: RC=rcode FOR LVL=t1v, NAME=name, DATA=ndata, POFT=stop

**Explanation:** An unexpected return code was set after a system-managed named token service request. The service type, return code, token level, token name, token data, and token persistence option are displayed in the message.

**User response:** The named-token return code is sent to the routine which requested the service, and processing continues as dictated by the routine which requested the server.

---

HLV0391E func ROUTINE ERROR: error additinfo1, additinfo2 ... additinfo7

**Explanation:** An error or unexpected condition was detected in a Services support facility routine.

**User response:** For initialization error, the server will terminate. For termination time errors, server shutdown continues. Look for related messages indicating the cause of the error and correct the underlying problem. Contact Software Support if the problem cannot be found or corrected.

---

HLV0392W func ROUTINE WARNING: error additinfo1, additinfo2 ... additinfo7

**Explanation:** An unexpected condition was detected in a Services support facility routine.

**User response:** For initialization error, the server attempts to correct the condition and continue. Errors detected during termination are bypassed.

---

HLV0393S Services PARM parname additinfo1, additinfo2 ... additinfo7

**Explanation:** A Services configuration startup parameter is missing or incorrectly set. Services will substitute a corrected value, if possible, and activate with the updated value. If no default value can be substituted, Services activation will terminate server start after issuing MSG0391E.

**User response:** Check to ensure the z/Server-related parameter identified in the message is being set to a valid value during SxxxxIN00 processing. Restart the server.

---

HLV0394S SERVICES MAILBOX CONTROL rout FAILED: HASN=asid1, PASN=asid2, SASN=asid3, MODE=mode, RC=rcode, CALLER=cect, LT=lttype

**Explanation:** During an attempt to execute a Services mailbox request, a failure in the lock or unlock (rout) serialization routine was encountered. The current mailbox execution request will be abandoned and failed. In the message, the return code field will contain a non-zero value in byte 3 if the SETLOCK or ENQ service failed. It will contain a non-zero value in bytes 1 or 2 for environmental errors.

The message contains three asid values: home asid (asid1), primary asid (asid2), and secondary asid (asid3). mode may be "PROB" or "SUP"

**User response:** The current Services mailbox request is failed. Check for other messages which might indicate the cause of the error, and contact Software Support for further assistance.

---

HLV0395E SERVICES MAILBOX REQUEST reqtype ABEND ecode (rsnecode) AT modname+offset additinfo1 additinfo2 additinfo3 additinfo4

**Explanation:** During an attempt to execute a Services mailbox request, an ABEND failure was detected. The request is rejected with a return code indicating that an abend occurred.

reqtype may be "SYSTEM" or "USER"

**User response:** The failure is reflected to the requesting task, which then takes whatever action is appropriate to the situation. Check for other messages which might indicate the cause of the error, and contact Software Support for further assistance.

---

HLV0396T SERVICES MAILBOX INVALID POINTER (addrALET/sstorl/geth) DURING PKM AUTH CHECK - ABEND ecode (rsnecode)

**Explanation:** While validating a mailbox request, Services routines detected an invalid address passed as part of the request. The ABEND was detected while attempting to examine the protect key of the storage area.

**User response:** The pointer is rejected as invalid, and the mailbox request will either fail the overall request, or complete its operation without using the rejected pointer. Check for other messages which might indicate the cause of the error, and contact Software Support for further assistance.

---

HLV0397T func ROUTINE ERROR: error additinfo1, additinfo2 ... additinfo7

**Explanation:** An error or unexpected condition was detected in a Services support facility routine. This message is written to Trace Browse to record the same condition also written to the console by MSG0391E.

**User response:** For initialization error, the server will terminate. For termination time errors, server shutdown continues. Look for related messages indicating the cause of the error and correct the underlying problem. Contact Software Support if the problem cannot be found or corrected.
HLV0398T

**func ROUTINE WARNING: error additinfo1 additinfo2 ... additinfo7**

**Explanation:** An unexpected condition was detected in a Services support facility routine. This message is written to Trace Browse to record the same condition also written to the console by MSG0392W.

**User response:** For initialization error, the server attempts to correct the condition and continue. Errors detected during termination are bypassed.

HLV0399T

**Services E-O-T cleanup for TCB addr RC=rcode RS/CC=rsncode/code FDBK=feedback1, feedback2 ... feedback5**

**Explanation:** Services End of Task cleanup has been processed for the ending task. The message is traced if a non-zero return code is set by the cleanup function, or when the ZSRMOBOXTRACECMTC option is on.

**User response:** If the message reports a non-zero return code, look for other conditions which may be inhibiting E-O-T cleanup and correct. Or contact Software Support.

HLV0400S

**service OF desc FAILED, RC=rcode**

**Explanation:** This is a generic error message used to describe a wide variety of RRS initialization and termination errors. The message text provides the current operation (service) and what the current operation was trying to do.

**User response:** Check the error messages and the return code associated with this problem. There may be one or more error messages referring to the current problem. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support.

HLV0401S

**service PASSED desc - code**

**Explanation:** This is a generic error message used to describe a wide variety of RRS initialization and termination errors. The message text provides the current operation (service) and what data (valid or invalid) was passed to the current operation.

**User response:** Check the error messages and the return code associated with this problem. There may be one or more error messages referring to the current problem. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support.

HLV0402S

**service TO desc FAILED, RC=rcode**

**Explanation:** This is a generic error message used to describe a wide variety of RRS initialization and termination errors. The message text provides the current operation and what the current operation was trying to do.

**User response:** Check the error messages and the return code associated with this problem. There may be one or more error messages referring to the current problem. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support.

HLV0403S

**RRS rsrc NAME MISSING**

**Explanation:** A resource (rsrc) name needed by the RRS product feature is missing. The current operation will be terminated. The message text contains the name of the missing resource.

**User response:** Check the resource name in the error message. Set the resource name using a product parameter.

HLV0404I

**RRS support terminating**

**Explanation:** This is an informational message that is issued when the product terminates its RRS support. If the RRS support is being terminated due to a fatal error condition, this message will have been preceded by error messages which depict the exact error condition encountered.

**User response:** Follow the course of action recommended for the error messages which preceded this error message, and if the product RRS support continues to terminate due to a fatal error condition, contact Software Support for further assistance.

HLV0405I

**RRS support activated**

**Explanation:** This message is issued when the product RRS server has received a notification that the connection(s) to the RRS region(s) have been established successfully.

**User response:** None. This message is for informational purposes only.

HLV0406H

**msgtext**

**Explanation:** This is a general purpose message that may or may not indicate some type of RRS error.

**User response:** Read the message text carefully. Some messages produced under this message ID are actually error messages. If the message indicates an error, check for any associated RRS produced error messages. If the problem cannot be resolved, contact Software Support.

HLV0407E

**Failure trying to register with RRS**

**Explanation:** This message is issued when the RRS Register Resource Manager call is unsuccessful. The product is unable to use RRS services, and two-phase commit support is disabled.

**User response:** Ensure that RRS is functioning correctly.
HLV0408E  ERROR SETTING RRS EXITS, CHECK RRS STATUS

**Explanation:** This message is issued when the RRS Set Exit Information call is unsuccessful. This usually indicates that the RRS subsystem is not up and running. The product will attempt to establish its RRS exits when it hears from RRS that it is up and running. RRS support and two-phase commit support will not be available until the product can successfully connect to RRS.

**User response:** Ensure that the RRS subsystem is up and running. If the RRS subsystem is not up and running, start it.

HLV0409E  RRS %I EXIT MANAGER UNAVAILABLE

**Explanation:** This message is issued when RRS alerts the product that an IBM exit manager for RRS has become unavailable. This causes the product to lose its connection to RRS immediately. The product will try to reconnect again when it hears RRS is up and running. RRS support and two-phase commit support will not be available until the product can successfully reconnect to RRS.

**User response:** Ensure that the RRS subsystem is up and running. If the RRS subsystem is not up and running, start it.

HLV0410E  Product RRS exits have been unset

**Explanation:** This message is issued when RRS alerts the product that the product RRS exits have become unset due to some error condition. This causes the product to lose its connection to RRS. RRS support and two-phase commit support will not be available.

**User response:** This indicates an error that should not occur. Contact Software Support.

HLV0411E  TRANS: token FROM host - REQUESTED ind1 BUT WAS HEURISTICALLY ind2

**Explanation:** The portion of a distributed transaction that ran under the product on z/OS was committed or rolled back heuristically manually or by a program - but not by the client-side transaction manager. The transaction manager has just informed the product that it wanted the transaction rolled back or committed. The data involved in the transaction may now be in an inconsistent state (partially committed and/or partially rolled back).

*ind1* indicates "COMMIT" or "BACKOUT", and *ind2* indicates "COMMITTED" or "BACKED OUT"

**User response:** This situation may need to be corrected manually. The data that was committed on MVS may need to be backed out, and the data sources may need to be restored to their state before the transaction. Note that the committed data may have already been accessed by later programs and transactions.

HLV0413E  THE DB2ATTACHFACILITY PARAMETER IS NOT SET TO RRSAF, RRS SUPPORT TERMINATED

**Explanation:** The product DB2ATTACHFACILITY must be set to use the Recoverable Resources Attach Facility (RRSAF) for RRS support to work properly.

**User response:** Modify the product parameter data set member.

HLV0414E  RRS RECOVERY TABLE SIZE EXCEEDED - TRANSACTION ABORTED

**Explanation:** The RRS Recovery Table size was exceeded. A transaction was aborted, which will be indicated in another message.

**User response:** Increase the number of entries in the RRS Recovery Table, specified by the product parameter RECTABLEENTRIES. If this parameter is not specified, the value defaults to 400 entries.

HLV0415E  Incompatible supplied driver on client system - transaction aborted

**Explanation:** An incompatible product-supplied driver was encountered on the client system.

**User response:** Contact Software Support.

HLV0416E  ZERO COLUMNS RETURNED FROM PREPARE - ERROR IN SYSTEM

**Explanation:** Zero columns were returned from PREPARE. This is most likely due to an error in z/OS, RRS, and/or Db2.

**User response:** Contact Software Support for the latest information regarding how to bypass this problem.

HLV0417E  RRS IS NOT ACTIVATED FOR THIS SERVER - XA TRANSACTION ABORTED

**Explanation:** When this server was initialized, either it was not instructed to activate an RRS connection or the initialization for connection failed.

**User response:** If the initialization parameters specify that RRS is to be activated, review the messages created when this server was initialized and correct any associated problems.
HLV0420E  TWO-PHASE COMMIT SUPPORT WAS REQUESTED, BUT RRS IS NOT ACTIVE

Explanation: The RRS parameter was set to NO, or RRS initialization failed. Two-phase commit cannot be supported unless RRS is active.

User response: Check the joblog for RRS initialization error messages and correct any problems. Then, restart this server with the RRS parameter set to YES.

HLV0421E  ERROR IN TWO-PHASE indicator PROCESS. RRS RETURN CODE = rcode

Explanation: Two-phase commit was requested for all transactions from this task. RRS returned an error code indicating that the commit was not successful.

indicator indicates "COMMIT" or "BACKOUT"

User response: Check the return code from the RRS ATRCMIT function in the IBM manual titled z/OS Programming; Resource Recovery.

HLV0422E  RRS RECOVERY TABLE COUNT NEGATIVE, RESET TO ZERO

Explanation: The RRS Recovery Table entry count was found to be negative during XA-RECOVER processing. The entry count was reset to zero.

User response: There may be some XA transactions that were left in an incomplete state, leftover from a communication line disconnect or host system crash.

HLV0423T  Access to data sources through Enterprise Transactions is not configured.

Explanation: None.

User response: Contact IBM Software Support.

HLV0424E  TWO-PHASE COMMIT SUPPORT WAS REQUESTED, BUT THE RRS MANAGER WAS NOT ACTIVE

Explanation: RRS was requested, but RRS was not active.

User response: Check the joblog for messages related to RRS initialization. Correct the initialization errors and restart this server.

HLV0425E  IBM/MQSERIES/RRS SUPPORT ENTRY entry IN MODULE modname MISSING

Explanation: An IBM/MQSeries support entry was missing from the module specified. There is an incompatibility between the MQSeries® library provided and product MQSeries/RRS support.

User response: Ensure that the library provided is the standard IBM library. If the problem cannot be resolved, contact Software Support.

HLV0426S  IBM/MQSERIES/RRS SUPPORT MODULE modname MISSING - NO TWO-PHASE COMMIT SUPPORT PROVIDED

Explanation: The specified IBM/MQSeries support module is necessary for two-phase commit support for MQSeries. Processing will continue without MQSeries two-phase commit support.

User response: Check the IBM/MQSeries library, defined in the product JCL procedure. It may be an old version.

HLV0428T  CREATION OF RRS PRIVATE CONTEXT FAILED - CONNECTION TERMINATED. CALL: calltype - R15: rcode - R0: rsncode

Explanation: With the product RRS support active and Private Contexts selected, the product creates an RRS Private Context immediately when the session connects. The RRS calls to do this failed.

User response: Check to be sure that the IBM RRS facility is active and not generating errors.

HLV0480S  MQSERIES support deactivated - access routines cannot be loaded.

Explanation: During initialization MQSERIES access modules could not be loaded from either HLVMQSLB or STEPLIB.

User response: The server deactivates MQSERIES support and continues start-up processing. Check to ensure you have an HLVMQSLB DD JCL statement in the server start-up JCL.

HLV0500E  IBM-assigned CSR table entry setup error, contains val, not product OPVN pointer

Explanation: During initialization, the product Vendor Vector Table entry contained an invalid value (val). The assigned fullword contains a value which does not address the product OPVN control block. The IBM-assigned, entry in the table is located at decimal offset 184, hexadecimal offset B8 of the vector table addressed by ECVTCTBL. The fullword value at that location contained a non-zero value that did NOT point to an already established product OPVN control block. The product cannot initialize without establishing the OPVN block pointer. The existing value in the vector table fullword is saved and overlaid with the product OPVN block address.

User response: Determine who/what is responsible for creating the invalid entry in the table, clear the word to x’00’$s, and restart the product. Caution should
be used when deciding to clear the entry. Most likely, another ISV has inadvertently used this entry; clearing it to 0’s could cause problems for some other product.

HLV0501E  service OF desc FAILED, RC=rcode
Explanation: This is a generic error message used to describe a variety of Server initialization and termination errors. The message text provides the information about the current operation.
User response: Check the error messages and the return code associated with this problem. There may be one or more error messages referring to the current problem. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support.

HLV0502E  subsys directory table entry exists.
Explanation: During initialization, the server directory table was found to contain an entry with the same subsystem ID as the one being started. Most likely, a server address space is active on this MVS image with this subsystem name.
User response: Determine if a server address space is currently active with this subsystem name. If so, change the subsystem name and restart (if it is necessary to start another server address space). If the problem cannot be resolved, contact IBM Software Support.

HLV0503E  No ERLY exists for DB2 %1
Explanation: None.
User response: Contact IBM Software Support.

HLV0504E  %1 DB2 owned by another server.
Explanation: None.
User response: Contact IBM Software Support.

HLV0505E  %1 DB2 search error.
Explanation: None.
User response: Contact IBM Software Support.

HLV0506E  %1 server software PC reset failed.
Explanation: None.
User response: Contact IBM Software Support.

HLV0507E  %1 product PC reset failed.
Explanation: None.
User response: Contact IBM Software Support.

HLV0508E  %1 server software PC entry unknown.
Explanation: None.
User response: Contact IBM Software Support.

HLV0509E  %1 DB2 server init error.
Explanation: None.
User response: Contact IBM Software Support.

HLV0510E  %1 DB2 server %2 error.
Explanation: The server main task for the named Db2 system encountered an error from the common subroutine. Either ECB WAIT or STIMER.
User response: Contact IBM Software Support.

HLV0511E  %1 DB2 SSCTSUSE ERROR,
Explanation: None.
User response: Contact IBM Software Support.

HLV0512I  %1 DB2 main task PC reset error.
Explanation: None.
User response: Contact IBM Software Support.

HLV0513I  %1 product main task TERM PC error
Explanation: None.
User response: Contact IBM Software Support.

HLV0515E  MAXIMUM NUMBER OF DB2 SUBSYSTEMS PREVIOUSLY DEFINED. MAX = %1. DEFINE FOR DB2 SSID %2 IGNORED.
Explanation: During initialization, the input parameter data set contains more Db2 subsystem statements than the maximum allowable set by default or by QSMAXDB2.
User response: All parameter statements pertaining to this Db2 subsystem are ignored.

HLV0516E  DUPLICATE DB2 SUBSYSTEM DEFINITION FOR DB2 SSID %1
Explanation: During initialization, the input parameter data set contains more than one DEFINE for the same Db2 subsystem ID.
User response: All parameter statements within the subsequent DEFINE for this Db2 are ignored.
HLV0517E  RETURN CODE %I FROM ALESERV
ADD OF DB2 DBM1 FOR %2

Explanation: None.
User response: Contact IBM Software Support.

HLV0518E  TERMINATION WAITING ON DB2
STATUS TASK FOR %I

Explanation: None.
User response: Contact IBM Software Support.

HLV0519E  maximum number of server address
spaces are already active. max possible
%I. currently active %2.

Explanation: None.
User response: Contact IBM Software Support.

HLV0520E  Maximum number of DB2 systems are
already active. max possible %I. DB2
%3.

Explanation: The maximum number of subsystems
allowed by the server are already active.
User response: Edit the server configuration file, and
reduce the number of database definitions in the file.

HLV0521S  DB2 subsysid STATUS TASK ABEND
abcode AT modname+offset DURING desc.

Explanation: None.
User response: Contact IBM Software Support.

HLV0522W  Proprietary R&$D utilities are activated
for this start-up

Explanation: This warning indicates that private
R-and-D utility functions are activated within
the system. Customer copies of the product should never produce this message during start-up processing.
User response: If this message appears during
start-up, terminate the server and contact Software
Support. The execution of internal developer utilities
off-site may produce damaging side effects.

HLV0523W  E/SQA ROUTINE AT addr WILL BE
REBUILT DUE TO INVALID PTR OR
DATA

Explanation: This warning indicates that the special
E/SQA-resident SRASTC routine will be rebuilt. The
existing pointer to the routine, or the routine itself,
appears to have been damaged.
User response: Start-up processing clears the existing
pointer and builds a new copy of the needed routine
into E/SQA storage. The storage, if any, previously
anchored by the OPVN vendor CSR table control block
is orphaned. Contact Software Support.

HLV0600S  IMS/OTMA XCF reftype FAILED,
RC=rcode RS=rscode IMS=imsID

Explanation: This is a generic error message used to
describe a wide variety of IMS/OTMA initialization
and termination errors. The message text provides the
current operation and what the current operation was
trying to do.
User response: Check the error messages and the
return code associated with this problem. There may be
one or more error messages referring to the current
problem. If possible, fix the problem identified by the
error messages, and restart the product. If the problem
cannot be resolved, contact Software Support.

HLV0601S  service OF desc FAILED, RC=rcode

Explanation: This is a generic error message used to
describe a wide variety of IMS/OTMA initialization
and termination errors. The message text provides the
current operation and what the current operation was
trying to do.
User response: Check the error messages and the
return code associated with this problem. There may be
one or more error messages referring to the current
problem. If possible, fix the problem identified by the
error messages, and restart the product. If the problem
cannot be resolved, contact Software Support.

HLV0602I  IMS/OTMA server waiting OTMA INIT
for IMS SSID=subsys

Explanation: This message indicates that the
IMS/OTMA Transaction Server is waiting for
initialization of the selected IMS subsystem. This
message is informational and issued periodically when
OTMA support is waiting for IMS subsystem startup to
occur.
User response: Determine why the IMS subsystem is
unavailable. Start the IMS subsystem to allow OTMA
support to be enabled. If this message is issued in error,
contact Software Support.

HLV0603I  IMS/OTMA server INIT in progress for
IMS SSID=subsysID

Explanation: This message indicates that the
IMS/OTMA Transaction Server initialization is in
progress for the selected IMS subsystem.
User response: None. This message is for
informational purposes only.
HLV0604I  IMS/OTMA server INIT complete for IMS SSID=imsID using XCF member xcfID

Explanation: This message indicates that the IMS/OTMA Transaction Server initialization has been successfully completed for the selected IMS subsystem.

User response: None. This message is for informational purposes only.

HLV0605I  IMS/OTMA server has detected OTMA TERM for IMS SSID=subsysID

Explanation: This message indicates that the IMS/OTMA Transaction Server has detected IMS terminating OTMA support. This message is issued when it has been determined that IMS is leaving the XCF OTMA group. This may be due to IMS termination, a /STOP OTMA command, or OTMA abnormal termination. The product IMS/OTMA server will wait for IMS to restart OTMA support and continue processing OTMA request activity.

User response: None. This message is for informational purposes only.

HLV0606I  IMS/OTMA server TERM in progress for IMS SSID=subsysID

Explanation: This message indicates that the IMS/OTMA Transaction Server is terminating for the selected IMS subsystem. This message is issued during product termination.

User response: None. This message is for informational purposes only.

HLV0607I  IMS/OTMA server TERM complete for IMS SSID=subsysID

Explanation: This message indicates that the IMS/OTMA Transaction Server has completed termination for the selected IMS subsystem. This message is issued during product termination.

User response: None. This message is for informational purposes only.

HLV0608S  IMS/OTMA TPIPE TASK task FOR CONNECTION conn ABENDED CODE abcode

Explanation: This message indicates that the IMS/OTMA Transaction Pipe has ABENDED.

User response: Examine the Trace Browse and JES JOBLOG to determine why the ABEND occurred. If the problem cannot be resolved, contact Software Support.

HLV0620S  SIS/XCF XCF reqtype FAILED, RC=rcode RS=rsncode SIS=sisID

Explanation: This is a generic error message used to describe a wide variety of SIS/XCF initialization and termination errors. The message text provides the current operation and what the current operation was trying to do.

User response: Check the error messages and the return code associated with this problem. There may be one or more error messages referring to the current problem. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support.

HLV0621S  service OF desc FAILED, RC=rcode

Explanation: This is a generic error message used to describe a wide variety of SIS/XCF initialization and termination errors. The message text provides the current operation (service) and what the current operation was trying to do.

User response: Check the error messages and the return code associated with this problem. There may be one or more error messages referring to the current problem. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support.

HLV0622T  SIS/XCF member waiting SIS/XCF %1 INIT for mbr=%2

Explanation: This message indicates that the SIS/XCF Server is waiting for initialization of the selected SIS subsystem. This message is informational and issued periodically when an SIS/XCF standard member is waiting for the SIS/XCF manager to initialize.

User response: Determine why the SIS/XCF manager is unavailable. Start the SIS/XCF manager to allow SIS/XCF support to be enabled. If this message is issued in error, contact Software Support.

HLV0623I  SIS/XCF %I INIT in progress for member=%2

Explanation: This message indicates that the SIS/XCF Server initialization is in progress for the selected SIS subsystem.

User response: None. This message is for informational purposes only.

HLV0624I  SIS/XCF server INIT complete for SIS SSID=sisID using XCF member xcfID

Explanation: This message indicates that the SIS/XCF Server initialization has been successfully completed for the selected SIS subsystem.

User response: None. This message is for informational purposes only.
HLV0625I  SIS/XCF %1 instance has detected termination of %2 instance member %3

Explanation: This message indicates that the SIS/XCF Transaction Server has detected SIS terminating SIS/XCF support. This message is issued when it has been determined that SIS is leaving the XCF OTMA group. This may be due to SIS termination, or OTMA abnormal termination. The SIS/XCF server will wait for SIS to restart SIS/XCF support and continue processing SIS request activity.

User response: None. This message is for informational purposes only.

HLV0626I  SIS/XCF %1 TERM in progress for member=%2

Explanation: This message indicates that the SIS/XCF Server is terminating for the selected SIS subsystem. This message is issued during product termination.

User response: None. This message is for informational purposes only.

HLV0627I  SIS/XCF %1 TERM complete for member=%2

Explanation: This message indicates that the SIS/XCF Transaction Server has completed termination for the selected SIS subsystem. This message is issued during product termination.

User response: None. This message is for informational purposes only.

HLV0701W  ZIIPCLASS=class HAS TOO MANY PERIODS SPECIFIED

Explanation: This message indicates that WLM initialization found too many matching report classes. Only six periods are allowed, and more than that matched the naming convention.

User response: Delete the extra report classes.

HLV0702W  CLASS class1 SPECIFIES A ZIPCLASS NAME THAT DOES NOT EXIST, class2

Explanation: This message indicates that WLM initialization found a class that referenced a ZIIPCLASS that could not be found.

User response: Correct the indicated WLM Class to reference an existing WLM pseudo-class.

HLV0703W  ZIIPCLASS=class CONTAINS INVALID PARMS

Explanation: This message indicates that WLM initialization found a ZIIPCLASS report class definition with invalid parms. The description must contain a Pnnn percent definition and all but the last one must contain a Dnnnnnnn duration.

User response: Correct the definition field of the ZIIPCLASS report class definition.

HLV0704H  WLM refresh command completed

Explanation: The WLM command has successfully completed, refreshing WLM data within the product.

User response: None.

HLV0706I  product subsys requires the following elements missing from WLM Service type name

Explanation: Product initialization detected that the current WLM service policy does not have the all of the required definitions for Version 7.1 of the product. Messages listing the required service definition elements will follow this message.

User response: Respond to the WTOR prompts that follow these messages.

HLV0707I  Type: PEtype, Server Parameter: PEnname, Value: parmname

Explanation: Generic message used by product WLM initialization to list elements missing from the WLM service definition.

The PE in this message's variables stands for Policy Element

parmname represents the IN00 parameter name

User response: Respond to the WTOR prompts that follow this message.

HLV0708R  Reply 'GO' to update the WLM Service Definition, or 'CANCEL' to terminate server initialization

Explanation: This message is issued when product WLM initialization is about to update the current WLM service definition with the policy elements required for product server execution.

User response: Reply GO to allow the server to update the WLM service definition. Reply CANCEL to terminate server initialization.
HLV0709I WLM Service Definition def has been updated with required product elements

Explanation: This message is issued when product WLM initialization has updated the WLM service definition (def) with the required product elements.

User response: Respond to the WTOR prompts that follow this message.

HLV0710E Invalid reply: reply. Reply 'GO' or 'CANCEL'

Explanation: An invalid reply was specified to the server WLM initialization console message.

User response: Reply GO to cause the message to be reissued. Reply CANCEL to terminate server initialization.

HLV0711E REPLY WAIT EXCEEDED 2 MINUTES. CANCEL ASSUMED

Explanation: The product waited over two minutes for a reply to the WLM initialization message. Since no response was received during that time, CANCEL was assumed and server initialization terminated.

User response: None. If a reply was desired, you will need to speed your response to the message.

HLV0712E 3 INVALID REPLIES. CANCEL ASSUMED

Explanation: Three invalid replies were made to the product WLM initialization message. Since no correct response was received, CANCEL was assumed and server initialization terminated.

User response: None. Reply as required next time.

HLV0713S WLM administration user ID userID logon failed.

Explanation: The WLM admin user ID specified by the WLMUSERID system parameter failed logon processing during start-up.

User response: The server initialization process is aborted. Ensure that the user ID specified by the WLMUSERID start-up parameter is correct. If possible, fix the problem identified by the error messages and restart the product. If the problem cannot be resolved, contact IBM Software Support.

HLV0714I WLM administration userid userID logged on to system

Explanation: The WLM admin userid specified by the WLMUSERID system parameter has been logged on to the system.

User response: Server initialization processing continues.

HLV0715I WLM Service Definition definition does not contain current Service Policy policy

Explanation: This message is issued when product WLM initialization has updated the WLM service definition and has determined that it does not contain the currently active service Policy.

User response: Respond to the WTOR prompts that follow this message.

HLV0716R Enter name of Service Policy to activate, 'LIST', or 'CANCEL' to terminate server initialization

Explanation: This message is issued when product WLM initialization has updated the Service Definition and needs to know which Service Policy should be activated.

User response: Enter a name to activate Service Policy with that name. Reply LIST to get a list of available Policies. Reply CANCEL to terminate server initialization.

HLV0717I The following Service Policies are available for activation

Explanation: This message is issued when product WLM initialization is about to list the Service Policies defined in the current Service Definition.

User response: Respond to the WTOR prompts that follow this message.

HLV0718I Policy: policyname - policydesc

Explanation: Generic message used by product WLM initialization to list Service Policies available for activation.

User response: Respond to the WTOR prompts that follow this message.

HLV0719R Reply 'GO' to activate Policy %1, or 'CANCEL' to terminate server initialization

Explanation: This message is issued when product WLM initialization has updated the WLM service definition with the named service policy.

User response: Reply GO to allow the server to activate the service policy. Reply CANCEL to terminate server initialization 1 = policy name of WLM policy to be created.
HLV0720S  WLM reset to service class class failed for job jobname subsystem subsys ASID asid
Explanation: The server WLM initialization failed to reset the service class for the server.
User response: Look for preceding error messages in the system log.

HLV0721I  WLM classify successful for transaction - Service Class class
Explanation: The server WLM enclave classification was successful.
User response: None.

HLV0722I  Unable to classify transaction trans for subsystem subsys
Explanation: The server was unable to classify the named transaction.
User response: Look for preceding error messages in the system log.

HLV0723I  WLM enclave create successful for Service Class class
Explanation: The server WLM enclave classification was successful.
User response: None.

HLV0724I  subsys WLM health changed from subsystem%% to oper1%% oper2
Explanation: The WLM health value for the specified product subsystem was changed from the first value to the second.
User response: If the health value decreases, look for abends or timeouts in the Server. Currently only ACI abends and timeouts are measured. If the health value increases, this is an indication that no further failures have been detected, and the product is returning to full health.

The variable fields of the message text are: subsystem the WLM subsystem type oper1 the old health value oper2 the new health value reason reason description

HLV0725I  RACF administration USERID (userID) logged on to system
Explanation: The RACF admin USERID specified by the SERVERID system parameter has been logged on to the system.
User response: Server initialization processing continues.

HLV0726S  RACF administration USERID (userID) logon failed
Explanation: The RACF admin USERID specified by the SERVERID system parameter failed logon processing during start-up.
User response: The server initialization process is aborted. Ensure that the USERID specified by the SERVERID start-up parameter is correct. If possible, fix the problem identified by the error messages and restart the product. If the problem cannot be resolved, contact IBM Software Support.

HLV0800I  IDMS SERVER INIT IN PROGRESS FOR CONNECTION=%1
Explanation: This message indicates that the IDMS initialization is in progress for the selected IDMS connection name.
User response: None. This message is for informational purposes only.

HLV0801I  IDMS SERVER INIT COMPLETE FOR CONNECTION=target USING MAILBOX=connID
Explanation: This message indicates that the IDMS initialization has been successfully completed for the selected IDMS target using the defined connection (connID).
User response: None. This message is for informational purposes only.

HLV0802I  CONNECTION BROKEN WITH IDMS CONNECTION=connID USING MAILBOX=jobname
Explanation: This message indicates that the IDMS connection has been broken for the selected IDMS connection (connID)
User response: None. This message is for informational purposes only.

HLV0900E  service of ddname/cblk failed, RC=rcode.
Explanation: During compilation or execution of a REXX program, an MVS service returned a non-zero error code. One of the following occurred: (1) a file failed to open or close, (2) a failure in writing a record (WRITE or ENDREQ), (3) storage for a control block could not be obtained or freed, or (4) parsing of the command failed.
User response: Depending on which of the above cases pertains, take one of the following actions: (1) check for a message indicating why the file failed to open or close (most likely, the SYSEXEC file name was not allocated properly - e.g. allocated to a sequential file instead of a partitioned data set); (2) if a WRITE or
ENDREQ failed message was issued, check the status of the PDS allocated in the HLVCOMP or SWSCOMP DD (it may not be allocated properly - e.g., ran out of space); (3) if the error reported a GETMAIN, allocate or allocation failure, you may have to increase the TSO region size for your TSO session; or (4) check the command you issued for incorrect syntax.

HLV0901E  CANNOT OPEN member (ABEND abcode AT modname+offset)

Explanation: During the open processing of the REXX program to be run, an abend occurred. The PDS member containing the REXX source program could not be opened because of the abend.

User response: Ensure that the given library is a PDS similar by definition to the other REXX libraries. Check the IBM message and codes manuals for the abend code. Most likely, either the member does not exist or the data set attributes are in error (sequential DSORG or the LRECL and BLKSIZE are not compatible). If a system 913 abend code is reported, data set access has been disallowed by your security subsystem.

HLV0902E  Cannot find program program ddname.

Explanation: The REXX interpreter (HLVI, HLVX, SWI, or SWSX TSO command processor) could not locate the specified REXX program in the data set allocated to the SYSEXEC ddname (for SDBI or SWSI) or in the data set specified on the HLVX or SWSX commands.

User response: Ensure the program name being executed exists in one of the SYSEXEC concatenated data sets (for HLVI or SWSI) or in the data set specified on the HLVX or SWSX command. Check the spelling of the program name.

HLV0903E  ERROR 43 rectype caller, LINE lineno: ROUTINE routine NOT FOUND

Explanation: While compiling a REXX program, the REXX interpreter could not locate a routine called by the main program or called by one of its subroutines.

User response: Check the calling program (described in this message) to make sure that the subroutine name is spelled correctly. If spelling is correct, the missing routine must be added to a library allocated to the SYSEXEC ddname or to the same library in which the calling program resides.

HLV0906E  No syntax errors found during scan.

Explanation: The compiler found no syntax errors during a HLVX scan. This is an informational message.

User response: No action is required.

HLV0907S  ABEND abcode OCCURRED AT csect+offset OF PROGRAM program

Explanation: An abend occurred during the execution of a REXX program by the REXX interpreter (HLVI or HLVX TSO command). The name of the REXX program being executed at the time of the abend is shown in this message.

User response: Check the line being executed at the time of the abend. Check the abend code in the IBM messages and codes manual, and follow action stipulated there.

HLV0908E  PROGRAM program IS TOO LARGE - INPUT BUFFER OVERFLOW

Explanation: The REXX interpreter (HLVI or HLVX TSO command) could not successfully compile a REXX program because it is too large.

User response: Split the program into smaller subroutines. This error is directly related to the number and length of source input lines in a single REXX program.

HLV0909E  PROGRAM program - ARG LENGTH (lgth) EXCEEDS MAXIMUM LENGTH (maxlgth)

Explanation: The length of the argument string for the REXX program exceeds the implementation limit.

User response: Check if there are an excessive number of blanks in the argument string. If so, remove the blanks from the argument string. If you need to pass long values to a REXX program, use global variables to pass the values.

HLV0911E  Missing REXX program name

Explanation: The HLVI command was invoked using the TSO CALL command without a parameter field (containing the REXX program name to execute), or the @#$! command was invoked from within ISPF edit and the ISPF environment could not be established.

User response: If the HLVI command was invoked via the TSO CALL command, you must add the parameter field with a REXX program name (and optional arguments). Otherwise, contact Software Support for assistance.

HLV0912E  Missing REXX program name detected at - addr

Explanation: The HLVI or HLVX TSO command was invoked without a program name.

User response: You must specify a program name on the HLVI or HLVX TSO command. Contact Software Support.
HLV0913E  Invalid REXX program name detected - program

Explanation: The REXX program name specified is invalid. It must be a valid PDS member name and cannot exceed eight (8) characters in length.

User response: Specify a valid REXX program name. If the problem cannot be resolved, contact Software Support.

HLV0914E  UNKNOWN RETURN CODE FROM PARSE ROUTINE, RC=rcode

Explanation: An unexpected return code was received from the internal parse routine.

User response: Contact Software Support for assistance.

HLV0915E  BATCH OR TSO CALL PARAMETER STRING TOO LONG

Explanation: The parameter field passed to a batch program, or a program invoked by TSO CALL cannot exceed 100 characters.

User response: Reduce the length of the parameter string. Contact Software Support to obtain additional assistance.

HLV0916E  routine built-in function not found - called by caller.

Explanation: A compatibility problem exists between the product subsystem in use and the pre-compiled REXX program being re-loaded. A product built-in function that was to be used by the pre-compiled REXX program no longer exists.

User response: Check the subsystem release levels used when the REXX program was compiled. It may be necessary to recompile the REXX program again under the current product subsystem (HLVICOMP).

HLV0917E  ERROR SAVING THE COMPILED OUTPUT IN %1

Explanation: An error occurred while attempting to save a pre-compiled program. This message is accompanied by an earlier message detailing the cause of the error.

User response: Check the previous error message for possible actions.

HLV0918E  CANNOT WRITE EXECUTABLE OBJECT obj1, obj2 TO DS(name) addinfo

Explanation: SEF is unable to save an executable object binary image or data area because of a runtime problem. The source rule or data file are named, along with the target dataset.

User response: Try to browse the data set using ISPF and see if the member list directory is accessible for the PDS. If not, contact your local DASD administrator for obj1 and obj2 may indicate a ruleset or a datafile.

Based on the value of obj1, obj2 may indicate a rule or data member.

User response: Check for other messages indicating the source of the problem and retry the request.

HLV0919I  Successful compile and save of program in dname.

Explanation: THE REXX interpreter (HLVICOMP, HLVXCOMP, SWSICOMP or SWSXCOMP commands) was successful in compiling and saving the REXX program.

User response: No action is required.

HLV0920E  REBUILD FAILED FOR COMPILED REXX PROGRAM - program

Explanation: The REXX interpreter command processor was attempting to rebuild a REXX program from a previously compiled PDS member when the failure occurred.

User response: Check for other accompanying error messages. You may have to delete the compiled version of the program and recompile it again, or execute the REXX source program.

HLV0921W  ALLOCATION OF COMPILED LIBRARY (dsname) FAILED

Explanation: The product attempted to allocate the library with the compiled versions of REXX programs. The dynamic allocation failed.

User response: Make sure that the data set name specified in the first panel of this application is valid. Contact the person at your installation who is responsible for the product to get the proper data set name.

HLV0922W  ITRACE KEYWORD NOT ALLOWED DURING COMPILe ONLY REQUEST

Explanation: Setting the initial trace value for a COMPILe ONLY request is not allowed.

User response: Do not specify the ITRACE keyword in a COMPILe ONLY request. The ITRACE value only has meaning during the execution phase of REXX.

HLV0923S  COMPILe ALL FAILED - ERROR READING THE DIRECTORY OF dsname

Explanation: A COMPILe ONLY request was received for an entire PDS, but an error was detected while reading the directory.

User response: Try to browse the data set using ISPF and see if the member list directory is accessible for the PDS. If not, contact your local DASD administrator for...
possible data set recovery. If you are able to browse the data set and list its members properly, contact Software Support.

**HLV0990E** RUNNING program: INCOMPATIBLE CONTROL BLOCKS

**Explanation:** The REXX program was compiled with an older version of the Product REXX interface module. The REXX control blocks in the compiled module are incompatible with the current version.

**User response:** This error should only occur when executing a pre-compiled, saved version of a program or rule. In that case, the program or rule should be recompiled and then re-executed. If the error occurred in any other case, contact Software Support for assistance.

**HLV0991E** RUNNING program: INTERNAL ERROR DETECTED AT addr

**Explanation:** The REXX interface module detected an internal error.

**User response:** There may be other error messages related to this condition. This error may be caused by a REXX workspace overflow condition. If this is the case, refer to message 0998E for additional information. If the problem cannot be resolved, contact Software Support.

**HLV0997T** lineno TRACE MESSAG

**Explanation:** Informational message only. This message gives the output from the REXX TRACE command when used in a rule.

**User response:** None. This message is for informational purposes only.

**HLV0998E** RUNNING program LINE lineno: COMPILER WORK SPACE OVERFLOW (value1 value2)

**Explanation:** The rule or program used up all of the available REXX variable work space.

**User response:** In either case, check if the program is incorrectly creating too many variables. If so, correct the program, and retry the operation. If the program is operating correctly, the work space size may be too small. In the rule environment, the SEFSIZE parameter needs to be increased, and the product must be restarted. In the case of a Product REXX program (SWSI command), use the WORKSPACE keyword parameter to override the default size. For WWW rules, override the default workspace specification by coding the WORKSPACE() operand on the /*WWW header statement for the rule.

**HLV0999E** STAX calltype MACRO FAILED - RC=rcode

**Explanation:** The STAX macro failed with the indicated return code while the Product REXX compiler was trying to initialize or terminate execution of a REXX program.

**calltype** can be "ON" or "OFF"

**User response:** Record the error message and return code. Contact Software Support.

The STAX macro failed with the indicated return code while the Product REXX compiler was trying to initialize or terminate execution of a REXX program.

**HLV1000I** msgtext

**Explanation:** The product message used for REXX SAY statements.

**User response:** None. This message is for informational purposes only.

**HLV1004I** ERROR 4 process program, LINE lineno: PROGRAM INTERRUPTED

**Explanation:** The system halted the execution of a REXX program because of some error or by user request. Unless trapped by SIGNAL ON HALT, this message will force the language processor to immediately cease execution.

**process** may be "compiling" or "running"

**User response:** None. This message is for informational purposes only.

**HLV1005I** ERROR 5 process program, LINE lineno: MACHINE RESOURCES EXHAUSTED

**Explanation:** While attempting to execute a REXX program, the language processor was unable to obtain the resources it needed to continue execution. The following items may be the cause of this message: (1) the external data queue is full or (2) all available storage has been used.

**process** may be "compiling" or "running"

**User response:** Try increasing the size of the external data queue or the amount of storage available to the program.

**HLV1006I** ERROR 6 var1 var2, LINE lineno: UNMATCHED """" OR "QUOTE

**Explanation:** A comment string or a literal string was started but never finished. For comments, this may be detected at the end of the program or at the end of an INTERPRET instruction. For literal strings, this may be detected at the end of a line.
HLV1007I • HLV1014I

User response: Examine the rule or REXX program, and correct the string.

HLV1007I  ERROR 7 process program, LINE lineno:
WHEN OR OTHERWISE EXPECTED

Explanation: Within a SELECT construct, at least one WHEN construct (and possibly an OTHERWISE clause) is expected. If any other instruction is found (or no WHEN construct is found before OTHERWISE), then this message results. This is commonly caused by forgetting the DO and END around the list of instructions following a WHEN.

process may be "compiling" or "running"

User response: Examine the REXX program, and correct the error.

HLV1008I  ERROR 8 process program, LINE lineno:
UNEXPECTED THEN OR ELSE

Explanation: A THEN or an ELSE has been found that does not match a corresponding IF or WHEN clause. This error often occurs because of a missing END or DO...END in part of a complex IF...THEN...ELSE construct.

process may be "compiling" or "running"

User response: Examine the program, and correct the error.

HLV1009I  ERROR 9 process program, LINE lineno:
UNEXPECTED WHEN OR OTHERWISE

Explanation: A WHEN or OTHERWISE has been found outside of a SELECT construct. It may have been enclosed unintentionally in a DO...END construct by leaving off an END instruction, or an attempt may have been made to branch to it with a SIGNAL instruction (which cannot work because a SELECT is terminated by a SIGNAL).

process may be "compiling" or "running"

User response: Examine your program, and fix the part in error.

HLV1010I  ERROR 10 process program, LINE lineno:
UNEXPECTED OR UNMATCHED END

Explanation: Either there are more ENDS in the program than DOs and SELECTS or the ENDS are wrongly placed so they do not match the DOs and SELECTs. It may be useful to use trace scan to show the structure of the program; hence, making it more obvious where the error is. A common mistake that causes this error is attempting to jump into the middle loop using the SIGNAL instruction. This error will also be generated if an END immediately follows a THEN or an ELSE.

process may be "compiling" or "running"

User response: Examine the line in error, and correct the REXX program.

HLV1011I  ERROR 11 process program, LINE lineno:
CONTROL STACK FULL

Explanation: An implementation limit of levels of nesting of control structures (DO...END, IF...THEN...ELSE, etc.) has been exceeded. The message should state the actual restriction. This error could be due to a looping INTERPRET instruction or due to infinite recursive calls.

process may be "compiling" or "running"

User response: Examine the line in error, and fix the program.

HLV1012I  ERROR 12 process program, LINE lineno:
CLAUSE TOO LONG

Explanation: There may be an implementation restriction that limits the length of the internal representation of a clause. This message is generated if this limit is exceeded.

process may be "compiling" or "running"

User response: Reduce the length of the literal and hexadecimal strings that exceed the documented limits. If the problem cannot be resolved, contact Software Support.

HLV1013I  ERROR 13 process program, LINE lineno:
INVALID CHARACTER IN PROGRAM

Explanation: The program includes a character outside the literal quoted string that neither alphanumeric nor one of the acceptable special characters.

process may be "compiling" or "running"

User response: Examine the line in error, and correct the invalid character.

HLV1014I  ERROR 14 process program, LINE lineno:
INCOMPLETE DO/SELECT/IF

Explanation: On reaching the end of the program (or the end of the string in an INTERPRET instruction), it has been detected that there is a DO or SELECT without a matching END or an IF that is not followed by a THEN clause to execute.

process may be "compiling" or "running"

User response: Find the unbalanced DO or SELECT, and correct it.
Explanation: Hexadecimal constants may not have leading or trailing blanks and may only have embedded blanks at byte boundaries. Only the digits 0 - 9 and the letters a-f are allowed. Binary strings may only have blanks added at the boundaries of groups of four binary digits. Only the digits 0 and 1 are allowed. The error may also be caused by following a literal string either by the one character symbol “x” when the string is not intended to be taken as a hexadecimal specification or by the symbol “b” when the string is not intended to be taken as a binary specification. Use the explicit concatenation operator,”| |”, in this situation to concatenate the string to the value of the symbol.

process may be “compiling” or “running”  
User response: Locate the error on the line, and correct it.

Explanation: A SIGNAL instruction has been executed, or an event occurred for which a trap was set, and the label specified cannot be found in the program.

process may be “compiling” or “running” 
User response: Correct the error, and rerun the program.

Explanation: A PROCEDURE instruction was encountered which was not the first instruction executed after a call or function invocation. A possible cause of this is dropping through into an internal routine rather than invoking it properly.

process may be “compiling” or “running” 
User response: Examine the line, correct the problem, and rerun the program.

Explanation: All IF and WHEN clauses in REXX must be followed by a THEN clause. Some other clause was found when a THEN was expected.

process may be “compiling” or “running” 
User response: Examine the line, and correct the error.

Explanation: Following either the keyword call or the sequence SIGNAL ON or SIGNAL OFF, a literal string or a symbol was expected but neither was found.

process may be “compiling” or “running”  
User response: Add the literal string or symbol that is needed.

Explanation: In the clauses END, ITERATE, LEAVE, NUMERIC, PARSE, and PROCEDURE, a symbol can be expected. Either it was not present when required or some other token was found. Alternately, DROP and the EXPOSE option of PROCEDURE expect a list of symbols. Some other token was found.

process may be “compiling” or “running” 
User response: Correct the REXX program, and rerun.

Explanation: A clause such as SELECT or NOP is followed by some token other than a comment.

process may be “compiling” or “running” 
User response: Correct the line, and rerun the REXX program.

Explanation: This error results if a literal string contains character codes that are not valid in a particular implementation. This might be because some characters are impossible or because the character set is extended in some way and certain character combinations are not allowed.

process may be “compiling” or “running” 
User response: Examine the line, and correct the error.

Explanation: The setting specified on a trace instruction or as the argument to the trace built-in function starts with a character that does not match one of the valid trace settings. This error is also raised if an attempt is made to request trace scan when inside any kind of control construct.

process may be “compiling” or “running” 
User response: Contact Software Support to obtain additional assistance.
HLV1025I  ERROR 25 process program, LINE lineno: INVALID SUB-KEYWORD FOUND

Explanation: An unexpected token has been found in the position in an expression where a particular sub-keyword was expected.

process may be "compiling" or "running"

User response: Correct the problem, and rerun the REXX program.

HLV1026I  ERROR 26 process program, LINE lineno: INVALID WHOLE NUMBER

Explanation: One of the following either did not evaluate to a whole number or is greater than the implementation limit for these uses: (1) the expression for digits or fuzz in the numeric instruction, (2) a parsing positional parameter, (3) a repetition phrase of a DO clause, or (4) the right-hand of the POWER("**") operator. This error is also raised if a negative repetition count is found in a DO clause.

process may be "compiling" or "running"

User response: Correct the problem on the line, and then rerun the program.

HLV1027I  ERROR 27 process program, LINE lineno: INVALID DO SYNTAX

Explanation: Some syntax error has been found in the DO instruction. This might be using the TO, BY, or FOR sub-keywords twice or when there is no control variable specified.

process may be "compiling" or "running"

User response: Fix the error, and rerun the job.

HLV1028I  ERROR 28 process program, LINE lineno: INVALID LEAVE OR ITERATE

Explanation: A LEAVE or ITERATE instruction was encountered in an invalid position. Either no loop is active or the name specified on the instruction does not match the control variable of an active loop. Note that since internal routine calls and the INTERPRET instruction protect DO loops, they become inactive. A common cause of this error is attempting to use the SIGNAL instruction to transfer control within or into the loop.

process may be "compiling" or "running"

User response: Fix the bug, and rerun the program.

HLV1029I  ERROR 29 process program, LINE lineno: ENVIRONMENT NAME IS TOO LONG

Explanation: The environment name specified by the ADDRESS instruction is longer than permitted for the system under which REXX is running. This message should state the maximum length permitted.

process may be "compiling" or "running"

User response: Correct the problem, and rerun the REXX program.

HLV1030I  ERROR 30 process program, LINE lineno: NAME OR STRING TOO LONG

Explanation: This error results if there is an implementation limit that is exceeded for the length of a variable name, a label name, or a literal string.

process may be "compiling" or "running"

User response: Fix the error, and rerun the REXX program.

HLV1031I  ERROR 31 process program, LINE lineno: NAME STARTS WITH NUMBER OR "."

Explanation: A value may not be assigned to a variable whose name starts with a numeric digit or a period (if it were allowed, one could redefine numeric constants).

process may be "compiling" or "running"

User response: Correct the error, and rerun the REXX program.

HLV1032I  ERROR 32 process program, LINE lineno: LOGICAL VALUE NOT 0 OR 1

Explanation: The result of an expression in an instruction was found to be invalid in the particular context it was used. This may be due to an illegal fuzz or digits value in a numeric instruction (fuzz may not become larger than digits).

process may be "compiling" or "running"

User response: Correct the program.

HLV1033I  ERROR 33 process program, LINE lineno: INVALID EXPRESSION RESULT

Explanation: The result of an expression in an instruction was found to be invalid in the particular context it was used. This may be due to an illegal fuzz or digits value in a numeric instruction (fuzz may not become larger than digits).

process may be "compiling" or "running"

User response: Contact Software Support.

HLV1034I  ERROR 34 process program, LINE lineno: LOGICAL VALUE NOT 0 OR 1

Explanation: The expression in an IF, WHEN, DO WHILE, or DO UNTIL phrase must result in a 0 or a 1, as must any term operated on by a logical operator.

process may be "compiling" or "running"

User response: Fix the bug, and rerun the program.

HLV1035I  ERROR 35 process program, LINE lineno: INVALID EXPRESSION

Explanation: This is due to a grammatical error in an expression, such as ending it with an operator or having two operators adjacent with nothing in between. It may also be due to an expression that is missing when one is required. A common error is to
include special characters in an intended character expression without enclosing them in quotes.

process may be "compiling" or "running"

User response: Examine the line, fix the problem, and then rerun.

HLV1036I  ERROR 36 process program, LINE lineno: UNMATCHED "(" IN EXPRESSION

Explanation: This is due to not pairing parentheses correctly within an expression. There are more left parentheses than right parentheses.

process may be "compiling" or "running"

User response: Examine the line, fix the problem, and then rerun.

HLV1037I  ERROR 37 process program, LINE lineno: UNEXPECTED "," OR ")"

Explanation: Either a comma has been found outside a function invocation or there are too many right parentheses in an expression.

process may be "compiling" or "running"

User response: Examine the line, fix the problem, and then rerun.

HLV1038I  ERROR 38 process program, LINE lineno: INVALID TEMPLATE OR PATTERN

Explanation: Within a parsing template, either a special character that is not allowed has been found or the syntax of a variable pattern is incorrect. This error may also be raised if the WITH sub-keyword is omitted in a parse value instruction.

process may be "compiling" or "running"

User response: Examine the program, fix the problem, and then rerun.

HLV1039I  ERROR 39 process program, LINE lineno: EVALUATION STACK OVERFLOW

Explanation: The expression is too complex to be evaluated by the language processor. There are too many nested parentheses, functions, etc. The message should state the actual restriction.

process may be "compiling" or "running"

User response: Examine the program, simplify the expression, and then rerun.

HLV1040I  ERROR 40 process program, LINE lineno: INCORRECT CALL TO ROUTINE

Explanation: The specified built-in or external routine does exist but has been used incorrectly. Either invalid arguments were passed to the routine, the program invoked was not compatible with the REXX language processor, or more than an implementation-limited number of arguments were passed to the routine.

process may be "compiling" or "running"

User response: Examine the statement calling the routine, and correct it.

HLV1041I  ERROR 41 process program, LINE lineno: BAD ARITHMETIC CONVERSION

Explanation: Either one of the terms involved in an arithmetic operation is not a valid number or its exponent exceeds the implementation limit.

process may be "compiling" or "running"

User response: Examine the program, and correct the problem.

HLV1042I  ERROR 42 process program, LINE lineno: ARITHMETIC OVERFLOW/UNDERFLOW

Explanation: The result of an arithmetic operation requires an exponent that is outside the range supported by the implementation. This can happen during evaluation of an expression (commonly an attempt to divide a number by 0) or possibly during the stepping of a DO loop control variable.

process may be "compiling" or "running"

User response: Examine the program, and correct the error.

HLV1043I  ERROR 43 process program, LINE lineno: ROUTINE NOT FOUND

Explanation: A function that has been invoked within an expression cannot be found, or a subroutine that has been invoked by call cannot be found. No label with the specified name exists in the program. It is not the name of a built-in function, and the language processor has been unable to locate it externally. The name has probably been typed incorrectly, or a symbol or literal string is adjacent to a "(" when it was meant to be separated by a blank or some other operator. Functions referenced in an INTERPRET statement that are not product built-in functions and have not been previously referenced will also result in this error.

process may be "compiling" or "running"

User response: Examine the program, and correct the error.

HLV1044I  ERROR 44 process program, LINE lineno: FUNCTION DID NOT RETURN DATA

Explanation: An external function has been invoked within an expression, but even though it appeared to
end without error, it did not return data for use within the expression.

process may be "compiling" or "running"

User response: Examine the program, and correct the error.

HLV1045I  ERROR 45 process program, LINE lineno: NO DATA SPECIFIED IN FUNCTION RETURN

Explanation: The program has been called as a function, but an attempt is being made (by RETURN) to return without passing back any data.

process may be "compiling" or "running"

User response: Examine the program, and correct the error.

HLV1046I  ERROR 46 process program, LINE lineno: INVALID VARIABLE REFERENCE

Explanation: An attempt to indirectly reference a variable is invalid. This would most likely occur on an EXPOSE or INTERPRET instruction. For example: EXPOSE (Y) where Y is a number.

process may be "compiling" or "running"

User response: Examine the program, and correct the error.

HLV1048I  ERROR 48 process program, LINE lineno: FAILURE IN system service

Explanation: Some system service used by the REXX language processor (such as stream input or output) has failed to work correctly; hence, normal execution cannot continue.

process may be "compiling" or "running"

User response: Examine the program, and correct the error.

HLV1049I  ERROR 49 process program, LINE lineno: INTERPRETATION ERROR

Explanation: Implementations of the REXX language will normally carry out internal self-consistency checks during execution. This message indicates that some kind of severe error has been detected within the language processor or execution process.

process may be "compiling" or "running"

User response: Contact Software Support for further assistance.

HLV1064I  ERROR 64 process program, LINE lineno: UNIMPLEMENTED FEATURE

Explanation: The program has used a REXX language feature which is not supported by this version of the REXX interpreter. Code 64 is an extended error code used only by REXX.

process may be "compiling" or "running"

User response: Check documentation for support of the feature. Change the REXX program to bypass use of the feature.

HLV1066I  ERROR 66 process program, LINE lineno: AMPERSAND VARIABLES UNSUPPORTED

Explanation: The program has used the ampersand as a prefix to a symbol. The REXX interpreter does not allow this.

process may be "compiling" or "running"

User response: Contact Software Support.

HLV1067I  ERROR 67 process program, LINE lineno: DUPLICATE LABEL

Explanation: The program has defined the same label name twice.

process may be "compiling" or "running"

User response: Change the label on one of the two statements.

HLV1068I  ERROR 68 process program, LINE lineno: FUNCTION NAME > 32 CHARACTERS

Explanation: The program has defined or referenced a function whose name exceeds the maximum function name length of 32 characters.

process may be "compiling" or "running"

User response: Change the function name to a shorter name.

HLV1069I  ERROR 69 process program, LINE lineno: FUNCTION HAS TOO FEW ARGUMENTS

Explanation: The program has called a function that requires more arguments than specified on the function call.

process may be "compiling" or "running"

User response: Add the necessary arguments to the function call. Check the documentation for the specified function.

process may be "compiling" or "running"

User response: Contact Software Support.

---

HLV1083I  ERROR 83 process program, LINE lineno: CODE BLOCK TOO LARGE, EVAL STACK FULL

Explanation: If this occurs during the compile phase, the program is using a structure too complex for the compiler to handle. This could occur if a SELECT statement has too many WHEN clauses or if there are too many nested control structures.

process may be "compiling" or "running"

User response: Reduce the complexity of the structure flagged, and retry the compile. If the problem cannot be resolved, contact Software Support.

---

HLV1084I  ERROR 84 process program, LINE lineno: TOO MANY SYMBOLS, SYMBOL TABLE FULL

Explanation: If this occurs during the compile phase, the program is using too many symbols and the symbol table has overflowed.

process may be "compiling" or "running"

User response: Reduce the number of symbols used by the program, and retry the compile. If this does not solve the problem, contact Software Support.

---

HLV1085I  ERROR 85 process program, LINE lineno: INVALID USE OF EXTENDED VARIABLE TYPE

Explanation: The REXX program has attempted to use a variable in a manner that is not supported. This could occur if a product global variable is used as the control variable in a controlled repetitive loop (e.g. DO GLOBAL1 = 1 TO 10).

process may be "compiling" or "running"

User response: Modify the REXX program so that it does not use a global variable as the loop control variable.

---

HLV1086I  ERROR 86 process program, LINE lineno: INVALID GLOBAL SYMBOL

Explanation: A Product REXX global symbol whose derived name exceeds the Product REXX global variable symbol length limit of 50 characters has been used.

process may be "compiling" or "running"

User response: Check the statement in error, and determine which symbol substitution caused the derived name of a global variable to exceed the specified limit. Modify the program to use a shorter derived name.

---

HLV1087I  ERROR 87 process program, LINE lineno: INVALID INTERNAL OBJECT

Explanation: This is an internal Product REXX error.

process may be "compiling" or "running"

User response: Please contact Software Support to obtain additional assistance.

---

HLV1088I  ERROR 88 process program, LINE lineno: INTERPRETER STACK ERROR

Explanation: This is an internal Product REXX error.

process may be "compiling" or "running"

User response: Please contact Software Support to obtain additional assistance.

---

HLV1090I  var1 var2 var3 var4 var5 var6 var7 var8 var9 var10 var11

Explanation: Message: SWS1090I REXX abend in OPRXCMRU+x'offset'. This message is normally accompanied by a 1049I message which relates to an error 49 in a given rule type.

User response: Check the given rule. In the case of a variable passed to the given error line, make sure the variable is valid. Display fields such as RULE and others in Trace Browse. For a test situation of the given rule or REXX program, include a SAY statement to print the value of the given variable at the of the error. If the error is not related to variables, validate the given line, and take appropriate action. Parameters like BROWSEGLV could be used if this is a global variable rule error. See other browse parameters and use as applicable.

---

HLV1091I  ERROR 91 process program, LINE lineno: INVALID OR MISPLACED OPTIONS STATEMENT

Explanation: The OPTIONS statement contains options which are not valid. Note that unknown OPTIONS keywords are ignored and are not flagged as errors. Only partially incorrect OPTIONS keywords are flagged.

process may be "compiling" or "running"

User response: Correct the OPTIONS statement, and retry the operation.

---

HLV1092I  ERROR 92 process program, LINE lineno: OVER maxno CLAUSES EXECUTED IN RECOVERY EXIT

Explanation: A REXX program or a rule exceeded the maximum number of clauses allowed for a SIGNAL ON syntax or SIGNAL ON HALT recovery routine following a product limit exceeded condition. The maximum number of clauses allowed when recovering
from a product limit type error is indicated in the error text.

process may be "compiling" or "running"

User response: Reduce the number of clauses that are executed in the limit failure recovery routine.

HLV1093E  ERROR 93 process program, LINE lineno: GLOBAL VARIABLE WORKSPACE OVERFLOW (parmlist - workspc)

Explanation: A shared/permanent global variable or temporary global variable value cannot be stored successfully. This message may be issued under a number of circumstances if a global or global-temporary variable update/addition fails. The conditions causing this message to be issued are: 1) The number of global variables now allocated and in-use (GLOBALUSED or RXWSGVCN for temporary workspace) exceeds the maximum count limit configured by the GLOBALMAX (shared/permanent variables) or GLOBALTEMPMAX (temporary variables) parameters. You must use the ISPF C.3 display Note that you must use the ISPF C.3 panel display, selecting "RXWS GLVEVENT. WORK SPACE", in order to view RXWSGVCN and obtain the temporary workspace variable count. 2) There is insufficient free space anywhere within the global workspace to update or add a variable’s value. The value requires multiple workspace segments (RXGV’s) for storage and enough free RXGV’s could not be found on the free element chain (RXWSFCCN / GLOBALFREEAREAS), or there was insufficient un-allocated space at the end of the workspace (RXWSLN / GLOBALSIZE minus RXWSNXFR / GLOBALNEXT). Contiguous RXGV freespace blocks are required for allocation of the value storage area. Note that the parameters GLOBALFREEAREAS, GLOBALSIZE, and GLOBALNEXT apply only to the shared/permanent workspace. For the temporary workspace, you must examine the RXWS field value using the ISPF C.3 "RXWS GLVEVENT. WORK SPACE" block display. No product parameters map these values for the temporary workspace. The word "TEMP" is inserted into the message as the last word (within final parentheses) if the TEMPORARY global workspace has overflowed. GLVEVENT. stem and internal-use global stem variables are allocated within the temporary global workspace. Otherwise, the word "TEMP" is not present in the message and it is the shared/permanent global workspace that has overflowed. GLOBAL., and GLOBAL0. through GLOBAL9. stem variables are in the shared/permanent workspace area.

process may be "compiling" or "running"

User response: You may need to analyze the contents of the global variable database using the global variables application, product parameters, or the ISPF C.3 RXWS displays. Use the ISPF E.1 panel to remove unneeded permanent GLOBAL. stem variables. Otherwise, increase the GLOBALMAX or GLOBALTEMPMAX start-up parameters. If the workspace is too small, you may also need to (re) allocate a larger global variable checkpoint DIV dataset and copy the original DIV into the new one using Access Method Services REPRO. To prevent future out-of-space hard failures, set the warning threshold percent (GLOBALWARNTHRESH or GLOBALTEMPWARNTH) and interval (GLOBALWARNINTERVAL or GLOBALTEMPWARNIV) so that a threshold is established and reported periodically via MSG 4290. Automate this message so that sufficient notification is given to prevent the out-of-space hard failure limit from being reached before the workspaces can be expanded.

HLV1094E  ERROR 94 process program, LINE lineno: OVER see SECONDS USED FOR EXECUTION

Explanation: A rule or REXX program exceeded its wall clock time limits as set by SEFMAXSECONDS (rule) or REXXMAXSECONDS (REXX program) product parameters. These limits may be overridden using NOMAXSECONDS or MAXSECONDS=nnnn on the REXX OPTIONS statement.

process may be "compiling" or "running"

User response: Determine whether this problem was caused by a looping program or whether the limits are too low. The limits that affect all rules/programs can be modified by changing the xxxPARM limits (SEFMAXSECONDS and/or REXXMAXSECONDS). The limits for the individual program can be overridden by using the REXX OPTIONS statement as described in the product Reference Manual.

HLV1095E  ERROR 95 process program, LINE lineno: OVER maxno HOST COMMANDS ISSUED

Explanation: A rule or REXX program exceeded its host command limits as set by SEFMAXCOMMANDS (rule) or REXXMAXCOMMANDS (REXX program) product parameters. These limits may be overridden using NOMAXCOMMANDS or MAXCOMMANDS=nnnn on the REXX OPTIONS statement.

process may be "compiling" or "running"

User response: Determine whether this problem was caused by a looping program or whether the limits are too low. The limits that affect all rules/programs can be modified by changing the xxxPARM limits (SEFMAXCOMMANDS and/or REXXMAXCOMMANDS). The limits for the individual program can be overridden by using the REXX OPTIONS statement as described in the product Reference Manual.
HLV1096E **ERROR 96 process program, LINE lineno: OVER maxno "SAY" CLAUSES EXECUTED**

**Explanation:** A rule or REXX program exceeded its SAY/TRACE limits as set by SEFMAXSAYS (rule) or REXXMAXSAYS (REXX program) product parameters. These limits may be overridden using NOMAXSAYS or MAXSAYS=nnnn on the REXX OPTIONS statement.

*process may be "compiling" or "running"*

**User response:** Determine whether this problem was caused by a looping program or whether the limits are too low. The limits that affect all rules/programs can be modified by changing the xxxPARM limits (SEFMAXSAYS and/or REXXMAXSAYS). The limits for the individual program can be overridden by using the REXX OPTIONS statement as described in the product Reference Manual.

HLV1097E **ERROR 97 process program, LINE lineno: OVER maxno CLAUSES EXECUTED**

**Explanation:** A rule or REXX program exceeded its clause limits as set by SEFMAXCLAUSES (rule) or REXXMAXCLAUSES (REXX program) product parameters. These limits may be overridden using NOMAXCLAUSES or MAXCLAUSES=nnnn on the REXX OPTIONS statement.

*process may be "compiling" or "running"*

**User response:** Determine whether this problem was caused by a looping program or whether the limits are too low. The limits that affect all rules/programs can be modified by changing the xxxPARM limits (SEFMAXCLAUSES and/or REXXMAXCLAUSES). The limits for the individual program can be overridden by using the REXX OPTIONS statement as described in the product Reference Manual.

HLV1098I **lineno TRACE MESSAG**

**Explanation:** Informational message only. This message gives the output from the REXX TRACE command.

**User response:** None. This message is for informational purposes only.

HLV1099I **statement**

**Explanation:** This message is issued when the REXX compiler detects an error during compilation. The first line of the message lists the statement in error and the second line indicates where in the first line the error was detected.

**User response:** Review the REXX statement, and correct the error.

HLV1100S **RETRY LIMIT CONVERSION ERROR - VALUE SPECIFIED = val**

**Explanation:** An error was detected while trying to convert the character representation of the specified retry limit (val) to its integer counterpart.

**User response:** Review the retry limit specification contained in the error message. If the specified retry limit contains an invalid value, correct the error, and reinvoke the DSN command. If all attempts at correcting the specified retry limit fail, contact Software Support for further assistance.

HLV1101S **TEST LEVEL CONVERSION ERROR - VALUE SPECIFIED = val**

**Explanation:** An error was detected while trying to convert the character representation of the specified test level (val), to its integer counterpart.

**User response:** Review the test level specification contained in the error message. If the specified test level contains an invalid value, correct the error, and reinvoke the DSN command. If all attempts at correcting the specified test level fail, contact Software Support for further assistance.

HLV1102S **subsys NOT VALID SUBSYSTEM ID, COMMAND TERMINATED**

**Explanation:** A subsystem control table that corresponded to the subsystem name contained in the error message could not be located by the SSCT chain scan logic.

**User response:** If the subsystem name was specified on the SYSTEM() command argument, review the name, and revise the SYSTEM() specification, if necessary. If a SYSTEM() command line argument was not specified, the product-provided default value may not be appropriate for your installation. This value was obtained from the local copy of the DSNHDECP Db2 parameters module, if one could be found. If a local copy of the DSNHDECP parameters module contains an invalid value, run the JCL jobstream contained in the HLV CNTL data set member ZAPDECP after updating the REP control card. If a local copy of the DSNHDECP parameters module was not found, the product will attempt to use the standard IBM default subsystem, DSN. For further assistance in providing the product with the correct subsystem name value, contact Software Support.

HLV1104S **Subsystem subsystem is not a valid DB2 subsystem**

**Explanation:** The SSCT located for the subsystem name that was extracted is neither a valid product SSCT nor a valid Db2 SSCT.

**User response:** If the subsystem name was specified on the SYSTEM() command argument, review the
name, and revise the SYSTEM() specification, if necessary. If a SYSTEM() command line argument was not specified, the product provided default value may not be appropriate for your installation. This value was obtained from the local copy of the DSNHDECP Db2 parameters module, if one could be found. If a local copy of the DSNHDECP parameters module contains an invalid value, run the JCL jobstream contained in the S__CNTL data set member ZAPDECP after updating the REP control card. If a local copy of the DSNHDECP parameters module was not found, the product will attempt to use the standard IBM default subsystem, DSN. If the problem cannot be resolved, contact Software Support.

**HLV1105S  LOAD FOR DSNECP00 FAILURE**

**Explanation:** The attempt to load the renamed version of DSNECP00 has failed.

**User response:** Ensure that the product installation process was completed successfully. Ensure that the load library containing the renamed version of DSNECP00 is accessible by the product. If all attempts to correct the problem situation fail, contact Software Support for further assistance.

**HLV1106S  subsys NOT OPERATIONAL, RETRY COUNT ZERO**

**Explanation:** The SSCT for the product indicated that the product is not currently active.

**User response:** Determine if the product may have started and terminated abnormally. If so, review the accompanying messages in the SYSLOG. If the product did not terminate abnormally, issue the appropriate start command. If necessary, contact Software Support for further assistance.

**HLV1108S  CONNECTION FAILURE RC = rcode REASON = rsncode**

**Explanation:** The attempt to connect to the remote Db2 subsystem failed.

**User response:** Review the return code and the reason code values contained in the error message. Compare the return code and reason code with those listed in the IBM SQL Application Programming Manual, and take the appropriate action. If all attempts to correct the problem fail, contact Software Support for further assistance.

**HLV1109S  DISCONNECT FAILURE RC = rcode REASON = rsncode**

**Explanation:** The attempt to disconnect from the remote Db2 subsystem has failed.

**User response:** Review the return code and the reason code values contained in the error message. Compare the return code and reason code with those listed in the IBM SQL Application Programming Manual, and take the appropriate action. If all attempts to correct the problem fail, contact Software Support for further assistance.

**HLV11113S  COMMAND REJECTED - cmd CMD NOT SUPPORTED UNDER DSN**

**Explanation:** The subcommand specified (cmd) is not supported under the DSN command.

**User response:** Review the command string entered. Revise the command string, if appropriate. Re-enter the revised command string. If the problem cannot be resolved, contact Software Support.

**HLV1114R  msgtext**

**Explanation:** Module OPDSN10 issued the current message (msgtext) as a prompt for valid subcommand input.

**User response:** Respond with an appropriate subcommand name, or enter the END subcommand if processing is complete.

**HLV1115S  ERROR ISSUING SUBCOMMAND PROMPT - RC = rcode**

**Explanation:** An error occurred either issuing the subcommand prompt or while waiting for valid subcommand input.

**User response:** Contact Software Support for further assistance.

**HLV1117S  COMMAND BUFFER SCAN ERROR - RC = rcode**

**Explanation:** An attempt to scan the command buffer utilizing the services of IKJSCAN failed.

**User response:** Review the command string entered. Revise the command string, if appropriate. Re-enter the revised command string. If the problem cannot be resolved, contact Software Support.

**HLV1118S  RUN SUBCOMMANDS CAN NOT HAVE A PROGRAM PARAMETER AND A CP PARAMETER**

**Explanation:** The PROGRAM and CP parameters of the RUN subcommand are mutually exclusive.

**User response:** Revise the subcommand string entered. If the program to be executed is not a TSO command processor, specify only the PROGRAM() parameter. If the program to be executed is a TSO command processor, specify only the CP parameter.
HLV119S  •  HLV1132S

HLV119S  RUN SUBCOMMAND REQUIRE (1)PROGRAM PARAMETER OR (2)PLAN AND CP PARAMETER
Explanation: The RUN subcommand requires that either the PROGRAM parameter be specified or the PLAN and CP parameters be specified.
User response: Revise the subcommand string entered. If the program to be executed is not a TSO command processor, specify only the PROGRAM parameter. If the program to be executed is a TSO command processor, specify the PLAN and CP parameters.

HLV1120S  DSNRLI func FUNCTION FAILED. RC = rcode REASON = rsncode
Explanation: The RRSAF function (func) failed.
User response: Review the return code and the reason code values contained in the error message. Compare the return code and reason code with those listed in the IBM SQL Application Programming Manual, and take the appropriate action. If all attempts to correct the problem fail, contact Software Support for further assistance.

HLV1121I  PLEASE WAIT...CONNECTION RETRY IN PROGRESS
Explanation: The remote Db2 subsystem is currently not active and a RETRY() value greater than one (1) was specified. The connection request will be retried.
User response: No action required.

HLV1121I  COMMAND SPUFI IGNORED, VALID ISPF ENVIRONMENT MUST EXIST
Explanation: The SPUFI subcommand requires that a valid ISPF environment exist.
User response: Re-invoke the DSN command from within ISPF. If the error persists, contact Software Support to obtain additional assistance.

HLV1123S  COMMAND REJECTED, CMD NOT SUPPORTED UNDER DSN
Explanation: The subcommand specified is not supported under the DSN command.
User response: Review the command string entered. Revise the command string, if appropriate. Re-enter the revised command string. If the error condition persists despite correcting errors in the command string that was entered, contact Software Support.

HLV1126S  PLAN OPEN FAILURE RC = rcode REASON = rsncode
Explanation: The attempt to open the application plan failed.
User response: Review the return code and the reason code values contained in the error message. Compare the return code and reason code with those listed in the IBM SQL Application Programming Manual, and take the appropriate action. If all attempts to correct the problem fail, contact Software Support for further assistance.

HLV1127S  PLAN CLOSE FAILURE RC = rcode REASON = rsncode
Explanation: The attempt to close the application plan failed.
User response: Review the return code and the reason code values contained in the error message. Compare the return code and reason code with those listed in the IBM SQL Application Programming Manual, and take the appropriate action. If all attempts to correct the problem fail, contact Software Support for further assistance.

HLV1129R  ENTER TSO COMMAND
Explanation: Module OPDSN10 issued the current message as a prompt for a valid TSO command.
User response: Respond with a valid TSO command name.

HLV1130S  ERROR ISSUING TSO COMMAND PROMPT - RC = rcode
Explanation: An error occurred either while issuing the TSO command prompt or while waiting for valid TSO command input.
User response: Contact Software Support for further assistance.

HLV1131S  cmd NOT VALID COMMAND
Explanation: The TSO command (cmd) entered is not a valid command.
User response: Correct the value specified and re-enter the RUN subcommand. If the error persists, contact Software Support for further assistance.

HLV1132S  cmd ENDED DUE TO ERROR
Explanation: The DSN command (cmd) has ended due to an abend detected in a user task.
User response: Correct the error condition in the program or TSO command that was specified, and re-enter the DSN command. If the error condition

<td>HLV1137S</td>
<td>ERROR EXECUTING TSO COMMAND RC = rcode REASON = rsncode</td>
<td>OPDSN10 detected that the command entered was a TSO command; however, an error was detected while attempting to invoke the TSO command. The above message depicts the return code and reason code values received from the product TSOEXEC service routine.</td>
<td>Examine the TSO command entered, and correct the command string if an error was detected. If the error condition persists despite correcting any command string errors, contact Software Support for further assistance.</td>
</tr>
<tr>
<td>HLV1138I</td>
<td>SET_CLIENT_ID CALL FAILED - DB2 NOT AT PROPER MAINTENANCE LEVEL OR RELEASE. SUBSYSTEM: subsys</td>
<td>A client requested a SET_CLIENT_ID command be issued to Db2. This is usually invoked via the SQLSETI client function. However, Db2 rejected the request. This probably is due to APAR PQ67691 (or its equivalent) being applied.</td>
<td>This is not a serious problem. The Db2 DISPLAY THREAD display just will not contain additional information that was supplied by the client.</td>
</tr>
<tr>
<td>HLV1154S</td>
<td>COMMAND BUFFER INTERNAL FORMAT ERROR</td>
<td>During an attempt by the DSN command processor to analyze the contents of the command buffer, it was determined that the command buffer had the wrong length, invalid operands, or the wrong format.</td>
<td>Review the command string entered. Revise the command string, if appropriate. Re-enter the revised command string. If the error condition persists despite correcting errors in the command string that was entered, contact Software Support for further assistance.</td>
</tr>
<tr>
<td>HLV1163S</td>
<td>COMMAND BUFFER PARSE ERROR - RC = rcode</td>
<td>The IBM TSO parse routine, IKJPARS, returned a non-zero return code after attempting to parse the DSN command string.</td>
<td>Review the accompanying TSO error messages in the SYSLOG. Review the command string entered. Revise the command string, if appropriate. Take action recommended in the TSO messages manual. If all attempts at revised command string entry fail, contact Software Support for further assistance.</td>
</tr>
<tr>
<td>HLV1250I</td>
<td>var1 var2</td>
<td>The message ID used to display parameter value requested with an xxxPARAM command.</td>
<td>None. This message is for informational purposes only.</td>
</tr>
<tr>
<td>HLV1251T</td>
<td>THE VALUE OF THE <strong>parmname</strong> PARAMETER WAS ROUNDED UP TO <strong>parnval</strong> BYTES</td>
<td>The parameter was rounded to a 1K (1024) byte boundary.</td>
<td>None. This message is for informational purposes only.</td>
</tr>
</tbody>
</table>
HLV1252T  THE VALUE SPECIFIED FOR THE
parmname  PARAMETER WAS
CHANGED FROM parmval1 TO
parmval2

Explanation: The value of the parameter was changed.

User response: None. This message is informational only.

HLV1253T  THE VALUE OF
ROLLBACKPOSITIVERC WAS
CHANGED TO 'NO' BECAUSE
IGNOREPOSITIVESC WAS SET TO
'YES'

Explanation: The value of the
ROLLBACKPOSITIVERC parameter was changed to
'NO' because the IGNOREPOSITIVESC parameter was set to YES. ROLLBACKS for positive SQL codes cannot be performed if they are being ignored.

User response: None. This message is informational only. If ROLLBACKS are required for positive SQL codes, then set IGNOREPOSITIVESC to 'YES', then set ROLLBACKPOSITIVERC to 'YES'.

HLV1254T  THE VALUE OF
ROLLBACKPOSITIVERC CANNOT BE
CHANGED TO 'YES' BECAUSE
IGNOREPOSITIVESC IS 'YES'

Explanation: The value of the
ROLLBACKPOSITIVERC parameter cannot be set to
'YES' because IGNOREPOSITIVESC parameter is set to YES. ROLLBACKS for positive SQL codes cannot be performed if they are being ignored.

User response: None. This message is informational only. If ROLLBACKS are required for positive SQL codes, then set IGNOREPOSITIVESC to 'YES', then set ROLLBACKPOSITIVERC to 'YES'.

HLV1255E  parmname - cannot be changed after initialization

Explanation: Many of product parameters may be changed at any time, but some of them can only be set once during initialization. The parameter you attempted to change must be set during product initialization.

User response: Update the initialization REXX exec xxxIN00. These changes will take effect the next time the product is started.

The variable fields of the message text are: parm parameter name

HLV1257E  parmname - cannot be displayed

Explanation: The parameter you selected cannot be displayed.

User response: Check the manual to see if the parameter you requested is spelled correctly.

HLV1258E  desc - errmsg suffix

Explanation: The ADDRESS HLV processing routine found an error in the parameter text string passed with the MODIFY PARM command. The parameter text string is invalid. MODIFY PARM command processing is aborted.

User response: Validate the VALUE keyword value, correct it for errors, and re-initiate the command. For more details on the MODIFY PARM command, refer to your Product User's Guide.

HLV1259E  PARAMETER parmname POINTS TO
UNINITIALIZED ENUMERATED
VALUE IN cblk AT addr

Explanation: During a parameter display operation, a product parameter table entry pointed to an un-initialized field within a product control block. The field should be initialized with one of the valid values enumerated for the parameter.

User response: The product parameter's value is displayed as "*INTERNAL-ERROR*", and processing continues.

HLV1262I  grpdesc grpname

Explanation: The parameter group (grp) being listed by this xxxPARM command could not be found. The command is terminated.

User response: Review the xxxPARM command being executed, checking the group operand and whether or not there is a group listing for it. Refer to the product Server Started Task Parameters Guide for the details on using the.xxxPARM command and its group operand.

HLV1263E  prefix-parmval-suffix

Explanation: This message is never meant to be seen. It is used by OPPAFU to convert product parameters to printable character strings.

User response: If you see this message, an internal error has occurred. Contact Software Support.
HLV1264W  No parameter value information is available.
Explanation: The xxxPARM parameter you are using is not available. The SHLVPARM command is terminated.
User response: The parameter you are trying to set using SHLVPARM is not supported or not valid in this release of the product. Check the parameter in the product documentation.

HLV1265W  WARNING: parmname PARAMETER (val) CONTAINS TOO FEW QUALIFIERS TO ENSURE PROPER HTTP COOKIE OPERATION
Explanation: The host domain name parameter contains too few qualifiers (name segments separated by periods) to ensure that Web browsers will properly store and transmit HTTP cookies. At least three levels of qualification (two levels if the name ends with .com, .edu, .net, .org, .gov, .mil, or .int) are usually required to ensure that HTTP cookies are stored and later retransmitted properly.
User response: The parameter is accepted but is always folded to a lowercase string. The server's built-in browser-based administration utilities require HTTP cookies for proper operation. These administration utilities may not function correctly using the host domain name string now set.

HLV1266W  WARNING: parmname PARAMETER (val) MAY CAUSE INCONSISTENT OPERATION USING HTTP COOKIES
Explanation: The host domain name parameter contains a dot-notation format IP address. Browser anomalies may arise that cause HTTP cookies to be stored improperly or retransmitted incorrectly when using a dot-notation host domain name value.
User response: The parameter is accepted. The server's built-in browser-based administration utilities require HTTP cookies for proper operation. These administration utilities may not function correctly using the host domain name string now set.

HLV1275S  ABEND abcode IN AUTHORIZATION ROUTINE modname+offset
Explanation: An abend occurred in the authorization checking routine.
User response: Contact Software Support for assistance.
The variable fields of the message text are: abcd abend code mod module name off module offset

HLV1277S  cblk Control block not found
Explanation: The MODIFY PARM functional routine has been passed an invalid product control block name.
User response: First, check the MODIFY PARM command, correct any errors, and rerun. If the problem persists, verify that all of the product modules are at the same release level. Also, check that the last product installation was successful. If all of the above are checked and the problem remains, gather all related problem data (error data, SVFX level, install information), and contact Software Support for further assistance.

HLV1281E  service desc FAILED, RC=rcode, DETECTED AT addr
Explanation: This is a generic error message used to describe a wide variety of errors. The message text gives a description of the current operation (service) and what the current operation was trying to do.
User response: Check the error messages and the return code associated with this problem. There may be one or more error messages referring to the current problem. If possible, fix the problem identified by the error messages, and retry the operation. If the problem cannot be resolved, contact Software Support for further assistance.

HLV1290H  jb parmname parmval
Explanation: This message logs a change to the product parameters via the ADDRESS HLV MODIFY command. The message contains the name of the product parameter and its new value.
User response: No action is required. This message is written to the log for informational and tracking purposes only.
The variable fields of the message text are: parm parameter field name parmval parameter field value

HLV1291W  Warning: parmname is an obsolete parameter
Explanation: This message is issued when an obsolete parameter value is modified.
User response: Refer to the product Server documentation for information on this parameter. Modifying an obsolete parameter may not have the desired effect. In many cases, obsolete parameters have no effect on the server and are ignored. Obsolete parameters are normally removed from the product in the next release. You should check the product initialization exec (xxxxIN00) and remove all references to this obsolete parameter from it.
HLV1292E  Exit code  ecod is invalid for  paramname
Explanation:  An invalid exit code has been defined in an internal product control block that defines a product parameter table entry.
User response:  This is an internal error. Please report this problem to Software Support.

HLV1293E  errdesc
Explanation:  An attempt to set a product parameter has failed. The error message describes the reason for the failure.
User response:  Review the error message, and attempt to correct the problem.

HLV1294E  desc OF process FOR PARAMETER CHANGE EVENT NOTIFICATION FAILED WITH RC=rcode
Explanation:  A product parameter update attempt was made, but the system was unable to properly notify an asynchronous process of the change. The update to the parameter may or may not have been made, but in either case, the asynchronous process is now in an unknown state.
User response:  Review the error message and any others related to the problem, and notify Software Support. Timing errors during shutdown normally do not represent a serious condition unless they occur consistently.

HLV1295W  PARM paramname AND ANY DEFINE ISPFCONCAT ARE MUTUALLY EXCLUSIVE. paramname WILL BE IGNORED.
Explanation:  The xxxxIN00 EXEC specifies at least one DEFINE ISPFCONCAT statement and the mutually exclusive ISP PARM statement. All ISP PARM statements are ignored when at least one DEFINE ISPFCONCAT statement is specified. The following is a complete list of the ISP PARM parameters that will be ignored: EXECDSNAME, COMPEXECDSNAME, ISPLLIBDSNAME, ISPMLIBDSNAME, ISPOLLIBDSNAME and ISPTLIBDSNAME.
User response:  Change the xxxxIN00 EXEC to specify the DEFINE ISPFCONCAT statements for all of the required libraries and remove the obsolete PARM NAME(ISP%LIBDSNAME) parameters.

HLV1296T  Security optimization processing terminated
Explanation:  The TERMINATESECOPT parameter was set to ‘YES’ causing all security optimization processing to halt. The product continues to operate normally.
User response:  If you want to execute with security optimization active, you must stop and restart the product.

HLV1297T  Logging processing terminated
Explanation:  The TERMINATELOGGING parameter was set to ‘YES’ causing all logging functions to halt. The product continues to operate normally.
User response:  If you want to execute with logging active, you must stop and restart the product.

HLV1298T  Interval recording %1
Explanation:  Interval recording was enabled or disabled. The product continues to operate normally.
User response:  You can reenable interval recording if the TERMINATEINTERVAL parameter is set to ‘NO’.

HLV1299T  Interval recording terminated
Explanation:  The TERMINATEINTERVAL parameter was set to ‘YES’ causing all interval recording to halt. The product continues to operate normally.
User response:  If you want to execute with interval recording active, you must stop and restart the product.

HLV1340I  echotext
Explanation:  This message is simply an echo of a reply to a WTOR issued.
User response:  None.

HLV1346E  MESSAGE ID AND TEXT ARE TOO LONG
Explanation:  While building a WTO or WTOR parameter list, the product detected that the combined message ID and message text exceeds the system limits. The limit for a WTO is 125 characters, and the limit for a WTOR is 122 characters.
User response:  This could indicate an internal logic error within the product. Contact Software Support for further assistance.

HLV1348E  NO WTOR REPLY RECEIVED - TIMER EXPIRED
Explanation:  A timeout has occurred prior to receiving the response to a WTO/WTOR.
User response:  This could indicate an internal logic error within the product. Contact Software Support for further assistance.
### HLV1349I
**THE MESSAGE IDENTIFICATION NUMBER IS** setolID

**Explanation:** This message is simply an echo of the message identification number returned by the WTO/WTOR to identify the message.

**User response:** None. The WTO ID can be used to DOM a highlighted message.

### HLV1364S
**sysres RETURN CODE = rcode**

**Explanation:** Some type of error occurred either in the system management routines of the product or by invoking a system service (sysres) directly. See the actual text of the message for an explanation. The error was probably caused by a failure in an operating system service.

**User response:** Check if any other error messages were generated along with the error message above. If the combined error messages are sufficient to explain the problem, take whatever corrective action is appropriate. If the problem cannot be resolved, contact Software Support.

### HLV1370H
**jobname rcode descname mcsno time msgID msgtext**

**Explanation:** This message is used to document an internally generated WTO. It is written to the hardcopy log to identify the source of the message issued.

- `mcs` represents the MCS flags
- `cno` represents the console number
- `time` represents a wait time if the REPL keyword is coded

**User response:** None.

### HLV1400S
**TSO/E is not installed**

**Explanation:** TSO/E (IBM's program product number 5665-293) is required to support the use of ISPF/HLV.

**User response:** Verify that this product is available at your installation.

### HLV1401S
**service CMD(modname) FAILED, RC=rcode**

**Explanation:** HLV called TSO to execute ISPSTART and received a non-zero return code. The ISPF initiation attempt is aborted.

**User response:** Review the message text, and check why the request did not complete successfully. Review your ISPF/HLV environment, and take corrective action. If the problem cannot be resolved, contact Software Support.

### HLV1402S
**Dialog Manager service service error, RC=rcode**

**Explanation:** A product internal routine called TSO to execute ISPSTART and got a dialog manager service error.

**User response:** Review the ISPF error, checking the service name string for what service was invoked, and take corrective action. For additional assistance, contact your local S__ systems programming support group.

### HLV1404S
**ABEND OCCURRED PROCESSING SUBROUTINE subrut IN MODULE modname**

**Explanation:** The product ISPF application ABENDed while extracting information from constants in the subroutine's prolog.

**User response:** Contact Software Support for further assistance.

### HLV1405T
**ABEND OCCURRED PROCESSING SUBROUTINE subrut IN MODULE modname**

**Explanation:** The product ISPF application ABENDed while extracting information from constants in the subroutine's prolog.

**User response:** Contact Software Support for further assistance.

### HLV1406S
**THE ENTRY FOR SUBROUTINE subrut IN MODULE modname POINTS TO SUBROUTINE subrut**

**Explanation:** The ISPF application detected an error in a subroutine vector table.

**User response:** Contact Software Support for further assistance.

### HLV1407T
**THE ENTRY FOR SUBROUTINE subrut IN MODULE modname POINTS TO SUBROUTINE subrut**

**Explanation:** The ISPF application detected an error in a subroutine vector table.

**User response:** Contact Software Support for further assistance.

### HLV1420S
**service OF DIRECTED LOAD LIBRARY (ddname) FAILED RC=rcode**

**Explanation:** The S__ ISPF application attempted to do a directed load based upon a parameter setting in the OPMS(ISPLLIBDSNAME).

**service** may be "allocation" or "deallocation"

**User response:** Check the data set name specified in
the aforementioned parameter. After correcting the name, restart the Server address space.

**HLV1421E**  
infotext COMMAND infotext  

**Explanation:** The next message is not actually used by any code in the product. The message is used to reserve a return code. No action required.  
**User response:** None.

**HLV1423E**  
errmsg  

**Explanation:** Product security has denied the current user access to Trace Browse.  
**User response:** If this an undesirable situation, contact the product systems support group to grant you the required access.

**HLV1424E**  
CURRENT cmd COMMAND NOT AUTHORIZED - errdesc  

**Explanation:** Authorization check failed. The use of HLV/SWS is restricted by your installation security product.  
**User response:** Contact the person at your installation who installs and maintains the product to obtain access authority.

**HLV1440W**  
ISPF LOADLIB at level lvl, but Server LOADLIB at level lvl. Processing continues.  

**Explanation:** The version of the load library allocated to ISPF is at a different release than that of the server.  
**User response:** The product ISPF application continues. The inconsistency between the Server and the ISPF load libraries should be resolved.

**HLV1441S**  
ABEND abcode IN AUTHORIZATION ROUTINE modname+offset  

**Explanation:** An abend occurred in the authorization checking routine.  
**User response:** Contact the person at your installation who installs and maintains your installation security product.

**HLV1442S**  
COMMAND BUFFER PARSE RC=rcode  

**Explanation:** The IBM TSO parse routine, IKJPARS, returned a non-zero return code after attempting to parse a command string. The parse process for the command is terminated.  
**User response:** Gather the relevant problem data, and contact your local product systems programming group for assistance.

**HLV1443S**  
COMMAND BUFFER INTERNAL FORMAT ERROR  

**Explanation:** During an attempt to analyze the contents of the command buffer, it was determined that the command buffer had the wrong length, invalid operands, or the wrong format.  
**User response:** Review the command string entered. Revise the command string, if appropriate. Re-enter the revised command string. If the error condition persists despite correcting errors in the command string that was entered, contact Software Support for further assistance.

**HLV1444S**  
parmname PARAMETER reqval SPECIFIED WITH ARCHTYPE(parmval)  

**Explanation:** The Trace Browse/view program was invoked with invalid parameters.  
**User response:** Review the command string entered. Revise the command string, if appropriate. Re-enter the revised command string. If the error condition persists despite correcting errors in the command string that was entered, contact Software Support for further assistance.

**HLV1445S**  
SYSTEM MANAGER SERVICE service ERROR, RC=rcode  

**Explanation:** The product browse subroutine requested authorization in order to validate your request and did not find the necessary control blocks for this validation. The request is aborted.  
**User response:** This message indicates a possible product ISPF interface error. Gather the data, and contact your local systems programming support group.

**HLV1446S**  
ISPF service service error, return code = rcode  

**Explanation:** HLV invoked an ISPF service routine to accomplish the ISPF-related task indicated in the error message and received a non-zero return code.  
**User response:** Review the message text, and check why the request did not complete successfully. Review your ISPF/HLV environment, and take corrective action. If the error persists, contact Software Support.

**HLV1447E**  
Member member not found  

**Explanation:** A BLDL failed to find the specified member.  
**User response:** Examine the data set concatenation to ensure that the proper libraries are allocated. If the error persists, contact Software Support for further assistance.
HLV1448E  func failed for member=member  RC=rcode
Explanation:  An I/O operation (func) failed while attempting to do a BLDL.
User response:  Use this message in conjunction with any other messages that may accompany it to resolve the problem. You may also want to examine the data set for problems. Once the problem is corrected, restart the product.

HLV1449E  ISPF LOADLIB at version version1, 
Server LOADLIB at version2, please correct inconsistency
Explanation:  The version of the load library allocated to ISPF is at a different release than that of the server.
User response:  The library inconsistency should be resolved prior to invoking the ISPF application.

HLV1450H  jobname subsysID
Explanation:  This message is used to provide an audit trail in Trace Browse when using the Trace Browse option of the product.
User response:  No action is required. This message is for audit trail purposes only.

HLV1451H  jobname subsysID ARCHIVE REVIEW 
dname
Explanation:  This message is used to provide an audit trail in Trace Browse when using the Trace Archive View function.
User response:  None. This message is for audit trail purposes only.

HLV1452S  ABEND abcode REASON rsn 
OCCURRED IN modname+offset
Explanation:  An abend occurred in the browse program.
User response:  Check for other errors, and correct the problem. If unable to correct the problem, contact Software Support for further assistance.

HLV1453S  service OF desc FAILED, RC=rcode, 
DETECTED AT addr
Explanation:  This is a generic error message used to describe a wide variety of product ISPF initialization, execution, and termination errors. The message text provides the current operation (service) and what the current operation was trying to do.
User response:  Check the error messages and the return code associated with this problem. There may be one or more error messages referring to the current problem. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support.

HLV1454S  servrout errdesc FAILED, ABEND=abcode, 
REASON CODE=rsncode
Explanation:  This is a generic error message used to describe a wide variety of product ISPF initialization, execution, and termination errors. The message text provides the current operation and what the current operation (servrout) was trying to do.
User response:  Check the error messages and the return code associated with this problem. There may be one or more error messages referring to the current problem. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support.

HLV1455S  Subsystem subsys not active
Explanation:  The specified subsystem is not active
User response:  Start the specified subsystem and then restart the ISPF application or choose another subsystem ID to start the ISPF application with

HLV1456S  ISPF service service error, return code = rcode. Unable to start ISPF dialog.
Explanation:  HLV invoked an ISPF service routine to start the ISPF dialog and received a terminating return code.
User response:  Review the message text, and check why the request did not complete successfully. Review your ISPF/HLV environment, specifically the DEFINE ISPFCONCAT statements in the xxxxIN00 EXEC, and take corrective action. If the error persists, contact Software Support.

HLV1457W  Subsystem subsys not active
Explanation:  The specified subsystem is not active
User response:  The ISPF dialog could not find the specified subsystem.

HLV1600E  Module DSNACAF not properly linked
Explanation:  The product-related Db2 interface module tried to load the address of a module needed to connect to the actual Db2 system. The address field was zero. The module could not be invoked, and the connection to the actual Db2 system failed.
User response:  Ensure that the product is properly installed. The load module referred to in the error message must be properly linked with the product module having the same name. Relink the DSNACAF module, and rerun the Db2 application program.
HLV1601E  Product is not active at this time

Explanation: The product-related Db2 interface module tried to communicate with the main product (not Db2) address space. The main product address space was not active. This error normally occurs at the start of SQL application program execution.

User response: Ensure that the main product address space is active. Start or restart the main product address space, if necessary. Rerun the SQL application program from the beginning.

HLV1602E  Product failed while SQL application program executing

Explanation: The product-related Db2 interface module tried to communicate with the main product (not Db2) address space. The main product address space was not active. This error normally occurs at the start of SQL application program execution.

User response: Ensure that the main product address space is active. Start or restart the main product address space, if necessary. Rerun the SQL application program from the beginning.

HLV1603E  Module DSNTIAR not properly linked

Explanation: The product-related Db2 interface module tried to load the address of a module needed to connect to the actual Db2 system. The address field was zero. The module could not be invoked, and the connection to the actual Db2 system failed.

User response: Ensure that the product is properly installed. The load module referred to in the error message must be properly linked with the product module having the same name. Relink the DSNTIAR module, and rerun the Db2 application program.

HLV1700E  service desc FAILED, RC=rcode, DETECTED AT addr

Explanation: This is a generic error message used to describe a wide variety of errors. The message text gives a description of the current operation (service) and what the current operation was trying to do.

User response: Check the error messages and the return code associated with this problem. There may be one or more error messages referring to the current problem. If possible, fix the problem identified by the error messages, and retry the operation. If the problem cannot be resolved, contact Software Support.

HLV1701E  ERROR CODE queue SENDING MESSAGE TO %2 QUEUE

Explanation: An error has occurred while attempting to send a record to a product queue. The most likely cause for this message is that the queue is full - which is indicated by an error code of 4. In the case of either

product load balancing queue, a queue full condition results in no further sessions being sent to this server by the Group Director until the pending work on the queue has been significantly reduced. For any other error code, no additional work will be sent to this server and the server must be terminated and restarted.

User response: Contact your local product systems programming group for assistance.

HLV1702E  desc func FAILED, RC=rcode, DETECTED AT addr

Explanation: This is a generic error message used to describe errors that occurred while attempting to allocate or free (func) a product control block. Allocation failures are typically an indication of insufficient virtual storage.

User response: Check the error messages and the return code associated with this problem. There may be one or more error messages referring to the current problem. If possible, fix the problem identified by the error messages, and retry the operation. If the problem cannot be resolved, contact Software Support.

HLV1740T  Invoking IEFSSREQ for SSI function func - codedesc

Explanation: The ADDRESS SPOOL S/REXX Host Command Environment or another routine using Sysout Application Programming Interface (SAPI) common routines is invoking a SubSystem (SSI) service. This message is traced, prior to each invocation of the IEFSSREQ SSI gateway macro.

User response: None. The indicated SSI function is invoked immediately after this message is traced.

HLV1741T  IEFSSREQ SSI return code is rcode

Explanation: An invocation of the SubSystem Interface (SSI) macro IEFSSREQ has completed, and the resulting return code is displayed in the message. This message is traced, following each SSI service request invocation when the SSITRACE command option is in effect.

User response: None. The SSI gateway interface has returned with the IEFSSREQ return code shown in the message in R15.

HLV1742T  SSOBRETN FUNCTION-SPECIFIC RETURN CODE IS rcode

Explanation: An invocation of the SubSystem Interface (SSI) macro IEFSSREQ has completed with return code zero. The function- specific return code is traced by this message following each SSI service request invocation made while the SSITRACE command option is in effect.

User response: None. The indicated SSI function has completed with the SSOBRETN return code shown in the message.
HLV1743T  WAITING FOR NEW SYSOUT FILES FOR sec SECONDS

Explanation: The Sysout Application Programming Interface SSI service has been invoked with a PUTGET request that has returned an END-OF-DATA signal. The system will await new SYSOUT output to become available for the indicated time period. This message is traced prior to entered a WAIT for more SYSOUT output data to become available.

User response: None. A WAIT is entered for more SYSOUT output which will expire after the indicated number of seconds.

HLV1744T  WAIT TIMELIMIT EXPIRED - END-OF-DATA FOR SYSOUT

Explanation: A Sysout Application Programming Interface SSI service request routine had entered a WAIT until additional SYSOUT output became available, following receipt of an END-OF-DATA signal. The timelimit for waiting on additional SYSOUT output to become available has expired and the request routine will now process the END-OF-DATA signal. This message is traced when the SSITRACE command option is in effect.

User response: None. The WAIT for new SYSOUT output is terminated and the procedure continues by recognizing the END-OF-DATA signal.

HLV1745T  NEW SYSOUT FILE NOW AVAILABLE

Explanation: A Sysout Application Programming Interface SSI service request routine had entered a WAIT until additional SYSOUT output became available. The primary subsystem has posted the requestor ready and indicated the additional SYSOUT output is now available. This message is traced when the SSITRACE command option is in effect. Because another process or writer may select the same SYSOUT file for processing, there is no guarantee that the file will be available when selection is requested.

User response: None. The WAIT for new SYSOUT output has completed and the procedure continues by attempting to select the new SYSOUT file for processing.

HLV1746T  IRXEXCOM action REQUEST FOR varname FAILED WITH RC/SHVRET=rcode/SHVRETvval

Explanation: The ADDRESS SPOOL Host Command Interface encountered an error while attempting to set, change, or drop (action) a variable in the S/REXX variable pool. The Host Command being processed will be failed with a severe error signal.

User response: Make additional workspace available for execution of the product REXX procedure. If the problem persists and cannot be resolved by increasing the allocated workspace, contact Software Support for assistance.

HLV1747T  ADDRESS SPOOL ENCLOSED ABEND CC=rcode, RS=rsncode AT modname+offset, PSW=psw, RETRY BY addr

Explanation: The ADDRESS SPOOL Host Command Interface encountered an ABEND while processing the current request. The ADDRESS SPOOL host command will be terminated with a failure signal.

User response: Check for other messages which may provide insight into the cause of the ABEND. Correct the Host Command, or other conditional as applicable. If unresolved, contact Software Support.

HLV1748T  ABEND CC=rcode, RS=rsncode AT modname+offset, PSW=psw, ACCESSING dsect STRCT AT addr, RETRY BY addr

Explanation: The ADDRESS SPOOL JOBSTATUS command encountered an ABEND while processing the indicated extended status information DSECT. The command abandons further processing of the extended status information returned by the SSI service.

User response: Check for other messages which may provide insight into the cause of the ABEND. Correct the Host Command, or other condition as applicable. If unresolved, contact Software Support.

HLV1749T  SSI ABEND CC=rcode, RS=rsncode AT modname+offset, PSW=psw, RETRY BY addr

Explanation: An SSI service request call to the IEFSREQ interface ABENDED. The ABEND completion code and reason are displayed in this message. The ABEND may be due to some error in parameters passed on the service request, or due to some permanent or transient operating system failure.

User response: Check for other messages which may provide insight into the cause of the ABEND. Correct the Host Command, or other condition as applicable. If unresolved, contact Software Support.

HLV1750T  DDNAME ddname ALLOCATED TO SYSOUT FILE dname

Explanation: A SYSOUT dataset has been allocated to the indicated DDNAME. The caller may now process the SYSOUT file using the DDNAME allocation. This message is traced when the SSITRACE command option is in effect. If the DDNAME is "<SKIPPED>" no allocation has been made for the indicate SYSOUT dataset, and processing continues without an outstanding DDNAME allocation.

User response: None. The SYSOUT allocation remains...
until the next SAPI request is processed, or until the environment is ended.

HLV1751T DDNAME ddname DEALLOCATED

Explanation: A SYSOUT dataset has been deallocated from the DDNAME provided in the trace message. This message traced when the SSITRACE command option is in effect.

User response: None. The SYSOUT file has been deallocated and processing continues.

HLV1752T SPOOL HCE ERROR(rcode/rsncode): rsndesc

Explanation: An error has been encountered while processing a SPOOL Host Command Environment request. This message may be traced after an error, depending on tracing options in effect while processing the command. The request is being rejected with the return code and reason code (in parentheses), having the description given.

User response: Check for other messages which may provide insight into the cause of the problem. Correct the Host Command, or other condition as applicable. If unresolved, contact Software Support for assistance.

HLV1753T SPOOL HCE SECONDARY ERROR(rcode/rsncode): rsndesc

Explanation: An error has been encountered while processing a SPOOL Host Command Environment request. A previous error has already been logged and this error occurred during Host Command Environment cleanup. This message may be traced after an error, depending on tracing options in effect while processing the command. The request is being rejected with the original return and reason codes. This message describes the secondary error.

User response: Check for other messages which may provide insight into the cause of the problem. Correct the Host Command, or other condition as applicable. If unresolved, contact Software Support for assistance.

HLV1754T SPOOL CLEANUP ABEND CC=rcode, RS=rsncode AT modname+offset, PSW=psw, action, RETRY RTNE AT addr

Explanation: An ADDRESS SPOOL environment cleanup routine encountered an ABEND during resource recovery processing. Processing to recovery resources continues. One or more resources may not be recovered correctly.

User response: Check for other messages which may provide insight into the cause of the ABEND. Correct the Host Command, or other condition as applicable. If unresolved, contact Software Support.

HLV1755T SPOOL HCE MSG:code/rsncode: rsndesc

Explanation: An informational message traced while processing a SPOOL Host Command Environment request. This message may be traced after an error, depending on tracing options in effect while processing the command.

User response: None. Processing continues.

HLV1840E errdesc

Explanation: A syntax error (errdesc) has been detected while analyzing the EXECIO command.

User response: Correct the EXECIO command syntax errors, and attempt to execute the REXX program again.

HLV1841E errdesc, RC=rcode

Explanation: Some type of service routine (operating system or product specific) failed. The error message identifies the type of error.

User response: Check the full text of the error message, and attempt to correct the error.

HLV1842E errdesc1 ddname errdesc2

Explanation: The ddname specified on the EXECIO command is not allocated to the current job. The error description has two parts,.errdesc1 and errdesc2.

User response: Allocate the appropriate data set to the ddname, or change the ddname. Then, rerun the REXX program.

HLV1843E ddname is FAILED, RC=rcode, DETECTED AT addr

Explanation: Some type of error occurred during invocation of a product I/O routine (io) associated with the EXECIO command.

User response: Check if any other error messages were generated along with the error message above. If the combined error messages are sufficient to explain the problem, take whatever corrective action is appropriate. If the problem cannot be resolved, contact Software Support.

HLV2020S dsname FAILURE RC=rcode

Explanation: An attempt to obtain or release storage on behalf of a product subsystem data set (dsname) failed.

User response: Ensure that the address space requesting product subsystem data set services has a large enough region.
HLV2021S  desc CANNOT USE SUBSYS FILE ALLOCATIONS

Explanation: The product has detected that a system address space (e.g. "master") or a TSO user has requested that a product subsystem data set be opened. This is not allowed.

desc describes, for example, system tasks

User response: The subsystem data set interface may only be used by normal (non-system) started tasks and batch jobs.

HLV2022S  UNKNOWN SUBSYS OPEN ENVIRONMENT ASID asid

Explanation: The product received an OPEN request for a subsystem data set and is unable to determine what environment the requesting address space (asid) is running in.

User response: The subsystem data set interface may only be used by TSO server started tasks.

HLV2023S  No server block found for USERID=jobname

Explanation: The product received an OPEN request for a subsystem data set and found that the request was not from a TSO server address space initiated as an outboard server by the product.

User response: This is most likely an internal problem. Contact Software Support for further assistance.

HLV2026S  Invalid subsystem file count count found for server jobname

Explanation: The product has detected an internal error during close processing for a subsystem data set. The count of open subsystem data sets for this address space has gone negative.

User response: Gather the available problem data, and contact your local product systems programming group for support in this area.

HLV2027S  SUBSYS req blk VALIDATION ERROR - ADDRESS addr

Explanation: The product has detected an error validating system control blocks while processing an OPEN request (req) for a product subsystem data set control block.

User response: Gather the available problem data, and contact your local product systems programming group for assistance.

HLV2030S  ABEND abcode IN USER EXIT modname+offset

Explanation: An abend occurred in the authorization checking routine.

User response: Contact the person at your installation who installs and maintains the product security exit routine.

HLV2031W  TSO SERVER (procedure) - SYSTSIN BLKSIZE = blksize, USE maxblksize

Explanation: The BLKSIZE specified on the SYSTSIN DD card in the TSO server started task JCL is one of the factors that limits the length of commands that can be sent to servers.

User response: It is recommended that you modify the BLKSIZE on the SYSTSIN DD card in the specified procedure to the BLKSIZE specified.

HLV2032T  SUBSYSTEM DATA req (reqcode) PROCESSED FOR DDNAME ddname - RC=rcode

Explanation: The product's subsystem data set SSI intercept routine has processed a request. This message traces the interception request.

User response: None. This is a diagnostic message.

HLV2040T  SRP RABND: SRVR NOT RESPONDING - ASID=asid ASCB=ascb TCB=tcb

Explanation: A request for service has been made to server subtask either inside or outside the main product address space. The requesting task has attempted to revoke the request due to timeout or shutdown, but the server has not acknowledged. The request for service has been forcibly revoked.

User response: Depending on the nature of the request, either the requesting task or the server task TCB will be cancelled.

HLV2041T  SRP SFREE: RQSTR CANNOT BE POSTED - CODE=pcode - ASID=asid TCB=tcb CNID=cnid TOKEN=token SMAF=addr

Explanation: A request for service has been made to a server subtask either inside or outside the main product address space. The server task is unable to post the requestor task because the task has ended.

User response: The server task continues without posting the requestor.
**Explanation:** This is a diagnostic message issued by the service requestor/provider interface.

word1 and word2 represent control words before and after image, respectively

tb represents a traceback point

**User response:** None. This message is for diagnostic use only.

---

**Explanation:** This is a diagnostic message issued by the service requestor/provider interface.

word represents a control word before image

**User response:** None. This message is for diagnostic use only.

---

**Explanation:** This is a diagnostic message issued by the service requestor/provider interface.

word1 and word2 represent control words before and after image, respectively

tb represents a traceback point

**User response:** None. This message is for diagnostic use only.

---

**Explanation:** This is a diagnostic message issued by the service requestor/provider interface.

word represents a control word before image

**User response:** None. This message is for diagnostic use only.

---

**Explanation:** This is a diagnostic message issued by the service requestor/provider interface.

word1 and word2 represent control words before and after image, respectively

tb represents a traceback point

**User response:** None. This message is for diagnostic use only.

---

**Explanation:** This is a diagnostic message issued by the service requestor/provider interface.

Word represents a traceback point

**User response:** None. This message is for diagnostic use only.

---

**Explanation:** This is a diagnostic message issued by the service requestor/provider interface.

tb represents a traceback point

**User response:** None. This message is for diagnostic use only.

---

**Explanation:** While processing this request, product main command processing function detected an abnormal shutdown of the product.

**User response:** Check the abend, what caused it, and how to best restart the product. Resolve the current problem and continue.

---

**Explanation:** The product End-Of-Memory (EOM) processing detected the unexpected termination of an outboard TSO server address space. The server should be restarted automatically by the product, providing that the server control limits have not been modified.
User response: You may want to determine why the server failed.

HLV2084E service operand FAILED, RC=rcode, DETECTED AT addr

Explanation: A CALLRTM invocation within the product End-Of-Memory (EOM) failed. The EOM routine was attempting to cancel an outbound TSO server.

User response: Check the service and return codes, and attempt to resolve the problem. If the problem cannot be resolved, contact Software Support.

HLV2101S userID init FAILED - macro RC=rcode

Explanation: The product security function processing routine GETMAIN for some private storage failed. This storage is required for the processing of security control blocks.

init represents the initialization type

User response: Review the above storage GETMAIN error. Determine why storage is unavailable. Check for any exit that limits usage of below-the-line private storage. Resolve the above problems, and restart.

HLV2102E reftype REQUEST FOR userID FAILED - failrsn

Explanation: The product security function routine (reftype) received a non-zero return code for the listed user ID.

User response: Check the security error for the user ID. Correct the access problem, or contact your security administrator for further assistance.

HLV2103S userID rcode FAILED - RACF CODES rsncode text

Explanation: The product received an unknown return code from RACF.

User response: Check the related RACF errors, and validate the return code in the RACF Messages and Codes Manual. Contact your local systems programming group for assistance.

HLV2104E userID init FAILED - failrsn

Explanation: During LOGON command security checking, the product security function routine received a non-zero return code from the security package for the current userid.

init represents the initialization type

User response: Check the security error for the userid. Correct the access problem, or contact your security administrator for further assistance.

HLV2106H userID init FOR conID AT i2 ON d2

Explanation: Product security function routine issued this informational message for the TSO address spaces. init represents the initialization type

User response: None. This message is for informational purposes only.

HLV2107H LOGON FAILED FOR userID, rcode1 rcode2 rsncode - errtext.

Explanation: Product received a non-zero return code from a LOGON request for an internal task.

The message has two return codes; rcode1 represents the security module return code, and rcode2 represents the RACF (SAF) return code

User response: Check the security error for the userid. Correct the access problem, or contact your security administrator for further assistance.

HLV2108E errmsg1 errmsg2 FAILED - RC=rcode

Explanation: The product failed to extract the security product user ID.

User response: Validate the current system situation. Ensure that the security package initialization is complete before the product is started.

HLV2120I MEMBER member - additinfo

Explanation: The product copy utility has started copying members between PDSs.

User response: None. This message is for informational purposes only.

HLV2121S io FAILED, RC=rcode, MEMBER=member, DDNAME=addrname, DNAME=dsname

Explanation: The product copy utility was copying members from one PDS to another, and the copy failed.

io represents the current I/O operation

User response: Check the return codes and related MVS error messages. Ensure that the data sets have enough space. Take action as recommended for the return codes.

HLV2122I MEMBER member RECORD recono LENGTH lth IS INVALID

Explanation: The product VB to FB conversion program found a record with an invalid length.

User response: Fix the invalid record, and rerun the VB to FB conversion program.
HLV2200E  service desc FAILED RC=rcode, DETECTED AT addr

Explanation: This is a generic error message used to describe a wide variety of errors. The message text gives a description of the current operation (service) and what the current operation was trying to do.

User response: Check the error messages and the return code associated with this problem. There may be one or more error messages referring to the current problem. If possible, fix the problem identified by the error messages, and retry the operation. If the problem cannot be resolved, contact Software Support.

HLV2300E  NLS SERVICE ROUTINE (OPTRTB) ABEND abcode, RS=rsnrcode AT modname+offset

Explanation: The NLS service routine detected an abend while processing a request.

User response: Check if any other error messages were generated along with the error message above. If the combined error messages are sufficient to explain the problem, take whatever corrective action is appropriate. Otherwise, contact Software Support for assistance.

HLV2301I  NLS INVOKED WITH INVALID FUNCTION CODE funcode

Explanation: The NLS service routine was invoked with an invalid function code (in hex).

User response: Check if any other error messages were generated along with the error message above. If the combined error messages are sufficient to explain the problem, take whatever corrective action is appropriate. Otherwise, contact Software Support for assistance.

HLV2302I  NO VALID MAPPING FOR src CODEPOINT srccp TO output - SUBSTITUTING subcp

Explanation: The NLS service routine was invoked for conversion of a DBCS character stream to/from ASCII/EBCDIC. No valid DBCS codepoint is defined for the input DBCS code point.

src represents the source encoding, however srccp represents the source codepoint (in hex)
subcp represents the substitution codepoint

User response: The DBCS codepoint is converted to a standard substitution character and the operation continues. Ensure that the character stream passed to the conversion routine contains only DBCS characters that have defined translation codepoint assignments. You may need to define an ASCII/EBCDIC codepoint entry during start-up for GAIJI codepoints or for codepoints not built in to the system.

HLV2303I  UNEVEN BYTES IN PURE DBCS STRING - byte FOUND IN TRAILING POSITION - DISCARDED

Explanation: The NLS service routine was invoked for conversion of EBCDIC pure DBCS data. An uneven number of bytes were present in the input stream.

User response: Handling of the current DBCS conversion is completed by skipping the trailing, unmatched single byte.

HLV2304I  NO TRAILING SHIFT-IN DELIMITER BEFORE END OF DBCS STRING - ASSUME SHIFT-IN WAS PRESENT

Explanation: The NLS service routine was invoked for conversion of EBCDIC mixed SBCS/DBCS string. While processing DBCS characters, the input stream was exhausted before a shift-in character was found. DBCS sequences should always be terminated by a trailing shift-in byte.

User response: Handling of the current DBCS conversion is completed by assuming that a shift-in character was present.

HLV2305I  INVALID ENCODING PARAMETER (parmname) DETECTED IN NLS E-TO-A ENCODING ROUTINE

Explanation: The NLS service routine was invoked for conversion of EBCDIC to ASCII. The encoding parameter is invalid.

User response: The server assumes ISO-8859-1 SBCS EBCDIC to ASCII conversion.

HLV2306I  DESTRUCTIVE OVERLAP DETECTED IN SBCS E-TO-A OR A-TO-ENCODING ROUTINE

Explanation: The NLS service routine was invoked for EBCDIC to ASCII or ASCII to EBCDIC encoding of SBCS data. Overlap of the input and output areas was detected. The encoding request is aborted by deliberate generation of an S0C3 abend.

User response: This is probably a logic error. Contact Software Support.

HLV2307I  NO NLS TABLE FOUND FOR ASCII/EBCDIC MAPPING CODE tblname

Explanation: The NLS service routine was invoked to look up an NLS EBCDIC to ASCII or ASCII TO EBCDIC translation table (tblname). The requested table was not found.

User response: Ensure that valid values are set for the server ASCIEBCDICMAPPING and CHARACTERENCODING parameters. Check for other
messages which indicate whether a non-default setting was selected during processing of the current transaction. Also, check the ISPF 5.19 display for a list of coded character sets that are defined to the system. The server will continue the operation using the built-in ENU ASCIIEBCDICMAPPING table for SBCS operations and will set the CHARACTERENCODING to ISO-8859-1.

HLV2308I  NO BUILT-IN NLS TABLE FOUND FOR scheme (tblname)

Explanation: The NLS service routine was invoked to encode or decode data which contains a multi-byte character set algorithm. A built-in NLS character set conversion table was not present.

User response: The encode/decode operation is aborted by deliberate generation of an S0C3 abend. Check for reasons why the built-in table described in the message is undefined to the system.

HLV2309I  UNPAIRED scheme DBCS LEAD-BYTE BY DECODER

Explanation: The NLS service routine was invoked to decode data which contains a multi-byte character set algorithm. A single byte was found which should be the first byte of a two-byte DBCS character sequence; however, no more input bytes were present.

User response: The decode routine skips the invalid DBCS lead-byte and omits it from the EBCDIC result.

HLV2310I  UNSUPPORTED ESCAPE SEQUENCE seq FOR meth

Explanation: The NLS service routine was invoked to decode data which contains multi-byte character sets including escape sequences. The escape sequence (seq) reported in the message is not supported by the server.

User response: The decode routine copies the escape sequence and converts it to SBCS EBCDIC.

HLV2311I  UTF-8 ind NOT SUPPORTED FOR NLS page - ASSUMING HOST CODE PAGE IS "ENU"

Explanation: The NLS service routine was invoked to decode or encode a UTF-8 data stream. The server does not support UTF-8 data streams for the selected EBCDIC host code page (page).

User response: The routine assumes the EBCDIC host code page is set to ENU (IBM-1047). This may lead to incorrect results when the input or output stream has been processed.

HLV2312I  BYTE byte IS AN INVALID UTF-8 BYTE - SKIPPING TO NEXT BYTE OF STREAM

Explanation: The NLS service routine was invoked to decode a UTF-8 data stream. An invalid lead-byte value has been found in the UTF-8 stream (x80-xBF, or xF8-xFF). The decoder will skip over the offending byte and ATTEMPT to re-orient at the next input byte position.

User response: The decode operation continues at the next input stream position. This may lead to additional errors or incorrect decoding of the stream.

HLV2320T  DBCS conversion bypassed for parameter parmm: rsn

Explanation: The DBCS Dynamic Conversion Service bypassed conversion of the specified parameter to graphic for the reason listed. The operation will be passed on to Db2 which will most likely issue an SQLCODE = -301 error.

User response: This is a programming error in the client application.

HLV2401E  db2ID conntype func ERROR, RC=rcode REASON=rscn

Explanation: Db2 Streams Collector received an unexpected failure return code from a CAF or RRSAF function.

User response: Refer to the Db2 Messages and Codes for further details on the error. Message 2402 may be issued as well.

HLV2402E  db2ID : msgtext

Explanation: Db2 Streams Collector received an unexpected failure return code from a CAF or RRSAF function.

User response: Refer to the Db2 Messages and codes for further details on the messages.

HLV2403E  conntype module mismatch for DB2 subsystem db2ID

Explanation: Db2 Streams Collector received a return code 4 and reason code 00C10823 attempting to create a CAF or RRSAF connection to the specified Db2.

User response: Change the STEPLIB used by the product to point to the highest level version of Db2.
HLV2404E  User ID userID does not have authority to access DB2 db2ID

Explanation: Db2 Streams Collector received a return code 8 and reason code 00F30013 attempting to create a CAF or RRSAF connection to the specified Db2.

User response: Correct the DEFINE PUBLISH statement to specify a userid authorized to access the particular Db2.

HLV2405E  DB2 system db2ID not defined

Explanation: Db2 Streams Collector received a return code 8 and reason code 00F30006 attempting to create a CAF or RRSAF connection to the specified Db2.

User response: Correct the DEFINE PUBLISH statement

HLV2406T  db2ID conntype ISSUED, RC=rcode REASON=rscncde

Explanation: Trace Streams Db2 CAF and RRSAF return codes

User response: None

HLV2407T  PUBLISH SOURCE db2ID USERID userID LOGON FAILED rcode1 rcode2 rsncode

Explanation: The PUBLISH USERID specified could not be logged on. This message should be followed by another message with the SAF error message.

The message has two return codes; rcode1 represents the security module return code, and rcode2 represents the RACF (SAF) return code.

User response: The Streams routine is aborted. Ensure that the userid specified is correct.

HLV2408E  Streams plan plan not defined TO db2ID

Explanation: Return code 8 Reason code 00F30040 received attempting to open the specified plan.

User response: The Streams source task is aborted. Ensure that the specified plan is bound.

HLV2409I  sctype %2 Streams source task now starting

Explanation: The DEFINE PUBLISH TYPE(DB2) task is starting.

User response: This message is for informational purposes only.

HLV2410I  Streams destination task for destination starting

Explanation: DEFINE PUBLISH DESTINATION task starting

User response: None

HLV2411W  PUBLISH - service OF desc FAILED, RC=rcode

Explanation: The product tried to initialize or a Publish task during product initialization or termination. An internal service routine called during Publish task initialization or termination exited with a non-zero return code.

User response: Check the error messages and the return code associated with this problem. There may be one or more additional error messages or abends referring to the current Publish task initialization or termination problem. Also, check for storage allocation errors or abends. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support to obtain additional assistance.

HLV2412I  Streams tasktype task for destination terminating

Explanation: DEFINE PUBLISH task terminating

User response: None

HLV2413T  data1 data2 data3 data4 data5 data6 data7 data8 data9 %SK

Explanation: This message emits information related to the Trace Streams Db2 routines.

User response: None

HLV2414W  UNABLE TO FIND DATASET NAME FOR DDNAME ddname

Explanation: Streams destination is unable to access the Dataset name for the listed DD name, which contains XML formatting information.

User response: None

HLV2415E  CANNOT SERIALIZE ON db2ID QUALIFIER qualifier

Explanation: It appears that another copy of the product is using the same Event Publisher Db2 tables that this copy of the product is attempting to use.

User response: No action is required.
Streams support not configured - it cannot be initialized

Explanation: None.
User response: Contact IBM Software Support.

Invalid return from Streams rule rulename rval

Explanation: An SEF rule (rulename) for a Streams event provided a syntactically invalid return value (rval). The event was not Published.
User response: Correct the SEF rule and retry.

PUBLISH ITEM keyfield FOR SOURCE srcID - errtext - STATUS=scode RC=rcode REASON=rsncode DIAG=diaginfo- FAILED

Explanation: Error attempting to Publish an update for the particular item.
User response: Attempt to correct the error.

PUBLISH DESTINATION dest FAILURE errtext - STATUS=scode RC=rcode REASON=rsncode DIAG=diaginfo - WILL RETRY

Explanation: Error attempting to Publish an update for the particular item.
User response: Attempt to correct the error.

DB2 db2ID CONTENTION ON table CODE - sqlcode - WILL RETRY LATER

Explanation: Timeout detected trying to access one of the Streams tables.
User response: None - the Streams will retry the request.

DUPLICATE PUBLISH OF pkgdest (HTX) TO destination IGNORED

Explanation: An Streams rule tried to ship the same update more than once to a particular destination (pkgdest). Only the first instance was published.
User response: Correct the SEF rule.

MACHINE machID (index) IS USING UNKNOWN PROTOCOL protocol

Explanation: A saved ODBC generated destination is requesting an unsupported protocol. The destination is ignored.
User response: Contact Software Support.

MACHINE machID (index) DOES NOT HAVE A SAVED URL

Explanation: A saved ODBC generated TCPIP destination does not have a saved URL.
User response: Have the client process reissue the ENABLETRANSMISSIONS ODBC call. If the problem cannot be resolved, contact Software Support.

MACHINE machID (index) INVALID URL errcode - detailed

Explanation: A saved ODBC generated TCPIP destination have an invalid saved URL.
User response: Have the client process reissue the ENABLETRANSMISSIONS ODBC call. If problem persists contact Software Support.

WORKTABLE UPDATE FOR keyfield destination FAILED - ROW NO LONGER EXISTS

Explanation: A deferred status for the publication of a particular item could not be reflected into the worktable because the row describing the item no longer exists.
User response: Ignore if the row was deleted while the status was outstanding. If problem persists contact Software Support to obtain additional assistance.

MACHINE machID (index) DOES NOT HAVE A SAVED MQ NAME

Explanation: A saved ODBC generated MQSeries destination does not have a saved target MQ name.
User response: Have the client process reissue the ENABLETRANSMISSIONS ODBC call. If problem persists contact Software Support to obtain additional assistance.

Task task not started - not licensed for feature.

Explanation: None.
User response: Contact IBM Software Support.

task SOURCE TASK PARAMETER MQREPLYQNAME mqrreplyqname IGNORED - NOT LICENSED FOR USE

Explanation: None.
User response: Contact IBM Software Support.
HLV2429E  NON-REPORT MQ MESSAGE RECEIVED ON mqrqname (start) - IGNORED

Explanation: An MQSeries message other than a status report was received on the MQREPLYQNAME. start represents the start of the text

User response: Ensure that the MQREPLYQNAME MQSeries Q is not used for anything other than Streams as an MQREPLYQNAME.

HLV2430E  source MQSERIES MQ FAILURE ON mqrqname RC=rcode REASON=rsncode - errdesc

Explanation: An unexpected MQSeries failure occurred when attempting to record report messages to the WorkFile.

User response: Ensure that the MQREPLYQNAME was properly defined in the MQSeries catalog.

HLV2431I  jobname Streams exit exit enabled

Explanation: The Streams PLTPI program has been enabled during CICS PLTPI phase three initialization.

User response: None. This message is for informational purposes only.

HLV2432E  UNRECOGNIZED MQ REPORT MESSAGE RECEIVED ON mqrqname (corrid)

Explanation: An MQSeries report message had an unrecognized correlation ID value (corrid).

User response: Ensure that the MQREPLYQNAME MQSeries Q is not used for anything other than Streams as an MQREPLYQNAME.

HLV2433E  EVENT DEFINITION BUILD FAILED FOR source event datamap

Explanation: Streams source task initialization failed while attempting to build an event definition from the a data map.

User response: Ensure that the data map used in the event definition is correct and matches the layout of the data to be captured. in the case of an IMS/DB map, make sure that a COBOL map that defines the data fields has been successfully merged.

HLV2434W  tsksname tskttype DB2 EVENT TABLE ROWNUM percent FULL

Explanation: The specified publish task EVENT table, DTRIGGERTABLE, column name ROWNUM has a value that is nearing the end of its available range. It must be reset before it runs out of available numbers in its range. The range is 1 to 2147483647. The percent specified in the message shows how much of that range has been used.

User response: Quiesce the source task or stop the product and DROP and CREATE the proper TRIGGERTABLE.

HLV2435S  jobname error inquiring CICS system information for Streams - EIBRESP: respcode

Explanation: The Streams PLTPI program encountered an error inquiring CICS system information.

User response: Probable CICS error. Check the system log for errors.

HLV2436S  jobname error enabling Streams exit program for exit exit - EIBRESP: respcode

Explanation: The Streams PLTPI program encountered an error enabling a Streams exit program.

User response: Check that the exit program has been correctly defined to CICS.

HLV2437S  jobname error extracting GWA address for Streams program program - EIBRESP: respcode

Explanation: The Streams PLTPI program encountered an error extracting the Global Work Area address for the exit program.

User response: Probable CICS error. Check the system log for errors.

HLV2438S  VSAM capture not enabled, already being processed by subsystem subsys

Explanation: VSAM capture is already being processed by another product subsystem. Only one product subsystem is allowed to capture VSAM events.

User response: Informational.

HLV2440I  VSAM event capture enabled

Explanation: VSAM event capture has been enabled by this product subsystem.

User response: Informational.

HLV2441E  Error in enabling VSAM event capture, RC=rcode

Explanation: An error was encountered while enabling VSAM event capture.

User response: Contact Software Support.
HLV2443I  VSAM caller is in key callers and only key 8 callers are supported, VSAM capture terminated.

Explanation: Only key 8 programs are supported for VSAM capture.

User response: Contact Software Support.

HLV2444E  VSAM capture prefix not set, VSAM capture not enabled

Explanation: A capture prefix (PUBLISHVSAMPREFIX) must be specified to capture VSAM events.

User response: Contact Software Support.

HLV2445S  jobname error operation Streams exit program - EIBRESP: resPCODE

Explanation: The Streams PLT program encountered an error starting or stopping the exit program.

operation indicates "STARTING" or "STOPPING"

User response: Check that the exit program has been correctly defined to CICS.

HLV2446I  jobname enabling Streams exit program for exit exit

Explanation: The Streams PLTP program is about to enable the exit program.

User response: None. This message is for informational purposes only.

HLV2447I  jobname operation Streams exit program program

Explanation: The Streams PLT program is about to start or stop the exit program.

operation indicates "STARTING" or "STOPPING"

User response: None. This message is for informational purposes only.

HLV2448I  jobname Streams exit program program operation

Explanation: The Streams global user exit program has been started or stopped.

operation indicates "STARTED" or "STOPPED"

User response: None. This message is for informational purposes only.

HLV2449I  Unable to create capture file file, RC = rcode1, REC = rsncode, SSIRC = rcode2

Explanation: An error occurred trying to create the VSAM capture file.

The message contains two return codes; rcode1 represents the catalog management return code, and rcode2 represents the SMS SSI call return code.

User response: Return and reason codes can be found in msg IDC3009I

HLV2450I  Unable to allocate capture file file, RC = rcode, REC = rsncode

Explanation: An error occurred trying to allocate the VSAM capture file.

User response: Return and reason codes can be found in "Authorized Assembler Services Guide"

HLV2451I  Unable to open capture file file, RC = rcode

Explanation: An error occurred trying to open the VSAM capture file.

User response: Return code documented in "Macro Instr for Data Sets"

HLV2452I  Capture file file is not SMS managed, but SMS is required for the capture file

Explanation: The capture file is non-sms, but SMS management is required for the capture file.

User response: Alter SMS ACS rules as required to SMS manage the data set.

HLV2453S  Streams work file not allocated - Streams source task terminated

Explanation: The Streams global user exit is about to write an event record to the event file.

User response: Check that the file has been correctly allocated and defined to CICS.

The variable fields of the message text are: Streams CICS Source name

HLV2454E  tskname tsktype TASK NOT STARTED - MQSERIES NOT ACTIVE

Explanation: The specified publish task could not be started because MQSeries is not active.

User response: Ensure that MQSeries is active on the system and that the Streams initialization exec sets the MQACTIVE parameter to YES.

Chapter 14. Troubleshooting  801
HLV2455E  tskname tsktype filetype FILE, NAME filename VERSION MISMATCH, EXPECTED verno1, FOUND verno2

Explanation: The specified publish task could not be started because the file contained data with a version number that is not supported by this release.

The message contains two version numbers, verno1 and verno2, which represent the expected version number and found version number respectively

User response: Ensure that the proper EVENT or WORK or Db2 file is used with Streams. Most likely, a different version was used to create the indicated file.

HLV2456W  tskname tsktype WORK FILE, DDNAME ddbname percent FULL

Explanation: The specified publish task WORK file has records that use the specified percent of available space. It is possible that remaining space is lower than indicated by this message.

User response: Ensure that the WORK file has sufficient free space to continue normal operation.

HLV2457E  tskname tsktype WORK FILE, DSNAME ddbname COMPLETELY FULL

Explanation: The specified publish task WORK file has been completely filled up with records, and VSAM has refused to write additional records. The Publish Source task has stopped.

User response: Make more space available to the WORK file. If additional extents may be allocated to the WORK file, make more space available on the volume(s) the WORK file is on.

HLV2458E  SOURCE NAME tskname NOT ACTIVE OR NOT FOUND

Explanation: No active publish source task with the specified name has been found. The requested action was not completed.

User response: Enter an active source task name in the request.

HLV2459E  UNICODE CONVERSION for tblname FROM source TO target NOT SUPPORTED

Explanation: Unicode conversion services on this system are not configured to support the data conversion required by a Streams definition.

User response: Reconfigure z/OS Unicode conversions services to support codepage conversions between the listed CCSIDs (source and target).

HLV2460E  THE ZEVRAW SPECIFICATION ON EVENT DEFINITION src def REQUIRES THE RAW DATA OPTION

Explanation: The event definition requested ZEVRAW formatting. This require that either the raw data option be selected, or a rule is specified on the source (src) or event definition (def).

User response: Edit the source or the event definition to specify a rule for event routing, or select the raw data option on the event definition.

HLV2461E  Error loading Streams program - program

Explanation: The Streams PLT program encountered an error trying to load the named program.

User response: Check that the program has been correctly defined to CICS. Sample CICS definitions are distributed in the CNTL library CICSCSD member.

The variable fields of the message text are: program name

HLV2462E  EVENT DATA TOO LONG FOR source event datamap

Explanation: Streams source task initialization failed while attempting to build an event definition (event) from the a data map.

User response: Ensure that the data map used in the event definition is correct and matches the layout of the data to be captured. In the case of an IMS/DB map, make sure that a COBOL map that defines the data fields has been successfully merged.

HLV2463E  DATA CAPTURE CHANGES NOT DEFINED FOR event tblqual tblname

Explanation: Streams source task initialization failed while attempting to build an event definition (event) for a Db2 table.

User response: Ensure that the table referred by the event definition has the DATACAPTURE attribute on.

HLV2464E  MONITOR2 and TRACE Authority are required for user ID userID.

Explanation: Streams Db2 IFI source task user ID requires Db2 SYSOPR authority to issue a START MONITOR TRACE command.

User response: Ensure that the user ID specified in the Db2 IFI source definition has been granted SYSOPR authority.
HLV2465I  Streams native VSAM capture not enabled
Explanation: VSAM event capture has not been enabled by this product subsystem.
User response: Informational.

HLV2466W  tskname tsktype WORK FILE, DDNAME ddbname EXTENDED, NOW percent FULL
Explanation: The specified publish task WORK file has records that use the specified percent of available space. The percent used has decreased, indicating that the dataset has been extended.
User response: Ensure that the volume containing the WORK file has sufficient free space to allow any additional extension of the WORK file needed to continue normal operation.

HLV2467E  MORE THAN ONE EVENT TABLE CANNOT BE ACTIVE FOR SOURCE tskname. ALL ACTIVE EVENT TABLES FOLLOW.
Explanation: A Streams source task has more than one Event Table marked active. Only one Event Table may be marked active at any time. A list of active Event Tables follows.
User response: Ensure that only one Event Table is marked active.

HLV2468E  Streams source tskname, event table table in map map marked active.
Explanation: The specified publish source task has this Event Table marked active. Only one Event Table may be marked active at any one time.
User response: Ensure that only one Event Table is marked active.

HLV2469E  Streams source tskname, event table table in map map, cannot find map map.
Explanation: The specified Event Table for this source references a map that cannot be found, or is not active, or not enabled for event publishing.
User response: Ensure that the Event Table references active maps, and that each is enabled for event publishing.

HLV2470S  Streams IMS source task srcname not activated - RRS not enabled
Explanation: The Streams global IMS source task (srcname) could not be activated because RRS was not enabled for this Streams server.
User response: Change the server initialization parameters to specify RRS(YES) and restart the server.

HLV2471S  Streams IMS source task srcname not activated - EVENTQ not defined
Explanation: The Streams IMS source task (srcname) could not be activated because the required MQSeries event repository was not correctly defined.
User response: Correct the DEFINE SEM_ENDPOINT specification for ZEVENETQ in the server initialization parameters and restart the server.

HLV2472I  routine Capture successful/failed rcode rscode
Explanation: Generic debugging message issued by Streams capture processes (routine). The presence of the SDPHDBUG load module in the capture process load library will cause these debug messages to be issued. To create SDPHDBUG, edit member ZEVDBUG from the product sample library to set desired debug trace options and assemble and link as SDPHDBUG.
User response: Remove member SDPHDBUG to prevent these messages.

HLV2473I  routine text1 text2 text3 text4
Explanation: This message tracks the generic debugging message issued by Streams capture process (routine) initialization. The presence of the SDPHDBUG load module in the capture process load library will cause these debug messages to be issued. To create SDPHDBUG, edit member ZEVDBUG from the product sample library to set desired debug trace options and assemble and link as SDPHDBUG.
User response: Remove member SDPHDBUG to prevent these messages.

HLV2474I  routine text1 text2 text3 text4
Explanation: This message tracks the generic debugging message issued by Streams event capture (routine). The presence of the SDPHDBUG load module in the capture process load library will cause these debug messages to be issued. To create SDPHDBUG, edit member ZEVDBUG from the product sample library to set desired debug trace options and assemble and link as SDPHDBUG.
User response: Remove member SDPHDBUG to prevent these messages.

HLV2475I  routine Blocksize: maxsize Blocklen: length Blockid:blkID
Explanation: Logstream debugging message issued by Streams event capture (routine). The presence of the SDPHDBUG load module in the capture process load library will cause these debug messages to be issued.
To create SDPHDBG, edit member ZEVDBUG from the product sample library to set desired debug trace options and assemble and link as SDPHDBG.

**User response:** Remove member SDPHDBG to prevent these messages.

**HLV2476I**  
routine Streamtoken: token  
**Explanation:** Logstream debugging message issued by Streams event capture (routine). The presence of the SDPHDBG load module in the capture process load library will cause these debug messages to be issued. To create SDPHDBG, edit member ZEVDBUG from the product sample library to set desired debug trace options and assemble and link as SDPHDBG.

**User response:** Remove member SDPHDBG to prevent these messages.

**HLV2477I**  
routine text1 text2 text3 text4  
**Explanation:** This message tracks the generic debugging message issued by Streams event capture (routine). The presence of the SDPHDBG load module in the capture process load library will cause these debug messages to be issued. To create SDPHDBG, edit member ZEVDBUG from the product sample library to set desired debug trace options and assemble and link as SDPHDBG.

**User response:** Remove member SDPHDBG to prevent these messages.

**HLV2478E**  
tskname tsktype TASK NOT STARTED - STRNO val TOO SMALL  
**Explanation:** The specified publish task could not be started because there were not enough VSAM strings allocated at startup.

**User response:** Ensure that the PUBLISHSTRNO value is one larger than the number of Streams SOURCE tasks.

**HLV2479S**  
jobname ERROR OBTAINING CONTAINER DATA FOR container - EIBRESP: respcode  
**Explanation:** The Streams CICS event processing adapter encountered an error getting data from a channel container.

**User response:** Probable CICS error. Check the system log for errors.

**HLV2480I**  
Streams server version ver1 does not match DB2 function version ver2  
**Explanation:** The Streams server that has been configured to publish Db2 events does not match the version of the Streams Db2 wake_publish function.

**User response:** Check that the correct version of the wake publish function load module (SDD2PCRU) is in the Db2 RUNLIB, and check that the Streams server is at the same level.

**HLV2481I**  
jobname Streams version ver SFVXno date time  
**Explanation:** Streams CICS load library maintenance level information.

**User response:** None.

**HLV2482T**  
RENDEZVOUS CALL FAILED -  
RC=rcode1 REAS=rsncode - ENCLAVE  
RC=rcode2 FEEDBACK= (fbcodes)  
**Explanation:** An attempt to send a message to a Tibco Rendezvous destination failed.

The message contains two return codes; rcode1 represents the rendezvous interface return code, and rcode2 represents the LE/370 enclave manager return code.

**User response:** Check for other messages indicating the cause of the failure, and resolve the problem, if possible.

**HLV2483T**  
Streams parmname parameter not specified  
**Explanation:** The file dataset name prefix was not specified. The file cannot be allocated.

**User response:** Check that the parameter is correctly specified in the server initialization exec (xxxxIN00)

**HLV2484T**  
jobname Streams Name/Token operation result for token  
**Explanation:** The Streams capture process has attempted a name/token operation.

operation may indicate "CREATE", "RETRIEVE", or "DELETE"

token may indicate "SUCCEEDED" or "FAILED"

**User response:** None

**HLV2485I**  
Streams DB2 FUNCTION VERSION ver date time  
**Explanation:** Streams Db2 exit maintenance level information.

date and time indicate time and date of assemble

**User response:** None.
HLV2486I Streams source improper version ver found ver

Explanation: Streams found a record with an improper version in it.

User response: The improper record will be deleted.

HLV2487T PUBLISH LOGON FAILED - errmsg

Explanation: The PUBLISH LOGON failed for the following reason.

User response: The Streams routine is aborted. Ensure that the userid specified is correct.

HLV2488R REPLY 'GO' TO CONTINUE, OR 'CANCEL' TO TERMINATE Streams Initialization

Explanation: This message is issued when there was a failed attempt to load the IMS data capture user exit specified with the PUBLISHIMSUDEX1 parameter. Check that the correct exit program name has been specified and that the program has been copied to the Streams server load library. If more than two minutes expire while waiting for your reply or three invalid replies are made, the default action of CANCEL will be taken.

User response: Reply GO to continue Streams server initialization Reply CANCEL to terminate Streams server initialization

HLV2489E Invalid Streams initialization reply: reply

Explanation: An invalid reply was specified to the Streams initialization console message. The message causing the error will be reissued so that you can correctly reply. After three invalid replies for the same message, default action will be taken. For a description of the default action, see the explanation of the original message.

User response: Determine the proper reply from the text of the message, and reply correctly.

HLV2490E Streams reply wait exceeded 2 minutes. Default used

Explanation: The product waited over two minutes for a reply to the Streams initialization message. Since no response was during that time, default action was taken.

User response: None. If a reply was desired, you will need to speed your response to the message.

HLV2491E 3 Invalid Streams replies. Default taken

Explanation: Three invalid replies were made to a Streams initialization message. Since no correct response was received, default action was taken.

User response: None. Reply as required next time.

HLV2492I Streams not active on this server

Explanation: An attempt was made to access the Streams control task and it was not active.

User response: If the server is intended as a Streams server, check the IN00 initialization parameters for the server.

HLV2493E Streams TASK task UNABLE TO operation LOGSTREAM logstream, RC=rcode, RSN=rsnscod

Explanation: A Streams task attempted an operation on an MVS logstream and it was not successful.

User response: Determine the problem from the logstream function return code and reason code, and correct the error. These codes are documented in SYSLIBD(XDGCON) and in z/OS MVS Assembler Services Reference in IXGxxxx macros return codes.

HLV2494W INVALID RECORD FOUND IN task LOGSTREAM logstream, FOUND STATUS scode, TO dest. KEY timestamp

Explanation: A Streams task found a record in its MVS logstream with an invalid status (scode) and destination (dest) name. The record is discarded.

User response: Check other Logstream activity to be sure data has not been corrupted with data from some other program.

HLV2495W TASK task LOG logstream MISSING REPLY, STATUS scode, DEST. dest., KEY timestamp

Explanation: A Streams task received an MQSeries confirmation that did not match the next record in the task Logstream. The record is discarded.

User response: Check other MQSeries activity to be sure messages or responses have not been inadvertently discarded.

HLV2496W TASK task LOG logstream RECORD WITH STATUS statcode, DEST. dest., KEY timestamp, CONFIRMATION ARRIVED, RECORD MISSING

Explanation: A Streams task received an MQSeries confirmation that did not match the next record in the task Logstream. The confirmation is discarded.

User response: Check other Logstream activity to be sure messages have not been inadvertently discarded.
HLV2497W • HLV2521T

HLV2497W Logstream operation exp
Explanation: A Logstream operation received a return code. This message tries to explain (exp) the return code and reason codes.

User response: Check other Logstream messages to determine the problem.

HLV2498T Streams does not support Tibco Rendezvous destinations
Explanation: Tibco Rendezvous destinations are not supported.

User response: Delete Tibco Rendezvous destinations.

HLV2499T Streams does not support Oracle destinations
Explanation: Oracle destinations are not supported.

User response: Delete Oracle destinations.

HLV2500T source COPYWORK time1 time2
Explanation: Streams trace record. An Event has been copied from the trigger table to the Work file.
The message contains two time variables; time1 represents the time of the update, time2 represents the time the record was copied.

User response: None

HLV2501T source RUNRULES
Explanation: Streams trace record. The Event processor is running SEF rules for records in the Work file.

User response: None

HLV2502T source DYNDEST keyfield machID index
Explanation: Streams trace record. An Event is being processed for a dynamic JCA 1.5 destination. The identifiers for the JCS 1.5 Adapter requestor are traced.

User response: None

HLV2503T dest SENDPLUP-RESTART
Explanation: Streams trace record. Processing for an Event source is being restarted to a destination (dest).

User response: None

HLV2504T source MQMARK
Explanation: Streams trace record. MQSeries processing for an Event source is marking the current status of update records.

User response: None

HLV2505T source SENDITEM dest keyfield
Explanation: Streams trace record. An Event is being queued for sending to a destination (dest).

User response: None

HLV2506T source DOPRUNE time count
Explanation: Streams trace record. Old Publish records (counted by count) are being pruned from the Workfile.

User response: None

HLV2507T source WAITABIT caller sec SECONDS
Explanation: Streams trace record. The Streams task is waiting for more work.
caller represents the calling subroutine

User response: None

HLV2508T source PREPROC dest keyfield urID
Explanation: Streams trace record. The Streams task is preprocessing an update for transmission to a destination.

User response: None

HLV2509T source PREPROC **SKIP** keyfield
Explanation: This message documents the streams trace record. The Streams task preprocessor has determined that an update should NOT be sent to any destination.

User response: None. This is an informational message only.

HLV2510T source POSTPROC dest keyfield rcode urID
Explanation: Streams trace record. The Streams task is doing postprocessing for an update.

User response: None

HLV2520T ENABLETRANSMISSIONS dest machine
Explanation: Streams trace record. The Streams is enabling transmissions to a dynamic destination for the JCA 1.5 interface.

User response: None

HLV2521T DISABLETRANSMISSIONS dest machine
Explanation: Streams trace record. The Streams is disabling transmissions to a dynamic destination for the JCA 1.5 interface.

User response: None
HLV2530T ADDCOLUMN colname colval
Explanation: Streams trace record. The Streams JCA 1.5 Adapter interface is adding a column of Publish data.
User response: None

HLV2531T ADDTOPIC topic
Explanation: Streams trace record. The Streams JCA 1.5 Adapter interface is adding a topic for MQ Broker processing.
User response: None

HLV2540T srctsk capture EVENT CAPTURE datatype operation mapname
Explanation: Streams trace record. The Streams capture process (capture) has captured an event. Data associated with the event has been saved in a dataspace owned by the Streams server.
operation represents the change type
User response: None

HLV2541T srctsk capture EVENT BUILD datatype operation mapname
Explanation: Streams trace record. The Streams capture process (capture) has built an event record in a dataspace owned by the Streams server.
operation represents the change type
User response: None

HLV2542T srctsk capture EVENT POST datatype operation mapname
Explanation: Streams trace record. The Streams capture process (capture) has posted the source task in the Streams server.
operation represents the change type
User response: None

HLV2543T srctsk capture EVENT BACKOUT datatype operation mapname
Explanation: Streams trace record. The Streams capture process (capture) has backed out the data saved for an event. The event is discarded.
operation represents the change type
User response: None

HLV2544W source CATALOG SEARCH ERROR, RC=rcode REASON=rsncode ID=modID TYPE=type, ENTRY=entry
Explanation: Streams is searching the catalog for Archive data sets using the CSI Catalog Search Interface, and encountered an error. The entry is skipped.
source represents the source task name
User response: Examine the VSAM catalog for errors using the diagnostic information provided.

HLV2545E Invalid Streams service request received
Explanation: Streams main task received an invalid service request.
User response: Contact Software Support.

HLV2600T ABEND ccode RS=rsnocde OCCURRED AT modname+offset. FUNCTION CODE=funcode.
Explanation: An ABEND occurred while processing a Security Optimization Manager request.
User response: The routine signals an error to the caller and processing continues, when possible.

HLV2606E Security optimization processing is terminated
Explanation: Security Optimization processing was terminated due to an internal processing error. The product continues to operate without the Security Optimizer.
User response: If you want to execute with the Security Optimizer, you must stop and restart the product.

HLV2607I Security server ENF signal 71 not available
Explanation: A request by Security Optimization to listen for event notification facility signal 71 (RACF user profile changes) failed. The product continues to operate without notifications.
User response: Examine any other messages accompanying this one. If the security server you are using does not support ENF signal 71, check with the security server product vendor for more information. Otherwise, contact Software Support for assistance with this problem.
HLV2608W • HLV3002T

HLV2608W  SOM RACF new password exit is not installed

Explanation: Security Optimization Management (SOM) initialization was unable to verify that the product's RACF new password exit, S_ICHPWX, is installed as part of the ICHPWX01 load module.

User response: The product continues to run. This exit detects password changes that are made during logon to applications other than the product. Users will still be able to use the old password in the product until the SOM cache entry expires. Password changes made during the product logon are recognized without this exit, and SOM signals all other product servers that this user's password has changed.

HLV2620I  Security optimizer entry for user ID userID was expired.

Explanation: The request to expire the entry for a user ID in the security optimization cache was successful.

User response: None. This message is for informational purposes only.

HLV2621I  Security optimization is not active

Explanation: A request to expire a Security Optimization entry could not be processed because Security Optimization is not active.

User response: None. This message is for informational purposes only.

HLV2622I  User ID userID was not located by the security optimizer.

Explanation: A request to expire a security optimizer entry could not be processed because the user ID was not located.

User response: No action is required.

HLV2623I  Security optimizer processing abended

Explanation: The Security Optimizer Manager ABENDED while processing the expire request.

User response: Check if any other error messages were generated along with the error message above. If the combined error messages are sufficient to explain the problem, take whatever corrective action is appropriate. Otherwise, contact Software Support with this problem.

HLV2700E  Error bb-ccc ddd Processing request. Extra Information: eee

Explanation: An error has occurred with the z/OS Connect interface. The following information is provided:
• bb is a major error number, as follows:

01: Storage error
02: Input data error
03: Input vectors error
04: Input JSON parsing error
05: Input JSON understanding error
06: Processing error
09: Miscellaneous error
• ccc is a minor error number
• ddd is an error description
• Extra Information: eee provides extra information, if available.

User response: Contact IBM Software Support.

HLV3000T  recovery LEVEL lerrdesc=abcode
           REASON CODE=rsncode TIME=time
           SEQ=seqno CPU=cpuID ASID=asid

Explanation: The product detected an abend error. The current message provides some information about the abend. This message, along with other messages, should provide a detailed description of the current abend error. The pr

recovery may indicate "ESTAE", "FRR", or "ARR"
rsn may also be the text "UNKNOWN"

User response: Check if any other error messages were generated along with the error message above. If the combined error messages are sufficient to explain the problem, take whatever corrective action is appropriate. Otherwise, contact Software Support for assistance with this problem.

HLV3001S  func errdesc, ABEND abcode AT
           modname+offset

Explanation: The product ESTAE routine detected an abend in a routine called by it. The message describes the abend error. The product ESTAE routine will continue to attempt recovery from the original error.

User response: Check if any other error messages were generated along with the error message above. If the combined error messages are sufficient to explain the problem, take whatever corrective action is appropriate. Otherwise, contact Software Support with this problem.

HLV3002T  Data at PSW PSWdata

Explanation: The product detected an abend error. The current message provides some information about the abend. This message, along with other messages, should provide a detailed description of the current abend error.

PSWdata contains the PSW address and PSW data

User response: Check if any other error messages were generated along with the error message above. If
the combined error messages are sufficient to explain the problem, take whatever corrective action is appropriate. If the problem cannot be resolved, contact Software Support.

**HLV3005S**

<table>
<thead>
<tr>
<th>ESTAE level</th>
<th>lcl ESTAE fune error</th>
<th>RC=rcode</th>
</tr>
</thead>
</table>

**Explanation:** The product ESTAE routine tried to protect itself by issuing an ESTAE macro. The ESTAE failed with a non-zero return code.

**HLV3006T**

<table>
<thead>
<tr>
<th>PSW at time of error</th>
<th>/PSW ILC ilc INTC intc</th>
</tr>
</thead>
</table>

**Explanation:** The product ESTAE routine detected an abend error. There is no product specific recovery for this error. The ESTAE routine tries to document the abend error by displaying the failing PSW. This message is part of the mini-dump used to describe the current abend error.

*ilc* represents an instruction length code

*intc* represents an interrupt code

**User response:** Check if any other error messages (other than the mini-dump) were generated along with the error message above. If the combined error messages are sufficient to explain the problem, take whatever corrective action is appropriate. Otherwise, contact Software Support for assistance with this problem.

**HLV3007T**

<table>
<thead>
<tr>
<th>Current routine name=modname address=addr1 offset=offset</th>
</tr>
</thead>
</table>

**Explanation:** The product ESTAE routine detected an abend error. There is no product specific recovery for this error. The ESTAE routine tries to document the abend error by displaying the failing PSW and registers. This message is part of the mini-dump used to describe the current abend error.

**User response:** Check if any other error messages (other than the mini-dump) were generated along with the error message above. If the combined error messages are sufficient to explain the problem, take whatever corrective action is appropriate. Otherwise, contact Software Support for assistance with this problem.

**HLV3008T**

<table>
<thead>
<tr>
<th>ind register</th>
</tr>
</thead>
</table>

**Explanation:** The product ESTAE routine detected an abend error. There is no product specific recovery for this error. The ESTAE routine tries to document the abend error by displaying the failing PSW and register content (register). This message is part of the mini-dump used to describe the current abend error.

*ind* indicates "AR/GR" or "GR"

**User response:** Check if any other error messages (other than the mini-dump) were generated along with the error message above. If the combined error messages are sufficient to explain the problem, take whatever corrective action is appropriate. If the problem cannot be resolved, contact Software Support.

**HLV3009T**

<table>
<thead>
<tr>
<th>modname calltype modname+offset</th>
</tr>
</thead>
</table>

**Explanation:** The product ESTAE routine detected an abend error. There is no product specific recovery for this error. The ESTAE routine tries to document the abend error by displaying the calling module sequence of the current routine. This message is part of the mini-dump used to describe the current abend error.

**User response:** Check if any other error messages (other than the mini-dump) were generated along with the error message above. If the combined error messages are sufficient to explain the problem, take whatever corrective action is appropriate. Otherwise, contact Software Support for assistance with this problem.

**HLV3010T**

<table>
<thead>
<tr>
<th>Too many entries</th>
</tr>
</thead>
</table>

**Explanation:** The product ESTAE routine detected an abend error. While producing the module call trace (message 3009T), the loop limit was reached. The product ceases to issue calling module trace messages and proceeds to other processing.

**User response:** Check if any other error messages (other than the mini-dump) were generated along with the error message above. If the combined error messages are sufficient to explain the problem, take whatever corrective action is appropriate. If the problem cannot be resolved, contact Software Support.

**HLV3020S**

<table>
<thead>
<tr>
<th>INVALID STRING ADDRESS addr1, DETECTED addr2</th>
</tr>
</thead>
</table>

**Explanation:** A request to the tokenization routine passed an invalid string address. The address in the parameter list was less than or equal to zero.

**User response:** Check if any other error messages were generated along with the error message above. If the combined error messages are sufficient to explain the problem, take whatever corrective action is appropriate. Otherwise, contact your local Software Support group for assistance with this problem.
appropriate. Otherwise, contact your local product systems programming group for help with this problem.

**HLV3022S**

**TOKENIZATION LOGIC ERROR, DETECTED addr**

**Explanation:** The tokenization routine detected a logic error during processing of the current request.

**User response:** Check if any other error messages were generated along with the error message above. If the combined error messages are sufficient to explain the problem, take whatever corrective action is appropriate. Otherwise, contact your local product systems programming group for help with this problem.

**HLV3030E**

**sererout errdesc FAILED, RC=rcode, DETECTED AT addr**

**Explanation:** Some type of error occurred in one of the product common subroutines. See the actual text of the message for an explanation. The error was probably caused by a failure in an operating system service requested by the subroutine.

**User response:** Check if any other error messages were generated along with the error message above. If the combined error messages are sufficient to explain the problem, take whatever corrective action is appropriate. Otherwise, contact Software Support with this problem.

**HLV3031E**

**ABEND abcode IN sererout, REASON CODE=rsncode, CALLED BY cs**

**Explanation:** An abend was detected in one of the product common subroutines. The abend code and service routine are described in the message text. The error was probably caused by a failure in an operating system service requested by the subroutine.

**User response:** Check if any other error messages were generated along with the error message above. If the combined error messages are sufficient to explain the problem, take whatever corrective action is appropriate. Otherwise, contact Software Support with this problem.

**HLV3032T**

**INVALID INPUT COMMUNICATION BUFFER PREFIX READ - blksize**

**Explanation:** An invalid buffer prefix was read in from a client application. The buffer prefix was either negative or exceeded the maximum input buffer size.

**User response:** The connection to the client system is terminated. The client application will probably report an error. Check for any client system error messages. If the failure continues, contact Software Support.

**HLV3033T**

**DATASPACE CREATED, NAME=dspname, CALLED BY cs**

**Explanation:** An MVS dataspace was created for temporary storage of data. The space name (dspname) is displayed.

**User response:** None. This message is for informational purposes only.

**HLV3034T**

**DATASPACE DELETED, NAME=dspname, CALLED BY cs**

**Explanation:** An MVS dataspace was deleted. The space token is displayed.

**User response:** None. This message is for informational purposes only.

**HLV3035T**

**DATASPACE EXTENDED, NAME=dspname, CALLED BY cs**

**Explanation:** An MVS dataspace was extended. The storage in the dataspace was used up and more was allocated to it. The space token is displayed.

**User response:** None. This message is for informational purposes only.

**HLV3036T**

**DATASPACE RELEASED, NAME=dspname, CALLED BY cs**

**Explanation:** Storage in an MVS dataspace was released. The storage is no longer required. The space token is displayed.

**User response:** None. This message is for informational purposes only.

**HLV3037T**

**DATASPACE func FAILED, NAME=dspname, RETURN CODE=rcode, REASON CODE = rsncode,CALLED BY cs**

**Explanation:** A dataspace function failed. The return code and reason code are displayed. The space token is displayed.

**User response:** Installation limits may have caused the failure. Examine the limits set by the installation’s IEFUSI exit to determine if they caused the failure. If the problem cannot be resolved, contact Software Support.

**HLV3038T**

**ALET CREATED, NAME=dsaname, ALET=alen, CALLED BY cs**

**Explanation:** An ALET was created for accessing a dataspace. The space token is displayed. The resulting ALET is displayed.

**User response:** None. This message is for informational purposes only.
HLV3039T  ALET DELETED, NAME=dspname, ALET=alet, CALLED BY cs

Explanation: An ALET for accessing a dataspace was deleted. The space token is displayed. The deleted ALET is displayed.

User response: None. This message is for informational purposes only.

HLV3040T  ALESERV func FAILED, NAME=dspname, RETURN CODE=rcode, REASON CODE = rsncode, CALLED BY cs

Explanation: An ALESERV function failed. The return code and reason code are displayed. The space token is displayed.

User response: Installation limits may have caused the failure. Examine the limits set by the installation’s IEFUSI exit to determine if they caused the failure. If the problem cannot be resolved, contact Software Support.

HLV3041T  ABEND abcode IN servrout, REASON CODE=rsncode, NAME=dspname, ALET=alet, CALLED BY cs

Explanation: An abend was detected while manipulating a dataspace. The abend code and service routine are described in the message text. The error was probably caused by a failure in an operating system service requested by the subroutine. The space token is displayed. The ALET, if any, is displayed.

User response: Check if any other error messages were generated along with the error message above. If the combined error messages are sufficient to explain the problem, take whatever corrective action is appropriate. If the problem cannot be resolved, contact Software Support. In certain recovery situations, this message may be ignored.

HLV3042S  Module modname is not AMODE(31)

Explanation: A module that had to load in AMODE(31) loaded with AMODE(24) or AMODE(64) instead. This is a serious error. Many modules, including RPCs and user record exits, are only allowed to be AMODE(31).

User response: Relink the module (other changes may be needed) using AMODE(31). Run the application again.

HLV3043S  MODULE modname LOAD FAILED, ABEND=abcode, REASON CODE=rsncode

Explanation: A module could not be loaded. The load failed with an abend error.

User response: Check the error messages and the reason code associated with this problem. There may be one or more error messages referring to the current problem. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support.

HLV3044S  MODULE modname DELETE FAILED, RETURN CODE=rcode

Explanation: A module could not be deleted. The delete failed with a non-zero return code.

User response: Check the error messages and the reason code associated with this problem. There may be one or more error messages referring to the current problem. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support.

HLV3060S  INVALID PC FUNCTION CODE funcode, DETECTED AT addr

Explanation: The product space switch PC routine has been invoked with an invalid function code (funcode). This may be caused by specifying an incorrect product subsystem ID on a request when there are multiple copies of the product in the system at different release levels.

User response: Verify that the request that resulted in the product space switch PC routine being invoked is being issued to the correct product subsystem. If the problem cannot be resolved, contact Software Support.

HLV3061E  service ABEND abcode AT modname+offset

Explanation: An abend failure occurred in the product space switch PC routine. The error message provides the abend code and abend location. This failure was probably caused by a programming error in the calling routine or in the space switch PC routine. This failure can also be caused by product installation and maintenance errors.

User response: Check if any other error messages were generated along with the error message above. If the combined error messages are sufficient to explain the problem, take whatever corrective action is appropriate. Otherwise, contact Software Support to obtain additional assistance.

HLV3062E  service desc FAILED RC=rcode, DETECTED AT addr

Explanation: This is a generic error message used to describe a wide variety of errors. The message text gives a description of the current operation (service) and what the current operation was trying to do.

User response: Check the error messages and the return code associated with this problem. There may be one or more error messages referring to the current problem. If possible, fix the problem identified by the
error messages, and retry the operation. If the problem cannot be resolved, contact Software Support.

**HLV3063E**  
plist action FAILED, DETECTED AT addr

**Explanation:** The space switch PC routine is attempting to copy (action) a parameter list (plist) passed by its caller into storage that can be accessed in space switch mode and has found that the target storage area is not large enough.

**User response:** This is an internal product error condition. Contact Software Support. Software Support.

**HLV3070S**  
func (funcname) SERVICE errdesc code rscode errloc modname+offset creg15

**Explanation:** The product stacking PC function (func) has been invoked in an invalid manner, has been invoked in an invalid environmental state, or has abended during execution.

creg15 represents control register 15, if avail, or zeroes

**User response:** Verify that the request that resulted in the stacking space switch PC routine being invoked is being issued to the correct product subsystem. If the problem cannot be resolved, contact Software Support.

**HLV3071T**  
func (funcname) SERVICE errdesc code rscode errloc modname+offset creg15

**Explanation:** The product stacking PC function (func) has been invoked in an invalid manner, has been invoked in an invalid environmental state, or has abended during execution. This is a duplicate of message 3070S but is written to the trace.

creg15 represents control register 15, if avail, or zeroes

**User response:** Verify that the request that resulted in the stacking space switch PC routine being invoked is being issued to the correct product subsystem. If the problem cannot be resolved, contact Software Support.

**HLV3080E**  
operation FAILED FOR userID RC=rcode AT addr

**Explanation:** A logoff to the current server address space was attempted by a user other than the one currently logged on. The current server address space is terminated, and a new one will be started.

**User response:** If problems are encountered with servers, the product cancels them and restarts them. This is normal product operation. Check if the current ABEND was an independent one or if it was caused by the product, and resolve the problem accordingly.

**HLV3081T**  
TSO SERVER IN ASID asid traceinfo1 traceinfo2 traceinfo3 traceinfo4

**Explanation:** This is a trace message issued by the subsystem data set read/write routine.

**User response:** None. This message is for informational purposes only.

**HLV3082W**  
OUTPUT LIMIT EXCEEDED (limit LINES) - CANCEL SELF WITH S722

**Explanation:** A TSO command running in a product TSO server address space has exceeded the output line limit for server commands as specified in the TSOSRVMAXLINES parameter.

**User response:** Modify the command to reduce the number of lines output, or increase the TSOSRVMAXOUTPUTLINES value. The TSO server will cancel itself with an S722 completion code to abort processing of the current command.

**HLV3083S**  
Command requested more input - command aborted

**Explanation:** The product Servers do not support commands that request additional input in subcommand mode.

**User response:** Modify the command processor so that subcommand input is not required.

**HLV3084W**  
service OF desc FAILED, RC=rcode

**Explanation:** This is a generic error message used to describe a wide variety of errors detected by the product TSOSRV subsystem interface read/write interface routine. The message text provides the current operation (service) and what the current operation was trying to do.

**User response:** Check the error messages and the return code associated with this problem. There may be one or more error messages referring to the current problem. If possible, fix the problem identified by the error messages, and restart the product.

**HLV3085H**  
jobname A=asid1 (asid2) TSO server terminated by request

**Explanation:** A product Server address space has received a request to terminate. This may occur at shutdown or when one of the parameters governing the TSO servers (MIN or MAX values) has been modified.

The message contains two address space identifiers (asid1 and asid2), which are in decimal and hexadecimal respectively

**User response:** None. This message is for informational purposes only.
HLV3086H  LOGON of userID to TSO server failed -
RC=rcode1 (rcode2) Reason=rsncode

Explanation: A product TSO server address space was
not able to LOGON the indicated client userid. The
current command is bypassed.

The message contains two return codes; rcode1
represents the SAF interface return code, and rcode2
represents the RACF return code.

User response: Determine why the client userid logon
failed, and resubmit the command.

HLV3087H  Requestor has revoked command
request - cancel self with S622

Explanation: A product TSO server address space was
not able to bind to the requesting task while attempting
to return the results of a TSO command. The server
abandons the request and terminates additional
processing of the request by cancelling itself with a 622
completion code.

User response: Determine why the requesting task
abandoned the request, and resubmit. The requesting
task may have timed out while waiting for a response
to the request.

HLV3100S  Invalid text insertion address - msgno
addr modname+offset

Explanation: The product message formatting routine
detected an error in a data address passed to it.
Because of the invalid data address, a product message
cannot be sent. This means that some other error may
have occurred, but the error message was not sent
because of the current error. The invalid address is
actually an scon. The offset is the location of the calling
routine that passed the invalid data.

User response: Check if any other error messages
were generated along with the error message above. If
the combined error messages are sufficient to explain
the problem, take whatever corrective action is
appropriate. Otherwise, contact Software Support for
assistance with this problem.

HLV3101S  Message number msgno not found -
modname+offset

Explanation: The product message formatting routine
could not find a message number passed to it in the
product message table. Because the message number
could not be found, a product message cannot be sent.
This means that some other error may have occurred,
but the error message was not sent because of the
current error. The error is caused by either a calling
routine passing an invalid message number or an error
in the message table. The offset is the location of the
calling routine that passed the message number that
could not be found.

User response: Ensure that the product is properly
installed. Check the message table assembly time, date,
and version number. Check if any other error messages
were generated along with the error message above. If
the combined error messages are sufficient to explain
the problem, take whatever corrective action is
appropriate. If the problem cannot be resolved, contact
Software Support.

HLV3102S  Invalid message text variable - msgno
varname modname+offset

Explanation: The product message formatting routine
could not process a substitution variable found in a
message skeleton. Because the substitution variable
could not be processed, a product message cannot be
sent. This means that some other error may have
occurred, but the error message was not sent because of
the current error. The error is caused by a
programming error in the message table. The offset is
the location of the calling routine that invoked the
message formatting routine.

User response: Ensure that the product is properly
installed. Check the message table assembly time, date,
and version number. Check if any other error messages
were generated along with the error message above. If
the combined error messages are sufficient to explain
the problem, take whatever corrective action is
appropriate. If the problem cannot be resolved, contact
Software Support.

HLV3103S  Invalid text insertion data length - msgno
modname+offset

Explanation: The product message formatting routine
could not process the length part of a substitution
variable ("%()") found in a message skeleton. Because the
substitution variable could not be processed, a
product message cannot be sent. This means that some
other error may have occurred, but the error message
was not sent because of the current error. The error is
cased by a programming error in the message table.
The offset is the location of the calling routine that
invoked the message formatting routine.

User response: Ensure that the product is properly
installed. Check the message table assembly time, date,
and version number. Check if any other error messages
were generated along with the error message above. If
the combined error messages are sufficient to explain
the problem, take whatever corrective action is
appropriate. Otherwise, contact Software Support for
assistance with this problem.

HLV3104S  Invalid text insertion data type - msgno
modname+offset

Explanation: The product message formatting routine
detected an invalid data type value passed to it by a
calling routine. Because of the invalid data type value,
a product message cannot be sent. This means that
some other error may have occurred, but the error message was not sent because of the current error. The error is caused by a programming error in the calling routine. The offset is the location of the calling routine that passed the invalid data type value.

User response: Ensure that the product is properly installed. Check the calling module assembly time, date, and version number. Check if any other error messages were generated with the error message above. If the combined error messages are sufficient to explain the problem, take whatever corrective action is appropriate. If the problem cannot be resolved, contact Software Support.

---

HLV3105S  Output message buffer overflow - msgno modname+offset

Explanation: The product message formatting routine found that the current message will not fit in the output buffer. Because of the buffer overflow condition, a product message cannot be sent. This means that some other error may have occurred, but the error message was not sent because of the current error. The error is caused by either a programming error in the calling routine or a message table error. The offset is the location of the calling routine that invoked the message formatting routine.

User response: Ensure that the product is properly installed. Check the calling module assembly time, date, and version number. Also check the message table assembly time, date, and version number. Check if any other error messages were generated with the error message above. If the combined error messages are sufficient to explain the problem, take whatever corrective action is appropriate. If the problem cannot be resolved, contact Software Support.

---

HLV3106S  Invalid packed decimal for text insertion - val modname+offset

Explanation: The product message formatting routine detected that an invalid decimal data value (val) had been passed to it by a calling routine. Because of the invalid decimal data value, a product message cannot be sent. This means that some other error may have occurred, but the error message was not sent because of the current error. The error is caused by a programming error in the calling routine. The offset is the location of the calling routine that invoked the message formatting routine.

User response: Ensure that the product is properly installed. Check the calling module assembly time, date, and version number. Check if any other error messages were generated with the error message above. If the combined error messages are sufficient to explain the problem, take whatever corrective action is appropriate. If the problem cannot be resolved, contact Software Support.

---

HLV3107S  INVALID REPLY PARAMETER - modname+offset

Explanation: The product message formatting routine detected that a reply area had been passed to it for a message that is not marked as a WTOR in the message table. Because of this logical inconsistency, a product message cannot be sent. This means that some other error may have occurred, but the error message was not sent because of the current error. The error is caused by either a programming error in the calling routine or a message table error. The offset is the location of the calling routine that invoked the message formatting routine.

User response: Ensure that the product is properly installed. Check the calling module assembly time, date, and version number. Also check the message table assembly time, date, and version number. Check if any other error messages were generated with the error message above. If the combined error messages are sufficient to explain the problem, take whatever corrective action is appropriate. If the problem cannot be resolved, contact Software Support.

---

HLV3108S  INVALID REPLY AREA LENGTH - length modname+offset

Explanation: The data value entered by a user was too long for the reply area passed by the calling routine. This error was detected by the message formatting routine. The error is caused by a programming error in the calling routine. The offset is the location of the calling routine that invoked the message formatting routine.

User response: Ensure that the product is properly installed. Check the calling module assembly time, date, and version number. Check if any other error messages were generated with the error message above. If the combined error messages are sufficient to explain the problem, take whatever corrective action is appropriate. If the problem cannot be resolved, contact Software Support.

---

HLV3109E  INTERNAL ERROR DETECTED AT OPSNMG +offset, RC = rcod

Explanation: The message formatting routine detected a serious internal error. For example, a system service may have failed with a non-zero return code, or an abend may have occurred. This means that some other error may have occurred, but the error message was not sent because of the current error. The error is caused by either a programming error in the calling routine or a message table error.

User response: Ensure that the product is properly installed. Check the calling module assembly time, date, and version number. Also check the message table assembly time, date, and version number. Check if any other error messages were generated with the error
message above. If the combined error messages are sufficient to explain the problem, take whatever corrective action is appropriate. If the problem cannot be resolved, contact Software Support.

**HLV3110I**  
* data1 data2 data3 data4 data5 data6 data7  
* data8 data9 data10  

**Explanation:** This message lists List Enable/Close/Force results.  

**User response:** None. This message is for informational purposes only.

**HLV3111I**  
* errdesc for dsnname not found for cmd command.  

**Explanation:** An error was encountered in processing a VSAM file command.  

**User response:** Correct the command and reenter it.

**HLV3119T**  
* data1 data2 data3 data4 data5 data6 data7  
* data8 data9 %SK  

**Explanation:** This message lists Trace Open/Close functions  

**User response:** None. This message is for informational purposes only.

**HLV3120S**  
* method service FAILED FOR  
* DDNAME=ddname, DSNNAME=dsnname  

**Explanation:** An attempt to open (service) the specified data set failed.  

* method may be QSAM, BSAM, or BPAM  

**User response:** Try to determine why the attempt failed. If you are unable to determine the reason for the failure, contact Software Support.

**HLV3121S**  
* RECORD SIZE size INVALID,  
* LRECL=lrec, BLKSIZE=blksize,  
* DDNAME=ddname, DSNNAME=dsnname  

**Explanation:** During a WRITE/PUT operation, the product I/O routines have been passed a record with an invalid record size. The record size is either 0 or greater than the maximum logical record size (LRECL) allowed for the indicated data set.  

**User response:** Attempt to determine the reason for the failure. If you are unable to determine the reason for the failure, contact Software Support for assistance.

**HLV3122S**  
* VSAM service FAILED, RC=rcode, fldname FIELD=fldval, DDNAME=ddname,  
* DSNNAME=dsnname  

**Explanation:** A product generalized input/output processing routine tried to open a VSAM data set. The VSAM OPEN (service) failed.  

* fldname and fldval represent the ACB/RPL field name and value respectively

**User response:** Review the error message text. Determine what caused the OPEN to fail, based on the return code. Review the current data set for any obvious errors. Correct the above problems, and restart.

**HLV3123S**  
* UNSUPPORTED obj TYPE,  
* DDNAME=ddname, DSNNAME=dsnname  

**Explanation:** The product generalized I/O routine has been passed a DSORG or RECFM (obj) that is not supported.  

**User response:** Validate that the data set specified has a supported data set organization (DSORG) or record format (RECFM). If you are unable to determine the reason for the failure, contact Software Support.

**HLV3124S**  
* SHOWCAT FAILED, RC=rcode,  
* DDNAME=ddname, DSNNAME=dsnname  

**Explanation:** A product generalized input/output processing routine tried to list the required message data from a data set, but the SHOWCAT operation failed with the above return code.  

**User response:** Review the error message text. Determine what caused the SHOWCAT operation to fail, based on the return code. Correct the above problems, and restart. For further assistance, contact your local product systems programming group.

**HLV3125S**  
* INVALID VSAM OBJECT (obj),  
* DDNAME=ddname, DSNNAME=dsnname  

**Explanation:** While processing a VSAM data set, a product generalized input/output processing routine found the object (obj) to be invalid.  

**User response:** Review the error message text. Validate the VSAM object and analyze it for integrity. Review errors in the definition of the current data set. Ensure that the data set was properly defined and that no other errors exist with it.

**HLV3126E**  
* DYNAMIC ALLOCATION FAILED,  
* RC=rcode, ERROR CODE=rcode, INFO CODE=rsncode, DDNAME=ddname,  
* DSNNAME=dsnname  

**Explanation:** An attempt to dynamically allocate a data set failed. The error message contains the information associated with the failed request.  

**User response:** Review the information contained in the message, and attempt to correct the problem. Information on the codes may be obtained from the IBM documentation. If, after reviewing this
information, you are still unable to correct the problem, contact Software Support.

**HLV3127S**  
**VSAM service FAILED, RC=rcode, DDNAME=ddname, DSNAME=dsname**  
**Explanation:** A product generalized input/output processing routine could not display the check error message for the current VSAM data set. The operation (service) failed.  
**User response:** Review the error message text. Validate the VSAM data set, and analyze it for integrity. Review errors with the definition of the current data set. Ensure that it was properly defined and that no other errors exist with it.

**HLV3128E**  
**service desc FAILED RC=rcode, DETECTED AT addr**  
**Explanation:** This is a generic error message used to describe a wide variety of I/O related errors. The message text gives a description of the current operation (service) and what the current operation was trying to do.  
**User response:** Check the error messages and the return code associated with this problem. There may be one or more error messages referring to the current problem. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support.

**HLV3129E**  
**service desc**  
**Explanation:** This is a generic error message used to describe a wide variety of I/O related errors. The message text gives a description of the current operation (service) and what the current operation was trying to do.  
**User response:** Check the error messages and the return code associated with this problem. There may be one or more error messages referring to the current problem. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support.

**HLV3130E**  
**DYNAMIC ALLOCATION COMMAND ERROR, errmsg cmd**  
**Explanation:** The format of a dynamic allocation/de-allocation command (cmd) is invalid. The message contains information associated with the parameter(s) in error.  
**User response:** Review the information contained in the message, and correct the command format.

**HLV3131E**  
**DESERV GET_ALL FAILED: RC=rcode, RSN=rsncode, DDNAME=ddname-index, DSNAME=dsname**  
**Explanation:** While issuing the DESERV macro to obtain directory entry information, the system returned an unexpected return code and reason code.  
index represents the concatenation index where the error occurred  
**User response:** Contact Software Support.

**HLV3132E**  
**HFS service FAILED FOR path - RC=rcode, name1, RSN=rsncode (name2) - desc1 / desc2**  
**Explanation:** While invoking an Open Edition HFS Service for the entity identified by path, the system returned an unexpected return code and reason code.  
nome1 and desc1 refer to ERRNO names and descriptions  
nome2 and desc2 refer to JERRNO names and descriptions  
**User response:** Review the appropriate Open Edition manual for the meaning of the return and reason codes. If the cause of the error cannot be readily determined, contact Software Support.

**HLV3133E**  
**HFS service FAILED FOR path - errdesc additinfo**  
**Explanation:** While invoking an Open Edition HFS Service for the entity identified by path, the server interface detected an error.  
**User response:** If the cause of the error cannot be readily determined from this and other messages, contact Software Support.

**HLV3134I**  
**dsname Library directory empty (DDN=ddname)**  
**Explanation:** While attempting to read a PDS(E) dataset directory, the I/O services routines discovered that the PDS(E) directory is empty.  
**User response:** An empty PDS(E) directory may be normal or may represent a problem, depending on the library being accessed. If a problem results because the empty directory is an abnormality, this informational message may aid in resolution.

**HLV3135E**  
**DYNAMIC DEALLOCATION FAILED, RC=rcode, ERROR CODE=rsncode, INFO CODE=rsncode, DDNAME=ddname, DSNAME=dsname**  
**Explanation:** An attempt to dynamically free a data set failed. The error message contains the information associated with the failed request.
User response: Review the information contained in the message, and attempt to correct the problem. Information on the codes may be obtained from the IBM documentation. If, after reviewing this information, you are still unable to correct the problem, contact Software Support.

HLV3136T User record exits cannot be loaded because DDNAME ddname is not allocated. Exits: program1 and program2

Explanation: An attempt to load a user record post-read (program1) and/or pre-write (program2) exit routine failed because the HLVRPCLB DD statement is not allocated. User record exit routines must reside in the the in the S__RPCLB library.

User response: Modify the product server started task JCL to include the HLVRPCLB DD statement.

HLV3137S Load for user record exit program program failed

Explanation: An attempt to load a user record post-read and/or pre-write exit program failed.

User response: The user record post-read and pre-write programs must reside in a library allocated to the product HLVRPCLB DD statement. Check the JOBLG for related error messages. If the combined error messages are sufficient to explain the problem, take whatever corrective action is appropriate. If the problem cannot be resolved, contact Software Support.

HLV3138T User record exits cannot be used because the SQL feature is not configured

Explanation: None.

User response: Contact IBM Software Support.

HLV3139T Non-zero return code from user exit program. RC=rcode

Explanation: A user record exit program returned a non-zero return code.

User response: The task is terminated.

HLV3140W INVALID desc CODE func FOR service, DETECTED AT addr

Explanation: A product routine called the system management module with an invalid function code. This failure was probably caused by a programming error in the calling routine. This failure can also be caused by product installation and maintenance errors.

User response: Check if any other error messages were generated along with the error message above. If the combined error messages are sufficient to explain the problem, take whatever corrective action is appropriate. Otherwise, contact Software Support with this problem.

HLV3141E rsync sysserv FAILED, RC=rcode, DETECTED AT addr

Explanation: Some type of error occurred in the system management routines of the product. See the actual text of the message for an explanation. The error was probably caused by a failure in an operating system service (sysserv) requested by a product system management routine.

User response: Check if any other error messages were generated along with the error message above. If the combined error messages are sufficient to explain the problem, take whatever corrective action is appropriate. Otherwise, contact Software Support for assistance with this problem.

HLV3142W Invalid data FOR func, Detected at addr. Stack: %SK

Explanation: Some type of error occurred in the system management routines of the product. See the actual text of the message for an explanation. This failure was probably caused by a programming error in the calling routine or in the system management module. This failure can also be caused by product installation and maintenance errors.

User response: Check if any other error messages were generated along with the error message above. If the combined error messages are sufficient to explain the problem, take whatever corrective action is appropriate. Otherwise, contact Software Support with this problem.

HLV3143U DISPATCHER FAILURE DETECTED AT addr

Explanation: The internal product dispatcher detected a serious error. This failure was probably caused by a programming error in the system management module. This failure can also be caused by product installation and maintenance errors.

User response: Check if any other error messages were generated along with the error message above. If the combined error messages are sufficient to explain the problem, take whatever corrective action is appropriate. Otherwise, contact Software Support with this problem.

HLV3144E rsync sysserv FAILED, RC=rcode, DETECTED AT routine+offset

Explanation: Some type of error occurred in the system management routines of the product. See the actual text of the message for an explanation. The error was probably caused by a failure in an operating
system service requested by a product system management routine.

User response: Check if any other error messages were generated along with the error message above. If the combined error messages are sufficient to explain the problem, take whatever corrective action is appropriate. Otherwise, contact Software Support with this problem.

HLV3145S  cblk ERROR SUBSYS = subsys

Explanation: The product detected a serious operating system control block (cblk) error. The operating system control block error prevented the system management routine from performing some request on behalf of a caller. This control block error may cause other system errors and may cause the operating system to fail.

User response: Check if any other error messages were generated along with the error message above. If the combined error messages are sufficient to explain the problem, take whatever corrective action is appropriate. You may need to IPL the system to resolve this problem. If the problem cannot be resolved, contact Software Support.

HLV3146S  EMERGENCY PRODUCT SHUTDOWN STARTED - errdesc

Explanation: The product is shutting down because of a serious error. The message text describes the error. The error may be caused by an abend failure inside the product or by a product rate limit that has been exceeded. Also, the error may have been caused by a product programming error or by a system failure of some kind. The product will turn itself off and disconnect itself from the operating system.

User response: Check if any other error messages were generated along with the error message above. If the combined error messages are sufficient to explain the problem, take whatever corrective action is appropriate. If the problem cannot be resolved, contact Software Support.

HLV3147T  src sysserver FAILED, RC=rcode, DETECTED AT routine+offset

Explanation: Some type of error occurred in the system management routines of the product. See the actual text of the message for an explanation. The error was probably caused by a failure in an operating system service (sysserver) requested by a product system management routine.

User response: Check if any other error messages were generated along with the error message above. If the combined error messages are sufficient to explain the problem, take whatever corrective action is appropriate. Otherwise, contact Software Support with this problem.

HLV3148E  Main product address space not active

Explanation: Some routine tried to use a product facility that requires the main product address space to be active. The product facility could not be used because the main product address space is not active.

User response: This may or may not be an error condition. Start or restart the main product address space, if necessary. Check if any other error messages were generated along with the error message above. If the combined error messages are sufficient to explain the problem, take whatever corrective action is appropriate. If the problem cannot be resolved, contact Software Support.

HLV3149E  ENFREQ reqtype CODE ecode FAILED, RC=rcode. STACK: %5K

Explanation: A z/OS event notification facility request, ENFREQ, failed. The meaning of the return code can be found in the IBM Authorized Assembler Services manual.

User response: If the security server you are using does not support ENF signal 71, check with the security server product vendor for more information. Otherwise, contact Software Support for assistance with this problem.

HLV3150E  INVALID desc, VALUE data, DETECTED AT addr

Explanation: A system management routine detected invalid data. The error message describes the invalid data (data). This failure was probably caused by a programming error in the calling routine or in the system management module. This failure can also be caused by product installation and maintenance errors.

User response: Check if any other error messages were generated along with the error message above. If the combined error messages are sufficient to explain the problem, take whatever corrective action is appropriate. Otherwise, contact Software Support with this problem.

HLV3151H  ABEND abcode IN func modname+offset

Explanation: A system management routine detected an abend while processing a message queue. The message text provides the abend code, current operation, and abend location. This failure may have been caused by a programming error in the calling routine or in the system management module. This failure can also be caused by product installation and maintenance errors. This failure will also occur when an address space containing a message queue terminates unexpectedly.

User response: Check if any other error messages were generated along with the error message above. If the combined error messages are sufficient to explain
the problem, take whatever corrective action is appropriate. If the problem cannot be resolved, contact Software Support.

HLV3152W  errdesc1 errdesc2 errdesc3, DETECTED AT addr

Explanation: A system management routine detected an error while processing a request on behalf of a caller. The message text describes the failure. This failure may have been caused by a programming error in the calling routine or in the system management module. This failure can also be caused by product installation and maintenance errors.

User response: Check if any other error messages were generated along with the error message above. If the combined error messages are sufficient to explain the problem, take whatever corrective action is appropriate. Otherwise, contact Software Support with this problem.

HLV3153E  ABEND abcode IN func modname+offset

Explanation: A system management routine detected an abend while performing a service on behalf of a caller. The message text provides the abend code, current operation, and abend location. This failure may have been caused by a programming error in the calling routine or in the system management module. This failure can also be caused by product installation and maintenance errors.

User response: Check if any other error messages were generated along with the error message above. If the combined error messages are sufficient to explain the problem, take whatever corrective action is appropriate. If the problem cannot be resolved, contact Software Support.

HLV3156E  rsrsrc MISSING AND REQUIRED FOR sysserc, DETECTED AT addr

Explanation: A system management routine detected that a resource (rsrsrc) needed to perform a service on behalf of a user is not available. The service (sysserc) cannot be provided because of the error. The message text identifies the service requested by the user and the missing resource.

User response: Check if any other error messages were generated along with the error message above. If the combined error messages are sufficient to explain the problem, take whatever corrective action is appropriate. Otherwise, contact Software Support with this problem.

HLV3157E  func ABEND abcode AT addr

Explanation: An abend failure occurred when a system management routine called an MVS service routine. The abend occurred in the MVS service routine. The error message provides the abend code and abend location. This failure was probably caused by a programming error in the calling routine, in the system management module, or possibly in the IBM service routine. This failure can also be caused by product installation and maintenance errors.

User response: Check if any other error messages were generated along with the error message above. If the combined error messages are sufficient to explain the problem, take whatever corrective action is appropriate. Otherwise, contact Software Support with this problem.

HLV3200W  INVALID SUBPOOL NUMBER=spno REQUESTED BY modname+offset

Explanation: The storage management routine detected an invalid subpool number (spno) in a parameter list passed by a caller. The subpool number is not supported by the storage management routine. The storage management module cannot perform the service requested by the caller. The error message gives the invalid subpool number and the location of the calling routine. This failure may have been caused by a programming error in the calling routine or in the storage management routine. This failure can also be caused by product installation and maintenance errors.

User response: Check if any other error messages were generated along with the error message above. If the combined error messages are sufficient to explain the problem, take whatever corrective action is appropriate. Otherwise, contact Software Support with this problem.

HLV3202W  func ERROR RC=rcode REQUESTED BY modname+offset, SP=subp, LEN=lgth, A=addr

Explanation: A GETMAIN or FREEMAIN request failed with a non-zero return code. The error message gives the storage request type (GET or FREE), the return code, and the location of the calling routine. This failure may have been caused by a programming error in the calling routine or in the storage management routine. This failure can also be caused by product installation and maintenance errors.

subp represents the requested subpool

User response: Check if some type of operating system problem (such as storage shortage) may have caused the problem. Check if any other error messages were generated along with the error message above. If the combined error messages are sufficient to explain the problem, take whatever corrective action is
appropriate. Otherwise, contact Software Support with this problem.

**HLV3204T**

```
modname+offset func stortype spno stg1 stg2
token
```

**Explanation:** This is a storage trace message generated by the product storage management routine. Storage traces are used to analyze product storage utilization and to find storage management bugs. This is not an error message. The message gives the calling module name, calling module offset, current function (GET or FREE), storage type, subpool number (spno), storage area size (stg1), old storage total (stg2), and new storage total.

**User response:** Check if storage trace was activated for some reason. If storage trace is active, ignore this message. Otherwise, storage trace has been inadvertently activated by a memory overlay. Contact Software Support with this problem.

The variable fields of the message text are: mod module name off module offset func current function sttype storage type (E/CSA or E/Private) subp storage spno stg1 storage area size or amount stg2 storage area size or amount token storage token if any

**HLV3205E**

```
STORAGE ROUTINE ABEND CODE
abcode AT modname+offset
```

**Explanation:** The storage management routine detected an abend while performing a service on behalf of a caller. The message text provides the abend code and abend location. This failure may have been caused by a programming error in the calling routine or in the storage management module. This failure can also be caused by product installation and maintenance errors.

**User response:** Check if some type of operating system problem (such as storage shortage) may have caused the problem. Check if any other error messages were generated along with the error message above. If the combined error messages are sufficient to explain the problem, take whatever corrective action is appropriate. Otherwise, contact Software Support for assistance with this problem.

**HLV3206S**

```
SUBPOOL subp REQUIRES GLOBAL MASTER AT modname+offset
```

**Explanation:** The storage management routine detected a request for a subpool that can only be executed using the control blocks of the main product address space. However, the caller did not provide the main product address space control blocks. The current storage request will be rejected. This message indicates an internal error in the product. This failure may have been caused by a programming error in the calling routine or in the storage management module. This failure can also be caused by product installation and maintenance errors.

**User response:** This is a very serious error and requires immediate action. If the message shows that CSA is being returned for ECSA requests, then ECSA has been depleted. One or more products may have to be terminated to release ECSA. At some point, the amount of ECSA allocated may have to be increased. Note that the product can continue to execute in this case. However, CSA is likely to be depleted, leading to complete MVS system failure. If the message indicates that the problem is occurring for private area storage, contact Software Support with this problem.

**HLV3207S**

```
CROSS MEMORY REQUIRES GLOBAL MASTER AT modname+offset
```

**Explanation:** The storage management routine detected a request for a cross memory GETMAIN or FREEMAIN that can only be executed using the control blocks of the main product address space. However, the caller did not provide the main product address space control blocks. The current storage request will be rejected. This message indicates an internal error in the product. This failure may have been caused by a programming error in the calling routine or in the storage management module. This failure can also be caused by product installation and maintenance errors.

**User response:** Check if any other error messages were generated along with the error message above. If the combined error messages are sufficient to explain the problem, take whatever corrective action is appropriate. Otherwise, contact Software Support with this problem.

**HLV3208S**

```
storype RETURNED FOR storype REQUESTED BY modname+offset,
SP=subp, LEN=length
```

**Explanation:** The storage management routine detected that a request for extended storage (above the 16MB line) was satisfied with non-extended storage (below the 16MB line). This will only happen when the extended storage area has been depleted and MVS is returning non-extended storage to satisfy storage requests. For example, the product is requesting ECSA storage but MVS is returning CSA storage because ECSA has been completely allocated. This problem can also occur for private area storage as well.

**User response:** Check if any other error messages were generated along with the error message above. If the combined error messages are sufficient to explain the problem, take whatever corrective action is appropriate. Otherwise, contact Software Support with this problem.

**User response:** This is a very serious error and requires immediate action. If the message shows that CSA is being returned for ECSA requests, then ECSA has been depleted. One or more products may have to be terminated to release ECSA. At some point, the amount of ECSA allocated may have to be increased. Note that the product can continue to execute in this case. However, CSA is likely to be depleted, leading to complete MVS system failure. If the message indicates that the problem is occurring for private area storage, contact Software Support with this problem.
HLV3209S  NO ASCB SPECIFIED FOR TCB-LEVEL STORAGE REQUEST AT modname+offset

Explanation: The storage management routine detected that a cross memory GETMAIN or FREEMAIN with an explicitly specified TCB association did not specify the address space designation along with the request.

User response: Check if any other error messages were generated along with the error message above. If the combined error messages are sufficient to explain the problem, take whatever corrective action is appropriate. Otherwise, contact Software Support with this problem.

HLV3210S  retype XFORM SP=subp LEN=lgth A=addr FROM modname+offset failrsn

Explanation: The storage management routine determined that an SRB-mode memory GETMAIN or FREEMAIN request could not be internally converted to an appropriate branch-entry request. Without transformation, the request cannot execute in SRB-mode.

User response: The request to get or free storage is rejected. Check if any other error messages were generated along with the error message above. If the combined error messages are sufficient to explain the problem, take whatever corrective action is appropriate. Otherwise, contact Software Support for assistance with this problem.

HLV3211S  STG OBTAINED AT addr NOT 2**reql BOUNDARY ALIGNED REQUESTED BY modname+offset

Explanation: The storage management routine determined that obtained storage was not aligned on the requested boundary (reql).

User response: The storage management routine generates an S0C3 to abnormally end the calling procedure. This is done to prevent errors which are likely to occur subsequently if the incorrectly aligned storage is used. Contact Software Support with this problem.

HLV3212S  INVALID REQUEST TO FREE ALL SUBPOOL subp STORAGE REQUESTED BY modname+offset

Explanation: The storage management routine determined that a product storage FREEMAIN request has been made with a zero address. Such a request results in freeing all storage within the specified subpool (subp). The requestor has either inadvertently specified the FREEMAIN storage address as zero, or a legitimate FREEPool request was coded incorrectly.

User response: The storage management routine generates an S0C3 to abnormally end the calling procedure. This is done to prevent errors which are likely to occur subsequently after an entire subpool is freed inadvertently. If the problem cannot be resolved, contact Software Support.

HLV3250S  service ERROR RC=rcode

Explanation: This message describes a variety of errors encountered while using the QEDIT supervisor service.

User response: This problem may be caused by a failure either in the product or in the operating system. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support.

HLV3251I  cmd msgtext

Explanation: This message is only issued when the product is in debugging mode. It echoes commands sent to the product.

User response: None. This message is for informational purposes only.

HLV3252S  component initialization timeout detected

Explanation: This message is issued when the product attempted to initialize full SEF (component) support, but SEF initialization did not complete in the allowed time period. This is a serious error, and product initialization is terminated.

User response: Check if any other error messages were generated along with the error message above. If the combined error messages are sufficient to explain the problem, take whatever corrective action is appropriate. If the problem cannot be resolved, contact Software Support.

HLV3253I  proddate version proddver buildno subsystem subsys initialization complete

Explanation: This is the standard message indicating that product initialization is complete.

User response: No action required.

HLV3254I  component map build beginning d2 at t2 for ss

Explanation: This message is issued when a SQL map build is complete.

Response: None. This message is for informational purposes only.
HLV3255I • HLV3305E

HLV3255I component map build complete on d2 at t2 for ss

Explanation: This message is issued when a SQL map build is complete.
Response: None. This message is for informational purposes only.

HLV3256S SQL map build failed due to component

Explanation: This message is issued when the SQL engine map build process does not complete in the allowed time period (five minutes). This is a serious error, and major parts of the product may not function correctly.
Response: Check if any other error messages were generated along with the error message above. If the combined error messages are sufficient to explain the problem, take whatever corrective action is appropriate. If the problem cannot be resolved, contact IBM Software Support.

HLV3259E (cmd) invalid command

Explanation: The product tried to match an operator command to an existing command rule (cmd) and was unsuccessful.
User response: Verify that the specified command is spelled correctly. Also, verify that it exists and is enabled in the current command rule data set.

HLV3260I Server subsystem subsys is an ERLY subsystem

Explanation: The product has been started as an ERLY subsystem for use by other (non-product) subsystems that normally start before ordinary product subsystems. An ERLY product subsystem can be started SUB=MSTR if desired. It does not perform normal product work and uses very few system resources.
User response: None. This message is for informational purposes only.

HLV3300W INVALID desc CODE func FOR service, DETECTED AT addr

Explanation: A product routine called the SQL management module with an invalid function code. This failure was probably caused by a programming error in the calling routine. This failure can also be caused by product installation and maintenance errors.
User response: Check if any other error messages were generated along with the error message above. If the combined error messages are sufficient to explain the problem, take whatever corrective action is appropriate. Otherwise, contact Software Support with this problem.

HLV3301E PLAN plan DBRM dbrm TIMESTAMPs MISMATCH time1 time2

Explanation: The timestamp associated with the SQL statement plist does not match the timestamp in the DBRM. The exact SQL statement cannot be displayed.
This message contains two timestamps; time1 represents the plist timestamp, and time2 represents the DBRM timestamp
User response: Verify that the DBRM library specified in the JCL of the main product library is synchronized with the application program load library (i.e. both the load and the DBRM were produced from the same version of the source). Correct any mismatch, and restart the product.

HLV3302E ddbname DDNAME not allocated - SQL source not available

Explanation: The DBRM DD statement is not present in the JCL used to start the main product address space.
User response: Add the DBRM DD statement to the JCL of the main product address space.

HLV3303E DBRM OPEN failed for

DDNAME=ddname DSNAME=dsname
RC=rcode

Explanation: HLV tried to open the DBRM library for input and the open operation failed. Actual SQL statement texts must have the DBRM(s).
User response: Examine the data set and any other messages that may accompany this one. If you are able to resolve the problem, restart the product.

HLV3304E Member dbrm not found in DBRM library

Explanation: A BLDL for the DBRM member failed.
User response: Determine why the DBRM is missing from the DBRM library. If necessary, change the library specified in the JCL for the main address space, and restart the product.

HLV3305E func failed for MEMBER=dbrm

DDNAME=ddname DSNAME=dsname
RC=rcode

Explanation: An I/O operation (func) failed while attempting to access the DBRM library.
User response: Use this message in conjunction with any other messages that may accompany it to resolve the problem. You may also want to examine the data set for problems. Once the problem is corrected, restart the product.

</tr>
</tbody>
</table>
HLV3316T  Operational mode for DB2 subsystem  

subsys could not be determined

Explanation: The product is not aware of the version of DB2 executing in the DB2 subsystem and cannot determine the operational mode.

User response: Processing continues. Contact Software Support to report this message.

HLV3700H  TSO/SRV now using count servers -  

MIN=parmval1 MAX=parmval2

Explanation: The product has allocated a new server descriptor control block and will start a new TSO/SRV server address space.

parmval1 represents the value of CGIMIN, and parmval2 represents the value of CGIMAX

User response: None. This message is for informational purposes only.

HLV3701I  service OF desc FAILED, RC=rcode

Explanation: This is a generic error message used to describe a wide variety of errors detected by the product Server routine manager. The message text provides the current operation (service) and what the current operation was trying to do.

User response: Check the error messages and the return code associated with this problem. There may be one or more error messages referring to the current problem. If possible, fix the problem identified by the error messages, and restart the product.

HLV3702H  TSO/SRV started server  

jobname,ASID=asid

Explanation: The product has issued a START command to create a new TSO/SRV server address space, and the address space has been created.

User response: None. This message is for informational purposes only.

HLV3703W  TSO/SRV SUBTASK UNABLE TO SCHEDULE EXTERNAL TSO SERVER -  

ABEND/POST CODES=(abcode,pcode)

Explanation: The product TSO/SRV execute queue processing function detected an abend or error while attempting to schedule a command into an external TSO server address space. This message is returned to the original requestor.

User response: Gather all abend error data, and contact your local product systems programming group for support.

HLV3704H  TSO/SRV cancelled server  

jobname,ASID=asid

Explanation: The product has issued a CANCEL command to eliminate a TSO/SRV server address space (asid). This may occur either because of a change (reduction) in the value of the TSOMAXSERVERS parameter or because of a server command exceeding its execution limits.

User response: When a server command exceeds the server execution limits, this message is accompanied by a message describing which limit is exceeded. Either modify the limit or correct the server command/program.

HLV3705I  Idle TSO server terminated due to TSOMAXSERVERS

Explanation: The product detected that there were currently more servers active than specified in the TSOMAXSERVERS parameter and terminated the server in question because it was currently idle.

User response: None. This message is for informational purposes only.

HLV3706W  Transaction aborted

Explanation: This message is sent to the issuer of a TSO/SRV server command when the server has terminated while executing the transaction.

User response: Check for other messages associated with this condition, and attempt to resolve the problem.

HLV3707S  TSO/SRV server failed during initialization

Explanation: The product attempted to start a TSO/SRV server address space. However, the address space failed during initialization.

User response: Verify that the TSO/SRV server started task JCL is correct. JCL errors of one kind or another (e.g. data set does not exist) are frequently the cause of this condition. If you are unable to resolve the problem, contact Software Support.

HLV3708E  Unable to find ASVT entry for TSO/SRV server ASID=asid

Explanation: After issuing an internal START command for a TSO/SRV address space, the product attempted to validate the returned ASID and found it to be invalid. This error indicates one of the following conditions: (1) the ASID is negative, (2) the ASID is greater than the system MAXUSER value, or (3) the associated ASVT entry is currently not in use.

User response: This condition is extremely unlikely to occur.
HLV3709W  TSO server canceled - max transaction time exceeded

Explanation: The transaction currently being processed by the server in question has exceeded the maximum amount of time allowed by TSOMAXCMDRUNTIME and has caused the cancellation of the server.

User response: Please examine the SYSLOG for the _3710I companion message, which will detail the command in error and its approximate start time. Either correct the command in error or increase the TSOMAXCMDRUNTIME value.

HLV3710I  CMD TEXT = cmd, START TIME = time

Explanation: This is the companion message to _3709W. It details the command which was being processed by the canceled server and its approximate start time.

User response: Either correct the command in error or increase the TSOMAXCMDRUNTIME specification.

HLV3711I  Idle server terminated due to TSOMINSERVERS or TSOSRVDORMANT timeout

Explanation: The product detected that the current number of servers is greater than the user specified TSOMINSERVERS parameter but not greater than the user specified TSOMAXSERVERS value and that the server has been idle longer than the user specified TSODORMANTTIMEOUT value. The product terminated the server in question because it was currently idle.

User response: None. This message is for informational purposes only.

HLV3712W  TSOMAXSERVERS value (parmval1) invalid. Set to TSOMINSERVERS (parmval2).

Explanation: The product Server processing has detected that the TSOMAXSERVERS value has been set to a value that is lower than the TSOMINSERVERS value. This is invalid - the maximum number of servers can never be lower than the minimum number of servers. The maximum value is changed to the minimum value.

parmval1 represents the value of TSOMAXSERVERS, and parmval2 represents the value of TSOMINSERVERS

User response: If the incorrect values are set via the startup exec or any other program, correct the program(s). You may also adjust the TSOMINSERVERS and TSOMAXSERVERS values using the ISPF parameter display.

HLV3713I  TSO/SRV server added due to excessive queue depth (qdep)

Explanation: The number of requests on the TSO/SRV server execute queue currently exceeds the threshold set by the user specified TSOSRVDQUEUEADDDEPTH. The number of servers is being increased by one until the number of servers is still below the maximum number of servers limit as specified by the TSOMAXSERVERS value.

User response: None. This message is for informational purposes only.

HLV3714H  TSO/SRV terminated server jobname,ASID=asid

Explanation: The product has terminated a TSO server address space. The server has been terminated because either the current number of servers exceeds the TSOMAXSERVERS limit, or the current number of servers exceeds the TSOMINSERVERS value and the current server has been idle more than TSOSRVDORMANTTIMEOUT seconds. This message may also occur when a control command requested server termination. The server address space may not terminate immediately if it is currently running a transaction. If the server does not terminate voluntarily within a limited time period, the server will be cancelled by the product.

User response: None. This message is for informational purposes only.

HLV3715H  TSO/SRV SUBTASK ABEND abcode in func modname+offset

Explanation: The product TSO/SRV execute queue processing function detected an abend. The message text contains the abend code, current operation, and abend location.

User response: Check if any other error messages were generated along with the error message above. If the combined error messages are sufficient to explain the problem, take whatever corrective action is appropriate.

HLV3716O  Cancelled TSO server jobname stepname (ASID=asid), has not terminated

Explanation: The product has issued a CANCEL command to terminate a TSO server. More than one (1) minute has elapsed since the CANCEL command was issued, but the server address space has not terminated.

User response: First, attempt another CANCEL command using the STEP NAME from the message. If this does not cause the server to terminate, use the MVS FORCE command or attempt to kill the server address space using any other means at your disposal.
HLV3717H  TSO server execute queue reset

**Explanation:** A control command has caused the TSO/SRV execute queue to be cleared. All pending TSO transactions have been discarded.

**User response:** None. This message is for informational purposes only.

---

HLV3718E  TSO ADDRESS SPACE CREATION FAILED, RC = rcode, REASON CODE = rrsncode

**Explanation:** A failure occurred in the service routine that schedules an address space CREATE. The TSO address space will not be created. The return and reason codes in the message are from the MVS ASCRE service routine.

**User response:** Check the return code in the message. If the return code is 52 or higher, this error is most likely a system related problem, and you should report this to your system programming staff. If necessary, set the TSO/TSOUSER/ASCRE to NO so that START commands (rather than ASCRE) will be used to create TSO outboard server address spaces.

---

HLV3720T  TSO EXECUTE QUEUE ADD; QD=qdep, CMD=cmd

**Explanation:** This message is actually issued by the ADDRESS TSO | CGI processor when the DEBUG flag is set ON. This message indicates that a command (cmd) is being sent to the product Server queue. Note that queue depth (qdep) is displayed prior to the addition of the current command.

**User response:** None. This message is used for debugging and analysis purposes only.

---

HLV3721T  TSO COMMAND DISPATCH;  
**Explanation:** This message indicates that a command has been removed from the TSO execute queue and has been sent to a product TSO server address space. This message is only issued when DEBUG is set ON.

qdep represents queue depth
qtime represents time spent on TSO execute queue in 100ths of a second

**User response:** None. This message is used for debugging and analysis purposes only.

---

HLV3722T  TSO COMMAND RECEIVED; ASID=asid, ETIME=etime, CMD=cmd

**Explanation:** This message indicates that a server has received a command. The delay between the time (etime) the TSO command dispatch message is issued and the time this message is issued is due to operating system scheduling factors. This message is only issued when DEBUG is set ON.

**User response:** None. This message is used for debugging and analysis purposes only.

---

HLV3723T  TSO COMMAND COMPLETE; ASID=asid, ETIME=time1, CPU=time2, I/O=count, CMD=cmd

**Explanation:** This message indicates that a server has completed execution of a command. This message is only issued when DEBUG is set ON.

The message has two time values; time1 represents time since command was sent to server in seconds, and time2 represents command CPU time in hex (microseconds)

**User response:** None. This message is used for debugging and analysis purposes only.

---

HLV3724H  name (userID) SENT TSO CMD cmd

**Explanation:** This message indicates that a server has received a command (cmd). The program or ruleset.rulename (name) indicates where the command originated.

**User response:** No action is required.

---

HLV3725T  TSO execute processor posted by component

**Explanation:** This message indicates that the TSO execute processor has received a signal from another component.

**User response:** None. This message is used for debugging and analysis purposes only.

---

HLV3729T  msgtext var2 var3

**Explanation:** This message is for TSO debugging and trace purposes only.

**User response:** None. This message is for informational purposes only.

---

HLV3750H  SEF var1 var2

**Explanation:** This message indicates that the product has terminated.

**User response:** This message is for informational purposes only unless it indicates that the SEF command has not been allocated. In that case, you should check for any other messages that appeared on the console during product initialization that may assist you in resolving this problem. If you are unable to
resolve the problem, contact Software Support for further assistance.

HLV3751I  SEF service OF desc FAILED, RC=rcode

Explanation: This is a generic error message used to describe a wide variety of global variable initialization and termination errors. The message text provides the current operation (service) and what the current operation was trying to do.

User response: Check the error messages and the return code associated with this problem. There may be one or more error messages referring to the current problem. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support.

HLV3752W  SEF API INITIALIZATION FAILED
DUE TO initstep additinfo1 additinfo2

Explanation: During SEF initialization, an error was detected while creating API interface linkages. The message describes the error encountered.

User response: Check the error messages and the return code associated with this problem. There may be one or more error messages referring to the current problem. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support.

HLV3753W  ABEND var1 AT var2+var3, SEF COMMAND var4 ABORTED

Explanation: There was an error within the SEF rule processor.

User response: Review the messages just before and after this message to understand the context.

HLV3754I  SEF command syntax error; cmd

Explanation: The SEF execution processor detected a command with invalid syntax for the ADDRESS SEF environment. Normally, the syntax error should have been detected at rule enabled or program compile time.

User response: Modify the rule or program that issued the command to use a valid ADDRESS SEF command.

HLV3755E  service OF PRECOMPILED DATA SET
(dsnname) FAILED RC=rcode

Explanation: The SEF execution processor detected a request to allocate/deallocate (service) a compiled rules library, and the request failed. Check error messages preceding this failure for more allocation error data.

User response: Check any allocation error messages that preceded this message for more diagnostic information. After fixing the problem, reset the parameters SEFPRECOMPILED and SEFPRECOMPILEDDSN.

HLV3756I  SEF precompiled rules active

Explanation: SEF has activated the Compiled Rules Facility. This facility is activated by the setting of the parameter SEFPRECOMPILED to ON and the parameter SEFPRECOMPILEDDSN to a valid compiled rule library.

User response: None. This message is for informational purposes only.

HLV3757I  SEF var1 var2

Explanation: This message indicates that a command has executed and is returning status information. It indicates the success or failure of the command.

User response: This message is for informational purposes only. If it indicates failure of the command, check that the parameters you have given are correct.

HLV3780I  func OF desc FAILED, RC=rcode

Explanation: A failure occurred in the service routine that sets (func) the wait timer interval (desc) for the next trace checkpoint. This message should be preceded by a message containing the return code from the MVS STIMER service.

User response: Contact Software Support.

HLV3781S  ABEND abcode OCCURRED AT
modname+offset - desc

Explanation: An abend occurred during trace checkpoint processing. The location of the abend is shown in the abend error message. All trace checkpoint processing will be suspended until the main product address space is restarted. Note that the main product address space will start to accumulate non-VIO ASM slots as if no DIV data set had ever been allocated. The gradual accumulation of ASM slots by the main product address space could eventually cause an ASM slot shortage.

User response: Check the error messages and the abend code associated with this problem. There may be one or more additional error messages or abends referring to the current trace checkpoint processing problem. Check for OPEN errors, such as security product related abends. Also, check for storage allocation errors or abends. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support.
HLV3782S  file dname error FAILED RC=rcode errdesc

Explanation: A problem was encountered while opening or refreshing a product data set. The message indicates the cause of the failure.

User response: Check the error messages associated with this problem. There may be one or more additional error messages or abends referring to the current processing problem. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support.

HLV3783S  file dname processing ABENDED code=rcode reason=rsname at modname+offset

Explanation: A problem was encountered while opening or refreshing a product data set. The message indicates the abort code associated with the processing function.

User response: Check the error messages associated with this problem. There may be one or more additional error messages or abends referring to the current processing problem. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support.

HLV3784T  src DUPLICATES THE type ID IN src - SKIPPED

Explanation: A problem was encountered while opening or refreshing a product data set. The message indicates that a duplicate entity was detected. The DUPLICATING entity will be ignored.

Variables in this message (src, type, and ID) refer to the duplicating entity

User response: Check the error messages associated with this problem. There may be one or more additional error messages or abends referring to the current processing problem. If possible, fix the problem identified by the error messages, and refresh or restart the product. If the problem cannot be resolved, contact Software Support.

HLV3785H  src DUPLICATES THE type ID IN src - SKIPPED

Explanation: A problem was encountered while opening or refreshing a product data set. The message indicates that a duplicate entity was detected. The DUPLICATING entity will be ignored.

Variables in this message (src, type, and ID) refer to the duplicating entity

User response: Check the error messages associated with this problem. There may be one or more additional error messages or abends referring to the current processing problem. If possible, fix the problem identified by the error messages, and refresh or restart the product. Normally, this is done by manually removing one or the other source file identified in the message. If the problem cannot be resolved, contact Software Support.

HLV3786E  RULESET rsname additinfo1, additinfo2 ... additinfo8

Explanation: The SEF request is rejected because the ruleset status prevents execution of the request.

User response: Examine previously reported conditions to determine the cause of the problem.

HLV3787I  RULESET rsname additinfo1, additinfo2 ... additinfo8

Explanation: An error occurred while processing an SEF request and the status of a ruleset is effected. This message follows the original error message to warn of additional/on-going ramifications from the error.

User response: The server takes the action reported in this message in order to recover from the previously reported error cause.

HLV3788E  Required master WWW ruleset not defined - HTTP processing impossible

Explanation: SEF Rule manager did not find a Master WWW ruleset definition. The rule manager will not enable ANY WWW rulesets.

User response: Check your initialization procedure, SW5xIN00, to be sure it defines ONE master WWW ruleset using the "WWWCLASS(MASTER)" keyword.

HLV3789I  SEF version OPERATIONAL MODE DOES NOT SUPPORT THE func FUNCTION

Explanation: SEF rule manager received a command which it does not support when operating in the indicated operational mode.

User response: Correct the command, and re-issue.

HLV3790I  func OF desc FAILED, RC=rcode

Explanation: A failure occurred in the service routine that sets (func) the wait timer interval (desc) for the next global variable checkpoint. This message should be preceded by a message containing the return code from the MVS STIMERM service.

User response: Contact Software Support for assistance.
HLV3791E  func for creating global variable backup, 
RC = rcode, Reason code = rsicode

Explanation: A failure occurred in the service routine 
(func) that schedules an address space create. The 
global variable backup will not execute. The return and 
reason codes in the message are from the MVS ASCE 
service routine.

User response: Check the return code in the message. 
If the return code is 52 or higher, the error is most 
likely a system related problem, and you should report 
this to your system programming staff. If the problem 
cannot be resolved, contact Software Support for 
assistance.

HLV3792I  Global Variable Backup address space 
procedure has been created

Explanation: This message is informational only. The 
message indicates that the product created the global 
variable backup address space.

User response: None. This message is for 
informational purposes only.

HLV3800T  An unknown value was found in field 
field by routine.

Explanation: A value was found in a control block 
field that cannot be validated by the SERVER API.

User response: Contact IBM Software Support.

HLV3847W  Error compiling SEF rule rule, closing */ 
not found where expected.

Explanation: SEF rule manager attempted to compile 
a REXX rule with a /*%include statement that 
contained invalid syntax. After the member name, only 
*/ is allowed. Imbedded comments inside the 
/%include phrase are not supported.

User response: Correct the /*%include statement and 
try again.

HLV3848W  Error compiling SEF rule rule, INCLUDE 
name memname too long.

Explanation: SEF rule manager attempted to compile 
a REXX rule with a /*%include statement that specified 
a member name (memname) longer than 8 bytes.

User response: Correct the /*%include statement and 
try again.

HLV3849T  SEF version operational mode does not 
support the func function

Explanation: SEF rule manager received a command 
which it does not support when operating in the 
indicated operational mode.

User response: Correct the command, and re-issue.

HLV3850E  INTERNAL routine1 ERROR 
DETECTED BY routine2: CALLER(csect) 
RTADDR(addr) - additinfo

Explanation: An error occurred while an internal API 
routine was executing. This message reports some 
 inconsistency or a possible logic error.

User response: The API rejects the current request and 
continues. Check for other messages which may 
indicate the precipitating cause.

HLV3851I  NO EXECUTABLE OBJECT (XO) 
DATASETS ARE CURRENTLY 
DEFINED OR IN-USE

Explanation: This response is returned for 'LIST 
=XOFILES' SEF command if no executable object image 
(XO) datasets are defined or in use. XO datasets may 
do contain pre-compiled executable object images such as 
SEF rules or HTX skeletons.

User response: None.

HLV3852I  %1

Explanation: This response is returned for 'LIST 
=XOFILES' SEF command for each individual XO 
dataset allocated in the system. A list of zero or more 
associations may follow this message.

User response: None. This is an informational 
message only.

HLV3853I  %1

Explanation: This response is returned for 'LIST 
=XOFILES' SEF command for each association with an 
XO dataset. This message follows the XO dataset status 
message MSG3852I.

User response: None. This is an informational 
message only.

HLV3854I  %%INCLUDE processing ignored when 
ISPF EDIT source being compiled, line 
lineno

Explanation: A %INCLUDE statement was detected in 
the source of the Product REXX program being 
compiled. The procedure source is being fetched from 
the current ISPF Edit session and %INCLUDE is not 
supported in this environment.

User response: The %INCLUDE statement, with its 
including comment delimiters is not processed. The 
original text is preserved in the procedure source being 
fetched from the current edit session.
HLV3855I  %INCLUDE statement syntax invalid, line lineno
Explanation: A %INCLUDE statement was detected in the source of the Product REXX program being compiled, but the statement was incomplete. /*%INCLUDE, the named member, and */ must all be present on a single source line. The member name must be less than or equal to 8 bytes in length.
User response: The %INCLUDE statement is rejected

HLV3856I  %INCLUDE member (member) not found, line lineno
Explanation: A %INCLUDE statement was detected in the source of the Product REXX program being compiled, but the member named in the statement cannot be found in either the library dataset where the source member resides or in the SYSEXEC library concatenation.
User response: The %INCLUDE statement is rejected

HLV3861E  RULESET rsname additinfo1, additinfo2 ...
Explanation: The SEF request is rejected because the ruleset status prevents execution of the request.
User response: Examine previously reported conditions to determine the cause of the problem.

HLV3881E  RULESET rsname additinfo1, additinfo2 ...
Explanation: An error occurred while processing an SEF request and the status of a ruleset is affected. This message follows the original error message to warn of additional/on-going ramifications from the error.
User response: The server takes the action reported in this message in order to recover from the previously reported error cause.

HLV3882E  Required master WWW ruleset not defined - HTTP processing impossible
Explanation: SEF Rule manager did not find a Master WWW ruleset definition. The rule manager will not enable ANY WWW rulesets.
User response: Check your initialization procedure, SW5xIN00, to be sure it defines ONE master WWW ruleset using the "WWWCLASS(MASTER)" keyword.

HLV3883I  SEF version OPERATIONAL MODE DOES NOT SUPPORT THE func FUNCTION
Explanation: SEF rule manager received a command which it does not support when operating in the indicated operational mode.
User response: Correct the command, and re-issue.

HLV3884I  msgs
Explanation: SEF rule manager uses this message to list formatted control block output messages (msgs).
User response: These messages contain the formatted control block image.

HLV3891I  output
Explanation: SEF rule manager issued the current message to list ruleset information to the output area.
User response: The current message is statistical and lists the rulesets in the output area. No response is required to this message. Check the rule output listing, and make choices accordingly.

HLV3892I  INDEX COMMAND OPERAND (operand) IS NOT VALID - NO ACTION TAKEN
Explanation: This message is generated if an invalid INDEX command is passed to the ADDRESS SEF host command environment.
User response: No action is taken, and the command is not processed further.

HLV3893E  SEF RULESET rsname HAVE INVALID RULETYPE(ruletype) - RULESET STOPPED/OFFLINE
Explanation: While opening a ruleset SEF, SEF detected that the ruleset’s definition contains an invalid RULETYPE() specification.
User response: The ruleset is considered to be offline and is not opened. Check for causes that might explain the invalid RULETYPE() designation for the ruleset named in the message.

HLV3895I  data
Explanation: This message is issued in response to an SEF INDEX URL command. It is the first message returned for each active rule. The data items returned, blank delimited, in this message are the ruleset name, the rule member name, master/subord, gateway/target, count of rule process sections, and the URL match criterion.
User response: None. This message is for informational purposes only.

HLV3896E  RULESET OFFLINE rsname dsname ruletype errdesc
Explanation: An SEF request was made that required that a ruleset be opened for processing, but the ruleset is currently stopped or offline.
User response: Take action to place the ruleset online, and re-issue the request. One common problem is that the ruleset dsname no longer exists.

HLV3897E  RULESET rsname is not defined

Explanation: An SEF request was made that required that a ruleset be opened for processing. The ruleset is not defined to the system.

User response: Check the list of defined rulesets to determine if the ruleset was not properly defined or specify the correct ruleset name.

HLV3898W  RULESET rsname1 AND rsname2 ARE BOTH DEFINED AS MASTER WWW RULESETS - RULESET rsname2 FLAGGED WITH STATUS(OFFLINE)

Explanation: When the SEF rule manager attempted to process the list of rulesets defined to the system, it found that more than one master WWW ruleset had been defined. Only one ruleset can be defined with RULETYPE(WWW) WWWCLASS(MASTER) attributes.

User response: The second ruleset defined as a master WWW ruleset will not be processed. It is flagged with STATUS(OFFLINE) and stopped so that no processing of the data set will occur until the RULESET definition has been changed.

HLV3899W  No SEF rulesets have been defined

Explanation: When the SEF rule manager attempted to process the list of rulesets defined to the system, it found that no valid rulesets had been defined.

User response: The current message is a rule status report message and may not require any response. If rulesets should be defined, check your start-up procedure for errors which might have occurred while processing DEFINE RULESET statements.

HLV3900T  RULE rsname1,rulename FOR ruletype pc status

Explanation: SEF rule manager issued the current informational message to report the status of the current rule. The ruleset rulename is now enabled.

pc represents primary criterion

User response: The current message is a rule status report message and does not require any response.

HLV3901E  service OF operand FAILED, RC=rcode

Explanation: A configuration, authorization, runtime, or I/O error has been encountered while executing an SEF rule manager request. The request cannot be completed, but may be possible at a later time. The SEF ruleset involved with the request may be placed into STOPPED or OFFLINE state.

User response: Examine surrounding messages to determine if the SEF request failed because of insufficient authorization on the part of the requestor to execute the request. If the request is due to a configuration error, you may find it necessary to correct server startup parameters and restart the server.

HLV3902E  var1 var2 SECTION IN RULE var3

Explanation: The SEF rule manager did not find a matching section header table entry. The processing of the current rule is terminated.

User response: Ensure that the rule sections are properly coded and valid. Review the rule for obvious coding errors. Refer to the product Server Administration Guide for more details on rule coding. Correct the above problem, and restart.

HLV3903E  INVALID CRITERION crit IN ruletype rule rulename

Explanation: SEF rule manager detected an invalid criterion (crit) when processing the current rule. Only a single wildcard is allowed in the rule criterion. Rule processing is terminated.

User response: Check the error message text for the criterion field, and ensure that the criterion is limited to one match criteria or one wildcard. Refer to the product Server Administration Guide for more details on the firing of rules and the valid criteria.

HLV3906I  output

Explanation: SEF rule manager issued the current message to list the rule data set index (prefix/suffix) to the output area.

User response: The current message is statistical and lists the rulesets in the output area. No response is required to this message. Check the rule output listing, and make choices accordingly.

HLV3907I  SEF is not active

Explanation: SEF rule manager has detected that SEF is not active.

User response: Ensure that the product is started and SEF is active. Contact your local product systems programming group for assistance.

HLV3908I  INVALID SEF REQUEST TYPE roctype rsname rulename

Explanation: SEF rule manager detected an invalid SEF request type during rule request processing. The current request is terminated.

User response: Check the current request for any errors. Check the request type in the error message text against the rule sections in the product Server
Administration Guide for any inconsistencies. Review the problem, and take corrective action.

**HLV3909I**  RULE rsname.rulename IS NOT ENABLED

**Explanation:** An attempt to disable a rule failed because the rule is not currently enabled.

**User response:** No action required.

**HLV3910I**  No rules enabled in Rule Set rsname

**Explanation:** This is an informational or status report message issued by SEF rule manager. Either no rules exist or no rules are enabled in ruleset.

**User response:** No action required.

**HLV3911I**  RULE rsname.rulename not found

**Explanation:** SEF rule manager did not find the member name that contains the current rule. The rule request is aborted.

**User response:** Ensure that the rule listed in the rule name field of the error message exists, or create one before invoking the request.

**HLV3912E**  No ISPF statistics for rule rulename in rsname.

**Explanation:** SEF rule manager found no ISPF statistics for the rule member in the indicated ruleset.

**User response:** Ensure that statistics exist for the rule in the PDS directory and that ISPF statistics is turned on.

**HLV3913E**  ind Criterion syntax error lineno in rule rulename

**Explanation:** A syntax error was detected in a rule while attempting to enable it. The time criteria are syntactically incorrect.

*ind* may indicate “Time” or “Screen”

**User response:** Check the product Server Administration Guide for the correct syntax. Correct the rule, and re-enable it.

**HLV3914E**  INCONSISTENT ind CRITERION lineno IN RULE rulename

**Explanation:** A time or screen (ind) criterion was syntactically correct but inconsistent. A starting time greater than an ending time or a row range whose first row value is larger than the second may cause this error message.

**User response:** Correct the inconsistent criterion, and re-enable the rule.

**HLV3915E**  MAXIMUM OF maxno ind CRITERIA EXCEEDED IN RULE rulename

**Explanation:** Too many screen or time (ind) criteria were specified in the header section of a rule.

**User response:** Reduce the number of time or screen criteria in the rule, and re-enable the rule.

**HLV3916I**  TOD RULE rsname,rulename HAS BEEN DISABLED - ALL TIME CRITERIA HAVE EXPIRED

**Explanation:** SEF rule manager disabled the current rule (TOD) after all time criteria expired. This may or may not be an error.

**User response:** The current TOD rule time criterion is not valid beyond the last fire time. If rule was intended to go beyond the last fire time, ensure that the next TOD rule is created with the required start/stop/interval or time criteria desired.

**HLV3918E**  Error 43 retype program, line lineno: routine routine not found

**Explanation:** SEF rule manager did not find the current routine.

**User response:** Review the current rule code for the correct invocation and coding of a routine name. Refer to the product Server Administration Guide for calls to routines. Correct the problem, and restart.

**HLV3919E**  NO VALID RULE HEADER FOUND IN RULE rulename - errdesc

**Explanation:** SEF rule manager did not find a valid rule header in the current rule.

**User response:** Review the current rule code for a valid rule header. Refer to the product Server Administration Guide for rule header coding. Correct the problem, and restart.

**HLV3920W**  Following line(s) ignored in rule rulename

**Explanation:** SEF rule manager found a line that was skipped and will ignore the following lines.

**User response:** Review the current rule code, and eliminate any blank lines. Correct the rule, and restart.

**HLV3921W**  Rule rulename contains no executable sections

**Explanation:** SEF rule manager found no executable sections in the current rule.

**User response:** Review the current rule code to make sure it is executable code (e.g. RETURN SUPPRESS in PROC section if this is a message rule). Without any
executable sections, the current rule cannot be processed by the SEF manager.

**HLV3922I** MATCH TABLE LIST - d1 t2

**Explanation:** The SEF rule manager issued this message to list the match table (message parameter list).

**User response:** None. This message is for informational purposes only.

**HLV3923I** MATCH TABLE AT addr PFX=prefix SFX=suffix LEN=length PRI=pcode ROOT=addr1 node nesting level addr2 low subtree address addr3 high subtree address addr4 address current AORL addr1 length AORL length

**Explanation:** SEF rule manager issued this message to list the match table at the address shown in the message text.

**User response:** None. This message is for informational purposes only.

**HLV3924I** Match table list empty

**Explanation:** SEF rule manager issued this message to list a match table entry that is empty.

**User response:** None. This message is for informational purposes only.

**HLV3925I** seqno rsname.rulename critlvl NODE LVL=lvl AORL=addr1 LO=addr2 HI=addr3 AORL=addr4 LEN=length

**Explanation:** This message is for debugging purposes only.

**User response:** None.

The variable fields of the message text are: seqno sequential order rule ruleset, rule crit criterion level node nesting level addr1 address current OPTI addr2 low subtree address addr3 high subtree address addr4 address current AORL length AORL length

**HLV3926I** SECTION section INVALID errdesc ON LINE lineno

**Explanation:** The SEF facility found an invalid section header within the rule, so the rule could not be enabled.

**User response:** Correct the event procedure, and re-enable.

**HLV3927I** No match for rulename

**Explanation:** The product rule manager did not find a match for this rule.

**User response:** None. This message is for informational purposes only.
HLV3933E  ABEND IN CELL POOL PROCESSING DURING.func

Explanation: An abend occurred during cell pool processing initiated by the SEF rule manager.

User response: If the error occurred during a GET, check the product region size. If the error did not occur during a GET, contact Software Support.

HLV3934E  errdesc BE STORED IN RULESET rsname - ERROR FOUND FOR rsname.rulename

Explanation: SEF rule manager found the current rule header not applicable for storage in the current ruleset.

User response: Security rules can only be stored in the security ruleset (if security rules are found). Also, non-security rules cannot be stored in the security ruleset. Ensure that the current rule is stored in the appropriate ruleset environment.

HLV3935E  CANNOT OPEN ddname (ABEND abcode AT modname+offset)

Explanation: During the open processing of the compiled rule library, an abend occurred.

User response: Ensure that the given library is a PDS, similar by definition to the other product supplied pre-compiled libraries. Check IBM message and codes manuals for the abend code. Most likely, the member does not exist or the data set attributes are in error (sequential DSORG or incompatibility in LRECL and BLKSIZE). If a system 913 abend code is reported, data set access has been disallowed by your security subsystem.

HLV3936E  cmdtype FAILED FOR rsname.rulename - service OF ddname FAILED

Explanation: The COMPILE or LISTCOMP SEF (cmdtype) command failed.

User response: Ensure that the given library is properly allocated. Also, ensure that the given library is a PDS, similar by definition to the other product supplied pre-compiled libraries. Check IBM message and codes manuals for the abend code. Most likely, the member does not exist or the data set attributes are in error (sequential DSORG or incompatibility in LRECL and BLKSIZE). If a system 913 abend code is reported, data set access has been disallowed by your security subsystem.

HLV3937E  LISTCOMP FOR RULESET rsname FAILED - NO RULES FOUND

Explanation: The LISTCOMP command for an individual ruleset failed. No saved compile rule was found in the compiled rule library.

User response: Ensure that the given ruleset for the LISTCOMP command is the valid one, and re-issue the command.

HLV3938E  RULESET- rsname UNABLE TO ACCESS COMPILED RULES

Explanation: The COMPILE, LISTCOMP, or DELCOMP SEF command failed.

User response: Ensure that a proper PDS was allocated to the XODSN keyword of the ruleset specified. Special restrictions apply to the SWIRULE ruleset, which cannot be compiled by a customer.

HLV3939E  SEF COMPILE PROCESSING OF name FAILED

Explanation: The COMPILE, LISTCOMP, or DELCOMP SEF command failed.

name will be a rule name or a ruleset name

User response: This message should have been accompanied by other messages.

HLV3940E  AUTOENABLED FAILED - name IS A REXX EXTERNAL ROUTINE

Explanation: An AUTOENABLE command was issued for a member of a ruleset that is actually a Product REXX external routine.

name will be a rule name or a ruleset name

User response: Verify your command. Re-issue the command, if possible.

HLV3941W  SOURCE OF rulename MODIFIED SINCE LAST COMPIL - SEF WILL USE SOURCE

Explanation: SEF had detected that a compiled version of the current rule exists. But, it detected that the source version of the rule has been modified since the last time the rule was compiled. SEF will use the source version of the rule for this enablement.

User response: You may want to re-compile the rule or auto-enable it, which also automatically saves the compiled version of a rule.

HLV3942I  NO rulename RULES ENABLED IN RULESET rsname

Explanation: This is a product SEF command LISTINST RULETYPE() informational or status report message. No rules of the type specified are enabled in the ruleset.

User response: No action required.
HLV3943I There are no rules currently enabled

Explanation: SEF command LISTINST was unable to return rule or ruleset statistics because there are no enabled rules.

User response: None. This message is for informational purposes only.

HLV3944I ruleinfo

Explanation: SEF command LISTINST ruleset.rulename produces one line for each enabled rule in the ruleset.

User response: The current message is for information purposes only and lists information about the enabled rule in the output area. No response is required to this message.

HLV3945I rsinfo

Explanation: SEF command LISTINST ruleset (with no rule names) produces one line for each enabled ruleset.

User response: The current message is for information purposes only and lists information about the enabled ruleset in the output area. No response is required to this message.

HLV3946I TYP PROCEDURE (set member) SET INVALID parmname VALUE OF parmval

Explanation: During initialization processing of a TYP event procedure, the REXX routine set an invalid parameter value.

User response: The current message is for information purposes only and lists information about the enable attempt. The TYP rule will not be enabled.

HLV3947I TYP EXECUTION MODULE modname NOT FOUND FOR varname IN (set member)

Explanation: During initialization processing of a TYP event procedure, an invalid load module name was specified.

User response: The current message is for information purposes only and lists information about the enable attempt. The TYP rule will not be enabled.

HLV3948W Too many sections found in rule procedure

Explanation: More than one process section was found in the rule. This restriction may be removed in future releases.

User response: At the present time, only a single process section may be coded within a WWW or RPC rule.

HLV3949I ruletype WWW RULE rulename ALREADY DEFINES THE URL val

Explanation: A duplicate URL criterion value (val) is specified on more than one WWW rule at the same administrative level. Duplicate URL processing rules may only be activated when one of the pair resides within the master WWW ruleset and one resides in a subordinate ruleset. In such a case, the master rule is always processed before the subordinate rule, and the subordinate rule is only processed when the master rule is a header-only, generic rule. If the master rule contains a procedural specification, such as a REXX, FILE, or PROGRAM section, the subordinate rule will never be processed.

ruletype may be MASTER or SUBORDINATE

User response: Disable the duplicate rule before activating the current rule, or change the URL criterion value in the current rule to a unique value.

HLV3950I output

Explanation: SEF rule manager issued the current message to list the data set statistics and status.

User response: The current message is statistical and lists the data set information. No response is required to this message. Check the PDS output listing, and make choices accordingly.

HLV3951E DDNAME ddname NOT ALLOCATED

Explanation: SEF rule manager attempted to open a data set for the processing of */FILE sections. The data set could not be opened because the ddname is unassigned.

User response: Ensure that the ddname specified in the message is allocated to a data set in the subsystem started task JCL, or ensure that the correct ddname value has been specified within the */FILE section header.

HLV3952E DDNAME ddname COULD NOT BE OPENED (code) additinfo

Explanation: SEF rule manager attempted to open a data set for the processing of */FILE sections. The data set could not be opened.

User response: Ensure that the ddname specified in the message is allocated to a data set in the subsystem started task JCL, or ensure that the correct ddname value has been specified within the */FILE section header.
HLV3953T  msgtext

Explanation: The Web transaction invoked an ADDRESS SEF command for intermediate processing. The ADDRESS SEF command failed. Messages issued by the ADDRESS SEF command are logged to the trace using this message ID.

User response: Examine the messages to see why the original /*FILE request was rejected.

HLV3954T  MEMBER member NOT FOUND IN DATA SET ddname

Explanation: The indicated member was not found within the referenced PDS data set. The file-related process is terminated with a member not found error.

User response: Examine the messages to see why the original /*FILE request was rejected.

HLV3955T  MEMBER member NOT FOUND IN DATA SET ddname

Explanation: The indicated member was not found within the referenced PDS data set. The file-related process is terminated with a member not found error.

User response: Examine the messages to see why the original /*FILE request was rejected.

HLV3956I  FILE ddname NOW status

Explanation: The indicated file has been placed online or offline, as the message indicates.

status may indicate ONLINE or OFFLINE

User response: None. The message is traced to indicate /*FILE related activation or deactivation of a shared PDS file.

HLV3957I  output

Explanation: SEF rule manager issued the current message to list the PDS member statistics.

User response: The current message is statistical and lists the PDS data set member information. No response is required to this message.

HLV3958E  ABEND abcode (rsn) IN modname+offset DURING service PROCESSING, SOME FILES MAY NOT BE status

Explanation: An abend occurred during file open or close processing at initialization or termination time. Some files may not have been processed.

User response: The initialization or termination process continues.

HLV3959I  count of total shared data files now status

Explanation: During initialization or termination, this message is issued to indicate the results of file processing.

User response: No action is required, unless some files remain unopened at open time.

HLV3960E  DSNAME dsname could not be allocated (rcode)

Explanation: SEF rule manager attempted to allocate a data set for processing of /*FILE sections. The data set could not be opened.

User response: Ensure that the dsname specified in the message exists, or ensure that the correct dsname value has been specified within the /*FILE section header.

HLV3961I  DSNAME dsname DDNAME ddname ALLOCATED

Explanation: The indicated ddname has been allocated to the indicated ddname.

User response: None. The message is traced to indicate /*FILE related allocation.

HLV3962I  DDNAME ddname DEALLOCATED

Explanation: The indicated ddname has been deallocated.

User response: None. The message is traced to indicate ddname deallocation.

HLV3963I  Generated DDNAME counter field rollover occurred

Explanation: The 8 byte counter field used to generate ddnames rolled over.

User response: None. The message is traced to indicate a rollover of the 8 byte counter field used to generate ddnames occurred.

HLV3964E  Member list not valid for sequential data sets DDNAME ddname, DSNAME dsname

Explanation: The member list function was issued for a sequential data set. The member list function is available only for partitioned data sets (PDS or PDSE).

User response: Issue the member list function only for PDS or PDSE data sets.
HLV3965T  WARNING: OUTBOUND RESP DATA PRECEDES THIS FILE REQUEST - HTTP RESP PROTOCOL ELEMENTS WILL BE UNUSABLE BY CLIENT

Explanation: When SWSSFILE(SEND) or /*FILE was invoked to transmit a file to the HTTP client, the server found that output data had previously been flushed for transmission to the client. The server proceeds with the file request after issuing this warning message. Because the server's file routines generate HTTP response protocol headers (such as Content-Type, Content-Length, Expires, etc.), any data preceding these headers will LIKELY cause some unpredictable result at the client. For example, the data sent by the file routines may not be visible or interpreted incorrectly (i.e. the client may attempt to process HTML text as a GIF image), or the client may close the communications session.

User response: If the output which precedes the file request was generated by a customer-written transaction procedure, you can correct this condition by eliminating the preceding output, foregoing the use of /*FILE or SWSSFILE(SEND) within the same transaction, or ensuring that no SWSSEND(FLUSH) operation occurs.

HLV3966T  External data queue full

Explanation: When an SWSSFILE operation outputs its results to the external data queue (QUEUE and MBRLIST functions) and the external data queue fills before all of the information can be written, this message is traced.

User response: The current SWSSFILE operation ends with return code 28. Increase the size of the external data queue by specifying the QUEUESIZE() override on the /*WWW header statement.

HLV3967I  dname concat

Explanation: SEF rule manager issued the current message to list the next concatenated dataset for a single shared-file DD name or next concatenated dataset for an SEF ruleset.

concat represents the concatenation index, relative to 1

User response: The current message is statistical and lists the data set information. No response is required to this message. Check the PDS output listing, and make choices accordingly.

HLV3968I  service FAILED. RETURN CODE: rcode

Explanation: SEF rule manager issued the message due to a failure in a system service.

User response: This problem is generated due to a file processing error. Correct the file, and re-process your request.

HLV3969I  FORMAT OF SHARED FILE BLOCK FAILED - INVALID IDENTIFIER val

Explanation: An invalid or unmatched identifier value (val) was specified for an internal FMTSFILE command. Either the identifier was invalid or the corresponding shared file block no longer exists.

User response: The shared file block is not formatted and processing continues.

HLV3970E  MATCH CRITERION MUST BEGIN WITH /set - %2.%3

Explanation: During event procedure enablement, a WWW rule was found to be invalid because its match criterion does not begin with the specified string. All WWW event procedure match criteria must begin with the event procedure set name unless they are defined in the master procedure set.

User response: Correct the error, and re-enable the event procedure.

The variable fields of the message text are: set name of event procedure set

HLV3971E  /*WWW STMT - errtext - %2.%3

Explanation: During event procedure enablement, a WWW procedure header statement was found to be coded incorrectly. The procedure is not enabled.

User response: Correct the error, and re-enable the event procedure.

HLV3972E  /*WWW STMT - key MAY ONLY BE CODED WITHIN THE rule RULESET - %3.%4

Explanation: During event procedure enablement, a WWW procedure header statement was found to be coded incorrectly. The indicated keyword may only be coded on header statements in the master WWW ruleset. The master WWW ruleset must be designated as such by coding WWWCLASS(MASTER) on the DEFINE RULESET statement that defines the ruleset.

User response: Correct the error, and re-enable the event procedure.

The variable fields of the message text are: keyword that is not valid rule name or description of master WWW ruleset

HLV3973E  /*REXX STMT - errtext - %2

Explanation: During event procedure enablement, a REXX section header statement was coded incorrectly. The procedure is not enabled.

User response: Correct the error, and re-enable the event procedure.

### HLV3985E  XO DATASET dname ERROR - additinfo

**Explanations:**
- An error was encountered while processing the indicated executable object (XO) dataset.

**User response:** None

### HLV3986E  FILE dname action REJECTED BY SEF - additinfo

**Explanations:**
- The indicated shared file definition or modification (action) could not be processed into the SEF configuration.

**User response:** Correct the original request and resubmit.

### HLV3987H  Shared file dname SEF configuration action accepted

**Explanations:**
- The indicated shared file definition or modification (action) was completed successfully.

**User response:** None

### HLV3988E  SEF task is terminating due to severe configuration or environmental error with critical resource

**Explanations:**
- The SEF subtask will self-terminate, causing the server to shut down. A critical resource is not configured properly or an environmental error prevents access to the critical resource. Generally, this means that a definition, OPEN error, or rule auto-enablement error has occurred for a critical shared file or an ATH, TYP, or WWW rule set with WWWCLASS(MASTER).

**User response:** Examine preceding message to determine the resource or definition which is missing, was undefined, or which cannot be accessed. Correct the start-up definitions pertaining to the resource and restart the server.

### HLV3989W  SEF RULE MGR ABEND abcode REASON rsncode AT modname+offset WHILE PROCESSING REQUEST plist

**Explanations:**
- The SEF rule manager trapped and recovered from an ABEND at the location shown. The rule manager returns the ABEND completion code to the service requestor, which must determine whether the error is of critical importance. The invoker may ignore, compensate for, or escalate the error, as appropriate to the request.

**User response:** Examine preceding and following messages to determine the resource or definition which is missing, incorrectly configured or which cannot be accessed. Correct the SEF start-up definitions pertaining to the resource and restart the server.

### HLV3990E  /*FILE STMT - errtext

**Explanations:**
- During event procedure enablement, a /*FILE section was not enabled due to the error given.

**User response:** Correct the error, and re-enable the event procedure.

### HLV3991H  SEF RULESET rsname DATASET dname IS status

**Explanations:**
- The indicated rule set dataset status has changed.

**User response:** None. This message is for informational purposes only.

### HLV3992T  SEF RULESET rsname DATASET dname IS status

**Explanations:**
- The indicated rule set dataset status has changed.

**User response:** None. This message is for informational purposes only.

### HLV3993H  SEF RULESET rsname DATASET dname WAS STOPPED. RSN: rsn

**Explanations:**
- The indicated rule set was stopped.

**User response:** This is an informational message. If the rule set should not be stopped, then review the Trace Browse and SYSLOG to determine what caused the rule set to stop.

### HLV3994T  SEF RULESET rsname DATASET dname WAS STOPPED. RSN: rsn

**Explanations:**
- The indicated rule set was stopped.

**User response:** This is an informational message. If the rule set should not be stopped, then review the Trace Browse and SYSLOG to determine what caused the rule set to stop.

### HLV3998I  data

**Explanations:**
- SEF rule manager uses this message to list formatted control block output messages for shared files, represented here by data.

**User response:** These messages contain the formatted control block image.

### HLV4000H  errtext

**Explanations:**
- This is a general purpose message for certain VTAM errors.

**User response:** Not every condition reported by this message is really an error. Read the text of the message carefully to determine whether an error has occurred or not. If an error has occurred and you cannot resolve it,
contact Software Support for assistance.

**HLV4001H**  **UNKNOWN service CODES - R0=R0  R15=R15**

**Explanation:** This message reports VTAM return and reason codes (R0 and R15) that are unknown to SHL.

**User response:** This may indicate some type of internal error. It is also possible that you are running a version of VTAM that is not yet supported by SHL. If the version of VTAM that you are running does appear to be supported, contact Software Support.

---

**HLV4002H**  **UNKNOWN service CODES - RCPR=code1  RCSC=code2**

**Explanation:** This message appears in conjunction with the 4001H message.

`code1` and `code2` represent primary and secondary,rpl extension codes, respectively.

**User response:** This may indicate some type of internal error. It is also possible that you are running a version of VTAM that is not yet supported by the product. If the version of VTAM that you are running does appear to be supported, contact Software Support.

---

**HLV4003H**  **service**

**Explanation:** This message is used for tracing certain VTAM-related events within the product.

**User response:** No action is required unless the trace messages are appearing without your requesting tracing.

---

**HLV4004H**  **service - luname**

**Explanation:** This message is used for tracing certain VTAM-related events within the product.

**User response:** No action is required unless the trace messages are appearing without your requesting tracing.

---

**HLV4005H**  **service - lunamode**

**Explanation:** This message is used for tracing certain VTAM-related events within the product.

**User response:** No action is required, unless the trace messages are appearing without your requesting tracing.

---

**HLV4006H**  **VTAM APPLID NOT SET - LU 6.2 SUPPORT NOT ACTIVATED**

**Explanation:** The local VTAM applid has not been set. VTAM processing on this copy of HLV is impossible.

**User response:** The VTAM task of the main address space shuts down. This is not an error unless you actually did specify the VTAM applid in the xxxxxIN00 EXEC. Note that other communication protocols may be activated even though VTAM LU6.2 is not being used.

---

**HLV4007H**  **INVALID FMH-5 CONTROL BLOCK RECEIVED FROM luname**

**Explanation:** An invalid FMH-5 control block was received from a peer LU `(luname)`. The invalid FMH-5 block will be ignored, and the conversation will be terminated immediately.

**User response:** This error will only occur if another product tries to establish a conversation with the main product address. This error should be reported to whoever is responsible for the other product.

---

**HLV4010T**  **TCB MODE SWITCH ERROR: errdesc additinfo**

**Explanation:** An error was detected while switching from SRB to TCB dispatchable unit execution mode.

**User response:** The request to switch from SRB to TCB fails. The SRB mode routine generates an S0C3 ABEND if it cannot continue or continues processing in SRB mode, as indicated in the message.

---

**HLV4012T**  **SRB MODE SWITCH ERROR: errdesc additinfo**

**Explanation:** An error was detected while switching from TCB to SRB dispatchable unit execution mode.

**User response:** The request to switch from TCB mode fails. The TCB mode routine generates an S0C3 ABEND if it cannot continue, or continues processing in TCB mode, as indicated in the message.

---

**HLV4014T**  **Shunting to mode execution mode prior to ABEND retry, retry GPR14 in ABEND traces contains retry target address**

**Explanation:** A retry is being attempted following an intercepted ABEND. The dispatchable unit of work is currently executing in a different mode (SRB or TCB) than the retry routine expects. The server is transferring execution into the correct dispatch mode, before retrying.

**User response:** This message is traced for ABEND retries only when a shunt to a different execution mode is required, and only when tracing pause element dispatch activity. The preceding ABEND event trace records GPR14 retry register contains the true target retry address, given control after shunting.
**HLV4015I** count new SRBs scheduled with PRIORITY=CURRENT because no WLM enclave is joined

**Explanation:** This message is issued when a change is noted in the number of SRBs that have been scheduled with PRIORITY=CURRENT instead of the preferred PRIORITY=ENCLAVE option. This occurs when a task is not joined to a WLM enclave at the time it schedules an SRB. The SRB is scheduled with the same priority as the scheduling task. This precludes execution of the SRB on the zIIP co-processor.

**User response:** No action is normally required. Some sites may receive these notifications with regular frequency; other sites may rarely or never receive these notifications. If you note an increase in the number of these messages, contact Software Support for further analysis.

**HLV4016S** FRR PARAMETER UNSTACK ERROR - rsn

**Explanation:** This message is issued when a PC routine attempts to unstack and restore nested FRR parameters during SRB-mode execution. The unstack operation has failed because the state of the current FRR stack has changed unexpectedly.

**User response:** The PC routine generates an S0C3 ABEND following issuance of this message. Existing FRRs may receive control and attempt to recover. The PC-call stack areas will not be recovered until check limits processing re-activates them during periodic processing. Contact Software Support.

**HLV4017T** TYPE-1 LDU TERMINATION CALL ERROR - failrsn additinfo

**Explanation:** An error was detected while terminating a Type-1 Logical Dispatchable Unit construct used for TCB/SRB mode switches. The request for LDU termination is bypassed.

**User response:** The termination routine returns to the calling routine. This message serves as notification of a potential logic error in End-of-Task cleanup processing since the routine was entered to process LDU termination for a subtask that cannot support this kind of Logical Dispatchable Unit processing.

**HLV4018I** count New SRB schedule (IEAMSCHD) failures encountered

**Explanation:** This message is issued when a change is noted in the number of SRBs that were not scheduled, due to failures returned by the IEAMSCHD service. The cause of these failures MAY be that the WLM enclave, into which the SRB is being scheduled, is no longer valid.

**User response:** Contact Software Support for further analysis.

**HLV4019T** Session lost (hung) due to type-4 LDU schedule failure

**Explanation:** This message is traced if a TYPE-4 LDU cannot be constructed or scheduled to close the communication session. The session is orphaned and remains hung until the server is recycled.

**User response:** Contact Software Support for further analysis.

**HLV4020T** DRDA processing bypassed for connection to subsys, failrsn

**Explanation:** This message is traced if DRDA processing is being skipped for the connection.

**User response:** The connection will be processing using standard RRSAF interfaces to the target Db2 subsystem. Contact Software Support for further analysis.

**HLV4021T** Generic (TLS) USERID userid ignored for DRDA connection

**Explanation:** This message is traced if a generic (TLS) userid has been sent with the current SQL request message.

**User response:** Generic Userid (TLS) support is disabled when a DRDA backend connection is in use. The generic userId sent by the client is ignored for Db2 processing. It will still be used when creating SMF log records, etc..

**HLV4022T** CONNECT TO DDF HOST=dom/ip, PORT=portno, CMIDADR=addr CMID=addr

**Explanation:** This message is traced when a DRDA connection has been successfully opened.

**User response:** None

**HLV4023T** calltype CALL TRACE: crlist

**Explanation:** This message produces a calling routine (crlist) trace

**User response:** None

**HLV4024T** Passticket generation failed for USERID=userID, APPL=appl, with RC = rcode

**Explanation:** A passticket could not be generated for the indicated userID and APPL name combination.

**User response:** Ensure RACF PTKDATA class is activated and that a resource matching the APPL name is defined in the class. The possible return codes are as follows: RC = x’04’ - Invalid passticket parameter list RC = x’08’ - No PTKDATA profile found for the APPL
name RC = x'0C' - No task or address space ACEE
found RC = x'10' - Caller is not authorized RC = x'14' -
The PTKTDATA class is not active

HLV4025S  Metal-C function func in module
module not found, failr

Explanation: During initialization a Metal-c function
requiring external visibility was not found.

User response: Initialization is aborted. DRDA
processing in the server may ABEND unexpectedly
when the missing function is invoked. Contact Software
Support for assistance.

HLV4026I  DRDA modules not loaded, Machine
below architecture-9 level, Found(lvi)

Explanation: During initialization the installed
machine instruction set is examined to determine the
 correspondingly C/C++ compiler architecture level.
DRDA modules are only provided to support machines
at ARCH(9) level and above.

User response: The DRDA processing modules are not
loaded and DRDA support is disabled. MSG4020T with
explanation "Z196 (2817-xxx) INSTRUCTION SET
REQUIRED" is traced if an attempt to open a DRDA
connection is made.

HLV4027T  ind being issued to avoid DRDA idle
thread time limit

Explanation: ind indicates that 1) A ROLLBACK is
being issued automatically because the client
ODBC/JDBC session has been idle for an extended
period. A ROLLBACK is issued to release PREPARED
statements so that the DRDA connection can be put
into INACTIVE state before DRDA terminates the idle
connection at the end of the IDTTH0IN time limit. OR
2) a SNDPKT (ping) request is being issued
automatically because transmission of the current
response to the client is taking longer than the DDF
idle time limit. Exchanging a SNDPKT (ping)
request/response reset the idle connection time limit
DRDA imposes on active but idle connections.

User response: A ROLLBACK is issued once before
awaiting additional client input. A SNDPKT request is
issued periodically while transmission of a large
response to the client is underway.

HLV4030T  errdesc TCP/IP

Explanation: Setup of a new session failed for the
reason reported in the message. Normally, the failure is
due to a lost connection or timeout while attempting to
receive the first part of the initial transmission. The
initial setup determines if the session is being opened
for HTTP or ODBC/JDBC connections. The leading
portion of the message will indicate if the session was
for HTTP or ODBC/JDBC if this is known at the time
of failure. It will also indicate if SSL encryption is in
use for the session when this can be determined. The
client IP address is always included in the message
which also contains an explanation of the failure that
caused session setup to fail.

User response: The connection to the client system is
terminated. The client application will probably report
an error. Check for any client system error messages
and related trace messages reporting communications
or SSL problems. Often for a timeout, only a SELECT
trace message will precede this message. The SELECT
completed with no sockets ready to receive, which is
recognized as a timeout failure.

HLV4040E  errdesc

Explanation: An error occurred processing a partner
ACI session for this connection.

User response: The session will be terminated.

HLV4041T  service buffer size lgth1, address addr,
length lgth2

Explanation: An error occurred processing a partner
ACI session for this connection.

The message contains two length values; lgth1
represents requested buffer length, and lgth2 represents
returned buffer length

User response: The session will be terminated.

HLV4042E  Parallel I/O ACI processing disabled

Explanation: An error occurred during initialization of
ACI support for Parallel I/O processing.

User response: Parallel I/O processing is disabled.

HLV4043T  errdesc additinfo

Explanation: MAP REDUCE was unable to process
this VSAM data set. If the VSAM KSDS is too small, it
cannot be subdivided for parallel processing by ACI
tasks. At a minimum, the VSAM KSDS must have two
sequence set records. The size of such a file will
depend upon the CI size of the index, and upon how
keys get compressed in the sequence set records.

User response: We recommend disabling MapReduce
for the data map for this data set to eliminate the
overhead of starting and stopping unneeded ACI
processing tasks. The VSAM file will be processed by a
single task, and MAP REDUCE will not be used for
this file.
The connection to the client system is terminated. The client application will probably report an error. Check for any client system error messages. If the failure continues, contact Software Support.

**HLV405T**

Name1 (name2,additinfo) - RV=real

RC=rcode RE=rendcode

Explanation: An Unix System Services callable service request was issued and the results were unexpected.

The message contains two name values; name1 represents the callable service entry point name, and name2 represents the callable service formal name.

User response: This message is traced to indicate an expected return value or return code from a USS callable service. Subsequent processing depends on the call issued. If the problem continues, contact Software Support.

**HLV4053E**

OPTPIN timed out waiting for a session to be passed

Explanation: OPTPIN was placed in posted state in anticipation of being passed a new connection, but the new session ECB was never posted. The connection attempt is abandoned.

User response: This message is trace to indicate an expected connection was not successfully passed from the listening task to the service task (OPTPIN). If the problem continues, contact Software Support.

**HLV4054T**

No data read from socket - errdesc - received from TCP/IP

Explanation: After 10 attempts to receive data (TCP/IP read) we returned with zero bytes read and no indication of any kind of network error.

User response: The connection to the client system is terminated. The client application will probably report an error. Check for any client system error messages. If the failure continues, contact Software Support.

**HLV4080T**

Invalid logon attempt by an unknown client detected, connection rejected.

Explanation: An attempt was made to logon by an unknown client driver. A connection to the server can only be made by a valid client driver. The connection is rejected.

User response: Contact IBM Software Support.

**HLV4081T**

Insufficient storage reserve for type (storant) detected, connection rejected

Explanation: The storage reserve for the specified area type (LSQA, Private or EPrivate) has been exceeded. The current attempt to connect to the host has been rejected. The host session will be terminated. The storage reserve values are either calculated or set via product parameters.
User response: Contact Software Support for advice on this matter.

HLV4082T  Maximum connected session limit is set to zero, server not accepting new connections

Explanation: The maximum connected session limit (CONCURRENTMX parameter) is currently set to ZERO. The server will not accept any new client connections. A limit of zero is normally set during a quiesce period, prior to shutdown, allowing existing client connections to complete their operations normally. Depending on the setting of QUIESCESYSTEMTYPE, existing client sessions will be cancelled (IMMEDIATE) or allowed to terminate normally (ATTRITION).

User response: Change the CONCURRENTMX parameter to a non-zero value if new client connections should be allowed.

HLV4083T  SQL is not activated on the server.

Explanation: None.

User response: Contact IBM Software Support.

HLV4084T  ODBC driver connections are not activated on the server. Session rejected.

Explanation: None.

User response: Contact IBM Software Support.

HLV4085T  Transaction Level Security is not activated on the server. Session rejected.

Explanation: None.

User response: Contact IBM Software Support.

HLV4086T  Network authentication is not enabled on this server. Session rejected.

Explanation: A client application has attempted to connect to the host using network authentication (SECU=YES), but the server is not configured to allow network authentication.

User response: The server rejects the connection request.

HLV4087T  Access to IDMS is not activated.

Explanation: None.

User response: Contact IBM Software Support.

HLV4088T  Access to IDMS is not enabled, set the desired APPC/IDMS initialization parameters

Explanation: The product is not enabled for use with IDMS from client applications. The current request to use client to connect to IDMS on the host has been rejected. The current host session will be terminated.

User response: If access to IDMS from client applications is needed, enable IDMS by setting the appropriate IDMS connectivity parameters. You may use APPC/IDMS as the transport for communication to IDMS from the product server address space.

HLV4089T  STORED PROCEDURE CALLS ARE NOT SUPPORTED WHEN USING EXTENDED CURSOR POOLS (EXCU=YES).

Explanation: The product does not support stored procedure calls when the client is connected to the server with extended cursor pool support enabled (EXCU=YES).

User response: Reconfigure the client to disable the extended cursor pool support (EXCU=NO).

HLV4090T  Access to IMS/TM is not activated.

Explanation: None.

User response: Contact IBM Software Support.

HLV4091T  Access to IMS/TM is not enabled, set the desired IMS/OTMA and/or IMS/APPC initialization parameters

Explanation: The product is not enabled for use with IMS/TM from client applications. The current request to use client to connect to IMS/TM on the host has been rejected. The current host session will be terminated.

User response: If access to IMS/TM from client applications is needed, enable IMS by setting the appropriate IMS connectivity parameters. You may use either IMS/OTMA or IMS/APPC as the transport for communication to IMS from the product server address space.

HLV4092T  Access to CICS is not activated.

Explanation: None.

User response: Contact IBM Software Support.

HLV4093T  Maximum number of type (count) already connected, connection rejected.

Explanation: None.

User response: Contact IBM Software Support.
HLV4094T  Access to Adabas is not activated.
Explanation: None.
User response: Contact IBM Software Support.

HLV4095T  Access to Adabas is not enabled, enable access by setting the ADABAS parameter value to YES
Explanation: The product is not enabled for use with Adabas from client applications. The current request to use client to connect to Adabas on the host has been rejected. The current host session will be terminated.
User response: If access to Adabas from client applications is needed, enable Adabas by setting the ADABAS product parameter to YES.

HLV4096T  Access to VSAM is not activated.
Explanation: None.
User response: Contact IBM Software Support.

HLV4097T  Access to IMS/DB is not enabled, enable access by setting the DBCTL parameter value to YES
Explanation: The product is not enabled for use with IMS/DB from client applications. The current request to use client to connect to IMS on the host has been rejected. The current host session will be terminated.
User response: If access to IMS/DB from client applications is needed, enable IMS/DB by setting the DBCTL product parameter to YES.

HLV4098T  No active started task copy of the product located
Explanation: The userid and password provided by the client application can not be validated because there is no active started task copy of the product. A started task copy of the product is required for userid and password validation if the client application is connecting to a test copy of the product running under TSO. This error can only occur while attempting to connect to a test copy of the host code running under TSO.
User response: The session is not permitted to proceed. The client must supply a valid userid/password combination (for the host) in order for the session to proceed. Change the client's userid to be the same as the TSO userid.

HLV4099T  CLIENT USERID userID1 UNEQUAL TO TSO USERID userID2
Explanation: The userid provided by the client application is not the same as the TSO userid running the test copy of the product. The connection attempt is rejected, and the connection is severed. This error can only occur while attempting to connect to a test copy of the host code running under TSO.
User response: The session is not permitted to proceed. The client must supply a valid userid/password combination (for the host) in order for the session to proceed. Change the client's userid to be the same as the TSO userid.

HLV4100E  BIND WITH rtype host FAILED - NO MATCHING errdesc
Explanation: The bind with the remote system failed because the local and remote systems could not agree on certain HLV-to-HLV communication parameters.
User response: The bind process has failed. No communication with the remote system is possible. Note that it is NOT a VTAM bind that has failed. The bind referred to by this message is a n HLV-to-HLV bind. Retry the process. If the failure continues, contact Software Support.

HLV4101T  Password validated for USERID userID from rtype host
Explanation: The userID/password combination from a remote (and untrusted) client was successfully validated.
User response: No action is required. Processing continues.

HLV4102T  LOGON attempt failed for USERID userID from rtype host
Explanation: A remote client was unable to connect for one of the reasons: (1) the userid/password combination may not have been valid or (2) the System Event Facility (SEF) may have rejected the logon attempt.
User response: The session is not permitted to proceed. The client must supply a valid userid/password combination (for the host) in order for a session to proceed. Ensure that the client's classification as untrusted is valid. If it is not, use the ADDRESS HLV MODIFY LINK command to change its status. If the client was rejected by the System Event Facility (SEF), the SEF ATH event logon rule may need to be modified.

HLV4103T  msgtext
Explanation: This message is used to display any ACF2/RACF message that may have been created as a result of a userid/password validation. This form is used for successful userid/password validations.
User response: None. This message is for informational purposes only.
**HLV4104T**  msgtext

**Explanation:** This message is used to display any ACF2/RACF message that may have been created as a result of a userid/password validation. This form is used for unsuccessful userid/password validations.

**User response:** The session is not permitted to proceed. The client must supply a valid userid/password combination (for the host) in order for a session to proceed. Ensure that the client’s classification as untrusted is valid. If it is not, use the ADDRESS HLV MODIFY LINK command to change its status.

---

**HLV4105E**  Bind failed - no matching compression type

**Explanation:** The bind with the remote system failed because the local and remote systems could not agree on a compression type.

**User response:** The bind process has failed. No communication with the remote system is possible. Note that it is NOT a VTAM bind that has failed. The bind referred to by this message is an HLV-to-HLV bind. Retry the process. If the failure continues, contact Software Support.

---

**HLV4106E**  BIND FAILED - NO MATCHING POINTER ENCODING TYPE

**Explanation:** The bind with the remote system failed because the local and remote systems could not agree on a pointer encoding type.

**User response:** The bind process has failed. No communication with the remote system is possible. Note that it is NOT a VTAM bind that has failed. The bind referred to by this message is an HLV-to-HLV bind. Retry the process. If the failure continues, contact Software Support.

---

**HLV4107E**  BIND FAILED - NO MATCHING DATA ENCODING TYPE

**Explanation:** The bind with the remote system failed because the local and remote systems could not agree on a data encoding type.

**User response:** The bind process has failed. No communication with the remote system is possible. Note that it is NOT a VTAM bind that has failed. The bind referred to by this message is an HLV-to-HLV bind. Retry the process. If the failure continues, contact Software Support.

---

**HLV4108E**  BIND FAILED - NO MATCHING APPLICATION TYPE

**Explanation:** The bind with the remote system failed because the local and remote systems could not agree on an application.

**User response:** The bind process has failed. No communication with the remote system is possible. Note that it is NOT a VTAM bind that has failed. The bind referred to by this message is an S__-to-S__ bind. Retry the process. If the failure continues, contact Software Support.

---

**HLV4109E**  BIND FAILED - NO MATCHING PROCESSING FUNCTIONS

**Explanation:** The bind with the remote system failed because the local and remote systems could not agree on processing functions.

**User response:** The bind process has failed. No communication with the remote system is possible. Note that it is NOT a VTAM bind that has failed. The bind referred to by this message is an S__-to-S__ bind. Retry the process. If the failure continues, contact Software Support.

---

**HLV4110S**  INVALID MODE DETECTED - LU unlname ROUTINE routine

**Explanation:** The LU 6.2 processing routine detected an invalid mode string. The mode string cannot be used for further processing.

**User response:** Report the error to Software Support. The complete message will be needed to diagnose the problem. One or more connection attempts may fail and have to be retried.

---

**HLV4111S**  INVALID LU NAME DETECTED - ROUTINE routine

**Explanation:** The LU 6.2 processing routine detected an invalid LU name string. The LU name string cannot be used for further processing.

**User response:** Report the error to Software Support. The complete message will be needed to diagnose the problem. One or more connection attempts may fail and have to be retried.

---

**HLV4112T**  Usage restricted to oem.

**Explanation:** None.

**User response:** Contact IBM Software Support.

---

**HLV4113T**  %1

**Explanation:** A connection is rejected for one of the following reasons:

- The maximum number of concurrent users has been reached.
- Some sort of virtual storage resource shortage has been detected. The current request to connect to the host has been rejected.
• A compressed buffer has been received on the port designated as the PIO port. PIO does not support compressed buffers. The connection has been closed.

User response: Depending on the message, either contact the person responsible for administering the product server to explore the possibility of raising the current maximum user count or the product has detected that the current virtual storage utilization is too high to allow additional connections. Change to use the standard ODBC port, or change the connection to send uncompressed buffers.

HLV4114T Dynamic SQL is not allowed by this instance of the server

Explanation: This instance of the product server is to be used for static-only Db2 applications. The dynamic SQL request has been rejected.

User response: Contact the person responsible for administering the product Server for the product Server(s) available that support dynamic SQL.

HLV4115S SECONDARY USERID COUNT (count) EXCEEDS MAXIMUM (max)

Explanation: The actual number of secondary userids for the current task exceeds the maximum number of supported secondary userids. Because of this problem, the secondary userid list can not be utilized and the current session will be terminated.

User response:

HLV4116T Access to DB2 is not activated.

Explanation: None.

User response: Contact IBM Software Support.

HLV4117T Connection mode is not activated.

Explanation: None.

User response: No action is required.

HLV4118T Insufficient virtual storage is available to handle this session. Session rejected

Explanation: A client application has attempted to connect to the host. Not enough virtual storage was available to handle the session. The session was rejected and terminated by the host.

User response: The server address space does not have enough virtual storage to handle the number of connections that are being directed to it. You can reduce the minimum storage requirements using product parameters. However, this is not recommended. One of the following solutions is recommended: (1) the amount of virtual storage per connection must be reduced, (2) the number of connections must be reduced, or (3) the load must be spread across multiple copies of the product.

HLV4119T REXX VARIABLE ERROR rcode1-fbcode rcode2 DURING FETCH OF varname FOR SEF rule procedure

Explanation: The product REXX processor encountered a failure during termination processing for a product REXX exec. A REXX variable value could not be fetched and returned to the product’s internal SEF routines during the termination process. Because a truncated or missing value may cause critical errors within the rule processing facility, the product generates an SOC3 abend. The SOC3 abend forces termination of the product REXX interpreter. It also stops the processing of the current SEF rule in which the procedure was defined. NOTE: For SHVRET code X’01-(New/Dropped Variable), the most likely cause of this error is an EXIT from a subroutine of the main Product REXX procedure. If the subroutine contains a PROCEDURE [EXPOSE] statement, some or all of the server’s built-in variables are hidden during EXIT processing and are not available for post-REXX-execution interrogation by the rule facility. Ensure that the product REXX routine does not deliberately specify an EXIT from an internal PROCEDURE. For other SHVRET error codes, the most likely cause of the error is an internal server error.

The message contains two return code values; rcode1 represents the SHVRET return code value as defined in IRXSHVB control block for IRXEXCOM, and rcode2 represents the R15 return code from IRXEXCOM.

fbcode represents a feedback code

User response: Check the REXX exec procedure and trace log for other messages which may indicate the precipitating cause of the failure, and correct the problem(s). Contact Software Support if this procedure fails to resolve the problem.

HLV4120T REXX VARIABLE varname TRUNCATED FOR SEF rule - SIZE (size) LONGER THAN MAX SIZE (maxsize)

Explanation: The SEF rule processor encountered a failure during termination processing for a REXX procedure. The termination time value assigned by REXX to a built-in server variable is larger than the defined maximum size allowed by the SEF facility. The variable is truncated to the maximum allowable size. Truncation, however, may cause additional, spin-off error conditions to arise.

User response: Check the REXX exec procedure to see if a value was assigned which exceeds the implementation maximums for specific built-in variable.
**HLV4121W**  
*service OF desc FAILED, RC=rcode*

**Explanation:** SEF message processing encountered a failure in a product service routine. A particular instance of this generic message may relate to a GETMAIN failure that occurs while attempting to allocate a REXX work space. In this case, the return code indicates the return code from the storage management routine.

**User response:** Check the message related to the failure, and attempt to resolve the problem. In the case of a storage allocation failure, check for related MVS and product messages. Also, ensure that your installation has an exit (e.g. IEFUSI) that limits virtual storage allocation. If possible, correct the problem, and retry the operation.

**HLV4122W**  
*ABEND abcode AT modname+offset IN LINE lineno OF rule*

**Explanation:** SEF event processing detected an abend. The current rule processing request is terminated.

**User response:** Determine what caused the abend. External interrupts (like a job CANCEL) may cause an abend. Determine if any product parameters limited the processing of the current rule. Refer to the product Server Administration Guide and the product Server Started Task Parameters book. Contact your local product administrator for assistance.

**HLV4123W**  
*SEF PROCESSING OF ruletype searchID FOR jobname ABORTED*

**Explanation:** SEF event processing routine detected an abend. The current rule processing request is aborted.

**User response:** Determine what caused the abend. External interrupts (like a job CANCEL) may cause the current rule to be aborted. If an ABEND occurred in the product, contact your local product systems programming group for assistance. If an abend happened within a job, treat this error as an environmental error. Correct or ignore the current error, as applicable to your environment.

**HLV4124W**  
*CANNOT language PROCEDURE procname - .SECTIONS NOT ENABLED*

**Explanation:** The SEF event processing routine detected that a TYP rule that is referenced by another even procedure has been disabled. The event procedure cannot be run because the TYP rule is currently disabled. Processing of the procedure is bypassed.

**User response:** Determine why the TYP rule is disabled, and re-enable it.

**HLV4127E**  
*errtext FOR MESSAGE ID=msgid*

**Explanation:** SEF event processing found too many compound symbols. The pattern match error is reported. Processing for the current rule is terminated.

**User response:** Check the exceeded compound symbol value, and adjust your rule code to it. Correct the above problem, and restart.

**HLV4128E**  
*RULE rule SET varname TO AN INVALID blk VALUE*

**Explanation:** SEF event processing encountered an error in conversion of a character to an integer. Further processing is terminated.

`blk` represents a control block field name.

**User response:** Check the error text for the invalid input character data causing this error. Remove or modify the invalid data, and restart.

**HLV4129E**  
*errtext FOR ruletype RULE rule*

**Explanation:** SEF event processing encountered too many internally generated compound symbols (security related), or the length of one of the internally generated compound symbol names exceeds an internal product limit. Further processing of this rule is terminated.

**User response:** This is an internal product error condition. Report this error condition to Software Support immediately.

**HLV4130E**  
*Rule rule disabled for exceeding firing limit of lim*

**Explanation:** SEF event processing detected excessive firing of the rule named in the message. As a result, the rule has been disabled.

**User response:** If appropriate, increase the firing limit, and enable the rule.

**HLV4131E**  
*Rule rule has exceeded the SEF firing limit of lim*

**Explanation:** SEF event processing detected excessive firing of the rule named in the message. The associated parameter, SEFLIMITDISABLE, indicates that the rule is not to be disabled.

**User response:** This message is informational. No response is required. You may wish to code a message rule that conditionally disables the rule.

**HLV4132I**  
*User program modname not found in library*

**Explanation:** While enabling a rule specifying execution of a user load module, the system was
unable to preload the indicated module. Enablment of the rule is suppressed.

User response: Verify that the module named in the rule actually exists within the user program load library or within STEPLIB.

HLV4134E  rsrv sys resp FAILED, RC=rcode, DETECTED AT addr

Explanation: Some type of error occurred in a product service routine. See the actual text of the message for an explanation. The error was probably caused by a failure in an operating system service requested by a product service routine.

User response: Check if any other error messages were generated along with the error message above. If the combined error messages are sufficient to explain the problem, take whatever corrective action is appropriate. Otherwise, contact Software Support with this problem.

HLV4135E  SEF rule processor entered by csect for invalid event type - typecode

Explanation: The SEF rule processing facility was invoked with an invalid event type. This is probably an internal error.

User response: Check for other error messages that were generated along with this error message. Capture a copy of the trace records, showing the TCB address, surrounding the time of this error, and contact Software Support.

HLV4136E  ABEND DURING cbk CONTROL BLOCK LOCATE - SEF RULE EXECUTION BYPASSED

Explanation: An internal control block could not be located prior to SEF event execution scheduling.

User response: Check if any other error messages were generated along with this error message. If the combined error messages are sufficient to explain the problem, take whatever corrective action is appropriate. Otherwise, contact Software Support with this problem.

HLV4137T  ENTERPRISE AUDITING GENERIC USERID userID NOT DEFINED TO HOST SECURITY SYSTEM OR REJECTED.

Explanation: Enterprise Auditing was activated on the connection and the client attempted to send the specified generic user ID for authorization checking. However, the user ID was not defined to the Host security system (ACF2, RACF or Top Secret) or was invalid for some other reason.

User response: The session is not permitted to proceed. The client must supply a valid host user ID. Contact the Installation Security Administrator to define or repair the user ID.

HLV4138T  ENCRYPTION METHOD CANNOT BE NEGOTIATED, HOST STORAGE UNAVAILABLE, BIND REJECTED

Explanation: This message is sent to client's when the requested key exchange and encryption method cannot be successfully negotiated at the host due to lack of host storage.

User response: The host rejects the encryption method requested by the client. The client may continue without encryption or may terminate the session.

HLV4139T  BIND ENCRYPTION METHOD REJECTED - method additinfo

Explanation: This message is traced when a client's requested key exchange and encryption method cannot be successfully negotiated at the host during bind processing.

User response: The host rejects the encryption method requested by the client. The client may continue without encryption or may terminate the session.

HLV4140T  LOGON credentials cannot be decrypted

Explanation: This message is sent to the client when logon credentials cannot be decrypted. The client logon is rejected because the userid, password, and new password fields cannot be converted to clear text for processing. The client is operating using Diffie-Hellman key exchange and DES to encrypt the logon authentication information.

User response: The host rejects the logon request by the client. The host traces MSG4146T with additional information about the decryption failure.

HLV4141T  LOGON credentials rejected for VCF reconnect, new key exchange required

Explanation: This message is transmitted to the client when Diffie- Hellman logon credential encryption is in use for a re-connecting VCF session, and the VCF security artifact for the VCF session has expired or been invalidated.

User response: The host rejects the logon request by the client. The VCF client is obliged to repeat the full Diffie-hellman key exchange, and re-transmit encrypted logon credentials. MSG4145T is traced to provide additional information about the problem encountered.
HLV4142T  ENCRYPTION METHOD CANNOT BE NEGOTIATED, DIFFIE-HELLMAN MODULE NOT LOADED, BIND REJECTED

Explanation: This message is sent to client's when the requested key exchange and encryption method cannot be successfully negotiated at the host due to absence of the Diffie-Hellman key exchange and decryption routines.

User response: The host rejects the encryption method requested by the client. The client may continue without encryption or may terminate the session.

HLV4143T  ENCRYPTION METHOD CANNOT BE NEGOTIATED, DIFFIE-HELLMAN KEY EXCHANGE FAILED, BIND REJECTED

Explanation: This message is sent to client's when the requested key exchange and encryption method cannot be successfully negotiated at the host due to failure of the Diffie-Hellman key exchange routine to calculate a valid shared secret.

User response: The host rejects the encryption method requested by the client. The client may continue without encryption or may terminate the session.

HLV4144T  ENCRYPTION METHOD CANNOT BE NEGOTIATED, UNKNOWN ENCRYPTION METHOD REQUESTED, BIND REJECTED

Explanation: This message is sent to client's when the requested key exchange and encryption method cannot be successfully negotiated at the host. The requested encryption method is unknown to the host.

User response: The host rejects the encryption method requested by the client. The client may continue without encryption or may terminate the session.

HLV4145T  LOGON CREDENTIALS REJECTED FOR VCID VCID, NEW KEY EXCHANGE REQUIRED, failrsn

Explanation: This message is traced when when client Diffie-Hellman logon credential encryption is in use for a re-connecting VCF session, and the VCF security artifact for the session has expired or been invalidated.

User response: The host rejects the logon request by the client. The VCF client is obliged to re-inaugurate Diffie-hellman key exchange and re-transmit encrypted logon credentials. MSG4141T is sent to the client.

HLV4146T  LOGON CREDENTIALS CANNOT BE DECRYPTED - failrsn

Explanation: This message is traced when a client's logon credentials cannot be decrypted. The client logon is reject because the userid, password, and new password fields cannot be rendered in clear text form.

User response: The host rejects the logon request by the client. MSG4140T is sent to the client.

HLV4148T  MISSING OR INVALID PARAMETERS IN SQL CALL RULE rsname,rulename failrsn

Explanation: This message is traced when an SQL CALL RULE cannot be processed due because not all the parameters were supplied or the parameters were too long to fit in the new buffer.

User response: The updates to the SQL CALL statement are discarded. Correct the SQL CALL rule based on the reason given.

HLV4149T  Connection from ipaddr TCP/IP, host name host, is using unsupported driver version version

Explanation: A remote client connection is using a version of the product driver that is not supported by the server. This is an informational message. Transaction processing continues.

User response: You should upgrade the application driver to a level that is supported by the server.

HLV4150T  desc addr size PLAN pln %SK

Explanation: This is a trace message that is produced whenever the TRACECURSOR parameter has been set to YES. This message provides information related to the product's SQL plist and status area.

User response: No action required.

The variable fields of the message text are: desc control block description addr address of the control block size size of the control block in hex pln the plan name stack trace information

HLV4151T  desc addr1 size DBRM dbrm CURSOR num1 DATA addr2 cnt QUERY length num2 TYPE stmt FLAGS tf %SK

Explanation: This is a trace message that is produced whenever the TRACECURSOR parameter has been set to YES. This message is used to trace the product's cursor control blocks. There may be multiple cursor control blocks for each product SQL plist.

User response: No action required.

The variable fields of the message text are: desc control block description addr1 address of the control block size size of the control block in hex dbrm the DBRM name num1 SQL section number addr2 first data block address cnt number of chained data blocks length total data row length num2 number of query columns stmt last prepared statement type tf trace flags stack trace information
HLV4152T desc addr size value1 value2 %SK

**Explanation:** This is a trace message that is produced whenever the TRACECURSOR parameter has been set to YES. This message is used to trace the columns of the SQLDA. There may be multiple columns described by the SQLDA.

**User response:** No action required.

The variable fields of the message text are: desc control block description addr address of the control block size of the control block in hex value1 next offset value (hex) value2 last offset value (hex) stack stack trace information

HLV4153T desc data length1 length2 col %SK

**Explanation:** This is a trace message that is produced whenever the TRACECURSOR parameter has been set to YES. This message is used to trace the columns of the SQLDA.

**User response:** No action required.

The variable fields of the message text are: desc control block description data type of data for the column (integer) length1 length of the data in the column (hex) length2 length of the column name (integer) col column name (up to 30 characters) stack stack trace information

HLV4154T desc addr1 size DBRM dbrm CURSOR num1 DATA addr2 cnt QUERY length num2 TYPE stmt FLAGS tf %SK

**Explanation:** This is a trace message that is produced whenever the TRACECURSOR parameter has been set to YES. This message is used to trace the release of a product cursor control block.

**User response:** No action required.

The variable fields of the message text are: desc control block description addr1 address of the control block size of the control block in hex dbrm the DBRM name num1 SQL section number addr2 first data block address cnt number of chained data blocks length total data row length num2 number of query columns stmt last prepared statement type tf trace flags stack stack trace information

HLV4157T SQL tracing for RPC transactions is not available

**Explanation:** SQL tracing for RPC transactions can not be performed because the Db2 DSNACAB module could not be validated.

**User response:** The product sets the TRACERPCSQL and TRACESQERRORS parameters to 'NO'. Contact Software Support.

HLV4178W SQL tracing for RPC transactions is not available

**Explanation:** SQL tracing for RPC transactions can not be performed because the Db2 DSNACAB module could not be validated.

**User response:** The product sets the TRACERPCSQL and TRACESQERRORS parameters to 'NO'. Contact Software Support.

HLV4179W count New RPC tasks timed out before redispach by RPC concurrent execution facility

**Explanation:** This message is issued when a change is noted in the number (count) of suspended RPC tasks that timed out before they were re-dispatched by the RPC concurrent execution facility. Tasks suspended while awaiting their turn to execute an RPC program will re-awake if not re-dispatched within the time period set by the RPCSLEEPIENTRAL parameter. Tasks which re-awake due to a timeout may execute the RPC program, regardless the RPCMAX limit, or may bypass execution by generating a -438 error return code. The action taken is governed by the RPCSTALLACTION parameter.

**User response:** No action is normally required and some sites may receive these notifications with regular frequency; other sites may rarely or never receive these notifications. If you note an increase in the number of time out failures, check the active tasks display to verify that RPC programs are completing. This message could indicate that one or more in-flight RPC programs are stalled preventing new RPC program executions from being dispatched. Adjust the RPCMAX and/or RPCSLEEPIENTRAL parameter, as necessary, to prevent timeouts.

HLV4180S Invalid buffer received from a client system

**Explanation:** This message is issued if an invalid communication buffer is received from a client system. The buffer should have contained a request for additional RPC data. However, it did not contain such a request.

**User response:** The session fails. Retry the session. If the problem persists, check to see if there are other messages that may indicate another problem. If there are no other messages, contact Software Support.

HLV4181S RPC DATA WILL NOT FIT INTO BUFFER

**Explanation:** This message is issued if an RPC data item of some kind will not fit into the communication buffer. This error should never occur.

**User response:** The session fails. Retry the session. If the problem persists, check to see if there are other
messages that may indicate another problem. If there are no other messages, contact Software Support.

---

**HLV4182I** percent percent of max concurrent RPC threshold achieved, value, value

**Explanation:** This message is produced once every 60 seconds when the currently executing number of rpc's is equal to or greater than 80 percent of the max allowable specified by RPCMAX parameter. The first value is the max number observed during the life of the server. The second value is the observed value at the time of the message.

**User response:** None. This message is for informational purposes only.

The variable fields of the message text are: value current percentage of max setting / value current max setting / value number concurrently executing

---

**HLV4183I** Max concurrent RPC execution less than value percent of max setting value

**Explanation:** This message is produced when the number of concurrently executing RPC's drops below the percent threshold and message 4182 was previously issued reporting that RPC executions exceeded this threshold. The percentage of RPCMAX at which reporting occurs is set by RPCMAXMSGPCENT.

**User response:** None. This message is for informational purposes only.

The variable fields of the message text are: value current max setting value number concurrently executing percent of RPCMAX to report (RPCMAXMSGPCENT)

---

**HLV4184T** ABEND CC=cocode RS=rsncode DETECTED AT modname+offset BY RPC CONCURRENCY ROUTINE routine recovery additinfo

**Explanation:** An ABEND was intercepted while one of the Concurrent RFC execution routines was in control. Information about the ABEND is logged in this message.

**User response:** The RPC concurrency routines may produce additional trace messages and/or produce an SDUMP in response to the ABEND. They will recover and continue, if possible. The message may give an indication of the recovery action (recovery) to be taken or other information identifying the cause of the ABEND.
recorded as first-failure-data capture. This is probably due to a logic error. Contact Software Support.

**HLV4189H** WARNING: count ADDITIONAL type EVENTS DETECTED BY RPC CONCURRENCY ROUTINES

Explanation: The RPCMAX routines have traced one or more (count) detected ERROR or ABEND events which have left some resource only partially recovered, indicate an imminent failure of the RPC concurrency controls, or where not detected prior to an ABEND occurrence. The RPC Concurrent execution limit facility may become impaired, or now is, inoperable. The system issues this console message when an ABEND is intercepted in the RPC routines, when heuristic checks indicate that an IMMINENT-FAILURE of the facility is likely occurring, or when an anomaly is detected for which only a PARTIAL-RECOVERY of resources can be predicted. Events of this type are always traced unless RPCMAXTRACE has been set to NONE. This console message is issued, no more frequently than once per minute, as an alert that the facility may be slowly degrading, rapidly failing, or has already become inoperable. ABEND-INTERCEPT messages, unless very infrequent, likely are due to logic errors within the facility; although these may occur infrequently if client transaction threads are killed manually or terminate abnormally for reasons unrelated to RPC program processing. FAILURE-IMMINENT messages, normally are issued just before the facility becomes inoperable in order to log information which may be useful in diagnosing problems. PARTIAL-RECOVERY events MAY indicate future facility failure if too many resources cannot be eventually recovered. However, the system is unable to predictively determine, nor later confirm, whether resources being bypassed NOW will eventually be recovered, or will remain inoperable permanently. A few, intermittent PARTIAL-RECOVERY messages with low event counts CAN represent a more or less normal operating condition for some system work loads. RPC termination, End-Of-Task, or cancelled-task cleanup may be lagging a bit behind mainline RPCMAX limit processing, rendering certain predictive health checks unable to confirm that in-flight recovery actions will be able to complete successfully. However, a large count of PARTIAL-RECOVERY events, issued frequently, probably indicates that resources are not being recovered in all cases. These event traces can be used to determine the originating cause of a downward spiral in many cases.

**User response:** If these messages appear frequently, or for any message reporting FAILURE-IMMINENT events, check the state of the concurrent RPC execution facility, along with Trace Browse activity. The trace may indicate the cause of a building problem early enough that it can be corrected prior to facility failure. If the facility has become or is rapidly becoming inoperable, set the RPCMAX parameter to zero, which will turn off most processing within the facility for new RPC execution requests. If the cause of degradation or failure cannot be corrected contact Software Support. For certain types of events, the system will generate an SDUMP of the product address space. SDUMPs are generated no more frequently than once per minute. Retain and forward the dumps to Software Support if the immediate cause of a problem cannot be resolved directly.

**HLV4190E** BIND WITH rtype host FAILED - NO MATCHING errdesc

Explanation: This message is produced when the local system is unable to negotiate a bind with the remote system. Note that this is not a VTAM bind. It is an HLV specific bind.

**User response:** The session fails. Retry the session. If the problem persists, check to see if there are other messages that may indicate another problem. If there are no other messages, contact Software Support.

**HLV4191E** msgtext

Explanation: This message indicates a logon failure. The text of the message is produced by the security package (RACF, ACF2).

**User response:** Check the text of the message to determine the cause of the logon failure. You may need additional authorization.

**HLV4192T** service - error - errdesc

Explanation: An error occurred while processing an ODBC request.

**User response:** This error message is a generalized message to identify user interface errors.

The variable fields of the message text are: service1 ODBC service being called (IMSTM, CICSEXCI) service2 element/operation in error desc error description

**HLV4193T** Access to DB2 LUW is not activated.

Explanation: None.

**User response:** Contact IBM Software Support.

**HLV4200I** host: cmd

Explanation: This message is issued as a result of a host command being sent to the product REXX MESSAGE environment.

**User response:** This message is informational. No response required.

The variable fields of the message text are: host host
environment name string (message) cmd host command insert

HLV4201E  BIND WITH msgtext %2 FAILED - NO MATCHING %3
Explanation: This message indicates a logon failure. The text of the message is produced by the security package (RACF, ACF2).
User response: Check the text of the message to determine the cause of the logon failure. You may need additional authorization.

HLV4233I  Error sending message to external data queue
Explanation: An error has occurred while attempting to send an informational record to the external data queue. This may be caused by a full external data queue.
User response: Contact your local product systems programming group for help.

HLV4240I  Load balancing resumed for %1
Explanation: This message is issued when it is detected that the load balancing queue is no longer full and is once again eligible to receive sessions from a Group Director.
User response: None. This is an informational message only.

HLV4250E  msgtext
Explanation: This message is used to write out error messages received from remote systems.
User response: Check the text of the message to determine the cause of the problem.

HLV4251E  INVALID ADDRESS addr PASSED BY PROGRAM proname
Explanation: This message is issued if an invalid address is detected in the routine that copies data from a user program into the buffer that is sent to the remote system. The data at the specified address could not be accessed.
User response: The program passing the invalid address to the product may fail or give incorrect results. Check the Db2 application program, and fix it if possible.

HLV4260E  Client processing disabled
Explanation: An error occurred during initialization of ACI support for client program processing. Client program processing is disabled.
User response: Contact Software Support.

HLV4261E  ACI FUNCTION func FAILED, RC=rcode errdesc
Explanation: An error occurred processing a client ACI session.
User response: The session will be terminated.

HLV4262E  Server client is not activated on server sysser.
Explanation: None.
User response: Contact IBM Software Support.

HLV4263I  Client processing is enabled.
Explanation: Client processing is enabled. Client initialization completed successfully and the client is ready to accept new connections.
User response: No action is required.

HLV4265W  Data Server Client buffer expansion disabled due to auxiliary storage event
Explanation: An auxiliary storage event has been signaled, where event is one of: warning, shortage, or critical shortage. DS Client immediately stops expanding shared memory object buffers.
User response: Investigate the reason for the auxiliary storage shortage. Use the PAGEADD command to add auxiliary storage.

HLV4266I  Data Server Client services resumed.
Explanation: An auxiliary storage event has expired or has been relieved. DS Client will resume full services.
User response: No action is required.

HLV4267W  Data Server Client refusing new requests due to auxiliary storage event
Explanation: An auxiliary storage event has been signaled, where event is one of: warning, shortage, or critical shortage. DS Client immediately stops accepting new requests.
User response: Investigate the reason for the auxiliary storage shortage. Use the PAGEADD command to add auxiliary storage.

HLV4270H  %1 SUBSYSTEM NAME NOT SET - %1 TCP/IP SUPPORT NOT ACTIVATED
Explanation: The name of the OEM vendor TCP/IP subsystem has not been set. TCP/IP processing using this copy of the product is not possible using the OEM vendor’s TCP/IP stack.
**User response:** The TCP/IP task of the main address space shuts down. This is not an error unless you actually did specify the TCP/IP subsystem name in the xxxxIN00 exec. Note that other communication protocols (such as OE SOCKETS TCP/IP) may be used even when the OEM Vendor TCP/IP interface is not in use.

**HLV4271S** SSL and non-SSL ports match - TCP/IP terminated

**Explanation:** SSL processing has been requested. However, the SSL port number is the same as the non-SSL port number. Interlink TCP/IP was terminated.

**User response:** Change either the SSL port number or the NON-SSL port number, and restart the product. The product parameter for setting the SSL port number is ITCSSLPOR. The product parameter for setting the non-SSL port number is ITCPOR. The product parameter for the vendor TCP/IP component is ITES SSLPORTNUMBER. The product parameter for the vendor TCP/IP component is ITES SSLPORTNUMBER.

**HLV4272H** vendor TCP/IP component FOR SUBSYSTEM subsys status

**Explanation:** This message is used to indicate incomplete INTERLINK TCP/IP initialization.

**User response:** No action is required. When TCP/IP completes initialization, HLV will complete its own TCP/IP-related initialization.

**HLV4273H** protovend protcomp support is being activated

**Explanation:** This message is issued by each of the four available communication protocol tasks when the corresponding protocol support is being activated. Other messages are issued if support for a particular protocol is not being made active during start-up.

**User response:** No action is required.

**HLV4274S** Non-load balancing TCP/IP port matches normal port or SSL port, server terminating.

**Explanation:** A non-load balanced TCP/IP port has been specified. However the port number is the same as the standard TCP/IP Port or the SSL Port.

**User response:** Change the port numbers so they do not match and restart the product. The product parameter for setting the SSL port is OESSLPOR. The product parameter for the non-load balanced port is OENLPOR. The product parameter for setting the non-SSL port number is OEPOR.

**HLV4275I** paramname reached -- at least one process waiting

**Explanation:** This message is issued when a target thread limit was reached in the prior checking interval. This means that some number of requests will have their processing delayed until a subtask is freed by the completion of another request. This is not a serious error if it happens infrequently. If response time complaints occur accompanied by these messages, the limit should be raised.

**User response:** Raise the value of the indicated parameter.

**HLV4276S** no new process block dynamic allocation failures due to unknown reasons.

**Explanation:** This message is issued when a change is noted in the number (no) of process block dynamic allocation failures. These failures will be noted when process block dynamic allocation fails for reasons other than storage constraints. This is a serious error.

**User response:** The bypass is to pre-allocate a sufficient number of process blocks during product initialization via the PROCESS parameter. This number can be determined via the product ISP panel (HLV Stats) C.4 and the “High water count” value in the “PC routines process blocks” section. Add 2 or 3 to this number, and use it as the initial PROCESS parameter value. For a permanent solution, contact IBM Software Support.

**HLV4277S** no new process block dynamic allocation failures due to storage restraints.

**Explanation:** This message is issued when a change is noted in the number (no) of process block dynamic allocation failures. These failures will be noted when process block dynamic allocation is unable to obtain either private storage within the product address space or common storage within the extended common storage area (ECSA). This is a serious error.

**User response:** The bypass is to pre-allocate a sufficient number of process blocks during product initialization via the PROCESS parameter. This number can be determined via the product ISP panel (HLV Stats) C.4 and the “High water count” value in the “PC routines process blocks” section. Add 2 or 3 to this number, and use it as the initial PROCESS parameter value. For a permanent solution, contact IBM Software Support.

**HLV4278I** no new process blocks allocated. Total process block count: total

**Explanation:** This message is issued when a change is noted in the number (no) of new process blocks that have been dynamically allocated. The message also
displays the total number (total) of cross memory process blocks in the pool.

**User response:** If the process block pool initialization count is set too low, there may be a few of these messages during the early portion of execution or during the first peak period of operation. This should be considered normal operation. If these messages persist and the size of the process block pool continually rises, it is possible that process blocks are not being freed and placed back into the pool as they should. In this case, contact Software Support for further analysis.

**HLV4279I no new RESMGR E-O-T cleanup failures or stalls detected and corrected**

**Explanation:** This message is issued when a change is noted in the number (no) of MVS Resource Manager end-of-task failures or stalls that have been detected and automatically corrected by the subsystem end-of-task SSI intercept. Missing RESMGR EOT notifications normally occur only for connected TSO users that (1) are cancelled with S622 abends (because the RESMGR EOT intercept is not scheduled by MVS) or (2) do not exit/reenter a dialog (such as the trace display) between restarts of the main product address space. Undetected EOT events may indicate a more serious problem when they occur for subtasks executing within the main product address space.

**User response:** No action is normally required. Some sites may receive these notifications with regular frequency; other sites may rarely or never receive these notifications. If you note an increase in the number of RESMGR EOT failures, check the trace to locate DET events (TRACEDETACHEVENTS must be YES). Those entries which contain the text EOT or EOM are of interest. Display the jobname and userid columns. If the failing DET events are not being recorded for TSO user address spaces, contact Software Support for further analysis.

**HLV4280T limitype TIME LIMIT EXCEEDED FOR userid FROM nodetype NODE node PLAN plan CNID connid TP progrname**

**Explanation:** This message is issued when a task has exceeded a warning limit of some kind. The limit (limitype) may have been either a CPU time limit or a wait time limit.

**User response:** No action is required. However, an automated response to this message may be needed.

**HLV4285S Process block pool is empty, size is poolsize**

**Explanation:** This message is issued when the process block pool is found to be empty. This can happen if all of the process blocks are in use or if process blocks are being lost (allocated and not freed).

**User response:** This is a very serious error. Terminate the main product address space as soon as possible, and raise the number of process blocks using the PROCESS product parameter in the product initialization exec. The number of process blocks must be at least as large as the number of IMS/DRA threads plus 5. If the error persists, contact Software Support for further assistance.

**HLV4285S no process block allocation failures have been detected**

**Explanation:** This message is issued when a number (no) of process block allocation failures are detected. This can happen if all of the process blocks are in use or if process blocks are being lost (allocated and not freed).

**User response:** This is a very serious error. Terminate the main product address space as soon as possible, and raise the number of process blocks using the PROCESS product parameter in the product initialization exec. The MINIMUM number of process blocks needed is the number of IMS/DRA threads, plus 5. Note that this is the minimum number required, and
it does NOT take into account various volume-based request handling. If the error persists after increasing the PROCESS parameter value, or if process block release errors are also being reported by the subsystem, contact Software Support for further assistance.

**HLV4286S**

**OPMS UPDATE FAILED FOR A LOGGING EXCEPTION LIMIT**

**Explanation:** This message is issued when an attempt to update product limits in the OPMS block failed for some reason. The update will not be performed. This error will normally occur only if a serious internal error has occurred. This error could occur if the product was attempting to update a limit value at the same time the ISPF interface was also being used to update a limit value.

**User response:** This is a serious error. If the error persists, contact Software Support for further assistance.

**HLV4287S**

**no PENDING LOGGING REQUESTS FOUND FOR DATABASE subsys**

**Explanation:** The number of pending logging requests has exceeded the product limit value. This message is issued to notify the operators of the system or an automated operations product that the limit has been exceeded.

**User response:** This is a serious error. The reason for the accumulation of pending requests must be determined and fixed. Some of the possible reasons include the Db2 subsystem being down or errors accessing the Db2 logging tables.

**HLV4288S**

**no pending logging requests cleared for database subsys**

**Explanation:** All of the pending logging requests for a database subsystem have been cleared and the associated storage has been released. This message is issued to notify the operators of the system or an automated operations product that the pending logging requests have been released.

**User response:** This is a serious error. The reason for the accumulation of pending requests must be determined and fixed. Some of the possible reasons include the Db2 subsystem being down or errors accessing the Db2 logging tables.

**HLV4289S**

**no SS-PC ENTRY FAILURES DETECTED, LAST: rsn AT time**

**Explanation:** One or more new failures were encountered during entry processing for the product’s switch or stacking PC routine. Each new failure represents a transaction task or user interface request which could not be processed. Usually, these failures are due to the inability of the product to obtain stack storage from its pool of pre-allocated cross-memory process blocks, and this message will be immediately preceded by message 4285S.

**User response:** If this message was preceded by message 4285S, terminate the main product as soon as possible, and raise the number of process blocks using the PROCESS product parameter, as described for message 4285S. If message 4285S does not precede this message or the problem persists, contact Software Support for further assistance.

**HLV4290E**

**wstype GLOBAL VARIABLE WORKSPACE IS percent FULL (count OF total BLOCKS USED), PROGRAM=proname.**

**Explanation:** The global (or temporary global) variable workspace, which contains global variables, has met or exceeded the warning threshold of blocks in use as defined by the GLOBALWARNTHRESH (or GLOBALTEMPWARNTH) product parameter. This message will also be issued every time a new high-water mark that is at least 5% higher than the previous high-water mark is met or exceeded. The frequency at which this message is issued is controlled by the GLOBALWARNINTVAL (or GLOBALTEMPWARNINTVAL) product parameter. Note that the check that results in this message is only made when a new global variable is allocated or an existing global variable is expanded. The condition is recorded, and the message will be issued on the next reference to a global variable. If no global variable references occur, you may not be warned of this condition until the database is full.

**User response:** You may need to analyze the contents of the global (or temporary global) variable database using the Global Variables application, and delete unused symbols. If the global variable data set is too small, allocate a larger global variable DIV data set, and copy the old one over to it using the access method services REPRO command. Modify the product GLOBALMAX (or GLOBALTEMPMAX) parameter to indicate the larger maximum number of global variable blocks. The program or rule wstype name in the message simply represents the program running at the time the condition was detected or at the time a deferred message was issued. This program may or may not have caused a significant portion of the global workspace to be used.

**HLV4291T**

**addinfo**

**Explanation:** This trace message is used for debugging purposes only.

**User response:** None.

<tbody>
<tr>
<td>HLV4292E</td>
<td>POSSIBLE vostype GLOBAL VARIABLE WORKSPACE INTEGRITY PROBLEM DETECTED (errtype - flag). REBUILD SCHEDULED.</td>
</tr>
<tr>
<td>Explanation:</td>
<td>An abend occurred while updating critical control blocks in either the global or temporary global variable workspace. The global variable workspace will be rebuilt at the next checkpoint interval. Until the rebuild is complete, attempts to access or update global variables may possibly fail. The error (errtype) may be SYNC or DELAYED.</td>
</tr>
<tr>
<td>flag represents the integrity flag byte, in hexadecimal.</td>
<td></td>
</tr>
<tr>
<td>User response:</td>
<td>In most cases, no problem has actually occurred. The rebuild will simply validate and recover all of the data. If the 0180I messages associated with the rebuild indicate any loss of data, perform the following: (1) print any LOGREC software records created by the product, (2) print the relevant sections of the Trace Browse leading up to the issuance of this message, (3) record the exact text of this message, and (4) contact Software Support for further assistance.</td>

</table>
HLV4304E  SEF COMMAND errdesc: cmdname

Explanation: An invalid SEF verb or an invalid SEF command has been detected by the ADDRESS SEF environment syntax checker.

User response: Correct the syntax of the SEF command.

HLV4305E  HLV/SWS version ver1 is incompatible with version ver2 of subsystem subsys.

Explanation: The version of the product that you are using in your TSO environment is incompatible with the version of the product running in the main Server address space related to the subsystem to which the SEF command has been addressed.

User response: Ensure that the correct product load library is allocated to your TSO environment, or address the SEF request to a copy of the product that is running the a compatible version.

HLV4307E  SUBSYS SEF command cannot be issued in a rule

Explanation: The SUBSYS SEF command cannot be issued from within an SEF rule environment

User response: Force this section of code to run in a server using OPSREQ.

HLV4308E  errdesc, RC=rcode

Explanation: Some type of service routine (operating system or product specific) failed. The error message identifies the type of error.

User response: Check the full text of the error message, and attempt to correct the error.

HLV4319T  ABEND IN 'ADDRESS SWSSEND'
CODE=rcode, REASON=rsncode AT addr

Explanation: An abend occurred within the ADDRESS SWSSEND host environment.

User response: Check for other errors that might explain the condition.

HLV4320H  subsysid SEF CMD FROM(jobname,userid): cmd

Explanation: This message logs the use of SEF host commands to the hardcopy console. The FROM keyword contains the job name and user ID used for authorization purposes.

User response: No action required. This message is for information tracking only.

HLV4321E  CURRENT verb COMMAND NOT AUTHORIZED • errmsg

Explanation: Product REXX SEF command authorization check routine found that the current user is not authorized to execute the SEF command. Access to the EXECUTE command is denied.

User response: Check the verb string of the error message text for the command whose access is denied. Ensure that the current user has the required access. Contact your security systems administrator for further help, if necessary.

HLV4322S  ABEND abcode IN AUTHORIZATION ROUTINE modname+offset

Explanation: An abend occurred in the authorization checking routine

User response: Contact the person at your installation who installs and maintains your installation security product.

HLV4336E  msgtext

Explanation: An SEF command was invalid or has failed for the reason indicated in the message.

User response: Correct and re-submit the SEF command.

HLV4337T  THE TSO COMMAND IS INVALID DUE TO errdesc

Explanation: A command passed to the ADDRESS TSO or ADDRESS TSOSRV environment is invalid for the reason given. The system rejects the command, with RC=-3 indicating an invalid host command environment command.

User response: Determine why the command was rejected, and resubmit the command.

HLV4338I  TSO REMOTE EXECUTION TIMEOUT VALUE SET TO time

Explanation: A GETTIMEOUT command was passed to the ADDRESS TSO interface. This message is returned on the external data queue as a response.

User response: None. The timeout value is given in 100ths of seconds.

HLV4339T  environment COMMAND TIMED OUT

Explanation: An ADDRESS TSO or ADDRESS CGI host command did not complete within the allowed time. The requesting routine is redispachted.

User response: Determine why the host command did not complete within the required time frame. The delay could be due to looping within the TSO/CGI command
procedure or heavy usage of the external TSO servers.

**HLV4340S** Subsystem subsysid inactive, must be (re)started

Explanation: An ADDRESS TSO or ADDRESS TSOsrv host command has been directed to a product subsystem that is not currently active.

User response: Start or restart the product subsystem whose subsystem ID appears in the message, or correct the program to specify the ID of an active product subsystem.

**HLV4341S** TSO/E is not installed

Explanation: TSO/E (IBM's program product number 5665-293) is required to support the use of the product.

User response: Verify that this product is available at your installation.

**HLV4342E** TSO command length (length) exceeds maximum length (maxlength)

Explanation: The length of the TSO command exceeds the implementation limits. Note that the length of TSO host commands sent from SEF rules to the OSF execute queue have a lower limit (256 bytes or the BLKSIZE on the server SYSTSIN DD statement, whichever is smaller).

User response: Check if there are an excessive number of blanks in the TSO command string. If so, remove the blanks from the command string. If you need to pass long values from a rule to a server REXX program, use global variables to pass the values.

**HLV4343S** TSO service error - errdesc

Explanation: An error occurred in the product service routine that executes TSO commands via the TSO command service routine.

User response: Check if any other error messages were generated along with the error message above. If the combined error messages are sufficient to explain the problem, take whatever corrective action is appropriate. If the problem cannot be resolved, contact Software Support.

**HLV4345S** TSO service error - errdesc - reason code rsncode

Explanation: An error was detected in the parameter list passed to the product service that calls the TSO command service routine.

User response: Check if any other error messages were generated along with the error message above. If the combined error messages are sufficient to explain the problem, take whatever corrective action is appropriate. If the problem cannot be resolved, contact Software Support.

**HLV4346E** Current verbaddr command not authorized - errmsg

Explanation: The authorization check failed. The use of ADDRESS OSF is restricted by your installation security product.

User response: Contact the person at your installation who installs and maintains your installation security product.

**HLV4347S** ABEND abcode IN AUTHORIZATION ROUTINE modname+offset

Explanation: An abend occurred in the authorization checking routine.

User response: Contact the person at your installation who installs and maintains your installation security product.

**HLV4348S** rsrcname sysserv FAILED, RC=rcode, DETECTED AT addr

Explanation: Some type of error occurred during invocation of a product service routine associated with the ADDRESS TSO or ADDRESS OSF environment. The error occurred while attempting to set up the environment for executing a TSO command via the TSO/E command service routine.

User response: Check if any other error messages were generated along with the error message above. If the combined error messages are sufficient to explain the problem, take whatever corrective action is appropriate. Otherwise, contact Software Support with this problem.

**HLV4349S** MESSAGE SEND TO TSO EXECUTE QUEUE FAILED, RC=rcode, DETECTED AT addr

Explanation: The product has attempted to send a command to the TSO server execute queue in a product Server address space, and the attempt has failed. If the return code in the message is 4, then the TSO execute queue is full. Any one or some combination of the following conditions may be true: (1) there is a rule or some combination of rules that is looping, (2) there is a
loop in an application that is causing TSO commands to be issued very frequently, (3) there are too few servers or the servers may be tied up running relatively long processes, or (4) the TSO execute queue may be too small for your server workload.

User response: Review the contents of the message and any associated messages, and attempt to resolve the problem. If the problem cannot be resolved, contact Software Support to obtain additional assistance.

HLV4350I Load for module modname failed, CCTL initialization error

Explanation: This message is issued if a module needed to initialize the CCTL interface to IMS could not be loaded. The message contains the module name. The module is either missing or some other error has occurred.

User response: Check if any other messages were issued. Check if the named module is in the search sequence. Note that this problem can be resolved without restarting the main product address space.

HLV4351I DRA control exit invalid PAPL subfunction = sfcd

Explanation: This message is issued when the product DRA control exit receives notification of a DRA failure but is passed an unrecognized subfunction code.

User response: No action required. The product will attempt to restore a connection with the IMS control region. Note that this error message may be followed by other, more descriptive error messages as the product attempts to reconnect to the IMS DBCTL.

HLV4352I DRA control exit invalid PAPL function = funcd

Explanation: This message is issued when the product DRA control exit receives an unrecognized function code.

User response: No action required. The product will attempt to restore a connection with the IMS control region. Note that this error message may be followed by other, more descriptive error messages as the product attempts to reconnect to the IMS DBCTL.

HLV4353I IMS CCTL support activated

Explanation: This message is issued when the product DRA control exit receives a notification that the connection to the IMS control region has been established successfully.

User response: No action required. This is an informational message only.

HLV4354I IMS CCTL support terminating

Explanation: This is an informational message that is issued when the product terminates its IMS CCTL support. If the IMS CCTL support is being terminated due to a fatal error condition, this message will have been preceded by error messages which depict the exact error condition encountered.

User response: Follow the course of action recommended for the error messages that preceded this error message. If the product CCTL support continues to terminate due to a fatal error condition, contact Software Support for further assistance.

HLV4355I IMS CCTL control exit resync failure

Explanation: The IMS CCTL control exit has been unable to successfully process a resync request during product initialization.

User response: Check the MVS system log for any IMS messages occurring around the time of this failure. Correct any IMS problems that may have occurred. Then ABORT the in-doubt UORs for this server. If the problem continues to persist, contact Software Support for further assistance.

HLV4356I IMS DRA terminating due to unknown error condition

Explanation: The IMS Data Resource Adaptor running inside of the main product address space has terminated due to some unknown error condition. Product IMS support will be terminated.

User response: Check the MVS system log for any IMS messages occurring around the time of this failure. Correct any IMS problems that may have occurred, and restart the HLV address space. If the problem continues to persist, contact Software Support for further assistance.

HLV4357I Invalid request, IMS CCTL feature not enabled

Explanation: None.

User response: Contact IBM Software Support.

HLV4358I Request failed product not identified to IMS

Explanation: The product has made one or more attempts identify itself to the IMS DBCTL region, but the attempts have failed. There is currently no active connection between the product address space and the IMS DBCTL region.

User response: Check Trace Browse for any related product messages. Check the MVS system log for any related IMS messages. Correct any IMS problems discovered. The product will continue to attempt to
connect to the IMS region until a successful connection has been established.

HLV4359I  PSB psb schedule request unsuccessful
Explanation: The product was unable to successfully schedule the PSB specified by the client application.
User response: Check the PSB name to ensure that it is correct. If the problem continues to persist, contact Software Support for further assistance.

HLV4360I  Request failed - PSB not in scheduled state
Explanation: The current request requires that a prior PSB schedule attempt had completed successfully, and no active thread was found for this task.
User response: Check the program logic in the client-side application to ensure that the "CC" message was sent prior to issuing DL/I requests or the "TERM" message. If the problem continues to persist, contact Software Support for further assistance.

HLV4362I  Invalid buffer function code funcd
Explanation: The buffer function code passed to this routine was invalid. The host transaction program could not handle the buffer function code passed by the client.
User response: Verify that the host application requested by the client matches the current call to the host. Contact Software Support for further assistance, if necessary.

HLV4363I  Previous CCTL termination failed, initialization will use previous session PAPLCTOK value
Explanation: This is an informational message that is issued during product initialization when the CCTL initialization routine determines that the previous CCTL termination did not complete successfully.
User response: No action is required. This message is for informational purposes only.

HLV4370I  Access to Services is not activated.
Explanation: None.
User response: Contact IBM Software Support.

HLV4371I  Services is not active on the server
Explanation: Services is not started on the server and cannot be used by client applications. The current request to use client to execute a web service is rejected. The current host session will be terminated.
User response: If access to Services is needed, enable Services by setting the correct parameters on the server.

HLV4372H  WEB SERVICE %1 UNDER VIRTUAL DIRECTORY %2 HAS BEEN %3
Explanation: A web service has been enabled or disabled.
User response: No action is required. This message is for informational purposes only.

HLV4375W  OE sockets WSOEPORT conflict with PIO port - zervices HTTP listener terminating
Explanation: The port number for OE Sockets Services (WSOEPORT) has been set to the same non-zero value as the parallel I/O port.
User response: This OE Sockets task of the main address space shuts down. Startup continues without Services support.

HLV4376W  MongoDB support services TCP/IP port(s) conflict with other port number assignments - Mongo terminating
Explanation: The port number(s) assigned for MongoDB server support conflicts with other non-zero port number assignments for other product support services.
User response: The MongoDB listener task will terminate and Mongo support will be deactivated.

HLV4377W  MongoDB listener ports not set - MongoDB support will not be activated
Explanation: The port numbers for MongoDB client connections have not been set. MongoDB support, requested by the MongoDB start-up parameter cannot be activated.
User response: The MongoDB listener task shuts down, and start-up continues without MongoDB support.

HLV4378W  OE sockets HTTP port (WSOEPORT) conflicts with main OE port (OEPORTNUMBER) - HTTP listener terminating
Explanation: The port number for OE Sockets HTTP and Services access is set to the same non-zero value as the normal (ODBC) port. Services HTTP listener task will terminate and HTTP access to this server will be unavailable.
User response: This OE Sockets task of the main address space shuts down. Startup continues without HTTP and Services support.
**HLV4379W**  
OE sockets HTTP port (WSOEPOR)  
unset - HTTP & Services support  
unavailable

**Explanation:** The port number for OE Sockets HTTP and Services access is un-set. Services Support, requested by WSACTIVE option, has been reset and will not be available. HTTP access to the server by the Studio will also be unavailable.

**User response:** This OE Sockets task of the main address space shuts down. Startup continues without HTTP and Services support.

**HLV4380E**  
MongoDB feature is not configured -  
Mongo listener on port portno will not be activated.

**Explanation:** None.

**User response:** Contact IBM Software Support.

**HLV4381H**  
Parallel I/O port OPEN failure

**Explanation:** An error occurred when trying to open a socket for the Parallel I/O port.

**User response:** Verify that the port number is correct.

**HLV4382H**  
Non load-balanced port OPEN failure

**Explanation:** An error occurred when trying to open a socket for a non load-balanced port.

**User response:** Verify that the port number is correct.

**HLV4383H**  
OE sockets TCP/IP DubProcess failed.  
RC=rcode. Reason code=rsicode.

**Explanation:** An error occurred when trying to set the DUBPROCESS option for OE Sockets processing.

**User response:** Verify that the userid used to start the server has an OMVS segment defined. If this does not resolve the problem, contact Software Support for additional assistance.

**HLV4384S**  
Services load balancing port not unique,  
server terminating

**Explanation:** A load balancing Services port has been specified. However the port number is already used by another listener such as the main TCP/IP listener, SSL, or regular Services.

**User response:** Change the port numbers so they do not match and restart the product. The product parameter for setting the SSL port is OESSLPORNUMBER. The product parameter for the non- load balanced port is OENLPORTNUMBER. The product parameter for setting the non-SSL port number is OEPORTNUMBER. The product parameter for setting the Services port number is WSOEPORT. The product parameter for setting the Services SSL port number is WSOESSLPOR The product parameter for setting the Services balanced port number is WSOEBALANCEDPORT

**HLV4385H**  
WS load-balanced port OPEN failure

**Explanation:** An error occurred when trying to open a socket for a ws load-balanced port.

**User response:** Verify that the port number is correct.

**HLV4386S**  
SSL port number required - OE sockets TCP/IP processing terminated

**Explanation:** SSL processing has been requested. However, the SSL port number has not been set or has been set to zero. OE Sockets was terminated.

**User response:** Set the SSL port number in the initialization exec, and restart the product. If this does not resolve the problem, contact Software Support for additional assistance.

**HLV4387S**  
PIO and ODBC ports match - OE sockets PIO port is reset to zero

**Explanation:** PIO processing has been requested. However, the PIO port number is the same as the ODBC port number. The OEPIOPORTNUMBER is set to zero. Parallel I/O support will be disabled.

**User response:** Change the OEPIOPORTNUMBER to be different from the OEPORTNUMBER value.

**HLV4388S**  
SSL and non-SSL ports match - OE sockets SSL port is reset to zero

**Explanation:** SSL processing has been requested. However, the SSL port number is the same as the non-SSL port number. The OESSLPORNUMBER is set to zero. The non-SSL port number will accept both SSL and non-SSL inbound requests.

**User response:** None required. To eliminate the message, remove the OESSLPORNUMBER parameter from the initialization exec.

**HLV4389S**  
OE stack oestack can not be used - OE sockets TCP/IP processing terminated

**Explanation:** The name of a specific OE stack was specified using the TCPNAME product parameter. However, this OE stack cannot be used for some reason. OE Sockets was terminated.

**User response:** Correct the name of the OE stack by modifying the TCPNAME product parameter. Restart the main product address space.
HLV4390E  Invalid dynamic VIPA IP address %I specified

Explanation: Dynamic VIPA support has been configured, however the IP address specified for Dynamic VIPA support to use is not valid. Dynamic VIPA support will be disabled.

User response: Either delete the Dynamic VIPA IP address or properly specify an IP address using dotted-decimal notation.

HLV4391I  OE stack binding port portno to IP address ipaddr

Explanation: The Open Edition support is binding the product to the indicated port and the indicated IP address.

User response: None. This is an informational message only.

HLV4392I  OE stack returning invalid results when sockets are ready

Explanation: This message is issued when the OE main task detects that select() returned a zero return value even though there were sockets ready in the returned socket mask. This could lead to a loop occurring in OPMAOT trying to process a listening socket.

User response: Your sales representative for instructions on gathering documentation for this problem in IBM Open Edition code.

HLV4393I  OE stack returning too soon from select when no sockets are ready

Explanation: This message is issued when the OE main task detects that select() returned sooner than expected when a timeout value was specified and there were no sockets ready for processing. This could lead to wasted time in OPMAOT when there is not work to do.

User response: Contact Software Support for instructions on gathering documentation for this problem.

HLV4400T  msgtext

Explanation: This is a general purpose message that may or may not indicate some type of TCP/IP error.

User response: Read the message text carefully. Some messages produced under this message ID are actually error messages. If the message indicates an error, check for any associated TCP/IP produced error messages. If you are unable to diagnose the problem, contact Software Support.

HLV4401W  No TCP/IP port number specified.

Explanation: This message indicates that no port number was specified for the product to LISTEN for, and ACCEP inbound OE Sockets TCP/IP sessions.

User response: Change the xxxxIN00 EXEC to specify a port number for the OEPORTNUMBER parameter which is used to LISTEN for, and ACCEP all inbound OE Sockets TCP/IP sessions.

HLV4410E  service OF desc FAILED RC=rcode, DETECTED AT addr

Explanation: This is a generic error message used to describe a wide variety of message processing errors. The message text gives a description of the current operation (service) and what the current operation was trying to do.

User response: Keep all the related error details, and contact your local product systems programming group for assistance with this problem.

HLV4411E  GLOBAL VARIABLE RULE CHAINING DEPTH EXCEEDS MAXIMUM VALUE

Explanation: Global variable rule chaining has exceeded the maximum value. All pending global variable rules will not be fired. The current operation continues.

User response: If this situation has been caused by a recursive infinite global variable rule loop, modify the global variable rule to avoid this situation. If this situation is not due to a REXX programming error, increase the global variable rule chaining limit (GLVCHAINMAX).

HLV4413I  no MESSAGES SINCE THE LAST ARCHIVE. CURRENT MESSAGE NUMBER IS seqno

Explanation: The number (no) of messages added to Trace Browse since the last Trace Browse message archived has exceeded a user-defined threshold.

User response: This message may be used as a trigger for starting the Trace Browse archive program based on the number of messages since the last archive rather than on a time basis using the TODARCH rule.

HLV4420H  msgtext

Explanation: This is a general purpose message that may or may not indicate some type of ITC/IP error.

User response: Read the message text carefully. Some messages produced under this message ID are actually error messages. If the message indicates an error, check for any associated ITC/IP produced error messages. If you are unable to diagnose the problem, contact Software Support.
HLV4421H  UNKNOWN  service CODES - R0=r0  R15=r15

Explanation: This message reports ITC/IP return and reason codes (R0 and R15) that are unknown to HLV.

User response: Probable CICS error. Check the system log for errors.

HLV4453S  jobname error starting client exit program progrname - EIBRESP: respcd

Explanation: The client PLT program encountered an error starting the user exit program.

User response: Check that the exit program has been correctly defined to CICS.

HLV4454I  jobname client exit program progrname started

Explanation: The client task-related user exit program has been started.

User response: None. This message is for informational purposes only.

HLV4455S  jobname GWA length not as expected for client exit program progrname - explength: explength, returned: GWA

Explanation: The GWA length returned by CICS for the client TRUE is not the expected length.

User response: Check that the exit program has been correctly defined to CICS.

HLV4456I  jobname program creation date: date

Explanation: This message provides the creation date of the client TRUE exit program.

User response: No action is required.

HLV4457S  jobname Program load failed - EIBRESP: respcd

Explanation: The client API interface routine could not be loaded.

User response: Ensure that the load module is available to the CICS region.

HLV4458W  jobname client exit program progrname is already enabled

Explanation: The client PLTPI program encountered an error enabling the client exit program. The program is already enabled.

User response: Check that the PLTPI program has been correctly defined to CICS.

HLV4459I  jobname client exit program progrname is enabled

Explanation: The client PLTPI program is enabled.

User response: This is an informational message. No action required.
HLV4460I  jobname Program GWA address: addr

Explanation: This message provides the address of the client TRU3 exit's Global Work Area (GWA).

User response: No action is required.

HLV4470S  IMS CCTL FEATURE MUST BE ENABLED TO ISSUE DL/I CALLS

Explanation: None.

User response: Contact IBM Software Support.

HLV4471S  INVALID PSB SCHEDULE ATTEMPT - PSB ALREADY SCHEDULED

Explanation: A user-written RPC program attempted to issue an IMS PCB call in order to schedule the program's PSB. However, the program's PSB is already scheduled.

User response: Correct the internal logic error in the user-written RPC program, and invoke the RPC program again.

HLV4472S  PSB SCHEDULE FAILURE - PSB NAME = psbname

Explanation: A user-written RPC program attempted to schedule the program's PSB. The PSB schedule attempt has failed.

User response: The PSB schedule may have failed for a variety of reasons. Ensure that the PSB load module is available to IMS. Ensure that the databases referenced by the PSB are available. Ensure that the PSB has not been stopped by IMS due to an earlier error. If none of the above conditions caused the error, check the IMS MTO log and the MVS MCS console for any related error messages. If all attempts to schedule the PSB fail, contact Software Support for further assistance.

User response: Check the abend code to determine if the region size should be increased. If necessary, increase the region size, and restart the product.

HLV4501U  desc UNABLE TO LOCATE THE MASTER BLOCK

Explanation: A subtask was unable to locate the product control blocks and was forced to terminate. The services provided by the subtask will not be available.

User response: Check the error messages and the return code associated with this problem. There may be one or more abend error messages referring to the current problem. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support with this problem.

HLV4502H  process subtask is active

Explanation: This is the standard subtask initialization message.

User response: This is not an error message, and no action is required.

HLV4503S  ESTAE service ERROR RC=rcode

Explanation: The subtask driver attempted to create an ESTAE recovery environment. The ESTAE macro failed.

User response: Check the error messages and the return code associated with this problem. There may be one or more ESTAE error messages referring to the current problem. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support with this problem.

HLV4504E  rsrv syserv FAILED, RC=rcode, DETECTED AT addr

Explanation: Some type of error occurred in the system management routines of the product. See the actual text of the message for an explanation. The error was probably caused by a failure in an operating system service requested by a product system management routine.

User response: Check if any other error messages were generated along with the error message above. If the combined error messages are sufficient to explain the problem, take whatever corrective action is appropriate. Otherwise, contact Software Support for assistance with this problem.
HLV4505H ABEND abendcode IN service modname+offset

Explanation: The subtask driver routine detected an
abend in the routine called by the driver. The message
text provides the abend code, current operation
(service), and abend location. This failure may have
been caused by a programming error in the routine that
caused the subtask exit to get control or in the subtask
exit routine itself. This failure can also be caused by
product installation and maintenance errors.

User response: Check if any other error messages
were generated along with the error message above. If
the combined error messages are sufficient to explain
the problem, take whatever corrective action is
appropriate. If the problem cannot be resolved, contact
Software Support.

HLV4506H process subtask terminating

Explanation: This is the standard message indicating
that subtask execution is complete.

User response: This is not an error message and no
action is required.

HLV4507E SUBTASK ERROR TERMINATION: RC=rcode

Explanation: This message is issued when the subtask
driver module terminates due to an error.

User response: Check if any other error messages
were generated along with the error message above. If
the combined error messages are sufficient to explain
the problem, take whatever corrective action is
appropriate. Otherwise, contact Software Support with
this problem.

HLV4508H subtask SUBTASK: objname objval

Explanation: This message is only issued when the
product service task debugging is requested using the
DEBUGATMD option.

User response: No action required. This message is
informational only.

HLV4520W LOAD FOR MODULE modname
FAILED, ODBA INITIALIZATION ERROR

Explanation: This message is issued if a module
needed to initialize the ODBA interface to IMS could
not be loaded. The message contains the module name.
The module is either missing or some other error has
occurred.

User response: Check if any other messages were
issued. Check if the named module is in the search
sequence. Resolve the problem and restart the server.

HLV4521S Unable to implant ODBA interface,
return code: rcode

Explanation: This message is issued if the product
was unable to implant its ODBA interface routine. The
return code is provided.

User response: Check if any other messages were
issued. Call Software Support.

HLV4522W UNABLE TO CONNECT TO
IMS/ODBA FOR STARTUP TABLE ID:
tblid, RETURN CODE: rcode, REASON
CODE: rsncode, ERROR CODE: errcd

Explanation: This message is issued if the product
was unable to connect to IMS/ODBA for the Startup
Table Identifier in the message.

Codes come from AIBRETRN, AIBREASN, and
AIBERRXT respectively.

User response: Check if any other messages were
issued and IMS/DB is active. If the Startup Table does
not exist, generate it. The next ODBA request for this
startup table identifier will retry this operation.

HLV4523W ERROR IN DISCONNECTING FROM
IMS/ODBA CONNECTIONS. RETURN
CODE: rcode, REASON CODE: rsncode

Explanation: This message is issued if the product
was unable to disconnect from IMS/ODBA.

Code comes from AIBRETRN, and AIBREASN.

User response: Check if any other messages were
issued and IMS/DB is active. If the Startup Table does
not exist, generate it. The next ODBA request for this
startup table identifier will retry this operation.

HLV4524W ERROR IN DISCONNECTING FROM
IMS/ODBA CONNECTION tblid.
RETURN CODE: rcode, REASON CODE: rsncode, ERROR CODE: errcd

Explanation: This message is issued if the product
was unable to connect to IMS/ODBA for the Startup
Table Identifier in the message.

Codes come from AIBRETRN, AIBREASN, AIBERRXT.

User response: Check if any other messages were
issued and IMS/DB is active. If the Startup Table does
not exist, generate it. The next ODBA request for this
startup table identifier will retry this operation.

HLV4525I MAXIMUM NUMBER OF
SIMULTANEOUS ODBA CONNECTIONS (max) REACHED - no
TIMES - CONNECTION DENIED

Explanation: This message is issued if the product
was unable to connect to IMS/ODBA because the
maximum number of simultaneous connections was reached a number (no) of times.

**User response:** Raise the MAXODBACONNECT parameter. Default is 8 if it was not specified.

**HLV4526I** no ODBA CONNECTION ENTRIES FREED

**Explanation:** This message is issued if the product ODBA Connection Entry table cleanup routine was able to free some previously allocated entries. This message is a warning of a table full condition that will begin denying connections.

**User response:** Raise the MAXODBACONNECT parameter. Default is 8 if it was not specified.

**HLV4527T** ODBA interface not type

**Explanation:** This message is issued if the product ODBA Interface is not either initialized or enabled.

*type* can be initialized or enabled.

**User response:** If it has not been initialized, contact Software Support. If it is not enabled, check initialization parameters.

**HLV4528I** Load for module *modname* failed, ODBA interface disabled

**Explanation:** This message is issued if a module needed to initialize the ODBA interface to IMS could not be loaded. The message contains the module name. The module is either missing or some other error has occurred.

**User response:** If IMS/ODBA support is not desired, then no action is needed. Otherwise check if other messages were issued. Check if the named module is in the search sequence. Resolve the problem and restart the server.

**HLV4529W** ERROR IN DEALLOCATING PSB: *psb* FOR STARTUP TABLE *tblid* DURING ODBA/RPC CLEANUP. RC: *rcode*, RE: *rsncode*

**Explanation:** This message is issued if an RPC that was using the IMS/DB ODBA Interface terminated, left some PSBs allocated, and product cleanup encountered an error deallocating them.

Codes come from ALERTDLI calls.

**User response:** Fix the error in the RPC that caused it to terminate without deallocating these PSBs.

**HLV4530I** IMS/DB ODBA INTERFACE TERMINATED

**Explanation:** This message is issued when the product has terminated the IMS/DB ODBA Interface.

**User response:** None.

**HLV4531W** ERROR TERMINATING IMS/DB ODBA INTERFACE. RC: *rcode*, RE: *rsncode*

**Explanation:** This message is issued when the product has terminated the IMS/DB ODBA Interface.

**User response:** None.

**HLV4532S** ODBA STARTUP TABLE MODULE - *modname* - IS NOT RE-ENTRANT. UNABLE TO MODIFY

**Explanation:** This message is issued when an IMS/ODBA Connection is requested, but the startup table module is not marked re-entrant. The product cannot modify the module with server userid if required nor merge DEFINE IMSODBA parameters.

**User response:** Re-generate the DFSxxxx0 module indicated and link it as re-entrant.

**HLV4533S** ODBA MODIFY ACTION BYPASSED FOR TABLE *modname*

**Explanation:** This message is issued when an IMS/ODBA Modify Action is requested, but there does not seem to be any active ODBA connection under the name requested.

**User response:** Re-enter the Modify command with the proper Startup Table name.

**HLV4534I** req of IMS/ODBA CONNECTION FOR STARTUP TABLE *modname* resolution

**Explanation:** This message is issued when an action on an IMS/ODBA connection is requested. The status of the request is displayed. If the status is "failed" look for other messages that will indicate the return and reason codes.

*resolution* can be succeeded or failed.

**User response:** Re-enter the Modify command after dealing with the errors indicated by the other messages.

**HLV4550T** OPRXSQ - USER *userid* CONNECTED WITH UNOPTIMIZED PLAN *plan*

**Explanation:** This message is issued when a user connected with an old unoptimized OPRXSQ Db2 Plan.

**User response:** Rebind the specified plan so it includes the optimized packages OPRXSQA-R.
**HLV4551T**  
`dbrm - UNRECOGNIZED type PROVIDED - SECTION stmtno - STATEMENT sectno`

**Explanation:** This message is issued when an unrecognized statement or section number is provided to the OPRXSQ plan translation routine.

`type` can be either `SECTION` or `STATEMENT`.

**User response:** Contact Software Support for assistance.

**HLV4552T**  
`COLLECTION ID colname FOR PLAN plan WILL USE PACKAGE PROCESSING`

**Explanation:** This informational message is issued when the Db2 collection name for the current connection has been determined.

**User response:** None

**HLV4553T**  
`PACKAGE OPRXSQ dbrm SECTION sectno1 USED FOR SECTION sectno1 STATEMENT stmtno`

**Explanation:** This informational message is issued when SQL section number translation is done for the product Db2 PLAN, OPRXSQ. This message will only be issued under the direction of Software Support.

Note that `sectno1` represents the new OPRXSQ section number, and `sectno2` represents the original OPRXSQ section number.

**User response:** None

**HLV4554T**  
`PLAN plan DOES NOT USE PACKAGE PROCESSING`

**Explanation:** This informational message is issued when the Db2 plan does not have a collection name that matches the package list.

**User response:** None

**HLV4555T**  
`PACKAGE OPRXSQ pkg IN COLLECTION colname SELECTED`

**Explanation:** This informational message is issued when SQL section number translation is done for the product Db2 PLAN, OPRXSQ.

**User response:** None

**HLV4556T**  
`PLAN plan WILL USE PACKAGE PROCESSING`

**Explanation:** This informational message is issued to indicate that the optimized packages will be used to process Db2 requests.

**User response:** None

**HLV4557T**  
`PACKAGE OPRXSQ pkg SELECTED`

**Explanation:** This informational message is issued when SQL section number translation is done for the product Db2 PLAN, OPRXSQ.

**User response:** None

The variable fields of the message text are: `pckg` Package name that will be used.

**HLV4558T**  
`PLAN plan WILL USE DRDA SUBSTITUTE PACKAGES`

**Explanation:** This informational message is issued when the Db2 plan will be internally converted to the use of substitute packages for DRDA connections.

**User response:** None

**HLV4601I**  
`status`

**Explanation:** This message contains the first of each two-line response to the TSOSR_V_LIST command. Each two-line response group shows the status of the TSO server and the command being executed.

**User response:** None.

**HLV4602I**  
`cmdname`

**Explanation:** This message contains the second of each two-line response to the TSOSR_V_LIST command. Each two-line response group shows the status of the TSO server and the command being executed.

**User response:** None.

**HLV4603I**  
`SERVER asid POSTED FOR TERMINATION`

**Explanation:** The TSOSR_STOP command has posted the server for termination.

**User response:** None.

**HLV4604I**  
`SERVER POSTED TO FREE TSSD AT addr`

**Explanation:** The TSOSR_FREE command has posted the server for release of the TSSD.

**User response:** None.

**HLV4605I**  
`status`

**Explanation:** The TSOSR_QUEUE command returns information using this message.

**User response:** None.
**HLV4606E** ADDRESS SEF TSOSRV_STOP asid: ASID NOT SERVER ADDRESS SPACE

**Explanation:** An invalid hex ASID was specified on a TSOSRV_STOP command.

**User response:** Correct the ASID, and re-issue the TSOSRV_STOP command.

---

**HLV4607S** funcd OF queue FAILED, RC=rcode

**Explanation:** The specified function failed within the ADDRESS SEF host command environment.

**User response:** Determine from the message text what function failed, and review the return codes for the failed function. Contact your local product systems programming group assistance.

---

**HLV4608E** ADDRESS SEF TSOSRV_FREE addr: ADDRESS NOT THAT OF A TSSD

**Explanation:** An invalid address was specified on the TSOSRV_FREE command.

**User response:** Correct the address, and re-issue the TSOSRV_FREE command.

---

**HLV4609I** stats

**Explanation:** The TSOSRV_EXECSSTATS command returns information using this message.

**User response:** None.

---

**HLV4612H** jobname HAS RESET THE TSO SERVER COMMAND EXECUTION QUEUE

**Explanation:** A TSOSRV_RESETQ command was issued from the specified job.

**User response:**

---

**HLV4650E** UNABLE TO OBTAIN storsize BYTES BELOW THE LINE

**Explanation:** ADDRESS LINKMVS is required to obtain storage below the 16MB line to hold both parameters and a register save area to be passed to the requested program. If this storage cannot be obtained, host command processing is terminated.

**User response:** Batch jobs must be rerun with a larger below the line region size. TSO users must log on with a larger region size, and re-issue the command.

---

**HLV4680T** ENCLAVE SET RC=rcode FOR CALL CODE called (calltype) - failmsg

**Explanation:** While attempting to invoke a High-Level Language (HLL) subroutine via the MVS Language Environment CEEPIPI interface module, an error occurred. This message logs the error. This message may be followed by message 4681 for subroutine invocations.

**User response:** The HLL subroutine is not called, and the product's LE/370 enclave may be terminated as indicated by other messages. If possible, determine the cause of the error using other messages logged, and correct the problem, or contact Software Support group.

---

**HLV4681T** ROUTINE INVOKED WAS indexd - subrout

**Explanation:** This message follows the 4680T message when a subroutine invocation was underway. The subroutine CEEPIPI table index value and its external name are reported.

**User response:** See message 4680T.

---

**HLV4682T** ROUTINE RC=rcode REASON=rsncode ENCLAVE FEEDBACK(feedback)

**Explanation:** This message follows the 4681T message and reports the subroutines return code, reason code, and the LE/370 enclave feedback codes (feedback).

**User response:** See message 4680T.

---

**HLV4683T** ENCLAVE MGR CANNOT REENTER SUPERVISOR STATE

**Explanation:** Following a call to the LE/370 CEEPIPI routine, normal supervisor state operation of the enclave manager could not be restored.

**User response:** Contact Software Support.

---

**HLV4684T** ENCLAVE ABENDED CONDITION CODE=rcode, REASON=rsncode FOR CALL CODE called (calltype) - failmsg

**Explanation:** While attempting to invoke a High-Level Language (HLL) subroutine via the MVS Language Environment CEEPIPI interface module, an abend was intercepted. This message logs the error. This message may be followed by message 4681T for subroutine invocations.

**User response:** The HLL subroutine is not called, and the product's LE/370 enclave may be terminated as indicated by other messages. If possible, determine the cause of the error using other messages logged, and correct the problem, or contact Software Support group.

---

**HLV4685T** api PLIST ERROR errdesc - plistval (data)

**Explanation:** While attempting to invoke a High-Level Language (HLL) callback routine, the callback routine detected a parameter list validation error. This message logs the reason for the plist validation error.

**User response:** An invalid plist return code is set by
the API function, and return is made to the HLL program. Contact Software Support with this error.

HLV4686S msgtext

Explanation: A severe error message was logged to the trace by a High-Level Language (HLL) component of the main product. The message is also logged to the operator console using this message ID.

User response: See the contents of the message and the trace surrounding this condition, and correct the problem. Contact Software Support with this error.

HLV4687T ENCLAVE TERMINATED BY COBOL STOP RUN - CLIENT CONNECTION TERMINATED

Explanation: A COBOL RPC program ended with a STOP RUN statement which caused the LE enclave to terminate.

User response: Replace the STOP RUN statement with a GOBACK statement and recompile the program.

HLV4700T %1 MODEL QUEUE NAME NOT SET - %2 USED AS MODEL QUEUE

Explanation: The name of the model queue for this qmanager instance has not been set. The default model queue will be used, if possible.

User response: The MQ task will attempt to open the queue using the default model queue.

HLV4702T %1 INPUT QUEUE NAME NOT SET - %1 PROCESSING TERMINATED

Explanation: The name of the input queue for this qmanager instance has not been set. The default input queue will be used, if possible.

User response: The MQ task will attempt to open the queue using the default input queue.

HLV4704H UNKNOWN service CODES - RE=rncode RC=rcode

Explanation: This message reports IBM/MQ return and reason codes that are unknown to HLV.

User response: This may indicate some type of internal error. It is also possible that you are running a version of IBM/MQ not yet supported by HLV. If the version of IBM/MQ that you are running DOES appear to be supported, contact Software Support.

HLV4706T msgtext

Explanation: This is a general purpose message that may or may not indicate some type of IBM/MQ error.

User response: Read the message text carefully. Some messages produced under this message ID are actually error messages. If the message indicates an error, check for any associated IBM/MQ produced error messages. If you are unable to diagnose the problem, contact Software Support.

HLV4750T IDCAMS SYSPRINT: msgtext

Explanation: The IDCAMS utility has generated SYSPRINT output. The output line is given in the message text. IDCAMS has been invoked using the product's S_HLVRXID interface.

User response: None. The message gives the text of a SYSPRINT line generated by the IDCAMS utility.

HLV4751T IDCAMS WARNING: msgtext

Explanation: The IDCAMS utility has generated SYSPRINT output. The output line is given in the message text. IDCAMS has been invoked using the product's HLVRXID interface. The message is issued in response to an IDCxxxx message condition detected by IDCAMS.

User response: None. The message gives the text of a SYSPRINT line generated by the IDCAMS utility.

HLV4752T IDCAMS SYSIN: msgtext

Explanation: The IDCAMS utility is about to be invoked by the HLVRXID REXX interface program. This message traces the command text that will be passed to the IDCAMS utility.

User response: None. The message gives the command text that will be presented to IDCAMS.

HLV4753T IDCAMS RESULTS: LASTCC=lstcc COMPCODE=ccode REASCODE=rncode

Explanation: The IDCAMS utility has completed. This message reports the LASTCC, completion codes, and reason codes.

User response: None. The message reports the completion codes at the end of the IDCAMS request.

HLV4800E DYNALLOC reqtype ddname - ABEND - COND=condc REASON=rncode

Explanation: A DYNALLOC request failed due to an abend.

User response: The request fails. Check for other messages that might indicate the cause of the failure.
HLV4801H  cmdname command (issued internally) rejected - another request request is already running

Explanation: An internally generated SEF command cannot be scheduled at the present time, because the system allows only one request of this type to be processed at once.

User response: The system rejects the request and continues to process the in-flight request. Normally, this message would be issued infrequently (only in certain "race" conditions). If this message is issued frequently, contact Software Support for advice on setting server start-up parameters.

HLV4802H  ABEND CC(condcode) REASON(rsncode) IN cmdname+offset WHILE PROCESSING cmdname COMMAND ISSUED BY userid

Explanation: An SEF command service processing subtask abended while processing the indicated command.

User response: Check for other messages which might indicate the cause of this failure.

HLV4803E  cmdname COMMAND FROM userid FAILED - RC = code desc code

Explanation: The SEF command service processing routine has ended with an error. The message reports the command being processed, the requesting MVS userid, the service return code, and any abend condition code encountered.

User response: Check for other messages which might indicate the cause of this failure.

HLV4804E  Trace Browse archiving disabled because BROWSEMAX(val) value is less than the minimum(minval) allowed

Explanation: Trace Browse archive support has been turned off, because the trace must contain at least the minimum given number of messages.

User response: When too few messages are supported in the trace, it can wrap around before archives of the trace can be created. This message indicates that the current trace contains so few messages that this is likely to occur. Increase the BROWSEMAX start-up parameter value to at least the minimum amount. Note that the minimum given is only a rough estimate and may be entirely insufficient to guarantee that wraparound will not occur.

HLV4805H  BROWSEARCHIVECOUNT parameter has been set to val - was below minimum (minval) allowed

Explanation: Trace Browse archive support has been turned on, but the BROWSEARCHIVECOUNT parameter was not set or was set too low.

User response: The system recalculates the BROWSEARCHIVECOUNT value as one-third of the BROWSEMAX value.

HLV4806H  BROWSEARCHIVECOUNT parameter has been set to val - was above maximum (maxval) allowed

Explanation: Trace Browse archive support has been turned on, but the BROWSEARCHIVECOUNT parameter was set too high.

User response: The system recalculates the BROWSEARCHIVECOUNT value as one-third of the BROWSEMAX value.

HLV4807H  BROWSEARCHIVECUSHION parameter has been set to val

Explanation: Trace Browse archive support has been turned on, but the BROWSEARCHIVECUSHION parameter was set too high or too low.

User response: The system resets the BROWSEARCHIVECUSHION value as indicated which is the minimum allowed value.

The variable fields of the message text are: value current BROWSEARCHIVECUSHION value

HLV4808S  Archive backup is under stress - val messages can be logged before overlay

Explanation: An archive backup of the trace currently cannot be scheduled because one is already underway. Wraparound trace recording has entered the final range of messages, and a wraparound will occur unless the previous archive completes in time for a new one to be scheduled.

User response: The system continues to monitor the status, either deleting this message when the condition is corrected or escalating the severity if a wraparound actually occurs. If some process is inhibiting the completion of archive backup processing in a timely manner, correct the problem. Consider that the trace size (BROWSEMAX) and/or the archive control parameters (BROWSEARCHIVECOUNT and BROWSEARCHIVECUSHION) may need to be enlarged.

HLV4809S  Trace Browse in overlay mode - unarchived records are being overwritten

Explanation: The trace log has wrapped around, and un-archived messages are now being overwritten. This message replaces the 4808S message if a stress condition is not relieved.

User response: The system continues operating and
monitoring conditions. This message is deleted if a new archive backup that relieves the overall stress condition can be completed; however, the overlaid records cannot be recovered.

HLV4810H Trace 'BACKUP ARCHIVE' command should be externally scheduled

**Explanation:** The BROWSEARCHIVE option is set to MESSAGE, and the system has detected that a backup archive of the trace should now be created.

**User response:** The system issues this message and takes no other action. You should immediately schedule an archive backup operation.

HLV4811H Trace 'ARCHIVE BACKUP' is being automatically requested

**Explanation:** The BROWSESEARCHIVE option is set to AUTO, and the trace subtask is requesting a backup-type archive of the selected messages.

**User response:** The BACKUP ARCHIVE request is scheduled by the SEF subtask for asynchronous execution.

HLV4812E SEF INTERFACE SET RC=rcode FOR cmdname COMMAND REQUEST ISSUED BY userid

**Explanation:** An internally generated SEF command was not scheduled due to an unexpected error in the command processing interface routines.

**User response:** The SEF command is not scheduled. The command requestor continues.

HLV4813I cmdname command cannot be scheduled at this time - a similar request is already running

**Explanation:** An archive request has been made, but processing of the request cannot be scheduled at this time, because a previous request of the same type has not yet completed. The system allows, at most, only one archive backup/cleanup task to run, and, at most, only one user requested archive extract.

**User response:** None. Resubmit the request once the previous request has completed.

HLV4814I cmdname command cannot be scheduled at this time - all SEF service subtasks are busy

**Explanation:** An archive request has been made, but processing of the request cannot be scheduled at this time, because a subtask is not available to service the request.

**User response:** None. Resubmit the request once a subtask is free.
HLV4821T  Service subtask subtask forcibly detached at shutdown - cmdname command sent by userid - RC=rcode

Explanation: An asynchronous command procedure subtask has forcibly detached during shutdown because it did not voluntarily terminate operation quickly enough.

User response: None.

HLV4822H 'ARCHIVE BACKUP' processor has been attached as an SEF service subtask

Explanation: A backup-type archive of the Trace Browse data has been requested. The processor service routine has now been attached. Additional status and completion messages will be logged to report the results of the backup operation.

User response: None.

HLV4823H Archive file: DSN=dsname,
FirstMsg=msgno, LastMsg=msgno,
Count=count

Explanation: A new archive data set has been successfully created. This message logs the dsname, the first and last message recorded in the archive, and the count of messages.

User response: None.

HLV4824H count messages beginning at number msgno cannot be backed up due to Trace wraparound

Explanation: A backup-type archive of the Trace Browse data has been scheduled. The indicated range of messages (count) cannot be backed up because it has been, or shortly will be, overlaid by wraparound within the trace.

User response: Processing continues. Check and adjust the BROWSEMAX, BROWSEARCHIVECOUNT, and BROWSEARCHIVECUSHION parameters to ensure that the trace does not wrap around without allowing backup operations to complete. This message is normal if you activate automatic archives against an existing trace file that has been in use for some time.

HLV4825H NO WORK TO DO - ARCHIVE STARTING MESSAGE = msgno - ENDING MESSAGE = msgno

Explanation: A backup-type archive of the Trace Browse data has been scheduled. There are no messages that can currently be backed up within the range allowed by the BROWSEARCHIVECUSHION value.

User response: Processing ends. Check and adjust the BROWSEMAX, BROWSEARCHIVECOUNT, and BROWSEARCHIVECUSHION parameters to ensure that the trace does not wrap around without allowing backup operations to complete, or explicitly request an ARCHIVE BACKUP, TOEND operation to bypass processing of the storage cushion value.

HLV4826W ARCHIVE PROCESSING ABORTED DUE TO SUBSYSTEM OR SEF TERMINATION REQUEST

Explanation: An archive process is being aborted either because a subsystem shutdown is underway or because SEF has requested early termination of the procedure.

User response: Processing ends as quickly as possible. Some resource cleanup may be deferred until subsystem restart.

HLV4827I msgdata

Explanation: The S_ARCHIV REXX procedure was executed while performing an archive allocation or cleanup service. The REXX routine produced trace or SAY messages.

The data in the message comes from SYSTSPRT.

User response: The messages produced by S_ARCHIV are logged by this message.

HLV4828E procedure REXX PROCEDURE RETURNED INVALID/INCORRECT RESULT FOR ARCHIVE DATA SET calltype REQUEST

Explanation: The S_ARCHIV REXX procedure was executed but it either did not return a result or it returned a result that was formatted improperly. The REXX procedure is assumed to have failed.

User response: The current archive-related operation is terminated.

HLV4829E procedure REXX PROCEDURE FAILED FOR calltype REQUEST - ROUTINE SET RETURN CODE TO rcode

Explanation: The S_ARCHIV REXX procedure was executed but returned with a failure return code value set.

User response: The current archive-related operation is terminated.

HLV4830E procedure REXX PROCEDURE FAILED TO RETURN DATA SET NAME FOR calltype REQUEST

Explanation: The S_ARCHIV REXX procedure was executed but returned without passing back an MVS data set name, as required for the sub-function request.
User response: The current archive-related operation is terminated.

HLV4831E  DYNALLOC FAILURE - RC=rcode
ERROR=sercd REASON=rscodedesc

Explanation: Dynamic allocation failure occurred while building an archive of the Trace Browse. The archival process terminates.

desc describes the DYNALLOC operation.

User response: Check other messages indicating the cause of the failure.

HLV4832H  Allocated: DDN=ddname, DSN=dsname - for archive output

Explanation: A ddname allocation was made for an archive output linear data set. Archive processing continues.

User response: None.

HLV4833H  LDS dsname created for cmdname command issues by userid

Explanation: An archive backup or extract procedure created a new VSAM linear data set for output. The actual IDCAMS definition was performed by the S_ARCHIV REXX routine in SYSEXEC. This message logs the new cluster name.

User response: None.

HLV4834S  service OF desc FAILED, RC=rcode

Explanation: This is a generic error message used to describe a wide variety of archive data set initialization and termination errors. The message text provides the current operation (service) and what the current operation was trying to do, such as GETMAIN, FREEMAIN, ATTACH, and so on.

User response: Check the error messages and the return code associated with this problem. There may be one or more error messages referring to the current problem. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support.

HLV4835S  service OF dsname FAILED, RC=rcode, REASON CODE=rscodedesc

Explanation: This error message describes errors that occurred while using the DIV (Data In Virtual) system service (service) during archive initialization, execution, or termination. For a list of the return codes and reason codes from the DIV macro see the appropriate IBM documentation.

User response: Check the DIV return and reason codes associated with this problem. There may be one or more error messages referring to the current problem. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support.

HLV4836S  service OF dsname FAILED,
ABEND=rcode, REASON CODE=rscodedesc

Explanation: This error message describes an abend that occurred while using the DIV (Data In Virtual) system service (service) during archive initialization, execution, or termination. The abend codes and reason codes from the DIV macro are documented in the IBM manual z/OS Programming: Assembler Services Reference.

User response: Check the DIV abend and reason codes associated with this problem. There may be one or more error messages referring to the current problem. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support.

HLV4837S  Possible shortage of storage, storsize bytes required to build archive output data set

Explanation: This is a follow-up message to message 4834S when a GETMAIN has failed. This message indicates the size, in bytes, of the area requested by the GETMAIN.

User response: If the GETMAIN return code indicates insufficient storage to complete the GETMAIN request, please increase your available storage (above the 16MB line) by the indicated amount.

HLV4838H  Deallocated: DDN=ddname, DSN=dsname - for archive output

Explanation: A ddname deallocation was processed for an archive data set.

User response: None.

HLV4839W  Archive file: count invalid/overlaid messages detected during execution

Explanation: While the archive data set was being created, messages were detected that had been overlaid or were otherwise invalid.

User response: None.

HLV4840H  CLEARARCHIVERECOVERY
PARAMETER SET TO YES - IN-FLIGHT ARCHIVE archtyp INFORMATION BEING CLEARED

Explanation: During subsystem startup, the CLEARARCHIVERECOVERY parameter was set.
In-flight recovery information will be deleted for the indicated archive type.

**User response:** None. Recovery information is cleared unconditionally.

---

**HLV4841H**  
CLEARED BACKUP RECOVERY INFO  
- OUTDSN=dsname MSGSTART=msgno MSGCOUNT=count LASTARCH=msgno

**Explanation:** This message follows message 4840H and logs the recovery information that is being cleared.

**User response:** None.

---

**HLV4842H**  
CLEARED EXTRACT RECOVERY INFO  
- OUTDSN=dsname MSGSTART=msgno MSGCOUNT=count FORUSER=user

**Explanation:** This message follows message 4840H and logs the recovery information that is being cleared.

**User response:** None.

---

**HLV4843I**  
**cmdname** command from **userid** completed successfully

**Explanation:** The SEF command service processing routine has ended successfully.

**User response:** None.

---

**HLV4844H**  
Archive backup of trace has successfully completed

**Explanation:** A checkpointing-type backup of the Trace Browse has been completed successfully.

**User response:** None.

---

**HLV4845H**  
Trace: current message is msgno - count messages since last archive

**Explanation:** Trace Browse archiving is enabled. This message is produced just before an archive request is generated.

**User response:** None.

---

**HLV4846H**  
Trace: last message archived was msgno - last requested for message msgno

**Explanation:** Trace Browse archiving in enabled. This message is produced just before an archive request is generated.

**User response:** None.

---

**HLV4847I**  
**cmdname** CMD NOT SCHEDULED - DUPLICATE %2 CMD RECOVERY NOT COMPLETED

**Explanation:** An SEF service request cannot be processed because internal controls indicate another operation is already in-flight. However, no subtask is currently processing the request. This error can occur when certain commands fail and require separate recovery procedures to be scheduled. For brief moments, a “race” condition may occur, where the recovery command has priority.

**User response:** Wait until the previous process is recovered. If the condition persists, manually request recovery.

---

**HLV4848H**  
**cmdname** CMD NOT SCHEDULED - DUPLICATE %2 CMD RECOVERY NOT COMPLETED

**Explanation:** See message 4847I. This message is hard-copied for internally issued requests.

**User response:** See message 4847I.

---

**HLV4849I**  
PARAMETERS: OPTION **parmval1** COUNT **parmval2** CUSHION **parmval3**

**Explanation:** An ARCHIVE STATUS request has been issued. This message is part of the response.

The **parmval** values represents BROWSEARCHIVE, BROWSEARCHIVECOUNT, and BROWSEARCHIVECUSHION values, respectively.

**User response:** None.

---

**HLV4850I**  
**desc** **TYPE** archtyp **USER** **userid**  
STARTMSG msgno MSGCOUNT count  
DSNAME dsname

**Explanation:** An archive status request has been issued. This message is part of the response.

**User response:** None.

---

**HLV4854E**  
**THE DIV OBJECT, dsname, CANNOT BE MAPPED - THE VERSION CODE (%1) IS BACKLEVEL AND INCOMPATIBLE**

**Explanation:** The archive data set review request cannot be serviced because DIV reports one size for the object but LISTCAT reports another.

**User response:** Contact Software Support.

---

**HLV4855E**  
**THE DIV OBJECT, dsname, CANNOT BE MAPPED - THE HI-USED-RBA code IS LESS THAN THE DIV-ACCESS PAGE COUNT size RETURN VALUE**

**Explanation:** The archive data set review request cannot be serviced because DIV reports one size for the object but LISTCAT reports another.

**User response:** Contact Software Support for assistance.
HLV4856E  THE DIV OBJECT, dsname, CANNOT BE MAPPED - THE DATA SET CONTROL AREA (BOST) IS INVALID

Explanation: The archive data set review request cannot be serviced because the first page of the linear data set object does not contain required control information.

User response: The probable cause of this error is that you are attempting to review an archive data set that is still being created or that was not closed properly.

HLV4857E  THE DIV OBJECT, dsname, CANNOT BE MAPPED - THE DATA SET CONTROL AREA SIZE INFORMATION (size1, size2) DOES NOT MATCH THE DIV OPEN STATS (size3, size4)

Explanation: The archive data set review request cannot be serviced because the first page of the linear data set object does not contain control information that matches the size information returned by DIV.

Note that size1 and size3 are in bytes, which size2 and size4 are in pages.

User response: The probable cause of this error is that you are attempting to review an archive data set that is still being created or that was not closed properly.

HLV4858E  THE DIV OBJECT, dsname, CANNOT BE MAPPED - THE DATA SET CONTROL AREA SIZE INFORMATION (ptrval) IS renALID baseptr/size

Explanation: The archive data set review request cannot be serviced because the first page of the linear data set object does not contain control information that is structurally correct.

User response: The probable cause of this error is that you are attempting to review an archive data set that is still being created or that was not closed properly.

HLV4859I  Archive reset command issued by userid has changed last-archived message from msgno to msgno

Explanation: An ARCHIVE RESET command has been processed.

User response: None.

HLV4860T  ARCHIVE FILE: DSN=dsname, FIRSTMSG=msgno, LASTMSG=msgno, COUNT=count

Explanation: A new archive data set has been successfully created. This message logs the dsname, the first and last message recorded in the archive, and the count of messages. This message is a duplicate of 4823 (used for tracing).

User response: None.

HLV4861I  statement

Explanation: An ARCHIVE STATUS request has been issued. This message is part of the response. This message is repeated up to eight (8) times. The server constructs a model IDCAMS DEFINE CLUSTER statement using configured parameters. You can review this statement to ensure that the configuration parameters are set correctly. The statement reported in this message is used to define archive backup files.

User response: None.

HLV4862I  statement

Explanation: An ARCHIVE STATUS request has been issued. This message is part of the response. This message is repeated up to eight (8) times. The server constructs a model IDCAMS DEFINE CLUSTER statement using configured parameters. You can review this statement to ensure that the configuration parameters are set correctly. The statement reported in this message is used to define archive extract files.

User response: None.

HLV4863I  parmval1, parmval2, ... parmval5

Explanation: An ARCHIVE STATUS request has been issued. This message is part of the response. This message reports the output data set allocation related parameter values set for building archive backup data sets.

parmval's 1-5 represent the values of ARCHIVEDSNPREFIX, ARCHIVEDATACLASS, ARCHIVEGMTCLASS, ARCHIVERCLASS, and ARCHIVEDEFCLPARMS respectively.

User response: None.

HLV4864I  parmval1, parmval2, ... parmval5

Explanation: An ARCHIVE STATUS request has been issued. This message is part of the response. This message reports the output data set allocation related parameter values set for building archive EXTRACT data sets.

parmval's 1-5 represent the values of EXTRACTDSNPREFIX, EXTRACTDATACLASS, EXTRACTGMTCLASS, EXTRACTRCLASS, and EXTRACTDEFCLPARMS respectively.

User response: None.
HLV4865E  Trace Browse archiving disabled because 'ARCHIVEDSNPREFIX' parameter is not set.

Explanation: Trace Browse archive support has been turned off because the output data set name prefix parameter ARCHIVEDSNPREFIX is not set. A data set name prefix is required.

User response: Note that you can review and possibly set values for the following extract data set allocation related parameters: ARCHIVEDSNPREFIX, ARCHIVEDATACLASS, ARCHIVEMGMTCLASS, ARCHIVESTORCLASS, and ARCHIVEDEFCLPARMS.

------------------------------------------------------------------------------------------------------------------

HLV4866E  Service of archive output data set failed due to failsn

Explanation: One of the following errors occurred: (1) allocation of a new archive backup or extract file failed, or (2) deletion during cleanup for a failed archive failed. For allocation failures, the reason may be that runtime parameters used to generate IDCAMS DEFINE CLUSTER statements are not set properly.

User response: The current archive-related operation is terminated.

------------------------------------------------------------------------------------------------------------------

HLV4867E  IDCAMS Utility: lastcc=lastcc --- ABEND CONDITION code, REASON code - SYSPRINT follows

Explanation: This message follows message 4866E when an IDCAMS DEFINE CLUSTER or DELETE CLUSTER statement failed to be processed through the IDCAMS utility. The SYSPRINT output of the IDCAMS utility, if any, follows this message.

User response: The current archive-related operation is terminated.

------------------------------------------------------------------------------------------------------------------

HLV4868E  IDCAMS SYSPRINT: msgdata

Explanation: This message follows message 4867E when an IDCAMS DEFINE CLUSTER or DELETE CLUSTER statement failed to be processed through the IDCAMS utility (msgdata) follows this message.

User response: The current archive-related operation is terminated.

------------------------------------------------------------------------------------------------------------------

HLV4869E  Trace Browse Extracts

DISABLED BECAUSE 'EXTRACTDSNPREFIX' PARAMETER IS NOT SET

Explanation: Trace Browse extract support has been turned off because the output data set name prefix parameter EXTRACTDSNPREFIX is not set. A data set name prefix is required.

User response: Note that you can review and possibly set values for the following extract data set allocation related parameters: EXTRACTDSNPREFIX, EXTRACTDATACLASS, EXTRACTMGMTCLASS, EXTRACTSTORCLASS, and EXTRACTDEFCLPARMS.

------------------------------------------------------------------------------------------------------------------

HLV4870E  reqtype reqfunc - ABEND - CODE=rcode

Explanation: An application programming interface request abended.

User response: The request fails. Check for other messages that might indicate the cause of the failure.

------------------------------------------------------------------------------------------------------------------

HLV4871S  Automatic archival of Trace suspended due to previous error - correct problem and issue "ARCHIVE CLEANUP"

Explanation: An archive backup operation has failed with an error requiring intervention. Such a condition exists if, for example, the IDCAMS allocation parameters are not configured properly. Any new attempt to automatically schedule an archive will likely fail until action is taken to correct the problem.

User response: Examine the console hardcopy log and the Trace Browse to determine why the previous automatic backup operation has failed. Correct the situation. Once the cause of the failure has been corrected, issue an ARCHIVE CLEANUP command via the SEF interface to reset the in-flight failure indicators. You can issue this command using the ISPF E3 application.

------------------------------------------------------------------------------------------------------------------

HLV5000S  MESSAGE NUMBER msgno IS NOT DEFINED

Explanation: This message is issued whenever an undefined message number is encountered.

User response: This probably indicates an internal product error. Contact Software Support.

------------------------------------------------------------------------------------------------------------------

HLV5001S  object IS AN INVALID %PX OBJECT

Explanation: You have tried to DEFINE/MODIFY an unknown HLV object.

User response: Correct the DEFINE/MODIFY command, and rerun.

------------------------------------------------------------------------------------------------------------------

HLV5002S  cmdname is an invalid %PX command.

Explanation: The command you have coded is unknown to ADDRESS HLV.

User response: Enter the correct HLV command, and rerun.
**HLV5003S**  
**keyword** is an invalid keyword.  

**Explanation:** This keyword is not part of any HLV command.  

**User response:** Recode the HLV command, and rerun.  

**HLV5004S**  
The **keyword** keyword is missing.  

**Explanation:** The indicated keyword is required but was not coded.  

**User response:** Recode the HLV command using the keyword, and rerun.  

**HLV5005S**  
**value** is not a valid value for the **keyword** keyword.  

**Explanation:** The value you have coded is not valid for the keyword.  

**User response:** Recode the value, and rerun the HLV command.  

**HLV5006S**  
**keyword** IS ONLY VALID FOR TYPE = **ktype**  

**Explanation:** The keyword indicated is not valid for the given value of the type of keyword.  

**User response:** Remove the erroneous keyword (or change the type), and rerun the command.  

**HLV5007S**  
**LINK** **host** already exists.  

**Explanation:** The indicated link has already been defined.  

Note that **host** is the host keyword.  

**User response:** Determine which definition is correct, and rerun.  

**HLV5008U**  
OPRXPC TERMINATED WITH SEVERE ERROR **RC** = **rcode**  

**Explanation:** An internal component of ADDRESS HLV has failed.  

**User response:** Contact Software Support.  

**HLV5009S**  
MODIFY CONTAINS FIELDS NOT SUPPORTED BY LINK **ktype**  

**Explanation:** You cannot modify fields that are undefined for this type of link.  

**User response:** Remove the keywords in error, and rerun the command.  

**HLV5010E**  
**HOST** = **host** DOES NOT EXIST  

**Explanation:** The link defined by the host is not yet defined; therefore, it cannot be modified.  

**User response:** Either define the link, or remove the MODIFY.  

**HLV5011S**  
**object** DISPLAY FAILED WITH **RC** = **rcode**  

**Explanation:** The display of the object failed severely.  

**User response:** There is probably some sort of internal error. Contact Software Support.  

**HLV5012S**  
**keyword** CONTAINS A QUOTE AND QUOTES ARE NOT PERMITTED  

**Explanation:** HLV keywords do not require or permit quotes.  

**User response:** Remove the quote marks, and rerun.  

**HLV5013S**  
%PX SUBSYSTEM **subsys** IS NOT ACTIVE  

**Explanation:** The indicated subsystem is not running. The ADDRESS HLV host environment command cannot be processed.  

**User response:** Start the subsystem (or use the SUBSYS command to identify another subsystem), and rerun the command.  

**HLV5014S**  
**subsystem** IS AN INVALID SUBSYSTEM NAME  

**Explanation:** The subsystem name coded is not valid.  

**User response:** Subsystem names must begin with an alpha (a-z) character, and all other characters can be alphanumeric. Also, the name can only be four (4) characters long.  

**HLV5015E**  
DATABASE **subsys** IS ALREADY DEFINED  

**Explanation:** The indicated database subsystem has already been defined.  

**User response:** Determine which definition is correct, and rerun.  

**HLV5016E**  
DATABASE = **subsys** DOES NOT EXIST  

**Explanation:** The database defined by name (**subsys**) is not yet defined; therefore, it cannot be modified.  

**User response:** Either define the database, or remove the MODIFY.
HLV5017S parmname IS NOT A VALID PRODUCT PARAMETER NAME

Explanation: The parameter name is not a valid, recognized product parameter.

User response: Correct the parameter name, and rerun.

HLV5018S parmval IS NOT A VALID VALUE FOR parmname

Explanation: The parameter value is not valid for this parameter.

User response: Correct the value, and rerun.

HLV5019E subsys IS A DB2 DATABASE SUBSYSTEM

Explanation: The database subsystem cannot be defined because the subsystem is an actual Db2 subsystem.

User response: Change the database subsystem name, and rerun.

HLV5020E ANOTHER COPY OF THE PRODUCT USES DATABASE SUBSYSTEM NAME subsys

Explanation: The database subsystem cannot be defined because another copy of the product is using the database subsystem.

User response: Change the database subsystem name, and rerun.

HLV5021E DATABASE SUBSYSTEM subsys COULD NOT BE CREATED

Explanation: The database subsystem control blocks could not be created.

User response: Fix any related errors, and rerun.

HLV5022E ANOTHER PRODUCT USES DATABASE SUBSYSTEM NAME subsys

Explanation: The database subsystem cannot be defined because another product is using the database subsystem.

User response: Change the database subsystem name, and rerun.

HLV5023E CONNECTION conn IS ALREADY DEFINED

Explanation: The indicated connection has already been defined.

User response: Determine which definition is correct, and rerun.

HLV5024E SESSION session IS ALREADY DEFINED

Explanation: The indicated session has already been defined.

User response: Determine which definition is correct, and rerun.

HLV5025I DDNAME ddname IS NOT ALLOCATED TO PRODUCT ADDRESS SPACE

Explanation: The indicated ddname is not allocated to the product address space.

User response: The attempt to define the file fails. Add a DD statement to the product start-up JCL for the indicated file, and restart the product.

HLV5026T MEASURED USAGE retype COMPLETED SUCCESSFULLY

Explanation: This message indicates that Measured Usage Request completed successfully.

User response: No action required.

HLV5027T MEASURED USAGE retype REQUEST MAY HAVE FAILED, RC=rcode

Explanation: This message indicates that Measured Usage Request may have failed. Please check return code and request type.

User response: No action required.

HLV6000T ENTER MODULE csect

Explanation: This diagnostic trace message is issued to indicate that control has entered a particular product module.

User response: This is an informational message. No action is required. However, if diagnostic tracing has been turned on at the request of Software Support, please call for further instructions.

HLV6003T MATCHING SSCT LOCATED FOR SUBSYSTEM subsys

Explanation: This diagnostic trace message is issued in response to being able to locate an SSCT that matches the subsystem name that was extracted.

User response: This is an informational message. No action is required. However, if diagnostic tracing has been turned on at the request of Software Support, please contact Software Support for further instructions.
HLV6004T  TRANSFERRING CONTROL TO
MODULE DSNECP00

Explanation: This diagnostic trace message is issued just prior to transferring control to the IBM-supplied DSN command. It has been determined that the current DSN command session is bound for a copy of Db2 whose connection is not being managed by the product.

User response: This is an informational message. No action is required. However, if diagnostic tracing has been turned on at the request of Software Support, please contact Software Support for further instructions.

HLV6007T  PRIOR TO LINKING TO OPDSN10
SUBCOMMAND HANDLER

Explanation: This diagnostic trace message is issued just prior to linking to OPDSN10, the subcommand handler.

User response: This is an informational message. No action is required. However, if diagnostic tracing has been turned on at the request of Software Support, please contact Software Support for further instructions.

HLV6008T  RETURN FROM LINKING TO
OPDSN10 SUBCOMMAND HANDLER

Explanation: This diagnostic trace message is issued on return from linking to OPDSN10, the subcommand handler.

User response: This is an informational message. No action is required. However, if diagnostic tracing has been turned on at the request of Software Support, please contact Software Support for further instructions.

HLV6009T  PRIOR TO ATTACHING OPDSN10
SUBCOMMAND HANDLER

Explanation: This diagnostic trace message is issued just prior to attaching OPDSN10, the subcommand handler.

User response: This is an informational message. No action is required. However, if diagnostic tracing has been turned on at the request of Software Support, please contact Software Support for further instructions.

HLV6010T  RETURN FROM ATTACHING
OPDSN10 SUBCOMMAND HANDLER

Explanation: This diagnostic trace message is issued on return from attaching OPDSN10, the subcommand handler.

User response: This is an informational message. No action is required. However, if diagnostic tracing has been turned on at the request of Software Support, please contact Software Support for further instructions.

HLV6011T  OPDSN10 SUBCOMMAND HANDLER
DETACHED SUCCESSFULLY

Explanation: This diagnostic trace message is issued after successfully detaching OPDSN10, the subcommand handler.

User response: This is an informational message. No action is required. However, if diagnostic tracing has been turned on at the request of Software Support, please contact Software Support for further instructions.

HLV6012T  EXITING MODULE csect

Explanation: This diagnostic trace message is issued just prior to exiting the module named in the diagnostic trace message.

User response: This is an informational message. No action is required. However, if diagnostic tracing has been turned on at the request of Software Support, please contact Software Support for further instructions.

HLV6013T  OPDSN10 STAX EXIT SUCCESSFULLY
ESTABLISHED

Explanation: This diagnostic trace message is issued after successfully establishing the STAX exit for module OPDSN10.

User response: This is an informational message. No action is required. However, if diagnostic tracing has been turned on at the request of Software Support, please contact Software Support for further instructions.

HLV6014T  OPDSN10 STAX EXIT SUCCESSFULLY
REMOVED

Explanation: This diagnostic trace message is issued after successfully removing the STAX exit for module OPDSN10.

User response: This is an informational message. No action is required. However, if diagnostic tracing has been turned on at the request of Software Support, please contact Software Support for further instructions.

HLV6015T  VALID SUBCOMMAND subcmd
ACCEPTED

Explanation: This diagnostic trace message is issued after determining that the subcommand entered by the user is one of the set of valid subcommands supported by module OPDSN10.

User response: This is an informational message. No action is required. However, if diagnostic tracing has been turned on at the request of Software Support, please contact Software Support for further instructions.
<table>
<thead>
<tr>
<th>HLV6017T</th>
<th>UNRECOGNIZED SUBCOMMAND ASSUME TSO COMMAND subcmd</th>
</tr>
</thead>
</table>
| **Explanation**: This diagnostic trace message is issued after determining that the subcommand entered by the user is neither one of the set of valid subcommands supported by OPDSN10 nor one of the set of TSO commands not supported by OPDSN10.  
**User response**: This is an informational message. No action is required. However, if diagnostic tracing has been turned on at the request of Software Support, please contact Software Support for further instructions. |

<table>
<thead>
<tr>
<th>HLV6018T</th>
<th>PRIOR TO LINKING TO TSO COMMAND subcmd</th>
</tr>
</thead>
</table>
| **Explanation**: This diagnostic trace message is issued just prior to linking to the TSO command specified as a DSN subcommand.  
**User response**: This is an informational message. No action is required. However, if diagnostic tracing has been turned on at the request of Software Support, please contact Software Support for further instructions. |

<table>
<thead>
<tr>
<th>HLV6019T</th>
<th>RETURN FROM LINKING TO TSO COMMAND subcmd</th>

action is required. However, if diagnostic tracing has been turned on at the request of Software Support, please contact Software Support for further instructions.

HLV6028T  PROGRAM : proiname

Explanation: This diagnostic trace message is issued in order to present the interpreted program specification.

User response: This is an informational message. No action is required. However, if diagnostic tracing has been turned on at the request of Software Support, please contact Software Support for further instructions.

HLV6029T  CP : indicator

Explanation: This diagnostic trace message is issued in order to present a YES/NO value (indicated by indicator) depicting whether the CP parameter was or was not specified.

User response: This is an informational message. No action is required. However, if diagnostic tracing has been turned on at the request of Software Support, please contact Software Support for further instructions.

HLV6030T  PARMS : indicator

Explanation: This diagnostic trace message is issued in order to present a YES/NO value (indicated by indicator) depicting whether the PARMS() parameter was or was not specified.

User response: This is an informational message. No action is required. However, if diagnostic tracing has been turned on at the request of Software Support, please contact Software Support for further instructions.

HLV6031T  BEFORE IDENTIFY DB2 CALL

Explanation: This diagnostic trace message is issued prior to processing the Db2 identify request.

User response: This is an informational message. No action is required. However, if diagnostic tracing has been turned on at the request of Software Support, please contact Software Support for further instructions.

HLV6032T  AFTER IDENTIFY DB2 CALL

Explanation: This diagnostic trace message is issued after processing the Db2 identify request.

User response: This is an informational message. No action is required. However, if diagnostic tracing has been turned on at the request of Software Support, please contact Software Support for further instructions.

HLV6033T  BEFORE CREATE THREAD DB2 CALL

Explanation: This diagnostic trace message is issued prior to processing the Db2 create thread request.

User response: This is an informational message. No action is required. However, if diagnostic tracing has been turned on at the request of Software Support, please contact Software Support for further instructions.

HLV6034T  AFTER CREATE THREAD DB2 CALL

Explanation: This diagnostic trace message is issued after processing the Db2 create thread request.

User response: This is an informational message. No action is required. However, if diagnostic tracing has been turned on at the request of Software Support, please contact Software Support for further instructions.

HLV6035T  BEFORE TERMINATE DB2 CALL

Explanation: This diagnostic trace message is issued prior to processing the terminate Db2 request.

User response: This is an informational message. No action is required. However, if diagnostic tracing has been turned on at the request of Software Support, please contact Software Support for further instructions.

HLV6036T  AFTER TERMINATE DB2 CALL

Explanation: This diagnostic trace message is issued after processing the terminate Db2 request.

User response: This is an informational message. No action is required. However, if diagnostic tracing has been turned on at the request of Software Support, please contact Software Support for further instructions.

HLV6037T  PRIOR TO LINKING TO PROGRAM

Explanation: This diagnostic trace message is issued just prior to linking to the program specified on the PROGRAM() parameter of the RUN subcommand.

User response: This is an informational message. No action is required. However, if diagnostic tracing has been turned on at the request of Software Support, please contact Software Support for further instructions.

HLV6038T  RETURN FROM LINKING TO PROGRAM

Explanation: This diagnostic trace message is issued on return from linking to the program specified on the PROGRAM() parameter of the RUN subcommand.
**User response:** This is an informational message. No action is required. However, if diagnostic tracing has been turned on at the request of Software Support, please contact Software Support for further instructions.

**HLV6041T** APPLICATION PROGRAM FAILED WITH ABEND CODE abcode

**Explanation:** This diagnostic trace message is issued if the application program fails with any type of abend code. This message is generated both when the application program is attached and when it is linked.

**User response:** This is an informational message. No action is required. However, if diagnostic tracing has been turned on at the request of Software Support, please contact Software Support for further instructions.

**HLV6042T** RRSAF func function RC rcode Reason rsncode was converted to RC 0 Reason 0.

**Explanation:** This message is issued when the product has ignored certain error reason codes from RRSAF function calls.

**User response:** This is an informational message. No action is required. However, if this action contributes to thread errors later in the process, please contact Software Support for further instructions.

**HLV6050S** ABEND abcode RS=rsncode OCCURRED AT madname+offset DURING DMF func entityid

**Explanation:** An ABEND occurred while processing a Data Mapping Facility (DMF) request.

**User response:** Theroutine signals an error to the caller and processing continues, when possible.

**HLV6051W** DMF operation WARNING: rsn item

**Explanation:** A correctable condition was encountered while processing a Data Mapping Facility (DMF) request.

*item* represents the item being processed at the time of warning detection.

**User response:** The routine issues this warning message and processes the requested function. The warning MAY indicate a condition which requires attention.

**HLV6052S** DMF operation ERROR: rsn item

**Explanation:** An un-correctable condition was encountered while processing a Data Mapping Facility (DMF) request.

*item* represents the item being processed at the time or error detection.

**User response:** The routine issues this error message and concludes processing of the requested function. Correct the condition and re-run the request. For STOW error's check the dataset space allocation for sufficient space and sufficient directory block allocations. If the dataset is a Services Metadata or Microflow dataset you can use the parameter WSALLOC in PRODZSERV to override the default allocation values.

**HLV6503I** DMF IMPORT var MAP member FROM source additinfo

**Explanation:** A DMF IMPORT request has successfully imported an XML data map definition and has saved the new or changed datamap into the mapping library. var is an indicator that can be "SAVED" or "REPLACED".

**User response:** This message is issued for each new or changed datamap successfully imported from an XML map definition document.

**HLV6041I** DMF import has refreshed in-storage data maps

**Explanation:** A DMF IMPORT request has refreshed the in-storage data map images following import of new or changed data maps.

**User response:** This message is issued after all new or changed datamaps have seem saved during XML import processing.

**HLV6055I** DMF import parsed map map from source

**Explanation:** A DMF IMPORT request has successfully processed an XML data map definition, but is not requested to save it. The data map will be discarded.

**User response:** This message is issued for each datamap parsed from an XML document, if the new/changed data map is not to be saved or replaced in the map library. This messages indicates that the XML document is valid.

**HLV606T** Required map map for conversion of EXCI to ACI missing

**Explanation:** The specified map is missing from DMF. This map is required to dynamically create the ACI server definition for the EXCI to ACI conversion.

**User response:** Use the product ISPF option "D.I" to initialize the maps required by the product.

**HLV6507T** Unable to create server serverconnection for CICS connection connection

**Explanation:** Unable to create an ACI server for EXCI to ACI conversion for the specified CICS connection (connection).
User response: This message is issued for each CICS connection that is to be converted to use ACI. Probable cause is a GETMAIN error. Check Trace Browse and the Joblog for further messages and contact Software Support.

HLV6520H  DMF Data-In-Virtual cache is being initialized for revision level %1 support
Explanation: During initialization the Data Mapping Facility (DMF) determined that its data-in-virtual cache is empty, contains errors, or is formatted for operation at a different revision level. The DIV object is being initialized or re-initialized for use at the current software support revision level.
User response: This DMF DIV data-in-virtual cache will be initialized for use and placed online.

HLV6521H  Existing DMF DIV cache at revision level %1 must be re-initialized at current level
Explanation: During initialization the Data Mapping Facility (DMF) found the DIV linear dataset cache dataset (#$MAPP) contained information formatted for an older/different revision level than the server software now supports. The cache must be discarded and re-loaded in order to switch to the current software support revision level.
User response: DMF cached data maps will be discarded and the DIV dataset re-initialized at the new support level. DMF will reload data maps into the cache, as these are read into storage from the @#$MAPP PDS library.

HLV6522H  Existing DMF DIV cache being discarded due to incomplete update at last LDS expansion
Explanation: During initialization the Data Mapping Facility (DMF) found the DIV linear dataset cache dataset (#$MAPP) could not be placed online because a DIV expansion operation failed to complete properly during the prior start-up. The cache must be discarded and re-loaded in order to remove any incompletely allocated logical window areas.
User response: DMF cached data maps will be discarded and the DIV dataset re-initialized. DMF will reload data maps into the cache as these are read into storage from the @#$MAPP PDS library.

HLV6523H  Existing DMF DIV cache being discarded due to window relocation problem
Explanation: During initialization the Data Mapping Facility (DMF) found the DIV linear dataset cache dataset (#$MAPP) could not be placed online because a problem occurred while attempting to relocate maps and map pointers within the DIV windows. The cache must be discarded and re-loaded in order to remove the erroneous/problematic information.
User response: DMF cached data maps will be discarded and the DIV dataset re-initialized. DMF will reload data maps into the cache as these are read into storage from the @#$MAPP PDS library.

HLV6524H  Existing DMF DIV cache being discarded due to unknown object type (%1)
Explanation: During initialization the Data Mapping Facility (DMF) found the DIV linear dataset cache dataset (#$MAPP) contains a DMF block area in which garbage or an unknown element block resides. The cache must be discarded and re-loaded in order to remove the corrupted data block.
User response: DMF cached data maps will be discarded and the DIV dataset re-initialized. DMF will reload data maps into the cache as these are read into storage from the @#$MAPP PDS library.

HLV6525S  DMF DIV routine %1 invoked within invalid x-mem environment
Explanation: While processing, a DMF service routine was invoked within a cross-memory environment which it does not support. The DMF service request cannot be completed.
User response: For some service requests, the routine aborts by generating an S0C3 ABEND. Other service routines return an error to the caller, which will likely cause the originating procedure to fail or ABEND. Contact Software Support.

HLV6526S  Free of DMF block in DIV cache failed - address of block (%1) is not %2
Explanation: During processing, a request to remove a dmf data area from DIV cache, a validation error was detected. The data area is not considered valid for the reason indicated.
User response: The removal routine returns an error to the caller, which may result in failure within the procedure being executed. Contact Software Support.
**HLV6527H** Existing dmf div cache being discarded. an invalid `%1 OBJect chain was found by %2.

**Explanation:** During initialization the data mapping facility (dmf) found the DIV linear dataset cache dataset (@#$MAPL) contains an invalid control block chain. the cache must be discarded and re-loaded in order to remove the corrupted data block.

**User response:** DMF cached data maps will be discarded and the div dataset re-initialized. dmf will re-load data maps into the cache as these are read into storage from the @#$MAPP pds library.

---

**HLV628H** Too many virtual directories - dataset `%1 not processed for path `%2

**Explanation:** During a refresh of in-storage maps by the data mapping Facility (dmf), more than 200 individual virtual directory datasets were defined. the system can process no more than 200 individual datasets allocated as virtual directories.

**User response:** The virtual directory definition entry is skipped and the indicated virtual directory dataset is not placed online.

---

**HLV700I** Syntax error: unmatched parenthesis

**Explanation:** The command used to invoke the system function was coded incorrectly. unbalanced parentheses were found in the input command, which consequently could not be understood and processed.

**User response:** Reenter the corrected command.

---

**HLV700II** Syntax error: unmatched quotation mark or apostroph

**Explanation:** The command used to invoke the system function was coded incorrectly. a literal string was not enclosed within matching quotation marks or apostrophes.

**User response:** Reenter the corrected command.

---

**HLV7002I** Syntax error: insufficient storage for parsing the command (`rncode`)

**Explanation:** The command used to invoke the system function could not be parsed because insufficient storage exists for the command parser.

**User response:** If the reason code is "1", increase the storage size of the region, and re-submit the command request. If reason code is "2", ensure that the command was correctly entered. If the problem cannot be resolved, contact Software Support.

---

**HLV7003I** Syntax error: invalid hex literal

**Explanation:** The command used to invoke the system function could not be parsed because it contains an incorrectly formatted hexadecimal literal. the hex literal contains more than eight (8) hex digits or contains an invalid digit.

**User response:** Reenter the corrected command.

---

**HLV7004I** Syntax error: extraneous or undefined input at token

**Explanation:** The command used to invoke the system function could not be parsed because it contains extraneous, undefined operands or duplicate keyword operands.

**User response:** Reenter the corrected command.

---

**HLV7005I** Syntax error: positional param. `parmno` of `parmname` - `errdesc`

**Explanation:** The command used to invoke the system function could not be parsed because an error in a positional parameter. the full text of the message explains which parameter number and what portion of the command contains the error. the message also contains an explanation as to why the parameter is invalid.

**User response:** Reenter the corrected command.

---

**HLV7006I** Syntax error: required keyword `keyword` - missing

**Explanation:** The required keyword was not entered on the command line.

**User response:** Reenter the corrected command.

---

**HLV7007I** Syntax error: required keyword missing - must be on

**Explanation:** A required keyword was not entered on the command line.

**User response:** Reenter the corrected command.

---

**HLV7008I** `keyword`

**Explanation:** This message lists the keywords from which a choice must be made.

**User response:** Reenter the corrected command.

---

**HLV7009I** Syntax error: operand of `keyword` is invalid or missing

**Explanation:** The operand coded for the indicated keyword is not valid or was omitted.

**User response:** Reenter the corrected command.

| **Explanation**: A syntax error was detected while a text file was scanned for HTML extension statements. The source file line number and offset within the line where
the error was found is noted in the message.

**User response:** Examine the source file, and correct the HTML extension statement syntax error.

---

**HLV7111T**  
Error 11 @linenolffset() - invalid keyword specified - not advance or no advance.

**Explanation:** A syntax error was detected while a text file was scanned for HTML extension statements. The source file line number and offset within the line where the error was found is noted in the message.

**User response:** Examine the source file, and correct the HTML extension statement syntax error.

---

**HLV7112T**  
Error 12 @linenolffset() - invalid condition name for if statement operand two.

**Explanation:** A syntax error was detected while a text file was scanned for HTML extension statements. The source file line number and offset within the line where the error was found is noted in the message.

**User response:** Examine the source file, and correct the HTML extension statement syntax error.

---

**HLV7113T**  
Error 13 @linenolffset() - variable name symbol too long - maximum name size is 50 characters.

**Explanation:** A syntax error was detected while a text file was scanned for HTML extension statements. The source file line number and offset within the line where the error was found is noted in the message.

**User response:** Examine the source file, and correct the HTML extension statement syntax error.

---

**HLV7114T**  
Error 14 @linenolffset() - number of nested if/endif statement pairs exceeds compiler maximum.

**Explanation:** A syntax error was detected while a text file was scanned for HTML extension statements. The source file line number and offset within the line where the error was found is noted in the message.

**User response:** Examine the source file, and correct the HTML extension statement syntax error.

---

**HLV7115T**  
Error 15 @linenoloffset() - else without preceding if statement.

**Explanation:** A syntax error was detected while a text file was scanned for HTML extension statements. The source file line number and offset within the line where the error was found is noted in the message.

**User response:** Examine the source file, and correct the HTML extension statement syntax error.

---

**HLV7116T**  
Error 16 @linenoloffset() - duplicate else statements for current if/endif pair.

**Explanation:** A syntax error was detected while a text file was scanned for HTML extension statements. The source file line number and offset within the line where the error was found is noted in the message.

**User response:** Examine the source file, and correct the HTML extension statement syntax error.

---

**HLV7117T**  
Error 17 @linenoloffset() - endif not preceded by if statement.

**Explanation:** A syntax error was detected while a text file was scanned for HTML extension statements. The source file line number and offset within the line where the error was found is noted in the message.

**User response:** Examine the source file, and correct the HTML extension statement syntax error.

---

**HLV7118T**  
Error 18 @linenoloffset() - nested do/enddo groups exceeds compiler maximum nesting levels.

**Explanation:** A syntax error was detected while a text file was scanned for HTML extension statements. The source file line number and offset within the line where the error was found is noted in the message.

**User response:** Examine the source file, and correct the HTML extension statement syntax error.

---

**HLV7119T**  
Error 19 @linenoloffset() - statement should only appear within do/enddo statement group.

**Explanation:** A syntax error was detected while a text file was scanned for HTML extension statements. The source file line number and offset within the line where the error was found is noted in the message.

**User response:** Examine the source file, and correct the HTML extension statement syntax error.

---

**HLV7120T**  
Error 20 @linenoloffset() - label name not defined by any preceding do statement.

**Explanation:** A syntax error was detected while a text file was scanned for HTML extension statements. The source file line number and offset within the line where the error was found is noted in the message.

**User response:** Examine the source file, and correct the HTML extension statement syntax error.

---

**HLV7121T**  
Error 21 @linenoloffset() - number of leave statements exceeds compiler maximums.

**Explanation:** A syntax error was detected while a text file was scanned for HTML extension statements. The source file line number and offset within the line where
the error was found is noted in the message.

**User response:** Examine the source file, and correct the HTML extension statement syntax error.

---

**HLV7122T** Error 22 @offset - duplicate do statement label name defined.

**Explanation:** A syntax error was detected while a text file was scanned for HTML extension statements. The source file line number and offset within the line where the error was found is noted in the message.

**User response:** Examine the source file, and correct the HTML extension statement syntax error.

---

**HLV7123T** Error 23 @offset - label not defined in source file

**Explanation:** A syntax error was detected while a text file was scanned for HTML extension statements. The source file line number and offset within the line where the error was found is noted in the message.

**User response:** Examine the source file, and correct the HTML extension statement syntax error.

---

**HLV7124T** Error 24 @offset - compiler maximum for label names within a source file exceeded.

**Explanation:** A syntax error was detected while a text file was scanned for HTML extension statements. The source file line number and offset within the line where the error was found is noted in the message.

**User response:** Examine the source file, and correct the HTML extension statement syntax error.

---

**HLV7125T** Error 25 @offset - one or more referenced statement labels are undefined in source file.

**Explanation:** A syntax error was detected while a text file was scanned for HTML extension statements. The source file line number and offset within the line where the error was found is noted in the message.

**User response:** Examine the source file, and correct the HTML extension statement syntax error.

---

**HLV7126T** Error 26 @offset - compiler area overflow - source file too complex.

**Explanation:** A syntax error was detected while a text file was scanned for HTML extension statements. The source file line number and offset within the line where the error was found is noted in the message.

**User response:** Examine the source file, and correct the HTML extension statement syntax error.

---

**HLV7127T** Error 27 @offset - one or more if statements has no matching endif.

**Explanation:** A syntax error was detected while a text file was scanned for HTML extension statements. The source file line number and offset within the line where the error was found is noted in the message.

**User response:** Examine the source file, and correct the HTML extension statement syntax error.

---

**HLV7128T** Error 28 @offset - one or more do statements has no matching enddo.

**Explanation:** A syntax error was detected while a text file was scanned for HTML extension statements. The source file line number and offset within the line where the error was found is noted in the message.

**User response:** Examine the source file, and correct the HTML extension statement syntax error.

---

**HLV7129T** Error 29 @offset - additional errors were detected in source file - first 5 reported.

**Explanation:** A syntax error was detected while a text file was scanned for HTML extension statements. The source file line number and offset within the line where the error was found is noted in the message.

**User response:** Examine the source file, and correct the HTML extension statement syntax error.

---

**HLV7130T** Error 30 @offset - SWINFO() PSEUDO=FUNCTION OPERAND VALUE.

**Explanation:** A syntax error was detected while a text file was scanned for HTML extension statements. The source file line number and offset within the line where the error was found is noted in the message.

**User response:** Examine the source file, and correct the HTML extension statement syntax error.

---

**HLV7131T** Error 31 @offset - HTXINDEX. STEM SYNTAX INVALID.

**Explanation:** A syntax error was detected while a text file was scanned for HTML extension statements. The source file line number and offset within the line where the error was found is noted in the message.

**User response:** Examine the source file, and correct the HTML extension statement syntax error.
HLV7132T • HLV7141T

HLV7132T  ERROR 32 @linenolffset) - FOR 'HTXINDEXLABEL' - THE 'LABEL' NAME IS NOT DEFINED.

Explanation: A syntax error was detected while a text file was scanned for HTML extension statements. The source file line number and offset within the line where the error was found is noted in the message.

User response: Examine the source file, and correct the HTML extension statement syntax error.

HLV7133T  ERROR 33 @linenolffset) - INVALID SWSPARM() PSEUDO-FUNCTIONOPERAND VALUE.

Explanation: A syntax error was detected while a text file was scanned for HTML extension statements. The source file line number and offset within the line where the error was found is noted in the message.

User response: Examine the source file, and correct the HTML extension statement syntax error.

HLV7134T  ERROR 34 @linenolffset) - INVALID TTOUPPER() PSEUDO-FUNCTIONOPERAND VALUE.

Explanation: A syntax error was detected while a text file was scanned for HTML extension statements. The source file line number and offset within the line where the error was found is noted in the message.

User response: Examine the source file, and correct the HTML extension statement syntax error.

HLV7135T  ERROR 35 @linenoloffset) - NESTED RULE STATEMENTS ARE NOT ALLOWED.

Explanation: A syntax error was detected while a text file was scanned for HTML extension statements. The source file line number and offset within the line where the error was found is noted in the message.

User response: Examine the source file, and correct the HTML extension statement syntax error.

HLV7137T  ERROR 37 @linenoloffset) - STORAGE ALLOCATION FAILURE DURING RULE PROCESSING.

Explanation: A syntax error was detected while a text file was scanned for HTML extension statements. The source file line number and offset within the line where the error was found is noted in the message.

User response: Examine the source file, and correct the HTML extension statement syntax error.

HLV7138T  ERROR 38 @linenoloffset) - ONE OR MORE RULE STATEMENTS HAS NO MATCHING /RULE.

Explanation: A syntax error was detected while a text file was scanned for HTML extension statements. The source file line number and offset within the line where the error was found is noted in the message.

User response: Examine the source file, and correct the HTML extension statement syntax error.

HLV7139T  ERROR 39 @linenoloffset) - ENABLEMENT FAILED FOR EMBEDDED RULE.

Explanation: A syntax error was detected while a text file was scanned for HTML extension statements. The source file line number and offset within the line where the error was found is noted in the message.

User response: Examine the source file, and correct the HTML extension statement syntax error.

HLV7140T  ERROR 40 @linenoloffset) - /FILE SECTIONS ARE NOT ALLOWED WITHIN EMBEDDED RULES.

Explanation: A syntax error was detected while a text file was scanned for HTML extension statements. The source file line number and offset within the line where the error was found is noted in the message.

User response: Examine the source file, and correct the HTML extension statement syntax error.

HLV7141T  ERROR 41 @linenoloffset) - DATE() OPERAND INVALID OR NOT SPECIFIED.

Explanation: A syntax error was detected in the DATE() HTML extension function. Refer to the documentation for the correct options.

User response: Examine the source file, and correct the HTML extension statement syntax error.
HLV7142T  ERROR 42 @((linenoloffset) - TIME(?) OPERAND INVALID OR NOT SPECIFIED.

Explanation: A syntax error was detected in the TIME(?) HTML extension function. Refer to the documentation for the correct options.

User response: Examine the source file, and correct the HTML extension statement syntax error.

HLV7143T  ERROR 43 @((linenoloffset) - EMBEDDED RULES CANNOT BE EMPTY.

Explanation: A syntax error was detected while a text file was scanned for HTML extension statements. The source file line number and offset within the line where the error was found is noted in the message.

User response: Examine the source file, and correct the HTML extension statement syntax error.

HLV7144T  ERROR 44 @((linenoloffset) - TARGET OF ASSIGNMENT MUST BE L-VALUE.

Explanation: A syntax error was detected while a text file was scanned for HTML extension statements. The source file line number and offset within the line where the error was found is noted in the message. The target of an assignment statement must be a valid L-Value (either a variable name or a complex expression that can evaluate at runtime to the name of a variable).

User response: Examine the source file, and correct the HTML extension statement syntax error.

HLV7145T  ERROR 45 @((linenoloffset) - IMS AUTO-HTML VARIABLE REFERENCE IS BADLY FORMED.

Explanation: A syntax error was detected while a text file was scanned for HTML extension statements. The source file line number and offset within the line where the error was found is noted in the message. A reference to an IMS Auto-HTML facility runtime variable (SWSSETFO, SWSFOCUS, SWSINMAP, or SWSCNVID) contains additional/extraneous characters.

User response: Examine the source file, and correct the HTML extension statement syntax error.

HLV7146T  ERROR 46 @((linenoloffset) - 1OPTIONS STATEMENT INVALID.

Explanation: A syntax error was detected while processing an OPTIONS statement within the HTX source file. The line number and offset within the line where the error was found is noted in the message. A more complex message indicating the exact error found in the OPTIONS statement may be present in the trace.

User response: Examine the source file, and correct the HTML extension statement syntax error.

HLV7147T  ERROR 47 @((linenoloffset) - OPTIONS STATEMENT OUT OF ORDER.

Explanation: A syntax error was detected while processing an OPTIONS statement within the HTX source file. Runtime OPTIONS must appear before any other HTX executable or insert statement within the source file.

User response: Examine the source file, and correct the HTML extension statement syntax error.

HLV7148T  ERROR 48 @((linenoloffset) - INVALID ENVIRONMENT FOR STATEMENT.

Explanation: A syntax error was detected while processing a statement. Some statements are only valid in either the HTTP Web Server or Accelerator Loader server. This statement was encountered in an incorrect environment.

User response: Examine the source file, and correct the HTML extension statement syntax error.

HLV7149T  ERROR 49 @((linenoloffset) - IMSATTR STATEMENTS NO LONGER SUPPORTED.

Explanation: A syntax error was detected while processing a statement. The deprecated IMSATTR statement is no longer supported by this version of the server.

User response: Examine the source file, and correct the HTML extension statement syntax error. If the HTML extension file was generated by the IMS Auto-HTML facility, re-extract the MFS source map and re-generate the HTML file.

HLV7150T  /UTILITY STMT - errtext (funcode)

Explanation: During event procedure enablement, a /UTILITY section was not enabled due to the error given.

User response: Correct the error, and re-enable the event procedure. The variable fields of the message text are: text err, text func, function code.

HLV7151T  /UTILITY STMT - errmsg - statement

Explanation: During execution of a /UTILITY statement, the statement was determined to be invalid or non-executable.

User response: If the statement text is invalid, correct the statement text. Otherwise, contact Software Support.
HLV7152T  UTILITY FUNCTION funcode NOT ENABLED. ASSOCIATED MODULE (modname) NOT FOUND IN THE %3 LIBRARY.

Explanation: While attempting to enable a utility function, the module associated with the function was not found in the S__RPCLB library.

User response: The associated vendor library must be concatenated with the S__RPCLB library.

HLV7153T  ACCESS TO UTILITY ROUTINES IS NOT AUTHORIZED.

Explanation: Your license code does not authorize you to execute utility routines.

User response: Contact IBM Software Support.

HLV7160T  LINE lineno - HTML EVALUATION ERROR (errdesc) - additinfo

Explanation: While processing file information that contains HTML extensions, evaluation of a statement failed.

User response: Examine the source file to determine why the error occurred.

HLV7161E  ABEND abcode, REASON rsncode DURING HTX PROCESSING

Explanation: While processing HTML extension processing, an abend occurred.

User response: Examine the source file to determine why the error occurred. Check for other messages that may indicate the cause of the error.

HLV7162E  var

Explanation: This message is used internally by OPHTXPR to build abend error reporting pages (HTML or text form).

User response: None. This message is for internal use only.

HLV7163E  ABEND abcode, REASON rsncode DURING OPHTXPR ABEND RECOVERY

Explanation: While attempting to recover from a previous abend, the second-level abend intercept was entered in OPHTXPR.

User response: Examine the source file to determine why the abend occurred. Check for other messages that may indicate the cause of the error.

HLV7164T  RUNTIME ERROR (LINE lineno) - EMBEDDED RULES AND RESCAN STMT NOT ALLOWED IN THIS FILE.

Explanation: A runtime error was detected while a text file was being processed by the HTML extension processor. The source file line number where the error was detected is noted in the message. Note that an HTX executable RESCAN statement may also generate this error because RESCAN is only allowed where embedded rules are authorized.

User response: The server aborts processing of the current file and generates an error message output page (HTML or text form). The HTML expansion request fails, with RC=16. Remove the rule or RESCAN statement that caused this condition to be raised, or authorize execution of embedded rules within this file. You authorize embedded rule execution by (1) requesting the file via the */FILE process section or via */WWW PATH() (from the HFS) and (2) specifying the RULE(YES) keyword for */FILE.

HLV7165T  RUNTIME ERROR (LINE lineno) - ASSIGNMENT STMT FAILED - errdesc - tvl

Explanation: A runtime error was detected while a text file was being processed by the HTML extension processor. The source file line number where the error was detected is noted in the message. A variable assignment statement failed for the reason indicated in the message.

User response: If the message indicates that the lvalue (tvl) must be a global variable, ensure that the original assignment statement refers only to a global variable. These include GLOBAL., GLVEVENT., or .GLVSTATE. variables. Otherwise, check for other messages that might indicate the cause of failure.

HLV7166T  <%RULE%> EXECUTION MUST NOT DRIVE RECURSIVE <%RULE%> EXECUTION

Explanation: A runtime error was detected while a text file was being processed by the HTML extension processor. The HTML extension processor is about to execute an embedded rule, but an embedded <%RULE%> execution is already underway. This type of recursion is not allowed.

User response: The current (nested) <%RULE%> section is bypassed, and HTML extension processing of the file is aborted.

HLV7167E  ABEND abcode, REASON rsncode DURING HTX PROCESSING OF EMBEDDED ruletype RULE

Explanation: While processing HTML extensions, an abend occurred while executing an embedded rule.
User response: Examine the source file to determine why the error occurred. Check for other messages that may indicate the cause of the error.

HLV7168T  LINE lineno - EXIT-FLUSH STATEMENT EXECUTED - RESCAN AND NEW RULE MATCHES DISABLED

Explanation: While processing file information that contains HTML extensions, an `<%EXIT FLUSH%>` statement was executed. This causes immediate exit from HTML extension file tailoring and also sets controls so that additional RESCAN or rule matches are inhibited.

User response: The server will flush (complete) the transaction without delay.

HLV7169T  LINE lineno - RESCAN STATEMENT OPERAND INVALID - reason - VALUE=value

Explanation: While processing file information that contains HTML extensions, a `<%RESCAN x%>` statement was executed. The RESCAN URL operand is invalid for the reason reported. If the RESCAN URL value was partially validated, it appears in the message (value); if it was not partially validated, the value string will be null.

User response: The server uses the value SYSTEM/ERROR/500 as a replacement for the invalid RESCAN URL. It also sets the HTTP response code to 500 (server error) and the error code to 61.

HLV7170T  LINE lineno - EXIT OPTION, option, IGNORED BECAUSE `<%RULE%>` PROCESSING NOT ENABLED

Explanation: While processing file information that contains HTML extensions, an `<%EXIT%>` statement with the indicated option was executed. The option is being ignored because HTML extension processing was requested via an interface that does not support the execution of embedded rules.

User response: The EXIT option is ignored.

HLV7171T  LINE lineno - !OPTIONS statement - errdesc

Explanation: While parsing an !OPTIONS statement a syntax error was found. This message is traced to provide a detailed reason for the failure. HTX processing of the file fails with error code 46.

User response: Correct the !OPTIONS statement and retry.

HLV7172T  ERROR 72 @(linenoloffset) - RESULTSET OPERAND INVALID OR NOT SPECIFIED.

Explanation: A syntax error was detected in the RESULTSET HTML extension function. Only values of 1 or 2 are supported at this time.

User response: Examine the source file, and correct the HTML extension statement syntax error.

HLV7173T  diagtext

Explanation: This message is used to dump out various internal work areas into the trace. It is triggered by setting a diagnostic parameter or control.

User response: If there are other messages indicating an error, use this message in conjunction with them to determine the cause of the problem.

HLV7179E  DATA MAPPING - map FIELD field IS TOO LONG

Explanation: During processing of a data map, a field was defined that was too long for processing. Fields of 3074 bytes are currently the longest fields allowed.

User response: Recreate the map with shorter fields, or disable this field.

HLV7180E  /*EXECSQL STMT - errtext

Explanation: During event procedure enablement, a /*SQL section was not enabled due to the error given.

User response: Correct the error, and re-enable the event procedure.

HLV7182T  HTML MEMBER NAME MISSING OR INVALID. DATA MAP: map, HTML MEMBER: memname

Explanation: During execution of an /*EXECSQL statement, the SQL statement was determined to be invalid or non-executable.

User response: If the SQL statement text is invalid, correct the SQL statement text. If the problem cannot be resolved, contact Software Support.

HLV7183T  HTML MEMBER NAME MISSING OR INVALID. DATA MAP: map, HTML MEMBER: memname

Explanation: During execution of an output file SEND, the HTML member name was not specified in the data map or the HTML member name was invalid.

User response: The error is reported as a system error aux on the Web browser. This problem may be correctable by refreshing the data map after the HTML generation is complete.
**HLV7183E** /*EXECCIMS STMT - `errtext`

**Explanation:** During event procedure enablement, a /*EXECCIMS section was not enabled due to the error given.

**User response:** Correct the error, and re-enable the event procedure.

**HLV7184T** /*EXECCIMS STMT - `errmsg - statement`

**Explanation:** During execution of an /*EXECCIMS statement, the statement was determined to be invalid or non-executable.

**User response:** If the IMS statement text is invalid, correct the IMS statement text. Otherwise, contact Software Support with this problem.

**HLV7185E** UNABLE TO OBTAIN INPUT STORAGE WORK AREA. LENGTH %1

**Explanation:** While processing an input request, there was insufficient storage to build the input message based upon the the product Mapping Facility definition of the input map.

**User response:** This may be caused by an error in the map definition. The input map may contain a field with an erroneous offset or length. The total length of the input message cannot exceed 32,702 bytes.

**HLV7186E** REQUIRED HTML VARIABLE MISSING. NAME=`swarnname`

**Explanation:** While processing an input URL, the /*EXECCIMS expects certain query variables: SWSINMAP, SWSCNVID and PFKIN. One or more of these variables was missing.

**User response:** This may be caused by an error in the coding of the HTML. The SWSINMAP variable contains the input map name required to process this URL. The SWSCNVID variable contains the conversation id required to process conversational IMS transactions. The PFKIN variable contains the interrupt key (ENTER, PF01...PF24).

**HLV7187E** /*EXECCICS STMT - `errtext`

**Explanation:** During event procedure enablement, an /*EXECCICS section was not enabled due to the error given.

**User response:** Correct the error, and re-enable the event procedure.

**HLV7188T** /*EXECCICS STMT - `errmsg - statement`

**Explanation:** During execution of an /*EXECCICS statement, the statement was determined to be invalid or non-executable.

**User response:** If the CICS statement text is invalid, correct the CICS statement text. Otherwise, contact Software Support with this problem.

**HLV7189T** TEMPORARY MAP map USED FOR HTML FILE SELECTION

**Explanation:** During execution of an output file SEND, the output file name was selected from the temporary map name. Permanent maps will arbitrarily use the file associated with the SWSAHTML ddname.

**User response:** For the /*EXECCIMS and /*EXECCICS rule sections, an HTML file output from the HTML data set name stored within the specified map name will be selected. This information is provided for auditing and control purposes. No action may be required.

**HLV7190E** /*TSOSRV STMT - `errmsg`

**Explanation:** During event procedure enablement, a /*TSOSRV section was not enabled due to the error given.

**User response:** Correct the error, and re-enable the event procedure.

**HLV7191T** /*TSOSRV STMT - `errmsg - cmdtext`

**Explanation:** During execution of an /*TSOSRV statement, the TSO command statement was determined to be invalid or non-executable.

**User response:** If the TSO command text is invalid, correct the command statement text. If the problem cannot be resolved, contact Software Support.

**HLV7192T** /*TSOSRV STMT - `errmsg - cmdtext`

**Explanation:** During execution of an /*TSOSRV statement, the TSO command statement was determined to be invalid or non-executable.

**User response:** If the TSO command text is invalid, correct the command statement text. If the problem cannot be resolved, contact Software Support.

**HLV7195E** `rsname.rulename, /*PROGRAM STMT - `errtext`

**Explanation:** During event procedure enablement, a /*PROGRAM section was not enabled due to the error given.

**User response:** Correct the error, and re-enable the event procedure.

feedback contains the LE/370 enclave termination feedback codes.

User response: Check for other messages indicating the cause of the termination, and resolve the problem, if possible.

HLV7209T var1, var2 ... var5
Explanation: The message is used to issue various warning messages when unusual conditions are detected during the parse of an inbound HTTP request.
User response: None.

HLV7210T SERVER VARIABLE varname SKIPPED BY GLVSTATE. PROCESSING
Explanation: The indicated inbound HTML query variable or HTTP cookie variable was not processed as expected to re-create a GLVSTATE. information set.
User response: Processing of the inbound HTTP request continues; however, subsequent processing of the transaction may encounter problems in the absence of the GLVSTATE. set.

HLV7211T SSL CONNECT FAILED - RC=rcd1
Explanation: A attempt to establish an SSL connection failed due to a validation failure or a failure within the SSL connection handling engine. This error reports the failure.

User response: Check for other messages indicating the cause of the termination, and resolve the problem, if possible.

feedback represents the LE/370 enclave termination feedback codes.

HLV7212T RELEASE OF SPECIALY SIZED atype AT addr1 FOR OPPR AT addr2 FAILED WITH RC=rcode
Explanation: During end-of-transaction cleanup, an oversized SEF work area could not be freed and has been orphaned. The oversized work area had been allocated during execution of the previous transaction through the use of the WORKSIZE() of QUEUESIZE() keywords of a WWW rule. Oversized areas are only freed when thread reuse is in effect, since they are otherwise released by end of task processing.

The message contains two addresses; addr1 represents the SEF work area address, and addr2 represents the owning process block address.

User response: Check for other messages indicating the cause of the termination, and resolve the problem, if possible. Contact Software Support if this error cannot be resolved locally.

HLV7213T SSL READ: desc
Explanation: Issued if TRACEURLREAD option is on, this message indicates that the reception of an inbound HTTP request is being traced. This message is generated by the SSL receive routines.
User response: None. This message indicates processing performed during HTTP request receive operations.

HLV7214T MAXIMUM NUMBER OF QUERY VARIABLES(maxnum) EXCEEDED - INBOUND REQUEST CANNOT BE PARSED
Explanation: This message indicates that the inbound HTTP request contains more query variable name/value pairs than the server is able to parse. The maximum number of variables that can effectively be handled is given in the message.

User response: The server aborts parsing of the current HTTP request and responds with an HTTP 400 status message, indicating that the inbound request message is invalid. In order to correct the problem, you will need to redesign your application so that it transmits fewer query variables with any single inbound request.

HLV7215T CANNOT DECODE DBCS QUERY DATA data
Explanation: This message indicates that the inbound HTTP request contains an ASCII encoded string (data) that could not be decoded by the server and converted to EBCDIC.

User response: The query data is set to include only the portion of the string that could be converted to EBCDIC. Set the DECODERACE parameter to YES, and rerun the transaction. Contact Software Support if you cannot determine the reason (invalid ISO-2022-JP or Shift-JIS encoding) for the failure.

HLV7216T SSL ACCEPT LEFT count UNCONSUMED LOOK-AHEAD BYTES - REJECTING SESSION
Explanation: This message indicates that the SSL accept processing completed normally, except that some (count) received bytes were unconsumed from the look-ahead receive buffer during acceptance processing. Since SSL Accept processing involves real-time certificate and key negotiation, no look-ahead bytes should have remained.

User response: This is probably due to a logic error in
the server. Contact Software Support.

HLV7217T HTTP-RECV: HTTP
TRANSFER-ENCODING: val

Explanation: Issued if TRACEURLREAD option is on, this message indicates that the reception of an inbound HTTP request is being traced.

User response: None. This message indicates processing performed during HTTP request receive operations.

HLV7218T HTTP-RECV: HTTP CONTENT
CHUNK LENGTH: val

Explanation: Issued if TRACEURLREAD option is on, this message indicates that the reception of an inbound HTTP request is being traced.

User response: None. This message indicates processing performed during HTTP request receive operations.

HLV7230T WEB BUFFER FLUSH ATTEMPTED IN X-MEM MODE
by modname+offset

Explanation: A Web transaction program has issued a flush request to transmit outbound response buffers. The caller is operating in cross-memory mode, and the request cannot be serviced. The buffer flush request is ignored.

User response: Check for other messages that might indicate the cause of the error.

HLV7231T SWSSEND REQUESTS EXCEPT PURGE OR FLUSH ARE INVALID FOLLOWING SWSSFILE(SEND) REQUEST

Explanation: A Web transaction program has issued a request to buffer additional outbound response data, but this request follows completion of an SWSSFILE(SEND) operation. Because SWSSFILE(SEND) has generated HTTP response headers specifying total response size, no additional data can be output unless the file-send request is first purged from the output buffers or flushed to the client.

User response: Check for other messages that might indicate the cause of the error, and correct the problem.

HLV7232T HTTP RESPONSE BUFFER LIMIT (limit) EXCEEDED - SWSSEND WILL ISSUE USER ABEND X'722'

Explanation: The total number of concurrently held output buffers for a single HTTP response has exceeded the MAXHTTPRESPBUFFERS limit. This may be due to a runaway transaction procedure or simply to unexpectedly large output.

User response: The SWSSEND API routine issues a user abend X'722' to begin cancellation of the Web transaction subtask. If your program is expected to generate excessive output, raise the MAXHTTPRESPBUFFERS limit.

HLV7233T HTTP RESPONSE BYTE LIMIT (limit) EXCEEDED - SWSSEND WILL ISSUE USER ABEND X'722'(1826)

Explanation: The total number of bytes output as part of a single HTTP response has exceeded the MAXHTTPRESPBYTES limit. This may be due to a runaway transaction procedure or simply to unexpectedly large output.

User response: The SWSSEND API routine issues an user abend X'722' to begin cancellation of the Web transaction subtask. If your program is expected to generate excessive output, raise the MAXHTTPRESPBYTES limit.

HLV7240T USER-SPECIFIED CONTENT-LENGTH DIFFERENT THAN CALCULATED LENGTH. USER LENGTH = length,
CALCULATED LENGTH = length

Explanation: A Web transaction program has created a Content-Length HTTP header with a length that is different than the calculated length of the data being transmitted. The product Server will use the content length specified by the user. If persistent session support (KEEPALIVE) is enabled, the server will generate a Connection: Close header to guard against problems that might be associated with sending the incorrect message body length value.

User response: Ensure that the user-generated Content-Length HTTP header does not include the length of the user-generated HTTP headers and correctly represents the length of the data being transmitted.

HLV7250E OPISTBRU FUNCTION TERMINATED: rsn

Explanation: A product display function was invoked improperly

User response: Correct the invocation parameter list, and re-run.

HLV7251T UNKNOWN OR INVALID COOKIE FOUND. errdesc : cookie

Explanation: During execution of OPISTBRU, an unrecognizable or unknown cookie was received.

User response: None. This is a warning message. The unknown cookie is ignored, and the product defaults are used.
**HLV7252T**  ONE OR MORE INVALID COOKIE VALUE FOUND.  cfield : val

**Explanation:** During execution of OPISTBRU, one or more cookie fields were defaulted because the value of the cookie field was invalid.

**User response:** None. This is a warning message. The invalid cookie field is ignored, and the product default for the field is used.

**HLV7253T**  INVALID COOKIE FORMAT count
INVALID VARIABLES FOUND: value

**Explanation:** During execution of OPISTBRU, the stated number of cookie fields were defaulted because the cookie field was of invalid format. A 7252T message is issued for each invalid cookie field prior to the issuing of this message.

**User response:** None. This is a warning message. The invalid cookie field(s) are ignored, and the product default(s) for the field(s) are used.

**HLV7254T**  TIMESTAMP UNRECOGNIZABLE IN RFC1123, RFC850 OR ANSI C ASCTIME() FORMAT time

**Explanation:** While parsing an HTTP request or response header, the timestamp value could not be parsed to yield a valid timestamp. This may be a browser dependency beyond the server's control.

**User response:** None. The server assumes no value is specified for the corresponding request or response header.

**HLV7255T**  VALUE OF varname IS IMPROPERLY ENCODED: reason

**Explanation:** While parsing an HTTP request, an SWSECRET_ query value was detected. The server cannot decrypt the information for the reason indicated. Note that query variables sent out to a browser before a product restart become stale and cannot be decrypted following a restart.

**User response:** None. The server rejects the badly formed or invalid query variable and subsequently rejects the transaction with a 400 (bad request) HTTP status message.

**HLV7300I**  Invalid command syntax: syntaxerr

**Explanation:** A host command statement was invalid or could not be parsed for the reason indicated. The error was detected during initial command syntax scanning.

**User response:** Correct the command statement and re-submit.
HLV7307I  operand KEYWORD INVALID FOR verb entity STATEMENT

Explanation: A host command statement was invalid because an operand was coded that is not valid for the command statement type.

User response: Correct the command statement, and re-submit.

HLV7308I  ONLY operand KEYWORD ALLOWED FOR verb entity STATEMENT

Explanation: A host command statement was invalid because an operand was coded that cannot be used for this type of command. Code only the single keyword operand indicated.

User response: Correct the command statement, and re-submit.

HLV7309I  operand KEYWORD MUST BE value additinfo

Explanation: A host command statement was invalid because an operand was not valid. The allowed format for the keyword operand is given.

User response: Correct the command statement, and re-submit.

HLV7310S  cmdname IS AN INVALID cmdtype COMMAND

Explanation: The command you have coded is unknown.

User response: Enter a correct command, and rerun.

HLV7311S  cmdname subsystem subsys is not active

Explanation: The indicated subsystem is not running. The address SHLV function cannot continue.

User response: Start the subsystem (or use the SUBSYS command to identify another subsystem), and rerun the command.

HLV7312S  verb entity STATEMENT FAILED WITH RC = rcode

Explanation: The requested operation failed severely.

User response: There is probably some sort of internal error. Contact Software Support.

HLV7313S  Authorization check failed for verb entity statement

Explanation: A host command statement authorization check routine found that the current user is not authorized to execute the command statement. Access to execute the statement is denied.

User response: Check the variables of the error message text for the command statement whose access is denied. Ensure that the current user has the required access. Contact your security systems administrator for further help, if necessary.

HLV7314S  parmname is not a valid product parameter name

Explanation: The parameter name is not a valid, recognized product parameter.

User response: Correct the parameter name, and rerun.

HLV7315S  parmvval is not a valid value for parmname

Explanation: The parameter value is not valid for this parameter.

User response: Correct the value, and rerun.

HLV7316E  entity value does not exist

Explanation: The entity defined by name is not yet defined; therefore, it cannot be modified.

User response: Either define the entity or remove the MODIFY.

HLV7317E  entity value is already defined

Explanation: The indicated entry has already been defined.

User response: Determine which definition is correct, and rerun.

HLV7318S  INVALID UPDATE ATTEMPT FOR entity

Explanation: An invalid update attempt has been detected.

User response: Remove the keywords in error, and rerun the command.

HLV7319I  DDNAME ddname is not allocated to product address space

Explanation: The indicated ddname is not allocated to the product address space.

User response: The attempt to define the file fails. Add a DD statement to the product start-up JCL for the indicated file, and restart the product.

HLV7320I  DSNAME(dname) MUST BE A PDS(E) DATA SET

Explanation: The indicated data set is not a PDS or PDSE data set.

User response: The attempt to define the file or...
ruleset fails. Change the DSNAME() keyword to correct the error.

<table>
<thead>
<tr>
<th>HLV7321I</th>
<th>RULESET indicator NOT rsname</th>
</tr>
</thead>
</table>
| **Explanation:** The indicated ruleset definition was processed.
| **User response:** This message logs definitions of or changes to SEF ruleset definitions. |

<table>
<thead>
<tr>
<th>HLV7322H</th>
<th>jobname HAS QUEUED RULESET(rsname) indicator FOR PROCESSING BY SEF</th>
</tr>
</thead>
</table>
| **Explanation:** The job or user indicated issued a critical configuration change command that was successfully scheduled for processing by the SEF task. The SEF task will indicate the outcome of the request.
| **User response:** Information only. This message is sent to the hardcopy console log. |

<table>
<thead>
<tr>
<th>HLV7323H</th>
<th>SUPERVISOR STATE REQUIRED FOR verb entity COMMAND</th>
</tr>
</thead>
</table>
| **Explanation:** The indicated command can only be processed by a real started-task copy of the product because supervisor state is required to perform the indicated action.
| **User response:** Information only. This message is sent to the hardcopy console log. |

<table>
<thead>
<tr>
<th>HLV7324I</th>
<th>operand KEYWORD CONTAINS INVALID CHARACTER(S) AT OFFSET offset OF THE STRING</th>
</tr>
</thead>
</table>
| **Explanation:** A host command statement was invalid because an operand was not valid. An invalid character or combination of characters was found at the indicated offset within the operand string.
| **User response:** Correct the command statement, and re-submit. |

<table>
<thead>
<tr>
<th>HLV7325E</th>
<th>operand IS INVALID IN COMBINATION WITH operand FOR verb entity STATEMENT</th>
</tr>
</thead>
</table>
| **Explanation:** A host command statement was invalid because the specified parameters conflict.
| **User response:** Correct the command statement, and re-submit. |

<table>
<thead>
<tr>
<th>HLV7326E</th>
<th>operand MUST BE SPECIFIED IN COMBINATION WITH operand FOR verb entity STATEMENT</th>
</tr>
</thead>
</table>
| **Explanation:** A host command statement was invalid because a required parameter was not specified
| **User response:** Correct the command statement, and re-submit. |

<table>
<thead>
<tr>
<th>HLV7327E</th>
<th>operand VALUE MUST BE errdesc THAN operand FOR verb entity STATEMENT</th>
</tr>
</thead>
</table>
| **Explanation:** A host command statement was invalid because the specified parameters conflict.
| **User response:** Correct the command statement, and re-submit. |

<table>
<thead>
<tr>
<th>HLV7328E</th>
<th>operand VALUE val INVALID - errdesc FOR verb entity STATEMENT</th>
</tr>
</thead>
</table>
| **Explanation:** A host command statement was invalid because the specified parameters is invalid.
| **User response:** Correct the command statement, and re-submit. |

<table>
<thead>
<tr>
<th>HLV7329S</th>
<th>Not configured for verb entity statement.</th>
</tr>
</thead>
</table>
| **Explanation:** None.
| **User response:** Contact IBM Software Support. |

<table>
<thead>
<tr>
<th>HLV7330S</th>
<th>rsname RULESET DEFINITION REJECTED - additinfo</th>
</tr>
</thead>
</table>
| **Explanation:** The ruleset definition is invalid because of the indicated condition. The definition is discarded.
| **User response:** Correct the ruleset definition and restart the server |

<table>
<thead>
<tr>
<th>HLV7331S</th>
<th>rsname SHARED FILE DEFINITION REJECTED - additinfo</th>
</tr>
</thead>
</table>
| **Explanation:** The file definition is invalid because of the indicated condition. The definition is discarded.
| **User response:** Correct the shared file definition and restart the server |

<table>
<thead>
<tr>
<th>HLV7332T</th>
<th>Authorization check failed for verb entity statement</th>
</tr>
</thead>
</table>
| **Explanation:** A host command statement authorization check routine found that the current user is not authorized to execute the command statement. Access to execute the statement is denied.
| **User response:** Check the variables of the error message text for the command statement whose access is denied. Ensure that the current user has the required... |
access. Contact your security systems administrator for further help, if necessary.

HLV7400T  varname INVALID GLVSTATE. VARIABLE - rsn additinno

Explanation: The indicated variable is not a valid GLVSTATE. prefix variable. See information on the automated variable name formats.

User response: Correct the variable name, and rerun the exec or program.

HLV7401T  setname DOES NOT EXIST AND CANNOT BE service

Explanation: An attempt to perform a control operation on a named state information set failed because the set is not known to the system.

User response: The current request is ignored.

HLV7402T  val IS NOT A VALID VALUE FOR THE varname VARIABLE

Explanation: The value indicated is not a valid value type for the variable identified.

User response: Correct the variable value, and rerun the exec or program.

HLV7403T  setname IS A READ-ONLY VARIABLE AND CANNOT BE UPDATED

Explanation: The update attempt for the named state information set failed because the indicated variable is read-only.

User response: Remove the update attempt for the variable.

HLV7404T  GLVSTATE.setname MUST BE ACTIVE BEFORE UPDATE TO varname

Explanation: The indicated variable does not belong to an active named state information set. The GLVSTATE. group has expired or has never been created.

User response: Create the set before attempting to set the variable.

HLV7405T  varname REQUIRES A NUMERIC VALUE - FOUND val

Explanation: The indicated variable requires a numeric value in order to update its value.

User response: Correct the variable specification, and rerun the exec or program.

HLV7406T  varname ADJUSTED FROM val TO MINIMUM VALUE OF minval for %4

Explanation: The indicated variable was adjusted because the value being set was lower than the minimum. The minimum value is used, instead.

User response: Correct the variable specification, and rerun the exec or program.

HLV7407T  varname1 IN varname2 MUST BE ALPHAMERIC, BEGIN ALPHA OR AN INTEGER 0-N

Explanation: The indicated variable is not valid for use as a GLVSTATE. user-assigned name. In GLVSTATE.name, name must be less than eight (8) bytes in length, begin alphabetic, and consist of only letters and numbers. The read-only variables, GLVEVENT.0 through GLVEVENT.n, are also valid but do not designate a named state variable set.

User response: Correct the variable specification, and rerun the exec or program.

HLV7408T  qualifier ALREADY EXISTS

Explanation: The indicated GLVSTATE.name group already exists. An attempt was made to assign NEW to the control variable. Such an attempt is taken as an unconditional create-set request for a set that must not previously exist.

User response: The NEW create-set request is rejected with an error. Interrogate GLVSTATE.name before issuing a request if a previously created set might exist.

HLV7409T  ++++++ reotype varname Diagnostic WWST Trace ++++++

Explanation: An internal-use diagnostic trace is being produced. Various internal state-related control blocks will be formatted and written to Trace Browse.

User response: None. For use by Software Support.

HLV7410T  SERVER TOKEN CREATE/DELETE SERVICE FAILED RC=rcode - GLVSTATE.setname UPDATE WILL FAIL

Explanation: An internal service failed to create/delete a server token needed to manage a GLVSTATE. variable set. The current GLVSTATE. update request will be failed in one of two ways: (1) as though the update were to an invalid variable field name or (2) as a HALT error. The failure method depends on the type of update.

User response: Check for other messages related to this failure, and contact Software Support.
HLV7411T  REQUEST VARIABLE varname
   INVALID AUTOMATED STATE TRANSPORT - rsn

Explanation: During Web transaction initialization, an HTML query variable or HTTP request header cookie was found with a name beginning with SWSSTATExxxxx or SWSTOKENxxxxx. All query variables and cookies with names in this form are reserved for automated processing of state information.

User response: The server bypasses built-in handling for this variable, which may result in improper sessions state management activities. A variable in this form is also rejected if the xxxxxxxx portion is invalid. To be valid, the customer-assigned name must be 1 to 8 bytes in length; begin with an alphabetic character; and contain only alphabetic characters, the digits 0 through 9, and the underbar character.

HLV7412T  varname BYPASSED BY ASMF -
   DUPLICATE GLVSTATE.setname SET ALREADY EXISTS

Explanation: During Web transaction initialization, an HTML query variable and/or HTTP request header cookie that contains built-in management information for a GLVSTATE set was found. Information for this GLVSTATE set has already been received from another query variable or cookie within this inbound request.

User response: The server bypasses built-in handling for this variable and uses only the first GLVSTATE restoration information. Note that this can occur if you include the same GLVSTATE.xxxxxx information in both an HTML form field and an HTTP cookie or if the browser transmits two HTTP cookies with the same name.

HLV7413T  VARIABLE varname DOES NOT
   CONTAIN A VALID SERVER TOKEN ID - rsn

Explanation: During Web transaction initialization, an HTML query variable or HTTP request header cookie was found with a name beginning with SWSTOKENxxxxx. All query variables and cookies with names of this form are reserved for built-in GLVSTATE processing. However, the contents of this element did not contain the expected displayable, hexadecimal, 24-byte token id value that was expected.

User response: The erroneous information is not used, the inbound query or cookie information is ignored, and no GLVSTATE information set is created.

HLV7414T  varname VARIABLE DOES NOT
   CONTAIN VALID INFORMATION TO RECONSTRUCT GLVSTATE.setname - rsn

Explanation: During Web transaction initialization, an HTML cookie variable was found with a name beginning with SWSSTATE_. The value data, however, does not appear to be formatted as expected for restoration of a GLVSTATE set. Note that this can occur for incorrect length information, bad encoding of the data, or some other input anomaly.

User response: The erroneous information is not used, the inbound cookie information is ignored, and no GLVSTATE information set is created for this variable.

HLV7415T  SERVER TOKEN ID (tknid) REUSED IMPROPERLY FOR
   GLVSTATE.setname1/GLVSTATE.setname2 SETS

Explanation: During Web transaction initialization, an HTML query variable or HTTP request header cookie was found with a name beginning with SWSSTATExxxxx. All query variables and cookies with names of this form are reserved for built-in GLVSTATE processing. However, the contents of this element contained an indication that a token id had been improperly re-used.

User response: This is a logic error. The server generates an S0C3 abend. Contact Software Support for assistance.

HLV7416T  GLVSTATE.setname NOT
   RECONSTRUCTED FOR
   TOKENID=tknid DUE TO ERROR errdesc

Explanation: During Web transaction initialization, an HTML query variable or HTTP request header cookie was found with a name beginning with SWSTOKENxxxxx. All query variables and cookies with names of this form are reserved for built-in GLVSTATE processing. However, a server-side token could not be retrieved due to an internal error, and this GLVSTATE set is being bypassed.

User response: This could be due to a storage shortage or other problem. The state information is handled as though the token has expired.

HLV7417T  AUTOMATED STATE MGMT
   MODULE (OPASMF) - INVALID PLIST
   plist

Explanation: The automated state management routine, OPASMF, was invoked with an invalid parameter list (plist).

User response: The module generates an S0C3 abend to terminate the request. Contact Software Support.
HLV7418T  'GLVSTATE.setname' MUST EXIST BEFORE UPDATE TO varname

Explanation: The indicated GLVSTATE. collection does not exist. It must be created before the update to any collection member can be performed.

The GLVSTATE associated setname may also be an index number.

User response: Create the set before attempting to set the variable.

HLV7419T  UPDATE TO csym NOT ALLOWED FOR GLVSTATE.collection COLLECTION WITH STATUS= status

Explanation: The indicated GLVSTATE. collection is currently flagged as being in a status that does not allow updates. Change the collection to ACTIVE status either by resetting it or by deleting and re-creating it.

User response: The current request is rejected.

HLV7420T  UPDATE TO 'csym' NOT ALLOWED BECAUSE val EXCEEDS CURRENT SUBKEY COUNT OF count

Explanation: The number of keyed values within the set is lower than the key-index value specified by the symbolic reference. Key-index references may not be used to create new keyed value pairs.

User response: The current request is rejected.

The variable fields of the message text are: csym collection symbol being updated value key index value in symbolic reference num current number of keys defined

HLV7421T  UPDATE TO 'csym' IGNORED BECAUSE GLVSTATE.collection IS A typed set TYPE SET WHICH DOES NOT USE HTTP COOKIES

Explanation: The indicated GLVSTATE. collection does not use HTTP cookies as a transport mechanism. The current update is ignored because it does not apply to non-cookie-based information sets.

User response: The current request is ignored.

The variable fields of the message text are: csym collection symbol being updated collect collection name value current set type value

HLV7422T  UPDATE TO 'csym' IGNORED BECAUSE GLVSTATE.collection IS A value TYPE SET WHICH DOES NOT USE SERVER-SIDE TOKENS

Explanation: The indicated GLVSTATE. collection does not use tokens as an indirect storage mechanism. The current update is ignored because it does not apply to non-token-based information sets.

User response: The current request is ignored.

The variable fields of the message text are: csym collection symbol being updated collect collection name value current set type value

HLV7423T  VALUE ASSIGNED TO 'csym' TRUNCATED BECAUSE field MAXIMUM LENGTH IS size

Explanation: The indicated GLVSTATE. variable value that was being assigned was truncated because only lengths up the size given are supported.

User response: The current request is ignored.

The variable fields of the message text are: csym collection symbol being updated field field usage size maximum size for this field

HLV7425T  UPDATE OF 'csym' IGNORED - TOKEN WITH ID= tknid HAS ALREADY EXPIRED

Explanation: The indicated GLVSTATE. variable value update failed because the indicated token has already expired.

User response: The current request is rejected with an error.

The variable fields of the message text are: csym collection symbol being updated token token id for which update required

HLV7426T  setname HAS BEEN RESET

Explanation: The indicated GLVSTATE. information set has been reset.

User response: None. The request completes normally.

HLV7427T  NO "SET-Cookie:" SENT FOR GLVSTATE.setname - COOKIE WOULD EXCEED 4K MAX. SIZE

Explanation: The indicated GLVSTATE. information set has not been used to generate an outbound HTTP Set-cookie: response because the total length of the value data, once encoded, exceeds the maximum 4k allowed by the Netscape cookie specification for the size of the name/value pair.

User response: The indicated state set is bypassed.

HLV7428T  ERROR WHILE BUILDING SET-Cookie: RESPONSE FOR GLVSTATE.setname - RC=rcode

Explanation: An error was encountered while building an outbound Set-cookie: response header for the indicated state information set.

Chapter 14. Troubleshooting  903
User response: Buffer flush processing continues.

HLV7429T VARIABLE varname CONTAINS INVALID SERVER TOKENID ID WHICH MAY BE SPOOF ATTEMPT (ID=tnid)

Explanation: An error was encountered while attempting to restore saved state information using a server-side token id. The characteristics of the error encountered MAY indicate an attempt to spoof a server token id value, although this is by no means certain. If the error occurs frequently, you may wish to investigate this possibility further.

User response: The server token id is handled as though it designates an expired token from which no application data values can be restored.

HLV8003E Unable to build JVM Profile List.
Explanation: Unable to build JVM Profile List.
User response: Contact Software Support.

HLV8004E Unable to allocate latch for JVM profile.
Explanation: Unable to build JVM Profile List.
User response: Contact Software Support.

HLV8900E errdesc additinfo
Explanation: An error was encountered while attempting to initialize a task runtime environment for C-language main product routines.
User response: The runtime environment is not initialized. Check for other messages that might indicate the cause of the failure, and contact Software Support.

HLV8901T tracedesc additinfo
Explanation: While initializing the C-language runtime environment, statistical tracing is enabled. This message is used to trace out information about the environment.
User response: Initialization processing continues.

HLV8902W errdesc additinfo
Explanation: A correctable error was detected while initializing a task runtime environment for C-language main product routines.
User response: The runtime environment is initialized after the error is corrected.

HLV8903T tracedesc additinfo
Explanation: While terminating the C-language runtime environment, statistical tracing is enabled. This message is used to trace out information about the environment.
User response: Termination processing continues.

HLV8904W errdesc additinfo
Explanation: A correctable error was detected while terminating a task runtime environment for C-language main product routines.
User response: The runtime environment is terminated if the error is correctable. Otherwise, the termination request will fail with a more severe error.
HLV8905E  errdesc additinfo

Explanation: While terminating the C-language runtime environment, an error was encountered. Termination processing continues but may leave allocated resources orphaned.

User response: Termination processing continues.

HLV9000H  modnamefuncode execution msgtext

Explanation: This message is used to trace product termination. A message is issued before and after the execution of each termination routine.

User response: There is no action for this message. This message is only used for trace and debugging purposes.

HLV9001I  Subsystem subsys termination complete

Explanation: This is the standard product termination complete message.

User response: No action is required.

HLV9002E  Subsystem subsys termination incomplete

Explanation: Product execution has terminated. However, one or more errors were detected during product termination. As a consequence, normal product termination was not possible.

User response: Check for any error messages issued during termination. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support. Please note the exact contents of the above error message and any other error messages associated with the product termination error.

HLV9008S  ABEND ERROR abcode-rsncode AT modname+offset

Explanation: A serious abend occurred during product initialization, execution, or termination. The abend was not recoverable, and the product was forced to terminate.

User response: Check the abend code and any related abend messages. If possible, fix the problem identified by the error messages, and restart the product. If the problem cannot be resolved, contact Software Support. Note the exact contents of the above error message and any other error messages associated with the product failure.

HLV9100T  INVALID COMBINATION OF / or ../ in pathname

Explanation: An HFS pathname string was rejected because it contains an invalid combination of ./, ../, or other characters that are not resolvable at runtime.

User response: If the PATH() operand of the matched-to WWW rule contains a wildcard(*), this may indicate an attempt by a client to refer to an HFS sub-directory to which access should not be granted. This message can also result from an incorrect combination of specifications for the server DOCUMENTROOT start-up parameter, the HFSROOT() parameter on a DEFINE RULESET statement, and/or the PATH() parameter on the WWW rule definition. The transaction is rejected with a 404 (file not found) error status.

HLV9504E  service OF desc FAILED, RC=rcode, DETECTED AT addr

Explanation: This is a generic error message used to describe a wide variety of internal errors. The message text provides a description of the current operation (service) and what the current operation was attempting to do, such as GETMAIN, FREEMAIN, and so on.

User response: Check the error messages and the return code associated with this problem. There may be one or more error messages referring to the current problem. If possible, fix the problem identified by the error messages, and retry the operation. If the problem cannot be resolved, contact Software Support.

HLV9505I  errdesc

Explanation: This is a generic informational message used to clarify a wide variety of internal errors. The message text provides further info for the current operation and what the current operation was attempting to do.

User response: Check the error messages and the return code associated with this problem. There may be one or more error messages referring to the current problem. If possible, fix the problem identified by the error messages, and retry the operation. If the problem cannot be resolved, contact Software Support.

HLV9506S  service OF desc FAILED, RC=rcode, DETECTED AT addr

Explanation: This is a generic error message used to describe a wide variety of internal errors. The message text provides a description of the current operation (service) and what the current operation was attempting to do, such as GETMAIN, FREEMAIN, and so on.

User response: Check the error messages and the return code associated with this problem. There may be one or more error messages referring to the current problem. If possible, fix the problem identified by the
error messages, and retry the operation. If the problem cannot be resolved, contact Software Support.

HLV9507E  DATA SET dsnname DOES NOT EXIST - LOCATE OF dsnname FAILED, RC=rcode, REASON=rsncode
Explanation: A failure occurred during a LOCATE of a data set. The return and reason codes in the message are from the LOCATE routine.
User response: Check the error messages and the return code associated with this problem. There may be one or more error messages referring to the current problem. If possible, fix the problem identified by the error messages, and retry the operation. If the problem cannot be resolved, contact Software Support.

HLV9508E  OBTAIN OF FORMAT1 DSCB FOR DSNNAME dsnname VOLUME Vvol FAILED, RC = rcode, REASON CODE = rsncode
Explanation: A failure occurred during an OBTAIN of a data set. The return and reason codes in the message are from the OBTAIN FORMAT1 DSCB routine.
User response: Check the error messages and the return code associated with this problem. There may be one or more error messages referring to the current problem. If possible, fix the problem identified by the error messages, and retry the operation. If the problem cannot be resolved, contact Software Support to obtain additional assistance.

HLV9509E  OBTAIN OF FORMAT1 DSCB FOR DSNNAME dsnname VOLUME Vvol FAILED BECAUSE DATA SET IS MIGRATED
Explanation: A failure occurred during an OBTAIN of a data set. The data set volser is set to MIGRAT, indicating the data set has been migrated offline.
User response: Check the error messages and the return code associated with this problem. There may be one or more error messages referring to the current problem. If possible, fix the problem identified by the error messages, and retry the operation. For some server functions, you may need to manually recall the data set before retrying the operation. If the problem cannot be resolved, contact Software Support to obtain additional assistance.

HLV9511E  service OF desc FAILED, RC=rcode, RS=rsnfail, DETECTED AT addr
Explanation: This is a generic error message used to describe a wide variety of internal errors. The message text provides a description of the current operation (service) and what the current operation was attempting to do, such as GETMAIN, FREEMAIN, and so on.
User response: Check the error messages and the return code associated with this problem. There may be one or more error messages referring to the current problem. If possible, fix the problem identified by the error messages, and retry the operation. If the problem cannot be resolved, contact Software Support.

HLV9513E  Unknown I/O reqid, diaginfo
Explanation: An unknown service request code has been detected by the server I/O routines. The request cannot be processed and an internal ABEND will be generated to log a symptom record in LOGREC. A general error return code will be reflected to the caller.
User response: Check for other error messages associated with the problem. There may be one or more error messages referring to the current problem or to the component or feature issuing the request. If the problem cannot be resolved, contact Software Support to obtain additional assistance.

HLV9990I  msgtext
Explanation: This is a generic message used to format information relating to abends detected by the product. The abend module, abend offset, abend code, and registers at the time of abend are all formatted for debugging purposes. In the case of internal errors, the reason for the internal abend is also indicated.
User response: Record all of the information, and report the problem to Software Support.

HLV9998S  TEXTMERGE (MSGID=M998) PROCESSING FAILURE REASON=rsncode
Explanation: Invalid parameters were passed to the message send routine for a special textmerge function call. This is likely due to a logic error on the part of the calling routine.
User response: Contact Software Support with this problem.

HLV9999S  msgtext
Explanation: This message is for internal product testing.
User response: No action is required.

FECA900E  Invalid Column Function value. Valid values: 1, 2, 3, 4
Explanation: An invalid character was entered in the Column Function field.
User response: Specify a valid character (1, 2, 3, or 4).
<table>
<thead>
<tr>
<th>FECA901E</th>
<th>Invalid Permanent View value. Valid values: Y, N</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Explanation:</strong></td>
<td>An invalid value was entered in the Permanent View field.</td>
</tr>
<tr>
<td><strong>User response:</strong></td>
<td>Correct the value or cancel. Valid values are Y and N.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>FECA902E</th>
<th>Invalid Reset View value. Valid values are Y, N</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Explanation:</strong></td>
<td>An invalid character was entered in the Reset View field. Valid characters are Y and N.</td>
</tr>
</tbody>
</table>
| **User response:** | Specify a valid value or cancel. Valid values are:  
  - Y - resets all customizations.  
  - N - customizations are not reset. |

<table>
<thead>
<tr>
<th>FECA903E</th>
<th>Invalid Stop Sorting value. Valid values: Y, N</th>
</tr>
</thead>
</table>
| **Explanation:** | The specified stop sorting value is not valid. Valid values are:  
  - Y - Indicates that sorting will be stopped.  
  - N - Indicates that sorting will continue. |
| **User response:** | Specify a valid value or cancel. |

<table>
<thead>
<tr>
<th>FECA904E</th>
<th>Invalid command in FORM display</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Explanation:</strong></td>
<td>The command you issued when viewing the FORM display was not valid.</td>
</tr>
<tr>
<td><strong>User response:</strong></td>
<td>Valid commands for FORM display include NROW and PROW.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>FECA905E</th>
<th>FORM command not supported from CSETUP function</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Explanation:</strong></td>
<td>The FORM command was issued from a CSETUP function. FORM is not supported while in a CSETUP function (CSETUP functions include CFIX, CORDER, CSIZE, and CS).</td>

</thead>
<tbody>
<tr>
<td><strong>Explanation:</strong></td>
<td>ICL is only allowed with columns that are not their maximum size. You can see the column’s current and maximum sizes by issuing CSIZE.</td>
</tr>
<tr>
<td><strong>User response:</strong></td>
<td>RIGHT and LEFT commands can be used to see all parts of this column.</td>
</tr>
</tbody>
</table>
FECA913E  Format mix data element not updated.
Explanation: Format MIX data cannot be updated when only part of the data is displayed.
User response: No action is required.

FECA914E  FORM command not supported from FORM function
Explanation: FORM was issued from within a FORM display. This is not supported.
User response: No action is required.

FECA915E  FORM PF keys set; NROW = nrow
PROW = prow
Explanation: The NROW (next row) and PROW (previous row) commands are used to move the FORM display window to another row. The UP, DOWN, LEFT, and RIGHT commands move the FORM display window within the current row.
Row, as mentioned above, refers to the row from the original report display, not any reformatted FORM display row.
By default, NROW advances the FORM display to the next row. If NROW n is issued, the FORM display will advance n rows.
Similarly, PROW moves the FORM display window to the immediately prior row PROW n moves the current FORM display window to the nth prior row.
User response: No action is required.

FECA916E  Invalid CNUM parm. Valid parms are ON, OFF, or blank.
Explanation: CNUM was issued with an invalid parameter. Issuing CNUM with no parameter acts as an ON/OFF toggle. ON and OFF are the only parameters accepted. ON turns the CNUM display on. OFF turns the CNUM display off.
User response: Use a valid CNUM parameter (ON, OFF, or blank)

FECA917E  Report width for print too large.
Explanation: The report width exceeds the maximum print width.
User response: The maximum report width that is currently supported is 32,760.

FECA918E  string not found. Press PF5 to continue from top.
Explanation: The indicated character string was not found.
User response: To continue searching for the character string from the top of the dialog, press PF5.

FECA920I  Chars chars found n times
Explanation: Indicates the number of times the specified character was found.
User response: No action is required.

FECA921I  Chars chars not found on any lines
Explanation: Indicates that the specified characters were not found on any of the lines.
User response: No action is required.

FECA922I  Search for CHARS chars was successful.
Explanation: Indicates the search for the indicated characters produced matches.
User response: No action is required.

FECA923E  Check for misspelled keywords or embedded blanks in search string.
Explanation: Indicates there may be invalid keywords or blanks embedded within the search string.
User response: Verify and correct the search string to remove embedded blanks or to correct keywords.

FECA924E  string and string cannot both be specified for FIND command.
Explanation: You specified two strings for the FIND command.
User response: You must specify one FIND string at a time.

FECA925E  Put quotes (" ") around the string of characters to be displayed.
Explanation: The string of characters is not enclosed in quotes.
User response: Place the string of characters in side quotes.

FECA926E  Maximum parameter length is 80
Explanation: The parameter you specified is too long.
User response: Specify a parameter that is 80 characters or less.

FECA927E  Invalid COLS parm. Valid parms are ON, OFF, or blank
Explanation: COLS was issued with an invalid parameter. Issuing COLS with no parameter acts as an ON/OFF toggle. ON and OFF are the only parameters accepted.
User response: Enter COLS ON or COLS OFF. COLS ON turns the COLS display on; COLS OFF turns the COLS display off.

FECA930I  No columns eligible for resizing.
Explanation: You cannot resize any columns.
User response: No action is required.

FECA931I  No columns eligible for sorting
Explanation: You cannot sort any columns.
User response: No action is required.

FECA932I  TBMOD failed. RC=rc
Explanation: An unexpected return code occurred during TBMOD.
User response: Suggested diagnostics:
• See z/OS ISPF Services Guide under TBMOD.
• Review ISPTLIB allocation.
• Review security-controlled access to ISPTLIB data sets.

FECA933E  Invalid column name: missing quote
Explanation: SORT or CSORT was issued with a parameter that had an initial quotation character, but not a second closing quotation character.
User response: Either clear the command line and select the desired sort column(s) from the displayed selection list or correct the command on the command line.

FECA934E  More than 9 columns specified
Explanation: SORT or CSORT was issued with too many columns specified as sort columns. A maximum of 9 sort columns can be specified.
User response: Either clear the command line and select the desired sort column(s) from the displayed selection list or correct the command on the command line.

FECA935E  Invalid column name
Explanation: SORT or CSORT was issued with a column parameter that does not match any column name. A list of the correct column names is seen in the SORT selection panel.
User response: Either clear the command line and select the desired sort column(s) from the displayed selection list or correct the command on the command line.

FECA936E  Invalid row selection character
Explanation: An invalid selection character was entered in the SSID selection list. The only valid selection character is S. Alternatively, place the cursor on the desired line and press ENTER (without a line selection character).
User response: Clear the invalid character.

FECA937E  Only one row selection allowed
Explanation: More than one SSID was selected from the SSID selection list. A maximum of one SSID can be selected.
User response: Clear all, or all but one row selection character.

FECA938E  Invalid command
Explanation: An invalid command was entered on the SSID selection list panel.
User response: Clear the command.

FECA939E  Read of control file failed
Explanation: Reading the control data set failed.
User response: Check the product setup (accessed from the main menu) to view the control data set currently in use. Verify that the data set name is correct.

FECA940E  Invalid DB2 Control data set
Explanation: Allocation of the control data set failed.
User response: Check the product setup (accessed from the main menu) to view the control data set currently in use. Verify that the data set name is correct.

FECA942E  IFCARC1=return code IFCARC2=reason code
Explanation: The Db2 command issued failed. The return code and reason code received from Db2 are in the error message. If there is any command output, it is displayed.
FECA943E  Invalid command
Explanation: An invalid command was issued. It is not supported on the current panel.
User response: Check the command for typographical error. Clear or correct the command.

FECA944I  Empty History
Explanation: This is an informational message. The history database is empty. If commands were previously entered, then either HCLEAR was issued or the size of the history database was set to 0. If ISPTABL and ISPTLIB are not allocated, history is not remembered across sessions, and each new session has an empty history database.
User response: No action is required. To verify allocation of ISPTLIB and ISPTABL, ISRDDN and ISPLIBD can be useful. Refer to [https://www.ibm.com/support/knowledgcenter/en/SSLTBW](https://www.ibm.com/support/knowledgcenter/en/SSLTBW) to access the ISPF services guide for your version of z/OS.

FECA945E  Invalid history size limit
Explanation: An invalid character was found in the History Size Limit field. Only numeric values from 0-999 are valid.
User response: Enter a valid value in the History Size Limit field.

FECA946I  No DB2 command history output library allocated
Explanation: This is an informational message. ISPTABL is not allocated. The history database cannot be saved across sessions when ISPTABL is not allocated.
User response: No action is required. If saving history across sessions is desired, see product installation instructions for allocating ISPTABL (and ISPTLIB).

FECA947I  No DB2 command history input library allocated
Explanation: This is an informational message. ISPTLIB is not allocated. If a history database is saved across sessions (using ISPTLIB DD), the ISPTLIB DD is used to initialize a new Db2 Command Processor session. If ISPTLIB is not allocated, this cannot occur and the history starts out empty.
User response: No action is required. If saving history across sessions is desired, see product installation instructions for allocating ISPTLIB (and ISPTABL).

FECA948E  TBOPEN failed. RC=return code
Explanation: TBOPEN for the history table failed. Return code is the return code from the TBOPEN service.
User response: Check ISPTLIB allocation. Verify the data sets in ISPTLIB. Verify it is a valid PDS. See ISPF manuals for ISPTLIB requirements.

FECA949E  Invalid command
Explanation: An invalid command was entered.
User response: Check for typographical error. Clear or correct the command. Issue HELP for the Db2 Command Processor tutorial to see what commands are valid. KEYS might also be a useful command, since some PF keys are set to valid Db2 Command Processor commands.

FECA950E  No SSIDs in control file
Explanation: There are no valid SSIDs found in the Db2 control file specified.
User response: A control file with no SSIDs is not useful. It is probably not the control file desired. See product installation instructions for information about creating and building a control file.

FECA951I  History cleared
Explanation: History was cleared either by issuing the HCLEAR command or by setting the History Size Limit to 0.
User response: No action is required.

FECA952E  Unable to list data sharing members. Display failed
Explanation: Command failed attempting to get a list of data sharing members. The reason code and return code are listed in the message.

FECA953I  Zero data sharing members found
Explanation: Zero data sharing members found. The current SSID is not a member of a data sharing group.
User response: The Datasharing Member field should be left blank.

FECA954E  Invalid command
Explanation: An invalid command was issued from the datasharing members list/selection panel.
User response: Clear the command.
FECA955I  
No member selected

Explanation: You exited the datasharing member selection panel without selecting a datasharing member.

User response: No action is required.

FECA956E  
Invalid row selection character

Explanation: An invalid selection character was entered in the History output display. A command listed in the History display can be selected for execution either by selecting it with an “S” selection character, or by placing the cursor anywhere on a line within the command and pressing Enter.

When selecting by cursor placement, the cursor can be on the line selection input line, which also has a command number, or on a line with some command text.

User response: Clear the invalid character.

FECA957E  
Only one row selection allowed

Explanation: More than one command was selected from the History display. Only one History command can be selected.

User response: Clear all, or all but one row selection character.

FECA958E  
Invalid row selection character

Explanation: An invalid selection character was entered in the displayed list of datasharing members. A datasharing member in this display can be selected by selecting it with an S selection character, or by placing the cursor anywhere on the desired row and pressing Enter.

User response: Clear the invalid character.

FECA959E  
Only one row selection allowed

Explanation: More than one datasharing member was selected from the list of displayed datasharing members.

User response: Clear all, or all but one row selection character.

FECA960E  
Cannot list commands without SSID

Explanation: A command was issued to select a command syntax diagram, but no SSID has been selected. Syntax diagrams cannot be displayed until an SSID has been selected.

User response: Select an SSID. You can generate a list of SSIDs by clearing the SSID field, or entering a ? (question mark).

FECA961E  
Invalid row selection character

Explanation: An invalid selection character was entered in the displayed list of Db2 commands. A Db2 command in this display can be selected by selecting it with an S selection character, or by placing the cursor anywhere on the desired row and pressing Enter.

User response: Clear the invalid character.

FECA962E  
Only one row selection allowed

Explanation: More than one Db2 command was selected from the list of displayed Db2 commands.

User response: Clear all, or all but one row selection character.

FECA963E  
Invalid command

Explanation: An invalid command was issued from the Db2 command list/selection panel.

User response: Clear the command.

FEC801E  
Pgm: program name Stmt: statement Type: type

Explanation: This message is used to convert SQL return code information into a text message. The data from the SQLCA is called using DSNTIAR and formatted into this message.

FEC802E  
An invalid return code of code was encountered on function function. The error message text follows: text

Explanation: An invalid return code was encountered for the specified function. The supporting diagnostic data are returned in the error message.

FEC803E  
The first character of the command is not a dash. Correct the syntax of the DB2 command and resubmit.

Explanation: The first character of the command is not a dash. Correct syntax for a Db2 command dictates that the command be preceded by a dash.

User response: Precede the command with a dash (‘-’) and reenter.
FEC804E  message_text

Explanation: An error occurred during call attach initialization.

User response: Refer to the message text for details. If a reason code accompanies the message, use the reason code to help you determine the appropriate corrective action. If you need assistance, contact IBM Software Support.

FEC901E  The default load library could not be located.

Explanation: The data set name entered for Db2 Tools Load Library was not found.

User response: Enter a valid loadlib data set name and continue.

FEC902E  A DB2 subsystem ID has to be entered for processing.

Explanation: There was no valid value entered for Db2 subsystem ID.

User response: Enter a valid Db2 subsystem name.

FEC903E  The default GDG base data set name could not be located.

Explanation: The data set name entered for GDG Base model was not found.

User response: Enter a valid model data set name and continue.

FEC904E  The specified data set could not be opened for I/O.

Explanation: A VSAM open error occurred while attempting to open the data set specified for the Db2 Control File.

User response: Verify that the VSAM data set is accessible.

FEC905E  An unexpected return code from VSAM was encountered while doing a read of the control file. RC1=rc RC2=rc

Explanation: A VSAM READ error occurred while attempting to access the data set specified for the Db2 Control File. The VSAM return code is provided for diagnostic purposes.

FEC906I  The control file record for DB2 subsystem ssid has been successfully updated.

Explanation: The Db2 Control File record has been successfully updated based on the definitions for the specified Db2 subsystem.

User response: No action is required.

FEC907E  An unexpected return code from VSAM was encountered while doing an update operation of the control file. RC1=rc RC2=rc

Explanation: A VSAM update error occurred while attempting to update the data set specified for the Db2 Control File. The RC1 and RC2 (VSAM return cards) are provided for diagnostic purposes.

FEC908I  The control file record for DB2 subsystem sys has been successfully added.

Explanation: The Db2 Control File record has been successfully updated based on the definitions for the specified Db2 subsystem.

User response: No action is required.

FEC909E  Invalid value. Valid options are 1 and 2.

Explanation: The value you specified is not valid. valid values are 1 and 2.

User response: Enter a valid value.

FEC910E  An unexpected return code from VSAM was encountered while doing an add operation to the control file. RC1=rc RC2=rc

Explanation: A VSAM error occurred while attempting to perform an add operation to the specified Db2 Control File. The RC1 and RC2 (VSAM return codes) are provided for diagnostic purposes.

FEC911E  The (F)IND command was entered but no parameters were specified.

Explanation: No parameters were specified with the (F)IND command. No match can be made unless you specify a string to find.

User response: Enter a FIND parameter.
FEC912I  The requested find string was not found.
Explanation:  No matches were found for the string you specified with the FIND command.
User response:  No action is required.

FEC913I  The control file record has been successfully updated.
Explanation:  The control file was updated successfully.
User response:  No action is required.

FEC914E  An unknown column was specified using the SORT command.
Explanation:  The column you specified with the SORT command is not known.
User response:  Verify that you correctly typed the name of the column or select another column.

FEC915E  SORT is not supported for the specified column.
Explanation:  The column you attempted to SORT is not supported as a column on which to sort.
User response:  Refer to the sort columns listed on the Define Sort Columns panel for a list of valid columns on which the sort can be based and redefine the sort.

FEC916E  Sort column not entered. Column name or number must be specified.
Explanation:  A column was not specified with the SORT. A column name or number must be specified for the SORT command.
User response:  Ensure that if the column name is used, that all spaces in the name are replaced with an underscore.

FEC917E  Put an ending quote at the end of the string.
Explanation:  You must place a quote at the end of the string.
User response:  Place a quote at the end of the string.

FEC918  CHAR string not found. Press PF5 to continue from top.
Explanation:  The indicated character string was not found.
User response:  To continue searching for the character string from the top of the dialog, press PF5.

FEC919  chars foundstr not found. Press PF5 to continue from bottom.
Explanation:  The indicated character string was not found.
User response:  To continue searching for the character string from the bottom of the dialog, press PF5.

FEC920E  File tailoring open returned a file tailoring already in progress condition
Explanation:  An attempt to perform file tailoring for utility customization failed. There was a file tailoring session already in progress. File tailoring sessions cannot be performed concurrently.
User response:  No action is required.

FEC921E  File tailoring open returned the output file already in use condition -- ENQ failed
Explanation:  An attempt to open the Db2 Control File failed with an ENQ error. The data set is already open for output.
User response:  Verify that you are the only user attempting to access this file.

FEC922E  File tailoring open returned the skeletal file or output file not allocated condition
Explanation:  An attempt to perform file tailoring failed because either the tailoring skeleton file or output file is not allocated.
User response:  Verify that all required files are allocated prior to performing file tailoring.

FEC923E  File tailoring open returned a severe error condition
Explanation:  An attempt to perform file tailoring failed because a severe error condition was encountered on open.
User response:  Verify that all required files are allocated and accessible prior to performing file tailoring.

FEC924E  File tailoring open returned an unknown code -- severe error
Explanation:  An attempt to perform file tailoring failed because a severe error condition was encountered on open.
User response:  Verify that all required files are allocated and accessible prior to performing file tailoring.

</tr>
</tbody>
</table>
allocated and accessible prior to performing file tailoring.

FEC936E  Allocation error - The ISPFILE DD is already allocated and cannot be deallocated - Process not completed

Explanation: The ISPFILE DD allocation failed. The DD is already allocated and cannot be deallocated for this TSO session. The process did not complete successfully.

User response: No action is required.

FEC937E  Allocation Error - An error was encountered allocating the ISPWRK1 or ISPWRK2 DD - Process not completed

Explanation: The ISPWRK1 or ISPWRK2 DD allocation failed.

User response: Verify TSO session parameters are set correctly for your site prior to allocation of these DD statements. The process did not complete successfully.

FEC938E  Field Required - The data set entered is a partitioned data set and the member name is required

Explanation: A required field was not specified. The data set entered is a PDS (partitioned data set) and a member in this PDS must be referenced.

User response: Enter a valid member name for PDS access.

FEC939E  The only valid values are "T" for tracks and "C" for cylinders

Explanation: You specified an invalid value. The only valid values are "T" for tracks and "C" for cylinders.

User response: Specify a valid value.

FEC940E  The specified data set could not be found in the MVS catalog.

Explanation: The specified data set could not be found in the MVS catalog.

User response: Ensure that the data set name is correct.

FEC941E  The RFIND key works only after a FIND character string is entered.

Explanation: A repeat FIND (RFIND) was issued before a FIND command was issued. You must issue FIND before RFIND will work.

User response: Issue FIND prior to attempting to issue RFIND.

FEC942E  Invalid Sort number. Enter a valid digit.

Explanation: An invalid character was entered in the Srt column. Valid characters are the digits 1, 2, 3... up to 9, or the number of sortable columns, whichever is less.

User response: Specify a valid sort number.

FEC943E  Same Sort number entered twice

Explanation: The same sort number was entered for more than one column. The screen is positioned to the second instance. Sort sequence numbers must be unique.

User response: Specify a valid sort number.

FEC944E  Sort sequence skips a number.

Explanation: The selected sorting sequence skips a number. This is not allowed. The screen is positioned to a selection whose number is lacking an immediate predecessor. The sort sequence is completely rebuilt from the Cmd (and Dir) information. Any previously existing sort sequence is entirely replaced. It is not added to or extended by the new entries.

User response: Please specify a valid sort sequence that does not skip a number.

FEC945E  Invalid Dir entered. Must be A or D (ascending/descending).

Explanation: The selected sorting direction is invalid. Only A (ascending) or D (descending) can be specified. A blank indicates ascending (default).

User response: Specify a valid sorting direction.

FEC946E  Dir not valid without Ord.

Explanation: A sorting direction was selected for a column that was not selected to be sorted. Sorting direction is only a valid choice for selected columns.

User response: Select a sorting direction and order.

FEC947E  Max Sort Columns exceeded. Sorting first 10 columns.

Explanation: More columns were selected for sorting than are supported. Nine columns can be selected. Under certain circumstances the limit is less than nine, due to internal constraints. For example, sorting a date field can be implemented by three sorts of partial column fields. In that case, the column would count as three toward the maximum of nine, not one.

User response: Specify the appropriate allowable maximum number of sort columns.
Fix Columns cannot exceed screen size.

Explanation: More columns were selected to be fixed than will fit on the screen.

User response: Remove the (F) selection character from one or more columns.

Invalid selection character. "F" and "U" are valid.

Explanation: An invalid Cmd character was entered. Valid characters are F (fix) and U (unfix). Fix causes the column to move to the fixed area on the left side of the screen. Fixed columns do not scroll horizontally when LEFT or RIGHT scrolling commands are issued. Unfix moves the column out of the fixed area, and allows it to scroll horizontally when LEFT and RIGHT scroll commands are issued.

User response: Either remove the invalid character or enter a valid one.

Invalid entry. Must be numeric.

Explanation: An invalid Cmd value was entered. Cmd values must be numeric. If the column is fixed, the number must be in the fixed range. If the column is not fixed, the number must be in the unfixed range.

User response: Either remove the invalid number or enter a valid one.

Invalid entry for fixed column.

Explanation: An invalid Cmd value was entered for a fixed column. Valid selections for fixed column are up to the number of fixed columns.

User response: Either remove the invalid number or enter a valid one.

Invalid entry for unfixed column.

Explanation: An invalid Cmd value was entered for an unfixed column. The number must be less than the number of columns, and greater than the number of fixed columns.

User response: Either remove the invalid number or enter a valid one.

Invalid value entered for column size: non-numeric data.

Explanation: An invalid Cmd value was entered. This must be a number between the values in the MIN and MAX fields.

User response: Either remove the invalid number or enter a valid one.

Invalid value entered for column size: out of range.

Explanation: An invalid Cmd value was entered. This must be a number between the values in the MIN and MAX fields. MIN is the smallest acceptable value. MAX is the largest acceptable value.

User response: Either remove the invalid number or enter a valid one.

Total fixed column sizes cannot exceed screen size.

Explanation: The Cmd values entered would result in the sum of the fixed column sizes to exceed the screen size. This is not allowed. The fixed columns are those with an or in the Fix column. Fixed columns are always displayed, and so must fit on the screen.

User response: Either change the fixed column sizes so that the total is less than the screen size or cancel to return to the previous panel.

New configuration makes this column size invalid.

Explanation: The requested column sizes make at least one unfixed column unable to be displayed. The cursor is positioned on the value where the problem was detected. The unfixed area on the screen would be too small to show the column where the cursor is placed.

User response: Do one of the following:
- Make the column where the cursor is smaller so that it can fit in the available unfixed area.
- Set it to its maximum size (width).
- Make the fixed area smaller.
- Cancel to return to the previous panel.

Column does not fit in unfixed area in new configuration.

Explanation: The requested column sizes would make the unfixed column where the cursor is positioned undisplayable. The unfixed area on the screen would be too small to show this column.

User response: Shrink the fixed area by either unfixing columns or making fixed columns smaller. The column where the cursor is cannot be partially displayed (min-max) so its size cannot be changed.

New configuration makes this column size invalid.

Explanation: Fixing the requested columns would shrink the available area for unfixed columns unacceptably. One or more unfixed columns would not fit in the remaining unfixed area of the screen. The cursor is placed on a row that represents one such
column. Therefore, the requested configuration is not allowed.

User response: To change column sizes, cancel out of the CFIX function and invoke the CSIZE function. Either cancel to exit CFIX with no change or blank out one or more FIX selections until an allowable fixed size is reached.

**FEC960E** Invalid fixed selections. Would not leave enough space for this column.

Explanation: Fixing the columns requested would make at least one unfixed column undisplayable. The cursor is positioned on the row that represents one such unfixed column, whose minimum displayable size would not fit in the available screen area.

User response: Shrink the requested fixed area by either:

- Requesting fewer fixed columns.
- Unfixing one or more fixed columns.
- Cancel out of CFIX and invoke CSIZE in order to shrink one or more fixed columns enough so that all unfixed columns have the space they require.

**FEC962E** Duplicate Cmd values entered.

Explanation: Duplicate Cmd numbers were entered. The cursor points to the second instance of a Cmd value.

User response: Either change this value, clear it, or exit the CORDER function.

**FEC963E** Cursor not on data element.

Explanation: CEXPAND was issued and the cursor was not located on a valid (expandable) area. CEXPAND requires the cursor to be positioned on a data element (non-heading area) in the dynamic area of the display. Or CEXPAND can be issued specifying the row and column of the data element to expand.

User response: Ensure the cursor is located on a valid (expandable) area prior to issuing the CEXPAND command.

**FEC964E** Invalid scroll amount for CRIGHT. Must be numeric.

Explanation: Invalid (non-numeric) parameter to CRIGHT specified. CRIGHT accepts one numeric parameter: the number of columns to scroll right. If no parameter is entered a value of 1 is assumed.

User response: Specify a numeric parameter to the CRIGHT command.

**FEC965E** Invalid scroll amount for CLEFT. Must be numeric.

Explanation: Invalid (non-numeric) parameter to CLEFT specified. CLEFT accepts one numeric parameter: the number of columns to scroll left. If no parameter is entered, a value of 1 is assumed.

User response: Specify a numeric parameter to the CLEFT command.

**FEC966E** Invalid parameter to ICRIGHT; must be numeric.

Explanation: A parameter to ICRIGHT is not numeric. ICRIGHT (inner column scroll right) accepts either zero, one, or two numeric parameters. ICRIGHT can be abbreviated as ICR.

User response: Specify a valid, numeric parameter for ICRIGHT.

**FEC967E** Parameter to ICRIGHT too long. Invalid.

Explanation: A parameter to ICRIGHT is too long. ICRIGHT does not process more than eight digits in a parameter, which is more than double any reasonable value.

User response: Specify a valid parameter for ICRIGHT.

**FEC968E** Parameter to ICRIGHT is zero. Invalid.

Explanation: A parameter to ICRIGHT has the value zero. This is not supported.

User response: Specify non-zero parameters to ICRIGHT.

**FEC969E** ICRIGHT: unspecified column.

Explanation: ICRIGHT was invoked with no parameters and the cursor is not positioned in the dynamic panel area.

User response: Either put the cursor in the column that should be scrolled or specify the column by number. Column numbers can refer to visible columns (in the current display window) only. Number starts at 1, on the left side.

**FEC971E** ICRIGHT: Column number specified is too big.

Explanation: A column number parameter to ICRIGHT must be between 1 and the number of columns currently on the display screen.

User response: To refer to a column by number you must first position the display window so that the desired column is visible.
FEC972E  Invalid parameter to ICLEFT; must be numeric.

Explanation: A parameter to ICLEFT is not numeric. ICLEFT (inner column scroll left) accepts either zero, one, or two numeric parameters. ICLEFT can be abbreviated as ICL.

User response: Specify a valid parameter for ICLEFT.

FEC973E  Parameter to ICLEFT too long. Invalid.

Explanation: A parameter to ICLEFT is too long. ICLEFT does not process more than eight digits in a parameter which is more than double reasonable value.

User response: Specify a parameter less than or equal to eight digits for ICLEFT.

FEC974E  Parameter to ICLEFT is zero. Invalid.

Explanation: A parameter to ICLEFT has the value zero. This is not supported.

User response: Specify a non-zero number for ICLEFT.

FEC975E  ICLEFT: unspecified column.

Explanation: ICLEFT was invoked with no parameters and the cursor is not positioned in the dynamic panel area.

User response: Either put the cursor in the column that should be scrolled or specify the column by number. Column numbers can refer to visible columns (in the current display window) only. Numbering starts at 1 on the left side.

FEC976E  Column selected not sortable. Sort selection list presented.

Explanation: You cannot preform a SORT on the column you selected. Valid sort columns are displayed in the sort selection list.

User response: Sort on one of the valid columns displayed in the selection list.

FEC977E  ICLEFT: Column number specified is too big.

Explanation: A column number parameter to ICLEFT must be between 1 and the number of columns currently on the display screen.

User response: To refer to a column by number, you must first position the display window so that the desired column is visible.

FEC978E  Invalid column number specified for SORT (not numeric).

Explanation: Invalid column number parameter to CSORT specified (non-numeric).

User response: Specify a column number parameter to CSORT that is between 1 and the number of columns currently on the display screen. This can be followed by a direction value A or D (ascending/descending).

FEC979E  Invalid column number specified. Too many digits.

Explanation: Invalid parameter to CSORT specified. More than eight digits were specified. Parsing stops at eight digits.

User response: Specify a column number parameter between 1 and the number of columns currently on the display screen. This can be followed by a direction value A or D (ascending/descending).

FEC980E  Invalid column number specified: zero.

Explanation: Invalid parameter to CSORT was specified (zero).

User response: Specify a column number parameter to CSORT that is between 1 and the number of columns currently on the display screen. This can be followed by a direction value A or D (ascending/descending).

FEC981E  Invalid column number specified: out of range.

Explanation: Invalid parameter to CSORT was specified (zero).

User response: Specify a column number parameter to CSORT that is between 1 and the number of columns currently on the display screen. This can be followed by a direction value A or D (ascending/descending).

FEC982E  Invalid view. View adjusted.

Explanation: The current view was adjusted but not deleted. The saved view did not match the report requirements. This could be caused by the report changing or the view file getting corrupted.

User response: The adjusted view will be used. You can issue CSET to modify the view.

FEC983E  Invalid view. View deleted.

Explanation: Invalid data was found in a view for this report. The view was deleted and contents ignored. This could be caused by the report changing or the view file getting corrupted.

User response: You can issue CSET to create a view that will match current report.
**FEC984E** Unexpected return code from TBSTATS: *rc*

**Explanation:** An unexpected failure issuing TBSTATS was received.

**User response:** Refer to [https://www.ibm.com/support/knowledgecenter/en/SSLTBW for information about ISPF messages and codes for your version of z/OS](https://www.ibm.com/support/knowledgecenter/en/SSLTBW) about ISPF messages and codes for your version of z/OS.

---

**FEC985E** View Library not allocated.

**Explanation:** A view input library has not been allocated. In order for a user to save and use report customizations that are created via the CSET command, ISPTABL and ISPTLIB must be allocated.

**User response:** Refer to [https://www.ibm.com/support/knowledgecenter/en/SSLTBW for information about ISPF messages and codes for your version of z/OS](https://www.ibm.com/support/knowledgecenter/en/SSLTBW) about ISPF messages and codes for your version of z/OS.

---

**FEC986E** TBCREATE failed. RC=rc

**Explanation:** TBCREATE was issued to create a view. It failed with a (hex) return code as indicated in the message.

**User response:** Review ISPTLIB allocation and data set characteristics. Refer to [https://www.ibm.com/support/knowledgecenter/en/SSLTBW for information about ISPF messages and codes for your version of z/OS](https://www.ibm.com/support/knowledgecenter/en/SSLTBW) for information about ISPF messages and codes for your version of z/OS.

---

**FEC987E** TBOPEN failed. RC=rc

**Explanation:** TBOPEN was issued to open a view. It failed with a (hex) return code as indicated in the message.

**User response:** Review ISPTLIB allocation and data set characteristics. Refer to [https://www.ibm.com/support/knowledgecenter/en/SSLTBW for information about ISPF messages and codes for your version of z/OS](https://www.ibm.com/support/knowledgecenter/en/SSLTBW) for information about ISPF messages and codes for your version of z/OS.

---

**FEC988E** TBGET failed. RC=rc

**Explanation:** A TBGET produced a return code (as indicated in the message).

**User response:** Review ISPTLIB allocation and data set characteristics. Refer to [https://www.ibm.com/support/knowledgecenter/en/SSLTBW for information about ISPF messages and codes for your version of z/OS](https://www.ibm.com/support/knowledgecenter/en/SSLTBW) for information about ISPF messages and codes for your version of z/OS.

---

**FEC989E** TBMOD failed. RC=rc

**Explanation:** A TBMOD produced an error and return code (as indicated in the message).

**User response:** Review ISPTLIB allocation and data set characteristics. Refer to [https://www.ibm.com/support/knowledgecenter/en/SSLTBW for information about ISPF messages and codes for your version of z/OS](https://www.ibm.com/support/knowledgecenter/en/SSLTBW) for information about ISPF messages and codes for your version of z/OS.

---

**FEC990E** TBCLOSE failed. RC=rc

**Explanation:** TBCLOSE failed with a (hex) return code as indicated in the message.

**User response:** Review ISPTLIB allocation and data set characteristics. Refer to [https://www.ibm.com/support/knowledgecenter/en/SSLTBW for information about ISPF messages and codes for your version of z/OS](https://www.ibm.com/support/knowledgecenter/en/SSLTBW) for information about ISPF messages and codes for your version of z/OS.

---

**FEC991E** TBDELETE failed. RC=rc

**Explanation:** TBDELETE failed with a (hex) return code as indicated in the message.

**User response:** Review ISPTLIB allocation and data set characteristics. Refer to [https://www.ibm.com/support/knowledgecenter/en/SSLTBW for information about ISPF messages and codes for your version of z/OS](https://www.ibm.com/support/knowledgecenter/en/SSLTBW) for information about ISPF messages and codes for your version of z/OS.

---

**FEC992E** Invalid selection.

**Explanation:** A command that is not supported on this panel was selected.

**User response:** Issue a valid command for the panel.

---

**FEC993I** Permanent view not supported.

**Explanation:** Db2 Analytics Accelerator Loader detected something that prevents views from being saved. The permanent view flag cannot be set to Y. The most likely cause of this is that either ISPTLIB or ISPTABL (or both) have not been properly allocated.

**User response:** Review ISPTLIB allocation and data set characteristics. Refer to [https://www.ibm.com/support/knowledgecenter/en/SSLTBW for information about ISPF messages and codes for your version of z/OS](https://www.ibm.com/support/knowledgecenter/en/SSLTBW) for information about ISPF messages and codes for your version of z/OS.

---

**FEC994E** Invalid row number.

**Explanation:** CEXPAND was issued with an invalid parameter of zero. CEXPAND can be issued with no parameters and the cursor on a data field, or with two parameters. The two parameters are the row number, followed by the column number of the data element to be expanded. The row number is counted down from the top, starting with the first scrollable row (heading not counted) The column number is counted from left to right, starting with the left column in the current display window.

**User response:** Specify a valid parameter count for use with CEXPAND.
FEC995E  Invalid column number.

Explanation:  CEXPAND was issued with an invalid parameter of zero.  CEXPAND can be issued with no parameters and the cursor on a data field, or with two parameters.  The two parameters are the row number, followed by the column number of the data element to be expanded.  The row number is counted down from the top, starting with the first scrollable row (heading not counted) The column number is counted from left to right, starting with the left column in the current display window.

User response:  Specify a valid parameter count for use with CEXPAND.

FEC996E  Invalid digits.

Explanation:  CEXPAND was issued with an invalid parameter of zero.  CEXPAND can be issued with no parameters and the cursor on a data field, or with two parameters.  The two parameters are the row number, followed by the column number of the data element to be expanded.  The row number is counted down from the top, starting with the first scrollable row (heading not counted) The column number is counted from left to right, starting with the left column in the current display window.

User response:  Specify a non-zero parameter.

FEC997E  Too many digits.

Explanation:  CEXPAND was issued with an invalid parameter of zero.  CEXPAND can be issued with no parameters and the cursor on a data field, or with two parameters.  The two parameters are the row number, followed by the column number of the data element to be expanded.  The row number is counted down from the top, starting with the first scrollable row (heading not counted) The column number is counted from left to right, starting with the left column in the current display window.

User response:  Specify a valid parameter count for use with CEXPAND.

Accelerator Loader server reason codes

The Accelerator Loader server produces reason codes that are used for troubleshooting TCP/IP and DRDA related issues.

Reason codes appear in system messages and driver messages.  For example, the following message includes a reason code, which, in this case, indicates that the password is missing:

Unable to connect to DB subsystem DBAA; Return code 8, Reason code 00BAD044

The following table lists the available reason codes.

<table>
<thead>
<tr>
<th>Reason codes</th>
<th>Short description</th>
<th>Detailed description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0X00BAD002</td>
<td>No query to continue</td>
<td>Indicates an internal error has occurred where an internal continue query command has been executed and there is not any query currently open.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Processing:</strong> Fails and request is terminated</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Action:</strong> See Server Trace for additional details of error.</td>

<td>Detailed description</td>
</tr>
<tr>
<td>--------------</td>
<td>-------------------</td>
<td>----------------------</td>
</tr>
<tr>
<td>0X00BAD00B</td>
<td>Abnormal end of work condition occurred</td>
<td>DRDA AS has returned a DRDA code point ABNUOWRM indicating an abnormal unit of work was encountered by the DB Server. For example, the reply message ABNUOWRM may be chained to an SQLCARD data object that carries the name of a resource involved in a deadlock that generated a relational database rollback operation. <strong>Processing:</strong> Current request is terminated <strong>Action:</strong> See Server Trace for additional details of error.</td>
</tr>
<tr>
<td>0X00BAD00C</td>
<td>Permanent Agent Error</td>
<td>DRDA AS has returned a DRDA code point which indicates the Server is failing the request. The Server Trace will normally report DRDA Server info in the form of Server Diagnostic messages as the DB Server provides. One example would be calling a Stored Procedure and the data passed to the SPC generated an ABEND via Data Execution. Threads may also generate a Permanent Agent Error when the DRDA VRF has a connection open in an in-doubt state and z/OS Db2 has terminated the thread. <strong>Processing:</strong> Current request is terminated. <strong>Action:</strong> See Server Trace for additional details of error. For Terminated Threads, a new connection should be established and commit / rollback processing should be used to insure the connection does not enter an in-doubt state for Idle Time set in Db2. For SPC Data Exceptions ensure the data passed to Stored Procedures is valid for the data type.</td>
</tr>
<tr>
<td>0X00BAD00D</td>
<td>Not Authorized To Use Command</td>
<td>DRDA AS has returned a DRDA code point CMDATHRM indicating the currently authenticated USERID is not authorized to issue the current command. </table>
| 0X00BAD010       | Manager Level Conflict      | DRDA AS has returned a DRDA code point SQLAM or MGRVLRLRM that is not supported by the DRDA VRF code base. By default the DRDA VRF requests SQLAM level 8 and the target DRDA AR should indicate if the DRDA AS supports the requested SQLAM or drops down to a supported SQLAM value. This should not occur unless there is a mismatch in the DRDA AS and the DRDA AR (VRF).  
**Processing:** Current request is terminated and normally will only occur during the initial DRDA connection.  
**Action:** See Server Trace for additional details of error. If the SQLAM is used on the DEFINE DATABASE be sure to use a value supported by the DRDA AS. |
| 0X00BAD011       | Manager Dependency Error    | DRDA AS has returned a DRDA code point MGRDEPRM. Reply Message indicates that a request has been made to use a manager, but the requested manager requires specific support from some other manager that is not present.  
**Processing:** Current request is terminated and normally will only occur during the initial DRDA connection.  
**Action:** See Server Trace for additional details of error. |
| 0X00BAD012       | Unexpected Server Reply (%s (PRCCNVCD)) | DRDA AS has returned a DRDA code point PRCCNVRM. Reply Message indicates that a conversational protocol error occurred. The response displayed is the DRDA AS Server reply code that is not expected.  
**Processing:** Current request is terminated.  
**Action:** See Server Trace for additional details of error. |
| 0X00BAD013       | Parameter Not Supported (%s) | DRDA AS has returned a DRDA code point PRMNSPRM. Reply Message indicates that the specified parameter is not recognized or not supported for the specified command. The response displayed is the DRDA AS Server parameter code that is not expected/supported.  
**Processing:** Current request is terminated.  
**Action:** See Server Trace for additional details of error. |

| 0X00BAD014   | Resource Limits Reached(%) Diagnostic Info: %s | DRDA AS has returned a DRDA code point RSCLMTRM. Reply Message indicates that the requested command could not be completed due to insufficient target server resources. Examples of resource limitations are as follows:  
- The target agent has insufficient memory to keep track of DCLFIL collections.  
- The lock manager cannot obtain another lock.  
- The communications manager send or receive buffer overflowed.  
- The target server lacks the memory or storage resource to create the instance of the manager requested. For example, an ACCRDB command could not create a target SQLAM manager because of the target server resource limitations.  

The message provide details on the limit reached followed by some Diagnostic information.  

**Processing:** Current request is terminated.  

**Action:** See Server Trace for additional details of error. |
| 0X00BAD015   | Data Stream Syntax Error (%8.8x) | DRDA AS has returned a DRDA code point SYNTAXXM. Reply Message indicates that the data sent to the target agent does not structurally conform to the requirements of the DDM architecture. The target agent terminated parsing of the DSS when the condition SYNERCD specified was detected. The DRDA AR (VDF) code base will report the syntax error in the message.  

**Processing:** Current request is terminated.  

**Action:** See Server Trace for additional details of error. Contact software supplier with full trace of the error along with version of the Db2 and any SQL that is processed. Full DRDA READ/WRITE tracing will provide best diagnostic information. |
| 0X00BAD017   | Incorrect object length | DRDA AS has returned a DRDA code point SYNTAXXM. Reply Message indicates that the data sent to the target agent does not structurally conform to the requirements of the DDM architecture. The target agent terminated parsing of the DSS when the condition SYNERCD specified was detected. The error indicates a length error for an object.  

**Processing:** Current request is terminated.  

**Action:** See Server Trace for additional details of error. Contact software supplier with full trace of the error along with version of the Db2 and any SQL that is processed. Full DRDA READ/WRITE tracing will provide best diagnostic information. |

</table>
| 0X00BAD02D   | Failed to access database %s | DRDA AS has returned a DRDA code point RDBNACRM. Reply Message indicates that the access relational database command (ACCRDB) was not issued prior to a command requesting RDB services. The message provides the name of the remote DB that failed to be accessed on the Target DRDA AS.  
**Processing:** Current request is terminated.  
**Action:** See Server Trace for additional details of error. Contact software supplier with full trace of the error along with version of the Db2 and any SQL that is processed. Full DRDA READ/WRITE tracing will provide best diagnostic information. |
| 0X00BAD02E   | Connection to application server %s would exceed limit | DRDA AS has returned a DRDA code point RDBAFLRM. Reply Message specifies that the relational database (RDB) failed the attempted connection. The DRDA VRF code base returns this error via the SQLCARD object that follows the RDBAFLRM code point. The message will explain why the RDB failed the connection.  
**Processing:** Current request is terminated.  
**Action:** See Server Trace for additional details of error and the SQLCODE following the error. Normally indicates the target DB Server cannot accept any new connections. |
| 0X00BAD02F   | Object not supported | DRDA AS has returned a DRDA code point OBJNSPRM. Reply Message indicates that the target server does not recognize or support the object specified as data in an OBJDSS for the command associated with the object. The OBJNSPRM is also returned if an object is found in a valid collection in an OBJDSS (such as the RECAL collection) that is not valid for that collection.  
**Processing:** Current request is terminated.  
**Action:** See Server Trace for additional details of error. Contact software supplier with full trace of the error along with version of the Db2 and any SQL that is processed. Full DRDA READ/WRITE tracing will provide best diagnostic information. |
| 0X00BAD030   | Descriptor received does not match associated data | DRDA AS has returned a DRDA code point DTAMCHRM. Reply Message which indicates that:  
• The descriptor received did not violate any Formatted Data Object Content Architecture (FD:OCA) or (DRDA) rules and was successfully assembled.  
• The data received did not match the received descriptor. That is, the amount of data received did not match the amount of data expected.  
**Processing:** Current request is terminated.  
**Action:** See Server Trace for additional details of error. Contact software supplier with full trace of the error along with version of the Db2 and any SQL that is processed. Full DRDA READ/WRITE tracing will provide best diagnostic information. |

### Tools Customizer troubleshooting

Use this information to diagnose and correct problems that you experience with Tools Customizer.

### Gathering diagnostic information

Before you report a problem with Tools Customizer to IBM Software Support, you need to gather the appropriate diagnostic information.

**Procedure**

Provide the following information for all Tools Customizer problems:

- A clear description of the problem and the steps that are required to re-create the problem
- Relevant screen captures
- All messages that were issued as a result of the problem
- Product release number and the number of the last program temporary fix (PTF) that was installed
- The version of Db2 that you are using and the type and version of the operating system that you are using
- The Tools Customizer trace data set
- The Tools Customizer data store data set and the `high_level_qualifier.SCCQTENU` data set

### Determining the trace data set name

You will need to identify the name of the trace data set if you cannot allocate the trace data set, the trace data set runs out of space, or IBM Software Support asks for it.
The name of the trace data set depends on the prefix setting in the TSO profile. To identify the name of the trace data set, you must know the prefix setting.

- If PREFIX is set, the name of the trace data set is prefix.CCQ.TRACE, where prefix is the TSO prefix that you specified in the profile.
- If NOPREFIX is set, the name of the trace data set is user_ID.CCQ.TRACE, where user_ID is your TSO user ID.

**Accelerator Loader troubleshooting**

Use this information to diagnose and correct problems that you experience with Accelerator Loader.

**Monitoring load job progress**

Monitor the progress of active Accelerator Loader load jobs.

**About this task**

Accelerator Loader provides a way to monitor load processing by periodically issuing a product message that reports the number of rows that have been loaded. The interval (in rows loaded) at which the message is issued is controlled by the parameter ACCEL_ROWS_REPORT_THRESHOLD. This parameter value is set globally in Tools Customizer using the parameter Report loaded rows threshold, and it can also be overridden for a specific job by specifying the keyword ACCEL_ROWS_REPORT_THRESHOLD as part of the utility syntax for the job.

This setting is described as follows:

**Report loaded rows threshold (ACCEL_ROWS_REPORT_THRESHOLD)**

The threshold (in rows) to use when reporting the number of rows that have been loaded for a job. Message "HLOU5062I" on page 714, which includes the cumulative number of rows loaded for the job, is issued to the Accelerator Loader job SYSPRINT each time the threshold value is met. Note that the message will be issued when the threshold is exceeded but will contain the current row count in the loading process, which might be more than the value specified. Valid values are integers in the range 0 - 2147483647. A value of 0 specifies that no reporting messages will be issued.

**Note:** You can also report the number of rows that have been loaded for a job to the Accelerator Loader started task by using the **DISPLAY SESSIONS** console command. For more information, see "Console commands for the Accelerator Loader started task“ on page 1026.

**Procedure**

Perform either of the following steps to specify the threshold (in rows) to use when reporting the number of rows that have been loaded for a job. If you specify a value of 0, no reporting messages will be issued.

- To set the threshold amount globally, use Tools Customizer to set the **Report loaded rows threshold** parameter. See "Task: Create the started task and its components (required)” on page 46.
- To set the threshold amount for a specific IDAA_ONLY, IDAA_DUAL or HALOAD utility batch job, overriding the global setting, include the
ACCEL_ROWS_REPORT_THRESHOLD parameter in the job syntax. The following example shows the parameter with an override threshold value of a million rows:

```
LOAD DATA REPLACE
  IDAA_DUAL ON IDAAS07
  ACCEL_ROWS_REPORT_THRESHOLD 1000000
  INTO TABLE "HL0IVPDB"."HL0IVPT1"
```

For more information, see Chapter 11, “Syntax,” on page 311.

**Results**

Each time the threshold value is met, the following message is issued to the Accelerator Loader job SYSPRINT:

```
HL0U5062I Rows loaded: number_of_rows_loaded
```

where `number_of_rows_loaded` is the cumulative number of rows that have been loaded for the job.

**Gathering diagnostic information**

If you encounter a problem and need to contact IBM Software Support, you must gather certain information about your Accelerator Loader system and the problem before contacting Support. Your Support representative will need this information to correctly diagnose and resolve the problem.

Provide Support with the following types of diagnostic information:

- The Accelerator Loader version.
- The identifier for the latest Accelerator Loader APAR or PTF that has been applied on your system.
- The operating system type, version, and maintenance level.
- Your Db2 version and whether you are using Db2 data sharing.
- All output from the Accelerator Loader started task.
- `(DSNUNITLB intercept users only)` All output for the Db2 utility execution for which the problem occurred
- `(Batch interface users only)` All output from your Accelerator Loader batch job.
- `(ISPF interface users only)` A description of the activity that you were performing in the interface when the problem occurred, including a screen capture of the relevant ISPF panel, if possible. Also, provide the contents of the log for the TSO user who was using the interface.
- All output from stored procedures address spaces.
- The complete contents of any dumps that Support requested. See “Producing dumps for diagnostic use.”
- All output from the Accelerator Loader server.
- Server trace data for the problem.
- Any messages in the z/OS System Log that might pertain to the problem.

Your Support representative will provide instructions for transmitting this information.

**Producing dumps for diagnostic use**

You might need to provide a dump to help Support diagnose a problem that you report.
About this task

You should request only one dump at a time on your z/OS system. For detailed information about the DUMP command, including descriptions of the SDATA options, see the IBM publication *MVS System Commands*.

Procedure

1. The JCL contains a SYSMDUMP DD statement that directs the system to produce a dump.

2. For problems related to the Load from External feature:
   - To produce a system dump of the started task address space only, you can issue the following Modify operator command from the z/OS console:
     ```
     F started_task_name,DUMP
     ```
     where `started_task_name` is the name of the Accelerator Loader started task configuration.
   - To produce a system dump of multiple address spaces (for example, a dump of the address spaces for the started task and the user interface that you are using), issue the MVS DUMP command from the z/OS console:
     ```
     DUMP COMM=(dump_title)
     Rid, JOBNAME=(name1, name2, ...), SDATA=(CSA, LPA, LSQA, PSA, RGN, SUM, SWA, TRT)
     ```
     Where:
     - `dump_title` is a name that you assign to the dump.
     - `id` is the reply identification number, as specified in system message IEE094D.
     - `name2, name2, ...` are values that identify the Accelerator Loader address spaces to dump. A name value can be:
       - The started task name (if you are dumping the started task address space)
       - A batch job name (if you are dumping a batch interface job or a DSNUTILB batch job)
       - The TSO user ID of an ISPF interface user (if you are dumping the ISPF interface address space)
     - `SDATA` specifies the options that indicate the specific storage areas to dump.

What to do next

After you produce a dump, send it to Support. Your Support representative will provide transmittal instructions.

Cleaning up common storage after a job fails

The Tools Customizer generates several jobs into the SAMPLIB when you select the step *Create repository maintenance members* on the Product Parameters panel during customization. One of these jobs, HLO#PIPE, runs the pipe cleanup utility program HLOCOMCL.

Generally, running the pipe cleanup utility is not necessary. Accelerator Loader determines whether a table is actually being simultaneously loaded by another Accelerator Loader job. If it is not, Accelerator Loader cleans up the common storage without ending the job and issuing an error.
However, you might occasionally need to run the pipe cleanup utility to clean up
the common storage to avoid errors with the data pipe when an Accelerator Loader
job fails and the common storage is not cleaned up.

The following messages might indicate conditions that require you to run the pipe
cleanup utility:
- Function=01 RC=03 in message HLOUS5700E: Error from call to HLOPIPE from
  HLOUSE35 Function=01 RC=03
- HL03623E: A table was specified that was already being loaded.

Note: It is possible that another job is running against the same table. In this case,
do not run the pipe cleanup utility. Doing so will corrupt the other job. Because of
risks associated with HLOPIPE, run it only under the guidance of IBM Software
Support.

Cleaning up the common storage for a table

You can use the pipe cleanup utility to clean up the common storage for an
individual table within the SSID (that is, remove just the specified table from
storage and retain all other common storage). Using the pipe cleanup utility to
perform this task might be useful when Accelerator Loader jobs repeatedly result
in the error HL03623E: A table was specified that was already being loaded.
Unless it references the same specified table, no other Accelerator Loader job will
be corrupted.

To clean up the common storage for a table, edit HLOPIPE to specify a table
creator and name as shown in the following example. The maximum number of
characters for creatortablename is 128 and it cannot exceed column 72; continue on
the next line in column 1. No special character is needed.

```
//TABLE DD *
creator.tablename
/*
```

Cleaning up the common storage for a job

You can use the pipe cleanup utility to clean up the common storage for a specific
unsuccesful Accelerator Loader job run. Using the pipe cleanup utility to perform
this task might be useful when a job ended abnormally and you know that the
ABEND led to the error HL03623E: A table was specified that was already
being loaded. Unless the job that you specify is currently running, no other
Accelerator Loader job will be corrupted.

To clean up the common storage for a job, edit HLOPIPE to specify a job ID and
job name in the order that is shown in the following example. In the example,
#jobid# is the SDSF output job number.

```
//JOB DD *
#jobid#
#jobname#
/*
```

Accelerator Loader studio and Accelerator Loader server
troubleshooting

Use this information to diagnose and correct problems that you experience when
using the Accelerator Loader studio and the Accelerator Loader server.
Troubleshooting studio issues

To make sure that studio messages are included in the server trace output, verify that you have enabled server trace for the studio. For more information, see “Server Trace” on page 258.

Troubleshooting server issues

Accelerator Loader server provides diagnostic tools and information that can be used to diagnose, debug, and correct problems. For more information, see “Monitoring” on page 448.

Changing network connections

If an attempt to create a virtual table or a source library fails with error message HTTP 401/403, changing network connections might resolve the issue.

About this task

Active Providers controls the profile that is used when opening connections. Values are as follows:

- **Native** (default): Settings that are discovered in the operating system (OS) are used. If the OS has proxy settings, the URL request might fail to find the server.
- **Direct**: Connections are opened without the use of a proxy server.
- **Manual**: Settings that are defined in Eclipse are used.

Procedure

1. From the **Window** menu, select **Preferences**>**General**>**Network Connections**>**Active Providers**.
2. Choose Direct.

Verifying that Unicode is installed

The Accelerator Loader server requires Unicode for translation.

Procedure

1. To show the status of available conversions and whether the conversion services are initialized, issue the following MVS system command:
   
   `/D UNI, ALL`

   You should receive the following output:

   ```
   CUN3000I 11.36.02 UNI DISPLAY 277
   ENVIRONMENT:  CREATED   01/13/2006 AT 14.52.07
                  MODIFIED  01/13/2006 AT 14.52.09
   IMAGE CREATED 02/16/2005 AT 10.13.49
   SERVICE:     CHARACTER  CASE        NORMALIZATION COLLATION
   STORAGE:     ACTIVE       427 PAGES
   LIMIT       1564 PAGES
   CASECONV:    NORMAL
   NORMALIZE:   DISABLED
   COLLATE:     DISABLED
   CONVERSION:  00037-00437-E  00037-00437-R
                  00037-00367-E
                  00037-00437-R
                  00037-01208-R
                  00939-00942-RE
                  00939-00942-R
                  00939-00942-R
                  00939-00942-R
                  00939-00942-R
                  01027-00367-E
                  01027-01208(13488)-R
                  01027-01208-R
                  01027-01041-E
                  01027-01041-R
                  01027-00930-RE
   ```
2. In the output, locate the following code conversion pages for Unicode, which are the defaults that Accelerator Loader server uses:
   - 1208 to 1047
   - 1047 to 1208

*Conversion CCSID table*

The Accelerator Loader server provides multicultural support.

Identify the Coded Character Set Identifiers (CCSID) that is used at your site. The following table lists CCSIDs that the server provides by default and the conversion technique.

*Table 37. Conversion CCSID*

</table>
Correcting character display problems (DRDA only)
Depending on the CCSID that you use, you might encounter incorrectly displayed characters in the studio for DRDA sources. To resolve the issue, instruct the server to load the required character translation tables.

Before you begin
- Verify that Unicode is installed (see “Verifying that Unicode is installed” on page 946).
Verify that your code page is installed (see “Conversion CCSID table” on page 947). If your code page is not listed in the table, add it as described in this task.

Determine whether you have the character display problem:

1. In the Accelerator Loader studio Server view, browse the SQL metadata for DRDA. Choose SQL > Data > Other Subsystems.
2. When navigating the tree, if you encounter garbled names, it is possible that the server was unable to perform the required character translation when accessing the catalog data. To confirm this problem and establish the CCSID values that are involved, review the server trace and search for messages similar to the following:
   
   ```
   Assert Warning(UCSconvertCCSIDs): No matching UCS conversion - source CCSID ccsid1, target CCSID ccsid2
   ```

**Procedure**

1. Locate data set hlq.SHLVEXEC member hlvidIN00, where hlvid represents the name of the Accelerator Loader server started task that was customized by using Tools Customizer.
2. Locate the section for DRDA data sources and add the following statements:
   
   ```
   "DEFINE CONV SOURCE(ccsid1) TARGET(ccsid2) TECH(RE)"
   "DEFINE CONV SOURCE(ccsid2) TARGET(ccsid1) TECH(RE)"
   ```

   where
   
   - Source and target ccsid1 and ccsid2 are the CCSID values that are shown in the server trace messages.
   - TECH specifies the technique to be used in the conversion (Roundtrip then Enforced Subset). For more information about character conversion, see the IBM z/OS Unicode Services User’s Guide and Reference.

**Managing DSNUTILB interception**

You can manage DSNUTILB interception by performing some routine and occasional tasks.

On a routine basis, check the messages from utility processing to determine whether DSNUTILB interception occurred and whether the Accelerator Loader batch job was correctly processed. Occasionally, you might do other tasks, for example, check the activation status of the intercept, diagnose interception problems, terminate a utility for which interception has occurred and clean up the associated worklist data, or restart a utility from the appropriate point when a normal Db2 restart fails.

**Determining whether DSNUTILB intercept processing occurred**

You can check whether DSNUTILB intercept processing occurred as you expected for the Db2 LOAD utility by checking the Accelerator Loader messages that are incorporated into the SYSPRINT data set for the utility job and the SYSPRINT data set for the Accelerator Loader started task. Use SDSF or an equivalent tool to view this information.

**Messages in the SYSPRINT data set for a Db2 utility**

The following table explains the key Accelerator Loader messages on DSNUTILB interception that can occur in the SYSPRINT data for a Db2 utility. Look for these messages to determine whether interception processing completed as intended. The messages are described in the order in which they appear in the SYSPRINT data set.
Messages that are issued for a worklist step (a utility command) are often paired; the first message provides the step number of the worklist step, and the second message provides the return code for that worklist step. A return code of less than 8 is ignored; DSNUTILB intercept processing continues. A return code of 8 or higher indicates that an error occurred and DSNUTILB intercept processing terminated abnormally. The return codes in messages that pertain to thread-cancellation processing can be from either the DSNUTILB intercept or the batch interface. The intercept calls the batch interface during intercept processing.

Table 38. Intercept messages in the utility SYSPRINT data set

</tbody>
</table>

For utility enhancements that modify the original DSNUTILB SYSIN stream (the additional options for the LOAD utility), messages HLOU5330, HLOU5331, and
HLOU5332 are also written to the SYSPRINT data set to present the enhanced DSNUTILB SYSIN stream. To determine whether the SYSIN was correctly processed, compare this SYSIN stream for the utility with the subsequent DSNUTILB messages.

**Messages in the SYSPRINT data set for the started task**

The following table explains the key messages on DSNUTILB intercept processing that can occur in the SYSPRINT data set for the started task.

*Table 39. Intercept messages in the started task SYSPRINT data set*

<td></td>
</tr>
</tbody>
</table>

**Displaying the DSNUTILB intercept status**

You can write the DSNUTILB intercept status (Enabled or Disabled) to the SYSPRINT data set that is allocated to the started task by specifying a z/OS console command. This feature is useful when you need to quickly check the current intercept status.

**Procedure**

To display the current intercept status, specify the following Modify operator command from the z/OS console:

```
F hlostc,DISPLAY INTERCEPT[,GLOBAL|ALL]
```

Where hlostc is the member name of the Accelerator Loader PROC in the system PROCLIB.

If you use SDSF, include a forward slash (/) in front of the Modify command, as follows:

```
/F hlostc,DISPLAY INTERCEPT[,GLOBAL|ALL]
```

If you issue the command without the optional GLOBAL or ALL parameter, the command displays the local status that is set for the specified started task only. If you specify the GLOBAL parameter, the command displays the global interception status.
status that is set for the entire z/OS image. If you specify the ALL parameter, the command writes all of the following information to the SYSPRINT data set: the local interception status; the global interception status; and a list of the Db2 SSIDs for which DSNUTILB interception is occurring, including the HLOID (configuration ID) of the started task that is involved in intercept processing.

Results

After issuing the command, navigate to the SYSPRINT data set for the started task to view the command output.

Example

The following example displays the messages that resulted from the DISPLAY INTERCEPT,ALL command. These messages indicate the local intercept status, the global intercept status, and the SSID of the single subsystem for which DSNUTILB interception is occurring.

**HLOS0814I** date_timestamp Command issued: DISPLAY INTERCEPT,ALL

**HLOS0817I** date_timestamp LOCAL DSNUTILB intercept status is: ENABLED

**HLOS0817I** date_timestamp GLOBAL DSNUTILB intercept status is: ENABLED

**HLOS0822I** date_timestamp DB2 SSID=DBP1 B10 HLOID=HLO01 DSNUTILB interception is installed

**Terminating a Db2 utility using the HLOMAINT utility**

If you need to terminate a Db2 utility for which DSNUTILB intercept processing is occurring or has occurred, you should use the HLOMAINT utility that Accelerator Loader provides to do so.

About this task

The HLOMAINT utility both issues the Db2 -TERM UTILITY command for a specific utility ID and removes the worklist rows that contain that utility ID from all intercept worklist tables in the Accelerator Loader repository.

If you manually issue the Db2 -TERM UTILITY command instead, you should still run the hloidMAINT utility to remove the data for the terminated utility (utility ID) from the worklist tables. If the data for the terminated utility remains in the worklist tables and you restart the utility, the DSNUTILB intercept will attempt to resume utility processing from the beginning of the current worklist step, as identified in the worklist tables.

Procedure

1. Ensure that the Accelerator Loader started task is running and that the Db2 plan for Accelerator Loader is bound on the subsystem against which the Db2 utility is running.

2. Customize the JCL for the HLOMAINT utility, which is located in the hloidMNT member (where hloid is the Accelerator Loader configuration ID) in the hlq.mlq.SHLOSAMP library, as follows:

   **Remember:** Tools Customizer creates a separate hloidMNT member for each started task configuration that you define.

   a. Add a job card, if necessary. If you specified a job card template when you ran Tools Customizer, that job card information should already be present.

   b. In the EXEC statement, set the following options on the PARM:

   ```
   PARM='hloid,#FUNCTION#,#DB2SSID#,UTILITY_ID#
   ```

   where:
• *hlolid* is the configuration ID of the Accelerator Loader started task that you are using to perform DSNUTILB interception. You specified this value in Tools Customizer during customization, and Tools Customizer inserts this value for you.

• #FUNCTION# must be the value TERM_UTILITY (the name of the function for terminating a Db2 utility and cleaning up the worklist tables).

• #DB2SSID# represents the subsystem identifier (SSID) of the Db2 subsystem against which the Db2 utility is running.

• #UTILITY_ID# represents the Db2 identifier (UTILID) for the Db2 utility.

c. In the STEPLIB DD statement, specify the high-level qualifier (?HLQ?) and the mid-level qualifier (?MLQ?) for the HLOLOAD library, if necessary. Tools Customizer inserted these values for you.

3. Submit the HLOMAINT job for execution.

**Results**

The HLOMAINT utility terminates the Db2 utility and removes all data that is associated with the utility ID from the worklist tables.

**Terminating a Db2 utility using HLORESET**

You can terminate a Db2 utility for which DSNUTILB intercept processing is occurring or has occurred and perform the associated maintenance tasks related to DSNUTILB interception by specifying the Accelerator Loader value HLORESET on the EXEC statement for the DSNUTILB program.

**About this task**

Using this method, you can terminate a stopped utility (if one exists), perform the associated maintenance tasks, and issue the new DSNUTILB request, all in one job.

**Note:** If you use the HLOMAINT utility directly, you must submit a job to use the HLOMAINT utility to terminate a stopped utility and perform the associated maintenance tasks, and then you must submit another job to run DSNUTILB.

To be used with an existing parameter for the DSNUTILB program, Accelerator Loader provides the value, HLORESET, which disallows any restart of external LOAD utility execution. This parameter value is only tolerated when DSNUTILB execution is intercepted through the DSNUTILF exit under the control of Accelerator Loader.

The DSNUTILB program accepts three standard parameters, as shown in the following EXEC statement:

```
//stepname EXEC PGM=DSNUTILB,PARM='system,[uid],[utproc]' 
```

The *utproc* parameter is optional and specifies a restart option. In addition to the standard values allowed by DSNUTILB, *utproc* can be coded with the Accelerator Loader value HLORESET. The HLORESET specification directs the Accelerator Loader intercept to perform the following tasks prior to running DSNUTILB:

1. Terminate any stopped utility with utility ID *uid* with the Db2 -TERM UTILITY command.
2. Delete all rows in the following Accelerator Loader status tables associated with utility ID *uid*:
   • HLOOBJSTAT
3. Restore the object space status if changed by Accelerator Loader due to a prior LOAD of a table in CDC replication state.

These actions are identical to running the HLOMAINT utility with the following parameters:

```
PARM='hloid,TERM_UTILITY,ssid,uid'
```

### Procedure

To terminate any stopped, intercepted utility and perform the associated maintenance tasks related to DSNUTILB interception prior to running DSNUTILB, include the HLORESET specification on the EXEC statement for the DSNUTILB program. The following example shows the syntax for an EXEC statement for the DSNUTILB program:

```
//stepname EXEC PGM=DSNUTILB,PARM='system,[uid],[utproc]'
```

**utproc** Specifies the restart processing behavior, as provided by the standard values allowed by DSNUTILB. To terminate a Db2 utility for which DSNUTILB intercept processing is occurring or has occurred and perform the associated maintenance tasks related to DSNUTILB interception, specify the following Accelerator Loader value:

**HLORESET**

Before running DSNUTILB, terminate any stopped, intercepted utility with utility ID uid and perform the associated maintenance tasks related to DSNUTILB interception. Also, restore the object space status if it was changed by Accelerator Loader due to a prior LOAD of a table in CDC replication state.

The following statement provides an example of using the new HLORESET specification:

```
//HLOLOAD EXEC PGM=DSNUTILB,PARM='RA1B,HLOIVP,HLORESET'
```

After the stopped utility is terminated and the associated maintenance tasks are performed, or if no stopped utility exists, the DSNUTILB request is processed. No additional modifications to existing JCL are required. For more information on the standard DSNUTILB parameters, see the *IBM Db2 Utility Guide and Reference*.

### Restarting a Db2 utility in exceptional circumstances

In certain circumstances, you can use the Accelerator Loader HLOMAINT utility to resume utility processing properly.

### About this task

When a Db2 utility for which DSNUTILB interception is occurring terminates abnormally, Db2 can usually resume utility processing from the appropriate point, without any special user intervention, when you restart the utility. However, when
Accelerator Loader is intercepting the LOAD utility for loading data onto the accelerator, and the LOAD utility fails for any reason, the utility ID in the worklist tables must also be restarted.

Consider using the HLOMAINT utility for restart purposes when an event such as an abend of the Accelerator Loader started task or of Db2 occurs and causes the Db2 utility to end before Accelerator Loader has recorded the status of the last utility-command operation within a worklist step in the intercept worklist tables. In this situation, you can use the HLOMAINT utility to resume utility processing from the last utility-command operation in the current worklist step, from the next operation within the current worklist step, or from the next worklist step.

**Procedure**

1. Ensure that the Accelerator Loader started task is running and that the Db2 plan for Accelerator Loader is bound on the subsystem against which the Db2 utility is running.

2. Customize the JCL for the HLOMAINT utility, which is located in the hlloidMNT member (where hlloid is the Accelerator Loader configuration ID) in the hlq.mlq.SHLOSAMP library, as follows:

   **Remember:** Tools Customizer creates a separate hlloidMNT member for each started task configuration that you define.

   a. Add a job card, if necessary. If you specified a job card template when you ran Tools Customizer, that job card information should already be present.

   b. In the EXEC statement, set the following options on the PARM:

   ```parma=hlloid,#FUNCTION#,#DB2SSID#,#UTILITY_ID#```

   where:

   • `hlloid` is the configuration ID of the Accelerator Loader started task that you are using to perform DSNUTILB interception. You specified this value during customization.

   • `#FUNCTION#` must be one of the following literal values, which identifies the restart function you want to use:

   - `FORCE_RESTART` - Sets the status of the last utility-command operation within the current worklist step (the operation for which the status was not recorded when the utility ended) such that the utility will be forced to restart from that operation.

   - `MARK_COMPLETE` - Sets the status of the last utility-command operation within the current worklist step (the operation that completed but was not recorded as complete when the utility ended) to complete. Accelerator Loader assumes that the utility-command operation completed successfully. When you restart the Db2 utility, it will resume intercept processing from the beginning of the next operation in the current worklist step.

   - `STEP_ADVANCE` - Sets the status of the current worklist step to complete. When you restart the Db2 utility, it will resume intercept processing from the beginning of the next worklist step. You should specify this function only if you are prepared to manually perform any required operations that the intercept did not finish for the current worklist step before the status of that worklist step was set to complete. For example, you might need to manually drop the mapping tables and mapping-table indexes that were created for the REORG TABLESPACE utility or to reset the access statuses of Db2 objects for which threads were blocked.
- TERM_Utility - Terminates the utility instead of restarting it. For more information, see “Terminating a Db2 utility using the HLOMAINT utility” on page 954.

- #DB2SSID# represents the subsystem identifier (SSID) of the Db2 subsystem against which the Db2 utility is running.
- #UTILITY_ID# represents the Db2 identifier (UTILID) for the Db2 utility.

c. In the STEPLIB DD statement, specify the high-level qualifier (?HLQ?) and the mid-level qualifier (?MLQ?) for the HLOLOAD library, if necessary. Tools Customizer inserted these values for you.

3. Submit the HLOMAINT job for execution.

4. When the HLOMAINT job completes, restart the Db2 utility. The utility will resume processing based on the function that you specified.
Chapter 15. Reference

These reference topics provide you with quick access to information about Accelerator Loader customization and functionality.

Tools Customizer terminology and data sets

Before you use Tools Customizer, you should understand the Tools Customizer terminology and the data sets that Tools Customizer uses during customization.

Tools Customizer terminology

Tools Customizer uses several unique terms that you should be familiar with before you begin to use Tools Customizer.

Products and components

How an IBM Tool is packaged determines whether it is referred to as a product or as a component in the Tools Customizer documentation and interface. An IBM Tool that is ordered as a stand-alone entity (that is, not as part of a solution pack) is referred to as a product. An IBM Tool that is part of a solution pack is referred to as a component. Some IBM Tools are available in both formats; therefore, the same IBM Tool can be referred to as a product or as a component depending on how it is packaged.

Db2 entry

You can customize Db2 Analytics Accelerator Loader on one or more Db2 entries. A Db2 entry can be any of the following items:

Db2 subsystem

A distinct instance of a relational database management system (RDBMS) that is not part of a data sharing group. An example of a Db2 subsystem name is DB01.

Db2 group attach name

The name that is used by the TSO/batch attachment, the call attachment facility (CAF), DL/I batch, utilities, and the Resource Recovery Services attachment facility (RRSAF) as a generic attachment name. An example of a group attach name is DSG1.

Db2 data sharing member

A Db2 subsystem that is assigned by the cross-system coupling facility (XCF) to a data sharing group. An example of a Db2 data sharing member name is DB02.

Tools Customizer maintains the following lists of Db2 entries:

Associated list

The list of Db2 entries that are associated with Db2 Analytics Accelerator Loader. If the product to be customized requires Db2 entries, you can customize Db2 Analytics Accelerator Loader only on Db2 entries that are in the associated list. When you customize Db2 Analytics Accelerator Loader, this list is displayed in the DB2 Entries, Associations, and Parameter Status section of the Customizer Workplace panel.
You can add and copy Db2 entries to the associated list. When you add or copy Db2 entries to the associated list, the entries are associated with Db2 Analytics Accelerator Loader.

**Master list**

The list of all Db2 entries that are defined but are not associated with Db2 Analytics Accelerator Loader. Tools Customizer obtains information about these Db2 entries either from entries that were created manually or from the customizations of other products that were discovered. If you remove a Db2 entry from the associated list, the Db2 entry is added to the master list. When you create a new Db2 entry, it is added to the master list, and when you associate the new entry with Db2 Analytics Accelerator Loader, it is removed from the master list and added to the associated list. The master list is displayed on the Associate a DB2 Entry for Product panel.

If the associated list does not have the Db2 entries on which you want to customize Db2 Analytics Accelerator Loader, you can associate existing entries from the master list to the associated list.

You can create new Db2 entries and copy existing entries to the master list.

**High-level qualifier**

The high-level qualifier is considered to be all of the qualifiers except the lowest level qualifier. A high-level qualifier includes a mid-level qualifier.

**Product parameters**

Parameters that are specific to Db2 Analytics Accelerator Loader. These parameters are defined by Db2 Analytics Accelerator Loader and are stored in a data member that is defined by Db2 Analytics Accelerator Loader.

**LPAR parameters**

Parameters on the local LPAR that are required to customize Db2 Analytics Accelerator Loader. These parameters are defined by Tools Customizer and are stored in an LPAR parameter data member.

**Db2 parameters**

Parameters for a Db2 entry. These parameters are defined by Tools Customizer and are stored in a Db2 parameter data member.

**Configuration**

A set of parameter values and selected tasks and steps that you use to generate the jobs that customize Db2 Analytics Accelerator Loader.

For example, you might want to have a test configuration and a production configuration on the same Db2 entry.

**Status type**

**Product, LPAR, and Db2 entry status type**

After you specify the product that you want to customize, the product, the LPAR, and the Db2 entries have a status. The status is partly based on whether required parameters are defined. For some products, LPAR parameters or Db2 parameters might not be required. In these cases, the status is Not Required.

To customize Db2 Analytics Accelerator Loader, all of the required parameters must be defined.
If required parameters for the product parameters, LPAR parameters, or Db2 parameters are not defined, the status of the parameters is Incomplete. Define values for parameters by manually editing them or by generating the customization jobs and specifying values for all of the required parameters that are displayed on the panels.

When values for all of the required parameters are defined, the status is Ready to Customize. Customization jobs can be generated only when all of the required parameters are defined and the status is Ready to Customize or Customized for the product parameters, LPAR parameters, and Db2 parameters for the Db2 entries on which Db2 Analytics Accelerator Loader will be customized.

The following table shows the meaning of the status types. Each status is defined differently for each type of parameter.

<table>
<thead>

Related tasks:

"Creating and associating Db2 entries“ on page 90
You can create new Db2 entries and associate them with Db2 Analytics Accelerator Loader.

"Copying Db2 entries“ on page 110
You can copy associated and not associated Db2 entries to other Db2 entries or to new Db2 entries.

"Removing Db2 entries“ on page 112
You can remove Db2 entries from the associated list.

Data sets that Tools Customizer uses during customization

Tools Customizer uses several unique data sets during the customization process. Familiarize yourself with these data sets before you begin to use Tools Customizer.

Several different data sets are required to customize Db2 Analytics Accelerator Loader with Tools Customizer. These data sets are supplied by Db2 Analytics Accelerator Loader, supplied by Tools Customizer, or allocated by Tools Customizer.

Db2 Analytics Accelerator Loader provides the following data sets:

Metadata library
Contains the metadata for the product to be customized. Tools Customizer uses the metadata to determine which tasks, steps, and parameters to display on the Product Parameters panel, the LPAR Parameters panel, and the DB2 Parameters panel. This data set also contains the templates that Tools Customizer uses to generate the customization jobs.

The metadata library naming convention is high_level_qualifier.SHLODENU, where high_level_qualifier is all of the segments of the data set name except the lowest-level qualifier.

You specify the metadata library on the Specify the Metadata Library panel. READ access to this data set is required.

Discover EXEC library
Contains the Db2 Analytics Accelerator Loader Discover EXEC. When you customize Db2 Analytics Accelerator Loader, you can use the Discover EXEC to automatically retrieve and store product information, such as parameter values from an already customized product. Tools Customizer saves the discovered information in the data store.

The default name of the data set is the high-level qualifier for the metadata library plus a lowest-level qualifier. For Db2 Analytics Accelerator Loader, the lowest-level qualifier is SHLODENU. You can change the default value on the Discover Customized Product Information panel. EXECUTE access to this data set is required.
Tools Customizer provides the following data sets:

**Tools Customizer metadata library**
Contains the metadata for the Db2 and LPAR parameters that are required to customize Db2 Analytics Accelerator Loader. Tools Customizer uses the metadata to determine which parameters to display on the DB2 Parameters panel and the LPAR Parameters panel. In addition, Tools Customizer uses information in the metadata library to determine whether additional Db2 and LPAR parameters need to be displayed on these panels. As you customize different products, different Db2 and LPAR parameters might need to be defined.

The default name of the data set is DB2TOOL.CCQ110.SCCQDENU. You can change the default value on the Tools Customizer Settings panel. READ access to this data set is required.

**Tools Customizer table library**
Stores information about jobs that are customized. Job information that is stored includes a description of the job, its member name and template name, the SSID, group attach name, and when the job was generated.

The default name of the data set is DB2TOOL.CCQ110.SCCQTENU. WRITE access to this data set is required.

Tools Customizer requires that the following data sets exist during the customization process. If the data sets do not exist, Tools Customizer automatically allocates them.

**Discover output data set**
Contains the output that is generated when you run the Db2 Analytics Accelerator Loader Discover EXEC. The Db2 Analytics Accelerator Loader Discover EXEC retrieves the metadata and values for the parameters from a previous customization of Db2 Analytics Accelerator Loader.

The default name of the data set is DB2TOOL.CCQ110.DISCOVER. You can change the default value on the Tools Customizer Settings panel or the Discover Customized Product Information panel. WRITE access to this data set is required.

**Data store data set**
Contains product, LPAR, and Db2 parameter values, and Db2 entry associations. Tools Customizer uses this data set to permanently store all information that is acquired about the product, Db2 subsystems or data sharing groups, and LPAR when you customize products on the local LPAR.

The default name of the data set is DB2TOOL.CCQ110.DA\_STOR. You can change the default value on the Tools Customizer Settings panel. WRITE access to this data set is required.

**Customization library**
Contains the customization jobs that Tools Customizer generates for Db2 Analytics Accelerator Loader.

Tools Customizer checks whether a customization library name was specified for more than one instance of the same version of the same product. If the same customization library name is specified for more than one product of the same version, the CCQD123E message is issued to prevent you from overwriting previously generated customization jobs. Ensure that you specify unique qualifier for the customization library for each instance of the product.
To customize Db2 Analytics Accelerator Loader, submit the members of the data set in the order in which they are displayed on the Finish Product Customization panel.

The data set naming convention is $hlq.LPAR_name$.xyzvrm, where:

- $hlq$ is the value of the Customization library qualifier field on the Tools Customizer Settings panel (CCQPSET)
- $LPAR_name$ is the four-character LPAR name
- $xyzvrm$ is the three-letter product identifier with the version, release, and modification level

For example, the data set name might be DB2TOOL.PRODUCT.CUST$MVS1$.XYZ410.

WRITE access to this data set is required.

Tools Customizer allocates the data sets for the discover output, the data store, and the customization library with the attributes that are shown in the following table:

<table>
<thead>
<tr>
<th>Data set</th>
<th>Organization</th>
<th>Record format</th>
<th>Record length</th>
<th>Block size</th>
<th>Data set name type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Discover output data set</td>
<td>PO</td>
<td>Variable block</td>
<td>16383</td>
<td>32760</td>
<td>LIBRARY</td>
</tr>
<tr>
<td>Data store data set</td>
<td>PO</td>
<td>Variable block</td>
<td>16383</td>
<td>32760</td>
<td>LIBRARY</td>
</tr>
<tr>
<td>Product customization library</td>
<td>PO</td>
<td>Fixed block</td>
<td>80</td>
<td>32720</td>
<td>LIBRARY</td>
</tr>
</tbody>
</table>

Restrictions:

- Multiple users cannot simultaneously share the discover output data set, data store data set, Tools Customizer metadata library, and metadata library.

How to read syntax diagrams

The following rules apply to the syntax diagrams that are used in this information:

- Read the syntax diagrams from left to right, from top to bottom, following the path of the line. The following conventions are used:
  - The >>> symbol indicates the beginning of a syntax diagram.
  - The --> symbol indicates that the syntax diagram is continued on the next line.
  - The ---> symbol indicates that a syntax diagram is continued from the previous line.
  - The -->< symbol indicates the end of a syntax diagram.
- Required items appear on the horizontal line (the main path).
- Optional items appear below the main path.
If an optional item appears above the main path, that item has no effect on the execution of the syntax element and is used only for readability.

- If you can choose from two or more items, they appear vertically, in a stack. If you must choose one of the items, one item of the stack appears on the main path.

- An arrow returning to the left, above the main line, indicates an item that can be repeated.

- Keywords, and their minimum abbreviations if applicable, appear in uppercase. They must be spelled exactly as shown. Variables appear in all lowercase italic letters (for example, column-name). They represent user-supplied names or values.

- Separate keywords and parameters by at least one space if no intervening punctuation is shown in the diagram.
• Enter punctuation marks, parentheses, arithmetic operators, and other symbols exactly as shown in the diagram.
• Footnotes are shown by a number in parentheses; for example, (1).

Accelerator Loader terminology

Db2 Analytics Accelerator Loader includes several unique terms. Ensure that you understand them before you begin to use the product.

**Accelerator-archived table/partition**
A table that has one or more of its partitions moved to the accelerator using the IBM Db2 Analytics Accelerator for z/OS High-performance Storage Saver (HPSS) feature.

**Accelerator-only table**
A table that exists on the accelerator only.

**Accelerator-shadow table**
A table that exists both in Db2 for z/OS and IDAA.

**Accelerator Loader server**
A mainframe-resident data access server that provides access to all data sources.

**Accelerator Loader studio**
A graphical user interface that you use to complete tasks to generate JCL to load data to the accelerator.

**Accelerator only load profile**
See profile types.

**Accelerator only table (AOT)**
A table that exists only in the accelerator. Db2 has a placeholder description for the table in the Db2 catalog, but no VSAM data sets exist for the object.

AOT See *Accelerator only table*.

**Consistent data load**
The process of using Accelerator Loader to process a group of tables in one batch job and load related sets of data to the accelerator to a common checkpoint.

**Consistent load profile**
See profile types.

**Db2 Analytics Accelerator**
See IBM Db2 Analytics Accelerator for z/OS.

**Db2 Direct**
An Accelerator Loader server feature that enables loading of data into an accelerator by reading Db2 VSAM linear data sets directly, without issuing an SQL statement against Db2 for z/OS.

**Dual load**
The process of using Accelerator Loader to load Db2 data on the accelerator and into Db2 simultaneously.

**Dual load profile**
See profile types.
External load
The process of using Accelerator Loader to update the data on the accelerator with data from a source other than Db2.

High availability load
The Accelerator Loader process of loading data to as many as four IBM Db2 Analytics Accelerator for z/OS (accelerators) in parallel from a single LOAD utility statement.

Historical data load
The process of using Accelerator Loader to process a group of tables in one batch job and load related sets of data to the accelerator to a time in the past.

IBM Db2 Analytics Accelerator for z/OS
A workload optimized appliance that combines System z® and Netezza® technologies to deliver mixed workload performance for complex analytic needs. The accelerator runs complex queries up to 2000 times faster, retains single record lookup speed, and eliminates costly query tuning while offloading query processing.

Image copy load
The process of loading data for a single table into the accelerator from a user-specified Db2 image copy. Specifying an end time or rolling through the logs is not required; the product uses the image copy as the content of the object to be loaded.

Image copy load profile
See profile types.

Inline copy
A backup copy of an accelerator table that is created as the data is loaded to the accelerator.

IMS Direct
An Accelerator Loader server feature that enables access to IMS data directly as opposed to accessing the data through DLI calls.

Netezza appliance
The IBM Netezza Data Warehouse Appliance, which is the foundation for the IBM Db2 Analytics Accelerator for z/OS (the accelerator). Accelerator Loader is a tool that updates the data on the accelerator without stopping update activity to the production tables while the data is being loaded into the accelerator.

Non-accelerator Db2 table
A table that exists in Db2 for z/OS only.

Profile types
The types of Db2 Analytics Accelerator Loader profiles are as follows:
- **Dual** specifies options for loading table data into both the accelerator and Db2 from an external data input file.
- **Accelerator only** specifies options for loading table data into only the accelerator from an external data input file.
- **Consistent** specifies options for loading data for multiple tables into the accelerator from a cataloged Db2 image copy.
- **Image copy** specifies options for loading data for a single table into the accelerator from a user-defined Db2 image copy.
- **Multi** specifies options for loading data to one to four accelerators from one or more Db2 tables (high availability load).
• **Backup** specifies options for backing up a table defined to the accelerator.
• **Recovery** specifies options for recovering a table defined to the accelerator.

**Staging libraries**
A copy of the product base libraries that are used when customizing Accelerator Loader. By using staging libraries, you can retain customized modules when maintenance is applied.

**Subsystem table**
Tables that are defined to other DRDA-connected RDBMS.

**Virtual Parallel Data (VPD)**
A feature that enables simultaneous loading of various record types from a virtual source to the accelerator.

**Virtual source library**
A partitioned data set (PDS) on z/OS that contains information that is required for mapping the source data to the target Db2 table on the Accelerator Loader server. A virtual source library is a reference to an existing library on z/OS that contains information that Db2 Analytics Accelerator Loader requires to virtualize the source data.

**Virtual table**
A product-created object that is registered within the Accelerator Loader server and visualized in Accelerator Loader studio; it represents the data in a format from which to query. A virtual table can be created on any data source, and it is required that one exist in order to load data to the accelerator.

**Virtual view**
The SELECT statement that contains the columns from the source data that are used to read data directly from the data source.

---

**Using the startup CLIST**

Use a startup CLIST to start the Accelerator Loader ISPF interface, optionally passing startup values.

**Before you begin**

The CLISTs that start the Accelerator Loader ISPF interface must already exist. The following CLISTs are created when customizing Accelerator Loader using Tools Customizer:

**Startup CLIST 1**
The name of the first startup CLIST that starts the product ISPF interface. The default value is HLOV21.

**Startup CLIST 2**
The name of the second startup CLIST. The default value is HLOV21C.

When starting the product ISPF interface for the first time, see [“Starting the ISPF interface” on page 201](#).
About this task

You use a startup CLIST to start the Accelerator Loader ISPF interface. You can also optionally specify the Db2 SSID and Server ID values to set on the Accelerator Loader main menu.

Use the following syntax when using a startup CLIST:

```
TSO ex 'hlq.mlq.SHLOCLST(hlo_clist) 'SSID(db2_ssid) SRVRID(hlvid)'
```

Where:

- `hlq.mlq` represents the high-level and mid-level qualifiers that you specified during product customization
- `hlo_clist` is the CLIST that you use to start the Accelerator Loader ISPF interface

Use the following optional parameters to pass the Db2 SSID and Server ID values to the Accelerator Loader main menu:

**SSID(db2_ssid)**

 Specifies the Db2 SSID value to use when starting the ISPF interface. The Db2 SSID value can be a Db2 subsystem, a Db2 group attach name for a Db2 data sharing group, or a Db2 data sharing member. A valid value is 1-4 characters.

**SRVRID(hlvid)**

 Specifies the Server ID value to use when starting the ISPF interface. The Server ID is the name of the z/OS system on which the Accelerator Loader server is running. A valid value is 1-4 characters.

When the Db2 SSID and Server ID values are not specified when using the CLIST, the fields on the main menu default to the values that were last used in the ISPF interface.

Use the following procedure to start the Accelerator Loader ISPF interface with a startup CLIST.

**Procedure**

From the z/OS console, issue one of the following operator commands:

- To start the Accelerator Loader ISPF interface without passing startup values for the Db2 SSID and Server ID fields:
  ```
  TSO ex 'hlq.mlq.SHLOCLST(hlo_clist)'
  ```

- To start the Accelerator Loader ISPF interface, passing startup values for the Db2 SSID and Server ID fields:
  ```
  TSO ex 'hlq.mlq.SHLOCLST(hlo_clist) 'SSID(db2_ssid) SRVRID(hlvid)'
  ```

Where:

- `hlq.mlq` represents the high-level and mid-level qualifiers that you specified during product customization
- `hlo_clist` is the CLIST that you use to start the product ISPF interface
- `db2_ssid` is the value to use in the Db2 SSID field
- `hlvid` is the value to use in the Server ID field
Navigating product panels

When data exceeds the size of the panel, indicators alert you that additional data exists outside the visible panel.

The text Row x of y or More: + in the upper right corner of the panels are used to indicate a scrollable page. Pages may be scrollable horizontally, vertically, or both.

A plus sign (+) or minus sign (-) indicates that additional data is available vertically.

- The plus sign (+) indicates more data below; use PF8 to scroll down.
- The minus sign (-) indicates more data above; use the PF7 key to scroll up.

The less than symbol (<) or the greater than symbol (>) indicates that additional data is available horizontally.

- The less than symbol (<) indicates more data to the left; use PF10 to scroll to the left.
- The greater than symbol (>) indicates more data to the right; use PF11 to scroll to the right.

Primary commands

You use Db2 Analytics Accelerator Loader primary commands to find information, navigate panels, modify the display of data, and print information.

FIND abc

Finds a unique string within a panel of data where abc is the string for which you are searching. If the specified string is found, the cursor moves to the first position of the found string. If the specified string is not found, a message is displayed. You should be as specific as possible when using the FIND command to ensure the correct return.

The syntax is:

FIND <string>

where <string> is the text that you want to find.

For example, to find the word "apple," use the following command:

FIND apple

To find the next and subsequent occurrences of the string, press PF5.

SORT column_number direction

Sorts data (on panels of scrollable or tabular data) by column where column_number is the number of the column by which you want to sort and direction can be either A (to sort data in ascending order) or D (to sort data in descending order).

You can refer to columns only by the column number (not the column name). Column numbers are not displayed on the panel. The CMD column is column 1 and columns to the right are incremented sequentially.

To specify sort order, append the A or D to the end of the SORT command. The default is ascending (A). For example, to sort column 2 in descending order, type:

SORT 2 D
in the command line and press Enter.

---

Panel commands and fields reference

This topic provides a reference to Accelerator Loader ISPF panel commands and fields.

The panels are presented in alphabetical order. For more information about a panel from within the product, press PF1.

Accelerator Loader Parameters panel

Specify product options such as sort program, log read and apply preferences, and file allocation parameters.

The following fields are available:

Use Db2 Sort when possible

Specifies whether the Db2 Sort product is to be used for internal product sorts.

- Y  If Y is specified, the Db2 Sort program product is to be used for internal product sorts.
- N  If N is specified, the product uses the sort program (DFSORT or SYNSORT) that is installed on the LPAR (specified in the Sort Program Installed field).

Sort program installed

Specifies the sort program that is installed on the LPAR, DFSORT or SYNSORT.

Log Read and Log Apply Preferences:

Log reader copy preference

Sets the default value for log reader copy preference. Unless you change it, the default value is R1R2A1A2 (where R indicates archive log and A indicates active log). You can specify different values for each SSID. The current SSID log reader value is used for JCL generation. For more information, see LOG_COPY_PREFERENCE in “Syntax definitions: Consistent load and Image Copy load” on page 334.

File Allocation Parameters:

Number of buffers

The number of buffers that the product is to use. Valid values are 1 - 99. (Synonymous with the JCL BUFNO= parameter.)

Channel programs

The number of channel programs that the product is to use. (Synonymous with the JCL NCP= parameter.) If a value of 0 is set, the product will use a predetermined channel program setting to attempt to gain optimal performance. Otherwise, a value of 1 - 99 can be specified to determine a best fit value for the site.

Note: The number of channel programs that you specify controls how many outstanding QSAM channel programs can run at the same time before the earliest one is checked for completion.

Data Set Parameters:
Device type
The device type for data sets created by Db2 Analytics Accelerator Loader. DASD devices and tape devices are valid for work files and SYSPRINT files.

Data set type
The type of data set that will be used for data sets created by Db2 Analytics Accelerator Loader.

Track or cylinder
The allocation unit for work data sets created by Db2 Analytics Accelerator Loader. Valid values are TRK (tracks) and CYL (cylinders).

Primary quantity
The primary quantity for data sets created by Db2 Analytics Accelerator Loader (in the units specified in the Track or Cylinder field).

Note: The maximum value that can be specified in the primary or secondary quantity field is 16777215. If you need to specify more space than the maximum, convert to a different space unit (for example, convert bytes to kilobytes by dividing by 1024) and specify the new value.

Secondary quantity
The secondary quantity for data sets created by Db2 Analytics Accelerator Loader (in the units specified in the Track or Cylinder field).

Note: The maximum value that can be specified in the primary or secondary quantity field is 16777215. If you need to specify more space than the maximum, convert to a different space unit (for example, convert bytes to kilobytes by dividing by 1024) and specify the new value.

Maximum volumes
The maximum number of volumes that can be used for work data sets.

Note: The Maximum Volumes field is valid when the device type is set to a DASD or tape device.

SMS data class
The SMS data class for data sets created by Db2 Analytics Accelerator Loader.

SMS storage class
The SMS storage class for data sets created by Db2 Analytics Accelerator Loader.

SMS management class
The SMS management class for data sets created by Db2 Analytics Accelerator Loader.

Sort Work Parameters:

Unit device
Indicates the sort work file unit device to be used when generating utility JCL. Valid values are SYSALLDA, DISK, and so on. Depending on the unit device that you specify, set the number of DDs as follows:

- For a tape device, specify a Number of DDs value from 3 through 99.
- For a DASD device, specify a Number of DDs value from 1 through 99.
Number of DDs
The number of SORTWKnn DD statements used for product sort work data sets. Set the value as follows, depending on the unit device value that you specify:
- For a tape device, specify a value from 3 through 99.
- For a DASD device, specify a value from 1 through 99.

Primary space
The primary space used (cylinders) for product sort work data sets.

Secondary space
The secondary space used (cylinders) for product sort work data sets.

Utility REGION Size
Indicates the REGION size in megabytes that the product is to use when generating utility JCL. Valid values are 0 - 2047.

Accelerator Table Selection panel
Use this panel to choose a table from the generated list for which to create a backup.

After you select the table to back up, an asterisk appears in the Cmd field. Only one table can be selected. The following commands are available.
- DEFAULT: Type this command on the command line to sort the panel contents in default order.
- S: Type this command in the Cmd field next to the table that you want to select.

The following fields are available:

Table creator like
The table creator search criteria. Wildcard values are allowed. The wildcard character is an asterisk (*).

Note: Case sensitivity of this field is controlled by the Case sensitive field on the Enter Table and Creator Like to Display panel.

Table name like
The table name search criteria. Wildcard values are allowed. The wildcard character is an asterisk (*).

Note: Case sensitivity of this field is controlled by the Case sensitive field on the Enter Table and Creator Like to Display panel.

Table Name
The table name.

Creator
The user ID of the table space creator.

Accelerator Name
A unique name for the accelerator server. This is the name by which the accelerator server is known to the local Db2 accelerated query tables.

Created Timestamp
The time when the CREATE statement was executed for the table.

Altered Timestamp
The time when the table was last altered.
Refresh Time
The timestamp when the data was last refreshed. If the data was not
refreshed, this column contains the default timestamp
(‘0001-01-01.00.00.00.000000’).

Add Db2 Tables/Db2 Table Selection panel
Use this panel to select the table to include in a load profile. The following
commands are available.

- DEFAULT: Type this command on the command line to sort the panel contents in
default order.
- S: Type this command in the Cmd field next to the table that you want to select.

The following fields are available:

Table creator like
The table creator search criteria. Wildcard values are allowed. The wildcard
character is an asterisk (*).

Note: Case sensitivity of this field is controlled by the Case sensitive field
on the Enter Table and Creator Like to Display panel.

Table name like
The table name search criteria. Wildcard values are allowed. The wildcard
character is an asterisk (*).

Note: Case sensitivity of this field is controlled by the Case sensitive field
on the Enter Table and Creator Like to Display panel.

Db2 SSID
The Db2 subsystem name, data sharing member name, or group
attachment name of the data sharing group against which Db2 Analytics
Accelerator Loader is running.

Table Name
The table name.

Part
The partition number (if the table space is partitioned). Note the following
values in this column:

- ALL All partitions will be included.
- N/A The table space is not partitioned.

Creator
The user ID of the table space creator.

Database
The database name.

Tablespace
The table space name.

Type
The object type:
- Table
- Alias
- View
- AOT (accelerator only table)
Administer Accelerator Loader server panel

Use this panel to manage the Accelerator Loader server and work with trace and events features.

Display server trace
Opens the Server Trace panel, which displays the last full page of the trace data. The trace data is maintained by the Accelerator Loader server and is a record of all communication, SQL, and internal events in message format.

Configure server
Opens the Server Management Menu panel, on which you can view and modify server data that is extracted from the main product address space for the subsystem that you have named.

Manage rules
Opens the Event Facility (SEF) Control panel, on which you can view and modify server event procedures and sets of rules that apply to procedures (rulesets).

Back Up Accelerator Table panel

Use this panel to specify options for generating JCL to use the BACKUP utility to back up a table defined to the accelerator.

These options can be saved to a Backup profile. All of the following commands are available on the editable version of the panel. On the view-only version of the panel, the BUILD command is available.

- **TABLE**: Type this command on the command line to open the Enter Table and Creator Like to Display panel and subsequently the Accelerator Table Selection panel from which you can select the table to back up.
- **SAVE**: Type this command on the command line to save your specifications to a Backup profile.
- **BUILD**: Type this command on the command line to build JCL for the profile to the specified data set.

The following fields are available on this panel.

**Creator/Profile creator**
The profile creator.

**Name/Profile Name**
The name of the profile, up to 30 characters. (Using meaningful names for profiles makes them easier to locate and reuse; for example, “Objects for Employee App.”)

**Share option**
Controls how other users can use a profile:

- **U (Update)**
  Other users can update the profile.

- **V (View only)**
  Other users can view the profile.

- **N (No access)**
  Other users cannot view nor update the profile.

**Description**
A description of the profile.
Schema
Table name
Accelerator

These fields display values for the currently selected table. To change the table, issue the TABLE command.

Copy Data Sets Options:

Local primary
Specifies the primary copy data set for the local site. To update the data set parameters, specify Yes in the Update field.

Local backup
Specifies the secondary (backup) copy data set for the local site. You can create a backup copy for the local site only when a primary copy for the local site is also being created. To update the data set parameters, specify Yes in the Update field.

Recovery primary
Specifies the primary copy data set for the remote recovery site. To update the data set parameters, specify Yes in the Update field.

Recovery backup
Specifies the secondary (backup) copy data set for the remote recovery site. You can create a backup copy for the remote recovery site only when a primary copy for the remote recovery site is also being created. To update the data set parameters, specify Yes in the Update field.

Backup Copy Selection panel
Use this panel to choose the backup copy for recovery of a table defined to the accelerator.

After you select a backup copy, an asterisk appears in the Cmd field.

The following command is available:
• S: Type this command in the Cmd field next to the backup copy that you want to select.

The following fields are available on this panel.

Schema
Table Name
These fields display values for the currently selected table.

Copy Data Set Name
The name of the backup copy data set.

Created Timestamp (Local Time)
The backup copy data set creation timestamp in local time.

Created Timestamp (UTC)
The backup copy data set creation timestamp in UTC.

Copy Type
The type of copy written to the backup copy data set.

INC Incremental
FULL Full
Copy Site Type
The type of backup copy data set.

LP  Local Primary
LB  Local Backup
RP  Recovery Primary
RB  Recovery Backup

Share Level
The share level of the backup copy data set.

Change
Reference

Unit Type
The type of device unit.

DASD  Disk device
Tape  Tape device

Unit  The name of device unit.

Build Load JCL panel
Use this panel to specify how you want to build your jobs using an existing load profile. The following commands are available.

- **BUILD**: Type this command on the command line to build JCL for the profile to the specified data set.
- **ADD**: Type this command on the command line to add another line to the job card.
- Type a command in the **Cmd** field next to a line to complete a task:
  - **D** to delete the line.
  - **I** to insert a new line.
  - **M** to move a line to a new position.

The following fields are available:

Generated JCL Data Set Name:

Data set name
The fully qualified data set name (without quotation marks) in which to save the generated job. If the data set does not exist, Db2 Analytics Accelerator Loader will create it. If you do not specify a member name, Db2 Analytics Accelerator Loader creates a sequential file. If you specify a member name, Db2 Analytics Accelerator Loader creates a PDS. To specify allocation parameters for this data set, select **Specify new data set allocation parameters**.

Member name
If the data set to hold the generated job is a PDS, indicates a member name for the job output. If the member does not exist, Db2 Analytics Accelerator Loader will create it.

Processing Options (Type a forward slash next to the options that you want to select.)
Specify new data set allocation parameters
Indicates whether you want to specify allocation parameters for this data set. If selected, when you enter the BUILD command, the Data set allocation parameters panel opens.

Review generated JCL
Indicates whether you want to review and edit the job after it has been generated. If selected, when you enter the BUILD command, the job appears in an edit session. If not selected, when you enter the BUILD command, the current panel is displayed.

Warn if JCL already exists
Indicates whether you want to be warned if the generated JCL will overwrite existing JCL.

Warn if JCL was edited after generation
Indicates whether you want to be warned if the generated JCL will overwrite existing JCL that was edited after it was generated.

Job Card Information
Specify how you want to build your job.

Confirm Action panel
Confirm or cancel deletions, such as deleting a Db2 SSID or a profile, or changes, such as changing a table. The panels display the name and description of the affected object.
- To confirm the deletion or change, press Enter.
- To cancel the deletion or change, press F12.
- (not available on all panels) To suppress future displays of the panel, type a forward slash (/) in the field next to Set item delete confirmation of

Copy Data Set Parameters panel
Use this panel to define the data set allocation parameters for backup copy data sets.

The title of this panel reflects the type of backup copy data set being created or updated (Local Primary, Local Backup, Recovery Primary, Recovery Backup).

The following fields are available:

Disposition
A valid z/OS data set disposition as documented in the z/OS MVS JCL Reference.

Data set type
A valid z/OS data set type value as documented in the z/OS MVS JCL Reference.

Management class

Storage class
The SMS management and storage classes for the backup copy data set created by Accelerator Loader.

Volume serial
The volume serial number to use for the backup copy data set created by Accelerator Loader. To let SMS select the volume on which to allocate the data set, leave the field blank.
Device type
The device type to use for the backup copy data set created by Accelerator Loader. To let SMS select the device type on which to allocate the data set, leave this field blank.

Data class
The SMS data class (up to 8 alphanumeric characters) to use for the backup copy data set created by Accelerator Loader.

Space units
The allocation unit to be used when allocating the backup copy data set.

Space primary
Space secondary
The primary and secondary allocation quantities of space to use when allocating the backup copy data set. The unit of measure that you specify in the Space units field is used.

Tape device options:
Expiration date
Specifies the expiration date for a new data set. On and after the expiration date, the data set can be deleted or written over by another data set. This value is valid for tape device only.

Retention period
Specifies the retention period for a new data set to help reduce the chance of later accidental deletion. After the retention period, the data set can be deleted or written over by another data set. This value is valid for tape device only.

Create Profile panel
Use this panel to choose the type of Accelerator Loader profile that you want to create.

Load Accelerator(s) and Db2 from external file
Opens the Load Accelerator(s) and Db2 from External File panel. Use this panel to specify options for a new Dual profile type, or to edit options for an existing profile. A Dual profile specifies options for loading table data into both the accelerator and Db2 from an external data input file.

Load Accelerator(s) from external file
Opens the Load Accelerator from External File panel. Use this panel to specify options for a new External profile type, or to edit options for an existing profile. An External profile specifies options for loading table data into only the accelerator from an external data input file.

Load Accelerator with consistent data
Opens the Load Accelerator with Consistent Data panel. Use this panel to specify options for a new Consistent load profile, or to edit options for an existing profile. A Consistent load profile specifies options for loading data for multiple tables into the accelerator from a cataloged Db2 image copy.

Load Accelerator from a specified image copy
Opens the Load Accelerator from Specified Image Copy panel. Use this panel to specify options for an Image Copy profile type. An Image Copy profile specifies options for loading data for a single table into the accelerator from a user-defined Db2 image copy.
**Load Accelerator(s) from Db2 table(s)**

Opens the Load Accelerator(s) from Db2 Table(s) panel. Use this panel to specify options for a new Multi (high availability load) profile type, or to edit options for an existing profile. A Multi profile specifies options for loading data to one to four accelerators from one or more Db2 tables.

**Back up Accelerator table**

Opens the Back Up Accelerator Table panel. Use this panel to specify options for a Backup profile, which is used for backing up a table defined to the accelerator.

**Recover Accelerator table(s) from a backup**

Opens the Recover Accelerator Table(s) from a Backup panel. Use this panel to specify options for a Recovery profile, which is used for recovering a table defined to the accelerator.

**Data set allocation parameters panel**

Use this panel to define the data set allocation parameters for the Db2 Analytics Accelerator Loader JCL data set. The following fields are available.

Use this panel to define the data set allocation parameters for the Db2 Analytics Accelerator Loader JCL data set. The following fields are available:

**SMS management class**

The SMS management class for data sets created by Db2 Analytics Accelerator Loader.

**SMS storage class**

The SMS storage class for data sets created by Db2 Analytics Accelerator Loader.

**Volume serial**

The volume serial number to use for the JCL data set created by Db2 Analytics Accelerator Loader. To let SMS select the volume on which to allocate the JCL data set, leave the field blank.

**Device type**

The device type to use for the JCL data set created by Db2 Analytics Accelerator Loader. To let SMS select the device type on which to allocate the JCL data set, leave this field blank.

**SMS data class**

The SMS data class for data sets created by Db2 Analytics Accelerator Loader.

**Space units**

 Specifies the unit of measure for space allocations. Valid values are BLKS, TRKS, CYLS, KB, MB, BYTES. The default is CYLS.

**Primary quantity**

**Secondary quantity**

Specifies the primary and secondary allocation quantities of space to use when allocating the JCL data set in the unit of measure that you specify in Space units.

**Block size**

Specifies the block size (physical record length), in bytes, of the blocks to be stored in the JCL data set.
**Data Set Allocation panel**

Use this panel to define the allocation parameters for the discard data set.

The following fields are available:

**Data set disposition**

Specifies a valid z/OS data set disposition. The default disposition is DISP(MOD,CA TLG,CA TLG).

**Unit type**

Specifies a valid DASD allocation unit for your installation. The product checks the eligible device table (EDT) to ensure that the specified value is valid. The default is blank.

**Space unit**

Specifies the unit of measure for space allocations. Valid values are CYL, TRK and MB. The control card is generated into the JCL as SPACE unit. If you do not specify a value for Space unit, then the default value is CYL.

**Space primary**

**Space secondary**

Specify the primary and secondary disk space allocation in the range 1 through 1677215. If you specify a value for Space primary, then you must also specify a value for Space secondary, and vice versa. If you do not specify values for Space primary and Space secondary, then default values (10 and 100) will be used.

**Current data set name**

Displays the current DSN that you have defined.

**Db2 Analytics Accelerator Selection panel**

Use this panel to select the accelerator onto which you want to load data. The panel displays the accelerators that are defined to the subsystem that you are using. The following command is available.

S: Type this command in the **Cmd** field next to the accelerator that you want to select.

The following fields are available:

**Name**

The name of the accelerator.

**Status**

The status of the accelerator.

**SSID**

The subsystem to which the accelerator is defined. This column is only displayed when the SSID is a data sharing group.

**Db2 Table List panel**

Use this panel to select the table to include in a load profile. The following commands are available.

- A00: Type this command on the command line to open the Enter Table and Creator Like to Display panel.
- D: Type this command in the **Cmd** field next to the table name to delete the table.
- T: Type this command in the **Cmd** field next to the table name to specify the target table. This command opens the Db2 Table List panel, on which you can select the target table.
• RIS: Type this command in the **Cmd** field next to the table name to display the Referentially Dependent Table Selection panel, which lists related tables from which you can choose.

• RIA: Type this command in the **Cmd** field next to the table name to select all related tables.

The following fields are available:

**Creator/Profile creator**  
The profile creator.

**Name/Profile Name**  
The name of the profile, up to 30 characters. (Using meaningful names for profiles makes them easier to locate and reuse; for example, “Objects for Employee App.”)

**Share option**  
Controls how other users can use a profile:

- **U (Update)**  
  Other users can update the profile.

- **V (View only)**  
  Other users can view the profile.

- **N (No access)**  
  Other users cannot view nor update the profile.

**Description**  
A description of the profile.

**Table Name**  
The table name.

**Part**  
The partition number (if the table space is partitioned). Note the following values in this column:

- **ALL**  
  All partitions will be included.

- **N/A**  
  The table space is not partitioned.

**Creator**  
The user ID of the table space creator.

**Database**  
The database name.

**Tablespace**  
The table space name.

**Target Name**  
The name of the table that is to be loaded.

**Target Creator**  
The creator of the table that is to be loaded.

---

**Db2 Table List panel**

Use this panel to select the table to include in a load profile. The following commands are available.

- **ADD**: Type this command on the command line to open the Enter Table and Creator Like to Display panel.
• D: Type this command in the Cmd field next to the table name to delete the table.
• RIS: Type this command in the Cmd field next to the table name to display the Referentially Dependent Table Selection panel, which lists related tables from which you can choose.
• RIA: Type this command in the Cmd field next to the table name to select all related tables.

The following fields are available:

Creator/Profile creator
The profile creator.

Name/Profile Name
The name of the profile, up to 30 characters. (Using meaningful names for profiles makes them easier to locate and reuse; for example, “Objects for Employee App.”)

Share option
Controls how other users can use a profile:

U (Update)
Other users can update the profile.

V (View only)
Other users can view the profile.

N (No access)
Other users cannot view nor update the profile.

Description
A description of the profile.

Db2 Subsystem Parameters panel
Change the definition of an existing Db2 subsystem entry.

The following command and fields are available:

Accelerator Loader parameters
Opens the Accelerator Loader Parameters panel.

SSID
The Db2 subsystem being edited, viewed, or created.

Description
A meaningful description of the subsystem, up to 44 alphanumeric characters.

Plan name
(required) The product plan to be used when connecting to the Db2 catalog; up to 8 alphanumeric characters. No default value.

Db2 ZPARMs member
The ZPARM load module member name generated for this Db2 subsystem; up to 8 alphanumeric characters. No default value.

Db2 Bootstrap DSN #01
(required) The full data set name of the first bootstrap data set that is being used by this Db2 subsystem. No default value.

Db2 Bootstrap DSN #02
(optional) The full data set name of the second bootstrap data set that is being used by this Db2 subsystem. No default value.
**Db2 Loadlib1**
(required) The name of the data set that comprises the current load library concatenation for Db2, and is used during batch job processing; up to 47 alphanumeric characters. No default value.

The load library usually consists of:
- a subsystem-specific DSNEXIT library
- the base DSNEXIT library for the current Db2 version
- the base DSNLOAD library for the current Db2 version

**Db2 Subsystems panel**
Select or edit information about the Db2 subsystem on which to run Db2 Analytics Accelerator Loader.

The following commands are available:
- **CREATE**: Type this command on the command line to create a new Db2 subsystem entry.
- Type one of the following commands in the **Cmd** field next to an existing SSID:
  - **S** to select the Db2 subsystem with which you want to work.
  - **D** to delete the selected Db2 subsystem from the control file. This command opens the Confirm Action panel.
  - **E** to edit information about the Db2 subsystem. This command opens the Db2 Subsystem Parameters panel.
  - **V** to view information about the Db2 subsystem. This command opens the Db2 Subsystem Parameters panel.
  - **C** to copy information from one subsystem to another. This command opens the New Db2 Subsystem panel panel.

The following fields are available:

**Current Db2 SSID**
The Db2 subsystem being edited, viewed, or created.

**Current user indicator**
The user indicator that is specified in the CLIST that is used to start the product. You cannot change this field; it is set when the product CLIST is started.

**Db2 control data set**
The name of the Db2 control data set. This is the VSAM control file that you have previously created and specified in the CLIST. You cannot change this field.

**DD Template Specification panel**
Use this panel to specify allocation options for an ERRDDN, MAPDDN, DISCARDDN, SYSUT1, or SORTOUT template.

The following command is available:
TEMPLATE: Type this command on the command line to edit the template DSN mask.

The following fields are available:

Data set disposition
Specifies a valid z/OS data set disposition as documented in the Db2 for z/OS Utility Guide and Reference. The default is MOD,DELETE,DELETE. When you specify a value, the control card is generated into the TEMPLATE statement as DISP(specified_value).

Example:
```
TEMPLATE SYSERR
  DSN 'syserr.dataset.name'
  DISP (MOD,DELETE,DELETE)
```

The default disposition for each type of template is as follows:
- ERRDDN: DISP(MOD,CATLG,CATLG)
- MAPDDN: DISP(MOD,CATLG,CATLG)
- DISCARDDN: DISP(MOD,CATLG,CATLG)
- SYSUT1: DISP(MOD,DELETE,CATLG)
- SORTOUT: DISP(MOD,DELETE,CATLG)

Unit type
Specifies a valid DASD allocation unit for your installation. The product checks the eligible device table (EDT) to ensure that the specified value is valid. The default is blank. When you specify a value, the control card is generated into the TEMPLATE statement as UNIT specified_unit_type.

Example:
```
TEMPLATE SYSERR
  UNIT SYSALLDA
  DSN 'syserr.dataset.name'
  SPACE TRK
  MAXPRIME 00006666
  UNCNT 5
  DISP (MOD,DELETE,DELETE)
```

Space unit
Specifies the unit of measure for space allocations. Valid values are CYL, TRK and MB. The default is CYL. The control card is generated into the JCL as SPACE unit. If you do not specify values for Space primary and Space secondary, then Db2 calculates the primary and secondary allocated space at runtime. Space unit is required when you specify values for Space primary and Space secondary.

Example (only Space unit is defined):
```
TEMPLATE SYSERR
  UNIT SYSDA
  DSN 'syserr.dataset.name'
  SPACE CYL
  DISP (MOD,DELETE,DELETE)
```

Example (Space primary, Space secondary, and Space unit are defined):
```
TEMPLATE SYSERR
  UNIT SYSALLDA
  DSN 'syserr.dataset.name'
  SPACE (10,5) CYL
  DISP (MOD,DELETE,DELETE)
```
Space primary
Space secondary
Specify the primary and secondary disk space allocation (1 - 1677215). The default value is blank. If you specify a value for Space primary, then you must also specify a value for Space secondary, and vice versa. The control card is generated into the JCL as SPACE (primary,secondary).

Example:
```
TEMPLATE SYSERR
  UNIT  SYSALLDA
  DSN   'syserr.dataset.name'
  SPACE (10,5) CYL
  MAXPRIME 00006666
  UNCNT 5
  DISP   (MOD,DELETE,DELETE)
```

PCTPRIME
Specifies primary space allocation as a percentage. Valid values are 0 through 100. The default value is blank. When you specify a value, the control card is generated into the JCL as PCTPRIME value.

Example:
```
TEMPLATE SYSERR
  UNIT  SYSALLDA
  DSN   'syserr.dataset.name'
  SPACE (10,5) CYL
  PCTPRIME 50
  DISP   (MOD,DELETE,DELETE)
```

MAXPRIME
Specifies the maximum allowable primary space allocation. The default is blank. You can specify an integer value of up to eight characters. The control card is generated into the JCL as MAXPRIME value.

Example:
```
TEMPLATE SYSERR
  UNIT  SYSALLDA
  DSN   'syserr.dataset.name'
  SPACE (10,5) CYL
  MAXPRIME 0000024
  PCTPRIME 50
  DISP   (MOD,DELETE,DELETE)
```

NBRSECOND
Specifies the division of secondary space allocations. Primary space is allocated first, and then remaining space is divided into the specified secondary allocations. The default is blank. You can specify a value of 1 - 10. The control card is generated into the JCL as NBRSECOND value.

Example:
```
TEMPLATE SYSERR
  UNIT  SYSALLDA
  DSN   'syserr.dataset.name'
  SPACE (10,5) CYL
  MAXPRIME 0000024
  PCTPRIME 50
  NBRSECOND 10
  DISP   (MOD,DELETE,DELETE)
```

Current Template DSN
Displays the default template for the DSN that you are defining.

The default DSN mask for each template is as follows:
- ERRDDN: &US..IDSE..&DB..&TS..&UQ.
DD DSN Template panel

Use this panel to specify options for the DSN that Db2 Analytics Accelerator Loader generates. The following command and fields are available.

SHOW
Type this command on the command line to display the DSN mask.

Template name
Displays the name of the template that you are editing.

Qualifier code
Specify a data set name specification code from the list of valid codes and press Enter.

Free form literal
Specify the qualifier code for Use freeform literal, and then in this field, type the literal value that you want to include in the data set name.

Current data set name qualifier string
Displays the symbolic string for your selected qualifier codes. You can also type the data set name directly in this field.

Database
Includes the database name.

Space name
Includes the table space name.

Partition/DSNUM
When you select this qualifier, you are prompted to enter a prefix to make the data set name valid. Enter the letter P to select a partition.

Date (YYYYDDD)
Includes the current date in the format YYYYDDD.

Year (YYYY)
Includes the current year in the format YYYY.

Month (MM)
Includes the current month in the format MM.

Day (DD)
Includes the current day of the month in the format DD.

Julian Day (DDD)
Includes the Julian day in the format DDD.

Time (HHMMSS)
Includes the current time in the format HHMMSS.

Hours (HH)
Includes the current time in hours in the format HH.

Minutes (MM)
Includes the current time in minutes in the format MM.

Seconds (SS)
Includes the current time in seconds in the format SS.
Local/Recovery (L/R)
When selected, this qualifier includes the backup type. L indicates local site and R indicates recovery site.

Primary/Backup (P/B)
Includes the backup type. P indicates primary and B indicates backup.

Copy type (Full/Incr)
Includes the type. F indicates full image copy type and I indicates incremental image copy type.

Listdef
Includes the name of the list that is defined by using the LISTDEF control statement and that is referenced on the same control statement as this TEMPLATE.

Sequence
Includes the sequence number of the item in the list being processed.

Unique
Unique eight characters that Db2 derives from the system clock at the time of allocation.

SSID
Includes the relevant subsystem ID.

User ID
Includes the TSO user ID of the job builder.

Job name
Includes the job name.

Step name
Includes the job step name.

Utility ID
Includes the utility ID.

Utility name
Includes the utility name.

Use Freeform Literal
Includes the eight-character literal that you type in the Free Form literal field.

Substring qualifier
Includes the substring qualifier. If you specify this qualifier code, the Substring Parameters popup is displayed, and contains the following fields:

Enter the Qualifier Code
Type the number corresponding to the qualifier code that you want to add.

Enter Starting Position
Type the starting position of the substring.

Enter Substring Length
Type the length of the substring.

**DD DSN Template (View) panel**
Use this panel to view information about a DD DSN template. For more detailed information about using a template and the options, see the *Db2 Utility Guide* for TEMPLATE. The following command and fields are available.
SHOW
Type this command on the command line to display the DSN mask.

Template name
Displays the name of the template that you are editing.

Qualifier code
Specify a data set name specification code from the list of valid codes and press Enter.

Free form literal
Specify the qualifier code for Use freeform literal, and then in this field, type the literal value that you want to include in the data set name.

Current data set name qualifier string
Displays the symbolic string for your selected qualifier codes. You can also type the data set name directly in this field.

Delimiter Parameters panel
Use this panel to specify the delimiter parameters for the input data file that is in a delimited format. The delimiter characters can be specified as either a character or a hexadecimal constant. You cannot specify the same character for more than one type of delimiter.

This panel includes the following fields:

Column delimiter
Specifies the column delimiter that is used in the input file. The default value is a comma (,).

Character string delimiter
Specifies the character string delimiter that is used in the input file. The default value is a double quotation mark (").

Decimal point delimiter
Specifies the decimal point character that is used in the input file. The default value is a period (.)

Display Global Variables panel
Use this panel to view, create, and modify global variables.

Global variables are shared by TSO address spaces and Accelerator Loader server Event Facility procedures. They are saved across system IPLs and product restarts. Global variables are implemented as REXX compound and are distinguished from other compound symbols by the stem string "GLOBAL" or "GLOBALx" where "x" is an alphanumeric character (A-Z or 0-9). Modify the "GLOBAL PREFIX:" entry on the panel to display a different Global Variable stem.

Subnode Name
The last part of the variable tail.

Nodes
The number of subnodes under this node.

Nodes Value
The data value assigned to this variable. When this subnode does not exist, the text string “NO VALUE ASSIGNED AT THIS LEVEL” is displayed.

Created
The date of creation.
DMF Map Adabas Password Encryption panel

Use this panel to create an encoded version of your Adabas password for use in a DMF batch job.

This panel enables you to create an encoded version of your Adabas password for use in a DMF batch job.

The following fields are available on this panel:

**Adabas password / Re-Enter Password**
Specifies the password in plain text to be used in batch DMF for Adabas.

**ADABAS PASSWORD =**
Returns the encoded version of the Adabas password. Copy and paste this value into your batch JCL SYSIN DD statement.

Enter Table and Creator Like to Display panel

Use this panel to filter tables from which to select for inclusion in the profile. The following fields are available.

**Table creator like**
The table creator search criteria. Wildcard values are allowed. The wildcard character is an asterisk (*).

**Note:** Case sensitivity of this field is controlled by the **Case sensitive** field on the Enter Table and Creator Like to Display panel.

**Table name like**
The table name search criteria. Wildcard values are allowed. The wildcard character is an asterisk (*).

**Note:** Case sensitivity of this field is controlled by the **Case sensitive** field on the Enter Table and Creator Like to Display panel.

**Match views and aliases**
The object type criteria. Specify **Yes** to display tables, views, and aliases. Specify **No** to display tables only. The product resolves a view or alias to the base table space and includes the base table space in the generated JCL.

**Case sensitive**
Controls case sensitivity in table names when you are selecting objects for a profile. If the value is **No** (the default), then lowercase letters match uppercase object names, and vice versa. If the value is **Yes**, then the wildcard patterns abc* and ABC* return different results.
Event Facility (SEF) Ruleset Entry Profile panel

Use this panel to control how the SEF procedure ruleset list is displayed, along with the following application control options:

- Restrict display to only the single ruleset in which you are interested, or (using SEF V4 only) display only rulesets containing a specific type of rule.
- Bypass rereading of a ruleset's PDS(E) directory if you do not require update-to-date member statistical information.
- Bypass confirmation panels when requesting a mass change operation.
- Indicate that this entry panel should be bypassed in the future.

Event Facility Proc. Rulesets - Using SEF V4 Configuration panel

This panel displays a list of event procedure rulesets. You can filter the list by setting entry panel options.

In the S column beside a member, type a line command to take one of the following actions:

- S: Display the list of members within the ruleset.
- E: Enable all members of an entire ruleset.
- D: Disable all members of an entire ruleset.
- U: Display the ISPF/PDF utility panel to rename, delete, or print members.
- A: Set the Auto-Enable (AE) flag for all members of a ruleset.
- Z: Reset the Auto-Enable (AE) flag for all members of a ruleset.

Event Facility (SEF) Event Procedure List panel

This panel displays all members in a specific ruleset and to create a new event procedure.

In the S column beside a member, type a line command to take one of the following actions:

- S: Select an event procedure for modification using the ISPF editor.
  
  To create a new event procedure, type “S” followed by a space and the name of the new event procedure.
- E: Enable an event procedure
- D: Disable an event procedure.
- A: Set the Auto-Enable (AE) flag for an event procedure member.
- Z: Reset the Auto-Enable (AE) flag for an event procedure member.
- B: Set the Auto-Enable (AE) flag and enable the event procedure.
- C: Disable an event procedure and reset the Auto-Enable (AE) flag.

Event Facility (SEF) Control panel

Use this panel to view and modify Server Event Facility (SEF) event procedures and procedure rulesets.

Global Variables

Select this option to open the Display Global Variables panel, on which you can view and modify global variables.
SEF Rule Management
Select this option to open the Event Facility (SEF) Ruleset Entry Profile panel, on which you can control SEF event procedures and libraries.

Interactive Command
Select this option to open the SEF - Command Response Display panel, on which you can view results of interactive command requests.

FlashCopy DSN Template panel
Use this panel to make changes to a FlashCopy DSN template.

For more detailed information about using a template and the options, see Db2 for z/OS Utility Guide and Reference.

SHOW
Type this command on the command line to display the DSN mask.

Template name
Displays the name of the template that you are editing.

Qualifier code
Specify a data set name specification code from the list of valid codes and press Enter.

Free form literal
Specify the qualifier code for Use freeform literal, and then in this field, type the literal value that you want to include in the data set name.

Current data set name qualifier string
Displays the symbolic string for your selected qualifier codes. You can also type the data set name directly in this field.

Database
Includes the database name.

Space name
Includes the table space name.

Partition/DSNUM
When you select this qualifier, you are prompted to enter a prefix to make the data set name valid. Enter the letter P to select a partition.

Date (YYYYDDD)
Includes the current date in the format YYYYDDD.

Year (YYYY)
Includes the current year in the format YYYY.

Month (MM)
Includes the current month in the format MM.

Day (DD)
Includes the current day of the month in the format DD.

Julian Day (DDD)
Includes the Julian day in the format DDD.

Time (HMHMSS)
Includes the current time in the format HHHHMMSS.

Hours (HH)
Includes the current time in hours in the format HH.
Minutes (MM)
Includes the current time in minutes in the format MM.

Seconds (SS)
Includes the current time in seconds in the format SS.

Local/Recovery (L/R)
When selected, this qualifier includes the backup type. L indicates local site and R indicates recovery site.

Primary/Backup (P/B)
Includes the backup type. P indicates primary and B indicates backup.

Copy type (Full/Incr)
Includes the type. F indicates full image copy type and I indicates incremental image copy type.

Listdef
Includes the name of the list that is defined by using the LISTDEF control statement and that is referenced on the same control statement as this TEMPLATE.

Sequence
Includes the sequence number of the item in the list being processed.

Unique
Unique eight characters that Db2 derives from the system clock at the time of allocation.

SSID
Includes the relevant subsystem ID.

User ID
Includes the TSO user ID of the job builder.

Job name
Includes the job name.

Step name
Includes the job step name.

Utility ID
Includes the utility ID.

Utility name
Includes the utility name.

Use Freeform Literal
Includes the eight-character literal that you type in the Free Form literal field.

Substring qualifier
Includes the substring qualifier. If you specify this qualifier code, the Substring Parameters popup is displayed, and contains the following fields:

Enter the Qualifier Code
Type the number corresponding to the qualifier code that you want to add.

Enter Starting Position
Type the starting position of the substring.

Enter Substring Length
Type the length of the substring.
FlashCopy DSN Template (View) panel

Use this panel to view information about a FlashCopy DSN template.

For more detailed information about using a template and the options, see Db2 for z/OS Utility Guide and Reference.

SHOW
Type this command on the command line to display the DSN mask.

Template name
Displays the name of the template that you are editing.

Qualifier code
Specify a data set name specification code from the list of valid codes and press Enter.

Free form literal
Specify the qualifier code for Use freeform literal, and then in this field, type the literal value that you want to include in the data set name.

Current data set name qualifier string
Displays the symbolic string for your selected qualifier codes. You can also type the data set name directly in this field.

IBM Db2 Analytics Accelerator Loader for z/OS main menu

The main panel for Db2 Analytics Accelerator Loader provides the following options and fields. Type the number or letter that corresponds to the task that you want to perform.

Setup
Opens the User Settings panel, on which you can choose the Db2 subsystem on which to run the product or specify the job card to use when building JCL.

Server administration
Opens the Administer Accelerator Loader server panel, on which you can work with the Accelerator Loader server.

Manage Loader profiles
Opens the Manage Loader Profiles panel, on which you can create, edit, or view an existing profile definition.

Load Accelerator(s) and Db2 from external file
Opens the Load Accelerator(s) and Db2 from External File panel. Use this panel to specify options for a new Dual profile type, or to edit options for an existing profile. A Dual profile specifies options for loading table data into both the accelerator and Db2 from an external data input file.

Load Accelerator(s) from external file
Opens the Load Accelerator from External File panel. Use this panel to specify options for a new External profile type, or to edit options for an existing profile. An External profile specifies options for loading table data into only the accelerator from an external data input file.

Load Accelerator with consistent data
Opens the Load Accelerator with Consistent Data panel. Use this panel to specify options for a new Consistent load profile, or to edit options for an existing profile. A Consistent load profile specifies options for loading data for multiple tables into the accelerator from a cataloged Db2 image copy.

Load Accelerator from a specified image copy
Opens the Load Accelerator from Specified Image Copy panel. Use this
panel to specify options for an Image Copy profile type. An Image Copy profile specifies options for loading data for a single table into the accelerator from a user-defined Db2 image copy.

**Load Accelerator(s) from Db2 table(s)**
Opens the Load Accelerator(s) from Db2 Table(s) panel. Use this panel to specify options for a new Multi (high availability load) profile type, or to edit options for an existing profile. A Multi profile specifies options for loading data to one to four accelerators from one or more Db2 tables.

**Back up Accelerator table**
Opens the Back Up Accelerator Table panel, on which you can specify options to generate JCL to back up a table defined to the accelerator. These options can be saved to a Backup profile.

**Recover Accelerator table(s) from a backup**
Opens the Recover Accelerator table(s) from a backup panel, on which you can specify options to generate JCL to recover a table defined to the accelerator. These options can be saved to a Recovery profile.

**Exit**
Closes the main menu.

**User ID**
Your user ID.

**System ID**
The z/OS system on which Db2 Analytics Accelerator Loader is running.

**Appl ID**
The Db2 Analytics Accelerator Loader application ID.

**Version**
The version of Db2 Analytics Accelerator Loader that you are running.

**Db2 SSID**
The Db2 subsystem name, group attachment name, or data sharing member name of the Db2 subsystem on which to run Db2 Analytics Accelerator Loader. To display a list of the existing Db2 SSIDs, type a question mark (?) in the field and press Enter. The Db2 Subsystems panel opens.

**Note:** You can optionally set this value when using the startup CLIST to start the Accelerator Loader ISPF interface. For more information, see “Using the startup CLIST” on page 968.

**Server ID**
Enter the name of the z/OS system on which the Accelerator Loader server is running.

**Note:** You can optionally set this value when using the startup CLIST to start the Accelerator Loader ISPF interface. For more information, see “Using the startup CLIST” on page 968.

**ISPF Session Parameters panel**
Use this panel to change parameters for the product ISPF application. The settings are saved in the current user’s profile variable pool under the SDB ISPF application.
Subsystem Name (SSID)
The four-character subsystem name for the product address space. This name is used to construct the name of the parameterization EXEC for the Debug Facility.

Status Information
Product version and build information.

Trace Browse Facility
The four-character subsystem name for the Trace Browse Facility subsystem for the Accelerator Loader server.

Load Accelerator from Specified Image Copy panel
Use this panel to specify or view processing options for an Image Copy load profile type.

The load job that is generated from the input on this panel loads data for a single table into the accelerator from a user-defined Db2 image copy. All of the following commands are available on the editable version of the panel. On the view-only panel, BUILD is available.

- **TABLE**: Type this command on the command line to add a Db2 table to a profile.
- **ACCELERATOR**: Type this command on the command line to select the accelerators into which you want to load data. This command opens the Db2 Analytics Accelerator Selection panel. You must have proper Db2 authority to access the list of accelerators.
- **SAVE**: Type this command on the command line to save your specifications in the profile.
- **BUILD**: Type this command on the command line to build JCL for the profile to the specified data set.

The following fields are available:

**Creator/Profile creator**
The profile creator.

**Name/Profile Name**
The name of the profile, up to 30 characters. (Using meaningful names for profiles makes them easier to locate and reuse; for example, “Objects for Employee App.”)

**Share option**
Controls how other users can use a profile:

- **U (Update)**
  Other users can update the profile.

- **V (View only)**
  Other users can view the profile.

- **N (No access)**
  Other users cannot view nor update the profile.

**Description**
A description of the profile.

**Schema**

**Table name**
Partition
These fields display values for the currently selected Db2 table. To change the table, issue the TABLE command.

Utility Processing Options:

Accelerator(s)
The individual accelerator(s) or accelerator group on which to load data. To display a list of existing accelerators or groups, use the ACCELERATOR command.

Add table to Accelerator
Indicates whether to add missing tables to the accelerator before starting the load job.

(default) N (No)
Do not add tables.

A (Add)
Add missing tables. This value generates the control card ACCEL_ADD_TABLES into the JCL.

R (Refresh)
Add missing tables; remove and re-add existing tables. This value generates the control card ACCEL_REMOVE_AND_ADD_TABLES into the JCL.

Enable acceleration on success
Controls whether Db2 Analytics Accelerator Loader enables query acceleration for the table after a successful load. Valid values are as follows:

• Y (Yes): Enable a table for acceleration after a successful load. This value generates the control card ACCEL_ON_SUCCESS_ENABLE YES into the JCL.

• (default) N (No): Do not enable a table for acceleration after a successful load. The control card ACCEL_ON_SUCCESS_ENABLE NO is generated into the JCL.

Continue on errors
Causes most errors to be ignored and the processing to continue. With the value Yes, the control card CONTINUE_ON_ERROR is generated into the JCL.

Note: If the CONTINUE_ON_ERROR control card is included in the JCL and errors that are higher than RC=4 are encountered, the errors are overridden. RC=4 is reported, and the job will not fail. I/O errors and other serious issues (such as out-of-memory issues) are not ignored and will still cause the job to fail.

Input image copy DSN
The data set that contains the image copy for the table spaces. The data set contains non-unique records in following format: DBNAME TSNAME PART ICDSN

The records come from the Db2 SYSCOPY table and are preordered by time stamp.

The JCL generator gets the image copy DSN from the input data set that you choose when you issue the TABLES command and uses it in the output JCL in the SPACE() scope as follows: TO_IC data_set.
Log Read and Log Apply Options:

Check data operating mode
Indicates if and when Accelerator Loader checks the integrity of Db2 for z/OS data pages. Valid values are:

No Do not check data page integrity.

Write (Default) Check data page integrity before passing the page to the accelerator.

Operation
Check data page integrity before and after each Db2 log apply operation to the image copy, as well as before passing the page to the accelerator.

Load Accelerator with Consistent Data panel
Use this panel to specify or view processing options for a Consistent load profile.

The load job that is generated from the input on this panel loads data for multiple tables into the accelerator from a cataloged Db2 image copy. All of the following commands are available on the editable version of the panel. On the view-only panel, TABLES and BUILD are available.

- TABLES: Type this command on the command line to add a Db2 table to a profile.
- ACCELERATOR: Type this command on the command line to select the accelerators into which you want to load data. This command opens the Db2 Analytics Accelerator Selection panel. You must have proper Db2 authority to access the list of accelerators.
- SAVE: Type this command on the command line to save your specifications in the profile.
- BUILD: Type this command on the command line to build JCL for the profile to the specified data set.

The following fields are available on this panel.

Creator/Profile creator
The profile creator.

Name/Profile Name
The name of the profile, up to 30 characters. (Using meaningful names for profiles makes them easier to locate and reuse; for example, “Objects for Employee App.”)

Share option
Controls how other users can use a profile:

U (Update) Other users can update the profile.

V (View only) Other users can view the profile.

N (No access) Other users cannot view nor update the profile.

Description
A description of the profile.

The following fields are available:
Utility Processing Options:

**Accelerator(s)**
The individual accelerator(s) or accelerator group on which to load data. To display a list of existing accelerators or groups, use the ACCELERATOR command.

**Target SSID**
Specifies the four-character Db2 subsystem ID that contains the table that is to be loaded. The default value is the current SSID (that is, the SSID that was selected on the main menu). To select the target SSID, type “?” (question mark) and press Enter. The Db2 Subsystems panel opens, on which you can select the target SSID. If the specified target SSID differs from the current SSID, the product searches for the accelerator that is associated with the target SSID (not the current SSID) and uses it to populate Accelerator name.

**Add tables to Accelerator**
Indicates whether to add missing tables to the accelerator before starting the load job.

(default) N (No)
Do not add tables.

A (Add)
Add missing tables. This value generates the control card ACCEL_ADD_TABLES into the JCL.

R (Refresh)
Add missing tables; remove and re-add existing tables. This value generates the control card ACCEL_REMOVE_AND_ADD_TABLES into the JCL.

**Enable acceleration on success**
Controls whether Db2 Analytics Accelerator Loader enables query acceleration for the table after a successful load. Valid values are as follows:

- Y (Yes): Enable a table for acceleration after a successful load. This value generates the control card ACCEL_ON_SUCCESS_ENABLE YES into the JCL.
- (default) N (No): Do not enable a table for acceleration after a successful load. The control card ACCEL_ON_SUCCESS_ENABLE NO is generated into the JCL.

**Load time**
Specifies the consistent or historical point at which data is loaded. Valid values are:

**Current**
Includes the TO_CURRENT keyword in Db2 Analytics Accelerator Loader syntax. This option directs Db2 Analytics Accelerator Loader to read the log and load data up to the current point in time, which is the end of the log file. A load time value of CURRENT and the option RBA or LRSN End Point are mutually exclusive. A load time value of CURRENT is required when Use Flashcopy is set to Yes.

**Specified**
Indicates that you will specify an end point in either the RBA/LRSN or the Timestamp End Point field.
Quiesce
Indicates that you will specify an end point in the **Quiesce end point** field. Includes the TO QUIESCE keyword in Db2 Analytics Accelerator Loader syntax. This option directs Db2 Analytics Accelerator Loader to read the log and load data up to the specified quiesce point.

**Notes:**
- The RBA (relative byte address) chosen is determined by rolling the RBA back to the start point of any in-flight URIDs. If there are none, the RBA may also be adjusted forward to the next SYSLOGRANGE start point (if there is one) or to the RBA of the last valid log record read from the log (if there are no further SYSLOGRANGE records). This allows Db2 Analytics Accelerator Loader not to have to verify the validity of a specified log point by attempting a read of that log record in the actual log and possibly incurring a tape mount, data set allocation, or extra I/O.
- Only with the TO QUIESCE option (option Q) will the RBA (retrieved from SYSCOPY) be considered to be validated. User-specified RBAs are not considered validated. This means that Db2 Analytics Accelerator Loader will load that validated RBA into SYSCOPY for a new image copy, but will still advance the RBA to a known valid point for user specified ones to avoid extra tape mounts, data set allocations, and I/O.

**RBA or LRSN end point**
With this option, the **Load Time** value must be SPECIFIED. Directs Db2 Analytics Accelerator Loader to read the log and to incorporate data into the image copy up to the specified hexadecimal end point. In a data sharing environment, **END LRSN byte_string** is added to the syntax. In a non-data sharing environment, **END RBA byte_string** is added to the syntax.

**Timestamp end point**
With this option, the **Load Time** value must be SPECIFIED. Indicates the end point at which the Db2 Analytics Accelerator Loader process will stop. Specify the time stamp in the format (YYYY-MM-DD-hh.mm.ss.nnnnnn). For convenience, you can copy the end point from SYSCOPY and paste it into this field.

**Time zone of timestamp**
The control card TO_TIMESTAMP/TO_TIMESTAMP_LOCAL is generated into the JCL. Time stamps are handled internally in GMT/Universal time. If you specify a local time stamp, it is converted to GMT/Universal. **TO_TIMESTAMP** is a GMT/Universal time stamp, and no conversion necessary. **TO_TIMESTAMP_LOCAL** is a local time zone time stamp that must be converted to GMT/Universal. The time zone in which the computer operates is given at IPL time; no action is required for the conversion from local to GMT/Universal.

**Quiesce end point**
With this option, the **Load Time** value must be QUIESCE.

**Continue on errors**
Causes most errors to be ignored and the processing to continue. With the value Yes, the control card CONTINUE_ON_ERROR is generated into the JCL.
**Note:** If the CONTINUE_ON_ERROR control card is included in the JCL and errors that are higher than RC=4 are encountered, the errors are overridden. RC=4 is reported, and the job will not fail. I/O errors and other serious issues (such as out-of-memory issues) are not ignored and will still cause the job to fail.

**Load partitions individually**
Indicates how the SPACE statement is generated for partitions of a partitioned table. With the default value **Yes**, when all partitions are specified, the SPACE statement is generated for each partition. With the value **No**, one SPACE statement is generated for the table.

**FlashCopy Options:**

**Use FlashCopy**
Indicates whether you want to create a new FlashCopy image copy for each table space that is involved in the load process. Specify **Yes** to generate the control card **FLASHCOPY** into the JCL with either a corresponding template name or an image copy data set name. The **NEW_COPY** keyword is also generated into the JCL. To use FlashCopy, you must specify a value of **CURRENT** for **Load Time**.

With the value **No**, a legacy image copy will be used.

**Note:** Use **FlashCopy** must be set to **Yes** if you want to create a new Db2 image copy. No other options result in a new image copy.

**Use FlashCopy DSN template**
Indicates whether you want to specify a FlashCopy data set template or use the default template the FlashCopy image copy that is specified in DSNZPARMS. If you specify **Yes**, then the control card parameter **FCCOPYDDN template_name** is generated after the **NEW_COPY** keyword in the JCL. **template_name** is the name of a template that you created.

```plaintext
TEMPLATE (template_name)
  DSN 'image.copy.dsn.spec'
NEW_COPY FCCOPYDDN (template_name)
```

**Update**
If you specified **Yes** for **Use FlashCopy DSN Template**, and you want to make changes to the template, specify **Yes** to access the FlashCopy DSN Template panel.

**Log Read and Log Apply Options:**

**SYSCOPY scan operating mode**
Specifies which SYSCOPY rows to consider when finding a starting point for processing. Valid values are:

- **Local**
  Refers to the LP/LB rows to find a starting point for processing.
  Includes the LOCAL_SITE keyword in Db2 Analytics Accelerator Loader syntax.

- **Recover**
  Uses the RP/RB rows to find a starting point for processing.
  Includes the RECOVERY_SITE keyword in Db2 Analytics Accelerator Loader syntax.

- **ZPARM**
  Default. Db2 Analytics Accelerator Loader detects the operating mode Db2 is running under and automatically inserts the
corresponding control card. This option omits the LOCAL_SITE, RECOVER_SITE, and IMAGE_COPY_PREFERENCE control cards; uses the value found in the ZPARMs on the Db2.

**User**

Uses the user-specified scan preference defined in the SYSCOPY Selection Preference field to find a starting point for processing. Includes the IMAGE_COPY_PREFERENCE keyword in Db2 Analytics Accelerator Loader JCL.

**SYSCOPY selection preference**

Specifies the image copy types to attempt to use when scanning SYSCOPY for a starting point. Results in generation of the control card IMAGE_COPY_PREFERENCE LPLBRPRB into the JCL. You can specify at least one and up to five image copy types for which to scan. For example:

- **LB** Scans for LB type image copies in SYSCOPY.
- **LP** Scans for LP type image copies in SYSCOPY.
- **LPLB** Scans first for LP type image copies, then for LB type image copies (and always uses LP type image copies on identically time-stamped SYSCOPY rows).
- **LPLBRB** Allows the SYSCOPY scan program to pick an RB if it came up first while scanning SYSCOPY backwards for a starting point.
- **LPLBRPRBFC** (Default) Causes the SYSCOPY Selection Preference to be ignored.

This selection preference is only applied if the SYSCOPY scan operating mode is set to USER. One to five codes in total can be entered in a packed 10-character maximum field. Valid codes are:

- **LP** Local primary.
- **LB** Local backup.
- **RP** Recovery primary.
- **RB** Recovery backup.
- **FC** FlashCopy. Enables Db2 Analytics Accelerator Loader to use Db2 Recovery Expert (ARY)-managed FlashCopy data sets in addition to Db2 V10 and later FlashCopy data sets as image copy starting points in Db2 Analytics Accelerator Loader processing.

**Log reader copy preference**

Includes the LOG_COPY_PREFERENCE keyword in the Db2 Analytics Accelerator Loader generated JCL.

Specifies the order in which the archive and active log lists in the BSDS are to be scanned when Accelerator Loader searches for a log to satisfy a need for log records. The value that you specify in this field must use the syntax R1 (archive log copy #1), R2 (archive log copy #2), A1 (active log #1), and A2 (active log #2). All four unique values must be specified, even if copy #2 is not used in Db2. For example:

- **A1A2R1R2** - Scans the active logs before scanning the archive logs.

**Note:** Avoid using this setting because Db2 might attempt to open one of the active logs for output that Accelerator Loader is currently reading for input. Such an attempt might result in an open error within Db2.
• RIR2A1A2 - (Default) Scans the archive logs first and uses archive logs when the same range exists in an archive and active log.

You can change the default value in the ISPF interface by using the Log Reader Copy Preference field on the Accelerator Loader Parameters panel.

Number of PARALLEL log read
(Default 0)

The number of parallel log read tasks. Valid values are integers, 0 - 16. A value of 0 means that a maximum of 1 task per data sharing group member will run at the same time. If a non-zero value is specified, then that number is the maximum number of parallel tasks that can run at the same time for log read. If there are more logs to read than the number of parallel tasks specified for Number of PARALLEL log read, a task to read the remaining logs will be launched as soon as a running task finishes and until all necessary logs have been read.

Number of PARALLEL log apply
(Default 4)

The number of parallel log apply tasks. Valid values are integers, 1 - 10. If a value greater than 1 is specified, and there is a single GROUP(...) control card structure present, the Db2 Analytics Accelerator Loader batch process clusters and reorders partitioned objects to distribute the objects into the specified number of tasks, and load the partitions in parallel. If there are multiple GROUP(...) control card structures present, the y value is ignored, and each GROUP is assigned its own parallel task.

When partition-level image copies are on tape, and the value of y is greater than 1, the following conditions apply:

• If each image copy is on a different volume sequence, the specified number of parallel tasks will be used for log apply processing.

• If all image copies are stacked on the same volume sequence, only one log apply task will be performed.

Bypass SYSIBM.SYSLGRNX Proc

Specifies whether the product skips reading SYSIBM.SYSLGRNX and only reads the Db2 logs.

Y  The product skips reading SYSIBM.SYSLGRNX and reads the entire Db2 log from the earliest object starting point to the latest object ending point.

N  The product reads SYSIBM.SYSLGRNX to limit reading only those portions of the Db2 log that are marked as being actively altered for the objects that are being processed.

Note: Skipping SYSIBM.SYSLGRNX might result in a significant increase in processing time due to the number of log data sets and log records read, and reading the entire Db2 log from the earliest object starting point to the latest object ending point.

Check data operating mode

Indicates if and when Accelerator Loader checks the integrity of Db2 for z/OS data pages. Valid values are:

No  Do not check data page integrity.

Write  (Default) Check data page integrity before passing the page to the accelerator.
Operation

Check data page integrity before and after each Db2 log apply operation to the image copy, as well as before passing the page to the accelerator.

Load Accelerator(s) and Db2 from External File panel

Use this panel to specify or view options for a Dual load profile type. A Dual load profile specifies options for loading table data into both the accelerator and Db2 from an external data input file. All of the following commands are available on the editable version of the panel. On the view-only version of the panel, only the BUILD command is available.

- **TABLE**: Type this command on the command line to add a Db2 table to a profile.
- **ACCELERATOR**: Type this command on the command line to select the accelerators into which you want to load data. This command opens the Db2 Analytics Accelerator Selection panel. You must have proper Db2 authority to access the list of accelerators.
- **COLINFO**: Edit column definitions within the data set that is defined in field Column Info DSN. This command opens an ISPF edit session that enables you to create or edit the column information for the LOAD control card. This data set must contain only the table column definitions (without the parenthesis), and not the entire LOAD utility syntax.
- **SAVE**: Type this command on the command line to save your specifications in the profile.
- **BUILD**: Type this command on the command line to build JCL for the profile to the specified data set.

The following fields are available on this panel. Scroll forward to see all fields.

**Creator/Profile creator**

The profile creator.

**Name/Profile Name**

The name of the profile, up to 30 characters. (Using meaningful names for profiles makes them easier to locate and reuse; for example, “Objects for Employee App.”)

**Share option**

Controls how other users can use a profile:

- **U (Update)**
  
  Other users can update the profile.

- **V (View only)**
  
  Other users can view the profile.

- **N (No access)**
  
  Other users cannot view nor update the profile.

**Description**

A description of the profile.

**Schema**

**Table name**

**Partition**

These fields display values for the currently selected Db2 table. To change the table, issue the TABLE command.
**Target Options:**

**Accelerator(s)**

The individual accelerator(s) or accelerator group on which to load data. On the editable panel, to display a list of existing accelerators or groups, use the ACCELERATOR command.

**Add table to Accelerator**

Indicates whether to add missing tables to the accelerator before starting the load job.

*(default) N (No)*

Do not add tables.

*A (Add)*

Add missing tables. This value generates the control card ACCEL_ADD_TABLES into the JCL.

*R (Refresh)*

Add missing tables; remove and re-add existing tables. This value generates the control card ACCEL_REMOVE_AND_ADD_TABLES into the JCL.

**Enable acceleration on success**

Controls whether Db2 Analytics Accelerator Loader enables query acceleration for the table after a successful load. Valid values are as follows:

- *Y (Yes):* Enable a table for acceleration after a successful load. This value generates the control card ACCEL_ON_SUCCESS_ENABLE YES into the JCL.
- *(default) N (No):* Do not enable a table for acceleration after a successful load. The control card ACCEL_ON_SUCCESS_ENABLE NO is generated into the JCL.

**Parallel load**

Indicates that you want to generate load control cards that will enable parallelism. This field is available when you choose to load a partitioned table. For nonpartitioned objects, the field is read-only and the value is No. Valid values are Yes and No.

When the value is Yes:

- You must enter a TEMPLATE data set name pattern in **Input data set.**
  This data set name pattern is used to generate a template definition.
- The **Load tasks** field is enabled.

**Load tasks**

Specifies the number of parallel load tasks to use. Valid values are blank or 1 - 20. If no value is specified, then the value from the options module parameter ACCEL_LOAD_TASKS is used. This value is used to generate the ACCEL_LOAD_TASKS n clause of the load statement.

**Input File Options:**

**Data set**

For the SYSREC data set that contains the data of the table in external format, specify a name or pattern as follows:

- The fully qualified data set name of the SYSREC data set. For a PDS, enclose the member name in parentheses; for example, HLO.LOADCARD(FILE). If you specify an existing data set, the product generates the DD ISYSREC in the output JCL.
The DSN template for the SYSREC data set. You can specify a DSN template for both parallel and nonparallel loads (Parallel load field). For a parallel load, the DSN template pattern must include the &PART variable to ensure that a unique SYSREC data set name is generated for each partition. The partition number must be included in your partition-level SYSREC data sets.

If you specify a DSN template, the product generates the TEMPLATE(...) statement in the output JCL.

To update the DSN template and its parameters, specify Yes in the Update field. You can specify the template pattern and the parameters with which to allocate the data set.

The product does not restore a previous value for the SYSREC data set if you change the value of Parallel load. In this case, only the SYSREC field validation changes to require the &PART variable for a parallel load.

**Encoding**

Specifies the SYSREC encoding scheme. Valid values are as follows:

- **UNICODE**
  
  When UNICODE is specified, the UNICODE Db2 LOAD utility keyword is generated into the LOAD control cards.

- **EBCDIC**
  
  (default) When EBCDIC is specified, no additional keywords are added to the LOAD control cards. EBCDIC is the default for both Accelerator Loader and Db2 LOAD.

**Format**

Indicates whether the SYSREC data is in Db2 internal, delimited format, or governed by the rules for field specifications. Valid values are:

- **Internal**
  
  The FORMAT INTERNAL keyword is included in the LOAD utility control cards.

- **Delimited**
  
  The FORMAT DELIMITED keyword is included in the LOAD utility control cards. To update the delimiter parameters, specify Yes in the Update field.

- **blank**
  
  (default) The format is governed by the rules for field specifications.

**Column info DSN**

The product detects whether the table column information data set is from an UNLOAD utility. If so, it automatically includes the correct information in the JCL that it generates. Otherwise, specify the name of the fully qualified data set that contains the column information from the SYSPUNCH data set. Specify a single data set; a template cannot be used in this field.

**Db2 Load Options:**

**Utility ID**

Specifies a unique identifier for this utility within Db2. This is an input parameter of type VARCHAR(16) in EBCDIC. It is passed as a parameter to the JCL in the PARM field, such as, //DLD0001 EXEC PGM=PGM#DLD, PARM=('QA1A, ,utility ID')
RESUME
Specify Yes to generate the control card LOAD RESUME YES into the JCL. The product appends data to the accelerator table rather than replacing it. When loading to both Db2 and the accelerator, Db2 will also append the data to the Db2 table. When loading to only the accelerator, no data is added to the Db2 table, but any existing data in Db2 is left intact. Specify No if you want the product to replace existing data rather than appending it.

KEEPDICTIONARY
Specify Yes to generate the control card KEEPDICTIONARY into the JCL.
Example:
LOAD DATA INDDN SYSREC REPLACE KEEPDICTIONARY
INTO TABLE schema.tableName part#

ENFORCE
Specifies whether to enforce check constraints and referential constraints. When you specify Yes for this option, MAPDDN is required. Specify No to generate the control card ENFORCE NO into the JCL.
Example:
LOAD DATA INDDN SYSREC REPLACE KEEPDICTIONARY LOG NO ENFORCE NO
INTO TABLE schema.tableName part#

LOG
Specifies whether logging occurs. Specify No to generate the control card LOG NO into the JCL.
Example:
LOAD DATA INDDN SYSREC REPLACE KEEPDICTIONARY LOG NO
INTO TABLE schema.tableName part#

NUMRECS
Specifies the number of input records for the specified table or table partition. Valid values are integers between 1 and 109951627776, or blank.
If the LOAD utility statement does not provide the number of SYSREC records with a NUMRECS or a SORTKEYS clause, the product estimates the record count. Using the estimated record count, it then adds a NUMRECS clause for each INTO TABLE clause. The record count enables Db2 to size index-build sorts, and reduces the possibility of sort failures when loading to both the accelerator and Db2.
When specified for a parallel load, the value is passed into each INTO TABLE clause in the LOAD control card.
When using the ISPF panels to generate LOAD JCL, you cannot specify a separate NUMRECS value for individual partitions. Specify either the average number of rows per partition or the largest number of records to be loaded into any single partition. The NUMRECS option will be generated once per INTO TABLE PART clause when the utility syntax is generated.

SORTDEVT
Specifies the device type to be used for temporary sort data sets. Valid values are 1 to 8 alphanumeric characters. The product checks the eligible device table (EDT) to ensure that the specified value is valid.

SORTNUM
Specifies the number of sort data sets that are to be allocated. This value can only be specified when a SORTDEVT value also specified. Valid values are 2 through 255.
**DISCARDS**
Specifies the maximum number of source records that are to be written on the discard data set. Valid values are 0 through 2147483647. The default value is 0, which specifies that you do not want to set a maximum value. The entire input data set can be discarded. If the discard maximum is reached, the LOAD job abnormally terminates, the discard data set is empty, and you cannot see which records were discarded. You can either restart the job with a larger limit, or terminate the utility.

To specify a DISCARDS value, you must provide a DISCARDDN template DD name.

**DISCARDDN template DD name**
Specifies the template name for a data set to be used for discarding data rows. If DISCARDDN is not necessary, then this field should be blank. This value is optional. The default is ISYSDISC.

If Parallel load = YES, then the template DSN must include the &PA or &PART variable. When JCL for a parallel LOAD is generated, a separate INDDN clause is created for each table partition. A parallel load also requires a separate DISCARDDN clause for each partition.

To update the template and its parameters, specify Yes in the Update field. You can specify the template pattern and the parameters with which to allocate the data set. If you include the DD, then you must define the template at least once in the profile.

**ERRDDN template DD name**
Specifies the template name for an error processing data set. This value is required when you specify Yes for ENFORCE. The default is ISYSERR.

To update the template and its parameters, specify Yes in the Update field. You can specify the template pattern and the parameters with which to allocate the data set. If you include the DD, then you must define the template at least once in the profile.

**MAPDDN template DD name**
Specifies the template name for a map data set to be used for record processing. This value is required when you specify Yes for ENFORCE. The default is ISYSMAP.

To update the template and its parameters, specify Yes in the Update field. You can specify the template pattern and the parameters with which to allocate the data set. If you include the DD, then you must define the template at least once in the profile.

**SYSUT1 template DD name**
Specifies the first of two work data sets. This value is required when you are running the LOAD utility. The default is ISYSUT1.

To update the template and its parameters, specify Yes in the Update field. You can specify the template pattern and the parameters with which to allocate the data set. If you include the DD, then you must define the template at least once in the profile.

**SORTOUT template DD name**
Specifies the second of two work data sets. This value is required when you are running the LOAD utility. The default is ISORTOUT.
To update the template and its parameters, specify Yes in the **Update** field. You can specify the template pattern and the parameters with which to allocate the data set. If you include the DD, then you must define the template at least once in the profile.

**Load Accelerator(s) from External File panel**

Use this panel to specify or view options for an External load profile type. An External load specifies options for loading table data into only the accelerator from an external data input file. All of the following commands are available on the editable version of the panel. On the view-only version of the panel, the **COLINFO** command is available.

- **TABLE**: Type this command on the command line to add a Db2 table to a profile.
- **ACCELERATOR**: Type this command on the command line to select the accelerators into which you want to load data. This command opens the Db2 Analytics Accelerator Selection panel. You must have proper Db2 authority to access the list of accelerators.
- **COLINFO**: Edit column definitions within the data set that is defined in field **Column Info DSN**. This command opens an ISPF edit session that enables you to create or edit the column information for the LOAD control card. This data set must contain only the table column definitions (without the parenthesis), and not the entire LOAD utility syntax.
- **SAVE**: Type this command on the command line to save your specifications in the profile.
- **BUILD**: Type this command on the command line to build JCL for the profile to the specified data set.

The following fields are available on this panel.

**Creator/Profile creator**

The profile creator.

**Name/Profile Name**

The name of the profile, up to 30 characters. (Using meaningful names for profiles makes them easier to locate and reuse; for example, “Objects for Employee App.”)

**Share option**

Controls how other users can use a profile:

- **U (Update)**
  
  Other users can update the profile.

- **V (View only)**
  
  Other users can view the profile.

- **N (No access)**
  
  Other users cannot view nor update the profile.

**Description**

A description of the profile.

**Schema**

**Table name**

**Partition**

These fields display values for the currently selected Db2 table. To change the table, issue the **TABLE** command.

**Target Options:**
Accelerator(s)
The individual accelerator(s) or accelerator group on which to load data.
On the editable panel, to display a list of existing accelerators or groups,
use the ACCELERATOR command.

Add table to Accelerator
Indicates whether to add missing tables to the accelerator before starting
the load job.
=default) N (No)
Do not add tables.
A (Add)
Add missing tables. This value generates the control card
ACCEL_ADD_TABLES into the JCL.
R (Refresh)
Add missing tables; remove and re-add existing tables. This value
generates the control card ACCEL_REMOVE_AND_ADD_TABLES
into the JCL.

Enable acceleration on success
Controls whether Db2 Analytics Accelerator Loader enables query
acceleration for the table after a successful load. Valid values are as
follows:
= Y (Yes): Enable a table for acceleration after a successful load. This value
generates the control card ACCEL_ON_SUCCESS_ENABLE YES into the
JCL.
= (default) N (No): Do not enable a table for acceleration after a successful
load. The control card ACCEL_ON_SUCCESS_ENABLE NO is generated
into the JCL.

Parallel load
Indicates that you want to generate load control cards that will enable
parallelism. This field is available when you choose to load a partitioned
table. For nonpartitioned objects, the field is read-only and the value is No.
Valid values are Yes and No.

When the value is Yes:
= You must enter a TEMPLATE data set name pattern in Input data set.
This data set name pattern is used to generate a template definition.
= The Load tasks field is enabled.

Load tasks
Specifies the number of parallel load tasks to use. Valid values are blank or
1 - 20. If no value is specified, then the value from the options module
parameter ACCEL_LOAD_TASKS is used. This value is used to generate the
ACCEL_LOAD_TASKS n clause of the load statement.

Input File Options:

Data set
For the SYSREC data set that contains the data of the table in external
format, specify a name or pattern as follows:
= The fully qualified data set name of the SYSREC data set. For a PDS,
enclose the member name in parentheses; for example,
HLO.LOADCARD(FILE). If you specify an existing data set, the product
generates the DD ISYSREC in the output JCL.
The DSN template for the SYSREC data set. You can specify a DSN template for both parallel and nonparallel loads (Parallel load field). For a parallel load, the DSN template pattern must include the &PART variable to ensure that a unique SYSREC data set name is generated for each partition. The partition number must be included in your partition-level SYSREC data sets.

If you specify a DSN template, the product generates the TEMPLATE(...) statement in the output JCL.

To update the DSN template and its parameters, specify Yes in the Update field. You can specify the template pattern and the parameters with which to allocate the data set.

The product does not restore a previous value for the SYSREC data set if you change the value of Parallel load. In this case, only the SYSREC field validation changes to require the &PART variable for a parallel load.

Encoding
Specifies the SYSREC encoding scheme. Valid values are as follows:

- **UNICODE**
  When UNICODE is specified, the UNICODE Db2 LOAD utility keyword is generated into the LOAD control cards.

- **EBCDIC**
  (default) When EBCDIC is specified, no additional keywords are added to the LOAD control cards. EBCDIC is the default for both Accelerator Loader and Db2 LOAD.

Format
Indicates whether the SYSREC data is in Db2 internal, delimited format, or governed by the rules for field specifications. Valid values are:

- **Internal**
  The FORMAT INTERNAL keyword is included in the LOAD utility control cards.

- **Delimited**
  The FORMAT DELIMITED keyword is included in the LOAD utility control cards. To update the delimiter parameters, specify Yes in the Update field.

- **blank**
  (default) The format is governed by the rules for field specifications.

Column info DSN
The product detects whether the table column information data set is from an UNLOAD utility. If so, it automatically includes the correct information in the JCL that it generates. Otherwise, specify the name of the fully qualified data set that contains the column information from the SYSPUNCH data set. Specify a single data set; a template cannot be used in this field.

Db2 Load Options:

Utility ID
Specifies a unique identifier for this utility within Db2. This is an input parameter of type VARCHAR(16) in EBCDIC. It is passed as a parameter to the JCL in the PARM field, such as, //DLD0001 EXEC PGM=PGM#DLD, PARM=('QA1A, 'utility ID')
RESUME
Specify Yes to generate the control card LOAD RESUME YES into the JCL. The product appends data to the accelerator table rather than replacing it. When loading to both Db2 and the accelerator, Db2 will also append the data to the Db2 table. When loading to only the accelerator, no data is added to the Db2 table, but any existing data in Db2 is left intact. Specify No if you want the product to replace existing data rather than appending it.

DISCARDS
Specifies the maximum number of source records that are to be written on the discard data set. Valid values are 0 - 2147483647. The default value is 0, which specifies that you do not want to set a maximum value. The entire input data set can be discarded. If the discard maximum is reached, the LOAD job abnormally terminates, the discard data set is empty, and you cannot see which records were discarded. You can either restart the job with a larger limit or terminate the utility. To specify a DISCARDS value, you must provide a DISCARDDN name.

DISCARDDN name
Specifies the DD name for a data set to be used for discarding data rows. This value is optional. The default is ISYSDISC. If you want to use DISCARDDN, you must specify both DISCARDDN name and DISCARDDN DSN. Use the Update field to specify data set allocation parameters for the DSN specified in the DISCARDDN DSN field. See “Data Set Allocation panel” on page 981.

DISCARDDN DSN
Specifies the data set name to be used for discarding data rows. To update the data set allocation parameters, specify Yes in the Update field next to the DISCARDDN name field. See “Data Set Allocation panel” on page 981.

SYSUT1 template DD name
Specifies the first of two work data sets. This value is required when you are running the LOAD utility. The default is ISYSUT1.

To update the template and its parameters, specify Yes in the Update field. You can specify the template pattern and the parameters with which to allocate the data set. If you include the DD, then you must define the template at least once in the profile.

SORTOUT template DD name
Specifies the second of two work data sets. This value is required when you are running the LOAD utility. The default is ISORTOUT.

To update the template and its parameters, specify Yes in the Update field. You can specify the template pattern and the parameters with which to allocate the data set. If you include the DD, then you must define the template at least once in the profile.

Inline Copy Data Sets Options:

Local primary
Specifies the primary copy data set for the local site. To update the data set parameters, specify Yes in the Update field.

Local backup
Specifies the secondary (backup) copy data set for the local site. You can
create a backup copy for the local site only when a primary copy for the local site is also being created. To update the data set parameters, specify Yes in the **Update** field.

**Recovery primary**
Specifies the primary copy data set for the remote recovery site. To update the data set parameters, specify Yes in the **Update** field.

**Recovery backup**
Specifies the secondary (backup) copy data set for the remote recovery site. You can create a backup copy for the remote recovery site only when a primary copy for the remote recovery site is also being created. To update the data set parameters, specify Yes in the **Update** field.

### Load Accelerator(s) from Db2 Table(s) panel

Use this panel to specify or view options for a Multi load profile type. A Multi load specifies options for loading data from one or more Db2 tables into one to four accelerators. All of the following commands are available on the editable version of the panel. On the view-only version of the panel, the **TABLES** and **BUILD** commands are available.

- **TABLES**: Type this command on the command line to add a Db2 table to a profile.
- **ACCELERATOR**: Type this command on the command line to a select the accelerators into which you want to load data. This command opens the Db2 Analytics Accelerator Selection panel. You must have proper Db2 authority to access the list of accelerators.
- **SAVE**: Type this command on the command line to save your specifications in the profile.
- **BUILD**: Type this command on the command line to build JCL for the profile to the specified data set.

The following fields are available on this panel.

**Creator/Profile creator**
The profile creator.

**Name/Profile Name**
The name of the profile, up to 30 characters. (Using meaningful names for profiles makes them easier to locate and reuse; for example, “Objects for Employee App.”)

**Share option**
Controls how other users can use a profile:

- **U (Update)**
  Other users can update the profile.

- **V (View only)**
  Other users can view the profile.

- **N (No access)**
  Other users cannot view nor update the profile.

**Description**
A description of the profile.

**Target Options:**
Accelerator(s)
The individual accelerator(s) or accelerator group on which to load data. On the editable panel, to display a list of existing accelerators or groups, use the ACCELERATOR command.

Add tables to Accelerator
Indicates whether to add missing tables to the accelerator before starting the load job.

(default) N (No)
Do not add tables.

A (Add)
Add missing tables. This value generates the control card ACCEL_ADD_TABLES into the JCL.

R (Refresh)
Add missing tables; remove and re-add existing tables. This value generates the control card ACCEL_REMOVE_AND_ADD_TABLES into the JCL.

Enable acceleration on success
Controls whether Db2 Analytics Accelerator Loader enables query acceleration for the table after a successful load. Valid values are as follows:

- Y (Yes): Enable a table for acceleration after a successful load. This value generates the control card ACCEL_ON_SUCCESS_ENABLE YES into the JCL.
- (default) N (No): Do not enable a table for acceleration after a successful load. The control card ACCEL_ON_SUCCESS_ENABLE NO is generated into the JCL.

Table lockmode
 Controls the protection level while tables on an accelerator are being loaded. The protection level ensures a consistent state of the data with respect to the specified entity. Valid value are:

- None: (Default) No locking at all. However, only committed data is loaded into the table because the Db2 data is unloaded with isolation level CS and SKIP LOCKED DATA.
- Table: Protects just the table that is currently being loaded.
- Tableset: Protects all tables to be loaded against changes during the load operation.
- Partitions: Protects the table space partition containing that part of the table that is currently being loaded. With this setting, an unpartitioned table is always locked completely.
- Row: Protects just the row or page that is being loaded against updates. Db2 data is unloaded with isolation level CS, but in contrast to lock mode NONE, rows locked by an application are not skipped. It is the recommended choice for loads in connection with continuous incremental updates.

Note: Consider the implications of using this lock mode, especially in connection with incrementally updated tables. You can safely use it if you have enabled continuous incremental updates. For more information, see the information about enabling continuous incremental updates in the documentation for the IBM Db2 Analytics Accelerator product.
Load tasks
Specifies the number of parallel load tasks to use. Valid values are blank or 1 - 20. If no value is specified, then the value from the options module parameter ACCEL_LOAD_TASKS is used. This value is used to generate the ACCEL_LOAD_TASKS n clause of the load statement.

Detect data changes
Indicates whether to load only those tables and partitions that have changed in Db2 since the last load.

Yes Load only the tables listed in the FROM TABLE clause that have changed in Db2 since the last load. For partitioned tables, any partition lists specified on the command are ignored; HALOAD will determine which partitions to reload. The control card DETECT_DATA_CHANGES is generated into the JCL.

No Load all specified tables and partitions.

Manage Loader Profiles panel
Use this panel to create, edit, or view an existing profile definition.

The following commands are available:
- CREATE: Type this command on the command line to create a profile. This command opens the Create Profile panel.
- Type one of the following line commands in the Cmd field next to an existing profile:
  - B to build the JCL for the selected profile. This command opens the Build Accelerator Loader JCL panel.
  - D to delete the selected profile or table. This command opens the Confirm action panel.
  - E to edit the selected profile. This command opens the options panel for the profile in edit mode.
  - R to rename the selected profile. This command opens the Rename Profile panel.
  - V to view the selected profile. This command opens the options panel for the profile in view mode.
  - C to copy the selected profile to a different profile name with any changes to creator, description, and share option. This command opens a panel to create a new profile of the copied type.

The following fields and columns are available on this panel. Scroll right to see all fields.

Profile like
The profile name or mask. To see different profiles on this screen, change the name or mask and press Enter. Use the asterisk wildcard (*) alone to display all object profiles. Enter one or more characters and the asterisk wildcard (*) to limit the list of names displayed to those containing the characters you specified.

Creator like
The creator name or mask. To see different creators on this screen, change the name or mask and press Enter. Use the asterisk wildcard (*) alone to display all object profiles. Enter one or more characters and the asterisk wildcard (*) to limit the list of names displayed to those that contain the characters that you specified.
Db2 SSID
The Db2 subsystem name, data sharing member name, or group attachment name of the data sharing group against which Db2 Analytics Accelerator Loader is running.

Name/Profile Name
The name of the profile, up to 30 characters. (Using meaningful names for profiles makes them easier to locate and reuse; for example, “Objects for Employee App.”)

Creator/Profile creator
The profile creator.

Type/Profile type
The types of Accelerator Loader profiles are as follows:
- **Dual** specifies options for loading table data into both the accelerator and Db2 from an external data input file.
- **Accelerator only** specifies options for loading table data into only the accelerator from an external data input file.
- **Consistent** specifies options for loading data for multiple tables into the accelerator from a cataloged Db2 image copy.
- **Image copy** specifies options for loading data for a single table into the accelerator from a user-defined Db2 image copy.
- **Multi** specifies options for loading data to one to four accelerators from one or more Db2 tables (high availability load).
- **Backup** specifies options for backing up a table defined to the accelerator.
- **Recovery/Recover** specifies options for recovering a table defined to the accelerator.
- **All** or * (asterisk) specifies all profile types.

Share option
Controls how other users can use a profile:
- **U** (Update) Other users can update the profile.
- **V** (View only) Other users can view the profile.
- **N** (No access) Other users cannot view nor update the profile.

Description
A description of the profile.

Created Userid
The user ID of the profile creator.

Created Timestamp
The date and time that the profile was created.

Last Updated Userid
The user ID of the last user to update the profile.

Last Updated Timestamp
The date and time that the profile was last updated.
New Db2 Subsystem panel
Specify a new Db2 subsystem ID. The following field is available:

Db2 SSID
The ID of the Db2 subsystem on which to run Db2 Analytics Accelerator Loader.

Parameter Groups panel
Use this panel to display a list of parameters that control the Accelerator Loader server address space.

These parameters control the behavior of the interfaces and facilities available within the address space. As indicated by each parameter or parameter group, some of these parameters can be altered while the address space is up and active; altering other parameters requires that the address space be shut down and restarted.

The following line commands are supported:
- D: Display the parameters within the group.
- F: Format the information for the selected row.
- P: Print the associated control block for the selected row.
- S: Display the associated control block for the selected row.

Product module information panel
Use this panel to view information about the Accelerator Loader server product module.

The panel displays status information about each module that is used in the server address space. Use this information to determine the location of any module and to obtain other status information. Software Support can use the data set that was created to contain the status information to help with problem diagnosis.

Recover Accelerator Table(s) from a Backup panel
Use this panel to specify options for generating JCL to recover a table defined to the accelerator.

These options can be saved to a Recovery profile. All of the following commands are available on the editable version of the panel. On the view-only version of the panel, the TABLES and BUILD commands are available.
- TABLES: Type this command on the command line to open the Recovery Table List panel from which you can select one or more tables to recover.
- ACCELERATOR: Type this command on the command line to open the Db2 Analytics Accelerator Selection panel where you can select the accelerator on which you want to recover data.
- SAVE: Type this command on the command line to save your specifications to a Recovery profile.
- BUILD: Type this command on the command line to build JCL for the profile to the specified data set.

The following fields are available on this panel.

Creator
The profile creator.
Name  The name of the profile, up to 30 characters. (Using meaningful names for profiles makes them easier to locate and reuse; for example, “Objects for Employee App.”).

Share option  Controls how other users can use a profile:

U (Update)  Other users can update the profile.

V (View only)  Other users can view the profile.

N (No access)  Other users cannot view nor update the profile.

Description  A description of the profile.

Target Options:

Accelerator(s)  Specifies the name of the accelerator(s) on which to recover data. To display a list of the existing accelerators, type a question mark (?) in the field and press Enter.

Add table to Accelerator  Indicates whether to add missing tables to the accelerator before starting the recover job.

N (No)  (default) Do not add tables.

A (Add)  Add missing tables. This setting generates the ACCEL_ADD_TABLES keyword in the LOAD command.

R (Refresh)  Add missing tables; remove and re-add existing tables. This setting generates the ACCEL_REMOVE_AND_ADD_TABLES keyword in the LOAD command.

Enable acceleration on success  Controls whether Accelerator Loader enables query acceleration for the table after a successful load. Valid values are as follows:

Yes  Enable a table for acceleration after a successful load. The control card ACCEL_ON_SUCCESS_ENABLE YES is generated into the JCL.

No  (default) Do not enable a table for acceleration after a successful load. The control card ACCEL_ON_SUCCESS_ENABLE NO is generated into the JCL.

Recovery Point Options:

Point in time  Specifies the point in time for recovery.

Current  Applies to all selected tables. Backup data sets for each table will be automatically chosen at time of recovery JCL generation.
**Timestamp**
Applies to all selected tables. Backup data sets for each table will be automatically chosen using values specified in Timestamp end point and Time zone of timestamp fields.

**Selected**
A backup data set for each selected table will be specified on the Recovery Table List panel, which is accessed by the TABLES command.

**Timestamp end point**
Indicates the end point at which all selected tables will be recovered. Specify the timestamp in the format (YYYY-MM-DD-hh.mm.ss.nnnnnn). For convenience, you can copy the end point from the HLOUCOPY table and paste it into this field.

**Time zone of timestamp**
Specifies the timezone of the Timestamp end point value.

**Recovery Table List panel**
Use this panel to identify the tables for which to recover data and to specify backup copies to use for the recovery.

The tables in this list are included in the Recovery profile. All of the following commands are available on the editable version of the panel. On the view-only panel, TABLES and BUILD are available.

- **ADD**: Type this command on the command line to open the Enter Table and Creator Like to Display and subsequently the Recovery Table Selection panel from which you can select one or more tables to recover.
- **D**: Type this command in the Cmd field next to the table name to delete the table from the profile.
- **B**: Type this command in the Cmd field next to the table name to specify the backup copy. This command opens the Backup Copy Selection panel, on which you can select the backup copy.

The following fields are available on this panel.

**Creator**
The profile creator.

**Name**
The name of the profile, up to 30 characters. (Using meaningful names for profiles makes them easier to locate and reuse; for example, Objects for Employee App.)

**Share option**
Controls how other users can use a profile:

- **U (Update)**
  Other users can update the profile.

- **V (View only)**
  Other users can view the profile.

- **N (No access)**
  Other users cannot view nor update the profile.

**Description**
A description of the profile.
**Table Name**

The table name.

**Creator**

The user ID of the table space creator.

**Copy Data Set Name**

The name of the backup copy data set.

**Copy Type**

The type of copy written to the backup copy data set.

- **INC**: Incremental copy
- **FULL**: Full copy

**Copy Created Timestamp (Local Time)**

The backup copy data set creation timestamp in local time.

**Copy Created Timestamp (UTC)**

The backup copy data set creation timestamp in UTC.

---

**Recovery Table Selection panel**

Use this panel to choose the tables from the generated list for which to recover data from backup copies.

After you select a table to recover, an asterisk appears in the **Cmd** field.

The following commands are available.

- **ALL**: Type this command on the command line to select all displayed tables.
- **DEFAULT**: Type this command on the command line to sort the panel contents in default order.
- **S**: Type this command in the **Cmd** field next to the table that you want to select.

The following fields are available:

**Table creator like**

The table creator search criteria. Wildcard values are allowed. The wildcard character is an asterisk (*).

**Note**: Case sensitivity of this field is controlled by the **Case sensitive** field on the Enter Table and Creator Like to Display panel.

**Table name like**

The table name search criteria. Wildcard values are allowed. The wildcard character is an asterisk (*).

**Note**: Case sensitivity of this field is controlled by the **Case sensitive** field on the Enter Table and Creator Like to Display panel.

**Table Name**

The table name.

**Creator**

The user ID of the table space creator.

**Database**

The database name.

**Tablespace**

The table space name.
Altered Timestamp (Local Time)
The timestamp of the table creation/alter in Local time.

Referentially Dependent Tables panel
Use this panel to select the table to include in a Consistent load profile. The following commands are available.

- **ALL**: Type this command on the command line to select all tables.
- **DEFAULT**: Type this command on the command line to sort the panel contents in default order.
- **S**: Type this command in the **Cmd** field next to the table name to select or deselect the table from the profile.

The following fields are available:

**Table Name**
The table name.

**Part**
The partition number (if the table space is partitioned). Note the following values in this column:

- **ALL**: All partitions will be included.
- **N/A**: The table space is not partitioned.

**Creator**
The user ID of the table space creator.

**Database**
The database name.

**Tablespace**
The table space name.

Rename Profile panel
Use this panel to rename your own profiles or those created by other users if the profile was created with a **Share Option** of **Update**. The following fields are available:

**Creator/Profile creator**
The profile creator.

**Type/Profile type**
The types of Accelerator Loader profiles are as follows:

- **Dual**: specifies options for loading table data into both the accelerator and Db2 from an external data input file.
- **Accelerator only**: specifies options for loading table data into only the accelerator from an external data input file.
- **Consistent**: specifies options for loading data for multiple tables into the accelerator from a cataloged Db2 image copy.
- **Image copy**: specifies options for loading data for a single table into the accelerator from a user-defined Db2 image copy.
- **Multi**: specifies options for loading data to one to four accelerators from one or more Db2 tables (high availability load).
- **Backup**: specifies options for backing up a table defined to the accelerator.
- **Recovery**: specifies options for recovering a table defined to the accelerator.
Name/Profile name
The name of the profile, up to 30 characters. Using meaningful names for profiles makes them easier to locate and reuse; for example, Objects for Employee App.

Resulting DSN Using Current panels
Panels enable you to view the DSN mask that results from your specifications.

Resulting DSN Using Current Symbolic String panel
Use this panel to view the DSN mask that results from your specifications on any of the data set template panels. This panel is informational only.

Resulting DSN Using Current Prefix
Use this panel to view the DSN mask that results from your prefix specification on the data set template panels. This panel is informational only.

Save Profile panel
Use this panel to specify information for a new profile.

Save Accelerator Loader options as a profile?
Choose Yes to save a new profile with the options that you specified.

Name/Profile name
The name of the profile, up to 30 characters. Using meaningful names for profiles makes them easier to locate and reuse; for example, Objects for Employee App.

Creator/Profile creator
The profile creator.

Type/Profile type
The types of Db2 Analytics Accelerator Loader profiles are as follows:
- Dual specifies options for loading table data into both the accelerator and Db2 from an external data input file.
- Accelerator only specifies options for loading table data into only the accelerator from an external data input file.
- Consistent specifies options for loading data for multiple tables into the accelerator from a cataloged Db2 image copy.
- Image copy specifies options for loading data for a single table into the accelerator from a user-defined Db2 image copy.
- Multi specifies options for loading data to one to four accelerators from one or more Db2 tables (high availability load).
- Backup specifies options for backing up a table defined to the accelerator.
- Recovery specifies options for recovering a table defined to the accelerator.

SEF - Command Response Display panel
To use this test facility, type the required host environment name at the top and then type a valid command for that environment on the command line below it.

The command will be sent to the requested environment, and the subsequent output will be displayed in the table.
Server Management Menu

Use this panel to view and modify Accelerator Loader server data that is extracted from the main product address space for the subsystem that you have named.

Display and modify ISPF session parameters
Select this option to open the ISPF Session Parameters panel. ISPF session parameters control only the ISPF application for the current user.

Display and modify Server parameters
Select this option to open the Parameter Groups panel. These parameters control the server and affect all product users.

Display product module information
Select this option to display information that Software Support can use to help diagnose problems.

Encrypt Adabas Password (ADASCR)
Select this option to open the DMF Map Adabas Password Encryption panel, where you can create an encoded version of your Adabas password.

Set Batch Job Card Information panel
Use this panel to specify how you want the batch job built when generating JCL with Accelerator Loader. The following commands are available:

- **ADD**: Type this command on the command line to add another line to the job card.
- **T**: Type a command in the **Cmd** field next to a line to complete a task:
  - **D** to delete the line.
  - **I** to insert a new line.
  - **M** to move a line to a new position.

Server Trace panel
Use this panel to view the list of product events captured by the server that are executing in your environment.

This list contains all of the events (SQL, IMS, TCP/IP, LU 6.2, and so on) that have occurred. The most recent messages are at the bottom of the list, and the oldest messages are at the top. You can display formatted columns of information such as user ID and time.

The following command line commands are available:

- **FIND**: Search for data or a specific time and date.
- **LOCATE**: Search for data or a specific time and date.
- **DISPLAY**: Display additional columns of information.
- **STATUS**: Display the trace browse status area.

Use alternate backup panel
Use this panel to specify an alternate backup copy data set after attempting to use a backup copy for recovery that is not usable.

The following fields are available on this panel.
Selected backup:

**Copy data set**

The name of the backup copy data set that is not usable.

**Creation time in UTC**

The backup copy data set creation timestamp in UTC.

Alternate backup:

**Copy data set**

The name of an alternate backup copy data set.

**Creation time in UTC**

The backup copy data set creation timestamp in UTC.

### User Settings panel

Select the Db2 subsystem on which to run the product and to specify the job card that you want to use when building JCL.

The following options and fields are available:

**Db2 subsystem**

Opens the Db2 Subsystems panel.

**Batch**

Opens the Set Batch Job Card Information panel.

**User ID**

Your user ID.

**System ID**

The z/OS system on which Db2 Analytics Accelerator Loader is running.

**Db2 SSID**

The ID of the Db2 subsystem on which Db2 Analytics Accelerator Loader is running.

### Warning panel

On the Build Accelerator Loader JCL panel, you selected the option to be warned if the generated JCL will overwrite existing JCL.

- To overwrite the JCL and continue, press Enter.
- To cancel JCL generation, press F12.

### Components and structure

Accelerator Loader runs as a started task on a z/OS system. The started task communicates with Db2 to perform product functions and to store information about product activities in Db2 tables.

The following topics provide information about Db2 Analytics Accelerator Loader components and how they work together.
Accelerator Loader started task

The Accelerator Loader started task receives input from the interfaces through the SVC and then communicates with the Db2 subsystems to run the JCL. A single started task can process simultaneous requests from multiple users across the system. After you start the started task, you can perform product functions.

Tip: In Db2 data sharing environments, all subsystems in a data sharing group share the same Db2 catalog. Consequently, you can create worklist tables on any single member within the group.

During customization, you must set several options for the Accelerator Loader started task in the initialization options member. For example, you must set the option that specifies the primary Db2 subsystem where the audit and logging tables are stored.

Tools Customizer generates the sample initialization options member hloidOPTS (where hloid is the started task configuration ID that you specify in Tools Customizer) in the hlq.mlq.SHLOSAMP library for your use. This member specifies the options with which your started task will be initialized. This member includes options that 1) specify the primary subsystem and the Db2 DSNLOAD library, 2) control Db2 connections, and 3) control Db2 tasks. You can edit the options member, if necessary.

DSNUTILB intercept and the DSNUTILB intercept policy

The Accelerator Loader DSNUTILB intercept is a front end to the DSNUTILB program and the Db2 LOAD utility when loading data from an external file.

To use the intercept, you must use the DSNUTILB intercept policy in XML that is created during product customization. The policy member (hloidPLCY) is specified in the started task PROC. The policy specifies the Db2 subsystem for which to perform DSNUTILB interception and the action to be performed, LOAD_ACCELERATOR. The following example shows the Accelerator Loader DSNUTILB intercept policy.

```xml
<?XML VERSION="1.0" ENCODING="UTF-8"?>
<!DOCTYPE OPTIONS SYSTEM "DD:DTD(HLODTDPL)">
<DSNUTILB_INTERCEPT>
  <POLICY>
    <DB2SYSTEM SSID="ssid" ACTION="LOAD_ACCELERATOR">
    </DB2SYSTEM>
  </POLICY>
</DSNUTILB_INTERCEPT>
```

The `<POLICY>` section identifies the Db2 subsystem "ssid".

A `<DB2SYSTEM>` element identifies a Db2 subsystem for which to monitor Db2 LOAD processing. During customization, the primary Db2 subsystem and all other Db2 SSIDS associated in the Tools Customizer Workplace panel are specified in the policy. You can also manually specify additional `<DB2SYSTEM>` elements within the `<POLICY>` section of the generated Accelerator Loader policy. The `<DB2SYSTEM>` element has the following attributes:

- The SSID attribute indicates a valid subsystem identifier for a Db2 subsystem on which you want to monitor Db2 LOAD processing. This value can be up to four characters long. No default value is provided. Wildcards are permitted. If you specify a generic wildcard pattern as its attribute value, this element can identify multiple Db2 subsystems.
Tip: Ensure that the Accelerator Loader plan is bound on the subsystem that you specify.

- The ACTION attribute indicates the DSNUTILB intercept action that is performed for the defined subsystem when evaluating the policy rules. The only valid value is LOAD_ACCELERATOR.

You must check the started task initialization options that pertain to the intercept worklist-error tables to ensure that they are set appropriately for your environment and intercept processing needs.

After you perform these configuration steps, the DSNUTILB intercept component can intercept the DSNUTILB program and analyze the DSNUTILB SYSIN stream for an Accelerator Loader job. The intercept divides the original SYSIN stream into separate worklist steps. Each step includes a single LOAD utility command and any applicable setup statements (for example, LISTDEF, TEMPLATE, or OPTIONS). Accelerator Loader examines the worklist steps and the DSNUTILB intercept policy to implement the enhanced load to the IBM Db2 Analytics Accelerator for z/OS.

From time to time, you might need to perform some intercept management tasks. For example, you might need to terminate a utility for which interception has occurred in a manner that removes the associated worklist data.

**Supervisor call (SVC)**

The SVC enables the product interfaces to communicate with the started task. One SVC is required for each started task. You specify the SVC number during customization. When you start the started task, the specified SVC is dynamically installed. When you stop the started task, the SVC is dynamically removed. No IPL or SYS1.PARMLIB changes are required.

### Console commands for the Accelerator Loader started task

Several z/OS console commands can be issued for the Accelerator Loader started task by using the `MODIFY` operator command.

**Syntax**

The `MODIFY` command is `F` if issued from the z/OS console or `/F` if issued from SDSF.

Use the following syntax to issue a console command from the z/OS console:

```
F started_task_name,command_name
```

where `started_task_name` is the name of the Accelerator Loader started task and `command_name` is the name of a supported console command. These names are separated by a comma only.

Use the following syntax to issue a console command from SDSF:

```
/F started_task_name,command_name
```

For some commands, you can add an option such as GLOBAL after the command name. In this case, specify the command name, a comma, and then the option name (without any blank spaces between these items), as follows:
F started_task_name,command_name,option

Commands

Tip: You can list all Accelerator Loader console commands in the started task output by using the HELP console command.

DISPLAY INTERCEPT[GLOBAL|,ALL]
Use this command to write the local DSNUTILB interception status (Enabled or Disabled) for the specified started task to the SYSPRINT data set that is allocated to the started task. You can optionally include the GLOBAL option to display the global interception status for the entire z/OS image. Alternatively, you can include the ALL option to write all of the following information to the SYSPRINT data set: the local interception status; the global interception status; and a list of the Db2 SSIDs for which DSNUTILB interception is occurring, including the HLQIDs of the started task instances that are involved in interception processing.

DISPLAY MEPL
Use this command to write a list of all Accelerator Loader modules to the SYSPRINT data set that is allocated to the started task. For each module, the list shows the module maintenance level, the date and time when the module was built, and other information for diagnostic use. Usually, you issue this command when directed to do so by IBM Software Support.

DISPLAY POLICY
Use this command to write the contents of the DSNUTILB intercept policy for the specified started task to the SYSPRINT data set that is allocated to the started task. This information includes the Db2 subsystems that are defined in your policy member (hlq/plcy).

DISPLAY SESSIONS[JOBNAME=jobname]
Use this command to list information on currently active sessions. The report includes the number of rows that have been loaded to the table by the job at the time the message is issued. Optionally, you can use the JOBNAME parameter to filter the report results by job name.

- To display information on all active sessions, issue the following MODIFY command from SDSF:
  /F started_task_name,DISPLAY SESSIONS

A report similar to the following example is produced in the JOBLOG:

where number_of_rows_loaded is the number of rows that have been loaded to the table by the job at the time the message is issued. The number_of_rows_loaded value is 0 if the parameter ACCEL_ROWSREPORT_THRESHOLD is set to 0.

Note: For more information about setting the ACCEL_ROWSREPORT_THRESHOLD parameter, see “Monitoring load job progress” on page 942.

When there are no active sessions, the command produces the following report:
To filter the report results by job name, issue the following **MODIFY** command, which includes the parameter JOBNAME, from SDSF:

```
/F started_task_name,DISPLAY SESSIONS,JOBNAME=jobname
```

where *jobname* is the name of the job to include in the report.

A report similar to the following example is produced in the JOBLOG:

HLOS0700I 264 17:19:33.97 TCB: 008BFBF8 SESSION REPORT *00000065*
HLOS0701I 264 17:19:33.97 +00000065+ SESS: 3683D4C8-00000024-U-jobname-S0877403-021F-user1
HLOS0702I 264 17:19:33.97 +00000065+ STATUS: SIGNED ON
HLOS0705I 264 17:19:33.97 +00000065+ ROWS LOADED: number_of_rows_loaded

**DISPLAY TRACE**

Use this command to capture trace information for the specified started task. This information is written to a SNAPTRC data set that is allocated to the started task. Trace information is primarily used for diagnosing problems. You should issue this command only when directed to do so by IBM Software Support.

**DUMP**

Use this command to perform an SVC dump of the started task address space. Usually, a dump is produced at the request of IBM Software Support to collect error information for analysis. You can find the location of the dump data set in the system log. If the started task is unresponsive, you can produce a dump of other Accelerator Loader address spaces.

**HELP**

Use this command to list all of the z/OS console commands that are supported for the started task in the SYSPRINT data set for the started task. The list indicates the correct syntax for these commands.

**--REFRESH DB2**

After a subsystem has been in maintenance mode, the Accelerator Loader started task is not notified by Db2 when the system is restarted for normal operation. Use this command to return a Db2 subsystem that had been in maintenance mode to active status with the Accelerator Loader started task.

It is recommended to use this command only when there are no active sessions in the Accelerator Loader started task. Active sessions, which represent active intercepts of a Db2 utility, can be displayed using the **DISPLAY SESSIONS** command.

**STOP [FORCE]**

Use this command to stop the specified started task. The operator command `/F started_task_name,STOP` is equivalent to the standard operator command `/P started_task_name`. If you want to stop the started task immediately, before it completes its current processing, you can add the optional FORCE option after the STOP command. To separate FORCE from STOP, use only a single space, as follows:

```
/F started_task_name,STOP FORCE
```

**TERMINATE SESSION,SESS=session_address**

If an Accelerator Loader batch job, intercepted DSNUTILB utility execution, or HLOMAINT job terminates abnormally without ending its session with the Accelerator Loader started task, you can use this command to force the termination of the session. For the SESS value in this command, specify a valid session address that is an 8-digit hexadecimal number. (A hexadecimal number can contain only the characters 0 through 9 and A through F.) You should be able to find this session address in an
HLOS0101I message. After you issue the command, look for the HLOS0103I message to determine whether the session terminated. You might want to use this command, for example, when the HLOS5113I message is issued. This message indicates that a Db2 utility cannot be restarted because its worklist is in use by another utility. If the other utility has terminated abnormally but is still associated with an active “owning session,” you can terminate the owning session by using this command. You should then be able to perform the restart operation.

Column display functions (CSETUP)

Column display functions (CSETUP functions) enable you to change the width of individual columns, and control the vertical ordering of columns.

CSETUP functionality enables you to:

- Change the width of individual columns using the CSIZE option.
- Control the vertical ordering of columns using the CSORT option.

Additional column display functions enable you to:

- Scroll horizontally between columns, in both left and right directions.
- Scroll horizontally within a single report column while other report columns remain stationary on the screen.
- Insert column numbers above each display column.
- Generate a ruler at the top of the report columns beneath the headings.
- Display an entire row-column data element.

The customizations, or views, you configure using CFIX, CORDER, CSIZE, and CSORT can be saved across sessions.

The following syntax restrictions apply to the use of CSETUP functionality:

- Underlined text indicates the minimum acceptable abbreviation for each keyword.
- Variables are shown in italicized lowercase type.
- Keyword options are separated by vertical lines ( | ).

Restrictions

The following restrictions apply to CSET options.

- Total fixed column sizes cannot exceed screen width.
- Total fixed column sizes must leave enough unfixed space for the minimum allowed size for all unfixed columns. If a column is not eligible to be re-sized, the column’s minimum size requirement is the same as its maximum size. Minimum and maximum sizes for all columns are shown in the CSIZE display.
- If a column has been re-sized, then its current width is treated as its smallest allowable size. When a column is re-sized its current size must fit on the screen completely. For example, on an 80-byte screen with no fixed columns, a 128-byte column can only be re-sized to 80 bytes or less (assuming no conflicting minimum size associated with the column). If there were two 10-byte fixed columns, for a total fixed area size of 20-bytes, the 128-byte column would be limited to 60 bytes or its minimum allowed size, whichever was smaller.
Accessing the CSETUP Primary Option Menu

The CSETUP primary option menu enables you to access the various CSETUP options and configure column display functions according to your display needs.

About this task

The CSETUP command uses the following syntax:

```
CSETUP
```

Launches the CSETUP Primary Option Menu.

To access and use the CSETUP Primary Option Menu:

Procedure

1. On any dynamic display (for example, the Manage Loader Profiles panel,) type CSETUP (or CSET) in the Option line and press Enter. The Setup Primary Option Menu displays.

2. On the command line, type the number corresponding to the option that you want to access and press Enter. The following options are available on the Setup Primary Option Menu:

   - **CFIX** Option 1, CFIX, enables you to fix and unfix columns.
   - **CORDER** Option 2, CORDER, enables you to reposition columns.
   - **CSIZE** Option 3, CSIZE, enables you to change the displayed width of columns.
   - **CSORT** Option 4, CSORT, enables you to select one or more columns for sorting and thus modify the order of the rows displayed.
   - **CHIDE** Option 5, HIDE, enables you to select one or more columns to be hidden.
   - **CRESET** Option 6, CRESET, enables you to reset all customizations.
   - **PVIEW** Option 7, PVIEW, enables you to toggle between permanent view and temporary view.

   Note: You can also directly invoke each CSETUP option by typing the corresponding command (for example, CFIX, CORDER, CSIZE, CSORT, CHIDE, CRESET, or PVIEW) in the option line on any dynamic display and pressing Enter.

Fixing a column

The CFIX option enables you to fix and unfix columns. A fixed column is always located at the far left side of the display.

About this task

It does not shift horizontally (as unfixed columns do) when scrolling to the left or right. INNER COLUMN SCROLLING and CEXPAND may be used on a fixed column if the column is narrower than its maximum width. Certain columns may be permanently fixed in the report and cannot be unfixed by the user. Such a column has a fix status of P (permanently fixed).

A column cannot be fixed if it is larger than the available display area. There are also restrictions for fixing columns related to the size requirements of other columns.
To fix a column:

**Procedure**

1. Type `CFIX` in the option line on any display panel and press Enter. The Define Fixed Columns panel displays as shown in the following figure:

```
CFIX ----------------- Define Fixed Columns ----------------- YYYY/MM/DD HH:MM:SS
Option ===>
scroll ===> PAGE

Column Function ===> 1 (1-Fix/Unfix, 2-Order, 3-Size, 4-Sort)
Permanent View ===> Y (Y-Perm, N-Temp) Reset View ===> N (Y,N)
Device_Width : 80
Old_Fixed_Width: 37 Old_Unfixed_Width: 43
New_Fixed_Width: New_Unfixed_Width:

Cmd New Old Len Column_Name
P P P 5 CMD
P P P 32 NAME
  10 CREATOR
  5 UPDT
  32 DESCRIPTION
  10 LAST_USER

Enter: Process selections; PF3: Exit and save; CAN: Exit without save
Line Cmds: F Fix U Unfix
```

**Figure 28. Define Fixed Columns panel**

The following fields appear on the Define Fixed Columns panel:

**Column Function**

Enables you to jump to any of the CSET functions by typing in the appropriate number. The number corresponding to the current option displays in this field.

**Permanent View**

Indicates whether the view you define is permanent or temporary. Valid values are:

- Y–View customizations are permanent.
- N–View customizations are temporary.

**Reset View**

Resets all customizations.

**Device_Width**

Shows the current display device size (screen width).

**Old_Fixed_Width**

Shows the sum of the FIXED column widths prior to any changes in the current CFIX panel.

**Old_Unfixed_Width**

Shows the UNFIXED area prior to any changes in the current CFIX panel. Old_Unfixed_Width = Device_Width - Old_Fixed_Width.

**New_Fixed_Width**

Shows the sum of the FIXED column widths that will result if the FIX/UNIFIX changes are saved.
**New_Unfixed_Width**

Shows the UNFIXED area that will result if the FIX/UNFIX changes are saved. \( \text{New_Unfixed_Width} = \text{Device_Width} - \text{New_Fixed_Width} \).

**Cmd**

Field where you specify line commands. Valid line commands are F (fix) and U (unfix).

**New**

Displays the new CFIX view settings.

**Old**

Displays the previous CFIX view settings.

**Len**

Shows the length of the column.

**Column_Name**

Shows the name of the column.

2. Type F in the **Cmd** field next to column(s) you want to fix.

3. Type U in the **Cmd** field next to column(s) you want to unfix.

4. Press Enter. The changed values display in the **New** column next to the corresponding column(s).

5. Press **PF3** to save changes and return to the display panel.

**Repositioning columns**

The **CORDER** option enables you to reposition report columns. If any columns are fixed, they are grouped together as the leftmost report columns. The unfixed columns are grouped together to the right of any fixed columns.

**About this task**

**CORDER** does not move a column out of its group. A fixed column cannot be relocated to the right of an unfixed column. Likewise, an unfixed column cannot be relocated to the left of a fixed column.

To reposition columns:

**Procedure**

1. Type **CORDER** in the option line on any display panel and press Enter. The Define Column Display Order panel displays as shown in the following figure:
The following fields appear on the Define Column Display Order panel:

**Column Function**
Enables you to jump to any of the CSET functions by typing in the appropriate number. The number corresponding to the current option displays in this field.

**Permanent View**
Indicates whether the view you define is permanent or temporary. Valid values are:
- Y—View customizations are permanent.
- N—View customizations are temporary.

**Reset View**
Resets all customizations.

**Cmd**
Field where you specify the number for column position.

**Fix**
Displays fixed columns. Valid values are:
- F—Indicates the column is fixed.
- P—Indicates the column is permanently fixed.

**New**
Displays the new CORDER view settings.

**Old**
Displays the previous CORDER view settings.

**Column_Name**
Shows the name of the column.

2. Type a number next to a column to specify its order.
3. Press Enter. The new column order numbers display in the **New** column next to each column.
4. Press **PF3** to return to the display panel.

**Resizing columns**
The CSIZE option enables you to change the displayed width of columns.
About this task

This function is primarily intended for non-numeric data where there are large blank areas in all (or most) rows in a given column. Although the displayed width may change, the underlying data does not change.

If a column’s size is less than the column maximum, it is possible that some date is not displayed. INNER COLUMN SCROLLING and CEXPAND can be used to see data outside the display range of the resized column.

**Note:** If the minimum and maximum column widths are equal, the column cannot be resized.

To resize columns:

**Procedure**

1. Type `CSIZE` in the option line on any display panel and press Enter. The Define Column Size panel displays as shown in the following figure:

   ![Figure 30. Define Column Size panel](image)

   Line Cnmds: Column size, between MIN and MAX

The following fields appear on the Define Column Size panel:

**Column Function**

Enables you to jump to any of the CSET functions by typing in the appropriate number. The number corresponding to the current option displays in this field.

**Permanent View**

Indicate whether the view you define is permanent or temporary. Valid values are:

- **Y**–View customizations are permanent.
- **N**–View customizations are temporary.

**Reset View**

Resets all customizations.

**Device_Width**

Shows the current display device size (screen width).
Old_Fixed_Width  
Shows the sum of the FIXED column widths.

Old_Unfixed_Width  
Shows the UNFIXED area.

New_Fixed_Width  
Shows the sum of the FIXED column widths.

New_Unfixed_Width  
Shows the UNFIXED area.

Cmd  
Field where you specify the number for column position.

New  
Displays the new CSIZE view settings.

Old  
Displays the previous CSIZE view settings.

Min  
Displays the minimum column length.

Note: If the minimum and maximum column widths are equal, the column cannot be resized.

Max  
Displays the maximum column length.

Note: If the minimum and maximum column widths are equal, the column cannot be resized.

Fix  
Displays fixed columns. Valid values are:
- F–Indicates the column is fixed.
- P–Indicates the column is permanently fixed.

Column_Name  
Shows the name of the column.

2. Type the desired column size in the **Cmd** field next to the column you want to resize.

   **Note:** The column size you specify must be between the Min and Max values shown for that column.

3. Press Enter. The new view criteria display in the **New** column.

4. Press PF3 to return to the display panel.

**Sort functionality**

**CSORT** functionality enables you to select one or more columns for sorting and thus modify the order of the rows displayed on many product panels.

Columns are selected by sort priority and direction. Direction is either ascending (default) or descending. When more than one column is selected for sorting, the second column only differentiates when rows have matching data in the first column. Similarly, a third column only impacts the sort when data in both the first two columns are identical.

**Defining sort columns**

You can sort display data by columns. You can select up to nine columns for sorting.
About this task

A maximum of nine columns can be selected for sorting at one time. Internal requirements may create a smaller maximum. A message is issued if the maximum number of columns selected for sorting is exceeded.

Note: CSORT and SORT are synonymous.

Procedure

1. Type CSORT (or SORT) in the option line on any display panel and press Enter.

The Define Sort Columns panel displays as shown in the following figure:

![Figure 31. Define Sort Columns panel](image)

The following fields appear on the Define Sort Columns panel:

- **Column Function**: Enables you to jump to any of the CSET functions by typing in the appropriate number. The number corresponding to the current option displays in this field.

- **Permanent View**: Indicate whether the view you define is permanent or temporary. Valid values are:
  - Y—View customizations are permanent.
  - N—View customizations are temporary.

- **Stop Sorting**: Indicates whether to stop sorting as specified. Valid values are:
  - Y—Stop sorting.
  - N—Continue sorting.

- **Cmd**: Field where you specify the sort order.
  - **Dir**: Specifies the lexicographic order for the column. Valid values are:
    - A—(Default) Values are listed in ascending order, smallest to largest.
    - D—Values are listed in descending order, largest to smallest.

- **New**: Displays the new CSORT view settings.
Old Displays the previous CSORT view settings.

Column_Name Shows the name of the column.

2. Type A or D in the Cmd field next to the columns on which you want to base your sort.
3. Press Enter. The new sort preferences are displayed in the New column.
4. Press PF3 to return to the display panel.

Fast-path SORT command
The SORT command can be used as a primary (fast-path) command by typing the appropriate SORT syntax in the Option line of any report panel and pressing Enter.

The functionality supports both single and multi-column sorting and enables users to specify sort order (ascending or descending) for each column in the sort.

Syntax for single-column sorting
The syntax for single-column sorting is as follows:

SORT column_identifier dir

Where column_identifier is either the column name or the relative column number and dir is the direction in which to sort the column data. Valid values for dir are:

- asc (Default) Sorts data in ascending order.
- desc Sorts data in descending order.

Notes:

1. There must be a space between the column_identifier and its dir (if used).
2. The relative column number for a column is determined based on the column's placement when visible on the screen. Thus, relative column numbers are only available for columns currently visible on the screen. Relative column numbers are determined by counting the displayed columns from left to right, with the leftmost visible column being assigned the number '1' and each successive column (reading left to right) being assigned a relative column number that is incremented by 1. Hint: To quickly determine the column number, use the CNUM command to toggle on the column numbers for each display column.
3. You can sort on a column that is not displayed if you use the column name (instead of the relative column number) as the column_identifier in the SORT syntax.

Multi-column sorting
The syntax for multi-column sorting is as follows:

SORT column_identifier dir column_identifier dir

Where column_identifier is either the column name or the relative column number and dir is an optional indication of the direction in which to sort the column data. Valid values for dir are:

- asc (Default) Sorts data in ascending order.
- desc Sorts data in descending order.
The column_identifier and dir values must all be separated by spaces. The maximum number of columns that can be sorted at once is 9.

**Usage examples**

For a report display that has three columns, all of which display on the screen:

Column 1: Name

Column 2 Creator

Column 3: Status

The following examples show how you can sort these columns:

SORT NAME
   Sorts display data in ascending order based on the value in the Name column (when no dir value is specified, the default sort order is ascending, thus SORT NAME and SORT NAME A are synonymous).

SORT NAME D
   Sorts display data in descending order based on the value in the Name column.

SORT NAME DESC
   Sorts display data in descending order based on the value in the Name column.

SORT NAME A CREATOR D
   Sorts display data first in ascending order based on the value in the Name column and then sorts data in descending order based on the value in the Creator column.

SORT NAME ASC CREATOR DESC
   Sorts display data first in ascending order based on the value in the Name column and then sorts data in descending order based on the value in the Creator column.

SORT 1 A
   Sorts display data in ascending order based on the value in the Name column.

SORT 1 A CREATOR D
   Sorts display data first in ascending order based on the value in the Name column and then sorts data in descending order based on the value in the Creator column.

SORT 3 2 1
   Sorts the display data first in ascending order based on the value in the Status column, then in ascending order based on the value in the Creator column, and finally in ascending order based on the value in the Name column.

**Note:** When you specify a column name using any of the above formats, you may enclose it in single quotes, double quotes, or be without any quotes. For example, the following are equivalent:

SORT NAME D

SORT 'NAME' D
Hiding columns

The CHIDE option enables you to hide one or more columns from the display.

About this task

Certain columns might be permanently fixed in the report and cannot be hidden. Such a column has a fix status of P (permanently fixed).

Procedure

1. Type CHIDE in the option line on any display panel and press Enter. The Define Hidden Columns panel displays.
   The following fields appear on the panel:
   - Column Function: Enables you to jump to any of the CSET functions by typing in the appropriate number. The number corresponding to the current option displays in this field.
   - Permanent View: Indicate whether the view you define is permanent or temporary. Valid values are:
     - Y–View customizations are permanent.
     - N–View customizations are temporary.
   - Reset View: Reset all customizations (Yes or No).
   - Cmd: Field where you specify the number for column function.
   - Fix: Displays fixed columns. Valid values are:
     - F–Indicates the column is fixed.
     - P–Indicates the column is permanently fixed.
   - New: Displays the new CHIDE view settings.
   - Old: Displays the previous CHIDE view settings.
   - Column_Name: Shows the name of the column.

2. To hide columns, type H in the Cmd field beside the columns that you want to hide.

3. To display previously hidden columns, type U in the Cmd field beside columns that you want to unhide.

Resetting CSET customizations

The CRESET option enables you to reset all customizations.

About this task

After CRESET is issued, all fixed columns are unfixed (except for any permanently fixed columns), all selected sort columns are deselected and sorting is disabled, all column sizes are set to the initial values or maximum values if no suggested value previously existed, and original column locations are restored.
Procedure

1. To issue the **CRESET** option, access the Setup Primary Option Menu by typing **CSET** in the option line of any report display and pressing Enter. The Setup Primary Option Menu displays.

2. Type **5** in the command line and press Enter. **CRESET** is issued and all fixed columns are unfixed (except for any permanently fixed columns), all selected sort columns are deselected and sorting is disabled, all column sizes are set to the initial values or maximum values if no suggested value previously existed, and original column locations are restored.

3. Alternatively, you can issue the **CRESET** command as a primary command using the following syntax:

   **CRESET**

   Resets all customizations (unfixes fixed columns, deselects selected sort columns, sorting disabled, column sizes set to initial values, original column locations restored).

   **Note:** **CRESET** differs from **CREMOVE** in that **CREMOVE** sets all column sizes to their maximum values ignoring any initial, suggested sizes.

What's new in previous editions

This topic summarizes significant enhancements and changes to previous editions of Db2 Analytics Accelerator Loader documentation.

**Version 2.1 SC27-6777-00 (First edition) - February 2016**

The **Accelerator Loader** provides the **Accelerator Loader server**. The server allows non-Db2 and non-z/OS data sources to be defined for the purpose of extracting data from the source, and loaded to the accelerator via the **Accelerator Loader studio**, a plug-in to IBM Data Studio. **Accelerator Loader studio** enables you to load data to the accelerator without first landing the data in a flat file.

The **Accelerator Loader** integrates with Db2 tables in replication mode via IBM Change Data Capture for z/OS (CDC) when loading data to both a table in Db2 and a table on the accelerator from an external file.

You can append data to a Db2 table, the accelerator table, or both. The RESUME YES load utility keyword and the **Resume** field on the Load Accelerator and Db2 from External File and Load Accelerator from External File panels support this enhancement.

The **Accelerator Loader** supports appending data when loading from an external file into a Db2 table, the accelerator table, or both. The field **RÉSUMÉ** on the ISPF panels generates RESUME YES into the LOAD utility control cards.

The ISPF interface has been enhanced to improve usability, as follows. For descriptions of each panel, see the reference section.

- **New panels:**
  - Save Profile panel
  - Create Profile panel
- **Changed panels:**
  - On the IBM Db2 Analytics Accelerator Loader for z/OS main menu, **Settings** is now **Setup**, **Db2 Analytics Accelerator Loader profiles** is now **Manage**
Loader profiles, and the following options for creating profiles were added: Load Accelerator and Db2 from External File, Load Accelerator from external file, Load Accelerator with consistent data, and Load Accelerator from a specified image copy.

- Profile Options panel was replaced by an options panel for each profile type.
- Profile Display panel was replaced by the Manage Loader Profiles panel.
- Load From External Options panel was replaced by the following panels:
  - Load Accelerator and Db2 from External File panel, which you use to specify options for a Dual load profile.
  - Load Accelerator from External File panel, which you use to specify options for an External load profile.
- Consistent Load Options panel was replaced by the following panels:
  - Load Accelerator with Consistent Data panel, which you use to specify options for a Consistent load profile.
  - Load Accelerator from Specified Image Copy panel, which you use to specify options for an Image Copy load profile.

- The following profile types are now supported:
  - **Dual** specifies options for loading table data into both the accelerator and Db2 from an external data input file.
  - **Accelerator only** specifies options for loading table data into only the accelerator from an external data input file.
  - **Consistent** specifies options for loading data for multiple tables into the accelerator from a cataloged Db2 image copy.
  - **Image copy** specifies options for loading data for a single table into the accelerator from a user-defined Db2 image copy.

The FLOAT option is now supported.

You can add tables to the accelerator before the load job starts. The ISPF panel field **Add tables to accelerator** and the extended syntax options ACCEL_ADD_TABLES and ACCEL_REMOVE_AND_ADD_TABLES support this enhancement.

You can enable query acceleration for a table after a successful load. The options module parameter **Enable acceleration after successful load**, ISPF panel field **Acceleration on success**, and the extended syntax option ACCEL_ON_SUCCESS_ENABLE support this enhancement.

You can use parameter MESSAGE in a call to ACCEL_LOAD_TABLES for tracing capabilities.

Tools Customizer provides the option of generating IVP jobs during customization. For more information, see the worksheet for gathering parameter values for Tools Customizer.

On the Load Accelerator with Consistent Data panel, the default value of the Log Reader copy preference field is now R1R2A1A2.

You can control case sensitivity in object names during searches. The field **Case sensitive** on the Enter Table and Creator Like to Display panel enables this feature.

When searching for profile types, you can use * (asterisk) in the **Profile Type** field on the Manage Profiles panel to indicate all profile types.
The product detects that a table column information data set is from an UNLOAD utility. It parses out only the field specifications and includes them in the JCL that it generates. Manually deleting the LOAD control cards from the column information data set is no longer required.

When you use an Image Copy profile, you can specify an image copy for a load job in the ISPF interface and the product generates a consistent load job to load from that image copy.

SYSIN lines for the batch JCL generator cannot exceed 72 symbols. To split a long table name among multiple lines, enter the names in positions 1 - 72, and then start a new line in position 1.

Load profiles can be used by the version of the product that you used to create the profile and by later versions.

The product's ability to clean up common storage has been enhanced, and options have been added for manually cleaning common storage by table or by batch job.

When the SYSIN contains only one executable statement, such as the LOAD statement, if an error occurs during the load to the accelerator, then the product will terminate the utility and then delete the worklist from the utility tables.

When loading from an external file, the product supports parallelism with accelerator-only loads for nonpartitioned and partition-by-growth tables, improving performance for these loads. The ACCEL_LOAD_TASKS extended syntax option and options module option are supported when loading a nonpartitioned or partition-by-growth object to the accelerator only.

You can specify the maximum number of source records that are to be written on the discard data set. The DISCARDS field was added to the Load Accelerator and Db2 from an External File panel to support this enhancement.

Enhancements for loading data to a consistent time (consistent load) are as follows:

- Accelerator Loader supports a LOAD utility syntax that has no FORMAT clause and no field specifications. The field-specification restrictions for the Db2 LOAD utility also apply to Accelerator Loader.
- You can optimize product performance for either CPU usage or elapsed time for loads that meet the following criteria:
  - Loading data to both the accelerator and Db2 (Dual load profile).
  - Performing nonparallel processing.
  - Loading to a table that is not partitioned or is partitioned by growth.
- The options module parameter **Optimize processing for CPU or elapsed time** and the extended syntax option ACCEL_OPTIMIZE_FOR support this enhancement.
- Use the **Load partitions individually** field to specify whether the SPACE statement is generated for each partition of a partitioned table, or for the entire table.
- Db2 Analytics Accelerator Loader provides an ISPF panel field (**Bypass SYSIBM.SYSLGRNX Proc**) and a syntax option (**NO_SYSLGRNX**) that enable you to specify whether the product skips reading SYSIBM.SYSLGRNX and reads the entire Db2 log range from earliest start point to the latest end point when you perform a consistent data load.
Accelerator Loader can read tape data sets that are stored in large block interface (LBI) format.

External load batch usability improvements, as follows:

- The product includes a snap dump of LDA control block that is triggered by the SNAPLDA DD to help diagnose S878 ABENDs. If you encounter an S878 ABEND, you can retain the SNAPLDA DD to send to IBM Software Support.
- The Load Accelerator and Db2 from External File and Load Accelerator from External File panels contain only one field for SYSREC and one field for SYSPUNCH.

Version 1.1 SC19-4165-02 (third edition) - December 2014

Accelerator Loader now verifies that a specified migrated data set exists without recalling that data set.

When filtering objects to include in a load profile, you can select a view or an alias instead of a table in the ISPF panels, or specify a view or an alias instead of a table in the batch interface. The product resolves the view or alias to the base table space and includes the base table space in the generated JCL. Support is limited to views from a single base table. A view that was created from a join of more than one table is not supported.

A batch interface enables you to generate JCL for Accelerator Loader jobs and specify new table names at JCL build time. The batch interface can be useful if you have a process or procedure that determines dynamically what tables need to be loaded and when. The batch interface allows you to specify a profile for the basic options and a list of tables to be loaded, and enables you to override many options for each table that you specify. For any parameter that you do not specify in the batch interface, the value is taken from the profile.

The Tools Customizer Discover EXEC can discover and use existing information from a previously configured installation of the Accelerator Loader. Tools Customizer can no longer use a control file from a previous installation of Db2 Change Accumulation Tool V3.1 to discover existing information to use with Accelerator Loader.

The following changes and enhancements were made to the load from an external file feature:

- Field specifications must be coded on the LOAD statement. Each INTO TABLE clause must have its own set of field specifications. The product issues a message and terminates the utility when field specifications are not coded on the LOAD statement.
- Accelerator Loader supports processing multiple partitions of the same table and loading them into the accelerator in parallel. To enable parallelism and improve performance when loading partitioned objects, you can specify multiple SYSREC data sets. The options module parameter ACCEL_LOAD_TASKS and extended syntax option ACCEL_LOAD_TASKS support this enhancement. When generating JCL through the ISPF interface, you can optionally generate load control cards that will enable parallelism by using new fields on the Load from External Options panel (HLOLEXLO).
- Accelerator Loader supports the IGNOREFIELDS clause of the Db2 LOAD utility. When loading only the accelerator (option IDAA_ONLY), Accelerator Loader generates valid rows when a field specification name begins with "DSN_". Previously, Accelerator Loader always behaved as though...
IGNOREFIELDS YES had been specified (though the product did not support the IGNOREFIELDS clause). Accelerator Loader behavior now matches that of the Db2 LOAD utility. That is, when the IGNOREFIELDS clause is omitted, Accelerator Loader behaves as though IGNOREFIELDS NO was specified.

- When performing a load to both the accelerator and Db2 (option IDAA_DUAL), Accelerator Loader can pass the load job to the Db2 LOAD utility to load data to Db2 only (no data is loaded to the accelerator) when it encounters the need for a value to be generated for an identity column. The options module parameter ACCEL_LOAD_TASKS supports this enhancement.
- If the LOAD utility statement does not contain either a NUMRECS or SORTKEYS clause to provide an estimated number of records, the product estimates the number of SYSREC records. Using the estimated record count, it then adds a NUMRECS clause for each INTO TABLE clause.
- When loading data to both the accelerator and Db2, you can provide one or more standard Db2 LOAD discard data sets.
- Accelerator Loader supports the NULLIF and DEFAULTIF LOAD utility options.
- Accelerator Loader supports the Db2 GRAPHIC, VARGRAPHIC, and TIMESTAMP WITH TIMEZONE data types.

The following changes and enhancements were made to the consistent load feature:

- Debugging information is no longer included in the Accelerator Loader output by default. To include debugging and troubleshooting information in the job output, contact IBM Software Support for instructions.
- Accelerator Loader supports processing multiple partitions of the same table and loading them into the accelerator in parallel. You can specify the number of objects that the product is to process at the same time. When generating JCL through the ISPF interface, you can optionally specify the number of parallel log apply tasks on the Consistent Load Options panel (HLOLECLO). The specified value is used as the "y" value in the PARALLEL control card in the JCL.
- Accelerator Loader always uses the 31-bit code paths, regardless of whether the BUFFERS_IN_31_BIT control card is present. The BUFFERS_IN_31_BIT control card is obsolete and was removed from the documentation. If the control card is present, the product ignores it.
- You can specify an image copy and load the data from that image copy into the accelerator. Specifying an end time or rolling through the logs is not required; the product uses the image copy as the content of the object to be loaded.
- To enable parallel processing of multiple partitions of the same table, you specify the number of parallel log apply and load tasks. You can use the ISPF interface or the PARALLEL option.

The Accelerator Loader documentation was corrected to remove the following unsupported options from the sample JCL:

- DISCARDDN ISYSDISC
- TEMPLATE ISYSDISC
- NULLIF

Privacy policy considerations

IBM Software products, including software as a service solutions, ("Software Offerings") may use cookies or other technologies to collect product usage information, to help improve the end user experience, to tailor interactions with the end user or for other purposes. In many cases no personally identifiable information is collected by the Software Offerings. Some of our Software Offerings can help enable you to collect personally identifiable information. If this Software
Offering uses cookies to collect personally identifiable information, specific information about this offering’s use of cookies is set forth below.

This Software Offering does not use cookies or other technologies to collect personally identifiable information.

If the configurations deployed for this Software Offering provide you as customer the ability to collect personally identifiable information from end users via cookies and other technologies, you should seek your own legal advice about any laws applicable to such data collection, including any requirements for notice and consent.
