ARC Archive log command
'' Normal write-force request

Deduced from the DB2 fields QW0032FT and QW0032RT.
Field Name: QW0032FT

IFCID 033 - Log Wait End:

This topic shows detailed information about “Record Trace - IFCID 033 - Log Wait End”.

This record is for IBM service use.

Record trace - IFCID 033 - Log Wait End

The field labels shown in the following sample layout of “Record Trace - IFCID 033 - Log Wait End” are described in the following section.

QW0033RS
IFCID 033 - Log Wait End

This field is for IBM service use.

Field Name: QW0033RS

IFCID 034 - Log Read Start:

This topic shows detailed information about “Record Trace - IFCID 034 - Log Read Start”.

Record trace - IFCID 034 - Log Read Start

The field labels shown in the following sample layout of “Record Trace - IFCID 034 - Log Read Start” are described in the following section.

DSID : X'XXXXXXXX
ACE : ZZ9
WAIT TIME TYPE: ACTIVE LOG READ
QW0034HR: X'HHHHH'
QW0034LR: X'HHHHHHHHH'

DSID

The data set identifier of the log manager.

Field Name: QW0034DI

WAIT TIME TYPE

The type of wait time. Possible values are:
• ACTIVE LOG READ
• ACTIVE LOG PREFETCH READ
• BSDS READ
• PEER-BSDS READ

Otherwise, a hexadecimal value is shown.

Field Name: QW0034TY

ACE

The relative number of the agent control element address in the ACE cross-reference table. This table is printed at the end of each location for every trace specified.

Field Name: QW0034AC

IFCID 035 - Log Read End:

This topic shows detailed information about “Record Trace - IFCID 035 - Log Read End”.

Record trace - IFCID 035 - Log Read End

The field labels shown in the following sample layout of “Record Trace - IFCID 035 - Log Read End” are described in the following section.

RET 0 ACE 1

RET

The return code.

Field Name: QW0035RT

ACE
IFCID 035 - Log Read End

The relative number of the agent control element address in the ACE cross-reference table. This table is printed at the end of each location for every trace specified.

Field Name: QW0035AC

IFCID 036 - Log Non I/O Start:

This topic shows detailed information about “Record Trace - IFCID 036 - Log Non I/O Start”.

Record trace - IFCID 036 - Log Non I/O Start

The field labels shown in the following sample layout of “Record Trace - IFCID 036 - Log Non I/O Start” are described in the following section.

<table>
<thead>
<tr>
<th>DSID</th>
<th>:</th>
<th>DSIDNAME</th>
<th>EVENT ID: ALLC</th>
</tr>
</thead>
<tbody>
<tr>
<td>REQUEST TYPE: ALLD</td>
<td>ACE</td>
<td>:</td>
<td>1</td>
</tr>
</tbody>
</table>

DSID

The data set identifier of the log manager.

Field Name: QW0036DI

EVENT ID

The event identifier:

- ALLC Allocation
- DTAU Data set unavailable
- OPEN Open
- CLOS Close
- DEAL Deallocate
- CLOC Wait for the catalog to be located
- WTOR Wait for reply from write-to-operator
- HSMR Wait for HSM recall
- UUNI Wait for unavailable tape unit
- URST Wait for unavailable reader service task
- MDSV Wait for multi-data set volume
- POSI Wait for tape volume positioning

Field Name: QW0036EI

REQUEST TYPE

The request type:

- ALLD Demand allocation
- ALLL Look ahead (premount) allocation

Field Name: QW0036RT

ACE
The relative number of the agent control element address in the ACE cross-reference table. This table is printed at the end of each location for every trace specified.

**Field Name:** QW0036AC

IFCID 037 - Log Non I/O End:

This topic shows detailed information about “Record Trace - IFCID 037 - Log Non I/O End”.

**Record trace - IFCID 037 - Log Non I/O End**

The field labels shown in the following sample layout of “Record Trace - IFCID 037 - Log Non I/O End” are described in the following section.

```
RET  0  ACE  1  
QW0037RC  0
```

RET

The return code.

**Field Name:** QW0037RT

ACE

The relative number of the agent control element address in the ACE cross-reference table. This table is printed at the end of each location for every trace specified.

**Field Name:** QW0037AC

IFCID 038 - Active Write Start:

This topic shows detailed information about “Record Trace - IFCID 038 - Active Write Start”.

**Record trace - IFCID 038 - Active Write Start**

The field labels shown in the following sample layout of “Record Trace - IFCID 038 - Active Write Start” are described in the following section.

```
DSID  ACTLG101  COPY  1  ACE  2  
CI     1
QW0038VR  4345856  QW0038FR  0
QW0038LR  155340800  QW0038LC  155344772
QW0038LB  X'7F709470'
```

DSID

The data set identifier of the log manager.

**Field Name:** QW0038DI

COPY

The copy number of the active log data set.

**Field Name:** QW0038CN

ACE

The relative number of the agent control element address in the ACE cross-reference table. This table is printed at the end of each location for every trace specified.
IFCID 038 - Active Write Start

Field Name: QW0038AC

CI
The number of contiguous control intervals.

Field Name: QW0038CC

IFCID 039 - Active Write End:

This topic shows detailed information about “Record Trace - IFCID 039 - Active Write End”.

Record trace - IFCID 039 - Active Write End

The field labels shown in the following sample layout of “Record Trace - IFCID 039 - Active Write End” are described in the following section.

<table>
<thead>
<tr>

<tr>
<td>QW0039RC</td>
<td>0</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**DSID**
The data set identifier.

Field Name: QW0039DI

**COPY**
The copy number of the active log data set.

Field Name: QW0039CN

**ACE**
The relative number of the agent control element address in the ACE cross-reference table. This table is printed at the end of each location for every trace specified.

Field Name: QW0039AC

**RET**
The return code.

Field Name: QW0039RT

IFCID 040 - Archive Write Start:

This topic shows detailed information about “Record Trace - IFCID 040 - Archive Write Start”.

Record trace - IFCID 040 - Archive Write Start

The field labels shown in the following sample layout of “Record Trace - IFCID 040 - Archive Write Start” are described in the following section.

<table>
<thead>
<tr>
<th>DSID</th>
<th>DSIDNAME</th>
</tr>
</thead>
</table>

**DSID**
The data set identifier of the log manager.

Field Name: QW0040DI
IFCID 041 - Archive Write End:

This topic shows detailed information about “Record Trace - IFCID 041 - Archive Write End”.

Record trace - IFCID 041 - Archive Write End

The field labels shown in the following sample layout of “Record Trace - IFCID 041 - Archive Write End” are described in the following section.

```
RET 0 BLOCKS 5
RET
```

The return code.

Field Name: QW0041RT

BLOCKS

The number of blocks written.

Field Name: QW0041BW

IFCID 042 - Checkpoint Start:

This topic shows detailed information about “Record Trace - IFCID 042 - Checkpoint Start”.

When present, data is printed in dump format, otherwise NO DATA is printed.

IFCID 043 - Checkpoint End:

This topic shows detailed information about “Record Trace - IFCID 043 - Checkpoint End”.

Record trace - IFCID 043 - Checkpoint End

The field labels shown in the following sample layout of “Record Trace - IFCID 043 - Checkpoint End” are described in the following section.

```
RBA X'0000008F65341288'
RBA
```

The beginning checkpoint RBA.

Field Name: QW0043BC

IFCID 044 - Lock Suspend:

This topic shows detailed information about “Record Trace - IFCID 044 - Lock Suspend”.

Record trace - IFCID 044 - Lock Suspend

The field labels shown in the following sample layout of “Record Trace - IFCID 044 - Lock Suspend” are described in the following section.
LOCK RES TYPE

The locked resource type.

Note: For data sharing, SKELETON CURSOR TABLE LOCKING and SKELETON PACKAGE TABLE LOCK are LP-locks (an LP-lock has an L-lock component and a P-lock component).

Field Name: QW0044KT

NAME

The plan name or collection name. This field is only printed if the value in LOCK RES TYPE is SKELETON CURSOR TABLE LOCKING or COLLECTION.

Deduced from the DB2 field QW0021KD, QW0021KP, and QW0021KR when the locked resource type is skeleton cursor table locking.

Field Name: RT21NAME

BPID

The buffer pool ID. This field is only printed if the value in LOCK RES TYPE is:

ALTER BUFFER POOL
GROUP BUFFERPOOL START/STOP LOCK
PAGESET/PARTITION P-LOCK
PAGE P-LOCK
GROUP BUFFERPOOL LEV CASTOUT P-LOCK
PAGESET/PARTITION LEV CASTOUT P-LOCK

For ALTER BUFFER POOL, deduced from QW0021KD || QW0021KP.

For GROUP BUFFERPOOL START/STOP LOCK, deduced from QW0021KD || QW0021KP.

For PAGESET/PARTITION P-LOCK, deduced from QW0021P1.

For PAGE P-LOCK, deduced from QW0021P1.

For GROUP BUFFERPOOL LEV CASTOUT P-LOCK deduced from QW0021P1.

For PAGESET/PARTITION LEV CASTOUT P-LOCK, deduced from QW0021P1.

Field Name: RT21BPID

DBID

The database ID. This field is not applicable if the value in LOCK RES TYPE is:

SKELETON CURSOR TABLE LOCKING
SKELETON PACKAGE TABLE LOCK
COLLECTION
ALTER BUFFER POOL

Deduced from the DB2 fields QW0044KD, QW0105DN or QW0107DN.

When present, the database name is shown, otherwise the decimal identifier from QW0044KD is shown, or N/A when this value is 0.

Field Name: RT0044DB

OBID
The object ID of the table space or page set. This field is not applicable if the value in LOCK RES TYPE is:
SKELETON CURSOR TABLE LOCKING
SKELETON PACKAGE TABLE LOCK
COLLECTION
ALTER BUFFER POOL

Deduced from the DB2 fields QW0044OB, QW0105TN, QW0107TN, QW0105OB, or QW0107OB.

The table space or object name is shown, when present, otherwise the decimal identifier from QW0044OB is shown, or N/A when this value is 0.

Field Name: RT0044OB

RESOURCE ID
The hexadecimal identifier of the small resource. If LOCK RES TYPE is:

DATA PAGE LOCKING
First 3 bytes are the page number

DATA SET LOCKING (PARTITION)
Last byte is the partition number

INDEX PAGE LOCKING
First 3 bytes are the page number

HASH ANCHOR LOCK
First 3 bytes are the page number and the last byte is the anchor point ID

CS-READ DRAIN
Last byte is the partition number (optional)

RR-READ DRAIN
Last byte is the partition number (optional)

WRITE DRAIN
Last byte is the partition number (optional)

ROW LOCK
First 3 bytes are the page number and the last byte is the row ID of the record

INDEX END OF FILE LOCK
Last byte is the partition number (optional)

Note:
• In large partitioned table spaces, the page number covers 4 bytes instead of 3.
• If table spaces use relative page numbers, the resource ID covers 7 bytes. It contains the partition number in the first 2 bytes, the page number in the next 4 bytes, and the record ID in the seventh byte.

This field is not applicable if the value in LOCK RES TYPE is SKELETON CURSOR TABLE LOCKING, SKELETON PACKAGE TABLE LOCK, COLLECTION, TABLE LOCK, or ALTER BUFFER POOL. If the value is UTILITY SERIALIZATION LOCK or BINDLOCK, N/A is printed.

Field Name: QW0044KR

COLL
IFCID 044 - Lock Suspend

The collection identifier. This field is only printed if the value in LOCK RES TYPE is SKELETON PACKAGE TABLE LOCKING.

The package identifier. This field is only printed if the value in LOCK RES TYPE is SKELETON PACKAGE TABLE LOCKING.

The consistency token. This field is only printed if the value in LOCK RES TYPE is SKELETON PACKAGE TABLE LOCKING.

The buffer pool ID. This field is only printed if the value in LOCK RES TYPE is ALTER BUFFER POOL.

Field Name: QW0044RN

IRLM FUNC CODE

The IRLM function code.

Field Name: QW0044FC

STATE

The lock state.

Field Name: QW0044ST

DURATION

The lock duration:

MANUAL  Varies depending on the ISOLATION parameter (QW0044DR=x '20')

MANUAL+1 Temporary change of consistency level from CS to RR during bind and DDL (QW0044DR=x '21')

COMMIT  Until commit (QW0044DR=x '40')

COMMIT+1 Past commit; applies to locks needed to maintain the position for a cursor opened WITH HOLD (QW0044DR=x '41')

ALLOCATION  Until deallocation (QW0044DR= '60')

PLAN  For the duration of the plan (QW0044DR=x '80')

UTIL  For the duration of the utility execution (QW0044DR=x '81')

INTEREST  Duration used for P-locks (QW0044DR=x 'FE')

FREE ALL  Until all locks are freed (QW0044DR=x 'FF')

N/A  Not applicable for NOTIFY SUSPEND

Field Name: QW0044DR

REASON SUSP

The reason for the suspend:

LC  IRLM latch contention

IQ  IRLM queued request

LR  Local resource contention
IFCID 044 - Lock Suspend

GR  Global resource contention
IS  Intersystem communication
N   Notify message sent
LS  No longer used
RL  Contention with a retained lock

Field Name: QW0044WS

REQ TOKEN
The IRLM lock request token.
Field Name: QW0044RT

LOCK ATTRIBUTES
The lock attributes.
Field Name: QW0044FO

PROP TO XES
Indicates whether the request was propagated to XES by IRLM.
Field Name: QW0044Y1

ASYN TO XES
Indicates whether the request was sent to XES asynchronously by IRLM.
Field Name: QW0044Y2

PARENT TOKEN
The parent token for explicit hierarchical locking. This field is valid if the
DB2 subsystem is a member of a data sharing group.
Field Name: QW0044PT

LOCK HASH VALUE
The hash value of the locked resource.
Field Name: QW0044LH

IFCID 045 - Lock Resume:

This topic shows detailed information about “Record Trace - IFCID 045 - Lock
Resume”.

Record trace - IFCID 045 - Lock Resume

The field labels shown in the following sample layout of “Record Trace - IFCID 045
- Lock Resume” are described in the following section.

REASON FOR RESUME : NORMAL RESUME
REASON FOR SUSPEND : X'08'
IRLM LATCH CONTENTION  : NO
IRLM QUEUED REQUEST    : NO
LOCAL RESOURCE CONTENTION : NO
RETIRED LOCK CONTENTION : NO
GLOBAL RESOURCE CONTENTION : YES
INTER-SYSTEM MESSAGE SENDING : NO
GLOBAL CONTENTION EXTENT  : X'F0'
XES GLOBAL CONTENTION    : NO
IRLM GLOBAL CONTENTION  : YES
IFCID 045 - Lock Resume

FALSE CONT OR CONV : NO
QW0045W4 NO QW0045W6 NO QW0045W8 NO
QW0045X1 NO QW0045X2 NO QW0045X5 NO
QW0045X6 NO QW0045X7 NO QW0045X8 NO

REASON FOR RESUME

The reason for the lock resume.
Field Name: QW0045R

REASON FOR SUSPEND

The reason for the suspension. The nonserviceability values are:

IRLM LATCH CONTENTION
Indicates whether IRLM latch contention occurred. (QW0045W1)

IRLM QUEUED REQUEST
Indicates whether there was an IRLM queued request. (QW0045W2)

LOCAL RESOURCE CONTENTION
Indicates whether local resource contention occurred. (QW0045W3)

RETAIINED LOCK CONTENTION
Indicates whether there was contention with a retained lock. (QW0045W4)

GLOBAL RESOURCE CONTENTION
Indicates whether intersystem communication was required to resolve an IRLM request. (QW0045W5)

INTER-SYSTEM MESSAGE SENDING
Indicates whether any intersystem message was sent. (QW0045W7)

Field Name: QW0045SR

GLOBAL CONTENTION EXTENT

The extent of global contention. This is applicable if the value in the GLOBAL RESOURCE CONTENTION field is YES. The nonserviceability values are:

XES GLOBAL CONTENTION
Indicates whether XES global contention occurred. DB2 field QW0045X3.

IRLM GLOBAL CONTENTION
Indicates whether IRLM global contention occurred. DB2 field QW0045X4.

FALSE CONT OR CONV
Indicates whether XES global contention or IRLM global contention occurred. DB2 field QW0045X4.

Field Name: QW0045XR

IFCID 046 - IBM Service Record:

This topic shows detailed information about “Record Trace - IFCID 046 - IBM Service Record”.

This record is for IBM service use.

3766 IBM Db2 Performance Expert on z/OS
IFCID 047 - IBM Service Record:

This topic shows detailed information about “Record Trace - IFCID 047 - IBM Service Record”.

This record is for IBM service use.

IFCID 048 - IBM Service Record:

This topic shows detailed information about “Record Trace - IFCID 048 - IBM Service Record”.

This record is for IBM service use.

IFCID 049 - IBM Service Record:

This topic shows detailed information about “Record Trace - IFCID 049 - IBM Service Record”.

This record is for IBM service use.

IFCID 050 - IBM Service Record:

This topic shows detailed information about “Record Trace - IFCID 050 - IBM Service Record”.

This record is for IBM service use.

IFCID 051 - IBM Service Record:

This topic shows detailed information about “Record Trace - IFCID 051 - IBM Service Record”.

This record is for IBM service use.

IFCID 052 - IBM Service Record:

This topic shows detailed information about “Record Trace - IFCID 052 - IBM Service Record”.

This record is for IBM service use.

IFCID 053 - SQL Describe/Commit/Rollback/Remote Statement:

This topic shows detailed information about “Record Trace - IFCID 053 - SQL Describe/Commit/Rollback/Remote Statement”.

If this event is not recognized, UNRECOG CMD is printed.

The following data is printed in the DATA column:

Record trace - IFCID 053 - SQL Describe/Commit/Rollback/Remote Statement

The field labels shown in the following sample layout of “Record Trace - IFCID 053 - SQL Describe/Commit/Rollback/Remote Statement” are described in the following section.
IFCID 053 - SQL Describe/Commit/Rollback/Remote Statement

LOCATION NAME
The location name.

Field Name: QW0053LN

PKG COLLECTION ID
The package collection identifier.

Field Name: QW0053PC

PROGRAM NAME
The name of the program.

Field Name: QW0053PN

CONSISTENCY TOKEN
The consistency token.

Field Name: QW0053TS

SECTION NUMBER
The section number of the Relational Data system Input parameter list (RDI).

Field Name: QW0053SECTN

STATEMENT NUMBER
The number of the statement executed.

Field Name: QW0053SN

QUERY COMMAND ID
The ID of the query command.

Field Name: QW0053QID

QUERY INSTANCE ID
The ID of the query instance.

Field Name: QW0053QID

SQL REQUEST TYPE
The type of SQL request.

Field Name: QW0053CID

EXPANSION REASON
The reason for the expansion. It can have the following values:
GET_ARCHIVE
Expansion caused by built-in SYSIBMADM.GET_ARCHIVE global variable.

TEMPORAL BUSINESS_TIME
Expansion caused by the current temporal BUSINESS_TIME special register.

TEMPORAL SYSTEM_TIME
Expansion caused by the current temporal SYSTEM_TIME special register.

TEMPORAL SYSTEM_TIME & BUSINESS_TIME
Expansion caused by the current temporal SYSTEM_TIME & current temporal BUSINESS_TIME special registers.

NO EXPANSION
The query does not contain any expansion.

Field Name: QW0053ER

SQLCA CONTENTS
This section contains the SQLCA fields. It is only printed if the value in the ENTRY/EXIT TYPE field is RETURNED.

Field Name: QW0053SQ

DATA TYPE
The scan type identification:

**INDX**  Index scan
**SEQD**  Sequential data scan
**SEQW**  Sequential data work-file scan

Field Name: QW0053ID

ROW PROC
The number of rows processed.

Field Name: QW0053RP

ROW EXAM
The number of rows examined. If DATA TYPE shows **INDX**, this number is the number of index entries (not rows) scanned.

Field Name: QW0053LA

STG1-QUAL
The number of rows qualified at stage 1.

Field Name: QW0053DQ

STG2-QUAL
The number of rows qualified at stage 2.

Field Name: QW0053RQ

ROW INSRT
The number of rows inserted.

Field Name: QW0053IN
IFCID 053 - SQL Describe/Commit/Rollback/Remote Statement

ROW UPDTE
The number of rows updated.
Field Name: QW0053UP

ROW DELET
The number of rows deleted. If the delete was a mass delete, the indicator MASS is printed.
Field Name: QW0053DE

PAGES
The number of get page requests issued by the data manager to the buffer manager. Note that for an index scan the value includes the number of index pages scanned.
Field Name: QW0053PS

RI SCAN
The number of additional pages scanned for referential integrity.
Field Name: QW0053PR

RI DELET
The number of additional rows deleted for referential integrity.
Field Name: QW0053DR

IFCID 055 - Set SQLID:

This topic shows detailed information about “Record Trace - IFCID 055 - Set SQLID”.

This IFCID is written when a SET CURRENT SQLID STATEMENT is issued. It shows the previous SQLID, the new SQLID, and whether the statement succeeded. This record is only written at the application server when DRDA protocol is used.

This record is written when performance trace class 3 is on. This record is written when audit class 7 is on. MONITOR1 privilege is required for reading via ifi.

The SQLID is the SQL authorization ID of the process. This is:
- The authorization ID used for authorization checking on dynamically prepared CREATE, GRANT, and REVOKE SQL statements
- The owner of a table space, database, storage group, or synonym created by a dynamically issued CREATE statement
- The implicit qualifier of all table, view, alias, and index names specified in dynamic SQL statements.

The initial value of CURRENT SQLID can be provided by the connection or sign-on exit routine, otherwise the initial value is the primary authorization ID of the process.

Record trace - IFCID 055 - Set SQLID

The field labels shown in the following sample layout of “Record Trace - IFCID 055 - Set SQLID” are described in the following section.
SET SQLID  NETWORKID: DEIBMIPS LUNAME: IPSAU851 LUWSEQ:  1
PREV SQLID:  DB2PM
NEW SQLID:  DB2PM
STATUS : SUCCESSFUL EXECUTION

PREV SQLID

The initial value of the SQLID before execution of the request.

Field Name: QW0055OI

NEW SQLID

If the command completed successfully, the new value of the SQLID is shown. If the command did not complete successfully, the value of the attempted SQLID change is shown.

Field Name: QW0055NI

STATUS

The success or failure of the attempted authorization change. Possible values are:
• SUCCESS or SUCCESSFUL for a successful authorization change
• FAILURE for a failed attempt

Note: The SQL statement is always successful if the user has SYSADM authority.

Field Name: QW0055ST

IFCID 056 - IBM Service Record:

This topic shows detailed information about “Record Trace - IFCID 056 - IBM Service Record”.

This record is for IBM service use.

Record trace - IFCID 056 - IBM Service Record

Field Name: QW0058TOS

EXPANSION REASON
The reason for the expansion. It can have the following values:

GET_ARCHIVE
Expansion caused by built-in SYSIBMADM.GET_ARCHIVE global variable.

TEMPORAL BUSINESS_TIME
Expansion caused by the current temporal BUSINESS_TIME special register.

TEMPORAL SYSTEM_TIME
Expansion caused by the current temporal SYSTEM_TIME special register.
TEMPORAL SYSTEM_TIME & BUSINESS_TIME
Expansion caused by the current temporal SYSTEM_TIME &
current temporal BUSINESS_TIME special registers.

NO EXPANSION
The query does not contain any expansion.

Field Name: QW0058EXR

SQLCA CONTENTS
This section contains the SQLCA fields. It is only printed if the value in the
ENTRY/EXIT TYPE field is RETURNED.

Field Name: QW0058SQ

DATA TYPE
The scan type identification.
INDX   Index scan
SEQD   Sequential data scan
SEQW   Sequential data work-file scan

Field Name: QW0058ID

ROW PROC
The number of rows processed.

Field Name: QW0058RP

ROW EXAM
The number of rows examined. If DATA TYPE shows INDX, this number is
the number of index entries (not rows) scanned.

Field Name: QW0058LA

STG1-QUAL
The number of rows qualified at stage 1.

Field Name: QW0058DQ

STG2-QUAL
The number of rows qualified at stage 2.

Field Name: QW0058RQ

ROW INSRT
The number of rows inserted.

Field Name: QW0058IN

ROW UPDTE
The number of rows updated.

Field Name: QW0058UP

ROW DELET
The number of rows deleted. If the delete was a mass delete, the indicator
MASS is printed.

Field Name: QW0058DE
PAGES
The number of get page requests issued by the data manager to the buffer manager. Note that for an index scan, the value includes the number of index pages scanned.
Field Name: QW0058PS

RI SCAN
The number of additional pages scanned for referential integrity.
Field Name: QW0058PR

RI DELET
The number of additional rows deleted for referential integrity.
Field Name: QW0058DR

LOB SCAN
Additional pages scanned in a LOB table space.
Field Name: QW0058PL

LOB UPDTE
Number of LOB data pages updated by SQL INSERT or SQL UPDATE.
Field Name: QW0058UL

IN-DB2 ELAPSED
The accumulated in-DB2 elapsed time.
Field Name: QW0058ET

IN-DB2 CPU
The accumulated in-DB2 CPU time. It includes CPU time consumed on an IBM specialty engine.
Field Name: QW0058CP

WAIT FOR SYNC I/O
The accumulated wait for synchronous I/O.
Field Name: QW0058SI

WAIT FOR LOCK/LATCH
The accumulated wait time for locks.
Field Name: QW0058LK

SYNC EXEC UNIT SWITCH
The accumulated wait time for the synchronous execution unit switches.
Field Name: QW0058EU

WT FOR GLOBAL LOCKS
The accumulated wait time for global locks.
Field Name: QW0058GL

WT FOR READ BY OTHER THR
The accumulated wait time for read activity done by another thread.
Field Name: QW0058OR

WT FOR WRTE BY OTHER THR
The accumulated wait time for write activity done by another thread.
Field Name: QW0058OW

NBR EXCEEDS DB2 LIMITS
The number of times RID list was not used because the number of RIDS would have exceeded DB2 limits.
Field Name: QW0058RL

NOT ENOUGH STORAGE
The number of time a RID list was not used because there is not enough storage available to hold the list of RIDs.
Field Name: QW0058RS

WAIT FOR LATCH
The accumulated wait for latch.
Field Name: QW0058LH

WAIT FOR PAGE LATCH
The accumulated wait time for page latch.
Field Name: QW0058PA

WAIT FOR DRAIN LOCK
The accumulated wait time for drain lock.
Field Name: QW0058DA

WAIT FOR CLAIM COUNT
The accumulated wait time for claim count.
Field Name: QW0058CL

WAIT FOR LOG WRITER
The accumulated wait time for log writer.
Field Name: QW0058LG

WAIT FOR CHILD L-LOCKS
The accumulated wait time for global child L-locks.
Field Name: QW0058AWTK

WAIT FOR PAGESET L-LOCKS
The accumulated wait time for global Pageset or Partition L-locks.
Field Name: QW0058AWTN

WAIT FOR OTHER L-LOCKS
The accumulated wait time for global other L-locks.
Field Name: QW0058AWTM

WAIT FOR PAGE P-LOCKS
The accumulated wait time for global page P-locks.
Field Name: QW0058AWTO

WAIT FOR OTHER P-LOCKS
The accumulated wait time for global other P-locks.

Field Name: QW0058AWTQ

WAIT FOR PIPE
The accumulated wait time for pipe.

Field Name: QW0058PW

WT FOR PARENT CHILD SYNC
The accumulated time waiting for parallel queries to synchronize between parent and child tasks.

Field Name: QW0058PQ

IFCID 059 - Fetch Start:

This topic shows detailed information about “Record Trace - IFCID 059 - Fetch Start”.

Record trace - IFCID 059 - Fetch Start

The field labels shown in the following sample layout of “Record Trace - IFCID 059 - Fetch Start” are described in the following section.

START LOCATION NAME : PM05DB51
PKG COLLECTION ID: HSRTEP2VL1XXXXXXXX2XXXXXXXX3XXXX
XXXXXXXXXXXXX5XXXXXXXX6XXXXXXXXX
7XXXXXXXXXXXXXXXX9XXXXXXXXX0XX
XXXXXXXX1XXXXXXXX2XXXXXXXXZ
PROGRAM NAME : DSN@EP2L
CURSOR NAME : C1
CONSISTENCY TOKEN: X'172A1C98193C380E'
STATEMENT NUMBER : 1627
STATEMENT TYPE : X'01'
QUERY COMMAND ID : ----
QUERY INSTANCE ID : ----
FETCH SENSITIVITY: UNSPECIFIED
FETCH ORIENTATION: NEXT

LOCATION NAME
The location name.

Field Name: QW0059LN

PKG COLLECTION ID
The package collection identifier.

Field Name: QW0059PC

PROGRAM NAME
The program name.

Field Name: QW0059PN

CURSOR NAME
The name of the cursor used by the FETCH statement.

Field Name: QW0059CN
IFCID 059 - Fetch Start

CONSISTENCY TOKEN
The consistency token.
Field Name: QW0059TS

STATEMENT NUMBER
The statement number.
Field Name: QW0059SN

STATEMENT TYPE
The statement type. X'01' indicates FETCH.
Field Name: QW0059ST

QUERY COMMAND ID
The ID of the query command.
Field Name: QW0059CID

QUERY INSTANCE ID
The ID of the query instance.
Field Name: QW0059QID

FETCH SENSITIVITY
Identifies the fetch sensitivity. It can be one of the following:
- Sensitive
- Insensitive
- Unspecified
Field Name: QW0059FS

FETCH ORIENTATION
Identifies the fetch orientation. It can be one of the following:
- First
- Last
- Before
- After
- Next
- Previous
- Current
- Absolute
- Relative
- Unspecified
Field Name: QW0059FO

IFCID 060 - Select Start:
This topic shows detailed information about “Record Trace - IFCID 060 - Select Start”.
Record trace - IFCID 060 - Select Start

The field labels shown in the following sample layout of “Record Trace - IFCID 060 - Select Start” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Value</th>

</table>

**LOCATION NAME**

The location name.

Field Name: QW0060LN

**PKG COLLECTION ID**

The package collection identifier.

Field Name: QW0060PC

**PROGRAM NAME**

The program name.

Field Name: QW0060PN

**CONSISTENCY TOKEN**

The consistency token.

Field Name: QW0060TS

**STATEMENT NUMBER**

The statement number of the statement executed.

Field Name: QW0060SN

**STATEMENT TYPE**

The statement type. X'00' indicates SELECT.

Field Name: QW0060ST

**QUERY COMMAND ID**

The ID of the query command.

Field Name: QW0060CID

**QUERY INSTANCE ID**

The ID of the query instance.

Field Name: QW0060QID

**ISOLATION**

The isolation level:

- RR  Repeatable read
- CS  Cursor stability
- RS  Read stability
IFCID 060 - Select Start

UR Uncommitted read

Field Name: QW0060I

REOPTIMIZATION
Indicates whether the access path of the SQL statement was reoptimized at run time.

Field Name: QW0060RO

IFCID 061 - Insert/Update/Delete Start:

This topic shows detailed information about “Record Trace - IFCID 061 - Insert/Update/Delete Start”.

Record trace - IFCID 061 - Insert/Update/Delete Start

The field labels shown in the following sample layout of “Record Trace - IFCID 061 - Insert/Update/Delete Start” are described in the following section.

```
START       LOCATION NAME       : PM05D851
PKG COLLECTION ID : DB2PM
PROGRAM NAME        : DG00PC4
CONSISTENCY TOKEN : X'1746B2741FC9F534'
STATEMENT NUMBER   : 168
STATEMENT TYPE      : UPDATE TYPE- NON CURSOR
CURSOR NAME         : N/P
QUERY COMMAND ID    : N/P
QUERY INSTANCE ID   : N/P
ISOLATION           : RR
REOPTIMIZATION      : NO
```

LOCATION NAME
The location name.

Field Name: QW0061LN

PKG COLLECTION ID
The package collection ID.

Field Name: QW0061PC

PROGRAM NAME
The program name.

Field Name: QW0061PN

CONSISTENCY TOKEN
The consistency token.

Field Name: QW0061TS

STATEMENT NUMBER
The statement number of the statement executed.

Field Name: QW0061SN

STATEMENT TYPE
The statement type. Possible values are:

- STATEMENT TYPE
- INSERT TYPE
IFCID 061 - Insert/Update/Delete Start

- UPDATE TYPE- NON CURSOR
- UPDATE TYPE- CURSOR
- MERGE TYPE
- DELETE TYPE- NON CURSOR
- DELETE TYPE- CURSOR
- TRUNCATE TYPE

Field Name: QW0061ST

CURSOR NAME
The name of the cursor.
Field Name: QW0061CN

QUERY COMMAND ID
The ID of the query command.
Field Name: QW0061CI

QUERY INSTANCE ID
The ID of the query instance.
Field Name: QW0061QI

ISOLATION
The isolation level:

RR  Repeatable read
CS  Cursor stability
RS  Read stability

Field Name: QW0061II

REOPTIMIZATION
Indicates whether the access path of the SQL statement was reoptimized at run time.
Field Name: QW0061RO

IFCID 062 - DDL Start:

This topic shows detailed information about “Record Trace - IFCID 062 - DDL Start”.

Record trace - IFCID 062 - DDL Start

The field labels shown in the following sample layout of “Record Trace - IFCID 062 - DDL Start” are described in the following section.

<table>
<thead>
<tr>
<th>DDL START</th>
<th>STATEMENT TYPE: ALTER VIEW</th>
</tr>
</thead>
<tbody>
<tr>
<td>OBJECT TYPE : TABLESPACE</td>
<td></td>
</tr>
<tr>
<td>OBJECT NAME : HSRPDSBU</td>
<td></td>
</tr>
</tbody>
</table>

STATEMENT TYPE
The type of statement that is processed. Possible values are:
- ALTER DATABASE
- ALTER FUNCTION
- ALTER INDEX
• ALTER JAR
• ALTER MASK
• ALTER PERMISSION
• ALTER PROCEDURE
• ALTER SEQUENCES
• ALTER STORAGE GROUP
• ALTER TABLE
• ALTER TABLESPACE
• ALTER TRUSTED CONT
• ALTER VIEW
• CREATE ALIAS
• CREATE AUX TABLE
• CREATE DATABASE
• CREATE DISTINCT TYPE
• CREATE FUNCTION
• CREATE GLBL T.TAB
• CREATE INDEX
• CREATE JAR
• CREATE MASK
• CREATE PERMISSION
• CREATE PROCEDURE
• CREATE ROLE
• CREATE SEQUENCES
• CREATE STORAGE GROUP
• CREATE SYNONYM
• CREATE TABLE
• CREATE TABLESPACE
• CREATE TRIGGER
• CREATE TRUSTED CONT
• CREATE VIEW
• COMMENT ON
• DECLARE GLBL T.TAB
• DROP ALIAS
• DROP DATABASE
• DROP DISTINCT TYPE
• DROP INDEX
• DROP JAR
• DROP MASK
• DROP PERMISSION
• DROP PROCEDURE
• DROP ROLE
• DROP SEQUENCES
• DROP STORAGE GROUP
• DROP SYNONYM
• DROP TABLE
• DROP TABLESPACE
• DROP TRIGGER
• DROP TRUSTED CONTEXT
• DROP PACKAGE
• DROP UDF
• DROP VIEW
• FREE LOCATOR
• GRANT
• HOLD LOCATOR
• LABEL ON
• LOCK
• RENAME INDEX
• RENAME TABLE
• REVOKE
• TRANSFER OWNERSHIP

Field Name: QW0062ST

OBJECT TYPE

The type of object that is processed. Possible values are:
• ALIAS
• DATABASE
• DISTINCT TYPE
• FUNCTION
• INDEX
• JAR
• NO OBJECT
• PACKAGE
• ROLE
• SEQUENCES
• STORAGE GROUP
• STORED PROC
• SYNONYM
• TABLE
• TABLESPACE
• TRIGGER
• TRUSTED CONTEXT
• VIEW

Field Name: QW0062OT

OBJECT NAME

The object name. The name does not include high-level qualifiers.

Field Name: QW0062ON

IFCID 063 - SQL Statement:

This topic shows detailed information about “Record Trace - IFCID 063 - SQL Statement”.

Chapter 6. Batch reporting 3783
Record trace - IFCID 063 - SQL Statement

The field labels shown in the following sample layout of “Record Trace - IFCID 063 - SQL Statement” are described in the following section.

SQL STATEMENT NETWORKID: DEIBMIPS LUNAME: IPSAU851 LUWSEQ: 1 OPTIONS: X’04’ HOST LANG: N/A SQL STATEMENT:
STATEMENT IDENTIFIER: 29011 TYPE OF STATEMENT : DYNAMIC CCSID: 1208 OPTIONS
This field consists of 8 bits. The bits indicate the parser options and the host language. The four most significant bits describe the parser options:

Bit 7  String delimiter (0 = apostrophe; 1 = quotation mark)
Bit 6  Decimal separator (0 = period; 1 = comma)
Bit 5  SQL delimiter (0 = apostrophe; 1 = quotation mark)
Bit 4  Mixed data (0 = no; 1 = yes)
Bit 3  Reserved
Bits 0 to 2  Host language

The three least significant bits (0 to 2) are the host language bit mask. The hexadecimal value indicates the host language:

001  Host language is Assembler
010  Host language is COBOL
011  Host language is PL/I
100  Host language is Dynamic SQL
101  Host language is FORTRAN
110  Host language is COBOL2
111  Look at HOST LANG field
Field Name: QW0063OT

HOST LANG
Additional host language option. This field is optional. When the OPTIONS host language bit mask is x'7', it indicates the host language.

**Field Name:** QW0063HL

**SQL STATEMENT**

The SQL statement being processed.

**Note:**
- SQL text longer than 5000 characters is truncated.
- Host variables are represented as :H

**Field Name:** QW0063ST

**STATEMENT IDENTIFIER**

The type of statement.

**Field Name:** QW0063TY

**TYPE OF STATEMENT**

The statement identifier.

**Field Name:** QW0063SI

**CCSID**

The coded character set identifier (CCSID).

**Field Name:** QW0063CC

**IFCID 064 - Prepare Start**:

This topic shows detailed information about “Record Trace - IFCID 064 - Prepare Start”.

**Record trace - IFCID 064 - Prepare Start**

The field labels shown in the following sample layout of “Record Trace - IFCID 064 - Prepare Start” are described in the following section.

```
START LOCATION NAME : PM05D851
PKG COLLECTION ID: HSRTEP2VL1XXXXXXXX2XXXXXXXXX3XXXX
XXXXXXXX4XXXXXXX5XXXXXXXX6XXXXXXXX
X7XXXXXXXX8XXXXXXXXX9XXXXXXXXX0XX
XXXXXXXX1XXXXXXXX2XXXXXXXXXZ
PROGRAM NAME : DSN@EP2L
TIME STAMP : X'172A1C98193C380E'
STATEMENT NUMBER : 1550
STATEMENT TYPE : X'81'
CURSOR NAME : C1
QUERY COMMAND ID : QRYCMD01
QUERY INSTANCE ID: QRYINS01
LOCATION NAME

The location name.

**Field Name:** QW0064LN

**PKG COLLECTION ID**

The package collection identifier.

**Field Name:** QW0064CI
PROGRAM NAME

The program name.

Field Name: QW0064PN

TIME STAMP

The hexadecimal value of the precompiler timestamp.

Field Name: QW0064TS

STATEMENT NUMBER

The statement number.

Field Name: QW0064SN

STATEMENT TYPE

The statement types:

x'81' Prepare a cursor section.

x'80' Prepare a noncursor section.

x'C1' Implicit prepare of a cursor section.

x'C0' Implicit prepare of a noncursor section.

Field Name: QW0064ST

CURSOR NAME

The name of the cursor used by the PREPARE statement.

Field Name: QW0064CN

QUERY COMMAND ID

The ID of the query command.

Field Name: QW0064CID

QUERY INSTANCE ID

The ID of the query instance.

Field Name: QW0064QID

IFCID 065 - Open Cursor:

This topic shows detailed information about “Record Trace - IFCID 065 - Open Cursor”.

Record trace - IFCID 065 - Open Cursor

The field labels shown in the following sample layout of “Record Trace - IFCID 065 - Open Cursor” are described in the following section.
QUERY COMMAND ID : ----
QUERY INSTANCE ID : ----
ISOLATION : RR
REOPTIMIZATION : NO
CURSOR SCROLLABILITY : NON-SCROLL
CURSOR SENSITIVITY : UNSPECIFIED
CURSOR RESULT TABLE TYPE: UNSPECIFIED
CURSOR CLOSE COMMIT : NO IMPLICIT COMMIT

LOCATION NAME
The location name.
Field Name: QW0065LN

PKG COLLECTION ID
The package collection identifier.
Field Name: QW0065PC

PROGRAM NAME
The program name.
Field Name: QW0065PN

CONSISTENCY TOKEN
The consistency token.
Field Name: QW0065TS

STATEMENT NUMBER
The statement number.
Field Name: QW0065SN

STATEMENT TYPE
The statement type. X'91' indicates OPEN.
Field Name: QW0065ST

CURSOR NAME
The name of the cursor used by the OPEN cursor statement.
Field Name: QW0065CN

QUERY COMMAND ID
The ID of the query command.
Field Name: QW0065CID

QUERY INSTANCE ID
The ID of the query instance.
Field Name: QW0065QID

ISOLATION
The isolation level:
RR Repeatability read
CS Cursor stability
RS Read stability
UR Uncommitted read
IFCID 065 - Open Cursor

XR  Repeatable read with X lock
XS  Read stability with X lock

Field Name: QW0065I

REOPTIMIZATION
Indicates whether the access path of the SQL statement was reoptimized at run time.
Field Name: QW0065RO

CURSOR SCROLLABILITY
Identifies the cursor scrollability. It can be one of the following:
• Scroll
• None-scroll
Field Name: QW0065SC

CURSOR SENSITIVITY
Identifies the cursor sensitivity. It can be one of the following:
• Sensitive
• Insensitive
• Unspecified
Field Name: QW0065SV

CUR RESULT TABLE TYPE
Identifies the type of the cursor result table. It can be one of the following:
• Static
• Dynamic
• Unspecified
Field Name: QW0065RT

CURSOR CLOSE COMMIT
The cursor attribute implicit commit, which closed the cursor. Possible values are:
• IMPPLICIT COMMIT
• NO IMPPLICIT COMMIT
• N/A
Otherwise the values are shown in hexadecimal.
Field Name: QW0065TY

IFCID 066 - Close Cursor:
This topic shows detailed information about “Record Trace - IFCID 066 - Close Cursor”.

Record trace - IFCID 066 - Close Cursor
The field labels shown in the following sample layout of “Record Trace - IFCID 066 - Close Cursor” are described in the following section.
CURSOR LOCATION NAME : PM05D851
PKG COLLECTION ID : HSRTEP2VL1XXXXXXXXX2XXXXXXXXX3
XXXXXXXXX4XXXXXXXXX5XXXXXXXXX6
XXXXXXXXX7XXXXXXXXX8XXXXXXXXX9
XXXXXXXXX0XXXXXXXXX1XXXXXXXXX2
XXXXXXXXXZ

PROGRAM NAME : DSN@EP2L
CONSISTENCY TOKEN : X'172A1C98193C380E'
STATEMENT NUMBER : 1889
STATEMENT TYPE : X'A1'
CURSOR NAME : C1
CLOSE STMT TYPE : IMPLICIT
QUERY COMMAND ID : ----
QUERY INSTANCE ID : ----

LOCATION NAME

The location name.
Field Name: QW0066LN

PKG COLLECTION ID

The package collection identifier.
Field Name: QW0066PC

PROGRAM NAME

The program name.
Field Name: QW0066PN

CONSISTENCY TOKEN

The consistency token.
Field Name: QW0066TS

STATEMENT NUMBER

The statement number.
Field Name: QW0066SN

STATEMENT TYPE

The statement type. X'A1' indicates CLOSE.
Field Name: QW0066ST

CURSOR NAME

The name of the cursor used by the CLOSE cursor statement.
Field Name: QW0066CN

CLOSE STMT TYPE

The Close statement type. Possible values are:
• IMPLICIT
• EXPLICIT
• N/A
Otherwise the values are shown in hexadecimal.
Field Name: QW0066TY

QUERY COMMAND ID

The ID of the query command.
IFCID 066 - Close Cursor

Field Name: QW0066CID

QUERY INSTANCE ID

The ID of the query instance.

Field Name: QW0066QID

IFCID 067 - Accounting:

This topic shows detailed information about “Record Trace - IFCID 067 - Accounting”.

When present, data is printed in dump format, otherwise NO DATA is printed.

IFCID 068 - Rollback Start:

This topic shows detailed information about “Record Trace - IFCID 068 - Rollback Start”.

Record trace - IFCID 068 - Rollback Start

The field labels shown in the following sample layout of “Record Trace - IFCID 068 - Rollback Start” are described in the following section.

PSWKEY  X'80'
QW0066FR  X'007C6428'

PSWKEY

The PSW key of the holder.

Field Name: QW0068CK

IFCID 069 - IBM Service Record:

This topic shows detailed information about “Record Trace - IFCID 069 - IBM Service Record”.

This record is for IBM service use.

IFCID 070 - Commit Phase 2 Start:

This topic shows detailed information about “Record Trace - IFCID 070 - Commit Phase 2 Start”.

Record trace - IFCID 070 - Commit Phase 2 Start

The field labels shown in the following sample layout of “Record Trace - IFCID 070 - Commit Phase 2 Start” are described in the following section.

PSWKEY  X'8E'
QW0070FR  X'00000000'

PSWKEY

The PSW key of the caller.

Field Name: QW0070CK
IFCID 071 - Commit Phase 2 End:

This topic shows detailed information about “Record Trace - IFCID 071 - Commit Phase 2 End”.

This record is for IBM service use.

Record trace - IFCID 071 - Commit Phase 2 End

The field labels shown in the following sample layout of “Record Trace - IFCID 071 - Commit Phase 2 End” are described in the following section.

```
71 COMMIT <-- NETWORKID: DEIBMIPS LUNAME: IPUAPZA5 LUWSEQ: 20796
PHASE 2 END QW0071FR X'00000000' QW0071RT 0
QW0071RS 14233856
QW0071NI X'00000000000000000000000000000000'
```

**QW0071FR**

This field is for IBM service use.

**Field Name:** QW0071FR

IFCID 072 - Create Thread Start:

This topic shows detailed information about “Record Trace - IFCID 072 - Create Thread Start”.

Record trace - IFCID 072 - Create Thread Start

The field labels shown in the following sample layout of “Record Trace - IFCID 072 - Create Thread Start” are described in the following section.

```
RESRC NAME: ABE5B03
```

**RESOURCE NAME**

The plan name used in thread creation. If the thread is created to process a DB2 command, the field shows 'BLANK'.

**Field Name:** QW0072RN

IFCID 073 - Create Thread End:

This topic shows detailed information about “Record Trace - IFCID 073 - Create Thread End”.

Record trace - IFCID 073 - Create Thread End

The field labels shown in the following sample layout of “Record Trace - IFCID 073 - Create Thread End” are described in the following section.

```
QLGTH 0
QW0073RT 0 QW0073RS 0
QW0073WT 1
```

**QLGTH**

The queue length of the create thread request.

**Field Name:** QW0073QL
IFCID 074 - Terminate Thread Start

IFCID 074 - Terminate Thread Start:

This topic shows detailed information about “Record Trace - IFCID 074 - Terminate Thread Start”.

When data is present, it is printed in dump format.

IFCID 075 - Terminate Thread End:

This topic shows detailed information about “Record Trace - IFCID 075 - Terminate Thread End”.

Record trace - IFCID 075 - Terminate Thread End

The field labels shown in the following sample layout of “Record Trace - IFCID 075 - Terminate Thread End” are described in the following section.

```
QW0075RT  0   QW0075RS  0
QW0075CO  X'2E8D5C3'
```

IFCID 076 - End of Memory Start:

This topic shows detailed information about “Record Trace - IFCID 076 - End of Memory Start”.

Record trace - IFCID 076 - End of Memory Start

The field labels shown in the following sample layout of “Record Trace - IFCID 076 - End of Memory Start” are described in the following section.

```
PSWKEY  X'01'  FLGS  X'07'  ASID  256
QW0076SS  X'01234567'  QW0076AM  X'89ABCDEF'
QW0076FC  2   QW0076AS  X'12345678'
```

PSWKEY

The PSW key of the SSI caller.

Field Name: QW0076CK

FLGS

SSI caller flags:

X'80' SSI caller problem state (P-bit)
X'40' A-bit SSI caller AMODE 31 (A-bit)
X'20' Abnormal end of memory

Field Name: QW0076F1

ASID

The identifier of the end of memory address space.

Field Name: QW0076ID

IFCID 077 - End of Memory End:

This topic shows detailed information about “Record Trace - IFCID 077 - End of Memory End”.

Record trace - IFCID 077 - End of Memory End

The field labels shown in the following sample layout of “Record Trace - IFCID 077 - End of Memory End” are described in the following section.

RETURN

The return code. This field is always 0.

Field Name: QW0077R0

PROCESSED END OF MEMORY?
Indicates whether end of memory was processed.

Field Name: QW0077PR

IFCID 078 - End of Task Start:
This topic shows detailed information about “Record Trace - IFCID 078 - End of Task Start”.

Record trace - IFCID 078 - End of Task Start

The field labels shown in the following sample layout of “Record Trace - IFCID 078 - End of Task Start” are described in the following section.

ACE 2
QW0078AS X’00B9F328’  QW0078AG X’00B226C8’

ACE
The relative number of the agent control element address in the ACE cross-reference table. This table is printed at the end of each location for every trace specified.

Field Name: QW0078AC

IFCID 079 - End of Task End:
This topic shows detailed information about “Record Trace - IFCID 079 - End of Task End”.

When present, data is printed in dump format, otherwise NO DATA is printed.

IFCID 080 - IBM Service Record:
This topic shows detailed information about “Record Trace - IFCID 080 - IBM Service Record”.

This record is for IBM service use.

IFCID 081 - IBM Service Record:
This topic shows detailed information about “Record Trace - IFCID 081 - IBM Service Record”.

This record is for IBM service use.
IFCID 082 - Identify Start

IFCID 082 - Identify Start:

This topic shows detailed information about “Record Trace - IFCID 082 - Identify Start”.

Record trace - IFCID 082 - Identify Start

The field labels shown in the following sample layout of “Record Trace - IFCID 082 - Identify Start” are described in the following section.

PSWKEY X'70'
FLAGS X'40'
QW0082SS X'007C9FBC' QW0082AM X'02E9C5A8'
QW0082FC 41

PSWKEY

The PSW key of the SSI caller.

Field Name: QW0082CK

FLAGS

The flags of the SSI caller:

X'80' P-bit of the SSI caller (problem state)
X'40' A-bit of the SSI caller (AMODE 31)

Field Name: QW0082F1

IFCID 083 - Identify End:

This topic shows detailed information about “Record Trace - IFCID 083 - Identify End”.

Record trace - IFCID 083 - Identify End

The field labels shown in the following sample layout of “Record Trace - IFCID 083 - Identify End” are described in the following section.

END RECOPT: 'BLANK' ACCESS: SUCCESSFUL
CURR SQLID : HSR
ORIG AUTHID: HSR
SECONDARY AUTHORIZATION IDS:
DE#01892 DE#03704 D010D PMDEV PMDEVX
PMDEVX5 PMDEVX6 PMDEVX7 PMDEV5 PMDEV6
PMDEV61 PMDEV7 PMDEV71 PMDEV72 PMDEV81
PM3704 USERS
ACEE UTOKEN : 'BLANK'
QW0083RT 0 QW0083RS 0
QW0083CT X'C2C1E3C3CB404040'

RECOPT

The record coordination option specification.

Field Name: QW0083RO

ACCESS

The success or failure of the attempted authorization change. Possible values are:

SUCCESSFUL

The access is permitted.
DENIED BY IDENTIFY AUTH EXIT
   The access is denied by the authorization exit.

DENIED BY SAF/SECURITY SYSTEM
   The access is denied by the security authorization facility or
   security system.

Field Name: QW0083AD

CURR SQLID
   The current SQL authorization ID.
Field Name: QW0083QD

ORIG AUTHID
   The original primary authorization ID.
Field Name: QW0083OP

SECONDARY AUTHORIZATION IDS
   A list of the secondary authorization IDs. This list is only produced if there
   are secondary authorization IDs.
Field Name: QW0083SA

ACEE U_TOKEN
   The ACEE U_TOKEN.
Field Name: QW0083UT

IFCID 084 - Prepare Start:
   This topic shows detailed information about “Record Trace - IFCID 084 - Prepare
   Start”.

Record trace - IFCID 084 - Prepare Start
   The field labels shown in the following sample layout of “Record Trace - IFCID 084
   - Prepare Start” are described in the following section.
   PSWKEY  X’00’
   QW0084FR  X’00000000’
   PSWKEY
   The PSW key of the caller.
Field Name: QW0084CK

IFCID 085 - Prepare End:
   This topic shows detailed information about “Record Trace - IFCID 085 - Prepare
   End”.

Record trace - IFCID 085 - Prepare End
   The field labels shown in the following sample layout of “Record Trace - IFCID 085
   - Prepare End” are described in the following section.
IFCID 086 - Signon Start

This topic shows detailed information about “Record Trace - IFCID 086 - Signon Start”.

Record trace - IFCID 086 - Signon Start

The field labels shown in the following sample layout of “Record Trace - IFCID 086 - Signon Start” are described in the following section.

**Field Name:** QW0086CK

- **PSWKEY**
  - The PSW key of the SSI caller.

**IFCID 087 - Signon End:**

This topic shows detailed information about “Record Trace - IFCID 087 - Signon End”.

Record trace - IFCID 087 - Signon End

The field labels shown in the following sample layout of “Record Trace - IFCID 087 - Signon End” are described in the following section.

**Field Name:** QW0087AD

- **ACCESS**
  - The success or failure of the attempted access. Possible values are:
    - **SUCCESSFUL**
      - If the access is permitted.
    - **DENIED BY SIGNON AUTH EXIT**
      - If the access was denied by the signon authorization exit.

**Field Name:** QW0087QD

- **CURRENT SQLID**
  - The value of the authorization ID as set by the IDENTIFY or SIGNON exit.

**Field Name:** QW0087OP

- **ORIGINAL AUTHID**
  - The original value of the authorization ID, as passed to the IDENTIFY or SIGNON authorization exit.

**Field Name:** QW0087AD

- **SECONDARY AUTHORIZATION IDS**
  - Lists the secondary authorization IDs set by the IDENTIFY or SIGNON authorization exits. If no secondary authorization IDs exist, this line is not printed. Secondary authorization IDs are printed in rows of five, up to a maximum of 49 rows (245 AUTHIDs).
Field Name: QW0087SA

ACEE UTOKEN

The ACEE UTOKEN.

Field Name: QW0087UT

IFCID 088 - Synch Start:

This topic shows detailed information about “Record Trace - IFCID 088 - Synch Start”.

Record trace - IFCID 088 - Synch Start

The field labels shown in the following sample layout of “Record Trace - IFCID 088 - Synch Start” are described in the following section.

PSWKEY X'00'
QW0088FR X'00000000'

PSWKEY

The PSW key of the caller.

Field Name: QW0088CK

IFCID 089 - Synch End:

This topic shows detailed information about “Record Trace - IFCID 089 - Synch End”.

Record trace - IFCID 089 - Synch End

The field labels shown in the following sample layout of “Record Trace - IFCID 089 - Synch End” are described in the following section.

QW0089FR X'007BC428' QW0089RT 0
QW0089RS 0

IFCID 090 - DB2 Command Start:

This topic shows detailed information about “Record Trace - IFCID 090 - DB2 Command Start”.

Record trace - IFCID 090 - DB2 Command Start

The field labels shown in the following sample layout of “Record Trace - IFCID 090 - DB2 Command Start” are described in the following section.

COMMAND: -ARCHIVE LOG MODE(QUIESCE) TIME(2)
PHB X'02BC1040'

COMMAND

The command text.

The input PHB token is extracted from the first 4 bytes of the COMMAND field.

Field Name: QW0090CT
IFCID 091 - Command End

IFCID 091 - Command End:

This topic shows detailed information about “Record Trace - IFCID 091 - Command End”.

Record trace - IFCID 091 - Command End

The field labels shown in the following sample layout of “Record Trace - IFCID 091 - Command End” are described in the following section.

QW0091RC 0 QW0091RS 0
QW0091BA X'7F4B9F10'

IFCID 092 - AMS Command Start:

This topic shows detailed information about “Record Trace - IFCID 092 - AMS Command Start”.

Record trace - IFCID 092 - AMS Command Start

The field labels shown in the following sample layout of “Record Trace - IFCID 092 - AMS Command Start” are described in the following section.

COMMAND: DEFINE CLUSTER
(NAME(DSN220C.DSNDBC.CDDB.EMPLOYEE.I0001.A001
) NOERASE LINEAR OWNER(DB2ADM) REUSE) DATA
(NAME(DSN220C.DSNDBD.CDDB.EMPLOYEE.I0001.A001
) RECORDS(00000003 00000003) OWNER(DB2ADM)
SHAREOPTIONS(3,3) REUSE VOLUMES('ELURU2'));

COMMAND
The command text.

Field Name: QW0092P1

IFCID 093 - IBM Service Record:

This topic shows detailed information about “Record Trace - IFCID 093 - IBM Service Record”.

This record is for IBM service.

IFCID 094 - IBM Service Record:

This topic shows detailed information about “Record Trace - IFCID 094 - IBM Service Record”.

This record is for IBM service use.

IFCID 095 - Sort Start:

This topic shows detailed information about “Record Trace - IFCID 095 - Sort Start”.

When present, data is shown in dump format, otherwise NO DATA is printed.

IFCID 096 - Sort End:

This topic shows detailed information about “Record Trace - IFCID 096 - Sort End”.
Record trace - IFCID 096 - Sort End

The field labels shown in the following sample layout of “Record Trace - IFCID 096 - Sort End” are described in the following section.

<table>
<thead>
<tr>
<th>COLLECTION ID: DB2PM</th>

</tbody>
</table>

**COLLECTION ID**

The package collection ID for the query that invokes sort.

*Field Name: QW0096PC*

**PROGRAM NAME**

The program name for the query that invokes sort.

*Field Name: QW0096PN*

**RECCNO**

The number of records sorted.

*Field Name: QW0096NR*

**AREA**

The sort data area size in bytes.

*Field Name: QW0096DL*

**KEYSZ**

The sort key size in bytes.

*Field Name: QW0096KL*

**SIZE**

The sort record size in bytes (the sort key size and the data area size).

*Field Name: QW0096WR*

**WORK**

The number of work files used for both input and merge phases.

*Field Name: QW0096WF*

**RET**

The sort return code:

0  Successful
4  Empty - sort successful
8  Resource unavailable
12 Sort key too long
16 Error detected by fetch routine during input phase
20 Serious processing error

Field Name: QW0096RC

IWORK

The number of initial work files. The sorting of records can take more than one work file. The number of work files needed depends on the distribution of sort key values. The maximum number of work files is limited by the buffer pool size.

Field Name: QW0096IR

ROW DEL

The number of rows deleted because records were merged for the evaluation of column functions with GROUP BY.

Field Name: QW0096RL

PASSES

The number of merge passes during sort processing.

Field Name: QW0096MP

SORT KEYS

The number of sort keys.

Field Name: QW0096SK

STMTNO

The statement number for the query that invokes sort.

Field Name: QW0096SN

WORKFILES

The number of work files, equal to the degree of parallelism, that sort has partitioned.

Field Name: QW0096PW

SORT COLUMNS

The number of sort columns.

Field Name: QW0096SC

PARTITIONING BY SORT

Indicates whether the sorted records were partitioned.

Field Name: QW0096PP

SORT IN ADDITION

Indicates whether the input records were only partitioned or partitioned and sorted:

YES The records were only partitioned.

NO The records were partitioned and sorted.

Field Name: QW0096PO

TYPE

The type of sort that occurred. The possible values are:
IFCID 096 - Sort End

<table>
<thead>
<tr>
<th>ESA</th>
<th>ORDER BY sort using the ESA sort hardware instructions</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESAG</td>
<td>GROUP BY sort using the ESA sort hardware instructions</td>

<td>GROUP RECYCLING sort using the ESA sort hardware instructions</td>
</tr>
<tr>
<td>REG</td>
<td>Regular sort</td>
</tr>
<tr>
<td>NONE</td>
<td>No sort occurred.</td>
</tr>
</tbody>
</table>

Field Name: QW0096TS

PARTITIONING OCCURRED

Indicates when partitioning took place:

W  The work file was partitioned at the end of the input phase. No merge occurred.
M  The output was partitioned during the last merge pass.
O  One record was put into one partition.
P  The records were presorted before being partitioned.
N  The work file was not partitioned.

Field Name: QW0096PT

IFCID 097 - AMS Command End:

This topic shows detailed information about “Record Trace - IFCID 097 - AMS Command End”.

Record trace - IFCID 097 - AMS Command End

The field labels shown in the following sample layout of “Record Trace - IFCID 097 - AMS Command End” are described in the following section.

RETURN 0 COMMAND: DEFINE DSNC210.DSNDBC.DB2PMDB1.DB2PMIX1.IO001.A001 CLUSTER CATALOG(DSNC210);

RETURN

The AMS return code.

Field Name: QW0097RC

COMMAND

The AMS command text.

Field Name: QW0097P1

IFCID 098 - IBM Service Record:

This topic shows detailed information about “Record Trace - IFCID 098 - IBM Service Record”.

This record is for IBM service use.
IFCID 099 - IBM Service Record:

This topic shows detailed information about “Record Trace - IFCID 099 - IBM Service Record”.

This record is for IBM service use.

IFCID 100 - IBM Service Record:

This topic shows detailed information about “Record Trace - IFCID 100 - IBM Service Record”.

This record is for IBM service use.

IFCID 101 - IBM Service Record:

This topic shows detailed information about “Record Trace - IFCID 101 - IBM Service Record”.

This record is for IBM service use.

IFCID 102 - IBM Service Record:

This topic shows detailed information about “Record Trace - IFCID 102 - IBM Service Record”.

This record is for IBM service use.

IFCID 103 - SOS Off:

This topic shows detailed information about “Record Trace - IFCID 103 - SOS Off”.

Record trace - IFCID 103 - SOS Off

The field labels shown in the following sample layout of “Record Trace - IFCID 103 - SOS Off” are described in the following section.

TIME: 3/18/92 14:25:37.400234

TIME

Store clock time.

Field Name: QW0103SC

IFCID 104 - Log Data Set:

This topic shows detailed information about “Record Trace - IFCID 104 - Log Data Set”.

Record trace - IFCID 104 - Log Data Set

The field labels shown in the following sample layout of “Record Trace - IFCID 104 - Log Data Set” are described in the following section.

DSID ACTLG103
DSNAME DSNC310.LOGCOPY1.DS03

DSID

The data set identifier of the active log manager.
Field Name: QW0104DI

DSNAME
The data set name of the active log.

Field Name: QW0104DN

IFCID 105 - DBID/OBID Translation:

This topic shows detailed information about “Record Trace - IFCID 105 - DBID/OBID Translation”.

This record contains up to 100 data sections. The following data is printed for each section in the record:

Record trace - IFCID 105 - DBID/OBID Translation

The field labels shown in the following sample layout of “Record Trace - IFCID 105 - DBID/OBID Translation” are described in the following section.

<table>
<thead>
<tr>
<th>DBID:</th>
<th>5</th>
<th>DATABASE NAME: DSNDB07</th>
</tr>
</thead>
<tbody>
<tr>
<td>OBID:</td>
<td>24</td>
<td>OBJECT NAME: DSN05X02</td>
</tr>
</tbody>
</table>

DBID
The decimal identifier of the database.

Field Name: QW0105DB

DATABASE NAME
The database name.

Field Name: QW0105DN

OBID
The decimal identifier of the object. Examples of objects are table space and index space.

Field Name: QW0105OB

OBJECT NAME
The name of the object. Examples of objects are table space and index space.

Field Name: QW0105TN

IFCID 106 - System Parameters: IFCID 106 shows the data from system parameters.

IFCID 106 - Application Programming Defaults:

This topic shows detailed information about “Record Trace - IFCID 106 - Application Programming Defaults”.

This block shows application programming defaults.

The values shown are used as default values by the program preparation panels, program preparation CLIST (DSNH), and precompiler. They can also be used as defaults by other programs, such as Query Management Facility (QMF).
Changing some of these defaults is not recommended because changes can make the syntax of existing SQL statements invalid or affect the way application programs run.

Values set here are contained in load module DSNHDECP, in library prefix.SDSNEXIT, which can be loaded and accessed by application programs. When modifying DSNHDECP, do so only by changing and running the installation CLIST.

Do not modify the data in DSNHDECP. If you modify any installation parameters by changing job DSNTIJUZ directly, these values are not recorded for later updates, new installations, or migrations.

Record trace - IFCID 106 - Application Programming Defaults

The field labels shown in the following sample layout of “Record Trace - IFCID 106 - Application Programming Defaults” are described in the following section.

---

VERSION ............: 1210
DECIMAL POINT OPT.: PERIOD
DEFAULT SUBSYSTEM: DC61
DEFLT ENC SCHEME : EBCDIC
DEFAULT HOST LANG: EBCDIC
DISTR SQL STR DEL: EBCDIC
DECFLOAT RND MODE: HALF EVEN
DEFAULT DELIMITER: APOST
DEFLT DEC ARITHM : DEC15
DATE FORMAT ......: ISO
TIME FORMAT ......: ISO
IMP TIMEZONE .......: CURRENT
IMP TIMEZONE(HEX): X'9999999C'
DEFAULT LOCALE ..: 'BLANK'
QWPBLVL ............: V12R1M0
QWPBLEN ............: 260
QWPBCHAR ............: ALPHANUM

VERSION
The version, release, and modification level.

Field Name: QWPBREL

DECIMAL POINT OPT
Indicates whether the decimal contains a comma (,) or a period (.). This parameter is used for dynamic SQL and COBOL programs. It is not used or supported by other languages.

Install parameter DECIMAL POINT IS on panel DSNTIPF, or ZPARM DECIMAL in DSNHDECP.

Derivation: DB2 field QWPBDE

Field Name: QWPBDE

EBCDIC SBCS CCSID
The EBCDIC single-byte coded character set ID.

A coded character set identifier (CCSID) must be specified when DDF STARTUP OPTION field on panel DSNTIPR is set to AUTO or COMMAND, or when the MIXED DATA field on panel DSNTIPF is set to YES. When mixed data is used, valid Mixed Data CCSID must also be specified.

A nonexistent CCSID causes an error.

An incorrect CCSID can corrupt data.
Install parameter EBCDIC CCSID on panel DSNTIPF, or ZPARM SCCSID in DSNHDECP.

Field Name: QWPBSID

DEFAULT SUBSYSTEM

The MVS subsystem name for DB2. The name is used in member IEFSSN xx of SYS1.PARMLIB.

A valid name has 1-4 characters, the first must be A-Z, #, $, or @. Others must be A-Z, 1-9, #, $, or @. Default is DSN1.

Install parameter SUBSYSTEM NAME on panel DSNTIPM, or ZPARM SSID in DSNHDECP.

Field Name: QWPBSSID

DEFAULT ENC SCHEME

The default encoding scheme, which can be ASCII or EBCDIC, or UNICODE.

Install parameter DEF ENCODING SCHEME on panel DSNTIPF, or ZPARM ENSCHEME in DSNHDECP.

Derivation: DB2 field QWPBENS

Field Name: QWPBENS

EBCDIC MBCS CCSID

The EBCDIC mixed coded character set ID.

A coded character set identifier (CCSID) must be specified when DDF STARTUP OPTION field on panel DSNTIPR is set to AUTO or COMMAND, or when the MIXED DATA field on panel DSNTIPF is set to YES. When mixed data is used, valid Mixed Data CCSID must also be specified.

A nonexistent CCSID causes an error.

An incorrect CCSID can corrupt data.

Install parameter EBCDIC CCSID on panel DSNTIPF, or ZPARM MCCSID in DSNHDECP.

Field Name: QWPBMID

DEFAULT HOST LANG

The default programming language for your site. This can be:

- ASM
- C
- CPP
- COBOL
- COB2
- IBMCOB
- FORTRAN
- PLI

When this is C or C++, you can fold SQL identifiers to uppercase.

Install parameter LANGUAGE DEFAULT on panel DSNTIPF, or ZPARM DEFLANG in DSNHDECP.
Field Name: QWPBLANG

DISTR SQL STR DEL

The SQL delimiter for bind operations at this DB2 if the requester does not provide DB2 with this information.

Field Name: QWPBDSD

EBCDIC GBCS CCSID

The EBCDIC graphic coded character set ID.

A coded character set identifier (CCSID) must be specified when DDF STARTUP OPTION field on panel DSNTIPR is set to AUTO or COMMAND, or when the MIXED DATA field on panel DSNTIPF is set to YES. When mixed data is used, valid Mixed Data CCSID must also be specified.

A nonexistent CCSID causes an error.

An incorrect CCSID can corrupt data.

Install parameter EBCDIC CCSID on panel DSNTIPF, or ZPARM GCCSID in DSNHDECP.

Field Name: QWPBGID

DECFLOAT RND MODE

The default rounding mode for the decimal floating point type. Possible values are:

- X'80' ROUND_CEILING
- X'40' ROUND_DOWN
- X'20' ROUND_FLOOR
- X'10' ROUND_HALF_DOWN
- X'08' ROUND_HALF_EVEN
- X'04' ROUND_HALF_UP
- X'02' ROUND_UP

Otherwise this field shows 'BLANK'.

ZPARM DEF_DECFLOAT_ROUND_MODE in DSNHDECP.

Field Name: QWPBDDRM

DEFLT DEC ARITHM

Indicates the rules of precision for a decimal field.

Install parameter DECIMAL ARITHMETIC on panel DSNTIP4, or ZPARM DECAR in DSNHDECP.

Derivation: DB2 field QWPBAR

Field Name: QWPBAR

ASCII SBCS CCSID

The ASCII single-byte coded character set ID.

The default (0) means the installation has no ASCII databases, table spaces, or tables.
Install parameter ASCII CCSID on panel DSNTIPF, or ZPARM ASCCSID in DSNHDECP.

Field Name: QWPBASID

DEFAULT DELIMITER

Shows the string delimiter for COBOL. Default string delimiter is the quotation mark. This option is applicable to all types of COBOL.

Install parameter STRING DELIMITER on panel DSNTIPF, or ZPARM DELIM in DSNHDECP.

Field Name: QWPBDL

DEFLT MIXED GRAPH

Indicates whether the code points X'0E' and X'0F' are the shift-out and shift-in controls for character strings that include double-byte characters.

Install parameter MIXED DATA on panel DSNTIPF, or ZPARM MIXED in DSNHDECP.

Field Name: QWPBGRA

ASCII MBCS CCSID

Indicates the ASCII mixed coded character set ID.

The default (0) means the installation has no ASCII databases, table spaces, or tables.

Install parameter ASCII CCSID on panel DSNTIPF, or ZPARM AMCCSID in DSNHDECP.

Field Name: QWPBAMID

DEFLT SQL DELIMIT

The string delimiter for SQL.

Install parameter SQL STRING DELIMITER on panel DSNTIPF, or ZPARM SQLDELI in DSNHDECP.

Derivation: DB2 field QWPBSNL

Field Name: QWPBSNL

SQL LANG SUPP LVL

Shows whether SQL, the language standard used by applications, conforms to 1986 ANSI SQL standard.

YES Conforms to the 1986 ANSI SQL standard

NO Conforms to the SQL language defined by DB2

86 Conforms to the 1986 ANSI SQL standard

Install parameter STD SQL LANGUAGE on panel DSNTIP4, or ZPARM STDSQL in DSNHDECP.

Field Name: QWPBSQL

ASCII GBCS CCSID

Indicates the ASCII graphic coded character set ID.

The default (0) means the installation has no ASCII databases, table spaces, or tables.
IFCID 106 - Application Programming Defaults

Install parameter ASCII CCSID on panel DSNTIPF, or ZPARM AGCCSID in DSNHDECP.

**Field Name:** QWPBAGID

**DATE FORMAT**

Default output format for dates.

Valid formats are ISO (yyyy-mm-dd), USA (mm/dd/yyyy), EUR (dd.mm.yyyy), JIS (yyyy-mm-dd), or LOCAL (your choice, defined by a date exit routine). DB2 interprets the input date from the punctuation and converts the output date to the required format.

Install parameter DATE FORMAT on panel DSNTIP4, or ZPARM DATE in DSNHDECP.

**Field Name:** QWPBDATE

**USE FOR DYN RULES**

Shows whether DB2 uses the application programming defaults specified on this panel or those of the DB2 precompiler options for dynamic SQL statements bound using DYNAMICRULES bind, define, or invoke behavior.

When YES, the application programming (DSNHDECP) defaults are used for dynamic SQL statements in plans or packages bound using DYNAMICRULES bind, define, or invoke behavior.

The following defaults are affected:

- DECIMAL POINT IS
- STRING DELIMITER
- SQL STRING DELIMITER
- MIXED DATA
- DECIMAL ARITHMETIC

When NO, values of the precompiler options are used for dynamic SQL statements in plans or packages bound with DYNAMICRULES(BIND).

Install parameter USE FOR DYNAMICRULES on panel DSNTIP4, or ZPARM DYNRULES in DSNHDECP.

**Field Name:** QWPBDRLS

**UNICODE SBCS CCSID**

Unicode Single Byte Character Set identification.

Parameter UNICODE CCSID in installation panel DSNTIPF, or ZPARM USCCSID in macro DSNHDECP.

**Field Name:** QWPBUSID

**TIME FORMAT**

Indicates the default output format for times.

Valid values are ISO (hh:mm:ss), USA (hh:mm AM), EUR (hh:mm:ss), JIS (hh:mm:ss), or LOCAL (your choice, defined by a time exit routine). DB2 interprets the input time from the punctuation and converts the output time to the required format.

Install parameter TIME FORMAT on panel DSNTIP4, or ZPARM TIME in DSNHDECP.
Field Name: QWPBTIME

DB2 DECP INDICAT
Indicates that DECP is supplied by DB2.
Using a DB2 supplied DECP could cause data corruption due to applications using wrong CCSIDs.

Field Name: QWPBDB2S

UNICODE MBCS CCSID
Unicode Mixed Character Set identification.
Parameter UNICODE CCSID in installation panel DSNTIPF, or ZPARM UMCCSID in macro DSNHDECP.

Field Name: QWPBUMID

IMP TIMEZONE
The implicit time zone that is associated with DB2 table columns and routine parameters that are declared as time stamp with time zone.
For IFCID 106 - Application Programming Defaults, this field is displayed twice, with its hex value and in a readable string.
This field corresponds to DSNHDECP field IMPLICIT_TIMEZONE.

Field Name: QWPBIMTZ

LOCAL DATE LENGTH
Shows the length of the longest field required to hold a locally defined date.
The default (0) indicates an IBM-supplied format (ISO, JIS, USA, or EUR).
Install parameter LOCAL DATE LENGTH on panel DSNTIP4, or ZPARM DATELEN in DSNHDECP.

Field Name: QWPBDLEN

UNICOD GBCS CCSID
Unicode graphics character set identification.
Parameter UNICODE CCSID in installation panel DSNTIPF, or ZPARM UGCCSID in macro DSNHDECP.

Field Name: QWPBUGID

IMP TIMEZONE (HEX)
The implicit time zone that is associated with DB2 table columns and routine parameters that are declared as time stamp with time zone.
For IFCID 106 - Application Programming Defaults, this field is displayed twice, with its hex value and in a readable string.
This field corresponds to DSNHDECP field IMPLICIT_TIMEZONE.

Field Name: QWPBIMTZ

LOCAL TIME LENGTH
Shows the length of the longest field required to hold a time when a locally defined time format is used.
The default (0) indicates an IBM-supplied format (ISO, JIS, USA, or EUR).
Install parameter LOCAL TIME LENGTH on panel DSNTIP4, or ZPARAM TIMELEN in DSNHDECP.

Field Name: QWPBTLEN

NEWFUN CUR REL

If YES, the DB2 subsystem/group is running in New Function Mode. At this mode/catalog level, the New Function Mode is enabled and available. The DB2 catalog is completely Unicode (UTF-8) and long names can be used.

Install parameter INSTALL TYPE on panel DSNTIPA1, or ZPARAM NEWFUN in DSNHDECP.

Field Name: QWPBNEWF

APPLIC ENCODING

Application encoding scheme.

Install parameter APPLICATION ENCODING on installation panel DSNTIPF, or ZPARAM APPENSC in DSNHDECP.

Field Name: QWPBAPSC

PAD NULL-TERMIN

Shows whether output host variables that are NULL-terminated strings are padded with blanks and a NULL terminator.

When NO, NULL-terminated output host variables have the NULL terminator placed at the end of actual data returned in the host variable. When YES, NULL-terminated output host variables have the NULL terminator placed at the end of the string, after the string has been padded with blanks from the end of the actual data to the declared length of the output host variable.

Install parameter PAD NUL-TERMINATED on installation panel DSNTIP4, or ZPARAM PADNTSTR in DSNHDECP.

Field Name: QWPB PAD

NEWFUN CUR REL-1

Shows the current release minus one of the new-function mode (NEWFUN).

Field Name: QWPBNEWFN1

DSNHDECP DS NAME

Shows the fully qualified DECP name of the data set from which the DSNHDECP module was loaded.

Field Name: QWPBLNM

NEWFUN CUR REL-2

Shows the current release minus two of the new-function mode (NEWFUN).

Field Name: QWPBNEWFN2

DEFAULT LOCALE

The system LOCALE LC_CTYPE.
A locale is the part of the system environment that depends on language and cultural conventions. An LC_TYPE is a subset of a locale that applies to character functions. The UPPER, LOWER, and TRANSLATE scalar functions use the CURRENT LOCALE LC_CTYPE system default or special register. The results of these functions can vary, depending on the setting of the locale.

The following values are possible:

**BLANK**
The source field is empty.

This is the default, unless it is necessary to run the UPPER, LOWER, or TRANSLATE functions for data that must be interpreted using the rules provided by specific locales, for example, En_US or Fr_CA.

**1st word**
The source field contains left-justified word(s), where each byte of a word is > X'40'. It can be a single word or several ones, delimited by bytes <= X'40'.

*Note:* These hexadecimal codes do not represent printable characters.

**N/P**
The source field contains regular words that are not left-justified. This means that the first bytes are <= X'40'. N/P is also shown if the whole source field only consists of bytes < X'40', such as zeros.

Install parameter LOCALE LC_CTYPE on panel DSNTIPF, or ZPARM LC_TYPE in DSNHDECP.

**Field Name:** QWP8LCTP

**DSNHDECP DS NAME**
The system LOCALE LC_CTYPE.

A locale is the part of the system environment that depends on language and cultural conventions. An LC_TYPE is a subset of a locale that applies to character functions. The UPPER, LOWER, and TRANSLATE scalar functions use the CURRENT LOCALE LC_CTYPE system default or special register. The results of these functions can vary, depending on the setting of the locale.

The following values are possible:

**BLANK**
The source field is empty.

This is the default, unless it is necessary to run the UPPER, LOWER, or TRANSLATE functions for data that must be interpreted using the rules provided by specific locales, for example, En_US or Fr_CA.

**1st word**
The source field contains left-justified word(s), where each byte of a word is > X'40'. It can be a single word or several ones, delimited by bytes <= X'40'.

*Note:* These hexadecimal codes do not represent printable characters.
IFCID 106 - Application Programming Defaults

N/P  The source field contains regular words that are not left-justified. This means that the first bytes are <= X'40'. N/P is also shown if the whole source field only consists of bytes < X'40', such as zeros.

Install parameter LOCALE LC_CTYPE on panel DSNTIPF, or ZPARM LC_TYPE in DSNHDECP.

Field Name: DSNHDECP

QWPBLVL

This field is for IBM service.

Field Name: QWPBLVL

QWPBLEN

Shows the length of the control block.

Field Name: QWPBLEN

QWPBEYE

Shows the control block eyecatcher (DECP).

Field Name: QWPBEYE

QWPBCHAR

Shows the default character set, ALPHANUM or KATAKANA.

ZPARM CHARSET in DSNHDECP.

Field Name: QWPBCHAR

IFCID 106 - Data Sharing Parameters:

This topic shows detailed information about “Record Trace - IFCID 106 - Data Sharing Parameters”.

This block shows the members in a data-sharing group.

DB2 subsystems that share data must belong to a DB2 data sharing group, which runs on a Parallel Sysplex. A data sharing group is a collection of one or more DB2 subsystems that access shared DB2 data. A Parallel Sysplex is a collection of MVS systems that communicate and cooperate with each other.

Record trace - IFCID 106 - Data Sharing Parameters

The field labels shown in the following sample layout of “Record Trace - IFCID 106 - Data Sharing Parameters” are described in the following section.

<table>
<thead>
<tr>
<th>GROUP NAME</th>
<th>DATA SHARING PARAMETERS</th>
<th>MAX # OF MEMBERS</th>
<th>NO</th>
</tr>
</thead>
<tbody>
<tr>
<td>GROUP NAME</td>
<td>'BLANK'</td>
<td>248</td>

<td>DSN1210</td>
<td>QWPACOOR</td>
<td>NO</td>
</tr>
<tr>
<td>QWPASST</td>
<td></td>
<td>QWPAPASSST</td>
<td>NO</td>
</tr>
</tbody>
</table>

GROUP NAME

The name of the DB2 data sharing group.

The group name encompasses the entire data sharing group and is the basis for the coupling facility structure names.

N/A means this DB2 is not part of a data sharing group.
Install parameter GROUP NAME on panel DSNTIPK, or ZPARM GRPNAME in DSN6GRP.

Field Name: QWPAGRPN

DATA SHARING ENAB
Indicates whether data sharing is enabled.

Field Name: QWPADSHR

MAX # OF MEMBERS
The maximum number of members possible in a data sharing group. This is a constant (248) and is not shown on any installation panel.

Field Name: QWPAMAXM

MEMBER NAME
The member name of this DB2.
N/A means this DB2 is not part of a data sharing group.

Install parameter MEMBER NAME on panel DSNTIPK, or ZPARM MEMBNAME in DSN6GRP.

Field Name: QWPAMBRN

IMMEDWRITE FLAG
Indicates how DB2 updates group buffer pool dependent pages. This is only valid in a data-sharing environment.

Group buffer pool dependent pages can be written to DASD or SYSTEM pagesets.

Values shown are:

NO  DB2 uses normal write activity for updates, this is the default. Pages are written out at, or before phase 2 commit, or at the end of an abend for transactions that have rolled back.

PH1  Pages are written out at, or before phase 1 commit.

If a transaction subsequently rolls back, the pages are updated in the group buffer pool at the end of the rollback and are written out at the end of the abend.

YES  Pages are written out to the coupling facility as soon as the buffer update commits. Pages are written out regardless of whether the update occurs during forward progress or rollback of the transaction.

This option can affect performance due to coupling facility overhead.

Install parameter IMMEDIATE WRITE on panel DSNTIP8, or ZPARM IMMEDWR1 in DSN6GRP.

Field Name: QWPAIMMW

CONVERSION FACTOR
The CPU service unit conversion factor for this CPU.
This factor allows conversion CPU time in seconds to a common unit, called service unit (SU). The conversion factor used depends on the machine. Service units allow you to calculate CPU execution times across a data sharing group.

The conversion factor is used as follows:

\[
CP\text{ secs} \times \frac{16,000,000}{\text{Conversion Factor}} = \text{SUs}
\]

\[
\text{SUs} \times \frac{\text{Conversion Factor}}{16,000,000} = CP\text{ secs}
\]

This field does not map to an installation panel.

Field Name: QWPASUCV

RANDOM ATTACH

Specifies a random group attach flag:

N  Not eligible for random group attach.

NOT N  Eligible for random group attach.

This field corresponds to field RANDOM ATTACH on installation panel DSNTIPK. The ZPARM name is RANDOMATT in DSN6GRP.

Field Name: QWPARAND

PEER RECOVERY

Specifies whether this data sharing member is to participate in data sharing peer recovery.

NONE  None.

RECOVER  This member is recovered by a peer member in case it fails.

ASSIST  This member attempts to initiate peer recovery for other failed members. When this member detects a failure, it will attempt to initiate a LIGHT(YES) restart for the failed member if it has not been initiated to recover the retained locks.

BOTH  Both RECOVER and ASSIST options are activated for this member.

Field Name: QWPAPERREC

QWPACOOR

Shows whether this DB2 member can coordinate parallel processing on other members of the group.

When NO, a query can be processed by this DB2 member only.

When YES, a read-only query running on this DB2 member can be processed in part on other members of the group.

N/A means this DB2 is not part of a data sharing group.

Install parameter COORDINATOR on panel DSNTIPK or ZPARM COORDNTR in DSN6GRP.

Field Name: QWPACOOR

QWPASST
Shows whether this DB2 member can assist a parallelism coordinator with parallel processing.

When YES, this member is considered an assistant at both bind and run time. To be a viable assistant at run time, both the VPPSEQT and VPXPSEQT buffer pool thresholds of this member must be greater than 0.

N/A means this DB2 is not part of a data sharing group.

Install parameter ASSISTANT on panel DSNTIPK or ZPARM ASSIST in DSN6GRP.

**Field Name:** QWPASST

**IFCID 106 - Databases/Spaces Automatically Deferred:**

This topic shows detailed information about “Record Trace - IFCID 106 - Databases/Spaces Automatically Deferred”.

**Record trace - IFCID 106 - Databases/Spaces Automatically Deferred**

The field labels shown in the following sample layout of “Record Trace - IFCID 106 - Databases/Spaces Automatically Deferred” are described in the following section.

**DATABASES/SPACES**

**STARTED AUTOMATICALLY ALL**

**Tablespace Names**

Contains the name of a table space or index space that is to be started automatically.

**Field Name:** QWPS8SPNM

**IFCID 106 - Databases/Spaces Automatically Restarted:**

This topic shows detailed information about “Record Trace - IFCID 106 - Databases/Spaces Automatically Restarted”.

**Database Names**

The name of a database that is to be started automatically.

**Field Name:** QWP8DBNM

**IFCID 106 - Databases/Spaces Automatically Started:**

This topic shows detailed information about “Record Trace - IFCID 106 - Databases/Spaces Automatically Started”.

**Record trace - IFCID 106 - Databases/Spaces Automatically Started**

The field labels shown in the following sample layout of “Record Trace - IFCID 106 - Databases/Spaces Automatically Started” are described in the following section.

**DATABASES/SPACES**

**STARTED AUTOMATICALLY ALL**

**Database names**

The name of a database that is to be started automatically.

**Field Name:** QWP8DBNM

**Tablespace names**
IFCID 106 - Databases/Spaces Automatically Started

Contains the name of a table space or index space that is to be started automatically.

Field Name: QWP8SPNM

IFCID 106 - Distributed Data Facility Parameters:

This topic shows detailed information about “Record Trace - IFCID 106 - Distributed Data Facility Parameters”.

This block shows how Distributed Data Facility (DDF) was started and the protocols used.

To use DDF, you must have VTAM installed, even if you use TCP/IP connections only.

Record trace - IFCID 106 - Distributed Data Facility Parameters

The field labels shown in the following sample layout of “Record Trace - IFCID 106 - Distributed Data Facility Parameters” are described in the following section.

<table>
<thead>
<tr>
<th>FIELD NAME</th>
<th>VALUE</th>

<tr>
<td>DSBL_IMPCAST_NJV</td>
<td>NO</td>
</tr>
</tbody>
</table>

FACILITY NAME

The name of the DDF facility.

Field Name: QWP9NAME

FACILITY START

Indicates whether DDF is loaded, and if so, how it was started.

When NO, DDF was not loaded at DB2 startup and cannot be started.

AUTO means DDF was loaded and started automatically when DB2 was started. The DDF address space was started as part of DDF initialization.

COMMAND means DDF was initialized and the DDF address space was started at DB2 startup. IF DDF is running, it was started from the console with the -DSN1 DSTART DDF command. If it is not running, it can be started with this command.

Install parameter DDF STARTUP OPTION on panel DSNTIPR, or ZPARM DDF in DSN6FAC.

Field Name: QWP9STRT

TCP/IP VERIFIED

Indicates whether DB2 accepts TCP/IP connection requests containing only a user ID.

When YES, a connection request is accepted with a user ID only. This value must be the same for all members of a data sharing group.

When NO (default), TCP/IP clients must provide authentication information (password, RACF PassTicket, or Kerberos ticket) to gain access to DB2.
Install parameter TCP/IP ALREADY VERIFIED on panel DSNTIP5, or ZPARM TCPALVER in DSN6FAC.

**Field Name:** QWP9TCPA

**DBAT STATUS**

Shows whether DB2 inactives threads that have successfully committed or rolled back, and hold no cursors.

ACTIVE provides the best performance but consumes system resources.

INACTIVE is recommended when the installation must support a large number of connections.

When a thread becomes eligible for inactivation, DB2 tries to make it a type 2 inactive thread, which uses less storage than a type 1 inactive thread. If this fails, DB2 tries to make it a type 1 inactive thread. If neither attempt is successful, the thread remains active.

Install parameter DDF THREADS on panel DSNTIPR, or ZPARM CMTSTAT in DSN6FAC.

**Field Name:** QWP9CMST

**RLF DYNAMIC ERROR**

Shows what DB2 does when the governor cannot access the resource limit specification table or when no row in the table matches the currently executing statement.

NOLIMIT (default) allows all dynamic SQL statements to run without limit.

NORUN terminates all dynamic SQL statements immediately with an SQL error code.

The number of CPU service units allowed for a query can be anywhere from 1 to 5000000.

Install parameter RLST ACCESS ERROR on panel DSNTIPR, or ZPARM RLFERRD in DSN6FAC (DB2 field QWP9RLER).

**Field Name:** QWP9RLER

**TCP/IP KEEPALIVE**

Indicates whether the TCP/IP configuration KeepAlive value has been overwritten.

When ENABLE (default), KeepAlive is enabled, the TCP/IP configuration stack value is used.

When DISABLE, TCP/IP KeepAlive has been disabled.

A value in the range 1 through 65534 means KeepAlive is active, and the TCP/IP stack value has been overridden. The number reported shows the time, in seconds, between TCP/IP probes.

When considering overwriting the keep-alive time, it is recommended to set a value close to the IDLE THREAD TIMEOUT value on installation panel DSNTIPR or the IRLM RESOURCE TIMEOUT value on installation panel DSNTIPI. It is good practice to set all these to about five minutes, or less.
Because KeepAlive detection is accomplished by probing the network at this interval, avoid small values, which can cause excessive network traffic and system resource consumption.

The trick is to find a proper balance that allows network failures to be detected on a timely basis without impacting system and network performance.

Install parameter TCP/IP KEEPALIVE on panel DSNTIP5, ZPARM TCPIPAlive in DSN6FAC.

Field Name: QWP9TCKA

**IDLE THR TIMEOUT**

The approximate time, in seconds, that an active server thread can remain idle before it is canceled.

Inactive and indoubt threads are not subject to timeout.

Threads are checked for timeouts every 3 minutes. This means that timeouts might not be honored for up to 3 minutes when the timeout value is less than this.

0 (default) means timeout processing is disabled, idle server threads remain in the system and continue to hold their resources, if any.

Install parameter IDLE THREAD TIMEOUT on panel DSNTIPR, or ZPARM IDTHTOIN in DSN6FAC.

Field Name: QWP9TTO

**RLF STATIC ERROR**

Shows what DB2 does when the governor cannot access the resource limit specification table or when no row in the table matches the currently running statement:

**NOLIMIT**

This is the default. It allows all static SQL statements to run without limit.

**NORUN**

Terminates all static SQL statements immediately with an SQL error code. A number from 1 to 500000 is the default limit; if the limit is exceeded, the SQL statement is terminated.

Install parameter REMOTE STATIC SQL on panel DSNTIPO4, or ZPARM RLFERRDSTC in DSN6FAC (DB2 field QWP9RLER).

Field Name: RLFERRDSTC

**MAX T1 INACT THR**

Indicates the number of type 1 inactive threads that DB2 allows.

A large number of type 1 inactive threads can adversely affect system performance. Type 1 inactive threads are used for DB2 private protocol.

DRDA uses type 2 inactive threads.

Zero indicates that type 1 inactive connections are not allowed. Threads remain active when they become eligible to be made a type 1 inactive thread.
A value greater than zero indicates that type 1 inactive connections are allowed, but are limited to this number. When a thread becomes eligible to be made a type 1 inactive thread, and this threshold is reached, the remote connection is terminated.

When this is equal to MAX REMOTE CONNECTED on panel DSNTIPE, DB2 allows all remote threads to become type 1 inactive threads.

Install parameter MAX INACTIVE DBATS on panel DSNTIPR, or ZPARM MAXTYPE1 in DSN6FAC.

**Field Name:** QWP9MAX1

**POOL THR TIMEOUT**

The approximate time, in seconds, that a DBAT can remain idle in the pool before it is terminated.

A DBAT thread in the pool counts as an active thread against MAX REMOTE ACTIVE and can hold locks, but does not have any cursors.

Threads are checked for timeouts every 3 minutes. This means that timeouts might not be honored for up to 3 minutes when the timeout value is less than this. The default is 120.

Install parameter POOL THREAD TIMEOUT on panel DSNTIP5, ZPARM POOLINAC in DSN6FAC.

**Field Name:** QWP9INAC

**PRIVATE PROTOCOL**

Shows if it is allowed to use the private protocol. It can have the following values:

**YES**  Allows private-protocol-related plan-owner-based package authorization behavior. Plan-owner-based package execution authorization semantics are honored for DB2 for z/OS DRDA requester systems that might rely on it. Secondary IDs are not used to determine package execution privileges for remote DB2 for z/OS applications.

**NO**  Does not allow any private-protocol-related behavior.

Plan-owner-based package execution authorization semantics are not honored. This might affect DB2 for z/OS DRDA requester systems that rely on it. Secondary IDs are used to determine package execution privileges for remote DB2 for z/OS applications.

**ZPARM name** PRIVATE_PROTOCOL in DSN6FAC.

**Field Name:** QWP9PRVPA

**RESYNCH INTERVAL**

The number of minutes between resynchronization periods.

A resynchronization period is the time during which indoubt logical units of work involving this DB2 subsystem and partner logical units are processed.

Install parameter RESYNC INTERVAL on panel DSNTIPR, or ZPARM RESYNC in DSN6FAC.

**Field Name:** QWP9RYC

**CONN Q MAX DEPTH**
The maximum depth of the connection-request queue of connections that are waiting for a DBAT to process a request. If this value is non-zero, and QWP9CMST is active, or the subsystem is not a member of a data sharing group, DB2 operates as if this value were 0.

A value of 0 is displayed for OFF; a value of 32767 is displayed for ON.

This field corresponds to field CONN QUEUE MAX DEPTH on installation panel DSNTIP5. The ZPARM name is MACONQN in DSN6FAC.

Field Name: QWP9MCONQN

ID & PASSWORD REQ

Shows whether user ID and password are required. In addition, one of the following is required:

- The user ID and password and any RACF PassTickets (A PassTicket is a one-time-only password that is generated by a requesting product or function) are Advanced Encryption Standard (AES) encrypted.
- A Kerberos ticket is required.
- The connection is protected by a z/OS Communications Server IP Application Transparent Transport Layer Security (AT-TLS) policy, which is ensured through a DB2 SECPORT.
- The connection is protected by an IPSec tunnel.

Field Name: QWP9TCPVE

SQL INTRPT DISABL

Shows how SQL interrupts are processed. It can have the following values:

- **NO** SQL interrupt processing is enabled.
- **YES** DB2 SQL interrupt support is disabled.

Note: YES should only be used if remote client systems experience failures because of SQL interrupts. In this case, SQL interrupt support should be disabled only until the remote client systems can be modified to tolerate SQL interrupts.

ZPARM name SQLINTRP in DSN6FAC.

Field Name: QWP9SINTD

CONN Q MAX WAIT

The maximum time that a connection waits for a DBAT request. If this value is non-zero, and QWP9CMST is active, or the subsystem is not a member of a data sharing group, DB2 operates as if this value were 0.

A value of 0 is displayed for OFF; a value of 1 is displayed for ON.

This field corresponds to field CONN QUEUE MAX WAIT on installation panel DSNTIP5. The ZPARM name is MAXCONQW in DSN6FAC.

Field Name: QWP9MCONQW

DDF COMP PRIOR V

The DDF compatibility parameter. The DB2 server with new-function mode has not yet been activated. The DDF compatibility parameter causes this server to identify itself to all remote clients as being in new-function mode for the previous version. The format of this field in the trace record is \textit{nnr}, where \textit{nn} is the version of the DB2 server and \textit{r} is the release.
Field Name: QWP9DDFCIP

SP_PARMS_JV

Specifies that when a Java client application calls a DB2 for z/OS stored procedure, DB2 returns output argument values with data types that match the data types that were specified in the CallableStatement.registerOutParameter method calls.

If SP_PARMS_JV is not specified, DB2 returns output parameter values with data types that match the data types of the parameters in the stored procedure definition.

ZPARM name DDF_COMPATIBILITY and ZPARM value SP_PARMS_JV in DSN6FAC.

Field Name: QWP9SPPMJ

SP_PARMS_NJV

Specifies that when a non-Java client application calls a DB2 for z/OS stored procedure, DB2 returns output argument values with data types that match the data types of the corresponding CALL statement arguments, unless one of the following conditions are true:

- The non-Java client is Version 10 or later.
- The stored procedure uses a parameter data type that was introduced in DB2 for z/OS Version 10 (XML, TIMESTAMP WITH TIMEZONE, or TIMESTAMP with precision greater than 6).

If one condition is true, DB2 returns output parameter values with data types that match the data types of the parameters in the stored procedure definition. If SP_PARMS_NJV is not specified, DB2 returns output parameter values with data types that match the data types of the parameters in the stored procedure definition.

ZPARM name DDF_COMPATIBILITY and ZPARM value SP_PARMS_NJV in DSN6FAC.

Field Name: QWP9ICFJ

IGNORE_TZ

Shows whether to ignore the time zone (TMZ) in TMZ input for Java.

Field Name: QWP9ITZJ

DSBL_IMPCAST_JV

Specifies whether the DB2 for z/OS server disables implicit casting of input host variables from numeric data types to string data types, or from string data types to numeric data types, when the application is a Java client application that uses the IBM Data Server Driver for JDBC and SQLJ.

If application compatibility is set to:

- V10R1: DB2 uses DISABLE_IMPCAST_JV.
- V11R1 or later: DB2 always does implicit casting.

ZPARM name DDF_COMPATIBILITY ZPARM value DISABLE_IMPCAST_JV in DSN6FAC.

Field Name: QWP9IC1J

DSBL_IMPCAST_NJV
Specifies that DB2 for z/OS disables implicit casting of input host variables from numeric data types to string data types, or from string data types to numeric data types, when the application is a non-Java client application that uses an IBM Data Server client or driver that is at Version 10.5 or earlier.

ZPARM name DDF_COMPATIBILITY and ZPARM value DISABLE_IMPCAST_NJV in DSN6FAC.

Field Name: QWP9ICIN

IFCID 106 - IRLM Processing Parameters:

This topic shows detailed information about “Record Trace - IFCID 106 - IRLM Processing Parameters”.

Record trace - IFCID 106 - IRLM Processing Parameters

The field labels shown in the following sample layout of “Record Trace - IFCID 106 - IRLM Processing Parameters” are described in the following section.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>PC SPECIFIED</td>

</tr>
<tr>
<td>MAX 64-BIT STOR</td>
<td>0</td>
</tr>
</tbody>
</table>

PC SPECIFIED

Shows whether the IRLM uses the cross-address-space program call. This parameter determines where the IRLM lock control block structure is stored.

If you run a tightly-controlled environment and virtual storage is not constrained, use PC=NO. PC=YES is the conservative choice where insufficient information about the environment is available to make a well-informed decision.

With PC=NO, locks are managed in extended common service area (ECSA) and it is possible to achieve better CPU performance, because DB2 does not use cross-memory services for IRLM requests. However, ECSA is a limited resource and constrains the size of the private address space area available above the 16-MB line. The demand for ECSA storage to support locks may be excessive when one or more of the following conditions are true:

- Extensive use of row-level locking
- Ineffective lock avoidance
- Infrequent application commits
- Lock escalation via NUMLKTS and LOCKMAX is disabled because the applications cannot tolerate the impact
- Effectively no limit on the number of locks taken by an application (NUMLKUS is set very high)
- Multiple DB2 subsystems with IRLM PC=NO reside on the same z/OS image

Assuming the average lock consumes 536 bytes of storage, a single application which takes 100000 locks before a commit would consume almost 52 MB of ECSA when IRLM is configured with PC=NO. MAXCSA would have to be set to at least 52 MB. If a very large number of locks are held by concurrent application processes, the demand for ECSA may not be able to be supported.
Recommendation: If you run applications that have many of the above characteristics, it is strongly recommended to use PC=YES. Certain ERP vendor applications that run concurrent processes can acquire a very large number of held locks that would require a very large setting for MAXCSA, or cause an ECSA overflow which would adversely impact the availability of the z/OS image.

If PC=NO is selected, MAXCSA should be sized to support the concurrent number of held locks required and to avoid an ECSA overflow condition. When setting MAXCSA, check to ensure that the ECSA setting in PARMLIB is sufficient to support the aggregate demand from IRLM and other subsystems. The ECSA size for z/OS is specified by the CSA keyword in the IEASSYSnn member in SYS1.PARMLIB.

With PC=YES, locks are managed in the extended private area of the IRLM address space. This can increase the CPU cost of lock and unlock requests relative to PC=NO. However, with reasonable lock avoidance, the total CPU overhead is likely to be limited to 1 to 2%, which is well within measurement noise and therefore not significant.

With PC=YES, the MAXIMUM ECSA option is ignored but must not be zero. The amount of storage allowed for LOCK usage is determined from the extended storage provided to the IRLM address space at startup time. This amount is reduced by 200 MB to allow a buffer for IRLM and z/OS required storage and for DMBS MUST COMPLETE processes. The amount being monitored can be seen in the display message from the irlmproc,STATUS,STOR command. IRLM still uses CSA and ECSA for other purposes. If you need to create a dump for DB2 diagnostic purposes, you need to ensure that IRLM is included in the dump, and that the dump data sets are large enough to hold IRLM.

PC=NO is a good solution when one or more of the following conditions are true, particularly when running a data sharing configuration:

- Optimal CPU performance is required
- No constraint is necessary on available ECSA
- Significant IRLM lock contention and a very large number of lock requests with ineffective lock avoidance
- Relatively high IRLM SRB time

YES puts the lock control block structure in the IRLM private address space, and the program call instruction is used to address it. IRLM still uses CSA and ECSA for other purposes. With PC=YES, the MAXIMUM ECSA option is ignored.

**Field Name**: QWP5PCY

**DEADLOCK WAIT**

Wait time for local deadlock.

**Field Name**: QWP5DLOK

**LOCAL/GLOBAL CYC**

Number of local cycles per global cycle.

**Field Name**: QWP5DCYC

**TIMEOUT INTERVAL**

Timeout interval.
MAX CSA USAGE

The maximum amount of common service area that can be used by IRLM.

The amount of space needed for the common service area (CSA) below the 16 MB line is less than 40 KB for each DB2 subsystem and 24 KB for each IRLM. High concurrent activity, parallelism, or high contention can require more CSA.

Most of the DB2 common data resides in the extended common service area (ECSA). Most modules, control blocks, and buffers reside in the extended private area. A DB2 subsystem with 200 concurrent users and 2000 open data sets should need less than 2 MB of virtual storage below the 16 MB line.

LOCKTAB HASH ENTR

The number of z/OS lock table hash entries.

MAX 31-BIT STOR

The maximum amount of 31-bit IRLM private storage that is available of the 2 GB virtual storage limit, for normal operations in IRLM. IRLM reserves an additional 10% of the 2 GB for use by requests in IRLM.

PENDING HASH ENTR

The number of z/OS lock table hash entries pending.

LOCKTAB LIST ENTR

The number of z/OS lock table list entries.

MAX 64-BIT STOR

The maximum amount of 64-bit IRLM private storage that is available of the total amount of storage that is specified by MEMLIMIT, for normal operations in IRLM. IRLM reserves an additional 10% of the amount that is specified by MEMLIMIT for use by requests in IRLM.

Record trace - IFCID 106 - Log Initialization Parameters (Part 1)

This topic shows detailed information about “Record Trace - IFCID 106 - Log Initialization Parameters (Part 1)”.

The field labels shown in the following sample layout of “Record Trace - IFCID 106 - Log Initialization Parameters (Part 1)” are described in the following section.
LOG OUTPUT BUFFER

The output log buffer size in kilobytes.

There is only one output log buffer per DB2 subsystem.

Increasing this parameter reduces BSDS I/O updates when there is a buffer wraparound. Frequent wraparounds are likely in LOAD or REORG with logging, and mass insert operations.

Increasing this parameter also helps avoid log write waits for an available buffer during heavy update workload.

When the specified size is not a 4 KB multiple, it is rounded up to the next 4 KB multiple.

Install parameter OUTPUT BUFFER on DSNTIPL, or ZPARM OUTBUFF in DSN6LOGP.

Field Name: QWP2OBPS

MAX ARCH INP UNIT

The maximum number of archive log volumes that can be allocated at the same time.

Field Name: QWP2INLM

DEALLOC TIME(MIN)

The number of minutes an archive read tape unit can remain unused before it is deallocated.

When archive log data is read from tape, this value should be high enough to allow DB2 to optimize tape handling for multiple read applications.

Install parameter DEALLOC PERIOD on panel DSNTIPA, or ZPARM DEALLCT in DSN6LOGP.

Field Name: QWP2DMIN

READ COPY2 ARCH

Indicates whether COPY2 archives should be read first when the DB2 subsystem is started. The default is NO. Install parameter READ COPY2 ARCHIVE on panel DSNTIPO, or ZPARM TRKRSITE in DSN6SPRM.

Field Name: QWP2ARC2

MAX ARCH IN BSDS

The maximum number of archive log volumes that can be recorded in the BSDS.

When this number is exceeded, recording resumes at the beginning of the BSDS.

For dual archive, this value applies to each log data set. As an example, a value of 500 allows 500 COPY-1 and 500 COPY-2 data sets in the BSDS.

You must create image copies of all DB2 objects, probably several times, before the archive log data sets are discarded. If you fail to retain an adequate number of archive log data sets for all the image copies, you might need to cold start or reinstall DB2. In either case, data is lost.
IFCID 106 - Log Initialization Parameters (Part 1)

Install parameter RECORDING MAX on panel DSNTIPA, or ZPARM MAXARCH in DSN6LOGP.

Field Name: QWP2ARCL

DEALLOC TIME(SEC)

The deallocation time in seconds.

Field Name: QWP2DSEC

ACTIVE LOG COPIES

The number of copies of the active log being maintained: 2 indicates dual logging.

Field Name: QWP2DUAL

DUAL BSDS MODE

Shows whether two BSDS data sets are used.

A second BSDS (strongly recommended) makes recovery much easier in most situations. In cases that normally require recovery and restart, a second BSDS allows you to continue working. The storage overhead required is small and the data set is relatively inactive.

DB2 parameter TWOBSDS in DSN6LOGP.

Field Name: QWP2DBSD

OFFLOAD OPTION

Shows whether the offload process is initiated online.

ZPARM OFFLOAD in macro DSN6LOGP.

Field Name: QWP2OFFL

ARCH LOG COPIES

The number of copies of the archive log being produced during offloading: 2 indicates dual logging.

Install parameter NUMBER OF COPIES on PANEL DSNTIPH, or ZPARM TWOARCH in DSN6LOGP.

Field Name: QWP2ADL

REM COPY SW ACCEL

Specifies whether DB2 uses software (SW) to control the remote copy process for active log output in peer-to-peer remote copy (PPRC) environments. It can have the following values:

• DISABLE (This is the default value)
• ENABLE

ZPARM REMOTE_COPY_SW_ACCEL in DSN6LOGP.

Field Name: QWP2RCSA

IFCID 106 - Log Initialization Parameters (Part 2):

This topic shows detailed information about “Record Trace - IFCID 106 - Log Initialization Parameters (Part 2)”.
The field labels shown in the following sample layout of “Record Trace - IFCID 106 - Log Initialization Parameters (Part 2)” are described in the following section.

**DATASET BLOCKSIZE:**

The block size of the archive log data set.

The block size must be compatible with the device type used for archive logs. The value is rounded up to the next multiple of 4096 bytes.

If the archive log is written to tape, use the largest possible block size to improve the reading speed.

Recommended block size values are 28672 for tape, 20480 for 3380, and 24576 for 3390 or RAMAC.

Install parameter BLOCK SIZE on panel DSNTIPA, or ZPARM BLKSIZE in DSN6ARVP.

Field Name: QWP3BKSZ

**COPY1 DEVICE TYPE**

The device type or unit name for storing archive log data sets.

The value can be any alphanumeric string. If you choose to archive to DASD, you can specify a generic device type with a limited volume range. DB2 requires that all archive log data sets allocated on DASD are cataloged.

If the device type is DASD, CATALOG DATA must be set to YES. If the unit name specifies DASD, the archive log data sets can extend to a maximum of 15 volumes. PRIQTY and SECQTY must be large enough to contain all active log data set data without extending beyond 15 volumes. If the unit name specifies a tape device, DB2 can extend to a maximum of 20 volumes. Default is TAPE.

Install parameter DEVICE TYPE 1 on panel DSNTIPA, or ZPARM UNIT in DSN6ARVP.

Field Name: QWP3UNT1

**MSS GROUP NAME 1**

The mass storage system volume group name of the first storage group.

Field Name: QWP3MSV1

**PRIMARY ALLOCATION**

The primary space allocation for archive data sets.
IFCID 106 - Log Initialization Parameters (Part 2)

Install parameter PRIMARY QUANTITY on installation panel DSNTIPA, or ZPARM PRIQTY in DSN6ARVP.

Field Name: QWP3RISP

COPY2 DEVICE TYPE

Indicates the device type or unit name for storing the second copy of archive log data sets.

The value can be any alphanumeric string. If you choose to archive to DASD, you can specify a generic device type with a limited volume range. DB2 requires that all archive log data sets allocated on DASD are cataloged.

If the device type is DASD, then CATALOG DATA must be set to YES. If the unit name specifies DASD, the archive log data sets can extend to a maximum of 15 volumes. PRIQTY and SECQTY must be large enough to contain all active log data set data without extending beyond 15 volumes.

If the unit name specifies a tape device, DB2 can extend to a maximum of 20 volumes. Default is TAPE.

Install parameter DEVICE TYPE 2 on panel DSNTIPA, or ZPARM UNIT2 in DSN6ARVP.

Field Name: QWP3UNT2

MSS GROUP NAME 2

The mass storage system volume group name of the second storage group.

Field Name: QWP3MSV2

SECONDARY ALLOC.

The amount of DASD secondary space allocation for an archive log data set.

The units used are specified by the ALLOCATION UNITS field. When blank (default), the CLIST calculates this space using block size and size of the log.

Install parameter SECONDARY QTY on panel DSNTIPA, or ZPARM SECQTY in DSN6ARVP.

Field Name: QWP3SECS

COPY 1 PREFIX

The prefix of the first archive log data set.

Install parameter Archive Logs: COPY1 PREFIX on panel DSNTIPH, or ZPARM ARCPFX1 in DSN6ARVP.

Field Name: QWP3RE1N

RETENTION PERIOD

The number of days DB2 keeps archive log data sets.

This value is added to the current date to calculate the expiration date.

The retention period is often used in tape management systems to control the reuse and scratching of data sets and tapes. DB2 uses this as the value for the dynamic allocation parameter DALRETPD when archive log data sets are created.
Install parameter RETENTION PERIOD on panel DSNTIPA, or ZPARM ARCRETN in DSN6ARVP.

Field Name: QWP3RETN

COPY 2 PREFIX

The prefix of the second archive log data set. If single logging is used, this value is a default.

Install parameter Archive Logs: COPY2 PREFIX on panel DSNTIPH, or ZPARM ARCPFX2 in DSN6ARVP.

Field Name: QWP3RE2N

SINGLE VOLUME

Indicates whether single-volume DASD archives are used.

Install parameter SINGLE VOLUME on panel DSNTIPA, or ZPARM SVOLARC in DSN6ARVP.

Field Name: QWP3SVOL

QUIESCE PERIOD

The maximum amount of time (in seconds) permitted for DB2 to attempt a full system quiesce.

Install parameter QUIESCE PERIOD on panel DSNTIPA, or ZPARM QUIESCE in DSN6ARVP.

Field Name: QWP3MQP

CATALOG ARCH DS

The alias of the VSAM integrated catalog facility user catalog or the name of the master catalog where the DB2 VSAM data sets created during installation are cataloged. The MVS catalog alias is also used as the high-level qualifier for DB2 VSAM data sets.

Install parameter CATALOG ALIAS on panel DSNTIPA, or ZPARM CATALOG in DSN6ARVP.

Field Name: QWP3CTLG

SPACE ALLOC METHOD

The unit used in allocating archive data sets. Possible values are:

CYLINDER
Space allocation by cylinders (QWP3CYL=1)

TRACKS
Space allocation by tracks (QWP3TRCK=1)

BLOCKS
Space allocation by blocks (QWP3CYL=0 and QWP3TRCK=0)

Install parameter ALLOCATION UNITS on panel DSNTIPA, or ZPARM ALCUNIT in DSN6ARVP.

Field Name: RT0106SA

ARCHLOG RACF PROT

Indicates whether archive log data sets are protected with individual RACF profiles when they are created.
When YES, RACF protection must be active for DB2. YES also means that you cannot use RACF generic profiles for archive log data sets. If your archive log is on tape, RACF class TAPEVOL must be active, otherwise, the off-load will fail.

Install parameter ARCHIVE LOG RACF on panel DSNTIPP, or ZPARM PROTECT in DSN6ARVP.

**Field Name:** QWP3RTCT

**WTOR BEF ARCH MNT**

Indicates whether DB2 must send a message to the operator and wait for an answer before attempting to mount an archive log data set.

Other DB2 users can be forced to wait while the mount is pending. They are not affected while DB2 is waiting for a response to the message.

When YES, a device such as tape is used that requires long delays for mounts. DEVICE_TYPE 1 shows the device type or unit name.

Install parameter WRITE TO OPER on panel DSNTIPA, or ZPARM ARCWTOR in DSN6ARVP.

**Field Name:** QWP3WTOR

**COMPACT DATA**

Indicates whether data written to archive logs is compacted.

This option only applies to data written to a 3480 device that has the improved data recording capability (IDRC) feature.

Install parameter COMPACT DATA on panel DSNTIPA, or ZPARM COMPACT in DSN6ARVP.

**Field Name:** QWP3COMP

**TS ARCHLOG DS**

Indicates whether the date and time of creation of the DB2 archive log data set is included in the archive log data set name.

Possible values are:

**YES (QWP3DTIM=1)**

The maximum allowable length of the user-controlled portion of the archive log prefix is reduced from 35 characters to 19 characters. This allows the 16-character timestamp to be added to the archive log data set prefix. The timestamp format is as follows: $DydddThhmmnst$, where:

- **D** Starts the date.
- **yy** Is the last two digits of the year.
- **ddd** Is the day of the year.
- **T** Starts the time.
- **hh** Is the hour.
- **mm** Are the minutes.
- **ss** Are the seconds.
- **t** Is the tenths of a second.
The maximum allowable length of the user-controlled portion of the archive log prefix is reduced from 35 characters to 19 characters. This reduction in size permits the 16-character date and time qualifiers (timestamp) to be added to the archive log data set prefix.

**NO (QWP3DTIM=0 and QWP3DTFM=0)**

The archive data set name does not contain a timestamp.

**EXT (QWP3DTFM=1)**

The archive data set name contains a timestamp with an extended date component in the format: .Dyyyyddd. A value of EXT in this field causes the lengths of the values that are entered for field COPY 1 PREFIX and field COPY 2 PREFIX to be audited to ensure that neither exceeds 17 bytes (19 bytes for other settings of TIMESTAMP ARCHIVES).

Install parameter TIMESTAMP ARCHIVES on panel DSNTIPH, or ZPVTSTAMP in DSN6ARVP.

**Field Name: QWP3LVL**

This field is for IBM service.

**Field Name: QWP3WLST**

This field is for IBM service.

**IFCID 106 - Miscellaneous Installation Parameters**

This topic shows detailed information about “Record Trace - IFCID 106 - Miscellaneous Installation Parameters”.

This block shows values that are not shown on DB2 installation panels. These values are either set internally by DB2, or calculated from other install parameter values.

When this block contains names that are too long for the space available, they are truncated. The full name is shown in the list of long names, which is printed at the end of this block. When present, the list shows the parameter identifier, in alphabetic order, and the complete name. If the name is too long for one line, it continues on the next line.

**Record trace - IFCID 106 - Miscellaneous Installation Parameters**

The field labels shown in the following sample layout of “Record Trace - IFCID 106 - Miscellaneous Installation Parameters” are described in the following section.

## IRLM PROCEDURE

The name of the IRLM procedure invoked by MVS if AUTO START is YES.

The name cannot be the same as the subsystem name given for SUBSYSTEM NAME.

Install parameter PROC NAME on panel DSNTIPI, or ZPARM IRLMPRC in DSN6SPRM.

Field Name: QWP4IPRC

## TAB OWNER

The owner of the application registration table and the object registration table.

This identifier can be a long string. If there is insufficient space to show the complete string, the string is truncated in the report block. The complete string is shown in a separate list of long names at the end of the report.

Install parameter REGISTRATION OWNER on panel DSNTIPZ, or ZPARM RGFCOLID in DSN6SPRM.

Field Name: QWP4REGC

## INST DD CTRL SUPT

Indicates whether data definition support has been installed.
IFCID 106 - Miscellaneous Installation Parameters

Install parameter INSTALL DD CONTROL SUPT on panel DSNTIPZ, or ZPARM RGFINSTL in DSN6SPRM.

Field Name: QWP4REGI

IRLM MODULE NAME

The IRLM subsystem name defined to MVS.

This is used for communication between DB2 and the IRLM. It is included in the MVS subsystem table IEFSSN xx, where xx is the value of SUBSYSTEM MEMBER on installation panel DSNTIPM.

If the IRLM for IMS is installed, the DB2 IRLM name is different because two IRLMs on the same MVS system must have unique names.

Install parameter SUBSYSTEM NAME on panel DSNTIPI, or ZPARM IRLMSID in DSN6SPRM.

Field Name: QWP4ISID

APPL TABLE

The name of the application registration table.

Install parameter APPL REGISTRATION TABLE on panel DSNTIPZ or ZPARM RGFNMPRT in DSN6SPRM.

Field Name: QWP4REGA

CTRL ALL APPLIC

Indicates that the DB2 system is completely controlled by a set of closed applications identified in the application registration table.

Closed applications require their DB2 objects to be managed solely through the plans or packages registered in the application registration table.

Install parameter CONTROL ALL APPLICATIONS on panel DSNTIPZ, or ZPARM RGFDEDPL in DSN6SPRM.

Field Name: QWP4REGD

IRLM START TIME

The IRLM wait time in seconds.

DB2 autostart abends if IRLM does not start within this time.

Install parameter TIME TO AUTOSTART on panel DSNTIPI, or ZPARM IRLMSWT in DSN6SPRM.

Field Name: QWP4ISWT

OBJ TABLE

The name of the object registration table.

Install parameter OBJT REGISTRATION TABLE on panel DSNTIPZ, or ZPARM RGFNMORT in DSN6SPRM.

Field Name: QWP4REGO

REQ FULL NAMES

Indicates whether registered objects require fully qualified names.

Install parameter REQUIRE FULL NAMES on panel DSNTIPZ, or ZPARM RGFFULLQ in DSN6SPRM.
Field Name: QWP4REGQ

IRLM INIT TIME

The number of seconds DB2 waits before querying whether IRLM has completed initialization.

DB2 parameter SPRMISWI in DSNMSPRM.

Field Name: QWP4ISWI

INSTALL SYSADM

One of two authorization IDs with SYSADM authority. SYSADM users can access to DB2 in all cases.

This identifier can be a long string. If there is insufficient space to show the complete string, the string is truncated in the report block. The complete string is shown in a separate list of long names at the end of the report.

Install parameter SYSTEM ADMIN 1 on panel DSNTIPP, or ZPARM SYSADM in DSN6SPRM.

Field Name: QWP4SADM

UNREGIST DDL DFLT

The action taken for DDL that names an unregistered object.

Options are REJECT, ACCEPT, or APPL, which rejects the DDL when the current application is not registered.

Install parameter UNREGISTERED DDL DEFAULT on panel DSNTIPZ, or ZPARM RGFDEFLT in DSN6SPRM.

Field Name: QWP4SADM

IRLM AUTOSTART

Indicates whether IRLM is started automatically by DB2.

Install parameter AUTO START on panel DSNTIPI, or ZPARM IRLMAUT in DSN6SPRM.

Field Name: QWP4AUT

SYSADM ID 2

One of two authorization IDs with SYSADM authority. SYSADM users can access to DB2 in all cases.

This identifier can be a long string. If there is insufficient space to show the complete string, the string is truncated in the report block. The complete string is shown in a separate list of long names at the end of the report.

Install parameter SYSTEM ADMIN 2 on panel DSNTIPP, or ZPARM SYSADM2 in DSN6SPRM.

Field Name: QWP4ADM2

UTILITY FACTOR

Shows how much longer utilities can wait for a resource than SQL applications can.

This is the number of RESOURCE TIMEOUT units that a utility or utility command can wait for a lock or for all claims on a resource of a particular claim class to be released. The default value is 6, meaning a utility can wait 6 times longer than an SQL application for a resource.
IFCID 106 - Miscellaneous Installation Parameters

Install parameter UTILITY TIMEOUT on panel DSNTIPI, or ZPARM UTIMOUT in DSN6SPRM.

Field Name: QWP4UTO

IRLM TIMEOUT

The number of seconds before a timeout is detected.
This is an integer multiple of DEADLOCK TIME on panel DSNTIPJ.
Timeout means that a lock request has waited for a resource (or for claims on a resource for a particular claim class to be released) longer than this time.
For data sharing, the actual timeout period is longer than the timeout value.

Install parameter RESOURCE TIMEOUT on panel DSNTIPI, or ZPARM IRLMRWT in DSN6SPRM.

Field Name: QWP4TOUT

DEFAULT USERID

The authorization ID used if RACF is not available for batch access and USER= is not specified in the job statement.
This identifier can be a long string. If there is insufficient space to show the complete string, the string is truncated in the report block. The complete string is shown in a separate list of long names at the end of the report.

Install parameter UNKNOWN AUTHID on panel DSNTIPP, or ZPARM DEFLTID in DSN6SPRM.

Field Name: QWP4DFID

EXPLAIN AUTOBIND

Indicates whether EXPLAIN processing occurs during automatic rebind.
YES means EXPLAIN processing happens during automatic rebind of a plan or package that has EXPLAIN(YES) as a bind option. If the PLAN_TABLE does not exist, automatic rebind continues, but there is no EXPLAIN output. Explain processing does not happen for a plan or package with EXPLAIN(NO).

Install parameter EXPLAIN PROCESSING on panel DSNTIPO, or ZPARM ABEXP in DSN6SPRM.

Field Name: QWP4ABX

MAXIMUM DATASETS

The maximum number of data sets that can be open at one time.
The practical limit can be less than the MVS limit of 32727, depending on available storage below the line.

Install parameter DSMAX on panel DSNTIPC, or ZPARM DSMAX in DSN6SPRM.

Field Name: QWP4DSMX

DATABASE NAME

The name of the database that contains the registration tables.
IFCID 106 - Miscellaneous Installation Parameters

Install parameter REGISTRATION DATABASE on panel DSNTIPZ, or ZPARM RGFDNBANAM in DSN6SPRM.

Field Name: QWP4REGN

ENABLE DATA CAPT

Indicates whether change data capture is enabled.

Install parameter DPROP SUPPORT on panel DSNTIPO. ZPARM name is CHGDC in DSN6SPRM.

Field Name: QWP4CDC

ASYNC DRAIN START

The percentage below 100% DSMAX that open data sets can reach before an asynchronous drain is started. The default is 1, meaning that asynchronous drain starts when the number of open data sets reaches 99% of DSMAX.

DB2 defers closing and deallocating the table spaces or indexes until the number of open data sets reaches one of the following limits:
- The MVS limit for the number of concurrently open data sets.
- 99% (default) of the value that you specified for DSMAX.

When one of these limits is reached, DB2 closes a number of data sets not in use equal to 3% (default) of the value DSMAX. Thus, DSMAX controls not only the limit of open data sets, but also the number of data sets that are closed when that limit is reached.

DB2 parameter SPRMTDD in DSN6SPRM.

Field Name: QWP4TDDN

SYSOPER ID

One of two authorization IDs with SYSOPR authority. SYSOPR users can access DB2 even if the DB2 catalog is unavailable.

This identifier can be a long string. If there is insufficient space to show the complete string, the string is truncated in the report block. The complete string is shown in a separate list of long names at the end of the report.

Install parameter SYSTEM OPERATOR 1 on panel DSNTIPP, or ZPARM SYSOPR1 in DSN6SPRM.

Field Name: QWP4OPR1

SITE TYPE

Shows whether this system is at a local site or a recovery site.

LOCALSITE
- This is the site of the current system. Multiple image copies are made and are operational here. This is the default.

RECOVERYSITE
- This an alternative site for recovery purposes.

The RECOVER utility uses this parameter to determine what site the current system is on and recovers everything from the copies of data registered at that site.

The RECOVER and MERGECOPY utilities use this to determine whether COPYDDN or RECOVERDDN is allowed with NEWCOPY NO.
IFCID 106 - Miscellaneous Installation Parameters

Install parameter SITE TYPE on panel DSNTIPO, or ZPARM SITETYP in DSN6SPRM.

**Field Name:** QWP4MSTY

**SYNC DRAIN STOP**

The percentage of maximum open data sets until the asynchronous drain operations are stopped.

DB2 parameter SPRMMDD in DSN6SPRM.

**Field Name:** QWP4MDDN

**SYSPER ID 2**

One of two authorization IDs with SYSPR authority. SYSPR users can access DB2 even if the DB2 catalog is unavailable.

This identifier can be a long string. If there is insufficient space to show the complete string, the string is truncated in the report block. The complete string is shown in a separate list of long names at the end of the report.

Install parameter SYSTEM OPERATOR 2 on panel DSNTIPP, or ZPARM SYSPR2 in DSN6SPRM.

**Field Name:** QWP4OPR2

**TRACKER SITE**

Indicates whether this subsystem is a remote tracker site for another DB2 subsystem.

When YES, this is a tracker site.

A DB2 tracker site is a separate DB2 subsystem or data sharing group that exists solely for the purpose of keeping shadow copies of your primary site's data. No independent work can be run on the tracker site.

Install parameter TRACKER TYPE on panel DSNTIPO, or ZPARM TRKRSTYPE in DSN6SPRM.

**Field Name:** QWP4TRKR

**ENFORCE DPROP**

Shows whether DataPropagator NonRelational (DPROP) is used to propagate SQL changes made to tables defined with DATA CAPTURE CHANGES.

1. No changes are propagated.
2. DPROP propagates SQL changes, and those changes made to tables defined with DATA CAPTURE CHANGES are only allowed when monitor trace class 6 is active, DPROP is installed, and the DB2 application is running in an IMS environment. If any of these conditions are not met, no changes to the DB2 table are permitted.
3. Data propagation occurs when monitor trace class 6 is active, DPROP is installed, and the DB2 application is running in an IMS environment. In this instance, an application that is not running in an IMS environment can update DB2 tables defined with DATA CAPTURE CHANGES. However, these changes are not propagated to IMS.

**ANY** Allows subsystems to propagate some data with DPROP and other data with a different propagation program.
Tables that should only be updated by DB2 applications running in an IMS environment can be protected using the following methods:

- Use the ENABLE parameter on BIND to specify a specific attachment facility through which updates to data propagation tables can be made.
- Define a validation procedure for data propagation tables to define which plans can update those tables.
- Allow update authority for data propagation tables to a group of authorization IDs that can only run in IMS.

Install parameter DPROP SUPPORT on panel DSNTIPO, or ZPARM EDPROP and CHGDC in DSN6SPRM.

Field Name: QWP4ENF

**DDCS ESCAPE CHAR**

The escape character used in the application registration table (ART) or object registration table (ORT).

Sets of names in the ART and ORT can be represented by patterns that use the underscore (_) and percent sign (%) characters in the same way as in an SQL LIKE predicate.

Install parameter ART/ORt ESCAPE CHARACTER on panel DSNTIPZ, or ZPARM RGFESCP in DSN6SPRM.

Field Name: QWP4ESC

**WAIT RETAIN LOCKS**

Indicates whether a request is suspended until an incompatible retained lock becomes available.

This value is only significant in a data sharing environment. It indicates how long a transaction should wait for a lock on a resource if another DB2 in the data sharing group has failed and is holding an incompatible lock on that resource. Locks held by failed DB2 members are called retained locks.

This value is a multiplier that is applied to the connection's normal timeout value. For example, if the retained lock multiplier is 2, then the timeout period for a call attachment connection that is waiting for a retained lock is twice the normal CAF timeout period. The default is 0, meaning applications do not wait for incompatible retained locks, the lock request is immediately rejected and the application receives a "resource unavailable" SQLCODE.

Install parameter RETAINED LOCK TIMEOUT on panel DSNTIPI, or ZPARM RETLWAIT in DSN6SPRM.

Field Name: QWP4WAIT

**IMS/BMP TIMEOUT**

The number of RESOURCE TIMEOUT units that an IMS BMP connection waits for a lock to be released.

The default value is 4, meaning that an IMS BMP connection can wait 4 times the resource timeout value for a resource.

Install parameter IMS BMP TIMEOUT on panel DSNTIPI, or ZPARM BMPTOUT in DSN6SPRM.

Field Name: QWP4WBMP
BIND NEW PACKAGE

Shows whether BIND or BINDADD authority is required to BIND a new version of an existing package.

When BINDADD (default), only users with BINDADD system privilege can create a new package.

BIND users with BIND privilege for a package or collection can create a new version of an existing package when they bind it. This also allows users with PACKADM authority to add a new package or a new version of a package to a collection.

Install parameter BIND NEW PACKAGE on panel DSNTIPP, or ZPARM BINDNV in DSN6SPRM.

Field Name: QWP4BNV

AUTO BIND

Indicates whether autobind is enabled. Values are:

YES  Allows automatic rebind operations to be performed when a plan/package:
   • Was marked “invalid”.
   • Was bound on DB2 Vn, but is now running on DB2 Vn-1
   • After use on DB2 Vn-1 (as previously described), is later used again on DB2 Vn

NO   Prevent DB2 from performing any automatic rebind operations under any circumstances.

COEXIST  Allows automatic rebind operation to be performed in a DB2 Data Sharing coexistence environment when the plan/package:
   • Is marked “invalid” or
   • Was last bound in DB2 Vn and is running on DB2 Vn-1

Install parameter AUTO BIND on panel DSNTIPO, or ZPARM ABIND in DSN6SPRM.

Field Name: QWP4ABN

IMS/DLI TIMEOUT

The number of RESOURCE TIMEOUT units that a DL/I batch connection waits for a lock to be released.

The default value is 6, meaning that an IMS BMP connection can wait 4 times the resource timeout value for a resource.

Install parameter DL/I BATCH TIMEOUT on panel DSNTIPI, or ZPARM DLITOUT in DSN6SPRM.

Field Name: QWP4WDLI

ENABLE DB2 AUTH

Shows whether DB2 performs authorization checking.

When all authorization checking by DB2 is disabled, the GRANT statement is also disabled (granting every privilege to PUBLIC); this is not recommended.
Install parameter USE PROTECTION on panel DSNTIPP, or ZPARM AUTH in DSN6SPRM.

**Field Name:** QWP4AUTH

**MAX APPL LOCKS**

The maximum number of page or row locks that a single application can hold concurrently on all table spaces.

This includes locks on data pages, index pages, and rows that the program acquires when it accesses table spaces.

The limit applies to all table spaces defined with the LOCKSIZE PAGE, LOCKSIZE ROW, or LOCKSIZE ANY options. 0 means that there is no limit to the number of page and row locks a program can acquire.

DB2 assumes that 250 bytes of storage are required for each lock. If NO is specified for CROSS MEMORY, the value of this field has to take into account the available lock space. If referential constraints between tables is defined, the value of this field might need to be increased.

Install parameter LOCKS PER USER on panel DSNTIPJ, or ZPARM NUMLKUS in DSN6SPRM.

**Field Name:** QWP4LKUS

**CACHE DYNAMIC SQL**

Indicates whether prepared dynamic SQL statements are saved for later use by eligible application processes in the EDM pool.

Install parameter CACHE DYNAMIC SQL on panel DSNTIP8, or ZPARM CACHEDYN in DSN6SPRM.

**Field Name:** QWP4CDYN

**AUTH CACHE SIZE**

The size of the authorization cache to be used if no CACHESIZE is specified on the BIND PLAN subcommand.

The size of the cache is 32 bytes of overhead + (8 bytes of storage X number of concurrent users).

0 means authorization caching is not used.

Install parameter PLAN AUTH CACHE on panel DSNTIPP, or ZPARM AUTHCACH in DSN6SPRM.

**Field Name:** QWP4AUCA

**REP READ U LOCK**

Indicates whether the U (UPDATE) lock is used when using repeatable read (RR) or read stability (RS) isolation to access a table.

When YES, the U lock is used for an updated cursor with repeatable read or read stability.

When NO, the S lock is used for an updated cursor with repeatable read or read stability. If the cursor in the running applications includes the clause FOR UPDATE OF, but updates are infrequent, S locks generally provide better performance.

Install parameter U LOCK FOR RR/RS on panel DSNTIPI, or ZPARM RRULOCK in DSN6SPRM.
**IFCID 106 - Miscellaneous Installation Parameters**

**Field Name: QWP4RRU**

**MAX KEPT DYN STMT**

Shows the total number of prepared dynamic SQL statements that are saved past a commit point.

0 means that prepared dynamic SQL statements are not saved past commit points.

Install parameter MAX KEPT DYN STMTS on panel DSNTIPE, or ZPARM MAXKEEPD in DSN6SPRM.

**Field Name: QWP4MXKD**

**ACCEL MODELING**

The ACCELMODEL subsystem parameter determines whether to enable modeling of query workload for evaluating potential savings for both the accumulated elapsed time and CPU time if the plan is executed on an accelerator.

Only queries that are deemed eligible for execution on an accelerator by DB2 will be included in accelerator-related fields of Accounting trace IFCID 3:

- **No** Specifies that no modeling is to be performed. This is the default setting.
- **Yes** Specifies that modeling is to be performed. Consider acceleration eligibility for an SQL statement and update the new Accounting fields accordingly.

To enable modeling, the IBM DB2 Analytics Accelerator for z/OS special register CURRENT QUERY ACCELERATION and ZPARM QUERY_ACCELERATION (set by the CURRENT QUERY ACCEL) must be set to NONE for accelerator modeling. All other values for the special register and ZPARM will take the existing logic of IBM DB2 Analytics Accelerator for z/OS. This means that existing queries that already execute on the accelerator with CURRENT QUERY ACCELERATION = ENABLE, ENABLE WITH FAILBACK, ELIGIBLE, or ALL will not be part of the accelerator-related Accounting fields.

**Field Name: QWP4ACMO**

**MAX TSPACE LOCK**

The default (SYSTEM) for the LOCKMAX clause of the SQL statements CREATE TABLESPACE and ALTER TABLESPACE.

Install parameter LOCKS PER TABLE(SPACE) on panel DSNTIPJ, or ZPARM NUMLKTS in DSN6SPRM.

**Field Name: QWP4LKTS**

**CURRENT DEGREE**

Shows the default for the CURRENT DEGREE special register when no degree is explicitly set with SET CURRENT DEGREE.

The default disables query parallelism.

Install parameter CURRENT DEGREE on panel DSNTIP8, or ZPARM CDSSRDEF in DSN6SPRM.

**Field Name: QWP4CDEG**
OPT HINTS ALLOWED

Shows whether DB2 can use optimization hints from the PLAN_TABLE to influence the access paths used for certain queries.

Install parameter OPTIMIZATION HINTS on panel DSNTIP8, or ZPARM OPTHINTS in DSN6SPRM.

Field Name: QWP4HINT

SORT POOL SIZE

Indicates the amount of storage needed for the sort pool.

This can be the value calculated by the CLIST, based on input from previous panels, or the value entered in the Override column at installation time.

Install parameter SORT POOL SIZE on panel DSNTIPC, or ZPARM SRTPPOOL in DSN6SPRM.

Field Name: QWP4SPOL

STATIC DESCRIBE

Shows whether DB2 builds a DESCRIBE SQLDA when binding static SQL statements.

A DESCRIBE cannot be issued against a static SQL statement except:

• In a distributed environment, where DB2 for z/OS is the server and the requester supports extended dynamic SQL. In this instance, a DESCRIBE on an SQL statement in the extended dynamic package appears to DB2 as a DESCRIBE on a static SQL statement in the DB2 package.

• When an application uses a stored procedure result set, the application must allocate a cursor for that result set. The application can do this using a DESCRIBE CURSOR statement. The SQL statement actually described is the one with the cursor declared in the stored procedure. If that statement is static, a static SQL statement must be described.

When NO (default), DB2 does not generate a DESCRIBE SQLDA at BIND time for static SQL statements. If a DESCRIBE request is received at execution time, DB2 generates an error. However, if the describe request comes from a DESCRIBE CURSOR statement, DB2 satisfies the request but is only able to provide data type and length information. Column names are not provided.

When YES, DB2 generates a DESCRIBE SQLDA at BIND time so that DESCRIBE requests for static SQL can be satisfied during execution.

Note: You must rebind packages after this value has been set to YES.

This option increases the size of some packages because the DESCRIBE SQLDA is now stored with each statically-bound SQL SELECT statement.

Install parameter DESCRIBE FOR STATIC on panel DSNTIP4, or ZPARM DESCSTAT in DSN6SPRM.

Field Name: QWP4DSST

RIDPOOL SIZE (KB)

The amount of storage needed for the RID pool.
This can be the value calculated by the CLIST, based on input from previous panels, or the value entered in the Override column at installation time.

When 0, DB2 does not use access paths or join methods that depend on RID pool storage.

Install parameter RID POOL SIZE on panel DSNTIPC, or ZPARM MAXRBLK in DSN6SPRM.

Field Name: QWP4RMAX

**PACK AUTH CACHE**

The amount of storage allocated for caching authorization information for all packages on this DB2 member.

32 KB hold about 375 collection-ID.package-IDs. The cache is stored in the DSN1DBM1 address space.

Install parameter PACKAGE AUTH CACHE on panel DSNTPP, or ZPARM CACHEPAC in DSN6SPRM.

Field Name: QWP4PAC

**CONTR THREAD STOR**

In DB2 12 this field is a serviceability field.

Indicates whether DB2 returns unused thread storage at commit. Possible values are:

**YES** DB2 checks threads at commit points and periodically returns unused storage to the system.

**NO** DB2 does not check threads at commit points and returns acquired storage on deallocation.

Install parameter CONTRACT THREAD STG on panel DSNTIPE, or ZPARM CONTSTOR in DSN6SPRM.

Field Name: QWP4CONT

**MAX DEG OF PARALL**

Indicates the upper limit on the degree of parallelism for a parallel group.

This field has a value of 0. This means PARAMDEG is not set and DB2 can set a default maximum degree of parallelism based on the system configuration.

Install parameter MAX DEGREE on panel DSNTIP8, or ZPARM PARAMDEG in DSN6SPRM.

Field Name: QWP4MDEG

**RTN AUTH W/O CAT**

The amount of storage allocated for caching authorization information for all routines on this DB2 member.

Routines include stored procedures and user-defined functions.

32 KB hold about 380 schema.routine.type entries.

Install parameter ROUTINE AUTH CACHE on panel DSNTPP, or ZPARM CACHERAC in DSN6SPRM.

Field Name: QWP4RAC
USE X LOCK

The locking method used when performing a searched UPDATE or DELETE.

When NO, DB2 uses an S or U lock when scanning for qualifying rows.
For any qualifying rows or pages the lock is upgraded to an X lock before performing the update or delete. For nonqualifying rows or pages the lock is released if using ISOLATION(CS). For ISOLATION(RS), or ISOLATION(RR), an S lock is retained on the rows or pages until the next commit point. This option is used to achieve higher rates of concurrency.

When YES, DB2 gets an X lock on qualifying rows or pages. For ISOLATION(CS), the lock is released if the rows or pages are not updated or deleted. For ISOLATION(RS) or ISOLATION(RR), an X lock is retained until the next commit point. This is beneficial in a data sharing environment when most or all searched updates and deletes use an index. The downside is that if searched updates or deletes result in a tablespace scan, the likelihood of timeouts and deadlocks greatly increases.

Install parameter X LOCK FOR SEARCHED U/D on panel DSNTIPI, or ZP ARM XLKUPDLT in DSN6SPRM.

Field Name: QWP4XLUD

STAR JOIN ENABL

Star join enable indicator. Possible values are:

-1 (DISABLE)
Star join is disabled. This is the default.

0 (ENABLE)
Star join is enabled when the join meets the conditions described in the DB2 administration information for performance.

1
Star join is enabled without comparing the ratio of the fact-table cardinality to the cardinality of the largest dimension table. The table with the largest cardinality is the fact table.

n
This is the star join fact table and the largest dimension table ratio. The lowest ratio of the cardinality of the fact table compared to the cardinality of the largest dimension table for which star join is used. 2 < N <= 32768.

Install parameter STAR JOIN QUERIES on panel DSNTIP8, or ZP ARM STARJOIN in DSN6SPRM.

Background and Tuning Information

This parameter allows you to set the star join ratio to increase or decrease the dimension table and fact table ratio rule according to application needs.

This parameter also allows you to disable star join if needed for performance reasons. The default is to allow star join if star join detection is successful.

Star join technique is only used when these conditions exist:
- At least two dimensions exist.
- The join predicates are between the fact table and the dimension tables only. (No join predicates lie between the dimension tables.)
- The join predicates are equijoin predicates.
- No correlated subqueries cross dimensions.
IFCID 106 - Miscellaneous Installation Parameters

- No cycles within the dimensions exist. This means that no predicate can reference more than one candidate dimension table with respect to the same column of the fact table.
- No outer join exists.
- The data type and length of the join predicates are the same.
- The fact table is larger than the dimension table.

Field Name: QWP4SJRT

NPAGES THRESHOLD

This parameter allows you to specify the optimizer threshold for qualifying a table as small.

-1 Every table qualifies as small.
0 No table qualifies as small (this is the default).
1 Only tables with zero pages qualify as small.
2 Tables with less than two pages qualify as small.
10 Tables with less than ten pages qualify as small.
502 Tables with less than 502 pages, and tables that have not had statistics collected qualify as small. For example, when NPAGES = -1.

DB2 parameter NPGTHRSH in DSN6SPRM.

Background and Tuning Information

Tables can be populated using insert just prior to their use by queries and then cleared immediately on completion of the queries. These tables are permanent even though the data they contain is transient.

This can cause problems when RUNSTATS is run overnight, or at other times when these tables are empty. This gives the optimizer the false indication that these tables contain no data when in fact, the tables will contain data when the query executes. This causes the optimizer to pick an inefficient access path. Usually the optimizer chooses to do a table scan, which would be the most efficient access path if the table were truly empty. Because the table is not empty when the query executes, it would be more efficient to use matching index access.

With this parameter, you can force the optimizer to treat tables containing no data as small tables. For these tables, the optimizer will:

- Select a matching index access rather than a table space scan and non-matching index access.
- Select the index with the most matching columns when more than one index qualifies for matching index access.
- Select indexes with the same number of matching columns on cost.

Field Name: QWP4NPAG

DBADM CREATE VIEW

Shows whether a DB2 administrator can create a view or alias for another user. Possible values are YES or NO. The default is NO.

Install parameter DBADM CREATE AUTH on panel DSNTIPP. ZPARM DBACRVW in macro DSN6SPRM.

Field Name: QWP4CRVW
MAX # LE TOKENS

The maximum number of LE tokens active at any time. When zero, no tokens are available.

A token is used each time one of the following is used: trigonometry functions, degrees, radians, rand, exp, power, log functions, upper, lower, translate.

Install parameter MAXIMUM LE TOKENS on panel DSNTIP7, or ZPARM LEMAX in DSN6SPRM.

Field Name: QWP4LEM

MAX EXT SERV TASK

Maximum number of extended service tasks.

Field Name: QWP4EST

PROJ Z INS THRESH

Project z insertion threshold.

Field Name: QWP4ZTN

MAX NOT FOUND-HSH

The maximum number of NOT FOUND hash records.

Field Name: QWP4KNFC

FIELD PROCs T BLK

The number of field procedures for the DESCRIBE TABLE block.

ZPARM SPRMFDP.

Field Name: QWP4FDP

MANAGE THREAD STO

In DB2 12 this field is a serviceability field.

Shows whether DB2 uses storage management to optimize the amount of working storage consumed by individual threads.

Install parameter MANAGE THREAD STORAGE on panel DSNTIPE, or ZPARM MINSTOR in DSN6SPRM.

For best performance, this parameter should be NO, meaning DB2 does not manage thread storage.

When YES, DB2 uses best fit algorithm to manage and assign thread storage. This can help on systems that have many long-running threads and that are constrained on DBM1 address space.

Field Name: QWP4MSTG

EVAL UNCOMMITTED

Shows whether stage 1 predicate evaluation during table access can proceed upon uncommitted data or not.

This applies to isolation levels of Read Stability and Cursor Stability only.

When NO (default), predicate evaluation occurs only on committed data (or on the application's own uncommitted changes). NO ensures that all qualifying data is always included in the answer set.
When YES, predicate evaluation can occur upon uncommitted data. Only committed data is returned to the query. However, a decision can be made to omit a row from the answer set based on uncommitted data. Later, undo processing (statement rollback or statement failure) could cause the data to revert to a state that satisfies the predicate.

When YES, DB2 can request fewer locks than in previous versions when processing isolation level Read Stability and Cursor Stability queries. The number of locks avoided is related to the access path of the query, the number of rows evaluated when processing the stage 1 predicate of the query, and the number of those rows that are overflow rows. Specifically, for isolation level Read Stability and Cursor Stability queries, locks are avoided for rows that do not satisfy the stage 1 predicate, provided they are not overflow rows. Table access includes table space scans and index-to-data access, including ridlist-to-data access. For isolation Cursor Stability ridlist production, all row/page locking is avoided.

Install parameter EVALUATE UNCOMMITTED on panel DSNTIP8, or ZPARM EVALUNC in DSN6SPRM.

Field Name: QWP4EVUN

STATISTICS ROLLUP

Shows whether RUNSTATS utility aggregates the partition level statistics, even though some parts may not contain data.

This should be YES for DB2 systems that have large partitioned table spaces, index spaces, or both. This enables the aggregation of part level statistics and helps the optimizer to choose a better access path.

Install parameter STATISTICS ROLLUP on panel DSNTIPO, or ZPARM STATROLL in DSN6SPRM.

Field Name: QWP4STRL

STATISTICS HIST

Shows which inserts and updates are recorded in catalog history tables. The report can show the following values:

N / NONE
Changes in the catalog are not recorded. This is the default.

A / ALL
All inserts and updates in the catalog are recorded.

P / ACCESSPATH
All inserts and updates to access path related catalog statistics are recorded.

S / SPACE
All inserts and updates to space related catalog statistics are recorded.

Install parameter STATISTICS HISTORY on panel DSNTIPO, or ZPARM STATHIST in DSN6SPRM.

Field Name: QWP4STHT

SUPPRESS SOFT ERR
Shows whether the recording of errors, such as invalid decimal data and arithmetic exceptions, in the operating system data set SYS1.LOGREC is suppressed.

When YES, these exceptions are not recorded in the LOGREC data set.

Install parameter SUPPRESS SOFT ERRORS on panel DSNTIPM or ZPARM SUPERRS in DSN6SPRM.

**Field Name:** QWP4SAE

**REAL TIME STATS**

The time interval that DB2 waits before it attempts to write out page set statistics to the real-time statistics tables. This value is between 1 and 65535 minutes.

Install parameter REAL TIME STATS on panel DSNTIPO, or ZPARM STATSINT in DSN6SPRM.

**Field Name:** QWP4INTE

**EDM STATMNT CACHE**

The size of the statement cache that can be used by the Environmental Descriptor Manager (EDM). This value is used at DB2 startup time as the minimum value. You can increase and subsequently decrease this value with the SET SYSPARM command. This value cannot be decreased below the value that is specified at DB2 startup. The CLIST calculates a statement cache size. This storage pool is located above the 2 GB bar.

The value used at DB2 startup time is either calculated by the CLIST based on input from other installation information or an override value.

For record trace, this value is shown in bytes. For other reports, the value is shown in kilobytes.

Install parameter EDM STATEMENT CACHE on panel DSNTIPC, or ZPARM EDMSTMTC in DSN6SPRM.

**Field Name:** QWP4ESTC

**STAR JOIN THRESH**

The minimum number of tables in the star schema query block, including the fact table, dimensions tables, and snowflake tables. This value is considered only if the subsystem parameter STARJOIN qualifies the query for star join.

Possible values are:

0   Star join is disabled. This is the default.
1, 2, or 3   Star join is always considered.
4 through 255   Star join is considered if the query block has at least the specified number of tables.
256 and greater   Star join is never considered.

DB2 parameter SJTABLES in DSN6SPRM.
Although star join can reduce bind time significantly it does not provide optimal performance in all cases. Performance of star join depends on a number of factors such as the available indexes on the fact table, the cluster ratio of the indexes, and the selectivity of rows through local and join predicates. Follow these general guidelines for setting the value of SJTABLES:

- If you have star schema queries with less than 10 tables and you want to make the star join method applicable to all qualified queries, set the value of SJTABLES to a low number, such as 5.
- If you have some star schema queries that are not necessarily suitable for star join but want to use star join for relatively large queries, use the default. The star join method will be considered for all qualified queries that have 10 or more tables.
- If you have star schema queries but normally do not want to use star join, you could increase SJTABLES, say to 15. This will greatly cut the bind time for large queries and avoid a potential bind time SQL return code -101 for large qualified queries.

**Field Name:** QWP4SJTB

**ZOSMETRICS**

YES indicates that gathering of z/OS metrics using the RMF interface is enabled. ZPARM ZOSMETRICS in DSN6SPRM.

**Field Name:** QWP4MITE

**EDM DBD CACHE**

The minimum size of the DBD cache that can be used by the Environmental Descriptor Manager (EDM). This value is used at DB2 startup time as the minimum value. You can increase and subsequently decrease the value with the SET SYSPARM command. This value cannot be decreased below the value that is specified at DB2 startup. This storage pool is located above the 2 GB bar. The CLIST calculates the DBD cache size.

The value used at DB2 startup time is either calculated by the CLIST based on input from other installation information or an override value.

Install parameter EDM DBD CACHE on panel DSNTIPC, or ZPARM EDMDBDC in DSN6SPRM.

**Field Name:** QWP4EDBC

**LONG RUNNING READ**

Shows the number of minutes that a read claim can be held by an agent before DB2 reports it as a long-running reader. Valid values are 0 (default) through 1439.

Install parameter LONG-RUNNING READER on installation panel DSNTIPE, or ZPARM LRDRTHLD in DSN6SYSP.

**Field Name:** QWP4LRTH

**MAX OPEN CURSORS**

Shows the maximum number of cursors, including allocated cursors, that are open at a given DB2 site per thread. RDS keeps a total of currently open cursors. If an application attempts to open a thread after the maximum is reached, the statement will fail.
In a data sharing group, this parameter is shown at member scope.

Install parameter MAX OPEN CURSORS on panel DSNTIPX, or ZPARM MAX_NUM_CUR in DSN6SPRM.

Field Name: QWP4MXNC

EDM SKEL POOLSIZE

The minimum size of the EDM pool for skeleton package and skeleton cursor tables. For record trace, this value is shown in bytes. For other reports, the value is shown in kilobytes.

Install parameter EDM SKELETON POOL SIZE on panel DSNTIPC or ZPARM EDM_SKELETON_POOL in DSN6SPRM.

Field Name: QWP4SKLC

CUR MAINT TYPE

Shows the default special register for the CURRENT MAINTAINED TABLE TYPES FOR OPTIMIZATION statement when no value is explicitly set. Possible values are:

- ALL
- NONE
- SYSTEM (default)
- USER

The default allows query rewrite using system-maintained materialized query tables (SYSTEM) when CURRENT REFRESH AGE is set to ANY. When USER, query rewrite is done using user-maintained materialized query tables when CURRENT REFRESH AGE is set to ANY. ALL means that query rewrite uses both system-maintained and user-maintained materialized query tables.

Install parameter CURRENT MAINT TYPES on panel DSNTIP8, or ZPARM MAINTYPE in DSN6SPRM.

Field Name: QWP4MNTY

PAD IDX BY DEFLT

Shows whether new indexes are be padded by default.

- YES indicates that a new index is padded unless the NOT Padded option is specified on the CREATE INDEX statement.
- The default value, NO, indicates that a new index is not padded unless the PADDED option is specified on the CREATE INDEX statement.

Install parameter PAD INDEXES BY DEFAULT on installation panel DSNTIPE, or ZPARM PADIX in DSN6SPRM.

Field Name: QWP4PDIX

MIN DIVIDE SCALE

The minimum scale for the result of a decimal division. The values for this parameter are none (the default), 3, or 6. If 3 or 6 is specified, this parameter overrides the DECDIV3 parameter.

Field Name: QWP4MDSC

FREE CACHED STMTS
Indicates whether DB2 can free statements from the local dynamic statement cache to relieve storage constraints below the 2 GB bar. This parameter applies only for packages or plans that are bound with KEEPDYNAMIC(YES). Possible values are:

0  DB2 cannot free statements from the local cache
1  DB2 can free statements from the local cache

DB2 parameter CACHEDYN_FREELOCAL in DSN6SPRM.

Field Name: QWP4FRLC

TEMP UNIT NAME

Shows the device type or unit name for allocating temporary data sets. It is the direct access or disk unit name used for the precompiler, compiler, assembler, sort, linkage editor, and utility work-files in the tailored jobs and CLISTs.

It can be any device type acceptable to the DYNALLOC parameter of the SORT or OPTION options for DFSORT.

The default is SYSDA.

Install parameter TEMPORARY UNIT NAME on DSNTIPA2, or ZPARM VOLTDEVT in DSN6SPRM.

Field Name: QWP4VDTY

CUR REFRESH AGE

Shows the default for the CURRENT REFRESH AGE special register deferred materialized query tables.

Install parameter CURRENT REFRESH AGE on panel DSNTIP8, or ZPARM REFSHAGE in DSN6SPRM.

Field Name: QWP4RFSH

MAX DATA CACHING

The maximum amount of virtual memory in megabytes (MB) that is allocated for data caching.

Install parameter MAX DATA CACHING on panel DSNTIP8, or ZPARM MXDTCACH in DSN6SPRM.

Field Name: QWP4MXDC

ONL ZPARM TYPE

The type of DB2 system parameter changed by the last SET SYSPARM statement.

Field Name: QWP4OZTP

RESTORE/RECOVER

If YES, the system-level backup that is the recovery base, is from a dump on tape. Otherwise NO is shown.

Install parameter RESTORE/RECOVER on installation panel DSNTIP6, or ZPARM RESTORE_RECOVER_FROMDUMP in DSN6SPRM.

Field Name: QWP4RRFD

MAX STORED PROCS
Shows the maximum number of stored procedures per thread. If an application attempts to call a stored procedure after this is reached, the statement will fail. In a data sharing group, this parameter is shown as member scope.

Install parameter MAX STORED PROCES on panel DSNTIPX, or ZPARM MAX_ST_PROC in DSN6SPRM.

Field Name: QWP4MXSP

ONL ZParm USER ID

The user ID that made the last online change to DB2 system settings.

Field Name: QWP4OZUS

INDEX I/O PARALL

In DB2 12 this field is a serviceability field.

The enablement of the index I/O parallelism ZPARM.

Field Name: QWP4IIOP

MAX TEMP STORAGE

The maximum amount of temporary storage in megabytes (MB) for each agent.

Install parameter MAX TEMP STORAGE on panel DSNTIP6 or ZPARM MAXTEMPS in DSN6SPRM.

Field Name: QWP4WFAL

ONL ZParm CORID

The correlation ID of the online application that made the last change to DB2 system settings.

Field Name: QWP4OZCI

REVOKE DEP PRIVIL

Include dependent privileges on REVOKE. Possible values are:

Y  If INCLUDING DEPENDENT PRIVILEGES is enforced.
N  If NOT INCLUDING DEPENDENT PRIVILEGES is enforced.
S  If specified in a REVOKE statement.

Field Name: QWP4RVDPR

MAX CONC AUTOBIND

The maximum number of package requests that can be processed simultaneously.

DB2 parameter MAX_CONCURRENT_PKG_OPS in DSN6SPRM.

Field Name: QWP4MXAB

ONL ZParm TIME

Time of the last online change made to DB2 system settings.

Field Name: QWP4OZTM

PLANMGMNT
IFCID 106 - Miscellaneous Installation Parameters

Shows if and how access path information is stored in the repository. Possible values are:

O  On
F  Off
B  Basic
E  Extended

Field Name: QWP4PMGT

ADM SCHED JCLPROC

The name of the JCL procedure for starting the DB2 administrative scheduler task address space.

DB2 parameter ADMTPROC in DSN6SPRM.

Field Name: QWP4ADMT

SYS-LEVEL BACKUP

Shows if RECOVER uses system level backups as the recovery base.

Install parameter SYSTEM-LEVEL BACKUPS on installation panel DSNTIP6, or ZPARM SYSTEM_LEVEL_BACKUPS in DSN6SPRM.

Field Name: QWP4SLBU

PLANMGMTSCOPE

Controls which queries are populated in the access path repository (ZPARM parameter PLANMGMTSCOPE). Possible values are:

A  ALL: Includes static and dynamic SQL queries.
S  STATIC: Includes static SQL queries only. This is the default.
D  DYNAMIC: Includes dynamic SQL queries only.

Field Name: QWP4PMSC

DUMP CLASS NAME

The name of the DFSMSHSM dump class used by the restore system utility to restore from a system-level backup that has been dumped to tape.

Install parameter DUMP CLASS NAME on installation panel DSNTIP6, or ZPARM UTILS_DUMP_CLASS_NAME in DSN6SPRM.

Field Name: QWP4RSDC

MAX TAPE UNITS

The maximum number of tape units or tape drives that the restore system utility can use to restore from a system-level backup that has been dumped to tape.

A value of 0 is displayed for NOLIMIT.

Install parameter MAXIMUM TAPE UNITS on installation panel DSNTIP6, or ZPARM RESTORE_TAPEUNITS in DSN6SPRM.

Field Name: QWP4RSMT

SEPARATE SECURITY

Separate security tasks. Possible values are:
Y      SYSADM/SYSCTRL cannot GRANT/REVOKE
N      SYSADM/SYSCTRL can GRANT/REVOKE

Field Name: QWP4SEPSD

SECADM1 ID
Security administrator 1.
Field Name: QWP4SECA1

SECADM1 TYPE
Security administrator 1 type. Possible values are:
' '      Blank indicates that the authorization ID (AUTH ID) is used.
'L'      Indicates that ROLE is used.

This field corresponds to field SEC ADMIN 1 TYPE on installation panel
DSNTIP1, or ZPARM SECADM1_TYPE in DSN6SPRM.
Field Name: QWP4SECA1_TYPE

MAX TEMP RID
The maximum number of RID blocks of temporary storage in the Workfile
database that a single RID list can use at any point in time. This field
corresponds to field MAX TEMP RID on installation panel DSNTIP9. The
ZPARM name is MAXTEMPS_RID.

It can have the following values:
• -1 if MAXTEMPS_RID=NONE
• 0 if MAXTEMPS_RID=NOLIMIT
• 1 to 329166 otherwise
Field Name: QWP4WFRD

SECADM2 ID
Security administrator 2.
Field Name: QWP4SECA2

SECADM2 TYPE
Security administrator 2 type. Possible values are:
'blank'  Indicates that the authorization ID (AUTH ID) is used.
'L'      Indicates that ROLE is used.

This field corresponds to field SEC ADMIN 2 TYPE on installation panel
DSNTIP1, or ZPARM SECADM2_TYPE in DSN6SPRM.
Field Name: QWP4SECA2_TYPE

SKIP UNCOMM INS
YES indicates that uncommitted inserts are treated as if they have not yet
been executed. The ZPARM name is SKIPUNCI.
Field Name: QWP4SKUI

GET ACCEL ARCHIVE
Determines the default value that is to be used for the CURRENT
GET_ACCEL_ARCHIVE special register:
IFCID 106 - Miscellaneous Installation Parameters

NO Indicates that if a table is archived in an accelerator server, and a query references that table, the query does not use the data that is archived.

YES Indicates that if a table is archived in an accelerator server, and a query references that table, the query uses the data that is archived.

ZPARM name GET_ACCEL_ARCHIVE in macro DSN6SPRM.

Field Name: QWP4CGAA

LMT CONV PART TAB

Shows whether to include all columns in the partitioning key during conversion from index-controlled partitioning to table-controlled partitioning:

NO Includes all columns

YES Includes trailing columns only if they affect partitioning

This field corresponds to field EXCLUDE PART KEY ELEMENTS on installation panel DSNTIP71. The ZPARM name is IX_TB_PART_CONV_EXCLUDE in DSN6SPRM.

Field Name: QWP4XPKE

DDL TIMEOUT FACT

Shows the time out factor of the SQL data definition. The time out value is the product of this value and the IRLMRWT value.

ZPARM name DDLTOX in DSN6SPRM.

Field Name: QWP4DDLTO

CUR QUERY ACCEL

Determines the default value that is to be used for the CURRENT QUERY ACCELERATION special register. Possible values are:

NONE Indicates that no query acceleration is done. This is the default value.

ENABLE Indicates that queries are accelerated only if DB2 determines that it is advantageous to do so. If there is an accelerator failure while a query is running, or the accelerator returns an error, DB2 returns a negative SQLCODE to the application.

ENABLE_WITH_FAILBACK Indicates that queries are accelerated only if DB2 determines that it is advantageous to do so. If the accelerator returns an error during the PREPARE or first OPEN for the query, DB2 executes the query without the accelerator. If the accelerator returns an error during a FETCH or a subsequent OPEN, DB2 returns the error to the user, and does not execute the query.

ELIGIBLE Indicates that queries are accelerated if they are eligible for acceleration. DB2 does not use cost information to determine whether to accelerate the queries. Queries that are not eligible for acceleration are executed by DB2. If there is an accelerator failure
while a query is running, or the accelerator returns an error, DB2 returns a negative SQLCODE to the application.

**ALL**
Indicates that queries are accelerated if they are eligible for acceleration. DB2 does not use cost information to determine whether to accelerate the queries. Queries that are not eligible for acceleration are not executed by DB2, and an SQL error is returned. If there is an accelerator failure while a query is running, or the accelerator returns an error, DB2 returns a negative SQLCODE to the application.

ZPARM name QUERY_ACCELERATION in DSN6SPRM.

**Field Name:** QWP4CQAC

**REORG SORT NPSI**
Specifies the default method of building a non-partitioned secondary index during the REORG tablespace part. This setting is used when the SORTNPSI keyword is not specified in a utility control statement.

Possible values are:
- Auto
- Disable
- Enable

This field corresponds to field REORG PART SORT NPSI in installation panel DSNTIP61. The ZPARM name is REORG_PART_SORT_NPSI in DSN6SPRM.

**Field Name:** QWP4RPSN

**MAX UTIL PARALL**
The maximum degree of utility parallelism.

**Field Name:** QWP4UMD

**ACCEL STARTUP OPT**
Specifies whether to enable accelerator servers. Possible values are:

**AUTO**
Enable and start accelerator servers.

**COMMAND**
Enable but do not start accelerator servers.

**NO**
Do not enable accelerator servers.

This field corresponds to field ACCEL STARTUP on installation panel DSNTIP81. ZPARM name is ACCEL in DSN6SPRM.

**Field Name:** QWP4ACCS

**REORG IGN FREESP**
YES indicates that REORG tablespace does not use the PCTFREE and FREEPAGE values when it reloads data rows into a partition-by-growth (PBG) table space if:
- A subset of the partitions is reorganized.
- The associated table contains LOB columns that cause a REORG AUX NO REQUEST to fail.
IFCID 106 - Miscellaneous Installation Parameters

This field corresponds to field REORG IGNORE FREESPACES in installation panel DSNTIP61. ZPARM name is REORG_IGNORE_FREESPACES in DSN6SPRM.

Field Name: QWP4RIFS

MULT INDEX ACCESS

Specifies whether to enable or disable multiple index access for queries that have subquery predicates:

NO  Disables multiple index access for queries.
YES  Enables multiple index access for queries.

The ZPARM name is SUBQ_MIDX IN DSN6SPRM.

Field Name: QWP4SSEQ

QUERY ACCEL OPT

Specifies additional types of SQL queries that are eligible for acceleration.

NONE
Indicates that no additional types of SQL queries are eligible. Therefore, the types of queries that are described in the other available values for this parameter are not eligible for acceleration. This is the default value.

1
Indicates that queries that include data that is encoded with the EBCDIC mixed or graphic encoding schemes are eligible for acceleration.

2
Indicates that an INSERT with SELECT statement is eligible for acceleration. However, only the SELECT operation of the query is processed by the accelerator server.

3
Indicates that queries that contain built-in functions for which DB2 processes each byte of the input string, rather than each character of the input string, can run on an accelerator server.

4
The queries that reference an expression with a DATE data type that uses a LOCAL format are not blocked from executing on IBM DB2 Analytics Accelerator for z/OS. IBM DB2 Analytics Accelerator for z/OS will use the dd/mm/yyyy format to interpret the input and output date value. Specify option 4 only when you also specify LOCAL as the setting for the DSNHDECFP.DATE parameter and your LOCAL date exit defines the specific dd/mm/yyyy date format. Otherwise, queries may return unpredictable results.

5
Allow OFFLOAD of SYSTEM_TIME temporal queries.

6
Allow OFFLOAD of queries that reference timestamp columns with a precision of up to 12.

7
OFFLOAD uses YYYYMMDD date format.

ZPARM name QUERY_ACCEL_OPTIONS in macro DSN6SPRM.

Field Name: QWP4QACO

REORG TABSPC LIST

Specifies the default value for the REORG TABLESPACE PARALLEL option.
• Parallel
• Serial

The ZPARM name is REORG_LIST_PROCESSING in DSN6SPRM.

Field Name: QWP4RLPR

OPT 1 ROW-NO SORT

Specifies whether DB2 explicitly blocks sort operations when the OPTIMIZE FOR 1 ROW clause is specified on a query:

NO = DISABLE

Means that when OPTIMIZE FOR 1 ROW is specified, DB2 avoids access paths that involve sorts. If an access path that avoids a sort exists, it is possible, although unlikely, that an access path that involves a sort is chosen instead. This behavior is used in DB2 9 and earlier releases.

YES = ENABLE

Means that when OPTIMIZE FOR 1 ROW is specified, DB2 chooses access paths that avoid sorts whenever such a path is available.

ZPARM name is OPT1ROWBLOCKSORT in DSN6SPRM.

Field Name: QWP4O1RBS

AUTH EXIT CHECK

Specifies whether the DB2 authorization ID or the RACF primary authorization ID is to be used for authorization checks, when the access control authorization exit is active:

Primary

DB2 provides:

• The ACEE of the package owner to perform statement authorization checks during AUTOMATIC REBIND, BIND, and REBIND processing
• The ACEE of the package owner, routine definer, or routine invoker, as determined by the dynamic rules behavior for dynamic SQL authorization checking, when a DYNAMICRULES BIND option value other than run is in effect.

The access control authorization exit uses the ACEE for the XAPLUCHK authorization ID field to perform the authorization. The authorization ID in XAPLUCHK must be defined as a RACF user and must have the privileges required to execute the SQL statements in the package.

DB2

DB2 provides the ACEE of the primary authorization ID for performing all authorization checks. The primary authorization ID must have the privileges required to execute the SQL statements in the package. This field corresponds to field "RACF AUTH CHECK" on installation panel DSNTIPP. ZPARM name is RACF_AUTHCHECK in DSN6SPRM.

Field Name: QWP4RACK

REORG MAPPING DB

The default database in which REORG TABLESPACE SHRLEVEL change implicitly creates the mapping table. This field corresponds to field
**IFCID 106 - Miscellaneous Installation Parameters**

RECORD MAPPING DB on installation panel DSNTIP61. The Z Parm name RECORD_MAPPING_TABLE in DSN6SPRM.

**Field Name:** QWP4RMDB

**UTIL OBJ CONVER**

This field can have the following values:

- **NONE (QWP4UTOC1=0 and QWP4UTOC2=0)**
  
  No conversion is performed. This option is the default setting of this parameter. NONE is allowed regardless of the OBJECT CREATE FORMAT setting.

- **BASIC (QWP4UTOC1=1 and QWP4UTOC2=0)**
  
  Existing table spaces and indexes that use extended 10-byte page format are converted to basic 6-byte page format. BASIC is allowed only if the OBJECT CREATE FORMAT field is also set to BASIC.

- **EXTENDED (QWP4UTOC1=0 and QWP4UTOC2=1)**
  
  Existing table spaces and indexes that use 6-byte page format are converted to extended 10-byte page format. EXTENDED is allowed only if the OBJECT CREATE FORMAT field is also set to EXTENDED.

- **NO BASIC (QWP4UTOC1=1 and QWP4UTOC2=1)**
  
  Prevents the conversion of table spaces and indexes in extended page format to basic page format and disallows a utility that accepts the RBALRSN_CONVERSION utility keyword from running on an object in basic page format unless it converts it to extended page format. This setting is permitted only when OBJECT_CREATE_FORMAT=EXTENDED is set.

The Z Parm name is UTILITY_OBJECT_CONVERSION in DSN6SPRM.

**Field Name:** RT0106OC

**AUTHEX CACHE REF**

Specifies whether the package authorization cache, routine authorization cache, and dynamic statement cache entries are refreshed when an access control authorization exit is active, and the user profile is changed in RACF. Possible values are:

- All
- None

This field corresponds to field AUTH EXIT CACHE REFR in installation panel DSNTIPP. Z Parm name is AUTHEXIT_CACHEREFRESH in DSN6SPRM.

**Field Name:** QWP4AECR

**REORG DROP PARTS**

If YES, REORG completes, REORG drops empty, and trailing partitions are set in a PARTITION-BY-GROWTH table space.

This field corresponds to field REORG DROP PBG PARTS on INSTALLATION panel DSNTIP61. The Z Parm name is REORG_DROP_PBG_PARTS in DSN6SPRM.

**Field Name:** QWP4RPBG

**OBJ CREATE FORMAT**
ICCID 106 - Miscellaneous Installation Parameters

Creates new table spaces and indexes in the following log record format:

**EXTENDED**

- Creates new table spaces and indexes in extended log record format.

**BASIC**

- Creates new table spaces and indexes in basic log record format.

Field Name: QWP4OBCF

**PKG RELEASE COMMIT**

YES indicates that the following operations on a package that are bound with RELEASE(DEALLOCATE) are permitted while the package is active and allocated by DB2:

- BIND and REBIND requests, including AUTOMATIC REBIND
- Data definition language changes to objects that are statically referenced by the package

The ZPARM name is PKGREL_COMMIT in DSN6SPRM.

Field Name: QWP4PKRC

**REORG KEEP DICT**

Indicates that KEEPDICTIONARY is used when a REORG converts a table space from basic row format (BRF) to reordered row format (RRF).

Field Name: QWP4HKEEPD

**TEMPLATE TIME**

Specifies the default setting for the TIME option of the template utility control statement. Possible values are:

- UTC (utility control)
- Local

This field corresponds to field TEMPLATE TIME on installation panel DSNTIP6. The ZPARM name is TEMPLATE_TIME in DSN6SPRM.

Field Name: QWP4TPTM

**MAX IN-MEM SORT**

The maximum amount of storage in kilobytes to allocate for sorting the results of each query that contains the order by clause, the group by clause, or both. This field corresponds to field MAX IN-MEMORY SORT SIZE in installation panel DSNTIPC. The ZPARM name is MAXSORT_IN_MEMORY in DSN6SPRM.

Field Name: QWP4MIMTS

**STATIST FEEDBACK**

Specifies the scope of SQL statements for which DB2 is to recommend statistics. Possible values are:

- All
- Dynamic
- None
- Static

This value corresponds to field STATISTICS FEEDBACK on installation panel DSNTIPO. The ZPARM name is STATFDBK_SCOPE in DSN6SPRM.
IFCID 106 - Miscellaneous Installation Parameters

Field Name: QWP4SFBS

MAX PARA DEG DPSI

The maximum degree of parallelism for a parallel group in which a data-partitioned secondary index is used to control parallelism. This field corresponds to field MAX DEGREE FOR DPSI on installation panel DSNTIP81. The ZPARM name is PARAMDEG_DPSI in DSN6SPRM.

Field Name: QWP4DEGD

APPL COMPAT

Specifies the DB2 level for downward compatibility with applications. The ZPARM name is APPLCOMPAT in DSN6SPRM.

Field Name: QWP4APCO_VAR

PCTFREE UPDATE

Specifies the default percentage of each page that DB2 leaves as free space in a table space when a table in this table space is populated. This value applies only to table spaces whose definitions do not include PCTFREE and for UPDATE.

This value corresponds to field PERCENT FREE FOR UPDATE on installation panel DSNTIP71. The ZPARM name is PCTFREE_UPD in DSN6SPRM.

Field Name: QWP4PFUP

WF DB AGNT THRESH

Specifies the percentage of space that is used in the Workfile Database by a single agent when DB2 issues a warning message.

This value corresponds to field AGENT LEVEL THRESHOLD on installation panel DSNTIP91. The ZPARM name is WFSTGUSE_AGENT_THRESHOLD in DSN6SPRM.

Field Name: QWP4WFSAT

LIKE BLANK INSIGN

YES indicates that blanks are not significant when DB2 applies the LIKE predicate to a string. Blanks are significant in DB2 10.

This setting corresponds to field LIKE BLANK INSIGNIFICANT on installation panel DSNTIP41. The ZPARM name is LIKE_BLANK_INSIGNIFICANT in DSN6SPRM.

Field Name: QWP4LBIN

IDX CLEANUP THRDS

The maximum number of threads that can be created to clean up pseudo-deleted index entries on a data sharing member of a subsystem. This field corresponds to field INDEX CLEANUP THREADS on installation panel DSNTIPE1. The ZPARM name is INDEX_CLEANUP_THREADS in DSN6SPRM.

Field Name: QWP4IXCU

WF DB SYS THRESH
Specifies the percentage of space that is used in the Workfile Database by all agents in a DB2 subsystem or data sharing member when DB2 issues a warning message.

This value corresponds to field SYSTEM_LEVEL_THRESHOLD on installation panel DSNTIP91. The ZPARM name is WFSTGUSE_SYSTEM_THRESHOLD in DSN6SPRM.

**Field Name:** QWP4WFSST

### D_STMT_CACHE_STOR

Specifies the number of gigabytes of storage that DB2 allocates for hashing entries in the dynamic statement cache. This parameter can avoid storage shortages for long-running threads. The storage is allocated above the bar.

The ZPARM name is CACHE_DEP_TRACK_STOR_LIM in DSN6SPRM.

**Field Name:** QWP4CDTSL

### SPT01_INLINE_LENGTH

The maximum length in bytes of LOB columns in the SPT01 directory space that are maintained in the base table. The ZPARM name is SPT01_INLINE_LENGTH in DSN6SPRM. The default value is 0. When NOINLINE is specified, the value is set to -1.

**Field Name:** QWP4S1IL

### SIMULATED_CPUS

The number of CPUs that are online.

**Field Name:** QWP4NCPU

### MSEC_OF_TASK/SRB

Microseconds of task or SRB (service request block) execution time for each service unit (SU).

**Field Name:** QWP4CPUM

### COMPRESS_SPT01

Enables the compression of SPT01.

**Field Name:** QWP4CS01

### UT_SORT_DS_ALLOC

In DB2 12 this field is a serviceability field.

YES indicates that utilities invoke a SORT use and a space prediction algorithm for dynamically allocated SORT work data sets. The ZPARM name is UTSORTAL in DSN6SPRM.

**Field Name:** QWP4SRAL

### MAX_ZL_DICT_ENTR

The maximum number of ZIVLEMPEL dictionary entries.

**Field Name:** QWP4MDE

### I/O_SCHEDULING

Determines whether the I/O scheduling feature is activated. DB2 parameter SPRMIOP in DSN6SPRM.

**Field Name:** QWP4IOP
IFCID 106 - Miscellaneous Installation Parameters

UT DB2 SORT USE
In DB2 12 this field is a serviceability field.
Enables the use of DB2 SORT.
Field Name: QWP4DB2SRT

ENABLE DB CHECK
Enable database checking.
Field Name: QWP4DBCK

IGN SORTNUM STMT
Ignores SORTNUM clause in utility control statements. The ZPARM name is IGNSORTN in DSN6SPRM.
Field Name: QWP4IGSN

UT TEMP STORCLASS
Specifies the name of the SMS storage class that DB2 uses for defining temporary shadow data sets. A blank value indicates that the temporary shadow data sets are defined in the same storage class as the production page set. This field corresponds to field "UTIL TEMP STORCLASS" on installation panel DSNTIP6. The ZPARM name is UTIL_TEMP_STORCLASS in DSN6SPRM.
Field Name: QWP4CHEC

BIF COMPATIBILITY
The BIF_COMPATIBILITY subsystem parameter specifies whether the built-in functions and specifications are to return results in the DB2 10 format or revert to the pre-Version 10 format. It can have the following values:
- CURRENT
- V9
- V9_TRIM
- V9_DECIMAL_VARCHAR (default for migration)
- N/P (default for new installation)
This field corresponds to field BIF_COMPATIBILITY on installation panel DSNTIPX.
ZPARM name BIF_COMPATIBILITY in DSN6SPRM.
Field Name: QWP4_BIF_COMPAT

FAST REPLICA
The FASTREPLICATION type for check utilities:
- N=NONE
- P=PREFERRED
- R=REQUIRED
This field corresponds to field "Fast replication" in installation panel DSNTIP6. The ZPARM name is CHECK_FASTREPLICATION in DSN6SPRM.
Field Name: QWP4CFRP

FLASHCOPY PPRC
Specifies the behavior for DFSMSdss FLASHCOPY requests when the target disk storage volume is the primary device in a peer-to-peer remote copy (metro mirror) relationship (DB2 field: QWP4FCPPRC). This field corresponds to field "FLASHCOPY PPRC" on installation panel DSNTIP6. The ZPARM name is FLASHCOPY_PPRC.

Field Name: QWP4FCPPRC

CAT DAT DATACLASS

The SMS data class for DB2 catalog data sets. This field corresponds to column SMS data class in field "Directory and catalog data" on installation panel DSNTIPA3. The ZPARM name is CATDDACL in DSN6SPRM.

Field Name: QWP4CDDC

FAST RESTORE

Specifies how the Recover utility directs DFSMSdss copy to restore an image copy that was created with FLASHCOPY. This field corresponds to field "Fast restore" on installation panel DSNTIP6. The ZPARM name is REC_FASTREPLICATION.

Field Name: QWP4RFRP

FLASHCOPY COPY

YES indicates that the Copy utility uses the subsystem parameter settings for FLASHCOPY and FCCOPYDDN when those keywords are not present in the utility control statement. The ZPARM name is FLASHCOPY_COPY in DSN6SPRM.

Field Name: QWP4FCCP

CAT DAT MGMTCLASS

The SMS management class for DB2 catalog data sets. This field corresponds to column SMS MGMT class in field "Directory and catalog data" on installation panel DSNTIPA3. The ZPARM name is CATDMGCL in DSN6SPRM.

Field Name: QWP4CDMC

RESTRICT ALT COL DCC

A value of YES prevents the use of ALTER table ALTER column with SET DATA TYPE, SET DEFAULT, and DROP DEFAULT when data capture changes is enabled on the target table. The ZPARM name is RESTRICT_ALT_COL_FOR_DCC in DSN6SPRM.

Field Name: QWP4RACD

FLASHCOPY LOAD

YES indicates that the load utility uses the subsystem parameter settings for FLASHCOPY, FCCOPYDD, and FCAUXOBS when those keywords are not present in the utility control statement. ZPARM NAME: FLASHCOPY_LOAD IN DSN6SPRM.

Field Name: QWP4FCLD

CAT DAT STORCLASS
The SMS storage class for DB2 catalog data sets. This field corresponds to column SMS STOR class in field "Directory and catalog data" on installation panel DSNTIPA3. The ZPARM name is CATDSTCL in DSN6SPRM.

Field Name: QWP4CDSC

SET CHECK PENDING

In DB2 12 this field is a serviceability field.

YES sets the object in check-pending status when the check utility detects an inconsistency. This field corresponds to field "Set check pending" on installation panel DSNTIP61. The ZPARM name is CHECK_SETCHKP in DSN6SPRM.

Field Name: QWP4CSCP

FLASHCOPY REB IX

YES indicates that the Rebuild Index utility uses the subsystem parameter settings for FLASHCOPY and FCCOPYDDN when those keywords are not present in the utility control statement (DB2 field: QWP4FCRBI). The ZPARM name is FLASHCOPY_REBUILD_INDEX in DSN6SPRM.

Field Name: QWP4FCRBI

CAT IDX DATACLASS

The SMS data class for DB2 catalog index data sets. This field corresponds to column SMS data class in field "Directory and catalog indexes" on installation panel DSNTIPA3. The ZPARM name is CATXDAACL in DSN6SPRM.

Field Name: QWP4CXDC

DISABLE EDM RTS

Hexadecimal (X'01'). YES disables the use of EDM real-time Statistics. The ZPARM name is DISABLE_EDMR in DSN6SPRM.

Field Name: QWP4DEDR

FLASHCPY REORG TS

YES indicates that the Reorg Tablespace utility uses the subsystem parameter settings for FLASHCOPY, FCCOPYDDN, and FCAUXOBJ5 when these keywords are not present in the utility control statement. The ZPARM name is FLASHCOPY_REORG_TS in DSN6SPRM.

Field Name: QWP4FCROT

CAT IDX MGMTCLASS

The SMS management class for DB2 catalog index data sets. This field corresponds to column SMS MGMT class in field "Directory and catalog indexes" on installation panel DSNTIPA3. The ZPARM name is CATXMGCL in DSN6SPRM.

Field Name: QWP4CXMC

DRDA RESOLV ALIAS

YES means that in SQL statements, DB2 replaces aliases that refer to three-part names with qualified object names before it sends the statements to the remote location. This substitution is done in the following cases:

- When PREPARE or EXECUTE IMMEDIATE is performed
• When REMOTE BIND of a package is performed.

ZPARM name DRDA_RESOLVE_ALIAS in DSN6SPRM.

Field Name: QWP4RSLV

FLASHCPY REORG IX

YES indicates that the Rebuild Index utility uses the subsystem parameter settings for FLASHCOPY and FCCOPYDDN when those keywords are not present in the utility control statement (DB2 field: QWP4FCRBI). The ZPARM name is FLASHCOPY_REBUILD_INDEX in DSN6SPRM.

Field Name: QWP4FCRBI

CAT IDX STORCLASS

The SMS storage class for DB2 catalog index data sets. This field corresponds to column SMS STOR class in field "Directory and catalog indexes" on installation panel DSNTIPA3. The ZPARM name is CATXSTCL in DSN6SPRM.

Field Name: QWP4CXSC

MANAGE REAL STOR

Specifies whether DB2 manages real storage consumption. This field corresponds to field MANAGE REAL STORAGE on installation panel DSNTIPE. The ZPARM name is REALSTORAGE_MANAGEMENT in DSN6SPRM.

Field Name: QWP4STMN

MAX REAL+AUX STOR

The maximum amount of real plus auxiliary storage that can be used.

A value of 0 is displayed for NOLIMIT.

The ZPARM name is REALSTORAGE_MAX in DSN6SPRM.

Field Name: QWP4RSMX

PARALL EFFICIENCY

The parallelism efficiency factor.

Note: This field has value of 0 if the System Management Facilities (SMF) trace contains the hexadecimal value X’8000’.

This field corresponds to field PARALLELISM EFFICIENCY on installation panel DSNTIP8. The ZPARM name is PARA_EFF in DSN6SPRM.

Field Name: QWP4PAEF

REORDERD ROW FORM

In DB2 12 this field is a serviceability field.

A value of YES shows that reordered row format is enabled.

This field corresponds to field REORDERED ROW FORMAT on installation panel DSNTIP7. The ZPARM name is RRF in DSN6SPRM.

Field Name: QWP4RRF

SEPAR WORK FILES
YES directs processing of declared temporary tables only to DB2-managed table spaces that are defined with SECQTY>0 (DB2 field: QWP4WFDBSEP). It directs all other processing to DB2-managed table spaces that are defined with SECQTY=0 or to user-managed table spaces. This field corresponds to field "Separate Work Files" in installation panel DSNTIP9. The ZPARM name is WFDBSEP in DSN6SPRM.

**Field Name:** QWP4WFDBSEP

### PREVENT ALTER LMT

Determines whether DB2 disallows altering the limit key by using an ALTER TABLE statement for index-controlled partitioned table spaces. This alter operation places the table space in REORG-pending (REORP) restrictive status, and the data is not available until the affected partitions are reorganized. Use PREVENT_ALTERTB_LIMITKEY to avoid this data unavailability.

- **NO** Specifies that you can alter a limit key by using an ALTER TABLE statement for index-controlled partitioned table spaces. NO is the default.

- **YES** Specifies that it is not permitted to alter a limit key by using an ALTER TABLE statement for index-controlled partitioned table spaces. An ALTER TABLE statement must not attempt to alter the limit key for an index-controlled partitioned table.

Install parameter PREVENT ALTER LIMITKEY on panel DSNTIP71, or ZPARM: PREVENT_ALTERTB_LIMITKEY in DSN6SPRM.

**Field Name:** QWP4PALK

### PREVENT IDX PART

Determines whether DB2 does not allow the creation of new index-controlled partitioned tables. This subsystem parameter ensures that new partitioned tables use table-controlled partitioning, which is the preferred partitioning method for non-universal table spaces.

- **NO** Specifies that new index-controlled partitioned tables can be created. NO is the default value.

- **YES** Specifies that new partitioned table spaces must use table-controlled partitioning. A CREATE INDEX statement must not attempt to create an index-controlled partitioned table.

Install parameter PREVENT INDEX PART CREATE on panel DSNTIP71, or ZPARM: PREVENT_NEW_IDXCTRL_PART in DSN6SPRM.

**Field Name:** QWP4PCIP

### RETRY STOPPED OBJ

Specifies whether DB2 should immediately reject requests for a stopped object or retry them, up to the IRLM timeout limit, if the object is restarted.

- **NO** This is the default. It indicates that DB2 immediately rejects requests for a stopped object.

- **YES** DB2 retries such requests, up to the IRLM timeout setting, if the stopped object is restarted.

Install parameter RETRY STOPPED OBJECTS on panel DSNTIP72, or ZPARM RETRY_STOPPED_OBJECTS in DSN6SPRM.
Field Name: QWP4RSO

EMPTY XML ELEMENT
Indicates whether empty XML elements are serialized:
NO  Serialization of empty XML elements is not defined.
YES  Empty XML elements are serialized using a start-element tag followed by an end-element tag.

ZPARM name is XML_RESTRICT_EMPTY_TAG in DSN6SPRM.

Field Name: QWP4NOET

RENAME TABLE
Specifies whether the RENAME TABLE statement should extend to tables that are referenced in a view definition or the definition of an SQL table function:
YES  ALLOW_DEP_VIEW_SQLTUDF
NO  DISALLOW_DEP_VIEW_SQLTUDF

Install parameter RENAME TABLE on panel DSNTIP72, or ZPARM RENAMETABLE in DSN6SPRM.

Field Name: QWP4ERTS

ALTERNATE COPYPOOL
Specifies an optional alternate SMS copy pool for the DB2 BACKUP SYSTEM utility.

This field corresponds to field ALTERNATE COPYPOOL on INSTALLATION panel DSNTIP62. The ZPARM name is ALTERNATE_CP in DSN6SPRM.

Field Name: QWP4BSACP

DB BAK STG GRP
Specifies an optional backup SMS storage group to be used by the DB2 BACKUP SYSTEM utility for the DB copy pool.

This field corresponds to field DB BACKUP STG GROUP on INSTALLATION panel DSNTIP62. The ZPARM name is UTIL_DBBSG in DSN6SPRM.

Field Name: QWP4UDBSG

LOG BAK STG GRP
Specifies an optional backup SMS storage group to be used by the DB2 BACKUP SYSTEM utility for the LOG copy pool.

This field corresponds to field LOG BACKUP STG GRP on INSTALLATION panel DSNTIP62. The ZPARM name is UTIL_LGBSG in DSN6SPRM.

Field Name: QWP4ULBSG

COPY FAST REPLIC
Specifies whether FlashCopy fast replication is preferred, required, or should not be used.
This field corresponds to field COPY FAST REPLICATION on INSTALLATION panel DSNTIP61. The ZPARM name is COPY_FASTREPLICATION in DSN6SPRM.

**Field Name:** QWP4CYFR

**PAGE NUMBERING**

Specifies whether range-partitioned table spaces and associated indexes will be created to use absolute page numbers across partitions or relative page numbers.

- **A** Absolute page numbers
- **R** Relative page numbers

Install parameter PAGE SET PAGE NUMBERING on panel DSNTIP71, or ZPARM PAGESET_PAGENUM in DSN6SPRM.

**Field Name:** QWP4PSPN

**COMPRESS_DIRLOB**

Specifies whether DB2 compresses large object (LOB) table spaces in the DB2 directory the next time that the table spaces are reorganized.

- **0** indicates NO
- **1** indicates YES

This value corresponds to field COMPRESS DB2 DIR LOBS on installation panel DSNTIPA2. ZPARM name: COMPRESS_DIRLOB in DSN6SPRM.

**Field Name:** QWP4CDRL

**CACHE DYN STABIL**

Specifies when dynamic SQL statements can be captured for stabilization. When a statement is stabilized, the current SQLID, statement text, and runtime structures are written to catalog tables. If a dynamic SQL statement is not present in the dynamic SQL statement cache, DB2 will load the runtime structures from catalog table rather than performing a full prepare. This extends the stability and reliability of performance of a dynamic SQL. It can have the following values:

**CAPTURE**

Statements may be stabilized through the -START DYNQUERY command using both MONITOR(NO) and MONITOR(YES). DB2 will not load stabilized statements from SYSDYNQRY.

**LOAD**

Statements may not be stabilized via any means. The -START DYNQUERY command will fail, and any MONITOR(YES) commands in progress will not stabilize statements, even if stabilization criteria are matched. During long prepare, DB2 will attempt to load stabilized statements from SYSDYNQRY with which to run.

**BOTH**

Statements may be stabilized through the -START DYNQUERY command via both MONITOR(NO) and MONITOR(YES). During long prepare, DB2 will attempt to load stabilized statements from SYSDYNQRY with which to run. BOTH is the default setting.

**NONE**

Statements may not be stabilized via any means. The -START DYNQUERY command will fail, and any MONITOR(YES)
commands in progress will not stabilize statements, even if stabilization criteria are matched. DB2 will not load stabilized statements from SYSDYNQRY.

This field corresponds to field CACHE DYN STABILITY on installation panel DSNTIP8. The ZPARM name is CACHEDYN_STABILIZATION in DSNTIP8.

Field Name: QWP4CDST

SELECT FOR UNLOAD

Shows the AUTH_COMPATIBILITY ZPARM values (DB2 field: QWP4AUTCSU):

1 The unload utility checks whether the user has the SELECT privilege on the target table.
0 The unload utility checks whether the user has the UNLOAD privilege on the target table.

Field Name: QWP4ACSU

DDL MATERIALIZATION

Specifies when DB2 materializes changes to the definition of an object. This value corresponds to field DDL_MATERIALIZATION on installation panel DSNTIP71. ZPARM name is DDL_MATERIALIZATION in DSN6SPRM.

Field Name: QWP4DDLM

INDEX MEMORY CTRL

Shows the amount of memory that DB2 should allocate for fast traversing of DB2 indexes:

-1 = AUTO
  Specifies that DB2 sets the upper limit of the storage to 20% of the currently allocated buffer pools.

0 = DISABLE
  Specifies that DB2 returns any existing storage allocated for fast index traversal and does not allocate any further storage for this purpose.

500 - 200000
  Indicates the storage limit for fast index traversal.

The ZPARM name is INDEX_MEMORY_CONTROL in DSN6SPRM.

Field Name: QWP4JXMC

HSM MSG DS HLQ

Shows the high level qualifier (HLQ) for data sets (DS) to be allocated by the DB2 BACKUP SYSTEM and RESTORE SYSTEM utilities to receive messages from the Data Facility Hierarchical Storage Manager (DFHSM) and the IBM Data Facility Data Set Services (DFDSS) (DB2 field: QWP4UHMDH).

This value corresponds to field HSM MESSAGE DS HLQ on installation panel DSNTIP62. ZPARM name: UTILS_HSM_MSGDS_HLQ in DSN6SPRM.

Field Name: QWP4UHMDH

DFLT INSERT ALG
Specifies the default algorithm for inserting data into table spaces. This value corresponds to the field DEFAULT INSERT ALGORITHM on installation panel DSNTIP71. The ZPARM name DEFAULT_INSERT_ALGORITHM is in DSN6SPRM.

Field Name: QWP4DINA

STATFDBK PROFILE

Specifies whether Statistics recommendations that are identified during query optimization cause DB2 to modify to Statistics profiles.

- 0 indicates NO
- 1 indicates YES

This value corresponds to field STATS PROFILE FEEDBACK on installation panel DSNTIP8. ZPARM name: STATFDBK_PROFILE in DSN6SPRM.

Field Name: QWP4SFPR

MAT NODET SQLTUDF

DB2 materializes the result of a user-defined SQL table function that is defined as not deterministic.

- 0=NO
- 1=YES

ZPARM name is MATERIALIZE_NODET_SQLTUDF in DSN6SPRM.

Field Name: QWP4MNSU

ZHYPERLINK

The scope of zHyperLink I/O usage for this Db2 subsystem. Valid values are:

- DISABLED
  zHyperLink I/O not used by this subsystem.
- ENABLED
  All eligible I/Os will use zHyperLink if possible.
- DATABASE
  zHyperLink will only be used for eligible I/O on database objects.
- ACTIVELOG
  zHyperLink will only be used for eligible I/O on active log objects.

Field Name: QWP4ZHYPL

ENCRYPTION KEY

If non-blank, the name of a ICSF key to be used for encrypting archive log data sets, directory data sets, catalog data sets and user-defined indexes on the Db2 catalog. A blank value shows as N/P in the report.

Field Name: QWP4ENKL

IFCID 106 - Stored Procedures Parameters:

This topic shows detailed information about “Record Trace - IFCID 106 - Stored Procedures Parameters”.

Record trace - IFCID 106 - Stored Procedures Parameters

The field labels shown in the following sample layout of “Record Trace - IFCID 106 - Stored Procedures Parameters” are described in the following section.
IFCID 106 - Stored Procedures Parameters

**MVS PROCEDURE NAME**

The name of the MVS JCL procedure used to start the DB2 stored procedures address space.

Install parameter DB2 PROC NAME on panel DSNTIPX, or ZPARM STORPROC in DSN6SYSP.

**Field Name:** QWP1SPPN

**ALLOWABLE ABENDS**

The number of times a stored procedure is allowed to terminate abnormally, after which SQL CALL statements for the stored procedure are rejected.

Install parameter MAX ABEND COUNT on panel DSNTIPX, or ZPARM STORMXAB in DSN6SYSP.

**Field Name:** QWP1SPAB

**TIMEOUT VALUE**

The number of seconds before DB2 stops waiting for an SQL CALL statement to be assigned to one of the TCBs in the DB2 stored procedures address space.

Install parameter TIMEOUT VALUE on panel DSNTIPX, or ZPARM STORXTIME in DSN6SYSP.

**Field Name:** QWP1SPTO

**IFCID 106 - System Initialization Parameters:**

This topic shows detailed information about “Record Trace - IFCID 106 - System Initialization Parameters”.

When this block contains names that are too long for the space available, they are truncated. The full name is shown in the list of long names, which is printed at the end of this block. When present, the list shows the parameter identifier, in alphabetic order, and the complete name. If the name is too long for one line, it continues on the next.

**Record trace - IFCID 106 - System Initialization Parameters**

The field labels shown in the following sample layout of “Record Trace - IFCID 106 - System Initialization Parameters” are described in the following section.

<table>

**SYSTEM INITIALIZATION PARAMETERS**

- **CHECKFREQ**
  - Specifies the frequency of checkpointing.
- **TDROUTESCODES**
  - Specifies the route codes for troubleshooting.
- **BKGROUNDDIS**
  - Specifies the disposition of background threads.
- **RLFMAXLIMIT**
  - Specifies the maximum limit for RLF.
- **RLFMAXLOC**
  - Specifies the maximum location for RLF.
- **RLFMAXSCOPE**
  - Specifies the maximum scope for RLF.
- **RLFAUTO**
  - Specifies the auto parameter for RLF.
- **EXTENDEDSECURITY**
  - Specifies extended security.
- **WLMENVIRONMENT**
  - Specifies the WLM environment.
- **ROLUPPARA**
  - Specifies rollup parallel threads.
- **LEVELIDCHECKS**
  - Specifies level ID checks.
- **BP4K**
  - Specifies BP 4K block.
- **BP8K**
  - Specifies BP 8K block.
- **BP16K**
  - Specifies BP 16K block.
- **BP32X**
  - Specifies BP 32X block.
- **BPUINDEX**
  - Specifies BP user index.
- **BPIMMLLOB**
  - Specifies BP implicit lob.
CHECKPOINT FREQUENCY

Checkpoint frequency. This shows either the number of minutes (1 through 60) or the number of DB2 log records between the start of successive checkpoints. DB2 starts a new checkpoint when this value is reached.

You can use the SET LOG command to change the number of log records between checkpoints dynamically. Valid values are 1-60 when specifying a time value and 200-16000000 when specifying a number of records.

Install parameter CHECKPOINT FREQ on panel DSNTIPL, ZPARM CHKFREQ in DSN6SYSP.

Field Name: QWP1LOGL

TRACETAB SIZE(4K)

Shows the size of the RES trace table in 4 KB blocks. A value of 16 means 64 KB have been allocated for this table.

This is the default destination for the global trace records in DB2. Most trace records require 32-byte entries; events with more than three data items require 64-byte entries.

Install parameter TRACE SIZE on panel DSNTIPN, or ZPARM TRACTBL in DSN6SYSP.

Field Name: QWP1TRSZ

GLOBAL CLASSES

Shows whether the global trace is started automatically when DB2 is started.

When YES, the global trace starts for the default classes (classes 1, 2, and 3) whenever DB2 is started, and additional data consistency checks are made whenever a data page or index page is modified. When ALL, the global trace is automatically started for all classes.

The global trace is used to diagnose problems in DB2 but it also impacts DB2 performance. If you have production systems requiring high performance, you might consider turning off global trace. If you do this, be aware that this presents a serviceability exposure. In the event of a system failure, IBM service personnel will ask you to turn on global trace and attempt to recreate the problem.

Install parameter TRACE AUTO START on panel DSNTIPN, or ZPARM TRACSTR in DSN6SYSP.

Field Name: QWP1TRST

WTO ROUTE CODES

The MVS console routing codes.

These codes are assigned to messages that are not solicited from a specific console. Up to 16 comma-separated codes can be shown.
IFCID 106 - System Initialization Parameters

Install parameter WTO ROUTE CODES on panel DSNTIPO, or ZPARM ROUTCDE in DSN6SYSP.

Field Name: QWP1SMRC

LOCAL TRACETAB SZ

The size of the local trace tables in multiples of 4 KB. ZPARM name TRACLOC in DSN6SYSP.

Field Name: QWP1TLSZ

STATS CLASSES

Shows whether a Statistics trace was started automatically at DB2 startup time.

The classes started are shown separated by commas.

DB2 sends collected trace data to SMF. The SMFPRM xx member of SYS1.PARMLIB must be set to allow SMF to write the records.

Install parameter SMF STATISTICS on panel DSNTIPN, or ZPARM SMFSTAT in DSN6SYSP.

Field Name: QWP1SMFS

BACKGROUND IDS

The maximum allowed number of concurrent connections for batch jobs and utilities. This includes:

- All batch jobs using QMF.
- All batch jobs using the DSN command processor.
- All tasks connected to DB2 through call attach facility (CAF) running in batch. This can include:
  - Batch jobs using QMF
  - APPC applications
  - TCP/IP FTP connections

When the number of batch jobs reaches this limit, further requests are rejected.

Install parameter MAX BATCH CONNECT on panel DSNTIPE, or ZPARM IDBACK in DSN6SYSP.

Field Name: QWP1IDB

MONITOR BUF SIZE

The default number of bytes allocated for the monitor trace buffer.

Install parameter MONITOR SIZE on panel DSNTIPN, or ZPARM MONSIZE in DSN6SYSP.

Field Name: QWP1MONS

ACCOUNT CLASSES

Shows whether DB2 sends accounting data to SMF automatically when DB2 is started. Numeric values show what classes are sent. When YES, the default class (class 1) is sent. When ALL, accounting classes one through five are started.

The SMFPRM xx member of SYS1.PARMLIB must also be set to allow SMF to write the records.
IFCID 106 - System Initialization Parameters

Install parameter SMF ACCOUNTING on panel DSNTIPN, or ZPARM SMFACCT in DSN6SYSP.

Field Name: QWP1SMFA

FOREGROUND IDS

The maximum number of concurrent TSO foreground connections (QMF, DSN, DB2I, and SPUFI).

Each of the following is a separate user:

- Each TSO foreground user executing a DSN command.
- Each TSO foreground user connected to DB2 through the call attachment facility (CAF). This can include QMF users running in TSO foreground or user-written CAF applications running in TSO foreground.

When the number of TSO users attempting to access DB2 exceeds this limit, connection requests are rejected.

There is no subsystem parameter to control the maximum concurrent connections for IMS and CICS. These are controlled by using IMS and CICS facilities. For CICS attachment, the maximum number of connections to DB2 can be controlled using the resource control table (RCT) TYPE=INIT THRDMAX value.

Install parameter MAX TSO CONNECT on panel DSNTIPE, or ZPARM IDFORE in DSN6SYSP.

Field Name: QWP1IDF

STATS INTERVAL

The time interval, in minutes, between statistics collections. Statistics records are written approximately at the end of this interval.

Install parameter STATISTICS TIME on panel DSNTIPN, or ZPARM STATTIME in DSN6SYSP.

Field Name: QWP1STIM

AUDIT CLASSES

Shows whether the audit trace is started automatically when DB2 is started.

When YES, the audit trace is started for the default class (class 1) whenever DB2 is started. When ALL, an audit trace is automatically started for all classes.

Install parameter AUDIT TRACE on panel DSNTIPN, or ZPARM AUDITST in DSN6SYSP.

Field Name: QWP1AUDT

RLIMIT TABLE ID

The default resource limit specification table (RLST) suffix.

This suffix is used when the resource limit facility (governor) is automatically started or when the governor is started without specifying a suffix.

Install parameter RLST NAME SUFFIX on panel DSNTIPO4, or ZPARM RLFTBL in DSN6SYSP.
Prior to DB2 12: Install parameter RLST NAME SUFFIX on panel DSNTIPO4, or ZP ARM RLFTBL in DSN6SYSP.

Field Name: QWP1RLFT

PSEUDOCLOSE CHKPT

The number of consecutive DB2 checkpoints that a page set or partition can remain in read/write mode since it was last updated. When this limit or the RO SWITCH TIME is reached, DB2 changes the page set or partition to read-only.

This can improve performance for recovery, logging, and data-sharing processing.

Install parameter RO SWITCH CHKPTS on panel DSNTIPL, or ZP ARM PCLOSEN in DSN6SYSP.

Field Name: QWP1FREQ

MONITOR CLASSES

Shows whether the monitor trace is started automatically when DB2 is started. When YES, the default (trace class 1) is started. Numeric values show which classes are started. When ALL, monitor trace classes 1 through 8 are started.

Install parameter MONITOR TRACE on panel DSNTIPN, or ZP ARM MON in DSN6SYSP.

Field Name: QWP1MON

RLIMIT TAB AUTHID

The authorization ID used for the resource limit facility (governor).

This identifier can be a long string. If there is insufficient space to show the complete string, the string is truncated in the report block. The complete string is shown in a separate list of long names at the end of the report.

Install parameter RESOURCE AUTHID on panel DSNTIPP, or ZP ARM RLFAUTH in DSN6SYSP.

Field Name: QWP1RLFA

PSEUDOCLOSE MIN

The number of minutes that a page set or partition can remain in read-write mode since it was last updated. When this limit or the RO SWITCH CHKPTS is reached, DB2 changes the page set or partition to read-only.

This can improve performance for recovery, logging, and data-sharing processing.

Install parameter RO SWITCH TIME on panel DSNTIPL, or ZP ARM PCLOSET in DSN6SYSP.

Field Name: QWP1TMR

REM THRDS(ACTIVE)

The maximum number of database access threads (DBATs) that can be active concurrently.

When this limit has been reached, DB2 uses the value of DDF THREADS on panel DSNTIPR to decide how to handle a new allocation request.
When DDF THREADS is ACTIVE and MAX REMOTE CONNECTED has not been reached, the allocation request is allowed but any further processing for the connection is queued waiting for an active database access thread to terminate.

When DDF THREADS is INACTIVE and MAX REMOTE CONNECTED has not been reached, the allocation request is allowed and is processed when DB2 can assign an unused database access thread slot to the connection.

The total number of threads accessing data concurrently is the sum of MAX USERS and MAX REMOTE ACTIVE. The maximum allowable value for this sum is 2000.

Install parameter MAX REMOTE ACTIVE on panel DSNTIPE, or ZPARM MAXDBAT in DSN6SYSP.

Field Name: QWP1RMT

RLF DYNAMIC ERROR

Shows whether the resource limit facility (governor) is automatically started when DB2 is started.

Install parameter RLF AUTO START on panel DSNTIPO4, or ZPARM RLF in DSN6SYSP.

Field Name: QWP1RLF

CONCURR THREADS

The maximum number of allied threads (threads started at the local subsystem) that can be allocated concurrently.

Separate threads are created for each occurrence of the following:

- TSO user (whether running a DSN command or a DB2 request from QMF)
- Batch job (whether running a DSN command or a DB2 utility)
- IMS region that can access DB2
- Active CICS transaction that can access DB2
- Task connected to DB2 through the call attachment facility.

Install parameter MAX USERS on panel DSNTIPE, or ZPARM CTHREAD in DSN6SYSP.

Field Name: QWP1CT

REM THRDS(CONN)

The maximum allowed number of concurrent remote connections.

When this limit is reached, any new connection request is rejected.

Install parameter MAX REMOTE CONNECTED on panel DSNTIPE, or ZPARM CONDBAT in DSN6SYSP.

Field Name: QWP1CDB

UR LOG THRESHOLD

Shows the number of log records that are to be written by an uncommitted unit of recovery (UR) before DB2 issues a warning message to the console. This provides notification of a long-running UR. Long-running URs might result in a lengthy DB2 restart or a lengthy recovery situation for critical
tables. Log records are specified in 1-K (1000 log records) increments. A value of 0 indicates that no write check is to be performed.

Install parameter UR LOG WRITE CHECK on panel DSNTIPL, ZPARM URLGWTH in DSN6SYSP.

**Field Name:** QWP1LWCK

**LIMIT BACKOUT**

Shows whether some backward log processing should be postponed.

When NO, DB2 backward log processing processes all inflight units of recovery (URs) and URs for abending transactions.

When YES, DB2 postpones backout processing for some units of work until the command RECOVER POSTPONED is issued.

AUTO (default) postpones some backout processing but automatically starts the backout processing when DB2 restarts and begins accepting new work.

When YES or AUTO, backout processing runs concurrently with new work. Page sets or partitions with backout work pending are unavailable until their backout work is complete.

Install parameter LIMIT BACKOUT on panel DSNTIPL, or ZPARM LBACKOUT in DSN6SYSP.

**Field Name:** QWP1LMB

**EXTENDED SECURITY**

Extended security options.

When YES (strongly recommended), detailed reason codes are returned to a DRDA level 3 client when a DDF connection request fails because of security errors. When using SNA protocols, the requester must have included a product that supports the extended security sense codes, such as DB2 Connect version 5 and subsequent releases.

RACF users can change their passwords using the DRDA change password function. This support is only for DRDA level 3 requesters that have implemented support for changing passwords.

YES allows properly enabled DRDA clients to determine the cause of security failures without requiring DB2 operator support.

When NO, generic error codes are returned to the clients and RACF users are prevented from changing their passwords.

Install parameter EXTENDED SECURITY on panel DSNTIPR, or ZPARM EXTSEC in DSN6SYSP.

**Field Name:** QWP1SCER

**UR CHECK FREQ**

Shows the number of checkpoint cycles to complete before DB2 issues a warning message to the console and writes an IFCID 313 record for an uncommitted, indoubt, or inflight unit of recovery (UR). The default is 0, which disables this option.

Install parameter UR CHECK FREQ on panel DSNTIPL, or ZPARM URCHKTH in DSN6SYSP.

**Field Name:** QWP1URCK
BACKOUT DURATION

Indicates how much of the log to process for backout when LIMIT BACKOUT = YES or AUTO.

During restart, backward log processing continues until both of the following events occur:

- All inflight and inabort URs with update activity against the catalog or directory are backed out.
- The number of log records processed is equal to the number specified in BACKOUT DURATION times the value of CHECKPOINT FREQ. If the checkpoint frequency is specified in minutes, the number of records processed is the default of 50000 records multiplied by the value of CHECKPOINT FREQ.

In-flight and in-abort URs that are not completely backed out during restart are converted to postponed-abort status. Page sets or partitions with postponed-backout work are put into restart pending (RESTP). This state blocks all access to the object other than access by the command RECOVER POSTPONED or by automatic backout processing performed by DB2 when LIMITED BACKOUT = AUTO.

A table space might be in restart pending mode, without the associated index spaces also in restart pending mode. This happens if a postponed abort UR makes updates only to non-indexed fields of a table in a table space. In this case, the indexes are accessible to SQL (for index-only queries), even though the table space is inaccessible.

Install parameter BACKOUT DURATION on panel DSNTIPL, or ZP ARM BACKODUR in DSN6SYSP.

Field Name: QWP1BDUR

WLM ENVIRONMENT

Workload manager environment.

Install parameter WLM ENVIRONMENT on panel DSNTIPX, or ZP ARM WLMENV in DSN6SYSP.

Field Name: QWP1WLME

ROLLUP PARAL THRD

Indicates whether DB2 generates a trace record at the originating task level that summarizes accounting information for all parallel tasks.

DB2 parameter PTASKROL in DSN6SYSP.

Field Name: QWP1PROL

UNIT PRICE TRACK

Specifies whether DB2 performs detailed tracking for measured usage pricing. You can select the following values:

YES  DB2 does detailed measured usage tracking if SMF type 89 records are activated. When SMF89 is set to YES, DB2 invokes a z/OS service on every entry into or exit out of DB2 to ensure accurate tracking.

NO (the default value)  DB2 does not do detailed measured usage tracking. If the SMF type 89 record is activated, only high-level tracking is recorded in
the SMF type 89 record. Selecting NO reduces CPU usage, but also increases the amount of time spent in DB2 as measured by SMF 89.

**Note:** Select SMF89 YES only if you use measured usage pricing.

DB2 parameter SMF89.

**Field Name:** QWP1SM89

**OTC LIC ACCEPTED**

Indicates that the one-time charge (OTC) license terms are accepted for this DB2 installation.

DB2 parameter OTC_LICENSE.

**Field Name:** QWP1OLAC

**LEVEL ID CHECKPS**

Shows how often, in checkpoints, the level ID of a page set or partition is updated. When zero (0), down-level detection is disabled. When five (5), down-level is enabled.

Use the following criteria to decide on a suitable value for this parameter:

- **How often are backup and restore methods used outside of the DB2 control (such as DSN1COPY or DFDSS dump and restore)?** If rarely used, there is no need to update the level ID frequently.

- **How many page sets are open for update at the same time?** If DB2 updates level IDs frequently, there is extra protection against down-level page sets. However, a performance degradation can occur if the level IDs for many page sets must be set at every checkpoint.

- **How often does the subsystem take checkpoints?** If the DB2 subsystem takes frequent system checkpoints, set the level ID frequency to a higher value.

Install parameter LEVELID UPDATE FREQ on panel DSNTIPL, or ZPARM DLDFREQ in DSN6SYSP.

**Field Name:** QWP1DFRQ

**USER LOB VAL STOR**

The maximum amount of storage (KB) each user can use for LOB values.

Install parameter USER LOB VALUE STORAGE on panel DSNTIP7, or ZPARM LOBVALA in DSN6SYSP.

**Field Name:** QWP1LVA

**USER XML VAL (KB)**

The maximum amount of memory in kilobytes (KB) for each user for storing XML values.

ZPARM XMLVALA in DSN6SYSP.

**Field Name:** QWP1XVA

**DEF 4K BP U.DATA**

The name of the 4 KB buffer pool for user table spaces.

Install parameter DEFAULT BUFFER POOL FOR USER DATA on installation panel DSNTIPL, or ZPARM TBSBPOOL in DSN6SYSP.

**Field Name:** QWP1TBPL
SYS LOB VAL STOR
The maximum amount of storage (MB) each system can use for LOB values.
Install parameter SYSTEM LOB VALUE STORAGE on panel DSNTIP7, or ZPARM LOBVALS in DSN6SYSP.
Field Name: QWP1LV

SYS XML VAL (MB)
The maximum amount of memory in megabytes (MB) for each system for storing XML values.
ZPARM XMLVALS in DSN6SYSP.
Field Name: QWP1XVS

DEF 8K BP U.DATA
The default 8 KB buffer pool for:
• Table spaces with an 8 KB page size in implicitly created databases
• Explicitly created table spaces with an 8 KB page size, but without a buffer pool clause that is specified in the create table space statement.
Install parameter DEFAULT 8-KB BUFFER POOL FOR USER DATA on panel DSNTIP1 or ZPARM TBSBP8K in DSN6SYSP.
Field Name: QWP1TP8

LOB INLINE LENGTH
Default inline length for any new storing large object (LOB) column in a Universal Table Space on the DB2 subsystem. The valid values are from 0 to 32680 inclusive (in bytes). The default value for this ZPARM is 0, which indicates that no inline attribute is required for any LOB column (BLOB, CLOB or DBCLOB) created on this subsystem.
Field Name: QWP1LBIL

RANDOM XML DOCID
Specifies whether DB2 generates document ID elements sequentially or randomly. Possible values are:

YES  Sequentially
NO   Randomly
ZPARM name XML_RANDOMIZE_DOCID in DSN6SYSP.
Field Name: QWP1XRDI

DEF 16K BP U.DATA
The default 16 KB buffer pool for:
• Table spaces with a 16 KB page size in implicitly created databases
• Explicitly created table spaces with a 16 KB page size, but without a buffer pool clause that is specified in the create table space statement.
Install parameter DEFAULT 16-KB BUFFER POOL FOR USER DATA on panel DSNTIP1 or ZPARM TBSBP16K in DSN6SYSP.
Field Name: QWP1TP16

EXTRA BLOCKS SRV
The maximum number of extra DRDA query blocks DB2 returns to a DRDA client.

The default is 100.

This controls the total amount of data that can be transmitted on any given network exchange. It does not limit the size of the SQL query answer set.

Install parameter EXTRA BLOCKS SRV on panel DSNTIP5, ZPARM EXTRASRV in DSN6SYSP.

**Field Name:** QWP1EXBS

**SYNCVAL W/IN HOUR**

Shows whether DB2 statistics recording is synchronized with some part of the hour. The installation can specify that the DB2 statistics recording interval be synchronized with the beginning of the hour (00 minutes past the hour) or any number of minutes past the hour up to 59. Possible values are: 0-59, which indicate the synchronization point. When NO or N/A is shown, synchronization is disabled, this is the default.

If STATISTICS TIME INTERVAL IN MINUTES (STATIME) is greater than 60, NO or N/A is shown.

Install parameter STATISTICS SYNC on panel DSNTIPN, or ZPARM SYNCVAL in DSN6SYSP.

**Field Name:** QWP1SYNV

**DEF 32K BP U.DATA**

The default 32 KB buffer pool for:
- Table spaces with a 32 KB page size in implicitly created databases
- Explicitly created table spaces with a 32 KB page size, but without a buffer pool clause that is specified in the create table space statement.

Install parameter DEFAULT 32-KB BUFFER POOL FOR USER DATA on panel DSNTIP1 or ZPARM TBSBP32K in DSN6SYSP.

**Field Name:** QWP1TP32

**EXTRA BLOCKS REQ**

The maximum number of extra DRDA query blocks DB2 requests from a remote DRDA server.

The default is 100.

This controls the total amount of data that can be transmitted on any given network exchange. It does not limit the size of the SQL query answer set.

Install parameter EXTRA BLOCKS REQ on panel DSNTIP5, ZPARM EXTRAREQ in DSN6SYSP.

**Field Name:** QWP1EXBR

**SYNCHR FLAG**

Interval synchronization flag, shows whether the synchronization is enabled. The default is NO. When YES, the DB2 statistics are synchronized to the value shown in INTERVAL SYNCHR W/IN HOUR.

**Field Name:** QWP1SYFL

**DEF BP USER INDEX**
The name of the 4 KB buffer pool used for indexes on user data.

Install parameter DEFAULT BUFFER POOL FOR USER INDEXES on installation panel DSNTIP1, or ZPARM IDXBPPOOL in DSN6SYSP.

**Field Name:** QWP1IXPL

**DDF/RRSAF ACCUM**

Shows whether DB2 accounting data for DDF and RRSAF threads is accumulated by end user.

When NO, DB2 writes an accounting record when a DDF thread is made inactive, or when signon occurs for an RRSAF thread. A value in the range 2 through 65535 shows the number of times an end-user identifier should occur before DB2 writes an accounting record. An end-user identifier is the concatenation of the end-user user ID, end-user transaction name, and the end-user workstation name.

These values can be set by DDF threads using SERVER CONNECT and SET CLIENT calls, and by RRSAF threads using the RRSAF SIGN, AUTH SIGNON, and CONTEXT SIGNON functions.

An accounting record might be written prior to the number of end user occurrences in the following instances:

- When an internal storage threshold is reached for the accounting RRSAF signon call.
- When the thread deallocates, the accumulated accounting data for all end users on this thread is written (one record per end user).
- When this parameter is dynamically changed to deactivate accounting accumulation. In this instance, the next end-UR (for DDF thread) or signon (for a RRSAF thread) causes DB2 to write the accumulated accounting data for all end users on this thread (one record per end user).

Install parameter DDF/RRSAF ACCUM on installation panel DSNTIPN, or ZPARM ACCUMACC in DSN6SYSP.

**Field Name:** QWP1ACCU

**TS ALLOCATION**

Shows the amount of space in KB for primary and secondary space allocation for DB2-defined data sets for table spaces created without the USING clause. 0 indicates that DB2 uses standard defaults.

Install parameter TABLE SPACE ALLOCATION on panel DSNTIP7, or ZPARM TSQTY in DSN6SYSP.

**Field Name:** QWP1TSQT

**DEF BP IMPL LOB**

The name of the buffer pool that is used for implicitly created LOB table spaces. This field corresponds to field default buffer pool for USER LOB DATA on installation panel DSNTIP1. The ZPARM name is TBSBPLOB in DSN6SYSP.

**Field Name:** QWP1TPLB

**DSET STATS TIME**
The time interval, in minutes, before DB2 resets data set statistics collected for the online performance monitors. Online performance monitors can request DB2 data set statistics for the current interval with an IFI READS request for IFCID 199.

Install parameter DATASET STATS TIME on panel DSNTIPN, or ZPARM DSSTIME in DSN6SYSP.

Field Name: QWP1DTIM

IX ALLOCATION

Shows the amount of space in KB for primary and secondary space allocation for DB2-defined data sets for index spaces created without the USING clause. 0 indicates that DB2 uses standard defaults.

Install parameter INDEX SPACE ALLOCATION on panel DSNTIP7, or ZPARM IXQTY in DSN6SYSP.

Field Name: QWP1IXQT

DEF BP IMPL XML

The name of the buffer pool that is used for XML table spaces. This field corresponds to field default buffer pool for USER XML DATA on installation panel DSNTIP1. The ZPARM name is TBSBPXML in DSN6SYSP.

Field Name: QWP1TPXM

UNICODE IFCIDS

Shows whether output from IFC records should include Unicode information. Only a subset of the character fields (identified in the IFCID record definition by a %U in the comment area to the right of the field declaration in the DSNDQWxx copy files) are encoded in Unicode. The remaining fields maintain the same encoding of previous releases.

Install parameter UNICODE IFCIDS on panel DSNTIPN, or ZPARM UIFCIDS in DSN6SYSP.

Field Name: QWP1_UNICODE

OPT EXTENT SIZING

Indicates whether DB2 uses sliding secondary quantity for DB2 managed data sets to optimize extent sizing.

Install parameter OPTIMIZE EXTENT SIZING on panel DSNTIP7, or ZPARM MGEXTSZ in DSN6SYSP.

Field Name: QWP1MESZ

VARY DS CTRL INTV

Indicates whether DB2 optimizes VSAM CONTROL INTERVAL to page size for data set allocation.

Install parameter VARY DS CONTROL INTERVAL on panel DSNTIP7, or ZPARM DSVCI in DSN6SYSP.

Field Name: QWP1VVCI

DEL CF STRUCTS

Shows whether to:

• Delete change-data (CD) structures during restart
IFCID 106 - System Initialization Parameters

- Attempt to delete coupling-facility (CF) structures, including shared communications area (SCA) structures, internal resource lock manager (IRLM lock) structures, and allocated group buffer pools.

This field corresponds to field DEL CF STRUCTS on installation panel DSNTIPK.

ZPARM name DEL_CFSTRUCTS_ON_RESTART in DSN6SYSP.

Field Name: QWP1DCFS

DEF PART SEGSIZE

The default segment size to be used for a partitioned table space when the CREATE TABLESPACE statement does not include the SEGSIZE parameter.

This field corresponds to field DEFAULT PARTITION SEGSIZE on installation panel DSNTIP7. The ZPARM name is DPSEGSZ in DSN6SYSP.

Field Name: QWP1DPSS

AGGREGATION FLDS

Shows the aggregation fields used for DDF and RRSAF accounting rollup.

Values are defined as follows:

0  End user ID, transaction name, and workstation name
1  End user ID
2  End user transaction name
3  End user workstation name
4  End user ID and transaction name
5  End user ID and workstation name
6  End user transaction name and workstation name

This value is ignored if DDF or RRSAF accounting are not used. DB2 writes individual accounting threads for threads that do not have all aggregation fields populated that are specified by this parameter.

Install parameter AGGREGATION FIELDS on installation panel DSNTIPN, or ZPARM ACCUMUID in DSN6SYSP.

Field Name: QWP1ACID

USE DATA COMPRESS

Shows whether data compression in table spaces in implicitly defined databases is used.

Install parameter USE DATA COMPRESSION on panel DSNTIP7 or ZPARM IMPTSCMP in DSN6SYSP.

Field Name: QWP1CITS

DSSIZE IMPL TS

Shows the maximum DSSIZE in gigabytes that DB2 uses for creating each partition of an implicitly created base table space.

This field corresponds to field DEFAULT DSSIZE on installation panel DSNTIP7. The ZPARM name is IMPDSSIZE in DSN6SPRM.

Field Name: QWP1DSSZ

DEFINE DATA SETS
Defines the underlying data sets when a table space (TS) that is contained in an implicitly created database is created.

Install parameter DEFINE DATA SETS on panel DSNTIP7 or ZPARM IMPDSDEF in DSN6SYSP.

Field Name: QWP1DIDS

COMPRESS SMF RECS

Shows the COMPRESS DEST(SMF) TRACE records. This field corresponds to field COMPRESS SMF RECS on installation panel DSNTIPN. ZPARM name: SMFCOMP in DSN6SYSP.

Field Name: QWP1CSMF

TRACKMOD IMPL TS

Shows whether you have specified the TRACKMOD option on ALTER TABLESPACE for an implicitly created table space.

This field corresponds to field TRACK MODIFIED PAGES on installation panel DSNTIP7. The ZPARM name is IMPTKMOD in DSN6SPRM.

Field Name: QWP1TKMD

PARAMETER MODULE

Shows the name of the active subsystem parameter module.

This field corresponds to field PARAMETER MODULE on installation panel DSNTIP03.

Field Name: QWP1ZPNM

MAX OPEN FILE REF

The maximum number of concurrently open data sets for processing LOB file references.

Install parameter MAX OPEN FILE REFS on panel DSNTIPE or ZPARM MAXOFILR in DSN6SYSP.

Field Name: QWP1MOFR

RESERV Z/OS SPACE

The amount of space reserved for MVS functions.

Field Name: QWP1DB1M

ACCESS CONTROL

Shows the name of the default access control exit module.

This field corresponds to field ACCESS CONTROL on installation panel DSNTIPO3. The ZPARM name is ACCESS_CNTL_MODULE in DSN6SYSP.

Field Name: QWP1DXAC

CHECKPOINT TYPE

Shows the LOG checkpoint type. It can have the following values:

SINGLE

Either records or minutes.
IFCID 106 - System Initialization Parameters

**Both**
Both records and minutes, as specified by Records Between Checkpoint (QWP1LOGR) and Mins Between Checkpoint (QWP1LOGM).

ZPARM CHKTYPE in DSN6SYSP.

**Field Name:** QWP1LOGT

**Reserve CRIT Space**
The amount of space reserved for critical work that must be completed.

**Field Name:** QWP1CRIT

**Identify/Auth**
Shows the name of the default identify or authorization exit module.

This field corresponds to field IDENTIFY/AUTH on installation panel DSNTIPO3. The ZPARM name is IDAUTH_MODULE in DSN6SYSP.

**Field Name:** QWP1DATH

**Records/Checkpoint**
Shows the number of records between log checkpoints if the LOG checkpoint type is BOTH (records and minutes).

This field corresponds to field RECORDS/CHECKPOINT on installation panel DSNTIMAL, or ZPARM name CHKLOGR in DSN6SYSP.

**Field Name:** QWP1LOGR

**Reserve SOS Space**
The amount of space above z/OS and critical (QWP1DB1M + QWP1CRIT) that DB2 tries to leave available.

**Field Name:** QWP1SOS

**Signon**
Shows the name of the default signon exit module.

This field corresponds to field SIGNON on installation panel DSNTIPO3. The ZPARM name is SIGNON_MODULE in DSN6SYSP.

**Field Name:** QWP1DSGN

**Minutes/Checkpoint**
Shows the number of minutes between log checkpoints if the LOG checkpoint type is BOTH (records and minutes).

This field corresponds to field MINUTES/CHECKPOINT on installation panel DSNTIMAL, or ZPARM name CHKMINS in DSN6SYSP.

**Field Name:** QWP1LOGM

**Profile Autostart**
Specifies whether START PROFILE command processing is automatically initiated as part of DB2 startup (DB2 field: QWP1PFASY):

- 0 indicates NO
- 1 indicates YES

This field corresponds to field PROFILE AUTOSTART on installation panel DSNTIFO. ZPARM name: PROFILE_AUTOSTART in DSN6SYSP.
Field Name: QWP1PFASY

QWP1LVL

This field is for IBM service use.

Field Name: QWP1LVL

QWP1LVL

Level of this block. It is used to detect parameters or code that is out of sync.

Field Name: QWP1LVL

QWP1DON'T

Indicates whether the resource limit facility (RLF) is started automatically by DB2.

Field Name: QWP1DON'T

IFCID 106 - VSAM Catalog Name Qualifier:

This topic shows detailed information about “Record Trace - IFCID 106 - VSAM Catalog Name Qualifier”.

Record trace - IFCID 106 - VSAM Catalog Name Qualifier

The field labels shown in the following sample layout of “Record Trace - IFCID 106 - VSAM Catalog Name Qualifier” are described in the following section.

VSAM CATALOG NAME QUALIFIER
DSNB51

Qualifiers

The high-order qualifier name of all DB2 system data sets.

Field Name: QWP6CATN

IFCID 107 - Open/Close:

This topic shows detailed information about “Record Trace - IFCID 107 - Open/Close”.

Record trace - IFCID 107 - Open/Close

The field labels shown in the following sample layout of “Record Trace - IFCID 107 - Open/Close” are described in the following section.

DBID: 5 DATABASE NAME: DSNDB07
OBID: 24 OBJECT NAME: DSNDSX02

DBID

The decimal identifier of the database.

Field Name: QW0107DB

DATABASE NAME

The name of the database.

Field Name: QW0107DN

OBID
IFCID 107 - Open/Close

The decimal identifier of the object. Examples of objects are table space and index space.

Field Name: QW0107OB

OBJECT NAME

The name of the object. Examples of objects are table space and index space.

Field Name: QW0107TN

IFCID 108 - Bind Start:

This topic shows detailed information about “Record Trace - IFCID 108 - Bind Start”.

Record trace - IFCID 108 - Bind Start

The field labels shown in the following sample layout of “Record Trace - IFCID 108 - Bind Start” are described in the following section.

LOCATION

The package location.

Field Name: QW0108NL

SQLERROR

Indicates whether a package is created if SQL errors are encountered:

CONTIN A package is created even if SQL errors are encountered.

NOPACK A package is not created if SQL errors are encountered.

Field Name: QW0108E

REBIND PLAN(*)

Indicates whether a plan is rebound.

Field Name: QW0108S

ISOLATION

The isolation level for plans and packages:

RR Repeatable read

CS Cursor stability

RS Read stability

UR Uncommitted read

For packages only:
DF  Default (at run time, assumes the isolation level of the current plan)

Field Name: QW0108I

RELEASE
Indicates when to release the locks:

  COMMIT  Release locks at commit time.

  DEALLOC  Release locks at deallocation time.

For packages only:

  DEFAULT  Release locks at run time, which is the default.

Field Name: QW0108R

COLLECT ID
The collection identifier of the package.

Field Name: QW0108NC

DEGREE
The degree bind option:

  ANY    Degree(any)

  1      Degree(1)

Field Name: QW0108PL

EXPLAIN
Indicates whether EXPLAIN was specified.

Field Name: QW0108X

TYPE
The type of bind.

Field Name: QW0108T

QUALIFIER
The qualifier used for unqualified object names.

Field Name: QW0108QL

PACKAGE ID
The package identifier.

Field Name: QW0108NI

SQLRULES
The SQL rules option.

Field Name: QW0108SR

OWNER
The plan or package owner.

Field Name: QW0108OW
ACTION
Indicates whether the plan or package replaces an existing plan or package with the same name or is new. This field only applies to BIND activities.
Field Name: QW0108A

CACHE SIZE
The authorization cache size. A value of 0 indicates that DB2 determines the size.
Field Name: QW0108CA

TOKEN
The consistency token of the package.
Field Name: QW0108NT

DISCONNECT
The disconnect option:
EXPL  Explicit
AUTO  Automatic
COND  Conditional
Field Name: QW0108DC

OBJECT TYPE
The type of object bound or rebound.
Field Name: QW0108TY

VALIDATION
The time of validation:
RUN   Validate at run time.
BIND  Validate at bind time.
Field Name: QW0108V

REOPT
Indicates whether reoptimization was requested:
YES  REOPT(VARS) was specified to reoptimize the access path of the SQL statement at run time.
NO   NOREOPT(VARS) was specified to optimize the access path of the SQL statement only at bind time.
Field Name: QW0108RO

PLAN NAME
The plan name. 'BLANK' indicates that a test bind was performed.
Field Name: QW0108PN

DYNAMICRULES
The value of the DYNAMICRULES option on the BIND/REBIND command:
RUN
Run-time rules apply to a dynamic SQL statement for authorization checking and object qualification at run time.

BIND
Bind-time rules apply to a dynamic SQL statement for authorization checking and object qualification at run time.

N/P
DYNAMICRULES was not specified.

Field Name: QW0108DY

CURRENTDATA
Controls the data currency for ambiguous cursors:

NO
Data currency is not required for ambiguous cursors. Blocking for ambiguous cursors is allowed.

YES
Data currency is required for ambiguous cursors. Blocking for ambiguous cursors is inhibited.

ALL
Data currency is required for all cursors. Applicable to packages only.

Field Name: QW0108F

ACQUIRE
Indicates when to acquire the locks:

ALLOC
Acquire the locks when the plan is allocated.

USE
Acquire the locks when the application first accesses them.

Field Name: QW0108Q

KEEPDYNAMIC
Indicates whether DB2 keeps (KEEPDYNAMIC(YES)) or discards (KEEPDYNAMIC(NO)) prepared SQL statements at commit points.

Field Name: QW0108KD

DBPROTOCOL
Database protocol option. Possible values are:

DRDA
DRDA protocol

PRIVATE
DB2 private protocol

Field Name: QW0108PR

DEFERPREPARE
Indicates whether preparation of dynamic SQL statements was deferred. Possible values are:

YES
Dynamic SQL statement preparation was deferred.

NO
Dynamic SQL statements were prepared immediately.

Field Name: QW0108DP

OPT_HINT_IDENT
Query optimization hint identifier, the default is blanks.

Field Name: QW0108OH
IMMEDWRITE

Indicates how DB2 updates group buffer pool dependent pages. This is only valid in a data-sharing environment.

Group buffer pool dependent pages can be written out to DASD or SYSTEM pagesets. Values shown are:

**NO**  DB2 uses normal write activity for updates, this is the default. Pages are written out at, or before phase 2 commit, or at the end of an abort for transactions that have rolled back.

**PH1**  Pages are written out at, or before phase 1 commit.

If a transaction subsequently rolls back, the pages are updated in the group buffer pool at the end of the rollback, and are written out at the end of the abort.

**YES**  Pages are written out to the coupling facility as soon as the buffer update commits. Pages are written out regardless of whether the update occurs during forward progress or rollback of the transaction.

This option can affect DB2 performance due to coupling facility overhead.

**N/P**  The DB2 subsystem is not part of a data sharing group.

**Field Name:** QW0108WI

VERSION

The version.

**Field Name:** QW0108VN

IFCID 109 - Bind End:

This topic shows detailed information about “Record Trace - IFCID 109 - Bind End”.

**Record trace - IFCID 109 - Bind End**

The field labels shown in the following sample layout of “Record Trace - IFCID 109 - Bind End” are described in the following section.

**RETURN**

The bind return code:

- **0**  Successful bind/rebind
- **4**  Warning
- **8**  Error

**Field Name:** QW0109RC

IFCID 110 - Bind Free Start:

This topic shows detailed information about “Record Trace - IFCID 110 - Bind Free Start”.

**Field Name:** QW0108WI
Record trace - IFCID 110 - Bind Free Start

The field labels shown in the following sample layout of “Record Trace - IFCID 110 - Bind Free Start” are described in the following section.

BIND FREE --> 'BLANK'

IFCID 111 - Bind Free End:
This topic shows detailed information about “Record Trace - IFCID 111 - Bind Free End”.

Chapter 6. Batch reporting  3895
Record trace - IFCID 111 - Bind Free End

The field labels shown in the following sample layout of “Record Trace - IFCID 111 - Bind Free End” are described in the following section.

RETURN 0

RETURN

The bind return code:

0   Successful free plan
4   Warning
8   Error

Field Name: QW0111RC

IFCID 112 - Thread Allocate:

This topic shows detailed information about “Record Trace - IFCID 112 - Thread Allocate”.

Record trace - IFCID 112 - Thread Allocate

The field labels shown in the following sample layout of “Record Trace - IFCID 112 - Thread Allocate” are described in the following section.

THREAD -- NETWORKID: DEIBMIPS LUNAME: IPSAU851 LUWSEQ: 1
ALLOCATE PLAN NAME: DSNBIND ACQUIRE: ALLOCATION
ISOLATION: CS RELEASE: DEALLOCATION
DYNAMICRULES: RUN REOPT: NO
KEEPDYNAMIC: NO PREPARE: NO
DBPROTOCOL: PRIVATE
HINTID: 'BLANK'
IMMEDWRITE: NO

PLAN NAME

The plan name for the thread.

Field Name: QW0112PN

ACQUIRE

Indicates when to acquire locks:

ALLOCATION

Acquire the locks when the plan is allocated.

USE

Acquire the locks when the application first accesses them.

Field Name: QW0112Q

ISOLATION

The isolation level:

RR  Repeatable read
CS  Cursor stability
RS  Read stability
UR  Uncommitted read

Field Name: QW0112I

RELEASE
Indicates when to release locks:

**COMMIT**  Release locks at commit time.

**DEALLOCATION**  Release locks at deallocation time.

**Field Name:** QW0112R

**DYNAMICRULES**

The value of the DYNAMICRULES option on the BIND/REBIND command:

**RUN**  Run-time rules apply to a dynamic SQL statement for authorization checking and object qualification at run time.

**BIND**  Bind-time rules apply to a dynamic SQL statement for authorization checking and object qualification at run time.

**N/P**  DYNAMICRULES was not specified.

**Field Name:** QW0112DY

**REOPT**

Indicates whether reoptimization was requested:

**YES**  REOPT(VARS) was specified to reoptimize the access path of the SQL statement at run time.

**NO**  NOREOPT(VARS) was specified to optimize the access path of the SQL statement only at bind time.

**Field Name:** QW0112RO

**KEEPDYNAMIC**

Indicates whether DB2 keeps (KEEPDYNAMIC(YES)) or discards (KEEPDYNAMIC(NO)) prepared SQL statements at commit points.

**Field Name:** QW0112KD

**DBPROTOCOL**

Database protocol option. Possible values are:

**DRDA**

**PRIVATE**

**Field Name:** QW0112PR

**PREPARE**

Indicates whether preparation of dynamic SQL statements was deferred. Possible values are:

**YES**  Dynamic SQL statement preparation was deferred.

**NO**  Dynamic SQL statements were prepared immediately.

**Field Name:** QW0112DP

**HINTID**

Query optimization hint identifier, the default is blanks.

**Field Name:** QW0112OH

**IMMEDWRITE**
Indicates how DB2 updates group buffer pool dependent pages. This is only valid in a data-sharing environment.

Group buffer pool dependent pages can be written out to DASD or SYSTEM pagesets. Values shown are:

**NO**  DB2 uses normal write activity for updates, this is the default. Pages are written out at, or before phase 2 commit, or at the end of an abort for transactions that have rolled back.

**PH1**  Pages are written out at, or before phase 1 commit.

If a transaction subsequently rolls back, the pages are updated in the group buffer pool at the end of the rollback, and are written out at the end of the abort.

**YES**  Pages are written out to the coupling facility as soon as the buffer update commits. Pages are written out regardless of whether the update occurs during forward progress or rollback of the transaction.

This option can affect DB2 performance due to coupling facility overhead.

**N/P**  The DB2 subsystem is not part of a data sharing group.

**Field Name:** QW0112WI

### IFCID 113 - Agent Allocate:

This topic shows detailed information about “Record Trace - IFCID 113 - Agent Allocate”.

### Record trace - IFCID 113 - Agent Allocate

The field labels shown in the following sample layout of “Record Trace - IFCID 113 - Agent Allocate” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>

### ISOLATION

The isolation level:
RR     Repeatable read
CS     Cursor stability
RS     Read stability
UR     Uncommitted read

Field Name: QW0113I

RELEASE
Indicates when to release locks:

COMMIT Release locks at commit time.

DEALLOCATION
Release locks at deallocation time.

Field Name: QW0113R

DYNAMICRULES
The value of the DYNAMICRULES option on the BIND/REBIND command:

RUN     Run-time rules apply to a dynamic SQL statement for authorization checking and object qualification at run time.
BIND    Bind-time rules apply to a dynamic SQL statement for authorization checking and object qualification at run time.
N/P     DYNAMICRULES was not specified.

Field Name: QW0113DY

REOPT
Indicates whether reoptimization was requested:

YES     REOPT(VARS) was specified to reoptimize the access path of the SQL statement at run time.
NO      NOREOPT(VARS) was specified to optimize the access path of the SQL statement only at bind time.

Field Name: QW0113RO

KEEPDYNAMIC
Indicates whether DB2 keeps (KEEPDYNAMIC(YES)) or discards (KEEPDYNAMIC(NO)) prepared SQL statements at commit points.

Field Name: QW0113KD

DBPROTOCOL
Database protocol option. Possible values are:

DRDA
PRIVATE

Field Name: QW0113PR

PREPARE
Indicates whether preparation of dynamic SQL statements was deferred. Possible values are:

YES     Dynamic SQL statement preparation was deferred.
Dynamic SQL statements were prepared immediately.

Field Name: QW0113DP

**HINTID**

Query optimization hint identifier, the default is blanks.

Field Name: QW0113OH

**IMMEDWRITE**

Indicates how DB2 updates group buffer pool dependent pages. This is only valid in a data-sharing environment.

Group buffer pool dependent pages can be written out to DASD or SYSTEM pagesets. Values shown are:

- **NO**: DB2 uses normal write activity for updates, this is the default. Pages are written out at, or before phase 2 commit, or at the end of an abort for transactions that have rolled back.
- **PH1**: Pages are written out at, or before phase 1 commit.
  - If a transaction subsequently rolls back, the pages are updated in the group buffer pool at the end of the rollback, and are written out at the end of the abort.
- **YES**: Pages are written out to the coupling facility as soon as the buffer update commits. Pages are written out regardless of whether the update occurs during forward progress or rollback of the transaction.
  - This option can affect DB2 performance due to coupling facility overhead.
- **N/P**: The DB2 subsystem is not part of a data sharing group.

Field Name: QW0113WI

**IFCID 113 - Agent Allocate**

Field Name: QW0113DP

**HINTID**

Query optimization hint identifier, the default is blanks.

Field Name: QW0113OH

**IMMEDWRITE**

Indicates how DB2 updates group buffer pool dependent pages. This is only valid in a data-sharing environment.

Group buffer pool dependent pages can be written out to DASD or SYSTEM pagesets. Values shown are:

- **NO**: DB2 uses normal write activity for updates, this is the default. Pages are written out at, or before phase 2 commit, or at the end of an abort for transactions that have rolled back.
- **PH1**: Pages are written out at, or before phase 1 commit.
  - If a transaction subsequently rolls back, the pages are updated in the group buffer pool at the end of the rollback, and are written out at the end of the abort.
- **YES**: Pages are written out to the coupling facility as soon as the buffer update commits. Pages are written out regardless of whether the update occurs during forward progress or rollback of the transaction.
  - This option can affect DB2 performance due to coupling facility overhead.
- **N/P**: The DB2 subsystem is not part of a data sharing group.

Field Name: QW0113WI

**IFCID 114 - Archive Wait Start**

This topic shows detailed information about “Record Trace - IFCID 114 - Archive Wait Start”.

**Record trace - IFCID 114 - Archive Wait Start**

The field labels shown in the following sample layout of “Record Trace - IFCID 114 - Archive Wait Start” are described in the following section.

| DSID | 00000002 | ACE | 2 |
| DSID | 00000002 | ACE | 2 |

**DSID**

The data set identifier of the log manager.

Field Name: QW0114DI

**ACE**

The relative number of the agent control element address in the ACE cross-reference table. This table is printed at the end of each location for every trace specified.

Field Name: QW0114AC
IFCID 115 - Archive Wait End DASD:

This topic shows detailed information about “Record Trace - IFCID 115 - Archive Wait End DASD”.

Record trace - IFCID 115 - Archive Wait End DASD

The field labels shown in the following sample layout of “Record Trace - IFCID 115 - Archive Wait End DASD” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RET</td>
<td>The return code.</td>
</tr>
<tr>
<td>ACE</td>
<td>The relative number of the agent control element address in the ACE cross-reference table. This table is printed at the end of each location for every trace specified.</td>
</tr>
</tbody>
</table>

IFCID 116 - Archive Wait End Tape:

This topic shows detailed information about “Record Trace - IFCID 116 - Archive Wait End Tape”.

Record trace - IFCID 116 - Archive Wait End Tape

The field labels shown in the following sample layout of “Record Trace - IFCID 116 - Archive Wait End Tape” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>

DSID

The data set identifier.

Field Name: QW0119DI

ACE

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACE</td>
<td></td>
</tr>
</tbody>
</table>

ACE

The relative number of the agent control element address in the ACE cross-reference table. This table is printed at the end of each location for every trace specified.

Field Name: QW0119AC
IFCID 120 - BSDS Write End:

This topic shows detailed information about “Record Trace - IFCID 120 - BSDS Write End”.

Record trace - IFCID 120 - BSDS Write End

The field labels shown in the following sample layout of “Record Trace - IFCID 120 - BSDS Write End” are described in the following section.

RETURN

The return code.

Field Name: QW0120RT

ACE

The relative number of the agent control element address in the ACE cross-reference table. This table is printed at the end of each location for every trace specified.

Field Name: QW0120AC

IFCID 121 - IBM Service Record:

This topic shows detailed information about “Record Trace - IFCID 121 - IBM Service Record”.

This record is for IBM service use.

IFCID 122 - IBM Service Record:

This topic shows detailed information about “Record Trace - IFCID 122 - IBM Service Record”.

This record is for IBM service use.

IFCID 123 - SRV Record:

This topic shows detailed information about “Record Trace - IFCID 123 - SRV Record”.

Record trace - IFCID 123 - SRV Record

The field labels shown in the following sample layout of “Record Trace - IFCID 123 - SRV Record” are described in the following section.

LENGTH

The length of the area.

Field Name: QW0123LN

IFCID

The IFCID of the original entry.
IFCID 123 - SRV Record

Field Name: QW0123ID

IFCID 124 - SQL Statement Record:

This topic shows detailed information about “Record Trace - IFCID 124 - SQL Statement Record”.

Record trace - IFCID 124 - SQL Statement Record

The field labels shown in the following sample layout of “Record Trace - IFCID 124 - SQL Statement Record” are described in the following section.

CONNECTION TYPE

The connection type. ‘BLANK’ indicates that there is no connection type.

Field Name: QW01246Y

ACE TOKEN

The ACE token in hexadecimal.

Field Name: QW01246A

THREAD ASID

The ASID of the thread in hexadecimal.

Field Name: QW01246S

ASCB TOKEN

The ASCB token in hexadecimal.

Field Name: QW01246C

APPL REQ COUNT

The number of calls to DB2 in decimal.

Field Name: QW01246Q

AGENT NAME

When an agent is running a stored procedure, trigger, or user-defined function, this is the unqualified name of the routine. Otherwise, this field is blank.

Field Name: QW0124SP

THREAD STATUS

The status of the thread.

Field Name: QW01246I

TCB TOKEN

The TCB token in hexadecimal.

Field Name: QW01246T

THREAD TYPE

The type of thread.
The type of thread.
Field Name: QW01246D

AGENT TYPE
The type of the agent.
Field Name: QW0124AF

STATEMENT TYPE
The statement type.
Field Name: QW0124TK

STATEMENT IDENTIFIER
The statement ID (former Cached Dynamic SQL Identifier).
Field Name: QW0124ST

LOCATION
The name of the location where the thread executes the package.
Field Name: QW0124LN

COLLECTION
The collection name.
Field Name: QW0124CI

PACKAGE
The package identifier.
Field Name: QW0124PN

TOKEN
The consistency token.
Field Name: QW0124CN

NETWORKID
The network identifier.
Field Name: QW0124NI

LUNAME
The logical unit name.
Field Name: QW0124LM

UNIQUENESS VALUE
The instance number.
Field Name: QW0124UV

LUWSEQ
The LUW sequence number.
Field Name: QW0124CC

ENDUSER
The user ID at the end user's workstation.
IFCID 124 - SQL Statement Record

Field Name: QW0124EI

WSNAME

The workstation name of the end user.

Field Name: QW0124EW

TRANSACT

The transaction name of the end user.

Field Name: QW0124ET

IFCID 125 - RID Pool Processing:

This topic shows detailed information about “Record Trace - IFCID 125 - RID Pool Processing”.

This record is written when performance class 8 is ON. Monitor privilege is required for reading via IFI. The record contains standard information and one section for each index used to obtain candidate record identifiers (RIDs).

Record trace - IFCID 125 - RID Pool Processing

The field labels shown in the following sample layout of “Record Trace - IFCID 125 - RID Pool Processing” are described in the following section.

<table>

</tbody>
</table>

COLLECTION

Package collection identifier for this query.

Field Name: QW0125PC

PLAN NAME

Plan name for this query.

Field Name: QW0125PL

PROG NAME

Program name for this query.

Field Name: QW0125PN

STATEMENT NUMB

Statement number for this query.

Field Name: QW0125SN

CONSISTENCY TOKEN
Consistency token for this query.

Field Name: QW0125TS

**USED**

Indicates whether multiple index access paths are used, or whether RID pool processing is invoked.

Field Name: QW0125AT

**NOT USED**

Indicates why multiple index access paths are not used, or whether RID pool processing is not invoked.

Field Name: QW0125MR or QW0125NS

QW0125MR or QW0125NS (but not both) may be used as the basis to print the value in the report. If QW0125NS is set to “S”, it takes precedence.

**LEGS REORDERED**

Indicates that the legs of a multiple index access path are reordered. It can have the following values:

- Yes
- No

Field Name: QW0125RE

**ADAPT IDX PROCESS**

Indicates whether adaptive index processing was done. It can have the following values:

- Yes
- No

Field Name: QW0125AD

**RIDS IN FINAL LIST**

The number of record identifiers in the final index list. It indicates how many RID sections are printed. Each RID section contains one set of DBID, INDEX RID, OBID, and THRESHOLD data.

This field can also contain NO STORAGE, or MAX EXCEEDED.

Field Name: QW0125NR

**DBID**

The database ID. Deduced from the DB2 fields QW0125DB, QW0105DN or QW0107DN.

When present, the database name is shown, otherwise the decimal identifier from QW0125DB is shown, or N/A when this value is 0.

Field Name: RT0125DB

**INDEX RIDS**

The number of record identifiers in the index. This field can also contain one of the following values:

- NO RETRIEVAL
- NO STORAGE
- LIMIT EXCEEDED
- N/P
Field Name: QW0125RI

OBID

The object ID. Deduced from the DB2 fields QW0125OB, QW0105TN or QW0107TN.

When present, the name of the object is shown, otherwise the decimal identifier from QW0125OB is shown, or N/A when this value is 0.

Field Name: RT0125OB

THRESHOLD

The highest value of RIDs allowed for this index.

Field Name: QW0125TH

ESTIMATE RIDS IN IDX

The index probing estimate of the total number of record identifiers (RIDs) in the index (set to MAX BIGINT for full leg).

Field Name: QW0125TI

ESTIMATE RIDS IN KEYRANGE

The index probing estimate of the number of record identifiers (RIDs) within the key range, adjusted for filter factor.

Field Name: QW0125QI

RSN TERMINATED

The reason why a leg of a multiple index access path was terminated:

F     The leg was marked FULL.
T     The leg had less than 32 record identifiers (RIDs).

Field Name: QW0125_TRSN

This field may be left blank.

RSN NOT PROBED

The reason why a leg of a multiple index access path was not probed:

A     All legs fetched all record identifiers (RIDs).
B     This leg fetched all RIDs (< 1 RIDblock).
E     Probing failed.
F     A leg was marked FULL.
K     Probing is not done because a high or low key is missing.
M     A mix of R, I, or U entries is not reordered.
O     Access Path Selection (APS) indicated not to probe.
S     An earlier leg of index intersection (AND) processing was likely to have performed a high degree of filtering.
V     A leg was likely to have performed a high degree of filtering.

Field Name: QW0125_PRSN

This field may be left blank.
The reason why a leg of a multiple index access path was reordered:

P  Probing was performed.
V  The leg was likely to have performed a high degree of filtering.

Field Name: QW0125_ORSN
This field may be left blank.

RSN MRKED FULL
The reason why a leg of a multiple index access path was marked FULL:

G  AGGRESSIVE termination of a leg was done.
L  The predicate contained a non-filtering LIKE clause.
M  Neither index union (OR) processing nor index intersection (AND) processing was done, and the estimated number of RIDS was greater than the RID list logical limit.
P  Index union (OR) processing was done, and the estimated number of record identifiers (RIDs) was greater than 30% of the table, or index intersection (AND) processing was done, and the estimated number of RIDS was greater than 50% of the table.
R  The predicate was a range predicate (non-LIKE).
T  Index intersection (AND) processing was done. It was greater than or equal to 35%, and the most selective leg was processed first.

Field Name: QW0125_FRSN
This field may be left blank.

IFCID 126 - Log Buffer Write:
This topic shows detailed information about “Record Trace - IFCID 126 - Log Buffer Write”.

Record trace - IFCID 126 - Log Buffer Write
The field labels shown in the following sample layout of “Record Trace - IFCID 126 - Log Buffer Write” are described in the following section.

IFCID 127 - Page Wait I/O In Prog (Start):
This topic shows detailed information about “Record Trace - IFCID 127 - Page Wait I/O In Prog (Start)”.

Record trace - IFCID 127 - Page Wait I/O In Prog (Start)
The field labels shown in the following sample layout of “Record Trace - IFCID 127 - Page Wait I/O In Prog (Start)” are described in the following section.
DBID
The database ID. Deduced from the DB2 fields QW0127DB, QW0105DN or QW0107DN.
When present, the database name is shown, otherwise the decimal identifier from QW0127DB is shown, or N/A when this value is 0.
Field Name: RT0127DB

OBID / PSID
For classic segmented table spaces, this value shows the table OBID. For partitioned table spaces, it is the PSID of the table space. Deduced from the DB2 fields QW0127OB, QW0105TN, or QW0107TN.
When present, the name of the object is shown, otherwise the decimal identifier from QW0127OB is shown, or N/A when this value is 0.
Field Name: RT0127OB

PAGE NUMBER
The number of the page being read or written.
Field Name: QW0127PN

PAGE NUMBERING
Indicates how page numbers are shown for partitioned tables:
REL Indicates that relative page numbers are shown in the partition.
ABS Indicates that absolute page numbers are shown in the partition.
N/A Not applicable.
Field Name: QW0127P1

PARTITION
Shows the partition number or 0 if non-partitioned.
Field Name: QW0127PT

TYPE OF I/O
The type of I/O process.
Field Name: QW0127F

POOL ID
The buffer pool internal identifier. The values 0 through 49 are the identifiers for BP0 through BP49. The values 80 through 89 are the identifiers for BP32K through BP32K9.
Field Name: QW0127BP

ACE
The relative number of the agent control element address in the ACE cross-reference table. This table is printed at the end of each location for every trace specified.
Field Name: QW0127AC

TABLE SPACE TYPE
The type of the table space:
IFCID 128 - Page Wait I/O In Prog (Start)

L Non-EA large table
N Non-large table
V EA-enabled large table

Field Name: QW0127FG

IFCID 128 - Page Wait I/O In Prog (End):

This topic shows detailed information about “Record Trace - IFCID 128 - Page Wait I/O In Prog (End)”.

Record trace - IFCID 128 - Page Wait I/O In Prog (End)

The field labels shown in the following sample layout of “Record Trace - IFCID 128 - Page Wait I/O In Prog (End)” are described in the following section.

DBID: TDKURDB
OBID: TDKURTS1
PAGE NUMBER: X'00000000'
PAGE NUMBERING: ABS
PARTITION: 1
TYPE OF I/O: FORCE WRITE
ACE: 1
STATUS FL: NOT CANCELED
TABLE_SPACE_TYPE: L

DBID

The database ID. Deduced from the DB2 fields QW0128DB, QW0105DN or QW0107DN.

When present, the database name is shown, otherwise the decimal identifier from QW0128DB is shown, or N/A when this value is 0.

Field Name: RT0128DB

OBID / PSID

For classic segmented table spaces, this value shows the table OBID. For partitioned table spaces, it is the PSID of the table space. Deduced from the DB2 fields QW0128OB, QW0105TN, or QW0107TN.

When present, the name of the object is shown, otherwise the decimal identifier from QW0128OB is shown, or N/A when this value is 0.

Field Name: RT0128OB

PAGE NUMBER

The number of the page being read or written.

Field Name: QW0128PN

PAGE NUMBERING

Indicates how page numbers are shown for partitioned tables:

REL Indicates that relative page numbers are shown in the partition.
ABS Indicates that absolute page numbers are shown in the partition.
N/A Not applicable.

Field Name: QW0128P1

PARTITION

Shows the partition number or 0 if non-partitioned.

Field Name: QW0128PT

TYPE OF I/O

Chapter 6. Batch reporting 3911
IFCID 128 - Page Wait I/O In Prog (End)

The type of I/O process.

Field Name: QW0128F

ACE

The relative number of the agent control element address in the ACE cross-reference table. This table is printed at the end of each location for every trace specified.

Field Name: QW0128AC

STATUS FL

The status flag indicating whether the I/O process was canceled.

Field Name: QW0128S

TABLE SPACE TYPE

The type of the table space:

L  Non-EA large table
N  Non-large table
V  EA-enabled large table

Field Name: QW0128FG

IFCID 129 - CI-S Obtained via IFI Reads:

This topic shows detailed information about “Record Trace - IFCID 129 - CI-S Obtained via IFI Reads”.

Record trace - IFCID 129 - CI-S Obtained via IFI Reads

The field labels shown in the following sample layout of “Record Trace - IFCID 129 - CI-S Obtained via IFI Reads” are described in the following section.

IFCID 140 - Audit Auth Failures:

This topic shows detailed information about “Record Trace - IFCID 140 - Audit Auth Failures”.

Record trace - IFCID 140 - Audit Auth Failures

The field labels shown in the following sample layout of “Record Trace - IFCID 140 - Audit Auth Failures” are described in the following section.
RID OF ROW: ‘BLANK’ SECLABEL OF ROW: ‘BLANK’
AUTH ID TYPE: PRIMARY OR SECONDARY AUTH ID

AUTH CHECKED
The authorization ID being checked.
Field Name: QW0140UR

REASON
The user-defined reason code from the access control authorization exit routine.
Field Name: QW0140RS

STATMNT LENGTH
Is the length of the failing SQL statement plus 4. It is zero (0) if no SQL statement exists.
Field Name: QW0140LL

PRIV CHECKED
The privilege that was checked. Possible values are provided in the DB2 macro DSNDQW02.
Field Name: QW0140PR

RETCOD
The return code from the access control authorization exit routine.
Field Name: QW0140RC

OBJECT
The object type. N/P is printed if there is no object type. Possible values are:
- ACEE
- APPLICATION PLAN
- BUFFERPOOL
- COLLECTION
- DATABASE
- DISTINCT TYPE
- FUNCTION
- JAR
- PACKAGE
- PROCEDURE
- ROW
- SCHEMA
- SEQUENCE
- STORAGE GROUP
- TABLE OR VIEW
- TABLESPACE
- USER AUTH
  System privileges, such as SYSADM or SYSOPR
Field Name: QW0140OB
OPTIONS

The options used in the host to check the SQL statement. The bits of this field are used as indicators. If all bits are 0, the statement is not an SQL statement. The values are:

Bit 1  Host language character string delimiter
       0    Apostrophe
       1    Quote

Bit 2  Decimal point symbol
       0    Period
       1    Comma

Bit 3  SQL character string delimiter
       0    Apostrophe
       1    Quote

Bit 4  Mixed character string indicator
       0    No
       1    Yes

Bit 5  Host language options indicator
       0    Do not use host language options
       1    Use host language options

Bits 6 to 8  Host language indicator
             001  Assembler
             010  Cobol
             011  PL/I
             100  None - Dynamic SQL
             101  Fortran
             110  Cobol2
             111  Null - See bits 17 to 24 for the language

Bits 9 to 16  Character set being used
              00000000  Alphanumeric
              00000001  Katakana

Bits 17 to 24  Alternate host language field
              B    Assembler
              C    Cobol
              P    PL/I
              F    Fortran
IFCID 140 - Audit Auth Failures

2 Cobol2
D C

**Bits 25 to 28**
Time option

0000 None
1000 Local
0100 JIS
0010 ISO/EUR
0001 USA

**Bits 29 to 32**

00000000 No SQLFLAG option
00000001 SQLFLAG(SAA)

**Field Name:** QW0140HO

**SOURCE OBJECT**
The source object name.

**Field Name:** QW0140SN

**SOURCE OWNER**
The source object owner.

**Field Name:** QW0140SC
IFCID 140 - Audit Auth Failures

TARGET OBJECT
The target object name.
Field Name: QW0140TN

TARGET OWNER
The target object owner.
Field Name: QW0140TC

SQL_STMT
The SQL statement text. Long SQL text can be truncated.
Field Name: QW0140SQ

ACEE_U_TOKEN
Shows the ACEE U_TOKEN, if it is available. If it is not available, the first word of this field contains one of the following values:
0   The U_TOKEN cannot be accessed
-1  An abend occurred during the attempt to access the ACEE.
Field Name: QW0140UT

RID OF ROW
Shows the RID of the row that is updated or deleted if the table has multilevel security.
Field Name: QW0140ID

SECLABEL OF ROW
Shows the security label of the row, for a table with multilevel security.
Field Name: QW0140RL

AUTH ID TYPE
The authorization ID type. Possible values are:
L     A ROLE is used.
blank The user ID of the primary or the secondary authorization ID is used.
N/P   A blank is shown in the performance database.
N/A   A blank is shown in the performance database.
Field Name: QW0140AT

IFCID 141 - Audit DDL Grant/Revoke:
This topic shows detailed information about “Record Trace - IFCID 141 - Audit DDL Grant/Revoke”.

Record trace - IFCID 141 - Audit DDL Grant/Revoke
The field labels shown in the following sample layout of “Record Trace - IFCID 141 - Audit DDL Grant/Revoke” are described in the following section.
GRANTOR/REVOKER

The authorization ID of the user (grantor/revoker) who received access. Possible values are:

- **L**: A ROLE is used.
- **blank**: The user ID of the primary or the secondary authorization ID is used.
- **N/P**: A blank is shown in the performance database.
- **N/A**: A blank is shown in the performance database.

**Field Name**: QW0141OR

REASON

The reason why access was granted.

In the Audit report set this field is only valid for GRANTS. It indicates the authorization level of the grantor. For REVOKEs and unsuccessful GRANTS, N/A is printed.

Possible values are:
- PACKADMA (abbreviation for PACKADM ON ALL COLLECTIONS)
- DBCTRL
- DBADM
- SECADM
- ACCCTRL (abbreviation for ACCESSCTRL)
- SYSCTRL
- DBMAINT
- SYSOPR
- PACKADMS (abbreviation for PACKADM ON A SPECIFIC COLLECTION-ID)
- SYSADM

**Field Name**: QW0141RE

RETURN

The SQL return code.

**Field Name**: QW0141CO

OBJECT

The object type. Possible values are:

**BUFFERPOOL**
Buffer Pool

**COLLECTION**
Collection

**DATABASE**
Database
DISTINCT TYPE
  Distinct Type

FUNCTION
  Function

Field Name: QW0141HO

GRANTOR TYPE/REVOKER TYPE

The authorization ID of the owner. Possible values are:

A ROLE or ROLE
A role is used.

PRIMARY OR SECONDARY AUTH ID or PRIM/SECOND AUTHID
The user ID of the primary or the secondary authorization ID is used.

N/P or N/A
The field is not present or not applicable. String NONE is shown in the performance database.

N/A  A blank is shown in the performance database.

Field Name: QW0141OT

SQL STMT

The SQL statement text. Long SQL text can be truncated.

Field Name: QW0141TX

IFCID 142 - Audit DDL Create/Alter/Drop:

This topic shows detailed information about “Record Trace - IFCID 142 - Audit DDL Create/Alter/Drop”.

Audit DDL reports on SQL CREATE, ALTER, and DROP statements executed against an auditable object.

The SQL statement types are AUDIT DDL CREATE, AUDIT DDL ALTER, or AUDIT DDL DROP. These statements are all reported in the same format.

Record trace - IFCID 142 - Audit DDL Create/Alter/Drop

The field labels shown in the following sample layout of “Record Trace - IFCID 142 - Audit DDL Create/Alter/Drop” are described in the following section.

AUDIT DDL  NETWORKID: DEIBMIPS LUNAME: IPSAU851 LUWSEQ: 1
UNKNOWN  TABLE NAME : AUDTB1
TABLE OWNER : PRL
TABLE CREATOR: PRL
TABLE OWNER TYPE:N/A
OPTIONS: X'0400000000000000'
DATABASE: 264
TABLE OBID: 3
SECLABEL OF MLS TABLE: N/P
MULTILEVEL SECURITY: N/P

SQL STMT:
CREATE TABLE PRL.AUDTB1 (IDCOLUMN INTEGER
GENERATED ALWAYS AS IDENTITY, NNAME VARCHAR
(50) NOT NULL, VNAME CHAR(10) NOT NULL,
ANZAHL INTEGER NOT NULL) AUDIT ALL IN

TABLE NAME
The table name being created, altered, or dropped.
Field Name: QW0142TN

TABLE OWNER
The table owner (same as table qualifier).
Field Name: QW0142OW

TABLE CREATOR
The table creator.
Field Name: QW0142CR

TABLE OWNER TYPE
The type of the table owner (grantor or revoker). Possible values are:
L A ROLE is used.
blank The user ID of the primary or the secondary authorization ID is used.
N/P A blank is shown in the performance database.
N/A A blank is shown in the performance database.
Field Name: QW0142OR

OPTIONS
The options used in the host to check the SQL statement. The bits of this field are used as indicators. If all bits are 0, the statement is not an SQL statement. The values are:

Bit 1 Host language character string delimiter
0 Apostrophe
1 Quote

Bit 2 Decimal point symbol
0 Period
1 Comma

Bit 3 SQL character string delimiter
0 Apostrophe
1 Quote

Bit 4 Mixed character string indicator
0 No
**IFCID 142 - Audit DDL Create/Alter/Drop**

1 Yes

**Bit 5**  Host language options indicator
0 Do not use host language options
1 Use host language options

**Bits 6 to 8**  Host language indicator
001 Assembler
010 Cobol
011 PL/I
100 None - Dynamic SQL
101 Fortran
110 Cobol2
111 Null - See bits 17 to 24 for the language

**Bits 9 to 16**  Character set being used
00000000 Alphanumeric
00000001 Katakana

**Bits 17 to 24**  Alternate host language field

00000000 No SQLFLAG option
00000001 SQLFLAG(SAA)

**Field Name:** QW0142HO

**DATABASE**

The database ID. Deduced from the DB2 fields QW0142DB, QW0105DN or QW0107DN.

When present, the database name is shown, otherwise the decimal identifier from QW0142DB is shown, or N/A when this value is 0.

**Field Name:** RT0142DB

**TABLE OBID**

The object ID. Deduced from the DB2 fields QW0142OB, QW0105TN or QW0107TN.

When present, the name of the object is shown, otherwise the decimal identifier from QW0142OB is shown, or N/A when this value is 0.

**Field Name:** RT0142OB

**SECLABEL OF MLS TABLE**

The security label that is used when the table is defined.

**Field Name:** QW0142SL

**MULTILEVEL SECURITY**

The Multilevel Security (MLS) table can contain the following values:

**YES** For a Create or Drop operation of a table that has multilevel security, or for an Alter operation of a table to add a security label column.

**NO** For an Alter operation of a table that has multilevel security.

**NON MLS TABLE**

The table does not have multilevel security.
IFCID 142 - Audit DDL Create/Alter/Drop

N/P Not present. A blank is shown in the performance database.
N/A A blank is shown in the performance database.

Field Name: QW0142ML

ROW/CLMN ACCESS CTRL

The access control field contains data about ROW-LEVEL and COLUMN-LEVEL (R/C) ACCESS CONTROL in DDL. It can have the following values:

'R' (ROW)
Activates row-level access control.

'C' (COLUMN)
Activates column-level access control.

'B' (BOTH)
Activates row-level and column-level access control.

' ' (NONE)
Activates no access control.

Field Name: QW0142RC

SQL STMT

The SQL statement text. Long SQL text can be truncated.

Field Name: QW0142TX

IFCID 143 - Audit First Write:

This topic shows detailed information about “Record Trace - IFCID 143 - Audit First Write”.

Record trace - IFCID 143 - Audit First Write

The field labels shown in the following sample layout of “Record Trace - IFCID 143 - Audit First Write” are described in the following section.

DATABASE: DSNBD23A  LOGRBA: X'0000000000000000'
PAGE SET: 4  TABLE OBID: 14

DATABASE
The database ID. Deduced from the DB2 fields QW0143DB, QW0105DN or QW0107DN.

When present, the database name is shown, otherwise the decimal identifier from QW0143DB is shown, or N/A when this value is 0.

Field Name: RT0143DB

LOGRBA
The identifier of the unit of recovery.

Field Name: QW0143UR

PAGESET
The page set name or decimal identifier.

Field Name: RT0143PS

TABLE OBID
IFCID 143 - Audit First Write

The object ID. Deduced from the DB2 fields QW0143OB, QW0105TN or QW0107TN.

When present, the name of the object is shown, otherwise the decimal identifier from QW0143OB is shown or N/A when this value is 0.

Field Name: RT0143OB

IFCID 144 - Audit First Read:

This topic shows detailed information about “Record Trace - IFCID 144 - Audit First Read”.

Record trace - IFCID 144 - Audit First Read

The field labels shown in the following sample layout of “Record Trace - IFCID 144 - Audit First Read” are described in the following section.

DATABASE: DSND006
LOGRBA: X’000000000000’
PAGE SET: DSNDX01
TABLE OBID: 5

DATABASE

The database ID. Deduced from the DB2 fields QW0144DB, QW0105DN or QW0107DN.

When present, the database name is shown, otherwise the decimal identifier from QW0144DB is shown, or N/A when this value is 0.

Field Name: RT0144DB

LOGRBA

The identifier of the unit of recovery.

Field Name: QW0144UR

PAGESET

The page set name or decimal identifier.

Field Name: QW0144PS

IFCID 145 - Audit DML Statement:

This topic shows detailed information about “Record Trace - IFCID 145 - Audit DML Statement”.

Record trace - IFCID 145 - Audit DML Statement

The field labels shown in the following sample layout of “Record Trace - IFCID 145 - Audit DML Statement” are described in the following section.

*** AUDIT LOG RECORD ***

SECTION 1 - AUDIT INFORMATION:

LOCATION NAME: DB0B
PKG COLLECT ID: DSNTEP2
PROGRAM NAME: DSNTEP2
STMT TIME : X'10CABFE7169A11C0'
TYPE : SELECT - QUERY
SQL CODE : 0
STMT # : 1829
HOST OPTIONS : X'0400000000000000'
STMT ID : 50
OBID/OBID # : 1
MASK/PERM # : 2

LOCATION NAME (LONG): DB0B
PKG COLLECT ID (LONG): DSNTEP2
PROGRAM NAME (LONG): DSNTEP2

SECTION 2 - AUDIT OBJECTS:

Chapter 6. Batch reporting 3925
IFCID 145 - Audit DML Statement

DATABASE: 353  TABLE OBID: 3

SECTION 3 - ROW/COLUMN ACCESS CTRL OBJECTS:

SCHEMA NAME: DB0BSECA
OBJECT NAME: INCOME_BRANCH

SCHEMA NAME: DB0BSECA
OBJECT NAME: RA01_CUSTOMERS

SECTION 4 - SQL STATEMENT TEXT:

SELECT * FROM DB2R5.CUSTOMER

LOCATION NAME
The location name.
Field Name: QW0145LN

PKG COLLECT ID
The package collection identifier.
Field Name: QW0145PC

PROGRAM NAME
The program name.
Field Name: QW0145PN

STMT TIME
The hexadecimal value of the precompiler timestamp.
Field Name: QW0145TS

TYPE
The SQL statement type.
Field Name: QW0145ST

ISOLATION
The isolation level of the DML statement:
RR  Repeatable read
CS  Cursor stability
RS  Read stability
UR  Uncommitted read
XR  Repeatable read with X lock
XS  Read stability with X lock
Field Name: QW0145IS

HOST OPTIONS
The options used in the host to check the SQL statement. The bits of this field are used as indicators. If all bits are 0, the statement is not an SQL statement. The values are:

Bit 1  Host language character string delimiter
  0    Apostrophe
  1    Quote

Bit 2  Decimal point symbol

3926  IBM Db2 Performance Expert on z/OS
0     Period
1     Comma

**Bit 3**  SQL character string delimiter
0     Apostrophe
1     Quote

**Bit 4**  Mixed character string indicator
0     No
1     Yes

**Bit 5**  Host language options indicator
0     Do not use host language options
1     Use host language options

**Bits 6 to 8**  Host language indicator
001     Assembler
010     Cobol
011     PL/I
100     None - Dynamic SQL
101     Fortran
110     Cobol2
111     Null - See bits 17 to 24 for the language

**Bits 9 to 16**  Character set being used
00000000     Alphanumeric
00000001     Katakana

**Bits 17 to 24**  Alternate host language field
B     Assembler
C     Cobol
P     PL/I
F     Fortran
2     Cobol2
D     C

**Bits 25 to 28**  Time Option
0000     None
1000     Local
0100     JIS

0000  None
1000  Local
0100  EUR
0010  ISO/JIS
0001  USA

Bit 33  Decimal
0  No
1  Yes

Bits 34 to 40
Unused

Bits 41 to 48
Remote option
00000001
  SQL(ALL)
00000010
  SQL(DB2)

Bits 49 to 56
SQL flag option
00000000
  No SQLFLAG option
00000001
  SQLFLAG(SAA)

Field Name: QW0145HO

SQL CODE
The SQLCODE of the SQL statement.

Field Name: QW0145SC

STMT #
The precompiler statement number.

Field Name: QW0145SN

STMT ID
The SQL unique statement ID.

Field Name: QW0145SI

DBID/OBID #
The number of unique non-zero DBID and OBID in the audited statement.

Field Name: QW0145OB_NUM

MASK/PERM #
The number of masks or permissions enforced in the audited statement.

Field Name: QW0145AC_NUM

LOCATION NAME (LONG)
The location name.
Field Name: QW0145LN

PKG COLLECT ID (LONG)
The package collection identifier.
Field Name: QW0145PC

PROGRAM NAME (LONG)
The program name.
Field Name: QW0145PN

DATABASE
The audit log table DBID in hexadecimal.
Field Name: QW0145DB

TABLE OBID
The audit log table OBID in hexadecimal.
Field Name: QW0145OB

SCHEMA NAME
The name of the access control schema.
Field Name: QW0145AS

OBJECT NAME
The name of the access control object.
Field Name: QW0145AO

SECTION 4 - SQL STATEMENT TEXT (NO LABEL)
The SQL statement text associated with the BIND. If SQL text is not present, N/P is printed. Long SQL text can be truncated.
Field Name: QW0145RT

IFCID 146 - User Record:

This topic shows detailed information about “Record Trace - IFCID 146 - User Record”.

When present, the IFCID 146 record is printed in the standard hexadecimal dump format. The character format is on the right.

IFCID 147 - Thread Summary:  This record only contains data from an Online Monitor trace data set.

IFCID 147 - Data Sharing Accounting Data:

This topic shows detailed information about “Record Trace - IFCID 147 - Data Sharing Accounting Data”.

Chapter 6. Batch reporting  3929
IFCID 147 - Data Sharing Accounting Data

Record trace - IFCID 147 - Data Sharing Accounting Data

The field labels shown in the following sample layout of “Record Trace - IFCID 147 - Data Sharing Accounting Data” are described in the following section.

DATA SHARING ACCOUNTING DATA
MEMBER NAMES: N/P

MEMBER NAMES

For an assisting task, the name of the parallelism coordinator. For a coordinating task, the name of each assisting member.

Field Name: QWDAXCQO

IFCID 147 - Distributed Header Data:

This topic shows detailed information about “Record Trace - IFCID 147 - Distributed Header Data”.

Place text here

Record trace - IFCID 147 - Distributed Header Data

The field labels shown in the following sample layout of “Record Trace - IFCID 147 - Distributed Header Data” are described in the following section.

DISTRIBUTED HEADER DATA
REQUESTING LOCATION : REQUESTLOCATION1
AR NAME : SRVNAMPARAMETER1
REQUESTING TIMESTAMP : N/P PRDID : PRD VID R0 M1

REQUESTING LOCATION

The location name of the requester. If the thread is an allied thread (no distributed requests) or the thread is an allied-distributed thread (this location is the requester), OMEGAMON XE for DB2 PE sets this field equal to the local location. If the thread is a database access thread (this location is a server).

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup. For parallel query rollup records, the value will be derived from the parent record.

Field Name: QWHDRQNM

AR NAME

The application requester name.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup. For parallel query rollup records, the value will be derived from the parent record.

Field Name: QWHDSVNM

REQUESTING TIMESTAMP

The timestamp for database access thread (DBAT) records.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup. For parallel query rollup records, the value will be derived from the parent record.

Field Name: QWHDTSTP
PRIDID

Shows the product identifier (ID) of the requester. It can have the following values:

- **DB2** For DB2 UDB for z/OS
- **SQL/DS** For DB2 UDB for VSE and VM
- **JDBC DRIVER** For Universal JDBC driver
- **COMMON SER** For DB2 UDB for Linux, UNIX, Windows
- **DB2/400** For DB2 UDB for iSeries

Otherwise, it shows the first 3 characters of the product ID, or N/P if the record was written at the application requester location.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup. For parallel query rollup records, the value will be derived from the parent record.

**Field Name:** QWHDPRID

**IFCID 147 - Instrumentation Accounting Data:**

This topic shows detailed information about “Record Trace - IFCID 147 - Instrumentation Accounting Data”.

**Note:** This report has the same layout as IFCID 003, for details refer to “IFCID 003 - Instrumentation Accounting Data” on page 3679.

**IFCID 147 - Instrumentation Accounting Data Overflow:**

This topic shows detailed information about “Record Trace - IFCID 147 - Instrumentation Accounting Data Overflow”.

**Note:** This report has the same layout as IFCID 003, for details refer to “IFCID 003 - Instrumentation Accounting Data Overflow” on page 3694.

**Record trace - IFCID 147 - Instrumentation Accounting Data Overflow**

The field labels shown in the following sample layout of “Record Trace - IFCID 147 - Instrumentation Accounting Data Overflow” are described in the following section.

```
INSTRUMENTATION ACCOUNTING DATA OVERFLOW

ARCH.LOG(QUES) SUSP TIME  0.000000  ARCH.LOG(QUES) SUSP EVENTS  0
ACUM. READ SUSP TIME       0.000000  ACUM. READ SUSP EVENTS     0
DRAIN LOCK SUSP TIME       0.000000  DRAIN LOCK SUSP EVENTS      0
CLAIM RELEASE SUSP TIME    0.000000  CLAIM RELEASE SUSP EVENTS   0
I/O SERVICE TASK SUSP TIME 0.000000  I/O SERVICE TASK SUSP EVENTS 0
SYSLGRNG SUSP TIME          0.000000  SYSLGRNG SUSP EVENTS        0
DS MANAGER SUSP TIME        0.000000  DS MANAGER SUSP EVENTS      0
OTHER SERVICE SUSP TIME     0.000000  OTHER SERVICE SUSP EVENTS   0
COMMIT PHI WRITE I/O TIME   0.000000  COMMIT PHI WRITE I/O EVENTS 0
ASYNCH. IXL REG. TIME      0.000000  ASYNCH. IXL EVENTS          0
LOB COMPRESSION SUSP TIME   0.000000  LOB COMPRESSION SUSP EVENTS 0
FAST INSERT PIPE WAIT TIME  0.000000  FAST INSERT PIPE WAIT EVENTS 0
SYNC READ DASD CACHE HIT WAIT TIME 0.000000  SYNC READ WAIT DASD CACHE HIT EVENTS 0
```

**ARCH.LOG(QUES) SUSP TIME**
The accumulated waiting time due to the processing of ARCHIVE LOG MODE(QUIESCE) commands.
This time does not represent the time required to perform the entire command.

**Field Name:** QWAXALOG

This is an *exception* field.

**ARCH.LOG(QUIES) SUSP EVENTS**
The number of ARCHIVE LOG MODE (QUIESCE) commands issued.

**Field Name:** QWAXALCT

**ACCUM. READ SUSP TIME**
The accumulated wait time for:
- Archive Log reads
- Active Log reads
- Active Log prefetch reads
- Fast Log apply log reads

**Field Name:** QWAXAWAR

**WAIT TRACE READ EVENTS**
**DB2 V8:** The number of wait trace events processed for archive reads, active reads, and active log prefetch reads.

**Field Name:** QWAXANAR

**DRAIN LOCK SUSP TIME**
The accumulated waiting time for a drain lock. This is the time the requester is suspended while waiting to acquire the drain lock.

**Field Name:** QWAXAWDR

This is an *exception* field.

**DRAIN LOCK SUSP EVENTS**
The number of wait trace events processed for waits for drain locks.

**Field Name:** QWAXARND

**CLAIM RELEASE SUSP TIME**
The accumulated waiting time for a drain waiting for claims to be released. After the drain lock is acquired, the drainer must wait for claim holders to release the object.

**Field Name:** QWAXAWCL

This is an *exception* field.

**CLAIM RELEASE SUSP EVENTS**
The number of wait trace events processed for waits for claims to be released.

**Field Name:** QWAXARNC

**I/O SERVICE TASK SUSP TIME**
Accumulated waiting time for a synchronous execution unit switch to the DB2 OPEN/CLOSE data set service for the HSM recall service.
This value is an average.

**Field Name:** QWAXOCSE

**I/O SERVICE TASK SUSP EVENTS**

Number of wait trace events processed of waits for synchronous execution unit switching to the Open/Close service.

**Field Name:** QWAXOCNS

**SYSLGRNG SUSP TIME**

Accumulated wait time for a synchronous execution unit switch to the DB2 SYSLGRNG recording service. This service is sometimes used for Level ID checking for downlevel detection.

This value is an average.

**Field Name:** QWAXSLS

**DS MANAGER SUSP TIME**

Accumulated wait time for a synchronous execution unit switch to the DB2 data space manager services. This includes DEFINE DATA SET, EXTEND DATA SET, DELETE DATA SET, RESET DATA SET, and VSAM CATALOG ACCESS.

This value is an average.

**Field Name:** QWAXDSN

**OTHER SERVICE SUSP TIME**

Could be due to a VSAM catalog update. In the distributed environment, it includes the waiting time for the response from the server system. Performance trace for IFCID 46 to 50, 170, and 171 provide more detailed information for analysis.

**Field Name:** QWAXOTS

**COMMIT PH1 WRITE I/O TIME**

The accumulated time waiting for phase 1 commit write I/O. An example for this suspension is LOB Table Space with LOG NO Phase 1 commit database synchronous write I/O processing.

**Field Name:** QWAXAWF
COMMIT PH1 WRITE I/O EVENTS
The total number of wait trace events for commit phase 1 I/O.

Field Name: ADFCSUSC

ASYNC. IXL REQ. TIME
The accumulated wait time for IXLCACHE and IXLFCOMP requests.

Field Name: QWAXIXLT

ASYNC. IXL EVENTS
Number of wait trace events processed for asynchronous IXLCACHE or IXLFCOMP invocations.

Field Name: QWAXIXLE

LOB COMPRESSION SUSP TIME
The accumulated time waiting for a compression of DB2 large objects (LOB) (DB2 field QWAX_LOBCOMP_WAIT).

Field Name: QWAX_LOBCOMP_WAIT

LOB COMPRESSION SUSP EVENTS
The number of wait trace events processed for DB2 large object (LOB) compressions.

Field Name: QWAX_LOBCOMP_COUNT

FAST INSERT PIPE WAIT TIME
The accumulated wait time for a pipe while this package was executed (DB2 field QPAC_PIPE_WAIT).

Field Name: QPAC_PIPE_WAIT

FAST INSERT PIPE WAIT EVENTS
The number of wait trace events that were processed for waits for a pipe while this package was executed (DB2 field QPAC_PIPEWAIT_COUNT).

Field Name: QPAC_PIPEWAIT_COUNT

SYNC READ DASD CACHE HIT WAIT TIME
The amount of time spent waiting for synchronous database reads where the requested pages were found in the DASD subsystem’s cache.

Field Name: QWACAWTD

SYNC READ WAIT DASD CACHE HIT EVENTS
The number of times the thread waited for synchronous database reads where the requested pages were found in the DASD subsystem’s cache.

Field Name: QWACAWCD

IFCID 147 - Logging:
This topic shows detailed information about “Record Trace - IFCID 147 - Logging”.

Record trace - IFCID 147 - Logging
The field labels shown in the following sample layout of “Record Trace - IFCID 147 - Logging” are described in the following section.

LOGGING
LOG RECORDS WRITTEN 0  BYTES LOGGED 0
LOG RECORDS WRITTEN

The number of log records written.

**Field Name:** QWACLRNL

BYTES LOGGED

The number of log record bytes written. This field is calculated from DB2 fields QWACLRAB x QWACLRNL.

**Field Name:** RT0147BW

IFCID 147 - Monitor Detail Data:

This topic shows detailed information about “Record Trace - IFCID 147 - Monitor Detail Data”.

Record trace - IFCID 147 - Monitor Detail Data

The field labels shown in the following sample layout of “Record Trace - IFCID 147 - Monitor Detail Data” are described in the following section.

API BEGIN ELAPSED TIME

The API begin elapsed time in the format day, hour, minute, second, and milliogth of a second. If the value is 0, N/P is printed.

**Field Name:** QW0148AB

API ENDING ELAPSED TIME

The API ending elapsed time in the format day, hour, minute, second, and milliogth of a second. If the value is 0, N/P is printed.

**Field Name:** QW0148AE

API BEGIN CPU TIME

The API beginning CPU time in the format minute, second, and milliogth of a second. If the value is 0, N/P is printed.

**Field Name:** QW0148AE

API ENDING CPU TIME

The API ending CPU time in the format minute, second, and milliogth of a second. If the value is 0, N/P is printed.

**Field Name:** QW0148UB

Chapter 6. Batch reporting 3935
IFCID 147 - Monitor Detail Data

The API ending CPU time in the format minute, second, and millionth of a second. If the value is 0, N/P is printed.

Field Name: QW0148UE

API BEGIN SRB TIME

The API beginning SRB time in the format minute, second, and millionth of a second. If the value is 0, N/P is printed.

Field Name: QW0148SB

API ENDING SRB TIME

The API ending SRB time in the format minute, second, and millionth of a second. If the value is 0, N/P is printed.

Field Name: QW0148SE

IFI BEGIN ELAPSED TIME

The IFI begin elapsed time in the format day, hour, minute, second, and millionth of a second. If the value is 0, N/P is printed.

Field Name: QW148IAB

IFI ENDING ELAPSED TIME

The IFI ending elapsed time in the format day, hour, minute, second, and millionth of a second. If the value is 0, N/P is printed.

Field Name: QW148IAE

IFI BEGIN CPU TIME

The IFI beginning CPU time in the format minute, second, and millionth of a second. If the value is 0, N/P is printed.

Field Name: QW148IUB

IFI ENDING CPU TIME

The IFI ending CPU time in the format minute, second, and millionth of a second. If the value is 0, N/P is printed.

Field Name: QW148IUE

BEGIN/RESUME CPU TIME

The start or resume CPU time for a stored procedure, user-defined function, or trigger.

Field Name: QW148ATC

TCB TIME BEFORE ENCLAVE

The accumulated TCB time that is used when running under the control of a trigger. This does not include the time that is used while running in user-defined functions or stored procedures that are called from the trigger. This CPU time does not include the CPU time that is consumed on an IBM specialty engine.

Field Name: QWACTRITT

This is an exception field.

BEGIN/RESUME TOD TIME
The start or resume TOD time for a stored procedure, user-defined function, or trigger.

Field Name: QW148AOD

LOCK - I/O - LATCH BEGIN TIME
The beginning time of the I/O including lock and latch use in the format day, hour, minute, second, and millionth of a second. If the value is 0, N/P is printed.

Field Name: QW0148LB

LOCK - I/O - LATCH ENDING TIME
The ending time of the I/O including lock and latch use in the format day, hour, minute, second, and millionth of a second. If the value is 0, N/P is printed.

Field Name: QW0148LE

END-OF-TASK CPU TIME
The CPU time from DSN3EOT0 in the format minute, second, and millionth of a second. If the value is 0, N/P is printed.

Field Name: QW0148EO

ACCOUNTING ENTRY CPU TIME
The CPU time at entry to a monitoring or accounting class 2 or class 3 wait, in the format minute, second, and millionth of a second. If the value is 0, N/P is printed.

Field Name: QW0148LW

EU SWITCH BEGIN ELAPSED TIME
The beginning of the elapsed time of the wait for the execution unit switch.
If the value is 0, N/P is printed.

Field Name: QW0148EB

EU SWITCH ENDING ELAPSED TIME
The end of the elapsed time of the wait for the execution unit switch. If the value is 0, N/P is printed.

Field Name: QW0148EE

ARCH LOG(QUIESCE) BEGIN TIME
The beginning of the elapsed time of the wait for the ARCHIVE LOG MODE (QUIESCE) command. If the value is 0, N/P is printed.

Field Name: QW0148RB

ARCH LOG(QUIESCE) ENDING TIME
The end of the elapsed time of the wait for the ARCHIVE LOG MODE (QUIESCE) command. The end time minus begin time should be the total time the agent is suspended due to the ARCHIVE LOG MODE (QUIESCE) command. If the value is 0, N/P is printed.

Field Name: QW0148RE

ACE TOKEN
IFCID 147 - Monitor Detail Data

The hexadecimal address of the agent control element. Indicates the thread reported here. If the value is 0, N/P is printed.

Field Name: QW0148AC

APPL REQUEST COUNT

The number of attachment facility calls to DB2.

Field Name: QW0148RQ

ASCB TOKEN

The ASCB token in hexadecimal. If the value is 0, N/P is printed.

Field Name: QW0148MA

LATCH TOKEN

The latch token. If the value is 0, N/P is printed.

Field Name: QW0148LA

TCB TOKEN

The TCB token. If the value is 0, N/P is printed.

Field Name: QW0148MT

AGENT ASID

The ASID of the thread.

Field Name: QW0148AS

STATUS INDICATOR 1

Indicates whether the thread is at plan or signon/identify level.

Field Name: QW0148CD

CONNECTION TYPE

The connection type.

Field Name: QW0148TY

LATEST IFCID

The latest IFCID processed.

Field Name: QW0148IL

STATUS INDICATOR 2

Indicates whether the agent is in end-of-task processing.

Field Name: QW0148ES

DBID

The database ID. Deduced from the DB2 fields QW0148DB, QW0105DN or QW0107DN.

When present, the database name is shown, otherwise the decimal identifier from QW0148DB is shown, or N/A when this value is 0.

Field Name: RT0148DB

PREVIOUS IFCID

The previous IFCID processed.
Field Name: QW0148IP

STATUS INDICATOR 3
Indicates whether the create thread request is queued.

Field Name: QW0148CQ

OBID
The object ID. Deduced from the DB2 fields QW0148OB, QW0105TN or QW0107TN.

If present, the name of the object is shown, otherwise the decimal identifier from QW0148OB is shown, or N/A if this value is 0.

Field Name: RT0148OB

LATCH CLASS
The latch class in hexadecimal.

Field Name: QW0148LC

TSO CONNECTION TYPE
The TSO connection type.

Field Name: QW0148TS

THREAD TYPE
The type of thread being processed.

Field Name: QW0148DD

THREAD STATUS
The status of the thread being processed.

Field Name: QW0148AI

STATUS INDICATOR 5
Indicates whether the agent is queued for end-of-task processing.

Field Name: QW0148EQ

THREAD TOKEN
The thread token. This token uniquely identifies a specific thread and also appears in the display thread command response.

Field Name: QW148TTK

LUWSEQ
The LUW sequence number.

Field Name: QW0148CC

STATUS INDICATOR 6
Indicates whether the thread is running a stored procedure in DB2.

Field Name: QW0148SN

NESTING.LVL
Nesting level of the stored procedure, user-defined function or trigger, in the range 1 through 16.

Field Name: QW148ALV
IFCID 147 - Monitor Detail Data

STATUS INDICATOR 7
Indicates whether the thread is queued waiting for a stored procedure to be scheduled.
Field Name: QW0148SQ

NESTING ACTIVITY
Nesting activity of the stored procedure, user-define function or trigger, if any.
Field Name: QW148AFG

CONS.TOKEN
The consistency token.
Field Name: QW0148CN

NETWORKID
The network identifier.
Field Name: QW0148NI

LUNAME
The logical unit name.
Field Name: QW0148LM

UNIQUENESS VALUE
The instance number.
Field Name: QW0148UV

ENCL.TOKEN
The enclave token, if under enclave, otherwise zero.
Field Name: QW148ETK

LOCATION
The name of the location where the thread executes the package.
Field Name: QW0148LN

COLLECTION
The collection name.
Field Name: QW0148CI

PACKAGE
The package identifier.
Field Name: QW0148PN

STORED PROCEDURE NAME
The stored procedure name.
Field Name: QW0148SP

SCHEMA NAME
Schema name, under which a stored procedure, user-define function or trigger is executing.
### Field Name: QW148SCH

**TOKEN**

The consistency token.

### Field Name: QW0148CN

**IFCID 147 - Thread Correlation Data:**

This topic shows detailed information about “Record Trace - IFCID 147 - Thread Correlation Data”.

### Record trace - IFCID 147 - Thread Correlation Data

The field labels shown in the following sample layout of “Record Trace - IFCID 147 - Thread Correlation Data” are described in the following section.

```plaintext
! *** Long name section: ! ORGANIZATION AUTHID : EDVA ! PRIMARY AUTHID : EDVA ! END USER ID : EDVA ! *** End of long names

! AUTHORIZATION ID : EDVA ! PLAN NAME : DSNREXX ! ACCOUNTING TOKEN: N/A ! END USER ID : EDVA ! END USER WST : DB2CALL

---

<table>
<thead>
<tr>
<th>ORIGINAL AUTHID</th>
<th>PRIMARY AUTHID</th>
<th>END USER ID</th>
<th>AUTHORIZATION ID</th>
<th>PLAN NAME</th>
<th>ACCOUNTING TOKEN</th>
<th>END USER WST</th>
</tr>
</thead>
<tbody>
<tr>
<td>EDVA</td>
<td>EDVA</td>
<td>EDVA</td>
<td>EDVA</td>
<td>DSNREXX</td>
<td>N/A</td>
<td>DB2CALL</td>
</tr>
</tbody>
</table>

---

**ORIGINAL AUTHID**

The original authorization ID. Possible values are:

- For TSO: the logon ID
- For batch: the user ID on the job statement
- For IMS (message-driven regions): the signon ID, LTERM, ASXBUSR, or FSB name
- For IMS (control regions): the user ID on the job statement, or the RACF started procedure entry if RACF is used
- For CICS: the user ID, TERM ID, TRAN ID, or as specified in the resource control table
- For MVS operator commands and DB2 system internal agents: SYSOPR
- For a distributed application server (AS):
  - If the application requester (AR) is a DB2 system, then this is the same value that was assigned at the AR.
  - If the application requester is not a DB2 system, then this is the user ID used to make the initial connection with the application server.

### Field Name: QWHCOPID

**PRIMARY AUTHID**

The primary authorization ID from a connection or signon. The connection authorization exit and the signon authorization exit can change the primary authorization ID so that it differs from the original primary authorization ID (ORIGAUTH). Distributed authorization ID translation can also change the primary authorization ID.

### Field Name: QWHCAID

**END USER ID**
The user ID of the workstation end user. This user ID can be different from the authorization ID used to connect to DB2. This field contains blanks if the client does not supply this information.

Field Name: QWHCEUID

AUTHORIZATION ID

The primary authorization ID from a connection or signon. The connection authorization exit and the signon authorization exit can change the primary authorization ID so that it differs from the original primary authorization ID (ORIGAUTH). Distributed authorization ID translation can also change the primary authorization ID.

Field Name: QWHCAID

CONNECTION NAME

The connection name. Possible values are:
- For batch: BATCH
- For TSO: TSO
- For QMF: DB2CALL
- For utilities: UTILITY
- For DB2 private protocol this is the DB2 subsystem ID
- For IMS: the IMS ID
- For CICS, this is the CICS ID
- For DRDA connections from non-DB2 requesters: SERVER

Field Name: QWHCCN

This is an exception field.

CORRELATION VALUE

Correlation ID value:

FOR BATCH
   Job name

FOR TSO
   Logon ID

FOR IMS/VS
   PST#.PSBNAME

FOR CICS
   CONNECTION_TYPE.THREAD_TYPE.THREAD_#.TRAN-ID

FOR RRSAF
   CORRELATION-ID VALUE FROM SIGNON FUNCTION

For threads using the DB2 private protocol or DRDA from a DB2 requester
   This field contains the correlation-id name of the thread at the requesting location.

For threads using DRDA from a non-DB2 requester
   This field contains the first 12 characters in the DDM external name (EXTNAM) parameter of the DDM EXCSAT command received as part of the SQL connect.

Field Name: QWHCCV
PLAN NAME
   The plan name. It is blank for a DB2 command thread; otherwise:
   
   DSNESPRR
      For SPUFI with repeatable read.
   
   DSNESPCS
      For SPUFI with cursor stability.
   
   DSNUTIL
      For utilities.
   
   DSNTEP2
      For DSNTEP2.
   
   DSNBIND
      For binding.
   
   The application plan name
      For IMS.
   
   The application plan name
      For CICS.
   
   A blank plan name
      For IMS and CICS commands.
   
   DSQPLAN
      For QMF.
   
   The first 8 bytes of the application name
      For DRDA connections to the common servers.

Field Name: QWHCPLAN
   This is an exception field.

ORIGINAL AUTH ID
   The original authorization ID. Possible values are:
   
   • For TSO: the logon ID
   • For batch: the user ID on the job statement
   • For IMS (message-driven regions): the signon ID, LTERM, ASXBUSR, or PSB name
   • For IMS (control regions): the user ID on the job statement, or the RACF started procedure entry if RACF is used
   • For CICS: the user ID, TERM ID, TRAN ID, or as specified in the resource control table
   • For MVS operator commands and DB2 system internal agents: SYSOPR
   • For a distributed application server (AS):
      – If the application requestor (AR) is a DB2 system, then this is the same value that was assigned at the AR.
      – If the application requestor is not a DB2 system, then this is the user ID used to make the initial connection with the application server.

Field Name: QWHCOPID

CONNECTION TYPE
   The connecting system type code (in hexadecimal). This field can have a null value. Utilities, for example, do not have a connecting system type.
IFCID 147 - Thread Correlation Data

Field Name: QWHCATYP

ACCOUNTING_TOKEN

Accounting correlation token.
This field applies only if CONNECTION_TYPE equals CICS ATTACH or RRSAF ATTACH, otherwise N/A is shown.
If connection type is CICS ATTACH, the first eight bytes identify the network name (right padded with blanks), the second eight bytes identify the LU name (right padded with blanks), the final six bytes are the uniqueness value.
If the connection type is RRSAF ATTACH, the field is the value of the parameter accounting token in the RRSAF signon function.
This field is shown as both a character and a hexadecimal string.

Field Name: QWHCTOKN

TOKEN_IN_HEX

Accounting correlation token.
This field applies only if CONNECTION_TYPE equals CICS ATTACH or RRSAF ATTACH, otherwise N/A is shown.
If connection type is CICS ATTACH, the first eight bytes identify the network name (right padded with blanks), the second eight bytes identify the LU name (right padded with blanks), the final six bytes are the uniqueness value.
If the connection type is RRSAF ATTACH, the field is the value of the parameter accounting token in the RRSAF signon function.
This field is shown as both a character and a hexadecimal string.

Field Name: QWHCEUID

END_USER_ID

The user ID of the workstation end user. This user ID can be different from the authorization ID used to connect to DB2. This field contains blanks if the client does not supply this information.

Field Name: QWHCEUTX

TRANSACTION

The transaction or application name that is run.

Field Name: QWHCEUTX

JOBSTEP_NAME

If the thread that is currently running is a TCB, this value is the step name in the JCL that is running the batch job.

Field Name: QWHCJOBSTEP

END_USER_WST

The end user's workstation name.

Field Name: QWHCEUWN

IFCID 149 - Resource Locking: This record only contains data from an Online Monitor trace data set.
Note: This report has the same layout as IFCID 150, for details refer to “IFCID 150 - Thread Locking.”

IFCID 150 - Thread Locking: This record only contains data from an Online Monitor trace data set.

IFCID 150 - Global Interest Data:

This topic shows detailed information about “Record Trace - IFCID 150 - Global Interest Data”.

Record trace - IFCID 150 - Global Interest Data

The field labels shown in the following sample layout of “Record Trace - IFCID 150 - Global Interest Data” are described in the following section.

GLOBAL INTEREST DATA
A BLOCK IS HELD : NO
RESULTANT REQUESTED STATE: SHARED AND INTENTION EXCLUSIVE, LOWER LEVEL PLOCKS ACQUIRED
SUBSYSTEM NAME : SYS00006
RESULTANT HELD STATE : SHARED AND INTENTION EXCLUSIVE, LOWER LEVEL PLOCKS ACQUIRED

A BLOCK IS HELD
Indicates if a P-lock is held. It can have one of the following values:
• YES
• NO
• N/P

Field Name: QW01505P

RESULTANT REQUESTED STATE
The result of the requested lock state. It can have one of the following values:
• UNPROTECTED SHARE
• INTENTION SHARE
• INTENTION EXCLUSIVE
• SHARE
• UPDATE
• SHARE AND INTENTION EXCLUSIVE
• NON-SHARED UPDATE
• EXCLUSIVE
• INTENTION SHARE, LOWER LEVEL PLOCKS ACQUIRED
• INTENTION EXCLUSIVE, LOWER LEVEL PLOCKS ACQUIRED
• SHARED AND INTENTION EXCLUSIVE, LOWER LEVEL PLOCKS ACQUIRED

Field Name: QW01505R

SUBSYSTEM NAME
The name of the subsystem.

Field Name: QW01505S

RESULTANT HELD STATE
The result of the requested P-lock held state. It can have one of the following values:
• UNPROTECTED SHARE
IFCID 150 - Global Interest Data

- INTENTION SHARE
- INTENTION EXCLUSIVE
- SHARE
- UPDATE
- SHARE AND INTENTION EXCLUSIVE
- NON-SHARED UPDATE
- EXCLUSIVE
- INTENTION SHARE, LOWER LEVEL PLOCKS ACQUIRED
- INTENTION EXCLUSIVE, LOWER LEVEL PLOCKS ACQUIRED
- SHARED AND INTENTION EXCLUSIVE, LOWER LEVEL PLOCKS ACQUIRED

Field Name: QW01505H

IFCID 150 - Held Lock Data:

This topic shows detailed information about “Record Trace - IFCID 150 - Held Lock Data”.

Record trace - IFCID 150 - Held Lock Data

The field labels shown in the following sample layout of “Record Trace - IFCID 150 - Held Lock Data” are described in the following section.

HELD LOCK DATA
LOCK REQUEST TOKEN : X'0C000002'
ACE TOKEN : X'000000B9'
LOCK DURATION : X'00'
QW0150RW: X'0C000002'
QW0150UC: X'00000000'
QW0150SC: (1) 0 (2) 0 (3) 0 (4) 0 (5) 0 (6) 0 (7) 0 (8) 0

LOCK REQUEST TOKEN
The lock request token in hexadecimal.

Field Name: QW0150R3

LOCK STATE
The lock state.

Field Name: QW0150ST

SUBSYSTEM NAME
The name of the subsystem.

Field Name: QW0150N4

ACE TOKEN
The hexadecimal address of the agent control element indicating the holder of this lock.

Field Name: QW0150A3

LOCK TYPE
The type of lock.

Field Name: QW0150TL

FUNCTION
The lock function.
Field Name: QW0150F4

**LOCK DURATION**

The duration for which the lock is held:

**MANUAL**  Varies depending on the ISOLATION parameter

**MANUAL+1**
Temporary change of consistency level from CS to RR during bind and DDL

**COMMlT**  Until commit

**COMMIT+1**
Past commit; applies to locks needed to maintain the position for a cursor opened WITH HOLD

**ALLOCATION**
Until deallocation

**PLAN**  For the duration of the plan

**FREE ALL LOCKS**
Until all locks are freed

Field Name: QW0150D4

IFCID 150 - Lock Resource Data:

This topic shows detailed information about “Record Trace - IFCID 150 - Lock Resource Data”.

**Record trace - IFCID 150 - Lock Resource Data**

The field labels shown in the following sample layout of “Record Trace - IFCID 150 - Lock Resource Data” are described in the following section.

<table>
<thead>
<tr>
<th>LOCK RES TYPE</th>
<th>OBID: 25290</th>
<th>OBID: 51968</th>
<th>RESOURCE ID: X'00000313123456'</th>
</tr>
</thead>
<tbody>
<tr>
<td>HASH TOKEN</td>
<td>X'00000002'</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**LOCK RES TYPE**

The locked resource type.

**Note:** For data sharing, SKELETON CURSOR TABLE LOCKING and SKELETON PACKAGE TABLE LOCK are LP-locks (an LP-lock has an L-lock component and a P-lock component).

Field Name: QW0150KT

**DBID**

The database ID. This field is not applicable if the value in LOCK RES TYPE is SKELETON CURSOR TABLE LOCKING, SKELETON PACKAGE TABLE LOCK, COLLECTION, or ALTER BUFFER POOL.

Deduced from the DB2 fields QW0150DB, QW0105DN, or QW0107DN.

If present, the database name is shown, otherwise the decimal identifier from QW0150DB is shown, or N/A if this value is 0.

Field Name: RT0150DB

**OBID**
IFCID 150 - Lock Resource Data

The object ID of the table space or pageset involved in the lock. This field is not applicable if the value in LOCK RES TYPE is SKELETON CURSOR TABLE LOCKING, SKELETON PACKAGE TABLE LOCK, or COLLECTION.

Deduced from the DB2 fields QW0149KP, QW0105TN, QW0107TN, QW0149KP, QW0105OB or QW0107OB.

If present, then name of the object is shown. Otherwise the decimal identifier from QW0150KP is shown, or N/A if this value is 0.

Field Name: RT0150OB

RESOURCE ID

The hexadecimal identifier of the small resource. If LOCK RES TYPE is:

- **DATA SET LOCKING (PARTITION)**
  Last byte is the partition number
- **DATA PAGE LOCKING**
  First 3 bytes are the page number
- **INDEX PAGE LOCKING**
  First 3 bytes are the page number
- **HASH ANCHOR LOCK**
  First 3 bytes are the page number and the last byte is the anchor point ID
- **CS-READ DRAIN**
  Last byte is the partition number (optional)
- **RR-READ DRAIN**
  Last byte is the partition number (optional)
- **WRITE DRAIN**
  Last byte is the partition number (optional)
- **ROW LOCK**
  First 3 bytes are the page number and the last byte is the row ID of the record
- **INDEX END OF FILE LOCK**
  Last byte is the partition number (optional)

Note:

- In large partitioned table spaces, the page number covers 4 bytes instead of 3.
- If table spaces use relative page numbers, the resource ID covers 7 bytes. It contains the partition number in the first 2 bytes, the page number in the next 4 bytes, and the record ID in the seventh byte.

This field is not applicable if the value in LOCK RES TYPE is SKELETON CURSOR TABLE LOCKING, SKELETON PACKAGE TABLE LOCK, COLLECTION, ALTER BUFFER POOL, or PAGESET LOCK. If the value is UTILITY SERIALIZATION LOCK or BINDLOCK, N/A is printed.

Field Name: QW0150KR

HASH TOKEN

The hash token of the resource name.

Field Name: QW0150LH
IFCID 150 - Retained Lock Data:

This topic shows detailed information about “Record Trace - IFCID 150 - Retained Lock Data”.

Record trace - IFCID 150 - Retained Lock Data

The field labels shown in the following sample layout of “Record Trace - IFCID 150 - Retained Lock Data” are described in the following section.

```
RETAI NED LOCK DATA
LOCK REQUEST TOKEN : X'00000003'
LOCK STATE : X'08'
SUBSYSTEM NAME : SUBSYS23

LOCK REQUEST TOKEN
The lock request token in hexadecimal.
Field Name: QW0150T4

LOCK STATE
The lock state in hexadecimal.
Field Name: QW0150R4

SUBSYSTEM NAME
The name of the subsystem.
Field Name: QW0150N4

IFCID 150 - Suspend Lock Data:

This topic shows detailed information about “Record Trace - IFCID 150 - Suspend Lock Data”.

Record trace - IFCID 150 - Suspend Lock Data

The field labels shown in the following sample layout of “Record Trace - IFCID 150 - Suspend Lock Data” are described in the following section.

```
SUSPEND LOCK DATA

LOCK REQUEST TOKEN
The lock request token in hexadecimal.
Field Name: QW0150R3

LOCK STATE
The lock state.
Field Name: QW0150ST

SUBSYSTEM NAME
The name of the subsystem.
Field Name: QW0150N4

ACE TOKEN
The hexadecimal address of the agent control element indicating the holder of this lock.
**IFCID 150 - Suspend Lock Data**

** Field Name: QW0150A3  
LOCK TYPE  
The type of lock.  
Field Name: QW0150TL  
FUNCTION  
The lock function.  
Field Name: QW0150F4  
LOCK DURATION  
The duration for which the lock is held:  
MANUAL  
Varies depending on the ISOLATION parameter  
MANUAL+1  
Temporary change of consistency level from CS to RR during bind and DDL  
COMMIT  
Until commit  
COMMIT+1  
Past commit; applies to locks needed to maintain the position for a cursor opened WITH HOLD  
ALLOCATION  
Until deallocation  
PLAN  
For the duration of the plan  
FREE ALL LOCKS  
Until all locks are freed  
Field Name: QW0150D4

**IFCID 151 - User Record:**

This topic shows detailed information about “Record Trace - IFCID 151 - User Record”.

When present, data is shown in hexadecimal dump format.

**IFCID 152 - User Record:**

This topic shows detailed information about “Record Trace - IFCID 152 - User Record”.

When present, data is shown in hexadecimal dump format.

**IFCID 153 - User Record:**

This topic shows detailed information about “Record Trace - IFCID 153 - User Record”.

When present, data is shown in hexadecimal dump format.
IFCID 154 - User Record:

This topic shows detailed information about “Record Trace - IFCID 154 - User Record”.

When present, data is shown in hexadecimal dump format.

IFCID 155 - User Record:

This topic shows detailed information about “Record Trace - IFCID 155 - User Record”.

When present, data is shown in hexadecimal dump format.

IFCID 156 - User Record:

This topic shows detailed information about “Record Trace - IFCID 156 - User Record”.

When present, data is shown in hexadecimal dump format.

IFCID 157 - DRDS RDS Interface:

This topic shows detailed information about “Record Trace - IFCID 157 - DRDS RDS Interface”.

Record trace - IFCID 157 - DRDS RDS Interface

EVENT

The type of event.

Field Name: QW0160E

MSGTYPE

The message type. This field is only applicable if the value in EVENT is
RECEIVE RESPONSE MESSAGE or SEND REQUEST MESSAGE.

Field Name: QW0160T

MSG RESPONSE

The message response. This field is only applicable if the value in EVENT
is RECEIVE RESPONSE MESSAGE or SEND REQUEST MESSAGE.

Field Name: QW0160R

MSG LGTH
IFCID 160 - DC Requester

The message length. This field is only applicable if the value in EVENT is RESET CONVERSATION, RECEIVE RESPONSE MESSAGE, or SEND REQUEST MESSAGE.

Field Name: QW0160ML

MSGCLASS

The message class. This field is only applicable if the value in EVENT is RESET CONVERSATION, RECEIVE RESPONSE MESSAGE, SEND REQUEST MESSAGE, or WAIT FOR RESPONSE MESSAGE.

Field Name: QW0160MC

MSGNO

The message number. This field is only applicable if the value in EVENT is RESET CONVERSATION, RECEIVE RESPONSE MESSAGE, SEND REQUEST MESSAGE, or WAIT FOR RESPONSE MESSAGE.

Field Name: QW0160MN

MSGTIME

The timestamp at the start of the VTAM request.

Field Name: QW0160MS

IFCID 161 - DC Server:

This topic shows detailed information about “Record Trace - IFCID 161 - DC Server”.

Record trace - IFCID 161 - DC Server

The field labels shown in the following sample layout of “Record Trace - IFCID 161 - DC Server” are described in the following section.

IFCID 168 - IBM Service Record:

This topic shows detailed information about “Record Trace - IFCID 168 - IBM Service Record”.

This record is for IBM service use.

IFCID 169 - DIST Authid Translation:

This topic shows detailed information about “Record Trace - IFCID 169 - DIST Authid Translation”.

Record trace - IFCID 169 - DIST Authid Translation

The field labels shown in the following sample layout of “Record Trace - IFCID 169 - DIST Authid Translation” are described in the following section.

IDENTIFIER TYPE : TRUSTED CONTEXT SYSTEM AUTHID
TRANSL TYPE: INBOUND
RESPOND LINKNAME: RESPLNK1
RESPOND LOC : RESPLCATION0001
SYST AUTHID : REQAUTH1
TRANS AUTHID: TRLAUTH1

IDENTIFIER TYPE

Identifier type of the source ID. Possible values are:

A AUTHID
L LOCATION ALIAS
D DATABASE ALIAS
S TRUSTED CONTEXT SYSTEM AUTHID

Field Name: QW0169ID

TRANSL TYPE

The type of translation:

INBOUND

The responding DB2 site translates the AUTHID after receiving the data.

OUTBOUND

The requesting DB2 site translates the AUTHID before sending the data.

Field Name: QW0169TY

RESPOND LINKNAME

The logical unit name.

If the value of TRANSLATION TYPE is INBOUND, this is the VTAM LU name of the requester location or row in SYSIBM.SYSIPNAMES.

If the value of TRANSLATION TYPE is OUTBOUND, this is the VTAM LU name of the remote server or

Field Name: QW0169LU
RESPOND LOC

If the value of TRANSLATION TYPE is INBOUND, this is the service location name regardless of whether the server is another DB2. If the value of TRANSLATION TYPE is OUTBOUND, this field contains one of the following values:

- The name of the requesting DB2 location
- <LUNAME>
- NNN.NNN.NNN.NNN

Field Name: QW0169LO

SYST AUTHID

Either authorization ID or location or alias before translation. Depending on the translation type OUTBOUND and identifier type TRUSTED CONTEXT, this field contains the original value of the authorization ID or the system authorization ID.

Field Name: QW0169AU

TRANS AUTHID

The new value of the authorization ID, location, or alias. Depending on the translation type OUTBOUND and identifier type TRUSTED CONTEXT, this field contains the value of the authorization ID or the translated system authorization ID.

Field Name: QW0169NE

IFCID 170 - Suspend of Agent:

This topic shows detailed information about “Record Trace - IFCID 170 - Suspend of Agent”.

Record trace - IFCID 170 - Suspend of Agent

The field labels shown in the following sample layout of “Record Trace - IFCID 170 - Suspend of Agent” are described in the following section.

ACE:

| 1 | QW0170ID X’01’ | QW0170FC X’05’ |

ACE

Indicates the requester. The relative number of the agent control element address in the ACE cross-reference table. This table is printed at the end of each location for every trace specified.

Field Name: QW0170AC

IFCID 171 - IBM Service Record:

This topic shows detailed information about “Record Trace - IFCID 171 - IBM Service Record”.

This record is for IBM service use.

IFCID 172 - Deadlock Data: This topic shows the records available for deadlock data.
IFCID 172 - Deadlock Header

IFCID 172 - Deadlock Header:

This topic shows detailed information about “Record Trace - IFCID 172 - Deadlock Header”.

This record is written every time that DB2 takes action to resolve a deadlock. This record details all of the units of work involved in the deadlock, the resource for which they were contending, and the attributes of their requests. One record is written for each locked resource in the deadlock.

Statistics class 3 or performance class 6 trace must be active.

DB2 can resolve a deadlock either by rolling back a unit of work for one of the agents involved, or by requesting a process to terminate.

There is no correlation between the number of IFCID 172 records written and the number of deadlocks counted by IFCIDs 2 and 3. Deadlocks can be broken without intervention by DB2, as an example when a process times out. Also, multiple IFCID 172 records can be written for a single deadlock.

Record trace - IFCID 172 - Deadlock Header

The field labels shown in the following sample layout of “Record Trace - IFCID 172 - Deadlock Header” are described in the following section.

**INTERVAL COUNT**

The deadlock interval counter.

Field Name: QW0172IT

**WAITERS INVOLVED**

The number of waiters involved in the deadlock.

Field Name: QW0172NR

**TIME DETECTED**

The date and time when the deadlock was detected.

Field Name: QW0172TD

IFCID 172 - Unit of Work - Resource:

This topic shows detailed information about “Record Trace - IFCID 172 - Unit of Work - Resource”.

The content of the LOCK RES TYPE field determines which other fields are printed in this record.

Blocker and waiter information is shown for each resource involved in the deadlock.

Record trace - IFCID 172 - Unit of Work - Resource

The field labels shown in the following sample layout of “Record Trace - IFCID 172 - Unit of Work - Resource” are described in the following section.
LOCK RES TYPE

The locked resource type.

Note: For data sharing, SKELETON CURSOR TABLE LOCKING and SKELETON PACKAGE TABLE LOCK are LP-locks (an LP-lock has an L-lock component and a P-lock component).

Field Name: QW0172FR

DBID

The database ID. This field is not applicable if the value in LOCK RES TYPE is SKELETON CURSOR TABLE LOCKING, SKELETON PACKAGE TABLE LOCK, or COLLECTION. Deduced from the DB2 fields QW0172DB, QW0105DN, or QW0107DN.

If present, the database name is shown, otherwise the decimal identifier from QW0172DB is shown, or N/A if this value is 0.

Field Name: RT0172DB

OBID

The object ID of the resource involved in the lock. This field is not applicable if the value in LOCK RES TYPE is SKELETON CURSOR TABLE LOCKING, SKELETON PACKAGE TABLE LOCK, or COLLECTION.

Deduced from the DB2 fields QW0172KP, QW0105TN, QW0107TN, QW0172KP, QW0105OB, or QW0107OB.

If present, then name of the object is shown. Otherwise the decimal identifier from QW0172KP is shown, or N/A if this value is 0.

Field Name: RT0172OB

RESOURCE ID

The hexadecimal identifier of the small resource. If LOCK RES TYPE is:

DATA PAGE LOCKING
First 3 bytes are the page number

DATA SET LOCKING (PARTITION)
Last byte is the partition number

INDEX PAGE LOCKING
First 3 bytes are the page number

HASH ANCHOR LOCK
First 3 bytes are the page number and the last byte is the anchor point ID

CS-READ DRAIN
Last byte is the partition number (optional)

RR-READ DRAIN
Last byte is the partition number (optional)

WRITE DRAIN
Last byte is the partition number (optional)
ROW LOCK
First 3 bytes are the page number and the last byte is the row ID of the record

INDEX END OF FILE LOCK
Last byte is the partition number (optional)

Note:
• In large partitioned table spaces, the page number covers 4 bytes instead of 3.
• If table spaces use relative page numbers, the resource ID covers 7 bytes. It contains the partition number in the first 2 bytes, the page number in the next 4 bytes, and the record ID in the seventh byte.

This field is not applicable if the value in LOCK RES TYPE is SKELETON CURSOR TABLE LOCKING, SKELETON PACKAGE TABLE LOCK, COLLECTION, or ALTER BUFFER POOL. If the value is UTILITY SERIALIZATION LOCK or BINDLOCK, N/A is printed.

Field Name: QW0172KR
LOCK HASH VALUE
The hash value of the locked resource.

Field Name: QW0172LH

IFCID 172 - Unit of Work - Blocker:
This topic shows detailed information about “Record Trace - IFCID 172 - Unit of Work - Blocker”.

A blocker is a thread that prevents its victim from acquiring its lock. The blocker might be a holder of the lock, or it might be another waiter (that came in before the victim) that is incompatible with the holder's lock.

Note: If the fields PLAN NAME, CORR ID, CONN, and NETWORKID show an asterisk (*), the blocking request was released by the requester or was timed out between the detection and reporting of the deadlock.

Record trace - IFCID 172 - Unit of Work - Blocker
The field labels shown in the following sample layout of “Record Trace - IFCID 172 - Unit of Work - Blocker” are described in the following section.

PRIMAUTH
The authorization ID of the thread holding the resource.

Field Name: QW0172HB

PLAN NAME
The plan name of the blocker.

Field Name: QW0172HP
CORR ID
The correlation name of the blocker.

Field Name: QW0172HR

CONN ID
The connection ID of the blocker.

Field Name: QW0172HN

NETWORKID
Provides the following information:
• The logical unit of work identifier of the blocker. The data shown is only valid for distributed threads.
• The logical unit name of the blocker. The data shown is only valid for distributed threads.
• The uniqueness value of the blocker. The data shown is only valid for distributed threads.

Field Name: QW0172HL

LUNAME
Provides the following information:
• The logical unit of work identifier of the blocker. The data shown is only valid for distributed threads.
• The logical unit name of the blocker. The data shown is only valid for distributed threads.
• The uniqueness value of the blocker. The data shown is only valid for distributed threads.

Field Name: QW0172HL

OWNING WORK UNIT
The owning unit of work of the blocker.

Field Name: QW0172HO

UNIQUENESS VALUE
Provides the following information:
• The logical unit of work identifier of the blocker. The data shown is only valid for distributed threads.
• The logical unit name of the blocker. The data shown is only valid for distributed threads.
• The uniqueness value of the blocker. The data shown is only valid for distributed threads.

Field Name: QW0172HL

MEMBER
The DB2 member name.

Field Name: QW0172HI

DURATION
The lock duration of the thread blocking the resource.

Field Name: QW0172HD
IFCID 172 - Unit of Work - Blocker

STATE
The lock state of the thread holding the resource.
Field Name: QW0172HS

ACE
The owning unit of work of the blocker.
Field Name: QW0172HO

TRANSACTION
The transaction or application name that is run.
Field Name: QWHCEUTX

WS_NAME
The end user's workstation name.
Field Name: QWHCEUWN

END_USER
The user ID of the workstation end user. This user ID can be different from the authorization ID used to connect to DB2. This field contains blanks if the client does not supply this information.
Field Name: QWHCEUID

PROGRAM NAME
The name of the program that is in control at the time of the deadlock. It need not be the program that acquired the lock.
Field Name: QW0172Q1

LOCATION
Location of the program that is in control at the time of the deadlock. It need not be the program that acquired the lock.
Field Name: QW0172Q3

PCKG/COLL ID
Package collection ID of the program that is in control at the time of the deadlock. It need not be the program that acquired the lock.
Field Name: QW0172Q2

CONS_TOKEN
Consistency token of the program that is in control at the time of the deadlock. It need not be the program that acquired the lock.
Field Name: QW0172Q4

STMT ID
Shows the cached statement ID for the thread holding the resource. This field contains zero (0) if the client does not supply this information.
Field Name: QW0172H9

STMT ID
The holder statement ID.
Field Name: QW0172HZ
TYPE

The holder statement information.

Field Name: QW0172HY

STATUS

The status of the blocker.

WAIT  The blocker is waiting for the resource.

HOLD  The blocker is holding the resource.

Field Name: QW0172H2

IFCID 172 - Unit of Work - Blocker:

This topic shows detailed information about “Record Trace - IFCID 172 - Unit of Work - Waiter”.

Record trace - IFCID 172 - Unit of Work - Waiter

The field labels shown in the following sample layout of “Record Trace - IFCID 172 - Unit of Work - Waiter” are described in the following section.

WAITER

PRIMAUTH : 'BLANK'  PLAN NAME : WAITPLAN  CORR ID : WAITCORRID01  CONN ID : WAITCONN
NETWORKID : LUWID 1  LUNAME : XXXXXXXX  OWNING WORK UNIT: 51683  UNIQUENESS VALUE: X'E7E7E7E7E7'
MEMBER : WAITMEM2  DURATION : PLAN  STATE : SHARED  ACE : 3
TRANSACTION : WAITER TRANSACTION NAME  WS_NAME : WAITER WORKSTATION  END_USER : 'BLANK'
PROGRAM NAME: PGM000W1  LOCATION : LOCATION000000W1  PCKG/COLL ID: COLLECTIONID0000W1
DB2 ASID : 59073  REQ WORK UNIT: 51683  EB PTR : X'E6E409F1'  REQ FUNCTION: CHANGE
WORTH : X'11'  QW0172W6: X'10'

PRIMAUTH

The authorization ID of the thread waiting for the resource.

Field Name: QW0172WB

PLAN NAME

The plan name of the waiter.

Field Name: QW0172WP

CORR ID

The correlation ID of the waiter.

Field Name: QW0172WR

CONN ID

The connection ID of the waiter.

Field Name: QW0172WN

NETWORKID

Provides the following information:

- The logical unit of work identifier of the waiter. The data shown is only valid for distributed threads.
- The logical unit name of the waiter. The data shown is only valid for distributed threads.
- The uniqueness value of the waiter. The data shown is only valid for distributed threads.
Field Name: QW0172WL

**LUNAME**

Provides the following information:
- The logical unit of work identifier of the waiter. The data shown is only valid for distributed threads.
- The logical unit name of the waiter. The data shown is only valid for distributed threads.
- The uniqueness value of the waiter. The data shown is only valid for distributed threads.

Field Name: QW0172WL

**OWNING WORK UNIT**

The owning unit of work of the waiter.

Field Name: QW0172WO

**UNIQUENESS VALUE**

Provides the following information:
- The logical unit of work identifier of the waiter. The data shown is only valid for distributed threads.
- The logical unit name of the waiter. The data shown is only valid for distributed threads.
- The uniqueness value of the waiter. The data shown is only valid for distributed threads.

Field Name: QW0172WL

**MEMBER**

The waiter's DB2 member name.

Field Name: QW0172WI

**DURATION**

The lock duration of the thread waiting for the resource.

- **MANUAL** Varies depending on the ISOLATION parameter (QW0172DR=x'20')
- **MANUAL+1** Temporary change of consistency level from CS to RR during bind and DDL (QW0172DR=x'21')
- **COMMIT** Until commit (QW0172DR=x'40')
- **COMMIT+1** Past commit; applies to locks needed to maintain the position for a cursor opened WITH HOLD (QW0172DR=x'41')
- **ALLOCATION** Until deallocation (QW0172DR=x'60')
- **PLAN** For the duration of the plan (QW0172DR=x'80')
- **UTIL** For the duration of the utility execution (QW0172DR=x'81')
- **INTEREST** Duration used for P-locks (QW0172DR=x'FE')
- **FREE ALL** Until all locks are freed (QW0172DR=x'FF')
N/A Not applicable for NOTIFY SUSPEND

Field Name: QW0172WD

STATE
The lock state of the thread waiting for the resource.
Field Name: QW0172WS

ACE
The owning unit of work of the waiter.
Field Name: QW0172WO

TRANSACTION
The transaction or application name that is run.
Field Name: QWHCEUTX

WS_NAME
The end user’s workstation name.
Field Name: QWHCEUWN

END_USER
The user ID of the workstation end user. This user ID can be different from the authorization ID used to connect to DB2. This field contains blanks if the client does not supply this information.
Field Name: QWHCEUID

PROGRAM NAME
The name of the program that is in control at the time of the deadlock. It need not be the program that acquired the lock.
Field Name: QW0172Q5

LOCATION
Package collection ID of the program that is in control at the time of the deadlock. It need not be the program that acquired the lock.
Field Name: QW0172Q6

PCKG/COLL ID
Location of the program that is in control at the time of the deadlock. It need not be the program that acquired the lock.
Field Name: QW0172Q7

CONS_TOKEN
Consistency token of the program that is in control at the time of the deadlock. It need not be the program that acquired the lock.
Field Name: QW0172Q8

STMT ID
Shows the cached statement ID for the thread waiting for the resource. This field contains zero (0) if the client does not supply this information.
Field Name: QW0172W9

STMT ID
The waiter statement ID.

Field Name: QW0172WZ

TYPE

The waiter statement information.

Field Name: QW0172WY

DB2S ASIC

The DB2S ASIC of the waiter. A unique number allocated to the requesting work unit of the waiter. The EB pointer of the waiter.

Field Name: QW0172AS

REQ WORK UNIT

The waiter's requesting work unit.

Field Name: QW0172UW

EB PTR

The EB pointer of the waiter.

Field Name: QW0172WE

REQ FUNCTION

The function requested by the waiter.

Field Name: QW0172WF

WORTH

The worth value DB2 assigns to the waiter.

Field Name: QW0172WA

IFCID 173 - Class 2 Time:

This topic shows detailed information about “Record Trace - IFCID 173 - Class 2 Time”.

When present, data for this IFCID is printed in dump format, otherwise NO DATA is printed.

Record trace - IFCID 173 - Class 2 Time

The field labels shown in the following sample layout of “Record Trace - IFCID 173 - Class 2 Time” are described in the following section.

AUTH ID

The authorization ID.

Field Name: QW0173ID

PACKAGE COLL ID

The package collection ID.
Field Name: QW0173PC

PACKAGE NAME
The package name.
Field Name: QW0173PK

CURSOR NAME
The cursor name, if there is a cursor.
Field Name: QW0173CN

PLAN NAME
The plan name.
Field Name: QW0173PL

SECTION NUMBER
The section number in the plan.
Field Name: QW0173SN

STATEMENT NUMBER
The statement number in the plan.
Field Name: QW0173ST

CACHED STMNT ID
The cached statement ID. Zero (0) indicates that this information is not supplied.
Field Name: QW0173CS

IFCID 174 - Arch Log CMD Sus Start:

This topic shows detailed information about “Record Trace - IFCID 174 - Arch Log CMD Sus Start”.

Record trace - IFCID 174 - Arch Log CMD Sus Start

The field labels shown in the following sample layout of “Record Trace - IFCID 174 - Arch Log CMD Sus Start” are described in the following section.

ACE: 1
QW0174EB X’0243918B’ QW0174UR X’0242C168’

ACE
The relative number of the agent control element address in the ACE cross-reference table. This table is printed at the end of each location for every trace specified.
Field Name: QW0174AC

IFCID 175 - Arch Log CMD Sus End:

This topic shows detailed information about “Record Trace - IFCID 175 - Arch Log CMD Sus End”.

Chapter 6. Batch reporting 3969
Record trace - IFCID 175 - Arch Log CMD Sus End

The field labels shown in the following sample layout of “Record Trace - IFCID 175 - Arch Log CMD Sus End” are described in the following section.

ACE:

ACE

The relative number of the agent control element address in the ACE cross-reference table. This table is printed at the end of each location for every trace specified.

Field Name: QW0175AC

IFCID 177 - Package Allocation:

This topic shows detailed information about “Record Trace - IFCID 177 - Package Allocation”.

Record trace - IFCID 177 - Package Allocation

The field labels shown in the following sample layout of “Record Trace - IFCID 177 - Package Allocation” are described in the following section.

PACKAGE NETWORKID: G91E81D0 LUNAME: D179 LUWSEQ: 2
ALLOCATION REQUESTING LOCATION: 9.30.129.208
REQUESTING TIMESTAMP: N/P
AR NAME: gixxer PROID: CLNT/SER V8 R1 M4
ACCTKN X'C7F9F1C5F8F1C4F04BC4F1F7F9000F92022652404040'
LOCATION : DSND81B
COLLECTION ID : AIXPGMS
PACKAGE ID : SQLEMBT
CONSISTENCY TOKEN: X'5A4276344E644C54'
VERSION NAME : N/P
DYNAMICRULES : RUN
PLAN : DISTSERV
ISOLATION : CS
ACQUIRE : USE
RELEASE : COMMIT
REOPTIMIZATION : NO
DEFERPREPARE : NO
KEEPDYNAMIC : NO
DBPROTOCOL : DRDA
OPT_HINT_IDENT : 'BLANK'
IMMEDWRITE : NO

LOCATION

The location of the package. This field shows 'BLANK' if the local location is not defined.

Field Name: QW0177LO

COLLECTION ID

The collection name.

Field Name: QW0177CO

PACKAGE ID

The package identifier.

Field Name: QW0177PI

CONSISTENCY TOKEN
The consistency token (timestamp) of the program.

Field Name: QW0177CT

VERSION NAME

The version. This field shows N/P if the record does not contain a valid version.

Field Name: QW0177VN

DYNAMICRULES

The value of the DYNAMICRULES option on the BIND/REBIND command:

- **RUN**  Runtime rules apply to a dynamic SQL statement for authorization checking and object qualification at run time.
- **BIND** Bind-time rules apply to a dynamic SQL statement for authorization checking and object qualification at run time.

N/P in this field indicates that DYNAMICRULES was not specified.

Field Name: QW0177DY

PLAN

The name of the plan under which the package is running.

Field Name: QW0177PL

ISOLATION

The isolation level of the package:

- **RR**  Repeatable read
- **CS**  Cursor stability
- **RS**  Read stability
- **UR**  Uncommitted read

Field Name: QW0177IS

ACQUIRE

The acquire level of the package.

Field Name: QW0177AQ

RELEASE

The release level of the package.

Field Name: QW0177RL

REOPTIMIZATION

Indicates whether reoptimization was requested:

- **YES**  REOPT(VARS) was specified to reoptimize the access path of the SQL statement at run time.
- **NO**  NOREOPT(VARS) was specified to optimize the access path of the SQL statement only at bind time.

Field Name: QW0177RO

DEFERPREPARE
Indicates whether the preparation of dynamic SQL statements was deferred:

**YES**  
DEFER(PREPARE) was specified to defer the preparation of the dynamic SQL statements that refer to remote objects until run time.

**NO**  
NODEFER(PREPARE) was specified to prepare the dynamic SQL statements at bind time.

**Field Name:** QW0177DP

**KEEPDYNAMIC**
Indicates whether DB2 keeps (KEEPDYNAMIC(YES)) or discards (KEEPDYNAMIC(NO)) prepared SQL statements at commit points.

**Field Name:** QW0177KD

**DBPROTOCOL**
Protocol. Possible values are:
- **DRDA**
- **PRIVATE**

**Field Name:** QW0177PR

**OPT_HINT_IDENT**
Query optimization hint identifier, the default is blanks.

**Field Name:** QW0177OH

**IMMEDWRITE**
Indicates how DB2 updates group buffer pool dependent pages. This is only valid in a data-sharing environment.

Group buffer pool dependent pages can be written out to DASD or SYSTEM pagesets. Values shown are:

**NO**  
DB2 uses normal write activity for updates, this is the default. Pages are written out at, or before phase 2 commit, or at the end of an abort for transactions that have rolled back.

**PH1**  
Pages are written out at, or before phase 1 commit.

If a transaction subsequently rolls back, the pages are updated in the group buffer pool at the end of the rollback, and are written out at the end of the abort.

**YES**  
Pages are written out to the coupling facility as soon as the buffer update commits. Pages are written out regardless of whether the update occurs during forward progress or rollback of the transaction.

This option can affect DB2 performance due to coupling facility overhead.

**N/P**  
The DB2 subsystem is not part of a data sharing group.

**Field Name:** QW0177WI

**IFCID 178 - IBM Service Record:**

This topic shows detailed information about “Record Trace - IFCID 178 - IBM Service Record”.

3972  IBM Db2 Performance Expert on z/OS
This record is for IBM service use.

**IFCID 179 - IBM Service Record:**

This topic shows detailed information about “Record Trace - IFCID 179 - IBM Service Record”.

This record is for IBM service use.

**IFCID 180 - DC Communication Buffers:**

This topic shows detailed information about “Record Trace - IFCID 180 - DC Communication Buffers”.

The format of this record depends on the format of the network protocol.

**Record trace - IFCID 180 - DC Communication Buffers**

The field labels shown in the following sample layout of “Record Trace - IFCID 180 - DC Communication Buffers” are described in the following section.

### If SNA:

```
TYPE OF EVENT : SENT AN FMH-5 TO ALLOCATE A CONVERSATION
NETWORK PROTOCOL: SNA    CONVERSATION ID : X'00000010'    SESSION : X'1000000000000000'
MSG LENGTH : 52
MSG/FMH-5 : TRACEXXXX1XXXXXXXXX2XXXXXXXXX3XXXXXXXXX4XXXXXXXXXZ
```

### If TCP/IP V4:

```
TYPE OF EVENT : RECEIVED DISTRIBUTED DATA MESSAGE
NETWORK PROTOCOL: TCP/IP V4    SOCKET DESCRIPTOR: X'00000010'    IP ADDRESS: X'1000000000000000D3D4E7E7E7E7E7E9'
LOCAL PORT : X'A7A7'    PARTNER PORT : X'A7A7'
MSG LENGTH : 52
MSG/FMH-5 : TRACEXXXX1XXXXXXXXX2XXXXXXXXX3XXXXXXXXX4XXXXXXXXXZ
```

### If TCP/IP V6:

```
TYPE OF EVENT : RECEIVED A DISTRIBUTED DATA MESSAGE
NETWORK PROTOCOL: TCP/IP V6    SOCKET DESCRIPTOR: X'00000010'    IP ADDRESS: X'1000000000000000D3D4E7E7E7E7E7E9'
LOCAL PORT : X'A7A7'    PARTNER PORT : X'A7A7'
MSG LENGTH : 52
MSG/FMH-5 : TRACEXXXX1XXXXXXXXX2XXXXXXXXX3XXXXXXXXX4XXXXXXXXXZ
```

**TYPE OF EVENT**

The type of event:

- **R** A distributed data message was received.
- **S** A distributed data message was sent.
- **F** An FMH-5 on an incoming conversation was received (only possible for VTAM conversations).
- **A** An FMH-5 to allocate a conversation was sent (only possible for VTAM conversations).

**Field Name:** QW0180E

**NETWORK PROTOCOL**

The type of network protocol:

- SNA
- TCP/IP IPV4
- TCP/IP IPV6

Chapter 6. Batch reporting 3973
**Field Name:** QW0180NP

**SESSION ID or IP ADDRESS(V4), LOCAL PORT(V4), PARTNER PORT(V4)**

For SNA: this field contains the session ID. For TCP/IP: If QWHSRN is lower than 91, this field contains the 32-bit IPV4 IP address, followed by the 16-bit local port number, followed by the 16-bit partner port number.

**Field Name:** QW0180SI

**IPADDRESS (V6)**

The IP address for TCP/IP:
- If QWHSRN is lower than or equal to 91, this field contains the IP address in internal form.
- If QW0180NP is equal to '01'B, this field contains an IPV4 IP address, which can be mapped.
- If QW0180NP is equal to '10'B, this field contains a 128-bit IPV6 IP address.

**Field Name:** QW0180IP

**MODE**

For SNA: the entry name of the log mode.

**Field Name:** QW0180LM

**LOCAL PORT (V6)**

The local port.

**Field Name:** QW0180LP

**PARTNER PORT (V6)**

The partner port.

**Field Name:** QW0180PP

**MSG LENGTH**

The length of the variable length area mapped by QW0180DS.

**Field Name:** QW0180DL

**MSG/FMH-5**

The variable length message or FMH-5 data. (The password in the FMH-5 or the TCP/IP message is changed to blanks.)

**Field Name:** QW0180DS

**IFCID 181 - IBM Service Record:**

This topic shows detailed information about “Record Trace - IFCID 181 - IBM Service Record”.

This record is for IBM service use.

**IFCID 182 - IBM Service Record:**

This topic shows detailed information about “Record Trace - IFCID 182 - IBM Service Record”.

This record is for IBM service use.
IFCID 183 - DRDS RDS/SCC Interface:

This topic shows detailed information about “Record Trace - IFCID 183 - DRDS RDS/SCC Interface”.

This record provides information about the type of request being processed at the requester.

This record is produced only for DRDA requests.

Record trace - IFCID 183 - DRDS RDS/SCC Interface

The field labels shown in the following sample layout of “Record Trace - IFCID 183 - DRDS RDS/SCC Interface” are described in the following section.

The return code.

Field Name: QW0183RC

IFCID 184 - DC Communication Buffers:

This topic shows detailed information about “Record Trace - IFCID 184 - DC Communication Buffers”.

Record trace - IFCID 184 - DC Communication Buffers

The field labels shown in the following sample layout of “Record Trace - IFCID 184 - DC Communication Buffers” are described in the following section.

TYPE OF EVENT

The type of event can be one of the following:
IFCID 184 - DC Communication Buffers

- MSG RECEIVED
- MSG SENT
- MSG CONTINUED

Field Name: QW0184E

NETWORK PROTOCOL
The partner port.
Field Name: QW0184PP

SOCKET DESCRIPTOR
The descriptor of the TCP/IP socket in hexadecimal.
Field Name: QW0184SD

IP ADDRESS
The IP Address or Port in hexadecimal.
Field Name: QW0184SI

LOCAL PORT
The local port.
Field Name: QW0184LP

PARTNER PORT
The partner port.
Field Name: QW0184PP

MESSAGE LENGTH
The length of the message.
Field Name: QW0184DL

MESSAGE TEXT
The text of the message.
Field Name: QW0184DS

IFCID 185 - READs Data Capture Start:
This topic shows detailed information about “Record Trace - IFCID 185 - READs Data Capture Start”.

When present, data is printed in hexadecimal dump format, otherwise NO DATA is printed.

IFCID 186 - IBM Service Record:
This topic shows detailed information about “Record Trace - IFCID 186 - IBM Service Record”.

This record is for IBM service use.

IFCID 188 - READs Data Capture End:
This topic shows detailed information about “Record Trace - IFCID 188 - READs Data Capture End”.
Record trace - IFCID 188 - READs Data Capture End

The field labels shown in the following sample layout of “Record Trace - IFCID 188 - READs Data Capture End” are described in the following section.

REQUEST TYPE

The type of request from the WQALCDCD field of the IFI qualification area.

Field Name: QW0188TP

READS REQUEST FLAG

The reads request flag. If the value is x'40', reads were required because more data was available than would fit in the user return area. If this occurs frequently, consider increasing the size of the user return area.

Field Name: QW0188FL

DESCRIBES

The number of data capture describes.

Field Name: QW0188MB

LONGEST LOG READ

The portion of the log read that took the longest amount of time.

Field Name: QW0188PL

BEGIN REQUEST RBA

The beginning RBA of the requested log range.

Field Name: QW0188BT

DESCRIBE ELAPSED

The elapsed time of the data capture describe.

Field Name: QW0188BR

LOG READS RETURNED

The total number of log records from which data rows are returned for this single READs request.

Field Name: QW0188RD

END REQUEST RBA

The end RBA of the requested log range.

Field Name: QW0188ER

LOG READS PERFORMED

The number of log reads performed.

Field Name: QW0188LR

TABLES RETURNED

The number of data capture tables returned.
IFCID 188 - READs Data Capture End

Field Name: QW0188TB

LOG READ ELAPSED
The elapsed time of the longest log read.

Field Name: QW0188LL

LOG RECS RETURNED
The total number of log records retrieved by one or more reads requests for IFCID 185 for a single SQL change. If the value in this field is less than the value in LOG RECS CAPTURED, then additional log records must be retrieved to obtain all log records involved in the SQL change.

Field Name: QW0188RR

DATA ROWS RETURNED
The number of data rows returned.

Field Name: QW0188DR

LOG EXTRACT ELAPSED
The log extraction elapsed time for IFCID 185 requests.

Field Name: QW0188LT

LOG RECS CAPTURED
The total number of log records captured on the log for this particular SQL change.

Field Name: QW0188LC

DATA DESCRIPTOR
The number of data descriptions returned.

Field Name: QW0188DD

IFCID 190 - IBM Service Record:

This topic shows detailed information about “Record Trace - IFCID 190 - IBM Service Record”.

This record is for IBM service use.

IFCID 191 - DDM Level 6B Objects: This record can contain six types of data section. One header section and one 6B DSS section are always present. The other sections are only printed if they are present.

IFCID 191 - Command and/or Reply Section:

This topic shows detailed information about “Record Trace - IFCID 191 - Command and/or Reply Section”.

Record trace - IFCID 191 - Command and/or Reply Section

The field labels shown in the following sample layout of “Record Trace - IFCID 191 - Command and/or Reply Section” are described in the following section.
EYECATCHER

The type of data in this section:

DRDACMND
Command data

DRDARPLY
Reply data

DRDAHCMND
Command data

DRDAHRPY
Reply data

DRDARDTA
Reply data

DRDACDTA
Command data

Field Name: QW0191RE

PARSE STATUS

The parse status:

DRDASUCC
The parse is successful.

DRDAFAIL
The parse is unsuccessful.

Field Name: QW0191PS

CODE POINT

The code point.

Field Name: QW0191C3

RELATIVE NUMBER

The relative number of the data stream structure carrier.

Field Name: QW0191NM

RPY/RQS/OBJ

Offset to the start of RPY/RQS/OBJ DSS within the IFCID 191 record.

Field Name: QW0191OF

PARSE FAIL

Offset relative to the IFCID 191 record point at which parse failed.

Field Name: QW0191FO

FD SECTION

Offset relative to the IFCID 191 record to the LATE DESCRIPTOR section.

Field Name: QW0191D1

RT SECTION

Offset relative to the IFCID 191 record to the RDTA DATA section.

Field Name: QW0191D2
IFCID 191 - Command and/or Reply Section

LT SECTION
Offset relative to the IFCID 191 record to the FD LIDLST section.

Field Name: QW0191D3

EA SECTION
Offset relative to the IFCID 191 record to the ZEDA DATA section.

Field Name: QW0191D4

IFCID 191 - DB2 ZEDA:

This topic shows detailed information about “Record Trace - IFCID 191 - DB2 ZEDA”.

DB2 ZEDA is available if the pointer EA SECTION is set on the COMMAND AND/OR REPLY section.

Record trace - IFCID 191 - DB2 ZEDA

The field labels shown in the following sample layout of “Record Trace - IFCID 191 - DB2 ZEDA” are described in the following section.

Field Name: QW0191RE

IFCID 191 - Header Section:

This topic shows detailed information about “Record Trace - IFCID 191 - Header Section”.

IBM Db2 Performance Expert on z/OS
Record trace - IFCID 191 - Header Section

The field labels shown in the following sample layout of “Record Trace - IFCID 191 - Header Section” are described in the following section.

LOCATION
The name of the remote location.
Field Name: QW0191LN

VERSION
The version number for all sections.
Field Name: QW0191VS

OBJ LEN.
The length of the failed object.
Field Name: QW0191FL

REASON
The reason code.
Field Name: QW0191RS

RECORD
The sequence number for this IFCID 191 record out of the total number of IFCID 191 records.
Field Name: QW0191NO

OF TOTAL
The total number of IFCID 191 records.
Field Name: QW0191TO

MODULE
The module name.
Field Name: QW0191MN

SOURCE
The source ID in the module.
Field Name: QW0191MI

ERROR TOKEN
The unique error token.
Field Name: QW0191TK

DDM COMMAND CODE POINT
The DDM command code point.
Field Name: QW0191C1
IFCID 191 - Header Section

The DB2 parse state:

P1 Application requester parse
P2 Application server parse

Field Name: QW0191PA

RN RECEIVED
The number of relay messages received.
Field Name: QW0191RN

OBJDSS RECEIVED
The number of object data stream structures received.
Field Name: QW0191ON

DSS TOTAL
The total number of data stream structures.
Field Name: QW0191DN

ERROR TYPE
The type of error:

0 SQLSTATE is SQLCA generated
1 Reply message sent

Field Name: QW0191ER

DIMENSION
The dimension of PARSE TRACE ARRAY.
Field Name: QW0191TN

PARSE TRACE ARRAY
The last five top level parse traces. These are shown in the format STATE, EVENTS.
Field Name: QW0191PT

IFCID 191 - Late Descriptor Section:
This topic shows detailed information about “Record Trace - IFCID 191 - Late Descriptor Section”.

Record trace - IFCID 191 - Late Descriptor Section
The field labels shown in the following sample layout of “Record Trace - IFCID 191 - Late Descriptor Section” are described in the following section.

LATE DESCRIPTORS PROCESSED
The number of late environmental descriptors processed.
Field Name: QW0191LD

SQLDTAGRP TRIPLETS
The total number of data stream structures.
Field Name: QW0191GN

L1

SQLDTAGRP local ID extracted.

Field Name: QW0191L1

L2

SQLCADTA local ID extracted.

Field Name: QW0191L2

L3

SQLDTA local ID extracted.

Field Name: QW0191L3

L4

SQLDTARD local ID extracted.

Field Name: QW0191L4

GEOMETRY STATUS

The FD:OCA geometry status. This field is a bit mask. The hexadecimal value of the field is printed.

- If bit 0 is on, the status of SQLDTAGRP is OK.
- If bit 1 is on, the status of SQLCADTA is OK.
- If bit 2 is on, the status of SQLDTA is OK.
- If bit 3 is on, the status of SQLDTARD is OK.

Field Name: QW0191GO

IFCID 191 - 6B DSS Section:

This topic shows detailed information about “Record Trace - IFCID 191 - 6B DSS Section”.

Record trace - IFCID 191 - 6B DSS Section

The field labels shown in the following sample layout of “Record Trace - IFCID 191 - 6B DSS Section” are described in the following section.

The field labels shown in the following sample layout of “Record Trace - IFCID 192 - DDM Level 6A Header Errors” are described in the following section.
REMOTE LOCATION

The name of the remote location.

Field Name: QW0192LN

VERSION NUMBER

The version number for the IFCID 192 records.

Field Name: QW0192VN

CSECT

The CSECT that detected the error.

Field Name: QW0192CS

ERROR TYPE

The DDM error type returned.

Field Name: QW0192ER

SEVERITY

The DDM severity code returned.

Field Name: QW0192SV

ERROR CODE

The DDM error code returned. For DDM protocol errors, this is the DDM PRCCNVCD value. For DDM syntax errors, this is the DDM SYNERRCD value.

Field Name: QW0192CD

IFCID 192 - Previous 6A Header:

This topic shows detailed information about “Record Trace - IFCID 192 - Previous 6A Header”.

OFFSET

Offset into the data stream of the current DDM level 6A header (that is, the last valid DDM header).

Field Name: QW0192PO

GDS LENGTH

Generalized data stream (GDS) length field.

Field Name: QW0192PL

DDM CONST

The DDM constant.

Field Name: QW0192PI

FLAG

The DDM flag byte.

Field Name: QW0192PF
IFCID 192 - Previous 6A Header

REQ CORR
The DDM request correlator.
Field Name: QW0192PC

IFCID 193 - UOW/SQLCODE Mismatch:

This topic shows detailed information about “Record Trace - IFCID 193 - UOW/SQLCODE Mismatch”.

Record trace - IFCID 193 - UOW/SQLCODE Mismatch

The field labels shown in the following sample layout of “Record Trace - IFCID 193 - UOW/SQLCODE Mismatch” are described in the following section.

REMOTE LOCATION
The location name of the server.
Field Name: QW0193LN

VERSION
The version number of this trace record.
Field Name: QW0193VS

CSECT
The CSECT that detected the error.
Field Name: QW0193CS

SQLCODE
The SQL code returned by the server.
Field Name: QW0193SC

COMMAND SENT
The command sent to the server.
Field Name: QW0193CO

UOW DISPOSITION
The unit of work (UOW) disposition reported by the server.
Field Name: QW0193UW

IFCID 194 - Invalid SNA FMH-5 Received:

This topic shows detailed information about “Record Trace - IFCID 194 - Invalid SNA FMH-5 Received”.

Record trace - IFCID 194 - Invalid SNA FMH-5 Received

The field labels shown in the following sample layout of “Record Trace - IFCID 194 - Invalid SNA FMH-5 Received” are described in the following section.
REMOTE LOCATION
The name of the remote location.
Field Name: QW0194LN

VERSION NUMBER
The version number of this trace record.
Field Name: QW0194VN

CSECT
The CSECT that detected the error.
Field Name: QW0194CS

SNA SENSE CODE
The SNA sense code describing the error.
Field Name: QW0194SN

FMH5 DATA
The invalid SNA FMH-5 record.
Field Name: QW0194DS

IFCID 195 - SQLDA Discrepancy:
This topic shows detailed information about “Record Trace - IFCID 195 - SQLDA Discrepancy”.

Record trace - IFCID 195 - SQLDA Discrepancy
The field labels shown in the following sample layout of “Record Trace - IFCID 195 - SQLDA Discrepancy” are described in the following section.

REMOTE LOCATION: xxxxxxxxxxxxxxxx VERSION: 99999
MODULE: xxxxxxxx ID: 99999 FIELD IN ERROR: xxxxxxxx
COLUMN: 9999999999 EXISTING SQLDA: 9999999999
NEW SQLDA: 9999999999

REMOTE LOCATION
The name of the remote location.
Field Name: QW0195LN

VERSION
The version number of this trace record.
Field Name: QW0195VI

MODULE
The name of the module.
Field Name: QW0195MN

ID
The source ID in the module.
IFCID 195 - SQLDA Discrepancy

Field Name: QW0195UI

FIELD IN ERROR
The field in error:
SQLD   The number of entries in SQLD
SQLTYPE   Data type
SQLLEN   Data length
SQLDATA   CCSID

Field Name: QW0195FD

COLUMN
The column number for the field in error.

Field Name: QW0195NO

EXISTING SQLDA
The contents in the existing SQLDA field.

Field Name: QW0195SE

NEW SQLDA
The contents in the new SQLDA field.

Field Name: QW0195SN

IFCID 196 - Timeout Data:    IFCID 196 provides information on a lock request that resulted in the timeout of its DB2 task because one or more other tasks were holding incompatible locks on the requested resource. DB2 always obtains (GETMAIN) storage for this record even if the user did not activate Statistics trace class 3 or performance trace class 6.

IFCID 196 - Holder:

This topic shows detailed information about “Record Trace - IFCID 196 - Holder”.

The header label is “H O L D E R” when the task holds the lock. The header label is “W A I T E R” when the task is a higher priority waiter of the lock.

Record trace - IFCID 196 - Holder

The field labels shown in the following sample layout of “Record Trace - IFCID 196 - Holder” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PRIMAUTH</td>
<td>Authorization ID of the thread holding the resource.</td>
</tr>
<tr>
<td>PLAN NAME</td>
<td></td>
</tr>
</tbody>
</table>

IBM Db2 Performance Expert on z/OS
The holder’s plan name or, if there is contention with a retained lock, the word SYSTEM.

**Field Name:** QW0196HP

**CORR ID**

The holder’s correlation ID or, if there is contention with a retained lock, the word SYSTEM.

**Field Name:** QW0196HR

**CONN**

The holder’s connection ID or, if there is contention with a retained lock, the word SYSTEM.

**Field Name:** QW0196HN

**LUWID - NETWORKID, LUNAME, INSTANCE**

This field contains an asterisk (*) if the lock holder is not a database access thread (DBAT). It provides the input for the:

- Holder’s network ID or, if there is contention with a retained lock, the word SYSTEM.
- Holder’s LU name or, if there is contention with a retained lock, the word SYSTEM.
- Holder’s LUW instance or, if there is contention with a retained lock, the word SYSTEM.

**Note:** This field is only valid for distributed threads.

**Field Name:** QW0196HL

**OWNING WORK UNIT**

The holder’s owning work unit. This value is printed in hexadecimal.

If there is contention with a retained lock, this field is set to X'00'.

**Field Name:** QW0196HO

**LOCK STATE**

The holder’s lock state.

**Field Name:** QW0196HS

**LOCK DURATION**

The lock duration of the holder:

- **MANUAL**
  - Varies depending on the ISOLATION parameter (QW0196HD=x'20')

- **MANUAL+1**
  - Temporary change of consistency level from CS to RR during bind and DDL (QW0196HD=x'21')

- **COMMIT**
  - Until commit (QW0196HD=x'40')

- **COMMIT+1**
  - Past commit; applies to locks needed to maintain the position for a cursor opened WITH HOLD (QW0196HD=x'41')
IFCID 196 - Holder

**ALLOCATION**
Until deallocation (QW0196HD=x'60')

**PLAN**
For the duration of the plan (QW0196HD=x'80')

**UTIL**
For the duration of the utility execution (QW0196HD=x'81')

**INTEREST**
Duration used for P-locks (QW0196HD=x'FE')

**FREE ALL**
Until all locks are freed (QW0196HD=x'FF')

x'00'
Contention with a retained lock (QW0196HD=x'00x')

**Field Name:** QW0196HD

**MEMBER**
The holder’s DB2 member name. For non-data sharing environments, N/P is shown in this field.

**Field Name:** QW0196HI

**TRANSACT**
The transaction or application name that is run.

**Field Name:** QWHCEUTX

**WS_NAME**
The end user’s workstation name.

**Field Name:** QWHCEUWN

**END_USER**
The user ID of the workstation end user. This user ID can be different from the authorization ID used to connect to DB2. This field contains blanks if the client does not supply this information.

**Field Name:** QWHCEUID

**STMT ID**
The cached statement ID for the statement holding the resource. A value of zero indicates that the client did not supply this information.

**Field Name:** QW0196H9

**STMT TYPE**

**STATIC**
The statement is of type static.

**DYNAMIC**
The statement is of type dynamic.

**Field Name:** QW0196HY

*IFCID 196 - Timeout Header:*

This topic shows detailed information about “Record Trace - IFCID 196 - Timeout Header”. 

---

3992  IBM Db2 Performance Expert on z/OS
Record trace - IFCID 196 - Timeout Header

The field labels shown in the following sample layout of “Record Trace - IFCID 196 - Timeout Header” are described in the following section.

NUMBER OF HOLDERS/WAITERS

The number of agents causing the timeout.

Field Name: QW0196NU

LOCK HASH VALUE

The hash value of the locked resource.

Field Name: QW0196RH

LOCK RES TYPE

The locked resource type.

Note: For data sharing, SKELETON CURSOR TABLE LOCKING and SKELETON PACKAGE TABLE LOCK are LP-locks (an LP-lock has an L-lock component and a P-lock component).

Field Name: QW0196RN

DBID

The database ID. This field is not applicable if the value in LOCK RES TYPE is SKELETON CURSOR TABLE LOCKING, SKELETON PACKAGE TABLE LOCK, COLLECTION, or ALTER BUFFER POOL.

Deducted from the DB2 fields QW0196KD, QW0105DN or QW0107DN.

If present, the database name is shown, otherwise the decimal identifier from QW0196KD is shown or N/A if this value is 0.

Field Name: RT0196DB

OBID

The object ID. This field is not applicable if the value in LOCK RES TYPE is SKELETON CURSOR TABLE LOCKING, SKELETON PACKAGE TABLE LOCK, COLLECTION, or ALTER BUFFER POOL.

Deducted from the DB2 fields QW0196KP, QW0105TN or QW0107TN.

If present, the object name is shown, otherwise the decimal identifier from QW0196KP is shown or N/A if this value is 0.

Field Name: RT0196OB

RESOURCE ID

The hexadecimal identifier of the small resource. If LOCK RES TYPE is:

DATA PAGE LOCKING
First 3 bytes are the page number

DATA SET LOCKING (PARTITION)
Last byte is the partition number
INDEX PAGE LOCKING
   First 3 bytes are the page number

HASH ANCHOR LOCK
   First 3 bytes are the page number and the last byte is the anchor point ID

CS-READ DRAIN
   Last byte is the partition number (optional)

RR-READ DRAIN
   Last byte is the partition number (optional)

WRITE DRAIN
   Last byte is the partition number (optional)

ROW LOCK
   First 3 bytes are the page number and the last byte is the row ID of the record

INDEX END OF FILE LOCK
   Last byte is the partition number (optional)

Note:
   • In large partitioned table spaces, the page number covers 4 bytes instead of 3.
   • If table spaces use relative page numbers, the resource ID covers 7 bytes.
      It contains the partition number in the first 2 bytes, the page number in the next 4 bytes, and the record ID in the seventh byte.

This field is not applicable if the value in LOCK RES TYPE is SKELETON CURSOR TABLE LOCKING, SKELETON PACKAGE TABLE LOCK, COLLECTION, TABLE LOCK, or ALTER BUFFER POOL. If the value is UTILITY SERIALIZATION LOCK or BINDLOCK, N/A is printed.

Field Name: QW0196KR

REQUESTED FUNCTION
   The victim's type of request.

Field Name: QW0196WU

REQUESTED STATE
   The victim's lock state.

Field Name: QW0196WS

REQUESTED DURATION
   The victim's lock duration.

Field Name: QW0196WD

REQUESTED FLAGS
   The victim's lock flag.

Field Name: QW0196WF

REQUESTED OWNING WORK UNIT
   The victim's owning work unit.

Field Name: QW0196WO
ZPARM INTERVAL
The timeout interval of the ZPARM value.
Field Name: QW0196TI

INTERVAL COUNTER
The timeout counter for this thread.
Field Name: QW0196TC

WTR STMT ID
The cached statement ID for the statement waiting for the resource. A value of zero indicates that the client did not supply this information.
Field Name: QW0196W9

WTR STMT TYPE
The waiter statement information. Possible values are:
STATIC
The statement is of type static.
DYNAMIC
The statement is of type dynamic.
Field Name: QW0196WY

IFCID 197 - DB2 Messages:
This topic shows detailed information about “Record Trace - IFCID 197 - DB2 Messages”.

This IFCID enables monitoring of DB2 messages. If this trace is enabled, all console messages will be written to IFCID 197 records. This record is written when performance trace class 18 is on.

Note: Not all messages are written to the message log. DISPLAY commands, for example, are filtered out and are not shown in the log.

Record trace - IFCID 197 - DB2 Messages
The field labels shown in the following sample layout of “Record Trace - IFCID 197 - DB2 Messages” are described in the following section.

MESSAGE ID
The message ID.
Field Name: QW0197ID

MESSAGE Text
The message text can consist of up to 2500 bytes.
Field Name: QW0197TX
IFCID 198 - Buffer Manager Page Access:

This topic shows detailed information about “Record Trace - IFCID 198 - Buffer Manager Page Access”.

Record trace - IFCID 198 - Buffer Manager Page Access

The field labels shown in the following sample layout of “Record Trace - IFCID 198 - Buffer Manager Page Access” are described in the following section.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBID</td>
<td>DB2PM</td>
</tr>
<tr>
<td>PSID</td>
<td>PROCESS</td>
</tr>
<tr>
<td>BPID</td>
<td>X'00'</td>
</tr>
<tr>

<td>GET PAGE</td>
</tr>
<tr>
<td>PAGE STATUS</td>
<td>PAGE HIT IN BUFFERPOOL</td>
</tr>
<tr>
<td>ACCESS</td>
<td>RANDOM</td>
</tr>
<tr>
<td>ACE</td>
<td>1</td>
</tr>
<tr>
<td>PAGE REFRESH</td>
<td>N/A</td>
</tr>
<tr>
<td>PARTITION</td>
<td>0 PAGE NUMBERING: N/A</td>
</tr>
</tbody>
</table>

DBID

The database ID. Deduced from the DB2 fields QW0198DB, QW0105DN or QW0107DN.

When present, the database name is shown, otherwise the decimal identifier from QW0198DB is shown or N/A if this value is 0.

Field Name: RT0198OB

PSID

The page set object identifier. When present, this is the page set object name, otherwise the decimal identifier from QW0198OB is shown.

Field Name: RT0198PS

BPID

The buffer pool identifier.

Field Name: QW0198BP

FUNCTION

The page request function code.

Field Name: QW0198FC

PAGE STATUS

The page status in the buffer pool.

Field Name: QW0198PS

ACCESS

The page access type. This is only applicable if the value in FUNCTION is GET PAGE or RELEASE PAGE.

Field Name: QW0198AT

PAGE

The page number.

Field Name: QW0198PN

ACE

The relative number of the agent control element address in the ACE cross-reference table. This table is printed at the end of each location for every trace specified.
Field Name: QW0198AC

PAGE REFRESH

Page refresh status in case of a missed page in the virtual buffer pool. Possible values:
- FROM GROUP BUFFER POOL
- FROM DASD

Field Name: QW0198PR

PARTITION

The partition number. This field contains 0 if the request is non-partitioned.

Field Name: QW0198PT

PAGE NUMBERING

Indicates how page numbers are shown:
- REL Indicates that relative page numbers are shown in the partition.
- ABS Indicates that absolute page numbers are shown in the partition.
- N/A Not applicable.

Field Name: QW0198P1

IFCID 199 - Buffer Pool Statistics at Data Set Level:

This topic shows detailed information about “Record Trace - IFCID 199 - Buffer Pool Statistics at Data Set Level”.

Record trace - IFCID 199 - Buffer Pool Statistics at Data Set Level

The field labels shown in the following sample layout of “Record Trace - IFCID 199 - Buffer Pool Statistics at Data Set Level” are described in the following section.

INTERVAL STATIME COMPLETED: 02/09/19 08:51:48.206479
-------------------------------------------------------------------------------------------------------------------------
DBID: 452  DBNAME : 452  GBP DEPENDENT : NO  LAST IN SEQUENCE NO

SYNC.I/O FOR WRITE AND READ  ASYNC.I/O FOR WRITE, READ, CASTOUT  BUFFER POOL CACHED PAGES
AVG. DELAY I/O (USEC) 40  AVG. DELAY I/O (USEC) 17  VPOOL CACHE CURR. 1759
MAX. DELAY I/O (USEC) 979  MAX. DELAY I/O (USEC) 1575  VPOOL CACHE CHANGED 0
TOTAL I/O PAGES 7727  TOTAL I/O PAGES 2876545  TOTAL 1/0 COUNT 1798520
VPOOL CACHE CHANGED 0
TOTAL 1/0 COUNT 1798520
CURRENT GETPAGES 60177764

INTERVAL STATIME COMPLETED

Stores the clock value at the end of the statistics interval.

Field Name: QW0199TS

DBID

Internal identifier of the database where the tablespace or indexspace resides.

The ID can be used to match column DBID of table SYSIBM.SYSDATABASE in the DB2 catalog.
IFCID 199 - Buffer Pool Statistics at Data Set Level

Be aware the value in the catalog may have changed since the time the DB2 trace record was written.

**Field Name:** QW0199DB

**DBNAME**

Internal identifier of the database where the tablespace or indexspace resides.

The ID can be used to match column DBID of table SYSIBM.SYSDATABASE in the DB2 catalog.

Be aware the value in the catalog may have changed since the time the DB2 trace record was written.

**Field Name:** QW0199DB

**GBP DEPENDENT**

Indicates whether the pageset is group buffer pool dependent. This is possible only if DB2 has been set up for data sharing.

**Field Name:** QW0199GD

**LAST IN SEQUENCE**

Indicates if this is the last IFCID 0199 record.

**Field Name:** QW0199LS

**OBID**

The internal identifier of the pageset. This can be either a table space or an index space.

For a table space the ID can be used to match column 'PSID' in SYSIBM.SYSTABLESPACE of the catalog.

For an index space the ID can be used to match column 'ISOBID' in SYSIBM.SYSINDEXES.

Be aware the value in the catalog may have changed since the time the DB2 trace record was written.

**Field Name:** QW0199OB

**OBNAME**

The internal identifier of the pageset. This can be either a table space or an index space.

For a table space the ID can be used to match column 'PSID' in SYSIBM.SYSTABLESPACE of the catalog.

For an index space the ID can be used to match column 'ISOBID' in SYSIBM.SYSINDEXES.

Be aware the value in the catalog may have changed since the time the DB2 trace record was written.

**Field Name:** QW0199OB

**TYPE OF DATASET**

Indicates whether the data set is a data table or an index space.

**Field Name:** QW0199ID

**BPID**
Identifies the buffer pool to which the information in this section refers:

- Values 0 through 49 are identifiers for BP0 through BP49.
- Values 80 through 89 are identifiers for BP32K through BP32K9.
- Values 100 through 109 are identifiers for BP8K through BP8K9.
- Values 120 through 129 are identifiers for BP16K through BP16K9.

**Field Name:** QW0199BP

**SHADOW COPY**
Indicates if it is a shadow data set.

**Field Name:** QW0199SD

**PARTITION**
For a partitioned table space or index space, this is the partition number. For a nonpartitioned table space or index space, this is the data set number.

**Field Name:** QW0199DN

**LAST STATISTICS**
The timestamp of the last time this data set was externalized in the data set Statistics record. If this is the first time, this data set appears in the Statistics record, this timestamp represents the time when the data set was opened.

**Field Name:** QW0199SC

**SYNC.I/O FOR WRITE AND READ – AVG. DELAY I/O (USEC)**
Average synchronous I/O delay for pages in the pageset, in microseconds.

**Field Name:** QW0199S1

**SYNC.I/O FOR WRITE AND READ – MAX. DELAY I/O (USEC)**
Maximum synchronous I/O delay for pages in the pageset, in microseconds.

**Field Name:** QW0199S2

**SYNC.I/O FOR WRITE AND READ - TOTAL I/O PAGES**
The number of synchronous I/Os for the pageset in the reported interval.

**Field Name:** QW0199SP

**ASYNC.I/O FOR WRITE, READ, CASTOUT – AVG. DELAY I/O (USEC)**
Average asynchronous I/O delay for pages in the pageset, in microseconds.

**Field Name:** QW0199A1

**ASYNC.I/O FOR WRITE, READ, CASTOUT – AVG. DELAY I/O (USEC)**
Average asynchronous I/O delay for pages in the pageset, in microseconds.

**Field Name:** QW0199A2

**ASYNC.I/ASYNC.I/O FOR WRITE, READ, CASTOUT - TOTAL I/O PAGES**
Number of pages read or written asynchronously for the pageset in the reported interval.

**Field Name:** QW0199AP

**ASYNC.I/ASYNC.I/O FOR WRITE, READ, CASTOUT - TOTAL I/O COUNT**
IFCID 199 - Buffer Pool Statistics at Data Set Level

The number of asynchronous I/Os for the pageset during the reported interval.
Field Name: QW0199AC

BUFFER POOL CACHED PAGES - VPOOL CACHE CURR.
Number of pageset pages in the virtual buffer pool.
Field Name: QW0199VP

BUFFER POOL CACHED PAGES - VPOOL CACHED CHANGED
Number of changed page set pages in the virtual buffer pool.
Field Name: QW0199VD

ZHYPERLINK READ – AVG. DELAY I/O (USEC)
Average delay for zHyperLink read I/O for pages in the pageset, in microseconds.
Field Name: QW0199Z1

ZHYPERLINK READ – MAX. DELAY I/O (USEC)
Maximum delay for zHyperLink read I/O for pages in the pageset, in microseconds.
Field Name: QW0199Z2

ZHYPERLINK READ – TOTAL I/O PAGES
The number of pages in the pageset read using zHyperLink during the reported interval.
Field Name: QW0199ZP

CURRENT GETPAGES
The current number of Getpage requests.
Field Name: QW0199GP

IFCID 201 - Alter Buffer Pool:

This topic shows detailed information about “Record Trace - IFCID 201 - Alter Buffer Pool”.

This IFCID records the status of a buffer pool before and after an ALTER BUFFERPOOL command.

Record trace - IFCID 201 - Alter Buffer Pool

The field labels shown in the following sample layout of “Record Trace - IFCID 201 - Alter Buffer Pool” are described in the following section.

BUFFERPOOL ID: 25 NAME: BP25 ALTER COMMAND: ALTER RETURN CODE: 0 REASON CODE: 0

OLD STATUS                  NEW STATUS
-----------------------------------------------
VPOOL SIZE : 0              VPOOL SIZE : 10
VPOOL SEQ THRESH : 80       VPOOL SEQ THRESH : 80
VPOOL DWT THRESH : 30       VPOOL DWT THRESH : 30
VPOOL VMT THRESH :          VPOOL VMT THRESH :
PERCENTAGE : 5              PERCENTAGE : 5
BUFFERS : 0                 BUFFERS : 0
VPOOL PLL SEQ THRESH : 50   VPOOL PLL SEQ THRESH : 50
ASSISTAN. SEQ THRESH : 0    ASSISTAN. SEQ THRESH : 0
PAGE STEAL METHOD : LRU    PAGE STEAL METHOD : LRU
AUTOSIZE : NO               AUTOSIZE : NO
FRAMESIZE : 4K              FRAMESIZE : 4K
VPOOL SIZE MIN : 0          VPOOL SIZE MIN : 0
BUFFERPOOL ID

The buffer pool internal identifier. The values 0 through 49 are the identifiers for BP0 through BP49. The values 80 through 89 are the identifiers for BP32K through BP32K9.

Field Name: QW0201BP

NAME

Buffer pool name.

Field Name: QDBPNM

ALTER COMMAND

This field indicates how the buffer pool was altered. Possible values:

ALTER

The ALTER BUFFERPOOL command was used.

AUTOSIZE

The AUTOMATIC AUTOSIZING (AUTOSIZE(YES) option on ALTER BUFFERPOOL was previously specified.

Field Name: QW0201CD

RETURN CODE

The return code for the ALTER BUFFERPOOL command.

Field Name: QW0201RT

REASON CODE

The reason code returned from an unsuccessful ALTER BUFFERPOOL command.

Field Name: QW0201RE

VPOOL SIZE (OLD)

The size of the old virtual pool.

Field Name: QW0201OP

VPOOL SIZE (NEW)

The size of the new virtual buffer pool.

Field Name: QW0201NP

VPOOL SEQ THRESH

The old and new virtual pool sequential steal threshold.

Old status taken from the DB2 field QW0201OT.

New status taken from the DB2 field QW0201NT.

Field Name: RT0201VS

VPOOL DWT THRESH

The old and new virtual pool deferred write threshold (DWT).

Old status taken from the DB2 field QW0201OD.

New status taken from the DB2 field QW0201ND.
IFCID 201 - Alter Buffer Pool

Field Name: RT0201VD

**VPOOL VDWT THRESH - PERCENTAGE**

The vertical deferred write threshold for the virtual buffer pool expressed as percentage.

Old status taken from the DB2 field QW0201OV.
New status taken from the DB2 field QW0201NV.

Field Name: RT0201PC

**VPOOL VDWT THRESH - BUFFERS**

The vertical deferred write threshold for the virtual buffer pool expressed as an absolute number of buffers. It is only used if VERTICAL DEFERRED WRITE THRESHOLD (PERCENTAGE) is 0.

Old status taken from the DB2 field QW0201OJ.
New status taken from the DB2 field QW0201NJ.

Field Name: RT0201BU

**VPOOL PLL SEQ THRESH**

The old and new virtual pool parallel sequential threshold.

Old status taken from the DB2 field QW0201OQ.
New status taken from the DB2 field QW0201NQ.

Field Name: RT0201VP

**ASSISTAN. SEQ THRESH**

The assisting parallel sequential threshold before and after the ALTER BUFFERPOOL command was issued.

Old status taken from the DB2 field QW0201OX.
New status taken from the DB2 field QW0201NX.

Field Name: RT0201AS

**PAGE STEAL METHOD**

Identifies the page stealing algorithm (PGSTEAL) that is used for the virtual buffer pool. It controls when and whether performance-critical objects in buffer pools are removed from buffer pools when the space is needed by other objects. Possible values are:

**LRU**  Least recently used (LRU) objects are removed first. This means it takes away pages that are not used so that more recently used pages can remain in the virtual buffer pool. This is used by default.

**FIFO**  First-In-First-Out (FIFO) means that the oldest objects are removed first. This results in a small decrease in the cost of a Getpage operation. It can reduce internal DB2 latch contention in environments that require very high concurrency.

**NONE**  Objects are not removed from buffer pool (no page stealing). This setting provides the highest availability for business-critical objects.

Old status taken from the DB2 field QW0201OK.
New status taken from the DB2 field QW0201NK.
Field Name: RT0201PS

AUTOSIZE
The old and new status of the AUTOSIZE attribute.
Old status taken from the DB2 field QW0201OZ.
New status taken from the DB2 field QW0201NZ.

Field Name: RT0201AT

FRAMESIZE (OLD)
The size of the old frame (4 KB, 1 MB, or 2 GB).

Field Name: QW0201OC

FRAMESIZE (NEW)
The new frame size (4 KB, 1 MB, or 2 GB).

Field Name: QW0201NC

VPOOL SIZE MIN (OLD)
The minimum size of the old virtual pool.

Field Name: QW0201OA

VPOOL SIZE MIN (NEW)
The minimum size of the new virtual pool.

Field Name: QW0201NA

VPOOL SIZE MAX (OLD)
The maximum size of the old virtual pool.

Field Name: QW0201OB

VPOOL SIZE MAX (NEW)
The maximum size of the new virtual pool.

Field Name: QW0201NB

SIM POOL SIZE (OLD)
The old number of simulated buffers specified for the simulated buffer pool.

Field Name: QW0201OS

SIM POOL SIZE (NEW)
The new number of simulated buffers specified for the simulated buffer pool.

Field Name: QW0201NS

SIM POOL SEQ THRESH (OLD)
The old sequential steal threshold for the simulated buffer pool, expressed as a percentage of the total simulated buffer pool size.

Field Name: QW0201OH

SIM POOL SEQ THRESH (NEW)
The new sequential steal threshold for the simulated buffer pool, expressed as a percentage of the total simulated buffer pool size.
IFCID 201 - Alter Buffer Pool

Field Name: QW0201NH

IFCID 202 - Buffer Pool Attributes:

This topic shows detailed information about “Record Trace - IFCID 202 - Buffer Pool Attributes”.

Record trace - IFCID 202 - Buffer Pool Attributes

The field labels shown in the following sample layout of “Record Trace - IFCID 202 - Buffer Pool Attributes” are described in the following section.

BUFFEROOOPOOL ID : BP0  VPOOL SIZE : 5000  VPOOL VDWT THRESH BUF : 0
PSTEAL METHOD : LRU  VPOOL SEQ THRESH : 80  VPOOL VDWT THRESH (%) : 5
PGFIX ATTRIB : NO  PARALLEL SEQ THRESH : 50  VPOOL DWT THRESH : 30
AUTOSIZE : NO  ASS PAR SEQ THRESH : 0
FRAMESIZE : 4K  VPOOL SIZE MIN : 0  VPOOL SIZE MAX : 0
SIM POOL SIZE : 200  SIM POOL SEQ THRESH : 50

QDBPSLA : 49879

BUFFEROOOPOOL ID

Buffer pool name.

Field Name: QDBPNM

VPOOL SIZE

The size of the virtual buffer pool.

Old status taken from the DB2 field QW0201OP.
New status taken from the DB2 field QW0201NP.

Field Name: QDBPVPSZ

VPOOL VDWT THRESH BUF

The vertical deferred write threshold (VDWQT), shown as the number of buffers in the virtual buffer pool that might be occupied by updated pages from a single page set.

Field Name: QDBPVDQB

PSTEAL METHOD

Identifies the page stealing algorithm (PGSTEAL) that is used for the virtual buffer pool. It controls when and whether performance-critical objects in buffer pools are removed from buffer pools when the space is needed by other objects. Possible values are:

LRU  Least recently used (LRU) objects are removed first. This means it takes away pages that are not used so that more recently used pages can remain in the virtual buffer pool. This is used by default.

FIFO  First-In-First-Out (FIFO) means that the oldest objects are removed first. This results in a small decrease in the cost of a Getpage operation. It can reduce internal DB2 latch contention in environments that require very high concurrency.

NONE  Objects are not removed from buffer pool (no page stealing). This setting provides the highest availability for business-critical objects.

Field Name: QDBPPGST
VPOOL SEQ THRESH

Virtual pool sequential threshold (VPSEQT). This threshold is a percentage of the virtual buffer pool that might be occupied by sequentially accessed pages. The pages can be in the state updated, in use, or available. Therefore, each page might count regarding exceeding any other buffer pool threshold.

The default value for VPSEQT is 80%. You can change this value to a value from 0% to 100% by using the VPSEQT option of the ALTER BUFFERPOOL command.

VPSEQT is checked before stealing a buffer for a sequentially accessed page instead of accessing the page in the virtual buffer pool. If the threshold is exceeded, DB2 tries to steal a buffer that holds a sequentially accessed page rather than one that holds a randomly accessed page.

If you set VPSEQT to 0%, sequential pages cannot occupy space in the virtual buffer pool. In this case, prefetch is disabled, and sequentially accessed pages are discarded when they are released. You can, however, set the value for HPSEQT to a value above zero and the value for VPSEQT to zero. If you set VPSEQT to 100%, sequential pages can monopolize the entire virtual buffer pool.

Field Name: QDBPVPSH

VPOOL VDWT THRESH (%)

Vertical deferred write threshold (VDWQT). This threshold is similar to the deferred write threshold but it applies to the number of updated pages for one single page set in the buffer pool. If the percentage or number of updated pages for the data set exceeds the threshold, writes up to 128 pages are scheduled for that data set.

VDWQT can be specified in one of the following ways:

1. As a percentage of the virtual buffer pool that might be occupied by updated pages from one single page set. The default value for this threshold is 5%. You can change the percentage to any value from 0% to 90%.

2. As the total number of buffers in the virtual buffer pool that might be occupied by updated pages from one single page set. You can specify the number of buffers from 0 to 9999. If you want to use the number of buffers as your threshold, you must set the percentage threshold to 0.

Field Name: QDBPVDQT

PFGIX ATTRIB

Indicates whether a page is fixed in real storage when it is first used. It can have one of the following values: YES or NO.

Field Name: QDBPPFIX

PARALLEL SEQ THRESH

Virtual buffer pool parallel sequential threshold (VPSEQT). This threshold is a part of the virtual buffer pool that might support parallel operations. It is measured as a percentage of the sequential steal threshold (VPSEQT). Setting VPSEQT to zero disables parallel operation.

The default value for this threshold is 50% of the sequential steal threshold (VPSEQT). You can change the default value to any value from 0% to 100% by using the VPPSEQT option on the ALTER BUFFERPOOL command.
Field Name: QDBPPSQT

VPOOL DWT THRESH

This threshold is a percentage of the virtual buffer pool that might be occupied by unavailable pages, including updated pages and pages in use.

The default value for QWQT is 30%. You can change this value to any value from 0% to 90% using the DWQT option of the ALTER BUFFERPOOL command.

DB2 checks QWQT when an update to a page is complete. If the percentage of unavailable pages in the virtual buffer pool exceeds QWQT, write operations are scheduled for up to 128 pages per data set to decrease the number of unavailable buffers to 10% below QWQT. For example, if QWQT is 50%, the number of unavailable buffers is reduced to 40%.

When the limit of QWQT is reached, data sets containing the oldest updated pages are written asynchronously. DB2 continues to write pages until the ratio goes below the QWQT.

Field Name: QDBPDWQT

AUTOSIZE

Indicates if the AUTOSIZE option is activated on the ALTER BUFFERPOOL command.

Field Name: QDBPASIZ

ASS PAR SEQ THRESH

Virtual buffer pool assisting parallel sequential threshold (VPXPSEQT). This threshold is a part of the virtual buffer pool that might support parallel operations initiated from another DB2 in the data sharing group. It is measured as a percentage of VPPSEQT.

Setting VPXPSEQT to zero (default) prevents DB2 from supporting sysplex query parallelism at run time for queries that use this buffer pool.

You can change the default value to any value from 0% to 100% using the VPXPSEQT option of the ALTER BUFFERPOOL command.

Field Name: QDBPXSEQT

FRAMESIZE

The frame size.

Field Name: QDBPFRAM

VPOOL SIZE MIN

The minimum size of the virtual pool.

Field Name: QDBPVPMI

VPOOL SIZE MAX

The maximum size of the virtual pool.

Field Name: QDBPVPMAX

SIM POOL SIZE

The number of simulated buffers allocated in the simulated buffer pool.

Field Name: QDBPSPSSZ
SIM POOL SEQ THRESH

The sequential steal threshold for the simulated buffer pool, expressed as a percentage of the total simulated buffer pool size.

Field Name: QDBPSPST

QDBPSLA (Prior to DB2 11)

This field is for IBM service.

Field Name: QDBPSLA

IFCID 203 - DDF Heuristic COMMIT/ROLLBK:

This topic shows detailed information about “Record Trace - IFCID 203 - DDF Heuristic COMMIT/ROLLBK”.

This record reports a heuristic decision that has forced a COMMIT or ROLLBACK for a distributed indoubt thread. The record is produced when a RECOVER INDOUBT command is issued and a remote participant in a distributed thread reports a heuristic rollback or commit during the resynchronization process.

Record trace - IFCID 203 - DDF Heuristic COMMIT/ROLLBK

The field labels shown in the following sample layout of “Record Trace - IFCID 203 - DDF Heuristic COMMIT/ROLLBK” are described in the following section.

DECISION SOURCE: LOCAL  DECISION REPORTED: COMMIT  REMOTE DECISION LOCATION: 'BLANK'

AFFECTED THREAD:  NETID: USIBMSS  LUNAME: SY00CD82  INSTANCE: X'A73916396F69'  LUW SEQ: 1  URID: X'0000154E0AA4'

COORDINATOR LOCATION: M05EC00C
PARTICIPANT LOCATIONS: N/P

DECISION SOURCE

The source of the decision.
Field Name: QW0203LR

DECISION REPORTED

The decision that was reported.
Field Name: QW0203CA

REMOTE DECISION LOCATION

The location, LU name, or IP address ( NNN.NNN.NNN ) of the location that sent the decision.
Field Name: QW0203LO

NETID

The NETID portion of logical unit of work ID (LUWID).
Field Name: QW0203NT

LUNAME

The LU name portion of the logical unit of work ID (LUWID).
Field Name: QW0203LU

INSTANCE

The instance number portion of the logical unit of work ID (LUWID).
Field Name: QW0203IN

LUW SEQ

The LUW sequence number (commit count) portion of the logical unit of work ID (LUWID).

Field Name: QW0203CM

URID

The recovery log RBA (URID) for the thread.

Field Name: QW0203UR

COORDINATOR LOCATION

The location name, LU name, or IP address (NNN.NNN.NNN) of the coordinator.

Field Name: QW0203CO

PARTICIPANT LOCATIONS

The location name of the participants in this unit of work that were accessed directly by this DB2 subsystem.

Field Name: QW0203PA

IFCID 204 - DDF Partner Cold Start:

This topic shows detailed information about “Record Trace - IFCID 204 - DDF Partner Cold Start”.

This record is written when DB2 tries to reconnect to a remote system that requests a cold start. A cold start means that the remote system has no memory of the work that was in progress when the previous connection failed. This record is only produced when DB2 has memory of threads whose outcome must be resolved.

Record trace - IFCID 204 - DDF Partner Cold Start

The field labels shown in the following sample layout of “Record Trace - IFCID 204 - DDF Partner Cold Start” are described in the following section.

LOCATION: SY00DDB2
OLD RECOVERY LOG: SY00DDB2
NEW RECOVERY LOG: SY00DDB2
AFFECTED THREADS:
NETID: USIBMUSY LUNAME: SY10DDB2 INSTANCE: X’4729F420E443’ LUW SEQ: 4
TOKEN: 1 URID: X’000000000000’ ROLE: COORDINATOR STATUS: COMMITTED

LOCATION

The location, LU name, or IP address (NNN.NNN.NNN) of the remote partner that had the cold start.

Field Name: QW0204LO

OLD RECOVERY LOG

The partner's recovery log name before the cold start.

Field Name: QW0204OR

NEW RECOVERY LOG

The partner's recovery log name after the cold start.

Field Name: QW0204NR

NETID
The NETID portion of the logical unit of work ID (LUWID).

**Field Name:** QW0204NT

**LUNAME**

The LU name portion of the logical unit of work ID (LUWID).

**Field Name:** QW0204LU

**INSTANCE**

The instance number portion of the logical unit of work ID (LUWID).

**Field Name:** QW0204IN

**LUW SEQ**

The LUW sequence number (commit count) portion of the logical unit of work ID (LUWID).

**Field Name:** QW0204CM

**TOKEN**

The local token representing the logical unit of work ID (LUWID).

**Field Name:** QW0204TK

**URID**

The recovery log RBA (URID) for the thread.

**Field Name:** QW0204UR

**ROLE**

The role of DB2 in the LUW.

**Field Name:** QW0204RL

**STATUS**

The status of the local DB2 thread.

**Field Name:** QW0204TS

**IFCID 205 - DDF Warm Start Log Name Error Information:** This topic shows the data available for IFCID 205.

*IFCID 205 - As Remembered by DB2:*

This topic shows detailed information about “Record Trace - IFCID 205 - As Remembered by DB2”.

**Record trace - IFCID 205 - As Remembered by DB2**

The field labels shown in the following sample layout of “Record Trace - IFCID 205 - As Remembered by DB2” are described in the following section.

**AS REMEMBERED BY DB2**

**PROTOCOL:** PRESUMED ROLLBACK PS HEADER USE: FLAGS LUNAME EXCHANGE: YES

**PROTOCOL**

The protocol used previously as remembered by DB2.

**Field Name:** QW0205DP

**PS HEADER USE**

Indicates how the PS header was previously used as remembered by DB2.
IFCID 205 - As Remembered by DB2

Field Name: QW0205DF

LUNAME EXCHANGE
Indicates whether the LU name of the conversation correlator was exchanged in the sync point protocol previously used as remembered by DB2.

Field Name: QW0205DC

IFCID 205 - As Remembered by Partner:
This topic shows detailed information about “Record Trace - IFCID 205 - As Remembered by Partner”.

Record trace - IFCID 205 - As Remembered by Partner
The field labels shown in the following sample layout of “Record Trace - IFCID 205 - As Remembered by Partner” are described in the following section.

PROTOCOL
The protocol used previously as remembered by the partner.

Field Name: QW0205PP

PS HEADER USE
Indicates how the PS header was previously used as remembered by the partner.

Field Name: QW0205PF

LUNAME EXCHANGE
Indicates whether the LU name of the conversation correlator was exchanged in the sync point protocol previously used as remembered by the partner.

Field Name: QW0205PC

IFCID 205 - DDF Warm Start Log Name Error:
This topic shows detailed information about “Record Trace - IFCID 205 - DDF Warm Start Log Name Error”.

This record is written when a remote site uses a recovery log name that is different to the last log name used.

Record trace - IFCID 205 - DDF Warm Start Log Name Error
The field labels shown in the following sample layout of “Record Trace - IFCID 205 - DDF Warm Start Log Name Error” are described in the following section.

LOCATION: USIBMSYTD2  OUR RECOVERY LOG : LOG NUMBER 1
OUR LOG AS REMEMBERED : LOG NUMBER 2
PARTNER WARM START LOG: LOG NUMBER 3
PARTNER PREVIOUS LOG : LOG NUMBER 4

LOCATION
The location or LU name of the remote partner that had the warm start.

Field Name: QW0205LO
OUR RECOVERY LOG
The name of the local DB2 subsystem's recovery log.

Field Name: QW0205OR

OUR LOG AS REMEMBERED
The name of the local DB2 subsystem's recovery log as remembered by the partner. This field shows 'BLANK' unless the exchange of log names was initiated by the partner.

Field Name: QW0205NR

PARTNER WARM START LOG
The name of the partner's warm start recovery log.

Field Name: QW0205WR

PARTNER PREVIOUS LOG
The name of the partner's previous recovery log.

Field Name: QW0205PR

IFCID 206 - DDF Protocol Error:
This topic shows detailed information about “Record Trace - IFCID 206 - DDF Protocol Error”.

Record trace - IFCID 206 - DDF Protocol Error
The field labels shown in the following sample layout of “Record Trace - IFCID 206 - DDF Protocol Error” are described in the following section.
DB2 ROLE
The role of DB2 in the logical unit of work (LUW).
Field Name: QW0206RL

DETECTING SITE
The site which detected the error.
Field Name: QW0206DT

NETID
The NETID portion of the logical unit of work ID (LUWID).
Field Name: QW0206NT

LU NAME
The LU name portion of the logical unit of work ID (LUWID).
Field Name: QW0206LU

INSTANCE
The instance number portion of the logical unit of work ID (LUWID).
Field Name: QW0206IN

COMMIT COUNT
The LUW sequence number (commit count) portion of the logical unit of work ID (LUWID).
Field Name: QW0206CM

TOKEN
The local token representing the logical unit of work ID (LUWID).
Field Name: QW0206TK

URID
The recovery log RBA (URID) for the thread.
Field Name: QW0206UR

SENT
The last message sent by this DB2 site during the compare states exchange.
Field Name: QW0206MS

RCVD
The last message received by this DB2 site during the compare states exchange.
Field Name: QW0206MR

VTAM RPL
The VTAM RPL associated with the last compare states message received during the compare states exchange.
Field Name: QW0206VR

EXT
The VTAM RPL extension which describes the LU 6.2 verb indicators for the last message received.
Field Name: QW0206VX

IFICID 207 - DDF Heuristic Damage:

This topic shows detailed information about “Record Trace - IFCID 207 - DDF
Heuristic Damage”.

This record reports when heuristic damage is detected during the two-phase
commit resynchronization. Heuristic damage occurs when a user forces an indoubt
unit of work to commit or roll back and the user’s choice conflicts with the
outcome chosen by the coordinator of the unit of work.

Record trace - IFCID 207 - DDF Heuristic Damage

The field labels shown in the following sample layout of “Record Trace - IFCID 207
- DDF Heuristic Damage” are described in the following section.

WHERE OCCURRED
The location, LU name, or IP address (NNN.NNN.NNN) of the location
where heuristic damage occurred.

Field Name: QW0207HN

LOCAL LOCATION
The name of this location (the location writing this IFCID).

Field Name: QW0207TN

UPSTREAM COORDINATOR
The location, LU name, or IP address (NNN.NNN.NNN) of the upstream
coordinator of this location. This field shows ‘BLANK’ if this location has
no upstream coordinator.

Field Name: QW0207UN

CICS/IMS COORDINATOR
The connection name of the local CICS or IMS coordinator. This field
shows ‘BLANK’ if no local CICS or IMS coordinator exists.

Field Name: QW0207CO

NETID
The NETID portion of the logical unit of work ID (LUWID).

Field Name: QW0207NT

LUNAME
The LU name portion of the logical unit of work ID (LUWID).

Field Name: QW0207LU

INSTANCE
IFCID 207 - DDF Heuristic Damage

The instance number portion of the logical unit of work ID (LUWID).
Field Name: QW0207IN

LUW SEQ
The LUW sequence number (commit count) portion of the logical unit of work ID (LUWID).
Field Name: QW0207CM

TOKEN
The local token representing the logical unit of work ID (LUWID).
Field Name: QW0207TK

URID
The recovery log RBA (URID) for the thread.
Field Name: QW0207UI

ROLE
The role of DB2 in the LUW.
Field Name: QW0207RL

DAMAGE SITE ACTION
The action taken by the site with the heuristic damage.
Field Name: QW0207HA

LOCAL SITE ACTION
The action taken by the local site.
Field Name: QW0207TA

UPSTREAM SITE ACTION
The action taken by the upstream coordinator if one exists.
Field Name: QW0207UA

DAMAGE SITE RECOVERY LOG
The recovery log name of the site where the heuristic damage occurred.
Field Name: QW0207HR

LOCAL SITE RECOVERY LOG
The recovery log name of the local location.
Field Name: QW0207TR

UPSTREAM SITE RECOVERY LOG
The recovery log name of the upstream coordinator (if an upstream coordinator exists).
Field Name: QW0207UR

IFCID 208 - DDF Syncpoint Protocol Error:

This topic shows detailed information about “Record Trace - IFCID 208 - DDF Syncpoint Protocol Error”.
Record trace - IFCID 208 - DDF Syncpoint Protocol Error

The field labels shown in the following sample layout of “Record Trace - IFCID 208 - DDF Syncpoint Protocol Error” are described in the following section.

REMOTE LOCATION: M05EC00C

FIELD NAME: QW0208LO

LAST OPERATION: RECEIVE

FIELD NAME: QW0208SR

FIELD NAME: QW0208RL

DETECTING SITE: LOCAL

FIELD NAME: QW0208DT

LOCAL THREAD STATUS: INDOUBT

FIELD NAME: QW0208TS

ASSUMED REMOTE THREAD STATUS: ROLLED BACK?

FIELD NAME: QW0208PS

NETID

FIELD NAME: QW0208NT

LUNAME

FIELD NAME: QW0208LU

REMOTE LOCATION

The location name or LU name of the remote partner involved in the protocol error.

FIELD NAME: QW0208LO

LAST OPERATION

Indicates whether the last network operation was a send or receive.

FIELD NAME: QW0208SR

DB2 ROLE

The role of DB2 in the LUW.

FIELD NAME: QW0208RL

DETECTING SITE

The site which detected the error.

FIELD NAME: QW0208DT

LOCAL THREAD STATUS

The status of the local DB2 thread.

FIELD NAME: QW0208TS

ASSUMED REMOTE THREAD STATUS

The assumed status of the remote thread.

FIELD NAME: QW0208PS

NETID

The NETID portion of the logical unit of work ID (LUWID).

FIELD NAME: QW0208NT

LUNAME

The LU name portion of the logical unit of work ID (LUWID).

FIELD NAME: QW0208LU

Chapter 6. Batch reporting 4015
IFCID 208 - DDF Syncpoint Protocol Error

INSTANCE
The instance number portion of the logical unit of work ID (LUWID).
Field Name: QW0208IN

COMMIT COUNT
The LUW sequence number (commit count) portion of the logical unit of work ID (LUWID).
Field Name: QW0208CM

TOKEN
The local token representing the logical unit of work ID (LUWID).
Field Name: QW0208TK

URID
The recovery log RBA (URID) for the thread.
Field Name: QW0208UR

SENT
The last message sent by this DB2 site during sync point processing.
Field Name: QW0208MS

RCVD
The last message received by this DB2 site during sync point processing.
Field Name: QW0208MR

VTAM RPL
The VTAM RPL associated with the last compare states message received during the compare states exchange.
Field Name: QW0208VR

EXT
The VTAM RPL extension which describes the LU 6.2 verb indicators for the last message received.
Field Name: QW0208VX

IFCID 209 - DDF Syncpoint Comm Failure:
This topic shows detailed information about “Record Trace - IFCID 209 - DDF Syncpoint Comm Failure”.

This record is written when a communication failure occurs after phase 1 of the SNA commit process. The thread that experiences the communication failure might still be indoubt at the participant location.

Record trace - IFCID 209 - DDF Syncpoint Comm Failure
The field labels shown in the following sample layout of “Record Trace - IFCID 209 - DDF Syncpoint Comm Failure” are described in the following section.
REMOTE PARTNER LOCATION
The location, LU name, or IP address (NNN.NNN.NNN) of the remote partner involved in the communication error.

Field Name: QW0209LO

NETID
The NETID portion of the logical unit of work ID (LUWID).

Field Name: QW0209NT

LUNAME
The LU name portion of the logical unit of work ID (LUWID).

Field Name: QW0209LU

INSTANCE
The instance number portion of the logical unit of work ID (LUWID).

Field Name: QW0209IN

LUW SEQ
The LUW sequence number (commit count) portion of the logical unit of work ID (LUWID).

Field Name: QW0209CM

TOKEN
The local token representing the logical unit of work ID (LUWID).

Field Name: QW0209TK

URID
The recovery log RBA (URID) for the thread.

Field Name: QW0209UR

ROLE
The role of DB2 in the logical unit of work (LUW).

Field Name: QW0209RL

LOCAL THREAD STATUS
The status of the local DB2 thread.

Field Name: QW0209TS

IFCID 210 - Warm Start Log Name Change:
This topic shows detailed information about “Record Trace - IFCID 210 - Warm Start Log Name Change”.

This record is written when a remote site warm starts with a recovery log name that is different from its previous recovery log name. DB2 has no threads that require resolution, so the new recovery log name is accepted.

Record trace - IFCID 210 - Warm Start Log Name Change
The field labels shown in the following sample layout of “Record Trace - IFCID 210 - Warm Start Log Name Change” are described in the following section.
IFCID 210 - Warm Start Log Name Change

LOCATION: SYD2       WARM START RECOVERY LOG: CURRENT RECOVERY LOG
PREVIOUS RECOVERY LOG : PREVIOUS RECOVERY LOG

LOCATION
The location, LU name, or IP address (NNN.NNN.NNN) of the remote partner that sent the warm start indication.
Field Name: QW0210LO

WARM START RECOVERY LOG
The name of the partner's warm start recovery log.
Field Name: QW0210WR

PREVIOUS RECOVERY LOG
The name of the partner's previous recovery log.
Field Name: QW0210PR

IFCID 211 - Claim Data:

This topic shows detailed information about “Record Trace - IFCID 211 - Claim Data”.

This record contains information about making and releasing a claim. One record is written for each request to make a claim or release a claim.

Record trace - IFCID 211 - Claim Data

The field labels shown in the following sample layout of “Record Trace - IFCID 211 - Claim Data” are described in the following section.

DBID: DSN0806  PSID: DSN0101  PARTITION NO.: 0  CLAIM REQUEST TYPE: ACQUIRE  CLAIM CLASS: RR READ
CLAIM DURATION: HELD UNTIL COMMIT  CLAIM RESULT: LOGICAL CLAIM NEEDED
REASON IF CLAIM UNSUCCESSFUL: RESOURCE IS STOPPED

DBID
The database identifier of the object of the claim request. This field contains 0 if the request is for a release of all claims.
Field Name: QW0211DB

PSID
The page set identifier of the object of the claim request. This field contains 0 if the request is for a release of all claims.
Field Name: QW0211PS

PARTITION NO.
The partition number of the object of the claim request. This field contains 0 if the request is for a release of all claims or if the table space or index space is not partitioned (and the claim request is at the page set level rather than the logical partition level).
Field Name: QW0211PT

CLAIM REQUEST TYPE
The claim request type.
Field Name: QW0211RQ

CLAIM CLASS
The claim class.

Field Name: QW0211CC

CLAIM DURATION

The claim duration. This field shows 'BLANK' if the claim is released.

Field Name: QW0211DU

CLAIM RESULT

The result of the claim request.

Field Name: QW0211RC

REASON IF CLAIM UNSUCCESSFUL

The reason for an unsuccessful claim. This field is only printed if the value in CLAIM RESULT is UNSUCCESSFUL.

Field Name: QW0211RS

IFCID 212 - Drain Data:

This topic shows detailed information about “Record Trace - IFCID 212 - Drain Data”.

This record contains information about requesting and releasing a drain or a pseudo drain. One record is written for each drain or release request on a claim class. Another record is written for a drain that is only waiting for the claimers to release claims and not acquiring a drain lock (pseudo drain).

Record trace - IFCID 212 - Drain Data

The field labels shown in the following sample layout of “Record Trace - IFCID 212 - Drain Data” are described in the following section.

<table>
<thead>

DBID

The database identifier of the object of the drain request. This field contains 0 if the request is for a release of all drains.

Field Name: QW0212DB

PSID

The page set identifier of the object of the drain request. This field contains 0 if the request is for a release of all drains.

Field Name: QW0212PS

PARTITION NO.

The partition number of the object of the drain request. This field contains 0 if the request is for a release of all drains or if the table space or index space is non-partitioned (and the drain request is at the page set level rather than the logical partition level).

Field Name: QW0212PT

DRAIN REQUEST TYPE

The drain request type.
IFCID 212 - Drain Data

Field Name: QW0212RQ

CLAIM CLASS
The claim class.
Field Name: QW0212CC

DRAIN LOCK MODE
The mode of the drain lock requested. This field shows 'BLANK' if the drain is released or no lock is requested.
Field Name: QW0212MO

DRAIN RESULT
The result of the drain request.
Field Name: QW0212RC

REASON IF DRAIN UNSUCCESSFUL
The reason for an unsuccessful drain. This field is only printed if the value in CLAIM RESULT is UNSUCCESSFUL.
Field Name: QW0212RS

IFCID 213 - Drain Lock Wait Start:

This topic shows detailed information about “Record Trace - IFCID 213 - Drain Lock Wait Start”.

This record contains information about the beginning of a wait for a drain lock. For drain locks, this record is written instead of IFCID 44.

Record trace - IFCID 213 - Drain Lock Wait Start

The field labels shown in the following sample layout of “Record Trace - IFCID 213 - Drain Lock Wait Start” are described in the following section.

<table>
<thead>
<tr>
<th>LOCK HASH VALUE: X'00000000'</th>
<th>LOCK NAME LENGTH: 8</th>
<th>LOCK QUALIFIER: X'0020'</th>
</tr>
</thead>
<tbody>
<tr>
<td>LOCK RES TYPE: CS-READ DRAIN LOCK</td>
<td>DBID: 1</td>
<td>OBID: 2</td>
</tr>
<tr>
<td>IRLM FUNCTION: LOCK</td>
<td>STATE: X'00'</td>
<td>DURATION: X'00'</td>
</tr>
<tr>
<td>REASON SUSP: LATCH CONTENTION</td>
<td></td>
<td></td>
</tr>
<tr>
<td>QW0213FL</td>
<td>X'00'</td>
<td></td>
</tr>
</tbody>
</table>

LOCK HASH VALUE
The hash value of the locked resource.
Field Name: QW0213LH

LOCK NAME LENGTH
The length of the lock name.
Field Name: QW0213LK

LOCK QUALIFIER
The lock qualifier.
Field Name: QW0213KQ

LOCK RES TYPE
The locked resource type or the type of locking operation.
Field Name: QW0213KT
DBID
The database ID of the object of the claim request.
Field Name: QW0213DB

PSID
The page set identifier of the object of the claim request.
Field Name: QW0213PS

PARTITION NO.
The partition number of the object of the lock request. This field contains 0 if the table space or index space is not partitioned (and the lock request is at the page set level rather than the logical partition level).
Field Name: QW0213PT

IRLM FUNCTION
The IRLM function.
Field Name: QW0213FC

STATE
The lock state.
Field Name: QW0213ST

REASON SUSP
The reason for the suspension.
Field Name: QW0213WS

IFCID 214 - Drain Lock Wait End:

This topic shows detailed information about “Record Trace - IFCID 214 - Drain Lock Wait End”.

This record contains information about the end of a wait for a drain lock. For drain locks, this record is written instead of IFCID 45.

Record trace - IFCID 214 - Drain Lock Wait End

The field labels shown in the following sample layout of “Record Trace - IFCID 214 - Drain Lock Wait End” are described in the following section.

```
DRAIN LOCK <-- NETWORKID: DEIBMIPS LUNAME: IPSAQ811 LUNSEQ: 1
WAIT END    REASON FOR RESUME: NORMAL RESUME
REASON FOR SUSPEND: X'80'
IRLM LATCH CONTENTION: YES
IRLM QUEUED REQUEST: NO
LOCAL RESOURCE CONTENTION: NO
GLOBAL RESOURCE CONTENTION: NO
INTER-SYSTEM MESSAGE SENDING: NO
GLOBAL CONTENTION EXTENT: X'20'
XES GLOBAL CONTENTION: NO
IRLM GLOBAL CONTENTION: NO
FALSE CONTENTION: NO
QW0214W4 NO QW0214W6 NO QW0214W8 NO
QW0214X1 NO QW0214X2 NO QW0214X5 NO
QW0214X6 NO QW0214X7 NO QW0214X8 NO
```
IFCID 214 - Drain Lock Wait End

REASON FOR RESUME
The reason for the lock resume.
Field Name: QW0214R

REASON FOR SUSPEND
The reason for the suspension. The nonserviceability values are:
Field Name: QW0214SR

IRLM LATCH CONTENTION
Indicates whether IRLM latch contention occurred.
Field Name: QW0214W1

IRLM QUEUED REQUEST
Indicates whether IRLM queued request occurred.
Field Name: QW0214W2

LOCAL RESOURCE CONTENTION
Indicates whether local resource contention occurred.
Field Name: QW0214W3

GLOBAL RESOURCE CONTENTION
Indicates whether intersystem communication was required to resolve an IRLM request.
Field Name: QW0214W5

INTER-SYSTEM MESSAGE SENDING
Indicates whether any intersystem messages were sent.
Field Name: QW0214W7

GLOBAL CONTENTION EXTENT
The extent of global contention. This is applicable only if the value in GLOBAL RESOURCE CONTENTION is YES. The nonserviceability values are:
Field Name: QW0214XR

XES GLOBAL CONTENTION
Indicates whether XES global resource contention occurred.
Field Name: QW0214X3

IRLM GLOBAL CONTENTION
Indicates whether IRLM global resource contention occurred.
Indicates whether there was IRLM or XES global resource contention.
Field Name: QW0214X4

IFCID 215 - Claim Count 0 Wait Start:
This topic shows detailed information about “Record Trace - IFCID 215 - Claim Count 0 Wait Start”. 
This IFCID records the beginning of a wait for the number of pending claims to reach 0.

**Record trace - IFCID 215 - Claim Count 0 Wait Start**

The field labels shown in the following sample layout of “Record Trace - IFCID 215 - Claim Count 0 Wait Start” are described in the following section.

<table>
<thead>
<tr>
<th>Field Label</th>

</tbody>
</table>
IFCID 216 - Claim Count 0 Wait End

PSID
The page set identifier of the object of the drain request.
Field Name: QW0216PS

PARTITION NO.
The partition number of the object of the drain request. This field contains 0 if the object is a non-partitioned table space or non-partitioned index being drained at the page set level.
Field Name: QW0216PT

CLAIM CLASS
The claim class.
Field Name: QW0216CC

REASON FOR RESUME
The reason for the resume.
Field Name: QW0216R

IFCID 217 - Storage Pools: This record only contains data for IFCID 217.

IFCID 217 - Agent Local Storage Pool Sizes:
This topic shows detailed information about “Record Trace - IFCID 217 - Agent Local Storage Pool Sizes”.

Record trace - IFCID 217 - Agent Local Storage Pool Sizes
The field labels shown in the following sample layout of “Record Trace - IFCID 217 - Agent Local Storage Pool Sizes” are described in the following section.

AGENT LOCAL STORAGE POOL SIZES
TOTAL POOL STORAGE : 0
CONNECTION NAME : DA61
WORKSTATION NAME : N/P
FIXED STORAGE POOL : NO
AUTHORIZATION ID : ‘BLANK’

STORAGE CLASS : 21
CORRELATION ID : 010.CS16K5
TRANSACTION NAME : N/P
VARIA STORAGE POOL: YES
OWNING ASID : 261

USERID : N/P

QW02173H: X’0000020050A4DA30’
QW02173F: B’01100000’
QW02173C: N/A

TOTAL POOL STORAGE
Total storage in the agent local pool.
Field Name: QW02173T

STORAGE CLASS
Storage class for agent local pools.
Field Name: QW02173L

CONNECTION NAME
The connection name. Possible values are:
• For batch: BATCH
• For TSO: TSO
• For QMF: DB2CALL
• For utilities: UTILITY
• For DB2 private protocol this is the DB2 subsystem ID
• For IMS: the IMS ID
• For CICS, this is the CICS ID
• For DRDA connections from non-DB2 requesters: SERVER

Field Name: QW0217QN

CORRELATION ID
Correlation identifier.
Field Name: QW0217QR

PLAN NAME
The plan name. It is blank for a DB2 command thread; otherwise:

DSNESPRR
For SPUFI with repeatable read.

DSNESPCS
For SPUFI with cursor stability.

DSNUTIL
For utilities.

DSNTEP2
For DSNTEP2.

DSNBIND
For binding.

The application plan name
For IMS.

The application plan name
For CICS.

A blank plan name
For IMS and CICS commands.

DSQPLAN
For QMF.

The first 8 bytes of the application name
For DRDA connections to the common servers.

Field Name: QW0217QP

WORKSTATION NAME
The end user's workstation name.
Field Name: QW0217QW

TRANSACTION NAME
The transaction or application name that is run.
Field Name: QW0217QX

MVS SUBPOOL
MVS subpool.
Field Name: QW0217BP

FIXED STORAGE POOL
Indicates if the storage pool is fixed.
Field Name: QW02173X
VARIA STORAGE POOL

Indicates if the storage pool is variable.

Field Name: QW02173R

AUTHORIZATION ID

The primary authorization ID from a connection or signon. The connection authorization exit and the signon authorization exit can change the primary authorization ID so that it differs from the original primary authorization ID (ORIGAUTH). Distributed authorization ID translation can also change the primary authorization ID.

Field Name: QW0217QC

USERID

The user ID of the workstation end user. This user ID can be different from the authorization ID used to connect to DB2. This field contains blanks if the client does not supply this information.

Field Name: QW0217QD

QW02173H

This field is for IBM service.

Field Name: QW02173H

QW02173F

Storage pool flags:
- Fixed storage pool
- Variable storage pool
- More agent storage pool data in one or more ifcid 0217 records after this one.
- This is the last ifcid 0217 record in this sequence of agent storage pool data.
- This is a parent task for parallelism.
- This is a child task for parallelism.

Field Name: QW02173F

QW02173C

This field is for IBM service.

Field Name: QW02173C

IFCID 217 - DBM1 Storage Pool Sizes:

This topic shows detailed information about “Record Trace - IFCID 217 - DBM1 Storage Pool Sizes”.

Record trace - IFCID 217 - DBM1 Storage Pool Sizes

The field labels shown in the following sample layout of “Record Trace - IFCID 217 - DBM1 Storage Pool Sizes” are described in the following section.
TOTAL POOL STORAGE

Total amount of DBM1 storage available for pools.

Field Name: QW0217ST

STORAGE CLASS

Storage class.

Field Name: QW0217CL

MVS SUBPOOL

MVS subpool.

Field Name: QW0217BP

DESCRIPTION

Storage pool description.

Field Name: QW0217DE

FIXED STORAGE POOL

Indicates if the storage pool is fixed.

Field Name: QW02173X

VARIA STORAGE POOL

Indicates if the storage pool is variable.

Field Name: QW02173R

QW0217PH

Contains QW0217PH.

Field Name: QW0217PH

QW0217FL

Storage pool flags.

Fixed storage pool
Variable storage pool

More DBM1 local data follows, in one or more ifcid 0217 records after this one.

This is the last ifcid 0217 record in this sequence of local DBM1 data. ifcid 0217 records with agent local storage pool data follow.

Field Name: QW0217FL

IFCID 217 - Storage Manager Pool Statistics:

This topic shows detailed information about “Record Trace - IFCID 217 - Storage Manager Pool Statistics”.

Record trace - IFCID 217 - Storage Manager Pool Statistics

The field labels shown in the following sample layout of “Record Trace - IFCID 217 - Storage Manager Pool Statistics” are described in the following section.

Storage Manager Pool Statistics

<table>
<thead>
<tr>

DB2 V10 TOKEN : 0

Chapter 6. Batch reporting 4027
**IFCID 217 - Storage Manager Pool Statistics**

**DB2 V10 TOKEN**

The size of the common storage area (CSA) above the 16 MB line.

Field Name: QW0217TK

**IFCID 218 - Lock Avoidance Summary:**

This topic shows detailed information about “Record Trace - IFCID 218 - Lock Avoidance Summary”.

This record indicates whether a successful lock avoidance test occurred during a given unit of work. The record is externalized at the agent at each commit or rollback.

**Record trace - IFCID 218 - Lock Avoidance Summary**

The field labels shown in the following sample layout of “Record Trace - IFCID 218 - Lock Avoidance Summary” are described in the following section.

LOCK AVOID DURING UNIT OF WORK: YES NO
PAGE SET SUBRECORDS: 4
DBID: INSQDB PSID: EVENTS LOCK AVOID DURING UNIT OF WORK: YES
DBID: DSNDB06 PSID: SYSDBAUT LOCK AVOID DURING UNIT OF WORK: NO

**LOCK AVOID DURING UNIT OF WORK**

Indicates whether there was a successful lock avoidance test during this unit of work.

Field Name: QW0218CT

**NO. PAGE SET SUBRECORDS**

The number of page set subrecords contained in this record. The fields DBID, PSID, and LOCK AVOID DURING UNIT OF WORK are repeated for each page set that has a lock avoidance test.

Field Name: QW0218N

**DBID**

The database ID.

Field Name: QW0218PD

**PSID**

The page set ID.

Field Name: QW0218PP

**LOCK AVOID DURING UNIT OF WORK**

Indicates whether there was a successful lock avoidance test for this page set during this unit of work.

Field Name: QW0218PC

**IFCID 219 - Utility LISTDEF List Information:**

This topic shows detailed information about “Record Trace - IFCID 219 - Utility LISTDEF List Information”.

Field Name: QW0219PC
Record trace - IFCID 219 - Utility LISTDEF List Information

The field labels shown in the following sample layout of “Record Trace - IFCID 219 - Utility LISTDEF List Information” are described in the following section.

LIST NAME: LOCATION_NUMBER001 LIST TYPE: T LIST SIZE: 69287

LIST NAME
Name of list definition information.
Field Name: QW0219LN

LIST TYPE
Type of LISTDEF information:
T Table space list.
I Index space list.
M Mixed list.
Field Name: QW0219LT

LIST SIZE
Number of entries in the LISTDEF.
Field Name: QW0219LS

IFCID 220 - Utility Data Set Information:

This topic shows detailed information about “Record Trace - IFCID 220 - Utility Data Set Information”.

This record is written when a data set is closed.

Record trace - IFCID 220 - Utility Data Set Information

The field labels shown in the following sample layout of “Record Trace - IFCID 220 - Utility Data Set Information” are described in the following section.

DD NAME
Data definition.
Field Name: QW0220DD

DATA SET NAME
Data set name.
Field Name: QW0220DN

TEMPLATE NAME
Template name.
Field Name: QW0220TN

NO. READS
Number of READ operations.
Field Name: QW0220RD

Chapter 6. Batch reporting  4029
IFCID 220 - Utility Data Set Information

NO. WRITES
Number of WRITE operations.
Field Name: QW0220WR

NO. CHECKS
Number of checks.
Field Name: QW0220CH

NO. EOVS
Number of End of Volumes.
Field Name: QW0220EV

I/O WAIT TIME
I/O wait time in milliseconds.
Field Name: QW0220WT

OPEN TIME STAMP
Time the data set was opened.
Field Name: QW0220OT

DEVICE TYPE
Device type:
D  DASD.
T  Tape.
Field Name: QW0220DT

IFCID 221 - Parallel Group Execution: This topic shows the data available for IFCID 221.

IFCID 221 - Buffer Pool Constrained Data (Section Type C):
This topic shows detailed information about “Record Trace - IFCID 221 - Buffer Pool Constrained Data (Section Type C)”.

Record trace - IFCID 221 - Buffer Pool Constrained Data (Section Type C)
The field labels shown in the following sample layout of “Record Trace - IFCID 221 - Buffer Pool Constrained Data (Section Type C)” are described in the following section.

BUFFERPOOL CONSTRAINED DATA
LENGTH: X’0010’
DBID  PSID  TYPE  BPID  WITH_SECT_E
0 0  W  7  0
0 0  W  7  0

LENGTH
The total length of all entries.
Field Name: QW0221CL

DBID
The database identifier.
IFCID 221 - Buffer Pool Constrained Data (Section Type C)

Field Name: QW0221DB

PSID
The page set identifier.
Field Name: QW0221PS

TYPE
The type of page set:
T Table space
I Index
W Work file
Field Name: QW0221TY

BPID
The buffer pool identifier.
Field Name: QW0221BP

WITH_SECT.E
The number of detail buffer pool constrained data sections to follow in section type E.
Field Name: QW0221DN

IFCID 221 - Detail Buffer Pool Constrained Data (Section Type E):
This topic shows detailed information about “Record Trace - IFCID 221 - Detail Buffer Pool Constrained Data (Section Type E)”.

LENGTH
The total length of all entries.
Field Name: QW0221CL

DB2_MEMBER
The name of the DB2 member.
Field Name: QW0221MN

CONSTRANDED
Indicates whether the DB2 member is constrained.
Field Name: QW0221CS

IFCID 221 - Parallel Data:
This topic shows detailed information about “Record Trace - IFCID 221 - Parallel Data”.

Record trace - IFCID 221 - Parallel Data
The field labels shown in the following sample layout of “Record Trace - IFCID 221 - Parallel Data” are described in the following section.
PLANNED(BIND) DEGREE: 16448  
REP.SECTION TYPE : N/P  
PARALL.GROUP NO: 16448  
PLANNED(RUN) DEGREE: 16448  
ACTUAL(RUN) DEGREE: 16448  
REP.SECTIONS : 16448  
NUMBER OF MEMBERS : 1077952576  
REASON : X '40'  
RECORD 16448 OF 16448  
HI/LO PARTITION TYPE: LOGICAL

### LOCATION NAME

The location name or RDB name.

**Field Name:** QW0221LN

### PKG COLLECTION ID

The package collection ID.

**Field Name:** QW0221PC

### PROGRAM NAME

The program name.

**Field Name:** QW0221PN

### STMT.NO

The statement number. It is the same as the QUERYNO in the PLAN_TABLE, if the PLAN_TABLE exists.

**Field Name:** QW0221SN

### QUERYBLOCK NUMBER

The query block number. It is the same as the QBLOCKNO in the PLAN_TABLE, if the PLAN_TABLE exists.

**Field Name:** QW0221QN

### CONS.TOKEN

The timestamp (consistency token).

**Field Name:** QW0221TS

### PLANNED(BIND) DEGREE

The planned degree of parallelism at bind time. Parallelism decisions are made at bind time. However, the value in this field is 0 if the statement has host variables, because host variables cause the parallelism decision to be made at run time. See field PLANNED(RUN) DEGREE.

**Field Name:** QW0221PD

### REP.SECTION TYPE

The type of the repeating section.

**Field Name:** QW0221TP

### PARALL.GROUP NO

The parallel group number.

**Field Name:** QW0221GN

### PLANNED(RUN) DEGREE

The planned degree of parallelism at run time. The value in this field is equal to the value in PLANNED(BIND) DEGREE unless the statement contains host variables.

**Field Name:** QW0221RD

### ACTUAL(RUN) DEGREE
The actual degree of parallelism at run time, taking into account only those DB2 members that have enough buffer pool storage.

Field Name: QW0221AD

REP.SECTIONS
The number of repeating sections contained in this record.

Field Name: QW0221N

TYPE OF PARALLELISM
The type of parallelism:

- CP CPU query parallelism
- I/O I/O query parallelism
- SYS Sysplex query parallelism

Field Name: QW0221MO

NUMBER OF MEMBERS
The number of DB2 members on which a query was executed during sysplex query parallel processing.

Field Name: QW0221XC

REASON
The reason for deriving the planned (runtime) degree of parallelism:

- NORMAL The planned runtime degree is derived from the planned bind time degree.
- HOSTVAR Host variable partitioning.
- NO ESA No ESA sort support.
- CURSOR The cursor might be used for an update or deletion.
- EMPTY The parallel group is empty.
- MVS/ESA MVS/ESA enclave services are not available.

Field Name: QW0221RN

RECORD
The position of this record in the series of IFCID 221 records.

Field Name: QW0221TR

OF
The total number of IFCID 221 records in this series.

Field Name: QW0221NR

HI/LO PARTITION TYPE
Type of partition for low and high pages in the partition range. Possible values are:

- LOGICAL Logical low and high pages.
IFCID 221 - Parallel Data

PHYSICAL
Physical low and high pages.

Field Name: QW0221ZZ

IFCID 221 - Section Type D:

This topic shows detailed information about “Record Trace - IFCID 221 - Section Type D”.

Record trace - IFCID 221 - Section Type D

The field labels shown in the following sample layout of “Record Trace - IFCID 221 - Section Type D” are described in the following section.

LOW PAGE RANGE
If the partitioning scheme uses a page range, the low page number of the page range.

Field Name: QW0221PL

STATUS
The status of this partition range:

NORMAL  A parallel task is created for this partition range.
EMPTY    No parallel task is created for this page range.

Field Name: QW0221AN

LOW KEY RANGE
If the partitioning scheme uses a key range, the first 240 bytes of the low boundary key range.

Field Name: QW0221KL

HIGH PAGE RANGE
If the partitioning scheme uses a page range, the high page number of the page range.

Field Name: QW0221PH

HIGH KEY RANGE
If the partitioning scheme uses a key range, the first 240 bytes of the high boundary key range.

Field Name: QW0221KH
IFCID 222 - Parallel Group Elapsed Time:

This topic shows detailed information about “Record Trace - IFCID 222 - Parallel Group Elapsed Time”.

This record contains parallel group elapsed time information.

Record trace - IFCID 222 - Parallel Group Elapsed Time

The field labels shown in the following sample layout of “Record Trace - IFCID 222 - Parallel Group Elapsed Time” are described in the following section.

RECORD

The position of this record in the series of IFCID 222 records.

Field Name: QW0222TR

OF

The total number of IFCID 222 records in this series.

Field Name: QW0222NR

LOCATION

The location name or RDB name.

Field Name: QW0222LN

PACKAGE

The package collection ID.

Field Name: QW0222PC

PROGRAM

The program name.

Field Name: QW0222PN

CON.TOKEN

The timestamp (consistency token).

Field Name: QW0222TS

STATEMENT NO

The statement number.

Field Name: QW0222SN

QUERY BLOCK NO

The query block number.

Field Name: QW0222QN
IFCID 222 - Parallel Group Elapsed Time

**PARALLEL GROUP NO**

The parallel group number.

**Field Name:** QW0222GN

**REPEAT.GRPS**

The number of repeat groups in the section.

**Field Name:** QW0222RN

**PIPE CREATION**

The time of pipe creation in DB2 timestamp format.

**Field Name:** QW0222PS

**PIPE TERMINATION**

The time of pipe termination in DB2 timestamp format.

The elapsed time between pipe creation and pipe termination in DB2 timestamp format.

**Field Name:** QW0222PE

**SUB-PIPE CREATION**

The time of subpipe creation in DB2 timestamp format.

**Field Name:** QW0222SS

**SUB-PIPE ELAPSED**

The elapsed time between subpipe creation and subpipe termination in DB2 timestamp format.

The time of subpipe termination in DB2 timestamp format.

**Field Name:** QW0222SE

**TASK TOKEN**

The task token associated with the subpipe.

**Field Name:** QW0222TK

**MEMBER**

The name of the DB2 member that supplies the data.

**Field Name:** QW0222SM

**IFCID 223 - Lock Avoidance Detail:**

This topic shows detailed information about “Record Trace - IFCID 223 - Lock Avoidance Detail”.

This record shows lock avoidance information for each successful test.

**Record trace - IFCID 223 - Lock Avoidance Detail**

The field labels shown in the following sample layout of “Record Trace - IFCID 223 - Lock Avoidance Detail” are described in the following section.

- **LOCK RES TYPE:** ROW LOCK
- **DBID:** DSNDB06  **OBID:** SYSUSER
- **TABLE_SPACE_TYPE:** N
- **RESOURCE ID:** X'000008313'
PARTITION: 0  PAGE NUMBERING: ABS
QW0223U X'008500331ACA3460'
QW0223O X'008500331ACA33A0'
QW0223CL X'00'

LOCK RES TYPE
The resource type being accessed.
Field Name: QW0223KT

DBID
The database ID.
Field Name: QW0223KD

OBID
Object id of the page set or table record.
Field Name: QW0223KP

TABLE_SPACE_TYPE
The type of the table space:
L Non-EA large table
N Non-large table
R Partitioned by range (PBR) universal table spaces (UTS) that use relative page numbers
V EA-enabled large table
Field Name: QW0223TY

RESOURCE ID
The ID of the small resource.
Field Name: QW0223KR

PARTITION
Shows the partition number or 0 if non-partitioned.
Field Name: QW0223PT

PAGE NUMBERING
Indicates how page numbers are shown for partitioned tables:
REL Indicates that relative page numbers are shown in the partition.
ABS Indicates that absolute page numbers are shown in the partition.
N/A Not applicable.
Field Name: QW0223P1

IFCID 224 - Select Procedure Bypassed:
This topic shows detailed information about “Record Trace - IFCID 224 - Select Procedure Bypassed”.

This record is written at the end of a unit of work. It records the total columns for which an invalid select procedure was encountered. Invalid select procedures are bypassed by DB2 and can cause performance degradation.
Record trace - IFCID 224 - Select Procedure Bypassed

The field labels shown in the following sample layout of “Record Trace - IFCID 224 - Select Procedure Bypassed” are described in the following section.

SPROC BYPASSED ‘BLANK’
NETWORKID: DEIBMIPS LUNAME: IPSAR721 LUWSEQ: 1
PACKAGE : PLANNAM2
COLLECTION: COLLECTIONNAME0002
COLUMNS : 128

COLUMNS
The select procedure bypass column count. This is the total number of columns (rows * columns) for which a select procedure was bypassed because the select procedure was invalidated by applying service to DB2.

Field Name: QW0224CL

PACKAGE
Package name.

Field Name: QW0224PN

COLLECTION ID
Collection identifier.

Field Name: QW0224CI

IFCID 225 - Storage MGR Pool Summary: This topic shows the data available for IFCID 225.

IFCID 225 - Address Space Summary - DBM1:
This topic shows detailed information about “Record Trace - IFCID 225 - Address Space Summary - DBM1”.

Note: This report has the same layout as “IFCID 225 - Address Space Summary - DIST.”

IFCID 225 - Address Space Summary - DIST:
This topic shows detailed information about “Record Trace - IFCID 225 - Address Space Summary - DIST”.

Record trace - IFCID 225 - Address Space Summary - DIST
The field labels shown in the following sample layout of “Record Trace - IFCID 225 - Address Space Summary - DIST” are described in the following section.

EXTENDED REGION SIZE (MAX)

The maximum amount of MVS private storage available above the 16 MB line.

Field Name: QW0225RG

24-BIT LOW PRIVATE

The amount of private MVS storage below the 16 MB line. This storage is obtained from bottom upward, usually for unauthorized programs.

Field Name: QW0225LO

24-BIT HIGH PRIVATE

The amount of private MVS storage below the 16 MB line. This storage is obtained from top downward, usually for authorized programs.

Field Name: QW0225HI

31-BIT EXTENDED LOW PRIVATE

The amount of private MVS storage above the 16 MB line. This storage is obtained from bottom upward, usually for unauthorized programs.

Field Name: QW0225EL

31-BIT EXTENDED HIGH PRIVATE

The amount of private MVS storage above the 16 MB line. This storage is obtained from top downward, usually for authorized programs.

Field Name: QW0225EH

CURR HIGH ADDR 24-BIT PRIV REGION

The current high address of the 24-bit private region.

Field Name: QW0225TP

CURR HIGH ADDR 31-BIT PRIV REGION

The current high address of the 31-bit private region.

Field Name: QW0225EP

31-BIT RESERVED FOR MUST COMPLETE

Storage reserved for operation that must complete before DB2 is allowed to stop.

Field Name: QW0225CR

31-BIT RESERVED FOR MVS

The amount of storage available for operating system activity.

Field Name: QW0225MV

STORAGE CUSHION WARNING TO CONTRACT

The amount of free storage, in megabytes, available in the DBM1 data space.

Field Name: QW0225SO
TOTAL 31-BIT GETMAINED STACK
Total GETMAINED storage allocated for program stack use.

Field Name: QW0225GS

TOTAL 31-BIT STACK IN USE
The amount of stack storage that is in use.

Field Name: QW0225SU

TOTAL 31-BIT VARIABLE POOL
Total storage used by all variable pools. This includes storage used by:
- System agents
- Local agents
- RID pool
- Pipe manager subpool
- Local dynamic statement cache control blocks
- Local dynamic statement cache statement pool
- Buffer and data manager trace tables
- A list of objects in restricted state including the new PRO state. If consumption of this storage pool is high, review restrictive exception state of database objects and check whether they can be resolved or reduced.

Field Name: QW0225VR

TOTAL 31-BIT FIXED POOL
Total amount of fixed storage.

Field Name: QW0225FX

TOTAL 31-BIT GETMAINED
Total storage acquired by GETMAIN. This includes space for virtual pools, EDM pool, compression dictionary, castout buffers, and the data space looksaside buffer, and data space buffer pool control blocks.

This figure can be different from the sum of GETMAIN storage items shown in the statistics DBM1 storage, because DB2 does not produce grouping statistics for all GETMAIN storage.

Field Name: QW0225GM

AMOUNT OF AVAILABLE 31-BIT
The total amount of storage available for storage manager pools.

Field Name: QW0225AV

SYSTEM AGENT STACK STORAGE IN USE
The amount of 31-bit stack storage that is in use for system agents. This is a subset of QW0225SU.

Field Name: QW0225SS

TOTAL 64-BIT VARIABLE POOL
Amount of variable storage available above the 2 GB bar.

Field Name: QW0225VA
TOTAL 64-BIT FIXED
The total amount of fixed storage above the 2 GB bar.
Field Name: QW0225FA

TOTAL 64-BIT GETMAINED
Total storage acquired by GETMAIN. This includes space for the compression dictionary, and statement and DBD cache that can be used by the Environmental Descriptor Manager (EDM).
This figure can be different from the sum of GETMAIN storage items shown in the statistics DBM1 storage, because DB2 does not produce grouping statistics for all GETMAIN storage.
Field Name: QW0225GA

TOTAL 64-BIT PRIVATE FOR STOR MANAG
Total 64-bit storage allocated for storage manager control structures.
Field Name: QW0225SM

REAL 4K FRAMES IN USE
Number of real-storage frames (4K) in use for 31- and 64-bit private pools.
Field Name: QW0225RL

AUXILIARY SLOTS IN USE
Number of auxiliary slots (4K) in use for 31- and 64-bit private pools.
Field Name: QW0225AX

64-BIT REAL 4K FRAMES IN USE
The number of real 4K frames in use for 64-bit private pools.
Note: This value is available from z/OS V1.11.
Field Name: QW0225HVPAGESINREAL

64-BIT 4K AUX SLOTS IN USE
The number of auxiliary 4K slots in use for 64-bit private pools.
Note: This value is available from z/OS V1.11.
Field Name: QW0225HVAUXSLOTS

ABOVE VALUE W/O BP STORAGE
Number of real-storage frames (4K) in use for 64-bit private pools. This is a subset of QW0225HVPagesInReal and does not include buffer pool storage.
Note: This field is available in z/OS 1.10 (and maintenance) or later.
Field Name: QW0225PRISTG_REAL

ABOVE VALUE W/O BP STORAGE
Number of auxiliary slots (4K) in use for 64-bit private pools. This does not include buffer pool storage. This field only includes auxiliary slots occupied by pages that are paged out.
Note: This field is available in z/OS 1.10 (and maintenance) or later.
IFCID 225 - Address Space Summary - DIST

Field Name: QW0225PRISTG_AUX

HWM 64-BIT REAL 4K FRAMES IN USE

The number of real 4K frames in use for 64-bit private pools.

Note: This value is available from z/OS V1.11.

Field Name: QW0225HVGPAGESINREAL

HWM 64-BIT AUX SLOTS IN USE

High water mark for the number of auxiliary 4K slots in use for 64-bit private pools.

Note: This value is available from z/OS V1.11.

Field Name: QW0225HVGAUXSLOTS

QW0225CTLP (S)

This field is for IBM service.

Field Name: QW0225CTLP

QW0225CTLS (S)

This field is for IBM service.

Field Name: QW0225CTLS

IFCID 225 - IRLM Pool Statistics:

This topic shows detailed information about “Record Trace - IFCID 225 - IRLM Pool Statistics”.

Record trace - IFCID 225 - IRLM Pool Statistics

The field labels shown in the following sample layout of “Record Trace - IFCID 225 - IRLM Pool Statistics” are described in the following section.

IRLM POOL STATISTICS

ABOVE THE BAR VALUES:
ATB CSA CURRENT : 0 ATB CSA HIGH WATER MARK : 0
ATB PRIVATE CURRENT : 5 ATB PRIVATE HIGH WATER MARK : 5
ATB PRIVATE MAX AVAILABILITY : 1844

BELOW THE BAR VALUES:
BTB PRIVATE CURRENT : 5773596 BTB PRIVATE HIGH WATER MARK : 5773596
BTB PRIVATE MAX AVAILABILITY : 5773596

ECSA:
ECSA CURRENT : 1856551 ECSA HIGH WATER MARK : 2015271

ATB CSA CURRENT

The total amount of 64-bit common storage that is currently in use by IRLM pools.

Field Name: QW0225I_ABCSA

ATB CSA HIGH WATER MARK

The high-water mark of 64-bit common storage allocated by IRLM pools.

Field Name: QW0225I_ABCSH

ATB PRIVATE CURRENT

The total amount of 64-bit private storage in use by IRLM pools.
Field Name: QW0225I_ABPVT

**ATB PRIVATE HIGH WATER MARK**

The high-water mark of 64-bit private storage allocated by IRLM pools.

Field Name: QW0225I_ABPVH

**ATB PRIVATE MAX AVAILABILITY**

The threshold of virtual 64-bit private storage available for normal IRLM execution. Only requests for storage by "must complete" tasks will be granted if this threshold is exceeded.

Field Name: QW0225I_APMAX

**BTB PRIVATE CURRENT**

The total amount of 31-bit private storage currently in use by IRLM pools.

Field Name: QW0225I_BBPVT

**BTB PRIVATE HIGH WATER MARK**

The high-water mark of 31-bit private storage allocated by IRLM pools.

Field Name: QW0225I_BBPVH

**BTB PRIVATE MAX AVAILABILITY**

The threshold of 31-bit private storage available for normal IRLM execution. Only requests for storage by "must complete" tasks will be granted if this threshold is exceeded.

Field Name: QW0225I_BPMAX

**ECSA CURRENT**

The total amount of Extended Common Service Area (ECSA) storage in use by IRLM pools.

Field Name: QW0225I_BBECSA

**ECSA HIGH WATER MARK**

The high-water mark of ECSA storage allocated by IRLM pools.

Field Name: QW0225I_BBECSAH

**IFCID 225 - Statement Cache / XPROC Detail:**

This topic shows detailed information about “Record Trace - IFCID 225 - Statement Cache / XPROC Detail”.

**Record trace - IFCID 225 - Statement Cache / XPROC Detail**

The field labels shown in the following sample layout of “Record Trace - IFCID 225 - Statement Cache / XPROC Detail” are described in the following section.

Chapter 6. Batch reporting  4043
ALLOCATED STOR FOR DYN SQL STMTS

The total shareable storage allocated for dynamic SQL statements used by active threads.

Field Name: QW0225SC8

REQUESTED STOR FOR DYN SQL STMTS

The total shareable storage requested for dynamic SQL statements used by active threads.

Field Name: QW0225LS8

ALLOCATED STOR FOR STATIC SQL STMTS

The total shareable storage allocated for static SQL statements.

Field Name: QW0225SX8

HWM REQUESTED STOR FOR DYN SQL STMTS

A statistics interval high-water mark of requested shareable storage for dynamic SQL statements used by active threads.

Field Name: QW0225HS8

ALLOCATED STOR FOR STMT DEPENDENCIES

The amount of storage allocated above the 2 GB bar to support object dependencies on statements that are in the Dynamic Statement Cache.

Field Name: QW0225DMH

TOTAL 31-BIT XPROC DYNAMIC SQL

The amount of storage allocated for the local cache storage pool below the bar.

Note: For DB2 10, the storage is allocated for executable code sequences of dynamic SQL statements.

Field Name: QW0225SC

ALLOCATED 31-BIT XPROC DYNAMIC SQL

The amount of storage used for thread copies in the local cache storage pool below the bar. This is a subset of the total allocated storage for thread copies QW0225SC.

Note: For DB2 10, the storage is used for executable code sequences of dynamic SQL statements.

Field Name: QW0225LS

TOTAL 31-BIT XPROC STATIC SQL

The amount of storage allocated below the bar for executable code sequences of static SQL statements.

Field Name: QW0225SX

HWM ALLOCATED 31-BIT XPROC DYNAMIC SQL

A statistics interval high-water mark of allocated storage for thread copies in the local cache storage pool below the bar.
Note: For DB2 10, the high water mark is related to executable code sequences of dynamic SQL statements.

Field Name: QW0225HS

STATEMENTS IN 64-BIT AGENT LOCAL POOLS (ALP)
The number of dynamic SQL local cache statements used by active threads. This value is related to shared agent local variable pools above the bar.

Field Name: QW0225LC

HWM STMT COUNT IN 64-BIT ALP AT HIGH STOR TIME
The number of dynamic SQL local cache statements used by active threads at high storage time. This value is related to shared agent local variable pools above the bar.

Field Name: QW0225HC

ALLOCATED STMT CACHE IN 64-BIT ALP
The total non-shareable storage requested for dynamic SQL statements used by active threads. This value is related to shared agent local variable pools above the bar.

Field Name: QW0225L2

HWM ALLOCATED STMT CACHE 64-BIT ALP
This value is related to shared agent local variable pools above the bar.

Field Name: QW0225H2

TIMESTAMP OF HWM AFTER LAST 225 REC
The timestamp at high-water storage.

Field Name: QW0225HT

TOTAL 64-BIT STMT CACHE BLKS 2G
The total statement cache storage blocks above the bar (64-bit shared variable pool).

Field Name: QW0225S2

QW0225F1
This field is for IBM service.

Field Name: QW0225F1

QW0225F2
This field is for IBM service.

Field Name: QW0225F2

IFCID 225 - Shared/Common Storage Summary:
This topic shows detailed information about “Record Trace - IFCID 225 - Shared/Common Storage Summary”.

Record trace - IFCID 225 - Shared/Common Storage Summary
The field labels shown in the following sample layout of “Record Trace - IFCID 225 - Shared/Common Storage Summary” are described in the following section.
31-BIT COMMON FIXED POOL STORAGE

The amount of storage allocated for 31-bit common fixed pool storage.

Field Name: QW0225FC

31-BIT COMMON VARIABLE POOL STORAGE

The amount of storage allocated for 31-bit common variable pool storage.

Field Name: QW0225VC

31-BIT COMMON GETMAINED STORAGE

The amount of storage allocated for 31-bit common getmained storage.

Field Name: QW0225GC

EXTENDED CSA SIZE

The size of the common storage area (CSA) above the 16 MB line.

Field Name: QW0225EC

64-BIT COMMON FIXED POOL STORAGE

The amount of storage allocated for 64-bit common fixed pool storage.

Field Name: QW0225FCG

64-BIT COMMON VARIABLE POOL STORAGE

The amount of storage allocated for 64-bit common variable pool storage.

Field Name: QW0225VCG

64-BIT COMMON GETMAINED STORAGE

The amount of storage allocated for 64-bit common getmained storage.

Field Name: QW0225GCG

64-BIT COMMON STORAGE-STOR MGR CTRL

The amount of storage allocated for 64-bit common storage for storage manager control structures.
Field Name: QW0225SMC

64-BIT SHARED VARIABLE POOL STORAGE
The amount of virtual shared variable storage above the 2 GB bar.

Field Name: QW0225SV

64-BIT SHARED FIXED POOL STORAGE
The amount of total fixed virtual shared storage above the 2 GB bar.

Field Name: QW0225SF

64-BIT SHARED GETMAINED STORAGE
The amount of virtual shared storage acquired by GETMAIN above the 2 GB bar.

Field Name: QW0225SG

64-BIT SHARED STORAGE-STOR MGR CTRL
The amount of 64-bit shared storage allocated for storage manager control structures.

Field Name: QW0225SMS

64-BIT SHARED SYSTEM AGENT STACK (AS)
The amount of 64-bit shared storage allocated for system agent stack use.

Field Name: QW0225GSG_SYS

64-BIT SHARED SYSTEM AS IN USE
The amount of 64-bit shared system agent stack that is in use.

Field Name: QW0225SUG_SYS

64-BIT SHARED NON-SYSTEM AS
The amount of 64-bit shared storage allocated for non-system agent stack use.

Field Name: QW0225GSG

64-BIT SHARED NON-SYSTEM AS IN USE
The amount of 64-bit shared non-system agent stack that is in use.

Field Name: QW0225SUG

SHARED MEMORY OBJECTS
The number of shared memory objects allocated for this MVS LPAR.

Field Name: QW0225SHRNMB

64-BIT SHARED MEMORY PAGES
The number of 64-bit shared memory pages allocated for this MVS LPAR (this count includes hidden pages).

Field Name: QW0225SHRPAGES

HWM FOR 64-BIT SHARED BYTES
High water mark for number of 64-bit shared bytes for this MVS LPAR.

Field Name: QW0225SHRGBYTES

64-BIT SHARED PAGES BACKED IN REAL

Chapter 6. Batch reporting
The number of 64-bit shared pages backed in real storage (4K pages) for this MVS LPAR.

Field Name: QW0225SHRINREAL

AUX SLOTS USED FOR 64-BIT SHARED STOR
The number of auxiliary slots used for 64-bit shared storage for this MVS LPAR.

Field Name: QW0225SHRAUXSLOTS

64-BIT PAGES PAGED IN FROM AUX STOR
The number of 64-bit shared pages paged in from auxiliary storage for this MVS LPAR.

Field Name: QW0225SHRPAGEINS

64-BIT PAGES PAGED OUT TO AUX STOR
The number of 64-bit shared pages paged out to auxiliary storage for this MVS LPAR.

Field Name: QW0225SHRPAGEOUTS

64-BIT SHARED STG REAL 4K FRMS IN USE
The number of real-storage frames (4K) in use for 64-bit shared storage. This does not include shared stack storage. This is recorded at the subsystem level.

Note: This field is available in z/OS 1.10 (and maintenance) or later.

Field Name: QW0225SHRSTG_REAL

64-BIT SHARED STG 4K AUX SLOTS IN USE
The number of auxiliary slots (4K) in use for 64-bit shared storage. This does not include shared stack storage. This is recorded at the subsystem level. This field only includes auxiliary slots occupied by pages that are paged out.

Note: This field is available in z/OS 1.10 (and maintenance) or later.

Field Name: QW0225SHRSTG_AUX

64-BIT STACK STG REAL 4K FRMS IN USE
The number of real-storage frames (4K) in use for 64-bit shared stack storage. This is recorded at the subsystem level.

Note: This field is available in z/OS 1.10 (and maintenance) or later.

Field Name: QW0225SHRSTKSTG_REAL

64-BIT STACK STG 4K AUX SLOTS IN USE
The number of auxiliary slots (4K) in use for 64-bit shared stack storage. This is recorded at the subsystem level. This field only includes auxiliary slots occupied by pages that are paged out.

Note: This field is available in z/OS 1.10 (and maintenance) or later.

Field Name: QW0225SHRSTKSTG_AUX

64-BIT COMMON STG REAL 4K FRMS IN USE
The number of real-storage frames (4K) in use for 64-bit common storage. This is recorded at the subsystem level.

**Note:** This field is available in z/OS 1.10 (and maintenance) or later.

**Field Name:** QW0225COMSTG_REAL

### 64-BIT COMMON STG 4K AUX SLOTS IN USE

The number of auxiliary slots (4K) in use for 64-bit common storage. This is recorded at the subsystem level. This field only includes auxiliary slots occupied by pages that are paged out.

**Note:** This field is available in z/OS 1.10 (and maintenance) or later.

**Field Name:** QW0225COMSTG_AUX

### LOG MGR WRITE BUFFER FRAMES IN REAL

The number of real-storage frames (4K) in the 64-bit common area in use for Log Manager write buffers.

**Field Name:** QW0225_LMWRITE_REAL

### LOG MANAGER CONTROL FRAMES IN REAL

The number of real-storage frames (4K) in the 64-bit common area in use for Log Manager control blocks.

**Field Name:** QW0225_LMCTRL_REAL

### LOG MGR WRITE BUFFER FRAMES IN AUX

The number of auxiliary slots (4K) in the 64-bit common area in use for Log Manager write buffers.

**Field Name:** QW0225_LMWRITE_AUX

### LOG MANAGER CONTROL FRAMES IN AUX

The number of auxiliary slots (4K) in the 64-bit common area in use for Log Manager control blocks.

**Field Name:** QW0225_LMCTRL_AUX

**QW0225_ECSA_CONV**

This field is for IBM service.

**Field Name:** QW0225_ECSA_CONV

**QW0225LFAREA**

This field is for IBM service (DB2 Field: QW0225LFAREA).

**Field Name:** QW0225LFAREA

**QW0225_RS**

This field is for IBM service (DB2 field: QW0225_RS).

**Field Name:** QW0225_RS

*IFCID 225 - Storage Pool Details:*

This topic shows detailed information about “Record Trace - IFCID 225 - Storage Pool Details”.

Chapter 6. Batch reporting 4049
IFCID 225 - Storage Pool Details

Record trace - IFCID 225 - Storage Pool Details

The field labels shown in the following sample layout of “Record Trace - IFCID 225 - Storage Pool Details” are described in the following section.

STORAGE POOL DETAILS

31-BIT DBM1 PRIVATE VARIABLE POOLS:

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>AGENT LOCAL STORAGE</td>
<td>2162688</td>

</tbody>
</table>

SYSTEM AGENT STORAGE

Storage used by system agents.

Field Name: QW0225AS

BUFFER MANAGER STORAGE BLOCKS

Storage used for page set control blocks.

Field Name: QW0225BB

SHARED AGENT LOCAL (VARIABLE POOL)

The amount of storage allocated for agent-related 64-bit local storage (DB2 field: QW0225ALG).

Field Name: QW0225ALG

SHARED SYSTEM AGENT (VARIABLE POOL)

The amount of 64-bit storage used by system agents (DB2 field: QW0225ASG).

Field Name: QW0225ASG

RID POOL STORAGE (FIXED POOL)

Storage for RID list processing such as list prefetch, index ANDing, and ORing.

Field Name: QW0225RP

COMPRESSION DICT (DBM1 PRIVATE)

Storage space allocated for the compression dictionary.

AGENT LOCAL STORAGE

The amount of storage allocated for agent-related local storage. This storage is used for operations such as sort.

Background and Tuning Information

Sorting requires a large amount of virtual storage because there can be multiple copies of the data being sorted at a given time.

DB2 Sort uses two kinds of storage pool for various internal control structures and data records, an agent-related local storage pool and a global sort pool. To take advantage of the 64-bit addressability for larger storage pool, some high level sort control structures are kept in agent-related storage below the 2 GB bar, which contain 64-bit pointers to areas in the global sort pool above the 2 GB bar. The sort pool above 2 GB contains sort tree nodes and data buffers.

Field Name: QW0225AL
Field Name: QW0225CD

ARRAY VARIABLE STORAGE
The amount of storage in use for array variables.
Field Name: QW0225AR

IFCID 225 - Thread Information:
This topic shows detailed information about “Record Trace - IFCID 225 - Thread Information”.

Record trace - IFCID 225 - Thread Information
The field labels shown in the following sample layout of “Record Trace - IFCID 225 - Thread Information” are described in the following section.

ACTIVE THREADS
The number of active allied threads.
Field Name: QW0225AT

ACTIVE AND DISCONNECTED DBATS
The number of active and disconnected DBAT threads.
Field Name: QW0225DB

CASTOUT ENGINES
Number of engines available for data-sharing castout processing.
Field Name: QW0225CE

DEFERRED WRITE ENGINES
Number of engines used for deferred write operations.
Field Name: QW0225DW

GBP WRITE ENGINES
Number of engines for group buffer pool writes.
Field Name: QW0225GW

PREFETCH ENGINES
Number of engines used for sequential, list, and dynamic prefetch.
Field Name: QW0225PF

P-LOCK/NOTIFY EXIT ENGINES
Number of data sharing P-Lock engines and Notify Exit engines.
Field Name: QW0225PL

PARALLEL CHILD THREADS
The number of active parallel child threads.
Field Name: QW0225PT
IFCID 226 - Page Latch Contention Start

IFCID 226 - Page Latch Contention Start:

This topic shows detailed information about “Record Trace - IFCID 226 - Page Latch Contention Start”.

This IFCID records the beginning of an agent suspend to wait for a page latch that is currently held by another agent.

Record trace - IFCID 226 - Page Latch Contention Start

The field labels shown in the following sample layout of “Record Trace - IFCID 226 - Page Latch Contention Start” are described in the following section.

DBID: DSN0DB7  PSID: DSN4K00
PAGE NUMBER: X'000001'  LATCH TYPE: X
PARTITION: 0  PAGE NUMBERING: ABS
TABLE_SPACE_TYPE: N
BUFFERPOOL ID: 7  ACE TOKEN: 1

DBID
The database ID. Deduced from the DB2 fields QW0226DB, QW0105DN or QW0107DN.
When present, the database name is shown, otherwise the decimal identifier from QW0226DB is shown or N/A when this value is 0.
Field Name: RT0226DB

PSID
The page set object identifier. When present, this is the page set object name, otherwise the decimal identifier from QW0226OB is shown.
Field Name: RT0226OB

PAGE NUMBER
The number of the page being read or written. If the value in TABLE_SPACE_TYPE is L or V, the page number covers 4 bytes instead of 3.
Field Name: QW0226PN

LATCH TYPE
The type of latch.
Field Name: QW0226F

PARTITION
Shows the partition number or 0 if non-partitioned.
Field Name: QW0226PT

PAGE NUMBERING
Indicates how page numbers are shown for partitioned tables:
REL Indicates that relative page numbers are shown in the partition.
ABS Indicates that absolute page numbers are shown in the partition.
N/A Not applicable.
Field Name: QW0226P1

TABLE SPACE TYPE
The type of the table space:

- **L**  Non-EA large table
- **N**  Non-large table
- **R**  Partitioned by range (PBR) universal table spaces (UTS) that use relative page numbers
- **V**  EA-enabled large table

**Field Name:** QW0226FG

**BUFFERPOOL ID**

The buffer pool internal identifier. The values 0 through 49 are the identifiers for BP0 through BP49. The values 80 through 89 are the identifiers for BP32K through BP32K9.

**Field Name:** QW0226BP

**ACE TOKEN**

The agent control element token of the requester.

**Field Name:** QW0226AC

**IFCID 227 - Page Latch Contention End**

This topic shows detailed information about “Record Trace - IFCID 227 - Page Latch Contention End”.

This IFCID records the end of an agent suspend wait for a page latch that was currently held by another agent.

**Record trace - IFCID 227 - Page Latch Contention End**

The field labels shown in the following sample layout of “Record Trace - IFCID 227 - Page Latch Contention End” are described in the following section.

- **DBID:** DSNDB07
- **PSID:** DSN4K00
- **PAGE NUMBER:** X'000001'
- **CANCEL STATUS:** N
- **PARTITION:** 1
- **PAGE NUMBERING:** ABS
- **ACE TOKEN:** 1
- **TABLE_SPACE_TYPE:** N

**DBID**

The database ID. Deduced from the DB2 fields QW0227DB, QW0105DN or QW0107DN.

When present, the database name is shown, otherwise the decimal identifier from QW0227DB is shown or N/A when this value is 0.

**Field Name:** RT0227DB

**PSID**

The page set object identifier. When present this is the page set object name, otherwise it is the decimal identifier from QW0227OB.

**Field Name:** RT0227OB

**PAGE NUMBER**

The number of the page being read or written. If the value in TABLE_SPACE_TYPE is L or V, the page number covers 4 bytes instead of 3.
IFCID 227 - Page Latch Contention End

Field Name: QW0227PN

CANCEL STATUS
Indicates whether the latch requester was canceled.
Field Name: QW0227F

PARTITION
Shows the partition number or 0 if non-partitioned.
Field Name: QW0227PT

PAGE NUMBERING
Indicates how page numbers are shown for partitioned tables:
REL Indicates that relative page numbers are shown in the partition.
ABS Indicates that absolute page numbers are shown in the partition.
N/A Not applicable.
Field Name: QW0227P1

ACE TOKEN
The agent control element token of the requester.
Field Name: QW0227AC

TABLE SPACE TYPE
The type of the table space:
L Non-EA large table
N Non-large table
V EA-enabled large table
Field Name: QW0227FG

IFCID 228 - Archive Deallocation Start:

This topic shows detailed information about “Record Trace - IFCID 228 - Archive Deallocation Start”.

Record trace - IFCID 228 - Archive Deallocation Start
The field labels shown in the following sample layout of “Record Trace - IFCID 228 - Archive Deallocation Start” are described in the following section.

</table>
IFCID 230 - Group Buffer Pool Attributes

Field Name: QBGBGDR

PENDING DIR TO DATA RATIO
The pending directory entry to data entry ratio.

Field Name: QBGBGR2

CLASS CASTOUT THRESH (PGS)
The threshold at which the castout is to be initiated for the group buffer pool. It is expressed as a percentage of the size of the group buffer pool.
For ALTER GROUPBUFFERPOOL commands, it reports the value specified in the GBPOOLT keyword.

Field Name: QBGBGGR

ACTUAL # OF DATA ENTRIES
The actual number of allocated data entries.

Field Name: QBGBGDT

GBP CHECKPOINT INTERVAL (MIN)
The time interval, in minutes, between successive group buffer pool checkpoints.
For ALTER GROUPBUFFERPOOL commands, it reports the value specified in the GBPCHKPT keyword.

Field Name: QBGBGCK

GBP CASTOUT THRESH (%)
The threshold at which the castout is to be initiated for the group buffer pool. It is expressed as a percentage of the size of the group buffer pool.
For ALTER GROUPBUFFERPOOL commands, it reports the value specified in the GBPOOLT keyword.

Field Name: QBGBGGT

DIRECTORY-ENTRY-RECLAIM
The number of times that a page name assignment required that a coupling facility directory entry be reclaimed (stolen).

Field Name: QBGBDRR

DATA-ENTRY-RECLAIM
The number of times that a page name assignment required that a coupling facility data entry be reclaimed (stolen).

Field Name: QBGBDTR

AUTOREC
Indicates whether automatic recovery takes place in the event of a structure failure or a loss of connectivity. When automatic recovery is active, all members of the group are recovered to the group buffer pool.

Field Name: QBGBGAS

TOTAL-CHANGED
The number of allocated data entries that are currently in changed state. This is a snapshot value and is not cumulative.
Field Name: QBGBTCC

XI-DIRECTORY-ENTRY-RECLAIM

The number of times that a directory entry was stolen and one or more XI signals had to be sent because the page in the directory was cached in one or more DB2 buffer pools.

Field Name: QBGBRXI

GBP CACHE

GBP cache attribute. Possible values are:

YES  GBP is used for both data caching and cross-invalidation.

NO  GBP is used for cross-invalidation only.

Field Name: QBGBGCS

MODE

Simplex or duplex mode indicator.

Field Name: QBGBDUP

SEC-GBP ALLOC

The allocated size of the secondary GBP when the GBP is DUPERX.

This field is not shown when MODE is SIMPLEX.

Field Name: QBGBGSZ2

SEC-GBP ALLOC DIRECTORIES

Number of allocated directory entries in the secondary GBP when MODE is DUPLEX.

Field Name: QBGBGDR2

SEC-GBP DATA ENTERIES

The allocated data entries in the secondary GBP when MODE is DUPERX.

Field Name: QBGBGDT2

IFCID 231 - Parallel Group Task Time:

This topic shows detailed information about “Record Trace - IFCID 231 - Parallel Group Task Time”.

Place text here

Record trace - IFCID 231 - Parallel Group Task Time

The field labels shown in the following sample layout of “Record Trace - IFCID 231 - Parallel Group Task Time” are described in the following section.
IFCID 231 - Parallel Group Task Time

**STATEMENT NO**

The statement number. If the PLAN_TABLE exists, this is the same as QUERYNO in the PLAN_TABLE.

**Field Name:** QW0231SN

**QUERY BLOCK NO**

The query block number. If the PLAN_TABLE exists, this is the same as QBLOCKNO in the PLAN_TABLE.

**Field Name:** QW0231QN

**PARALLEL GROUP NO**

The parallel group number. If the PLAN_TABLE exists, this is the same as ACCESS_PGROUP_ID in the PLAN_TABLE.

**Field Name:** QW0231GN

**REPEAT.GRPS**

The number of repeat groups in the section.

**Field Name:** QW0231RN

**RECORD**

The position of this record in the series of IFCID 222 records.

**Field Name:** QW0231TR

**OF**

The total number of IFCID 231 records in this series.

**Field Name:** QW0231NR

**GROUP CREATION**

The time of group creation in DB2 timestamp format.

**Field Name:** QW0231CT

**GROUP TERMINATION**

The time of group termination in DB2 timestamp format.

**Field Name:** QW0231ET

**GROUP ELAPSED**

The elapsed time between group creation and group termination in DB2 timestamp format.

**Field Name:** RT0231GE

**TASK SEQ. NUMBER**

The task sequence number.

**Field Name:** QW0231TQ

**TASK TOKEN**

The task token.

**Field Name:** QW0231TK

**TASK CREATION**

The time of task creation in DB2 timestamp format.
Field Name: QW0231TC

TASK ELAPSED

The elapsed time between task creation and task termination in DB2 timestamp format. If this value is negative, N/C is printed.

Field Name: RT0231EL

TASK TERMINATION

The time of task termination in DB2 timestamp format.

Field Name: QW0231TT

CPU TIME

Task CPU execution time.

Field Name: QW0231TX

MEMBER

The name of the DB2 member on which the task was executed.

Field Name: QW0231TM

CPU SU CONS

The CPU service units that the task consumed.

Field Name: QW0231SU

IFCID 233 - Call User Routine:

This topic shows detailed information about “Record Trace - IFCID 233 - Call User Routine”.

IFCID 233 signals the start or end of a call to a user routine (stored procedure or user-defined function) at a DB2 server.

This record is written when performance trace class 3 is active. MONITOR1 PRIVILEGE is required for reading via IFI.

This record traces the caller’s information.

Record trace - IFCID 233 - Call User Routine

The field labels shown in the following sample layout of “Record Trace - IFCID 233 - Call User Routine” are described in the following section.
IFCID 233 - Call User Routine

The package collection identifier.
Field Name: QW0233PC

PROGRAM NAME
The program name.
Field Name: QW0233PN

SCHEMA NAME
The name of the schema associated with this routine.
Field Name: QW0233SC

ROUTINE NAME
The specific name of the routine.
Field Name: QW0233PR

VERSION NAME
The name of the version.
Field Name: QW0233VER

ROUTINE TYPE
The routine type can have the following values:

PROCEDURE
The routine is a stored procedure

FUNCTION
The routine is a User-Defined Function
Field Name: QW0233TY

CONSISTENCY TOKEN
The consistency token.
Field Name: QW0233TS

ENTRY/EXIT TYPE
The entry or exit event type can have the following values:

ENTERING
The agent is entering a routine.

RETURNED
The agent has returned from a routine.
Field Name: QW0233EX

NESTING LEVEL
The nesting level of the routine.
Field Name: QW0233NL

STATEMENT NO
The statement number of the statement executed.
Field Name: QW0233SN

TYPE
The statement type. Possible values are DYNAMIC or STATIC.
Field Name: QW0233STY

ROUTINE ID
The routine identifier.
Field Name: QW0233RID

STATEMENT ID
The unique identifier of the currently executing statement. It is shown as an integer and in hexadecimal format.
Field Name: QW0233SID

CONV INTO HEX
The unique identifier of the currently executing statement. It is shown as an integer and in hexadecimal format.
Field Name: QW0233SID

IFCID 234 - Calling Agent Auth IDs:
This topic shows detailed information about “Record Trace - IFCID 234 - Calling Agent Auth IDs”.
This IFCID returns the authorization ID information for the calling agent.

Record trace - IFCID 234 - Calling Agent Auth IDs
The field labels shown in the following sample layout of “Record Trace - IFCID 234 - Calling Agent Auth IDs” are described in the following section.

PRIM AUTHID: USERID01
SQL AUTHID: SQLAUTHID01
SEC AUTHID: SQLAUTHID02
SEC AUTHID: SQLAUTHID03

IFCID 236 - DDF SNA XLN Protocol Error:
This topic shows detailed information about “Record Trace - IFCID 236 - DDF SNA XLN Protocol Error”.

Record trace - IFCID 236 - DDF SNA XLN Protocol Error
The field labels shown in the following sample layout of “Record Trace - IFCID 236 - DDF SNA XLN Protocol Error” are described in the following section.
REMOTE LOCATION
The location name or LU name of the remote partner involved in the protocol error.
Field Name: QW0236LO

LAST OPERATION
Indicates whether the last network operation was a send or receive.
Field Name: QW0236SR

SENT
The last message sent by this DB2 site during the XLN exchange.
Field Name: QW0236MS

RCVD
The last message received by this DB2 site during the XLN exchange.
Field Name: QW0236MR

VTAM RPL
The VTAM RPL associated with the last XLN message received during the exchange log names (XLN).
Field Name: QW0236VR

EXT
The VTAM RPL extension which describes the LU 6.2 verb indicators for the last message received.
Field Name: QW0236VX

IFCID 237 - Set Current Degree:
This topic shows detailed information about “Record Trace - IFCID 237 - Set Current Degree”.

This record is generated when an SQL SET CURRENT DEGREE statement is executed.

Record trace - IFCID 237 - Set Current Degree

The field labels shown in the following sample layout of “Record Trace - IFCID 237 - Set Current Degree” are described in the following section.

PREV DEGREE: 1     NEW DEGREE: ANY     STATUS: SUCCESSFUL

PREV DEGREE
The previous (current) degree.
Field Name: QW0237OI
NEW DEGREE

The new (attempted) degree.

Field Name: QW0237NI

STATUS

The status of the statement.

Field Name: QW0237ST

IFCID 238 - IBM Service Record:

This topic shows detailed information about “Record Trace - IFCID 238 - IBM Service Record”.

This record is for IBM service use.

IFCID 239 - Overflow Package/DBRM: This topic shows the data available for IFCID 239.

IFCID 239 - Buffer Manager Accounting Data:

This topic shows detailed information about “Record Trace - IFCID 239 - Buffer Manager Accounting Data”.

Record trace - IFCID 239 - Buffer Manager Accounting Data

The field labels shown in the following sample layout of “Record Trace - IFCID 239 - Buffer Manager Accounting Data” are described in the following section.

<table>
<thead>
<tr>
<th>BUFFER MANAGEMENT DATA</th>
</tr>
</thead>
<tbody>
<tr>
<td>BUFFER POOL ID</td>
</tr>
<tr>
<td>GETPAGES</td>
</tr>
<tr>
<td>GETPAGES FAILED</td>
</tr>
<tr>
<td>BUFFER UPDATES</td>
</tr>
<tr>
<td>SYNCHRON. WRITE</td>
</tr>
<tr>
<td>ZHYPERLINK READ</td>
</tr>
<tr>
<td>DASD CACHE READ HITS</td>
</tr>
</tbody>
</table>

BUFFER POOL ID

The buffer pool ID used by this thread.

Field Name: QBACPID

SYNCHRON. READ

The number of synchronous read I/O operations. DB2 increments this counter for each media manager synchronous physical read. Asynchronous I/O requests are not counted.

Field Name: QBACRIO

GETPAGES

The number of Getpage requests. This counter is incremented by successful Getpage requests for queries processed in parallel for each thread and for all successful and unsuccessful Getpage requests for queries that are not processed in parallel.

Background and Tuning Information
Reducing the number of Getpages can improve DB2 performance by reducing the number of synchronous page reads. With fewer Getpages, the requested page is more likely to be returned from the buffer pool. CPU usage is also reduced.

Check the ratio of Getpages to SQL DML statements, as a rule of thumb, try and keep this ratio below six for a typical online transaction SQL.

You might need to modify the database and query design, for example:

- Add indexes to tables to reduce the number of pages scanned.
- Reassess the number of tables used and denormalize them, if necessary.

As an example, a large table with many columns can result in several pages being fetched to satisfy a simple query requesting just a few columns. Splitting such a table into several tables with fewer columns, tailored to queries, will result in fewer pages returned for each query.

- Use correlated rather than non-correlated queries to force the use of an index.

**Field Name:** QBACGET

This is an *exception* field.

**SEQ. PREFETCH**

The number of SEQUENTIAL PREFETCH requests. This is incremented for each PREFETCH request. Each request can result in an I/O read. If it does, up to 64 pages can be read for SQL and up to 128 pages for utilities. For SQL, depending on the buffer pool size, a request does not result in an I/O if all the requested pages are already in the buffer pool.

DB2 can use sequential prefetch if the data is accessed in sequential order even though sequential prefetch was not requested at bind time. This is known as sequential detection and is not included in the sequential prefetch count. Sequential detection is included in dynamic prefetch requests field.

**Background and Tuning Information**

Table space scans and nonmatching index scans generally use sequential prefetch.

**Field Name:** QBACSEQ

This is an *exception* field.

**GETPAGES FAILED**

The number of times that a page requested for a query processed in parallel was unavailable because an I/O was in progress or the page was not found in the buffer pool. The agent does not wait, but control returns to the agent.

This counter is used only when queries are processed in parallel.

**Background and Tuning Information**

If this value is close to zero, most pages are already in the buffer pool, and wait time for synchronous I/O is small.

This counter can be high when, for example, there is a cluster index scan and the data is not truly clustered by the index key. In this instance, data pages are not accessed in their true order and the cluster ratio is not valid. Use the Runstats utility to update it.
The value of this field is also used to determine how many sequential prefetches of one page were scheduled.

**Field Name:** QBACNGT

**LIST PREFETCH**

The number of LIST PREFETCH requests.

**Special Considerations:**
1. List prefetch allows DB2 to access data pages efficiently even if the needed data pages are not contiguous. It can be used with single index access and is always used with multiple index access.
2. List prefetch is always used to access data from the inner table during a hybrid join.
3. Data pages are read in quantities equal to the sequential prefetch quantity, which depends on the buffer pool size and is usually 64 pages.
4. During bind time DB2 does not use list prefetch if the estimated number of RIDs to be processed would take more than 50% of the RID pool. During execution time, list prefetch processing terminates if DB2 detects that more than 25% of the rows in the table need to be accessed. If list prefetch is terminated, it is indicated in IFCID 125.

**Field Name:** QBACLPF

This is an *exception* field.

**BUFFER UPDATES**

The number of times a buffer update occurs. This is incremented every time a page is updated and is ready to be written to DASD. If the same page is updated twice, for example, the number is incremented by 2.

This number is kept for all types of pages including data pages and work-file pages.

**Background and Tuning Information**

A nonzero value indicates any of the following activities:
- SQL INSERT, UPDATE, or DELETE
- Merge scan join
- Internal sort activity on the work files

Check the access path to determine whether sort activity can be minimized or avoided.

**Field Name:** QBACSWS

This is an *exception* field.

**DYNAMIC PREFETCH**

The number of (dynamic) PREFETCH requests. This is triggered by sequential detection. This includes prefetches for segmented table spaces.

**Background and Tuning Information**

Dynamic prefetch is typically used for a SELECT or UPDATE that is run repeatedly, accessing the index for each access.

If sequential prefetch, list prefetch, and dynamic prefetch reads have large values, check whether the access path can be improved.
IFCID 239 - Buffer Manager Accounting Data

Field Name: QBACDPF
This is an exception field.

SYNCHRON.WRITE
The number of immediate (synchronous) write I/O operations.

Background and Tuning Information
Although an immediate write is rare, a small nonzero value is acceptable. A large value indicates that the system needs tuning.

Field Name: QBACIMW
This is an exception field.

PAGES READ ASYN-PAR
The number of asynchronous pages read by prefetch that the agent triggered.

Background and Tuning Information
This is used to determine the buffer pool hit ratio: (Getpage requests - Synchronous reads - Asynchronous pages read) / Getpage requests.

Field Name: QBACSIO
This is an exception field.

ZHYPERLINK READ
The number of DASD reads done using zHyperLink.

Field Name: QBACSYI

ZHYPERLINK CPU TIME
The amount of CPU time used for successful zHyperLink reads. zHyperLink I/O is synchronous with respect to the CPU, thus CPU time accumulates from the beginning of the I/O until it completes.

Field Name: QBACSYIT

DASD CACHE READ HITS
The number of I/Os where the requested pages were found in the DASD subsystem cache. These I/Os could have potentially been successful if zHyperLink was used to do the I/O.

Field Name: QBACIOC

IFCID 239 - General Package Overflow Accounting Data:

This topic shows detailed information about “Record Trace - IFCID 239 - General Package Overflow Accounting Data”.

Record trace - IFCID 239 - General Package Overflow Accounting Data

The field labels shown in the following sample layout of “Record Trace - IFCID 239 - General Package Overflow Accounting Data” are described in the following section.

GENERAL PACKAGE OVERFLOW ACCOUNTING DATA
NUMBER OF PACKAGES  1  FIRST SECTION  2  LAST SECTION  3

NUMBER OF PACKAGES
The number of packages.
IFCID 239 - General Package Overflow Accounting Data

Field Name: QPKGPKGN

FIRST SECTION
The number of the first section in this record.

Field Name: QPKGPKNF

LAST SECTION
The number of the last section in this record.

Field Name: QPKGPKNL

IFCID 239 - Locking Data:

This topic shows detailed information about “Record Trace - IFCID 239 - Locking Data”.

Record Trace - IFCID 239 - Locking Data

The field labels shown in the following sample layout of “Record Trace - IFCID 239 - Locking Data” are described in the following section.

<table>
<thead>
<tr>

<tr>
<td>DRain REQUESTS FAIL</td>
<td>20</td>
</tr>
</tbody>
</table>

DEADLOCKS
The number of times deadlocks were detected. This number should be low, ideally 0.

Background and Tuning Information

Deadlocks occur when two or more application processes each hold locks on resources that the others need, without which they cannot proceed. Ensure that all applications accessing the same tables access them in the same order.

To improve concurrency:
• Use row level locking instead of page level locking to minimize deadlocks.
• For small tables use page level locking with MAXROWS 1.

To minimize deadlocks:
• Delay updates to just before commit.
• Use SELECT with the FOR UPDATE clause to use U lock.
• Adjust the deadlock detection cycle parameter DEADLOK in the IRLM procedure.

This field is incremented once for each deadlock encountered. There is no correlation between this field and the deadlock events reported in the Locking report set or the number of IFCID 172 records written. This field reports all deadlocks, regardless of how they were resolved. The locking report and record trace IFCID 172 show only those deadlocks that were resolved by DB2.

Field Name: QTXADEA

This is an exception field.

LOCK REQUEST
The number of requests to lock a resource.

**Field Name:** QTXALOCK

This is an *exception* field.

**LOCK SUSPENSIONS**

The number of times a lock could not be obtained and the unit of work was suspended.

**Background and Tuning Information**

This number should be low, ideally 0.

The number of lock suspensions is a function of the lock requests. Lock suspensions (or conflicts) can happen on either LOCK REQUEST or CHANGE REQUEST.

Suspensions are highly dependent on the application and table space locking protocols.

**Field Name:** QTXASLOC

This is an *exception* field.

**CLAIM REQUESTS**

The number of claim requests.

**Field Name:** QTXACLNO

This is an *exception* field.

**TIMEOUTS**

The number of times a unit of work was suspended for a time exceeding the timeout value. This number should be low, ideally 0.

**Field Name:** QTXATIM

This is an *exception* field.

**UNLOCK REQUEST**

The number of requests to unlock a resource.

This value can be less than the number of lock requests because DB2 can release several locks with a single unlock request.

**Field Name:** QTXAUNLK

**IRLM LATCH SUSPENS.**

The number of latch suspensions.

**Field Name:** QTXASLAT

**CLAIM REQ. FAILED**

The number of unsuccessful claim requests.

**Field Name:** QTXACLUN

**ESCALATIONS(SHR)**

The number of times the maximum page locks per table space are exceeded, and the table space lock escalates from a page lock (IS) to a table space lock (S) for this thread. You can specify the number of locks allowed per table space with the LOCKS PER TABLE(SPACE) parameter on the DB2 install panel DSNTIPJ.
Background and Tuning Information

Escalations can cause unpredictable response times. Lock escalations should only happen when an application process updates or references (if repeatable read is used) more pages than normal.

Field Name: QTXALES
This is an exception field.

QUERY REQUEST
The number of query requests.
Field Name: QTXAQR
This is an exception field.

OTHER SUSPENSIONS
The number of suspensions caused by something other than lock or latch.
Field Name: QTXASOTH
This is an exception field.

DRAIN REQUESTS
The number of drain requests.
Field Name: QTXADRNO
This is an exception field.

ESCALATIONS(EXC)
The number of times the maximum page locks per table space are exceeded and the table space lock escalates from a page lock (IX) to a table space lock (X).

Background and Tuning Information

Escalations can cause unpredictable response times. Lock escalations should only happen when an application process updates or references (if repeatable read is used) more pages than it normally does.

A useful rule of thumb is to compare the number of escalations (shared and exclusive) to the successful escalations (those that did not cause deadlocks and timeouts). If this value, or the number Lock escalations - shared and if the number of timeouts or deadlocks is also not 0, the timeout or deadlock is probably caused by the escalation.

If many escalations cause deadlocks and timeouts, the recommendation is to change the escalation threshold value. Use of ANY is extremely useful to prevent unnecessary and expensive page locks, for example locking all pages in a table space.

Lock escalations, shared or exclusive, should not be expected in a transaction environment.
Field Name: QTXALEX
This is an exception field.

CHANGE REQUEST
The number of change requests.
Field Name: QTXACHG
IFCID 239 - Locking Data

This is an exception field.

DRAIN REQ. FAILED
The number of unsuccessful drain requests.

Field Name: QTXADRUN
This is an exception field.

MAXIMUM PAGE/ROW LOCKS HELD
The maximum number of page or row locks concurrently held against all table spaces by a single application during its execution. This count is a high-water mark. It cannot exceed the LOCKS PER USER parameter on panel DSNTIPJ.

Field Name: QTXANPL
This is an exception field.

OTHER REQUEST
The number of requests to IRLM to perform a function other than LOCK, UNLOCK, QUERY, or CHANGE.

Field Name: QTXAIRLM
This is an exception field.

IFCID 239 - Package/DBRM Accounting Data:

This topic shows detailed information about “Record Trace - IFCID 239 - Package/DBRM Accounting Data”.

Record trace - IFCID 239 - Package/DBRM Accounting Data

The field labels shown in the following sample layout of “Record Trace - IFCID 239 - Package/DBRM Accounting Data” are described in the following section.

LOCATION:
The location name.
If this field is blank in trace or report, the package or DBRM was executed locally. If it is not blank, all times represent the time spent locally to execute the remote package for this APPL_DIR requester.

This field is invalid (N/P) if summary rollup data is present.

**Field Name:** QPACLOCN

This is an *exception* field.

**COLLECTION**

The package collection ID. This field does not apply to DBRMs. If the program name cannot be identified, this field is not present in report or trace.

This field is invalid if summary rollup data is present. It can have the following value in:

- Accounting trace and report: N/P
- The Accounting FILE and SAVE PROGRAM table: blank

**Field Name:** QPACCOLN

This is an *exception* field.

**PACKAGE ID**

The program name (package ID or DBRM name).

In the case of rollup data (Accounting data of DDF/RRSAF threads and parallel tasks accumulated by DB2), the following value is shown:*ROLSUM*.

**Field Name:** QPACP Kidd

This is an *exception* field.

**TOKEN**

The program (package or DBRM) consistency token.

This field is invalid (0) if summary rollup data is present.

**Field Name:** QPACCONT

**SECTION NMB**

The number of this particular data section in the series.

**Field Name:** QPACRECN

**TYPE**

The program type. It can be DBRM (field name QPACDBRM) or package (field name QPACPACK).

**Field Name:** QPACFLGS

**SCHEMA NAME**

Schema name of the nested activity.

If the package is defined for a trigger, stored procedure, or user-defined function, then this field contains the name of the schema to which the nested activity belongs. It can have the following value in:

- Accounting Trace and Report: N/P
- The Accounting FILE and SAVE PROGRAM tables: blank
**ICID 239 - Package/DBRM Accounting Data**

This field is invalid if summary rollup data is present.

**Field Name: QPACASCH**

**SQL STMTS**
The number of SQL statements issued in this package or DBRM.
This number may not be equal to the total number of SQL statements in the QXST data section because QXST does not count all SQL statements. For example, it does not count commit or rollback statements.

**Note:** This field is shown for the following field labels in Accounting trace:
- SQL STMT - TOTAL
- SQL STMT - AVERAGE:

**Field Name: QPACSQLC**
This is an *exception* field.

**USED BY STOR.PROC**
Indicates whether this package was loaded by a stored procedure.
This field is invalid if unique or summary rollup data is present.

**Field Name: QPACINSP**

**NON-ZERO CLASS 8**
Indicates if Class 8 data is in this record.

**Field Name: QPACCLS8**

**ACTIVITY NAME**
The name of the nested activity.
This field contains the name of the nested activity if the package is defined for a:
- Trigger
- Stored procedure
- User-defined function (UDF)
- Native SQL procedure
- Non-inline UDF
In a data block that reports totals it is set to ALL NAMES.
This field is invalid if summary rollup data is present.
It can have the following value in:
- Accounting Trace and Report: N/P
- The Accounting FILE and SAVE PROGRAM tables: blank

**Field Name: QPACAANM**

**SUCC AUTH CHECK**
Indicates whether a successful package EXECUTE authorization check was made and DB2 catalog access was avoided.
This field is invalid if unique or summary rollup data is present.

**Field Name: QPACPAC**

**LAST EXECUTED**
This package or DBRM is either currently executing or is the most recently executed package or DBRM. This field is invalid if unique or summary rollup data is present.

**Field Name:** QPACCRNT

**NON-ZERO CLASS 7**

There is nonzero accounting class 7 data in this QPAC data instance.

**Field Name:** QPACCLS7

**ACTIVITY TYPE**

The type of activity. The following values indicate how the package was loaded:

**ALL TYPES**

In a data block that reports totals it is set to ALL TYPES.

**STORED PROC**

When running an external procedure

**TRIGGER**

When running a trigger

**UDF**

When running a user-defined function

**NATIVE SQL PROC**

When running a native SQL procedure

**NATIVE UDF**

When running a native UDF procedure (a non-inline user-defined function)

**NONNESTED**

Indicates that none of the above values is true

**MULTIPLE**

Indicates that packages with the same key but with different activity types were running

**N/P**

Invalidated in case of rollup summary

The nested activity values that are shown in column NEST_ACTIVITY_TYPE of the table DB2PMFACCT_PROGRAM are:

<table>
<thead>
<tr>
<th>Character</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>S</td>
<td>For Stored Procedure</td>
</tr>
<tr>
<td>T</td>
<td>For Trigger</td>
</tr>
<tr>
<td>U</td>
<td>For UDF</td>
</tr>
<tr>
<td>Q</td>
<td>For native SQL procedure</td>
</tr>
<tr>
<td>D</td>
<td>For Native UDF</td>
</tr>
<tr>
<td>N</td>
<td>For nonnested (other)</td>
</tr>
<tr>
<td>blank</td>
<td>For invalidated in case of rollup summary</td>
</tr>
</tbody>
</table>

This field is invalid if unique or summary rollup data is present.

**Field Name:** QPACAASFG

**PACKAGE SWITCH**

The number of times package was invoked from a different package. For the first package run by an application, the initial call counts as a package
switch. If this package called a nested package (such as a trigger, UDF, or stored procedure), a switch will not be counted upon return from such a package.

**Field Name:** QPACSWITCH

**ROLLED NBR THREADS**

This value can be one of the following:

- In general, the number of threads to roll data into this QPAC data section. Non-rollup QPACs have a value of 1 and rollup QPACs have a value of 1 or more. This number is used as a divisor for calculating averages for package class 7, 8, or 10 times and events.
- If REPORT ORDER (ACTNAME) is specified, the number of threads to roll data into this QPAC data section of a special activity type depends on the following:
  - If IFCID 233 or 380 is available, the number of threads to roll data into this QPAC data section for stored procedures (SP) is counted based on the available IFCID. If both IFCIDs are available, IFCID 380 is the preferred one for SP reporting. Subprograms called by these SPs are not taken into account.
  - If IFCID 233 or 381 is available, the number of threads to roll data into this QPAC data section for user-defined functions (UDF) is counted based on the available IFCID. If both IFCIDs are available, IFCID 381 is the preferred one for UDF reporting. Subprograms called by these UDFs are not taken into account.
  - If neither IFCID 233, 380, nor 381, is collected, the total number of threads to roll data into this QPAC data section is counted. The sum also includes the number of subprograms.

**Field Name:** QPACRLNU

**CLASS 7: BEGINNING STORE CLOCK TIME**

The store clock time at entry to DB2 for the most recent execution of this package or DBRM.

This field is invalid if unique or summary rollup data is present.

**Field Name:** QPACSCB

**CLASS 7: ENDING STORE CLOCK TIME**

The store clock time at exit from DB2 after the most recent execution of this package or DBRM.

This field is invalid if unique or summary rollup data is present.

**Field Name:** QPACSCE

**CLASS 7: BEGINNING TCB CPU TIME**

The CPU time at entry to DB2 for the most recent execution of this package or DBRM. This time does not include the CPU time consumed on an IBM specialty engine.

This field is invalid if unique or summary rollup data is present.

**Field Name:** QPACBJST

**CLASS 7: ENDING TCB CPU TIME**
The CPU time at exit from DB2 for the most recent execution of this package or DBRM. This time does not include CPU consumed on an IBM specialty engine.

This field is invalid if unique or summary rollup data is present.

Field Name: QPACEJST

CLASS 7: TOTAL ELAPSED TIME
The total elapsed time for executing the package or DBRM.

Field Name: QPACSCCT

CLASS 7: DB2 ENTRY/EXIT
The number of DB2 entries or exits processed during the execution of the package or DBRM.

In Accounting reports this is shown twice; as a total and as an average.

Field Name: QPACARNA

CLASS 7: TOTAL TCB TIME
The class 7 CPU time for all executions of the package or DBRM. This time does not include the:
- Class 7 time for parallel tasks
- CPU time that is consumed on an IBM specialty engine

Field Name: QPACTJST

This is an exception field.

CLASS 7: SE CPU TIME
The total CPU time for all executions of this package or DBRM that was consumed on an IBM specialty engine (SE).

Note: All CPU times of an IBM specialty engine that are reported in DB2 trace records are already normalized by DB2 to the speed of the general purpose processor.

Field Name: QPACCLS7_ZIIP

CLASS 8: LOCK/LATCH SUSP TIME
The accumulated lock elapsed wait time that occurred while executing this package.

Background and Tuning Information
OMEGAMON XE for DB2 PE might adjust this value if the thread was suspended when performance data was gathered.

If the suspension time is high, investigate locking activity.

Field Name: QPACAWTL

This is an exception field.

CLASS 8: LOCK/LATCH SUSP EVENTS
The number of wait trace events processed for waits for lock while executing this package.

Field Name: QPACARNL

CLASS 8: WAIT TIME LOCAL LOCKS
The accumulated latch elapsed wait time for latch suspensions that occurred while executing this package.

Field Name: QPACAWLH

CLASS 8: LOCAL LOCK WAIT TRACE EVENTS

The number of wait trace events processed for page latch contention while executing this package.

Field Name: QPACANLH

CLASS 8: DB2 LATCH SUSP TIME

The accumulated lock elapsed wait time that occurred while executing this package.

Background and Tuning Information

OMEGAMON XE for DB2 PE might adjust this value if the thread was suspended when performance data was gathered.

If the suspension time is high, investigate locking activity.

Field Name: QPACAWTL

This is an exception field.

CLASS 8: LATCH WAIT TRACE EVENTS

The number of wait trace events processed for waits for lock while executing this package.

Field Name: QPACARNL

CLASS 8: SYNCHRONOUS I/O SUSP TIME

The accumulated elapsed wait time for I/O suspensions under this thread during the execution of the package or DBRM.

Background and Tuning Information

OMEGAMON XE for DB2 PE might adjust this value if the thread was suspended when its performance data was gathered.

Field Name: QPACAWTI

This is an exception field.

CLASS 8: SYNCHRONOUS I/O SUSP EVENTS

The number of wait trace events processed for I/O.

Field Name: QPACARNE

CLASS 8: OTHER READ SUSP TIME

The accumulated waiting time for a read I/O performed under a thread other than this one during the execution of the package or DBRM.

Background and Tuning Information

OMEGAMON XE for DB2 PE might adjust this value if the thread was suspended when performance data was gathered.

This field includes waits caused by sequential prefetch, list prefetch, dynamic prefetch, and synchronous read I/O performed by other threads.

If the value in this field is high, the problem could be an I/O bound query using prefetch or an I/O contention. The application is accessing data from
a busy data set, volume, or control unit and is continually being suspended. Consult the DBA and MVS systems programmer.

Field Name: QPACAWTR
This is an exception field.

CLASS 8: OTHER READ SUSP EVENTS
The number of suspensions due to read I/O.

Field Name: QPACARNR

CLASS 8: OTHER WRITE SUSP TIME
The accumulated waiting time due to a write I/O performed for another thread during the execution of a package or DBRM.

Background and Tuning Information
If the value in this field is high, the problem could be I/O contention. The application is accessing data from a busy data set, volume, or control unit and is continually being suspended. Consult the DBA and MVS systems programmer to resolve possible data set placement problems.

Field Name: QPACAWTW
This is an exception field.

CLASS 8: OTHER WRITE SUSP EVENTS
The number of suspensions due to write I/O.

Field Name: QPACARNW

CLASS 8: SERV.TASK SWITCH SUSP TIME
The accumulated waiting time due to a synchronous execution unit switch to DB2 services from this thread during the execution of the package or DBRM.

Background and Tuning Information
OMEGAMON XE for DB2 PE might adjust this value if the thread was suspended when its performance data was gathered.

This value includes the waits because of an OPEN/CLOSE data set, SYSLOGNG update, DATASPACE MANAGER services, DEFINE, EXTEND, and DELETE data set, AUTONOMOUS PROCEDURE, and DDF Requester waiting for Server reply and VSAM Catalog update.

Field Name: QPACAWTE
This is an exception field.

CLASS 8: SERV.TASK SWITCH SUSP EVENTS
The number of wait trace events processed for DB2 service tasks.

Field Name: QPACARNS

CLASS 8: ARCH.LOG(QUIES) SUSP TIME
The accumulated waiting time caused by processing ARCHIVE LOG(QUIESCE) commands during the execution of the package or DBRM. This number represents the amount of time that an individual thread was suspended because of the command, not the time it took for the entire command to complete.
Background and Tuning Information

OMEGAMON XE for DB2 PE might adjust this value if the thread was suspended when its performance data was gathered.

Avoid issuing the -ARCHIVE LOG QUIESCE command during peak periods.

Field Name: QPACALOG

CLASS 8: ARCH.LOG(QUIES) SUSP EVENTS
The number of ARCHIVE LOG MODE (QUIESCE) commands issued.
Field Name: QPACALCT

CLASS 8: DRAIN LOCK SUSP TIME
The accumulated waiting time due to a drain lock.
Field Name: QPACAWDR

CLASS 8: DRAIN LOCK SUSP EVENTS
The number of wait trace events processed for waits for drain locks.
Field Name: QPACARND

CLASS 8: CLAIM RELEASE SUSP TIME
The accumulated waiting time for a drain waiting for claims to be released during the execution of the package or DBRM.

Background and Tuning Information

OMEGAMON XE for DB2 PE might adjust this value if the thread was suspended when its performance data was gathered.

Field Name: QPACAWCL

CLASS 8: CLAIM RELEASE SUSP EVENTS
The number of wait trace events processed for waits for claims to be released.
Field Name: QPACARNC

CLASS 8: PAGE LATCH SUSP TIME
The accumulated waiting time caused by a page latch contention.
Field Name: QPACAWTP

CLASS 8: PAGE LATCH SUSP EVENTS
The number of page latch wait trace events processed.
Field Name: QPACARNH

CLASS 8: NOTIFY MESSAGES SUSP TIME
The accumulated elapsed waiting time due to suspensions caused by sending notify messages to other members in the data sharing group. Messages are sent, for example, when database descriptors are changed due to DDL.

This value is only calculated if accounting class 8 is active and DB2 is a member of a DB2 data sharing group.

Field Name: QPACAWTG
CLASS 8: NOTIFY MESSAGES EVENTS
The number of wait trace events processed for sending notify messages to other members in the data sharing group.
Field Name: QPACARNG

CLASS 8: GLOBAL CONTENT. PARENT SUSP TIME
The accumulated wait time due to global contention for parent L-Locks.
Parent L-Locks are any of the following L-Lock types: database, tablespace, table, or partition.
Field Name: QPACAWTJ

CLASS 8: GLOBAL CONTENT. PARENT EVENTS
The number of wait trace entry/exit events processed for waits for global lock contention for parent L-Locks.
Field Name: QPACARNJ

CLASS 8: UDF EXECUTED
The number of user-defined functions scheduled.
Field Name: QPACUDNU

CLASS 8: STORED PROCEDURE EXECUTED
The number of stored procedures scheduled.
Field Name: QPACSPNS

CLASS 8: TCP/IP LOB XML TIME
The number of wait trace events that were processed for waits for TCP/IP LOB and XML materialization while this package or DBRM was running.
Field Name: QPACALBC

CLASS 8: TCP/IP LOB XML EVENTS
The accumulated wait time for TCP/IP LOB and XML materialization while running this package or DBRM.
Field Name: QPACALBW

ACCELERATOR SUSP TIME
The accumulated wait time for requests to an accelerator while executing this package.
Field Name: QPACAAACW

ACCELERATOR EVENTS
The number of wait trace events processed for requests to an accelerator while executing this package.
Field Name: QPACAACC

PARALLEL QUERY SYNC WAIT TIME
The accumulated time waiting for parallel query processing to synchronize between parent and child tasks.
Field Name: QPAC_PQS_WAIT

PARALLEL QUERY SYNC WAIT EVENTS
IFCID 239 - Package/DBRM Accounting Data

The number of times the parallel query processing suspended because it was waiting for the synchronization of the parent/child.

Field Name: QPAC_PQS_COUNT

FAST INSERT PIPE WAIT TIME

The accumulated wait time for a pipe while this package was executed (DB2 field QPAC_PIPE_WAIT).

Field Name: QPAC_PIPE_WAIT

FAST INSERT PIPE WAIT EVENTS

The number of wait trace events that were processed for waits for a pipe while this package was executed (DB2 field QPAC_PIPEWAIT_COUNT).

Field Name: QPAC_PIPEWAIT_COUNT

IFCID 239 - RDS Package Accounting:

This topic shows detailed information about “Record Trace - IFCID 239 - RDS Package Accounting”.

Record trace - IFCID 239 - RDS Package Accounting

The field labels shown in the following sample layout of “Record Trace - IFCID 239 - RDS Package Accounting” are described in the following section.

<table>
<thead>
<tr>
<th>RDS PACKAGE ACCOUNTING</th>
<th>SELECTS</th>
<th>INSERTS</th>

</tbody>
</table>

SELECTS

The number of SQL SELECT statements executed.

Field Name: QPSELECT

This is an exception field.

INSERTS

The number of INSERT statements executed.

Field Name: QPINSRT

This is an exception field.

UPDATES

The number of UPDATE statements executed.

Field Name: QPUPDTE

This is an exception field.

DELETES

The number of DELETE statements executed.

Field Name: QPDELET

This is an exception field.

DESCRIBES

The number of data capture describes.

Field Name: QPDESC
IFCID 239 - RDS Package Accounting

PREPARES
The number of full prepare requests.
Field Name: QPPREP

OPENS
The number of full open requests.
Field Name: QPOPEN

CLOSES
The number of close requests.
Field Name: QPCLOSE

FETCHS
The number of fetch requests.
Field Name: QPFETCH

LOCK TABLES
The number of lock tables.
Field Name: QPLOCK

SQL CALLS
The number of SQL calls.
Field Name: QPCALL

IFCID 239 - Resource Limit Facility:
This topic shows detailed information about “Record Trace - IFCID 239 - Resource Limit Facility”.

Record trace - IFCID 239 - Resource Limit Facility
The field labels shown in the following sample layout of “Record Trace - IFCID 239 - Resource Limit Facility” are described in the following section.

RES LIMIT SCOPE
Indicates how the resource limit was established. A value of 0 shows that the resource limit facility was not started.
Field Name: QTXAPREC

RLF TABLE ID
The identifier of the resource limit specification table.
Field Name: QTXARLID

LIMIT IN CPU 16 MICROSEC
The CPU time limit, in microseconds, set by the resource limit facility.
Field Name: QTXACLMT

RES LIMIT TYPE
Indicates how the type of resource limit was established: infinite, zero, or limit.

**Note:** Label QTXAFLG1 presents the first flag byte in hexadecimal:
- X'80' Infinite limit
- X'40' No run or zero limit

**Field Name:** QTXAFLG1

**LIMIT IN SERVICE UNITS**

The maximum number of CPU service units to be used. Normally, the value is not 0 if the RES LIMIT TYPE is LIMIT. A value of 0 indicates no limit.

**Field Name:** QTXASLMT

**HIGHEST CPU 16 MICROSEC USED**

The highest CPU time used by a single DB2 call, in microseconds. Note that there can be many DB2 calls for one SQL statement.

**Field Name:** QTXACHUS

**QTXAFLG1 (S)**

Indicates how the type of resource limit was established: infinite, zero, or limit.

**Note:** Label QTXAFLG1 presents the first flag byte in hexadecimal:
- X'80' Infinite limit
- X'40' No run or zero limit

**Field Name:** QTXAFLG1

**IFCID 247 - SQLDA Data and Input Host Variable Data:**

This topic shows detailed information about “Record Trace - IFCID 247 - SQLDA Data and Input Host Variable Data”.

IFCID 247 records SQLDA data and INPUT HOST VARIABLE data are related to a user application program. Each host variable is traced individually as it is moved from the user application area to the DB2 address space.

For dynamic SQL statements of length 5000 or less, you can use these records in combination with records from IFCID 064 and IFCID 063 to determine which statements are associated with which host variables. To do this, you need to match the statement number in this record to the statement number in an IFCID 064 record. An IFCID 063 Record that follows the IFCID 064 record that has the same CORRELATION ID and ACE values contains the SQL statement associated with the host variables.

**Record trace - IFCID 247 - SQLDA Data and Input Host Variable Data**

The field labels shown in the following sample layout of “Record Trace - IFCID 247 - SQLDA Data and Input Host Variable Data” are described in the following section.
LOCATION NAME
Location name.
Field Name: QW0247LN

COLLECTION ID
Package collection identifier.
Field Name: QW0247PC

PROGRAM NAME
Program name.
Field Name: QW0247PN

STATEMENT NUMBER
Statement number.
Field Name: QW0247SN

CONSISTENCY TOKEN
The consistency token.
Field Name: QW0247TS

LENGTH EACH SQLDA ENTRY
Length of each SQLDA entry.
Field Name: QW0247LE

NUMBER ENTRIES IN SQLDA
Number of entries in the SQL data area.
Field Name: QW0247NE

FORMAT SQLDA
The format of the SQLDA. Possible values are:

0 - COMPRESSED
Is a compressed form of the SQLDA.

1 - COMPLETE
Is a complete SQLDA containing the data type, address, and address of the indicator variable for each host variable.

2 - FIXED LENGTH
Is a variable length character format containing the length of the string and text.

? - UNKNOWN
Is shown, if none of the above field names is used.
Field Name: QW0247FE

SQLDA NAME
SQLDA name, if Format 1 SQLDA. The first two bytes are the length of the NAME and are not shown.

Field Name: QW0247NA

SQLDA ENTRY NUMBER
SQLDA entry number.

Field Name: QW0247NO

DATA TYPE
Is derived as described in DB2 SQL Reference, based on the SQLTYPE:

- 384, 385
  - DATE
- 388, 389
  - TIME
- 392, 393
  - TIMESTAMP
- 448, 449
  - VARYING LENGTH CHARACTER STRING
- 452, 453
  - FIXED-LENGTH CHARACTER STRING
- 456, 457
  - LONG VARYING CHARACTER STRING
- 480, 481
  - FLOATING POINT
- 484, 485
  - PACKED DECIMAL
- 496, 497
  - LARGE INTEGER
- 500, 501
  - SMALL INTEGER

Note:
• Any other SQLTYPES are shown as: NON DISPLAYABLE DATA
• Values are shown in DB2 internal format.

Field Name: QW0247TY

LENGTH
Length of data for this entry. If the field type is decimal (484 or 485), the length is not applicable.

Field Name: QW0247LD

ADDRESS TO DATA
The address of the host variable in the application address space.

Field Name: QW0247PT
**IFCID 247 - SQLDA Data and Input Host Variable Data**

**PRECISION (IF DEC)**
If the field type is decimal (484 or 485), this is the precision.

**Field Name:** QW0247LP

**SCALE (ID DEC)**
If the field is decimal (484 or 485), this is the scale.

**Field Name:** QW0247LS

**ADDRESS TO NULL INDICATOR**
The address of the indicator variable, if the value in QW0247TY is odd (NULLABLE).

**Field Name:** QW0247IN

**NULL INDICATOR**
Null indicator values:
- YES, if X'00'
- NO, if X'FF'

**Field Name:** QW0247NL

**LENGTH OF DATA AREA**

**Field Name:** QW0247LL

**SQLDA DATA**

**Field Name:** QW0247DA

**IFCID 248 - IBM Service Record:**
This topic shows detailed information about “Record Trace - IFCID 248 - IBM Service Record”.

This record is for IBM service use.

**IFCID 249 - EDM Pool Invalidate DBD:**
This topic shows detailed information about “Record Trace - IFCID 249 - EDM Pool Invalidate DBD”.

This record traces DBD invalidations. A DBD is invalidated in the data sharing environment when one DB2 subsystem changes a DBD that needed, it is read, resulting in multiple copies of the DBD in the EDM pool.

**Record trace - IFCID 249 - EDM Pool Invalidate DBD**
The field labels shown in the following sample layout of “Record Trace - IFCID 249 - EDM Pool Invalidate DBD” are described in the following section.

**DBID** : USIBMSYSTDB2
**DATABASE NAME** : DSNDB01
**DB2 MEMBER NAME** : AAAAAAAA

**DBID**
The database ID. Deduced from the DB2 fields QW0249ID, and QW0105DN or QW0107DN.
IFCID 249 - EDM Pool Invalidate DBD

When present, the database name is shown, otherwise the decimal identifier from QW0249ID is shown or N/A when this value is 0.

Field Name: RT0249DB

DATABASE NAME

The database name.

Field Name: QW0249NM

DB2 MEMBER NAME

The name of the DB2 member causing the invalidation.

Field Name: QW0249MC

IFCID 250 - Connect/Rebuild Connect/Disconnect Group Bpool:

This topic shows detailed information about “Record Trace - IFCID 250 - Connect/Rebuild Connect/Disconnect Group Bpool”.

This record is written for a group buffer pool (coupling facility cache structure) connect, rebuild, or disconnect event.

The DESCRIPTION column indicates what event occurred. The format of this record and data shown depends on the event being reported.

Record trace - IFCID 250 - Connect/Rebuild Connect/Disconnect Group Bpool

The field labels shown in the following sample layout of “Record Trace - IFCID 250 - Connect/Rebuild Connect/Disconnect Group Bpool” are described in the following section.

<table>

STRUCTURE NAME

The name of the coupling facility structure.

Field Name: QW0250SN
GROUP BP NAME
The group buffer pool name.
Field Name: QW0250GN

RETURN CODE
The return code.
The reason code.
Field Name: QW0250RC

STRUCTURE SIZE
The structure size, that is, the number of 4 KB blocks. The actual size might be less than the requested size due to insufficient space in the preference list facilities.
Field Name: QW0250SZ

DIRECTORY ENTRIES
The number of allocated directory entries.
Field Name: QW0250DR

ALLOCATION
Indicates whether this connect caused a structure allocation.
Field Name: QW0250CA

MAX NUMBER CASTOUT
The maximum number of castout classes.
Field Name: QW0250CO

DATA ELEMENTS
The number of data elements allocated. For DB2 group buffer pools, the size of the data elements is 4 KB. Each data entry consists of one or more data elements.
Field Name: QW0250DT

MAX STRUCTURE SIZE
The maximum structure size saved at the time the structure was allocated. The maximum structure size is obtained from the active policy at the time the structure is allocated.
Field Name: QW0250SM

CONNECT TYPE
The type of connection.
Field Name: QW0250CD

EXCLUSION LIST HONORED
Indicates whether the exclusion list was honored.
This field is only applicable if the value in ALLOCATION is YES. Otherwise, N/A is printed in this field.
Field Name: QW0250F2

SAF RETURN CODE
IFCID 250 - Connect/Rebuild Connect/Disconnect Group Bpool

The system authorization facility (SAF) return code.

Field Name: QW0250X1

SAF REASON CODE
The SAF reason code.
Field Name: QW0250X2

COUPLING FACILITY NAME
The coupling facility name.
Field Name: QW0250ZN

COUPLING FACILITY REASON
The reason why the coupling facility was not suitable.
Field Name: QW0250ZR

MIN CONTROL SPACE
The minimum control space required (in 4 KB blocks) to allocate the structure for which connect was requested.
Field Name: QW0250ZM

TOTAL SPACE
The total space in the coupling facility in 4 KB blocks, including control and noncontrol space.
Field Name: QW0250ZG

TOTAL CONTROL SPACE
The total control space in the coupling facility in 4 KB blocks.
Field Name: QW0250ZH

TOTAL FREE SPACE
The total free space in 4 KB blocks, including control and noncontrol space.
Field Name: QW0250ZI

FREE CONTROL SPACE
The free control space in 4 KB blocks.
Field Name: QW0250ZJ

STORAGE SIZE
The storage increment size in 4 KB blocks.
Field Name: QW0250ZK

MAXIMUM ELEMENT
The maximum element characteristic. DB2 always requests a 4 KB element size. Therefore, this field should always equal 4.
Field Name: QW0250ZL

MAXIMUM CASTOUT
The maximum number of castout classes for a structure using this coupling facility.
Field Name: QW0250ZO
DISCONNECT TYPE

The type of disconnect.

Field Name: QW0250DD

IFCID 251 - Buffer Manager PSET/Part P-Lock Request:

This topic shows detailed information about “Record Trace - IFCID 251 - Buffer Manager PSET/Part P-Lock Request”.

Record trace - IFCID 251 - Buffer Manager PSET/Part P-Lock Request

The field labels shown in the following sample layout of “Record Trace - IFCID 251 - Buffer Manager PSET/Part P-Lock Request” are described in the following section.

Field Name: QW0251KT

DBID

The database ID. Deduced from the DB2 fields QW0251KD, and QW0105DN or QW0107DN.

When present, the database name is shown, otherwise the decimal identifier from QW0251KD is shown or N/A when this value is 0.

Field Name: RT0251DB

OBID

The object ID. Deduced from the DB2 fields QW0251KP, QW0105TN or QW0107TN.

When present, the name of the object is shown, otherwise the decimal identifier from QW0251KP is shown or N/A if this value is 0.

Field Name: RT0251OB

PARTITION NMBR.

The partition number. If this is a non-partitioned page set, 0 is printed in this field.

Field Name: QW0251KR

BP ID

The internal buffer pool ID (0-49 and 80-89).

Field Name: QW0251KU

IRLM FUNC CODE

The IRLM function code.

Field Name: QW0251IF
OBJECT TYPE

The object type.

Field Name: QW0251OB

REQUESTED STATE

The requested lock state if the value in IRLM FUNC CODE is LOCK or CHANGE. If the value is CHANGE FROM P-LOCK EXIT, then this is the P-lock state requested by the other member causing the P-lock exit of this member. In this case, this field is 0 if the request from the other member was not in conflict with the state of this member.

Field Name: QW0251ST

CONDITIONAL

Indicates whether the request was conditional.

Field Name: QW0251C1

RESTART

Indicates whether there was a restart lock request.

If the lock is currently retained on behalf of this DB2, a restart request causes the lock to be changed from retained to active. If the lock is not retained, the lock grant process is as normal.

Field Name: QW0251C6

MODIFY

Indicates whether this is a modify lock.

Field Name: QW0251C7

DATABASE NAME

The database name.

Field Name: QW0251DN

PAGESET NAME

The page set name.

Field Name: QW0251PN

DB2 MEMBER NAME

The DB2 member name that depends on the value in IRLM FUNC CODE:

- When CHANGE FROM P-LOCK EXIT this is the name of the database in conflict with the P-lock state currently held by this member.
- If it is not CHANGE FROM P-LOCK EXIT and the P-lock was rejected, this is the name of the database in conflict with this request

Field Name: QW0251DB

HELD STATE

Old and new P-lock held state. Old state taken from the DB2 field QW0251OS. New state taken from the DB2 field QW0251NS.

Field Name: RT251HS

CACHED STATE
Old and new P-lock cached state. Old state taken from the DB2 field QW0251OC. New state taken from the DB2 field QW0251NC.

**Field Name**: RT251CS

**IFCID 252 - IBM Service Record:**

This topic shows detailed information about “Record Trace - IFCID 252 - IBM Service Record”.

This record is for IBM service use.

**IFCID 254 - Coupling Facility Cache Structure Statistics:**

This topic shows detailed information about “Record Trace - IFCID 254 - Coupling Facility Cache Structure Statistics”.

**Record trace - IFCID 254 - Coupling Facility Cache Structure Statistics**

The field labels shown in the following sample layout of “Record Trace - IFCID 254 - Coupling Facility Cache Structure Statistics” are described in the following section.

<table>
<thead>
<tr>
<th>GROUP BUFFER POOL NAME</th>

<td>0</td>
</tr>
</tbody>
</table>

**GROUP BUFFER POOL NAME**

The name of the group buffer pool.

**Field Name**: QW0254GN

**EXPLICIT XI COUNTER**

The number of times a request was made to the group coupling facility to explicitly cross invalidate a page and a number of XI signals were sent because the page was cached in one or more DB2 buffer pools.

**Field Name**: QW0254CI

**READ HIT**

The number of coupling facility read requests in which data was returned.

**Field Name**: QW0254RH

**CHANGED PAGE WRITE HIT**

The number of coupling facility write requests for changed pages that has successfully completed.

**Field Name**: QW0254WH

**XI DIRECTORY ENTRY RECLAIM**

The number of times that a directory entry was stolen and XI signals had to be sent because the page for the directory entry was cached in one or more DB2 buffer pools.

**Field Name**: QW0254XR

**READ MISS DIRECTORY HIT**
IFCID 254 - Coupling Facility Cache Structure Statistics

The number of coupling facility read requests for a page in which data was not returned but the page name was already assigned in the coupling facility directory (SES did not have to assign a directory entry for the page).

Field Name: QW0254RD

CLEAN PAGE WRITE HIT
The number of facility write requests for clean pages successfully completed.

Field Name: QW0254WC

CASTOUT
The number of castout operations performed.

Field Name: QW0254CC

READ MISS ASSIGNMENT SUPPRESSED
The number of times that a coupling facility read request specified a page for which no directory entry exists and no directory entry is created. DB2 does not create a directory entry if it does not need to register the page to the coupling facility for cross invalidation (XI); that is when no other DB2 member in the group has R/W interest in the page set/partition.

Field Name: QW0254RS

WRITE MISS CACHE FULL
The number of coupling facility write requests that could not complete due to a lack of coupling facility storage resources.

Field Name: QW0254WF

DIRECTORY ENTRY
The number of allocated directory entries (not cumulative).

Field Name: QW0254DE

READ MISS NAME ASSIGNED
The number of times that a coupling facility read request specified a page for which a directory entry was created.

Field Name: QW0254RN

DIRECTORY ENTRY RECLAIM
The number of times that a page name assignment required a coupling facility directory entry to be reclaimed (stolen).

Field Name: QW0254DR

DATA ENTRY
The number of allocated data entries (not cumulative).

Field Name: QW0254TE

READ MISS CACHE FULL
The number of times that a coupling facility read request specified a page for which no directory entry exists and no directory entry is created due to the lack of storage in the group buffer pool. A non-zero value in this field
indicates that the backing coupling facility cache structure size might be too small to support the current workload.

Field Name: QW0254RF

**DATA ENTRY RECLAIM**

The number of times that a page name assignment required a coupling facility data entry to be reclaimed (stolen).

Field Name: QW0254TR

**TOTAL CHANGED**

The snapshot value of the current number of changed pages.

Field Name: QW0254TC

**SEC-GBP CHANGED PAGE WRITE HIT**

The number of successful coupling facility write requests for changed pages.

Field Name: QW02542W

**SEC-GBP WRITE MISS CACHE FULL**

The number of unsuccessful coupling facility write requests because of insufficient coupling facility storage resources.

Field Name: QW02542F

**SEC-GBP DIRECTORY ENTRY**

The number of allocated directory entries. This is a snapshot value.

Field Name: QW02542D

**SEC-GBP DATA ENTRY**

The number of allocated data entries. This is a snapshot value.

The number of allocated data entries that are currently in *changed* state. This is a snapshot value.

Field Name: QW02542C

**IFCID 255 - Buffer Refresh Due to XI:**

This topic shows detailed information about “Record Trace - IFCID 255 - Buffer Refresh Due to XI”.

This record is written when a buffer refresh was caused by the cross invalidation (XI) of a data page in the group buffer pool. Cross invalidation occurs when a DB2 member of a data sharing group updates a data page and writes the newly changed page to the group buffer pool. All DB2 members that have this data page cached in their buffer pools are notified that the page was invalidated. If a member needs that data page, it must be refreshed.

**Record trace - IFCID 255 - Buffer Refresh Due to XI**

The field labels shown in the following sample layout of “Record Trace - IFCID 255 - Buffer Refresh Due to XI” are described in the following section.
### DBID
The database ID. Deduced from the DB2 fields QW0255DB, QW0105DN or QW0107DN.

When present, the database name is shown, otherwise the decimal identifier from QW0225DB is shown or N/A when this value is 0.

**Field Name:** RT0255DB

### PIECE NUMBER
The data set number of the page set.

**Field Name:** QW0255PN

### OBID
The object ID. Deduced from the DB2 fields QW0255OB, QW0105TN or QW0107TN.

When present, the name of the object is shown, otherwise the decimal identifier from QW0142OB is shown or N/A if this value is 0.

**Field Name:** RT0255OB

### PAGE NUMBER
The relative page number within the data set.

**Field Name:** QW0255PG

### BPID
The internal buffer pool ID.

**Field Name:** QW0255BP

### ACE TOKEN
Ace token of the requester. This address ties the coupling facility read requests for prefetch to the allied agent or database access thread.

**Field Name:** QW0255AC

### TYPE
Indicates whether the buffer refresh was synchronous or asynchronous.

**Field Name:** QW0255AS

### FROM
Indicates whether data was returned from the group buffer pool or DASD.

**Field Name:** QW0255DR

### IFCID 256 - Alter Group Buffer Pool:

This topic shows detailed information about “Record Trace - IFCID 256 - Alter Group Buffer Pool”.

This record shows the old and the new status of the altered group buffer pool.
Record trace - IFCID 256 - Alter Group Buffer Pool

The field labels shown in the following sample layout of “Record Trace - IFCID 256 - Alter Group Buffer Pool” are described in the following section.

<table>
<thead>
<tr>

</tbody>
</table>

GROUP BUFFER POOL ID

The DB2 group buffer pool ID.

Field Name: QW0256GB

DIRECTORY TO DATA RATIO

The directory entry to data entry ratio. This is the value specified in the RATIO keyword of the ALTER GROUPBUFFERPOOL command.

New status deduced from the DB2 field QW0256NR.

Old status deduced from the DB2 field QW0256OR.

Field Name: RT0256DR

CLASS CASTOUT THRESHOLD (%)

The threshold at which the class castout is to be initiated. It is expressed as a percentage of the group buffer pool size. This is the value specified in the CLASST keyword of the ALTER GROUPBUFFERPOOL command.

New status deduced from the DB2 field QW0256NC.

Old status deduced from the DB2 field QW0256OC.

Field Name: RT0256CT

CLASS CASTOUT THRESHOLD (PAGES) (OLD)

The old class castout threshold based on the number of pages.

Field Name: QW0256ON

CLASS CASTOUT THRESHOLD (PAGES) (NEW)

The new class castout threshold based on the number of pages.

Field Name: QW0256NN

GBP CASTOUT THRESHOLD (%)

The threshold at which the castout is to be initiated for the group buffer pool. This is the value specified in the GBPOOLT keyword of the ALTER GROUPBUFFERPOOL command.

New status deduced from the DB2 field QW0256NG.

Old status deduced from the DB2 field QW0256OG.

Field Name: RT0256GT

GBP CHECKPOINT INTERVAL (MIN)
The time interval (in minutes) between successive group buffer pool checkpoints. This is the value specified in the GBPCHKPT keyword of the ALTER GROUPBUFFERPOOL command.

New status deduced from the DB2 field QW0256NK.
Old status deduced from the DB2 field QW0256OK.

Field Name: RT0256CI

GBP CACHE SETTING

GBPCACHE value before and after the ALTER GROUPBUFFERPOOL command was issued. This field specifies whether DB2 should write changed pages for the group buffer pool dependant pageset or partitions directly to DASD and use the group buffer pool only for sending XI signals.

New status deduced from the DB2 field QW0256NB.
Old status deduced from the DB2 field QW0256OB.

Field Name: RT0256CS

AUTOREC

A flag indicating how the AUTOREC option of the ALTER GROUPBUFFERPOOL command has been set. It specifies whether DB2 should automatically recover if GBP fails. The old value specifies the AUTOREC value before the ALTER GBP command was issued. The new value specifies the AUTOREC value after the ALTER GBP command was issued.

New status deduced from the DB2 field QW0256NA.
Old status deduced from the DB2 field QW0256OA.

Field Name: RT0256AR

IFCID 257 - IRLM Notify Req Detail:

This topic shows detailed information about “Record Trace - IFCID 257 - IRLM Notify Req Detail”.

This record shows the inter-DB2 notify message sending detail. IRLM notify requests are used to communicate among members of a DB2 data sharing group.

Record trace - IFCID 257 - IRLM Notify Req Detail

The field labels shown in the following sample layout of “Record Trace - IFCID 257 - IRLM Notify Req Detail” are described in the following section.
Note: For data sharing, SKELETON CURSOR TABLE LOCKING and SKELETON PACKAGE TABLE LOCK are LP-locks (an LP-lock has an L-lock component and a P-lock component).

**Field Name:** QW0021KT

**DBID**

The database ID. This field is not applicable if the value in LOCK RES TYPE is:

- SKELETON CURSOR TABLE LOCKING
- UTILITY SERIALIZATION LOCK
- SKELETON PACKAGE TABLE LOCK
- COLLECTION
- BINDLOCK
- ALTER BUFFER POOL
- GROUP BUFFERPOOL START/STOP LOCK
- GROUP BUFFER POOL LEV CASTOUT P-LOCK
- CATMAINT MIGRATION LOCK
- CATMAINT CONVERT CATALOG LOCK
- CATMAINT CONVERT DIRECTORY LOCK

**Field Name:** QW0021KD

**OBID**

The object ID. This field is not applicable if the value in LOCK RES TYPE is:

- SKELETON CURSOR TABLE LOCKING
- UTILITY SERIALIZATION LOCK
- SKELETON PACKAGE TABLE LOCK
- COLLECTION
- BINDLOCK
- ALTER BUFFER POOL
- GROUP BUFFERPOOL START/STOP LOCK
- DDF CDB P-LOCK
- GROUP BUFFER POOL LEV CASTOUT P-LOCK
- DBD P-LOCK
- CATMAINT MIGRATION LOCK
- CATMAINT CONVERT CATALOG LOCK
- CATMAINT CONVERT DIRECTORY LOCK

**Field Name:** QW0021KP

**RESOURCE ID**

The hexadecimal identifier of the small resource. If LOCK RES TYPE is:

**DATA PAGE LOCKING**

First 3 bytes are the page number

**PARTITION LOCKING**

Last byte is the partition number

**INDEX PAGE LOCKING**

First 3 bytes are the page number

**HASH ANCHOR LOCK**

First 3 bytes are the page number and the last byte is the anchor point ID

**CS-READ DRAIN**

Last byte is the partition number (optional)

**RR-READ DRAIN**

Last byte is the partition number (optional)
WRITE DRAIN
Last byte is the partition number (optional)

ROW LOCK
First 3 bytes are the page number and the last byte is the row ID of the record

INDEX END OF FILE LOCK
Last byte is the partition number (optional)

PAGE SET/PARTITION P-LOCK
First byte is the 1-based partition number (optional)

PAGE P-LOCK
First byte is the 1-based partition number (optional) and the last 3 bytes are the relative page number

PAGE SET/PARTITION LEV CASTOUT P-LOCK
First byte is the 1-based partition number (optional)

Note:
• In large partitioned table spaces, the page number covers 4 bytes instead of 3.
• If table spaces use relative page numbers, the resource ID covers 7 bytes. It contains the partition number in the first 2 bytes, the page number in the next 4 bytes, and the record ID in the seventh byte.

For all other lock resource types, the resource ID is not applicable.

Field Name: QW0021KR

STATE
The lock state. This field is only applicable if the value in OPERATION is SEND. Otherwise, N/A is printed in this field.

Field Name: QW0257ST

NUMBER OF HOLDERS
The number of lock holders notified. This field is only applicable if the value in OPERATION is SEND. Otherwise, N/A is printed in this field.

Field Name: QW0257NU

OPERATION
The notify operation.

Field Name: QW0257OP

REQUEST
Indicates whether the request was synchronous or asynchronous. This field is only applicable if the value in OPERATION is SEND. Otherwise, N/A is printed in this field.

Field Name: QW0257FL

IFCID 258 - Data Set Extend Activity:

This topic shows detailed information about “Record Trace - IFCID 258 - Data Set Extend Activity”.

This record is written every time a data set is extended.
Record trace - IFCID 258 - Data Set Extend Activity

The field labels shown in the following sample layout of “Record Trace - IFCID 258 - Data Set Extend Activity” are described in the following section.

**DATA SET NAME**

Data set name.

Field Name: QW0258DS

**TIMESTAMP**

The timestamp when the Data Set Extend Activity is completed. It shows the date and time in DB2 timestamp format.

Field Name: QW0258TS

**DATABASE NAME**

Database name.

Field Name: QW0258DN

**DBID**

Database identifier.

Field Name: QW0258DB

**TABLESPACE NAME**

Table or index space name.

Field Name: QW0258TN

**PSID**

Page set identifier.

Field Name: QW0258PS

**PRIMARY QUANTITY**

Primary allocation quantity in 4 KB units.

Field Name: QW0258PQ

**SEC. QUANTITY**

Secondary allocation quantity in 4 KB units.

Field Name: QW0258SQ

**HIGH ALLOC BEFORE**

High allocated space before the extend in 4KB units.

Field Name: QW0258HB

**HIGH ALLOC AFTER**

High allocated space after the extend in 4 KB units.

Field Name: QW0258HA

**MAX DS SIZE**

Chapter 6. Batch reporting 4099
Maximum size for the data set in 4 KB units.

Field Name: QW0258MS

EXTENTS BEFORE

Number of extends before the reported extend.

Field Name: QW0258XB

EXTENTS AFTER

Number of extends after the reported extend.

Field Name: QW0258XA

MAX EXTENTS

The maximum number of extents for the VSAM data set.

Field Name: QW0258XM

VOLUMES BEFORE

Number of volumes before the extend.

Field Name: QW0258VB

VOLUMES AFTER

Number of volumes before the extend.

Field Name: QW0258VA

MAX VOLUMES

The maximum number of volumes in the VSAM data set.

Field Name: QW0258VM

IFCID 259 - Buffer Manager Pg P-Lock Req:

This topic shows detailed information about “Record Trace - IFCID 259 - Buffer Manager Pg P-Lock Req”.

Record trace - IFCID 259 - Buffer Manager Pg P-Lock Req

The field labels shown in the following sample layout of “Record Trace - IFCID 259 - Buffer Manager Pg P-Lock Req” are described in the following section.

P-LOCK TYPE: PAGE
DBID: TPCC1
DBID: TOOLW000
PARTITION NMBR: 0
BP ID: X'00'

IRLM FUNC CODE: LOCK
OBJECT TYPE: TABLESPACE
MODIFY: NO
PAGE NMBR: 23

DB2 MEMBER NAME: 'BLANK'
CONDITIONAL: YES
RESTART: NO
REQUESTED STATE: SHARED
NEW HELD STATE: NOT HELD
OLD HELD STATE: NOT HELD

QW0259EV X'03'
QW0259KT X'00000000'
QW0259RC X'00000000'
QW0259RS X'40000000'
QW0259PC X'0000'

P-LOCK TYPE

The P-lock type. This field can only have one value: PAGE.

Field Name: QW0259KT

DBID

The database ID. Deduced from the DB2 fields QW0259KD, QW0105DN or QW0107DN.

When present, the database name is shown, otherwise the decimal identifier from QW0259KD is shown or N/A if this value is 0.

Field Name: RT0259DB
OBID
The database ID. Deduced from the DB2 fields QW0259KP, QW0105TN or QW0107TN.

When present, the object identifier is shown, otherwise the decimal identifier from QW0259KP is shown or N/A if this value is 0.
Field Name: RT0259OB

PARTITION NMBR
The partition number. If this is a nonpartitioned page set, 0 is printed in this field.
Field Name: QW0259KR

BP ID
The internal buffer pool ID (0-49 and 80-89).
Field Name: QW0259KU

IRLM FUNC CODE
The IRLM function code.
Field Name: QW0259IF

OBJECT TYPE
The object type.
Field Name: QW0259OB

MODIFY
Indicates whether this is a modify lock.
Field Name: QW0259C7

PAGE NMBR
The relative page number.
Field Name: QW0259KQ

DB2 MEMBER NAME
The DB2 member name that depends on the value in IRLM FUNC CODE:
- When CHANGE FROM P-LOCK EXIT this is the name of the database in conflict with the P-lock state currently held by this member.
- If it is not CHANGE FROM P-LOCK EXIT and the P-lock was rejected, this is the name of the database in conflict with this request
Field Name: QW0259DB

CONDITIONAL
Indicates whether the request was conditional.
Field Name: QW0259C1

RESTART
Indicates whether there was a restart lock request.
If the lock is currently retained on behalf of this DB2, a restart request causes the lock to be changed from retained to active. If the lock is not retained, the lock grant process is as normal.
Field Name: QW0259C6

REQUESTED STATE

The requested lock state if the value in IRLM FUNC CODE is LOCK or CHANGE. If the value is CHANGE FROM P-LOCK EXIT, then this is the P-lock state requested by the other member causing the P-lock exit of this member.

Field Name: QW0259ST

OLD HELD STATE

The previously held P-LOCK state.

Field Name: QW0259PS

NEW HELD STATE

The newly held P-LOCK state.

Field Name: QW0259NS

IFCID 260 - IBM Service Record:

This topic shows detailed information about “Record Trace - IFCID 260 - IBM Service Record”.

This record is for IBM service use.

IFCID 261 - Group Buffer Pool Checkpoint:

This topic shows detailed information about “Record Trace - IFCID 261 - Group Buffer Pool Checkpoint”.

Record trace - IFCID 261 - Group Buffer Pool Checkpoint

The field labels shown in the following sample layout of “Record Trace - IFCID 261 - Group Buffer Pool Checkpoint” are described in the following section.

<table>
<thead>
<tr>
<th>BUFFERPOOL ID</th>
<th>CASTOUT P-LOCKS</th>
<th>INIT BY SPECIAL CASTOUT</th>
<th>INIT W/O SENDING MSG</th>
<th>NEW MINIMUM LRSN</th>
<th>OLD MINIMUM LRSN</th>
<th>READ DIRECTORY INFO</th>
<th>START TIME</th>
<th>ELAPSED TIME</th>
<th>LRSN</th>
</tr>
</thead>
<tbody>
<tr>

<td>1</td>
<td>12/13/08</td>
<td>12:06:06</td>
<td>X'ADE91B349E86'</td>
</tr>
</tbody>
</table>

BUFFERPOOL ID

The internal identifier of the buffer pool. The values 0 through 49 are the identifiers for BP0 through BP49. The values 80 through 89 are the identifiers for BP32K through BP32K9.

Field Name: QW0261BP

CASTOUT P-LOCKS

The number of page sets or partition castout P-locks obtained by the GBP checkpoint process.

Field Name: QW0261PD

NEW RECOVERY LRSN

The global recovery record sequence number (LRSN) for this GBP checkpoint.

Field Name: QW0261NL
START TIME

The date and time at which GBP checkpoint processing started. The RECORD TIME field shows when processing ended.

Field Name: QW0261TS

INIT BY SPECIAL CASTOUT

The number of page sets and partitions for which a castout had to be initiated by a special castout process because the castout owner did not exist for the page set or partition.

Field Name: QW0261PS

OLD RECOVERY LRSN

The global recovery log record sequence number (LRSN) of the GBP checkpoint prior to this one.

Field Name: QW0261OL

ELAPSED TIME

The duration of the GBP checkpoint process. Calculated by QW0261TS - QWHSSSTCK.

Field Name: RT0261ET

INIT W/O SENDING MSG

The number of page sets and partitions for which a castout was locally initiated without a message being sent.

Field Name: QW0261PL

NEW MINIMUM LRSN

The minimum restart/replay point for this GBP checkpoint.

Field Name: QW0261NM

READ DIRECTORY INFO

The number of coupling facility requests to read directory information.

Field Name: QW0261RD

INIT BY SENDING MSG

The number of page sets and partitions for which a castout was initiated by sending a message to the castout owner.

Field Name: QW0261PN

OLD MINIMUM LRSN

The minimum restart/replay point of the GBP checkpoint prior to this one.

Field Name: QW0261OM

DIRECTORY ENTRIES

The number of directory entries for changed pages processed.

Field Name: QW0261DP

IFCID 262 - GBPOOLT Castout Threshold Processing:

This topic shows detailed information about “Record Trace - IFCID 262 - GBPOOLT Castout Threshold Processing”.

Chapter 6. Batch reporting 4103
GBPOOLT castout threshold processing shows the data from IFCID 262. This IFCID contains statistics related to the GBPOOLT castout threshold processing for a GBP. It is only written if the GBPOOLT threshold has been reached.

This record is only written in a data sharing environment.

**Record trace - IFCID 262 - GBPOOLT Castout Threshold Processing**

The field labels shown in the following sample layout of “Record Trace - IFCID 262 - GBPOOLT Castout Threshold Processing” are described in the following section.

**BUFFERPOOL ID**

The internal identifier of the buffer pool. The values 0 through 49 are the identifiers for BP0 through BP49. The values 80 through 89 are the identifiers for BP32K through BP32K9.

Field Name: QW0262BP

**READ CASTOUT CLASS**

The number of coupling facility read castout class requests.

Field Name: QW0262RC

**CASTOUT P-LOCKS**

The number of page set or partitions castout P-locks obtained by the GBPOOLT process.

Field Name: QW0262PD

**START TIME**

The date and time at which the GBP castout started. The RECORD TIME field shows when processing ended.

Field Name: QW0262TS

**READ CASTOUT STATISTICS**

The number of coupling facility requests to cast out statistics.

Field Name: QW0262RS

**CHANGED PAGES CASTOUT**

The number of changed page names that were passed to the page set and partition castout owner for castout.

Field Name: QW0262CP

**ELAPSED TIME**

The duration of the GBP castout process. Calculated by QW0262TS - QWHSSTCK.

Field Name: RT0262ET

**INIT BY SENDING MSG**

The number of page sets and partitions for which castout was initiated by sending a notify message to the castout owner.
Field Name: QW0262PN

CHANGED PAGES IN GBP

The number of changed pages in group buffer pool.

Field Name: QW0262DP

FIRST CASTOUT CLASS

The first castout class processed.

Field Name: QW0262FC

INIT W/O SENDING MSG

The number of changed pages and partitions for which castout was locally initiated without a message being sent to the castout owner.

Field Name: QW0262PL

CHANGED PAGES GBPOOLT

The number of changed pages required to reach the GBPOOLT.

Field Name: QW0262GT

LAST CASTOUT CLASS

The last castout class processed. Sometimes the value in this field is smaller than the one in the FIRST CASTOUT CLASS field. This can happen if DB2 wraps around at the end of the castout class numbers.

Field Name: QW0262LC

IFCID 263 - Page Set and Partition Castout Detail:

This topic shows detailed information about “Record Trace - IFCID 263 - Page Set and Partition Castout Detail”.

This record shows page set and partition castout statistics. It is written by the page set or partition castout owner after the castout engine completed servicing the castout request.

This record is only written in a data sharing environment.

Record trace - IFCID 263 - Page Set and Partition Castout Detail

The field labels shown in the following sample layout of “Record Trace - IFCID 263 - Page Set and Partition Castout Detail” are described in the following section.

<table>
<thead>
<tr>

</tbody>
</table>

BUFFEROOL ID

The internal identifier of the buffer pool. The values 0 through 49 are the identifiers for BP0 through BP49. The values 80 through 89 are the identifiers for BP32K through BP32K9.

Field Name: QW0263BP

CASTOUT REASON

Chapter 6. Batch reporting 4105
The reason why the castout was invoked.
- CLASS THRESHOLD
- GROUP BUFFER POOLT THRESHOLD
- GROUP BUFFER POOL CHECKPOINT
- GROUP BUFFER REBUILD
- SYNCHRONOUS CASTOUT
- CONVERTED TO NON-GBP-DEPENDENT OR ASYNCH. CASTOUT

Field Name: QW0263RS

DATABASE ID
The ID of the database.
Field Name: QW0263DB

PAGE SET OBJECT ID
The ID of the page set object.
Field Name: QW0263PS

START TIME
The date and time at which castout processing started.
Field Name: QW0263TS

PARTITION NUMBER
The partition number. It is 0 if this is a non-partitioned page set.
Field Name: QW0263PT

PRIVATE BUFFER
The number of private buffer allocated to this engine (in 4K increments).
Field Name: QW0263PB

ELAPSED TIME
The duration of the castout process. The RECORD TIME field shows when this process ended. Calculated by QW0263TS - QWHSTCK.
Field Name: RT0263ET

CASTOUT DATA REQUESTS
The number of coupling facility requests to cast out data.
Field Name: QW0263CD

UNLOCK FOR CASTOUT
The number of coupling facility requests to unlock for a castout.
Field Name: QW0263UN

READ CASTOUT CLASS
The number of coupling facility requests to read a castout class.
Field Name: QW0263RC

DELETE NAME REQUESTS
The number of coupling facility requests to delete a name.
Field Name: QW0263DN
WRITE I/O REQUESTS

The number of write I/O requests.

Field Name: QW0263IO

GBP DEL NAME LIST

The number of IXLCACHE delete_name_list requests to the secondary group buffer pool when the GBP MODE is DUPLEX.

Field Name: QW02632D

TIME DEL-NAME GBP

Duration of DELETE_NAME to primary GBP.

Field Name: QW0263TD

DEL-NAME GBP

The number of times a DELETE_NAME request was reissued to the primary GBP.

Field Name: QW0263RD

TIME DEL-NAME SEC-GBP

Duration of DELETE_NAME to the secondary GBP.

Field Name: QW02632T

DEL-NAME SEC-GBP

The number of times a DELETE_NAME request was reissued to the secondary GBP for duplexing.

Field Name: QW02632R

IFCID 265 - IBM Service Record:

This topic shows detailed information about “Record Trace - IFCID 265 - IBM Service Record”.

This record is for IBM service use.

IFCID 266 - IBM Service Record:

This topic shows detailed information about “Record Trace - IFCID 266 - IBM Service Record”.

This record is for IBM service use.

IFCID 267 - CF Rebuild/Alter/Start:

This topic shows detailed information about “Record Trace - IFCID 267 - CF Rebuild/Alter/Start”.

This record shows the start of a coupling facility (CF) rebuild or alter, which is indicated by the OPERATION field. A rebuild or alter is reported in the same format.
Record trace - IFCID 267 - CF Rebuild/Alter/Start

The field labels shown in the following sample layout of “Record Trace - IFCID 267 - CF Rebuild/Alter/Start” are described in the following section.

OPERATION

The operation for the DB2 data sharing coupling facility structures:

F  The rebuild due to the coupling facility structure failure or loss of connectivity to the coupling facility.

O  The MVS rebuild initiated by the MVS operator command SETXCF START, REBUILD

M  The rebuild caused by the maximum number of lock structure users being reached.

A  The dynamic expansion or contraction initiated by the MVS operator command SETXCF START, ALTER

D  Rebuild started to establish DUPLEX

P  Duplexing being stopped, falling back to primary.

W  Duplexing being stopped, switching to secondary.

S  Dynamic expand/contract initiated by MVS SETXCF START,ALTER operator command against a secondary group buffer pool.

Field Name: QW0267RS

STRUCTURE NAME

The name of the CF structure.

Field Name: QW0267NM

REQUESTED SIZE

The requested size of the CF structure in 4 KB increments. This field is valid only if the value in the REASON is ALTER COMMAND.

Field Name: QW0267SZ

IFCID 268 - CF Rebuild/Alter End:

This topic shows detailed information about “Record Trace - IFCID 268 - CF Rebuild/Alter End”.

This record shows the end of a coupling facility (CF) alter or rebuild. This end record matches the start record, IFCID 267.

Record trace - IFCID 268 - CF Rebuild/Alter End

The field labels shown in the following sample layout of “Record Trace - IFCID 268 - CF Rebuild/Alter End” are described in the following section.
The operation for the DB2 data sharing coupling facility structures:

F  The rebuild due to the coupling facility structure failure or loss of connectivity to the coupling facility.
O  The MVS rebuild initiated by the MVS operator command SETXCF START, REBUILD
M  The rebuild caused by the maximum number of lock structure users being reached.
A  The dynamic expansion or contraction by the MVS operator command SETXCF START, REBUILD
D  Rebuild started to establish DUPLEX
P  Duplexing being stopped, falling back to primary.
W  Duplexing being stopped, switching to secondary.
S  Dynamic expand/contract initiated by MVS SETXCF START,ALTER operator command against a secondary group buffer pool.

Field Name: QW0268FC

The date and time of the start of the rebuild.

Field Name: QW0268BT

The result of the operation:

O  The operation completed successfully.
N  The expansion or contraction completed successfully, however, the allocated size is smaller than the requested size.
S  The rebuild, expansion, or contraction was stopped.

Field Name: QW0268RC

The reason why the rebuild, expansion, or contraction was stopped:

C  Duplexing rebuild stopped because of insufficient connectivity due to a change in the set of connectors
F  Structure failed before the operation completed
G  An MVS service failed before the operation completed
I  New structure does not provide connectivity which is better than or equivalent to the current structure
J  The structure alter request could not complete due to a rebuild initiated for the structure
K  Rebuild process was stopped because of failure on connect to the new structure
L  Lost connectivity to the structure
N  New structure does not provide better connectivity than the current structure for a LossConn rebuild
O  Operator requested to stop
P  Duplexing was stopped by new CFRM policy
R  Resource manager requested to stop
S  Invalid ratio specified
T  Rebuild process was stopped because the new lock structure is full
U  Rebuild process was stopped because of failure of a required IRLM in the group
W  Rebuild stopped due to successful group function level change--complete rebuild is not required
X  Rebuild stopped due to unsuccessful completion of group function level change

This field is only valid if the value in OPERATION RESULT is S.

Field Name: QW0268RS

DIRECTORY COUNT

If the structure was altered, this is the current directory count of the directory entries. If the GBP was rebuilt, this field is not used. For the SCA and lock structure, this is a serviceability field.

Field Name: QW0268DN

STRUCTURE NAME

The name of the CF structure.

Field Name: QW0268NM

ELEMENT COUNT

If the structure was altered, this is the current count of the elements. For an GBP with a 8 KB page size, the element count equals the data entry count. For a GBP with a 16 KB page size, the element count is eight times the data entry count. If the GBP was rebuilt, this field is not used. For the SCA and lock structure, this is a serviceability field.

Field Name: QW0268TN

MINIMUM SIZE

If the structure was altered, this is the current minimum structure in increments of 4 KB. If the GBP was rebuilt, this is number of pages cast out by this member.

Field Name: QW0268MS

CURRENT SIZE

If the structure was altered, this is the current structure size in increments of 4 KB. If the GBP was rebuild, this is number of pages written to the new structure by this member.
Field Name: QW0268CS

IFCID 269 - Trusted/Context Trace:

This topic shows detailed information about “Record Trace - IFCID 269 - Trusted/Context Trace”.

This record is produced, if a trusted connection is established or reused.

Record trace - IFCID 269 - Trusted/Context Trace

The field labels shown in the following sample layout of “Record Trace - IFCID 269 - Trusted/Context Trace” are described in the following section.

<table>
<thead>
<tr>
<th>CONNECTION TYPE: ESTABLISHED</th>
<th>STATUS: FAILED</th>
<th>SQLCODE: 20360</th>
<th>OBJECT OWNER: N/P</th>
</tr>
</thead>
</table>

**CONNECTION TYPE**

The type of trusted connection. Possible values are:

**ESTABLISHED or ESTABLISH TRUSTED CONNECTION**

If a trusted connection is established.

**REUSED or REUSE TRUSTED CONNECTION**

If a trusted connection is reused.

Field Name: QW0269TY

**STATUS**

The status of the trusted connection:

**SUCCESS**

If a trusted connection was established or reused successfully.

**FAILED or FAILURE**

If a trusted connection failed, when it was tried to be established or reused.

If the status is neither SUCCESS nor FAILURE, the value itself is shown.

Field Name: QW0269ST

**SQLCODE**

The SQL code returned after running the SQL statement.

Field Name: QW0269SQ

**OBJECT OWNER**

The owner of the objects that are created using the trusted context:
IFCID 269 - Trusted/Context Trace

ROLE
The role.

AUTHID
The AUTHORIZATION ID.
Field Name: QW0269OT

SECURITY LABEL
The security label.
Field Name: QW0269SL

TRUSTED CONTEXT NAME
The trusted context name.
Field Name: QW0269TC

SYSTEM AUTHID USED
The system authorization ID that is used to establish the trusted connection.
Field Name: QW0269SA

ROLE ASSOCIATED
The default role associated with the context.
Field Name: QW0269RC

TCP/IP ADDRESS
The actual communication TCP/IP address used for connection.
Field Name: QW0269AD

SERVAUTH NAME
The SERVAUTH name of the TCP/IP security zone.
Field Name: QW0269SR

ENCRYPTION
The encryption value to be associated with the encryption trust attribute for a trusted context. Possible values are:
- NONE
- LOW
- HIGH
Field Name: QW0269EC

JOB NAME
The job name for a local application.
Field Name: QW0269JN

REUSE AUTHID
The authorization ID under which a trusted connection is reused.
Field Name: QW0269RA

USER ROLE
The user role.
IFCID 269 - Trusted/Context Trace

**PROFILE NAME**

The RACF profile name that contains the authorization IDs that can use the connection in the trusted context.

**FIELD NAME:** QW0269RU

**IFCID 270 - Trusted/Context Trace:**

This topic shows detailed information about “Record Trace - IFCID 270 - Trusted/Context Trace”.

This record is produced, if a trusted connection is created or altered.

**Record trace - IFCID 270 - Trusted/Context Trace**

The field labels shown in the following sample layout of “Record Trace - IFCID 270 - Trusted/Context Trace” are described in the following section.

```
STATEMENT TYPE: CREATE  SQLCODE: 11  SQL STMT LENGTH: 12
SQL STATEMENT : CREATE MYTAB
```

**STATEMENT TYPE**

The type of trusted context. Possible values are:

- CREATE TRUSTED CONTEXT or CREATE
  - If a trusted context is created.
- ALTER TRUSTED CONTEXT or ALTER
  - If a trusted context is altered.

**FIELD NAME:** QW0270TY

**SQLCODE**

The SQL return code from the CREATE or ALTER TRUSTED CONTEXT statement.

**FIELD NAME:** QW0270SQ

**SQL STMT LENGTH**

The length of the SQL statement.

**FIELD NAME:** QW0270SL

**SQL STATEMENT**

The SQL statement (truncated at 4000 bytes).

**FIELD NAME:** QW0270SS

**IFCID 271 - Row Level and Column Level Access Control:**

This topic shows detailed information about “Record Trace - IFCID 271 - Row Level and Column Level Access Control”.

This IFCID records the following events:

- When a row permission or column mask is created.
- When a row permission or column mask is dropped.
- When a row permission or column mask is altered.
IFCID 271 - Row Level and Column Level Access Control

Record trace - IFCID 271 - Row Level and Column Level Access Control

The field labels shown in the following sample layout of “Record Trace - IFCID 271 - Row Level and Column Level Access Control” are described in the following section.

<table>
<thead>
<tr>
<th>STATEMENT TYPE: CREATE</th>
<th>OBJECT ......: ROW PERMISSION SQLCODE ......: -1</th>
<th>STMT LENGTH ..: 78</th>
</tr>
</thead>
<tbody>
<tr>
<td>SQL STATEMENT: THIS IS A SQL STATEMENT TEXT TO VERIFY ITS CORRECT PRESENTATION IN BATCH AUDIT</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**TYPE**

Identifies the SQL statement type:
- CREATE or C
  Creates row permission or column mask.
- DROP or D
  Drops row permission or column mask.
- ALTER or A
  Alters row permission or column mask.

Otherwise, a hexadecimal value is shown.

Field Name: QW0271TY

**OBJECT**

Identifies the object type:
- Row permission (R)
- Column mask (M)

Otherwise, a hexadecimal value is shown.

Field Name: QW0271OB

**SQLCODE**

The SQL code from the execution of the CREATE, DROP, or ALTER statement.

Field Name: QW0271SQ

**STMT LENGTH**

The length of the SQL statement.

Field Name: QW0271SL

**SQL STATEMENT**

The SQL statement text associated with the table access. The maximum length is 4000 bytes. Long SQL text can be truncated.

Field Name: QW0271SS

IFCID 272 - Associate Locators:

This topic shows detailed information about “Record Trace - IFCID 272 - Associate Locators”.

Record trace - IFCID 272 - Associate Locators

The field labels shown in the following sample layout of “Record Trace - IFCID 272 - Associate Locators” are described in the following section.
LOCATION
The location name where the stored procedure executes.

Field Name: QW0272LN

PKG COLLECTION ID
The Package collection identificator. This is BLANK when the statement executes without a package.

Field Name: QW0272PC

PROGRAM NAME
The program name.

Field Name: QW0272PG

STO PROC LOCATION
The location of the stored procedure.

Field Name: QW0272LP

STO PROC QUALIFIER
The qualifier of the stored procedure.

Field Name: QW0272QN

STO PROC NAME
The name of the stored procedure.

Field Name: QW0272PN

STATEMENT NUMBER
The statement number of ASSOCIATE LOCATORS statement.

Field Name: QW0272SN

NUMBER OF LOCATORS
The number of locators referenced in the ASSOCIATE LOCATORS statement.

Field Name: QW0272NL

CONSISTENCY TOKEN
The consistency token.

Field Name: QW0272TS

IFCID 273 - Allocate Cursor:
This topic shows detailed information about “Record Trace - IFCID 273 - Allocate Cursor”.

Chapter 6. Batch reporting  4115
Record trace - IFCID 273 - Allocate Cursor

The field labels shown in the following sample layout of “Record Trace - IFCID 273 - Allocate Cursor” are described in the following section.

LOCATION NAME
The location name where the stored procedure executes.
Field Name: QW0273LN

PKG COLLECTION ID
The Package collection identificator. This is BLANK when the statement executes without a package.
Field Name: QW0273PC

PROGRAM NAME
The program name.
Field Name: QW0273PG

STO PROC LOCATION
The location of the stored procedure.
Field Name: QW0273LP

STO PROC QUALIFIER
The qualifier of the stored procedure.
Field Name: QW0273QN

STO PROC NAME
The name of the stored procedure.
Field Name: QW0273PN

ALLOCATED CURSOR
The name of the ALLOCATE CURSOR statement.
Field Name: QW0273CN

REAL CURSOR NAME
The name of cursor in the stored procedure.
Field Name: QW0273RN

STATEMENT NUMBER
The statement number of ALLOCATE CURSOR statement.
From QW0273SN or QW0273TS.

**Field Name:** RT0325SN

**LOCATOR VALUE**

The value of the locator associated with the result set for which this cursor is defined.

**Field Name:** QW0273LV

**CONSISTENCY TOKEN**

The consistency token.

**Field Name:** QW0273TS

**QUERY COMMAND ID**

The ID of the query command.

**Field Name:** QW0273CID

**QUERY INSTANCE ID**

The ID of the query instance.

**Field Name:** QW0273QID

**IFCID 305 - Table Check Constraint:**

This topic shows detailed information about “Record Trace - IFCID 305 - Table Check Constraint”.

**Record Trace - IFCID 305 - Table Check Constraint**

The field trace shown in the following sample layout of “Record Trace - IFCID 305 - Table Check Constraint” are described in the following section.

<table>
<thead>
<tr>
<th>EDVA</th>
<th>EDVA</th>
<th>DSNTEP2</th>

<td>85</td>
<td>2</td>
</tr>
</tbody>
</table>

**NAME**

The check constraint name.

**Field Name:** QW0305CN

**TEXT**

The first 30 characters of the check constraint text.

**Field Name:** QW0305CT

---

**Chapter 6. Batch reporting** 4117
IFCID 305 - Table Check Constraint

DBID
The DBID of the database for the table on which the check constraint is defined.
Field Name: QW0305DB

OBID
The OBID of the table on which the check constraint is defined.
Field Name: QW0305OB

OPERATION
The operation that is utilizing the check constraint function:
CREATE  A check constraint is defined with a CREATE TABLE operation.
ALTER ADD  A check constraint is defined with an ALTER TABLE operation.
ALTER ADD ENFORCE  A check constraint is enforced during an ALTER TABLE operation.
ALTER DROP  A check constraint is removed with an ALTER TABLE operation.
ENFORCE  A check constraint is enforced. DB2 checks that a row does not violate a check constraint.
Field Name: QW0305OP

RESULT
The result of the enforced check constraint:
REJ  The check constraint was rejected due to a check constraint violation.
OK  No check constraint was violated.
Field Name: QW0305RS

RECORD IDENTIFIER
The record identifier (RID) of the record that failed the check constraint. This field is only valid if the value in RESULT is REJ.
Field Name: QW0305ID

TABLE_SPACE_TYPE
The type of the table space:
L  Non-EA large table
N  Non-large table
R  Partitioned by range (PBR) universal table spaces (UTS) that use relative page numbers
V  EA-enabled large table
Field Name: QW0305TY

PARTITION
Shows the partition number if TABLE_SPACE_TYPE is R.
**IFCID 305 - Table Check Constraint**

**Field Name: QW0305PT**

**CHARACTERS**

The first 30 characters of the rejected record (shown in text and hexadecimal format) that failed the check constraint condition. This field is only valid if the value in RESULT is REJ. Otherwise, N/A is printed in this field.

**Field Name: QW0305RR**

**IFCID 311 - Global Temp Table Usage:**

This topic shows detailed information about “Record Trace - IFCID 311 - Global Temp Table Usage”.

**Record trace - IFCID 311 - Global Temp Table Usage**

The field labels shown in the following sample layout of “Record Trace - IFCID 311 - Global Temp Table Usage” are described in the following section.

```
<table>
<thead>

```

**TEMP TAB CREATOR**

The creator of the global temporary table.

**Field Name: QW0311QN**

**TEMP TABLE NAME**

The name of the global temporary table.

**Field Name: QW0311TN**

**PACK LOCATION NAME**

The package location name for the query that uses the global temporary table.

**Field Name: QW0311LN**

**PROGRAM NAME**

The program name for the query that uses the global temporary table.

**Field Name: QW0311PN**

**CURSOR NAME**

The cursor name for fetches. This field is only applicable if the value in WORKFILE TYPE is RC. Otherwise, N/A is printed.

**Field Name: QW0311CN**

**PACK COLLECTION ID**

The package collection identifier for the query that uses the global temporary table.

**Field Name: QW0311PC**

**PACK VERSION**

The package version for the query that uses the global temporary table.
IFCID 311 - Global Temp Table Usage

Field Name: QW31PVF

CURSOR HOLD STATUS

The cursor hold status:

HO      The cursor is held through commit.
'B'BLANK'  The cursor is not held through commit.

Field Name: QW0311HO

WORKFILE TYPE

The work-file type:

TT      Temporary table
C       Cursor on a temporary table
TR     Transition table
CT     Cursor on transition table.

Field Name: QW0311TY

OPERATION

The operation using the global temporary table:

AT      Alter the temporary table.
CI      Create the temporary table instantiation. A work file is created for the temporary table.
OC      Open the cursor on a temporary table.
D       Delete work files for temporary table.
DA     Delete all rows from the temporary table, but leave the work-file structures intact.
CC     Close cursor on the temporary table.

Field Name: QW0311OP

QW0311CA

This field is for IBM service use.

Field Name: QW0311CA

QW0311TA

This field is for IBM service use.

Field Name: QW0311TA

IFCID 313 - Uncommitted Unit of Recovery:

This topic shows detailed information about “Record Trace - IFCID 313 - Uncommitted Unit of Recovery”.

Uncommitted unit of recovery (UR) shows data from IFCID 313. It reflects the same information given in the DB2 messages DSNR035I and DSNR036I.
Record trace - IFCID 313 - Uncommitted Unit of Recovery

The field labels shown in the following sample layout of “Record Trace - IFCID 313 - Uncommitted Unit of Recovery” are described in the following section.

UNCOMMITTED URID

The ID of the uncommitted unit of recovery.

Field Name: QW0313ID

CHKPTS TAKEN

For inflight units of recovery (UR), the number of checkpoints taken since the beginning of the UR. For indoubt URs, this field is set to -1.

Field Name: QW0313CK

TYPE OF UR/UW

The type of uncommitted unit of recovery (UR/UW):

FL  Inflight UR
DU  Indoubt UR
RR  Repeatable read

Field Name: QW0313TY

LUWID - NETWORKID, LUNAME, INSTANCE, COMMIT COUNT

The logical unit of work ID (LUWID) identifies the thread within the network. It consists of the:

• Fully qualified network name
• Logical unit name
• Logical unit of work (LUW) instance number
• Logical unit of work (LUW) sequence number which identifies the last COMMIT scope, in which the logical unit participated

Field Name: QW0313LU

CONNECTION ID

The connection ID.

Field Name: QW0313CN

CORRELATION ID

The correlation ID.

Field Name: QW0313CR

MESSAGE NUMBER

The number of the DB2 message reflecting the information in this IFCID.

Field Name: QW0313MG

Chapter 6. Batch reporting  4121
IFCID 313 - Uncommitted Unit of Recovery

PLAN NAME
Plan Name from URE, if the UR is active, from RURE, if the UR is inactive (indoubt).

Field Name: QW0313PN

LOG RECS WRTN
Shows one of the following:
- The number of log records written
- The total number of minutes that the reader has been running

Field Name: QW0313LW

THRESHOLD TYPE
The type of threshold reached:
- C Checkpoints
- L Log records

Field Name: QW0313TH

AUTHORIZATION ID
Authorization ID from URE, if the UR is active, from RURE, if the UR is inactive (indoubt).

Field Name: QW0313AI

END USER USERID
End-user ID from CCB, if the UR is active. End user information is not available for indoubt URs.

Field Name: QW0313EU

TRANSACTION
End-user transaction name from CCB, if the UR is active. End user information is not available for indoubt URs.

Field Name: QW0313ET

WORKSTATION
End-user workstation name from CCB if the UR is active. End user information is not available for indoubt URs.

Field Name: QW0313EW

IFCID 314 - Authorization Exit Parameters:

This topic shows detailed information about “Record Trace - IFCID 314 - Authorization Exit Parameters”.

It is generated after the authorization exit is called and shows the contents of the parameter list.

This record can be useful when debugging an authorization exit.

Record trace - IFCID 314 - Authorization Exit Parameters

The field labels shown in the following sample layout of “Record Trace - IFCID 314 - Authorization Exit Parameters” are described in the following section.
ADDRESS EXPL: X'000000AA'

Field Name: QW0314EL

EXIT RETURN CODE

The return code from the exit:

0 Access allowed.
4 Check the DB2 authorization.
8 Access denied.
12 Unable to determine authorization. Do not call the exit again.

Field Name: QW0314RC

STO CLOCK BEFORE EXIT CALL

The store clock value before the exit was called.

Field Name: QW0314BC

ADDRESS WORK AREA

The address of the work area.

Field Name: QW0314WA

EXIT REASON CODE

The reason code from the user-defined exit.

Field Name: QW0314RS

STO CLOCK AFTER EXIT CALL

The store clock value after the exit was called.

Field Name: QW0314AC

AUTH ID

The authorization ID that is checked by DB2.

Field Name: QW0314UN

UNQUALIFIED OBJECT NAME

The unqualified object name.

Field Name: QW0314BN

OBJECT OWNER

The object owner or qualifier.
IFCID 314 - Authorization Exit Parameters

Field Name: QW0314ON

RELATED INFO 1

Shows other related information in field 1.

Field Name: QW03141N

RELATED INFO 2

Shows other related information in field 2.

Field Name: QW03142N

LENGTH WORK AREA

The length of the work area.

Field Name: QW0314WL

ACEE UTOKEN

Shows the ACEE UTOKEN, if it is available. If it is not available, the first word of this field contains one of the following values:

0       The UTOKEN cannot be accessed
-1      An abend occurred during the attempt to access the ACEE.

Field Name: QW0314UT

PARAMETER LIST

The list of parameters specific to the exit.

Field Name: QW0314PL

IFCID 316 - SQL Statement Statistics:

This topic shows detailed information about “Record Trace - IFCID 316 - SQL Statement Statistics”.

IFCID 316 reports on the contents of the prepared SQL statement cache. This record is only written when an IFI application requests IFCID 316 through the READS interface.

It provides one record for each qualifying SQL statement in the cache. These multiple records are placed in the output area provided by the IFI application. The IFI application can specify qualification criteria for which statements should be reported.

Record trace - IFCID 316 - SQL Statement Statistics

The field labels shown in the following sample layout of “Record Trace - IFCID 316 - SQL Statement Statistics” are described in the following section.

<table>
<thead>

</tbody>
</table>
**STATEMENT NAME**

The name of the statement generated by DB2.

**Field Name:** QW0316NM

**STATEMENT IDENTIFIER**

The unique identifier of the statement. A number is generated to uniquely identify a statement in the prepared statement cache.

**Field Name:** QW0316TK

**LITERAL REPLACEMENT**

Indicates the cache literal replacement. Possible values are:

**NO**  
No literal replacement was done.

**REPLACE**  
Literals were replaced in the statement.

**DUPLICATE**  
Literals were replaced in the statement, but the cached statement is
a duplicate of another statement in the cache. A match with the other statement in the cache failed only because the literal reuse criteria were not met.

Field Name: QW0316LR

LINE NUMBER

The precompiler line number of the initial PREPARE statement.

Field Name: QW0316LX

STATUS

The status of the statement. If any of the following flags are set, the statement has actually been removed from the cache but current users might still have an active copy. DB2 will continue to track the statement until the use-count and copy-count are zero.

It can be one of the following:

- INVALIDATED BY DROP OR ALTER
- INVALIDATED BY REVOKE
- REMOVED FROM CACHE BY LRU
- INVALIDATED BY UTILITIES

Field Name: QW0316FL

ELIGIBLE FOR ACCELERATOR

The statement is eligible for the execution on an accelerator (DB2 field: QW0316ELI).

Field Name: 316ELI

TIME STATISTICS COLLECTION START

Shows the time stamp when the statistics collection began.

Field Name: QW0316TS

TIME STATEMENT STORED IN CACHE

The date and time when the statement was inserted into the cache (in DB2 timestamp format).

Field Name: QW0316TM

IN STORE CLOCK FORMAT

The date or time when the statement was inserted into the cache (in store clock format) (DB2 field: QW0316TM2).

Field Name: RT316TM2

TIME STATEMENT UPDATED IN CACHE

The date and time when the statement was updated, in internal format (DB2 field: QW0316UT2).

Field Name: RT316UT2

IN STORE CLOCK FORMAT

The date or time when the statement statistic was updated (in store clock format) (DB2 field: QW0316UT1).

Field Name: RT316UT1
STATEMENT COPIES
The number of copies of the statement owned by all threads in the system.

Note: This includes QW0316US and any copies owned by plans or packages bound with KEEP_DYNAMIC(YES) that were not used in their current unit of work. These users prepared the statement in a previous unit of work and still have it in a prepared state.

Field Name: QW0316CP

STATEMENT EXECUTIONS
The number of statement executions.

Note: For a cursor statement, this is the number of OPENS.

Field Name: QW0316NE

SYNCH BUFFER READS
The number of synchronous buffer read operations performed for the statement.

Field Name: QW0316NB

SYNCH BUFFER WRITES
The number of synchronous buffer write-operations performed for statement.

Field Name: QW0316NW

CURRENT USERS
Number of current users of the SQL statement.

Note: These users have prepared or executed the statement during their current unit of work.

Field Name: QW0316US

GETPAGE OPERATIONS
The number of Getpage operations performed for a statement.

Field Name: QW0316NG

TABLESPACE SCANS
The number of scan operations for table spaces that are performed for a statement.

Field Name: QW0316NT

PARALLEL GROUPS CREATED
The number of parallel groups that are created for a statement.

Field Name: QW0316NL

ROWS EXAMINED
The number of rows that are examined for the statement.

Field Name: QW0316NR

ROWS PROCESSED
IFCID 316 - SQL Statement Statistics

The number of rows that are processed for the statement. For example, the number of rows returned for a SELECT statement, or the number of rows affected by an INSERT, UPDATE, or DELETE statement.

Field Name: QW0316NP

SORTS
The number of sort operations performed for a statement.

Field Name: QW0316NS

INDEX SCANS
The number of index scans performed for a statement.

Field Name: QW0316NI

ACCUMULATED CPU TIME
The accumulated CPU time.

Field Name: QW0316CT

ACCUMULATED ELAPSED TIME
Shows the accumulated elapsed time used for a statement.

Field Name: QW0316AE

STABILIZED STMT ID
The ID of the dynamic statement that could be stabilized by the catalog (DB2 field: QW0316_SDQ_STMTID).

Field Name: Q316SDQI

HASH-ID VERSION
The version of the hash ID of the dynamic query (DB2 field: QW0316_QUERY_HASH_VER).

Field Name: Q316QHVE

HASH-ID
The hash ID of a stabilized dynamic query.

Field Name: Q316QHID

STABILIZATION GROUP NAME
The name of the stabilization group. This is the group ID of the stabilization dynamic query (DB2 field: QW0316_STBLGRP).

Field Name: Q316STBG

RL NOT USED LIMIT EXCEEDED
The number of times that a RID list was not used, because the number of:
- RIDs would have exceeded one or more internal DB2 limits
- RID blocks exceeded the value set by the MAXTEMPS_RID system parameter.

Field Name: QW0316RT

RL NOT USED NO STOR AVAIL
The number of times that a RID list was not used because there was not enough storage. This also applies if the work file storage was not available.
Field Name: QW0316RS

RL OV - NO POOL STOR AVAIL

The number of times a RID list was overflowed to a work file because no RID pool storage was available to hold the list of RIDs (DB2 field: QW0316WFRIDS).

Field Name: RT316IDS

RL OV - RIDS EXCEED LIMIT

The number of times a RID list was overflowed to a work file because the number of RIDs exceeded one or more internal limits (DB2 field: QW0316WFRIDT).

Field Name: RT316IDT

HJA - NO POOL STOR AVAIL

The number of times a RID list append for a hybrid join was interrupted because no RID pool storage was available to hold the list of RIDs (DB2 field: QW0316HJINCS). For example, the number of times DB2 interrupted the RID phase and switched to the data phase.

Field Name: RT316NCS

HJA - RIDS EXCEED LIMIT

The number of times a RID list append for a hybrid join was interrupted because the number of RIDs exceeded one or more internal limits (DB2 field: QW0316HJINCT). For example, it shows the number of times DB2 interrupted the RID phase and switched to the data phase.

Field Name: RT316NCT

RL RETRIEVAL IA SKIPPED

The number of times a RID list retrieval for multiple index access was skipped because DB2 predetermined the outcome of index ANDing or ORing (DB2 field: QW0316RSMIAP).

Field Name: RT316IAP

READ BY OTHER THREAD

The accumulated wait time for a read activity that is performed by another thread.

Field Name: QW0316W5

SYNCH EXECUTION UNIT SWITCH

The accumulated wait time for a synchronous execution unit switch.

Field Name: QW0316W3

WRITE BY OTHER THREAD

The accumulated wait time for a write activity that is performed by another thread.

Field Name: QW0316W6

SYNCHRONOUS I/O

The accumulated wait time for a synchronous I/O.
Note: This wait time and the following wait times are only collected if a CLASS 3 accounting trace is started.

Field Name: QW0316W1

GLOBAL LOCKS
The accumulated wait time for global locks.
Field Name: QW0316W4

LOCK AND LATCH REQ
The accumulated wait time for lock and latch requests.
Field Name: QW0316W2

LATCH REQUEST
The accumulated wait time for lock requests.
Field Name: QW0316W7

PAGE LATCH
The accumulated wait time for page latches.
Field Name: QW0316W8

DRAIN LOCK
The accumulated wait time for drain locks.
Field Name: QW0316W9

DRAIN WAITING FOR CLAIM REL
The accumulated wait time for drains when waiting for claims to be released.
Field Name: QW0316WA

LOG WRITER
The accumulated wait time for log writers.
Field Name: QW0316WB

WAIT CHILD L-LOCKS
The accumulated wait time for child L-locks for the statement.
Field Name: QW0316WC

WAIT OTHER L-LOCKS
The accumulated wait time for other L-locks for the statement.
Field Name: QW0316WD

WAIT P/P P-LOCKS
The accumulated wait time for P/P P-locks for the statement.
Field Name: QW0316WE

WAIT PAGE P-LOCKS
The accumulated wait time for page P-locks for the statement.
Field Name: QW0316WF

WAIT OTHER P-LOCKS
The accumulated wait time for other P-locks for the statement.

Field Name: QW0316WG

**WAIT PIPE**

The accumulated wait time for pipe wait (DB2 field: QW0316_PIPE_WAIT).

Field Name: Q316PIPW

**WAIT PARALLEL QUERIES**

The accumulated time waiting for parallel queries to synchronize between parent and child tasks (DB2 field: QW0316_PQS_WAIT).

Field Name: Q316PQSW

**CURRENT DATA BIND OPTION**

The CURRENTDATA bind option. It can be one of the following:

- YES
- NO

Field Name: QW0316X7

**CURSOR WITH HOLD**

Shows if the position for a cursor opened WITH HOLD. It can be one of the following:

- YES
- NO

Field Name: QW0316XC

**CURRENT PRECISION SPEC REG**

Shows the CURRENT PRECISION special register. It can be one of the following:

- DEC31
- DEC15

Field Name: QW0316XB

**DYNAMIC RULES BIND OPTION**

Shows the dynamic rules bind option. It can be one of the following:

- BIND
- RUN

Field Name: QW0316X8

**CURRENT DEGREE SPECIAL REG**

Shows value of the CURRENT DEGREE special register. It can be one of the following:

- ANY
- 1

Field Name: QW0316X9

**ISOLATION BIND OPTION**

The value of the ISOLATION bind option that is in effect for the initial PREPARE statement. It can be one of the following:

- UNCOMMITTED READ
IFCID 316 - SQL Statement Statistics

- CURSOR STABILITY
- READ STABILITY
- REPEATABLE READ

Note: This value does not reflect if it is specified in a WITH clause.

Field Name: QW0316X6

CURRENT RULES SPECIAL REG

Shows the value of the CURRENT RULES special register. It can be one of the following:
- DB2
- SQL

Field Name: QW0316XA

DSG MEMBER

The data sharing DB2 member that cached the SQL statement (DB2 field: QW0316MBR).

Field Name: RT316MBR

TRANSACTION NAME

The text of the transaction name.

Field Name: QW0316T2

SIGNON USER ID

The End User ID is provided during RRS signon or resignon for initial prepare.

Field Name: QW0316XE

WORKSTATION ID

The Workstation ID is provided during RRS signon or resignon for initial prepare.

Field Name: QW0316XF

PROGRAM NAME

The text of the program name.

Field Name: QW0316T1

USER ID

The user ID.

Field Name: QW0316T3

USER GROUP

The name of the user group. The user group is the current SQLID of the user who started the initial PREPARE statement.

Field Name: QW0316X4

OBJECT QUALIFIER

The qualifier that is used for unqualified table names.

Field Name: QW0316X5
REFERENCED TABLE QUALIFIER

The qualifier of the referenced table name.
Field Name: QW0316QD

REFERENCED TABLE NAME

The name of the referenced table.
Field Name: QW0316TD

USER PROVIDED ID STRING

The identification (ID) string provided by the user.
Field Name: QW0316UI

CURRENT SCHEMA

The special register text of the current schema.
Field Name: QW0316SC

LENGTH OF SQL STATEMENT

The length of the entire statement.
Field Name: QW0316LN

SQL STATEMENT - FIRST 60 BYTES

The first 60 bytes of the SQL statement text.
Field Name: QW0316TX

ACCELERATOR NAME

The accelerator name (DB2 field: QW0316ANM).
Field Name: 316ANM

TIME STATEMENT STORED IN CACHE

The date or time when the statement was inserted into the cache (in DB2 timestamp format) (DB2 field: QW0316ATM).
Field Name: 316ATM

STATEMENT IDENTIFIER

The statement identifier, for correlation with IFCID 316 data section 1 (DB2 field: QW0316AID).
Field Name: 316AID

MEMBER NAME

The member name in case of a data sharing group (DSG). It is used for correlation with IFCID data section 1 (if DSG) (DB2 field: QW0316AMBR).
Field Name: 316AMBR

ACCELERATOR EXECUTIONS

The number of executions on this accelerator (DB2 field: QW0316AEXEC).
Field Name: 316AEXEC

ACCUMULATED # ROWS RETURNED

Shows the accumulated number of rows returned for the SELECT statement (DB2 field: QW0316AROW).
Field Name: 316AROW

**ACCUMULATED CPU TIME**

Shows the accumulated CPU time spent in the accelerator when processing the query request for the statement.

This value reflects parallel processing such that the CPU value may exceed the accumulated elapsed time (DB2 field: QW0316ACPU).

For completed queries, this is the CPU time from the initial request to the last row being returned to DB2. For in-process queries, this is the time from the initial request to the current point in time. The counter includes the CPU time spent in the accelerator and also the CPU time spent in the Netezza® backend (on the coordinator node and all worker nodes).

Field Name: 316ACPU

**ACCUMULATED # BYTES RETURNED**

Shows the accumulated number of bytes returned for the SELECT statement (DB2 field: QW0316ABYT).

For completed queries, this is the total number of bytes returned and produced by the accelerator (this is not necessarily the total number of bytes returned to DB2 in case DB2 does not fetch all the data).

For in-process queries, this is the number of bytes that have been sent so far (and more bytes may still be coming).

This value is always set to 0 for DML statements (INSERT, UPDATE, DELETE) because no such wait times occurs.

Field Name: 316ABYT

**ACCUMULATED ELAPSED TIME**

Shows the accumulated elapsed time spent in the accelerator processing the query request for the statement (DB2 field: QW0316AELA).

For completed queries, this is the time from the initial request to the last row that is returned to DB2. For in-process queries, this is the time from the initial request to the current point in time.

Field Name: 316AELA

**ACCUMULATED EXECUTION TIME**

Shows the accumulated execution time spent in processing the query request for the statement (DB2 field: QW0316AEXE).

For completed queries, this is the time spent since starting the query execution until the query execution has finished. Subsequent processing and transfer of the result set is not included, but there may be an overlapping time window in which result set processing (fetching) and query execution takes place.
For in-process queries, it is the time measured from starting query execution inside the accelerator up to the current point in time or until query execution has finished and only result set processing and transfer remains (whichever occurs earlier).

This time is measured for the actual execution time spent for the query. Compared to the total elapsed time (QW0316AELA and QW0401AELA), it does not include any preprocessing done in the accelerator (such as PREPARE), and it does not include time spent, such as in spill-to-disk or other things, related to the final query result processing.

Field Name: 316AEXE

ACCUMULATED QUEUE WAIT TIME

Shows the accumulated queue wait time for the statement (DB2 field: QW0316AWAT).

For completed queries, this is the time that the query has spent in queues, waiting to be processed.

For in-process queries, the value is only available once the query execution itself has finished and only result processing remains. Until then, the value will be (nearly) 0.

Field Name: 316AWAT

WAIT TIME FOR DB2

Shows the total time the accelerator waited for DB2 to request query results (DB2 field: QW0316ATWDB2).

For completed queries, this is from the time when the first row of the result set was produced by the accelerator until the last row was sent to DB2. For in-process queries, it is 0 (if the accelerator has not yet computed a result row) or the time from computing the first row to the current point in time (if at least one result row is available).

This value is always set to 0 for DML statements (INSERT, UPDATE, DELETE) because these wait times do not occur for DML statements.

Field Name: 316ATWDB

WAIT TIME FOR 1ST ROW

Shows the time waited for first row of query result to be available (DB2 field: QW0316ATW1R).

For completed queries, this is the time from receiving the query in the accelerator until the first row of the result set was computed. For in-process queries, this is the time from receiving the query in the accelerator to the current point in time (if no result rows are available yet) or until the first row of the result set was computed (if at least one result row is available).

This value is always set to 0 for DML statements (INSERT, UPDATE, DELETE) because no such wait times occurs.

Field Name: 316ATW1R

IFCID 317 - SQL Statement String:

This topic shows detailed information about “Record Trace - IFCID 317 - SQL Statement String”.

IFCID 317 - SQL Statement String

Record trace - IFCID 317 - SQL Statement String

The field labels shown in the following sample layout of “Record Trace - IFCID 317 - SQL Statement String” are described in the following section.

SQL STATEMENT NAME

The name of the SQL statement.
Field Name: QW0317NM

SQL STATEMENT IDENTIFIER

The identifier of the SQL statement in hexadecimal.
Field Name: QW0317ID

SQL STATEMENT LENGTH

The length of the SQL statement.
Field Name: QW0317LN

SQL STATEMENT TEXT

The text of the SQL statement.
Field Name: QW0317TX

ATTRIBUTE STRING LENGTH

The length of the attribute string.
Field Name: QW03172LN

ATTRIBUTE STRING TEXT

The text of the attribute string.
Field Name: QW03172TX

IFCID 319 - Audit Security Record:

This topic shows detailed information about “Record Trace - IFCID 319 - Audit Security Record”.

When a local DB2 receives a non-RACF identity that represents a user, it maps that name to a local user ID for use in connection processing. This record traces the mapping. This record provides an audit trail for security processing.

Record trace - IFCID 319 - Audit Security Record

The field labels shown in the following sample layout of “Record Trace - IFCID 319 - Audit Security Record” are described in the following section.

REQ COMMUNICATION ADDR

Requesting communication address. For SNA, this field shows the LU name, for TCP/IP, this shows the dotted decimal IP address.

Field Name: QW0319AD

COMMUNICATION ADDR TYPE

Type of communication address: SNA or TCP/IP.

Field Name: QW0319CT

CLIENT PRODUCT ID

The identification of the client product.

Field Name: QW0319CP

DERIVED LOCAL USERID

Local user ID mapped by DB2.

Field Name: QW0319US

SECURITY TYPE

The type of security identity. Possible values are:

- KERBEROS
- ENCRYPTED

Field Name: QW0319TY

SECURITY MECHANISM

The security mechanism used. Possible values are:

- User ID (UID) and encrypted password (PW)
- Encrypted UID and PW
- Encrypted UID, PW, and new PW
- Encrypted UID and data
- Encrypted UID, PW, and data
- Encrypted UID, PW, new PW, and data
- Encrypted UID only

Field Name: QW0319SM

FLAGS - USER REGISTRY NAME

This flag shows if the caller passed the user registry name.

Field Name: QW0319UR

FLAGS - AES IS USED

This flag shows if Advanced Encryption Standard (AES) is used for encryption.

Field Name: QW0319AE
IFCID 319 - Audit Security Record

FLAGS - SERVER ENCRYPT COMP
This flag shows whether the remote connection is compatible with the Db2 system parameter TCPALVER=SERVER_ENCRYPT.

Field Name: QW0319SC

FLAGS - SECURE CONNECTION
This flag shows whether the remote connection was secure.

Field Name: QW0319SE

IPV6 ADDRESS
If the type of the communication address is TCP/IP, it is the 16 byte hexadecimal (HLHLHLHLHLHLHLHLHLHLHLHLHLHLHLHL) IP address of the internal 128 bit format, where:

• H represents the high order half byte value
• L represents the low order half byte value

Field Name: QW0319IPA

PRINCIPAL NAME LENGTH
Length of principal name.

Field Name: QW0319L1

PRINCIPAL NAME
The requesting principal name. This can be up to 256 characters and can contain lowercase characters.

Field Name: QW0319D1

PORT-INTERNAL FORMAT
If the type of the communication address is TCP/IP, this field shows the 16 bit port number in internal format.

Field Name: QW0319PRT

IFCID 321 - Force-at-Commit Begin:

This topic shows detailed information about “Record Trace - IFCID 321 - Force-at-Commit Begin”.

Record trace - IFCID 321 - Force-at-Commit Begin

The field labels shown in the following sample layout of “Record Trace - IFCID 321 - Force-at-Commit Begin” are described in the following section.

TARGET LOCATION FOR WRITE
The target location for write.

Field Name: QW0321LO

IFCID 322 - Force-at-Commit End:

This topic shows detailed information about “Record Trace - IFCID 322 - Force-at-Commit End”. 
Record trace - IFCID 322 - Force-at-Commit End

The field labels shown in the following sample layout of “Record Trace - IFCID 322 - Force-at-Commit End” are described in the following section.

**PAGES_WRITTEN**

The number of pages written.

Field Name: QW0322NP

IFCID 324 - Function Resolution:

This topic shows detailed information about “Record Trace - IFCID 324 - Function Resolution”.

Record trace - IFCID 324 - Function Resolution

The field labels shown in the following sample layout of “Record Trace - IFCID 324 - Function Resolution” are described in the following section.

<table>
<thead>
<tr>
<th>QUERYNO</th>
<th>1853</th>
<th>PLANNAME</th>
<th>PLAN01</th>
<th>APP</th>
</tr>
</thead>
<tbody>

</tr>
</tbody>
</table>

**QUERYNO**

The query number.

Field Name: QW0324QN

**PLANNAME**

The plan name.

Field Name: QW0324PN

**COLLECTION_ID**

The collection ID.

Field Name: QW0324CI

**APPLNAME**

The name of the application.

Field Name: QW0324AL

**PROGNAME**

The program name.

Field Name: QW0324PG

**CONSIS_TOKEN**

The consistency token.

Field Name: QW0324CT

**GRP_MBR**

The group member name.

Field Name: QW0324GM

**BIND_TIME**
The time stamp of the bind time.

Field Name: QW0324TS

VERSION

The version.

Field Name: QW0324VN

CURRENT_PATH

The current path.

Field Name: QW0324CP

FUNCT_SCHEMA

A short SQL identifier, either ordinary or delimited, following the concept of qualified names consistent with the ANSI/ISO SQL92 standard.

Field Name: QW0324FS

FUNCT_NAME

The name of a function without a qualifier.

Field Name: QW0324FN

SPECIFIC_NAME

Identifies the particular function. The specific name must identify a specific function name in the explicitly or implicitly specified schema.

Field Name: QW0324FI

FUNCT_TYPE

The classification of the function:

SU Scalar UDF
TU Table UDF

Field Name: QW0324FY

VIEW_CREATOR

The name of the view creator if the function is referenced in a view definition.

Field Name: QW0324CV

VIEW_NAME

The name of the view if the function is referenced in a view definition.

Field Name: QW0324NV

QUERY_BLOCKNO

A number that identifies the query block number being explained.

Field Name: QW0324QB

FUNCT_TEXT

Contains the text of the function reference, function name, and parameters. It can be up to 254 characters long.

Field Name: QW0324FT
IFCID 325 - Trigger Activation:

This topic shows detailed information about “Record Trace - IFCID 325 - Trigger Activation”.

Record trace - IFCID 325 - Trigger Activation

The field labels shown in the following sample layout of “Record Trace - IFCID 325 - Trigger Activation” are described in the following section.

**STATEMENT NO:**
The statement number of the SQL statement that activated the trigger.

**Field Name:** QW0325SN

**SQL STATEMENT**
Triggering SQL statement. Possible values are:

- D: DELETE
- I: INSERT
- U: UPDATE

**Field Name:** QW0325SS

**COLLECTION ID**
The collection ID of the package containing the statement that activated the trigger.

**Field Name:** QW0325CO

**PROG NAME**
Program or package containing the statement that activated the trigger.

**Field Name:** QW0325PR

**TRIGGER NAME**
Trigger name.

**Field Name:** QW0325NM

**EXT.TRIGGER NAME**
External trigger name.

**Field Name:** QW0325TX

**SCHEMA NAME**
IFCID 325 - Trigger Activation

Schema name of the trigger.
Field Name: QW0325SC

TIMESTAMP
Trigger timestamp.
Field Name: QW0325TS

ACTIVATION TIME
Possible values are:
A Trigger activation time is AFTER.
B Trigger activation time is BEFORE.
Field Name: QW0325AC

ENTRY/EXIT TYPE
Possible values are:
E Trigger is starting.
X Trigger is ending.
Field Name: QW0325ET

GRANULARITY
Possible values are:
R Trigger granularity is FOR EACH ROW.
S Trigger granularity is FOR EACH STATEMENT.
Field Name: QW0325GR

EVALUATION
Triggered action condition evaluation. Possible values are:
T Triggered action tested TRUE
F Triggered action tested FALSE
N No triggered action condition.
Field Name: QW0325CN

NESTING LEVEL
Nesting level of the trigger.
Field Name: QW0325NL

SQLCA CONTENTS
This section contains the SQLCA fields. It is only printed if the value in the ENTRY/EXIT TYPE field is RETURNED.
Field Name: QW0325SQ

IFCID 329 - IXL Suspensions:
This topic shows detailed information about “Record Trace - IFCID 329 - IXL Suspensions”.

4142 IBM Db2 Performance Expert on z/OS
## Record trace - IFCID 329 - IXL Suspensions

The field labels shown in the following sample layout of “Record Trace - IFCID 329 - IXL Suspensions” are described in the following section.

### GBP NAME

Name of the group buffer pool.

**Field Name:** QW0329GB

### REQUEST TYPE

The request type can be one of the following:

- READ-DIRINFO (IXLCACHE)
- READ-COCLASS (IXLCACHE)
- CASTOUT-DATA (IXLCACHE)
- DELETE-NAME (IXLCACHE)
- RESET-REFBIT (IXLCACHE)
- FORCE (IXLFORCE)
- CONNECT (IXLCONN)
- DISCONNECT (IXLDISC)
- PROCESS-REFLIST (IXLCACHE)
- READ-DATA (IXLCACHE)
- READ-STGSTATS (IXLCACHE)
- READ-COSTATS (IXLCACHE)
- UNLOCK-CASTOUT (IXLCACHE)
- SET-RECLVCTR (IXLCACHE)
- WRITE-DATA (IXLCACHE)
- X-INVALIDATE (IXLCACHE)
- REGISTER-PAGE-LIST (IXLCACHE)
- WRITE-DATA TO SECONDARY (IXLCACHE)
- DELETE-NAME-LIST TO SECONDARY (IXLCACHE)
- DELETE-NAME TO SECONDARY (IXLCACHE)
- READ-STGSTATS TO SECONDARY (IXLCACHE)

**Field Name:** QW0329RT

### ASYNC. WAIT TIME

Asynchronous wait time in microseconds.

**Field Name:** QW0329ST

## IFCID 330 - Active Log Space Shortage:

This topic shows detailed information about “Record Trace - IFCID 330 - Active Log Space Shortage”.

This record is written of each group buffer pool present. Each repeating section contains information about each group buffer pool to which this DB2 data sharing member is currently connected.
IFCID 330 - Active Log Space Shortage

Record trace - IFCID 330 - Active Log Space Shortage

The field labels shown in the following sample layout of “Record Trace - IFCID 330 - Active Log Space Shortage” are described in the following section.

ACTIVE LOG COPY NUMBER: X

LAST LOG DATA SET USAGE: 999%

ACTIVE LOG COPY NUMBER

Active log copy number (1 or 2).

Field Name: QW0330CP

LAST LOG DATA SET USAGE

Percentage of the last available active log data set for this log copy that is used.

Field Name: QW0330PC

IFCID 331 - IBM Service Record:

This topic shows detailed information about “Record Trace - IFCID 331 - IBM Service Record”.

This record is for IBM service use.

IFCID 332 - IBM Service Record:

This topic shows detailed information about “Record Trace - IFCID 332 - IBM Service Record”.

This record is for IBM service use.

IFCID 333 - IBM Service Record:

This topic shows detailed information about “Record Trace - IFCID 333 - IBM Service Record”.

This record is for IBM service use.

IFCID 335 - System Event Stalled:

This topic shows detailed information about “Record Trace - IFCID 335 - System Event Stalled”.

This IFCID records information about stalled system events. These records include the checkpoint process or a log offload task.

Record trace - IFCID 335 - System Event Stalled

The field labels shown in the following sample layout of “Record Trace - IFCID 335 - System Event Stalled” are described in the following section.

STALLED SYST EVT : OFFLOAD

TIMESTAMP : 11-11-11 12:44:54.324520

LOG RBA PRIO EVT : QWERTY

CURRENT LOG RBA : YTREWQ

STALLED SYST EVT

The stalled system event can be:

CKPT    System checkpoint processor

OFLD    Log offload task
Field Name: QW0335SE

TIMESTAMP
The timestamp of the previous event.
Field Name: QW0335TS

LOG RBA PRIO EVT
The log RBA of the previous event.
Field Name: QW0335PR

CURRENT LOG RBA
The current, highest-written log RBA.
Field Name: QW0335CR

IFCID 337 - Lock Escalation Occurrences:
This topic shows detailed information about “Record Trace - IFCID 337 - Lock Escalation Occurrences”.
When performance trace class 6 or statistics trace class 3 is on, a record is written each time a lock escalation occurs.

Record trace - IFCID 337 - Lock Escalation Occurrences
The field labels shown in the following sample layout of “Record Trace - IFCID 337 - Lock Escalation Occurrences” are described in the following section.

DATABASE ID
Database name.
Field Name: QW0337DB

PAGESET/TABLE ID
Page set name or table OBID.
Field Name: QW0337OB

STATEMENT NUMBER
Statement number.
Field Name: QW0337SN

LOCK STATE
New state to which the lock was escalated. This is not shown if selective partition locking is used.
Field Name: QW0337LS

LOWER LOCK TYPE
Type of lower level lock used. This can be:
- Page lock
- Row lock
IFCID 337 - Lock Escalation Occurrences

- LOB lock

Field Name: QW0337LL

NUMBER LOWER LOCKS

Number of held lower-level locks that were released by escalation.

Field Name: QW0337LH

WAITERS STMT ID

The waiter statement ID.

Field Name: QW0337SI

WAITER TYPE

The waiter statement information. Possible values:

- STATIC
  The statement is of type static.

- DYNAMIC
  The statement is of type dynamic.

- NONE (NO ID, NO TYPE)
  No statement ID, no type.

Field Name: QW0337TY

COLLECTION ID

Collection identifier.

Field Name: QW0337CN

PACKAGE NAME

The package name.

Field Name: QW0337PK

IFCID 342 - WF/TEMP DB Usage:

This topic shows detailed information about “Record Trace - IFCID 342 - WF/TEMP DB Usage”.

Record trace - IFCID 342 - WF/TEMP DB Usage

The field labels shown in the following sample layout of “Record Trace - IFCID 342 - WF/TEMP DB Usage” are described in the following section.

WF/TEMP DB USAGE

DATABASE TYPE: WFDB
PSID OF SPACE: X'0010'

DBID OF DB: X'0010'

AGENT TOKEN: X'000003EA'
CURRENT NO TABLE BLOCKS: 100

MAX NO TABLE BLOCKS: 1000

PARENT TOKEN: '000003EB'
CURRENT NO INDEX BLOCKS: 101

MAX NO INDEX BLOCKS: 1000

DATABASE TYPE

The database type.

Field Name: QW0342TY
DBID OF DB
The database ID (DBID).
Field Name: QW0342DB

PSID OF SPACE
The page set object identifier (PSID) of the database.
Field Name: QW0342PS

AGENT TOKEN
The agent token.
Field Name: QW0342AT

CURRENT NO TABLE BLOCKS
The current space for tables that is used by the agent in the database (in KB).
Field Name: QW0342CT

MAX NO TABLE BLOCKS
The maximum space for tables that is used by the agent in the database (in KB).
Field Name: QW0342MT

PARENT TOKEN
The parent token.
Field Name: QW0342PT

CURRENT NO INDEX BLOCKS
The current space for indexes on the tables used by the agent in the database (in KB).
Field Name: QW0342CI

MAX NO INDEX BLOCKS
The maximum space for indexes on the tables used by the agent in the database (in KB).
Field Name: QW0342MI

IFCID 343 - MAXTEMPS Limit/Exceeded:
This topic shows detailed information about “Record Trace - IFCID 343 - MAXTEMPS Limit/Exceeded”.

This record is written if the MAXTEMPS zparm limit for an agent is exceeded.

Record trace - IFCID 343 - MAXTEMPS Limit/Exceeded
The field labels shown in the following sample layout of “Record Trace - IFCID 343 - MAXTEMPS Limit/Exceeded” are described in the following section.
IFCID 343 - MAXTEMPS Limit/Exceeded

The authorization ID for the agent.
Field Name: QW0343ID

PACKAGE COLLECTION ID
The package collection ID for the agent.
Field Name: QW0343PC

PACKAGE NAME
The package name for the agent.
Field Name: QW0343PK

PLAN NAME
The plan name for the agent.
Field Name: QW0343PL

MAX TEMP STORAGE
The MAXTEMP zparm value for the agent (KB).
Field Name: QW0343MS

CURRENT WORKFILE SIZE
The current total system wide usage of WORKFILE storage (KB).
Field Name: QW0343CU

MAX WORKFILE SIZE
The maximum total system wide usage of WORKFILE storage (KB).
Field Name: QW0343MU

IFCID 345 - Trace Data / SP/UDF:
This topic shows detailed information about “Record Trace - IFCID 345 - Trace Data / SP/UDF”.

Record trace - IFCID 345 - Trace Data / SP/UDF
The field labels shown in the following sample layout of “Record Trace - IFCID 345 - Trace Data / SP/UDF” are described in the following section.

TRACE BUFFER LENGTH
Length of the trace buffer.
Field Name: QW0345TR_LEN

TRACE BUFFER
Trace buffer.
Field Name: QW0345TR

IFCID 346 - Package/DBRM Detail:
This topic shows detailed information about “Record Trace - IFCID 346 - Package/DBRM Detail”. 
Record trace - IFCID 346 - Package/DBRM Detail

The field labels shown in the following sample layout of “Record Trace - IFCID 346 - Package/DBRM Detail” are described in the following section.

LOCATION: The location name.

If this field is blank in trace or report, the package or DBRM was executed locally. If it is not blank, all times represent the time spent locally to execute the remote package for this APPL_DIR requester.

This field is invalid (N/P) if summary rollup data is present.

Field Name: QPACLOCN

This is an exception field.

COLLECTION: The package collection ID. This field does not apply to DBRMs. If the program name cannot be identified, this field is not present in report or trace.

This field is invalid if summary rollup data is present. It can have the following value in:

- Accounting trace and report: N/P
- The Accounting FILE and SAVE PROGRAM table: blank

Field Name: QPACCOLN

This is an exception field.

PACKAGE ID: The program name (package ID or DBRM name).

In the case of rollup data (Accounting data of DDF/RRSAF threads and parallel tasks accumulated by DB2), the following value is shown *ROLSUM*.

Field Name: QPACPKID
This is an exception field.

TOKEN
The program (package or DBRM) consistency token.
This field is invalid (0) if summary rollup data is present.

Field Name: QPACCONT

SECTION NMB
The number of this particular data section in the series.

Field Name: QPACRECN

TYPE
The program type. It can be DBRM (field name QPACDBRM) or package
(field name QPACPACK).

Field Name: QPACFLGS

SCHEMA NAME
Schema name of the nested activity.
If the package is defined for a trigger, stored procedure, or user-defined
function, then this field contains the name of the schema to which the
nested activity belongs. It can have the following value in:
• Accounting Trace and Report: N/P
• The Accounting FILE and SAVE PROGRAM tables: blank
This field is invalid if summary rollup data is present.

Field Name: QPACASCH

SQL STMTS
The number of SQL statements issued in this package or DBRM.
This number may not be equal to the total number of SQL statements in
the QXST data section because QXST does not count all SQL statements.
For example, it does not count commit or rollback statements.

Note: This field is shown for the following field labels in Accounting trace:
• SQL STMT - TOTAL
• SQL STMT - AVERAGE:

Field Name: QPACSQLC
This is an exception field.

USED BY STOR.PROC
Indicates whether this package was loaded by a stored procedure.
This field is invalid if unique or summary rollup data is present.

Field Name: QPACINSP

NON-ZERO CLASS 8
Indicates if Class 8 data is in this record.

Field Name: QPACCLS8

ACTIVITY NAME
The name of the nested activity.
This field contains the name of the nested activity if the package is defined for a:

- Trigger
- Stored procedure
- User-defined function (UDF)
- Native SQL procedure
- Non-inline UDF

In a data block that reports totals it is set to ALL NAMES.
This field is invalid if summary rollup data is present.
It can have the following value in:

- Accounting Trace and Report: N/P
- The Accounting FILE and SAVE PROGRAM tables: blank

Field Name: QPACAANM

SUCC AUTH CHECK
Indicates whether a successful package EXECUTE authorization check was made and DB2 catalog access was avoided.
This field is invalid if unique or summary rollup data is present.
Field Name: QPACPAC

LAST EXECUTED
This package or DBRM is either currently executing or is the most recently executed package or DBRM. This field is invalid if unique or summary rollup data is present.
Field Name: QPACCRNT

NON-ZERO CLASS 7
There is nonzero accounting class 7 data in this QPAC data instance.
Field Name: QPACCLS7

ACTIVITY TYPE
The type of activity. The following values indicate how the package was loaded:

ALL TYPES
In a data block that reports totals it is set to ALL TYPES.

STORED PROC
When running an external procedure

TRIGGER
When running a trigger

UDF
When running a user-defined function

NATIVE SQL PROC
When running a native SQL procedure

NATIVE UDF
When running a native UDF procedure (a non-inline user-defined function)
NONNESTED
   Indicates that none of the above values is true

MULTIPLE
   Indicates that packages with the same key but with different activity types were running

N/P    Invalidated in case of rollup summary

The nested activity values that are shown in column NEST_ACTIVITY_TYPE of the table DB2PMFACCT_PROGRAM are:

S    For Stored Procedure
T    For Trigger
U    For UDF
Q    For native SQL procedure
D    For Native UDF
N    For nonnested (other)
blank    For invalidated in case of rollup summary

This field is invalid if unique or summary rollup data is present.

Field Name: QPACAAFG

PACKAGE SWITCH

The number of times package was invoked from a different package. For the first package run by an application, the initial call counts as a package switch. If this package called a nested package (such as a trigger, UDF, or stored procedure), a switch will not be counted upon return from such a package.

Field Name: QPACSWITCH

ROLLED NBR THREADS

This value can be one of the following:

- In general, the number of threads to roll data into this QPAC data section. Non-rollup QPACs have a value of 1 and rollup QPACs have a value of 1 or more. This number is used as a divisor for calculating averages for package class 7, 8, or 10 times and events.
- If REPORT ORDER (ACTNAME) is specified, the number of threads to roll data into this QPAC data section of a special activity type depends on the following:
  - If IFCID 233 or 380 is available, the number of threads to roll data into this QPAC data section for stored procedures (SP) is counted based on the available IFCID. If both IFCIDs are available, IFCID 380 is the preferred one for SP reporting. Subprograms called by these SPs are not taken into account.
  - If IFCID 233 or 381 is available, the number of threads to roll data into this QPAC data section for user-defined functions (UDF) is counted based on the available IFCID. If both IFCIDs are available, IFCID 381 is the preferred one for UDF reporting. Subprograms called by these UDFs are not taken into account.
  - If neither IFCID 233, 380, nor 381, is collected, the total number of threads to roll data into this QPAC data section is counted. The sum also includes the number of subprograms.
Field Name: QPACRLNU

ACE

ACE token. You can use this value to correlate this record with other monitor trace records.

Field Name: QW0346_ACE

HREF HREF

ACE token. You can use this value to correlate this record with other monitor trace records.

Field Name: HREF

CLASS 7: BEGINNING STORE CLOCK TIME

The store clock time at entry to DB2 for the most recent execution of this package or DBRM.

This field is invalid if unique or summary rollup data is present.

Field Name: QPACSCB

CLASS 7: ENDING STORE CLOCK TIME

The store clock time at exit from DB2 after the most recent execution of this package or DBRM.

This field is invalid if unique or summary rollup data is present.

Field Name: QPACSCE

CLASS 7: BEGINNING TCB CPU TIME

The CPU time at entry to DB2 for the most recent execution of this package or DBRM. This time does not include the CPU time consumed on an IBM specialty engine.

This field is invalid if unique or summary rollup data is present.

Field Name: QPACBJST

CLASS 7: ENDING TCB CPU TIME

The CPU time at exit from DB2 for the most recent execution of this package or DBRM. This time does not include CPU consumed on an IBM specialty engine.

This field is invalid if unique or summary rollup data is present.

Field Name: QPACEJST

CLASS 7: TOTAL ELAPSED TIME

The total elapsed time for executing the package or DBRM.

Field Name: QPACSCCT

CLASS 7: DB2 ENTRY/EXIT

The number of DB2 entries or exits processed during the execution of the package or DBRM.

In Accounting reports this is shown twice; as a total and as an average.

Field Name: QPACARNN

CLASS 7: TOTAL TCB TIME

Chapter 6. Batch reporting  4153
The class 7 CPU time for all executions of the package or DBRM. This time does not include the:

- Class 7 time for parallel tasks
- CPU time that is consumed on an IBM specialty engine

**Field Name:** QPACTJST

This is an *exception* field.

**CLASS 7: SE CPU TIME**

The total CPU time for all executions of this package or DBRM that was consumed on an IBM specialty engine (SE).

**Note:** All CPU times of an IBM specialty engine that are reported in DB2 trace records are already normalized by DB2 to the speed of the general purpose processor.

**Field Name:** QPACCLS7_ZIIP

**CLASS 8: LOCK/LATCH SUSP TIME**

The accumulated lock elapsed wait time that occurred while executing this package.

**Background and Tuning Information**

OMEGAMON XE for DB2 PE might adjust this value if the thread was suspended when performance data was gathered.

If the suspension time is high, investigate locking activity.

**Field Name:** QPACAWTL

This is an *exception* field.

**CLASS 8: LOCK/LATCH SUSP EVENTS**

The number of wait trace events processed for waits for lock while executing this package.

**Field Name:** QPACARNL

**CLASS 8: WAIT TIME LOCAL LOCKS**

The accumulated latch elapsed wait time for latch suspensions that occurred while executing this package.

**Field Name:** QPACAWLH

**CLASS 8: LOCAL LOCK WAIT TRACE EVENTS**

The number of wait trace events processed for page latch contention while executing this package.

**Field Name:** QPACANLH

**CLASS 8: DB2 LATCH SUSP TIME**

The accumulated lock elapsed wait time that occurred while executing this package.

**Background and Tuning Information**

OMEGAMON XE for DB2 PE might adjust this value if the thread was suspended when performance data was gathered.

If the suspension time is high, investigate locking activity.
Field Name: QPACAWTL
This is an exception field.

**CLASS 8: LATCH WAIT TRACE EVENTS**
The number of wait trace events processed for waits for lock while executing this package.

Field Name: QPACARNL

**CLASS 8: SYNCHRONOUS I/O SUSP TIME**
The accumulated elapsed wait time for I/O suspensions under this thread during the execution of the package or DBRM.

**Background and Tuning Information**
OMEGAMON XE for DB2 PE might adjust this value if the thread was suspended when its performance data was gathered.

Field Name: QPACAWTI
This is an exception field.

**CLASS 8: SYNCHRONOUS I/O SUSP EVENTS**
The number of wait trace events processed for I/O.

Field Name: QPACARNE

**CLASS 8: OTHER READ SUSP TIME**
The accumulated waiting time for a read I/O performed under a thread other than this one during the execution of the package or DBRM.

**Background and Tuning Information**
OMEGAMON XE for DB2 PE might adjust this value if the thread was suspended when performance data was gathered.

This field includes waits caused by sequential prefetch, list prefetch, dynamic prefetch, and synchronous read I/O performed by other threads.

If the value in this field is high, the problem could be an I/O bound query using prefetch or an I/O contention. The application is accessing data from a busy data set, volume, or control unit and is continually being suspended. Consult the DBA and MVS systems programmer.

Field Name: QPACAWTR
This is an exception field.

**CLASS 8: OTHER READ SUSP EVENTS**
The number of suspensions due to read I/O.

Field Name: QPACARNR

**CLASS 8: OTHER WRITE SUSP TIME**
The accumulated waiting time due to a write I/O performed for another thread during the execution of a package or DBRM.

**Background and Tuning Information**
If the value in this field is high, the problem could be I/O contention. The application is accessing data from a busy data set, volume, or control unit and is continually being suspended. Consult the DBA and MVS systems programmer to resolve possible data set placement problems.
Field Name: QPACAWTW
This is an exception field.

CLASS 8: OTHER WRITE SUSP EVENTS
The number of suspensions due to write I/O.
Field Name: QPACARNW

CLASS 8: SERV.TASK SWITCH SUSP TIME
The accumulated waiting time due to a synchronous execution unit switch to DB2 services from this thread during the execution of the package or DBRM.

Background and Tuning Information
OMEGAMON XE for DB2 PE might adjust this value if the thread was suspended when its performance data was gathered.
This value includes the waits because of an OPEN/CLOSE data set, SYSLGRNG update, DATASPACE MANAGER services, DEFINE, EXTEND, and DELETE data set, AUTONOMOUS PROCEDURE, and DDF Requester waiting for Server reply and VSAM Catalog update.
Field Name: QPACAWTE
This is an exception field.

CLASS 8: SERV.TASK SWITCH SUSP EVENTS
The number of wait trace events processed for DB2 service tasks.
Field Name: QPACARNS

CLASS 8: ARCH.LOG(QUIES) SUSP TIME
The accumulated waiting time caused by processing ARCHIVE LOG(QUIESCE) commands during the execution of the package or DBRM. This number represents the amount of time that an individual thread was suspended because of the command, not the time it took for the entire command to complete.

Background and Tuning Information
OMEGAMON XE for DB2 PE might adjust this value if the thread was suspended when its performance data was gathered.
Avoid issuing the -ARCHIVE LOG QUIESCE command during peak periods.
Field Name: QPACALOG

CLASS 8: ARCH.LOG(QUIES) SUSP EVENTS
The number of ARCHIVE LOG MODE (QUIESCE) commands issued.
Field Name: QPACALCT

CLASS 8: DRAIN LOCK SUSP TIME
The accumulated waiting time due to a drain lock.
Field Name: QPACAWDR

CLASS 8: DRAIN LOCK SUSP EVENTS
The number of wait trace events processed for waits for drain locks.
Field Name: QPACARND

CLASS 8: CLAIM RELEASE SUSP TIME

The accumulated waiting time for a drain waiting for claims to be released during the execution of the package or DBRM.

Background and Tuning Information

OMEGAMON XE for DB2 PE might adjust this value if the thread was suspended when its performance data was gathered.

Field Name: QPACAWCL

CLASS 8: CLAIM RELEASE SUSP EVENTS

The number of wait trace events processed for waits for claims to be released.

Field Name: QPACARNC

CLASS 8: PAGE LATCH SUSP TIME

The accumulated waiting time caused by a page latch contention.

Field Name: QPACAWTP

CLASS 8: PAGE LATCH SUSP EVENTS

The number of page latch wait trace events processed.

Field Name: QPACARNH

CLASS 8: NOTIFY MESSAGES SUSP TIME

The accumulated elapsed waiting time due to suspensions caused by sending notify messages to other members in the data sharing group. Messages are sent, for example, when database descriptors are changed due to DDL.

This value is only calculated if accounting class 8 is active and DB2 is a member of a DB2 data sharing group.

Field Name: QPACAWTG

CLASS 8: NOTIFY MESSAGES EVENTS

The number of wait trace entry/exit events processed for waits for notify messages to other members in the data sharing group.

Field Name: QPACARNG

CLASS 8: GLOBAL CONTENT. PARENT SUSP TIME

The accumulated wait time due to global contention for parent L-locks. Parent L-Locks are any of the following L-Lock types: database, tablespace, table, or partition.

Field Name: QPACAWTJ

CLASS 8: GLOBAL CONTENT. PARENT EVENTS

The number of wait trace entry/exit events processed for waits for global lock contention for parent L-Locks.

Field Name: QPACARNJ

CLASS 8: UDF EXECUTED

The number of user-defined functions scheduled.
Field Name: QPACUDNU

CLASS 8: STORED PROCEDURE EXECUTED
    The number of stored procedures scheduled.

Field Name: QPACSPNS

CLASS 8: TCP/IP LOB XML TIME
    The number of wait trace events that were processed for waits for TCP/IP
    LOB and XML materialization while this package or DBRM was running.

Field Name: QPACALBC

CLASS 8: TCP/IP LOB XML EVENTS
    The accumulated wait time for TCP/IP LOB and XML materialization
    while running this package or DBRM.

Field Name: QPACALBW

ACCELERATOR SUSP TIME
    The accumulated wait time for requests to an accelerator while executing
    this package.

Field Name: QPACAACW

ACCELERATOR EVENTS
    The number of wait trace events processed for requests to an accelerator
    while executing this package.

Field Name: QPACAACC

PARALLEL QUERY SYNC WAIT TIME
    The accumulated time waiting for parallel query processing to synchronize
    between parent and child tasks.

Field Name: QPAC_PQS_WAIT

PARALLEL QUERY SYNC WAIT EVENTS
    The number of times the parallel query processing suspended because it
    was waiting for the synchronization of the parent/child.

Field Name: QPAC_PQS_COUNT

FAST INSERT PIPE WAIT TIME
    The accumulated wait time for a pipe while this package was executed
    (DB2 field QPAC_PIPE_WAIT).

Field Name: QPAC_PIPE_WAIT

FAST INSERT PIPE WAIT EVENTS
    The number of wait trace events that were processed for waits for a pipe
    while this package was executed (DB2 field QPAC_PIPEWAIT_COUNT).

Field Name: QPACPIPEWAIT_COUNT

IFCID 350 - SQL Statement:

This topic shows detailed information about “Record Trace - IFCID 350 - SQL
Statement”.

4158 IBM Db2 Performance Expert on z/OS
IFCID 350 records the complete text of a parsed SQL statement. These records are written when a static or dynamic SQL statement is bound.

**Record trace - IFCID 350 - SQL Statement**

The field labels shown in the following sample layout of “Record Trace - IFCID 350 - SQL Statement” are described in the following section.

```
OPTIONS : X'04'   HOST LANG : N/A
SQL SEGMENT : PORTION  STMT ID : N/A
STMT TYPE : N/A   CCSID : N/A
SQL LENGTH: 0
SQL STATEMENT:
```

**OPTIONS**

Shows the parser options and host language.

*Field Name:* QW0350OT

**HOST LANG**

Determines the host language. It can have the following values:

- ASSEMBLER
- COBOL
- C
- FORTRAN
- PL/I
- COBOL II
- IBM COBOL
- C++

*Field Name:* QW0350HL

**SQL SEGMENT**

Shows the first, the last, the complete, or a portion of the SQL statement.

*Field Name:* QW0350FG

**STMT ID**

The statement identifier.

*Field Name:* QW0350SI

**STMT TYPE**

The statement type. Possible values are DYNAMIC, STATIC, or N/P.

*Field Name:* QW0350TY

**CCSID**

The coded character set identifier (CCSID).

*Field Name:* QW0350CC

**SQL LENGTH**

The total length of the SQL statement. The maximum length is 5000 bytes.

*Field Name:* QW0350TL

**SQL STATEMENT**

Shows the complete SQL statement that is being parsed or only a part of it.
IFCID 350 - SQL Statement

Note: Host variables in this field are represented by :h.

Field Name: QW0350SP

IFCID 351 - Wait TCPIP LOB:

This topic shows detailed information about “Record Trace - IFCID 351 - Wait TCPIP LOB”.

IFCID 0351 is generated at the beginning of the time that is spent waiting for TCP/IP to materialize a LOB. You can activate this trace by starting accounting trace class 3 or 8.

Record trace - IFCID 351 - Wait TCPIP LOB

The field labels shown in the following sample layout of “Record Trace - IFCID 351 - Wait TCPIP LOB” are described in the following section.

REQUEST TYPE : CLOSEALL

REQUEST TYPE

The request type. Possible values are:

GET Materialize a LOB/XML value into the database.

CLOSE Receive and discard a LOB/XML value from the network.

CLOSEALL Receive and discard all the LOB/XML values for this request.

Field Name: QW0351RT

IFCID 353 - IBM Service Record:

This topic shows detailed information about “Record Trace - IFCID 353 - IBM Service Record”.

This record is for IBM service use.

IFCID 354 - IBM Service Record:

This topic shows detailed information about “Record Trace - IFCID 354 - IBM Service Record”.

4160 IBM Db2 Performance Expert on z/OS
This record is for IBM service use.

**IFCID 357 - Beginning of an Index I/O Parallel INSERT:**

This topic shows detailed information about “Record Trace - IFCID 357 - Beginning of an Index I/O Parallel INSERT”.

IFCID 357 records the beginning of data insertion into an index, with I/O parallelism. This record is written when performance trace class 4 is active.

**Record trace - IFCID 357 - Beginning of an Index I/O Parallel INSERT**

The field labels shown in the following sample layout of “Record Trace - IFCID 357 - Beginning of an Index I/O Parallel INSERT” are described in the following section.

| DATABASE ID: | 0B123456 | TABLE OBID: | TB12345678 | IDX SPACE PG SET ID: | x'1234' |

**DATABASE ID**

The database identifier (ID) of the first index involved in the I/O parallel INSERT.

**Field Name:** QW0357DB

**TABLE OBID**

The object identifier (OBID) of the table involved in the INSERT.

**Field Name:** QW0357TB

**IDX SPACE PG SET ID**

The page set ID of the first index.

**Field Name:** QW0357PS

**IFCID 358 - End of an Index I/O Parallel INSERT:**

This topic shows detailed information about “Record Trace - IFCID 358 - End of an Index I/O Parallel INSERT”.

IFCID 358 records the end of data insertion into an index, with I/O parallelism. This record is written when performance trace class 4 is active.

**Record trace - IFCID 358 - End of an Index I/O Parallel INSERT**

The field labels shown in the following sample layout of “Record Trace - IFCID 358 - End of an Index I/O Parallel INSERT” are described in the following section.

| DATABASE ID: | 0B123456 | TABLE OBID: | TB12345678 | IDX SPACE PG SET ID: | x'1234' | PARALL. DEGREE: | 12345678 |

**DATABASE ID**

The database ID of the last index involved in the I/O parallel INSERT.

**Field Name:** QW0358DB

**TABLE OBID**

The object identifier (OBID) of the table involved in the INSERT.

**Field Name:** QW0358TB

**IDX SPACE PG SET ID**

The page set ID of the last index.
IFCID 358 - End of an Index I/O Parallel INSERT

Field Name: QW0358PS

PARALL. DEGREE

The degree of I/O parallelism on the INSERT.

Field Name: QW0358DE

IFCID 359 - Index Page Split:

This topic shows detailed information about “Record Trace - IFCID 359 - Index Page Split”.

IFCID 359 records information about index page splits. This record is written when performance trace class 4 is active.

Record trace - IFCID 359 - Index Page Split

The field labels shown in the following sample layout of “Record Trace - IFCID 359 - Index Page Split” are described in the following section.

DATABASE ID:

Field Name: QW0359DB

INDEX PAGE SET ID:

Field Name: QW0359OB

PARTITION NUMBER:

Field Name: QW0359PT

SPLITTING PAGE NUMBER:

Field Name: QW0359PG

FLAGS

Shows if the index depends on the group buffer pool (GBP).

Field Name: QW0359FL

TIMESTAMP BEGIN

The time stamp when index splitting started.

Field Name: QW0359TS

TIMESTAMP END

The time stamp when index splitting stopped.

Field Name: QW0359TE
IFCID 360 - Incrementally Rebound Queries:

This topic shows detailed information about “Record Trace - IFCID 360 - Incrementally Rebound Queries”.

IFCID 360 records information about queries that are incrementally rebound, because parallelism was chosen in packages that were created before DB2 10. This record is written when performance trace class 3 or 10 is on.

Record trace - IFCID 360 - Incrementally Rebound Queries

The field labels shown in the following sample layout of “Record Trace - IFCID 360 - Incrementally Rebound Queries” are described in the following section.

### PLAN NAME

The name of the plan.

**Field Name:** QW0360PLAN

### QUERY STMT NUMBER

The query statement number.

**Field Name:** QW0360STMTNO

### QUERY SECT NUMBER

The query section number.

**Field Name:** QW0360SECTN

### COLLECTION NAME

The name of the package collection ID.

**Field Name:** QW0360COLLIDN

### PACKAGE NAME

The name of the package.

**Field Name:** QW0360PKGIDN

### PKG CONSIST TOKEN

The package consistency token.

**Field Name:** QW0360CONTK

IFCID 361 - Audit Admin Authorities:

This topic shows detailed information about “Record Trace - IFCID 361 - Audit Admin Authorities”.

Record trace - IFCID 361 - Audit Admin Authorities

The field labels shown in the following sample layout of “Record Trace - IFCID 361 - Audit Admin Authorities” are described in the following section.
IFCID 361 - Audit Admin Authorities

TARGET OBJ QUALIF: ADMF001
TARGET OBJ NAME : N/P
OTHER OBJ NAME : N/P

SQL STATEMENT: GRANT DBADM TO OMVSADM

AUTHORITY TYPE

The authority type.
Possible values are:
- SYSDBADM (System DBADM)
- DBCTRL
- DBADM
- SECADM
- ACCSCTRL (ACCESSCTRL)
- SYSADMI (Installation SYSADM)
- SQLADM
- SYSCTRL
- DBMAINT
- SYSOPR
- PACKADM
- SYSOPRI (Installation SYSOPR)
- SYSADM
- DATAACCESS (DATAACCESS)
- USER

Field Name: QW0361AT

AUTHID TYPE

The authorization ID type. Possible values are:

AUTHORIZATION ID
Indicates that the authorization ID (AUTH ID) is used.

L Indicates that ROLE is used.

Field Name: QW0361IT

PRIVILEGE CHECKED

The privilege that was checked. Possible values are provided in the DB2 macro DSNRQW05.

Field Name: QW0361PR

OBJECT TYPE

The DB2 object type.
Possible values are:
- ACEE
- BUFFER (Bufferpool)
- COLLECT (Collection)
- DATABASE
- DISTTYPE (Distinct Type)
- FUNCTION
- SESSIONV (Session Variable)
Field Name: QW0361OT

AUTHORIZATION ID
The authorization ID or the role that has the authority.

Field Name: QW0361ID

SOURCE OBJ QUALIF
The source object qualifier or owner.

Field Name: QW0361SC

SOURCE OBJ NAME
The source object name.

Field Name: QW0361SN

TARGET OBJ QUALIF
The target object qualifier or owner.

Field Name: QW0361TC

TARGET OBJ NAME
The target object name.

Field Name: QW0361TN

OTHER OBJ NAME
The other object name or subsystem parameter.

Field Name: QW0361ON

SQL STATEMENT
The SQL statement (truncated at 4000 bytes).

Field Name: QW0361SQ

IFCID 362 - Start Trace and Stop Trace with Audit Policy:
This topic shows detailed information about “Record Trace - IFCID 362 - Start Trace and Stop Trace with Audit Policy”.

IFCID 362 - Start Trace and Stop Trace with Audit Policy

**Field Name:** QW0363EI

**IFCID 365 - Remote Location Statistics:**

This topic shows detailed information about “Record Trace - IFCID 365 - Remote Location Statistics”.

IFCID 0365 records detailed statistics about the remote locations with which a DB2 subsystem communicates using the DRDA protocol. This record is written when Statistics trace class 7 is on. The DDF DATA BY LOCATION section is shown for each location with which the DB2 subsystem communicates.

**Record trace - IFCID 365 - Remote Location Statistics**

The field labels shown in the following sample layout of “Record Trace - IFCID 365 - Remote Location Statistics” are described in the following section.

**SECTIONS IN RECORD**

Provides the number of QLST sections that are part of this IFCID 365 record.

**Field Name:** QW0365NO

**ANOTHER IFCID365 FOLLOWS**

This bitcounter indicates if another IFCID 365 is shown in the DB2 trace data.

**Field Name:** QW0365FL

**LOCATION NAME (SHORT)**

The name of the remote location.

**Field Name:** QLSTLOCN

**PRDID REMOTE LOCATION**

The product ID and version of the remote location.

**Field Name:** QLSTPRID

**LOCATION NAME (LONG)**

The name of the remote location.

**Field Name:** QLSTLOCN

**INITIATED CONVERSATIONS**
The number of conversations that were initiated from the requester location. This value is maintained at the requester location. This value is updated at the server location.

Field Name: QLSTCNVS

DEALLOCA TED CONVERSATIONS

The number of conversations that were deallocated from this site to the remote site.

Field Name: QLSTCNVT

INITIATED FROM REMOTE SITE

The number of conversations that were initiated at the server location.

Field Name: QLSTCNVI

MESSAGES SENT TO REMOTE

The number of messages sent to the remote location. This value is maintained at the remote location. This value is updated at the server location.

Field Name: QLSTMSGS

MESSAGES RECEIVED FROM REMOTE

The number of messages received by VTAM from the remote location. More messages might be sent from the server location than are received by the requester due to the manner in which distributed SQL statements are processed internally.

Field Name: QLSTMSGR

SQL STATEMENTS SENT TO REMOTE

The number of SQL statements sent to the remote server. This value is updated at the requester location.

Field Name: QLSTSQLS

SQL STATEMENTS RECEIVED FROM REMOTE

The number of SQL statements received from the requester location. This value is updated at the server location.

Field Name: QLSTSQLR

BYTES SENT TO REMOTE

The number of bytes of data sent to the requester location. This value is maintained at the server location.

Field Name: QLSTBYTS

BYTES RECEIVED FROM REMOTE

The number of bytes of data received from the requester location. This value is maintained at the remote location.

Field Name: QLSTBYTR
More bytes of data might be sent from the server location than are received by the requester due to the manner in which distributed SQL statements are processed internally.

Field Name: QLSTBYTR

ROWS SENT TO REMOTE

The number of data rows sent to the requester location (includes SQLDA). This value is updated at the server location.

Field Name: QLSTROWS

ROWS RETRIEVED FR REMOTE

The number of data rows received from the server location. This value is maintained at the requester location.

Note:

• This value does not include any SQLDA or SQLCA transmitted.
• Block fetch can significantly affect the number of rows sent across the network. When used with nonupdate cursors, block fetch groups as many rows as possible into the message buffer, and transmits the buffer over the network without requiring a VTAM message. Consequently, more rows of data might be sent from the server location than are received by the requester location.

This is especially true when DB2 private protocol is used because multiple blocks can be transmitted from the server with no intervening messages from the requester.

Field Name: QLSTROWR

BLOCKS TRANSMITTED

The number of blocks transmitted using block fetch. This value is maintained at the server location.

Field Name: QLSTBTBF

BLOCKS RECEIVED

The number of blocks received from the remote location using block fetch. This value is maintained at the requester location.

Field Name: QLSTBRBF

IFCID 366 - Incompatible Functions Executed:

This topic shows detailed information about “Record Trace - IFCID 366 - Incompatible Functions Executed”.

Chapter 6. Batch reporting  4181
IFCID 371 - Database Close Information

Field Name: QW0371DB

OBID

The page set OBID.

Field Name: QW0371OB

PART NUMBER

The part number.

Field Name: QW0371PN

INSTANCE NUMBER

The instance number.

Field Name: QW0371IN

DSMAX

The maximum number of data sets (DSMAX).

Field Name: QW0371DM

DEALLOCATION TIME

The deallocation time. It is based on the execution time of SVC 99 invoked by DSNB1CST.

Field Name: QW0371DA

CLOSE TIME

The close time. It is based on the execution time of DSNB4CDS.

Field Name: QW0371CL

OPENED DATA SETS

The number of opened data sets.

Field Name: QW0371DO

IFCID 377 - Pseudo Delete Daemon Cleanup:

This topic shows detailed information about “Record Trace - IFCID 377 - Pseudo Delete Daemon Cleanup”.

IFCID 0377 records automatic cleanup of pseudo-deleted index entries by the index pseudo-delete daemon. This record is not associated with a trace class.

Record trace - IFCID 377 - Pseudo Delete Daemon Cleanup

The field labels shown in the following sample layout of “Record Trace - IFCID 377 - Pseudo Delete Daemon Cleanup” are described in the following section.
DATABASE ID

The database ID of the index for which entries are cleaned up.

Field Name: QW0377DB

INDEX PAGE NUMBER

The page number of the index page that was cleaned up.

Field Name: QW0377PG

PARTITION NUMBER

The index partition number.

Field Name: QW0377PT

INDEX PAGE SET ID

The page set ID of the index.

Field Name: QW0377OB

PD ENTRIES REMOVED

The number of pseudo-deleted entries that were removed.

Field Name: QW0377NU

FLAG

The reason for the page removal:

- A page is deleted from an index (DB2 field: QW0377DL)
- A page is cleaned up (DB2 field: QW0377CL)

Field Name: RW0377DL

IFCID 378 - Accel. Call Event Begin:

This topic shows detailed information about “Record Trace - IFCID 378 - Accel. Call Event Begin”.

Record trace - IFCID 378 - Accel. Call Event Begin

The field labels shown in the following sample layout of “Record Trace - IFCID 378 - Accel. Call Event Begin” are described in the following section.

ACCELERATOR NAME: VMNPS14

ACCELERATOR NAME

The name of the accelerator.

Field Name: QW0378ACN
IFCID 379 - Accel. Call Event End

IFCID 379 - Accel. Call Event End:

This topic shows detailed information about “Record Trace - IFCID 379 - Accel. Call Event End”.

Record trace - IFCID 379 - Accel. Call Event End

The field labels shown in the following sample layout of “Record Trace - IFCID 379 - Accel. Call Event End” are described in the following section.

ACCELERATOR NAME: VMNPS14

ACCELERATOR NAME

The name of the accelerator.

Field Name: QW0379ACN

IFCID 380 - Stored Procedure Detail Record:

This topic shows detailed information about “Record Trace - IFCID 380 - Stored Procedure Detail Record”.

IFCID 380 (Stored procedure detail record) and IFCID 381 (UDF detail record) have the same mapping structure.

Both records are written at the beginning and the end of a stored procedure or UDF.

The first data section of IFCID 380 shows fields provided with IFCID 233. The second data section starting with CURRENT TOTAL NESTED CLASS 1 CP TIME shows additional fields for IFCID 380 and IFCID 381.

Record trace - IFCID 380 - Stored Procedure Detail Record

The field labels shown in the following sample layout of “Record Trace - IFCID 380 - Stored Procedure Detail Record” are described in the following section.

LOCATION NAME

The location name.
Field Name: QW0233LN

COLLECTION ID
The package collection identifier.
Field Name: QW0233PC

PROGRAM NAME
The program name.
Field Name: QW0233PN

SCHEMA NAME
The name of the schema associated with this routine.
Field Name: QW0233SC

ROUTINE NAME
The specific name of the routine.
Field Name: QW0233SC

VERSION NAME
The name of the version.
Field Name: QW0233PR

ROUTINE TYPE
The routine type can have the following values:

PROCEDURE
The routine is a stored procedure

FUNCTION
The routine is a User-Defined Function
Field Name: QW0233TY

CONSISTENCY TOKEN
The consistency token.
Field Name: QW0233TS

ENTRY/EXIT TYPE
The entry or exit event type can have the following values:

ENTERING
The agent is entering a routine.

RETURNED
The agent has returned from a routine.
Field Name: QW0233EX

NESTING LEVEL
The nesting level of the routine.
Field Name: QW0233NL

STATEMENT NO
The statement number of the statement executed.
Field Name: QW0233SN
IFCID 380 - Stored Procedure Detail Record

TYPE
The statement type. Possible values are DYNAMIC or STATIC.
Field Name: QW0233STY

ROUTINE ID
The routine identifier.
Field Name: QW0233RID

STATEMENT ID
The unique identifier of the currently executing statement. It is shown as an integer and in hexadecimal format.
Field Name: QW0233SID

CONV INTO HEX
The unique identifier of the currently executing statement. It is shown as an integer and in hexadecimal format.
Field Name: QW0233SID

CURRENT TOTAL NESTED CLASS 1 CP TIME
The current, total, nested class 1 CP time. This does not include time spent executing on an IBM specialty engine.
Field Name: QW0380_CLS1CP

CURRENT TOTAL NESTED CLASS 1 SE TIME
The current, total, nested class 1 specialty engine time.
Field Name: QW0380_CLS1SE

CURRENT TOTAL NESTED CLASS 2 CP TIME
The current, total, nested class 2 CP time. This is time in the DB2 processing SQL statements. This time also includes in DB2 time needed to connect and disconnect the SP task for non-SQL procedure stored procedures. This does not include time spent executing on an IBM specialty engine.
Field Name: QW0380_CLS2CP

CURRENT TOTAL NESTED CLASS 2 SE TIME
The current, total, nested class 2 specialty engine time. This is the time in DB2 processing SQL statements.
Field Name: QW0380_CLS2SE

CURRENT TOTAL NESTED ELAPSED CLASS 2 TIME
The current, total, nested elapsed class 2 time. This is the time in DB2 processing SQL statements. This time also includes in DB2 time needed to connect and disconnect the SP task for non-SQL procedure stored procedures.
Field Name: QW0380_CLS2ELAP

IFCID 381 - UDF Detail Record:
This topic shows detailed information about “Record Trace - IFCID 381 - UDF Detail Record”.

4186 IBM Db2 Performance Expert on z/OS
IFCID 380 (Stored procedure detail record) and IFCID 381 (UDF detail record) have the same mapping structure.

Both records are written at the beginning and the end of a stored procedure or UDF.

The first data section of IFCID 380 shows fields provided with IFCID 233. The second data section starting with CURRENT TOTAL NESTED CLASS 1 CP TIME shows additional fields for IFCID 380 and IFCID 381.

Record trace - IFCID 381 - UDF Detail Record

The field labels shown in the following sample layout of "Record Trace - IFCID 381 - UDF Detail Record" are described in the following section.

LOCATION NAME
The location name.

Field Name: QW0233LN

COLLECTION ID
The package collection identifier.

Field Name: QW0233PC

PROGRAM NAME
The program name.

Field Name: QW0233PN

SCHEMA NAME
The name of the schema associated with this routine.

Field Name: QW0233SC

ROUTINE NAME
The specific name of the routine.

Field Name: QW0233PR

VERSION NAME
The name of the version.

Field Name: QW0233VER

ROUTINE TYPE
The routine type can have the following values:

**PROCEDURE**
The routine is a stored procedure

**FUNCTION**
The routine is a User-Defined Function

**Field Name:** QW0233TY

**CONSISTENCY TOKEN**
The consistency token.

**Field Name:** QW0233TS

**ENTRY/EXIT TYPE**
The entry or exit event type can have the following values:

**ENTERING**
The agent is entering a routine.

**RETURNED**
The agent has returned from a routine.

**Field Name:** QW0233EX

**NESTING LEVEL**
The nesting level of the routine.

**Field Name:** QW0233NL

**STATEMENT NO**
The statement number of the statement executed.

**Field Name:** QW0233SN

**TYPE**
The statement type. Possible values are DYNAMIC or STATIC.

**Field Name:** QW0233STY

**ROUTINE ID**
The routine identifier.

**Field Name:** QW0233RID

**STATEMENT ID**
The unique identifier of the currently executing statement. It is shown as an integer and in hexadecimal format.

**Field Name:** QW0233SID

**CONV INTO HEX**
The unique identifier of the currently executing statement. It is shown as an integer and in hexadecimal format.

**Field Name:** QW0233SID

**CURRENT TOTAL NESTED CLASS 1 CP TIME**
The current, total, nested class 1 CP time. This does not include time spent executing on an IBM specialty engine.

**Field Name:** QW0380_CLS1CP
CURRENT TOTAL NESTED CLASS 1 SE TIME

The current, total, nested class 1 specialty engine time.

**Field Name:** QW0380_CLS1SE

CURRENT TOTAL NESTED CLASS 2 CP TIME

The current, total, nested class 2 CP time. This is time in the DB2 processing SQL statements. This time also includes in DB2 time needed to connect and disconnect the SP task for non-SQL procedure stored procedures. This does not include time spent executing on an IBM specialty engine.

**Field Name:** QW0380_CLS2CP

CURRENT TOTAL NESTED CLASS 2 SE TIME

The current, total, nested class 2 specialty engine time. This is the time in DB2 processing SQL statements.

**Field Name:** QW0380_CLS2SE

CURRENT TOTAL NESTED ELAPSED CLASS 2 TIME

The current, total, nested elapsed class 2 time. This is the time in DB2 processing SQL statements. This time also includes in DB2 time needed to connect and disconnect the SP task for non-SQL procedure stored procedures.

**Field Name:** QW0380_CLS2ELAP

IFCID 384 - IBM Service Record:

This topic shows detailed information about “Record Trace - IFCID 384 - IBM Service Record”.

This record is for IBM service use.

IFCID 385 - IBM Service Record:

This topic shows detailed information about “Record Trace - IFCID 385 - IBM Service Record”.

This record is for IBM service use.

IFCID 386 - IBM Service Record:

This topic shows detailed information about “Record Trace - IFCID 386 - IBM Service Record”.

This record is for IBM service use.

IFCID 389 - FTB Indexes:

This topic shows detailed information about “Record Trace - IFCID 389 - FTB Indexes”.

IFCID 389 traces indexes with structures for fast index traversal (FTB). This record is written when the Statistics class 8 trace is on.
### NUMBER OF INDEXES

The number of indexes with fast traversal blocks.

**Field Name**: QW0389NU

**DBID**

The database ID.

**Field Name**: QW0389DB

**PSID**

The index page set ID.

**Field Name**: QW0389OB

**PARTITION NO**

The partition number.

**Field Name**: QW0389PT

**INDEX LEVELS**

The number of index levels in the fast traversal block.

**Field Name**: QW0389LV

**FTB SIZE**

Indicates the size of the fast traversal block (FTB), in bytes.

**Field Name**: QW0389SZ

---

**IFCID 390 - IBM Service Record:**

This topic shows detailed information about “Record Trace - IFCID 390 - IBM Service Record”.

This record is for IBM service use.

**IFCID 391 - IBM Service Record:**

This topic shows detailed information about “Record Trace - IFCID 391 - IBM Service Record”.

This record is for IBM service use.
IFCID 397 - IBM Service Record:

This topic shows detailed information about “Record Trace - IFCID 397 - IBM Service Record”.

This record is for IBM service use.

IFCID 398 - IBM Service Record:

This topic shows detailed information about “Record Trace - IFCID 398 - IBM Service Record”.

This record is for IBM service use.

IFCID 399 - IBM Service Record:

This topic shows detailed information about “Record Trace - IFCID 399 - IBM Service Record”.

This record is for IBM service use.

IFCID 401 - Static Statements in EDM Pool:

This topic shows detailed information about “Record Trace - IFCID 401 - Static Statements in EDM Pool”.

IFCID 401 has READS and READA capability. It supports threshold value filtering.

Record trace - IFCID 401 - Static Statements in EDM Pool

The field labels shown in the following sample layout of “Record Trace - IFCID 401 - Static Statements in EDM Pool” are described in the following section.

Accumulated Execution Time: 0.138040
Accumulated Queue Wait Time: 0.000000
Wait Time for 1st Row: 0.048265

PACKAGE NAME
The package name.
Field Name: QW0401PK

COLLECTION ID
The collection ID.
Field Name: QW0401CL

DATE/TIME WHEN INSERTED
The date or time when the statement was inserted into the EDM Pool.
Field Name: QW0401TM

STORE CLOCK FORMAT
The date or time when the statement was inserted into the EDM pool (in store clock format) (DB2 field: QW0401TM2).
Field Name: RT401TM2

DATE/TIME WHEN UPDATED
The date or time when statement statistics were updated (in external format) (DB2 field: QW0401UT2).
Field Name: RT401UT2

STORE CLOCK FORMAT
The date or time when statement statistics were updated (in store clock format) (DB2 field: QW0401UT1).
Field Name: RT401UT1

CONSISTENCY TOKEN
The consistency token of the package.
Field Name: QW0401CT

STATEMENT IDENTIFIER
The statement identifier.
Field Name: QW0401ID

ELIGIBLE FOR ACCELERATOR
The statement is eligible for the execution on an accelerator (DB2 field: QW0401ELI).
Field Name: 401ELI

NBR OF EXECUTIONS
The number of executions.
Field Name: QW0401EX

NBR OF SYNC BUFFER READS
The number of synchronous buffer reads.
Field Name: QW0401SR
NBR OF GETPAGES
The number of Getpages.
Field Name: QW0401GP

NBR OF ROWS EXAMINED
The number of rows examined.
Field Name: QW0401ER

NBR OF ROWS PROCESSED
The number of rows processed.
Field Name: QW0401PR

NBR OF SORTS
The number of sorts.
Field Name: QW0401ST

NBR OF INDEX SCANS
The number of index scans.
Field Name: QW0401IX

NBR OF TABLESPACE SCANS
The number of tablespace scans.
Field Name: QW0401TB

NBR OF BUFFER WRITES
The number of buffer writes.
Field Name: QW0401WT

NBR OF PAR. GRPS CREATED
The number of parallel groups created.
Field Name: QW0401PG

IN-DB2 ELAPSED
Accumulated in-DB2 elapsed time.
Field Name: QW0401ET

IN-DB2 CPU
The accumulated in-DB2 CPU time. This time includes CPU consumed on an IBM specialty engine.
Field Name: QW0401CP

WAIT FOR SYNC I/O
The accumulated wait time for synchronous I/O.
Field Name: QW0401SI

WAIT FOR LOCK/LATCH
The accumulated wait time for locks.
Field Name: QW0401LK

SYNC EXEC UNIT SWITCH
IFCID 401 - Static Statements in EDM Pool

The accumulated wait time for synchronous execution unit switch.

**Field Name:** QW0401EU

**WT FOR GLOBAL LOCKS**

The accumulated wait time for global locks.

**Field Name:** QW0401GL

**WT FOR READ BY OTHER THR**

The accumulated wait time for a read activity done by another thread.

**Field Name:** QW0401OR

**WT FOR WRTE BY OTHER THR**

The accumulated wait time for a write activity done by another thread.

**Field Name:** QW0401OW

**WAIT FOR LATCH REQ**

The accumulated wait time for a latch request.

**Field Name:** QW0401LH

**WAIT FOR PAGE LATCH**

The accumulated wait time for a page latch.

**Field Name:** QW0401PL

**WAIT FOR DRAIN LOCK**

The accumulated wait time for a drain lock.

**Field Name:** QW0401DL

**WAIT FOR CLAIM RELEASE**

The accumulated wait time for a drain lock that is waiting for claims to be released.

**Field Name:** QW0401CM

**WAIT FOR LOG WRITER**

The accumulated wait time for a log writer.

**Field Name:** QW0401LW

**WAIT CHILD L-LOCKS**

The accumulated wait time for child L-locks for the statement.

**Field Name:** QW0401WC

**WAIT OTHER L-LOCKS**

The accumulated wait time for other L-locks for the statement.

**Field Name:** QW0401WD

**WAIT P/P P-LOCKS**

The accumulated wait time for P/P P-locks for the statement.

**Field Name:** QW0401WE

**WAIT PAGE P-LOCKS**

The accumulated wait time for page P-locks for the statement.
Field Name: QW0401WF

WAIT OTHER P-LOCKS
The accumulated wait time for other P-locks for the statement.

Field Name: QW0401WG

FAST INSERT PIPE WAIT TIME
The accumulated wait time for pipe wait.

Field Name: QW0401WH

PARENT CHILD WAIT TIME
The accumulated time waiting for parallel queries to synchronize between parent and child tasks.

Field Name: QW0401WPQS

RL NOT USED LIMIT EXCEEDED
The number of times RID list was not used because the number of:
• RIDs would have exceeded the DB2 limits
• RID blocks exceeded the value set by the MAXTEMPS_RID system parameter

Field Name: QW0401RL

RL NOT USED NO STOR AVAL
The number of time a RID list was not used because there is not enough storage available to hold the list of RIDs. This also applies if the work file storage was not available.

Field Name: QW0401RS

RL OV - NO POOL STOR AVAL
The number of times a RID list was overflowed to a work file because no RID pool storage was available to hold the list of RIDs (DB2 field: QW0401WFRIDS).

Field Name: RT401IDS

RL OV - RIDS EXCEED LIMIT
The number of times a RID list was overflowed to a work file because the number of RIDs exceeded one or more internal limits (DB2 field: QW0401WFRIDT).

Field Name: RT401IDT

HJA - NO POOL STOR AVAL
The number of times a RID list append for a hybrid join was interrupted because no RID pool storage was available to hold the list of RIDs. It shows the number of times DB2 interrupted the RID phase and switched to the data phase (DB2 field: QW0401HJINCS).

Field Name: RT401NCS

HJA - RIDS EXCEED LIMIT
The number of times a RID list append for a hybrid join was interrupted because the number of RIDs exceeded one or more internal limits. It shows
IFCID 401 - Static Statements in EDM Pool

the number of times DB2 interrupted the RID phase and switched to the data phase (DB2 field: QW0401HJINCT).

Field Name: RT401NCT

RL RETRIEVAL IA SKIPPED

The number of times a RID list retrieval for multiple index access was skipped because DB2 predetermined the outcome of index ANDing or ORing (DB2 field: QW0401RSMIAP).

Field Name: RT401IAP

ACCELERATOR NAME

The accelerator name (DB2 field: QW0401ANM).

Field Name: 401ANM

STATEMENT IDENTIFIER

The statement identifier, for correlation with IFCID 401 data section 1 (DB2 field: QW0401AID).

Field Name: 401AID

ACCELERATOR EXECUTIONS

The number of executions on this accelerator (DB2 field: QW0401AEXEC).

Field Name: 401AEXEC

ACCUMULATED # ROWS RETURNED

Shows the accumulated number of rows returned for the SELECT statement (DB2 field: QW0401AROW).

For completed queries, this is the total number of rows returned that were computed by the accelerator (this is not necessarily the number of rows returned to DB2 in case DB2 does not fetch all rows).

For in-process queries, this is the number of rows that have been sent so far (and more rows may still be coming).

This value is always set to 0 for DML statements (INSERT, UPDATE, DELETE) because these wait times do not occur for DML statements.

Field Name: 401AROW

ACCUMULATED CPU TIME

Shows the accumulated CPU time spent in the accelerator when processing the query request for the statement.

This value reflects parallel processing such that the CPU value may exceed the accumulated elapsed time (DB2 field: QW0401ACPU).

For completed queries, this is the CPU time from the initial request to the last row being returned to DB2. For in-process queries, this is the time from the initial request to the current point in time. The counter includes the CPU time spent in the accelerator and also the CPU time spent in the Netezza backend (on the coordinator node and all worker nodes).

Field Name: 401ACPU

ACCUMULATED # BYTES RETURNED

Shows the accumulated number of bytes returned for the SELECT statement (DB2 field: QW0401ABYT).
For completed queries, this is the total number of bytes returned and produced by the accelerator (this is not necessarily the total number of bytes returned to DB2 in case DB2 does not fetch all the data).

For in-process queries, this is the number of bytes that have been sent so far (and more bytes may still be coming).

This value is always set to 0 for DML statements (INSERT, UPDATE, DELETE) because no such wait times occurs.

Field Name: 401ABYT

ACCUMULATED ELAPSED TIME

Shows the accumulated elapsed time spend in the accelerator processing the query request for the statement (DB2 field: QW0401AELA).

For completed queries, this is the time from the initial request to the last row that is returned to DB2. For in-process queries, this is the time from the initial request to the current point in time.

Field Name: 401AELA

ACCUMULATED EXECUTION TIME

Shows the accumulated execution time spent in processing the query request for the statement (DB2 field: QW0401AEXE).

For completed queries, this is the time spent since starting the query execution until the query execution has finished. Subsequent processing and transfer of the result set is not included, but there may be an overlapping time window in which result set processing (fetching) and query execution takes place.

For in-process queries, it is the time measured from starting query execution inside the accelerator up to the current point in time or until query execution has finished and only result set processing and transfer remains (whichever occurs earlier).

This time is measured for the actual execution time spent for the query. Compared to the total elapsed time (QW0316AELA and QW0401AELA), it does not include any preprocessing done in the accelerator (such as PREPARE), and it does not include time spent, such as in spill-to-disk or other things, related to the final query result processing.

Field Name: 401AEXE

ACCUMULATED QUEUE WAIT TIME

Shows the accumulated queue wait time for the statement (DB2 field: QW0401AWAT).

For completed queries, this is the time that the query has spent in queues, waiting to be processed.

For in-process queries, the value is only available once the query execution itself has finished and only result processing remains. Until then, the value will be (nearly) 0.

Field Name: 401AWAT

WAIT TIME FOR DB2

Shows the total time the accelerator waited for DB2 to request query results (DB2 field: QW0401ATWDB2).
For completed queries, this is from the time when the first row of the result set was produced by the accelerator until the last row was sent to DB2. For in-process queries, it is 0 (if the accelerator has not yet computed a result row) or the time from computing the first row to the current point in time (if at least one result row is available).

This value is always set to 0 for DML statements (INSERT, UPDATE, DELETE) because these wait times do not occur for DML statements.

**Field Name:** 401ATWDB

**WAIT TIME FOR 1ST ROW**

Shows the time waited for first row of query result to be available (DB2 field: QW0401ATW1R).

For completed queries, this is the time from receiving the query in the accelerator until the first row of the result set was computed. For in-process queries, this is the time from receiving the query in the accelerator to the current point in time (if no result rows are available yet) or until the first row of the result set was computed (if at least one result row is available).

This value is always set to 0 for DML statements (INSERT, UPDATE, DELETE) because no such wait times occurs.

**Field Name:** 401ATW1R

**IFCID 402 - System Profile - Monitoring Statistics:**

This topic shows detailed information about “Record Trace - IFCID 402 - System Profile - Monitoring Statistics”.

IFCID 402 records information about any profile warnings or exception conditions that occurred during a Statistics interval. Each trace record can contain information for up to 500 unique profiles. Multiple trace records are written if profile thresholds are exceeded for more than 500 unique profiles during a given Statistics interval.

This record is written when Statistics class 4 is on.

**Record trace - IFCID 402 - System Profile - Monitoring Statistics**

The field labels shown in the following sample layout of “Record Trace - IFCID 402 - System Profile - Monitoring Statistics” are described in the following section.

The profile ID.

**Field Name:** QW0402PI

**THR EXC TSH EXCEEDED**

---

**IFCID 401 - Static Statements in EDM Pool**

For completed queries, this is from the time when the first row of the result set was produced by the accelerator until the last row was sent to DB2. For in-process queries, it is 0 (if the accelerator has not yet computed a result row) or the time from computing the first row to the current point in time (if at least one result row is available).

This value is always set to 0 for DML statements (INSERT, UPDATE, DELETE) because these wait times do not occur for DML statements.
The accumulated counter of thread exception threshold that was exceeded.

**Field Name:** QW0402TE

**THR QUEUED/SUSP WHEN EXC TSH WAS EXCEEDED**
The accumulated counter of the thread that was queued or suspended when the thread exception threshold was exceeded.

**Field Name:** QW0402TQ

**REQUEST FAILED WHEN THR EXC TSH WAS EXCEEDED**
The accumulated counter of the request that failed when the thread exception threshold was exceeded.

**Field Name:** QW0402TF

**THR WARNING TSH BEING EXCEEDED**
The accumulated counter of thread warning threshold that was exceeded.

**Field Name:** QW0402TW

**CONNECTION EXC TSH BEING EXCEEDED**
Accumulated counter of the connection exception threshold that was exceeded.

**Field Name:** QW0402CE

**CONNECTION WARN TSH BEING EXCEEDED**
The accumulated counter of the connection warning threshold that was exceeded.

**Field Name:** QW0402CW

**IDLE THR EXC TSH BEING EXCEEDED**
The accumulated counter of the idle thread exception threshold that was exceeded.

**Field Name:** QW0402OE

**IDLE THR WARN TSH BEING EXCEEDED**
The accumulated counter of the idle thread warning threshold that was exceeded.

**Field Name:** QW0402OW

**IFCID 404 - IBM Service Record:**
This topic shows detailed information about “Record Trace - IFCID 404 - IBM Service Record”.

This record is for IBM service use.

**Record trace - IFCID 404 - IBM Service Record**
The field labels shown in the following sample layout of “Record Trace - IFCID 404 - IBM Service Record” are described in the following section.
IFCID 413 - Beginning of Wait for Pipe Suspend

IFCID 413 - Beginning of Wait for Pipe Suspend:

This topic shows detailed information about “Record Trace - IFCID 413 - Beginning of Wait for Pipe Suspend”.

This IFCID records the beginning of a wait for a pipe suspend. If Accounting class 3 or Monitor class 3 is on, or if Accounting class 8, Monitor class 8, or Monitor class 29 is on, this IFCID signals the beginning of this wait. The time spent for this wait is reported in IFCID 3 when the wait ends. MONITOR1 privilege is required for reading using the instrumentation facility interface (IFI).

Record trace - IFCID 413 - Beginning of Wait for Pipe Suspend

The field labels shown in the following sample layout of “Record Trace - IFCID 413 - Beginning of Wait for Pipe Suspend” are described in the following section.

PRC NAME
The procedure name that started the pipe wait.
Field Name: QW0413PN

DB ID
The database ID that started the pipe wait.
Field Name: QW0413DB

PAGESET ID
The pageset ID that started the pipe wait.
Field Name: QW0413PS

PARTITION
The partition number that started the pipe wait.
Field Name: QW0413PT

IFCID 414 - End of Wait for Pipe Suspend:

This topic shows detailed information about “Record Trace - IFCID 414 - End of Wait for Pipe Suspend”.

This IFCID records the end of the wait for pipe suspend. If Accounting class 3 or Monitor class 3 is on, or if Accounting class 8, Monitor class 8, or Monitor class 29 is on, this IFCID signals the end of this wait. The time spent for this wait is reported in IFCID 3. MONITOR1 privilege is required for reading using the Instrumentation Facility Interface (IFI).

Record trace - IFCID 414 - End of Wait for Pipe Suspend

The field labels shown in the following sample layout of “Record Trace - IFCID 414 - End of Wait for Pipe Suspend” are described in the following section.

PIPE RESUME REASON: B
QW0414FL: X'0000'

PIPE RESUME REASON
The reason why the pipe resumed.
Field Name: QW0414R

IFCID 477 - FTB IDX ALLOC:

This topic shows detailed information about “Record Trace - IFCID 477 - FTB IDX ALLOC”.

IFCID 477 shows the allocation and deallocation of structures for fast index traversal (FTB). This record is written when the performance class 4 trace is on.

Record trace - IFCID 477 - FTB IDX ALLOC

The field labels shown in the following sample layout of “Record Trace - IFCID 477 - FTB IDX ALLOC” are described in the following section.

<table>
<thead>
<tr>
<th>CONNECT</th>
<th>INSTANCE</th>

</tbody>
</table>

ACTION

Shows the allocation and deallocation for fast index traversal. It can have the following values:

- Create
- Free

Field Name: QW0477FL

DBID

Shows the database ID.

Field Name: QW0477DB

PSID

Shows the index page set ID.

Field Name: QW0477OB

PARTITION NO

Shows the partition number.

Field Name: QW0477PT

INDEX LEVELS

Shows the number of index levels in the fast traversal block (FTB).

Field Name: QW0477LV

FTB SIZE

Shows the size of the fast traversal block (FTB) in bytes.

Field Name: QW0477SZ

IFCID 497 - Non Nested Statement ID Record:

This topic shows detailed information about “Record Trace - IFCID 497 - Non Nested Statement ID Record”.
IFCID 497 - Non Nested Statement ID Record

IFCID 497 (Non Nested Statement ID Record), IFCID 498 (UDF Statement ID Record), and IFCID 499 (Stored Procedure Statement ID Record) have the same mapping structure comprising two data sections.

Record trace - IFCID 497 - Non Nested Statement ID Record

The field labels shown in the following sample layout of “Record Trace - IFCID 497 - Non Nested Statement ID Record” are described in the following section.

IFCID 498 - UDF Statement ID Record:

This topic shows detailed information about “Record Trace - IFCID 498 - UDF Statement ID Record”.

IFCID 497 (Non Nested Statement ID Record), IFCID 498 (UDF Statement ID Record), and IFCID 499 (Stored Procedure Statement ID Record) have the same mapping structure comprising two data sections.

Record trace - IFCID 498 - UDF Statement ID Record

The field labels shown in the following sample layout of “Record Trace - IFCID 498 - UDF Statement ID Record” are described in the following section.
REASON IFCID WAS EXTERNALIZED

Identifies the reason why this IFCID was externalized.

Field Name: QW0499RS

STATEMENT ID

The unique statement identifier. It is shown as an integer and in hexadecimal format.

Field Name: QW0499SID

CONV INTO HEX

The unique statement identifier. It is shown as an integer and in hexadecimal format.

Field Name: QW0499SID

EXECUTIONS

The number of executions.

Field Name: QW0499NEC

TYPE

The statement type. Possible values are DYNAMIC or STATIC. In addition, the statement type of IFCID 499 can also have the values STATIC CALL or DYNAMIC CALL.

Field Name: QW0499STY

IFCID 499 - Stored Procedure Statement ID Record

This topic shows detailed information about “Record Trace - IFCID 499 - Stored Procedure Statement ID Record”.

IFCID 497 (Non Nested Statement ID Record), IFCID 498 (UDF Statement ID Record), and IFCID 499 (Stored Procedure Statement ID Record) have the same mapping structure comprising two data sections.

Record trace - IFCID 499 - Stored Procedure Statement ID Record

The field labels shown in the following sample layout of “Record Trace - IFCID 499 - Stored Procedure Statement ID Record” are described in the following section.
IFCID 499 - Stored Procedure Statement ID Record

Identifies the reason why this IFCID was externalized.

Field Name: QW0499RS

STATEMENT ID

The unique statement identifier. It is shown as an integer and in hexadecimal format.

Field Name: QW0499SID

CONV INTO HEX

The unique statement identifier. It is shown as an integer and in hexadecimal format.

Field Name: QW0499SID

EXECUTIONS

The number of executions.

Field Name: QW0499NEC

TYPE

The statement type. Possible values are DYNAMIC or STATIC. In addition, the statement type of IFCID 499 can also have the values STATIC CALL or DYNAMIC CALL.

Field Name: QW0499STY

The Record Trace File Data Set and Output Records

The record trace file data set is a sequential data set of formatted records suitable for loading into the performance database using the DB2 load utility and from which reports can be produced using a reporting facility such as Query Management Facility (QMF).

The output of the FILE subcommand is a sequential variable blocked data set. The content of the output data set is determined by the FILE command options you specify, and by the input SMF/GTF records processed.

This data set contains SQL statement records and RID pool records.

Descriptions of the Record Trace File data sets and the fields contained can be found in the RKO2SAMP library under the following names:

DGONDFMB
For Minibind (IFCID 022) records

DGONDFSQ
For SQL Statement (IFCID 063) records

DGONDFSE
For Sort End (IFCID 096) records

DGONDFRP
For RID Pool (IFCID 125) records

DGONDFDL
For Deadlock (IFCID 172) records

DGONDFTI
For Timeout (IFCID 196) records
SQL Activity Report Set

These topics provide information about the SQL activity reports.

Note:
1. Refer also to the sections of [Reporting User’s Guide] that deal with SQL Activity.
2. For an introduction to the SQL Activity report set and general SQL Activity information refer to the [Reporting User’s Guide].

Introduction to the SQL Activity Report Set

The SQL Activity report set consists of reports and traces and provides information on the SQL activity taking place during the processing of a DB2 application. The reports show the processing of an SQL statement and all the related DB2 activity, known as workload, related to that statement.

Also included in these reports are trigger and nesting level information. When the appropriate IFCID 003 is present, Accounting Trace is also reported.

In most situations, an SQL Activity trace gives details on either a DB2 thread or part of a reused thread between two signons. In CP query and sysplex query parallelism, an originating thread and multiple parallel threads are created to execute an SQL statement. Data from parallel threads can also be included in the originating thread if you specify an INPUTDD containing the relevant data in your JCL. The term thread is used to include the originating and the parallel threads. The trace is a collection of threads presented in logical unit of work ID (LUWID) sequence with an index to help you find a particular thread.

An SQL Activity report is an aggregation of threads ordered by the combination of OMEGAMON for Db2 PE identifiers you specify. If you specify no OMEGAMON for Db2 PE identifiers with ORDER, the default order of PRIMAUTH and PLANNAME is used. The report is a summary of all the work belonging to, and ordered by, those identifiers.

The following information is collected for each thread provided that the appropriate IFCIDs are available:

- Thread identification (OMEGAMON for Db2 PE identifiers, DB2 logical unit of work ID (LUWID), CICS logical unit of work ID (LUWID), ACE, thread start and stop time, thread type, and location)
- Programs (DBRMs and packages), stored procedures, cursors used, UDF, and triggers.
- SQL statements executed within the thread with their workload detail
- Events and time spent in DDF processing
- Time spent in signon processing
- Time spent creating and terminating threads
- Time spent in autobind processing
- Accounting information
You can control the level of summarization, the sorting of events, and the workload detail within a unit of reporting.

### Explanation of short and long fields

To improve the evaluation of SQL activities, DB2 supports both, short and long fields. If the field value exceeds the available field length (such as long values in the header information), the string is truncated, depending on the space available. Truncated values are then listed at the end of each logical report unit, together with their full values.

A "greater than" sign (>) indicates whether a value is truncated. When a value is truncated, the "greater than" sign (>) is printed instead of a colon (:) following the label name. The full value starts with a "greater than" sign followed by the label. For example:

```
Tname  > This value is truncated
...

>Tname : This value was truncated - now you see its full length
...
```

If truncated values are listed, the "greater than" sign (>) is shown at the end of each value, because there is no colon (:) as a delimiter between the label and the value. In lists the label is used as a column heading.

**Note:** The mapping between truncated and full values remains the same for multiple reports from the same input data. This mapping is not supported for multiple reports from different input data. The printing of abbreviations and full text can cause inaccurate results in Batch SQL Activity output.

Here are examples of SQL Activity layouts with truncated values:

**SQL Activity - Minibind:**

```
ACCESS_CREATOR  ACCESS_NAME  MATCHCOLS  INDEXONLY  PREFETCH_INDEX  OPERATION  MIXOSEQ
TDK_LONG>  IX_OMPE_FIRST_LONG>  0  YES  SEQUENTIAL  SCAN  1
...
>ACCESS_CREATOR : TDK_LONG_NAMED_COLLECTION_FOR_LONG_NAMED_OBJECTS
>ACCESS_NAME : IX_OMPE_FIRST_LONG_NAMED_TABLE_FOR_UNCOMMITTED_READ
```

**SQL Activity trace, where WSNAME and TRANSACT, and the OMEGAMON for Db2 PE identifiers, PRIMAUTH and ORIGAUTH, are truncated.**

```
LOCATION: OMPDBZ4
GROUP: DBZ4
MEMBER: S242
SUBSYSTEM: S242
DB2 VERSION: V10

PRIMAUTH> cccccccc CONNECT : BATCH CORRNAME: YCLO6287 CONNTYPE: TSO
ORIGAUTH> cccccccc PLANNAME: DSNTIA10 CORRNRBR: 'BLANK' THTYYPE: ALLIED
>ENDUSER : cccccccc WSNAME : dddddddd TRANSACT: eeeeeeeeeeeeeeeeeeeeeeeeeeeeee
```

**General SQL Activity Information**

Here you find information common to all SQL Activity reports and traces.
Explanation of short and long fields

To improve the evaluation of SQL activities, DB2 supports both, short and long fields. If the field value exceeds the available field length (such as long values in the header information), the string is truncated, depending on the space available. Truncated values are then listed at the end of each logical report unit, together with their full values.

A "greater than" sign (>) indicates whether a value is truncated. When a value is truncated, the "greater than" sign (>) is printed instead of a colon (:) following the label name. The full value starts with a "greater than" sign followed by the label.

For example:

```
Tname  > This value is truncated
...
> Tname : This value was truncated - now you see its full length
...
```

If truncated values are listed, the "greater than" sign (>) is shown at the end of each value, because there is no colon (:) as a delimiter between the label and the value. In lists the label is used as a column heading.

**Note:** The mapping between truncated and full values remains the same for multiple reports from the same input data. This mapping is not supported for multiple reports from different input data. The printing of abbreviations and full text can cause inaccurate results in Batch SQL Activity output.

Here are examples of SQL Activity layouts with truncated values:

- **SQL Activity - Minibind:**
  
<table>
<thead>
<tr>
<th>ACCESS_CREATOR</th>
<th>ACCESS_NAME</th>
<th>MATCHCOLS</th>
<th>INDEXONLY</th>
<th>PREFETCH_INDEX</th>
<th>OPERATION</th>
<th>MIXOPSEQ</th>
</tr>
</thead>
<tbody>
<tr>
<td>TDK_LONG&gt;</td>
<td>IX_OMPE_FIRST_LONG&gt;</td>
<td>0</td>
<td>YES</td>
<td>SEQUENTIAL</td>
<td>SCAN</td>
<td>1</td>
</tr>
</tbody>
</table>
  ...

  > ACCESS_CREATOR : TDK_LONG.NAMED_COLLECTION.FOR_LONG.NAMED.OBJECTS
  > ACCESS_NAME : IX_OMPE_FIRST_LONG.NAMED_TABLE.FOR_UNCOMMITTED_READ
  
- **SQL Activity trace, where WSNAME and TRANSACT, and the OMEGAMON for Db2 PE identifiers, PRIMAUTH and ORIGAUTH, are truncated:**

  LOCATION: OMPDBZ4
  OMEGAMON XE FOR DB2 PERFORMANCE EXPERT (VSRAM)  SQL ACTIVITY - TRACE  PAGE: 1-1
  REQUESTED FROM: NOT SPECIFIED
  TO: NOT SPECIFIED
  ACTUAL FROM: 12/17/15 08:54:37.74

<table>
<thead>
<tr>
<th>PRIMAUTH&gt;</th>
<th>ORIGAUTH&gt;</th>
<th>ENDUSER</th>
<th>WSNAME</th>
<th>TRANSACT</th>
</tr>
</thead>
<tbody>
<tr>

<td>cccccccc</td>
<td>cccccccc</td>
<td>ddddddd</td>
<td>eeeeeeeeee</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

  **Summarization:**

  When you summarize statements, statements with similar characteristics are merged into a single record. As an example, if you were to summarize by statement number and you had 3 occurrences of statement 777, one of 778 and four of 779 in the same package, one for each statement number would be created.

  You can summarize the SQL events by any combination of:
SQL Activity Report

Cursor
Statements with the same cursor name in the same DBRM or package name are grouped into one record.

Occurrence
All SQL statement occurrences are shown as separate records. Statements are not merged. This is valid for traces only, and is the default. When summarization by occurrence is shown, the nesting level of the trigger or user-defined function is also shown.

Program
Statements with the same DBRM or package name are grouped into one record. This is the default for reports.

Statement number
Statements with the same statement number in the same DBRM or package name are grouped into one record.

Statement type
Statements of the same statement type are grouped into one record.

SQL Activity trace automatically includes a summary by thread and, if there is more than one thread per location, a summary by location.

Note:
1. The statement number is printed in a summary by cursor if an SQL statement does not include the cursor name, or if summarization by cursor is not appropriate for that statement. The following SQL statements are not summarized by cursor:
   - CALL
   - DELETE (noncursor or noncurrent of cursor)
   - DESCRIBE
   - INSERT
   - PREPARE
   - SQL COMMIT
   - SQL ROLLBACK
   - SQL statement at application requester using DRDA
   - UPDATE (noncursor or noncurrent of cursor).
   In a summary by cursor, these statements are organized by the statement number.

2. The statement type is printed in a summary by cursor and a summary by statement number if an SQL statement does not include the statement number or cursor name.

3. If DDL and DCL statements are present in a summary by cursor or a summary by statement number, they are organized by statement type.

SQL Activity prints all the SQL it receives. If some SQL cannot be summarized at the requested level, it is presented in the closest possible summary format.

Sorting:

This topic explains how to sort events in a summarized report or trace.

They can be sorted by:
- Average elapsed time
• Average TCB time
• Default
• Exits
• Exit time
• I/O requests
• I/O time
• Lock suspensions
• Lock suspension time
• Number of scans
• Pages scanned
• Records sorted
• Rows processed
• Sort workfiles

If DEFAULT is used, the sort order is dictated by the summarization, as follows:

**Cursor**
Sorted in alphabetical order within program

**Occurrence**
Sorted in timestamp order (trace default)

**Program**
Sorted in alphabetical order of package or DBRM name (report default)

**Statement number**
Sorted in numerical order within program

**Statement type**
Sorted in alphabetical order.

**Workload Detail:**

The workload figures are applied to the event being summarized.

Any combination of the following workload detail can be requested:

• Accounting, see 2 on page 4210
• All
• Data capture activity
• Exit activity
• I/O activity
• Locking activity
• Minibind, see 3 on page 4210
• None
• Scan, RID list, and query parallelism activity
• Sort activity
• UDF, see 4 on page 4210
• Vars
• Workload highlights

None is the default.
SQL Activity Report

Note:
1. The amount of processing required depend on the level of detail you request. IBM recommends that you do not specify WORKLOAD(ALL) with a large amount of input data unless absolutely necessary.
2. When IFCID 003 is included in the input, Accounting Trace activity is automatically included as part of the workload detail.
3. When IFCID 022 is included in the input, minbind activity is included automatically as part of the workload detail.
4. When IFCID 324 is included in the input, UDF activity is automatically included as part of the workload detail.

Headers Used in SQL Activity:

A header is printed at the top of every SQL Activity trace, report, and index page.

The following topics provide additional information:
- "SQL Activity Report Header" on page 4212
- "SQL Activity Trace Header" on page 4213
- "SQL Activity Trace Index Header" on page 4213

The report headers contain the standard OMEGAMON for Db2 PE header information and the following additional data:

SORTED BY
The event by which the report or trace is sorted, which can be the default or as specified in the SORTBY option.

WITH detail WORKLOAD
The workload details included in the report or trace as specified in the WORKLOAD option.

OMEGAMON for Db2 PE identifiers
The identifiers define the order of the SQL Activity data printed. If you specify no OMEGAMON for Db2 PE identifiers with ORDER, the default order of PRIMAUTH-PLANNAME is used.

TRACE #
Each trace occurrence and thread within the TRACE subcommand is numbered sequentially in the format x.yyyy, where:
- x can be 1 through 5, representing the five TRACE subcommands
- yyyyy can be 1 through 99 999, representing each thread being traced.

DB2 LUWID
The identifier of the logical unit of work. The following parts of this identifier are printed:
- The network ID
- The name of the logical unit, which is the name by which VTAM recognizes the DB2 subsystem
- The instance number

ACE ADDRESS
The agent control element absolute address in hexadecimal.

START TIME
The timestamp showing when the startup of the thread ended or, if the REQUESTED FROM time is after the thread begin, the REQUESTED FROM timestamp.
START ELAPSED
The thread start elapsed time, if calculable.

START REASON
The event that started the thread:
• CREATE THREAD
• CREATE DBAT
• NEW USER
• RESIGNON
• IN PROGRESS, no thread start IFCID present.

STOP TIME
The timestamp showing when the thread stopped or, if the REQUESTED TO time is after the thread end, the REQUESTED TO timestamp.

STOP ELAPSED
The thread stop elapsed time, if calculable.

STOP REASON
The event that stopped the thread:
• TERMINATE THREAD
• DEALLOCATE DBAT
• NEW USER
• RESIGNON
• ACCOUNTING FOUND—the thread terminated with the accounting record
• LOCATION CHANGED—the thread was terminated due to a location change
• END OF FILE—the thread was terminated because there were no records left to process.

START AET
The average thread start elapsed time.

STOP AET
The average thread stop elapsed time.

AUTOBIND AET
The average autobind elapsed time, if present.

ARCHIVE LOG AET
The average archive log (quiesce) elapsed time, if present.

Explanation of short and long fields

To improve the evaluation of SQL activities, DB2 supports both, short and long fields. If the field value exceeds the available field length (such as long values in the header information), the string is truncated, depending on the space available. Truncated values are then listed at the end of each logical report unit, together with their full values.

A "greater than" sign (>) indicates whether a value is truncated. When a value is truncated, the "greater than" sign (>) is printed instead of a colon (:) following the label name. The full value starts with a "greater than" sign followed by the label.
For example:
SQL Activity Report

This is an example of the SQL Activity report header.

SUMMARIZED BY PROGRAM

<table>
<thead>
<tr>
<th>EVENT</th>
<th>COUNT</th>
<th>TOTAL ELAPSED</th>
<th>TOTAL TCB</th>
<th>DETAIL</th>
</tr>
</thead>
<tbody>
<tr>
<td>SYSTAT</td>
<td>1</td>
<td>0.124457</td>
<td></td>
<td></td>
</tr>
<tr>
<td>PACKAGE_TOUR_OFFER</td>
<td>1</td>
<td>0.078445</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Note: The mapping between truncated and full values remains the same for multiple reports from the same input data. This mapping is not supported for multiple reports from different input data. The printing of abbreviations and full text can cause inaccurate results in Batch SQL Activity output.
SQL Activity Report

SQL Activity Trace Header:

This section introduces the header of the SQL Activity trace.

SQL Activity Trace Header

Here is an example of an SQL Activity trace header.

LOCATION: DSNAPC3  
GROUP: GROUP_1  
MEMBER: MEMBER_1  
SUBSYSTEM: APC3  
DB2 VERSION: V10  

SUMMARIZED BY OCCURRENCE  

PRIMAUTH: XXASP09  
CONNECT: BATCH  
CORNAME: XXASP09F  
CONNTYPE: TSO  

ORIGAUTH: XXASP09  
PLANNAME: LOCURHL  
CORRMBR: 'BLANK'  
THRTYPE: ALLIED  
ENUSER: 123456789012345678  
WSNAME: 123456789012345678  

The SQL Activity Report

This topic shows examples of SQL Activity reports and the commands used to generate them.

These example reports are summarized and sorted at the following levels:

- All
- Cursor
- Statement ID
- Statement number
- Statement type
- Program
- Thread

The SQL Activity report groups SQL Activity according to a combination of up to three OMEGAMON for Db2 PE identifiers. This grouping is applied to any SUMMARIZEBY, SORTBY, or WORKLOAD options you specify.

The ORDER subcommand specifies by which OMEGAMON for Db2 PE identifiers, and in which order, the SQL Activity is reported. If you specify no OMEGAMON for Db2 PE identifiers with ORDER, the default order of PRIMAUTH and PLANNAME is used.

Examples of an SQL Activity Report:

This topic shows examples of an SQL Activity report.

"Summarized by Statement Number" on page 4214 to "Summarized by Statement Type" on page 4216 show excerpts of an SQL Activity report summarized by all. The layout of the report is similar for each of the possible summary levels. The order is plan name within primary authorization ID, by default.
Summarized by Statement Number

This summary level presents totals for each statement number belonging to the selected combination of OMEGAMON for Db2 PE identifiers. The events are qualified by package name.

By default, the package names are sorted alphabetically and the statement numbers within packages are sorted numerically, in ascending order.

Note: Not every statement can be summarized by statement number. DDL, for example, has no statement numbers. An event name is chosen from the closest possible level of summarization, which is the statement type LOCK in this example.

The following command produces an SQL Activity report summarized by Statement Number:

```
SQLACTIVITY
REPORT
SUMMARIZE BY (STMTNO)
```

This is an example for an SQL Activity report summarized by statement number.

---

Summarized by Cursor

This summary level shows totals for each cursor name belonging to the selected combination of OMEGAMON for Db2 PE identifiers that are qualified by package name. By default, the package names and the events within each package are sorted alphabetically.

This is an example for an SQL Activity report summarized by cursor.

Chapter 6. Batch Reporting 4215
Summarized by Statement Type

This summary level shows totals for each cursor name belonging to the selected combination of OMEGAMON for Db2 PE identifiers that are qualified by package name. By default, the package names and the events within each package are sorted alphabetically.

This is an example for an SQL Activity report summarized by statement type.

Summarized by Thread

This summary level presents totals for each statement type executed by this combination of OMEGAMON for Db2 PE identifiers. By default, the events are sorted alphabetically. There is no further qualification at this level.

This is an example for an SQL Activity report summarized by thread.
Example of an SQL Activity Report with Workload:

The following examples show excerpts of an SQL Activity report with workload detail.

They are generated by the following command:

```
SQLACTIVITY REPORT
SUMMARIZE BY (ALL)
WORKLOAD (ALL)
```

Summarized by Statement Number, with All Workload

This page of the report shows the summary by statement number for primary authorization ID WRL and plan name DSNESPRR for location SYS1DSN2. It includes all workload contained in the input.

**Total:** 2  
**DB2:** Activity: Report

---

### Summary:

This page of the report shows the summary by statement type for primary authorization ID WRL and plan name DSNESPRR for location SYS1DSN2. It includes all workload contained in the input.
The SQL Activity Trace

This topic contains examples of SQL Activity traces and the commands used to generate them.

These traces are summarized at different levels. They can be summarized at the following levels:

- All
- Cursor
- Occurrence
- Program
- Statement number
- Statement type

Note: The trace also automatically includes a summary by thread and, if there is more than one thread per location, a summary by location. Each summary begins on a new page of the trace.

Example of an SQL Activity Trace:

The following examples show excerpts of an SQL Activity trace summarized at all levels.

They are generated by the following command:

```
: ;
SQLACTIVITY
   TRACE
       SUMMARIZEBY (ALL)
```

SQL Activity Trace Summarized by All

This summary level shows totals for each cursor name belonging to the thread that is qualified by package name. By default, the package names and the events within each package are sorted alphabetically.

This is an example of an SQL Activity Trace Summarized by All
### SQL Activity Trace Summarized by Occurrence

Summary by occurrence shows individual SQL statement occurrences. In this thread the SQL statements belong to one package, the name of which is printed at the head of its work. When present, SQL text and DDF information is embedded in the events. Commits appear as standalone events. The events are, by default, sorted in timestamp sequence.

This is an example of an SQL Activity Trace Summarized by Occurrence.

### SQL Activity Trace Summarized by Occurrence, sorted by ELAPSED TIME

This summary level sorts the SQL activity trace that belongs to the thread, by elapsed time. The section number field (SECT#) provides the section number of the Relational Data system Input parameter list (RDI).

This is an example of an SQL Activity Trace Summarized by Occurrence, sorted by ELAPSED TIME.
### SQL Activity Trace Summarized by Occurrence with All Workload

Summary by occurrence with all workload shows individual SQL statement occurrences. It also shows workload highlights, scan activity and minibind activity.

This is an example of an SQL Activity Trace Summarized by Occurrence with All Workload.

Chapter 6. Batch Reporting 4225
### SQL Activity Trace Summarized by Program

This summary level presents totals for statement number belonging to the thread. The events are qualified by the package name.

From this level on, timestamps are not appropriate so the second column becomes a count of the occurrences of each event. SQL text is omitted.

By default, the package names are printed alphabetically and the statement numbers are sorted numerically within each package.

**Note:** Not every statement can be summarized by statement number. DCL, for example, has no statement number. An event name is chosen from the closest possible level of summarization, which is the statement type GRANT in this example.

This is an example of an SQL Activity Trace Summarized by Statement Number (STMTNO).

```sql
<table>
<thead>
<tr>
<th>EVENT</th>
<th>COUNT</th>
<th>TOT.ELAPS</th>
<th>TOTAL TCB</th>
<th>AET/EVENT</th>
<th>TCB/EVENT</th>
<th>DETAIL</th>
</tr>
</thead>
<tbody>

<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td># 1924</td>
<td>1</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
```

**SQL Activity Trace Summarized by Statement Number (STMTNO).**
**SQL Activity Report**

**SQL Activity Trace Summarized by Statement Type**

This summary level presents totals for each statement type executed by the thread. By default, the events are sorted alphabetically. There is no further qualification at this level.

This is an example of an SQL Activity Trace Summarized by Statement Type.

**Chapter 6. Batch reporting**

4227
The SQL Activity Trace Index:

The SQL Activity trace index provides a page index to the threads traced during the execution of an SQLACTIVITY command. An SQL Activity trace index is produced for each TRACE subcommand and is printed on a new page at the end of the trace output.

Each thread on the trace is listed in timestamp order followed by various OMEGAMON for Db2 PE identifiers.

If a thread satisfies the selection criteria for more than one TRACE subcommand, it is presented on each relevant trace, and is indexed accordingly.

SQL Activity Trace Index

The following example represents the trace for location SYS1DSN2. From this page you can see the following:

- This trace is the result of the first TRACE subcommand.
- There are four threads.
- There were no dates or times specified on the TRACE subcommand or on the GLOBAL command.
- Both allied threads and DBATs are present. For allied threads, the requester location is the same as the local location (for example, the first entry shown in "SQL Activity Trace Index"). For DBATs, the requester location is different to the local location (for example, the second entry shown in "SQL Activity Trace Index").

</tr>
</tbody>
</table>

Field description

Here is a description of the field labels shown in the trace summary index:

**TRACE START**
The start time of the trace of the thread.

**OMEGAMON for Db2 PE identifiers**
The identifiers define the order of the SQL Activity data printed. If you specify no OMEGAMON for Db2 PE identifiers with ORDER, the default order of PRIMAUTH and PLANNAME is used.

**SERVER**
Reported in the same column as REQUESTER. All server locations involved are listed in alphabetical sequence below the requester location.

**TRACE NO**
The number of the thread, in the format x:yyyy, where x is the number of the TRACE subcommand and yyyy is the number of the thread reported as a result of that TRACE subcommand.
STARTS PAGE NO
The number of the page on which the beginning of the thread is reported. It is shown in the format x-yyyyy, where x is the location number and yyyyy is the page number within the location.

Note: If more than one summary level is selected, STARTS PAGE NO relates to the first summary printed for that thread.

SQL Activity Report and Trace Blocks
Here you find the blocks reported by SQL Activity report and trace.

Note: In query CP and sysplex query parallelism, the TCB time in the reports and traces only reflects the TCB time of the originating record. For the TCB time of the parallel records, refer to the query parallelism workload detail block described in “Query Parallelism” on page 4253.

SQL Detail Section:
This section shows the report and trace detail portions for each SQL statement type.

Field descriptions are shown in “Field Descriptions of SQL Activity Detail Report and Trace Details” on page 4231.

DDF information is included in all SQL Activity summaries, when present.

When an SQL statement type is not recognized, other is printed.

The report and details blocks are divided into columns. The column labels vary for report and trace and for the summarization used. The following column labels are used:

NL Nesting level of stored procedures, triggers and user-defined functions. This is valid for trace only. Values are summarized by occurrence.

EVENT The event being reported or traced, such as the cursor name in a summary by cursor or the program name in a summary by program.

COUNT The number of occurrences of this event.

TIMESTAMP The timestamp of the event begin.

TOT.ELAPS The total elapsed time of the event, that is the elapsed time for all statements within the event.

AET/EVENT The average elapsed time of the event.

TOTAL TCB The total TCB time of the event, that is the TCB time for all statements within the event.

TCB/EVENT The average TCB time of the event.

ELAP.TIME The elapsed time of the event.
TCB TIME
The TCB time of the event.

Report and Trace Details:
This section described the report and trace details for SQL activities.

SQL Activity Trace Package Detail
The first line of PACKAGE details shows the fully-qualified package name, if applicable. It consists of:
• The location name of the DB2 subsystem where the package was bound
• The name of the package collection
• The name of the program
• The consistency token generated by the DB2 precompiler, if present
• The version ID of the package, if present
To avoid duplication, the package name is not embedded in the detail when the events are sorted in default sequence. It is printed once at the head of its work.

For details of other fields shown for package, see “Field Descriptions of SQL Activity Detail Report and Trace Details” on page 4231.

Here is an example of an SQL Activity Trace Package Detail.

<table>
<thead>
<tr>
<th>NL</th>
<th>EVENT</th>
<th>TIMESTAM</th>
<th>ELAP.TIME</th>
<th>TCB TIME</th>
<th>DETAIL</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

SQL Activity Trace Statement Detail
For field information, see “Field Descriptions of SQL Activity Detail Report and Trace Details” on page 4231.

Here is an example of an SQL Activity Trace Statement Detail for CLOSE.

<table>
<thead>
<tr>
<th>NL</th>
<th>EVENT</th>
<th>TIMESTAM</th>
<th>ELAP.TIME</th>
<th>TCB TIME</th>
<th>DETAIL</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLOSE</td>
<td>15:45:32.71</td>
<td>0.000026</td>
<td>0.000026</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
SQL Activity Trace Trigger Detail

For field information, see “Field Descriptions of SQL Activity Detail Report and Trace Details.”

Here is an example for an SQL Activity Trace Trigger Detail.

```
NL EVENT TIMESTAMP ELAP.TIME TCB TIME DETAIL
-------------- --------------- --------- --------- ---------------
....
....
1 TRIGGER 17:16:27.46 0.180439 0.001409 COLLID: DSNTEP3
           1216 TRIGGER : SBTRIGR
           SQLSTATE: N/P SQLCODE: 0
           EXT_NAME: SBTRIGR
           ACT_TIME: AFTER
           GRAN : STMT STMT : INSERT EVAL : TRUE
```

SQL Activity Trace Stored Procedure Detail and UDF Detail

For field information, see “Field Descriptions of SQL Activity Detail Report and Trace Details.”

Here is an example of an SQL Activity Trace Stored Procedure Detail.

```
NL EVENT TIMESTAMP ELAP.TIME TCB TIME DETAIL
-------------- --------------- --------- --------- ---------------
....
....
1 CALL 09:00:00.00 25:00.00000 25:00.000 STMT# 64 PROCEDURE: MANFREDS STOPROC01
        SQLSTATE: N/P SQLCODE: 0
        SCHEDULE TIME: N/P SCHEDULE TCB: N/P SCHEMA : MANF__01
```

Here is an example of an SQL Activity Trace UDF Detail.

```
NL EVENT TIMESTAMP ELAP.TIME TCB TIME DETAIL
-------------- --------------- --------- --------- ---------------
....
....
2 INVOKE 21:20:16.61 0.003687 STMT# 0 FUNCTION : UDFSBSZT2
         SQLSTATE: N/P SQLCODE: 0
         SCHEDULE TIME: N/P SCHEDULE TCB: N/P SCHEMA : USRT001
         PACKAGE: STLECL.USRT001.'X'000000000000000'
```

Field Descriptions of SQL Activity Detail Report and Trace Details:

The following list shows the fields displayed in the SQL Activity detail report and trace details, in alphabetical order.

**ACQUIRE**

The acquire level of the package showing USE or ALLOCATE.

**AET/OCCUR**

The average elapsed time for each occurrence.

**ACT_TIME**

Trigger activation time.

- **BEFORE**
- **AFTER**

**BUFFER WRITES**

The number of buffer writes.
SQL Activity Report

CHILD L LOCK
The accumulated wait time for global child L-locks.

CLAIM COUNT
The accumulated wait time for claim count.

CLOSE TYPE
The Close statement type. Possible values are:
- IMPLICIT
- EXPLICIT
- N/A
Otherwise the values are shown in hexadecimal.

COLLID
Collection identifier.

COMMENTS
The total number of the following statements for the requester:
- Rollback
- Commit phase 2
- Sync
The total number of the following statements for the server:
- Commit request received
- Backout request received

COUNT
The number of occurrences as derived from the statement type.

CURSOR
The name of the cursor, if applicable.

CURSOR_NAME
Allocate cursor name.

DBRM
The name of the program, if applicable.
To avoid duplication, the DBRM name is not embedded in the detail when
the events are sorted in default sequence. It is printed once at the head of
its work.

DRAIN LOCK
The accumulated wait time for drain lock.

DYNAMICRULES
The value of the DYNAMICRULES option on the BIND/REBIND
command:
- RUN run time rules apply to a dynamic SQL statement for authorization
  checking and object qualification at run time.
- BIND Bind-time rules apply to a dynamic SQL statement for
  authorization checking and object qualification at run time.
- N/P DYNAMICRULES was not specified.

ELAPSE TIME
Duration of trigger activity.

EVAL Triggered action condition. Possible values are:
- TRUE
• FALSE
• NONE

EXT_NAM
External trigger name.

FUNCTION
Function name.

GET PAGES
The number of Getpages.

GLOBAL LOCK
The accumulated wait time for global locks.

GRAN
Trigger granularity. Possible values are:
• ROW
• STMT

IMMEDWRITE
Indicates how DB2 updates group buffer pool dependent pages. This is only valid in a data sharing environment.

Group buffer pool dependent pages can be written to DASD or SYSTEM pagesets.

Values shown are:

NO  DB2 uses normal write activity for updates, this is the default. Pages are written out at, or before phase 2 commit, or at the end of an abort for transactions that have rolled back.

PH1  Pages are written out at, or before phase 1 commit.

If a transaction subsequently rolls back, the pages are updated in the group buffer pool at the end of the rollback and are written out at the end of the abort.

YES  Pages are written out to the coupling facility as soon as the buffer update commits. Pages are written out regardless of whether the update occurs during forward progress or rollback of the transaction.

This option can affect performance due to coupling facility overhead.

IMPLICIT COMMIT
The cursor attribute implicit commit, which closed the cursor. It can be YES or NO.

IN-DB2 CPU
The accumulated In-DB2 CPU time. This time includes CPU time that was consumed on an IBM specialty engine.

IN-DB2 ELAPSED
The accumulated In-DB2 elapsed time.

INDEX SCANS
The number of index scans.

ISOLATION or ISO
The isolation level of the statement:
• CS  Cursor stability
SQL Activity Report

<table>
<thead>
<tr>
<th></th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RS</td>
<td>Read stability</td>
</tr>
<tr>
<td>RR</td>
<td>Repeatable read</td>
</tr>
<tr>
<td>UR</td>
<td>Uncommitted read</td>
</tr>
</tbody>
</table>

**KEEPDYNAMIC**
Indicates whether DB2 keeps (KEEPDYNAMIC(YES)) or discards (KEEPDYNAMIC(NO)) prepared SQL statements at commit points.

**KEEP UPDATE LOCKS; KEEP UPD. LOCKS**
Indicates whether X locks are used. X locks can only be used for SQL OPEN CURSOR statements and an isolation level of RS and RR.

**LATCH**
The accumulated wait for latch.

**LOCAL**
The number of statements that were distributed without going through VTAM.

**LOCKS**
The accumulated wait for locks.

**# LOCATORS**
The number of locators.

**# LOCATOR_VAL**
The number of locators.

**LOG WRITER**
The accumulated wait time for log writer.

**NAME**
The object name, without qualifier, in the DDL statement.

**NEW DEGREE**
The requested degree of parallelism regardless of whether the request is successful.

**NEW SQLID**
The requested SQL ID regardless of whether the request is successful.

**OPTHINT**
Value of optimization hints, if used.

**OTHER L LOCK**
The accumulated wait time for global other L-locks.

**OTHER P LOCK**
The accumulated wait time for global other P-locks.

**PACKAGE**
Package name (UDF only).

**PAGE LATCH**
The accumulated wait time for page latch.

**PAGE P LOCK**
The accumulated wait time for global page P-locks.

**PAGESET L LOCK**
The accumulated wait time for global Pageset or Partition L-locks.

**PARALLEL GRP CREATEs**
The number of parallel groups creates.
PARENT CHILD SYN
The accumulated time waiting for parallel queries to synchronize between parent and child tasks.

PIPE
The accumulated wait time for pipe.

PREPARE
Indicates whether the preparation of dynamic SQL statements was deferred:
DEFER
The preparation of the dynamic SQL statements that refer to remote objects was deferred until run time.
NODEFER
The dynamic SQL statements were prepared at bind time.

PREVIOUS DEGREE
The previous or current degree of parallelism.
If the statement executed successfully, this is the previous degree of parallelism. If it executed unsuccessfully, this is the current degree of parallelism.

PREVIOUS SQLID
The previous or current SQL ID.
If the request to change the SQL ID is successful, this is the user’s previous SQL ID. If it is unsuccessful, this is the user’s current SQL ID.

PROCEDURE
The unqualified stored procedure name.

PROC_LOC
Location of stored procedure.

PROC_NAME
Name of stored procedure.

PROC_QUALIF
Qualifier of stored procedure.

PROGRAM
Program or package name.

PROTOCOL
DB protocol:
DRDA
Convert three-part names to DRDA
PRIVATE
Three-part names use private protocol
NOT_SPEC
DB protocol was not specified.

READ-OTH. THREAD
The accumulated wait time for read activity by another thread.

RELEASE
The release level of the package, showing the option COMMIT or DEALLOCATE, if available.

REMOTE
The number of statements that went through VTAM.
REOPTIMIZED or REOPT
Indicates whether the access path of the SQL statement was reoptimized:

YES or Y
The access path was reoptimized at run time.

NO or N
The access path was only optimized at bind time.

RID-LIMIT EXC.
The number of times RID list was not used because the number of RIDs
would have exceeded DB2 limits.

RID-NO STORAGE
The number of times a RID list was not used because there is not enough
storage available to hold the list of RIDs.

ROWS EXAMINED
The number of rows examined.

ROWS PROCESSED
The number of rows processed.

SCHEDULE TCB
The TCB time for scheduling the stored procedure.

SCHEDULE TIME
The elapsed time for scheduling the stored procedure. This field also
includes the time for processing application logic, if any, up to the first
SQL statement within the stored procedure.

SCHEMA
Schema name.

SCROLL
Identifies the cursor scrollability. It can be one of the following:
• Scroll
• None-scroll

SECT#
The section number of the Relational Data system Input parameter list
(RDI).

SENSITIVE
The cursor sensitivity. It can be one of the following:
• Sensitive
• Insensitive
• Unspecified

SERVER
The server location in a distributed transaction. If there are multiple server
locations, an asterisk (*) is printed.

SORTS
The number of sorts.

SQLCODE or SQLCO
The return code from the SQL event. Obtained from the DB2 SQLCODE
which remaps the DB2 field.

SQLSTATE or SQLST
The SQL state.
The status of the statement:
- SUCCESSFUL
- FAILED
- SYSADM — Although authorization validation failed, the statement is successful because the user had SYSADM authority.

Triggering SQL statement.
- UPDATE
- INSERT
- DELETE

The number of the statement executed.

Note: For implicit connects, the statement number shown is the number of the SQL statement that caused the connect.

The statement identifier.

The statement type.

Note: In a summary by statement number, you find the statement number instead of the statement type.

The number of synchronous buffer reads.

The accumulated wait for synchronous I/O.

The cursor result table type. It can be one of the following:
- Static
- Dynamic
- Unspecified

The number of tablespace scans.

The average TCB time for each occurrence. It is the TCB time spent at the location being traced or reported on this line. For requester locations, it shows only the small amount of processing done at the requester.

Duration of trigger activity.

The text of the SQL statement, if present.

Note:
1. The text is only printed in a summary by occurrence if it is a dynamic SQL.
2. Text exceeding 5000 characters is truncated.
3. Host variables are presented as :H.
TIMESTAMP
   Trigger timestamp.

TRIGGER
   Trigger name.

TYPE
   The type of object in the DDL statement.

UNIT SWITCH
   The accumulated wait time for synchronous execution unit switches.

WRITE-OTH. THREAD
   The accumulated wait time for write activity by another thread.

Workload Detail:

Workload detail is available on all summary levels. The workload figures are applied to the event being summarized.

Any workload performed during thread creation is shown on the first SQL statement occurrence encountered in a thread.

Accounting:

The layout of the accounting section is identical to the accounting long report or trace, depending on whether an SQL Activity report or trace has been requested.

For explanations of the blocks and fields shown the accounting section, see "Accounting Report and Trace Blocks" on page 3215.

Data Capture Activity:

This block shows the average data capture activity performed by the event.

Data Capture Workload Block Example

Here is an example of the data capture workload block:

--- DATA CAPTURE

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>DESCRIBES</td>
<td>3.14</td>
</tr>
<tr>
<td>MAX READ TIME</td>
<td>1.928397</td>
</tr>
<tr>
<td>DATA DESC RETURNED</td>
<td>3.77</td>
</tr>
<tr>
<td>AET/DESCRIBE</td>
<td>0.028367</td>
</tr>
<tr>
<td>RECS RETURNED</td>
<td>24.86</td>
</tr>
<tr>
<td>TABLES RETURNED</td>
<td>0.00</td>
</tr>
<tr>
<td>LOG READS</td>
<td>5.20</td>
</tr>
<tr>
<td>RECS CAPTURED</td>
<td>29.15</td>
</tr>
<tr>
<td>AET/EXTRACTION</td>
<td>1.044382</td>
</tr>
<tr>
<td>ROWS RETURNED</td>
<td>132.50</td>
</tr>
</tbody>
</table>

Field description

Here is a description of the field labels shown in the data capture workload block:

DESCRIBES
   The average number of data capture describes.

AET/DESCRIBE
   The average elapsed time of data capture describes.

LOG READS
   The average number of log reads performed.

AET/EXTRACTION
   The average elapsed time of log extraction.
MAX READ TIME
The longest elapsed time of a log read.

RECS RETURNED
The average number of log records returned.

RECS CAPTURED
The average number of records that were captured for this update. To perform all data capture updates, all captured log records need to be returned.

ROWS RETURNED
The average number of data rows returned.

DATA DESC RETURNED
The average number of data capture data descriptions returned.

TABLES RETURNED
The average number of data capture tables returned.

Exit Activity:
This block shows the exits performed by the event.

Exits Workload Block Example
Here is an example of an exits workload block.

<table>
<thead>
<tr>
<th>MEMBER</th>
<th>VALIDATION TOTAL</th>
<th>AET/EXIT</th>
<th>EDIT TOTAL</th>
<th>AET/EXIT</th>
</tr>
</thead>
<tbody>
<tr>
<td>SE11</td>
<td>1</td>
<td>N/C</td>
<td>0</td>
<td>0.000060</td>
</tr>
</tbody>
</table>

Field description
Here is a description of the field labels shown in the exits workload block:

MEMBER
The name of the DB2 member within the DB2 data sharing group.

VALIDATION TOTAL
The number of results of a validation exit call written for every validation row.

VALIDATION AET/EXIT
The summarized elapsed validation time divided by the value in VALIDATION TOTAL.

EDIT TOTAL
The summary of results of an edit exit call to encode a record written for every row edited and the results of an edit exit call to decode a record written for every row decoded.

EDIT AET/EXIT
The summarized elapsed edit time divided by the value in EDIT TOTAL.

Function Resolution Activity:
This section shows the layout of a function resolutions block and its field descriptions.

SQL Activity Function Resolutions Workload Block
The following figure shows the layout of the function resolutions block.
SQL Activity - Function Resolution

--- FUNCTION RESOLUTION(S) ---

QUERYNO : 1383
PLANNAME : DSNTEP61 COLLECTION_ID : DSNTEP61
APPLNAME : xxxxxxxx PROGNAME : xxxxxxxx CONSIS_TOKEN : xxxxxxxxxxxxxxxx
BIND_TIME: 01/30/10 03:28:55.21 VERSION : xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx64
CURRENT_PATH : ............................

....................................................................................................................

FUNCT_SCHEMA : xxxxxxxx FUNCT_NAME : xxxxxxxxxxxxxxxx SPECIFIC_NAME : xxxxxxxxxxxxxxxx FUNCT_TYPE : xxxx
VIEW_CREATOR : NAME-111 VIEW_NAME : xxxxxxxxxxxxxxxx QUERY_BLOCKNO : 53
FUNCT_TEXT : ............................

.....................................................................................................................

Field description

Here is a description of the field labels shown in the function resolutions block:

QUERYNO
The query number.

PLANNAME
The plan name.

COLLECTION_ID
The collection ID.

APPLNAME
The name of the application.

PROGNAME
The program name.

CONSIS_TOKEN
The consistency token.

BIND_TIME
The time stamp of the bind time.

VERSION
The version ID.

CURRENT_PATH
The current path.

FUNCT_SCHEMA
A short SQL identifier, either ordinary or delimited, following the concept of qualified names consistent with the ANSI/ISO SQL92 standard.

FUNCT_NAME
The name of a function without a qualifier.

SPECIFIC_NAME
Identifies the particular function. The specific name must identify a specific function name in the explicitly or implicitly specified schema.

FUNCT_TYPE
The classification of the function:

SCALAR  Scalar UDF
**TABLE**  
Table UDF

**VIEW_CREATOR**  
The name of the view creator if the function is referenced in a view definition.

**VIEW_NAME**  
The name of the view if the function is referenced in a view definition.

**QUERY_BLOCKNO**  
A number that identifies the query block number being explained.

**FUNCT_TEXT**  
Contains the text of the function reference, function name, and parameters.  
It can be up to 254 characters long.

**I/O Activity:**

This block shows the I/O activity for each object performed by the event.

**I/O Activity Workload Block Example**

The following example shows the I/O activity workload block.

<table>
<thead>
<tr>
<th>DATABASE</th>
<th>PAGESET</th>
<th>MEMBER</th>
<th>BP</th>
<th>TOTAL</th>
<th>AET</th>
<th>TYPE</th>
<th>AET/WITH</th>
<th>%WITH PAGE/WITH</th>

<td></td>
</tr>
</tbody>
</table>

**Field description**

Here is a description of the field labels shown in the I/O activity workload block:

**DATABASE**  
The database name. If the name is not available, the decimal DBID/OBID is printed.

**PAGESET**  
The page set name. If the name is not available, the decimal DBID/OBID is printed.

**MEMBER**  
The name of the DB2 member within the DB2 data sharing group. This field shows N/P in a non-data-sharing environment.

**BP**  
The buffer pool name.

**I/O REQUEST TOTAL**  
The total number of I/O requests.

**I/O REQUEST AET**  
The average elapsed time for each I/O request.

**READ REQUEST TOTAL**  
The number of read I/O requests of a specific type.

**READ REQUEST TYPE**  
The type of read request:

SYNCH  
Synchronous read request.
SEQPF
Sequential prefetch request

DYNPF
Dynamic prefetch request

LSTPF
List prefetch request

READ REQUEST AET/WITH
The average elapsed time for a read with I/O of a specific type.

READ REQUEST %WITH
The percentage of total read requests with I/O for a particular type.

READ REQUEST PAGE/WITH
The pages read for each read request with I/O of a particular type.

READ REQUEST %WITHOUT
The percentage of total read requests without I/O for a particular type. This can occur because all the pages requested by a prefetch read were already in the buffer pool.

WRITE REQUEST TOTAL
The number of write I/O requests.

WRITE REQUEST TYPE
The type of write request.

WRITE REQUEST CAST
Indicates whether the write operations were initiated due to a coupling facility castout.

WRITE REQUEST AET
The average elapsed time for each write.

WRITE REQUEST PAGE/WRITE
The number of pages written.

Lock Suspension Activity:

This block shows the lock suspension activity for each object performed by the event.

Lock Suspension Activity Workload Block Example

The field labels shown in the following sample layout of "Lock Suspension Activity Workload Block" are described in the following section.

<table>
<thead>
<tr>
<th>RESOURCE NAME</th>
<th>TYPE</th>

</tr>
</tbody>
</table>

The following list describes the fields in the lock suspension activity workload block:

Field  Description
RESOURCE NAME
The name of the resource on which the suspended request is made. The content of the field depends on the resource type:

- The plan name for SKCT
- The collection and package IDs for SKPT
- The collection ID for COLLECT
- The database name for DATABASE, CDB PLK, DBD PLCK
- The buffer pool ID for ALTERBUF, GBP S/S, P/P PLCK, PAGEPLCK, GBP CAST, P/P CAST
- The anchor point ID for HASH-ANC
- The row ID for ROW
- N/A for MASS, UTILITY, BINDLOCK, ALTERBUF, CATM MIG, CATM CAT, CATM DIR
- The database and page set names for all others

The database and page set names are translations obtained from the IFICIDs 105 and 107. If these records are unavailable, the decimal DBIDs and OBIDs are printed.

MEMBER
The name of the DB2 member within the DB2 data sharing group.

TYPE
The type of the locked resource. Possible values are shown in Table 261 on page 3461.

REQUEST
The type of request that has been suspended:

- LOCK  IRLM lock request
- UNLOCK  IRLM unlock request
- CHANGE  IRLM change request
- QUERY  IRLM query request
- NOTIFY  IRLM notify request
- DRAIN  Drain request
- LATCH  Latch request

SUSPEND REASON LOCAL
The number of suspensions due to local resource contentions.

SUSPEND REASON LATCH
The number of suspensions due to IRLM latch contentions.

SUSPEND REASON IRLMQ
The number of suspensions due to IRLM queued requests.

SUSPEND REASON GROUP
The number of suspensions due to global contention.
SQL Activity - Lock Suspension

**SUSPEND REASON NOTIFY**
The number of suspensions due to intersystem message sending.

**SUSPEND REASON OTHER**
The number of suspensions due to reasons other than those listed previously.

**Note:** For drain suspensions, the suspension reason is always “waiting for the claim count to reach zero” and is categorized as OTHER.

**NORML RESUME COUNT**
The number of suspensions that ended in the task, resuming normal processing after the lock request has completed.

**NORML RESUME AET**
The normal resume average elapsed time. This is the normal resume elapsed time divided by the NORML RESUME COUNT.

**TIMEO RESUME COUNT**
The number of suspensions that ended in a timeout.

**TIMEO RESUME AET**
The average elapsed timeout time. This is the elapsed timeout time divided by the TIMEO RESUME COUNT.

**DEADL RESUME COUNT**
The number of suspensions that ended in a deadlock.

**DEADL RESUME AET**
The average elapsed deadlock time. This is the elapsed deadlock time divided by the DEADL RESUME COUNT.

**Minibind Activity:**

The minibind activity block shows information about mini plans, which are generated by the optimizer at bind and SQL prepare time. This block is written once for each IFCID 022 encountered. The block consists of a header followed by one or more repeating sections.

One mini plan is generated for each table and for each subselect block in the query. This means that if your query uses subqueries, more than one mini plan record is written.

**Note:**
1. This block is shown for SQL Activity trace only.
2. When interpreting this record, relate table and mini plans by table name.
3. The order of the mini plans might not be the same as the order of the table as written in the SQL statement.
4. When you are not sure about the accessing order of the tables, use EXPLAIN to get the query block number and plan number.
5. This block also shows whether sequential prefetch is used.

If the IFCIDs 105 and 107 are present before IFCID 022, the DBID and OBID can be translated.
Explanation of short and long fields

To improve the evaluation of SQL activities, DB2 supports both, short and long fields. If the field value exceeds the available field length (such as long values in the header information), the string is truncated, depending on the space available. Truncated values are then listed at the end of each logical report unit, together with their full values.

A "greater than" sign (>) indicates whether a value is truncated. When a value is truncated, the "greater than" sign (>) is printed instead of a colon (:) following the label name. The full value starts with a "greater than" sign followed by the label. For example:

Tname  > This value is truncated
...
> Tname  : This value was truncated - now you see its full length
...

If truncated values are listed, the "greater than" sign (>) is shown at the end of each value, because there is no colon (:) as a delimiter between the label and the value. In lists the label is used as a column heading.

Note: The mapping between truncated and full values remains the same for multiple reports from the same input data. This mapping is not supported for multiple reports from different input data. The printing of abbreviations and full text can cause inaccurate results in Batch SQL Activity output.

Here are examples of SQL Activity layouts with truncated values:

• SQL Activity - Minibind:

• SQL Activity trace, where WSNAME and TRANSACT, and the OMEGAMON for Db2 PE identifiers, PRIMAUTH and ORIGAUTH, are truncated.

Minibind Workload Block Example

Here is an example of the minibind workload block.
### Field description

Here is a description of the field labels shown in the minibind workload block.

**QUERYNO**

The number identifying the statement to be prepared.

**PLANNAME**

The plan name or package ID.

**COST**

The relative cost of the SQL statement. It might not relate to the actual CPU or elapsed time for the query.

**PARALLELISM_DISABLED**

Indicates whether query parallelism is disabled by the resource limit facility (RLF) for dynamic queries:

- **NO** — The RLF does not affect this statement.

**I/O ONLY**

Query I/O parallelism is disabled.

**CP ONLY**

Query CP parallelism is disabled.

**CP + I/O**

Query I/O and CP parallelism is disabled.

**X**

Sysplex query parallelism is disabled.

**X + I/O**

Sysplex query and query I/O parallelism is disabled.

**X + CP**

Sysplex query and query CP parallelism is disabled.
YES  The entire query parallelism (I/O, CP, and Sysplex) is disabled.
N/A  Query parallelism does not apply to this statement.

QBLOCKNO
The position of the query in the statement.

COLLID
The collection ID of the package.

PROGNAME
The name of the package containing the statement to be prepared.

CONSISTENCY_TOKEN
The consistency token.

APPLNAME
The name of the application plan.

WHEN_OPTIMIZE
Indicates when the access path of the SQL statement is optimized and determined:
BIND  The access path is determined at bind and run time.
DEFAULT  The access path is determined at bind time.
REOPT  The statement is bound with REOPT. The access path is determined at run time.
RUN  The access path is determined at run time.

OPT_HINT_IDENT
Access path hint value.

OPTIMIZE_HINTS_USED
Indicates whether the query used access path hints.

UNITS
Cost in CPU units.

MILLI_SEC
Cost in milliseconds.

COST_CATEGORY
Cost category.

BIND_TIME
The date and time at which the plan or package to which the SQL statement belongs was bound.

VERSION
The version ID of the package (64 characters).

PLANNO
The number of the step in which the query is processed.

METHOD
The join method used for the step.

SORTN_UNIQ
Indicates whether the new table is sorted to remove duplicate rows.

SORTC_UNIQ
Indicates whether the composite table is sorted to remove duplicate rows.
SQL Activity - Minibind

**DATABASE**
The database ID.

**NEXTSTEP**
The next step in a join.
NOT APPLICABLE is printed if this is the last step of a join, or if this is not a join.

**SORTN_JOIN**
Indicates whether the new table is sorted for a merge scan join or hybrid join. For a hybrid join, this is a sort of the RID list.

**SORTC_JOIN**
Indicates whether the composite table is sorted for a nested loop join, merge scan join, or hybrid join.

**OBJECT**
The internal ID of the table space.

**ACCESTYPE**
The method of accessing the new table. N/P is printed if there is no access type.

**SORTN_ORDERBY**
Indicates whether the new table is sorted for ORDER BY.

**SORTC_ORDERBY**
Indicates whether the composite table is sorted for ORDER BY.

**CREATOR**
The creator of the new table accessed in this step.

**PAGE_RANGE**
Indicates whether the table qualifies for page range screening so that plans scan only the partitions that are needed.

**SORTN_GROUPBY**
Indicates whether the new table is sorted for GROUP BY.

**SORTC_GROUPBY**
Indicates whether the composite table is sorted for GROUP BY.

**TNAME**
The name of the table accessed in this step, without qualifier. This field is blank if a view is used instead of a real table.

**JOIN_TYPE**
The type of join enabled:
- **LEFT** Left outer join
- **FULL** Full outer join
- **INNER** Inner join
- **STAR** Star join
- **N/A** Not applicable is shown if DB2 never produces a counter value in a specific context.

**SORTN_PGROUP_ID**
The parallel group ID for the parallel sort of the new table.
A parallel group is the collective term for consecutive operations (in this case a sort) executed in parallel that have the same number of parallel tasks.

**SORTC_PGROUP_ID**
The parallel group ID for the parallel sort of the composite table.

**CORRELATION_NAME**
The correlation name of a table or view that is specified in the statement. If no correlation name is specified, the field is blank.

**MERGE_JOIN_COLS**
The number of columns that are joined during a merge scan join.

**ACCESS_DEGREE**
The number of parallel tasks or operations activated by a query.

**JOIN_DEGREE**
The number of parallel tasks or operations used in joining the composite table with the new table.

**TSLOCKMODE**
Indicates the lock mode to be acquired on the new table or its table space.

If the isolation can be determined at bind time, possible values are:

- **IS** Intent share lock
- **IX** Intent exclusive lock
- **S** Share lock
- **U** Update lock
- **X** Exclusive lock
- **SIX** Share with intent exclusive lock
- **N** UR isolation, no lock

If the isolation cannot be determined at bind time, the lock mode determined by the isolation at run time is shown by the following values:

- **NS** For UR isolation: no lock. For CS or RR isolation: an S lock.
- **NIS** For UR isolation: no lock. For CS or RR isolation: an IS lock.
- **NSS** For UR isolation: no lock. For CS isolation: an IS lock. For RR isolation: an S lock.
- **SS** For UR or CS isolation: no lock. For RR isolation: an S lock.

**PARALLELISM_MODE**
The kind of parallelism used at bind time:

- **I/O** Query I/O parallelism
- **CP** Query CP parallelism
- **X** Sysplex query parallelism
- **NO** No parallelism was used.

**ACCESS_PGROUP_ID**
The ID of the parallel group for accessing the new table.

**JOIN_PGROUP_ID**
The ID of the parallel group for joining the composite table with the new table.
ACCESS_NAME
The index name. This field applies only to index scans. N/A is printed for table space scans or when no index is used.

ACCESS_CREATOR
The index creator.

STATEMENT_CACHE
Statement cache flag. Possible values are:
YES  The prepared statement is retrieved from the prepared statement cache.
NO   The prepared statement is not retrieved from the prepared statement cache.

MATCHCOLS
The number of index keys used in an index scan. This field is 0 if either no index is used or an index is used that has no matching columns.

PREFETCH
Indicates what kind of prefetch of the data is used:
SEQ   Sequential prefetch
LIST  List prefetch
No    No prefetch

OPERATION
The type of index access operation.

PREFETCH_INDEX
Indicates whether data pages are to be read in advance by a prefetch.

MIXOPSEQ
The sequence number of a step in a multiple index operation.

INDEXONLY
Indicates whether the access to an index alone is sufficient to carry out the step.

COLUMN_FN_EVAL
Indicates when an SQL column function is evaluated.

PAGES_FOR_TABLE
Pages for table.

TAB_CARDINALITY
Table cardinality.

DIRECT_ROW_ACC
Indicates whether direct row access was used, possible values are:
YES  Direct row access was used
NO   Direct row access was not used

STARJOIN
Indicates whether star join was used, possible values are:
YES  Star join was used
NO   Star join was not used
N/A  Not applicable
Page and Row Locking Activity:

This block shows the page locking, row locking, and lock avoidance activity for each object, performed by the event.

The page and row locking activity block is only printed if a commit occurred or a thread terminated.

In summary by occurrence, page and row locking activity information generated for explicit commits is shown on the relevant commit events.

In summaries by cursor or program, any explicit commits occurring during the life of that cursor or program are counted. Page and row locking activity caused by those commits is shown on the relevant cursor or program.

In summaries by statement number or statement type, commits are not counted. Because page and row locking activity is not relevant for these summary levels, it is not printed.

Any page or row locking activity occurring when a thread terminated is shown in the summary by thread. This activity is added to any page or row locking which took place in the body of the thread. Therefore, page and row locking figures in summary by thread can be greater than the sum of page locking figures shown in the body of the thread. The difference is the page and row locking activity occurring at thread termination.

Page and Row Locking Workload Block Example

Here is an example of the page and row locking workload block.

<table>
<thead>

<td></td>
</tr>
</tbody>
</table>

Note:
1. The DBID and OBID are obtained from IFCID 020.
2. The values in MAX PAGE OR ROW LOCKS HELD, LOCK ESCALATIONS SHARED, and LOCK ESCALATIONS EXCLUSIVE are accumulated within a subsystem. They are reset only at thread deallocation or when a new user signon occurs.
3. The values in MAXIMUM PAGE OR ROW LOCKS, HIGHEST LOCK, and # LOCK ESCAL are reset at commit time for dynamic BINDs and for static BINDs for which release (commit) is specified. Otherwise, these values accumulate until thread deallocation or until a new user signon occurs.
4. IFCID 218 is an additional lock summary record, written for lock avoidance. It indicates whether a successful lock avoidance test occurred during a given unit of work. The record is externalized for the agent at each commit or rollback.
5. For each event, the relevant IFCID 020 and 218 records are processed. If there is a DBID/OBID combination present for IFCID 218 but not for IFCID 020, the
SQL Activity - Page and Row Locking

IFCID 020 fields show N/P. If there is a DBID/OBID combination present for IFCID 020 but not for IFCID 218, the IFCID 218 field (LOCK AVOID SUCCESSFUL) shows N/P.

Field description

Here is a description of the field labels shown in the page and row locking workload block.

MEMBER
The name of the DB2 member within the DB2 data sharing group.

DATABASE
The database name, if available.
If the name is not available, the decimal DBID is printed instead.

PAGESET
The page set name, if available.
If the name is not available, the decimal OBID is printed instead.

COUNT
The number of page locking or row locking occurrences for each page set.
• Specific database and page set:
  – At commit time: always 1
  – At thread termination: the number of times this database and page set occurred on a commit record
• TOTAL
  – At commit time: the total number of page sets listed
  – At thread termination: the sum of the values for all page sets

LOCK SIZE
The lock size used:
PAGE Page lock
ROW Row lock
TABLE Table space or table lock
LOB LOB lock
UNKN Unknown lock
* Multiple lock sizes

MAXIMUM PAGE OR ROW LOCKS
The maximum number of either page locks or row locks held at one time against this object.

# LOCK ESCAL
The number of lock escalations:
• 0 if no escalations occur
• For simple table spaces and partitioned table spaces not using selective partition locking (SPL): 1 if any escalation occurred for this table space in this logical unit of work
• For segmented table spaces: the number of tables within the table space that have experienced lock escalations
• For partitioned table spaces using SPL: the number of partitions for which locks escalated within the table space
The TOTAL contains the sum of all values in this column.

**HIGHEST LOCK**
The highest table space lock state.

If the table space is simple or partitioned not using SPL, it is the highest lock state for this database or page set. At trace end, it is the largest value from any commit for this object. The following values are possible:

- **IS** Intent share
- **IX** Intent exclusive
- **S** Share
- **U** Update share
- **SIX** Share with intent exclusive
- **X** Exclusive

If the table space is segmented or partitioned using SPL, this field is blank.

**TS TYPE**
The table space type:

- **SIMPL** Simple table space
- **SEG** Segmented table space
- **PARTI** Partitioned table space
- **SPL** Partitioned table space using selective partition locking (SPL)
- **LOB** LOB table space

**LOCK AVOID SUCCESSFUL**
Indicates whether there was a successful lock avoidance test during the unit of work.

If the state of this field changed during the summarization period, an asterisk (*) is shown.

**MAX PAGE OR ROW LOCKS HELD**
The maximum number of page locks and row locks held at one time across all objects.

**LOCK ESCALATIONS: SHARED**
The total of shared lock escalations.

**LOCK ESCALATIONS: EXCLUSIVE**
The total of exclusive lock escalations.

*Query Parallelism:*

This section introduces the Query Parallelism block.

This block shows query parallelism activity performed by the event.

*Note:* In query CP and sysplex query parallelism, this is the only place where the TCB time of the parallel records is shown.

**Query Parallelism Workload Block Example**

Here is an example of a Query Parallelism Workload block.
Field description

An example of a query parallelism workload block is shown in “Query Parallelism Workload Block Example” on page 4253.

The fields in the query parallelism workload block are:

**QUERY BLOCK**
- The query block number.

**PARALLEL GROUP**
- The parallel group number.

**PLANNED AT BIND**
- The degree of parallelism planned at bind time.
  - This field contains 0 if host variables in the statement caused the parallelism decision to be made at bind time.

**PLANNED AT RUN**
- The degree of parallelism planned at run time.

**NEGOTIATED AT RUN**
- The degree of parallelism negotiated at run time, which depends on buffer pool availability.
  - If the value in this field is 1, the plan for parallel I/O processing falls back to sequential execution mode.

**REASON**
- The reason for deriving the planned run time degree of parallelism:
  - **NORMAL**
    - The planned run time degree is derived from planned bind-time degree.
  - **HOSTVAR**
    - Host variable partitioning
  - **NOESA**
    - No ESA sort support
  - **CURSOR**
    - Cursor that can be used for update and delete.
  - **EMPTY**
    - Empty parallel group
  - **ENCLUNAV**
    - MVS/ESA enclave services are not available
  - **UNKNOWN**
    - None of the above

**PIPE ELAPSED TIME**
- The time of pipe creation subtracted from the time of pipe termination.

**TASK CPU TIME**
- The sum of the normalized CPU times spent for the parallel tasks. In
sysplex query parallelism, the CPU times are normalized by the conversion factor that is derived from IFCID 106 and related to the conversion factor of the originating task.

If IFCID 106 is not present, asterisks are printed.

The task CPU time is calculated as follows:

- Let \( CV_O \) be the conversion factor for the member where the originating thread is running.
- Let \( CV_P \) be the conversion factor for the member where the parallel thread is running.
- Let \( TCB_P \) be the TCB time that is recorded by DB2 for an activity of the parallel thread.
- Then the following formula applies:

\[
\text{Normalized TCB time for that activity} = (TCB_P \times \frac{CV_O}{CV_P})
\]

**TYPE**  
The type of parallelism:

- CP  CP parallelism  
- I/O  I/O parallelism  
- SYS  Sysplex query parallelism

**NUMBER OF MEMBERS**  
The number of members on which the query executed.

**RID List Processing:**

This block shows the record ID (RID) list activity performed by the event.

**RID List Processing Workload Block Example**

Here is an example of the RID list processing workload block.

```plaintext
--- RID LIST PROCESSING

<table>

```

**Field description**

Here is a description of the field labels shown in the RID List Processing Workload Block.

**RIDS IN FINAL LIST**  
The number of RIDs in the final list.

**RID LIST USED**  
The number of times RID list was used.

**UNUSED (LIMIT EXCEEDED)**  
The number of RID lists not used because the number of RIDs exceeded the maximum limit.

**UNUSED (NO STORAGE)**  
The number of RID lists not used because no RID storage was available.

**DATABASE**  
The database name for the index.
SQL Activity - RID List Processing

**PAGESET**
The internal identifier index fan-set descriptor for the index.

**THRESHOLD**
The threshold value for the index.

The threshold value for list prefetch and ORing multiple indexes for access is the maximum of 25 percent of the table size (in bytes) or the number of RIDs that one RID block can hold. For ANDing multiple indexes, it is 25 percent of the table size.

The average is the total value of this field divided by the number of indexes (database/page set combinations).

**RIDS OBTAINED**
The number of RIDs obtained from an index.

The average is the total value of this field divided by the number of indexes (database/page set combinations).

**RIDS EXCEEDED LIMIT**
The number of RIDs which exceeded the maximum limit.

The average is the total value of this field divided by the number of indexes (database/page set combinations).

### Scan Activity:

This block shows the total scan activity for each object, performed by the event.

The database name and page set name for each scan are printed if they are available. These do not usually occur in DB2 trace records. The decimal database ID (DBID) and object ID (OBID) occur instead. When possible, OMEGAMON for Db2 PE translates the DBID and OBID into database names and page set names. If the translation does not work, the DBID or OBID decimal number is printed instead.

### Scan Activity Workload Block Example

Here is an example of the Scan Activity Workload Block.

### Field description

Here is a description of the field labels shown in the Scan Activity Workload Block.

**DATABASE**
The database name.

If the name is not available, the decimal DBID is printed.
If IFCID 058 is not present, DBID information is not available and therefore the field is left blank.

**MEMBER**
The name of the DB2 member within the DB2 data sharing group. This field shows N/P in a non-data-sharing environment.

**PAGESET**
The page set name.

*Note:* If the value shown in the TYPE column is INDX, this column shows the index name if provided by DB2.

**TYPE**
Indicates whether the scan performed by the data manager is an index file (INDX), a sequential data file (SEQD), or a sequential work file (SEQW).

**SCANS**
The total number of scans performed by the data manager.

**ROWS PROCESS**
Number of rows of all record types processed by a scan. As an example:

```sql
SELECT A1 FROM TABLE_A WHERE A1=3
```

Where the table space that contains TABLE_A also contains TABLE_B and TABLE_C. Note that this does not include partitioned table spaces because a partitioned table space can have only one table.

For a simple table space, this is a count of all scanned rows from all three tables.

This field is identical to ROWS EXAMINE when the table space is segmented, or when the scan is an index scan.

**FST INS**
The number of rows inserted using the fast insert algorithm. This value is usually 1, but it is more than 1 for insert with subselect.

**ROWS EXAMINE**
The number of rows of a specific record type processed by the scan. If the table space contains more than one table, scanned rows from the specific table only are counted.

For index scans, this value represents the number of index entries processed.

For a table space containing only one table, the value of ROWS EXAMINE is the same as the value of ROWS PROCESS.

**N-PIPE**
The number of times that fast insert could not be used for the insert operation, so a non-pipe insert algorithm was used instead.

**QUALIFIED AT STAGE 1**
The total number of rows that were qualified at stage 1.

**PIPE RE**
The number of times that the fast insert pipe was refilled for the insert operation.

**QUALIFIED AT STAGE 2**
The total number of rows that were qualified at stage 2. The value in this field cannot be greater than the value in QUALIFIED AT STAGE 1.
SQL Activity - Scan

INS WAIT
The number of times that the insert operation waited for the fast insert pipe to fill.

ROWS INSERTS
The number of rows inserted by the data manager.

ROWS UPDATES
The number of rows updated by the data manager.

ROWS DELETES
The number of rows deleted by the data manager.

PAGES SCANNED
The number of Getpage requests the data manager issued to the buffer manager. For an index scan, the field shows the number of Getpage requests on index pages.

RI SCANS
The number of additional Getpage requests the data manager issued to the buffer manager to enforce referential constraints.

RI DELETES
The number of additional rows deleted or set to null due to referential integrity.

Sort Activity:
This block shows sort activity for each sort performed by the event.

The sort activity is divided into the following sections:

- "Sort Activity - QW0095/96," which describes the sort activity recorded by IFCID 095 and 096 (Sort Start and Sort End) pairs
- "Sort Activity - QW0028" on page 4261, which describes the multiple distinct sort activity recorded by IFCID 028

Sort Activity - QW0095/96:
This topic shows detailed information about “COMPO - Sort Activity - QW0095/96”.

Sort Activity - QW0095/96
The field labels shown in the following sample layout of “COMPO - Sort Activity - QW0095/96” are described in the following section.

MEMBER : SAUBSC MAX RETURN CODE : 0 WORKFILES : 1.00 RECORDS : 77.00
TOTAL SORTS : 1 INITIAL WORKFILES : 1 RECORD SIZE : 832.00 SORT TYPE : ESA
SORT KEYS : 2.00 SORT COLUMNS : 50.00 KEY SIZE : 10.00 MERGE PASSES : 27.00
AET/SORT : 20.28794 DATA SIZE : 822.00 ROWS DELETED : 72.00
PARTITIONING: NO PARTITION TYPE : NONE W-FILES PART : 85.00 PARTIT & SORTING : NO

MEMBER
The member name of this DB2.

N/A means this DB2 is not part of a data sharing group.

Install parameter MEMBER NAME on panel DSNTIPK, or ZPARM MEMBNAME in DSN6GRP.

Field Name: QWPAMBRN

MAX RETURN CODE
The sort return code:

- **0** Successful
- **4** Empty - sort successful
- **8** Resource unavailable
- **12** Sort key too long
- **16** Error detected by fetch routine during input phase
- **20** Serious processing error

Field Name: QW0096RC

**WORKFILES**

The number of work files used for both input and merge phases.

Field Name: QW0096WF

**RECORDS**

The number of records sorted.

Field Name: QW0096NR

**TOTAL Sorts**

The total number of sorts that occurred during the reporting period.

Field Name: SQLTOTSO

**INITIAL WORKFILES**

The number of initial work files. The sorting of records can take more than one work file. The number of work files needed depends on the distribution of sort key values. The maximum number of work files is limited by the buffer pool size.

Field Name: QW0096IR

**RECORD SIZE**

The sort record size in bytes (the sort key size and the data area size).

Field Name: QW0096WR

**SORT TYPE**

The type of sort that occurred. The possible values are:

- **ESA** ORDER BY sort using the ESA sort hardware instructions
- **ESAG** GROUP BY sort using the ESA sort hardware instructions
- **ESAT** ESA tag sort using the ESA sort hardware instructions
- **RCYC** GROUP RECYCLING sort using the ESA sort hardware instructions
- **REG** Regular sort
- **NONE** No sort occurred.

Field Name: QW0096TS

**SORT KEYS**

The number of sort keys.

Field Name: QW0096SK
SORT COLUMNS
The number of sort columns.
Field Name: QW0096SC

KEY SIZE
The sort key size in bytes.
Field Name: QW0096KL

MERGE PASSES
The number of merge passes during sort processing.
Field Name: QW0096MP

AET/SORT
The average elapsed time per sort.
Field Name: SQLAVTSO

DATA SIZE
The sort data area size in bytes.
Field Name: QW0096DL

ROWS DELETED
The number of rows deleted because records were merged for the evaluation of column functions with GROUP BY.
Field Name: QW0096RL

PARTITIONING
Indicates whether the sorted records were partitioned.
Field Name: QW0096PP

PARTITION TYPE
Indicates when partitioning took place:
W   The work file was partitioned at the end of the input phase. No merge occurred.
M   The output was partitioned during the last merge pass.
O   One record was put into one partition.
P   The records were presorted before being partitioned.
N   The work file was not partitioned.
Field Name: QW0096PT

W-FILES PART
The number of work files, equal to the degree of parallelism, that sort has partitioned.
Field Name: QW0096PW

PARTIT & SORTING
Indicates whether the input records were only partitioned or partitioned and sorted:
YES   The records were only partitioned.
The records were partitioned and sorted.

Field Name: QW0096PO

Sort Activity - QW0028:

This topic shows detailed information about “COMPO - Sort Activity - QW0028”.

Sort Activity - QW0028

The field labels shown in the following sample layout of “COMPO - Sort Activity - QW0028” are described in the following section.

NO. OF WORKFILES: The number of records sorted into work files after the sort input phase.

Field Name: QW0028NR

TOTAL MULTIPLE DS: Total number of multiple distinct sorts.

Field Name: QW0028DS

MULTIPLE_DISTINCT Sorts: The multiple distinct sort currently being processed.

Field Name: QW0028DC

REQUESTED WORKFILES: The number of work files requested from the buffer manager at the beginning of each merge pass (MVS/ESA 3.1.3). It is valid if TYPE equals S.

If this field is greater than WORKFILES ACQ, there is another merge pass. If both fields are equal, this is the last or only merge pass.

Field Name: QW0028WA

ACTUAL WORKFILES: The number of work files actually acquired from the buffer manager at the beginning of each merge pass (MVS/ESA 3.1.3). It is valid if TYPE equals S.

Field Name: QW0028WG

RECORDS IN WORKFILE: The number of records in the work file during work file partitioning.

Field Name: SQ28TYZ

PARTITION PARALLEL: The partition work file number. The value in this field is 0 if partitioning is not requested. If partitioning is requested, the value can be from 1 to n, where n is the degree of parallelism. It is valid if TYPE equals Z, W, X, K, M, L, T, O, U, V, P, or Y.
Field Name: QW0028PW

RECORDS LAST MERGE
The number of sort records in the partition work file during the last merge.

Field Name: SQ28TYQ

PARTITIONING ONE RECORD
The number of times that partitioning occurred when only one record was sorted and put into a partition work file.

Field Name: SQ28TYT

PRE-SORTED RECORDS
The number of times partitioning occurred when presorted records are put into multiple work files.

Field Name: SQ28TYV

RECORDS MDS GROUPS
The number multiple distinct loops containing a number of multiple distinct sorts.

Field Name: SQ28TYB

CURRENT MERGE PASS
The current merge pass. It is issued at the end of the merge pass and, therefore, valid if TYPE equals E.

Field Name: QW0028MP

TOTAL MDS GROUPS
The total number of multiple distinct sort groups.

Field Name: QW0028DG

RECORDS MDS GROUPBY
The number of records read into a group at the start of the GROUPBY phase for a multiple distinct sort.

Field Name: SQ28TYD

MAX REQUESTED
The maximum number of work files requested from buffer manager during merge passes.

Field Name: SQ28MAXR

AVG REQUESTED
The average number of work files requested from buffer manager during merge passes.

Field Name: SQ28AVRQ

MAX NOT ACQUIRED
The maximum number of work files requested but not received from buffer manager during merge passes.

Field Name: SQ28MXNA

AVG NOT ACQUIRED
The average of work files requested but not received from buffer manager during merge passes.

**Field Name:** SQ28AVNA

**Host Variables:**

This block shows the host variables to represent the values that will be sent to or received from the SQL statement.

**Note:**
1. The number of shown host variables is limited to 100.
2. A warning message is issued in DPMLOG, if the limit is reached or if SQLDA entries are missing.

**Workload Host Variables Example**

Here is an example of the workload host variables.

```plaintext
--- HOST VARIABLES ---
LOCATION : SYSDSN1  COLLID : PMDEMO  PROGNAME : DYNSEL08  CONSIS_TOKEN : X'5A427634E644C54'
STMT_NO : 133  FORMAT : 1 - COMPLETE  NO.SQLDA ENTRIES : 3

<table>
<thead>
<tr>

<td>X'5A427634E644C54'</td>
</tr>
</tbody>
</table>
```

**Field description**

Here is a description of the field labels shown in the workload host variables block.

**LOCATION**
Location name.

**Field Name:** QW0247LN

**COLLID**
Package collection identifier.

**Field Name:** QW0247PC

**PROGNAME**
Program name.

**Field Name:** QW0247PN

**CONSIS_TOKEN**
Not present (N/P) is shown for this field if the value is X'40' or X'00'; otherwise the hexadecimal value of the field is shown.

**Field Name:** QW0247TS

**STMT_NO**

Statement number.

Field Name: QW0247SN

FORMAT

The format of the SQLDA. Possible values are:

B'1000'

0 - COMpressed
   Is a compressed form of the SQLDA.

B'0100'

1 - Complete
   Is a complete SQLDA containing the data type, address,
   and address of the indicator variable for each host variable.

B'0010'

2 - Fixed Length
   Is a variable length character format containing the length
   of the string and text.

? - Unknown
   Is shown, if none of the above field names is used.

Field Name: QW0247FE

ENTRY_NO.

SQLDA entry number.

Field Name: QW0247NO

NAME

SQLDA name, if Format 1 SQLDA. The first two bytes are the length of the
NAME and are not shown.

Field Name: QW0247NA

NULL_INDICATOR

Null indicator values:

- YES, if X'00'
- NO, if X'FF'

Field Name: QW0247NA

SQLTYPE

SQL type (see DB2 SQL Reference).

Field Name: QW0247TY

DATA TYPE

DATA TYPE is derived as described in DB2 SQL Reference, based on the
SQLTYPE:

384, 385
   DATE

388, 389
   TIME
TIMESTAMP
VARYING LENGTH CHARACTER STRING
FIXED-LENGTH CHARACTER STRING
LONG VARYING CHARACTER STRING
FLOATING POINT
PACKED DECIMAL
LARGE INTEGER
SMALL INTEGER

Note:
1. Any other SQL TYPES are shown as: NON DISPLAYABLE DATA
2. Values are shown in DB2 internal format.

Field Name: QW0247TY

PRECISION
If the field is decimal (484 or 485), this is the precision.
Field Name: QW0247LP

SCALE
If the field is decimal (484 or 485), this is the scale.
Field Name: QW0247LS

ADDR_HOST_VAR
The address of the host variable in the application address space.
Field Name: QW0247PT

ADDR_IND_VAR
The address of the indicator variable, if the value in QW0247TY is odd (NULLABLE).
Field Name: QW0247IN

DATA
The host variable data.
Field Name: QW0247DA

Workload Highlight:
This block shows the highlights of the workload activity performed by the event. All workload fields available in the SORTBY option are included.
Workload Highlights (HILITE) Block Example

Here is an example of the workload highlight (HILITE) block.

--- WORKLOAD HILITE -----------------------------------------------------------------------------------------------
SCANS : 8 RECS/SORT: 3.00 I/O REQS : 1 SUSPENDS : 2 EXITS : 2 AMS : 1
ROWSPROC : 8 WORK/SORT: 2.00 AET/I/O : 1.374752 AET/SUSP : 0.485483 AET/EXIT : 0.048234 AET/AMS : 0.094745
PAGESCAN: 47 PASS/SORT: 2.00 DATACAPT: YES RIDS UNUSED: 2 CHECKCON : REJECTED DEGREE REDUCTION : 3
LOB_PAGSCAN: 12345 LOB_UPD_PAGE: 12345

Field description

Here is a description of the field labels shown in the workload highlight (HILITE) block.

SCANS
The total number of scans performed by the data manager.

RECS/SORT
The average number of records per sort.

I/O REQS
The number of SYNCHRONOUS and ASYNCHRONOUS READ and SYNCHRONOUS WRITE I/O requests per event.

SUSPENDS
The number of LOCK SUSPENSIONS per event.

EXITS
The number of validation, encode edit, and decode edit exits per event.

AMS
The number of times Access Method Services (AMS) was invoked within the event. AMS can be invoked by:
- Creating a DB2 page set (table space, table partition, index space)
- Expanding an existing DB2 page set
- Deleting a DB2 page set

ROWSPROC
The number of rows processed (of all record types).

WORK/SORT
The average number of work files per sort.

AET/I/O
The average elapsed time I/O requests.

AET/SUSP
The average elapsed time for LOCK SUSPENSIONS.

AET/EXIT
The average elapsed time per EXIT invocation.

AET/AMS
The average elapsed time of the AMS invocations within the event.

PAGESCAN
The number of pages scanned.

DATACAPT
The data capture indicator; shows whether IFCID 188 is present.

RIDS UNUSED
The number of times RID list processing was not used because nor RID storage was available or the number of RIDs exceeded the maximum limit.
CHECKCON
Indicates that a table check constraint was performed for the current SQL event:

OK The check constraint was ok.

REJECTED
The row to be inserted or updated was rejected due to a check constraint.

N/P No check was performed.

DEGREE REDUCTION
The difference between planned and negotiated run time degree.

LOB_PAGSCAN
The number of LOB pages scanned.

LOB_UPD_PAGE
The number of LOB pages updated.

SYSPLEX QUERY PARALLELISM USED
This field is shown if the query is executed on more than one member, this field shows the number of members. Otherwise this field is blank.

Note:
1. All fields in the highlight block are printed. If other detail blocks are requested, then some of the highlights are shown twice, once in the highlight block and again in the detail block.
2. If the records required for a field are not present, N/P is printed for that field. N/A is printed if the field is not relevant to the level of DB2.

Statistics report set
These topics provide information about the statistics reports.

This section provides examples of the statistics default layout for SHORT and LONG. Descriptions of the fields in the layout are described in the next section. Because the layout of the report and trace is the same (with the exception of the highlights block), only a report example is reproduced here.

When data from a particular DB2 version is processed, N/A is printed for all fields in the report that are not applicable to that version.

You can use the user-tailored reporting (UTR) facility to modify the layouts and store the changes. If you do this, store your layouts under a different name to avoid confusion and keep the layouts relevant to this documentation.

Note: For an introduction to the Statistics report set and general Statistics information refer to the [Reporting User’s Guide](#). It also provides information on input to Statistics reports.

Statistics Short Report
This topic introduces the short version of the Statistics reports.

The SHORT layout presents selected data from all Statistics categories using the following blocks of data:
- “Accounting Rollup” on page 4329
- “Buffer Pool General” on page 4334
Statistics Report

Utilities:
- “Buffer Pool Write” on page 4349
- “CPU Times” on page 4359
- “Data Sharing Locking” on page 4365
- “EDM Pool Activity” on page 4397
- “Global DDF Activity” on page 4401
- “Group Buffer Pool Activity” on page 4405
- “Highlights” on page 4417
- “Locking Activity” on page 4433
- “Log Activity” on page 4436
- “Miscellaneous statistics report” on page 4440
- “Open/Close Activity” on page 4443
- “Plan/Package Activity” on page 4444
- “Query Parallelism” on page 4449
- “RID List Processing” on page 4457
- “ROWID” on page 4460
- “SQL DCL” on page 4471
- “SQL DDL” on page 4473
- “SQL DML” on page 4478
- “Stored Procedures” on page 4463
- “Subsystem Services” on page 4464
- “Triggers” on page 4480
- “Use Currently Committed” on page 4481
- “User-Defined Functions” on page 4481
- “Workfile Database” on page 4482

Use the following command to print a Statistics short report:

```
STATISTICS REPORT LAYOUT (SHORT)
```

Statistics Long Report

This topic introduces the long version of the Statistics reports.

The following report is an example of a member-scope statistics long report, produced with the command:

```
STATISTICS REPORT DSETSTAT LAYOUT(LONG)
```

Statistics Long Report

This is an example of a long report for Statistics.

--- HIGHLIGHTS

### Notes

- The report provides a detailed breakdown of storage usage and auxiliary information for DBM1 and DBZ2 for the period from 08/24/16 07:01:00.00 to 08/24/16 10:02:00.00.
- The total number of threads was 110.00.
- The total commits were 479.00.
- The data sharing member was N/A.
- The report includes statistics on various storage categories such as getmain storage, compression dictionary, cached SQL statements, and system copies of static SQL.
- The report also highlights the usage of variables, buffers, and storage spaces across different time intervals, providing insights into system performance and resource utilization.

This section shows the individual blocks presented by OMEGAMON for Db2 PE reports and traces together with a short explanation of each field. The examples shown are taken from the statistics long reports and traces.
Statistics Report

The layout of the Statistics report and trace blocks is the same. Statistics traces show times and events as delta records describing the activity between two consecutive DB2 record pairs. Statistics reports show times and events over a user-specified period of time.

Each block is presented in the default layout. Some block can have columns, rows, or fields that are not included in the default layout. You can include columns, rows, and fields not shown in the default layouts with user-tailored reporting (UTR).

In the short report and trace, field names can differ slightly from the names shown in the long report or trace.

If a counter value or specific information in reports, in windows, or on panels is not shown, the following notation is used to indicate the reason:

**N/A** Not applicable is shown if DB2 never produces a counter value in a specific context. Examples are:
- A counter is not available in one DB2 version.
- Counters are mutually exclusive.

**N/C** Not calculated is shown for a derived field where the value cannot be calculated or is useless. Examples are:
- A divide by zero (percentages, ratios).
- Suppression of negative elapsed time values.
- Required counter values for calculation marked as N/A or N/P.
- Insufficient data or small counter values to allow significant statements (meaningless or misleading averages).

**N/P** Not present is shown for a field where DB2 can present values, but does not in this instance. Examples are:
- When counter values are not generated because of operational conditions (a trace class is not active).
- An application does not provide a value because it is optional.

**Accelerator Data Overview:** This topic shows Accelerator Data report and trace blocks that are provided for the following versions of IBM DB2 Analytics Accelerator for z/OS.

**Accelerator Data - Prior to Version 4:**

This topic shows detailed information about “Statistics - Accelerator Data - Prior to Version 4”.

**Note:** This topic only refers to IBM DB2 Analytics Accelerator for z/OS prior to version 4.

The Statistics Accelerator report block is shown for each accelerator that provided services to the DB2 subsystem or to the DB2 data sharing group within the reported interval. The accelerator name is shown in the header line of each column together with the labels ACCELERATION and CONTINUED.

**Note:**
- The DB2 subsystem is connected with an accelerator via DRDA when submitting SQL queries. The performance counters of the DRDA connection (rows from
CONNECTS TO ACCELERATOR to ROWS RECEIVED FROM ACCELERATOR and the four time counters at the bottom) are collected and reported on an individual subsystem or member basis.

- The other Statistics counters are collected periodically from the accelerator and reported as single subsystem values or as total data sharing group values if the reported subsystem is a member (with enabled acceleration) of a data sharing group.
- The full accelerator name is shown in the header if it does not exceed 16 characters. Otherwise, the name is replaced by a short name in the header and the long name is displayed at the end of the report.
- The field descriptions of the fields QUERIES SUCCESSFULLY EXECUTED, QUERIES FAILED TO EXECUTE, CURRENTLY EXECUTING QUERIES, and MAXIMUM EXECUTING QUERIES refer to SQL statements passed to the accelerator. For product identifiers of IBM DB2 Analytics Accelerator for z/OS prior to AQT04015, the SQL statements are SELECT queries passed to the accelerator.

Statistics - Accelerator Data - Prior to Version 4

The field labels shown in the following sample layout of “Statistics - Accelerator Data - Prior to Version 4” are described in the following section.

### IDENTIFIER

The accelerator server identifier.

Field Name: Q8STNAME

### QUERIES SUCCESSFULLY EXECUTED

The number of SQL statements (sent by this DB2 system since accelerator start) that were successfully executed in the accelerator.

Field Name: Q8STSREQ

### QUERIES FAILED TO EXECUTE

The number of SQL statements (sent by this DB2 system since accelerator start) that failed to be successfully executed for any reason.

Field Name: Q8STFREQ

### ACCELERATOR IN INVALID STATE
The number of queries (sent by this DB2 system since accelerator start) that failed to be successfully executed, for example, because the accelerator was in an invalid state.

**Field Name:** Q8STFINV

**CURRENTLY EXECUTING QUERIES**

The number of currently (actively) executing SQL statements in the accelerator on behalf of all DB2 systems (Field name for DB2 Analytics Accelerator for z/OS Version 4: Q8STACTV_64).

**Field Name:** Q8STACTV

**MAXIMUM EXECUTING QUERIES**

The maximum number of SQL statements actively executing in the accelerator concurrently at any time since accelerator start on behalf of all DB2 systems (Field name for DB2 Analytics Accelerator for z/OS Version 4: Q8STMAXA_64).

**Field Name:** Q8STMAXA

**CONNECTS TO ACCELERATOR**

The number of connects to the accelerator from this DB2 system.

**Field Name:** Q8STCONN

**REQUESTS SENT TO ACCELERATOR**

The number of Distributed Relational Database Architecture (DRDA) requests sent by this DB2 system to the accelerator.

**Field Name:** Q8STREQ

**TIMED OUT**

The number of connections that were timed out when this DB2 system sent requests to the accelerator.

**Field Name:** Q8STTOUT

**FAILED**

The number of connections that failed when this DB2 system sent requests to the accelerator.

**Field Name:** Q8STFAIL

**BYTES SENT TO ACCELERATOR**

The total number of bytes sent to the accelerator.

**Field Name:** Q8STBYTS

**BYTES RECEIVED FROM ACCELERATOR**

The total number of bytes received from the accelerator.

**Field Name:** Q8STBYTR

**MESSAGES SENT TO ACCELERATOR**

The total number of messages sent to the accelerator.

**Field Name:** Q8STMSGS

**MESSAGES RECEIVED FROM ACCELERATOR**

The total number of messages received from the accelerator.
Field Name: Q8STMSGR

**BLOCKS SENT TO ACCELERATOR**

The total number of blocks sent to the accelerator.

Field Name: Q8STBLKS

**BLOCKS RECEIVED FROM ACCELERATOR**

The total number of blocks received from the accelerator.

Field Name: Q8STBLKR

**ROWS SENT TO ACCELERATOR**

The total number of rows sent to the accelerator.

Field Name: Q8STROWS

**ROWS RECEIVED FROM ACCELERATOR**

The total number of rows received from the accelerator.

Field Name: Q8STROWR

**TCP/IP SERVICES ELAPSED TIME**

The accumulated accelerator services TCP/IP elapsed time measured in DB2. It starts when sending the requests to the accelerator and ends when receiving the results from the accelerator.

Field Name: Q8STTELA

**WAIT TIME IN ACCELERATOR**

The wait time spent in the accelerator when executing requests from the DB2 subsystem.

Field Name: Q8STAWAT

**AVG QUEUE LENGTH (LAST 3 HRS)**

The average queue length during the last 3 hours at the accelerator.

Field Name: Q8STAVGQ03

**AVG QUEUE LENGTH (LAST 24 HRS)**

The average queue length during the last 24 hours at the accelerator.

Field Name: Q8STAVGQ24

**MAXIMUM QUEUE LENGTH**

The high watermark of the queue length at the accelerator (Field name for DB2 Analytics Accelerator for z/OS Version 4: Q8STMAXQ_64).

Field Name: Q8STMAXQ

**AVG QUEUE WAIT ELAPSED TIME**

The average wait time at the accelerator queue.

Field Name: Q8STQUEW

**MAX QUEUE WAIT ELAPSED TIME**

The maximum wait time at the accelerator queue.

Field Name: Q8STQUEM

**WORKER NODES**
Accelerator Data - Prior to Version 4

The number of active worker nodes (Field name for DB2 Analytics Accelerator for z/OS Version 4: Q8STWNOD_64).

**Field Name:** Q8STWNOD

**WORKER NODES AVG CPU UTILIZATION (%)**

The current CPU utilization on the accelerator worker nodes. This is a snapshot, which is the average CPU utilization across all worker nodes (Field name for DB2 Analytics Accelerator for z/OS Version 4: Q8STWCPU_64).

**Field Name:** Q8STWCPU

**COORDINATOR AVG CPU UTILIZATION (%)**

The current CPU utilization on the accelerator coordinator node (Field name for DB2 Analytics Accelerator for z/OS Version 4: Q8STCCPU_64).

**Field Name:** Q8STCCPU

**DISK STORAGE AVAILABLE (MB)**

The disk storage (MB) available at the accelerator.

**Field Name:** Q8STDSDKA

**DISK STORAGE AVAILABLE - IN USE (%)**

The current disk utilization of the accelerator worker nodes, expressed as percentage of the used I/O channels/resources.

**Field Name:** Q8STDSDKU

**DISK STORAGE AVAILABLE - IN USE FOR DATABASE (MB)**

The disk storage in-use for accelerator databases for this DB2 system.

**Field Name:** Q8STDSDKB

**DATA SLICES**

The number of data slices at the accelerator. This equals the degree of parallel I/O channels.

**Field Name:** Q8STNMDS

**DATA SKEW**

When table data is loaded into the accelerator, it may be unevenly distributed across the different data slices on the disks. This disparity is called data skew. The counter represents the accumulated skew over all tables that belong to the DB2 subsystem. The skew of a table is the ratio that shows how uneven the data slices are, as calculated by 

\[
\text{Skew} = \frac{\text{maximum data slice size} - \text{minimum data slice size}}{\text{median data slice size}}
\]

A high value indicates that data reorganization can improve disk utilization and query performance.

**Field Name:** Q8STSKEW

**PROCESSORS**

The number of CPU cores available on all worker nodes.

**Field Name:** Q8STCORS

**ELAPSED TIME IN ACCELERATOR**
The accumulated elapsed time spent in the accelerator when executing requests from the DB2 subsystem.

Field Name: Q8STAELA

CPU TIME SPENT IN ACCELERATOR

The CPU time spent in the accelerator when executing requests from the DB2 subsystem.

Field Name: Q8STACPU

Accelerator Data - Version 4 or later:

This topic shows detailed information about “Statistics - Accelerator Data - Version 4 or later”.

The Statistics Accelerator report block is shown for each accelerator that provided services to the DB2 subsystem or to the DB2 data sharing group within the reported interval. The left part consists of accelerator performance metrics from a subsystem or data sharing group perspective. The right parts contains total values from an accelerator perspective. The accelerator name is shown in the header line of each column.

With IBM DB2 Analytics Accelerator for z/OS version 4 or later, the Statistics report block shows performance data for the replication services which transmit data from DB2 to the accelerator. As for other counters, the replication values are shown in a DB2 subsystem or data sharing group view and in a total accelerator view. Most subsystem- or group-related replication fields are aggregated counters and shown as delta values in TRACE blocks and as apportioned interval values in the REPORT blocks in the left part. On the contrary, the corresponding total accelerator values in the right part are snapshot counters. This is due to the fact, that the replication can be disabled during the reporting period such that the accelerator only summarizes values from enabled replication engines.

In addition, the status of accelerators and replication engines may be unknown, and DB2 externalizes negative values -1 for related performance counters. The Statistics component handles such values as follows:

- Unknown (negative) accelerator values are snapshot counters and presented as zero. This matches the behavior of previous DB2 Accelerator versions, where zero values have been provided in the performance counters.
- Unknown (negative) replication engine values are shown as N/P in Statistics reports and as -1 in the Statistics accelerator table of the Performance Database as long as the status of the replication engine is not known. Once the status is known and non-negative performance values occur, aggregated and snapshot counters are handled as usual. If the replication status becomes unknown again, the aggregated counters are externalized as zero and shown as non-negative delta and interval values once replication has resumed.

Note:

- The DB2 subsystem is connected with an accelerator via DRDA when submitting SQL queries. The performance counters of the DRDA connection (rows from CONNECTS TO ACCELERATOR to WAIT TIME IN ACCELERATOR) are collected and reported on an individual subsystem or member basis in the left part.
Accelerator Data - Version 4 or later

- The other Statistics counters are collected periodically from the accelerator and reported as single subsystem values or as total data sharing group values in the left part if the reported subsystem is a member (with enabled acceleration) of a data sharing group.
- The full accelerator name is shown in the header if it does not exceed 16 characters. Otherwise, the name is replaced by a short name in the header and the long name is displayed at the end of the report.
- The descriptions of the fields labelled with QUERIES refer to SQL statements passed to the accelerator. For product identifiers of IBM DB2 Analytics Accelerator for z/OS prior to AQT04015, the SQL statements are SELECT queries passed to the accelerator and the fields INSERT STMTS to ROLLBACK STMTS are N/A.

Statistics - Accelerator Data - Version 4 or later

</table>

IDENTIFIER

The accelerator server identifier.

Field Name: Q8STNAME

QUERIES SUCCESSFULLY EXECUTED

The number of SQL statements (sent by this DB2 system since accelerator start) that were successfully executed in the accelerator.

Field Name: Q8STSRQ

QUERIES FAILED TO EXECUTE
The number of SQL statements (sent by this DB2 system since accelerator start) that failed to be successfully executed for any reason.

Field Name: Q8STFREQ

CURRENTLY EXECUTING QUERIES

The number of currently executing SQL statements in the accelerator on behalf of this DB2 system.

Field Name: Q8STNQCS

MAXIMUM EXECUTING QUERIES

Shows the maximum number of SQL statements executing in the accelerator at any time since accelerator start on behalf of this DB2 system.

Field Name: Q8STMNQS

CPU TIME EXECUTING QUERIES

The total CPU cost associated with executing SQL statements in the accelerator on behalf of this DB2 system.

Field Name: Q8STTCQS

CPU TIME LOAD/ARCHIVE/RESTORE

The total CPU cost spent in the accelerator for data maintenance operations from this DB2 system. Replication-related operations are not included.

Field Name: Q8STTCMS

INSERT STMTS SENT TO ACCELERATOR

The number of INSERT statements sent by the DB2 system to the accelerator.

Field Name: Q8STINSC

UPDATE STMTS SENT TO ACCELERATOR

The number of UPDATE statements sent by the DB2 system to the accelerator.

Field Name: Q8STUPDC

DELETE STMTS SENT TO ACCELERATOR

The number of DELETE statements sent by the DB2 system to the accelerator.

Field Name: Q8STDELC

OPEN STMTS SENT TO ACCELERATOR

The number of OPEN statements sent by the DB2 system to the accelerator.

Field Name: Q8STOPNC

CREATE STMTS SENT TO ACCELERATOR

The number of CREATE statements sent by the DB2 system to the accelerator.

Field Name: Q8STCRTC

DROP STMTS SENT TO ACCELERATOR

The number of DROP statements sent by the DB2 system to the accelerator.

</tbody>
</table>
BLOCKS RECEIVED FROM ACCELERATOR

The total number of blocks received from the accelerator.

Field Name: Q8STBLKR

ROWS SENT TO ACCELERATOR

The total number of rows sent to the accelerator.

Field Name: Q8STROWS

ROWS RECEIVED FROM ACCELERATOR

The total number of rows received from the accelerator.

Field Name: Q8STROWR

TCP/IP SERVICES ELAPSED TIME

The accumulated accelerator services TCP/IP elapsed time measured in DB2. It starts when sending the requests to the accelerator and ends when receiving the results from the accelerator.

Field Name: Q8STTELA

ELAPSED TIME IN ACCELERATOR

The accumulated elapsed time spent in the accelerator when executing requests from the DB2 subsystem.

Field Name: Q8STAELA

WAIT TIME IN ACCELERATOR

The wait time spent in the accelerator when executing requests from the DB2 subsystem.

Field Name: Q8STAWAT

CPU TIME FOR REPLICATION

The total CPU cost associated with the replication apply process for this DB2 system.

Field Name: Q8STTC excess

LOG RECORDS READ

The number of log records read by the replication capture agent for this DB2 system.

Field Name: Q8STNLRS

LOG RECORDS READ - LOG RECORDS FOR ACCEL TABLES

The number of log records (read by the replication capture agent for this DB2 system) that are applicable to tables in this accelerator.

Field Name: Q8STNLTS

LOG RECORD BYTES PROCESSED

The number of log record bytes processed by the replication capture agent for this DB2 system.

Field Name: Q8STNBS

INSERT ROWS FOR ACCEL TABLES
The number of INSERT rows applicable to accelerator tables that were processed by the replication capture agent for this DB2 system.

Field Name: Q8STNIS

**UPDATE ROWS FOR ACCEL TABLES**

The number of UPDATE rows applicable to accelerator tables that were processed by the replication capture agent for this DB2 system.

Field Name: Q8STNUS

**DELETE ROWS FOR ACCEL TABLES**

The number of DELETE rows applicable to accelerator tables that were processed by the replication capture agent for this DB2 system.

Field Name: Q8STNDS

**REPLICATION LATENCY**

The current replication latency for this DB2 system. Latency is defined as the time difference between the timestamp, when the last log record was applied to the target, compared to the current time.

Field Name: Q8STCRL

**REPLICATION STATUS CHANGE**

The timestamp when the last change of the accelerator replication state occurred for this DB2 system.

Field Name: Q8STTLSC

**QUERIES SUCCESSFULLY EXECUTED**

The number of SQL statements (sent by all DB2 systems since accelerator start) that successfully executed in the accelerator.

Field Name: Q8STNQSA

**QUERIES FAILED TO EXECUTE**

Shows the number of SQL statements (sent by all DB2 systems since accelerator start) that were not successfully executed for any reason.

Field Name: Q8STNQFA

**CURRENTLY EXECUTING QUERIES**

The number of currently (actively) executing SQL statements in the accelerator on behalf of all DB2 systems (Field name for DB2 Analytics Accelerator for z/OS Version 4: Q8STACTV_64).

Field Name: Q8STACTV

**MAXIMUM EXECUTING QUERIES**

The maximum number of SQL statements actively executing in the accelerator concurrently at any time since accelerator start on behalf of all DB2 systems (Field name for DB2 Analytics Accelerator for z/OS Version 4: Q8STMAXA_64).

Field Name: Q8STMAXA

**CPU TIME EXECUTING QUERIES**

The total CPU cost associated with executing SQL statements in the accelerator on behalf of all DB2 systems.
Field Name: Q8STTCQA

CPU TIME LOAD/ARCHIVE/RESTORE

The total CPU cost spent in the accelerator for data maintenance operations from all DB2 systems. Replication-related operations are not included.

Field Name: Q8STTCMA

DISK STORAGE AVAILABLE (MB)

The disk storage (MB) available at the accelerator.

Field Name: Q8STDSCA

DISK STORAGE AVAILABLE - IN USE FOR ACCEL DB - ALL DB2 (MB)

The disk storage (MB) in-use for accelerator databases for all DB2 systems.

Field Name: Q8STDSA

DISK STORAGE AVAILABLE - IN USE FOR ACCEL DB - THIS DB2(MB)

The disk storage in-use for accelerator databases for this DB2 system.

Field Name: Q8STDSKB

MAXIMUM QUEUE LENGTH

The high watermark of the queue length at the accelerator (Field name for DB2 Analytics Accelerator for z/OS Version 4: Q8STMAXQ_64).

Field Name: Q8STMAXQ

CURRENT QUEUE LENGTH

The current queue length at the accelerator.

Field Name: Q8STCQL

AVG QUEUE WAIT ELAPSED TIME

The average wait time at the accelerator queue.

Field Name: Q8STQUEW

MAX QUEUE WAIT ELAPSED TIME

The maximum wait time at the accelerator queue.

Field Name: Q8STQUEM

WORKER NODES

The number of active worker nodes (Field name for DB2 Analytics Accelerator for z/OS Version 4: Q8STWNOD_64).

Field Name: Q8STWNOD

WORKER NODES DISK UTILIZATION (%)

The current disk utilization of the accelerator worker nodes, expressed as percentage of the used I/O channels/resources.

Field Name: Q8STDSDKU

WORKER NODES AVG CPU UTILIZATION (%)

The current CPU utilization on the accelerator worker nodes. This is a snapshot, which is the average CPU utilization across all worker nodes (Field name for DB2 Analytics Accelerator for z/OS Version 4: Q8STWCPU_64).
Accelerator Data - Version 4 or later

Field Name: Q8STWCPU

COORDINATOR CPU UTILIZATION (%)
The current CPU utilization on the accelerator coordinator node (Field name for DB2 Analytics Accelerator for z/OS Version 4: Q8STCCPU_64).

Field Name: Q8STCCPU

PROCESSORS
The number of CPU cores available on all worker nodes.

Field Name: Q8STCORS

DATA SLICES
The number of data slices at the accelerator. This equals the degree of parallel I/O channels.

Field Name: Q8STNMDS

CPU TIME FOR REPLICATION
The total CPU cost associated with the replication apply process for all DB2 systems.

Field Name: Q8STTCCA

LOG RECORDS READ
The number of log records read by the replication capture agents for all DB2 systems.

Field Name: Q8STNLRA

LOG RECORDS READ - LOG RECORDS FOR ACCEL TABLES
The number of log records read by the replication capture agents for all DB2 systems that are applicable to tables in this accelerator.

Field Name: Q8STNLTA

LOG RECORD BYTES PROCESSED
The number of log record bytes processed by the replication capture agents for all DB2 systems.

Field Name: Q8STNBA

INSERT ROWS FOR ACCEL TABLES
The number of INSERT rows applicable to accelerator tables that were processed by the replication capture agents for all DB2 systems.

Field Name: Q8STNIA

UPDATE ROWS FOR ACCEL TABLES
The number of UPDATE rows applicable to accelerator tables that were processed by the replication capture agents for all DB2 systems.

Field Name: Q8STNUA

DELETE ROWS FOR ACCEL TABLES
The number of DELETE rows applicable to accelerator tables that were processed by the replication capture agents for all DB2 systems.

Field Name: Q8STNDA
ACCELERATOR SERVER START

The timestamp when the accelerator server process started last time.
Field Name: Q8STTART

ACCELERATOR STATUS CHANGE

The timestamp when the last change of the accelerator occurred.
Field Name: Q8STTATC

Accounting Rollup:

This topic shows detailed information about “Statistics - Accounting Rollup”.

Statistics - Accounting Rollup

The field labels shown in the following sample layout of “Statistics - Accounting Rollup” are described in the following section.

<table>
<thead>
<tr>
<th>ACCOUNTING ROLLUP</th>
<th>QUANTITY /SECOND</th>
<th>/THREAD</th>
<th>/COMMIT</th>
</tr>
</thead>
<tbody>
<tr>
<td>ROLLUP THRESH RECS WRITTEN</td>
<td>4.00</td>
<td>0.02</td>
<td>N/C</td>

<td>N/C</td>
</tr>
<tr>
<td>RECS UNQUALIFIED FOR ROLLUP</td>
<td>0.00</td>
<td>0.00</td>
<td>N/C</td>
</tr>
</tbody>
</table>

ROLLUP THRESH RECS WRITTEN

The number of roll-up accounting records written due to roll-up threshold exceeded.
Field Name: QWSDARTH

STORAGE THRESH RECS WRITTEN

The number of roll-up accounting records written due to roll-up accounting storage threshold exceeded.
Field Name: QWSDARSG

STALEN THRESH RECS WRITTEN

The number of roll-up accounting records written due to staleness threshold exceeded.
Field Name: QWSDARST

RECS UNQUALIFIED FOR ROLLUP

The number of records that failed to qualify for accounting roll-up because all roll-up key fields are equal to NULL or because of NULL values that are not permitted.
Field Name: QWSDARIR

Aggregated Accounting Statistics:

This topic shows detailed information about “Statistics - Aggregated Accounting Statistics”.

IFCID 369 contains aggregated Accounting data from IFCID 3 listed by connection type.
**Aggregated Accounting Statistics**

IFCID 369 is started using the START TRACE command for STATISTICS CLASS(9). IFCID 3 must also be enabled (ACCOUNTING CLASS(1)) to get 369 trace records. IFCID 369 values are aggregated each time an IFCID 3 is written and contain total values. In the Statistics reports, IFCID 369 delta values are calculated to show which IFCID 3 events occurred in a Statistics interval.

In contrast to Accounting reports, the IFCID 369 statistics performance metrics cannot distinguish between IFCID 3 records for parallel and non-parallel threads. In Accounting, the elapsed times of parallel threads are derived from IFCID 3 of the originating thread. In IFCID 369, all times (even the elapsed times of the originating thread and parallel subtasks) are aggregated and shown as such in the Statistics report. That is why IFCID 369 can provide more diagnostics on what is currently happening in a DB2 subsystem and whether there are bottlenecks (also for parallel subtasks).

For more information on the Accounting fields referred to in the field descriptions below, see:
- “Times - Class 1 - Application Time” on page 3341
- “Times - Class 2 - DB2 Time” on page 3347

**Statistics - Aggregated Accounting Statistics**

The field labels shown in the following sample layout of “Statistics - Aggregated Accounting Statistics” are described in the following section.

<table>

</tbody>
</table>

**CL1 ELAPSED**

The class 1 elapsed time aggregated by connection type. See also the description of Accounting field ADRECETT.

**Note:** In contrast to ADRECETT, elapsed times of parallel records are included in SDRECETT.

**Field Name:** SDRECETT

**CL1 CPU**

The class 1 CPU time aggregated by connection type. See also the description of Accounting field ADCPUT.

**Field Name:** SDCPU

**CL1 SE CPU**

The sum of several accumulated CPU times consumed while running on an IBM specialty engine in all environments and aggregated by connection type. See also the description of Accounting field AWACC1Z.

**Field Name:** SWACC1Z

**CL2 ELAPSED**

The class 2 elapsed time aggregated by connection type. See also the description of Accounting field ADDB2ETT.
Aggregated Accounting Statistics

Note: In contrast to ADDB2ETT, elapsed times of parallel records are included in SDDB2ETT.

Field Name: SDDB2ETT

CL2 CPU

The class 1 CPU time aggregated by connection type. See also the description of Accounting field ADDBCPUT.

Field Name: SDBBCPUT

CL2 SE CPU

The accumulated and consumed class 2 time on an IBM specialty engine aggregated by connection type. See also the description of Accounting field AWACC2Z.

Field Name: SWACC2Z

CL3 SUSP

The waiting time for all types of class 3 suspensions aggregated by connection type. See also the description of Accounting field ADTSUST.

Field Name: SDTSUST

CL2 NOT ACC

The time not accounted in DB2 and aggregated by connection type. See also the description of Accounting field ADNOTACC.

Note: In contrast to ADNOTACC, unaccounted times of parallel records are included in SDNOTACC.

Field Name: SDNOTACC

QUANTITY

The number of parallel child agents, Accounting intervals, or autonomous procedures rolled up for all threads of the connection type. See also the description of Accounting field QWACPCNT.

Field Name: SWACPCNT

Authorization Management:

This topic shows detailed information about “Statistics - Authorization Management”.

There are three authorization caches, located in the EDM pool:
• Plan, one cache per plan
• Package, one per subsystem
• Routine, for stored procedures and user-defined functions, one per subsystem

Allied threads (CICS, IMS, TSO, batch) are checked for EXECUTE authority at plan level. The package, and routine authorization caches only check EXECUTE authority for distributed applications.

The size of the plan authorization cache is set at BIND time, with the option CACHESIZE. When this is not specified, the default is taken from the ZPARM AUTHCACHE.
Authorization Management

If you run the plan infrequently, or if authority to run the plan is granted to PUBLIC, you might want to turn off caching for the plan so that DB2 does not use unnecessary storage. In this case specify a value of 0 for the CACHESIZE option.

Any plan that you run repeatedly is a good candidate for tuning by using the CACHESIZE option. Also, if you have a plan that a large number of users run concurrently, you might want to use a larger CACHESIZE.

The size of the package authorization cache is determined by ZPARM CACHEPAC.

The size of the routine authorization cache is determined by ZPARM CACHERAC.

Statistics - Authorization Management

The field labels shown in the following sample layout of “Statistics - Authorization Management” are described in the following section.

TOTAL AUTH ATTEMPTS

The number of authorization checks performed for plans, packages, and stored procedures since DB2 was started. This includes successful and failed checks.

Field Name: QTAUCHK

TOTAL AUTH SUCC

The number of successful authorization checks performed on plans, packages, and stored procedures, since DB2 was started.

Field Name: QTAUSUC

PLAN-AUTH SUCC-W/O CATALOG

The number of successful authorization checks that do not use the DB2 catalog (including plan cache checks and public checks).

Background and Tuning Information

For transaction level security, ENABLE and DISABLE on BIND PACKAGE should be used to ensure adequate security. Granting execute authority on the plan to public should be adequate.

Field Name: QTAUCCH

PLAN-AUTH SUCC-PUB-W/O CAT
The number of successful authorization checks based on EXECUTE authority granted to PUBLIC.

**Field Name:** QTAUPUB

**PKG-AUTH SUCC-W/O CATALOG**

The number of successful package EXECUTE authorization checks without accessing the DB2 catalog.

**Field Name:** QTPACAUT

**PKG-AUTH SUCC-PUB-W/O CAT**

The number of successful package EXECUTE authorization checks without accessing the DB2 catalog. Package EXECUTE authority was granted to PUBLIC in the package authorization cache.

**Field Name:** QTPACPUB

**PKG-AUTH UNSUCC-CACHE**

The number of unsuccessful package EXECUTE authorization checks in the package authorization cache. No applicable entry was found in the cache and DB2 catalog access was used.

**Field Name:** QTPACNOT

**PKG CACHE OVERWRT - AUTH ID**

The number of times an authorization ID was overwritten to add another one to the package authorization cache.

**Field Name:** QTPACOW1

**PKG CACHE OVERWRT - ENTRY**

The number of times an entry for a collection-ID or package-ID was overwritten to add another one to the package authorization cache.

**Field Name:** QTPACOW2

**RTN-AUTH SUCC-W/O CATALOG**

The number of times the routine authorization cache was checked successfully of EXECUTE authority on a stored procedure or user-defined function. The DB2 catalog was not accessed. This counter includes the number of PUBLIC authorization checks.

**Field Name:** QTRACAUT

**RTN-AUTH SUCC-PUB-W/O CAT**

Number of successful authorization checks for user-defined function or stored procedure execution authority when that authority is held by PUBLIC. The DB2 catalog was not checked.

**Field Name:** QTRACPUB

**RTN-AUTH UNSUCC-CACHE**

Number of unsuccessful authorization checks for user-defined function or stored procedure EXECUTE authority because no applicable entry was found in the routine authorization cache.

**Field Name:** QTRACNOT

**RTN CACHE OVERWRT - AUTH ID**
Authorization Management

Number of times that DB2 overwrote an authorization ID in the routine authorization cache.

Field Name: QTRACOW1

RTN CACHE OVERWRT - ENTRY

Number of times that DB2 overwrote a routine entry in the routine authorization cache.

An entry in the routine authorization cache can refer to a function or procedure or to all functions or procedures within a specific schema.

Field Name: QTRACOW2

RTN CACHE - ENTRY NOT ADDED

Number of times that DB2 could not add an entry to the routine authorization cache.

An entry in the routine authorization cache can refer to a function or procedure or to all functions or procedures within a specific schema.

Field Name: QTRACNAC

Buffer Pool General:

This topic shows detailed information about “Statistics - Buffer Pool General”.

This block is only printed when the buffer pool is active. If more than one 4 KB or 32 KB buffer pool block is present, a summary block showing buffer pool totals is also printed. If the report contains both 4 KB and 32 KB buffer pool blocks, a block showing the totals for all buffer pools is printed.

Statistics - Buffer Pool General

CURRENT ACTIVE BUFFERS

The total number of currently active (nonstealable) buffers. This field is an instantaneous sample of the number of buffers in the buffer pool that were updated or in use at the time this monitor data was requested. Because this field gives a snapshot value at statistics collection time, it only shows a problem if it happens at this time.

Background and Tuning Information

The buffer pool might be too small if the percentage of active pages in the buffer pool is beyond the deferred write threshold (DWQT).

Field Name: QBSTCBA

UNAVAIL.BUFFER-VPOOL FULL

The number of times a usable buffer could not be located in the virtual buffer pool because the virtual buffer pool was full.

Background and Tuning Information

Ideally, this value should be 0. Any other value indicates that the buffer pool is underallocated. In this case, use the ALTER BUFFERPOOL command to increase the virtual buffer pool size until this value remains at 0.

Field Name: QBSTXFL

NUMBER OF DATASET OPENS

The number of data sets physically opened successfully. This value is cumulative from the start of the DB2 statistics interval.

Field Name: QBSTDOS

BUFFERS ALLOCATED - VPOOL

The number of buffers allocated for a virtual buffer pool.

Note: In DB2 10, the buffer pool size can increase continuously by up to 25% for each DB2 restart. In DB2 11, the AUTOSIZE option of the ALTER BUFFERPOOL command can limit the range within VPSIZEMIN and VPSIZEMAX.

Background and Tuning Information

You should monitor the buffer pool hit ratio field to find the optimum size of the buffer pool. Usually the buffer pool hit ratio is improved by increasing the size of the buffer pool. However, paging the buffer pool storage impacts DB2 performance if the virtual buffer pool is too large.

Page-ins Required for Read I/O (QBSTRPI) and Page-ins Required for Write I/O (QBSTWPI) are useful when determining whether paging affects the performance of a certain buffer pool. The Resource Measurement Facility (RMF) also provides reports on MVS paging activity:

Storage Paging

When the virtual buffer pool is extended into expanded storage, MVS storage paging activity occurs. If a large buffer pool size results in excessive storage paging, consider allocating more real storage to the LPAR.
Paging to Auxiliary Storage

If the virtual buffer pool size requirements exceed the central storage and expanded storage available, the oldest buffer pool pages migrate to auxiliary paging storage. When these pages are accessed subsequently, I/O must bring them back into real storage. This should be avoided. You could have a smaller buffer pool and let DB2 do the I/O rather than use MVS paging with its I/O CPU overhead. This is a situation that you (as the system programmer) should monitor.

You can use the ALTER BUFFERPOOL command to alter the size of the virtual buffer pool.

Changing the size of the virtual buffer pool implicitly changes the buffer pool thresholds. See the Deferred Write Threshold Reached field (QBSTDWT).

Field Name: QBSTVPL

DFHSM MIGRATED DATASET

The number of times migrated data sets were encountered.

Field Name: QBSTMIG

DFHSM RECALL TIMEOUTS

The number of recall timeouts.

Field Name: QBSTRTO

VPOOL EXPANS. OR CONTRACT.

The number of successful virtual buffer pool expansions or contractions due to the ALTER BUFFERPOOL command. An increase in this counter indicates that buffer-pool-related system parameters have been changed.

Field Name: QBSTVPA

This is an exception field.

VPOOL EXPANS. FAILURES

The total number of virtual buffer pool expansion failures due to the lack of virtual storage space.

Background and Tuning Information

Ideally, this value should be 0. If it is not, check the virtual storage allocation of the DB2 database address space for areas that can be reduced. For example, you can reduce the size of other buffer pools.

Field Name: QBSTXFV

This is an exception field.

CONCUR.PREF/I/O STREAMS-HWM

The highest number of concurrent prefetch I/O streams allocated to support a parallel I/O or CP query in this buffer pool. It reflects prefetch activities for non-workfile page sets.

This number only applies to query I/O and CP parallelism.

Field Name: QBSTXIS

This is an exception field.
**PREFI/O STREAMS REDUCTION**

The total number of requested prefetch I/O streams that were denied because of a lack of buffer pool storage space.

It only applies to query I/O and CP parallelism.

For example, if 100 prefetch I/O streams are requested and only 80 are granted, then 20 is added to the number in this field.

**Background and Tuning Information**

Consider increasing the size of the buffer pool if this value is not 0.

The ratio of this field and the Reduced parallel query requests field gives the average degree of parallel query processing that was reduced because of insufficient buffer pool space. The Prefetch I/O streams - Concurrent streams - high-water mark field gives the highest degree of parallel query processing that was reduced for one or more queries processed in parallel.

The number in this field reflects the prefetch activities for non-workfile page sets.

**Field Name:** QBSTJIS

This is an exception field.

**PARALLEL QUERY REQUESTS**

The total number of requests made for parallel query support in this buffer pool. This field only applies to non-workfile page sets in query I/O and CP parallelism.

**Field Name:** QBSTPQO

**PARALLEL QUERY REQ.REDUCTION**

The number of times that DB2 could not allocate the requested number of buffer pages to allow a parallel group to run as planned.

This field only applies to non-workfile page sets in query I/O and CP parallelism.

**Background and Tuning Information**

This is caused by a shortage of storage in the buffer pool. A nonzero value could suggest that the buffer pool is too small. You can increase it using the ALTER BUFFERPOOL command.

**Field Name:** QBSTPQF

This is an exception field.

**PREF.QUANT.REDUCED TO 1/2**

The total number of times prefetch quantity is reduced from normal to 50% of normal. The normal size depends on the page size of the buffer pool.

This field only applies to query I/O and CP parallelism.

**Background and Tuning Information**

The number in this field indicates when DB2 had to reduce the sequential prefetch quantity to continue executing concurrently with parallel queries in the system. If the number is small, it may be tolerable.

**Field Name:** QBSTPL1

This is an exception field.
**Buffer Pool General**

**PREFQUANT.REDUCED TO 1/4**

The total number of times prefetch quantity is reduced from 50% to 25% of normal. The normal size depends on the page size of the buffer pool.

This field only applies to query I/O and CP parallelism.

**Background and Tuning Information**

The query response for parallel queries can be significantly degraded if the value in this field is not 0.

**Field Name:** QBSTPL2

This is an exception field.

**NUMBER OF LPL INSERTS**

The number of times that one or more pages were added to the logical page list (LPL).

**Field Name:** QBSTLPL

**MIN BUFFERS ON SLRU**

The minimum number of buffers on the sequential least-recently-used (SLRU) chain in the last statistical period. This is the low-water mark (LWM) within an interval.

**Field Name:** QBSTSMIN

**MAX BUFFERS ON SLRU**

The maximum number of buffers on the sequential least-recently-used (SLRU) chain in the last statistical period. This is the high-water mark (HWM) within an interval.

**Field Name:** QBSTSMAX

**SLRU LENGTH EQUALS VPSEQT**

The number of times when the length of the sequential least-recently-used (SLRU) chain equals the sequential steal threshold VPSEQT.

**Field Name:** QBSTHST

**GETPAGE REQU RANDOM ON SLRU**

The number of times that the random Getpage request has a buffer hit and the buffer is on the least-recently-used (SLRU) chain.

**Field Name:** QBSTRHS

**Buffer pool read statistics report:**

This topic shows detailed information about “Statistics - Buffer Pool Read”.

This block is only printed when the buffer pool is active. If more than one 4 KB or 32 KB buffer pool block is present, a summary block showing buffer pool totals is also printed. If the report contains both 4 KB and 32 KB buffer pool blocks, a block showing the totals for all buffer pools is printed.

**Statistics - Buffer Pool Read**

<table>
<thead>
<tr>
<th>BP0 READ OPERATIONS</th>
<th>QUANTITY /SECOND /THREAD /COMMIT</th>
</tr>
</thead>
<tbody>
<tr>
<td>BPOOL HIT RATIO (%)</td>
<td>50.90</td>
</tr>
<tr>
<td>BPOOL HIT RATIO (%)</td>
<td>50.89</td>
</tr>
</tbody>
</table>
The percentage of Getpage operations that were satisfied by a page already in the buffer pool.

The value is calculated as the ratio of number of successful Getpage operations minus the number of pages read from DASD (both synchronously and using prefetch), to the number of successful Getpage operations, expressed as a percentage.

**Background and Tuning Information**

The highest possible hit ratio is 100%, that is, when every page requested is always in the buffer pool. If the requested page is not in the buffer pool, the hit ratio is 0% or less. If the hit ratio is negative, this means that prefetch brought pages into the buffer pool that are not subsequently referenced, either because the query stops before it reaches the end of the table space, or because the prefetched pages are stolen by DB2 for reuse before the query can access them. A low buffer pool hit ratio is not necessarily bad. The hit ratio is a relative value, based on the type of application. For example, an application that browses large data might have a buffer pool hit ratio of 0. Watch for those cases where the hit ratio drops significantly for the same application. Here are some suggestions to increase the buffer hit ratio:

- Run the REORG utility for indexes or table spaces associated with the virtual buffer pool.
- Reserve more pages for random I/O by setting the SEQUENTIAL STEAL THRESHOLD (VPSEQT) to a lower value.
- Increase the buffer pool as long as the cost of paging does not outweigh the benefit of I/O avoidance.
Establish more separate buffer pools, perhaps to isolate different applications.

Place the objects that are accessed only sequentially in a separate buffer pool.

When the hit ratio is negative, it means that prefetch has brought pages into the buffer pool that are not subsequently referenced, either because the query stops before it reaches the end of the table space, or because the prefetched pages are stolen by DB2 for reuse before the query can access them.

The hit ratio measurement becomes less meaningful if the buffer pool is used by additional processes, such as utilities or work files.

**Field Name:** SBUFFRAT

**BPOOL HIT RATIO (%) SEQU**

The percentage of sequential Getpage operations that were satisfied by a page already in the buffer pool.

**Field Name:** SBUFFSEQ

**BPOOL HIT RATIO (%) RANDOM**

The percentage of random Getpage operations that were satisfied by a page already in the buffer pool. If this value is low, it indicates that page residency in the buffer pool is too low, therefore the buffer pool may be too small.

**Field Name:** SBUFFRDM

**GETPAGE REQUEST**

The number of Getpage requests including conditional and unconditional requests.

**Field Name:** QBSTGET

**GETPAGE REQS-SEQUENTIAL**

The number of Getpage requests issued by sequential access requesters.

**Field Name:** QBSTSGT

**IN-MEM OVFL SEQ REQS**

The number of sequential GETPAGE requests using overflowed buffers. If this counter has a non-zero value, the buffer pool size should be increased.

**Field Name:** QBSTASGE

This is an *exception* field.

**GETPAGE REQS-RANDOM**

The number of random Getpage requests.

**Field Name:** SDGETRAN

**IN-MEM OVFL RND REQS**

The number of non-sequential GETPAGE requests using overflowed buffers. If this counter has a non-zero value, the buffer pool size should be increased.
Field Name: QBSTAGET
This is an exception field.

SYNCHRONOUS READS
The number of synchronous read I/O operations performed by DB2 for applications and utilities.

Background and Tuning Information
This number includes both Synchronous Reads Sequential Access Only (QBSTSIO) and synchronous read operations for non-sequential access.

You can use this value and the value of Synchronous Reads Sequential Access Only to calculate the number of Non-Sequential Synchronous Reads.

Check the buffer pool hit ratio if the number of non-sequential synchronous reads is larger than expected.

Field Name: QBSTRIO
This is an exception field.

SYNC READS-SEQUENTIAL
The number of synchronous read I/O requests issued by sequential access requesters.

Background and Tuning Information
Sequential synchronous read I/Os can occur because:
• Prefetch is disabled (QBSTSPD).
• Prefetch pages could have been stolen from the buffer pool before the Getpage request is issued for those pages. Subsequently the pages are reread synchronously. A negative buffer pool hit ratio can indicate the same problem.
• The pages requested are not consecutive: DB2 estimated the selected range of pages to be so small that prefetch would make no sense. See also Sequential Prefetch Requested (QBSTSEQ).

It is normal to have a small value for SYNC READ I/O (SEQUENTIAL) because before the sequential prefetch is scheduled, the first page of a prefetch is read by SYNC READ I/O. However, if this number is large, consider increasing the size of the buffer pool or reviewing the sequential steal thresholds (VPSEQT and HPSEQT).

Field Name: QBSTSIO
This is an exception field.

IN-MEM OVFL SEQ READS
The number of synchronous read I/O operations for sequential GETPAGE requests using overflowed buffers.

If this counter has a non-zero value, the buffer pool size should be increased.

Field Name: QBSTASSE
This is an exception field.

SYNC READS-RANDOM
The number of random synchronous read I/O requests.
Buffer Pool Read

Field Name: SDSTRAN
This is an exception field.

IN-MEM OVFL RND READS
The number of synchronous read I/O operations for non-sequential GETPAGE requests using overflowed buffers.
If this counter has a non-zero value, the buffer pool size should be increased.

Field Name: QBSTASYN
This is an exception field.

GETPAGE PER SYN.READ-RANDOM
The number of random Getpage requests per random synchronous read I/O request.

Background and Tuning Information
This ratio is a good indicator of read efficiency in a transaction environment. The higher the number is, the better.

Field Name: SBRGPRIO

SEQUENTIAL PREFETCH REQUEST
The number of sequential prefetch requests. This counter is incremented for each PREFETCH request (which can result in an I/O read). If the prefetch results in an I/O read, up to 64 pages may be read for SQL, and up to 128 pages for utilities. A request does not result in an I/O read if all pages to be prefetched are already in the buffer pool.
This counter does not include sequential detection, which is recorded in the Dynamic Prefetch - Requested field.

Background and Tuning Information
Sequential prefetch reads a sequential set of pages. It allows CP and I/O operations to be overlapped. DB2 determines at BIND time whether sequential prefetch is used or not.
Sequential prefetch is generally used for a table space scan.
The number of prefetch requests by itself is not a good indicator for efficiency of prefetching:
• At run time not every prefetch request results in read I/O: the Sequential Prefetch Reads field (QBSTPIO) shows the number of read I/O operations caused by sequential prefetch. The Prefetch Disabled No Buffer (QBSTSPD) and Prefetch Disabled No Read Engine fields (QBSTREE) show the number of times prefetch was disabled because buffers and read engines had not been available.
• Check the value in the buffer pool hit ratio. A negative value indicates that prefetched pages are stolen from the buffer pool before they are read. The pages are subsequently reread synchronously. There will be also a large value in the Synchronous Reads Total (QBSTRIO) field.
• Decreasing the size of the buffer pool can reduce the prefetch quantity, leading to a larger number of prefetch requests. See also the Sequential Prefetch Pages Read field (QBSTSP).

Field Name: QBSTSEQ
This is an *exception* field.

**SEQUENTIAL PREFETCH READS**

The number of asynchronous read I/O operations due to normal sequential prefetch (applications and utilities).

**Background and Tuning Information**

Prefetch Read I/O is not activated if one of the following conditions applies:

- All pages in the prefetch range are already in the buffer pool.
- Prefetch is disabled (QBSTSPD).

This means that the value in this field is usually smaller than the number of sequential prefetch requests (QBSTSEQ).

**Field Name:** QBSTPIO

This is an *exception* field.

**PAGES READ VIA SEQ.PREFETCH**

The total number of pages read due to a normal sequential prefetch. A sequential prefetch request does not result in a read I/O if all the pages you want are found in the buffer pool.

**Background and Tuning Information**

For requests issued by application programs, the number of pages per READ I/O primarily depends on the page size and the size of the buffer pool. Normally sixty-four 4 KB pages (or eight 32 KB pages) is the maximum prefetch quantity for table space scans, whether data or index. Utilities use a prefetch quantity of up to 64 pages.

The number of pages per READ I/O can be lower because:

- Pages within the prefetch range may already be in the buffer pool.
- Not enough pages are available because of a buffer shortage.
- A prefetch quantity of 8 pages or less is used for work files.

A small value for this ratio can indicate:

- A good performing buffer pool being so large that most of the pages, which had otherwise to be prefetched, are cached in the buffer pool. In this case, the buffer pool hit ratio should be high.
- A buffer shortage condition, reducing the efficiency of sequential prefetch. This could mean, for example, work-file prefetch quantity reduction from 8 to 4 to 2, as the number of available buffers shrinks. In this case, you should consider tuning the buffer pool.

**Field Name:** QBSTSPP

This is an *exception* field.

**S.PREFPAGES READ/S.PREF.READ**

The number of sequential prefetch pages read per sequential prefetch read I/O operation.

**Field Name:** SBRPRRIO

This is an *exception* field.

**LIST PREFETCH REQUESTS**

The number of list prefetch requests.
List prefetch allows DB2 to access data pages efficiently even when the required data pages are not contiguous. It allows CP and I/O operations to be overlapped.

**Background and Tuning Information**

DB2 determines at BIND time whether sequential prefetch is used. List prefetch is chosen as follows:

- Usually with a single index that has a cluster ratio lower than 80%.
- Sometimes on a single index with a high cluster ratio, if the estimated amount of data to be accessed is too small to make sequential prefetch efficient.
- Always to access data by multiple index access.
- Always to access data from the inner table during a hybrid join.

DB2 never chooses list prefetch if the estimated number of RIDs to be processed takes more than 50% of the RID pool. During execution time, list prefetch processing terminates if more than 25% of the rows (with a minimum of 4075) in the table must be accessed.

Data pages are read in quantities equal to the sequential prefetch quantity (QBSTSEQ), which depends on buffer pool size and is usually 64 pages.

Field Name: QBSTLPF

This is an exception field.

**LIST PREFETCH READS**

The number of asynchronous read I/O operations caused by the list prefetch.

The number of pages read is shown by the List Prefetch Pages Read (QBSTLPP) field.

**Background and Tuning Information**

Prefetch Read I/O is not activated if one of the following conditions apply:

- All pages in the prefetch range are already in the buffer pool.
- Prefetch is disabled (Prefetch Disabled No Read Engine - QBSTREE).

This means that the value in this field is usually less than the number of list prefetch requests (QBSTLPF).

Field Name: QBSTLIO

This is an exception field.

**PAGES READ VIA LIST PREFETCH**

The number of pages read via list prefetch.

Field Name: QBSTLPP

**L.PREF.PAGES READ/L.PREF.READ**

The number of list prefetch pages read per list prefetch read I/O.

Field Name: SDLPPPIO

This is an exception field.

**DYNAMIC PREFETCH REQUESTED**
The number of dynamic prefetch requests. Dynamic prefetch is the process that is triggered because of sequential detection. If the prefetch request results in an I/O read, up to 32 advancing pages can be read at a time.

**Background and Tuning Information**

Dynamic prefetch reads a sequential set of pages. It allows CP and I/O operations to be overlapped. If DB2 does not choose prefetch at bind time it can sometimes use it at execution time. The method is called sequential detection.

The number of prefetch requests by itself is not a good indicator for efficiency of prefetching because:

- At run time not every prefetch request results in read I/O: the Dynamic Prefetch Reads field shows the number of read I/O operations caused by dynamic prefetch. The Prefetch Disabled No Buffer (QBSTSPD) and Prefetch Disabled No Read Engine (QBSTREE) fields show the number of times prefetch was disabled because buffers and read engines had not been available.
- Prefetch pages can be stolen from the buffer pool before they are read. This is indicated by a negative buffer pool hit ratio. The pages are subsequently reread synchronously. This will also cause an unexpectedly large value for total synchronous reads (QBSTRI).

Decreasing the size of the buffer pool can reduce the prefetch quantity (QBSTDPP), leading to a larger number of prefetch requests.

**Field Name:** QBSTDPF

This is an exception field.

**DYNAMIC PREFETCH READS**

The number of asynchronous read I/Os because of dynamic prefetch. The number of pages read is recorded in the Dynamic Prefetch Pages Read field.

**Background and Tuning Information**

A prefetch request does not result in an I/O if one of the following conditions apply:

- All pages to be prefetched are already in the buffer pool.
- The prefetch is canceled.

This means that the value in this field is usually smaller than the number of dynamic prefetch requests.

**Field Name:** QBSTDJO

This is an exception field.

**PAGES READ VIA DYN.PREFETCH**

The number of pages read because of dynamic prefetch. Dynamic prefetch is the process that is triggered by sequential detection.

**Background and Tuning Information**

The ratio of Dynamic Prefetch Pages Read to Dynamic Prefetch Reads is between 0 and 32.

DB2 can fetch up to 32 pages per prefetch.

The number of pages per READ I/O can be lower because:
Buffer Pool Read

- Pages within the prefetch range are already in the buffer pool.
- Not as many pages are available due to a buffer shortage.

A small value for this ratio can indicate:
- A good performing buffer pool being large enough to contain pages that would otherwise be prefetched. This is indicated by a high buffer pool hit ratio.
- A buffer shortage condition, which reduces the efficiency of dynamic prefetch. In this instance the buffer pool hit ratio will be low. Consider tuning the buffer pool.

Field Name: QBSTDPP
This is an exception field.

D.PREF.Pages Read/D.PREF.READ
The number of dynamic prefetch pages read per dynamic prefetch read I/O.

Field Name: SDDPPPIO
This is an exception field.

PREDEFINED-NO BUFFER
The total number of times sequential prefetch was disabled because buffers were not available.

Field Name: QBSTSPD
This is an exception field.

PREDEFINED-NO READ ENG
The total number of times a prefetch is disabled because of an unavailable read engine.

Background and Tuning Information
Because there are 600 read engines, a maximum of 600 concurrent prefetch operations can be processed at a time. When this maximum is reached, prefetching is disabled and this count is incremented. The value in this field should be close to 0.

Field Name: QBSTREE
This is an exception field.

PAGE-INS REQUIRED FOR READ
The number of page-ins required for a read I/O.

Note: A non-zero value can be accepted if a buffer pool expansion via ALTER BPSIZE occurs. In other situations, a non-zero value indicates a shortage of real storage relative to the buffer pool size.

Field Name: QBSTRPI
This is an exception field.

ZHYPERLINK READ – I/O
The number of successful reads using zHyperLink during the reported interval.

Field Name: QBSTSYIO
READ I/O – DASD CACHE HIT

The number of read I/Os where the requested data was found in the DASD subsystem cache during the reported interval.

Field Name: QBSTSIOC

Buffer Pool Sort/Merge:

This topic shows detailed information about “Statistics - Buffer Pool Sort/Merge”.

This block is only printed when the buffer pool is active. If more than one 4 KB or 32 KB buffer pool block is present, a summary block showing buffer pool totals is also printed. If the report contains both 4 KB and 32 KB buffer pool blocks, a block showing the totals for all buffer pools is printed.

Statistics - Buffer Pool Sort/Merge

The field labels shown in the following sample layout of “Statistics - Buffer Pool Sort/Merge” are described in the following section.

<table>

</tbody>
</table>

MAX WORKFILES CONCURR. USED

The maximum number of work files concurrently used during merge processing within this statistics period.

Ideally, each work file needs 16 buffers to allow DB2 to perform a sequential prefetch for work files.

Field Name: QBSTWFM

This is an exception field.

MERGE PASSES REQUESTED

The total number of merge passes for DB2 sort activities. This value reflects how many merge passes were requested for DB2 to determine the number of work files permitted to support each merge pass.

Field Name: QBSTWFR

MERGE PASS DEGRADED-LOW BUF

The number of times that a merge pass was not efficiently performed due to a shortage of space in the buffer pool. The number in this field is incremented for each merge pass where the maximum number of work files allowed is less than the number of work-files requested.

Background and Tuning Information

The maximum number of work files allowed is calculated as follows:
• Buffers consumed = 2 * (work files already allocated)
• Buffers available = (sequential steal threshold * buffer pool size - buffers consumed)
Buffer Pool Sort/Merge

- Maximum work files allowed = buffers available / (2 * 8)

The default for the sequential steal threshold is 0.8.

Ideally, the number in this field should be 0. Otherwise, it indicates a shortage of buffer pool space or that there are too many concurrent work files. For example, there could be a number of concurrently open cursors that require sorting. Consider increasing the buffer pool size using the ALTER BUFFERPOOL command.

**Field Name:** QBSTWFF

This is an *exception* field.

**WORKFILE REQ.REJCTD-LOW BUF**

The total number of work files that were rejected during all merge passes because of insufficient buffer resources.

**Background and Tuning Information**

This field and the degraded low buffers field determine the average number of work files that cannot be honored at each merge pass because of insufficient buffer pool space.

Ideally, the number in this field should be 0. Otherwise, it indicates a shortage of buffer pool space or that there are too many concurrent work files. For example, there could be a number of concurrently open cursors that require sorting. Consider increasing the size of the buffer pool using the ALTER BUFFERPOOL command.

Note that, when there are many concurrent sorts or large sorts, it is a good idea to dedicate a separate buffer pool for sort work files. This will greatly facilitate work-file performance tuning.

**Field Name:** QBSTWFD

This is an *exception* field.

**WORKFILE REQ-ALL MERGE PASS**

The total number of work files requested for all merge passes.

This field and the Merge Passes Requested field determine the average number of work files requested in a single merge pass.

For DB2 to perform an efficient prefetch for work files, each workfile should have at least 16 dedicated buffers. Work files used during sort phase processing or other non-sort-related processing are not included in this number.

**Field Name:** QBSTWFT

**WORKFILE NOT CREATED-NO BUF**

This field is only applicable if DB2 is running under MVS/XA.

The number of times a work file could not be created due to insufficient buffer resources. It indicates that a sort is in progress and limited in regard to the number of work files it can use.

**Background and Tuning Information**

Ideally, this should be 0. Otherwise, it indicates a shortage of buffer pool space or that there are many concurrent work files. For example, there could be a number of open cursors that require sorting.
Generally, sorts are performed more efficiently with additional work files, but there are internal DB2 limits on the number of work files a transaction can have. It is possible that at run time a transaction cannot use as many work files as it had planned. You can control this by increasing the buffer pool size (ALTER BUFFERPOOL), or changing the transaction so it requires fewer concurrent work files.

**Field Name:** QBSTMAX

This is an *exception* field.

**WORKFILE PRF NOT SCHEDULED**

The number of times a sequential prefetch was not scheduled for a work file because the dynamic prefetch quantity is zero.

**Background and Tuning Information**

The work-file prefetch checks the dynamic prefetch quantity (normally 1 to 8 pages). When the quantity is zero, the value in this field is incremented. A high number in this field implies that the buffer pool is too small.

Ideally, the number in this field should be 0. Otherwise, it indicates a shortage of buffer pool space or that there are many concurrent work files. For example, there could be a number of concurrently open cursors that require sorting.

Consider increasing the size of the buffer pool or allocating a buffer pool specifically for DSNDB07 usage. This can be especially effective with high-use query systems whose reports make extensive use of sort activity.

**Field Name:** QBSTWKPD

This is an *exception* field.

**Buffer Pool Write:**

This topic shows detailed information about “Statistics - Buffer Pool Write”.

This block is only printed when the buffer pool is active. If more than one 4 KB or 32 KB buffer pool block is present, a summary block showing buffer pool totals is also printed. If the report contains both 4 KB and 32 KB buffer pool blocks, then a block showing the totals for all buffer pools is printed.

**Statistics - Buffer Pool Write**

The field labels shown in the following sample layout of “Statistics - Buffer Pool Write” are described in the following section.

**BUFFER UPDATES**

The number of times buffer updates were requested against pages in the buffer pool.

**Background and Tuning Information**

The ratio of Buffer Updates to Pages Written (QBSTPWS) suggests a high level of efficiency as it increases, because more updates are being externalized per physical write.

Buffer updates per pages written depends strongly on the type of application. For example, a batch program that processes a table in sequential mode with a high row update frequency in a dedicated environment can achieve very good update efficiency. In contrast, update efficiency tends to be lower for transaction processing applications, because transaction processing tends to be random.

The following can influence the number of updates per page:

- **Number of rows per page**
  A small PCTFREE value gathers more rows on the same page. However, at the same time this can impact concurrency.

- **Buffer pool size and deferred write thresholds**
  Increase DWQT and VDWQT or the size of the buffer pool. This causes DB2 to let page updates accumulate in the buffer pool. Therefore, the probability that more updates per page get captured increases. This effect is less significant if the buffer pool is concurrently used by several transactions, it also depends on the type of transaction.

Field Name: QBSTSWS

This is an *exception* field.

**PAGES WRITTEN**

The number of pages in the buffer pool written to DASD.

**Background and Tuning Information**

Consider the ratio of Pages Written per write I/O. The number of write I/O operations includes Asynchronous Writes (QBSTWIO) and Synchronous Writes (QBSTIMW).

The ratio of pages per write I/O suggests a high level of efficiency as the ratio increases, because more pages are being externalized per physical write.

The following factors impact the ratio of pages written per write I/O:

- **Checkpoint frequency**
  At checkpoint time, I/Os are scheduled to write all updated pages on the deferred write queue to DASD. If this occurs too frequently, the deferred write queue does not grow large enough to achieve a high ratio of pages written per write I/O.
The checkpoint frequency depends on the number of logs written between two consecutive checkpoints. This number is set at installation time; see the field CHECKPOINT FREQ of installation panel DSNTIPN.

**Frequency of active log switch**
DB2 takes a system checkpoint each time the active log is switched. High frequency of active log switches causes the problem described under checkpoint frequency.

**Buffer pool size and deferred write thresholds**
The deferred write thresholds (VDWQT and DWQT) are a function of buffer pool size. If the buffer pool size is decreased, these thresholds are reached more frequently, causing I/Os to be scheduled more often to write some of the pages on the deferred write queue to DASD. This prevents the deferred write queue from growing large enough to achieve a high ratio of pages written per write I/O.

**Number of data sets, and the spread of updated pages across them**
The efficiency of write I/O also depends on the number of data sets associated with the buffer pool and spread of updated pages across them. Because of the nature of batch processing, the ratio of pages written to write I/Os can be expected to be higher than that expected for transaction type workloads.

To determine update efficiency, use also the value in the Buffer Updates field (QBSTWS) to check the number of buffer updates per page written.

**Field Name:** QBSTPWS

This is an *exception* field.

**BUFF. UPDATES/PAGES WRITTEN**
The number of buffer updates per page written from the buffer pool to DASD.

The ratio of BUFFER UPDATES (QBSTWS) to PAGES WRITTEN (QBSTPWS) suggests a high level of efficiency as the ratio increases, because more updates are being externalized per physical write. For example, if there are 10 updates on the same page before it is externalized, then the ratio is 10:1 or 10. If all 10 updates are on 10 distinct pages, then the ratio is 10:10 or 1.

**Background and Tuning Information**
Buffer updates per pages written depends strongly on the type of application. For example, a batch program that processes a table in skip sequential mode with a high row update frequency in a dedicated environment can achieve very good update efficiency. In contrast, update efficiency tends to be lower for transaction processing applications, because transaction processing tends to be random.

The following factors can influence the number of updates per page:

**Number of rows per page**
A small PCTFREE value will gather more rows on the same page. However, at the same time this can have impact on concurrency.

**Buffer pool size and deferred write thresholds**
Increase DWQT and VDWQT or the size of the buffer pool. This
Buffer Pool Write

would tell DB2 to let page updates accumulate in the buffer pool. This means, the probability that more updates per page get captured increases. This effect is less significant if the buffer pool is concurrently used by multiple transactions, it depends on the type of transaction.

Field Name: SBRBUPW

SYNCHRONOUS WRITES

The total number of immediate writes.

Immediate writes occur when:

• An immediate write threshold (IWTH) is reached
• No deferred write engines are available
• More than two checkpoints pass without a page being written.

Sometimes DB2 uses synchronous writes even when the IWTH is not exceeded. As an example, when more than two checkpoints pass without a page being written. This type of situation does not indicate a buffer shortage.

Background and Tuning Information

A small number of immediate writes can be expected. Synchronous writes occur if there are too many checkpoints and/or the buffer pool is too small.

If a large number of synchronous writes occur, monitor the DM Critical Threshold Reached (QBSTDMC) field. Reaching Immediate Write Threshold (IWTH-97.5%) implies that the Data Management Threshold (DMTH-95%) has been crossed. You can ignore the value in the immediate write field when DM Critical Threshold Reached is zero. Otherwise consider increasing the size of the buffer pool. You can use the ALTER BUFFERPOOL command.

Check also the System Event Checkpoint field (QWSDCKPT) in the Subsystem Services block to see whether the frequency of DB2 checkpoints should be reduced. To do this, increase the value of ZPARM LOGLOAD.

Field Name: QBSTIMW

This is an exception field.

ASYNCHRONOUS WRITES

The number of asynchronous write I/O operations performed by media manager to a direct access storage device.

Field Name: QBSTWIO

This is an exception field.

PAGES WRITTEN PER WRITE I/O

The number of pages written from the buffer pool to DASD per synchronous or asynchronous write I/O. This count does not include preformatting I/O, such as I/O needed to prepare a data set for use.

Background and Tuning Information

The following factors impact the ratio of pages written per write I/O:

Checkpoint frequency

At checkpoint time, I/Os are scheduled to write all updated pages
on the deferred write queue to DASD. If this occurs too frequently, the deferred write queue does not grow large enough to achieve a high ratio of pages written per write I/O.

The checkpoint frequency depends on the number of logs written between two consecutive checkpoints. This number is set at installation time; see the field CHECKPOINT FREQ of installation panel DSNTIPN.

**Frequency of active log switch**
DB2 takes a system checkpoint each time the active log is switched. High frequency of active log switches causes the problem described under checkpoint frequency.

**Buffer pool size and deferred write thresholds**
The deferred write thresholds (VDWQT and DWQT) are a function of buffer pool size. If the buffer pool size is decreased, these thresholds are reached more frequently, causing I/Os to be scheduled more often to write some of the pages on the deferred write queue to DASD. This prevents the deferred write queue from growing large enough to achieve a high ratio of pages written per write I/O.

**Number of data sets, and the spread of updated pages across them**
The efficiency of write I/O also depends on the number of data sets associated with the buffer pool and spread of updated pages across them. Because of the nature of batch processing, the ratio of pages written to write I/Os can be expected to be higher than that expected for transaction type workloads.

To determine update efficiency check also the ratio Buffer Updates / Pages Written (SBRBUPW).

Field Name: SBRPWWIO

**PAGES WRTN FOR CASTOUT I/O**
The number of pages written for castout I/O operations.

Field Name: QBSTPCO

**NUMBER OF CASTOUT I/O**
The number of castout I/O operations.

Field Name: QBSTCIO

**HORIZ.DEFWRITE THRESHOLD**
The number of times the deferred write threshold (DWTH) was reached.

This threshold is a percentage of the virtual buffer pool that might be occupied by unavailable pages, including both updated pages and pages in use. DB2 checks this threshold when an update to a page is completed. If the percentage of unavailable pages in the virtual buffer pool exceeds the threshold, write operations are scheduled for enough data sets (up to 128 pages per data set) to reduce the number of unavailable buffers to 10% below the threshold.

**Background and Tuning Information**
The default value for this threshold is 30%. You can change that to any value from 0% to 90% by using the DWQT option on the ALTER BUFFERPOOL command.
Buffer Pool Write

The deferred write thresholds, DWQT and VDWQT, are specified as a percentage, their absolute value depends on the size of the virtual buffer pool.

Consider the following aspects when changing the deferred write thresholds:

Optimize the ratio of pages written per write I/O
The ratio can be monitored using the Pages Written (QBSTPWS) field.

When the buffer pool is relatively small, the default thresholds could prevent the deferred write queue from growing large enough to achieve a high ratio of pages written per write I/O. Raising these thresholds will, in this instance, reduce the I/O write frequency, increasing the number of pages written per I/O.

Distribute I/O evenly over time
If a virtual buffer pool is very large, it is unlikely that the default values of either DWQT or VDWQT will ever be reached. In this case, write I/Os tend to occur in surges, triggered by DB2 checkpoints. Lowering the VDWQT and the DWQT could improve performance by distributing the write I/Os more evenly over time.

Impact on other buffer pool thresholds
Increasing DWQT and VDWQT allows updated pages to use a larger portion of the virtual buffer pool. Large DWQT and VDWQT can have a significant effect on the other thresholds. For example, in work load where pages are frequently updated, and the updated pages exceed the size of the virtual buffer pool, setting both DWQT and VDWQT to 90% would probably cause frequent threshold-reached events for sequential prefetch (and possibly the data management and immediate write).

Field Name: QBSTDWT
This is an exception field.

VERTI.DEF.WRITE THRESHOLD
The number of times the vertical deferred write threshold (VDWQT) was reached. This threshold is similar to the deferred write threshold but it applies to the number of updated pages for one single page set in the buffer pool. If the percentage or number of updated pages for the data set exceeds the threshold, writes up to 128 pages are scheduled for that data set.

Field Name: QBSTDWV
This is an exception field.

DM THRESHOLD
The number of times the data manager critical threshold (DMTH-95%) was reached.

This field shows how many times a page was immediately released because the data management threshold was reached.

The threshold is checked before a page is read or updated. If the threshold has not been exceeded, DB2 accesses the page in the virtual buffer pool once for each page, no matter how many rows are retrieved or updated in that page. If the threshold has been exceeded, Getpage requests and
RELEASEs apply to rows instead of pages. That is, if more than one row is retrieved or updated in a page, more than one Getpage request and RELEASE is performed on that page.

Background and Tuning Information

Avoid reaching this threshold wherever possible because it significantly affects CPU usage. Set virtual buffer pool sizes large enough or reduce the workload on the buffer pool.

Field Name: QBSTDMC

This is an exception field.

PAGE-INS REQUIRED FOR WRITE

The number of page-ins required for a write I/O.

Field Name: QBSTWPI

Common Storage Below and Above 2 GB:

This topic shows detailed information about “Statistics - Common Storage Below and Above 2 GB”.

Statistics - Common Storage Below and Above 2 GB

EXTENDED CSA SIZE (MB)

The size of the common storage area (CSA) above the 16 MB line.

Field Name: QW0225EC

FIXED POOL BELOW (MB)

The amount of storage allocated for 31-bit common fixed pool storage.

Field Name: QW0225FC

VARIABLE POOL BELOW (MB)

The amount of storage allocated for 31-bit common variable pool storage.
Common Storage Below and Above 2 GB

Field Name: QW0225VC
GETMAINED BELOW (MB)
The amount of storage allocated for 31-bit common getmained storage.
Field Name: QW0225GC
FIXED POOL ABOVE (MB)
The amount of storage allocated for 64-bit common fixed pool storage.
Field Name: QW0225FCG
VARIABLE POOL ABOVE (MB)
The amount of storage allocated for 64-bit common variable pool storage.
Field Name: QW0225VCG
GETMAINED ABOVE (MB)
The amount of storage allocated for 64-bit common getmained storage.
Field Name: QW0225GCG
STORAGE MANAGER CONTROL BLOCKS ABOVE (MB)
The amount of storage allocated for 64-bit common storage for storage manager control structures.
Field Name: QW0225SMC
REAL LOG MANAGER WRITE BUFFERS ABOVE (MB)
The amount of real storage in the 64-bit common area in use for Log Manager write buffers.
Field Name: S225LWR
REAL LOG MANAGER CONTROL BLOCKS ABOVE (MB)
The amount of real storage in the 64-bit common area in use for Log Manager control blocks.
Field Name: S225LCR
AUX LOG MANAGER CONTROL BLOCKS ABOVE (MB)
The amount of auxiliary storage in the 64-bit common area in use for Log Manager control blocks.
Field Name: S225LCA
REAL STORAGE IN USE (MB)
The amount of real storage in use for 64-bit common storage. This is recorded at the subsystem level.

Note: This field is available in z/OS 1.10 (and maintenance) or later.
Field Name: S225CSR
AVERAGE THREAD FOOTPRINT (MB)
The current average real storage in use for common storage of active user threads (allied threads + active and pooled DBATs).
Field Name: S225CTFR
AUXILIARY STORAGE IN USE (MB)
The amount of auxiliary storage in use for 64-bit common storage. This is recorded at the subsystem level.

**Note:** This field is available in z/OS 1.10 (and maintenance) or later.

**Field Name:** S225CSA

**CPU and Storage Metrics:**

This topic shows detailed information about “Statistics - CPU and Storage Metrics”.

This block shows information about CPU usage and storage metrics gathered by the z/OS Resource Measurement Facility (RMF) interface. The subsystem parameter ZOSMETRICS must be set to YES for enabling DB2 to retrieve data from RMF.

**Statistics - CPU and Storage Metrics**

The field labels shown in the following sample layout of “Statistics - CPU and Storage Metrics” are described in the following section.

**CP LPAR**

The number of standard central processors (CPs) on the logical partition (LPAR) at the end of the defined Monitor III gatherer time interval (called MINTIME). This value does not include ZIIPs. This value is from Resource Measurement Facility (RMF) field CPUG3_PRCON.

**Field Name:** QWOSLNCP

**CPU UTILIZATION LPAR**

The percentage of the MINTIME time interval during which RMF reported that the entire LPAR was in use, averaged for a single processor. This value is calculated using Resource Measurement Facility (RMF) field CPUG3_LOGITI.

**Field Name:** QWOSLPRU

**CPU UTILIZATION DB2**

The percentage of the MINTIME time interval during which RMF reported that all DB2 address spaces were in use, calculated for a single processor.

**Field Name:** QWOSDB2U

**CPU UTILIZATION DB2 MSTR**
CPU and Storage Metrics

The percentage of the MINTIME time interval during which RMF reported that the DB2 MSTR address space was in use, calculated for a single processor.

Field Name: QWOSMSTU

CPU UTILIZATION DB2 DBM1

The percentage of the MINTIME time interval during which RMF reported that the DB2 DBM1 address space was in use, calculated for a single processor.

Field Name: QWOSDBMU

UNREFERENCED INTERVAL COUNT

The Unreferenced Interval Count (UIC). This value is RMF field GEIAHUIC_VE.

Field Name: QWOSLUIC

REAL STORAGE LPAR (MB)

The total real storage in the LPAR, in MB. This value is derived from RMF field GEIRPOOL_VE, which is the number of online real storage frames.

Field Name: QWOSLRST

FREE REAL STORAGE LPAR (MB)

The free real storage in the LPAR, in MB. This value is derived from RMF field GEIRAFC, which is the number of available real storage frames.

Field Name: QWOSLRSF

USED REAL STORAGE DB2 (MB)

The real storage used by DB2 subsystems, in MB. This value is the sum of the following values for all DB2 address spaces in the LPAR, converted to MB:

- The number of frames for swapped-in users. This value is derived from RMF field ASIFMCT_VE.
- The number of frames for idle users. This value is derived from RMF field ASIFMCTI_VE.

Field Name: QWOSDRSU

VIRTUAL STORAGE LPAR (MB)

The total virtual storage in the LPAR, in MB. This value is the sum of the following values for all address spaces in the LPAR:

- The number of frames for swapped-in users. This value is derived from RMF field ASIFMCT_VE.
- The number of frames for idle users. This value is derived from RMF field ASIFMCTI_VE.
- The number of auxiliary slots. This value is derived from RMF field ASIAUXSC_VE.

Field Name: QWOSLVST

FREE VIRTUAL STOR LPAR (MB)

The free virtual storage in the LPAR, in MB. This value is the sum of the following values, converted to MB:

- The total real storage in the LPAR (QWOSLRST)
• The number of currently available slots (RMF field GEISLTA)

**Field Name: QWOSLVSF**

### USED VIRTUAL STOR DB2 (MB)

The virtual storage used by DB2 subsystems, in MB. This value is the sum of the following values for all DB2 address spaces in the LPAR, converted to MB:

• The number of frames for swapped-in users. This value is derived from RMF field ASIFMCT_VE.

• The number of frames for idle users. This value is derived from RMF field ASIFMCTI_VE.

**Field Name: QWOSDVSU**

### CPU Times:

This topic shows detailed information about “Statistics - CPU Times”.

This block shows statistics data of CPU timer values for each resource manager and control address space.

DB2 can generate parallel tasks for the efficient execution of queries. Parallel tasks are executable units composed of special SRBs (service request block), which are called preemptable SRBs. With preemptable SRBs, the z/OS dispatcher can interrupt a task at any time to run other work at the same or higher dispatching priority. For non-distributed parallel work, parallel tasks run under a type of preemptable SRB, which is called a client SRB. The client SRB lets the parallel task inherit the importance of the originating address space. For distributed requests, the parallel tasks run under a preemptable SRB, which is called an enclave SRB.

### Statistics - CPU Times

LOG RECORDS CAPTURED

The number of log records retrieved for which data capture processing was invoked.

Field Name: QWSDCDLC

LOG READS PERFORMED

The total number of data capture log reads for processing IFI reads requests for IFCID 185.

Field Name: QWSDCDLR

LOG RECORDS RETURNED

The total number of data capture log records returned.

Field Name: QWSDCDLR

DATA ROWS RETURNED

The total number of data capture data rows returned.

Field Name: QWSDCDRR

DESCRIBES PERFORMED

The total number of data capture describes performed.

A data capture describe is the process of getting descriptive information about a DB2 table from the catalog.

Field Name: QWSDCDMB

DATA DESCRIPTIONS RETURNED

The total number of data capture describes performed.

A data capture describe is the process of getting descriptive information about a DB2 table from the catalog.

Field Name: QWSDCDDD

TABLES RETURNED

The total number of data capture tables returned to the caller of the IFI reads call for IFCID 185.

Field Name: QWSDCDTB

Data set statistics report:

This topic shows detailed information about “Statistics - Data Set Statistics”.

4362 IBM Db2 Performance Expert on z/OS
Within IFCID 199, DB2 externalizes data set performance counters for open data sets that had high I/O activities (at least 1 I/O per second) in the last Statistics interval (determined by system parameter STATTIME). The metrics are reported with respect to a page set to which a data set belongs and which makes up a DB2 table space or index space. The average values are calculated with respect to the I/O start and end times shown in the report.

You have to use the DSETSTAT report option for creating the data set Statistics report block. The report shows data set metrics from the perspective of buffer pools which are assigned to page sets and related data sets. The DSETSTAT report option is ignored in the Statistics REPORT or SAVE subcommand if an INTERVAL(X) option with X>0 has been specified.

BPOOL

The name of the buffer pool to which this information refers.

Field Name: S199BPNM

DATABASE

Database name.

Field Name: S199DBNM

SPACENAM

Pageset name, which can be a table space or an index space.

This is derived from the internal pageset identifier. For a table space this is the value in the PSID column in SYSIBM.SYSTABLESPACE of the catalog when the DB2 trace record was written. For an index space, this is the value in the ISOBID column in SYSIBM.SYINDEXES.

When OMEGamon XE for DB2 PE cannot determine the pageset name, the ID is shown in hexadecimal.

Field Name: S199OBNM

PART

For a partitioned table space or index space, this is the partition number. For a nonpartitioned table space or index space, this is the data set number.
Data Set Statistics

Field Name: QW0199DN

**TYPE**

This field indicates whether the pageset is a table space (T or TSP) or an index space (I or IDX).

Field Name: S199TYP

**GBP**

The value in this field specifies whether the pageset is group buffer pool dependent. This is only possible if DB2 has been set up for data sharing.

Field Name: S199GBP

**SHDW**

Indicates if it is a shadow data set.

Field Name: QW0199SD

**I/O START TIME**

The start time of the I/O activities for this data set externalized in the data set Statistics record. The field value is derived from QW0199SC.

Field Name: S199SC

**I/O END TIME**

The end time of the I/O activities for this dataset externalized in the data set Statistics record.

Field Name: S199EC

**SYNCH I/O AVG**

Average number of synchronous I/Os for the pageset, per second.

Field Name: S199SPAV

**ASYNC I/O AVG**

Average number of asynchronous I/Os for the pageset, per second.

Field Name: S199ACAV

**ASY I/O PGS AVG**

Average number of pageset pages read or written per asynchronous I/O.

Field Name: S199APAV

**SYN I/O AVG DELAY**

Average synchronous I/O delay for pages in the pageset, in milliseconds.

Field Name: QW0199S1 / 1000

**SYN I/O MAX DELAY**

Maximum synchronous I/O delay for pages in the pageset, in milliseconds.

Field Name: QW0199S2 / 1000

**ZHL I/O AVG**

The average number of zHyperLink I/Os for the pageset, per second.

Field Name: S199ZPA1
ZHL I/O AVG DELAY
The average zHyperLink I/O delay for the pageset, in milliseconds.
Field Name: QW0199Z1 / 1000

ZHL I/O MAX DELAY
The maximum zHyperLink I/O delay for the pageset, in milliseconds.
Field Name: QW0199Z2 / 1000

ASYN I/O AVG DELAY
Average asynchronous I/O delay for pages in the pageset, in milliseconds.
Field Name: QW0199A1 / 1000

ASYN I/O MAX DELAY
The maximum asynchronous I/O delay for pages in the pageset, in milliseconds.
Field Name: QW0199A2 / 1000

CURRENT PAGES (VP)
Number of pageset pages in the virtual buffer pool.
Field Name: QW0199VP

CHANGED PAGES (VP)
Number of changed page set pages in the virtual buffer pool.
Field Name: QW0199VD

NUMBER OF GETPAGES
The current number of Getpage requests.
Field Name: QW0199GP

Data Sharing Locking:
This topic shows detailed information about “Statistics - Data Sharing Locking”.
In this example, the quantities per thread show as not calculated (N/C) because DB2 threads remained open during the reporting period.

Statistics - Data Sharing Locking
The field labels shown in the following sample layout of “Statistics - Data Sharing Locking” are described in the following section.

GLOBAL CONTENTION RATE (%)
The total number of suspends because of contention divided by the total number of synchronous requests that went to XES, and the lock requests that were converted from synchronous to asynchronous locks, and the locks because of child lock propagation.

Note: If multiple members from the same data sharing group run on the same LPAR, the global contention rate should be ignored for a member where the QTGSFCON flag is zero. The QTGSFCON flag indicates whether the false contention is reported at the subsystem (=1) or LPAR level (=0).

Field Name: SGLOBRAT

FALSE CONTENTION RATE (%)
The total number of suspends because of false contention divided by the total number of synchronous requests that went to XES, and the lock requests that were converted from synchronous to asynchronous locks, and the locks because of child lock propagation. A false contention is if two different locks on different resources hash to the same lock entry.

Note: If multiple members from the same data sharing group run on the same LPAR, the global contention rate should be ignored for a member where the QTGSFCON flag is zero. The QTGSFCON flag indicates whether the false contention is reported at the subsystem (=1) or LPAR level (=0).

Background and Tuning Information
Try to keep the false contention rate to no more than 50% of the total global lock contention.

Field Name: SFLSERAT

P/L-LOCKS XES RATE (%)
Shows the percentage of P/L-lock requests that were propagated to XES synchronously.

Background and Tuning Information
This number reflects the effects of explicit hierarchical locking and other locking optimizations. Assuming a 100% Data Sharing workload, a value of 94% would mean that 6% of all Transaction Locks were not propagated to XES due to Data Sharing locking optimizations.
DB2 has some optimizations to reduce the necessity to go beyond the local IRLM whenever possible:

- Explicit hierarchical locking allows IRLM to grant child locks locally when there is no inter-DB2 R/W interest on the parent.
- If there is a single DB2 with update interest and multiple DB2s with read-only interest, DB2 propagates fewer locks than when all DB2s have update interest in the page set.
- All locks that go beyond the local IRLM are owned by the subsystem, not by an individual work unit. This allows for another optimization. Only the most restrictive lock mode for an object on a given subsystem must be propagated to XES and the coupling facility. A new lock that is equal to or less restrictive than one currently being held is not propagated.

**Field Name:** SLLOCRAT

**LOCK REQUESTS (P-LOCKS)**

The number of lock requests for P-locks.

**Field Name:** QTGSLPLK

**UNLOCK REQUESTS (P-LOCKS)**

The number of unlock requests for P-locks.

**Field Name:** QTGSUPLK

**CHANGE REQUESTS (P-LOCKS)**

The number of change requests for P-locks.

**Field Name:** QTGSCPLK

**SYNCH.XES - LOCK REQUESTS**

The number of P/L-lock requests propagated to z/OS XES synchronously.

This number is not incremented if the request is suspended before going to XES.

**Field Name:** QTGSLSLM

**SYNCH.XES - CHANGE REQUESTS**

The number of change requests propagated to z/OS XES synchronously, including logical and physical locks.

This number is not incremented if the request is suspended before going to XES.

**Field Name:** QTGSCSLM

**SYNCH.XES - UNLOCK REQUESTS**

The number of unlock requests propagated to z/OS XES synchronously, including logical and physical locks.

This number is not incremented if the request is suspended before going to XES.

**Field Name:** QTGSUSLM

**BACKGROUND.XES - CHILD LOCKS**

The number of resources propagated by IRLM to z/OS XES asynchronously, including logical and physical locks.
This can happen when new inter-DB2 interest occurs on a parent resource or when a request completes after the requester’s execution unit was suspended.

Field Name: QTGSKIDS

ASYNCH.XES -CONVERTED LOCKS

The number of synchronous to asynchronous heuristic conversions for LOCK requests in XES. This conversion is done when XES determines that it is more efficient to drive the request asynchronously to the coupling facility (CF).

Field Name: QTGSFLSE

SUSPENDS - IRLM GLOBAL CONT

The number of suspensions due to IRLM global resource contention. All IRLM lock states were in conflict on the same resource.

Global contention requires intersystem communication to resolve the lock conflict whereas local contention does not.

Field Name: QTGSIGLO

SUSPENDS - XES GLOBAL CONT.

The number of suspensions due to z/OS XES global resource contention. The z/OS XES lock states were in conflict but the IRLM lock states were not.

IRLM has many lock states but XES is only aware of the exclusive and shared lock states.

Field Name: QTGSSGLO

SUSPENDS - FALSE CONT. MBR

The total number of false contentions for LOCK and UNLOCK requests. A false contention occurs when different resource names hash to the same entry in the coupling facility (CF) lock table. The CF detects contention within the hash entry, and XES uses intersystem messaging to determine that no actual resource contention exists.

Note: The QTGSFCON flag indicates whether the false contention is reported at subsystem (=1) or LPAR level (=0).

Field Name: STGSFLM1

SUSPENDS - FALSE CONT. LPAR

The total number of false contentions for LOCK and UNLOCK requests. A false contention occurs when different resource names hash to the same entry in the coupling facility (CF) lock table. The CF detects contention within the hash entry, and XES uses intersystem messaging to determine that no actual resource contention exists.

Note: The QTGSFCON flag indicates whether the false contention is reported at subsystem (=1) or LPAR level (=0).

Field Name: STGSFLM2

NO DELAY LOCK REQ REJECTS
The total number of failed DB2 lock requests to XES to process without delay. XES rejects the lock request because it could not process it synchronously.

Field Name: QTGSCREJ

INCOMPATIBLE RETAINED LOCK

The number of global lock or change requests denied or suspended due to an incompatible retained lock.

Field Name: QTGSDRTA

NOTIFY MESSAGES SENT

The number of notify messages sent.

Field Name: QTGSNTFY

NOTIFY MESSAGES RECEIVED

The number of notify messages received.

Field Name: QTGSNTFR

P-LOCK/NOTIFY EXITS ENGINES

The maximum number of engines available for physical lock exit or notify exit requests.

Field Name: QTGSPEMX

P-LCK/NFY EX.ENGINE UNAVAIL

The number of times an engine is not available for physical lock exit or notify exit requests.

Field Name: QTGSPeqW

PSET/PART P-LCK NEGOTIATION

The number of times this DB2 was driven to negotiate a partition or page set physical lock due to changing inter-DB2 interest levels on the partition or page set.

Field Name: QTGSPpPE

PAGE P-LOCK NEGOTIATION

The number of times this DB2 negotiated a page physical lock because of physical lock contention within DB2.

Field Name: QTGSPGPE

OTHER P-LOCK NEGOTIATION

The number of times this DB2 was driven to negotiate a physical lock type other than page set, partition, or page.

Field Name: QTGSOTPE

P-LOCK CHANGE DURING NEG.

The number of times a physical lock change request was issued during physical lock negotiation.

Field Name: QTGSCnHP
DBM1 and MVS Storage Below 2 GB:

This topic shows detailed information about “Statistics - DBM1 and MVS Storage Below 2 GB”.

This block shows information about storage allocation within the DBM1 address space.

Storage quantities are shown in megabytes, this means that when you want to compare this with absolute values, as stored in the performance database, for example, you need to multiply the value shown by 1048576 (1024*1024). Similarly where a quantity is shown followed by a K, for example 262.1K, the quantity shown is 262.1MB*1000 (262.1*1048576*1000 bytes).

Statistics - DBM1 and MVS Storage Below 2 GB

The field labels shown in the following sample layout of “Statistics - DBM1 and MVS Storage Below 2 GB” are described in the following section.

<table>

</table>

TOTAL DBM1 STORAGE BELOW 2 GB (MB)

Total DBM1 storage. This includes:

- Fixed length storage use
- Getmained storage
- Save areas
- Variables

Field Name: SW0225DB

TOTAL GETMAINEd STORAGE (MB)
Total storage acquired by GETMAIN. This includes space for virtual pools, EDM pool, compression dictionary, castout buffers, and the data space lookaside buffer, and data space buffer pool control blocks.

This figure can be different from the sum of GETMAIN storage items shown in the statistics DBM1 storage, because DB2 does not produce grouping statistics for all GETMAIN storage.

Field Name: QW0225GM

TOTAL VARIABLE STORAGE (MB)

Total storage used by all variable pools. This includes storage used by:

- System agents
- Local agents
- RID pool
- Pipe manager subpool
- Local dynamic statement cache control blocks
- Local dynamic statement cache statement pool
- Buffer and data manager trace tables
- A list of objects in restricted state including the new PRO state. If consumption of this storage pool is high, review restrictive exception state of database objects and check whether they can be resolved or reduced.

Field Name: QW0225VR

TOTAL AGENT LOCAL STORAGE (MB)

The amount of storage allocated for agent-related local storage. This storage is used for operations such as sort.

Background and Tuning Information

Sorting requires a large amount of virtual storage because there can be multiple copies of the data being sorted at a given time.

DB2 Sort uses two kinds of storage pool for various internal control structures and data records, an agent-related local storage pool and a global sort pool. To take advantage of the 64-bit addressability for larger storage pool, some high level sort control structures are kept in agent-related storage below the 2 GB bar, which contain 64-bit pointers to areas in the global sort pool above the 2 GB bar. The sort pool above 2 GB contains sort tree nodes and data buffers.

Field Name: QW0225AL

TOTAL AGENT SYSTEM STORAGE (MB)

Storage used by system agents.

Field Name: QW0225AS

NUMBER OF PREFETCH ENGINES

Number of engines used for sequential, list, and dynamic prefetch.

Field Name: QW0225PF

NUMBER OF DEFERRED WRITE ENGINES

Number of engines used for deferred write operations.

Field Name: QW0225DW
NUMBER OF CASTOUT ENGINES

Number of engines available for data-sharing castout processing.
Field Name: QW0225CE

NUMBER OF GBP WRITE ENGINES

Number of engines for group buffer pool writes.
Field Name: QW0225GW

NUMBER OF P-LOCK/NOTIFY EXIT ENGINES

Number of data sharing P-Lock engines and Notify Exit engines.
Field Name: QW0225PL

TOTAL AGENT NON-SYSTEM STORAGE (MB)

Total Agent Non-System Storage. It is the difference between the Total Agent Local Storage (QW0225AL) and the Total Agent System Storage (QW0225AS).
Field Name: SW0225AN

TOTAL NUMBER OF ACTIVE USER THREADS

Total number of active user threads. This includes all active allied threads and the current number of active DBATs.
Field Name: SACUSTHR

NUMBER OF ALLIED THREADS

The number of active allied threads.
Field Name: QW0225AT

NUMBER OF ACTIVE DBATS

The number of active connections, or active and disconnected DBAT threads.
Field Name: SACDBATS

NUMBER OF POOLED DBATS

The current number of disconnected (pooled) DBATs that are available to process type 2 inactive or new connections.
Field Name: QDSTNADS

NUMBER OF PARALLEL CHILD THREADS

The number of active parallel child threads.
Field Name: QW0225PT

SYSTEM COPIES OF CACHED SQL STMTS (MB)

The total shareable storage allocated for dynamic SQL statements used by active threads.
- For DB2 11, this field is derived from QW0225SC8 and related to storage above the bar.
- Prior to DB2 11, this field is derived from QW0225SC and related to storage below the bar. The storage is used for executable code sequences (xPROC).
Field Name: SW0225SC
IN USE STORAGE (MB)

The total shareable storage requested for dynamic SQL statements used by active threads.

- For DB2 11, this field is derived from QW0225LS8 and related to storage above the bar.
- Prior to DB2 11, this field is derived from QW0225LS and related to storage below the bar. The storage is used for executable code sequences (xPROC).

Field Name: SW0225LS

HWM FOR ALLOCATED STATEMENTS (MB)

A statistics interval high-water mark of requested shareable storage for dynamic SQL statements used by active threads.

- For DB2 11, this field is derived from QW0225HS8 and related to storage above the bar.
- Prior to DB2 11, this field is derived from QW0225HS and related to storage below the bar. The storage is used for executable code sequences (xPROC).

Field Name: SW0225HS

SYSTEM COPIES OF STATIC SQL (MB)

The total shareable storage allocated for static SQL statements.

- For DB2 11, this field is derived from QW0225SX8 and related to storage above the bar.
- Prior to DB2 11, this field is derived from QW0225SX and used for storage of executable code sequences (xPROC) below the bar.

Field Name: SW0225SX

IN USE STORAGE (MB)

The total storage requested for shareable static SQL statements.

- For DB2 11, this field is derived from QISEKSPA and related to storage above the bar.
- Prior to DB2 11, this field is derived from QISEKSPA8 and used for storage of executable code sequences (xPROC) below the bar.

Field Name: SISEKSPA

THREAD PLAN AND PACKAGE STORAGE (MB)

The storage allocated to plans and packages below the bar.

Field Name: SISESQB

BUFFER MANAGER STORAGE CNTL BLKS (MB)

Storage used for page set control blocks.

Field Name: QW0225BB

TOTAL FIXED STORAGE (MB)

Total amount of fixed storage.

Field Name: QW0225FX

TOTAL GETMAINED STACK STORAGE (MB)

Total GETMAINED storage allocated for program stack use.
### Field Name: QW0225GS

**TOTAL STACK STORAGE IN USE (MB)**

The amount of stack storage that is in use.

### Field Name: QW0225SU

**SYSTEM AGENT STACK STORAGE IN USE (MB)**

The amount of 31-bit stack storage that is in use for system agents. This is a subset of QW0225SU.

### Field Name: QW0225SS

**STORAGE CUSHION (MB)**

Storage reserved to allow DB2 to complete critical functions while short on storage. This includes the contract warning cushion, storage reserved for must-complete operations, and storage for MVS use.

### Field Name: STORCUSH

**DBM1 Storage Above 2 GB:**

This topic shows detailed information about “Statistics - DBM1 Storage Above 2 GB”.

### Statistics - DBM1 Storage Above 2 GB

The field labels shown in the following sample layout of “Statistics - DBM1 Storage Above 2 GB” are described in the following section.

</tbody>
</table>
GETMAINED STORAGE (MB)

Total storage acquired by GETMAIN. This includes space for the compression dictionary, and statement and DBD cache that can be used by the Environmental Descriptor Manager (EDM).

This figure can be different from the sum of GETMAIN storage items shown in the statistics DBM1 storage, because DB2 does not produce grouping statistics for all GETMAIN storage.

Field Name: QW0225GA

COMPRESSION DICTIONARY (MB)

Storage space allocated for the compression dictionary.

Field Name: QW0225CD

IN USE EDM DBD POOL (MB)

The amount of storage used by database descriptors in the EDM DBD pool above the 2 GB bar.

Field Name: SISEDDBDP

IN USE EDM STATEMENT POOL (MB)

The amount of storage used by cached dynamic SQL statements in the EDM Statement pool above the 2 GB bar.

Field Name: SISEDYNP

IN USE EDM RDS POOL (MB)

The amount of storage used by objects in the EDM RDS pool above the 2 GB bar.

Field Name: SISECPTA

IN USE EDM SKELETON POOL (MB)

The amount of storage used by objects in the EDM Skeleton pool above the 2 GB bar.

Field Name: SISESKCP

FIXED STORAGE POOL (MB)

The total amount of fixed storage above the 2 GB bar.

Field Name: QW0225FA

VARIABLE STORAGE POOL (MB)

Amount of variable storage available above the 2 GB bar.

Field Name: QW0225VA

STORAGE MANAGER CONTROL BLOCKS (MB)

Total 64-bit storage allocated for storage manager control structures.
**DBM1 Storage Above 2 GB**

**Field Name:** QW0225SM

**VIRTUAL BUFFER POOLS (MB)**
Total storage allocated for virtual buffer pools above the 2 GB bar.

**Field Name:** SVPOOLZ

**VIRTUAL POOL CONTROL BLOCKS (MB)**
Storage used for primary virtual pool control blocks above the 2 GB bar.

**Field Name:** SBSTVPLZ

**CASTOUT BUFFERS (MB)**
Storage used for castout buffers.

**Field Name:** SW0225C2

**SHARED GETMAINED STORAGE (MB)**
The amount of virtual shared storage acquired by GETMAIN above the 2 GB bar.

**Field Name:** QW0225SG

**STORAGE FOR STMT DEPENDENCIES (MB)**
The amount of storage allocated above the 2 GB bar to support object dependencies on statements that are in the Dynamic Statement Cache (DB2 field: QW0225DMH).

**Field Name:** SW225DMH

**SHARED FIXED STORAGE (MB)**
The amount of total fixed virtual shared storage above the 2 GB bar.

**Field Name:** QW0225SF

**RID POOL (MB)**
Storage for RID list processing such as list prefetch, index ANDing, and ORing.

**Field Name:** QW0225RP

**SHARED VARIABLE STORAGE (MB)**
The amount of virtual shared variable storage above the 2 GB bar.

**Field Name:** QW0225SV

**TOTAL AGENT LOCAL STORAGE (MB)**
The amount of storage allocated for agent-related 64-bit local storage (DB2 field: QW0225ALG).

**Field Name:** SW225ALG

**TOTAL AGENT SYSTEM STORAGE (MB)**
The amount of 64-bit storage used by system agents (DB2 field: QW0225ASG).

**Field Name:** SW225ASG

**TOTAL AGENT NON-SYSTEM STORAGE (MB)**
The amount of 64-bit storage used by non-system agents. It is the difference between the Total Agent Local Storage (QW0225ALG) and the Total Agent System Storage (QW0225ASG).

**Field Name:** SW225ANG

**THREAD COPIES OF CACHED SQL STMTS (MB)**

This field is provided for consistency purposes. It has a value of N/A. The value can be estimated by the HWM FOR ALLOCATED STATEMENTS (QW0225H2).

**Field Name:** SW0225DY

**IN USE STORAGE (MB)**

The total non-shareable storage requested for dynamic SQL statements used by active threads. This value is related to shared agent local variable pools above the bar.

**Field Name:** QW0225L2

**STATEMENTS COUNT**

The number of dynamic SQL local cache statements used by active threads. This value is related to shared agent local variable pools above the bar.

**Field Name:** QW0225LC

**HWM FOR ALLOCATED STATEMENTS (MB)**

This value is related to shared agent local variable pools above the bar.

**Field Name:** QW0225H2

**STATEMENT COUNT AT HWM**

The number of dynamic SQL local cache statements used by active threads at high storage time. This value is related to shared agent local variable pools above the bar.

**Field Name:** QW0225HC

**DATE AT HWM**

The timestamp at high-water storage.

**Field Name:** QW0225HT

**TIME AT HWM**

The timestamp at high-water storage.

**Field Name:** QW0225HT

**DYNAMIC STMT CACHE CNTL BLKS (MB)**

The total statement cache storage blocks above the bar (64-bit shared variable pool).

**Field Name:** QW0225S2

**SYSTEM COPIES OF CACHED SQL STMTS (MB)**

The total shareable storage allocated for dynamic SQL statements used by active threads.

- For DB2 11, this field is derived from QW0225SC8 and related to storage above the bar.
Prior to DB2 11, this field is derived from QW0225SC and related to storage below the bar. The storage is used for executable code sequences (xPROC).

**Field Name:** SW0225SC

**IN USE STORAGE (MB)**
The total shareable storage requested for dynamic SQL statements used by active threads.

- For DB2 11, this field is derived from QW0225LS8 and related to storage above the bar.
- Prior to DB2 11, this field is derived from QW0225LS and related to storage below the bar. The storage is used for executable code sequences (xPROC).

**Field Name:** SW0225LS

**HWM FOR ALLOCATED STATEMENTS (MB)**
A statistics interval high-water mark of requested shareable storage for dynamic SQL statements used by active threads.

- For DB2 11, this field is derived from QW0225HS8 and related to storage above the bar.
- Prior to DB2 11, this field is derived from QW0225HS and related to storage below the bar. The storage is used for executable code sequences (xPROC).

**Field Name:** SW0225HS

**SYSTEM COPIES OF STATIC SQL (MB)**
The total shareable storage allocated for static SQL statements.

- For DB2 11, this field is derived from QW0225SX8 and related to storage above the bar.
- Prior to DB2 11, this field is derived from QW0225SX and used for storage of executable code sequences (xPROC) below the bar.

**Field Name:** SW0225SX

**IN USE STORAGE (MB)**
The total storage requested for shareable static SQL statements.

- For DB2 11, this field is derived from QISEKSPA and related to storage above the bar.
- Prior to DB2 11, this field is derived from QISEKSPA8 and used for storage of executable code sequences (xPROC) below the bar.

**Field Name:** SISEKSPA

**THREAD PLAN AND PACKAGE STORAGE (MB)**
The storage allocated to plans and packages above the bar.

**Field Name:** SISESQA

**ARRAY VARIABLE STORAGE**
The amount of storage in use for array variables.

**Field Name:** QW0225AR

**SHARED STORAGE MANAGER CNTL BLKS (MB)**
The amount of 64-bit shared storage allocated for storage manager control structures (DB2 field: QW0225SMS).

Field Name: SW225SMS

**SHARED SYSTEM AGENT STACK STORAGE (MB)**

The amount of 64-bit shared storage allocated for system agent stack use (DB2 field: QW0225GSG_SYS).

Field Name: SW225GSG

**STACK STORAGE IN USE (MB)**

The amount of 64-bit shared system agent stack that is in use (DB2 field: QW0225SUG_SYS).

Field Name: SW225SUG

**SHARED NON-SYSTEM AGENT STACK STORAGE (MB)**

The amount of 64-bit shared storage allocated for non-system agent stack use (DB2 field: QW0225GSG).

Field Name: SW225GSG

**STACK STORAGE IN USE (MB)**

The amount of 64-bit shared non-system agent stack that is in use (DB2 field: QW0225SUG).

Field Name: SW225SUG

### Dynamic SQL Statement

This topic shows detailed information about “Statistics - Dynamic SQL Statement”.

#### Statistics - Dynamic SQL Statement

The field labels shown in the following sample layout of “Statistics - Dynamic SQL Statement” are described in the following section.

PREPARE REQUESTS

The number of requests for prepared statement cache sections.

Field Name: QISEDGS

PREPARE REQUESTS - FULL PREPARES

The number of full prepare requests.

A Full Prepare occurs for both Explicit Prepare and Implicit Prepare requests when the skeleton copy of the prepared SQL statement is not found in global dynamic SQL cache in the EDM pool.

Field Name: QISEDSS

PREPARE REQUESTS - SHORT PREPARES

The number of short prepare requests.

A Short Prepare is executed for both Explicit Prepare and Implicit Prepare requests when the skeleton copy of the prepared SQL statement is found in global dynamic SQL cache in the EDM pool.

For DB2 12 or later, this number also includes the number of catalog loads to solve a prepare request.

Field Name: SPREPSHT

SHORT PREPARES

The number of short prepare requests.

A Short Prepare is executed for both Explicit Prepare and Implicit Prepare requests when the skeleton copy of the prepared SQL statement is found in global dynamic SQL cache in the EDM pool.

For DB2 12 or later, this number also includes the number of catalog loads to solve a prepare request.

Field Name: SPREPSHT

SHORT PREPARES - BASED ON CACHE

The number of short prepare requests based on cache.

For DB2 12 or later, the number of loads from the catalog is excluded.

Field Name: SCACHSHT

SHORT PREPARES - BASED ON CATALOG

The number of times a dynamic SQL statement is found in a catalog.

Field Name: QISEDPSF

LOOK-UP IN CATALOG

The number of look-ups in a catalog to satisfy a dynamic SQL statement prepare request.

This field is updated when a statement is not found in the cache and the criteria is met to look for it in the catalog table. It is only incremented on the first look up and not if there are multiple rows that might be a match.
This is a system level value so it will be the number of times it has been checked since DB2 was started. It is incremented even if no copies of the statement have been captured.

Field Name: QISEDPSL

**CACHE HIT RATIO (%)**

The cache hit ratio in percent.

This field is a performance indicator for dynamic SQL statement execution. If this number is high, many fast Short Prepares cause a good performance. If this number is low, many slow Full Prepares lower the statement execution.

Field Name: SCACHHRA

**CACHE+CATALOG HIT RATIO (%)**

The cache and catalog hit ratio in percent.

This field is a performance indicator for dynamic SQL statement execution when DPS (Dynamic Plan Stability) is used. It provides how efficient DB2 loads dynamic statements from the catalog and the cache. Always observe this field in combination with the Cache Hit Ratio to identify how efficient DPS works.

Field Name: STOTCHRA

**TOTAL PREPARES**

The number of all Explicit and Implicit prepare requests.

An Explicit Prepare occurs when an SQL PREPARE or EXECUTE IMMEDIATE is requested by the application. An Explicit Prepare always results in either a Short Prepare or a Full Prepare.

An Implicit Prepare occurs when the user copy of the prepared SQL statement no longer exists in the local dynamic SQL cache. An Implicit Prepare always results in either a Short Prepare or a Full Prepare.

Field Name: SPREPSUM

**TOTAL PREPARES - EXPLICIT PREPARES**

The number of SQL PREPARE statements executed. This number at the server location might not match the number at the user application because of the internal processing of the Distributed Data Facility (DDF).

Field Name: QXPREP

**TOTAL PREPARES - IMPLICIT PREPARES**

An implicit prepare occurs when the user copy of the prepared SQL statement no longer exists in the local dynamic SQL cache and the application plan or package is bound with KEEPDYNAMIC YES.

If the skeleton copy of the prepared SQL statement exists in the global dynamic SQL cache in the EDM pool, a short prepare is executed, otherwise a full prepare is executed.

Field Name: QXSTIPRP

**STABILIZED PREPARES**

The number of loads from the catalog.
Dynamic SQL Statement

It shows the number of times a PREPARE request was satisfied by making a copy from the stabilized statement in the SYSIBM.SYSDYNQRY catalog table. The stabilized statement search is done only when no matching statement was found in the prepared statement cache. This field should be identical to QISEDPSL, but it is reported from the QXST section (SQL Statement Execution).

**Field Name:** QXSTSFND

**PREPARES AVOIDED**

This field indicates the number of times where no SQL PREPARE or EXECUTE IMMEDIATE was issued by the application and a copy of a prepared SQL statement was found in local dynamic SQL cache.

When an application plan or package is bound with KEEPDYNAMIC YES, a copy of each prepared SQL statement for the application thread is held in the local dynamic SQL cache and kept across a commit boundary.

An application thread can save the total cost of a prepare by using a copy of the prepared statement in the local dynamic SQL cache from an earlier prepare by the same thread. To do this, the application must be modified to avoid issuing repetitive SQL PREPAREs for the same SQL statement.

**Field Name:** QXSTNPRP

**CACHE LIMIT EXCEEDED**

The number of times statements are invalidated in the local dynamic SQL cache because the MAXKEEPD limit has been reached and prepared SQL statements in the local dynamic SQL cache have to be reclaimed.

**Field Name:** QXSTDEXP

**PREP STMT PURGED**

The number of times statements are invalidated in the local dynamic SQL cache because of SQL DDL or updated RUNSTATS information and prepared SQL statements in the local dynamic SQL cache have to be reclaimed.

**Field Name:** QXSTDINV

**LOCAL CACHE HIT RATIO (%)**

The local cache hit ratio. This shows the percentage of SQL statements that avoided prepares because the statements were retrieved from the local cache. It indicates the effectiveness of the local SQL statement cache.

A value near to 100 indicates that in most cases DB2 found skeleton copies of prepared statements in local dynamic cache and avoided statement prepares.

A value near to 0 indicates that in most cases skeleton copies of prepared statements were not found in local dynamic cache and implicit prepares were performed.

**Field Name:** SLCACRAT

**CSWL - STMTS PARSED**

The number of times DB2 parsed dynamic statements because CONCENTRATE STATEMENTS WITH LITERALS behavior was used for the prepare of the statement for the dynamic statement cache.

**Field Name:** QXSTCWLP
CSWL - LITS REPLACED

The number of times DB2 replaced at least one literal in a dynamic statement because CONCENTRATE STATEMENTS WITH LITERALS was used for the prepare of the statement for dynamic statement cache.

Field Name: QXSTCWLRL

CSWL - MATCHES FOUND

The number of times DB2 found a matching reusable copy of a dynamic statement in cache during prepare of a statement that had literals replaced because of CONCENTRATE STATEMENTS WITH LITERALS.

Field Name: QXSTCWLM

CSWL - DUPLS CREATED

The number of times DB2 created a duplicate STMT instance in the statement cache for a dynamic statement that had literals replaced by CONCENTRATE STATEMENTS WITH LITERALS behavior. The duplicate STMT instance was needed because a cache match failed because the literal reusability criteria was not met.

Field Name: QXSTCWLD

DB2 API:

This topic shows detailed information about “Statistics - DB2 API”.

Statistics - DB2 API

The field labels shown in the following sample layout of “Statistics - DB2 API” are described in the following section.

ABENDS

The number of instrumentation facility interface (IFI) abends.

Field Name: QWSDSCA

UNRECOGNIZED

The number of calls made to IFI using a function that is not recognized by the interface.

Field Name: QWSDSCU

COMMAND REQUESTS

The number of calls made to IFI using the COMMAND function.

Field Name: QWSDSCCO

READA REQUESTS
The number of calls made to IFI using the READA (read asynchronous data) function.

Field Name: QWSDSCRA

READS REQUESTS
The number of calls made to IFI using the READS (read synchronous data) function.

Field Name: QWSDSCRS

WRITE REQUESTS
The number of calls made to IFI using the WRITE function.

Field Name: QWSDCWR

TOTAL
The total number of calls made to IFI.

Field Name: SDIFITOT

DB2 Commands:

DISPLAY DATABASE

The number of DB2 DISPLAY DATABASE commands issued to view objects within one or more DB2 databases. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR0

DISPLAY THREAD

The number of DB2 DISPLAY THREAD commands issued to view threads active within the DB2 subsystem. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR1

DISPLAY UTILITY

The number of DB2 DISPLAY UTILITY commands issued to view the status of one or more DB2 utilities. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR2

DISPLAY TRACE

The number of DB2 DISPLAY TRACE commands issued to determine the currently active DB2 traces. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR3
**DB2 Commands**

**DISPLAY RLIMIT**

The number of DB2 DISPLAY RLIMIT commands issued to view the current status of the DB2 resource limit facility. This includes normal and abnormal completion of the command.

*Field Name:* Q9STCTRGR

**DISPLAY LOCATION**

The number of DB2 DISPLAY LOCATION commands issued to display statistics about threads with a distributed relationship. This includes normal and abnormal completion of the command.

*Field Name:* Q9STCTRL

**DISPLAY ARCHIVE**

The number of DB2 DISPLAY ARCHIVE commands issued. This includes normal and abnormal completion of the command.

*Field Name:* Q9STCTRLQ

**DISPLAY BUFFERPOOL**

The number of DB2 DISPLAY BUFFERPOOL commands issued. This includes normal and abnormal completion of the command.

*Field Name:* Q9STCTRRO

**DISPLAY GROUPBUFFERPOOL**

The number of DB2 DISPLAY GROUPBUFFERPOOL commands issued. This includes normal and abnormal completion of the command.

*Field Name:* Q9STCTRRT

**DISPLAY GROUP**

The number of DB2 DISPLAY GROUP commands issued. This includes normal and abnormal completion of the command.

*Field Name:* Q9STCTRX

**DISPLAY PROCEDURE**

The number of DB2 DISPLAY PROCEDURE commands executed. This includes normal and abnormal completion of the command.

*Field Name:* Q9STCTRLU

**DISPLAY FUNCTION**

The number of DB2 DISPLAY FUNCTION commands issued. This includes normal and abnormal completion of the command.

*Field Name:* Q9STCTRLZ

**DISPLAY LOG**

The number of DB2 DISPLAY LOG commands issued. This includes normal and abnormal completion of the command.

*Field Name:* Q9STCTX3

**DISPLAY DDF**

The number of DB2 DISPLAY DDF commands issued. This includes normal and abnormal completion of the command.
Field Name: Q9STCTX5

DISPLAY PROFILE

The number of DB2 DISPLAY PROFILE commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTSD

DISPLAY ACCEL

The number of DB2 DISPLAY ACCEL commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTDA

DISPLAY DYNQUERycAPTURE

The number of DISPLAY DYNQUERYCAPTURE DB2 commands.

Field Name: Q9STCTDQ

ALTER BUFFERPOOL

The number of DB2 ALTER BUFFERPOOL commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTRN

ALTER GROUPBUFFERPOOL

The number of DB2 ALTER GROUPBUFFERPOOL commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTRS

ALTER UTILITY

The number of DB2 ALTER UTILITY commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTRY

START DATABASE

The number of DB2 START DATABASE commands issued to make a database available for use. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR5

START TRACE

The number of DB2 START TRACE commands issued to initiate a DB2 trace. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR6

START DB2

The number of DB2 START DB2 commands issued to bring up a DB2 subsystem. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR7

START RLIMIT
DB2 Commands

The number of DB2 START RLIMIT commands issued to enable the DB2 resource limit facility. This includes normal and abnormal completion of the command.

Field Name: Q9STCTRE

START DDF
The number of DB2 START DDF commands issued to enable the DB2 distributed data facility. This includes normal and abnormal completion of the command.

Field Name: Q9STCTRI

START PROCEDURE
The number of DB2 START PROCEDURE commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTRV

START FUNCTION
The number of DB2 START FUNCTION commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTX0

START PROFILE
The number of DB2 START PROFILE commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTSS

START ACCEL
The number of DB2 START ACCEL commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTSA

START DYNQUERYCAPTURE
The number of START DYNQUERYCAPTURE DB2 commands.

Field Name: Q9STCTSQ

STOP DATABASE
The number of DB2 STOP DATABASE commands issued to prevent access to a DB2 database. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR8

STOP TRACE
The number of DB2 STOP TRACE commands issued to terminate one or more active DB2 traces. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR9

STOP DB2
The number of DB2 STOP DB2 commands issued to terminate the DB2 subsystem. This includes normal and abnormal completion of the command.
Field Name: Q9STCTRA

STOP RLIMIT
The number of DB2 STOP RLIMIT commands issued to disable the DB2 resource limit facility. This includes normal and abnormal completion of the command.

Field Name: Q9STCTRF

STOP DDF
The number of DB2 STOP DDF commands issued to disable the DB2 distributed data facility. This includes normal and abnormal completion of the command.

Field Name: Q9STCTRJ

STOP PROCEDURE
The number of DB2 STOP PROCEDURE commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR

STOP FUNCTION
The number of DB2 STOP FUNCTION commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTX1

STOP PROFILE
The number of DB2 STOP PROFILE commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTST

STOP ACCEL
The number of DB2 STOP ACCEL commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTXA

STOP DYNQUERYCAPTURE
The number of STOP DYNQUERYCAPTURE DB2 commands.

Field Name: Q9STCTXQ

MODIFY TRACE
The number of DB2 MODIFY TRACE commands issued to alter trace events (IFCIDs) for an active trace. This includes normal and abnormal completion of the command.

Field Name: Q9STCTRL

MODIFY DDF
The number of DB2 MODIFY DDF commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTMD

CANCEL THREAD
DB2 Commands

The number of DB2 CANCEL THREAD commands issued to cancel a thread. This includes normal and abnormal completion of the command.

Field Name: Q9STCTRK

TERM UTILITY

The number of DB2 TERM UTILITY commands issued to stop execution of a DB2 utility. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR8

RECOVER BSDS

The number of DB2 RECOVER BSDS commands issued to reestablish dual bootstrap data sets after one has been disabled by a data set error. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR3

RECOVER INDOUBT

The number of DB2 RECOVER INDOUBT commands issued to recover threads left indoubt because DB2 or a transaction manager could not automatically recover them. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR4

RESET INDOUBT

The number of DB2 RESET INDOUBT commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR8

RESET GENERICLU

The number of DB2 RESET GENERICLU commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR3

ARCHIVE LOG

The number of DB2 ARCHIVE LOG commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR8

SET ARCHIVE

The number of DB2 SET ARCHIVE commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR8

SET LOG

The number of DB2 SET LOG commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR8

SET SYSPARM

The number of DB2 SET SYSPARM commands issued. This includes normal and abnormal completion of the command.
Field Name: Q9STCTX4

ACCESS DATABASE

The number of DB2 ACCESS DATABASE commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTAD

UNRECOGNIZED COMMANDS

The number of commands not recognized by DB2. The number is incremented if the command verb or primary keyword cannot be determined. For example:

- ":-DISPLOX DATABASE(*)" is an unknown verb.
- ":-DISPLAY FATAFASE(*)" is an unknown primary keyword.

Field Name: Q9STEROR

TOTAL

The total number of DB2 commands that were issued.

Field Name: SDSTTOTT

DIST Storage Above 2 GB:

This topic shows detailed information about “Statistics - DIST Storage Above 2 GB”.

Statistics - DIST Storage Above 2 GB

The field labels shown in the following sample layout of “Statistics - DIST Storage Above 2 GB” are described in the following section.

<table>
<thead>
<tr>
<th>DIST STORAGE ABOVE 2 GB</th>
<th>QUANTITY</th>
</tr>
</thead>
<tbody>
<tr>
<td>FIXED STORAGE (MB)</td>
<td>0.96</td>
</tr>
<tr>
<td>GETMAINED STORAGE (MB)</td>
<td>0.00</td>
</tr>
<tr>
<td>VARIABLE STORAGE (MB)</td>
<td>40.66</td>
</tr>
<tr>
<td>STORAGE MANAGER CONTROL BLOCKS (MB)</td>
<td>8.47</td>
</tr>
</tbody>
</table>

GETMAINED STORAGE (MB)

Total storage acquired by GETMAIN. This includes space for the compression dictionary, and statement and DBD cache that can be used by the Environmental Descriptor Manager (EDM).

This figure can be different from the sum of GETMAIN storage items shown in the statistics DBM1 storage, because DB2 does not produce grouping statistics for all GETMAIN storage.

Field Name: QW0225GA

FIXED STORAGE (MB)

The total amount of fixed storage above the 2 GB bar.

Field Name: QW0225FA

VARIABLE STORAGE (MB)

Amount of variable storage available above the 2 GB bar.

Field Name: QW0225VA

STORAGE MANAGER CONTROL BLOCKS (MB)
Total 64-bit storage allocated for storage manager control structures.

Field Name: QW0225SM

DIST and MVS Storage Below 2 GB:

This topic shows detailed information about “Statistics - DIST and MVS Storage Below 2 GB”.

Statistics - DIST and MVS Storage Below 2 GB

The field labels shown in the following sample layout of “Statistics - DIST and MVS Storage Below 2 GB” are described in the following section.

<table>
<thead>
<tr>
<th>DIST AND MVS STORAGE BELOW 2 GB</th>
<th>QUANTITY</th>
</tr>
</thead>
<tbody>
<tr>
<td>TOTAL DIST STORAGE BELOW 2 GB</td>
<td>133.03</td>
</tr>
<tr>
<td>TOTAL GETMAINED STORAGE</td>
<td>0.04</td>
</tr>
<tr>
<td>TOTAL VARIABLE STORAGE</td>
<td>14.21</td>
</tr>
<tr>
<td>NUMBER OF ACTIVE CONNECTIONS</td>
<td>967.74</td>
</tr>
<tr>
<td>NUMBER OF INACTIVE CONNECTIONS</td>
<td>0.00</td>
</tr>
<tr>
<td>TOTAL FIXED STORAGE</td>
<td>0.85</td>
</tr>
<tr>
<td>TOTAL GETMAINED STACK STORAGE</td>
<td>117.92</td>
</tr>
<tr>
<td>TOTAL STACK STORAGE IN USE</td>
<td>117.89</td>
</tr>
<tr>
<td>SYSTEM AGENT STACK STORAGE IN USE</td>
<td>15.73</td>
</tr>
<tr>
<td>STORAGE CUSHION</td>
<td>358.03</td>
</tr>

<td>0.23</td>
</tr>
<tr>
<td>24 BIT HIGH PRIVATE</td>
<td>0.21</td>
</tr>
<tr>
<td>24 BIT PRIVATE CURRENT HIGH ADDRESS</td>
<td>0000000000042000</td>
</tr>
<tr>
<td>31 BIT EXTENDED LOW PRIVATE</td>
<td>5.14</td>
</tr>
<tr>
<td>31 BIT EXTENDED HIGH PRIVATE</td>
<td>147.14</td>
</tr>
<tr>
<td>31 BIT PRIVATE CURRENT HIGH ADDRESS</td>
<td>000000018325000</td>
</tr>
<tr>
<td>EXTENDED REGION SIZE (MAX)</td>
<td>1666.00</td>
</tr>
</tbody>
</table>

TOTAL DIST STORAGE BELOW 2 GB (MB)

Total DIST storage below the bar. This includes:
- Fixed length storage use
- Getmained storage
- Save areas
- Variables

Field Name: SW0225DI

TOTAL GETMAINED STORAGE (MB)

Total storage acquired by GETMAIN. This includes space for virtual pools, EDM pool, compression dictionary, castout buffers, and the data space lookaside buffer, and data space buffer pool control blocks.

This figure can be different from the sum of GETMAIN storage items shown in the statistics DBM1 storage, because DB2 does not produce grouping statistics for all GETMAIN storage.

Field Name: QW0225GM

TOTAL VARIABLE STORAGE (MB)

Total storage used by all variable pools. This includes storage used by:
- System agents
- Local agents
- RID pool
• Pipe manager subpool
• Local dynamic statement cache control blocks
• Local dynamic statement cache statement pool
• Buffer and data manager trace tables
• A list of objects in restricted state including the new PRO state. If consumption of this storage pool is high, review restrictive exception state of database objects and check whether they can be resolved or reduced.

Field Name: QW0225VR

NUMBER OF ACTIVE CONNECTIONS
The number of active connections, or active and disconnected DBAT threads.

Field Name: SACDBATS

NUMBER OF INACTIVE CONNECTIONS
The current number of type 2 inactive connections.

Field Name: QDSTCIN2

TOTAL FIXED STORAGE (MB)
Total amount of fixed storage.

Field Name: QW0225FX

TOTAL GETMAINED STACK STORAGE (MB)
Total GETMAINED storage allocated for program stack use.

Field Name: QW0225GS

TOTAL STACK STORAGE IN USE (MB)
The amount of stack storage that is in use.

Field Name: QW0225SU

SYSTEM AGENT STACK STORAGE IN USE (MB)
The amount of 31-bit stack storage that is in use for system agents. This is a subset of QW0225SU.

Field Name: QW0225SS

STORAGE CUSHION (MB)
Storage reserved to allow DB2 to complete critical functions while short on storage. This includes the contract warning cushion, storage reserved for must-complete operations, and storage for MVS use.

Field Name: STORCUSH

24 BIT LOW PRIVATE (MB)
The amount of private MVS storage below the 16 MB line. This storage is obtained from bottom upward, usually for unauthorized programs.

Field Name: QW0225LO

24 BIT HIGH PRIVATE (MB)
The amount of private MVS storage below the 16 MB line. This storage is obtained from top downward, usually for authorized programs.
DIST and MVS Storage Below 2 GB

Field Name: QW0225HI

**24 BIT PRIVATE CURRENT HIGH ADDRESS**

The current high address of the 24-bit private region.

Field Name: QW0225TP

**31 BIT EXTENDED LOW PRIVATE (MB)**

The amount of private MVS storage above the 16 MB line. This storage is obtained from bottom upward, usually for unauthorized programs.

Field Name: QW0225EL

**31 BIT EXTENDED HIGH PRIVATE (MB)**

The amount of private MVS storage above the 16 MB line. This storage is obtained from top downward, usually for authorized programs.

Field Name: QW0225EH

**31 BIT PRIVATE CURRENT HIGH ADDRESS**

The current high address of the 31-bit private region.

Field Name: QW0225EP

**EXTENDED REGION SIZE (MAX) (MB)**

The maximum amount of MVS private storage available above the 16 MB line.

Field Name: QW0225RG

**DRDA Remote Locations:**

This topic shows detailed information about “Statistics - DRDA Remote Locations”.

It shows information about remote locations of Distributed Relational Database Architecture (DRDA).

**Statistics - DRDA Remote Locations**

The field labels shown in the following sample layout of “Statistics - DRDA Remote Locations” are described in the following section.

<table>
<thead>
<tr>
<th>DRDA REMOTE LOCATIONS</th>
<th>SENT</th>
<th>RECEIVED</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONVERSATIONS</td>
<td>0.00</td>
<td>2.00</td>
</tr>
<tr>
<td>CONVERSATIONS QUEUED</td>
<td>0.00</td>
<td></td>
</tr>
<tr>
<td>CONVERSATIONS DEALLOCATED</td>
<td>0.00</td>
<td></td>
</tr>
<tr>
<td>SQL STATEMENTS</td>
<td>0.00</td>
<td>49.00</td>
</tr>
<tr>
<td>COMMITS</td>
<td>0.00</td>
<td>33.00</td>
</tr>
<tr>
<td>ROLLBACKS</td>
<td>0.00</td>
<td>0.00</td>
</tr>
<tr>
<td>ROWS</td>
<td>16.00</td>
<td>0.00</td>
</tr>
<tr>
<td>MESSAGES</td>
<td>1540.00</td>
<td>1540.00</td>
</tr>
<tr>
<td>BYTES</td>
<td>140.7K</td>
<td>280.5K</td>
</tr>
<tr>
<td>BLOCKS</td>
<td>32.00</td>
<td>0.00</td>
</tr>
<tr>
<td>THREAD INDOUBT-REM.L.COORD.</td>
<td>0.00</td>
<td></td>
</tr>
</tbody>
</table>

**SENT - CONVERSATIONS**

The number of conversations that were initiated from the requester location. This value is maintained at the requester location.
A conversation is a specific instance of using TCP/IP or SNA LU 6.2 to transfer information between a requester and a server. A conversation is a logical connection between a requester and a server.

Field Name: QLSTCNVS

SENT - CONVERSATIONS QUEUED
The number of conversation requests queued by the distributed data facility and waiting for allocation. This value is maintained at the requester location.

Background and Tuning Information
When this value is high, increase the limit for the number of conversations.

Field Name: QLSTCNVQ
This is an exception field.

SENT - CONVERSATIONS DEALLOCATED
The number of conversations that were deallocated from this site to the remote site.

Field Name: QLSTCNVT

SENT - SQL STATEMENTS
The number of SQL statements sent to the remote server. This value is updated at the requester location.

Field Name: QLSTSQLS

SENT - COMMITS
The number of commit requests sent to the server (single-phase commit protocol) and the committed requests sent to the participant (two-phase commit protocol).

Field Name: QLSTCOMS

SENT - ROLLBACKS
The number of abort requests sent to the server (single-phase commit protocol) and backout requests sent to the participant (two-phase commit protocol).

Field Name: QLSTABRS

SENT - ROWS
The number of data rows sent to the requester location (includes SQLDA). This value is updated at the server location.

Field Name: QLSTROWS

SENT - MESSAGES
The number of messages sent to the remote location. A message is a group of characters and control bit sequences transferred on a single TCP/IP or SNA API call. This value is maintained at the location where the messages originated.

Field Name: QLSTMSGS

SENT - BYTES
The number of bytes of data sent to the requester location. This value is maintained at the server location.

**Field Name:** QLSTBYTS

**SENT - BLOCKS**

The number of blocks transmitted using block fetch. This value is maintained at the server location.

**Field Name:** QLSTBTBF

**SENT - THREAD INDOUBT-REM.L.COORD.**

The number of threads that became indoubt with the remote location as the coordinator (two-phase commit operations only). A large value might indicate network problems.

**Field Name:** QLSTINDT

**RECEIVED - CONVERSATIONS**

The number of conversations that were initiated from the requester to the server location. This value is updated at the server location.

**Field Name:** QLSTCNVR

**RECEIVED - SQL STATEMENTS**

The number of SQL statements received from the requester location. This value is updated at the server location.

**Field Name:** QLSTSQLR

**RECEIVED - COMMITS**

The number of commit requests received from the requester (single-phase commit protocol) and committed requests received from the coordinator (two-phase commit protocol).

**Field Name:** QLSTCOMR

**RECEIVED - ROLLBACKS**

The number of abort requests received from the requester (single-phase commit protocol) and backout requests received from the coordinator (two-phase commit protocol).

**Field Name:** QLSTABRR

**RECEIVED - ROWS**

The number of data rows received from the server location. This value is maintained at the requester location.

**Note:**

- This value does not include any SQLDA or SQLCA transmitted.
- Block fetch can significantly affect the number of rows sent across the network. When used with nonupdate cursors, block fetch groups as many rows as possible into the message buffer, and transmits the buffer over the network without requiring a VTAM message. Consequently, more rows of data might be sent from the server location than are received by the requester location.

This is especially true when DB2 private protocol is used because multiple blocks can be transmitted from the server with no intervening messages from the requester.
Field Name: QLSTROWR

RECEIVED - MESSAGES

The number of messages received by VTAM from the remote location. This value is maintained at the location where the messages were received.

More messages might be sent from the server location than are received by the requester due to the manner in which distributed SQL statements are processed internally.

Field Name: QLSTMSGR

RECEIVED - BYTES

The number of bytes of data received from the server location. This value is maintained at the requester location.

More bytes of data might be sent from the server location than are received by the requester due to the manner in which distributed SQL statements are processed internally.

Field Name: QLSTBYTR

RECEIVED - BLOCKS

The number of blocks received from the remote location using block fetch. This value is maintained at the requester location.

Field Name: QLSTBRBF

EDM Pool Activity:

This topic shows detailed information about “Statistics - EDM Pool Activity”.

Statistics - EDM Pool Activity

The field labels shown in the following sample layout of “Statistics - EDM Pool Activity” are described in the following section.

### PAGES IN DBD POOL (ABOVE) (Prior to DB2 12)

This field shows the number of pages in the DBD pool above the 2 GB bar.

**Field Name:** QISEDPPGE

### HELD BY DBD

The current number of pages used for database descriptors (DBDs). This is a snapshot value.

**Field Name:** QISEDDBD

### STEALABLE PAGES

The current number of stealable pages used for database descriptors (DBDs).

**Field Name:** QISEDLRU

### FREE PAGES (Prior to DB2 12)

This field shows the number of free pages in the DBD pool above the 2 GB bar.

**Field Name:** QISEDPPRE

This is an exception field.

### % PAGES IN USE

The percentage of DBD pages in use expressed as complement of the percentage of available DBD pages (ratio of stealable and free pages to the total number).

**Field Name:** SISEDPUIU

### FAILS DUE TO DBD POOL FULL

This field shows the total number of failures because the DBD pool above the 2 GB bar was full.

**Field Name:** QISEDFFAL

This is an exception field.

### PAGES IN STMT POOL (ABOVE)

The current number of pages in the EDM Statement pool above the 2 GB bar. This is a snapshot value. For DB2 12 this field shows N/A.

**Field Name:** QISECPGE

### HELD BY STATEMENTS

The number of pages in the EDM Statement pool above the 2 GB bar that is used for cached dynamic SQL statements. This is a snapshot value.

**Field Name:** QISEDYNP
FREE PAGES
The number of pages currently not used by any object in the EDM Statement pool above the 2 GB bar. For DB2 12 this field shows N/A.
Field Name: QISECFRE

FAILS DUE TO STMT POOL FULL
The total number of failures because the EDM Statement pool above the 2 GB bar was full. For DB2 12 this field shows N/A.
Field Name: QISECFAL

PAGES IN SKEL POOL (ABOVE) (Prior to DB2 12)
The current number of pages in the EDM skeleton pool above the 2 GB bar.
Field Name: QISEKPGE

HELD BY SKCT
The current number of pages used for skeleton cursor tables (SKCTs). This is a snapshot value.
Field Name: QISESKCT

HELD BY SKPT
The current number of pages used for skeleton package tables (SKPTs). This is a snapshot value.
Field Name: QISESKPT

STEALABLE PAGES
The current number of stealable pages used for skeleton cursor and package tables.
Field Name: QISEKLRU

FREE PAGES (Prior to DB2 12)
The number of pages currently not used by any object in the EDM skeleton pool above the 2 GB bar.
Field Name: QISEKFRE

% PAGES IN USE
The percentage of skeleton pages in use expressed as complement of the percentage of available skeleton pages (ratio of stealable and free pages to the total number).
Field Name: SISEKPIU

FAILS DUE TO SKEL POOL FULL
The total number of failures because the EDM skeleton pool above the 2 GB bar was full.
Field Name: QISEKFAL

DBD REQUESTS
The number of requests for database descriptors (DBDs).
Field Name: QISEDBDG

DBD NOT FOUND
EDM Pool Activity

The total number of times database descriptors were loaded from DASD. To find the number of times the DBD was already in the EDM pool, subtract this value from the value of Requests for sections - DBD field.

Field Name: QISEDBDL
This is an exception field.

DBD HIT RATIO (%)
The ratio of successful requests for database descriptors (DBD) from the EDM pool to the total number of requests for database descriptors expressed as a percentage.

Field Name: SERDBLR
This is an exception field.

CT REQUESTS
The number of requests for cursor table (CT) sections.

Field Name: QISECTG
This is an exception field.

CT NOT FOUND
The number of times a cursor table section was loaded from DASD. To find the number of times the CT was found in the EDM pool, subtract this value from the value of the Requests for sections - CT field.

Field Name: QISECTL
This is an exception field.

CT HIT RATIO (%)
The ratio of successful requests for cursor tables from the EDM pool to the total number of requests for cursor tables expressed as a percentage.

Field Name: SERCTLR
This is an exception field.

PT REQUESTS
The number of requests for package table (PT) sections.

Field Name: QISEKTG
This is an exception field.

PT NOT FOUND
The number of times a package table section was loaded from DASD. To find the number of times the PT was already in the EDM pool, subtract this value from the value of the Requests for sections - PT field.

Field Name: QISEKTL
This is an exception field.

PT HIT RATIO (%)
The ratio of successful package table requests from the EDM pool to the total number of package table requests, expressed as a percentage.

Field Name: SERPTLR
This is an exception field.

PKG SEARCH NOT FOUND

When a package is bound with a wild card (*) for package names, in the form of PKLIST(COL1.*,COL2.*.....), EDM generates a NOT-FOUND record to avoid future I/O if a collection ID/package name combination does not exist.

This field shows how often a cached record was located during package binding.

Field Name: QISEKNFM

PKG SEARCH NOT FOUND INSERT

When a package is bound with a wild card (*) for package names, in the form of PKLIST(COL1.*,COL2.*.....), EDM generates a NOT-FOUND record to avoid future I/O if a collection ID/package name combination does not exist.

This field shows how often a record was added to the cache during package binding.

Field Name: QISEKNFA

PKG SEARCH NOT FOUND DELETE

When a package is bound with a wild card (*) for package names, in the form of PKLIST(COL1.*,COL2.*.....), EDM generates a NOT-FOUND record to avoid future I/O if a collection ID/package name combination does not exist.

This field shows how often a record was removed from the cache during package binding.

Field Name: QISEKNFR

STATEMENTS IN GLOBAL CACHE

Number of statements in the global cache.

Field Name: QISESTMT

Global DDF Activity:

This topic shows detailed information about “Statistics - Global DDF Activity”.

Statistics - Global DDF Activity

The field labels shown in the following sample layout of “Statistics - Global DDF Activity” are described in the following section.

**DBAT/CONN QUEUED-MAX ACTIVE**

The number of times a DBAT or connection was queued because it reached the ZPARM maximum for active remote threads (MAXDBAT).

**Field Name:** QDSTQDBT

This is an exception field.

**CONN REJECTED-MAX CONNECTED**

The number of connections that were rejected because the ZPARM limit for maximum remote connections (CONDBAT) was reached.

**Field Name:** QDSTQ CRT

**CONN CLOSED - MAX QUEUED**

The number of queued client connections whose TCP/IP sockets were closed because the system parameter MAXCONQN was exceeded.

The socket close only occurs when the DB2 subsystem is a member of a data sharing group and DB2 was started with DDF THREADS set to INACTIVE.

**Field Name:** QDSTNCQC

**CONN CLOSED - MAX WAIT**

The number of queued client connections whose TCP/IP socket were closed due to system parameter MAXCONQW being exceeded.

The socket close only occurs when the DB2 subsystem is a member of a data sharing group and DB2 was started with DDF THREADS set to INACTIVE.

**Field Name:** QDSTNCCW

**COLD START CONNECTIONS**

The number of cold start connections with all remote locations (two-phase commit operations only).

**Field Name:** QDSTCSTR

This is an exception field.
WARM START CONNECTIONS

The number of warm start connections with all remote locations (two-phase commit operations only).

Field Name: QDSTWSTR
This is an exception field.

RESYNCHRONIZATION ATTEMPTED

The number of resynchronization connections attempted with all remote locations (two-phase commit operations only).

Background and Tuning Information
A large value can indicate network or system problems.

Field Name: QDSTRSAT
This is an exception field.

RESYNCHRONIZATION SUCCEEDED

The number of resynchronization connections that succeeded with all remote locations (two-phase commit operations only).

Background and Tuning Information
If the value of this field is much less than the number of resynchronizations attempted, network problems might exist.

Field Name: QDSTRSSU
This is an exception field.

CUR TYPE 1 INACTIVE DBATS

The current number of inactive DBATs type 1 (snapshot).

Field Name: QDSTQCIT

HWM TYPE 1 INACTIVE DBATS

The maximum number of inactive type 1 DBATs.
This value is a high-water mark.

Field Name: QDSTQMIT
This is an exception field.

TYPE 1 CONNECTIONS TERMINATED

The number of threads or connections that were terminated instead of being made type 1 inactive because the maximum number of type 1 inactive threads was reached (MAXTYPE1).

Field Name: QDSTNITC

CUR INACTIVE CONNS (TYPE 2)

The current number of type 2 inactive connections.

Field Name: QDSTCIN2

HWM INACTIVE CONNS (TYPE 2)

The maximum number of concurrent type 2 inactive connections that existed.
This value is a high-water mark for QDSTCIN2.
Global DDF Activity

Field Name: QDSTMIN2
**ACC QU INACT CONNS (TYPE 2)**

The number of RECEIVE requests on type 2 inactive or new connections that are queued to be serviced by a disconnected (pooled) DBAT.

Field Name: QDSTQIN2
**CUR QU INACT CONNS (TYPE 2)**

The current number of type 2 inactive or new connections that are queued waiting for a database access thread (DBAT).

Field Name: QDSTNQR2
**MIN QUEUE TIME**

The minimum queue time of a type 2 inactive or new connection that was queued waiting for a database access thread (DBAT) in the last statistical period.

Field Name: QDSTNQMN
**MAX QUEUE TIME**

The maximum queue time of a type 2 inactive or new connection that was queued waiting for a database access thread (DBAT) in the last statistical period.

Field Name: QDSTNQMX
**AVG QUEUE TIME**

The average queue time of a type 2 inactive or new connection that was queued waiting for a database access thread (DBAT) in the last statistical period.

Field Name: QDSTNQAV
**HWM QU INACT CONNS (TYPE 2)**

The maximum number of type 2 inactive or new connections that are queued waiting for a database access thread.

This value is a high-water mark for QDSTNQR2.

Field Name: QDSTMQR2
**CUR ACTIVE AND DISCON DBATS**

The current number of active and disconnected (pooled) DBATs.

Field Name: QDSTCNAT
**HWM ACTIVE AND DISCON DBATS**

The maximum number of active and disconnected (pooled) DBATs that existed.

This value is a high-water mark for QDSTCNAT.

Field Name: QDSTHWAT

This is an exception field.

**HWM TOTL REMOTE CONNECTIONS**

The maximum number of active and remote connections. This value is a high-water mark.
Field Name: QDSTHWDT
This is an exception field.

CUR DISCON DBATS NOT IN USE
The current number of disconnected (pooled) DBATs that are available to process type 2 inactive or new connections.

Field Name: QDSTNADS

HWM DISCON DBATS NOT IN USE
The maximum number of disconnected (pooled) DBATs that are available to process type 2 inactive or new connections.
This value is a high-water mark for QDSTNADS.

Field Name: QDSTMADS

DBATS CREATED
The number of requests that required a database access thread (DBAT) to be created to process the request.

Note: This does not include database access threads created to replace disconnected (pooled) DBATs that terminated because they reached their reuse limit.

Field Name: QDSTNDBA

DISCON (POOL) DBATS REUSED
The number of requests that were satisfied by assigning a disconnected (pooled) DBAT to process the request.

Field Name: QDSTPOOL

CUR ACTIVE DBATS-BND DEALLOC
The current number of DBATs that are active because the associated packages were bound with RELEASE(DEALLOCATE).

Field Name: QDSTNARD

HWM ACTIVE DBATS-BND DEALLOC
The maximum number of DBATs that are active because the associated packages were bound with RELEASE(DEALLOCATE).

Field Name: QDSTMARD

Group Buffer Pool Activity:
This topic shows detailed information about “Statistics - Group Buffer Pool Activity”.

This block shows activity for the group buffer pool connected to the reported DB2 system. The counters are cumulative from the time when the buffer pool was first connected. If more than one 4 KB or 32 KB group buffer pool block is printed, blocks showing the 4 KB and 32 KB group buffer pool totals are printed. If the report contains both 4 KB and 32 KB group buffer pool blocks, a block showing the totals of all group buffer pools is printed.

</tbody>
</table>
### GROUP BP R/W RATIO (%)

The group buffer pool read/write ratio. This reflects the effectiveness of the group buffer pool and whether the GBPCACHE NONE option can be used.

**Field Name:** SGBRWRAT

### GBP SYN.READ(XI) HIT RATIO(%)

The percentage of all requests made to read a page from the group buffer pool because the page was invalidated in the member's buffer pool, which found the data in the group buffer pool and did not have to retrieve the page from DASD.

**Background and Tuning Information**

For highly active group buffer pools, consider increasing the GBP size if the SYN.READ(XI) HIT RATIO percent is smaller than 90.

**Field Name:** SGBXIRAT

### GBP-DEPENDENT GETPAGES

The number of Getpages made for GBP-dependent objects.

**Field Name:** QBGLGG

### SYN.READ(XI)-DATA RETURNED

The number of requests made to read a page from the group buffer pool because the page was invalidated in the member's buffer pool. The member found the required page in the group buffer pool.

**Background and Tuning Information**

When you increase the size of the group buffer pool (GBP), the number of pages returned from the GBP can increase. Conversely, decreasing the size of the GBP can cause DB2 to return fewer pages because the GBP cannot hold pages long enough to allow them to be retrieved again.

**Field Name:** QBGLXD

This is an exception field.

### SYN.READ(XI)-NO DATA RETURN

The number of requests to read a page from the group buffer pool that were required because the page was invalidated in the member's buffer pool. The member did not find the data in the group buffer pool and had to retrieve the page from DASD.

**Background and Tuning Information**

Normally, when the page in a member's buffer is cross invalidated, the buffer is refreshed from the group buffer pool. In this instance, the requested page was not found in the group buffer pool though the page set is still GBP-dependent. The page has been removed from the group buffer pool for one of two reasons:

- Shortage of data pages and consequent reclamation of this page

---

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Data Pages</th>
<th>Index Leaf Pages</th>
<th>Pages in Write-Around</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>0.00</td>
<td>0.00</td>
<td>0.00</td>
</tr>
</tbody>
</table>
Group Buffer Pool Activity

- Shortage of directory entries and consequent removal of the page together with cross invalidation of that page in the local buffer pools of all members using that page.

If the value in this field is high, you may want to tune the group buffer pool (GBP). Depending on the reason, increase the number of GBP data pages, increase the size of the directory entry space, or increase both the number of GBP data pages and the space for directory entries. Oversizing the group buffer pool can cause unnecessary GBP checkpoint overhead.

Field Name: QBGLXR

SYN.READ(NF)-DATA RETURNED

The number of requests made to read a page from the group buffer pool because the page was not in the buffer pool of the member. The member found the page in the group buffer pool.

Background and Tuning Information

The requesting member needs a page from a table space or index that is GBP-dependent or has GBPCACHE ALL defined. To get that page, the group buffer pool is checked before the page set on DASD.

If the group buffer pool is used to cache both clean and changed pages (GBPCACHE ALL is used for all data), you can try to get more pages returned from the group buffer pool by increasing the size of the group buffer pool. Do not tune the GBP based on this counter if it is used for caching changed pages only (GBPCACHE CHANGED).

Field Name: QBGLMD

This is an exception field.

SYN.READ(NF)-NO DATA RETURN

The number of requests made to read a page from the group buffer pool because the page was not in the member’s buffer pool and had to retrieve the page from DASD.

Background and Tuning Information

You can compare the value in this counter with the number of pages that were returned from the group buffer pool, see Sync.Read (Not Found) - Data Returned. If the group buffer pool is used to cache both clean and changed pages (GBPCACHE ALL is used for all data), you can try to get more pages returned from the group buffer pool by increasing the size of the group buffer pool. Do not tune the GBP based on this counter if it is used for caching changed pages only (GBPCACHE CHANGED).

Field Name: QBGLMR

UNREGISTER PAGE

The number of times DB2 unregistered interest for a single page. This happens when DB2 steals pages from the member’s buffer pool that belong to GBP-dependent page sets or partitions.

Background and Tuning Information
A large value here indicates that the local buffer pool contains a mixture of GBP-dependent data and non-GBP-dependent data.

The page stolen from the local buffer pool is replaced by a new one. This counter makes a distinction on whether the new page depends on the group buffer pool or not.

Usually a page of a GBP-dependent page set or partition is replaced by a page that is also GBP-dependent. In this instance, the unregister request for the page being stolen is combined with the read and register request for the new page. These combined requests do not contribute to this counter.

If, however, a page of a GBP-dependent page set or partition is replaced by a page that is not GBP-dependent, then only an unregister request is sent to the coupling facility. These separate requests are counted here.

**Field Name:** QBGLDG

**CLEAN PAGES SYNC.WRITTEN**

The number of clean pages that were synchronously written to the group buffer pool from the virtual pool.

**Background and Tuning Information**

Only GBPCACHE ALL causes clean (unchanged) pages to be written to the coupling facility. The pages are written to the coupling facility even if the page set is not GBP-dependent. If group buffer pool caching works effectively for prefetch, the value in this field should be much smaller than the value in Synchronous Read (Not Found) - Data Returned.

**Field Name:** QBGLWC

This is an *exception* field.

**CLEAN PAGES ASYNC.WRTN**

The number of clean pages that were asynchronously written to the group buffer pool from the virtual pool.

**Background and Tuning Information**

Only GBPCACHE ALL causes clean (unchanged) pages to be written to the group coupling facility. In this instance pages are written even if the page set is not GBP-dependent. Asynchronous write is done under prefetch processing.

If group buffer pool caching works effectively for prefetch, the value in this field should be much smaller than the combined values in:

- Synchronous Read (Not Found) - Data Returned
- Asynchronous Reads - Data Returned
- Clean pages - Read after register page list

**Field Name:** QBGLAC

This is an *exception* field.

**REG.PAGE LIST (RPL) REQUEST**

The number of register page list (RPL) requests made by prefetch. The group buffer pool must be allocated in a group coupling facility with CFLEVEL=2 or higher.

**Background and Tuning Information**

Performance might be improved by enabling RPL.
Field Name: QBGLAX
This is an exception field.

NUMBER OF PAGES RETR.FROM GBP

The number of coupling facility reads performed by prefetch to retrieve a changed page from the group buffer pool.

Field Name: QBGLAY
This is an exception field.

PAGES CASTOUT

The number of data pages that were cast out of the group buffer pool of the member.

Castout to a page set or partition is done by the castout owner of the page set or partition. This is normally the DB2 subsystem that had the first update intent on the page set or partition.

Background and Tuning Information

The number of pages written per I/O is normally close to the value of this field divided by the value in Unlock Castout.

For example, if an average of four pages is written per castout write I/O, the number of pages cast out should be four times the number in this field.

Because DB2 usually includes more than one page in the request to write pages to DASD, the number in this field should always be significantly more than Unlock Castout. If it is not (for example, when "unlock castout" is more than half of "pages castout"), the castout write I/O is inefficient; probably because you have random update patterns on the DB2 data or a low castout threshold.

Field Name: QBGLRC
This is an exception field.

UNLOCK CASTOUT

The number of times DB2 issued an unlock request to the coupling facility for completed castout I/Os.

When pages are cast out to DASD, they are locked for castout in the coupling facility. This castout lock is not an IRLM lock; it is to ensure that only one system can cast out a given page at a time.

Background and Tuning Information

The number of pages written per I/O is normally close to the value of pages castout divided by the value of this field.

For example, if an average of four pages is written per castout write I/O, the number of pages cast out should be four times the value in this field.

Because DB2 usually includes more than one page in a write request, the number in this field should always be significantly less than pages castout. If it is not (for example, when "unlock castout" is more than half of "pages castout"), the castout write I/O is inefficient; probably because you have random update patterns on the DB2 data or a low castout threshold.

Field Name: QBGLUN

READ CASTOUT CLASS
The number of requests made to the group buffer pool to determine which
pages, from a particular page set or partition, must be cast out because
they are cached as changed pages.

This request is issued either by the page set or partition castout owner, or,
when the group buffer pool castout threshold is reached, by the group
buffer pool structure owner.

**Field Name:** QBGLCC

**READ DIRECTORY INFO**

The number of requests issued by the group buffer pool structure owner to
read the directory entries of all changed pages in the group buffer pool.

This request is issued at group buffer pool checkpoints to record the oldest
recovery log record sequence number (LRSN). It is used as a basis for
recovery if the group buffer pool fails.

Such requests might have to be issued several times for each group buffer
pool checkpoint to read the directory entries for all changed pages.

**Background and Tuning Information**

If the value of this counter appears to be abnormally high, consider
upgrading the coupling facility to CFLEVEL=2 or higher to raise the
number of directory entries that can be read with one request. You can also
increase the group buffer pool checkpoint interval, but this can lengthen
the recovery for the group buffer pool.

**Field Name:** QBGLRD

**READ STORAGE STATISTICS**

The number of times DB2 requested statistics information from the group
buffer pool. It is issued by the group buffer pool structure owner at timed
intervals to determine whether the group buffer pool castout threshold
(GBPPOOL) has been reached.

**Field Name:** QBGLOS

**REGISTER PAGE**

The number of times DB2 registered interest in a single page.

These are "register-only" requests, which means that DB2 is not requesting
any data back from the request.

This request is made only to create a directory entry for the page to be
used for cross-invalidation when the page set or partition P-lock is
downgraded from S to IS mode, or from SIX to IX mode.

**Field Name:** QBGLRG

**DELETE NAME**

The number of requests made by DB2 to delete directory and data entries
associated with a particular page set or partition from the group buffer
pool.

DB2 issues this request when it changes a page set or partition from
GBP-dependent to non GBP-dependent. DB2 also issues this request for
objects that are defined with GBPCACHE ALL when those objects are first
opened.

**Background and Tuning Information**
Group Buffer Pool Activity

This counter is a measure of how often page sets or partitions change between being and not being dependent on the group buffer pool.

You can prevent DB2 going in and out of GBP dependency too often by tuning the following subsystem parameters that affect data sets when they are switched to a different state:

**PCLOSEN**

Pseudoclose frequency. The number of checkpoints required before a data set that was not updated can be a pseudoclose candidate.

If the PCLOSEN condition is met, the page set or partition is converted from read-write to read-only state. Depending on other concurrent users, this could raise the chance for the page set or partition to go out of GBP dependency.

**PCLOSET**

Pseudoclose time. The amount of time (in minutes) that must elapse before a data set can be a pseudoclose candidate.

If the PCLOSEN or PCLOSET condition is met, the page set or partition is converted from read-write to read-only state. Depending on other concurrent users, this could raise the chance for the page set or partition to go out of GBP dependency.

**LOGLOAD**

The number of log records that DB2 writes between successive checkpoints.

These parameters are specified in the CHECKPOINT FREQ field in panel DSNTIPN.

**Field Name:** QBGLDN

**ASYNCH GBP REQUESTS**

The number of IXLCACHE invocations for the primary group buffer pool.

**Field Name:** QBGLHS

**EXPLICIT X-INVALIDATIONS**

The number of times an explicit coupling facility cross-invalidation request was issued.

**Field Name:** QBGLEX

**CASTOUT CLASS THRESHOLD**

The number of times group buffer pool castout was initiated because the group buffer pool class castout threshold was detected.

**Background and Tuning Information**

The class castout threshold is one of two group buffer pool thresholds. In most cases the default value for the class threshold (5 percent) is a good choice. Depending on your workload, altering this value can reduce DASD contention during castout.

**Field Name:** QBGLCT

This is an exception field.

**GROUP BP CASTOUT THRESHOLD**
The number of times a group buffer pool castout was initiated because the group buffer pool castout threshold was detected.

**Background and Tuning Information**

The GBP castout threshold, GBP class castout threshold, and the length of the GBP checkpoint interval determine the castout characteristics of the group buffer pool.

You can consider this threshold a safety margin to protect the group buffer pool from being accidentally flooded by overactive applications.

In most situations, the default value for the group buffer pool castout threshold of 30 percent is a good choice. Use the ALTER GROUPBUFFERPOOL command to tune the group buffer pool thresholds.

**Field Name:** QBGLGT

This is an *exception* field.

**GBP CHECKPOINTS TRIGGERED**

The number of group buffer pool checkpoints triggered by this member.

**Background and Tuning Information**

The value of this counter depends on the length of the group buffer pool checkpoint interval.

**Field Name:** QBGLCK

**WRITE FAILED-NO STORAGE**

The number of coupling facility write requests that could not complete due to a lack of coupling facility storage resources.

**Background and Tuning Information**

A value greater than zero indicates that the data page resources of the coupling facility are being consumed faster than the DB2 castout processes can free them.

On write failure, the affected DB2 member initiates castout and retries several times, and finally, if it is a changed page, it will be added to the logical page list (LPL) requiring recovery.

If the problem is not simply due to a momentary surge in activity, you need either to decrease the group buffer pool castout thresholds, or to increase the number of data entries in the group buffer pool. To increase the number of data entries, you can do one of the following:

- Increase the total size of the group buffer pool.
- Adjust the ratio of directory entries to data entries in favor of data entries.

**Field Name:** QBGLWF

This is an *exception* field.

**WRITE TO SEC-GBP FAILED**

The number of coupling facility requests to write changed pages to the secondary group buffer pool for duplexing that failed because of a lack of storage in the coupling facility.

**Field Name:** QBGL2F

This is an *exception* field.
Group Buffer Pool Activity

COMPL CHECKS SUSPENDED

The number of completion checks for writes to the secondary GBP that were suspended because the write had not yet been completed.

Field Name: QBGL2S

DELETE NAME LIST SEC-GBP

The number of DELETE NAME LIST requests to delete pages from the secondary group buffer pool that have just been cast out from the primary.

Field Name: QBGL2D

DELETE NAME FROM SEC-GBP

The number of group buffer pool requests to delete a page from the secondary group buffer pool. These requests are issued by the group buffer pool structure owner to delete orphaned data entries in the secondary GBP as part of the garbage collection logic.

Field Name: QBGL2N

UNLOCK CASTOUT STATS SEC-GBP

The number of coupling facility requests to read the castout statistics for the secondary group buffer pool. These requests are issued by the group buffer pool structure owner to check for orphaned data entries in the secondary group buffer pool.

Field Name: QBGL2R

ASYNCH SEC-GBP REQUESTS

The number of asynchronous IXLCACHE invocations for the secondary group buffer pool.

Field Name: QBGL2H

WRITE AND REGISTER

The number of Write and Register requests.

Field Name: QBGLWS

WRITE AND REGISTER MULT

The number of Write and Register Multiple requests.

Field Name: QBGLWM

CHANGED PGS SYNC.WRTN

The number of changed pages written synchronously to the group buffer pool.

Pages are written with Write and Register (WAR) requests or Write and Register Multiple (WARM) requests.

At commit time changed pages are forced from the virtual buffer pool of the member to the coupling facility.

Background and Tuning Information

In data sharing, changed pages must have been written to the group buffer pool by the time a transaction commits. The pages are written either synchronously (force at commit) or asynchronously, for example, when a local buffer pool threshold is reached or at a member's checkpoint. The
number of pages that have to be forced out synchronously (in “burst mode”) at commit time can be reduced if asynchronous writes are triggered more frequently.

You can use the vertical deferred write threshold (VDWQT) to reduce the number of pages that have to be forced out synchronously and to increase the number of pages that are asynchronously written before the transaction commits. For GBP-dependent page sets, writes triggered by the vertical deferred write threshold go to the coupling facility. You can cause changed pages to be written out quicker and in smaller increments, by reducing the vertical deferred write threshold (VDWQT).

**Field Name:** QBGLSW

This is an *exception* field.

**CHANGED PGS ASYNC.WRTN**

The number of changed pages written asynchronously to the group buffer pool.

Pages are written in response to Write and Register (WAR) and Write and Register Multiple (WARM) requests.

Changed pages can be written from the member’s virtual buffer pool to the group coupling facility before the application commits. This happens when, for example, a local buffer pool threshold is reached, or when P-lock negotiation forces the pages on the vertical deferred write queue to be written to the group buffer pool.

**Background and Tuning Information**

In data sharing, changed pages must have been written to the group buffer pool before a transaction commits. The pages are written either synchronously during commit processing or asynchronously before the transaction commits when, for example, a local buffer pool threshold is reached or at a member’s checkpoint. See Changed Pages - Written Synchronously for the number of changed pages synchronously written to the group buffer pool.

The vertical deferred write threshold (VDWQT) can be used to reduce the number of pages that have to be forced out synchronously and to increase the number of pages that are asynchronously written before the transaction commits. For GBP-dependent page sets, writes triggered by the vertical deferred write threshold go to the coupling facility. If you want changed pages to be written out quicker and in smaller increments, you can lower the vertical deferred write threshold (VDWQT).

**Field Name:** QBGLAW

This is an *exception* field.

**PAGES WRITE & REG MUL**

The number of pages written using Write and Register Multiple (WARM) requests.

**Field Name:** QBGLWP

**READ FOR CASTOUT**

The number of Read For Castout requests. One page read per request.

**Field Name:** QBGLCR
Group Buffer Pool Activity

READ FOR CASTOUT MULT
The number of Read For Castout Multiple requests.
Field Name: QBGLCM

PAGE P-LOCK LOCK REQ
The sum of all page P-lock lock requests.
Field Name: SBGLPLR

SPACE MAP PAGES
The number of page P-lock lock requests for space map pages.
Field Name: QBGLP1

DATA PAGES
The number of page P-lock requests for data pages.
Field Name: QBGLP2

INDEX LEAF PAGES
The number of page P-lock requests for index leaf pages.
Field Name: QBGLP3

PAGE P-LOCK UNLOCK REQ
The number of page P-lock unlock requests.
Field Name: QBGLU1

PAGE P-LOCK LOCK SUSP
The sum of all page P-lock lock suspensions.
Field Name: SBGLPLS

SPACE MAP PAGES
The number of page P-lock suspensions for space map pages.
Field Name: QBGLS1

DATA PAGES
The number of page P-lock suspensions for data pages.
Field Name: QBGLS2

INDEX LEAF PAGES
The number of page P-lock suspensions for index leaf pages.
Field Name: QBGLS3

PAGE P-LOCK LOCK NEG
The sum of all page P-lock lock negotiations.
Field Name: SBGLPLN

SPACE MAP PAGES
The number of page P-lock negotiations for space map pages.
Field Name: QBGLN1

DATA PAGES
The number of page P-lock negotiations for data pages.

Field Name: QBGLN2

INDEX LEAF PAGES

The number of page P-lock negotiations for index leaf pages.

Field Name: QBGLN3

PAGES IN WRITE-AROUND

The number of changed pages that were written to disk through group buffer pool write-around due to condition write failures to the group buffer pool.

Field Name: QBGLWA

Highlights:

This topic shows detailed information about “Statistics - Highlights”.

The sample shows the Statistics Highlights block for the long report. The description also shows additional fields printed with the Statistics short report.

Statistics - Highlights

The field labels shown in the following sample layout of “Statistics - Highlights” are described in the following section.

--- HIGHLIGHTS

INTERVAL START : 07/26/10 19:32:45.57
SAMPLING START: 07/26/10 19:32:45.57
TOTAL THREADS : 0.00
INTERVAL END : 07/26/10 19:35:47.34
SAMPLING END : 07/26/10 19:35:47.34
TOTAL COMMITS : 33.00
INTERVAL ELAPSED: 3:01.768843
OUTAGE ELAPSED: 0.000000
DATA SHARING MEMBER: N/A

INTERVAL START

The start time of the period represented by this report or trace entry.

For a trace, it is the timestamp of the DB2 Statistics records pair which marks the beginning of the delta record represented by the trace entry.

For the group page of group-scope reports it is the beginning of the earliest interval across reported members.

For SAVE data, it is the timestamp of the first DB2 Statistics report pair used to derive a row in the statistics SAVE and FILE tables.

For FILE, it is the timestamp of the DB2 Statistics records pair which marks the beginning of the delta record represented by a row in the statistics SAVE and FILE tables.

Field Name: SDBEGREC

INTERVAL END

The end time of the period represented by this report or trace entry.

For a trace, it is the timestamp of the DB2 statistics records pair which marks the end of the delta record represented by the trace entry.

For the group page of group-scope reports it is the ending of the latest interval across reported members.

For SAVE data, it is the timestamp of the last DB2 statistics report pair used to derive a row in the statistics SAVE and FILE tables.
For FILE, it is the timestamp of the DB2 statistics records pair which marks the end of the delta record represented by a row in the statistics SAVE and FILE tables.

Field Name: SDENDREC

INTERVAL ELAPSED
The elapsed time of the period represented by this report or trace entry.
For a trace, it is the time elapsed between two consecutive DB2 statistics records pairs which mark the beginning and the end of the delta record represented by the trace entry. For a report, it is the elapsed time for the period within the interval record for which the DB2 statistics data is available.
For the group page of group-scope reports it is the average elapsed time of all the reported members.
Field Name: SDELTIME

SAMPLING START
The timestamp of the first DB2 statistics records pair used to derive a report entry (an interval record). For example, when INTERVAL(0) is specified, the sampling start coincides with the interval record start time in member-scope reports.
Field Name: SDSAMPST

SAMPLING END
The timestamp of the last DB2 statistics records pair used to derive a report entry (an interval record). For example, when INTERVAL(0) is specified, the sampling start coincides with the interval record end time in member-scope reports.
Field Name: SDSAMPEN

OUTAGE ELAPSED
The time for which OMEGAMON XE for DB2 PE detected discontinuity in the available DB2 statistics data. The most common reason for this is a stop or start of the reported DB2 system within the reported interval. For the group page of group-scope reports it is the average outage time of all reported members.
Field Name: SDOUTEL

TOTAL THREADS
The number of successful create thread requests. It does not include DBATs.
A thread is required before an application can use SQL. When established, a thread can have one or more secondary authorization IDs.
A thread is needed to perform any DB2 activity. For example, a thread is needed to run a DB2 utility to perform an IFI request such as READS, or to process a DB2 command such as -DISPLAY THREAD. However, a thread is not created if the command failed because of a syntax error.

Background and Tuning Information
Thread reuse can help improve performance.
The term *thread reuse* only applies to IMS and CICS attachments. In the case of the TSO attachment facility and the call attachment facility (CAF), threads cannot be reused, because the threads are allocated to the user address space.

Thread reuse should be considered in the following cases:

- **If transaction volume is high:**
  High volume transactions should achieve a high percentage of thread reuse. If threads are reused on low volume transactions, the number of threads needed increases because these threads are not automatically terminated by IMS when not being used. This may result in too many idle threads for the level of the DB2 workload. Under CICS, protected threads are terminated after about 45 seconds if no transaction eligible to reuse the thread has been received.

- **If thread creation cost is significant:**
  As a rule of thumb, more than 5% of the total CPU cost of transaction processing is considered significant.

The ACQUIRE and RELEASE parameters of BIND should be specified to minimize the thread creation cost, while providing the needed concurrency:

- If most of the application plan’s SQL statements are executed, then ACQUIRE(ALLOCATE) is cheaper than ACQUIRE(USE).
- If only a small number of the SQL statements are executed, ACQUIRE(USE) becomes cheaper and improves concurrency, because the required resources are only acquired (locked) when the plan actually references (uses) them. An example would be a generalized plan used by many different transactions. It would contain multiple logic paths referencing different tables.

  Note that, when packages are involved, ACQUIRE(USE) is always implicitly used.

- **Concurrency in thread reuse** is based on page locking provided by the IS and IX intent locks, whose duration is governed by ACQUIRE and RELEASE of BIND.

  RELEASE(DEALLOCATE) is strongly recommended for thread-reuse transactions to reduce transaction CPU time.

When thread reuse is implemented, monitor the EDM pool. It should be sufficient in size to accommodate expanding plans where the next transaction requires additional plan sections over those that are already part of the plan.

**Field Name:** Q3STCTHD

This is an *exception* field.

**TOTAL COMMITS**

The total number of commits during the interval covered by the report or trace. This includes commit, read-only commit, sync, and rollback events.

DBATIs executed on this location are not included in reports generated with the SCOUP(GROUP) subcommand option.

**Field Name:** SDCOMMIT

This is an *exception* field.

**DATA SHARING MEMBER**
In group-scope reports, this field shows the name of the member for which statistics is presented, and, on the group total page, the number of DB2 subsystems in the reported data sharing group. In member-scope reports, this field shows N/A.

**Field Name:** QWHAMEMN

This is an exception field.

**INCREMENTAL BINDS**

The number of incremental binds (excluding prepare). It is incremented by:

- SQL statements with BIND VALIDATE(RUN) that fail at bind time and are bound again at execution time
- Static DDL statements (such as CREATE TABLE, DROP TABLE, LOCK TABLE) that use DB2 private protocol

**Background and Tuning Information**

If a plan is bound with VALIDATE(RUN), DB2 performs validity checks at bind time and rechecks any failures at run time. This can result in catalog contention and degraded application performance, depending on the number of statements flagged and how many times they are executed. Avoid VALIDATE(RUN) if possible. Ensure that all objects are created and all privileges are granted before bind, and select the VALIDATE(BIND) option.

**Field Name:** QXINCRB

This is an exception field.

**DBAT QUEUED**

The number of times a DBAT or connection was queued because it reached the ZPARM maximum for active remote threads (MAXDBAT).

**Field Name:** QDSTQDBT

This is an exception field.

**AUTH SUCC.W/OUT CATALOG**

The number of successful authorization checks that do not use the DB2 catalog (including plan cache checks and public checks).

**Background and Tuning Information**

For transaction level security, ENABLE and DISABLE on BIND PACKAGE should be used to ensure adequate security. Granting execute authority on the plan to public should be adequate.

**Field Name:** QTAUCCH

**DB2 Command**

The total number of DB2 commands that were issued.

**Field Name:** SDSTTTOTL

**BUFUPDT/PAGES WRITTEN**

The number of buffer updates per page written from the buffer pool to DASD.

The ratio of BUFFER UPDATES (QBSTSWS) to PAGES WRITTEN (QBSTPWS) suggests a high level of efficiency as the ratio increases, because more updates are being externalized per physical write. For
example, if there are 10 updates on the same page before it is externalized, then the ratio is 10:1 or 10. If all 10 updates are on 10 distinct pages, then the ratio is 10:10 or 1.

**Background and Tuning Information**

Buffer updates per page written depends strongly on the type of application. For example, a batch program that processes a table in skip sequential mode with a high row update frequency in a dedicated environment can achieve very good update efficiency. In contrast, update efficiency tends to be lower for transaction processing applications, because transaction processing tends to be random.

The following factors can influence the number of updates per page:

**Number of rows per page**

A small PCTFREE value will gather more rows on the same page. However, at the same time this can have impact on concurrency.

**Buffer pool size and deferred write thresholds**

Increase DWQT and VDWQT or the size of the buffer pool. This would tell DB2 to let page updates accumulate in the buffer pool. This means, the probability that more updates per page get captured increases. This effect is less significant if the buffer pool is concurrently used by multiple transactions, it depends on the type of transaction.

**Field Name:** SBRBUPW

**TOTAL API**

The total number of calls made to IFI.

**Field Name:** SDIFITTOT

**PAGES WRITTEN/WRITE I/O**

The number of pages written from the buffer pool to DASD per synchronous or asynchronous write I/O. This count does not include preformatting I/O, such as I/O needed to prepare a data set for use.

**Background and Tuning Information**

The following factors impact the ratio of pages written per write I/O:

**Checkpoint frequency**

At checkpoint time, I/Os are scheduled to write all updated pages on the deferred write queue to DASD. If this occurs too frequently, the deferred write queue does not grow large enough to achieve a high ratio of pages written per write I/O.

The checkpoint frequency depends on the number of logs written between two consecutive checkpoints. This number is set at installation time; see the field CHECKPOINT FREQ of installation panel DSNTIPN.

**Frequency of active log switch**

DB2 takes a system checkpoint each time the active log is switched. High frequency of active log switches causes the problem described under checkpoint frequency.

**Buffer pool size and deferred write thresholds**

The deferred write thresholds (VDWQT and DWQT) are a function of buffer pool size. If the buffer pool size is decreased, these
thresholds are reached more frequently, causing I/Os to be scheduled more often to write some of the pages on the deferred write queue to DASD. This prevents the deferred write queue from growing large enough to achieve a high ratio of pages written per write I/O.

**Number of data sets, and the spread of updated pages across them**

The efficiency of write I/O also depends on the number of data sets associated with the buffer pool and spread of updated pages across them. Because of the nature of batch processing, the ratio of pages written to write I/Os can be expected to be higher than that expected for transaction type workloads.

To determine update efficiency check also the ratio Buffer Updates / Pages Written (SBRBUPW).

**Field Name:** SBRPWWIO

**MEMBER**

In group-scope reports, this field shows the name of the member for which statistics is presented, and, on the group total page, the number of DB2 subsystems in the reported data sharing group. In member-scope reports, this field shows N/A.

**Field Name:** QWHAMEMN

**IFC Destinations:**

This topic shows detailed information about “Statistics - IFC Destinations”.

**Statistics - IFC Destinations**

The total number of OP4 records not written. This field should be 0. Otherwise, records may have been lost.

Field Name: SDIOP4NW

OP5 - NOT WRITTEN

The total number of OP5 records not written. This field should be 0. Otherwise, records may have been lost.

Field Name: SDIOP5NW

OP6 - NOT WRITTEN

The total number of OP6 records not written. This field should be 0. Otherwise, records may have been lost.

Field Name: SDIOP6NW

OP7 - NOT WRITTEN

The total number of OP7 records not written. This field should be 0. Otherwise, records may have been lost.

Field Name: SDIOP7NW

OP8 - NOT WRITTEN

The total number of OP8 records not written. This field should be 0. Otherwise, records may have been lost.

Field Name: SDIOP8NW

TOTAL NOT WRITTEN

The total number of IFC records not written.

Field Name: SDTOTNW

SMF - BUF.OVER

The total number of SMF buffer overruns. Ideally, this field should be 0 or very small.

Field Name: SDISMFBF

SMF - NOT ACCP

The total number of SMF records not accepted. Ideally, this field should be 0 or very small.
Field Name: SDISMFRA

GTF - NOT ACCP

The total number of GTF records not accepted. Ideally, this field should be 0 or very small.

Field Name: SDIGTFRA

OP1 - NOT ACCP

The total number of OP1 records not accepted. Ideally, this field should be 0 or very small.

Field Name: SDIOP1RA

OP2 - NOT ACCP

The total number of OP2 records not accepted. Ideally, this field should be 0 or very small.

Field Name: SDIOP2RA

OP3 - NOT ACCP

The total number of OP3 records not accepted. Ideally, this field should be 0 or very small.

Field Name: SDIOP3RA

OP4 - NOT ACCP

The total number of OP4 records not accepted. Ideally, this field should be 0 or very small.

Field Name: SDIOP4RA

OP5 - NOT ACCP

The total number of OP5 records not accepted. Ideally, this field should be 0 or very small.

Field Name: SDIOP5RA

OP6 - NOT ACCP

The total number of OP6 records not accepted. Ideally, this field should be 0 or very small.

Field Name: SDIOP6RA

OP7 - NOT ACCP

The total number of OP7 records not accepted. Ideally, this field should be 0 or very small.

Field Name: SDIOP7RA

OP8 - NOT ACCP

The total number of OP8 records not accepted. Ideally, this field should be 0 or very small.

Field Name: SDIOP8RA

TOTAL NOT ACCP

The total number of IFC records not accepted.

Field Name: SDTOTNA
IFC Destinations

SMF - WRT.FAIL

The total number of SMF write failures. Ideally, this field should be 0 or very small.

Field Name: SDISMFWF

GTF - WRT.FAIL

The total number of GTF write failures. Ideally, this field should be 0 or very small.

Field Name: SDIGTFWF

TOTAL WRT.FAIL

The total number of IFC write failures.

Field Name: SDTOTWF

IFC Record Counts:

This topic shows detailed information about “Statistics - IFC Record Counts”.

Statistics - IFC Record Counts

The field labels shown in the following sample layout of “Statistics - IFC Record Counts” are described in the following section.

<table>
<thead>

SYSTEM RELATED (WRITTEN)

The number of system-related records written.

Field Name: SDISRRW

DATABASE RELATED (WRITTEN)

The number of database-related records written.

Field Name: SDIDRRW

ACCOUNTING (WRITTEN)

The number of accounting records written.

Field Name: SDIACTW

START TRACE (WRITTEN)

The number of start trace records written.

Field Name: SDISTRW

STOP TRACE (WRITTEN)

The number of stop trace records written.
Field Name: SDISTPW
SYSTEM PARAMETERS (WRITTEN)
The number of DB2 system parameter records written.

Field Name: SDIZPMW
SYS.PARMS-BPOOLS (WRITTEN)
The number of DB2 system parameter buffer pool records written.

Field Name: SDBSCRSW
AUDIT (WRITTEN)
The number of DB2 audit records written.

Field Name: SDIAUDW
TOTAL (WRITTEN)
The total number of records that were successfully written.

Field Name: SDTSCRSW
SYSTEM RELATED (NOT WRTN)
The number of system-related records not written. Ideally, this field should be 0 or very small.

Field Name: SDISRRN
DATABASE RELATED (NOT WRTN)
The number of database-related records not written. Ideally, this field should be 0 or very small.

Field Name: SDIDRRN
ACCOUNTING (NOT WRTN)
The number of accounting records not written. Ideally, this field should be 0 or very small.

Field Name: SDIACTN
START TRACE (NOT WRTN)
The number of start trace records not written. Ideally, this field should be 0 or very small.

Field Name: SDISTRN
STOP TRACE (NOT WRTN)
The number of stop trace records not written. Ideally, this field should be 0 or very small.

Field Name: SDISTPN
SYSTEM PARAMETERS (NOT WRTN)
The number of DB2 system parameter records not written. Ideally, this field should be 0 or very small.

Field Name: SDIZPMN
SYS.PARMS-BPOOLS (NOT WRTN)
The number of DB2 system parameter buffer pool records not written. Ideally, this field should be 0 or very small.
IFC Record Counts

Field Name: SDBSCRNW

AUDIT (NOT WRITN)
The number of DB2 audit records that were not written.

Field Name: SDIAUDN

TOTAL (NOT WRITN)
The total number of records that were not written.

Field Name: SDTSCRNW

IRLM Storage Below and Above 2 GB (DB2 11):

This topic shows detailed information about “Statistics - IRLM Storage Below and Above 2 GB (DB2 11)”.

Statistics - IRLM Storage Below and Above 2 GB (DB2 11)
The field labels shown in the following sample layout of “Statistics - IRLM Storage Below and Above 2 GB (DB2 11)” are described in the following section.

IRLM STORAGE BELOW AND ABOVE 2 GB

<table>
<thead>
<tr>
<th>Field Name</th>

HWM 64 BIT COMMON IN USE (MB)

The high-water mark of 64-bit common storage allocated by IRLM pools (DB2 field: QW0225I_ABCSH).

Field Name: S225IACH

Latch Counters:

This topic shows detailed information about “Statistics - Latch Counters”.

The QVLS latch counters represent the number of suspends that were performed by agents that attempted to obtain a latch.

There is not a one-to-one relationship between the QVLS counters and IFCID 56 or 57, because an agent might suspend multiple times or not at all, while trying to obtain a latch. That is why the QVLS counters are not directly related to Accounting Class 3.

Statistics - Latch Counters

The field labels shown in the following sample layout of “Statistics - Latch Counters” are described in the following section.

### LC01

This field is infrequently used.

**Field Name:** QVLSLC01

### LC02

The predominant latch usage is: Global authorization cache.

**Field Name:** QVLSLC02

### LC03

The predominant latch usage is: DDF disconnect.

**Field Name:** QVLSLC03

### LC04

The predominant latch usage is: SYSSTRING cache.

**Field Name:** QVLSLC04

### LC05

The predominant latch usage is: IRLM data sharing exits or RLF.

**Field Name:** QVLSLC05

### LC06

The predominant latch usage is: Data sharing index split.

**Field Name:** QVLSLC06

### LC07

The predominant latch usage is: Index lotch and OBD allocation.

**Field Name:** QVLSLC07

### LC08

The predominant latch usage is: Query parallelism.

**Field Name:** QVLSLC08

### LC09

The predominant latch usage is: Utilities or stored procedure URIDs.

**Field Name:** QVLSLC09

### LC10

The predominant latch usage is for Sequence objects (stand-alone and table-based Identity Column). DB2 12 latch contention can be significantly reduced for the Identity Column in a data-sharing environment because of the reduction in log force write.

**Field Name:** QVLSLC10

### LC11
Latch Counters

The predominant latch usage is for Sequence objects (stand-alone and table-based Identity Column) for concurrent transactions. DB2 12 latch contention can be significantly reduced for the Identity Column in a data-sharing environment because of the reduction in log force write.

Field Name: QVLSLC11

LC12

The predominant latch usage is database allocation control latch (latch class X'0C') or WebSphere global transaction ID latch (latch class X'4C').

Field Name: QVLSLC12

LC13

The predominant latch usage is: Pageset operations.

Field Name: QVLSLC13

LC14

The predominant latch usage is represented by various buffer pool related activities, including buffer pool control block and pool serialization.

Field Name: QVLSLC14

LC15

The predominant latch usage is: ARCHIVE LOG MODE(QUIESCE).

Field Name: QVLSLC15

LC16

The predominant latch usage is: UR synonym chain.

Field Name: QVLSLC16

LC17

The predominant latch usage is: RURE chain.

Field Name: QVLSLC17

LC18

The predominant latch usage is: DDF resynch list.

Field Name: QVLSLC18

LC19

The predominant latch usage is logical log write (in contrast to physical log write).

Field Name: QVLSLC19

LC20

The predominant latch usage is: System checkpoint.

Field Name: QVLSLC20

LC21

The predominant latch usage is: Accounting rollup.

Field Name: QVLSLC21

LC22
**Latch Counters**

The predominant latch usage is: Internal checkpoint.  
**Field Name:** QVLSLC22

</tbody>
</table>

**SUSPENSIONS (ALL)**

The total number of suspensions.

Field Name: SLRSUSP

**SUSPENSIONS (LOCK ONLY)**

The number of times a lock could not be obtained and the unit of work was suspended.

Background and Tuning Information

This number should be low, ideally 0.

The number of lock suspensions is a function of the lock requests. Lock suspensions (or conflicts) can happen on either LOCK REQUEST or CHANGE REQUEST.

Suspensions are highly dependent on the application and table space locking protocols.

Field Name: QTXASLOC

This is an exception field.

**SUSPENSIONS (IRLM LATCH)**

The number of latch suspensions.

Field Name: QTXASLAT

This is an exception field.
Locking Activity

SUSPENSIONS (OTHER)

The number of suspensions caused by something other than lock or latch.

**Field Name:** QTXASOTH

This is an *exception* field.

TIMEOUTS

The number of times a unit of work was suspended for a time exceeding the timeout value. This number should be low, ideally 0.

**Field Name:** QTXATIM

This is an *exception* field.

DEADLOCKS

The number of times deadlocks were detected. This number should be low, ideally 0.

**Background and Tuning Information**

Deadlocks occur when two or more application processes each hold locks on resources that the others need, without which they cannot proceed. Ensure that all applications accessing the same tables access them in the same order.

To improve concurrency:
- Use row level locking instead of page level locking to minimize deadlocks.
- For small tables use page level locking with MAXROWS 1.

To minimize deadlocks:
- Delay updates to just before commit.
- Use SELECT with the FOR UPDATE clause to use U lock.
- Adjust the deadlock detection cycle parameter DEADLOK in the IRLM procedure.

This field is incremented once for each deadlock encountered. There is no correlation between this field and the deadlock events reported in the Locking report set or the number of IFCID 172 records written. This field reports all deadlocks, regardless of how they were resolved. The locking report and record trace IFCID 172 show only those deadlocks that were resolved by DB2.

**Field Name:** QTXADEA

This is an *exception* field.

LOCK REQUESTS

The number of requests to lock a resource.

**Field Name:** QTXALOCK

This is an *exception* field.

UNLOCK REQUESTS

The number of requests to unlock a resource.

This value can be less than the number of lock requests because DB2 can release several locks with a single unlock request.

**Field Name:** QTXAUNLK
QUERY REQUESTS

The number of query requests.

Field Name: QTXAQR

CHANGE REQUESTS

The number of change requests.

Field Name: QTXACHG

OTHER REQUESTS

The number of requests to IRLM to perform a function other than LOCK, UNLOCK, QUERY, or CHANGE.

Field Name: QTXAIRLM

LOCK ESCALATION (SHARED)

The number of times the maximum page locks per table space are exceeded, and the table space lock escalates from a page lock (IS) to a table space lock (S) for this thread. You can specify the number of locks allowed per table space with the LOCKS PER TABLE(SPACE) parameter on the DB2 install panel DSNTIPJ.

Background and Tuning Information

Escalations can cause unpredictable response times. Lock escalations should only happen when an application process updates or references (if repeatable read is used) more pages than normal.

Field Name: QTXALES

This is an exception field.

LOCK ESCALATION (EXCLUSIVE)

The number of times the maximum page locks per table space are exceeded and the table space lock escalates from a page lock (IX) to a table space lock (X).

Background and Tuning Information

Escalations can cause unpredictable response times. Lock escalations should only happen when an application process updates or references (if repeatable read is used) more pages than it normally does.

A useful rule of thumb is to compare the number of escalations (shared and exclusive) to the successful escalations (those that did not cause deadlocks and timeouts). If this value, or the number Lock escalations - shared and if the number of timeouts or deadlocks is also not 0, the timeout or deadlock is probably caused by the escalation.

If many escalations cause deadlocks and timeouts, the recommendation is to change the escalation threshold value. Use of ANY is extremely useful to prevent unnecessary and expensive page locks, for example locking all pages in a table space.

Lock escalations, shared or exclusive, should not be expected in a transaction environment.

Field Name: QTXALEX

This is an exception field.

DRAIN REQUESTS
The number of drain requests.

**Field Name:** QTXADRNO

This is an *exception* field.

**DRAIN REQUESTS FAILED**

The number of unsuccessful drain requests.

**Field Name:** QTXADRUN

This is an *exception* field.

**CLAIM REQUESTS**

The number of claim requests.

**Field Name:** QTXACLNO

This is an *exception* field.

**CLAIM REQUESTS FAILED**

The number of unsuccessful claim requests.

**Field Name:** QTXACLUN

This is an *exception* field.

**Log Activity:**

This topic shows detailed information about “Statistics - Log Activity”.

**READS SATISIFIED-OUTPUT BUFF**

The number of log reads satisfied from the output buffer.
Background and Tuning Information

This field, together with the reads satisfied from active log and reads satisfied from archive log (QJSTRACT and QJSTRARH) fields indicate how efficiently DB2 retrieves log records. Use these numbers to adjust the number of output buffers and the total active log capacity to maximize DB2 performance.

Field Name: QJSTRBUF
This is an exception field.

READS SATISFIED-OUTP.BUF(%)  
The percentage of log reads that were satisfied in the output log buffer.

Field Name: SARLBUF

READS SATISFIED-ACTIVE LOG
The number of log reads satisfied from the active log data set.

Background and Tuning Information

This field, together with the reads satisfied from archive log and reads satisfied from output buffer fields, indicate how efficiently DB2 retrieves log records. Use these numbers to adjust the number of output buffers and the total active log capacity to maximize DB2 performance. Ideally, this value should be 0 or very small.

Field Name: QJSTRACT
This is an exception field.

READS SATISFIED-ACTV.LOG(%)  
The percentage of log reads satisfied from the active log.

Field Name: SARLACT
This is an exception field.

READS SATISFIED-ARCHIVE LOG
The number of log reads satisfied from the archive log data set.

Background and Tuning Information

This field, together with the reads satisfied from active log and reads satisfied from output buffer fields indicate how efficiently DB2 retrieves log records. Use these numbers to adjust the number of output buffers and the total active log capacity to maximize DB2 performance. Ideally, this value should be 0 or very small.

Field Name: QJSTRARH
This is an exception field.

READS SATISFIED-ARCH.LOG(%)  
The percentage of log reads that were satisfied from the archive log data set.

Field Name: SARLRARC
This is an exception field.

TAPE VOLUME CONTENTION WAIT
Log Activity

The number of read accesses that were delayed because of a tape volume contention when only one reader per tape is possible.

Background and Tuning Information
This field shows the number of agents forced to wait because a tape volume was already in use by another. If this number is not 0, increase the read tape units on the archive log data set parameters panel DSNTIPA.

Field Name: QJSTTVC
This is an exception field.

READ DELAYED-UNAVAIL.RESOUR
The number of read accesses delayed due to unavailable resources.

Background and Tuning Information
Generally, this can be due to insufficient tape units allocated. If this is so, reissue the SET ARCHIVE command and use a higher value for the count parameter. Another (although unlikely) cause is insufficient archive log read service task availability.

Field Name: QJSTWUR
This is an exception field.

ARCHIVE LOG READ ALLOCATION
The number of archive log read allocations.

It indicates the frequency of archive log open and close activity.

Background and Tuning Information
A high number indicates a need for more or larger active log data sets. This value should be small, ideally 0.

Field Name: QJSTALR
This is an exception field.

ARCHIVE LOG WRITE ALLOCATION
The number of archive log write allocations.

It indicates the frequency of archive log open and close activity.

Background and Tuning Information
A high number indicates a need for more or larger active log data sets. This value should be small, ideally 0.

Field Name: QJSTALW

CONTR.INTERV.OFFLOADED-ARCH
The number of control intervals (CIs) offloaded from the active log to the archive log.

Field Name: QJSTCIOF

LOOK-AHEAD MOUNT ATTEMPTED
The number of look ahead (tape volume) mounts attempted.

Background and Tuning Information
This field and field QJSTLAMS (label LOOK-AHEAD MOUNT SUCCESSFUL) show the efficiency of look ahead for tape mounts.
Field Name: QJSTLAMA

LOOK-AHEAD MOUNT SUCCESSFUL
The number of successful look-ahead (tape volume) mounts. It indicates the look-ahead mounting performance gains.

Background and Tuning Information
For maximum performance, this field and field QJSTLAMA (label LOOK-AHEAD MOUNT ATTEMPTED) should be equal. To find the number of failed attempts, subtract the value in this field from LOOK-AHEAD MOUNT ATTEMPTED. Too many failed attempts negate potential performance gains. This can be caused by not having enough tape units available. Issue the DISPLAY ARCHIVE command and note the current count value. Then issue the SET ARCHIVE command using a higher value for the count parameter.

Field Name: QJSTLAMS

UNAVAILABLE OUTPUT LOG BUFF
The number of waits caused by an unavailable output log buffer.
When DB2 wants to write a log record and the log buffer is not available, DB2 and the application must wait for an available log buffer.

Background and Tuning Information
Another possible cause is that the size of the write threshold might be too close to the size of the output buffer.
If this field is not 0, increase the number in the output buffer field on installation panel DSNTIPL to increase the number of output buffers or increase the size of the buffer.

Field Name: QJSTWTB
This is an exception field.

OUTPUT LOG BUFFER PAGED IN
The number of times an output log buffer had to be paged in before it could be initialized. The log-write latch is held at this point.

Background and Tuning Information
A nonzero value could indicate that the output log buffer size is too large, or there is insufficient real storage to back up the output log buffer size.

Field Name: QJSTBPAG

LOG RECORDS CREATED
The number of log write requests.
The log record is written asynchronously to the log buffer. The application does not wait for the record to be written to the log data set and regains control immediately.
Buffered log records are written to DASD when the buffer threshold is exceeded.

Field Name: QJSTWRNW

LOG CI CREATED
The number of active log output control intervals created.
Log Activity

Background and Tuning Information

Log records are placed sequentially in output log buffers, which are formatted as VSAM control intervals. The control intervals are written to a set of predefined DASD active log data sets, which are used sequentially and recycled.

The ratio of this field to write output log buffers should be low.

Rules of thumb:

The lower the value, the better. A high value indicates that too many I/Os are required for the number of log buffers created.

It is possible that WRTTHRSH is set too low. It is also possible that transactions could be arriving so infrequently that at commit time force requests are not queued and each force request is individually triggering an I/O of its log buffers.

Field Name: QJSTBFFL

LOG WRITE I/O REQ (LOG1&2)

The total number of log-write I/O requests (such as media manager calls). This is the sum of the IFCID 038/039 pairs and includes both copy1 and copy2 active log data set writes.

Background and Tuning Information

This value should correspond to the active log write I/O activity in an RMF report.

Field Name: QJSTLOGW

LOG CI WRITTEN (LOG1&2)

The total number of log control intervals (CIs) written. This includes CI rewrites and both copy1 and copy2 active log data set writes. If a given CI is rewritten 5 times, this counter is incremented by 5.

Field Name: QJSTCIWR

LOG RATE FOR 1 LOG (MB)

The log rate for the active log data sets in MB per second. This figure is valid for dual logging, if single logging is used, multiply the value shown by 2.

Background and Tuning Information

To calculate this rate (mega bytes/second) at which data is written to the active log data set, multiply the value of field QJSTCIWR (label LOG CI WRITTEN (LOG1&2)) by 4096 and divide it by 1024 * 1024 * statistics-interval-seconds * 2. When the value exceeds 10MB/sec per log copy, you should examine I/O tuning of log data sets (for example, using faster log devices and/or I/O striping, using variable-length or compressed log record layouts to reduce log data size).

Field Name: SJSTCIWR

Miscellaneous statistics report:

This topic shows detailed information about “Statistics - Miscellaneous”.

4440  IBM Db2 Performance Expert on z/OS
Statistics - Miscellaneous

The field labels shown in the following sample layout of “Statistics - Miscellaneous” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Value</th>

</tbody>
</table>

**HIGH LOG RBA**

The high-used RBA address of the log (DB2 field prior to DB2 11: QWSDLR).

*Field Name: QWSDLRG*

**BYPASS COL**

The total number of columns (rows x columns) for which an invalid select procedure was encountered.

DB2 bypasses invalid select procedures which can cause some degradation in performance.

*Field Name: QISTCOLS*

**MAX SQL CASCAD LEVEL**

The maximum level of indirect SQL cascading. This includes cascading because of triggers, UDFs, or stored procedures.

*Field Name: QXCASCDP*

This is an exception field.

**MAX STOR LOB VALUES (MB)**

Maximum storage used for LOB values.

*Field Name: QXSTLOBV*

This is an exception field.

**MAX STOR XML VALUES (MB)**

Maximum storage used for XML values.

*Field Name: QXSTXMLV*

**ARRAY EXPANSIONS**

The number of times an array variable is expanded beyond 32 KB.

*Field Name: QXSTARRAY_EXPANSIONS*

**SPARSE IX DISABLED**

The number of times that sparse index was disabled because of insufficient storage.

*Field Name: QXSISTOR*
SPARSE IX BUILT WF

The number of times that sparse-index built a physical work file for probing.

Field Name: QXSIWF

NO DM CALL RIDL/LPF

The number of times that RDS did not call data manager for RID list retrieval for multiple index access or list prefetch because runtime adaptive index processing was able to determine the outcome.

Field Name: QXRSDMAD

FETCH 1 BLOCK ONLY

The number of times that RDS fetched one block and made no subsequent requests for additional blocks.

Field Name: QXR1BOAD

MVS LPAR Shared Storage Above 2 GB:

This topic shows detailed information about “Statistics - MVS LPAR Shared Storage Above 2 GB”.

Statistics - MVS LPAR Shared Storage Above 2 GB

The field labels shown in the following sample layout of “Statistics - MVS LPAR Shared Storage Above 2 GB” are described in the following section.

<table>
<thead>
<tr>
<th>MVS LPAR SHARED STORAGE ABOVE 2 GB</th>
<th>QUANTITY</th>
</tr>

</tbody>
</table>

SHARED MEMORY OBJECTS

The number of shared memory objects allocated for this MVS LPAR (DB2 field: QW0225SHRMOMB).

Field Name: SW225SMO

64 BIT SHARED STORAGE (MB)

The amount of 64-bit shared storage allocated for this MVS LPAR (including hidden pages).

Field Name: S225SPG

HWM FOR 64 BIT SHARED STORAGE (MB)

High water mark of 64-bit shared storage allocated for this MVS LPAR (DB2 field: QW0225SHRGBYTES).

Field Name: SW225SGB

64 BIT SHARED STORAGE BACKED IN REAL (MB)

The amount of 64-bit shared storage backed in real storage for this MVS LPAR.

Field Name: S225SRL
AUX STORAGE USED FOR 64 BIT SHARED (MB)

The amount of auxiliary storage used for 64-bit shared storage for this MVS LPAR (including reserved auxiliary slots for pages that arepaged in).

Field Name: S225SAX

64 BIT SHARED STORAGE PAGED IN FROM AUX (MB)

The amount of 64-bit shared storage paged in from auxiliary storage for this MVS LPAR.

Field Name: S225SPI

64 BIT SHARED STORAGE PAGED OUT TO AUX (MB)

The amount of 64-bit shared storage paged out to auxiliary storage for this MVS LPAR.

Field Name: S225SPO

Open/Close Activity:

This topic shows detailed information about “Statistics - Open/Close Activity”.

Statistics - Open/Close Activity

The field labels shown in the following sample layout of “Statistics - Open/Close Activity” are described in the following section.

<table>
<thead>
<tr>
<th>OPEN/CLOSE ACTIVITY</th>

</tbody>
</table>

OPEN DATASETS - HWM

The maximum number of data sets concurrently open since the last time DB2 was started. This is a high-water mark (HWM).

Background and Tuning Information

Monitor this field to see whether you are reaching the maximum number of open data sets permissible.

Note: The maximum number of open data sets is 200,000. The default is 20,000.

Field Name: QTMAXDS

This is an exception field.

OPEN DATASETS

The number of data sets concurrently open (snapshot).

Field Name: QTDSOPN

DS NOT IN USE, NOT CLOSE-HWM
Open/Close Activity

The maximum number of data sets on the deferred close queue. It is a high-water mark representing the maximum number of data sets that are not in use but have not been physically closed yet.

Field Name: QTMAXPB
This is an exception field.

DS NOT IN USE, NOT CLOSED
The number of data sets that are not currently used, but are not closed due to a deferred close (snapshot).

Field Name: QTSLLWDDD
This is an exception field.

IN USE DATA SETS
The number of data sets currently in use (snapshot).

Field Name: SDINUSEC
This is an exception field.

DSETS CLOSED-THRESH. REACHED
The number of data sets that were closed because the total number of open data sets reached the deferred close threshold value. The deferred close value is based on the value of DSMAX or the MVS DD limit (whichever is smaller).

Field Name: QTDSDRN
This is an exception field.

DSETS CONVERTED R/W -> R/O
The number of infrequently updated data sets that are converted from R/W to R/O state. An updated data set is considered infrequently updated when it has not been updated for either 5 consecutive DB2 checkpoints or 60 minutes. For tablespace data sets, the switching from R/W to R/O state means the SYSLGRNG entry is closed.

Field Name: QTPCCT
This is an exception field.

Plan/Package Activity:
This topic shows detailed information about “Statistics - Plan/Package Activity”.

Statistics - Plan/Package Activity
The field labels shown in the following sample layout of “Statistics - Plan/Package Activity” are described in the following section.

</tbody>
</table>

INCREMENTAL BINDS

The number of incremental binds (excluding prepare). It is incremented by:

- SQL statements with BIND VALIDATE(RUN) that fail at bind time and are bound again at execution time
- Static DDL statements (such as CREATE TABLE, DROP TABLE, LOCK TABLE) that use DB2 private protocol

Background and Tuning Information

If a plan is bound with VALIDATE(RUN), DB2 performs validity checks at bind time and rechecks any failures at run time. This can result in catalog contention and degraded application performance, depending on the number of statements flagged and how many times they are executed. Avoid VALIDATE(RUN) if possible. Ensure that all objects are created and all privileges are granted before bind, and select the VALIDATE(BIND) option.

Field Name: QXINCRB

This is an exception field.

PLAN ALLOCATION ATTEMPTS

The number of times a request was made to allocate a bound plan for an agent.

It represents the number of times DB2 was requested to create a thread by the attachment facility for the user. This does not include allocations for DB2 system agents.

Field Name: QTALLOCA

This is an exception field.

PLAN ALLOCATION SUCCESSFUL

The number of successful plan allocation attempts.

The cause of plan allocation failure could be plan unavailability or attempting to allocate a nonexistent plan.
Plan/Package Activity

Field Name: QTALLOC

PACKAGE ALLOCATION ATTEMPT
The number of attempts to allocate a package.

Field Name: QTPKALL

PACKAGE ALLOCATION SUCCESS
The number of successful package allocation attempts.

Background and Tuning Information
Package allocation failure can occur when a package is unavailable or does not exist.

A high count of the number of packages unsuccessfully allocated (QTPKALLA - QTPKALL) typically occurs when a package list with multiple collections is used and frequently-located packages are found in the back end rather than in the front end of a package list. For example, when a package is found in the tenth collection, QTPKALLA is incremented by 10, one for each collection searched, but QTPKALL is incremented by 1.

A high number of packages unsuccessfully allocated can be accompanied by a high count of the number of unsuccessful checks for package execute authority made using the package authorization check because an application entry was not found in the cache (QTPACNOT). In this case, placing frequently used packages in the front end of a package list would reduce the number of Buffer Manager Getpages to the catalog/directory tablespaces.

Field Name: QTPKALL

PLANS BOUND
The number of plans successfully bound and kept for future agent allocations.

This field represents the sum of successful BIND ADD (QTBINDA) and successful BIND REPLACE (QTBINDR) commands. This counter is not incremented for BIND subcommands with no plan ID specified, as identified by QTTESTB. Note that QTBINDA + QTBINDR is not necessarily equal to this field. It is equal only if all BIND ADD and BIND REPLACE subcommands issued are successful.

Field Name: QTPLNBD

BIND ADD SUBCOMMANDS
The number of successful and unsuccessful BIND ADD subcommands issued.

The sum of QTBINDA, QTBINDR, and QTTESTB equals the total number of BIND subcommands.

Field Name: QTBINDA

BIND REPLACE SUBCOMMANDS
The number of successful and unsuccessful BIND REPLACE subcommands issued.

Field Name: QTBINDR

TEST BINDS NO PLAN-ID
The number of BIND subcommands issued without a plan ID.

**Field Name:** QTTTESTB

### PACKAGES BOUND

The number of packages bound and kept for future package allocations. It is the sum of successful BIND ADD PACKAGE and BIND REPLACE PACKAGE subcommands, but only if all these commands are really issued successfully.

**Field Name:** QTPKGBD

### BIND ADD PACKAGE SUBCOMMAND

The number of successful and unsuccessful BIND ADD PACKAGE subcommands issued.

**Field Name:** QTBINDPA

### BIND REPLACE PACKAGE SUBCOMMAND

The number of successful and unsuccessful BIND REPLACE PACKAGE subcommands issued.

**Field Name:** QTBINDPR

### AUTOMATIC BIND ATTEMPTS

The number of attempts to autobind a plan. This occurs when the plan was invalidated by modifications to the declarations of the data referenced by the programs bound as part of the plan. For example, dropping an index when it is used in the plan results in automatic bind.

**Field Name:** QTABINDA

### AUTOMATIC BINDS SUCCESSFUL

The number of plans successfully autobound.

**Field Name:** QTABIND

### AUTO.BIND INVALID RES. IDS

The number of requests to allocate a nonexistent plan or package. This is the number of all plan and package allocation attempts that failed because the resource was unavailable or the object did not exist.

**Field Name:** QTINVRID

### AUTO.BIND PACKAGE ATTEMPTS

The number of attempts to autobind a package.

**Background and Tuning Information**

If YES was specified, or defaulted, for autobind on DB2 install panel DSNTIPB, an autobind occurs when a plan or package:

- Is invalid because declarations of the data referenced by the program or package were modified. For example, when an index used in a package is dropped, an automatic bind occurs when the package is run for the first time after the index was dropped.
- Was bound in a later release and is used in a previous release for the first time.
- Was used in a previous release but is later remigrated and used in a later release for the first time.
Plan/Packet Activity

Field Name: QTAUTOBA
This is an exception field.

AUTO.BIND PACKAGES SUCCESS
The number of packages successfully autobound.
Field Name: QTPKABND
This is an exception field.

REBIND SUBCOMMANDS
The number of REBIND subcommands issued. More than one plan can be rebound with a single REBIND subcommand. If the value in this field is 1, the number of plans you are attempting to rebind is shown in the Rebind - plan attempts field.
Field Name: QTREBIND

ATTEMPTS TO REBIND A PLAN
The number of attempts to rebind a plan. This number can be larger than the value shown in the Rebind - plan subcommands field because you can specify more than one plan in a single REBIND subcommand.
Field Name: QTRBINDA

PLANS REBOUND
The number of rebind attempts that completed successfully. This field is equal to the Rebind - Plan attempts field if all specified plans rebound successfully.
Field Name: QTPLNRBD

REBIND PACKAGE SUBCOMMANDS
The number of REBIND PACKAGE subcommands issued. More than one package can be rebound with a single subcommand. If the value in this field is 1, Rebind - package attempts shows the number of packages you are attempting to rebind.
Field Name: QTRBINDP

ATTEMPTS TO REBIND PACKAGE
The number of attempts to rebind a package. This can be larger than the value shown in Rebind package subcommands because you can rebind more than one package with a single command.
Field Name: QTRBNDPA

PACKAGES REBOUND
The number of packages successfully rebound. If all specified packages were rebound successfully, this field is equal to Rebind package attempts.
Field Name: QTPKGRBD

FREE PLAN SUBCOMMANDS
The number of FREE subcommands issued.
More than one plan can be freed with a single FREE subcommand. If this field is 1, then the number of plans you are trying to free is shown in ATTEMPTS TO FREE A PLAN.
Field Name: QTFREE

ATTEMPTS TO FREE A PLAN

The number of attempts to free a plan.

This value can be larger than FREE PLAN SUBCOMMANDS because multiple plan IDs can be specified in a single FREE subcommand.

Field Name: QTFREEA

PLANS FREED

The number of times a plan was successfully freed.

Freeing a plan can fail if someone else is using the plan and holds a lock on it.

Field Name: QTPLNFRD

FREE PACKAGE SUBCOMMANDS

The number of FREE PACKAGE subcommands issued.

More than one package can be freed with a single FREE subcommand. If the value in this field is 1, then the number of packages you are attempting to free is shown in ATTEMPTS TO FREE A PACKAGE.

Field Name: QTFREEP

ATTEMPTS TO FREE A PACKAGE

The number of attempts to free a package. This number can be larger than FREE PACKAGE SUBCOMMANDS because you can free several packages with a single command.

Field Name: QTFREEAP

PACKAGES FREED

The number of times a package was successfully freed. If all the specified packages were freed successfully, the value of this field is equal to ATTEMPTS TO FREE A PACKAGE.

Field Name: QTPKGFRD

Query Parallelism:

This topic shows detailed information about “Statistics - Query Parallelism”.

This block shows information about query parallelism used by DB2 to perform parallel operations in SQL query processing. Dependent on various settings, DB2 may create parallel groups for a query where each parallel group consists of a set of tasks or I/O operations that can be executed in parallel. The degree of parallelism is the number of parallel tasks or I/O operations that DB2 determines. It can be used for the operations on the parallel group.

The DB2 users can limit the maximum number of parallel operations to reduce the resource consumption of a parallelism environment, and even DB2 may decide during execution time to reduce the planned degree of parallelism in order to respond to system limitations.
Statistics - Query Parallelism

The field labels shown in the following sample layout of “Statistics - Query Parallelism” are described in the following section.

<table>
<thead>
<tr>
<th>QUERY PARALLELISM</th>

**MAX DEGREE - ESTIMATED**

The maximum degree of parallelism estimated for a parallel group at bind time based on the cost formula. If the parallel group contains a host variable or parameter marker, then bind time will estimate the parallel group degree based on a valid assumption value.

Field Name: QXMAXESTIDG

**MAX DEGREE - PLANNED**

The maximum degree of parallelism planned for a parallel group. It is the ideal parallel group degree obtained at execution time after the host variable or parameter marker value is “plug-in” and before buffer pool negotiation and system negotiation are performed.

Field Name: QXMAXPLANIDG

**MAX DEGREE - EXECUTED**

The maximum degree of parallelism executed among all parallel groups to indicate the extent to which queries were processed in parallel.

Field Name: QXMAXDEG

**PARALLEL GROUPS EXECUTED**

The total number of parallel groups executed.

Field Name: QXTOTGRP

**RAN AS PLANNED**

The total number of parallel groups that executed in the planned parallel degree. This field is incremented by one for each parallel group that executed in the planned degree of parallelism (as determined by DB2).

Field Name: QXNORGRP

**RAN REDUCED- STORAGE**
The total number of parallel groups that did not reach the planned parallel degree because of a lack of storage space or contention on the buffer pool.

The exception field name is QXREDGRP.

**Background and Tuning Information**

If this field is not 0, increase the size of the current buffer pool using the ALTER BUFFERPOOL command or use the ALTER TABLESPACE command to assign table spaces accessed by this query to a different buffer pool.

**Field Name**: QXREDGRP

This is an *exception* field.

**RAN REDUCED-NEGOTIATION**

The total number of parallel groups that did not reach the planned parallel degree due to system negotiation result of system stress level.

**Field Name**: QXSTOREDGRP

**SEQUENTIAL-CURSOR**

The total number of parallel groups that fell back to sequential mode due to a cursor that can be used by UPDATE or DELETE.

**Field Name**: QXDEGCUR

**SEQUENTIAL-NO ESA**

The total number of parallel groups that fell back to sequential mode due to a lack of ESA sort support.

**Field Name**: QXDEGESA

**SEQUENTIAL-NO BUFFER**

The total number of parallel groups that fell back to sequential mode due to a storage shortage or contention on the buffer pool.

The exception field name is QXDEGBUF.

**Field Name**: QXDEGBUF

**SEQUENTIAL-AUTONOMOUS PROC**

The total number of parallel groups that fell back to sequential mode under an autonomous procedure.

**Field Name**: QXDEGAT

**SEQUENTIAL-NEGOTIATION**

The total number of parallel groups that fell back to sequential mode due to system negotiation result of system stress level.

**Field Name**: QXSTODGNGRP

**ONE DB2 - COORDINATOR = NO**

The total number of parallel groups executed on a single DB2 subsystem due to the COORDINATOR subsystem value being set to NO. When the statement was bound, the COORDINATOR subsystem value was set to YES. This situation can also occur when a package or plan is bound on a DB2 subsystem with COORDINATOR=YES, but is run on a DB2 subsystem with COORDINATOR=NO.
Query Parallelism

Field Name: QXCOORNO

ONE DB2 - ISOLATION LEVEL

The total number of parallel groups executed on a single DB2 subsystem due to repeatable-read or read-stability isolation.

Field Name: QXISORR

ONE DB2 - DCL TTABLE

The number of parallel groups in a query block that were downgraded to CPU parallelism because they referenced a UDF and a declared temporary table was detected at execution time.

DB2 enforces execution on a single DB2 (CPU parallelism), in this instance, because it cannot determine at incremental bind time for the statement whether the UDF will reference the declared temporary table. Other parallel groups in the same statement are not necessarily downgraded.

Field Name: QXDEGDTT

MEMBER SKIPPED (%)

The percentage of parallel groups that were not distributed over the data sharing group because one or more DB2 members did not have enough buffer pool storage. This only applies to parallel groups that were intended to run in sysplex query parallelism.

Background and Tuning Information

This percentage is only recorded when the buffer pool is defined to allow for parallelism. For example, if VPXPSEQT=0 on an assistant, DB2 does not send parallel work there, and the percentage is not increased.

Field Name: SXXCRAT

REFORM PARAL-CONFIG CHANGED

The total number of parallel groups where DB2 reformulated the parallel portion of the access path because of a change in the number of active members, or because of a change of processor models on which they run, from bind time to run time. This counter is incremented only on the parallelism coordinator at run time.

Field Name: QXREPOP1

REFORM PARAL-NO BUFFER

The total number of parallel groups in which DB2 reformulated the parallel portion of the access path because there were insufficient buffer-pool resources. This counter is incremented only at the parallelism coordinator at run time.

Field Name: QXREPOP2

31/64-BIT PRIVATE (DBM1) (MB)

The amount of real storage in use for 31-bit and 64-bit private pools.

Field Name: SW0225RL

31/64-BIT PRIVATE (DIST) (MB)

The amount of real storage in use for 31-bit and 64-bit private pools.

Field Name: SW0225RL

64-BIT SHARED THREAD AND SYSTEM (MB)

The amount of real storage in use for 64-bit shared storage. This does not include shared stack storage. This is recorded at the subsystem level.

Note: This field is available in z/OS 1.10 (and maintenance) or later.

Field Name: S225SSR

64-BIT SHARED STACK (MB)

The amount of real storage in use for 64-bit shared stack storage. This is recorded at the subsystem level.

Note: This field is available in z/OS 1.10 (and maintenance) or later.

Field Name: S225KSR

64-BIT COMMON (MB)

The amount of real storage in use for 64-bit common storage. This is recorded at the subsystem level.

Note: This field is available in z/OS 1.10 (and maintenance) or later.

Field Name: S225CSR

TOTAL REAL STORAGE IN USE (MB)

The total amount of real storage in use.

Field Name: S225RLTL
RID List Processing:

This topic shows detailed information about “Statistics - RID List Processing”.

The RID pool is used for:

- List prefetch
- Multiple index access
- Hybrid joins

DB2 uses a matching index scan to collect those record identifiers (RID) that match the selection criteria and places them in a list in the RID pool. The list is sorted by page number, which is contained in the RID. DB2 then uses the sorted list to access the table by reading up to 32 pages per I/O and attempting to read ahead one block of 32 pages before use.

The RID pool is allocated dynamically as it is needed. The maximum size of the pool is determined by the ZPARM MAXRBLK.

The work file database is used to store a RID list when the RID pool storage cannot contain all the RIDs of the list. When RID pool storage overflow occurs for a RID list, DB2 attempts to store the RID list in work file storage instead of falling back to a relational scan.

The maximum number of RIDs (measured in RID blocks) that DB2 is allowed to store in the work file database is determined by ZPARM MAXTEMPS_RID.

Statistics - RID List Processing

SUCCESSFUL

The number of times RID list (also called RID pool) processing is used.

During RID (RECORD ID) list processing, DB2 uses an index to produce a list of candidate RIDs, which is called a RID list. The RID list can be sorted and intersected (ANDed) or unioned (ORed) with other RID lists before actually accessing the data pages. RID list processing is used for a single
RID List Processing

index (index access with list prefetch) or for multiple indexes (multiple index access), which is when the RID lists are ANDed and ORed.

This field is incremented once for a given table access when RID list processing is used for index access with list prefetch, for multiple index access, or for both. For multiple index access, if a final RID list is obtained through ANDing and ORing of RID lists, the counter is incremented once, even if not all indexes were used by the RIDs in the multiple index access.

**Background and Tuning Information**

A nonzero value in this field indicates that DB2 has used list prefetch. If this is the case, check the access path selection.

**Field Name:** QXMIAP

This is an exception field.

**NOT USED-NO STORAGE**

The number of times DB2 detected that no storage was available to hold a list of RIDs during a given RID list process involving one index (single index access with list prefetch) or multiple indexes (multiple index access).

This field can be incremented during retrieval, sorting, ANDing, and ORing of RID lists for index access with list prefetch (single index). For single index access, this field can only be incremented once per access. For multiple index access, it can be incremented for every index involved in the ANDing and ORing of RID lists.

**Field Name:** QXNSMIAP

This is an exception field.

**NOT USED-MAX LIMIT**

The number of times DB2 detected that a RID list exceeded one or more internal limits during a given RID list (or RID pool) process involving one index (single index access with list prefetch) or multiple indexes (multiple index access). The internal limits include the physical limitation of the number of RIDs a RID list can hold and threshold values for the retrieval, ORing, and ANDing of RIDs.

For index access with list prefetch (single index), this field can only be incremented during RID list retrieval. For multiple index access, this field can be incremented during RID list retrieval, ANDing, and ORing. This counter reflects the number of times internal limits or threshold values were exceeded for the RID lists obtained directly from an index as well as for RID lists derived during the ANDing and ORing process.

**Background and Tuning Information**

Before you increase the RID list storage size, investigate the cause of the failure using the statistics record or the performance trace. You can specify the size for the RID list on the DB2 installation panel DSNTIPC.

**Field Name:** QXMRMIAP

This is an exception field.

**MAX RID BLOCKS ALLOCATED**

The highest number of RID blocks in use at any time since DB2 startup. This is a high-water mark.

**Field Name:** QISTRHIG
This is an *exception* field.

**CURRENT RID BLOCKS ALLOCATED.**

The number of RID blocks currently in use (snapshot value).

Field Name: QISTRCUR

This is an *exception* field.

**MAX RID BLOCKS OVERFLOWED**

This field is currently not set by DB2.

Field Name: QISTWFRRHIG

**CURRENT RID BLOCKS OVERFLOWED**

This field is currently not set by DB2.

Field Name: QISTWFRCUR

**STORAGE LIMIT EXCEEDED**

The number of times the DBM1 storage was exhausted during RID list processing.

**Background and Tuning Information**

This failure occurs when the DBM1 storage limit is reached.

Field Name: QISTRSTG

This is an *exception* field.

**RDS LIMIT EXCEEDED**

The number of times when the number of RIDs that can fit into the guaranteed number of RID blocks was greater than the maximum limit (25% of table size).

**Background and Tuning Information**

Ideally, this value should be 0.

The matching index scan part of the RID list processing scanned more than 25% of the index. RID list processing is then terminated, the index scan is abandoned and normally replaced by a tablespace scan.

Reasons for this are:

- Inaccurate or incomplete RUNSTATS statistics. To avoid this, you should collect all statistics on a regular basis, especially simple and correlated column statistics. Using RUNSTATS with SHRLEVEL(CHANGE) does not prevent access to data.

- Optimizer error. In this instance, you could disable RID list processing by adding the clause OPTIMIZE FOR 1 ROW to the SQL statement, or force the access path to index only by adding the necessary columns to the index.

Field Name: QISTRLLM

This is an *exception* field.

**DM LIMIT EXCEEDED**

The number of times when the number of RID entries was greater than the physical limit of approximately 26 million RIDs.

Field Name: QISTRPLM
RID List Processing

This is an *exception* field.

**PROC.LIMIT EXCEEDED**

The number of times the maximum RID pool storage was exceeded.

The size is determined by the installation parameter RID POOL SIZE (DB2 install panel DSNTIPC). It can be 0, or between 128 KB and 10 GB. The general formula for calculating the RID pool size is:

\[(\text{Number of concurrent RID processing activities}) \times (\text{average number of RIDs}) \times 2 \times (5 \text{ bytes per RID}).\]

**Field Name:** QISTRMAX

This is an *exception* field.

**OVERFLOWED-NO STORAGE**

The number of times a RID list was overflowed to a work file because no RID pool storage was available to hold the list of RIDs.

**Field Name:** QXWFRIDS

**OVERFLOWED-MAX LIMIT**

The number of times a RID list was overflowed to a work file because the number of RIDs exceeded one or more internal limits.

**Field Name:** QXWFRIDT

**INTERRUPTED (HJ)-NO STORAGE**

The number of times a RID list append for a hybrid join was interrupted because no RID pool storage was available to hold the list of RIDs.

**Field Name:** QXHJINCS

**INTERRUPTED (HJ)-MAX LIMIT**

The number of times a RID list append for a hybrid join was interrupted because the number of RIDs exceeded one or more internal limits.

**Field Name:** QXHJINCT

**SKIPPED-INDEX KNOWN**

The number of times a RID list retrieval for multiple index access was skipped because it was not necessary due to DB2 being able to predetermine the outcome of index ANDing or ORing.

**Field Name:** QXRSMIAP

**ROWID:**

This topic shows detailed information about “Statistics - ROWID”.

**Statistics - ROWID**

The field labels shown in the following sample layout of “Statistics - ROWID” are described in the following section.

<table>
<thead>
<tr>
<th>ROW ID</th>
<th>QUANTITY</th>
<th>/SECOND</th>
<th>/THREAD</th>
<th>/COMMIT</th>
</tr>
</thead>
<tbody>
<tr>
<td>DIRECT ACCESS</td>
<td>0.00</td>

<td>N/C</td>
<td>0.00</td>
</tr>
<tr>
<td>INDEX USED</td>
<td>0.00</td>
<td>0.00</td>
<td>N/C</td>
<td>0.00</td>
</tr>
<tr>
<td>TABLE SPACE SCAN USED</td>
<td>0.00</td>
<td>0.00</td>
<td>N/C</td>
<td>0.00</td>
</tr>
</tbody>
</table>

**DIRECT ACCESS**
The number of times that direct row access was successful.

**Field Name:** QXROIMAT

**INDEX USED**

The number of times that direct row access failed and an index was used to find a record.

**Background and Tuning Information**

This can happen, for example, when a REORG is performed between the read of the ROWID column and the use of the host variable in the WHERE clause of the SQL statement. This causes the RID value in the host variable to be incorrect.

**Field Name:** QXROIIDX

**TABLE SPACE SCAN USED**

The number of times that an attempt to use direct row access reverted to using a table-space scan because DB2 was unable to use a matching index scan.

**Background and Tuning Information**

Ideally, this value should be 0.

Table-space scans can happen, for example, when a REORG is performed between the read of the ROWID column and the use of the host variable in the WHERE clause of the SQL statement. This causes the RID value in the host variable to be incorrect. DB2 first tries a matching-index scan before using a table-space scan.

To avoid table space scans, you can force the access path of an unsuccessful direct row access to use a matching index scan on the primary-index key by adding PKCOL to the WHERE clause in the SQL statement. 

```
..... WHERE ROWIDCOL=:HVROWID AND PKCOL=:HVPK
```

**Field Name:** QXROIITS

**Short-on-Storage Metrics:**

This topic shows detailed information about “Statistics - Short-on-Storage Metrics”.

**Statistics - Short-on-Storage Metrics**

The field labels shown in the following sample layout of “Statistics - Short-on-Storage Metrics” are described in the following section.

<table>
<thead>
<tr>
<th>SHORT-ON-STORAGE METRICS</th>

SIM BP
The buffer pool ID.

Field Name: QBSPBPID

CUR PAGES IN USE
The number of simulated buffers currently in use in the simulated buffer pool.

Field Name: QBSPIUS

MAX PAGES IN USE
The highest number of simulated buffers that were in use in the simulated buffer pool.

Field Name: QBSPHUS

CUR SEQ PAGES IN USE
The number of simulated buffers currently in use for sequential pages in the simulated buffer pool.

Field Name: QBSPSUS

MAX SEQ PAGES IN USE
The highest number of simulated buffers that were in use for sequential pages in the simulated buffer pool.
**Field Name:** QBSPHSU

**SYNC READ I/O (R)**

The number of pages found in the simulated buffer pool for a random request that could have avoided a synchronous read I/O from disk.

**Field Name:** QBSPDRR

**SYNC READ I/O (S)**

The number of pages found in the simulated buffer pool for a sequential request that could have avoided a synchronous read I/O from disk.

**Field Name:** QBSPDRS

**ASYNC READ I/O**

The number of pages found in the simulated buffer pool for a prefetch request that could have avoided an asynchronous read I/O from disk.

**Field Name:** QBSPDRA

**SYNC GBP READS (R)**

The number of pages found in the simulated buffer pool for a random request that could have avoided a synchronous read from GBP.

**Field Name:** QBSPGRR

**SYNC GBP READS (S)**

The number of pages found in the simulated buffer pool for a sequential request that could have avoided a synchronous read from GBP.

**Field Name:** QBSPGRS

**ASYNC GBP READS**

The number of pages found in the simulated buffer pool for a prefetch request that could have avoided an asynchronous read from GBP.

**Field Name:** QBSPGRA

**PAGES MOVED INTO SIM BP**

The number of pages logically moved into the simulated buffer pool from the virtual buffer pool.

**Field Name:** QBSPMVI

**TOTAL SYNC I/O DELAY**

The total time waiting for synchronous read I/O from disk for pages found in the simulated buffer pool.

**Field Name:** QBSPDTM

---

**Stored Procedures:**

This topic shows detailed information about “Statistics - Stored Procedures”.

**Statistics - Stored Procedures**

The field labels shown in the following sample layout of “Statistics - Stored Procedures” are described in the following section.
Subsystem Services:

This topic shows detailed information about “Statistics - Subsystem Services”.

**Statistics - Subsystem Services**

The field labels shown in the following sample layout of “Statistics - Subsystem Services” are described in the following section.

</tbody>
</table>

**IDENTIFY**

The number of successful connections to DB2 from an allied address space (TSO, BATCH, CICS, IMS, CAF, or UTILITY).
**Field Name:** Q3STIDEN

**CREATE THREAD**

The number of successful create thread requests. It does not include DBATs.

A thread is required before an application can use SQL. When established, a thread can have one or more secondary authorization IDs.

A thread is needed to perform any DB2 activity. For example, a thread is needed to run a DB2 utility to perform an IFI request such as READS, or to process a DB2 command such as -DISPLAY THREAD. However, a thread is not created if the command failed because of a syntax error.

**Background and Tuning Information**

Thread reuse can help improve performance.

The term *thread reuse* only applies to IMS and CICS attachments. In the case of the TSO attachment facility and the call attachment facility (CAF), threads cannot be reused, because the threads are allocated to the user address space.

Thread reuse should be considered in the following cases:

- **If transaction volume is high:**
  
  High volume transactions should achieve a high percentage of thread reuse. If threads are reused on low volume transactions, the number of threads needed increases because these threads are not automatically terminated by IMS when not being used. This may result in too many idle threads for the level of the DB2 workload. Under CICS, protected threads are terminated after about 45 seconds if no transaction eligible to reuse the thread has been received.

- **If thread creation cost is significant:**
  
  As a rule of thumb, more than 5% of the total CPU cost of transaction processing is considered significant.

The ACQUIRE and RELEASE parameters of BIND should be specified to minimize the thread creation cost, while providing the needed concurrency:

- If most of the application plan’s SQL statements are executed, then ACQUIRE(ALLOCATE) is cheaper than ACQUIRE(USE).

- If only a small number of the SQL statements are executed, ACQUIRE(USE) becomes cheaper and improves concurrency, because the required resources are only acquired (locked) when the plan actually references (uses) them. An example would be a generalized plan used by many different transactions. It would contain multiple logic paths referencing different tables.

  Note that, when packages are involved, ACQUIRE(USE) is always implicitly used.

- Concurrency in thread reuse is based on page locking provided by the IS and IX intent locks, whose duration is governed by ACQUIRE and RELEASE of BIND. RELEASE(DEALLOCATE) is strongly recommended for thread-reuse transactions to reduce transaction CPU time.
When thread reuse is implemented, monitor the EDM pool. It should be sufficient in size to accommodate expanding plans where the next transaction requires additional plan sections over those that are already part of the plan.

**Field Name:** Q3STCTHD

This is an *exception* field.

**SIGNON**

The number of signons that identified a new user of an existing thread for IMS and CICS.

This field is valid only for CICS and IMS (not valid for TSO, CAF, or UTILITY).

The initial signon does not perform an authorization check because the thread does not exist yet, but a resignon can.

**Background and Tuning Information**

If the number of signons is greater than the number of create thread occurrences, some threads have been reused. In the case of the TSO attachment facility and the call attachment facility (CAF), there is no sign-on, because the user is identified when the TSO address space is connected.

**Field Name:** Q3STSIGN

This is an *exception* field.

**TERMINATE**

The number of time threads that terminated successfully.

This number does not agree with the create thread count because each level of a thread’s access (IDENTIFY, SIGNON, and CREATE THREAD) must be terminated.

**Background and Tuning Information**

The value of this field is usually greater than the number of create thread occurrences, because it also includes the termination of connections to DB2 (IDENTIFY) and other internal counts.

**Field Name:** Q3STTERM

**ROLLBACK**

The number of times a unit of recovery was successfully rolled back. Some reasons for a rollback include:

- Application program abend
- Application rollback request
- Application deadlock on database records
- Application canceled by operator
- Thread abend due to resource shortage

This number also includes successfully aborted agents associated with threads that use the Recoverable Resource Manager Services Attach Facility (RRSAF).

**Field Name:** Q3STABRT

This is an *exception* field.
COMMIT PHASE 1

The number of successful requests for commit phase 1 in a two-phase commit environment such as CICS or IMS. It includes successfully prepared agents associated with threads that use the Recoverable Resource Manager Services Attach Facility (RRSAF). It does not include successful single-phase commits or distributed two-phase commits.

Background and Tuning Information

IMS and CICS applications use the PREPARE and COMMIT sequence to commit work.

Field Name: Q3STPREP

This is an exception field.

COMMIT PHASE 2

The number of successful commit phase 2 in a two-phase environment such as CICS or IMS. It includes successfully committed agents associated with threads that use the Recoverable Resource Manager Services Attach Facility (RRSAF). It does not include successful single-phase commits or distributed two-phase commits.

Background and Tuning Information

IMS and CICS applications use the PREPARE and COMMIT sequence to commit work. A nonzero value for this field indicates that updates have occurred.

Field Name: Q3STCOMM

READ ONLY COMMIT

The number of read-only commits.

There are occasions when CICS or IMS invokes DB2 when no DB2 resource was altered since the completion of the last commit process. When this occurs, DB2 performs both phases of the two-phase commit during the first commit phase and records that the user or job is read-only in relation to its DB2 processing.

Field Name: Q3STRDON

UNITS OF RECOVERY INDOUBT

The number of indoubt units of recovery.

A unit of recovery is indoubt when a failure occurs after a successful prepare but before a successful commit. The failure can occur in the address space of the application, the transaction manager, DB2, or all of these. IMS and CICS applications use the prepare and commit sequence to commit work. Ideally, this value should be 0.

Field Name: Q3STINDT

UNITS OF REC.INDBT RESOLVED

The number of indoubt units of recovery successfully resolved, either automatically or manually. It includes successful indoubt resolutions for agents associated with threads that use the Recoverable Resource Manager Services Attach Facility (RRSAF).
A unit of recovery is indoubt when a failure occurs after a successful prepare but before a successful commit. This number should equal the number of units of recovery gone indoubt. If it is less, then some indoubt units of recovery might still exist.

Field Name: Q3STRIUR

SYNCHS(SINGLE PHASE COMMIT)

The total number of commits in a single-phase commit environment such as TSO, CAF, or UTILITY. IMS applications use the prepare-and-commit sequence; CICS applications use both the synchronized commit request and the prepare-and-commit sequence to commit work.

Note that DBATs executed on this location are not included. For DBAT statistics, see SINGLE PHASE COMMITS received on the DDF activity block.

Field Name: Q3STSYNC

QUEUED AT CREATE THREAD

The number of create thread requests queued (not including DBATs).

The total number of threads accessing data that can be allocated concurrently is the MAX USERS value on the installation panel DSNTIPE. Requests are queued when the MAX USERS value is exceeded. If no threads are queued during peak hours, the maximum number of threads might be set too high.

Background and Tuning Information

As a rule of thumb about 1% thread queuing is acceptable. When this is appreciably higher, increase the value of MAX USERS on the DB2 install panel DSNTIPE.

The combined maximum allowed for MAX USERS and MAX REMOTE ACTIVE cannot exceed 2000.

Field Name: Q3STCTHW

This is an exception field.

SUBSYSTEM ALLIED MEMORY EOT

The number of times non-DB2 tasks abended while connected to DB2.

Field Name: Q3STMEOT

This is an exception field.

SUBSYSTEM ALLIED MEMORY EOM

The number of times MVS deleted non-DB2 address space while connected to DB2.

Field Name: Q3STMEOM

This is an exception field.

SYSTEM EVENT CHECKPOINT

The number of checkpoints DB2 has taken.

A checkpoint is a point at which DB2 records internal status information to the DB2 log. This information is used in the recovery process if DB2 abends.
Background and Tuning Information

For Statistics reports only: A checkpoint is taken when the specified number of log records have been written. A checkpoint is also taken each time DB2 switches to a new active log data set. If the Statistics reporting period is 30 minutes and the value of this field is 15, then DB2 is taking checkpoints every 2 minutes.

If the data sets are too small or the value for LOGLOAD is too low, checkpoints occur too frequently. As a result, database writes do not perform efficiently. The frequency of DB2 checkpoints can be decreased by increasing the value of the DSNZPARM LOGLOAD (CHECKPOINT FREQ on the Tracing install panel).

Rule of thumb: In a production environment, DB2 should take checkpoints every 10 minutes or so.

The default value for LOGLOAD is 50000. The actual value that you choose is dependent on the volume and nature of the work performed by your DB2 subsystem. It is a trade-off between the performance efficiency of larger numbers and the longer time to restart DB2 when there is an abnormal termination.

Field Name: QWSDECKPT
This is an exception field.

HIGH WATER MARK IDBACK

The maximum number of connections to a single instance from batch or TSO background tasks.

This is a high-water mark.

Field Name: Q3STHWIB

HIGH WATER MARK IDFORE

The maximum number of connections to a single instance from TSO foreground tasks.

This is a high water-mark.

Field Name: Q3STHWIF

HIGH WATER MARK CTHREAD

The highest number of batch CICS, IMS, and TSO tasks (CTHREAD) to a single instance.

This is a high-water mark.

Field Name: Q3STHWCT

Subsystem Shared Storage Above 2 GB:

This topic shows detailed information about “Statistics - Subsystem Shared Storage Above 2 GB”.

Statistics - Subsystem Shared Storage Above 2 GB

The field labels shown in the following sample layout of “Statistics - Subsystem Shared Storage Above 2 GB” are described in the following section.
Subsystem Shared Storage Above 2 GB

<table>
<thead>
<tr>
<th>Subsystem Shared Storage Above 2 GB</th>
<th>Quantity</th>

</tbody>
</table>

**REAL STORAGE IN USE (MB)**

The total amount of real storage in use for 64-bit shared storage. This is recorded at the subsystem level.

*Note:* This field is available in z/OS 1.10 (and maintenance) or later.

*Field Name:* S225RLU

**SHARED THREAD AND SYSTEM (MB)**

The amount of real storage in use for 64-bit shared storage. This does not include shared stack storage. This is recorded at the subsystem level.

*Note:* This field is available in z/OS 1.10 (and maintenance) or later.

*Field Name:* S225SSR

**SHARED STACK STORAGE (MB)**

The amount of real storage in use for 64-bit shared stack storage. This is recorded at the subsystem level.

*Note:* This field is available in z/OS 1.10 (and maintenance) or later.

*Field Name:* S225KSR

**AVERAGE THREAD FOOTPRINT (MB)**

The current average real storage in use for subsystem shared storage of active user threads (allied threads + active and pooled DBATs).

*Field Name:* S225STFR

**AUXILIARY STORAGE IN USE (MB)**

The total amount of auxiliary storage in use for 64-bit shared storage. This is recorded at the subsystem level.

*Note:* This field is available in z/OS 1.10 (and maintenance) or later.

*Field Name:* S225AXU

**SHARED THREAD AND SYSTEM (MB)**

The amount of auxiliary storage in use for 64-bit shared storage that does not include shared stack storage. This is recorded at the subsystem level.

*Note:* This field is available in z/OS 1.10 (and maintenance) or later.

*Field Name:* S225SSA

**SHARED STACK STORAGE (MB)**

The amount of auxiliary storage in use for 64-bit shared stack storage. This is recorded at the subsystem level.
Note: This field is available in z/OS 1.10 (and maintenance) or later.

Field Name: S225KSA

SQL DCL:

</tr>
</tbody>
</table>

**SELECT**

The number of SQL SELECT statements executed.

**Field Name:** QXSELECT

**INSERT**

The number of INSERT statements executed.

**Field Name:** QXINSRT

**INSERT - NUMBER OF ROWS**

The number of rows inserted (DB2 field: QXRWSINSRTD).

**Field Name:** SRWINSRT

**UPDATE**

The number of UPDATE statements executed.

**Field Name:** QXUPDTE

**UPDATE - NUMBER OF ROWS**

The number of rows updated (DB2 field: QXRWSUPDTD).

**Field Name:** SRWUPDAT

**MERGE**

The number of times a MERGE statement was executed.

**Field Name:** QXMERGE

**DELETE**

The number of DELETE statements executed.

**Field Name:** QXDELET

**DELETE - NUMBER OF ROWS**

The number of rows deleted (DB2 field: QXRWSDELETED).
Field Name: SRWDELET

PREPARE
The number of SQL PREPARE statements executed. This number at the server location might not match the number at the user application because of the internal processing of the Distributed Data Facility (DDF).

Field Name: QXPREP

DESCRIBE
The number of DESCRIBE, DESCRIBE CURSOR, DESCRIBE INPUT, and DESCRIBE PROCEDURE statements executed. This number at the server location might not match the number at the user application because of the internal processing of the Distributed Data Facility (DDF).

Field Name: QXDESC

DESCRIBE TABLE
The number of DESCRIBE TABLE statements executed.

Field Name: QXDSCRTB

OPEN
The number of OPEN statements executed.

Field Name: QXOPEN

CLOSE
The number of CLOSE statements executed. This number at the server location might not match the number at the user application because of the internal processing of the Distributed Data Facility (DDF).

Field Name: QXCLOSE

FETCH
The number of FETCH statements executed. This number at the server location might not match the number at the user application because of the internal processing of the Distributed Data Facility (DDF).

Field Name: QXFETCH

FETCH - NUMBER OF ROWS
The number of rows fetched (DB2 field: QXRWSFETCHD).

Field Name: SRWFETCH

TOTAL
The total number of SQL DML statements executed.

Field Name: SSCDML
This is an exception field.

Triggers:
This topic shows detailed information about “Statistics - Triggers”.

Statistics - Triggers
The field labels shown in the following sample layout of “Statistics - Triggers” are described in the following section.
TRIGGERS

<table>
<thead>
<tr>
<th>TRIGGERS</th>
<th>QUANTITY /SECOND /THREAD /COMMIT</th>
</tr>
</thead>
<tbody>
<tr>
<td>STATEMENT TRIGGER ACTIVATED</td>
<td>0.00 0.00 N/C 0.00</td>
</tr>
<tr>
<td>ROW TRIGGER ACTIVATED</td>
<td>0.00 0.00 N/C 0.00</td>
</tr>
<tr>
<td>SQL ERROR OCCURRED</td>
<td>0.00 0.00 N/C 0.00</td>
</tr>
</tbody>
</table>

**STATEMENT TRIGGER ACTIVATED**

The number of times a statement trigger was activated.

**Field Name:** QXSTTRG

**ROW TRIGGER ACTIVATED**

The number of times a row trigger was activated.

**Field Name:** QXROWTRG

**SQL ERROR OCCURRED**

The number of times an SQL error occurred during the execution of a triggered action. This includes errors that occur in user-defined functions or stored procedures that are called from triggers and that pass back a negative SQLCODE.

**Field Name:** QXTRGERR

**Use Currently Committed:**

This topic shows detailed information about “Statistics - Use Currently Committed”.

**Statistics - Use Currently Committed**

The field labels shown in the following sample layout of “Statistics - Use Currently Committed” are described in the following section.

<table>
<thead>
<tr>
<th>USE CURRENTLY COMMITTED</th>
<th>QUANTITY /SECOND /THREAD /COMMIT</th>
</tr>
</thead>
<tbody>
<tr>
<td>INSERT ROWS SKIPPED</td>
<td>0.00 0.00 N/C 0.00</td>
</tr>
<tr>
<td>DELETE ROWS ACCESSED</td>
<td>0.00 0.00 N/C 0.00</td>
</tr>
<tr>
<td>UPDATE ROWS ACCESSED</td>
<td>0.00 0.00 N/C 0.00</td>
</tr>
</tbody>
</table>

**INSERT ROWS SKIPPED**

The number of rows skipped by read transactions because of uncommitted INSERT operations (using currently committed semantic for FETCH).

**Field Name:** QISTRCCI

**DELETE ROWS ACCESSED**

The number of rows accessed by read transactions because of uncommitted DELETE operations (using currently committed semantic for FETCH).

**Field Name:** QISTRCCD

**UPDATE ROWS ACCESSED**

The number of rows accessed by read transactions because of uncommitted UPDATE operations (using currently committed semantic for FETCH).

**Field Name:** QISTRCCU

**User-Defined Functions:**

This topic shows detailed information about “Statistics - User-Defined Functions”.

**User-Defined Functions:**

This topic shows detailed information about “Statistics - User-Defined Functions”.
User-Defined Functions

Statistics - User-Defined Functions

The field labels shown in the following sample layout of “Statistics - User-Defined Functions” are described in the following section.

<table>
<thead>
<tr>
<th>USER DEFINED FUNCTIONS</th>
<th>QUANTITY</th>
<th>/SECOND</th>
<th>/THREAD</th>
<th>/COMMIT</th>
</tr>
</thead>
<tbody>
<tr>
<td>EXECUTED</td>
<td>0.00</td>
<td>0.00</td>
<td>N/C</td>
<td>0.00</td>
</tr>
<tr>
<td>ABENDED</td>
<td>0.00</td>
<td>0.00</td>
<td>N/C</td>
<td>0.00</td>
</tr>
<tr>
<td>TIMED OUT</td>
<td>0.00</td>
<td>0.00</td>
<td>N/C</td>
<td>0.00</td>
</tr>
<tr>
<td>REJECTED</td>
<td>0.00</td>
<td>0.00</td>
<td>N/C</td>
<td>0.00</td>
</tr>
</tbody>
</table>

EXECUTED
The number of user-defined functions executed.

Field Name: QXCAUD

ABENDED
The number of times a user-defined function abended.

Field Name: QXCAUDAB

TIMED OUT
The number of times a user-defined function timed out while waiting to be scheduled.

Field Name: QXCAUDTO

REJECTED
The number of times a user-defined function was rejected.

Field Name: QXCAUDRJ

Workfile Database:

This topic shows detailed information about “Statistics - Workfile Database”.

This block shows information about the Workfile Database used by DB2 as storage for work files for processing SQL statements, and as storage for created and declared global temporary tables.

The performance metrics in the report block distinguish between work files for declared global temporary tables (DGTTs) and work files for non-DGTT data such as created global temporary tables or sort results. In addition, DB2 supports in-memory work files which are sufficient for performing simple operations and do not require physical allocations. In-memory work files may overflow to physical records in the Workfile Database in case of memory constraints.

Statistics - Workfile Database

The field labels shown in the following sample layout of “Statistics - Workfile Database” are described in the following section.

**TOTAL STORAGE CONFIG (KB)**

The total storage (KB) configured for all table spaces in the Workfile Database.

**Field Name:** QISTWSTG

**TOT DGTT STOR Config (KB)**

The total preferred storage (KB) configured for DGTTs in the Workfile Database.

**Field Name:** QISTDGTTSTG

**TOT WF STOR Config (KB)**

The total preferred storage (KB) configured for non-DGTT work files in the Workfile Database.

**Field Name:** QISTWFSTG

**TOTAL STORAGE THRESHOLD (%)**

The alert threshold of high space-usage for DGTTs or non-DGTT work files in the Workfile Database (derived from zparm WFSTGUSE_SYSTEM_THRESHOLD).

**Field Name:** QISTSSTH

**MAX TOTAL STORAGE USED (KB)**

The maximum total amount of storage (KB) ever used in the Workfile Database at system level since DB2 startup.

**Field Name:** QISTWMXU

**MAX DGTT STOR USED (KB)**

---

Chapter 6. Batch reporting  4483
Workfile Database

The maximum total amount of storage (KB) ever used for DGTTs in the Workfile Database by all agents on the system since DB2 startup.

Field Name: QISTDGTTMXU

MAX WF STORAGE USED (KB)

The maximum total amount of storage (KB) ever used for non-DGTT work files in the Workfile Database by all agents on the system since DB2 startup.

Field Name: QISTWFMXU

CUR TOTAL STORAGE USED (KB)

The total amount of storage (KB) currently used in the Workfile Database at system level.

Field Name: QISTWCTO

CUR DGTT STOR USED (KB)

The total amount of storage (KB) currently used for DGTTs in the Workfile Database by all agents on the system.

Field Name: QISTDGGTCTO

CUR WF STORAGE USED (KB)

The total amount of storage (KB) currently used for non-DGTT work files in the Workfile Database by all agents on the system.

Field Name: QISTWFCTO

STORAGE IN 4K TS (KB)

The total amount of storage (KB) currently used for 4 KB table spaces in the Workfile Database.

Field Name: QISTW4K

STORAGE IN 32K TS (KB)

The total amount of storage (KB) currently used for 32 KB table spaces in the Workfile Database.

Field Name: QISTW32K

4K USED INSTEAD OF 32K TS

The number of times that space in a 4 KB page table space was used because space in a 32 KB page table space was preferred but not available in the Workfile Database.

Field Name: QISTWFP2

32K USED INSTEAD OF 4K TS

The number of times that space in a 32 KB page table space was used because space in a 4 KB page table space was preferred but not available in the Workfile Database.

Field Name: QISTWFP1

MAX ACTIVE (DM) IN-MEMORY

The maximum number of in-memory work files (created by the Data Manager) that were active at any point in time since DB2 startup. This is a high-water mark count.
Field Name: QISTIMAH

MAX ACT (NONSORT) IN-MEM

The maximum number of non-SORT related in-memory work files created by the Data Manager that were active at any point in time since DB2 startup. This is a high-water mark count.

Field Name: QISTI2AH

CUR ACTIVE (DM) IN-MEMORY

The number of currently active in-memory work files created by the Data Manager.

Field Name: QISTIMAC

CUR ACT (NONSORT) IN-MEM

The number of currently active non-SORT related in-memory work files created by the Data Manager.

Field Name: QISTI2AC

MAX STOR (DM) IN-MEM (KB)

The maximum space used for active in-memory work files created by the Data Manager at any point in time since DB2 startup. This is a high-water mark count.

Field Name: QISTIMSH

CUR STOR (DM) IN-MEM (KB)

The total space used for currently active in-memory work files created by the Data Manager.

Field Name: QISTIMSC

MAX ACTIVE (SORT) IN-MEMORY

The maximum number of in-memory work files created by the SORT component that were active at any point in time since DB2 start. This is a high-water mark count.

Field Name: QISTSIAH

CUR ACTIVE (SORT) IN-MEMORY

The number of currently active in-memory work files created by the SORT component.

Field Name: QISTSIAAC

MAX STOR (SORT) IN-MEM (KB)

The maximum space used for active in-memory work files created by the SORT component at any point in time since DB2 startup. This is a high-water mark count.

Field Name: QISTSISH

CUR STOR (SORT) IN-MEM (KB)

The total space used for currently active in-memory work files created by the SORT component.

Field Name: QISTSISC

IN-MEM (NONSORT) OVERFLOWED
Workfile Database

The number of times non-SORT related in-memory work files overflowed into a physical table space.

Field Name: QISTI2OF

IN-MEM WORKF NOT CREATED

The number of times an in-memory work file was not created due to critical storage conditions.

Field Name: QISTIMNC

AGENT STORAGE CONFIG (KB)

The maximum amount of storage (KB) in the Workfile Database that can be used by each agent (derived from ZPARM MAXTEMPS).

Field Name: QISTWMXA

NUMBER OF LIMIT EXCEEDED

The number of times the maximum amount of storage that an agent can use in the Workfile database was exceeded.

Field Name: QISTWFNE

AGENT STORAGE THRESHOLD (%)

The alert threshold of high space-usage for DGTTs or non-DGTT work files in the Workfile Database by an agent (derived from ZPARM WFGUSE_AGENT_THRESHOLD).

Field Name: QISTAStH

MAX AGENT STORAGE USED (KB)

The maximum amount of storage (KB) ever used in the Workfile Database by any thread since DB2 startup.

Field Name: QISTAMXU

DM FAST INSERT PIPES

The number of Data Manager (DM) fast insert pipes that were allocated since DB2 restart.

Field Name: QISTINPA

DM FAST INSERT PIPES DISAB

The number of DM fast insert pipes that have been disabled since DB2 restart.

Field Name: QISTINPD

The Statistics Save-File Utility

Use the Save-File utility to migrate and convert Statistics Save data sets into a format suitable for OMEGAMON for Db2 PE V5.4.0.

The function performed is specified in a parameter on the EXEC command.

Migrating Data Sets:

This topic describes how to migrate Statistics Save data sets created by OMEGAMON for Db2 PE V5.2.0 or V5.3.0 into the record format of OMEGAMON for Db2 PE V5.4.0.
To migrate Statistics Save data sets:

1. Create a VSAM data set for V520 or V530.
2. Define an OMEGAMON for Db2 PE V5.4.0 VSAM data set using IDCAMS as output.
3. Use the MIGRATE function of the Save-File utility to migrate the data sets of OMEGAMON for Db2 PE V5.2.0 or V5.3.0.
4. Restore the migrated VSAM data sets in V540 and compare the reports.

The RK02SAMP library provides the sample job DGOPJSMI, which you can modify to suit your installation.

Note:
- You can only process VSAM data sets in the same version of OMEGAMON for Db2 PE as they have been created. For example, if you create a SAVE data set in version 530, it can only be RESTORED in version 530. To use a SAVE data set in a higher version, you must migrate the SAVE data set using a migration utility.
- Before you restore or convert SAVE data sets from V5.2.0 or V5.3.0, you must first migrate this data to OMEGAMON for Db2 PE V5.4.0 format.
- Restored reports only show fields that are supported by the current version of OMEGAMON for Db2 PE.

Converting Data Sets:

To store performance data in Performance Database tables or spreadsheets, you must first convert Statistics Save data sets of OMEGAMON for Db2 PE V5.4.0 into sequential data sets that can be used by the DB2 load utility or the Spreadsheet Input-Data Generator of OMEGAMON for Db2 PE.

You can use the CONVERT function of the Statistics Save-File Utility to convert Statistics Save data sets of OMEGAMON for Db2 PE V5.4.0 into sequential data sets. The RK02SAMP library provides the sample job DGOPJSCO, which you can modify to suit your installation.

You can also use the STATISTICS SAVE subcommand with the CONVERT option to convert and save reduced data into a sequential data set. The output of this subcommand option is a sequential data set, that is specified and requested in SYSIN. The data set attributes are:

**Organization**
- PS

**Record format**
- VB

**Record length**
- 9072

**Block size**
- 9076

For more information about the STATISTICS SAVE subcommand refer to "Report Command Reference."
Workfile Database

The following list shows the types of records that are created by the CONVERT function (or CONVERT command option) and where to find their layout descriptions in the sample library RKO2SAMP:

- General data records (DGOSDGEN)
- Buffer Pool data records (DGOSDBUF)
- DDF data records (DGOSDDDF)
- Group Buffer Pool records (DGOSDBGP)
- Buffer Pool data set records (DGOSDSET)
- Accelerator data records (DGOSDXCL)
- Aggregated Accounting data records (DGOSDACC)
- Storage data records (DGOSDSTG)

For more information of the Spreadsheet Input-Data Generator refer to Reporting User’s Guide.

Save-File Utility DD Statements:

This topic lists the DD statements needed for migration and conversion. All of the DD statements described here are required.

Input

The DDNAME of the input data set. This can be an OMEGAMON for Db2 PE V5.2.0 or V5.3.0 Statistics Save data set for the MIGRATE function, or an OMEGAMON for Db2 PE V5.4.0 Statistics VSAM Save data set for the CONVERT function.

Output

The DDNAME of the output data set.

For CONVERT, allocate the data set with the following characteristics:

```
RECFM
  VB
LRECL
  9072
BLKSIZE
  9076
```

Refer to "OMEGAMON for Db2 PE VSAM Data Sets" on page 4647 for details on how to specify the allocated data sets to migrate to OMEGAMON for Db2 PE V5.4.0.

DPMLOG

OMEGAMON for Db2 PE command processor messages and messages indicating exceptional processing conditions are written to DPMLOG. If DPMLOG is not specified, it is dynamically allocated to the SYSOUT message class of the job. Allocate the data set with the following attributes:

```
RECFM
  FBA
```
The Statistics File Data Set and Output Records

Use the FILE subcommand to format DB2 Statistics records and write them to sequential data sets suitable for use by the DB2 load utility. You can store unreduced Statistics data into the performance database. Use the performance database to produce tailored reports using a reporting facility such as Query Management Facility (QMF).

The format of the output data from the Statistics File data set is identical with that of the CONVERT function of the Save-File utility.

You can also use the File data sets to generate CSV (comma-separated value) input-data. This CSV data can then be transferred to workstations and imported into spreadsheets to improve DB2 performance analysis using graphical representations or pivot tables. For more information refer to Reporting User’s Guide.

The Statistics File data set is produced when OMEGAMON for Db2 PE Statistics delta records are externalized using the FILE subcommand. Each such delta record represents the period of time between two pairs of DB2 Statistics delta records and can be represented in the File data set by up to 8 types of records. File data is written to a File data set. The following types of records are created. Descriptions of the layouts of these records can be found in the RKO2SAMP library under the following names:

Table 288. Record Type and Description for Statistics File Data Sets and Output Records

<table>
<thead>
<tr>
<th>Record type</th>
<th>Description</th>
<th>Layout description in the RKO2SAMP library</th>
</tr>
</thead>
<tbody>
<tr>
<td>General Statistics</td>
<td>Records contain data from IFCID 001 and 002. One general Statistics record is produced for each Statistics delta record.</td>
<td>DGOSDGEN</td>
</tr>
<tr>
<td>Buffer Pool Statistics</td>
<td>Records contain data derived from IFCID 002 records. One buffer pool record is produced for each buffer pool active at the start time of the corresponding delta record. Each OMEGAMON for Db2 PE Statistics delta record can produce up to 80 buffer pool Statistics records.</td>
<td>DGOSDBUF</td>
</tr>
<tr>
<td>DDF Statistics</td>
<td>Records contain DDF Statistics originating from IFCID 001. A DDF record is produced for all remote locations that used DRDA (where at least one location used this method at the start time of the delta record).</td>
<td>DGOSDDDF</td>
</tr>
<tr>
<td>Group Buffer Pool Statistics</td>
<td>Records contain data derived from IFCID 002 records. One group buffer pool record is produced for each group buffer pool active at the start time of the corresponding delta record. Each OMEGAMON for Db2 PE Statistics delta record can produce up to 80 group buffer pool Statistics records.</td>
<td>DGOSDGBP</td>
</tr>
<tr>
<td>Buffer Pool Data Set</td>
<td>Records contain data derived from IFCID 199. One row is written for each open data set that has an I/O event rate at least one event per second during the reporting interval.</td>
<td>DGOSDSET</td>
</tr>
<tr>
<td>Accelerator</td>
<td>Records contain data derived from IFCID 002. One row is written for each active accelerator attached to the DB2 subsystem that is currently reported.</td>
<td>DGOSDXCL</td>
</tr>
</tbody>
</table>
### System parameters report set

These topics provide information about the system parameters reports.  

**Note:** For an introduction to the System Parameters report set and general system parameter information refer to the Reporting User’s Guide.

#### System Parameters Report Header

This section introduces the System Parameters report header.

There are two different types of report headers for system parameters, for:

- MEMBER scope reports.
- GROUP scope reports.

#### System Parameters Report Header for MEMBER-Scope and GROUP-Scope Reports

Here is an example of a System Parameters report header for MEMBER-scope reports:

```plaintext
LOCATION: STLECI
GROUP: GPA
MEMBER: M2
SUBSYSTEM: SSDQ
DB2 VERSION: V10

OMEGAMON XE FOR DB2 PERFORMANCE EXPERT (V5R4M0)  
SYSTEM PARAMETERS REPORT  
PAGE: 1-1  
ACTUAL FROM: 01/30/15 22:50:03.98
```

Here is an example of a System Parameters report header for GROUP-scope reports:

```plaintext
LOCATION: SYS1DSN2
GROUP: DSN2
DB2 VERSION: V10

OMEGAMON XE FOR DB2 PERFORMANCE EXPERT (V5R4M0)  
SYSTEM PARAMETERS REPORT  
PAGE: 4-1  
ACTUAL FROM: 01/30/15 06:10:23.14
```

#### Field description

The OMEGAMON for Db2 PE system parameters report header contains the following information, described line by line:

**LOCATION**

The DB2 reporting location. If the location name is not available, the DB2 data sharing group name is printed in this field. If the DB2 data sharing group name does not exist, the DB2 subsystem ID is printed.

**OMEGAMON XE FOR DB2 PERFORMANCE EXPERT (VnRnMn)**

The product name and the version, release, and modification level.

</tr>
</tbody>
</table>
**System Parameters - Report Header**

**PAGE**
The page number in the format ill-nnnnn, where ill denotes the location number within the report and nnnnn the page number within the location.

**GROUP**
The name of the DB2 data sharing group. This field shows N/A if there is no group name.

**SYSTEM PARAMETERS REPORT**
The title of the report.

**MEMBER**
The name of the DB2 data sharing member or the member name of the DB2 subsystem. This field shows N/A if there is no member name.

This field is not printed on the report page showing the GROUP BUFFERPOOLS PARAMETERS.

**SUBSYSTEM**
The ID of the DB2 subsystem that generated the data. This field is not printed on the report page showing the GROUP BUFFERPOOLS PARAMETERS.

**ACTUAL FROM/TO**
The date and time of the first and last record included in the log for a location, group, subsystem, or member.

**DB2 VERSION**
The DB2 version number of the subsystem that generated the data.

**Example of the System Parameters Report**
This section shows an example of the System Parameters report.

MAXIMUM SIZE OF EDM POOL IN BYTES (EDMPOOL)...........6,782,976

MAXIMUM SIZE OF SORT POOL IN BYTES (SRTPOL)...........10,240,000

MAXIMUM SIZE OF REORG POOL IN KB (REORGPK)............104,000

MAXIMUM SIZE OF DATAFILES CONCURRENTLY RUNNING IN DB2 (DITREAD)..............400

IRLM INSTALLATION PARAMETERS (DSNTP1B)

IRLM SUBSYSTEM NAME (IRLMSID)..........................IC51

IRLM RESOURCE TIMEOUT IN SECONDS (IRLMTOUT)............60

IRLM AUTOMATIC START (IRLMAUT).........................YES

IRLM START PROCEDURE NAME (IRLMPRD)....................IC51IRLM

SECONDS DB2 WILL WAIT FOR IRLM START (IRLMWRT)............120

U LOCK FOR REPEATABL READ OR READ STABILITY (RULOCK)........YES

MSC/MSM TIMEOUT FACTOR (BMTOUT)........................1

MSD/MSU TIMEOUT FACTOR (MTOUT)..........................6

WAIT FOR RETAINED LOCKS (RRTWAIT)......................NO

DISABLE DB CHECKING........................................NO

IRLM INITIALIZATION TIME ................................1

IRLM PROCESSING PARAMETERS

MAX NO OF USERS CONCURRENTLY RUNNING IN DB2 (CTHREAD)........400

MAX NO OF CONCURRENT REMOTE ACTIVE CONNECTIONS (MXDBAT)....200

MAX NO OF TSO CONNECTIONS (TDSFONE)..................200

MAX NO OF BATCH CONNECTIONS (TBDTBACK)..................200

MAXIMUM KEPT DYNAMIC STATEMENTS (MXKEEPC)...............5,000

MAX OPEN FILE REFS (MAXMKLF)..........................100

MANAGE REAL STORAGE (REALSTORAGE_MGMT)..................AUTO

MAXIMUM REAL STORAGE (REALSTORAGE_MAX)................0

MAXIMUM THREAD STORAGE (MNTORS).........................N/A

MANAGE THREAD STORAGE (MNSTOR).........................N/A

LONG-RUNNING READER IN MINUTES (LRIENDTHL)............10

DOL TIMEOUT FACTOR (DOLTO).........................1,000

INDEX CLEANUP THREADS (INDEX_CLEANUP_THREADS)...........10

IRLM INSTALLATION PARAMETERS (DSNTP1B)

WAIT TIME FOR LOCAL DEADLOCK..........................5,000

TIMEOUT INTERVAL ........................................60

IRLM MAXIMUM CSA USAGE ALLOWED.........................0

PENDING NUMBER OF HASH ENTRIES........................0

Z/OS LOCK TABLE LIST ENTRIES.............................0

MAX 31-BIT IRLM PRIVATE STORAGE.......................0

MAX 64-BIT IRLM PRIVATE STORAGE.......................0

ARCHIVE LOG INSTALLATION PARAMETERS (DSNTP1B)

IRLM INSTALLATION PARAMETERS (DSNTP1B)

CATALOG ARCHIVE DATASETS (CATALOG).....................NO

COPY1 ARCHIVE LOG DEVICE TYPES (UNIT)...............DASD

COPY2 ARCHIVE LOG DEVICE TYPES (UNIT)...............0

SPACE ALLOCATION METHOD (ALCUNIT)......................CYLINDER

PRIMARY SPACE ALLOCATION (PROITY)......................125

SECONDARY SPACE ALLOCATION (SECITY)....................15

ARCHIVE LOG BLOCK SIZE IN BYTES (BLKSIZE)...........24,576

MAXIMUM READ TAPE UNITS (MAXRTU)......................2

TAPE UNIT DEALLOCATION PERIOD (REALCET)...............0000:00

MAX NUMBER OF DATASETS RECORDED IN BSDS (MAXARCH).......10,000

FIRST ARCHIVE COPY MASS STG GROUP NAME.............'NONE'

SECOND ARCHIVE COPY MASS STG GROUP NAME.............'NONE'

DAYS TO RETAIN ARCHIVE LOG DATA SETS (ARCREN)........9,999

ISSUE WTOR BEFORE MOUNT FOR ARCHIVE VOLUME (ARCWTOR)....YES

System parameters report blocks

This section describes the blocks and fields shown in the system parameters report.

Blocks are listed in alphabetical order, fields are shown in the order they appear in the block.

Application Programming Defaults Panel 1 (DSNTIPF):

This topic shows detailed information about “System Parameters - Application Programming Defaults Panel 1 (DSNTIPF)”.

This block shows application programming defaults.

The values shown are used as default values by the program preparation panels, program preparation CLIST (DSNH), and precompiler. They can also be used as defaults by other programs, such as Query Management Facility (QMF).

Changing some of these defaults is not recommended because changes can make the syntax of existing SQL statements invalid or affect the way application programs run.

Values set here are contained in load module DSNHDECP, in library prefix.SDSNEXIT, which can be loaded and accessed by application programs. When modifying DSNHDECP, do so only by changing and running the installation CLIST.

Do not modify the data in DSNHDECP. If you modify any installation parameters by changing job DSNTIJUZ directly, these values are not recorded for later updates, new installations, or migrations.

Note: The fields shown on this panel depend on the installed DB2 version.
DEFAULT HOST LANGUAGE (DEFLANG)

The default programming language for your site. This can be:
- ASM
- C
- CPP
- COBOL
- COB2
- IBMCOB
- FORTRAN
- PLI

When this is C or C++, you can fold SQL identifiers to uppercase.

Install parameter LANGUAGE DEFAULT on panel DSNTIPF, or ZPARM DEFLANG in DSNHDECP.

Field Name: QWPBLANG

DECIMAL POINT OPTION (DECIMAL)

Indicates whether the decimal contains a comma (,) or a period (.). This parameter is used for dynamic SQL and COBOL programs. It is not used or supported by other languages.

Install parameter DECIMAL POINT IS on panel DSNTIPF, or ZPARM DECIMAL in DSNHDECP.

Derivation: DB2 field QWPBDE

Field Name: QWPBDE

DEFAULT DELIMITER (DELIM)

Shows the string delimiter for COBOL. Default string delimiter is the quotation mark. This option is applicable to all types of COBOL.

Install parameter STRING DELIMITER on panel DSNTIPF, or ZPARM DELIM in DSNHDECP.

Field Name: QWPBDL

DEFAULT SQL DELIMITER (SQLDELI)

The string delimiter for SQL.
Install parameter SQL STRING DELIMITER on panel DSNTIPF, or ZPARM SQLDELI in DSNHDECP.

Derivation: DB2 field QWPBSDL

Field Name: QWPBSDL

DIST SQL STRING DELIMITER (DSQLDELI)

Shows the SQL string delimiter used by this DB2 for bind operations when the requester does not give DB2 that information.

Install parameter DIST SQL STR DELIMTR on panel DSNTIPF, or ZPARM DSQLDELI in DSNHDECP.

Field Name: QWPBDSSD

DEFAULT MIXED GRAPHIC (MIXED)

Indicates whether the code points X'0E' and X'0F' are the shift-out and shift-in controls for character strings that include double-byte characters.

Install parameter MIXED DATA on panel DSNTIPF, or ZPARM MIXED in DSNHDECP.

Field Name: QWPBGRA

EBCDIC SBCS CCSID (SCCSID)

The EBCDIC single-byte coded character set ID.

A coded character set identifier (CCSID) must be specified when DDF STARTUP OPTION field on panel DSNTIPR is set to AUTO or COMMAND, or when the MIXED DATA field on panel DSNTIPF is set to YES. When mixed data is used, valid Mixed Data CCSID must also be specified.

A nonexistent CCSID causes an error.

An incorrect CCSID can corrupt data.

Install parameter EBCDIC CCSID on panel DSNTIPF, or ZPARM SCCSID in DSNHDECP.

Field Name: QWPBSID

EBCDIC MBCS CCSID (MCCSID)

The EBCDIC mixed coded character set ID.

A coded character set identifier (CCSID) must be specified when DDF STARTUP OPTION field on panel DSNTIPR is set to AUTO or COMMAND, or when the MIXED DATA field on panel DSNTIPF is set to YES. When mixed data is used, valid Mixed Data CCSID must also be specified.

A nonexistent CCSID causes an error.

An incorrect CCSID can corrupt data.

Install parameter EBCDIC CCSID on panel DSNTIPF, or ZPARM MCCSID in DSNHDECP.

Field Name: QWPBMID

EBCDIC GBCS CCSID (GCCSID)

The EBCDIC graphic coded character set ID.
A coded character set identifier (CCSID) must be specified when DDF STARTUP OPTION field on panel DSNTIPR is set to AUTO or COMMAND, or when the MIXED DATA field on panel DSNTIPF is set to YES. When mixed data is used, valid Mixed Data CCSID must also be specified.

A nonexistent CCSID causes an error.

An incorrect CCSID can corrupt data.

Install parameter EBCDIC CCSID on panel DSNTIPF, or ZPARM GCCSID in DSNHDECP.

Field Name: QWPBGID

ASCII SBCS CCSID (ASCCSID)

The ASCII single-byte coded character set ID.

The default (0) means the installation has no ASCII databases, table spaces, or tables.

Install parameter ASCII CCSID on panel DSNTIPF, or ZPARM ASCCSID in DSNHDECP.

Field Name: QWPBASID

ASCII MBCS CCSID (AMCCSID)

Indicates the ASCII mixed coded character set ID.

The default (0) means the installation has no ASCII databases, table spaces, or tables.

Install parameter ASCII CCSID on panel DSNTIPF, or ZPARM AMCCSID in DSNHDECP.

Field Name: QWPBAMID

ASCII GBCS CCSID (AGCCSID)

Indicates the ASCII graphic coded character set ID.

The default (0) means the installation has no ASCII databases, table spaces, or tables.

Install parameter ASCII CCSID on panel DSNTIPF, or ZPARM AGCCSID in DSNHDECP.

Field Name: QWPBAGID

UNICODE SBCS CCSID (USCCSID)

Unicode Single Byte Character Set identification.

Parameter UNICODE CCSID in installation panel DSNTIPF, or ZPARM USCCSID in macro DSNHDECP.

Field Name: QWPBUSID

UNICODE MBCS CCSID (UMCCSID)

Unicode Mixed Character Set identification.

Parameter UNICODE CCSID in installation panel DSNTIPF, or ZPARM UMCCSID in macro DSNHDECP.

Field Name: QWPBUMID

UNICODE GBCS CCSID (UGCCSID)
Unicode graphics character set identification.

Parameter UNICODE CCSID in installation panel DSNTIPF, or ZPARM UGCCSID in macro DSNHDECP.

Field Name: QWPBUGID

DEFAULT ENCODING SCHEME (ENSCHEME)

The default encoding scheme, which can be ASCII or EBCDIC, or UNICODE.

Install parameter DEF ENCODING SCHEME on panel DSNTIPF, or ZPARM ENSCHEME in DSNHDECP.

Derivation: DB2 field QWPBENS

Field Name: QWPBENS

APPLICATION ENCODING (APPENSCH)

Application encoding scheme.

Install parameter APPLICATION ENCODING on installation panel DSNTIPF, or ZPARM APPENSCH in DSNHDECP.

Field Name: QWPBAPSC

LOCALE LC_CTYPE (LC_TYPE)

The system LOCALE LC_CTYPE.

A locale is the part of the system environment that depends on language and cultural conventions. An LC_TYPE is a subset of a locale that applies to character functions. The UPPER, LOWER, and TRANSLATE scalar functions use the CURRENT LOCALE LC_CTYPE system default or special register. The results of these functions can vary, depending on the setting of the locale.

The following values are possible:

BLANK
The source field is empty.

This is the default, unless it is necessary to run the UPPER, LOWER, or TRANSLATE functions for data that must be interpreted using the rules provided by specific locales, for example, En_US or Fr_CA.

1st word
The source field contains left-justified word(s), where each byte of a word is > X'40'. It can be a single word or several ones, delimited by bytes <= X'40'.

Note: These hexadecimal codes do not represent printable characters.

N/P
The source field contains regular words that are not left-justified. This means that the first bytes are <= X'40'. N/P is also shown if the whole source field only consists of bytes < X'40', such as zeros.

Install parameter LOCALE LC_CTYPE on panel DSNTIPF, or ZPARM LC_TYPE in DSNHDECP.

Field Name: QWPBLCTP

DECFLOAT ROUND MODE (DEF_DECFLOAT_ROUND_MODE)
The default rounding mode for the decimal floating point type. Possible values are:

- X'80'  ROUND_CEILING
- X'40'  ROUND_DOWN
- X'20'  ROUND_FLOOR
- X'10'  ROUND_HALF_DOWN
- X'08'  ROUND_HALF_EVEN
- X'04'  ROUND_HALF_UP
- X'02'  ROUND_UP

Otherwise this field shows 'BLANK'.

ZPARM DEF_DECFLOAT_ROUND_MODE in DSNHDECP.

Field Name: QWPBDDRM

**DEFAULT CHARSET (CHARSET)**

Shows the default character set, ALPHANUM or KATAKANA.

ZPARM CHARSET in DSNHDECP.

Field Name: QWPBCHAR

**Application Programming Defaults Panel 2 (DSNTIP4, DSNTIP41):**

This topic shows detailed information about “System Parameters - Application Programming Defaults Panel 2 (DSNTIP4, DSNTIP41)”.

This block is a continuation of DSNTIPF and shows application programming defaults.

The values shown are used as default values by the program preparation panels, the program preparation CLIST (DSNH), and the precompiler. They can also be used as defaults by other programs, such as Query Management Facility (QMF).

Changing some of these defaults is not recommended because changes can make the syntax of existing SQL statements invalid or affect the way application programs run.

**System Parameters - Application Programming Defaults Panel 2 (DSNTIP4, DSNTIP41)**

The field labels shown in the following sample layout of “System Parameters - Application Programming Defaults Panel 2 (DSNTIP4, DSNTIP41)” are described in the following section.

```
APPLICATION PROGRAMMING DEFAULTS PANEL 2 (DSNTIP4,DSNTIP41)
---------------------------------------------------------------
MINIMUM DIVIDE SCALE (DECDIV3)...............................NO
DECIMAL ARITHMETIC (DECARTH)...............................DEC15
USE FOR DYNAMIC RULES (DYNRULS)............................YES
STATIC DESCRIBE (DESCSTAT).................................YES
DATE FORMAT (DATE)............................................ISO
TIME FORMAT (TIME)..........................................ISO
LOCAL DATE LENGTH (DATELEN)..............................N/A
LOCAL TIME LENGTH (TIMELEN)..............................N/A
IMPLICIT TIMEZONE...........................................CURRENT
```
**APPLICATION PROGRAMMING DEFAULTS PANEL 2 (DSNTIP4, DSNTIP41)**

STD SQL LANGUAGE (STDSQL) ............................................. NO
PAD NULL-TERMINATED (PADNTSTR) ...................................... NO
APPL COMPAT LEVEL (APPLCOMPAT) ........................................ N/A
LIKE BLANK INSIGNIFICANT (LIKE_BLANK_INSIGNIFICANT) .......... N/A
FULLY QUALIFIED NAME OF DSNHDECP LOAD MODULE...................
SYS1.DSNEXIT(DSNHDECP)

**MINIMUM DIVIDE SCALE (DECDIV3)**

This field is for IBM service use.

**Field Name:** QWP4DIV3

**DECIMAL ARITHMETIC (DECAR)**

Indicates the rules of precision for a decimal field.

Install parameter DECIMAL ARITHMETIC on panel DSNTIP4, or ZPARM DECAR in DSNHDECP.

**Derivation:** DB2 field QWPBAR

**Field Name:** QWPBARTH

**USE FOR DYNAMIC RULES (DYNRULS)**

Shows whether DB2 uses the application programming defaults specified on this panel or those of the DB2 precompiler options for dynamic SQL statements bound using DYNAMICRULES bind, define, or invoke behavior.

When YES, the application programming (DSNHDECP) defaults are used for dynamic SQL statements in plans or packages bound using DYNAMICRULES bind, define, or invoke behavior.

The following defaults are affected:

- DECIMAL POINT IS
- STRING DELIMITER
- SQL STRING DELIMITER
- MIXED DATA
- DECIMAL ARITHMETIC

When NO, values of the precompiler options are used for dynamic SQL statements in plans or packages bound with DYNAMICRULES(BIND).

Install parameter USE FOR DYNAMICRULES on panel DSNTIP4, or ZPARM DYNRULS in DSNHDECP.

**Field Name:** QWPBDRLS

**STATIC DESCRIBE (DESCSTAT)**

Shows whether DB2 builds a DESCRIBE SQLDA when binding static SQL statements.

A DESCRIBE cannot be issued against a static SQL statement except:

- In a distributed environment, where DB2 for z/OS is the server and the requester supports extended dynamic SQL. In this instance, a DESCRIBE on an SQL statement in the extended dynamic package appears to DB2 as a DESCRIBE on a static SQL statement in the DB2 package.

- When an application uses a stored procedure result set, the application must allocate a cursor for that result set. The application can do this using a DESCRIBE CURSOR statement. The SQL statement actually
described is the one with the cursor declared in the stored procedure. If that statement is static, a static SQL statement must be described.

When NO (default), DB2 does not generate a DESCRIBE SQLDA at BIND time for static SQL statements. If a DESCRIBE request is received at execution time, DB2 generates an error. However, if the describe request comes from a DESCRIBE CURSOR statement, DB2 satisfies the request but is only able to provide data type and length information. Column names are not provided.

When YES, DB2 generates a DESCRIBE SQLDA at BIND time so that DESCRIBE requests for static SQL can be satisfied during execution.

Note: You must rebind packages after this value has been set to YES.

This option increases the size of some packages because the DESCRIBE SQLDA is now stored with each statically-bound SQL SELECT statement.

Install parameter DESCRIBE FOR STATIC on panel DSNTIP4, or ZPARM DESCSTAT in DSN6SPRM.

Field Name: QWP4DSST

DATE FORMAT (DATE)

Default output format for dates.

Valid formats are ISO (yyyy-mm-dd), USA (mm/dd/yyyy), EUR (dd.mm.yyyy), JIS (yyyy-mm-dd), or LOCAL (your choice, defined by a date exit routine). DB2 interprets the input date from the punctuation and converts the output date to the required format.

Install parameter DATE FORMAT on panel DSNTIP4, or ZPARM DATE in DSNHDECP.

Field Name: QWPBDATE

TIME FORMAT (TIME)

Indicates the default output format for times.

Valid values are ISO (hh.mm.ss), USA (hh:mm AM), EUR (hh.mm.ss), JIS (hh:mm:ss), or LOCAL (your choice, defined by a time exit routine). DB2 interprets the input time from the punctuation and converts the output time to the required format.

Install parameter TIME FORMAT on panel DSNTIP4, or ZPARM TIME in DSNHDECP.

Field Name: QWPBTIME

LOCAL DATE LENGTH (DATELEN)

Shows the length of the longest field required to hold a locally defined date.

The default (0) indicates an IBM-supplied format (ISO, JIS, USA, or EUR).

Install parameter LOCAL DATE LENGTH on panel DSNTIP4, or ZPARM DATELEN in DSNHDECP.

Field Name: QWPBDLEN

LOCAL TIME LENGTH (TIMELEN)
Application Programming Defaults Panel 2 (DSNTIP4, DSNTIP41)

Shows the length of the longest field required to hold a time when a locally defined time format is used.

The default (0) indicates an IBM-supplied format (ISO, JIS, USA, or EUR).

Install parameter LOCAL TIME LENGTH on panel DSNTIP4, or ZPARM TIMELEN in DSNHDECP.

Field Name: QWPBTLEN

IMPLICIT TIMEZONE

The implicit time zone that is associated with DB2 table columns and routine parameters that are declared as time stamp with time zone.

For IFCID 106 - Application Programming Defaults, this field is displayed twice, with its hex value and in a readable string.

This field corresponds to DSNHDECP field IMPLICIT_TIMEZONE.

Field Name: QWPBIMTZ

STD SQL LANGUAGE (STDSQL)

Shows whether SQL, the language standard used by applications, conforms to 1986 ANSI SQL standard.

YES Conforms to the 1986 ANSI SQL standard
NO Conforms to the SQL language defined by DB2
86 Conforms to the 1986 ANSI SQL standard

Install parameter STD SQL LANGUAGE on panel DSNTIP4, or ZPARM STDSQL in DSNHDECP.

Field Name: QWPBSQL

PAD NULL-TERMINATED (PADNTSTR)

Shows whether output host variables that are NULL-terminated strings are padded with blanks and a NULL terminator.

When NO, NULL-terminated output host variables have the NULL terminator placed at the end of actual data returned in the host variable. When YES, NULL-terminated output host variables have the NULL terminator placed at the end of the string, after the string has been padded with blanks from the end of the actual data to the declared length of the output host variable.

Install parameter PAD NULL-TERMINATED on installation panel DSNTIP4, or ZPARM PADNTSTR in DSNHDECP.

Field Name: QWPBPAD

APPL COMPAT LEVEL (APPLCOMPAT)

Specifies the DB2 level for downward compatibility with applications. The ZPARM name is APPLCOMPAT in DSN6SPRM.

Field Name: QWP4APCO_VAR

LIKE BLANK INSIGNIFICANT (LIKE_BLANK_INSIGNIFICANT)

YES indicates that blanks are not significant when DB2 applies the LIKE predicate to a string. Blanks are significant in DB2 10.
Application Programming Defaults Panel 2 (DSNTIP4, DSNTIP41)

This setting corresponds to field LIKE BLANK INSIGNIFICANT on installation panel DSNTIP41. The ZPARM name is LIKE_BLANK_INSIGNIFICANT in DSN6SPRM.

Field Name: QWP4LBIN

FULLY QUALIFIED NAME OF DSNHDECP LOAD MODULE

Shows the fully qualified DECP name of the data set from which the DSNHDECP module was loaded.

Field Name: QWPBLNM

Archive Log Installation Parameters (DSNTIPA):

This topic shows detailed information about “System Parameters - Archive Log Installation Parameters (DSNTIPA)”. This block shows the characteristics of archive log data sets.

System Parameters - Archive Log Installation Parameters (DSNTIPA)

The field labels shown in the following sample layout of “System Parameters - Archive Log Installation Parameters (DSNTIPA)” are described in the following section.

ARCHIVE LOG INSTALLATION PARAMETERS (DSNTIPA)

---------------------------------------------
CATALOG ARCHIVE DATASETS (CATALOG).................YES
COPY1 ARCHIVE LOG DEVICE TYPE (UNIT).................DASD
COPY2 ARCHIVE LOG DEVICE TYPE (UNIT2)...............‘BLANK’
SPACE ALLOCATION METHOD (ALCUNIT)....................CYLINDER
PRIMARY SPACE ALLOCATION (PRIQTY)....................100
SECONDARY SPACE ALLOCATION (SECQTY)..................10
ARCHIVE LOG BLOCK SIZE IN BYTES (BLKSIZE)...........24,576
MAXIMUM READ TAPE UNITS (MAXRTU)....................2
TAPE UNIT DEALLOCATION PERIOD (DEALLCT)............0000:00
MAX NUMBER OF DATASETSRecorded in BSDS (MAXARCH).....1,000
FIRST ARCHIVE COPY MASS STG GROUP NAME............‘NONE’
SECOND ARCHIVE COPY MASS STG GROUP NAME.............‘NONE’
DAYS TO RETAIN ARCHIVE LOG DATA SETS (ARCRETN)........30
ISSUE WTOR BEFORE MOUNT FOR ARCHIVE VOLUME (ARCWTOR).YES
COMPACT DATA (COMPACT)..............................NO
QUIESCE PERIOD (QUIESCE)............................5
SINGLE VOLUME (SVOLARC)............................NO

CATALOG ARCHIVE DATASETS (CATALOG)

The alias of the VSAM integrated catalog facility user catalog or the name of the master catalog where the DB2 VSAM data sets created during installation are cataloged. The MVS catalog alias is also used as the high-level qualifier for DB2 VSAM data sets.

Install parameter CATALOG ALIAS on panel DSNTIPA, or ZPARM CATALOG in DSN6ARVP.

Field Name: QWP3CTLG

COPY1 ARCHIVE LOG DEVICE TYPE (UNIT)

The device type or unit name for storing archive log data sets.
The value can be any alphanumeric string. If you choose to archive to DASD, you can specify a generic device type with a limited volume range. DB2 requires that all archive log data sets allocated on DASD are cataloged.

If the device type is DASD, CATALOG DATA must be set to YES. If the unit name specifies DASD, the archive log data sets can extend to a maximum of 15 volumes. PRIQTY and SECQTY must be large enough to contain all active log data set data without extending beyond 15 volumes. If the unit name specifies a tape device, DB2 can extend to a maximum of 20 volumes. Default is TAPE.

Install parameter DEVICE TYPE 1 on panel DSNTIPA, or ZPARM UNIT in DSN6ARVP.

Field Name: QWP3UNT1

COPY2 ARCHIVE LOG DEVICE TYPE (UNIT2)

Indicates the device type or unit name for storing the second copy of archive log data sets.

The value can be any alphanumeric string. If you choose to archive to DASD, you can specify a generic device type with a limited volume range. DB2 requires that all archive log data sets allocated on DASD are cataloged.

If the device type is DASD, then CATALOG DATA must be set to YES. If the unit name specifies DASD, the archive log data sets can extend to a maximum of 15 volumes. PRIQTY and SECQTY must be large enough to contain all active log data set data without extending beyond 15 volumes. If the unit name specifies a tape device, DB2 can extend to a maximum of 20 volumes. Default is TAPE.

Install parameter DEVICE TYPE 2 on panel DSNTIPA, or ZPARM UNIT2 in DSN6ARVP.

Field Name: QWP3UNT2

SPACE ALLOCATION METHOD (ALCUNIT)

The unit used in allocating archive data sets. Possible values are:

- CYLINDER
  - Space allocation by cylinders (QWP3CYL=1)

- TRACKS
  - Space allocation by tracks (QWP3TRCK=1)

- BLOCKS
  - Space allocation by blocks (QWP3CYL=0 and QWP3TRCK=0)

Install parameter ALLOCATION UNITS on panel DSNTIPA, or ZPARM ALCUNIT in DSN6ARVP.

Field Name: RT0106SA

PRIMARY SPACE ALLOCATION (PRIQTY)

The primary space allocation for archive data sets.

Install parameter PRIMARY QUANTITY on installation panel DSNTIPA, or ZPARM PRIQTY in DSN6ARVP.

Field Name: QWP3RISP
SECONDARY SPACE ALLOCATION (SECQTY)

The amount of DASD secondary space allocation for an archive log data set.

The units used are specified by the ALLOCATION UNITS field. When blank (default), the CLIST calculates this space using block size and size of the log.

Install parameter SECONDARY QTY on panel DSNTIPA, or ZPARM SECQTY in DSN6ARVP.

Field Name: QWP3SECS

ARCHIVE LOG BLOCK SIZE IN BYTES (BLKSIZE)

The block size of the archive log data set.

The block size must be compatible with the device type used for archive logs. The value is rounded up to the next multiple of 4096 bytes.

If the archive log is written to tape, use the largest possible block size to improve the reading speed.

Recommended block size values are 28672 for tape, 20480 for 3380, and 24576 for 3390 or RAMAC.

Install parameter BLOCK SIZE on panel DSNTIPA, or ZPARM BLKSIZE in DSN6ARVP.

Field Name: QWP3BKSZ

MAXIMUM READ TAPE UNITS (MAXRTU)

The maximum number of tape units that can be allocated for archive read purposes.

Install parameter READ TAPE UNITS on panel DSNTIPA, or ZPARM MAXRTU in DSN6LOGP.

Field Name: QWP2MRTU

TAPE UNIT DEALLOCATION PERIOD (DEALLCT)

The number of minutes an archive read tape unit can remain unused before it is deallocated.

When archive log data is read from tape, this value should be high enough to allow DB2 to optimize tape handling for multiple read applications.

Install parameter DEALLOC PERIOD on panel DSNTIPA, or ZPARM DEALLCT in DSN6LOGP.

Field Name: QWP2DMIN

MAX NUMBER OF DATASETS RECORDED IN BSDS (MAXARCH)

The maximum number of archive log volumes that can be recorded in the BSDS.

When this number is exceeded, recording resumes at the beginning of the BSDS.

For dual archive, this value applies to each log data set. As an example, a value of 500 allows 500 COPY-1 and 500 COPY-2 data sets in the BSDS.

You must create image copies of all DB2 objects, probably several times, before the archive log data sets are discarded. If you fail to retain an
adequate number of archive log data sets for all the image copies, you might need to cold start or reinstall DB2. In either case, data is lost.

Install parameter RECORDING MAX on panel DSNTIPA, or ZPARM MAXARCH in DSN6LOGP.

Field Name: QWP2ARCL

FIRST ARCHIVE COPY MASS STG GROUP NAME
The mass storage system volume group name of the first storage group.
Field Name: QWP3MSV1

SECOND ARCHIVE COPY MASS STG GROUP NAME
The mass storage system volume group name of the second storage group.
Field Name: QWP3MSV2

DAYS TO RETAIN ARCHIVE LOG DATA SETS (ARCRETN)
The number of days DB2 keeps archive log data sets.
This value is added to the current date to calculate the expiration date.
The retention period is often used in tape management systems to control the reuse and scratching of data sets and tapes. DB2 uses this as the value for the dynamic allocation parameter DALRETPD when archive log data sets are created.
Install parameter RETENTION PERIOD on panel DSNTIPA, or ZPARM ARCRETN in DSN6ARVP.
Field Name: QWP3RETN

ISSUE WTOR BEFORE MOUNT FOR ARCHIVE VOLUME (ARCWTOR)
Indicates whether DB2 must send a message to the operator and wait for an answer before attempting to mount an archive log data set.
Other DB2 users can be forced to wait while the mount is pending. They are not affected while DB2 is waiting for a response to the message.
When YES, a device such as tape is used that requires long delays for mounts. DEVICE TYPE 1 shows the device type or unit name.
Install parameter WRITE TO OPER on panel DSNTIPA, or ZPARM ARCWTOR in DSN6ARVP.
Field Name: QWP3WTOR

COMPACT DATA (COMPACT)
Indicates whether data written to archive logs is compacted.
This option only applies to data written to a 3480 device that has the improved data recording capability (IDRC) feature.
Install parameter COMPACT DATA on panel DSNTIPA, or ZPARM COMPACT in DSN6ARVP.
Field Name: QWP3COMP

QUIESCE PERIOD (QUIESCE)
The maximum amount of time (in seconds) permitted for DB2 to attempt a full system quiesce.
Install parameter QUIESCE PERIOD on panel DSNTIPA, or ZPARM QUIESCE in DSN6ARVP.

Field Name: QWP3MQP

SINGLE VOLUME (SVOLARC)
Indicates whether single-volume DASD archives are used.
Install parameter SINGLE VOLUME on panel DSNTIPA, or ZPARM SVOLARC in DSN6ARVP.

Field Name: QWP3SVOL

Buffer Pool Parameters (DSNTIP1):

This topic shows detailed information about “System Parameters - Buffer Pool Parameters (DSNTIP1)”.

This block shows the default buffer pools for user data and indexes.

System Parameters - Buffer Pool Parameters (DSNTIP1)
The field labels shown in the following sample layout of “System Parameters - Buffer Pool Parameters (DSNTIP1)” are described in the following section.

BUFFER POOL PARAMETERS (DSNTIP1)
-------------------------------------
DEFAULT 4-KB BUFFER POOL FOR USER DATA (TBSBPOOL)...........BP2
DEFAULT 8-KB BUFFER POOL FOR USER DATA (TBSBP8K)...........BP8K0
DEFAULT 16-KB BUFFER POOL FOR USER DATA (TBSBP16K).........BP16K0
DEFAULT 32-KB BUFFER POOL FOR USER DATA (TBSBP32K)........BP32K
DEFAULT BUFFER POOL FOR USER LOB DATA (TBSBLOB)..........BP0
DEFAULT BUFFER POOL FOR USER XML DATA (TBSBPXML).........BP16K0
DEFAULT BUFFER POOL FOR USER INDEXES (IDXPOOL)............BP3

DEFAULT 4-KB BUFFER POOL FOR USER DATA (TBSBPOOL)
The name of the 4 KB buffer pool for user table spaces.
Install parameter DEFAULT BUFFER POOL FOR USER DATA on installation panel DSNTIP1, or ZPARM TBSBPOOL in DSN6SYSP.

Field Name: QWP1TBPL

DEFAULT 8-KB BUFFER POOL FOR USER DATA (TBSBP8K)
The default 8 KB buffer pool for:
• Table spaces with an 8 KB page size in implicitly created databases
• Explicitly created table spaces with an 8 KB page size, but without a buffer pool clause that is specified in the create table space statement.
Install parameter DEFAULT 8-KB BUFFER POOL FOR USER DATA on panel DSNTIP1 or ZPARM TBSBP8K in DSN6SYSP.

Field Name: QWP1TP8

DEFAULT 16-KB BUFFER POOL FOR USER DATA (TBSBP16K)
The default 16 KB buffer pool for:
• Table spaces with a 16 KB page size in implicitly created databases
• Explicitly created table spaces with a 16 KB page size, but without a buffer pool clause that is specified in the create table space statement.
Install parameter DEFAULT 16-KB BUFFER POOL FOR USER DATA on panel DSNTIP1 or ZPARM TBSBP16K in DSN6SYSP.

Field Name: QWP1TP16

DEFAULT 32-KB BUFFER POOL FOR USER DATA (TBSBP32K)

The default 32 KB buffer pool for:
- Table spaces with a 32 KB page size in implicitly created databases
- Explicitly created table spaces with a 32 KB page size, but without a buffer pool clause that is specified in the create table space statement.

Install parameter DEFAULT 32-KB BUFFER POOL FOR USER DATA on panel DSNTIP1 or ZPARM TBSBP32K in DSN6SYSP.

Field Name: QWP1TP32

DEFAULT BUFFER POOL FOR USER LOB DATA (TBSBPLOB)

The name of the buffer pool that is used for implicitly created LOB table spaces. This field corresponds to field default buffer pool for USER LOB DATA on installation panel DSNTIP1. The ZPARM name is TBSBPLOB in DSN6SYSP.

Field Name: QWP1TPLB

DEFAULT BUFFER POOL FOR USER XML DATA (TBSBPXML)

The name of the buffer pool that is used for XML table spaces. This field corresponds to field default buffer pool for USER XML DATA on installation panel DSNTIP1. The ZPARM name is TBSBPXML in DSN6SYSP.

Field Name: QWP1TPXM

DEFAULT BUFFER POOL FOR USER INDEXES (IDXBOOOL)

The name of the 4 KB buffer pool used for indexes on user data.

Install parameter DEFAULT BUFFER POOL FOR USER INDEXES on installation panel DSNTIP1, or ZPARM IDXBPOOL in DSN6SYSP.

Field Name: QWP1IXPL

Data Definition Control Support (DSNTIPZ):

This topic shows detailed information about “System Parameters - Data Definition Control Support (DSNTIPZ)”.

This shows the installation and configuration for data definition control support.

Two SQL tables (application and object registration) are identified and created even if data definition control support is not installed. This simplifies future activation of the facility. Specified application identifiers (DB2 plans or collections of packages) can be registered in the application registration table and, optionally, their associated DB2 object names can be registered in the object registration table. DB2 consults these two tables prior to accepting a given DDL statement to make sure that a particular application identifier and object name are registered.

Fields in this block can contain long names. When a long name exceeds the available space, it is truncated, the parameter identifier and the full name are printed in a separate list at the end of the report.
System Parameters - Data Definition Control Support (DSNTIPZ)

The field labels shown in the following sample layout of “System Parameters - Data Definition Control Support (DSNTIPZ)” are described in the following section.

**DATA DEFINITION CONTROL SUPPORT (DSNTIPZ)**

<table>
<thead>
<tr>
<th>Parameter Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>INSTALL DD CONTROL (RGFINSTL)</td>
<td>NO</td>
</tr>
<tr>
<td>CONTROL ALL APPLICATIONS (RGFDEDPL)</td>
<td>NO</td>
</tr>
<tr>
<td>REQUIRE FULL NAMES (RGFFULLQ)</td>
<td>YES</td>
</tr>
<tr>
<td>UNREGISTERED DDL DEFAULT (RGFDEFLT)</td>
<td>ACCEPT</td>
</tr>
<tr>
<td>REGISTER TABLE OWNER (RGFCOLID)</td>
<td>DSNZPARM</td>
</tr>
<tr>
<td>DDL REGISTRATION DATABASE NAME (RGFDBNAM)</td>
<td>DSNRGFDB</td>
</tr>
<tr>
<td>APPL REGISTRATION TABLE NAME (RGFNMPRT)</td>
<td>DSNZPARMGRFNMPRTD</td>
</tr>
<tr>
<td>OBJECT REGISTRATION TABLE NAME (RGFNMORT)</td>
<td>DSNZPARMGRFNMORTD</td>
</tr>
<tr>
<td>ESCAPE CHARACTER (RGFESCP)</td>
<td>X'40'</td>
</tr>
</tbody>
</table>

**INSTALL DD CONTROL (RGFINSTL)**

Indicates whether data definition support has been installed.

Install parameter INSTALL DD CONTROL SUPT on panel DSNTIPZ, or ZPARM RGFINSTL in DSN6SPRM.

**Field Name:** QWP4REGI

**CONTROL ALL APPLICATIONS (RGFDEDPL)**

Indicates that the DB2 system is completely controlled by a set of closed applications identified in the application registration table.

Closed applications require their DB2 objects to be managed solely through the plans or packages registered in the application registration table.

Install parameter CONTROL ALL APPLICATIONS on panel DSNTIPZ, or ZPARM RGFDEDPL in DSN6SPRM.

**Field Name:** QWP4REGD

**REQUIRE FULL NAMES (RGFFULLQ)**

Indicates whether registered objects require fully qualified names.

Install parameter REQUIRE FULL NAMES on panel DSNTIPZ, or ZPARM RGFFULLQ in DSN6SPRM.

**Field Name:** QWP4REGQ

**UNREGISTERED DDL DEFAULT (RGFDEFLT)**

The action taken for DDL that names an unregistered object.

Options are REJECT, ACCEPT, or APPL, which rejects the DDL when the current application is not registered.

Install parameter UNREGISTERED DDL DEFAULT on panel DSNTIPZ, or ZPARM RGFDEFLT in DSN6SPRM.

**Field Name:** QWP4REGU

**REGISTER TABLE OWNER (RGFCOLID)**

The owner of the application registration table and the object registration table.

This identifier can be a long string. If there is insufficient space to show the complete string, the string is truncated in the report block. The complete string is shown in a separate list of long names at the end of the report.
Data Definition Control Support (DSNTIPZ)

Install parameter REGISTRATION OWNER on panel DSNTIPZ, or ZPARM RGFCOLID in DSN6SPRM.

**Field Name:** QWP4REGC

**DDL REGISTRATION DATABASE NAME (RGFDBNAM)**

The name of the database that contains the registration tables.

Install parameter REGISTRATION DATABASE on panel DSNTIPZ, or ZPARM RGFDBNAM in DSN6SPRM.

**Field Name:** QWP4REGN

**APPL REGISTRATION TABLE NAME (RGFNMPRT)**

The name of the application registration table.

Install parameter APPL REGISTRATION TABLE on panel DSNTIPZ or ZPARM RGFNMPRT in DSN6SPRM.

**Field Name:** QWP4REGA

**OBJECT REGISTRATION TABLE NAME (RGFNMORT)**

The name of the object registration table.

Install parameter OBJT REGISTRATION TABLE on panel DSNTIPZ, or ZPARM RGFNMORT in DSN6SPRM.

**Field Name:** QWP4REGO

**ESCAPE CHARACTER (RGFESCP)**

The escape character used in the application registration table (ART) or object registration table (ORT).

Sets of names in the ART and ORT can be represented by patterns that use the underscore (_) and percent sign (%) characters in the same way as in an SQL LIKE predicate.

Install parameter ART/ORT ESCAPE CHARACTER on panel DSNTIPZ, or ZPARM RGFESCP in DSN6SPRM.

**Field Name:** QWP4ESC

Data parameters (DSNTIPA3):

This topic shows detailed information about "System Parameters - Data Parameters Panel (DSNTIPA3)."

---

**DATA PARAMETERS PANEL (DSNTIPA3)**

**ZHYPERLINKS SCOPE (ZHYPERLINK)**

The scope of zHyperLink I/O usage for this Db2 subsystem. Valid values are:

**DISABLED**

zHyperLink I/O not used by this subsystem
ENABLED
All eligible I/Os will use zHyperLink if possible

DATABASE
zHyperLink will only be used for eligible I/O on database objects

ACTIVELOG
zHyperLink will only be used for eligible I/O on active log object

Field name: QWP4ZHYPL

Define Group or Member (DSNTIPK):

This topic shows detailed information about “System Parameters - Define Group or Member (DSNTIPK)”.

This panel shows the members in a data sharing group.

DB2 subsystems that share data must belong to a DB2 data sharing group, which runs on a Parallel Sysplex. A data sharing group is a collection of one or more DB2 subsystems that access shared DB2 data. A Parallel Sysplex is a collection of MVS systems that communicate and cooperate with each other.

System Parameters - Define Group or Member (DSNTIPK)

The field labels shown in the following sample layout of “System Parameters - Define Group or Member (DSNTIPK)” are described in the following section.

DEFINE GROUP OR MEMBER (DSNTIPK)

GROUP NAME (GRPNAME)....................................DSNDBPG
MEMBER NAME (MEMBNAME).....................................DBP0
MAX NUMBER OF MEMBERS.......................................248
RANDOM ATTACH (RANDOMATT)...................................YES
DEL CF STRUCTS (DEL_CFSTRUCTS_ON_RESTART)....................NO
PARALLELISM ASSISTANT (ASSIST)..................................NO
PARALLELISM COORDINATOR (COORDNTR)..........................NO

GROUP NAME (GRPNAME)
The name of the DB2 data sharing group.
The group name encompasses the entire data sharing group and is the basis for the coupling facility structure names.
N/A means this DB2 is not part of a data sharing group.
Install parameter GROUP NAME on panel DSNTIPK, or ZPARM GRPNAME in DSN6GRP.
Field Name: QWPAGRPN

MEMBER NAME (MEMBNAME)
The member name of this DB2.
N/A means this DB2 is not part of a data sharing group.
Install parameter MEMBER NAME on panel DSNTIPK, or ZPARM MEMBNAME in DSN6GRP.
Field Name: QWPAMBRN

MAX NUMBER OF MEMBERS
The maximum number of members possible in a data sharing group. This is a constant (248) and is not shown on any installation panel.

Field Name: QWPAMAXM

RANDOM ATTACH (RANDOMATT)

Specifies a random group attach flag:
N Not eligible for random group attach.
NOT N Eligible for random group attach.

This field corresponds to field RANDOM ATTACH on installation panel DSNTIPK. The ZPARM name is RANDOMATT in DSN6GRP.

Field Name: QWPARAND

DEL CF STRUCTS (DEL_CFSTRUCTS_ON_RESTART)

Shows whether to:
• Delete change-data (CD) structures during restart
• Attempt to delete coupling-facility (CF) structures, including shared communications area (SCA) structures, internal resource lock manager (IRLM lock) structures, and allocated group buffer pools.

This field corresponds to field DEL CF STRUCTS on installation panel DSNTIPK.

ZPARM name DEL_CFSTRUCTS_ON_RESTART in DSN6SYSP.

Field Name: QWP1DCFS

PARALLELISM ASSISTANT (ASSIST)

Shows whether this DB2 member can assist a parallelism coordinator with parallel processing.

When YES, this member is considered an assistant at both bind and run time. To be a viable assistant at run time, both the VPPSEQT and VPXPSEQT buffer pool thresholds of this member must be greater than 0.

N/A means this DB2 is not part of a data sharing group.

Install parameter ASSISTANT on panel DSNTIPK or ZPARM ASSIST in DSN6GRP.

Field Name: QWPAAESS

PARALLELISM COORDINATOR (COORDNTR)

Shows whether this DB2 member can coordinate parallel processing on other members of the group.

When NO, a query can be processed by this DB2 member only.

When YES, a read-only query running on this DB2 member can be processed in part on other members of the group.

N/A means this DB2 is not part of a data sharing group.

Install parameterCOORDINATOR on panel DSNTIPK or ZPARM COORDNTR in DSN6GRP.

Field Name: QWPACOOR
Databases and Spaces Started Automatically (DSNTIPS):

This topic shows detailed information about “System Parameters - Databases and Spaces Started Automatically (DSNTIPS)”.

This block shows the databases, table spaces, and index spaces that are started or restarted automatically when DB2 is started. ZP ARM ALL/dbname in DSN6SPRM.

System Parameters - Databases and Spaces Started Automatically (DSNTIPS):

The field labels shown in the following sample layout of “System Parameters - Databases and Spaces Started Automatically (DSNTIPS)” are described in the following section.

DATABASES AND SPACES STARTED AUTOMATICALLY (DSNTIPS)
----------------------------------------------------
ALL

DATABASE NAME

The name of a database that is to be started automatically.

Field Name: QWP8DBNM

SPACE NAME

Contains the name of a table space or index space that is to be started automatically.

Field Name: QWP8SPNM

Default Startup Modules (DSNTIPO3):

This topic shows detailed information about “System Parameters - Default Startup Modules (DSNTIPO3)”.

System Parameters - Default Startup Modules (DSNTIPO3)

The field labels shown in the following sample layout of “System Parameters - Default Startup Modules (DSNTIPO3)” are described in the following section.

DEFAULT STARTUP MODULES (DSNTIPO3)
----------------------------------
PARAMETER MODULE..........................DSNZPARM
ACCESS CONTROL (ACCESS_CNTL_MODULE)..........................DSNX0XAC
IDENTIFY/AUTH (IDAUTH_MODULE)..........................DSN30ATH
SIGNON (SIGNON_MODULE)..........................DSN30SGN

PARAMETER MODULE

Shows the name of the active subsystem parameter module.

This field corresponds to field PARAMETER MODULE on installation panel DSNTIPO3.

Field Name: QWP1ZPNM

ACCESS CONTROL (ACCESS_CNTL_MODULE)

Shows the name of the default access control exit module.

This field corresponds to field ACCESS CONTROL on installation panel DSNTIPO3. The ZP ARM name is ACCESS_CNTL_MODULE in DSN6SYSP.

Field Name: QWP1DXAC
IDENTIFY/AUTH (IDAUTH_MODULE)

Shows the name of the default identify or authorization exit module.

This field corresponds to field IDENTIFY/AUTH on installation panel DSNTIPO3. The ZPARM name is IDAUTH_MODULE in DSN6SYSP.

Field Name: QWP1DATH

SIGNON (SIGNON_MODULE)

Shows the name of the default signon exit module.

This field corresponds to field SIGNON on installation panel DSNTIPO3. The ZPARM name is SIGNON_MODULE in DSN6SYSP.

Field Name: QWP1DSGN

Distributed Data Facility Panel 1 (DSNTIPR):

This topic shows detailed information about “System Parameters - Distributed Data Facility Panel 1 (DSNTIPR)”.

This block shows how Distributed Data Facility (DDF) was started and the names used to connect another DB2 subsystem.

To use DDF, you must have VTAM installed, even if you use TCP/IP connections only.

System Parameters - Distributed Data Facility Panel 1 (DSNTIPR)

The field labels shown in the following sample layout of “System Parameters - Distributed Data Facility Panel 1 (DSNTIPR)” are described in the following section.

DISTRIBUTED DATA FACILITY PANEL 1 (DSNTIPR)
---------------------------------------------
FACILITY NAME...............................................DDF
DDF STARTUP OPTION (DFD).................................AUTO
RLST ACCESS ERROR (RLFERRD)..............................NOLIMIT
RESYNCHRONIZATION INTERVAL IN MINUTES (RESYNC).........2
DBAT STATUS (CMTSTAT)......................................INACTIVE
MAX TYPE 1 INACTIVE THREADS (MAXTYPE1)........................0
IDLE THREAD TIMEOUT INTERVAL (IDTHTOIN)...............1,800
EXTENDED SECURITY (EXTSEC)..............................YES
USER ID AND PASSWORD REQUIRED..........................NO
SQL INTERRUPT PROCESSING DISABLED (SQLINTRP)..........NO
PRIVATE PROTOCOL (PRIVATE_PROTOCOL)..................AUTH

FACILITY NAME

The name of the DDF facility.
Field Name: QWP9NAME

DDF STARTUP OPTION (DFD)

Indicates whether DDF is loaded, and if so, how it was started.

When NO, DDF was not loaded at DB2 startup and cannot be started.
AUTO means DDF was loaded and started automatically when DB2 was started. The DDF address space was started as part of DDF initialization.
COMMAND means DDF was initialized and the DDF address space was started at DB2 startup. If DDF is running, it was started from the console with the -DSN1 START DDF command. If it is not running, it can be started with this command.

Install parameter DDF STARTUP OPTION on panel DSNTIPR, or ZPARM DDF in DSN6FAC.

Field Name: QWP9STRT

RLST ACCESS ERROR (RLFERRD)

Shows what DB2 does when the governor cannot access the resource limit specification table or when no row in the table matches the currently executing statement.

NOLIMIT (default) allows all dynamic SQL statements to run without limit.

NORUN terminates all dynamic SQL statements immediately with an SQL error code.

The number of CPU service units allowed for a query can be anywhere from 1 to 5000000.

Install parameter RLST ACCESS ERROR on panel DSNTIPR, or ZPARM RLFERRD in DSN6FAC (DB2 field QWP9RLER).

Field Name: QWP9RLER

RESYNCHRONIZATION INTERVAL IN MINUTES (RESYNC)

The number of minutes between resynchronization periods.

A resynchronization period is the time during which indoubt logical units of work involving this DB2 subsystem and partner logical units are processed.

Install parameter RESYNC INTERVAL on panel DSNTIPR, or ZPARM RESYNC in DSN6FAC.

Field Name: QWP9RYC

DBAT STATUS (CMTSTAT)

 Shows whether DB2 inactivates threads that have successfully committed or rolled back, and hold no cursors.

ACTIVE provides the best performance but consumes system resources.

INACTIVE is recommended when the installation must support a large number of connections.

When a thread becomes eligible for inactivation, DB2 tries to make it a type 2 inactive thread, which uses less storage than a type 1 inactive thread. If this fails, DB2 tries to make it a type 1 inactive thread. If neither attempt is successful, the thread remains active.

Install parameter DDF THREADS on panel DSNTIPR, or ZPARM CMTSTAT in DSN6FAC.

Field Name: QWP9CMST

MAX TYPE 1 INACTIVE THREADS (MAXTYPE1)

Indicates the number of type 1 inactive threads that DB2 allows.
A large number of type 1 inactive threads can adversely affect system performance. Type 1 inactive threads are used for DB2 private protocol.

DRDA uses type 2 inactive threads.

Zero indicates that type 1 inactive connections are not allowed. Threads remain active when they become eligible to be made a type 1 inactive thread.

A value greater than zero indicates that type 1 inactive connections are allowed, but are limited to this number. When a thread becomes eligible to be made a type 1 inactive thread, and this threshold is reached, the remote connection is terminated.

When this is equal to MAX REMOTE CONNECTED on panel DSNTIPE, DB2 allows all remote threads to become type 1 inactive threads.

Install parameter MAX INACTIVE DBATS on panel DSNTIPR, or ZPARM MAXTYPE1 in DSN6FAC.

**Field Name:** QWP9MAX1

**IDLE THREAD TIMEOUT INTERVAL (IDTHTOIN)**

The approximate time, in seconds, that an active server thread can remain idle before it is canceled.

Inactive and indoubt threads are not subject to timeout.

Threads are checked for timeouts every 3 minutes. This means that timeouts might not be honored for up to 3 minutes when the timeout value is less than this.

0 (default) means timeout processing is disabled, idle server threads remain in the system and continue to hold their resources, if any.

Install parameter IDLE THREAD TIMEOUT on panel DSNTIPR, or ZPARM IDTHTOIN in DSN6FAC.

**Field Name:** QWP9TT0

**EXTENDED SECURITY (EXTSEC)**

Extended security options.

When YES (strongly recommended), detailed reason codes are returned to a DRDA level 3 client when a DDF connection request fails because of security errors. When using SNA protocols, the requester must have included a product that supports the extended security sense codes, such as DB2 Connect version 5 and subsequent releases.

RACF users can change their passwords using the DRDA change password function. This support is only for DRDA level 3 requesters that have implemented support for changing passwords.

YES allows properly enabled DRDA clients to determine the cause of security failures without requiring DB2 operator support.

When NO, generic error codes are returned to the clients and RACF users are prevented from changing their passwords.

Install parameter EXTENDED SECURITY on panel DSNTIPR, or ZPARM EXTSEC in DSN6SYSP.

**Field Name:** QWP1SCER

**USER ID AND PASSWORD REQUIRED**
Shows whether user ID and password are required. In addition, one of the following is required:

- The user ID and password and any RACF PassTickets (A PassTicket is a one-time-only password that is generated by a requesting product or function) are Advanced Encryption Standard (AES) encrypted.
- A Kerberos ticket is required.
- The connection is protected by a z/OS Communications Server IP Application Transparent Transport Layer Security (AT-TLS) policy, which is ensured through a DB2 SECPORT.
- The connection is protected by an IPSec tunnel.

Field Name: QWP9TCPVE

SQL INTERRUPT PROCESSING DISABLED (SQLINTRP)

Shows how SQL interrupts are processed. It can have the following values:

- NO  SQL interrupt processing is enabled.
- YES DB2 SQL interrupt support is disabled.

Note: YES should only be used if remote client systems experience failures because of SQL interrupts. In this case, SQL interrupt support should be disabled only until the remote client systems can be modified to tolerate SQL interrupts.

ZPARM name SQLINTRP in DSN6FAC.

Field Name: QWP9SINTD

PRIVATE PROTOCOL (PRIVATE_PROTOCOL)

Shows if it is allowed to use the private protocol. It can have the following values:

- YES Allows private-protocol-related plan-owner-based package authorization behavior. Plan-owner-based package execution authorization semantics are honored for DB2 for z/OS DRDA requester systems that might rely on it. Secondary IDs are not used to determine package execution privileges for remote DB2 for z/OS applications.
- NO Does not allow any private-protocol-related behavior. Plan-owner-based package execution authorization semantics are not honored. This might affect DB2 for z/OS DRDA requester systems that rely on it. Secondary IDs are used to determine package execution privileges for remote DB2 for z/OS applications.

ZPARM name PRIVATE_PROTOCOL in DSN6FAC.

Field Name: QWP9PRVPA

Distributed Data Facility Panel 2 (DSNTIP5):

This topic shows detailed information about “System Parameters - Distributed Data Facility Panel 2 (DSNTIP5)”.

This block shows how Distributed Data Facility (DDF) was started and the names used to connect to another DB2 subsystem.

To use DDF, you must have VTAM installed, even if you use TCP/IP connections only.
**Note:** The fields shown on this panel depend on the installed DB2 version.

**System Parameters - Distributed Data Facility Panel 2 (DSNTIP5)**

The field labels shown in the following sample layout of “System Parameters - Distributed Data Facility Panel 2 (DSNTIP5)” are described in the following section.

---

**TCP/IP ALREADY VERIFIED (TCPALVER)**

Indicates whether DB2 accepts TCP/IP connection requests containing only a user ID.

When YES, a connection request is accepted with a user ID only. This value must be the same for all members of a data sharing group.

When NO (default), TCP/IP clients must provide authentication information (password, RACF PassTicket, or Kerberos ticket) to gain access to DB2.

Install parameter TCP/IP ALREADY VERIFIED on panel DSNTIP5, or ZPARM TCPALVER in DSN6FAC.

**Field Name:** QWP9TCPA

**EXTRA BLOCKS REQ (EXTRAREQ)**

The maximum number of extra DRDA query blocks DB2 requests from a remote DRDA server.

The default is 100.

This controls the total amount of data that can be transmitted on any given network exchange. It does not limit the size of the SQL query answer set.

Install parameter EXTRA BLOCKS REQ on panel DSNTIP5, ZPARM EXTRAREQ in DSN6SYSP.

**Field Name:** QWP1EXBR

**EXTRA BLOCKS SRV (EXTRASRV)**

The maximum number of extra DRDA query blocks DB2 returns to a DRDA client.

The default is 100.

This controls the total amount of data that can be transmitted on any given network exchange. It does not limit the size of the SQL query answer set.

Install parameter EXTRA BLOCKS SRV on panel DSNTIP5, ZPARM EXTRASRV in DSN6SYSP.

**Field Name:** QWP1EXBS

**TCP/IP KEEPALIVE (TCPKPALV)**
Indicates whether the TCP/IP configuration KeepAlive value has been overwritten.

When ENABLE (default), KeepAlive is enabled, the TCP/IP configuration stack value is used.

When DISABLE, TCP/IP KeepAlive has been disabled.

A value in the range 1 through 65534 means KeepAlive is active, and the TCP/IP stack value has been overridden. The number reported shows the time, in seconds, between TCP/IP probes.

When considering overwriting the keep-alive time, it is recommended to set a value close to the IDLE THREAD TIMEOUT value on installation panel DSNTIPR or the IRLM RESOURCE TIMEOUT value on installation panel DSNTIPI. It is good practice to set all these to about five minutes, or less.

Because KeepAlive detection is accomplished by probing the network at this interval, avoid small values, which can cause excessive network traffic and system resource consumption.

The trick is to find a proper balance that allows network failures to be detected on a timely basis without impacting system and network performance.

Install parameter TCP/IP KEEPALIVE on panel DSNTIP5, ZPARM TCPKPALV in DSN6FAC.

Field Name: QWP9TCKA

**CONNECTION QUEUE MAX DEPTH (MAXCONQN)**

The maximum depth of the connection-request queue of connections that are waiting for a DBAT to process a request. If this value is non-zero, and QWP9CMST is active, or the subsystem is not a member of a data sharing group, DB2 operates as if this value were 0.

A value of 0 is displayed for OFF; a value of 32767 is displayed for ON.

This field corresponds to field CONN QUEUE MAX DEPTH on installation panel DSNTIP5. The ZPARM name is MACONQN in DSN6FAC.

Field Name: QWP9MCONQN

**CONNECTION QUEUE MAX WAIT (MAXCONQW)**

The maximum time that a connection waits for a DBAT request. If this value is non-zero, and QWP9CMST is active, or the subsystem is not a member of a data sharing group, DB2 operates as if this value is 0.

A value of 0 is displayed for OFF; a value of 1 is displayed for ON.

This field corresponds to field CONN QUEUE MAX WAIT on installation panel DSNTIP5. The ZPARM name is MAXCONQW in DSN6FAC.

Field Name: QWP9MCONQW

**POOL THREAD TIMEOUT (POOLINAC)**

The approximate time, in seconds, that a DBAT can remain idle in the pool before it is terminated.

A DBAT thread in the pool counts as an active thread against MAX REMOTE ACTIVE and can hold locks, but does not have any cursors.
Threads are checked for timeouts every 3 minutes. This means that timeouts might not be honored for up to 3 minutes when the timeout value is less than this. The default is 120.

Install parameter POOL THREAD TIMEOUT on panel DSNTIP5, ZPARM POOLINAC in DSN6FAC.

**Field Name:** QWP9INAC

### DB2 Catalog and Directory Panel (DSNTIPA2):

This topic shows detailed information about “System Parameters - DB2 Catalog and Directory Panel (DSNTIPA2)”.

### System Parameters - DB2 Catalog and Directory Panel (DSNTIPA2)

The field labels shown in the following sample layout of “System Parameters - DB2 Catalog and Directory Panel (DSNTIPA2)” are described in the following section.

#### DB2 CATALOG AND DIRECTORY PANEL (DSNTIPA2)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>SMS Data Class for Catalog Data (CATDDACL)</th>
<th>SMS Management Class for Catalog Data (CATDMGCL)</th>
<th>SMS Storage Class for Catalog Data (CATDSTCL)</th>
<th>SMS Data Class for Catalog Index Data (CATXDAACL)</th>
<th>SMS Management Class for Catalog Index Data (CATXMGCL)</th>
<th>SMS Storage Class for Catalog Index Data (CATXSTACL)</th>
<th>COMPRESS SPT01</th>
<th>SPT01 INLINE LENGTH</th>
</tr>
</thead>
<tbody>
<tr>
<td>Value</td>
<td>N/P</td>
<td>N/P</td>
<td>SCPProd</td>
<td>N/P</td>
<td>N/P</td>
<td>SCPProd</td>
<td>YES</td>
<td>32,138</td>
</tr>
</tbody>
</table>

**SMS DATA CLASS FOR CATALOG DATA (CATDDACL)**

The SMS data class for DB2 catalog data sets. This field corresponds to column SMS data class in field “Directory and catalog data” on installation panel DSNTIPA3. The ZPARM name is CATDDACL in DSN6SPRM.

**Field Name:** QWP4CDDC

**SMS MANAGEMENT CLASS FOR CATALOG DATA (CATDMGCL)**

The SMS management class for DB2 catalog data sets. This field corresponds to column SMS MGMT class in field "Directory and catalog data" on installation panel DSNTIPA3. The ZPARM name is CATDMGCL in DSN6SPRM.

**Field Name:** QWP4CDMC

**SMS STORAGE CLASS FOR CATALOG DATA (CATDSTCL)**

The SMS storage class for DB2 catalog data sets. This field corresponds to column SMS STOR class in field “Directory and catalog data” on installation panel DSNTIPA3. The ZPARM name is CATDSTCL in DSN6SPRM.

**Field Name:** QWP4CDSC

**SMS DATA CLASS FOR CATALOG INDEX DATA (CATXDAACL)**

The SMS data class for DB2 catalog index data sets. This field corresponds to column SMS data class in field "Directory and catalog indexes" on installation panel DSNTIPA3. The ZPARM name is CATXDAACL in DSN6SPRM.

**Field Name:** QWP4CXDC
SMS MANAGEMENT CLASS FOR CATALOG INDEX DATA (CATXMGCL)

The SMS management class for DB2 catalog index data sets. This field corresponds to column SMS MGMT class in field “Directory and catalog indexes” on installation panel DSNTIPA3. The ZPARM name is CATXMGCL in DSN6SPRM.

Field Name: QWP4CXMC

SMS STORAGE CLASS FOR CATALOG INDEX DATA (CATXSTCL)

The SMS storage class for DB2 catalog index data sets. This field corresponds to column SMS STOR class in field “Directory and catalog indexes” on installation panel DSNTIPA3. The ZPARM name is CATXSTCL in DSN6SPRM.

Field Name: QWP4CXSC

COMPRESS SPT01 (COMPRESS_SPT01)

Enables the compression of SPT01.

Field Name: QWP4CS01

SPT01 INLINE LENGTH (SPT01_INLINE_LENGTH)

The maximum length in bytes of LOB columns in the SPT01 directory space that are maintained in the base table. This field corresponds to field SPT01 INLINE LENGTH on installation panel DSNTIPA2. The ZPARM name is SPT01_INLINE_LENGTH in DSN6SPRM.

Field Name: QWP4S1IL

DB2 Utilities Parameters (DSNTIP6, DSNTIP61, DSNTIP62):

This topic shows detailed information about “System Parameters - DB2 Utilities Parameters (DSNTIP6, DSNTIP61, DSNTIP62)”.

This block shows the default behavior of enhancements to the BACKUP SYSTEM and other utilities.

System Parameters - DB2 Utilities Parameters (DSNTIP6, DSNTIP61, DSNTIP62)

The field labels shown in the following sample layout of “System Parameters - DB2 Utilities Parameters (DSNTIP6, DSNTIP61, DSNTIP62)” are described in the following section.

DB2 UTILITIES PARAMETERS (DSNTIP6,DSNTIP61,DSNTIP62)

=================================================================================================================================
TEMPORARY UNIT NAME (VOLTDEVT)...............................SYSDA
UTIL TEMP STORCLAS (UTIL TEMP STORCLAS)......................N/P
STATISTICS HISTORY (STATHIST)................................NONE
STATISTICS ROLLUP (STATROLL)...................................YES
UTILITY TIMEOUT FACTOR (UTIMOUT)...............................6
UT SORT DATA SET ALLOCATION (UTSORTAL).......................YES
IGNORE SORTNUM STMT (IGNSORTN)..............................NO
SET CHECK PENDING (CHECK SETCHKP)............................NO
UT DB2 SORT USE (DB2SORT).................................YES
TEMPLATE TIME (TEMPLATE_TIME).........................UTC
MAXIMUM DEGREE OF UTILITY PARALLELISM (PARAMDEG_UTIL)....99
FAST REPLICATION (CHECK FASTREPLICATION)....................PREFERRED
FAST RESTORE (REC FASTREPLICATION)..........................PREFERRED
COPY FAST REPLICATION (COPY FASTREPLICATION)................PREFERRED
FLASHCOPY PPRC (FLASHCOPY_PPRC)............................REQUIRED
DEFAULT TEMPLATE (FCCOPYDDN)..............................
TEMPORARY UNIT NAME (VOLTDEVT)

Shows the device type or unit name for allocating temporary data sets. It is the direct access or disk unit name used for the precompiler, compiler, assembler, sort, linkage editor, and utility work-files in the tailored jobs and CLISTS.

It can be any device type acceptable to the DYNALLOC parameter of the SORT or OPTION options for DFSORT.

The default is SYSDA.

Install parameter TEMPORARY UNIT NAME on DSNTIPA2, or ZPARM VOLTDEVT in DSN6SPRM.

Field Name: QWP4VDTY

UTIL TEMP STORCLAS (UTIL_TEMP_STORCLAS)

Specifies the name of the SMS storage class that DB2 uses for defining temporary shadow data sets. A blank value indicates that the temporary shadow data sets a defined in the same storage class as the production page set. This field corresponds to field "UTIL TEMP STORCLAS" on installation panel DSNTIP6. The ZPARM name is UTIL_TEMP_STORCLAS in DSN6SPRM.

Field Name: QWP4CHEC

STATISTICS HISTORY (STATHIST)

Shows which inserts and updates are recorded in catalog history tables.

The report can show the following values:

N / NONE
Changes in the catalog are not recorded. This is the default.

A / ALL
All inserts and updates in the catalog are recorded.

P / ACCESSPATH
All inserts and updates to access path related catalog statistics are recorded.
S / SPACE
All inserts and updates to space related catalog statistics are recorded.

Install parameter STATISTICS HISTORY on panel DSNTIPO, or ZPARM STATHIST in DSN6SPRM.

Field Name: QWP4STHT

STATISTICS ROLLUP (STATROLL)
Shows whether RUNSTATS utility aggregates the partition level statistics, even though some parts may not contain data.

This should be YES for DB2 systems that have large partitioned table spaces, index spaces, or both. This enables the aggregation of part level statistics and helps the optimizer to choose a better access path.

Install parameter STATISTICS ROLLUP on panel DSNTIPO, or ZPARM STATROLL in DSN6SPRM.

Field Name: QWP4STRL

UTILITY TIMEOUT FACTOR (UTIMOUT)
Shows how much longer utilities can wait for a resource than SQL applications can.

This is the number of RESOURCE TIMEOUT units that a utility or utility command can wait for a lock or for all claims on a resource of a particular claim class to be released. The default value is 6, meaning a utility can wait 6 times longer than an SQL application for a resource.

Install parameter UTILITY TIMEOUT on panel DSNTIPI, or ZPARM UTIMOUT in DSN6SPRM.

Field Name: QWP4UTO

UT SORT DATA SET ALLOCATION (UTSORTAL)
In DB2 12 this field is a serviceability field.

YES indicates that utilities invoke a SORT use and a space prediction algorithm for dynamically allocated SORT work data sets. The ZPARM name is UTSORTAL in DSN6SPRM.

Field Name: QWP4SRAL

IGNORE SORTNUM STMT (IGNSORTN)
Ignores SORTNUM clause in utility control statements. The ZPARM name is IGNSORTN in DSN6SPRM.

Field Name: QWP4IGSN

SET CHECK PENDING (CHECK_SETCHKP)
In DB2 12 this field is a serviceability field.

YES sets the object in check-pending status when the check utility detects an inconsistency. This field corresponds to field “Set check pending” on installation panel DSNTIP61. The ZPARM name is CHECK_SETCHKP in DSN6SPRM.

Field Name: QWP4CSCP

UT DB2 SORT USE (DB2SORT)

Chapter 6. Batch reporting 4541
**DB2 Utilities Parameters (DSNTIP6, DSNTIP61, DSNTIP62)**

In DB2 12 this field is a serviceability field.

Enables the use of DB2 SORT.

**Field Name:** QWP4DB2SRT

**TEMPLATE TIME (TEMPLATE_TIME)**

Specifies the default setting for the TIME option of the template utility control statement. Possible values are:

- UTC (utility control)
- Local

This field corresponds to field TEMPLATE TIME on installation panel DSNTIP6. The ZPARM name is TEMPLATE_TIME in DSN6SPRM.

**Field Name:** QWP4TPTM

**MAXIMUM DEGREE OF UTILITY PARALLELISM (PARAMDEG_UTIL)**

The maximum degree of utility parallelism.

**Field Name:** QWP4UMD

**FAST REPLICATION (CHECK_FASTREPLICATION)**

The FASTREPLICATION type for check utilities:

- N=NONE
- P=PREFERRED
- R=REQUIRED

This field corresponds to field "Fast replication" in installation panel DSNTIP6. The ZPARM name is CHECK_FASTREPLICATION in DSN6SPRM.

**Field Name:** QWP4CFRP

**FAST RESTORE (REC_FASTREPLICATION)**

Specifies how the Recover utility directs DFSMSdss copy to restore an image copy that was created with FLASHCOPY. This field corresponds to field "Fast restore" on installation panel DSNTIP6. The ZPARM name is REC_FASTREPLICATION.

**Field Name:** QWP4RFRP

**COPY FAST REPLICATION (COPY_FASTREPLICATION)**

Specifies whether FlashCopy fast replication is preferred, required, or should not be used.

This field corresponds to field COPY FAST REPLICATION on INSTALLATION panel DSNTIP61. The ZPARM name is COPY_FASTREPLICATION in DSN6SPRM.

**Field Name:** QWP4CYFR

**FLASHCOPY PPRC (FLASHCOPY_PPRC)**

Specifies the behavior for DFSMSdss FLASHCOPY requests when the target disk storage volume is the primary device in a peer-to-peer remote copy (metro mirror) relationship (DB2 field: QWP4FCPPRC). This field corresponds to field "FLASHCOPY PPRC" on installation panel DSNTIP6. The ZPARM name is FLASHCOPY_PPRC.

**Field Name:** QWP4FCPPRC
DEFAULT TEMPLATE (FCCOPYDDN)

Specifies the default setting of the FCCOPYDDN subsystem parameter for the COPY, LOAD, REBUILD INDEX, REORG INDEX, and REORG TABLESPACE utility control statements when the FLASHCOPY parameter is YES or CONSISTENT. FCCOPYDDN specifies a DB2 utility template data-set name expression that is used to derive the copy data-set name that is allocated by the utility during operation.

This field corresponds to field DEFAULT TEMPLATE on installation panel DSNTIP6. The ZPARM name is FCOPYDDN in DSN6SPRM.

Field Name: QWP4FCCD

FLASHCOPY COPY (FLASHCOPY_COPY)

YES indicates that the Copy utility uses the subsystem parameter settings for FLASHCOPY and FCCOPYDDN when those keywords are not present in the utility control statement. The ZPARM name is FLASHCOPY_COPY in DSN6SPRM.

Field Name: QWP4FCCP

FLASHCOPY LOAD (FLASHCOPY_LOAD)

YES indicates that the load utility uses the subsystem parameter settings for FLASHCOPY, FCCOPYDDN, and FCAUXOBJ when those keywords are not present in the utility control statement. ZPARM NAME: FLASHCOPY_LOAD in DSN6SPRM.

Field Name: QWP4FCLD

FLASHCOPY REORG TABLESPACE (FLASHCOPY_REORG_TS)

YES indicates that the Reorg Tablespace utility uses the subsystem parameter settings for FLASHCOPY, FCCOPYDDN, and FCAUXOBJ when these keywords are not present in the utility control statement. The ZPARM name is FLASHCOPY_REORG_TS in DSN6SPRM.

Field Name: QWP4FCROT

FLASHCOPY REBUILD INDEX (FLASHCOPY_REBUILD_INDEX)

YES indicates that the Rebuild Index utility uses the subsystem parameter settings for FLASHCOPY and FCCOPYDDN when those keywords are not present in the utility control statement (DB2 field: QWP4FCRBI). The ZPARM name is FLASHCOPY_REBUILD_INDEX in DSN6SPRM.

Field Name: QWP4FCRBI

FLASHCOPY REORG INDEX (FLASHCOPY_REORG_INDEX)

YES indicates that the Reorg Index utility uses the subsystem parameter settings for FLASHCOPY and FCCOPYDDN when these keywords are not present in the utility control statement (DB2 field: QWP4FCROI). The ZPARM name is FLASHCOPY_REORG_INDEX in DSN6SPRM.

Field Name: QWP4FCROI

SYSTEM-LEVEL BACKUPS (SYSTEM_LEVEL_BACKUPS)

Shows if RECOVER uses system level backups as the recovery base.

Install parameter SYSTEM-LEVEL BACKUPS on installation panel DSNTIP6, or ZPARM SYSTEM_LEVEL_BACKUPS in DSN6SPRM.

Field Name: QWP4SLBU
**DB2 Utilities Parameters (DSNTIP6, DSNTIP61, DSNTIP62)**

**RESTORE/RECOVER (RESTORE_RECOVER_FROMDUMP)**

If YES, the system-level backup that is the recovery base, is from a dump on tape. Otherwise NO is shown.

Install parameter RESTORE/RECOVER on installation panel DSNTIP6, or ZPARM RESTORE_RECOVER_FROMDUMP in DSN6SPRM.

**Field Name:** QWP4RRFD

**DUMP CLASS NAME (UTILS_DUMP_CLASS_NAME)**

The name of the DFSMSHSM dump class used by the restore system utility to restore from a system-level backup that has been dumped to tape.

Install parameter DUMP CLASS NAME on installation panel DSNTIP6, or ZPARM UTILS_DUMP_CLASS_NAME in DSN6SPRM.

**Field Name:** QWP4RSDC

**MAXIMUM TAPE UNITS (RESTORE_TAPEUNITS)**

The maximum number of tape units or tape drives that the restore system utility can use to restore from a system-level backup that has been dumped to tape.

A value of 0 is displayed for NOLIMIT.

Install parameter MAXIMUM TAPE UNITS on installation panel DSNTIP6, or ZPARM RESTORE_TAPEUNITS in DSN6SPRM.

**Field Name:** QWP4RSMT

**REORG PART SORT NPSI (REORG_PART_SORT_NPSI)**

Specifies the default method of building a non-partitioned secondary index during the REORG tablespace part. This setting is used when the SORTNPSI keyword is not specified in a utility control statement.

Possible values are:
- `Auto`
- `Disable`
- `Enable`

This field corresponds to field REORG PART SORT NPSI in installation panel DSNTIP61. The ZPARM name is REORG_PART_SORT_NPSI in DSN6SPRM.

**Field Name:** QWP4RPSN

**REORG LIST PROCESSING (REORG_LIST_PROCESSING)**

Specifies the default value for the REORG TABLESPACE PARALLEL option.
- `Parallel`
- `Serial`

The ZPARM name is REORG_LIST_PROCESSING in DSN6SPRM.

**Field Name:** QWP4RLPR

**REORG MAPPING DATABASE (REORG_MAPPING_DATABASE)**

The default database in which REORG TABLESPACE SHRLLEVEL change implicitly creates the mapping table. This field corresponds to field
RECORD MAPPING DB on installation panel DSNTIP61. The ZPARM name RECORD_MAPPING_TABLE in DSN6SPRM.

Field Name: QWP4RMDB

REORG DROP PBG PARTS (REORG_DROP_PBG_PARTS)
If YES, REORG completes, REORG drops empty, and trailing partitions are set in a PARTITION-BY-GROWTH table space.
This field corresponds to field REORG DROP PBG PARTS on INSTALLATION panel DSNTIP61. The ZPARM name is REORG_DROP_PBG_PARTS in DSN6SPRM.

Field Name: QWP4RPBG

UTILITY CACHE OPTION (SEQPRES) (DB2 10 only)
Shows whether utilities that scan a nonpartitioned index followed by an update of a subset of the pages in the index allow data to remain in 3990 cache longer when reading data.
Install parameter UTILITY CACHE OPTION on panel DSNTIPE, or ZPARM SEQPRES in DSN6PRM.

Field Name: QWP4PST

STATISTICS CLUSTERING (STATCLUS) (DB2 10 only)
Shows if the RUNSTATS utility uses enhanced or standard clustering statistics: ENHANCED is used if it is on, otherwise STANDARD is shown.
Install parameter STATISTICS CLUSTERING on panel DSNTIP6, or ZPARM STATCLUS in DSN6SPRM.

Field Name: QWP4STCL

ALTERNATE COPYPOOL (ALTERNATE_CP)
Specifies an optional alternate SMS copy pool for the DB2 BACKUP SYSTEM utility.
This field corresponds to field ALTERNATE COPYPOOL on INSTALLATION panel DSNTIP62. The ZPARM name is ALTERNATE_CP in DSN6SPRM.

Field Name: QWP4BSACP

DB BACKUP STG GROUP (UTIL_DBBSG)
Specifies an optional backup SMS storage group to be used by the DB2 BACKUP SYSTEM utility for the DB copy pool.
This field corresponds to field DB BACKUP STG GROUP on INSTALLATION panel DSNTIP62. The ZPARM name is UTIL_DBBSG in DSN6SPRM.

Field Name: QWP4UDBSG

LOG BACKUP STG GROUP (UTIL_LGBSG)
Specifies an optional backup SMS storage group to be used by the DB2 BACKUP SYSTEM utility for the LOG copy pool.
This field corresponds to field LOG BACKUP STG GRP on INSTALLATION panel DSNTIP62. The ZPARM name is UTIL_LGBSG in DSN6SPRM.
DB2 Utilities Parameters (DSNTIP6, DSNTIP61, DSNTIP62)

Field Name: QWP4ULBSG

HSM MESSAGE DS HLQ (UTILS_HSM_MSGDS_HLQ)

Shows the high level qualifier (HLQ) for data sets (DS) to be allocated by the DB2 BACKUP SYSTEM and RESTORE SYSTEM utilities to receive messages from the Data Facility Hierarchical Storage Manager (DFHSM) and the IBM Data Facility Data Set Services (DFDSS) (DB2 field: QWP4UHMDH).

This value corresponds to field HSM MESSAGE DS HLQ on installation panel DSNTIP62. ZPARM name: UTILS_HSM_MSGDS_HLQ in DSN6SPRM.

Field Name: QWP4UHMDH

DB2 Version Install (DSNTIPA1):

This topic shows detailed information about “System Parameters - DB2 Version Install (DSNTIPA1)”.

System Parameters - DB2 Version Install (DSNTIPA1)

The field labels shown in the following sample layout of “System Parameters - DB2 Version Install (DSNTIPA1)” are described in the following section.

DB2 VERSION INSTALL (DSNTIPA1)

---------------------------------------
DATA SHARING ENABLED (DSHARE) ...............YES
CURRENT DB2 RELEASE (NEWFUN) ....................NO
CURRENT DB2 RELEASE - 1 ..........................YES
CURRENT DB2 RELEASE - 2 ..........................NO
COMPRESS LOB TS FOR DIRECTORY (COMPRESS_DIRLOB) ..........NO

DATA SHARING ENABLED (DSHARE)

Indicates whether data sharing is enabled.

Install parameter DATA SHARING on panel DSNTIPA1, or ZPARM DSHARE in DSN6GRP.

Field Name: QWP4AIOPT

CURRENT DB2 RELEASE (NEWFUN)

If YES, the DB2 subsystem/group is running in New Function Mode. At this mode/catalog level, the New Function Mode is enabled and available. The DB2 catalog is completely Unicode (UTF-8) and long names can be used.

Install parameter INSTALL TYPE on panel DSNTIPA1, or ZPARM NEWFUN in DSNHDECP.

Field Name: QWP4BNEWF

CURRENT DB2 RELEASE - 1

Shows the current release minus one of the new-function mode (NEWFUN).

Field Name: QWP4BNEWFN1

CURRENT DB2 RELEASE - 2

Shows the current release minus two of the new-function mode (NEWFUN).
Field Name: QWPBNEWFN2

COMPRESS LOB TS FOR DIRECTORY (COMPRESS_DIRLOB)

Specifies whether DB2 compresses large object (LOB) table spaces in the DB2 directory the next time that the table spaces are reorganized.

- 0 indicates NO
- 1 indicates YES

This value corresponds to field COMPRESS DB2 DIR LOBS on installation panel DSNTIP2. ZPARM name: COMPRESS_DIRLOB in DSN6SPRM.

Field Name: QWP4CDRL

Install DB2 - Resource Limit Facility (DSNTIPO4) (DB2 12):

This topic shows detailed information about “System Parameters - Install DB2 - Resource Limit Facility (DSNTIPO4) (DB2 12)”.

System Parameters - Install DB2 - Resource Limit Facility (DSNTIPO4) (DB2 12)

The field labels shown in the following sample layout of “System Parameters - Install DB2 - Resource Limit Facility (DSNTIPO4) (DB2 12)” are described in the following section.

<table>
<thead>
<tr>
<th>INSTALL DB2 - RESOURCE LIMIT FACILITY (DSNTIPO4)</th>
</tr>
</thead>
<tbody>
<tr>
<td>RESOURCE LIMIT FACILITY AUTOMATIC START (RLF)........NO</td>
</tr>
<tr>
<td>RESOURCE LIMIT SPECIFICATION TABLE SUFFIX (RLFTBL)........01</td>
</tr>
<tr>
<td>RESOURCE LIMIT DYNAMIC ERROR ACTION (RLFERR)........NOLIMIT</td>
</tr>
<tr>
<td>RESOURCE LIMIT STATIC ERROR ACTION (RLFERRSTC).........NOLIMIT</td>
</tr>
<tr>
<td>RLF REMOTE DYNAMIC ERROR ACTION (RLFERRD)............NOLIMIT</td>
</tr>
<tr>
<td>RLF REMOTE STATIC ERROR ACTION (RLFERRDSTC)...........NOLIMIT</td>
</tr>
<tr>
<td>RLF SCOPE (RLFENABLE)..................................DYNAMIC</td>
</tr>
</tbody>
</table>

RESOURCE LIMIT FACILITY AUTOMATIC START (RLF)

Shows whether the resource limit facility (governor) is automatically started when DB2 is started.

Install parameter RLF AUTO START on panel DSNTIPO4, or ZPARM RLF in DSN6SYSP.

Field Name: QWP1RLF

RESOURCE LIMIT SPECIFICATION TABLE SUFFIX (RLFTBL)

The default resource limit specification table (RLST) suffix.

This suffix is used when the resource limit facility (governor) is automatically started or when the governor is started without specifying a suffix.

Install parameter RLST NAME SUFFIX on panel DSNTIPO4, or ZPARM RLFTBL in DSN6SYSP.

Prior to DB2 12: Install parameter RLST NAME SUFFIX on panel DSNTIPO4, or ZPARM RLFTBL in DSN6SYSP.

Field Name: QWP1RLFT

RESOURCE LIMIT DYNAMIC ERROR ACTION (RLFERR)

The action taken by DB2 when the governor cannot use the resource limit:
NOLIMIT
The dynamic SQL statements run without limit.

NORUN
The dynamic SQL statements terminated with an SQL error code.

A number from 1 to 5000000 represents the number of CPU service units allowed for a query.

Install parameter DYNAMIC SQL on panel DSNTIPO4, or ZPARM RLFERR in DSN6SYSP.

Prior to DB2 12: Install parameter RLST ACCESS ERROR on panel DSNTIPO, or ZPARM RLFERR in DSN6SYSP.

Field Name: RLFERR

RESOURCE LIMIT STATIC ERROR ACTION (RLFERRSTC)
The action taken by DB2 when the governor cannot use the resource limit:

NOLIMIT
The static SQL statements run without limit.

NORUN
The static SQL statements terminated with an SQL error code. The number of CPU service units allowed for a query can be anywhere from 1 to 5000000.

Install parameter STATIC SQL on panel DSNTIPO4, or ZPARM RLFERRSTC in DSN6SYSP (DB2 field QWP1RLFR).

Field Name: RLFERRSTC

RLF REMOTE DYNAMIC ERROR ACTION (RLFERRD)
Shows what DB2 does when the governor cannot access the resource limit specification table or when no row in the table matches the currently running statement:

NOLIMIT
This is the default. It allows all dynamic SQL statements to run without limit.

NORUN
Terminates all dynamic SQL statements immediately with an SQL error code. A number from 1 to 5000000 is the default limit. If the limit is exceeded, the SQL statement is terminated.

Install parameter REMOTE DYNAMIC SQL on panel DSNTIPO4, or ZPARM RLFERRD in DSN6FAC (DB2 field QWP9RLFR).

Field Name: RLFERRD

RLF REMOTE STATIC ERROR ACTION (RLFERRDSTC)
Shows what DB2 does when the governor cannot access the resource limit specification table or when no row in the table matches the currently running statement:

NOLIMIT
This is the default. It allows all static SQL statements to run without limit.

NORUN
Terminates all static SQL statements immediately with an SQL error code.
error code. A number from 1 to 5000000 is the default limit; if the limit is exceeded, the SQL statement is terminated.

Install parameter REMOTE STATIC SQL on panel DSNTIPO4, or ZPARM RLFERRDSTC in DSN6FAC (DB2 field QWP9RLER).

Field Name: RLFERRDSTC

RLF SCOPE (RLFENABLE)

The level of RLF governing:

DYNAMIC
  Dynamic SQL only

STATIC
  Static SQL only

ALL   Both, dynamic and static SQL

Install parameter RLF SCOPE on panel DSNTIPO4, or ZPARM RLFENABLE in DSN6SYSP (DB2 field QWP1RLFR).

Field Name: RLFENABLE

IRLM Installation Parameters (DSNTIPI):

This topic shows detailed information about “System Parameters - IRLM Installation Parameters (DSNTIPI)”.

This block shows the installation parameters of the internal resource lock manager (IRLM). There is one IRLM for each DB2 subsystem.

Note: The fields shown on this panel depend on the installed DB2 version.

System Parameters - IRLM Installation Parameters (DSNTIPI)

The field labels shown in the following sample layout of “System Parameters - IRLM Installation Parameters (DSNTIPI)” are described in the following section.

IRLM INSTALLATION PARAMETERS (DSNTIPI)

----------------------------------------------------------------------------------
IRLM SUBSYSTEM NAME (IRLMSID)..........................DJPO
IRLM RESOURCE TIMEOUT IN SECONDS (IRLMRWT)..............120
IRLM AUTOMATIC START (IRLMAUT)..........................YES
IRLM START PROCEDURE NAME (IRLMPROC)..........................DBP0IRLM
SECONDS DB2 WILL WAIT FOR IRLM START (IRLMSWT)..............300
U LOCK FOR REPEATABLE READ OR READ STABILITY (RRULock).....NO
X LOCK FOR SEARCHED UPDATE/DELETE (XLKUPDLT)................YES
IMS/BMP TIMEOUT FACTOR (BMPTOUT)..........................4
IMS/DLI TIMEOUT FACTOR (DLITOUT)..........................6
WAIT FOR RETAINED LOCKS (RETLWAIT).........................0
ENABLE DB CHECKING.....................................NO
IRLM INITIALIZATION TIME.................................1

IRLM SUBSYSTEM NAME (IRLMSID)

The IRLM subsystem name defined to MVS.

This is used for communication between DB2 and the IRLM. It is included in the MVS subsystem table IEFSSNxx, where xx is the value of SUBSYSTEM MEMBER on installation panel DSNTIPM.

If the IRLM for IMS is installed, the DB2 IRLM name is different because two IRLMs on the same MVS system must have unique names.
IRLM Installation Parameters (DSNTIPI)

Install parameter SUBSYSTEM NAME on panel DSNTIPI, or ZPARM IRLMSID in DSN6SPRM.

Field Name: QWP4ISID

IRLM RESOURCE TIMEOUT IN SECONDS (IRLMRWT)

The number of seconds before a timeout is detected.
This is an integer multiple of DEADLOCK TIME on panel DSNTIPJ.
Timeout means that a lock request has waited for a resource (or for claims on a resource for a particular claim class to be released) longer than this time.
For data sharing, the actual timeout period is longer than the timeout value.
Install parameter RESOURCE TIMEOUT on panel DSNTIPI, or ZPARM IRLMRWT in DSN6SPRM.

Field Name: QWP4TOUT

IRLM AUTOMATIC START (IRLMAUT)

Indicates whether IRLM is started automatically by DB2.
Install parameter AUTO START on panel DSNTIPI, or ZPARM IRLMAUT in DSN6SPRM.

Field Name: QWP4IAUT

IRLM START PROCEDURE NAME (IRLMPRC)

The name of the IRLM procedure invoked by MVS if AUTO START is YES.
The name cannot be the same as the subsystem name given for SUBSYSTEM NAME.
Install parameter PROC NAME on panel DSNTIPI, or ZPARM IRLMPRC in DSN6SPRM.

Field Name: QWP4IPRC

SECONDS DB2 WILL WAIT FOR IRLM START (IRLMSWT)

The IRLM wait time in seconds.
DB2 autostart abends if IRLM does not start within this time.
Install parameter TIME TO AUTOSTART on panel DSNTIPI, or ZPARM IRLMSWT in DSN6SPRM.

Field Name: QWP4ISWT

U LOCK FOR REPEATABLE READ OR READ STABILITY (RRULOCK)

Indicates whether the U (UPDATE) lock is used when using repeatable read (RR) or read stability (RS) isolation to access a table.
When YES, the U lock is used for an updated cursor with repeatable read or read stability.
When NO, the S lock is used for an updated cursor with repeatable read or read stability. If the cursor in the running applications includes the clause FOR UPDATE OF, but updates are infrequent, S locks generally provide better performance.
Install parameter U LOCK FOR RR/RS on panel DSNTIPI, or ZPARM RRULOCK in DSN6SPRM.

**Field Name:** QWP4RRU

**X LOCK FOR SEARCHED UPDATE/DELETE (XLKUPDLT)**

The locking method used when performing a searched UPDATE or DELETE.

When NO, DB2 uses an S or U lock when scanning for qualifying rows. For any qualifying rows or pages the lock is upgraded to an X lock before performing the update or delete. For nonqualifying rows or pages the lock is released if using ISOLATION(CS). For ISOLATION(RS), or ISOLATION(RR), an S lock is retained on the rows or pages until the next commit point. This option is used to achieve higher rates of concurrency.

When YES, DB2 gets an X lock on qualifying rows or pages. For ISOLATION(CS), the lock is released if the rows or pages are not updated or deleted. For ISOLATION(RS) or ISOLATION(RR), an X lock is retained until the next commit point. This is beneficial in a data sharing environment when most or all searched updates and deletes use an index. The downside is that if searched updates or deletes result in a tablespace scan, the likelihood of timeouts and deadlocks greatly increases.

Install parameter X LOCK FOR SEARCHED U/D on panel DSNTIPI, or ZPARM XLKUPDLT in DSN6SPRM.

**Field Name:** QWP4XLUD

**IMS/BMP TIMEOUT FACTOR (BMPTOUT)**

The number of RESOURCE TIMEOUT units that an IMS BMP connection waits for a lock to be released.

The default value is 4, meaning that an IMS BMP connection can wait 4 times the resource timeout value for a resource.

Install parameter IMS BMP TIMEOUT on panel DSNTIPI, or ZPARM BMPTOUT in DSN6SPRM.

**Field Name:** QWP4WBMP

**IMS/DLI TIMEOUT FACTOR (DLITOUT)**

The number of RESOURCE TIMEOUT units that a DL/I batch connection waits for a lock to be released.

The default value is 6, meaning that an IMS BMP connection can wait 4 times the resource timeout value for a resource.

Install parameter DL/I BATCH TIMEOUT on panel DSNTIPI, or ZPARM DLITOUT in DSN6SPRM.

**Field Name:** QWP4WDLI

**WAIT FOR RETAINED LOCKS (RETLWAIT)**

Indicates whether a request is suspended until an incompatible retained lock becomes available.

This value is only significant in a data sharing environment. It indicates how long a transaction should wait for a lock on a resource if another DB2 in the data sharing group has failed and is holding an incompatible lock on that resource. Locks held by failed DB2 members are called retained locks.
IRLM Installation Parameters (DSNTIPI)

This value is a multiplier that is applied to the connection's normal timeout value. For example, if the retained lock multiplier is 2, then the timeout period for a call attachment connection that is waiting for a retained lock is twice the normal CAF timeout period. The default is 0, meaning applications do not wait for incompatible retained locks, the lock request is immediately rejected and the application receives a "resource unavailable" SQLCODE.

Install parameter RETAINED LOCK TIMEOUT on panel DSNTIPI, or ZPARM RETLWAIT in DSN6SPRM.

Field Name: QWP4WAIT

ENABLE DB CHECKING

Enable database checking.

Field Name: QWP4DBCK

IRLM INITIALIZATION TIME

The time, in seconds, between Db2 periodic checks for IRLM initialization completion. There is currently no external parameter to control this time, but it is part of the IFCID 106 record, which is the basis for this section of the report. Db2 will keep checking until IRLM completes initialization or until the IRLM Wait Time (IRLMSWT) is reached. IRLM Wait Time is the total amount of time Db2 will wait for IRLM initialization.

Field Name: QWP4ISWI

IRLM Processing Parameters:

This topic shows detailed information about “System Parameters - IRLM Processing Parameters”.

This block shows the system parameters for internal resource lock manager (IRLM) processing.

Note: The fields shown on this panel depend on the installed DB2 version.

System Parameters - IRLM Processing Parameters

The field labels shown in the following sample layout of “System Parameters - IRLM Processing Parameters” are described in the following section.

IRLM PROCESSING PARAMETERS

----------------------------------
WAIT TIME FOR LOCAL DEADLOCK...................5,000
NUMBER OF LOCAL CYCLES PER GLOBAL CYCLE........1
TIMOUT INTERVAL..................................30
IRLM MAXIMUM CSA USAGE ALLOWED................0
Z/OS LOCK TABLE HASH ENTRIES...................1,048,576
PENDING NUMBER OF HASH ENTRIES..................0
Z/OS LOCK TABLE LIST ENTRIES...................8,282
MAX 31-BIT IRLM PRIVATE STORAGE................0
MAX 64-BIT IRLM PRIVATE STORAGE...............0

WAIT TIME FOR LOCAL DEADLOCK

Wait time for local deadlock.

Field Name: QWP5DLOK
NUMBER OF LOCAL CYCLES PER GLOBAL CYCLE

Number of local cycles per global cycle.

Field Name: QWP5DCYC

TIMEOUT INTERVAL

Timeout interval.

Field Name: QWP5TVAL

IRLM MAXIMUM CSA USAGE ALLOWED

The maximum amount of common service area that can be used by IRLM. The amount of space needed for the common service area (CSA) below the 16 MB line is less than 40 KB for each DB2 subsystem and 24 KB for each IRLM. High concurrent activity, parallelism, or high contention can require more CSA.

Most of the DB2 common data resides in the extended common service area (ECSA). Most modules, control blocks, and buffers reside in the extended private area. A DB2 subsystem with 200 concurrent users and 2000 open data sets should need less than 2 MB of virtual storage below the 16 MB line.

Field Name: QWP5MCSA

Z/OS LOCK TABLE HASH ENTRIES

The number of z/OS lock table hash entries.

Field Name: QWP5HASH

PENDING NUMBER OF HASH ENTRIES

The number of z/OS lock table hash entries pending.

Field Name: QWP5PHSH

Z/OS LOCK TABLE LIST ENTRIES

The number of z/OS lock table list entries.

Field Name: QWP5RLE

MAX 31-BIT IRLM PRIVATE STORAGE

The maximum amount of 31-bit IRLM private storage that is available of the 2 GB virtual storage limit, for normal operations in IRLM. IRLM reserves an additional 10% of the 2 GB for use by requests in IRLM.

Field Name: QWP5BPM

MAX 64-BIT IRLM PRIVATE STORAGE

The maximum amount of 64-bit IRLM private storage that is available of the total amount of storage that is specified by MEMLIMIT, for normal operations in IRLM. IRLM reserves an additional 10% of the amount that is specified by MEMLIMIT for use by requests in IRLM.

Field Name: QWP5APM

Lock Escalation Parameters (DSNTIPJ):

This topic shows detailed information about “System Parameters - Lock Escalation Parameters (DSNTIPJ)”.
Lock Escalation Parameters (DSNTIPJ)

This panel shows the characteristics of IRLM time-sharing fields and other locking options.

The default values are adequate for most sites in normal conditions.

System Parameters - Lock Escalation Parameters (DSNTIPJ)

The field labels shown in the following sample layout of “System Parameters - Lock Escalation Parameters (DSNTIPJ)” are described in the following section.

LOCK ESCALATION PARAMETERS (DSNTIPJ)

------------------------------------
MAX PAGE OR ROW LOCKS PER TABLE SPACE (NUMLKTS)...........1,000
MAX PAGE OR ROW LOCKS PER USER (NUMLKUS).................10,000

MAX PAGE OR ROW LOCKS PER TABLE SPACE (NUMLKTS)

The default (SYSTEM) for the LOCKMAX clause of the SQL statements CREATE TABLESPACE and ALTER TABLESPACE.

Install parameter LOCKS PER TABLE SPACE on panel DSNTIPJ, or ZPARM NUMLKTS in DSN6SPRM.

Field Name: QWP4LKTS

MAX PAGE OR ROW LOCKS PER USER (NUMLKUS)

The maximum number of page or row locks that a single application can hold concurrently on all table spaces.

This includes locks on data pages, index pages, and rows that the program acquires when it accesses table spaces.

The limit applies to all table spaces defined with the LOCKSIZE PAGE, LOCKSIZE ROW, or LOCKSIZE ANY options. 0 means that there is no limit to the number of page and row locks a program can acquire.

DB2 assumes that 250 bytes of storage are required for each lock. If NO is specified for CROSS MEMORY, the value of this field has to take into account the available lock space. If referential constraints between tables is defined, the value of this field might need to be increased.

Install parameter LOCKS PER USER on panel DSNTIPJ, or ZPARM NUMLKUS in DSN6SPRM.

Field Name: QWP4LKUS

Log Installation Parameters (DSNTIPL, DSNTIPH):

This topic shows detailed information about “System Parameters - Log Installation Parameters (DSNTIPL, DSNTIPH)”.

This block shows the characteristics of active log data sets.

System Parameters - Log Installation Parameters (DSNTIPL, DSNTIPH)

The field labels shown in the following sample layout of “System Parameters - Log Installation Parameters (DSNTIPL, DSNTIPH)” are described in the following section.

LOG INSTALLATION PARAMETERS (DSNTIPL, DSNTIPH)

---------------------------------------------
OUTPUT BUFFER SIZE IN K BYTES (OUTBUFF)...............4,000
CHECKPOINT FREQUENCY (CHKFREQ)....................500,000
OUTPUT BUFFER SIZE IN K BYTES (OUTBUFF)

The output log buffer size in kilobytes.

There is only one output log buffer per DB2 subsystem.

Increasing this parameter reduces BSDS I/O updates when there is a buffer
wraparound. Frequent wraparounds are likely in LOAD or REORG with
logging, and mass insert operations.

Increasing this parameter also helps avoid log write waits for an available
buffer during heavy update workload.

When the specified size is not a 4 KB multiple, it is rounded up to the next
4 KB multiple.

Install parameter OUTPUT BUFFER on DSNTIPL, or ZPARM OUTBUFF in
DSN6LOGP.

Field Name: QWP2OBPS

CHECKPOINT FREQUENCY (CHKFREQ)

Checkpoints frequency. This shows either the number of minutes (1 through
60) or the number of DB2 log records between the start of successive
checkpoints. DB2 starts a new checkpoint when this value is reached.

You can use the SET LOG command to change the number of log records
between checkpoints dynamically. Valid values are 1-60 when specifying a
time value and 200-16000000 when specifying a number of records.

Install parameter CHECKPOINT FREQ on panel DSNTIPL, ZPARM
CHKFREQ in DSN6SYSP.

Field Name: QWP1LOGL

UR CHECK FREQUENCY (URCHKTH)

Shows the number of checkpoint cycles to complete before DB2 issues a
warning message to the console and writes an IFCID 313 record for an
uncommitted, indoubt, or inflight unit of recovery (UR). The default is 0,
which disables this option.

Install parameter UR CHECK FREQ on panel DSNTIPL, or ZPARM
URCHKTH in DSN6SYSP.

Field Name: QWP1URCK

UR LOG RECORD WRITTEN THRESHOLD IN KB (URLGWTH)

Shows the number of log records that are to be written by an uncommitted
unit of recovery (UR) before DB2 issues a warning message to the console.
This provides notification of a long-running UR. Long-running URs might result in a lengthy DB2 restart or a lengthy recovery situation for critical tables. Log records are specified in 1-K (1000 log records) increments. A value of 0 indicates that no write check is to be performed.

Install parameter UR LOG WRITE CHECK on panel DSNTIPL, ZPARM URLGWTH in DSN6SYSP.

Field Name: QWP1LWCK

LIMIT BACKOUT (LBACKOUT)

Shows whether some backward log processing should be postponed.

When NO, DB2 backward log processing processes all inflight units of recovery (URs) and URs for abending transactions.

When YES, DB2 postpones backout processing for some units of work until the command RECOVER POSTPONED is issued.

AUTO (default) postpones some backout processing but automatically starts the backout processing when DB2 restarts and begins accepting new work.

When YES or AUTO, backout processing runs concurrently with new work. Page sets or partitions with backout work pending are unavailable until their backout work is complete.

Install parameter LIMIT BACKOUT on panel DSNTIPL, or ZPARM LBACKOUT in DSN6SYSP.

Field Name: QWP1LMBO

BACKOUT DURATION (BACKODUR)

Indicates how much of the log to process for backout when LIMIT BACKOUT = YES or AUTO.

During restart, backward log processing continues until both of the following events occur:

- All inflight and inabort URs with update activity against the catalog or directory are backed out.
- The number of log records processed is equal to the number specified in BACKOUT DURATION times the value of CHECKPOINT FREQ. If the checkpoint frequency is specified in minutes, the number of records processed is the default of 50000 records multiplied by the value of CHECKPOINT FREQ.

In-flight and in-abort URs that are not completely backed out during restart are converted to postponed-abort status. Page sets or partitions with postponed-backout work are put into restart pending (RESTP). This state blocks all access to the object other than access by the command RECOVER POSTPONED or by automatic backout processing performed by DB2 when LIMITED BACKOUT = AUTO.

A table space might be in restart pending mode, without the associated index spaces also in restart pending mode. This happens if a postponed abort UR makes updates only to non-indexed fields of a table in a table space. In this case, the indexes are accessible to SQL (for index-only queries), even though the table space is inaccessible.

Install parameter BACKOUT DURATION on panel DSNTIPL, or ZPARM BACKODUR in DSN6SYSP.
Field Name: QWP1BDUR

PSEUDO-CLOSE FREQUENCY (PCLOSEN)

The number of consecutive DB2 checkpoints that a page set or partition can remain in read/write mode since it was last updated. When this limit or the RO SWITCH TIME is reached, DB2 changes the page set or partition to read-only.

This can improve performance for recovery, logging, and data-sharing processing.

Install parameter RO SWITCH CHKPTS on panel DSNTIPL, or ZPARM PCLOSEN in DSN6SYSP.

Field Name: QWP1FREQ

PSEUDO-CLOSE TIMER (PCLOSET)

The number of minutes that a page set or partition can remain in read-write mode since it was last updated. When this limit or the RO SWITCH TIME is reached, DB2 changes the page set or partition to read-only.

This can improve performance for recovery, logging, and data-sharing processing.

Install parameter RO SWITCH TIME on panel DSNTIPL, or ZPARM PCLOSET in DSN6SYSP.

Field Name: QWP1TMR

CHECKPOINTS BETWEEN LEVEL ID UPDATES (DLDFREQ)

Shows how often, in checkpoints, the level ID of a page set or partition is updated. When zero (0), down-level detection is disabled. When five (5), down-level is enabled.

Use the following criteria to decide on a suitable value for this parameter:

- **How often are backup and restore methods used outside of the DB2 control (such as DSN1COPY or DFDSS dump and restore)?** If rarely used, there is no need to update the level ID frequently.

- **How many page sets are open for update at the same time?** If DB2 updates level IDs frequently, there is extra protection against down-level page sets. However, a performance degradation can occur if the level IDs for many page sets must be set at every checkpoint.

- **How often does the subsystem take checkpoints?** If the DB2 subsystem takes frequent system checkpoints, set the level ID frequency to a higher value.

Install parameter LEVELID UPDATE FREQ on panel DSNTIPL, or ZPARM DLDFREQ in DSN6SYSP.

Field Name: QWP1DFRQ

NUMBER OF ACTIVE LOG COPIES (TWOACTV)

The number of copies of the active log being maintained: 2 indicates dual logging.

Field Name: QWP2DUAL

NUMBER OF ARCHIVE LOG COPIES (TWOARCH)
Log Installation Parameters (DSNTIPL, DSNTIPH)

The number of copies of the archive log being produced during offloading: 2 indicates dual logging.

Install parameter NUMBER OF COPIES on PANEL DSNTIPH, or ZPARM TWOARCH in DSN6LOGP.

Field Name: QWP2ADL

COPY 1 PREFIX (ARCPFX1)

The prefix of the first archive log data set.

Install parameter Archive Logs: COPY1 PREFIX on panel DSNTIPH, or ZPARM ARCPFX1 in DSN6ARVP.

Field Name: QWP3RE1N

COPY 2 PREFIX (ARCPFX2)

The prefix of the second archive log data set. If single logging is used, this value is a default.

Install parameter Archive Logs: COPY2 PREFIX on panel DSNTIPH, or ZPARM ARCPFX2 in DSN6ARVP.

Field Name: QWP3RE2N

TIMESTAMP ARCHIVE LOG DATA SETS (TSTAMP)

Indicates whether the date and time of creation of the DB2 archive log data set is included in the archive log data set name.

Possible values are:

YES (QWP3DTIM=1)

The maximum allowable length of the user-controlled portion of the archive log prefix is reduced from 35 characters to 19 characters. This allows the 16-character timestamp to be added to the archive log data set prefix. The timestamp format is as follows: DyymddThhmmssst, where:

- D Starts the date.
- yy Is the last two digits of the year.
- ddd Is the day of the year.
- T Starts the time.
- hh Is the hour.
- mm Are the minutes.
- ss Are the seconds.
- t Is the tenths of a second.

The maximum allowable length of the user-controlled portion of the archive log prefix is reduced from 35 characters to 19 characters. This reduction in size permits the 16-character date and time qualifiers (timestamp) to be added to the archive log data set prefix.

NO (QWP3DTIM=0 and QWP3DTFM=0)

The archive data set name does not contain a timestamp.

EXT (QWP3DTFM=1)

The archive data set name contains a timestamp with an extended
date component in the format: .Dyyyyddd. A value of EXT in this field causes the lengths of the values that are entered for field COPY 1 PREFIX and field COPY 2 PREFIX to be audited to ensure that neither exceeds 17 bytes (19 bytes for other settings of TIMESTAMP ARCHIVES).

Install parameter TIMESTAMP ARCHIVES on panel DSNTIPH, or ZPARM TSTAMP in DSN6ARVP.

Field Name: RT0106AL

CHECKPOINT TYPE (CHKTYPE)

Shows the LOG checkpoint type. It can have the following values:

SINGLE
Either records or minutes.

BOTH
Both records and minutes, as specified by Records Between Checkpoint (QWP1LOGR) and Mins Between Checkpoint (QWP1LOGM).

ZPARM CHKTYPE in DSN6SYSP.

Field Name: QWP1LOGT

RECORDS/CHECKPOINT (CHKLOGR)

Shows the number of records between log checkpoints if the LOG checkpoint type is BOTH (records and minutes).

This field corresponds to field RECORDS/CHECKPOINT on installation panel DSNTIPL1, or ZPARM name CHKLOGR in DSN6SYSP.

Field Name: QWP1LOGR

MINUTES/CHECKPOINT (CHKMINS)

Shows the number of minutes between log checkpoints if the LOG checkpoint type is BOTH (records and minutes).

This field corresponds to field MINUTES/CHECKPOINT on installation panel DSNTIPL1, or ZPARM name CHKMINS in DSN6SYSP.

Field Name: QWP1LOGM

List of Long Names:

This topic shows detailed information about “System Parameters - List of Long Names”.

This block is printed at the end of the system parameters report when the report contains long names that have been truncated. The block shows the parameter identifier, in alphabetic order, and the complete name. If the name is too long to show on one line, it continues on the next.

System Parameters - List of Long Names

The field labels shown in the following sample layout of “System Parameters - List of Long Names” are described in the following section.

LIST OF LONG NAMES

DEFLTID DSNZPARMDEFLTIDDSNZPARMDEFLTIDDSNZPARMDEFLTID

Chapter 6. Batch reporting 4559
MVS Parmlib Update Parameters (DSNTIPM):

This topic shows detailed information about “System Parameters - MVS Parmlib Update Parameters (DSNTIPM)”.

This block shows the parameters used to produce the DSNTIJMV job that defined DB2 to MVS and updated the following PARMLIB members:

IEFSSN xx
to define DB2 and IRLM as formal MVS subsystems

IEAAPF xx
to authorize the prefix.SDSNLOAD, prefix.SDSNLINK, and prefix.SDSNEXIT libraries

LNKLST xx
to include the prefix.SDSNLINK library.

System Parameters - MVS Parmlib Update Parameters (DSNTIPM)

The field labels shown in the following sample layout of “System Parameters - MVS Parmlib Update Parameters (DSNTIPM)” are described in the following section.

MVS PARMLIB UPDATE PARAMETERS (DSNTIPM)

---------------------------------------

SUBSYSTEM DEFAULT (SSID) .................................D851
SUPPRESS SOFT ERRORS (SUPERRS) ..........................NO

SUBSYSTEM DEFAULT (SSID)

The MVS subsystem name for DB2. The name is used in member IEFSSN xx of SYS1.PARMLIB.

A valid name has 1-4 characters, the first must be A-Z, #, $, or @. Others must be A-Z, 1-9, #, $, or @. Default is DSN1.

Install parameter SUBSYSTEM NAME on panel DSNTIPM, or ZPARM SSID in DSNHDECP.

Field Name: QWPBSSID

SUPPRESS SOFT ERRORS (SUPERRS)

Shows whether the recording of errors, such as invalid decimal data and arithmetic exceptions, in the operating system data set SYS1.LOGREC is suppressed.

When YES, these exceptions are not recorded in the LOGREC data set.

Install parameter SUPPRESS SOFT ERRORS on panel DSNTIPM or ZPARM SUPERRS in DSN6SPRM.

Field Name: QWP4SAE
Operator Functions Installation Parameters (DSNTIPO):

This topic shows detailed information about “System Parameters - Operator Functions Installation Parameters (DSNTIPO)”.

This block shows various operator functions, such as write-to-operator route codes, automatic recall, and the maximum amount of CPU time allocated for a dynamic SQL statement.

Note: The fields shown on this panel depend on the installed DB2 version.

System Parameters - Operator Functions Installation Parameters (DSNTIPO)

The field labels shown in the following sample layout of “System Parameters - Operator Functions Installation Parameters (DSNTIPO)” are described in the following section.

---

**WTO ROUTE CODES (ROUTCDE)**

The MVS console routing codes.

These codes are assigned to messages that are not solicited from a specific console. Up to 16 comma-separated codes can be shown.

Install parameter WTO ROUTE CODES on panel DSNTIPO, or ZPARM ROUTCDE in DSN6SYSP.

Field Name: QWP1SMRC

**RESOURCE LIMIT FACILITY AUTOMATIC START (RLF) (prior to DB2 12)**

Shows whether the resource limit facility (governor) is automatically started when DB2 is started.

Install parameter RLF AUTO START on panel DSNTIPO4, or ZPARM RLF in DSN6SYSP.

Field Name: QWP1RLF

**RESOURCE LIMIT SPECIFICATION TABLE SUFFIX (RLFTBL) (prior to DB2 12)**

The default resource limit specification table (RLST) suffix.

This suffix is used when the resource limit facility (governor) is automatically started or when the governor is started without specifying a suffix.

Install parameter RLST NAME SUFFIX on panel DSNTIPO4, or ZPARM RLFTBL in DSN6SYSP.

Prior to DB2 12: Install parameter RLST NAME SUFFIX on panel DSNTIPO4, or ZPARM RLFTBL in DSN6SYSP.
Operator Functions Installation Parameters (DSNTIPO)

Field Name: QWP1RLFT

RESOURCE LIMIT SPEC TABLE ERROR ACTION (RLFERR) (prior to DB2 12)

The action taken by DB2 when the governor cannot use the resource limit:

NOLIMIT
The dynamic SQL statements run without limit.

NORUN
The dynamic SQL statements terminated with an SQL error code.

A number from 1 to 5000000 represents the number of CPU service units allowed for a query.

Install parameter DYNAMIC SQL on panel DSNTIPO4, or ZPARM RLFERR in DSN6SYSP.

Prior to DB2 12: Install parameter RLST ACCESS ERROR on panel DSNTIPO, or ZPARM RLFERR in DSN6SYSP.

Field Name: RLFERR

AUTO BIND (ABIND)

Indicates whether autobind is enabled. Values are:

YES Allows automatic rebind operations to be performed when a plan/package:
• Was marked “invalid”.
• Was bound on DB2 Vn, but is now running on DB2 Vn-1
• After use on DB2 Vn-1 (as previously described), is later used again on DB2 Vn

NO Prevent DB2 from performing any automatic rebind operations under any circumstances.

COEXIST
Allows automatic rebind operation to be performed in a DB2 Data Sharing coexistence environment when the plan/package:
• Is marked “invalid” or
• Was last bound in DB2 Vn and is running on DB2 Vn-1

Install parameter AUTO BIND on panel DSNTIPO, or ZPARM ABIND in DSN6SPRM.

Field Name: QWP4ABN

ALLOW EXPLAIN AT AUTOBIND (ABEXP)

Indicates whether EXPLAIN processing occurs during automatic rebind.

YES means EXPLAIN processing happens during automatic rebind of a plan or package that has EXPLAIN(YES) as a bind option. If the PLAN_TABLE does not exist, automatic rebind continues, but there is no EXPLAIN output. Explain processing does not happen for a plan or package with EXPLAIN(NO).

Install parameter EXPLAIN PROCESSING on panel DSNTIPO, or ZPARM ABEXP in DSN6SPRM.

Field Name: QWP4ABX

DPROP SUPPORT (EDPROP)
Operator Functions Installation Parameters (DSNTIPO)

Shows whether DataPropagator NonRelational (DPROP) is used to propagate SQL changes made to tables defined with DATA CAPTURE CHANGES.

1. No changes are propagated.
2. DPROP propagates SQL changes, and those changes made to tables defined with DATA CAPTURE CHANGES are only allowed when monitor trace class 6 is active, DPROP is installed, and the DB2 application is running in an IMS environment. If any of these conditions are not met, no changes to the DB2 table are permitted.
3. Data propagation occurs when monitor trace class 6 is active, DPROP is installed, and the DB2 application is running in an IMS environment. In this instance, an application that is not running in an IMS environment can update DB2 tables defined with DATA CAPTURE CHANGES. However, these changes are not propagated to IMS.

ANY Allows subsystems to propagate some data with DPROP and other data with a different propagation program.

Tables that should only be updated by DB2 applications running in an IMS environment can be protected using the following methods:
- Use the ENABLE parameter on BIND to specify a specific attachment facility through which updates to data propagation tables can be made.
- Define a validation procedure for data propagation tables to define which plans can update those tables.
- Allow update authority for data propagation tables to a group of authorization IDs that can only run in IMS.

Install parameter DPROP SUPPORT on panel DSNTIPO, or ZPARM EDPROP and CHGDC in DSN6SPRM.

Field Name: QWP4ENF

SITE TYPE (SITETYP)

Shows whether this system is at a local site or a recovery site.

LOCALSITE
This is the site of the current system. Multiple image copies are made and are operational here. This is the default.

RECOVERYSITE
This an alternative site for recovery purposes.

The RECOVER utility uses this parameter to determine what site the current system is on and recovers everything from the copies of data registered at that site.

The RECOVER and MERGECOPY utilities use this to determine whether COPYDDN or RECOVERDDN is allowed with NEWCOPY NO.

Install parameter SITE TYPE on panel DSNTIPO, or ZPARM SITETYP in DSN6SPRM.

Field Name: QWP4MSTY

TRACKER SITE (TRKRSITE)

Indicates whether this subsystem is a remote tracker site for another DB2 subsystem.
When YES, this is a tracker site.

A DB2 tracker site is a separate DB2 subsystem or data sharing group that exists solely for the purpose of keeping shadow copies of your primary site's data. No independent work can be run on the tracker site.

Install parameter TRACKER TYPE on panel DSNTIPO, or ZPARM TRKRSITE in DSN6SPRM.

Field Name: QWP4TRKR

READ COPY2 ARCHIVE (ARC2FRST)

This field indicates whether the COPY2 archives should be read first when the DB2 subsystem is started.

Install parameter READ COPY2 ARCHIVE on DSNTIPO, or ZPARM ARC2FRST in DSN6LOGP.

Field Name: QWP2OPT2

REAL TIME STATS (STATSINT)

The time interval that DB2 waits before it attempts to write out page set statistics to the real-time statistics tables. This value is between 1 and 65535 minutes.

Install parameter REAL TIME STATS on panel DSNTIPO, or ZPARM STATSINT in DSN6SPRM.

Field Name: QWP4INTE

STATISTICS FEEDBACK (STATFDBK_SCOPE)

Specifies the scope of SQL statements for which DB2 is to recommend statistics. Possible values are:

- All
- Dynamic
- None
- Static

This value corresponds to field STATISTICS FEEDBACK on installation panel DSNTIPO. The ZPARM name is STATFDBK_SCOPE in DSN6SPRM.

Field Name: QWP4SFBS

PROFILE AUTOSTART (PROFILE_AUTOSTART)

Specifies whether START PROFILE command processing is automatically initiated as part of DB2 startup (DB2 field: QWP1PFASY):

- 0 indicates NO
- 1 indicates YES

This field corresponds to field PROFILE AUTOSTART on installation panel DSNTIPO. ZPARM name: PROFILE_AUTOSTART in DSN6SYSP.

Field Name: QWP1PFASY

Other system parameters report:

This topic shows detailed information about “System Parameters - Other System Parameters”.

Other System Parameters

This block shows values not shown on other DB2 installation panels. These values are either set internally by DB2, or calculated from other install parameter values.

Note: The fields shown on this panel depend on the installed DB2 version.

### System Parameters - Other System Parameters

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DUAL BDSM MODE (TWOBSDS)</td>
<td>Shows whether two BSDS data sets are used. A second BDS (strongly recommended) makes recovery much easier in most situations. In cases that normally require recovery and restart, a second BDS allows you to continue working. The storage overhead required is small and the data set is relatively inactive. DB2 parameter TWOBSDS in DSN6LOGP.</td>
</tr>
<tr>
<td>ROLL UP PARALLEL TASK ACCOUNTING (PTASKROL)</td>
<td>Indicates whether DB2 generates a trace record at the originating task level that summarizes accounting information for all parallel tasks.</td>
</tr>
</tbody>
</table>

</tbody>
</table>
DB2 parameter PTASKROL in DSN6SYSP.

Field Name: QWP1PROL

NO. PAGES SMALL TABLE THRESHOLD (NPGTHRSH)

This parameter allows you to specify the optimizer threshold for qualifying a table as small.

-1 Every table qualifies as small.
0 No table qualifies as small (this is the default).
1 Only tables with zero pages qualify as small.
2 Tables with less than two pages qualify as small.
10 Tables with less than ten pages qualify as small.
502 Tables with less than 502 pages, and tables that have not had statistics collected qualify as small. For example, when NPAGES = -1.

DB2 parameter NPGTHRSH in DSN6SPRM.

Background and Tuning Information

Tables can be populated using insert just prior to their use by queries and then cleared immediately on completion of the queries. These tables are permanent even though the data they contain is transient.

This can cause problems when RUNSTATS is run overnight, or at other times when these tables are empty. This gives the optimizer the false indication that these tables contain no data when in fact, the tables will contain data when the query executes. This causes the optimizer to pick an inefficient access path. Usually the optimizer chooses to do a table scan, which would be the most efficient access path if the table were truly empty. Because the table is not empty when the query executes, it would be more efficient to use matching index access.

With this parameter, you can force the optimizer to treat tables containing no data as small tables. For these tables, the optimizer will:

- Select a matching index access rather than a table space scan and non-matching index access.
- Select the index with the most matching columns when more than one index qualifies for matching index access.
- Select indexes with the same number of matching columns on cost.

Field Name: QWP4NPAG

OFFLOAD OPTION (OFFLOAD)

Shows whether the offload process is initiated online.

ZPARM OFFLOAD in macro DSN6LOGP.

Field Name: QWP2OFFL

SU CONVERSION FACTOR

The CPU service unit conversion factor for this CPU.

This factor allows conversion CPU time in seconds to a common unit, called service unit (SU). The conversion factor used depends on the machine. Service units allow you to calculate CPU execution times across a data sharing group.
The conversion factor is used as follows:

\[ \text{CP secs} \times \frac{16,000,000}{\text{Conversion Factor}} = \text{SUs} \]

\[ \text{SUs} \times \frac{\text{Conversion Factor}}{16,000,000} = \text{CP secs} \]

This field does not map to an installation panel.

**Field Name:** QWPASUCV

**MINIMUM DIVIDE SCALE (MINDVSC)**

The minimum scale for the result of a decimal division. The values for this parameter are none (the default), 3, or 6. If 3 or 6 is specified, this parameter overrides the DECDIV3 parameter.

**Field Name:** QWP4MDSC

**STAR JOIN THRESHOLD (SJTABLES)**

The minimum number of tables in the star schema query block, including the fact table, dimensions tables, and snowflake tables. This value is considered only if the subsystem parameter STARJOIN qualifies the query for star join.

Possible values are:

- **0** Star join is disabled. This is the default.
- **1, 2, or 3** Star join is always considered.
- **4 through 255** Star join is considered if the query block has at least the specified number of tables.
- **256 and greater** Star join is never considered.

DB2 parameter SJTABLES in DSN6SPRM.

**Background and Tuning Information**

Although star join can reduce bind time significantly it does not provide optimal performance in all cases. Performance of star join depends on a number of factors such as the available indexes on the fact table, the cluster ratio of the indexes, and the selectivity of rows through local and join predicates. Follow these general guidelines for setting the value of SJTABLES:

- If you have star schema queries with less than 10 tables and you want to make the star join method applicable to all qualified queries, set the value of SJTABLES to a low number, such as 5.
- If you have star schema queries that are not necessarily suitable for star join but want to use star join for relatively large queries, use the default. The star join method will be considered for all qualified queries that have 10 or more tables.
- If you have star schema queries but normally do not want to use star join, you could increase SJTABLES, say to 15. This will greatly cut the bind time for large queries and avoid a potential bind time SQL return code -101 for large qualified queries.

**Field Name:** QWP4SJTB

**ONLINE SYSTEM PARM USER ID MONITOR**
Other System Parameters

The user ID that made the last online change to DB2 system settings.

Field Name: QWP4OZUS

ONLINE SYSTEM PARM CORREL ID MONITOR

The correlation ID of the online application that made the last change to DB2 system settings.

Field Name: QWP4OZCI

ONLINE SYSTEM PARM TIME CHANGED

Time of the last online change made to DB2 system settings.

Field Name: QWP4OZTM

ONLINE SYSTEM PARM TYPE

The type of DB2 system parameter changed by the last SET SYSPARM statement.

Field Name: QWP4OZTP

DB2-SUPPLIED DECP INDICATOR

Indicates that DECP is supplied by DB2.

Using a DB2 supplied DECP could cause data corruption due to applications using wrong CCSIDs.

Field Name: QWPBDB2S

MAX CONCURRENT PKG OPS (MAX_CONCURRENT_PKG_OPS)

The maximum number of package requests that can be processed simultaneously.

DB2 parameter MAX_CONCURRENT_PKG_OPS in DSN6SPRM.

Field Name: QWP4MXAB

ADMIN SCHEDULER JCL PROC NAME (ADMTPROC)

The name of the JCL procedure for starting the DB2 administrative scheduler task address space.

DB2 parameter ADMTPROC in DSN6SPRM.

Field Name: QWP4ADMT

FREE LOCAL CACHED STATEMENTS (CACHEDYN_FREELOCAL)

Indicates whether DB2 can free statements from the local dynamic statement cache to relieve storage constraints below the 2 GB bar. This parameter applies only for packages or plans that are bound with KEEP_DYNAMIC(YES). Possible values are:

0  DB2 cannot free statements from the local cache
1  DB2 can free statements from the local cache

DB2 parameter CACHEDYN_FREELOCAL in DSN6SPRM.

Field Name: QWP4FRLC

INDEX I/O PARALLELISM (INDEX_IO_PARALLELISM)

In DB2 12 this field is a serviceability field.

The enablement of the index I/O parallelism ZPARM.
Field Name: QWP4IIOP

ZOSMETRICS
YES indicates that gathering of z/OS metrics using the RMF interface is enabled. ZPARM ZOSMETRICS in DSN6SPRM.

Field Name: QWP4METE

USE TRACKMOD FOR IMPLICIT TS (IMPTKMOD)
Shows whether you have specified the TRACKMOD option on ALTER TABLESPACE for an implicitly created table space.

This field corresponds to field TRACK MODIFIED PAGES on installation panel DSNTIP7. The ZPARM name is IMPTKMOD in DSN6SPRM.

Field Name: QWP1TKMD

DSSIZE FOR IMPLICIT TS (IMPDSSIZE)
Shows the maximum DSSIZE in gigabytes that DB2 uses for creating each partition of an implicitly created base table space.

This field corresponds to field DEFAULT DSSIZE on installation panel DSNTIP7. The ZPARM name is IMPDSSIZE in DSN6SPRM.

Field Name: QWP1DSSZ

ENABLE MULTIPLE INDEX ACCESS (SUBQ_MIDX)
Specifies whether to enable or disable multiple index access for queries that have subquery predicates:

NO Disables multiple index access for queries.

YES Enables multiple index access for queries.

The ZPARM name is SUBQ_MIDX IN DSN6SPRM.

Field Name: QWP4SQMX

SP_PARMS_JV (DDF_COMPATIBILITY)
Specifies that when a Java client application calls a DB2 for z/OS stored procedure, DB2 returns output argument values with data types that match the data types that were specified in the CallableStatement.registerOutParameter method calls.

If SP_PARMS_JV is not specified, DB2 returns output parameter values with data types that match the data types of the parameters in the stored procedure definition.

ZPARM name DDF_COMPATIBILITY and ZPARM value SP_PARMS_JV in DSN6FAC.

Field Name: QWP9SPPMJ

SP_PARMS_NJV (DDF_COMPATIBILITY)
Specifies that when a non-Java client application calls a DB2 for z/OS stored procedure, DB2 returns output argument values with data types that match the data types of the corresponding CALL statement arguments, unless one of the following conditions are true:

- The non-Java client is Version 10 or later.
Other System Parameters

- The stored procedure uses a parameter data type that was introduced in DB2 for z/OS Version 10 (XML, TIMESTAMP WITH TIMEZONE, or TIMESTAMP with precision greater than 6).

If one condition is true, DB2 returns output parameter values with data types that match the data types of the parameters in the stored procedure definition. If SP_PARMS_NJV is not specified, DB2 returns output parameter values with data types that match the data types of the parameters in the stored procedure definition.

ZPARM name DDF_COMPATIBILITY and ZPARM value SP_PARMS_NJV in DSN6FAC.

Field Name: QWP9SPPM

DISABLE_IMPCAST_JV (DDF_COMPATIBILITY) (DB2 11 or later)

Specifies whether the DB2 for z/OS server disables implicit casting of input host variables from numeric data types to string data types, or from string data types to numeric data types, when the application is a Java client application that uses the IBM Data Server Driver for JDBC and SQLJ. If application compatibility is set to:
- V10R1: DB2 uses DISABLE_IMPCAST_JV.
- V11R1 or later: DB2 always does implicit casting.

ZPARM name DDF_COMPATIBILITY ZPARM value DISABLE_IMPCAST_JV in DSN6FAC.

Field Name: QWP9ICIJ

DISABLE_IMPCAST_NJV (DDF_COMPATIBILITY)

Specifies that DB2 for z/OS disables implicit casting of input host variables from numeric data types to string data types, or from string data types to numeric data types, when the application is a non-Java client application that uses an IBM Data Server client or driver that is at Version 10.5 or earlier.

ZPARM name DDF_COMPATIBILITY and ZPARM value DISABLE_IMPCAST_NJV in DSN6FAC.

Field Name: QWP9ICIN

IGNORE_TZ (DDF_COMPATIBILITY)

Shows whether to ignore the time zone (TMZ) in TMZ input for Java.

Field Name: QWP9ITZJ

DDF COMP PRIOR VERSION (DDF_COMPATIBILITY)

The DDF compatibility parameter. The DB2 server with new-function mode has not yet been activated. The DDF compatibility parameter causes this server to identify itself to all remote clients as being in new-function mode for the previous version. The format of this field in the trace record is mmr, where mm is the version of the DB2 server and r is the release.

Field Name: QWP9DDFCIP

DYN STMT CACHE STOR (CACHE_DEP_TRACK_STOR_LIM)

Specifies the number of gigabytes of storage that DB2 allocates for hashing entries in the dynamic statement cache. This parameter can avoid storage shortages for long-running threads. The storage is allocated above the bar.
The ZP ARN name is CACHE_DEP_TRACK_STOR_LIM in DSN6SPRM.

**Field Name**: QWP4CDTSL

### ACTIVATE I/O SCHEDULING

Determines whether the I/O scheduling feature is activated. DB2 parameter SPRMIOP in DSN6SPRM.

**Field Name**: QWP4IOP

### VALUE FOR TRIGGER DRAIN

The percentage below 100% DSMAX that open data sets can reach before an asynchronous drain is started. The default is 1, meaning that asynchronous drain starts when the number of open data sets reaches 99% of DSMAX.

DB2 defers closing and deallocating the table spaces or indexes until the number of open data sets reaches one of the following limits:

- The MVS limit for the number of concurrently open data sets.
- 99% (default) of the value that you specified for DSMAX.

When one of these limits is reached, DB2 closes a number of data sets not in use equal to 3% (default) of the value DSMAX. Thus, DSMAX controls not only the limit of open data sets, but also the number of data sets that are closed when that limit is reached.

DB2 parameter SPRMTDD in DSN6SPRM.

**Field Name**: QWP4TDDN

### MAX NUMBER OF DDS WITH HOLD

The percentage of maximum open data sets until the asynchronous drain operations are stopped.

DB2 parameter SPRMMDD in DSNDSPRM.

**Field Name**: QWP4MDDN

### FIELD PROCS FOR DESCRIBE TABLE BLOCK

The number of field procedures for the DESCRIBE TABLE block.

ZP ARM SPRMFDP.

**Field Name**: QWP4FDP

### RESTRICT ALTER COLUMN FOR DCC (RESTRICT_ALT_COL_FOR_DCC)

A value of YES prevents the use of ALTER table ALTER column with SET DATA TYPE, SET DEFAULT, and DROP DEFAULT when data capture changes is enabled on the target table. The ZP ARM name is RESTRICT_ALT_COL_FOR_DCC in DSN6SPRM.

**Field Name**: QWP4RACD

### SPACE RESERVED FOR Z/OS FUNCTIONS

The amount of space reserved for MVS functions.

**Field Name**: QWP1DB1M

### SPACE RESERVED FOR CRITICAL WORK

The amount of space reserved for critical work that must be completed.

**Field Name**: QWP1CRIT
**Other System Parameters**

**SPACE RESERVED ON TOP OF Z/OS AND CRITICAL SPACE**

The amount of space above z/OS and critical (QWP1DB1M + QWP1CRIT) that DB2 tries to leave available.

*Field Name:* QWP1SOS

**DETAILED MEASURED UNIT PRICE TRACKING**

Specifies whether DB2 performs detailed tracking for measured usage pricing. You can select the following values:

**YES**  DB2 does detailed measured usage tracking if SMF type 89 records are activated. When SMF89 is set to YES, DB2 invokes a z/OS service on every entry into or exit out of DB2 to ensure accurate tracking.

**NO (the default value)**  DB2 does not do detailed measured usage tracking. If the SMF type 89 record is activated, only high-level tracking is recorded in the SMF type 89 record. Selecting NO reduces CPU usage, but also increases the amount of time spent in DB2 as measured by SMF 89.

*Note:* Select SMF89 YES only if you use measured usage pricing.

DB2 parameter SMF89.

*Field Name:* QWP1SM89

**OTC LICENSE TERMS ACCEPTED**

Indicates that the one-time charge (OTC) license terms are accepted for this DB2 installation.

DB2 parameter OTC_LICENSE.

*Field Name:* QWP1OLAC

**SIMULATED CPUS**

The number of CPUs that are online.

*Field Name:* QWP4NCPU

**EXECUTION TIME OF TASK/SRB IN MICROSECONDS**

The accumulated SRB time for the address space. This value includes both, the preemptable and nonpreemptable SRB time. It does not include CPU time that is consumed on an IBM zIIP.

*Field Name:* QWSASRBT

**MAX 'NOT FOUND' HASH RECORDS**

The maximum number of NOT FOUND hash records.

*Field Name:* QWP4KNFC

**MAX EXTEND SERVICE TASKS**

Maximum number of extended service tasks.

*Field Name:* QWP4EST

**PROJECT Z INSERTION THRESHOLD**

Project Z insertion threshold.

*Field Name:* QWP4ZTN
MAX ZIVLEMPNEL DICTIONARY ENTRIES

The maximum number of ZIVLEMPNEL dictionary entries.

Field Name: QWP4MDE

REORG KEEPDICTIONARY IN BRF TO RRF CONVERSION

Indicates that KEEPDICTIONARY is used when a REORG converts a table space from basic row format (BRF) to reordered row format (RRF).

Field Name: QWP4HKEEPD

DRDA RESOLVE ALIAS (DRDA_RESOLVE_ALIAS)

YES means that in SQL statements, DB2 replaces aliases that refer to three-part names with qualified object names before it sends the statements to the remote location. This substitution is done in the following cases:

- When PREPARE or EXECUTE IMMEDIATE is performed
- When REMOTE BIND of a package is performed.

ZPARM name DRDA_RESOLVE_ALIAS in DSN6SPRM.

Field Name: QWP4HKEEPD

PC YES SPECIFIED

Shows whether the IRLM uses the cross-address-space program call. This parameter determines where the IRLM lock control block structure is stored.

If you run a tightly-controlled environment and virtual storage is not constrained, use PC=NO. PC=YES is the conservative choice where insufficient information about the environment is available to make a well-informed decision.

With PC=NO, locks are managed in extended common service area (ECSA) and it is possible to achieve better CPU performance, because DB2 does not use cross-memory services for IRLM requests. However, ECSA is a limited resource and constrains the size of the private address space area available above the 16-MB line. The demand for ECSA storage to support locks may be excessive when one or more of the following conditions are true:

- Extensive use of row-level locking
- Ineffective lock avoidance
- Infrequent application commits
- Lock escalation via NUMLKTS and LOCKMAX is disabled because the applications cannot tolerate the impact
- Effectively no limit on the number of locks taken by an application (NUMLKUS is set very high)
- Multiple DB2 subsystems with IRLM PC=NO reside on the same z/OS image

Assuming the average lock consumes 536 bytes of storage, a single application which takes 100000 locks before a commit would consume almost 52 MB of ECSA when IRLM is configured with PC=NO. MAXCSA would have to be set to at least 52 MB. If a very large number of locks are held by concurrent application processes, the demand for ECSA may not be able to be supported.
Recommendation: If you run applications that have many of the above characteristics, it is strongly recommended to use PC=YES. Certain ERP vendor applications that run concurrent processes can acquire a very large number of held locks that would require a very large setting for MAXCSA, or cause an ECSA overflow which would adversely impact the availability of the z/OS image.

If PC=NO is selected, MAXCSA should be sized to support the concurrent number of held locks required and to avoid an ECSA overflow condition. When setting MAXCSA, check to ensure that the ECSA setting in PARMLIB is sufficient to support the aggregate demand from IRLM and other subsystems. The ECSA size for z/OS is specified by the CSA keyword in the IEASSYSnn member in SYS1.PARMLIB.

With PC=YES, locks are managed in the extended private area of the IRLM address space. This can increase the CPU cost of lock and unlock requests relative to PC=NO. However, with reasonable lock avoidance, the total CPU overhead is likely to be limited to 1 to 2%, which is well within measurement noise and therefore not significant.

With PC=YES, the MAXIMUM ECSA option is ignored but must not be zero. The amount of storage allowed for LOCK usage is determined from the extended storage provided to the IRLM address space at startup time. This amount is reduced by 200 MB to allow a buffer for IRLM and z/OS required storage and for DMBS MUST COMPLETE processes. The amount being monitored can be seen in the display message from the irlmprc,STATUS,STOR command. IRLM still uses CSA and ECSA for other purposes. If you need to create a dump for DB2 diagnostic purposes, you need to ensure that IRLM is included in the dump, and that the dump data sets are large enough to hold IRLM.

PC=NO is a good solution when one or more of the following conditions are true, particularly when running a data sharing configuration:

- Optimal CPU performance is required
- No constraint is necessary on available ECSA
- Significant IRLM lock contention and a very large number of lock requests with ineffective lock avoidance
- Relatively high IRLM SRB time

YES puts the lock control block structure in the IRLM private address space, and the program call instruction is used to address it. IRLM still uses CSA and ECSA for other purposes. With PC=YES, the MAXIMUM ECSA option is ignored.

Field Name: QWP5PCY

**BLOCK OPT 1 ROW SORT (OPT1ROWBLOCKSORT)**

Specifies whether DB2 explicitly blocks sort operations when the OPTIMIZE FOR 1 ROW clause is specified on a query:

NO = DISABLE

Means that when OPTIMIZE FOR 1 ROW is specified, DB2 avoids access paths that involve sorts. If an access path that avoids a sort exists, it is possible, although unlikely, that an access path that involves a sort is chosen instead. This behavior is used in DB2 9 and earlier releases.
YES = ENABLE
Meaning that when OPTIMIZE FOR 1 ROW is specified, DB2 chooses access paths that avoid sorts whenever such a path is available.

ZPARM name is OPT1ROWBLOCSORT in DSN6PRM.

Field Name: QWP4O1RBS

SMS DATACLASS NAME FOR TS (SMSDCFL) (Prior to DB2 11)

SMS data class for table spaces. The data class name is a string of one to eight characters. The default is an empty string, which means that the SMS cluster is defined without the DATACLASS parameter.

When a valid data class name is specified, the SMS cluster is specified with the DATACLASS parameter using the name specified. If the name is not valid, SMS returns an error.

DB2 parameter SMSDCFL in DSN6PRM.

Field Name: QWP4DCFS

SMS DATACLASS NAME FOR IS (SMSDCIX) (Prior to DB2 11)

SMS data class for index table spaces. The data class name is a string of one to eight characters. The default is an empty string, which means that the SMS cluster is defined without the DATACLASS parameter.

When a valid data class name is specified, the SMS cluster is specified with the DATACLASS parameter using the name specified. If the name is not valid, SMS returns an error.

DB2 parameter SMSDCIX in DSN6PRM.

Field Name: QWP4DCIX

OUTER JOIN PERFORMANCE ENHANCEMENTS (OJPERFEH) (Prior to DB2 11)

Indicates whether outer join performance enhancements are enabled.

DB2 parameter OJPERFEH in DSN6PRM.

Field Name: QWP4OJEH

EMPTY XML ELEMENT (XML_RESTRICT_EMPTY_TAG)

Indicates whether empty XML elements are serialized:

NO Serialization of empty XML elements is not defined.

YES Empty XML elements are serialized using a start-element tag followed by an end-element tag.

ZPARM name is XML_RESTRICT_EMPTY_TAG in DSN6PRM.

Field Name: QWP4NOET

SUPPRESS_HINT_SQLCODE_DYN (SUPPRESS_HINT_SQLCODE_DYN)

Specifies whether DB2 suppresses SQLCODE +394 and SQLCODE +395 when specified access paths are applied for dynamic SQL statements.

NO DB2 issues SQLCODEs +394 and +395 for statement-level access paths and PLAN_TABLE access paths. NO is the default value.

STMT DB2 suppresses SQLCODEs +394 and +395 for statement-level access paths for dynamic SQL statements.
Other System Parameters

**ALL** DB2 suppresses SQLCODEs +394 and +395 for statement-level access paths and PLAN_TABLE access paths for dynamic SQL statements.

The ZPARM name is SUPPRESS_HINT_SQLCODE_DYN in DSN6SPRM.

**Field Name:** QWP4SHDE

**INDEX MEMORY CONTROL (INDEX_MEMORY_CONTROL)**

Shows the amount of memory that DB2 should allocate for fast traversing of DB2 indexes:

-1 = AUTO
   Specifies that DB2 sets the upper limit of the storage to 20% of the currently allocated buffer pools.

0 = DISABLE
   Specifies that DB2 returns any existing storage allocated for fast index traversal and does not allocate any further storage for this purpose.

500 - 200000
   Indicates the storage limit for fast index traversal.

The ZPARM name is INDEX_MEMORY_CONTROL in DSN6SPRM.

**Field Name:** QWP4IXMC

**SELECT FOR UNLOAD (AUTH_COMPATIBILITY)**

Shows the AUTH_COMPATIBILITY ZPARM values (DB2 field: QWP4AUTCSU):

1  The unload utility checks whether the user has the SELECT privilege on the target table.

0  The unload utility checks whether the user has the UNLOAD privilege on the target table.

**Field Name:** QWP4AUTCSU

**MATERIALIZE NODET SQLTUDF (MATERIALIZE_NODET_SQLTUDF)**

DB2 materializes the result of a user-defined SQL table function that is defined as not deterministic.

- 0=NO
- 1=YES

ZPARM name is MATERIALIZE_NODET_SQLTUDF in DSN6SPRM.

**Field Name:** QWP4MNSU

**ENCRYPTION_KEYLABEL (ENCRYPTION_KEYLABEL)**

If non-blank, the name of a ICSF key to be used for encrypting archive log data sets, directory data sets, catalog data sets and user-defined indexes on the Db2 catalog. A blank value shows as N/P in the report.

**Field Name:** QWP4ENKL

**Performance and Optimization (DSNTIP8, DSNTIP81):**

This topic shows detailed information about “System Parameters - Performance and Optimization (DSNTIP8, DSNTIP81)”.

**Note:** The fields shown on this panel depend on the installed DB2 version.
System Parameters - Performance and Optimization (DSNTIP8, DSNTIP81)

The field labels shown in the following sample layout of “System Parameters - Performance and Optimization (DSNTIP8, DSNTIP81)” are described in the following section.

PERFORMANCE AND OPTIMIZATION (DSNTIP8,DSNTIP81)

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>CACHE DYNAMIC SQL (CACHEDYN)</td>
<td>YES</td>

</tbody>
</table>

**CACHE DYNAMIC SQL (CACHEDYN)**

Indicates whether prepared dynamic SQL statements are saved for later use by eligible application processes in the EDM pool.

Install parameter CACHE DYNAMIC SQL on panel DSNTIP8, or ZPARM CACHEDYN in DSN6SPRM.

Field Name: QWP4CDYN

**CACHE DYN STABILITY (CACHEDYN_STABILIZATION)**

Specifies when dynamic SQL statements can be captured for stabilization. When a statement is stabilized, the current SQLID, statement text, and runtime structures are written to catalog tables. If a dynamic SQL statement is not present in the dynamic SQL statement cache, DB2 will load the runtime structures from catalog table rather than performing a full prepare. This extends the stability and reliability of performance of a dynamic SQL. It can have the following values:

**CAPTURE**

Statements may be stabilized through the -START DYNQUERY command using both MONITOR(NO) and MONITOR:YES). DB2 will not load stabilized statements from SYSDYNQRY.

**LOAD**

Statements may not be stabilized via any means. The -START DYNQUERY command will fail, and any MONITOR:YES) commands in progress will not stabilize statements, even if stabilization criteria are matched. During long prepare, DB2 will attempt to load stabilized statements from SYSDYNQRY with which to run.

**BOTH**

Statements may be stabilized through the -START DYNQUERY command via both MONITOR(NO) and MONITOR:YES). During
long prepare, DB2 will attempt to load stabilized statements from SYSDYNQRY with which to run. BOTH is the default setting.

NONE

Statements may not be stabilized via any means. The -START DYNQUERY command will fail, and any MONITOR(YES) commands in progress will not stabilize statements, even if stabilization criteria are matched. DB2 will not load stabilized statements from SYSDYNQRY.

This field corresponds to field CACHE DYN STABILITY on installation panel DSNTIP8. The ZPARM name is CACHEDYN_STABILIZATION in DSNTIP8.

Field Name: QWP4CDST

OPTIMIZATION HINTS ALLOWED (OPTHINTS)

Shows whether DB2 can use optimization hints from the PLAN_TABLE to influence the access paths used for certain queries.

Install parameter OPTIMIZATION HINTS on panel DSNTIP8, or ZPARM OPTHINTS in DSN6SPRM.

Field Name: QWP4HINT

EVALUATE UNCOMMITTED (EVALUNC)

Shows whether stage 1 predicate evaluation during table access can proceed upon uncommitted data or not.

This applies to isolation levels of Read Stability and Cursor Stability only. When NO (default), predicate evaluation occurs only on committed data (or on the application's own uncommitted changes). NO ensures that all qualifying data is always included in the answer set.

When YES, predicate evaluation can occur upon uncommitted data. Only committed data is returned to the query. However, a decision can be made to omit a row from the answer set based on uncommitted data. Later, undo processing (statement rollback or statement failure) could cause the data to revert to a state that satisfies the predicate.

When YES, DB2 can request fewer locks than in previous versions when processing isolation level Read Stability and Cursor Stability queries. The number of locks avoided is related to the access path of the query, the number of rows evaluated when processing the stage 1 predicate of the query, and the number of those rows that are overflow rows. Specifically, for isolation level Read Stability and Cursor Stability queries, locks are avoided for rows that do not satisfy the stage 1 predicate, provided they are not overflow rows. Table access includes table space scans and index-to-data access, including ridlist-to-data access. For isolation Cursor Stability ridlist production, all row/page locking is avoided.

Install parameter EVALUATE UNCOMMITTED on panel DSNTIP8, or ZPARM EVALUNC in DSN6SPRM.

Field Name: QWP4EVUN

SKIP UNCOMM INSERTS (SKIPUNCI)

YES indicates that uncommitted inserts are treated as if they have not yet been executed. The ZPARM name is SKIPUNCI.

Field Name: QWP4SKUI
IMMEDWRITE OVERRIDE FLAG (IMMEDWRI)

Indicates how DB2 updates group buffer pool dependent pages. This is only valid in a data-sharing environment.

Group buffer pool dependent pages can be written to DASD or SYSTEM pagesets.

Values shown are:

- **NO**  DB2 uses normal write activity for updates, this is the default. Pages are written out at, or before phase 2 commit, or at the end of an abend for transactions that have rolled back.
- **PH1** Pages are written out at, or before phase 1 commit.
  
  If a transaction subsequently rolls back, the pages are updated in the group buffer pool at the end of the rollback and are written out at the end of the abend.
- **YES**  Pages are written out to the coupling facility as soon as the buffer update commits. Pages are written out regardless of whether the update occurs during forward progress or rollback of the transaction.
  
  This option can affect performance due to coupling facility overhead.

Install parameter IMMEDIATE WRITE on panel DSNTIP8, or ZPARM IMMEDWRI in DSN6GRP.

**Field Name:** QWPAMMMW

REBIND PLANMGMT DEFAULT (PLANMGMT)

Shows if and how access path information is stored in the repository. Possible values are:

- **O**  On
- **F**  Off
- **B**  Basic
- **E**  Extended

**Field Name:** QWP4PMGT

PLANMGMTSCOPE DEFAULT (PLANMGMTSCOPE)

Controls which queries are populated in the access path repository (ZPARM parameter PLANMGMTSCOPE). Possible values are:

- **A**  ALL: Includes static and dynamic SQL queries.
- **S**  STATIC: Includes static SQL queries only. This is the default.
- **D**  DYNAMIC: Includes dynamic SQL queries only.

**Field Name:** QWP4PMSC

PACKAGE RELEASE COMMIT (PKGREL_COMMIT)

YES indicates that the following operations on a package that are bound with RELEASE(DEALLOCATE) are permitted while the package is active and allocated by DB2:

- BIND and REBIND requests, including AUTOMATIC REBIND
Data definition language changes to objects that are statically referenced by the package

The ZPARM name is PKGREL_COMMIT in DSN6SPRM.

Field Name: QWP4PKRC

RANDOMIZE XML DOCID (XML_RANDOMIZE_DOCID)

Specifies whether DB2 generates document ID elements sequentially or randomly. Possible values are:

YES      Sequentially
NO       Randomly

ZPARM name XML_RANDOMIZE_DOCID in DSN6SYSP.

Field Name: QWP1XRDI

DISABLE EDM RTS (DISABLE_EDMRTS)

Hexadecimal (X'01'). YES disables the use of EDM real-time Statistics. The ZPARM name is DISABLE_EDMRTS in DSN6SPRM.

Field Name: QWP4DEDR

CURRENT DEGREE (CDSSRDEF)

Shows the default for the CURRENT DEGREE special register when no degree is explicitly set with SET CURRENT DEGREE.

The default disables query parallelism.

Install parameter CURRENT DEGREE on panel DSNTIP8, or ZPARM CDSSRDEF in DSN6SPRM.

Field Name: QWP4CDEG

MAX DEGREE OF PARALLELISM (PARAMDEG)

Indicates the upper limit on the degree of parallelism for a parallel group.

This field has a value of 0. This means PARAMDEG is not set and DB2 can set a default maximum degree of parallelism based on the system configuration.

Install parameter MAX DEGREE on panel DSNTIP8, or ZPARM PARAMDEG in DSN6SPRM.

Field Name: QWP4MDEG

MAX DEGREE FOR DPSI (PARAMDEG_DPSI)

The maximum degree of parallelism for a parallel group in which a data-partitioned secondary index is used to control parallelism. This field corresponds to field MAX DEGREE FOR DPSI on installation panel DSNTIP81. The ZPARM name is PARAMDEG_DPSI in DSN6SPRM.

Field Name: QWP4DEGD

PARALLELISM EFFICIENCY (PARA_EFF)

The parallelism efficiency factor.

Note: This field has value of 0 if the System Management Facilities (SMF) trace contains the hexadecimal value X'8000'.
This field corresponds to field PARALLELISM EFFICIENCY on installation panel DSNTIP8. The ZPARM name is PARA_EFF in DSN6SPRM.

Field Name: QWP4PAEF

STAR JOIN ENABLING (STARJOIN)

Star join enable indicator. Possible values are:

-1 (DISABLE)
Star join is disabled. This is the default.

0 (ENABLE)
Star join is enabled when the join meets the conditions described in the DB2 administration information for performance.

1
Star join is enabled without comparing the ratio of the fact-table cardinality to the cardinality of the largest dimension table. The table with the largest cardinality is the fact table.

n
This is the star join fact table and the largest dimension table ratio. The lowest ratio of the cardinality of the fact table compared to the cardinality of the largest dimension table for which star join is used. 2 < N <= 32768.

Install parameter STAR JOIN QUERIES on panel DSNTIP8, or ZPARM STARJOIN in DSN6SPRM.

Background and Tuning Information

This parameter allows you to set the star join ratio to increase or decrease the dimension table and fact table ratio rule according to application needs.

This parameter also allows you to disable star join if needed for performance reasons. The default is to allow star join if star join detection is successful.

Star join technique is only used when these conditions exist:

• At least two dimensions exist.
• The join predicates are between the fact table and the dimension tables only. (No join predicates lie between the dimension tables.)
• The join predicates are equijoin predicates.
• No correlated subqueries cross dimensions.
• No cycles within the dimensions exist. This means that no predicate can reference more than one candidate dimension table with respect to the same column of the fact table.
• No outer join exists.
• The data type and length of the join predicates are the same.
• The fact table is larger than the dimension table.

Field Name: QWP4SJRT

MAX DATA CACHING IN MB (MXDTCACH)

The maximum amount of virtual memory in megabytes (MB) that is allocated for data caching.

Install parameter MAX DATA CACHING on panel DSNTIP8, or ZPARM MXDTCACH in DSN6SPRM.

Field Name: QWP4MXDC

CURRENT REFRESH AGE (REFSHAGE)
Shows the default for the CURRENT REFRESH AGE special register deferred materialized query tables.

Install parameter CURRENT REFRESH AGE on panel DSNTIP8, or ZPARM REFSHAGE in DSN6SPRM.

Field Name: QWP4RFSH

CURRENT MAINT TYPE (MAINTYPE)

Shows the default special register for the CURRENT MAINTAINED TABLE TYPES FOR OPTIMIZATION statement when no value is explicitly set. Possible values are:

- ALL
- NONE
- SYSTEM (default)
- USER

The default allows query rewrite using system-maintained materialized query tables (SYSTEM) when CURRENT REFRESH AGE is set to ANY. When USER, query rewrite is done using user-maintained materialized query tables when CURRENT REFRESH AGE is set to ANY. ALL means that query rewrite uses both system-maintained and user-maintained materialized query tables.

Install parameter CURRENT MAINT TYPES on panel DSNTIP8, or ZPARM MAINTYPE in DSN6SPRM.

Field Name: QWP4MNTY

VARCHAR FROM INDEX (RETVLCFK)

Indicates whether the VARCHAR column is retrieved from the index.

The data sharing scope of this parameter is GROUP.

When NO, index-only access of variable length column data is disabled. DB2 must retrieve data from the data page. Data is retrieved with no padding.

When YES, index-only access of variable length column data is enabled. This can improve performance. Data retrieved from the index is padded with blanks to the maximum length of the column.

Install parameter VARCHAR FROM INDEX on panel DSNTIP8, or ZPARM RETVLCFK in DSN6SPRM.

Field Name: QWP4VCFK

STATS PROFILE FEEDBACK (STATFDBK_PROFILE)

Specifies whether Statistics recommendations that are identified during query optimization cause DB2 to modify to Statistics profiles.

- 0 indicates NO
- 1 indicates YES

This value corresponds to field STATS PROFILE FEEDBACK on installation panel DSNTIP8. ZPARM name: STATFDBK_PROFILE in DSN6SPRM.

Field Name: QWP4SFPR
Protection Installation Parameters (DSNTIPP):

This topic shows detailed information about “System Parameters - Protection Installation Parameters (DSNTIPP)”.

This block shows security settings.

Data sets, including data sets defined to DFSMS, should be protected by a security manager, such as RACF.

Fields in this block can contain long names. When a long name exceeds the available space, it is truncated, the parameter identifier and the full name are printed in a separate list at the end of the report.

System Parameters - Protection Installation Parameters (DSNTIPP)

The field labels shown in the following sample layout of “System Parameters - Protection Installation Parameters (DSNTIPP)” are described in the following section.

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ARCHIVE LOG RACF PROTECTION (PROTECT)</td>
<td>Indicates whether archive log data sets are protected with individual RACF profiles when they are created.</td>
</tr>
<tr>
<td>DB2 AUTHORIZATION ENABLED (AUTH)</td>
<td>Shows whether DB2 performs authorization checking.</td>
</tr>
<tr>
<td>PLAN AUTHORIZATION CACHE SIZE (AUTHCACH)</td>
<td></td>
</tr>
<tr>
<td>PACKAGE AUTHORIZATION CACHE SIZE (CACHEPAC)</td>
<td></td>
</tr>
<tr>
<td>ROUTINE AUTHORIZATION CACHE SIZE (CACHERAC)</td>
<td></td>
</tr>
<tr>
<td>AUTH EXIT CHECK (AUTHEXIT_CHECK)</td>
<td></td>
</tr>
<tr>
<td>AUTH EXIT CACHE REFRESH (AUTHEXIT_CACHREFRESH)</td>
<td></td>
</tr>
<tr>
<td>SYSTEM ADMINISTRATOR 1 AUTHORIZATION ID (SYSADM)</td>
<td></td>
</tr>
<tr>
<td>SYSTEM ADMINISTRATOR 2 AUTHORIZATION ID (SYSADM2)</td>
<td></td>
</tr>
<tr>

<td></td>
</tr>
<tr>
<td>SYSTEM OPERATOR 2 AUTHORIZATION ID (SYSOPR2)</td>
<td></td>
</tr>
<tr>
<td>DEFAULT (UNKNOWN) USER AUTHORIZATION ID (DEFLTID)</td>
<td></td>
</tr>
<tr>
<td>RESOURCE LIMIT TABLE CREATOR AUTH ID (RLFAUTH)</td>
<td></td>
</tr>
<tr>
<td>BIND NEW PACKAGE (BINDNV)</td>
<td></td>
</tr>
<tr>
<td>DBA CREATE VIEW (DBACRVW)</td>
<td></td>
</tr>
</tbody>
</table>

ARCHIVE LOG RACF PROTECTION (PROTECT)

Indicates whether archive log data sets are protected with individual RACF profiles when they are created.

When YES, RACF protection must be active for DB2. YES also means that you cannot use RACF generic profiles for archive log data sets. If your archive log is on tape, RACF class TPEVOL must be active, otherwise, the off-load will fail.

Install parameter ARCHIVE LOG RACF on panel DSNTIPP, or ZPARM PROTECT in DSN6ARVP.

Field Name: QWP3RTCT

DB2 AUTHORIZATION ENABLED (AUTH)

Shows whether DB2 performs authorization checking.

When all authorization checking by DB2 is disabled, the GRANT statement is also disabled (granting every privilege to PUBLIC); this is not recommended.

Install parameter USE PROTECTION on panel DSNTIPP, or ZPARM AUTH in DSN6SPRM.
Protection Installation Parameters (DSNTIPP)

Field Name: QWP4AUTH

PLAN AUTHORIZATION CACHE SIZE (AUTHCACH)

The size of the authorization cache to be used if no CACHESIZE is specified on the BIND PLAN subcommand.

The size of the cache is 32 bytes of overhead + (8 bytes of storage X number of concurrent users).

0 means authorization caching is not used.

Install parameter PLAN AUTH CACHE on panel DSNTIPP, or ZPARM AUTHCACH in DSN6SPRM.

Field Name: QWP4AUCA

PACKAGE AUTHORIZATION CACHE SIZE (CACHEPAC)

The amount of storage allocated for caching authorization information for all packages on this DB2 member.

32 KB hold about 375 collection-ID.package-IDs. The cache is stored in the DSN1DBM1 address space.

Install parameter PACKAGE AUTH CACHE on panel DSNTIPP, or ZPARM CACHEPAC in DSN6SPRM.

Field Name: QWP4PAC

ROUTINE AUTHORIZATION CACHE SIZE (CACHERAC)

The amount of storage allocated for caching authorization information for all routines on this DB2 member.

Routines include stored procedures and user-defined functions.

32 KB hold about 380 schema.routine.type entries.

Install parameter ROUTINE AUTH CACHE on panel DSNTIPP, or ZPARM CACHERAC in DSN6SPRM.

Field Name: QWP4RAC

AUTH EXIT CHECK (AUTHEXIT_CHECK)

Specifies whether the DB2 authorization ID or the RACF primary authorization ID is to be used for authorization checks, when the access control authorization exit is active:

Primary

DB2 provides:

- The ACEE of the package owner to perform statement authorization checks during AUTOMATIC REBIND, BIND, and REBIND processing
- The ACEE of the package owner, routine definer, or routine invoker, as determined by the dynamic rules behavior for dynamic SQL authorization checking, when a DYNAMICRULES BIND option value other than run is in effect.

The access control authorization exit uses the ACEE for the XAPLUCHK authorization ID field to perform the authorization. The authorization ID in XAPLUCHK must be defined as a RACF user and must have the privileges required to execute the SQL statements in the package.
DB2  DB2 provides the ACEE of the primary authorization ID for performing all authorization checks. The primary authorization ID must have the privileges required to execute the SQL statements in the package. This field corresponds to field "RACF AUTH CHECK" on installation panel DSNTIPP. ZPARM name is RACF_AUTHCHECK in DSN6SPRM.

Field Name: QWP4RACK

AUTH EXIT CACHE REFRESH (AUTHEXIT_CACHEREFRESH)

Specifies whether the package authorization cache, routine authorization cache, and dynamic statement cache entries are refreshed when an access control authorization exit is active, and the user profile is changed in RACF. Possible values are:

- All
- None

This field corresponds to field AUTH EXIT CACHE REFR in installation panel DSNTIPP. ZPARM name is AUTHEXIT_CACHEREFRESH in DSN6SPRM.

Field Name: QWP4AECR

SYSTEM ADMINISTRATOR 1 AUTHORIZATION ID (SYADM)

One of two authorization IDs with SYADM authority. SYADM users can access to DB2 in all cases.

This identifier can be a long string. If there is insufficient space to show the complete string, the string is truncated in the report block. The complete string is shown in a separate list of long names at the end of the report.

Install parameter SYSTEM ADMIN 1 on panel DSNTIPP, or ZPARM SYADM in DSN6SPRM.

Field Name: QWP4SADM

SYSTEM ADMINISTRATOR 2 AUTHORIZATION ID (SYADM2)

One of two authorization IDs with SYADM authority. SYADM users can access to DB2 in all cases.

This identifier can be a long string. If there is insufficient space to show the complete string, the string is truncated in the report block. The complete string is shown in a separate list of long names at the end of the report.

Install parameter SYSTEM ADMIN 2 on panel DSNTIPP, or ZPARM SYADM2 in DSN6SPRM.

Field Name: QWP4ADM2

SYSTEM OPERATOR 1 AUTHORIZATION ID (SYSOPR1)

One of two authorization IDs with SYSOPR authority. SYSOPR users can access DB2 even if the DB2 catalog is unavailable.

This identifier can be a long string. If there is insufficient space to show the complete string, the string is truncated in the report block. The complete string is shown in a separate list of long names at the end of the report.

Install parameter SYSTEM OPERATOR 1 on panel DSNTIPP, or ZPARM SYSOPR1 in DSN6SPRM.

Field Name: QWP4OPR1
Protection Installation Parameters (DSNTIPP)

SYSTEM OPERATOR 2 AUTHORIZATION ID (SYSOPR2)

One of two authorization IDs with SYSOPR authority. SYSOPR users can access DB2 even if the DB2 catalog is unavailable.

This identifier can be a long string. If there is insufficient space to show the complete string, the string is truncated in the report block. The complete string is shown in a separate list of long names at the end of the report.

Install parameter SYSTEM OPERATOR 2 on panel DSNTIPP, or ZPARM SYSOPR2 in DSN6SPRM.

Field Name: QWP4OPR2

DEFAULT (UNKNOWN) USER AUTHORIZATION ID (DEFLTID)

The authorization ID used if RACF is not available for batch access and USER= is not specified in the job statement.

This identifier can be a long string. If there is insufficient space to show the complete string, the string is truncated in the report block. The complete string is shown in a separate list of long names at the end of the report.

Install parameter UNKNOWN AUTHID on panel DSNTIPP, or ZPARM DEFLTID in DSN6SPRM.

Field Name: QWP4DFID

RESOURCE LIMIT TABLE CREATOR AUTH ID (RLFAUTH)

The authorization ID used for the resource limit facility (governor).

This identifier can be a long string. If there is insufficient space to show the complete string, the string is truncated in the report block. The complete string is shown in a separate list of long names at the end of the report.

Install parameter RESOURCE AUTHID on panel DSNTIPP, or ZPARM RLFAUTH in DSN6SYS.

Field Name: QWP1RLFA

BIND NEW PACKAGE (BINDNV)

Shows whether BIND or BINDADD authority is required to BIND a new version of an existing package.

When BINDADD (default), only users with BINDADD system privilege can create a new package.

BIND users with BIND privilege for a package or collection can create a new version of an existing package when they bind it. This also allows users with PACKADM authority to add a new package or a new version of a package to a collection.

Install parameter BIND NEW PACKAGE on panel DSNTIPP, or ZPARM BINDNV in DSN6SPRM.

Field Name: QWP4BNVA

DBA CREATE VIEW (DBACRVW)

Shows whether a DB2 administrator can create a view or alias for another user. Possible values are YES or NO. The default is NO.

Install parameter DBADM CREATE AUTH on panel DSNTIPP, ZPARM DBACRVW in macro DSN6SPRM.

Field Name: QWP4CRVW
Protection Panel (DSNTIPP1):

This topic shows detailed information about “System Parameters - Protection Panel (DSNTIPP1)”.

System Parameters - Protection Panel (DSNTIPP1)

The field labels shown in the following sample layout of “System Parameters - Protection Panel (DSNTIPP1)” are described in the following section.

SECURITY ADMINISTRATOR 1 AUTHORIZATION ID (SECA1)

Security administrator 1 authorization ID (blank if ROLE).

This field corresponds to field SECURITY ADMIN 1 on installation panel DSNTIPP1, or ZPARM SECA1 in DSN6SPRM.

Field Name: QWP4SECA1_E

SECURITY ADMINISTRATOR 1 TYPE (SECA1_TYPE)

Security administrator 1 type. Possible values are:

' ' Blank indicates that the authorization ID (AUTH ID) is used.

'L' Indicates that ROLE is used.

This field corresponds to field SEC ADMIN 1 TYPE on installation panel DSNTIPP1, or ZPARM SECA1_TYPE in DSN6SPRM.

Field Name: QWP4SECA1_TYPE

SECURITY ADMINISTRATOR 2 AUTHORIZATION ID (SECA2)

Security administrator 2 authorization ID (blank if ROLE).

This field corresponds to field SECURITY ADMIN 2 on installation panel DSNTIPP1, or ZPARM SECA2 in DSN6SPRM.

Field Name: QWP4SECA2_E

SECURITY ADMINISTRATOR 2 TYPE (SECA2_TYPE)

Security administrator 2 type. Possible values are:

'blank' Indicates that the authorization ID (AUTH ID) is used.

'L' Indicates that ROLE is used.

This field corresponds to field SEC ADMIN 2 TYPE on installation panel DSNTIPP1, or ZPARM SECA2_TYPE in DSN6SPRM.

Field Name: QWP4SECA2_TYPE

SEPARATE SECURITY DUTIES (SEPARATE_SECURITY)

Separate security tasks. Possible values are:

Y SYSADM/SYSCTRL cannot GRANT/REVOKE

N SYSADM/SYSCTRL can GRANT/REVOKE
Field Name: QWP4SEPSD

INCLUDE DEPENDENT PRIVILEGES (REVOKE_DEP_PRIVILEGES)

Include dependent privileges on REVOKE. Possible values are:

Y  If INCLUDING DEPENDENT PRIVILEGES is enforced.
N  If NOT INCLUDING DEPENDENT PRIVILEGES is enforced.
S  If specified in a REVOKE statement.

Field Name: QWP4RVDPR

Query Accelerator Preferences (DSNTP82):

This topic shows detailed information about “System Parameters - Query Accelerator Preferences (DSNTP82)”.

System Parameters - Query Accelerator Preferences (DSNTP82)

The field labels shown in the following sample layout of “System Parameters - Query Accelerator Preferences (DSNTP82)” are described in the following section.

**QUERY ACCELERATOR PREFERENCES (DSNTP82)**

----------------------------------------
ACCELERATOR STARTUP OPTION (ACCEL)...........................NO
GET ACCEL ARCHIVE (GET_ACCEL_ARCHIVE)........................NO
ACCELERATION OPTIONS (QUERY_ACCEL_OPTIONS).................NONE
CURRENT QUERY ACCEL (QUERY_ACCELERATION)....................NONE
ACCELERATION MODELING (ACCELMODEL)..........................YES
REMOTE COPY SW ACCEL (REMOTE_COPY_SW_ACCEL).............YES

**ACCELERATOR STARTUP OPTION (ACCEL)**

Specifies whether to enable accelerator servers. Possible values are:

AUTO
   Enable and start accelerator servers.

COMMAND
   Enable but do not start accelerator servers.

NO
   Do not enable accelerator servers.

This field corresponds to field ACCEL STARTUP on installation panel DSNTP81. ZPARM name is ACCEL in DSN6SPRM.

Field Name: QWP4ACCS

**GET ACCEL ARCHIVE (GET_ACCEL_ARCHIVE)**

Determines the default value that is to be used for the CURRENT GET_ACCEL_ARCHIVE special register:

NO
   Indicates that if a table is archived in an accelerator server, and a query references that table, the query does not use the data that is archived.

YES
   Indicates that if a table is archived in an accelerator server, and a query references that table, the query uses the data that is archived.

ZPARM name GET_ACCEL_ARCHIVE in macro DSN6SPRM.

Field Name: QWP4CGAA

**ACCELERATION OPTIONS (QUERY_ACCEL_OPTIONS)**
Specifies additional types of SQL queries that are eligible for acceleration.

NONE
 Indicates that no additional types of SQL queries are eligible. Therefore, the types of queries that are described in the other available values for this parameter are not eligible for acceleration. This is the default value.

1
 Indicates that queries that include data that is encoded with the EBCDIC mixed or graphic encoding schemes are eligible for acceleration.

2
 Indicates that an INSERT with SELECT statement is eligible for acceleration. However, only the SELECT operation of the query is processed by the accelerator server.

3
 Indicates that queries that contain built-in functions for which DB2 processes each byte of the input string, rather than each character of the input string, can run on an accelerator server.

4
 The queries that reference an expression with a DATE data type that uses a LOCAL format are not blocked from executing on IBM DB2 Analytics Accelerator for z/OS. IBM DB2 Analytics Accelerator for z/OS will use the dd/mm/yyyy format to interpret the input and output date value. Specify option 4 only when you also specify LOCAL as the setting for the DSNHDECP.DATE parameter and your LOCAL date exit defines the specific dd/mm/yyyy date format. Otherwise, queries may return unpredictable results.

5
 Allow OFFLOAD of SYSTEM_TIME temporal queries.

6
 Allow OFFLOAD of queries that reference timestamp columns with a precision of up to 12.

7
 OFFLOAD uses YYYYMMDD date format.

ZPARM name QUERY_ACCEL_OPTIONS in macro DSN6SPRM.

Field Name: QWP4QACO

CURRENT QUERY ACCEL (QUERY_ACCELERATION)

Determines the default value that is to be used for the CURRENT QUERY ACCELERATION special register. Possible values are:

NONE
 Indicates that no query acceleration is done. This is the default value.

ENABLE
 Indicates that queries are accelerated only if DB2 determines that it is advantageous to do so. If there is an accelerator failure while a query is running, or the accelerator returns an error, DB2 returns a negative SQLCODE to the application.

ENABLE_WITH_FAILBACK
 Indicates that queries are accelerated only if DB2 determines that it is advantageous to do so. If the accelerator returns an error during the PREPARE or first OPEN for the query, DB2 executes the query without the accelerator. If the accelerator returns an error during a FETCH or a subsequent OPEN, DB2 returns the error to the user, and does not execute the query.
ELIGIBLE
Indicates that queries are accelerated if they are eligible for acceleration. DB2 does not use cost information to determine whether to accelerate the queries. Queries that are not eligible for acceleration are executed by DB2. If there is an accelerator failure while a query is running, or the accelerator returns an error, DB2 returns a negative SQLCODE to the application.

ALL
Indicates that queries are accelerated if they are eligible for acceleration. DB2 does not use cost information to determine whether to accelerate the queries. Queries that are not eligible for acceleration are not executed by DB2, and an SQL error is returned. If there is an accelerator failure while a query is running, or the accelerator returns an error, DB2 returns a negative SQLCODE to the application.

ZPARM name QUERY_ACCELERATION in DSN6SPRM.

Field Name: QWP4CQAC

ACCELERATION MODELING (ACCELMODEL)
The ACCELMODEL subsystem parameter determines whether to enable modeling of query workload for evaluating potential savings for both the accumulated elapsed time and CPU time if the plan is executed on an accelerator.

Only queries that are deemed eligible for execution on an accelerator by DB2 will be included in accelerator-related fields of Accounting trace IFCID 3:

No Specifies that no modeling is to be performed. This is the default setting.

Yes Specifies that modeling is to be performed. Consider acceleration eligibility for an SQL statement and update the new Accounting fields accordingly.

To enable modeling, the IBM DB2 Analytics Accelerator for z/OS special register CURRENT QUERY ACCELERATION and ZPARM QUERY_ACCELERATION (set by the CURRENT QUERY ACCEL) must be set to NONE for accelerator modeling. All other values for the special register and ZPARM will take the existing logic of IBM DB2 Analytics Accelerator for z/OS. This means that existing queries that already execute on the accelerator with CURRENT QUERY ACCELERATION = ENABLE, ENABLE WITH FAILBACK, ELIGIBLE, or ALL will not be part of the accelerator-related Accounting fields.

Field Name: QWP4ACMO

REMOTE COPY SW ACCEL (REMOTE_COPY_SW_ACCEL)
Specifies whether DB2 uses software (SW) to control the remote copy process for active log output in peer-to-peer remote copy (PPRC) environments. It can have the following values:

• DISABLE (This is the default value)
• ENABLE

ZPARM REMOTE_COPY_SW_ACCEL in DSN6LOGP.

Field Name: QWP2RCSA
Routine Parameters (DSNTIPX):

This topic shows detailed information about “System Parameters - Routine Parameters (DSNTIPX)”.

This block shows information about the stored procedures address space used to run stored procedures or user-defined functions.

**Note:** The fields shown on this panel depend on the installed DB2 version.

System Parameters - Routine Parameters (DSNTIPX)

The field labels shown in the following sample layout of “System Parameters - Routine Parameters (DSNTIPX)” are described in the following section.

**ROUTINE PARAMETERS (DSNTIPX)**

```
MAX ABEND COUNT (STORMXAB)....................0
TIMEOUT VALUE (STORTIME)..........................180
WLM ENVIRONMENT (WLMENV)..........................DBPGD800
MAX OPEN CURSORS (MAX_NUM_CUR)..................500
MAX STORED PROCS (MAX_ST_PROC)..................2,000
MAXIMUM NUMBER OF LE TOKENS (LEMAX)............20
BIF COMPATIBILITY (BIF_COMPATIBILITY)..........V9_DECIMAL_VARCHAR
```

**MAX ABEND COUNT (STORMXAB)**

The number of times a stored procedure is allowed to terminate abnormally, after which SQL CALL statements for the stored procedure are rejected.

Install parameter MAX ABEND COUNT on panel DSNTIPX, or ZPARAM STORMXAB in DSN6SYSP.

**Field Name:** QWP1SPAB

**TIMEOUT VALUE (STORTIME)**

The number of seconds before DB2 stops waiting for an SQL CALL statement to be assigned to one of the TCBs in the DB2 stored procedures address space.

Install parameter TIMEOUT VALUE on panel DSNTIPX, or ZPARAM STORTIME in DSN6SYSP.

**Field Name:** QWP1SPTO

**WLM ENVIRONMENT (WLMENV)**

Workload manager environment.

Install parameter WLM ENVIRONMENT on panel DSNTIPX, or ZPARAM WLMENV in DSN6SYSP.

**Field Name:** QWP1WLME

**MAX OPEN CURSORS (MAX_NUM_CUR)**

Shows the maximum number of cursors, including allocated cursors, that are open at a given DB2 site per thread. RDS keeps a total of currently open cursors. If an application attempts to open a thread after the maximum is reached, the statement will fail.

In a data sharing group, this parameter is shown at member scope.
Routine Parameters (DSNTIPX)

Install parameter MAX OPEN CURSORS on panel DSNTIPX, or ZPARM MAX_NUM_CUR in DSN6SPRM.

Field Name: QWP4MXNC

MAX STORED PROCS (MAX_ST_PROC)

Shows the maximum number of stored procedures per thread. If an application attempts to call a stored procedure after this is reached, the statement will fail. In a data sharing group, this parameter is shown as member scope.

Install parameter MAX STORED PROCS on panel DSNTIPX, or ZPARM MAX_ST_PROC in DSN6SPRM.

Field Name: QWP4MXSP

MAXIMUM NUMBER OF LE TOKENS (LEMAX)

The maximum number of LE tokens active at any time. When zero, no tokens are available.

A token is used each time one of the following is used: trigonometry functions, degrees, radians, rand, exp, power, log functions, upper, lower, translate.

Install parameter MAXIMUM LE TOKENS on panel DSNTIP7, or ZPARM LEMAX in DSN6SPRM.

Field Name: QWP4LEM

BIF COMPATIBILITY (BIF_COMPATIBILITY)

The BIF_COMPATIBILITY subsystem parameter specifies whether the built-in functions and specifications are to return results in the DB2 10 format or revert to the pre-Version 10 format. It can have the following values:

- CURRENT
- V9
- V9_TRIM
- V9_DECIMALVARCHAR (default for migration)
- N/P (default for new installation)

This field corresponds to field BIF COMPATIBILITY on installation panel DSNTIPX.

ZPARM name BIF_COMPATIBILITY in DSN6SPRM.

Field Name: QWP4_BIF_COMPAT

Sizes Panel 1 (DSNTIPD):

This topic shows detailed information about “System Parameters - Sizes Panel 1 (DSNTIPD)”.

System Parameters - Sizes Panel 1 (DSNTIPD)

The field labels shown in the following sample layout of “System Parameters - Sizes Panel 1 (DSNTIPD)” are described in the following section.

```
SIZES PANEL 1 (DSNTIPD)
------------------------
LOB INLINE LENGTH (LOB_INLINE_LENGTH)...............0
USER LOB VALUE STORAGE IN KB (LOBVALA)...............200,000
```
LOB INLINE LENGTH (LOB_INLINE_LENGTH)
Default inline length for any new storing large object (LOB) column in a Universal Table Space on the DB2 subsystem. The valid values are from 0 to 32680 inclusive (in bytes). The default value for this ZPARM is 0, which indicates that no inline attribute is required for any LOB column (BLOB, CLOB or DBCLOB) created on this subsystem.

Field Name: QWP1LBIL

USER LOB VALUE STORAGE IN KB (LOBVALA)
The maximum amount of storage (KB) each user can use for LOB values.
Install parameter USER LOB VALUE STORAGE on panel DSNTIP7, or ZPARM LOBVALA in DSN6SYSP.

Field Name: QWP1LVA

SYSTEM LOB VALUE STORAGE IN MB (LOBVALS)
The maximum amount of storage (MB) each system can use for LOB values.
Install parameter SYSTEM LOB VALUE STORAGE on panel DSNTIP7, or ZPARM LOBVALS in DSN6SYSP.

Field Name: QWP1LVS

MAXIMUM NUMBER OF LE TOKENS (LEMAX)
The maximum number of LE tokens active at any time. When zero, no tokens are available.
A token is used each time one of the following is used: trigonometry functions, degrees, radians, rand, exp, power, log functions, upper, lower, translate.
Install parameter MAXIMUM LE TOKENS on panel DSNTIP7, or ZPARM LEMAX in DSN6SPRM.

Field Name: QWP4LEM

USER XML VALUE STG IN KB (XMLVALA)
The maximum amount of memory in kilobytes (KB) for each user for storing XML values.
ZPARM XMLVALA in DSN6SYSP.

Field Name: QWP1XVA

SYSTEM XML VAL STG IN MB (XMLVALS)
The maximum amount of memory in megabytes (MB) for each system for storing XML values.
ZPARM XMLVALS in DSN6SYSP.

Field Name: QWP1XVS
SQL Object Defaults Panel (DSNTIP7, DSNTIP71, DSNTIP72):

This topic shows detailed information about “System Parameters - SQL Object Defaults Panel (DSNTIP7, DSNTIP71, DSNTIP72).”

This block shows the limits for the amount of storage that can be used for storing large object (LOB) values.

**Note:** The fields shown on this panel depend on the installed DB2 version.

System Parameters - SQL Object Defaults Panel (DSNTIP7, DSNTIP71, DSNTIP72)

The field labels shown in the following sample layout of “System Parameters - SQL Object Defaults Panel (DSNTIP7, DSNTIP71, DSNTIP72)” are described in the following section.

```
SQL OBJECT DEFAULTS PANEL (DSNTIP7,DSNTIP71,DSNTIP72)
-----------------------------------------------------
REORDERED ROW FORMAT (RRF)..................................YES
OBJECT CREATE FORMAT (OBJECT_CREATE_FORMAT)..............EXTENDED
UTILITY OBJECT CONVERSION (UTILITY_OBJECT_CONVERSION)....NONE
VARY DS CONTROL INTERVAL (DSVCI)............................YES
TABLE SPACE ALLOCATION IN KB (TSQTY)..........................0
INDEX SPACE ALLOCATION IN KB (IXQTY)..........................0
OPTIMIZE EXTENT SIZING (MEASIZE)............................NO
PAD INDEX BY DEFAULT (PADIX).................................NO
DEFAULT PARTITION SEGSIZE (DPSEGSZ)..........................32
PERCENT FREE FOR UPDATE (PCTFREE_UPD).......................0
DEFINE DATA SETS (IMPDSET)..................................YES
USE DATA COMPRESSION (IMPSCMP)...............................NO
LIMIT KEY CONV PART TAB (IX_TB_PART_CONV_EXCLUDE).........NO
RETRY STOPPED OBJECTS (RETRY_STOPPED_OBJECTS).............NO
RENAME TABLE (RENAME_TABLE)..................................NO
PREVENT ALTER LIMITKEY (PREVENT_ALTERTB_LIMITKEY)........NO
PREVENT INDEX PART CREATE (PREVENT_NEW_IXCTRL_PART)......NO (DB2 11 or later)
DDL MATERIALIZATION (DDL_MATERIALIZATION)..............ALWAYS_IMMEDIATE
DEFAULT_INSERT_ALGORITHM (DEFAULT_INSERT_ALGORITHM)......2
```

**REORDERED ROW FORMAT (RRF)**

In DB2 12 this field is a serviceability field.

A value of YES shows that reordered row format is enabled.

This field corresponds to field REORDERED ROW FORMAT on installation panel DSNTIP7. The ZPARM name is RRF in DSN6SPRM.

Field Name: QWP4RRF

**OBJECT CREATE FORMAT (OBJECT_CREATE_FORMAT)**

Creates new table spaces and indexes in the following log record format:

- **EXTENDED**
  
  Creates new table spaces and indexes in extended log record format.

- **BASIC**

  Creates new table spaces and indexes in basic log record format.

Field Name: QWP4OBCF

**UTILITY OBJECT CONVERSION (UTILITY_OBJECT_CONVERSION)**

This field can have the following values:
SQL Object Defaults Panel (DSNTIP7, DSNTIP71)

NONE (QWP4UTOC1=0 and QWP4UTOC2=0)
No conversion is performed. This option is the default setting of this parameter. NONE is allowed regardless of the OBJECT CREATE FORMAT setting.

BASIC (QWP4UTOC1=1 and QWP4UTOC2=0)
Existing table spaces and indexes that use extended 10-byte page format are converted to basic 6-byte page format. BASIC is allowed only if the OBJECT CREATE FORMAT field is also set to BASIC.

EXTENDED (QWP4UTOC1=0 and QWP4UTOC2=1)
Existing table spaces and indexes that use 6-byte page format are converted to extended 10-byte page format. EXTENDED is allowed only if the OBJECT CREATE FORMAT field is also set to EXTENDED.

NO BASIC (QWP4UTOC1=1 and QWP4UTOC2=1)
Prevents the conversion of table spaces and indexes in extended page format to basic page format and disallows a utility that accepts the RBALRSN_CONVERSION utility keyword from running on an object in basic page format unless it converts it to extended page format. This setting is permitted only when OBJECT_CREATE_FORMAT=EXTENDED is set.

The ZPARM name is UTILITY_OBJECT_CONVERSION in DSN6SPRM.

Field Name: RT0106OC

VARY DS CONTROL INTERVAL (DSVCI)
Indicates whether DB2 optimizes VSAM CONTROL INTERVAL to page size for data set allocation.

Install parameter VARY DS CONTROL INTERVAL on panel DSNTIP7, or ZPARM DSVCI in DSN6SYSP.

Field Name: QWP1VVICI

TABLE SPACE ALLOCATION IN KB (TSQTY)
Shows the amount of space in KB for primary and secondary space allocation for DB2-defined data sets for table spaces created without the USING clause. 0 indicates that DB2 uses standard defaults.

Install parameter TABLE SPACE ALLOCATION on panel DSNTIP7, or ZPARM TSQTY in DSN6SYSP.

Field Name: QWP1TSQT

INDEX SPACE ALLOCATION IN KB (IXQTY)
Shows the amount of space in KB for primary and secondary space allocation for DB2-defined data sets for index spaces created without the USING clause. 0 indicates that DB2 uses standard defaults.

Install parameter INDEX SPACE ALLOCATION on panel DSNTIP7, or ZPARM IXQTY in DSN6SYSP.

Field Name: QWP1IXQT

OPTIMIZE EXTENT SIZING (MGEXTSZ)
Indicates whether DB2 uses sliding secondary quantity for DB2 managed data sets to optimize extent sizing.
Install parameter OPTIMIZE EXTENT SIZING on panel DSNTIP7, or ZPARM MGEXTSZ in DSN6SYSP.

Field Name: QWP1MESZ

**PAD INDEX BY DEFAULT (PADIX)**

Shows whether new indexes are be padded by default.

- YES indicates that a new index is padded unless the NOT Padded option is specified on the CREATE INDEX statement.
- The default value, NO, indicates that a new index is not padded unless the Padded option is specified on the CREATE INDEX statement.

Install parameter PAD INDEXES BY DEFAULT on installation panel DSNTIE, or ZPARM PADIX in DSN6SPRM.

Field Name: QWP4PDIX

**DEFAULT PARTITION SEGSIZE (DPSEGSZ)**

The default segment size to be used for a partitioned table space when the CREATE TABLESPACE statement does not include the SEGSIZE parameter. This field corresponds to field DEFAULT PARTITION SEGSIZE on installation panel DSNTIP7. The ZPARM name is DPSEGSZ IN DSN6SYSP.

Field Name: QWP1DPSS

**PERCENT FREE FOR UPDATE (PCTFREE_UPD)**

Specifies the default percentage of each page that DB2 leaves as free space in a table space when a table in this table space is populated. This value applies only to table spaces whose definitions do not include PCTFREE and for UPDATE.

This value corresponds to field PERCENT FREE FOR UPDATE on installation panel DSNTIP71. The ZPARM name is PCTFREE_UPD in DSN6SPRM.

Field Name: QWP4PFUP

**DEFINE DATA SETS (IMPDSDEF)**

Defines the underlying data sets when a table space (TS) that is contained in an implicitly created database is created.

Install parameter DEFINE DATA SETS on panel DSNTIP7 or ZPARM IMPDSDEF in DSN6SYSP.

Field Name: QWP1DIDS

**USE DATA COMPRESSION (IMPTSCMP)**

Shows whether data compression in table spaces in implicitly defined databases is used.

Install parameter USE DATA COMPRESSION on panel DSNTIP7 or ZPARM IMPTSCMP in DSN6SYSP.

Field Name: QWP1CITS

**LIMIT KEY CONV PART TAB (IX_TB_PART_CONV_EXCLUDE)**

Shows whether to include all columns in the partitioning key during conversion from index-controlled partitioning to table-controlled partitioning:

- NO  Includes all columns
YES  Includes trailing columns only if they affect partitioning

This field corresponds to field EXCLUDE PART KEY ELEMENTS on installation panel DSNTIP71. The ZPARM name is IX_TB_PART_CONV_EXCLUDE in DSN6SPRM.

Field Name: QWP4XPKE

PAGE SET PAGE NUMBERING (PAGESET_PAGENUM)

Specifies whether range-partitioned table spaces and associated indexes will be created to use absolute page numbers across partitions or relative page numbers.

A  Absolute page numbers
R  Relative page numbers

Install parameter PAGE SET PAGE NUMBERING on panel DSNTIP71, or ZPARM PAGESET_PAGENUM in DSN6SPRM.

Field Name: QWP4PSPN

RETRY STOPPED OBJECTS (RETRY_STOPPED_OBJECTS)

Specifies whether DB2 should immediately reject requests for a stopped object or retry them, up to the IRLM timeout limit, if the object is restarted.

NO  This is the default. It indicates that DB2 immediately rejects requests for a stopped object.
YES  DB2 retries such requests, up to the IRLM timeout setting, if the stopped object is restarted.

Install parameter RETRY STOPPED OBJECTS on panel DSNTIP72, or ZPARM RETRY_STOPPED_OBJECTS in DSN6SPRM.

Field Name: QWP4RSO

RENAME TABLE (RENAMETABLE)

Specifies whether the RENAME TABLE statement should extend to tables that are referenced in a view definition or the definition of an SQL table function:

YES  ALLOW_DEP_VIEW_SQLTUFD
NO  DISALLOW_DEP_VIEW_SQLTUFD

Install parameter RENAME TABLE on panel DSNTIP72, or ZPARM RENAMETABLE in DSN6SPRM.

Field Name: QWP4ERTS

PREVENT ALTER LIMITKEY (PREVENT_ALTERTB_LIMITKEY)

Determines whether DB2 disallows altering the limit key by using an ALTER TABLE statement for index-controlled partitioned table spaces. This alter operation places the table space in REORG-pending (REORP) restrictive status, and the data is not available until the affected partitions are reorganized. Use PREVENT_ALTERTB_LIMITKEY to avoid this data unavailability.

NO  Specifies that you can alter a limit key by using an ALTER TABLE statement for index-controlled partitioned table spaces. NO is the default.
YES  Specifies that it is not permitted to alter a limit key by using an
ALTER TABLE statement for index-controlled partitioned table spaces. An ALTER TABLE statement must not attempt to alter the limit key for an index-controlled partitioned table.

Install parameter PREVENT ALTER LIMITKEY on panel DSNTIP71, or ZPARM: PREVENT_ALTERTB_LIMITKEY in DSN6SPRM.

Field Name: QWP4PALK

PREVENT INDEX PART CREATE (PREVENT_NEW_IXCTRL_PART) (DB2 11 or later)

Determines whether DB2 does not allow the creation of new index-controlled partitioned tables. This subsystem parameter ensures that new partitioned tables use table-controlled partitioning, which is the preferred partitioning method for non-universal table spaces.

NO Specifies that new index-controlled partitioned tables can be created. NO is the default value.

YES Specifies that new partitioned table spaces must use table-controlled partitioning. A CREATE INDEX statement must not attempt to create an index-controlled partitioned table.

Install parameter PREVENT INDEX PART CREATE on panel DSNTIP71, or ZPARM: PREVENT_NEW_IXCTRL_PART in DSN6SPRM.

Field Name: QWP4PCIP

DDL MATERIALIZATION (DDL_MATERIALIZATION)

Specifies when DB2 materializes changes to the definition of an object. This value corresponds to field DDL_MATERIALIZATION on installation panel DSNTIP71. ZPARM name is DDL_MATERIALIZATION in DSN6SPRM.

Field Name: QWP4DDLM

DEFAULT_INSERT_ALGORITHM (DEFAULT_INSERT_ALGORITHM)

Specifies the default algorithm for inserting data into table spaces. This value corresponds to the field DEFAULT_INSERT_ALGORITHM on installation panel DSNTIP71. The ZPARM name DEFAULT_INSERT_ALGORITHM is in DSN6SPRM.

Field Name: QWP4DINA

Storage Sizes Installation Parms (DSNTIPC, DSNTIPE, DSNTIPE1):

This topic shows detailed information about “System Parameters - Storage Sizes Installation Parms (DSNTIPC, DSNTIPE, DSNTIPE1)”.

This block shows the storage sizes calculated by the installation CLIST.

These space estimates do not account for cylinder rounding. Base requirements can be 10 to 20% higher depending on the DASD type. Most of the needed virtual storage is in extended private storage (including the buffer pool, the EDM pool, most of the code, and a significant amount of working storage).

Note: The fields shown on this panel depend on the installed DB2 version.
System Parameters - Storage Sizes Installation Parms (DSNTIPC, DSNTIPE, DSNTIPE1)

The field labels shown in the following sample layout of "System Parameters - Storage Sizes Installation Parms (DSNTIPC, DSNTIPE, DSNTIPE1)" are described in the following section.

---

**STORAGE SIZES INSTALLATION PARMS (DSNTIPC, DSNTIPE, DSNTIPE1)**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAX NO OF DATA SETS CONCURRENTLY IN USE (DSMAX)</td>
<td>The maximum number of data sets that can be open at one time. The practical limit can be less than the MVS limit of 32727, depending on available storage below the line. Install parameter DMAX on panel DSNTIPC, or ZPARM DMAX in DSN6SPRM. <strong>Field Name:</strong> QWP4DSMX</td>
</tr>
<tr>
<td>EDM STATEMENT CACHE SIZE IN KB (EDMSTMTC)</td>
<td>The size of the statement cache that can be used by the Environmental Descriptor Manager (EDM). This value is used at DB2 startup time as the minimum value. You can increase and subsequently decrease this value with the SET SYSPARM command. This value cannot be decreased below the value that is specified at DB2 startup. The CLIST calculates a statement cache size. This storage pool is located above the 2 GB bar. The value used at DB2 startup time is either calculated by the CLIST based on input from other installation information or an override value. For record trace, this value is shown in bytes. For other reports, the value is shown in kilobytes. Install parameter EDM STATEMENT CACHE on panel DSNTIPC, or ZPARM EDMSTMTC in DSN6SPRM. <strong>Field Name:</strong> QWP4ESTC</td>
</tr>
<tr>
<td>EDM DBD CACHE SIZE IN KB (EDMDBDC)</td>

---

**Chapter 6. Batch reporting** 4599
Storage Sizes Installation Parms (DSNTIPC, DSNTIPE, DSNTIPE1)

The minimum size of the DBD cache that can be used by the Environmental Descriptor Manager (EDM). This value is used at DB2 startup time as the minimum value. You can increase and subsequently decrease the value with the SET SYSPARM command. This value cannot be decreased below the value that is specified at DB2 startup. This storage pool is located above the 2 GB bar. The CLIST calculates the DBD cache size.

The value used at DB2 startup time is either calculated by the CLIST based on input from other installation information or an override value.

Install parameter EDM DBD CACHE on panel DSNTIPC, or ZPARM EDMDBDC in DSN6SPRM.

Field Name: QWP4EDBC

EDM SKELETON POOL SIZE IN KB (EDM_SKELETON_POOL)

The minimum size of the EDM pool for skeleton package and skeleton cursor tables. For record trace, this value is shown in bytes. For other reports, the value is shown in kilobytes.

Install parameter EDM SKELETON POOL SIZE on panel DSNTIPC or ZPARM EDM_SKELETON_POOL in DSN6SPRM.

Field Name: QWP4SKLC

MAXIMUM SIZE OF EDM POOL IN BYTES (EDMPOOL)

The size (in kilobytes) of the environmental descriptor manager (EDM) pool.

This can be the value calculated by the CLIST, based on input from previous panels, or the value entered in the Override column at installation time.

Install parameter EDMPOOL STORAGE SIZE on panel DSNTIPC, or ZPARM EDMPOOL in DSN6SPRM.

Field Name: QWP4EDPL

MAXIMUM SIZE OF SORT POOL IN BYTES (SORTPOOL)

Indicates the amount of storage needed for the sort pool.

This can be the value calculated by the CLIST, based on input from previous panels, or the value entered in the Override column at installation time.

Install parameter SORT POOL SIZE on panel DSNTIPC, or ZPARM SORTPOOL in DSN6SPRM.

Field Name: QWP4SPOL

MAX IN-MEMORY SORT SIZE (MAXSORT_IN_MEMORY)

The maximum amount of storage in kilobytes to allocate for sorting the results of each query that contains the order by clause, the group by clause, or both. This field corresponds to field MAX IN-MEMORY SORT SIZE in installation panel DSNTIPC. The ZPARM name is MAXSORT_IN_MEMORY in DSN6SPRM.

Field Name: QWP4MIMTS

MAXIMUM SIZE OF RID POOL IN KB (MAXRBLK)

The amount of storage needed for the RID pool.
Storage Sizes InstallationParms (DSNTIPC, DSNTIPE, DSNTIPE1)

This can be the value calculated by the CLIST, based on input from previous panels, or the value entered in the Override column at installation time.

When 0, DB2 does not use access paths or join methods that depend on RID pool storage.

Install parameter RID POOL SIZE on panel DSNTIPC, or ZPARM MAXRBLK in DSN6SPRM.

Field Name: QWP4RMAX

MAX NO OF USERS CONCURRENTLY RUNNING IN DB2 (CTHREAD)

The maximum number of allied threads (threads started at the local subsystem) that can be allocated concurrently.

Separate threads are created for each occurrence of the following:
- TSO user (whether running a DSN command or a DB2 request from QMF)
- Batch job (whether running a DSN command or a DB2 utility)
- IMS region that can access DB2
- Active CICS transaction that can access DB2
- Task connected to DB2 through the call attachment facility.

Install parameter MAX USERS on panel DSNTIPE, or ZPARM CTHREAD in DSN6SYSP.

Field Name: QWP1CT

MAX NO OF CONCURRENT REMOTE ACTIVE CONNECTIONS (MAXDBAT)

The maximum number of database access threads (DBATs) that can be active concurrently.

When this limit has been reached, DB2 uses the value of DDF THREADS on panel DSNTIPR to decide how to handle a new allocation request.

When DDF THREADS is ACTIVE and MAX REMOTE CONNECTED has not been reached, the allocation request is allowed but any further processing for the connection is queued waiting for an active database access thread to terminate.

When DDF THREADS is INACTIVE and MAX REMOTE CONNECTED has not been reached, the allocation request is allowed and is processed when DB2 can assign an unused database access thread slot to the connection.

The total number of threads accessing data concurrently is the sum of MAX USERS and MAX REMOTE ACTIVE. The maximum allowable value for this sum is 2000.

Install parameter MAX REMOTE ACTIVE on panel DSNTIPE, or ZPARM MAXDBAT in DSN6SYSP.

Field Name: QWP1RMT

MAX NO OF REMOTE CONNECTIONS (CONDBAT)

The maximum allowed number of concurrent remote connections.

When this limit is reached, any new connection request is rejected.

Install parameter MAX REMOTE CONNECTED on panel DSNTIPE, or ZPARM CONDBAT in DSN6SYSP.
Field Name: QWP1CDB

MAX NO OF TSO CONNECTIONS (IDFORE)

The maximum number of concurrent TSO foreground connections (QMF, DSN, DB2I, and SPUFI).

Each of the following is a separate user:

- Each TSO foreground user executing a DSN command.
- Each TSO foreground user connected to DB2 through the call attachment facility (CAF). This can include QMF users running in TSO foreground or user-written CAF applications running in TSO foreground.

When the number of TSO users attempting to access DB2 exceeds this limit, connection requests are rejected.

There is no subsystem parameter to control the maximum concurrent connections for IMS and CICS. These are controlled by using IMS and CICS facilities. For CICS attachment, the maximum number of connections to DB2 can be controlled using the resource control table (RCT) TYPE=INIT THRDMAX value.

Install parameter MAX TSO CONNECT on panel DSNTIPE, or ZPARM IDFORE in DSN6SYSP.

Field Name: QWP1IDF

MAX NO OF BATCH CONNECTIONS (IDBACK)

The maximum allowed number of concurrent connections for batch jobs and utilities. This includes:

- All batch jobs using QMF.
- All batch jobs using the DSN command processor.
- All tasks connected to DB2 through call attach facility (CAF) running in batch. This can include:
  - Batch jobs using QMF
  - APPC applications
  - TCP/IP FTP connections

When the number of batch jobs reaches this limit, further requests are rejected.

Install parameter MAX BATCH CONNECT on panel DSNTIPE, or ZPARM IDBACK in DSN6SYSP.

Field Name: QWP1IDB

MAXIMUM KEPT DYNAMIC STATEMENTS (MAXKEEPD)

Shows the total number of prepared dynamic SQL statements that are saved past a commit point.

0 means that prepared dynamic SQL statements are not saved past commit points.

Install parameter MAX KEPT DYN STMTS on panel DSNTIPE, or ZPARM MAXKEEPD in DSN6SPRM.

Field Name: QWP4MXKD

MAX OPEN FILE REFS (MAXOFILR)
Storage Sizes Installation Parms (DSNTPC, DSNTIPE, DSNTIPE1)

The maximum number of concurrently open data sets for processing LOB file references.

Install parameter MAX OPEN FILE REFS on panel DSNTIPE or ZPARM MAXOFILR in DSN6SYSP.

Field Name: QWP1MOFR

MANAGE REAL STORAGE (REALSTORAGE_MANAGEMENT)

Specifies whether DB2 manages real storage consumption. This field corresponds to field MANAGE REAL STORAGE on installation panel DSNTIPE. The ZPARM name is REALSTORAGE_MANAGEMENT in DSN6SPRM.

Field Name: QWP4STMN

MAXIMUM REAL STORAGE (REALSTORAGE_MAX)

The maximum amount of real plus auxiliary storage that can be used.

A value of 0 is displayed for NOLIMIT.

The ZPARM name is REALSTORAGE_MAX in DSN6SPRM.

Field Name: QWP4RSMX

CONTRACT THREAD STORAGE (CONTSTOR)

In DB2 12 this field is a serviceability field.

Indicates whether DB2 returns unused thread storage at commit. Possible values are:

YES DB2 checks threads at commit points and periodically returns unused storage to the system.

NO DB2 does not check threads at commit points and returns acquired storage on deallocation.

Install parameter CONTRACT THREAD STG on panel DSNTIPE, or ZPARM CONTSTOR in DSN6SPRM.

Field Name: QWP4CONT

MANAGE THREAD STORAGE (MINSTOR)

In DB2 12 this field is a serviceability field.

Shows whether DB2 uses storage management to optimize the amount of working storage consumed by individual threads.

Install parameter MANAGE THREAD STORAGE on panel DSNTIPE, or ZPARM MINSTOR in DSN6SPRM.

For best performance, this parameter should be NO, meaning DB2 does not manage thread storage.

When YES, DB2 uses best fit algorithm to manage and assign thread storage. This can help on systems that have many long-running threads and that are constrained on DBM1 address space.

Field Name: QWP4MSTG

LONG-RUNNING READER IN MINUTES (LRDRTHLD)

Shows the number of minutes that a read claim can be held by an agent before DB2 reports it as a long-running reader. Valid values are 0 (default) through 1439.
Install parameter LONG-RUNNING READER on installation panel DSNTIPE, or ZPARM LRDRTHLD in DSN6SYSP.

Field Name: QWP4LRTH

DDL TIMEOUT FACTOR (DDLTOX)

Shows the time out factor of the SQL data definition. The time out value is the product of this value and the IRLMRWT value.

ZPARM name DDLTOX in DSN6SPRM.

Field Name: QWP4DDLTO

INDEX CLEANUP THREADS (INDEX_CLEANUP_THREADS)

The maximum number of threads that can be created to clean up pseudo-deleted index entries on a data sharing member of a subsystem. This field corresponds to field INDEX CLEANUP THREADS on installation panel DSNTIPE1. The ZPARM name is INDEX_CLEANUP_THREADS in DSN6SPRM.

Field Name: QWP4IXCU

3990 CACHE (SEQCACH)

Indicates whether DB2 prefetch uses sequential mode to read cached data from a 3990 controller. When BYPASS (default), DB2 prefetch bypasses the cache.

When SEQ, DB2 prefetch uses sequential access for read activity. There is a performance benefit using SEQ with DFSMS or DFP controls with newer 3990 caches.

Install parameter SEQUENTIAL CACHE on panel DSNTIPE, or ZPARM SEQCACH in DSN6SPRM.

Field Name: QWP4SCAC

Tracing, Checkpoint & Pseudo-Close Parameters (DSNTIPN):

This topic shows detailed information about “System Parameters - Tracing, Checkpoint & Pseudo-Close Parameters (DSNTIPN)”.

This block shows audit, global, accounting, and monitor trace and checkpoint frequency parameters.

System Parameters - Tracing, Checkpoint & Pseudo-Close Parameters (DSNTIPN)

The field labels shown in the following sample layout of “System Parameters - Tracing, Checkpoint & Pseudo-Close Parameters (DSNTIPN)” are described in the following section.

```
TRACING, CHECKPOINT & PSEUDO-CLOSE PARAMETERS (DSNTIPN)

START AUDIT TRACE (AUDITST) .................1
START GLOBAL TRACE (TRACSTR) ..................NO
TRACE TABLE SIZE IN 4K BYTES (TRACTBL) ..............16
LOCAL TRACE TABLE SIZE IN 4K BYTES (TRACLOC) ...........16
START SMF ACCOUNTING (SMFACCT) .............1,2,3,7,8
START SMF STATISTICS (SMFSTAT) ............1,3,4,5,6,10
STATISTICS TIME INTERVAL IN MINUTES (STATIME) .........1
SYNCHRONIZATION INTERVAL WITHIN THE HOUR (SYNCVAL) ....NO
ONLINE DATASET STATISTICS TIME INTERVAL IN MIN.(DSSTIME) ..5
```
START MONITOR TRACE (MON) .................................. NO
MONITOR BUFFER SIZE IN BYTES (MONSIZE) .............. 1,048,576
UNICODE IFIDS (UIFIDS) .................................................. NO
DDF/RRSAF ACCUM (ACCUMACC) .............................. 20
AGGREGATION FIELDS (ACCUMUID) ......................... 0
COMPRESSION SMF RECS (SMFCOMP) ......................... OFF

START AUDIT TRACE (AUDITST)

Shows whether the audit trace is started automatically when DB2 is started.

When YES, the audit trace is started for the default class (class 1) whenever DB2 is started. When ALL, an audit trace is automatically started for all classes.

Install parameter AUDIT TRACE on panel DSNTIPN, or ZPARM AUDITST in DSN6SYSP.

Field Name: QWP1AUDT

START GLOBAL TRACE (TRACSTR)

Shows whether the global trace is started automatically when DB2 is started.

When YES, the global trace starts for the default classes (classes 1, 2, and 3) whenever DB2 is started, and additional data consistency checks are made whenever a data page or index page is modified. When ALL, the global trace is automatically started for all classes.

The global trace is used to diagnose problems in DB2 but it also impacts DB2 performance. If you have production systems requiring high performance, you might consider turning off global trace. If you do this, be aware that this presents a serviceability exposure. In the event of a system failure, IBM service personnel will ask you to turn on global trace and attempt to recreate the problem.

Install parameter TRACE AUTO START on panel DSNTIPN, or ZPARM TRACSTR in DSN6SYSP.

Field Name: QWP1TRST

TRACE TABLE SIZE IN 4K BYTES (TRACTBL)

Shows the size of the RES trace table in 4 KB blocks. A value of 16 means 64 KB have been allocated for this table.

This is the default destination for the global trace records in DB2. Most trace records require 32-byte entries; events with more than three data items require 64-byte entries.

Install parameter TRACE SIZE on panel DSNTIPN, or ZPARM TRACTBL in DSN6SYSP.

Field Name: QWP1TRSZ

LOCAL TRACE TABLE SIZE IN 4K BYTES (TRACLOC)

The size of the local trace tables in multiples of 4 KB. ZPARM name TRACLOC in DSN6SYSP.

Field Name: QWP1TLSZ

START SMF ACCOUNTING (SMFACCT)
Shows whether DB2 sends accounting data to SMF automatically when DB2 is started. Numeric values show what classes are sent. When YES, the default class (class 1) is sent. When ALL, accounting classes one through five are started.

The SMFPRM xx member of SYS1.PARMLIB must also be set to allow SMF to write the records.

Install parameter SMF ACCOUNTING on panel DSNTIPN, or ZPARM SMFACCT in DSN6SYSP.

Field Name: QWP1SMFA

START SMF STATISTICS (SMFSTAT)

Shows whether a Statistics trace was started automatically at DB2 startup time.

The classes started are shown separated by commas.

DB2 sends collected trace data to SMF. The SMFPRM xx member of SYS1.PARMLIB must be set to allow SMF to write the records.

Install parameter SMF STATISTICS on panel DSNTIPN, or ZPARM SMFSTAT in DSN6SYSP.

Field Name: QWP1SMFS

STATISTICS TIME INTERVAL IN MINUTES (STATIME)

The time interval, in minutes, between statistics collections. Statistics records are written approximately at the end of this interval.

Install parameter STATISTICS TIME on panel DSNTIPN, or ZPARM STATETIME in DSN6SYSP.

Field Name: QWP1STIM

SYNCHRONIZATION INTERVAL WITHIN THE HOUR (SYNCVAL)

Shows whether DB2 statistics recording is synchronized with some part of the hour. The installation can specify that the DB2 statistics recording interval be synchronized with the beginning of the hour (00 minutes past the hour) or any number of minutes past the hour up to 59. Possible values are: 0-59, which indicate the synchronization point. When NO or N/A is shown, synchronization is disabled, this is the default.

If STATISTICS TIME INTERVAL IN MINUTES (STATIME) is greater than 60, NO or N/A is shown.

Install parameter STATISTICS SYNC on panel DSNTIPN, or ZPARM SYNCVAL in DSN6SYSP.

Field Name: QWP1SYNV

ONLINE DATASET STATISTICS TIME INTERVAL IN MIN.(DSSTIME)

The time interval, in minutes, before DB2 resets data set statistics collected for the online performance monitors. Online performance monitors can request DB2 data set statistics for the current interval with an IFI READS request for IFCID 199.

Install parameter DATASET STATS TIME on panel DSNTIPN, or ZPARM DSSTIME in DSN6SYSP.

Field Name: QWP1DTIM
START MONITOR TRACE (MON)

Shows whether the monitor trace is started automatically when DB2 is started. When YES, the default (trace class 1) is started. Numeric values show which classes are started. When ALL, monitor trace classes 1 through 8 are started.

Install parameter MONITOR TRACE on panel DSNTIPN, or ZPARM MON in DSN6SYSP.

Field Name: QWP1MON

MONITOR BUFFER SIZE IN BYTES (MONSIZE)

The default number of bytes allocated for the monitor trace buffer.

Install parameter MONITOR SIZE on panel DSNTIPN, or ZPARM MONSIZE in DSN6SYSP.

Field Name: QWP1MONS

UNICODE IFCIDS (UIFCIDS)

Shows whether output from IFC records should include Unicode information. Only a subset of the character fields (identified in the IFCID record definition by a %U in the comment area to the right of the field declaration in the DSNDQWxx copy files) are encoded in Unicode. The remaining fields maintain the same encoding of previous releases.

Install parameter UNICODE IFCIDS on panel DSNTIPN, or ZPARM UIFCIDS in DSN6SYSP.

Field Name: QWP1_UNICODE

DDF/RRSAF ACCUM (ACCUMACC)

Shows whether DB2 accounting data for DDF and RRSAF threads is accumulated by end user.

When NO, DB2 writes an accounting record when a DDF thread is made inactive, or when signon occurs for an RRSAF thread. A value in the range 2 through 65535 shows the number of times an end-user identifier should occur before DB2 writes an accounting record. An end-user identifier is the concatenation of the end-user user ID, end-user transaction name, and the end-user workstation name.

These values can be set by DDF threads using SERVER CONNECT and SET CLIENT calls, and by RRSAF threads using the RRSAF SIGN, AUTH SIGNON, and CONTEXT SIGNON functions.

An accounting record might be written prior to the number of end user occurrences in the following instances:

- When an internal storage threshold is reached for the accounting RRSAF signon call.
- When the thread deallocates, the accumulated accounting data for all end users on this thread is written (one record per end user).
- When this parameter is dynamically changed to deactivate accounting accumulation. In this instance, the next end-UR (for DDF thread) or signon (for a RRSAF thread) causes DB2 to write the accumulated accounting data for all end users on this thread (one record per end user).

Install parameter DDF/RRSAF ACCUM on installation panel DSNTIPN, or ZPARM ACCUMACC in DSN6SYSP.
Field Name: QWP1ACCU

AGGREGATION FIELDS (ACCUMUID)

Shows the aggregation fields used for DDF and RRSAF accounting rollup. Values are defined as follows:

0   End user ID, transaction name, and workstation name
1   End user ID
2   End user transaction name
3   End user workstation name
4   End user ID and transaction name
5   End user ID and workstation name
6   End user transaction name and workstation name

This value is ignored if DDF or RRSAF accounting are not used. DB2 writes individual accounting threads for threads that do not have all aggregation fields populated that are specified by this parameter.

Install parameter AGGREGATION FIELDS on installation panel DSNTIPN, or ZPARM ACCUMUID in DSN6SYSP.

Field Name: QWP1ACID

COMPRESS SMF RECS (SMFCOMP)

Shows the COMPRESS DEST(SMF) TRACE records. This field corresponds to field COMPRESS SMF RECS on installation panel DSNTIPN. ZPARM name: SMFCOMP in DSN6SYSP.

Field Name: QWP1CSMF

Workfile Database Panel (DSNTIP91):

This topic shows detailed information about “System Parameters - Workfile Database Panel (DSNTIP91)”.

System Parameters - Workfile Database Panel (DSNTIP91)

The field labels shown in the following sample layout of “System Parameters - Workfile Database Panel (DSNTIP91)” are described in the following section.

WORKFILE DATABASE PANEL (DSNTIP91)

----------------------------------------------
MAX TEMP STORAGE PER AGENT IN MB (MAXTEMPS)...........25,000
SEPARATE WORK FILES (WFDBSEP)..........................NO
MAX TEMP RID (MAXTEMPS_RID)..............................NONE
AGENT LEVEL THRESHOLD (WFSTGUSE_AGENT_THRESHOLD)......N/A
SYSTEM LEVEL THRESHOLD (WFSTGUSE_SYSTEM_THRESHOLD).......N/A

MAX TEMP STORAGE PER AGENT IN MB (MAXTEMPS)

The maximum amount of temporary storage in megabytes (MB) for each agent.

Install parameter MAX TEMP STORAGE on panel DSNTIP6 or ZPARM MAXTEMPS in DSNTIP9.

Field Name: QWP4WFAL

SEPARATE WORK FILES (WFDBSEP)
YES directs processing of declared temporary tables only to DB2-managed table spaces that are defined with SECQTY>0 (DB2 field: QWP4WFDBSEP). It directs all other processing to DB2-managed table spaces that are defined with SECQTY=0 or to user-managed table spaces. This field corresponds to field "Separate Work Files" in installation panel DSNTIP9. The ZPARM name is WFDBSEP in DSN6SPRM.

**Field Name:** QWP4WFDBSEP

**MAX TEMP RID (MAXTEMPS_RID)**

The maximum number of RID blocks of temporary storage in the Workfile database that a single RID list can use at any point in time. This field corresponds to field MAX TEMP RID on installation panel DSNTIP9. The ZPARM name is MAXTEMPS_RID.

It can have the following values:

- -1 if MAXTEMPS_RID=NONE
- 0 if MAXTEMPS_RID=NOLIMIT
- 1 to 329166 otherwise

**Field Name:** QWP4WFFRD

**AGENT LEVEL THRESHOLD (WFSTGUSE_AGENT_THRESHOLD)**

Specifies the percentage of space that is used in the Workfile Database by a single agent when DB2 issues a warning message.

This value corresponds to field AGENT LEVEL THRESHOLD on installation panel DSNTIP9. The ZPARM name is WFSTGUSE_AGENT_THRESHOLD in DSN6SPRM.

**Field Name:** QWP4WFSAT

**SYSTEM LEVEL THRESHOLD (WFSTGUSE_SYSTEM_THRESHOLD)**

Specifies the percentage of space that is used in the Workfile Database by all agents in a DB2 subsystem or data sharing member when DB2 issues a warning message.

This value corresponds to field SYSTEM LEVEL THRESHOLD on installation panel DSNTIP9. The ZPARM name is WFSTGUSE_SYSTEM_THRESHOLD in DSN6SPRM.

**Field Name:** QWP4WFSST

**Alter Buffer Pool Command Issued**

This topic shows detailed information about “System Parameters - Alter Buffer Pool Command Issued”.

**System Parameters - Alter Buffer Pool Command Issued**

The field labels shown in the following sample layout of “System Parameters - Alter Buffer Pool Command Issued” are described in the following section.
FRAMESIZE  4K  4K
VPOOL SIZE MIN  0  0
VPOOL SIZE MAX  0  0
SIM POOL SIZE  200  300
SIM POOL SEQ THRESH  50  75

BUFF POOL ID

The buffer pool internal identifier. The values 0 through 49 are the identifiers for BP0 through BP49. The values 80 through 89 are the identifiers for BP32K through BP32K9.

Field Name: QW0201BP

VPOOL SIZE (PAGES) (OLD)

The size of the old virtual pool.

Field Name: QW0201OP

VPOOL SIZE (PAGES) (NEW)

The size of the new virtual buffer pool.

Field Name: QW0201NP

VPOOL SEQ THRESH

The old and new virtual pool sequential steal threshold.

Old status taken from the DB2 field QW0201OT.

New status taken from the DB2 field QW0201NT.

Field Name: RT0201VS

HORIZ DEFER WRITE THRESH

This threshold is a percentage of the virtual buffer pool that might be occupied by unavailable pages, including updated pages and pages in use.

The default value for QWQT is 30%. You can change this value to any value from 0% to 90% using the DWQT option of the ALTER BUFFERPOOL command.

DB2 checks QWQT when an update to a page is complete. If the percentage of unavailable pages in the virtual buffer pool exceeds QWQT, write operations are scheduled for up to 128 pages per data set to decrease the number of unavailable buffers to 10% below QWQT. For example, if QWQT is 50%, the number of unavailable buffers is reduced to 40%.

When the limit of QWQT is reached, data sets containing the oldest updated pages are written asynchronously. DB2 continues to write pages until the ratio goes below the QWQT.

Field Name: QDBPDWQT

VERT DEFER WRITE THRESH (%)

The vertical deferred write threshold for the virtual buffer pool expressed as percentage.

Old status taken from the DB2 field QW0201OV.

New status taken from the DB2 field QW0201NV.

Field Name: RT0201PC

VERT DEFER WRITE THRESH (BUF)
The vertical deferred write threshold for the virtual buffer pool expressed as an absolute number of buffers. It is only used if VERTICAL DEFERRED WRITE THRESHOLD (PERCENTAGE) is 0.

Old status taken from the DB2 field QW0201OJ.
New status taken from the DB2 field QW0201NJ.

Field Name: RT0201BU

VPOOL PARALLEL SEQ THRESH
The old and new virtual pool parallel sequential threshold.
Old status taken from the DB2 field QW0201OQ.
New status taken from the DB2 field QW0201NQ.

Field Name: RT0201VP

ASSISTING PARALLEL SEQ THRESH
The assisting parallel sequential threshold before and after the ALTER BUFFERPOOL command was issued.
Old status taken from the DB2 field QW0201OX.
New status taken from the DB2 field QW0201NX.

Field Name: RT0201AS

PGFIX ATTRIBUTE
Indicates whether a page is fixed in real storage when it is first used. It can have one of the following values: YES or NO.

Field Name: QDBPPFIX

PAGE STEAL METHOD
Identifies the page stealing algorithm (PGSTEAL) that is used for the virtual buffer pool. It controls when and whether performance-critical objects in buffer pools are removed from buffer pools when the space is needed by other objects. Possible values are:

LRU Least recently used (LRU) objects are removed first. This means it takes away pages that are not used so that more recently used pages can remain in the virtual buffer pool. This is used by default.

FIFO First-In-First-Out (FIFO) means that the oldest objects are removed first. This results in a small decrease in the cost of a Getpage operation. It can reduce internal DB2 latch contention in environments that require very high concurrency.

NONE Objects are not removed from buffer pool (no page stealing). This setting provides the highest availability for business-critical objects.

Old status taken from the DB2 field QW0201OK.
New status taken from the DB2 field QW0201NK.

Field Name: RT0201PS

AUTOSIZE
The old and new status of the AUTOSIZE attribute.
Old status taken from the DB2 field QW0201OZ.
Alter Buffer Pool Command Issued

New status taken from the DB2 field QW0201NZ.

Field Name: RT0201AT

FRAMESIZE (OLD)

The size of the old frame (4 KB, 1 MB, or 2 GB).

Field Name: QW0201OC

FRAMESIZE (NEW)

The new frame size (4 KB, 1 MB, or 2 GB).

Field Name: QW0201NC

VPOOL SIZE MIN (OLD)

The minimum size of the old virtual pool.

Field Name: QW0201OA

VPOOL SIZE MIN (NEW)

The minimum size of the new virtual pool.

Field Name: QW0201NA

VPOOL SIZE MAX (OLD)

The maximum size of the old virtual pool.

Field Name: QW0201OB

VPOOL SIZE MAX (NEW)

The maximum size of the new virtual pool.

Field Name: QW0201NB

SIM POOL SIZE

The number of simulated buffers specified for the simulated buffer pool. Old value is taken from the DB2 field QW0201OS. New value is taken from the DB2 field QW0201NS.

Field Name: RT0201SZ

SIM POOL SEQ THRESH

The sequential steal threshold for the simulated buffer pool, expressed as a percentage of the total simulated buffer pool size. Old value is taken from the DB2 field QW0201OH. New value is taken from the DB2 field QW0201NH.

Field Name: RT0201ST

Alter Group Buffer Pool Command Issued

This topic shows detailed information about “System Parameters - Alter Group Buffer Pool Command Issued”.

System Parameters - Alter Group Buffer Pool Command Issued

The field labels shown in the following sample layout of “System Parameters - Alter Group Buffer Pool Command Issued” are described in the following section.
GBP ID

The DB2 group buffer pool ID.

Field Name: QW0256GB

CURRENT DIRECTORY TO DATA RATIO

The directory entry to data entry ratio. This is the value specified in the RATIO keyword of the ALTER GROUPBUFFERPOOL command.

New status deduced from the DB2 field QW0256NR.

Old status deduced from the DB2 field QW0256OR.

Field Name: RT0256DR

CLASS CASTOUT THRESHOLD (%)

The threshold at which the class castout is to be initiated. It is expressed as a percentage of the group buffer pool size. This is the value specified in the CLASST keyword of the ALTER GROUPBUFFERPOOL command.

New status deduced from the DB2 field QW0256NC.

Old status deduced from the DB2 field QW0256OC.

Field Name: RT0256CT

CLASS CASTOUT THRESHOLD (PAGES) (OLD)

The old class castout threshold based on the number of pages.

Field Name: QW0256ON

CLASS CASTOUT THRESHOLD (PAGES) (NEW)

The new class castout threshold based on the number of pages.

Field Name: QW0256NN

GBP CASTOUT THRESHOLD (%)

The threshold at which the castout is to be initiated for the group buffer pool. This is the value specified in the GBPOOLT keyword of the ALTER GROUPBUFFERPOOL command.

New status deduced from the DB2 field QW0256NG.

Old status deduced from the DB2 field QW0256OG.

Field Name: RT0256GT

GBP CHECKPOINT INTERVAL (MIN)

The time interval (in minutes) between successive group buffer pool checkpoints. This is the value specified in the GBPCHKPT keyword of the ALTER GROUPBUFFERPOOL command.

New status deduced from the DB2 field QW0256NK.

Old status deduced from the DB2 field QW0256OK.

Field Name: RT0256CI

GBP CACHE SETTING
Alter Group Buffer Pool Command Issued

GBPCACHE value before and after the ALTER GROUPBUFFERPOOL command was issued. This field specifies whether DB2 should write changed pages for the group buffer pool dependant pageset or partitions directly to DASD and use the group buffer pool only for sending XI signals.

New status deduced from the DB2 field QW0256NB.
Old status deduced from the DB2 field QW0256OB.

Field Name: RT0256CS

AUTO REC

A flag indicating how the AUTOREC option of the ALTER GROUPBUFFERPOOL command has been set. It specifies whether DB2 should automatically recover if GBP fails. The old value specifies the AUTOREC value before the ALTER GBP command was issued. The new value specifies the AUTOREC value after the ALTER GBP command was issued.

New status deduced from the DB2 field QW0256NA.
Old status deduced from the DB2 field QW0256OA.

Field Name: RT0256AR

Buffer Pool Parameters

This topic shows detailed information about “System Parameters - Buffer Pool Parameters”.

Normally, buffer pool information is reported once for each buffer pool if the attributes remain the same over the reporting period.

Buffer pool attributes can be changed while DB2 is active using the DB2 ALTER BUFFERPOOL command. If the performance trace class 10 is active, the event is recorded in the system parameters report.

When an ALTER BUFFERPOOL command is recorded, the status of the buffer pool before and after the command is shown.

Note: The fields shown on this panel depend on the installed DB2 version.

System Parameters - Buffer Pool Parameters

The field labels shown in the following sample layout of “System Parameters - Buffer Pool Parameters” are described in the following section.

<table>
<thead>
<tr>

<tr>
<td>FRAMESIZE</td>
</tr>
<tr>
<td>VPOOL SIZE MIN</td>
</tr>
</tbody>
</table>
BUFFER POOL ID

Buffer pool name.

Field Name: QDBPNM

VPOOL SIZE (PAGES)

The size of the virtual buffer pool.

Old status taken from the DB2 field QW0201OP.

New status taken from the DB2 field QW0201NP.

Field Name: QDBPVPSZ

VPOOL SEQ THRESH

Virtual pool sequential threshold (VPSEQT). This threshold is a percentage of the virtual buffer pool that might be occupied by sequentially accessed pages. The pages can be in the state updated, in use, or available. Therefore, each page might count regarding exceeding any other buffer pool threshold.

The default value for VPSEQT is 80%. You can change this value to a value from 0% to 100% by using the VPSEQT option of the ALTER BUFFERPOOL command.

VPSEQT is checked before stealing a buffer for a sequentially accessed page instead of accessing the page in the virtual buffer pool. If the threshold is exceeded, DB2 tries to steal a buffer that holds a sequentially accessed page rather than one that holds a randomly accessed page.

If you set VPSEQT to 0%, sequential pages cannot occupy space in the virtual buffer pool. In this case, prefetch is disabled, and sequentially accessed pages are discarded when they are released. You can, however, set the value for HPSEQT to a value above zero and the value for VPSEQT to zero. If you set VPSEQT to 100%, sequential pages can monopolize the entire virtual buffer pool.

Field Name: QDBPVPSH

HORIZ DEFER WRITE THRESH

This threshold is a percentage of the virtual buffer pool that might be occupied by unavailable pages, including updated pages and pages in use.

The default value for QWQT is 30%. You can change this value to any value from 0% to 90% using the DWQT option of the ALTER BUFFERPOOL command.

DB2 checks QWQT when an update to a page is complete. If the percentage of unavailable pages in the virtual buffer pool exceeds QWQT, write operations are scheduled for up to 128 pages per data set to decrease the number of unavailable buffers to 10% below QWQT. For example, if QWQT is 50%, the number of unavailable buffers is reduced to 40%.

When the limit of QWQT is reached, data sets containing the oldest updated pages are written asynchronously. DB2 continues to write pages until the ratio goes below the QWQT.

Field Name: QDBPDWQT
VERT DEFER WRITE THRESH (%)

Vertical deferred write threshold (VDWQT). This threshold is similar to the deferred write threshold but it applies to the number of updated pages for one single page set in the buffer pool. If the percentage or number of updated pages for the data set exceeds the threshold, writes up to 128 pages are scheduled for that data set.

VDWQT can be specified in one of the following ways:

- As a percentage of the virtual buffer pool that might be occupied by updated pages from one single page set. The default value for this threshold is 5%. You can change the percentage to any value from 0% to 90%.
- As the total number of buffers in the virtual buffer pool that might be occupied by updated pages from one single page set. You can specify the number of buffers from 0 to 9999. If you want to use the number of buffers as your threshold, you must set the percentage threshold to 0.

Field Name: QDBPVDQT

VERT DEFER WRITE THRESH (BUF)

The vertical deferred write threshold (VDWQT), shown as the number of buffers in the virtual buffer pool that might be occupied by updated pages from a single page set.

Field Name: QDBPVDQB

VPOOL PARALLEL SEQ THRESH

Virtual buffer pool parallel sequential threshold (VPPSEQT). This threshold is a part of the virtual buffer pool that might support parallel operations. It is measured as a percentage of the sequential steal threshold (VPSEQT). Setting VPPSEQT to zero disables parallel operation.

The default value for this threshold is 50% of the sequential steal threshold (VPSEQT). You can change the default value to any value from 0% to 100% by using the VPPSEQT option on the ALTER BUFFERPOOL command.

Field Name: QDBPPSQT

ASSISTING PARALLEL SEQ THRESH

Virtual buffer pool assisting parallel sequential threshold (VPXPSEQT). This threshold is a part of the virtual buffer pool that might support parallel operations initiated from another DB2 in the data sharing group. It is measured as a percentage of VPPSEQT.

Setting VPXPSEQT to zero (default) prevents DB2 from supporting sysplex query parallelism at run time for queries that use this buffer pool.

You can change the default value to any value from 0% to 100% using the VPXPSEQT option of the ALTER BUFFERPOOL command.

Field Name: QDBPXSQT

PGFIX ATTRIBUTE

Indicates whether a page is fixed in real storage when it is first used. It can have one of the following values: YES or NO.

Field Name: QDBPPFIX

PAGE STEAL METHOD

Buffer Pool Parameters
Identifies the page stealing algorithm (PGSTEAL) that is used for the virtual buffer pool. It controls when and whether performance-critical objects in buffer pools are removed from buffer pools when the space is needed by other objects. Possible values are:

**LRU**  Least recently used (LRU) objects are removed first. This means it takes away pages that are not used so that more recently used pages can remain in the virtual buffer pool. This is used by default.

**FIFO**  First-In-First-Out (FIFO) means that the oldest objects are removed first. This results in a small decrease in the cost of a Getpage operation. It can reduce internal DB2 latch contention in environments that require very high concurrency.

**NONE**  Objects are not removed from buffer pool (no page stealing). This setting provides the highest availability for business-critical objects.

Old status taken from the DB2 field QW0201OK.
New status taken from the DB2 field QW0201NK.

**Field Name:** RT0201PS

**AUTOSIZE**
Indicates if the AUTOSIZE option is activated on the ALTER BUFFERPOOL command.

**Field Name:** QDBPASIZ

**FRAMESIZE**
The frame size.

**Field Name:** QDBPFRAM

**VPOOL SIZE MIN**
The minimum size of the virtual pool.

**Field Name:** QDBPVPMI

**VPOOL SIZE MAX**
The maximum size of the virtual pool.

**Field Name:** QDBPVPMA

**SIM POOL SIZE**
The number of simulated buffers allocated in the simulated buffer pool.

**Field Name:** QDBBPSPSZ

**SIM POOL SEQ THRESH**
The sequential thief threshold for the simulated buffer pool, expressed as a percentage of the total simulated buffer pool size.

**Field Name:** QDBBSPST

**Group Buffer Pool Parameters**
This topic shows detailed information about “System Parameters - Group Buffer Pool Parameters”.

This block shows the merged group buffer pool data from all the members of a DB2 data sharing group. To produce this report, statistics class 5 must be active.
Group Buffer Pool Parameters

Each time an ALTER GROUPBUFFERPOOL command is issued for a member, an IFCID 230 record is produced showing information about the group buffer pools connected to that particular member of a data sharing group. If the IFCID 230 record indicates that the status of the group buffer pools has changed since the last IFCID 230 record was produced (regardless of which member produced it), or if this is the first IFCID 230 encountered, the new status of the group buffer pools is printed.

The status of the group buffer pools changes if the IFCID 230 record indicates one of the following:

- A member uses a new group buffer pool.
- A member does not use a group buffer pool that it used previously.
- At least one of the group buffer pool attributes has changed.

All the group buffer pools connected to the member, whether or not they have changed, are printed.

System Parameters - Group Buffer Pool Parameters

The field labels shown in the following sample layout of “System Parameters - Group Buffer Pool Parameters” are described in the following section.

CURRENT DIRECTORY TO DATA RATIO

The current directory entry to data entry ratio.

For ALTER GROUPBUFFERPOOL commands, this field reports the value specified in the RATIO keyword.

Field Name: QBGBGRI

CLASS CASTOUT THRESHOLD (%)

The threshold at which the class castout is to be initiated. It is expressed as a percentage of the size of the group buffer pool.

For ALTER GROUPBUFFERPOOL commands, it reports the value specified in the CLASST keyword.

Field Name: QBGBGCT

GBP ID

Field Name: QBGBGCI
Group buffer pool name.

Field Name: QBGBGN

**DB2 11: CLASS CASTOUT THRESHOLD (PAGES)**

The class castout threshold based on the number of pages.

Field Name: QBGBGCTN

**ALLOCATED GBP SIZE (4K)**

The allocated size of the group buffer pool in 4 KB blocks.

Field Name: QBGBGSZ

**GBP CASTOUT THRESHOLD (%)**

The threshold at which the castout is to be initiated for the group buffer pool. It is expressed as a percentage of the size of the group buffer pool.

For ALTER GROUPBUFFERPOOL commands, it reports the value specified in the GBPOOLT keyword.

Field Name: QBGBGGT

**ACTUAL DIRECTORY**

The actual number of allocated directory entries.

Field Name: QBGBGDR

**GBP CHECKPOINT INTERVAL (MIN)**

The time interval, in minutes, between successive group buffer pool checkpoints.

For ALTER GROUPBUFFERPOOL commands, it reports the value specified in the GBPCHKPT keyword.

Field Name: QBGBGCK

**ACTUAL DATA ENTRY**

The actual number of allocated data entries.

Field Name: QBGBGDT

**GBP CACHE SETTING**

GBP cache attribute. Possible values are:

- **YES**  GBP is used for both data caching and cross-invalidation.
- **NO**   GBP is used for cross-invalidation only.

Field Name: QBGBGCS

**PENDING DIRECTORY TO DATA RATIO**

The pending directory entry to data entry ratio.

Field Name: QBGBGR2

**AUTO REC**

Indicates whether automatic recovery takes place in the event of a structure failure or a loss of connectivity. When automatic recovery is active, all members of the group are recovered to the group buffer pool.

Field Name: QBGBGAS
Group Buffer Pool Parameters

MODE
Simplex or duplex mode indicator.

Field Name: QBGBDUP

Prior to DB2 11: SEC-GBP ALLOC
The allocated size of the secondary GBP when the GBP is DUPLEX.
This field is not shown when MODE is SIMPLEX.

Field Name: QBGBGSZ2

Prior to DB2 11: SEC-GBP ALLOC DIRECTORY ENTRY
Number of allocated directory entries in the secondary GBP when MODE is DUPLEX.

Field Name: QBGBGDR2

Prior to DB2 11: SEC-GBP ALLOC DATA ENTRY
The allocated data entries in the secondary GBP when MODE is DUPLEX.

Field Name: QBGBGDT2

Utility Activity Report Set
These topics provide information about the Utility Activity reports.

Note: For an introduction to the Utility Activity report set and general Utility Activity information refer to the Reporting User’s Guide. It also provides information on input to Utility Activity reports.

Headers Used in Utility Activity
OMEGAMON for Db2 PE header information is printed at the top of each Utility Activity report or trace page.

There are two types of headers:
• The Utility Activity report header
• The Utility Activity trace header.

The report and trace header shows the following information:

LOCATION
The DB2 reporting location. If the location name is not available, the DB2 data sharing group name is printed in this field. If the DB2 data sharing group name does not exist, the DB2 subsystem ID is printed.

OMEGAMON XE FOR DB2 PERFORMANCE EXPERT (VnRnMn)
The product name and the version, release, and modification level.

PAGE The page number in the format lll-nnnnnn, where lll denotes the location number within the report and nnnnnn the page number within the location.

GROUP The name of the DB2 data sharing group. This field shows N/A if there is no group name.

REQUESTED FROM and TO
The FROM and TO dates and times specified in the REPORT or TRACE subcommand.
If both FROM and TO dates and times are omitted from the REPORT subcommand, the FROM and TO dates and times specified in GLOBAL are printed. If only the FROM date and time or only the TO date and time has been specified, NOT SPECIFIED is printed for the unspecified value.

If FROM and TO are not specified in REPORT or GLOBAL, NOT SPECIFIED appears for both the FROM and TO values.

If you have specified FROM and TO times without dates in REPORT or GLOBAL, ALL DATES is printed along with the specified times.

**MEMBER**

The name of the DB2 data sharing member or the member name of the DB2 subsystem. This field shows N/A if there is no member name.

This field is not printed on the report page showing the GROUP BUFFERPOOLS PARAMETERS.

**SUBSYSTEM**

The ID of the DB2 subsystem that generated the data. This field is not printed on the report page showing the GROUP BUFFERPOOLS PARAMETERS.

**ORDER**

If the ORDER option of the REPORT or TRACE subcommand was used to arrange the report entries, the selected keywords are shown in this field. Depending on the context, the OMEGAMON for Db2 PE identifiers by which lock events are grouped are shown here.

**ACTUAL FROM/TO**

The date and time of the first and last record included in the log for a location, group, subsystem, or member.

**DB2 VERSION**

The DB2 version number of the subsystem that generated the data.

**PAGE DATE**

The date of the timestamps printed on this page. A page break occurs at the change of the date. This is useful if a trace page contains more than one entry and the date is not shown for each entry.

**IDENTIFIED BY**

Shows the identifiers specified with the ORDER option.

**WITH detail WORKLOAD**

The workload details as specified on the WORKLOAD option of the TRACE subcommand.

**Utility Activity Report Header Example:**

The Utility Activity reports contain information in the header at the top of each page as shown in the following example.

```plaintext
LOCATION: USIBMSYST082
GROUP: DSNCAT
MEMBER: SSDQ
SUBSYSTEM: SSDQ
DB2 VERSION: V10

OMEGAMON XE FOR DB2 PERFORMANCE EXPERT (VSAM)  PAGE: 1-1
UTILITY ACTIVITY REPORT  REQUESTED FROM: NOT SPECIFIED
ORDER: PRIMAUTH-PLANNAME  TO: NOT SPECIFIED
ACTUAL FROM: 01/30/15 23:50:43.70  TO: 01/30/15 02:35:57.68
```

**Utility Activity Trace Header:**

This section introduces the header of the Utility Activity trace.
Utility Activity - Report Headers

Utility Activity Trace Header Example

The Utility Activity trace header contains the following information.

LOCATION: USIBMSYSTDB2
GROUP: DSNCAT
MEMBER: SSOQ
SUBSYSTEM: SSOQ
DB2 VERSION: V10

OMEGAMON XE FOR DB2 PERFORMANCE EXPERT (V5R4M0)
UTILITY ACTIVITY TRACE
REQUESTED FROM: NOT SPECIFIED
TO: NOT SPECIFIED
ACTUAL FROM: 01/30/15 23:50:43.70
PAGE DATE: 01/30/15
IDENTIFIED BY PRIMAUTH/PLANNAME/INSTANCE WITH ALL WORKLOAD

The Utility Activity Reports

This topic describes the Utility Activity report.

The following command generates the Utility Activity report shown in "Utility Activity Report Example".

```
:;
UTILITY REPORT ;
:;
```

This command produces a report including both BIND and UTILITY activity types by default.

Utility Activity Report Example

```
LOCATION: PMODA22
GROUP: N/P

UTILITY ACTIVITY REPORT COMPLETE
```

Field description

The report contains the following fields:

**OMEGAMON for Db2 PE identifiers**

Up to three OMEGAMON for Db2 PE identifiers can be printed in this column. They are printed whenever they change. The second and third identifiers are indented. If the ORDER option is not used, the default of PLANNAME within PRIMAUTH is shown. Refer to Report Command Reference for more information about the ORDER option.

**OCCURRENCES**

The total number of bind or utility threads for the current combination of OMEGAMON for Db2 PE identifiers. A bind thread is identified by the presence of appropriate pairs of IFCIDs 108, 109, 110, 111, 177, and 183. A utility thread is identified by the presence of IFCIDs 023, 024, and 025.

**TOT. ELAPSED**

The time difference between the first bind or utility record and the last bind or utility record.

**AVG. ELAPSED**

The TOT. ELAPSED time divided by OCCURRENCES.
TOT. CP CPU
The difference between the CPU time of the first bind or utility record and the CPU time of the last bind or utility record.

AVG. CP CPU
The TOT. CPUTIME divided by OCCURRENCES.

ACTIVITY TYPE
The name of the activity type and event. The activity type can only be BIND for bind events including remote bind activity, or UTILITY for utility events. All events are indented.

The bind events are as follows:

BIND PLAN
BIND PLAN subcommand issued

BIND PACK
BIND PACKAGE subcommand issued

BIND R-PACK
BIND PACKAGE subcommand issued for a remote location

RBND PLAN
REBIND PLAN subcommand issued

RBND PACK
REBIND PACKAGE subcommand issued

RBND R-PACK
REBIND PACKAGE subcommand issued for a remote location

FREE PLAN
FREE PLAN subcommand issued

FREE PACK
FREE PACKAGE subcommand issued

FREE R-PACK
FREE PACKAGE subcommand issued for a remote location

CONNECT
BIND CONNECT or CONNECT RESET subcommand issued for a remote location.

The utility events are as follows:

CHECKDAT
Identifies the utility as CHECK DATA.

CHECKIDX
Identifies the utility as CHECK INDEX.

COPY
Identifies the utility as COPY.

DIAGNOSE
Identifies the utility as DIAGNOSE.

LOAD
Identifies the utility as LOAD.

MERGECOP
Identifies the utility as MERGECOPY.

MODIFY
Identifies the utility as MODIFY.
Utility Activity - Report

QUIESCE
   Identifies the utility as QUIESCE.

RECOVER
   Identifies the utility as RECOVER TABLESPACE.

RECOVERI
   Identifies the utility as RECOVER INDEX.

REBUILDI
   Identifies the utility as REBUILD INDEX.

REORG
   Identifies the utility as REORG.

REPAIR
   Identifies the utility as REPAIR.

REPORT
   Identifies the utility as REPORT.

RUNSTATS
   Identifies the utility as RUNSTATS.

STOSPACE
   Identifies the utility as STOSPACE.

UNLOAD
   Identifies the utility as UNLOAD.

COUNT
   The number of occurrences of a single bind or utility event.

TOT. ELAPSED
   The time difference between the first and last occurrence of a specific bind or utility event.

AVG. ELAPSED
   The TOT. ELAPSED time divided by COUNT.

TOT. CP CPU
   The difference between the CPU time of the first occurrence of a specific bind or utility event and the CPU time of the UTILEND of the last occurrence of this bind or utility event.

AVG. CP CPU
   The TOT. CP TIME divided by COUNT.

TOT. SORTCPU
   The sum of the Sort CPU time for all occurrences of a specific utility event.

TOT. ZIIP
   The sum of the total utility ZIIP time for all occurrences of a specific utility event.

AVG. ZIIP
   The TOT. ZIIP time divided by COUNT.

SORT ZIIP
   The sum of the Sort ZIIP time for all occurrences of a specific utility event.

The Utility Activity Trace
   This topic introduces the Utility Activity trace.
Traces are presented in the order in which the threads complete. Start times might not be shown in ascending order if other threads finished prior to completion of a thread which started earlier.

The Utility Activity trace is generated with the following command:

```
UTILITY TRACE ORDER (PRIMAUTH=PLANNAME=INSTANCE)
```

This command produces a trace including both BIND and UTILITY activity types but excluding any workload detail by default.

**Utility Activity Short Trace Example**

Here is an example of a Utility Activity Short trace.

```
LOCATION: OMPDB51
GROUP: N/P
MEMBER: N/P
SUBSYSTEM: DB2
DB2 VERSION: V11

UTILITY-ID JOB NAME SHRLEVEL DATABASE PAGESET STEP SORT CPU SORT ZIIP
KOZS 12:33:31.62 0.732401 UTILITY KOZS.KOZUNLUT KOZUNLUT CHANGE
      0 1 0 0.008799 REDOS DBZPE .TSPA.FDF UNRL1 0.001200
      Y N 0 1 0 0.002311 0.000900

UTILITY TRACE COMPLETE
```

**Field description**

The trace contains the following fields:

**OMEGAMON for Db2 PE identifiers**

The OMEGAMON for Db2 PE identifiers specified in the ORDER option. They are printed whenever they change. The second and third identifiers are indented.

**PLANNAME**

The DB2 application plan name of the thread.
Utility Activity - Trace

**ELAPSED TIME**
The time difference between START TIME and the timestamp of the ENDUTIL of the last bind or utility record of the originating task.

**JOB NAME**
User-defined job name.

**SHRLEVEL**
The SHRLEVEL value of the utility. Possible values are: NONE, REFERENCE, or CHANGE.

**START TIME**
The timestamp of the first bind or utility record encountered for that thread.

**CPU TIME**
The CPU time of the bind or utility event, including the CPU time of any parallel tasks.

**ACTIVITY TYPE**
The name of the activity type and event. The activity type can only be BIND for bind events including remote bind activity, or UTILITY for utility events. All events are indented.

For a detailed description of Activity Type, see page "Field description" on page 4622.

**OBJECT(S)**
The description depends on whether it is a utility event, a bind event referring to a plan, a bind event referring to a package, or a BIND CONNECT:

- In the case of a utility, it is the database name.object name for each object worked on by the utility. Each database name.object name is shown only once.
- In the case of a BIND PLAN, RBND PLAN, or FREE PLAN event, it is the plan name.
- In the case of a BIND PACK, RBND PACK, FREE PACK, BIND R-PACK, RBND R-PACK, or FREE R-PACK event, the following information is shown:
  - **LOCN** The location of the package.
  - **COLL** The collection to which the package belongs.
  - **PKID** The package ID.
  - **VRID** The first 53 characters of the version name.
  - **CONS** The consistency token for the package.
- In the case of a CONNECT, it is LOCN, the location of the package.

**TOT. ZIIP**
The total utility ZIIP time (if Accounting class 1 trace is activated).

**SORT**
The following fields provide information about sorting. They are only written for utility events:

- **DF** Shows if DFSORT was invoked at least once (Y/N).
- **DB2** Shows if DB2SORT was invoked at least once (Y/N).
- **DATA** Shows the number of parallel data sorts.
INDEX
Shows the number of parallel index sorts.

OTHER
Shows the number of other sorts.

SORT CPU
Shows the SORT CPU time.

SORT ZIIP
Shows the SORT ZIIP time (if provided by the SORT program).

Workload Detail
Workload detail blocks are only printed in Utility Activity traces.

The workload detail blocks are displayed beneath the thread events.

Bind Activity:

This topic describes the layout of the Bind Activity block.

This block shows the bind activity for:
- BIND PACK
- BIND R-PACK
- RBND PACK
- RBND R-PACK
- BIND PLAN
- RBND PLAN

The layout depends on whether it is a package or a plan for which bind activity is shown.

Bind Activity Workload Block Example for Packages or Plans

Here is an example of the Bind Activity Workload Block for Packages.

--- BIND ACTIVITY -------------------------------------------------------------------------------------------------------------------------------------
ISOLATION : CS  TYPE : AUTOMATIC  ACQUIRE : ALLOCATION  DEGREE : ANY  VALIDATE : BIND

IMMEDIATE : PH1
Field description

Here is a description of the field labels shown in the bind activity workload block for both packages and plans.

**ISOLATION**
Indicates the isolation level of the plan or package.

**TYPE**
The type of bind.

**ACQUIRE**
Indicates when to acquire the locks:
- **ALLOCATION**
  Acquire the locks when the plan or package is allocated.
- **USE**
  Acquire the locks when the application first accesses them.

**DEGREE**
Indicates whether DB2 is to attempt to run a query using parallel processing.
- **1**
  Parallelism is prohibited
- **ANY**
  Parallelism is allowed
- **ALL**
  Data currency is required for all cursors. Applicable to packages only.

**VALIDATE**
The time of validation:
- **RUN**
  Validate at run time.
- **BIND**
  Validate at bind time.

**OWNER**
The plan or package owner.

**CURRENTDATA**
Controls the data currency for ambiguous cursors:
- **NO**
  Data currency is not required for ambiguous cursors. Blocking for ambiguous cursors is allowed.
- **YES**
  Data currency is required for ambiguous cursors. Blocking for ambiguous cursors is inhibited.
- **ALL**
  Data currency is required for all cursors. Applicable to packages only.

**RELEASE**
Indicates when to release the locks:
- **COMMIT**
  Release locks at commit time.
- **DEALLOCATION**
  Release locks at deallocation time.
  For packages only:
- **DEFAULT**
  Release locks at run time, which is the default.

**KEEPDYNAMIC**
Indicates whether the prepared dynamic SQL statements are preserved past a commit:
The prepared dynamic SQL statements are destroyed at each commit.

The prepared dynamic SQL statements are preserved past a commit. Any subsequent OPEN, EXECUTE, or DESCRIBE assumes that the previous SQL statement is to be executed.

Indicates whether EXPLAIN was specified for the bind request.

The value of the DYNAMICRULES option on the BIND/REBIND command:

- **RUN**: Run time rules apply to a dynamic SQL statement for authorization checking and object qualification at run time.
- **BIND**: Bind-time rules apply to a dynamic SQL statement for authorization checking and object qualification at run time.
- **N/P**: DYNAMICRULES was not specified.

Indicates which remote connections are terminated during commit operations:

- **EXPLICIT**: Only connections in the release state are terminated.
- **AUTOMATIC**: All remote connections are terminated.
- **CONDITIONAL**: All remote connections are terminated provided that an open WITH HOLD cursor is not associated with the connection.

Indicates whether the preparation of dynamic SQL statements was deferred:

- **DEFER**: The preparation of the dynamic SQL statements that refer to remote objects was deferred until run time.
- **NODEFER**: The dynamic SQL statements were prepared at bind time.

The qualifier used for unqualified object names.

Indicates whether reoptimization was requested:

- **YES**: REOPT(VARS) was specified to reoptimize the access path of the SQL statement at run time.
- **NO**: NOROEPT(VARS) was specified to optimize the access path of the SQL statement only at bind time.

Specifies whether the plan or package replaces an existing plan or package with the same name or is new:

- **REPLACE**: The existing plan or package is replaced.
Utility Activity - Bind Activity

ADD   A new plan or package is added.

This field only applies to BIND activities. For all other activities, N/P is printed.

IMMEDWRITE
Indicates how DB2 updates group buffer pool dependent pages. This is only valid in a data sharing environment.

Group buffer pool dependent pages can be written to DASD or SYSTEM pagesets.

Values shown are:

NO   DB2 uses normal write activity for updates, this is the default. Pages are written out at, or before phase 2 commit, or at the end of an abort for transactions that have rolled back.

PH1   Pages are written out at, or before phase 1 commit.

If a transaction subsequently rolls back, the pages are updated in the group buffer pool at the end of the rollback and are written out at the end of the abort.

YES   Pages are written out to the coupling facility as soon as the buffer update commits. Pages are written out regardless of whether the update occurs during forward progress or rollback of the transaction.

This option can affect performance due to coupling facility overhead.

SQLERROR
Indicates whether a package is created if SQL errors are encountered:

CONTINUE   A package is created even when SQL errors are encountered.

NOPACKAGE   No package is created if SQL errors are encountered.

CACHE SIZE
The size (in bytes) of the authorization cache specified for the CACHESIZE keyword. A value of 0 indicates that DB2 determines the size of the authorization cache.

SQLRULES
Indicates whether a type-2 CONNECT statement was executed according to the rules of DB2 or the ISO/ANS SQL2 standard:

DB2   An error does not occur if CONNECT identifies an existing SQL statement.

STD   An error occurs if CONNECT identifies an existing SQL statement.

PROTOCOL
Valid values are:

DRDA   Protocol is DRDA.

PRIVATE   Protocol is a private protocol

NOT_SPEC   Protocol was not specified. This is only valid for packages.
OPTHINT
Indicates whether optimizations hints are to be used. This can be:

- YES
- NO

SENT
The number of SQL statements sent to be bound at the server, and the elapsed and CPU times spent for that event at the requester site.

This field is only shown for remote events.

STMT. BOUND
The number of SQL PARSER events and one or more minibind events that occur between matched BIND or REBIND begin/end record pairs, and the elapsed and CPU times spent for those events.

When a statement is bound, DB2 chooses an access path for the DB2 statement. The only bound DB2 statements are SELECT, UPDATE, INSERT, and DELETE. The other DB2 statements do not require an access path to be generated.

This field shows N/P if the CPU header is not present in the trace data. It is not shown if the IFCIDs 022 and 063 are not available.

STMT. BOUND
The number of SQL PARSER events without corresponding minibind events that occur between matched record pairs (BIND or REBIND begin/end), and the elapsed and CPU times spent for those events.

A statement is not bound if DB2 does not calculate an access path.

DETERM CURSOR and CLOSE CURSOR are examples of statements that are not bound.

This field shows N/P if the CPU header is not present in the trace data. It is not shown if the IFCIDs 022 and 063 are not available.

Data Set Information:
This block shows the data set information available for the activity.

Utility Data Set Information Workload Block
Here is an example of the Utility Data Set Information Workload Block:

--- DATA SET INFO -----------------------------------------------
DD NAME : CCCCCCB  DS NAME : CCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCC44  TEMPLATE NAME : CCCCCCB
DURATION : 02:03:05.10  DEVICE TYPE : C  OPEN TIMESTAMP: 01/30/15 18:15:44.38

Field description
Here is a description of the field labels shown in the Utility Data Set Information Workload Block:

DD NAME
Data definition.

DS NAME
Data set name.

TEMPLATE NAME
Template name.

NO.READS
Number of READ operations.
Utility Activity - Data Set Information

NO.WRITES
Number of WRITE operations.

NO.CHECKS
Number of checks.

NO.EOVS
Number of End of Volumes.

I/O WAIT TIME
I/O wait time.

DURATION
The number of seconds the data set was open.

DEVICE TYPE
Device type:
D DASD.
T Tape.

OPEN TIMESTAMP
Time the data set was opened.

Exit Activity:
This block shows the exits performed by the event.

Exits Workload Block Example
Here is an example of the Exits Workload Block.

--- EXITS ------------------------------------------------------------------
MEMBER VALIDATION TOTAL AET/EXIT EDIT TOTAL AET/EXIT
SE11 1 N/C 0 0.000060

Field description
Here is a description of the field labels shown in the Exits Workload Block.

MEMBER
The name of the DB2 member within the DB2 data sharing group.

VALIDATION TOTAL
The number of results of a validation exit call written for every validation row.

VALIDATION AET/EXIT
The summarized elapsed validation time divided by the value in VALIDATION TOTAL.

EDIT TOTAL
The summary of results of an edit exit call to encode a record written for every row edited and the results of an edit exit call to decode a record written for every row decoded.

EDIT AET/EXIT
The summarized elapsed edit time divided by the value in EDIT TOTAL.

I/O Activity:
This block shows the I/O activity for each object performed by the event.
I/O Activity Workload Block Example

This is an example of the I/O Activity Workload Block.

<table>
<thead>

</tr>
</tbody>
</table>

Field description

Here is a description of the field labels shown in the I/O Activity Workload Block.

**DATABASE**
The database name. If the name is not available, the decimal DBID/OBID is printed.

**PAGESET**
The page set name. If the name is not available, the decimal DBID/OBID is printed.

**MEMBER**
The name of the DB2 member within the DB2 data sharing group.

**BP**
The buffer pool name.

**I/O REQUEST TOTAL**
The total number of I/O requests.

**I/O REQUEST AET**
The average elapsed time for each I/O request.

**READ REQUEST TOTAL**
The number of read I/O requests of a specific type.

**READ REQUEST TYPE**
The type of read request:

- **SYNCH**
  Synchronous read request

- **SEQPF**
  Sequential prefetch request

- **DYNPF**
  Dynamic prefetch request

- **LSTPF**
  List prefetch request

**READ REQUEST AET/WITH**
The average elapsed time for a read with I/O of a specific type.

**READ REQUEST %WITH**
The percentage of total read requests with I/O for a particular type.

**READ REQUEST PAGE/WITH**
The pages read for each read request with I/O of a particular type.

**READ REQUEST %WITHOUT**
The percentage of total read requests without I/O for a particular type. This can occur because all the pages requested by a prefetch read were already in the buffer pool.
Utility Activity - I/O

WRITE REQUEST TOTAL
The number of write I/O requests.

WRITE REQUEST TYPE
The type of write request.

WRITE REQUEST CAST
Indicates whether the write operations were initiated due to a coupling facility castout.

WRITE REQUEST AET
The average elapsed time for each write.

WRITE REQUEST PAGE/WRITE
The number of pages written.

LISTDEF Information:

This topic describes the workload block of the list definition (LISTDEF) information.

LISTDEF Information Workload Block

This is an example of the workload block of the list definition (LISTDEF) information.

--- LISTDEF LIST INFO ---------------------------------------------------------------
LIST NAME : CCCCCCCCCCCCCCCCCB LIST TYPE : M LIST SIZE : 12345

Field description

The workload block of the list definition (LISTDEF) information contains the following fields:

LIST NAME
Name of list definition information.

LIST TYPE
Type of LISTDEF information:
T Table space list.
I Index space list.
M Mixed list.

Lock Suspension Activity:

This topic shows detailed information about “Workload Detail - Lock Suspension Activity”.

This block shows the lock suspension activity for each object performed by the event.

Lock Suspension Activity Workload Block Example

The field labels shown in the following sample layout of “Lock Suspension Activity Workload Block” are described in the following section.

--- LOCK SUSPENSION ACTIVITY ---------------------------------------------------------
RESOURCE NAME TYPE REQUEST LOCAL LATCH IRLMQ GROUP NOTIF OTHER COUNT AET COUNT AET COUNT AET
DBPARALL TSPARALL DATAPAGE NOTIFY 0 0 0 24 24 0 0 24 0.74382 0 N/C 0 N/C

IBM Db2 Performance Expert on z/OS
The following list describes the fields in the lock suspension activity workload block:

**RESOURCE NAME**

The name of the resource on which the suspended request is made. The content of the field depends on the resource type:

- The plan name for SKCT
- The collection and package IDs for SKPT
- The collection ID for COLLECT
- The database name for DATABASE, CDB PLK, DBD PLCK
- The buffer pool ID for ALTERBUF, GBP S/S, P/P PLCK, PAGEPLCK, GBP CAST, P/P CAST
- The anchor point ID for HASH-ANC
- The row ID for ROW
- N/A for MASS, UTILITY, BINDLOCK, ALTERBUF, CATM MIG, CATM CAT, CATM DIR
- The database and page set names for all others

The database and page set names are translations obtained from the IFCIDs 105 and 107. If these records are unavailable, the decimal DBIDs and OBIDs are printed.

**MEMBER**

The name of the DB2 member within the DB2 data sharing group.

**TYPE**

The type of the locked resource. Possible values are shown in Table 261 on page 3461.

**REQUEST**

The type of request that has been suspended:

- LOCK  IRLM lock request
- UNLOCK  IRLM unlock request
- CHANGE  IRLM change request
- QUERY  IRLM query request
- NOTIFY  IRLM notify request
- DRAIN  Drain request
- LATCH  Latch request

**SUSPEND REASON LOCAL**

The number of suspensions due to local resource contentions.

**SUSPEND REASON LATCH**

The number of suspensions due to IRLM latch contentions.
Utility Activity - Lock Suspension

SUSPEND REASON IRLMQ
The number of suspensions due to IRLM queued requests.

SUSPEND REASON GROUP
The number of suspensions due to global contention.

SUSPEND REASON NOTIFY
The number of suspensions due to intersystem message sending.

SUSPEND REASON OTHER
The number of suspensions due to reasons other than those listed previously.

Note: For drain suspensions, the suspension reason is always “waiting for the claim count to reach zero” and is categorized as OTHER.

NORML RESUME COUNT
The number of suspensions that ended in the task, resuming normal processing after the lock request has completed.

NORML RESUME AET
The normal resume average elapsed time. This is the normal resume elapsed time divided by the NORML RESUME COUNT.

TIMEO RESUME COUNT
The number of suspensions that ended in a timeout.

TIMEO RESUME AET
The average elapsed timeout time. This is the elapsed timeout time divided by the TIMEO RESUME COUNT.

DEADL RESUME COUNT
The number of suspensions that ended in a deadlock.

Note: Drain suspensions do not end in a deadlock.

DEADL RESUME AET
The average elapsed deadlock time. This is the elapsed deadlock time divided by the DEADL RESUME COUNT.

Page and Row Locking Activity:
This block shows the page locking, row locking, and lock avoidance activity for each object, performed by the event.

The page and row locking activity block is only printed if a commit occurred or a thread terminated.

In summary by occurrence, page and row locking activity information generated for explicit commits is shown on the relevant commit events.

In summaries by cursor or program, any explicit commits occurring during the life of that cursor or program are counted. Page and row locking activity caused by those commits is shown on the relevant cursor or program.

In summaries by statement number or statement type, commits are not counted. Because page and row locking activity is not relevant for these summary levels, it is not printed.

Any page or row locking activity occurring when a thread terminated is shown in the summary by thread. This activity is added to any page or row locking which
took place in the body of the thread. Therefore, page and row locking figures in summary by thread can be greater than the sum of page locking figures shown in the body of the thread. The difference is the page and row locking activity occurring at thread termination.

An example of the page and row locking workload block is shown in the following example.

### Page and Row Locking Workload Block Example

<table>
<thead>
<tr>
<th>MEMBER</th>
<th>DATABASE</th>
<th>PAGESET</th>
<th>COUNT</th>
<th>LOCK</th>
<th>MAXIMUM PAGE OR ROW LOCKS HELD</th>
<th># LOCK ESCALATIONS</th>

</tr>
<tr>
<td>TOTAL</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Note:**

1. The DBID and OBID are obtained from IFCID 020.
2. The values in MAX PAGE OR ROW LOCKS HELD, LOCK ESCALATIONS SHARED, and LOCK ESCALATIONS EXCLUSIVE are accumulated within a subsystem. They are reset only at thread deallocation or when a new user signon occurs.
3. The values in MAXIMUM PAGE OR ROW LOCKS, HIGHEST LOCK, and # LOCK ESCAL are reset at commit time for dynamic BINDs and for static BINDs for which release (commit) is specified. Otherwise, these values accumulate until thread deallocation or until a new user signon occurs.
4. IFCID 218 is an additional lock summary record, written for lock avoidance. It indicates whether a successful lock avoidance test occurred during a given unit of work. The record is externalized for the agent at each commit or rollback.
5. For each event, the relevant IFCID 020 and 218 records are processed. If there is a DBID/OBID combination present for IFCID 218 but not for IFCID 020, the IFCID 020 fields show N/P. If there is a DBID/OBID combination present for IFCID 020 but not for IFCID 218, the IFCID 218 field (LOCK AVOID SUCCESSFUL) shows N/P.

**Field description**

The fields in the page and row locking workload block are:

**MEMBER**

The name of the DB2 member within the DB2 data sharing group.

**DATABASE**

The database name, if available.

If the name is not available, the decimal DBID is printed instead.

**PAGESET**

The page set name, if available.

If the name is not available, the decimal OBID is printed instead.

**COUNT**

The number of page locking or row locking occurrences for each page set.

* Specific database and page set:
Utility Activity - Page and Row Locking

- At commit time: always 1
- At thread termination: the number of times this database and page set occurred on a commit record

• TOTAL
  - At commit time: the total number of page sets listed
  - At thread termination: the sum of the values for all page sets

LOCK SIZE
The lock size used:

PAGE Page lock
ROW Row lock
TABLE Table space or table lock
LOB LOB lock
UNKN Unknown lock
*
Multiple lock sizes

MAXIMUM PAGE OR ROW LOCKS
The maximum number of either page locks or row locks held at one time against this object.

# LOCK ESCAL
The number of lock escalations:

• 0 if no escalations occur
• For simple table spaces and partitioned table spaces not using selective partition locking (SPL): 1 if any escalation occurred for this table space in this logical unit of work
• For segmented table spaces: the number of tables within the table space that have experienced lock escalations
• For partitioned table spaces using SPL: the number of partitions for which locks escalated within the table space

The TOTAL contains the sum of all values in this column.

HIGHEST LOCK
The highest table space lock state.

If the table space is simple or partitioned not using SPL, it is the highest lock state for this database or page set. At trace end, it is the largest value from any commit for this object. The following values are possible:

IS Intent share
IX Intent exclusive
S Share
U Update share
SIX Share with intent exclusive
X Exclusive

If the table space is segmented or partitioned using SPL, this field is blank.

TS TYPE
The table space type:

SIMPL Simple table space
SEG  Segmented table space
PARTI Partitioned table space
SPL  Partitioned table space using selective partition locking (SPL)
LOB  LOB table space

LOCK AVOID SUCCESSFUL
Indicates whether there was a successful lock avoidance test during the unit of work.
If the state of this field changed during the summarization period, an asterisk (*) is shown.

MAX PAGE OR ROW LOCKS HELD
The maximum number of page locks and row locks held at one time across all objects.

LOCK ESCALATIONS: SHARED
The total of shared lock escalations.

LOCK ESCALATIONS: EXCLUSIVE
The total of exclusive lock escalations.

Utility Phases:
This block shows the utility phases for each object performed by the event. Its layout depends on whether the utility produces parallel tasks.

Note: You can process up to 40 utility phases for each object.

Phases Workload Block Example without Parallel Tasks
Here is an example of the phases workload block without parallel tasks. An example of the phases workload block with parallel tasks is shown in "Phases Workload Block Example with Parallel Tasks" on page 4640.
Utility Activity - Page and Row Locking

Phases Workload Block Example with Parallel Tasks

Here is an example of the phases workload block with parallel tasks.

--- Utility Phases ---

**Note:**

1. In LOAD and REORG utility parallelism, the calculation of the elapsed and CPU times for the SORT phase only takes into account the parallel sort, not the originating task.

2. Although not a phase of the LOAD or REORG utility, COPY is reported as a phase when a concurrent COPY was requested for the LOAD or REORG.

3. If the utility runs on several objects or partitions, a TOTAL is shown for each phase.

**Header Fields - Utility Phases:**

This topic describes the header fields of the Utility Phases.

**START TIME**

Start of the utility. This is the timestamp of the IFCID 023 (Utility Start) for the UTILINIT.

**ELAPSED TIME**

Total elapsed time. This is the difference between the timestamp of the IFCID 025 (Utility End) for the UTILTERM and the timestamp of the IFCID 023 (Utility Start) for the UTILINIT.

**UTILITY-ID**

User-defined utility identifier. This can be up to 16 characters in length.

**JOB NAME**

User-defined job name.
SHRLEVEL
The SHRLEVEL value of the utility. Possible values are: NONE, REFERENCE, or CHANGE.

SUBTASKS
These three numbers show the following information about parallel subtasks:
1. Requested number of subtasks.
2. Number of actual subtasks.
3. Number of reused subtasks.

Note: You can process up to 40 subtasks.

N/A is printed for both values when no subtasks or parallelism are used.

CPU TIME
Total CPU time. This is the difference between the CPU time of the IFCID 025 (Utility End) for the UTILTERM and the CPU time of the IFCID 023 (Utility Start) for the UTILINIT.

ACTIVITY TYPE
The name of the activity type and event. The activity type can only be BIND for bind events including remote bind activity, or UTILITY for utility events. All events are indented.

For a detailed description, of Activity Type, see page “Field description” on page 4622.

DATABASE.PAGESET
The page set ID. This field should match the corresponding field of the preceding IFCID 0024 record.

STEP
The step name of the utility job.

TOT. ZIIP
The total utility ZIIP time (if Accounting class 1 trace is activated).

SORT
The type of Sort:
- DF: DFSORT was invoked at least once. Possible values: are: Y or N.
- DB2: DB2 SORT was invoked at least once. Possible values: are: Y or N.
- DATA: The number of parallel data sorts.
- INDEX: The number of parallel index sorts.
- OTHER: The number of other sorts.

SORT CPU
The Sort CPU time.

SORT ZIIP
The Sort ZIIP time (if provided by the Sort program).

Field description - Utility phases:
This topic describes the fields of the Utility Phases.

PHASE
The name of the phase used by the utility.
Utility phases

UNLOAD
The unload phase of the maintask or the summary of unload subtasks.

SORT
The sort phase of the maintask or the summary of sort subtasks.

BUILD
The build phase of the maintask or the summary of build subtasks.

DATABASE
The database name of the object.

PAGESET
The table space name or index name of the object.

When the sort or build phase, or both, are running in parallel as part of a subtask, ******** is printed if the number of objects is greater than one.

PARTNO
The number of the partition or data set if the utility is operating on a single partition or data set. Otherwise, the value in this field is 0.

TYPE
The item type for the individual phases.

COUNT
The number of item types processed by the phase for one object.

ELAPSED TIME
The elapsed time of the phase. This is the time between the IFCID 024 (utility change) of the phase and the IFCID 024 of the next phase. For the last phase, this is the time between the IFCID 024 (utility change) of the phase and the IFCID 024 of the UTILTERM.

CPU TIME
The CPU time of the phase. This is the time between the IFCID 024 (utility change) of the phase and the IFCID 024 of the next phase. For the last phase, this is the time between the IFCID 024 (utility change) of the phase and the IFCID 024 of the UTILTERM.

UTILINIT/ UTILTERM
This is the starting and ending time of the utility. This is the sum of the time between the IFCID 023 (Utility start) for the subtask and the IFCID 024 of the first phase and the time between the IFCID 024 and the IFCID 025 (Utility end) of the UTILTERM. This is shown as elapsed time and CPU time.

MAIN TASK TOTAL
The total time spent processing main tasks. This is shown as elapsed time and CPU time.

SUBTASK
For each subtask, the following information is shown:

SUBTASK
The time between the IFCID 023 (utility start) for the subtask and the IFCID 024 (utility change) for the first phase within the subtask. This is shown as elapsed time and CPU time.

Phase
The name of the phase and time information. For a single phase, this is the time between the IFCID 024 (utility change) for the phase and the IFCID (utility end) of the subtask.

When a subtask contains multiple phases, the duration of the first and intermediate phases is measured from the IFCID 024 of the
phase to the IFCID 024 of the next phase. For the last phase in the
subtask, phase duration is taken from the IFCID 024 (utility
change) for the phase to the IFCID 025 (utility end) of the subtask.

This is shown as elapsed time and CPU time.

**SUBTASK TOTAL**
Total time spent processing the subtask. This is the time between
the IFCIDs 23 (utility start) and 25 (utility end) for the subtask.
This is shown as elapsed time and CPU time.

**Additional Record Information**
These topics provide additional information about reports.

**DPMOUT Record**
The externalized DPMOUT data is a sequential data set with variable-length
records. The following table outlines the format of the DPMOUT record.

*Note:* Do not use this record as a programming interface.

The DPMOUT record consists of the following sections:
- Header
- Product data section showing:
  - Instrumentation data
  - CPU data
  - DDF data
  - Data sharing information
- Repeating section information
- DBID and OBID translation information

The following tables show the layout of the DPMOUT record:

**DPMOUT header**

### OMEGAMON for Db2 PE VSAM Data Sets

This section explains the VSAM Data Sets of OMEGAMON for Db2 PE.

OMEGAMON for Db2 PE uses the following VSAM data sets:

- A VSAM-Save data set is written when the job stream contains a SAVE subcommand without the CONVERT option.
- A physical sequential data set is written when the job stream contains a SAVE subcommand with a CONVERT option.
- Job summary data sets are written when new data is processed.
Utility phases

All VSAM data sets used in an OMEGAMON for Db2 PE job must exist before OMEGAMON for Db2 PE is executed. Preallocate the data sets using the IDCAMS command. You can run IDCAMS as an initial step in the OMEGAMON for Db2 PE job. The required attributes for VSAM data sets are shown in Table 297. An example of the required IDCAMS commands is shown in "IDCAMS Commands."

Refer to the z/OS DFSMS for more information about IDCAMS.

Note:
1. When the SAVE subcommand is specified, the save data set should be empty. If it is not empty, all existing records are deleted. If save and restore use the same physical data set, the restored data is rewritten during save.
2. You need not prime OMEGAMON for Db2 PE VSAM data sets.

### Table 297. Attributes for OMEGAMON for Db2 PE VSAM Data Sets

<table>
<thead>
<tr>
<th>Data Set</th>
<th>Key Length (bytes)</th>
<th>Maximum Record Length (bytes)</th>
<th>Average Record Length (bytes)</th>
<th>Buffer Space (bytes)</th>
<th>Data Control Interval Size (bytes)</th>
<th>Index Control Interval Size (bytes)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accounting SAVE (ACSAVDD)</td>
<td>255</td>
<td>5500</td>
<td>3000</td>
<td>40 960</td>
<td>8192</td>
<td>4096</td>
</tr>
<tr>
<td>Statistics SAVE (STSAVDD)</td>
<td>92</td>
<td>8192</td>
<td>2400</td>
<td>40 960</td>
<td>8192</td>
<td>4096</td>
</tr>
<tr>
<td>Job Summary (JSSRSDD)</td>
<td>52</td>
<td>2462</td>
<td>160</td>
<td>40 960</td>
<td>8192</td>
<td>4096</td>
</tr>
</tbody>
</table>

Note: Buffer space and control interval size are suggestions only. You can modify them to suit the requirements of your installation.

### IDCAMS Commands

In this example, the job deletes the cluster if it already exists, then defines a new cluster with the specified attributes.

```
//ALCVSAM EXEC PGM=IDCAMS
//SYSPRINT DD SYSOUT=* 
//SYSPIN DD * 
DELETE (cluster.name) 
DEFINE - 
   CLUSTER { - 
      NAME (cluster.name) - 
      TRACKS (as required) - 
      VOLUMES (as required) - 
      KEYS (keylength 0) - 
      RECORDSIZE (average maximum) - 
      BUFFERSPACE (40960) - 
      REUSE - 
   ) - 
DATA { - 
      CONTROLINTERVALSIZE (8192) - 
   } 
INDEX { - 
      CONTROLINTERVALSIZE (4096) - 
   } 
/*
```

### Correlation Translation Record

Utility phases
Chapter 7. Commands

This section describes each command and its command syntax.

“Operator commands”
“Report commands” on page 4665

Operator commands

You can issue commands to the OMEGAMON Collector and its subtasks from the operator console.

This figure gives a graphical overview of the command hierarchy:

![Command Hierarchy Diagram]

Figure 297. Overview of the command hierarchy

The started-task commands apply to the OMEGAMON Collector.

The subtask commands comprise:
- General subtask commands that apply to all subtasks
- Specific subtask commands that apply to a specific subtask

The command syntax is:
started-task command,subtask command,subcommand

The commands are listed in “Started-task commands” and “Additional OMEGAMON Collector subtask commands” on page 4652.

Started-task commands

The OMEGAMON Collector runs as a started task.

Started-task commands for the OMEGAMON Collector are:

**START command**

Starts the started task for the OMEGAMON Collector.

You can abbreviate START to S.
$ cccccccc
where cccccccc is the started task name that you specify for the OMEGAMON Collector during the configuration within the Configuration Tool.

STOP command

Stops the started task for the OMEGAMON Collector.

You can abbreviate STOP to P.

P cccccccc
where cccccccc is the started task name that you specify for the OMEGAMON Collector during the configuration within the Configuration Tool.

MODIFY command

Changes the started task for the OMEGAMON Collector.

You can abbreviate MODIFY to F.

F cccccccc
where cccccccc is always the started task name that you specify for the OMEGAMON Collector during the configuration within the Configuration Tool.

Parameters for this command are:

F cccccccc,DISPLAY
  Shows all active tasks. It displays the unique ID for the task and the task program name. The internal ID is required, for example, if you want to stop the subtask under the OMEGAMON Collector.

  **Note:** Command output is displayed in system log.

  This example shows system output for the DISPLAY parameter:
  
  CIO543: THE FOLLOWING TASK IDS ARE ACTIVE:
  CIO594 ID=O2U518  PROGRAM=KO2OINTB
  CIO594 ID=O2U520  PROGRAM=KO2OINTB
  CIO594 ID=OBVTAM  PROGRAM=KO2VTAM
  CIO594 ID=H2      PROGRAM=KO2HWLMB
  CIO594 ID=EVENTMGR PROGRAM=KO2EINTB
  
  F cccccccc,LIST
  Shows all active tasks. Is an alternate name for the DISPLAY parameter and produces the same results.

Additional OMEGAMON Collector subtask commands

You can issue commands to subtasks, such as COMM COLL, H2WLMGR, or EVENTMGR, which run under the OMEGAMON Collector. The subtask commands must be preceded by the MODIFY command of the OMEGAMON Collector.

General subtask commands are:

START subtask command

Starts a subtask under the OMEGAMON Collector.

You can abbreviate START to $.
**START subtask command**

This example of the **START** subtask command starts the subtask Near-Term History Data Collector from collecting trace data from the DB2 subsystem D41X.

F cccccccc,S H2D41X

where **H2D41X** is the subtask ID for the Near-Term History Data Collector.

**STOP subtask command**

This example of the **STOP** subtask command stops the subtask Near-Term History Data Collector from collecting trace data from the DB2 subsystem D41X.

F cccccccc,P H2D41X

where **H2D41X** is the subtask ID for the Near-Term History Data Collector.

You can also issue specific subtask commands as described in:

- “Subtask commands to Performance Expert Server” on page 4661
- “Subtask commands to the Near-Term History Data Collector” on page 4661
- “Subtask commands to the Event Collection Manager” on page 4663

**Subtask commands to Performance Expert Server**

You can issue specific subtask commands to the Performance Expert Server subtask (PESERVER). The subtask commands must be preceded by the MODIFY command.

Specific subtask commands are:

**START command**

This example of the **START** subtask command starts the subtask Near-Term History Data Collector from collecting trace data from the DB2 subsystem D41X.

F cccccccc,F PESERVER,S db2ssid

where

- **db2ssid** is the started task name that you specify for the OMEGAMON Collector during the configuration within the Configuration Tool
• *db2ssid* is the identifier of the DB2 subsystem for which you want to start the Performance Expert Server instance

**STOP command**

Stops an instance of Performance Expert Server for a specific DB2 subsystem.

**Note:** If you stop a Performance Expert Server instance with the **STOP** command, it will no longer be started automatically during the detect cycles of the DB2 subsystem auto detect feature until the OMEGAMON Collector subtask PESERVER is restarted.

You can abbreviate **STOP** to **P**.

```
Fcccccccc,F PESERVER,P db2ssid
```

where

- *cccccccc* is the started task name that you specify for the OMEGAMON Collector during the configuration within the Configuration Tool
- *db2ssid* is the identifier of the DB2 subsystem for which you want to stop the Performance Expert Server instance

**MODIFY command**

Issues a subcommand to the PESERVER subtask.

```
Fcccccccc,F PESERVER,F db2ssid,option
```

where:

- *cccccccc* is the started task name that you specify for the OMEGAMON Collector during the configuration within the Configuration Tool
- *db2ssid* is the identifier of the DB2 subsystem on which the PESERVER subtask runs.

**Tip:** Enter **ALL** for all of the DB2 subsystems on which the PESERVER subtask runs.

- *option* is the subcommand for the PESERVER subtask

Subcommands for the PESERVER subtask are:

**DB2MSGMON=parameter**

Starts or stops the DB2 messages collector. This collector shows or hides DB2 messages in the Tivoli Enterprise Portal workspaces. *parameter* can be one of these values:

- **Y** Starts the DB2 messages collector, which shows DB2 messages in the Tivoli Enterprise Portal workspaces. The DB2 messages collector is a function of the READA collector support task. If the READA collector support task has not been started, enabling the DB2 messages collector will start the READA collector support task.
- **N** Stops the DB2 messages collector, which hides DB2 messages in the Tivoli Enterprise Portal workspaces. If the DB2 messages collector is the only function enabled for the READA collector support task, disabling the DB2 messages collector will stop the READA collector support task.

**DISPLAY=(parameter,parameter,...)**

Specifies that specific details of the PESERVER subtask are displayed, where *parameter* can be one of these values:
PARMS
  Shows parameters for the PESERVER subtask.
  You can abbreviate this parameter to P.

USERS
  Shows users of the PESERVER subtask.
  You can abbreviate this parameter to U.

TRACE
  Shows the current status of all internal traces of the PESERVER subtask.
  You can abbreviate this parameter to T.

If you specify DISPLAY without parameters, all details are shown.

EPTT=parameter
  Specifies the threshold value for the elapsed processing time in seconds, where:
  •  parameter is an integer from 0 to 240

  If EPTT is set to a value greater than 0, the elapsed processing time and threshold are being compared. If the elapsed processing time exceeds the threshold, message FPEV2100W is issued.

  If EPTT is set to 0, the threshold is cleared and the comparison is disabled.

  The MODIFY command can be used to diagnose timeout conditions that are reported during the operation of the monitoring PESERVER subtask. For example, message FPEV2102W reports timeout conditions when data retrieval requests issued by the Classic Interface are not completed by the PESERVER subtask within 10 seconds. The MODIFY command sets an internal threshold for the elapsed processing time (EPTT) in the DB2 interface task of the PESERVER subtask. If a call to the DB2 IFI interface does not complete within the specified time:
  •  Message FPEV2103I is issued (optional).
  •  Message FPEV2100I is issued.

  The control block containing measured elapsed times is dumped to the server log in hexadecimal format for use by IBM support. An SVC dump for the DB2 address spaces of the monitored DB2 subsystem is initiated. The dump will only be taken for the first occurrence of a timeout after EPTT is set. In this case message FPEV2101I is issued to inform the user that a dump was initiated. The dump title is 'FPEVDB2I - DB2 ADDRESS SPACES FOR db2ssid', where db2ssid is the identifier for the DB2 subsystem. No further dump can be initiated until the PESERVER subtask is recycled.

TONT=parameter
  Specifies the value for the timeout notify threshold in seconds, where:
  •  parameter is an integer from 0 to 240

  If TONT is set to a value greater than 0, the time exceeding the internal timeout value and the timeout notify threshold are compared. If the internal timeout value for the elapsed processing time is exceeded by more time than specified in the timeout notify threshold, message FPEV2102W is issued. Otherwise message FPEV2102W is suppressed.

  If TONT is set to 0, the threshold is cleared, the comparison is disabled and message FPEV2102W will be issued for each data retrieval request exceeding the internal timeout value.
The MODIFY command sets the timeout notify threshold (TONT) in the DB2 interface task of the PESERVER subtask. If a call to the DB2 IFI interface does not complete within the time, which is calculated as internal timeout value plus specified notify threshold time, message FPEV2102W is issued. The current setting for the timeout notify threshold is displayed as part of the response to the DISPLAY MODIFY command (F cccccccc,F PESERVER,F db2ssid,DISPLAY).

The MODIFY command can be used to suppress the reporting of timeout conditions that are detected during the operation of the monitoring PESERVER subtask. You can suppress message FPEV2102W for systems running at their capacity limit where timeout conditions are expected but extraordinary situations will be reported. For example, message FPEV2102W reports timeout conditions when data retrieval requests issued by the Classic Interface are not completed by the PESERVER subtask within 10 seconds. If message FPEV2102W displays values up to 8 seconds in phases where limited responsiveness is expected, the timeout notify threshold can be set to 9 seconds to suppress expected messages and to still get alerted in case responsiveness decreases.

`RACOPS=parameter`

`RACOPSIZE=parameter`

Changes the size of the OP buffer used by the READA collector support task to retrieve READA data from the monitored DB2 subsystem or data sharing group, where:

- `parameter` is an integer between 16 and 64 (representing an OP buffer size in MB)

**Note:** Changing the OP buffer size will stop and restart the DB2 trace that is currently active for the OP buffer.

`RACOPT=parameter`

`RACOPTHRESHOLD=parameter`

Changes the threshold of the OP buffer used by the READA collector support task to retrieve READA data from the monitored DB2 subsystem or data sharing group, where:

- `parameter` is an integer between 6 and 75 (representing a percentage value)

The OP buffer threshold defines the fill level of the OP buffer that should trigger processing of OP buffer data by the READA collector support task. For example, specifying a OP buffer threshold of 15% causes the READA collector support task to retrieve data from the OP buffer as soon as the OP buffer space is used up to 15%.

**Note:** Changing the OP buffer size will stop and restart the DB2 trace that is currently active for the OP buffer.

`SHDATASETSTATISTICS=(parameter,interval)`

Specifies that data set information is collected, where:

- `parameter` can be Y or N
- `interval` is the time interval between two consecutive snapshots in seconds

`SHDB2CONNECTAPPLICATION=(parameter,interval)`

Specifies that DB2 Connect application data is collected if Performance Expert Agent for DB2 Connect Monitoring is installed, where:

- `parameter` can be Y or N
- `interval` is the time interval between two consecutive snapshots in seconds
**Recommendation:** For correlation reasons, the interval value should be identical to the interval value of the subcommand SHTHREAD.

**Restriction:** When DB2 Connect monitoring is active for more than one server, only one of these servers should access the collected data on the corresponding DB2 subsystem at a time. For more information about this restriction, refer to “Configuring Performance Expert Agent for DB2 Connect Monitoring on Windows” on page 411 or to “Configuring Performance Expert Agent for DB2 Connect Monitoring on UNIX and Linux” on page 429.

**SHDB2CONNECTSYSTEM** = *(parameter, interval)*

Specifies that DB2 Connect system data is collected if Performance Expert Agent for DB2 Connect Monitoring is installed, where:
- *parameter* can be Y or N
- *interval* is the time interval between two consecutive snapshots in seconds

**Recommendation:** For correlation reasons, the interval value should be identical to the interval value of the subcommand SHSTATISTICS.

**Restriction:** When DB2 Connect monitoring is active for more than one server, only one of these servers should access the collected data on the corresponding DB2 subsystem at a time. For more information about this restriction, refer to “Configuring Performance Expert Agent for DB2 Connect Monitoring on Windows” on page 411 or to “Configuring Performance Expert Agent for DB2 Connect Monitoring on UNIX and Linux” on page 429.

**SHSQLCACHE** = *(parameter, interval)*

Specifies that SQL statement cache information is collected, where:
- *parameter* can be Y or N
- *interval* is the time interval between two consecutive snapshots in seconds

**SHSTATISTICS** = *(parameter, interval)*

Specifies that DB2 statistics information is collected, where:
- *parameter* can be Y or N
- *interval* is the time interval between two consecutive snapshots in seconds

**Recommendation:** For correlation reasons, the interval value should be identical to the interval value of the subcommand SHDB2CONNECTSYSTEM.

**SHPYSTEMPARAMETERS** = *(parameter, interval)*

Specifies that system parameter information is collected, where:
- *parameter* can be Y or N
- *interval* is the time interval between two consecutive snapshots in seconds

**SHTHREAD** = *(parameter, interval)*

Specifies that thread information is collected, where:
- *parameter* can be Y or N
- *interval* is the time interval between two consecutive snapshots in seconds

**Recommendation:** For correlation reasons, the interval value should be identical to the interval value of the subcommand SHDB2CONNECTAPPLICATION.

If SHTHREAD is set to Y, thread detail data is collected, except for lock data and SQL text data.

If you want to collect lock data or SQL text data, or both, you must specify the parameters SHTHREADLOCK or SHTHREADSQL, or both succeeding the parameter SHTHREAD. Lock data and SQL text data is then collected within the same time interval as SHTHREAD.
SHTHREADLOCK=parameter
If SHTHREAD is set to Y, SHTHREADLOCK specifies if thread data, which is collected for Snapshot History, includes lock data.

*parameter* can be one of these values:

- **Y**: Thread data for Snapshot History is collected including lock data.
- **N**: Thread data for Snapshot History is collected excluding lock data.

SHTHREADSQL=parameter
If SHTHREAD is set to Y, SHTHREADSQL specifies if thread data, which is collected for Snapshot History, includes SQL text data.

*parameter* can be one of these values:

- **Y**: Thread data for Snapshot History is collected including SQL text data.
- **N**: Thread data for Snapshot History is collected excluding SQL text data.

SNAPSHOTHISTORY=parameter
Activates or deactivates Snapshot History processing, where *parameter* can be one of these values:

- **Y**: Activates Snapshot History processing.
- **N**: Deactivates Snapshot History processing.

You can abbreviate the subcommand to **SH**.

**Restriction:** When DB2 Connect monitoring is active for more than one server, only one of these servers should access the collected data on the corresponding DB2 subsystem at a time. For more information about this restriction, refer to “Configuring Performance Expert Agent for DB2 Connect Monitoring on Windows” on page 411 or to “Configuring Performance Expert Agent for DB2 Connect Monitoring on UNIX and Linux” on page 429.

SPMON=parameter
Starts or stops the stored procedure collector. This collector shows or hides stored procedure monitoring data in the IBM InfoSphere Optim Performance Manager dashboards.

*parameter* can be one of these values:

- **Y**: Starts the stored procedure collector, which shows stored procedure monitoring data in the IBM InfoSphere Optim Performance Manager dashboards. The stored procedure collector is a function of the READA collector support task. If the READA collector support task has not been started, enabling the stored procedure collector will start the READA collector support task.
- **N**: Stops the stored procedure collector, which hides stored procedure monitoring data in the IBM InfoSphere Optim Performance Manager dashboards. If the stored procedure collector is the only function enabled for the READA collector support task, disabling the stored procedure collector will stop the READA collector support task.

TRACELEVEL=parameter
Specifies the trace level for internal data server traces, where *parameter* is an integer value from 0 to 127.

You can abbreviate this parameter to **TL**.

This example shows the command to display all PESERVER parameters for the monitored DB2 subsystem D721:
$F\ D721\ DM1S,\ F\ PESERVER,\ F\ D721,\ DISPLAY=(PARMS)$

where D721DM1S is the started task for the OMEGAMON Collector.

This example shows the command to display all PESERVER parameters and users for all monitored DB2 subsystems:

$F\ D721\ DM1S,\ F\ PESERVER,\ F\ ALL,\ DISPLAY=(PARMS,USERS)$

where D721DM1S is the started task for the OMEGAMON Collector.

**Subtask commands to TEP Data Collection**

You can issue specific subtask commands to the TEP Data Collection. The subtask commands must be preceded by the `MODIFY` command.

Specific subtask commands are:

**MODIFY command**

Issues a subcommand to the COMMCOLL subtask.

$F\ cccccccc,\ F\ COMMCOLL,\ option$

where:

- `ccccccc` is the started task name that you specify for the OMEGAMON Collector during the configuration within the Configuration Tool
- `option` is the task that the COMMCOLL subtask should perform

`option` can be one of the following:

**CONNECTIONS**

Displays the active Agent connections to DB2 subsystems that are created by the D5API collector on behalf of the Agent.

**STIMER**

Changes the D5API collect interval value.

**REGISTRY**

Displays the internal contents of the D5API registration table.

**TRACE=NO**

Removes additional D5API collector write-to-operator (WTO) messages in the joblog of the server address space.

**TRACE=YES**

Displays additional D5API collector write-to-operator (WTO) messages in the joblog of the server address space.

**TRACEALL**

Displays the internal contents of the D5API trace table.

**STATUS**

Displays the status of the D5API.

This example shows how the D5API collect interval is changed.

$F\ D2DBnnn,\ F\ COMMCOLL,\ STIMER=hhmmsssth$

$F\ D2DB046,\ F\ COMMCOLL,\ STIMER=00001000$

CI0760: PROCESSING COMMAND
CI0720: PROCESS MESSAGES FOLLOW
D53101I COMMCOLL MODIFY PROCESSING IN PROGRESS
This example shows how the contents of the D5API registration table are displayed.

The registration table (REGISTRY) contains registration entries (RTBEs) for every OMEGAMON Collector instance running on an MVS image.

**F D2DBnnn,F COMMCCOLL,REGISTRY**

D53101I COMMCCOLL MODIFY PROCESSING IN PROGRESS
D53106I COMMON COLLECTOR REGISTRATION DATA DISPLAY
RTBE: ACTIVE=00000002 CONNECTED=00000002 MAX=00000040
RTBE DATA: FLGS=80000000 ATTACH=0001 DETACH=0001 STIMER=00000150
RTBE DATA: FLGS=80000000 ATTACH=0000 DETACH=0000 STIMER=00000150

If the module KO2AINIB is attached to any DB2 address space, the KO2AINIB registration routine adds an RTBE entry to the registration table. The RTBE contains the JOB/STC name of the DB2 address space and the address of the D5API communication control table and other information.

This list describes the RTB fields:

**ACTIVE**
- The active number of number of connections

**CONNECTED**
- The number of connected D2 address spaces

**MAX**
- The maximum number of D2 address spaces supported

This list describes the RTBE fields:

**RTBE**
- The registration table entry address within the RTB

**D2**
- The registration entry owning D2 address space

**D5APIUSE**
- The D5API common control table address

**STATUS**
- The status of the D5API in the D2 address space

**FLAGS**
- The status of the RTBE entry x'80' in use, x'00' available' Other flags currently 000000

**ATTACH**
- The number of times the D5API has attached KO2ACONB

**DETACH**
- The number of times the D5API has detached KO2ACONB

**STIMER**
- The elapsed interval value in the format of hhmmssth that a collect call can consume

This example shows how the internal contents of the D5API trace table are changed.
This example shows how the status of the D5API is displayed.

**Subtask commands to the Near-Term History Data Collector**

You can issue specific subtask commands to the Near-Term History Data Collector subtask (H2WLMGR). The subtask commands must be preceded by the `MODIFY` command of the OMEGAMON Collector.

Specific subtask commands are:

**START command**

The `START` command starts the Near-Term History Data Collector.

**STOP command**

The `STOP` command stops the Near-Term History Data Collector.
where
- \textit{cccccccc} is the started task name that you specify for the OMEGAMON Collector during the configuration within the Configuration Tool
- \textit{xxxx} is the name of the DB2 subsystem that the Near-Term History Data Collector monitors

\textbf{LISTH2DS command}

Lists the Virtual Storage Access Method (VSAM) data sets for history data that are defined in the collections options member. It also displays the status of each data set and the amount of space used.

\textbf{SWITCH command}

The Near-Term History Data Collector can switch and archive data sets automatically when the data set is full. The \texttt{SWITCH} command allows you to perform this operation manually whenever you want.

\textbf{Requirement:} Before you use this command, check the availability of your VSAM data sets by using the \texttt{LISTH2DS} command. Data is saved only for available data sets.

\textbf{VARY command}

Changes the collection specifications when the Near-Term History Data Collector is active.
members for specific DB2 subsystems can be created and invoked at startup of a Near-Term History Data Collector. Collection options in a COPTcccc data set member are specified by keywords and associated keyword values. Basically, keywords and values specify and limit the data to be collected by the Near-Term History Data Collector.

Generally, the Configuration Tool should be used to generate collection options members. Nevertheless, a collection options member for a specific DB2 subsystem can also be created by copying an existing collection options member or the default member rhilev.RKD2PAR(COPTcccc) and modifying the collection options in the copied member.

Keywords in a collection options member are used in the following ways:

- **Keyword(value)**
- **Keyword(value,value,...)**
- **Keyword(value:value,...)**

If a keyword accepts only one value, enter the value in parentheses after the keyword. If a keyword accepts multiple values, enter the values in parentheses after the keyword and separate the values by commas or spaces.

The NOT operator (¬) negates value specifications. For example, CONNID(¬IM3D,¬I210) specifies that the Near-Term History Data Collector should collect data about all connection identifiers except for IM3D and I210.

The asterisk (*) wildcard character can be used at the end of value specifications. For example, PLAN(ABCD*) specifies that the Near-Term History Data Collector should collect data about all plans with names that begin with ABCD.

The question mark (?) wildcard character can be used as a single character replacement within value specifications. For example, DB2ID(D??T) specifies that the Near-Term History Data Collector should collect data about all DB2 subsystems with names that begin with D, followed by two variable characters, and end with T.

If you must continue statements in an COPTcccc member on another line for keywords such as AUTHID, CONNID, CORRID, ORIGAUTH, or PLAN:
- Do not use a continuation character. This means, do not repeat a “Keyword(“ entry on the next line.
- Do no start the continuation line in column 1. Only keywords should begin in column 1, as in the following example:

```
PLAN(¬DSNG* ¬OSNI+ ¬FINA1 ¬FINA2 ¬DSNG*
  ¬DSNZZ ¬FINA3 ¬FINA4 ¬DSNR+ ¬DSNR*
  ¬FINA5 ¬FINAN6)
```

For more information refer to “Near-term history data collection options” on page 325.

The new collection specifications take effect after the current collection interval expires.

**Subtask commands to the Event Collection Manager**

You can issue specific subtask commands to the Event Collection Manager subtask (EVENTMGR). The subtask commands must be preceded by the MODIFY command of the OMEGAMON Collector.
Specific subtask commands are:

**START DB2=value**

Starts the object and volume analysis collectors for one or more Db2 subsystems. The Db2 subsystems are specified by subsystem IDs.

**Requirement:** If you specify more than one Db2 ID, you must enclose the string in parentheses.

You can use this parameter with the `MODIFY` command for the Event Collection Manager. The Event Collection Manager must already be started.

**F cccccccc,START EVENTMGR**

**F cccccccc,F EVENTMGR,START DB2=(db2ssid1,db2ssid2,...,db2ssidn)**

where:

- `ccccccc` is the started task name that you specify for the OMEGAMON Collector during the configuration within the Configuration Tool
- `db2ssid1,db2ssid2,...,db2ssidn` are the identifiers of the Db2 subsystems for which object and volume analysis collectors should be started

**STOP DB2=value**

Stops the object and volume analysis collectors for one or more Db2 subsystems. The Db2 subsystems are specified by subsystem IDs.

**Requirement:** If you specify more than one Db2 ID, you must enclose the string in parentheses.

**F cccccccc,F EVENTMGR,STOP DB2=(db2ssid1,db2ssid2,...,db2ssidn)**

where:

- `ccccccc` is the started task name that you specify for the OMEGAMON Collector during the configuration within the Configuration Tool
- `db2ssid` is the identifier of the Db2 subsystem for which object and volume analysis collectors should be stopped

**START INTERVAL=value**

Specifies the time interval for the start of the object and volume analysis collectors in minutes.

**Restrictions:**

- You can specify only one value for the interval.
- The value must be a number from 1 to 1440.

You can use this parameter with the `MODIFY` command for the Event Collection Manager.

**F cccccccc,F EVENTMGR,START DB2=db2ssid,INTERVAL=value**

where:

- `ccccccc` is the started task name that you specify for the OMEGAMON Collector during the configuration within the Configuration Tool
- `db2ssid` is the identifier of the Db2 subsystem for which object and volume analysis collectors are started
- `value` is the value for the interval
**START PARM=(COLD=value)**

Specifies if the Event Collection Manager configuration should be restarted. This option should only be used if a Db2 subsystem has been dynamically added to the z/OS LPAR since the Event Collection Manager was started, or under guidance from Level 2 support.

You can specify YES or NO. The default value is NO.

You can use this parameter with the `START` command for the Event Collection Manager.

```
F cccccccc,START EVENTMGR,PARM=(COLD=YES)
```

where:

- `ccccccc` is the started task name that you specify for the OMEGAMON Collector during the configuration within the Configuration Tool

**START THREAD=value**

Specifies if the object and volume analysis collectors should collect thread information.

You can specify YES or NO. The default value is YES.

You can use this parameter with the `MODIFY` command for the Event Collection Manager.

```
F cccccccc,F EVENTMGR,START DB2=db2ssid,THREAD=YES
```

where:

- `ccccccc` is the started task name that you specify for the OMEGAMON Collector during the configuration within the Configuration Tool
- `db2ssid` is the identifier of the Db2 subsystem for which object and volume analysis collectors are started

---

**Report commands**

This section describes the report commands and command syntax.

**OMEGAMON for Db2 PE identifiers**

This section provides a description of the OMEGAMON for Db2 PE identifiers that are used in reports and traces. These identifiers describe the object that OMEGAMON for Db2 PE is reporting on.

**Usage**

DB2 trace records contain identifiers that OMEGAMON for Db2 PE uses to:

- Group data
- Order reports
- Identify trace records
- Include or exclude specific data

**Note:** PRIMAUTH, ORIGAUTH, PLANNAME, CONNECT, CORRNAME, CORRNMBR, INSTANCE, CONNTYPE, and MAINPACK do not apply to statistics records. Except for MAINPACK, N/A is printed for these fields. For MAINPACK, nothing is printed.
Identifiers

ACE (Agent control element address)
The absolute hexadecimal address of the DB2 agent control element for the thread. Each work request in DB2 is represented by an agent. When a work request identifies itself to DB2, an agent control element address (ACE) is used to track the agent. The agent can be:

- An allied agent representing a work request that originated in allied address spaces
- A system agent representing a work request internal to DB2

You can use this address to select records for a particular thread. Note that an ACE address can be reused after a thread terminates.

BY The basis used for comparing values in the records to values in the exception threshold data set. Values are:

- TOTAL An absolute value (the default)
- MINUTE By minute
- SECOND By second
- COMMIT By commit
- THREAD By thread

BPID (Buffer pool ID)
The buffer pool ID.

CALCULATED OR FIELD VALUE
The value from the field in exception status. It can be an absolute value or a value calculated according to the comparison basis. Time values are reported in the format ssssss.thtt, where ssssss is time in seconds and thtt is in tenths, hundredths, thousandths, and ten-thousandths of seconds. Integer values such as aborts and selects are reported in the format nnnnnnnnnnn. Other values are reported in the format nnnnnnnn.nn.

CLASS (DB2 trace class)
DB2 groups records of a similar nature into classes. When running a DB2 performance trace, you can limit the type of information that is traced by selecting one or more trace classes. OMEGAMON for Db2 PE can be used to select records by DB2 performance class.

CONNECT (Connection ID)
The DB2 connection ID of the thread. The connection identifier of the correlation header, which is the ID of the address space that interfaces with DB2. You can, for example, specify the CICS or IMS ID.

CONNTYPE (Connection type)
The type of connection for the associated thread. You can, for example, specify that you want to include only records that have a connection type of TSO or CICS.

Note: If connection type is not present, 'BLANK' is printed.
Possible values for thread connection types are:
Correlation identifier

This value identifies the DB2 task in conjunction with the connection ID.

OMEGAMON for Db2 PE uses the correlation ID to derive two identifiers: the correlation name and the correlation number:

**CORRNAME (Correlation name)**
The correlation name of the thread. An identifier assigned to a task. This field is a subset of the correlation ID. Its meaning varies with the connection type.

**CORRNMBR (Correlation number)**
The correlation number of the thread. An identifier assigned to a task. This field is a subset of the correlation ID. Its meaning varies with the connection type.

The location of the correlation name and correlation number within the 12-character value depends on the type of connection that the task executes in.

In distributed processing, when the application requestor is a DB2 system, the value assigned to the correlation ID at the application server is the same as the value assigned to the application requestor. If the application requestor is not a DB2 system, the value assigned to the correlation ID at the application server is the name of the job, task, or process the requestor is servicing.

For more information about correlation ID translation, see [[Monitoring Performance from ISPF]](https://example.com).

**DATABASE (Database name)**
The name of the DB2 database.
Note that INCLUDE and EXCLUDE processing uses the character names of databases, while DB2 instrumentation records contain the decimal IDs used by DB2. OMEGAMON for Db2 PE translates the decimal ID to the character name.

**DATASET (Data set name)**
The 8-character name of the archive log, active log, or bootstrap data set (BSDS).

**ENDUSER (End user ID)**
The user ID of the workstation end user. This can be different from the AUTHID used to connect to DB2.

**EXCEPTION TIME**
For Accounting records, this is the Accounting timestamp. For Statistics records, this is the END TIME of the statistics interval in which the exception occurred.

**FIELD (Comparison with data in a record field)**
This option is used in conjunction with the FIELD command. By using the FIELD command, you can define a value and comparison operator for a data field in a specific IFCID type. You can include or exclude records based on the result of the comparison.

**FIELD DESCRIPTION**
A description of the field in exception status. This description matches, as closely as possible, the terminology used in the Accounting and Statistics reports. If the field in exception status is a buffer pool field, the buffer pool ID is printed in front of the field description on the same line. Values are:
- BP0 - BP49
- BP32K - BP32K9

All nondistributed fields for an accounting thread or statistics interval are listed first. Any distributed fields in exception status follow the nondistributed fields and are grouped by remote location. Packages follow after DDF and are grouped by package name.

**FIELD ID**
The field ID of the Accounting or Statistics field in exception status.

**GROUP (Group name)**
The name of the data-sharing group.

**IFCID (Instrumentation Facility Component Identifier)**
A decimal identifier that represents a significant DB2 event and appears in the trace records produced by DB2.

**INSTANCE (Instance number)**
The LUW instance number. This hexadecimal number is mainly for distributed activity and is part of the LUWID. It can be used to match the activity performed by DBATs, DBAT-distributed threads, and allied-distributed threads. The instance number is allocated at thread creation.

**LOCATION (Location name)**
The name of a DB2 system. The location name is unique among DB2 systems that can communicate with each other.
If an input data set contains data from several subsystems, at least one of the following identifiers has to be different if OMEGAMON for Db2 PE is to distinguish between different subsystems: group name, location name, member name, or subsystem ID.

**MAINPACK (Main package)**
This identifier can be used to distinguish between plans according to the packages they contain. The representative package is either the first or last package or DBRM in a plan.

This identifier is useful when the name of a plan does not provide satisfactory identification.

The MAINPACK definition is stored in the DPMPARMS member MAINPACK. You can get access to the member by using the MAINPACK Definition Editor panel of the IRF. A different MAINPACK definition can be specified for each unique combination of requester location, connection ID, and plan name.

The default value for MAINPACK is the package ID of the first executed package for any requester location, connection ID, and plan name. If there is no package data available, MAINPACK returns to the default plan name.

**MEMBER (Member name)**
The name of the data-sharing group member.

**OBJECT (Object type)**
The type of DB2 resource. Valid values are:
- **BUFFER** Buffer pool
- **COLLECT** Collection
- **DATABASE** Database
- **DISTTYPE** Distribution type
- **FUNCTION** Function
- **PACKAGE** Package
- **SCHEMA** Schema
- **APPLPLAN** Application plan
- **LOBTS** LOB table space
- **STOGROUP** Storage group
- **TAB/VIEW** Table or view
- **USERAUTH** For system privileges like SYSADM or SYSOPR

**OP** The greater than (>) or less than (<) operator.

**ORIGAUTH (Original authorization ID)**
The original authorization ID of the thread. The original value of the primary authorization ID at the time of connection to DB2 and before it can be changed by any authorization exits.
In distributed processing and if the requester is a DB2 system, the value of the original authorization ID at the application server is the same as the value assigned to the application requester. If the application requester is not a DB2 system, the value of the original authorization ID at the application server is the user ID used during the initial connection with the application server.

**PACKAGE (Package information)**
This identifier is used to identify a package or DBRM. It is displayed in traces and reports in the headings of corresponding package data blocks.

**PAGESET (Page set name)**
The name of the page set.

Note that INCLUDE and EXCLUDE processing uses the character names of page sets, while DB2 instrumentation records contain the decimal IDs used by DB2. OMEGAMON for Db2 PE translates the decimal ID to the character name.

**PARTNBR (Partition number)**
PARTNBR identifies a partition of a table space by its number.

Table spaces can be partitioned or non-partitioned. The value for this identifier is zero if the table is not partitioned. This identifier is only valid for the ORDER command used with IOACTIVITY. You must specify PAGESET before you can specify PARTNBR.

**PLANNAME (Plan name)**
The DB2 application plan name of the thread. The plan name from the correlation header. A plan is a control structure produced during the bind process and used by DB2 to process SQL statements encountered during statement execution.

To receive better identification and granulation of bind and utility traces and reports, it is necessary to filter and order data. The plan name on a bind event (constant DSNBIND) is replaced by the program name, and the plan name on a utility event (constant DSNUTIL) is replaced by the utility name.

**PER**
This value identifies the log entry as an exception per system, per plan, or per program.

**PRIMAUTH (Primary authorization ID) or AUTHID (Authorization ID)**
The two terms are interchangeable. This is the primary authorization ID of the thread.

**REQLOC (Requester location)**
For distributed processing, this is the location requesting the work. If the requester location is not a DB2 subsystem, or is not recognized by DB2, the logical unit name from the DRDA LUWID is printed instead of the requester location name. The logical unit name is enclosed in less than (<) and greater than (>) symbols.

For TCP/IP connections, the requester location can contain the dotted-decimal IP address.

**Note:** The IP address must be specified in a specific format. For example, REQLOC('::10.4.1.237').

**RESOURCETYPE (Resource type)**
The type of lock resource. You can specify one of the following values:
DATAPAGE
Data page locking

DATABASE
Locking of the DBD

PAGESET
Page set locking

DATASET
Locking of partitioned data sets

SKCT
Skeleton cursor table locking

INDEX
Index page locking

TABLE
Table locking

SKPT
Skeleton package table locking

COLLECT
Collection ID locking

DRAIN
All types of drain locking

ROW
Data row lock

OTHER
All unlisted resource types

Role
The role ID.

RMID (Resource manager identifier)
The decimal identifier of a DB2 resource manager. You can use RMID to select a particular type of activity. For example, RMID 6 selects records associated with storage management.

SQLCODE
The SQL return code. This identifier is only valid with the SQLACTIVITY TRACE or SQLACTIVITY FILE commands. It can be used to include statements that completed, for example, with a specific error.

SUBSYSTEMID (Subsystem ID)
The ID of the DB2 subsystem that generated the data.

TCONTEXT
The ID of a trusted context. A trusted context is an independent database entity that you can define based on a system authorization ID and connection trust attributes.

THREADTYPE (Thread type category)
The type of thread that you want included in a report. You can specify one or more of the following values:

ALLIED
Threads without distributed activity. An allied thread does not involve distributed activity, that is, it is not initiated by a remote location and does not request data from another location.

ALLIED_DIST
Threads that request work from remote locations. An allied-distributed thread is not initiated by a remote location, but it requests data from one or more server locations.

This category covers thread type ALLDDIST. It can be reported in Accounting Report if ordered by THREADTYPE.
DBAT

Threads performed on behalf of remote locations.

In the Accounting report, if data is ordered by THREADTYPE, this category covers following thread types:

- DBAT - Indicates accumulated data of threads that are initiated, created, and performing work on behalf of a remote (requester) location.
- DBATDP - Indicates accumulated data of DBAT duplicate threads.
- DBATDIST - Indicates accumulated data of DBAT distributed threads that are initiated by a requester location and executed by the server location that in turn requests data from another server location.
- DBATDICP - Indicates accumulated data of DBAT distributed and copy threads.
- DBATDIDP - Indicates accumulated data of DBAT distributed and duplicate threads.

THRESHOLD TYPE

Describes whether the THRESHOLD VALUE is defined in the exception threshold data set as a WARNING or a PROBLEM.

THRESHOLD VALUE

The value defined in the exception threshold data set, above or below which the actual value must fall to be considered in exception status.

TRANSACT (End user transaction name)

The transaction or application that the client is running.

TYPE (Event type)

Specifies which event types are to be included in, or excluded from, the lock detail trace. Valid event type values are:

- IRLMREQ
  - Lock, unlock, change, query, and notify requests
- CLAIMREQ
  - Claim acquire, claim change, and claim release
- DRAINREQ
  - Drain request and drain release
- PLOCKREQ
  - Page set or partition and page P-lock requests
- IRLMSUSP
  - The beginning of lock, unlock, change, query, and notify suspensions
- DRAINTUSP
  - The beginning of drain suspensions
- LATCHSUSP
  - The beginning of page latch suspensions
- IRLMRES
  - The end (resumption) of lock, unlock, change, query, and notify suspensions
- DRAINRES
  - The end (resumption) of drain suspensions
- LATCHRES
  - The end (resumption) of page latch suspensions
- TIMEOUT
  - Timeouts
- DEADLOCK
  - Deadlocks
LOCKSUMMARY
  Lock summary events
LOCKAVOID
  Successful lock avoidance events

The default is all event types.

Note: TYPE can also be used with the REDUCE and FILE subcommands of LOCKING, with the following limitations:
  • Valid types for REDUCE are: IRLMRES, DRAINRES, and LATCHRES.
  • Valid types for FILE are: IRLMREQ, CLAIMREQ, DRAINREQ, and LOCKAVOID.

If values other than those listed are used with INCLUDE, REDUCE, or FILE, an empty report or file is produced.

If values not relevant to REDUCE or FILE are used with EXCLUDE, the event type is not filtered.

WSNAME (End user workstation name)
  The user’s workstation name.

The OMEGAMON for DB2 PE command stream
  A JCL command stream consists of DD statements that determine the data sets used with reports and traces, and the commands, subcommands and subcommand options that determine the type of report or trace to be produced.

Usage
  You can create OMEGAMON for DB2 PE reports and traces as follows:
  • Interactively, by choosing the Create and execute reporting commands option from the main menu. This invokes the Interactive Report Facility (IRF), which lets you interactively specify the type of report and further options and then composes and submits a corresponding batch report command stream. The IRF is described in the Reporting User’s Guide.
  • Manually, by using the ISPF editor and creating JCL command streams to generate reports and traces. This method is described herein, together with the OMEGAMON for DB2 PE commands, subcommands, options and keywords that can be used in commands streams.

Usage notes
  • Most of the DD statements with a SYSOUT destination do not have to be specified because they are dynamically allocated by OMEGAMON for DB2 PE. See the individual DD statement descriptions for more information.
  • The final EXEC statement is required. If you do not include the EXEC statement in your JCL, no report is produced. All statements following the EXEC statement are ignored.
  • The syntax of your JCL is checked and written to the DPMLOG data set together with any information, warning or error messages raised.

Example
  Figure 298 on page 4674 shows a sample of the JCL required to produce OMEGAMON for DB2 PE reports and traces. In this sample, several place holders
Output from OMEGAMON for DB2 PE reports

This section helps you understand output values, date formats, and time formats.

Usage

The output from OMEGAMON for DB2 PE is one, or more, data sets containing the reports you requested, and a set of log file data sets. These log files are described in the Report Reference. The reports and traces produced are described and explained in detail in the relevant sections of this information.

Large and missing values in reports

Values printed on reports can be either total values or average values.

If there is insufficient space to print a value on a report or trace, a rounded value is printed followed by one of the following letters to indicate the magnitude:

// PE MAIN EXEC PGM=FPECMAIN
//* FOLLOWING ARE SYSTEM DDNAMES
//STEPLIB DD DSN=FPE.FPELIB.RKANMOD,DISP=SHR
//DPMPARAMS DD DSN=FPE.FPELIB.DPMPARMS,DISP=SHR
//INPUTDD DD DSN=FPE.FPELIB.DPMIN,DISP=SHR
//DPMLOG DD SYSOUT**
//SYSOUT DD SYSOUT**
//JOBSUMDD DD SYSOUT**
//EXCPDD DD DSN=FPE.EXCEPT.THRESH,DISP=OLD
//EXTRDD DD SYSOUT**
//EXFILDD DD DSN=FPE.EXCEPT.LOGFILE,DISP=OLD
//SYSPRMDD DD SYSOUT**
//DPMOUTDD DD DSN=FPE.FPELIB.DPMOUT.DATA,DISP=OLD
//JSSRSDD DD DSN=FPE.FPELIB.JSSRS.DATA,DISP=OLD
//SYSUDUMP DD DUMMY
//* FOLLOWING ARE REPORT SET DDNAMES
//ccWORK DD DSN=FPE.FPELIB.op.WORKDD,DISP=OLD
//ccRPTDD DD SYSOUT**
//ccTRCDD DD SYSOUT**
//ccSAVDD DD DSN=FPE.FPELIB.opSAV.DATA,DISP=OLD
//ccSTDD DD DSN=FPE.FPELIB.opRST.DATA,DISP=SHR
//ccFILDD DD DSN=FPE.FPELIB.op.FILE,DISP=OLD
//SYSIN DD *

Figure 298. Sample JCL
K  kilo    —  10^3
M  mega —  10^6
G  giga —  10^9
T  tera —  10^12
P  peta —  10^15
E  exa  —  10^18

The letter is printed directly after the number, without blank spaces. There can, however, be decimal places, as follows:

- Valid conversions of 12 345 include 12K, 12.35K, and 12.3K.
- Valid conversions of 1 234 567 include 1M, 1.2346M, and 1235K.

If a counter value or specific information in reports, in windows, or on panels is not shown, the following notation is used to indicate the reason:

N/A  Not applicable is shown if DB2 never produces a counter value in a specific context. Examples are:
   - A counter is not available in one DB2 version.
   - Counters are mutually exclusive.

N/C  Not calculated is shown for a derived field where the value cannot be calculated or is useless. Examples are:
   - A divide by zero (percentages, ratios).
   - Suppression of negative elapsed time values.
   - Required counter values for calculation marked as N/A or N/P.
   - Insufficient data or small counter values to allow significant statements (meaningless or misleading averages).

N/P  Not present is shown for a field where DB2 can present values, but does not in this instance. Examples are:
   - When counter values are not generated because of operational conditions (a trace class is not active).
   - An application does not provide a value because it is optional.

**Default date format**

By default, OMEGAMON for DB2 PE shows dates as mm/dd/yy. You can change this format to suit your own national language, or corporate convention by using `DATEFORMAT`. For more information, see “DATEFORMAT subcommand option” on page 4809.

This example shows the default date format as printed in the header of an Accounting short report.

**Elapsed time formats**

Time values are presented in one of the following formats:

```
dd hh:mm:ss.ffffffff
```

where:
dd represents days
hh represents hours
mm represents minutes
ss represents seconds
ffffffff represents the fractions of a second up to 8 decimal places.

For example, a time value of 1:30:25.10 represents 1 hour, 30 minutes, and 25.1 seconds.

Some of the reports that use this format might not report days (dd) or hours (hh).

ssssssss.ffffffff
where:
ssssssss represents seconds
ffffffff represents the fractions of a second up to 8 decimal places.

The actual number of decimal places varies from one field to another.

Some time fields can be rounded. If there is insufficient space to print a time value, the time is rounded by removing decimal places as required. For elapsed times, a rounded value is printed.

DD statements

Here you find a description of the DD statements used for OMEGAMON for DB2 PE.

This section describes the DD statements and the data sets shown in Figure 298 on page 4674.

The values for RECFM, LRECL, and BLKSIZE shown for some data sets are the values that OMEGAMON for DB2 PE generates at run time.

Note: The generated value for BLKSIZE is not mandatory, but it is recommended. Do not override the values for RECFM and LRECL.

ACMEMnn statements

The ACMEMnn statements are applicable to Accounting report set.

Usage

If you use the TRACE subcommand, OMEGAMON for DB2 PE temporarily uses an ACMEMnn work data set for each DB2 member that occurs in the input records. For example, if the input data set contains, or data sets contain, data from three different members, the ddnames ACMEM01, ACMEM02 and ACMEM03 are used. The work data sets are normally created on the MVS-defined work volumes, and on completion of the task.

Usage notes

- Only include ACMEMnn in your JCL if you want to control the placement or size of the data set. If your input has a large amount of data for a specific member, you might get a B37 abend on the ACMEMnn work data set. In that event, specify ACMEMnn.
- OMEGAMON for DB2 PE allocates 68 MB for a work data set by default. Define it as a temporary data set. As a guide, if the number of accounting-related input records for a specific member that satisfy the GLOBAL and ACCOUNTING command criteria exceeds 40 000, specify ACMEMnn.
• Do not specify DUMMY or DISP=MOD for this data set.

**RECFM:**

VBS

**LRECL:**

32 756

**BLKSIZE:**

6 233

**DPMLOG statement**
The DPMLOG statement is applicable to all report sets.

**Usage**

OMEGAMON for DB2 PE command processor messages are written to DPMLOG.

If DPMLOG is omitted, it is dynamically allocated to the SYSOUT message class of the job.

**Values**

**RECFM:**

FBA

**LRECL:**

133

**BLKSIZE:**

6 251

**DPMOUTDD statement**
The DPMOUTDD statement is applicable to all report sets.

**Usage**

If you:

- **Do not specify DPMOUTDD:**
  All DPMOUT-related processing is completed in storage. Only the records that relate to the report set commands in the same step are processed. No data is externalized.

- **Specify DPMOUTDD:**
  All records that satisfy GLOBAL FROM TO and INCLUDE or EXCLUDE selection criteria are reformatted to OMEGAMON for DB2 PE trace format, sorted by time sequence, location and group name, and written to the data set specified by DPMOUTDD.

**Usage notes**

- Include DPMOUTDD in your JCL only if you want to retain a copy of the input data as filtered by any GLOBAL options.

- Do not specify DUMMY or DISP=MOD for DPMOUTDD.

- You can specify a permanent or temporary data set for DPMOUTDD.

- Only specify the temporary DPMOUT data set if the number of filtered input records is likely to exceed 45 000. By default, OMEGAMON for DB2 PE allocates up to 68 MB for a work data set.

- The size of the DPMOUT data set depends on the number of input records and the GLOBAL filters. The input records are the IFCID records included in the DB2-related SMF record types 100, 101, and 102. One input record occupies approximately 1.5 KB of the space in the DPMOUT data set.
- When the input data set is composed mostly of DB2-related records, a good size for DPMOUT is 1.6 times the size of the input data set.

**Values**

**RECFM:**

VBS

**LRECL:**

32 756

**BLKSIZE:**

6 233

**DPMPARMS statement**

The DPMPARMS statement is applicable to all report sets.

**Usage**

The DPMPARMS data set is used to store changes that you have made to standard OMEGAMON for DB2 PE settings. For example, if you tailor your own report layout, it is stored in the DPMPARMS data set. Specify DPMPARMS if you want to use this layout. The modified OMEGAMON for DB2 PE settings stored in DPMPARMS are:

- Time zone processing
- Exception messages
- MAINPACK definition
- Correlation translation
- UTR layouts

**Usage notes**

Do not specify DUMMY for this data set.

**Values**

DPMPARMS must be a partitioned data set. Use the following attributes if you want to preallocate a new DPMPARMS data set. You should increase the number of directory blocks if you intend to tailor many report layouts.

**RECFM:**

FB

**LRECL:**

80

**BLKSIZE:**

6 160

**ERRDMPDD statement**

The ERRDMPDD statement is applicable to all report sets.

**Usage**

For diagnose purposes only. This DD statement provides corrupted input trace records.

This ddname is not required unless any corrupted IFCIDs are reported in your JOBSUMDD.
EXCPTDD statement
The EXCPTDD statement is applicable to Accounting and Statistics report sets.

Usage
The exception threshold data set EXCPTDD contains the user-defined exception thresholds.

This ddname is required if you want to produce an exception log or if you specified the EXCEPTION subcommand option with the TRACE, REPORT, or FILE subcommand.

EXFILDD1 statement
The EXFILDD1 statement is applicable to Accounting and Statistics report sets.

Usage
The data for the exception log file data set is written to EXFILDD1.

This DD statement is required if you want to produce an exception log file data set.

Usage notes
The exception threshold data set, as defined in EXCPTDD, is also required to produce an exception log file data set.

EXPRODDA statement
The EXPRODDA statement is applicable to Accounting and Statistics report sets.
Usage

The EXPRODDA data set defines the exception profile.

If EXPRODDA is omitted, it is dynamically allocated by OMEGAMON for DB2 PE and deleted after the job completes. If your input has a large amount of data for a specific member, you might experience a B37 abend on the work data set. If you want to control the placement or size of this data set, define a temporary data set.

Usage notes

Do not specify DUMMY or DISP=MOD for this data set.

Values

RECFM: VBS
LRECL: 32 756
BLKSIZE: 6 233

EXTRCDD1 statement

The EXTRCDD1 statement is applicable to Accounting and Statistics report sets.

Usage

The data for the exception log is written to EXTRCDD1 data set. This DD statement is required if you want to produce an exception log. For more information, see the Report Reference.

Usage notes

The exception threshold data set, as defined in EXCPTDD, is also required to produce an exception log.

Values

RECFM: FBA
LRECL: 133
BLKSIZE: 6 251

INPUTDD statement

The INPUTDD statement is applicable to all report sets.

Usage

The INPUTDD data set stores changes that you have made to standard OMEGAMON for DB2 PE settings. It lists the input data sets containing the DB2 performance data created by the DB2 trace facility. You can process several input data sets. These data sets are concatenated in the JCL to create one logical data set. The input data sets can be in SMF, GTF, or DPMOUT format or data sets generated by the Collect Report Data function of the Online Monitor. The normal rules for concatenating data sets apply. If DFSORT is used, see the z/OS information in the IBM Knowledge Center for rules governing the concatenation of data sets.
Note:

- INPUTDD is not required if you use RESTORE REPORT for Accounting or Statistics.
- If your DB2 performance data is provided in SMF log streams, specify the log stream name and the usage of the DFSORT IFASEXIT feature. Additional date filters can be provided for DFSORT if required. For example:

```bash
//INPUTDD DD DSN=IFASMF.SYSA.DB2,
// DCB=(RECFM=VB,BLKSIZE=32760,LRECL=32756),
// SUBSYS=(LOGR,IFASEXIT,'FROM=OLDEST,TO=YOUNGEST')
```

Values

The default ddname for the input data set is INPUTDD. You can specify another ddname by using the INPUTDD option of the GLOBAL command. If you specify another ddname, make sure that your JCL includes a valid DD statement for the new name. For more information, see "GLOBAL command" on page 4785.

JOBSUMDD statement

The JOBSUMDD statement is applicable to all report sets.

Usage

The job summary log and the IFCID frequency distribution log are written to JOBSUMDD.

This ddname is not required unless you want these logs. For more information, see the Report Reference.

Values

- **RECFM:** FBA
- **LRECL:** 133
- **BLKSIZE:** 6 251

JSSRSDD statement

The JSSRSDD statement applies to Accounting and Statistics report sets.

Usage

Job summary data is written to JSSRSDD when a SAVE subcommand is processed, and is restored from JSSRSDD when a RESTORE subcommand is processed.

If you are restoring data, the data set defined by JSSRSDD and the data set defined by xXRSTDD should match, that is, be produced by the same Save operation. For more information, see the Report Reference.

Usage notes

- JSSRSDD is optional.
- If you omit JSSRSDD, information about the previous processing of saved data is not restored, and information about current processing is not saved.
- The VSAM data set defined by JSSRSDD must exist before you run OMEGAMON for Db2 PE. You can do one of the following:
– Specify an existing data set from a previous OMEGAMON for Db2 PE run (when restoring data). If an existing data set is used and the SAVE subcommand is specified, the new job summary data is added to the previous content.
– Specify a new data set allocated by using the IDCAMS DEFINE CLUSTER function.

* Do not specify DUMMY for JSSRSDD.

For information about the allocation of the save data set, see *Monitoring Performance from ISPF*.

**SYSIN statement**
The SYSIN statement is applicable to all report sets.

**Usage**

SYSIN contains the commands of each OMEGAMON for DB2 PE report set that are input to OMEGAMON for DB2 PE. This DD statement is required.

**Values**

RECFM:

FB

LRECL: 80

BLKSIZE: 6 160

**SYSOUT statement**
The SYSOUT statement is applicable to all report sets.

**Usage**

Messages from DFSORT are written to the ddname SYSOUT.

If SYSOUT is omitted, it is dynamically allocated to the SYSOUT message class of the job.

**Values**

RECFM:

FBA

LRECL: 133

BLKSIZE: 6 251

**SYSPRMDD statement**
The SYSPRMDD statement is applicable to all report sets.

**Usage**

The System Parameters report is written to SYSPRMDD.

Specify this ddname if you want a System Parameters report.
Usage notes

- This ddname is optional.
- The default ddname for the System Parameters report is SYSPRMDD.
- You can specify another ddname by using the SYSPRMDD option of the OMEGAMON for DB2 PE GLOBAL command.
- If you specify another ddname, make sure that your JCL contains a valid DD statement for the new ddname. For information about the GLOBAL command, see “GLOBAL command” on page 4785.

Values

**RECFM:**
FBA

**LRECL:**
133

**BLKSIZE:**
6 251

### ccFILDD1 statements

The ccFILDD1 statements are applicable to Accounting (cc=AC), Audit (cc=AU), Locking (cc=LO), Record Trace (cc=RT), Statistics (cc=ST) and System Parameters (cc=SY) report sets.

Usage

By default, the output from the FILE subcommand is written to ccFILDD1.

Usage notes

- You can specify a different ddname by using the DDNAME option of the FILE subcommand.
- If you specify a different ddname, your JCL must contain a valid DD statement for the specified ddname.
- If you do not specify a different ddname, your JCL must contain a valid DD statement for the default ddname.

Values

**RECFM:**
VB

**LRECL:**
9 072

**BLKSIZE:**
9 076

### ccRPTDD statements

The ccRPTDD statements are applicable to Accounting (cc=AC), Audit (cc=AU), I/O Activity (cc=IO), Locking (cc=LO), Record Trace (cc=RT), SQL Activity (cc=SQ), Statistics (cc=ST), and Utility Activity (cc=UT) report sets.

Usage

ccRPTDD is the default output ddname for the REPORT subcommand.

The reports are written to ccRPTDD in the sequence corresponding to the REPORT subcommands. If ccRPTDD is omitted, it is dynamically allocated to the SYSOUT message class of the job.
Usage notes

You can specify a different ddname by using the DDNAME option of each
REPORT subcommand. If you specify a different ddname, your JCL must contain a
valid DD statement for the specified ddname.

Values

RECFM:
  FBA
LRECL:
  133
BLKSIZE:
  6 251

ccRSTDD statements

The ccRSTDD statements are applicable to Accounting (cc=AC) and Statistics
(cc=ST) report sets.

Usage

Data processed by the RESTORE subcommand is read from ccRSTDD by default. A
valid DD statement is required if your job stream contains a RESTORE
subcommand.

Usage notes

• You can specify a different ddname by using the DDNAME option of the
RESTORE subcommand.
• If your job stream contains a RESTORE subcommand that uses the DDNAME
option, your JCL must contain a valid DD statement for the specified ddname. If
your job stream contains a RESTORE subcommand that does not use the
DDNAME option, your JCL must contain a valid DD statement for the default
ddname.
• Do not specify DUMMY for ccRSTDD.

ccSAVDD statements

The ccSAVDD statements are applicable to Accounting (cc=AC) and Statistics
(cc=ST) report sets.

Usage

Reduced data processed by the SAVE subcommand is, by default, written as a
VSAM data set to ccSAVDD. Batch Accounting and Statistics offer a CONVERT
option of the SAVE subcommand that requires to specify a ddname that is
assigned to a sequential data set. A valid DD statement is required if your job
stream contains a SAVE subcommand.

Usage notes

• You can specify another ddname by using the DDNAME option of the SAVE
subcommand. If you specify a different ddname, your JCL must contain a valid
DD statement for the specified ddname. If you do not specify a different
ddname, your JCL must contain a valid DD statement for the default ddname.
• The VSAM data set (that is the default in Batch Accounting and Statistics)
defined by ccSAVDD must exist before you run OMEGAMON for DB2 PE.
Either specify an existing data set from a previous OMEGAMON for DB2 PE
run (when restoring data), or specify a new data set allocated by using the
IDCAMS DEFINE CLUSTER function. Note that the existing contents of the data set are lost unless the DDNAME options of both SAVE and RESTORE subcommands specify the same dname or data set.

- Do not specify DUMMY for ccSAVDD.

For information on the allocation of the save data set or sequential data set, see Report Reference.

**ccTRCDDx statements**
The ccTRCDDx statements are applicable to Accounting (cc=AC), Audit (cc=AU), I/O Activity (cc=IO), Locking (cc=LO), Record Trace (cc=RT), SQL Activity (cc=SQ), Statistics (cc=ST), System Parameters (cc=SY) and Utility Activity (cc=UT) report sets.

**Usage**

ccTRCDD is the output ddname for the TRACE subcommand.

If ccTRCDDx is omitted, it is dynamically allocated to the SYSOUT message class of the job.

**Usage notes**

- Up to five traces can be run in one job step. The default ddnames for the traces are ccTRCDD1 to ccTRCDD5, consecutively.
- You can specify a different ddname by using the DDNAME option in the corresponding TRACE subcommand. If you specify a different ddname, your JCL must contain a valid DD statement for the specified ddname.

**Values**

- **RECFM:** FBA
- **LRECL:** 133
- **BLKSIZE:** 6 251

**ccWORK statements**
The ccWORK statements are applicable to Accounting (cc=AC), Audit (cc=AUD), I/O Activity (cc=IO), Locking (cc=LO), Record Trace (cc=RT), SQL Activity (cc=SQL), Statistics (cc=ST), and Utility Activity (cc=UT) report sets.

**Usage**

ccWORK controls the placement or size of the data set.

If you reduce data, OMEGAMON for DB2 PE uses a temporary REDUCE work data set to provide virtual storage constraint relief. This is normally created on the MVS-defined work volumes, and deleted by OMEGAMON for DB2 PE. Include ccWORK in your JCL when you want to control the placement or size of the data set or if you get a B37 abend. This can happen if you are trying to reduce a large amount of data with a large number of different OMEGAMON for DB2 PE identifiers and a short reduction interval.
Usage notes

- If you specify ccWORK, OMEGAMON for DB2 PE allocates up to 68 MB for a work data set by default. Define it as a temporary data set.
- As a guide, if the number of accounting-related input records that satisfy the GLOBAL and report set command criteria exceeds 45 000 and the reduction ratio is very low, specify ccWORK.
- Do not specify DUMMY or DISP=MOD for this data set.

Values

RECFM: VBS
LRECL: 32 756
BLKSIZE: 6 233

OMEGAMON for DB2 PE commands

This section describes the OMEGAMON for DB2 PE report commands, their subcommands, and subcommand options.

The description of the subcommand options is intentionally brief, to avoid recurrences. See “OMEGAMON for DB2 PE subcommand options” on page 4806 for comprehensive descriptions.

The following topics provide additional information:

Report set commands:
- “ACCOUNTING command” on page 4690
- “AUDIT command” on page 4709
- “EXEC command” on page 4718
- “EXPLAIN command” on page 4719
- “IOACTIVITY command” on page 4729
- “LOCKING command” on page 4734
- “RECTRACE command” on page 4741
- “SQLACTIVITY command” on page 4746
- “STATISTICS command” on page 4755
- “SYSPARMS command” on page 4771
- “UTILITY command” on page 4774

Auxiliary commands:
- “CASE command” on page 4781
- “FIELD command” on page 4782
- “GLOBAL command” on page 4785
- “GROUP command” on page 4792
- “LIST command” on page 4800

Troubleshooting commands:
- “DUMP command” on page 4802
- “TAPECOPY command” on page 4804
Overview of the commands
The table below identifies the commands and their related subcommands and subcommand options. There are three types of commands: report set commands, auxiliary commands and troubleshooting commands.

Report set command - ACCOUNTING
This section gives a short overview of the commands, subcommands, and subcommand options. For details refer to the corresponding detailed sections:

Table 301. ACCOUNTING commands - Subcommands and subcommand options

**ACCOUNTING command**

This section provides an overview of the ACCOUNTING command.

**Usage**

Use the ACCOUNTING command to generate Accounting reports, traces, and data sets. You can also use it to reduce, save, and restore data.

**Usage notes**

- This command can be used once in a job step.
- However, it can be used in the same job step with commands of the other report sets.
- You can filter records with the GLOBAL command and first. This can minimize your report output and reduce processing time. See “GLOBAL command” on page 4785 for more information.

**Syntax**

```
ACCOUNTING
   REPORT subcommand (1)
   REDUCE subcommand (2)
   SAVE subcommand (3)
   RESTORE subcommand (4)
   TRACE subcommand (5)
   FILE subcommand (6)
```

**Notes:**

1. You can specify REPORT up to 35 times.
2. You can specify REDUCE only once. If specified, you must also specify REPORT or SAVE at least once.
3. You can specify SAVE only once.
4. You can specify RESTORE only once.
5. You can specify TRACE up to five times.
6. You can specify FILE up to six times.
Subcommands

The subcommands are described in detail, together with their various options, in the following sections.

Sample JCL for requesting Accounting functions

This is a sample of the JCL required to produce Accounting reports and traces. See “DD statements” on page 4676 for descriptions of the DD statements.

The OMEGAMON for DB2 PE command language shown in this example may not be appropriate in all circumstances. You must modify it to meet your requirements. Most of the DD statements with a SYSOUT destination do not have to be specified because they are dynamically allocated by OMEGAMON for DB2 PE. See the individual DD statement descriptions for more information.

Note:
1. There is an advantage in omitting DPMOUTDD from your JCL. For more information, see “DPMOUTDD statement” on page 4677.
2. If you omit the EXEC statement, a report is not produced, the syntax of the OMEGAMON for DB2 PE command stream is checked and written together with any information, warning, or error messages generated to the DBPMLOG data set. All statements following the EXEC are ignored.

```assembler
//PEMAIN EXEC PGM=FPECMAIN
//* FOLLOWING ARE SYSTEM DDNAMES
//STEPIBM DD DSN=FPE.FPELIB.RKANMOD,DISP=SHR
//DPMPARMS DD DSN=MYID.FPELIB.DPMPARMS,DISP=SHR
//INPUTDD DD DSN=MYID.FPELIB.DPMIN,DISP=SHR
//DPMLOG DD SYSOUT=
//SYSOUT DD SYSOUT=
//JOBSUMDD DD SYSOUT=
//EXCTPD DD DSN=MYID.EXCEPT.THRESH,DISP=OLD
//EXTRCD1 DD SYSOUT=
//EXFILDD DD DSN=MYID.EXCEPT.LOGFILE,DISP=OLD
//DPMOUTDD DD DSN=MYID.FPELIB.DPMOUT.DATA,DISP=OLD
//JSSRSD DD DSN=MYID.FPELIB.JSSRS.DATA,DISP=OLD
//SYSUDUMP DD DUMMY
//* FOLLOWING ARE REPORT SET DDNAMES
//ACRPTDD DD SYSOUT=
//ACTRPCDD DD SYSOUT=
//ACSAVDD DD DSN=MYID.FPELIB.ACSAV.DATA,DISP=OLD
//ACRSTDD DD DSN=MYID.FPELIB.ACRST.DATA,DISP=SHR
//ACFILDD DD DSN=MYID.FPELIB.ACC.FILE,DISP=OLD
//ACWKRDD DD DSN=MYID.FPELIB.ACC.WORKDD,DISP=OLD
//* FOLLOWING IS THE COMMAND STREAM
//SYSPIN DD *
ACCOUNTING REDUCE RESTORE TRACE FILE REPORT SAVE EXEC
```

Figure 300. Sample JCL for requesting Accounting functions
ACCOUNTING command with REPORT subcommand:

This section describes the ACCOUNTING command with the REPORT subcommand.

Usage

Use the REPORT subcommand to generate reports from reduced records.

Usage notes

- Up to 35 REPORT subcommands can be specified within each ACCOUNTING command.

Syntax of the REPORT subcommand

Subcommand options

The syntax diagram shows the options that are available with this subcommand. For comprehensive descriptions of these options, see "OMEGAMON for DB2 PE subcommand options" on page 4806. The following list gives additional or specific descriptions of selected options, where appropriate.

FROM/TO

Limits the range of records included in the reporting process by date and time. For details, see "FROM/TO subcommand options" on page 4812.

You need to specify a REDUCE INTERVAL() for the FROM/TO subcommand under ACCOUNTING REPORT. Otherwise, you will see the following message:

NO DATA TO REPORT - NO ADEQUATE INPUT DATA OR TOO RESTRICTIVE FILTERS.

The reason for this message is that all accounting input data will be reduced by default to only one reporting interval. If you request several ACCOUNTING REPORTs with different FROM/TO subcommands, the INTERVAL() value that you chose should be the smallest of all FROM/TO intervals specified, as in the following example:

ACCOUNTING
REDUCE INTERVAL(15)
REPORT DNAME(ACCLONG1) /*ACCOUNTING REPORT*/
FROM,(10:00:00)
In order to ensure that no extra reporting interval is taken into account, specify either FROM or TO in a way that it does not overlap an adjacent interval boundary. In the following example, the report will show only one reporting interval every day FROM,(13:00:00) TO,(13:14:59):

ACCOUNTING

REDUCE INTERVAL(15)
REPORT DDNAME(ACCLONG3) /*ACCOUNTING REPORT*/
FROM,(13:00:00)
TO,(13:14:59)

As a comparison, the following report will report two adjacent reporting intervals every day - one from 13:00 to 13:15 and one from 13:15 to 13:30:

ACCOUNTING

REDUCE INTERVAL(15)
REPORT DDNAME(ACCLONG3) /*ACCOUNTING REPORT*/
FROM,(13:00)
TO,(13:15)

For more details, see “BOUNDARY subcommand option” on page 4807 and “INTERVAL subcommand option” on page 4818.

SCOPE

Specifies the scope of the report in a data sharing environment.

MEMBER

In member-scope reports, a data sharing group’s instrumentation data is presented member by member. The events are reported in the specified ORDER sequence within the DB2 subsystem (member) where they occurred. Member-scope reports are used for DB2 subsystems that are not involved in data sharing.

GROUP

In group-scope reports, instrumentation data belonging to individual members is merged and presented for the entire group. The events are reported in the specified ORDER sequence within the DB2 data sharing group, regardless of which member of the group actually generated the events.

LAYOUT

Specifies the name of a report layout. You can specify one of the supplied layouts or one that you have previously tailored:

SHORT

This is the default.

LONG

This option provides detailed thread-related data. You can also use other functions such as Record Trace and SQL Activity to find detailed DB2 trace data.

Historical Reporter migration layouts

Use the Historical Reporter migration layouts to help you identify OMEGAMON for DB2 PE data that was previously shown in the reports of the OMEGAMON Historical Reporter. The migration layouts include:
User-defined layouts

You can customize your own report layouts by specifying which blocks of data and which fields within the blocks are included, and their relative order. To adapt the reports according to your requirements, you use user-tailored reporting (UTR). With UTR, you can control the volume, contents, and layout of Statistics traces and reports.

For information about tailoring report layouts, see the Reporting User’s Guide.

EXCEPTION

Specify EXCEPTION if you want to show those records with at least one field in exception status. Otherwise, a standard report is produced.

If you use this option, your JCL must contain a valid DD definition for the ddname EXCPTDD. For more information about required ddnames, see Figure 300 on page 4691.

TOP

To identify report entries with a high value in certain fields, you can produce an Accounting report with TOP lists. TOP lists indicate which entries on the report have the highest value in the field you have specified by using the TOP subcommand option.

For more information about TOP processing, see “TOP subcommand option” on page 4831 and the Reporting User’s Guide. You can specify:

- **number**
  - By default, the TOP list contains the top ten entries, but you can change the number to anything from one to fifty.
  - * Specifies any combination of the fields. You can generate reports showing TOP lists for all the fields available for use with the TOP subcommand option.

- **ONLY**
  - ONLY indicates the use of TOP as a filter. When TOP is requested as a filter, the index is not shown. For example, the report produced by the command following shows only the top 3 entries for the default TOP field, elapsed time in application (INAPPLET).

```
ACCOUNTING
REPORT
  TOP (3 ONLY)
```

TOTAL

Produces reports that show total values instead of averages.

**keyword**

TOP lists for package fields report the maximum values of these fields in individual packages within a trace entry. TOP lists for buffer pool fields contain the totals for all the buffer pools.

The following list shows the keywords that these fields are specified by:

- **INAPPLET**
  - The class 1 elapsed time (in an application). This value is an average.

  If no TOP subcommand option is specified, the default is class 1 elapsed time (INAPPLET).
BUFFUPDTS
   The number of buffer updates. This value is an average.

CMPERUPD
   The ratio of the sum of commits and rollbacks to the sum of SQL
   UPDATE, SQL INSERT, and SQL DELETE statements.

DCLSTAT
   The total number of DCL statements executed.

DDLSTAT
   The total number of DDL statements executed.

DMLSTAT
   The total number of SQL DML statements executed.

GETPAGES
   The number of Getpage requests. This value is an average.

INAPPLPT
   The class 1 CPU time in an application. This value is an average.

INAPPLWT
   The class 1 waiting time in an application. This value is an average.

INDB2ET
   The class 2 elapsed time accumulated in DB2. This value is an average.

INDB2PT
   The class 2 CPU time in DB2. This value is an average.

INDB2WT
   The class 2 waiting time in DB2. This value is an average.

MAXWRKF
   Identifies the threads with the highest values for the field MAX WFILE
   BLKS (DB2 field QWAC_WORKFILE_MAX) which is shown in the
   Highlights data blocks. This value is a maximum.

NOTACCT
   The time not accounted in DB2. You use this time to determine
   whether there is a large percentage of time that has not been captured
   within the DB2 Accounting record. This value is an average.

OUTDB2ET
   The elapsed time outside DB2. This value is an average.

OUTDB2PT
   The CPU time outside DB2. This value is an average.

OUTDB2WT
   The waiting time outside DB2. This value is an average.

PINDBET
   The total elapsed time for executing the package or DBRM. This value
   is an average.

PINDBPT
   The CPU time spent by the package or DBRM (class 7). This value is
   an average.

PNOTACCT
   The total unaccounted time in DB2 caused by the execution of the
   package or DBRM. This value is an average.

PTSUSTME
   The waiting time for the package or DBRM caused by a class 8
   suspension. This value is an average.

SYNCREAD
   The number of synchronous read I/O operations. This value is an
   average.

TOTPREF
   The number of all types of prefetch requests. This value is an average.

TOTSUSP
   The number of suspensions. This value is an average.
The waiting time for all class 3 suspensions. This value is an average.

The sum of SQL UPDATE, SQL INSERT, and SQL DELETE statements executed.

 Specifies the data set where the report is written. The default ddname for report is ACRPTDD.

Specifies which OMEGAMON for DB2 PE identifiers are used to aggregate Accounting records.

For details, see “ORDER subcommand option” on page 4827 and “OMEGAMON for Db2 PE identifiers” on page 4665.

Additionally, you can use the REDUCE INTERVAL to order data on Accounting reports and Statistics reports. For example, if you want to report data at daily interval, specify INTERVAL (1440) in the REDUCE subcommand and ORDER(INTERVAL) in the REPORT subcommand.

Includes or excludes data associated with specific OMEGAMON for DB2 PE identifiers.

For details, see “INCLUDE and EXCLUDE subcommand options” on page 4814, which lists other allowed identifiers with this command and subcommand combination, and “OMEGAMON for Db2 PE identifiers” on page 4665.

Special considerations for DDF trace data:

For single DB2 systems the PLANNNAME identifier can be used to filter data and order reports in a meaningful manner.

When DB2 is acting as a DDF server, the PLANNNAME identifier has a constant value of DISTSERV for requesters using DRDA. For OMEGAMON for DB2 PE Accounting data, DISTSERV is replaced with the first eight characters of the name of the client application so that filtering on PLANNNAME, is meaningful.

Because this replacement is done by the batch accounting component, you need to consider the impact when using the INCLUDE and EXCLUDE subcommand options with other commands. This can cause unexpected results, for example when GLOBAL INCLUDE is used.

The following example shows how PLANNNAME can be used in Accounting reports with DDF data to include data from a PLANNNAME with the value CAPPNAME:

```
GLOBAL
  INCLUDE (PLANNNAME(DISTSERV)) // to include all DDF data
ACCOUNTING
  REDUCE
    INCLUDE (PLANNNAME(CAPPNAME))
REPORT
  INCLUDE (PLANNNAME(CAPPNAME))
```

When GLOBAL INCLUDE is omitted, a report is produced, containing replaced names.
When REDUCE INCLUDE is omitted, no report is produced. This is because REDUCE is called implicitly by REPORT by using the GLOBAL filter. As accounting works with the replaced values, DISTSERV is not found in the input records.

When INCLUDE is omitted from REPORT, there is no data to report. The GLOBAL filter is used as default, explicitly including DISTSERV. As accounting works with the replaced values, DISTSERV is not found in the input records.

If the use of PLANNAME as a filter causes unexpected results across reports, use REQLOC, CONNTYPE and THREADTYPE, which are interpreted in exactly the same way in all OM XE for DB2 PE reports.

Example using REPORT with LAYOUT, INCLUDE, FROM, and TO options

The following example specifies:
• An Accounting long report
• Data is included that is only associated with the location in the range of LOCN01 to LOCN05
• Using records between and including the FROM and TO times

```
REPORT
  LAYOUT (LONG)
  INCLUDE (LOCATION(R(LOCN01 LOCN05)))
  FROM (03/18/99,10:00:00.00)
  TO (03/19/99,12:00:00.00)
```

Example using ACCOUNTING REPORT, specifying two order sets

This example specifies that two reports are produced:
• Both reports use the SHORT layout by default.
• The first report is ordered by primary authorization ID within plan name within connection ID.
• The second report is ordered by plan name within primary authorization ID.
• For both reports, a TOP list is produced identifying the top three report entries for INDB2ET (elapsed time spent in DB2).
• Both reports include data for the following primary authorization IDs:
  – UID0001
  – UID0005
  – UID0009.
• As no ddname was specified, both reports are written to the data set with the default ddname ACRPTDD.

```
ACCOUNTING
  REPORT
    TOP (3 INDB2ET)
    ORDER (CONNECTION-PLANNAME-PRIMAUTH,PRIMAUTH-PLANNAME)
    INCLUDE (PRIMAUTH(UID0001 UID0005 UID0009))
```

Example using ACCOUNTING with multiple REPORT subcommands

This example demonstrates how you can produce Accounting reports to show all accounting data for different requesting locations.
Because the Statistics report set does not offer a breakdown of the activity of DRDA protocol requests, an Accounting report showing the DDF statistics can be useful.

The first report shows fields summarized by the requesting location.

The information is shown for every requesting location, including the reporting location, regardless of the method of access.

The second report shows accounting data summarized by requesting location for all locations (except the reporting location) using DRDA protocol.

ACCOUNTING command with REDUCE subcommand:

This section describes the ACCOUNTING command with the REDUCE subcommand.

Usage

Use the REDUCE subcommand to reduce the volume of data that is input to the REPORT and SAVE subcommands.

Usage notes

- REDUCE consolidates records with certain common characteristics into one record.
- REDUCE can be used once in an ACCOUNTING command.
- REDUCE is invoked automatically when you use REPORT or SAVE. You must specify REDUCE, however, if you want to:
  - Specify an interval that can be used to order data on Accounting reports.
  - Produce several reports with different time spans.
  - Define the interval and input filters for SAVE. SAVE does not have its own FROM and TO, and INCLUDE or EXCLUDE filters. Instead, it uses REDUCE FROM and TO, and INCLUDE or EXCLUDE filters.
- In most cases, the reduced records contain totals of the values from the individual records. In some cases, the reduced records contain maximum values.

Syntax of the REDUCE subcommand
Subcommand options

The syntax diagram shows the options that are available with this subcommand. See “OMEGAMON for DB2 PE subcommand options” on page 4806 for comprehensive descriptions of these options. The following list gives additional or specific descriptions of selected options, where appropriate.

**FROM/TO**

Limits the range of records included in the reduction process by date and time.

For details, see “FROM/TO subcommand options” on page 4812.

**INTERVAL**

Defines the interval of time that accounting data is summarized for. Note the remarks about performance impact in “INTERVAL subcommand option” on page 4818.

**BOUNDARY**

Controls the alignment of the intervals used to summarize records in the reduction process.

**CALCULATE**

Indicates that a calculation of consumed or required ACWORK has to be done during the reduction of data for an Accounting REPORT or SAVE function.

For details, see the Reporting User’s Guide.

**INCLUDE/EXCLUDE**

Includes or excludes data associated with specific OMEGAMON for DB2 PE identifiers.

For details, see “INCLUDE and EXCLUDE subcommand options” on page 4814, which lists other identifiers allowed with this command and subcommand combination, and “OMEGAMON for Db2 PE identifiers” on page 4665.

Some care is needed when using PLANNAME as a filter in a DDF environment, see Special considerations for DDF trace data.

**Example using REDUCE**

This example requests the following:

- Reduce the input data on daily intervals.
- Report the Accounting data by intervals.
- Write the report to the data set defined by the default ddname ACRPTDD.

```
ACCOUNTING
    REDUCE
        INTERVAL(1440)
    REPORT
```
ACCOUNTING command with SAVE subcommand:

This section describes the ACCOUNTING command with the SAVE subcommand.

Usage

Use the SAVE subcommand (without CONVERT option) to produce a VSAM data set containing reduced records. After the data has been saved, you can:

- Convert the save files to sequential data sets by using the save-file utility and load it to DB2 for subsequent use.
- Restore and combine it with newly reduced data to produce long-term reports.
- Restore it and use it in later reporting.

Use the SAVE subcommand with CONVERT option to produce a sequential data set containing reduced data in records. After the data has been processed, you can:

- Load it to DB2 for subsequent use.

Note: In contrast to the other usage, the conversion by the save-file utility is accomplished directly. VSAM data is not being produced, thus it also not possible to restore it.

You can also use the converted SAVE data sets to generate CSV (comma-separated value) input-data. This CSV data can then be transferred to workstations and imported into spreadsheets to improve DB2 performance analysis using graphical representations or pivot tables. For more information refer to Reporting User’s Guide.

Usage notes

- VSAM data sets cannot be concatenated.
- For information on migration refer to Report Reference

Note:

- You can only process VSAM data sets in the same version of OMEGAMON for Db2 PE as they have been created. For example, if you create a SAVE data set in version 530, it can only be RESTORED in version 530.

To use a SAVE data set in a higher version, you must migrate the SAVE data set using a migration utility.

- Before you restore or convert SAVE data sets from V5.2.0 or V5.3.0, you must first migrate this data to OMEGAMON for Db2 PE V5.4.0 format.
- Restored reports only show fields that are supported by the current version of OMEGAMON for Db2 PE.

Syntax of the SAVE subcommand

```
SAVE [CONVERT]
```
Subcommand options

The syntax diagram shows the options that are available with this subcommand. See “OMEGAMON for DB2 PE subcommand options” on page 4806 for comprehensive descriptions of these options. The following list gives additional or specific descriptions of selected options, where appropriate.

**CONVERT**

Specifies that converted reduced data is written directly to a sequential data set.

It is recommended to specify this option if you want to create high amount of loadable reduced data in a sequential data set. It avoids a temporary VSAM data set to be used as a SAVE data set. This options causes OMEGAMON for DB2 PE to write converted reduced data directly to a sequential data set in a single step. The resulting output is loadable to the PDB tables. The user may experience performance improvements compared to the default path with a separate SAVE step and the subsequent convert of saved data by the save-file utility.

**Note:** Not every big trace input results in big reduced data and small trace input in small reduced data. This option becomes effective when the reduction results in high amount of reduced data. For example, it depends on the amount of different criteria that results due to your filtering. It is possible that you experience more performance improvement with a small input trace that results in many different criteria than with a large trace input with only a few different criteria.

This option can generally be used as it is neutral to the performance when processing only a few reduced records, but becomes effective when processing a high amount of reduced data. However, do not use this option if you want to RESTORE and REPORT saved data.

**DATATYPE**

Specifies which data types are to be written to the VSAM or sequential data set with each record. By default, if DATATYPE is not specified, or if DATATYPE() is specified (without keywords), all data types are written to the reduced data set.

This subcommand option lets you improve the system performance while the VSAM or sequential data set is generated by explicitly specifying only the required data types. If performance is not critical, you can safely ignore this subcommand option. Use one or more of the following keywords to specify the required data types.

**Note:** Note that a later restore of partially saved data does not reconstruct the unsaved data types.

**GENERAL**

General performance data. Always required for a save data set. Note that the GENERAL keyword needs to be specified explicitly.
**DDNAME**

Specifies the ddname where the save data is written. The default ddname is ACSAVDD.

**Without CONVERT option:**

The VSAM data set defined by the default ddname must already exist when you run OMEGAMON for DB2 PE. Either specify an existing data set from a previous OMEGAMON for DB2 PE run (when restoring data), or specify a new data set allocated by using the IDCAMS DEFINE CLUSTER function.

**Note:** If ddname is assigned to a non-VSAM file, you receive an error message and the job terminates.

**With CONVERT option:**

The ddname needs to be assigned to a physical sequential data set. This data set can be used for a subsequent load to Accounting SAVE tables.

**Note:** If ddname is assigned to a nonsequential data set, you receive an error message and the job terminates.

### Example using SAVE

This example requests the following:

- Save aggregated Accounting data to the VSAM save data set with ddname ACSAVDD1.

```
ACCOUNTING
SAVE
  DDNAME(ACSAVDD1)
```

This example requests the following:

- Convert reduced Accounting data and write it to the sequential data set with ddname ACSAVDD2.

```
ACCOUNTING
SAVE
  CONVERT
  DDNAME(ACSAVDD2)
```

**ACCOUNTING command with RESTORE subcommand:**

This section describes the ACCOUNTING command with the RESTORE subcommand.
Usage

Use the RESTORE subcommand to reload previously saved data (in a VSAM data set) for additional processing. After the data is restored, you can produce reports from the restored data alone, or from the restored data combined with newly reduced data.

Usage notes

- Saved data can be restored as often as required.

Syntax of the RESTORE subcommand

```
RESTORE DDNAME (ddname)
```

Subcommand options

The syntax diagram shows the options that are available with this subcommand. See “OMEGAMON for DB2 PE subcommand options” on page 4806 for comprehensive descriptions of these options. The following list gives additional or specific descriptions of selected options, where appropriate.

**DDNAME**

Specifies the ddname used to reload a previously saved file for additional use. The ddname specifies the data set being restored. The default ddname is ACRSTDD.

Example using RESTORE with DDNAME option

This example specifies that the previously saved, reduced data is read from the data set defined by the ddname RESDANDD.

Note:

1. Do not specify DUMMY in your JCL for ACRSTDD. When you are not using RESTORE, omit this ddname from your JCL.
2. If you use the RESTORE and REDUCE subcommands in the same job stream, the INTERVAL and BOUNDARY options specified in REDUCE should match the INTERVAL and BOUNDARY options that were used to reduce the data being restored. If these values are different, the interval and boundary from the restored data is used.
3. Data from previous versions of OM XE for DB2 PE cannot be restored until it has been changed to the current OMEGAMON for DB2 PE format by using the migrate function of the save-file utility. For information about migrating data, see “Report Reference”.

```
RESTORE DDNAME (RESDANDD)
```

ACCOUNTING command with TRACE subcommand:

This section describes the ACCOUNTING command with the TRACE subcommand.
Usage

Use the TRACE subcommand to produce traces with an entry for each of the following:

- An IFCID 3 with associated IFCIDs 239 if more than 10 packages or DBRMs are executed within the plan
- Several IFCIDs 3 (and 239) generated at different locations for a distributed transaction (in merged traces only)
- Several IFCIDs 3 (and 239) generated for the originating and associated parallel tasks in CP parallelism

Usage notes

- An entry in an Accounting trace is referred to as a logical Accounting record as it can consist of several physical Accounting records (IFCID 3 and 239).
- Up to five traces can be requested in a job step.

Syntax of the TRACE subcommand

```plaintext
TRACE
   FROM/TO block
   LAYOUT (SHORT
            LONG
            name)
   NOEXCEPTION
   EXCEPTION
   TOP (10
        number
        ONLY
        INAPPLET
        keyword)
   DDNAME (ACTRCDD
            name)
   INCLUDE/EXCLUDE block
```

Subcommand options

The syntax diagram shows the options that are available with this subcommand. See “OMEGAMON for DB2 PE subcommand options” on page 4806 for comprehensive descriptions of these options. The following list gives additional or specific descriptions of selected options, where appropriate.

FROM/TO

Limits the range of records included in the trace by date and time.

For details, see “FROM/TO subcommand options” on page 4812.

LAYOUT

Specifies the name of a report layout. You can specify one of the supplied layouts or one that you have previously tailored:

SHORT

This is the default.

LONG

This option provides detailed thread-related data. You can also use other functions such as Record Trace and SQL Activity to find detailed DB2 trace data.

Historical Reporter migration layouts

Use the Historical Reporter migration layouts to help you identify
OMEGAMON for DB2 PE data that was previously shown in the reports of the OMEGAMON Historical Reporter. The migration layouts include:

- "Options for OMEGAMON Historical Reporter Accounting reports" on page 4820
- "Options for OMEGAMON Historical Reporter Statistics reports" on page 4824

User-defined Layouts

You can customize your own report layouts by specifying which blocks of data and which fields within the blocks are included, and their relative order. To adapt the reports according to your requirements, you use user-tailored reporting (UTR). With UTR, you can control the volume, contents, and layout of Statistics traces and reports.

For information about tailoring report layouts, see the Reporting User's Guide.

**EXCEPTION**

**NOEXCEPTION**

Specify EXCEPTION if you want to show those accounting trace entries with at least one field in exception status. Otherwise, a standard report is produced.

If you use this option, your JCL must contain a valid DD definition for the ddname EXCPTDD. For more information about required ddnames, see Figure 300 on page 4691.

**TOP**

Identifies trace entries with a high value in certain fields, you can produce an Accounting trace with TOP lists. TOP lists indicate which entries on the trace have the highest value in the field you have specified by using the TOP subcommand option.

For more information about TOP processing, see "TOP subcommand option" on page 4831 and Examples of TOP processing, as well as the Reporting User’s Guide.

You can specify:

- number

By default, the TOP list contains the top ten entries, but you can change the number to anything from one to fifty.

**ONLY**

ONLY allows to use TOP as a filter. When TOP is requested as a filter, the index is not shown. For example, the trace produced by the command following ONLY shows the top 3 entries for the default TOP field, elapsed time in application (INAPPLET). The keyword ONLY is valid wherever a resource name can be used.

```
ACCOUNTING
TRACE
  TOP (3 ONLY)
```

* Specifies any combination of the fields. You can generate reports showing TOP lists for all the fields available for use with the TOP subcommand option.

**keyword**

TOP lists for package fields report the maximum values of these fields in individual packages within a trace entry. TOP lists for buffer pool fields contain the totals for all the buffer pools.

The following list shows the keywords that these fields are specified by:

**INAPPLET**

The class 1 elapsed time (in an application). This value is an average.
If no TOP subcommand option is specified, the default is class 1 elapsed time (INAPPLPT).

**BUFUPDTS**
The number of buffer updates. This value is an average.

**CMPERUPD**
The ratio of the sum of commits and rollbacks to the sum of SQL UPDATE, SQL INSERT, and SQL DELETE statements.

**DCLSTAT**
The total number of DCL statements executed.

**DDLSTAT**
The total number of DDL statements executed.

**DMLSTAT**
The total number of SQL DML statements executed.

**GETPAGES**
The number of Getpage requests. This value is an average.

**INAPPLPT**
The class 1 CPU time in an application. This value is an average.

**INAPPLWT**
The class 1 waiting time in an application. This value is an average.

**INDB2ET**
The class 2 elapsed time accumulated in DB2. This value is an average.

**INDB2PT**
The class 2 CPU time in DB2. This value is an average.

**INDB2WT**
The class 2 waiting time in DB2. This value is an average.

**MAXWRKF**
Identifies the threads with the highest values for the field MAX WFILE BLKS (DB2 field QWAC_WORKFILE_MAX) which is shown in the Highlights data blocks. This value is a maximum.

**NOTACCT**
The time not accounted in DB2. You use this time to determine whether there is a large percentage of time that has not been captured within the DB2 Accounting record. This value is an average.

**OUTDB2ET**
The elapsed time outside DB2. This value is an average.

**OUTDB2PT**
The CPU time outside DB2. This value is an average.

**OUTDB2WT**
The waiting time outside DB2. This value is an average.

**PINDBET**
The total elapsed time for executing the package or DBRM. This value is an average.

**PINDBPT**
The CPU time spent by the package or DBRM (class 7). This value is an average.

**PNOTACCT**
The total unaccounted time in DB2 caused by the execution of the package or DBRM. This value is an average.

**PTSUSTME**
The waiting time for the package or DBRM caused by a class 8 suspension. This value is an average.

**SYNCREAD**
The number of synchronous read I/O operations. This value is an average.

**TOTPREF**
The number of all types of prefetch requests. This value is an average.
**TOTSUSP**

The number of suspensions. This value is an average.

**TOTSUSTM**

The waiting time for all class 3 suspensions. This value is an average.

**UPDPERCM**

The sum of SQL UPDATE, SQL INSERT, and SQL DELETE statements executed.

**DDNAME**

Specifies the data set where the trace is written. The default ddname for the first trace is ACTRCDD1. The default ddnames for the second to fifth traces are ACTRCDD2 through ACTRCDD5.

**INCLUDE/EXCLUDE**

Includes or excludes data associated with specific OMEGAMON for DB2 PE identifiers.

For details, see “INCLUDE and EXCLUDE subcommand options” on page 4814, which lists other identifiers allowed with this command and subcommand combination, and “OMEGAMON for Db2 PE identifiers” on page 4665.

Some care is needed when using PLANNAME as a filter in a DDF environment, see Special considerations for DDF trace data.

**Example using TRACE without subcommand options**

The following example specifies:

- An accounting short trace
- Exception data is not presented
- Written to ACTRCDD1

```
TRACE ACCOUNTING command with FILE subcommand:

This section describes the ACCOUNTING command with the FILE subcommand.

**Usage**

Use the FILE subcommand to format unreduced DB2 data and store it in sequential data sets suitable for use by the DB2 load utility.

**Usage notes**

- In the case of CP parallelism, the logical Accounting record (aggregation of all the activity within the thread) is stored in the data set.
- The records can be placed in DB2 tables, and you can produce reports by using a reporting facility such as Query Management Facility (QMF).
- You can also use the FILE data sets to generate CSV (comma-separated value) input-data. This CSV data can then be transferred to workstations and imported into spreadsheets to improve DB2 performance analysis using graphical representations or pivot tables. For more information refer to [Reporting User’s Guide](#).

Chapter 7. Commands  4707
Syntax of the FILE subcommand

```
FILE
  FROM/TO block
  NOEXCEPTION
  EXCEPTION
  DATATYPE(GENERAL,BP,GBP,DDF,PACKAGE,ACCEL)
  DATATYPE(GENERAL,BP,GBP,DDF,PACKAGE,ACCEL)
  INCLUDE/EXCLUDE block
  DDNAME(ddname)
  ACFILDD1
```

Subcommand options

The syntax diagram shows the options that are available with this subcommand. See "OMEGAMON for DB2 PE subcommand options" on page 4806 for comprehensive descriptions of these options. The following list gives additional or specific descriptions of selected options, where appropriate.

**FROM/TO**
Limits the range of records included in the data set by date and time.
For details, see "FROM/TO subcommand options" on page 4812.
If you are reducing data, the times specified in REDUCE affect the data available for filing.

**EXCEPTION**
Specify EXCEPTION if you want to include only those file entries with values outside the user-specified limits. Otherwise, all records are included.
If you use this option, your JCL must contain a valid DD definition for the ddname EXCPTDD. For more information about required ddnames, see Figure 300 on page 4691.

**DATATYPE**
Specifies which data types are to be written to the FILE data set specified in the DDNAME subcommand option. By default, if DATATYPE is not specified, or if DATATYPE() is specified (without keywords), all data types are written.
This subcommand option lets you improve the system performance while the data set is generated by explicitly specifying only the required data types. If performance is not critical, you can safely ignore this subcommand option. Use one or more of the following keywords to specify the required data types.

**GENERAL**
General performance data

**BP**
Buffer pool performance data

**GBP**
Group buffer pool performance data

**DDF**
Distributed Data Facility (DDF) data

**PACKAGE**
Package execution data

**ACCEL**
Accelerator data
**DDNAME**

 Specifies the ddname where the file data set is written. The default ddname is ACFILDD1 for the first file instance, ACFILDD2 for the second file instance, and so on.

**INCLUDE/EXCLUDE**

 Includes or excludes data associated with specific OMEGAMON for DB2 PE identifiers.

 For details, see “INCLUDE and EXCLUDE subcommand options” on page 4814, which lists other identifiers allowed with this command and subcommand combination, and “OMEGAMON for Db2 PE identifiers” on page 4665.

**Example using FILE with EXCEPTION and INCLUDE options**

 This example specifies a file that includes only exception records for User10, User11, and User12. The file is generated on ddname ACFILDD1 by default.

 ..

 FILE

 EXCEPTION

 INCLUDE (PRIMAUTH(USER10 USER11 USER12))

 ..

**AUDIT command**

 This section provides an overview of the AUDIT command.

**Usage**

 Use the AUDIT command to reduce data and generate Audit reports, traces, and file data sets. The subcommands are described in detail, together with their various options, in the following sections.

**Usage notes**

 - This command can be used once in a job step.
 - However, it can be used in the same job step with commands of the other report sets.
 - You can filter records with the GLOBAL command first. This can minimize your report output and reduce processing time. See “GLOBAL command” on page 4785 for more information.

**Syntax**

```
AUDIT  
   REPORT subcommand  (1) 
   REDUCE subcommand  (2) 
   TRACE subcommand   (3) 
   FILE subcommand    (4) 
```

**Notes:**

1. You can specify REPORT up to 5 times.
You can specify REDUCE only once. If specified, you must also specify REPORT, TRACE, or FILE at least once.

You can specify TRACE up to 5 times.

You can specify FILE up to 7 times.

Subcommands

The subcommands are described in detail, together with their various options, in the following sections.

Sample JCL for requesting Audit functions

The OMEGAMON for DB2 PE command language shown in this example is not appropriate in all circumstances. You must modify it to meet your requirements.

Most of the DD statements with a SYSOUT destination do not have to be specified because they are dynamically allocated by OMEGAMON for DB2 PE. See “DD statements” on page 4676 for full descriptions of the DD statements.

Note:

1. There is an advantage in omitting DPMOUTDD from your JCL. For more information, see “DPMOUTDD statement” on page 4677.
2. The OMEGAMON for DB2 PE command stream is only processed if EXEC is included as the last command. Otherwise, OMEGAMON for DB2 PE only checks the syntax and writes the command stream together with any information, warning, or error messages generated to the job summary log.

This is a sample of the JCL required to produce Audit reports and traces. A description of the DD statements follows the sample.

```
//PEMAIN EXEC PGM=FPECMAIN
//** FOLLOWING ARE SYSTEM DDNAMES
//STEPLIB DD DSN=FPE.FPELIB.RKANMOD,DISP=SHR
//DPMPARMS DD DSN=MYID.FPELIB.DPMPARMS,DISP=SHR
//INPUTDD DD DSN=MYID.FPELIB.DPMIN,DISP=SHR
//DPMLOG DD SYSOUT**
//SYSSOUT DD SYSOUT**
//JOBSUMDD DD SYSOUT**
//DPMOUTDD DD DSN=MYID.FPELIB.DPMOUT.DATA,DISP=OLD
//SYSUDUMP DD DUMMY
//** FOLLOWING ARE REPORT SET DDNAMES
//AURPTDD DD SYSOUT**
//AUTRCDDx DD SYSOUT**
//AUFILDDx DD DSN=MYID.FPELIB.AUDIT.FILE,DISP=OLD
//AUDWORK DD DSN=MYID.FPELIB.AUDIT.WORKDD,DISP=OLD
//** FOLLOWING IS THE COMMAND STREAM
//SYSIN DD *

:: AUDIT
   REDUCE
   REPORT
   TRACE
   FILE
:: EXEC
```

Figure 301. Sample JCL for requesting Audit functions
AUDIT command with REPORT subcommand:

This section describes the AUDIT command with the REPORT subcommand.

Usage

Use the REPORT subcommand to generate reports from records.

Usage notes

- Up to five REPORT subcommands can be specified within each AUDIT command.

Syntax of the REPORT subcommand

```
REPORT
  FROM/TO block
  LEVEL (SUMMARY | DETAIL)
  TYPE (AUTHCHG | AUTHCNTL | AUTHFAIL | BIND | DDL | DML | UTILITY | MEMBER)
  SCOPE (GROUP)
  DDNAME (ddname)
  ORDER block
  INCLUDE/EXCLUDE block
```

Subcommand options

The syntax diagram shows the options that are available with this subcommand. See "OMEGAMON for DB2 PE subcommand options" on page 4806 for comprehensive descriptions of these options. The following list gives additional or specific descriptions of selected options, where appropriate.

FROM/TO

Limits the range of records included in the reporting process by date and time.

For details, see "FROM/TO subcommand options" on page 4812.

SCOPE

Specifies the scope of the report in a data sharing environment.

```
MEMBER
  GROUP
```

LEVEL

Specifies the level of the report. You can enter either of the following:

```
SUMMARY
  Produces reports of aggregated audit data.

DETAIL
  Produces reports of non-aggregated audit data in timestamp sequence
```
within the requested TYPE and ORDER. Events within reports are sorted by timestamp within OMEGAMON for DB2 PE identifiers.

**Note:** There is a dependency between the two commands AUDIT REPORT LEVEL(SUMMARY) and AUDIT REPORT LEVEL(DETAIL). If you request a SUMMARY report and a DETAIL report for the same audit TYPE, then first specify the DETAIL report and then the SUMMARY report in order to receive meaningful data in the SUMMARY report. If you request a SUMMARY report without a DETAIL report, then there is no dependency and the SUMMARY report delivers valuable results.

**TYPE**
Specifies the type of audit data to be reported. You can enter one or more of the following:

- **ALL**
  All audit categories are reported (the default)

- **AUTHCHG**
  Changes to authorization identifiers

- **AUTHCNTL**
  GRANTs and REVOKEs of privileges

- **AUTHFAIL**
  Authorization failure

- **BIND**
  DML statements at bind of auditable DB2 tables

- **DDL**
  DDL operations against auditable DB2 tables

- **DML**
  Read/write access against auditable DB2 tables

- **UTILITY**
  Utility access against auditable DB2 tables

**Note:**
1. If you select audit types in REPORT that were not specified in the TYPE option of REDUCE, blank reports are generated for those audit types.
2. If TYPE is specified with LEVEL(SUMMARY), a report of aggregated audit data is produced for each type requested.
3. If TYPE is not specified with LEVEL(SUMMARY), one report showing aggregated totals for all audit types is produced.
4. If TYPE is specified with LEVEL(DETAIL), one report showing nonaggregated audit data of all the requested types is produced.
5. If TYPE is not specified with LEVEL(DETAIL), a report showing nonaggregated audit data of all types is produced.

**DDNAME**
Specifies the data set where the report is written.

**ORDER**
Specifies the OMEGAMON for DB2 PE identifiers and their sequence for sorting the report and, in summary reports, which identifiers are used for aggregation.

For details, see "ORDER subcommand option” on page 4827 and "OMEGAMON for Db2 PE identifiers” on page 4665.

The default for ORDER varies with the LEVEL and TYPE specified.

The definition of an object depends on the LEVEL and TYPE specified.
INCLUDE/EXCLUDE

Includes or excludes data associated with specific OMEGAMON for DB2 PE identifiers.

For details, see "INCLUDE and EXCLUDE subcommand options" on page 4814, which lists other identifiers allowed with this command and subcommand combination, and "OMEGAMON for Db2 PE identifiers" on page 4665.

Example using REPORT with LEVEL and TYPE option

The following example uses LEVEL and TYPE:

```
AUDIT REPORT
   LEVEL (DETAIL)
   TYPE (AUTHFAIL, AUTHCNTL)
```

This example produces a detail report for all authorization failures and authorization GRANTS and REVOKEs found in the input data. By default, the reports are in PRIMAUTH-PLANNAME sequence and, for summary reports, the output is aggregated by PRIMAUTH-PLANNAME. The output is sent to default ddname AURPTDD.

Example using REPORT with ORDER option

In the following example ORDER specifies that three authorization failure detail reports are to be produced.

```
REPORT
   LEVEL (DETAIL)
   TYPE (AUTHFAIL)
   ORDER (PRIMAUTH-PLANNAME-REQLOC
         CONNECT-PLANNAME-REQLOC-PRIMAUTH)
```

- The first report is ordered by requesting location within plan name within primary authorization ID.
- The second report is ordered by plan name within connection ID.
- The third report is ordered by primary authorization ID within requesting location.

AUDIT command with REDUCE subcommand:

This section describes the AUDIT command with the REDUCE subcommand.

Usage

You use the REDUCE subcommand to reduce the volume of data that is input to subsequent subcommands.

Usage notes

- REDUCE can be used once in an AUDIT command.
The syntax diagram shows the options that are available with this subcommand. See “OMEGAMON for DB2 PE subcommand options” on page 4806 for comprehensive descriptions of these options. The following list gives additional or specific descriptions of selected options, where appropriate.

Subcommand options

FROM/TO
Limits the range of records included in the reduction process by date and time.
For details, see “FROM/TO subcommand options” on page 4812.

TYPE
Specifies the type of audit data to be reduced. One or more categories can be selected. Only the data selected on the REDUCE subcommand is available to subsequent REPORT subcommands. You can enter one or more of the following:

- **ALL**
  All audit categories are reported (the default)
- **AUTHCHG**
  Changes to authorization identifiers
- **AUTHCNTL**
  GRANTS and REVOKEs of privileges
- **AUTHFAIL**
  Authorization failure
- **BIND**
  DML statements at bind of auditable DB2 tables
- **DDL**
  DDL operations against auditable DB2 tables
- **DML**
  Read/write access against auditable DB2 tables
- **UTILITY**
  Utility access against auditable DB2 tables

INCLUDE/EXCLUDE
Includes or excludes data associated with specific OMEGAMON for DB2 PE identifiers.
For details, see “INCLUDE and EXCLUDE subcommand options” on page 4814, which lists other identifiers allowed with this command and subcommand combination, and “OMEGAMON for Db2 PE identifiers” on page 4665.
Example using REDUCE

This example requests the following:
• Reduce only input data of type AUTHCHG (Authority Change).
• Include only data of subsystem DSN1.
• Write the report to the data set defined by the default ddname AUDRPTDD.

AUDIT
    REDUCE
    TYPE (AUTHCHG)
    INCLUDE (SUBSYSTEM(DSN1))
    REPORT

AUDIT command with TRACE subcommand:

This section describes the AUDIT command with the TRACE subcommand.

Usage

Use the TRACE subcommand to produce traces with an entry for each DB2 Audit record.

Usage notes
• Up to five traces can be requested in a job step.

Syntax of the TRACE subcommand

```
TRACE
    FROM/TO block
    TYPE (AUTHCHG)
    INCLUDE (SUBSYSTEM(DSN1))
```

Subcommand options

The syntax diagram shows the options that are available with this subcommand. See “OMEGAMON for DB2 PE subcommand options” on page 4806 for comprehensive descriptions of these options. The following list gives additional or specific descriptions of selected options, where appropriate.

FROM/TO
Limits the range of records included in the trace by date and time.
For details, see “FROM/TO subcommand options” on page 4812.
**TYPE**
Identifies the type of data traced. You can enter one or more of the following:

- **ALL**
  All audit categories are reported (the default)
- **AUTHCHG**
  Changes to authorization identifiers
- **AUTHCNTL**
  GRANTs and REVOKEs of privileges
- **AUTHFAIL**
  Authorization failure
- **BIND**
  DML statements at bind of auditable DB2 tables
- **DDL**
  DDL operations against auditable DB2 tables
- **DML**
  Read/write access against auditable DB2 tables
- **UTILITY**
  Utility access against auditable DB2 tables

**SCOPE**
Specifies the scope of the trace.

- **MEMBER**
- **GROUP**

**DDNAME**
Specifies the data set where the trace is written.

**INCLUDE/EXCLUDE**
Includes or excludes data associated with specific OMEGAMON for DB2 PE identifiers.

For details, see "INCLUDE and EXCLUDE subcommand options" on page 4814, which lists other identifiers allowed with this command and subcommand combination, and "OMEGAMON for Db2 PE identifiers" on page 4665.

**Example using TRACE with TYPE option**

This command traces only authorization failures (in the order that they occur). The output goes to the default ddname AUTRCDD1.

```
AUDIT
  TRACE
    TYPE (AUTHFAIL)
```

**AUDIT command with FILE subcommand:**

This section describes the AUDIT command with the FILE subcommand.

**Usage**

Use the FILE subcommand to format unreduced DB2 data and store it in sequential data sets suitable for use by the DB2 load utility. The records can be placed in DB2 tables, and you can produce reports by using a reporting facility such as Query Management Facility (QMF).
Usage notes

By using the FILE subcommand you can:

- Process the different audit types separately by specifying one audit type for each FILE subcommand.
- Process the different audit types simultaneously by specifying any number of the available audit types in each FILE subcommand.

The FILE subcommand can occur a maximum of seven times in a job step.

Syntax of the FILE subcommand

```
FILE
  FROM/TO block
  ALL
  TYPE (AUTHCHG AUTHCNTL AUTHFAIL BIND DDL DML UTILITY AUFILOD*)
  DDNAME (ddname)
  INCLUDE/EXCLUDE block
```

Subcommand options

The syntax diagram shows the options that are available with this subcommand. See “OMEGAMON for DB2 PE subcommand options” on page 4806 for comprehensive descriptions of these options. The following list gives additional or specific descriptions of selected options, where appropriate.

**FROM/TO**

Limits the range of records included in the data set by date and time.

For details, see “FROM/TO subcommand options” on page 4812.

**TYPE**

Selects the audit category. It identifies the type of data included in the data set.

You can enter one or more of the following:

- **ALL**
  All audit categories are reported (the default)
- **AUTHCHG**
  Changes to authorization identifiers
- **AUTHCNTL**
  GRANTS and REVOKEs of privileges
- **AUTHFAIL**
  Authorization failure
- **BIND**
  DML statements at bind of auditable DB2 tables
- **DDL**
  DDL operations against auditable DB2 tables
DML
Read/write access against auditable DB2 tables

UTILITY
Utility access against auditable DB2 tables

DDNAME
Specifies the ddname where the file data set is written. The default ddname is AUFILDD1 for the first file data set, and AUFILDD2 to AUFILDD7 for the second to seventh file data sets.

You can specify a different ddname by using the DDNAME option in the FILE subcommand. In this case, your JCL must contain a valid DD statement for the ddname you specify. If you do not specify a different ddname, your JCL must contain a valid DD statement for the corresponding default ddname. For example, if you omit the DDNAME option from the third FILE subcommand in the job stream, your JCL must contain a valid DD statement for AUFILDD3.

INCLUDE/EXCLUDE
Includes or excludes data associated with specific OMEGAMON for DB2 PE identifiers.

For details, see “INCLUDE and EXCLUDE subcommand options” on page 4814, which lists other identifiers allowed with this command and subcommand combination, and “OMEGAMON for Db2 PE identifiers” on page 4665.

Example using FILE with TYPE option

This command generates a data set in the default ddname AUFILDD1. The data set contains one or more records for each authorization failure: an AUTHFAIL record and any matching records containing the text of the SQL statement that caused the authorization failure.

FILE
   TYPE (AUTHFAIL)

EXEC command
This section describes the EXEC command.

Usage
Typically, the EXEC command is the last statement in the OMEGAMON for DB2 PE command stream. This command causes the generation of any previously specified reports. It takes no arguments.

Usage notes
- When the EXEC command is not present, no report is produced. The syntax of the command stream is checked and written out, together with any information, warning, or error messages to the DPMOUTDD data set.
- All statements following the EXEC are ignored.
- You can filter records with the GLOBAL command first. This can minimize your report output and reduce processing time. See “GLOBAL command” on page 4785 for more information.
Syntax

EXPLAIN command
This section provides an overview of the EXPLAIN command.

Usage
Use the OMEGAMON for DB2 PE EXPLAIN command to produce explain reports.

Usage notes
• You can specify any number of EXPLAIN commands in the OMEGAMON for DB2 PE command stream.
• For each EXPLAIN command a separate OMEGAMON for DB2 PE explain report is produced.
• Some parameters can include a wildcard (*) provided that it is the last character in the text string.

Syntax

Subcommands and options
Each of the functions is identified with an appropriate keyword, followed by various subcommands and options, which identify the object being explained and control the amount of detail being produced.

The following sections identify the subcommands available for each function. Here you find a description of the EXPLAIN subcommands and options that can be specified with the EXPLAIN and GLOBAL commands:

ACCTYPE
Can be specified for the PLAN and PACKAGE keywords to control the statements that are to be explained within the plan or package based on the chosen access path. The following values are available:

ALL
For each explainable SQL statement in the plan, a report is produced. This is the default value.

MATCHING
Only explainable SQL statements where an access path of matching index scan has been selected, are processed and reported.

NONMATCH
Only explainable SQL statements where an access path of nonmatching index scan has been selected, are processed and reported.
TABSCAN

Only explainable SQL statements where an access path of table space scan has been selected, are processed and reported.

Note: ACCTYPE selection, as with any other OMEGAMON for DB2 PE explain selection, applies to individual PLAN_TABLE rows, not to the entire SQL statement. For example, if a particular SQL statement is executed in two steps, the first using matching index scan and the second using nonmatching index scan, and ACCTYPE(MATCHING) is specified, only the first step is reported.

DBRM

Can be specified for the PLAN keyword to control the DBRMs to be explained within the plan. If DBRM is not specified, all DBRMs within the plan are explained. If only a given DBRM within the plan is to be explained, you must specify the actual DBRM name in DBRM. If all DBRMs with a given name pattern are to be explained, a wildcard (*) can be used.

DEGREE

Can be specified for the QMFQUERY and SQLSTMT keywords to indicate whether the SQL statement or statements are eligible for query parallelism. The following values are available:

1 The SQL statement does not use query parallelism. This is the default.

ANY The SQL statement is eligible for query parallelism.

DSJ Disable star join.

ESJ Enable star join.

FIRST/LAST

Specifies the number of the first and the last statement in the plan or package to be explained, to control the range of SQL statements to be explained within the plan or package.

If FIRST is not specified, a value of 1 is used. If LAST is not specified, a value of 999 999 999 is used. If FIRST is greater than LAST, both parameters are set to the value of FIRST.

FORCE

Can be specified for the PACKAGE keyword to control the explanation of the SQL statements in a package. The following values are available:

NO If more than one package is referenced, the statements are only explained if the total number of SQL statements is less than 300. This is the default value.

YES All statements in all packages that conform to the specification are explained.

FORMAT

Can be specified for the PLAN and PACKAGE keywords to control the formatting of the SQL statements in the plan or package. The following values are available:

YES The SQL statement is formatted so that a new line is started for SQL
keywords such as SELECT, INTO, FROM, WHERE. Subselects, however, are not indented. This is the default value.

**NO** The SQL statement is formatted so that a new line is only started for the SQL keywords SELECT and UNION. By using this option, the SQL statement uses minimum page space.

**GEN**
Controls the number of version generations in a package to be explained, with PLAN and PACKAGE.

Specify a value from 1 to 99 to overwrite the default. For PLAN, if GEN is not specified, the default is 1.

For PACKAGE, if GEN is not specified, the default is 1, when no wildcard is used in the version ID of the package. If a wildcard is present, a value of 99 is used.

**HOSTVAR**
Can be specified for the PLAN and PACKAGE keywords to control the listing of host variable specifications. The following values are available:

**NO** No host variable definitions are listed in the report. This is the default value.

**YES** A listing of all (maximum 500) host variables used in the SQL statement is produced. This listing includes the definition type, length, and null characteristics.

**INDEX**
Controls the level of index information unless the index data block is excluded by using the LEVEL option. The following values are available:

**YES** If DB2 has selected a matching or nonmatching index scan, OMEGAMON for DB2 PE explain shows all index information for the selected index including key column information. If DB2 has selected a table space scan, OMEGAMON for DB2 PE explain shows detailed index information for all indexes of the accessed table. This is the default value.

**NO** No index information is shown in the report.

**ALL** Information for all indexes created for the table (including key column information) is shown in the report. The information is listed after the table details.

**LEVEL**
Controls which of the following blocks of data the OMEGAMON for DB2 PE explain report contains:

- “Raw” SQL EXPLAIN data as found in the PLAN_TABLE
- Access path data
- Table and table space data
- Index data
- Key data
- Distribution of the ten mostly used keys
- Plan/package bind data, if applicable
- Host variables data, if applicable
- Summary report
The table below summarizes which values can be specified and which blocks are reported.

Table 303. LEVEL values

</table>

LOCATION

Can be specified for the PLAN keyword to determine the location of the plan. If LOCATION is not specified, the local location, that is, the location specified in the SSID option, is used.

When a valid location name is specified, OMEGAMON for DB2 PE explain connects to the specified location and EXPLAIN PLAN processing continues at that location. To be valid, the location name must appear in the LOCATION column of the SYSIBM.SYSLOCATIONS table, or be the local DB2 subsystem's location name.

OWNER

Can be specified for the GLOBAL and QUERYNO keywords to control the authorization ID of the PLAN_TABLE for the current request. To select the correct PLAN_TABLE, OMEGAMON for DB2 PE explain looks for the authorization ID specified in the OWNER option of QUERYNO. If it is not specified, the OWNER value in GLOBAL is used. If OWNER is not specified in GLOBAL, OMEGAMON for DB2 PE explain uses the authorization ID of the job submitter.

PACKAGES

Can be specified for the PLAN keyword to control the explanation of statements in packages within a plan. The following values are available:

YES

For each package in the plan, only statements in the most recent version are explained. This is the default value.

NO

No statements in the packages are explained.

ALL

All statements in all versions of the packages are explained.

PACKLIMIT

Controls the number of packages to be explained.

A particular plan can consist of more packages than has been specified in PACKLIMIT (default is 100). In this case, a report listing all packages is produced but no SQL statements in these packages are explained. PACKLIMIT does not affect DBRMs.
One of the steps in OMEGAMON for DB2 PE installation is to bind the OMEGAMON for DB2 PE explain application. The default name for this plan is KO2EXPL.

If you do not want to use the default name, you can specify the name of the OMEGAMON for DB2 PE explain plan at OMEGAMON for DB2 PE execution time. This is done by specifying PLANEXPLAIN(xxxxxxxx) in GLOBAL, where xxxxxxxx is the OMEGAMON for DB2 PE explain plan name.

SQLID
Defines the current SQL ID. If you specify SQLID(USER), the primary SQL ID is set. Otherwise, a valid secondary authorization ID is set. This option has the same effect and is used in the same context as the SQL statement SET CURRENT SQLID.

SSID
Identifies the DB2 subsystem where the object specified in EXPLAIN resides. If SSID is not specified in either EXPLAIN or GLOBAL, an error message is issued and OMEGAMON for DB2 PE resumes processing with the next command.

TABLE
Can be specified for the PLAN and PACKAGE keywords to control the statements that are to be explained within the plan or package. If TABLE is not specified, all statements within the plan or package are explained.

If only statements accessing a given table are to be explained, you must specify the actual table name in TABLE. If only statements accessing tables with a given name pattern are to be explained, you can use a wildcard (*).

EXPLAIN PLAN specifications:

This section describes the EXPLAIN PLAN specifications.

Usage
Use this specification if you want to investigate all or selected SQL statements in a given plan. You can specify the name of the plan to be explained.

Usage notes
• OMEGAMON for DB2 PE EXPLAIN verifies that the specified plan exists in the catalog table SYSIBM.SYSPLAN.
• If it does, OMEGAMON for DB2 PE EXPLAIN further verifies that the plan has been bound with the EXPLAIN(YES) option.

Syntax of the EXPLAIN PLAN specification

EXPLAIN PLAN(planname) (1)

SSID(DB2 subsystem id)
Notes:
1. SSID is required unless specified in a preceding GLOBAL command.

Subcommand options

Note: This section only explains specific subcommands. The other subcommands and options are described in “Subcommands and options” on page 4719. The following list gives additional or specific descriptions of selected options, where appropriate.

planname
Identifies the plan that statements are to be explained for.

EXPLAIN PACKAGE specifications:

This section describes the EXPLAIN PACKAGE specifications.

Usage

Use this specification to investigate all or selected SQL statements for given packages.
Usage notes

• OMEGAMON for DB2 PE EXPLAIN verifies that the specified package exists in the catalog table SYSIBM.SYSPACKAGE.

• If it does, OMEGAMON for DB2 PE EXPLAIN further verifies that the package has been bound with the EXPLAIN(YES) option.

Syntax of the EXPLAIN PACKAGE specification

```
►► EXPLAIN PACKAGE
►-(collection id
  package id
  version id)

►-(SSID DB2 subsystem id)
  SQLID secondary authid)

►-(LEVEL (DETAIL
  BASIC
  INDEXES
  KEYDIST
  SQL
  SUMMARY
  NORAWXPL)

►-(ACCTYPE (ALL
  MATCHING
  NONMATCH
  TABSCAN)

►-(TABLE (authid
  tabname)

►-(FIRST (n)
  LAST (n)
  GEN (n)

►-(FORCE (NO
  YES)
  FORMAT (YES
  NO)
```

Notes:

1. SSID is required unless specified in a preceding GLOBAL command.

Subcommand options

Note: This section only explains specific subcommands. The other subcommands and options are described in "Subcommands and options" on page 4719. The following list gives additional or specific descriptions of selected options, where appropriate.

collection id
package id
version id

Identify the package that statements are to be explained for.

The asterisk is allowed as wildcard character for collection id, package id, and version id.

The version id string can contain the following special characters: underscore (_), at (@), number (#), dollar ($), dash (~), and period (.)
Use \(-n\) (the version generation number preceded by a minus sign) to specify the version id. The version generation number is the line counter of a package list sorted by the precompile date in descending order. The newest package version has the generation number "0" and the oldest package version has the generation number "\(-n\).

**EXPLAIN QMFQUERY specifications:**

This section describes the EXPLAIN QMFQUERY specifications.

**Usage**

Use this specification to check if a saved QMF query is written in the SQL language.

**Usage notes**

- QBE and PROMPTED queries must be converted to SQL before they can be explained.
- Apart from explaining your own saved QMF queries, you can explain a query created by other users provided that the query was saved with SHARE=YES.
- The QMF query can contain parameters, for example PARM1 and \&PARM1; These parameters can also substitute column names in the select list. However, the query must not contain literals and other strings with one or more ampersands (\&), enclosed between quotes ('). If there is more than one entry in the **PLAN_TABLE** with the same identifiers (for example, query number, plan name, and program name), a report for the most recent entry is produced.

**Syntax of the EXPLAIN QMFQUERY specification**

```
EXPLAIN QMFQUERY( qmf query name )
```

```
SSID( DB2 subsystem id )
```

```
SQLID( secondary authid )
```

```
LEVEL( BASIC INDEXES KEYDIST SQL SUMMARY NORAWXPL )
```

```
INDEX( YES NO )
```

```
DEGREE( ANY DSJ ESJ )
```

**Notes:**

1. SSID is required unless specified in a preceding GLOBAL command.
Subcommand options

Note: This section only explains specific subcommand options. The other subcommand options are described in “Subcommands and options” on page 4719. The following list gives additional or specific descriptions of selected options, where appropriate.

authid
qmfs query name
Identify the saved QMF query to be explained.

EXPLAIN SQLSTMT specifications:

This section describes the EXPLAIN SQLSTMT specifications.

Usage

Use this specification to investigate a particular SQL statement supplied in its text form.

Usage notes

- The supplied SQL statement is explained by SQL EXPLAIN using a query number of 99973591. If this number already exists in the PLAN_TABLE of the job submitter, OMEGAMON for DB2 PE explain deletes the rows before processing the SQL statement. After successful execution of SQL EXPLAIN, the newly created rows in the PLAN_TABLE of the job submitter are used to produce the usual OMEGAMON for DB2 PE Explain report.

Syntax of the EXPLAIN SQLSTMT specification

```
EXPLAIN SQLSTMT(explainable sql statement text;)
```

Notes:

1. SSID is required unless specified in a preceding GLOBAL command.
Subcommand options

Note: This section only explains specific subcommands. The other subcommands and options are described in "Subcommands and options" on page 4719. The following list gives additional or specific descriptions of selected options, where appropriate.

\[ \text{explainable SQL statement text} \]

Can span several lines.

EXPLAIN QUERYNO specifications:

This section describes the EXPLAIN QUERYNO specifications.

Usage

Use this specification to check if a particular SQL statement that is identified by its query number. You can obtain the query number as follows:

- A dynamic SQL EXPLAIN statement has been executed with a given query number. The SQL EXPLAIN statement might have been executed from either DB2I or QMF. If the query number is not specified in the SQL EXPLAIN statement, DB2 assigns a number. You can obtain the query number directly from the PLAN_TABLE.
- The application has been bound with the EXPLAIN(YES) option on the BIND or REBIND commands. The query number is the statement number that was assigned by the precompiler and placed in the DBRM.

Note: If a statement belonging to a particular plan or package is to be explained, EXPLAIN PLAN or EXPLAIN PACKAGE specifications are better suited than EXPLAIN QUERYNO. By using EXPLAIN PACKAGE or EXPLAIN PLAN options such as FIRST, LAST, or DBRM, the statement can be better identified.

Usage notes

- OMEGAMON for DB2 PE EXPLAIN searches for the query number in the job submittor's PLAN_TABLE, unless the OWNER keyword with a different user ID is specified.
- If the job submittor has SELECT authorization to another user's PLAN_TABLE, the job submittor can select EXPLAIN information from this table, by specifying the other user's authorization ID as the OWNER option.
- If the specified query number does not exist in the PLAN_TABLE, a warning message is issued. OMEGAMON for DB2 PE resumes processing with the next request.

Syntax of the EXPLAIN QUERYNO specification

\[ \text{EXPLAIN QUERYNO} \left( \text{query number} \right) \]

\[ \text{SSID} \left( \text{DB2 subsystem id} \right) \]

(1)
Notes:
1  SSID is required unless specified in a preceding GLOBAL command.

Subcommand options

Note: This section only explains specific subcommands. The other subcommands and options are described in “Subcommands and options” on page 4719. The following list gives additional or specific descriptions of selected options, where appropriate.

query number
   Identifies a query number in the PLAN_TABLE being accessed.

IOACTIVITY command
This section provides an overview of the IOACTIVITY command.

Usage
Use the IOACTIVITY command to reduce data and generate I/O Activity reports.

Usage notes
• You can specify this command only once in a job step.
• However, you can use it in the same job step with commands of the other report sets.
• You can filter records with the GLOBAL command first. This can minimize your report output and reduce processing time. See “GLOBAL command” on page 4785 for more information.

Syntax

Notes:
1  You can specify REPORT up to 5 times.
2  You can specify REDUCE only once. If specified, you must also specify REPORT at least once.
Subcommands

The subcommands are described in detail, together with their various options, in the following sections.

Sample command stream for IOACTIVITY

See “DD statements” on page 4676 for full descriptions of the DD statements contained in this sample.

```
// EXEC PGM=FPECMAIN
//** FOLLOWING ARE SYSTEM DDNAMES
//STEPLIB DD DSN=FPE.FPELIB.RKANMOD,DISP=SHR
//DPMPARMS DD DSN=MYID.FPELIB.DPMPARMS,DISP=SHR
//INPUTDD DD DSN=MYID.FPELIB.DPMIN,DISP=SHR
//DPMLOG DD SYSOUT**
//SYSOUT DD SYSOUT**
//JOBSUMDD DD SYSOUT**
//DPMOUTDD DD DSN=MYID.FPELIB.DPMOUT.DATA,DISP=OLD
//SYSJUMP DD DUMMY
//** FOLLOWING ARE REPORT SET DDNAMES
//** FOLLOWING IS THE COMMAND STREAM
//SYSIN DD *
IOACTIVITY
  REDUCE
  REPORT
EXEC
```

Figure 302. Sample command stream for IOACTIVITY

IOACTIVITY command with REPORT subcommand:

This section describes the IOACTIVITY command with the REPORT subcommand.

Usage

Use the REPORT subcommand to generate reports from records.

Usage notes

- Up to five REPORT subcommands can be specified within each IOACTIVITY command.

Syntax of the REPORT subcommand
Subcommand options

The syntax diagram shows the options that are available with this subcommand. See “OMEGAMON for DB2 PE subcommand options” on page 4806 for comprehensive descriptions of these options. The following list gives additional or specific descriptions of selected options, where appropriate.

**FROM/TO**

Limits the range of records included in the reporting process by date and time.

For details, see “FROM/TO subcommand options” on page 4812.

**LEVEL**

Specifies the level of the report. The following keywords can be used with LEVEL:

- **SUMMARY**
  
  Gives a summary of all I/O activity for the following categories:
  
  - Buffer pool
  - EDM pool
  - Active log
  - Archive log and BSDS
  - Cross invalidation

  SUMMARY also gives the grand totals of all the I/O statistics for the reporting interval for each category. It provides a quick overview of system-wide I/O activity to help monitor trends and identify potential problem areas.

  The following levels generate detail reports. See the ORDER subcommand option for default ordering of detail reports.

  - **ACTLOG**
    
    The active log report presents counts and average elapsed time for reads, writes, and other I/O activity.

  - **ARCLOG**
    
    The archive log/BSDS report presents the archive log and BSDS read and write requests.

  - **BUFFER**
    
    The buffer pool report presents successful and unsuccessful asynchronous and synchronous (prefetch) read requests and write requests.

  - **EDM**
    
    The environmental descriptor manager pool report presents cursor table (CT), package table (PT), and database descriptor (DBD) references, loads from a hard disk drive, elapsed time for each load, and average section lengths.

  - **XI**
    
    The cross-invalidation report presents buffer refresh events caused by aggregated cross invalidation.

  The default for LEVEL is SUMMARY.

**DDNAME**

Specifies the data set where the report is written. You can specify any valid ddname including the default, provided that your JCL contains a DD statement for it. If a DD statement is omitted, it will be dynamically allocated to the SYSOUT message class of the job. The default ddname for report is IORPTDD.
ORDER

Specifies the OMEGAMON for DB2 PE identifiers and their sequence for sorting detail reports. Note that ORDER cannot be used with LEVEL(SUMMARY), which is the default. To use ORDER, you must specify LEVEL with one or more of the detail levels.

For details, see "ORDER subcommand option" on page 4827 and "OMEGAMON for DB2 PE identifiers" on page 4665.

The default for ORDER (if not explicitly specified) depends on the specification of LEVEL:
- LEVEL(ACTLOG) orders by DATASET.
- LEVEL(ARCLOG) orders by DATASET.
- LEVEL(BUFFER) orders by PRIMAUTH-PLANNAME-BPID.
- LEVEL(EDM) orders by PRIMAUTH-PLANNAME.
- LEVEL(XI) orders by PRIMAUTH-PLANNAME.
- If LEVEL specifies multiple detail reports, default ordering is by PRIMAUTH-PLANNAME.

If ORDER is used once, and if LEVEL specifies multiple detail reports, each detail report is ordered by the OMEGAMON for DB2 PE identifiers specified with ORDER.

If ORDER is used multiple times, and if LEVEL specifies one or more detail reports, each detail report is repeated for each specified ordering.

Note: The EDM pool report contains the plan name and the database name. Ordering by these identifiers results in repetitious information.

In the following example ORDER specifies that three EDM pool reports are produced.

```
REPORT
  LEVEL (EDM)
  ORDER (PRIMAUTH-PLANNAME-REQLOC
        CONNECT-PLANNAME INTERVAL-PRIMAUTH-PLANNAME)
```

- The first report is ordered by requesting location within plan name within primary authorization ID.
- The second report is ordered by plan name within connection ID.
- The third report is ordered by requesting location within primary authorization ID within interval.

INCLUDE/EXCLUDE

Includes or excludes data associated with specific OMEGAMON for DB2 PE identifiers.

For details, see "INCLUDE and EXCLUDE subcommand options" on page 4814, which lists other identifiers allowed with this command and subcommand combination, and "OMEGAMON for DB2 PE identifiers" on page 4665.

Example using REPORT with FROM, TO, LEVEL, and INCLUDE options

This example specifies the following:
- A summary report
- Using records with the time and date range of 10:00 a.m. on 22 November 2002 to noon on 23 November 2002
• Data is included that is only associated with the location in the range of
  LOCN01 to LOCN05

REPORT
  FROM (11/22/02,10:00:00.00)
  TO (11/23/02,12:00:00.00)
  LEVEL (SUMMARY)
  INCLUDE (LOCATION(R(LOCN01 LOCN05)))

Example using REPORT with FROM, TO, LEVEL, ORDER, and EXCLUDE options

This example specifies the following:
• A buffer pool report
• Sorted by plan name within primary authorization ID within correlation name
• Records are used with the time and date range of 10:00 a.m. on 18 March 2002
to noon on 19 March 2002
• Data is excluded that is associated with the following locations:
  – LOCN10
  – LOCN12
  – LOCN15
  – LOCN20

REPORT
  FROM (03/18/02,10:00:00.00)
  TO (03/19/02,12:00:00.00)
  LEVEL (BUFFER)
  ORDER (CORRNAME-PRIMAUTH-PLANNAME)
  EXCLUDE (LOCATION(LOCN10 LOCN12 LOCN15 LOCN20))

Example using IOACTIVITY with REDUCE and REPORT subcommands

This example requests the following:
• Reduce only input data with a timestamp within the time range of 10:30 to 11:00
  on 14 May 2002.
• Create a summary report (the default) with the default order of PLANNAME
  within PRIMAUTH.
• Write the report to the data set defined by the default ddname IORPTDD.

IOACTIVITY
  REDUCE
  FROM (05/14/02,10:30:00.00)
  TO (11:00:00.00)
  REPORT

IOACTIVITY command with REDUCE subcommand:

This section describes the IOACTIVITY command with the REDUCE subcommand.

Usage

Use the REDUCE subcommand to reduce the volume of data that is input to subsequent subcommands. REDUCE consolidates records with certain common characteristics into one record.

Usage notes
• You can specify REDUCE only once in an IOACTIVITY command.
Syntax of the REDUCE subcommand

```plaintext
REDUCE
  FROM/TO block
    INTERVAL (minutes)
    BOUNDARY (minutes)
  INCLUDE/EXCLUDE block
```

Subcommand options

The syntax diagram shows the options that are available with this subcommand. See “OMEGAMON for DB2 PE subcommand options” on page 4806 for comprehensive descriptions of these options. The following list gives additional or specific descriptions of selected options, where appropriate.

FROM/TO
Limits the range of records included in the reduction process by date and time.

For details, see “FROM/TO subcommand options” on page 4812.

INTERVAL
Defines the time interval for consolidating and averaging records. Note the remarks about performance impact in “INTERVAL subcommand option” on page 4818.

BOUNDARY
Controls the alignment of the intervals used to summarize records in the reduction process.

INCLUDE/EXCLUDE
Includes or excludes data associated with specific OMEGAMON for DB2 PE identifiers.

For details, see “INCLUDE and EXCLUDE subcommand options” on page 4814, which lists other identifiers allowed with this command and subcommand combination, and “OMEGAMON for Db2 PE identifiers” on page 4665.

Example using REDUCE with REPORT

This example specifies the following:
- Reduce only input data with a timestamp within the time range of 10:00 to 11:00 on 14 May 2002.
- Create a summary report (the default) with the default order of PLANNAME within PRIMAUTH
- Write the report to the data set defined by the default ddname IORPTDD.

```plaintext
IOACTIVITY
  REDUCE
    FROM (05/14/02,10:00:00.00)
    TO (,11:00:00.00)
  REPORT
```

LOCKING command

This section provides an overview of the LOCKING command.
Usage

Use the LOCKING command to generate Locking reports, traces, and file data sets on locking-related DB2 data.

Usage notes

- This command can be used once in a job step.
- However, it can be used in the same job step with commands of the other report sets.
- You can filter records with the GLOBAL command first. This can minimize your report output and reduce processing time. See “GLOBAL command” on page 4785 for more information.

Syntax

```
LOCKING (1)  
  | REPORT subcommand (2)  
  | REDUCE subcommand (3)  
  | TRACE subcommand (4)  
  | FILE subcommand
```

Notes:

1. You can specify REPORT up to 5 times.
2. You can specify REDUCE only once. If specified, you must also specify REPORT at least once.
3. You can specify TRACE up to 5 times.
4. You can specify FILE only once.

Subcommands

The subcommands are described in detail, together with their various options, in the following sections.

Sample JCL for requesting Locking functions

The following is a sample of the JCL required to produce Locking reports and traces. A description of the DD statements follows the sample.
Most of the DD statements with a SYSOUT destination do not have to be specified because they are dynamically allocated by OMEGAMON for DB2 PE. See “DD statements” on page 4676 for descriptions and more information.

Note:
1. There is an advantage in omitting DPMOUTDD from your JCL. For more information, see “DPMOUTDD statement” on page 4677.
2. If you do not include the EXEC statement in your JCL, no report is produced. The syntax of your JCL is checked and written to the DPMLOG data set together with any information, warning, or error messages raised.

LOCKING command with REPORT subcommand:

This section describes the LOCKING command with the REPORT subcommand.

Usage

Use the REPORT subcommand to generate reports from records.

Usage notes

- Up to five REPORT subcommands can be specified within each LOCKING command.

Syntax of the REPORT subcommand
Subcommand options

The syntax diagram shows the options that are available with this subcommand. See “OMEGAMON for DB2 PE subcommand options” on page 4806 for comprehensive descriptions of these options. The following list gives additional or specific descriptions of selected options, where appropriate.

**LEVEL**

Specifies the level of the report. Both the SUSPENSION and LOCKOUT keyword can be used together in the same REPORT subcommand.

**SUSPENSION**

Generates a lock suspension report. This is the default level.

**LOCKOUT**

Generates a lockout report.

**DETAIL**

Generates a detail report.

**SPREADSHEETDD**

Specifies that lock suspension report data should be written to the specified data set. The data is written in a format that can be imported by spreadsheet programs. The data set should be allocated using the following attributes:

- **RECFM:** VB
- **LRECL:** 1 200 or greater

Use this subcommand option only together with LEVEL(SUSPENSION), which is the default if LEVEL(LOCKOUT) is not specified. See also “Example using REPORT with LEVEL, ORDER, and SPREADSHEETDD options” on page 4738.

This subcommand option accumulates additional locking data. When written to the specified data set, the individual fields are separated by a separator character (a colon) so that workstation-based spreadsheet programs can import the data for further evaluation. When you download the data set to a client, ensure that you specify ascii or text, not binary, as transfer type in your file transfer program. This ensures that the necessary EBCDIC to ASCII conversion is performed.

For more information about using lock suspension report data, see the Report Reference (“Locking Report”).
Example using REPORT with LEVEL, ORDER, and INCLUDE options

This example specifies the following:

• A lock suspension report
• Sorted by plan name
• Data is included that is only associated with the location in the range of LOCN01 to LOCN05

```
REPORT
  LEVEL (SUSPENSION)
  ORDER (PLANNAME)
  INCLUDE (LOCATION(R(LOCN01 LOCN05)))
```

Example using REPORT with FROM, TO, LEVEL, ORDER, and EXCLUDE options

This example specifies the following:

• A lockout report
• Sorted by plan name within primary authorization ID within correlation name
• Records are used with the time and date range of 10:00 a.m. on 18 March 2001 to noon on 19 March 2001
• Data is excluded that is associated with the following locations:
  – LOCN10
  – LOCN12
  – LOCN15
  – LOCN20

```
REPORT
  FROM (03/18/01,10:00:00.00)
  TO (03/19/01,12:00:00.00)
  LEVEL (LOCKOUT)
  ORDER (CORRNAME-PRIMAUTH-PLANNAME)
  EXCLUDE (LOCATION(LOCN10 LOCN12 LOCN15 LOCN20))
```

Example using REPORT with LEVEL, ORDER, and SPREADSHEETDD options

This example specifies the following:

• A lock suspension report
• A sort order by PAGESET identifier within DATABASE identifier, which is the default, but any other ordering will do
• The data set TEST1DD where the Locking report is written in a spreadsheet-compatible format

```
REPORT
  LEVEL (SUSPENSION)
  ORDER (DATABASE-PAGESET)
  SPREADSHEETDD (TEST1DD)
```

LOCKING command with REDUCE subcommand:

This section describes the LOCKING command with the REDUCE subcommand.

Usage

You use the REDUCE subcommand to limit the volume of data that is input to subsequent subcommands.
Usage notes

- REDUCE consolidates records with certain common characteristics into one record.
- REDUCE can be used once in a LOCKING command.

Syntax of the REDUCE subcommand

```
REDUCE
  FROM/TO block
  INTERVAL (minutes)
  BOUNDARY (minutes)
  INCLUDE/EXCLUDE block
```

Subcommand options

The syntax diagram shows the options that are available with this subcommand. See “OMEGAMON for DB2 PE subcommand options” on page 4806 for comprehensive descriptions of these options.

Example using REDUCE with FROM, TO, and INTERVAL options

This example specifies that data is to be reduced between 10:00 a.m. on 4 February 2001 and noon on 5 February 2001. The records are to be reduced into 60-minute intervals.

```
REDUCE
  FROM (02/04/01,10:00:00.00)
  TO (02/05/01,12:00)
  INTERVAL (60)
```

LOCKING command with TRACE subcommand:

This section describes the LOCKING command with the TRACE subcommand.

Use the TRACE subcommand to produce traces with an entry for every DB2 locking event.

Usage notes

- Up to five traces can be requested in a job step.

Syntax of the TRACE subcommand
Subcommand options

The syntax diagram shows the options that are available with this subcommand. See “OMEGAMON for DB2 PE subcommand options” on page 4806 for comprehensive descriptions of these options. The following list gives additional or specific descriptions of selected options, where appropriate.

LEVEL

Specifies the type of trace and the amount of detail. One LEVEL option can be specified for each TRACE subcommand:

- **DETAIL**
  Generates a lock detail trace.

- **SUSPENSION**
  Generates a lock suspension trace.

- **LOCKOUT**
  Generates a lockout trace. This is the default.

- **DEADLOCK**
  Generates a deadlock trace.

- **TIMEOUT**
  Generates a timeout trace.

INCLUDE/EXCLUDE

Includes or excludes data associated with specific OMEGAMON for DB2 PE identifiers.

For details, see “INCLUDE and EXCLUDE subcommand options” on page 4814, which lists other identifiers allowed with this command and subcommand combination, and “OMEGAMON for Db2 PE identifiers” on page 4665.

Note that the identifier TYPE can only be used with LEVEL(DETAIL).

Example using TRACE with FROM and TO options

This example specifies that:

- Three lockout (default) traces are produced for the time intervals specified.
- Each trace covers a unique 10-minute period of time on the same day.
- Each trace is written to the data set defined by the default ddname for the trace.

```
TRACE
FROM (03/18/00, 10:00:00.00)
TO (03/18/00, 10:10:00.00)
```
LOCKING command with FILE subcommand:

This section describes the LOCKING command with the FILE subcommand.

Usage

Use the FILE subcommand to format unreduced DB2 data and store it in sequential data sets suitable for use by the DB2 load utility. The records can be placed in DB2 tables and you can produce reports by using a reporting facility such as Query Management Facility (QMF).

Usage notes

- FILE is used to format lock detail records (from IFCIDs 21, 211, 212, and 223) describing Internal Resource Lock Manager (IRLM) requests, claim and drain requests, and successful lock avoidance events.
- Only one file data set can be generated in a job step.

Syntax of the FILE subcommand

```
FILE FROM/TO block LOFILDD1 DDNAME (ddname) INCLUDE/EXCLUDE block
```

Subcommand options

The syntax diagram shows the options that are available with this subcommand. See "OMEGAMON for DB2 PE subcommand options" on page 4806 for comprehensive descriptions of these options.

Example using FILE with INCLUDE option

This command generates a data set on the default ddname LOFILDD1. The data set contains detailed information about the locking requests made by the primary authorization ID SYSADM.

```
FILE INCLUDE (PRIMAUTH(SYSADM))
```

RECTRACE command

This section provides an overview of the RECTRACE command.

Usage

Use the RECTRACE command to generate Record traces and file data sets.
Usage notes

- The command can be used once in a job step.
- However, it can be used in the same job step with commands of the other report sets.
- You can filter records with the GLOBAL command first. This can minimize your report output and reduce processing time. See “GLOBAL command” on page 4785 for more information.

Syntax of the RECTRACE command

```
RECTRACE (1)
     TRACE subcommand
     FILE subcommand (2)
```

Notes:

1. You can specify TRACE up to 5 times.
2. FILE can be specified only once.

Subcommands

The subcommands are described in detail, together with their various options, in the following sections.

Sample JCL for requesting Record trace functions

The following is a sample of the JCL required to produce Record traces. For details about the JCL and DD statements used, see “The OMEGAMON for DB2 PE command stream” on page 4673.

```
// PEMAIN EXEC PGM=FPECMAIN
//* FOLLOWING ARE SYSTEM DDNAMES
//STEPLIB DD DSN=FPE.FPELIB.RKANMOD,DISP=SHR
//DPMPARMS DD DSN=MYID.FPELIB.DPMPARMS,DISP=SHR
//INPUTDD DD DSN=MYID.FPELIB.DPMIN,DISP=SHR
//DPMLOG DD SYSOUT=* SYSOUT**
//JOBSUMDD DD SYSOUT=* SYSOUT**
//DPMOUTDD DD DSN=MYID.FPELIB.DPMOUT.DATA,DISP=OLD SYSOUT
//SYSUDUMP DD DUMMY
//* FOLLOWING ARE REPORT SET DDNAMES
//RTTRCDD1 DD SYSOUT**
//RTFILDD1 DD DSN=MYID.FPELIB.RTFIL.DATA,DISP=OLD
//RTWORK DD DSN=MYID.FPELIB.RT.WORKDD,DISP=OLD
//* FOLLOWING IS THE COMMAND STREAM
//SYSIN DD *
RECTRACE
     TRACE
     FILE
EXEC
```

Figure 304. Sample JCL for requesting Record trace functions

The OMEGAMON for DB2 PE command language shown in this section is not appropriate in all circumstances. You must modify it to meet your requirements.
Most of the DD statements with a SYSOUT destination do not have to be specified because they are dynamically allocated by OMEGAMON for DB2 PE. See the individual DD statement descriptions for more information.

Note: The OMEGAMON for DB2 PE command stream is only processed if EXEC is included as the last command. Otherwise, OMEGAMON for DB2 PE only checks the syntax.

RECTRACE command with TRACE subcommand:

This section describes the RECTRACE command with the TRACE subcommand.

Usage

Use the TRACE subcommand to produce traces with an entry for every IFCID available.

Usage notes

- Up to five traces can be requested in a job step.

Syntax of the TRACE subcommand

```
TRACE
FROM/TO block
LEVEL (SUMMARY)
SHORT
LONG
DUMP
TIMESTAMP
SORTBY (LUWID)
RTTRCDD* DDNAME (ddname)
INCLUDE/EXCLUDE block
```

Subcommand options

The syntax diagram shows the options that are available with this subcommand. See "OMEGAMON for DB2 PE subcommand options" on page 4806 for comprehensive descriptions of these options. The following list gives additional or specific descriptions of selected options, where appropriate.

FROM/TO

Limits the range of records included in the trace by date and time.

For details, see "FROM/TO subcommand options" on page 4812.

LEVEL

Selects the amount of detail in the trace. You can specify one of the following keywords:

SUMMARY

Produces a trace that lists all user-selected records in the input data set.

SHORT

Produces a trace that includes all user-selected records that are used in other OMEGAMON for DB2 PE reports. This is the default.
LONG
Produces a trace that includes all user-selected records. Serviceability data is also reported.

DUMP
Produces a trace that presents all user-selected records in hexadecimal dump format. The entire record is dumped. This option is used for diagnostic purposes.

SORTBY
Sorts the events within each location. You can specify either of the following:

LUWID
Records are sorted by timestamp within thread within location.

TIMESTAMP
Records are sorted by timestamp within location. TIMESTAMP is the default.

One entry of SORTBY can be specified for each TRACE subcommand.

DDNAME
Specifies the data set where the trace is written.

INCLUDE/EXCLUDE
Includes or excludes data associated with specific OMEGAMON for DB2 PE identifiers.

For details, see “INCLUDE and EXCLUDE subcommand options” on page 4814, which lists other identifiers allowed with this command and subcommand combination, and “OMEGAMON for Db2 PE identifiers” on page 4665.

Examples

For an example refer to “Example using RECTRACE with TRACE and FILE subcommands” on page 4745

RECTRACE command with FILE subcommand:

This section describes the RECTRACE command with the FILE subcommand.

Usage

Use the FILE subcommand to format DB2 data and store it in sequential data sets suitable for use by the DB2 load utility. The records can be placed in DB2 tables and you can produce reports by using a reporting facility such as Query Management Facility (QMF).

Usage notes

- FILE is used to format Record Trace records from IFCID 22, 63, 96, 125, 172, 196, 316, 365, and 401.
- Only one file data set can be generated in a job step.

Syntax of the FILE subcommand
Subcommand options

The syntax diagram shows the options that are available with this subcommand. See “OMEGAMON for DB2 PE subcommand options” on page 4806 for comprehensive descriptions of these options. The following list gives additional or specific descriptions of selected options, where appropriate.

**FROM/TO**

Limits the range of records included in the data set by date and time.

For details, see “FROM/TO subcommand options” on page 4812.

**DDNAME**

Specifies the ddname where the file data set is written. The default ddname is RTFILDD1.

**INCLUDE/EXCLUDE**

Includes or excludes data associated with specific OMEGAMON for DB2 PE identifiers.

For details, see “INCLUDE and EXCLUDE subcommand options” on page 4814, which lists other identifiers allowed with this command and subcommand combination, and “OMEGAMON for Db2 PE identifiers” on page 4665.

Example using RECTRACE with TRACE and FILE subcommands

This example requests a Record trace that:
- Includes records generated between 08:00 and 08:10 on each day included
- Includes records with PRIMAUTH:
  - UID0001
  - UID0002
  - UID0003
- Excludes records with PLANNAME:
  - PLIT2A01
  - PLIT2A02
- Generates a data set on ddname RTFILDD1 by default. The data set contains detailed information about the IFCIDs generated by the primary authorization ID SYSADM.

**Note:** If the EXEC statement is omitted, no trace is produced. The syntax of your command stream is checked and is written to the DPMLOG data set together with any error, warning, or information messages produced. All statements after the EXEC are ignored.

::

RECTRACE
TRACE
  FROM (,08:00:00)
  TO (,08:10:00)
  INCLUDE (PRIMAUTH(UID0001 UID0002 UID0003))
  EXCLUDE (PLANNAME(PLIT2A01 PLIT2A02))
FILE
SQLACTIVITY command
This section provides an overview of the SQLACTIVITY command.

Usage
Use the SQLACTIVITY command to reduce data, and to generate reports and traces.

Usage notes
- This command can be used once in a job step, it can be used in the same job step with other report set commands.
- For migration purposes you can use the SQLACTIVITY command to find information that was previously contained in the following report subjects for ACCOUNTING report types of the OMEGAMON Historical Reporter:
  - SCAN_ACTIVITY
  - SORT_ACTIVITY
  - SUMMARY
  - DETAIL
- You can filter records with the GLOBAL command first. This can minimize your report output and reduce processing time. See "GLOBAL command" on page 4785 for more information.

Syntax of the SQLACTIVITY command

```
SQLACTIVITY (TRACE subcommand) (REPORT subcommand)
```

Notes:
1. You can specify TRACE up to 5 times.
2. You can specify REPORT up to 5 times.

Subcommands
The subcommands are described in detail, together with their various options, in the following sections.

Sample JCL for requesting SQL Activity functions
The following figure is a sample of the JCL required to produce SQL Activity reports and traces. A description of the DD statements follows the sample.
The OMEGAMON for DB2 PE command language shown in this section is not appropriate in all circumstances. You must modify it to meet your requirements.

Most of the DD statements with a SYSOUT destination do not have to be specified because they are dynamically allocated by OMEGAMON for DB2 PE.

Note:
1. There is an advantage in omitting DPMOUTDD from your JCL. For more information, see “DPMOUTDD statement” on page 4677.
2. The OMEGAMON for DB2 PE command stream is only processed if EXEC is included as the last command. Otherwise, no report is generated. OMEGAMON for DB2 PE checks the syntax of your command stream and writes it, together with any information, warning, or error messages generated.

SQLACTIVITY command with REPORT subcommand:

This section describes the SQLACTIVITY command with the REPORT subcommand.

Usage

Use the REPORT subcommand to generate reports from records.

Usage notes

- Up to five REPORT subcommands can be specified within each SQLACTIVITY command.

Syntax of the REPORT subcommand
Subcommand options

The syntax diagram shows the options that are available with this subcommand. See “OMEGAMON for DB2 PE subcommand options” on page 4806 for comprehensive descriptions of these options. The following list gives additional or specific descriptions of selected options, where appropriate.

FROM/TO
Limits the range of records included in the reporting process by date and time.

For details, see “FROM/TO subcommand options” on page 4812.

SUMMARIZEBY
Selects the SQL events to be summarized. You can specify one entry of SUMMARIZEBY for each REPORT subcommand. The following events can be specified:

PROGRAM
This is the default.

CURSOR
Cursor
**STMTID**
Statement ID

**STMTNO**
Statement number

**STMTYPE**
Statement type

**ALL**
All of the above

For more information about summarization, see the Reporting User’s Guide.

**SORTBY**
Sorts the SQL events within each summary level within each thread. You can specify one entry of SORTBY for each REPORT subcommand. One of the following events can be specified:

**DEFAULT**
The default sort sequence depends on the summary level specified.

**ELAPSEDTIME**
Average elapsed time

**EXITS**
Number of exits

**EXITTIME**
Elapsed time for each exit

**IOREQS**
I/O requests

**IOTIME**
Elapsed time for each I/O request

**PAGESCAN**
Pages scanned

**ROWSPROC**
Rows processed

**SCANS**
Number of scans

**SORTRECS**
Records sorted

**SORTWORK**
Workfiles sorted

**SUSP**
Lock suspensions

**SUSPTIME**
Elapsed time for each lock suspension

**TCBTIME**
Average TCB time

For more information about sorting and default, see the Reporting User’s Guide.

**WORKLOAD**
Displays workload detail for each event. The following detail can be reported:

**NONE**
No workload activity. This is the default.

**ACCT**
Accounting

**ALL**
All workload activity

Including MINIBIND if IFCID 22 is included in the input.

Including UDF activity if IFCID 324 is included in the input.
Note that the more workload detail you request, the more time OMEGAMON for DB2 PE requires for processing your request. It is recommended that you do not specify WORKLOAD(ALL) with a large amount of input data unless absolutely necessary.

**DCAP**
Data capture activity

**EXIT**
Exit activity

**HILITE**
Workload highlights

**IO**
I/O activity

**LOCK**
Lock suspension and page and row locking activity

**SCAN**
Scan activity, RID list activity, and query parallelism activity

**SORT**
Sort activity

**Note:** When IFCID 3 is included in the input, Accounting Trace activity is automatically included as part of the workload detail.

For more information about workload detail, see the [Reporting User’s Guide](#) and the [Report Reference](#).

**DDNAME**
Specifies the data set where the report is written.

**ORDER**
Specifies the OMEGAMON for DB2 PE identifiers and their sequence for sorting the report and, in summary reports, which identifiers are used for aggregation.

For details, see “ORDER subcommand option” on page 4827 and “OMEGAMON for Db2 PE identifiers” on page 4665.

**INCLUDE/EXCLUDE**
Includes or excludes data associated with specific OMEGAMON for DB2 PE identifiers.

For details, see “INCLUDE and EXCLUDE subcommand options” on page 4814, which lists other identifiers allowed with this command and subcommand combination, and “OMEGAMON for Db2 PE identifiers” on page 4665.

**Example using REPORT with FROM, TO, and EXCLUDE options**

This example specifies the following:
- Records are used with the time and date range of 10:00 a.m. on 18 March 2002 to noon on 19 March 2002
- Data is excluded that is associated with the following locations:
  - LOCN10
  - LOCN12
  - LOCN15
  - LOCN20
  ...

```
REPORT
FROM (03/18/02,10:00:00.00)
TO (03/19/02,12:00:00.00)
```
SQLACTIVITY command with TRACE subcommand:

This section describes the SQLACTIVITY command with the TRACE subcommand.

Usage

Use the TRACE subcommand to produce traces with an entry for every DB2 SQL event.

Usage notes

- Up to five traces can be requested in a job step.
- For more information about including or excluding IFCIDs, see the Reporting User’s Guide.
Syntax of the TRACE subcommand

Subcommand options

The syntax diagram shows the options that are available with this subcommand. See “OMEGAMON for DB2 PE subcommand options” on page 4806 for comprehensive descriptions of these options. The following list gives additional or specific descriptions of selected options, where appropriate.

FROM/TO
Limits the range of records included in the trace by date and time.
For details, see “FROM/TO subcommand options” on page 4812.

SUMMARIZEBY
Selects the SQL events to be summarized. You can specify one entry of SUMMARIZEBY for each TRACE subcommand. The following events can be specified:
**OCCURRENCE**
- SQL statement occurrence. This is the default.

**PROGRAM**
- Program

**CURSOR**
- Cursor

**STMNO**
- Statement number

**STMTTYPE**
- Statement type

**ALL**
- All of the above

For more information about summarization, see the Reporting User’s Guide.

**SORTBY**
Sorts the SQL events within each summary level within each thread. You can specify one entry of SORTBY for each TRACE subcommand. One of the following events can be specified:

**DEFAULT**
- The default sort sequence depends on the summary level specified.

**ELAPSED TIME**
- Average elapsed time

**EXITS**
- Number of exits

**EXIT TIME**
- Elapsed time for each exit

**IOREQS**
- I/O requests

**IOTIME**
- Elapsed time for each I/O request

**PAGESCAN**
- Pages scanned

**ROWSPROC**
- Rows processed

**SCANS**
- Number of scans

**SORTRECS**
- Records sorted

**SORTWORK**
- Workfiles sorted

**SUSP**
- Lock suspensions

**SUSPTIME**
- Elapsed time for each lock suspension

**TCBTIME**
- Average TCB time

For more information about sorting and default, see the Report Reference.

**WORKLOAD**
Displays the workload detail for each event. The following detail can be reported:

**ACCT**
- Accounting

**ALL**
- All workload activity
Including MINIBIND if IFCID 22 is included in the input.
Including UDF activity if IFCID 324 is included in the input.
Note that the more workload detail you request, the more time OMEGAMON for DB2 PE requires for processing your request. It is recommended that you do not specify WORKLOAD(ALL) with a large amount of input data unless absolutely necessary.

DCAP
  Data capture activity
EXIT
  Exit activity
HILITE
  Workload highlights
IO
  I/O activity
LOCK
  Lock suspension and page and row locking activity
NONE
  No workload activity. This is the default.
SCAN
  Scan activity, RID list activity, and query parallelism activity.
SORT
  Sort activity
VARS
  Show host variables data, if host variables are used by the SQL statements.

If option WORKLOAD(VARS) is specified, option SUMMARIZEDBY(OCCURRENCE) is required (the default).

Note: When IFCID 3 is included in the input, Accounting Trace activity is automatically included as part of the workload detail.

For more information about workload detail, see the Reporting User’s Guide and the Report Reference.

DDNAME
  Specifies the data set where the trace is written.

LIMIT
  Sets the maximum number of threads processed by TRACE. The range is 1 to 99 999. If, for example, 3 is specified for LIMIT, no more than three threads are reported. A different limit can be set for each of the five possible traces. The default is 10.

INCLUDE/EXCLUDE
  Includes or excludes data associated with specific OMEGAMON for DB2 PE identifiers.

For details, see “INCLUDE and EXCLUDE subcommand options” on page 4814, which lists other identifiers allowed with this command and subcommand combination, and “OMEGAMON for Db2 PE identifiers” on page 4665.

In addition to the common identifiers used with these options, the SQLACTIVITY TRACE command also has an SQLCODE identifier. This identifier can be used to include statements that completed, for example, with a specific error. The following are usage examples of the SQLCODE identifier.

SQLACTIVITY TRACE EXCLUDE(SQLCODE(0))
  This excludes any SQL statement that completed without warnings or errors.
SQLACTIVITY TRACE INCLUDE(SQLCODE(R(-251,-203)))
   This includes any SQL statements that ended with SQL error codes in the range -251 through -203.

SQLACTIVITY TRACE INCLUDE(SQLCODE(-805,-204,495))
   This includes only SQL statements that ended with the specific error codes -805, -204, and 495.

SQLACTIVITY TRACE INCLUDE(SQLCODE(LT(0)))
   This includes only SQL statements that ended with an error (-n).

SQLACTIVITY TRACE INCLUDE(SQLCODE(GT(0)))
   This includes only SQL statements that ended with a warning.

Example using TRACE with SUMMARIZEBY, SORTBY, and LIMIT options

```
TRACE
   FROM (,08:00:00.00)
   TO (,08:10:00.00)
   SUMMARIZEBY (STMTNO)
   SORTBY (ELAPSEDTIME)
   LIMIT (20)
   INCLUDE (PRIMAUTH(UID0001 UID0003 UID0005)
              PLANNAME(PLIT2A01,PLIT2A02))
```

It is summarized by statement number and sorted by elapsed time.

It reports the ten-minute period from 8:00 a.m. to 8:10 a.m. and includes only data that contains any of the following primary authorization IDs:
   - UID0001
   - UID0003
   - UID0005

Using any of the following plan names:
   - PLIT2A01
   - PLIT2A02

LIMIT has set the maximum number of threads processed to 20.

The trace is written to the data set defined by the default ddname SQTRCDD1.

**STATISTICS command**

This section provides an overview of the STATISTICS command.

**Usage**

Use the STATISTICS command to generate Statistics reports, traces, and file data sets. You can also use it to reduce, save, and restore data.

**Usage notes**

- This command can be used once in a job step.
- However, it can be used in the same job step with commands of the other report sets.
- You can filter records with the GLOBAL command first. This can minimize your report output and reduce processing time. See "GLOBAL command" on page 4785 for more information.
Syntax of the STATISTICS command

- REPORT subcommand
- REDUCE subcommand
- SAVE subcommand
- RESTORE subcommand
- TRACE subcommand
- FILE subcommand

Notes:
1 You can specify REPORT up to 5 times.
2 You can specify REDUCE only once. If specified, you must also specify REPORT or SAVE at least once.
3 You can specify SAVE only once.
4 You can specify RESTORE only once.
5 You can specify TRACE up to 5 times.
6 You can specify FILE only once.

Subcommands

The subcommands are described in detail, together with their various options, in the following sections.

Sample JCL for requesting Statistics functions

Figure 306 on page 4757 is a sample of the JCL required to produce statistic reports and traces. See “DD statements” on page 4676 for descriptions of the DD statements.
The OMEGAMON for DB2 PE command language shown in this section is not appropriate in all circumstances. You must modify it to meet your requirements.

Most of the DD statements with a SYSOUT destination do not have to be specified because they are dynamically allocated by OMEGAMON for DB2 PE. See the individual DD statement descriptions for more information.

Note:
1. There is a performance advantage in omitting DPMOUTDD from your JCL. For more information, see "DPMOUTDD statement" on page 4677.
2. The OMEGAMON for DB2 PE command stream is only processed if EXEC is included as the last command. Otherwise, OMEGAMON for DB2 PE only checks the syntax.

STATISTICS command with REPORT subcommand:

This section describes the STATISTICS command with the REPORT subcommand.

Usage

Use the REPORT subcommand to present statistics interval records. For the definition of the interval records see Report Reference.

The duration and alignment of the interval records are specified by the REDUCE subcommand.
The interval records can be either presented individually (if the ORDER(INTERVAL) subcommand option is specified) or aggregated into a new interval record for the duration that is specified with the FROM and TO options in the REPORT subcommand.

**Usage notes**

- Up to five REPORT subcommands can be specified within a STATISTICS command.

**Syntax of the REPORT subcommand**

```
REPORT
  FROM/TO block
  NOEXCEPTION
  EXCEPTION
  SCOPE Group
  STRPTDD ddname
  DDNAME ddname
  ORDER INTERVAL
  SHORT name
  LAYOUT LONG
  INCLUDE/EXCLUDE block
  DSETSTAT
```

**Subcommand options**

The syntax diagram shows the options that are available with this subcommand. See "OMEGAMON for DB2 PE subcommand options" on page 4806 for comprehensive descriptions of these options. The following list gives additional or specific descriptions of selected options, where appropriate.

**FROM/TO**

Limits the range of interval records included in the reporting process by date and time.

Combinations of FROM date and time, and TO date and time can be specified. Interval records are included from the first with an ending timestamp greater than or equal to the FROM date and time, to the last with an ending timestamp less than the TO date and time.

If you do not specify a date and time, FROM/TO defaults to the dates and times specified in the GLOBAL command. If FROM/TO is not specified in GLOBAL, all records are included in the report.

The specified FROM/TO dates and times are printed on the report. If FROM/TO is not specified in REPORT or GLOBAL, NOT SPECIFIED is printed on the report. If only the FROM date and time or only the TO date and time has been specified, NOT SPECIFIED is printed for the unspecified value.

Note that GLOBAL FROM and TO filters individual DB2 Statistics records whereas REPORT FROM and TO filters interval records. For example, with a REPORT FROM time of 14:15, an interval record starting at 14:00 and ending at 14:30 would appear on thereport (based on the end interval record time). However, a GLOBAL FROM time of 14:15 would filter the DB2 Statistics records at 14:00 and the interval record (14:00 to 14:30) might not be created (subject to the BOUNDARY specification).
You can specify a time adjustment for a DB2 location using the TIMEZONE option of the GLOBAL command. The time adjustment is applied to the record timestamp before FROM/TO processing.

If you are reducing data, the FROM/TO times specified in REDUCE can affect the data available for reporting.

Refer to “GLOBAL command” on page 4785 for more information.

For details on how to use the FROM/TO option, see “FROM/TO subcommand options” on page 4812.

**LAYOUT**

Specifies the name of a report layout. You can specify one of the supplied layouts or one that you have previously tailored:

**SHORT**

This is the default.

**LONG**

This option provides detailed thread-related data. You can also use other functions such as Record Trace and SQL Activity to find detailed DB2 trace data.

**Historical Reporter migration layouts**

Use the Historical Reporter migration layouts to help you identify OMEGAMON for DB2 PE data that was previously shown in the reports of the OMEGAMON Historical Reporter. The migration layouts include:

- “Options for OMEGAMON Historical Reporter Accounting reports” on page 4820
- “Options for OMEGAMON Historical Reporter Statistics reports” on page 4824

**User-defined layouts**

You can customize your own report layouts by specifying which blocks of data and which fields within the blocks are included, and their relative order. To adapt the reports according to your requirements, you use user-tailored reporting (UTR). With UTR, you can control the volume, contents, and layout of Statistics traces and reports.

For information about tailoring report layouts, see the Reporting User’s Guide.

**SCOPE**

Specifies the scope of the report in a data sharing environment.

**MEMBER**

Member-scope reporting presents DB2 statistics on a per-member basis without aggregating data-sharing-related counters for the entire data-sharing group.

**GROUP**

Group-scope reporting presents data-sharing-related counters for an entire data-sharing group.

**EXCEPTION NOEXCEPTION**

Specify EXCEPTION if you want to report only those interval records on Statistics reports with at least one field in exception status. Otherwise, a standard report is produced.

If you use this subcommand option, your JCL must contain a valid DD definition for the ddname EXCPTDD. For more information about required ddnames, see Figure 306 on page 4757.
DDNAME

Specifies the data set where the report is written. You can specify any valid ddname including the default, provided that your JCL contains a DD statement for it. If a DD statement is omitted, it will be dynamically allocated to the SYSOUT message class of the job. The default ddname for report is STRPTDD.

ORDER(INTERVAL)

Specifies that your report contains statistics data for each interval record that satisfies input filters.

For details, see “ORDER subcommand option” on page 4827 and “OMEGAMON for Db2 PE identifiers” on page 4665.

If you want to report the statistics data for the entire period covered by the interval records, do not specify this option.

INCLUDE/EXCLUDE

Includes or excludes data associated with specific OMEGAMON for DB2 PE identifiers.

For details, see “INCLUDE and EXCLUDE subcommand options” on page 4814, which lists other identifiers allowed with this command and subcommand combination, and “OMEGAMON for Db2 PE identifiers” on page 4665.

DSETSTAT

Include buffer pool data set statistics. This option is ignored if option INTERVAL(X) with X>0 has been specified. Statistics interval processing with intervals > 0 can only be applied to IFCIDs 1, 2, 225, and 369 that are externalized by DB2 every minute. IFCID 199 externalization is controlled by system parameter STATTIME and can range from 1 to 60 minutes. Interval metrics for buffer pool data sets can be derived from Statistics TRACE or FILE data created with DSETSTAT.

Example using REDUCE, and REPORT with INCLUDE option

This example specifies the following:
• One interval record is derived. It covers the entire period that the DB2 statistics data is available for.
• The report uses the default SHORT layout.
• Data is included that is only associated with the location in the range of LOCN01 to LOCN05

REDUCE
REPORT
   INCLUDE (LOCATION(R(LOCN01 LOCN05)))

Example using REDUCE with INTERVAL option, and REPORT with several options

This example specifies the following:
• The input DB2 statistics data is distributed over 60-minutes intervals aligned with hour boundaries.
• The interval records between 10:00 a.m. on 18 March 1996 and noon on 19 March 1996 are considered for reporting, subject to the exception criteria.
• Each of the qualifying interval records is reported.
• The report uses the LONG layout.
REDUCE
  INTERVAL(60)
REPORT
  FROM (09/18/98,10:00:00.00)
  TO (09/19/98,12:00:00.00)
  LAYOUT (LONG)
  EXCEPTION ORDER (INTERVAL)

STATISTICS command with REDUCE subcommand:

This section describes the STATISTICS command with the REDUCE subcommand.

Usage

Specify REDUCE to control the following:

- The duration and alignment of statistics interval records. For a definition of the interval record, see Report Reference.
- The volume of data to be presented in traces and reports and stored in file and save data sets.

Usage notes

- REDUCE is invoked automatically when you use the REPORT or SAVE subcommand.
- REDUCE can be used once in a STATISTICS command.

Syntax of the REDUCE subcommand

```
REDUCE
  FROM/TO block
  INTERVAL (minutes)
  BOUNDARY (minutes)
  INCLUDE/EXCLUDE block
```

Subcommand options

The syntax diagram shows the options that are available with this subcommand. See OMEGAMON for DB2 PE subcommand options” on page 4806 for comprehensive descriptions of these options. The following list gives additional or specific descriptions of selected options, where appropriate.

FROM/TO

Limits the range of DB2 statistics records to process by date and time.
Combinations of FROM date and time and TO date and time can be specified.

Note: DB2 statistics records are included from the last with a timestamp less than the FROM date and time to the last with a timestamp less than the TO date and time. The FROM/TO dates and times specified in REDUCE affect the other functions.
The DB2 statistics records available to REDUCE are limited by the GLOBAL FROM/TO dates and times.
If you do not specify a date and time, FROM/TO defaults to the date and time specified in the GLOBAL command. If dates and times are not specified in the GLOBAL command, all DB2 statistics records are included in the reduction process.

You can specify a time adjustment for a DB2 location using the TIMEZONE option of the GLOBAL command. The time adjustment is applied to the DB2 statistics record timestamp before FROM/TO processing.

Refer to “GLOBAL command” on page 4785 for more information.

For details on how to use the FROM/TO option, see “FROM/TO subcommand options” on page 4812.

**INTERVAL**

Defines the duration of statistics interval records. The range is from 0 to 99,999 and is specified in minutes. When the DB2 statistics data is distributed to the interval records, they can be presented in Statistics reports and stored in a save data set.

For example, if INTERVAL(15) is specified, 15-minute intervals are created over the period that the DB2 statistics data is available for and the DB2 data is distributed to these intervals.

INTERVAL(0) specifies that only one interval record is created, starting with the first and ending with the last DB2 Statistics record pair.

If no interval is specified, the interval specified in the GLOBAL command is used. If no interval is specified in GLOBAL, the default is 0.

INTERVAL has an impact on performance. Always use the largest interval that meets your reporting requirements. If interval processing is not required, the default INTERVAL(0) is recommended for optimum performance. For more information about intervals, see “Processing intervals.”

The following example uses INTERVAL to specify an interval of two hours:

```
INTERVAL (120)
```

**BOUNDARY**

Controls the alignment of the statistic interval records defined by the INTERVAL option.

For more information on boundaries, see “Processing intervals.”

**INCLUDE/EXCLUDE**

Includes or excludes data associated with specific OMEGAMON for DB2 PE identifiers.

For details, see “INCLUDE and EXCLUDE subcommand options” on page 4814, which lists other identifiers allowed with this command and subcommand combination, and “OMEGAMON for DB2 PE identifiers” on page 4665.

**Processing intervals**

The start time of the first interval processed by REDUCE is influenced by BOUNDARY, INTERVAL, and FROM.

OMEGAMON for DB2 PE attempts to reduce all data that falls between FROM and TO dates and times. The first interval processed starts at a time aligned with
BOUNDARY, at or before the FROM time. If an interval cannot be aligned with the FROM time, the first properly aligned interval starting before the FROM time is used.

Although there is no restriction on the INTERVAL and BOUNDARY combination, your specification should comply with the following recommendations:

- For intervals of less than 60 (excluding 0), there should be a whole number of intervals in an hour. Choose one of the following values:
  - 1, 2, 3, 4, 5, 6, 10, 12, 15, 20, or 30.
- For intervals of 60 or greater, there should be a whole number of intervals in a day. Choose one of the following values:
  - 60, 120, 180, 240, 360, 480, 720, or 1,440.
- For intervals of one day (1,440) or greater, INTERVAL should be a multiple of 1,440.
- Select your interval and boundary so that the first interval starts at the FROM time.

The first interval record starts at a time aligned with BOUNDARY, at or before the FROM time. If an interval record cannot start at the FROM time, it starts before, at the nearest time that satisfies the BOUNDARY specification. Note that an interval record starting before the FROM time only contains data between the FROM time and the end of the interval record. Input data before the FROM time is not processed. An interval record ending after the TO time only contains data between the beginning of the interval record and the TO time. Input data after the TO time is not processed.

**Example using REDUCE with FROM, TO, INTERVAL, BOUNDARY, and INCLUDE options**

BOUNDARY(60) aligns the start time of interval records at the start of an hour, so the first interval record starts at the FROM time (08:00). Subsequent interval records start every 30 minutes (08:30, 09:00, and 09:30 each day). Only the DB2 statistics for location SYDNEY is processed.

```plaintext
REDUCE FROM (,08:00) TO (,10:00) INTERVAL (30) BOUNDARY (60) INCLUDE (LOCATION(SYDNEY))
```

**Example using REDUCE with options, together with SAVE**

The following defaults are applied in this example:
- For FROM, all dates and a time of 00:00:00.00.
- For TO, all dates and a time of 23:59:59.99.

BOUNDARY(60) aligns the start time of interval records at the start of an hour, so the first interval record starts at the FROM time (00:00). Subsequent interval records cover 1,440 minutes or one day; an interval starts at 00:00 each day.

The interval records are saved in a data set for subsequent use.

```plaintext
REDUCE INTERVAL (1440)
```
Example using REDUCE with options, together with REPORT with options

BOUNDARY(60) aligns the start time of interval records at the start of an hour, so the first interval record starts at the first properly aligned time before the FROM time, which is 08:00. Subsequent interval records start every two hours (10:00 and 12:00).

A report presenting the statistics data for each of the 2-hour periods is produced.

```
REDUCE
  FROM (,08:15)
  TO (,13:00)
  INTERVAL (120)
  BOUNDARY (60)
  REPORT
    ORDER (INTERVAL)
```

STATISTICS command with SAVE subcommand:

This section describes the STATISTICS command with the SAVE subcommand.

Usage

Use the SAVE subcommand (without CONVERT option) to produce a VSAM data set containing interval records. After the data has been saved, you can:

- Archive the Statistics data for producing long-term reports.
- Convert the save files to sequential data sets by using the Save-File utility and load them into DB2 for subsequent use.
- Restore and combine it with newly reduced data to produce long-term reports.
- Restore it and use it in later reporting.

Use the SAVE subcommand with CONVERT option to produce a sequential data set containing reduced data in records. After the data has been processed, you can:

- Load it to DB2 for subsequent use.

Note: In contrast to the other usage, the conversion by the Save-File utility is accomplished directly. You cannot restore it, because VSAM data is not produced.

You can also use the converted SAVE data sets to generate CSV (comma-separated value) input-data. This CSV data can then be transferred to workstations and imported into spreadsheets to improve DB2 performance analysis using graphical representations or pivot tables. For more information refer to Reporting User’s Guide.

Usage notes

- VSAM data sets cannot be concatenated.
- For information on migration refer to Report Reference

Note:
You can only process VSAM data sets in the same version of OMEGAMON for Db2 PE as they have been created. For example, if you create a SAVE data set in version 530, it can only be RESTORED in version 530.

To use a SAVE data set in a higher version, you must migrate the SAVE data set using a migration utility.

Before you restore or convert SAVE data sets from V5.2.0 or V5.3.0, you must first migrate this data to OMEGAMON for Db2 PE V5.4.0 format.

Restored reports only show fields that are supported by the current version of OMEGAMON for Db2 PE.

Syntax of the SAVE subcommand

```
SAVE
  DDNAME(ddname)
  DSETSTAT
  CONVERT
```

Subcommand options

The syntax diagram shows the options that are available with this subcommand. See "OMEGAMON for DB2 PE subcommand options" on page 4806 for comprehensive descriptions of these options. The following list gives additional or specific descriptions of selected options, where appropriate.

**DDNAME**

Specifies the ddname where the save data is written. The default ddname is STSAVDD. You can specify any valid ddname provided that your JCL contains a valid DD statement for it.

Without CONVERT option:

When using SAVE, your JCL can also include a valid DD statement for JSSRSDD, so that the related job summary information can be saved.

**Note:** Do not specify DUMMY in the JCL for either STSAVDD or JSSRSDD. When you are not using SAVE, omit these ddnames from your JCL.

The VSAM data set defined by the default ddname must already exist when you run OMEGAMON for DB2 PE. See the Report Reference for a description of VSAM data sets. Either specify an existing data set from a previous OMEGAMON for DB2 PE run (when restoring data), or specify a new data set allocated using the IDCAMS DEFINE CLUSTER function.

**Note:** If ddname is assigned to a non-VSAM file, you receive an error message and the job terminates.

With CONVERT option:

The ddname needs to be assigned to a physical sequential data set. This data set can be used for a subsequent load to Statistics SAVE tables.

**Note:** If ddname is assigned to a nonsequential data set, you receive an error message and the job terminates.

**DSETSTAT**

Include buffer pool data set statistics. This option is ignored if option INTERVAL(X) with X>0 has been specified. Statistics interval processing with
intervals > 0 can only be applied to IFCIDs 1, 2, 225, and 369 that are externalized by DB2 every minute. IFCID 199 externalization is controlled by system parameter STATIME and can range from 1 to 60 minutes. Interval metrics for buffer pool data sets can be derived from Statistics TRACE or FILE data created with DSETSTAT.

**CONVERT**

Specifies that converted reduced data is written directly to a sequential data set.

It is recommended to specify this option if you want to create high amount of loadable reduced data in a sequential data set. It avoids a temporary VSAM data set to be used as a SAVE data set. This option causes OMEGAMON for DB2 PE to write converted reduced data directly to a sequential data set in a single step. The resulting output is loadable to the PDB tables. The user may experience performance improvements compared to the default path with a separate SAVE step and the subsequent convert of saved data by the save-file utility.

**Note:** Not every big trace input results in big reduced data and small trace input in small reduced data. This option becomes effective when the reduction results in high amount of reduced data. For example, it depends on the amount of different criteria that results due to your filtering. It is possible that you experience more performance improvement with a small input trace that results in many different criteria than with a large trace input with only a few different criteria.

This option can generally be used as it is neutral to the performance when processing only a few reduced records, but becomes effective when processing a high amount of reduced data. However, do not use this option if you want to RESTORE and REPORT saved data.

**Example using REDUCE, and SAVE with DDNAME and CONVERT option**

This example specifies that one interval record covering the entire input statistics data (because INTERVAL(0) is issued) is written to the external data set defined by the ddname SAVDSNDD. In this case it has to be a sequential data set.

```
REDUCE
SAVE
    DDNAME (SAVDSNDD)
    CONVERT
```

**STATISTICS command with RESTORE subcommand:**

This section describes the STATISTICS command with the RESTORE subcommand.

**Usage**

Use the RESTORE subcommand to reload previously saved data for additional processing.

**Usage notes**

- After the data is restored, you can produce reports from the restored data alone, or from the restored data combined with newly reduced data.
- Saved data can be restored as often as required.
Syntax of the RESTORE subcommand

```
  RESTORE
      DDNAME (ddname)
```

Subcommand options

The syntax diagram shows the options that are available with this subcommand. See “OMEGAMON for DB2 PE subcommand options” on page 4806 for comprehensive descriptions of these options. The following list gives additional or specific descriptions of selected options, where appropriate.

**DDNAME**

Specifies the ddname used to reload a previously saved file for additional use. The ddname specifies the data set being restored. The default ddname is STRSTDD. You can specify any valid ddname, provided your JCL contains a valid DD statement for it.

When using RESTORE, your JCL can also include a valid DD statement for JSSRSDD, so that the related job summary information can also be restored.

Example using RESTORE with DDNAME option

This example specifies that the previously saved, reduced data is read from the data set defined by the ddname RESDSNDD.

**Note:**

1. Do not specify DUMMY in the JCL for either STRSTDD or JSSRSDD. When you are not using RESTORE, omit these ddnames from your JCL.
2. If you use the RESTORE and REDUCE subcommands in the same job stream, the INTERVAL and BOUNDARY options specified in REDUCE should match the INTERVAL and BOUNDARY options that were used to reduce the data being restored. If these values are different, the interval and boundary from the restored data is used.
3. Data from previous versions of DB2 PM cannot be restored until it has been changed to the current OMEGAMON for DB2 PE format by using the migrate function of the save-file utility. For information about migrating data, see the Report Reference.

```
  : RESTORE DDNAME (RESDSNDD)
  : STATISTICS command with TRACE subcommand:
  
  This section describes the STATISTICS command with the TRACE subcommand.
  
  Usage
  
  Use the TRACE subcommand to present statistics delta records.
  
  Usage notes
  
  • Up to five traces can be requested in a job step.
  ```
Syntax of the TRACE subcommand

```plaintext
TRACE
  FROM/TO block
    LAYOUT (SHORT (name), LONG (name))
    NOEXCEPTION
    EXCEPTION
    DDNAME (ddname)
    INCLUDE/EXCLUDE block
    DSETSTAT
```

Subcommand options

The syntax diagram shows the options that are available with this subcommand. See "OMEGAMON for DB2 PE subcommand options" on page 4806 for comprehensive descriptions of these options. The following list gives additional or specific descriptions of selected options, where appropriate.

**FROM/TO**

Limits the range of delta records included in the trace by date and time.

Combinations of FROM date and time, and TO date and time can be specified. Delta records are included from the first with an ending timestamp greater than or equal to the FROM date and time, to the last with an ending timestamp less than the TO date and time.

If you do not specify a date and time, FROM/TO defaults to the dates and times specified in the GLOBAL command. If FROM/TO is not specified in GLOBAL, all records are included in the trace.

The specified FROM/TO dates and times are printed on the trace. If FROM/TO is not specified in TRACE or GLOBAL, NOT SPECIFIED is printed on the trace. If only the FROM date and time or only the TO date and time has been specified, NOT SPECIFIED is printed for the unspecified value.

Note that GLOBAL FROM and TO filters individual DB2 Statistics records whereas TRACE FROM and TO filters delta records. For example, with a TRACE FROM time of 14:15, a delta record starting at 14:00 and ending at 14:30 would appear on the trace (based on the end delta record time).

However, a GLOBAL FROM time of 14:15 would filter the DB2 Statistics records at 14:00 and the delta record (14:00 to 14:30) might not be created (subject to the BOUNDARY specification).

You can specify a time adjustment for a DB2 location using the TIMEZONE option of the GLOBAL command. The time adjustment is applied to the record timestamp before FROM/TO processing.

If you are reducing data, the FROM/TO times specified in REDUCE can affect the data available for tracing.

Refer to "GLOBAL command" on page 4785 for more information.

For details on how to use the FROM/TO option, see "FROM/TO subcommand options" on page 4812.

**LAYOUT**

Specifies the name of a report layout. You can specify one of the supplied layouts or one that you have previously tailored:
This option provides detailed thread-related data. You can also use other functions such as Record Trace and SQL Activity to find detailed DB2 trace data.

**Historical Reporter migration layouts**

Use the Historical Reporter migration layouts to help you identify OMEGAMON for DB2 PE data that was previously shown in the reports of the OMEGAMON Historical Reporter. The migration layouts include:

- “Options for OMEGAMON Historical Reporter Accounting reports” on page 4820
- “Options for OMEGAMON Historical Reporter Statistics reports” on page 4824

**User-defined Layouts**

You can customize your own report layouts by specifying which blocks of data and which fields within the blocks are included, and their relative order. To adapt the reports according to your requirements, you use user-tailored reporting (UTR). With UTR, you can control the volume, contents, and layout of Statistics traces and reports.

For information about tailoring report layouts, see the Reporting User’s Guide.

**EXCEPTION**

Specify EXCEPTION if you want to report only those delta records on Statistics reports with at least one field in exception status. Otherwise, a standard report is produced.

If you use this subcommand option, your JCL must contain a valid DD definition for the ddname EXCPTDD. For more information about required ddnames, see Figure 300 on page 4691.

**DDNAME**

Specifies the data set where the trace is written. The default ddname for the first trace is STTRCDD1. The default ddnames for the second to fifth traces are STTRCDD2 through STTRCDD5.

You can specify a different ddname by using the DDNAME subcommand option in the TRACE subcommand. In this case, your JCL must contain a valid DD statement for the ddname you specify.

**INCLUDE/EXCLUDE**

Includes or excludes data associated with specific OMEGAMON for DB2 PE identifiers.

For details, see “INCLUDE and EXCLUDE subcommand options” on page 4814, which lists other identifiers allowed with this command and subcommand combination, and “OMEGAMON for Db2 PE identifiers” on page 4665.

**DSETSTAT**

Include buffer pool data set statistics.

Example using TRACE with DSETSTAT, LAYOUT, and DDNAME

This example:

- Includes the buffer pool data set statistics.
• Specifies the default (short) report format.
• Writes the data to the STTRCDD1 dataset.

```
TRACE
DSETSTAT
LAYOUT(SHORT)
DDNAME(STTRCDD1)
```

**STATISTICS command with FILE subcommand:**

This section describes the STATISTICS command with the FILE subcommand.

**Usage**

• Use the FILE subcommand to format unreduced DB2 data and store it in sequential data sets suitable for use by the DB2 load utility. The records can be placed in DB2 tables, and you can produce reports by using a reporting facility such as Query Management Facility™ (QMF).
• You can also use the FILE data sets to generate CSV (comma-separated value) input-data. This CSV data can then be transferred to workstations and imported into spreadsheets to improve DB2 performance analysis using graphical representations or pivot tables. For more information refer to Reporting User’s Guide.

**Usage notes**

• The data is stored in delta records in a sequential data set.

**Syntax of the FILE subcommand**

```
FILE
  FROM/TO block
  NOEXCEPTION
  EXCEPTION
  DDNAME(ddname)
  INCLUDE/EXCLUDE block
  DSETSTAT
```

**Subcommand options**

The syntax diagram shows the options that are available with this subcommand. See “OMEGAMON for DB2 PE subcommand options” on page 4806 for comprehensive descriptions of these options. The following list gives additional or specific descriptions of selected options, where appropriate.

**FROM/TO**

Limits the range of delta records included in the data set by date and time.

Combinations of FROM date and time, and TO date and time can be specified. Delta records are included from the first with an ending timestamp greater than or equal to the FROM date and time, to the last with an ending timestamp less than the TO date and time.

Any FROM/TO dates and times specified in GLOBAL can restrict the range of delta records included in the file data set. GLOBAL FROM/TO filters the raw
DB2 statistics records used to make up the delta records. Therefore, all records with begin or end times outside the GLOBAL dates and times are discarded. If the date and time is not specified in GLOBAL, all records in the input data are available.

You can specify a time adjustment for a DB2 location using the TIMEZONE option of the GLOBAL command. The time adjustment is applied to the record timestamp before FROM/TO processing.

If you are reducing data, the FROM/TO times specified in REDUCE can affect the data available for filing.

Refer to “GLOBAL command” on page 4785 for more information.

For details on how to use the FROM/TO option, see “FROM/TO subcommand options” on page 4812.

**EXCEPTION**

**NOEXCEPTION**

Specifies EXCEPTION to include only those file entries containing fields with values outside user-specified limits. Otherwise, all records are included.

If you use this subcommand option, your JCL must contain a valid DD definition for the ddname EXCPTDD. For more information about required ddnames, see “EXCPTDD statement” on page 4679.

**DDNAME**

Specifies the ddname where the file data set is written. The default ddname is STFILDD1.

**INCLUDE/EXCLUDE**

Includes or excludes data associated with specific OMEGAMON for DB2 PE identifiers.

For details, see “INCLUDE and EXCLUDE subcommand options” on page 4814, which lists other identifiers allowed with this command and subcommand combination, and “OMEGAMON for Db2 PE identifiers” on page 4665.

**DSETSTAT**

Includes buffer pool data set statistics.

Example using FILE with DSETSTAT, and DDNAME

This example:

- Includes buffer tool data set statistics.
- Writes the data to the STFILDD1 dataset.

```
FILE
  DSETSTAT
  DDNAME(STFILDD1)
```

**SYSPARMS command**

This section provides an overview of the SYSPARMS command.
Usage

Use the SYSPARMS command to generate System Parameter reports. This command replaces the SYSPRMDD card. You can still use the SYSPRMDD in existing jobs, but not concurrently with the SYSPARMS command.

Usage notes

- With the SYSPARMS command, you can use the FILE subcommand to store system parameter information in FILE data sets, which can be loaded into the OMEGAMON for DB2 PE Performance Database.
- You can filter records with the GLOBAL command first. This can minimize your report output and reduce processing time. See “GLOBAL command” on page 4785 for more information. If you use global filtering and no records meet your filter conditions, the system parameter report is not generated. In this case your JOBSUMDD contains further information. System parameter reports are based on information from IFCID 106, 201, 202, 230, and 256.

Syntax of the SYSPARMS command

```
SYSPARMS [TRACE subcommand] [FILE subcommand]
```

Notes:

1. You can specify TRACE only once.
2. You can specify FILE only once.

Subcommands

The subcommands are described in detail, together with their various options, in the following sections.

Sample JCL for requesting SYSPARMS functions

The following is a sample of the JCL required to produce SYSPARMS reports and traces. See “DD statements” on page 4676 for descriptions of the DD statements.
The OMEGAMON for DB2 PE command language shown in this section is not appropriate in all circumstances. You must modify it to meet your requirements.

Most of the DD statements with a SYSOUT destination do not have to be specified because they are dynamically allocated by OMEGAMON for DB2 PE. See the individual DD statement descriptions for more information.

Note:
1. There is a performance advantage in omitting DPMOUTDD from your JCL. For more information, see “DPMOUTDD statement” on page 4677.
2. The OMEGAMON for DB2 PE command stream is only processed if EXEC is included as the last command. Otherwise, OMEGAMON for DB2 PE only checks the syntax.

**SYSPARMS command with TRACE subcommand:**

This section describes the SYSPARMS command with the TRACE subcommand.

**Usage**

Use the TRACE subcommand to produce traces with an entry for every DB2 system parameter event.

**Syntax of the SYSPARMS TRACE subcommand**

```
TRACE DDNAME(SYTRCDD1)
```

**Subcommand options**

The syntax diagram shows the options that are available with this subcommand. See “OMEGAMON for DB2 PE subcommand options” on page 4806 for...
comprehensive descriptions of these options.

Example using TRACE

The following is an example of the SYSPARMS command with the TRACE subcommand.

```
SYSPARMS
TRACE
EXEC
```

SYSPARMS command with FILE subcommand:

This section describes the SYSPARMS command with the FILE subcommand.

Usage

To create system parameter data for the Performance Database, use the SYSPARMS command with the FILE subcommand to produce a data set suitable for loading into DB2.

Syntax of the SYSPARMS FILE subcommand

```
FILE
```

Subcommand options

The syntax diagram shows the options that are available with this subcommand. See “OMEGAMON for DB2 PE subcommand options” on page 4806 for comprehensive descriptions of these options.

Example using FILE

The following is an example of the SYSPARMS command with the FILE subcommand.

```
SYSPARMS
FILE
EXEC
```

UTILITY command

This section provides an overview of the UTILITY command.

Usage

Use the UTILITY command to generate Utility Activity reports and traces.

Usage notes

- The command can be used once in a job step.
- However, it can be used in the same job step with commands of the other report sets.
You can filter records with the GLOBAL command first. This can minimize your report output and reduce processing time. See “GLOBAL command” on page 4785 for more information.

Syntax of the UTILITY command

```
UTILITY
    (1)
      REPORT subcommand
    (2)
      REDUCE subcommand
    (3)
      TRACE subcommand
```

Notes:

1. You can specify REPORT up to 5 times.
2. You can specify REDUCE only once. If specified, you must also specify REPORT at least once.
3. You can specify TRACE up to 5 times.

Subcommands

The subcommands are described in detail, together with their various options, in the following sections.

Sample JCL for requesting Utility Activity functions

The following figure is a sample of the JCL required to produce Utility Activity reports and traces. A description of the DD statements can be found in “DD statements” on page 4676.

```
//PEMAIN EXEC PGM=FPECMAIN
/* FOLLOWING ARE SYSTEM DDNAMES*/
//STEPLIB   DD DSN=FPE.FPELIB.RKANMOD,DISP=SHR
//DPMPARMS  DD DSN=MYID.FPELIB.DPMPARMS,DISP=SHR
//INPUTDD   DD DSN=MYID.FPELIB.DPMIN,DISP=SHR
//DPMLOG    DD SYSOUT**
//SYSOUT    DD SYSOUT**
//JOBSUMDD  DD SYSOUT**
//SYSPRMDD  DD SYSOUT**
//DPMOUTDD  DD DSN=MYID.FPELIB.DPMOUT.DATA,DISP=OLD
//SYSUDUMP  DD DUMMY
/* FOLLOWING ARE REPORT SET DDNAMES*/
//UTRPTDD   DD SYSOUT**
//UTRTPDD1  DD SYSOUT**
//UTWORK    DD DSN=MYID.FPELIB.UT.WORKDD,DISP=OLD
/* FOLLOWING IS THE COMMAND STREAM*/
//SYIN      DD *
;
UTILITY
  REDUCE
  TRACE
  REPORT
  ...
EXEC
```

Figure 308. Sample JCL for requesting Utility Activity functions
The OMEGAMON for DB2 PE command language shown in this section is not appropriate in all circumstances. You must modify it to meet your requirements.

Most of the DD statements with a SYSOUT destination do not have to be specified because they are dynamically allocated by OMEGAMON for DB2 PE. See the individual DD statement descriptions for more information.

**Note:**
1. There is an advantage in omitting DPMOUTDD from your JCL. For more information, see the “DPMOUTDD statement” on page 4677.
2. The OMEGAMON for DB2 PE command stream is only processed if EXEC is included as the last command. If you omit the EXEC statement, no report is generated. OMEGAMON for DB2 PE checks the syntax of the job stream and writes it, together with any information, warning, or error messages generated to the job summary log.

**UTILITY command with REPORT subcommand:**

This section describes the UTILITY command with the REPORT subcommand.

**Usage**

Use the REPORT subcommand to generate reports from records.

**Usage notes**

- Up to five REPORT subcommands can be specified within each UTILITY command.

**Syntax of the REPORT subcommand**

```
REPORT
   FROM/TO block
   BIND
   TYPE ( )
     BIND
     UTILITY
   ORDER block
   UTRPTDD
     DDNAME ( ddname )
   INCLUDE/EXCLUDE block
```

The syntax diagram shows the options that are available with this subcommand. See “OMEGAMON for DB2 PE subcommand options” on page 4806 for comprehensive descriptions of these options. The following list gives additional or specific descriptions of selected options, where appropriate.

**Subcommand options**

- **FROM/TO**
  Limits the range of records included in the reporting process by date and time.
TYPE
Specifies the activity types. You can select one or both of these activity types with each REPORT subcommand:

BIND
Gives the elapsed time for each occurrence of a bind event. This includes information on the number of bound and nonbound events and the distribution of the bind into various bind subevents.

UTILITY
Gives the elapsed time for each occurrence of a utility event. Also provides information on the performance and resource usage of the various utility events.

If the TYPE subcommand option is omitted, both activity types are reported.

ORDER
Specifies the OMEGAMON for DB2 PE identifiers and their sequence for sorting the report, and in summary reports, the identifiers are used for aggregation.

For details, see “ORDER subcommand option” on page 4827 and “OMEGAMON for Db2 PE identifiers” on page 4665.

In the following example ORDER specifies that three Utility reports are to be produced.

```
REPORT
  TYPE (UTILITY)
  ORDER (PRIMAUTH-PLANNAME-REQLOC
          CONNECT-PLANNAME REQLOC-PRIMAUTH)
```

• The first report is ordered by requesting location within plan name within primary authorization ID.
• The second report is ordered by plan name within connection ID.
• The third report is ordered by primary authorization ID within requesting location.

DDNAME
Specifies the data set where the report is written.

INCLUDE/EXCLUDE
Includes or excludes data associated with specific OMEGAMON for DB2 PE identifiers.

For details, see “INCLUDE and EXCLUDE subcommand options” on page 4814, which lists other identifiers allowed with this command and subcommand combination, and “OMEGAMON for Db2 PE identifiers” on page 4665.

Example using REPORT with FROM, TO, ORDER, and EXCLUDE options

This example specifies the following:
• A report
• Sorted by plan name within primary authorization ID within correlation name
• Records are used with the time and date range of 10:00 a.m. on 18 March 1999 to noon on 19 March 1999
• Data is excluded that is associated with the following locations:
This section describes the UTILITY command with the REDUCE subcommand.

Usage

Use the REDUCE subcommand to reduce the volume of data that is input to subsequent subcommands. REDUCE consolidates records with certain common characteristics into one record.

Usage notes

- REDUCE can be used once in a UTILITY command.

Syntax of the REDUCE subcommand

```
REDUCE
   FROM/TO block
   INTERVAL (minutes)
   BOUNDARY (minutes)
   INCLUDE/EXCLUDE block
```

Subcommand options

The syntax diagram shows the options that are available with this subcommand. See "OMEGAMON for DB2 PE subcommand options" on page 4806 for comprehensive descriptions of these options. The following list gives additional or specific descriptions of selected options, where appropriate.

Example using REDUCE with FROM, TO, and INTERVAL options

This example specifies that data is to be reduced between 10:00 a.m. on 4 February 1999 and noon on 5 February 1999. The records are to be reduced into 60-minute intervals.

```
REDUCE
   FROM  (02/04/99,10:00:00.00)
   TO    (02/05/99,12:00)
   INTERVAL 60
```
UTILITY command with TRACE subcommand:

This section describes the UTILITY command with the TRACE subcommand.

Usage

Use the TRACE subcommand to produce traces with an entry for each DB2 utility or bind event.

Usage notes

- Up to five traces can be requested in a job step.

Syntax of the TRACE subcommand

```
TRACE [FROM/TO block]
  WORKLOAD (NONE | ALL | BIND | EXIT | IO | LOCK | PHASE)
  TYPE (BIND | UTILITY)
  ORDER block
  DDNAME (UTRCDD=ddname)
  INCLUDE/EXCLUDE block
```

Subcommand options

The syntax diagram shows the options that are available with this subcommand. See “OMEGAMON for DB2 PE subcommand options” on page 4806 for comprehensive descriptions of these options. The following list gives additional or specific descriptions of selected options, where appropriate.

FROM/TO

Limits the range of records included in the trace by date and time.

For details, see “FROM/TO subcommand options” on page 4812.

WORKLOAD

Displays the workload detail for each event. The following detail can be specified:

- **NONE**
  
  No workload activity. This is the default.

- **BIND**
  
  Bind activity

- **EXIT**
  
  Exit activity

- **IO**
  
  I/O activity
LOCK
Lock suspension and page and row locking activity

PHASE
Utility phases

ALL
All workload activity

TYPE
There are two activity types. You can select one or both of these activity types with each TRACE subcommand. If the TYPE subcommand option is omitted, both activity types are reported.

BIND
Gives the elapsed time for each occurrence of a bind event for each trace entry. This includes information on the number of bound and nonbound events and the distribution of the bind into various bind subevents.

UTILITY
Gives the elapsed time for each occurrence of a utility event for each trace entry, LISTDEF information, and information on the performance and resource and data set usage of the various utility events.

ORDER
Specifies the OMEGAMON for DB2 PE identifiers reported in the trace.
For details, see "ORDER subcommand option" on page 4827 and "OMEGAMON for Db2 PE identifiers" on page 4665.

Note: Traces are printed in the order that the threads end in and are not sorted by these identifiers.

DDNAME
Specifies the data set where the trace is written.

INCLUDE/EXCLUDE
Includes or excludes data associated with specific OMEGAMON for DB2 PE identifiers.
For details, see "INCLUDE and EXCLUDE subcommand options" on page 4814, which lists other identifiers allowed with this command and subcommand combination, and "OMEGAMON for Db2 PE identifiers" on page 4665.

Example using TRACE with FROM and TO options

This example specifies:
• A trace with no workload.
• Including records from 10:00 to 10:15 on the input data set regardless of the date, because it was not specified.
• Sent to UTTRCDD1 by default.

::
TRACE
   FROM (,10:00)
   TO (,10:15)
::

Auxiliary commands
This section provides an overview of the Auxiliary commands.
Usage

This section describes auxiliary processing commands shared by various report sets. You can use these commands to streamline the generation of reports. For each command its subcommand options and keywords and its relationship to the report set command is described. The description of the subcommand options is intentionally brief, to avoid recurrences. See “OMEGAMON for DB2 PE subcommand options” on page 4806 for comprehensive descriptions.

Usage notes

The table below shows which auxiliary commands can affect which OMEGAMON for DB2 PE report sets.

<table>
<thead>
<tr>
<th>Auxiliary Command</th>
<th>Accounting</th>
<th>Audit</th>
<th>I/O Activity</th>
<th>Locking</th>

The following topics provide additional information:

- “CASE command”
- “FIELD command” on page 4782
- “GLOBAL command” on page 4785
- “GROUP command” on page 4792
- “LIST command” on page 4800

CASE command

This section provides an overview of the Auxiliary command CASE.

Usage

Use the CASE command to differentiate between lowercase and uppercase values for DB2 PE identifiers. Specify CASE (SENSITIVE) before other commands if you want the commands to differentiate between uppercase and lowercase values. If no CASE command is specified or if you specify CASE (ANY), there is no differentiation between lowercase characters and uppercase characters.

Usage notes

- The CASE command affects all of the commands listed below it.
- You should usually list the CASE command first so that it affects all of the commands in the execution.

Syntax

```
CASE (SENSITIVE | ANY)
```
Subcommand options

The syntax diagram shows the options that are available with this subcommand. The following list gives descriptions of these options.

**SENSITIVE**
- Differentiates between uppercase and lowercase values.

**ANY**
- Does not differentiate between uppercase and lowercase values.

Examples using the CASE command

In these examples, there are two correlation names: driver and DRIVER. They are differentiated by their case.

In this example, CASE(SENSITIVE) is specified. Data related to the lower case correlation name driver is retrieved:
```
  CASE(SENSITIVE)
  GLOBAL
  INCLUDE (IFCID (3,239))
  INCLUDE (CORRNAME (driver))
  EXEC
  /*
```

In this example, CASE(SENSITIVE) is specified. Data related to the uppercase correlation name DRIVER is retrieved:
```
  CASE(SENSITIVE)
  GLOBAL
  INCLUDE (IFCID (3,239))
  INCLUDE (CORRNAME (DRIVER))
  EXEC
  /*
```

In this example, CASE(ANY) is specified. Data related to the lowercase correlation name driver and the uppercase correlation name DRIVER is retrieved:
```
  CASE(ANY)
  GLOBAL
  INCLUDE (IFCID (3,239))
  INCLUDE (CORRNAME (driver))
  EXEC
  /*
```

In this example, CASE is not specified. Data related to the lowercase correlation name driver and the uppercase correlation name DRIVER is retrieved:
```
  GLOBAL
  INCLUDE (IFCID (3,239))
  INCLUDE (CORRNAME (driver))
  EXEC
  /*
```

FIELD command

This section provides an overview of the Auxiliary command FIELD.
Usage

Use the FIELD command to define exception conditions. You can then filter individual records meeting these conditions by using the INCLUDE or EXCLUDE subcommand option.

Usage notes

- The FIELD command is used only with the INCLUDE and EXCLUDE subcommand option with RECTRACE. By using FIELD, you define the location of the data in a particular IFCID type, a comparison operator, and a value to compare the data against. The OMEGAMON for DB2 PE Record traces produced include or exclude those records that meet the comparison value. For example:

  ```
  //SYSIN DD *
  FIELD (  
    QW0018ID,  
    18,  
    0,  
    3,  
    C,  
    EQ,  
    INDX  
  )  
  RECTRACE 
  TRACE   
    LEVEL (SHORT) 
    INCLUDE (IFCID(18)) 
  FIELD (QW0018ID)) 
  : 
  EXEC
  ```

  This example reads the scan end record IFCID 18, looking for all records that contain index data (INDX). It produces a short Record trace containing only those scan end records that meet this condition.

- Effective use of the FIELD command requires a detailed knowledge of the DB2 IFCID record formats.

- You can specify the following with FIELD:
  - A value you want used as a comparison value.
  - A location within a particular type of performance input record (identified by IFCID) that you want compared to the comparison value.
  - The type of comparison that you want to make between the previous two values (that is, data in the record equal to the comparison value).

- The decision to include a record in the trace is based on whether the comparison was true or false (see Table 305) and whether the field name for the field definition was referenced in an INCLUDE or an EXCLUDE statement.

### Table 305. Comparison values

<table>
<thead>
<tr>
<th>Comparison True?</th>
<th>Field name Location</th>
<th>Decision</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>in INCLUDE</td>
<td>Record is used in the trace.</td>
</tr>
<tr>
<td>No</td>
<td>in INCLUDE</td>
<td>Record is not used in the trace.</td>
</tr>
<tr>
<td>Yes</td>
<td>in EXCLUDE</td>
<td>Record is not used in the trace.</td>
</tr>
<tr>
<td>No</td>
<td>in EXCLUDE</td>
<td>Record is used in the trace.</td>
</tr>
</tbody>
</table>
Syntax

\[
\text{FIELD} [\text{fname}][\text{IFCID}][\text{selfdef. sect. no.}][\text{offset}][\text{rep. group no.}][\text{field type}][\text{EQ comp. vol.}]\]

Parameters

The syntax diagram shows the parameters that are available with this subcommand. The following list gives additional or specific descriptions of selected parameters, where appropriate.

*field name*
   - An 8-character name identifying a particular field.

*IFCID*
   - The decimal IFCID number of the performance record.

*self defining section number*
   - The decimal number identifying the self-defining data section that points to the data section containing the field to be compared. If the value is 0, the self-defining section identified is the first one that points to the product section. If the value is 1, the self-defining section is the first one that points to a data section.

*offset*
   - The decimal offset into the data section of the starting byte of the record field to be compared.

*repeating group number*
   - The number of repeating data sections where the comparison is made. If this field contains a value of 0, the comparison is made in all repeating data sections. If the value is, for example, 12, the self-defining section is the twelfth one that points to a data section.
   - Valid values are 0-99.

*field type*
   - A character indicating the type of data to be compared:
     - C Character data
     - X Hexadecimal data
     - F Fullword binary data
     - H Halfword binary data

*comparison type*
   - The type of comparison to be made between the field in the performance record and the comparison value in the definition:
     - EQ Equal to
     - NE Not equal to
     - GE Greater than or equal to
     - LE Less than or equal to
     - GT Greater than
     - LT Less than

*comparison value*
   - The value to be compared to the defined field in the performance record:
Character data
