**Application Name** The name of the application running at the client as known to the database manager or DB2 Connect. Together with the **Application ID** counter, it can be used to relate data items with your application.

**Application Status Change Time** The date and time the application entered its current status. This counter allows you to determine how long an application has been in its current status. If it has been in the same status for a long period of time, this can indicate a problem.

**Authorization ID** Shows the authorization ID of the user who invoked the application that is being monitored. On a DB2 Connect gateway node, this is the authorization ID of the user on the host.

**Authorization ID** The authorization ID.

**Authid (Unicode)** The authorization ID.
Client Communication Protocol  The communication protocol that the client application is using to communicate with the server. You can use this counter for problem determination on remote applications.

Valid values for this counter are:
• API Constant Communication Protocol
• SQLM PROT_UNKNOWN (Note 1)
• SQLM PROT_LOCAL none (Note 2)
• SQLM PROT APPC APPC
• SQLM PROT TCPIP TCP/IP
• SQLM PROT IPXSPX IPX/SPX
• SQLM PROT NETBIOS NETBIOS

Note: The client is communicating using an unknown protocol. This value is only returned if future clients connect with a down-level server. The client is running on the same node as the server and no communications protocol is in use.

Client Operating Platform  The operating system on which the client application is running. You can use this counter for problem determination on remote applications.

Client Process ID  The process ID of the client application that made the connection to the database. You can use this counter to correlate monitor information such as CPU and I/O time to your client application. In the case of a DRDA-AS connection, this counter is set to 0.

Client Product Version ID  The product and version that is running on the client. You can use this counter to identify the product and code version of the database client. It is in the form  pppvvvrrm, where:
•  ppp stands for SQL
•  vv identifies a 2-digit version number (with high-order 0 in the case of a 1-digit version)
•  rr identifies a 2-digit release number (with high-order 0 in the case of a 1-digit release)
•  m identifies a 1-digit modification level

Code Page Used by Application  The code page ID. For snapshot monitor data, this is the code page at the partition where the monitored application started. This ID can be used for problem determination for remote applications. You can use this information to ensure that data conversion is supported between the application code page and the database code page or, for DRDA host databases, the host coded character set ID (CCSID). For event monitor data, this is the code page of the database for which event data is collected. You can use this counter to determine whether your event monitor application is running under a different code page from that used by the database. Data written by the event monitor uses the database code page. If your event monitor application uses a different code page, you might need to perform some character conversion to make the data readable.

Commit Statements Attempted  The total number of SQL COMMIT statements that have been attempted.
A small change rate in this counter during the monitor period can indicate that applications do not commit frequently, which can lead to problems with logging and data concurrency. You can also use this counter to calculate the total number of units of work by calculating the sum of the following:

\[
(\text{Commit statements attempted}) + (\text{Internal commits}) + (\text{Rollback statements attempted}) + (\text{Internal rollbacks})
\]

**Configuration Name of Client** The NNAME in the database manager configuration file at the client node. You can use this counter to identify the client node that is running the application.

**DB2 Connect Server at Thread Level Overview Attributes** Identifies the connection of an application to a DB2 system.

It is an alphanumeric text string, with a maximum length of eight characters.

**Corrid** The correlation ID.

**Database Alias at the Gateway** The alias used at the DB2 Connect gateway to connect to the host database. Use this counter for problem determination on DCS applications.

**DB2 Connect First Connect** The date and time at which the first connection to the host database was initiated from the DB2 Connect gateway. Use this counter for problem determination on DCS applications.

**DB2 ID** The DB2 subsystem ID.

**DCS Application Status** The current status of the application. It can help you diagnose potential application problems.

**DCS Database Name** The name of the remote database as cataloged in the DCS directory. Use this counter for problem determination on DCS applications.

**Elapsed Time DB2CONN Execution** Shows the time, in seconds and microseconds, at the DB2 Connect gateway to process an application request (since the connection was established), or to process a single statement. Use this counter to determine what portion of the overall processing time is due to DB2 Connect gateway processing.

**Failed Statement Percentage** The number of statements that were attempted, but failed.

**Failed Statements Operations** The number of SQL statements that were attempted, but failed.

You can use this counter to calculate the total number of successful SQL statements at the database or application level:

\[
(\text{Dynamic SQL statements attempted}) + (\text{Static SQL statements attempted}) - (\text{Failed statement operations})
\]

This count includes all SQL statements that received a negative SQLCODE. This counter might also help you determine the reasons for poor performance because failed statements mean time wasted by the database manager and, as a result, lower throughput for the database.

**Gateway Snapshot Time** The date and time at which the database system monitor information was collected.
Host Coded Character Set ID The coded character set ID (CCSID) of the host database. Use this counter for problem determination on DCS applications.

Host Database Name The real name of the host database for which information is being collected or to which the application is connected. This is the name that was given to the database when it was created. Use this counter for problem determination on DCS applications.

Host Product Version ID The product and version that is running on the server.

This counter is used to identify the product and code version of the DRDA host database product. It is in the form pppvvvrrm, where:

- **ppp** identifies the host DRDA product:
  - ARI for DB2 for VSE & VM
  - DSN for DB2 for OS/390 and z/OS
  - QSQ for DB2 UDB for AS/400
  - SQL for other DB2 products
- **vv** identifies a 2-digit version number (with high-order 0 in the case of a 1-digit version)
- **rr** identifies a 2-digit release number (with high-order 0 in the case of a 1-digit release)
- **m** identifies a 1-digit modification level

Inbound Bytes Received The number of bytes received (measured in 1000-byte increments) by the DB2 Connect gateway from the client, excluding communication protocol overhead (for example, TCP/IP or SNA headers). Use this counter to measure the throughput from the client to the DB2 Connect gateway.

Inbound Communication Address The communication address of the client. For example, it could be an SNA net ID and Logical Unit partner name, or an IP address and port number for TCP/IP. Use this counter for problem determination on DCS applications.

IP Address The current IP address.

Last Reset Timestamp The date and time that the monitor counters were reset for the application issuing the GET SNAPSHOT. You can use this counter to determine the scope of information returned by the database system monitor. If the database manager counters have never been reset, the value for this counter is zero. The database manager counters is only reset if you reset all active databases.

Most Recent Unit of Work Elapsed Time The elapsed execution time of the most recently completed unit of work. It indicates time that it takes for units of work to complete.

MVSID The MVS system identifier.

Name The name in the database manager configuration file at the client node. It identifies the client node that is running the application.

Number of Open Cursors The number of cursors currently open for an application. Use this counter to assess how much memory is being allocated. The amount of memory allocated by the DB2 client, DB2 Connect, or the database agent on the target database is related to the number of cursors that are currently open.
open. Knowing this information can help with capacity planning. For example, each open cursor that is blocking has a buffer size as specified by the RQRIOBLK database manager configuration parameter. If DEFERRED_PREPARE is enabled, two buffers are allocated.

**Number of SQL Statements Attempted** The number of SQL statements that have been attempted since the latter of: application startup, database activation, or last reset. For a data transmission, this is the number of SQL statements that have been attempted against this DCS database or in this DCS application since the database was activated, the connection to it was established by the application, or RESET MONITOR was issued against the database, and that used this number of data transmissions between the DB2 Connect gateway and the host during statement processing. Use this counter to measure the database activity for a database or application. To calculate the SQL statement throughput for a given period, you can divide this counter by the elapsed time between two snapshots. For a data transmission, use this counter to get statistics on how many statements used two, three, four, etc. data transmissions during their processing. At least two data transmissions are necessary to process a statement: a send and a receive. These statistics can give you a better idea of the database or application activity and network traffic for a database or an application.

**Number of Transmissions** The number of data transmissions between the DB2 Connect gateway and the host that was used to process this DCS statement. (One data transmission consists of one send or one receive.) Use this counter to get a better understanding of the reasons why a particular statement took longer to execute. For example, a query returning a large result set might need many data transmissions to complete.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Outbound Application ID** This ID is generated when the application connects to the DRDA host database. It is used to connect the DB2 Connect gateway to the host, while the application ID is used to connect a client to the DB2 Connect gateway.

You can use this counter in conjunction with the **Application ID** counter to correlate the client and server parts of the application information. This ID is unique across the network.
### Network Logical Unit Name Application instance

**Example:** CAIBMTOR.OSFDBM0.930131

**Details:** This application ID is the displayable format of an actual SNA LUWID (logical unit-of-work ID) that flows on the network when an APPC conversation is allocated. APPC-generated application IDs are made up by concatenating the network name, the Logical Unit name, and the LUWID instance number, which creates a unique label for the client/server application. The network name and Logical Unit name can each be a maximum of 8 characters. The application instance corresponds to the 12-decimal-character LUWID instance number.

---

**Outbound Application ID Internal** The interval for the Outbound Application ID.

**Outbound Communication Address** The communication address of the target database. For example, it could be an SNA net ID and Logical Unit partner name, or an IP address and port number for TCP/IP. Use this counter for problem determination on DCS applications.

**Outbound Communication Protocol** The communication protocol used between the DB2 Connect gateway and the host. Use this counter for problem determination on DCS applications.

Valid values are:

- SQLM_PROT_APPC
- SQLM_PROT_TCPIP

**Outbound Sequence Number** Reserved for future use. In this release, its value will is always 0001. It can contain different values in future releases of the product.

**Previous Unit of Work Completion Timestamp** The time when the previous unit of work was completed.

You can use this counter with the **Overall transaction data - Unit of work stop timestamp** counter to calculate the total elapsed time between COMMIT or ROLLBACK points, and with the **Overall transaction data - Unit of work start timestamp** counter to calculate the time spent in the application between units of work:

- For applications currently within a unit of work, this is the time at which the latest unit of work completed.
- For applications not currently within a unit of work (the application has completed a unit of work, but not yet started a new one), this is the stop time of...
the last unit of work that completed prior to the one that just completed. The stop time of the one just completed is indicated by the Overall transaction data - Unit of work stop timestamp counter.

- For applications within their first unit of work, this is the database connection request completion time.

**Plan** The plan name.

**Rollback Statements Attempted** The total number of SQL ROLLBACK statements that have been attempted.

A ROLLBACK can result from an application request, a DEADLOCK, or an error situation. This counter only includes the number of ROLLBACK statements issued from applications. For an application, this counter can help you determine the level of database activity for the application and the amount of conflict with other applications. For a database, it can help you determine the amount of activity in the database and the amount of conflict between applications running on the database.

**Note:** Try to minimize the number of rollbacks because higher rollback activity results in lower throughput for the database.

You can also use this counter to calculate the total number of units of work, by calculating the sum of the following:

\[\text{(Commit statements attempted) + (Internal commits) + (Rollback statements attempted) + (Internal rollbacks)}\]

**Row Selected** The number of rows that have been selected and returned to the application.

You can use this counter to gain insight into the current level of activity within the database. This counter does not include a count of rows read for actions, such as COUNT(*) or joins. For a federated system you can calculate the average time to return a row to the federated server from the data source:

\[\text{average time} = \frac{\text{rows returned}}{\text{aggregate query response time}}\]

You can use these results to modify CPU speed or communication speed parameters in $\text{SYS}CAT\text{.SER}VERS$. Modifying these parameters can impact whether the optimizer does or does not send requests to the data source.

**Sequence Number** Is incremented whenever a unit of work ends, that is, when a COMMIT or ROLLBACK terminates a unit of work.

Together with the Application ID counter, this counter uniquely identifies a transaction.

**Server Instance Name** The name of the database manager instance for which the snapshot was taken. If a system contains more than one instance of the database manager, this name is used to uniquely identify the instance for which the snapshot call was issued. Along with configuration NNAME at monitoring (server) node, this information can be useful if you are saving your monitor output in a file or database for later analysis, and you need to differentiate the data from different instances of the database manager.

**Time Stamp** The start time of this interval.
**Transaction ID** The unique transaction ID across all databases generated by a transaction manager in a two-phase commit transaction.

You can use this ID to correlate the transaction generated by the transaction manager with the transactions executed against multiple databases. In addition, it can help you diagnose transaction manager problems by tying database transactions that involve a two-phase commit protocol with the transactions that are originated by the transaction manager.

**Total Inbound Bytes Sent** The number of bytes (measured in 1000-byte increments) sent by the DB2 Connect gateway to the client, excluding communication protocol overhead, for example, TCP/IP or SNA headers. Use this counter to measure the throughput from the DB2 Connect gateway to the client.

**Total Host Response Time** For a DCS statement, this is the elapsed time between the time that the statement was sent from the DB2 Connect gateway to the host for processing and the time when the result was received from the host.

For a DCS database or DCS application, it is the sum of the elapsed times for all the statements that were executed for a particular database or application. For a data transmission, this is the sum of host response times for all the statements that used this many data transmissions. Use this counter with the **Overall transaction data - Total outbound bytes sent** and **Overall transaction data - Total out bytes received** counters to calculate the outbound response time (transfer rate):

\[
\frac{(\text{Total outbound bytes sent}) + (\text{Total out bytes received})}{\text{Total host response time}}
\]

**Total Outbound Bytes Received** The number of bytes (measured in 1000-byte increments) received by the DB2 Connect gateway from the host, excluding communication protocol overhead, for example, TCP/IP or SNA headers. For a data transmission, this is the number of bytes received by the DB2 Connect gateway from the host during the processing of all the statements that used this number of data transmissions. Use this counter to measure the throughput from the host databases to the DB2 Connect gateway.

**Total Outbound Bytes Sent** The number of bytes sent (measured in 1000-byte increments) by the DB2 Connect gateway to the host, excluding communication protocol overhead, for example, TCP/IP or SNA headers. For a data transmission, this is the number of bytes sent by the DB2 Connect gateway to the host during the processing of all the statements that used this number of data transmissions. Use this counter to measure the throughput from the DB2 Connect gateway to the host database.

**Total Statement Execution Elapsed Time** For a DCS statement, this is the elapsed time spent processing an SQL request on a host database server. This value is reported by this server. In contrast to the **Overall transaction data - Total host response time** counter, this counter does not include the network elapsed time between DB2 Connect and the host database server. At other levels, this value represents the sum of the host execution times for all the statements that were executed for a particular database or application, or for those statements that used a given number of data transmissions. Use this counter, along with other elapsed time monitor elements, to evaluate the processing of SQL requests by the database server and to help isolate performance issues. Subtract the value for this counter from the value for the **Overall transaction data - Total host response time** counter to calculate the network elapsed time between DB2 Connect and the host database server.
Uniqueness Value The instance number: When concatenated with the fully qualified network name, it uniquely identifies a distributed thread (DB2 field name: QWHSLUUV).

Uniqueness Value 2 The DB2 thread uniqueness value. For internal use.

Unit of Work Completion Status The status of the unit of work and how it stopped.

You can use this counter to determine if the unit of work ended due to a DEADLOCK or abnormal termination. It can be:

- Committed due to a commit statement
- Rolled back due to a rollback statement
- Rolled back due to a deadlock
- Rolled back due to an abnormal termination
- Committed at normal application termination
- Unknown as a result of a FLUSH EVENT MONITOR command for which units of work were in progress

Note: API users should refer to the sqlmon.h header file containing definitions of database system monitor constants.

Unit of Work Start Timestamp The date and time at which the unit of work first required database resources.

This resource requirement occurs at the first SQL statement execution of that unit of work:

- For the first unit of work, it is the time of the first database request (SQL statement execution) after the date and time that a connection request was granted.
- For subsequent units of work, it is the time of the first database request (SQL statement execution) after the previous COMMIT or ROLLBACK.

The database system monitor excludes the time spent between the COMMIT/ROLLBACK and the next SQL statement from its definition of a unit of work. This measurement method reflects the time spent by the database manager in processing database requests, separate from the time spent in the application before the first SQL statement of that unit of work. The unit-of-work elapsed time does include the time spent running the application between SQL statements within the unit of work. You can use this counter with the Overall transaction data - Unit of work stop timestamp counter to calculate the total elapsed time of the unit of work and with the Overall transaction data - Previous Unit of Work completion timestamp counter to calculate the time spent in the application between units of work. You can use the Overall transaction data - Unit of work stop timestamp and Overall transaction data - Previous Unit of Work completion timestamp counters to calculate the elapsed time for a unit of work.

Unit of Work Stop Timestamp The date and time at which the most recent unit of work completed, which occurs when database changes are committed or rolled back.

You can use this counter with the Overall transaction data - Previous Unit of Work completion timestamp counter to calculate the total elapsed time between COMMIT or ROLLBACK points, and with the Overall transaction data - Unit of
**work start timestamp** counter to calculate the elapsed time of the latest unit of work. The timestamp contents are set as follows:

- When the application has completed a unit of work and has not yet started a new one (as defined by the **Overall transaction data - Unit of work start timestamp** counter). This counter is a valid, nonzero timestamp.
- When the application is currently executing a unit of work, this counter contains zeros.
- When the application first connects to the database, this counter is set to the connection completion time.

As a new unit of work is started, the contents of this counter are moved to the **Overall transaction data - Previous Unit of Work completion timestamp** counter.

**User Login ID** Shows the ID that the user specified when logging in to the operating system. This ID differs from authorization ID, which the user specifies when connecting to the database. You can use this counter to determine the operating system user ID of the individual running the application that you are monitoring.

**DB2 Connect Server at Thread Level Package Attributes**

Use **DB2 Connect Server at Thread Level Package attributes** to create situations that identify any statement with long elapsed time.

**Ace Address** The DB2 thread ACE address for internal use.

**Application ID** The ID that is generated when the application connects to the database at the database manager or when Distributed Database Connection Services (DDCS) receives a request to connect to a DRDA database. It is known at both the client and the server, so you can use it to correlate the client and server parts of the application. For DDCS applications, you will also need to use the **Outbound Application ID** to correlate the client and server parts of the application.

**Application Name** The name of the application running at the client as known to the database manager or DB2 Connect. Together with the **Application ID** counter, it can be used to relate data items with your application.

**Authorization ID** The authorization ID.

**Authid (Unicode)** The authorization ID.

**Corrid** The correlation ID.

**DB2 Connect Server at Thread Level Package Attributes** Identifies the connection of an application to a DB2 system.

It is an alphanumeric text string, with a maximum length of eight characters.

**DB2 ID** The DB2 subsystem ID.

**Gateway Snapshot Time** The date and time at which the database system monitor information was collected.

**IP Address** The current IP address.

**Max Data Rcvd** The number of statements with outbound bytes received.
The following are valid ranges:

128 1 through 128 statements with outbound bytes received.

256 129 through 256 statements with outbound bytes received.

512 257 through 512 statements with outbound bytes received.

1024 513 through 1024 statements with outbound bytes received.

2048 1025 through 2048 statements with outbound bytes received.

4096 2049 through 4096 statements with outbound bytes received.

8192 4097 through 8193 statements with outbound bytes received.

16384 8194 through 16384 statements with outbound bytes received.

31999 16385 through 31999 statements with outbound bytes received.

64000 32000 through 64000 statements with outbound bytes received.

GT64K Greater than 64000 statements with outbound bytes received.

Use this counter to get a better idea of the database activity and network traffic at a database or application.

Max Data Sent The number of statements with outbound bytes sent.

The following are valid ranges:

128 1 through 128 statements with outbound bytes sent.

256 129 through 256 statements with outbound bytes sent.

512 257 through 512 statements with outbound bytes sent.

1024 513 through 1024 statements with outbound bytes sent.

2048 1025 through 2048 statements with outbound bytes sent.

4096 2049 through 4096 statements with outbound bytes sent.

8192 4097 through 8193 statements with outbound bytes sent.

16384 8194 through 16384 statements with outbound bytes sent.

31999 16385 through 31999 statements with outbound bytes sent.

64000 32000 through 64000 statements with outbound bytes sent.

GT64K Greater than 64000 statements with outbound bytes sent.

Use this counter to get a better idea of the database activity and network traffic at a database or application.
Max Time The number of statements whose network time was within the indicated time range. Network time is the difference between the host response time and the elapsed execution time for a statement.

The following are valid network time ranges:

**2 ms** Less than, or equal to, 2 milliseconds.

**4 ms** Greater than 2 milliseconds but less than, or equal to, 4 milliseconds.

**8 ms** Greater than 4 milliseconds but less than, or equal to, 8 milliseconds.

**16 ms** Greater than 8 milliseconds but less than, or equal to, 16 milliseconds.

**32 ms** Greater than 16 milliseconds but less than, or equal to, 32 milliseconds.

**GT32 ms** Greater than 32 milliseconds.

Use this counter to get a better idea of the database activity and network traffic at a database or application.

MVSID The MVS system identifier.

Name The name in the database manager configuration file at the client node. It identifies the client node that is running the application.

Originating System ID The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

Outbound Application ID This ID is generated when the application connects to the DRDA host database. It is used to connect the DB2 Connect gateway to the host, while the application ID is used to connect a client to the DB2 Connect gateway.

Outbound Application ID Internal The interval for the Outbound Application ID.

Outbound Data Received The number of bytes received by the DB2 Connect gateway from the host, excluding communication protocol overhead, for example, TCP/IP or SNA headers. For a data transmission, this is the number of bytes received by the DB2 Connect gateway from the host during the processing of all the statements that used this number of data transmissions.

Use this counter to measure the throughput from the host databases to the DB2 Connect gateway.

Outbound Data Received Bottom The lowest number of bytes received per statement by the DB2 Connect gateway from the host during the processing of all the statements against this DCS database, or in this DCS application, that used this number of data transmissions.

Use this counter in conjunction with Outbound Data Received counter as another parameter that illustrates the throughput from the host database to the DB2 Connect gateway.
**Outbound Data Received Top** The maximum number of bytes received per statement by the DB2 Connect gateway from the host during the processing of all the statements against this DCS database, or in this DCS application, that used this number of data transmissions.

Use this counter in conjunction with **Outbound Data Received** counter as another parameter that illustrates the throughput from the host database to the DB2 Connect gateway.

**Outbound Data Sent** The number of bytes sent by the DB2 Connect gateway to the host, excluding communication protocol overhead, for example, TCP/IP or SNA headers. For a data transmission, this is the number of bytes sent by the DB2 Connect gateway to the host during the processing of all the statements that used this number of data transmissions.

Use this counter to measure the throughput from the DB2 Connect gateway to the host database.

**Outbound Data Sent Bottom** The lowest number of bytes sent per statement by the DB2 Connect gateway to the host during the processing of all the statements against this DCS database, or in this DCS application, that used this number of data transmissions.

Use this counter in conjunction with **Outbound Data Sent** counter as another parameter that illustrates the throughput from the DB2 Connect Gateway to the host database.

**Outbound Data Sent Top** The maximum number of bytes sent per statement by the DB2 Connect gateway to the host during the processing of all the statements against this DCS database, or in this DCS application, that used this number of data transmissions.

Use this counter in conjunction with **Outbound Data Sent** counter as another parameter that illustrates the throughput from the DB2 Connect Gateway to the host database.

**Plan** The plan name.

**Server Instance Name** The name of the database manager instance for which the snapshot was taken.

**Time Stamp** The start time of this interval.

**Uniqueness Value** The instance number: When concatenated with the fully qualified network name, it uniquely identifies a distributed thread (DB2 field name: QWHSLUUV).

**Uniqueness Value 2** The DB2 thread uniqueness value. For internal use.

**DB2 DDF CONV Attributes**

Use the DB2 DDF CONV attributes to create situations to monitor conversation (connection between two transaction programs) information.

**Conversation LOGMODE** The conversation ID (LOGMODE Name). It is an alphanumeric text string, with a maximum length of eight characters.
**Conversation LUNAME** The conversation ID (LUNAME Name). It is an alphanumeric text string, with a maximum length of eight characters.

**Conversation Utilization** The percentage of maximum conversations that is currently in use. Valid entry ranges from 0.0 to 100.0.

**Conversation Waits** The count of processes waiting because the conversation limit has been reached.

**Conversations In Use** The current count of conversations.

**Conversations Max** The maximum number of concurrent conversations allowed as derived from CNOS.

**Conversations Other Limit** The maximum number of concurrent conversations defined in CDB.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Time** The date and time, as set on the monitored system, indicating the instance when the agent collects information.

The timestamp format for SCAN and STR functions is CYYMMDDHHMMSSmmm (as in 1180315064501000 for 03/15/18 06:45:01) where:

- C = Century (0 for 20th, 1 for 21st)
- Y = Year
- M = Month
- D = Day
- H = Hour
- M = Minute
- S = Second
- m = Millisecond

**DB2 DDF STAT Attributes**
Use the DB2 DDF STAT attributes to create situations to monitor Distributed Database Facility statistics.

**Aborts Received** The number of aborts received from remote location.

**Aborts Sent** The number of aborts sent to remote location.

**Agent Elapsed Time** The elapsed time at the local site spent processing for the remote site (in units that represent tenths of seconds).

**Block Mode Switches** The count of block mode switches performed.

**Blocks Received** The blocks received from remote location.

**Blocks Sent** The blocks sent to remote location.

**Commits Received** The number of commits received from remote location.
Commits Sent The number of commits sent to remote location.

Conversations Initiated Local The number of conversations initiated by local side of connection.

Conversations Initiated Remote The number of conversations initiated by remote side of connection.

Conversations Allocated The conversations allocated.

Conversations Deallocated The conversations deallocated.

Conversations Queued The number of conversations queued.

Coordinator Backouts Received The number of backout requests received from coordinator (2-phase commit only).

Coordinator Backouts Sent The number of backout requests sent to the coordinator (2-phase commit only).

Coordinator Commits Received The number of commit requests received from coordinator (2-phase commit only).

Coordinator Commits Sent The number of commit requests sent to the coordinator (2-phase commit only).

Coordinator Forgets Sent The number of forget response requests sent to the coordinator (2-phase commit only).

Data Bytes Received The number of data bytes received from the remote location.

Data Bytes Sent The number of data bytes sent to the remote location.

Data Rows Received The number of data rows received from the remote location.

Data Rows Sent The number of data rows sent to the remote location.

DB Access CPU Time The database access agent CPU time at the remote site (in units that represent milliseconds).

Directed Access The type of directed access.

Elapsed DB Access The elapsed database access agent time at the remote site (in units that represent tenths of seconds).

Interval Time The number of seconds since last sample (in units that represent seconds).

Last Agent Request Received The number of last agent requests received from initiator (2-phase commit only).

Last Agent Request Sent The number of last agent requests sent to coordinator (2-phase commit only).

Local Elapsed Time The elapsed time, in tenths of a second, for local thread (in units that represent tenths of seconds).
Maximum Conversations  The maximum conversations allowed.

Message Buffer Rows  The message buffer rows.

Messages Received  The number of messages received from remote location.

Messages Sent  The number of messages sent to remote location.

Originating System ID  The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

Participant Backouts Received  The number of backout requests received from participant (2-phase commit only).

Participant Backouts Sent  The number of backout requests sent to the participant (2-phase commit only).

Participant Commits Received  The number of commit requests received from participant (2-phase commit only).

Participant Commits Sent  The number of commit requests sent to the participant (2-phase commit only).

Participant Forgets Received  The number of forget requests received from participant (2-phase commit only).

Prepare Requests Received  The number of prepare requests received from participant (2-phase commit only).

Prepare Requests Sent  The number of prepare requests sent to participant (2-phase commit only).

Protocol Used  The protocol used for this conversation. It is an alphanumeric text string, with a maximum length of 12 characters.

Remote Binds  The binds from remote access.

Remote Commit Operations  The number of commit operations performed with the remote location as COORD.

Remote CPU Time  The CPU time for remote system in milliseconds (in units that represent milliseconds).

Remote Elapsed Time  The elapsed time for remote thread in tenths of a second (in units that represent tenths of seconds).

Remote In Doubt Threads  The number of threads that went in doubt with the remote location as COORD.

Remote Location Name  The name of the remote system to which this thread is connected. It is an alphanumeric text string, with a maximum length of 12 characters.
**Remote Logical Unit Name** The LUNAME of the connection to the remote DB2 system. It is an alphanumeric text string, with a maximum length of eight characters.

**Remote Product ID** The remote product ID. It is an alphanumeric text string, with a maximum length of eight characters.

**Remote Rollback Operations** The number of rollback operations performed with the remote location as COORD.

**SQL Calls Received** The number of SQL calls received from the remote location.

**SQL Calls Sent** The number of SQL calls made to the remote location.

**Thread Token** The attribute that ties this entry to the owning thread by using the thread token as a foreign key.

**Time** The date and time, as set on the monitored system, indicating the instance when the agent collects information.

The timestamp format for SCAN and STR functions is `CYYMMDDHHMMSSmmm` (as in 1180315064501000 for 03/15/18 06:45:01) where:

- **C** = Century (0 for 20th, 1 for 21st)
- **Y** = Year
- **M** = Month
- **D** = Day
- **H** = Hour
- **M** = Minute
- **S** = Second
- **m** = Millisecond

**Transactions Received** The number of Transactions received from remote location.

**Transactions Sent** The number of transactions sent to remote location.

**DB2 GBP CF Statistics Attributes**

**Changed Page Write Hit Counter Secondary GBP** The number of successful coupling facility write requests for changed pages (Field name: QW02542W).

**Changed Page Write Hit Counter** This is the number of times a coupling facility write request for a changed page successfully completed (Field name: QW0254WH).

**Clean Page Write-Hit Counter** This is the number of times a coupling facility write request for a clean page completed successfully (Field name: QW0254WC).

**DB2 Subsystem** The DB2 subsystem ID.

**DB2 Version** The DB2 version.

**DSG Member Name** The Data Sharing Group (DSG) member name.
Data Entry Counter of Secondary GBP  The data-entry counter for the secondary group buffer pool (GBP). This is the snapshot value of the number of allocated data entries (Field name: QW02542T).

Data Entry Reclaim Counter  This is the number of times a name assignment required that a data page must be reclaimed by the coupling facility (Field name: QW0254TR).

Data Sharing Group  The data sharing group name.

Dir Counter for Secondary Group Buffer Pool  The directory-entry counter for the secondary group buffer pool. This is the snapshot value of the number of allocated directory entries (Field name: QW02542D).

Directory Entry Reclaim Counter  This is the number of times a name assignment required that a directory entry must be reclaimed by the coupling facility (Field name: QW0254DR).

Explicit XI Requests  This is the number of times that a request was made to the coupling facility to explicitly cross-invalidate a page. XI signals were sent because the named page was cached in one or more DB2 buffer pools (Field name: QW0254CI).

Global Group Buffer Pool Name  The name of the global group buffer pool for which statistics are reported (Field name: QW0254GC).

Global Group Buffer Pool ID  The number of the global group buffer pool for which statistics are reported (Field name: QW0254GN).

Interval Start  The start time of this interval.

MVS System ID  The MVS identifier.

Number of Allocated Data Entries (snapshot)  This is the number of data entries allocated for the coupling facility cache structure (DB2 group buffer pool). Data entries are the actual places where the data page resides. This is a snapshot value and is not affected by whether this is an incremental or cumulative display (Field name: QW0254TE).

Number of Allocated Directory Entries (Snapshot)  This is the number of directory entries allocated for the coupling facility cache structure (DB2 group buffer pool). A directory entry contains control information for one database page. A directory entry is used by the coupling facility to determine where to send cross-invalidation signals when a page of data is changed or when the directory entry must be reused. This is a snapshot value and is not affected by whether this is an incremental or cumulative display (Field name: QW0254DE).

Number of Castout Operations Performed  This is the number of castout operations performed. Castout is the process of writing pages from the group buffer pool to DASD (Field name: QW0254CC).

Number of Data Entries in Changed State  The total changed counter. This is the snapshot value of the current number of changed pages. The displayed value of this counter is not affected by whether this is an incremental or cumulative display (Field name: QW0254WH).
Originating System The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

Read Count The total read count (Field name: SW254RDC).

Read Hit Counter This is the number of times that a page was returned on a coupling facility read request (Field name: QW0254RH).

Read Hit Percent The percentage of read hits (Field name: SW254RHR).

Read Miss Directory Hit Counter This is the number of times that a coupling facility read request specified a page for which a directory entry exists, but no data was cached for that page (Field name: QW0254RD).

Read Miss Assignment Suppressed Counter This is the number of times that a coupling facility read request specified a page for which no directory entry exists and no directory entry is created. DB2 does not create a directory entry when it does not need to register the page to the coupling facility for cross-invalidation (XI) because no other DB2 in the group has R/W interest in the page set or partition. This counter also represents the number of times that pages are deregistered due to buffer stealing (Field name: QW0254RS).

Read Miss Cache Full Counter This is the number of times that a coupling facility read request specified a page for which no directory entry exists and no directory entry is created because of a lack of storage in the group buffer pool. A nonzero value in this field indicates that the backing coupling facility cache structure size might be too small to support the current workload (Field name: QW0254RF).

Read Miss Name Assigned This is the number of times that a coupling facility read request specified a page for which a directory entry was created (Field name: QW0254RN).

Total Changed Counter for Secondary GBP This is the snapshot value of the number of allocated data entries that are currently in changed state (Field name: QW02542C).

Write Miss Secondary Cache Full Counter This is the number of coupling facility write requests that could not complete because of insufficient coupling facility storage resources (Field name: QW02542F).

Write Miss Cache Full Counter This is the number of times a coupling facility write request was not completed because of a lack of storage in the group buffer pool. A value in this field indicates that the data page resources of the coupling facility are being consumed faster than the DB2 castout process can free them. For more information about alleviating this condition refer to DB2 data sharing, planning and administration (Field name: QW0254WF).

XI Directory Entry Reclaim Counter This is the number of times a directory entry was reclaimed (stolen) and cross-invalidation (XI) signals had to be sent (that is, the stolen directory entry had registered DB2 interest). A high number might indicate a problem. Check the group buffer pool hit ratio to determine if the lack of directory entries might be causing excessive reads from the group buffer pool (Field name: QW0254XR).

DB2 Group Buffer Pool (GBP) Attributes

Use these attributes to view the DB2 group buffer pool (GBP).
**Asynch GBP Requests** The number of asynchronous requests for the primary group buffer pool (Field name: QBGLHS).

**Castout Class Threshold** The number of times group buffer pool castout was initiated because the class castout threshold was detected (Field name: QBGLCT).

**Clean Pages Written Async** The number of clean pages asynchronously written to the group buffer pool (Field name: QBGLAC).

**DB2 Subsystem** The DB2 subsystem ID.

**DB2 Version** The DB2 version.

**DSG Member Name** The Data Sharing Group (DSG) member name.

**Data Sharing Group** The Data Sharing Group name.

**Delete Name** The number of group buffer pool requests to delete all directory and data entries for a page set or partition. DB2 issues this request when it converts a page set or partition from GBP-dependent to non GBP-dependent. For objects defined with GBPCACHE ALL, DB2 issues this request when the first DB2 member opens the object (Field name: QBGLDN).

**Explicit Cross-Invalidation** The number of explicit cross-validations (Field name: QBGLEX).

**GBP Checkpoints Triggered** The number of group buffer pool checkpoints triggered by this member (Field name: QBGLCK).

**Group Buffer Castout Threshold** The number of times group buffer pool castout was initiated because the group buffer pool castout threshold was detected (Field name: QBGLGT).

**Group Buffer Pool ID** The group buffer pool ID (Field name: QBGLGN).

**Group Buffer Pool Name** The group buffer pool name (Field name: QBGLGNC).

**Hit Ratio** The hit ratio (Field name: SGBPHITP).

**Interval Start** The start time of this interval.

**MVS System ID** The MVS identifier.

**Number of Write and Register requests** The number of write and register (WAR) requests. one page is written for each request (Field name: QBGLWS).

**Originating System** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; example, DB91:SYS1:DB2.

**Page Locks For Data Pages** The number of page P-lock requests for data pages (Field name: QBGLP2).

**Page Locks For Index Pages** The number of page P-lock requests for index leaf pages (Field name: QBGLP3).
**Page Locks For Space Maps** The number of page P-lock requests for space map pages (Field name: QBGLP1).

**Page P-Lock Suspensions for Space Maps** The number of page P-lock suspensions for space map pages (Field name: QBGLS1).

**Page P-Lock Suspensions for Data Pages** The number of page P-lock suspensions for data pages (Field name: QBGLS2).

**Page P-Lock Suspensions for Index Leaf Pages** The number of page P-lock suspensions for index leaf pages (Field name: QBGLS3).

**Page Unlocks** The number of page P-lock unlock requests (DB2 field name: QBGLU1).

**Page in Write Around** The number of changed pages that were written to disk through group buffer pool write-around due to conditional write failures to the group buffer pool (Field name: QBGLWA).

**Pages Castout** The number of pages cast out from the group buffer pool to DASD (DB2 field name: QBGLRC).

**Pages Written Via WARM** The number of pages that were written using write and register multiple (Field name: QBGLWP).

**Participate in GBP rebuild** The number of coupling facility requests to write changed pages to the secondary group buffer pool for duplexing (Field name: QBGL2W).

**Read Castout Class** The number of coupling facility requests to read the castout class (Field name: QBGLCC).

**Read Castout Statistics** The number of coupling facility requests to read the castout statistics (Field name: QBGLCS).

**Read Directory Info** The number of coupling facility requests to read directory information (Field name: QBGLRD).

**Read Storage Statistics** The number of coupling facility requests to read storage statistics. The group buffer pool structure owner issues this request once for each checkpoint (Field name: QBGLOS).

**Read for Castout Multiple Requests** The number of read-for-castout-multiple requests. Each request is for multiple pages (Field name: QBGLCM).

**Read for Castout Requests** The number of read-for-castout requests. Each request is for a single page (Field name: QBGLCR).

**Reads Prefetch Changed Pages Read After Register** The number of coupling facility reads to retrieve a changed page from the group buffer pool as a result of feedback from the request to register a page list. See Reads Prefetch Register Page List Request (QBGLAX). This field refers to DB2 field name: QBGLAY.
**Reads Prefetch Register Page List Request** The number of requests to register a page list in the coupling facility. DB2 prefetch can do this only if the group buffer pool is allocated in a coupling facility with CFLEVEL=2 or above (Field name: QBGLAX).

**Register Page** The number of coupling facility requests to register a page (Field name: QBGLRG).

**Secondary Async GBP Requests** The number of asynchronous requests for the secondary group buffer pool (Field name: QBGL2H).

**Secondary Delete Name List** The number of group buffer pool requests to the secondary group buffer pool to delete a list of pages after they were cast out from the primary group buffer pool (Field name: QBGL2D).

**Secondary Delete Name** The number of group buffer pool requests to delete a page from the secondary group buffer pool (Field name: QBGL2N).

**Secondary Read Castout Statistics** The number of coupling facility requests to read the castout statistics for the secondary group buffer pool (Field name: QBGL2R).

**Sync read XI Data returned** The number of synchronous coupling facility read requests caused by the buffer that is marked invalid. Data is returned from the group buffer pool (Field name: QBGLXD).

**Sync read XI No data returned** The number of synchronous coupling facility read requests caused by the buffer that is marked invalid. Data is not returned from the group buffer pool and a directory entry is created if it does not already exist. This means another DB2 in the group has R/W interest in the page set or partition (Field name: QBGLXR).

**Synch read (not found) No data returned** The number of synchronous coupling facility reads necessary because the requested page was not found in the buffer pool to which data was not returned (Field name: QBGLMR).

**Synchronous read (not found) Data returned** The number of synchronous coupling facility reads necessary because the requested page was not found in the buffer pool to which data was returned from the group buffer pool (Field name: QBGLMD).

**Total P-Lock Negotiations** The sum of all page P-lock lock negotiations (Field name: SBGLPLN).

**Total P-Lock Negotiations Data Pages** The number of page P-lock negotiations for data pages (Field name: QBGLN2).

**Total P-Lock Negotiations Index leaf Pages** The number of page P-lock negotiations for index leaf pages (Field name: QBGLN3).

**Total P-Lock Negotiations Space Map Pages** The number of page P-lock negotiations for space map pages (Field name: QBGLN1).

**Total Lock Suspensions** The sum of all page P-lock lock suspensions (Field name: SBGLPLS).
Total P-Page Lock Requests The sum of all page P-lock lock requests (DB2 field name: SBGLPLR).

Unlock Castout The number of coupling facility requests to unlock the castout lock on the pages (Field name: QBGLUN).

Unregister Page The number of coupling facility requests to unregister a page (Field name: QBGLDG).

Write Failed No Storage The number of coupling facility write requests that could not complete because of a lack of coupling facility storage resources (Field name: QBGLWF).

Write and Register Multiple requests The number of write and register multiple (warm) requests. Multiple pages are written for each request (Field name: QBGLWM).

Writes Changed pages Written async The number of changed pages asynchronously written to the group buffer pool under a system execution unit (DB2 field name: QBGLAW).

Writes Changed pages Written sync The number of changed pages synchronously written to the group buffer pool under a user’s execution unit (Field name: QBGLSW).

Writes Clean pages Written sync The number of clean pages synchronously written to the group buffer pool under a user’s execution unit (Field name: QBGLWC).

DB2 Group Coupling Facility Attributes
Use the DB2 Group Coupling Facility attributes to create situations that determine the excess usage and reduced availability of group coupling facility structures.

Data Sharing Group The name of a data sharing group. It is an alphanumeric text string, with a maximum of 8 characters; for example, TDDB241G.

DB2 Change Requests The number of change requests for P-locks. Valid value is an integer in the range 0 - 99999999.

DB2 False Contention Provides a global view of false contentions for all DB2 systems in a data sharing group. The formula is the number of false contentions divided by the total number of global contentions, multiplied by 100. Valid value is an integer in the range 0 - 99999999.

DB2 False Suspends The number of suspends because of MVS XES (Cross-system Extended Services) false contention. Valid value is an integer in the range 0 - 99999999.

DB2 Global Contention Provides a global view of global contentions for all DB2 systems in a data sharing group. The formula is the total number of suspends because global contention divided by the total number of XES requests, multiplied by 100. Valid value is an integer in the range 0 - 99999999.

DB2 IRLM Suspends The number of suspends because of IRLM global resource contentions. This occurs when IRLM states are in conflict and require inter-system communication for resolution. Valid value is an integer in the range 0 - 99999999.
**DB2 Lock Requests** The number of lock requests for P-locks. Valid value is an integer in the range 0 - 99999999.

**DB2 Unlock Requests** The number of unlock requests for P-locks. Valid value is an integer in the range 0 - 99999999.

**DB2 XESSuspends** The number of suspends because MVS XES global resource contentions that are not IRLM-level contention. This occurs when XES lock states are in conflict but the IRLM lock states are not in conflict. Valid value is an integer in the range 0 - 99999999.

**False Contention** The number of contentions that the IRLM thought were competing for the same database resource. Valid value is an integer in the range 0 - 99999999.

Usage: An IRLM subsystem identifies a contention but grants a lock to a contending IRLM subsystem because the contending IRLM is requesting access to a different segment in the database.

**False Contention Rate** The number of false contentions divided by the number of seconds during the collection interval. Valid value is an integer in the range 0 - 99999999.

**Global Contention** The total number of contentions competing for the same database resource. Valid value is an integer in the range 0 - 99999999.

**Global Contention Rate** The number of contentions divided by the number of seconds during the collection interval. Valid value is an integer in the range 0 - 99999999.

**IDNAME** An internal attribute used for navigation, it contains either the Data Sharing Group Name or the DB2ID.

**List Entries Allocated** The total number of list entries that a DB2 system has allocated for the LOCK1 coupling facility structure. Valid value is an integer in the range 0 - 99999999.

**List Entries Percent** The number of list entries that IRLM is currently using divided by the number of list entries that DB2 has allocated. Valid value is an integer in the range 0 - 100.

**List Entries Used** The total number of list entries IRLM is currently using for the LOCK1 coupling facility structure. Valid value is an integer in the range 0 - 99999999.

**Lock Entries Allocated** The total number of lock entries that a DB2 system has allocated for the LOCK1 coupling facility structure. Valid value is an integer in the range 0 - 99999999.

**Lock Entries Percent** The number of lock entries that IRLM is currently using divided by the number of lock entries DB2 has allocated. Valid value is an integer in the range 0 - 100.

**Lock Entries Used** The total number of lock entries IRLM is currently using for the LOCK1 coupling facility structure. Valid value is an integer in the range 0 - 99999999.
**Number of Indexes** Identifies the number of indexes.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Structure Connect Count** The number of active connections to a structure. Valid value is an integer in the range 0 - 16.

**Structure Name** The name of a DB2 coupling facility structure. It is an alphanumeric text string, with a maximum of 16 characters; for example, TDDB241G.SCA.

**Structure Size** The size, in kilobytes, of a DB2 coupling facility structure. Valid value is an integer in the range 0 - 99999999.

**Structure Status** The current status of the coupling facility structure. Valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACTIVE</td>
<td>The structure is active</td>
</tr>
<tr>
<td>INACTIVE</td>
<td>The structure is inactive</td>
</tr>
</tbody>
</table>

For duplexed group buffer pool structures, additional valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>REB_NEW</td>
<td>Rebuild on new (secondary GBP)</td>
</tr>
<tr>
<td>REB_OLD</td>
<td>Rebuild on old (primary) GBP</td>
</tr>
<tr>
<td>REB_TRAN</td>
<td>Structure is in transition</td>
</tr>
<tr>
<td>REB_HOLD</td>
<td>Structure is in holding state</td>
</tr>
<tr>
<td>REB_ERR</td>
<td>Error during the structure rebuild</td>
</tr>
</tbody>
</table>

**Structure Type** The type of DB2 coupling facility structure. Valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CACHE</td>
<td>Cache data of interest to several DB2 systems in data sharing group</td>
</tr>
<tr>
<td>LIST</td>
<td>Shared Communications Area (SCA) for data sharing group members</td>
</tr>
<tr>
<td>LOCK</td>
<td>Controls locking</td>
</tr>
</tbody>
</table>

**Structure Used** The number of kilobytes that DB2 uses within a structure type. Valid value is an integer in the range 0 - 99999999.

**Structure Used Percent** The percent of the total available kilobytes that DB2 is currently using within a structure type. Valid value is an integer in the range 0 - 100.
**Time Stamp** Represents the end of data collection or the end of an interval, and is the local time where the system is running.

Valid format is MM-DD-YY HH:MM:SS, where:
- M = Month
- D = Day
- Y = Year
- H = Hour
- M = Minute
- S = Second

For example, 07-16-18 14:58:29 indicates that data collection ended on July 16th, 2018, at 14:58:29 PM.

**DB2 IMS Connections Attributes**
Use the DB2 IMS Connections attributes to create situations to monitor DB2 thread activity originating from connected IMS subsystems.

**Active Threads** The count of threads currently active for this IMS region.

**Connected Dependent Regions** The count of dependent regions currently connected to this DB2 system.

**Defined Dependent Regions** The count of defined dependent regions for this IMS connection.

**IMS Name** The ID for this IMS connection. It is an alphanumeric text string, with a maximum length of four characters.

**IMS Version** The version of the IMS system. It is an alphanumeric text string, with a maximum length of four characters.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Time** The date and time, as set on the monitored system, indicating the instance when the agent collects information.

The timestamp format for SCAN and STR functions is CYYMMDDHHMMSSmmm (as in 118031506450100 for 03/15/18 06:45:01) where:
- C = Century (0 for 20th, 1 for 21st)
- Y = Year
- M = Month
- D = Day
- H = Hour
- M = Minute
- S = Second
- m = Millisecond

**Unconnected Regions** The number of regions not connected.
DB2 IMS Regions Attributes
Use the DB2 IMS Regions attributes to create situations to monitor IMS dependent regions.

Application Name The PSB name active in the IMS dependent region. This field applies only to dependent regions (not to the control region). It is an alphanumeric text string, with a maximum length of eight characters.

Command Recognition Character The command recognition character used to pass commands to the external subsystem. It is an alphanumeric text string, with a maximum length of four characters.

Connection Status The region connection status.

Error Option Specification The type of error option specification in use.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>R</td>
<td>The appropriate return code is sent to the application, and the SQL code is returned.</td>
</tr>
<tr>
<td>Q</td>
<td>The application is abended. This is a PSTOP transaction type. The input transaction is re-queued for processing and new transactions are queued.</td>
</tr>
<tr>
<td>A</td>
<td>The application is abended. This is a STOP transaction type. The input transaction is discarded and new transactions are not queued.</td>
</tr>
</tbody>
</table>

It is an alphanumeric text string, with a maximum length of four characters.

IMS Name The ID for this IMS connection. Valid entry is an alphanumeric text string, with a maximum length of four characters.

IMS Version The version of the IMS system. Valid entry is an alphanumeric text string, with a maximum length of four characters.

Interface Control Module The name of the interface control module. It is an alphanumeric text string, with a maximum length of eight characters.

Language Token Interface The name of the language interface token. It is an alphanumeric text string, with a maximum length of four characters.

Originating System ID The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

Region Name The region started task name. It is an alphanumeric text string, with a maximum length of eight characters.

Region Type The type of IMS region.

Resource Translation Table The name of the resource translation table. This table maps the IMS application names into DB2 plan names. If this entry is omitted, the DB2 plan name is the IMS application program name. It is an alphanumeric text string, with a maximum length of eight characters.
**Status** The current DB2 status of the thread. Valid entry is an alphanumeric text string, with a maximum length of 12 characters.

Valid values are:

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NOT-AVAIL</td>
<td>The thread is not available.</td>
</tr>
<tr>
<td>IN-ABORT</td>
<td>The thread is in abort processing.</td>
</tr>
<tr>
<td>IN-ACCEL</td>
<td>The thread is executing on IBM DB2 Analytics Accelerator for z/OS.</td>
</tr>
<tr>
<td>IN-AUTO-PROC</td>
<td>The thread is processing an autonomous procedure.</td>
</tr>
<tr>
<td>IN-BIND-DYNM</td>
<td>The thread is in dynamic bind processing.</td>
</tr>
<tr>
<td>IN-BIND-STAT</td>
<td>The thread is in static bind processing.</td>
</tr>
<tr>
<td>IN-COMMAND</td>
<td>Command threads display this status when they are active in DB2 and</td>
</tr>
<tr>
<td></td>
<td>executing within the DB2 command processor. (This type of thread always</td>
</tr>
<tr>
<td></td>
<td>has a blank plan name.)</td>
</tr>
<tr>
<td>IN-COMMIT</td>
<td>The thread is in Commit processing (applies only to threads that originate</td>
</tr>
<tr>
<td></td>
<td>from an attachment that does not use two-phase-commit protocol).</td>
</tr>
<tr>
<td>IN-COMT-PHS1</td>
<td>The thread is in Commit phase 1 processing.</td>
</tr>
<tr>
<td>IN-COMT-PHS2</td>
<td>The thread is in Commit phase 2 processing.</td>
</tr>
<tr>
<td>IN-CRTE-THRDM</td>
<td>The thread is in Create Thread processing.</td>
</tr>
<tr>
<td>IN-DB2</td>
<td>The thread is executing in DB2. A more descriptive status could not be</td>
</tr>
<tr>
<td></td>
<td>determined.</td>
</tr>
<tr>
<td>INDOUBT</td>
<td>The thread is in doubt.</td>
</tr>
<tr>
<td>IN-SIGNON</td>
<td>The thread is in signon processing. This status applies only to threads</td>
</tr>
<tr>
<td></td>
<td>originating from CICS or IMS attachments.</td>
</tr>
<tr>
<td>IN-SQL-CALL</td>
<td>The thread is processing an SQL call.</td>
</tr>
<tr>
<td>IN-SQL-SORT</td>
<td>The thread is executing an SQL call and is doing the sort processing</td>
</tr>
<tr>
<td></td>
<td>required to satisfy the call’s request.</td>
</tr>
<tr>
<td>IN-STOR-PROC</td>
<td>The thread is currently running in a stored procedure.</td>
</tr>
</tbody>
</table>
IN-TERM-THRD
The thread is in termination as a result of allied task termination. This status corresponds to DB2 DISPLAY THREAD=D status.

IN-TRIGGER
The thread is currently running in a trigger.

IN-USER-FUNC
The thread is currently running a user-defined function.

NOT-IN-DB2
The thread is not currently executing in DB2.

SP/UDF-INACT
The thread is trying but not able to run in a stored procedure or user-defined function.

SWAPPED-OUT
The thread is not currently executing in DB2. The thread originating address space is swapped out.

WAIT-ARCHIVE
The thread is waiting for an archive log tape mount necessary during thread abort processing.

WAIT-ARCREAD
The thread is currently waiting for read of archive log from tape.

WAIT-ASYNCRD
The thread is currently waiting for completion of a read I/O that is being done under a thread other than this one (for example, sequential or List Prefetch).

WAIT-ASYNCWR
The thread is currently waiting for completion of Write I/O that is being done under a thread other than this one (for example, Deferred Writes).

WAIT-CONVLIM
The distributed thread is in a synchronous wait because the conversation limit has been reached for its designated logmode.

WAIT-CTHREAD
The thread is queued in Create Thread processing because DB2 reached the CTHREAD value. This status corresponds to DB2 DISPLAY THREAD=QD status.

WAIT-GLBLOCK
The thread is currently waiting for either:
- Inter-system communication within the data sharing group to determine if there is lock contention.
- A lock held by another subsystem in the data sharing group.

WAIT-LOCK
The thread is waiting for a lock.

WAIT-MSGSEND
The thread is waiting because of inter-system message sending contention.

WAIT-REMREQ
The database access thread is in a synchronous wait (waiting for a response or a request from the originating DB2 subsystem).
WAIT-REMSQL
The distributed allied thread is in a synchronous wait (waiting for a response from the remote DB2 subsystem being accessed).

WAIT-REUSE
The thread is not currently in use and is waiting to be reused. This status applies only to CICS and IMS threads.

WAIT-SERVICE
The thread is currently waiting for completion of a DB2 service. Types of DB2 services include: open/close of a dataset, DFHSM recall of a dataset, SYSLGRNG update or define/extend/delete of a dataset, rollback, and Commit phase 2 for read only threads.

WAIT-SP-STOP
The thread is queued waiting for a stopped stored procedure.

WAIT-TERM-TH
The thread is queued and waiting for thread termination as a result of allied task termination. This status corresponds to DB2 DISPLAY THREAD=QD status.

UTIL-STOP
The DB2 utility was started but not completed because of abnormal termination.

The following status are only available when class 2/3 traces are on:

WAIT-ACCEL
The thread is currently waiting for claimers to be released after acquiring drain lock.

WAIT-CLAIMER
The thread is currently waiting for claimers to be released after acquiring drain lock.

WAIT-CL3LOCK
The thread is currently waiting for the completion of an identify call to the IRLM.

WAIT-COMMIT
The thread is waiting for the FORCE-AT-COMMIT event to complete.

WAIT-DRNLOCK
The thread is currently waiting to acquire drain lock.

WAIT LOB
The thread is currently waiting for TCP/IP to materialize a LOB.

WAIT-LOCKLAT
The thread is waiting for a LOCK-I/O-LATCH.

WAIT-LOCKPIP
The thread is currently waiting for a PIPE suspend.

WAIT-LOCKPQS
The thread is currently suspended for parallel task synchronization.

WAIT-LOGQSC
The thread is currently suspended because of an ARCHIVE LOG MODE(QUIESCE) command.

WAIT-PGLATCH
The thread is currently waiting for page latch.
WAIT-SP-SCHD
The thread is waiting for a TCB to become available in the stored procedures address space to schedule a stored procedure.

WAIT-SWITCH
The thread is currently waiting for the completion of a synchronous execution switch.

WAIT-SYNC-IO
The thread is currently waiting for completion of a synchronous Read I/O or Write I/O.

Note: This status can indicate that a DB2 resource is not large enough. You can use the OMEGAMON XE for DB2 PE resource manager or object analysis displays to further isolate the problem.

Time
The date and time, as set on the monitored system, indicating the instance when the agent collects information.

The timestamp format for SCAN and STR functions is CYYMMDDHHMMSSmmm (as in 1180315064501000 for 03/15/18 06:45:01) where:
- C = Century (0 for 20th, 1 for 21st)
- Y = Year
- M = Month
- D = Day
- H = Hour
- M = Minute
- S = Second
- m = Millisecond

DB2 Lock Conflict Attributes
Use DB2 Lock Conflict Group attributes to create situations that monitor DB2 database lock conflicts.

Authorization ID
The primary authorization ID from connection or sign-on, that identifies the execution privileges an application has to a DB2 object or service. It is an alphanumeric text string with a maximum of 8 characters; for example, TRAN5.

Authorization ID (Unicode)
The primary authorization ID from connection or sign-on, that identifies the execution privileges an application has to a DB2 object or service. It is an alphanumeric text string with a maximum of 8 characters; for example, TRAN5.

Begin Time
Beginning store clock value (STCK) for the period covered by this accounting record. You can determine the elapsed time of the application by subtracting this field from QWACESC (ending store clock value). Threads that do not terminate (such as CICS primed threads and imn wait-for-input message regions) can have an ending clock value that includes the time the thread was inactive and waiting to perform work.

DB2 Lock Conflict Attributes
Identifies the connection of an application to a DB2 system.

It is an alphanumeric text string, with a maximum length of eight characters.
**DB2 Lock Conflict Attributes** The type of connection associated with the thread.

Valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BATCH</td>
<td>Batch job</td>
</tr>
<tr>
<td>CICS</td>
<td>CICS attach</td>
</tr>
<tr>
<td>DLIBATCH</td>
<td>DL/I batch</td>
</tr>
<tr>
<td>Distributed</td>
<td>Distributed Database Access thread</td>
</tr>
<tr>
<td>IMS_BMP</td>
<td>IMS attach BMP</td>
</tr>
<tr>

<tr>
<td>TSO</td>
<td>TSO foreground and background</td>
</tr>
<tr>
<td>UNKNOWN</td>
<td>Unrecognizable connection type</td>
</tr>
<tr>
<td>UTILITY</td>
<td>DB2 Utility</td>
</tr>
</tbody>
</table>

**Correlation ID** The correlation between an application and the connection to a DB2 system. It is an alphanumeric text string, with a maximum of 12 characters; for example, DLKEX212.

**DB2 ID** The name of a DB2 subsystem.

**Display Elapsed Time** The total amount of elapsed time since thread creation or DB2 sign-on.

**IDNAME** An internal attribute used for navigation, it contains either the Data Sharing Group Name or the DB2ID.

It is an alphanumeric text string with a maximum of 8 characters; for example TDDB242G.

**Lock Elapsed Time** The amount of time (in seconds) a waiter has been waiting for the resource.

**Lock Level** Identifies the lock resource usage.

Valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IS</td>
<td>Intent share</td>
</tr>
<tr>
<td>IX</td>
<td>Intent exclusive</td>
</tr>
<tr>
<td>NSU</td>

<td>-------------</td>
</tr>
<tr>
<td>U</td>
<td>Update</td>
</tr>
<tr>
<td>UNS</td>
<td>Unprotected shared</td>
</tr>
<tr>
<td>X</td>
<td>Exclusive</td>
</tr>
</tbody>
</table>

**Lock Resource** The resource a lock owner currently has locked or the resource that caused DB2 to suspend a lock request. It is an alphanumeric text string, with a maximum of 50 characters; for example, DB=TBLBLK2 PS=PAGELK2.

**Lock Status** The status of a job holding or waiting on a lock: If the status is OWN with a DB2 subsystem name, the lock is owned by another DB2 subsystem in the Data Sharing Group (DSG); for example, if lock status is OWN-DB2A, the lock is owned by DB2 subsystem DB2A.

**Lock Token** Lock Token.

**Lock Type** The lock type of the lock request.

Valid values are:

### Table 197. Lock types

<table>
<thead>
<tr>
<th>Lock type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACSC</td>
<td>The Accelerator Services commands (ACSC) lock.</td>
</tr>
<tr>
<td>ALBP</td>
<td>The Alter buffer pool (ALBP) lock indicates a lock on a buffer pool during execution of an ALTER BUFFERPOOL command.</td>
</tr>
<tr>
<td>BIND</td>
<td>The BIND lock indicates an autobind or remote bind lock.</td>
</tr>
<tr>
<td>BMBA</td>
<td>The Buffer manager SCA MBA (BMBA) L-lock. The Buffer Manager (BM) gets this lock when it needs to read, insert, or update a multiple buffer pool (MBA) record in a Shared Communications Area (SCA). (BMC_MBAO or BMC_MBAR)</td>
</tr>
<tr>
<td>BPPS</td>
<td>The Buffer Manager Pageset (BPPS) RR (repeatable read) P-lock: • BP = buffer pool ID • DB = database name • PS = pageset name</td>
</tr>
<tr>
<td>CCAT</td>
<td>The CATMAINT convert catalog (CCAT) lock is acquired when catalog conversion is performed.</td>
</tr>
<tr>
<td>CDBL</td>
<td>The Compress dictionary build (CDBL) lock.</td>
</tr>
<tr>

<tr>
<td>DBEX</td>
<td>The Database exception (DBEX) lock indicates a lock on a &quot;Logical page list&quot; (LPL) or &quot;Group buffer pool recovery pending&quot; (GRECP) database exception status. This lock is only used in a data sharing environment.</td>
</tr>
<tr>
<td>DBXU</td>
<td>The DB exception update lock is used for updating the database exception status.</td>
</tr>
<tr>
<td>DGTT</td>
<td>The DGTT URID lock is acquired to protect segments that belong to a Declared Global Temporary Table (DGTT). These segments are deallocated during Commit 1 by logging them and serializing them using the Unit of Recovery ID (URID) lock.</td>
</tr>
</tbody>
</table>
| DPAG      | The DB2 page (DPAG) lock in a tablespace. When programs read data or update data, they acquire a page lock containing the data.  
• DB = database name  
• PS = pageset name  
• PG = page |
| DSET      | The partitioned lock.  
A partitioned tablespace contains one or more partitions (up to 64). It is created when you create a table space using the SQL CREATE TABLESPACE statement with the NUMPARTS parameter.  
Only one table can be stored on a partitioned tablespace. Each partition contains one part of a table. The partitioned lock only locks the partition with the data that is referenced.  
• DB = database name  
• PS = pageset name  
• PT = partition number |
| DTBS      | The Database lock indicates a lock on the database.  
• DB = database name  
• PS = pageset name  
• PT = partition number |
| GRBP      | The Group buffer pool (GRBP) start/stop lock.  
BP=buffer pool ID |
| HASH      | The Hash anchor (HASH) lock.  
• DB = database name  
• PS = pageset name  
• PG = page |
| HPSP      | The Header Page (HP) Bucket or Stored Procedure (SP) Command lock. |
| IEOF      | The Index end of file (IEOF) lock is acquired at the index end of file.  
• DB = database name  
• PS = pageset name  
• PT = partition |
<table>
<thead>
<tr>
<th>Lock type</th>
<th>Description</th>
</tr>
</thead>
</table>
| **IPAG**  | The Index page (IPAG) lock in an index space. When application programs read or update data, they acquire a lock on the page containing the index when indexing is used.  
  - DB = database name  
  - PS = pageset name  
  - PG = page |
| **IXKY**  | The Index key (IXKY) lock. |
| **LBLK**  | The Large object (LOB) lock. |
| **LPLR**  | The Logical page list recovery (LPLR) lock. |
| **MDEL**  | The Mass delete (MDEL) lock is acquired when doing a mass delete from a table (for example, when you DELETE FROM a table) within a segmented tablespace.  
  It is used to prevent another user from reusing freed segments before a delete operation is committed.  
  - DB = database name  
  - PS = pageset name |
| **PALK**  | The Partition lock.  
  - DB = database name  
  - PS = pageset name  
  - PT = partition |
| **PBPC**  | The Group BP level castout (PBPC) P-lock.  
  A physical lock acquired when a castout of a group buffer pool occurs. Castout is the process of writing pages in the group buffer pool out to DASD.  
  This lock is only used in a data sharing environment. |
| **PCDB**  | The DDF CDB P-lock.  
  A Distributed Data Facility communication database physical lock.  
  This lock is only used in a data sharing environment. |
| **PDBD**  | The DBD P-lock is a database descriptor physical lock.  
  This lock is only used in a data sharing environment. |
| **PDSO**  | The Pageset or partitioned pageset open lock.  
  If the data set supporting the tablespace that is referenced by the application is not opened, the program will acquire a lock to open the data set. The data set will stay open if CLOSE=NO is defined in the SQL statement creating the tablespace.  
  - DB = database name  
  - PS = pageset name |
| **PITR**  | The Index manager tree (PITR) is a physical lock (P-lock).  
  This lock is only used in a data sharing environment.  
  - DB = database name  
  - PS = pageset name  
  - PT = partition |
### Table 197. Lock types (continued)

<table>
<thead>
<tr>
<th>Lock type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PPAG</td>
<td>The Page P-lock is a physical lock on a page. This lock is only used in a data sharing environment.</td>
</tr>
<tr>
<td>PPSC</td>
<td>The Pageset/partition level castout physical lock (P-lock). This lock is only used in a data sharing environment.</td>
</tr>
<tr>
<td>PPSP</td>
<td>The Pageset/partition physical lock (P-lock). This lock is only used in a data sharing environment.</td>
</tr>
<tr>
<td>PRLF</td>
<td>The Resource Limit Facility (RLF) physical lock (P-lock). This lock is only used in a data sharing environment.</td>
</tr>
<tr>
<td>PSET</td>
<td>The Pageset (PSET) lock can be a tablespace or indexspace. A pageset containing DB2 tables is a tablespace. A pageset containing DB2 index structure is an indexspace. A pageset can be simple or partitioned. This lock type is for the simple pageset only.</td>
</tr>
<tr>
<td></td>
<td>- DB = database name</td>
</tr>
<tr>
<td></td>
<td>- PS = pageset name</td>
</tr>
<tr>
<td>PSPI</td>
<td>The Pageset piece (PSPI) lock. A pageset is a collection of pageset pieces. Each pageset piece is a separate VSAM data set. A simple pageset contains from 1 to 32 pieces. Each piece of a simple pageset is limited to 2 GB. Whenever a simple pageset piece reaches this size, another piece is allocated and the pageset grows. This is a lock on the expanded pageset piece.</td>
</tr>
<tr>
<td>RDBD</td>
<td>The Repair DBD (RDBD) lock is acquired when REPAIR DBD REBUILD is running (test/diagnose).</td>
</tr>
<tr>
<td>RDRN</td>
<td>The Repeatable Read drain (RDRN) lock is acquired to drain all RR access to an object.</td>
</tr>
<tr>
<td></td>
<td>- DB = database name</td>
</tr>
<tr>
<td></td>
<td>- PS = pageset name</td>
</tr>
<tr>
<td></td>
<td>- PT = partition</td>
</tr>
<tr>
<td>RGDA</td>
<td>The Retry Getpage During Abort (RGDA) lock.</td>
</tr>
<tr>
<td>ROW</td>
<td>The Row lock indicates a lock on a row.</td>
</tr>
<tr>
<td>RSTR</td>
<td>The Shared Communications Area (SCA) restart (RSTR) lock indicates a lock on SCA access for restart/redo information. (BMC-RSTP)</td>
</tr>
<tr>
<td>SDBA</td>
<td>The Start/stop lock on DBA (SDBA) table indicates a lock on the table, tablespace, or database when a CREATE/DROP is processed against these objects.</td>
</tr>
<tr>
<td></td>
<td>- DB = database name</td>
</tr>
<tr>
<td></td>

<tr>
<td>SENV</td>
<td>The System environment (SYSENV) serialization lock.</td>
</tr>
<tr>
<td>Lock type</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
</tr>
<tr>
<td>SKCT</td>
<td>The Skeleton cursor table (SKCT) lock indicates a lock on the application plan. PLAN=plan name</td>
</tr>
<tr>
<td>SKPT</td>
<td>The Skeleton package table (SKPT) lock indicates a lock on the application package. TOKEN= the consistency token (CONTOKEN) column from SYSIBM.SYSPACKAGE.</td>
</tr>
<tr>
<td>SPRC</td>
<td>The System level point in time (PIT) recovery lock. SYS_PITR</td>
</tr>
</tbody>
</table>
| SREC      | The Log range lock. DB writes a record in the log range tablespace (SYSLGRNG) every time a tablespace is opened and updated, and updates SYSLGRNG whenever that tablespace is closed. The record contains the opening and/or closing log RBA (relative byte address) for the tablespace. When DB writes to SYSLGRNG, the program acquires a lock on the tablespace with updates. | DB = database name  
|           | TS = tablespace name |
| TABL      | The Table (TABL) lock on the table which resides in a segmented tablespace. | DBID = DBid  
|           | TABL = Tableid |
| UIDA      | The Util I/O Damage Assessment lock. |
| UNDT      | The Undetermined (UNDT) lock indicates that this lock cannot be determined because it is not part of the other listed lock types. Resource ID (in hexadecimal). |
| UNKN      | The Unknown (UNKN) lock indicates the resource does not exist. |
| UTEX      | The Utility exclusive execution (UTEX) lock. UTEXEC |
| UTID      | The Utility identifier (UTID) lock. UID=utility id |
| UTOB      | The Utility object (UTOB) lock. | DB = database name  
|           | PS = pageset name  
|           | PT = partition |
| UTSE      | The Utility serialization (UTSE) lock is required when running utility jobs. UTSERIAL |
Table 197. Lock types (continued)

<table>
<thead>
<tr>
<th>Lock type</th>
<th>Description</th>
</tr>
</thead>
</table>
| WDRN      | The Write drain (WDRN) lock is acquired to drain all write access to an object.  
  - DB = database name  
  - PS = pageset name  
  - PT = partition |
| XMLK      | The XML lock. |

LUWID The logical unit of work ID (LUWID) for a thread.

MVS System An ID for the MVS System Management Facility (SMF). It is an alphanumeric text string with a maximum of 4 characters; for example SP11.

Originating System ID The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

Plan Name The name of an application plan that DB2 produces during the bind process and uses for processing SQL statements during execution. It is an alphanumeric text string with a maximum of 8 characters. For example PLANLCK2 is the name of an application plan. *SYSTEM* indicates DB2 subsystem-generated threads that own or are waiting on a lock.

Resource Name 1 (Unicode) The resource name of type defined by type code.

Resource Name 2 (Unicode) The resource name of type defined by type code.

Resource Name 3 The resource name of type defined by type code.

Resource Name 4 The resource name of type defined by type code.

Resource Type 1 This value indicates what is contained in Resource Name 1.

Valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BP</td>
<td>Buffer Pool</td>
</tr>
<tr>
<td>CO</td>
<td>Collection name</td>
</tr>
<tr>
<td>DB Hash</td>
<td>Database</td>
</tr>
<tr>
<td>HC</td>
<td>Class</td>
</tr>
<tr>
<td>PL</td>
<td>Plan name</td>
</tr>
<tr>
<td>UT</td>
<td>Utility ID</td>
</tr>
</tbody>
</table>

Resource Type 2 This value indicates what is contained in Resource Name 2.

Valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PK</td>
<td>Package</td>
</tr>
<tr>
<td>Value</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>----------------------</td>
</tr>
<tr>
<td>PS</td>
<td>Page Set (Table space)</td>
</tr>
</tbody>
</table>

**Resource Type 3** This value indicates what is contained in Resource Name 3.

**Resource Type 4** This value indicates what is contained in Resource Name 4.

Valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PT</td>
<td>Partition</td>
</tr>
</tbody>
</table>

**SUBSYS** The IRLM subsystem name.

**Thread Status** The current status of a thread.

Valid values are:

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NOT-AVAIL</td>
<td>The thread is not available.</td>
</tr>
<tr>
<td>IN-ABORT</td>
<td>The thread is in abort processing.</td>
</tr>
<tr>
<td>IN-ACCEL</td>
<td>The thread is executing on IBM DB2 Analytics Accelerator for z/OS.</td>
</tr>
<tr>
<td>IN-AUTO-PROC</td>
<td>The thread is processing an autonomous procedure.</td>
</tr>
<tr>
<td>IN-BIND-DYNM</td>
<td>The thread is in dynamic bind processing.</td>
</tr>
<tr>
<td>IN-BIND-STAT</td>
<td>The thread is in static bind processing.</td>
</tr>
<tr>
<td>IN-COMMAND</td>
<td>Command threads display this status when they are active in DB2 and executing within the DB2 command processor. (This type of thread always has a blank plan name.)</td>
</tr>
<tr>
<td>IN-COMMIT</td>
<td>The thread is in Commit processing (applies only to threads that originate from an attachment that does not use two-phase-commit protocol).</td>
</tr>
<tr>
<td>IN-COMT-PHS1</td>
<td>The thread is in Commit phase 1 processing.</td>
</tr>
<tr>
<td>IN-COMT-PHS2</td>
<td>The thread is in Commit phase 2 processing.</td>
</tr>
<tr>
<td>IN-CRTE-THRD</td>
<td>The thread is in Create Thread processing.</td>
</tr>
<tr>
<td>IN-DB2</td>
<td>The thread is executing in DB2. A more descriptive status could not be determined.</td>
</tr>
</tbody>
</table>
INDOUTB
   The thread is in doubt.

IN-SIGNON
   The thread is in signon processing. This status applies only to threads
   originating from CICS or IMS attachments.

IN-SQL-CALL
   The thread is processing an SQL call.

IN-SQL-SORT
   The thread is executing an SQL call and is doing the sort processing
   required to satisfy the call’s request.

IN-STOR-PROC
   The thread is currently running in a stored procedure.

IN-TERM-THRD
   The thread is in termination as a result of allied task termination. This
   status corresponds to DB2 DISPLAY THREAD=D status.

IN-TRIGGER
   The thread is currently running in a trigger.

IN-USER-FUNC
   The thread is currently running a user-defined function.

NOT-IN-DB2
   The thread is not currently executing in DB2.

SP/UDF-INACT
   The thread is trying but not able to run in a stored procedure or
   user-defined function.

SWAPPED-OUT
   The thread is not currently executing in DB2. The thread originating
   address space is swapped out.

WAIT-ARCHIVE
   The thread is waiting for an archive log tape mount necessary during
   thread abort processing.

WAIT-ARCREAD
   The thread is currently waiting for read of archive log from tape.

WAIT-ASYNCRD
   The thread is currently waiting for completion of a read I/O that is being
   done under a thread other than this one (for example, sequential or List
   Prefetch).

WAIT-ASYNCWR
   The thread is currently waiting for completion of Write I/O that is being
   done under a thread other than this one (for example, Deferred Writes).

WAIT-CONVLIM
   The distributed thread is in a synchronous wait because the conversation
   limit has been reached for its designated logmode.

WAIT-CTHREAD
   The thread is queued in Create Thread processing because DB2 reached the
   CTHREAD value. This status corresponds to DB2 DISPLAY THREAD=QD
   status.
WAIT-GLBLOCK
The thread is currently waiting for either:
- Inter-system communication within the data sharing group to determine if there is lock contention.
- A lock held by another subsystem in the data sharing group.

WAIT-LOCK
The thread is waiting for a lock.

WAIT-MSGSEND
The thread is waiting because of inter-system message sending contention.

WAIT-REMRQ
The database access thread is in a synchronous wait (waiting for a response or a request from the originating DB2 subsystem).

WAIT-REMSQL
The distributed allied thread is in a synchronous wait (waiting for a response from the remote DB2 subsystem being accessed).

WAIT-REUSE
The thread is not currently in use and is waiting to be reused. This status applies only to CICS and IMS threads.

WAIT-SERVICE
The thread is currently waiting for completion of a DB2 service. Types of DB2 services include: open/close of a dataset, DFHSM recall of a dataset, SYSLGRNG update or define/extend/delete of a dataset, rollback, and Commit phase 2 for read only threads.

WAIT-SP-STOP
The thread is queued waiting for a stopped stored procedure.

WAIT-TERM-TH
The thread is queued and waiting for thread termination as a result of allied task termination. This status corresponds to DB2 DISPLAY THREAD=QD status.

UTIL-STOP
The DB2 utility was started but not completed because of abnormal termination.

The following status are only available when class 2/3 traces are on:

WAIT-ACCEL
The thread is currently waiting for claimers to be released after acquiring drain lock.

WAIT-CLAIMER
The thread is currently waiting for claimers to be released after acquiring drain lock.

WAIT-CL3LOCK
The thread is currently waiting for the completion of an identify call to the IRLM.

WAIT-COMMIT
The thread is waiting for the FORCE-AT-COMMIT event to complete.

WAIT-DRNLOCK
The thread is currently waiting to acquire drain lock.
**WAIT LOB**
The thread is currently waiting for TCP/IP to materialize a LOB.

**WAIT-LOCKLAT**
The thread is waiting for a LOCK-I/O-LATCH.

**WAIT-LOCKPIP**
The thread is currently waiting for a PIPE suspend.

**WAIT-LOCKPQS**
The thread is currently suspended for parallel task synchronization.

**WAIT-LOGQSCE**
The thread is currently suspended because of an ARCHIVE LOG MODE(QUIESCE) command.

**WAIT-PGLATCH**
The thread is currently waiting for page latch.

**WAIT-SP-SCHD**
The thread is waiting for a TCB to become available in the stored procedures address space to schedule a stored procedure.

**WAIT-SWITCH**
The thread is currently waiting for the completion of a synchronous execution switch.

**WAIT-SYNC-IO**
The thread is currently waiting for completion of a synchronous Read I/O or Write I/O.

*Note:* This status can indicate that a DB2 resource is not large enough. You can use the OMEGAMON XE for DB2 PE resource manager or object analysis displays to further isolate the problem.

**Thread Token** The thread token uniquely identifies a specific thread.

**DB2 Lock Conflict Attributes** The type of thread.

It can be:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BATCH</td>
<td>Batch job</td>
</tr>
<tr>
<td>CICS</td>
<td>CICS attach</td>
</tr>
<tr>
<td>DLIBATCH</td>
<td>DL/I batch</td>
</tr>
<tr>
<td>Distributed</td>
<td>Distributed Database Access thread</td>
</tr>
<tr>
<td>IMS_BMP</td>
<td>IMS attach BMP</td>
</tr>
<tr>
<td>IMS_CTL</td>
<td>IMS control region</td>
</tr>
<tr>
<td>IMS_MPP</td>
<td>IMS attach MPP</td>
</tr>
<tr>
<td>IMS_TBMP</td>
<td>IMS transaction BMP</td>
</tr>
<tr>
<td>DistAllied</td>
<td>Distributed Allied thread</td>
</tr>
<tr>
<td>RRSAF</td>
<td>DB2 Resource Recovery Services attachment facility</td>
</tr>
<tr>
<td>SYSTEM</td>
<td>System directed access</td>
</tr>
<tr>
<td>TSO</td>
<td>TSO foreground and background</td>
</tr>
<tr>
<td>UNKNOWN</td>
<td>Unrecognizable connection type</td>
</tr>
<tr>
<td>Value</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>----------------------</td>
</tr>
<tr>
<td>UTILITY</td>
<td>DB2 Utility</td>
</tr>
</tbody>
</table>

**Value Description**

**Time Stamp** Represents the end of data collection or the end of an interval, and is the local time where the system is running.

Valid format is MM-DD-YY HH:MM:SS, where:

- M = Month
- D = Day
- Y = Year
- H = Hour
- M = Minute
- S = Second

For example, 07-16-18 14:58:29 indicates that data collection ended on July 16th, 2018, at 14:58:29 PM.

**Uniqueness Value** The instance number: When concatenated with the fully qualified network name, it uniquely identifies a distributed thread (DB2 field name: QWHSLUUV).

**Uniqueness Value2** The instance number: When concatenated with the fully qualified network name, it uniquely identifies a distributed thread (DB2 field name: the last 2 bytes of QWHSLUUV).

**DB2 Memory Attributes**

Use the attributes to view the DB2 memory for the database address space (DBM1 or DIST).

**4-Bit Aux Frames Shared Stack** Identifies the number of auxiliary slots (4K) in use for 64-bit shared stack storage. This is recorded at the subsystem level. This field only includes auxiliary slots occupied by pages that are paged out (DB2 field name: QW0225ShrStkStg_Aux). This field is available in z/OS 1.10 (and maintenance) or later.

**Shared stack storage (MB)** Identifies the number of real-storage frames (4K) in use for 64-bit shared stack storage. This is recorded at the subsystem level (DB2 field name: QW0225ShrStkStg_Real). This field is available in z/OS 1.10 (and maintenance) or later.

**64-Bit Shared Storage (MB)** Identifies the number of 64-bit shared memory pages allocated for this MVS LPAR (this count includes hidden pages) (DB2 field name: QW0225SRHPAGES).

**Active and Disconnect DBATs** Identifies the number of active and disconnected DBAT threads (DB2 field name: QW0225DB).

**Active Threads** Identifies the number of active allied threads (DB2 field name: QW0225AT).

**Average Thread Footprint 64-bit common real** Shows the current average real storage in use for common storage of active user threads (allied threads + active and pooled DBATs).
**Average Thread Footprint (MB)** Shows the current average real storage in use for subsystem shared storage of active user threads (allied threads + active and pooled DBATs).

**Agent Local Storage (MB)** The amount of storage, in MB, allocated for agent-related local storage (DB2 field name: QW0225AL). This storage is used for operations such as sort. Valid value is an integer in the range 0 - 9999999. This field includes the total agent local storage (31-bit DBM1 private variable pools) and total agent local storage (64-bit shared variable pools).

**Agent System Storage (MB)** Identifies the storage used by system agents (DB2 field name: QW0225AS). This field includes the total system agent storage (31-bit DBM1 private variable pools) and the total system agent storage (64-bit shared variable pools).

**Aux Storage Used 64-Bit shared (MB)** Shows the amount of auxiliary storage used for 64-bit shared storage for this MVS LPAR (including reserved auxiliary slots for pages that are paged in).

**Aux Stg In Use 64-Bit Common (MB)** Shows the number of auxiliary slots (4K) in use for 64-bit common storage. This is recorded at the subsystem level. This field only includes auxiliary slots occupied by pages that are paged out (DB2 field name: QW0225ComStg_Aux). This field is available in z/OS 1.10 (and maintenance) or later.

**Auxiliary Slots Used Shared Storage 64 Bit** Shows the number of auxiliary slots used for 64-bit shared storage for this MVS LPAR (DB2 field name: QW0225SHRAUXSLOTS).

**Auxiliary Storage in use (MB)** Shows the number of 4 KB auxiliary slots that are used for 64-bit shared stack storage. This value is recorded at the subsystem level. It includes only auxiliary slots that are occupied by pages that are page out. This field is available in z/OS 1.10 (and maintenance) or later.

**Buffer Manager Storage Control Blocks (MB)** Identifies the total storage used for page set control blocks (DB2 field name: QW0225BB).

**Castout Engines** Identifies the number of engines available for data-sharing castout processing (DB2 field name: QW0225CE).

**Common Fixed Pool Above (MB)** Identifies the amount of storage allocated for 64-bit common fixed pool storage (DB2 field name: QW0225FCG).

**Common Fixed Pool Below (MB)** Identifies the amount of storage allocated for 31-bit common fixed pool storage (DB2 field name: QW0225FC).

**Common Getmained Above (MB)** Identifies the amount of storage allocated for 64-bit common getmained storage (DB2 field name: QW0225GCG).

**Common Getmained Below (MB)** Identifies the amount of storage allocated for 31-bit common getmained storage (DB2 field name: QW0225GC).

**Common Storage Manager Control Block Above (MB)** Identifies the amount of storage allocated for 64-bit common storage for storage manager control structures (DB2 field name: QW0225SMC).
Common Variable Pool Above (MB) Shows the amount of storage allocated for 64-bit common variable pool storage (DB2 field name: QW0225VCG).

Common Variable Pool Below (MB) Identifies the amount of storage allocated for 31-bit common variable pool storage (DB2 field name: QW0225VC).

Compression Dictionary Identifies the storage space allocated for the compression dictionary (DB2 field name: QW0225CD).

Data Sharing Group The name of the DB2 data sharing group. It is an alphanumeric text string with a maximum of 8 characters.

Data Sharing Member The name of the DB2 data sharing member or the member name of the DB2 subsystem. It is an alphanumeric text string with a maximum of 8 characters.

DB2 Subsystem The name of the DB2 subsystem.

DB2 Version The version of the DB2 system.

Deferred Write Engines Identifies the number of engines used for deferred write operations (DB2 field name: QW0225DW).

Dynamic Statement Cache Control Block (MB) Identifies the amount of storage used for dynamic statement cache control blocks above the 2 GB bar (DB2 field name: QW0225S2).

Extended CSA Size (MB) Identifies the size of the common storage area (CSA) above the 16 MB line (DB2 field name: QW0225EC).

GBP Write Engines Identifies the number of engines for group buffer pool writes (DB2 field name: QW0225GW).

HWM 64-Bit Shared Storage (MB) Identifies the high water mark number of 64-bit shared bytes for this MVS LPAR (DB2 field name: QW0225SHRGBYTES).

HWM Requested Non Shr Dyn SQL (MB) Shows statistics interval high-water mark (HWM) of requested non-shareable storage for dynamic SQL statements used by active threads. For DB2 10 or later, this value is related to shared agent local variable pools above the bar.

HWM Shr Dyn SQL (MB) Identifies the statistics interval high-water mark (HWM) of requested shareable storage for dynamic SQL statements used by active threads.

Interval Start The start time of this interval.

IRLM Current used 31-bit private Shows the total amount of 31-bit private storage that is currently in use by Internal Resource Lock Manager (IRLM) pools (DB2 field name: QW02251_BBPVT). This value is the total of all 31-bit IRLM private pools.

It can show the following values:

N/A Not applicable is shown if DB2 never produces a counter value in a specific context. Examples are:

- A counter is not available in one DB2 version.
• Counters are mutually exclusive.

N/C Not calculated is shown for a derived field where the value cannot be calculated or is useless. Examples are:
• A divide by zero (percentages, ratios).
• Suppression of negative elapsed time values.
• Required counter values for calculation marked as N/A or N/P.
• Insufficient data or small counter values to allow significant statements (meaningless or misleading averages).

N/P Not present is shown for a field where DB2 can present values, but does not in this instance. Examples are:
• When counter values are not generated because of operational conditions (a trace class is not active).
• An application does not provide a value because it is optional.

IRLM Current used 64-bit common Shows the total amount of 64-bit common storage that is currently in use by Internal Resource Lock Manager (IRLM) pools (DB2 field name: QW0225I_ABCSA). This value is the total of all 64-bit common IRLM pools.

It can show the following values:

N/A Not applicable is shown if DB2 never produces a counter value in a specific context. Examples are:
• A counter is not available in one DB2 version.
• Counters are mutually exclusive.

N/C Not calculated is shown for a derived field where the value cannot be calculated or is useless. Examples are:
• A divide by zero (percentages, ratios).
• Suppression of negative elapsed time values.
• Required counter values for calculation marked as N/A or N/P.
• Insufficient data or small counter values to allow significant statements (meaningless or misleading averages).

N/P Not present is shown for a field where DB2 can present values, but does not in this instance. Examples are:
• When counter values are not generated because of operational conditions (a trace class is not active).
• An application does not provide a value because it is optional.

IRLM Current used 64-bit private Shows the total amount of 64-bit private storage in use by Internal Resource Lock Manager (IRLM) pools (DB2 field name: QW0225I_ABPVT).

It can show the following values:

N/A Not applicable is shown if DB2 never produces a counter value in a specific context. Examples are:
• A counter is not available in one DB2 version.
• Counters are mutually exclusive.

N/C Not calculated is shown for a derived field where the value cannot be calculated or is useless. Examples are:
• A divide by zero (percentages, ratios).
• Suppression of negative elapsed time values.
• Required counter values for calculation marked as N/A or N/P.
• Insufficient data or small counter values to allow significant statements (meaningless or misleading averages).

N/P Not present is shown for a field where DB2 can present values, but does not in this instance. Examples are:
  • When counter values are not generated because of operational conditions (a trace class is not active).
  • An application does not provide a value because it is optional.

**IRLM Current used ECSA** Shows the total amount of Extended Common Service Area (ECSA) storage in use by Internal Resource Lock Manager (IRLM) pools.

It can show the following values:

N/A Not applicable is shown if DB2 never produces a counter value in a specific context. Examples are:
  • A counter is not available in one DB2 version.
  • Counters are mutually exclusive.

N/C Not calculated is shown for a derived field where the value cannot be calculated or is useless. Examples are:
  • A divide by zero (percentages, ratios).
  • Suppression of negative elapsed time values.
  • Required counter values for calculation marked as N/A or N/P.
  • Insufficient data or small counter values to allow significant statements (meaningless or misleading averages).

N/P Not present is shown for a field where DB2 can present values, but does not in this instance. Examples are:
  • When counter values are not generated because of operational conditions (a trace class is not active).
  • An application does not provide a value because it is optional.

**IRLM ECSA high water mark** Shows the high water mark of Extended Common Service Area (ECSA) storage allocated by Internal Resource Lock Manager (IRLM) pools.

It can show the following values:

N/A Not applicable is shown if DB2 never produces a counter value in a specific context. Examples are:
  • A counter is not available in one DB2 version.
  • Counters are mutually exclusive.

N/C Not calculated is shown for a derived field where the value cannot be calculated or is useless. Examples are:
  • A divide by zero (percentages, ratios).
  • Suppression of negative elapsed time values.
  • Required counter values for calculation marked as N/A or N/P.
  • Insufficient data or small counter values to allow significant statements (meaningless or misleading averages).
N/P Not present is shown for a field where DB2 can present values, but does not in this instance. Examples are:
- When counter values are not generated because of operational conditions (a trace class is not active).
- An application does not provide a value because it is optional.

IRLM HWM for 31-bit private (MB) Shows the high water mark of 31-bit private storage that has been in use (DB2 field name: QW0225I_BBPVH). This value is the total amount of all 31-bit private IRLM pools.

It can show the following values:

N/A Not applicable is shown if DB2 never produces a counter value in a specific context. Examples are:
- A counter is not available in one DB2 version.
- Counters are mutually exclusive.

N/C Not calculated is shown for a derived field where the value cannot be calculated or is useless. Examples are:
- A divide by zero (percentages, ratios).
- Suppression of negative elapsed time values.
- Required counter values for calculation marked as N/A or N/P.
- Insufficient data or small counter values to allow significant statements (meaningless or misleading averages).

N/P Not present is shown for a field where DB2 can present values, but does not in this instance. Examples are:
- When counter values are not generated because of operational conditions (a trace class is not active).
- An application does not provide a value because it is optional.

IRLM HWM for 64-bit common (MB) Shows the high water mark of 64-bit common storage that has been in use. This value is the total of all 64-bit common IRLM pools (DB2 field name: QW0225I_ABCSH).

It can show the following values:

N/A Not applicable is shown if DB2 never produces a counter value in a specific context. Examples are:
- A counter is not available in one DB2 version.
- Counters are mutually exclusive.

N/C Not calculated is shown for a derived field where the value cannot be calculated or is useless. Examples are:
- A divide by zero (percentages, ratios).
- Suppression of negative elapsed time values.
- Required counter values for calculation marked as N/A or N/P.
- Insufficient data or small counter values to allow significant statements (meaningless or misleading averages).

N/P Not present is shown for a field where DB2 can present values, but does not in this instance. Examples are:
- When counter values are not generated because of operational conditions (a trace class is not active).
• An application does not provide a value because it is optional.

**IRLM HWM for 64-bit private** Shows the high water mark of 64-bit private storage allocated by IRLM pools (DB2 field name: QW0225I_ABPVH).

It can show the following values:

---

**N/A** Not applicable is shown if DB2 never produces a counter value in a specific context. Examples are:
- A counter is not available in one DB2 version.
- Counters are mutually exclusive.

**N/C** Not calculated is shown for a derived field where the value cannot be calculated or is useless. Examples are:
- A divide by zero (percentages, ratios).
- Suppression of negative elapsed time values.
- Required counter values for calculation marked as N/A or N/P.
- Insufficient data or small counter values to allow significant statements (meaningless or misleading averages).

**N/P** Not present is shown for a field where DB2 can present values, but does not in this instance. Examples are:
- When counter values are not generated because of operational conditions (a trace class is not active).
- An application does not provide a value because it is optional.

**IRLM Threshold virtual 31-Bit** Shows the threshold of 31-bit virtual storage available for normal IRLM execution. Only requests for storage by "must complete" tasks will be granted if this threshold is exceeded (DB2 field name: QW0225I_BPMAX).

It can show the following values:

---

**N/A** Not applicable is shown if DB2 never produces a counter value in a specific context. Examples are:
- A counter is not available in one DB2 version.
- Counters are mutually exclusive.

**N/C** Not calculated is shown for a derived field where the value cannot be calculated or is useless. Examples are:
- A divide by zero (percentages, ratios).
- Suppression of negative elapsed time values.
- Required counter values for calculation marked as N/A or N/P.
- Insufficient data or small counter values to allow significant statements (meaningless or misleading averages).

**N/P** Not present is shown for a field where DB2 can present values, but does not in this instance. Examples are:
- When counter values are not generated because of operational conditions (a trace class is not active).
- An application does not provide a value because it is optional.

**IRLM Threshold virtual 64-Bit** Shows the threshold of 64-bit virtual storage available for normal IRLM execution. Only requests for storage by "must complete" tasks will be granted if this threshold is exceeded.
It can show the following values:

**N/A** Not applicable is shown if DB2 never produces a counter value in a specific context. Examples are:
- A counter is not available in one DB2 version.
- Counters are mutually exclusive.

**N/C** Not calculated is shown for a derived field where the value cannot be calculated or is useless. Examples are:
- A divide by zero (percentages, ratios).
- Suppression of negative elapsed time values.
- Required counter values for calculation marked as N/A or N/P.
- Insufficient data or small counter values to allow significant statements (meaningless or misleading averages).

**N/P** Not present is shown for a field where DB2 can present values, but does not in this instance. Examples are:
- When counter values are not generated because of operational conditions (a trace class is not active).
- An application does not provide a value because it is optional.

**Log Manager Control frames Aux (MB)** The number of frames in auxiliary storage that are being used for log manager control structures.

**Log Manager Control frames REAL (MB)** The number of frames in real storage that are being used for log manager control structures.

**Log Manager Wrt buff frames REAL (MB)** The number of frames in real storage that are being used for log manager write buffers.

**MVS System ID** The MVS system identifier.

**Number of active parallel child threads** Shows the number of active parallel child threads.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**P-Lock Notify Exit Engines** Identifies the number of data sharing P-Lock engines and Notify Exit engines (DB2 field name: QW0225PL).

**Prefetch Engines** Identifies the number of engines used for sequential, list, and dynamic prefetch (DB2 field name: QW0225PF).

**RID Pool Storage (MB)** Identifies the storage for RID list processing such as list prefetch, index ANDing and ORing (DB2 field name: QW0225RP).

**Real Frames Common 64-Bit** Identifies the number of real-storage frames (4K) in use for 64-bit common storage. This is recorded at the subsystem level (DB2 field name: QW0225ComStg_Real). This field is available in z/OS 1.10 (and maintenance) or later.
Real Storage in use (MB) Shows the total amount of real storage in use for 64-bit shared storage. This is recorded at the subsystem level. This field is available in z/OS 1.10 (and maintenance) or later.

Shared Agent Local Storage (MB) Shows the amount of storage allocated for agent-related 64-bit local storage (DB2 field name: QW0225ALG).

Shared Agent Non-System Storage (MB) Shows the amount of 64-bit storage used by non-system agents. It is the difference between the Total Agent Local Storage (DB2 field name: QW0225ALG) and the Total Agent System Storage (DB2 field name: QW0225ASG).

Shared Agent System Storage (MB) Shows the amount of 64-bit storage used by system agents (DB2 field name: QW0225ASG).

Shared Fixed Storage 64-bit (MB) Identifies the amount of total fixed virtual shared storage above the 2 GB bar (DB2 field name: QW0225SF).

Shared Getmained Storage (MB) Identifies the amount of virtual shared storage acquired by GETMAIN above the 2 GB bar (DB2 field name: QW0225SG).

Shared Memory Objects Identifies the number of shared memory objects allocated for this MVS LPAR (DB2 field name: QW0225SHRNOMOMB).

Shared Non-System Agent Stack Storage (MB) Shows the amount of 64-bit shared storage allocated for non-system agent stack use.

Shared Non-System Agent Stack Storage in Use (MB) Shows the amount of 64-bit shared non-system agent stack that is in use.

Shared Pages Backed in Real Storage 64 Bit Shows the number of 64-bit shared pages backed in real storage (4K pages) for this MVS LPAR (DB2 field name: QW0225SHRINREAL).

Shared Pages Paged In from Aux Storage 64 Bit Identifies the number of 64-bit shared pages paged in from auxiliary storage for this MVS LPAR (DB2 field name: QW0225SHRPAGEINS).

Shared Pages Paged Out from Auxiliary Storage 64 Bit Shows the number of 64-bit shared pages paged out to auxiliary storage for this MVS LPAR (DB2 field name: QW0225SHRPAGEOUTS).

Shared System Agent Stack Storage (MB) Shows the amount of 64-bit shared storage allocated for system agent stack use.

Shared Storage Manager Control Block (MB) Shows the amount of 64-bit shared storage allocated for storage manager control structures.

Shared Variable Storage (MB) Identifies the amount of virtual shared variable storage above the 2 GB bar (DB2 field name: QW0225SV).

Stack Storage In Use (MB) Shows the amount of 64-bit shared system agent stack that is in use.

Shared thread and system (MB) Shows the number of real-storage frames (4K) in use for 64-bit shared storage. This does not include shared stack storage (DB2 field
name: QW0225ShrStg_Real). This is recorded at the subsystem level. This field is available in z/OS 1.10 (and maintenance) or later.

**Subsystem 64-bit Shared Thd and Sys** Shows the number of auxiliary slots (4K) in use for 64-bit shared storage. This does not include shared stack storage (DB2 field name: QW0225ShrStg_Aux). This is recorded at the subsystem level. This field only includes auxiliary slots occupied by pages that are paged out. This field is available in z/OS 1.10 (and maintenance) or later.

**Thread Copies of Cached SQL Date at HWM** Identifies the timestamp at high-water storage (DB2 field name: QW0225HT).

**Thread Copies of Cached SQL Statement Count** Identifies the number of statements in the local cache storage pool (DB2 field name: QW0225LC).

**Thread Copies of Cached SQL Statement Count at HWM** Identifies the number of statements in the local cache storage pool at high storage time (DB2 field name: QW0225HC).

**Total Agent Non-System Storage (MB)** Shows the total Agent Non-System Storage. It is the difference between the Total Agent Local Storage (QW0225AL) and the Total Agent System Storage (QW0225AS).

**Total Alloc Shr Static SQL (MB)** Identifies the total shareable storage allocated for static SQL statements.

**Total Allocated Shareable Storage for dynamic (MB)** Identifies the total shareable storage allocated for dynamic SQL statements used by active threads.

**Total Requested Non Shr Dyn SQL (MB)** Identifies the total non-shareable storage requested for dynamic SQL statements used by active threads. For DB2 10 or later, this value is related to shared agent local variable pools above the bar.

**Total Requested Shr Dyn SQL (MB)** Identifies the total shareable storage requested for dynamic SQL statements used by active threads.

**DB2 Memory DBM1 or DIST Attributes**
Use the attributes to view the DB2 memory for the database address space (DBM1 or DIST).

**24 Bit High Private (MB)** Identifies the amount of private MVS storage below the 16 MB line (DB2 field name: QW0225HI). This storage is obtained from top downward, usually for authorized programs.

**24 Bit Low Private (MB)** Identifies the amount of private MVS storage below the 16 MB line (DB2 field name: QW0225LO). This storage is obtained from bottom upward, usually for unauthorized programs.

**31 Bit Extended High Private (MB)** Identifies the amount of private MVS storage above the 16 MB line (DB2 field name: QW0225EH). This storage is obtained from top downward, usually for authorized programs.

**31 Bit Extended Low Private (MB)** Identifies the amount of private MVS storage above the 16 MB line (DB2 field name: QW0225EL). This storage is obtained from bottom upward, usually for unauthorized programs.
31 Bit Storage Reserved for MVS Identifies the amount of storage available for operating system activity (DB2 field name: QW0225MV).

64 Bit Thread and System Only Aux (MB) Shows the amount of auxiliary storage in use for 64-bit private pools. This does not include buffer pool storage (DB2 field name: QW0225PriStg_Aux). This field only includes auxiliary slots occupied by pages that are paged out. This field is available in z/OS 1.10 (and maintenance) or later.

64 Bit Thread and System Only Real (MB) Shows the number of real-storage frames (4K) in use for 64-bit private pools. This is a subset of QW0225HVPagesInReal and does not include buffer pool storage (DB2 field name: QW0225PriStg_Real). This field is available in z/OS 1.10 (and maintenance) or later.

Address Space Name Shows the address space name (DBM1 or DIST) (DB2 field name: QW0225AN).

Aux 31 Bit in Use Shows the amount of auxiliary storage in use for 31-bit private pools. This value is available from z/OS V1.11.

Auxiliary Slots Used Shared Storage 64 Bit Shows the number of auxiliary slots used for 64-bit shared storage for this MVS LPAR (DB2 field name: QW0225SHRAUXSLOTS).

Auxiliary Storage in Use Shows the number of auxiliary slots that are in use. Each slot is 4 KB. This value is available from z/OS V1.11.

Auxiliary 4K Slot in Use 64 Bit Identifies the number of 4 KB auxiliary slots currently in use for 64-bit private storage. This value includes reserved auxiliary slots for pages that are paged in (DB2 field name: QW0225HVAUXSLOTS). This value is available from z/OS V1.11.

Available 31-Bit Storage Shows the total amount of storage available for storage manager pools (DB2 field name: QW0225AV).

Avg Thread Footprint (MB) Shows the current average memory usage of active user threads (allied threads and DBATs).

Average Thread Footprint private real Shows the current average real storage in use for private DBM1 storage of active user threads (allied threads + active and pooled DBATs).

Average Thread Mem Usage Type 2 Shows the current average memory usage of active allied threads and the maximum number of active DBATs that existed. The formula used for this value is suited for Enterprise Resource Planning (ERP) systems.

Castout Buffers (MB) Shows the total storage for buffers needed for all castout engines. It is calculated as follows: (castout engines) * 128 * 1024.

Current Private High Addr 24 Bit Identifies the current high address of the 24-bit private region (DB2 field name: QW0225TP). It indicates the highest value (upper limit) of the private area of the DB2 database address space and the private area of the distributed data address space.
**Current Private High Addr 31 Bit** Identifies the current high address of the 31-bit private region (DB2 field name: QW0225EP).

**Data Sharing Group** The name of the DB2 data sharing group. It is an alphanumeric text string with a maximum of 8 characters.

**Data Sharing Member** The name of the DB2 data sharing member or the member name of the DB2 subsystem. It is an alphanumeric text string with a maximum of 8 characters.

**DB2 Subsystem** The name of the DB2 subsystem.

**DB2 Version** The version of the DB2 system.

**Fixed Storage (MB)** Identifies the total amount of fixed storage (DB2 field name: QW0225FX).

**Fixed Storage above (MB)** Identifies the total amount of fixed storage above the 2 GB bar (DB2 field name: QW0225FA).

**Getmained Storage (MB)** Identifies the total storage acquired by GETMAIN (DB2 field name: QW0225GM). This includes space for virtual pools, EDM pool, compression dictionary, castout buffers, and the data space lookaside buffer, hiperpool control blocks, and data space buffer pool control blocks. This figure can be different from the sum of GETMAIN storage items shown in the statistics DBM1 storage, because DB2 does not produce grouping statistics for all GETMAIN storage.

**Getmained Storage above (MB)** Identifies the total storage acquired by GETMAIN (DB2 field name: QW0225GA). This includes space for the compression dictionary, and statement and DBD cache that can be used by the Environmental Descriptor Manager (EDM). This figure can be different from the sum of GETMAIN storage items shown in the statistics DBM1 storage, because DB2 does not produce grouping statistics for all GETMAIN storage.

**Getmained Stack Storage (MB)** Identifies the total GETMAINED storage allocated for program stack use (DB2 field name: QW0225GS). This includes total getmained stack storage, total 64-bit shared system agent stack, and total 64-bit shared non-system agent stack.

**HWM Auxiliary 4K Slot in Use 64 Bit** Shows the high water mark of auxiliary storage in use for 64-bit private pools. This value is available from z/OS V1.11.

**HWM 64 bit real storage in use MB** Shows the high water mark of real storage in use for 64-bit private pools. This value is available from z/OS V1.11.

**Interval Start** The start time of this interval.

**Max Extended Region Size (MB)** Identifies the maximum amount of MVS private storage available above the 16 MB line (DB2 field name: QW0225RG).

**Max Number of Threads** The maximum number of possible threads. It depends on the storage size and average memory usage of active user threads.
Max Number Possible Type 2 Threads The maximum number of possible threads. It depends on the storage size and average memory usage of active allied threads and the maximum number of active DBATs that existed.

MVS System ID The MVS system identifier.

Number of Real Frames in Use Identifies the amount of real-storage frames in use for 31-bit and 64-bit private pools (DB2 field name: QW0225RL).

 Originating System ID The managed system name of the agent. It is an alphanumeric text string with a maximum of 32 characters; for example, DB91:SYS1:DB2.

Real 31 bit in use (MB) Shows the amount of real storage in use for 31-bit private pools. This value is available from z/OS V1.11.

Real 64 bit in use (MB) Shows the amount of real storage in use for 64-bit private pools. This value is available from z/OS V1.11.

Real 4K Frame in Use Shows the amount of real storage in use for 31-bit and 64-bit private pools; prior to DB2 10, it shows the real storage used by DBM1, in megabytes.

Stack Storage In Use (MB) The amount of stack storage which is in use; this includes total stack storage in use, total 64-bit shared system agent stack in use, and total 64-bit shared non-system agent stack in use (DB2 field name: QW0225SS).

Storage Manager Control Block (MB) Identifies the total 64-bit storage allocated for storage manager control structures (DB2 field name: QW0225SM). This includes total 64-bit private storage for storage manager control structures, total 64-bit common storage for storage manager control structures, and total 64-bit shared storage for storage manager control structures.

Stor Res Must Complete Identifies the storage reserved for operation that must complete before DB2 is allowed to stop (DB2 field name: QW0225CR).

Storage Cushion Warning to Contract Storage cushion warning to contract (DB2 field name: QW0225SO).

Storage Cushion (MB) Identifies the storage reserved to allow DB2 to complete critical functions while short on storage. This includes the contract warning cushion, storage reserved for must-complete operations, and storage for MVS use.

Total 31-bit stack in use for system agents Shows the amount of 31-bit stack storage that is in use for system agents (DB2 field name: QW0225SS). This is a subset of QW0225SSU.

Total Storage Below (MB) Shows the total DBM1 storage below 2 GB.

Total Storage Below (MB) Shows the total DIST storage below the bar.

Variable Storage (MB) The total variable storage available below the 31-bit bar. Valid value is an integer in the range 0 - 9999999 (DB2 field name: QW0225VR).
Variable Storage Above (MB) Identifies the total variable storage available above the 31-bit bar (DB2 field name: QW0225VA).

DB2 Message Attributes
Use the DB2 Message attributes to identify problems with your DB2 system.

DB2ID The name of a DB2 subsystem.

DB2 Version The version of the DB2 system.

Interval Start The date and time, as set on the monitored system, indicating the instance when the agent collects information.

Long Message Action Code The long message action code.

Message ID The system identification number for the message. It is an alphanumeric text string with a maximum of eight characters.

Message Text A description of the message. It is an alphanumeric text string with a maximum of 2500 characters.

MVS System ID The MVS system identifier.

Originating System ID The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

Note: By default DB2 messages are not collected. If you want to collect DB2 messages, use the Configuration Tool and select: Monitoring Profile configuration -> Additional configuration settings. If you configure it to YES, the DB2 message subtask is started during DB2 instance initialization.

To start or stop DB2 message collection manually specify the following:
F <cccccccc>,F PESEVER,F<db2>,DB2MSGMON=<p>

where:
cccccccc Identifies the OMEGAMON Collector started task name.

<db2> Identifies the DB2 name.

<p> Select Y to start or N to stop the message subtask.

If you do not see any DB2 messages, check if DB2 message subtask is started from the OMEGAMON Collector started task.

DB2 Parameters Attributes
Use the DB2 Parameters attributes to view ZPARM fields to see how your DB2 subsystem is configured. This information also applies if DB2 is a member of a data sharing group.

Data Sharing Group The name of the DB2 data sharing group. It is an alphanumeric text string with a maximum of 8 characters.
**Data Sharing Member** The name of the DB2 data sharing member or the member name of the DB2 subsystem. It is an alphanumeric text string with a maximum of 8 characters.

**DB2 Subsystem** The name of the DB2 subsystem.

**Field Name** The name of the DB2 field. It is an alphanumeric text string with a maximum of 8 characters.

**Field Description** The description of the DB2 field. It is an alphanumeric text string with a maximum of 44 characters.

The field descriptions of the DB2 parameters are listed in alphabetical order:

<table>
<thead>
<tr>
<th>DB2 parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>3990-3 SEQ CACHE (SEQCACH)</td>
<td>Indicates whether DB2 prefetch uses sequential mode to read cached data from a 3990 controller. When BYPASS (default), DB2 prefetch bypasses the cache.  When SEQ, DB2 prefetch uses sequential access for read activity. There is a performance benefit using SEQ with DFSMS or DFP controls with newer 3990 caches. Install parameter SEQUENTIAL CACHE on panel DSNTIPE, or ZPARM SEQCACH in DSN6SPRM.</td>
</tr>
<tr>
<td>ACCEL STARTUP (ACCEL)</td>
<td>Specifies the accelerator servers to be used.</td>
</tr>
<tr>
<td>ACCESS CONTROL (ACCESS CNTL MODULE)</td>
<td>Shows the name of the default access control exit module. This field corresponds to field ACCESS CONTROL on installation panel DSNTIPO3. The ZPARM name is ACCESS CNTL MODULE in DSN6SYSP.</td>
</tr>
<tr>
<td>ACTIVATE I/O SCHEDULING (SPRMIOP)</td>
<td>The enablement of the index I/O parallelism ZPARM.</td>
</tr>
<tr>
<td>ACTIVE LOGS - NUMBER OF COPIES (TWOACTV)</td>
<td>The TWOACTV subsystem parameter specifies the number of copies of the active log that DB2 is to maintain: 1 (single logging) or 2 (dual logging). ZPARM TWOACTV in DSN6LOGP</td>
</tr>
<tr>
<td>ACTIVE LOGS ARE OFFLOADED ONLINE</td>
<td>Shows whether the offload process is initiated online.</td>
</tr>
<tr>
<td>ADMIN SCHEDULER (ADMTPROC)</td>
<td>The name of the JCL procedure for starting the DB2 administrative scheduler task address space. DB2 parameter ADMTPROC in DSN6SPRM.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>AGGREGATION FIELDS (ACCUMUID)</td>
<td>Shows the aggregation fields used for DDF and RRSAF accounting rollup. Values are defined as follows:</td>
</tr>
<tr>
<td></td>
<td>0  End user ID, transaction name, and workstation name</td>
</tr>
<tr>
<td></td>
<td>1  End user ID</td>
</tr>
<tr>
<td></td>
<td>2  End user transaction name</td>
</tr>
<tr>
<td></td>
<td>3  End user workstation name</td>
</tr>
<tr>
<td></td>
<td>4  End user ID and transaction name</td>
</tr>
<tr>
<td></td>
<td>5  End user ID and workstation name</td>
</tr>
<tr>
<td></td>
<td>6  End user transaction name and workstation name</td>
</tr>
<tr>
<td></td>
<td>This value is ignored if DDF or RRSAF accounting are not used. DB2 writes individual accounting threads for threads that do not have all aggregation fields populated that are specified by this parameter.</td>
</tr>
<tr>
<td></td>
<td>Install parameter AGGREGATION FIELDS on installation panel DSNTIPN, or ZPARM ACCUMUID in DSN6SYSP.</td>
</tr>
<tr>
<td>ALLOCATION UNITS (ALCUNIT)</td>
<td>The unit used in allocating archive data sets. Possible values are CYLINDER, TRACK, and BLOCK.</td>
</tr>
<tr>
<td></td>
<td>Install parameter ALLOCATION UNITS on panel DSNTIPA, or ZPARM ALCUNIT in DSN6ARVP.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| ALLOW AUTOBIND OPERATION (ABIND)                  | Indicates whether autobind is enabled. Values are:                                                                                             | YES | Allows automatic rebind operations to be performed when a plan/package:  
• Was marked “invalid”.  
• Was bound on DB2 Vn, but is now running on DB2 Vn-1  
• After use on DB2 Vn-1 (as previously described), is later used again on DB2 Vn |
|                                                  | NO | Prevent DB2 from performing any automatic rebind operations under any circumstances.                                                                                     | ZPARM ABIND in DSN6SPRM. |
| ALLOW EXPLAIN AT AUTOBIND (ABEXP)                | Indicates whether EXPLAIN processing occurs during automatic rebind.              | YES | EXPLAIN processing happens during automatic rebind of a plan or package that has EXPLAIN=YES as a bind option. If the PLAN TABLE does not exist, automatic rebind continues, but there is no EXPLAIN output. Explain processing does not happen for a plan or package with EXPLAIN=NO. | ZPARM ABEXP in DSN6SPRM. |
| ALLOW TRACKMOD FOR IMPLICIT TSS (IMPTKMOD)       | Shows whether you have specified the TRACKMOD option on ALTER TABLESPACE for an implicitly created table space.  
This field corresponds to field TRACK MODIFIED PAGES on installation panel DSNTIP7. The ZPARM name is IMPTKMOD in DSN6SPRM. | | |
<p>| AMOUNT OF SPACE ABOVE MVS                       | The amount of space above MVS                                                                                                                                                                                                                                               | | |
| APPL COMPAT LEVEL (APPL COMPAT)                  | The application compatibility level.                                                                                                                                                                                                                                          | | |
| APPL REGISTRATION TABLE (RGFNMPRT)               | The name of the application registration table. Install parameter APPL REGISTRATION TABLE on panel DSNTIPZ or ZPARM RGFNMPRT in DSN6SPRM.                                                                                       | | |</p>
<table>
<thead>
<tr>
<th>DB2 parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>APPLICATION ENCODING DEFAULT (APPENSCH)</td>
<td>The Application encoding scheme. Install parameter APPLICATION ENCODING on installation panel DSNTIPF, or ZPARM APPENSCH in DSNHDECP.</td>
</tr>
<tr>
<td>ARCHIVE COPY 1 MASS STORAGE GROUP (MSGVP)</td>
<td>The mass storage system volume group name of the first storage group.</td>
</tr>
<tr>
<td>ARCHIVE COPY 2 MASS STORAGE GROUP (MSGVP2)</td>
<td>The mass storage system volume group name of the second storage group.</td>
</tr>
<tr>
<td>ARCHIVE LOG BLOCK SIZE BYTES (BLKSIZE)</td>
<td>The block size of the archive log data set. The block size must be compatible with the device type used for archive logs. The value is rounded up to the next multiple of 4096 bytes. If the archive log is written to tape, use the largest possible block size to improve the reading speed. Recommended block size values are 28672 for tape, 20480 for 3380, and 24576 for 3390 or RAMAC. Install parameter BLOCK SIZE on panel DSNTIPA, or ZPARM BLKSIZE in DSN6ARVP.</td>
</tr>
<tr>
<td>ARCHIVE LOG RACF PROTECTION (PROTECT)</td>
<td>Indicates whether archive log data sets are protected with individual RACF profiles when they are created. When YES, RACF protection must be active for DB2. YES also means that you cannot use RACF generic profiles for archive log data sets. If your archive log is on tape, RACF class TAPEVOL must be active, otherwise, the off-load will fail. Install parameter ARCHIVE LOG RACF on panel DSNTIPP, or ZPARM PROTECT in DSN6ARVP.</td>
</tr>
<tr>
<td>ARCHIVE LOGS - COPY 1 PREFIX (ARCPFX1)</td>
<td>The prefix for copy 1 of the archive data set. This prefix is appended to the high-level qualifier. ZPARM ARCPFX1 in DSN6ARVP.</td>
</tr>
<tr>
<td>ARCHIVE LOGS - COPY 2 PREFIX (ARCPFX2)</td>
<td>The prefix for copy 2 of the archive data set. This prefix is appended to the high-level qualifier. ZPARM: ARCPFX2 in DSN6ARVP.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>ART/ORT ESCAPE CHAR (RGFESCP)</td>
<td>The escape character used in the application registration table (ART) or object registration table (ORT). Sets of names in the ART and ORT can be represented by patterns that use the underscore (_) and percent sign (%) characters in the same way as in an SQL LIKE predicate. Install parameter ART/ORT ESCAPE CHARACTER on panel DSNTIPZ, or ZPARM RGFESCP in DSN6SPRM.</td>
</tr>
<tr>
<td>ASCII GRAPHIC CCSID (AGCCSID)</td>
<td>Indicates the ASCII graphic coded character set ID. The default (0) means the installation has no ASCII databases, table spaces, or tables. Install parameter ASCII CCSID on panel DSNTIPF, or ZPARM AGCCSID in DSNHDECP.</td>
</tr>
<tr>
<td>ASCII MIXED CCSID (AMCCSID)</td>
<td>Indicates the ASCII mixed coded character set ID. The default (0) means the installation has no ASCII databases, table spaces, or tables. Install parameter ASCII CCSID on panel DSNTIPF, or ZPARM AMCCSID in DSNHDECP.</td>
</tr>
<tr>
<td>ASCII SINGLE-BYTE CCSID (ASCCSID)</td>
<td>The ASCII single-byte coded character set ID. The default (0) means the installation has no ASCII databases, table spaces, or tables. Install parameter ASCII CCSID on panel DSNTIPF, or ZPARM ASCCSID in DSNHDECP.</td>
</tr>
<tr>
<td>ASSEMBLY DATE</td>
<td>The date on which this module was assembled.</td>
</tr>
<tr>
<td>AUTH EXIT CHECK (AUTHEXIT CHECK)</td>
<td>The AUTH subsystem parameter controls whether DB2 is to check authorizations.</td>
</tr>
<tr>
<td>AUTH EXIT LIMIT (AEXITLIM)</td>
<td>The AEXITLIM subsystem parameter controls the number of abends of the DB2 access control authorization exit routine that are to be tolerated before it is shut down.</td>
</tr>
<tr>
<td>AUTHEXIT CACHEREFRESH</td>
<td>The authorization exit cache refresh.</td>
</tr>
<tr>
<td>AUTO START (IRLMAUT)</td>
<td>Indicates whether IRLM is started automatically by DB2. Install parameter AUTO START on panel DSNTIPI, or ZPARM IRLMAUT in DSN6SPRM.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------</td>
</tr>
<tr>
<td>AUTO STARTED DATABASE/TBLSPACE</td>
<td>Database or table space is automatically started.</td>
</tr>
<tr>
<td>AUTOMATICALLY REOPTIMIZE DYN SQL (REOPTEXT)</td>
<td>Indicates that the access path of the dynamic SQL statement was automatically reoptimized.</td>
</tr>
</tbody>
</table>
| BACKOUT DURATION (BACKODUR) | Indicates how much of the log to process for backout when LIMIT BACKOUT = YES or AUTO. During restart, backward log processing continues until both of the following events occur:  
  • All inflight and inabort URs with update activity against the catalog or directory are backed out.  
  • The number of log records processed is equal to the number specified in BACKOUT DURATION times the value of CHECKPOINT FREQ. If the checkpoint frequency is specified in minutes, the number of records processed is the default of 50000 records multiplied by the value of CHECKPOINT FREQ.  
  In-flight and in-abort URs that are not completely backed out during restart are converted to postponed-abort status. Page sets or partitions with postponed-backout work are put into restart pending (RESTP). This state blocks all access to the object other than access by the command RECOVER POSTPONED or by automatic backout processing performed by DB2 when LIMITED BACKOUT = AUTO.  
  A table space might be in restart pending mode, without the associated index spaces also in restart pending mode. This happens if a postponed abort UR makes updates only to non-indexed fields of a table in a table space. In this case, the indexes are accessible to SQL (for index-only queries), even though the table space is inaccessible.  
  Install parameter BACKOUT DURATION on panel DSNTIPL, or ZPARM BACKODUR in DSN6SYSP. |
<table>
<thead>
<tr>
<th>DB2 parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BIF COMPATIBILITY</td>
<td>The BIF_COMPATIBILITY subsystem parameter specifies whether the built-in functions and specifications are to return results in the DB2 10 format or revert to the pre-Version 10 format. Acceptable values are: CURRENT V9 V9_TRIM V9_DECIMAL_VARCHAR N/P ZPARM BIF_COMPATIBILITY in DSN6SPRM.</td>
</tr>
<tr>
<td>BIND NEW PACKAGE (BINDNV)</td>
<td>The BINDNV subsystem parameter controls whether BIND or BINDADD authority is to be required for a user to bind a new version of an existing package. Acceptable values are BINDADD (default) or BIND. ZPARM BINDNV in DSN6SPRM.</td>
</tr>
<tr>
<td>CACHE DYNAMIC SQL STATEMENTS (CACHEDYN)</td>
<td>Indicates whether prepared dynamic SQL statements are saved for later use by eligible application processes in the EDM pool. Install parameter CACHE DYNAMIC SQL on panel DSNTIP8, or ZPARM CACHEDYN in DSN6SPRM.</td>
</tr>
<tr>
<td>CATALOG DATA (CATALOG)</td>
<td>The value of the CATALOG DATA field specifies whether archive log data sets on tape are to be cataloged. Acceptable values are YES or NO (default). ZPARM CATALOG in DSN6ARVP.</td>
</tr>
<tr>
<td>CHARACTER SET (DECPCHAR)</td>
<td>The character set.</td>
</tr>
<tr>
<td>CHECK FASTREPLICATION</td>
<td>The CHECK FASTREPLICATION parameter specifies the type of replication that DSS COPY uses to copy objects to shadow data sets when it is invoked by the DB2 CHECK utilities. The CHECK utilities can stipulate fast replication as PREFERRED or REQUIRED (default). ZPARM CHECK FASTREPLICATION in DSN6SPRM.</td>
</tr>
<tr>
<td>CHK FREQ RECORDS (LOGLOAD)</td>
<td>The LOGLOAD value specifies the number of log records that DB2 writes between checkpoints.</td>
</tr>
<tr>
<td>COMPACT DATA (COMPACT)</td>
<td>The COMPACT subsystem parameter controls whether data that is written to archive logs is to be compacted. Acceptable values are YES or NO (default). ZPARM COMPACT in DSN6ARVP.</td>
</tr>
<tr>
<td>COMPATIBILITY OPTION (COMPAT)</td>
<td>Indicates that DB2 is running in compatibility mode.</td>
</tr>
<tr>
<td></td>
<td>DB2 parameter COMPAT in DSNHDECP.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>COMPRESS SMF RECORDS (SMFCOMP)</td>
<td>Shows the COMPRESS DEST(SMF) TRACE records. This field corresponds to field COMPRESS SMF RECS on installation panel DSNTIPN. ZPARM name: SMFCOMP in DSN6YSFP.</td>
</tr>
<tr>
<td>COMPRESS SPT01</td>
<td>COMPRESS SPT01 in macro DSN6SPRM specifies whether the SPT01 table space is to be compressed. Valid values are YES and NO. In a data sharing environment, all members should use the same setting for the COMPRESS SPT01 parameter. The default value is NO, which means that the SPT01 table space is not compressed.</td>
</tr>
<tr>
<td>CONN QUEUE MAX DEPTH (MAXCONQN)</td>
<td>Specifies the maximum number of inactive or new connections that can be queued waiting for a DBAT to process the request. The default value is OFF.</td>
</tr>
<tr>
<td></td>
<td>OFF means that the depth of the connection queue is limited by the value of the CONDBAT subsystem parameter. ON means that the depth of the connection queue is limited by the value of the MAXDBAT subsystem parameter. A numeric value specifies the maximum number of connections that can be queued waiting for a DBAT to process a request.</td>
</tr>
<tr>
<td></td>
<td>ZPARM MAXCONQN in DSN6FAC.</td>
</tr>
<tr>
<td>CONN QUEUE MAX WAIT (MAXCONQW)</td>
<td>Specifies the maximum length of time that a client connection waits for a DBAT to process the next unit-of-work or new connection request. The default value is OFF.</td>
</tr>
<tr>
<td></td>
<td>ON means that connections wait as long as the value specified by the IDHTOIN subsystem parameter. OFF means that connections wait indefinitely for a DBAT to process requests. A numeric value specifies a time duration in seconds that a connection waits for a DBAT to process the request.</td>
</tr>
<tr>
<td></td>
<td>ZPARM MAXCONQW in DSN6FAC.</td>
</tr>
<tr>
<td>CONTRACT THREAD STORAGE (CONTSTOR)</td>
<td>Indicates whether DB2 returns unused thread storage at commit. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>YES  DB2 checks threads at commit points and periodically returns unused storage to the system.</td>
</tr>
<tr>
<td></td>
<td>NO   DB2 does not check threads at commit points and returns acquired storage on deallocation.</td>
</tr>
<tr>
<td></td>
<td>Install parameter CONTRACT THREAD STG on panel DSNTIPE, or ZPARM CONTSTOR in DSN6SPRM.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>CONTROL ALL APPLICATIONS (RGFDEDPL)</td>
<td>The RGFDEDPL subsystem parameter specifies whether the DB2® subsystem is to be completely controlled by a set of closed applications that are identified in the application registration table. Acceptable values are YES or NO (default). ZPARM RGFDEDPL in DSN6SPRM.</td>
</tr>
<tr>
<td>CONTROL PACKAGE HASH TABLES</td>
<td>The size of the control package hash table.</td>
</tr>
<tr>
<td>COPY (FLASHCOPY COPY)</td>
<td>The value of the FLASHCOPY COPY parameter specifies whether the FLASHCOPY option of the COPY utility is to be used by default. Acceptable values are NO (default) or YES. ZPARM FLASHCOPY COPY in DSN6SPRM.</td>
</tr>
<tr>
<td>CORRELATION ID MONITOR (SPRMOZC1)</td>
<td>The correlation ID of the online application that made the last change to DB2 system settings.</td>
</tr>
<tr>
<td>CURRENT DEGREE (CDSSRDEF)</td>
<td>Shows the default for the CURRENT DEGREE special register when no degree is explicitly set with SET CURRENT DEGREE. The default disables query parallelism. Install parameter CURRENT DEGREE on panel DSNTIP8, or ZPARM CDSSRDEF in DSN6SPRM.</td>
</tr>
<tr>
<td>CURRENT MAINTAINED TABLE TYPE (MAINTYPE)</td>
<td>Shows the default special register for the CURRENT MAINTAINED TABLE TYPES FOR OPTIMIZATION statement when no value is explicitly set. Possible values are: • ALL  • NONE  • SYSTEM (default)  • USER  The default allows query rewrite using system-maintained materialized query tables (SYSTEM) when CURRENT REFRESH AGE is set to ANY. When USER, query rewrite is done using user-maintained materialized query tables when CURRENT REFRESH AGE is set to ANY. ALL means that query rewrite uses both system-maintained and user- maintained materialized query tables. Install parameter CURRENT MAINT TYPES on panel DSNTIP8, or ZPARM MAINTYPE in DSN6SPRM.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------</td>
</tr>
<tr>
<td>CURRENT QUERY ACCEL. (QUERY ACCELERATION)</td>
<td>Determines the default value that is to be used for the CURRENT QUERY ACCELERATION special register. Possible values are:</td>
</tr>
<tr>
<td>NONE</td>
<td>Indicates that no query acceleration is done. This is the default value.</td>
</tr>
<tr>
<td>ENABLE</td>
<td>Indicates that queries are accelerated only if DB2 determines that it is advantageous to do so. If there is an accelerator failure while a query is running, or the accelerator returns an error, DB2 returns a negative SQLCODE to the application.</td>
</tr>
<tr>
<td>ENABLE WITH FAILBACK</td>
<td>Indicates that queries are accelerated only if DB2 determines that it is advantageous to do so. If the accelerator returns an error during the PREPARE or first OPEN for the query, DB2 executes the query without the accelerator. If the accelerator returns an error during a FETCH or a subsequent OPEN, DB2 returns the error to the user, and does not execute the query.</td>
</tr>
<tr>
<td>ELIGIBLE</td>
<td>Indicates that queries are accelerated if they are eligible for acceleration. DB2 does not use cost information to determine whether to accelerate the queries. Queries that are not eligible for acceleration are executed by DB2. If there is an accelerator failure while a query is running, or the accelerator returns an error, DB2 returns a negative SQLCODE to the application.</td>
</tr>
<tr>
<td>ALL</td>
<td>Indicates that queries are accelerated if they are eligible for acceleration. DB2 does not use cost information to determine whether to accelerate the queries. Queries that are not eligible for acceleration are not executed by DB2, and an SQL error is returned. If there is an accelerator failure while a query is running, or the accelerator returns an error, DB2 returns a negative SQLCODE to the application.</td>
</tr>

<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| DATABASE PROTOCOL (DBPROTCL)             | The default protocol (DRDA or PRIVATE) used when option DBPROTocol BIND is not explicitly specified for the bind of a plan or a package.  
When field INSTALL TYPE on panel DSNTIPA1 is INSTALL, the default value for DATABASE PROTOCOL is DRDA. When the value of INSTALL TYPE is MIGRATE, the default value for DATABASE PROTOCOL is PRIVATE.  
An application program might contain statements with three-part names, or aliases that reference remote objects. At bind or rebind of a plan, a user can specify whether these statements flow to the remote site using DB2 private or DRDA protocol.  
DB2 private protocol is appropriate if you do not plan to move applications that use three-part names to DRDA access immediately. To use DRDA access for applications with three-part names, you must bind packages for those applications at each location that the applications access, then bind all packages into a plan. If you cannot perform this activity immediately, and you want your applications to continue to work, you should specify PRIVATE for DATABASE PROTOCOL.  
The BIND commands for DB2-supplied applications are in job DSNTIJSG.  
Install parameter DATABASE PROTOCOL on panel DSNTIP5, or ZPARM DBPROTCL in DSN6SYSP. |
| DATASET STATS TIME (DSSTIME)             | The time interval, in minutes, before DB2 resets data set statistics collected for the online performance monitors. Online performance monitors can request DB2 data set statistics for the current interval with an IFI READS request for IFCID 199.  
Install parameter DATASET STATS TIME on panel DSNTIPN, or ZPARM DSSTIME in DSN6SYSP. |
<table>
<thead>

<tbody>
<tr>
<td>DATE FORMAT (DATE)</td>
<td>Default output format for dates. Valid formats are ISO (yyyy-mm-dd), USA (mm/dd/yyyy), EUR (dd.mm.yyyy), JIS (yyyy- mm-dd), or LOCAL (your choice, defined by a date exit routine). DB2 interprets the input date from the punctuation and converts the output date to the required format. Install parameter DATE FORMAT on panel DSNTIP4, or ZPARM DATE in DSNHDECP.</td>
</tr>
<tr>
<td>DB2-SUPPLIED DECP</td>
<td>Indicates that DECP is supplied by DB2. Using a DB2 supplied DECP could cause data corruption due to applications using wrong CCSIDs.</td>
</tr>
<tr>
<td>DBADM CREATE AUTH (DBACR VW)</td>
<td>Shows whether a DB2 administrator can create a view or alias for another user. Possible values are YES or NO. The default is NO. Install parameter DBADM CREATE AUTH on panel DSNTIPP. ZPARM DBACR VW in macro DSN6SPRM.</td>
</tr>
<tr>
<td>DDF COMPATIBILITY</td>
<td>The DDF compatibility.</td>
</tr>
<tr>
<td>DDF START OPTION (DDF)</td>
<td>Specifies how the data types of stored procedure output parameters are determined when a non-Java client calls a DB2 for z/OS stored procedure. Valid values are null and SP_P ARMS_NV. The default value of null means that the data types of the returned output data match the data types of the parameters in the stored procedure definition. This is the default behavior starting in DB2 for z/OS Version 10.</td>
</tr>
<tr>
<td>DDF THREADS (CMTSTAT)</td>
<td>The CMTSTAT subsystem parameter controls whether threads are to be made active or inactive after they successfully commit or roll back and hold no cursors. A thread can become inactive only if it holds no cursors, has no temporary tables defined, and executes no statements from the dynamic statement cache. Acceptable values are ACTIVE or INACTIVE. ZPARM CMTSTAT in macro DSN6FAC.</td>

<tr>
<td>DDF/RRSAF ACCUMULATION (ACCUMACC)</td>
<td>Shows whether DB2 accounting data for DDF and RRSAF threads is accumulated by end user. When NO, DB2 writes an accounting record when a DDF thread is made inactive, or when signon occurs for an RRSAF thread. A value in the range 2 through 65535 shows the number of times an end-user identifier should occur before DB2 writes an accounting record. An end-user identifier is the concatenation of the end-user user ID, end-user transaction name, and the end-user workstation name. Tracing, Checkpoint &amp; Pseudo-Close Parameters (DSNTIPN). These values can be set by DDF threads using SERVER CONNECT and SET CLIENT calls, and by RRSAF threads using the RRSAF SIGN, AUTH SIGNON, and CONTEXT SIGNON functions. An accounting record might be written prior to the number of end user occurrences in the following instances:</td>
</tr>
<tr>
<td></td>
<td>• When an internal storage threshold is reached for the accounting RRSAF signon call.</td>
</tr>
<tr>
<td></td>
<td>• When the thread deallocates, the accumulated accounting data for all end users on this thread is written (one record per end user).</td>
</tr>
<tr>
<td></td>
<td>• When this parameter is dynamically changed to deactivate accounting accumulation. In this instance, the next end-UR (for DDF thread) or signon (for a RRSAF thread) causes DB2 to write the accumulated accounting data for all end users on this thread (one record per end user).</td>
</tr>
<tr>
<td></td>
<td>Install parameter DDF/RRSAF ACCUM on installation panel DSNTIPN, or ZPARM ACCUMACC in DSN6SYSP.</td>
</tr>
<tr>
<td>DEADLOCK CYCLES (DEADLOK)</td>
<td>The value of the DEADLOCK CYCLE field specifies the number of local deadlock cycles that must expire before the IRLM does global deadlock detection processing. The DEADLOCK CYCLE field is used only for DB2® data sharing. The associated IRLM PROC parameter is DEADLOK.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>

<tr>
<td>-------------------</td>
<td>-----------------</td>
</tr>
</tbody>
</table>
| DESCRIBE FOR STATIC SQL (DESCSTAT) | Shows whether DB2 builds a DESCRIBE SQLDA when binding static SQL statements. A DESCRIBE cannot be issued against a static SQL statement except:  
• In a distributed environment, where DB2 for z/OS is the server and the requester supports extended dynamic SQL. In this instance, a DESCRIBE on an SQL statement in the extended dynamic package appears to DB2 as a DESCRIBE on a static SQL statement in the DB2 package.  
• When an application uses a stored procedure result set, the application must allocate a cursor for that result set. The application can do this using a DESCRIBE CURSOR statement. The SQL statement actually described is the one with the cursor declared in the stored procedure. If that statement is static, a static SQL statement must be described.  
When NO (default), DB2 does not generate a DESCRIBE SQLDA at BIND time for static SQL statements. If a DESCRIBE request is received at execution time, DB2 generates an error. However, if the describe request comes from a DESCRIBE CURSOR statement, DB2 satisfies the request but is only able to provide data type and length information. Column names are not provided.  
When YES, DB2 generates a DESCRIBE SQLDA at BIND time so that DESCRIBE requests for static SQL can be satisfied during execution.  
**Note:** You must rebind packages after this value has been set to YES.  
This option increases the size of some packages because the DESCRIBE SQLDA is now stored with each statically-bound SQL SELECT statement.  
Install parameter DESCRIBE FOR STATIC on panel DSNTIP4, or ZPARAM DESCSTAT in DSN6SPRM. |
<p>| DEVICE TYPE 1 (UNIT) | The UNIT subsystem parameter specifies the device type or unit name that is to be used for storing archive log data sets. Acceptable values are the device type or unit name. The default value is TAPE. |</p>

<td>ENFORCE DPROP SUPPORT (EDPROP)</td>
<td>Shows whether DataPropagator NonRelational (DPROP) is used to propagate SQL changes made to tables defined with DATA CAPTURE CHANGES.</td>
</tr>
<tr>
<td></td>
<td>1  No changes are propagated.</td>
</tr>
<tr>
<td></td>
<td>2  DPROP propagates SQL changes, and those changes made to tables defined with DATA CAPTURE CHANGES are only allowed when monitor trace class 6 is active, DPROP is installed, and the DB2 application is running in an IMS environment. If any of these conditions are not met, no changes to the DB2 table are permitted.</td>
</tr>
<tr>
<td></td>
<td>3  Data propagation occurs when monitor trace class 6 is active, DPROP is installed, and the DB2 application is running in an IMS environment. In this instance, an application that is not running in an IMS environment can update DB2 tables defined with DATA CAPTURE CHANGES. However, these changes are not propagated to IMS.</td>
</tr>
<tr>
<td>ANY</td>
<td>Allows subsystems to propagate some data with DPROP and other data with a different propagation program.</td>
</tr>
</tbody>
</table>

Tables that should only be updated by DB2 applications running in an IMS environment can be protected using the following methods:

- Use the ENABLE parameter on BIND to specify a specific attachment facility through which updates to data propagation tables can be made.
- Define a validation procedure for data propagation tables to define which plans can update those tables.
- Allow update authority for data propagation tables to a group of authorization IDs that can only run in IMS.

Install parameter DPROP SUPPORT on panel DSNTIPO, or ZPARM EDPROP and CHGDC in DSN6SPRM.
<table>
<thead>
<tr>
<th>DB2 parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EVALUATE UNCOMMITTED (EVALUNC)</td>
<td>Shows whether stage 1 predicate evaluation during table access can proceed upon uncommitted data or not. This applies to isolation levels of Read Stability and Cursor Stability only. When NO (default), predicate evaluation occurs only on committed data (or on the application's own uncommitted changes). NO ensures that all qualifying data is always included in the answer set. When YES, predicate evaluation can occur upon uncommitted data. Only committed data is returned to the query. However, a decision can be made to omit a row from the answer set based on uncommitted data. Later, undo processing (statement rollback or statement failure) could cause the data to revert to a state that satisfies the predicate. When YES, DB2 can request fewer locks than in previous versions when processing isolation level Read Stability and Cursor Stability queries. The number of locks avoided is related to the access path of the query, the number of rows evaluated when processing the stage 1 predicate of the query, and the number of those rows that are overflow rows. Specifically, for isolation level Read Stability and Cursor Stability queries, locks are avoided for rows that do not satisfy the stage 1 predicate, provided they are not overflow rows. Table access includes table space scans and index-to-data access, including ridlist-to-data access. For isolation Cursor Stability ridlist production, all row/page locking is avoided. Install parameter EVALUATE UNCOMMITTED on panel DSNTIP8, or ZPARM EVALUNC in DSN6SPRM.</td>
</tr>
<tr>
<td>EXTENDED DATESTAMP INDICATOR</td>
<td>The indicator of the extended date stamp.</td>
</tr>
<tr>
<td>EXTENDED OPTION FOR TCPALVER</td>
<td>Indicates whether DB2 accepts TCP/IP connection requests containing only a user ID. When YES, a connection request is accepted with a user ID only. This value must be the same for all members of a data sharing group. When NO (default), TCP/IP clients must provide authentication information (password, RACF PassTicket, or Kerberos ticket) to gain access to DB2. ZPARM TCPALVER in DSN6FAC.</td>

<tr>
<td>IMMEDIATE WRITE (IMMEDWRI)</td>
<td>Indicates how DB2 updates group buffer pool dependent pages. This is only valid in a data-sharing environment. Group buffer pool dependent pages can be written to DASD or SYSTEM pagesets. Install parameter IMMEDIATE WRITE on panel DSNTIP8, or ZPARM IMMEDWRI in DSN6GRP.</td>
</tr>
<tr>
<td>IMPLICIT TIMEZONE (IMPLICIT TIMEZONE)</td>
<td>The implicit time zone that is associated with DB2 table columns and routine parameters that are declared as time stamp with time zone. For IFCID 106 - Application Programming Defaults, this field is displayed twice, with its hex value and in a readable string. This field corresponds to DSNHDECP field IMPLICIT TIMEZONE.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>IMS BMP TIMEOUT (BMPTOUT)</td>
<td>The number of RESOURCE TIMEOUT units that an IMS BMP connection waits for a lock to be released. The default value is 4, meaning that an IMS BMP connection can wait 4 times the resource timeout value for a resource. Install parameter IMS BMP TIMEOUT on panel DSNTIP1, or ZPARM BMPTOUT in DSN6SPRM.</td>
</tr>
<tr>
<td>IMS DLI TIMEOUT (DLITOUT)</td>
<td>The number of RESOURCE TIMEOUT units that a DL/I batch connection waits for a lock to be released. For example, if you use the default value of 6, a DL/I batch application can wait 6 times the resource timeout value for a resource. Install parameter DL/I BATCH TIMEOUT on panel DSNTIP1, or ZPARM DLITOUT in DSN6SPRM.</td>
</tr>
<tr>
<td>INCLUDE DEPENDENT PRIVILEGE ON REVOKE</td>
<td>Allows revoking of dependent privileges to be controlled at the SQL level.</td>
</tr>
<tr>
<td>INDEX CLEANUP THREADS</td>
<td>The index cleanup threads.</td>
</tr>
<tr>
<td>INDEX I/O PARALLELISM (INDEX IO PARALLELISM)</td>
<td>The enablement of the index I/O parallelism ZPARM.</td>
</tr>
<tr>
<td>INDEX SPACE ALLOCATION IN KB (IXQTY)</td>
<td>Shows the amount of space in KB for primary and secondary space allocation for DB2-defined data sets for index spaces created without the USING clause. 0 indicates that DB2 uses standard defaults. Install parameter INDEX SPACE ALLOCATION on panel DSNTIP7, or ZPARM IXQTY in DSN6SYSP.</td>
</tr>
<tr>
<td>INITIAL MODULE</td>
<td>The name of the initial DSNZPARM load module.</td>
</tr>
<tr>
<td>INSTALL DD CONTROL SUPT (RGFINSTL)</td>
<td>Indicates whether data definition support has been installed. Install parameter INSTALL DD CONTROL SUPT on panel DSNTIPZ, or ZPARM RGFINSTL in DSN6SPRM.</td>
</tr>
<tr>
<td>IRLM INITIALIZATION INQUIRY TIME</td>
<td>The number of seconds DB2 waits before querying whether IRLM has completed initialization. DB2 parameter SPRMISWI in DSNMSPRM.</td>
</tr>
<tr>
<td>IRLM MAXIMUM CSA ALLOWED</td>
<td>The maximum common service area (CSA) allowed for internal resource lock manager (IRLM).</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>IRLM SUBSYSTEM (IRLMSID)</td>
<td>The IRLM subsystem name defined to MVS. This is used for communication between DB2 and the IRLM. It is included in the MVS subsystem table IEFSSN xx, where xx is the value of SUBSYSTEM MEMBER on installation panel DSNTIPM. If the IRLM for IMS is installed, the DB2 IRLM name is different because two IRLMs on the same MVS system must have unique names. Install parameter SUBSYSTEM NAME on panel DSNTIP, or ZPARM IRLMSID in DSN6SPRM.</td>
</tr>
<tr>
<td>IX TB PART CONV EXCLUDE</td>
<td>Shows whether to include all columns in the partitioning key during conversion from index-controlled partitioning to table-controlled partitioning:</td>
</tr>
<tr>
<td></td>
<td>NO  Includes all columns</td>
</tr>
<tr>
<td></td>
<td>YES Includes trailing columns only if they affect partitioning</td>
</tr>
<tr>
<td></td>
<td>This field corresponds to field EXCLUDE PART KEY ELEMENTS on installation panel DSNTIP71. The ZPARM name is IX TB PART CONV EXCLUDE in DSN6SPRM.</td>
</tr>
<tr>
<td>LANGUAGE DEFAULT (DEFLANG)</td>
<td>The default programming language for your site. This can be:</td>
</tr>
<tr>
<td></td>
<td>• ASM</td>
</tr>
<tr>
<td></td>
<td>• C</td>
</tr>
<tr>
<td></td>
<td>• CPP</td>
</tr>
<tr>
<td></td>
<td>• COBOL</td>
</tr>
<tr>
<td></td>
<td>• COB2</td>
</tr>
<tr>
<td></td>
<td>• IBMCOB</td>
</tr>
<tr>
<td></td>
<td>• FORTRAN</td>
</tr>
<tr>
<td></td>
<td>• PLI</td>
</tr>
<tr>
<td></td>
<td>When this is C or C++, you can fold SQL identifiers to uppercase.</td>
</tr>
<tr>
<td></td>
<td>Install parameter LANGUAGE DEFAULT on panel DSNTIPF, or ZPARM DEFLANG in DSNHDECP.</td>
</tr>
<tr>
<td>LEVELID UPDATE FREQ (DLDFREQ)</td>
<td>The DLDFREQ subsystem parameter specifies whether the level ID of a page set or partition is to be updated at DB2-determined checkpoint intervals. Acceptable values are ON (default) or OFF. ZPARM DLDFREQ in DSN6SYSP.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>LIKE BLANK INSIGNIFICANT</td>
<td>The LIKE BLANK INSIGNIFICANT field specifies whether blanks are significant when applying the LIKE predicate to a string. When the LIKE predicate is applied against fixed length character column data, DB2 strips trailing blanks from the data before performing the comparison. If the data is all blank, DB2 reduces it to a single blank before performing the comparison. If not set, LIKE treats trailing blanks within fixed length character strings as significant.</td>
</tr>
<tr>
<td>LIMIT BACKOUT (LBACKOUT)</td>
<td>The LBACKOUT subsystem parameter specifies whether DB2 is to postpone backward-log processing for some units of work. Acceptable values are AUTO (default), YES, LIGHT, LIGHTAUTO, or NO. ZPARM LBACKOUT in DSN6SYSP.</td>
</tr>
<tr>
<td>LOAD (FLASHCOPY LOAD)</td>
<td>The value of the FLASHCOPY LOAD subsystem parameter specifies whether the FLASHCOPY option of the LOAD utility is to be used by default. Acceptable values are NO (default) or YES. ZPARM FLASHCOPY LOAD in DSN6SPRM.</td>
</tr>
<tr>
<td>LOB INLINE LEN (LOB INLINE LENGTH)</td>
<td>The default inline length for any new storing large object (LOB) column in a Universal Table Space on the DB2 subsystem. The valid values are from 0 to 32680 inclusive (in bytes). The default value for this ZPARM is 0, which indicates that no inline attribute is required for any LOB column (BLOB, CLOB or DBCLOB) created on this subsystem.</td>
</tr>
<tr>
<td>LOCAL DATE LENGTH (DATELEN)</td>
<td>Shows the length of the longest field required to hold a locally defined date. The default (0) indicates an IBM-supplied format (ISO, JIS, USA, or EUR). Install parameter LOCAL DATE LENGTH on panel DSNTIP4, or ZPARM DATELEN in DSNHDECP.</td>
</tr>
<tr>
<td>LOCAL TIME LENGTH (TIMELEN)</td>
<td>Shows the length of the longest field required to hold a time when a locally defined time format is used. The default (0) indicates an IBM-supplied format (ISO, JIS, USA, or EUR). Install parameter LOCAL TIME LENGTH on panel DSNTIP4, or ZPARM TIMELEN in DSNHDECP.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>LOCALE LC CTYPE (LC CTYPE)</td>
<td>The LC TYPE DECP value specifies the system LOCALE LC CTYPE. A locale is the part of your system environment that depends on language and cultural conventions. An LC CTYPE is a subset of a locale that applies to character functions. A valid locale can consist of 0 to 50 characters.</td>
</tr>
<tr>
<td>LOCKS PER TABLE (SPACE) (NUMLKTS)</td>
<td>The default (SYSTEM) for the LOCKMAX clause of the SQL statements CREATE TABLESPACE and ALTER TABLESPACE. Install parameter LOCKS PER TABLE(SPACE) on panel DSNTIPJ, or ZPARM NUMLKTS in DSN6SPRM.</td>
</tr>
<tr>
<td>LOCKS PER USER (NUMLKUS)</td>
<td>The maximum number of page or row locks that a single application can hold concurrently on all table spaces. This includes locks on data pages, index pages, subpages, and rows that the program acquires when it accesses table spaces. The limit applies to all table spaces defined with the LOCKSIZE PAGE, LOCKSIZE ROW, or LOCKSIZE ANY options. 0 means that there is no limit to the number of page and row locks a program can acquire. DB2 assumes that 250 bytes of storage are required for each lock. If NO is specified for CROSS MEMORY, the value of this field has to take into account the available lock space. If referential constraints between tables is defined, the value of this field might need to be increased. Install parameter LOCKS PER USER on panel DSNTIPJ, or ZPARM NUMLKUS in DSN6SPRM.</td>
</tr>
<tr>
<td>LOG CHECKPOINT TYPE (CHKTYPE)</td>
<td>The CHKTYPE subsystem parameter indicates whether the interval between log checkpoints is to be based on the number of written log records, the time between checkpoints, or both. Acceptable values are LOGRECS, MINUTES (default), or BOTH. ZPARM CHKTYPE in DSN6SYSP.</td>
</tr>
<tr>
<td>MANAGE REAL STORAGE (REALSTORAGE MANAGEMENT)</td>
<td>Specifies whether DB2 should manage real storage consumption. Valid values are ON, OFF, and AUTO (default). The default setting is AUTO. ZPARM REALSTORAGE MANAGEMENT in DSN6SPRM.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------------------------</td>
<td>-----------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>MANAGE THREAD STORAGE (MINSTOR)</td>
<td>Shows whether DB2 uses storage management to optimize the amount of working storage consumed by individual threads.</td>
</tr>
<tr>
<td></td>
<td>Install parameter MANAGE THREAD STORAGE on panel DSNTIPE, or ZPARM MINSTOR in DSN6SPRM.</td>
</tr>
<tr>
<td></td>
<td>For best performance, this parameter should be NO, meaning DB2 does not manage thread storage.</td>
</tr>
<tr>
<td></td>
<td>When YES, DB2 uses best fit algorithm to manage and assign thread storage. This can help on systems that have many long-running threads and that are constrained on DBM1 address space.</td>
</tr>
<tr>
<td>Max 31-bit IRLM Private Storage</td>
<td>The maximum 31-bit IRLM private storage.</td>
</tr>
<tr>
<td>Max 64-bit IRLM Private Storage</td>
<td>The maximum 64-bit IRLM private storage.</td>
</tr>
<tr>
<td>MAX ABEND COUNT (STORMXAB)</td>
<td>The number of times a stored procedure is allowed to terminate abnormally, after which SQL CALL statements for the stored procedure are rejected.</td>
</tr>
<tr>
<td></td>
<td>Install parameter MAX ABEND COUNT on panel DSNTIPX, or ZPARM STORMXAB in DSN6SYSP.</td>
</tr>
<tr>
<td>MAX BATCH CONNECTIONS (IDBACK)</td>
<td>The maximum allowed number of concurrent connections for batch jobs and utilities. This includes:</td>
</tr>
<tr>
<td></td>
<td>• All batch jobs using QMF.</td>
</tr>
<tr>
<td></td>
<td>• All batch jobs using the DSN command processor.</td>
</tr>
<tr>
<td></td>
<td>• All tasks connected to DB2 through call attach facility (CAF) running in batch. This can include:</td>
</tr>
<tr>
<td></td>
<td>– Batch jobs using QMF</td>
</tr>
<tr>
<td></td>
<td>– APPC applications</td>
</tr>
<tr>
<td></td>
<td>– TCP/IP FTP connections</td>
</tr>
<tr>
<td></td>
<td>When the number of batch jobs reaches this limit, further requests are rejected.</td>
</tr>
<tr>
<td></td>
<td>Install parameter MAX BATCH CONNECT on panel DSNTIPE, or ZPARM IDBACK in DSN6SYSP.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>MAX CONCURRENT PKG OPS</td>
<td>Specifies the maximum number of automatic bind requests, remote bind requests, remote rebind requests, CREATE TRIGGER statements, and CREATE PROCEDURE statements for packages that can be processed simultaneously. If the value of the AUTO BIND field of panel DSNTIPO is set to NO, the value of MAX_CONCURRENT_PKG_OPS has no effect. The default value of MAX_CONCURRENT_PKG_OPS is 10. ZPARM MAX_CONCURRENT_PKG_OPS in macro DSN6SPRM.</td>
</tr>
<tr>
<td>MAX CONCURRENT(CTHREAD)</td>
<td>The maximum number of allied threads (threads started at the local subsystem) that can be allocated concurrently. Separate threads are created for each occurrence of the following: • TSO user (whether running a DSN command or a DB2 request from QMF) • Batch job (whether running a DSN command or a DB2 utility) • IMS region that can access DB2 • Active CICS transaction that can access DB2 • Task connected to DB2 through the call attachment facility. Install parameter MAX USERS on panel DSNTIPE, or ZPARM CTHREAD in DSN6SYSP.</td>
</tr>
<tr>
<td>MAX DATA CACHING MB (MXDTCACH)</td>
<td>The MXDTCACH subsystem parameter specifies the maximum amount of memory, in MB, that is to be allocated for data caching per thread. Acceptable values are 0 to 512. ZPARM MXDTCACH in DSN6SPRM</td>
</tr>
<tr>
<td>MAX DBM1 STG FOR LOG</td>
<td>The maximum DBM1 storage that can be used by the fast log apply process. The default value is 0 MB, which means that fast log apply is disabled except during DB2 restart, when fast log apply is always enabled. Install parameter LOG APPLY STORAGE on panel DSNTIPL, or ZPARM LOGAPSTG in DSN6SYSP.</td>
</tr>
<tr>
<td>MAX DSSIZE FOR IMPLICIT TSS (IMPDSSIZE)</td>
<td>Shows the maximum DSSIZE in gigabytes that DB2 uses for creating each partition of an implicitly created base table space. This field corresponds to field DEFAULT DSSIZE on installation panel DSNTIP7. The ZPARM name is IMPDSSIZE in DSN6SPRM.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>MAX INACTIVE DBATS (MAXTYPE1)</td>
<td>Indicates the number of type 1 inactive threads that DB2 allows. A large number of type 1 inactive threads can adversely affect system performance. Type 1 inactive threads are used for DB2 private protocol. DRDA uses type 2 inactive threads. Zero indicates that type 1 inactive connections are not allowed. Threads remain active when they become eligible to be made a type 1 inactive thread. A value greater than zero indicates that type 1 inactive connections are allowed, but are limited to this number. When a thread becomes eligible to be made a type 1 inactive thread, and this threshold is reached, the remote connection is terminated. When this is equal to MAX REMOTE CONNECTED on panel DSNTIPE, DB2 allows all remote threads to become type 1 inactive threads. Install parameter MAX INACTIVE DBATS on panel DSNTIPR, or ZPARM MAXTYPE1 in DSN6FAC.</td>
</tr>
<tr>
<td>Max Numb in IN-List (INLISTP)</td>
<td>Allows you to specify the maximum number of elements in an IN-list for certain IN predicate optimizations to occur. The default value for INLISTP is 50. ZPARM INLISTP in macro DSN6SPRM.</td>
</tr>
<tr>
<td>MAX NUMBER DS CONCURRENTLY IN USE (DSMAX)</td>
<td>The maximum number of data sets that can be open at one time. The practical limit can be less than the MVS limit of 32727, depending on available storage below the line. Install parameter DMAX on panel DSNTIPC, or ZPARM DMAX in DSN6SPRM.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>MAX OPEN CURSORS (MAX_NUM_CUR)</td>
<td>Shows the maximum number of cursors, including allocated cursors, that are open at a given DB2 site per thread. RDS keeps a total of currently open cursors. If an application attempts to open a thread after the maximum is reached, the statement will fail. In a data sharing group, this parameter is shown at member scope. Install parameter MAX OPEN CURSORS on panel DSNTIPX, or ZPARM MAX_NUM_CUR in DSN6SPRM.</td>
</tr>
<tr>
<td>MAX OPEN FILE REFS (MAXOFILR)</td>
<td>The maximum number of concurrently open data sets for processing LOB file references. Install parameter MAX OPEN FILE REFS on panel DSNTIPE or ZPARM MAXOFILR in DSN6SYSP.</td>
</tr>
<tr>
<td>MAX REMOTE ACTIVE (MAXDBAT)</td>
<td>The maximum number of database access threads (DBATs) that can be active concurrently. When this limit has been reached, DB2 uses the value of DDF THREADS on panel DSNTIPR to decide how to handle a new allocation request. When DDF THREADS is ACTIVE and MAX REMOTE CONNECTED has not been reached, the allocation request is allowed but any further processing for the connection is queued waiting for an active database access thread to terminate. When DDF THREADS is INACTIVE and MAX REMOTE CONNECTED has not been reached, the allocation request is allowed and is processed when DB2 can assign an unused database access thread slot to the connection. The total number of threads accessing data concurrently is the sum of MAX USERS and MAX REMOTE ACTIVE. The maximum allowable value for this sum is 2000. Install parameter MAX REMOTE ACTIVE on panel DSNTIPE, or ZPARM MAXDBAT in DSN6SYSP.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>MAX RID BLOCKS OF TEMP STRG (MAXTEMPS RID)</td>
<td>The maximum number of RID blocks of temporary storage in the work file database that a single RID list can use at any point in time. This field corresponds to field MAX TEMP RID on installation panel DSNTIP9. The ZPARM name is MAXTEMPS RID. It can have the following values:</td>
</tr>
<tr>
<td></td>
<td>-1 If MAXTEMPS RID=NONE</td>
</tr>
<tr>
<td></td>
<td>0 If MAXTEMPS RID=NOLIMIT</td>
</tr>
<tr>
<td></td>
<td>1 to 329166 Otherwise</td>
</tr>
<tr>
<td>MAX RID POOL SIZE (MAXRBLK)</td>
<td>The amount of storage needed for the RID pool.</td>
</tr>
<tr>
<td></td>
<td>This can be the value calculated by the CLIST, based on input from previous panels, or the value entered in the Override column at installation time.</td>
</tr>
<tr>
<td></td>
<td>When 0, DB2 does not use access paths or join methods that depend on RID pool storage.</td>
</tr>
<tr>
<td></td>
<td>Install parameter RID POOL SIZE on panel DSNTIPC, or ZPARM MAXRBLK in DSN6SPRM.</td>
</tr>
<tr>
<td>MAX STORED PROCS (MAX_ST_PROC)</td>
<td>Shows the maximum number of stored procedures per thread. If an application attempts to call a stored procedure after this is reached, the statement will fail. In a data sharing group, this parameter is shown as member scope.</td>
</tr>
<tr>
<td></td>
<td>Install parameter MAX STORED PROCS on panel DSNTIPX, or ZPARM MAX_ST_PROC in DSN6SPRM.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| MAX TSO USERS (IDFORE) | The maximum number of concurrent TSO foreground connections (QMF, DSN, DB2I, and SPUFI). Each of the following is a separate user:  
  • Each TSO foreground user executing a DSN command.  
  • Each TSO foreground user connected to DB2 through the call attachment facility (CAF). This can include QMF users running in TSO foreground or user-written CAF applications running in TSO foreground.  
  When the number of TSO users attempting to access DB2 exceeds this limit, connection requests are rejected. There is no subsystem parameter to control the maximum concurrent connections for IMS and CICS. These are controlled by using IMS and CICS facilities. For CICS attachment, the maximum number of connections to DB2 can be controlled using the resource control table (RCT) TYPE=INIT THRDMAX value.  
  Install parameter MAX TSO CONNECT on panel DSNTIPF, or ZPARM IDFORE in DSN6SYSP. |
| MAX ZIVLEMP EL DICT ENTRY (SPRMMDE) | Hardware data compression uses the Ziv-Lempel compression technique, which uses a fixed number of bits to replace a variable number of bytes. This technique requires use of a dictionary. |
| MAXIMUM DEGREE PARALLELISM (PARAMDEG) | Indicates the upper limit on the degree of parallelism for a parallel group.  
  This field has a value of 0. This means PARAMDEG is not set and DB2 can set a default maximum degree of parallelism based on the system configuration.  
  Install parameter MAX DEGREE on panel DSNTIP8, or ZPARM PARAMDEG in DSN6SPRM. |
| MAX DS OPEN STOP ASYNC DRAIN (SPRMMDD) | The percentage of maximum open data sets until the asynchronous drain operations are stopped.  
  DB2 parameter SPRMMDD in DSN6SPRM. |
<p>| MAXIMUM EXTEND SERVICE TASKS (SPRMEST) | Maximum number of extended service tasks. |
| MAXIMUM KEPT DYNAMIC STATEMENTS (MAXKEEPD) | Shows the total number of prepared dynamic SQL statements that are saved past a commit point. 0 means that prepared dynamic SQL statements are not saved past commit points. Install parameter MAX KEPT DYN STMTS on panel DSNTIPF, or ZPARM MAXKEEPD in DSN6SPRM. |</p>

<tbody>
<tr>
<td><strong>MAXIMUM LE TOKENS (LEMAX)</strong></td>
<td>The maximum number of LE tokens active at any time. When zero, no tokens are available.</td>
</tr>
<tr>
<td></td>
<td>A token is used each time one of the following is used: trigonometry functions, degrees, radians, rand, exp, power, log functions, upper, lower, translate.</td>
</tr>
<tr>
<td></td>
<td>Install parameter <code>MAXIMUM LE TOKENS</code> on panel DSNTIP7, or <code>ZPARM LEMAX</code> in DSN6SPRM.</td>
</tr>
<tr>
<td><strong>MAXIMUM NOT FOUND HASH RECORDS (SPRMKFC)</strong></td>
<td>The maximum number of NOT FOUND hash records.</td>
</tr>
<tr>
<td><strong>MAXIMUM NUMBER OF DS IN BSDS (MAXARCH)</strong></td>
<td>The maximum number of archive log volumes that can be recorded in the BSDS.</td>
</tr>
<tr>
<td></td>
<td>When this number is exceeded, recording resumes at the beginning of the BSDS.</td>
</tr>
<tr>
<td></td>
<td>For dual archive, this value applies to each log data set. As an example, a value of 500 allows 500 COPY-1 and 500 COPY-2 data sets in the BSDS.</td>
</tr>
<tr>
<td></td>
<td>You must create image copies of all DB2 objects, probably several times, before the archive log data sets are discarded. If you fail to retain an adequate number of archive log data sets for all the image copies, you might need to cold start or reinstall DB2. In either case, data is lost.</td>
</tr>
<tr>
<td></td>
<td>Install parameter <code>RECORDING MAX</code> on panel DSNTIPA, or <code>ZPARM MAXARCH</code> in DSN6LOGP.</td>
</tr>
<tr>
<td><strong>MAXIMUM READ TAPE UNITS (MAXRTU)</strong></td>
<td>The maximum number of tape units that can be allocated for archive read purposes.</td>
</tr>
<tr>
<td></td>
<td>Install parameter <code>READ TAPE UNITS</code> on panel DSNTIPA, or <code>ZPARM MAXRTU</code> in DSN6LOGP.</td>
</tr>
<tr>
<td><strong>MAXIMUM REMOTE CONNECT (CONDBAT)</strong></td>
<td>The maximum allowed number of concurrent remote connections. When this limit is reached, any new connection request is rejected. Install parameter <code>MAX REMOTE CONNECTED</code> on panel DSNTIPE, or <code>ZPARM CONDBAT</code> in DSN6SYSP.</td>
</tr>
<tr>
<td><strong>MAXIMUM TAPE UNITS (RESTORE TAPEUNITS)</strong></td>
<td>The maximum number of tape units or tape drives that the restore system utility can use to restore from a system-level backup that has been dumped to tape.</td>
</tr>
<tr>
<td></td>
<td>Install parameter <code>MAXIMUM TAPE UNITS</code> on installation panel DSNTIP6, or <code>ZPARM RESTORE TAPEUNITS</code> in DSN6SPRM.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------</td>
</tr>
<tr>
<td>MAXIMUM TEMP STG/AGNT IN MB (MAXTEMPS)</td>
<td>The maximum amount of storage in the Workfile Database that can be used by each agent (derived from ZPARM MAXTEMPS).</td>
</tr>
<tr>
<td>MAXSORT IN MEMORY</td>
<td>The maximum number of in-memory work files created by the SORT component that were active at any point in time since DB2 start. This is a high-water mark count.</td>
</tr>
<tr>
<td>MEASURED USAGE PRICING</td>
<td>Detailed measured usage price tracking.</td>
</tr>
<tr>
<td>MEMBER NAME (MEMBNAME)</td>
<td>The member name of this DB2. N/A means this DB2 is not part of a data sharing group. Install parameter MEMBER NAME on panel DSNTIPK, or ZPARM MEMBNAME in DSN6GRF.</td>
</tr>
<tr>
<td>MIN SCALE DECIMAL DIVIDE (MINDVSCL)</td>
<td>The minimum scale for the result of a decimal division. The values for this parameter are none (the default), 3, or 6. If 3 or 6 is specified, this parameter overrides the DECDIV3 parameter.</td>
</tr>
<tr>
<td>MINIMUM DIVIDE SCALE (DECDIV3)</td>
<td>The DECDIV3 subsystem parameter determines whether to retain at least three digits to the right of the decimal point after any decimal division. Acceptable values are YES or NO. The default is NO. ZPARM DECDIV3 in DSN6SPRM.</td>
</tr>
<tr>
<td>MINS BETWEEN CHECKPOINT (CHKMINS)</td>
<td>Shows the number of minutes between log checkpoints if the LOG checkpoint type is BOTH (records and minutes). This field corresponds to field MINUTES/CHECKPOINT on installation panel DSNTIPL1, or ZPARM name CHKMINS in DSN6SYSP.</td>
</tr>
<tr>
<td>MINUTES/CHECKPOINT (CHKFREQ)</td>
<td>Checkpoint frequency. This shows either the number of minutes (1 through 60) or the number of DB2 log records between the start of successive checkpoints. DB2 starts a new checkpoint when this value is reached. You can use the SET LOG command to change the number of log records between checkpoints dynamically. Valid values are 1-60 when specifying a time value and 200-16000000 when specifying a number of records. Install parameter CHECKPOINT FREQ on panel DSNTIPL, ZPARM CHKFREQ in DSN6SYSP.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>

</table>

| OPTIMIZATION HINTS ALLOWED (OPTHINTS)                                       | Shows whether DB2 can use optimization hints from the PLAN TABLE to influence the access paths used for certain queries.                          |
|                                                                                | Install parameter OPTIMIZATION HINTS on panel DSNTIP8, or ZPARM OPTHINTS in DSN6SPRM.                                                                 |

| OPTIMIZE EXTENT SIZING (MGEXTSZ)                                             | Indicates whether DB2 uses sliding secondary quantity for DB2 managed data sets to optimize extent sizing. Install parameter OPTIMIZE EXTENT SIZING on panel DSNTIP7, or ZPARM MGEXTSZ in DSN6SYSP. |

<p>| OUTER JOIN PERFORM ENHANCEMENT (OJPERFEH)                                   | Indicates whether outer join performance enhancements are enabled.                                                                            |
|                                                                                | DB2 parameter OJPERFEH in DSN6SPRM.                                                                                                           |</p>
<table>
<thead>
<tr>
<th>DB2 parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OUTPUT BUFFER (OUTBUFF)</td>
<td>The output log buffer size in kilobytes.</td>
</tr>
<tr>
<td></td>
<td>There is only one output log buffer per DB2 subsystem.</td>
</tr>
<tr>
<td></td>
<td>Increasing this parameter reduces BSDS I/O updates when there is a buffer wraparound. Frequent wraparounds are likely in LOAD or REORG with logging, and mass insert operations.</td>
</tr>
<tr>
<td></td>
<td>Increasing this parameter also helps avoid log write waits for an available buffer during heavy update workload.</td>
</tr>
<tr>
<td></td>
<td>When the specified size is not a 4 KB multiple, it is rounded up to the next 4 KB multiple.</td>
</tr>
<tr>
<td></td>
<td>Install parameter OUTPUT BUFFER on DSNTIPL, or ZPARM OUTBUFF in DSN6LOGP.</td>
</tr>
<tr>
<td>PACKAGE AUTH CACHE SIZE (CACHEPAC)</td>
<td>The amount of storage allocated for caching authorization information for all packages on this DB2 member.</td>
</tr>
<tr>
<td></td>
<td>32 KB hold about 375 collection-ID.package-IDs. The cache is stored in the DSN1DBM1 address space.</td>
</tr>
<tr>
<td></td>
<td>Install parameter PACKAGE AUTH CACHE on panel DSNTIPP, or ZPARM CACHEPAC in DSN6SPRM.</td>
</tr>
<tr>
<td>PAD INDEXES BY DEFAULT (PADIX)</td>
<td>Shows whether new indexes are be padded by default.</td>
</tr>
<tr>
<td></td>
<td>• YES indicates that a new index is padded unless the NOT PADDDED option is specified on the CREATE INDEX statement.</td>
</tr>
<tr>
<td></td>
<td>• The default value, NO, indicates that a new index is not padded unless the PADDDED option is specified on the CREATE INDEX statement.</td>
</tr>
<tr>
<td></td>
<td>Install parameter PAD INDEXES BY DEFAULT on installation panel DSNTIPE, or ZPARM PADIX in DSN6SPRM.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>PAD NULL TERMINATED STRING (PADNTSTR)</td>
<td>Shows whether output host variables that are NULL-terminated strings are padded with blanks and a NULL terminator. When NO, NULL-terminated output host variables have the NULL terminator placed at the end of actual data returned in the host variable. When YES, NULL-terminated output host variables have the NULL terminator placed at the end of the string, after the string has been padded with blanks from the end of the actual data to the declared length of the output host variable. Install parameter PAD NUL-TERMINATED on installation panel DSNTIP4, or ZPARM PADNTSTR in DSNHDECP.</td>
</tr>
<tr>
<td>PARALLEL ACCOUNTING ROLLUP (PTASKROL)</td>
<td>Indicates whether DB2 generates a trace record at the originating task level that summarizes accounting information for all parallel tasks. DB2 parameter PTASKROL in DSN6SYSP.</td>
</tr>
<tr>
<td>PARALLEL ASSIST (ASSIST)</td>
<td>Shows whether this DB2 member can assist a parallelism coordinator with parallel processing. When YES, this member is considered an assistant at both bind and run time. To be a viable assistant at run time, both the VPPSEQT and VPXPSEQT buffer pool thresholds of this member must be greater than 0. N/A means this DB2 is not part of a data sharing group. Install parameter ASSISTANT on panel DSNTIPK or ZPARM ASSIST in DSN6GRP.</td>
</tr>
<tr>
<td>PARALLEL COORDINATOR (COORDNTR)</td>
<td>Shows whether this DB2 member can coordinate parallel processing on other members of the group. When NO, a query can be processed by this DB2 member only. When YES, a read-only query running on this DB2 member can be processed in part on other members of the group. N/A means this DB2 is not part of a data sharing group. Install parameter COORDINATOR on panel DSNTIPK or ZPARM COORDNTR in DSN6GRP.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>PARALLISM EFFICIENCY FACTOR (PARA EFF)</td>
<td>The PARA EFF subsystem parameter controls the efficiency that DB2 assumes for parallelism when DB2 chooses an access path. The integer value that is used for this parameter represents a percentage efficiency. Acceptable values are 0 - 100. The default is 50. ZPARM PARA EFF in DSN6SPRM.</td>
</tr>
<tr>
<td>PARAMDEG DPSI</td>
<td>The maximum degree of parallelism that is to be allowed for a data-partitioned secondary index (DPSI).</td>
</tr>
<tr>
<td>PARAMDEG UTIL</td>
<td>The maximum degree of parallelism that is to be allowed for a utility.</td>
</tr>
<tr>
<td>PC SPECIFIED</td>
<td>This IRLM process flag indicates whether PC Yes was specified.</td>
</tr>
<tr>
<td>PCTFREE UPD</td>
<td>The update of the PCTFREE parameter.</td>
</tr>
<tr>
<td>PENDING HASH ENTRIES</td>
<td>The number of z/OS lock table hash entries pending.</td>
</tr>
<tr>
<td>PKGREL COMMIT (PKGREL COMMIT)</td>
<td>If the MODIFY DDF PKGREL(COMMIT) command has been issued at the server, the value of the bind option has no effect on packages that are executed on a DB2 server through a DRDA connection with the client system.</td>
</tr>
<tr>
<td>PLAN AUTH CACHE (AUTHCACH)</td>
<td>The size of the authorization cache to be used if no CACHESIZE is specified on the BIND PLAN subcommand.</td>
</tr>
<tr>
<td></td>
<td>The size of the cache is 32 bytes of overhead + (8 bytes of storage X number of concurrent users). 0 means authorization caching is not used. Install parameter PLAN AUTH CACHE on panel DSNTIPP, or ZPARM AUTHCACH in DSN6SPRM.</td>
</tr>
<tr>
<td>PLAN MGMT SCOPE (PLANMGMTSCOPE)</td>
<td>The PLANMGMTSCOPE subsystem parameter specifies the default plan management scope to use when the PLANMGMTSCOPE option is not explicitly specified for the bind or rebind of a package. The value in this field is meaningful only when the value of the PLAN MANAGEMENT field is BASIC or EXTENDED. It can have a value of STATIC (default). ZPARM PLANMGMTSCOPE in DSN6SPRM.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------</td>
</tr>
<tr>
<td>POOL THREAD TIMEOUT (POOLINAC)</td>
<td>The approximate time, in seconds, that a DBAT can remain idle in the pool before it is terminated. A DBAT thread in the pool counts as an active thread against MAX REMOTE ACTIVE and can hold locks, but does not have any cursors. Threads are checked for timeouts every 3 minutes. This means that timeouts might not be honored for up to 3 minutes when the timeout value is less than this. The default is 120. Install parameter POOL THREAD TIMEOUT on panel DSNTIP5, ZPARM POOLINAC in DSN6FAC.</td>
</tr>
<tr>
<td>PREVIOUS MODULE</td>
<td>The name of the previous DSNZPARM load module.</td>
</tr>
<tr>
<td>PRIMARY QUANTITY (PRIQTY)</td>
<td>The primary space allocation for archive data sets. Install parameter PRIMARY QUANTITY on installation panel DSNTIPI, or ZPARM PRIQTY in DSN6ARVP.</td>
</tr>
<tr>
<td>PRIVATE PROTOCOL</td>
<td>The Private protocol is no longer supported for DB2 10; however, this subsystem parameter controls package EXECUTE authorization behavior related to remote DB2 requester applications. When a remote DB2 requester application accesses the server DB2 subsystem through DRDA protocol, a plan owner is associated with the remote DB2 requester application plan. For packages that are executed as part of this plan by a remote DB2 requester application using DRDA protocol, the PRIVATE_PROTOCOL parameter has the following effects. This parameter is online updatable, and valid values are NO and AUTH.ZPARM PRIVATE_PROTOCOL in macro DSN6FAC.</td>
</tr>
<tr>
<td>PROC NAME (IRLMPRC)</td>
<td>The name of the IRLM procedure invoked by MVS if AUTO START is YES. The name cannot be the same as the subsystem name given for SUBSYSTEM NAME. Install parameter PROC NAME on panel DSNTIPI, or ZPARM IRLMPRC in DSN6SPRM.</td>
</tr>
<tr>
<td>PROJECT Z INSERT THRESHOLD (SPRMZTN)</td>
<td>The Project Z insertion threshold.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>QUERY ACCEL OPTIONS</td>
<td>Specifies additional types of SQL queries that are eligible for acceleration.</td>
</tr>
<tr>
<td>NONE</td>
<td>Indicates that no additional types of SQL queries are eligible. Therefore, the types of queries that are described in the other available values for this parameter are not eligible for acceleration. This is the default value.</td>
</tr>
<tr>
<td>1</td>
<td>Indicates that queries that include data that is encoded with the EBCDIC mixed or graphic encoding schemes are eligible for acceleration.</td>
</tr>
<tr>
<td>2</td>
<td>Indicates that an INSERT with SELECT statement is eligible for acceleration. However, only the SELECT operation of the query is processed by the accelerator server.</td>
</tr>
<tr>
<td>3</td>
<td>Indicates that queries that contain built-in functions for which DB2 processes each byte of the input string, rather than each character of the input string, can run on an accelerator server.</td>
</tr>
<tr>
<td>ZPARM name QUERY ACCEL OPTIONS in macro DSN6SPRM</td>
<td></td>
</tr>
<tr>
<td>QUIESCE PERIOD SECONDS (QUIESCE)</td>
<td>The maximum amount of time (in seconds) permitted for DB2 to attempt a full system quiesce.</td>
</tr>
<tr>
<td>Install parameter QUIESCE PERIOD on panel DSNTIPA, or ZP ARM QUIESCE in DSN6ARVP.</td>
<td></td>
</tr>
<tr>
<td>RANDOMIZE GROUP ATTACHMENT (RANDOMATT)</td>
<td>The RANDOMATT subsystem parameter specifies whether this DB2 member can be used for randomized group attachment or subgroup attachment processing. This setting is ignored when the GROUP ATTACH field is blank. Acceptable values are YES (default) or NO.</td>
</tr>
<tr>
<td>ZPARM RANDOMATT in DSN6GRP.</td>
<td></td>
</tr>
<tr>
<td>READ COPY2 ARCHIVES FIRST (ARC2FRST)</td>
<td>This field indicates whether the COPY2 archives should be read first when the DB2 subsystem is started.</td>
</tr>
<tr>
<td>Install parameter READ COPY2 ARCHIVE on DSNTIPO, or ZP ARM ARC2FRST in DSN6LOGP.</td>
<td></td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>REAL TIME STATS (STATSINT)</td>
<td>The time interval that DB2 waits before it attempts to write out page set statistics to the real-time statistics tables. This value is between 1 and 65535 minutes. Install parameter REAL TIME STATS on panel DSNTIPO, or ZPARM STATSINT in DSN6SPRM.</td>
</tr>
<tr>
<td>REALSTORAGE MAX</td>
<td>The maximum amount of real storage.</td>
</tr>
<tr>
<td>REBIND PLAN MGMT DEFAULT</td>
<td>Controls which queries are populated in the access path repository (ZPARM parameter PLANMGMTSCOPE). Possible values are:</td>
</tr>
<tr>
<td></td>
<td>A ALL: Includes static and dynamic SQL queries.</td>
</tr>
<tr>
<td></td>
<td>S STATIC: Includes static SQL queries only. This is the default.</td>
</tr>
<tr>
<td></td>
<td>D DYNAMIC: Includes dynamic SQL queries only.</td>
</tr>
<tr>
<td>REBUILD INDEX (FLASHCOPY REBUILD INDEX)</td>
<td>The value of the FLASHCOPY REBUILD INDEX subsystem parameter specifies whether the FLASHCOPY option of the REBUILD INDEX utility is to be used by default. Acceptable values are NO (default) or YES. ZPARM FLASHCOPY REBUILD INDEX in DSN6SPRM.</td>
</tr>
<tr>
<td>RECALL DATABASE (RECALL)</td>
<td>The RECALL subsystem parameter controls whether DFSMSHsm automatic recall is to be performed for DB2 databases:</td>
</tr>
<tr>
<td></td>
<td>• YES indicates that DFSMSHsm is invoked to automatically recall migrated table spaces. This is the default.</td>
</tr>
<tr>
<td></td>
<td>• NO indicates that a DB2 table space that has been migrated is considered to be an unavailable resource. It must be recalled explicitly before DB2 can use it.</td>
</tr>
<tr>
<td></td>
<td>ZPARM RECALL in DSN6SPRM.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>RECALL DELAY (RECALLD)</td>
<td>The RECALLD subsystem parameter specifies the maximum length of time, in seconds, that a program can be delayed for a DFSMShsm recall. If the recall is not completed within the specified number of seconds, the program receives an error message indicating that the set is unavailable, but that a recall was initiated. If you use 0 and the RECALL DATABASE field is YES, the recall is performed asynchronously. This field is ignored if the RECALL DATABASE field is NO. The RECALL DELAY option is not used when running a DB2 utility against a DB2-migrated data set. ZPARM RECALLD in DSN6SPRM.</td>
</tr>
<tr>
<td>RECORDS BETWEEN CHECKPOINT (CHKLOGR)</td>
<td>Shows the number of records between log checkpoints if the LOG checkpoint type is BOTH (records and minutes). This field corresponds to field RECORDS/CHECKPOINT on installation panel DSNTIPL1, or ZPARM name CHKLOGR in DSN6SYSP.</td>
</tr>
<tr>
<td>RECORDS/CHECKPOINT (CHKFREQ)</td>
<td>Checkpoint frequency. This shows either the number of minutes (1 through 60) or the number of DB2 log records between the start of successive checkpoints. DB2 starts a new checkpoint when this value is reached. You can use the SET LOG command to change the number of log records between checkpoints dynamically. Valid values are 1-60 when specifying a time value and 200-16000000 when specifying a number of records. Install parameter CHECKPOINT FREQ on panel DSNTIPL, ZPARM CHKFREQ in DSN6SYSP.</td>
</tr>
<tr>
<td>REGISTRATION DATABASE (RGFDBNAM)</td>
<td>The name of the database that contains the registration tables. Install parameter REGISTRATION DATABASE on panel DSNTIPZ, or ZPARM RGFDBNAM in DSN6SPRM.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| REGISTRATION TABLE OWNER (RGFCOLID)      | The owner of the application registration table and the object registration table.  
This identifier can be a long string. If there is insufficient space to show the complete string, the string is truncated in the report block. The complete string is shown in a separate list of long names at the end of the report.  
Install parameter REGISTRATION OWNER on panel DSNTIPZ, or ZPARM RGFCOLID in DSN6SPRM. |
| RELEASE CURSOR HOLD LOCKS (RELCURHL)     | Indicates whether, at commit time, DB2 should release a data page or row lock on which a cursor defined WITH HOLD is positioned.  
This lock is not necessary for maintaining cursor position.  
YES indicates that DB2 releases this data page or row lock after a COMMIT is issued for cursors defined WITH HOLD. This can improve concurrency.  
NO indicates that DB2 holds the data page or row lock for WITH HOLD cursors after the COMMIT. This option is provided to allow existing applications, which rely on this lock to continue to work correctly. Otherwise this field is left blank.  
Install parameter RELEASE CURSOR HOLD LOCKS on panel DSNTIP8, or ZPARM RELCURHL in DSN6SPRM. |
<table>
<thead>
<tr>
<th>DB2 parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>REORDERED ROW FORMAT (RRF)</td>
<td>The reordered row format (RRF). The value of this parameter specifies whether most newly created table spaces are to store data in reordered row format (RRF) or basic row format (BRF) by default.</td>
</tr>
<tr>
<td></td>
<td><strong>ENABLE</strong></td>
</tr>
<tr>
<td></td>
<td><strong>DISABLE</strong></td>
</tr>
<tr>
<td></td>
<td>ZPARM RRF in DSN6SPRM.</td>
</tr>
<tr>
<td>REORG DROP PBG PARTS</td>
<td>REORG DROP partition-by-growth (PBG) parts.</td>
</tr>
<tr>
<td>REORG IGNORE FREE SPACE</td>
<td>Controls whether DB2 uses the PCTFREE and FREEPAGE values that are defined for a partition-by-growth table space in the following situations:</td>
</tr>
<tr>
<td></td>
<td>• When REORG TABLESPACE is run against a subset of the partitions in a partition-by-growth (PBG) table space</td>
</tr>
<tr>
<td></td>
<td>• When REORG TABLESPACE is run against a partition-by-growth table space in which a table contains LOB columns</td>
</tr>
<tr>
<td>REORG INDEX (FLASHCOPY REORG INDEX)</td>
<td>The value of the FLASHCOPY REORG INDEX subsystem parameter specifies whether the FLASHCOPY option of the REORG INDEX utility is to be used by default. Acceptable values are NO (default) or YES.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>REORG LIST PROCESSING</td>
<td>Specifies the default setting for the PARALLEL option of the DB2 REORG TABLESPACE utility. Valid values for the REORG_LIST_PROCESSING subsystem parameter are PARALLEL and SERIAL. ZPARM REORG_LIST_PROCESSING in macro DSN6SPRM.</td>
</tr>
<tr>
<td>REORG MAPPING DATABASE</td>
<td>REORG mapping database.</td>
</tr>
<tr>
<td>REORG PART SORT NPSI</td>
<td>Specifies whether the REORG TABLESPACE PART utility decides to sort all of the keys of a non-partitioned secondary index. The setting is ignored for a REORG that is not part-level or without non-partitioned secondary indexes. The default value of REORG PART SORT NPSI is NO, which means that only keys of the non-partitioned secondary indexes that are in the scope of the REORG are sorted. ZPARM REORG PART SORT NPSI in DSN6SPRM.</td>
</tr>
<tr>
<td>REORG TABLESPACE (FLASHCOPY REORG TS)</td>
<td>The value of the FLASHCOPY REORG TS subsystem parameter specifies whether the FLASHCOPY option of the REORG TABLESPACE utility is to be used by default. Acceptable values are NO (default) or YES. ZPARM FLASHCOPY REORG TS in DSN6SPRM.</td>
</tr>
<tr>
<td>REQUIRE FULL NAMES (RGFFULLQ)</td>
<td>Indicates whether registered objects require fully qualified names. Install parameter REQUIRE FULL NAMES on panel DSNTIPZ, or ZPARM RGFFULLQ in DSN6SPRM.</td>
</tr>
<tr>
<td>RESIDENT TRACE TBL SIZE (TRACTBL)</td>
<td>Shows the size of the RES trace table in 4 KB blocks. A value of 16 means 64 KB have been allocated for this table. This is the default destination for the global trace records in DB2. Most trace records require 32-byte entries; events with more than three data items require 64-byte entries. Install parameter TRACE SIZE on panel DSNTIPN, or ZPARM TRACTBL in DSN6SYSP.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>RESOURCE AUTHID (RLFAUTH)</td>
<td>The authorization ID used for the resource limit facility (governor). This identifier can be a long string. If there is insufficient space to show the complete string, the string is truncated in the report block. The complete string is shown in a separate list of long names at the end of the report. Install parameter RESOURCE AUTHID on panel DSNTIPP, or ZPARM RLFAUTH in DSN6SYSP.</td>
</tr>
<tr>
<td>RESOURCE LIMIT AUTO START (RLF)</td>
<td>Shows whether the resource limit facility (governor) is automatically started when DB2 is started. Install parameter RLF AUTO START on panel DSNTIPO, or ZPARM RLF in DSN6SYSP.</td>
</tr>
<tr>
<td>RESOURCE TIMEOUT (IRLMRWT)</td>
<td>The number of seconds before a timeout is detected. This is an integer multiple of DEADLOCK TIME on panel DSNTIPJ. Timeout means that a lock request has waited for a resource (or for claims on a resource for a particular claim class to be released) longer than this time. For data sharing, the actual timeout period is longer than the timeout value. Install parameter RESOURCE TIMEOUT on panel DSNTIPI, or ZPARM IRLMRWT in DSN6SPRM.</td>
</tr>
<tr>
<td>RESTART OR DEFER (RESTART)</td>
<td>The RESTART subsystem parameter determines whether DB2 is to restart or defer processing for the specified databases, table spaces, and index spaces when DB2 is started. Acceptable values are RESTART (default) or DEFER. ZPARM RESTART in DSN6SPRM.</td>
</tr>
<tr>
<td>RESTORE RECOVER FROMDUMP</td>
<td>If YES, the system-level backup that is the recovery base, is from a dump on tape. Otherwise NO is shown. Install parameter RESTORE/RECOVER on installation panel DSNTIP6, or ZPARM RESTORE RECOVER FROMDUMP in DSN6SPRM.</td>
</tr>
<tr>
<td>RESTRICT ALT COL FOR DCC</td>
<td>Specifies whether restrictions apply to ALTER TABLE ALTER COLUMN statements for target tables that are defined with the DATA CAPTURE CHANGES attribute. Valid values are NO (default) and YES.RESTRICT_ALT_COL_FOR_DCC in macro DSN6SPRM.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>RESYNC INTERVAL (RESYNC)</td>
<td>The number of minutes between resynchronization periods.</td>
</tr>
<tr>
<td></td>
<td>A resynchronization period is the time during which indoubt logical units of work involving this DB2 subsystem and partner logical units are processed.</td>
</tr>
<tr>
<td></td>
<td>Install parameter RESYNC INTERVAL on panel DSNTIPR, or ZPARM RESYNC in DSN6FAC.</td>
</tr>
<tr>
<td>RETAINED LOCK TIMEOUT (RETLWAIT)</td>
<td>Indicates whether a request is suspended until an incompatible retained lock becomes available.</td>
</tr>
<tr>
<td></td>
<td>This value is only significant in a data sharing environment. It indicates how long a transaction should wait for a lock on a resource if another DB2 in the data sharing group has failed and is holding an incompatible lock on that resource. Locks held by failed DB2 members are called retained locks.</td>
</tr>
<tr>
<td></td>
<td>This value is a multiplier that is applied to the connection’s normal timeout value. For example, if the retained lock multiplier is 2, then the timeout period for a call attachment connection that is waiting for a retained lock is twice the normal CAF timeout period. The default is 0, meaning applications do not wait for incompatible retained locks, the lock request is immediately rejected and the application receives a &quot;resource unavailable&quot; SQLCODE.</td>
</tr>
<tr>
<td></td>
<td>Install parameter RETAINED LOCK TIMEOUT on panel DSNTIP, or ZPARM RETLwait in DSN6SPRM.</td>
</tr>
<tr>
<td>RETENTION PERIOD (ARCRETN)</td>
<td>The number of days DB2 keeps archive log data sets.</td>
</tr>
<tr>
<td></td>
<td>This value is added to the current date to calculate the expiration date.</td>
</tr>
<tr>
<td></td>
<td>The retention period is often used in tape management systems to control the reuse and scratching of data sets and tapes. DB2 uses this as the value for the dynamic allocation parameter DALRETPD when archive log data sets are created.</td>
</tr>
<tr>
<td></td>
<td>Install parameter RETENTION PERIOD on panel DSNTIPA, or ZPARM ARCRETN in DSN6ARVP.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------</td>

</tbody>
</table>
| REVOKE DEP PRIV (REVOKE_DEP_PRIVILEGES) | Include dependent privileges on REVOKE. Possible values are:  
Y  If INCLUDING DEPENDENT PRIVILEGES is enforced.  
N  If NOT INCLUDING DEPENDENT PRIVILEGES is enforced.  
S  If specified in a REVOKE statement. |

| RLF ERROR PARAMETER | Shows what DB2 does when the governor cannot access the resource limit specification table or when no row in the table matches the currently executing statement.  
NOLIMIT (default) allows all dynamic SQL statements to run without limit.  
NORUN terminates all dynamic SQL statements immediately with an SQL error code.  
The number of CPU service units allowed for a query can be anywhere from 1 to 5000000.  
Install parameter RLST ACCESS ERROR on panel DSNTIPR, or ZPARM RLFERRD in DSN6FAC. |

| RLST ACCESS ERROR (RLFERR) | The action taken by DB2 when the governor cannot use the resource limit:  
**NOLIMIT**  
The dynamic SQL statements run without limit.  
**NORUN**  
The dynamic SQL statements terminated with an SQL error code.  
A number from 1 to 5000000 represents the number of CPU service units allowed for a query. Install parameter RLST ACCESS ERROR on panel DSNTIPO, or ZPARM RLFERR in DSN6SYSP. |

| RLST ACCESS ERROR (RLFERRD) | The action taken by DB2 when the governor cannot use the resource limit:  
**NOLIMIT**  
The dynamic SQL statements run without limit.  
**NORUN**  
The dynamic SQL statements terminated with an SQL error code.  
A number from 1 to 5000000 represents the number of CPU service units allowed for a query. Install parameter RLST ACCESS ERROR on panel DSNTIPO, or ZPARM RLFERR in DSN6SYSP. |

<tr>
<td>RLST NAME SUFFIX (RLFTBL)</td>
<td>The default resource limit specification table (RLST) suffix. This suffix is used when the resource limit facility (governor) is automatically started or when the governor is started without specifying a suffix. Install parameter RLST NAME SUFFIX on panel DSNTIPO, or ZPARM RLFTBL in DSN6SYSP.</td>
</tr>
</tbody>
</table>
| RO SWITCH CHKPTS (PCLOSEN)            | The number of consecutive DB2 checkpoints that a page set or partition can remain in read/write mode since it was last updated. When this limit or the RO SWITCH TIME is reached, DB2 changes the page set or partition to read-only.  
This can improve performance for recovery, logging, and data-sharing processing.  
Install parameter RO SWITCH CHKPTS on panel DSNTIPL, or ZPARM PCLOSEN in DSN6SYSP. |
| RO SWITCH TIME (PCLOSET)              | The number of minutes that a page set or partition can remain in read-write mode since it was last updated. When this limit or the RO SWITCH CHKPTS is reached, DB2 changes the page set or partition to read-only.  
This can improve performance for recovery, logging, and data-sharing processing.  
Install parameter RO SWITCH TIME on panel DSNTIPL, or ZPARM PCLOSET in DSN6SYSP. |
| ROUTINE AUTH CACHE (CACHERAC)         | The amount of storage allocated for caching authorization information for all routines on this DB2 member. Routines include stored procedures and user-defined functions.  
32 KB hold about 380 schema.routine.type entries.  
Install parameter ROUTINE AUTH CACHE on panel DSNTIPP, or ZPARM CACHERAC in DSN6SPRM. |
| SEC ADMIN 1 TYPE (SECADM1 TYPE)       | Security administrator 1 type. Possible values are:  
' ' Blank indicates that the authorization ID (AUTH ID) is used.  
'L' Indicates that ROLE is used.  
This field corresponds to field SEC ADMIN 1 TYPE on installation panel DSNTIPP1, or ZPARM SECADM1_TYPE in DSN6SPRM. |

<tr>
<td>TAPE UNIT DEALLOCATION PERIOD (DEALLCT)</td>
<td>The number of minutes an archive read tape unit can remain unused before it is deallocated.</td>
</tr>
<tr>
<td></td>
<td>When archive log data is read from tape, this value should be high enough to allow DB2 to optimize tape handling for multiple read applications.</td>
</tr>
<tr>
<td></td>
<td>Install parameter DEALLOC PERIOD on panel DSNTIPA, or ZPARM DEALLCT in DSN6LOGP.</td>
</tr>
<tr>
<td>TCP/IP ALREADY VERIFIED (TCPALVER)</td>
<td>Indicates whether DB2 accepts TCP/IP connection requests containing only a user ID.</td>
</tr>
<tr>
<td></td>
<td>When YES, a connection request is accepted with a user ID only. This value must be the same for all members of a data sharing group.</td>
</tr>
<tr>
<td></td>
<td>When NO (default), TCP/IP clients must provide authentication information (password, RACF PassTicket, or Kerberos ticket) to gain access to DB2.</td>
</tr>
<tr>
<td></td>
<td>Install parameter TCP/IP ALREADY VERIFIED on panel DSNTIP5, or ZPARM TCPALVER in DSN6FAC.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------</td>
</tr>
<tr>
<td><strong>TCP/IP KEEPALIVE (TCPKPALV)</strong></td>
<td>Indicates whether the TCP/IP configuration KeepAlive value has been overwritten. When ENABLE (default), KeepAlive is enabled, the TCP/IP configuration stack value is used. When DISABLE, TCP/IP KeepAlive has been disabled. A value in the range 1 through 65534 means KeepAlive is active, and the TCP/IP stack value has been overridden. The number reported shows the time, in seconds, between TCP/IP probes. When considering overwriting the keep-alive time, it is recommended to set a value close to the IDLE THREAD TIMEOUT value on installation panel DSNTIPR or the IRLM RESOURCE TIMEOUT value on installation panel DSNTIPI. It is good practice to set all these to about five minutes, or less. Because KeepAlive detection is accomplished by probing the network at this interval, avoid small values, which can cause excessive network traffic and system resource consumption. The trick is to find a proper balance that allows network failures to be detected on a timely basis without impacting system and network performance. Install parameter TCP/IP KEEPALIVE on panel DSNTIP5, ZPARM TCPKPALV in DSN6FAC.</td>
</tr>
<tr>
<td><strong>TEMP DS UNIT NAME (VOLTDEVT)</strong></td>
<td>Shows the device type or unit name for allocating temporary data sets. It is the direct access or disk unit name used for the precompiler, compiler, assembler, sort, linkage editor, and utility work-files in the tailored jobs and CLISTS. It can be any device type acceptable to the DYNALLOC parameter of the SORT or OPTION options for DFSORT. The default is SYSDA. Install parameter TEMPORARY UNIT NAME on DSNTIPA2, or ZPARM VOLTDEVT in DSN6SPRM.</td>
</tr>
<tr>
<td><strong>TEMPLATE TIME</strong></td>
<td>The template time.</td>
</tr>
<tr>
<td><strong>DB2 parameter</strong></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>------------------------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>TEMPORARY UNIT NAME</td>
<td>The value of the TEMPORARY UNIT NAME field specifies the device type or unit name that is to be used for allocating temporary data sets. The value of TEMPORARY UNIT NAME is the direct access or disk unit name that is used for the precompiler, compiler, assembler, sort, linkage editor, and utility work files in the tailored jobs and CLISTs.</td>
</tr>
<tr>
<td>THE LIMIT IN SUS</td>
<td>The limit in service units (SUS).</td>
</tr>
<tr>
<td>TIME FORMAT (TIME)</td>
<td>Indicates the default output format for times. Valid values are ISO (hh:mm:ss), USA (hh:mm AM), EUR (hh:mm:ss), JIS (hh:mm:ss), or LOCAL (your choice, defined by a time exit routine). DB2 interprets the input time from the punctuation and converts the output time to the required format. Install parameter TIME FORMAT on panel DSNTIP4, or ZPARM TIME in DSNHDECP.</td>
</tr>
<tr>
<td>TIME OF LAST CHANGE</td>
<td>Time of the last online change made to DB2 system settings.</td>
</tr>
<tr>
<td>TIME TO AUTOSTART (IRLMSWT)</td>
<td>The IRLM wait time in seconds. DB2 autostart abends if IRLM does not start within this time.                                                                                                                      Install parameter TIME TO AUTOSTART on panel DSNTIPI, or ZPARM IRLMSWT in DSN6SPRM.</td>
</tr>
<tr>
<td>TIMEOUT INTERVAL</td>
<td>The approximate time, in seconds, that an active server thread can remain idle before it is canceled. Inactive and indoubt threads are not subject to timeout. Threads are checked for timeouts every 3 minutes. This means that timeouts might not be honored for up to 3 minutes when the timeout value is less than this. 0 (default) means timeout processing is disabled, idle server threads remain in the system and continue to hold their resources, if any. Install parameter IDLE THREAD TIMEOUT on panel DSNTIPR, or ZPARM IDTHTOIN in DSN6FAC.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>TIMEOUT VALUE (STORTIME)</td>
<td>The number of seconds before DB2 stops waiting for an SQL CALL statement to be assigned to one of the TCBs in the DB2 stored procedures address space. Install parameter TIMEOUT VALUE on panel DSNTIPX, or ZPARM STORTIME in DSN6SYSP.</td>
</tr>
<tr>
<td>TIMESTAMP IN NAME (TSTAMP)</td>
<td>Determines whether the time stamp is to be placed in the name of an archive log data set. You can specify YES or NO. This field is a constant for QWP3FLG1.</td>
</tr>
<tr>
<td>TRACKER SITE (TRKRSITE)</td>
<td>Indicates whether this subsystem is a remote tracker site for another DB2 subsystem. When YES, this is a tracker site. A DB2 tracker site is a separate DB2 subsystem or data sharing group that exists solely for the purpose of keeping shadow copies of your primary site’s data. No independent work can be run on the tracker site. Install parameter TRACKER TYPE on panel DSNTIPO, or ZPARM TRKRSITE in DSN6SPRM.</td>
</tr>
<tr>
<td>U LOCK FOR RR OR RS (RRULOCK)</td>
<td>Indicates whether the U (UPDATE) lock is used when using repeatable read (RR) or read stability (RS) isolation to access a table. When YES, the U lock is used for an updated cursor with repeatable read or read stability. When NO, the S lock is used for an updated cursor with repeatable read or read stability. If the cursor in the running applications includes the clause FOR UPDATE OF, but updates are infrequent, S locks generally provide better performance. Install parameter U LOCK FOR RR/RS on panel DSNTIPI, or ZPARM RRULOCK in DSN6SPRM.</td>
</tr>
<tr>
<td>UNICODE GRAPHIC CCSID (UGCCSID)</td>
<td>Unicode graphics character set identification. Parameter UNICODE CCSID in installation panel DSNTIPF, or ZPARM UGCCSID in macro DSNHDECP.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------</td>
</tr>
<tr>
<td>UNICODE IFCIDS (UIFCIDS)</td>
<td>Shows whether output from IFC records should include Unicode information. Only a subset of the character fields (identified in the IFCID record definition by a %U in the comment area to the right of the field declaration in the DSNDQWxx copy files) are encoded in Unicode. The remaining fields maintain the same encoding of previous releases.</td>
</tr>
<tr>
<td>UNICODE MIXED CCSID (UMCCSID)</td>
<td>Unicode Mixed Character Set identification. Parameter UNICODE CCSID in installation panel DSNTIPF, or ZPARM UMCCSID in macro DSNHDECP.</td>
</tr>
<tr>
<td>UNICODE SINGLE-BYTE CCSID (USCCSID)</td>
<td>Unicode Single Byte Character Set identification. Parameter UNICODE CCSID in installation panel DSNTIPF, or ZPARM USCCSID in macro DSNHDECP.</td>
</tr>
<tr>
<td>UNION COLNAME 7</td>
<td>The UNION COLNAME 7.</td>
</tr>
<tr>
<td>UNKNOWN AUTHID (DEFLTID)</td>
<td>The authorization ID used if RACF is not available for batch access and USER= is not specified in the job statement. This identifier can be a long string. If there is insufficient space to show the complete string, the string is truncated in the report block. The complete string is shown in a separate list of long names at the end of the report.</td>
</tr>
<tr>
<td>UNREGISTERED DDL DEFAULT (RGFDEFLT)</td>
<td>The action taken for DDL that names an unregistered object. Options are REJECT, ACCEPT, or APPL, which rejects the DDL when the current application is not registered.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------</td>
</tr>
<tr>
<td><strong>UPDATE PART KEY COLUMNS (PARTKEYU)</strong></td>
<td>Indicates whether values in columns that participate in partitioning keys can be updated. Possible values are YES, NO, or SAME. When SAME, updates are allowed only when the updated row remains in the same partition. The default value is YES. Install parameter UPDATE PART KEY COLS on panel DSNTIP8, or ZPARM PARTKEYU in DSN6SPRM.</td>
</tr>
<tr>
<td><strong>UR CHECKPOINT FREQ (URCHKTH)</strong></td>
<td>Shows the number of checkpoint cycles to complete before DB2 issues a warning message to the console and writes an IFCID 313 record for an uncommitted, indoubt, or inflight unit of recovery (UR). The default is 0, which disables this option. Install parameter UR CHECK FREQ on panel DSNTIPL, or ZPARM URCHKTH in DSN6SYSP.</td>
</tr>
<tr>
<td><strong>UR LOG WRITE CHECK (URLGWTH)</strong></td>
<td>Shows the number of log records that are to be written by an uncommitted unit of recovery (UR) before DB2 issues a warning message to the console. This provides notification of a long-running UR. Long-running URs might result in a lengthy DB2 restart or a lengthy recovery situation for critical tables. Log records are specified in 1-K (1000 log records) increments. A value of 0 indicates that no write check is to be performed. Install parameter UR LOG WRITE CHECK on panel DSNTIPL, ZPARM URLGWTH in DSN6SYSP.</td>
</tr>
<tr>
<td><strong>UR WARNING THRESHOLD MINUTES (LRDRTHLD)</strong></td>
<td>Shows the number of minutes that a read claim can be held by an agent before DB2 reports it as a long-running reader. Valid values are 0 (default) through 1439. Install parameter LONG-RUNNING READER on installation panel DSNTIPE, or ZPARM LRDRTHLD in DSN6SYSP.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>USE FOR DYNAMIC RULES (DYNRULS)</td>
<td>Shows whether DB2 uses the application programming defaults specified on this panel or those of the DB2 precompiler options for dynamic SQL statements bound using DYNAMICRULES bind, define, or invoke behavior.</td>
</tr>
</tbody>
</table>
|                                                   | When YES, the application programming (DSNHDECP) defaults are used for dynamic SQL statements in plans or packages bound using DYNAMICRULES bind, define, or invoke behavior. The following defaults are affected:  
|                                                   | • DECIMAL POINT IS  
|                                                   | • STRING DELIMITER  
|                                                   | • SQL STRING DELIMITER  
|                                                   | • MIXED DATA  
|                                                   | • DECIMAL ARITHMETIC  
|                                                   | When NO, values of the precompiler options are used for dynamic SQL statements in plans or packages bound with DYNAMICRULES(BIND).                                                                                                                                                                                                                                                                                                                                 |
|                                                   | Install parameter USE FOR DYNAMICRULES on panel DSNTIP4, or ZPARM DYNRULS in DSNHDECP.                                                                                                                                                                                                                                                                                                                                                                                                 |
| USE PROTECTION (AUTH)                             | Shows whether DB2 performs authorization checking.  
<p>|                                                   | When all authorization checking by DB2 is disabled, the GRANT statement is also disabled (granting every privilege to PUBLIC); this is not recommended.                                                                                                                                                                                                                                                                                                                         |
|                                                   | Install parameter USE PROTECTION on panel DSNTIPP, or ZPARM AUTH in DSN6SPRM.                                                                                                                                                                                                                                                                                                                                                                                                 |
| USER ID MONITOR (SPRMOZUS)                       | The user ID that made the last online change to DB2 system settings.                                                                                                                                                                                                                                                                                                                                                                                                              |
| USER LOB VALUE STORAGE (LOBVALA)                  | Specifies an integer that establishes an upper limit for the amount of storage each user can be used for storing lob values (in KB).                                                                                                                                                                                                                                                                                                                                                   |
| USER XML VALUE STORAGE (XMLVALA)                  | The maximum amount of memory for each user for storing XML values. This is ZPARM XMLVALA in DSN6SYSP.                                                                                                                                                                                                                                                                                                                                                                              |
| UT DB2 SORT USE (DB2SORT)                        | The DB2SORT subsystem parameter specifies whether DB2 utilities are to use DB2 Sort instead of DFSORT for utility sort processing when DB2 Sort is installed. Acceptable values are ENABLE (default) or DISABLE.                                                                                                                                                                                                                                                                                                    |
|                                                   | ZPARM DB2SORT in DSN6SPRM.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |</p>
<table>
<thead>
<tr>
<th>DB2 parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UT SORT DATA SET ALLOCATION (UTSORTAL)</td>
<td>The UTSORTAL subsystem parameter specifies how sort work data sets are allocated when utilities are run. This parameter applies to the CHECK, LOAD, REBUILD, REORG, and RUNSTATS utilities. Acceptable values are YES (default) or NO. ZPARM UTSORTAL in DSN6PRM.</td>
</tr>
<tr>
<td>UTILITY CACHE OPTION (SEQPRES)</td>
<td>Shows whether utilities that scan a nonpartitioned index followed by an update of a subset of the pages in the index allow data to remain in 3990 cache longer when reading data. Install parameter UTILITY CACHE OPTION on panel DSNTIPE, or ZPARM SEQPRES in DSN6PRM.</td>
</tr>
<tr>
<td>UTILITY OBJECT CONVERSION</td>
<td>The conversion of UTILITY OBJECT.</td>
</tr>
<tr>
<td>UTILITY TIMEOUT FACTOR (UTIMOUT)</td>
<td>Shows how much longer utilities can wait for a resource than SQL applications can. This is the number of RESOURCE TIMEOUT units that a utility or utility command can wait for a lock or for all claims on a resource of a particular claim class to be released. The default value is 6, meaning a utility can wait 6 times longer than an SQL application for a resource. Install parameter UTILITY TIMEOUT FACTOR on panel DSNTIPI, or ZPARM UTIMOUT in DSN6PRM.</td>
</tr>
</tbody>
</table>
| VALUE FOR TRIGGER DRAIN (SPRMTDD)                 | The percentage below 100% DMAX that open data sets can reach before an asynchronous drain is started. The default is 1, meaning that asynchronous drain starts when the number of open data sets reaches 99% of DMAX. DB2 defers closing and deallocating the table spaces or indexes until the number of open data sets reaches one of the following limits:  
  • The MVS limit for the number of concurrently open data sets.  
  • 99% (default) of the value that you specified for DMAX.  
  When one of these limits is reached, DB2 closes a number of data sets not in use equal to 3% (default) of the value DMAX. Thus, DMAX controls not only the limit of open data sets, but also the number of data sets that are closed when that limit is reached. DB2 parameter SPRMTDD in DSN6PRM. |
<table>
<thead>
<tr>
<th>DB2 parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VARCHAR INDEX (RETVLCFK)</td>
<td>Indicates whether the VARCHAR column is retrieved from the index. The data sharing scope of this parameter is GROUP. When NO, index-only access of variable length column data is disabled. DB2 must retrieve data from the data page. Data is retrieved with no padding. When YES, index-only access of variable length column data is enabled. This can improve performance. Data retrieved from the index is padded with blanks to the maximum length of the column. Install parameter VARCHAR FROM INDEX on panel DSNTIP8, or ZPARM RETVLCFK in DSN6SPRM.</td>
</tr>
<tr>
<td>VARY DS CONTROL INTERVAL (DSVCI)</td>
<td>Specifies whether DB2 optimizes VSAM CONTROL INTERVAL to page size for data set allocation. It shows if DB2-managed data sets created by CREATE TABLESPACE have variable VSAM control intervals (VARY DS CONTROL INTERVAL). Install parameter VARY DS CONTROL INTERVAL on panel DSNTIP7, or ZPARM DSVCI in DSN6SYSP.</td>
</tr>
<tr>
<td>WFSTGUSE AGENT THRESHOLD</td>
<td>The alert threshold of high space-usage for DGTs or non-DGT work files in the Workfile Database by an agent (derived from ZPARM WFSTGUSE_AGENT_THRESHOLD).</td>
</tr>
<tr>
<td>WFSTGUSE SYSTEM THRESHOLD</td>
<td>The alert threshold of high space-usage for DGTs or non-DGT work files in the Workfile Database (derived from zparm WFSTGUSE_SYSTEM_THRESHOLD).</td>
</tr>
<tr>
<td>WLM ENVIRONMENT (WLMENV)</td>
<td>Workload manager environment. Install parameter WLM ENVIRONMENT on panel DSNTIPX, or ZPARM WLMENV in DSN6SYSP.</td>
</tr>
<tr>
<td>WTO ROUTING CODES (ROUTECD)</td>
<td>The MVS console routing codes. These codes are assigned to messages that are not solicited from a specific console. Up to 16 comma-separated codes can be shown. Install parameter WTO ROUTE CODES on panel DSNTIPO, or ZPARM ROUTCDE in DSN6SYSP.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>WT OR BEFORE MOUNT FOR ARCHIVE (ARCWTOR)</td>
<td>Indicates whether DB2 must send a message to the operator and wait for an answer before attempting to mount an archive log data set. Other DB2 users can be forced to wait while the mount is pending. They are not affected while DB2 is waiting for a response to the message. When YES, a device such as tape is used that requires long delays for mounts. DEVICE TYPE 1 shows the device type or unit name. Install parameter WRITE TO OPER on panel DSNTIPA, or ZPARM ARCWTOR in DSN6ARVP.</td>
</tr>
<tr>
<td>X LOCK FOR SEARCHED U/D (XLKUPDLT)</td>
<td>The locking method used when performing a searched UPDATE or DELETE. When NO, DB2 uses an S or U lock when scanning for qualifying rows. For any qualifying rows or pages the lock is upgraded to an X lock before performing the update or delete. For nonqualifying rows or pages the lock is released if using ISOLATION(CS). For ISOLATION(RS), or ISOLATION(RR), an S lock is retained on the rows or pages until the next commit point. This option is used to achieve higher rates of concurrency. When YES, DB2 gets an X lock on qualifying rows or pages. For ISOLATION(CS), the lock is released if the rows or pages are not updated or deleted. For ISOLATION(RS) or ISOLATION(RR), an X lock is retained until the next commit point. This is beneficial in a data sharing environment when most or all searched updates and deletes use an index. The downside is that if searched updates or deletes result in a tablespace scan, the likelihood of timeouts and deadlocks greatly increases. Install parameter X LOCK FOR SEARCHED U/D on panel DSNTIPI, or ZPARM XLKUPDLT in DSN6SPRM.</td>
</tr>
<tr>
<td><strong>DB2 parameter</strong></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>-------------------</td>
<td>-----------------</td>
</tr>
<tr>
<td>XML RANDOMIZE DOCID</td>
<td>Specifies whether DB2 is to sequentially or randomly generate the DOCID values for XML columns. This parameter does not affect existing tables that have XML columns. Those tables continue to generate DOCIDs in the order that was specified by XML RANDOMIZE DOCID when the table was created or in sequential order if the parameter was not specified. Acceptable values are NO (default) or YES. ZPARM XML RANDOMIZE in DSN6SYSP.</td>
</tr>
<tr>
<td>Z/OS CRITICAL RESERVED SPACE MUST COMPLETE</td>
<td>The amount of space reserved for z/OS critical work that must be completed.</td>
</tr>
<tr>
<td>Z/OS LOCK TABLE HASH ENTRIES</td>
<td>The number of z/OS lock table hash entries.</td>
</tr>
<tr>
<td>Z/OS LOCK TABLE LIST ENTRIES</td>
<td>The number of z/OS lock table list entries.</td>
</tr>
<tr>
<td>Z/OS METRICS (ZOSMETRICS)</td>
<td>YES indicates that gathering of z/OS metrics using the RMF interface is enabled. ZPARM ZOSMETRICS in DSN6SPRM.</td>
</tr>
<tr>
<td>Z/OS RESERVED SPACE</td>
<td>The z/OS reserved space.</td>
</tr>
</tbody>
</table>

**Field Value** The value of the DB2 field. It is an alphanumeric text string with a maximum of 44 characters.

**Interval Start** The start time of this interval.

**MVS System ID** The MVS system identifier.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**DB2 SRM BPD Attributes**

Use the DB2 SRM BPD attributes to create situations to monitor activity details associated with specific buffer pools.

**Buffer Pool Hit Percent Random** The random buffer pool hit percentage calculated as follows: \((\text{# of Random Getpages} - \text{# Random Sync Read I/O}) / \text{# of Random Getpages}\) * 100. Valid entry ranges from 0.0 to 100.0.

**Buffer Pool Hit Percent Sequential** The sequential buffer pool hit percentage calculated as follows: \((\text{# of Sequential Getpages} - \text{#Getpage Fails} - \text{# pages read from DASD}) / \text{# of Sequential Getpages} - \text{#Getpage Fails}\) * 100. The # pages read from DASD is the sum of Sequential Sync Read I/O, Sequential Prefetch Pages, List Prefetch Pages, and Dynamic Prefetch Pages. Valid entry ranges from 0.0 to 100.0.

</table>

It is an alphanumeric text string, with a maximum length of four characters.

**Deferred Write Thresh** The deferred write threshold for the virtual buffer pool - DWQT. Write operations are scheduled when the percentage of unavailable pages in the virtual buffer pool exceeds this threshold in order to decrease the unavailable pages to 10% below the threshold.

**Dyn Prefetch Per IO** The ratio of dynamic prefetch requests to dynamic prefetch I/Os.

**Dyn Prefetch Per IO Extended Precision** The ratio of dynamic prefetch requests to dynamic prefetch I/Os.

**Getpages Per Syn IO** The ratio of getpage requests to read I/Os.

**GetPages Per Synchronous IO Extended Precision** The ratio of getpage requests to read I/Os.

**Interval Time** The number of seconds since last sample.

**List Prefetch Per IO** The ratio of list prefetch requests to list prefetch I/Os.

**List Prefetch Per IO Extended Precision** The ratio of list prefetch requests to list prefetch I/Os.

**Max Concur Prefetch** The highest number of concurrent prefetch I/O streams allocated to support I/O parallelism.

**Maximum Concurrent Prefetch Extended Precision** The highest number of concurrent prefetch I/O streams allocated to support I/O parallelism.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Page Reads Per Dyn Prefetch** The ratio of pages read by dynamic prefetch to dynamic prefetch requests.

**Page Reads Per Dyn Prefetch Extended Precision** The ratio of pages read by dynamic prefetch to dynamic prefetch requests.

**Page Reads Per List Prefetch** The ratio of pages read by list prefetch to list prefetch requests.

**Page Reads Per List Prefetch Extended Precision** The ratio of pages read by list prefetch to list prefetch requests.

**Page Reads Per Prefetch** The ratio of pages read by prefetch processing to total prefetch requests.
**Page Reads Per Prefetch Extended Precision** The ratio of pages read by prefetch processing to total prefetch requests.

**Page Reads Perseq Prefetch** The ratio of pages read by sequential prefetch to sequential prefetch requests.

**Page Reads Per Sequential Prefetch Extended Precision** The ratio of pages read by sequential prefetch to sequential prefetch requests.

**Page Writes Per Write IO** The ratio of page writes to physical I/Os.

**Page Writes Per Write IO Extended Precision** The ratio of page writes to physical I/Os.

**Pages In Use** The number of virtual buffer pool pages in use at the end of the interval (a snapshot value of the current number of non-stealable buffers). A non-stealable buffer is either one which has an outstanding getpage (someone is currently looking at this page) or one which has been updated and not yet written out to DASD.

**Pool ID** Buffer Pool ID.

**Prefetch Per IO** The ratio of prefetch requests to physical I/Os.

**Prefetch Per IO Extended Precision** The ratio of prefetch requests to physical I/Os.

**Sequential Prefetch Per IO** The ratio of pages read by sequential prefetch to sequential prefetch I/O.

**Sequential Prefetch Per IO Extended Precision** The ratio of pages read by sequential prefetch to sequential prefetch I/O.

**Sysplex Parallel Thresh** Parallel I/O sequential threshold - VPPSEQT. This threshold determines how much of the virtual buffer pool might be used for parallel I/O operations. It is a percentage of the VPSEQT. If set to zero, I/O parallelism is disabled.

**Time** The date and time, as set on the monitored system, indicating the instance when the agent collects information.

The timestamp format for SCAN and STR functions is CYYMMDDHHMMSmmm (as in 1180315064501000 for 03/15/18 06:45:01) where:

- C = Century (0 for 20th, 1 for 21st)
- Y = Year
- M = Month
- D = Day
- H = Hour
- M = Minute
- S = Second
- m = Millisecond

**Use Count** The number of open table spaces and index spaces in this buffer pool.
Vert Deferred Write Thresh The vertical deferred write threshold for the virtual buffer pool - VDWQT. This is the percentage of the buffer pool that might be occupied by updated pages from a single data set.

Virtual Page Steal Method Identifies the page stealing algorithm (PGSTEAL) that is used for the virtual buffer pool (DB2 field name: QDBPPGST). It controls when and whether performance-critical objects in buffer pools are removed from buffer pools when the space is needed by other objects. Possible values are:

- **LRU**  Least recently used (LRU) objects are removed first. This means it takes away pages that are not used so that more recently used pages can remain in the virtual buffer pool. This is used by default.

- **FIFO**  This results in a small decrease in the cost of a Getpage operation. It can reduce internal DB2 latch contention in environments that require very high concurrency.

- **NONE**  Objects are not removed from buffer pool (no page stealing). This setting provides the highest availability for business-critical objects.

**VP Buffers Allocated** The number of pages allocated to the virtual buffer pool.

**VP Buffers Delete** The number of pages to be deleted from an active virtual buffer pool as a result of pool contraction.

**VP Parallel Sequential Thresh** The parallel I/O sequential threshold - VPPSEQT. This threshold determines how much of the virtual buffer pool might be used for parallel I/O operations. It is a percentage of the VPSEQT. If set to zero, I/O parallelism is disabled.

**VP Sequential Thresh** The sequential steal threshold for the virtual buffer pool - VPSEQT. This is the percentage of the virtual buffer pool that might be occupied by sequentially accessed pages. If set to zero, prefetch is disabled.

**VP Size** The size of the virtual buffer pool.

Workfile Maximum The maximum number of work files that were allocated during sort/merge processing during the current statistics period.

Workfile Maximum Extended Precision The maximum number of work files that were allocated during sort/merge processing during the current statistics period.

**DB2 SRM BPM Attributes**

Use the DB2 SRM BPM attributes to create situations to monitor buffer pool activity.

- **Allocated Pages** The total number of pages allocated to the buffer pool: It includes pages that are currently read or updated, updated pages, and available pages.

- **Get Page Rate** The number of get page operations per second over the last interval.

- **Get Page Rate Extended Precision** The number of get page operations per second over the last interval.

- **Interval Time** The number of seconds since last sample.
**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Pages In Use** The number of virtual buffer pool pages in use at the end of the interval (a snapshot value of the current number of non-stealable buffers): A non-stealable buffer is either one which has an outstanding Getpage (someone is currently looking at this page) or one which has been updated and not yet written out to DASD.

**Pool ID** The buffer pool ID.

**Prefetch Request Rate** The number of prefetch requests issued per second over the last interval.

**Prefetch Request Rate Extended Precision** The number of prefetch requests issued per second over the last interval.

**Read IO Rate** The number of read I/O operations per second over the last interval.

**Read IO Rate Extended Precision** The number of read I/O operations per second over the last interval.

**Time** The date and time, as set on the monitored system, indicating the instance when the agent collects information.

The timestamp format for SCAN and STR functions is `CYYMMDDHHMMSSmmm` (as in 1180315064501000 for 03/15/18 06:45:01) where:
- **C** = Century (0 for 20th, 1 for 21st)
- **Y** = Year
- **M** = Month
- **D** = Day
- **H** = Hour
- **M** = Minute
- **S** = Second
- **m** = Millisecond

**Utilization** The percentage of the buffer pool currently in use: It is calculated as: $(\text{QBSTCBA} / \text{QBSTVPL}) \times 100$ for DB2 9 and $(\text{QBSTCBA} / \text{QDBPVPSZ}) \times 100$ for DB2 10 or later.

Field descriptions:

**QBSTCBA** The total number of currently active (nonstealable) buffers.

**QBSTVPL** The number of buffers allocated for a virtual buffer pool.

**QDBPVPSZ** The size of the virtual buffer pool.

Valid entry ranges from 0 to 10000.
VP Size The size of the virtual buffer pool.

Write IO Rate The number of write I/Os performed per second over the last interval.

Write IO Rate Extended Precision The number of write I/Os performed per second over the last interval.

DB2 SRM EDM Attributes
Use the DB2 SRM EDM attributes to create situations to monitor the Environmental Descriptor Manager (EDM) pool activity connected with DB2.

Available Pages The total number of EDM pages currently available. It is zero for DB2 9 or later.

Available Percentage The percentage of EDM that is currently available. Valid entry ranges from 0.0 to 100.0. It is zero for DB2 9 or later.

Cursor Table Load Rate The number of Cursor Table loads from DASD per second.

Cursor Table Request Rate The number of Cursor Table requests per second.

Cursor Table Pages The total number of EDM pages currently in use for Cursor Tables. It is zero for DB2 10 or later.

Cursor Table Percentage The percentage of EDM that is currently in use for Cursor Tables. Valid entry ranges from 0.0 to 100.0. It is zero for DB2 10 or later.

Database Descriptor Pages The total number of EDM pages currently in use for database descriptors.

Database Descriptor Percentage The percentage of EDM that is currently in use for database descriptors. Valid entry ranges from 0.0 to 100.0.

DB2 Version The version of the DB2 system.

DBD Load Rate The number of database descriptor loads from DASD per second.

DBD Request Rate The number of database descriptor requests per second.

Delta Cursor Table Loads The Cursor Table loads from DASD during the last interval.

Delta Cursor Table Requests The Cursor Table requests during the last interval.

Delta DBD Loads The DBD loads from DASD during the last interval.

Delta DBD Requests The database descriptor requests during the last interval.

Delta Dynamic SQL Loads The dynamic SQL loads from DASD during the last interval.

Delta Dynamic SQL Requests The dynamic SQL requests during the last interval.
**Delta Failures EDM Full** The total number of failures because the EDM pool was full during the last interval.

**Delta Percent Cursor Table Loads** The percentage of Cursor Table loads from DASD over last interval. Valid entry ranges from 0.0 to 100.0.

**Delta Percent DBD Loads** The percentage of DBD loads from DASD over last interval. Valid entry ranges from 0.0 to 100.0.

**Delta Percent Dynamic SQL Loads** The percentage of Dynamic SQL loads from DASD over last interval. Valid entry ranges from 0.0 to 100.0.

**Delta Percent Package Table Loads** The percentage of Package Table loads from DASD over last interval. Valid entry ranges from 0.0 to 100.0.

**Delta Package Table Loads** The Package Table loads from DASD during the last interval.

**Delta Package Table Requests** The Package Table requests during the last interval.

**Dynamic SQL Cache** The total number of EDM pages currently used for dynamic SQL cache.

**Dynamic SQL Cache Percentage** The percentage of EDM that is currently used for Dynamic SQL caching. Valid entry ranges from 0.0 to 100.0.

**Dynamic SQL Load Rate** The number of Dynamic SQL loads from DASD per second.

**Dynamic SQL Request Rate** The number of Dynamic SQL requests per second.

**Failure Rate** The number of failures per second because the EDM pool is full.

**Free Pages** The total number of EDM pages (DB2 9 or below) or DBD pages (DB2 10 or later) that are currently on the free queue.

**Free Percentage** The percentage of EDM (DB2 9 or below) or DBD (DB2 10 or later) that is currently on the free queue. Valid entry ranges from 0.0 to 100.0.

**Interval Time** The number of seconds since last sample.

**In Use Pages** The total number of EDM pages (DB2 9 or below) or DBD pages (DB2 10 or later) that are currently in use.

**In Use Percentage** The percentage of EDM (DB2 9 or below) or DBD (DB2 10 or later) that is currently in use. Valid entry ranges from 0.0 to 100.0.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Package Table Load Rate** The number of Package Table loads from DASD per second.

**Package Table Pages** The total number of EDM pages currently in use for Package Table. It is zero for DB2 10 or later.
**Package Table Percentage** The percentage of EDM that is currently in use for Package Table. Valid entry ranges from 0.0 to 100.0. It is zero for DB2 10 or later.

**Package Table Request Rate** The number of Package Table requests per second.

**Skeleton Cursor Table Pages** The total number of EDM pages currently used for skeleton cursor tables.

**Skeleton Cursor Table Percentage** The percentage of EDM that is currently used for skeleton cursor tables. Valid entry ranges from 0.0 to 100.0.

**Skeleton Package Table Pages** The total number of EDM pages currently used for skeleton package tables.

**Skeleton Package Table Percentage** The percentage of EDM that is currently used for skeleton package tables. Valid entry ranges from 0.0 to 100.0.

**Time** The date and time, as set on the monitored system, indicating the instance when the agent collects information.

The timestamp format for SCAN and STR functions is *CYYMMDDHHMMSSmmm* (as in 1180315064501000 for 03/15/18 06:45:01) where:
- **C** = Century (0 for 20th, 1 for 21st)
- **Y** = Year
- **M** = Month
- **D** = Day
- **H** = Hour
- **M** = Minute
- **S** = Second
- **m** = Millisecond

**Total Cursor Table Loads** The total number of Cursor Table loads from DASD.

**Total Cursor Table Requests** The total number of Cursor Table requests.

**Total DBD Loads** The total number of database descriptor loads from DASD.

**Total DBD Requests** The total number of database descriptor requests.

**Total Dynamic SQL Loads** The total number of Dynamic SQL loads from DASD.

**Total Dynamic SQL Requests** The total number of Dynamic SQL requests.

**Total Failures EDM Full** The total number of failures because the EDM pool is full.

**Total Pages** The total number of pages assigned to EDM pool (DB2 9 or below) or DBD pool (DB2 10 or later).

**Total Percent Cursor Table Loads** The percentage of all Cursor Table loads from DASD. Valid entry ranges from 0.0 to 100.0.

**Total Percent DBD Loads** The percentage of all DBD loads from DASD. Valid entry ranges from 0.0 to 100.0.
Total Percent Dynamic SQL Loads The percentage of all Dynamic SQL loads from DASD. Valid entry ranges from 0.0 to 100.0.

Total Percent Package Table Loads The percentage of all Package Table loads from DASD. Valid entry ranges from 0.0 to 100.0.

Total Package Table Loads The total number of Package Table loads from DASD.

Total Package Table Requests The total number of Package Table requests.

DB2 SRM EDM Statistics Attributes
Use the DB2 SRM EDM Statistics attributes to create situations to monitor the Environmental Descriptor Manager (EDM) pool activity details.

DB2 Version The version of the DB2 system.

Delta The change since last sample.

Description The monitored pool activity description.

Interval Time The number of seconds since last sample.

Originating System ID The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

Rate The number of requests per second over last sampling interval.

Total The total since DB2 started.

DB2 SRM Log Manager Attributes
Use the DB2 SRM Log Manager attributes to create situations to monitor the DB2 log manager activity.

Active Log CIs Rate The number of active log control intervals (CIs) created per second over the last sampling period.

Archive CIs Offloaded Rate The number of archive log write CIs offloads per second over the last sampling period.

Archive Read Allocation Rate The number of archive log read allocations per second over the last sampling period.

Archive Recording Mode The recording mode for the archive can be either dual or single. It is an alphanumeric text string, with a maximum length of one character.

Archive Write Allocation Rate The number of archive log write allocations per second over the last sampling period.

Begin RBA The lowest Relative Byte Address (RBA) in the log of the primary data set (DB2 11).

BSDS Access Rate The number of BSDS access requests per second over the last sampling period.
**Checkpoint Frequency** The number of bytes in the output buffer before a checkpoint is performed.

**Current RBA** The current Relative Byte Address (RBA) in the log of the primary data set (DB2 11).

It is an alphanumeric text string, with a maximum length of 20 characters. For DB2 11, the RBA can consist of up to 10 bytes. For versions prior to DB2 11, the RBA can consist of up to 6 bytes.

**Current Relative Byte Address** The current Relative Byte Address (RBA) in the log of the primary data set. It is an alphanumeric text string, with a maximum length of 12 characters.

**Data Set Size** The size of the current logging data set.

**Data set Utilization** The percentage of the current data that is in use. Valid entry ranges from 0.0 to 100.0.

**Delta Active Log CIs** The number of active log CIs created during the last sampling period.

**Delta Archive CIs Offloaded** The number of archive log CIs offloads during the last sampling period.

**Delta Archive Read Allocation** The number of archive log read allocations during the last sampling period.

**Delta Archive Write Allocation** The number of archive log write allocations during the last sampling period.

**Delta BSDS Access** The number of BSDS access requests during the last sampling period.

**Delta LookAhead Tape Failed** The number of look ahead tape mounts not satisfied during the last sampling period.

**Delta LookAhead Tape Performed** The number of look ahead tape mounts performed during the last sampling period.

**Delta LookAhead Tape Requests** The number of look ahead tape mounts attempted during the last sampling period.

**Delta Reads Active Archive Log** The number of reads from the active archive log during the last sampling period.

**Delta Reads Active Log** The number of reads from the active log during the last sampling period.

**Delta Reads Delayed No Control Unit** The number of reads delayed because no tape control unit during the last sampling period.

**Delta Reads Delayed Contention** The number of reads delayed as a result of the tape contention during the last sampling period.
**Delta Reads Output Log Buffer** The number of reads from the output log buffer during the last sampling period.

**Delta Write Active Buffer** The number of write active log buffer during the last sampling period.

**Delta Write Delay No Buffer** The number of write delays as a result of no buffers during the last sampling period.

**Delta Write Force** The number of write force requests during the last sampling period.

**Delta Write Nowait** The number of write NOWAIT requests during the last sampling period.

**Delta Write Wait** The number of write wait requests during the last sampling period.

**End RBA** The highest Relative Byte Address (RBA) in the log of the primary data set (DB2 11).

It is an alphanumeric text string, with a maximum length of 20 characters. For DB2 11, the RBA can consist of up to 10 bytes. For versions prior to DB2 11, the RBA can consist of up to 6 bytes.

**Filler** A placeholder to keep fullword alignment.

**High Relative Byte Address** The highest Relative Byte Address (RBA) in the log of the primary data set. It is an alphanumeric text string, with a maximum length of 12 characters.

**Input Buffer Size** The size of the log input buffer.

**Interval Time** The number of seconds since last sample.

**Log Recording Mode** The recording mode for the log, which can be either dual or single. It is an alphanumeric text string, with a maximum length of one character.

**Logs Available** The number of log data sets that are currently available.

**Logs Defined** The number of log data sets that have been defined.

**Look Ahead Tape Failed Rate** The number of look ahead tape mounts not satisfied per second over the last sampling period.

**Look Ahead Tape Performed Rate** The number of look ahead tape mounts performed per second over the last sampling period.

**Look Ahead Tape Requests Rate** The number of look ahead tape mount attempts per second over the last sampling period.

**Low Relative Byte Address** The lowest Relative Byte Address (RBA) in the log of the primary data set. It is an alphanumeric text string, with a maximum length of 12 characters.

**Next Checkpoint** The number of bytes before next checkpoint is to be performed.
**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Output Buffersize** The size of the log output buffer.

**Percent Logs Available** The percentage of active log data sets that are currently available.

**Primary Data Set Name** The current name of the log of the primary data set. It is an alphanumeric text string, with a maximum length of four characters.

**Read Active Archive Log Rate** The number of reads per second from the active archive log over the last sampling period.

**Read Active Archive Log Rate** The number of reads from the active log per second over the last sampling period.

**Read Output Log Buffer Rate** The number of reads from the output log buffer per second over the last sampling period.

**Reads Delayed Contention Rate** The number of reads delayed because the tape contention per second over the last sampling period.

**Reads Delayed NoCU Rate** The number of reads delayed as a result of no tape control unit per second over the last sampling period.

**Secondary Data Set Name** The current name of the log of the secondary data set. It is an alphanumeric text string, with a maximum length of four characters.

**Time Stamp** The date and time, as set on the monitored system, indicating the instance when the agent collects information.

The timestamp format for SCAN and STR functions is CYYMMDDHHMMSSmmm (as in 1180315064501000 for 03/15/18 06:45:01) where:

- C = Century (0 for 20th, 1 for 21st)
- Y = Year
- M = Month
- D = Day
- H = Hour
- M = Minute
- S = Second
- m = Millisecond

**Total Active Log CIs** The total number of active log CIs created.

**Total Archive CIs Offloaded** The total number archive log CIs offloads.

**Total Archive Read Allocation** The total number of archive log read allocations.

**Total Archive Write Allocation** The total number of archive log write allocations.

**Total BSDS Access** The total number of BSDS access requests.
**Total Look Ahead Tape Failed** The total number of look ahead tape mounts not satisfied.

**Total Look Ahead Tape Performed** The total number of look ahead tape mounts performed.

**Total Look Ahead Tape Requests** The total number of look ahead tape mounts attempted.

**Total Reads Active Archive Log** The total number of reads from the active archive log.

**Total Reads Active Log** The total number of reads from the active log.

**Total Reads Delayed Contention** The total number of reads delayed as a result of tape contention.

**Total Reads Delayed No Control Unit** The total number of reads delayed as a result of no tape control unit.

**Total Reads Output Log Buffer** The total number of reads from the output log buffer.

**Total Write Active Buffer** The total number of write active log buffers.

**Total Write Delay No Buffer** The total number of writes delayed as a result of no buffer.

**Total Write Force** The total number of write force requests.

**Total Write Nowait** The total number of write nowait requests.

**Total Write Wait** The total number of write wait requests.

**Write Active Buffer Rate** The number of write active log buffers per second over the last sampling period.

**Write Delay No Buffer Rate** The number of write delays per second as a result of no buffer over the last sampling period.

**Write Force Rate** The number of write force requests per second over the last sampling period.

**Write Nowait Rate** The number of write nowait requests per second over the last sampling period.

**Write Threshold** Write threshold.

**Write Wait Rate** The number of write wait requests per second over the last sampling period.

**DB2 SRM Log Statistics Attributes**

Use the DB2 SRM Log Statistics attributes to create situations to monitor logging and archiving activity of the DB2 log manager.

**Delta** The change since last sample.
**Description** The monitored log activity description.

**Interval Time** The number of seconds since last sample.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Rate** The number of requests per second over last sampling interval.

**Total** The total since DB2 started.

**Total 64** The total since DB2 started. It has a length of 64 bit to resolve overflow problems.

**DB2 SRM Subsystem Attributes**
Use the DB2 SRM Subsystem attributes to create situations to monitor workload related information associated with a DB2 subsystem.

**Abends EOM Rate** The number of abends per second because an End of Memory (EOM) condition was detected over the last sampling period.

**Abends EOT Rate** The number of abends per second because an End of Task (EOT) condition was detected over the last sampling period.

**Abort Rate** The number of abort requests per second over the last sampling period.

**Background Limit** The system limit on background connections.

**Background Utilization** The percentage of available threads being used for background connections. Valid entry ranges from 0.0 to 100.0.

**CONDBAT** The maximum number of concurrent remote connections of Database Access Threads (DBATs) defined in DSNZPARM (Field name: QWP1CDB). When this limit is reached, any new connection request is rejected. Valid entry is an integer.

**Commit Rate** The number of commits per second over the last sampling period.

**Create Thread Wait Rate** The number of Create Thread requests per second that had to wait over the last sampling period.

**Create Threads Rate** The number of threads created per second over the last sampling period.

**CTHREAD HWM** The highest number of batch CICS, IMS, and TSO tasks.

**Current Background** The current number of background connections.

**Current DBAT** The current number of active DBATs.

**Current Foreground** The current number of foreground connections.

**Current Threads** The current number of active threads; Database Access threads are not included.
DBAT Conn HWM The number of high water mark remote connections (Field name: QDSTHWDT).

DBAT Conn Utilization The percentage of remote connections (CONDBAT) (derived field: SDBATCUT). The value is calculated as follows: DBAT connection * 100 / QWP1CDB

DBAT Connection The current number of remote connections for both, active and inactive connections (derived field: SDBATCON).

The value of active connections is calculated as follows: QDSTCNAT - QDSTNADS (active DBATs - disconnected DBATs)

The value of inactive connections is calculated as follows: QDSTQCIT + QDSTCIN2 (type1 inactive DBATs + type2 inactive DBATs)

DBAT Utilization The number of Database Access Threads (DBATs) in use is approaching the maximum number of DBATs defined by the MAXDBAT parameter in DSNZPARM.

Delta Abends EOM The number of abends detected because an End of Memory during the last sampling period.

Delta Abends EOT The number of abends detected because End of Task during the last sampling period.

Delta Aborts The number of abort requests during the last sampling period.

Delta Commits The number of commits during the last sampling period.

Delta Create Thread Wait The number of times a Create Thread operation had to wait during the last sampling period.

Delta Create Threads The number of threads created during the last sampling period.

Delta Identify The number of Identify requests during the last sampling period.

Delta In Doubt The number of Unit of Recovery threads that went in doubt during the last sampling period.

Delta In Doubt Resolve The number of Unit of Recovery threads that were in doubt and resolved during the last sampling period.

Delta Phase1 Commits The number of phase 1 commits during the last sampling period.

Delta Phase2 Commits The number of phase 2 commits during the last sampling period.

Delta Read Only Commits The number of Read Only commits during the last sampling period.

Delta Sign-on The number of sign-on requests during the last sampling period.
**Delta Single Phase Commits** The number of single phase commits during the last sampling period.

**Delta Terminate Thread** The number of threads terminated during the last sampling period.

**Foreground Limit** The system limit on foreground connections.

**Foreground Utilization** The percentage of available threads being used for foreground connections. Valid entry ranges from 0.0 to 100.0.

**IDBACK HWM** The maximum number of connections from batch or TSO background tasks.

**Identify Rate** The number of identify requests per second over the last sampling period.

**IDFORE HWM** The maximum number of connections from TSO foreground tasks.

**In Doubt Rate** The number of Unit of Recovery threads per second that went in doubt over the last sampling period.

**In Doubt Resolve Rate** The number of Unit of Recovery threads that were in doubt and resolved per second over the last sampling period.

**Interval Time** The number of seconds since last sample.

**Location** The DB2 location name.

**MAXDBAT** The number of maximum DBATs defined in DSNZPARM.

**MAXDBAT HWM** The maximum number of active and disconnected (pooled) DBATs that existed (field name: QDSTHWAT). This value is a high-water mark for QDSTCNAT.

**Max Threads Allowed** The total number of concurrent threads allowed.

**OPM IP ADDR** The host name or IP address of the IBM Optim Performance manager Web console.

**OPM Port** The port number of the IBM Optim Performance Web console.

**OPM HTTP** The HTTP or HTTPS for internal use only.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Phase1 Commit Rate** The number of phase 1 commits per second over the last sampling period.

**Phase2 Commit Rate** The number of phase 2 commits per second over the last sampling period.

**Read Only Commit Rate** The number of read only commits per second over the last sampling period.
Sign-on Rate  The number of sign-on requests per second over the last sampling period.

Single Phase Commit Rate  The number of single phase commits per second over the last sampling period.

Terminate Thread Rate  The number of Terminate Thread requests per second over the last sampling period.

Thread Utilization  The percentage of available threads being used; this percentage is calculated as Current Threads/CTHREAD parameter in DSNZPARM *100; Database Access threads are not included. Valid entry ranges from 0.0 to 100.0.

Time  The date and time, as set on the monitored system, indicating the instance when the agent collects information.

The timestamp format for SCAN and STR functions is CYYMMDDHHMMSSmmm (as in 1180315064501000 for 03/15/18 06:45:01) where:
- C = Century (0 for 20th, 1 for 21st)
- Y = Year
- M = Month
- D = Day
- H = Hour
- M = Minute
- S = Second
- m = Millisecond

Total Abends EOM  The total number of abends detected because End of Memory.

Total Abends EOT  The total number of abends detected because End of Task.

Total Aborts  The total number of abort requests.

Total Commits  The total number of commit requests.

Total Create Thread Wait  The total number of times a Create Thread operation has to wait.

Total Create Threads  The total number of threads created.

Total Identify  The total number of Identify requests.

Total In Doubt  The total number of Unit of Recovery threads that went in doubt.

Total In Doubt Resolve  The total number of Unit of Recovery threads that were in doubt that were resolved.

Total Phase1 Commits  The total number of phase 1 commits.

Total Phase2 Commits  The total number of phase 2 commits.

Total Read Only Commits  The total number of read only commits.

Total Sign-on  The total number of sign-on requests.
**Total Single Phase Commits** The total number of single phase commits.

**Total Terminate Thread** The total number of thread terminations.

**DB2 SRM Subsystem Statistics Attributes**
Use the DB2 SRM Subsystem Statistics attributes to create situations to monitor the request rate of a DB2 subsystem.

**Delta** The change since last sample.

**Description** The description of the monitored activity.

**Interval Time** The number of seconds since last sample.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Rate** The number of requests per second over last sampling interval.

**Total** The total since DB2 started.

**DB2 SRM UTL Attributes**
Use the DB2 SRM UTL attributes to create situations to monitor all active utilities. Monitoring also includes utilities that due to abnormal termination, have not yet completed their run.

**ID** The utility qualifier. It is an alphanumeric text string, with a maximum length of eight characters.

**Job Name** The utility job name. It is an alphanumeric text string, with a maximum length of eight characters.

**Name** The utility name. It is an alphanumeric text string, with a maximum length of eight characters.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Phase** The utility phase. It is an alphanumeric text string, with a maximum length of eight characters.

**Record Count** The number of records/pages processed.

**Run Date** The date the job was run (if available).

The timestamp format for SCAN and STR functions is CYYMDDHHMMSSmmm (as in 1180315064501000 for 03/15/18 06:45:01) where:

- **C** = Century (0 for 20th, 1 for 21st)
- **Y** = Year
- **M** = Month
- **D** = Day
- **H** = Hour
- **M** = Minute
**Stat** A for Active, S for stopped.

**Status** The utility status. It is an alphanumeric text string, with a maximum length of 12 characters.

**Statement** The statement number.

**Time** The date and time, as set on the monitored system, indicating the instance when the agent collects information.

The timestamp format for SCAN and STR functions is **CYYMMDDHHMMSSmmm** (as in 1180315064501000 for 03/15/18 06:45:01) where:

- C = Century (0 for 20th, 1 for 21st)
- Y = Year
- M = Month
- D = Day
- H = Hour
- M = Minute
- S = Second
- m = Millisecond

**User** The user ID. It is an alphanumeric text string, with a maximum length of eight characters.

**Utilid** The utility qualifier. It is an alphanumeric text string, with a maximum length of 16 characters.

**DB2 System States Attributes**

Use the DB2 System States attributes to create situations to monitor system-level performance and exception alerts.

**Active Stored Procedures** The number of stored procedures currently executing.

**Active Triggers** The number of triggers currently executing.

**Active User Functions** The number of user defined functions currently executing.

**Allowed locks per TS** The default (SYSTEM) for the LOCKMAX clause of the SQL statements CREATE TABLESPACE and ALTER TABLESPACE. Install parameter LOCKS PER TABLESPACE on panel DSNTIPJ, or ZPARAM NUMLKTS in DSN6SPRM.

**Archive Device** The CCUU address of the device that is to be used for mounting the tape. It is an alphanumeric text string, with a maximum length of four characters.

**Archive DSN** The data set name of the archive file being waited on. It is an alphanumeric text string, with a maximum length of 44 characters.

**Archive Volser** The volser for tape volume being waited on. It is an alphanumeric text string, with a maximum length of six characters.
**ASIDs Stored Procedures** The number of unique active threads executing stored procedures.

**ASIDs User Functions** The number of ASIDs executing user functions.

**Bytes written to log** The log rate for the active log data sets in MB per second. This figure is valid for dual logging. If single logging is used, multiply the value shown by 2. This rate is MB/sec at which data is written to the active log data set. It was calculated by multiplying QJSTCIWR (label LOG CI WRITTEN (LOG1&2)) by 4096, then dividing the result by (1024 * 1024 * statistics-interval-seconds * 2). When the value exceeds 10MB/sec per log copy, you should examine I/O tuning of log data sets; for example, using faster log devices and/or I/O striping, using variable-length or compressed log record layouts to reduce log data size.

**CF global contention** The total number of suspends because of contention divided by the total number of synchronous requests that went to XES, and the lock requests that were converted from synchronous to asynchronous locks, and the locks because of child lock propagation. If multiple members from the same data sharing group run on the same LPAR, the global contention rate should be ignored for a member where the QTGSFCON flag is zero. The QTGSFCON flag indicates whether the false contention is reported at the subsystem (=1) or LPAR level (=0).

**Checkpoint freq** Checkpoint frequency. This shows either the number of minutes (1 through 60) or the number of DB2 log records between the start of successive checkpoints. DB2 starts a new checkpoint when this value is reached. You can use the SET LOG command to change the number of log records between checkpoints dynamically. Valid values are 1-60 when specifying a time value and 200-16000000 when specifying a number of records. Install parameter CHECKPOINT FREQ on panel DSNTIPL, ZPARM CHKFREQ in DSN6SYSP.

**Class castout thresh reached** The number of times group buffer pool castout was initiated because the group buffer pool class castout threshold was detected. The class castout threshold is one of two group buffer pool thresholds. In most cases the default value for the class threshold (10 percent) is a good choice. Depending on your workload, altering this value can reduce DASD contention during castout.

**Current Open Data Set** The current number of open data sets.

**Current Thread Count** The current number of active threads.

**DB2 ID** The name of a DB2 subsystem.

**DB2 version** The DB2 version.

**DB Wait Percent** The percentage of threads that are waiting for database services. Valid entry ranges from 0.0 to 100.0.

**DeadLocks** The number of times deadlocks were detected. This number should be low, ideally 0. Deadlocks occur when two or more application processes each hold locks on resources that the others need, without which they cannot proceed. Ensure that all applications accessing the same tables access them in the same order. Deadlocks can also occur through index page splits if there is high insert activity. In this case, the recommendation is to set SUBPAGES to 1 for the index. This field is incremented once for each deadlock encountered. There is no correlation between this field and the deadlock events reported in the Locking report set or the number of IFCID 172 records written. This field reports all
deadlocks, regardless of how they were resolved. The locking report and record trace IFCID 172 show only those deadlocks that were resolved by DB2.

**Dist DB Inactive** The state will be true if this DB2 system is not enabled for the Distributed Data Facility (DDF). It is an alphanumeric text string, with a maximum length of one character.

**Dist Receive Rate** The DDF Receive bytes per second in units of 1,000.

**Dist Send Rate** The DDF Send bytes per second in units of 1,000.

**DM critical thresh reached** The number of times the deferred write threshold (DWTH) was reached. This threshold is a percentage of the virtual buffer pool that might be occupied by unavailable pages, including both updated pages and pages in use. DB2 checks this threshold when an update to a page is completed. If the percentage of unavailable pages in the virtual buffer pool exceeds the threshold, write operations are scheduled for enough data sets (up to 128 pages per data set) to reduce the number of unavailable buffers to 10% below the threshold.

**DSC active** Indicates whether prepared dynamic SQL statements are saved for later use by eligible application processes in the EDM pool. Install parameter CACHE DYNAMIC SQL on panel DSNTIP8, or ZPARM CACHEDYN in DSN6SPRM.

**DSC size** The size of the statement cache that can be used by the Environmental Descriptor Manager (EDM). This value is used at DB2 startup time as the minimum value. You can increase and subsequently decrease this value with the SET SYSPARM command. This value cannot be decreased below the value that is specified at DB2 startup. The CLIST calculates a statement cache size. This storage pool is located above the 2 GB bar. The value used at DB2 startup time is either calculated by the CLIST based on input from other installation information or an override value. For record trace, this value is shown in bytes. Install parameter EDM STATEMENT CACHE on panel DSNTIPC, or ZPARM EDMSTMTMC in DSN6SPRM.

**DSMAX** The maximum number of open data sets allowed to be specified in DSNZPARM.

**DSMAX Utilization** The number of data sets opened is approaching the maximum number of open data sets defined by the DMAX parameter in DSNZPARM.

**DWQT reached** The number of times the deferred write threshold (DWTH) was reached. This threshold is a percentage of the virtual buffer pool that might be occupied by unavailable pages, including both updated pages and pages in use. DB2 checks this threshold when an update to a page is completed. If the percentage of unavailable pages in the virtual buffer pool exceeds the threshold, write operations are scheduled for enough data sets (up to 128 pages per data set) to reduce the number of unavailable buffers to 10% below the threshold.

**EDM Current Pages** The current number of EDM pages (DB2 9 or below) or the current number of DBD pages (DB2 10 or later) that are used.

**EDM Pool full** The total number of failures because the EDM pool or EDM pool was full.
**EDM Total Pages** The total number of pages allocated for the EDM pool (DB2 9 or below) or the total number of pages allocated for the DBD pool (DB2 10 or later).

**EDM Utilization** The current EDM pages divided by total EDM pages (DB2 9 or below) or the current DBD pages divided by total DBD pages (DB2 10 or later).

**GBP castout thresh reached** The number of times a group buffer pool castout was initiated because the group buffer pool castout threshold was detected. The GBP castout threshold, GBP class castout threshold, and the length of the GBP checkpoint interval determine the castout characteristics of the group buffer pool. You can consider this threshold a safety margin to protect the group buffer pool from being accidentally flooded by overactive applications. In most situations, the default value for the group buffer pool castout threshold of 50 percent is a good choice. Use the ALTER GROUPBUFFERPOOL command to tune the group buffer pool thresholds. A value near to 100 indicates that in most cases DB2 found skeleton copies of prepared statements in global dynamic cache and could perform short prepares. A value near to 0 indicates that in most cases skeleton copies of prepared statements were not found in global dynamic cache and full prepares were performed.

**Global cache hit ratio** The ratio of successful search requests for prepared statements from the global dynamic SQL cache. This indicates the effectiveness of the global dynamic SQL cache in the EDM pool.

**Global Trace Active** The state will be true if this DB2 system currently has the global tracing active. It is an alphanumeric text string, with a maximum length of one character.

**Group or Subsystem Name** The DB2ID or data sharing group name. It is an alphanumeric text string with a maximum of 8 characters; for example, TDDB241G.

**Group Object Analysis Status** The status of the Event Manager for Object Analysis.

Valid values are:

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MIX</td>
<td>Some Event Managers are active</td>
</tr>
<tr>
<td>NO</td>
<td>Event Manager is not active</td>
</tr>
<tr>
<td>YES</td>
<td>Event Manager is active</td>
</tr>
</tbody>
</table>

**Group or Subsystem Type** Indicates whether a group or subsystem is a DB2 or a data sharing group.

Valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DB2</td>
<td>DB2 subsystem</td>
</tr>
<tr>
<td>DSGRP</td>
<td>Data sharing group</td>
</tr>
</tbody>
</table>

**Incomp retained locks** The number of global lock or change requests denied or suspended due to an incompatible retained lock.
In Doubt Threads The number of threads that are in an INDOUBT status.

Indoubt-URs The number of indoubt units of recovery. A unit of recovery is indoubt when a failure occurs after a successful prepare but before a successful commit. The failure can occur in the address space of the application, the transaction manager, DB2, or all of these. IMS and CICS applications use the prepare and commit sequence to commit work. Ideally, this value should be 0.

Interval Time The number of seconds since last sample.

Lock Conflict Count The total number of owners and waiters that are in lock conflict. Valid value is an integer in the range 0 - 99999999.

Lock Escalations Number of all types of lock escalations.

Lock Escalation Exclusive The number of times that the allowable number of locks per table space was exceeded resulting in page (IX) lock to escalate to table or table space lock in exclusive mode.

Lock Escalation Rate The number of lock escalations (exclusive and shared) per second in this interval.

Lock Escalation Shared The number of times that the allowable number of locks per table space was exceeded, resulting in page (IS) lock to escalate to table or table space lock in shared mode.

Max active DBATs The maximum number of database access threads (DBATs) that can be active concurrently. The maximum number of database access threads (DBATs) that can be active concurrently. When this limit has been reached, DB2 uses the value of DDF THREADS on panel DSNTIPR to decide how to handle a new allocation request. When DDF THREADS is ACTIVE and MAX REMOTE CONNECTED has not been reached, the allocation request is allowed but any further processing for the connection is queued waiting for an active database access thread to terminate. When DDF THREADS is INACTIVE and MAX REMOTE CONNECTED has not been reached, the allocation request is allowed and is processed when DB2 can assign an unused database access thread slot to the connection. The total number of threads accessing data concurrently is the sum of MAX USERS and MAX REMOTE ACTIVE. The maximum allowable value for this sum is 2000. Install parameter MAX REMOTE ACTIVE on panel DSNTIPE, or ZPARM MAXDBAT in DSN6SYSP.

Max Batch users The maximum allowed number of concurrent connections for batch jobs and utilities. This includes:

- All batch jobs using QMF.
- All batch jobs using the DSN command processor.
- All tasks connected to DB2 through call attach facility (CAF) running in batch.
  This can include:
  1. Batch jobs using QMF
  2. APPC applications
  3. TCP/IP FTP connections

Install parameter MAX USERS on panel DSNTIPE, or ZPARM CTHREAD in DSN6SYSP.
Max DB2 allied users  The maximum number of allied threads (threads started at the local subsystem) that can be allocated concurrently. Separate threads are created for each occurrence of the following:
• TSO user (whether running a DSN command or a DB2 request from QMF)
• Batch job (whether running a DSN command or a DB2 utility)
• IMS region that can access DB2
• Active CICS transaction that can access DB2
• Task connected to DB2 through the call attachment facility

Install parameter MAX USERS on panel DSNTIPE, or ZPARM CTHREAD in DSN6SYSP.

Max degree  Indicates the upper limit on the degree of parallelism for a parallel group. This field has a value of 0. This means PARAMDEG is not set and DB2 can set a default maximum degree of parallelism based on the system configuration.

Install parameter MAX DEGREE on panel DSNTIP8, or ZPARM PARAMDEG in DSN6SPRM.

Max opened DS  The maximum number of data sets that can be open at one time. The practical limit can be less than the MVS limit of 32727, depending on available storage below the line. Install parameter DSMAX on panel DSNTIPC, or ZPARM DSMAX in DSN6SPRM.

Max kept dyn stmt  Shows the total number of prepared dynamic SQL statements that are saved past a commit point. 0 means that prepared dynamic SQL statements are not saved past commit points. Install parameter MAX KEPT DYN STMTS on panel DSNTIPE, or ZPARM MAXKEEPD in DSN6SPRM.

Max size of EDM Pool  The size (in kilobytes) of the environmental descriptor manager (EDM) pool. This can be the value calculated by the CLIST, based on input from previous panels, or the value entered in the Override column at installation time. Install parameter EDMPOOL STORAGE SIZE on panel DSNTIPC, or ZPARM EDMPOOL in DSN6SPRM.

Max TSO users  The maximum number of concurrent TSO foreground connections (QMF, DSN, DB2I, and SPUFI). Each of the following is a separate user:
• Each TSO foreground user executing a DSN command.
• Each TSO foreground user connected to DB2 through the call attachment facility (CAF). This can include QMF users running in TSO foreground or user-written CAF applications running in TSO foreground.

When the number of TSO users attempting to access DB2 exceeds this limit, connection requests are rejected. There is no subsystem parameter to control the maximum concurrent connections for IMS and CICS. These are controlled by using IMS and CICS facilities. For CICS attachment, the maximum number of connections to DB2 can be controlled using the resource control table (RCT) TYPE=INIT THRDMAX value. Install parameter MAX TSO CONNECT on panel DSNTIPE, or ZPARM IDFORE in DSN6SYSP.

Merge error BP shortage  The total number of work files that were rejected during all merge passes because of insufficient buffer resources. This field and the degraded low buffers field determine the average number of work files that cannot be honored at each merge pass because of insufficient buffer pool space. Ideally, the number in this field should be 0. Otherwise, it indicates a shortage of buffer pool space or that there are too many concurrent work files. For example, there
could be a number of concurrently open cursors that require sorting. Consider increasing the size of the buffer pool using the ALTER BUFFERPOOL command. Note that, when there are many concurrent sorts or large sorts, it is a good idea to dedicate a separate buffer pool for sort work files. This will greatly facilitate work-file performance tuning.

**Migrated DS timed out** The number of recall timeouts.

**MVS System** An ID for the MVS System Management Facility (SMF). It is an alphanumeric text string with a maximum of 4 characters; for example SP11.

**No QP BP shortage** The total number of parallel groups that fell back to sequential mode due to a storage shortage or contention on the buffer pool.

**No QP no MVS enclave serv** The total number of parallel groups that executed in sequential mode due to the unavailability of MVS/ESA enclave services.

**Nonstealable pages** Percentage of non-stealable pages in use.

**Number of Active DBATs** The current number of active and disconnected (pooled) DBATs.

**Number of batch users** The number of connections to a single instance from batch or TSO background tasks.

**Number of DB2 systems** The total number of monitored DB2 systems. Valid value is an integer in the range 1 - 64.

**Number of GBP Connections** The total number of Group Buffer Pool (GBP) Connections.

**Number of TSO users** The number of connections to a single instance from TSO foreground tasks.

**Object Analysis DB Count** The total number of monitored databases in a specific data sharing group that are participating in object analysis. Valid value is an integer in the range 0 - 4999.

**Open DS thresh reached** The number of data sets that were closed because the total number of open data sets reached the deferred close threshold value. The deferred close value is based on the value of DMAX or the MVS DD limit (whichever is smaller).

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Output buffer full** The number of waits caused by an unavailable output log buffer. When DB2 wants to write a log record and the log buffer is not available, DB2 and the application must wait for an available log buffer.

**Output buffer size** The output log buffer size in kilobytes. There is only one output log buffer per DB2 subsystem. Increasing this parameter reduces BSDS I/O updates when there is a buffer wraparound. Frequent wraparounds are likely in LOAD or REORG with logging, and mass insert operations. Increasing this parameter also helps avoid log write waits for an available buffer during heavy
update workload. When the specified size is not a 4KB multiple, it is rounded up to the next 4 KB multiple. Install parameter OUTPUT BUFFER on DSNTIPL, or ZPARM OUTBUFF in DSN6LOGP.

**Pages castout** The number of times a group buffer pool castout was initiated because the group buffer pool castout threshold was detected. The GBP castout threshold, GBP class castout threshold, and the length of the GBP checkpoint interval determine the castout characteristics of the group buffer pool. You can consider this threshold a safety margin to protect the group buffer pool from being accidentally flooded by overactive applications. In most situations, the default value for the group buffer pool castout threshold of 50 percent is a good choice. Use the ALTER GROUPBUFFERPOOL command to tune the group buffer pool thresholds.

**Pages read from BPs** The number of Getpage requests including conditional and unconditional requests.

**Pages read from DASD** The number of synchronous read I/O operations performed by DB2 for applications and utilities. This number includes both Synchronous Reads Sequential Access Only (QBSTSIO) and synchronous read operations for non-sequential access. You can use this value and the value of Synchronous Reads Sequential Access Only to calculate the number of Non-Sequential Synchronous Reads. Check the buffer pool hit ratio if the number of non-sequential synchronous reads is larger than expected.

**Resource Timeout** The number of seconds before a timeout is detected. This is an integer multiple of DEADLOCK TIME on panel DSNTIPJ. Timeout means that a lock request has waited for a resource (or for claims on a resource for a particular claim class to be released) longer than this time. For data sharing, the actual timeout period is longer than the timeout value. Install parameter RESOURCE TIMEOUT on panel DSNTIPJ, or ZPARM IRLMRWT in DSN6SPRM.

**Resource unavailable** The number of read accesses delayed due to unavailable resources. Generally, this can be due to insufficient tape units allocated. If this is so, reissue the SET ARCHIVE command and use a higher value for the count parameter. Another (although unlikely) cause is insufficient archive log read service task availability.

**Resync attempted** The number of resynchronization connections attempted with all remote locations (two-phase commit operations only). A large value can indicate network or system problems.

**RID Pool size** The size of the RID pool in bytes.

**RID Pool size too small** The number of times the maximum RID pool storage was exceeded. The size is determined by the installation parameter RID POOL SIZE (DB2 install panel DSNTIPC). It can be 0, or between 128 KB and 10 GB. The general formula for calculating the RID pool size is: (Number of concurrent RID processing activities) x (average number of RIDs) x 2 x (5 bytes per RID).

**RIDPool Fail No Storage** Due to insufficient storage for the candidate RID lists, DB2 was unable to use more than one index when accessing a DB2 table.

**RIDPool Fail No Storage Rate** The number of RIDPOOL fallbacks per second in this interval.
**SMF overruns**  The total number of SMF buffer overruns. Ideally, this field should be 0 or very small.

**Sort degraded BP too small**  The number of times that a merge pass was not efficiently performed due to a shortage of space in the buffer pool. The number in this field is incremented for each merge pass where the maximum number of work files allowed is less than the number of work-files requested. The maximum number of work files allowed is calculated as follows: Buffers consumed=2*(work files already allocated); Buffers available = (sequential steal threshold * buffer pool size - buffers consumed); Maximum work files allowed = buffers available / (2 * 8); Ideally, the number in this field should be 0. Otherwise, it indicates a shortage of buffer pool space or that there are too many concurrent work files. For example, there could be a number of concurrently open cursors that require sorting. Consider increasing the buffer pool size using the ALTER BUFFERPOOL command.

**Sort error BP shortage**  The number of times a work file could not be created due to insufficient buffer resources. It indicates that a sort is in progress and limited in regard to the number of work files it can use. Ideally, this should be 0. Otherwise, it indicates a shortage of buffer pool space or that there are many concurrent work files. For example, there could be a number of open cursors that require sorting. Generally, sorts are performed more efficiently with additional work files, but there are internal DB2 limits on the number of work files a transaction can have. It is possible that at run time a transaction cannot use as many work files as it had planned. You can control this by increasing the buffer pool size (ALTER BUFFERPOOL), or changing the transaction so it requires fewer concurrent work files.

**SP abends**  The number of times a stored procedure terminated abnormally.

**SP start failed/rejected**  The number of times an SQL CALL statement was rejected due to the procedure being in the STOP ACTION(REJECT) state.

**SP timed out**  The number of times an SQL call timed out waiting to be scheduled.

**Status**  Indicates whether a DB2 subsystem or data sharing group for a monitored entity is operational. Valid values are OFFLINE or ONLINE.

**Tape volume contention**  The number of read accesses that were delayed because of a tape volume contention when only one reader per tape is possible.

**Threads Wait Limit**  The number of inactive connections waiting because the system thread limit (MAXDBAT) has been reached: If CONQUED is less than or equal to DSCDBAT and CONQUED is less than or equal to (MDBAT-ADBAT), inactive connections waiting equals to 0, otherwise inactive connections waiting equals to CONQUED - (MDBAT-ADBAT+DSCDBAT); refer to the DB2 DISPLAY DDF DETAIL command for the field names.

**Threads Wait Lock**  The number of threads in a suspend state because they are waiting to obtain a lock.

**Time**  The date and time, as set on the monitored system, indicating the instance when the agent collects information.

The timestamp format for SCAN and STR functions is **CYYMDDHHMMSSmmm** (as in 1180315064501000 for 03/15/18 06:45:01) where:
• C = Century (0 for 20th, 1 for 21st)
• Y = Year
• M = Month
• D = Day
• H = Hour
• M = Minute
• S = Second
• m = Millisecond

Timeouts The number of times a unit of work was suspended for a time exceeding the timeout value. This number should be low, ideally 0.

Transactions per second The number of successful requests for commit phase 1 in a two-phase commit environment such as CICS or IMS. It includes successfully prepared agents associated with threads that use the Recoverable Resource Manager Services Attach Facility (RRSAF). It does not include successful single-phase commits or distributed two-phase commits. IMS and CICS applications use the PREPARE and COMMIT sequence to commit work.

Trigger Depth The depth of the largest trigger stack.

UDF abended The number of times a user-defined function abended.

UDF start failed/rejected The number of times a user-defined function was rejected.

UDF timed out The number of times a user-defined function timed out while waiting to be scheduled.

Users Waiting Threads The count of users waiting for threads.

Wait Tape Mount The state will be true if the DB2 system is waiting on a tape mount to recover from an archive log. It is an alphanumeric text string, with a maximum length of one character.

Write failed no storage The number of coupling facility write requests that could not complete due to a lack of coupling facility storage resources. It is an alphanumeric text string, with a maximum length of one character.

DB2 Thread Accounting Attributes
Use these attributes to view DB2 Thread accounting information.

ACE Address The agent control element (ACE) (see QWHSACE) of the thread that is reported. The value in QWHSACE is the ACE of the IFI application that requested this trace record (Field name: QW0148AC).

Agent Class 1 It comprises the class 1 CPU time of the allied agent, which may include the accumulated class 1 CPU time for processing stored procedures, user-defined functions, and triggers if present.

Agent Non-Nested Class 1 The class 1 CPU time of the non-nested activity of the allied agent.
Authorization ID  The primary authorization ID from connection or signon. For z/OS operator commands and DB2 system internal agents, the value is SYSOPR. Secondary authorization IDs might be the RACF groups associated with this primary authorization ID. The SQL ID is initially set to this primary authorization ID. The connection authorization exit and the signon authorization exit can change the primary authorization ID so that it is not the same as the original primary authorization ID (QWHCOPID). Distributed authorization ID translation can also change the primary authorization ID (Field name: UWHCAID).

CP CPU Outside DB2 Class 2  The CP CPU time outside DB2 (Class 2) (DB2 field name: ADCPUODB).

CP CPU Time Class 1  The class 1 CPU time in an application (Field name: ADCPUT).

Collection Name  The collection name (Field name: UW0148CI).

Connection ID  The connection name (Field name: QWHCCN). It is not valid on end of memory and reflects the z/OS home address space (ASID) connection name for:

- Batch: 'BATCH'
- TSO: 'TSO'
- QMF: 'DB2CALL'
- Utility: 'UTILITY'
- DB2 internal subsystem ID
- IMS: IMS-ID
- CICS: CICS-ID
- RRSAF: 'RRSAF'

Distributed database access threads:
- For threads from a DB2 requester, this field contains the connection name of the thread at the requesting location.
- For threads using the DRDA protocol from a non-DB2 requester, this field contains the constant 'SERVER'.

Correlation ID  The correlation ID value (Field name: QWHCCV).
- For batch: JOBNAME
- For TSO: LOGON-ID
- For IMS/VS: PST#.PSBNAME
- For CICS: CONNECTION_TYPE.THREAD_TYPE.THREAD_#.TRAN-ID
- For RRSAF: CORRELATION-ID value from signon function
- For threads from a DB2 requester: this field contains the correlation-ID name of the thread at the requesting location.
- For threads using the DRDA protocol from a non-DB2 requester, this field contains the first 12 characters in the DDM external name (EXTNAM) parameter of the DDM EXCSAT command received as part of the SQL connect.

DB2 Subsystem  The DB2 subsystem ID.
**DB2 Version** The DB2 version.

**DSG Member Name** The Data Sharing Group (DSG) member name.

**Data Sharing Group** The Data Sharing Group name.

**Elapsed Outside DB2 Class 2** The elapsed time outside DB2 (Class 2) (DB2 field name: ADTTTOTOD).

**Elapsed class 1** The class 1 elapsed time of the allied agent (Field name: ADRECETT).

**End User ID** The user ID of the end user’s workstation (Field name: QWHCEUID). This can be different from the authorization ID used to connect to DB2. This field contains blanks if the client did not supply this information. If QWHCEUID_OFF is not 0, this value is truncated.

**In-DB2 Agent CPU Time Class 2** It comprises the class 2 CPU time of the allied agent. This time includes the accumulated class 2 CPU time for processing stored procedures, user-defined functions, and triggers, if present. CPU time for processing parallel tasks is not charged to this counter. This CPU time does not include the CPU time that is consumed on an IBM specialty engine (Field name: ADAGENT2).

**In-DB2 CP CPU Time Class 2** The class 2 CPU time (in DB2) (Field name: ADDBCPUT). It indicates:

- The class 2 CPU time for the allied agent. This includes the accumulated class 2 TCB time for processing any stored procedures, user-defined functions, and triggers.
- The accumulated CPU time for processing parallel tasks. This is valid for query CP parallelism, sysplex query parallelism, and parallel tasks generated by utilities. In sysplex query parallelism, only CPU times of parallel tasks, running on the same member of the sysplex group as the originating task, are included. This CPU time does not include time that is consumed on an IBM specialty engine.

**In-DB2 Elapsed Class 2** The class 2 elapsed time of the allied agent accumulated in DB2 (Field name: ADDB2ETT).

**In-DB2 Non-Nested CPU Time Class 2** The accumulated CPU time for all environments (CICS, IMS, RRSAF, TSO, and DDF). This CPU time does not include:

- CPU time that is consumed on an IBM specialty engine.
- CPU time for processing SQL on behalf of a stored procedure. For stored procedure time, see **In-DB2 SP CPU Time Class 2** (QWACSPTT).

A value of binary zero means that no time value is available (Field name: QWCAJST).

**In-DB2 Non-Nested Class 2/3** The accumulated elapsed time in DB2 (Field name: QWACASC). This field is calculated if accounting class 2 is on. This field is calculated for threads by taking the store clock (STCK) time on exit from DB2 and subtracting the store clock value on entry to DB2. However, the times for most thread allocation and certain abend conditions are not included.
In-DB2 Not Accounted Class 2 The time not accounted in DB2 (Field name: ADNOTACC). This time determines whether there is a large percentage of time that has not been captured within the DB2 accounting record and whether system monitoring tools (such as RMF) should be examined to determine the cause of a performance problem.

In-DB2 Parallel CPU Time Class 2 The sum of the CPU times of the parallel tasks running in DB2 (Field name: ADDBCPC2). These tasks can be query CP, sysplex query parallel tasks, parallel tasks produced by utilities, or rollup autonomous tasks. In sysplex query parallelism, the accumulated time reflects only parallel tasks running on the same DB2 subsystem as the originating task. This time does not include the CPU time consumed on an IBM specialty engine.

In-DB2 SE CPU Class 2 The accumulated and consumed class 2 time on an IBM specialty engine that consists of times for non-nested, stored procedures, user-defined functions, triggers, and parallel tasks (Field name: AWACC2Z).

Note: All CPU times of an IBM specialty engine (SE) that are reported in DB2 trace records are already normalized by DB2 to the speed of the purpose processor.

In-DB2 SP CPU Time Class 2 The Accumulated CPU time that was spent in DB2 for processing SQL statements that were issued by stored procedures in WLM-established stored procedure address spaces (Field name: QWACSPPTT). This time also includes DB2 time that was used for connecting and disconnecting the stored procedure task for external stored procedures. SQL procedure times are included in this time if the SQL procedures were called on a nested task, and were not invoked by the main application execution unit. This time is a subset of the QWACSPCP time. It does not include time that is consumed on an IBM specialty engine.

In-DB2 SP Class 2/3 The total elapsed time that was spent for processing SQL statements that were issued by stored procedures in WLM-established stored procedure address spaces. This time also includes time that was used for connecting and disconnecting the stored procedure task, for external stored procedures. SQL procedure times are included in this time if the SQL procedures were called on a nested task, and were not invoked by the main application execution unit. (Field name: QWACSPEB).

In-DB2 Suspend Time Agent Class 2 The waiting time of the allied agent for all types of class 3 suspension (Field name: ADTCBCL3). This counts class 3 suspension time within nested activity. Suspension time of parallel tasks in query or utility parallelism is not included.

In-DB2 Suspend Time Class 2 The waiting time for all types of class 3 suspensions by the originating task and parallel tasks, if parallelism is employed (Field name: ADTSUST).

In-DB2 Suspend Time Parallel Class 2 The sum of the suspension times spent for parallel tasks (Field name: ADCPCL3T). These tasks can be query CP or sysplex query parallel tasks, parallel tasks produced by utilities, or roll-up autonomous tasks.

In-DB2 UDF CPU Time Class 2 The accumulated CPU time that was spent in DB2 for processing SQL statements that were issued by user-defined functions in WLM-established stored procedure address spaces (Field name: QWACUDTT). This time also includes DB2 time that was used for connecting and disconnecting the
user-defined function task. This time includes time for a non-inline user-defined function if the user-defined function was called on a nested task and was not invoked by the main application execution unit. This time is a subset of the QWACUDCP time. It does not include time that is consumed on an IBM specialty engine.

**In-DB2 UDF Class 2/3** The total elapsed time that was spent in DB2 for processing SQL statements that were issued by user-defined functions in WLM-established stored procedure address spaces (Field name: QWACUDEB). This time also includes DB2 time that was used for connecting and disconnecting the user-defined function task. This time includes time for a non-inline user-defined function if the user-defined function was called on a nested task and was not invoked by the main application execution unit.

**In-DB2 Waiting Time Class 2** The waiting time in DB2 (Class 2/3) (Field name: ADTWTDB).

**Interval Start** The start time of this interval.

**Location Name** The location name (Field name: UW0148LN). The location name contains the name of the local location or remote location, depending on where the thread executes a package. The following statements execute locally, regardless of the current package name:
- COMMIT
- ROLLBACK
- SET <HOST VARIABLE> = CURRENT PACKAGE
- SET <HOST VARIABLE> = CURRENT SERVER

For these statements, this field contains the location where the package executes, not the location where the statement executes.

**Logical Unit of work ID** The logical unit of the work ID (LUWID) as defined for the LU 6.2 interface (Field name: QW0148LU). The LUWID uniquely identifies the thread within the network, and consists of the following:
- A fully qualified network name (QW0148LM)
- An LUW instance number (QW0148UV) and an LUW sequence number (see fields below).

It consists of two 8-character fields: QW0148NI and QW0148LM, which together uniquely identify a client system.

**MVS System ID** The MVS identifier.

**Non Nested Class 1** The non-nested class 1 elapsed time of the allied agent (Field name: ADNNNET1).

**Non-Nested Outside DB2 Class 2** The class 2 CP CPU time of the non-nested activity of the allied agent outside DB2 (Field name: ADTTCBOD).

**Originating System** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Package ID** The package ID (Field name: UW0148PN).
**Parallel Tasks CPU Class 1** The sum of the CPU times of the parallel tasks running in an application. It can also include the accumulated class 1 CPU time for processing stored procedures, user-defined functions, and triggers if present. These parallel tasks can be query CP, sysplex query parallel tasks, or parallel tasks produced by utilities. In sysplex query parallelism, the accumulated time reflects only parallel tasks running on the same DB2 subsystem as the originating task (Field name: ADCPUPLL).

**Plan Name** The plan name (Field name: QWHCPLAN). It shows blank for DB2 command thread; otherwise:
- For SPUFI with cursor stability: 'DSNESPCS'
- For SPUFI with repeatable read: 'DSNESPPR'
- For TSO: the application plan name
- For IMS: the application plan name
- For CICS: application plan name, IMS and CICS commands have a blank plan name.
- For RRSAF create thread with the collection parameter: '?RRSAF '
- For QMF: 'DSQPLAN'
- For Distributed Database Access threads:
  - For threads using the DRDA protocol from a requester, this field contains the plan name that is executed at the requesting location.
  - For threads using the DRDA protocol from a non-DB2 requester or from a DB2 2.3 requester, this field contains the constant 'DISTSERV'.
- For binding: 'DSNBIND' (system plan)
- For utility: 'DSNUTIL ' (system plan)
- For authorization: 'ACT' + X'0000000000' (system plan)
- For unallocated threads and miscellaneous DB2 system service tasks: 'BCT' + X'0000000000' (system plan)
- For startup: 'STARTCT' + X'00' (system plan)

**QWACFLGS** Flags (Field name: QWACFLGS).

**SE CPU Class 1** The sum of several accumulated CPU times consumed while running on an IBM specialty engine in all environments (Field name: AWACCC1Z). These times are consumed when:
- Running stored procedure requests and triggers on the main application execution unit.
- Satisfying stored procedure requests processed in a DB2 stored procedure or WLM address space.
- SQL procedure times are included in this time if the SQL procedure was called on a nested task and was not invoked by the main application execution unit.
- Satisfying UDF requests processed in a DB2 stored procedure or WLM address space.
- Running triggers on a nested task.
- Running parallel tasks in an application which contains the accumulated CPU time used to satisfy UDF requests.

**Note:** All CPU times of an IBM specialty engine (SE) that are reported in DB2 trace records are already normalized by DB2 to the speed of the general purpose processor.
**SE CPU Eligible** The accumulated CPU time that ran on a standard CP for work eligible on an IBM specialty engine (Field name: AWACZEL).

**SE Trigger CPU** The accumulated CPU time consumed on an IBM specialty engine while running triggers on a nested task or on the main application execution unit (Field name: AWACTRZ).

**SP CPU Class 1** The accumulated CPU time used to satisfy external stored procedure requests that were processed in WLM-established stored procedure address spaces. SQL procedure time is included only if the SQL procedures were called on a nested task, and were not invoked by the main application execution unit. This time does not include CPU time that was consumed on an IBM specialty engine (Field name: QWACSPCP).

**Stored Proc Class 1** The total elapsed time used to satisfy external stored procedure requests that were processed in WLM-established stored procedure address spaces. SQL procedure time is included only if the SQL procedures were called on a nested task, and were not invoked by the main application execution unit. This value includes time that was used for executing SQL statements (Field name: QWACSPCP).

**Thread Type** The connecting system type code (in hexadecimal). This field can have a null value. For example, this field contains a null value for some utilities (Field name: QWHCATYP).

**Transaction Name** The transaction or application name that the end user is running (Field name: QWHCEUTX). This identifies the application that is currently running, not the product that is used to run the application. This field contains blanks if the client did not supply this information.

**Trigger CPU Class 1** The accumulated CPU time consumed while executing under the control of triggers. For triggers there is no distinction between class 1 and class 2 CPU time. All processing controlled by a trigger is within DB2 (Field name: ADTRCP).

**Triggers Class 1** The total elapsed time spent by the allied agent in triggers (Field name: ADTRET).

**UDF CPU Class 1** The accumulated CPU time that was used to satisfy user-defined function requests that were processed in a WLM-established stored procedure address space. This time includes time for a non-inline user-defined function if the user-defined function was called on a nested task and was not invoked by the main application execution unit. This time does not include CPU time that is consumed on an IBM specialty engine (DB2 field name: QWACUDCP).

**UDF Class 1** The total elapsed time that was spent in user-defined functions in WLM-established stored procedure address spaces. This time includes time for a non-inline user-defined function if the user-defined function was called on a nested task and was not invoked by the main application execution unit. This time includes time that was spent executing SQL statements (Field name: QWACUDEA).

**Workstation Name** The end user’s workstation name. This field contains blanks if the client did not supply this information (Field name: QWHCEUWN).
**DB2 Thread Class 3 Attributes**

Use these attributes to view DB2 Thread Class 3 information.

**ACE Address** The agent control element (ACE) (see QWHSACE) of the thread that is reported. The value in QWHSACE is the ACE of the IFI application that requested this trace record (Field name: QW0148AC).

**Archive Log Quiesce Events** Events due to processing ARCHIVE LOG MODE(QUIESCE) commands (Field name: QWACALCT).

**Archive Log Quiesce** The waiting time caused by processing ARCHIVE LOG(QUIESCE) commands (DB2 field name: QWACALOG).

**Archive Log Read Events** Events due to processing ARCHIVE LOG READ commands (Field name: QWACANAR).

**Archive Log Read** The waiting time caused by processing ARCHIVE LOG READ commands (Field name: QWACAWAR).

**Authorization ID** The primary authorization ID from connection or signon (Field name: UWHCAID). For z/OS operator commands and DB2 system internal agents, the value is SYSOPR. Secondary authorization IDs might be the RACF groups associated with this primary authorization ID. The SQL ID is initially set to this primary authorization ID. The connection authorization exit and the signon authorization exit can change the primary authorization ID so that it is not the same as the original primary authorization ID (QWHCOPID). Distributed authorization ID translation can also change the primary authorization ID.

**Collection Name** The collection name (Field name: UW0148CI).

**Connection ID** The connection name (Field name: QWHCCN). It is not valid on end of memory and reflects the z/OS home address space (ASID) connection name for:

- **Batch:** 'BATCH'
- **TSO:** 'TSO'
- **QMF**: 'DB2CALL'
- **Utility:** 'UTILITY'
- **DB2 internal** DB2 subsystem ID
- **IMS** IMS-ID
- **CICS** CICS-ID
- **RRSAF** 'RRSAF'

**Distributed database access threads:**

- For threads from a DB2 requester, this field contains the connection name of the thread at the requesting location.
- For threads using the DRDA protocol from a non-DB2 requester, this field contains the constant 'SERVER'.

**Correlation ID** The correlation ID value (Field name: QWHCCCV).

- For batch: JOBNAME
• For TSO: LOGON-ID
• For IMS/VS: PST#.PSBNAME
• For CICS: CONNECTION_TYPE.THREAD_TYPE.THREAD_.#.TRAN-ID
• For RRSAF: CORRELATION-ID value from signon function
• For threads from a DB2 requester: this field contains the correlation-ID name of
  the thread at the requesting location.
• For threads using the DRDA protocol from a non-DB2 requester, this field
  contains the first 12 characters in the DDM external name (EXTNAM) parameter
  of the DDM EXCSAT command received as part of the SQL connect.

DB I/O Events The number of wait trace events processed for waits for database
I/O under this thread (Field name: QWACARNE).

DB2 Subsystem The DB2 subsystem ID.

DB2 Version The DB2 version.

DSG Member Name The Data Sharing Group (DSG) member name.

Data Sharing Group The Data Sharing Group name.

Drain Lock Events Events due to drain lock processing during the execution of the
package or DBRM (Field name: QWACARND).

Drain Lock The waiting time caused by drain lock processing (Field name:
QWACAWDR).

End User ID The user ID of the end user's workstation (Field name: QWHCEUID).
This can be different from the authorization ID used to connect to DB2. This field
contains blanks if the client did not supply this information. If QWHCEUID_OFF
is not 0, this value is truncated.

Extended Delete Define Dataset The accumulated wait time for a synchronous
execution unit switch to the DB2 data space manager services, which include
define data set, extend data set, delete data set, reset data set, and VSAM catalog
access (DB2 field name: QWAXDSSE).

Extended Delete Define Events The number of wait trace events processed for
waits for synchronous execution unit switching to the data space manager service
tasks (Field name: QWAXDSNS).

Interval Start The start time of this interval.

Latch Events The number of wait trace events processed for waits for latch
contention (Field name: QWACARLH).

Location Name The location name (Field name: UW0148LN). The location name
contains the name of the local location or remote location, depending on where the
thread executes a package. The following statements execute locally, regardless of
the current package name:
• COMMIT
• ROLLBACK
• SET <HOST VARIABLE> = CURRENT PACKAGE SET
• SET <HOST VARIABLE> = CURRENT SERVER
For these statements, this field contains the location where the package executes, not the location where the statement executes.

**Lock Events** The number of wait trace events processed for waits for local contention for locks (Field name: QWACARNL).

**Log Write I/O Events** The number of wait trace events that were processed for waits for log read I/O (Field name: QWACARLG).

**Logical Unit of work ID** The logical unit of the work ID (LUWID) as defined for the LU 6.2 interface (Field name: QW0148LU). The LUWID uniquely identifies the thread within the network, and consists of the following:

- A fully qualified network name (QW0148LM)
- An LUW instance number (QW0148UV) and an LUW sequence number (see fields below).

It consists of two 8-character fields: QW0148NI and QW0148LM, which together uniquely identify a client system.

**MVS System ID** The MVS identifier.

**Open Close Dataset** The accumulated wait time for a synchronous execution unit switch to the DB2 OPEN/CLOSE data set service or the HSM recall service (Field name: QWAXOCSE).

**Open Close Events** The number of wait trace events processed for waits for the synchronous execution unit switching to the OPEN/CLOSE service (Field name: QWAXOCNS).

**Originating System** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Other Read I/O Events** The number of wait trace events processed for waits for read I/O under another thread (Field name: QWACARNR).

**Other Read I/O** The accumulated wait time for read I/O that is done under a thread other than this one (Field name: QWACAWTR). This value is calculated for threads by subtracting the store clock (STCK) time on entry to event wait from STCK time on exit resume from the event. This time represents the time the thread that is reported waited for the subject I/O and not the total duration of that I/O. This field is collected if accounting class 3 is on. The following I/O waits are included in this field:

- SEQUENTIAL PREFETCH
- SEQUENTIAL DETECTION
- LIST PREFETCH
- SYNCHRONOUS READ I/O performed by a thread
- Other than the thread that is reported.

**Other Service Events** The number of wait trace events processed for waits for synchronous execution unit switching to other service tasks (Field name: QWAXOTNS).

**Other Services** The accumulated wait time for a synchronous execution unit switch to other DB2 service tasks (Field name: QWAXOTSE).
Other Write I/O Events The number of wait trace events processed for waits for write I/O under another thread. This number includes wait trace events for buffer manager force write I/O waits (Field name: QWACARNW).

Other Write I/O The accumulated wait time for write I/O that is done under a thread other than this one (Field name: QWACAWTW). This value is calculated for threads by subtracting the store clock (STCK) time on entry to event wait from STCK time on exit resume from the event. This time represents the time the thread being reported waited for the subject I/O and not the total duration of that I/O. This field is collected if accounting class 3 is on. The following I/O waits are included in this field:

- ASYNCHRONOUS WRITE I/O
- SYNCHRONOUS WRITE I/O performed by a thread other than the thread being reported
- BUFFER MANAGER FORCE WRITE I/O

Package ID The package ID (Field name: UW0148PN).

Plan Name The plan name (Field name: QWHCPLAN). It shows a blank for a DB2 command thread; otherwise:

- For SPUFI with cursor stability: 'DSNESPCS'
- For SPUFI with repeatable read: 'DSNESPRR'
- For TSO: the application plan name
- For IMS: the application plan name
- For CICS: application plan name, IMS and CICS commands have a blank plan name.
- For RRSAF create thread with the collection parameter: '?RRSAF '
- For QMF: 'DSQPLAN'
- For Distributed Database Access threads:
  - For threads using the DRDA protocol from a requester, this field contains the plan name that is executed at the requesting location.
  - For threads using the DRDA protocol from a non-DB2 requester or from a DB2 2.3 requester, this field contains the constant 'DISTSERV'.
- For binding: 'DSNBIND' (system plan)
- For utility: 'DSNUTIL ' (system plan)
- For authorization: 'ACT' + X'0000000000' (system plan)
- For unallocated threads and miscellaneous DB2 system service tasks: 'BCT' + X'0000000000' (system plan)
- For startup: 'STARTCT' + X'00' (system plan)

QWACFLGS Flags (Field name: QWACFLGS).

Sync I/O Events The total number of synchronous I/O suspensions (Field name: ADIOSUSC).

SYSLGRNG Events The number of wait trace events processed for waits for synchronous execution unit switching to the SYSLGRNG recording service (Field name: QWAXSLNS).
**SYSLGRNG** Accumulated wait time for a synchronous execution unit switch to the DB2 SYSLGRNG recording service. This service is also sometimes used for level ID checking for down-level detection (Field name: QWAXSLSE).

**Service Task Switch Events** The total number of suspensions due to a synchronous execution unit switching to DB2 services from the thread being reported (Field name: ADSTSUSC).

**Service Task Switch** The accumulated waiting time due to a synchronous execution unit switching to DB2 services from the thread being reported (Field name: ADSTSUST). It includes:
- Open/close data set
- SYSLGRNG or SYSLGRNX update
- Commit phase 2 for read-only threads originating from TSO or batch
- Dataspace manager services
- Define data set
- Extend data set
- Delete data set
- Log I/Os for commit and abort processing

**Special Considerations:**
1. A probable cause for high values in this field is data set preformatting.
2. There are no service waits associated with commit phase 2 under read-only threads originating from CICS or IMS. There is a service wait for any thread doing commit phase 2 after an update.
3. There is no overlap between the elapsed time reported in this field and the other class 3 elapsed times.

**Thread Type** The connecting system type code (in hexadecimal). This field can have a null value. For example, this field contains a null value for some utilities (Field name: QWHCATYP).

**Transaction Name** The transaction or application name that the end user is running (Field name: QWHCEUTX). This identifies the application that is currently running, not the product that is used to run the application. This field contains blanks if the client did not supply this information.

**Update Commit Events** The number of wait trace events processed for waits for synchronous execution unit switching for COMMIT or ABORT (Field name: QWACARNS).

**Update Commit** The accumulated wait time because of a synchronous execution unit switch for DB2 COMMIT, ABORT, or DEALLOCATION processing (Field name: QWACAWTE). For RRSAF threads, this value includes explicit COMMIT time for SRRCMIT calls. See QWACAWLG for implicit RRS COMMIT time.

**Wait Time DB I/O** The accumulated I/O elapsed wait time for database I/O done under this thread (Field name: QWACAWTI). This field is for synchronous I/O only. It includes synchronous read and write I/O. This value is calculated for threads by subtracting the store clock (STCK) time on entry to event wait from STCK time on exit resume from the event. Its value indicates the elapsed time the allied agent waited for its I/O in DB2. When db2 makes an I/O request for an allied agent and makes the agent wait, the store clock value is saved. When the
I/O completes, the ending time is used to calculate the total elapsed I/O time. The result is added to the previously saved elapsed synchronous I/O wait time in DB2.

**Wait Time Latches** The accumulated wait time due to latch contention (Field name: QWACAWLH).

**Wait Time Locks** The accumulated wait time due to local contention for locks (Field name: QWACAWTL). Local contention does not involve intersystem communication. Local contention is resolved entirely within a single subsystem. Global contention, which involves intersystem communication, is reported in field QWACAWTJ.

**Wait Time Log Write** The accumulated wait time for log write I/O (Field name: QWACAWLIG). For RRSAF threads, this value includes implicit commit time for RRS at EOT if uncommitted work exists. SEE QWACAWTE for explicit RRS commit time.

**Wait Time Sync I/O** The I/O elapsed time accumulated due to synchronous I/O suspensions. DB2 calculates this value by subtracting the store clock time when an agent begins waiting for a synchronous I/O from the time the agent is resumed (Field name: ADIOSUST).

**Workstation Name** The end user's workstation name. This field contains blanks if the client did not supply this information (Field name: QWHCEUWN).

**DB2 Thread Wait 2 Attributes**

Use these attributes to view DB2 Thread Wait 2 information.

**ACE Address** The agent control element (ACE) (see QWHSACE) of the thread that is reported. The value in QWHSACE is the ACE of the IFI application that requested this trace record (Field name: QW0148AC).

**Accelerator Wait Events** The number of wait trace events that were processed for requests to an accelerator (Field name: QWACAACC).

**Accelerator Wait Time** The accumulated wait time for requests to an accelerator (Field name: QWACAACW).

**Asynchronous IXL Events** The number of wait trace events processed for asynchronous IXLCACHE/IXLCOMP invocations. These are incremented by IFCID 329, which is not part of a begin/end pair, so this number represents the true number of events. It is not doubled, as other wait events are (Field name: QWAXIXLE).

**Asynchronous IXL requests** The waiting time of the asynchronous IXL requests (Field name: AQWAXIXL).

**Authorization ID** The primary authorization ID from connection or signon (Field name: UWHCAID). For z/OS operator commands and DB2 system internal agents, the value is SYSOPR. Secondary authorization IDs might be the RACF groups associated with this primary authorization ID. The SQL ID is initially set to this primary authorization ID. The connection authorization exit and the signon authorization exit can change the primary authorization ID so that it is not the same as the original primary authorization ID (QWHCOPID). Distributed authorization ID translation can also change the primary authorization ID.
**Autonomous Procedure Events** The number of autonomous procedures that were executed (Field name: QWACACNT).
- For a non-rollup record, this value is the number of autonomous procedures that were executed.
- For a parallel query rollup record, this value is 0.
- For a ddf or RRSAF rollup record, this value is the number of autonomous procedures that were executed.

**Autonomous Procedure** The accumulated wait time for autonomous procedures to complete (Field name: QWACWAIT).

**Child L-Lock Events** The number of global contention wait events for child L-locks (Field name: ADLCSUSC).

**Child L-Locks** The accumulated wait time due to global contention for child L-Locks (Field name: QWACAWTK).

**Claim Release Events** The total number of suspensions until the claims are released (Field name: QWACARNC).

**Claim Release** The waiting time for a claim to be released (Field name: QW02542W).

**Collection Name** The collection name (Field name: UW0148CI).

**Commit Phase 1 Write I/O Events** The number of wait trace events processed for FORCE-COMMIT. (Field name: QWAXFCCT).

**Commit Phase 1 Write I/O** The accumulated wait time for commit phase 1 database write I/O completion (Field name: QWAXAWFC).

**Connection ID** The connection name (Field name: QWHCCN). It is not valid on end of memory and reflects the z/OS home address space (ASID) connection name for:
- **Batch:** 'BATCH'
- **TSO:** 'TSO'
- **QMF** 'DB2CALL'
- **Utility** 'UTILITY'
- **DB2 internal**
  - DB2 subsystem ID
- **IMS** IMS-ID
- **CICS** CICS-ID
- **RRSAF** 'RRSAF'

**Distributed database access threads:**
- For threads from a DB2 requester, this field contains the connection name of the thread at the requesting location.
- For threads using the DRDA protocol from a non-DB2 requester, this field contains the constant 'SERVER'.
**Correlation ID** The correlation ID value (Field name: QWHCCV).
- For batch: JOBNAME
- For TSO: LOGON-ID
- For IMS/VS: PST#.PSBNAME
- For CICS: CONNECTION_TYPE.THREAD_TYPE.THREAD_.TRAN-ID
- For RRSAF: CORRELATION-ID value from signon function
- For threads from a DB2 requester: this field contains the correlation-ID name of the thread at the requesting location.
- For threads using the DRDA protocol from a non-DB2 requester, this field contains the first 12 characters in the DDM external name (EXTNAM) parameter of the DDM EXCSAT command received as part of the SQL connect.

**DB2 Subsystem** The DB2 subsystem ID.

**DB2 Version** The DB2 version.

**DSG Member Name** The Data Sharing Group (DSG) member name.

**Data Sharing Group** The Data Sharing Group name.

**End User ID** The user ID of the end user's workstation (Field name: QWHCEUID). This can be different from the authorization ID used to connect to DB2. This field contains blanks if the client did not supply this information. If QWHCEUID OFF is not 0, this value is truncated.

**Global Contention Events** The number of suspensions caused by global lock contention. This value is only calculated if accounting class 3 is active and DB2 is a member of a data sharing group (Field name: ADGCSUSC).

**Global Contention** The total accumulated waiting time caused by the suspension of IRLM lock requests due to global lock contention in a data sharing environment that requires intersystem communication to resolve (Field name: ADGCSUST).

**Interval Start** The start time of this interval.

**L-Lock Events** The number of global contention waits for all L-locks (Field name: ADLKSUSC).

**L-Locks** The accumulated global contention wait time for all L-locks. (Field name: ADLKSUST).

**Location Name** The location name (Field name: UW0148LN). The location name contains the name of the local location or remote location, depending on where the thread executes a package. The following statements execute locally, regardless of the current package name:
- COMMIT
- ROLLBACK
- SET <HOST VARIABLE> = CURRENT PACKAGE SET
- SET <HOST VARIABLE> = CURRENT SERVER

For these statements, this field contains the location where the package executes, not the location where the statement executes.
Logical Unit of work ID The logical unit of the work ID (LUWID) as defined for the LU 6.2 interface (Field name: QW0148LU). The LUWID uniquely identifies the thread within the network, and consists of the following:

- A fully qualified network name (QW0148LM)
- An LUW instance number (QW0148UV) and an LUW sequence number (see fields below).

It consists of two 8-character fields: QW0148NI and QW0148LM, which together uniquely identify a client system.

MVS System ID The MVS identifier.

Notify Messages Events The number of wait trace events processed for waits for sending messages to other members in the data sharing group. This value is calculated only if accounting class 3 is active and DB2 is a member of a data sharing group (Field name: QWACARNG).

Notify Messages The accumulated elapsed wait time caused by suspension for sending messages to other members in the data sharing group (Field name: QWACAWTG). One common use of intersystem message sending is when database descriptors are changed due to create, alter, or drop statements. This value is calculated only if accounting class 3 is active and DB2 is a member of a data sharing group.

Originating System The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

Other L-Lock Events The number of global contention wait events for other L-locks (Field name: ADLOSUSC).

Other L-Locks The accumulated wait time due to global contention for other L-locks. (Field name: QWACAWTM).

Other P-Locks The accumulated wait time due to global contention for other P-locks (Field name: QWACAWTQ).

P-Lock Events The number of global contention waits for all P-locks. (Field name: ADPLSUSC).

P-Lock Other Events The number of global contention waits for other P-locks (Field name: ADPOSUSC).

P-Lock Page Events The number of global contention waits for page P-locks (Field name: ADPPSUSC).

P-Lock Pgset Part Events The number of global contention waits for pageset and partition P-locks (Field name: ADPSSUSC).

P-Locks Page The accumulated wait time due to global contention for page P-locks (Field name: QWACAWTO).

P-Locks Pageset Partition The accumulated wait time due to global contention for page set or partition P-locks (Field name: QWACAWTN).

P-Locks The accumulated global contention wait time for all P-locks (Field name: ADPLSUST).
**Package ID** The package ID (Field name: UW0148PN).

**Page Latch Events** The number of wait trace events processed for page latch contention (Field name: QWACARNH).

**Page Latch** The accumulated wait time because of page latch contention. For example, when runstats and copy utilities are run with the SHRLEVEL(CHANGE) option, they use a page latch instead of locking to serialize the collection of statistics or the copying of a page. You can reduce page latch contention by controlling the way you schedule your applications (Field name: QWACAWTP).

**Parallel Sync Events** The number of times that waits for parallel query processing to synchronize parent and child tasks were suspended (Field name: QWACPQSC).

**Parallel Sync Time** The accumulated wait time for parallel queries to synchronize parent and child tasks (Field name: QWACPQSW).

**Parent L-Lock Events** The number of wait trace events processed for waits for global lock contention for parent L-locks (Field name: QWACARNJ).

**Parent L-Locks** The accumulated wait time due to global contention for parent L-locks. Global contention occurs when intersystem communication is required to resolve an IRLM lock or change request. QPACAWTTL contains the wait time due to local contention. Local communication does not require intersystem communication. It can be resolved by the local subsystem (Field name: QWACAWTJ).

**Plan Name** The plan name (Field name: QWHCPLAN). It shows a blank for a DB2 command thread; otherwise:
- For SPUFI with cursor stability: 'DSNESPCS'
- For SPUFI with repeatable read: 'DSNESPRR'
- For TSO: the application plan name
- For IMS: the application plan name
- For CICS: application plan name, IMS and CICS commands have a blank plan name.
- For RRSAF create thread with the collection parameter: '?RRSAF '
- For QMF: 'DSQPLAN'
- For Distributed Database Access threads:
  - For threads using the DRDA protocol from a requester, this field contains the plan name that is executed at the requesting location.
  - For threads using the DRDA protocol from a non-DB2 requester or from a DB2 2.3 requester, this field contains the constant 'DISTSERV'.
- For binding: 'DSNBIND' (system plan)
- For utility: 'DSNUTIL ' (system plan)
- For authorization: 'ACT' + X'0000000000' (system plan)
- For unallocated threads and miscellaneous DB2 system service tasks: 'BCT' + X'0000000000' (system plan)
- For startup: 'STARTCT' + X'00' (system plan)

**QWACFLGS** Flags (Field name: QWACFLGS).
**Stored Procedure** The total elapsed time spent waiting for an available TCB before the stored procedure could be scheduled. This time is calculated only if accounting class 3 is active (Field name: QWACCAST).

**Stored Procedure Events** The number of times an SQL call statement had to wait for an available TCB before the stored procedure could be scheduled. This value is calculated only if accounting class 3 is active (Field name: QWACCANM).

**Suspensions Class 3 Events** The total number of class 3 suspensions (Field name: ADTSUSC).

**TCP/IP LOB XML Events** The number of wait trace events that were processed for waits for TCP/IP LOB or XML materialization (Field name: QWACALBC).

**TCP/IP LOB XML** Accumulated wait time for tcp/ip lob or xml materialization (Field name: QWACALBW).

**Thread Type** The connecting system type code (in hexadecimal). This field can have a null value. For example, this field contains a null value for some utilities (Field name: QWHCATYP).

**Total Class 3 Time** The waiting time for all types of class 3 suspensions by the originating task and parallel tasks, if parallelism is employed (Field name: ADTSUST).

**Transaction Name** The transaction or application name that the end user is running (Field name: QWHCEUTX). This identifies the application that is currently running, not the product that is used to run the application. This field contains blanks if the client did not supply this information.

**Workstation Name** The end user's workstation name (Field name: QWHCEUWN). This field contains blanks if the client did not supply this information.

**DB2 Thread Exceptions Attributes** Use the DB2 Thread Exceptions attributes to create situations to monitor thread-related performance.

**Ace Address** The DB2 thread ACE address for internal use.

**Archive Tape Wait** True if waiting for a tape for an archive operation. It is an alphanumeric text string, with a maximum length of one character.

**Asynchronous Page Reads** The number of asynchronous page reads for prefetch. Valid value is an integer in the range 0 - 2147483647.

**Authorization ID** The authorization ID of the thread. It is an alphanumeric text string, with a maximum length of eight characters.

**Authorization ID (Unicode)** The authorization ID of the thread. It is an alphanumeric text string, with a maximum length of eight characters.

**Begin Time** Beginning store clock value (STCK) for the period covered by this accounting record. You can determine the elapsed time of the application by subtracting this field from QWACESC (ending store clock value). Threads that do
not terminate (such as CICS primed threads and ims wait-for-input message regions) can have an ending clock value that includes the time the thread was inactive and waiting to perform work.

**Cancel Command** The command string needed to cancel a thread. It is an alphanumeric text string, with a maximum length of eight characters.

**CICS MVS ID** The MVS identifier used for CICS dynamic workspace linking.

**Collection ID** The collection ID.

**Collection ID (Unicode)** The collection ID.

**Commit Count** The number of times the thread successfully completed commit processing. DB2 resets the commit count at Create Thread and Signon. If Signon is not driven, the count is cumulative.

**Commit Ratio** The ratio of total system page updates to total commits.

**Connection ID** Identifies the connection of an application to a DB2 system. It is an alphanumeric text string, with a maximum length of eight characters.

**Connection Type** The type of thread connection.

Valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application_Directed</td>
<td>Application directed access</td>
</tr>
<tr>
<td>CICS</td>
<td>CICS attach</td>

</tbody>
</table>

**Correlation ID** The correlation ID for this thread. It is an alphanumeric text string, with a maximum length of 12 characters.

**CPU Utilization** The rate of CPU consumption during last interval.
**CP CPU Time** The total amount of central processor CPU time that DB2 has accumulated for a thread.

**CP DB2 CPU Used** The CP CPU time accumulated in DB2 when the SQL statement exit from DB2.

**DB2 Elapsed Time** The elapsed time accumulated in DB2 when the SQL statement exit from DB2.

**DB2 ID** The name of the DB2 system on which this thread is running. It is an alphanumeric text string, with a maximum length of four characters.

**Display CPU Time** The total amount of CPU time that DB2 has accumulated for a thread.

Valid format is HH:MM:SS:mmm, where:
- H = Hour
- M = Minute
- S = Second
- m = Millisecond

If the time goes over 24 hours, the format is DD-HH:MM where:
- D = Day
- H = Hour
- M = Minute

For example, 00:14:59 indicates that the display CPU time is 14 minutes and 59 seconds.

**Display Elapsed Time** The total amount of elapsed time since thread creation or DB2 sign-on.

Valid format is DD-HH:MM:SS, where:
- D = Day
- H = Hour
- M = Minute
- S = Second

For example, 00-20:16:18 indicates that the display elapsed time is 20 hours, 16 minutes, and 18 seconds.

**Display Wait Time** The total amount of thread wait time. The collection of thread wait time requires activation of Accounting Class 2 in the monitored DB2 subsystem.

Valid format is HH:MM:SS:mmm, where:
- H = Hour
- M = Minute
- S = Second
- m = Millisecond

If the time goes over 24 hours, the format is DD-HH:MM where:
- D = Day
- H = Hour
• M = Minute

For example, 00:14:59 indicates that the display CPU time is 14 minutes and 59 seconds.

**Distributed Bytes Received** The amount of data received by distributed threads from remote DB2.

**Distributed Bytes Received 64** The amount of data received by distributed threads from remote DB2. It has a length of 64 bit to resolve overflow problems.

**Distributed Bytes Sent** The amount of data sent by distributed threads to remote DB2.

**Distributed Bytes Sent 64** The amount of data sent by distributed threads to remote DB2. It has a length of 64 bit to resolve overflow problems.

**Distributed CPU Seconds** The amount of CPU time being used by a distributed DB access thread (in units that represent milliseconds).

**Dynamic Prefetch** The number of dynamic prefetch requests. Valid value is an integer in the range 0 - 2147483647.

**Elapsed Time** The elapsed time for a DB2 thread (in units that represent seconds).

**Getpage Count** The number of get page operations for this thread during the last interval.

**Getpage Ratio** The number of Get pages divided by the Read I/O count.

**IDNAME** An internal attribute used for navigation, it contains either the Data Sharing Group Name or the DB2ID.

**Immediate Write I/O** The number of synchronous write I/O requests that DB2 issues on behalf of a thread. Valid value is an integer in the range 0 - 2147483647.

**In-DB2 IIP CPU Time** The IIP CPU time consumed when executing in DB2.

**In Doubt** If True, the thread is in an INDOUBT status. It is an alphanumeric text string, with a maximum length of one character.

**Interval Time** The amount of time this thread has existed during the last sampling period (in units that represent seconds).

**Job Name** The job name connected to a coupling facility structure. It is an alphanumeric text string with a maximum of 8 characters; for example, IRLM.

**List Prefetch** The number of list prefetch requests that a thread issues. Valid value is an integer in the range 0 - 2147483647.

**Lock Percentage** The number of locks owned divided by the maximum allowed locks for a thread.

**Locks Max** The maximum number of locks allowed for a single thread.

**Locks Owned** The number of locks this thread currently owns.
LUWID The logical unit of work ID (LUWID) for a thread.

This value consists of two parts: the logical unit of work ID (luw-id) and a token. The token can be used in place of the luw-id in any DB2 command that accepts luw-id as input. Format:

luw-id=token

The luw-id consists of the network name, the originating VTAM LUNAME, and a unique identifier (separated by periods). Thus, the LuwId field displays data such as the following:

USCAC001.02D22A.A1FE8E04B9D4=8

Misc Flag Miscellaneous flag. It is an alphanumeric text string, with a maximum length of one character.

MVS System The name of the MVS image where the DB2 system identified by the DB2ID field is running. It is an alphanumeric text string, with a maximum length of four characters.

Name The name of the DB2 thread. It is an alphanumeric text string, with a maximum length of four characters.

Originating System ID The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

Package DBRM (Unicode) The package DBRM name.

Package Name The name of the package to which this thread belongs.

Page Update Rate The number of page update requests per second made by a thread.

Plan Name The ID of the plan this thread is executing. It is an alphanumeric text string, with a maximum length of eight characters.

Parent Ace The token used to correlate parallel task or utility subtask records with the records of the originating task or main utility task. For a record that is issues from a parallel task or utility subtask this field contains a token that is equal to the agent control element (ACE) of the originating task or main utility task. Otherwise, the value in this field is zero.

Prefetch Count The number of sequential, prefetch operations during the interval.

Prefetch Rate The read sequential, prefetch rate.

Read Count The number of read operations during the interval.

Read I/O Rate The thread synchronous read I/O rate.

Resource Count The total resource count.

Resource Limit The limit on number of resources allowed.

Resource Limit Percent The resource usage divided by resource limit.
**Sync Read Count** The number of synchronous reads during last interval.

**Thread Connection Type** The type of thread connection.

**Thread Create Wait** The application waiting for thread creation. It is an alphanumeric text string, with a maximum length of one character.

**Thread Group Member Name** The name of the member within a data sharing group for a thread.

**Thread Group Name** The name of a data sharing group for a thread. It is an alphanumeric text string, with a maximum of 8 characters; for example, TDDDB241G.

**Thread Status** The description of the current thread status. It is an alphanumeric text string, with a maximum length of 12 characters.

Valid values are:

**Status**  **Description**

NOT-AVAIL  The thread is not available.

IN-ABORT   The thread is in abort processing.

IN-ACCEL    The thread is executing on IBM DB2 Analytics Accelerator for z/OS.

IN-AUTO-PROC The thread is processing an autonomous procedure.

IN-BIND-DYNM The thread is in dynamic bind processing.
IN-BIND-STAT
The thread is in static bind processing.

IN-COMMAND
Command threads display this status when they are active in DB2 and executing within the DB2 command processor. (This type of thread always has a blank plan name.)

IN-COMMIT
The thread is in Commit processing (applies only to threads that originate from an attachment that does not use two-phase-commit protocol).

IN-COMT-PHS1
The thread is in Commit phase 1 processing.

IN-COMT-PHS2
The thread is in Commit phase 2 processing.

IN-CRTE-THRD
The thread is in Create Thread processing.

IN-DB2
The thread is executing in DB2. A more descriptive status could not be determined.

INDOUBT
The thread is in doubt.

IN-SIGNON
The thread is in signon processing. This status applies only to threads originating from CICS or IMS attachments.

IN-SQL-CALL
The thread is processing an SQL call.

IN-SQL-SORT
The thread is executing an SQL call and is doing the sort processing required to satisfy the call’s request.

IN-STOR-PROC
The thread is currently running in a stored procedure.

IN-TERM-THRD
The thread is in termination as a result of allied task termination. This status corresponds to DB2 DISPLAY THREAD=D status.

IN-TRIGGER
The thread is currently running in a trigger.

IN-USER-FUNC
The thread is currently running a user-defined function.

NOT-IN-DB2
The thread is not currently executing in DB2.

SP/UDF-INACT
The thread is trying but not able to run in a stored procedure or user-defined function.

SWAPPED-OUT
The thread is not currently executing in DB2. The thread originating address space is swapped out.
WAIT-ARCHIVE
The thread is waiting for an archive log tape mount necessary during thread abort processing.

WAIT-ARCREAD
The thread is currently waiting for read of archive log from tape.

WAIT-ASYNCRD
The thread is currently waiting for completion of a read I/O that is being done under a thread other than this one (for example, sequential or List Prefetch).

WAIT-ASYNCWR
The thread is currently waiting for completion of Write I/O that is being done under a thread other than this one (for example, Deferred Writes).

WAIT-CONVLM
The distributed thread is in a synchronous wait because the conversation limit has been reached for its designated logmode.

WAIT-CTHREAD
The thread is queued in Create Thread processing because DB2 reached the CTHREAD value. This status corresponds to DB2 DISPLAY THREAD=QD status.

WAIT-GLBLOCK
The thread is currently waiting for either:
- Inter-system communication within the data sharing group to determine if there is lock contention.
- A lock held by another subsystem in the data sharing group.

WAIT-LOCK
The thread is waiting for a lock.

WAIT-MGSSEND
The thread is waiting because of inter-system message sending contention.

WAIT-REMREQ
The database access thread is in a synchronous wait (waiting for a response or a request from the originating DB2 subsystem).

WAIT-REMSQL
The distributed allied thread is in a synchronous wait (waiting for a response from the remote DB2 subsystem being accessed).

WAIT-REUSE
The thread is not currently in use and is waiting to be reused. This status applies only to CICS and IMS threads.

WAIT-SERVICE
The thread is currently waiting for completion of a DB2 service. Types of DB2 services include: open/close of a dataset, DFHSM recall of a dataset, SYSLGRNG update or define/extend/delete of a dataset, rollback, and Commit phase 2 for read only threads.

WAIT-SP-STOP
The thread is queued waiting for a stopped stored procedure.

WAIT-TERM-TH
The thread is queued and waiting for thread termination as a result of allied task termination. This status corresponds to DB2 DISPLAY THREAD=QD status.
The DB2 utility was started but not completed because of abnormal termination.

The following status are only available when class 2/3 traces are on:

**WAIT-ACCEL**
The thread is currently waiting for claimers to be released after acquiring drain lock.

**WAIT-CLAIMER**
The thread is currently waiting for claimers to be released after acquiring drain lock.

**WAIT-CL3LOCK**
The thread is currently waiting for the completion of an identify call to the IRLM.

**WAIT-COMMIT**
The thread is waiting for the FORCE-AT-COMMIT event to complete.

**WAIT-DRNLOCK**
The thread is currently waiting to acquire drain lock.

**WAIT LOB**
The thread is currently waiting for TCP/IP to materialize a LOB.

**WAIT-LOCKLAT**
The thread is waiting for a LOCK-I/O-LATCH.

**WAIT-LOCKPIP**
The thread is currently waiting for a PIPE suspend.

**WAIT-LOCKPQS**
The thread is currently suspended for parallel task synchronization.

**WAIT-LOGQSCE**
The thread is currently suspended because of an ARCHIVE LOG MODE(QUIESCE) command.

**WAIT-PGLATCH**
The thread is currently waiting for page latch.

**WAIT-SP-SCHD**
The thread is waiting for a TCB to become available in the stored procedures address space to schedule a stored procedure.

**WAIT-SWITCH**
The thread is currently waiting for the completion of a synchronous execution switch.

**WAIT-SYNC-IO**
The thread is currently waiting for completion of a synchronous Read I/O or Write I/O.

**Note:** This status can indicate that a DB2 resource is not large enough. You can use the OMEGAMON XE for DB2 PE resource manager or object analysis displays to further isolate the problem.

**Thread Stored Procedure Name** The name of the stored procedure that a thread invokes. It is an alphanumeric text string, with a maximum of 18 characters; for example, SPCALC_TAX.
Thread Token The thread token used as foreign key to DDF, also used for the cancel thread command.

Thread Type The type of thread. It can be:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BATCH</td>
<td>Batch job</td>
</tr>
<tr>
<td>CICS</td>
<td>CICS attach</td>

<tr>
<td>UTILITY</td>
<td>DB2 Utility</td>
</tr>
</tbody>
</table>

Thread Wait Time The total amount of thread wait time. It is an integer in the range 09 - 99999999 seconds. Note: collection of thread time requires activation of Accounting Class 2 in the Monitored DB2 subsystem.

Time The date and time, as set on the monitored system, indicating the instance when the agent collects information.

The timestamp format for SCAN and STR functions is CYYMMDDHHMMSSmmm (as in 1180315064501000 for 03/15/18 06:45:01) where:
• C = Century (0 for 20th, 1 for 21st)
• Y = Year
• M = Month
• D = Day
• H = Hour
• M = Minute
• S = Second
• m = Millisecond

Type Indicator Indicates the type of parallel thread.

Valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Normal</td>
<td>Not a parallel thread</td>
</tr>
<tr>
<td>Parent</td>
<td>Parallel thread is a parent</td>
</tr>
<tr>
<td>Child</td>
<td>Parallel thread is a child</td>
</tr>
<tr>
<td>Value</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>---------------------------------------------------------------</td>
</tr>
<tr>
<td>Autonomous SP</td>
<td>Originating thread which invoked autonomous stored procedures</td>
</tr>
</tbody>
</table>

**Unsuccessful Get Page Operation** The number of conditional getpage requests that failed. Valid value is an integer in the range 0 - 2147483647.

**Update Count** The number of update operations during last interval.

**Wait Resource** The resource being waited on. It is an alphanumeric text string, with a maximum length of six characters.

**Wait Time** Total class3 wait time for a thread.

**Wait Time Distributed Query** The time distributed allied thread has been waiting for response - remote SQL (in units that represent milliseconds).

**Wait Time Drain Claims** The time thread waiting for drain of claims.

**Wait Time Drain Lock** The time thread waiting for acquisition of drain lock.

**Wait Time Global Lock** The time thread waiting because of global contention.

**Wait Time Log Queue** The time thread waiting for ARCHIVE LOG MODE(QUIESCE).

**Wait Time Procedure** The time thread waiting for a TCB to schedule a stored procedure.

**Wait Time Resource** The time thread waiting for a resource.

**Wait Time Service** The time thread waiting for DB2 Service (in units that represent milliseconds).

**DB2 Volume Activity Attributes**
Use the DB2 Volume Activity attributes to create situations to monitor the status and performance of DB2 volume activity.

**Data Sharing Group** The name of a data sharing group. It is an alphanumeric text string, with a maximum length of eight characters.

**DB2 IO Percent** The percentage of DB2 I/O activity to the volume. Valid entry ranges from 0.0 to 100.0.

**DB2 ID** The name of the DB2 subsystem. It is an alphanumeric text string, with a maximum length of four characters.

**Extents per Data Set Ratio** The ratio of total extents allocated to the total data set count.

**Filler** A placeholder to keep fullword alignment.

**IDNAME** An internal attribute used for navigation, it contains either the data sharing group name or the DB2ID. It is an alphanumeric text string, with a maximum length of eight characters.
**MVS System** The MVS System Management Facility (SMF) ID. It is an alphanumeric text string, with a maximum length of four characters.

**Number of Data Sets** The total number of allocated data sets for the DB2 subsystem being monitored.

**Number of DB2 systems** The total number of monitored DB2 systems that are sharing this volume.

**Number of Extents** The number of extents the operating system has allocated for a data set.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Time** The date and time, as set on the monitored system, indicating the instance when the agent collects information.

The timestamp format for SCAN and STR functions is CYYMMDDHHMMSSmmm (as in 1180315064501000 for 03/15/18 06:45:01) where:
- **C** = Century (0 for 20th, 1 for 21st)
- **Y** = Year
- **M** = Month
- **D** = Day
- **H** = Hour
- **M** = Minute
- **S** = Second
- **m** = Millisecond

**Volume DB2 IO** The total number of I/Os for this volume originating from the DB2 system being monitored.

**Volume DB2 IO Rate** The total number of I/Os per second for the volume originating from the DB2 subsystem being monitored.

**Volume DB2 IO Rate MAX** The maximum I/O rate per second during the collection period.

**Volume Name** The name of the volume that contains the DB2 objects. It is an alphanumeric text string, with a maximum length of six characters.

**Volume Service Time** The average service time for the volume since the beginning of the collection interval.

**Volume Service Time MAX** The maximum service time for the volume since the beginning of the collection interval.

**Volume Total IO** The total number of I/Os for this volume.

**Volume Total IO Rate** The total number of I/Os per second for the volume.
Volume Use Percent The percentage of DB2 I/O activity to the volume that is attributable to the database, computed by dividing the total I/O rate for the database by the total DB2 I/O rate to the volume. Valid entry ranges from 0.0 to 100.0.

Volume Utilization The percentage of volume utilization, which represents the percent of time the volume is in use. Valid entry ranges from 0.0 to 100.0.

Distributed Thread Detail Attributes
Use the Distributed Thread Detail attributes to create situations that monitor VTAM APPC conversations and TCP/IP conversations of a distributed (DDF) thread.

Aborts Received The number of rollback requests received from the requesting location (single-phase commit operators only). This value is maintained at the server location.

Aborts Sent The number of rollback requests sent to the server location (single-phase commit operations only). This value is maintained at the requesting location.

Ace Address The ace address.

Agent Address The agent address.

AGNT ASID The address space ID (ASID) of the agent.

Agent TCB Address The Agent TCB address.

Allocations Received The number of create database access thread (DBAT) requests received by the server DBAT from the requester allied agent. This value is maintained by the server DBAT and is always 1.

Allocations Sent The number of successful conversation allocations. All allocation attempts, whether successful or not, are counted in QLACCNVS. The difference between QLACCNVS and QLACCNVA can be used to identify a session resource on resource constraint problem.

Application Directed Access If using application directed access, this is on.

Authorization ID The authorization ID.

Authorization ID (Unicode) The authorization ID.

Backouts Received The number of backout requests received from the coordinator (two-phase commit operations only).

Backouts Received from Coordinator The number of backout responses received from the participant (two-phase commit operations only). This indicates that the participant voted no to the prepare request.

Backouts Sent The number of backout requests sent to the participant (two-phase commit operations only).
**Backouts Sent to Coordinator** The number of backout responses sent to the coordinator (two-phase commit operations only). This indicates that the participant voted no to the prepare request.

**Binds** The number of static SQL statements that were bound for remote access (DB2 private protocol only). This value is maintained at the requester location.

**Block Mode Switch Count** The number of times a switch was made from continuous block mode to limited block mode (DB2 private protocol only).

**Blocks Received** The number of blocks received using block fetch. This value is maintained at the requester location.

**Blocks Sent** The number of blocks transmitted using block fetch. This value is maintained at the server location.

**Bytes Received** The number of bytes of data received from the server location. More bytes of data might be sent from the server location than are received by the requester because of the way SQL statements are processed internally.

**Bytes Sent** The number of bytes of data sent to the requester location. This value is maintained at the server location.

**Collection** The package collection ID.

**Collection (Unicode)** The package collection ID.

**Commits Performed** The number of commit operations performed with the remote location as the coordinator (two-phase commit operations only).

**Commits Received** The number of commit requests received from the requester location (single-phase commit operations only). This value is maintained as the server location.

**Commits Received Phase 2** The number of commit requests received from the coordinator (two-phase commit operations only).

**Commits Sent** The number of commit requests sent to the server location (single-phase commit operations only). This value is maintained at the requester location.

**Commits Sent Phase 2** The number of commit requests sent to the participant (two-phase commit operations only).

**Distributed Thread Detail Attributes** Identifies the connection of an application to a DB2 system.

It is an alphanumeric text string, with a maximum length of eight characters.

**Distributed Thread Detail Attributes** The type of connection associated with the thread.

Valid values are:
Value | Description
---|---
BATCH | Batch job
CICS | CICS attach
DLIBATCH | DL/I batch
Distributed | Distributed Database Access thread
IMS_BMP | IMS attach BMP
IMS_CTL | IMS control region
IMS_MPP | IMS attach MPP
IMS_TBMP | IMS transaction BMP
DistAllied | Distributed Allied thread
RRSAF | DB2 Resource Recovery Services attachment facility
SYSTEM | System directed access
TSO | TSO foreground and background
UNKNOWN | Unrecognizable connection type
UTILITY | DB2 Utility

**Conversation ID** The conversation ID.

**Conversations Allocated** The number of successful conversation allocations.

**Conversations Deallocated** The number of conversations terminated.

**Conversations Initiated Location** The number of conversations that were initiated from the requester to the server location. This value is updated as the server location.

**Conversations Initiated Thread** The number of conversations that were initiated from the requester location. This value is maintained at the requester.

**Conversations Queued** The number of conversation requests queued by DDF that are waiting for allocation. This value is maintained at the requester location. If the value is a large number, you might want to increase the limit for the number of conversations. See SE for the number of conversations.

**Conversation Status** The conversation status.

**Correlation ID** The correlation ID.

**DBAT CPU** The database access agent CPU time at the serving location.

**DBAT Elapsed** The elapsed time at the requester. It includes the total of DB2 and network time (DB2 field name: ADDSELRQ).

**DB2 ID** The DB2 subsystem ID.

**End User ID** The user ID of the workstation end user. This user ID can be different from the authorization ID used to connect to DB2. This field contains blanks if the client does not supply this information (DB2 field name: QWHCEUID).
Forgets Received  The number of forget responses received from the participant (two-phase commit operations only). This indicates that the participant was read only.

Forgets Sent  The number of forget responses sent to the coordinator (two-phase commit operations only). This indicates that the participant was read only.

From Location  The location from.

Host Name  The host name.

Interval Start  The start time of this interval.

IP Address  The TCP/IP address (prior to DB2 9).

Last Agents Received  The number of last agent requests received from the initiator (two-phase commit operations only). This counter is incremented when the DB2 server is receiving a last agent request from its upstream partner.

Last Agents Sent  The number of last agent requests sent to the coordinator (two-phase commit operations only).

Last Appc Request  The conversation last appc request issued.

Last Appc Qualifier Used  The conversation last appc qual issued.

Location  The requesting location.

Location (Unicode)  The requesting location.

Logical Unit Name  The conversation Logical Unit name.

Maximum Conversations  The largest number of conversations open at any time.

Message Buffer Rows  The number of rows transmitted in message buffers using block fetch. This field is maintained at both the requester and the server locations.

Messages Received  The number of messages received from the location. More messages might be sent from the server location than are received by the requester because of the way SQL statements are processed internally. This value is maintained internally.

Messages Sent  The number or messages sent to the location. A message, as defined by VTAM, is a group of characters and control IT sequences transferred as an entity. This value is maintained at the location where the messages originated.

MVS ID  The MVS system identifier.

Number In Doubt  The number of threads that became INDOUBTz with the remote location as the coordinator (two-phase commit operations only). This indicates that communication with the coordinator was lost.

Originating System ID  The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.
Package DBRM The package DBRM name.

Package DBRM (Unicode) The package DBRM name.

Plan The plan name.

Port The TCP/IP port number.

Prepares Received The number of prepare requests received from the coordinator (two-phase commit operations only).

Prepares Sent The number of prepare requests sent to the participant (two-phase commit operations only).

Product Name Shows the ACCRDB PRID parameter of the DDM command, where "ACCRDB" is the product specific ID of the "access relational database" and "PRID" is the product ID of the requester. The value is zero if the record is written at the application requester location.

Protocol Used The protocol used.

Remote Elapsed Time The remote elapsed time.

Remote Wait Time The time spent waiting for remote response.

Request Commits Received The number of request commit responses received from the participant (two-phase commit operations only).

Request Commits Sent The number of request commit responses sent to the coordinator (two-phase commit operations only).

Rollbacks Remote The number of rollback operations performed with the remote location as the coordinator (two-phase commit operations only).

Row Count The row counter.

Rows Received The number of rows of data retrieved from the server location (the count does not include either the SQLDA or SQLCA if they are transmitted). This value is maintained at the requester location.

Rows Send The number of rows of data sent to the requester location (includes SQLDA). This value is maintained at the server location.

Service Name The EXSCAT SRVNAM parameter.

Session ID The session ID.

Srvclsnm The EXSCAT SRVNAM parameter.

SQL Calls Received The number of SQL statements received from the requester.

SQL Calls Sent The number of SQL statements sent to the server. This value is maintained at the requester location.

System Access System access.
**Thread Type** The thread type is DBACCESS/ALLIED.

**Time Since Last VTAM Request** The time since the last VTAM request was issued.

**Transaction ID** The transaction ID at the workstation.

**Uniqueness Value** The instance number: When concatenated with the fully qualified network name, it uniquely identifies a distributed thread (DB2 field name: QWHSLUUV).

**Uniqueness Value 2** The DB2 thread uniqueness value. For internal use.

**VTAM Logmode** The VTAM log mode entry name in use by the session.

**VTAM Luname** The location Logical Unit name.

**Workstation ID** The workstation ID.

**DSG DB2 Parameters**  
Use DSG DB2 Parameters attributes to view DB2 parameters for data sharing groups.

**DB2 ID** The DB2 subsystem ID.

**Data Sharing Group** The name of the Data Sharing Group.

**Data Sharing Member** The name of the Data Sharing Group Member.

**Field Description** The description of the data field.

**Field Name** The name of the data field.

**Field Value** The data value.

**Interval Start** The start time of this interval.

**MVS System ID** The MVS system identifier.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Sequence Number** The sequence number of the data field.

**DSG GBP CF Statistics Attributes**  
Use these attributes to view the group buffer pool (GBP) coupling facility (CF) statistics of the Data Sharing Group (DSG).

**Changed Page Write Hit Counter Secondary GBP** The number of successful coupling facility write requests for changed pages (Field name: QW02542W).

**Changed Page Write Hit Counter** This is the number of times a coupling facility write request for a changed page successfully completed (Field name: QW0254WH).
Clean Page Write-Hit Counter This is the number of times a coupling facility write request for a clean page completed successfully (Field name: QW0254WC).

DB2 Subsystem The DB2 subsystem ID.

DB2 Version The DB2 version.

DSG Member Name The Data Sharing Group (DSG) member name.

Data Entry Counter of Secondary GBP This is the snapshot value of the number of allocated data entries (Field name: QW02542T).

Data Entry Reclaim Counter This is the number of times a name assignment required that a data page must be reclaimed by the coupling facility (Field name: QW0254TR).

Data Sharing Group The data sharing group name.

Dir Counter for Secondary Group Buffer Pool The directory-entry counter for the secondary group buffer pool. This is the snapshot value of the number of allocated directory entries (Field name: QW02542D).

Directory Entry Reclaim Counter This is the number of times a name assignment required that a directory entry must be reclaimed by the coupling facility (Field name: QW0254DR).

Explicit XI Requests This is the number of times that a request was made to the coupling facility to explicitly cross-invalidate a page. XI signals were sent because the named page was cached in one or more DB2 buffer pools (Field name: QW0254CI).

Global Group Buffer Pool Name The name of the global group buffer pool for which statistics are reported.

Global Group Buffer Pool ID The number of the global group buffer pool for which statistics are reported (Field name: QW0254GN).

Interval Start The start time of this interval.

MVS System ID The MVS identifier.

Number of Allocated Data Entries (snapshot) This is the number of data entries allocated for the coupling facility cache structure (DB2 group buffer pool). Data entries are the actual places where the data page resides. This is a snapshot value and is not affected by whether this is an incremental or cumulative display (Field name: QW0254TE).

Number of Allocated Directory Entries (Snapshot) This is the number of directory entries allocated for the coupling facility cache structure (DB2 group buffer pool). A directory entry contains control information for one database page. A directory entry is used by the coupling facility to determine where to send cross-invalidation signals when a page of data is changed or when the directory entry must be reused. This is a snapshot value and is not affected by whether this is an incremental or cumulative display (Field name: QW0254DE).
**Number of Castout Operations Performed** This is the number of castout operations performed. Castout is the process of writing pages from the group buffer pool to DASD (Field name: QW0254CC).

**Number of Data Entries in Changed State** This is the snapshot value of the current number of changed pages. The displayed value of this counter is not affected by whether this is an incremental or cumulative display (Field name: QW0254TC).

**Originating System** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Read Count** The total read count (Field name: SW254RDC).

**Read Hit Counter** This is the number of times that a page was returned on a coupling facility read request (Field name: QW0254RH).

**Read Hit Percent** The percentage of read hits (Field name: SW254RHR).

**Read Miss Directory Hit Counter** This is the number of times that a coupling facility read request specified a page for which a directory entry exists, but no data was cached for that page (Field name: QW0254RD).

**Read Miss Assignment Suppressed Counter** This is the number of times that a coupling facility read request specified a page for which no directory entry exists and no directory entry is created. DB2 does not create a directory entry when it does not need to register the page to the coupling facility for cross-invalidation (XI) because no other DB2 in the group has R/W interest in the page set or partition. This counter also represents the number of times that pages are deregistered due to buffer stealing (Field name: QW0254RS).

**Read Miss Cache Full Counter** This is the number of times that a coupling facility read request specified a page for which no directory entry exists and no directory entry is created because of a lack of storage in the group buffer pool. A nonzero value in this field indicates that the backing coupling facility cache structure size might be too small to support the current workload (Field name: QW0254RF).

**Read Miss Name Assigned** This is the number of times that a coupling facility read request specified a page for which a directory entry was created (Field name: QW0254RN).

**Total Changed Counter for Secondary GBP** This is the snapshot value of the number of allocated data entries that are currently in changed state (Field name: QW02542C).

**Write Miss Secondary Cache Full Counter** This is the number of coupling facility write requests that could not complete because of insufficient coupling facility storage resources (Field name: QW02542F).

**Write Miss Cache Full Counter** This is the number of times a coupling facility write request was not completed because of a lack of storage in the group buffer pool. A value in this field indicates that the data page resources of the coupling facility are being consumed faster than the DB2 castout process can free them. For more information about alleviating this condition refer to DB2 data sharing, planning and administration (Field name: QW0254WF).
**XI Directory Entry Reclaim Counter** This is the number of times a directory entry was reclaimed (stolen) and cross-invalidation (XI) signals had to be sent (that is, the stolen directory entry had registered DB2 interest). A high number might indicate a problem. Check the group buffer pool hit ratio to determine if the lack of directory entries might be causing excessive reads from the group buffer pool (Field name: QW0254XR).

**DSG Group Buffer Pool (GBP) Attributes**

Use these attributes to view the group buffer pool (GBP) of the Data Sharing Group (DSG).

- **Asynch GBP Requests** The number of asynchronous requests for the primary group buffer pool (Field name: QBGLHS).

- **Castout Class Threshold** The number of times group buffer pool castout was initiated because the class castout threshold was detected (Field name: QBGLCT).

- **Clean Pages Written Asyn** The number of clean pages asynchronously written to the group buffer pool (DB2 field name: QBGLAC).

- **DB2 Subsystem** The DB2 subsystem ID.

- **DB2 Version** The DB2 version.

- **DSG Member Name** The Data Sharing Group (DSG) member name.

- **Data Sharing Group** The Data Sharing Group name.

- **Delete Name** The number of group buffer pool requests to delete all directory and data entries for a page set or partition. DB2 issues this request when it converts a page set or partition from GBP-dependent to non GBP-dependent. For objects defined with GBPCACHE ALL, DB2 issues this request when the first DB2 member opens the object (Field name: QBGLDN).

- **Explicit Cross-Invalidation** The number of explicit cross-invalidations (Field name: QBGLEX).

- **GBP Checkpoints Triggered** The number of group buffer pool checkpoints triggered by this member (Field name: QBGLCK).

- **Group Buffer Castout Threshold** The number of times group buffer pool castout was initiated because the group buffer pool castout threshold was detected (Field name: QBGLGT).

- **Group Buffer Pool ID** The group buffer pool ID (Field name: QBGLGN).

- **Group Buffer Pool Name** The group buffer pool name (Field name: QBGLGNC).

- **Hit Ratio** The hit ratio (Field name: SGBPHITP).

- **Interval Start** The start time of this interval.

- **MVS System ID** The MVS identifier.

- **Number of Write and Register requests** The number of write and register (WAR) requests. one page is written for each request (Field name: QBGLWS).
**Originating System** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; example, DB91:SYS1:DB2.

**Page Locks For Data Pages** The number of page P-lock requests for data pages (Field name: QBGLP2).

**Page Locks For Index Pages** The number of page P-lock requests for index leaf pages (Field name: QBGLP3).

**Page Locks For Space Maps** The number of page P-lock requests for space map pages (Field name: QBGLP1).

**Page P-Lock Suspensions for Space Maps** The number of page P-lock suspensions for space map pages (Field name: QBGLS1).

**Page P-Lock Suspensions for Data Pages** The number of page P-lock suspensions for data pages (Field name: QBGLS2).

**Page P-Lock Suspensions for Index Leaf Pages** The number of page P-lock suspensions for index leaf pages (Field name: QBGLS3).

**Page Unlocks** The number of page P-lock unlock requests (DB2 field name: QBGLU1).

**Page in Write Around** The number of changed pages that were written to disk through group buffer pool write-around due to conditional write failures to the group buffer pool (Field name: QBGLWA).

**Pages Castout** The number of pages cast out from the group buffer pool to DASD (DB2 field name: QBGLRC).

**Pages Written Via WARM** The number of pages that were written using write and register multiple (Field name: QBGLWP).

**Participate in GBP rebuild** The number of coupling facility requests to write changed pages to the secondary group buffer pool for duplexing (Field name: QBGL2W).

**Read Castout Class** The number of coupling facility requests to read the castout class (Field name: QBGLCC).

**Read Castout Statistics** The number of coupling facility requests to read the castout statistics (Field name: QBGLCS).

**Read Directory Info** The number of coupling facility requests to read directory information (Field name: QBGLRD).

**Read Storage Statistics** The number of coupling facility requests to read storage statistics. The group buffer pool structure owner issues this request once for each checkpoint (Field name: QBGLOS).

**Read for Castout Multiple Requests** The number of read-for-castout-multiple requests. Each request is for multiple pages (Field name: QBGLCM).

**Read for Castout Requests** The number of read-for-castout requests. Each request is for a single page (Field name: QBGLCR).
Reads Prefetch Changed Pages Read After Register The number of coupling facility reads to retrieve a changed page from the group buffer pool as a result of feedback from the request to register a page list (see Reads Prefetch Register Page List Request (QBGLAX)) (Field name: QBGLAY).

Reads Prefetch Register Page List Request The number of requests to register a page list in the coupling facility. DB2 prefetch can do this only if the group buffer pool is allocated in a coupling facility with CFLEVEL=2 or above (Field name: QBGLAX).

Register Page The number of coupling facility requests to register a page (Field name: QBGLRG).

Secondary Async GBP Requests The number of asynchronous requests for the secondary group buffer pool (Field name: QBGL2H).

Secondary Delete Name List The number of group buffer pool requests to the secondary group buffer pool to delete a list of pages after they were cast out from the primary group buffer pool (Field name: QBGL2D).

Secondary Delete Name The number of group buffer pool requests to delete a page from the secondary group buffer pool (Field name: QBGL2N).

Secondary Read Castout Statistics The number of coupling facility requests to read the castout statistics for the secondary group buffer pool (Field name: QBGL2R).

Sync read XI Data returned The number of synchronous coupling facility read requests caused by the buffer that is marked invalid. Data is returned from the group buffer pool (Field name: QBGLXD).

Sync read XI No data returned The number of synchronous coupling facility read requests caused by the buffer that is marked invalid. Data is not returned from the group buffer pool and a directory entry is created if it does not already exist. This means another DB2 in the group has R/W interest in the page set or partition (Field name: QBGLXR).

Synch read (not found) No data returned The number of synchronous coupling facility reads necessary because the requested page was not found in the buffer pool to which data was not returned (Field name: QBGLMR).

Synchronous read (not found) Data returned The number of synchronous coupling facility reads necessary because the requested page was not found in the buffer pool to which data was returned from the group buffer pool (Field name: QBGLMD).

Total P-Lock Negotiations The sum of all page P-lock lock negotiations (Field name: SBGLPLN).

Total P-Lock Negotiations Data Pages The number of page P-lock negotiations for data pages (Field name: QBGLN2).

Total P-Lock Negotiations Index leaf Pages The number of page P-lock negotiations for index leaf pages (Field name: QBGLN3).
Total P-Lock Negotiations Space Map Pages The number of page P-lock negotiations for space map pages (Field name: QBGLN1).

Total Lock Suspensions The sum of all page P-lock lock suspensions (Field name: SBGLPLS).

Total P-Page Lock Requests The sum of all page P-lock lock requests (DB2 field name: SBGLPLR).

Unlock Castout The number of coupling facility requests to unlock the castout lock on the pages (Field name: QBGLUN).

Unregister Page The number of coupling facility requests to unregister a page (Field name: QBGLDG).

Write Failed No Storage The number of coupling facility write requests that could not complete because of a lack of coupling facility storage resources (Field name: QBGLWF).

Write and Register Multiple requests The number of write and register multiple (warm) requests. Multiple pages are written for each request (Field name: QBGLWM).

 Writes Changed pages Written async The number of changed pages asynchronously written to the group buffer pool under a system execution unit (DB2 field name: QBGLAW).

 Writes Changed pages Written sync The number of changed pages synchronously written to the group buffer pool under a user's execution unit (Field name: QBGLSW).

 Writes Clean pages Written sync The number of clean pages synchronously written to the group buffer pool under a user's execution unit (Field name: QBGLWC).

DSG SQL Count Attributes
Use these attributes to view the SQL count of the Data Sharing Group (DSG).

DB2 Subsystem The DB2 subsystem ID.

DB2 Version The DB2 version.

Data Sharing Group The Data Sharing Group name.

Data Sharing Member The Data Sharing Group (DSG) member name.

Delta Value The change since last sample.

Field Name The data field name.

Field Value The data field value.

Interval Start The start time of this interval.

Interval Time The collection interval time.
MVS System ID The MVS identifier.

Originating System ID The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; example, DB91:SYS1:DB2.

Rate The amount over last sampling interval.

Sequence Number The data field sequence number.

Dynamic SQL Cache Attributes
Use these attributes to view dynamic SQL cache information.

AVG Actual Degree The average actual degree of parallelism for all parallel groups. The actual degree of parallelism is calculated at execution time, after buffer pool negotiation and system negotiation are taken into account (Field name: Q316ACT).

AVG Estimated Degree The average estimated degree of parallelism for all parallel groups. The estimated degrees are calculated at bind time, based on the cost formula. The average is calculated at execution time (Field name: Q316ESTI).

AVG Planned Degree The average planned maximum degree of parallelism for all parallel groups. The average is calculated at execution time. It is the optimal degree of parallelism that can be obtained at execution time, after host variables or parameter markers are resolved, and before buffer pool negotiation and system negotiation are performed (Field name: Q316PLAN).

Auth ID The text of the user ID. If QW0316T3_OFF is not 0, this value is truncated (Field name: QW0316T3).

CPU Time The accumulated CPU time. This value includes CPU time that is consumed on an IBM specialty engine (Field name: QW0316CT).

Claim Rel Wait The accumulated wait time for drains during waits for claims to be released (Field name: QW0316WA).

Coll Begin STCK The timestamp when statistics collection began. Data collection begins when a trace for IFCID 318 is started (Field name: QW0316TS).

Copies of Statements The number of copies of the STMT owned by all threads in the system. This includes QW0316US plus any copies owned by plans/packages bound with KEEP_DYNAMIC(YES) that were not used in their current unit of work. These users prepared the statement in a previous unit of work and still have it in a prepared state (Field name: QW0316CP).

Current users The number of current users of STMT. These are the users that have prepared or executed the statement during their current unit of work (Field name: QW0316US).

DB2 Subsystem The DB2 subsystem ID.

DB2 Version The DB2 version.

DSG Member Name The Data Sharing Group (DSG) member name.
Data Sharing Group  The Data Sharing Group name.

Drain Lock Wait  The accumulated wait time for drain locks (DB2 field name: QW0316W9).

Elapsed Time  The accumulated elapsed time used for statement (Field name: QW0316AE).

End User ID  The end-user ID. This value is provided during RRS signon or re-signon (Field name: SQW316XE).

Filler  Filler for padding.

Get Pages  The number of GETPAGE operations performed for statement (Field name: QW0316NG).

Global Lock Wait  The accumulated wait time for global locks (Field name: QW0316W4).

Global child\L-locks wait  Waits due to global contention for child L-locks (Field name: QW0316WC).

Global other\L-locks wait  Waits due to global contention for other L-locks (Field name: QW0316WD).

Global P/P P-locks wait  Waits due to global contention for Pageset/Partition P-locks (Field name: QW0316WE).

Global Page\P-locks wait  Waits due to global contention for Page P-locks (Field name: QW0316WF).

Global Other\P-locks wait  Waits due to global contention for other P-locks (Field name: QW316WG).

Index Scans  The number of index scans performed for statement (Field name: QW0316NI).

Insert Date Time  The date and time when the statement was inserted into the cache (in DB2 timestamp format) (Field name: QW0316TM).

Interval Start  The start time of this interval.

Latch Req Wait  The accumulated wait time for latch requests (Field name: QW0316W7).

Lock-Req Wait  The accumulated wait time for lock requests (Field name: QW0316W2).

Log Write Wait  The accumulated wait time for log writers. (Field name: QW0316WB).

MVS System ID  The MVS identifier.

Originating System  The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.
**Page Latch Wait** The accumulated wait time for page latches (Field name: QW0316W8).

**Parallel Groups Created** The number of parallel groups created for this statement (Field name: QW0316NL).

QW0316NM 1 Part 1 of QW0316NM.
QW0316NM 2 Part 2 of QW0316NM.
QW0316NM 3 Part 3 of QW0316NM.
QW0316NM 4 Part 4 of QW0316NM.

**RIDs HB Join/Limit** The number of times that appending to a RID list for a hybrid join was interrupted because the number RIDs exceeded one or more internal limits (Field name: QW316HJT).

**RIDs HB Join/Storage** The number of times that appending to a RID list for a hybrid join was interrupted because no RID pool storage was available to hold the list of RIDs (Field name: QW316HJS).

**RIDs No IX Access** The number of times that RID list retrieval for multiple index access was not done because DB2 could determine the outcome of index ANDing or ORing (Field name: QW316RSM).

**RIDs Not Used/Limit** The number of times that a RID list was not used because the number of RIDs exceeded one or more internal DB2 limits, and the number of RID blocks exceeded the value of subsystem parameter MAXTEMP_S_RID (Field name: QW0316RT).

**RIDs Not Used/Storage** The number of times that a RID list was not used because not enough storage was available to hold the RID list, or work file storage or resources were not available (Field name: QW0316RS).

**RIDs Overflow/Limit** The number of times that a RID list overflowed to a work file because the number of RIDs exceeded one or more internal limits (Field name: QW316WRT).

**RIDs Overflow/Storage** The number of times that a RID list overflowed to a work file because no RID pool storage was available to hold the list of RIDs (Field name: QW316WRS).

**Read Activity Wait** The accumulated wait time for read activity that is done by another thread (Field name: QW0316W5).

**Rows Examined** The number of rows examined for statement (Field name: QW0316NR).

**Rows Processed** The number of rows processed for statement. For example, the number of rows returned for a SELECT, or the number of rows affected by an INSERT, UPDATE, or DELETE (Field name: QW0316NP).

**SQL Text** The first 60 bytes of statement text (Field name: QW0316TX).
**Sorts Performed** The number of sorts performed for statement (Field name: QW0316NS).

**Statement Identifier** The unique statement identifier. A generated number for uniquely identifying a statement in the prepared statement cache (Field name: QW0316TK).

**Statement Name** The statement name generated by DB2 for this statement (Field name: QW0316NM).

**Stats Insert STCK** The date and time when the statement was inserted into the cache, in store clock format. (Field name: QW316TM2).

**Stats Update STCK** The date and time when the statement was updated, in store clock format (Field name: QW316UT1).

**Stmt Length** The length of entire statement (Field name: QW0316LN).

**Sync I/O Wait** The accumulated wait time for synchronous I/O. This wait time and the following wait times are collected only when a class 3 accounting trace is started (Field name: QW0316W1).

**Sync Switch Wait** The accumulated wait time for a synchronous execution unit switch (DB2 field name: QW0316W3).

**Sync Reads** The number of synchronous buffer reads performed for statement (Field name: QW0316NB).

**Sync Writes** The number of synchronous buffer write operations performed for statement (Field name: QW0316NW).

**Tablespace Scans** The number of tablespace scans performed for statement (Field name: QW0316NT).

**Times Exec.** The number of executions of the statement. For a cursor statement, this is the number of OPENs (Field name: QW0316NE).

**Total Wait** The total wait time for the dynamic SQL statement (Field name: QW0316WT).

**Transaction ID** The transaction name. This value is provided during RRS signon or re-signon (Field name: SQW316T2).

**Update Date Time** The date and time when the statement was updated, in internal format (Field name: QW316UT2).

**Workstation ID** The workstation name. This value is provided during RRS signon or re-signon (Field name: SQW316XF).

**Write Activity Wait** The accumulated wait time for write activity that is done by another thread (Field name: QW0316W6).

**Dynamic SQL Cache 1 Attributes**
Use these attributes to view dynamic SQL cache 1 information.
**Appl Data** User-provided identification string. If QW0316UI_OFF is not 0, this value is truncated (Field name: QW0316UI).

**Current Degree** Current degree special register value: ANY or 1 (Field name: AQW316X9).

**Current Precision** Current precision special register value: DEC31 or DEC15 (Field name: AQW316XB).

**Current Rule** Current rules special register value: DB2 or SQL (Field name: AQW316XA).

**Current Schema** Current schema special register contents (Field name: QW0316SC).

**Current data Bind** CURRENTDATA bind option: YES or NO (Field name: QW02542W).

**Cursor Hold** (DB2 field name: AQW316X7).

**DB2 Subsystem** The DB2 subsystem ID.

**DB2 Version** The DB2 version.

**DSG Member Name** The Data Sharing Group (DSG) member name.

**DSG Member** Data Sharing member that cached the SQL statement (Field name: QW0316MB).

**Data Sharing Group** The Data Sharing Group name.

**Dynamic Rules Bind** DYNAMICRULES bind option: BIND or RUN (DB2 field name: AQW316X8).

**End User ID** End-user ID. This value is provided during RRS signon or re-signon (Field name: QW0316XE).

**Expansion Reason** Expansion reason (Field name: AQW316EX). Possible values are:

- 'A' The query contains an implicit query transformation that was caused by the sysibmadm.get_archive built-in global variable.
- 'B' The query contains an implicit query transformation that was caused by the current temporal business_time special register.
- 'S' The query contains an implicit query transformation that was caused by the current temporal system_time special register.
- 'SB' The query contains an implicit query transformation that was caused by the current temporal business_time special register and the current temporal system_time special register.
- '' The query does not contain an implicit query transformation that was caused by the current temporal business_time special register, the current temporal system_time special register, or the sysibmadm.get_archive built-in global variable.
- 'N/A' Data is not available.
**Interval Start** The start time of this interval.

**Isolation Bind** Value of bind option isolation that is in effect for the initial prepare. This value does not reflect that it is specified in a WITH clause (DB2 field name: QW0316X6).

**Literal Replace Indic** Indicator for cache literal replacement (DB2 field name: QW0316LR).

**MVS System ID** The MVS identifier.

**Object Qualifier** Qualifier that is used for unqualified table names. If QW0316X5_OFF is not 0, this value is truncated (Field name: QW0316X5).

**Originating System** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Prepare ID** Text of the user ID. If QW0316T3_OFF is not 0, this value is truncated (Field name: QW0316T3).

**Program Name** Text of the program name. If QW0316T1_OFF is not 0, this value is truncated (Field name: QW0316T1).

**Ref Table Qualifier** Qualifier of the referenced table name. If QW0316QD_OFF is not 0, this value is truncated (Field name: QW0316QD).

**Ref Table** Text of the referenced table name. If QW0316TD_OFF is not 0, this value is truncated (Field name: QW0316TD).

**Statement Identifier** Unique statement identifier. A generated number for uniquely identifying a statement in the prepared statement cache (Field name: QW0316TK).

**Statement Name** Statement name generated by DB2 for this statement (Field name: QW0316NM).

**Statement Status** Status of the statement (Field name: AQW316FL). The statement has actually been removed from the cache but current users might still have an active copy:

**BYDROP**
Invalidated by DROP or ALTER

**BYREVOKE**
Invalidated by REVOKE

**BYLRU**
Removed from cache by LRU

**BYRUNSTA**
Invalidated by RUNSTATS

**UNKNOWN**
No statement status is set

**Transaction Name** Transaction name. This value is provided during RRS signon or re-signon (Field name: QW0316T2).
**User Group** User group (Field name: QW0316X4). User group is the current SQLID of the user who did the initial prepare. If QW0316X4_OFF is not 0, this value is truncated.

**Workstation Name** Workstation name (Field name: QW0316XF). This value is provided during RRS signon or re-signon.

**Dynamic SQL Cache Text Attributes**
Use these attributes to view dynamic SQL cache text information.

**DB2 Subsystem** The DB2 subsystem ID.

**DB2 Version** The DB2 version.

**DSG Member Name** The Data Sharing Group (DSG) member name.

**Data Sharing Group** The Data Sharing Group name.

**Interval Start** The start time of this interval.

**MVS System ID** The MVS identifier.

**Originating System** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Statement Text** The text of the SQL statement (Field name: QW0317TX).

**Statement Name** The name of the SQL statement (Field name: QW0317NM).

**Unique Identifier** The identifier of the SQL statement in hexadecimal (Field name: QW0317ID).

**EDM Pool Attributes**
Use the EDM Pool, DB2 SRM EDM, and DB2 SRM EDM Statistics attributes to create situations to monitor the Environmental Descriptor Manager (EDM) pool activity that is connected with DB2. The attributes depend on the DB2 version installed.

**Available Pages** The total number of EDM pages that are currently available. It is zero for DB2 10 or later.

**Available Percentage** The percentage of EDM Pool that is currently available. Valid entry ranges from 0.0 to 100.0. It is zero for DB2 9 or later.

**Cursor Table Load Rate (CT Loads)** The number of Cursor Table loads from DASD per second.

**Cursor Table Pages** The total number of EDM pages that are currently in use for Cursor Tables. It is zero for DB2 9 or later.

**Cursor Table Percentage** The percentage of EDM Pool that is currently in use for Cursor Tables. Valid entry ranges from 0.0 to 100.0. It is zero for DB2 10 or later.

**Cursor Table Request Rate (Cursor Table Reqs)** The number of Cursor Table requests per second.

<tr>
<td><strong>Dynamic SQL Cache Requests (Dynamic SQL Reqs)</strong></td>
<td>The total number of dynamic SQL requests.</td>
</tr>
<tr>
<td><strong>EDM Free Pages</strong></td>
<td>The total number of free pages in the EDM pool (DB2 9 or below) or the DBD pool (DB2 10 or later). It is zero for DB2 10 or later.</td>
</tr>
<tr>
<td><strong>EDM Free Percentage</strong></td>
<td>The percentage of free pages in the EDM pool (DB2 9 or below) or the DBD pool (DB2 10 or later). A valid entry ranges from 0.0 to 100.0. It is zero for DB2 10 or later.</td>
</tr>
<tr>
<td><strong>EDM In Use Pages</strong></td>
<td>The total number of pages that are currently in use in the EDM pool (DB2 9 or below) or the DBD pool (DB2 10 or later). It is zero for DB2 10 or later.</td>
</tr>
</tbody>
</table>
EDM In Use Percentage The percentage of EDM pages (DB2 9 or below) or the percentage of DBD pages (DB2 10 or later) that is currently in use. A valid entry ranges from 0.0 to 100.0. It is zero for DB2 10 or later.

EDM Total Pages The total number of pages that are assigned to the EDM pool (DB2 9 or below) or the DBD pool (DB2 10 or later). It is zero for DB2 10 or later.

Fails because of Dataspace Full The total number of fails because the EDM Pool Dataspace is full.

Fails because of DBD Pool Full The total number of fails because the DBD Pool is full.

Fails because of EDM Pool Full The total number of fails because the EDM Pool is full.

Fails because of RDS Pool Full The total number of fails because the RDS Pool (above) is full.

Fails because of SKEL Pool Full The total number of fails because the Skeleton (SKEL) Pool is full.

Fails because of STMT Pool Full The total number of fails because the Statement (STMT) Pool is full.

Fails because of RDS Pool (below) Full The total number of fails because the RDS Pool (below) is full.

Interval Start The date and time, as set on the monitored system, indicating the instance when the agent collects information.

Originating System ID The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

Package Search Not Found Delete The number of not found record deleted from CACHE.

Package Search Not Found Insert The number of not found record added to CACHE.

Package Search Not Found Match The number of CACHED not found record located.

Package Table Load Rate (PT Loads) The number of Package Table loads from DASD per second.

Package Table Pages The total number of pages that are currently in use for Package Table. It is zero for DB2 10 or later.

Package Table Percentage The percentage of EDM Pool that is currently in use for Package Table. Valid entry ranges from 0.0 to 100.0. It is zero for DB2 10 or later.

Package Table Request Rate (Package Table Reqs) The number of Package Table requests per second.
**RDS Above CT Pages**  The number of pages in the RDS pool above the bar used for the cursor tables (CTs). This is a snapshot value. It is zero for DB2 10 or later.

**RDS Above CT Percent**  The percentage of pages that are currently held for cursor table (CT) in the RDS Pool above the bar. It is zero for DB2 10 or later.

**RDS Above Free Pages**  The number of free pages in RDS Pool above the bar. It is zero for DB2 10 or later.

**RDS Above Free Percent**  The percentage of free pages in RDS Pool above the bar. It is zero for DB2 10 or later.

**RDS Above In Use Pages**  The number of pages that are currently in use in RDS Pool above the bar. It is zero for DB2 10 or later.

**RDS Above In Use Percent**  The percentage of pages that are currently in use in RDS Pool above the bar. It is zero for DB2 10 or later.

**RDS Above PT Pages Held**  The number of pages that are currently held for package tables (PT) in RDS Pool above the bar. It is zero for DB2 10 or later.

**RDS Above PT Percentage**  The percentage of pages that are currently held for package tables (PT) in RDS Pool above the bar. It is zero for DB2 10 or later.

**RDS Above Total Pages**  The total number of pages that are assigned to RDS Pool above the bar. It is zero for DB2 10 or later.

**RDS Below Cursor Table Pages**  The number of pages that are currently held for cursor tables in RDS Pool below the bar. It is zero for DB2 10 or later.

**RDS Below Cursor Table Percent**  The percentage of pages that are currently held for cursor tables in RDS Pool below the bar. It is zero for DB2 10 or later.

**RDS Below Free Pages**  The number of free pages in RDS Pool below the bar. It is zero for DB2 10 or later.

**RDS Below Free Percent**  The percentage of free pages in RDS Pool below the bar. It is zero for DB2 10 or later.

**RDS Below In Use Pages**  The number of pages that are currently in use in RDS Pool below the bar. It is zero for DB2 10 or later.

**RDS Below In Use Percent**  The percentage of pages that are currently in use in RDS Pool below the bar. It is zero for DB2 10 or later.

**RDS Below Package Table Pages**  The number of pages that are currently held for package tables in RDS Pool below the bar. It is zero for DB2 10 or later.

**RDS Below Package Table Percent**  The percentage of pages that are currently held for package tables in RDS Pool below the bar. It is zero for DB2 10 or later.

**RDS Below Total Pages**  The total number of pages that are assigned to RDS Pool below the bar. It is zero for DB2 10 or later.

**Skeleton Cursor Table Pages (SKCT Pages)**  The total number of EDM pages that are currently held for skeleton cursor tables (SKCT).
**Skeleton Cursor Table Percentage (SKCT Percentage)** The percentage of EDM that is currently held for skeleton cursor tables (SKCT). Valid entry ranges from 0.0 to 100.0.

**SKEL Free Pages** The number of free pages that are currently in the skeleton (SKEL) Pool.

**SKEL Free Percent** The percentage of free pages that are currently in the skeleton (SKEL) Pool.

**SKEL In Use Pages** The number of pages that are currently in use in the skeleton (SKEL) Pool.

**SKEL In Use Percentage** The percentage of pages that are currently in use in the skeleton (SKEL) Pool; for DB2 10, this percentage is calculated as 100 - (((stealable+free)/total)*100).

**SKEL Pool Pages** The current number of pages in the skeleton (SKEL) Pool above the bar.

**SKPT Pages** The total number of pages that are currently held for skeleton package tables (SKPT).

**SKPT Percentage** The percentage of pages that are currently held for skeleton package tables (SKPT). Valid entry ranges from 0.0 to 100.0.

**SKPT Stealable Pages** The total number of stealable pages used for skeleton package tables (SKPT) pages that can be reused.

**Statement Free Pages** The number of free pages that are currently in the Statement Pool.

**Statement Free Percent** The percentage of free pages that are currently in the Statement Pool.

**Statement in Global Cache** The number of statements in Global Cache.

**Statement Held Percentage** The percentage of pages that are currently held in the Statement Pool.

**Statements Pages Held** The number of pages that are currently held in the Statement Pool.

**Statement Total Pages** The current number of pages in the EDM Statement pool above the bar. This is a snapshot value.

**EDM Pool Statistics Attributes**
Use these attributes to view the Environmental Descriptor Manager (EDM) pool statistics.

4 bytes filler Not used.

CT Pages Used Not used.

DB2 Subsystem The DB2 subsystem ID.

</tbody>
</table>
**Shareable static SQL stmt** The total number of requests for shareable static SQL statements (Field name: QISEKSPG).

**Statement Pool in Use (MB)** The amount of storage used by cached dynamic SQL statements in the EDM Statement pool above the 2 GB bar (Field name: SISEDYNP).

**Statements in global cache** The number of statements in the EDM pool (Field name: QISESTMT).

**Stmt Pages Free** The number of free pages in the EDM statement pool (Field name: QISECFRE).

**Stmt Pages Held** The number of pages used in the EDM statement pool (Field name: QISEDYNP).

**Stmt Pool Pages** The number of pages in the EDM statement pool (Field name: QISECPGE).

**Storage alloc PKG ATB** The amount of storage above the bar that was allocated for packages (Field name: QISESQKA).

**Storage alloc PKG BTB** The amount of storage below the bar that was allocated for packages (Field name: QISESQKB).

**Storage alloc Plan ATB** The amount of storage above the bar that was allocated for plans (Field name: QISESQCA).

**Storage alloc Plan BTB** The amount of storage below the bar that was allocated for plans (Field name: QISESQCB).

**Total stg alloc static SQL statements** The total storage requested for shareable static SQL statements (Field name: QISEKSPA).

**EDM Statistics Attributes**

Use these attributes to view the Environmental Descriptor Manager (EDM) statistics.

**DB2 Subsystem** The DB2 subsystem ID.

**DB2 Version** The DB2 version.

**Delta Value** The change since the last sample.

**Field Name** The data field name.

**Data Sharing Group** The Data Sharing Group name.

**Interval Time** The collection interval time.

**Data Sharing Member** The Data Sharing Group member name.

**MVS System ID** The MVS identifier.
**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Rate** The amount over the last sampling interval.

**Sequence Number** The data field sequence number.

**Interval Start** The start time of this interval.

**Field Value** The data value.

**Group Buffer Pool Attributes**
Use Group Buffer Pool (GBP) attributes to create situations to determine the usage and availability of coupling facility structures relating to group buffer pools, the shared communication area, and the lock table.

**Cross Invalidate Count** The number of notifications that the DB2 buffer has modified. Valid value is an integer in the range 0 - 99999999.

**Cross Invalidate Rate** The rate of cross invalidations per second. Valid value is an integer in the range 0 - 99999999.

**Data Pages** The number of data pages that DB2 has allocated for the group buffer pool. Valid value is an integer in the range 0 - 99999999.

**Data Sharing Group** The name of a data sharing group. It is an alphanumeric text string, with a maximum of 8 characters; for example, TDDB241G.

**Directory Entries** The total number of directory entries that a DB2 system has allocated for a coupling facility structure. Valid value is an integer in the range 0 - 99999999.

**IDNAME** An internal attribute used for navigation. It contains either the Data Sharing Group Name or the DB2ID.

Valid format is alphanumeric with a maximum of 8 characters; for example TDDDB242G.

**MVS System** The MVS System Management Facility (SMF) ID. It is an alphanumeric text string with a maximum of 4 characters; for example SP11.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Read Count** The total number of page read requests to a group buffer pool. Valid value is an integer in the range 0 - 99999999.

**Read Hit Count** The number of successful page read requests to a group buffer pool without causing a physical database read. Valid value is an integer in the range 0 - 99999999.

**Read Hit Percent** The percentage of successful page read requests in relation to the total page read requests for a group buffer pool. Valid value is an integer in the range 0 - 100.
**Structure Connect Count** The number of active connections to a structure. Valid value is an integer in the range 0 - 16.

**Structure Name** The name of a DB2 coupling facility structure. It is an alphanumeric text string, with a maximum of 16 characters; for example, TDDB241G.SCA.

**Structure Size** The size, in kilobytes, of a DB2 coupling facility structure. Valid value is an integer in the range 0 - 99999999.

**Structure Status** The current status of the coupling facility structure.

Valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACTIVE</td>
<td>The structure is active</td>
</tr>
<tr>
<td>INACTIVE</td>
<td>The structure is inactive</td>
</tr>
</tbody>
</table>

For duplexed group buffer pool structures, additional valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>REB_NEW</td>
<td>Rebuild on new (secondary GBP)</td>
</tr>
<tr>
<td>REB_OLD</td>
<td>Rebuild on old (primary) GBP</td>
</tr>
<tr>
<td>REB_TRAN</td>
<td>Structure is in transition</td>
</tr>
<tr>
<td>REB_HOLD</td>
<td>Structure is in holding state</td>
</tr>
<tr>
<td>REB_ERR</td>
<td>Error during the structure rebuild</td>
</tr>
</tbody>
</table>

**Structure Type** The type of DB2 coupling facility structure.

Valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CACHE</td>
<td>Cache data of interest to several DB2 systems in data sharing group</td>
</tr>
<tr>
<td>LIST</td>
<td>Shared Communications Area (SCA) for data sharing group members</td>
</tr>
<tr>
<td>LOCK</td>
<td>Controls locking</td>
</tr>
</tbody>
</table>

**Time Stamp** Represents the end of data collection or the end of an interval, and is the local time where the system is running.

Valid format is MM-DD-YY HH:MM:SS, where:

- M = Month
- D = Day
- Y = Year
- H = Hour
- M = Minute
- S = Second

For example, 07-16-18 14:58:29 indicates that data collection ended on July 16th, 2018, at 14:58:29 PM.
**Group Buffer Pool Connection Attributes**

Use the Group Buffer Pool (GBP) Connection attributes to create situations that monitor connections to DB2 coupling facilities.

**Connection Status** The status of the connection between a DB2 coupling facility member (IRLM subsystem) and group.

Valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACTIVE</td>
<td>Active member connection</td>
</tr>
<tr>
<td>CONNECT</td>
<td>Member connected but not active</td>
</tr>
<tr>
<td>DISCONN</td>
<td>Member disconnected</td>
</tr>
<tr>
<td>FAILED</td>
<td>Member failed to connect</td>
</tr>
<tr>
<td>FAIL_PER</td>
<td>Member persistently fails to connect</td>
</tr>
</tbody>
</table>

**Coupling Facility Name** The name of a DB2 coupling facility. It is an alphanumeric text string with a maximum of 16 characters; for example, DB2_D411.

**Data Sharing Group** The name of a data sharing group. It is an alphanumeric text string, with a maximum of 8 characters; for example, TDBB241G.

**Data Sharing Group Element** The name of an element of within the data sharing group.

**DB2 ID** The name of a DB2 subsystem.

**IDNAME** An internal attribute used for navigation, it contains either the Data Sharing Group Name or the DB2ID.

**Job Name** The job name connected to a coupling facility structure. It is an alphanumeric text string with a maximum of 8 characters; for example, IRLM.

**MVS System** The MVS System Management Facility (SMF) ID. It is an alphanumeric text string with a maximum of 4 characters; for example SP11.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Structure Name** The name of a DB2 coupling facility structure. It is an alphanumeric text string, with a maximum of 16 characters; for example, TDBB241G.SCA.

**Time Stamp** Represents the end of data collection or the end of an interval, and is the local time where the system is running.

Valid format is MM-DD-YY HH:MM:SS, where:

- M = Month
- D = Day
- Y = Year
• H = Hour
• M = Minute
• S = Second

For example, 07-16-18 14:58:29 indicates that data collection ended on July 16th, 2018, at 14:58:29 PM.

**Group Buffer Pool Statistics Attributes**

Use Group Buffer Pool (GBP) Statistics attributes to create situations that monitor the utilization of critical group buffer pool resources.

**Castout Engine Not Available** The number of times a castout engine was not available to write changed pages from a group buffer pool to DASD. Valid value is an integer in the range 0 - 2147483647.

**Castout for Class Threshold** The group buffer pool castout class threshold. Castout begins when the number of changed pages for a particular castout class exceeds this threshold. Valid value is an integer in the range 0 - 2147483647.

**Castout for GBP Threshold** The group buffer pool castout threshold. Castout begins when the number of changed pages in the group buffer pool exceeds this threshold. Valid value is an integer in the range 0 - 2147483647.

**Changed Page Writes** The number of changed pages written to the group buffer pool. Valid value is an integer in the range 0 - 2147483647.

**Clean Page Writes** The number of clean pages written to the group buffer pool. Valid value is an integer in the range 0 - 2147483647.

**Cross Invalidate Reads No Data** The number of reads to the group buffer pool because a page in the member's buffer pool was invalidated, where the data was not found in the group buffer pool and the member read the page from DASD. Valid value is an integer in the range 0 - 2147483647.

**Cross Invalidate Reads With Data** The number of reads to the group buffer pool because a page in the member's buffer pool was invalidated, where the data was found and returned to the member. Valid value is an integer in the range 0 - 2147483647.

**Data Sharing Group** The name of a data sharing group. It is an alphanumeric text string, with a maximum of 8 characters; for example, TDDB241G.

**DB2 ID** The name of a DB2 subsystem.

**IDNAME** An internal attribute used for navigation, it contains either the Data Sharing Group Name or the DB2ID.

**GBP Reads No Data** The number of reads to the group buffer pool where the data was not found. Valid value is an integer in the range 0 - 2147483647.

**GBP Reads With Data** The number of reads to the group buffer pool where the data was found. Valid value is an integer in the range 0 - 2147483647.

**IXLCACHE Delete Name** The number of times that DB2 issued a request to the group buffer pool to delete directory and data entries associated with a specific page set or partition. Valid value is an integer in the range 0 - 2147483647.
**IXLCACHE Read Castout Class** The number of requests from the pageset or partition castout owner or the group buffer pool owner to the group buffer pool to determine which pages are cached in the group buffer pool as changed pages that need to be cast out. Valid value is an integer in the range 0 - 2147483647.

**IXLCACHE Read Castout Stats** The number of requests that the group buffer pool structure owner issues when the GBPOOLT threshold is reached to determine which castout classes have changed pages. Valid value is an integer in the range 0 - 2147483647.

**IXLCACHE Read Directory Information** The number of requests that the group buffer pool structure owner issues for group buffer pool checkpoints to read the directory entries of all changed pages in the group buffer pool. Valid value is an integer in the range 0 - 2147483647.

**IXLCACHE Read STGSTATS** The number of times DB2 requested statistical information from the group buffer pool. Valid value is an integer in the range 0 - 2147483647.

**IXLCACHE Unlock Castout** The number of times that DB2 issues an unlock request to the coupling facility for castout I/Os that have completed. Valid value is an integer in the range 0 - 2147483647.

**MVS System** The MVS System Management Facility (SMF) ID. It is an alphanumeric text string with a maximum of 4 characters; for example SP11.

**Number of Checkpoints** The number of times that DB2 writes the changed pages in the group buffer pool to the pageset. Valid value is an integer in the range 0 - 2147483647.

**Number of DB2 systems** The total number of monitored DB2 systems. Valid value is an integer in the range 1 - 64.

**Number of Pages Castout** The number of data pages that a member has cast out of the group buffer pool to DASD. Valid value is an integer in the range 0 - 2147483647.

**Number of Rebuilds** The number of times that a member has participated in rebuilding a group buffer pool. Valid value is an integer in the range 0 - 2147483647.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Prefetch Read No Data** The number of reads to the group buffer pool for prefetch processing, where the data is not found and the member reads the page from DASD. Valid value is an integer in the range 0 - 2147483647.

**Prefetch Read With Data** The number of reads to the group buffer pool for prefetch processing, where the data is found and returned to the member. Valid value is an integer in the range 0 - 2147483647.

**Read Fails for Storage** The number of group buffer pool read requests that failed because of a shortage of coupling facility resources. Valid value is an integer in the range 0 - 2147483647.
Register Page List Request  The number of register page list requests by prefetch. Valid value is an integer in the range 0 - 2147483647.

Register Page Request  The number of times that DB2 requested interest to the group buffer pool for a single page. Valid value is an integer in the range 0 - 2147483647.

RPL Reads Changed Pages  The number of group buffer pool reads by prefetch to retrieve a changed page from the group buffer pool as a result of feedback from the register page list. Valid value is an integer in the range 0 - 2147483647.

RPL Reads Clean Pages  The number of group buffer pool reads by prefetch to retrieve a clean page from the group buffer pool as a result of feedback from the register page list. Valid value is an integer in the range 0 - 2147483647.

Structure Name  The name of a DB2 coupling facility structure. It is an alphanumeric text string, with a maximum of 16 characters; for example, TDDB241G.SCA.

Time Stamp  Represents the end of data collection or the end of an interval, and is the local time where the system is running.

Valid format is MM-DD-YY HH:MM:SS, where:
• M = Month
• D = Day
• Y = Year
• H = Hour
• M = Minute
• S = Second

For example, 07-16-18 14:58:29 indicates that data collection ended on July 16th, 2018, at 14:58:29 PM.

For example, 07-16-12 14:58:29 indicates that data collection ended on July 16, 2012 at 14:58:29 PM.

Unregister Page Request  The number of times that DB2 unregistered interest for a single page from the group buffer pool. Valid value is an integer in the range 0 - 2147483647.

Write Engine Not Available  The number of times a write engine was not available to perform a coupling facility write. Valid value is an integer in the range 0 - 2147483647.

Write Fails for Storage  The number of group buffer pool write requests that failed because of a shortage of coupling facility resources. Valid value is an integer in the range 0 - 2147483647.

Write System Changed Page  The number of changed pages written to the group buffer pool. Valid value is an integer in the range 0 - 2147483647.

Write System Clean Page  The number of clean pages written to the group buffer pool. Valid value is an integer in the range 0 - 2147483647.
Group Buffer Pool Statistics Detail Attributes
Use the Group Buffer Pool (GBP) Statistics Detail attributes to create situations to
determine the usage of group buffer pools.

Castout Engine Not Available The number of times a castout engine was not
available to write changed pages from a group buffer pool to DASD. Valid value is
an integer in the range 0 - 2147483647.

Castout for Class Threshold The group buffer pool castout class threshold.
Castout begins when the number of changed pages for a particular castout class
exceeds this threshold. Valid value is an integer in the range 0 - 2147483647.

Castout for GBP Threshold The group buffer pool castout threshold. Castout
begins when the number of changed pages in the group buffer pool exceeds this
threshold. Valid value is an integer in the range 0 - 2147483647.

Changed Page Writes The number of changed pages written to the group buffer
pool. Valid value is an integer in the range 0 - 2147483647.

Clean Page Writes The number of clean pages written to the group buffer pool.
Valid value is an integer in the range 0 - 2147483647.

Cross Invalidate Reads No Data The number of reads to the group buffer pool
because a page in the member's buffer pool was invalidated, where the data was
not found in the group buffer pool and the member read the page from DASD.
Valid value is an integer in the range 0 - 2147483647.

Cross Invalidate Reads With Data The number of reads to the group buffer pool
because a page in the member's buffer pool was invalidated, where the data was
found and returned to the member. Valid value is an integer in the range 0 -
2147483647.

Data Sharing Group The name of a data sharing group. It is an alphanumeric text
string, with a maximum of 8 characters; for example, TDDB241G.

DB2 ID The name of a DB2 subsystem.

GBP Reads No Data The number of reads to the group buffer pool where the data
was not found.
Valid value is an integer in the range 0 - 2147483647.

GBP Reads With Data The number of reads to the group buffer pool where the
data was found. Valid value is an integer in the range 0 - 2147483647.

IDNAME An internal attribute used for navigation, it contains either the Data
Sharing Group Name or the DB2ID. VIt is an alphanumeric text string with a
maximum of 8 characters; for example TDDB242G.

IXLCACHE Delete Name The number of times that DB2 issued a request to the
group buffer pool to delete directory and data entries associated with a specific
page set or partition. Valid value is an integer in the range 0 - 2147483647.

IXLCACHE Read Castout Class The number of requests from the page set or
partition castout owner or the group buffer pool owner to the group buffer pool to
determine which pages are cached in the group buffer pool as changed pages that need to be cast out. Valid value is an integer in the range 0 - 2147483647.

**IXLCACHE Read Castout Stats** The number of requests that the group buffer pool structure owner issues when the GBPOOLT threshold is reached to determine which castout classes have changed pages. Valid value is an integer in the range 0 - 2147483647.

**IXLCACHE Read Directory Information** The number of requests that the group buffer pool structure owner issues for group buffer pool checkpoints to read the directory entries of all changed pages in the group buffer pool. Valid value is an integer in the range 0 - 2147483647.

**IXLCACHE Read STGSTATS** The number of times DB2 requested statistical information from the group buffer pool. Valid value is an integer in the range 0 - 2147483647.

**IXLCACHE Unlock Castout** The number of times that DB2 issues an unlock request to the coupling facility for castout I/Os that have completed. Valid value is an integer in the range 0 - 2147483647.

**MVS System** The MVS System Management Facility (SMF) ID. It is an alphanumeric text string with a maximum of 4 characters; for example SP11.

**Number of Checkpoints** The number of times that DB2 writes the changed pages in the group buffer pool to the page set. Valid value is an integer in the range 0 - 2147483647.

**Number of DB2 systems** The total number of monitored DB2 systems. Valid value is an integer in the range 1 - 64.

**Number of Pages Castout** The number of data pages that a member has cast out of the group buffer pool to DASD. Valid value is an integer in the range 0 - 2147483647.

**Number of Rebuilds** The number of times that a member has participated in rebuilding a group buffer pool. Valid value is an integer in the range 0 - 2147483647.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Prefetch Read No Data** The number of reads to the group buffer pool for prefetch processing, where the data is not found and the member reads the page from DASD. Valid value is an integer in the range 0 - 2147483647.

**Prefetch Read With Data** The number of reads to the group buffer pool for prefetch processing, where the data is found and returned to the member. Valid value is an integer in the range 0 - 2147483647.

**Read Fails for Storage** The number of group buffer pool read requests that failed because of a shortage of coupling facility resources. Valid value is an integer in the range 0 - 2147483647.
Register Page List Request The number of register page list requests by prefetch. Valid value is an integer in the range 0 - 2147483647.

Register Page Request The number of times that DB2 requested interest to the group buffer pool for a single page. Valid value is an integer in the range 0 - 2147483647.

RPL Reads Changed Pages The number of group buffer pool reads by prefetch to retrieve a changed page from the group buffer pool as a result of feedback from the register page list. Valid value is an integer in the range 0 - 2147483647.

RPL Reads Clean Pages The number of group buffer pool reads by prefetch to retrieve a clean page from the group buffer pool as a result of feedback from the register page list. Valid value is an integer in the range 0 - 2147483647.

Structure Name The name of a DB2 coupling facility structure. It is an alphanumeric text string, with a maximum of 16 characters; for example, TDDB241G.SCA.

Time Stamp Represents the end of data collection or the end of an interval, and is the local time where the system is running.

Valid format is MM-DD-YY HH:MM:SS, where:
• M = Month
• D = Day
• Y = Year
• H = Hour
• M = Minute
• S = Second

For example, 07-16-18 14:58:29 indicates that data collection ended on July 16th, 2018, at 14:58:29 PM.

Unregister Page Request The number of times that DB2 unregistered interest for a single page from the group buffer pool. Valid value is an integer in the range 0 - 2147483647.

Write Engine Not Available The number of times a write engine was not available to write changed pages from a group buffer pool to DASD. Valid value is an integer in the range 0 - 2147483647.

Write Fails for Storage The number of group buffer pool write requests that failed because of a shortage of coupling facility resources. Valid value is an integer in the range 0 - 2147483647.

Write System Changed Page The number of changed pages written to the group buffer pool. Valid value is an integer in the range 0 - 2147483647.

Write System Clean Page The number of clean pages written to the group buffer pool. Valid value is an integer in the range 0 - 2147483647.

Group Object Activity Summary Attributes
Use the Group Object Activity Summary attributes to create situations that monitor the I/O and getpage activity by database.
**ASYNC Write Rate** The number of asynchronous writes per second during the collection interval. Valid format is a decimal number, with 1 decimal place allowed, in the range 0.0 - 9999.9.

**Data Sharing Group** The name of a data sharing group. It is an alphanumeric text string, with a maximum of 8 characters; for example, TDDB241G.

**Database** The name of a DB2 database. It is an alphanumeric text string with a maximum of 8 characters; for example, DSNB06.

**DB2 ID** The name of a DB2 subsystem.

**Getpage Percent** The percentage of total getpage activity that is applicable to the database, space name, or thread. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 100.0; for example, 2.5.

**Getpage Rate** The number of getpage requests per second for the database or space name. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 2.3.

**Getpage RIO Ratio** The ratio of getpage requests to read I/Os for the database. The ratio is calculated by dividing the number of getpage requests by the sum of the following values:
- Number of synchronous reads
- Number of prefetch read I/Os

Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 1.8.

**ID Name** An internal attribute used for navigation, it contains either the Data Sharing Group Name or the DB2ID. It is an alphanumeric text string with a maximum of 8 characters; for example TDDB242G.

**MVS System** The MVS System Management Facility (SMF) ID. It is an alphanumeric text string with a maximum of 4 characters; for example SP11.

**Number of ASYNC Writes** The number of asynchronous writes during the collection interval. Valid value is an integer in the range 0 - 2147483647.

**Number of DB2 systems** The total number of monitored DB2 systems. Valid value is an integer in the range 1 - 64.

**Number of Getpages** The number of getpage reads for the database or space name. Valid value is an integer in the range 0 - 2147483647.

**Number of Other Writes** The number of immediate and format writes. Valid value is an integer in the range 0 - 2147483647.

**Number of Prefetch Reads** The number of prefetch read I/Os for the database. Valid value is an integer in the range 0 - 2147483647.

**Number of SYNC Reads** The number of synchronous reads for the database or space name. Valid value is an integer in the range 0 - 2147483647.
**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Other Write Rate** The number of immediate and format writes per second. Valid value is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 0.6.

**Percent of I/O** The percentage of the total I/O activity that is applicable to the database or space name. Valid value is a decimal number, with one decimal place allowed, in the range 0.0 - 100.0; for example, 2.0.

**Prefetch Read Rate** The number of prefetch read I/Os per second for the database or space name. Valid value is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 0.9.

**Space Name** The name of the selected space for which thread activity has occurred. It is an alphanumeric text string, with a maximum of 8 characters; for example DSNUCX01.

**SYNC Read Rate** The number of synchronous reads per second for the database or space name. Valid value is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 2.2.

**Time Stamp** Represents the end of data collection or the end of an interval, and is the local time where the system is running.

Valid format is MM-DD-YY HH:MM:SS, where:
- M = Month
- D = Day
- Y = Year
- H = Hour
- M = Minute
- S = Second

For example, 07-16-18 14:58:29 indicates that data collection ended on July 16th, 2018, at 14:58:29 PM.

**Group Object Analysis Attributes**
Use the Group Object Analysis (GOA) attributes to create situations that monitor object volume and extent activity for all DB2 systems in a data sharing group.

**Data Sharing Group** The name of a data sharing group. It is an alphanumeric text string, with a maximum of 8 characters; for example, TDB241G.

**Database Name** The name of a DB2 database. It is an alphanumeric text string with a maximum of 8 characters; for example, DSNDB06.

**DB2 ID** The name of a DB2 subsystem.

**Extents per Data Set Ratio** The average number of extents per data set or space name for a DB2 database. Valid value is an integer in the range 0 - 100.
**IDNAME** An internal attribute used for navigation, it contains either the Data Sharing Group Name or the DB2ID. It is an alphanumeric text string with a maximum of 8 characters; for example TDDB242G.

**Max Number of Exts per DSN** The largest number of extents per data set of space name for a DB2 database. Valid value is an integer in the range 0 - 219.

**MVS System** The MVS System Management Facility (SMF) ID. It is an alphanumeric text string with a maximum of 4 characters; for example SP11.

**Number of Data Sets** The total number of allocated data sets for the DB2 you are monitoring. Valid value is an integer in the range 0 - 10000.

**Number of DB2 systems** The total number of monitored DB2 systems. Valid value is an integer in the range 1 - 64.

**Number of Extents** The number of data set extents that the operating system has allocated for a data set. Valid value is an integer in the range 0 - 219.

**Number of Indexes** The number of index spaces that the operating system currently has allocated to DB2. Valid value is an integer in the range 0 - 99999.

**Number of Spaces** The total number of index spaces and table spaces that the operating system currently has allocated to DB2. Valid value is an integer in the range 0 - 99999.

**Number of Table Spaces** The number of table spaces that the operating system currently has allocated to DB2. Valid value is an integer in the range - 10000.

**Number of Volumes** The number of volumes on which the data set resides. Valid value is an integer in the range 0 - 256.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Time Stamp** Represents the end of data collection or the end of an interval, and is the local time where the system is running.

Valid format is MM-DD-YY HH:MM:SS, where:
- M = Month
- D = Day
- Y = Year
- H = Hour
- M = Minute
- S = Second

For example, 07-16-18 14:58:29 indicates that data collection ended on July 16th, 2018, at 14:58:29 PM.

**Group Object Analysis Thread Activity Summary Attributes**
Use the Group Object Analysis (GOA) Thread Activity summary attributes to create situations that monitor thread activity.
**ASYNC Write Rate** The number of asynchronous writes per second during the collection interval. Valid format is a decimal number, with one decimal place allowed.

**Authorization ID** The primary authorization ID from connection or sign-on that identifies the execution privileges an application has to a DB2 object or service. It is an alphanumeric text string with a maximum of 8 characters; for example, TRAN5.

**Correlation ID** The correlation between an application and the connection to a DB2 system. It is an alphanumeric text string, with a maximum of 4 characters; for example, D412.

**Database** The name of a DB2 database. Valid format is alphanumeric with a maximum of 8 characters; for example, DSNDB06.

**Data Sharing Group** The name of a data sharing group. It is an alphanumeric text string, with a maximum of 8 characters; for example, TDDB241G.

**DB2 ID** The name of a DB2 subsystem.

**Dynamic Prefetch Read Rate** The number of dynamic prefetch read I/Os made per second by the thread. Valid format is a decimal number, with one decimal place allowed.

**Getpage per Read I/O** The ratio of getpage requests to read I/Os for the database.

The ratio is calculated by dividing the number of getpage requests by the sum of the following values:

- Number of synchronous reads
- Number of prefetch read I/Os

Valid format is a decimal number, with one decimal place allowed.

**Getpage Percent** The percentage of total getpage activity that is applicable to the database, space name, or thread. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 100.0; for example, 2.5.

**Getpage Rate** The number of getpage requests per second for the database or space name. Valid format is a decimal number, with one decimal place allowed.

**IDNAME** An internal attribute used for navigation, it contains either the Data Sharing Group Name or the DB2ID. It is an alphanumeric text string with a maximum of 8 characters; for example TDDB242G.

**List Prefetch Read Rate** The number of list prefetch read I/Os made per second by the thread. Valid format is a decimal number, with one decimal place allowed.

**MVS System** The MVS System Management Facility (SMF) ID. It is an alphanumeric text string with a maximum of 4 characters; for example SP11.

**Number of ASYNC Writes** The number of asynchronous writes during the collection interval. Valid value is an integer in the range 0 - 2147483647.
Number of Dynamic Prefetch Reads  The number of dynamic prefetch read I/Os made by the thread. Valid value is an integer in the range 0 - 2147483647.

Number of Getpage Reads  The number of getpage reads for the database or space name. Valid value is an integer in the range 0 - 2147483647.

Number of List Prefetch Reads  The number of list prefetch I/Os made by the thread. Valid value is an integer in the range 0 - 2147483647.

Number of Other Writes  The number of immediate and format writes. Valid value is an integer in the range 0 - 2147483647.

Number of Sequential Prefetch Reads  The number of sequential prefetch reads for the thread. Valid value is an integer in the range 0 - 2147483647.

Number of SYNC Reads  The number of synchronous reads for the database or space name. Valid value is an integer in the range 0 - 2147483647.

Number of Threads  The total number of currently monitored threads. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9.

Originating System ID  The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

Other Write Rate  The number of immediate and format writes per second. Valid format is a decimal number, with one decimal place allowed.

Percent of I/O  The percentage of the total I/O activity that is applicable to the database or space name. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 100.0; for example, 2.0.

Plan Name  The name of an application plan that DB2 produces during the bind process and uses for processing SQL statements during execution. It is an alphanumeric text string, with a maximum of 8 characters. For example, PLANLCK2 is the name of an application plan. *SYSTEM* indicates DB2 subsystem-generated threads that own or are waiting on a lock.

Sequential Prefetch Read Rate  The number of sequential prefetch read I/Os per second made by the thread. Valid format is a decimal number, with one decimal place allowed.

Space Name  The name of the selected space for which thread activity has occurred. It is an alphanumeric text string, with a maximum of 8 characters; for example DSNUCX01.

SYNC Read Rate  The number of synchronous reads per second for the database or space name. Valid format is a decimal number, with one decimal place allowed.

Time Stamp  Represents the end of data collection or the end of an interval, and is the local time where the system is running.

Valid format is MM-DD-YY HH:MM:SS, where:

- M = Month
- D = Day
• Y = Year
• H = Hour
• M = Minute
• S = Second

For example, 07-16-18 14:58:29 indicates that data collection ended on July 16th, 2018, at 14:58:29 PM.

**Group Object Analysis Thread Volume Summary Attributes**

Use the Group Object Analysis (GOA) Thread Volume Summary attributes to create situations that monitor the thread activity for volumes.

**Authorization ID** The primary authorization ID from connection or sign-on that identifies the execution privileges an application has to a DB2 object or service. It is an alphanumeric text string with a maximum of 8 characters; for example, TRAN5.

**Correlation ID** The correlation between an application and the connection to a DB2 system. It is an alphanumeric text string, with a maximum of 4 characters; for example D412.

**Data Sharing Group** The name of a data sharing group. It is an alphanumeric text string, with a maximum of 8 characters; for example, TDDB241G.

**DB2 ID** The name of a DB2 subsystem.

**DB2 Read I/O** The number of read I/Os. Valid value is an integer in the range 0 - 2147483647; for example, 22.

**DB2 Read I/O Rate** The read I/O rate per second. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 1.2.

**DB2 Write I/O** The number of I/O writes. Valid value is an integer in the range 0 - 2147483647; for example, 20.

**DB2 Write I/O Rate** The write I/O rate per second. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 1.2.

**IDNAME** An internal attribute used for navigation, it contains either the Data Sharing Group Name or the DB2ID. It is an alphanumeric text string with a maximum of 8 characters; for example TDDB242G.

**Max DB2 I/O Rate** The maximum DB2 I/O rate per second during the current interval. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 2.2.

**Max DB2 Read I/O Rate** The maximum DB2 read I/O rate per second during the current interval. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 2.4.

**Max DB2 Write I/O Rate** The maximum write I/O rate per second during the current interval. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 1.0.

**MVS System** The MVS System Management Facility (SMF) ID. It is an alphanumeric text string with a maximum of 4 characters; for example SP11.
Number of Threads The total number of currently monitored threads. Valid value is an integer in the range 0 - 999999.

Originating System ID The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

Percent Volume Use The percentage of DB2 I/O activity to the volume. The program calculates the value by dividing the total I/O rate for the database by the total I/O rate for the volume. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 100.0; for example, 3.0.

Plan Name The name of an application plan that DB2 produces during the bind process and uses for processing SQL statements during execution. It is an alphanumeric text string, with a maximum of 8 characters. For example, PLANLCK2 is the name of an application plan. *SYSTEM* indicates DB2 subsystem-generated threads that own or are waiting on a lock.

Time Stamp Represents the end of data collection or the end of an interval, and is the local time where the system is running.

Valid format is MM-DD-YY HH:MM:SS, where:
- M = Month
- D = Day
- Y = Year
- H = Hour
- M = Minute
- S = Second

For example, 07-16-18 14:58:29 indicates that data collection ended on July 16th, 2018, at 14:58:29 PM.

Total DB2 I/O The total DB2 I/O count. Valid value is an integer in the range 0 - 2147483647.

Total DB2 I/O Rate The total I/O rate per second. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 2.4.

Volume Name The name of the volume that contains the DB2 objects. It is an alphanumeric text string, to a maximum of 6 characters; for example, PRI123.

**Group Object Analysis Volume Database Summary Attributes**
Use the Group Object Analysis (GOA) Volume Database Summary attributes to create situations that monitor I/O activity for a single volume in a DB2 database.

Database Name The name of a DB2 database. It is an alphanumeric text string with a maximum of 8 characters; for example, DSNDB06.

Data Sharing Group The name of a data sharing group. It is an alphanumeric text string, with a maximum of 8 characters; for example, TDDB241G.

DB2 ID The name of a DB2 subsystem.

DB2 Read I/O The number of read I/Os. Valid value is an integer in the range 0 - 2147483647; for example, 22.
DB2 Read I/O Rate The read I/O rate per second. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 1.2.

DB2 Read I/O Rate Max The maximum DB2 read I/O rate per second during the current interval. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 2.4.

DB2 Write I/O The number of write I/Os. Valid value is an integer in the range 0 - 2147483647; for example, 20.

DB2 Write I/O Rate The write I/O rate per second. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 1.0.

DB2 Write I/O Rate Max The maximum write I/O rate per second during the current interval. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 1.2.

IDNAME An internal attribute used for navigation, it contains either the Data Sharing Group Name or the DB2ID.

MVS System The MVS System Management Facility (SMF) ID. It is an alphanumeric text string with a maximum of 4 characters; for example SP11.

Number of Data Sets The total number of allocated data sets for the DB2 being monitored. Valid value is an integer in the range 0 - 10000.

Number of DB2 systems The total number of monitored DB2 systems. Valid value is an integer in the range 1 - 64.

Number of Extents The number of data set extents that the operating system has allocated for a data set. Valid value is an integer in the range 0 - 219.

Originating System ID The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

Space Name The name of the selected space for which thread activity has occurred. It is an alphanumeric text string, with a maximum of 8 characters; for example DSNUCX01.

Time Stamp Represents the end of data collection or the end of an interval, and is the local time where the system is running.

Valid format is MM-DD-YY HH:MM:SS, where:
• M = Month
• D = Day
• Y = Year
• H = Hour
• M = Minute
• S = Second

For example, 07-16-18 14:58:29 indicates that data collection ended on July 16th, 2018, at 14:58:29 PM.
**Total DB2 I/O** The total DB2 I/O count. Valid value is an integer in the range 0 - 2147483647.

**Total DB2 I/O Rate** The total I/O rate per second. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 2.4.

**Total DB2 I/O Rate Max** The maximum I/O rate per second during the collection interval. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 2.5.

**Volume Name** The name of the volume that contains the DB2 objects. It is an alphanumeric text string, to a maximum of 6 characters; for example, PRI123.

**Volume Use Percent** The percentage of DB2 I/O activity to the volume. The program calculates the value by dividing the total I/O rate for the database by the total I/O rate for the volume. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 100.0; for example, 3.0.

**Group Object Analysis Volume Summary Attributes**

**Data Sharing Group** The name of a data sharing group. It is an alphanumeric text string, with a maximum of 8 characters; for example, TDDB241G.

**DB2 ID** The name of a DB2 subsystem.

**DB2 I/O Percent** The percentage of total DB2 I/O that is attributable to the volume. It is calculated by dividing the volume DB2 I/O count by the total DB2 I/O count. Valid value is a decimal number, with one decimal place allowed, in the range 0.0 - 100.0; for example, 24.

**Extents per Data Set Ratio** The ratio of total extents allocated to the total data set count.

**IDNAME** An internal attribute used for navigation, it contains either the Data Sharing Group Name or the DB2ID.

**MVS System** The MVS System Management Facility (SMF) ID. It is an alphanumeric text string with a maximum of 4 characters; for example, SP11.

**Number of Data Sets** The total number of allocated data sets for the DB2 being monitored. Valid value is an integer in the range 0 - 10000.

**Number of DB2 systems** The total number of monitored DB2 systems. Valid value is an integer in the range 1 - 64.

**Number of Extents** The number of data set extents that the operating system has allocated for a data set. Valid value is an integer in the range 0 - 219.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.
**Time Stamp** Represents the end of data collection or the end of an interval, and is the local time where the system is running.

Valid format is MM-DD-YY HH:MM:SS, where:
- **M** = Month
- **D** = Day
- **Y** = Year
- **H** = Hour
- **M** = Minute
- **S** = Second

For example, 07-16-18 14:58:29 indicates that data collection ended on July 16th, 2018, at 14:58:29 PM.

**Volume DB2 I/O** The total number of I/Os for the volume originating from the DB2 subsystem being monitored. Valid value is an integer in the range 0 - 2147483647.

**Volume DB2 I/O Rate** The total number of I/Os per second for the volume originating from the DB2 subsystem being monitored. Valid value is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 0.9.

**Volume DB2 I/O Rate Max** The maximum I/O rate per second during the collection interval. Valid value is a decimal number, with one decimal place allowed, in the range 0.0 - 2147483647.0; for example, 2.5.

**Volume Name** The name of the volume that contains the DB2 objects. It is an alphanumeric text string, with a maximum of 6 characters; for example, PRI123.

**Volume Service Time** The average service time for the volume since the beginning of the collection interval. This value is the sum of the average IOS pending time, the average IOS connect time, and the average IOS disconnected time for the volume. It does not include IOS queue time. Valid value is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 1.7.

**Volume Service Time Max** The maximum service time for the volume since the beginning of the collection interval. The value is the sum of the IOS pending time, the IOS connect time, and the IOS disconnect time for the volume. It does not include IOS queue time. Valid value is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 0.5.

**Volume Total I/O** The total number of I/Os for the volume. The value is from an MVS perspective. If the volume is shared by multiple MVS systems, the value may not reflect all I/O activity for the volume. Valid value is an integer in the range 0 - 2147483647; for example, 19.

**Volume Total I/O Rate** The total number of I/Os per second for the volume. The value is from an MVS perspective. If the volume is shared by multiple MVS systems, the value may not reflect all I/O activity for the volume. Valid value is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 1.7.

**Volume Use Percent** The percentage of DB2 I/O activity to the volume. The program calculates the value by dividing the total I/O rate for the database by the
total I/O rate for the volume. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 100.0; for example, 3.0.

**Volume Utilization** The percentage of volume utilization and represents the percentage of time the volume is in use. Valid value is an integer in the range 0 - 100; for example, 22.

**Group Object Space Name Attributes**
Use the Group Object Space Name attributes to create situations that monitor object, volume, and extent activity for all DB2 object spaces in a data sharing group.

**Buffer Pool ID** An ID for a buffer pool.

Valid values are:
- 0 - 49
- 32K
- 32K0 - 32K9

**Data Sharing Group** The name of a data sharing group. It is an alphanumeric text string, with a maximum of 8 characters; for example, TDDB241G.

**Database Name** The name of a DB2 database. It is an alphanumeric text string with a maximum of 8 characters; for example, DSNDB06.

**DB2 ID** The name of a DB2 subsystem.

**Extents per Data Set Ratio** The average number of extents per data set or space name for a DB2 database. Valid value is an integer in the range 0 - 100.

**IDNAME** An internal attribute used for navigation, it contains either the Data Sharing Group Name or the DB2ID.

**Max Number of Extents per DSN** The largest number of extents per data set or space name for a DB2 database. Valid value is an integer in the range 0 - 219.

**MVS System** The MVS System Management Facility (SMF) ID. It is an alphanumeric text string with a maximum of 4 characters; for example SP11.

**Number of Data Sets** The total number of allocated data sets for the DB2 you are monitoring. Valid value is an integer in the range 0 - 10000.

**Number of DB2 systems** The total number of monitored DB2 systems. Valid value is an integer in the range 1 - 64.

**Number of Extents** The number of data set extents that the operating system has allocated for a data set. Valid value is an integer in the range 0 - 219.

**Number of Volumes** The number of volumes on which the data set resides. Valid value is an integer in the range 0 - 256.

**Object Space Name** The name of a DB2 object space. It is an alphanumeric text string, with a maximum of 8 characters; for example, DSNUCX01.

**Object Type** The type of object space name.
Valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INDX</td>
<td>Index</td>
</tr>
<tr>
<td>PTIX</td>
<td>Partitioned index</td>
</tr>
<tr>
<td>PTTS</td>
<td>Partitioned table space</td>
</tr>
<tr>
<td>SEGM</td>
<td>Segmented table space</td>
</tr>
<tr>
<td>TBLS</td>
<td>Simple table space</td>
</tr>
<tr>
<td>UNDT</td>
<td>Undetermined</td>
</tr>
</tbody>
</table>

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Time Stamp** Represents the end of data collection or the end of an interval, and is the local time where the system is running.

Valid format is MM-DD-YY HH:MM:SS, where:
- M = Month
- D = Day
- Y = Year
- H = Hour
- M = Minute
- S = Second

For example, 07-16-18 14:58:29 indicates that data collection ended on July 16th, 2018, at 14:58:29 PM.

**Local DB2 Coupling Facility Attributes**

Use the Local DB2 Coupling Facility attributes to create situations to determine the excess usage and reduced availability of coupling facility structures relating to group buffer pools, the shared communication area, and the lock table.

**Data Sharing Group** The name of a data sharing group. It is an alphanumeric text string, with a maximum of 8 characters; for example, TDDB241G.

**DB2 Change Requests** The number of change requests for P-locks. Valid value is an integer in the range 0 - 99999999.

**DB2 False Contention** Provides a global view of false contentions for all DB2 systems in a data sharing group. The formula is the number of false contentions divided by the total number of global contentions, multiplied by 100. Valid value is an integer in the range 0 - 99999999.

**DB2 False Suspends** The number of suspends because of MVS XES (Cross-system Extended Services) false contention. Valid value is an integer in the range 0 - 99999999.

**DB2 Global Contention** Provides a global view of global contentions for all DB2 systems in a data sharing group. The formula is the total number of suspends because global contention divided by the total number of XES requests, multiplied by 100. Valid value is an integer in the range 0 - 99999999.
**DB2 IRLM Suspends** The number of suspends because of IRLM global resource contentions. This occurs when IRLM states are in conflict and require inter-system communication for resolution. Valid value is an integer in the range 0 - 99999999.

**DB2 Lock Requests** The number of lock requests for P-locks. Valid value is an integer in the range 0 - 99999999.

**DB2 Unlock Requests** The number of unlock requests for P-locks. Valid value is an integer in the range 0 - 99999999.

**DB2 XES Suspends** The number of suspends because of MVS XES global resource contentions that are not IRLM-level contention. This occurs when XES lock states are in conflict but the IRLM lock states are not in conflict. Valid value is an integer in the range 0 - 99999999.

**False Contention** The number of contentions that the IRLM thought were competing for the same database resource. Valid value is an integer in the range 0 - 99999999.

Usage: An IRLM subsystem identifies a contention but grants a lock to a contending IRLM subsystem because the contending IRLM is requesting access to a different segment in the database.

**False Contention Rate** The number of false contentions divided by the number of seconds during the collection interval. Valid value is an integer in the range 0 - 99999999.

**Global Contention** The total number of contentions competing for the same database resource. Valid value is an integer in the range 0 - 99999999.

**Global Contention Rate** The number of contentions divided by the number of seconds during the collection interval. Valid value is an integer in the range 0 - 99999999.

**IDNAME** An internal attribute used for navigation, it contains either the Data Sharing Group Name or the DB2ID. It is an alphanumeric text string with a maximum of 8 characters; for example TDDB242G.

**List Entries Allocated** The total number of list entries that a DB2 system has allocated for the LOCK1 coupling facility structure. Valid value is an integer in the range 0 - 99999999.

**List Entries Percent** The number of list entries that IRLM is currently using divided by the number of list entries that DB2 has allocated. Valid value is an integer in the range 0 - 100.

**List Entries Used** The total number of list entries IRLM is currently using for the LOCK1 coupling facility structure. Valid value is an integer in the range 0 - 99999999.

**Lock Entries Allocated** The total number of lock entries that a DB2 system has allocated for the LOCK1 coupling facility structure. Valid value is an integer in the range 0 - 99999999.
**Lock Entries Percent** The number of lock entries that IRLM is currently using divided by the number of lock entries DB2 has allocated. Valid value is an integer in the range 0 -100.

**Lock Entries Used** The total number of lock entries IRLM is currently using for the LOCK1 coupling facility structure. Valid value is an integer in the range 0 - 99999999.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Structure Connect Count** The number of active connections to a structure. Valid value is an integer in the range 0 - 16.

**Structure Name** The name of a DB2 coupling facility structure. It is an alphanumeric text string, with a maximum of 16 characters; for example, TDDB241G.SCA.

**Structure Size** The size in kilobytes of a DB2 coupling facility structure. Valid value is an integer in the range 0 - 99999999.

**Structure Status** The current status of the coupling facility structure.

Valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACTIVE</td>
<td>The structure is active</td>
</tr>
<tr>
<td>ALTER</td>
<td>The structure is being altered</td>
</tr>
<tr>
<td>CLEANUP</td>
<td>The structure is inactive</td>
</tr>
<tr>
<td>REBUILD</td>
<td>The structure is being rebuilt</td>
</tr>
</tbody>
</table>

For duplexed group buffer pool structures, additional valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>REB_NEW</td>
<td>Rebuild on new (secondary GBP)</td>
</tr>
<tr>
<td>REB_ERR</td>
<td>Error during the structure rebuild</td>
</tr>
<tr>
<td>REB_HOLD</td>
<td>Structure is in holding state</td>
</tr>
<tr>
<td>REB_OLD</td>
<td>Rebuild on old (primary) GBP</td>
</tr>
<tr>
<td>REB_STOP</td>
<td>Structure rebuild is stopped</td>
</tr>
<tr>
<td>REB_TRAN</td>
<td>Structure is in transition</td>
</tr>
</tbody>
</table>

**Structure Type** The type of DB2 coupling facility structure.

Valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CACHE</td>
<td>Cache data of interest to several DB2 systems in data sharing group</td>
</tr>
<tr>
<td>LIST</td>
<td>Shared Communications Area (SCA) for data sharing group members</td>
</tr>
<tr>
<td>Value</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>LOCK</td>
<td>Controls locking</td>
</tr>
</tbody>
</table>

**Structure Used** The number of kilobytes that DB2 uses within a structure type. Valid value is an integer in the range 0 - 99999999.

**Structure Used Percent** The percent of the total available kilobytes that DB2 is currently using within a structure type. Valid value is an integer in the range 0 - 100.

**Time Stamp** Represents the end of data collection or the end of an interval, and is the local time where the system is running.

Valid format is MM-DD-YY HH:MM:SS, where:
- M = Month
- D = Day
- Y = Year
- H = Hour
- M = Minute
- S = Second

For example, 07-16-18 14:58:29 indicates that data collection ended on July 16th, 2018, at 14:58:29 PM.

**Local Group Buffer Pool Attributes**

Use Local Group Buffer Pool attributes to create situations to determine the usage and availability of coupling facility structures relating to group buffer pools, the shared communication area, and the lock table.

**Cross Invalidate Count** The number of notifications that the DB2 buffer has modified. Valid value is an integer in the range 0 - 99999999.

**Cross Invalidate Rate** The rate of cross invalidations per second. Valid value is an integer in the range 0 - 99999999.

**Data Pages** The number of data pages that DB2 has allocated for the group buffer pool. Valid value is an integer in the range 0 - 99999999.

**Data Sharing Group** The name of a data sharing group. It is an alphanumeric text string, with a maximum of 8 characters; for example, TDDB241G.

**Directory Entries** The total number of directory entries that a DB2 system has allocated for a coupling facility structure. Valid value is an integer in the range 0 - 99999999.

**IDNAME** An internal attribute used for navigation, it contains either the Data Sharing Group Name or the DB2ID. It is an alphanumeric text string with a maximum of 8 characters; for example TDDB242G.

**MVS System** The MVS System Management Facility (SMF) ID. It is an alphanumeric text string with a maximum of 4 characters; for example SP11.
**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Read Count** The total number of page read requests to a group buffer pool. Valid value is an integer in the range 0 - 99999999.

**Read Hit Count** The number of successful page read requests to a group buffer pool without causing a physical database read. Valid value is an integer in the range 0 - 99999999.

**Read Hit Percent** The percentage of successful page read requests in relation to the total page read requests for a group buffer pool. Valid value is an integer in the range 0 - 100.

**Structure Connect Count** The number of active connections to a structure. Valid value is an integer in the range 0 - 16.

**Structure Name** The name of a DB2 coupling facility structure. It is an alphanumeric text string, with a maximum of 16 characters; for example, TDDB241G.SCA.

**Structure Size** The size, in kilobytes, of a DB2 coupling facility structure. Valid value is an integer in the range 0 - 99999999.

**Structure Status** The current status of the coupling facility structure.

Valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACTIVE</td>
<td>The structure is active</td>
</tr>
<tr>
<td>ALTER</td>
<td>The structure is being altered</td>
</tr>
<tr>
<td>CLEANUP</td>
<td>The structure is inactive</td>
</tr>
<tr>
<td>REBUILD</td>
<td>The structure is being rebuilt</td>
</tr>
</tbody>
</table>

For duplexed group buffer pool structures, additional valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>REB_NEW</td>
<td>Rebuild on new (secondary GBP)</td>
</tr>
<tr>
<td>REB_ERR</td>
<td>Error during the structure rebuild</td>
</tr>
<tr>
<td>REB_HOLD</td>
<td>Structure is in holding state</td>
</tr>
<tr>
<td>REB_OLD</td>
<td>Rebuild on old (primary) GBP</td>
</tr>
<tr>
<td>REB_STOP</td>
<td>Structure rebuild is stopped</td>
</tr>
<tr>
<td>REB_TRAN</td>
<td>Structure is in transition</td>
</tr>
</tbody>
</table>

**Structure Type** The type of DB2 coupling facility structure.

Valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CACHE</td>
<td>Cache data of interest to several DB2 systems in data sharing group</td>
</tr>
<tr>
<td>Value</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>------------------------------------------------------------------</td>
</tr>
<tr>
<td>LIST</td>
<td>Shared Communications Area (SCA) for data sharing group members</td>
</tr>
<tr>
<td>LOCK</td>
<td>Controls locking</td>
</tr>
</tbody>
</table>

**Time Stamp** Represents the end of data collection or the end of an interval, and is the local time where the system is running.

Valid format is MM-DD-YY HH:MM:SS, where:
- M = Month
- D = Day
- Y = Year
- H = Hour
- M = Minute
- S = Second

For example, 07-16-18 14:58:29 indicates that data collection ended on July 16th, 2018, at 14:58:29 PM.

**Local Group Buffer Pool Connection Attributes**

Use the Local Group Buffer Pool (GBP) Connection attributes to create situations that monitor connections to DB2 coupling facilities.

**Connection Status** The status of the connection between a DB2 coupling facility member (IRLM subsystem) and group.

Valid values are:
- **ACTIVE**  
  Active member connection
- **CONNECT**  
  Member connected but not active
- **CON-DUAL**  
  Dual connection for duplexing the group buffer pool structures.
- **DISCONN**  
  Member disconnected
- **FAILED**  
  Member failed to connect
- **FAIL_PER**  
  Member persistently fails to connect

**Coupling Facility Name** The name of a DB2 coupling facility. It is an alphanumeric text string with a maximum of 16 characters; for example, DB2_D411.

**Data Sharing Group** The name of a data sharing group. It is an alphanumeric text string, with a maximum of 8 characters; for example, TDB241G.

**Data Sharing Group Element** The name of an element of within the data sharing group.
**DB2 ID** The name of a DB2 subsystem.

**IDNAME** An internal attribute used for navigation, it contains either the Data Sharing Group Name or the DB2ID. It is an alphanumeric text string with a maximum of 8 characters; for example TDDB242G.

**Job Name** The job name connected to a coupling facility structure. It is an alphanumeric text string with a maximum of 8 characters; for example, IRLM.

**MVS System** The MVS System Management Facility (SMF) ID. It is an alphanumeric text string with a maximum of 4 characters; for example, SP11.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Structure Name** The name of a DB2 coupling facility structure. It is an alphanumeric text string, with a maximum of 16 characters; for example, TDDB241G.SCA.

**Time Stamp** Represents the end of data collection or the end of an interval, and is the local time where the system is running.

Valid format is MM-DD-YY HH:MM:SS, where:
- M = Month
- D = Day
- Y = Year
- H = Hour
- M = Minute
- S = Second

For example, 07-16-18 14:58:29 indicates that data collection ended on July 16th, 2018, at 14:58:29 PM.

**Local Group Object Analysis Thread Activity Attributes**
Use the Local Group Object Analysis (GOA) Thread Activity attributes to create situations that monitor thread activity.

**ASYNC Write Rate** The number of asynchronous writes per second during the collection interval. Valid format is a decimal number, with 1 decimal place allowed, in the range 0.0 - 9999.9.

**Authorization ID** The primary authorization ID from connection or sign-on that identifies the execution privileges an application has to a DB2 object or service. It is an alphanumeric text string with a maximum of 8 characters; for example, TRAN5.

**Correlation ID** The correlation between an application and the connection to a DB2 system. It is an alphanumeric text string, with a maximum of 4 characters; for example D412.

**Data Sharing Group** The name of a data sharing group. It is an alphanumeric text string, with a maximum of 8 characters; for example, TDDB241G.
**Database** The name of a DB2 database. It is an alphanumeric text string with a maximum of 8 characters; for example, DSNDB06.

**DB2 ID** The name of a DB2 subsystem.

**Dynamic Prefetch Read Rate** The number of dynamic prefetch read I/Os made per second by the thread. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 2.2.

**Getpage per Read I/O** The ratio of getpage requests to read I/Os for the database. The ratio is calculated by dividing the number of getpage requests by the sum of the following values:

- Number of synchronous reads
- Number of prefetch read I/Os

Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 1.8.

**Getpage Percent** The percentage of total getpage activity that is applicable to the database, space name, or thread. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 100.0; for example, 2.5.

**Getpage Rate** The number of getpage requests per second for the database or space name. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 2.3.

**IDNAME** An internal attribute used for navigation, it contains either the Data Sharing Group Name or the DB2ID. It is an alphanumeric text string with a maximum of 8 characters; for example TDDDB242G.

**List Prefetch Read Rate** The number of list prefetch read I/Os made per second by the thread. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 2.5.

**MVS System** The MVS System Management Facility (SMF) ID. It is an alphanumeric text string with a maximum of 4 characters; for example SP11.

**Number of ASYNC Writes** The number of asynchronous writes during the collection interval. Valid value is an integer in the range 0 - 2147483647.

**Number of Dynamic Prefetch Reads** The number of dynamic prefetch read I/Os made by the thread. Valid value is an integer in the range 0 - 2147483647.

**Number of Getpage Reads** The number of getpage reads for the database or space name. Valid value is an integer in the range 0 - 2147483647.

**Number of List Prefetch Reads** The number of list prefetch read I/Os made by the thread. Valid value is an integer in the range 0 - 2147483647.

**Number of Other Writes** The number of immediate and format writes. Valid value is an integer in the range 0 - 2147483647.

**Number of Sequential Prefetch Reads** The number of sequential prefetch reads for the thread. Valid value is an integer in the range 0 - 2147483647.
**Number of SYNC Reads** The number of synchronous reads for the database or space name. Valid value is an integer in the range 0 - 2147483647.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Other Write Rate** The number of immediate and format writes per second. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 0.6.

**Percent of I/O** The percentage of the total I/O activity that is applicable to the database or space name. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 100.0; for example, 2.0.

**Plan Name** The name of an application plan that DB2 produces during the bind process and uses for processing SQL statements during execution. It is an alphanumeric text string, with a maximum of 8 characters. For example, PLANLCK2 is the name of an application plan. *SYSTEM* indicates DB2 subsystem-generated threads that own or are waiting on a lock.

**Sequential Prefetch Read Rate** The number of sequential prefetch read I/Os per second made by the thread. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 2.1.

**Space Name** The name of the selected space for which thread activity has occurred. It is an alphanumeric text string, with a maximum of 8 characters; for example DSNUCX01.

**SYNC Read Rate** The number of synchronous reads per second for the database or space name. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 2.2.

**Time Stamp** Represents the end of data collection or the end of an interval, and is the local time where the system is running.

Valid format is MM-DD-YY HH:MM:SS, where:
- M = Month
- D = Day
- Y = Year
- H = Hour
- M = Minute
- S = Second

For example, 07-16-18 14:58:29 indicates that data collection ended on July 16th, 2018, at 14:58:29 PM.

**Local Group Object Analysis Thread Volume Attributes**
Use the Local Group Object Analysis (GOA) Thread Volume attributes to create situations that monitor the thread activity for volumes.

**Authorization ID** The primary authorization ID from connection or sign-on that identifies the execution privileges an application has to a DB2 object or service. It is an alphanumeric text string with a maximum of 8 characters; for example, TRAN5.
**Correlation ID** The correlation between an application and the connection to a DB2 system. It is an alphanumeric text string, with a maximum of 4 characters; for example D412.

**Data Sharing Group** The name of a data sharing group. It is an alphanumeric text string, with a maximum of 8 characters; for example, TDDB241G.

**DB2 ID** The name of a DB2 subsystem.

**DB2 Read I/O** The number of read I/Os. Valid value is an integer in the range 0 - 2147483647; for example, 22.

**DB2 Read I/O Rate** The read I/O rate per second. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 1.2.

**DB2 Write I/O** The number of I/O writes. Valid value is an integer in the range 0 - 2147483647; for example, 20.

**DB2 Write I/O Rate** The write I/O rate per second. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 1.2.

**IDNAME** An internal attribute used for navigation, it contains either the Data Sharing Group Name or the DB2ID. It is an alphanumeric text string with a maximum of 8 characters; for example TDDB242G.

**MVS System** The MVS System Management Facility (SMF) ID. It is an alphanumeric text string with a maximum of 4 characters; for example SP11.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Percent Volume Use** The percentage of DB2 I/O activity to the volume. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 100.0; for example, 5.0.

**Plan Name** The name of an application plan that DB2 produces during the bind process and uses for processing SQL statements during execution. It is an alphanumeric text string, with a maximum of 8 characters. For example, PLANLCK2 is the name of an application plan. *SYSTEM* indicates DB2 subsystem-generated threads that own or are waiting on a lock.

**Time Stamp** Represents the end of data collection or the end of an interval, and is the local time where the system is running.

Valid format is MM-DD-YY HH:MM:SS, where:
- M = Month
- D = Day
- Y = Year
- H = Hour
- M = Minute
- S = Second

For example, 07-16-18 14:58:29 indicates that data collection ended on July 16th, 2018, at 14:58:29 PM.
Total DB2 I/O The total I/O count. Valid value is an integer in the range 0 - 2147483647; for example, 22.

Total DB2 I/O Rate The total I/O rate per second. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 2.4.

Volume Name The name of the volume that contains the DB2 objects. It is an alphanumeric text string, with a maximum of 6 characters; for example, PRI123.

Local Group Object Analysis Volume Database Attributes
Use the Local Group Object Analysis (GOA) Volume Database attributes to create situations that monitor I/O activity for a single volume in a DB2 database.

Data Sharing Group The name of a data sharing group. It is an alphanumeric text string, with a maximum of 8 characters; for example, TDDB241G.

Database The name of a DB2 database. Valid format is alphanumeric with a maximum of 8 characters; for example, DSNDB06.

DB2 ID The name of a DB2 subsystem. It is an alphanumeric text string with a maximum of 4 characters.

DB2 Read I/O The number of read I/Os. Valid value is an integer in the range 0 - 2147483647; for example, 22.

DB2 Read I/O Rate The read I/O rate per second. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 1.2.

DB2 Write I/O The number of write I/Os. Valid value is an integer in the range 0 - 2147483647; for example, 20.

DB2 Write I/O Rate The write I/O rate per second. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 1.2.

IDNAME An internal attribute used for navigation, it contains either the Data Sharing Group Name or the DB2ID. It is an alphanumeric text string with a maximum of 8 characters; for example TDDB242G.

MVS System The MVS System Management Facility (SMF) ID. It is an alphanumeric text string with a maximum of 4 characters; for example SP11.

Number of Data Sets The total number of allocated data sets for the DB2 being monitored. Valid value is an integer in the range 0 - 10000.

Number of Extents The number of data set extents that the operating system has allocated for a data set. Valid value is an integer in the range 0 - 219.

Originating System ID The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

Space Name The name of the selected space for which thread activity has occurred. It is an alphanumeric text string, with a maximum of 8 characters; for example DSNUCX01.
**Time Stamp** Represents the end of data collection or the end of an interval, and is the local time where the system is running.

Valid format is MM-DD-YY HH:MM:SS, where:
- M = Month
- D = Day
- Y = Year
- H = Hour
- M = Minute
- S = Second

For example, 07-16-18 14:58:29 indicates that data collection ended on July 16th, 2018, at 14:58:29 PM.

**Total DB2 I/O** The total I/O count. Valid value is an integer in the range 0 - 2147483647.

**Total DB2 I/O Rate** The total I/O rate per second. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 2.4.

**Volume Name** The name of the volume that contains the DB2 objects. It is an alphanumeric text string, to a maximum of 6 characters; for example, PRI123.

**Volume Use Percent** The percentage of DB2 I/O activity to the volume. The value is calculated by dividing the total I/O rate for the database by the total I/O rate for the volume. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 100.0; for example, 3.0.

**Local Group Object Analysis Volume Group Attributes**

Use the Local Group Object Analysis (GOA) Volume Group attributes to create situations that monitor DASD performance by volume.

**Data Sharing Group** The name of a data sharing group. It is an alphanumeric text string, with a maximum of 8 characters; for example, TDB241G.

**DB2 ID** The name of a DB2 subsystem.

**IDNAME** An internal attribute used for navigation, it contains either the Data Sharing Group Name or the DB2ID. It is an alphanumeric text string with a maximum of 8 characters; for example TDB242G.

**MVS System** The MVS System Management Facility (SMF) ID. Valid format is alphanumeric with a maximum of 4 characters; for example SP11.

**Number of Data Sets** The total number of allocated data sets for the DB2 being monitored. Valid value is an integer in the range 0 - 10000.

**Number of Extents** The number of data set extents that the operating system has allocated for a data set. Valid value is an integer in the range 0 - 219.

**Originating System ID** The managed system name of the agent. Valid format is alphanumeric, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Time Stamp** Represents the end of data collection or the end of an interval, and is the local time where the system is running.
Valid format is MM-DD-YY HH:MM:SS, where:

- M = Month
- D = Day
- Y = Year
- H = Hour
- M = Minute
- S = Second

For example, 07-16-18 14:58:29 indicates that data collection ended on July 16th, 2018, at 14:58:29 PM.

**Volume DB2 I/O** The total number of I/Os for the volume originating from the DB2 subsystem being monitored. Valid value is an integer in the range 0 - 2147483647.

**Volume DB2 I/O Rate** The total number of I/Os per second for the volume originating from the DB2 subsystem being monitored. Valid value is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 0.9.

**Volume Name** The name of the volume that contains the DB2 objects. It is an alphanumeric text string, with a maximum of 6 characters; for example, PRI123.

**Volume Service Time** The average service time for the volume since the beginning of the collection interval. This value is the sum of the average I/Os pending time, the average I/Os connect time, and the average I/Os disconnected time for the volume. It does not include I/Os queue time. Valid value is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 1.7.

**Volume Total I/O** The total number of I/Os for the volume. The value is from an MVS perspective. If the volume is shared by multiple MVS systems, the value may not reflect all I/O activity for the volume. Valid value is an integer in the range 0 - 2147483647; for example, 19.

**Volume Total I/O Rate** The total number of I/Os per second for the volume. The value is from an MVS perspective. If the volume is shared by multiple MVS systems, the value may not reflect all I/O activity for the volume. Valid value is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 1.7.

**Volume Use Percent** The percentage of DB2 I/O activity to the volume. The program calculates the value by dividing the total I/O rate for the database by the total I/O rate for the volume. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 100.0; for example, 3.0.

**Volume Utilization** The percentage of volume utilization. The value represents a percentage of time the volume is in use. Valid value is an integer in the range 0 - 100; for example, 22.

**Local DB2 Lock Conflict Attributes**
Use Local DB2 Lock Conflict Group attributes to create situations that monitor DB2 database lock conflicts.
**Authorization ID** The primary authorization ID from connection or signon, that identifies the execution privileges an application has to a DB2 object or service. It is an alphanumeric text string with a maximum of 8 characters; for example, TRAN5.

**Authorization ID (Unicode)** The primary authorization ID from connection or signon, that identifies the execution privileges an application has to a DB2 object or service. Valid format is alphanumeric with a maximum of 8 characters; for example, TRAN5.

**Begin Time** Beginning store clock value (STCK) for the period covered by this accounting record. You can determine the elapsed time of the application by subtracting this field from QWACESC (ending store clock value). Threads that do not terminate (such as CICS primed threads and ims wait-for-input message regions) can have an ending clock value that includes the time the thread was inactive and waiting to perform work.

**Local DB2 Lock Conflict Attributes** Identifies the connection of an application to a DB2 system.

It is an alphanumeric text string, with a maximum length of eight characters.

**Local DB2 Lock Conflict Attributes** The type of connection associated with the thread.

It can be:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BATCH</td>
<td>Batch job</td>
</tr>
<tr>
<td>CICS</td>
<td>CICS attach</td>
</tr>
<tr>
<td>DLIBATCH</td>
<td>DL/I batch</td>
</tr>
<tr>
<td>Distributed</td>
<td>Distributed Database Access thread</td>
</tr>
<tr>
<td>IMS_BMP</td>
<td>IMS attach BMP</td>
</tr>
<tr>
<td>IMS_CTL</td>
<td>IMS control region</td>
</tr>
<tr>
<td>IMS_MPP</td>
<td>IMS attach MPP</td>
</tr>
<tr>
<td>IMS_TBMP</td>
<td>IMS transaction BMP</td>
</tr>
<tr>
<td>DistAllied</td>
<td>Distributed Allied thread</td>
</tr>
<tr>
<td>RRSAF</td>
<td>DB2 Resource Recovery Services attachment facility</td>
</tr>
<tr>
<td>SYSTEM</td>
<td>System directed access</td>
</tr>
<tr>
<td>TSO</td>
<td>TSO foreground and background</td>
</tr>
<tr>
<td>UNKNOWN</td>
<td>Unrecognizable connection type</td>
</tr>
<tr>
<td>UTILITY</td>
<td>DB2 Utility</td>
</tr>
</tbody>
</table>

**Correlation ID** The correlation between an application and the connection to a DB2 system. It is an alphanumeric text string, with a maximum of 12 characters; for example, DLKEX212.

**DB2 ID** The name of a DB2 subsystem.
**Display Elapsed Time** The total amount of elapsed time since thread creation or DB2 sign-on.

**IDNAME** An internal attribute used for navigation, it contains either the Data Sharing Group Name or the DB2ID.

It is an alphanumeric text string with a maximum of 8 characters; for example TDB242G.

**Lock Elapsed Time** The amount of time (in seconds) a waiter has been waiting for the resource.

**Lock Level** Identifies the lock resource usage.

Valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IS</td>
<td>Intent share</td>
</tr>
<tr>
<td>IX</td>
<td>Intent exclusive</td>
</tr>
<tr>
<td>NSU</td>
<td>Non-shared Update</td>
</tr>
<tr>
<td>S</td>
<td>Share</td>
</tr>
<tr>
<td>SIX</td>
<td>Share intent exclusive</td>
</tr>
<tr>
<td>U</td>
<td>Update</td>
</tr>
<tr>
<td>UNS</td>
<td>Unprotected shared</td>
</tr>
<tr>
<td>X</td>
<td>Exclusive</td>
</tr>
</tbody>
</table>

**Lock Resource** The resource a lock owner currently has locked or the resource that caused DB2 to suspend a lock request. It is an alphanumeric text string, with a maximum of 50 characters; for example, DB=TBLBLK2 PS=PAGELK2.

**Lock Status** The status of a job holding or waiting on a lock: If the status is OWN with a DB2 subsystem name, the lock is owned by another DB2 subsystem in the Data Sharing Group (DSG); for example, if lock status is OWN-DB2A, the lock is owned by DB2 subsystem DB2A.

**Lock Token** Lock Token.

**Lock Type** The lock type of the lock request.

Valid values are:

*Table 198. Lock types*

<table>
<thead>
<tr>
<th>Lock type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACSC</td>
<td>The Accelerator Services commands (ACSC) lock.</td>
</tr>
<tr>
<td>ALBP</td>
<td>The Alter buffer pool (ALBP) lock indicates a lock on a buffer pool during execution of an ALTER BUFFERPOOL command.</td>
</tr>
<tr>
<td>BIND</td>
<td>The BIND lock indicates an autobind or remote bind lock.</td>
</tr>
</tbody>
</table>
Table 198. Lock types (continued)

<table>
<thead>
<tr>
<th>Lock type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BMBA</td>
<td>The Buffer manager SCA MBA (BMBA) L-lock. The Buffer Manager (BM) gets this lock when it needs to read, insert, or update a multiple buffer pool (MBA) record in a Shared Communications Area (SCA). (BMC_MBAO or BMC_MBAR)</td>
</tr>
</tbody>
</table>
| BPPS      | The Buffer Manager Pageset (BPPS) RR (repeatable read) P-lock:  
  • BP = buffer pool ID  
  • DB = database name  
  • PS = pageset name |
| CCAT      | The CATMAINT convert catalog (CCAT) lock is acquired when catalog conversion is performed. |
| CDBL      | The Compress dictionary build (CDBL) lock. |
| CDIR      | The CATMAINT convert directory (CDIR) lock is acquired when directory conversion is performed. |
| CDRN      | The Cursor Stability drain (CDRN) lock is acquired to drain all CS read access to an object:  
  • DB = database name  
  • PS = pageset name  
  • PT = partition |
| CMDS      | The DB2 Command Serialization (CMDS) lock. |
| CMIG      | The CATMAINT migration (CMIG) lock is acquired when catalog migration is performed. |
| COLL      | The Collection (COLL) lock |
| DBDL      | The DBD load (DBDL) lock is the database descriptor load lock. |
| DBEX      | The Database exception (DBEX) lock indicates a lock on a "Logical page list" (LPL) or "Group buffer pool recovery pending" (GRECP) database exception status. This lock is only used in a data sharing environment. |
| DBXU      | The DB exception update lock is used for updating the database exception status. |
| DGTT      | The DGTT URID lock is acquired to protect segments that belong to a Declared Global Temporary Table (DGTT). These segments are deallocated during Commit 1 by logging them and serializing them using the Unit of Recovery ID (URID) lock. |
| DPAG      | The DB2 page (DPAG) lock in a tablespace. When programs read data or update data, they acquire a page lock containing the data:  
  • DB = database name  
  • PS = pageset name  
  • PG = page |
<table>
<thead>
<tr>
<th>Lock type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DSET</td>
<td>The partitioned lock. A partitioned tablespace contains one or more partitions (up to 64). It is created when you create a table space using the SQL CREATE TABLESPACE statement with the NUMPARTS parameter. Only one table can be stored on a partitioned tablespace. Each partition contains one part of a table. The partitioned lock only locks the partition with the data that is referenced.</td>
</tr>
<tr>
<td>DTBS</td>
<td>The Database lock indicates a lock on the database.</td>
</tr>
<tr>
<td>GRBP</td>
<td>The Group buffer pool (GRBP) start/stop lock. BP=buffer pool ID</td>
</tr>
<tr>
<td>HASH</td>
<td>The Hash anchor (HASH) lock.</td>
</tr>
<tr>
<td>HPSP</td>
<td>The Header Page (HP) Bucket or Stored Procedure (SP) Command lock.</td>
</tr>
<tr>
<td>IEOF</td>
<td>The Index end of file (IEOF) lock is acquired at the index end of file.</td>
</tr>
<tr>
<td>IPAG</td>
<td>The Index page (IPAG) lock in an index space. When application programs read or update data, they acquire a lock on the page containing the index when indexing is used.</td>
</tr>
<tr>
<td>IXKY</td>
<td>The Index key (IXKY) lock.</td>
</tr>
<tr>
<td>LBLK</td>
<td>The Large object (LOB) lock.</td>
</tr>
<tr>
<td>LPLR</td>
<td>The Logical page list recovery (LPLR) lock.</td>
</tr>
<tr>
<td>MDEL</td>
<td>The Mass delete (MDEL) lock is acquired when doing a mass delete from a table (for example, when you DELETE FROM a table) within a segmented tablespace. It is used to prevent another user from reusing freed segments before a delete operation is committed.</td>
</tr>
</tbody>
</table>
Table 198. Lock types (continued)

<table>
<thead>
<tr>
<th>Lock type</th>
<th>Description</th>
</tr>
</thead>
</table>
| PALK      | The Partition lock.  
            | • DB = database name  
            | • PS = pageset name  
            | • PT = partition |
| PBPC      | The Group BP level castout (PBPC) P-lock.  
            | A physical lock acquired when a castout of a group buffer pool  
            | occurs. Castout is the process of writing pages in the group buffer  
            | pool out to DASD.  
            | This lock is only used in a data sharing environment. |
| PCDB      | The DDF CDB P-lock.  
            | A Distributed Data Facility communication database physical lock.  
            | This lock is only used in a data sharing environment. |
| PDBD      | The DBD P-lock is a database descriptor physical lock.  
            | This lock is only used in a data sharing environment. |
| PDSO      | The Pageset or partitioned pageset open lock.  
            | If the data set supporting the tablespace that is referenced by the  
            | application is not opened, the program will acquire a lock to open the  
            | data set. The data set will stay open if CLOSE=NO is defined in the  
            | SQL statement creating the tablespace.  
            | • DB = database name  
            | • PS = pageset name |
| PITR      | The Index manager tree (PITR) is a physical lock (P-lock).  
            | This lock is only used in a data sharing environment.  
            | • DB = database name  
            | • PS = pageset name  
            | • PT = partition |
| PPAG      | The Page P-lock is a physical lock on a page.  
            | This lock is only used in a data sharing environment. |
| PPSC      | The Pageset/partition level castout physical lock (P-lock).  
            | This lock is only used in a data sharing environment. |
| PPSP      | The Pageset/partition physical lock (P-lock).  
            | This lock is only used in a data sharing environment. |
| PRLF      | The Resource Limit Facility (RLF) physical lock (P-lock).  
<pre><code>        | This lock is only used in a data sharing environment. |
</code></pre>
<table>
<thead>
<tr>
<th>Lock type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PSET</td>
<td>The Pageset (PSET) lock can be a tablespace or indexspace. A pageset containing DB2 tables is a tablespace. A pageset containing DB2 index structure is an indexspace. A pageset can be simple or partitioned. This lock type is for the simple pageset only. • DB = database name • PS = pageset name</td>
</tr>
<tr>
<td>PSPI</td>
<td>The Pageset piece (PSPI) lock. A pageset is a collection of pageset pieces. Each pageset piece is a separate VSAM data set. A simple pageset contains from 1 to 32 pieces. Each piece of a simple pageset is limited to 2 GB. Whenever a simple pageset piece reaches this size, another piece is allocated and the pageset grows. This is a lock on the expanded pageset piece.</td>
</tr>
<tr>
<td>RDBD</td>
<td>The Repair DBD (RDBD) lock is acquired when REPAIR DBD REBUILD is running (test/diagnose).</td>
</tr>
<tr>
<td>RDRN</td>
<td>The Repeatable Read drain (RDRN) lock is acquired to drain all RR access to an object. • DB = database name • PS = pageset name • PT = partition</td>
</tr>
<tr>
<td>RGDA</td>
<td>The Retry Getpage During Abort (RGDA) lock.</td>
</tr>
<tr>
<td>ROW</td>
<td>The Row lock indicates a lock on a row.</td>
</tr>
<tr>
<td>RSTR</td>
<td>The Shared Communications Area (SCA) restart (RSTR) lock indicates a lock on SCA access for restart/redo information. (BMC-RSTP)</td>
</tr>
<tr>
<td>SDBA</td>
<td>The Start/stop lock on DBA (SDBA) table indicates a lock on the table, tablespace, or database when a CREATE/DROP is processed against these objects. • DB = database name • PS = pageset name</td>
</tr>
<tr>
<td>SENV</td>
<td>The System environment (SYSENV) serialization lock.</td>
</tr>
<tr>
<td>SKCT</td>
<td>The Skeleton cursor table (SKCT) lock indicates a lock on the application plan. PLAN=plan name</td>
</tr>
<tr>
<td>SKPT</td>
<td>The Skeleton package table (SKPT) lock indicates a lock on the application package. TOKEN= the consistency token (CONTOKEN) column from SYSIBM.SYSPACKAGE.</td>
</tr>
<tr>
<td>SPRC</td>
<td>The System level point in time (PIT) recovery lock. SYS_PITR</td>
</tr>
</tbody>
</table>
The Log range lock.

DB2 writes a record in the log range tablespace (SYSLGRNG) every time a tablespace is opened and updated, and updates SYSLGRNG whenever that tablespace is closed.

The record contains the opening and/or closing log RBA (relative byte address) for the tablespace. When DB2 writes to SYSLGRNG, the program acquires a lock on the tablespace with updates.

- DB = database name
- TS = tablespace name

The Table (TABL) lock on the table which resides in a segmented tablespace.

- DBID = DBid
- TABL = Tableid

The Util I/O Damage Assessment lock.

The Undetermined (UNDT) lock indicates that this lock cannot be determined because it is not part of the other listed lock types.

Resource ID (in hexadecimal).

The Unknown (UNKN) lock indicates the resource does not exist.

The Utility exclusive execution (UTEX) lock.

UID=utility id

The Utility identifier (UTID) lock.

The Utility object (UTOB) lock.

- DB = database name
- PS = pageset name
- PT = partition

The Utility serialization (UTSE) lock is required when running utility jobs.

The Write drain (WDRN) lock is acquired to drain all write access to an object.

- DB = database name
- PS = pageset name
- PT = partition

The XML lock.

 LUWID The logical unit of work ID (LUWID) for a thread.

MVS System An ID for the MVS System Management Facility (SMF). It is an alphanumeric text string with a maximum of 4 characters; for example SP11.

Originating System ID The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.
**Plan Name** The name of an application plan that DB2 produces during the bind process and uses for processing SQL statements during execution. It is an alphanumeric text string with a maximum of 8 characters. For example PLANLCK2 is the name of an application plan. *SYSTEM* indicates DB2 subsystem-generated threads that own or are waiting on a lock.

**Resource Name 1 (Unicode)** The resource name of type defined by type code.

**Resource Name 2 (Unicode)** The resource name of type defined by type code.

**Resource Name 3** The resource name of type defined by type code.

**Resource Name 4** The resource name of type defined by type code.

**Resource Type 1** This value indicates what is contained in Resource Name 1.

Valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BP</td>
<td>Buffer Pool</td>
</tr>
<tr>
<td>CO</td>
<td>Collection name</td>
</tr>
<tr>
<td>DB Hash</td>
<td>Database</td>
</tr>
<tr>
<td>HC</td>
<td>Class</td>
</tr>
<tr>
<td>PL</td>
<td>Plan name</td>
</tr>
<tr>
<td>UT</td>
<td>Utility ID</td>
</tr>
</tbody>
</table>

**Resource Type 2** This value indicates what is contained in Resource Name 2.

Valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PK</td>
<td>Package</td>
</tr>
<tr>
<td>PS</td>
<td>Page Set (Tablespace)</td>
</tr>
</tbody>
</table>

**Resource Type 3** This value indicates what is contained in Resource Name 3.

**Resource Type 4** This value indicates what is contained in Resource Name 4.

Valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PT</td>
<td>Partition</td>
</tr>
</tbody>
</table>

**SUBSYS** The IRLM subsystem name.

**Thread Status** The current status of a thread.

Valid values are:

**Status** Description
NOT-AVAIL
The thread is not available.

IN-ABORT
The thread is in abort processing.

IN-ACCEL
The thread is executing on IBM DB2 Analytics Accelerator for z/OS.

IN-AUTO-PROC
The thread is processing an autonomous procedure.

IN-BIND-DYNM
The thread is in dynamic bind processing.

IN-BIND-STAT
The thread is in static bind processing.

IN-COMMAND
Command threads display this status when they are active in DB2 and executing within the DB2 command processor. (This type of thread always has a blank plan name.)

IN-COMMIT
The thread is in Commit processing (applies only to threads that originate from an attachment that does not use two-phase-commit protocol).

IN-COMT-PHS1
The thread is in Commit phase 1 processing.

IN-COMT-PHS2
The thread is in Commit phase 2 processing.

IN-CRTE-THRD
The thread is in Create Thread processing.

IN-DB2
The thread is executing in DB2. A more descriptive status could not be determined.

INDOUBT
The thread is in doubt.

IN-SIGNON
The thread is in signon processing. This status applies only to threads originating from CICS or IMS attachments.

IN-SQL-CALL
The thread is processing an SQL call.

IN-SQL-SORT
The thread is executing an SQL call and is doing the sort processing required to satisfy the call’s request.

IN-STOR-PROC
The thread is currently running in a stored procedure.

IN-TERM-THRD
The thread is in termination as a result of allied task termination. This status corresponds to DB2 DISPLAY THREAD=T status.

IN-TRIGGER
The thread is currently running in a trigger.
IN-USER-FUNC
The thread is currently running a user-defined function.

NOT-IN-DB2
The thread is not currently executing in DB2.

SP/UDF-INACT
The thread is trying but not able to run in a stored procedure or user-defined function.

SWAPPED-OUT
The thread is not currently executing in DB2. The thread originating address space is swapped out.

WAIT-ARCHIVE
The thread is waiting for an archive log tape mount necessary during thread abort processing.

WAIT-ARCREAD
The thread is currently waiting for read of archive log from tape.

WAIT-ASYNCRD
The thread is currently waiting for completion of a read I/O that is being done under a thread other than this one (for example, sequential or List Prefetch).

WAIT-ASYNCWR
The thread is currently waiting for completion of Write I/O that is being done under a thread other than this one (for example, Deferred Writes).

WAIT-CONVLIM
The distributed thread is in a synchronous wait because the conversation limit has been reached for its designated logmode.

WAIT-CTHREAD
The thread is queued in Create Thread processing because DB2 reached the CTHREAD value. This status corresponds to DB2 DISPLAY THREAD=QD status.

WAIT-GLBBLOCK
The thread is currently waiting for either:
• Inter-system communication within the data sharing group to determine if there is lock contention.
• A lock held by another subsystem in the data sharing group.

WAIT-LOCK
The thread is waiting for a lock.

WAIT-MSGSEND
The thread is waiting because of inter-system message sending contention.

WAIT-REMREQ
The database access thread is in a synchronous wait (waiting for a response or a request from the originating DB2 subsystem).

WAIT-REMSQL
The distributed allied thread is in a synchronous wait (waiting for a response from the remote DB2 subsystem being accessed).

WAIT-REUSE
The thread is not currently in use and is waiting to be reused. This status applies only to CICS and IMS threads.
WAIT-SERVICE
The thread is currently waiting for completion of a DB2 service. Types of DB2 services include: open/close of a dataset, DFHSN recall of a dataset, SYSLGRNG update or define/extend/delete of a dataset, rollback, and Commit phase 2 for read only threads.

WAIT-SP-STOP
The thread is queued waiting for a stopped stored procedure.

WAIT-TERM-TH
The thread is queued and waiting for thread termination as a result of allied task termination. This status corresponds to DB2 DISPLAY THREAD=QD status.

UTIL-STOP
The DB2 utility was started but not completed because of abnormal termination.

The following status are only available when class 2/3 traces are on:

WAIT-ACCEL
The thread is currently waiting for claimers to be released after acquiring drain lock.

WAIT-CLAIMER
The thread is currently waiting for claimers to be released after acquiring drain lock.

WAIT-CL3LOCK
The thread is currently waiting for the completion of an identify call to the IRLM.

WAIT-COMMIT
The thread is waiting for the FORCE-AT-COMMIT event to complete.

WAIT-DRNLOCK
The thread is currently waiting to acquire drain lock.

WAIT LOB
The thread is currently waiting for TCP/IP to materialize a LOB.

WAIT-LOCKLAT
The thread is waiting for a LOCK-I/O-LATCH.

WAIT-LOCKPIP
The thread is currently waiting for a PIPE suspend.

WAIT-LOCKPQS
The thread is currently suspended for parallel task synchronization.

WAIT-LOGQSCE
The thread is currently suspended because of an ARCHIVE LOG MODE(QUIESCE) command.

WAIT-PGLATCH
The thread is currently waiting for page latch.

WAIT-SP-SCHD
The thread is waiting for a TCB to become available in the stored procedures address space to schedule a stored procedure.

WAIT-SWITCH
The thread is currently waiting for the completion of a synchronous execution switch.
WAIT-SYNC-IO

The thread is currently waiting for completion of a synchronous Read I/O or Write I/O.

Note: This status can indicate that a DB2 resource is not large enough. You can use the OMEGAMON XE for DB2 PE resource manager or object analysis displays to further isolate the problem.

Thread Token The thread token uniquely identifies a specific thread.

Local DB2 Lock Conflict Attributes The type of thread.

It can be:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BATCH</td>
<td>Batch job</td>
</tr>
<tr>
<td>CICS</td>
<td>CICS attach</td>
</tr>
<tr>
<td>DLIBATCH</td>
<td>DL/I batch</td>
</tr>
<tr>
<td>Distributed</td>
<td>Distributed Database Access thread</td>
</tr>
<tr>
<td>IMS_BMP</td>
<td>IMS attach BMP</td>
</tr>
<tr>
<td>IMS_CTL</td>
<td>IMS control region</td>
</tr>
<tr>
<td>IMS_MPP</td>
<td>IMS attach MPP</td>
</tr>
<tr>
<td>IMS_TBMP</td>
<td>IMS transaction BMP</td>
</tr>
<tr>
<td>DistAllied</td>
<td>Distributed Allied thread</td>
</tr>
<tr>
<td>RRSASF</td>
<td>DB2 Resource Recovery Services attachment facility</td>
</tr>
<tr>
<td>SYSTEM</td>
<td>System directed access</td>
</tr>
<tr>
<td>TSO</td>
<td>TSO foreground and background</td>
</tr>
<tr>
<td>UNKNOWN</td>
<td>Unrecognizable connection type</td>
</tr>
<tr>
<td>UTILITY</td>
<td>DB2 Utility</td>
</tr>
</tbody>
</table>

Time Stamp Represents the end of data collection or the end of an interval, and is the local time where the system is running.

Valid format is MM-DD-YY HH:MM:SS, where:
- M = Month
- D = Day
- Y = Year
- H = Hour
- M = Minute
- S = Second

For example, 07-16-18 14:58:29 indicates that data collection ended on July 16th, 2018, at 14:58:29 PM.

Uniqueness Value The instance number: When concatenated with the fully qualified network name, it uniquely identifies a distributed thread (DB2 field name: QWHSLUUV).
Uniqueness Value
The instance number: When concatenated with the fully qualified network name, it uniquely identifies a distributed thread (DB2 field name: the last 2 bytes of QWHSLUU). 

Local Object Activity Attributes
Use the Local Object Activity attributes to create situations that you can use to monitor the I/O and getpage activity by database.

ASYNC Write Rate The number of asynchronous writes per second during the collection interval. Valid format is a decimal number, with 1 decimal place allowed, in the range 0.0 - 9999.9; for example, 2.1.

Data Sharing Group The name of a data sharing group. It is an alphanumeric text string, with a maximum of 8 characters; for example, TDDB241G.

Database The name of a DB2 database. It is an alphanumeric text string with a maximum of 8 characters; for example, DSND806.

DB2 ID The name of a DB2 subsystem.

Getpage Rate The number of getpage requests per second for the database or space name. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 2.3.

Getpage RIO Ratio The ratio of getpage requests to read I/Os for the database.

The ratio is calculated by dividing the number of getpage requests by the sum of the following values:
• Number of synchronous reads
• Number of prefetch read I/Os

Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 1.8.

IDNAME An internal attribute used for navigation, it contains either the Data Sharing Group Name or the DB2ID.

MVS System The MVS System Management Facility (SMF) ID. It is an alphanumeric text string with a maximum of 4 characters; for example SP11.

Number of ASYNC Writes The number of asynchronous writes during the collection interval. Valid value is an integer in the range 0 - 2147483647.

Number of Getpages The number of getpage requests for the database or space name. Valid value is an integer in the range 0 - 2147483647.

Number of Other Writes The number of immediate and format writes. Valid value is an integer in the range 0 - 2147483647.

Number of Prefetch Reads The number of prefetch read I/Os for the database. Valid value is an integer in the range 0 - 2147483647.

Number of SYNC Reads The number of synchronous reads for the database or space name. Valid value is an integer in the range 0 - 2147483647.
**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Other Write Rate** The number of immediate and format writes per second. Valid value is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 0.6.

**Percent of Getpage Activity** The percentage of total getpage activity that is applicable to the database, space name, or thread. Valid value is a decimal number, with one decimal place allowed, in the range 0.0 - 100.0; for example, 2.6.

**Percent of I/O** The percentage of total I/O activity that is applicable to the database or space name. Valid value is a decimal number, with one decimal place allowed, in the range 0.0 - 100.0; for example, 2.0.

**Prefetch Read Rate** The number of prefetch read I/Os per second for the database or space name. Valid value is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 0.9.

**Space Name** The name of the selected space for which thread activity has occurred. It is an alphanumeric text string, with a maximum of 8 characters; for example, DSNUCX01.

**SYNC Read Rate** The number of synchronous reads per second for the database or space name. Valid value is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 2.2.

**Time Stamp** Represents the end of data collection or the end of an interval, and is the local time where the system is running.

Valid format is MM-DD-YY HH:MM:SS, where:
- M = Month
- D = Day
- Y = Year
- H = Hour
- M = Minute
- S = Second

For example, 07-16-18 14:58:29 indicates that data collection ended on July 16th, 2018, at 14:58:29 PM.

**Local Object Space Name Attributes**
Use the Local Object Space Name attributes to create situations that monitor object, volume, and extent activity for a specific DB2 object space.

**Buffer Pool ID** The ID for a buffer pool. Valid values are:
- 32K = 80
- 32K1 = 81
- 32K2 = 82
- 32K3 = 83
- 32K4 = 84
- 32K5 = 85
- $32K6 = 86$
- $32K7 = 87$
- $32K8 = 88$
- $32K9 = 89$

**Database Name** The name of a DB2 database. It is an alphanumeric text string with a maximum of 8 characters; for example, DSNDB06.

**Data Sharing Group** The name of a data sharing group. It is an alphanumeric text string, with a maximum length of eight characters.

**DB2 ID** The name of a DB2 subsystem.

**Extents per Data Set Ratio** The average number of extents per data set or space name for a DB2 database. Valid value is an integer in the range 0 - 100.

**IDNAME** An internal attribute used for navigation, it contains either the Data Sharing Group Name or the DB2ID.

**Max Number of Extents per DSN** The largest number of extents per data set or space name for a DB2 database. Valid value is an integer in the range 0 - 219.

**MVS System** The MVS System Management Facility (SMF) ID. It is an alphanumeric text string with a maximum of 4 characters; for example, SP11.

**Number of Data Sets** The total number of allocated data sets for the DB2 you are monitoring. Valid value is an integer in the range 0 - 10000.

**Number of Extents** The number of data set extents that the operating system has allocated for a data set. Valid value is an integer in the range 0 - 219.

**Number of Volumes** The number of volumes on which the data set resides. Valid value is an integer in the range 0 - 256.

**Object Space Name** The name of a DB2 object space. It is an alphanumeric text string, with a maximum of 8 characters; for example, DSNUCX01.

**Object Type** The type of object space name.

Valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INDX</td>
<td>Index</td>
</tr>
<tr>
<td>PTIX</td>
<td>Partitioned index</td>
</tr>
<tr>
<td>PTTS</td>
<td>Partitioned table space</td>
</tr>
<tr>
<td>SEGM</td>
<td>Segmented table space</td>
</tr>
<tr>
<td>TBLS</td>
<td>Simple table space</td>
</tr>
<tr>
<td>UNDT</td>
<td>Undetermined</td>
</tr>
</tbody>
</table>

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.
**Time Stamp** Represents the end of data collection or the end of an interval, and is the local time where the system is running.

Valid format is MM-DD-YY HH:MM:SS, where:
- **M** = Month
- **D** = Day
- **Y** = Year
- **H** = Hour
- **M** = Minute
- **S** = Second

For example, 07-16-18 14:58:29 indicates that data collection ended on July 16th, 2018, at 14:58:29 PM.

**Log Detail Attributes**
Use the Log Detail attributes to view log activities of the primary, secondary, or archive log data sets.

**Archive Device** The device type of the archive data set.

**Begin RBA** The beginning of the Relative Byte Address (RBA) in the primary, secondary, or archive log data set.

It is an alphanumeric text string, with a maximum length of 20 characters. For DB2 11, the RBA can consist of up to 10 bytes. For versions prior to DB2 11, the RBA can consist of up to 6 bytes.

**Current RBA** The current Relative Byte Address (RBA) in the primary, secondary, or archive log data set.

It is an alphanumeric text string, with a maximum length of 20 characters. For DB2 11, the RBA can consist of up to 10 bytes. For versions prior to DB2 11, the RBA can consist of up to 6 bytes.

**DB2 ID** The name of a DB2 subsystem.

**DB2 Version** The version of the DB2 system.

**Data Set Name** The name of the primary, secondary, or archive log data set.

It is an alphanumeric text string, with a maximum length of 44 characters.

**Data Set Type** The type of the primary, secondary, or archive log data set.

It is an alphanumeric text string, with a maximum length of 4 characters.

**End RBA** The end of the Relative Byte Address (RBA) in the primary, secondary, or archive log data set.

It is an alphanumeric text string, with a maximum length of 20 characters. For DB2 11, the RBA can consist of up to 10 bytes. For versions prior to DB2 11, the RBA can consist of up to 6 bytes.

**Log Percent Used** The log percentage used in the primary or secondary log data set.
Log Size  The log size of the primary or secondary log data set.

Log Volume Count  The number of log volumes counted for the primary or secondary log data set.

Log Volser  The volume serial number (volser) identified for the primary or secondary log data set.

It is an alphanumeric text string, with a maximum length of 40 characters.

Interval Start  The start time of this interval.

MVS System ID  The MVS system identifier.

Originating System ID  The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

Percent Archive Complete  The percentage of the archive activity that has been completed.

Log Statistics Attributes
Use these attributes to view the Log statistics.

DB2 Subsystem  The DB2 subsystem ID.

DB2 Version  The DB2 version.

Data Sharing Group  The Data Sharing Group name.

Data Sharing Member  The Data Sharing Group member name.

Delta Value  The change since the last sample.

Field Name  The data field name.

Field Value  The data value.

Interval Start  The start time of this interval.

Interval Time  The collection interval time.

MVS System ID  The MVS identifier.

Originating System ID  The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

Rate  The amount over the last sampling interval.

Sequence Number  The data field sequence number.

MVS Storage Attributes
Use the MVS Storage attributes to view the system storage sizes. This information is provided with DB2 10.
24 Bit High Private (MB) Identifies the amount of private MVS storage below the 16 MB line (DB2 field name: QW0225HI). This storage is obtained from top downward, usually for authorized programs.

24 Bit Low Private (MB) Identifies the amount of private MVS storage below the 16 MB line (DB2 field name: QW0225LO). This storage is obtained from bottom upward, usually for unauthorized programs.

31 Bit Extended High Private (MB) Identifies the amount of private MVS storage above the 16 MB line (DB2 field name: QW0225EH). This storage is obtained from top downward, usually for authorized programs.

31 Bit Extended Low Private (MB) Identifies the amount of private MVS storage above the 16 MB line (DB2 field name: QW0225EL). This storage is obtained from bottom upward, usually for unauthorized programs.

Active and Disconnect DBATs Identifies the number of active and disconnected DBAT threads (DB2 field name: QW0225DB).

Active Threads Identifies the number of active allied threads (DB2 field name: QW0225AT).

Address Space Name Shows the address space name (DBM1 or DIST) (DB2 field name: QW0225AN).

Agent Local Storage (MB) Identifies the amount of storage allocated for agent-related local storage (DB2 field name: QW0225AL). This storage is used for operations such as sort.

Agent Non-System Storage (MB) Identifies the total agent non-system storage. It is the difference between the Total Agent Local Storage (QW0225AL) and the Total Agent System Storage (QW0225AS).

Agent System Storage (MB) Identifies the storage used by system agents (DB2 field name: QW0225AS).

Auxiliary 4K Slot in Use 31 Bit Identifies the number of auxiliary slots (4K) in use by DBM1 (DB2 field name: QW0225AX).

Auxiliary 4K Slot in Use 64 Bit Identifies the number of auxiliary 4K slots in use for 64-bit private pools (DB2 field name: QW0225HVAuxSlots). This value is available from z/OS 1.11.

Auxiliary Slots Used Shared Storage 64 Bit Identifies the number of auxiliary slots used for 64-bit shared storage for this MVS LPAR (DB2 field name: QW0225SHRAUXSLOTS).

Auxiliary Storage in Use (MB) Identifies the number of auxiliary slots (4K) in use by DBM1 (DB2 field name: QW0225AX).

Avg Thread Footprint (MB) The current average memory usage of active allied threads and the maximum number of existing active DBATs. Valid value is an integer.

It is calculated as follows:
Average Thread Footprint (MB) The current average memory usage of active allied threads and the maximum number of existing active DBATs. It is an alphanumeric text string with a maximum of 10 characters.

It is calculated as follows:

\[
\frac{\text{total variable storage} - \text{total agent system storage} - \text{amount of storage allocated for the local cache storage pool}}{\text{active allied threads} + \text{active DBATs}}
\]

Buffer Manager Data Manager Trace Table (MB) Identifies the storage used for Buffer Manager and Data Manager internal trace tables (DB2 field name: QW0225TT).

Buffer Manager Storage Control Blocks (MB) Identifies the storage used for page set control blocks (DB2 field name: QW0225BB).

Castout Buffers (MB) Identifies the storage used for castout buffers (DB2 field name: SW0225C2).

Castout Engines Identifies the number of engines available for data-sharing castout processing (DB2 field name: QW0225CE).

Common Fixed Pool Above (MB) Identifies the amount of storage allocated for 64-bit common fixed pool storage (DB2 field name: QW0225FCG).

Common Fixed Pool Below (MB) Identifies the amount of storage allocated for 31-bit common fixed pool storage (DB2 field name: QW0225FC).

Common Getmained Above (MB) Identifies the amount of storage allocated for 64-bit common getmained storage (DB2 field name: QW0225GCG).

Common Getmained Below (MB) Identifies the amount of storage allocated for 31-bit common getmained storage (DB2 field name: QW0225GC).

Common Storage Manager Control Block Above (MB) Identifies the amount of storage allocated for 64-bit common storage for storage manager control structures (DB2 field name: QW0225SMC).

Common Variable Pool Above (MB) Identifies the amount of storage allocated for 64-bit common variable pool storage (DB2 field name: QW0225VCG).

Common Variable Pool Below (MB) Identifies the amount of storage allocated for 31-bit common variable pool storage (DB2 field name: QW0225VC).

Compression Dictionary Identifies the storage space allocated for the compression dictionary (DB2 field name: QW0225CD).
Current Private High Addr 24 Bit Identifies the current high address of the 24-bit private region (DB2 field name: QW0225TP). It indicates the highest value (upper limit) of the private area of the DB2 database address space and the private area of the distributed data address space.

Current Private High Addr 31 Bit Identifies the current high address of the 31-bit private region (DB2 field name: QW0225EP).

DB2 ID Identifies the DB2 ID.

DB2 Version The version of the DB2 system.

Deferred Write Engines Identifies the number of engines used for deferred write operations (DB2 field name: QW0225DW).

Dynamic Statement Cache Control Block (MB) Identifies the amount of storage used for dynamic statement cache control blocks above the 2 GB bar (DB2 field name: QW0225S2).

Extended CSA Size (MB) Identifies the size of the common storage area (CSA) above the 16 MB line (DB2 field name: QW0225EC).

Fixed Storage Identifies the total amount of fixed storage (DB2 field name: QW0225FX).

Fixed Storage above (MB) Identifies the total amount of fixed storage above the 2 GB bar (DB2 field name: QW0225FA).

GBP Write Engines Identifies the number of engines for group buffer pool writes (DB2 field name: QW0225GW).

Getmained Storage (MB) Identifies the total storage acquired by GETMAIN (DB2 field name: QW0225GM). This includes space for virtual pools, EDM pool, compression dictionary, castout buffers, and the data space lookaside buffer, hiperpool control blocks, and data space buffer pool control blocks. This figure can be different from the sum of GETMAIN storage items shown in the statistics DBM1 storage, because DB2 does not produce grouping statistics for all GETMAIN storage.

Getmained Storage above (MB) Identifies the total storage acquired by GETMAIN (DB2 field name: QW0225GA). This includes space for the compression dictionary, and statement and DBD cache that can be used by the Environmental Descriptor Manager (EDM). This figure can be different from the sum of GETMAIN storage items shown in the statistics DBM1 storage, because DB2 does not produce grouping statistics for all GETMAIN storage.

Getmained Stack Storage (MB) Identifies the total GETMAINED storage allocated for program stack use (DB2 field name: QW0225GS).

HWM Auxiliary 4K Slot in Use 64 Bit Identifies the high water mark for the number of auxiliary 4K slots in use for 64-bit private pools (DB2 field name: QW0225HVGAuxSlots). This value is available from z/OS 1.11.

HWM Real 4K Frame in Use 64 Bit Identifies the high water mark for the number of real 4K frames in use for 64-bit private pools (DB2 field name: QW0225HVGPagesInReal). This value is available from z/OS 1.11.
**HWM Shared Bytes 64 Bit (MB)** Identifies the high water mark for number of 64-bit shared bytes for this MVS LPAR (DB2 field name: QW0225SHRGBYTES).

**HWM Thread Copies Cached SQL (MB)** Identifies the statistics interval high-water mark of allocated storage for thread copies in the local cache storage pool (DB2 field name: QW0225HS).

**Interval Start** The time at the Tivoli Enterprise Monitoring Server location when the data was sampled. The format is MM/DD/YY HH:MM:SS.

**Local Dynamic Statement Cache Control Block (MB)** Identifies the storage for local dynamic statement cache control blocks (DB2 field name: QW0225SB).

**Max Extended Region Size (MB)** Identifies the maximum amount of MVS private storage available above the 16 MB line (DB2 field name: QW0225RG).

**Max Number of Threads** The maximum number of possible threads. This depends on the storage size, the average memory usage of active user threads, and the maximum number of existing active DBATs. Valid value is an integer.

It is calculated as follows:

\[
\frac{(\text{extended region size}) - (31 \text{ bit extended low private}) - \min (\text{extended region size} / 8, 200 \times 1024 \times 1024) - [(\text{total getmained storage}) + (\text{total getmained stack storage}) + (\text{total fixed storage})]}{(\text{average thread footprint})}
\]

**Maximum Number of Threads** The maximum number of possible threads. This depends on the storage size, the average memory usage of active user threads, and the maximum number of existing active DBATs. It is an alphanumeric text string with a maximum of 10 characters.

It is calculated as follows:

\[
\frac{(\text{extended region size}) - (31 \text{ bit extended low private}) - \min (\text{extended region size} / 8, 200 \times 1024 \times 1024) - [(\text{total getmained storage}) + (\text{total getmained stack storage}) + (\text{total fixed storage})]}{(\text{average thread footprint})}
\]

**MVS System ID** The MVS system identifier.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Prefetch Engines** Identifies the number of engines used for sequential, list, and dynamic prefetch (DB2 field name: QW0225PF).

**Pipe Manager Subpool Storage (MB)** Identifies the storage allocated to Pipe Manager for parallel query operations (DB2 field name: QW0225PM).

**P-Lock Notify Exit Engines** Identifies the number of data sharing P-Lock engines and Notify Exit engines (DB2 field name: QW0225PL).

**RDS OP Pool Storage (MB)** Identifies the storage for RDS operations pool used for sort, prepare, and so on (DB2 field name: QW0225RO).
Real 4K Frame in Use 31 Bit Identifies the amount of real-storage frames in use for 31-bit and 64-bit private pools (DB2 field name: QW0225RL).

Real 4K Frame in Use 64 Bit Identifies the number of real 4K frames in use for 64-bit private pools (DB2 field name: QW0225HVPagesInReal). This value is available from z/OS 1.11.

Real Storage in Use (MB) Identifies the amount of real storage in use for 31-bit and 64-bit private pools.

RID Pool Storage (MB) Identifies the storage for RID list processing such as list prefetch, index ANDing and ORing (DB2 field name: QW0225RP).

Shared Agent Local Storage (MB) Identifies the amount of storage allocated for agent-related 64-bit local storage (DB2 field name: QW0225ALG).

Shared Agent Non-System Storage (MB) Identifies the amount of 64-bit storage used by non-system agents. It is the difference between the Total Agent Local Storage (QW0225ALG) and the Total Agent System Storage.

Shared Agent System Storage (MB) Identifies the amount of 64-bit storage used by system agents (DB2 field name: QW0225ASG).

Shared Fixed Storage (MB) Identifies the amount of total fixed virtual shared storage above the 2 GB bar (DB2 field name: QW0225SF).

Shared Getmained Storage (MB) Identifies the amount of virtual shared storage acquired by GETMAIN above the 2 GB bar (DB2 field name: QW0225SG).

Shared Memory Objects Identifies the number of shared memory objects allocated for this MVS LPAR (DB2 field: QW0225SHRNMOMB).

Shared Memory Storage (MB) Identifies the total 64-bit storage allocated for storage manager control structures (DB2 field name: QW0225SM).

Shared Memory Pages 64 Bit Identifies the number of 64-bit shared memory pages allocated for this MVS LPAR (this count includes hidden pages) (DB2 field name: QW0225SHRPAGES).

Shared Non-System Agent Stack Storage (MB) Identifies the amount of 64-bit shared storage allocated for non-system agent stack use (DB2 field name: QW0225GSG).

Shared Non-System Stack Storage in Use (MB) Identifies the amount of 64-bit shared non-system agent stack that is in use (DB2 field name: QW0225SUG).

Shared Pages Backed in Real Storage 64 Bit Identifies the number of 64-bit shared pages backed in real storage (4K pages) for this MVS LPAR (DB2 field name: QW0225SHRINREAL).

Shared Pages Paged In from Auxiliary Storage 64 Bit Identifies the number of 64-bit shared pages paged in from auxiliary storage for this MVS LPAR (DB2 field name: QW0225SHRPAGEINS).
Shared Pages Paged Out from Auxiliary Storage 64 Bit Identifies the number of 64-bit shared pages paged out to auxiliary storage for this MVS LPAR (DB2 field name: QW0225SHRPAGEOUTS).

Shared Storage Manager Control Block (MB) Identifies the amount of 64-bit shared storage allocated for storage manager control structures (DB2 field name: QW0225SMS).

Shared System Agent Stack Storage (MB) Identifies the amount of 64-bit shared storage allocated for system agent stack use (DB2 field name: QW0225GSG_SYS).

Shared System Agent Stack Storage in Use (MB) Identifies the amount of 64-bit shared system agent stack that is in use (DB2 field name: QW0225SUG_SYS).

Shared Variable Storage (MB) Identifies the amount of virtual shared variable storage above the 2 GB bar (DB2 field name: QW0225SV).

Stack Storage In Use (MB) Identifies the amount of stack storage that is in use (DB2 field name: QW0225SU).

Storage Cushion (MB) Identifies the storage reserved to allow DB2 to complete critical functions while short on storage (DB2 field name: STORCUSH). This includes the contract warning cushion, storage reserved for must-complete operations, and storage for MVS use.

Storage Manager Control Block (MB) Identifies the total 64-bit storage allocated for storage manager control structures (DB2 field name: QW0225SM).

Thread Copies of Cached SQL (MB) Identifies the amount of storage allocated for the local cache storage pool (DB2 field name: QW0225SC). For DB2 10, the storage is allocated for executable code sequences of dynamic SQL statements.

Thread Copies of Cached SQL above HWM Allocated Statement (MB) Identifies the statistics interval high-water mark (HWM) of allocated storage for thread copies in the cache storage pool above the 2 GB bar (DB2 field name: QW0225H2).

Thread Copies of Cached SQL above In Use (MB) Identifies the amount of storage used for thread copies in the cache storage pool above the 2 GB bar (DB2 field name: QW0225L2).

Thread Copies of Cached SQL Date at HWM Identifies the timestamp at high-water storage (DB2 field name: QW0225HT).

Thread Copies of Cached SQL in Use (MB) Identifies the amount of storage used for thread copies in the local cache storage pool (DB2 field name: QW0225LS). This is a subset of the total allocated storage for thread copies QW0225SC.

Thread Copies of Cached SQL Statement Count Identifies the number of statements in the local cache storage pool (DB2 field name: QW0225LC).

Thread Copies of Cached SQL Statement Count at HWM Identifies the number of statements in the local cache storage pool at high storage time (DB2 field name: QW0225HC).
Thread Copies of Static SQL (MB) Identifies the amount of storage allocated below the bar for executable code sequences of static SQL statements (DB2 field name: QW0225SX).

Total Storage Below (MB) Identifies total DBM1 storage (DB2 field name: SW0225DB). This includes:
- Fixed length storage use
- Getmained storage
- Save areas
- Variables

Variable Storage (MB) Identifies the total storage used by all variable pools (DB2 field name: QW0225VR). This includes storage used by:
- System agents
- Local agents
- RID pool
- Pipe manager subpool
- Local dynamic statement cache control blocks
- Local dynamic statement cache statement pool
- Buffer and data manager trace tables

Variable Storage above (MB) Identifies the amount of variable storage available above the 2 GB bar (DB2 field name: QW0225VA).

QW0225AV Identifies the total amount of storage available for storage manager pools (DB2 field name: QW0225AV).

QW0225CR Identifies the storage reserved for operation that must complete before DB2 is allowed to stop (DB2 field name: QW0225CR).

QW0225F1 This field is for IBM service (DB2 field name: QW0225F1).

QW0225F2 This field is for IBM service (DB2 field name: QW0225F2).

QW0225MV Identifies the amount of storage available for operating system activity (DB2 field name: QW0225MV).

QW0225SO Identifies the amount of free storage, in megabytes, available in the DBM1 data space (DB2 field name: QW0225SO).

Storage Consumption Attributes
Use the Storage Consumption attributes to assess storage consumption issues for your DB2 version.

Agent Local Storage (MB) The amount of storage, in MB, allocated for agent-related local storage. This storage is used for operations such as sort. Valid value is an integer in the range 0 - 9999999 (DB2 field name: QW0225AL).

Agent System Storage (MB) The storage used by system agents. Valid value is an integer in the range 0 - 9999999 (DB2 field name: QW0225AS).

Auxiliary Storage in Use (MB) The auxiliary storage used by DBM1, in megabytes. Valid value is an integer in the range 0 - 9999999 (DB2 field name: QW0225AX).
**Average Thread Footprint (MB)** The current average memory usage of active allied threads and the maximum number of existing active DBATs. It is an alphanumeric text string with a maximum of 10 characters.

It is calculated as follows:

\[
\frac{[(\text{total variable storage}) - (\text{total agent system storage}) - (\text{amount of storage allocated for the local cache storage pool})]}{[(\text{active allied threads}) + (\text{active DBATs})]}
\]

**Buffer Manager Data Manager Trace Table (MB)** The storage used for Buffer Manager and Data Manager internal trace tables. Valid value is an integer in the range 0 - 999999 (DB2 field name: QW0225TT).

**Buffer Manager Storage CNTL Blocks (MB)** The storage used for Buffer Manager Control Blocks. Valid value is an integer in the range 0 - 999999 (DB2 field name: QW0225BB).

**Castout Engines** The number of engines available for data-sharing castout processing. Valid value is an integer in the range 0 - 999999 (DB2 field name: QW0225CC).

**Compression Dictionary (MB)** The storage space, in megabytes, allocated for the compression dictionary. Valid value is an integer in the range 0 - 9999999 (DB2 field name: QW0225CD).

**DBM1 Storage (MB)** The total DBM1 storage. Valid value is an integer in the range 0 - 999999.

This includes:

- Fixed length storage use
- Getmained storage
- Save areas
- Variables

It is calculated as follows:

\[
(\text{total getmained storage}) + (\text{total variable storage}) + (\text{total fixed storage}) + (\text{total getmained stack storage})
\]

**Castout Buffers (MB)** The total storage for buffers needed for all castout engines. Valid value is an integer in the range 0 - 999999.

It is calculated as follows:

\[
(\text{castout engines}) \times 128 \times 1024
\]

**DB2ID** The name of a DB2 subsystem.
**DB2 Version** The version of the DB2 system.

**Deferred Write Engines** The number of engines used for deferred write operations. Valid value is an integer in the range 0 - 999999 (DB2 field name: QW0225DW).

**Extended CSA Size (MB)** The size of the common storage area (CSA) above the 16 MB line. Valid value is an integer in the range 0 - 999999 (DB2 field name: QW0225EC).

**Fixed Storage above (MB)** The total amount of fixed storage above the 2 GB bar. Valid value is an integer in the range 0 - 999999 (DB2 field name: QW0225FA).

**Fixed Storage (MB)** The total amount of fixed storage. Valid value is an integer in the range 0 - 999999 (DB2 field name: QW0225FX).

**Fixed Virtual 64 Bit Shared (MB)** The amount of total fixed virtual shared storage above the 2 GB bar. Valid value is an integer in the range 0 - 999999 (DB2 field name: QW0225SF).

**GBP Write Engines** The number of engines for group buffer pool writes. Valid value is an integer in the range 0 - 999999 (DB2 field name: QW0225GW).

**Getmained Stack Storage (MB)** The total GETMAINED storage allocated for program stack use. Valid value is an integer in the range 0 - 999999 (DB2 field name: QW0225GS).

**Getmained Storage above (MB)** The total storage acquired by GETMAIN above the 2 GB bar. This includes space for virtual pools, EDM pool, compression dictionary, castout buffers, and the data space lookaside buffer, hiperpool control blocks, and data space buffer pool control blocks. Valid value is an integer in the range 0 - 999999 (DB2 field name: QW0225GA).

**Getmained Storage (MB)** The total storage acquired by GETMAIN. This includes space for virtual pools, EDM pool, compression dictionary, castout buffers, and the data space lookaside buffer, hiperpool control blocks, and data space buffer pool control blocks. Valid value is an integer in the range 0 - 999999 (DB2 field name: QW0225GM).

**Getmained Virtual 64 Bit Shared (MB)** The amount of virtual shared storage acquired by GETMAIN above the 2 GB bar. Valid value is an integer in the range 0 - 999999 (DB2 field name: QW0225SG).

**Interval Start** The date and time, as set on the monitored system, indicating the instance when the agent collects information.

**Local Dynamic Statement Cache Control Blocks** The storage for local dynamic statement cache blocks. Valid value is an integer in the range 0 - 999999 (DB2 field name: QW0225SB).

**Max Extended Region Size (MB)** The maximum amount of MVS private storage available above the 16 MB line. Valid value is an integer in the range 0 - 999999 (DB2 field name: QW0225RG).
**Maximum Number of Threads** The maximum number of possible threads. This depends on the storage size, the average memory usage of active user threads, and the maximum number of existing active DBATs. It is an alphanumeric text string with a maximum of 10 characters.

It is calculated as follows:

\[
\text{MaxThreads} = \left\lfloor \frac{\text{extended region size} - (31 \text{ bit extended low private}) - \text{minimum (extended region size / 8, } 200 \times 1024 \times 1024) - [\text{total getmained storage} + \text{total getmained stack storage} + \text{total fixed storage}]}{\text{average thread footprint}} \right\rfloor
\]

**MVS System ID** The MVS system identifier.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Pipe Manager Subpool Storage (MB)** The storage allocated to Pipe Manager for parallel query operations. Valid value is an integer in the range 0 - 9999999 (DB2 field name: QW0225PM).

**P-Lock Notify Exit Engines** The number of engines for data sharing P-lock/notify exit engines. Valid value is an integer in the range 0 - 999999 (DB2 field name: QW0225PL).

**Prefetch Engines** The number of engines used for sequential, list, and dynamic prefetch. Valid value is an integer in the range 0 - 999999 (DB2 field name: QW0225PF).

**RDS OP Pool Storage (MB)** The storage for RDS operations pool used for sort, prepare, and so on. Valid value is an integer in the range 0 - 999999 (DB2 field name: QW0225RO).

**Real Storage in Use (MB)** The real storage used by DBM1, in megabytes. Valid value is an integer in the range 0 - 999999.

**RID Pool Storage (MB)** The storage for RID list processing, such as list prefetch, index ANDing, and ORing. Valid value is an integer in the range 0 - 999999 (DB2 field name: QW0225RP).

**Shared Memory Storage (MB)** The amount of virtual shared memory storage above the 2 GB bar. Valid value is an integer in the range 0 - 999999.

**Stack Storage In Use (MB)** The amount of stack storage which is in use. Valid value is an integer in the range 0 - 9999999 (DB2 field name: QW0225SU).

**Storage Cushion (MB)** The storage reserved to allow DB2 to complete critical functions while short on storage. This includes the contract warning cushion, storage reserved for must-complete operations, and storage for MVS use. Valid value is an integer in the range 0 - 999999.

**Thread Copies of Cached SQL (MB)** The amount of storage allocated for the local cache storage pool. Valid value is an integer in the range 0 - 9999999 (DB2 field name: QW0225SC).
Thread Copies of Cached SQL above HWM for Allocated Statements (MB) The statistics interval high-water mark (HWM) of allocated storage for thread copies in the local cache storage pool above the 2 GB bar. This is a subset of the counter Thread Copies of Cached SQL Statement Count. Valid value is an integer in the range 0 - 9999999 (DB2 field name: QW0225H2).

Thread Copies of Cached SQL above In Use (MB) The amount of storage used for thread copies in the local cache storage pool above the 2 GB bar. This is a subset of the counter Thread Copies of Cached SQL Statement Count. Valid value is an integer in the range 0 - 9999999 (DB2 field name: QW0225L2).

Thread Copies of Cached SQL above (MB) The amount of storage allocated for the local cache storage pool above the 2 GB bar. Valid value is an integer in the range 0 - 9999999 (DB2 field name: QW0225S2).

Thread Copies of Cached SQL Date at High Water Mark The timestamp at high-water storage (DB2 field name: QW0225HT).

Valid format is MM-DD-YY HH:MM:SS, where:
• M = Month
• D = Day
• Y = Year
• H = Hour
• M = Minute
• S = Second

For example, 07-16-18 14:58:29 indicates that data collection ended on July 16th, 2018, at 14:58:29 PM.

Thread Copies of Cached SQL HWM for Allocated Statements (MB) The statistics interval high-water mark of the allocated storage for thread copies in the local cache storage pool. Valid value is an integer in the range 0 - 9999999 (DB2 field name: QW0225HS).

Thread Copies of Cached SQL In Use (MB) The amount of storage used for thread copies in the local cache storage pool. This is a subset of the total allocated storage for thread copies. Valid value is an integer in the range 0 - 9999999 (DB2 field name: QW0225LS).

Thread Copies of Cached SQL Statement Count The number of statements in the local cache storage pool. Valid value is an integer in the range 0 - 9999999 (DB2 field name: QW0225LC).

Thread Copies of Cached SQL Statement Count at High Water Mark The number of statements in the local cache storage pool at high storage time. Valid value is an integer in the range 0 - 9999999 (DB2 field name: QW0225HC).

Variable Storage (MB) The total storage used by all variable pools. Valid value is an integer in the range 0 - 9999999 (DB2 field name: QW0225VR).

This includes storage used by:
• System agents
• Local agents
• RID pool
Pipe manager subpool
Local dynamic statement cache control blocks
Local dynamic statement cache statement pool
Buffer and data manager trace tables

**Variable Storage above (MB)** The amount of variable storage available above the 2 GB bar. Valid value is an integer in the range 0 - 9999999 (DB2 field name: QW0225VA).

**Variable Virtual 64 Bit Shared (MB)** The amount of virtual shared variable storage above the 2 GB bar. Valid value is an integer in the range 0 - 9999999 (DB2 field name: QW0225SV).

**24 Bit High Private (MB)** The amount of private MVS storage below the 16 MB line. This storage is obtained from top downward, usually for unauthorized programs. Valid value is an integer in the range 0 - 9999999 (DB2 field name: QW0225HI).

**24 Bit Low Private (MB)** The amount of private MVS storage below the 16 MB line. This storage is obtained from bottom upward, usually for unauthorized programs. Valid value is an integer in the range 0 - 9999999 (DB2 field name: QW0225LO).

**31 Bit Extended High Private (MB)** The amount of private MVS storage above the 16 MB line. This storage is obtained from top downward, usually for authorized programs. Valid value is an integer in the range 0 - 9999999 (DB2 field name: QW0225EH).

**31 Bit Extended Low Private (MB)** The amount of private MVS storage above the 16 MB line. This storage is obtained from bottom upward, usually for unauthorized programs. Valid value is an integer in the range 0 - 9999999 (DB2 field name: QW0225EL).

**SQL Counts Attributes**
Use the SQL Counts attributes to create situations to monitor the SQL DCL (Data Control Language) declarations, SQL DDL (Data Definition Language) statements, and SQL DML (Data Manipulation Language) statements, associated with a DB2 subsystem. They also show information for stored procedures, user-defined functions, triggers, direct row access, parallelism, RID pool access, and prepare statements. They provide information about multi-row processing and concentrate statements.

**4K Used Instead 32K** The number of times that space in a 4 KB page table space was used because space in a 32 KB page table space was preferred but not available (Field name: QISTWFP2).

**32K Used Instead 4K** The number of times that space in a 32 KB page table space was used because space in a 4 KB page table space was preferred but not available (Field name: QISTWFP1).

**Agent Max Storage** The maximum amount of storage that can be used for each agent (Field name: QISTWMXA).

**Allocate Cursor** The number of SQL ALLOCATE CURSOR statements executed (field name: QXALOCC).
Alter Database The number of ALTER DATABASE statements executed (Field name: QXALDAB).

Alter Function The number of ALTER FUNCTION statements executed (Field name: QXALUDF).

Alter Index The number of ALTER INDEX statements executed (Field name: QXALTIX).

Alter Procedure The number of ALTER PROCEDURE statements executed (Field name: QXALPRO).

Alter Stogroup The number of ALTER STOGROUP statements executed (Field name: QXALTST).

Alter Table The number of ALTER TABLE statements executed (Field name: QXALTTA).

Alter Tablespace The number of ALTER TABLESPACE statements executed (Field name: QXALTTS).

Alter Trusted Context The number of alter trusted context statements executed (Field name QXALTCTX) - not supported prior to DB2 9.

Associate Locator The number of SQL ASSOCIATE LOCATORS statements executed (Field name: QXALOCL).

Close Cursor The number of CLOSE statements executed. This number at the server location might not match the user application because of DDF's internal processing (DB2 field name: QXCLOSE).

Comment On The number of COMMENT ON statements executed (Field name: QXCMTON).

Connect (Type 1) The number of CONNECT type 1 statements executed (Field name: QXCON1).

Connect (Type 2) The number of CONNECT type 2 statements executed (field name: QXCON2).

Create Alias The number of CREATE ALIAS statements executed (Field name: QXCRALS).

Create Database The number of CREATE DATABASE statements executed (Field name: QXCRDAB).

Create Distinct Type The number of CREATE DISTINCT TYPE statements executed (Field name: QXCDIST).

Create Function The number of CREATE FUNCTION statements executed (Field name: QXCRUDF).

Create Global Temp Table The number of CREATE GLOBAL TEMPORARY TABLE statements executed (Field name: QXCRGTT).
Create Index  The number of CREATE INDEX statements executed (Field name: QXCRINX).

Create Procedure  The number of CREATE PROCEDURE statements executed (Field name: QXCRPRO).

Create Role  The number of CREATE ROLE statements executed (Field name QXCRROL) - not supported prior to DB2 9.

Create Stogroup  The number of CREATE STOGROUP statements executed (Field name: QXCRSTG).

Create Synonym  The number of CREATE SYNONYM statements executed (field name: QXCRSYN).

Create Table  The number of CREATE TABLE statements executed (Field name: QXCRTAB).

Create Tablespace  The number of CREATE TABLESPACE statements executed (Field name: QXCTABS).

Create Trigger  The number of CREATE TRIGGER statements executed (field name: QXCTRIG).

Create Trusted Context  The number of create trusted context statements executed (Field name QXCRCTX) - not supported prior to DB2 9.

Create View  The number of CREATE VIEW statements executed (Field name: QXDEFVU).

Current Total Storage  The total whole kilobytes of storage that are currently used in the workfile database (field name: QISTWCTO).

DB2 ID  The DB2 subsystem ID.

Delete  The number of DELETE statements executed (DB2 field name: QXDELET).

Delete Rows Accessed  The number of rows accessed by READ transactions because of uncommitted DELETE operations (using currently committed semantic for FETCH) - (Field name: QISTRCCD).

Delta  The changes since the last sample period.

Describe  The number of DESCRIBE, DESCRIBE CURSOR, DESCRIBE INPUT, and DESCRIBE PROCEDURE statements executed. This number at the server location might not match the user application because of DDF's internal processing (Field name: QXDESC).

Describe Table  The number of DESCRIBE TABLE statements executed (Field name: QXDSCRRTB).

Description  The description of the monitored activity.

Direct Row Revert to Index  The number of times that direct row access failed and an index was used to find a record (Field name: QXROIIDX).
**Direct Row Revert to TS Scan** The number of times that an attempt to use direct row access reverted to using a table-space scan because DB2 was not able to use a matching index scan (Field name: QXROITS).

**Direct Row Successful** The number of times that direct row access was successful (Field name: QXROIMAT).

**Drop Alias** The number of SQL DROP ALIAS statements executed (field name: QXDRPAL).

**Drop Database** The number of DROP DATABASE statements executed (Field name: QXDRPDB).

**Drop Distinct Type** The number of DROP DISTINCT TYPE statements executed (Field name: QXDDIST).

**Drop Function** The number of DROP FUNCTION statements executed (field name: QXDRPFN).

**Drop Index** The number of DROP INDEX statements executed (Field name: QXDRPIX).

**Drop Package** The number of SQL DROP PACKAGE statements executed (field name: QXDRPPKG).

**Drop Procedure** The number of DROP PROCEDURE statements executed (Field name: QXDRPRP).

**Drop Role** The number of DROP ROLE statements executed (Field name QXDRPROL) - not supported prior to DB2 9.

**Drop Stogroup** The number of DROP STOGROUP statements executed (Field name: QXDRPST).

**Drop Synonym** The number of DROP SYNONYM statements executed (Field name: QXDRPSY).

**Drop Table** The number of DROP TABLE statements executed (Field name: QXDRPTA).

**Drop Tablespace** The number of DROP TABLESPACE statements executed (Field name: QXDRPTS).

**Drop Trigger** The number of DROP TRIGGER statements executed (Field name: QXDRPTR).

**Drop Trusted Context** The number of drop trusted context statements executed (Field name QXDRPCTX) - not supported prior to DB2 9.

**Drop View** The number of DROP VIEW statements executed (Field name: QXDRPVU).

**Fetch** The number of FETCH statements executed. This number at the server location might not match the user application because of DDF's internal processing (Field name: QXFETCH).
Grant The number of GRANT statements executed (Field name: QXGRANT).

Incremental Bind The number of incremental binds (excluding prepare) (field name: QXINCRB).

Insert The number of INSERT statements executed (Field name: QXINSRT).

Insert Rows Skipped The number of rows skipped by READ transactions because of uncommitted INSERT operations (using currently committed semantic for FETCH) - (Field name: QISTRCCI).

Interval Time The number of seconds since last sample.

Job Name The job name that is associated with a thread.

Label On The number of LABEL ON statements executed (Field name: QXLABON).

Literals Dups Created The number of times DB2 created a duplicate STMT instance in the statement cache for a dynamic statement that had literals replaced by CONCENTRATE STATEMENTS WITH LITERALS behavior (Field name: QXSTCWLD). The duplicate STMT instance was needed because a cache match failed because the literal reusability criteria was not met.

Literals Matches Found The number of times DB2 found a matching reusable copy of a dynamic statement in cache because of CONCENTRATE STATEMENTS WITH LITERALS behavior (Field name: QXSTCWLM).

Literals Parsed The number of times DB2 parsed dynamic statements because of CONCENTRATE STATEMENTS WITH LITERALS behavior (Field name: QXSTCWLP).

Literals Replaced The number of times DB2 replaced at least one literal in a dynamic statement because of CONCENTRATE STATEMENTS WITH LITERALS behavior (Field name: QXSTCWLR).

Lock Table The number of LOCK TABLE statements executed (Field name: QXLOCK).

Max Nested SQL Trigger The maximum level of indirect SQL cascading (Field name: QXCASCDP). This includes cascading because of triggers, UDFs, or stored procedures.

Max Total Storage The maximum total amount of storage that is used in the workfile database (Field name QISTWMXU).

Merge The number of MERGE statements executed (DB2 field name QXMERGE) - not supported prior to DB2 9.

MVS ID The MVS system identifier.

Number of Max Exceeded The number of times the maximum amount of storage that an agent can use was exceeded (field name: QISTWFNE).

Open Cursor The number of OPEN statements executed (Field name: QXOPEN).
**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Parallel Bypass DB2 (Buffers)** The number of times the parallelism coordinator had to bypass a DB2 when distributing tasks because one or more DB2 members did not have enough buffer pool storage (Field name: QXXCSKIP). The number in this field is only incremented at the parallelism coordinator once per parallel group, even though more than one DB2 might have lacked buffer pool storage for that parallel group. It is also only incremented when the buffer pool is defined to allow for parallelism. For example, if VXPSEQT=0 on an assistant, DB2 does not send parallel work there and the number in this field is not incremented.

**Parallel Degree Executed** The total number of parallel groups that executed in the planned parallel degree (DB2 field name: QXNORGRP). This field is incremented by one for each parallel group that executed in the planned degree of parallelism (as determined by DB2).

**Parallel Degree Reduced (no buffer)** The total number of parallel groups that did not reach the planned parallel degree because of a lack of storage space or contention on the buffer pool (Field name: QXREDGRP).

**Parallel Failed (Cursor)** The total number of parallel groups that fell back to sequential mode because of a cursor that can be used by UPDATE or DELETE (Field name: QXEGRCUR).

**Parallel Failed (No Buffer)** The total number of parallel groups that fell back to sequential mode because of a storage shortage or contention on the buffer pool (Field name: QXEGBUF).

**Parallel Failed (No ESA Sort)** The total number of parallel groups that fell back to sequential mode because of a lack of ESA sort support (DB2 field name: QXEGRESA).

**Parallel Failed (No Enclaves)** The total number of parallel groups that executed in sequential mode because of the unavailability of MVS/ESA enclave services (Field name: QXEGRGENC).

**Parallel Grp Executed** The total number of parallel groups that were executed (Field name: QXTOTGRP).

**Parallel Maximum LOB Storage** The maximum storage used for LOB values (DB2 field name: QXSTLOBV).

**Parallel Single DB2 (Coord=NO)** The total number of parallel groups executed on a single DB2 subsystem due to the COORDINATOR subsystem value being set to NO (Field name: QXCOORNO). When the statement was bound, the COORDINATOR subsystem value was set to YES. This situation can also occur when a package or plan is bound on a DB2 subsystem with COORDINATOR=YES, but is run on a DB2 subsystem with COORDINATOR=NO.

**Parallel Single DB2 (Cursor)** The total number of parallel groups executed on a single DB2 subsystem because of a repeatable-read or read-stability isolation (Field name: QXEGRCUR).
**Parallel Sysplex Intent** The total number of parallel groups that DB2 intended to run across the data sharing group (Field name: QXXCBPNX). This number is only incremented at the parallelism coordinator at run time.

**Prepare** The number of PREPARE statements executed. This number at the server location might not match the user application because of DDF's internal processing (Field name: QXPREP).

**Prepare Avoided KEEPDYN(YES)** The number of times where no SQL PREPARE or EXECUTE IMMEDIATE was issued by the application and a copy of a prepared SQL statement was found in local dynamic SQL cache (Field name: QXSTNPRP). When an application plan or package is bound with KEEPDYNAamic YES, a copy of each prepared SQL statement for the application thread is held in the local dynamic SQL cache and kept across a commit boundary. An application thread can save the total cost of a prepare by using a copy of the prepared statement in the local dynamic SQL cache from an earlier prepare by the same thread. To do this, the application must be modified to avoid issuing repetitive SQL PREPAREs for the same SQL statement.

**Prepare Copied from Cache** The number of times a PREPARE command was satisfied by copying a statement from the prepared statement cache (Field name: QXSTFND).

**Prepare Discarded - MAXKEEPD** The number of times statements are invalidated in the local dynamic SQL cache because the MAXKEEPD limit has been reached and prepared SQL statements in the local dynamic SQL cache have to be reclaimed (Field name: QXSTDEXP).

**Prepare Implicit KEEPDYN(YES)** An implicit prepare occurs when the user copy of the prepared SQL statement no longer exists in the local dynamic SQL cache and the application plan or package is bound with KEEPDYNAamic YES (Field name: QXSTIPRP). If the skeleton copy of the prepared SQL statement exists in the global dynamic SQL cache in the EDM pool, a short prepare is executed, otherwise a full prepare is executed.

**Prepare No Match** The number of times that DB2 searched the prepared statement cache but could not find a suitable prepared statement (Field name: QXSTNFND).

**Prepare Purged - DROP/ALT/REV** The number of times statements are invalidated in the local dynamic SQL cache because of SQL DDL or updated RUNSTATS information and prepared SQL statements in the local dynamic SQL cache have to be reclaimed (Field name: QXSTDINV).

**Rate** The number of requests per second over the last sampling interval.

**Release** The number of RELEASE statements executed (DB2 field name: QXREL).

**Rename Index** The number of RENAME INDEX statements executed (Field name QXRNIX) - not supported prior to DB2 9.

**Rename Table** The number of RENAME TABLE statements executed (Field name: QXRNTAB).

**Revoke** The number of REVOKE statements executed (Field name: QXREVOOk).
RID HWM The highest number of RID blocks in use at any time since DB2 startup (Field name: QISTRHIG). This is a high-water mark.

RID In Use The number of RID blocks currently in use (snapshot value) (Field name: QISTRCUR).

RID Exceeded Pool The number of times the maximum RID pool storage was exceeded (Field name: QISTRMAX). The size is determined by the installation parameter RID POOL SIZE (DB2 install panel DSNTIPC). It can be 0, or between 128 KB and 10 GB. The general formula for calculating the RID pool size is: (Number of concurrent RID processing activities) x (average number of RIDs) x 2 x (5 bytes per RID).

RID Exhausted Virtual The number of times RID pool processing was not used because DBM1 storage was exhausted (Field name: QISTRSTG).

RID Not Used (no storage) The number of times DB2 detected that no storage was available to hold a list of RIDs during a given RID pool process involving one index (single index access with list prefetch) or multiple indexes (multiple index access) (DB2 field name: QXNSMIAP).

RID Not Used (Max Limit) The number of times DB2 detected that a RID list exceeded one or more internal limits during a given RID list (or RID pool) process involving one index (single index access with list prefetch) or multiple indexes (multiple index access) (DB2 field name: QXMRMIAP). The internal limits include the physical limitation of the number of RIDs a RID list can hold and threshold values for the retrieval, ORing, and ANDing of RIDs.

RID Pool Used The number of times the RID (RECORD ID) pool has been processed (Field name: QXMIAP). During RID (RECORD ID) pool (also called RID list) processing, DB2 uses an index to produce a list of candidate RIDs, which is called a RID list. The RID list can be sorted and intersected (ANDed) or unioned (ORed) with other RID lists before actually accessing the data pages. RID list processing is used for a single index (index access with list prefetch) or for multiple indexes (multiple index access), which is when the RID lists are ANDed and ORed.

RID Terminated (> DM) The number of times a RID pool processing operation terminated because the number of RID entries was greater than the DM limit (Field name: QISTRPLM).

RID Terminated (> RDS) The number of times RID pool processing terminated because the number of RIDs that can fit into the guaranteed number of RID blocks was greater than the maximum limit (25% of table size) (Field name: QISTRLLM).

Row Triggers Executed The number of times a row trigger was activated (Field name: QXROWTRG).

Rows Deleted The number of rows that have been deleted because of SQL DELETE statements (Field name: QXRWSDELETED).

Rows Fetched The number of rows that have been fetched because of SQL FETCH statements (Field name: QXRWSFETCHD).

Rows Inserted The number of rows that have been inserted because of SQL INSERT statements (Field name: QXRWSINSRTD).
Rows Updated  The number of rows that have been updated because of SQL UPDATE statements (Field name: QXRWSUPDTD).

Select  The number of SQL SELECT statements executed (Field name: QXSELECT).

Set Connection  The number of SET CONNECTION statements executed (Field name: QXSETCON).

Set Current Degree  The number of SET CURRENT DEGREE statements executed (field name: QXSETCDG).

Set Current Path  The number of SET CURRENT PATH statements executed (Field name: QXSETPTH).

Set Current Rules  The number of SET CURRENT RULES statements executed (Field name: QXSETCRL).

Set Current SQLID  The number of SET CURRENT SQLID statements executed (Field name: QXSETSQL).

Set Host Variable  The number of SET HOST VARIABLE statements executed. The special register that was retrieved is not tracked (Field name: QXSETHV).

SP Abended  The number of times a stored procedure terminated abnormally (Field name: QXCALLAB).

SP Call Statements  The number of times the SQL CALL statements executed to invoke a stored procedure (SP).

SP Rejected  The number of times an SQL CALL statement was rejected because of the procedure that is in the STOP ACTION(REJECT) state (Field name: QXCALLRJ).

SP Timed-Out  The number of times an SQL CALL statement timed out when waiting to be scheduled (Field name: QXCALLTO).

SQL Error in Trigger  The number of times an SQL error occurred during the execution of a triggered action (Field name: QXTRGRERR). This includes errors that occur in user-defined functions or stored procedures that are called from triggers and that pass back a negative SQLCODE.

Stmt Triggers Executed  The number of times a statement trigger was activated (Field name: QXSTTRG).

Storage in 4K TS  The total whole kilobytes of storage that were used for 4 KB table spaces (Field name: QISTW4K).

Storage in 32K TS  The total whole kilobytes of storage that were used for 32 KB table spaces (Field name: QISTW32K).

Time Stamp  The date and time, as set on the monitored system, indicating the instance when the agent collects information.

The timestamp format for SCAN and STR functions is CYYMMDDHHMMSSmmm (as in 1180315064501000 for 03/15/18 06:45:01) where:

- C = Century (0 for 20th, 1 for 21st)
- Y = Year
- M = Month
- D = Day
- H = Hour
- M = Minute
- S = Second
- m = Millisecond

**Total** The total count executed by the thread.

**UDFs Abended** The number of times a user-defined function (UDF) abended (Field name: QXCAUDAB).

**UDFs Executed** The number of user-defined functions (UDFs) executed (Field name: QXCAUD).

**UDFs Rejected** The number of times a user-defined function (UDF) was rejected (Field name: QXCAUDRJ).

**UDFs Timed Out** The number of times a user-defined function (UDF) timed out while waiting to be scheduled (Field name: QXCAUDTO).

**Update** The number of UPDATE statements executed (Field name: QXUPDTE).

**Update Rows Accessed** The number of rows accessed by READ transactions because of uncommitted UPDATE operations (using currently committed semantic for FETCH) - (Field name: QISTRCCU).

**Static SQL Cache Attributes**
Use these attributes to view static SQL cache information.

**Accum In-DB2 CPU Time** The accumulated in-DB2 CPU time. This time includes CPU consumed on an IBM specialty engine (Field name: QW0401CP).

**Accum In-DB2 Time** Accumulated in-DB2 elapsed time (Field name: QW0401ET).

**Accumulated wait for lock** The accumulated wait time for locks (Field name: QW0401LK).

**Append RID exceeded** The number of times that appending to a RID list for a hybrid join was interrupted because the number RIDs exceeded one or more internal limits.

**Append RID no stg** The number of times that appending to a RID list for a hybrid join was interrupted because no RID pool storage was available to hold the list of RIDs.

**Avg parallel degree** The average actual degree of parallelism for all parallel groups. The actual degree of parallelism is calculated at execution time, after buffer pool negotiation and system negotiation are taken into account (Field name: Q401ESTI).

**Avg parallel est degree** The average estimated degree of parallelism for all parallel groups. The estimated degrees are calculated at bind time, based on the cost formula. The average is calculated at execution time (Field name: Q401ACT).
**Avg parallel plan degree** The average planned maximum degree of parallelism for all of the parallel groups. The average is calculated at execution time. It is the optimal degree of parallelism that can be obtained at execution time, after host variables or parameter markers are resolved, and before buffer pool negotiation and system negotiation are performed (Q401PLAN).

**Buffer Write** The number of buffer writes (Field name: QW0401WT).

**Collection** The package collection ID (Field name: QW0401CL).

**Consistency Token** Consistency token of the package (Field name: QW0401CT).

**DB2 Limit Exceeded** The number of times RID list was not used (Field name: QW0401RL). Because the number of:
- RIDS would have exceeded the DB2 limits
- RID blocks exceeded the value set by the MAXTEMPS_RID system parameter

**DB2 Subsystem** The DB2 subsystem ID.

**DB2 Version** The DB2 version.

**DSG Member Name** The Data Sharing Group (DSG) member name.

**Data Sharing Group** The Data Sharing Group name.

**Executions** The number of executions (Field name: QW0401EX). Reason that the SQL statement was expanded. See QW0053ER for possible values.

**Expansion reason** Expansion reason (Field name: Q401EXR).

**Filler** Filler.

**Filler2** Filler for padding.

**Global child L-locks wait** Waits due to global contention for child L-locks (Field name: QW401WC).

**Global other L-locks wait** Waits due to global contention for other L-locks (Field name: QW401WD).

**Global P/P P-locks wait** Waits due to global contention for Pageset/Partition P-locks (Field name: QW401WE).

**Global Page P-locks wait** Waits due to global contention for Page P-locks (Field name: QW401WF).

**Global Other P-locks wait** Waits due to global contention for other P-locks (Field name: QW401WG).

**Getpages** The number of Getpages (Field name: QW0401GP).

**Global Locks Wait Time** The accumulated wait time for global locks (Field name: QW0401GL).

**Index Scan** The number of index scans (Field name: QW0401IX).
<table>
<thead>
<tr>

<tr>
<td><strong>Sync Read</strong></td>
<td>The number of synchronous buffer reads (Field name: QW0401SR).</td>
</tr>
<tr>
<td><strong>Tablespace Scan</strong></td>
<td>The number of tablespace scans (Field name: QW0401TB).</td>
</tr>
<tr>
<td><strong>Update Date 2</strong></td>
<td>The date or time when statement statistics were updated in internal format (Field name: QW401UT2).</td>
</tr>
</tbody>
</table>
Update Date  The date or time when statement statistics were updated in store clock format (Field name: QW401UT1).

Wait for drain lock  The accumulated wait time for drain locks (Field name: QW0401DL).

Wait for latch req  The accumulated wait time for a latch request (Field name: QW0401LH).

Wait for log writer  The accumulated wait time for log writers (Field name: QW0401LW).

Wait for page latch  The accumulated wait time for page latches (Field name: QW0401PL).

Waits other Wait Time  The accumulated wait time for a write activity done by another thread (Field name: QW0401OW).

Wait for claim release  The accumulated wait time for drain locks that are waiting for claims to be released (Field name: QW0401CM).

Wait for sync exec switch  The accumulated wait time for synchronous execution unit switch (Field name: QW0401EU).

Static SQL Text Attributes
Use these attributes to view the static SQL text

Collection  The package collection ID.

DB2 Subsystem  The DB2 subsystem ID.

DB2 Version  The DB2 version.

DSG Member Name  The Data Sharing Group (DSG) member name.

Data Sharing Group  The data sharing group name.

Filler  Filler for padding.

Interval Start  The start time of this interval.

MVS System ID  The MVS identifier.

Originating System  The managed system name of the agent. A It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

Package Name  The package identifier.

Statement ID  The statement identifier.

Statement Text  The statement text.
Statistics SQL Count Attributes
Use these attributes to view the Statistics SQL count.

DB2 Subsystem The DB2 subsystem ID.

DB2 Version The DB2 version.

Data Sharing Group The Data Sharing Group name.

Data Sharing Member The Data Sharing Group (DSG) member name.

Delta Value The change since last sample.

Field Name The data field name.

Field Value The data field value.

Interval Start The start time of this interval.

Interval Time The collection interval time.

MVS System ID The MVS identifier.

Originating System ID The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; example, DB91:SYS1:DB2.

Rate The amount over last sampling interval.

Sequence Number The data field sequence number.

Thread Accelerator Information Attributes
Use these attributes to view thread accelerator information.

ACE Address The agent control element (ACE) (see QWHSACE) of the thread that is reported. The value in QWHSACE is the ACE of the IFI application that requested this trace record (Field name: QW0148AC).

Accel CPU The overall accelerator CPU time (Field name: Q8ACACPU).

Accel ET ime The overall accelerator elapsed time (Field name: Q8ACAELA).

Accel WTime The overall accelerator wait time (Field name: Q8ACAWAT).

Accelerator Name The accelerator name (Field name: Q8ACNAME).

Authorization ID The primary authorization ID from connection or signon (Field name: UWHCAID). For z/OS operator commands and DB2 system internal agents, the value is SYSOPR. Secondary authorization IDs might be the RACF groups associated with this primary authorization ID. The SQL ID is initially set to this primary authorization ID. The connection authorization exit and the signon authorization exit can change the primary authorization ID so that it is not the same as the original primary authorization ID (QWHCOPID). Distributed authorization ID translation can also change the primary authorization ID.
**Blks Received** The number of blocks returned from the accelerator (Field name: Q8ACBLKR).

**Blks Sent** Number of blocks sent to the accelerator (Field name: Q8ACBLKS).

**Bytes Received** Number of bytes returned from the accelerator (Field name: Q8ACBYTR).

**Bytes Sent** Number of bytes sent to the accelerator (Field name: Q8ACBYTS).

**Collection Name** The collection name (Field name: UW0148CI).

**Connection ID** The connection name (Field name: QWHCCN). It is not valid on end of memory and reflects the z/OS home address space (ASID) connection name for:

- **Batch**: 'BATCH'
- **TSO**: 'TSO'
- **QMF**: 'DB2CALL'
- **Utility**: 'UTILITY'
- **DB2 internal**: DB2 subsystem ID
- **IMS**: IMS-ID
- **CICS**: CICS-ID
- **RRSAF**: 'RRSAF'

**Distributed database access threads**:

- For threads from a DB2 requestor, this field contains the connection name of the thread at the requesting location.
- For threads using the DRDA protocol from a non-DB2 requestor, this field contains the constant 'SERVER'.

**Connects** Number of connections to the accelerator (DB2 field name: Q8ACCONN).

**Correlation ID** The correlation ID value (Field name: QWHCCV).

- For batch: JOBNAME
- For TSO: LOGON-ID
- For IMS/VS: PST#.PSBNAME
- For CICS: CONNECTION_TYPE.THREAD_TYPE.THREAD_.#.TRAN-ID
- For RRSAF: CORRELATION-ID value from signon function
- For threads from a DB2 requestor: this field contains the correlation-ID name of the thread at the requesting location.
- For threads using the DRDA protocol from a non-DB2 requestor, this field contains the first 12 characters in the DDM external name (EXTNAM) parameter of the DDM EXCSAT command received as part of the SQL connect.

**DB2 Subsystem** The DB2 subsystem ID.

**DB2 Version** The DB2 version.
DSG Member Name The Data Sharing Group (DSG) member name.

Data Sharing Group The Data Sharing Group name.

End User ID The user ID of the end user’s workstation (Field name: QWHCEUID). This can be different from the authorization ID used to connect to DB2. This field contains blanks if the client did not supply this information. If QWHCEUID_OFF is not 0, this value is truncated.

Failed Number of failed requests (Field name: Q8ACFAIL).

IP address of accel Accelerator IP address (Field name: Q8ACIPAD).

Interval Start The start time of this interval.

Location Name The location name (Field name: UW0148LN). The location name contains the name of the local location or remote location, depending on where the thread executes a package. The following statements execute locally, regardless of the current package name:
  - COMMIT
  - ROLLBACK
  - SET <HOST VARIABLE> = CURRENT PACKAGE SET
  - SET <HOST VARIABLE> = CURRENT SERVER

For these statements, this field contains the location where the package executes, not the location where the statement executes.

Logical Unit of work ID The logical unit of the work ID (LUWID) as defined for the LU 6.2 interface (Field name: QW0148LU). The LUWID uniquely identifies the thread within the network, and consists of the following:
  - A fully qualified network name (QW0148LM)
  - An LUW instance number (QW0148UV) and an LUW sequence number (see fields below).

It consists of two 8-character fields: QW0148NI and QW0148LM, which together uniquely identify a client system.

MVS System ID The MVS identifier.

Msgs Received Number of messages returned from the accelerator (Field name: Q8ACMSGR).

Msgs Sent Number of messages sent to the accelerator (Field name: QW02542W).

Originating System The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

Package ID The package ID (Field name: UW0148PN).

Plan Name The plan name (Field name: QWHCPLAN). It shows a blank for a DB2 command thread; otherwise:
  - For SPUFI with cursor stability: 'DSNESPCS'
  - For SPUFI with repeatable read: 'DSNESP RR'
  - For TSO: the application plan name
• For IMS: the application plan name
• For CICS: application plan name, IMS and CICS commands have a blank plan name.
• For RRSAF create thread with the collection parameter: '?RRSAF '
• For QMF: 'DSQPLAN'
• For Distributed Database Access threads:
  – For threads using the DRDA protocol from a requester, this field contains the plan name that is executed at the requesting location.
  – For threads using the DRDA protocol from a non-DB2 requester or from a DB2 2.3 requester, this field contains the constant 'DISTSERV'.
• For binding: 'DSNBIND' (system plan)
• For utility: 'DSNUTIL ' (system plan)
• For authorization: 'ACT' + X'0000000000' (system plan)
• For unallocated threads and miscellaneous DB2 system service tasks: 'BCT' + X'0000000000' (system plan)
• For startup: 'STARTCT' + X'00' (system plan)

Product ID Accelerator product ID. (Field name: Q8ACPRID).

QWACFLGS Flags (Field name: QWACFLGS).

Requests Number of requests to the accelerator (Field name: Q8ACREQL).

Rows Received Number of rows returned from the accelerator (Field name: Q8ACROWR).

Rows Sent Number of rows sent to the accelerator (Field name: Q8ACROWS).

SVCS CPU Accelerator services cpu time (Field name: Q8ACSCPU).

SVCS ETime Accelerator services elapsed time (Field name: Q8ACSELA).

TCP/IP CPU Accelerator services TCP/IP CPU time (Field name: Q8ACTCPU).

TCP/IP ETime Accelerator services TCP/IP elapsed time. This elapsed time is a subset of accounting class 3 wait time for accelerator services (Field name: Q8ACTELA).

Thread Type The connecting system type code (in hexadecimal). This field can have a null value. For example, this field contains a null value for some utilities (Field name: QWHCATYP).

Timeout Number of timed-out requests (Field name: Q8ACTOUT).

Transaction Name The transaction or application name that the end user is running (Field name: QWHCEUTX). This identifies the application that is currently running, not the product that is used to run the application. This field contains blanks if the client did not supply this information.

Workstation Name The end user's workstation name. This field contains blanks if the client did not supply this information (Field name: QWHCEUWN).
**Thread DB2 Connect Statement Attributes**

Use the DB2 Connect Statement attributes to create situations to identify any statement with long elapsed time.

**Ace Address** The DB2 thread ACE address for internal use.

**Application Creator** The authorization ID of the user who precompiled the application. You can use this counter to identify the SQL statement that is processing, in conjunction with the CREATOR column of the package section information in the catalogs.

**Application ID** The ID that is generated when the application connects to the database at the database manager or when Distributed Database Connection Services (DDCS) receives a request to connect to a DRDA database.

It is known at both the client and the server, so you can use it to correlate the client and server parts of the application. For DDCS applications, you will also need to use the **Outbound Application ID** to correlate the client and server parts of the application. This ID is unique across the network. There are different formats for the application ID, which are dependent on the communication protocol between the client and the server machine on which the database manager, the DDCS, or both, are running. Each of the formats consists of three parts separated by periods.

| IPX/SPX  | Netid.nodeid.Application instance | A1A8E5C.4000115282C0131214645 | An IPX/SPX-generated application ID is made up by concatenating a character network ID (8 hexadecimal characters), a node ID (12 hexadecimal characters), and a unique ID for the instance of the application. The application instance corresponds to a 10-decimal-character timestamp of the form *mmddhhmmss*, where:  
  - M = Month  
  - D = Day  
  - H = Hour  
  - M = Minute  
  - S = Second |
<table>
<thead>

<tbody>
<tr>
<td>NetBIOS</td>
<td>*NETBIOS.nname. Application instance</td>
<td>*NETBIOS.SBOIVIN. 930131214645</td>
<td>For nonpartitioned database systems, a NetBIOS application ID is made up by concatenating the string *NETBIOS, the NNAME defined in the database configuration file for the client, and a unique ID for the instance of this application. For partitioned database systems, a NetBIOS application ID is made up by concatenating the string N xxx.etc where xxx is the partition the application is attached to.</td>
</tr>
<tr>
<td>Local applications</td>
<td>*LOCAL.DB2 instance.Application instance</td>
<td>*LOCAL.DB2INST1. 930131235945</td>
<td>The application ID generated for a local application is made up by concatenating the string *LOCAL, the name of the DB2 instance, and a unique ID for the instance of this application.</td>
</tr>
</tbody>
</table>

**Application Name** The name of the application running at the client as known to the database manager or DB2 Connect.

Together with the Application ID counter, it can be used to relate data items with your application.

**Authorization ID** The authorization ID.

**Authid (Unicode)** The authorization ID.

**Blocking Cursor** Indicates whether the statement being executed is using a blocking cursor. Using blocking for data transfer for a query can improve its performance. The SQL used for a query can affect the use of blocking and might require some modification.

**Corrid** The correlation ID.

**Thread DB2 Connect Statement Attributes** Identifies the connection of an application to a DB2 system.

It is an alphanumeric text string, with a maximum length of eight characters.
**DB2 ID** The DB2 subsystem ID.

**Gateway Snapshot Time** The date and time at which the database system monitor information was collected.

**Host Response Time** For a DCS statement, this is the elapsed time between the time that the statement was sent from the DB2 Connect gateway to the host for processing and the time when the result was received from the host.

For a DCS database or a DCS application, it is the sum of the elapsed times for all the statements that were executed for a particular application or database. For a data transmission, this is the sum of host response times for all the statements that used this many data transmissions. Use this counter with the **Network statistic - Outbound number of bytes sent** and **Network statistic - Outbound bytes received** counters to calculate the outbound response time (transfer rate):

\[
\frac{\text{outbound number of bytes sent} + \text{outbound bytes received}}{\text{host response time}}
\]

**Inbound Number of Bytes Received** The number of bytes received by the DB2 Connect gateway from the client, excluding communication protocol overhead, for example, TCP/IP or SNA headers. Use this counter to measure the throughput from the client to the DB2 Connect gateway.

**Inbound Number of Bytes Sent** Shows the number of bytes sent by the DB2 Connect gateway to the client, excluding communication protocol overhead, for example, TCP/IP or SNA headers. Use this counter to measure the throughput from the DB2 Connect gateway to the client.

**IP Address** The current IP address.

**Local: System CPU Time** The total system CPU time, in seconds and microseconds, used by the statement that is currently executing.

Together with the other related CPU-time counters, it can help you understand the level of activity within an application and identify applications that could benefit from additional tuning. This counter includes time spent on SQL and non-SQL statements and on any fenced user-defined functions (UDF) or stored procedures executed by the application. System CPU represents the time spent in system calls. User CPU represents time spent executing database manager code.

**Note:** If this information is not available for your operating system, this counter is set to 0.

**Local: User CPU Time** The total user CPU time, in seconds and microseconds, used by the currently executing statement. Together with the other related CPU-time counters, it can help you understand the level of activity within an application and identify applications that could benefit from additional tuning. This counter includes time spent on SQL and non-SQL statements and on any fenced user-defined functions (UDF) or stored procedures executed by the application. System CPU represents the time spent in system calls. User CPU represents time spent executing database manager code.

**Most Recent Statement Elapsed Time** The elapsed execution time of the most recently completed statement. Use this counter as an indicator of the time that it takes for a statement to complete.

**MVSID** The MVS system identifier.
**Name** The name in the database manager configuration file at the client node. It identifies the client node that is running the application.

**Number of Successful Fetches** For statement snapshot monitoring and the statement event type, this is the number of successful fetches performed on a specific cursor. For DCS statement snapshot monitoring, this is the number of attempted physical fetches during the execution of a statement regardless of how many rows were fetched by the application. That is, this counter shows the number of times the server needed to send a reply data back to the gateway while processing a statement. You can use this counter to gain insight into the current level of activity within the database manager.

**Outbound Application ID (Internal)** This ID is generated when the application connects to the DRDA host database. It is used to connect the DB2 Connect gateway to the host, while the application ID is used to connect a client to the DB2 Connect gateway. You can use this counter in conjunction with the Application ID counter to correlate the client and server parts of the application information. This ID is unique across the network.

**Outbound Application ID** This ID is generated when the application connects to the DRDA host database. It is used to connect the DB2 Connect gateway to the host, while the application ID is used to connect a client to the DB2 Connect gateway. You can use this counter in conjunction with the Application ID counter to correlate the client and server parts of the application information. This ID is unique across the network.

**Outbound Blocking Cursor** Indicates whether blocking is used for data transfer from the DRDA server to the DB2 Connect gateway for a particular query. Using blocking for data transfer for a query can improve its performance. The SQL used for a query can affect the use of blocking and might require some modification.

**Outbound Bytes Received** The number of bytes received by the DB2 Connect gateway from the host, excluding communication protocol overhead, for example, TCP/IP or SNA headers.

For a data transmission, this is the number of bytes received by the DB2 Connect gateway from the host during the processing of all the statements that used this number of data transmissions.
Network Logical Unit Name.Application instance

CAIBMTOR.OSFDBM0.930131194520

This application ID is the displayable format of an actual SNA LUWID (logical unit-of-work ID) that flows on the network when an APPC conversation is allocated. APPC-generated application IDs are made up by concatenating the network name, the Logical Unit name, and the LUWID instance number, which creates a unique label for the client/server application. The network name and Logical Unit name can each be a maximum of 8 characters. The application instance corresponds to the 12-decimal-character LUWID instance number.

Outbound Number of Bytes Sent
The number of bytes sent by the DB2 Connect gateway to the host, excluding communication protocol overhead, for example, TCP/IP or SNA headers. For a data transmission, this is the number of bytes sent by the DB2 Connect gateway to the host during the processing of all the statements that used this number of data transmissions. Use this counter to measure the throughput from the DB2 Connect gateway to the host database. Use this counter to measure the throughput from the host databases to the DB2 Connect gateway.

Originating System ID
The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

Package Name
The name of the package that contains the SQL statement that is currently executing. You can use this counter to identify the application program and the SQL statement that is executing.

Plan
The plan name.

Query Cost Estimate
The estimated cost, in timerons, for a query, as determined by the SQL compiler. It allows correlation of actual run-time with the compile-time estimates.

In addition, it returns information for the following SQL statements when you are monitoring DB2 Connect.

- PREPARE represents the relative cost of the prepared SQL statement.
- FETCH contains the length of the row retrieved if the DRDA server is DB2 for OS/400.

If information is not collected for a DRDA server, this counter is set to zero.
Note: If the DRDA server is DB2 for OS/390 and z/OS, this estimate could be higher than $2^{32} - 1$ (the maximum integer number that can be expressed through an unsigned long variable). In that case, the value returned by the monitor for this counter is $2^{32} - 1$.

Query Number of Rows Estimate
The estimated number of rows that is returned by a query.

This estimate by the SQL compiler can be compared with the run-time actuals. This counter also returns information for the following SQL statements when you are monitoring DB2 Connect:

- INSERT, UPDATE, and DELETE indicate the number of rows affected.
- PREPARE estimates the number of rows that are returned if the DRDA server is DB2 Universal Database, DB2 for VM and VSE, or DB2 for OS/400.
- FETCH sets to the number of rows fetched if the DRDA server is DB2 for OS/400.

If information is not collected for a DRDA server, this counter is set to zero.

Section Number
The internal section number in the package for the SQL statement that is currently processing or has processed most recently.

For a static SQL, you can use this counter together with the creator, package version, and package name to query the SYSCAT.STATEMENTS system catalog table and obtain the static SQL statement text, using the sample query as follows:

```
SELECT SEQNO, SUBSTR(TEXT,1,120)
FROM SYSCAT.STATEMENTS
WHERE PKGNAME = 'package_name'
AND PKGSCHEMA = 'creator'
AND VERSION = 'package_version_id'
AND SECTNO = section_number
ORDER BY SEQNO
```

Note: This query can cause lock contentions. Therefore, try to use it only when there is little other activity against the database.

Server Instance Name
The name of the database manager instance for which the snapshot was taken.

Statement Operation
The statement operation that is currently being processed or has processed most recently (if none is currently running).

You can use this counter to determine the operation that is executing or recently finished. It can be one of the following:

- For SQL operations:
  - SELECT
  - PREPARE
  - EXECUTE
  - EXECUTE IMMEDIATE
  - OPEN
  - FETCH
  - CLOSE
  - DESCRIBE
  - STATIC COMMIT
- STATIC ROLLBACK
- FREE LOCATOR
- PREP_COMMIT
- CALL
- PREP_OPEN
- PREP_EXEC
- COMPile

* For non-SQL operations:
  - RUN STATISTICS
  - REORG
  - REBIND
  - REDISTRIBUT E
  - GET TABLE AUTHORIZATION
  - GET ADMINISTRATIVE AUTHORIZATION

**Note:** API users should refer to the sqlmon.h header file containing definitions of database system monitor constants.

**Statement Start Timestamp** The date and time at which the statement operation started executing. You can use this counter with the SQL statements - Statement operation counter to calculate the elapsed statement operation execution time.

**Statement Stop Timestamp** The date and time at which the statement operation stopped executing. You can use this counter with the SQL statements - Statement operation counter to calculate the elapsed statement operation execution time.

**Elapsed Execution Time** For a DCS statement, this is the elapsed time spent processing an SQL request on a host database server. This value is reported by this server. In contrast to the Times - Host response time counter, this counter does not include the network elapsed time between DB2 Connect and the host database server. At other levels, this value represents the sum of the host execution times for all the statements that were executed for a particular database or application, or for those statements that used a given number of data transmissions.

**No. of Statements** The number of SQL statements that have been attempted since the latter of: application startup, database activation, or last reset. For a data transmission, this is the number of SQL statements that have been attempted against this DCS database or in this DCS application since the database was activated, the connection to it was established by the application, or RESET MONITOR was issued against the database, and that used this number of data transmissions between the DB2 Connect gateway and the host during statement processing.

**No. of Transmissions** The number of data transmissions between the DB2 Connect gateway and the host that was used to process this DCS statement. One data transmission consists of one send or one receive.

**Time Spent on Gateway Processing** The time, in seconds and microseconds, at the DB2 Connect gateway to process an application request since the connection was established, or to process a single statement. Use this counter to determine what portion of the overall processing time is because of DB2 Connect gateway processing.
Time Stamp  The start time of this interval.

Uniqueness Value  The instance number: When concatenated with the fully qualified network name, it uniquely identifies a distributed thread (DB2 field name: QWHSLUUV).

Uniqueness Value 2  The DB2 thread uniqueness value. For internal use.

Thread DDF Statistics Attributes (64 bit)
Use the Thread DDF Statistics attributes for 64 bit to create situations to monitor Distributed Database Facility statistics.

Aborts Received  The number of aborts received from remote location.

Aborts Sent  The number of aborts sent to remote location.

Agent Elapsed Time  The elapsed time at the local site spent processing for the remote site (in units that represent tenths of seconds).

Block Mode Switches  The count of block mode switches performed.

Blocks Received  The blocks received from remote location.

Blocks Sent  The blocks sent to remote location.

Commits Received  The number of commits received from remote location.

Commits Sent  The number of commits sent to remote location.

Conversations Initiated Local  The number of conversations initiated by local side of connection.

Conversations Initiated Remote  The number of conversations initiated by remote side of connection.

Conversations Allocated  The conversations allocated.

Conversations DEALLOCATED  The conversations deallocated.

Conversations Queued  The number of conversations queued.

Coordinator Backouts Received  The number of backout requests received from coordinator (2-phase commit only).

Coordinator Backouts Sent  The number of backout requests sent to the coordinator (2-phase commit only).

Coordinator Commits Received  The number of commit requests received from coordinator (2-phase commit only).

Coordinator Commits Sent  The number of commit requests sent to the coordinator (2-phase commit only).

Coordinator Forgets Sent  The number of forget response requests sent to the coordinator (2-phase commit only).
Data Bytes Received The number of data bytes received from the remote location.

Data Bytes Sent The number of data bytes sent to the remote location.

Data Rows Received The number of data rows received from the remote location.

Data Rows Sent The number of data rows sent to the remote location.

DB Access CPU Time The database access agent CPU time at the remote site (in units that represent milliseconds).

DB2 ID The DB2 identifier.

DB2 Version The version of the DB2 system.

Directed Access The type of directed access.

Elapsed DB Access The elapsed database access agent time at the remote site (in units that represent tenths of seconds).

Interval Time The number of seconds since last sample (in units that represent seconds).

Last Agent Request Received The number of last agent requests received from initiator (2-phase commit only).

Last Agent Request Sent The number of last agent requests sent to coordinator (2-phase commit only).

Local Elapsed Time The elapsed time, in tenths of a second, for local thread (in units that represent tenths of seconds).

LUWID The logical unit of work ID (LUWID) for a thread.

This value consists of two parts: the logical unit of work ID (luw-id) and a token. The token can be used in place of the luw-id in any DB2 command that accepts luw-id as input. Format:

luw-id=token

The luw-id consists of the network name, the originating VTAM LUNAME, and a unique identifier (separated by periods). Thus, the Luwid field displays data such as the following:

USCAC001.02D22A.A1FEBEBF8D9=8

Maximum Conversations The maximum conversations allowed.

Message Buffer Rows The message buffer rows.

Messages Received The number of messages received from remote location.

Messages Sent The number of messages sent to remote location.

MVS System ID The MVS system identifier.
**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Participant Backouts Received** The number of backout requests received from participant (2-phase commit only).

**Participant Backouts Sent** The number of backout requests sent to the participant (2-phase commit only).

**Participant Commits Received** The number of commit requests received from participant (2-phase commit only).

**Participant Commits Sent** The number of commit requests sent to the participant (2-phase commit only).

**Participant Forgets Received** The number of forget requests received from participant (2-phase commit only).

**Prepare Requests Received** The number of prepare requests received from participant (2-phase commit only).

**Prepare Requests Sent** The number of prepare requests sent to participant (2-phase commit only).

**Protocol Used** The protocol used for this conversation. It is an alphanumeric text string, with a maximum length of 12 characters.

**Remote Binds** The binds from remote access.

**Remote Commit Operations** The number of commit operations performed with the remote location as COORD.

**Remote CPU Time** The CPU time for remote system in milliseconds (in units that represent milliseconds).

**Remote Elapsed Time** The elapsed time for remote thread in tenths of a second (in units that represent tenths of seconds).

**Remote In Doubt Threads** The number of threads that went in doubt with the remote location as COORD.

**Remote Location Name** The name of the remote system to which this thread is connected.

**Remote Location Name (Unicode)** The name of the remote system to which this thread is connected.

**Remote Logical Unit Name** The LUNAME of the connection to the remote DB2 system. It is an alphanumeric text string, with a maximum length of eight characters.

**Remote Product ID** The remote product identifier (ID). It is an alphanumeric text string, with a maximum length of eight characters.
Remote Rollback Operations The number of rollback operations performed with the remote location as COORD.

SQL Calls Received The number of SQL calls received from the remote location.

SQL Calls Sent The number of SQL calls made to the remote location.

Thread Token The attribute that ties this entry to the owning thread by using the thread token as a foreign key.

Time Stamp The date and time, as set on the monitored system, indicating the instance when the agent collects information.

The timestamp format for SCAN and STR functions is CYYMMDDHHMMSSmmm (as in 1180315064501000 for 03/15/18 06:45:01) where:

- C = Century (0 for 20th, 1 for 21st)
- Y = Year
- M = Month
- D = Day
- H = Hour
- M = Minute
- S = Second
- m = Millisecond

Transactions Received The number of transactions received from remote location.

Transactions Sent The number of transactions sent to remote location.

Thread Detail Attributes (Data Sharing)
Use Thread Detail attributes to create situations that monitor DB2 threads. This information is used locally for data sharing.

Authorization ID The primary authorization ID from connection or sign-on that identifies the execution privileges an application has to a DB2 object or service. It is an alphanumeric text string with a maximum of 8 characters.

Authorization ID (Unicode) The primary authorization ID from connection or sign-on that identifies the execution privileges an application has to a DB2 object or service. It is an alphanumeric text string with a maximum of 8 characters.

Collection ID The collection ID.

This field is blank for DBRM. It is an alphanumeric text string, with a maximum of 18 characters

Thread Detail Attributes (Data Sharing) Identifies the connection of an application to a DB2 system.

It is an alphanumeric text string, with a maximum length of eight characters.

Thread Detail Attributes (Data Sharing) The type of connection associated with the thread.

Valid values are:
<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BATCH</td>
<td>Batch job</td>
</tr>
<tr>
<td>CICS</td>
<td>CICS attach</td>

</tbody>
</table>

**Correlation ID** The correlation between an application and the connection to a DB2 system. It is an alphanumeric text string, with a maximum of 12 characters; for example DLKEX212.

**CPU Rate** The thread CPU rate.

**DB2 ID** The name of a DB2 subsystem.

**Display CPU Time** The total amount of CPU time that DB2 has accumulated for a thread.

Valid format is HH:MM:SS:mmm, where:
- H = Hour
- M = Minute
- S = Second
- m = Millisecond

If the time goes over 24 hours, the format is DD-HH:MM where:
- D = Day
- H = Hour
- M = Minute

For example, 00:14:59 indicates that the display CPU time is 14 minutes and 59 seconds.

**Display Elapsed Time** The total amount of elapsed time since thread creation or DB2 sign-on.

Valid format is DD-HH:MM:SS, where:
- D = Day
- H = Hour
- M = Minute
• S = Second

For example, 00-20:16:18 indicates that the display elapsed time is 20 hours, 16 minutes, and 18 seconds.

**Display Wait Time** The total amount of thread wait time. The collection of thread wait time requires activation of Accounting Class 2 in the monitored DB2 subsystem.

Valid format is HH:MM:SS:mmm, where:
• H = Hour
• M = Minute
• S = Second
• m = Millisecond

If the time goes over 24 hours, the format is DD-HH:MM where:
• D = Day
• H = Hour
• M = Minute

For example, 00:14:59 indicates that the display CPU time is 14 minutes and 59 seconds.

**ID Name** An internal attribute used for navigation, it contains either the Data Sharing Group Name or the DB2ID.

**IIP CPU** The accumulated CPU time consumed while executing on an IBM zIIP in all environments.

**In DB2 CP CPU Time** The CP CPU time accumulated in DB2 include the current in-DB2 CPU time for the SQL statement in progress.

**In DB2 Elapsed Time** The elapsed time accumulated in DB2 include the current in-DB2 time for the SQL statement in progress.

**MVS System** The MVS System Management Facility (SMF) ID. It is an alphanumeric text string with a maximum of 4 characters; for example SP11.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Package Name** Identifies the package name with which a thread is associated. It is an alphanumeric text string, with a maximum of 8 characters.

**Plan Name** The name of an application plan that DB2 produces during the bind process and uses for processing SQL statements during execution. It is an alphanumeric text string, with a maximum of 8 characters. For example, PLANLCK2 is the name of an application plan. *SYSTEM* indicates DB2 subsystem-generated threads that own or are waiting on a lock.

**Thread CPU Time** The total amount of CPU time that DB2 has accumulated for a thread. Valid value is an integer in the range 0 - 99999999 seconds.

**Thread Elapsed Time** The total amount of elapsed time since thread creation or DB2 sign-on. Valid value is an integer in the range 0 - 99999999 seconds.
**Thread Group Name** The name of a data sharing group for a thread. It is an alphanumeric text string, with a maximum of 8 characters; for example, TDDB241G.

**Thread Group Member Name** The name of the member within a data sharing group for a thread.

**Thread Status** The current status of a thread.

Valid values are:

**Status**  **Description**

**NOT-AVAIL**  
The thread is not available.

**IN-ABORT**  
The thread is in abort processing.

**IN-ACCEL**  
The thread is executing on IBM DB2 Analytics Accelerator for z/OS.

**IN-AUTO-PROC**  
The thread is processing an autonomous procedure.

**IN-BIND-DYNM**  
The thread is in dynamic bind processing.

**IN-BIND-STAT**  
The thread is in static bind processing.

**IN-COMMAND**  
Command threads display this status when they are active in DB2 and executing within the DB2 command processor. (This type of thread always has a blank plan name.)

**IN-COMMIT**  
The thread is in Commit processing (applies only to threads that originate from an attachment that does not use two-phase-commit protocol).

**IN-COMT-PHS1**  
The thread is in Commit phase 1 processing.

**IN-COMT-PHS2**  
The thread is in Commit phase 2 processing.

**IN-CRTE-THRD**  
The thread is in Create Thread processing.

**IN-DB2**  
The thread is executing in DB2. A more descriptive status could not be determined.

**INDOUBT**  
The thread is in doubt.

**IN-SIGNON**  
The thread is in signon processing. This status applies only to threads originating from CICS or IMS attachments.

**IN-SQL-CALL**  
The thread is processing an SQL call.
IN-SQL-SORT
The thread is executing an SQL call and is doing the sort processing required to satisfy the call’s request.

IN-STOR-PROC
The thread is currently running in a stored procedure.

IN-TERM-THRD
The thread is in termination as a result of allied task termination. This status corresponds to DB2 DISPLAY THREAD=D status.

IN-TRIGGER
The thread is currently running in a trigger.

IN-USER-FUNC
The thread is currently running a user-defined function.

NOT-IN-DB2
The thread is not currently executing in DB2.

SP/UDF-INACT
The thread is trying but not able to run in a stored procedure or user-defined function.

SWAPPED-OUT
The thread is not currently executing in DB2. The thread originating address space is swapped out.

WAIT-ARCHIVE
The thread is waiting for an archive log tape mount necessary during thread abort processing.

WAIT-ARCREAD
The thread is currently waiting for read of archive log from tape.

WAIT-ASYNCRD
The thread is currently waiting for completion of a read I/O that is being done under a thread other than this one (for example, sequential or List Prefetch).

WAIT-ASYNCWR
The thread is currently waiting for completion of Write I/O that is being done under a thread other than this one (for example, Deferred Writes).

WAIT-CONVLIM
The distributed thread is in a synchronous wait because the conversation limit has been reached for its designated logmode.

WAIT-CTHREAD
The thread is queued in Create Thread processing because DB2 reached the CTHREAD value. This status corresponds to DB2 DISPLAY THREAD=QD status.

WAIT-GLBLOCK
The thread is currently waiting for either:
- Inter-system communication within the data sharing group to determine if there is lock contention.
- A lock held by another subsystem in the data sharing group.

WAIT-LOCK
The thread is waiting for a lock.
WAIT-MGSSEND
The thread is waiting because of inter-system message sending contention.

WAIT-REMREQ
The database access thread is in a synchronous wait (waiting for a response or a request from the originating DB2 subsystem).

WAIT-REMSQL
The distributed allied thread is in a synchronous wait (waiting for a response from the remote DB2 subsystem being accessed).

WAIT-REUSE
The thread is not currently in use and is waiting to be reused. This status applies only to CICS and IMS threads.

WAIT-SERVICE
The thread is currently waiting for completion of a DB2 service. Types of DB2 services include: open/close of a dataset, DFHSM recall of a dataset, SYSLGRNG update or define/extend/delete of a dataset, rollback, and Commit phase 2 for read only threads.

WAIT-SP-STOP
The thread is queued waiting for a stopped stored procedure.

WAIT-TERM-TH
The thread is queued and waiting for thread termination as a result of allied task termination. This status corresponds to DB2 DISPLAY THREAD=QD status.

UTIL-STOP
The DB2 utility was started but not completed because of abnormal termination.

The following status are only available when class 2/3 traces are on:

WAIT-ACCEL
The thread is currently waiting for claimers to be released after acquiring drain lock.

WAIT-CLAIMER
The thread is currently waiting for claimers to be released after acquiring drain lock.

WAIT-CL3LOCK
The thread is currently waiting for the completion of an identify call to the IRLM.

WAIT-COMMIT
The thread is waiting for the FORCE-AT-COMMIT event to complete.

WAIT-DRNLOCK
The thread is currently waiting to acquire drain lock.

WAIT LOB
The thread is currently waiting for TCP/IP to materialize a LOB.

WAIT-LOCKLAT
The thread is waiting for a LOCK-I/O-LATCH.

WAIT-LOCKPIP
The thread is currently waiting for a PIPE suspend.

WAIT-LOCKPQS
The thread is currently suspended for parallel task synchronization.
WAIT-LOGQSCE
The thread is currently suspended because of an ARCHIVE LOG MODE(QUIESCE) command.

WAIT-PGLATCH
The thread is currently waiting for page latch.

WAIT-SP-SCHD
The thread is waiting for a TCB to become available in the stored procedures address space to schedule a stored procedure.

WAIT-SWITCH
The thread is currently waiting for the completion of a synchronous execution switch.

WAIT-SYNC-IO
The thread is currently waiting for completion of a synchronous Read I/O or Write I/O.

Note: This status can indicate that a DB2 resource is not large enough. You can use the OMEGAMON XE for DB2 PE resource manager or object analysis displays to further isolate the problem.

Thread Stored Procedure Name The name of the stored procedure that a thread invokes. It is an alphanumeric text string, with a maximum of 18 characters; for example, SPCALC_TAX.

Thread Detail Attributes (Data Sharing) The type of thread.

It can be:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BATCH</td>
<td>Batch job</td>
</tr>
<tr>
<td>CICS</td>
<td>CICS attach</td>

</table>

Thread Wait Time The total amount of thread wait time. It is an integer in the range 09 - 99999999 seconds. Note: collection of thread time requires activation of Accounting Class 2 in the Monitored DB2 subsystem.
**Time Stamp** Represents the end of data collection or the end of an interval, and is the local time where the system is running.

The timestamp format for SCAN and STR functions is `CYYMMDDHHMMSmmm` (as in `1180315064501000` for 03/15/18 06:45:01) where:

- **C** = Century (0 for 20th, 1 for 21st)
- **Y** = Year
- **M** = Month
- **D** = Day
- **H** = Hour
- **M** = Minute
- **S** = Second
- **m** = Millisecond

**Thread Detail Attributes (Local DB2)**
Use the Thread Detail attributes to create situations that monitor DB2 threads. This information is used for a local DB2 system.

**Ace Address** The Ace address.

**Active Tasks** The number of active parallel tasks or utility sub-tasks created for the originating task or main utility task. The value is zero for parallel tasks or utility sub-tasks. This value is only calculated if accounting class 1 is active.

**Agent Address** The Agent address.

**AGNT ASID** The address space ID (ASID) of the agent.

**Agent TCB Address** The Agent TCP address.

**Archive Log Suspends** The number of suspends for processing of archive log mode (quiesce) commands.

**Archive Quiesce Time** The accumulated wait time for processing of archive log mode (quiesce) commands.

**Archive Quiesce Time Current** The current wait time for processing of archive log mode (quiesce) commands.

**Archive Quiesce Waits** The number of suspensions for processing of archive log mode (quiesce) commands.

**Archive Tape Wait** The number of wait trace events processed for archive reads.

**Archive Tape Wait Time** The accumulated wait time for archive reads from tape.

**Archive Tape Wait Time Current** The current wait time for processing of archive log mode quiesce commands.

**Async Read Time** The accumulated wait time for a read I/O that is done under a thread other than this one.

**Async Read Time Current** The current wait time for a read I/O that is done under a thread other than this one.
Async Read Waits The number of wait trace events processed for a read I/O under another thread.

Async Write Time The accumulated wait time for a write I/O that is done under a thread other than this one.

Async Write Time Current The current wait time for a write I/O that is done under a thread other than this one.

Async Write Waits The number of wait trace events processed for waits for a write I/O under another thread.

Authorization ID The authorization ID.

Authorization ID (Unicode) The authorization ID.

CICS MVSID The MVS identifier used for CICS dynamic workspace linking.

CICS Task Number The CICS transaction ID.

CICS Terminal ID The CICS terminal ID.

CICS Thread Type The CICS thread type.

CICS Transaction ID The CICS transaction ID.

CICS Transaction ID From EIB The CICS Transaction ID from E18.

Claimer Waits The claimer waits.

Claimer Wait Time The total claimer wait time.

Claimer Wait Time Current The current claimer wait time.

Collection The package collection ID.

Collection (Unicode) The package collection ID.

Thread Detail Attributes (Local DB2) Connection ID. Identifies the connection of an application to a DB2 system.

It is an alphanumeric text string, with a maximum length of eight characters.

Thread Detail Attributes (Local DB2) The type of connection associated with the thread.

Valid values are:

<table>

</tbody>
</table>

**Correlation ID** The DB2 Correlation ID.

**CPU Before Enclave** The accumulated TCB time used before the enclave is created.

**CPU Rate** The thread CPU rate.

**CPU Time** The total CPU time.

**DB2 ID** The DB2 subsystem ID.

**DB2 Service Time** The accumulated wait time because of a synchronous execution unit switch for DB2 commit, abort, or deallocation processing.

**DB2 Service Time Current** The current wait time because of a synchronous execution unit switch for DB2 commit, abort, or deallocation processing.

**DB2 Service Waits** The number of wait trace events processed for waits for synchronous execution unit switching for commit or abort.

**Drain Lock Waits** The drain lock waits.

**Drain Wait Time** The total drain lock wait time.

**Drain Wait Time Current** The current drain lock wait time.

**Elapsed Time** The elapsed time.

**Force At Commit Waits** The force at commit waits.

**End User ID** The user ID of the workstation end user. This user ID can be different from the authorization ID used to connect to DB2. This field contains blanks if the client does not supply this information (DB2 field name: QWHCEUID).

**Force At Commit Wait Time** The total force at commit wait time.

**Force At Commit Wait Time Current** The current force at commit wait time.

**Global Child L-Lock Waits** The number of wait trace events processed for waits due to global contention for child L-locks.
Global Child L-Lock Wait Time The accumulated wait time due to global contention for child L-locks.

Global Child L-Lock Wait Time Current The current wait time due to global contention for child L-locks.

Global Contention Waits The global contention waits.

Global Contention Wait Time The accumulated wait time due to global contention for parent L-locks. Global contention occurs when intersystem communication is required to resolve an IRLM lock or change request. QPACA WTL contains the wait time due to local contention.

Global Contention Wait Time Current The current wait time due to global contention for parent L-locks. Global contention occurs when intersystem communication is required to resolve an IRLM lock or change request. QPACAWTL contains the wait time due to local contention.

Global Other L-Lock Waits The number of wait trace events processed for waits due to global contention for other L-locks.

Global Other L-Lock Wait Time The accumulated wait time due to global contention for other L-locks.

Global Other L-Lock Wait Time Current The current wait time due to global contention for other L-locks.

Global Other P-Lock Waits The number of wait trace events processed for waits due to global contention.

Global Other P-Lock Wait Time The accumulated wait time due to global contention for other P-locks.

Global Other P-Lock Wait Time Current The current wait time due to global contention for other P-locks.

Global Page P-Locks The number of wait trace events processed for waits due to global contention for page set or partition P-locks.

Global Page P-Lock Wait Time The accumulated wait time due to global contention for page P-locks.

Global Page P-Lock Wait Time Current The current wait time due to global contention for page P-locks.

Global Pageset P-Lock Waits The number of wait trace events processed for waits due to global contention for page set or partition P-locks.

Global Pageset P-Lock Wait Time The accumulated wait time due to global contention for page set or partition P-locks.

Global Pageset P-Lock Wait Time Current The current wait time due to global contention for page set or partition P-locks.

IIP CPU The accumulated CPU time consumed while executing on an IBM zIIP in all environments.
IMS Program Name The IMS region program name.

IMS Region Name The IMS region name.

IMS Region Number The IMS region number.

IMS Region Terminal Name The IMS region terminal name.

IMS Transaction Name The IMS transaction name.

In DB2 Allied CPU The allied CPU (TCB) time accumulated in DB2.

In DB2 CP CPU Time The CP CPU time accumulated in DB2 include the current in-DB2 CPU time for the SQL statement in progress.

In DB2 Elapsed Time The elapsed time accumulated in DB2 include the current in-DB2 time for the SQL statement in progress.

In DB2 SP CPU The accumulated TCB time spent processing SQL call statements in the DB2 stored procedures address space or a WLM address space. This time is calculated only if accounting class one is active.

In DB2 IIP CPU Time The IIP CPU time consumed when executing in DB2.

Interval Start The start time of this interval.

In UDF Time The accumulated TCB time in DB2 for processing SQL statements issued by user-defined functions (DB2 field name: QWACUDTT). This is a subset of the time recorded in QWACUDCP. The value is calculated only if accounting trace class 2 is active.

I/O Wait The accumulated I/O elapsed wait time for a database I/O done under this thread. This field is for synchronous I/O only. It includes synchronous read and write I/O.

I/O Wait Current The current I/O elapsed wait time for a database I/O done under this thread. This field is for synchronous I/O only. It includes synchronous read and write I/O.

Job Name The job name.

Location The requesting location.

Location (Unicode) The requesting location.

Lock Latch Waits The number of wait trace events processed for waits for a lock or latch.

Lock Latch Wait Time The accumulated lock and latch elapsed time.

Lock Latch Wait Time Current The current lock and latch elapsed time.

Log Write Waits The number of wait trace events processed for waits for log read I/O.

Log Write Wait Time The accumulated wait time for log write I/O.
**Log Write Wait Time Current** The current wait time for log write I/O.

**LUWID** LUWID for a thread.

This value consists of two parts: the logical unit of work ID (luw-id) and a token. The token can be used in place of the luw-id in any DB2 command that accepts luw-id as input. Format:

luw-id=token

The luw-id consists of the network name, the originating VTAM LUNAME, and a unique identifier (separated by periods). Thus, the **Luwid** field displays data such as the following:

USCAC001.O2D22A.A1FE8E04B9D4=8

**Message Sent Waits** The number of wait trace events processed for waits for sending messages to other members in the data sharing group. This value is calculated only if accounting class three is active and DB2 is a member of the data sharing group.

**Message Sent Wait Time** The accumulated elapsed wait time caused by suspension for sending messages to other members in a data sharing group. One common use of intersystem message sending is when database descriptions are changed due to CREATE, ALTER, or DROP statements.

**Message Sent Wait Time Current** The current elapsed wait time caused by suspension for sending messages to other members in a data sharing group. One common use of intersystem message sending is when database descriptions are changed due to CREATE, ALTER, or DROP statements.

**MVS ID** The MVS system identifier.

**MVS Status** The thread MVS status.

**Number IO Waits** The number of wait trace events processed for waits for a database I/O under this thread.

**Open Close Waits** The number of wait trace events processed for waits for synchronous execution unit switching to the open/close service.

**Open Close Wait Time** The accumulated wait time for a synchronous execution unit switch to the DB2 open/close data set service or the HSM recall service.

**Open Close Wait Time Current** The current wait time for a synchronous execution unit switch to the DB2 open/close data service or the HSM recall service.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Other Service Waits** The number of wait trace events processed for synchronous execution unit switching to other service tasks.

**Other Service Wait Time** The accumulated wait time for a synchronous execution unit.
Other Service Wait Time Current The current wait time for a synchronous execution unit.

Package DBRM The package DBRM name.

Package DBRM (Unicode) The package DBRM name.

Page Latches The number of wait trace events processed for page latch contention.

Page Latch Time The accumulated wait time because of page latch contention.

Page Latch Time Current The current wait time because of page latch contention.

Parallel Tasks The number of parallel tasks or utility sub-tasks created for the originating task or main utility task. The value is zero for parallel tasks or utility sub-tasks. This value is calculated only if accounting class one is active.

Plan The plan name.

Release Save Points The number of SQL release savepoint statements executed.

Rollback Save Points The number of SQL rollback to savepoint statements executed.

Save Points The number of SQL savepoint statements executed.

SP CPU The accumulated TCB time spent processing SQL call statements in DB2 stored procedures address space or a WLM address space. This time is calculated only if accounting class 1 is active.

SP Elapsed Time The total elapsed time in stored procedures, including time executing SQL.

SP Schedule Waits The number of times an SQL call statement had to wait for an available TCB before the stored procedure could be scheduled. This value is calculated only if accounting class 3 is active.

SP Schedule Wait Time The total elapsed time spent waiting for an available TCB before the stored procedure could be scheduled. This time is calculated only if accounting class 3 is active.

SP Schedule Wait Time Current The current elapsed time spent waiting for an available TCB before the stored procedure could be scheduled. This time is calculated only if accounting class 3 is active.

SP SQL Elapsed Time The total time spent executing SQL in stored procedures.

Status Status is the current DB2 status of the thread. Valid values are:

Status  Description

NOT-AVAIL
The thread is not available.

IN-ABORT
The thread is in abort processing.
IN-ACCEL
The thread is executing on IBM DB2 Analytics Accelerator for z/OS.

IN-AUTO-PROC
The thread is processing an autonomous procedure.

IN-BIND-DYNM
The thread is in dynamic bind processing.

IN-BIND-STAT
The thread is in static bind processing.

IN-COMMAND
Command threads display this status when they are active in DB2 and executing within the DB2 command processor. (This type of thread always has a blank plan name.)

IN-COMMIT
The thread is in Commit processing (applies only to threads that originate from an attachment that does not use two-phase-commit protocol).

IN-COMT-PHS1
The thread is in Commit phase 1 processing.

IN-COMT-PHS2
The thread is in Commit phase 2 processing.

IN-CRTE-THRD
The thread is in Create Thread processing.

IN-DB2
The thread is executing in DB2. A more descriptive status could not be determined.

INDOUBT
The thread is in doubt.

IN-SIGNON
The thread is in signon processing. This status applies only to threads originating from CICS or IMS attachments.

IN-SQL-CALL
The thread is processing an SQL call.

IN-SQL-SORT
The thread is executing an SQL call and is doing the sort processing required to satisfy the call’s request.

IN-STOR-PROC
The thread is currently running in a stored procedure.

IN-TERM-THRD
The thread is in termination as a result of allied task termination. This status corresponds to DB2 DISPLAY THREAD=D status.

IN-TRIGGER
The thread is currently running in a trigger.

IN-USER-FUNC
The thread is currently running a user-defined function.

NOT-IN-DB2
The thread is not currently executing in DB2.
SP/UDF-INACT
The thread is trying but not able to run in a stored procedure or user-defined function.

SWAPPED-OUT
The thread is not currently executing in DB2. The thread originating address space is swapped out.

WAIT-ARCHIVE
The thread is waiting for an archive log tape mount necessary during thread abort processing.

WAIT-ARCREAD
The thread is currently waiting for read of archive log from tape.

WAIT-ASYNCRD
The thread is currently waiting for completion of a read I/O that is being done under a thread other than this one (for example, sequential or List Prefetch).

WAIT-ASYNCWR
The thread is currently waiting for completion of Write I/O that is being done under a thread other than this one (for example, Deferred Writes).

WAIT-CONVLIM
The distributed thread is in a synchronous wait because the conversation limit has been reached for its designated logmode.

WAIT-CTHREAD
The thread is queued in Create Thread processing because DB2 reached the CTHREAD value. This status corresponds to DB2 DISPLAY THREAD=QD status.

WAIT-GLBLOCK
The thread is currently waiting for either:
- Inter-system communication within the data sharing group to determine if there is lock contention.
- A lock held by another subsystem in the data sharing group.

WAIT-LOCK
The thread is waiting for a lock.

WAIT-MSGSEND
The thread is waiting because of inter-system message sending contention.

WAIT-REMREQ
The database access thread is in a synchronous wait (waiting for a response or a request from the originating DB2 subsystem).

WAIT-REMSQL
The distributed allied thread is in a synchronous wait (waiting for a response from the remote DB2 subsystem being accessed).

WAIT-REUSE
The thread is not currently in use and is waiting to be reused. This status applies only to CICS and IMS threads.

WAIT-SERVICE
The thread is currently waiting for completion of a DB2 service. Types of DB2 services include: open/close of a dataset, DFHSM recall of a dataset, SYSLGRNG update or define/extend/delete of a dataset, rollback, and Commit phase 2 for read only threads.
WAIT-SP-STOP
    The thread is queued waiting for a stopped stored procedure.

WAIT-TERM-TH
    The thread is queued and waiting for thread termination as a result of
    allied task termination. This status corresponds to DB2 DISPLAY
    THREAD=QD status.

UTIL-STOP
    The DB2 utility was started but not completed because of abnormal
    termination.

The following status are only available when class 2/3 traces are on:

WAIT-ACCEL
    The thread is currently waiting for claimers to be released after acquiring
    drain lock.

WAIT-CLAIMER
    The thread is currently waiting for claimers to be released after acquiring
    drain lock.

WAIT-CL3LOCK
    The thread is currently waiting for the completion of an identify call to the
    IRLM.

WAIT-COMMIT
    The thread is waiting for the FORCE-AT-COMMIT event to complete.

WAIT-DRNLOCK
    The thread is currently waiting to acquire drain lock.

WAIT LOB
    The thread is currently waiting for TCP/IP to materialize a LOB.

WAIT-LOCKLAT
    The thread is waiting for a LOCK-I/O-LATCH.

WAIT-LOCKPIP
    The thread is currently waiting for a PIPE suspend.

WAIT-LOCKPQS
    The thread is currently suspended for parallel task synchronization.

WAIT-LOGQSCE
    The thread is currently suspended because of an ARCHIVE LOG
    MODE(QUIESCE) command.

WAIT-PGLATCH
    The thread is currently waiting for page latch.

WAIT-SP-SCHD
    The thread is waiting for a TCB to become available in the stored
    procedures address space to schedule a stored procedure.

WAIT-SWITCH
    The thread is currently waiting for the completion of a synchronous
    execution switch.

WAIT-SYNC-IO
    The thread is currently waiting for completion of a synchronous Read I/O
    or Write I/O.
**Note:** This status can indicate that a DB2 resource is not large enough. You can use the OMEGAMON XE for DB2 PE resource manager or object analysis displays to further isolate the problem.

**Switches to DMS** The number of wait trace events processed for waits for a synchronous execution unit switching to the data space manager service tasks.

**Switch To DMS Wait Time** The accumulated wait time for a synchronous execution unit switch to the DB2 data space manager services. The DB2 data manager services include the define data set, the extend data set, the delete reset data set and the vsam catalog access.

**Switch To DMS Wait Time Current** The current wait time for a synchronous execution unit switch to the DB2 data space manager services. The DB2 data manager services include the define data set, the extend data set, the delete reset data set and the vsam catalog access.

**Sync EU Wait Time** The accumulated wait time for a synchronous execution unit switch to the DB2 open/close data set service or the HSM recall service.

**Syslgrng Waits** The number of wait trace events processed for waits for synchronous execution unit switching to the syslgrng recording service.

**Syslgrng Wait Time** The accumulated wait time for a synchronous execution unit switch to the DB2 syslgrng recording service. This service is also sometimes used to level ID checking for down-level detection.

**Syslgrng Wait Time Current** The current wait time for a synchronous execution unit switch to the DB2 syslgrng recording service. This service is also sometimes used to level ID checking for down-level detection.

**Transaction** The transaction ID at the workstation.

**Trigger CPU In Enclave** The accumulated TCB time used for executing triggers under and enclave. This value is calculated only if accounting class one is active.

**Trigger CPU Not Enclave** The accumulated TCB time consumed executing triggers while not under an enclave.

**Trigger Elapsed In Enclave** The accumulated time used for executing triggers under an enclave. This value is calculated only if accounting trace class 1 is active.

**Trigger Elapsed Not Enclave** The accumulated elapsed time consumed executing triggers while not under an enclave.

**UDF CP CPU Time** The accumulated CPU time consumed executing user-defined functions (UDFs) on the main application execution unit (DB2 field name: QWACUDFNF_CP). This time does not include CPU time consumed on an IBM specialty engine. Since these UDFs run entirely within DB2, this time represents class 1 and class 2 time.

**UDF Elapsed Time WLM** The total elapsed time spent by the allied agent in UDF functions processed in a DB2 stored procedure or WLM address space (DB2 field name: QWACUDEA). A user-defined function may initiate a trigger or invoke a stored procedure. Non-inline UDF times are included in this time if the native UDF
was called on a nested task and was not invoked by the main application execution unit. This time includes time executing SQL.

**UDF Elapsed Time Main** The accumulated elapsed time consumed executing user-defined functions (UDFs) on the main application execution unit (DB2 field name: QWACUDFNF_ELAP). Since these UDFs run entirely within DB2, this time represents class 1 and class 2 time.

**UDF IIP CPU Time** The accumulated CPU time consumed executing user-defined functions (UDFs) on the main application execution unit on an IBM specialty engine (DB2 field name: QWACUDFNF_zIIP). Since these UDFs run entirely within DB2, this time represents class 1 and class 2 time.

**UDF SQL Elapsed Time** The total elapsed time that user-defined functions spent to execute SQL (DB2 field name: QWACUDEB).

**UDF SQL Events** The number of SQL entry/exit events performed by user-defined functions (DB2 field name: QWACUDNE). This value is calculated only if accounting trace class 2 is active.

**UDF TCB Wait Time** The total elapsed time spent waiting for an available TCB before the user-defined function could be scheduled (DB2 field name: QWACUDST).

**UDF Wait Time** The accumulated TCB time used to satisfy user-defined function requests (DB2 field name: QWACUDCP).

**Uniqueness Value** The instance number: When concatenated with the fully qualified network name, it uniquely identifies a distributed thread (DB2 field name: QWHSLUUV).

**Uniqueness Value 2** The DB2 thread uniqueness value. For internal use.

**Waits IO Other Thread** The number of wait trace events processed for write I/O under another thread.

**Waits Sync Execution Units** The number of wait trace events processed for waits for synchronous execution unit switching for commit or abort.

**Wait Time** Total class3 wait time for a thread.

**Wait Time IO Other Thread** The accumulated wait time for write I/O that is done under a thread other than this.

**Wait Time IO Other Thread Current** The current wait time for write I/O that is done under a thread other than this.

**Wait Time Sync Execution Units** The total wait time because the synchronous execution unit switched to DB2 services from this thread while executing this package on DBRM.

**Wait Time Sync Execution Units Current** The current wait time because the synchronous execution unit switched to DB2 services from this thread while executing this package on DBRM.

**Workstation ID** The workstation ID.
Thread Enclave Attributes
Use the Thread Enclave attributes to create situations that monitor the activity of threads that are connected to DB2 and are associated with an enclave token.

Accounting The account information.

Ace Address The ace address.

Agent Address The agent address.

AGNT ASID The address space ID (ASID) of the agent.

Agent TCB Address The Agent TCB Address.

Authorization ID The authorization ID.

Authorization ID (Unicode) The authorization ID.

Average Time Goal The average response time goal.

Class The transaction class.

Collection The package collection ID.

Collection (Unicode) The package collection ID.

Collection Name The subsystem collection name.

Thread Enclave Attributes Connection ID. Identifies the connection of an application to a DB2 system.

It is an alphanumeric text string, with a maximum length of eight characters.

Thread Enclave Attributes The connection type.

Valid values are:

<table>

</tbody>
</table>

**CPU Critical** CPU critical (Y or N).

**Correlation ID** The correlation ID.

**DB2 ID** The DB2 subsystem ID.

**Discretionary Goal** The discretionary goal.

**Duration Service Unit** The service class period duration in service units. The value is zero for the last period.

**Duration Service Unit 1** The service class period duration in service units. The value is zero for the last period.

**Duration Service Unit 2** The service class period duration in service units. The value is zero for the last period.

**Duration Service Unit 3** The service class period duration in service units. The value is zero for the last period.

**Duration Service Unit 4** The service class period duration in service units. The value is zero for the last period.

**Duration Service Unit 5** The service class period duration in service units. The value is zero for the last period.

**Duration Service Unit 6** The service class period duration in service units. The value is zero for the last period.

**Duration Service Unit 7** The service class period duration in service units. The value is zero for the last period.

**Duration Service Unit 8** The service class period duration in service units. The value is zero for the last period.

**Enclave CPU Time** The enclave CPU time.

**Enclave Export Token** The export token associated with the enclave, if any. A monitor can collect IWMRQRY answer areas from multiple systems and match RQAD for a particular multisystem enclave using the export token.

**Enclave STOKEN** The STOKEN of the address space that owns the enclave. If the enclave is foreign, this STOKEN refers to an address space on another system (not the local system).

**Enclave Token** The enclave token.

**End User ID** The user ID of the workstation end user. This user ID can be different from the authorization ID used to connect to DB2. This field contains blanks if the client does not supply this information (DB2 field name: QWHCEUID).
**Function Name** The function name.

**Goal Description** The goal description.

**Goal Description 1** The goal description one.

**Goal Description 2** The goal description two.

**Goal Description 3** The goal description three.

**Goal Description 4** The goal description four.

**Goal Description 5** The goal description five.

**Goal Description 6** The goal description six.

**Goal Description 7** The goal description seven.

**Goal Description 8** The goal description eight.

**Goal Mode** The system WLM mode (G for Goal or C for Compatibility).

**Goal Type** The goal type indicator.

**IIP Flag** Indicates if the systems has a zIIP processor. Valid values are Y or N.

**IIP Speed** Indicates if the zIIP processor runs at a different speed than CP processor.

**Importance Level** The importance level. The range is one to five; One is the most important.

**IMPORTANCE1** The importance level. The range is one to five; One is the most important.

**IMPORTANCE2** The importance level. The range is one to five; One is the most important.

**IMPORTANCE3** The importance level. The range is one to five; One is the most important.

**IMPORTANCE4** The importance level. The range is one to five; One is the most important.

**IMPORTANCE5** The importance level. The range is one to five; One is the most important.

**IMPORTANCE6** The importance level. The range is one to five; One is the most important.

**IMPORTANCE7** The importance level. The range is one to five; One is the most important.

**IMPORTANCE8** The importance level. The range is one to five; One is the most important.
Information Flag The return information flag.

Interval Start The start time of this interval.

Location The requesting location.

Location (Unicode) The requesting location.

Logical Unit The logical unit name.

LUWID The logical unit of work ID (LUWID) for a thread.

This value consists of two parts: the logical unit of work ID (luw-id) and a token. The token can be used in place of the luw-id in any DB2 command that accepts luw-id as input. Format:
luw-id=token

The luw-id consists of the network name, the originating VTAM LUNAME, and a unique identifier (separated by periods). Thus, the Luwid field displays data such as the following:
USCAC001.02022A.A1FEBE04B9D4=8

MVS ID The MVS system identifier.

Network ID The network ID.

Originating System ID The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

Owner Job Name The job name of the address space that owns the enclave. If the enclave is foreign, the job name refers to a job on another system (not the local system).

Owner System The name of the system where the owner of the enclave resides. If the enclave is foreign, this is the system where the original enclave is located. Otherwise it is the local system name.

Package DBRM The package DBRM name.

Package DBRM (Unicode) The package DBRM name.

Parm1 The first start parameters.

Parm2 The second start parameters.

Percentile The goal percentile value.

Percentile1 The goal percentile value.

Percentile2 The goal percentile value.

Percentile3 The goal percentile value.

Percentile4 The goal percentile value.
Percentile5 The goal percentile value.

Percentile6 The goal percentile value.

Percentile7 The goal percentile value.

Percentile8 The goal percentile value.

Percentile Time Goal The percentile response time goal.

Performance Index The performance index.

Performance Value The performance value.

Period Number The service class period number in goal mode. When in goal mode, if the address space is a server, this value is always one. When in compatibility mode, this is the performance group period number.

Plan The plan name.

Priority The subsystem priority.

Process Name The enclave process name.

Program Name The transaction program name.

Report Class The name of the report class associated with this address space. This is only valid in goal mode.

Report Class Description The report class description.

Resource Group The name of the resource group associated with this address space. This is only valid in goal mode.

Scheduling Environment The enclave scheduling environment.

Service Class The name of the service class associated with this address space. This is only valid in goal mode.

Service Class Description The service class description.

Service Class Resource Description The service class resource description.

Service Class Resource Group The service class resource group.

Service Class Workload The workload name.

Service Class Workload Description The description of the workload.

Service Periods The number of service class periods for this service class.

Storage Protection Storage protection (Y or N).

Stored Procedure Name The name of the stored procedure.

Subsystem The subsystem name.
**Subsystem Type** The subsystem type.

**Subsystem Parameter** The subsystem parameter.

**System Goal** The system goal.

**Time Unit** The response time unit indicator (mmm:SS:MM:HH).

Valid format is mmm:SS:MM:HH, where:
- m = Millisecond
- S = Second
- M = Minute
- H = Hour

**Time Unit1** The response time unit indicator (mmm:SS:MM:HH).

Valid format is mmm:SS:MM:HH, where:
- m = Millisecond
- S = Second
- M = Minute
- H = Hour

**Time Unit2** The response time unit indicator (mmm:SS:MM:HH).

Valid format is mmm:SS:MM:HH, where:
- m = Millisecond
- S = Second
- M = Minute
- H = Hour

**Time Unit3** The response time unit indicator (mmm:SS:MM:HH).

Valid format is mmm:SS:MM:HH, where:
- m = Millisecond
- S = Second
- M = Minute
- H = Hour

**Time Unit4** The response time unit indicator (mmm:SS:MM:HH).

Valid format is mmm:SS:MM:HH, where:
- m = Millisecond
- S = Second
- M = Minute
- H = Hour

**Time Unit5** The response time unit indicator (mmm:SS:MM:HH).

Valid format is mmm:SS:MM:HH, where:
- m = Millisecond
• S = Second
• M = Minute
• H = Hour

**Time Unit6** The response time unit indicator (mmm:SS:MM:HH).

Valid format is mmm:SS:MM:HH, where:
• m = Millisecond
• S = Second
• M = Minute
• H = Hour

**Time Unit7** The response time unit indicator (mmm:SS:MM:HH).

Valid format is mmm:SS:MM:HH, where:
• m = Millisecond
• S = Second
• M = Minute
• H = Hour

**Time Unit8** The response time unit indicator (mmm:SS:MM:HH).

Valid format is mmm:SS:MM:HH, where:
• m = Millisecond
• S = Second
• M = Minute
• H = Hour

**Total Delays** The total number of delay samples used in the SRMS execution velocity calculation.

**Total Usings** This is a sum of the number of times the work for the service class period is allowed to use WLM managed resources.

**Transaction** The transaction ID at the workstation.

**Type** The enclave type. It can be:

<table>
<thead>
<tr>
<th>Value</th>
<th>Enclave Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Original_Dependent</td>
<td>The enclave was created by IWMECREA and is a continuation of the transaction for the owning address space.</td>
</tr>
<tr>
<td>2</td>
<td>Original_Independent</td>
<td>The enclave was created by IWMECREA and is an independent transaction.</td>
</tr>
<tr>
<td>3</td>
<td>Foreign_Independent</td>
<td>The enclave was created by IWMIMPT and is a continuation of an independent enclave on another system.</td>
</tr>
<tr>
<td>4</td>
<td>Foreign_Dependent</td>
<td>The enclave was created by IWMIMPT and is a continuation of a dependent enclave on another system.</td>
</tr>
<tr>
<td>Value</td>
<td>Enclave Type</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>5</td>
<td>Inactive_Enclave</td>
<td>The enclave is currently on an inactive enclave queue because SRM did not find any work unit associated with the enclave. The enclave will move back to active queue once a work unit joins the enclave.</td>
</tr>
<tr>
<td>6</td>
<td>Currently_Promoted</td>
<td>The enclave is currently promoted because of a chronic resource contention.</td>
</tr>
<tr>
<td>7</td>
<td>Continuation_Independent</td>
<td>The enclave is a continuation of an independent enclave.</td>
</tr>
</tbody>
</table>

**Uniqueness Value** The instance number: When concatenated with the fully qualified network name, it uniquely identifies a distributed thread (DB2 field name: QWHSLUUV).

**Uniqueness Value 2** The DB2 thread uniqueness value. For internal use.

**User ID** The user ID.

**Velocity Goal** The velocity goal.

**Velocity or Response Time Goal** The response time goal or the velocity goal. The value is zero if the goal is discretionary or if its a system goal or if no goal is defined.

**Velocity or Response Time Goal 1** The response time goal or the velocity goal. The value is zero if the goal is discretionary or if its a system goal or if no goal is defined.

**Velocity or Response Time Goal 2** The response time goal or the velocity goal. The value is zero if the goal is discretionary or if its a system goal or if no goal is defined.

**Velocity or Response Time Goal 3** The response time goal or the velocity goal. The value is zero if the goal is discretionary or if its a system goal or if no goal is defined.

**Velocity or Response Time Goal 4** The response time goal or the velocity goal. The value is zero if the goal is discretionary or if its a system goal or if no goal is defined.

**Velocity or Response Time Goal 5** The response time goal or the velocity goal. The value is zero if the goal is discretionary or if its a system goal or if no goal is defined.

**Velocity or Response Time Goal 6** The response time goal or the velocity goal. The value is zero if the goal is discretionary or if its a system goal or if no goal is defined.

**Velocity or Response Time Goal 7** The response time goal or the velocity goal. The value is zero if the goal is discretionary or if its a system goal or if no goal is defined.

**Velocity or Response Time Goal 8** The response time goal or the velocity goal. The value is zero if the goal is discretionary or if its a system goal or if no goal is defined.
**Version** The version.

**WLM Descriptor** The WLM environment description.

**WLM Procedure** The WLM environment procedure name.

**WLM System Type** The type of WLM application environment system.

**Workload Manager** The WLM (application) environment.

**Workload Name** The name of the workload associated with this address space. This is only valid in goal mode.

**Workstation** The workstation ID.

**Thread ID Attributes**
Use these attributes to view the thread IDs.

**DB2 Subsystem** The DB2 subsystem ID.

**DB2 Version** The DB2 version.

**Field Name** The thread long-name fields.

**QW0148CI**
Collection name.

**QW0148LN**
Location name. The location name contains the name the local location or remote location, depending on where the thread executes a package.

**QW0148PN**
Package ID.

**QWHCEUID**
The end user’s work station user ID. This can be different from the authorization ID used to connect to DB2. This field contains blanks if the client did not supply this information.

**QWHCEUTX**
The transaction or application name that the end user is running. This identifies the application that is currently running, not the product that is used to run the application. This field contains blanks if the client did not supply this information.

**QWHCEUWN**
The end user’s workstation name. This field contains blanks if the client did not supply this information.

**QWHCTCXT**
Trust context name.

**QWHCROLE**
Role name that is associated with the authorization.

**QWHCAID**
Primary authorization ID from connection or signon.

**QWHCOPID**
Initial primary authorization ID.
QMDASUFX
Account suffix.

QMDAACCT
The z/OS accounting string associated with the DB2 SQL application's z/OS address space.

Field Value The long name value.

QW0148CI
Collection name.

QW0148LN
Location name. The location name contains the name the local location or remote location, depending on where the thread executes a package.

QW0148PN
Package ID.

QWHCEUID
The end user's work station user ID. This can be different from the authorization ID used to connect to DB2. This field contains blanks if the client did not supply this information.

QWHCEUTX
The transaction or application name that the end user is running. This identifies the application that is currently running, not the product that is used to run the application. This field contains blanks if the client did not supply this information.

QWHCEUWN
The end user's workstation name. This field contains blanks if the client did not supply this information.

QWHCTCXT
Trusted context name.

QWHCROLE
Role name that is associated with the authorization.

QWHCAID
Primary authorization ID from connection or signon.

QWHCOPID
Initial primary authorization ID.

QMDASUFX
Account suffix.

QMDAACCT
The z/OS accounting string associated with the DB2 SQL application's z/OS address space.

Interval Start The start time of this interval.

MVS System ID The MVS identifier.

Originating System ID The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.
**QW0148AC** The agent control element (ACE) (see QWHSACE) of the thread that is reported. The value in QWHSACE is the ACE of the IFI application that requested this trace record (Field name: QW0148AC).

**QW0148LU** The logical unit of the work ID (LUWID) as defined for the LU 6.2 interface (Field name: QW0148LU). The LUWID uniquely identifies the thread within the network, and consists of the following:
- A fully qualified network name (QW0148LM)
- An LUW instance number (QW0148UV) and an LUW sequence number (see fields below).

It consists of two 8-character fields: QW0148NI and QW0148LM, which together uniquely identify a client system.

**QWHCATYP** The connecting system type code (in hexadecimal). This field can have a null value. For example, this field contains a null value for some utilities (Field name: QWHCATYP).

**QWHCCN** The connection name (Field name: QWHCCN). It is not valid on end of memory and reflects the z/OS home address space (ASID) connection name for:
- **Batch**: 'BATCH'
- **TSO**: 'TSO'
- **QMF**: 'DB2CALL'
- **Utility**: 'UTILITY'
- **DB2 internal**
  - DB2 subsystem ID
- **IMS**
  - IMS-ID
- **CICS**
  - CICS-ID
- **RRSAF**
  - 'RRSAF'

**Distributed database access threads:**
- For threads from a DB2 requester, this field contains the connection name of the thread at the requesting location.
- For threads using the DRDA protocol from a non-DB2 requester, this field contains the constant 'SERVER'.

**QWHCCCV** The correlation ID value (Field name: QWHCCCV).
- For batch: JOBNAME
- For TSO: LOGON-ID
- For IMS/VS: PST#.PSBNAME
- For CICS: CONNECTION_TYPE.THREAD_TYPE.THREAD_.#.TRAN-ID
- For RRSAF: CORRELATION-ID value from signon function
- For threads from a DB2 requester: this field contains the correlation-ID name of the thread at the requesting location.
- For threads using the DRDA protocol from a non-DB2 requester, this field contains the first 12 characters in the DDM external name (EXTNAM) parameter of the DDM EXCSAT command received as part of the SQL connect.
**QWHCEUID** The user ID of the end user’s workstation (Field name: QWHCEUID). This can be different from the authorization ID used to connect to DB2. This field contains blanks if the client did not supply this information. If QWHCEUID_OFF is not 0, this value is truncated.

**QWHCEUTX** The transaction or application name that the end user is running (Field name: QWHCEUTX). This identifies the application that is currently running, not the product that is used to run the application. This field contains blanks if the client did not supply this information.

**QWHCEUWN** The end user’s workstation name (Field name: QWHCEUWN). This field contains blanks if the client did not supply this information.

**QWHCPLAN** The plan name (Field name: QWHCPLAN). It shows a blank for a DB2 command thread; otherwise:
- For SPUFI with cursor stability: 'DSNESPCS'
- For SPUFI with repeatable read: 'DSNESPRR'
- For TSO: the application plan name
- For IMS: the application plan name
- For CICS: application plan name, IMS and CICS commands have a blank plan name.
- For RRSAF create thread with the collection parameter: '?RRSAF '
- For QMF: 'DSQPLAN'
- For Distributed Database Access threads:
  - For threads using the DRDA protocol from a requester, this field contains the plan name that is executed at the requesting location.
  - For threads using the DRDA protocol from a non-DB2 requester or from a DB2 2.3 requester, this field contains the constant 'DISTSERV'.
- For binding: 'DSNBIND' (system plan)
- For utility: 'DSNUTIL ' (system plan)
- For authorization: 'ACT' + X'0000000000' (system plan)
- For unallocated threads and miscellaneous DB2 system service tasks: 'BCT' + X'0000000000' (system plan)
- For startup: 'STARTCT' + X'00' (system plan)

**Sequence Number** The thread long name descriptions.

**QW0148CI** Collection name.

**QW0148LN** Location name. The location name contains the name the local location or remote location, depending on where the thread executes a package.

**QW0148PN** Package ID.

**QWHCEUID** The end user’s work station user ID. This can be different from the authorization ID used to connect to DB2. This field contains blanks if the client did not supply this information.

**QWHCEUTX** The transaction or application name that the end user is running. This
identifies the application that is currently running, not the product that is used to run the application. This field contains blanks if the client did not supply this information.

**QWHCEUWN**
The end user's workstation name. This field contains blanks if the client did not supply this information.

**QWHCTCXT**
Trusted context name.

**QWHCROLE**
Role name that is associated with the authorization.

**QWHCAID**
Primary authorization ID from connection or signon.

**QWHCOPID**
Initial primary authorization ID.

**QMDASUFX**
Account suffix.

**QMDAACCT**
The z/OS accounting string associated with the DB2 SQL application's z/OS address space.

**UW0148CI** The collection name (Field name: UW0148CI).

**UW0148LN** The location name (Field name: UW0148LN). The location name contains the name of the local location or remote location, depending on where the thread executes a package. The following statements execute locally, regardless of the current package name:
- COMMIT
- ROLLBACK
- SET <HOST VARIABLE> = CURRENT PACKAGE SET
- SET <HOST VARIABLE> = CURRENT SERVER

For these statements, this field contains the location where the package executes, not the location where the statement executes.

**UW0148PN** The package ID (Field name: UW0148PN).

**UWHCAID** The primary authorization ID from connection or signon (Field name: UWHCAID). For z/OS operator commands and DB2 system internal agents, the value is SYSOPR. Secondary authorization IDs might be the RACF groups associated with this primary authorization ID. The SQL ID is initially set to this primary authorization ID. The connection authorization exit and the signon authorization exit can change the primary authorization ID so that it is not the same as the original primary authorization ID (QWHCOPID). Distributed authorization ID translation can also change the primary authorization ID.

**Thread Locks Owned Attributes**
Use Thread Locks Owned attributes to view detailed information about all the locks and claims owned by an individual thread.

**AGNT ASID** The address space ID (ASID) of the agent.

**Authorization ID** The authorization ID.
Authorization ID (Unicode) The primary authorization ID from connection or sign-on that identifies the execution privileges an application has to a DB2 object or service. It is an alphanumeric text string with a maximum of 128 characters.

Claim Class The type of claim class. Possible claim classes are:

- **CS** Cursor stability
- **RR** Repeatable read
- **Write** Write access

Claim Type The type of object that is claimed. Possible claim types are:

- **TS** Tablespace
- **TS LPRT** Tablespace logical partition
- **TS PART** Tablespace partition
- **IX** Index space
- **IX LPRT** Index space logical partition
- **IX PART** Index partition

Collection ID (Unicode) The collection ID. This field is blank for DBRM. It is an alphanumeric text string, with a maximum of 128 characters.

Thread Locks Owned Attributes Connection ID. Identifies the connection of an application to a DB2 system.

It is an alphanumeric text string, with a maximum length of eight characters.

Thread Locks Owned Attributes The type of connection associated with the thread.

Valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BATCH</td>
<td>Batch job</td>
</tr>
<tr>
<td>CICS</td>
<td>CICS attach</td>
</tr>
<tr>
<td>DLIBATCH</td>
<td>DL/I batch</td>
</tr>
<tr>
<td>Distributed</td>
<td>Distributed Database Access thread</td>
</tr>
<tr>
<td>IMS_BMP</td>
<td>IMS attach BMP</td>
</tr>
<tr>
<td>IMS_CTL</td>
<td>IMS control region</td>
</tr>
<tr>
<td>IMS_MPP</td>
<td>IMS attach MPP</td>
</tr>
<tr>
<td>IMS_TBMP</td>
<td>IMS transaction BMP</td>
</tr>
<tr>
<td>DistAllied</td>
<td>Distributed Allied thread</td>
</tr>
<tr>
<td>RRSAF</td>
<td>DB2 Resource Recovery Services attachment facility</td>
</tr>
<tr>
<td>SYSTEM</td>
<td>System directed access</td>
</tr>
</tbody>
</table>
Correlation ID The DB2 Correlation ID.

DB2 ID The name of a DB2 subsystem.

Elapsed time Shows the elapsed time in milliseconds.

End User ID The user ID of the workstation end user. This user ID can be different from the authorization ID used to connect to DB2. This field contains blanks if the client does not supply this information (DB2 field name: QWHCEUID).

Job Name The job name that is associated with a thread.

Lock Claim Resource The name of the object which is locked or claimed. The resource name can include the database name, pageset name, partition number, page number, record id (RID), collection ID, package name, or plan name:
- DB=database name can be represented as DBID=identifier.
- PS=pageset name can be represented as PSID=identifier.
- DBID represents the decimal identifier of the database.
- PSID represents the decimal identifier of the table space or index space.

Lock Level The level or mode of the lock request. This information describes the level of resource access demanded by the lock request. Possible lock levels are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IS</td>
<td>Intent share</td>
</tr>
<tr>
<td>IX</td>
<td>Intent exclusive</td>
</tr>
<tr>
<td>NSU</td>
<td>Non-shared Update</td>
</tr>
<tr>
<td>S</td>
<td>Share</td>
</tr>
<tr>
<td>SIX</td>
<td>Share intent exclusive</td>
</tr>
<tr>
<td>U</td>
<td>Update</td>
</tr>
<tr>
<td>UNS</td>
<td>Unprotected shared</td>
</tr>
<tr>
<td>X</td>
<td>Exclusive</td>
</tr>
</tbody>
</table>

Lock Type The lock type of the lock request. Possible lock types are:

<table>
<thead>
<tr>
<th>Lock type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACSC</td>
<td>The Accelerator Services commands (ACSC) lock.</td>
</tr>
<tr>
<td>ALBP</td>
<td>The Alter buffer pool (ALBP) lock indicates a lock on a buffer pool during execution of an ALTER BUFFERPOOL command.</td>
</tr>
<tr>
<td>BIND</td>
<td>The BIND lock indicates an autobind or remote bind lock.</td>
</tr>
</tbody>
</table>
### Table 199. Lock types (continued)

<table>
<thead>
<tr>
<th>Lock type</th>
<th>Description</th>
</tr>
</thead>
</table>
| **BMBA**  | The Buffer manager SCA MBA (BMBA) L-lock.  
            | The Buffer Manager (BM) gets this lock when it needs to read, insert,  
            | or update a multiple buffer pool (MBA) record in a Shared  
            | Communications Area (SCA).  
            | (BMC_MBAO or BMC_MBAR) |
| **BPPS**  | The Buffer Manager Pageset (BPPS) RR (repeatable read) P-lock:  
            | • BP = buffer pool ID  
            | • DB = database name  
            | • PS = pageset name |
| **CCAT**  | The CATMAINT convert catalog (CCAT) lock is acquired when  
            | catalog conversion is performed. |
| **CDBL**  | The Compress dictionary build (CDBL) lock. |
| **CDIR**  | The CATMAINT convert directory (CDIR) lock is acquired when  
            | directory conversion is performed. |
| **CDRN**  | The Cursor Stability drain (CDRN) lock is acquired to drain all CS  
            | read access to an object:  
            | • DB = database name  
            | • PS = pageset name  
            | • PT = partition |
| **CMDS**  | The DB2 Command Serialization (CMDS) lock. |
| **CMIG**  | The CATMAINT migration (CMIG) lock is acquired when catalog  
            | migration is performed. |
| **COLL**  | The Collection (COLL) lock |
| **DBDL**  | The DBD load (DBDL) lock is the database descriptor load lock. |
| **DBEX**  | The Database exception (DBEX) lock indicates a lock on a "Logical  
            | page list" (LPL) or "Group buffer pool recovery pending" (GRECP)  
            | database exception status.  
            | This lock is only used in a data sharing environment. |
| **DBXU**  | The DB exception update lock is used for updating the database  
            | exception status. |
| **DGTT**  | The DGTT URID lock is acquired to protect segments that belong to a  
            | Declared Global Temporary Table (DGTT). These segments are  
            | deallocated during Commit 1 by logging them and serializing them  
            | using the Unit of Recovery ID (URID) lock. |
| **DPAG**  | The DB2 page (DPAG) lock in a tablespace. When programs read  
            | data or update data, they acquire a page lock containing the data.  
            | • DB = database name  
            | • PS = pageset name  
            | • PG = page |
## Table 199. Lock types (continued)

<table>
<thead>
<tr>
<th>Lock type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>DSET</strong></td>
<td>The partitioned lock.</td>
</tr>
<tr>

<td>• PG = page</td>
</tr>
<tr>
<td><strong>HPSP</strong></td>
<td>The Header Page (HP) Bucket or Stored Procedure (SP) Command lock.</td>
</tr>
<tr>
<td><strong>IEOF</strong></td>
<td>The Index end of file (IEOF) lock is acquired at the index end of file.</td>
</tr>
<tr>
<td></td>
<td>• DB = database name</td>
</tr>
<tr>
<td></td>
<td>• PS = pageset name</td>
</tr>
<tr>
<td></td>
<td>• PT = partition</td>
</tr>
<tr>
<td><strong>IPAG</strong></td>
<td>The Index page (IPAG) lock in an index space. When application programs read or update data, they acquire a lock on the page containing the index when indexing is used.</td>
</tr>
<tr>
<td></td>
<td>• DB = database name</td>
</tr>
<tr>
<td></td>
<td>• PS = pageset name</td>
</tr>
<tr>
<td></td>
<td>• PG = page</td>
</tr>
<tr>
<td><strong>IXKY</strong></td>
<td>The Index key (IXKY) lock.</td>
</tr>
<tr>
<td><strong>LBLK</strong></td>
<td>The Large object (LOB) lock.</td>
</tr>
<tr>
<td><strong>LPLR</strong></td>
<td>The Logical page list recovery (LPLR) lock.</td>
</tr>
<tr>
<td><strong>MDEL</strong></td>
<td>The Mass delete (MDEL) lock is acquired when doing a mass delete from a table (for example, when you DELETE FROM a table) within a segmented tablespace.</td>
</tr>
<tr>
<td></td>
<td>It is used to prevent another user from reusing freed segments before a delete operation is committed.</td>
</tr>
<tr>
<td></td>
<td>• DB = database name</td>
</tr>
<tr>
<td></td>
<td>• PS = pageset name</td>
</tr>
<tr>
<td>Lock type</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>

</tbody>
</table>
| PALK      | The Partition lock.  
  • DB = database name  
  • PS = pageset name  
  • PT = partition | |
| PBPC      | The Group BP level castout (PBPC) P-lock.  
  A physical lock acquired when a castout of a group buffer pool occurs. Castout is the process of writing pages in the group buffer pool out to DASD.  
  This lock is only used in a data sharing environment. | |
| PCDB      | The DDF CDB P-lock.  
  A Distributed Data Facility communication database physical lock.  
  This lock is only used in a data sharing environment. | |
| PDBD      | The DBD P-lock is a database descriptor physical lock.  
  This lock is only used in a data sharing environment. | |
| PDSO      | The Pageset or partitioned pageset open lock.  
  If the data set supporting the tablespace that is referenced by the application is not opened, the program will acquire a lock to open the data set. The data set will stay open if CLOSE=NO is defined in the SQL statement creating the tablespace.  
  • DB = database name  
  • PS = pageset name | |
| PITR      | The Index manager tree (PITR) is a physical lock (P-lock).  
  This lock is only used in a data sharing environment.  
  • DB = database name  
  • PS = pageset name  
  • PT = partition | |
| PPAG      | The Page P-lock is a physical lock on a page.  
  This lock is only used in a data sharing environment. | |
| PPSC      | The Pageset/partition level castout physical lock (P-lock).  
  This lock is only used in a data sharing environment. | |
| PPSP      | The Pageset/partition physical lock (P-lock).  
  This lock is only used in a data sharing environment. | |
| PRLF      | The Resource Limit Facility (RLF) physical lock (P-lock).  
  This lock is only used in a data sharing environment. | |
<table>
<thead>
<tr>
<th>Lock type</th>
<th>Description</th>

</thead>
</table>
| PSET      | The Pageset (PSET) lock can be a tablespace or indexspace.  
A pageset containing DB2 tables is a tablespace. A pageset containing DB2 index structure is an indexspace.  
A pageset can be simple or partitioned. This lock type is for the simple pageset only.  
• DB = database name  
• PS = pageset name |
| PSPI      | The Pageset piece (PSPI) lock.  
A pageset is a collection of pageset pieces. Each pageset piece is a separate VSAM data set.  
A simple pageset contains from 1 to 32 pieces. Each piece of a simple pageset is limited to 2 GB. Whenever a simple pageset piece reaches this size, another piece is allocated and the pageset grows.  
This is a lock on the expanded pageset piece. |
| RDBD      | The Repair DBD (RDBD) lock is acquired when REPAIR DBD REBUILD is running (test/diagnose). |
| RDRN      | The Repeatable Read drain (RDRN) lock is acquired to drain all RR access to an object.  
• DB = database name  
• PS = pageset name  
• PT = partition |
| RGDA      | The Retry Getpage During Abort (RGDA) lock. |
| ROW       | The Row lock indicates a lock on a row. |
| RSTR      | The Shared Communications Area (SCA) restart (RSTR) lock indicates a lock on SCA access for restart/redo information.  
(BMC-RSTP) |
| SDBA      | The Start/stop lock on DBA (SDBA) table indicates a lock on the table, tablespace, or database when a CREATE/DROP is processed against these objects.  
• DB = database name  
• PS = pageset name |
| SENV      | The System environment (SYSENV) serialization lock. |
| SKCT      | The Skeleton cursor table (SKCT) lock indicates a lock on the application plan.  
PLAN=plan name |
| SKPT      | The Skeleton package table (SKPT) lock indicates a lock on the application package.  
TOKEN= the consistency token (CONTOKEN) column from SYSIBM.SYSPACKAGE. |
| SPRC      | The System level point in time (PIT) recovery lock.  
SYS_PITR |
## Table 199. Lock types (continued)

<table>
<thead>
<tr>
<th>Lock type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SREC</td>
<td>The Log range lock. DB2 writes a record in the log range tablespace (SYSLGRNG) every time a tablespace is opened and updated, and updates SYSLGRNG whenever that tablespace is closed. The record contains the opening and/or closing log RBA (relative byte address) for the tablespace. When DB2 writes to SYSLGRNG, the program acquires a lock on the tablespace with updates.</td>
</tr>
</tbody>
</table>
|           | • DB = database name  
|           | • TS = tablespace name |
| TABL      | The Table (TABL) lock on the table which resides in a segmented tablespace. |
|           | • DBID = DBid  
|           | • TABL = Tableid |
| UIDA      | The Util I/O Damage Assessment lock. |
| UNDT      | The Undetermined (UNDT) lock indicates that this lock cannot be determined because it is not part of the other listed lock types. Resource ID (in hexadecimal). |
| UNKN      | The Unknown (UNKN) lock indicates the resource does not exist. |
| UTEX      | The Utility exclusive execution (UTEX) lock. |
| UTID      | The Utility identifier (UTID) lock. |
|           | UID=utility id |
| UTOB      | The Utility object (UTOB) lock. |
|           | • DB = database name  
|           | • PS = pageset name  
|           | • PT = partition |
| UTSE      | The Utility serialization (UTSE) lock is required when running utility jobs. |
| WDRN      | The Write drain (WDRN) lock is acquired to drain all write access to an object. |
|           | • DB = database name  
|           | • PS = pageset name  
|           | • PT = partition |
| XMLK      | The XML lock. |

**LUWID** The logical unit of work ID (LUWID) for a thread.

This value consists of two parts: the logical unit of work ID (luw-id) and a token. The token can be used in place of the luw-id in any DB2 command that accepts luw-id as input. Format:

```
luw-id=token
```
The luw-id consists of the network name, the originating VTAM LUNAME, and a unique identifier (separated by periods). Thus, the Luwid field displays data such as the following:

USCAC001.02022A.A1FE8E04B9D4=8

**MVSID** The MVS system identifier.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Package DBRM (Unicode)** The package DBRM name.

**Plan** The plan name.

**Resource Type** The type of resource can be Lock or Claim.

**Time Stamp** Represents the end of data collection or the end of an interval, and is the local time where the system is running.

Valid format is MM-DD-YY HH:MM:SS, where:
- **M** = Month
- **D** = Day
- **Y** = Year
- **H** = Hour
- **M** = Minute
- **S** = Second

For example, 07-16-18 14:58:29 indicates that data collection ended on July 16th, 2018, at 14:58:29 PM.

**Total Locks** The number of locks of the same lock type owned by the thread.

**Uniqueness Value** The instance number: When concatenated with the fully qualified network name, it uniquely identifies a distributed thread (DB2 field name: QWHSLUUV).

**Uniqueness Value 2** The DB2 thread uniqueness value. For internal use.

**Thread Locks Owned Summary Attributes**

Use Thread Locks Owned Summary attributes to view a summary of all locks and claims owned by a thread.

**AGNT ASID** The address space ID (ASID) of the agent.

**Authorization ID** The authorization ID.

**Authorization ID (Unicode)** The primary authorization ID from connection or sign-on that identifies the execution privileges an application has to a DB2 object or service. It is an alphanumeric text string with a maximum of 128 characters.

**Bind ACQUIRE Option** The ACQUIRE option specified at BIND time: ALLOCATE or USE. This allows you to control when the allocation of tablespace locks is to occur. If ACQUIRE(USE) is specified, tablespace locks will be acquired when the resource is used by the application. If ACQUIRE(ALLOCATE) is specified, all
tablespace locks will be obtained at plan allocation time. Dynamic SQL users (QMF, SPUFI) always execute with the ACQUIRE(USE) option.

**Bind RELEASE Option** The RELEASE option specified at BIND time: COMMIT or DEALLOCATE. The RELEASE option controls when tablespace and SKCT locks are freed. RELEASE(COMMIT) causes these locks to be released at each commit point. RELEASE(DEALLOCATE) causes these locks to be freed at application termination. Page locks are always released at commit time, regardless of the release option.

**Catalog Locks** The total number of all catalog locks owned. This number includes any locks owned on a page or tablespace in database DSNDB06. This is the total of the catalog pageset and page locks.

**Catalog Page Row Locks** The total number of page and row locks on the catalog (DSNDB06) database. This includes data page (DPAG), index page (IPAG), and row (ROW) locks.

**Catalog Pageset Locks** The total number of pageset locks in which the object of the lock is a pageset owned by the catalog (DSNDB06) database (PSET).

**Collection ID (Unicode)** The collection ID. This field is blank for DBRM. It is an alphanumeric text string, with a maximum of 128 characters.

**Thread Locks Owned Summary Attributes** Connection ID. Identifies the connection of an application to a DB2 system.

It is an alphanumeric text string, with a maximum length of eight characters.

**Thread Locks Owned Summary Attributes** The type of connection associated with the thread.

Valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BATCH</td>
<td>Batch job</td>
</tr>
<tr>
<td>CICS</td>
<td>CICS attach</td>
</tr>
<tr>
<td>DLIBATCH</td>
<td>DL/I batch</td>
</tr>
<tr>
<td>Distributed</td>
<td>Distributed Database Access thread</td>
</tr>
<tr>
<td>IMS_BMP</td>
<td>IMS attach BMP</td>
</tr>
<tr>
<td>IMS_CTL</td>
<td>IMS control region</td>
</tr>
<tr>
<td>IMS_MPP</td>
<td>IMS attach MPP</td>
</tr>
<tr>
<td>IMS_TBMP</td>
<td>IMS transaction BMP</td>
</tr>
<tr>
<td>DistAllied</td>
<td>Distributed Allied thread</td>
</tr>
<tr>
<td>RRSAF</td>
<td>DB2 Resource Recovery Services attachment facility</td>
</tr>
<tr>
<td>SYSTEM</td>
<td>System directed access</td>
</tr>
<tr>
<td>TSO</td>
<td>TSO foreground and background</td>
</tr>
<tr>
<td>UNKNOWN</td>
<td>Unrecognizable connection type</td>
</tr>
<tr>
<td>UTILITY</td>
<td>DB2 Utility</td>
</tr>
</tbody>
</table>
**Correlation ID** The DB2 Correlation ID.

**DB2 ID** The name of a DB2 subsystem.

**Directory and Other Locks** The total number of directory and other locks owned by the thread. Directory locks are issued against resources contained in the DSNDB01 directory database.

**Elapsed time** Shows the elapsed time in milliseconds.

**End User ID** The user ID of the workstation end user. This user ID can be different from the authorization ID used to connect to DB2. This field contains blanks if the client does not supply this information (DB2 field name: QWHCEUID).

**ISOLATION Option** The ISOLATION option specifies when the plan is bound. The isolation parameter allows you to control the data consistency in the pages that the plan accesses. It has an effect on the number of page or row locks held concurrently by an application.

The available options are:

**Cursor Stability (CS or CURSOR)**
Causes a page lock acquired for read processing to be released when the application subsequently accesses data contained on another data page. (Page locks acquired as a result of update activity are always retained until commit.)

**Read Stability (RS or READ)**
Is similar to Repeatable Read but this isolation option allows to insert new rows or update rows that did not satisfy the original search condition of the application.

**Repeatable Read (RR or REPEAT)**
Causes all application locks obtained for read processing to be retained until application commit time.

**RR with X-lock (REPEATX)**
Means Repeatable Read with X-lock.

**RS with X-lock (READX)**
Means Read Stability with X-lock.

**Uncommitted Read (UR or UNCOMMIT)**
Causes data to be read without acquiring locks. This can result in accessing data that has been updated but not yet committed. It applies only to read-only operations: SELECT, SELECT INTO, or FETCH from a read-only result table. Use this isolation level only when:
- Data consistency is not necessary or inconsistencies already exist
- Errors cannot occur with its use, such as with a reference table that is rarely updated

**Job Name** The job name that is associated with a thread.

**Locks Owned** The total number of all locks owned by the thread. This includes all lock types.

**LUWID** The logical unit of work ID (LUWID) for a thread.
This value consists of two parts: the logical unit of work ID (luw-id) and a token. The token can be used in place of the luw-id in any DB2 command that accepts luw-id as input. Format:

\[ \text{luw-id}=\text{token} \]

The luw-id consists of the network name, the originating VTAM LUNAME, and a unique identifier (separated by periods). Thus, the Luwid field displays data such as the following:

USCAC001.02022A.A1FE8E04B9D4=8

**MVSID** The MVS system identifier.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Package DBRM (Unicode)** The package DBRM name.

**Page Row Lock** Total number of page and row locks owned by the thread. It includes data page locks (DPAG), index page locks (IPAG), and row locks (ROW). It excludes any locks in which the lock object is owned by the catalog database or the directory database.

**Pageset and Dataset Locks** The total number of pageset locks held. This excludes pageset locks in which the lock object is a pageset owned by the catalog database or the directory database. Lock types included are PSET and DSET.

**Percent NUMLKUS** The current percentage of NUMLKUS reached by the thread. NUMLKUS is an installation parameter in DSNZPARM that specifies the maximum number of page, row, LOB, or XML locks that can be held by a single process at any one time. It includes locks for both, the DB2 catalog and directory and for user data.

**Plan** The plan name.

**Time Stamp** Represents the end of data collection or the end of an interval, and is the local time where the system is running.

Valid format is MM-DD-YY HH:MM:SS, where:
- \( M \) = Month
- \( D \) = Day
- \( Y \) = Year
- \( H \) = Hour
- \( M \) = Minute
- \( S \) = Second

For example, 07-16-18 14:58:29 indicates that data collection ended on July 16th, 2018, at 14:58:29 PM.

**Uniqueness Value** The instance number: When concatenated with the fully qualified network name, it uniquely identifies a distributed thread (DB2 field name: QWHSCLUUV).

**Uniqueness Value 2** The DB2 thread uniqueness value. For internal use.
Thread Statistics Attributes

Use Thread Statistics attributes to create situations that determine the usage of parallel threads.

Asynchronous Page Reads The number of asynchronous page reads for prefetch. Valid value is an integer in the range 0 - 2147483647.

Correlation ID The correlation between an application and the connection to a DB2 system. It is an alphanumeric text string, with a maximum of 4 characters; for example D412.

Data Sharing Group The name of a data sharing group. It is an alphanumeric text string, with a maximum of 8 characters; for example, TDDB241G.

DB2 ID The name of a DB2 subsystem.

Dynamic Prefetch The number of dynamic prefetch requests. Valid value is an integer in the range 0 - 2147483647.

Get Page Requests The number of thread getpage requests. This includes conditional, unconditional, successful, and unsuccessful requests. Valid value is an integer in the range 0 - 2147483647.

IDNAME An internal attribute used for navigation, it contains either the Data Sharing Group Name or the DB2ID.

Immediate Write I/O The number of synchronous write I/O requests that DB2 issues on behalf of a thread. Valid value is an integer in the range 0 - 2147483647.

List Prefetch The number of list prefetch requests that a thread issues. Valid value is an integer in the range 0 - 2147483647.

MVS System The MVS System Management Facility (SMF) ID. It is an alphanumeric text string with a maximum of 4 characters; for example, SP11.

Number of SETW The number of set write requests to write a page out to DASD. Valid value is an integer in the range 0 - 2147483647.

Originating System ID The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

Plan Name The name of an application plan that DB2 produces during the bind process and uses for processing SQL statements during execution. It is an alphanumeric text string, with a maximum of 8 characters. For example, PLANLCK2 is the name of an application plan. *SYSTEM* indicates DB2 subsystem-generated threads that own or are waiting on a lock.

Sequential Prefetch The number of sequential prefetch requests that a thread issues. Valid value is an integer in the range 0 - 2147483647.

Synchronous Read I/O The number of synchronous read I/O requests that a thread issues. Valid value is an integer in the range 0 - 2147483647.

Time Stamp Represents the end of data collection or the end of an interval, and is the local time where the system is running.
Valid format is MM-DD-YY HH:MM:SS, where:
- M = Month
- D = Day
- Y = Year
- H = Hour
- M = Minute
- S = Second

For example, 07-16-18 14:58:29 indicates that data collection ended on July 16th, 2018, at 14:58:29 PM.

**Type Indicator** Indicates the type of parallel thread.

Valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>blank</td>
<td>Not a parallel thread</td>
</tr>
<tr>
<td>Parent</td>
<td>Parallel thread is a parent</td>
</tr>
<tr>
<td>Child</td>
<td>Parallel thread is a child</td>
</tr>
<tr>
<td>Autonomous SP</td>
<td>Originating thread who invoked autonomous stored procedures</td>
</tr>
</tbody>
</table>

**Unsuccessful Get Page Operation** The number of conditional getpage requests that failed. Valid value is an integer in the range 0 - 2147483647.

**Thread SQL Counts Attributes**

Use the Thread SQL Counts attributes to create situations to monitor the SQL DCL (Data Control Language) declarations, SQL DDL (Data Definition Language) statements, and SQL DML (Data Manipulation Language) statements, associated with a thread. These attributes also list information for stored procedures, user-defined functions, triggers, direct row access, parallelism, RID pool access, and prepare statements. They also show information for currently committed rows, multi-row processing, workfile storage, and concentrate statements.

**Abort** The number of times the thread has rolled back uncommitted data (Field name QWACCOMM).

**AGNT ASID** The address space ID (ASID) of the agent.

**Allocate Cursor** The number of SQL ALLOCATE CURSOR statements executed (Field name: QXALOCC).

**Alter Database** The number of ALTER DATABASE statements executed (Field name: QXALDAB).

**Alter Function** The number of ALTER FUNCTION statements executed (Field name: QXALUDF).

**Alter Index** The number of ALTER INDEX statements executed (Field name: QXALTIX).

**Alter Procedure** The number of ALTER PROCEDURE statements executed (Field name: QXALPRO).
**Alter Stogroup** The number of ALTER STOGROUP statements executed (Field name: QXALTST).

**Alter Table** The number of ALTER TABLE statements executed (Field name: QXALTTA).

**Alter Tablespace** The number of ALTER TABLESPACE statements executed (Field name: QXALTTS).

**Alter Trusted Context** The number of alter trusted context statements executed (Field name QXALTCTX) - not supported prior to DB2 9.

**Associate Locator** The number of SQL ASSOCIATE LOCATORS statements executed (Field name: QXALOCL).

**Authorization ID** The primary authorization ID from connection or sign-on that identifies the execution privileges an application has to a DB2 object or service. It is an alphanumeric text string with a maximum of 8 characters.

**Authorization ID (Unicode)** The primary authorization ID from connection or sign-on that identifies the execution privileges an application has to a DB2 object or service. It is an alphanumeric text string with a maximum of 128 characters.

**Close Cursor** The number of CLOSE statements executed. This number at the server location might not match the user application because of DDF's internal processing (DB2 field name: QXCLOSE).

**Collection ID (Unicode)** The collection ID. This field is blank for DBRM. It is an alphanumeric text string, with a maximum of 128 characters.

**Comment On** The number of COMMENT ON statements executed (Field name: QXCMTON).

**Commit** The number of times the thread successfully concluded commit phase 2 processing (Field name QWACABRT).

**Connect (Type 1)** The number of CONNECT type 1 statements executed (Field name: QXCON1).

**Connect (Type 2)** The number of CONNECT type 2 statements executed (Field name: QXCON2).

**Thread SQL Counts Attributes** Connection ID. Identifies the connection of an application to a DB2 system.

It is an alphanumeric text string, with a maximum length of eight characters.

**Thread SQL Counts Attributes** The type of connection associated with the thread.

Valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BATCH</td>
<td>Batch job</td>
</tr>
<tr>
<td>CICS</td>
<td>CICS attach</td>
</tr>
<tr>
<td>DLIBATCH</td>
<td>DL/I batch</td>
</tr>
<tr>
<td>Value</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>

<td>IMS control region</td>
</tr>
<tr>
<td>IMS_MPP</td>
<td>IMS attach MPP</td>
</tr>
<tr>
<td>IMS_TBMP</td>
<td>IMS transaction BMP</td>
</tr>
<tr>
<td>DistAllied</td>
<td>Distributed Allied thread</td>
</tr>
<tr>
<td>RRSAF</td>
<td>DB2 Resource Recovery Services attachment facility</td>
</tr>
<tr>
<td>SYSTEM</td>
<td>System directed access</td>
</tr>
<tr>
<td>TSO</td>
<td>TSO foreground and background</td>
</tr>
<tr>
<td>UNKNOWN</td>
<td>Unrecognizable connection type</td>
</tr>
<tr>
<td>UTILITY</td>
<td>DB2 Utility</td>
</tr>
</tbody>
</table>

**Correlation ID** The correlation between an application and the connection to a DB2 system. It is an alphanumeric text string, with a maximum of 12 characters; for example DLKEX212.

**Create Alias** The number of CREATE ALIAS statements executed (Field name: QXCRALS).

**Create Database** The number of CREATE DATABASE statements executed (Field name: QXCRDAB).

**Create Distinct Type** The number of CREATE DISTINCT TYPE statements executed (Field name: QXCDIST).

**Create Function** The number of CREATE FUNCTION statements executed (field name: QXCRUDF).

**Create Global Temp Table** The number of CREATE GLOBAL TEMPORARY TABLE statements executed (field name: QXCRGTT).

**Create Index** The number of CREATE INDEX statements executed (Field name: QXCRINX).

**Create Procedure** The number of CREATE PROCEDURE statements executed (Field name: QXCRPRO).

**Create Role** The number of CREATE ROLE statements executed (Field name QXCRROL) - not supported prior to DB2 9.

**Create Stogroup** The number of CREATE STOGROUP statements executed (field name: QXCRSTG).

**Create Synonym** The number of CREATE SYNONYM statements executed (Field name: QXCRSYN).

**Create Table** The number of CREATE TABLE statements executed (Field name: QXCRTAB).
Create Tablespace The number of CREATE TABLESPACE statements executed (Field name: QXCTABS).

Create Trigger The number of CREATE TRIGGER statements executed (Field name: QXCTRIG).

Create Trusted Context The number of create trusted context statements executed (Field name: QXCRCTX) - not supported prior to DB2 9.

Create View The number of CREATE VIEW statements executed (Field name: QXDEFVU).

DB2 ID The DB2 subsystem ID.

Delete The number of DELETE statements executed (DB2 field name: QXDELET).

Describe The number of DESCRIBE, DESCRIBE CURSOR, DESCRIBE INPUT, and DESCRIBE PROCEDURE statements executed. This number at the server location might not match the user application because of DDF's internal processing (Field name: QXDESC).

Describe Table The number of DESCRIBE TABLE statements executed (Field name: QXDSCR TB).

Description The description of the monitored activity.

Direct Row Revert to Index The number of times that direct row access failed and an index was used to find a record (Field name: QXROIIDX).

Direct Row Revert to TS Scan The number of times that an attempt to use direct row access reverted to using a table-space scan because DB2 was not able to use a matching index scan (Field name: QXROITS).

Direct Row Successful The number of times that direct row access was successful (Field name: QXROIMAT).

Drop Alias The number of SQL DROP ALIAS statements executed (Field name: QXDRPAL).

Drop Database The number of DROP DATABASE statements executed (field name: QXDRPDB).

Drop Distinct Type The number of DROP DISTINCT TYPE statements executed (Field name: QXDDIST).

Drop Function The number of DROP FUNCTION statements executed (Field name: QXDRPFN).

Drop Index The number of DROP INDEX statements executed (Field name: QXDRPIX).

Drop Package The number of SQL DROP PACKAGE statements executed (Field name: QXDRPPKG).

Drop Procedure The number of DROP PROCEDURE statements executed (Field name: QXDRPRR).
Drop Role The number of DROP ROLE statements executed (Field name: QXDRPROL) - not supported prior to DB2 9.

Drop Stogroup The number of DROP STOGROUP statements executed (Field name: QXDRPST).

Drop Synonym The number of DROP SYNONYM statements executed (Field name: QXDRPSY).

Drop Table The number of DROP TABLE statements executed (Field name: QXDRPTA).

Drop Tablespace The number of DROP TABLESPACE statements executed (Field name: QXDRPTS).

Drop Trigger The number of DROP TRIGGER statements executed (Field name: QXDRPTR).

Drop Trusted Context The number of drop trusted context statements executed (Field name: QXDRPCTX) - not supported prior to DB2 9.

Drop View The number of DROP VIEW statements executed (Field name: QXDRPVU).

End User ID The user ID of the workstation end user. This user ID can be different from the authorization ID used to connect to DB2. This field contains blanks if the client does not supply this information (Field name: QWHCEUID).

Fetch The number of FETCH statements executed. This number at the server location might not match the user application because of DDF's internal processing (Field name: QXFETCH).

Grant The number of GRANT statements executed (Field name: QXGRANT).

Incremental Bind The number of incremental binds (excluding prepare) (Field name: QXINCRB).

Insert The number of INSERT statements executed (Field name: QXINSRT).

Interval Start The date and time, as set on the monitored system, indicating the instance when the agent collects information.

Job Name The job name that is associated with a thread.

Label On The number of LABEL ON statements executed (Field name: QXLABON).

Literals Dups Created The number of times DB2 created a duplicate STMT instance in the statement cache for a dynamic statement that had literals replaced by CONCENTRATE STATEMENTS WITH LITERALS behavior (Field name: QXSTCWLD). The duplicate STMT instance was needed because a cache match failed because the literal reusability criteria was not met.

Literals Matches Found The number of times DB2 found a matching reusable copy of a dynamic statement in cache because of CONCENTRATE STATEMENTS WITH LITERALS behavior (Field name: QXSTCWLM).
**Literals Parsed** The number of times DB2 parsed dynamic statements because of CONCENTRATE STATEMENTS WITH LITERALS behavior (Field name: QXSTCWLP).

**Literals Replaced** The number of times DB2 replaced at least one literal in a dynamic statement because of CONCENTRATE STATEMENTS WITH LITERALS behavior (Field name: QXSTCWLRR).

**Lock Table** The number of LOCK TABLE statements executed (Field name: QXLOCK).

**LUWID** The logical unit of work ID (LUWID) for a thread.

This value consists of two parts: the logical unit of work ID (luw-id) and a token. The token can be used in place of the luw-id in any DB2 command that accepts luw-id as input. Format:

luw-id=token

The luw-id consists of the network name, the originating VTAM LUNAME, and a unique identifier (separated by periods). Thus, the LuwId field displays data such as the following:

USCAC001.02022A.A1FE8E04B9D4=8

**Max Nested SQL Trigger** The maximum level of indirect SQL cascading (Field name: QXCASCNDEP). This includes cascading because of triggers, UDFs, or stored procedures.

**Max Parallel Degree** The maximum degree of parallel query processing executed among all parallel groups to indicate the extent to which queries were processed in parallel (Field name: QXMAXDEG).

**Merge** The number of MERGE statements executed (DB2 field name QXMERGE) - not supported prior to DB2 9.

**MVS ID** The MVS system identifier.

**Open Cursor** The number of OPEN statements executed (Field name: QXOPEN).

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Package DBRM (Unicode)** The package name of the database request module (DBRM) with which a thread is associated. It is an alphanumeric text string with a maximum of 128 characters.

**Parallel Bypass DB2 (Buffers)** The number of times the parallelism coordinator had to bypass a DB2 when distributing tasks because one or more DB2 members did not have enough buffer pool storage (Field name: QXXCSKIP). The number in this field is only incremented at the parallelism coordinator once per parallel group, even though more than one DB2 might have lacked buffer pool storage for that parallel group. It is also only incremented when the buffer pool is defined to allow for parallelism. For example, if VPXSEQ=0 on an assistant, DB2 does not send parallel work there and the number in this field is not incremented.
Parallel Degree Executed The total number of parallel groups that executed in the planned parallel degree (Field name: QXNORGRP). This field is incremented by one for each parallel group that executed in the planned degree of parallelism (as determined by DB2).

Parallel Degree Reduced (no buffer) The total number of parallel groups that did not reach the planned parallel degree because of a lack of storage space or contention on the buffer pool (Field name: QXREDGRP).

Parallel Failed (Cursor) The total number of parallel groups that fell back to sequential mode because of a cursor that can be used by UPDATE or DELETE (Field name: QXDEGCUR).

Parallel Failed (No Buffer) The total number of parallel groups that fell back to sequential mode because of a storage shortage or contention on the buffer pool (Field name: QXDEGBUF).

Parallel Failed (No ESA Sort) The total number of parallel groups that fell back to sequential mode because of a lack of ESA sort support (Field name: QXDEGES).A.

Parallel Failed (No Enclaves) The total number of parallel groups that executed in sequential mode because of the unavailability of MVS/ESA enclave services (Field name: QXDEGEN).

Parallel Grp Executed The total number of parallel groups that were executed (Field name: QXTOTGRP).

Parallel Maximum LOB Storage The maximum storage used for LOB values (DB2 field name: QXSTLOBV).

Parallel Single DB2 (Coord=NO) The total number of parallel groups executed on a single DB2 subsystem due to the COORDINATOR subsystem value being set to NO (Field name: QXCOORNO). When the statement was bound, the COORDINATOR subsystem value was set to YES. This situation can also occur when a package or plan is bound on a DB2 subsystem with COORDINATOR=YES, but is run on a DB2 subsystem with COORDINATOR=NO.

Parallel Single DB2 (Cursor) The total number of parallel groups executed on a single DB2 subsystem because of a repeatable-read or read-stability isolation (Field name: QXISOR).

Parallel Sysplex Intent The total number of parallel groups that DB2 intended to run across the data sharing group (Field name: QXXCBPNX). This number is only incremented at the parallelism coordinator at run time.

Parallelism Disabled YES indicates that query parallelism is disabled by the Resource Limit Facility for at least one dynamic SQL SELECT statement.

Plan Name The name of an application plan that DB2 produces during the bind process and uses for processing SQL statements during execution. It is an alphanumeric text string, with a maximum of 8 characters. For example, PLANLCK2 is the name of an application plan. *SYSTEM* indicates DB2 subsystem-generated threads that own or are waiting on a lock.
**Prepare** The number of PREPARE statements executed. This number at the server location might not match the user application because of DDF’s internal processing (Field name: QXPREP).

**Prepare Avoided KEEPDYN(YES)** The number of times where no SQL PREPARE or EXECUTE IMMEDIATE was issued by the application and a copy of a prepared SQL statement was found in local dynamic SQL cache (Field name: QXSTNPRP). When an application plan or package is bound with KEEPDYNAMIC YES, a copy of each prepared SQL statement for the application thread is held in the local dynamic SQL cache and kept across a commit boundary. An application thread can save the total cost of a prepare by using a copy of the prepared statement in the local dynamic SQL cache from an earlier prepare by the same thread. To do this, the application must be modified to avoid issuing repetitive SQL PREPAREs for the same SQL statement.

**Prepare Copied from Cache** The number of times a PREPARE command was satisfied by copying a statement from the prepared statement cache (Field name: QXSTFND).

**Prepare Discarded - MAXKEEPD** The number of times statements are invalidated in the local dynamic SQL cache because the MAXKEEPD limit has been reached and prepared SQL statements in the local dynamic SQL cache have to be reclaimed (Field name: QXSTDEXP).

**Prepare Implicit KEEPDYN(YES)** An implicit prepare occurs when the user copy of the prepared SQL statement no longer exists in the local dynamic SQL cache and the application plan or package is bound with KEEPDYNAMIC YES (Field name: QXSTIPRP). If the skeleton copy of the prepared SQL statement exists in the global dynamic SQL cache in the EDM pool, a short prepare is executed, otherwise a full prepare is executed.

**Prepare No Match** The number of times that DB2 searched the prepared statement cache but could not find a suitable prepared statement (Field name: QXSTNFND).

**Prepare Purged - DROP/ALT/REV** The number of times statements are invalidated in the local dynamic SQL cache because of SQL DDL or updated RUNSTATS information and prepared SQL statements in the local dynamic SQL cache have to be reclaimed (Field name: QXSTDINV).

**Release** The number of RELEASE statements executed (DB2 field name: QXREL).

**Rename Index** The number of RENAME INDEX statements executed (Field name QXRNX) - not supported prior to DB2 9.

**Rename Table** The number of RENAME TABLE statements executed (Field name: QXRNTAB).

**Revoke** The number of REVOKE statements executed (Field name: QXREVO).

**RID HWM** The highest number of RID blocks in use at any time since DB2 startup (Field name: QISTRHIG). This is a high-water mark.

**RID In Use** The number of RID blocks currently in use (snapshot value) (Field name: QISTRCUR).
**RID Exceeded Pool** The number of times the maximum RID pool storage was exceeded (Field name: QISTRMAX). The size is determined by the installation parameter RID POOL SIZE (DB2 install panel DSNTIPC). It can be 0, or between 128 KB and 10 GB. The general formula for calculating the RID pool size is:

Number of concurrent RID processing activities x average number of RIDs x 2 x 5 bytes per RID.

**RID Exhausted Virtual** The number of times RID pool processing was not used because DBM1 storage was exhausted (Field name: QISTRSTG).

**RID Not Used (no storage)** The number of times DB2 detected that no storage was available to hold a list of RIDs during a given RID pool process involving one index (single index access with list prefetch) or multiple indexes (multiple index access) (DB2 field name: QXNSMIAP).

**RID Not Used (Max Limit)** The number of times DB2 detected that a RID list exceeded one or more internal limits during a given RID list (or RID pool) process involving one index (single index access with list prefetch) or multiple indexes (multiple index access) (DB2 field name: QXMRMIAP). The internal limits include the physical limitation of the number of RIDs a RID list can hold and threshold values for the retrieval, ORing, and ANDing of RIDs.

**RID Pool Used** The number of times the RID (RECORD ID) pool has been processed (Field name: QXMIAP). During RID (RECORD ID) pool (also called RID list) processing, DB2 uses an index to produce a list of candidate RIDs, which is called a RID list. The RID list can be sorted and intersected (ANDed) or unioned (ORed) with other RID lists before actually accessing the data pages. RID list processing is used for a single index (index access with list prefetch) or for multiple indexes (multiple index access), which is when the RID lists are ANDed and ORed.

**RID Terminated (> DM)** The number of times a RID pool processing operation terminated because the number of RID entries was greater than the DM limit (Field name: QISTRPLM).

**RID Terminated (> RDS)** The number of times RID pool processing terminated because the number of RIDs that can fit into the guaranteed number of RID blocks was greater than the maximum limit (25% of table size) (Field name: QISTRLLM).

**Row Triggers Executed** The number of times a row trigger was activated (Field name: QXROWTRG).

**Rows Deleted** The number of rows that have been deleted because of SQL DELETE statements (Field name: QXRWSDELETED).

**Rows Fetched** The number of rows that have been fetched because of SQL FETCH statements (Field name: QXRWSFETCHD).

**Rows Inserted** The number of rows that have been inserted because of SQL INSERT statements (Field name: QXRWSINSERTD).

**Rows Updated** The number of rows that have been updated because of SQL UPDATE statements (Field name: QXRWSUPDTD).

**Select** The number of SQL SELECT statements executed (Field name: QXSELECT).
Set Connection  The number of SET CONNECTION statements executed (Field name: QXSETCON).

Set Current Degree  The number of SET CURRENT DEGREE statements executed (Field name: QXSETCDG).

Set Current Path  The number of SET CURRENT PATH statements executed (Field name: QXSETPTH).

Set Current Rules  The number of SET CURRENT RULES statements executed (Field name: QXSETCRL).

Set Current SQLID  The number of SET CURRENT SQLID statements executed (Field name: QXSETSQL).

Set Host Variable  The number of SET HOST VARIABLE statements executed. The special register that was retrieved is not tracked (Field name: QXSETHV).

SP Abended  The number of times a stored procedure terminated abnormally (Field name: QXCALLAB).

SP Call Statements  The number of times the SQL CALL statements executed to invoke a stored procedure (SP).

SP Rejected  The number of times an SQL CALL statement was rejected because of the procedure that is in the STOP ACTION(REJECT) state (Field name: QXCALLRJ).

SP Timed-Out  The number of times an SQL CALL statement timed out when waiting to be scheduled (Field name: QXCALLTO).

SQL Error in Trigger  The number of times an SQL error occurred during the execution of a triggered action (Field name: QXTRGERR). This includes errors that occur in user-defined functions or stored procedures that are called from triggers and that pass back a negative SQLCODE.

Stmt Triggers Executed  The number of times a statement trigger was activated (Field name: QXSTTRG).

Total  The total count executed by the thread.

UDFs Abended  The number of times a user-defined function (UDF) abended (Field name: QXCAUDAB).

UDFs Executed  The number of user-defined functions (UDFs) executed (Field name: QXCAUD).

UDFs Rejected  The number of times a user-defined function (UDF) was rejected (Field name: QXCAUDRJ).

UDFs Timed Out  The number of times a user-defined function (UDF) timed out while waiting to be scheduled (Field name: QXCAUDTO).

Uniqueness Value  The instance number: When concatenated with the fully qualified network name, it uniquely identifies a distributed thread (Field name: QWHSLUUU).
Uniqueness Value 2 The DB2 thread uniqueness value. For internal use.

Update The number of UPDATE statements executed (Field name: QXUPDTE).

**Thread SQL Count Attributes**

Use these attributes to view the thread SQL count.

**DB2 Subsystem** The DB2 subsystem ID.

**DB2 Version** The DB2 version.

**Data Sharing Group** The Data Sharing Group name.

**Data Sharing Member** The Data Sharing Group member name.

**Field Name** The data field name.

**Field Value** The data value.

**Interval Start** The start time of this interval.

**MVS System ID** The MVS identifier.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**QW0148AC** The agent control element (ACE) (see QWHSACE) of the thread that is reported. The value in QWHSACE is the ACE of the IFI application that requested this trace record (Field name: QW0148AC).

**QW0148LU** The logical unit of the work ID (LUWID) as defined for the LU 6.2 interface (Field name: QW0148LU). The LUWID uniquely identifies the thread within the network, and consists of the following:

- A fully qualified network name (QW0148LM)
- An LUW instance number (QW0148UV) and an LUW sequence number (see fields below).

It consists of two 8-character fields: QW0148NI and QW0148LM, which together uniquely identify a client system.

**QWHCATYP** The connecting system type code (in hexadecimal). This field can have a null value. For example, this field contains a null value for some utilities (Field name: QWHCATYP).

**QWHCCN** The connection name (Field name: QWHCCN). It is not valid on end of memory and reflects the z/OS home address space (ASID) connection name for:

- **Batch**: 'BATCH'
- **TSO**: 'TSO'
- **QMF**: 'DB2CALL'
- **Utility**: 'UTILITY'
- **DB2 internal**
  - DB2 subsystem ID
IMS  IMS-ID
CICS  CICS-ID
RRSAF  'RRSAF'

**Distributed database access threads:**

- For threads from a DB2 requester, this field contains the connection name of the thread at the requesting location.
- For threads using the DRDA protocol from a non-DB2 requester, this field contains the constant 'SERVER'.

**QWHCCV** The correlation ID value (Field name: QWHCCV).
- For batch: JOBNAME
- For TSO: LOGON-ID
- For IMS/VS: PST#.PSBNAME
- For CICS: CONNECTION_TYPE.THREAD_TYPE.THREAD_#.TRAN-ID
- For RRSAF: CORRELATION-ID value from signon function
- For threads from a DB2 requester: this field contains the correlation-ID name of the thread at the requesting location.
- For threads using the DRDA protocol from a non-DB2 requester, this field contains the first 12 characters in the DDM external name (EXTNAM) parameter of the DDM EXCSAT command received as part of the SQL connect.

**QWHCEUID** The user ID of the end user's workstation (Field name: QWHCEUID). This can be different from the authorization ID used to connect to DB2. This field contains blanks if the client did not supply this information. If QWHCEUID_OFF is not 0, this value is truncated.

**QWHCEUTX** The transaction or application name that the end user is running (Field name: QWHCEUTX). This identifies the application that is currently running, not the product that is used to run the application. This field contains blanks if the client did not supply this information.

**QWHCEUWN** The end user's workstation name (Field name: QWHCEUWN). This field contains blanks if the client did not supply this information.

**QWHCPLAN** The plan name (Field name: QWHCPLAN). It shows a blank for a DB2 command thread; otherwise:
- For SPUFI with cursor stability: 'DSNESPCS'
- For SPUFI with repeatable read: 'DSNESPRR'
- For TSO: the application plan name
- For IMS: the application plan name
- For CICS: application plan name, IMS and CICS commands have a blank plan name.
- For RRSAF create thread with the collection parameter: '?RRSAF '
- For QMF: 'DSQPLAN'
- For Distributed Database Access threads:
  - For threads using the DRDA protocol from a requester, this field contains the plan name that is executed at the requesting location.
  - For threads using the DRDA protocol from a non-DB2 requester or from a DB2 2.3 requester, this field contains the constant 'DISTSERV'.

2400  IBM Db2 Performance Expert on z/OS
• For binding: 'DSNBIND' (system plan)
• For utility: 'DSNUTIL' (system plan)
• For authorization: 'ACT' + X'0000000000' (system plan)
• For unallocated threads and miscellaneous DB2 system service tasks: 'BCT' + X'0000000000' (system plan)
• For startup: 'STARTCT' + X'00' (system plan)

**Sequence Number** The thread long name descriptions.

**QW0148CI**
Collection name.

**QW0148LN**
Location name. The location name contains the name the local location or remote location, depending on where the thread executes a package.

**QW0148PN**
Package ID.

**QWHCEUID**
The end user's work station user ID. This can be different from the authorization ID used to connect to DB2. This field contains blanks if the client did not supply this information.

**QWHCEUTX**
The transaction or application name that the end user is running. This identifies the application that is currently running, not the product that is used to run the application. This field contains blanks if the client did not supply this information.

**QWHCEUWN**
The end user's workstation name. This field contains blanks if the client did not supply this information.

**QWHCTCXT**
Trusted context name.

**QWHCROLE**
Role name that is associated with the authorization.

**QWHCAID**
Primary authorization ID from connection or signon.

**QWHCOPID**
Initial primary authorization ID.

**QMDASUFX**
Account suffix.

**QMDAACCT**
The z/OS accounting string associated with the DB2 SQL application's z/OS address space.

**UW0148CI** The collection name (Field name: UW0148CI).

**UW0148LN** The location name (Field name: UW0148LN). The location name contains the name of the local location or remote location, depending on where the thread executes a package. The following statements execute locally, regardless of the current package name:
• COMMIT
- ROLLBACK
- SET <HOST VARIABLE> = CURRENT PACKAGE SET
- SET <HOST VARIABLE> = CURRENT SERVER

For these statements, this field contains the location where the package executes, not the location where the statement executes.

**UW0148PN** The package ID (Field name: UW0148PN).

**UWHCAID** The primary authorization ID from connection or signon (Field name: UWHCAID). For z/OS operator commands and DB2 system internal agents, the value is SYSOPR. Secondary authorization IDs might be the RACF groups associated with this primary authorization ID. The SQL ID is initially set to this primary authorization ID. The connection authorization exit and the signon authorization exit can change the primary authorization ID so that it is not the same as the original primary authorization ID (QWHCOPID). Distributed authorization ID translation can also change the primary authorization ID.

**Thread SQL Text Attributes**

Use these attributes to view thread SQL text.

**ACE Address** The agent control element (ACE) (see QWHSACE) of the thread that is reported. The value in QWHSACE is the ACE of the IFI application that requested this trace record (Field name: QW0148AC).

**Authorization ID** The primary authorization ID from connection or signon (Field name: UWHCAID). For z/OS operator commands and DB2 system internal agents, the value is SYSOPR. Secondary authorization IDs might be the RACF groups associated with this primary authorization ID. The SQL ID is initially set to this primary authorization ID. The connection authorization exit and the signon authorization exit can change the primary authorization ID so that it is not the same as the original primary authorization ID (QWHCOPID). Distributed authorization ID translation can also change the primary authorization ID.

**Collection Name** The collection name (Field name: UW0148CI).

**Connection ID** The connection name (Field name: QWHCCN). It is not valid on end of memory and reflects the z/OS home address space (ASID) connection name for:

- **Batch**: 'BATCH'
- **TSO**: 'TSO'
- **QMF**: 'DB2CALL'
- **Utility**: 'UTILITY'
- **DB2 internal**
  - DB2 subsystem ID
- **IMS**
  - IMS-ID
- **CICS**
  - CICS-ID
- **RRSAF**
  - 'RRSAF'

Distributed database access threads:
• For threads from a DB2 requester, this field contains the connection name of the thread at the requesting location.
• For threads using the DRDA protocol from a non-DB2 requester, this field contains the constant ‘SERVER’.

**Correlation ID** The correlation ID value (Field name: QWHCCV).

- For batch: JOBNAME
- For TSO: LOGON-ID
- For IMS/VS: PST#.PSBNAME
- For CICS: CONNECTION_TYPE.THREAD_TYPE.THREAD Baton.TRAN-ID
- For RRSAF: CORRELATION-ID value from signon function
- For threads from a DB2 requester: this field contains the correlation-ID name of the thread at the requesting location.
- For threads using the DRDA protocol from a non-DB2 requester, this field contains the first 12 characters in the DDM external name (EXTNAM) parameter of the DDM EXCSAT command received as part of the SQL connect.

**DB2 Subsystem** The DB2 subsystem ID.

**DB2 Version** The DB2 version.

**DSG Member Name** The Data Sharing Group (DSG) member name.

**Data Sharing Group** The Data Sharing Group name.

**End User ID** The user ID of the end user’s workstation (Field name: QWHCEUID). This can be different from the authorization ID used to connect to DB2. This field contains blanks if the client did not supply this information. If QWHCEUID OFF is not 0, this value is truncated.

**Interval Start** The start time of this interval.

**Location Name** The location name (Field name: UW0148LN). The location name contains the name of the local location or remote location, depending on where the thread executes a package. The following statements execute locally, regardless of the current package name:

- COMMIT
- ROLLBACK
- SET <HOST VARIABLE> = CURRENT PACKAGE SET
- SET <HOST VARIABLE> = CURRENT SERVER

For these statements, this field contains the location where the package executes, not the location where the statement executes.

**Logical Unit of work ID** The logical unit of the work ID (LUWID) as defined for the LU 6.2 interface (Field name: QW0148LU). The LUWID uniquely identifies the thread within the network, and consists of the following:

- A fully qualified network name (QW0148LM)
- An LUW instance number (QW0148UV) and an LUW sequence number (see fields below).

It consists of two 8-character fields: QW0148NI and QW0148LM, which together uniquely identify a client system.
MVS System ID The MVS identifier.

Originating System The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

Package ID The package ID (Field name: UW0148PN).

Plan Name The plan name (Field name: QWHCPLAN). It shows a blank for a DB2 command thread; otherwise:
- For SPUFI with cursor stability: 'DSNESPCS'
- For SPUFI with repeatable read: 'DSNESPRR'
- For TSO: the application plan name
- For IMS: the application plan name
- For CICS: application plan name, IMS and CICS commands have a blank plan name.
- For RRSAF create thread with the collection parameter: '?RRSAF '
- For QMF: 'DSQPLAN'
- For Distributed Database Access threads:
  - For threads using the DRDA protocol from a requester, this field contains the plan name that is executed at the requesting location.
  - For threads using the DRDA protocol from a non-DB2 requester or from a DB2 2.3 requester, this field contains the constant 'DISTSERV'.
- For binding: 'DSNBIND' (system plan)
- For utility: 'DSNUTIL ' (system plan)
- For authorization: 'ACT' + X'0000000000' (system plan)
- For unallocated threads and miscellaneous DB2 system service tasks: 'BCT' + X'0000000000' (system plan)
- For startup: 'STARTCT' + X'00' (system plan)

Statement Text The SQL statement text. This section is shown if the agent is at thread level and an SQL statement is present. For dynamic SQL, the reported statement might be a SELECT statement, even though the statement that is processed by the application is a PREPARE, OPEN, or FETCH statement. For static SQL, the reported statement might be a SELECT statement, even though the actual statement is DECLARE CURSOR. Check the RDISTYPE field to determine the actual SQL statement type. Host variables are displayed as ' :H ' in this field.

Thread Type The connecting system type code (in hexadecimal). This field can have a null value. For example, this field contains a null value for some utilities (Field name: QWHCATYP).

Transaction Name The transaction or application name that the end user is running (Field name: QWHCEUTX). This identifies the application that is currently running, not the product that is used to run the application. This field contains blanks if the client did not supply this information.

Workstation Name The end user’s workstation name. This field contains blanks if the client did not supply this information (Field name: QWHCEUWN).

ZOS CPU Utilization Attributes
Use the ZOS CPU Utilization attributes to determine how much of your processor is used by DB2.
Note: Parameter ZOSMETRICS must be set to YES for enabling DB2 to retrieve data from the RMF interface. If ZOSMETRICS is not set to YES, you might see negative Operating System CPU data. ZPARAM ZOSMETRICS in DSN6SPRM.

CPU Utilization DB2 The percentage of the processor used by the DB2 subsystem; if parameter ZOSMETRICS is not set to YES for enabling DB2 to retrieve data from the RMF interface, you might see negative Operating System CPU data.

CPU Utilization DB2 DBM1 The percentage of the processor used by the DB2 DBM1 address space; if parameter ZOSMETRICS is not set to YES for enabling DB2 to retrieve data from the RMF interface, you might see negative Operating System CPU data.

CPU Utilization DB2 MSTR The percentage of the processor used by the DB2 MSTR address space; if parameter ZOSMETRICS is not set to YES for enabling DB2 to retrieve data from the RMF interface, you might see negative Operating System CPU data.

CPU Utilization LPAR The average processor usage per LPAR; if parameter ZOSMETRICS is not set to YES for enabling DB2 to retrieve data from the RMF interface, you might see negative Operating System CPU data.

DB2ID The name of a DB2 subsystem.

DB2 Version The version of the DB2 system.

Free Real Storage LPAR (MB) The free real storage on the logical partition (LPAR), in MB.

Free Virtual Storage LPAR (MB) The free virtual storage on the LPAR, in MB.

Interval Start The date and time, as set on the monitored system, indicating the instance when the agent collects information.

MVS System ID The MVS system identifier.

Number of CPU on LPAR The number of processors on the LPAR; if parameter ZOSMETRICS is not set to YES for enabling DB2 to retrieve data from the RMF interface, you might see negative Operating System CPU data.

Originating System ID The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

Page-in Rate LPAR The Page-in Rate in percents for the LPAR.

Page-in Rate DB2 The Page-in Rate in percents for the DB2 subsystem.

Real Storage non LPAR (MB) The total real storage on the LPAR, in MB.

RMF API Reason Code The reason code from the RMF API call.

RMF API Return Code The return code from the RMF API call.

RMF API Status Flag The status flag for the Resource Measurement Facility (RMF) API call.
**Unreferenced Interval Count** The unreferenced interval count.

**Used Free Real DB2 (MB)** The real storage used by the DB2 subsystem, in MB.

**Used Virtual Storage DB2 (MB)** The virtual storage used by the DB2 subsystem, in MB.

**Virtual Storage LPAR (MB)** The total virtual storage on the LPAR, in MB.

**OMEGAMON XE for DB2 PE Workspaces**

The OMEGAMON XE for DB2 PE workspaces contain the table views you use to obtain information about the various aspects of DB2. The workspaces may also display other types of information such as graphs and charts.

The workspaces contain several counters that display data related to DB2 performance. If a counter value or specific information in a panels is not shown, the following notation is used to indicate the reason:

*Table 200. Notations for missing information*

<table>
<thead>
<tr>
<th>Value</th>
<th>Explanation</th>
</tr>
</thead>
</table>
| N/A   | Not applicable is shown if DB2 never produces a counter value in a specific context. Examples are:  
|       | • A counter is not available in one DB2 version.  
|       | • Counters are mutually exclusive. |
| N/C   | Not calculated is shown for a derived field where the value cannot be calculated or is useless. Examples are:  
|       | • A divide by zero (percentages, ratios).  
|       | • Suppression of negative elapsed time values.  
|       | • Required counter values for calculation marked as N/A or N/P.  
|       | • Insufficient data or small counter values to allow significant statements (meaningless or misleading averages). |
| N/P   | Not present is shown for a field where DB2 can present values, but does not in this instance. Examples are:  
|       | • When counter values are not generated because of operational conditions (a trace class is not active).  
|       | • An application does not provide a value because it is optional. |

**All Threads Connected to DB2 Workspace**

The All Threads Connected to DB2 workspace provides an overview of the activity of all threads that are connected to DB2.

This workspace is comprised of the following views:

**In-DB2 CP CPU Time (bar chart)**  
Shows the class 2 CPU time (in DB2) for all threads.

**In-DB2 Time (bar chart)**  
Shows the class 2 elapsed time (in DB2) for all threads.

**All Threads Connected to DB2 (table view)**  
Provides key data for all threads that are connected to DB2.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces
that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

You can link to the following Thread summary workspaces:
- “All Threads Connected to DB2 Workspace” on page 451
- “CICS Thread Summary Workspace” on page 479
- “Detailed Thread Exception Workspace” on page 554
- “Distributed Allied Thread Summary Workspace” on page 564
- “DBAT End-to-End SQL Monitoring Workspace” on page 544
- “Enclave Thread Summary Workspace” on page 677
- “IMS Thread Summary Workspace” on page 731
- “Lock Conflicts Workspace” on page 732
- “Thread Activity by Package Workspace” on page 803
- “Thread Activity by Plan Workspace” on page 803
- “Utility Jobs Workspace” on page 831

**Application Information Workspace**
The Application Information workspace provides details on the Database Connection Services (DCS) application. You can use it for problem determination on DCS applications.

This workspace is comprised of the following views:

- **Application Information (table view)**
  Shows the key data for the DCS application.

- **Client Information (table view)**
  Shows details on the client application.

- **DB2 Host (table view)**
  Identifies the host database and shows how communication between the DB2 Connect gateway and the host database is established.

- **Thread/Application ID (table view)**
  Identifies the thread and the DCS application.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**Buffer Pool Details Workspace**
The Buffer Pool Details workspace provides status, threshold, and ratio details associated with specific buffer pool activity.

This workspace is comprised of the following views:

- **Ratio (table view)**
  Provides thread performance details associated with the buffer pool.
Status (table view)
Provides "at a glance" buffer pool details, including size and page allocation information.

Thresholds (table view)
Lists the thread’s performance and status thresholds for the selected buffer pool.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

Buffer Pool Management Workspace
Buffer pools, also called virtual buffer pools, are areas of virtual storage where DB2 temporarily stores pages of table spaces or indexes.

The Buffer Pool Management workspace provides an overview of buffer pool activity. This workspace is comprised of the following views:

Buffer Pool Management (table view)
Shows activity details for specific buffer pools.

Buffer Pool Rates (bar chart)
Shows the rate of get page operations, read I/O operations, prefetch requests, and write I/Os performed.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

CICS Connections Workspace
The CICS Connections workspace provides an overview of DB2 thread activity originating from connected CICS subsystems. It provides information on a connection level about all CICS subsystems identified to DB2.

This workspace is comprised of the following views:

CICS Connections Summary (table view)
Lists thread status details, including the components of the Thread Usage chart and thread utilization data.

Thread Usage (bar chart)
Shows the counts of currently active pool threads, pool threads that are waiting because the maximum has been reached, and active threads for this CICS connection (including entry and pool threads).

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

CICS Threads Workspace
The CICS Threads workspace provides data to monitor DB2 thread activity originating from connected CICS subsystems.
This workspace is comprised of the following views:

**CICS Threads (table view)**
Identifies and measures thread activity from the CICS region.

**Thread Counts (bar chart)**
Shows "at a glance" counts of entry threads in use, entry threads waiting, and pool thread overflow.

**Note:** This workspace is available only when at least one thread is active from the CICS region.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**CICS Thread Summary Workspace**
The CICS Thread Summary workspace provides an overview for threads originating from CICS.

This workspace is comprised of the following views:

**CICS Thread Summary (table view)**
Shows summary information for the CICS threads.

**In-DB2-CPU Time (bar chart)**
Shows the class 2 CPU time (in DB2) for CICS threads.

**In-DB2 Time (bar chart)**
Shows the class 2 elapsed time (in DB2) for CICS threads.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

You can link to the following Thread summary workspaces:
- "All Threads Connected to DB2 Workspace" on page 451
- "CICS Thread Summary Workspace" on page 479
- "Detailed Thread Exception Workspace” on page 554
- “Distributed Allied Thread Summary Workspace” on page 564
- “DBAT End-to-End SQL Monitoring Workspace” on page 544
- “Enclave Thread Summary Workspace” on page 677
- “IMS Thread Summary Workspace” on page 731
- “Lock Conflicts Workspace” on page 732
- “Thread Activity by Package Workspace” on page 803
- “Thread Activity by Plan Workspace” on page 803
- “Utility Jobs Workspace” on page 831
Common Storage Workspace
The Common Storage workspace provides an overview of the common storage above and below the 2 GB bar. You can view this information if DB2 10 is installed.

This workspace is comprised of the following views:
- Common Storage Below 2 GB (table view)
- Common Storage Above 2 GB (table view)
- MVS LPAR Shared Storage Above 2 GB
- DB2 Subsystem Shared Storage Above 2 GB
- DB2 Subsystem Shared Variable Storage Above 2 GB

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

You can use the navigation links in the MVS LPAR Shared Storage Above 2 GB view to open:
- “MVS Storage Above 2 GB Workspace” on page 750
- “MVS Storage Below 2 GB Workspace” on page 750

Coupling Facility Connections Workspace
The Coupling Facility Connections workspace displays connection status information for all connections to a coupling facility structure.

Use the Coupling Facility Connections workspace to:
- View the status of all connections to a structure
- Identify the operating system name, the associated coupling facility name and job name

To investigate a non-active connection, review the information provided in Accessing an OMEGAMON Host Session.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

Coupling Facility Structures Workspaces
The Coupling Facility Structures workspace provides a global view of LOCK1 and SCA coupling facility structures for a specific data sharing group.

Use the workspace to:
- Monitor activity rates within a structure
- Track structure utilization over a period of time
- View structure data for a true coupling facility situation
- View comprehensive global and false contention data

Analyzing Coupling Facility Connections
You can analyze a specific coupling facility structure to view the connection status of all connections to the structure.
From the Coupling Facility Structure table view, right-click a structure name and then click **Link to --> Coupling Facility Connections**. The **Coupling Facility Connections workspace** is displayed. This view shows the connection status details for your coupling facility structure.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**Critical DB2 Messages by Message ID Workspace**

The Critical DB2 Messages by Message ID workspace displays critical DB2 messages sorted by message identification number.

This workspace is comprised of the following views:

- **Critical DB2 Messages by Message ID (table view)**
  Reports information about critical messages, including when the message was generated, the message identification number, and the message text.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

You can link to the following workspace from the Critical DB2 Messages by Message ID workspace:

- [DB2 Messages](#)

**Data Sharing Thread Activity Workspace**

The Data Sharing Thread Activity workspace provides a global view of thread activity for an entire data sharing group. A consolidated list of DB2 threads displays on the table view in alphabetical order by plan name. Your table view may sort differently if you have changed the sort field or sort order.

This workspace is comprised of the following views:

- Threads Using CP CPU (bar chart)
- Threads that have Wait Times (bar chart)
- Data Sharing Threads (table view)

Use the Data Sharing Threads table view to:

- Identify all active threads.
- Track thread activity for application threads over a period of time.
- Analyze thread data when a thread evaluates to true.

**Monitoring Thread Activity**

You can use the Data Sharing Threads table view to identify all active application threads and track thread activity over a period of time. You can use the thread data to:

- Monitor critical application threads.
- Evaluate the thread elapsed and wait times for critical threads.
- Observe thread activity for threads within the same system, group, and member.
Analyzing Thread Statistics

You can analyze a specific application thread on the Data Sharing Threads table view and review statistical information.
1. Right-click a row on the Data Sharing Threads table view.
2. Click Link to --> Thread Statistics.

The Thread Statistics workspace displaying statistical information for your thread is displayed.

Investigating Excessive Thread Elapsed Time

You can use the Tivoli Enterprise Portal terminal emulator adapter to access an OMEGAMON host session. You can then review further information that will assist you in investigating a thread with excessive elapsed time. For information about using this feature, see the Tivoli Enterprise Portal online help.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

Data Sharing Thread Statistics Workspace

The Data Sharing Thread Statistics workspace displays thread statistics for a specific application thread. If the application thread is a parallel thread, the table view displays thread statistics for all the associated parallel threads.

Viewing Additional Thread Information

You can use the Tivoli Enterprise Portal terminal emulator adapter to access an OMEGAMON host session to investigate a thread with excessive elapsed time. For information about using this feature, see the Tivoli Enterprise Portal online help.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

DB2 Connect/Gateway Statistics Workspace

The DB2 Connect/Gateway Statistics workspace provides statistics about the selected DB2 Connect gateway, including details about the number of agents and pooled agents, the connections waiting for the host to reply, and the connections waiting for the client to send a request.

This workspace is comprised of the following views:

DB2 Connect Server - Key Events (bar chart)
Shows the key events of the selected DB2 Connect gateway.

DB2 Connect Server - High Water Mark (bar chart)
Shows key high water marks with regard to agents.

DB2 Connect Information (table view)
Shows key data on the selected DB2 Connect gateway.

DB2 Connect Agents (table view)
Provides information about the agents.

Connections (table view)
Provides information about the connections.
Sorts/Memory (table view)

Shows the total number of allocated pages of sort heap space for all sorts at the level chosen and at the time the snapshot was taken.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

DB2 Connect Server Workspace

The DB2 Connect Server workspace provides key information about all active and inactive DB2 Connect gateways.

This workspace is comprised of the following views:

DB2 Connect Server - Key Events (bar chart)

Shows the key events of all active DB2 Connect gateways.

DB2 Connect Server (table view)

Shows key data on all active and inactive DB2 Connect gateways.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

DB2 Connect Server at Thread Level Workspace

The DB2 Connect Server at Thread Level workspace provides summary information about the Database Connection Services (DCS) application related to this thread.

This workspace is comprised of the following views:

Application Time (bar chart)

Shows the elapsed execution time of the unit of work that was completed most recently. It indicates the time that it takes for units of work to complete.

Thread/Application ID (table view)

Identifies the thread and the DCS application.

DB2 Connect Server Information (table view)

Shows key data on the DCS application.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

DB2 Connect Server Package Statistics Workspace

The Package Statistics workspace provides statistics about the packages that were received at the selected DB2 Connect gateway.

This workspace is comprised of the following views:
DB2 Connect Server - Package Network Time (bar chart)
Shows the network time and the average network time required for processing a sample SQL statement. The network time is the difference between the host response time and the elapsed execution time for a statement.

DB2 Connect Information (table view)
Shows key information about the selected DB2 Connect gateway.

Package Statistics (table view)
Provides details on the packages received at the DB2 Connect gateway.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

DB2 Messages Workspace
The DB2 Messages workspace displays messages that can help you identify problems with your DB2 system.

This workspace is comprised of the following views:

Critical DB2 Messages (table view)
Displays all critical DB2 messages and warning DB2 messages. Critical messages are highlighted in red and warning messages are highlighted in yellow.

Last 10 DB2 Messages (table view)
Displays the ten most recent DB2 messages. Critical messages are highlighted in red and warning messages are highlighted in yellow.

Note: Not all messages are written to the message log. DISPLAY commands, for example, are filtered out and are not shown in the log.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

Note: By default DB2 messages are not collected. If you want to collect DB2 messages, use the Configuration Tool and select: Monitoring Profile configuration –> Additional configuration settings. If you configure it to YES, the DB2 message subtask is started during DB2 instance initialization.

To start or stop DB2 message collection manually, specify the following:
F <cccccccc>, F PESERVER,F<db2>,,DB2MSGMON=<p>

where:
cccccccc
Identifies the OMEGAMON Collector started task name.

$db2$
Identifies the DB2 name.

$p$
Enter Y to start or N to stop the message subtask.

If you do not see any DB2 messages, check if the DB2 message subtask is started from the OMEGAMON Collector started task.

You can link to the following workspaces from the DB2 Messages workspace:
• Critical DB2 Messages by Message ID
• DB2 Messages by Time Interval
• DB2 Messages by Message ID

DB2 Messages by Message ID Workspace
The DB2 Messages by Message ID workspace displays DB2 messages sorted by message identification number.

This workspace is comprised of the following views:

DB2 Messages by Message ID (table view)
   Reports when the message was generated, the message identification number, and the message text.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

You can link to the following workspaces from the DB2 Messages by Message ID workspace:
• DB2 Messages
• DB2 Messages by Time Interval

DB2 Messages by Time Interval Workspace
The DB2 Messages by Time Interval workspace displays DB2 messages sorted by time. The most recent messages are at the top of the list.

This workspace is comprised of the following views:

DB2 Messages by Time Interval (table view)
   Reports when the message was generated, the message identification number, and the message text.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

You can link to the following workspaces from the DB2 Messages by Time Interval workspace:
• DB2 Messages
• DB2 Messages by Message ID

DBAT End-to-End SQL Monitoring Workspace
The DBAT End-to-End SQL Monitoring workspace provides summarized performance information about DDF (Distributed Data Facility) thread activity. From here you can launch to the Extended Insight Analysis Dashboard, which collects the various SQL statement executions and shows them in an aggregated view.

This workspace is comprised of the following views:

DDF DB Access Thread CPU% (bar chart)
   Shows the percentage of CPU that is used by distributed database access threads, which are server threads responding to SQL requests from a remote DB2 location.
DDF DB Access Thread In-DB2 CP CPU Time (bar chart)
Shows the class 2 CPU time (in DB2) that is used by distributed database access threads.

Distributed Database Access Thread Connection Summary (table view)
Provides the distributed database access threads connection summary. Click the End-to-End SQL Monitoring link to launch to the Extended Insight Analysis Dashboard.

Distributed Database Access Thread Summary (table view)
Provides key data to identify which distributed database access threads use resources excessively.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units:Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

You can link to the following Thread summary workspaces:
- “All Threads Connected to DB2 Workspace” on page 451
- “CICS Thread Summary Workspace” on page 479
- “Detailed Thread Exception Workspace” on page 554
- “Distributed Allied Thread Summary Workspace” on page 564
- “DBAT End-to-End SQL Monitoring Workspace” on page 544
- “Enclave Thread Summary Workspace” on page 677
- “IMS Thread Summary Workspace” on page 731
- “Lock Conflicts Workspace” on page 732
- “Thread Activity by Package Workspace” on page 803
- “Thread Activity by Plan Workspace” on page 803
- “Utility Jobs Workspace” on page 831

DDF Conversations Workspace
The DDF Conversations workspace presents conversation (connection between two transaction programs) information.

This workspace is comprised of the following view:

DDF Conversations (table view)
Lists conversation details, including IDs, counts, and maximums.

Note: This workspace is available only when the DB2 system is configured to use the distributed data facility.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

DDF Statistics Workspace
The DDF Statistics workspace monitors Distributed Database Facility (DDF) statistics, including send and receive counts.
This workspace is comprised of the following views:

**Send/Receive Counts (bar chart)**
Shows “at a glance” counts of SQL calls, messages, and transactions (received and sent).

**Distributed Thread Statistics (table view)**
Lists activity data associated with the DDF.

**Note:** This workspace is available for any thread defined as an allied-distributed thread.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**Detailed Thread Exception Workspace**
The Detailed Thread Exception workspace provides a detailed view of threads and thread exceptions connected to DB2.

This workspace is comprised of the following views:

**Locks owned (bar chart)**
Provides information about the number of locks owned by an individual thread.

**Detailed Thread Exceptions (table view)**
Lists “status” data for the activity of individual threads.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

You can link to the following Thread summary workspaces:
- "All Threads Connected to DB2 Workspace” on page 451
- “CICS Thread Summary Workspace” on page 479
- “Detailed Thread Exception Workspace” on page 554
- “Distributed Allied Thread Summary Workspace” on page 564
- “DBAT End-to-End SQL Monitoring Workspace” on page 544
- “Enclave Thread Summary Workspace” on page 677
- "IMS Thread Summary Workspace” on page 731
- “Lock Conflicts Workspace” on page 732
- “Thread Activity by Package Workspace” on page 803
- “Thread Activity by Plan Workspace” on page 803
- “Utility Jobs Workspace” on page 831

**Distributed Allied Thread Summary Workspace**
The Distributed Allied Thread Summary workspace provides summarized performance information about DDF (Distributed Data Facility) thread activity.
This workspace is comprised of the following views:

**DDF Allied Thread-Remote Elap Time (bar chart)**
Shows the remote elapsed time for the distributed allied threads that are used to issue SQL requests to a remote DB2 location.

**DDF Allied Thread-Remote CPU (bar chart)**
Shows the remote CPU for distributed allied threads.

**Distributed Allied Thread Summary (table view)**
Provides key data to identify which distributed allied threads use resources excessively.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

You can link to the following Thread summary workspaces:
- “All Threads Connected to DB2 Workspace” on page 451
- “CICS Thread Summary Workspace” on page 479
- “Detailed Thread Exception Workspace” on page 554
- “Distributed Allied Thread Summary Workspace” on page 564
- “DBAT End-to-End SQL Monitoring Workspace” on page 544
- “Enclave Thread Summary Workspace” on page 677
- “IMS Thread Summary Workspace” on page 731
- “Lock Conflicts Workspace” on page 732
- “Thread Activity by Package Workspace” on page 803
- “Thread Activity by Plan Workspace” on page 803
- “Utility Jobs Workspace” on page 831

**Distributed Thread Detail Workspace**
The Distributed Thread Detail workspace provides information about the VTAM APPC conversations and TCP/IP conversations of a distributed (DDF) thread.

This workspace is comprised of the following views:

**Thread ID (table view)**
Identifies the thread.

**Distributed VTAM APPC Conversations (table view)**
Shows the VTAM APPC conversations data of the thread if the thread is connected through VTAM APPC.

**Distributed TCP/IP Data (table view)**
Shows the TCP/IP data of the thread if the thread is connected through TCP/IP.

**Distributed Remote Location Summary (table view)**
Each row provides a SQL statistics summary for each remote DB2 location with which the thread has communicated, as a requester or a server.
You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**Distributed Thread SQL Statistics Workspace**
The Distributed Thread SQL Statistics workspace provides distributed SQL statistics for a remote DB2 location with which the distributed (DDF) thread has communicated, as a requester or a server.

This workspace is comprised of the following views:

**Thread ID (table view)**
Identifies the thread.

**Distributed VTAM APPC Conversations (table view)**
Shows the VTAM APPC conversations data of the thread if the thread is connected through VTAM APPC.

**Distributed TCP/IP Data (table view)**
Shows the TCP/IP data of the thread if the thread is connected through TCP/IP.

**Distributed SQL Statistics (table view)**
Shows SQL-related statistics for the selected remote DB2 location with which the thread has communicated, as a requester or a server.

**Send & Receive (table view)**
Shows send and receive data for the selected remote DB2 location with which the thread has communicated, as either a requester or a server.

**2-Phase Commit: Send & Receive (table view)**
Shows two-phase-commit-related send and receive data for the selected remote DB2 location with which the thread has communicated, as either a requester or a server.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**EDM Pool Workspace**
The EDM Pool workspace provides an overview of the Environmental Descriptor Manager (EDM) pool activity connected with DB2. The workspace layout depends on the DB2 version installed.

The EDM Pool workspace prior to DB2 10 is comprised of the following views:

**EDM Statistics (table view)**
Lists total counts, counts during the last sample period, and the "per second" count for a variety of tasks associated with the EDM pool.

**EDM Pool Load Activity Summary (bar chart view)**
Provides activity details of the EDM pool, including the number of pages dedicated to a type of pool usage and the percentage of the EDM pool dedicated to that type of usage.
EDM Pool Utilization (bar chart view)
- Shows the relative distribution of available pages, cursor table pages, database descriptor pages, and package table pages.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

Note: If DB2 10 is installed, click the navigation link EDM Pool (DB2 10) in the EDM Statistics view to open the “EDM Pool (DB2 10) Workspace” on page 676.

EDM Pool (DB2 10) Workspace
- The EDM Pool (DB2 10) workspace provides an overview of the Environmental Descriptor Manager (EDM) pool activity connected with DB2. You can view this information if DB2 10 is installed.

The EDM Pool (DB2 10) workspace is comprised of the following views:

EDM Statistics (table view)
- Lists total counts, counts during the last sample period, and the "per second" count for a variety of tasks associated with the EDM pool.

EDM Pool Load Activity Summary (bar chart view)
- Provides activity details of the EDM pool, including the number of pages dedicated to a type of pool usage and the percentage of the EDM pool dedicated to that type of usage.

EDM Pool Utilization (bar chart view)
- Shows the relative distribution of available pages, cursor table pages, database descriptor pages, and package table pages.

DBD Pool (table view)
- Lists information about database descriptors (DBDs).

DBD Pool Utilization (pie chart view)
- Shows information about the utilization of the database descriptor (DBD) pool.

PKG Search / STMT in Global Cache (table view)
- Lists information about package search and statement in global cache.

SKEL Pool (table view)
- Lists information about the EDM skeleton pool.

Statement Pool (table view)
- Lists information about the statements.

SKEL Pool Utilization (pie chart view)
- Shows information about the EDM skeleton pool.

Statement Pool Utilization (pie chart view)
- Shows information about the statements.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces
that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**Enclave Thread Summary Workspace**
The Enclave Thread Summary Workspace provides an overview of the activity of all threads that are connected to DB2 and are associated with an enclave token.

This workspace is comprised of the following views:

**Enclave Thread CPU% (bar chart)**
Shows the percentage of the CPU used by each thread that is associated with an enclave token.

**Enclave Thread Enclave CPU Time (bar chart)**
Shows the CPU time used by each thread that is associated with an enclave token.

**Enclave Thread Summary (table view)**
Provides an overview of the activity of all threads that are connected to DB2 and are associated with an enclave token.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

You can link to the following Thread summary workspaces:
- “All Threads Connected to DB2 Workspace” on page 451
- “CICS Thread Summary Workspace” on page 479
- “Detailed Thread Exception Workspace” on page 554
- “Distributed Allied Thread Summary Workspace” on page 564
- “DBAT End-to-End SQL Monitoring Workspace” on page 544
- “Enclave Thread Summary Workspace” on page 677
- “IMS Thread Summary Workspace” on page 731
- “Lock Conflicts Workspace” on page 732
- “Thread Activity by Package Workspace” on page 803
- “Thread Activity by Plan Workspace” on page 803
- “Utility Jobs Workspace” on page 831

**End-to-End SQL Monitoring Workspace**
The End-to-End SQL Monitoring workspace launches to the Extended Insight Analysis Dashboard for the selected subsystem.

The Extended Insight Analysis Dashboard collects the various SQL statement executions and shows them in an aggregated view. This view is updated every 1
minute. It does not display real-time snapshots. These SQL statements may be grouped using the application server, the end-user ID, end-user transaction name, or end-user workstation name.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

You can link to the following Thread summary workspaces:
- “All Threads Connected to DB2 Workspace” on page 451
- “CICS Thread Summary Workspace” on page 479
- “Detailed Thread Exception Workspace” on page 554
- “Distributed Allied Thread Summary Workspace” on page 564
- “DBAT End-to-End SQL Monitoring Workspace” on page 544
- “Enclave Thread Summary Workspace” on page 677
- “IMS Thread Summary Workspace” on page 731
- “Lock Conflicts Workspace” on page 732
- “Thread Activity by Package Workspace” on page 803
- “Thread Activity by Plan Workspace” on page 803
- “Utility Jobs Workspace” on page 831

**Global Lock Conflicts Workspace**
The Global Lock Conflicts workspace lets you view summary information about your enterprise.

This includes the number of:
- Lock conflicts, threads, and GBP connections
- Monitored databases for a data sharing group
- Monitored DB2 systems
- Object analysis databases

This workspace is comprised of the following views:

**Lock Elapsed Time in Seconds (bar chart)**
Shows the elapsed time in seconds.

**Local Lock Conflict Table View**
Shows more information about global locking conflicts.

Thread information is not available if the thread is owned by the other member of the data sharing group.

**Group Buffer Pool Workspace**
The DB2 Group Buffer Pool workspaces provide detailed coupling facility structure information about your group buffer pool (GBP) structures.

Using the Group Buffer Pool workspaces, you can:
Monitor structure utilization over a period of time
Verify the status of all connections to a structure

You must be running in a DB2 data sharing environment with the MVS/ESA Coupling Facility to take advantage of the DB2 Group Buffer Pools feature.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**Group Buffer Pool Connections Workspace:**

The Group Buffer Pool (GBP) Connections workspace displays connection status information for all connections to a specific group buffer pool structure.

Use this workspace to:
- Review the status of all connections to a structure
- Identify the operating system, together with the associated coupling facility name and job name

To investigate a nonactive connection, review the information provided in Accessing an OMEGAMON Host Session.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**Group Buffer Pool Detailed Statistics Workspace:**

Use the Group Buffer Pool (GBP) Detailed Statistics workspace to display group buffer pool statistics for a specific group buffer pool structure.

You can use data to monitor:
- The dynamic rebuild of a group buffer pool
- Castout paging and I/O activity

You can use the Tivoli Enterprise Portal terminal emulator adapter feature to access an OMEGAMON host session and view additional group buffer pool information.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**Group Buffer Pool Statistics Workspace:**

The Data Sharing Group Buffer Pool (GBP) Statistics workspace displays detailed information about the activity in a DB2 group buffer pool during the collection interval.

Using this workspace, you can:
- Monitor structure utilization over a period of time
- Verify the status of all connections to a structure
- Review GBP statistics for a data sharing group and GBP structure
You must be running in a DB2 data-sharing environment with MVS/ESA Coupling Facility to take advantage of the Data Sharing Group Buffer Pools Statistics feature.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**Group Buffer Pool Structures Workspace:**

You can use the Group Buffer Pool (GBP) Structures workspace to verify that your group buffer pool structures are active and to track structure utilization over a period of time.

Use the structure data on the workspace to:
- Monitor the read hit percent and buffer invalidate rate for group buffer pool structures
- Identify the number of DB2 subsystems using a group buffer pool
- Monitor the ratio of directory entries to data pages allocated

**Analyzing Group Buffer Pool Connections**

You can analyze a specific group buffer pool structure to view the connection status of all connections to the structure.

1. Right-click a structure name.
2. Click **Link to --> GBP Connections**.

The GBP Connections workspace is displayed showing the connection status details for your group buffer pool structure.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**Group Object Activity Database Workspace**

The Group Object Activity Database workspace displays information so that you can do a high-level analysis of getpage and I/O activity for a DB2 database.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**Group Object Analysis Workspace**

The DB2 Group Object Analysis workspaces provide detailed object analysis information about DB2 databases.

Using the Group Object Analysis workspaces, you can:
- Monitor and evaluate object allocation data for DB2 databases
- Evaluate and analyze space name allocation data for a specific DB2 database

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.
Group Object Analysis Thread Database Workspace:

The Group Object Analysis (GOA) Thread Database workspace displays information so that you can analyze which threads are generating I/O activity for a selected database.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

Group Object Analysis Thread Space Name Workspace:

The Group Object Analysis (GOA) Thread Space Name workspace displays information so that you can analyze which threads are generating I/O activity for the space name.

The workspace displays information for each thread that generated I/O activity to the space name during the collection interval.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

Group Object Analysis Thread Space Name Detail Workspace:

The Group Object Analysis (GOA) Thread Space Name Detail workspace displays detailed information about the threads that are generating I/O activity for the space name.

For example, for a space name, you can display the:
- Plan name
- Authorization ID
- Correlation ID
- DB2 ID

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

Group Object Analysis Volume Workspace:

The Group Object Analysis (GOA) Volume workspace displays information about the performance of volumes that contain DB2 objects so that you can monitor the DASD performance by volume.

The workspace displays only the volumes that contain DB2 objects that are allocated and available for use by DB2.

Using this table view, you can:
- Display the number of DB2 systems for the volume
- Monitor for volumes with a high utilization rate
- Determine the number of data sets and extents that are allocated

To display the view:
1. Right-click a volume name.
2. Click Link to followed by a specific Data Sharing workspace from the pop-up menu.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

*Group Object Analysis Volume Database Workspace:*

The Group Object Analysis (GOA) Volume Database workspace displays information you can use to analyze I/O activity for a single volume in a DB2 database.

The table view displays a row for each database that has I/O to the selected volume during the collection interval.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

*Group Object Analysis Volume Space Name Workspace:*

The Group Object Analysis (GOA) Volume Space Name workspace displays information that permits you to analyze I/O activity for a single volume for a DB2 database or space name.

The table view displays information for each space name in the selected database with I/O activity to the volume during the collection interval.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

*Group Object Analysis Volume Space Name Detail Workspace:*

The Group Object Analysis (GOA) Volume Space Name workspace displays detailed information for a single volume for a DB2 database or space name.

For each space name, you can display:

- The DB2 ID
- Information about the DB2 operations (such as the number of I/O reads and I/O writes)

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

*Group Object Analysis Volume Thread Workspace:*

The Group Object Analysis (GOA) Volume Thread workspace displays information you can use to analyze which threads are generating I/O activity for a single volume in a DB2 database.

The view shows information for each thread that generated I/O activity to the selected database during the collection interval.
Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

*Group Object Analysis Volume Thread Detail Workspace:*

The Group Object Analysis (GOA) Volume Thread Detail workspace displays detailed information about the DB2 threads that are generating I/O for the volume.

For each volume name, you can display the:
- Plan name
- Authorization ID
- Correlation ID
- DB2 ID

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

*Group Object Activity by Space Name:*

The Group Object Activity by Space Name workspace displays information about the getpage and I/O activity for spaces for a selected DB2 database.

The table view shows information about the spaces that have had getpage and I/O activity during the collection period.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

*Group Object Activity by Space Name Detail Workspace:*

The Group Object Activity by Space Name Detail workspace displays detailed information about the getpage and I/O activity for spaces for each DB2.

For example, for each space name, you can display:
- The DB2 ID
- Information about the DB2 operations, such as number of getpages and synchronous reads

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

*IMS Connections Workspace*

The IMS Connections workspace provides an overview of DB2 thread activity originating from connected IMS subsystems.

It provides information on a connection level about all IMS subsystems identified to DB2. This workspace is comprised of the following views:
IMS Connections (table view), which
Lists the number of active threads, unconnected regions, dependent regions currently connected to this DB2 system, and dependent regions defined for this IMS connection.

IMS Region Counts (bar chart)
Shows this information in a "graphic" form.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

IMS Region Information Workspace
The IMS Region Information workspace provides detailed status information for a specific IMS dependent region.

This workspace is comprised of the following view:

IMS Region Information (table view)
Lists region identification data and region status.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

IMS Thread Summary Workspace
The IMS Thread Summary workspace provides an overview for threads originating from connected IMS subsystems.

This workspace is comprised of the following views:

IMS Thread Summary (table view)
Shows summary information for the IMS threads.

In-DB2 CPU Time (bar chart)
Shows the class 2 CPU time (in DB2) for IMS threads.

In-DB2 Time (bar chart)
Shows the class 2 elapsed time (in DB2) for IMS threads.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

You can link to the following Thread summary workspaces:
- "All Threads Connected to DB2 Workspace" on page 451
- "CICS Thread Summary Workspace" on page 479
- "Detailed Thread Exception Workspace" on page 554
- "Distributed Allied Thread Summary Workspace" on page 564
- "DBAT End-to-End SQL Monitoring Workspace" on page 544
- "Enclave Thread Summary Workspace" on page 677
Installation Parameters
The Installation Parameters navigator item opens the DSNZPARM Thread Parameters workspace.

Select the Installation Parameters workspace to view information about DB2 parameters for a:
- Single DB2 subsystem
- Data sharing group (DSG)

DSG DSNZPARM Application Parameters Workspace:
The DSG DSNZPARM Application Parameters workspace for data sharing groups (DSG) shows information about the parameters that affect the default settings of the DB2 application.

This workspace is comprised of the following views:

DSNZPARM Module Information (table view)
Shows the name and the assembly date of the current, initial, and previous DSNZPARM module.

DSNTIPF - Application Default 1 (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries define application programming default values. These values are used as default values by the program preparation panels, the program preparation CLIST (DSNH), and the precompiler. These values can also be used as default values by other programs, such as DB2 QMF.

DSNTIP4 - Application Default 2 (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries define application programming default values. These values are used as default values by the program preparation panels, the program preparation CLIST (DSNH), and the precompiler. These values can also be used as default values by other programs, such as DB2 QMF.

DSNTIP4 - Application Default 3 (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries define application programming default values. These values are used as default values by the program preparation panels, the program preparation CLIST (DSNH), and the precompiler. These values can also be used as default values by other programs, such as DB2 QMF.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.
DSG DSNZP Archiving Parameters Workspace:

The DSG DSNZP Archiving Parameters workspace for data sharing groups (DSG) shows information about the parameters that affect DB2 archiving.

This workspace is comprised of the following views:

**DSNZPARCH Module Information (table view)**
Shows the name and the assembly date of the current, initial, and previous DSNZPARCH module.

**DSNTIPA - Archive Log Parameters (table view)**
Shows the DB2 field names, ZPARCH names, and the values set for each parameter. These entries define the characteristics of archive log data sets.

**DSNTIPH - System Resource (table view)**
Shows the DB2 field names, ZPARCH names, and the values set for each parameter. These entries specify the names of bootstrap data sets, active logs, and archive logs. These entries also specify the number of copies (1 for single logging or 2 for dual logging) for the active and archive logs.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

DSG DSNZPARCH Authorization, RLF, and DDF Parameters Workspace:

The DSG DSNZPARCH Authorization, RLF, and DDF Parameters workspace for data sharing groups (DSG) shows information about the parameters that affect DB2 access and security.

This workspace is comprised of the following views:

**DSNZPARCH Module Information (table view)**
Shows the name and the assembly date of the current, initial, and previous DSNZPARCH module.

**DSNTIPO - Operator Functions (table view)**
Shows the DB2 field names, ZPARCH names, and the values set for each parameter. These entries affect various operator functions. These functions include write-to-operator route codes, automatic recall, and the maximum amount of CPU time that is to be allocated for a dynamic SQL statement.

**DSNTIPP - Protection 1 (table view)**
Shows the DB2 field names, ZPARCH names, and the values set for each parameter. These entries define security information.

**DSNTIPP - Protection 2 (table view)**
Shows the DB2 field names, ZPARCH names, and the values set for each parameter. These entries define security information.

**DSNTIPR - DDF 1 (table view)**
Shows the DB2 field names, ZPARCH names, and the values set for each parameter.
parameter. These entries define the configuration options for the SYSIBM.USERNAMES encryption routine.

**DSNTIPR - DDF 2 (table view)**

Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries define the configuration options for the SYSIBM.USERNAMES encryption routine.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**DSG DSNZPARM Buffer Pool Parameters Workspace:**

The DSG DSNZPARM Buffer Pool Parameters workspace for data sharing groups (DSG) shows information about the parameters that affect DB2 buffer pool default settings.

This workspace is comprised of the following views:

- **DSNZPARM Module Information (table view)**
  Shows the name and the assembly date of the current, initial, and previous DSNZPARM module.

- **DSNTIP1 - Buffer Pools (table view)**
  Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries specify the size of your virtual buffer pools.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**DSG DSNZPARM Data Parameters Workspace:**

The DSG DSNZPARM Data Parameters workspace for data sharing groups (DSG) shows information about the data that affects the default settings of the DB2 application.

This workspace is comprised of the following views:

- **DSNZPARM Module Information (table view)**
  Shows the name and the assembly date of the current, initial, and previous DSNZPARM module.

- **DSNTIPA2 - Data (table view)**
  Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries define the name of the ICF catalog for DB2 VSAM
data sets and indicate whether to create the specified catalog. The entries also define z/OS Storage Management Subsystem (SMS) classes that are to be used when defining data sets for the DB2 catalog and directory.

**DSNTIPO3 - Default Startup (table view)**
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries define the default member names of certain modules that are to be loaded at DB2 startup. These modules are the system parameter module, the application default module, and the exit modules.

**DSNTIPM - MVS Parameters (table view)**
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries show the specifications for the DSNTIJMV job, which defines DB2 to z/OS and updates several PARMLIB members.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**DSG DSNZPARM Data Sharing Parameters Workspace:**

The DSG DSNZPARM Data Sharing Parameters workspace for data sharing groups (DSG) shows information about the data sharing installation parameters in the DSNZPARM module.

This workspace is comprised of the following views:

**DSNZPARM Module Information (table view)**
Shows the name and the assembly date of the current, initial, and previous DSNZPARM module.

**DSNTIPK - Data Sharing Parameters (table view)**
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries define the data sharing function (GROUP, MEMBER, or ENABLE).

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**DSG DSNZPARM Data Set and Database Parameters Workspace:**

The DSG DSNZPARM Data Set Parameters workspace for data sharing groups (DSG) shows information about the data set and database-related installation parameters in the DSNZPARM module.
This workspace is comprised of the following views:

DSNZP Module Information (table view)
Shows the name and the assembly date of the current, initial, and previous DSNZP module.

DSNTIP7 - SQL Object Defaults 1 (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries define default values for the system-required objects that DB2 creates automatically. DB2 uses these options for any indexes or table spaces that it implicitly creates. The remaining fields provide general default settings for creating table spaces.

DSNTIP71 - SQL Object Defaults 2 (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries define default values for the system-required objects that DB2 creates automatically. DB2 uses these options for any indexes or table spaces that it implicitly creates. The remaining fields provide general default settings for creating table spaces.

DSNTIP9 - Workfile Database (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries configure the 4 KB and 32 KB page size table spaces in the DB2 Workfile Database.

DSNTIPS - Auto Start DB/TS (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries show the databases, table spaces, and index spaces to restart automatically when you start DB2.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

DSG DSNZP DDCS Parameters Workspace:

The DSG DSNZP DDCS Data Definition Control Support (DDCS) Parameters workspace for data sharing groups (DSG) shows information about the DDCS installation parameters in the DSNZP module.

This workspace is comprised of the following views:

DSNZP Module Information (table view)
Shows the name and the assembly date of the current, initial, and previous DSNZP module.

DSNTIPZ - Data Definition Control (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries define the data definition control support.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli
Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**DSG DSNZPARM IRLM Parameters Workspace:**

The DSG DSNZPARM Internal Resource Lock Manager (IRLM) Parameters workspace for data sharing groups (DSG) shows information about the IRLM with which DB2 communicates.

This workspace is comprised of the following views:

**DSNZPARAM Module Information (table view)**
Shows the name and the assembly date of the current, initial, and previous DSNZPARAM module.

**DSNTIPI - IRLM 1 (table view)**
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries affect the installation of the internal resource lock manager (IRLM).

**DSNTIPI - IRLM 2 (table view)**
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries affect the installation of the internal resource lock manager (IRLM).

**DSNTIPI - IRLM Processing Parms (table view)**
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries define the IRLM processing parameters.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**DSG DSNZPARM Logging Parameters Workspace:**

The DSG DSNZPARM Logging Parameters workspace for data sharing groups (DSG) shows information about the parameters that affect DB2 logging.

This workspace is comprised of the following views:

**DSNZPARAM Module Information (table view)**
Shows the name and the assembly date of the current, initial, and previous DSNZPARAM module.

**DSNTIPL - Active Log Parms (table view)**
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries define characteristics of active log data sets.
DSNTIPL1 - Checkpoint Parameters (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries define characteristics for log checkpoints.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

DSG DSNZPARM Other System Parameters Workspace:
The DSG DSNZPARM Other System Parameters workspace for data sharing groups (DSG) shows information about the other system parameters invoked by SQL CALL statements.

This workspace is comprised of the following views:

DSNZPARM Module Information (table view)
Shows the name and the assembly date of the current, initial, and previous DSNZPARM module.

From DSN6SYSP (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries show the subsystem parameters that are associated with the DSN6SYSP macro.

From DSN6SPRM1 (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries show the subsystem parameters that are associated with the DSN6SPRM macro.

From DSN6SPRM2 (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries show the subsystem parameters that are associated with the DSN6SPRM macro.

From DSN6LOGP (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries show the subsystem parameters that are associated with the DSN6LOGP macro.

From DSN6ARVP (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries show the subsystem parameters that are associated with the DSN6ARVP macro.

From DSN6FAC (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries show the data-only subsystem parameters that are provided with the DSN6FAC macro.

From DSNHDECP (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter.
parameter. These entries show the parameters of the application default load module DSNHDECP which is generated as part of the DB2 installation or migration.

**Others (table view)**
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries show the subsystem parameters that are associated with the other system parameters.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**DSG DSNZPARAM Performance and Optimization Parameters Workspace:**
The DSG DSNZPARAM Performance and Optimization Parameters workspace for data sharing groups (DSG) shows information about the installation parameters for performance and optimization invoked by SQL CALL statements.

This workspace is comprised of the following views:

**DSNZPARAM Module Information (table view)**
Shows the name and the assembly date of the current, initial, and previous DSNZPARAM module.

**DSNTIP8 - Performance and Optimization 1 (table view)**
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries set the application programming default values pertaining to performance and optimization.

**DSNTIP81 - Performance and Optimization 2 (table view)**
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries set the application programming default values pertaining to performance and optimization.

**DSNTIP82 - Query Accelerator Ref (table view)**
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries show the performance and optimization parameters for query accelerators.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.
DSG DSNZPARM Storage and Size Parameters Workspace:

The DSG DSNZPARM Storage and Size Parameters workspace for data sharing groups (DSG) shows virtual storage allocations for the DB2 buffer pools and the Environmental Descriptor Manager (EDM) pool.

This workspace is comprised of the following views:

**DSNZPARM Module Information (table view)**
- Shows the name and the assembly date of the current, initial, and previous DSNZPARM module.

**DSNTIPC - Storage Sizes (table view)**
- Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries show the messages that the installation CLIST issues to indicate calculated storage sizes.

**DSNTIPD - Sizes (table view)**
- Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries show the size of the DB2 catalog, directory, and log data sets. They also define the amount of storage that can be used for storing large object (LOB) values.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

DSG DSNZPARM Stored Procedures Parameters Workspace:

The DSG DSNZPARM Stored Procedures Parameters workspace for data sharing groups (DSG) shows information about the installation parameters in the DSNZPARM module for stored procedures invoked by SQL CALL statements.

This workspace is comprised of the following views:

**DSNZPARM Module Information (table view)**
- Shows the name and the assembly date of the current, initial, and previous DSNZPARM module.

**DSNTIPX - Routine Parameters (table view)**
- Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries are used to start the stored procedures address space so that it can run stored procedures or user-defined functions.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.
DSG DSNZP ARM Thread Parameters Workspace:

The DSG DSNZP ARM Thread Parameters workspace for data sharing groups (DSG) shows information about the DB2 system-related installation parameters in the DSNZP ARM module.

This workspace is comprised of the following views:

**DSNZP ARM Module Information (table view)**
- Shows the name and the assembly date of the current, initial, and previous DSNZP ARM module.

**DSNTIPE - Thread Management 1 (table view)**
- Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries determine the main storage sizes.

**DSNTIPE1 - Thread Management 2 (table view)**
- Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries determine the main storage sizes.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

DSG DSNZP ARM Trace Parameters Workspace:

The DSG DSNZP ARM Trace Parameters workspace for data sharing groups (DSG) shows information about the automatic startup of traces in DB2.

This workspace is comprised of the following views:

**DSNZP ARM Module Information (table view)**
- Shows the name and the assembly date of the current, initial, and previous DSNZP ARM module.

**DSNTIPN - Trace Parameters (table view)**
- Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries affect the audit, global, accounting, and monitor traces and the checkpoint frequency.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.
DSG DSNZPARM Utility Parameters Workspace:

The DSG DSNZPARM Utility Parameters workspace for data sharing groups (DSG) shows information about the utility parameters invoked by SQL CALL statements.

This workspace is comprised of the following views:

**DSNZPARM Module Information (table view)**
Shows the name and the assembly date of the current, initial, and previous DSNZPARM module.

**DSNTP6 - Utility Parms 1 (table view)**
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries configure the default behavior of enhancements to the BACKUP SYSTEM, RESTORE SYSTEM, RECOVER, and other utilities.

**DSNTP6 - Utility Parms 2 (table view)**
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries configure the default behavior of enhancements to the BACKUP SYSTEM, RESTORE SYSTEM, RECOVER, and other utilities.

**DSNTP6 - Utility Parms 3 (table view)**
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries configure the default behavior of enhancements to the BACKUP SYSTEM, RESTORE SYSTEM, RECOVER, and other utilities.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

DSNZPARM Application Parameters Workspace:

The DSNZPARM Application Parameters workspace shows information about the parameters that affect the default settings of the DB2 application.

This workspace is comprised of the following views:

**DSNZPARM Module Information (table view)**
Shows the name and the assembly date of the current, initial, and previous DSNZPARM module.

**DSNTPF - Application Default 1 (table view)**
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries define application programming default values. These values are used as default values by the program preparation panels, the program preparation CLIST (DSNH), and the precompiler. These values can also be used as default values by other programs, such as DB2 QMF.

**DSNTP4 - Application Default 2 (table view)**
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries define application programming default values. These values are used as default values by the program preparation panels, the program preparation CLIST (DSNH), and the precompiler. These values can also be used as default values by other programs, such as DB2 QMF.
DSNTIP4 - Application Default 3 (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries define application programming default values. These values are used as default values by the program preparation panels, the program preparation CLIST (DSNH), and the precompiler. These values can also be used as default values by other programs, such as DB2 QMF.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

DSNZPARAM Archiving Parameters Workspace:

The DSNZPARAM Archiving Parameters workspace shows information about the parameters that affect DB2 archiving.

This workspace is comprised of the following views:

DSNZPARAM Module Information (table view)
Shows the name and the assembly date of the current, initial, and previous DSNZPARAM module.

DSNTIPA - Archive Log Parameters (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries define the characteristics of archive log data sets.

DSNTIPH - System Resource (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries specify the names of bootstrap data sets, active logs, and archive logs. These entries also specify the number of copies (1 for single logging or 2 for dual logging) for the active and archive logs.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

DSNZPARAM Authorization, RLF, and DDF Parameters Workspace:

The DSNZPARAM Authorization, RLF, and DDF Parameters workspace shows information about the parameters that affect DB2 access and security.

This workspace is comprised of the following views:

DSNZPARAM Module Information (table view)
Shows the name and the assembly date of the current, initial, and previous DSNZPARAM module.
**DSNTIPO - Operator Functions (table view)**
Shows the DB2 field names, ZP ARM names, and the values set for each parameter. These entries affect various operator functions. These functions include write-to-operator route codes, automatic recall, and the maximum amount of CPU time that is to be allocated for a dynamic SQL statement.

**DSNTIPP - Protection 1 (table view)**
Shows the DB2 field names, ZP ARM names, and the values set for each parameter. These entries define security information.

**DSNTIPP - Protection 2 (table view)**
Shows the DB2 field names, ZP ARM names, and the values set for each parameter. These entries define security information.

**DSNTIPR - DDF 1 (table view)**
Shows the DB2 field names, ZP ARM names, and the values set for each parameter. These entries define the configuration options for the SYSIBM.USERNAMES encryption routine.

**DSNTIPR - DDF 2 (table view)**
Shows the DB2 field names, ZP ARM names, and the values set for each parameter. These entries define the configuration options for the SYSIBM.USERNAMES encryption routine.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**DSNZPARM Buffer Pool Parameters Workspace:**

The DSNZPARM Buffer Pool Parameters workspace shows information about the parameters that affect DB2 buffer pool default settings.

This workspace is comprised of the following views:

**DSNZPARM Module Information (table view)**
Shows the name and the assembly date of the current, initial, and previous DSNZPARM module.

**DSNTIP1 - Buffer Pools (table view)**
Shows the DB2 field names, ZP ARM names, and the values set for each parameter. These entries specify the size of your virtual buffer pools.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.
**DSNZP ARM Data Parameters Workspace:**

The DSNZP ARM Data Parameters workspace shows information about the data that affects the default settings of the DB2 application.

This workspace is comprised of the following views:

**DSNZP ARM Module Information (table view)**
Shows the name and the assembly date of the current, initial, and previous DSNZP ARM module.

**DSNTIP A2 - Data (table view)**
Shows the DB2 field names, ZP ARM names, and the values set for each parameter. These entries define the name of the ICF catalog for DB2 VSAM data sets and indicate whether to create the specified catalog. The entries also define z/OS Storage Management Subsystem (SMS) classes that are to be used when defining data sets for the DB2 catalog and directory.

**DSNTIPO3 - Default Startup (table view)**
Shows the DB2 field names, ZP ARM names, and the values set for each parameter. These entries define the default member names of certain modules that are to be loaded at DB2 startup. These modules are the system parameter module, the application default module, and the exit modules.

**DSNTIPM - MVS Parameters (table view)**
Shows the DB2 field names, ZP ARM names, and the values set for each parameter. These entries show the specifications for the DSNTIJMV job, which defines DB2 to z/OS and updates several PARMLIB members.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**DSNZP ARM Data Sharing Parameters Workspace:**

The DSNZP ARM Data Sharing Parameters workspace shows information about the data sharing installation parameters in the DSNZP ARM module.

This workspace is comprised of the following views:

**DSNZP ARM Module Information (table view)**
Shows the name and the assembly date of the current, initial, and previous DSNZP ARM module.

**DSNTI PK - Data Sharing Parameters (table view)**
Shows the DB2 field names, ZP ARM names, and the values set for each parameter. These entries define the data sharing function (GROUP, MEMBER, or ENABLE).

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli
Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**DSNZPARM Data Set and Database Parameters Workspace:**

The DSNZPARM Data Set Parameters workspace shows information about the data set and database-related installation parameters in the DSNZPARM module.

This workspace is comprised of the following views:

**DSNZPARM Module Information (table view)**
- Shows the name and the assembly date of the current, initial, and previous DSNZPARM module.

**DSNTIP7 - SQL Object Defaults 1 (table view)**
- Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries define default values for the system-required objects that DB2 creates automatically. DB2 uses these options for any indexes or table spaces that it implicitly creates. The remaining fields provide general default settings for creating table spaces.

**DSNTIP71 - SQL Object Defaults 2 (table view)**
- Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries define default values for the system-required objects that DB2 creates automatically. DB2 uses these options for any indexes or table spaces that it implicitly creates. The remaining fields provide general default settings for creating table spaces.

**DSNTIP9 - Workfile Database (table view)**
- Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries configure the 4 KB and 32 KB page size table spaces in the DB2 Workfile Database.

**DSNTIPS - Auto Start DB/TS (table view)**
- Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries show the databases, table spaces, and index spaces to restart automatically when you start DB2.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**DSNZPARM DDCS Parameters Workspace:**

The DSNZPARM Data Definition Control Support (DDCS) Parameters workspace shows information about the DDCS installation parameters in the DSNZPARM module.

This workspace is comprised of the following views:
DSNZPARM Module Information (table view)
Shows the name and the assembly date of the current, initial, and previous DSNZPARM module.

DSNTIPZ - Data Definition Control (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries define the data definition control support.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

DSNZPARM IRLM Parameters Workspace:

The DSNZPARM Internal Resource Lock Manager (IRLM) Parameters workspace shows information about the IRLM with which DB2 communicates.

This workspace is comprised of the following views:

DSNZPARM Module Information (table view)
Shows the name and the assembly date of the current, initial, and previous DSNZPARM module.

DSNTIPI - IRLM 1 (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries affect the installation of the internal resource lock manager (IRLM).

DSNTIPI - IRLM 2 (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries affect the installation of the internal resource lock manager (IRLM).

DSNTIPI - IRLM Processing Parms (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries define the IRLM processing parameters.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

DSNZPARM Logging Parameters Workspace:

The DSNZPARM Logging Parameters workspace shows information about the parameters that affect DB2 logging.

This workspace is comprised of the following views:
DSNZPARM Module Information (table view)
Shows the name and the assembly date of the current, initial, and previous DSNZPARM module.

DSNTIPL - Active LogParms (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries define characteristics of active log data sets.

DSNTIPL1 - Checkpoint Parameters (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries define characteristics for log checkpoints.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

DSNZPARM Other System Parameters Workspace:

The DSNZPARM Other System Parameters workspace shows information about the other system parameters invoked by SQL CALL statements.

This workspace is comprised of the following views:

DSNZPARM Module Information (table view)
Shows the name and the assembly date of the current, initial, and previous DSNZPARM module.

From DSN6SYSP (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries show the subsystem parameters that are associated with the DSN6SYSP macro.

From DSN6SPRM1 (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries show the subsystem parameters that are associated with the DSN6SPRM macro.

From DSN6SPRM2 (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries show the subsystem parameters that are associated with the DSN6SPRM macro.

From DSN6LOGP (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries show the subsystem parameters that are associated with the DSN6LOGP macro.

From DSN6ARVP (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries show the subsystem parameters that are associated with the DSN6ARVP macro.
From DSN6FAC (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries show the data-only subsystem parameters that are provided with the DSN6FAC macro.

From DSNHDECP (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries show the parameters of the application default load module DSNHDECP which is generated as part of the DB2 installation or migration.

Others (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries show the subsystem parameters that are associated with the other system parameters.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

DSNZPARM Performance and Optimization Parameters Workspace:

The DSNZPARM Performance and Optimization Parameters workspace shows information about the installation parameters for performance and optimization invoked by SQL CALL statements.

This workspace is comprised of the following views:

DSNZPARM Module Information (table view)
Shows the name and the assembly date of the current, initial, and previous DSNZPARM module.

DSNTIP8 - Performance and Optimization 1 (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries set the application programming default values pertaining to performance and optimization.

DSNTIP81 - Performance and Optimization 2 (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries set the application programming default values pertaining to performance and optimization.

DSNTIP82 - Query Accelerator Ref (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries show the performance and optimization parameters for query accelerators.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.
Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**DSNZPARM Storage and Size Parameters Workspace:**

The DSNZPARM Storage and Size Parameters workspace shows virtual storage allocations for the DB2 buffer pools and the Environmental Descriptor Manager (EDM) pool.

This workspace is comprised of the following views:

**DSNZPARM Module Information (table view)**
- Shows the name and the assembly date of the current, initial, and previous DSNZPARM module.

**DSNTIPC - Storage Sizes (table view)**
- Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries show the messages that the installation CLIST issues to indicate calculated storage sizes.

**DSNTIPD - Sizes (table view)**
- Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries show the size of the DB2 catalog, directory, and log data sets. They also define the amount of storage that can be used for storing large object (LOB) values.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**DSNZPARM Stored Procedures Parameters Workspace:**

The DSNZPARM Stored Procedures Parameters workspace shows information about the installation parameters in the DSNZPARM module for stored procedures invoked by SQL CALL statements.

This workspace is comprised of the following views:

**DSNZPARM Module Information (table view)**
- Shows the name and the assembly date of the current, initial, and previous DSNZPARM module.

**DSNTIPX - Routine Parameters (table view)**
- Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries are used to start the stored procedures address space so that it can run stored procedures or user-defined functions.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.
Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**DSNZPARM Thread Parameters Workspace:**

The DSNZPARM Thread Parameters workspace shows information about the DB2 system-related installation parameters in the DSNZPARM module.

This workspace is comprised of the following views:

- **DSNZPARM Module Information (table view)**
  Shows the name and the assembly date of the current, initial, and previous DSNZPARM module.

- **DSNTIPE - Thread Management 1 (table view)**
  Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries determine the main storage sizes.

- **DSNTIPE1 - Thread Management 2 (table view)**
  Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries determine the main storage sizes.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**DSNZPARM Trace Parameters Workspace:**

The DSNZPARM Trace Parameters workspace shows information about the automatic startup of traces in DB2.

This workspace is comprised of the following views:

- **DSNZPARM Module Information (table view)**
  Shows the name and the assembly date of the current, initial, and previous DSNZPARM module.

- **DSNTIPN - Trace Parameters (table view)**
  Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries affect the audit, global, accounting, and monitor traces and the checkpoint frequency.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.
DSNZP Utility Parameters Workspace:

The DSNZP Utility Parameters workspace shows information about the utility parameters invoked by SQL CALL statements.

This workspace is comprised of the following views:

**DSNZP Module Information (table view)**
Shows the name and the assembly date of the current, initial, and previous DSNZP module.

**DSNTIP6 - Utility Parms 1 (table view)**
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries configure the default behavior of enhancements to the BACKUP SYSTEM, RESTORE SYSTEM, RECOVER, and other utilities.

**DSNTIP6 - Utility Parms 2 (table view)**
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries configure the default behavior of enhancements to the BACKUP SYSTEM, RESTORE SYSTEM, RECOVER, and other utilities.

**DSNTIP6 - Utility Parms 3 (table view)**
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries configure the default behavior of enhancements to the BACKUP SYSTEM, RESTORE SYSTEM, RECOVER, and other utilities.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**Lock Conflicts Workspace**

The Lock Conflicts workspace provides an overview of the DB2 database lock conflicts.

This workspace is comprised of the following views:

**Lock Elapsed Time in Seconds (bar chart)**
Shows the elapsed time in seconds.

**Local Lock Conflicts (table view)**
Shows more information about local locking conflicts.

Thread information is not available if the thread is owned by the other member of the data sharing group.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation.
Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

You can link to the following Thread summary workspaces:

- “All Threads Connected to DB2 Workspace” on page 451
- “CICS Thread Summary Workspace” on page 479
- “Detailed Thread Exception Workspace” on page 554
- “Distributed Allied Thread Summary Workspace” on page 564
- “DBAT End-to-End SQL Monitoring Workspace” on page 544
- “Enclave Thread Summary Workspace” on page 677
- “IMS Thread Summary Workspace” on page 731
- “Lock Conflicts Workspace” on page 732
- “Thread Activity by Package Workspace” on page 803
- “Thread Activity by Plan Workspace” on page 803
- “Utility Jobs Workspace” on page 831

Log Manager Workspace

The Log Manager workspace provides an overview of the DB2 log manager active logging and archiving activity.

This workspace is comprised of the following views:

Archive in Progress (table view)
Shows details associated with the log data sets of the current archiving activity.

Data Set Utilization (linear gauge chart view)
Indicates the percent of the current data set that is in use.

Log Manager Statistics (table view)
Lists total counts, counts during the last sample period, and the "per second" count for a variety of reads, writes, and allocations associated with DB2 SRM log management.

Log Manager Summary (table view)
Shows details associated with logging and archiving activity.

Primary Data Set (table view)
Shows details associated with the data sets of the primary log activity

Secondary Data Set (table view)
Shows details associated with the data sets of the secondary log activity.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.
MVS Storage Above 2 GB Workspace
The MVS Storage Above 2 GB workspace provides an overview of MVS storage above the 2 GB bar. It shows information about storage allocation within the DBM1 address space. You can view this information if DB2 10 is installed.

This workspace is comprised of the following views:
- MVS Storage Above 2 GB (table view)
- MVS Storage Above 2 GB (bar chart view)
- DBM1 MVS Storage above 2 GB (table view)
- Real and Auxiliary Storage (table view)

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

You can use the navigation links in the MVS Storage Above 2 GB view to open:
- “MVS Storage Below 2 GB Workspace” on page 750
- “Common Storage Workspace” on page 480

MVS Storage Below 2 GB Workspace
The MVS Storage Below 2 GB workspace provides an overview of MVS storage below the 2 GB bar. It shows information about storage allocation within the DBM1 address space. You can view this information if DB2 10 is installed.

This workspace is comprised of the following views:
- MVS Storage Below 2 GB (table view)
- MVS Storage Below 2 GB (bar chart view)
- MVS Storage (table view)
- DBM1 MVS Storage Below 2 GB (table view)
- System Storage Engines and Thread Information (table view)
- DB2 IRLM Storage (table view) shows the usage of IRLM storage (DB2 11 or later)

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

You can use the navigation links in the MVS Storage view to open:
- “MVS Storage Above 2 GB Workspace” on page 750
- “Common Storage Workspace” on page 480

Object Analysis Database Workspace
The Object Analysis Database workspace provides a global view of object allocation data for a specific data sharing group.

A consolidated list of DB2 databases is displayed on the table in ascending order by database name. Your view may sort differently if you have changed the sort field or sort order.

Use this view to:
- Evaluate DB2 database object allocations
- Track object allocation data over a period of time
• Analyze space name allocation data for a specific DB2 database

The Object Analysis Database table view only displays databases that contain spaces currently allocated to the DB2 subsystems that are part of the data sharing group you are monitoring.

**Note:** The Event Manager for Object Analysis must be active to allow object analysis data to be collected.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**Object Analysis Space Name Workspace:**

The Object Analysis Space Name workspace displays space name allocation data for a specific DB2 database.

Use this workspace to evaluate and analyze the space name allocation data that a specific DB2 database owns.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**Object Analysis Space Name Detail Workspace:**

The Object Analysis Space Name Detail workspace displays detail object analysis data for each DB2 object space in a DB2 database.

Use this workspace to evaluate and analyze space name allocation data for each DB2 object space in a DB2 database.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**Overall Transaction Data Workspace**

The Overall Transaction Data workspace provides information about the Database Connection Services (DCS) application at the transaction level.

This workspace is comprised of the following views:

**Application - Network (bar chart)**

Shows the number of data transmissions between the DB2 Connect gateway and the host database and the number of bytes sent between the client application, the DB2 Connect gateway, and the host database. This view enables you to measure the throughput between the client and the DB2 Connect gateway and between the DB2 Connect gateway and the host database.

**Application - SQL Statement (bar chart)**

Shows the number of SQL, SQL COMMIT, and SQL ROLLBACK statements that have been attempted and the number of SQL statements that have been attempted but have failed. This view enables you to measure the database activity for the DCS application.
Thread/Application ID (table view)
Identifies the thread and the DCS application.

Last Reset and Connect Timestamp (table view)
Shows when the monitor counters were reset for the application issuing the GET SNAPSHOT and when the first connection to the host database was initiated from the DB2 Connect gateway.

Network & Times (table view)
Provides details about the throughput, and the times for data transmissions, between the client application, the DB2 Connect gateway, and the host database.

Unit of Work (table view)
Provides details about the SQL statements and units of work performed.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

Package Statistics Workspace
The Package Statistics workspace provides information about the size of the data exchanged between the DB2 Connect gateway and the host database and about the network time required.

It enables you to measure the throughput between the host database and the DB2 Connect gateway and gives you a better idea of the database activity and network traffic at the application level.

This workspace is comprised of the following views:

Thread/Application ID (table view)
Identifies the thread and the Database Connection Services (DCS) application.

Outbound Data (table view)
Shows the number of bytes exchanged between the host database and the DB2 Connect gateway during the processing of statements.

Network Time (table view)
Shows how many statements required which network time. The network time is the difference between the host response time and the elapsed execution time for a statement.

Data Sent (table view)
Shows how many packages of a certain size were sent from the DB2 Connect gateway to the host database.

Data Received (table view)
Shows many packages of a certain size were sent from the host database to the DB2 Connect gateway.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

Performance Workspace
The Performance workspace shows the information obtained by running a sample SQL statement between the DB2 Connect gateway and the host database. It enables you to detect any bottlenecks.
This workspace is comprised of the following views:

**DB2 Connect Server - SQL Statement Time (pie chart)**
Shows the distribution of the various amounts of time required to process the sample SQL statement.

**DB2 Connect Information (table view)**
Shows key information about the selected DB2 Connect gateway.

**Time for Sample SQL Statement (table view)**
Shows the various amount of time required to process the sample SQL statement.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**SQL Counts 1 Workspace**
The SQL Counts 1 workspace provides information about SQL DCL (Data Control Language) declarations, SQL DDL (Data Definition Language) statements, and SQL DML (Data Manipulation Language) statements.

This workspace is comprised of the following views:

**DML (table view)**
Provides information on SQL DML (Data Manipulation Language) statements.

**DCL (table view)**
Provides information on DCL (Data Control Language) declarations.

**DDL Create (table view)**
Provides information on SQL DDL (Data Definition Language) statements for Create.

**DDL Drop (table view)**
Provides information on SQL DDL (Data Definition Language) statements for Drop.

**DDL Alter / Rename (table view)**
Provides information on SQL DDL (Data Definition Language) statements for Alter / Rename.

**Note:** Each table view provides the following information:

**Information**

**Description**

<table>
<thead>
<tr>
<th></th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total</td>
<td>The total counts since the last sample period.</td>
</tr>
<tr>
<td>Delta</td>
<td>The changes since the last sample period.</td>
</tr>
<tr>
<td>Rate</td>
<td>The number of requests per second over the last sampling interval.</td>
</tr>
</tbody>
</table>

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**SQL Counts 2 Workspace**
The SQL Counts 2 workspace provides information about stored procedures, User-defined functions, triggers, direct row access, parallelism, RID pool access, and prepare statements.
This workspace is comprised of the following views:
- Stored Procedures
- User-defined functions
- Triggers
- Direct row access
- Parallelism
- RID Pool Access
- Prepare Statements.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**SQL Counts 3 Workspace**
The SQL Counts 3 workspace provides information about currently committed rows, multi-row processing, workfile storage, and concentrate statements.

This workspace is comprised of the following views:

**Use Currently Committed**
Shows, for the selected thread, the number of rows for currently committed data that is skipped or accessed by read transactions when processing a DB2 application.

**Multi-Row Processing**
Enables you to track performance improvements such as multi-row fetch and multi-row insert.

**Workfile Storage**
Shows the statistics on the usage and storage of DB2 workfiles.

**Concentrate Statements**
Indicates if literal constants, which are referenced in dynamic SQL statements, are replaced with special markers so that these constants are not cached with the statement in the dynamic SQL statement cache.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**Statement Information Workspace**
The Statement Information workspace provides information about the SQL statement that was last performed by the Database Connection Services (DCS) application.

It enables you to measure the throughput between the client application, the DB2 Connect gateway, and the host database and to measure the times required for processing an SQL statement.

This workspace is comprised of the following views:

**Application - Network (bar chart)**
Shows the number of data transmissions between the DB2 Connect gateway and the host database and the number of bytes sent between the client, the DB2 Connect gateway, and the host database.
Thread/Application ID (table view)
Identifies the thread and the DCS application.

Statement Information (table view)
Provides information about the SQL statement that was last performed by the DCS application.

Time (table view)
Shows the times required for processing an SQL statement.

Network Statistics (table view)
Shows the number of bytes exchanged between the client application, the DB2 Connect gateway, and the host database.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

Storage Consumption Workspace
The Storage Consumption workspace provides an overview of DB2 DBM1 virtual storage, MVS storage and real storage.

This workspace is comprised of the following views:

Key Indicators (table view)
Shows the average size of the thread footprint and the projected maximum number of threads that you can run with the current storage configuration.

DBM1 Storage below 2 GB with Cushion (table view)
Shows the amount of virtual storage below 2 GB that is used by the DBM1 address space.

DBM1 Storage below 2 GB with Cushion (bar chart)
Shows the amount of virtual storage below 2 GB that is used by the DBM1 address space.

MVS Storage (table view)
Shows the amount of storage used by MVS.

MVS Storage (bar chart)
Shows the amount of storage used by MVS.

Real Storage (table view)
Shows the amount of real storage used by the main storage device and by the auxiliary storage device.

Real Storage (bar chart view)
Shows the amount of real storage used by the main storage device and by the auxiliary storage device.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.
You can link to one of the following workspaces from the DBM1 Storage Consumption workspace. In your workspace, you will only see the link that corresponds to the version of DB2 that you are monitoring.

- If DB2 10 is installed, click the navigation link DB2 10 MVS Storage in the EDM Statistics view to open the “MVS Storage Below 2 GB Workspace” on page 750 workspace.

**Subsystem Management Workspace**

The Subsystem Management workspace provides an overview of workload related information about the DB2 subsystem that you are monitoring.

This workspace is comprised of the following views:

**Background Utilization (needle gauge)**
- Shows the percentage of available threads being used for background connections.

**Foreground Utilization (needle gauge)**
- Shows the percentage of available threads being used for foreground connections.

**Subsystem Management Statistics (table view)**
- Lists total counts, counts during the last sample period, and the “per second” count for a variety of subsystem requests, abends, and thread statuses associated with the System Resource Manager (SRM) system.

**Subsystem Management Summary (table view)**
- Lists thread availability and usage statistics for foreground and background connections.

**Thread Events Approaching Max (bar chart view)**
- Shows the utilization of the thread events for foreground and background connections.

**Thread Events High Water Mark (bar chart view)**
- Shows the high-water marks for thread events for foreground and background connections.

**Thread Events (bar chart view)**
- Shows information on the thread events for foreground and background connections.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**System Status Workspace**

The System Status workspace reflects the health of your DB2 system.

This workspace is comprised of the following views:

**System Key Events (table view)**
- Shows the system key events.
System Key Events (bar chart)
Shows the system key events.

DDF Send Rate (needle gauge)
Reports the send rate of the Distributed Data Facility (DDF).

DDF Receive Rate (needle gauge)
Reports the receive rate of the Distributed Data Facility (DDF).

Thread Events Approaching Max (bar chart view)

EDM Utilization (needle gauge)
Reports the number of current EDM pages divided by total EDM pages for DB2 9 or below. For DB2 10 or later, it reports the number of current DBD pages divided by total DBD pages.

DBAT Wait Percent (needle gauge)
Shows the percentage of threads that are waiting for database services.

System State Information (table view)
Provides activity and performance details of your DB2 system.

Operating System CPU (table view)
Provides CPU information about the operating system.

Operating System CPU Utilization (bar chart)
Provides CPU information about the operating system.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

Tasks List Workspace
The Tasks List workspace provides statistics about the processes at the selected DB2 Connect gateway, such as the CPU and the working set. It enables you to determine if the DB2 Connect gateway is overloaded by DB2 Connect or any other allocation application.

This workspace is comprised of the following views:

DB2 Connect Server - Process Memory Usage (bar chart)
Shows the current working set of a process. The current working set is the number of pages that are currently resident in memory.

DB2 Connect Information (table view)
Shows key information about the selected DB2 Connect gateway.

Tasks List (table view)
Provides details on the processes.

Process CPU % (bar chart)
Shows the percentage of time that a process used the CPU since the last update.
Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**Threads Workspaces**

The DB2 Threads workspaces provide detailed thread activity information about your DB2 threads.

Using the Thread workspaces, you can:

- Identify all active threads within a data sharing group
- Evaluate and analyze thread activity for application threads
- Monitor and track thread activity over a period of time
- View statistics for an application thread
- View claim or locks owned by threads

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**Distributed Thread Detail Workspace:**

The Distributed Thread Detail workspace provides information about the VTAM APPC conversations and TCP/IP conversations of a distributed (DDF) thread.

This workspace is comprised of the following views:

- **Thread ID (table view)**
  Identifies the thread.

- **Distributed VTAM APPC Conversations (table view)**
  Shows the VTAM APPC conversations data of the thread if the thread is connected through VTAM APPC.

- **Distributed TCP/IP Data (table view)**
  Shows the TCP/IP data of the thread if the thread is connected through TCP/IP.

- **Distributed Remote Location Summary (table view)**
  Each row provides a SQL statistics summary for each remote DB2 location with which the thread has communicated, as a requester or a server.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**Thread Activity Workspace:**

The Thread Activity workspace provides a global view of thread activity for a specific DB2 subsystem. A consolidated list of DB2 threads displays on the table view in alphabetical order by plan name. Your table view may sort differently if you have changed the sort field or sort order.
Use the Thread Activity table view to:
- Identify all active threads
- Track thread activity for specific threads
- Analyze thread data when a thread evaluates to true
- View thread SQL counts 1, 2, or 3

Monitoring Thread Activity

You can view the Top Ten In-DB2 CPU Time threads from a bar chart as well as from the table view. You can use the thread data to:
- Monitor critical application threads
- Evaluate the thread elapsed and wait times for critical threads

Analyzing Specific Threads

You can analyze a specific application thread from the Thread Activity table view by viewing the thread detail.
1. Right-click a row on the Thread Activity table view.
2. Click Link to --> Thread Detail.

The Thread Detail workspace displays detailed information about a specific thread including the thread ID, thread activity, triggers, user-defined functions, and stored procedures.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

Thread Activity by Package Workspace:

The Thread Activity by Package workspace provides an overview of the activity of the ten threads, sorted by package name, that use the most class 2 CPU and elapsed time (in DB2).

This workspace is comprised of the following views:

Top Ten In-DB2 CPU Time Threads (bar chart)
Shows the class 2 CPU time (in DB2) for the ten threads that use the most class 2 CPU time.

Top Ten In-DB2 Time Threads (bar chart)
Shows the class 2 elapsed time (in DB2) for the ten threads that use the most class 2 elapsed time.

Top Ten In-DB2 CP CPU Time Threads (table view)
Provides key data for the ten threads, sorted by package name, that use the most class 2 CPU time (in DB2).

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.
Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

You can link to the following Thread summary workspaces:

- “All Threads Connected to DB2 Workspace” on page 451
- “CICS Thread Summary Workspace” on page 479
- “Detailed Thread Exception Workspace” on page 554
- “Distributed Allied Thread Summary Workspace” on page 564
- “DBAT End-to-End SQL Monitoring Workspace” on page 544
- “Enclave Thread Summary Workspace” on page 677
- “IMS Thread Summary Workspace” on page 731
- “Lock Conflicts Workspace” on page 732
- “Thread Activity by Package Workspace” on page 803
- “Thread Activity by Plan Workspace” on page 803
- “Utility Jobs Workspace” on page 831

**Thread Activity by Plan Workspace:**

The Thread Activity by Plan workspace provides an overview of the activity of the top ten threads, sorted by plan name, that use the most class 2 CPU and elapsed time (in DB2).

This workspace is comprised of the following views:

**Top Ten In-DB2 CP CPU Time Threads (bar chart)**

Shows the class 2 CPU time (in DB2) for the ten threads that use the most class 2 CPU time.

**Top Ten In-DB2 Time Threads (bar chart)**

Shows the class 2 elapsed time (in DB2) for the ten threads that use the most class 2 elapsed time.

**Top Ten In-DB2 CP CPU Time Threads (table view)**

Provides key data for the ten threads, sorted by plan name, that use the most class 2 CPU time (in DB2).

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

You can link to the following Thread summary workspaces:

- “All Threads Connected to DB2 Workspace” on page 451
- “CICS Thread Summary Workspace” on page 479
- “Detailed Thread Exception Workspace” on page 554
- “Distributed Allied Thread Summary Workspace” on page 564
- “DBAT End-to-End SQL Monitoring Workspace” on page 544
Thread Detail Workspace:

The Thread Detail workspace provides detailed information about the activity of an individual thread.

This workspace is comprised of the following views:
- Thread ID (table view), which identifies the thread.
- Accounting Time (chart view)
- In-DB2 Times (table view), which shows class 2 CPU time (in DB2).
- Triggers (table view)
- Thread Activity (table view), which provides information about the status of the thread, the CPU, and parallel tasks.
- User-Defined Functions (table view)
- Stored Procedures (table view)
- Savepoints (table view)
- Thread SQL counts 1 (table view), which provides information on the following statements associated with a thread:
  - SQL DCL (Data Control Language) declarations
  - SQL DDL (Data Definition Language) statements
  - SQL DML (Data Manipulation Language) statements
- Thread SQL counts 2 (table view), which provides information on:
  - Stored Procedures
  - User-Defined Functions
  - Triggers
  - Direct Row Access
  - Parallelism
  - RID Pool Access
  - Prepare Statements
- Thread SQL counts 3 (table view), which provides information on:
  - Multi-Row Processing
  - Concentrate Statements

All other tables provide details on the named activities.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli
Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**Thread Enclave Detail Workspace:**

The Thread Enclave workspace provides detailed information about the attributes of an enclave.

This workspace is comprised of the following views:

- Thread ID (table view)
- General Information (table view)
- Performance Index Input Data for Velocity Goal (table view)
- Service Period Information (table view)
- Classification Work Qualifiers (table view)
- Service Class Information (table view)
- WLM Application Environment (table view)
- zIIP Information (table view)

The Thread ID table identifies the thread. The General Information table shows details about the enclave token and the CPU. All other tables provide details on the named activities.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**Thread Enclave Service Period Information Workspace:**

The Thread Enclave Service Period Information workspace provides detailed information about the service periods for the current service class.

This workspace is comprised of the following views:

**Thread ID (table view)**

Identifies the thread.

**Current Period (table view)**

Provides the service class name and current period information.

**First Four Periods (table view)**

Provides information about the first four entries of period. If the period is not defined, a zero or no data is shown.

**Next Four Periods (table view)**

Provides information about the next four entries of period. If the period is not defined, a zero or no data is shown.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.
Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**Thread Locks Owned Workspace:**

The Thread Locks Owned workspace provides detailed information about all the locks and claims owned by an individual thread.

This workspace is comprised of the following views:

- **Thread ID (table view)**  
  Identifies the thread.

- **Locks Ownership Information (table view)**  
  Provides totals of all the types of locks owned by the thread, as well as the percentage of total locks allowed that are currently held (the percent of the DB2 parameter NUMLKUS).

- **Locks Owned (table view)**  
  Shows all the locks owned by this thread.

- **Claims Owned (table view)**  
  Shows all the claims owned by this thread.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**Thread Statistics Workspace:**

The Thread Statistics workspace displays thread statistics for a specific application thread. If the application thread is a parallel thread, the table view displays thread statistics for all the associated parallel threads.

**Viewing Additional Thread Information**

You can use the Tivoli Enterprise Portal terminal emulator adapter to access an OMEGAMON host session to investigate a thread with excessive elapsed time. For information about using this feature, see the Tivoli Enterprise Portal online help.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**Single Thread Summary for Transplex workspace:**

The Single Thread Summary for Transplex workspace provides information for a specific thread originating from IMS or CICS.

This workspace is comprised of the following views:
In-DB2 Time/In-DB2 CPU Time (bar chart)
Shows both the class 2 elapsed time as well as the CPU time (in DB2) for the specific thread.

Commits/GetPage Requests/Update counts (bar chart)
Shows the number of commits, getpage requests, and update counts for the specific thread.

Single Thread Summary for Transplex (table view)
Shows summary information for a thread originating from IMS or CICS.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

Thread Wait Events Workspace:

The Thread Wait Events workspace provides wait time and counts on events that the thread waited on.

This workspace is comprised of the following views:
- Thread ID (table view)
- Archive Log Wait Events (table view)
- Other Wait Events (table view)
- Local Lock/Latch Wait Events (table view)
- Global Lock Wait Events (table view)
- I/O & Switch Wait Events (table view)
- Log & Sync Ex Unit Wait Events (table view)

The Thread ID table identifies the thread. All other tables provide time information and counts with regard to the named events.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

Thread SQL Counts 1 Workspace:

The Thread SQL Counts 1 workspace provides information about SQL DCL (Data Control Language) declarations, SQL DDL (Data Definition Language) statements, and SQL DML (Data Manipulation Language) statements.

This workspace is comprised of the following views:

Thread ID (table view)
Lists the thread IDs.

DML (table view)
Provides information on SQL DML (Data Manipulation Language) statements.
DCL (table view)
Provides information on DCL (Data Control Language) declarations.

DDL Create (table view)
Provides information on SQL DDL (Data Definition Language) statements for Create.

DDL Drop (table view)
Provides information on SQL DDL (Data Definition Language) statements for Drop.

DDL Alter / Rename (table view)
Provides information on SQL DDL (Data Definition Language) statements for Alter / Rename.

Note: For DML, DCL, and DDL, each table view provides total counts since the last sample period.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

Thread SQL Counts 2 Workspace:

The Thread SQL Counts 2 workspace provides information about stored procedures, user-defined functions, triggers, direct row access, parallelism, RID pool access, and prepare statements.

This workspace is comprised of the following views:
• Thread ID (table view)
• Stored Procedures
• User-Defined Functions
• Triggers
• Parallelism
• RID Pool Access
• Prepare Statements
• Direct Row Access

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

Thread SQL Counts 3 Workspace:

The Thread SQL Counts 3 workspace provides information about multi-row processing and concentrate statements.

This workspace is comprised of the following views:

Thread ID (table view)
Lists the thread IDs.

Multi-Row Processing
Enables you to track performance improvements such as multi-row fetch and multi-row insert.
Concentrate Statements
Indicates if literal constants, which are referenced in dynamic SQL statements, are replaced with special markers so that these constants are not cached with the statement in the dynamic SQL statement cache.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

Utility Jobs Workspace
The Utility Jobs workspace provides an overview of all active utilities. Workspace monitoring includes utilities that because of abnormal termination, have not yet completed their run.

This workspace is comprised of the following view:

Notepad (notepad view)
Is a simple text editor for writing notes about the workspace.

Utility Jobs (table view)
Lists the phase, record counts, and status of DB2 utility jobs.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

You can link to the following Thread summary workspaces:

- “All Threads Connected to DB2 Workspace” on page 451
- “CICS Thread Summary Workspace” on page 479
- “Detailed Thread Exception Workspace” on page 554
- “Distributed Allied Thread Summary Workspace” on page 564
- “DBAT End-to-End SQL Monitoring Workspace” on page 544
- “Enclave Thread Summary Workspace” on page 677
- “IMS Thread Summary Workspace” on page 731
- “Lock Conflicts Workspace” on page 732
- “Thread Activity by Package Workspace” on page 803
- “Thread Activity by Plan Workspace” on page 803
- “Utility Jobs Workspace” on page 831

Volume Activity Workspace
The Volume Activity workspace provides an overview of the performance of volumes that contain DB2 objects in order to evaluate DASD performance by volume.

This workspace is comprised of the following views:

Service Time (bar chart)
Shows the average service time for the volume since the beginning of the collection interval.
Volume Activity (table view)
Includes data that allows you to monitor I/O activity for individual volumes.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

OMEGAMON XE for DB2 PE Situations
OMEGAMON XE for DB2 PE provides numerous predefined situations that you can use to immediately begin monitoring your DB2 managed systems, to monitor and manage, through localized automation, widely dispersed resources, or as models for creating your own situations.

Most of the predefined situations have an alert status of either Critical or Warning. You can view these situations as they augment by selecting the Logical View tab. If you choose to make changes to a predefined situation, we recommend you change a copy and preserve the original situation in the form in which it was shipped.

You can change conditions, relational operators, and compare values in these predefined situations to ones more appropriate to your environment.

Note: All of the predefined situations are disabled when shipped.

Buffer Pool Management Situations
Use the series of predefined situations associated with the Buffer Pool Management workspace to begin monitoring your system immediately or as templates for creating your own situations.

The names, descriptions, logic, and threshold values for the situations follow.

KDP_BMTH_Critical monitors a buffer pool mn, detecting a critical condition when a particular buffer pool reaches 90% capacity. The situation’s formula is:
KDP_SRM_BPM.Utilization GE 90.0

KDP_BMTH_Warning monitors a buffer pool mn, detecting a warning condition when a particular buffer pool’s capacity is in the range of 72% to 90%. The situation’s formula is:
KDP_SRM_BPM.Utilization GE 72.0

AND
KDP_SRM_BPM.Utilization LT 90.0

CICS Connections Situations
Use the series of predefined situations associated with the CICS Connections workspace to begin monitoring your system immediately or as templates for creating your own situations.

The names, descriptions, logic, and threshold values for the situations follow.

KDP_CICT_Critical monitors the percentage of active CICS threads to THRDMAX, detecting a critical condition when that percentage reaches 80%. The THRDMAX value is specified in the CICS RCT. The situation’s formula is:
DP_CICS_Exceptions.Total_Thread_Utilization GE 80.0
**KDP_CICT_Warning** monitors the percentage of active CICS threads to THRDMAX, detecting a warning condition when that percentage is in the range of 64% to 80%. The THRDMAX value is specified in the CICS RCT. The situation's formula is:

\[ \text{KDP_CICS_Exceptions.Total_Thread_Utilization} \geq 64.0 \]

AND

\[ \text{KDP_CICS_Exceptions.Total_Thread_Utilization} \lt 80.0 \]

**KDP_ENTO_Critical** monitors pool thread usage. A critical condition is detected when the number of POOL threads in use because of ENTRY thread overflow activity reaches 3 transactions. This situation limits its analysis to ENTRY definitions that specify TWAIT=POOL and THRDA>0. The situation's formula is:

\[ \text{KDP_CICS_Threads.Pool_Thread_Overflow} \geq 3 \]

**KDP_ENTO_Warning** monitors pool thread usage. A warning condition is detected when the number of POOL threads in use because of ENTRY thread overflow activity is in the range of two to three transactions. This situation limits its analysis to ENTRY definitions that specify TWAIT=POOL and THRDA>0. The situation's formula is:

\[ \text{KDP_CICS_Threads.Pool_Thread_Overflow} \geq 2 \]

AND

\[ \text{KDP_CICS_Threads.Pool_Thread_Overflow} \lt 3 \]

**KDP_ENTU_Critical** monitors CICS ENTRY thread usage. The definition and use of ENTRY threads enables the DB2 user to assign one or more DB2 threads to a single DB2 plan. It also allows definition of one or more transactions that may use the plan. A critical condition is detected when the percentage of active threads that originate from a CICS ENTRY definition to THRDA reaches 95%. The THRDA value is specified in the resource RCT. The situation's formula is:

\[ \text{KDP_CICS_Threads.Entry_Threads_InUse} \geq 95 \]

**KDP_ENTU_Warning** monitors CICS ENTRY thread usage. The definition and use of ENTRY threads enables the DB2 user to assign one or more DB2 threads to a single DB2 plan. It also allows definition of one or more transactions that may use the plan. A warning condition is detected when the percentage of active threads that originate from a CICS ENTRY definition to THRDA is in the range of 76% to 95%. The THRDA value is specified in the resource RCT. The situation's formula is:

\[ \text{KDP_CICS_Threads.Entry_Threads_InUse} \geq 76 \]

AND

\[ \text{KDP_CICS_Threads.Entry_Threads_InUse} \lt 95 \]

**KDP_ENTW_Critical** monitors CICS transactions waiting for ENTRY threads. A critical condition is detected when the number of CICS transactions waiting for a thread reaches two transactions. This situation detects transactions that are waiting, because all threads defined for use in the RCT ENTRY definition are already in use. This situation limits its analysis to ENTRY definitions that specify TWAIT=YES. The situation's formula is:

\[ \text{KDP_CICS_Threads.Entry_Thread_Waiting} \geq 2 \]

**KDP_ENTW_Warning** monitors CICS transactions waiting for ENTRY threads. A warning condition is detected when the number of CICS transactions waiting for a
thread is in the range of one to two transactions. This situation detects transactions that are waiting, because all threads defined for use in the RCT ENTRY definition are already in use. This situation limits its analysis to ENTRY definitions that specify TWAIT=YES. The situation's formula is:

\[ KDP\_CICS\_Threads.Entry\_Thread\_Waiting \geq 1 \text{ AND } KDP\_CICS\_Threads.Entry\_Thread\_Waiting < 2 \]

**KDP\_POLU\_Critical** monitors the percentage of pool threads in use. A critical condition is detected when the percentage of active CICS POOL threads to THRDA reaches 90%. The THRDA value is specified in the resource control table (RCT). The situation's formula is:

\[ KDP\_CICS\_Exceptions.Pool\_Threads\_Inuse \geq 90 \]

**KDP\_POLU\_Warning** monitors the percentage of pool threads in use. A warning condition is detected when the percentage of active CICS POOL threads to THRDA is in the range of 72% to 90%. The THRDA value is specified in the resource control table (RCT). The situation's formula is:

\[ KDP\_CICS\_Exceptions.Pool\_Threads\_Inuse \geq 72 \text{ AND } KDP\_CICS\_Exceptions.Pool\_Threads\_Inuse < 90 \]

**KDP\_POLW\_Critical** monitors the number of CICS transactions waiting for a POOL thread that originates from a CICS connection. A critical condition is detected when the number of CICS transactions waiting reaches two transactions. The situation's formula is:

\[ KDP\_CICS\_Exceptions.Pool\_Thread\_Waits \geq 2 \]

**KDP\_POLW\_Warning** monitors the number of CICS transactions waiting for a POOL thread that originates from a CICS connection. A warning condition is detected when the number of CICS transactions waiting is in the range of one to two transactions. The situation's formula is:

\[ KDP\_CICS\_Exceptions.Pool\_Thread\_Waits \geq 1 \text{ AND } KDP\_CICS\_Exceptions.Pool\_Thread\_Waits < 2 \]

**Data Sharing Situations**

Use the series of predefined situations associated with the Data Sharing workspace to begin monitoring your system immediately or as templates for creating your own situations.

The names, descriptions, logic, and threshold values for the situations follow.

**DB2\_CF\_Connections\_Warning** monitors the status of connections to coupling facility and group buffer pool structures, detecting a warning condition when Connection Status equals FAIL. Its formula is:

\[ Group\_Buffer\_Pool\_Connections.Connection\_Status \text{ EQ FAIL} \]

**DB2\_CF\_Structure\_Use\_Critical** monitors the percent of structures that a coupling facility uses, detecting a critical condition when Structure Used Percent is greater than 90%. Its formula is:
Group_Buffer_Pool.Structure_Used_Percent GT 90

**DB2_CF_Structure_Use_Warning** monitors the percent of structures that a coupling facility uses, detecting a warning condition when **Structure Used Percent** is in the range of 80 to 90%. Its formula is:

\[ \text{Group_Buffer_Pool.Structure_Used_Percent} \text{ GT 80 AND Group_Buffer_Pool.Structure_Used_Percent GE 90} \]

**DB2_CMD_Connection_Failed** monitors the status of connections to coupling facility and group buffer pool structures and automatically issues a message when data sharing is not active for a DB2 subsystem. To use this situation, you must replace the user ID with your TSO/E user ID. Its formula is:

\[ \text{Group_Buffer_Pool_Connections.Connection_Status EQ FAIL, send the following message to user (xxxxxxx): 'Coupling Facility for Group_Buffer_Pool_Connections.Data_Sharing_Group_Element has failed.'} \]

where: xxxxxxx should be replaced with your TSO/E user ID and a value will be substituted for the attribute in italics

**DB2_CMD_Group_BP_Read_Hit_Warning** monitors the percent of read hits for group buffer pools, and automatically issues a message when **Read_Hit_Percent** is in the range of 60 to 80 percent. To use this situation, you must replace the user ID with your TSO/E user ID. Its formula is:

\[ \text{Group_Buffer_Pool.Read_Hit_Percent GE 60 AND Group_Buffer_Pool.Read_Hit_Percent LT 80, send the following message to user (xxxxxxx): 'Group Buffer Pool.Read_Hit_Percent Decreasing'} \]

where: xxxxxxx should be replaced with your TSO/E user ID and a value will be substituted for the attribute in italics

**DB2_CMD_Lock_Wait_Time_Critical** monitors the lock elapsed time for application threads with a waiter lock status and automatically issues a message when **Lock_Elapsed_Time** is greater than 10 seconds. To use this situation, you must replace the user ID with your TSO/E user ID. Its formula is:

\[ \text{DB2_Lock_Conflict.Lock_Elapsed_Time GT 10, send the following message to user (xxxxxxx): 'Thread ID DB2_Lock_Conflict.Plan_Name has reached a critical state' \]

where: xxxxxxx should be replaced with your TSO/E user ID and a value will be substituted for the attribute in italics

**DB2_CMD_Thrd_Wait_Time_Critical** monitors the thread wait time and automatically issues a message when **Thread_Wait_Time** is greater than 10 seconds. To use this situation, you must replace the user ID with your TSO/E user ID. Its formula is:

\[ \text{Thread_Detail.Thread_Wait_Time GT 10, send the following message to user (xxxxxxx): 'Thread Thread_Detail.Plan_Name executing over 10 sec'} \]

where: xxxxxxx should be replaced with your TSO/E user ID and a value will be substituted for the attribute in italics
**DB2_Group_BP_Read_HitCritical** monitors the percent of read hits for group buffer pools, detecting a critical condition when **Read_Hit_Percent** is less than 60%. Its formula is:

\[ \text{Group_Buffer_Pool.Read_Hit_Percent} \lt 60 \]

**DB2_Group_BP_Read_Hit_WARNING** monitors the percent of read hits for group buffer pools, detecting a warning condition when **Read_Hit_Percent** is in the range of 60% to 80%. Its formula is:

\[ \text{Group_Buffer_Pool.Read_Hit_Percent} \geq 60 \text{ AND } \text{Group_Buffer_Pool.Read_Hit_Percent} \lt 80 \]

**DB2_Lock_Waiter_Time_Critical** monitors the lock elapsed time for application threads with a waiter lock status, detecting a critical condition when **Lock_Elapsed_Time** is greater than 10 seconds. Its formula is:

\[ \text{DB2_Lock_Conflict.Lock_Status} = \text{WAITER} \text{ AND } \text{DB2_Lock_Conflict.Lock_Elapsed_Time} > 10 \]

**DB2_Lock_Waiter_Time_Warning** monitors the lock elapsed time for application threads with a waiter lock status, detecting a warning condition when **Lock_Elapsed_Time** is in the range of 5 to 10 seconds. Its formula is:

\[ \text{DB2_Lock_Conflict.Lock_Status} = \text{WAITER} \text{ AND } \text{DB2_Lock_Conflict.Lock_Elapsed_Time} > 5 \text{ AND } \text{DB2_Lock_Conflict.Lock_Elapsed_Time} \leq 10 \]

**DB2_Thread_Wait_Time_Critical** monitors the thread wait time, detecting a critical condition when **Thread_Wait_Time** is greater than 10 seconds. Its formula is:

\[ \text{Thread_Detail.Thread_Wait_Time} > 10 \]

**DB2_Thread_Wait_Time_Warning** monitors the thread wait time, detecting a warning condition when **Thread_Wait_Time** is in the range of 5 to 10 seconds. Its formula is:

\[ \text{Thread_Detail.Thread_Wait_Time} > 5 \text{ OR } \text{Thread_Detail.Thread_Wait_Time} \leq 10 \]

**DB2 Connect Server Situations**

Use the series of predefined situations associated with the DB2 Connect Server workspace to begin monitoring your system immediately or as templates for creating your own situations.

The names, descriptions, logic, and threshold values for the situations follow.
KD5_Max_Agent_Overflows_Warning monitors the number of times that the Maximum Agent Overflows exceeds the threshold. A warning condition is detected when the system receives a number of requests to create a new agent after the MAXAGENTS configuration parameter has already been reached. This can indicate too high a workload for this node or that the MAXAGENTS configuration parameter is too small. The situation's formula is:

*IF  
  *VALUE DB2_CONNECT_SERVER.Maximum_Agent_Overflows *GE 20"

KD5_Max_Agents_Waiting_Warning monitors the maximum number of agents waiting for a token. A warning condition is detected when the maximum number of agents waiting for a token exceeds the threshold. You can use this element to help you evaluate the MAXCAGENTS configuration parameter. If the MAXCAGENTS parameter is set to its default value(-1), no agents need to wait for a token and the value of this monitor element is zero. The situation’s formula is:

*IF  
  *VALUE DB2_CONNECT_SERVER.Maximum_Agents_Waiting *GE 20

KD5_Stolen_Agents_Warning monitors the number of times that agents are stolen from an application. A warning condition is detected when the number of agents are stolen from an application exceeds the threshold. Agents are stolen when an idle agent associated with an application is reassigned to work on a different application. Reduce the number of agents stolen by increasing the NUM_POOLAGENTS configuration parameter. The situation’s formula is:

*IF  
  *VALUE DB2_CONNECT_SERVER.Stolen_Agents *GE 20

KD5_CPU_Usage_Per_Process_Warning monitors the CPU usage percentage for a process. A warning condition is detected when the CPU usage percentage of a process exceeds the threshold. The situation's formula is:

*IF  
  *VALUE DB2_CONNECT_TASKLIST.CPU_Usage_Per_Process *GE 20

KD5_Most_Recent_Stmt_ETIM_Warning monitors the most recent statement of elapsed time for an application. A warning condition is detected when the most recent statement of elapsed time for an application exceeds the threshold. The situation’s formula is:

*IF  
  *VALUE THREAD_DB2_CONNECT_STATEMENT.Most_Recent_Statement_Elapsed_Time *GE 20

KD5_Fail_Stmt_Percent_Warning monitors the percent of failed SQL statements for an application. A warning condition is detected when the failed SQL statement percentage for an application exceeds the threshold. The situation's formula is:

*IF  
  *VALUE THREAD_DB2_CONNECT_OVERVIEW.Failed_Statement_Percentage *GE 20

DB2 Message Situations

Use the series of predefined situations associated with the DB2 Message workspace to begin monitoring your system immediately or use them as templates for creating your own situations.

The names, descriptions, logic, and threshold values for the situations follow.

KD5_DSNP001I_Space_Warning monitors datasets for impending space shortages. A warning condition is detected when DB2 generates message DSNP001I. The situation’s formula is:

DB2_Message.Message_ID EQ 'DSNP001I'
KD5_DSNP007I_Space_Critical monitors dataset extensions that failed with a return code and with a thread ID. A critical condition is detected when DB2 generates message DSNP007I. The situation’s formula is:

DB2_Message.Message_ID EQ 'DSNP007I'

KD5_DSNT375I_Deadlock_Critical monitors deadlocks. A critical condition is detected when DB2 generates message DSNT375I. The situation’s formula is:

DB2_Message.Message_ID EQ 'DSNT375I'

KD5_DSNT376I_Timeout_Critical monitors timeouts for threads that exceed the specified wait time for a locked resource. A critical condition is detected when DB2 generates message DSNT376I. The situation’s formula is:

DB2_Message.Message_ID EQ 'DSNT376I'

KD5_DSNT500I_ResUnavail_Warning provides the reason, the resource type, and the name for an unavailable resource. A warning condition is detected when DB2 generates message DSNT500I. The situation’s formula is:

DB2_Message.Message_ID EQ 'DSNT500I'

KD5_DSNT501I_ResUnavail_Warning provides the thread ID, the reason, the resource type, and the name for an unavailable resource. A warning condition is detected when DB2 generates message DSNT501I. The situation’s formula is:

DB2_Message.Message_ID EQ 'DSNT501I'

KD5_DSNU511I_Recovery_CRITICAL warns if an object is not recoverable when recovery is requested. A critical condition is detected when DB2 generates message DSNU511I. The situation’s formula is:

DB2_Message.Message_ID EQ 'DSNU511I'

KD5_DSNU548I_Recovery_CRITICAL warns of a RECOVER utility job in which the DBID and the PSID in the header do not match the DB2 catalog (job ends with return code 8). A critical condition is detected when DB2 generates message DSNU548I. The situation’s formula is:

DB2_Message.Message_ID EQ 'DSNU548I'

KD5_DSNU621I_Runstats_Critical warn of a RUNSTATS commit or rollback that failed. A critical condition is detected when DB2 generates message DSNU621I. The situation’s formula is:

DB2_Message.Message_ID EQ 'DSNU621I'

**DDF Conversations Situations**

Use the series of predefined situations associated with the DDF Conversations workspace to begin monitoring your system immediately or as templates for creating your own situations.

The names, descriptions, logic, and threshold values for the situations follow.

KD5_MCNV_Critical monitors the number of conversations in use against the preset maximum for a given log mode. A critical condition is detected when the percentage of conversations in use to the specified maximum reaches 85%. The situation’s formula is:

KDP_System_States.Conversation_Utilization GE 85.0
**KDP_MCNV_Warning** monitors the number of conversations in use against the preset maximum for a given log mode. A warning condition is detected when the percentage of conversations in use to the specified maximum is in the range of 65% to 85%. The situation's formula is:

\[
\text{KDP System States.Conversation Utilization GE } 65.0 \text{ AND KDP System States.Conversation Utilization LT 85.0}
\]

**Detailed Thread Exception Situations**

Use the series of predefined situations associated with the Detailed Thread Exception workspace to begin monitoring your system immediately or as templates for creating your own situations.

OMEGAMON XE for DB2 PE includes a series of predefined situations associated with the Detailed Thread Exception workspace. You can use these situations to begin monitoring almost immediately, or as templates for creating your own situations.

The names, descriptions, logic, and threshold values for the situations follow.

**KDP_ARCM_Critical** monitors the status of thread backout processing, detecting a critical condition when the thread backout processing is waiting for an archive tape mount. DB2 requires the archive tape mount during abort processing to backout changes made in the current unit of recovery. The thread does not do any processing until the tape is mounted. It holds DB2 resources until the abort request is complete. The situation's formula is:

\[
\text{KDP Thread Exceptions.Archive Tape Wait EQ TRUE}
\]

**KD5_ARCM_Warning** monitors the status of thread backout processing, detecting a warning condition when the thread backout processing is waiting for an archive tape mount. DB2 requires the archive tape mount during abort processing to backout changes made in the current unit of recovery. The thread does not do any processing until the tape is mounted. It holds DB2 resources until the abort request is complete. The situation's formula is:

\[
\text{KD5 Thread Exceptions.Archive Tape Wait EQ TRUE}
\]

**KDP_COMT_Critical** monitors the ratio of updates to commits for the thread, detecting a critical condition when the ratio reaches 100. The situation's formula is:

\[
\text{KDP Thread Exceptions.Commit Ratio GE 100}
\]

**KDP_COMT_Warning** monitors the ratio of updates to commits for the thread, detecting a warning condition when the ratio is in the range of 80% to 100%. The situation's formula is:

\[
\text{KDP Thread Exceptions.Commit Ratio GE 80 AND KDP Thread Exceptions.Commit Ratio LT 100}
\]

**KDP_CTHD_Critical** monitors the state of an application, detecting a critical condition when an application is waiting for DB2 to create a thread. This condition arises when the system's maximum thread limit is reached. The situation's formula is:
KDP_Thread_Exceptions.Thread_Create_Wait EQ TRUE

**KD5_CTHD_Warning** monitors the state of an application, detecting a warning condition when an application is waiting for DB2 to create a thread. This condition arises when the system's maximum thread limit is reached. The situation's formula is:

KDP_Thread_Exceptions.Thread_Create_Wait EQ TRUE

**KDP_DWAT_Critical** monitors the period of time a distributed allied thread has been waiting for a response to a remote SQL request. A critical condition is detected when the period reaches ten seconds. The situation's formula is:

KDP_Thread_Exceptions.Wait_Time_Distributed_Query GE 00:00:10.000

**KD5_DWAT_Warning** monitors the period of time a distributed allied thread has been waiting for a response to a remote SQL request. A warning condition is detected when the period is in the range of eight to ten seconds. The situation's formula is:

KDP_Thread_Exceptions.Wait_Time_Distributed_Query GE 00:00:08.000

AND

KDP_Thread_Exceptions.Wait_Time_Distributed_Query LT 00:00:10.000

**KDP_ETIM_Critical** monitors the elapsed time for a DB2 thread (from sign-on or create thread). A critical condition is detected when the elapsed time reaches ten minutes. The situation's formula is:

KDP_Thread_Exceptions.Elapsed_Time GE 00:10:00

**KD5_ETIM_Warning** monitors the elapsed time for a DB2 thread (from sign-on or create thread). A warning condition is detected when the elapsed time ranges from eight to ten minutes. The situation's formula is:

KDP_Thread_Exceptions.Elapsed_Time GE 00:08:00

AND

KDP_Thread_Exceptions.Elapsed_Time LT 00:10:00

**KDP_GETP_Critical** monitors the status of getpage requests. A critical condition is detected when the ratio of logical page read (getpage) requests to physical page read (read I/O) requests is less than the specified threshold of 15. The default threshold for GETP is specified as an integer, where one equals 0.1 getpages to read I/Os. The situation's formula is:

KDP_Thread_Exceptions.Getpage_Ratio LT 15.0

**KD5_GETP_Warning** monitors the status of getpage requests. A warning condition is detected when the ratio of logical page read (getpage) requests to physical page read (read I/O) requests is in the range of 18 to 15. The default threshold for GETP is specified as an integer, where one equals 0.1 getpages to read I/Os. The situation's formula is:

KDP_Thread_Exceptions.Getpage_Ratio GE 15.0

AND

KDP_Thread_Exceptions.Getpage_Ratio LT 18.0
**KDP_IDBC_Critical** monitors the amount of CPU time used by DB2 to process a thread. A critical condition is detected when the CPU time reaches the specified threshold of one minute ten seconds. The situation's formula is:

KDP_Thread_Exceptions.DB2_CPU_Used GE 00:01:10.000

**KD5_IDBC_Warning** monitors the amount of CPU time used by DB2 to process a thread. A warning condition is detected when the CPU time ranges from 56 seconds to one minute ten seconds. The situation's formula is:

KD5_Thread_Exceptions.DB2_CPU_Used GE 00:00:56.000 AND KD5_Thread_Exceptions.DB2_CPU_Used LT 00:01:10.000

**KDP_IDBT_Critical** provides information about the length of time DB2 has been processing this thread. A critical condition is detected when the length of time that DB2 has been processing a thread is greater than five seconds. The situation's formula is:

KDP_Thread_Exceptions.DB2_Elapsed_Time GE 00:00:05.0

**KD5_IDBT_Warning** provides information about the length of time DB2 has been processing this thread. A warning condition is detected when the length of time that DB2 has been processing a thread is in the range of four to five seconds. The situation's formula is:

KD5_Thread_Exceptions.DB2_Elapsed_Time GE 00:00:04.0 AND KD5_Thread_Exceptions.DB2_Elapsed_Time LT 00:00:05.0

**KDP_INDB_Critical** provides information about individual threads that are in INDOUBT status. These threads may cause DB2 resources to be unavailable to other active threads until either restart or RECOVER INDOUBT processing occurs. A critical condition is detected when individual threads are in doubt. The situation's formula is:

KDP_Thread_Exceptions. Indoubt EQ TRUE

**KD5_INDB_Warning** provides information about individual threads that are in INDOUBT status. These threads may cause DB2 resources to be unavailable to other active threads until either restart or RECOVER INDOUBT processing occurs. A warning condition is detected when individual threads are in doubt. The situation's formula is:

KD5_Thread_Exceptions. Indoubt EQ TRUE

**KDP_LKUS_Critical** monitors the number of locks owned by an individual thread. A critical condition is detected when the percentage of page locks owned by an active thread to the total allowable number of held page locks reaches 80%. The situation's formula is:

KDP_Thread_Exceptions.Lock_Percentage GE 80.0

**KDP_LKUS_Warning** monitors the number of locks owned by an individual thread. A warning condition is detected when the percentage of page locks owned by an active thread to the total allowable number of held page locks is in the range of 64% to 80%. The situation's formula is:

KDP_Thread_Exceptions.Lock_Percentage GE 64.0
KDP_Thread_Exceptions.Lock_Percentage LT 80.0

**KDP_PGUP_Critical** monitors the number of page update requests per second made by a thread.

The update count reflected in this exception is incremented each time a row in a page is updated. Updated pages are not necessarily written at commit, but rather later, asynchronously as determined by the DB2 deferred write algorithm. There is no direct, immediate relationship, therefore, between page updates and page writes.

The counters that DB2 maintains for this activity are updated throughout the life of the thread, and are reset at DB2 sign-on if the thread is reused. A critical condition is detected when the number of row updates per second on behalf of a thread reaches ten. The situation's formula is:

KDP_Thread_Exceptions.Page_Update_Rate GE 10.0

**KDP_PGUP_Warning** monitors the number of page update requests per second made by a thread.

The update count reflected in this exception is incremented each time a row in a page is updated. Updated pages are not necessarily written at commit, but asynchronously as determined by the DB2 deferred write algorithm. There is no direct, immediate relationship between page updates and page writes.

The counters that DB2 maintains for this activity are updated throughout the life of the thread, and are reset at DB2 sign-on if the thread is reused. A warning condition is detected when the number of row updates per second on behalf of a thread is in the range of eight to ten. The situation's formula is:

KDP_Thread_Exceptions.Page_Update_Rate GE 8.0 AND KDP_Thread_Exceptions.Page_Update_Rate LT 10.0

**KDP_PREF_Critical** monitors read sequential prefetch activity.

Unlike normal read I/O, sequential prefetch read I/O is performed asynchronously with the user's request. It provides a read-ahead capability. A single sequential prefetch I/O results in multiple pages being read. Threads with excessive sequential prefetch rates may cause a negative impact on overall DB2 performance.

The counters which DB2 maintains for this activity are updated throughout the life of the thread, and are reset during DB2 sign-on if the thread is reused. A critical condition is detected when the number of sequential prefetch requests reaches ten per second. The situation's formula is:

KDP_Thread_Exceptions.Prefetch_Rate GE 10.0

**KDP_PREF_Warning** monitors read sequential prefetch activity.

Unlike normal read I/O, sequential prefetch read I/O is performed asynchronously with the user's request. It provides a read-ahead capability. A single sequential prefetch I/O results in multiple pages being read. Threads with excessive sequential prefetch rates may cause a negative impact on overall DB2 performance.
The counters which DB2 maintains for this activity are updated throughout the life of the thread, and are reset during DB2 sign-on if the thread is reused. A warning condition is detected when the number of sequential prefetch requests is in the range of eight to ten per second. The situation's formula is:

\[
\text{KDP\_Thread\_Exceptions.\text{Prefetch\_Rate} \geq 8.0 \text{ AND } KDP\_Thread\_Exceptions.\text{Prefetch\_Rate} < 10.0}
\]

**KDP\_RCPU\_Critical** monitors the amount of CPU time being used by a distributed database access thread at the remote DB2 location. A critical condition is detected when the amount of CPU time used by a database access thread at a remote DB2 location reaches fifty seconds. The situation's formula is:

\[
\text{KDP\_Thread\_Exceptions.\text{Distributed\_CPU\_Seconds} \geq 00:00:50.000}
\]

**KD5\_RCPU\_Warning** monitors the amount of CPU time being used by a distributed database access thread at the remote DB2 location. A warning condition is detected when the amount of CPU time used by a database access thread at a remote DB2 location is in the range of forty to fifty seconds. The situation's formula is:

\[
\text{KDP\_Thread\_Exceptions.\text{Distributed\_CPU\_Seconds} \geq 00:00:40.000 \text{ AND } KDP\_Thread\_Exceptions.\text{Distributed\_CPU\_Seconds} < 00:00:50.000}
\]

**KDP\_RELM\_Critical** monitors the ratio of the resource limit high water mark (CPU seconds) to the current resource limit. A critical condition is detected when the ratio of the resource limit high water mark (CPU seconds) to the resource limit in effect (CPU seconds) reaches 80%. The situation's formula is:

\[
\text{KDP\_Thread\_Exceptions.\text{Resource\_Limit\_Percent} \geq 80.0}
\]

**KDP\_RELM\_Warning** monitors the ratio of the resource limit high water mark (CPU seconds) to the current resource limit. A warning condition is detected when the ratio of the resource limit high water mark (CPU seconds) to the resource limit in effect (CPU seconds) is in the range of 64% to 80%. The situation's formula is:

\[
\text{KDP\_Thread\_Exceptions.\text{Resource\_Limit\_Percent} \geq 64.0 \text{ AND } KDP\_Thread\_Exceptions.\text{Resource\_Limit\_Percent} < 80.0}
\]

**KDP\_RIO\_Critical** monitors the thread synchronous read I/Os rate.

Generally, this exception indicates excessive physical read I/O on behalf of a thread. While a single SELECT may return a limited number of rows, the pages searched may be enormous. I/O may be caused by access path selection changes which occurred because of object changes (indexes dropped or no longer clustered), or by inadvertent use of stage 2 predicates. It might result from the fact that the SQL is a set-oriented language, that operates on sets of data, rather than on individual rows (records).

The counters which DB2 maintains for this activity are updated throughout the life of the thread, and are reset during DB2 sign-on if the thread is reused. A critical condition is detected when the physical read I/O rate per second on behalf of a thread reaches ten. The situation's formula is:
**KDP_Thread_Exceptions.Read_I/O_Rate**

**KD5_RIO_Warning** monitors the thread synchronous read I/Os rate.

Generally, this exception indicates excessive physical read I/O on behalf of a thread. While a single SELECT may return a limited number of rows, the pages searched may be enormous. I/O may be caused by access path selection changes which occurred because of object changes (indexes dropped or no longer clustered), or by inadvertent use of stage 2 predicates. It might result from the fact that the SQL is a set-oriented language, that operates on sets of data, rather than on individual rows (records).

The counters which DB2 maintains for this activity are updated throughout the life of the thread, and are reset during DB2 sign-on if the thread is reused. A warning condition is detected when the physical read I/O rate per second on behalf of a thread is in the range of eight to ten. The situation's formula is:

\[
\text{KD5_Thread_Exceptions.Read_I/O_Rate} \geq 8.0 \quad \text{AND} \quad \text{KD5_Thread_Exceptions.Read_I/O_Rate} < 10.0
\]

**KDP_TCPU_Critical** monitors the CPU rate (percent) of active threads.

For non-CICS threads, this is the CPU rate of the address space from which the thread originates. It includes both TCB and SRB time. For CICS threads, this is the CPU rate attributable to the thread originating from the CICS connection. It includes only TCB time incurred by the thread.

This situation limits its analysis of CPU use to DB2 connections that contain active threads. It does not report CPU use for connections with no active threads. A critical condition is detected when CPU utilization for an address space that has DB2 connections and threads reaches 20%. The situation's formula is:

\[
\text{KDP_Thread_Exceptions.CPU_Utilization} \geq 20.0
\]

**KD5_TCPU_Warning** monitors the CPU rate (percent) of active threads.

For non-CICS threads, this is the CPU rate of the address space from which the thread originates. It includes both TCB and SRB time. For CICS threads, this is the CPU rate attributable to the thread originating from the CICS connection. It includes only TCB time incurred by the thread.

This situation limits its analysis of CPU use to DB2 connections that contain active threads. It does not report CPU use for connections with no active threads. A warning condition is detected when CPU utilization for an address space that has DB2 connections and threads is in the range of 16% to 20%. The situation's formula is:

\[
\text{KD5_Thread_Exceptions.CPU_Utilization} \geq 16.0 \quad \text{AND} \quad \text{KD5_Thread_Exceptions.CPU_Utilization} < 20.0
\]

**KDP_TRCV_Critical** monitors the amount of data received by distributed threads from a remote DB2 subsystem. A critical condition is detected when the amount of data received by a requestor (allied) or server (distributed) DB2 thread in response to SQL requests reaches 1000 kilobytes. The situation's formula is:
KDP_Thread_Exceptions.Distributed_Receive_Bytes GE 1000

**KD5_TRCV_Warning** monitors the amount of data received by distributed threads from a remote DB2 subsystem. A warning condition is detected when the amount of data received by a requestor (allied) or server (distributed) DB2 thread in response to SQL requests is in the range of 800 to 1000 kilobytes. The situation's formula is:
KDP_Thread_Exceptions.Distributed_Receive_Bytes GE 800 AND
KDP_Thread_Exceptions.Distributed_Receive_Bytes LT 1000

**KDP_TSND_Critical** monitors the amount of data sent by distributed threads to a remote DB2 subsystem. A critical condition is detected when the amount of data sent by a requestor (allied) or server (distributed) DB2 thread in response to SQL requests reaches 1000 kilobytes. The situation's formula is:
KDP_Thread_Exceptions.Distributed_Send_Bytes GE 1000

**KD5_TSND_Warning** monitors the amount of data sent by distributed threads to a remote DB2 subsystem. A warning condition is detected when the amount of data sent by a requestor (allied) or server (distributed) DB2 thread in response to SQL requests is in the range of 800 to 1000 kilobytes. The situation's formula is:
KDP_Thread_Exceptions.Distributed_Send_Bytes GE 800 AND
KDP_Thread_Exceptions.Distributed_Send_Bytes LT 1000

**KDP_Wait_Time_Warning** indicates when the total wait time for a thread exceeded the threshold. The default threshold is 10 seconds. The situation's formula is:
Wait_Time GT 10

**KDP_WCLM_Critical** indicates when a thread has been waiting for more than the specified length of time for a resource to be drained of claimers. The default threshold is 60 seconds. The situation's formula is:
KDP_Thread_Exceptions.Wait_Time_Drain_Claims GE 60.000

**KD5_WCLM_Warning** cautions that a thread has been waiting for more than the specified length of time for a resource to be drained of claimers. The default warning range is 48 to 60 seconds. The situation's formula is:
KD5_Thread_Exceptions.Wait_Time_Drain_Claims GE 48.000 AND
KD5_Thread_Exceptions.Wait_Time_Drain_Claims LT 60.000

**KDP_WDLK_Critical** monitors the state of a thread waiting to acquire a drain lock. A critical condition is detected when the length of time to acquire a drain lock reaches 60 seconds. The situation's formula is:
KDP_Thread_Exceptions.Wait_Time_Drain_Lock GE 60.000

**KD5_WDLK_Warning** monitors the state of a thread waiting to acquire a drain lock. A critical condition is detected when the length of time to acquire a drain lock is in the range of 48 to 60 seconds. The situation's formula is:
KD5_Thread_Exceptions.Wait_Time_Drain_Lock GE 48.000
KDP_WGLK_Critical monitors the state of threads waiting to acquire a global lock. A critical condition is detected when a thread has been waiting for 60 seconds to acquire a global lock in a data sharing environment. The situation’s formula is:

KDP_Thread_Exceptions.Wait_Time_Global_Lock GE 60.000

KDP_WLGQ_Critical indicates that a thread has been waiting for more than the specified length of time for an ARCHIVE LOG MODE (QUIESCE) command to complete. A critical condition is detected when the amount of time that a thread has been suspended because of ARCHIVE LOG MODE (QUIESCE) reaches 60 seconds. The situation’s formula is:

KDP_Thread_Exceptions.Wait_Time_Log_Queue GE 60.000

KDP_WSPS_Critical indicates that a thread has been waiting for more than the specified length of time for the stored procedures address space to become available in order for a stored procedure to be scheduled. A critical condition is detected when the amount of time a thread has been waiting for an available TCB to schedule a stored procedure reaches 60 seconds. The situation’s formula is:

KDP_Thread_Exceptions.Wait_Time_Procedure GE 60.000

KDP_WSRV_Critical indicates that a thread has been waiting for more than the specified length of time for a DB2 service. DB2 service waits include open/close
A critical condition is detected when the amount of time a thread has been waiting for a DB2 service to complete reaches 30 seconds. The situation’s formula is:

\[ \text{KDP\_Thread\_Exceptions\_Wait\_Time\_Service} \geq 00:00:30.000 \]

**KD5\_WSRV\_Warning** indicates that a thread has been waiting for more than the specified length of time for a DB2 service. DB2 service waits include open/close data set, SYSLGRNG update, DFHSM recall, Dataspace Manager services, and define/delete/extend data set. A warning condition is detected when the amount of time a thread has been waiting for a DB2 service to complete ranges from 24 to 30 seconds. The situation's formula is:

\[ \text{KDP\_Thread\_Exceptions\_Wait\_Time\_Service} \geq 00:00:24.000 \]

\[ \text{AND} \]

\[ \text{KDP\_Thread\_Exceptions\_Wait\_Time\_Service} \lt 00:00:30.000 \]

**KDP\_WTRE\_Critical** monitors a thread’s wait time for a resource. A critical condition is detected when a thread has been waiting for 60 seconds. The situation's formula is:

\[ \text{KDP\_Thread\_Exceptions\_Wait\_Time\_Resource} \geq 60.000 \]

**KDP\_WTRE\_Warning** monitors a thread’s wait time for a resource. A critical condition is detected when a thread has been waiting between 48 and 60 seconds. The situation's formula is:

\[ \text{KDP\_Thread\_Exceptions\_Wait\_Time\_Resource} \geq 48.000 \]

\[ \text{AND} \]

\[ \text{KDP\_Thread\_Exceptions\_Wait\_Time\_Resource} \lt 60.000 \]

**OMEGAMON XE for DB2 PE Situations**

OMEGAMON XE for DB2 PE provides numerous predefined situations that you can use to immediately begin monitoring your DB2 managed systems, to monitor and manage, through localized automation, widely dispersed resources, or as models for creating your own situations.

Most of the predefined situations have an alert status of either Critical or Warning. You can view these situations as they augment by selecting the Logical View tab. If you choose to make changes to a predefined situation, we recommend you change a copy and preserve the original situation in the form in which it was shipped.

You can change conditions, relational operators, and compare values in these predefined situations to ones more appropriate to your environment.

**Note:** All of the predefined situations are disabled when shipped.

**IDAA Situations**

Use the series of predefined situations associated with IDAA to begin monitoring your system immediately or as templates for creating your own situations.

The names, descriptions, logic, and threshold values for the situations follow.

**KD5\_IDAA\_Avg\_QueueTime\_Warning** IDAA average query wait time exceeded warning threshold. Average query wait time greater then n seconds. High query
workload impacts query performance. More accelerator capacity might be needed, bigger model or additional accelerator server. n is customer defined.

**KD5_IDAA_Elap_Time_Warning** IDAA accumulated elapsed time exceeded warning threshold. The accumulated elapsed time spent in the accelerator when executing requests from the DB2 subsystem. It could be a run-away queries that trigger this situation.

**KD5_IDAA_Not_Online_Warning** IDAA is not online warning. The Accelerator is not operational. This could be due to planned maintenance, network problems or other issues related to the setup of the Accelerator.

**KD5_IDAA_Queue_Length_Warning** IDAA current queue length exceeded warning threshold. A high number in this counter can be an indication that the accelerator is not able to process the scheduled work efficiently as the current queue length at the accelerator is large. The elements queued can be queries, loads, replication and maintenance tasks.

**KD5_IDAA_Replic_Latency_Warning** IDAA average query wait time exceeded warning threshold. When replication latency too high (5min/300s in this sample), it may impact query result correctness as the data on the Accelerator is not current. Note that sporadically high values of this counter might be acceptable and the value should be observed for a certain interval of time. If the value constantly increases or stay on an elevated value, this indicates a potential problem with the replication setup, that might have to be tuned.

**KD5_IDAA_Replic_State_Warning** There is an issue with incremental update function warning. There is an issue with replication (incremental update) function.

**KD5_IDAA_Req_Fail_Warning** IDAA failed requests exceeded warning threshold. The number of connections that failed when this DB2 system sent requests to the accelerator. Failed requests shouldn't normally occur.

**KD5_IDAA_SQL_Exe_Fail_Warning** IDAA SQL execution failed exceeded warning threshold. The number of SQL statements sent by all DB2 systems since accelerator started that were not successfully executed for any reason.

**KD5_IDAA_Wait_Time_Warning** IDAA wait time spent exceeded warning threshold. The wait time spent in the accelerator when executing requests from the DB2 subsystem. It could be a run-away query that triggers this situation.

**IMS Connections Situations**

Use the series of predefined situations associated with the IMS Connections workspace to begin monitoring your system immediately or as templates for creating your own situations.

The names, descriptions, logic, and threshold values for the situations follow.

**KDP_IMCN_Critical** warns when an IMS region is defined to DB2, but the connection failed. A critical condition is detected when the specified IMS dependent region for the IMSID fails to connect to DB2 because of an error. The situation's formula is:

KDP_IMS_Connections.Defined_Dependent_Regions EQ 0
**KDP_IMND_Critical** warns when no IMS dependent region is defined to DB2. A critical condition is detected when there are no IMS dependent regions defined to DB2 for the IMSID. The situation's formula is:

```
KDP_IMS_Regions.Connection_Status NE 0
```

**Localized Automation Situations**

Use the series of predefined situations associated with the Localized Automation workspace to begin monitoring your system immediately or as templates for creating your own situations.

These situations have a name prefixed by **DB2_CMD**. Localized automation situations return a message to your TSO/E user ID. To use a localized automation situation, you must edit the Action modifier in the situation condition to specify your own TSO/E user ID.

**Log Manager Situations**

Use the series of predefined situations associated with the Log Manager workspace to begin monitoring your system immediately or as templates for creating your own situations.

The name, description, logic, and threshold value for the situation follows.

**KDP_LOGN_Critical** monitors the availability of primary active logs. Active log data sets are allocated to DB2 during start-up processing. When an active log data set is full, it is automatically archived by DB2 to an archive log. When an active log is successfully archived, it is available for reuse.

The availability of active logs is critical to the functioning of DB2. If no active log is available, the DB2 subsystem hangs until one becomes available.

The lack of an active log could be caused by an insufficient number of logs defined at installation time, too small a log data set size, or possibly because of problems encountered during the archive process. A critical condition is detected when the logs available is less than one. The situation's formula is:

```
KDP_SRM_Log_Manager.Logs_Available LT 1
```

**KD5_Percent_Log_Avail_Warning** indicates that the percentage of active logs available is dropping below the threshold. This indicates that the log files might be too small. This exception can happen when logs are filled up faster than they can be archived. The situation's formula is:

```
Percent Logs Available = Logs_Available * 100 / Logs_Defined
```

**Storage Consumption Situations**

Use the series of predefined situations associated with the Storage Consumption workspace to begin monitoring your system immediately or use them as templates for creating your own situations.

The names, descriptions, logic, and threshold values for the situations follow.

**KD5_MVS_Extended_CSA_Warning** monitors extended CSA storage to detect storage shortages. A warning condition is detected when the extended CSA size is more than 300 MB. The situation's formula is:

```
DBM1_Storage.Extended_CSA_Size GT 300
```
KD5_MVS_low_private_Warning monitors low private storage to detect storage shortages. A warning condition is detected when the low private size is less than 1 MB. The situation's formula is:

\[ \text{DBM1\_Storage.24\_Bit\_Low\_Private} \lt 1 \]

KD5_Real_Storage_Usage_Warning monitors real storage to detect storage shortages. A warning condition is detected when the real storage in use is more than 100 MB. The situation's formula is:

\[ \text{DBM1\_Storage.Real\_Storage\_in\_Use} \gt 100 \]

KD5_Storage_Cushion_Warning monitors the storage cushion to detect storage shortages. A warning condition is detected when the storage cushion is less than 300 MB. The situation's formula is:

\[ \text{DBM1\_Storage.Storage\_cushion} \lt 300 \]

KD5_Total_DBM1_Warning monitors total DBM1 storage to detect storage shortages. A warning condition is detected when the total DBM1 storage is more than 100 MB. The situation's formula is:

\[ \text{DBM1\_Storage.Total\_DBM1\_Storage} \gt 100 \]

**Subsystem Management Situations**

Use the series of predefined situations associated with the Subsystem Management workspace to begin monitoring your system immediately or as templates for creating your own situations.

The names, descriptions, logic, and threshold values for the situations follow.

KD5_DBA_T_Wait_Warning indicates the percentage of DBA_T (Database Access Thread) that has to wait because MAXDBA_T exceeded the threshold. A critical condition is detected when the percentage of active background connections to DBA_T_Wait reaches 0%. The situation's formula is:

\[ \text{DB2\_System\_States.DB\_Wait\_Percent} \geq 0 \]

KD5_DSMAX_Approach_Max_Warning indicates when the maximum percentage of open data sets exceeded the threshold. A critical condition is detected when the percentage of open data sets to DSMAX is approaching 80%. The situation's formula is:

\[ \text{DB2\_System\_States.DSMAX\_Approaching\_Max} \geq 80.0 \]

KDP_IDBK_Critical monitors how close DB2 is to the maximum background connections allowed. A critical condition is detected when the percentage of active background connections to IDBACK reaches 90%. The situation's formula is:

\[ \text{KDP\_SRM\_Subsystem.Background\_Utilization} \geq 90.0 \]

KDP_IDBK_Warning monitors how close DB2 is to the maximum background connections allowed. A warning condition is detected when the percentage of active background connections to IDBACK is in the range of 72% to 90%. The situation's formula is:

\[ \text{KDP\_SRM\_Subsystem.Background\_Utilization} \geq 72.0 \]

\[ \text{AND} \]

\[ \text{KDP\_SRM\_Subsystem.Background\_Utilization} \lt 90.0 \]
KDP_IDFR_Critical provides information about how close DB2 is to the maximum foreground connections allowed. A critical condition is detected when the percentage of active foreground connections to IDFORE reaches 85%. The situation's formula is:

\[ \text{KDP\_SRM\_Subsystem.\text{Foreground\_Utilization}} \geq 85.0 \]

KDP_IDFR_Warning provides information about how close DB2 is to the maximum foreground connections allowed. A warning condition is detected when the percentage of active foreground connections to IDFORE is in the range of 68% to 85%. The situation's formula is:

\[ \text{KDP\_SRM\_Subsystem.\text{Foreground\_Utilization}} \geq 68.0 \]

AND

\[ \text{KDP\_SRM\_Subsystem.\text{Foreground\_Utilization}} < 85.0 \]

KD5_LOCK_ESCAL_EXCL_Warning indicates when the number of times lock escalation exclusive happened exceeded the threshold. A warning condition is detected when the number of count of lock escalations to exclusive mode is greater than 20. The situation's formula is:

\[ \text{DB2\_System\_States.\text{Lock\_Escalation\_Excl}} \geq 20.0 \]

KD5_RID_Fallback_Warning indicates when the number of times RID Pool fallback exceeded the threshold. A warning condition is detected when the number of times RID fallback is greater than 20. The situation's formula is:

\[ \text{DB2\_System\_States.\text{RIDPool\_Fail\_No\_Storage}} \geq 20 \]

KD5_CONDBAT_Appr_Max_Warning indicates that the number of DBAT connections is approaching DSNZPARM CONDBAT. If this condition is detected, make sure CONDBAT is defined accurately for remote connections. The situation's formula is:

\[ \text{DB2\_SRM\_Subsystem.\text{DBAT\_Conn\_Utilization}} \geq 70 \]

**System Status Situations**

Use the series of predefined situations associated with the System Status workspace to begin monitoring your system immediately or as templates for creating your own situations.

The names, descriptions, logic, and threshold values for the situations follow.

KD5_LPAR_CPU_Warning monitors the processor consumption for the LPAR that is being monitored. A warning condition is detected when the consumption reaches 70% of the capacity of the processor. The situation's formula is:

\[ \text{ZOS\_System\_Statistics.\text{CPU\_Utilization\_LPAR}} \geq 70 \]

KDP_ARCV_Critical monitors the status of a DB2 recovery log archive. A critical condition is detected when an active DB2 log is full and must be archived, and a tape mount is outstanding for the archive log. The situation's formula is:

\[ \text{KDP\_System\_States.\text{Waiting\_On\_Tape\_Mount}} = \text{TRUE} \]

KDP_ARCV_Warning monitors the status of a DB2 recovery log archive. A warning condition is detected when an active DB2 log is full and must be archived, and a tape mount is outstanding for the archive log. The situation's formula is:

\[ \text{KDP\_System\_States.\text{Waiting\_On\_Tape\_Mount}} = \text{TRUE} \]
**KDP_DDFS_Critical** monitors the status of the distributed database facility (DDF), detecting a critical condition when the DDF is inactive. This condition could indicate that the DDF terminated abnormally or that it was not started. The situation's formula is:

\[ \text{KDP System States.Dist_DB_Inactive EQ TRUE} \]

**KDP_DDFS_Warning** monitors the status of the distributed database facility (DDF), detecting a warning condition when the DDF is inactive. This condition could indicate that the DDF terminated abnormally or that it was not started. The situation's formula is:

\[ \text{KDP System States.Dist_DB_Inactive EQ TRUE} \]

**KDP_DRCV_Critical** monitors the rate of data received by a requestor (local) or server (remote) DB2 subsystem in response to SQL requests. A critical condition is detected when the rate reaches 1000 kilobytes/second. The situation's formula is:

\[ \text{KDP System States.Dist_Receive_Rate GE 1000.0} \]

**KDP_DRCV_Warning** monitors the rate of data received by a requestor (local) or server (remote) DB2 subsystem in response to SQL requests. A warning condition is detected when the rate is in the range of 800 to 1000 kilobytes/second. The situation's formula is:

\[ \text{KDP System States.Dist_Receive_Rate GE 800.0 AND KDP System States.Dist_Receive_Rate LT 1000.0} \]

**KDP_DSND_Critical** monitors the amount of data sent to a requestor (local) or server (remote) DB2 subsystem. A critical condition is detected when the rate reaches 1000 kilobytes/second. The situation's formula is:

\[ \text{KDP System States.Dist_Send_Rate GE 1000.0} \]

**KDP_DSND_Warning** monitors the amount of data sent to a requestor (local) or server (remote) DB2 subsystem. A warning condition is detected when the rate is in the range of 800 to 1000 kilobytes/second. The situation's formula is:

\[ \text{KDP System States.Dist_Send_Rate GE 800.0 AND KDP System States.Dist_Send_Rate LT 1000.0} \]

**KDP_EDMU_Critical:**

- For DB2 9 or below: KDP_EDMU_Critical monitors the usage of environmental descriptor manager (EDM) pool pages. DB2 uses the EDM pool to manage and contain cursor tables (CTs) and package tables (PTs).
- For DB2 10 or later: KDP_EDMU_Critical monitors the usage of database descriptor (DBD) pool pages. DB2 uses the DBD pool to manage and contain database descriptors (DBDs).

A critical condition is detected when the percentage in use based on the total pool size reaches 90%. The situation's formula is:

\[ \text{KDP System States.EDM_Utilization GE 90.0} \]

- For DB2 9 or below: KDP_EDMU_Critical monitors the usage of environmental descriptor manager (EDM) pool pages. DB2 uses the EDM pool to manage and contain cursor tables (CTs) and package tables (PTs).
• For DB2 10 or later: KDP_EDMU_Critical monitors the usage of database descriptor (DBD) pool pages. DB2 uses the DBD pool to manage and contain database descriptors (DBDs).

A warning condition is detected when the percentage in use based on the total pool size is in the range of 72% to 90%. The situation’s formula is:

\[
\text{KDP\_System\_States.EDM\_Utilization} \geq 72.0 \\text{ AND } \text{KDP\_System\_States.EDM\_Utilization} < 90.0
\]

KDP_EDMU_Warning monitors the usage of environmental descriptor manager (EDM) pool pages. DB2 uses the EDM pool to manage and contain database descriptors (DBDs), cursor tables (CTs), skeleton cursor tables (SKCTs), package tables (PTs), skeleton package tables (SKPTs), and dynamic SQL caches (DSCs). A warning condition is detected when the percentage in use based on the total pool size is in the range of 72% to 90%. The situation’s formula is:

\[
\text{KDP\_System\_States.EDM\_Utilization} \geq 72.0 \\text{ AND } \text{KDP\_System\_States.EDM\_Utilization} < 90.0
\]

KDP_GTRC_Critical monitors the status of the DB2 global trace. It should not be active unless there is a specific purpose, such as diagnostic testing. The DB2 global trace can increase performance overhead. A critical condition is detected when the DB2 global trace is active. The situation’s formula is:

\[
\text{KDP\_System\_States.Global\_Trace\_Active} = \text{TRUE}
\]

KDP_GTRC_Warning monitors the status of the DB2 global trace. It should not be active unless there is a specific purpose, such as diagnostic testing. The DB2 global trace can increase performance overhead. A warning condition is detected when the DB2 global trace is active. The situation’s formula is:

\[
\text{KDP\_System\_States.Global\_Trace\_Active} = \text{TRUE}
\]

KDP_INDT_Critical monitors the number of in doubt threads in the DB2 system. A critical condition is detected when the number of terminated threads that are in doubt reaches two. The situation’s formula is:

\[
\text{KDP\_System\_States.Indoubt\_Threads} \geq 2
\]

KDP_INDT_Warning monitors the number of in doubt threads in the DB2 system. A warning condition is detected when the number of terminated threads that are in doubt reaches two. The situation’s formula is:

\[
\text{KDP\_System\_States.Indoubt\_Threads} \geq 2
\]

KDP_MDBT_Critical monitors the percentage of maximum allowed database access threads that are in use. The maximum is set in DSNZPARM by the MAXDBAT parameter. When the MAXDBAT limit is reached, conversations are queued (waiting on DBAT allocation), which can greatly increase response time. A critical condition is detected when the number of distributed database access threads in use reaches 85% of the preset maximum. The situation’s formula is:

\[
\text{KDP\_System\_States.DB\_Wait\_Percent} \geq 85.0
\]

KDP_MDBT_Warning monitors the percentage of maximum allowed database access threads that are in use. The maximum is set in DSNZPARM by the MAXDBAT parameter. When the MAXDBAT limit is reached, conversations are queued (waiting on DBAT allocation), which can greatly increase response time. A
warning condition is detected when the number of distributed database access threads in use is in the range of 68% to 85% of the preset maximum. The situation's formula is:

\[
\text{KDP\_System\_States\_DB\_Wait\_Percent} \geq 68.0 \\
\text{AND} \\
\text{KDP\_System\_States\_DB\_Wait\_Percent} < 85.0
\]

**KDP\_MDBW\_Critical** monitors the number of database access threads that are waiting because MAXDBAT was reached. Queuing of conversations when the MAXDBAT limit is reached can greatly impact response time. A critical condition is detected when the number of database access threads that are waiting reaches two. The situation's formula is:

\[
\text{KDP\_System\_States\_Thread\_Wait\_Limit} \geq 2
\]

**KDP\_MDBW\_Warning** monitors the number of database access threads that are waiting because MAXDBAT was reached. Queuing of conversations when the MAXDBAT limit is reached can greatly impact response time. A warning condition is detected when the number of database access threads that are waiting is in the range of one to two. The situation's formula is:

\[
\text{KDP\_System\_States\_Thread\_Wait\_Limit} \geq 1 \text{ AND } \text{KDP\_System\_States\_Thread\_Wait\_Limit} < 2
\]

**KDP\_SPAC\_Critical** monitors the number of ASIDs executing stored procedures. Stored procedures can be executed in a DB2 stored procedure address space and in any WLM-managed stored procedure address space. The threshold is a count of address spaces capable of executing stored procedures. A critical condition is detected when the count reaches five. The situation's formula is:

\[
\text{KDP\_System\_States\_ASIDs\_Stored\_Procedures} \geq 5
\]

**KDP\_SPAC\_Warning** monitors the number of ASIDs executing stored procedures. Stored procedures can be executed in a DB2 stored procedure address space and in any WLM-managed stored procedure address space. The threshold is a count of address spaces capable of executing stored procedures. A warning condition is detected when the count is in the range of two to five. The situation's formula is:

\[
\text{KDP\_System\_States\_ASIDs\_Stored\_Procedures} \geq 2 \text{ AND } \text{KDP\_System\_States\_ASIDs\_Stored\_Procedures} < 5
\]

**KDP\_STPE\_Critical** monitors the number of stored procedures executing. The threshold is expressed as a count of stored procedures currently executing. A critical condition is detected when the count reaches 20. The situation's formula is:

\[
\text{KDP\_System\_States\_Active\_Stored\_Procedures} \geq 20
\]

**KDP\_STPE\_Warning** monitors the number of stored procedures executing. The threshold is expressed as a count of stored procedures currently executing. A warning condition is detected when the count is in the range of 10 to 20. The situation's formula is:

\[
\text{KDP\_System\_States\_Active\_Stored\_Procedures} \geq 10 \text{ AND } \text{KDP\_System\_States\_Active\_Stored\_Procedures} < 20
\]
**KDP_SUSL_Critical** monitors the number of threads that are unable to continue execution because the number of lock waits exceeds the specified threshold. A critical condition is detected when the count reaches five suspended threads. The situation's formula is:

\[
\text{KDP\_System\_States.Thread\_Wait\_Lock} \geq 5
\]

**KDP_SUSL_Warning** monitors the number of threads that are unable to continue execution because the number of lock waits exceeds the specified threshold. A critical condition is detected when the count is in the range of four to five suspended threads. The situation's formula is:

\[
\text{KDP\_System\_States.Thread\_Wait\_Lock} \geq 4 \\&\& \text{KDP\_System\_States.Thread\_Wait\_Lock} < 5
\]

**KDP_THDQ_Critical** detects users waiting for thread creation to occur. This exception may indicate that DB2 reached the CTHREAD value that controls the number of active threads. A critical condition is detected when the number of users waiting for create thread processing reaches two. The situation's formula is:

\[
\text{KDP\_System\_States.User\_Waiting\_Threads} \geq 2
\]

**KDP_THDQ_Warning** detects users waiting for thread creation to occur. This exception may indicate that DB2 reached the CTHREAD value that controls the number of active threads. A warning condition is detected when the number of users waiting for create thread processing is in the range of one to two. The situation's formula is:

\[
\text{KDP\_System\_States.User\_Waiting\_Threads} \geq 1 \\&\& \text{KDP\_System\_States.User\_Waiting\_Threads} < 2
\]

**KDP_TMAX_Critical** monitors the percentage of active threads, by indicating when the number of active threads approaches the maximum number allowed. DB2 thread concurrency can be controlled by the CTHREAD value. CTHREAD defines the maximum number of concurrent threads allowed. A critical condition is detected when the percentage of active threads to the specified maximum reaches 85%. The situation's formula is:

\[
\text{DB2\_SRM\_Subsystem.Thread\_Utilization} \geq 85
\]

**KDP_TMAX_Warning** monitors the percentage of active threads, by indicating when the number of active threads approaches the maximum number allowed. DB2 thread concurrency can be controlled by the CTHREAD value. CTHREAD defines the maximum number of concurrent threads allowed. A warning condition is detected when the percentage of active threads to the specified maximum is in the range of 68% to 85%. The situation's formula is:

\[
\text{DB2\_SRM\_Subsystem.Thread\_Utilization} \geq 68 \\&\& \text{DB2\_SRM\_Subsystem.Thread\_Utilization} < 85
\]

**KDP_TRGD_Critical** monitors the depth of the largest trigger stack. A critical condition is detected when the number of triggers in the largest trigger stack reaches two. The situation's formula is:

\[
\text{KDP\_System\_States.Trigger\_Depth} \geq 2
\]
**KDP_TRGD_Warning** monitors the depth of the largest trigger stack. A warning condition is detected when the number of triggers in the largest trigger stack is in the range of one to two. The situation's formula is:

\[ KDP\_System\_States.Trigger\_Depth \geq 1 \]
\[ \text{AND} \]
\[ KDP\_System\_States.Trigger\_Depth < 2 \]

**KDP_TRGE_Critical** monitors the number of triggers. A critical condition is detected when the number of active triggers reaches 20. The situation's formula is:

\[ KDP\_System\_States.Active\_Triggers \geq 20 \]

**KDP_TRGE_Warning** monitors the number of triggers. A warning condition is detected when the number of active triggers is in the range of 10 to 20. The situation's formula is:

\[ KDP\_System\_States.Active\_Triggers \geq 10 \]
\[ \text{AND} \]
\[ KDP\_System\_States.Active\_Triggers < 20 \]

**KDP_UDFE_Critical** monitors the number of user-defined functions executing. A critical condition is detected when the number of user-defined functions reaches 20. The situation's formula is:

\[ KDP\_System\_States.Active\_User\_Functions \geq 20 \]

**KDP_UDFE_Warning** monitors the number of user-defined functions executing. A warning condition is detected when the number of user-defined functions is in the range of 10 to 20. The situation's formula is:

\[ KDP\_System\_States.Active\_User\_Functions \geq 10 \]
\[ \text{AND} \]
\[ KDP\_System\_States.Active\_User\_Functions < 20 \]

**KDP_UFAC_Critical** monitors the number of ASIDs executing user functions. A critical condition is detected when a count of address spaces capable of executing user-defined functions reaches five. User-defined functions can be executed only from WLM-managed stored procedure address spaces. The situation's formula is:

\[ KDP\_System\_States.ASIDs\_User\_Functions \geq 5 \]

**KDP_UFAC_Warning** monitors the number of ASIDs executing user functions. A warning condition is detected when a count of address spaces capable of executing user-defined functions is in the range of two to five. User-defined functions can be executed only from WLM-managed stored procedure address spaces. The situation's formula is:

\[ KDP\_System\_States.ASIDs\_User\_Functions \geq 2 \]
\[ \text{AND} \]
\[ KDP\_System\_States.ASIDs\_User\_Functions < 5 \]

**Thread Situations**

Use the series of predefined situations associated with the thread workspaces to begin monitoring your system immediately or as templates for creating your own situations.
You can use these situations to begin monitoring almost immediately, or as a template for creating your own situations. All of the predefined situations are disabled when shipped. The name, description, logic, and threshold value for the situation follows.

**KD5_CPU_Time** monitors the state of the CPU time. A warning is detected when a thread using CPU_Time is greater than 00:00:05.000. The situation formula is:

*IF *VALUE THREADDETAILS.CPU_Time *GE 5"

**KD5_In_DB2_IIP_CPU_Time** monitors the amount of time that DB2 has accumulated for a thread in the zIIP processor. A warning is detected when a thread using In_DB2_IIP_CPU_Time is greater than 00:00:02.000. The situation formula is:

*IF *VALUE THREADDETAILS.In_DB2_IIP_CPU *GE

**Utility Jobs Situations**

Use the series of predefined situations associated with the Utility Jobs workspace to begin monitoring your system immediately or as templates for creating your own situations.

The name, description, logic, and threshold value for the situation follows.

**KDP_UTIS_Critical** monitors the state of DB2 utilities. A critical condition is detected when a DB2 utility was started but did not finish running because of abnormal termination. Restart the utility with the corresponding phase. The situation's formula is:

KDP_SRM_UTL.Stat EQ 0

**Volume Activity Situations**

Use the series of predefined situations associated with the Volume Activity workspace to begin monitoring your system immediately or as templates for creating your own situations.

The names, descriptions, logic, and threshold values for the situations follow.

**KDP_VDIO_Critical** monitors volume DB2 I/O rate activity. A critical condition is detected when the DB2 I/O rate per second for the volume reaches 50. The situation's formula is:

KDP_Volume_Activity.DB2_IO_Percent GE 50

**KDP_VDIO_Warning** monitors volume DB2 I/O rate activity. A warning condition is detected when the DB2 I/O rate per second for the volume is in the range of 40 to 50. The situation's formula is:

KDP_Volume_Activity.DB2_IO_Percent GE 40 AND KDP_Volume_Activity.DB2_IO_Percent LT 50

**KDP_VEDR_Critical** monitors volume data set extend activity. A critical condition is detected when the number of DB2 extents on the volume divided by the number of DB2 data sets reaches ten. The situation's formula is:

KDP_Volume_Activity.Extents_per_Dataset_Ratio GE 10.0
**KDP_VEDR_Warning** monitors volume data set extend activity. A warning condition is detected when the number of DB2 extents on the volume divided by the number of DB2 data sets is in the range of eight to ten. The situation's formula is:

\[
\text{KDP\_Volume\_Activity}\text{.Extents\_per\_Dataset\_Ratio} \geq 8.0 \text{ AND } \text{KDP\_Volume\_Activity}\text{.Extents\_per\_Dataset\_Ratio} < 10.0
\]

**KDP_VSRV_Critical** monitors volume service time. A critical condition is detected when the service time for the volume reaches 25 milliseconds. The situation's formula is:

\[
\text{KDP\_Volume\_Activity}\text{.Volume\_Service\_Time} \geq 25.0
\]

**KDP_VSRV_Warning** monitors volume service time. A warning condition is detected when the service time for the volume is in the range of 20 to 25 milliseconds. The situation's formula is:

\[
\text{KDP\_Volume\_Activity}\text{.Volume\_Service\_Time} \geq 20.0 \text{ AND } \text{KDP\_Volume\_Activity}\text{.Volume\_Service\_Time} < 25.0
\]

**KDP_VTIO_Critical** monitors volume total I/O rate activity. A critical condition is detected when the total number of I/Os per second reaches 60. The situation's formula is:

\[
\text{KDP\_Volume\_Activity}\text{.Volume\_Total\_IO\_Rate} \geq 60
\]

**KDP_VTIO_Warning** monitors volume total I/O rate activity. A warning condition is detected when the total number of I/Os per second is in the range of 48 to 60. The situation's formula is:

\[
\text{KDP\_Volume\_Activity}\text{.Volume\_Total\_IO\_Rate} \geq 48 \text{ AND } \text{KDP\_Volume\_Activity}\text{.Volume\_Total\_IO\_Rate} < 60
\]

**KDP_VUTL_Critical** monitors volume utilization. A critical condition is detected when a volume's utilization reaches 30%. The situation's formula is:

\[
\text{KDP\_Volume\_Activity}\text{.Volume\_Utilization} \geq 30
\]

**KDP_VUTL_Warning** monitors volume utilization. A warning condition is detected when a volume's utilization is in the range of 24% to 30%. The situation's formula is:

\[
\text{KDP\_Volume\_Activity}\text{.Volume\_Utilization} \geq 24 \text{ AND } \text{KDP\_Volume\_Activity}\text{.Volume\_Utilization} < 30
\]

### Canceling Threads

The thread attribute groups DB2_Thread_Exceptions, ALL_THREADS, and Thread_Detail provide the cancel thread command attribute **Cancel_Command**.

Use **Cancel_Command** to cancel a thread via Take Action. Take Action is available from a table view or Situation Action.
The cancel thread command via Take Action in TEP uses TEP userids for security. For more information, refer to Take Action commands with TEP userids.

Performance Expert Client

This information describes how to monitor and tune IBM Database 2 products and create reports and traces using Performance Expert Client, which is one of the graphical interfaces of the following products:

- IBM OMEGAMON for Db2 Performance Expert on z/OS
- IBM OMEGAMON for Db2 Performance Monitor on z/OS

This information helps DB2 users perform the following tasks:
- Determine total DB2 performance and efficiency
- Analyze and improve SQL statements
- Tune DB2 systems and DB2 threads
- Identify the cause of performance problems

This information describes the individual tasks that you can perform with Performance Expert Client. For detailed information about the individual windows and the fields, buttons, and icons in the windows, refer to the Online Help. See "Getting help” on page 2507 for information on how to request help.

Always check the IBM DB2 and IMS Tools Library web page and the Tivoli library page for the most current version of this information:

- OMEGAMON for Db2 Performance Expert on z/OS (PDFs and Techdocs on Db2 Tools Product Page)
- OMEGAMON for Db2 Performance Monitor on z/OS (PDFs and Techdocs on Db2 Tools Product Page)

Who should read this information

This information is intended for those persons responsible for monitoring and tuning IBM Database 2 products and assumes a working knowledge of z/OS and OS/390®.

Before you begin

This section provides the information you need before you start working with OMEGAMON for Db2 PE.

It gives you an overview of OMEGAMON for Db2 PE and describes the main components and features of Performance Expert Client, which is one of the graphical interfaces of OMEGAMON for Db2 PE.

What does OMEGAMON for Db2 PE do?

OMEGAMON for Db2 PE is a host-based performance analysis and tuning tool for z/OS environments. Its main objective is to simplify DB2 performance management.

OMEGAMON for Db2 PE lets you monitor threads, system Statistics, and system parameters by using a single tool. It integrates performance monitoring, reporting, buffer pool analysis, and a Performance Warehouse function. It also provides a single overview system that monitors all DB2 subsystems and DB2 Connect gateways in a consistent way.
OMEGAMON for Db2 PE offers the following advantages:

- Performance analysis and tuning of DB2 and DB2 applications.
- Expert analysis, a real-time online monitor, and a wide range of reports for analyzing and optimizing DB2 applications and SQL statements.
- Performance Warehouse feature for storing performance data and analysis functions, and for collecting report data.
- Definitions and usage of analysis functions, such as rules of thumb and queries, to identify performance bottlenecks.
- A starter set of smart features that provide recommendations for system tuning to gain optimum throughput.
- An explain feature.
- A Reporting function that presents detailed information about DB2 events involving CPU times, buffer pool usage, locking, I/O activity, and more.
- A buffer pool analysis function that collects data and provides reports on related event activity to get information about current buffer pool behavior and to simulate anticipated future behavior. It can provide these reports in the form of tables, pie charts, and diagrams.
- Exception reports for common performance problems to help identify and quantify excessive CPU and elapsed time on a plan and package basis.
- Monitoring connections of remote applications using Performance Expert Agent for DB2 Connect Monitoring.

The stand-alone product OMEGAMON for Db2 PM provides a subset of the functions that are provided when you install OMEGAMON for Db2 PE. For a detailed description of the different capabilities, refer to the following Web site:

- OMEGAMON for Db2 Performance Expert on z/OS (PDFs and Techdocs on Db2 Tools Product Page)
- OMEGAMON for Db2 Performance Monitor on z/OS (PDFs and Techdocs on Db2 Tools Product Page)

The main components of OMEGAMON for Db2 PE are:

- Performance Expert Client which is one of the graphical interfaces of OMEGAMON for Db2 PE
- OMEGAMON Collector
- Performance Expert Agent for DB2 Connect Monitoring

**Related reading:** For information about the OMEGAMON Collector and Performance Expert Agent for DB2 Connect Monitoring, refer to Configuration and Customization

**Components and features of Performance Expert Client**

This topic introduces the main components and features of Performance Expert Client, which is one of the graphical interfaces of OMEGAMON for Db2 PE.

With Performance Expert Client you can monitor and analyze the performance of an application online and handle exception notifications. The Performance Warehouse provides a process-oriented view of the performance analysis tasks. It helps you manage and analyze buffer pools more efficiently by providing specific recommendations to adjust buffer pool sizes and threshold values.
Online monitoring and reporting:

Performance Expert Client enables online monitoring and reporting, including exception notification handling.

You can use the online monitoring and reporting component to:
- Determine the total DB2 system performance and efficiency.
- Measure the performance of an application.
- Review the resources used by an application.
- Evaluate an application’s impact on other applications and the DB2 system.
- Identify the cause of performance problems by checking certain thread-activity and Statistics fields for exceptions and listing the occurrence of specific events.
- Determine the tuning requirements for DB2.
- View performance data graphically.
- Analyze and improve SQL statements by using Explain products.

For more information refer to “Using Explain products to analyze and improve SQL statements” on page 2544.
- Monitor DB2 Connect gateways, including system-related information.

This component is similar to the host-based (ISPF) Online Monitor. It has some advantages over the host-based Online Monitor, such as:
- The graphics improve the representation of the relationship between counters and the trends and evolution of counters.
- You can monitor several DB2 systems at the same time.
- When DB2 performance is not satisfactory, you receive tuning recommendations.

Performance Warehouse management:

Performance Warehouse provides a process-oriented view of the performance analysis tasks.

It allows you to automate tasks that previously required user interaction, such as loading DB2 data into the Performance Warehouse database or generating reports.

Using the Performance Warehouse window, you can define, schedule, and run processes that automate the following tasks:
- Generating DB2 performance data
- Loading this data into the Performance Warehouse database
- Creating reports on the data in the Performance Warehouse database
- Collecting report data

You can then use rules of thumb and queries to analyze and evaluate the data in the Performance Warehouse database.

Samples of processes, rules of thumb, and queries are provided to help you get started.

Buffer pool analysis:

Buffer pool analysis helps you manage buffer pools more efficiently by providing specific recommendations to adjust buffer pool sizes and threshold values.
If you are interested in background information about current buffer pool behavior, you can get in-depth statistical data, comprehensive reports, and easy-to-read graphic information for all buffer pools and their objects.

Buffer pool analysis helps you tune DB2 buffer pools and get the most out of your system resources. It lets you optimize memory usage by specifically recommending which buffer pools to change and by how much.

It allows you to:
- Save central processing unit (CPU) cycles
- Improve response times and elapsed times
- Simulate buffer pool behavior

**Related reading:** This information does not cover buffer pool analysis. For information about how to use this component, see [Buffer Pool Analyzer User’s Guide](#).

**Getting started**

This section describes the tasks you need to perform before you can start working with OMEGAMON for Db2 PE.

Before you start working with OMEGAMON for Db2 PE, ensure that you have the correct authorization and DB2 privileges to perform monitoring tasks.

**Related reading:** To find out what authorization and DB2 privileges you need, see [Configuration and Customization](#).

Before you start working with OMEGAMON for Db2 PE, ensure that all DB2 traces are running. If you do not get any monitoring data, check if one or more DB2 traces are switched off.

**Starting Performance Expert Client:**

You can start Performance Expert Client directly or from the DB2 Control Center.

If you installed a firewall on your workstation, ensure that Performance Expert Client has correct access permissions. Otherwise, Performance Expert Client does not work correctly.

You can start Performance Expert Client directly in one of the following ways:
- Double-click the **IBM DB2 Performance Expert for zOS** icon on your desktop.
- Click **Start > All Programs > IBM DB2 Performance Expert for zOS > IBM DB2 Performance Expert for zOS**.

To start Performance Expert Client from the DB2 Control Center, click the toolbar button.

If you want to start Performance Expert Client more than once on a workstation and on the same operating system, Performance Expert Client must run under different user IDs. For example, if you want to start Performance Expert Client three times in such an environment, Performance Expert Client must run under three different user IDs or on different workstations.

After you start Performance Expert Client, the System Overview window is displayed, which is the main window.
Working with the System Overview window:

The System Overview window shows the main performance information about the DB2 systems that you monitor and to which you are logged on. From this window, you can access all monitoring functions that are supported by Performance Expert.

You can view performance information for all DB2 systems or for a specific DB2 system. If a member is in DSG, you can view the information for each member. Figure 170 shows the KPIs page of the System Overview window after you logged on to a DB2 subsystem.

![System Overview window](image)

Figure 170. System Overview window

The folders pane on the left lets you select the information level. The contents pane on the right shows the performance information for the selected information level. The performance information is shown on the following tabbed pages:

- **The KPIs page** shows the counters that are key performance indicators (KPIs) for the selected information level. Many of these counters have cumulative values, where the delta between the values of the last two snapshots is calculated. When you move the cursor over a KPI, hover help is displayed, which contains a short description of the KPI. Double-clicking a KPI takes you to the pane or page of the Statistics Details or System Parameters window that contains this counter. The counter is then highlighted in green.

- **The Data Views page** shows the performance graphs for the selected information level. Performance graphs show Statistics information in graphical format. You create these performance graphs as data views in the System Health window.
and make them available in the System Overview window. When you click and move the cursor over a data view, the values for the counters that are represented by the data view are shown.

To open the pane or page of the Statistics Details that contains the counters in the data view, right-click the data view and then select **Show in Statistics Details**. To open the **System Health** window, in which you created the data view, right-click the data view and then select **Show in System Health**.

- **The Exceptions page** shows the last 10 periodic exceptions and the last 10 event exceptions for the selected information level.

To view more details on an event exception or a periodic exception, do one of the following:
- Click the exception. The exception details are shown at the bottom of the page.
- Double-click the exception. The appropriate Details window opens.
- Delete link removes the entry from the table.
- New exceptions are shown in red. Exceptions that you have double-clicked to display details are shown in grey.

The toolbar buttons at the top of the window take you directly to the monitoring functions.

Specific icons and colors indicate whether the value of a counter falls below or above a warning or problem threshold. Event exceptions are also indicated by an icon. You are only informed of a warning or problem if the warning or problem threshold is active and if you activated the threshold set that contains this warning or problem threshold. For more information, refer to “**Processing periodic exceptions**” on page 2539.

The data in the System Overview window is refreshed at the rate that you specify for a DB2 system.

**Defining the DB2 systems that must be monitored:**

To monitor a DB2 subsystem or DB2 Connect gateway, you must enable Performance Expert Client to access the performance data of this DB2 system which is described in the following sections.

**Note:** “**Changing the properties of a DB2 subsystem**” on page 2503 and “**Changing the properties of a DB2 Connect gateway**” on page 2504 show how to change the properties of a DB2 system.

**Defining a DB2 subsystem:**

Each OMEGAMON Collector monitors the DB2 subsystem on which it is installed. The OMEGAMON Collector collects the performance data of the subsystem and stores it in its DB2PM database.

To monitor a DB2 subsystem from Performance Expert Client, you must establish a connection between Performance Expert Client and the OMEGAMON Collector installed on the DB2 subsystem so that Performance Expert Client can access the performance data of this subsystem. You do this by defining the DB2 subsystem:

1. On the System Overview window, click **Monitor > New DB2 System**.
   
   The New DB2 System wizard is displayed.

2. On the Object tab, click **DB2 on z/OS, OS/390 systems**, and then click **Next**.
3. On the Data Collector tab, specify the connection to the DB2 subsystem on which OMEGAMON Collector is installed:

   **Host**  The MVS host name.

   **Port**  Specify the port number to which the Performance Expert Client can connect when communicating with the OMEGAMON Collector. The port number specifies the TCP/IP port on which the server listens for incoming sessions of Performance Expert Client for the specified DB2 subsystem.

   If you do not know this information, contact your database administrator (DBA).

4. Click Next.

5. On the DB2 Subsystem tab, do one of the following:
   - Click **Retrieve** to use the DB2 subsystem information defined on the host. The Logon window is displayed.
   - In the **User ID** field, type your MVS host user ID. In the **Password** field, type your password. Then click **OK**.

   The DB2 Subsystem page of the New DB2 System window is displayed. For the **Name** field, OMEGAMON for Db2 PE supplies the same value as for the **Database alias** field. Ensure that the name is unique throughout Performance Expert Client.

   - Type the values for the following fields:
     - **Name**  Type a name for the DB2 subsystem that is unique throughout all DB2 subsystems. If you clicked Retrieve, this field shows the same value as the Database alias field. Ensure that this value is unique throughout Performance Expert Client.
     - **Database alias**  Type the alias of the DB2 subsystem location. If you clicked Retrieve, this field shows the alias of the DB2 subsystem location as defined on the host. The specified alias will appear in the folders pane of the System Overview window.
     - **MVS system**  The name of the MVS system.
     - **Data Sharing Group**  If the DB2 subsystem is a member of a data sharing group, type the group name here.
     - **Data Sharing Member**  If the DB2 subsystem is a member of a data sharing group, type the member name here.
     - **Description**  Use this field for a description of the DB2 subsystem. This field is optional.
     - **Local DB alias**  If you want to use Query Workload Tuner, type the local database alias of the DB2 subsystem.

6. Click Next.

7. On the Performance Warehouse tab, you can associate a Performance Warehouse system with the DB2 subsystem you are defining. You must specify a Performance Warehouse system if you want to create SQL activity traces.
In the **Database alias** field, type the alias of the Performance Warehouse database that is maintained by the OMEGAMON Collector that monitors this DB2 subsystem. This is the database alias that you specified when cataloging the DB2PM database of the OMEGAMON Collector by using the Configuration Assistant of DB2.

**Related reading:** For further information about cataloging the DB2PM database, see [Configuration and Customization](#).

8. Click **Next**.

9. On the DSM Information tab, you specify the settings for the Data Server Manager (DSM) Server:

   **Protocol**
   - The transfer protocol to be used for the Data Server Manager (DSM) Server. This can be HTTP or HTTPS.

   **DSM Server**
   - Shows the host name of the DSM Server. When the Protocol field has been set to HTTPS, this value should be matched to the host name specified in the public key stored in TrustStore.

   **DSM Port**
   - The port number for the Data Server Manager.

   **TrustStore**
   - The path to the TrustStore file. TrustStore should have the public key for the host name in the DSM Server field. If the Protocol is HTTP, this field is greyed out.

   **DSM user**
   - The user ID for logging into DSM.

   **DSM user password**
   - The user password for logging into DSM.

   **DSM connection**
   - The profile name for the monitored subsystem. For example, VB6A_RS29. When the SSL Secured checkbox is checked, this profile name is the Database connection name in the DSM Database Connections, and this profile should have SSL connectivity as JDBC security.

   **SSL Secured**
   - This checkbox enables SSL Secured connections. Note: there must be a predefined DSM connection in order to use SSL.

   **JDBC URL**
   - The URL for the monitored Db2 subsystem. If the SSL Secured box is checked, this field is greyed out.

   **Explain SQLID**
   - An optional field that tells the tuning service to use the Explain tables pertaining to a specific SQLID. If this field is blank, the PE Client logon user ID will be used as the Explain SQLID.

10. Click **Finish**.

    The DB2 subsystem is shown in the **System Overview** window under the z/OS folder.
Defining a DB2 Connect gateway:

If an OMEGAMON Collector is registered for a Performance Expert Agent for DB2 Connect Monitoring, it receives information about the DB2 Connect server that is installed on the same system as Performance Expert Agent for DB2 Connect Monitoring. The DB2 Connect server serves as DB2 Connect gateway. The information is stored in the DB2PM database of the OMEGAMON Collector.

To monitor a DB2 Connect gateway from Performance Expert Client, you must establish a connection between Performance Expert Client and the OMEGAMON Collector collecting the information about the activities of a DB2 Connect server that serves as DB2 Connect gateway. You do this by defining the DB2 Connect gateway:

   The New DB2 System wizard is displayed.

2. On the Object page, click DB2 Connect/Gateways and then click Next.

3. On the DB2 Connect/Gateways page, do the following:
   a. From the DB2 system alias list, select the DB2 subsystem monitored by the OMEGAMON Collector that receives data from one or more Performance Expert Agents for DB2 Connect Monitoring.
   b. Click Retrieve to retrieve the names of all DB2 Connect gateways with Performance Expert Agents for DB2 Connect Monitoring that send data to the selected OMEGAMON Collector.
      The Logon window is displayed.
   c. In the User ID field, type your user ID. In the Password field, type your password. Then click OK.
      The DB2 Connect/Gateways page of the New DB2 System window is displayed. The DB2 Connect gateway name consists of the following parts: the IP address, the workstation name, and the name of the DB2 subsystem containing Performance Expert Agent for DB2 Connect Monitoring. The fields under Gateway Information are shown.
   d. Select a DB2 Connect gateway name.
      This name is also displayed in the Gateway alias field.
   e. Optionally you can specify another name in the Gateway alias field that is unique throughout Performance Expert Client. This name is shown in the folders pane of the System Overview window.
   f. Optionally you can specify a description for the selected DB2 Connect gateway.

4. Click Finish to return to the System Overview window.
   The name of the DB2 Connect gateway is displayed in the System Overview window under the DB2 Connect/Gateways folder.

Changing the properties of a DB2 subsystem:

This topic describes how to change the properties of a DB2 subsystem.

To change the properties of a DB2 subsystem:

1. Log off from the OMEGAMON Collector that monitors this DB2 subsystem. Refer to “Logging off from DB2 systems” on page 2507 for more information.

2. Click Selected > Properties.
   The DB2 System Properties window is displayed.
You can define your changes on the various pages.

Changing the properties of a DB2 Connect gateway:

This topic describes how to change the properties of a DB2 Connect gateway.

To change the properties of a DB2 Connect gateway:

1. Log off from the OMEGAMON Collector that receives information from this DB2 Connect gateway. Refer to “Logging off from DB2 systems” on page 2507 for more information.
2. Click Selected > Properties.
   The DB2 System Properties window is displayed.

On the DB2 Connect/Gateways page, you can change the Gateway alias and Description fields.

Organizing the DB2 systems:

When you specify or import a new DB2 subsystem or DB2 Connect gateway for monitoring from Performance Expert Client, this DB2 system is added to the corresponding folder of the System Overview window. Within these folders, the DB2 systems are listed in alphabetical order. You can structure and sort the DB2 systems according to your needs using the My Shortcuts folder.

You can copy one DB2 system and paste it as a shortcut to the My Shortcuts folder. In this folder, you can create a hierarchical structure of subfolders and copy the shortcuts to one or more subfolders.

You can change a DB2 system or shortcut in one of the following ways:

- Rename a DB2 system and thus all of its shortcuts. To do this, you must use the DB2 System Properties window (see “Changing the properties of a DB2 subsystem” on page 2503 and “Changing the properties of a DB2 Connect gateway”).
- Delete a DB2 system and thus all of its shortcuts: click the DB2 system that you want to delete in the All Subsystems, All Data Sharing Group, or DB2 Connect Gateways folder and then click Selected > Delete.
- Remove a shortcut from a folder: click the shortcut in the appropriate folder and then click Selected > Delete to delete only this shortcut.

Specifying global settings:

Click Monitor > Configuration to specify preferences for global settings that are used throughout OMEGAMON for Db2 PE, such as your Web browser of choice, diagnostics settings, and accessibility settings. The Configuration window is displayed.

- On the Preferences page, you can:
  - Specify the location of your Web browser.
  - Permanently save your logon passwords for all DB2 systems.
  - Reactivate the display of message DGOK3638 (Monitor switches are not set) if you suppressed this message.
- On the Diagnostics page, you can specify email settings for sending diagnostics reports to IBM support.
- On the Accessibility page, you can specify high-contrast settings for your screen.
Logging on to DB2 systems:

To monitor a DB2 system, you must log on to the OMEGAMON Collector that collects the performance data for this DB2 system.

If you use the same password for several OMEGAMON Collectors, you can log on to them at once. During such a multiple logon, you can start monitoring functions.

Logging on to one DB2 subsystem or DB2 Connect gateway:

You log on to one DB2 subsystem or DB2 Connect gateway by logging on to the OMEGAMON Collector that collects the performance data for this DB2 system.

To log on to one DB2 subsystem or DB2 Connect gateway:
1. In the System Overview window, click the DB2 system and then click **Selected > Logon**.
   The Logon window is displayed.
2. In the **User ID** field, type your MVS host user ID.
3. In the **Password** field, type your password.
4. You can type your TSO group ID in the **Group ID** field. This is optional.
5. Click **OK**.

Logging on to several DB2 subsystems:

You log on to several DB2 subsystems at once by logging on to the OMEGAMON Collectors that collect the performance data for these DB2 subsystems and that are accessible with the same password.

To log on to several DB2 subsystems at once:
1. In the System Overview window, click **Monitor > Multiple Logon**.
   The Multiple Logon window is displayed.
2. Select the DB2 subsystems to which you want to log on. You can access the OMEGAMON Collector of these DB2 subsystems with the same password. You can also select the monitoring functions that you want to start.
3. Click **OK**. The Logon window is displayed.
4. Fill in the fields as described under “Logging on to one DB2 subsystem or DB2 Connect gateway” and click **OK**.

The Log window is opened telling you whether your logon requests were successful. If you selected one or more monitoring functions, the appropriate windows are also opened.

Starting several monitoring functions in one or more DB2 subsystems:

You can start several monitoring functions in one or more DB2 subsystems to which you are logged on.

To start several monitoring functions in one or more DB2 subsystems:
1. In the System Overview window, click **Monitor > Multiple Launch**.
   The Multiple Launch window is displayed.
2. Select the DB2 subsystems and the monitoring functions that you want to start and click **OK**.
The Log window is opened telling you whether your launch requests were successful. In addition, the appropriate monitoring windows are displayed.

**Starting a monitoring function from the DB2 Control Center:**

When you are working with DB2 you might want to start a specific performance-monitoring function from DB2. You can do this using the DB2 Control Center.

The DB2 system for which you want to view the performance data must have already been defined for monitoring from Performance Expert Client (see "Defining the DB2 systems that must be monitored" on page 2500). However, Performance Expert Client need not be open when you select the monitoring function from the Control Center.

To start a monitoring function from the Control Center, do the following:

1. In the folders pane, expand the system folder and right-click the DB2 subsystem for which you want to view performance data. If you are not connected to the selected DB2 subsystem, you are prompted to log on. You can also select **DB2 Performance Expert** to open a submenu containing the monitoring functions available for this DB2 subsystem.
2. Select the monitoring function you want to work with.
3. If the DB2 subsystem location alias of a DB2 subsystem is not found, a window is opened where you can select the OMEGAMON Collector monitoring this DB2 subsystem.

If OMEGAMON Collector is not already open, it is started. You can then view the requested performance data for the selected DB2 subsystem in a window.

**Issuing DB2 commands:**

You can issue any DB2 command for which you have authority from Performance Expert Client, except –START DB2. This command can be issued only from an MVS terminal.

To issue a DB2 command:

1. You can select one of the following ways:
   - In the System Overview window, select the DB2 subsystem in the folders pane and then click the **DB2 Commands** toolbar button ( ).
   - You can also use the menu bar or pop-up menu: click the DB2 subsystem in the folders pane, then click **Selected > Monitor > DB2 Commands** on the menu bar or **Monitor > DB2 Commands** on the pop-up menu.

   If you are not connected to the selected DB2 subsystem, you are prompted to log on.

   The DB2 Commands window is displayed.

2. In the **Command input** field, type your command or click the arrow to select a previously issued command from the list.
3. Click **Send** to send the command to your DB2 subsystem.

The command is added to the **Command input** list. The DB2 response is displayed in the **DB2 response** box.
To remove the DB2 response, right-click the **DB2 response is** box and then click **Clear**.

**Getting help:**

You can display help for all elements in a window or wizard and for the windows and wizards themselves.

To get help on:

- A window or wizard, click the **Help** button or toolbar button ( ) or **Help > General Help**.
- A pane of a window, click the name of the pane in the folders pane and then press F1.
- A tabbed page of a window, click the tab and then press F1.
- A toolbar button, move your mouse pointer over this button.
- A field in a window or wizard, click in the field and then press F1 or display help for the window or wizard (general help) and click **Field help**. Field help also covers the buttons displayed between and next to the fields.
- A command button at the bottom of a window or wizard, move the input focus to this button and press F1 or display help for the window or wizard (general help) and click **Button help**.
- A table in a window or pane, click in the table and then press F1.

**Logging off from DB2 systems:**

To log off from a DB2 subsystem or DB2 Connect gateway you must log off from the OMEGAMON Collector that collects the performance data for this DB2 system.

In the System Overview window, click the DB2 system and then click **Selected > Logoff**. If one or more monitoring activities are still running on your DB2 system, you are asked whether you want to continue or stop them.

The exceptions that occurred for the DB2 system from which you logged off are removed from the 100 Most Recent Exceptions pane of the System Overview window even if exception processing continues running. After your next logon, the exceptions that were collected during your previous logon and logoff are shown again.

**Deleting a DB2 system:**

If you do not want to monitor a DB2 subsystem or DB2 Connect gateway from Performance Expert Client anymore, you can delete it.

To delete a DB2 system:

1. If you are still logged on to the OMEGAMON Collector that collects the performance data of the DB2 system that you want to delete, you must log off. See [[Logging off from DB2 systems]](2507) for more information.
2. In the System Overview window, click the DB2 system that you want to delete and then click **Selected > Delete**.
   A message appears asking you whether you also want to delete the DB2 catalog entries for this DB2 system. If you decide to leave the catalog entries
and a Performance Warehouse system is associated with this DB2 system, you can continue working with this Performance Warehouse.

3. Make your selection, then click Yes.

The DB2 system and all its shortcuts are removed from the folders pane of the System Overview window.

**Leaving Performance Expert Client:**

To leave Performance Expert Client, click Monitor > Exit.

A message or a window appears:

- If you have already logged off from all DB2 systems or stopped all monitoring activities on the systems to which you are still logged on, a message is displayed asking you whether you want to leave Performance Expert Client. Monitoring activities that you did not stop when logging off from a DB2 system continue running.

- If you are still logged on to DB2 systems on which monitoring activities are running, a window is displayed asking you whether you want to stop or continue all activities.

**Online monitoring and reporting**

These topics describe how to monitor the performance of DB2 subsystems and DB2 Connect gateways and how to create reports and traces.

**Monitoring threads**

You can view the current and recent activity of all active threads connected to a DB2 subsystem. You can get an overview of all connected threads and detailed information about a specific thread. You can also view the SQL activity of a single thread and create traces on this activity.

This section describes how to get the overview and the detailed information, customize the displayed windows, and create SQL activity traces.

**Viewing all connected threads:**

You can display all active threads connected to a DB2 subsystem or a member of a data sharing group.

To do this, you can choose one of the following ways:

- In the System Overview window, select the DB2 subsystem or member of the data sharing group in the folders pane and then click the Thread Summary toolbar button ( ).

- You can also use the menu bar or pop-up menu: click the DB2 subsystem or member of the data sharing group in the folders pane, then click Selected > Monitor > Thread Summary on the menu bar or Monitor > Thread Summary on the pop-up menu.

If you are not connected to the selected DB2 subsystem, you are prompted to log on.
The Thread Summary window is displayed. It contains the key performance counters for all connected threads. If a thread has children, the number shown in the Parallel Threads column includes the parent thread.

To refresh the thread activity data, in the toolbar, select **Automatic** in the **Refresh** field. By default, values are updated every six seconds. To change the interval, click in the time field next to the **Refresh** field and overtype the value according to your requirements.

**Related information:**
- If the Thread Summary window lists too many threads, you can filter them. For more information refer to “Filtering threads” on page 2511.
- You can sort the threads in the window. For more information, see “Sorting threads” on page 2510.
- The Thread Summary window shows the key performance counters in a table. One or more columns might be hidden. For information about how to view hidden counters, to hide counters that you are not interested in, or to change the order of the columns, refer to “Customizing table columns” on page 2546.
- If you are monitoring a member of a data sharing group, refer to “Monitoring data sharing groups” on page 2542 for more information.
- If you are working in different time zones, refer to “Working in different time zones” on page 2547 for more information.

**Viewing details of a selected thread:**

You can get more details of a thread by double-clicking it in the Thread Summary window to open the Thread Details window.

The Overview pane of the Thread Details window shows the main counters of the selected thread. The folders pane lists additional counter categories. You can get more details on a counter category by clicking it in the folders pane.

If a thread has children, the children are listed on the Parallel Threads pane. You can get more details on a child by double-clicking it.

The folders pane of the Thread Details window lists the counter categories. The contents pane shows the counters for the selected counter category. You can get more details on a counter category by clicking it in the folders pane.

Some DB2 counters are also shown as percentages in bar charts, stacked to 100%. Each bar in the chart represents a snapshot and reflects several counters. The percentages of these counters are shown proportionately and accumulated to add up to 100%. Click the bar chart to see which counters are represented. You can increase or decrease the number of snapshots that are shown in a bar chart by using the plus (+) and minus (-) signs next to the x-axis of the chart.

For one or more DB2 counters in the Thread Details window an icon appears next to the counter affected if:
- You run periodic exception processing
- You specified a warning threshold, problem threshold, or both
- A counter value falls below or above a threshold

When you move your mouse pointer over such a counter, you see the timestamp of the exception. The icon disappears after the counter value falls below or above
the threshold or after periodic exception processing is stopped and you refresh the data in the window. No icon is shown for counters listed in a table.

On the SQL Statement pane, you see the text of the SQL statement that was recently performed by the thread. You can view the access plan for this statement in graphical format by clicking Explain. Refer to “Using Explain products to analyze and improve SQL statements” on page 2544 for more information. If the statement text is much longer than the space provided and, therefore, difficult to read, you can view it in another window. Click View Statement in New Window.

Related information:
• The Thread Details window shows part of its performance information in tables. In contents panes containing a table:
  – You can filter the entries listed. For more information refer to “Filtering threads” on page 2511.
  – One or more columns might be hidden. For information about how to view hidden counters, to hide counters that you are not interested in, or to change the order of the columns, refer to “Customizing table columns” on page 2546.
  – You can choose to view details on a table entry in another window or on a notebook page. For more information, refer to “Viewing details on a table entry in a contents pane” on page 2547.
• Performance counter values that are too long are truncated. For information about how to view the entire value, refer to “Viewing long performance counter values” on page 2547.
• If you are working in different time zones, refer to “Working in different time zones” on page 2547 for more information.

Sorting threads:

You can sort threads by a specific performance counter (simple sort) or by using several performance counters (hierarchical sort).

In windows that list threads, the entries are sorted by a performance counter (simple sort). By default, this is the leftmost column in the window. To change the order, click the name of another column.

In the Thread Summary window, you can create a specific sort hierarchy. You can select up to five performance counters as sort criteria; the first one selected has the highest sort criterion. You can sort the rows in ascending or descending order. You can also view them in a different order for each DB2 subsystem.

To sort the threads:
1. Click View > Sort.
   The Sort window is displayed.
2. In the Available columns box, click the column name to be the highest sort criterion and then click Add ( ).
   The selected column name is removed from the Available columns box and displayed in the Sort columns box.
   You can continue selecting additional sort criteria until you have reached the limit of five column names. Your selection is always hierarchical. This means, the column name you select first is the highest sort criterion, the one you select second is the second highest criterion, and so on. For example, if you select Plan as the highest sort key and there are several threads with the same Plan,
you might want to sort these threads by another column name, such as Elapsed Class 2, and would thus select Elapsed Class 2 as second sort key.

3. Within a sort criterion, the threads are, by default, sorted in ascending order. In the Sort columns box, click the column name for which you want to specify descending order and then click Descending to sort the threads in descending order.

4. You can use the Move Up and Move Down buttons to change the hierarchy of the sort criteria.

5. At any time during or after your selection, you can remove a sort criterion from your selection. In the Sort columns box, click the column name to be removed and then click Remove ( ). The selected column name is removed from the Sort columns box and displayed in the Available columns box at its previous position.

6. When you have finished specifying your sort criteria, click OK.

The Thread Summary window is displayed. The rows are sorted according to your specifications. The Sort ( ) icon is displayed in the right-hand corner of the status bar to show that your sort criteria are active. The current sort criteria remain valid for this DB2 subsystem until you change them again or disable them.

If you want to keep your sort criteria but temporarily disable them to view the default order, right-click the Sort ( ) icon and then click Disable. The Sort ( ) icon is dimmed and the threads are displayed in the default order.

To reactivate your sort criteria, right-click the dimmed Sort ( ) icon and then click Enable. The threads are sorted according to your specifications again.

Filtering threads:

You can filter threads so that only those meeting your specifications are displayed. This minimizes network traffic and can decrease response times considerably. For example, if you suspect that threads with a certain CPU Class 1 are causing problems, you can specify your filter to display only threads within CPU Class 1. You can define a different filter for each DB2 subsystem.

You start filtering on the Thread Summary window. If you have large amounts of data, you can also set filter criteria in the System Overview window.

To filter threads:

1. Click View > Filter/Qualify.
   The Filter/Qualify window is displayed.
2. On the Identifier Type/Status page, under Column name, click the column name for which you want to specify one or more values.
3. Type a value in the Value field. You can use a wildcard character (*) in the value. For example, if you want to cover all values that start with PM, you would specify PM*. Characters following the wildcard are ignored.
4. Click Add ( ).
   The selected column name is displayed in the Filter table, with its value and the include ( ) symbol.
   The include symbol means that all threads having the specified value for the selected column name are included in the list of threads.
5. At any time during or after your selection, you can change your criterion:

- You can change the include symbol to an exclude (.exclude) symbol for any previous specification in order to exclude threads having the specified value:
  
  Click the column name and then click **Exclude** under **Qualifier criteria**.

- To narrow the filter, you can select the same column name several times to specify more values. For example, you might want all threads starting with PM but exclude those starting with PMD. Up to 10 values are allowed for the same column name.

6. You can continue specifying additional filter criteria. All criteria and values that you specify are evaluated in the sequence in which you specify them and are combined. This means, the more criteria you specify the narrower the filter and the fewer the threads that are displayed.

7. At any time during or after your selection, you can remove filter criteria from the table.

   In the **Filter** table, click the criterion to be removed and then **Remove** ( ). If you remove all criteria of a column name, this column name is removed from the **Filter** table.

8. Click the **Additional Qualification** tab to specify the thread status and type.

   On the Additional Qualification page:

   - By default, all check boxes are selected, except for the **Exclude threads with no work in process** check box.
   
   - If the **In DB2** check box is selected, all items in the list are automatically selected. You can deselect the ones that you do not need.
   
   - If the **In** check box is selected, the field next to this check box and the check box of **Exclude threads with no work in process** can be selected. By default, **Application** is selected and the check box of **Exclude threads with no work in process** is not selected.

9. Click **OK**.

   The Thread Summary window is displayed, which is refreshed according to your specifications. The **Filter/Qualify** ( ) icon is displayed in the right-hand corner of the status bar to show that your filter is active. The current filter remains valid until you change it again or disable it.

   If you want to keep your filter but temporarily view the threads unfiltered, right-click the **Filter** ( ) icon and then click **Disable**. The **Filter** ( ) icon is dimmed and the data is displayed in the default order.

   To make your filter active again, right-click the dimmed **Filter** ( ) icon and then click **Enable**.

   The window is refreshed according to your specifications.

**Canceling threads:**

If you have the appropriate DB2 authority, you can cancel threads.

You can do this from the Thread Summary or the Thread Details window:

1. Do one of the following:
   
   - In the Thread Summary window, click the thread you want to cancel and then click **Selected > Cancel Thread**.
• In the Thread Details window, click **Thread Details > Cancel Thread**.

2. Click **Yes** to confirm the cancelation.

Creating and viewing SQL activity traces:

If you have MONITOR1 and MONITOR2 privileges, you can create traces on the DB2 system-wide SQL activity that takes place during the processing of a DB2 application. You can create such traces only if you are not viewing history data.

The trace results are displayed in a Web browser window. To ensure the correct display, use Netscape Communicator 7.0 or later, or Microsoft Internet Explorer 5.50 or later.

A trace can only be created if:

• The Performance Warehouse server is running.

• A Performance Warehouse system has been associated with the monitored DB2 subsystem. Verify that the Performance Warehouse page of the DB2 System Properties window contains the alias of the Performance Warehouse database maintained by the OMEGAMON Collector that is monitoring the DB2 subsystem. This alias is equal to the database alias that you specified when cataloging the DB2PM database by using the Configuration Assistant of DB2.

For information about how to display the DB2 System Properties window, refer to the "Defining a DB2 subsystem" on page 2501.

To create a trace, start in the Thread Summary or Thread Details window. When you select a thread, all threads with the same LUWID as the selected one, are included in the trace.

1. Do one of the following:

   • In the Thread Summary window, select the thread for which you want to create the trace and then click **Selected > SQL Activity Tracing**.

   • In the Thread Details window, click **Thread Details > SQL Activity Tracing**.

   The SQL Activity Report Generation window is displayed.

   Here, you can specify the criteria for the data collection to stop and the SQL activity events you want to see in the trace report.

2. In the **Elapsed time** and **Number of records collected** fields, you can leave the default specifications or specify both or only one of the criteria.

   If you specify both criteria, data collection stops as soon as the first criterion is met. For example, if you specify an elapsed time of five minutes (00:05:00) and a number of records of 5 and this number is reached after a minute, the trace stops and disregards the remaining four minutes.

3. Optionally, select the SQL statements with a negative return code and the workload blocks that are shown in trace report.

4. Click **OK**.

   If the message **Data set not cataloged** is displayed, set the OMEGAMON Collector startup parameter USERAUTHORIZATION to YES.

   **Related reading**: For more information about how to set this parameter, refer to the Configuration and Customization.

The collection of the performance data and the generation of the SQL activity trace are started and the SQL Activity Tracing window is displayed.

When the trace report is complete and the data sets are downloaded, the results are shown in a Web browser window.
The SQL activity trace results are downloaded as temporary files and are deleted when you leave OMEGAMON for Db2 PE. To save these files, use the save functions provided by your Web browser.

**Resolving locking conflicts**

When several threads try to access the same data at the same time, DB2 uses locks to control these concurrent attempts. A lock associates a DB2 resource with an application process in a way that affects how threads can access this resource.

You can view the threads involved in a locking situation where at least one thread is suspended. You can view the threads of a single DB2 subsystem or an entire data sharing group.

This section describes how to display the threads independently of the associated resource and to view only the threads associated with a specific resource.

**Related information:**

- Some windows show the key performance counters in a table. One or more columns might be hidden. For information about how to view hidden counters, to hide counters that you are not interested in, or to change the order of the columns, refer to “Customizing table columns” on page 2546.

**Viewing all threads involved in a locking situation:**

This topic describes how to view all threads for an entire DB2 subsystem or data sharing group.

To view all threads for an entire DB2 subsystem or data sharing group you can do one of the following:

- In the System Overview window, select the DB2 subsystem in the folders pane and then click the **Threads in Lock Conflicts** toolbar button ( ).
- You can also use the menu bar or pop-up menu: click the DB2 subsystem in the folders pane, then click **Selected > Monitor > Threads in Lock Conflicts** on the menu bar or **Monitor > Threads in Lock Conflicts** on the pop-up menu.

If you are not connected to the selected DB2 subsystem, you are prompted to log on.

The Threads in Lock Conflicts window shows all threads that are involved in a locking situation, independent of the resource with which they are associated. They are grouped by the thread that holds the lock (Holder) and the threads that wait for the resource to be freed (Waiter).

This window shows all threads involved in a locking situation, independent of the resource that they are associated with. They are grouped by the thread holding the lock (Holder) and the threads waiting for the resource to be freed (Waiter).

To view more details on a thread, double-click the thread, or click the thread and then click **Selected > Thread Details**.

**Related information:**

- If you are monitoring a member of a data sharing group, refer to “Monitoring data sharing groups” on page 2542 for more information.
Viewing the threads associated with a specific resource:

This topic describes how to view the threads associated with a specific resource.

To view the threads associated with a specific resource:

1. Open the Locking Conflicts window in one of the following ways:
   • In the System Overview window, select the DB2 subsystem in the folders pane and then click the Locking Conflicts toolbar button ( ).
   • You can also use the menu bar or pop-up menu: click the DB2 subsystem in the folders pane, then click Selected > Monitor > Locking Conflicts on the menu bar or Monitor > Locking Conflicts on the pop-up menu.

   This window lists all resources involved in a locking situation.

2. In the Locking Conflicts window, double-click the resource, or click the resource for which you want to view the associated threads and then click Selected > Threads in Lock Conflicts.

   The Threads in Lock Conflicts window for the selected resource type is displayed.

   This window contains detailed information about the selected resource and a list of the associated threads. The resource information changes with the selected resource. The threads are grouped by the thread holding the lock (Holder) and the threads waiting for the resource to be freed (Waiter).

3. To view more details on a thread, double-click the thread, or click the thread and then click Selected > Thread Details.

Viewing DB2 Statistics

You can view important Statistics and ratios of a DB2 subsystem in various levels of detail and processing modes.

This section explains some Statistics terms and the processing modes. It also describes how to get the Statistics information and how to refresh buffer pool Statistics.

Statistics values:

Most of the DB2 Statistics values accumulate while DB2 is active. When DB2 is started, accumulation begins and continues until DB2 is stopped. There are, however, certain fields that are not cumulative.

Some are reported as snapshot values (gauge values in a workgroup environment), and some are reported as high-water mark values. A snapshot value is a current value. It is updated each time the Statistics values are displayed. A high-water mark is the highest value reached since startup. It is updated each time the Statistics values are displayed.
The values in fields other than snapshot or high-water mark fields are *accumulated* or *delta values*. They are calculated by the Statistics display and derived differently for each of the Statistics processing modes.

**Processing modes:**

You can display the Statistics values in different modes: regular, interval, and delta.

*Interval* and *delta* modes determine the time period over which delta values are accumulated.

In all modes, Statistics values are updated each time a refresh occurs.

**Regular processing:**

Regular processing is the default processing mode whenever you open a Statistics window.

Figure 172 shows that the values displayed are accumulated from the start of DB2.

No calculations are performed on the Statistics values in this mode.

**Interval processing:**

The interval mode allows you to isolate DB2 Statistics activity beginning at a specific time.
Figure 173 shows the interval processing mode.

Figure 173. Interval processing

In this mode, all Statistics windows show the delta values accumulated since the start of interval processing. In Figure 173, interval processing was requested when the snapshot showed a value of 9. In this case, accumulation is set to zero and all future snapshots are accumulated from this point. When you stop interval processing, all following snapshots are shown in regular mode again, that is, as accumulated since the start of DB2.

Delta processing:

Delta processing allows you to isolate DB2 Statistics activity between two snapshot refreshes.

Figure 174 shows delta processing. It can help you discover a problem when running exception processing.

Figure 174. Delta processing

In this mode, all Statistics windows show the delta between the values of two consecutive snapshots. This means, accumulation starts at zero after each snapshot. When you stop delta processing, all following snapshots are shown in regular mode again, that is, as accumulated since the start of DB2.

Viewing Statistics information:

This topic describes how to view Statistics information for a DB2 subsystem.

To view Statistics information for a DB2 subsystem:

- In the System Overview window, select the DB2 subsystem in the folders pane and then click the Statistics Details toolbar button ( ).

- You can also use the menu bar or pop-up menu: click the DB2 subsystem in the folders pane, then click Selected > Monitor > Statistics Details on the menu bar or Monitor > Statistics Details on the pop-up menu.

If you are not connected to the selected DB2 subsystem, you are prompted to log on.

The Statistics Details window is displayed.
The folders pane of the Statistics Details window lists the counter categories. The contents pane shows the counters for the selected counter category. You can get more details on a counter category by clicking it in the folders pane.

Some DB2 counters are also shown as percentages in bar charts, stacked to 100%. Each bar in the chart represents a snapshot and reflects several counters. The percentages of these counters are shown proportionately and accumulated to add up to 100%. Click the bar chart to see which counters are represented. You can increase or decrease the number of snapshots that are shown in a bar chart by using the plus (+) and minus (-) signs next to the x-axis of the chart.

An icon appears next to the counter affected if:
• You run periodic exception processing.
• You specified a warning threshold, problem threshold, or both for one or more DB2 counters in the Statistics Details window.
• A counter value falls below or above a threshold.

When you move your mouse pointer over such a counter, you see the timestamp of the exception. The icon disappears after the counter value falls below or above the threshold or after periodic exception processing is stopped and you refresh the data in the window. No icon is shown for counters listed in a table.

On the SQL Statement pane, you see the text of the SQL statement that was recently performed by the thread. You can view the access plan for this statement in graphical format by clicking Explain. Refer to “Using Explain products to analyze and improve SQL statements” on page 2544 for more information. If the statement text is much longer than the space provided and, therefore, difficult to read, you can view it in another window. Click View Statement in New Window.

Related information:
• The Statistics Details window shows part of its performance information in tables. In contents panes containing a table:
  – One or more columns might be hidden. For information about how to view hidden counters, to hide counters that you are not interested in, or to change the order of the columns, refer to “Customizing table columns” on page 2546.
  – You can choose to view details on a table entry in another window or on a notebook page. For more information, refer to “Viewing details on a table entry in a contents pane” on page 2547.
• Performance counter values that are too long are truncated. For information about how to view the entire value, refer to “Viewing long performance counter values” on page 2547.
• If you are monitoring a member of a data sharing group, refer to “Monitoring data sharing groups” on page 2542 for more information.
• If the OMEGAMON Collector and Performance Expert Client are in different time zones, refer to “Working in different time zones” on page 2547 for more information.

Viewing the SQL statements in the dynamic SQL cache:

This topic describes how to view the SQL statements in the dynamic SQL cache.

You can view detailed information about the SQL statements in the dynamic SQL cache as follows:
1. In the folders pane of the Statistics Details window, click **Dynamic SQL Statements** and then click **SQL Statements**. The SQL Statements pane is displayed without any entries.

2. To display the SQL statements that are in the cache:
   a. Click the **Filter** toolbar button to check the filter values and set the appropriate values for your subsystem. For more information about defining filter criteria, see step 5.
   b. Select the **Receive Statement Cache information** check box. The list is refreshed whenever you click **View > Refresh** or when an automatic refresh occurs.

3. The SQL statements in the cache might be shown with the value 0 for all counters because no trace data has been collected yet. To get all values for the counters, click the **Start** toolbar button to start the collection of the specified counter values.

   After the next refresh, the counter values of all SQL statements displayed reflect the values collected since the trace started.

   Trace data collection continues until you click the **Stop** toolbar button. Because tracing can increase the overhead, stop tracing when you have finished working with the SQL statements. You can only stop the traces that you started.

4. To view the text of an SQL statement, double-click the statement. The SQL Statements text page opens, where text stands for the first couple of characters of the statement text.

   **Note:** If the text is much longer than the space provided and therefore difficult to read, click **View Statement in New Window** to view the text in another window.

   This page contains the text and the counters of the SQL statement. If you have an Explain product installed and the statement contains a SELECT, UPDATE, INSERT, DELETE, or VALUES clause, you can click **Explain** to view the access path. For more information about Explain products, refer to “Using Explain products to analyze and improve SQL statements” on page 2544.

5. To reduce the list of SQL statements:
   a. Return to the SQL Statements pane of the Statistics Details window.
   b. Click the **Filter** toolbar button.
      The Dynamic Statement Cache Filter Criteria window is displayed.
   c. Choose your filter method:
      * If you want to list only those SQL statements where a specific counter exceeds a certain value:
         Click **Statements with value higher than**, specify a value, and then select one of the counters listed under Fields.
      * If you want to display the SQL statements sorted by the values of a counter in descending order:
         Click **Statements with highest value** and then select one of the counters listed under Fields.

   This option is useful, for example, if there are more SQL statements in the cache than can be displayed (up to 1 MB). For example, if there are 5 MB of SQL statements in the cache and you are mainly interested in those with high Getpage counter values, ensure that these SQL statements are displayed by using this option.
d. Click **OK** to return to the SQL Statements pane.

The list of SQL statements is changed according to your filter criteria. The filter remains valid until you change it.

**Restriction:** If you are viewing history data, you cannot define a filter. For more information about history data, refer to “Viewing history data” on page 2543.

6. To change the order of the table columns shown or hide the table columns that you are not interested in, click the **Customize Columns** (工作任务栏按钮) toolbar button. The Customize Columns window is displayed.

For further information about how to customize columns, see “Customizing table columns” on page 2546.

**Refreshing buffer pool Statistics:**

The contents of a window or contents pane is normally refreshed when an automatic refresh occurs or when you click **View > Refresh**.

This does not apply, however, to buffer pool Statistics at dataset level.

Buffer pool Statistics at dataset level are received using IFCID 199. If I/O activity has taken place (at least one I/O per second), DB2 updates the list of buffer pool data sets every five minutes or according to the time interval set in the Online data set Statistics time interval (minutes) parameter in the Tracing Parameters (DSNTIPN) pane of the System Parameters window.

To view the update:
1. On the Data Sets pane of the Buffer Management page of the Statistics Details window, select the **Receive data set information** check box.
2. Click **View > Refresh** when the time interval has elapsed.

**Viewing system health**

Statistics information for a DB2 subsystem can be viewed as numerical values and percentages on various Statistics Details windows or as snapshots in graphical format.

“Viewing DB2 Statistics” on page 2515 explains the Statistics Details windows.

To view Statistics information in graphical format you can do one of the following:
- In the System Overview window, select the DB2 subsystem in the folders pane and then click the **System Health** toolbar button (工具栏按钮).
- You can also use the menu bar or pop-up menu: click the DB2 subsystem in the folders pane, then click **Selected > Monitor > System Health** on the menu bar or **Monitor > System Health** on the pop-up menu.

If you are not connected to the selected DB2 subsystem, you are prompted to log on.

The System Health window is displayed, split into the following panes:
- The folders pane on the left lists one or more of the following data groups:
  - The System Overview data group, which contains links to data views in data groups that you have defined. These linked data views are displayed as performance graphs on the Data Views page of the System Overview
window. They are refreshed at the refresh rate that you specified for the DB2 subsystem in the System Overview window.

- Any data groups and data views that you have defined.

- The contents pane on the right displays the contents of the selected data group.

You can arrange one or more counter categories, such as Hit ratios or Physical locks (P-locks), as data views in a data group. Each data view consists of a graphical representation, a legend, and a report of the counters selected for the counter category. Each data group can contain a different selection and arrangement of data views.

This section uses scenarios to help you understand and get started with system health. In addition, it describes the tasks that you are most likely to perform in system health.

**Related information:**

- If you are monitoring a member of a data sharing group, refer to “Monitoring data sharing groups” on page 2542 for more information.
- If you are working in different time zones, refer to “Working in different time zones” on page 2547 for more information.

**Getting started:**

The scenarios in this section are based on a data view that you create with the following steps. The options that you select and any alternatives are explained later in the section.

Perform the following steps:

1. Define a data group in which you will place the data view:
   a. Click **Data Groups** and then click **Selected > New**. The New Data Group window is displayed.
   b. Type My Locking in the **New name** field and then click **OK**.
      The new group appears in the folders pane of the System Health window.

2. Click **Data views** and then click **Selected > New** to define a data view. The New Data View wizard appears.

3. On the Category page:
   - In the **Data view name** field, type Locking as the name for this data view.
   - In the **Data view category** list, select Locking. The categories in the list correspond to the Statistics categories for counters and data elements.
   - Click **Next** to display the Counter page.

4. On the Counters page:
   - In the **Counter selection** list, select the Lock requests and Unlock requests check boxes to specify the counters for the data view.
   - Leave **Not stacked** selected as type of counter display. The counters are then displayed independently of one another as separate bars in a bar chart or lines in a line chart.
   - Click **Next** to display the Thresholds page.

5. On the Thresholds page:
   - Next to **Static scale**, change the default 1000 units to 30 and select **Second**.
   - Click **Next** to display the Graphics page.
6. On the Graphics page, leave the default selections and values. Note that Bar chart is selected to display the counters as bars.

Click Finish.

When you work with System Health for the first time, data is refreshed every 6 seconds and the new My Locking data view looks similar to this one:

![System Health window containing new data group and data view](image)

**Figure 175. System Health window containing new data group and data view**

**Scenario 1: Viewing current system health:**

The following scenario shows how to collect and display snapshots and helps you understand the chart and the values displayed. As an example, it uses the data view that you previously created.

Perform the following steps:

1. To start the collection and display of snapshots, in the toolbar, select **Automatic** in the **Refresh** field.

2. To specify how often a snapshot is to be collected and shown in the data view: click in the time field next to the **Refresh** field and overtype the displayed time with 0:00:06, which is 6 seconds. Then press Enter.

The data in the data view is refreshed every 6 seconds, which is the minimum refresh time.

By default, the latest eight snapshots are displayed in a bar chart. When this number is exceeded, a scroll bar appears at the bottom of the chart for you to scroll through the snapshots collected since the start of the collection. By default, up to 100 snapshots are kept in memory and can be viewed. Any older
snapshots are stored in the history data set and can be viewed in history mode. See [“Scenario 2: Viewing past system health.”]

The background color of a snapshot alternates for you to see when a new snapshot starts. This is useful if you selected several counters for a data view and, therefore, a snapshot consists of several bars.

The y-axis of the chart ends slightly above unit 700 because the highest visible value of one of the counters is just under 700. The y-axis changes when the highest value of one of the counters increases or decreases.

The values shown in the chart represent the delta between two subsequent snapshots. For example, assume that each minute 30 lock and unlock requests are performed, which is one every two seconds. Then a delta value of 3 is shown for snapshots that are taken every 6 seconds. The delta is smaller if you decrease the refresh time and is higher if you increase the refresh time.

3. To see which counters are represented in the data view and in which colors, click Legend.

4. To view the values for the individual counters, you can do one of the following:
   • Click a snapshot in the data view, to view the values for a specific snapshot.
   • Click Report to get an overview of several snapshots.

The scale of a chart depends on the threshold that you set for the counters in the data view.

5. To change the threshold for the data view:
   a. Click Selected > Properties. The Properties window is displayed. Click the Thresholds tab.
      A threshold for a counter is specified as units per time interval. The Static scale field shows 30 units per second, which you specified when creating the data view. This means that the threshold is reached if a lock or an unlock request is performed 30 times per second.
   b. Change 30 to 60 and then click Finish.

The y-axis of the data view reflects the threshold change. Because the data is refreshed every 10 seconds, the threshold is reached if a lock or an unlock request is performed, 600 times during this period. Therefore, the red horizontal (threshold) line is now at unit 600 and the y-axis of the chart ends slightly above it.

**Scenario 2: Viewing past system health:**

If your system is not performing well and you want to know when this started, you are interested in snapshots that were taken earlier and are probably no longer displayed to you. The following scenario tells you how to view past system health using the data view that you created and helps you understand the chart and the values displayed.

For the purpose of this scenario, it is assumed that you have collected locking data for at least a couple of minutes and you selected a refresh time of 10 seconds and a threshold of 60 units per second.

Perform the following steps:

1. To start the display of past system health, in the toolbar, select History in the Data field.
   The history slider is activated and the Refresh field is disabled.
2. Move the slider to a time during which snapshots were collected and wait a couple of seconds to receive the data.

The chart has changed as follows:

- The chart shows the eight snapshots collected from the time that the slider indicates. The time of the first and last snapshots displayed is shown below the chart.
  Note that the collection of the current snapshot continues in the background. So when you leave history mode, the most recent snapshots are displayed.
- The scale of the y-axis, the place of the threshold line, and the size of the bars changed:
  When you view the current system health you can specify how often the snapshots are refreshed. History snapshots are, however, displayed at the interval at which the OMEGAMON Collector collects data, which is 60 seconds for the recording interval. Because the refresh rate is now 60 seconds (instead of the 10 seconds you previously specified), the y-axis of the chart now ends above 3500 and contains a (threshold) line at unit 3600 and the size of the bars is adjusted accordingly.

For more information about how to select history snapshots in different ways, see “Viewing history data” on page 2543.

The number of snapshots available is limited by the size of the history file on the host. If their number exceeds this size, the oldest snapshot is deleted. Your chart reflects this change and the timestamp to the lower left of the chart is adapted.

Scenario 3: Creating a data view:

Scenario 3 describes how to create a data view.

You can create a data view in one of the following ways:

- Create a data view from scratch as shown in “Getting started” on page 2521.
- Copy an existing data view and then change it according to your needs. You can also copy a data view that is delivered with OMEGAMON for Db2 PE and contained in the Default Group data group.
- Use the templates delivered with OMEGAMON for Db2 PE. To create a data view using a template click Data views under the data group that is to contain the new data view and then click Selected > Open Predefined Data View. The Open Predefined Data View window appears, which lists the templates that you can select.

Changing the properties of a data view:

This topic describes how to change the properties of a data view.

Most of your tasks in system health are changes to the system health chart. They are explained in the following sections using the data view you created in “Getting started” on page 2521. To change this data view:

Click the data view in the folders pane and then click Selected > Properties. The Properties window is displayed, which is similar to the New Data View wizard.
Changing the method for displaying the counters:

In many cases, it is useful to display the counters as lines instead of bars. Or, you might want to see the ratio between the counters.

OMEGAMON for Db2 PE provides the following chart types:
- "Non-stacked bar chart"
- "Non-stacked line chart"
- "Stacked bar chart" on page 2526
- "Stacked area chart" on page 2527
- "Stacked-to-100% bar chart" on page 2527

To view these charts, you must change your selections under **Type of counter display** on the Counters page of the Properties window and under **Chart type** on the Graphics page of this window.

If a data view contains counters represented by numeric values and counters expressed as percentages, the chart has two scales, one for the numeric values and one for the percentages.

**Non-stacked bar chart:**

This section describes the non-stacked bar chart.

A sample is shown in **Figure 176:**
- Characteristics and purpose:
  - The counters are displayed independently of one another as separate bars in a bar chart. They can be a mixture of numeric and percentage values. This chart type is useful if you want to know the absolute values of each counter displayed and specify thresholds for individual counters (see "Specifying and adjusting single thresholds" on page 2528).
- Selections on Counters and Graphics pages:
  - On the Counters page, select **Not stacked** as type of counter display.
  - On the Graphics page, select **Bar chart** as chart type.

![Figure 176. Non-stacked bar chart](image)

**Non-stacked line chart:**

This section describes the non-stacked line chart.

A sample is shown in **Figure 177 on page 2526**
• Characteristics and purpose:
The counters are displayed independently of one another as separate lines in a line chart. They can be a mixture of numeric and percentage values. This chart type is useful if you want to get an overview of the absolute values of each counter displayed over a larger time period. You can specify thresholds for individual counters (see “Specifying and adjusting single thresholds” on page 2528).

• Selections on Counters and Graphics pages:
  On the Counters page, select **Not stacked** as type of counter display.
  On the Graphics page, select **Line chart** as chart type.

Figure 177. Non-stacked line chart

Stacked bar chart:

This section describes the stacked bar chart.

A sample is shown in [Figure 178]

• Characteristics and purpose:
The counters are accumulated in a single bar. They can be numeric values or percentage values. This chart type is useful if you want to see the value that each snapshot adds up to.

• Selections on Counters and Graphics pages:
  On the Counters page, select **Stacked** as type of counter display.
  On the Graphics page, select **Bar chart** as chart type.

Figure 178. Stacked bar chart
Stacked area chart:

This section describes the stacked area chart.

A sample is shown in Figure 179:

- Characteristics and purpose:
  The counters are accumulated in an area. They can be numeric values or percentage values. This chart type is useful if you want to view, over a larger period, the value that each snapshot adds up to.

- Selections on Counters and Graphics pages:
  On the Counters page, select Stacked as type of counter display.
  On the Graphics page, select Area chart as chart type.

![Figure 179. Stacked area chart](image)

Stacked-to-100% bar chart:

This section describes the stacked-to-100% bar chart.

A sample is shown in Figure 180 on page 2528:

- Characteristics and purpose:
  The counters are shown proportionally in a bar chart. They are accumulated to add up to 100%. For example, if the counters have the values: a=2, b=5, c=7, the values shown are a=14%, b=36%, c=50%.
  This chart type is comparable to a pie chart where single values are changed to percentages to fill 100%. It is useful if you want to see the ratio between the counter values and you are not interested in thresholds for individual counters.

- Selections on Counters and Graphics pages:
  On the Counters page, select Stacked to 100% as type of counter display.
  On the Graphics page, Bar chart is selected because this is the only choice.
Specifying a global threshold:

When defining a data view, you must specify a global threshold for all counters. This threshold enables you to see at which time a counter exceeds a certain value.

For example, when setting the threshold for the My Locking data view to 60 units per second, you want to see at a glance when a lock or an unlock request is performed, more than 60 times per second. The global threshold determines the scale of the chart and is represented as a red horizontal line. Step 5 on page 2523 shows you how to define or change this global threshold.

If you are not sure which unit and time interval to specify, you can try a couple of values for the units and time interval. Or, to get you started, you can define the scale to automatically adapt to the highest visible value of a counter.

To adapt the scale to the highest visible value:
1. Display the Thresholds page of the Properties window.
2. Click Dynamic scale and then click Finish.

You can use this kind of counter display to calculate the units and time interval for the scale. However, it is also useful if you want to compare the actual values of the counters with each other or get a better view of the relation between two counters.

Specifying and adjusting single thresholds:

In addition to the global threshold, you can also specify a threshold for each counter in your data view. These thresholds do not affect the scale of the chart. You can specify the thresholds if you view the counters in a non-stacked bar or line chart.

To specify thresholds for the lock and unlock request counters of the My Locking data view:
1. Display the Thresholds page of the My Locking Properties window.
2. Under Single thresholds, select the Threshold check box for each counter and specify a threshold:
   - For Lock requests, specify higher than 200 per Minute
   - For Unlock requests, specify higher than 100 per Minute
3. On the Graphics page, click Line chart as chart type and then click Finish.

You get a line chart with two additional threshold lines in the color of the respective counter. They are at about 20 units for lock requests and about 15 for unlock requests.
If you select a bar chart as chart type, you only see the threshold line if it is exceeded. In this case, the part of the bar exceeding this threshold is shaded.

Later you might want to change the global threshold (next to Static scale on the Thresholds page), which affects the scale of the chart. If you leave the single thresholds as they are, the proportions between the scale and the single thresholds are no longer correct.

To set the proportions right, perform the following steps on the Thresholds page of the Properties window:

1. Double the number next to Static scale: change 30 to 60.
2. The Adjust single thresholds button becomes available. Click this button.
   Under Single thresholds, the thresholds for the counters are automatically doubled.
3. Click Finish.

Changing the appearance of the bars, lines, or areas in the chart:

At any time, you can change the color of bar, line, and area charts and the pattern of bar charts. In addition, you can add a grid to your chart where a vertical line separates the snapshots. You perform these changes on the Graphics page of the Properties window.

Except for non-stacked bar charts, a grid separates each snapshot. In a non-stacked bar chart, however, two subsequent snapshots are distinguished by a different background. Therefore, the grid appears after every two snapshots.

Changing the number of visible snapshots in the chart:

By default, a chart contains eight snapshots in a bar chart or 30 snapshots in a line or area chart. This is defined in the Number of visible snapshots field on the Graphics page of the Properties window. You might, however, want to examine a longer snapshot period in a bar chart or view fewer snapshots in a line chart. You can change the default to a number from 4 through 99 or the number in the Maximum number of kept snapshots field.

You can also use the plus (+) and minus (-) signs next to the x-axis of the chart to increase or decrease the number of snapshots displayed.

The Maximum number of kept snapshots field defines how many snapshots are kept in memory by the data view. When this limit is exceeded the oldest snapshot is deleted and the latest snapshot is added. You can change the number in this field according to your needs.

Freezing the display of snapshots:

If you want to examine a snapshot in more detail or print the current chart, you must stop the continuous addition of new snapshots to your chart without canceling data collection. To achieve this freeze the display of snapshots. In the folders pane, click the data view that you want to freeze and then click Selected > Freeze.

The name of the data view is shown in italics in the folders pane for you to see that the view is frozen. Data collection continues in the background. To see the dynamic updates, click Selected > Freeze again.
Displaying data views as performance graphs in the System Overview window:

You can display one or more data views as performance graphs on the Data Views page of the System Overview window. This data view must have been created in a data group that you defined and it must contain a link in the System Overview data group of the System Health window.

If you want to display the IFI interface data view in the System Overview window, click the IFI interface data view in the folders pane of the System Health window and then click **Selected > Display in System Overview**.

A link to the selected data view is shown in the System Overview data group and the linked data view immediately appears on the Data Views page of the System Overview window. The name of the link consists of the name of the original data group and the name of the original data view. The icon in front of the original data view has changed to indicate that this data view is shown in the System Overview window.

When you change a data view, you always change the original data view. The link is automatically updated.

The data views that are displayed on Data Views page of the System Overview are refreshed at the rate that you specified for the DB2 subsystem on the System Overview window. Snapshots continue to be collected and shown in the System Overview window even after you stop snapshot collection in the System Health window.

Reusing data-view and data-group configurations:

You can copy data views and data groups within a DB2 subsystem and export and import entire data groups. This is useful, for example, if you want to share your configurations with your colleagues or use the same data views or data groups under several DB2 subsystems. Copying and moving data views between data groups also helps you organize your views.

To export or import a data group, click the data group in the folders pane and then click **Selected > Export** or **Selected > Import**. Use copy, cut, and paste to copy or move a data group or data view.

Gaps and sudden drops or rises in charts:

This topic lists reasons for gaps and sudden drops or rises in charts.

If there is a gap in a line chart or between two bars in a bar chart, or two consecutive snapshots differ considerably from each other, the interval between the snapshots might have changed for one of the following reasons:

- DB2 has been restarted. Because the data view shows delta values, the delta between the last value before the DB2 stop and the first value after the DB2 restart would be a negative number. To reflect this situation, a gap appears in the chart and the Report section of the data view shows a value of N/C. To view the Report section click **Report**.
- The interval at which history data is collected might have been configured. A line chart shows a sudden drop or rise and a bar chart continues with much smaller or larger bars.
Monitoring activities of DB2 Connect gateways and connections of DCS applications

You can monitor the activities of DB2 Connect servers (DB2 subsystem) that serve as DB2 Connect gateways. You can also monitor the connections of Database Connection Services (DCS) applications within the Distributed Relational Database Architecture (DRDA) of DB2. You can use the information that you obtain through these monitoring activities to evaluate the health of a DB2 Connect gateway and to make changes necessary to tune the system.

To monitor the activities of a DB2 Connect gateway and the connections of DCS applications, your system must meet the following criteria:

- Performance Expert Agent for DB2 Connect Monitoring is installed on the system, on which the DB2 Connect gateway runs, and is configured.
- At least one OMEGAMON Collector is registered for a Performance Expert Agent for DB2 Connect Monitoring.
- Performance Expert Agent for DB2 Connect Monitoring and the OMEGAMON Collector are started.

Related reading: Refer to [Configuration and Customization](#) for information about how to install, configure, and start Performance Expert Agent for DB2 Connect Monitoring and to register the OMEGAMON Collector.

Performance Expert Agent for DB2 Connect Monitoring periodically collects snapshots of performance-related information about the DB2 Connect gateway and the connections of DCS applications and sends them to the OMEGAMON Collector. One Performance Expert Agent for DB2 Connect Monitoring can send data to one or more OMEGAMON Collectors, and one OMEGAMON Collector can receive data from one or more Performance Expert Agents for DB2 Connect Monitoring. The collected data is stored in the DB2PM database of the OMEGAMON Collector.

Figure 181 on page 2532 provides an overview of how the activities of DB2 Connect gateways and the DCS connections are monitored.
Performance Expert Client enables you to view the collected data from various perspectives. You can view:

- A list of all DB2 Connect gateways that are connected to a specific DB2 subsystem. You can also view Statistics details on them.
- Statistics details on a specific DB2 Connect gateway, independent of any DB2 subsystem
- A list of all DCS applications that are connected to any DB2 subsystem and view details on them
- Information about the DCS application that is related to a specific thread

**Related information:**

- Some windows or panes show the key performance counters in a table. One or more columns might be hidden. For information about how to view hidden counters, to hide counters that you are not interested in, or to change the order of the columns, refer to "Customizing table columns" on page 2546.

**Viewing all DB2 Connect gateways connected to a DB2 subsystem:**

You can display a list of all DB2 Connect gateways that are connected to a DB2 subsystem and view Statistics details on them.

To view Statistics details:

1. In the System Overview window, select a DB2 subsystem in the folders pane and then click the Statistics Details toolbar button ( ).
   
   If you are not connected to this DB2 subsystem, you are prompted to log on.

2. In the folders pane of the displayed Statistics Details window, click **DB2 Connect Server**.
   
   The DB2 Connect Server pane opens, which lists all the DB2 Connect gateways that are connected to this DB2 subsystem.

3. To get more Statistics details on a specific DB2 Connect gateway, double-click it.
The DB2 Connect Server ip page opens, where ip stands for the IP address of the selected DB2 Connect gateway. On the various panes, you find:

- Statistics about the DB2 Connect gateway, including details on the number of agents and pooled agents, the connections waiting for the host to reply, and the connections waiting for the client to send a request
- Statistics about the processes at the selected DB2 Connect gateway, such as the CPU and the working set
- The amount of time that is required to process a sample SQL statement
- Statistical details on the packages received at the DB2 Connect gateway

**Viewing Statistics details on a specific DB2 Connect gateway:**

You can view information about a specific DB2 Connect gateway. In the System Overview window, select a DB2 Connect gateway in the folders pane and then click the Statistics toolbar button ( ).

If you are not connected to this DB2 Connect gateway, you are prompted to log on to the OMEGAMON Collector that is receiving information from the Performance Expert Agent for DB2 Connect Monitoring that is monitoring the DB2 Connect gateway.

The Statistics window opens. The information shown in this window is identical to the information on the DB2 Connect Server ip page of the Statistics Details window. See “Viewing all DB2 Connect gateways connected to a DB2 subsystem” on page 2532.

**Viewing information about all DCS applications connected to any DB2 subsystem:**

You can display a list of all the DCS applications that are connected to any DB2 subsystem and view details on them.

To view details:

1. In the System Overview window, select a DB2 Connect gateway in the folders pane and then double-click Application Summary in the contents pane.
   
   If you are not connected to this DB2 Connect gateway, you are prompted to log on.
   
   The Thread Summary window opens, which shows the key data for the DCS application connected to any DB2 subsystem.

2. To get more details on a specific DCS application, double-click it.
   
   The Thread Details window opens. On its various panes, you find:
   
   - An overview of the DCS application, such as cumulative counters and status information.
   - Information about the SQL statement that was last executed by the DCS application, including network Statistics, the host response time, and the CPU time distribution.
   - Outbound and inbound data and the network time taken to transmit the data.
Viewing information about the DCS application related to a thread:

You can view information about the DCS application that is related to a specific thread.

To view information about the DCS application that is related to a specific thread:
1. In the System Overview window, click a DB2 subsystem in the folders pane and then double-click **Thread Summary** in the contents pane.
   If you are not connected to this DB2 subsystem, you are prompted to log on.
   The Thread Summary window opens, which shows the key performance counters for all connected threads.
2. Double-click a thread.
   The Thread Details window opens.
3. In the folders pane of the Thread Details window, click **DB2 Connect Server**.
   The DB2 Connect Server pane is displayed, which lists the related DCS application.
4. To get more details on this DCS application, double-click it.
   The DB2 Connect Server **appl_id** page is displayed. **appl_id** stands for the identifier that is generated when the application connects to the database at the database manager or when Distributed Database Connection Services (DDCS) receives a request to connect to a DRDA database. The information shown on the various panes of this page is identical to the information on the Thread Details window. See “Viewing information about all DCS applications connected to any DB2 subsystem” on page 2533.

The gateway snapshot time:

The Gateway Snapshot Time counter on the DB2 Connect Server pane of the Statistics Details window and on the Statistics window shows the timestamp at which the snapshot was taken at the DB2 Connect gateway. This timestamp usually differs from the snapshot timestamp of the OMEGAMON Collector.

If you are viewing current data, the OMEGAMON Collector displays the most recent data that was received from the DB2 Connect gateway. In history mode, the OMEGAMON Collector searches for a DB2 Connect gateway snapshot that is closest to the history snapshot of the OMEGAMON Collector.

If the DB2 Connect gateway, OMEGAMON Collector, Performance Expert Client, or all of them are in different times zones, the times shown in the Gateway Snapshot Time counter and for the OMEGAMON Collector snapshot are adapted to the Performance Expert Client time. For example, if the OMEGAMON Collector receives a snapshot from the DB2 Connect gateway that was taken at 11 a.m., the OMEGAMON Collector location is two hours ahead of the DB2 Connect gateway location, and the Performance Expert Client location is three hours ahead of the OMEGAMON Collector location, the Gateway Snapshot Time counter displays a time of 16:00 (4 p.m.).

**Viewing DB2 system parameters**

You can view the system parameter values that you specified when configuring a DB2 subsystem.

To view the database configuration do one of the following:
• In the System Overview window, select the DB2 subsystem in the folders pane and then click **System Parameters** toolbar button.

• You can also use the menu bar or pop-up menu: click the DB2 subsystem in the folders pane, then click **Selected > Monitor > System Parameters** on the menu bar or **Monitor > System Parameters** on the pop-up menu.

If you are not connected to the selected DB2 subsystem, you are prompted to log on.

The System Parameters window shows the current values for the selected DB2 subsystem.

To view detailed information for a system parameter, click the name of the parameter in the folders pane.

**Related information:**

• The System Parameters window shows some of its system parameters in tables. In contents panes containing a table:
  – One or more columns might be hidden. For information about how to view hidden counters, to hide counters that you are not interested in, or to change the order of the columns, refer to “Customizing table columns” on page 2546.
  – You can choose to view details on a table entry in another window or on a notebook page. For more information, refer to “Viewing details on a table entry in a contents pane” on page 2547.

• Some windows or panes show the key performance counters in a table. One or more columns might be hidden. For information about how to view hidden counters, to hide counters that you are not interested in, or to change the order of the columns, refer to “Customizing table columns” on page 2546.

• Performance counter values that are too long are truncated. For information about how to view the entire value, refer to “Viewing long performance counter values” on page 2547.

• If you are working in different time zones, refer to “Working in different time zones” on page 2547 for more information.

**Working with exception processing**

Exception processing is an efficient way to monitor DB2 subsystems for performance problems. When exception processing is active, you are informed when certain events occur, or when specific counters reach levels that might produce problems.

Exceptions are recorded by the OMEGAMON Collector. To run exception processing, it must be set up during the customization of the OMEGAMON Collector.

**Related reading:** For more information about setting up exception processing, refer to **Configuration and Customization**.

Exception processing is started when the OMEGAMON Collector is started. It continues until you stop it, the OMEGAMON Collector or DB2 is stopped, or you log off from the DB2 subsystem that you are monitoring. When you leave Performance Expert Client you can request that the collection of exception processing data is continued.
OMEGAMON for Db2 PE supports:

- Event exception processing: This monitors a DB2 subsystem for the occurrence of particular events.
- Periodic exception processing: This periodically monitors thread-activity and Statistics fields for exception conditions.

This section explains how to start and stop exception processing, to view the exceptions that occurred, and to use the exception user exit.

**Starting exception processing:**

This topic explains how to start exception processing.

To work with exception processing, you can do one of the following:

- In the System Overview window, select the DB2 subsystem in the folders pane and then click the Exception Processing toolbar button ( ).
- In the System Overview window, click Tools > Exceptions > Exception Processing.

The Exception Processing window is displayed.

This window provides information about the status of both event and periodic exception processing for all DB2 subsystems to which you are logged on. The icons that are displayed when you click Event Exceptions in the folders pane of the window have the following meaning:

- The event is supported by the OMEGAMON Collector and switched on at its startup.
- The event is supported by the OMEGAMON Collector but was not switched on at its startup.
- N/A The event is not supported by the OMEGAMON Collector.

The Exception Processing window shows up to the latest 9999 exceptions recorded. If you want to change this number, click Exception Processing > Settings. The Exception Settings window is displayed. On its pages, you can change the number of entries that is collected in the log for event exception and periodic exception processing.

If you want to be informed whenever an exception is recorded, you can choose to be notified by a message or a beep. Click Exception Processing > Settings. The Exception Settings window is displayed. On its pages, you can specify the kind of notification for event exceptions and periodic exceptions.

**Processing event exceptions:**

This topic shows how to process event exceptions.

When you monitor event exceptions, you are informed about the following events:

- Authorization failure
- Coupling facility rebuild start
- Coupling facility rebuild stop
- Coupling facility alter
- Data set extension
- Deadlock
- EDM pool full
- Global trace start
- Log space shortage
- Thread commit in doubt
- Timeout
- Unit of recovery problem

All events must be enabled on the OMEGAMON Collector.

**Related reading:** Refer to [Configuration and Customization](#) for information about how to enable an event.

You can monitor exceptions for one or more DB2 subsystems.

**Starting and stopping event exception processing:**

This topic show how to start and stop event exception processing.

To start monitoring for event exceptions:

1. In the Exception Processing window, click **Exception Processing > Activation - z/OS**.
   
   The Activation window is displayed. The exact name of, the layout of, and the selections possible on, this window depend on whether you are logged on to one or to several DB2 subsystems. The following table shows the various possibilities.

<table>
<thead>
<tr>
<th>If you are logged on to ...</th>
<th>Description of Activation window</th>
</tr>
</thead>
<tbody>
<tr>
<td>One DB2 subsystem</td>
<td>The Activation – subsystem is displayed, where subsystem stands for the name of the DB2 subsystem to which you are logged on. The event list shows all events supported by z/OS. The events enabled by the OMEGAMON Collector are selected.</td>
</tr>
<tr>
<td>Several DB2 subsystems</td>
<td>The Activation – z/OS window is displayed. This window consists of the DB2 subsystems pane, listing all DB2 subsystems to which you are logged on, and the Activation pane. Select the DB2 subsystems you want to monitor. The event list appears and shows all events supported by z/OS. The events that are enabled on the OMEGAMON Collector of at least one DB2 subsystem are selected. The selected events that are not enabled by all OMEGAMON Collectors are followed by an asterisk (*).</td>
</tr>
</tbody>
</table>

2. Click the **Start ( )** button next to **Event exception processing**.

To stop event exception processing:

1. In the Exception Processing window, click **Exception Processing > Activation**.
   
   The Activation window is displayed.

2. Click the **Stop ( )** button next to **Event exception processing**.
Viewing event exceptions:

To get more information about an event exception, double-click it in the Event Exception Log pane of the Exception Processing window or in the 100 Most Recent Exceptions pane of the System Overview window.

When an event exception occurs, you are informed in the following ways:

- An entry is added to the Event Exception Log pane of the Exception Processing window.
- An entry is added to the 100 Most Recent Exceptions pane of the System Overview window.
- A message appears, a beep is issued, or both, if you requested this kind of notification in the Exception Settings window.

Viewing deadlocks:

This topic shows how to find out if a deadlock occurs.

When a deadlock occurs, you are informed in the following ways:

- An entry is added to the Event Exception Log pane of the Exception Processing window.
- In the folders pane of the System Overview window, the icon changes next to the DB2 Subsystem for which the deadlock was recorded and next to the folders that contain this DB2 Subsystem. The event exception icon changes, by default, for at least five minutes or for the minimum period of time that you specified on the Preferences page of the Configuration window. See “Specifying global settings” on page 2504. An event exception icon overrules any warning or problem icon.
- An entry is added to the Exceptions page of the System Overview window.
- By a message, a beep, an e-mail, or a mixture of them. Whether you receive these types of information, and which of them, depends on your specifications in the Exception Settings window and on the Exception page of the OMEGAMON Collector Properties window. To receive an e-mail, you must also have requested this type of information about the Activation window.
- By using a user exit. In this case, you must have enabled the user exit and specified its path on the Exception page of the OMEGAMON Collector Properties window. In addition, you must have selected the user exit in the Activation window. For information about how to write a user exit, refer to “Working with the exception user exit” on page 2541.

Viewing details on a deadlock:

When a deadlock occurs, you need to know what caused the deadlock and how to resolve it. OMEGAMON for Db2 PE helps you find the reasons for a deadlock by supplying information, such as which threads are involved in the deadlock, which statements led or might have led to the deadlock, and which thread holds the resource that is requested by another thread.

To view this information:

1. Double-click a deadlock in the Event Exception Log pane of the Exception Processing window or on the Exceptions page of the System Overview window. The various pages of the Deadlock Details window provide you with all the information that you need to narrow down the reasons for the deadlock.
2. To get information about the thread that was rolled back (victim), about the system and the DB2 Subsystem on which the deadlock occurred, and about the number of threads that are involved in the deadlock, have a look at the Overview page.

Processing periodic exceptions:

You can use periodic exception processing to periodically check DB2 counters against specific thresholds. When the value of a counter falls above or below these thresholds, an exception is logged.

To run periodic exception processing, you must first define thresholds for specific fields.

Establishing thresholds:

DB2 provides a comprehensive set of thread-activity and Statistics fields. However, you usually need to define only a limited number of thresholds. Long response times are a good indicator of a performance problem, so start by defining exception thresholds for time fields. You can, for example, set thresholds that are appropriate to your environment for class 1 and class 2 elapsed times.

Decide which are the most important applications or transactions in your system. Always define exception thresholds for critical business applications. Frequently executed applications are also good candidates for exception thresholds.

In a threshold set, you specify thresholds for all DB2 counters that you want to monitor together.

To create a threshold set:

1. In the Exception Processing window, click Exception Processing > New Threshold Set. The New Threshold Set window is displayed.
2. Select z/OS as operating system.
3. Type a unique name for the set and your name (this is usually your logon user ID). Then click OK. An empty Threshold Set Editor window is displayed.
4. To add a threshold, click Threshold Set > New Threshold. The New Threshold window is displayed.
5. Under Exception field, you select the counter you want to monitor. Select the appropriate exception category and exception subcategory. Then select the counter from the Select the exception field list.
6. Under Warning and problem thresholds, specify the threshold values for warnings and problems for the selected counter.
7. Under Qualifier, you can specify filter criteria for the counter.
8. Click OK to save your specifications.
9. You can continue with one or more of the following tasks or proceed with step [10 on page 2540]
   * To define more thresholds to the threshold set, click Threshold Set > New Threshold.
• To change a threshold, click it and then click **Selected > Edit**.
• If a threshold in the set should not be used during period exception processing, deactivate it: click the threshold and then click **Selected > Active**.

10. When you have finished defining thresholds and want to save your changes, click **Threshold Set > Save**. The Exception Processing window lists the new threshold set under the z/OS folder in the **Threshold Sets** folder.

To change the properties of a threshold set, click it in the folders pane of the Exception Processing window and then click **Selected > Properties**. The Threshold Set Properties window is displayed, which is similar to the New Threshold Set window.

To change the contents of a threshold set by adding more thresholds or removing or changing some of them, click the threshold set in the folders pane of the Exception Processing window and then click **Selected > Edit**. TheThreshold Set Editor window is displayed.

*Starting and stopping periodic exception processing:*

This topic describes how to start and stop periodic exception processing.

To start periodic exception processing:

1. In the Exception Processing window, click, for example, **Exception Processing > Activation - z/OS** (depending on which operating system you want to start periodic exception processing).
   The Activation window is displayed. For more information about the exact name of, the layout of, and the selections possible on this window, refer to [Table 201 on page 2537](#).

2. If you want to start periodic exception processing for several DB2 subsystems at once, you must select the subsystems you want to monitor.

3. Ensure that your threshold set is displayed in the **Threshold set** field. In addition, type the time interval at which the thread and Statistics fields are checked for exceptions.

4. Click the **Start (графика)** button next to **Periodic exception processing**.

All active thresholds in the threshold set are used during periodic exception processing.

To stop periodic exception processing:

1. In the Exception Processing window, click **Exception Processing > Activation**.
   The Activation window is displayed.

2. Click the **Stop (квадрат)** button next to **Periodic exception processing**.

*Viewing periodic exceptions:*

This topic describes how to view periodic exceptions.

When a periodic exception occurs that is outside of the specified warning or problem threshold, you are informed in the following ways:

- An entry is added to the Event Exception Log pane of the Exception Processing window.
• A warning icon (⚠️) or a problem icon (🔴) appears:
  – Next to the affected counter in the window that contains this counter.
  – In the folders pane of the System Overview window, next to the DB2 subsystem that contains the affected counter and next to the folders that include this DB2 subsystem.

A problem icon overrules a warning icon. No icon is shown for counters that are listed in a table.

When you move your mouse pointer over the counter, hover help shows the timestamp of the exception. If this counter is on a KPIs page of the System Overview window, hover help also contains the defined warning and problem thresholds.

The icon disappears after the counter value falls below or above the threshold or you stop periodic exception processing and after you refresh the data. In the System Overview window, you need not refresh the data.

• An entry is added to the 100 Most Recent Exceptions pane of the System Overview window.

• A message is displayed, a sound (beep) is played, or both, if you specify this kind of notification in the Exception Settings window.

You can get more information about a periodic exception from the Periodic Exception Log pane of the Exception Processing window and the 100 Most Recent Exceptions pane of the System Overview window. In the Periodic Exception Log pane, click the exception and then:

• Click Selected > Current Statistics Details to see the corresponding Statistics values.

• Click Selected > Field Exception History to see a log of the exception values for the counter.

• Click Selected > Thread Identity to see information about the application causing the exception.

• Click Selected > Current Thread Details to see thread information. (This is available only if your OMEGAMON Collector supports this function.)

In the 100 Most Recent Exceptions pane, right-click the exception and select the information you want to see.

**Working with the exception user exit:**

OMEGAMON for Db2 PE supports a user exit to handle event and periodic exceptions. This user exit is a predefined exit point where a user-written routine can be given control.

The name of the exception processing user exit is DGOMUPXT. A sample of this user exit is provided in TKO2SAMP.

To activate the user exit, do the following in the Exception Processing window:

1. Click Exception Processing > Activation.
   The Activation window is displayed.
2. Select the User exit check box.
3. Click the Start (►) button next to Periodic exception processing.
   Periodic exception processing must be running in order to use the user exit—even if you are only interested in event exceptions.
Related reading: Refer to Configuration and Customization for information about customizing this user exit.

Monitoring data sharing groups

If you are working with a member of a data sharing group, you might want to view, from time to time, the monitoring information collected for another member in the data sharing group. Or you might want to compare the data collected for all members in the group. Most of the monitoring functions allow you to switch among the individual members and between a member and the group. You find a Show Data for list in the toolbar.

From this list, you can select another member or the group. Depending on your selection, the window shows the data for the selected member or the group. If a member is not active, the member name in the list is followed by QUIESCED or FAILED. This depends on why the member became inactive.

Sometimes, while you are working with a member, another member is added to the group, a member is deleted, or the status of a member is changed. To refresh the displayed list, click View > Refresh Data Sharing Group Information.

To get monitoring information from all members of a data sharing group, ensure that the monitor traces are started on all members.

Related reading: For information about how to ensure this, refer to the description of the DATASHARINGGROUP and DB2COMMAND startup parameters in Configuration and Customization.

This section describes the windows displayed when you monitor the thread of a data sharing group and view Statistics information about it.

Monitoring the threads of a data sharing group:

When you request the display of all active threads connected to a member of a data sharing group, the Thread Summary window shows the member name in the Show Data for list and lists all active threads running on this member.

When you select the group from the Show Data for list, all active threads running on the entire group are displayed.

The Member column in the window shows, for each thread, the member on which it is running. In the case of CP parallelism or sysplex query parallelism, the parent thread is displayed and the values of the children are accumulated.

Viewing Statistics on a data sharing group:

When you request Statistics information about a member of a data sharing group, the Statistics Details window shows the member name in the Show Data for list and displays the Statistics information for this member.

When you select the group from the Show Data for list, the entries in the folders pane are reduced to those available in group view. The performance counters are displayed in tabular format, with a column for each active member of the data sharing group.

In member view, part of the Statistics information is already displayed in tabular format, such as the information about the Buffer Management pane. When you
view this pane for the entire group, the Buffer Management pane shows the values for the most important buffer-pool performance counter, which is the hit ratio, for each buffer pool and member in the data sharing group. The counter name is displayed above the buffer-pool table.

Thus, when Statistics information is shown in tabular format in member view and you want to view this information in group view, OMEGAMON for Db2 PE selects the most important performance counter in the table and displays its values for the entire group.

**Viewing the system health of a data sharing group:**

When you want to view the system health of a member of a data sharing group, the System Health window shows the member name in the Show Data for list and displays the system health for this member.

When you select another member from the Show Data for list, the displayed data views are cleared and the snapshots of the selected member appear.

When you select the group from the Show Data for list, the displayed data views show the following:

- A chart for each member in the data sharing group.
- A list of all members in the data sharing group, instead of a report.

To hide the chart of a member, clear the appropriate check box in the member list. To display the charts in a different order, right-click the member you want to move and then click the appropriate command. To view the report on a member, right-click its chart.

**Viewing history data**

You can view history data for threads, locking conflicts, Statistics, and system parameters. This data is stored as snapshots.

History data is useful, for example, if you want to examine events that lead to or follow an exception without recreating the situation.

The OMEGAMON Collector must be enabled for collecting history data. The data is then collected at intervals that you defined during installation.

**Related reading:** For information about setting up the OMEGAMON Collector to collect history data, see [Configuration and Customization](#).

You can display history data in the Thread Summary, Statistics Details, System Health, and System Parameters window, and in all windows dealing with threads involved in a locking situation.

To view history data:

1. Click View > History.

   The history slider is activated.

   The slider is divided into units where each unit stands for the date and time at which a snapshot was collected. The timestamp above the slider indicates the date and time of the snapshot at the current slider position. The timestamps below the slider show the time range through which data is available in history mode. This is useful, for example, if you zoom the time interval displayed to you.
2. To view the data of a specific snapshot, do one of the following:
   - Move the slider to the date and time you want.
   - Click View > History Settings. A window is displayed on which you can specify the date and time of the snapshot data you want. Click OK to get the snapshot data.
   - To view the next snapshot, click the right arrow (→) or View > Forward. To view the previous snapshot, click the left arrow (←) or View > Back. You can repeat these commands until you have reached the snapshot you want.
   - If the slider contains too many units for you to move the slider to an exact date and time, you can decrease the time interval shown by clicking the plus (+) sign above the slider as often as you need. To increase it again, click the minus (-) sign.

To display the current data again, click View > History again to deactivate the history slider.

**Restriction:** When you view SQL statements in the dynamic SQL cache in history mode, you cannot define a filter. For more information about SQL statements data, refer to “Viewing the SQL statements in the dynamic SQL cache” on page 2518.

### Using Explain products to analyze and improve SQL statements

This topic explains how to use Explain products to analyze and improve SQL statements.

To determine and improve the access path of dynamic and static SQL statements that contain a SELECT, UPDATE, INSERT, DELETE, or VALUES clause, you can use one of the following Explain products:

- IBM Db2 Query Workload Tuner for z/OS Version 5.1
- IBM InfoSphere Optim Query Workload Tuner Version 4.1 or later (including Data Studio) (before Db2 12)

You can use Explain products to view the access path of a dynamic or static SQL statement when:

- Monitoring an application or thread
- Viewing Statistics on the SQL statements stored in the dynamic SQL statement cache

If you want to use Query Workload Tuner, you must first define the local database alias of the currently monitored DB2 subsystem:

1. Open the following wizard or window:
   - The New DB2 System wizard as described in “Defining a DB2 subsystem” on page 2500
   - The DB2 System Properties window as described in “Changing the properties of a DB2 subsystem” on page 2503

2. Open the DB2 Subsystem page.
3. In the Local DB Alias field, type the local database alias of the DB2 subsystem.

### Displaying the access path while monitoring an application or thread:

This topic shows how to view the access path while monitoring an application or thread.

To view the access path:
1. Open the Thread Details window.

2. In the folders pane, click **SQL Statement**.
   The SQL Statement pane shows the SQL statement that is currently run by the thread. The Explain button is enabled.

3. Under **SQL statement text**, click Explain. If the statement contains a SELECT, UPDATE, INSERT, DELETE, or VALUES clause, Query Workload Tuner is opened to view the access path for this statement.

**Note:** Usually only one of the Explain products is started at the same time. (This depends on the data bridge server connection that is used.) You can also cut and paste the SQL statement text from Performance Expert Client to manually create a project.

**Displaying the access path while viewing Statistics on SQL statements:**

This topic shows how to display the access path while viewing Statistics on SQL statements stored in the dynamic SQL statement cache.

To display the access path:
1. Open the Statistics Details window.
2. In the folders pane, click **SQL Statements**.
   The SQL Statements pane is displayed without any entries.
3. To display the SQL statements that are in the cache:
   a. Click the Filter button to check the filter values and set the appropriate values for your system. For more information about defining filter criteria, see step 5 on page 2519.
   b. Select the Receive statement cache information check box.
      The list is refreshed whenever you click View > Refresh or when an automatic refresh occurs.
4. Double-click a statement.
   The SQL Statements text page opens, where text stands for the first couple of characters of the statement text.
5. Under **SQL statement**, click Explain.
6. If the statement contains a SELECT, UPDATE, INSERT, DELETE, or VALUES clause, the following window opens depending on the Explain products installed:
   • If Query Workload Tuner is installed and launched, a new Project is defined and the Statement text is shown. Use the corresponding function of Query Workload Tuner to generate the Access Plan.

**Exporting snapshot data for saving and printing**

You can export snapshot data to HTML format. You can then print the data or save it as an HTML file.

To export snapshot data:
1. Do one of the following in the window containing the snapshot data:
   • Click the Print/Export toolbar button.
   • Click the leftmost menu and then click Print/Export.
      The Print/Export window is displayed.
2. You can change the settings in this window as follows:
- If the window consists of several pages and you want to export them all, click **All** under **Pages**.
- If the window contains a large table, you can:
  - Specify how many columns and rows you want to export.
    
    **Example:** To export only the first five columns, select **Only first for Columns** and then specify 5 in the field.
  - Specify after which column the table is split. Select the **Split after** check box and then select the column number.

3. Click **OK**.

A Web browser window is displayed showing the window contents in HTML format. You can use your Web browser to save or print the contents of the window.

If your window contains a table with many columns and you specified to split the table after a specific number of columns, for example three, your HTML file looks similar to the example shown in **Figure 182**.

![Buffer Manager](image)

<table>
<thead>
<tr>
<th>Number</th>
<th>Buffer Pool</th>
<th>Hit Ratio</th>
<th>Getpage Requests</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>BP0</td>
<td>75.0</td>
<td>20</td>
</tr>
<tr>
<td>2</td>
<td>TOTAL</td>
<td>75.0</td>
<td>20</td>
</tr>
</tbody>
</table>

**Figure 182. Example of a split wide table**

To make the table easier to read, the rows are numbered in the **Number** column.

**Working with windows displaying snapshots**

This section provides you with the information that applies to all windows displaying snapshots.

**Customizing table columns:**

Some contents panes of the Thread Details, Statistics Details, and System Parameters window show the key performance counters in a table. One or more columns might be hidden.

To view hidden counters, to hide counters that you are not interested in, or to change the order of the counters, perform the following steps:

1. Click **View > Customize Columns**.

   The Customize Columns window is displayed.

2. To make a column visible, click the column in the **Hidden columns** list and then click **Add (►)**. The column is removed from the **Hidden columns** list and displayed at the bottom of the **Visible columns** list.

   To make all hidden columns visible, click ◄→ .

3. To hide a column, click the column in the **Visible columns** list and then click **Remove (▼)**. The column is removed from the **Visible columns** list and displayed in the **Hidden columns** list.

   To hide all columns, click ◄► .

---

2546   IBM Db2 Performance Expert on z/OS
4. To move a column up in the hierarchy, click the column in the **Visible columns** box and then click **Move up**. To move this column to the top of all columns, click **Move to top**. To move a column down in the hierarchy, click the column in the **Visible columns** box and then click **Move down**. To move this column to the bottom of all columns, click **Move to bottom**.

5. Click **OK**.
   The previous window is displayed with the columns rearranged, hidden, or made visible according to your specifications.

**Viewing details on a table entry in a contents pane:**

Some windows show part of the performance information and system parameters in tables. In the contents panes containing a table, you can get further details on a table entry by double-clicking the entry. When you work with Performance Expert Client for the first time, the window becomes a notebook where the initial counter categories or system parameters are shown on the Main page and where further details on the additional notebook pages are displayed.

If you want to compare the data on the individual pages, you can change to window view where each notebook page becomes a window within the main window that you can move, cascade, and tile according to your needs. Click **View > Switch to window view** in the main window. To return to page view, click **View > Switch to page view** in the main window. Your selection remains valid throughout Performance Expert Client until you change it again.

**Viewing long performance counter values:**

Some performance counter values exceed the length of the field in which they are displayed and are therefore truncated.

To view the entire value, move your mouse pointer over the field containing the value. Hover help is displayed showing the value in its full length. If the value is longer than 40 characters, a line break is inserted after every 40 characters.

To view the invisible parts of the value, click in the field containing the value and then use the left or right arrow, or press the Home or End key to go to the beginning or end of the value.

You can also copy the value by marking it and using copy and paste.

**Working in different time zones:**

The windows displaying snapshots contain timestamps to inform you when the snapshots were taken. If the OMEGAMON Collector and Performance Expert Client are in different time zones, the snapshot times are adapted to the Performance Expert Client time.

For example, if a snapshot is taken at 4 p.m. and the time at the OMEGAMON Collector location is six hours ahead of your Performance Expert Client, the window displaying this snapshot shows a time of 10:00 (10 a.m.).
Working with Performance Warehouse

This topic first describes the tasks you need to perform before you can start working with Performance Warehouse and then how to use Performance Warehouse to perform analysis tasks on DB2 performance data using processes, rules of thumb, and queries.

Performance Warehouse provides a process-oriented view of performance-analysis tasks. It allows you to automate tasks that previously required user interaction, such as loading DB2 data into the Performance Warehouse database or generating reports.

A process can consist of steps that link together these manual tasks. For example, you might want to transfer DB2 trace records on your MVS system to the Performance Warehouse database for further analysis. Your corresponding Performance Warehouse process might consist of a:

- **CONVERT** step that converts a save data set to a Save-File data set.
- **LOAD STATISTICS** step that loads the data set into the Performance Warehouse database.

Processes represent recurring performance-analysis tasks, they can be scheduled for automatic and repeated execution. You can trace these process executions from the workstation.

Processes produce output data that provides DB2 performance-related information. You can load this data into the Performance Warehouse database and then use rules of thumb and SQL queries to analyze it. Rules of thumb represent a category of expert rules. These rules help you identify more complex performance problems and provide you with tuning recommendations. For example, you can combine several performance counters in a value expression and relate this expression to problem and warning thresholds. You can also create, store, and run SQL queries on the Performance Warehouse database.

Sample processes, rules of thumb, and queries are provided to help you get started.

Running Performance Warehouse in a data-sharing environment

The Performance Warehouse database is maintained by the OMEGAMON Collector that runs with the startup parameter PERFORMANCEWAREHOUSE=YES. In a data sharing group, the OMEGAMON Collectors might be installed on more than one member.

Start the Performance Warehouse server task only for one OMEGAMON Collector in the data sharing group to avoid conflicts.

Figure 183 on page 2549 shows a typical data-sharing environment running Performance Warehouse.
The environment includes:

- Two MVS systems in a Parallel Sysplex® environment with one data sharing group, DSG 1, that comprises the members A1, A2, and A3, and additional DB2 subsystems B1 and C1.
- A Performance Warehouse that contains the performance data of the DB2 subsystems A1, A2, and A3, and a Performance Warehouse each for B1 and C1.
- OMEGAMON Collector 1 that is dedicated to data sharing group DSG 1 on MVS 1 maintains the Performance Warehouse database in a data sharing group.

The OMEGAMON Collectors 1, 2, and 4 run the processes to produce reports and load data into the Performance Warehouse database. If SMF data is to be loaded, the OMEGAMON Collector requires read access to the corresponding SMF data set.

Performance Expert Clients that want to use Performance Warehouse connect to the DB2 subsystem or the DB2 data sharing group that contains Performance Warehouse. If you wanted to connect to the data sharing group and access Performance Warehouse, you would specify the location of DSG 1 as the database name and MVS 1 or MVS 2 as the host name when cataloging the DB2PM database of the OMEGAMON Collector by using the Configuration Assistant of DB2, regardless of which member of DSG 1 you want to connect to.

**Logging on to Performance Warehouse**

You log on to a Performance Warehouse by connecting to its Performance Warehouse database.

You can log on to Performance Warehouse automatically or manually:

- You can automatically log on to a Performance Warehouse associated with a DB2 subsystem. You can associate a Performance Warehouse with a DB2 subsystem when defining the DB2 subsystem for monitoring from Performance Expert.
Client (see step 7 on page 2501) or when changing the properties of the DB2 subsystem (see “Changing the properties of a DB2 subsystem” on page 2503).

- You can manually log on to an associated Performance Warehouse or to any Performance Warehouse that was configured using the Configuration Assistant of DB2. When you log on manually the DB2 subsystem that it is associated with, the database need not exist any more. If you removed the associated DB2 subsystem from the System Overview window but kept the DB2 catalog entries, you can still work with Performance Warehouse.

If you log on to a Performance Warehouse database that is maintained by an OMEGAMON Collector that is not running, you can define processes, rules of thumb, and queries but you cannot run them.

Logging on to a Performance Warehouse automatically:

To log on to a Performance Warehouse automatically, select a DB2 subsystem ID in the folder pane of the System Overview window, then click Selected > Monitor > Performance Warehouse - Expert.

The Expert page of the Performance Warehouse window is displayed. The folders pane lists, under the z/OS folder, all Performance Warehouse systems to which you previously logged on or that you added manually (see “Adding a Performance Warehouse” on page 2551). The names that appear are the DB2 connection aliases, which associate a Performance Warehouse with a DB2 subsystem.

In addition, you are logged on to the Performance Warehouse that is associated with the selected DB2 subsystem. You can now work with the items that are listed on the displayed page of the Performance Warehouse window, or you can move to another page to perform a different set of tasks.

Logging on to a Performance Warehouse manually:

To log on to a Performance Warehouse manually, click the Performance Warehouse toolbar button ( ) in the System Overview window.

The Expert page of the Performance Warehouse window is displayed. The folders pane lists, under the z/OS folder, the DB2 connection alias of all Performance Warehouse systems to which you previously logged on or that you added manually (see “Managing Performance Warehouse systems” on page 2551).

If no Performance Warehouse systems are listed because you are working with Performance Warehouse for the first time or the Performance Warehouse of your choice is not listed, add the Performance Warehouse systems you need. For more information refer to “Managing Performance Warehouse systems” on page 2551.

Click the Performance Warehouse to which you want to log on and click Selected > Connect to open the Connect to Performance Warehouse window.

Specify your DB2 user ID and your password and then click OK.

You are logged on to the specified Performance Warehouse. You can now work with the items listed on the displayed page of the Performance Warehouse window or move to another page to perform a different set of tasks.
Managing Performance Warehouse systems
You can add and delete Performance Warehouse systems.

Adding a Performance Warehouse

You can add a Performance Warehouse system automatically or manually.

A Performance Warehouse is automatically added to the folders pane of the Performance Warehouse window the first time you perform an automatic logon to a Performance Warehouse. For information on how to do this, refer to “Logging on to a Performance Warehouse automatically” on page 2550. The name under which a Performance Warehouse appears in the Performance Warehouse window is the database alias, which associates a Performance Warehouse with a DB2 subsystem.

To add a Performance Warehouse manually, perform the following steps:
1. In the Performance Warehouse window, click **Performance Warehouse > New Performance Warehouse**.
   The New Performance Warehouse window is displayed.
2. Select **z/OS**.
3. In the **Database alias** field, type the alias of a Performance Warehouse database. This is the alias that you specified as database alias when cataloging the DB2PM database of an OMEGAMON Collector by using the Configuration Assistant of DB2.
   **Related reading:** For further information about cataloging the DB2PM database, see [Configuration and Customization](#).
4. If you want to log on to the new Performance Warehouse after leaving this window, select the **Connect immediately after configuration** check box.
5. Click **OK**.

The new Performance Warehouse is added to the **z/OS** folder and remains part of this folder until you delete it again. If you requested to log on immediately after defining the new Performance Warehouse, the Connect to Performance Warehouse window is displayed.

The name under which Performance Warehouse appears in the Performance Warehouse window is the database alias that you specified in the **Database alias** field of the New Performance Warehouse window and which associates a Performance Warehouse with a DB2 subsystem.

Deleting a Performance Warehouse

To delete a Performance Warehouse:
1. Select the Performance Warehouse to be deleted.
2. If you are still logged on to this Performance Warehouse, click **Selected > Disconnect**.
3. Click **Selected > Delete**.

The Performance Warehouse is removed from the respective folder.

Defining and running processes
Processes consist of one or more steps that perform tasks, such as loading existing DB2 performance data into the Performance Warehouse database or generating reports.
This section describes processes and reports in more detail, uses scenarios to show how to define and run processes, and gives hints and tips on certain tasks.

A process can consist of one or more of the following steps or step combinations:

- The **CONVERT step** reads an existing save data set and produces a save-file data set that can be used as input for a LOAD step.
- The **LOAD step** loads an existing file or save-file data set into the Performance Warehouse database.
- The **REPORT step** generates Statistics and Accounting reports from existing DB2 performance data. You can use various commands and subcommands to produce different report types. This step can include:
  - Creation, conversion, and loading of save data sets into the Performance Warehouse database.
  - Creation and loading of file data sets into the Performance Warehouse database.
- The **CRD (collect report data) step** collects report data and stores it in MVS data sets.

**Report types:**

To create different report types, you add various commands and subcommands to the REPORT step.

The GLOBAL command automatically appears as the first command in the REPORT step. You use this command to filter input data, set default values for subcommand options, and define global processing options. The following options are, for example, supported by the GLOBAL command:

- **FROM**
- **TO**
- **INTERVAL**
- **BOUNDARY**
- **INCLUDE/EXCLUDE**
- **TIMEZONE**

Table 202 shows the command options for Accounting commands and subcommands. Table 203 on page 2553 shows the command options for Statistics commands and subcommands. For more information about the individual command options, refer to Report Command Reference.

**Restriction:** After a process has run, all output data sets on the host are stored in the Performance Warehouse database and removed from the host. If you want to use the output data sets created by a REPORT step as input for a LOAD step or a CONVERT and LOAD step, you must include a LOAD FILE or LOAD SAVE subcommand as part of your REPORT step.

### Table 202. Supported Accounting command options.

**Scenario 1: Transferring performance data into the Performance Warehouse database:**

The following scenario shows how you can make use of existing data sets that were not generated by a Performance Warehouse REPORT step. It describes how to transfer save or save-file data sets on an MVS system to the Performance Warehouse database.

You can perform this scenario on the following pages of the Performance Warehouse window:

- Expert
- Report and Load
Creating a process group:

A process needs a process group as a container.

To create a process group:

1. In the folders pane, select Process Groups and then click Selected > Create. The Process Group Properties window is displayed. The Author, Creation date and time, and Modification date and time fields are filled in when you click OK. The Author field will contain your DB2 user ID.

2. In the Name field, type a unique name for the process group. Example: Type Legacy.

3. In the Description field, you can type a description for the process group. Example: Type Transfer "legacy" performance data sets into Performance Warehouse.

4. Click OK to save the process group and return to the Performance Warehouse window. The new group appears in the folders pane as a subitem of Process Groups.

Creating a process using a process template:

Process templates are supplied with the product. You can find these templates in the Public process group. Here, you use the template DB2PM.Templates.Load Warehouses 2 to create a process.

This template contains a CONVERT step and a LOAD STATISTICS step.

1. In the folders pane, under Public, select DB2PM.Templates.Load Warehouses 2 and then click Selected > Copy. The Copy Process window is displayed.

2. In the New process group list, select the Legacy process group.

3. In the New process name field, type a unique name for the copied process. Example: Transfer Statistics Save.

4. Click OK.

When you return to the Performance Warehouse window, the process appears under Processes of the Legacy process group. The template's steps are also copied.

Viewing the process properties:

To view the process properties, select the Transfer Statistics Save process in the folders pane, and then click Selected > Properties.

The Process Properties window is displayed:

1. Ensure that the following is set:

   • Status is set to in definition so that you can make changes to the process.
   • Scope is set to private. When you copy a process template, the scope changes from public to private so that this process is not available to other users.
   • Schedule of process is set to immediately.

2. Change the description in the Description field to match the process.
3. Click **OK** to save the changes to the process and return to the Performance Warehouse window.

*Configuring the process steps:*

The copied template contains default values for the process steps.

You must configure the steps to add:
- An input data set to the CONVERT step
- Target tables to the LOAD STATISTICS step

To configure the CONVERT step:

1. In the folders pane, click **Steps**. In the contents pane, select the CONVERT step and then click **Selected > Properties**.
   
   The Convert Properties window is displayed.

2. Click the **Options** tab.

3. Change the name of the input data set to *my.input.data.set* and click **OK** to save the changes.

To configure the LOAD STATISTICS step:

1. In the folders pane, click **Steps**. In the contents pane, select the LOAD STATISTICS step and then click **Selected > Properties**.

   The Load Statistics Step Properties window is displayed.

2. Click the **Options** tab. Specify the types of target tables that you want to load into the Performance Warehouse database.

3. Click **OK** to save the changes.

The process definition is now complete so you can run the process.

*Running the process:*

To run the process immediately, select the process in the folders pane, and then click **Selected > Execute**. The process is scheduled to start immediately and is activated.

The following information is recorded about processes:

- The processes (with their start and stop timestamps and their status) that are currently running and have run since you started working with Performance Warehouse.
- The individual steps of each process, with their start and stop timestamps and their status.
- The output data sets of each step in a process.

While the process is running, you can view its progress. In the folders pane, click **Process Executions** to view the progress of the process. The Process Executions pane is displayed, listing the process executions for all the processes. To view only the Transfer Statistics Save process, you must define filter criteria.

To define filter criteria:

1. Click **View > Filter**.

   The Filter Process Execution window is displayed.

2. Specify the filter conditions.
You can use wildcard characters in the filter criteria: _ (underscore) for one character and % for more than one character.

Example:

- In the Name field, type Transfer Sta%
- In the Group field, type Legacy
- As Comparison operator next to the Name field, select Like because you are using a wildcard character in the name

3. Click OK.

The Process Executions pane then lists only the process-execution entries for the Transfer Statistics Save process.

Viewing the output data sets:

When the process finishes (status FINISHED on the Process Execution pane), you can view its output.

To view the output:

1. On the Process Executions pane, select the process execution and then click Selected > Details.
   The Process Execution Details window is displayed. It contains information about all the steps of the process and the output data sets generated by these steps.

2. To view the list of output data sets generated by the LOAD STATISTICS step, click the Output Data Set folder under LOAD.

3. To view the contents of a data set, double-click the data set.
   The contents of the data set are shown in a Web browser. You can use your browser to save and print the data set. For information about how to specify your Web browser of choice, see “Specifying global settings” on page 2504.

To delete the data set from the Performance Warehouse database, select the corresponding data set, and click Delete.

Scenario 2: Defining Accounting and Statistics reports using an existing input data set:

Suppose you are a database administrator for several OS/390 locations hosted on an MVS system. Users tell you that they have DB2 performance problems during online transaction processing on certain DB2 locations every day between 11 a.m. and 12 noon.

You decide to generate Accounting reports to determine if there is a DB2 problem. You also decide to generate a Statistics report to get an overview of system activity. You think that you might also need to analyze the data later using queries and rules of thumb, so you make sure that the performance data is transferred to the Performance Warehouse database.

To create the reports and transfer the data, you must:

1. Create a REPORT step.
2. Define the Accounting and Statistics reports.
3. Run the process to generate reports and transfer data to the Performance Warehouse database.
4. View and analyze the generated reports.
“Scenario 1: Transferring performance data into the Performance Warehouse database” on page 2553 describes how to work with process groups, processes and steps, how to run the process, and how to view the results. This scenario describes how to use Performance Warehouse to define the reports the DBA needs to analyze the problem. It assumes that you have an existing input data set containing the Accounting and Statistics performance records for the timeframe and DB2 locations in question. If this is not the case, proceed with “Scenario 3: Collecting performance data for the generation of Accounting and Statistics reports” on page 2560.

To define the reports you must:
1. Specify an input data set.
2. Filter the performance records to produce meaningful results.
3. Set up an Accounting report.
4. Transfer data to the Performance Warehouse database.
5. Set up a Statistics report.

You can perform these tasks on the following pages of the Performance Warehouse window:
- Expert.
- Report and Load.

**Specifying an input data set:**

The input data set on the MVS system contains the Accounting and Statistics performance records for the timeframe and the DB2 locations in question.

To specify the input data set:
1. In the folders pane, click **Steps**. In the contents pane, select the REPORT step and then click **Selected > Properties**.
   The Report Step Properties window is displayed.
2. Click the **Options** tab.
3. In the **Current data set specification** pane, click **Add**.
   The Add Input Data Set window is displayed.
4. Type the name of the data set and click **OK**.

**Specifying filter criteria for the performance records:**

You know that the performance problems occur during online processing for certain locations in a particular timeframe. You can specify filter criteria to account for these symptoms and apply them to all reports.

You use the GLOBAL command to specify these global performance-record filter criteria:
1. Click **GLOBAL** in the folders pane.
   The GLOBAL command options are shown in the Current data set specification pane.
2. To restrict the records to the timeframe, type 11:00:00:00 in the **From Time** field and 12:00:00:00 in the **To Time** field.
3. To include performance records from online transaction-processing applications only, click the **Include** filter button.
   The Include/Exclude Filter window is displayed.
a. Select the row containing the DB2 PE identifier CONNTYPE (connection type) and click Add.
   The Add Include/Exclude Value window is displayed.

b. Associate the following values with CONNTYPE:
   • CICS
   • IMS-MPP
   • IMS-TBMP

   The symbol in the Usage column shows whether the DB2 PE identifier is included or excluded.

c. Click OK to include the filter in the GLOBAL command options.

   The performance problems occur only at certain “slow” locations but you do not know exactly which locations are affected. However, you do know that the location names starting with BOE and DVI perform well. You use a filter with wildcard characters to ensure that these “good performers” are excluded from the report.

4. To exclude performance records from a particular location, click the Exclude filter button.

   The Include/Exclude Filter window is displayed.

   a. Select the row containing the DB2 PE identifier LOCATION and click Add.

   The Add Include/Exclude Value window is displayed.

   b. Associate the following values with LOCATION:
      • BOE*
      • DVI*

   c. Click OK to include the filter in the GLOBAL command options.

Setting up an Accounting report:

To set up an Accounting report, right-click REPORT in the folders pane and click Add.

On the Add Command window:

1. Select ACCOUNTING and click OK.

   The ACCOUNTING folder is added to the REPORT step.

2. Right-click the ACCOUNTING folder and click Add.

   The Add Command window is displayed

3. Select REPORT and click OK.

   The REPORT subcommand is added to the ACCOUNTING REPORT set and the current ACCOUNTING REPORT command options are shown in the Current ACCOUNTING REPORT command options pane.

4. To get as much detailed information in the report as possible, select LONG in the Layout field.

   You need to produce two reports with different aggregation levels:
      • Aggregated information for all online transaction application executions
      • Aggregated information for each online transaction application execution

5. To filter the information needed for all online transaction application executions:

   a. Click the Order filter button.

      The Order Filter window is displayed. Set 1 contains the default order criteria PRIMAUTH and PLANNAME.
b. Use the appropriate buttons to remove PRIMAUTH and PLANNAME and add the DB2 PE identifier INTERVAL. INTERVAL represents the information needed for all online transaction application executions.

6. To filter the information needed for each online transaction application execution:
   a. Select Set 2 in the **Selected identifier for** field.
   b. Add the DB2 PE identifier CORRNAME using the appropriate button. CORRNAME represents the information needed for each online transaction application execution.
   c. Click **OK** to add the filter criteria to the ACCOUNTING REPORT command options.

*Transferring Accounting performance data to the Performance Warehouse database:*

To analyze Accounting performance data produced by the REPORT step at a later date, you must transfer the data to the Performance Warehouse database. You need to include a LOAD command in the REPORT step to do this.

To transfer the data:

1. Right-click the **ACCOUNTING** folder and click **Add**.
The Add Command window is displayed.
2. Select **SAVE** and click **OK**.
The **SAVE** folder is added to the Accounting report.
3. Right-click the **SAVE** folder and click **Add**.
The Add Command window is displayed.
4. Select **LOAD SAVE** and click **OK**.
The LOAD SAVE subcommand is added to the ACCOUNTING SAVE set and the current LOAD command options are shown in the Current DB2 LOAD command options pane.
5. Select the target tables to be loaded with the performance records and click **Add**.

*Setting up a Statistics report:*

To set up a Statistics report, right-click **REPORT** in the folders pane and click **Add**.

On the Add Command window:

1. Select **STATISTICS** and click **OK**.
The **STATISTICS** folder is added to the REPORT step.
2. Right-click the **STATISTICS** folder and click **Add**.
The Add Command window is displayed.
3. Select **REPORT** and click **OK**.
The REPORT subcommand is added to the STATISTICS REPORT set and the current STATISTICS REPORT command options are shown in the Current STATISTICS REPORT command options pane.
4. To get as much detailed information in the report as possible, select **LONG** in the **Layout** field and click **OK**.
The REPORT step is now complete and you can run the process. For information about how to run a process and view the output, see “Running the process” on page 2555 and “Viewing the output data sets” on page 2556.

Scenario 3: Collecting performance data for the generation of Accounting and Statistics reports:

If an input data set does not exist, you must collect the relevant performance data before you can define your Accounting and Statistics reports.

In “Scenario 2: Defining Accounting and Statistics reports using an existing input data set” on page 2556, you used an input data set that contained the Accounting and Statistics performance records for the timeframe and DB2 locations in question.

The list of tasks necessary to define the reports would then look as follows:
1. Create a CRD (collect report data) step.
2. Filter the performance records to produce meaningful results.
3. Set up an Accounting report.
4. Transfer data to the Performance Warehouse database.
5. Set up a Statistics report.
6. Schedule the process containing the CRD and REPORT steps.

You can perform this scenario on the following pages of the Performance Warehouse window:
- Expert
- Report and Load

Creating a CRD (collect report data) step:

To create a CRD step, click Steps in the folders pane and click Selected > Create.

On the Create Step window:
1. Select CRD.
   The CRD Step Properties window is displayed.
2. Click the Options tab.
3. To configure the data collection, select Data under Options categories.
   The Current data option pane is displayed.
4. Under Data categories, select Accounting and Statistics.
5. Specify which IFCIDs you want to collect.
6. To specify the criteria for the data collection to stop, select Stop under Options categories.
   The Current stop conditions pane is displayed.
7. In scenario 2, the database administrator wants to collect data between 11 a.m. and 12 noon. To specify this, select the Elapsed time check box and type a duration of one hour.
8. Click OK to save the configuration of the CRD step.

Steps 2 to 5 are described in “Scenario 2: Defining Accounting and Statistics reports using an existing input data set” on page 2556.
Scheduling the process containing the CRD (collect report data) and REPORT steps:

To start data collection at 11 a.m., you must schedule the process containing the CRD and REPORT steps. In the folders pane, select the appropriate process and then click Selected > Properties.

In the Process Properties window:
1. Click Schedule.
   The Process Schedule Properties window is displayed.
2. Click At schedule time and then click the button next to the schedule string.
   The Schedule Process window is displayed.
3. Set the schedule to 11 a.m.:
   - Under Minutes, select Specify minutes and type 0.
   - Under Hours, select Specify hours and type 11.
4. Click OK until you return to the Performance Warehouse window.

Recommendation: The Public process group contains the template Ad-Hoc Report, which consists of a CRD step and a REPORT step. This template collects data for five minutes and generates an Accounting and Statistics report in LONG format. You can use this template to get started.

Scenario 4: Collecting performance data regularly:

You might want to collect performance data on a regular basis, for example, to collect Statistics data between 12 noon and 4 p.m. every day.

To perform this task:
1. Define a process consisting of a single CRD (collect report data) step.
2. Schedule the process to run periodically and activate it.

You can perform this scenario on the following pages of the Performance Warehouse window:
- Trace
- Report and Load
- Expert

It is recommended that you use the Trace page because it only contains the items you need to configure and activate, and for which you want to view the progress, such as the CRD process.

To define a CRD process:
1. Copy the process template DB2PM_Templates.Collect Report Data from the Public process group to a process group of your own. This template collects Accounting and Statistics data for the duration of 5 minutes.
2. Display the properties for the Collect Report Data step and change the following option categories on the Options page:
   - For Output data set, type an output data set name and select Append.
   - For Data, clear the Accounting check box.
   - For Stop, specify an elapsed time of 4 hours.
To schedule the process, proceed as described in "Scheduling the process containing the CRD (collect report data) and REPORT steps" on page 2561, but type 12 under Hours.

To activate the process, display the process properties and change the status from in definition to active.

For more details on how to define, schedule, activate, and view the progress of a process, refer to "Scenario 1: Transferring performance data into the Performance Warehouse database" on page 2553.

Hints and tips:

The following sections give hints and tips on process-related Performance Warehouse tasks.

Understanding the schedule string:

When you specify a schedule for a process, the specifications you make in the Schedule Process window are reflected as a string in the Schedule of process field of the Process Properties window and in the At scheduled time field of the Process Schedule Properties window. This string can look as follows: 2007/1/16/*/16/58

A string consists of the following parts, in this sequence: year/month/day/day-of-the-week/hour/minute. A 0 for the day of the week stands for Saturday. An asterisk (*) represents all allowed values for a field.

Important: When you define a schedule in the Schedule Process window, you can specify the dates and weekdays when you want to run a process. However, you cannot specify that a process should run at a certain date only if this date is a specific day of the week.

For example, if you type 1 under Days and 5 under Months and select the Monday check box under Day of week, the process will run on May 1st and on every Monday. In this example, the string would look similar to this one: */5/1/2/*/*

Deleting process executions of processes scheduled ‘immediately’:

If you run a process that is scheduled ‘immediately’ and delete the process execution entry within five minutes after the process has finished, the OMEGAMON Collector runs the process again.

This is because the OMEGAMON Collector replaces ‘immediately’ with the time at which the process was started and interprets this time as a schedule when no process execution is available.

Reusing output data sets produced by a REPORT step:

After a process has run, all output data sets on the host are stored in the Performance Warehouse database and removed from the host.

If you want to use the output data sets created by a REPORT step as input for a LOAD or a CONVERT and a LOAD, you must define a LOAD FILE or LOAD SAVE subcommand as part of your REPORT step.
Deleting data permanently:

To permanently delete data sets and files from the Performance Warehouse database, you must delete them in the Process Execution Details window or delete the appropriate process execution entry from the Process Executions pane of the Performance Warehouse window.

For information about how to delete data from the tables in the Performance Warehouse database, refer to "Overview of the Performance Warehouse database" on page 2577.

Using rules of thumb to analyze performance data

Rules of thumb apply a few simple rules and ratios to key performance indicators.

The sample rules of thumb delivered with the product have been assembled by DB2 experts in the field over many years and are valuable criteria by which to measure the performance of applications in a DB2 system. They can be executed as they are.

Related reading:

• For more information about the sample rules of thumb, see Reporting User’s Guide.
• The samples are described in detail in the Online Help:
  – Click Help in the following windows:
    - Definition page of the Rules-of-Thumb Cluster Properties window
    - Definition page of the Rule-of-Thumb Properties window
    - Rules-of-Thumb Analysis window.
  – Use the links under the related topic Predefined rule-of-thumb cluster definitions for z/OS.

This section describes how to define rules of thumb and how to use them to analyze performance data. You always start in the Performance Warehouse window.

In the System Overview window, click the Performance Warehouse toolbar button to start Performance Warehouse. The Performance Warehouse window is displayed.

Managing rule-of-thumb groups:

A rule-of-thumb group is a container for rule-of-thumb clusters and rules of thumb.

The Public rule-of-thumb group contains the sample rules of thumb delivered with the product and those rules of thumb that other users have made generally available.

Creating a rule-of-thumb group:

To create a rule-of-thumb group, select Rule-of-Thumb Groups in the folders pane of the Performance Warehouse window and then click Selected > Create.

The Rule-of-Thumb Group Properties window is displayed. The Author, Creation date and time, and Modification date and time fields are filled in when you click OK. The Author field will contain your DB2 user ID. Then:

1. Specify a unique name for the rule-of-thumb group in the Name field.
2. You can type a description for the rule-of-thumb group in the **Description** field. This is optional.

3. Click **OK** to save this rule-of-thumb group and return to the Performance Warehouse window.
   
The new group appears in the folders pane as a subitem of **Rule-of-Thumb Groups**.

*Changing a rule-of-thumb group:*

You can change the description of the rule-of-thumb group, or rename or delete the rule-of-thumb group.

You can change a rule-of-thumb group in one of the following ways:

- Change the description of the rule-of-thumb group.
  
  To change the description, click the rule-of-thumb group and click **Selected > Properties**.

- Rename a rule-of-thumb group.
  
  To rename a group, click the rule-of-thumb group and click **Selected > Rename**.

- Delete a rule-of-thumb group.
  
  To delete a group, click the rule-of-thumb group and click **Selected > Delete**.

*Copying a rule-of-thumb group:*

If you want to create several rule-of-thumb groups that only differ in a rule-of-thumb cluster property or a rule of thumb, you might prefer to copy and change a rule-of-thumb group.

When you copy a rule-of-thumb group, any rule-of-thumb clusters and rules of thumb that it contains are copied with it.

To copy a rule-of-thumb group:

1. In the folders pane of the Performance Warehouse window, under **Rule-of-Thumb Groups**, click the rule-of-thumb group and then click **Selected > Copy**.
   
The Copy Rule-of-Thumb Group window is displayed.

2. In the **New rule-of-thumb group name** field, specify a unique name for the copied group.

3. Click **OK**.
   
The copied group appears in the folders pane.

*Managing rule-of-thumb clusters and rules of thumb:*

A rule-of-thumb cluster represents a counter category that you want to analyze and for which you want to define rules of thumb. Examples of counter categories are Accounting and Statistics.

The first rule of thumb that you define for a cluster or copy or move into the cluster determines the cluster category. Any additional rules of thumb that you create for a cluster, or copy or move into the cluster must match this cluster category.
Creating a rule-of-thumb cluster:

You can create a rule-of-thumb cluster using a template. Templates are displayed under the Public rule-of-thumb group. To create a cluster using a template, copy the template, and then change the copy.

To create a rule-of-thumb cluster without a template:
1. In the folders pane of the Performance Warehouse window, click Rule-of-Thumb Clusters and then click Selected > Create.
   The Rule-of-Thumb Cluster Properties window is displayed.
   The Author, Creation date and time, and Modification date and time fields are filled in when you click OK. The Author field will contain your DB2 user ID.
2. Specify a unique name for the rule-of-thumb group in the Name field.
3. In the Scope list, click one of the following:
   • private if you do not want to make this rule-of-thumb cluster available to other users.
   • public if you want other users to view, copy, and use this rule-of-thumb cluster as a template.
4. You can type a description for the rule-of-thumb cluster in the Description field.
5. Click OK to save the new rule-of-thumb cluster and return to the Performance Warehouse window.
   The new rule-of-thumb cluster appears as a subitem of Rule-of-Thumb Clusters and contains the subitem Rules of Thumb.
   To ensure name uniqueness throughout the rules-of-thumb-group folder, the rule-of-thumb cluster is displayed under the following name:
   user.rotgroup.rotclustername, where user stands for the DB2 user ID of the rule-of-thumb cluster creator, rotgroup for the rule-of-thumb group that this rule-of-thumb cluster belongs to, and rotclustername for the name of the rule-of-thumb cluster.

Creating a rule of thumb:

In a rule of thumb, you specify the tables, report blocks, and columns that you want to analyze for a specific counter category.

You also define the analysis rules, set the thresholds, and provide tuning recommendations.

To create a rule of thumb:
1. Click Rules of Thumb for the cluster in the folders pane of the Performance Warehouse window and then click Selected > Create.
   The General page of the Rule-of-Thumb Properties window is displayed.
   The Author, Creation date and time, and Modification date and time fields are filled when you click OK. The Author field will contain your DB2 user ID.
2. Specify a unique name for the rule of thumb in the Name field.
3. If this is the first rule of thumb in the cluster, select the counter category for the rules of thumb that you want to add in the Type list.
   You can define rules of thumb for Accounting and Statistics.
**Important:** The counter category you select here determines the category for the entire cluster. Therefore, this selection is not available for the second and subsequent rules of thumb in the cluster.

4. You can type a description for the rule of thumb in the **Description** field. This is optional.

5. Click the **Definition** tab. On the Definition page you can select the:
   - Tables
   - Report blocks
   - Columns that you want to analyze and for which you want to set rules, threshold values, and tuning recommendations.

You can do the following:
   - Select a report block or a table. Your selection determines the content of the **Columns** box.
   - Fill the **Filter expression** and **Additional columns** boxes by clicking a column in the **Columns** box and then clicking the appropriate **Add** button. The entry appearing in these boxes consists of the table and column names.
   - If you add several columns to the **VALUE expression** box, you must use operators to combine the columns into expressions. Simple arithmetic expressions are allowed that contain the operators (, ), +, -, /, *. The result of the arithmetic expression is run against the values that you specify under **WARNING** and **PROBLEM** thresholds.
   - If you want to include the values of columns that are not part of the arithmetic expression in the analysis result, add these columns to the **Additional columns** box.
   - The SQL query generated from the specifications for this and all other rules of thumb in the cluster and for the rules-of-thumb cluster itself must not exceed 32 KB.

6. Make your selections and fill in the various fields.

7. Click **OK** to save the new rule of thumb and to return to the Performance Warehouse window.
   The new rule of thumb appears in the contents pane of the Performance Warehouse window.

**Example of a rule-of-thumb definition:**

This example shows how to define your rule of thumb on the Definition page of the Rule-of-Thumb Properties window.

Assume the following:

You want to analyze specific data of the Buffer Pool Read report block of the **DB2PM_STAT_BUFFER** table. If the result of dividing the value in the **NO_PREFETCH_NO_BUF** column by the value in the **SEQ_PREFETCH_REQ** column is greater than 0.01, you want to get a warning. If the result exceeds 0.05, you want to be informed that a problem exists. In both cases, you want to give the recommendation that the EDM pool must be increased. In addition, you want the analysis result to include the value of the **SEQ_PREFETCH_REQ** column.

Your selections and specifications would then look as follows:

1. In the **Report block** list, click **BUFFER POOL READ**.
2. In the Columns box, click NO_PREFETCH_NO_BUF and then click Add ( ) next to the VALUE expression box.
   The selected column is added to the VALUE expression box, preceded by the table name.
3. In the Columns box, click SEQ_PREFETCH_REQ and then click Add ( ) next to the VALUE expression box.
   The selected column is added to the VALUE expression box, preceded by the table name. Performance Expert leaves a space between this and the previously added column.
4. In the VALUE expression box, type the operator / between the two columns to specify the division.
5. In the Columns box, click SEQ_PREFETCH_REQ and then click Add ( ) next to the Additional columns box.
6. In the VALUE list (under WARNING and PROBLEM thresholds), click the operator > because you want to be notified when the result of the previously selected columns exceeds a certain value.
7. In the WARNING threshold field, type 0.01.
8. In the PROBLEM threshold field, type 0.05.
9. In both Recommendation fields, type Increase BP size as needed.

Defining filter criteria and additional columns for the rule-of-thumb cluster:

You can specify additional columns and define filter criteria to reduce the analysis result. Your specifications apply to all rules of thumb in the cluster.

To define the additional columns and filter criteria:
1. Click the rule-of-thumb cluster, and then click Selected > Properties.
   The Rule-of-Thumb Cluster Properties window is displayed.
2. Click the Definition tab to do the following:
   • Select a report block or a table. Your selection determines the content of the Columns box.
   • Fill the Filter expression and Additional columns boxes by clicking a column in the Columns box and then clicking the appropriate Add ( ) button. The entry appearing in these boxes consists of the table and column names.
   • If you want the values of additional columns included in the analysis result of all rules of thumb, add these columns to the Additional columns box.
   • If you add several columns to the Filter expression box, you must use operators to combine the columns into an SQL query.
   • You can use variables in the filter expression that you can resolve during the rules-of-thumb analysis. See “Resolving variables” on page 2570 for more information.
   • The SQL query generated from the specifications on this page and for all rules of thumb in the cluster must not exceed 32 KB.
3. Make your selections and fill in the various fields.
4. Click OK to save the changes.

Changing a rule-of-thumb cluster or a rule of thumb:

You can change the properties of a rule-of-thumb cluster or a rule of thumb, or rename or delete a rule-of-thumb cluster or a rule of thumb.
You can change a rule-of-thumb cluster and its rules of thumb in one of the following ways:

- Change the properties of a rule-of-thumb cluster or a rule of thumb.
  To change the properties, click the cluster or the rule of thumb and click Selected > Properties.
- Rename a rule-of-thumb cluster or a rule of thumb.
  To rename a cluster or a rule of thumb, click the cluster or the rule of thumb and click Selected > Rename.
- Delete a rule-of-thumb cluster or a rule of thumb.
  To delete a cluster or a rule of thumb, click the cluster or the rule of thumb and click Selected > Delete.

Copying or moving a rule-of-thumb cluster to another rule-of-thumb group:

The tasks of copying and moving rule-of-thumb clusters are similar. You move a rule-of-thumb cluster to another rule-of-thumb group by copying it to the other rule-of-thumb group and then deleting it from the original rule-of-thumb group.

You can copy a rule-of-thumb cluster within the same rule-of-thumb group.

To copy a rule-of-thumb cluster:
1. In the folders pane of the Performance Warehouse window, under Rule-of-Thumb Clusters, click the rule-of-thumb cluster and then click Selected > Copy.
   The Copy Rule-of-Thumb Cluster window is displayed.
2. In the Rule-of-thumb group list, click an existing rule-of-thumb group to which you want to copy the rule-of-thumb cluster. You can select the same rule-of-thumb group that already contains the rule-of-thumb cluster.
3. In the New rule-of-thumb cluster name field, specify a name for the copy that is unique throughout the destination process group.
4. Click OK to return to the Performance Warehouse window.

The copied rule-of-thumb cluster appears under Rule-of-Thumb Clusters of the selected rule-of-thumb group.

If you copied a public rule-of-thumb cluster, its scope has changed from public to private.

Copying or moving a rule of thumb to another rule-of-thumb cluster:

The tasks of copying and moving rules of thumb are similar. You move a rule of thumb to another rule-of-thumb cluster by copying it to the other rule-of-thumb cluster and then deleting it from the original rule-of-thumb cluster. You can copy a rule of thumb within the same rule-of-thumb cluster.

To copy a rule of thumb, the following must apply:
- The destination rule-of-thumb group must contain at least one rule-of-thumb cluster.
- The rule of thumb that you want copy must be the first rule of thumb in the rule-of-thumb cluster or fit the cluster category. The cluster category is determined by the counter category of the first rule of thumb that you copy or move into, or create for, this cluster.
To copy a rule of thumb:

1. In the folders pane of the Performance Warehouse window, click **Rules of Thumb**. In the contents pane, click the rule of thumb and then click **Selected > Copy**.

The Copy Rule of Thumb window is displayed.

2. In the **Rule-of-thumb group** list, click a rule-of-thumb group to which you want to copy the rule of thumb. You can select the same rule-of-thumb group that already contains this rule of thumb.

3. In the **Rule-of-thumb cluster** field, click a rule-of-thumb cluster to which you want to copy the template. You can select the same rule-of-thumb cluster that already contains this rule of thumb.

4. In the **New rule-of-thumb name** field, specify a name for the copy that is unique throughout the destination rule-of-thumb cluster.

5. Click **OK** to return to the Performance Warehouse window.

The copied rule of thumb appears under the selected rule-of-thumb group and rule-of-thumb cluster.

**Analyzing the performance data:**

You can use rules of thumb to analyze data in the Performance Warehouse database.

For information about how to load data, see “Scenario 1: Transferring performance data into the Performance Warehouse database” on page 2553. You can analyze the data using all rules of thumb in a cluster or using individual rules of thumb. If you analyze an entire rule-of-thumb cluster, the analysis result will show a column for each of the rules of thumb in the cluster.

Several users can analyze the same data at the same time. To avoid a locking conflict, make sure that you are not analyzing the data while another user is loading data into the Performance Warehouse database.

1. To analyze the data, do one of the following:
   - If you want to use a single rule of thumb:
     a. In the folders pane of the Performance Warehouse window, select the appropriate rule-of-thumb cluster and then click its subitem **Rules of Thumb**.

     The contents pane lists all rules of thumb that you defined for this rule-of-thumb cluster.

     b. Select the rule of thumb you want and then click **Selected > Analyze**.
   - If you want to use all rules of thumb defined for a rule-of-thumb cluster:

     In the folders pane of the Performance Warehouse window, select the appropriate rule-of-thumb cluster and then click **Selected > Analyze**.

     The Options page of the Rules-of-Thumb Analysis window is displayed, which shows the filter expression specified for the rule-of-thumb cluster.

     2. **Specify filter criteria.** For more information refer to “Specifying filter criteria” on page 2570.

     3. **Resolve variables.** For more information refer to “Resolving variables” on page 2570.

     4. **Sort the analysis result by the result of the arithmetic expression defined for a specific rule of thumb.** For more information refer to “Sorting the analysis result” on page 2571.
5. Click Analyze to run the analysis.

The Result matrix page of the Rules-of-Thumb Analysis window is displayed. For more information about this and the other pages of this window, see “Viewing and understanding the analysis result” on page 2571.

Specifying filter criteria:

The LOADLOG table holds report and trace interval data for loaded data. You can use the trace start and end time, and the ID of the job step as criteria for filtering rules of thumb. This can be useful if you want to analyze only those trace records loaded by a specific user for a particular step at a certain time.

To specify filter criteria:

   The Time setting area is displayed in the lower-right corner of the contents pane.

   This area shows information from the LOADLOG table. It contains the user ID of the user that loaded the data, the trace interval data, and the load-job step ID associated with the load job. For more information about this table, refer to “The LOADLOG table” on page 2579.

2. Select a row that holds the appropriate trace-start time, trace-end time, or step-log ID and click Start time, End time, or LOAD step.

   If more than one table is referenced, the Select Table window is displayed. Select a table from the list and click OK.

   The corresponding filter expression is displayed in the text field. You can combine expressions using the AND, OR, and NOT operators.

   For example, if you clicked Start time, the filter expression comprises the table name, the trace-start time column name, and the value of the trace-start time for the selected row in the time-setting table.

   If you clicked LOAD step, the filter expression comprises the table name, the step-log ID column name, and the value of the step-log ID for the selected row in the time-setting table.

3. Click Apply. The filter expression is inserted in the Variables context field directly after the WHERE clause.

4. To remove the filter expression from the WHERE clause, click Reset.

Resolving variables:

Unresolved variables in the filter expression are prefixed by a colon.

To resolve these variables:

• On the Options page of the Rules-of-Thumb Analysis window, click Variables in the folders pane.

   The Variables setting area is displayed in the contents pane.

   This area shows a list of variables found in the filter expression with the last-saved values for these variables. Values are saved each time you analyze the trace data or execute a query using the same variables. You can enter a value for each of the variables shown. These values are used when you analyze the trace data.

• Click Reset to change the values of the variables back to the saved values.
Sorting the analysis result:

On the Result matrix and the Column details pages of the Rules-of-Thumb Analysis window, the analysis result is sorted by timestamp or as shown in the Variables context field on the Options page. You can change the order by selecting the result of the arithmetic expression specified for a rule of thumb as sort criterion. In this case, the Column details page shows the results of the arithmetic expression instead of the attention values.

To sort the analysis result:

1. On the Options page of the Rules-of-Thumb Analysis window, click Order by expression value in the folders pane.
   
   If you selected a single rule of thumb, the Select rule of thumb list contains this rule of thumb. If you selected a rule-of-thumb cluster, all rules of thumb in the rules-of-thumb cluster are listed.

2. Select the rule of thumb for the arithmetic expression that you want to use to sort the analysis result.

   You specified the arithmetic expression in the VALUE expression box on the Definition page of the Rule-of-Thumb Properties window for a rule of thumb. The sort direction (ascending or descending) depends on whether you set lower or upper limits for the WARNING and PROBLEM thresholds.

Viewing and understanding the analysis result:

The first page that you see after the analysis finishes is the Result matrix page.

The Result matrix page shows:

- A list of the entire trace data that was created between the trace-start and trace-end times that you specified on the Time pane of the Options page. The data is sorted as follows:
  
  - By timestamp
  
  - As shown in the Variables context field on the Options page
  
  - By the result of the arithmetic expression of the rule of thumb selected on the Order by value expression pane on the Options page

- Additional columns you specified for the rule-of-thumb cluster (cluster definition columns).

- A column for each rule of thumb that you used for the analysis.

- The attention value (OK, warning, problem) of the analysis for each timestamp and rule of thumb. The result depends on your specifications on the Definition page of the Rule-of-Thumb Properties window.

   A dash (–) means that a value is not available.

To reduce the list displayed on the Result matrix page, you can display only rows with at least one warning or a higher attention level or only rows with at least one problem:

- Click View > Warning to view all rows that contain at least one warning or at least one problem.

- Click View > Problem to view only rows that contain at least one problem.

Your selection remains valid until you click View > All again.

If there are a lot of entries in the list, they are not displayed all at one time. You can move to the next or previous set of entries by clicking View > Next or View >
**Previous.** If you previously reduced the list, for example, to rows that show only problems, this selection remains valid when you move to the next or previous set of entries.

*Viewing the results for a specific timestamp:*

In the Result matrix page, click a row in the **Timestamp** column to view the result of all rules of thumb for a specific timestamp. The Row details page of the Rules-of-Thumb Analysis window is displayed.

This page lists all the rules of thumb, the attention values, and the cluster-definition column values for a specific date and time.

The **Cluster definition columns** field shows the values for the columns that you added as additional columns to the rules-of-thumb cluster that contains the analyzed rules of thumb (see the Definition page of the Rules-of-Thumb Cluster Properties window).

The **Rule of thumb details** shows the result of the first rule of thumb in the list for which the **Attention** column contains a value.

To view the result of another rule of thumb, click it in the **ROT Name** column. For more information about the individual fields, see [Explanation of the individual fields in the Rules of thumb details](#).

*Viewing the results for all timestamps:*

In the Result matrix page, click a column other than the **Timestamp** column or the **Cluster definition columns** to view the result of a rule of thumb for all timestamps. The Column details page of the Rules-of-Thumb Analysis window is displayed.

This page lists the timestamps, the attention values, and the cluster-definition column values for the selected rule of thumb. If the analysis result is sorted by the result of the arithmetic expression of a specific rule of thumb, the results of the arithmetic expression are shown instead of the attention values and you are informed of the sort.

The **Cluster definition columns** field shows the values for the columns that you added as additional columns to the rules-of-thumb cluster that contains the selected rule of thumb (see the Definition page of the Rules-of-Thumb Cluster Properties window).

The **Rules of thumb details** shows the result of the first timestamp in the list for which the **Attention** column contains a value. To view the result of another timestamp, click it in the **Timestamp** column.

Explanation of the individual fields under **Rules of thumb details** on the Row Details and Column Details pages:

**ROT description**

The description that you specified for the rule of thumb on the General page of the Rule-of-Thumb Properties window.

**VALUE expression**

The arithmetic expression that you specified in the **VALUE expression** box on the Definition page of the Rule-of-Thumb Properties window.
VALUE
The result of the arithmetic expression and its relation to the appropriate threshold value, as defined on the Definition page of the Rule-of-Thumb Properties window.

Recommendation
The recommendation that you specified on the Definition page of the Rule-of-Thumb Properties window in the case of a problem or a warning.

VALUE expression columns
The individual table columns that you selected for the VALUE expression box on the Definition page of the Rule-of-Thumb Properties window and the value produced by the analysis.

Additional columns
The table columns that you added as additional columns to the selected rule of thumb (see the Definition page of the Rule-of-Thumb Properties window) and the values produced by the analysis.

Defining and running queries
You can use the query facility to define performance-management queries to run on the Statistics and Accounting tables in the Performance Warehouse database.

For example, Accounting tables contain performance data that shows how many resources are consumed by the applications. Appropriate queries on the ACCOUNTING table can help you achieve performance improvements. A set of queries is provided. They can be run as they are but you can also define and save your own queries.

You always start on the Performance Warehouse window. In the System Overview window, click the Performance Warehouse toolbar button to start Performance Warehouse. The Performance Warehouse window is displayed.

Managing query groups:
A query group is a container for queries. The Public query group contains the sample queries delivered with the product and those queries that other users have made generally available.

In the sample queries, the query strings and value expressions are not formatted. However, you can copy the queries and rules, and insert blanks or new lines to get a more readable format.

Creating a query group:
Before you define a query, you must create a query group to contain this query.

To create a query group:
1. In the folders pane of the Performance Warehouse window, select Query Groups and then click Selected > Create.
   The Query Group Properties window is displayed.
   The Author, Creation date and time, and Modification date and time fields are filled in when you click OK. The Author field will contain your DB2 user ID.
   
2. In the Name field, specify a unique name for the query group.
3. You can type a description for the query group in the **Description** field. This is optional.

4. Click **OK** to save this query group and return to the Performance Warehouse window.
   
The new group appears in the folders pane as a subitem of **Query Groups**.

**Changing a query group:**

You can change the description of the query group, or rename or delete a query group.

You can change a query group in one of the following ways:

- Change the description of the query group.
  
  To change the description, click the query group and click **Selected > Properties**.
- Rename a query group.
  
  To rename a group, click the query group and click **Selected > Rename**.
- Delete a query group.
  
  To delete a group, click the query group and click **Selected > Delete**.

**Copying a query group:**

If you want to create several query groups that only differ in a query property, you might prefer to copy and change a query group. When you copy a query group, any queries that it contains are copied with it.

To copy a query group:

1. In the folders pane of the Performance Warehouse window, under **Query Groups**, click the query group and then click **Selected > Copy**.
   
The Copy Query Group window is displayed.

2. In the **New query group name** field, specify a name for the copy that is unique within the query-group folder.

3. Click **OK**.
   
   When you return to the Performance Warehouse window, the copy appears in the folders pane.

**Managing queries:**

After you define query groups you can create and change queries.

**Creating a query:**

To create a query, select **Queries** in the folders pane of the Performance Warehouse window and then click **Selected > Create**.

The General page of the Query Properties window is displayed. The **Author**, **Creation date and time**, and **Modification date and time** fields are filled in when you click **OK**. The **Author** field will contain your DB2 user ID. Then:

1. Specify a unique name for the query in the **Name** field.
2. You can type a description for the query in the **Description** field. This is optional.
3. Click the **Definition** tab. Here you can select or specify the SQL string that makes up the query.
4. Select a report type.
5. Select a report block or a table. Your selection determines the content of Columns.
6. Select a row in Columns that contains the column or table name you want to include in your query and then select this name to include it in the query. For more information about the Columns contents, refer to “The Performance Warehouse data tables” on page 2577.
7. Click Add column or Add table to add the column or table name to the query. You can use SQL query operators to combine the names.
8. Click OK to save the query and return to the Performance Warehouse window.

Changing a query:

You can change the properties of a query, or rename or delete a query.

You can change a query in one of the following ways:

• Change the properties of a query, such as the scope, description, or query definition.
  To change the properties, click the query and click Selected > Properties.
• Rename a query.
  To rename a query, click the query and click Selected > Rename.
• Delete a query.
  To delete a query, click the query and click Selected > Delete.

Copying or moving a query to another query group:

The tasks of copying and moving queries are similar. You move a query to another query group by copying it to the other query group and then deleting it from the original query group.

You can copy a query within the same query group.

To copy a query:
1. In the folders pane of the Performance Warehouse window, click Queries. In the contents pane, click the query you want to copy and then click Selected > Copy.
   The Copy Query window is displayed.
2. In the Query group list, click an existing query group to which you want to copy the query. You can select the same query group that already contains this query.
3. In the New query name field, specify a unique name for the copied query.
4. Click OK to return to the Performance Warehouse window.
   The copied query appears under the selected query group.

Running a query:

You can run queries on the data in the Performance Warehouse database.

For information about how to load data, see “Scenario 1: Transferring performance data into the Performance Warehouse database” on page 2553. Several users can run their queries on the same data. In this case, however, to avoid a locking
conflict, make sure that you are not running the query while another user is loading data into the Performance Warehouse database.

1. In the folders pane of the Performance Warehouse window, select the appropriate query group and then click its subitem Queries. The contents pane lists all the queries in the query group.

2. Click the query you want to run and then click Selected > Execute. The View SQL page of the Query Execution window is displayed. It shows the query definition. From here you can edit the query, specify filter criteria, and resolve any unresolved variables in the query expression. Note that variables must begin with a colon followed by at least one alphanumeric character, such as :c. It can also consist of alphanumeric and underscore characters, for example, :connect_type6.

3. Specify filter criteria. For more information refer to “Specifying filter criteria.”

4. Resolve variables. For more information refer to “Resolving variables” on page 2577.

5. Click Execute to start the query. The View Result page of the Query Execution window is displayed. For more information about this window, see “Viewing the query results” on page 2577.

Specifying filter criteria:

The LOADLOG table holds report and trace interval data for loaded data. You can use the trace start and end time, and the ID of the job step as criteria for filtering queries. This can be useful if you want to analyze only those trace records loaded by a specific user for a particular step at a certain time.

To specify filter criteria:

1. On the View SQL page of the Query Execution window, click Time. The Time setting area is displayed in the contents pane. This area shows information from the LOADLOG table. It contains the user ID of the user that loaded the data, the trace-interval data, and the load-job step ID associated with the load job. For more information about this table, refer to “The LOADLOG table” on page 2579.

2. Select a column that holds the appropriate trace-start time, trace-end time, or step-log ID and click Start time, End time, or LOAD step. The Select Table window is displayed.

3. Select a table from the list and click OK. The corresponding filter expression is displayed in the text field. You can combine expressions using the AND, OR, and NOT operators. For example, if you clicked Start time, the filter expression comprises the table name, the trace start time column name, and the value of the trace start time of the selected row in the time-setting table. If you clicked LOAD step, the filter expression comprises the table name, the step-log ID column name, and the value of the step-log ID of the selected row in the time-setting table.

4. Click Apply. The filter expression is inserted in the query at the current cursor position.
Resolving variables:

Unresolved variables in the query expression are prefixed by a colon.

To resolve these variables:

1. On the View SQL page of the Query Execution window, click Variables. The Variables setting area is displayed in the contents pane.
   This area shows a list of variables found in the query expression with the last-saved values for these variables. Values are saved each time you analyze the trace data or execute a query using the same variables. You can enter a value for each of the variables shown. These values are used when you run the query.

2. Click Reset to change the values of the variables back to the saved values.

Viewing the query results:

After the query has run, the View SQL page of the Query Execution window is displayed.

The query expression is shown at the top of the page. The table shows the result of the query. The column headings are defined by the query. The number of rows read from the result set is shown at the bottom of the table. To sort the contents of the table, click a column heading.
- To save the results in a format that can be used by standard spreadsheet programs, click Save.
  The result matrix, the query properties, and the query expression are saved.
- To view the query results in a Web browser, click Browse.
  You can use the Web browser's standard functions to print the query results.

Overview of the Performance Warehouse database

To analyze your performance data, you can run SQL queries against the tables in the Performance Warehouse database. The sample queries delivered with Performance Warehouse help you understand the contents of, and relationships between, the tables and how data can be joined to evaluate performance data and identify performance problems.

However, to use your queries efficiently, you must understand the data model designed for the performance-relevant tables. In addition, you must be familiar with the LOADLOG table, which you need to access and manage the data in the Performance Warehouse database, for example, if you want to delete or archive it.

The Performance Warehouse database consists of:
- Performance Warehouse data tables that store the DB2 performance data collected from DB2.
- Control tables that establish the infrastructure of Performance Warehouse.

The Performance Warehouse data tables

The Performance Warehouse database contains the following Performance Warehouse data tables for table space STAT.
<table>
<thead>
<tr>
<th>Table name</th>
<th>Table description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DB2PM_STAT_BUFFER</td>
<td>One row for each buffer pool that is active at the start of:</td>
</tr>
<tr>
<td></td>
<td>• The corresponding delta record for file data.</td>
</tr>
<tr>
<td></td>
<td>• The interval record for save-file data.</td>
</tr>
<tr>
<td>DB2PM_STAT_DATASET</td>
<td>One row for each open data set that has an I/O event rate of at least one event per second during the reporting interval.</td>
</tr>
<tr>
<td>DB2PM_STAT_DDF</td>
<td>For each delta record (file data) or interval record (save-file data), one row per remote location participating in distributed activity using the system-directed access method and one row for all remote locations using the application-directed access method.</td>
</tr>
<tr>
<td>DB2PM_STAT_GBUFFER</td>
<td>One row per group buffer pool that is active at the start of the corresponding delta record for file data or of the interval record for save-file data.</td>
</tr>
<tr>
<td>DB2PM_STAT_GENERAL</td>
<td><strong>For file data:</strong> One row for each Statistics delta record, containing data from IFCID 1 and 2. A delta record is a set of counters describing the DB2 activity between two consecutive DB2 Statistics records pairs.</td>
</tr>
<tr>
<td></td>
<td><strong>For save-file data:</strong> One row for each Statistics interval record, containing data from IFCID 1 and 2. A Statistics interval record is a set of counters describing the DB2 activity within the interval specified by the user.</td>
</tr>
</tbody>
</table>

The Performance Warehouse database contains the following Performance Warehouse data tables for table space **ACCS**:

<table>
<thead>
<tr>
<th>Table name</th>
<th>Table description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DB2PMSACCT_BUFFER</td>
<td>One row per buffer pool used.</td>
</tr>
<tr>
<td>DB2PMSACCT_DDF</td>
<td>One row per remote location participating in distributed activity.</td>
</tr>
<tr>
<td>DB2PMSACCT_GBUFFER</td>
<td>One row per group buffer pool used.</td>
</tr>
<tr>
<td>DB2PMSACCT_GENERAL</td>
<td>One row per DB2 Accounting record, which is written when a thread terminates, is reused, or becomes inactive.</td>
</tr>
<tr>
<td>DB2PMSACCT_PROGRAM</td>
<td>One row per package and DBRM executed.</td>
</tr>
<tr>
<td>DB2PMSACCTRLF</td>
<td>One row per resource limit type encountered.</td>
</tr>
</tbody>
</table>

Related reading: For more information about these tables, refer to the part on the Performance Warehouse database in [Reporting User’s Guide](#).

The Performance Warehouse database described in the Reporting User’s Guide contains more tables than the one described here. However, it must be created and managed manually using the sample CREATE and LOAD parts shipped with OMEGAMON for Db2 PE. The Performance Warehouse database described here is created automatically, managed by the OMEGAMON Collector, and is accessible using the Performance Warehouse client.

Related reading: The Accounting and Statistics tables are associated in a 1:n relationship as described in [Reporting User’s Guide](#).

The general table is the parent table for all other tables. Each row in the general table is associated with zero, one, or several rows in the other tables. For Accounting SAVE tables, use the columns LOCAL_LOCATION to
CLIENT TRANSACTION for joining related data. For Statistics tables, use the columns LOCAL LOCATION, GROUP NAME, SUBSYSTEM ID, MEMBER NAME, INTERVAL TSTAMP, and BEGIN REC TSTAMP for joining related data.

The Accounting and Statistics tables in the Performance Warehouse database contain the following additional columns: STEPLOGID of type INTEGER and ROW_ID of type ROWID. These columns are populated by the OMEGAMON Collector and DB2 when performance data is loaded into the Performance Warehouse data tables. The value of STEPLOGID references the LOADLOG table and can be used to correlate the performance data and the LOAD step that loaded the data. DB2 generates the ROW_ID values automatically when rows are added to the Performance Warehouse data tables. They are used in the rules-of-thumb analysis to correlate general and detailed analysis results.

The LOADLOG table

The LOADLOG table contains the information you need to access and manage the performance data.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Key</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LL_ID</td>
<td>INTEGER</td>
<td>P</td>
<td>Unique LOADLOG ID</td>
</tr>
<tr>
<td>LL_INSERTEDBY</td>
<td>VARCHAR(8)</td>
<td></td>
<td>User ID of the user who inserted the data</td>
</tr>
<tr>
<td>LL.STARTTTS</td>
<td>TIMESTAMP</td>
<td></td>
<td>Date and time of the first event recorded</td>
</tr>
<tr>
<td>LL.STOPTS</td>
<td>TIMESTAMP</td>
<td></td>
<td>Date and time of the last event recorded</td>
</tr>
<tr>
<td>LL_LOADTYPE</td>
<td>CHAR(10)</td>
<td></td>
<td>Load type: ACCOUNTING, STATISTICS</td>
</tr>
</tbody>
</table>

Each row in the table is associated with a LOAD step executed by the OMEGAMON Collector and has a unique LL_ID. This LL_ID is referenced by an Accounting or a Statistics table with its foreign key STEPLOGID, which is defined with delete rule ON DELETE SET NULL. If you delete a row from the LOADLOG table, the column STEPLOGID of the dependent rows is set to NULL. To delete data from the DB2PM_STAT and DB2PMSACCT tables:

1. Determine the entries using the LOADLOG table and apply a search condition on the STEPLOGID column in the DELETE statements.
2. Delete the corresponding LOADLOG entries.

The LOADLOG entries related to the LOAD steps are displayed under Time setting on the View SQL page of the Query Execution window and on the Options page of the Rules-of-Thumb Analysis window. They help you restrict your queries and rules of thumb to the time intervals during which data was loaded.

Accessibility features in Performance Expert Client

This section describes the major accessibility features in Performance Expert Client.

Accessibility features help users who have a physical disability, such as restricted mobility or limited vision, use software products successfully. For general information about accessibility refer to “Accessibility features” on page 26.
You can:
• Operate all features using the keyboard instead of the mouse.
• Access the individual help files.
• Change the system settings to high contrast for all user interface controls and all client area contents.

This section explains how to use these accessibility features.

**Operating all features by using the keyboard**
You can use keys or key combinations to perform operations that can also be done through mouse actions. All menu items can be accessed from the keyboard. In those cases, the keyboard equivalent appears to the right of the menu item, or the shortcut letter is underlined. Some keyboard items also have shortcuts.

To navigate through a window or dialog by using the keyboard instead of the mouse, use the following keyboard shortcuts:

*Table 207. Navigating through a window or dialog*

<table>
<thead>
<tr>
<th>Navigating through a window or dialog</th>
<th>Shortcut</th>
</tr>
</thead>
<tbody>
<tr>
<td>Access the window menu</td>
<td>Alt, then down arrow (consecutively)</td>
</tr>
<tr>
<td>Access the menu bar in a window</td>
<td>Alt+underlined letter or F10</td>
</tr>
<tr>
<td>Activate a menu item in the menu bar</td>
<td>Enter</td>
</tr>
<tr>
<td>Access controls in a dialog</td>
<td>Alt+underlined letter</td>
</tr>
<tr>

**Changing the system settings for colors, fonts, and accessibility options**

If you are not satisfied with the colors, fonts, and accessibility options supplied by OMEGAMON for Db2 PE you can change them within your operating system or within Performance Expert Client.

You must restart OMEGAMON for Db2 PE before the new settings take effect.

To change the settings within Performance Expert Client:

1. In the System Overview window, click **Monitor > Configuration**. The Configuration window is displayed.
2. Click the **Accessibility** tab.
3. To specify the appearance scheme for high contrast and font size, select one of the following options in the **High contrast scheme** list:
   - To use the default settings, select **[None]**.
   - To specify a white background containing black text in normal font size, select **Black on white**.
   - To specify a white background containing black text in large font size, select **Black on white (large font)**.
   - To specify a black background containing white text in normal font size, select **White on black**.
   - To specify a black background containing white text in large font size, select **White on black (large font)**.

**Buffer Pool Analyzer**

This information describes how to use the suite of IBM Database 2 (DB2) Buffer Pool Analysis tools to analyze and tune the buffer pool performance of DB2 systems. Initially, it introduces the concept of buffer pool analysis and tuning and describes the tasks that can be performed to acquire comprehensive performance information. Further on, the information guides the user through the sophisticated object placement and simulation components that provide recommendations for tuning of buffer pool resources.
This information is designed to help performance analysts and database administrators perform these tasks:

- Plan for the analysis and optimization of DB2 buffer pool performance
- Collect appropriate buffer pool performance data
- Create and interpret reports from collected performance data
- View and interpret performance data in graphical form on a client
- Optimize the buffer pool usage by identifying optimal placements of table spaces and index spaces in buffer pools, and optimal buffer pool sizes and parameters
- Simulate different buffer pool scenarios and their effects to evaluate buffer pool tuning alternatives

This information focuses intentionally on the usage aspects of the Buffer Pool Analyzer tools and functions. Information regarding the task of buffer pool analysis is necessarily presented in a condensed form to keep the information focused. Users of this information should consider the Db2 IBM Redbook Performance Expert for z/OS (SG24-6867) which is written by experienced specialists and dedicates an entire chapter to optimizing buffer pool resources.

The product often provides context-related online help information that can be invoked from menus, panels, and windows through the F1 (Help) key or the Help button. Online help information is not necessarily repeated in this information, especially if it is very detailed information that is of interest only when you actively work with a function. You are encouraged to use F1 or Help to see the entire available information.

Always check the IBM DB2 and IMS Tools Library web page and the Tivoli library page for the most current version of this information:

- OMEGAMON for Db2 Performance Expert on z/OS (PDFs and Techdocs on Db2 Tools Product Page)
- OMEGAMON for Db2 Performance Monitor on z/OS (PDFs and Techdocs on Db2 Tools Product Page)

**Overview of Buffer Pool Analyzer**

This topic gives an overview of Buffer Pool Analyzer and the Buffer Pool Analysis tools of DB2 Performance Expert.

**What does Buffer Pool Analyzer do**

Buffer Pool Analyzer provides a suite of tools that support in-depth analysis of the performance of DB2 buffer pools.

- Collection of buffer pool related performance data
- Host-based creation of reports about buffer pool performance and group buffer pool performance
- Conversion of performance data to formats suitable for client-based functions and for loading into DB2 tables
- Client-based graphical representation of buffer pool performance data
- Client-based optimization of major buffer pool attributes, like the optimum assignment of objects in buffer pools and optimum buffer pool sizes, based on actual performance data
- Client-based simulation of the effects of different buffer pool attributes, based on actual performance data
- Client-based long-term analysis of historical and current performance data
These tools help performance analysts and database administrators to monitor, analyze, and optimize DB2 buffer pools on different levels in an effective way.

**Buffer Pool Analyzer functions and components**

Buffer Pool Analyzer consists of several functions and components. They are identical for the Buffer Pool Analyzer stand-alone product and the integrated Buffer Pool Analysis functions of DB2 Performance Expert.

- DB2 performance data is collected on a z/OS or OS/390 host. ISPF and the Collect Report Data (CRD) function, or the batch JCL, is used to configure and control a collect task.
- Reports are created from collected data through batch JCL and the **BPACTIVITY** (Buffer Pool Activity) command, which provides options to customize reports for different needs. The same function is used for conversion of performance data.
- The client-based Buffer Pool Analyzer functions are combined in a Windows-based application. Through its graphical user interface you can view reports, use the optimization and simulation functions, perform long-term analyses, and get access to previously generated results.

**How Buffer Pool Analyzer is used**

The suite of Buffer Pool Analyzer tools can be used to monitor, analyze, and tune buffer pools.

The tools’ usage varies with the goal to be achieved.

- If frequent monitoring and performance observation with minimum effort is the goal, high level summary reports can be created on the host from collected performance data. This process can be automated by frequently running batch jobs. Data collection and report creation can be configured for individual needs. Optionally, data can be viewed on the Buffer Pool Analyzer client in attractive and intuitive graphical representations.
- If an analysis of buffer pool related problems is needed, several summary and detail reports can be created to quickly identify possible problem areas. Reports can be customized to provide timely and content-specific information.
- If optimization and tuning of buffer pool resources and usage is the goal, the object placement and buffer pool sizing tool and the buffer pool simulation tool are first choice. Based on real and representative buffer pool performance data, these tools ease the process of finding optimal use of buffer pool resources and simulating the effects of possible changes.
  - The object placement and initial buffer pool sizing tool uses predefined and modifiable expert rules and the objects actual access behavior to calculate optimized buffer pool arrangements. It recommends ready-to-use SQL ALTER statements and DB2 ALTER commands, with their parameters set to the recommended values. The tool can be used to balance buffer pool sizes, for example to separate sequentially from randomly accessed objects into different buffer pools, to optimize memory usage, and to improve application response times.
  - The simulation tool uses actual objects’ access behavior and simulates different object placements and buffer pool size ranges. The simulation results provide a reliable prediction about the effects that different placements and sizes would have on a system. Simulation is used to perform what-if scenarios to balance buffer pool sizes and performance and to provide precise information about the prospective effects of different buffer pool scenarios.

Both tools complement each other by performing the (often complex and iterative) task of optimization and tuning on a client, thereby still relying on actual performance data. The strength of object placement and initial buffer pool
sizing is its rule-based algorithm and its ready-to-use recommendations. Simulation takes the surprises out of planned changes and minimizes the number of system disruptions.

The long-term analysis function adds another dimension to monitoring, analysis, and tuning: historical and current performance data can be combined and analysed as a whole to easily detect trends, hourly, daily, and weekly peaks, repetitive performance pattern, unbalanced resource usage, and much more. The client-based long-term analysis function provides an array of intuitive selections to focus on important performance indicators, buffer pools, and database objects.

Benefits of using Buffer Pool Analyzer

Buffer Pool Analyzer offers performance analysts and database administrators tuning advice that is based on the analysis of DB2 trace data.

The benefits from analyzing buffer pool performance with Buffer Pool Analyzer are:

- Easy monitoring of the performance of buffer pools and group buffer pools to detect bottlenecks, trends, and unused resources
- Fast adaptation of buffer pool parameters to changing DB2 usage conditions
- Optimized use of buffer pools by aligning buffer pool size and object placement to available resources
- Non-disruptive simulation of buffer pool behavior to test the impact of changes before they are applied
- Long-term analysis of factual performance for improved prediction of future performance and resource needs

Introduction to Buffer Pool Analyzer

This topic introduces the concept of DB2 buffer pool analysis and tuning, and the role of Buffer Pool Analyzer components and functions on the host and on the client.

Furthermore, the terminology that is used throughout this information is introduced and the mandatory and optional tasks that you can perform for each type of analysis are identified.

The following topics provide additional information:

- “The role and importance of DB2 buffer pools”
- “The role and importance of DB2 group buffer pools in data sharing groups” on page 2586
- “How Buffer Pool Analyzer supports performance analyses” on page 2587
- “Buffer pool analysis and tuning processes” on page 2588
- “The functions of Buffer Pool Analyzer” on page 2592
- “Summary of user tasks” on page 2602
- “Where to start” on page 2604

The role and importance of DB2 buffer pools

DB2 buffer pools are the means of caching frequently used DB2 data in fast memory to prevent or at least reduce the number of slow input/output (I/O) operations.

Buffer pools are used to cache disk pages of databases. Buffer pool management algorithms handle prefetching of blocks of data before the pages are needed,
maintain them in buffers for faster access by DB2 applications, and write them back to disk asynchronously, thus maximizing the performance of applications.

When DB2 is started, buffer pools are initiated with attributes that determine, for example, the sizes and thresholds of individual buffer pools. The activity in buffer pools and their efficiency is affected by these static attributes.

![Figure 184. The role of buffer pools in DB2 systems](image)

However, the activity in buffer pools is far more dependent on how the data in DB2 table spaces and index spaces is accessed. Table spaces and index spaces, commonly called objects in this information, hold DB2 tables and associated indexes. These spaces are divided into equal-sized pages, which are written to or read from disk in one operation. When the size of DB2 tables and indexes changes over time, or when the frequency and nature of accesses from DB2 changes, the initial buffer pool attributes might not be optimal after some time.

DB2 provides a set of commands and SQL statements to alter the size of buffer pools and the assignments of DB2 objects to buffer pools. These commands provide a means of altering buffer pool attributes that were set when DB2 was started, and they can be used to adapt the buffer pool characteristics to match the changing usage of DB2 data.

Despite the availability of commands, expert knowledge is required to optimally lay out a system and set up the parameters correctly. Important buffer pool attributes, like buffer pool sizes and assignments of objects to buffer pools, should not be seen as being final and might need to be varied over time to efficiently use the available buffer pools. Therefore, it is essential to frequently monitor the actual usage and performance of buffer pools to identify bottlenecks and to adjust the buffer pool attributes to their most efficient values. The performance of buffer pools strongly influences the data throughput of a DB2 system.

**The role and importance of DB2 group buffer pools in data sharing groups**

In a parallel sysplex environment two or more DB2 subsystems can be grouped in a so-called data sharing group to share a single set of data while maintaining data integrity.

Each member, respectively DB2 subsystem, of a data sharing group continues to own its local set of buffer pools for the purposes and benefits described so far. However, to coordinate the flow of data between multiple subsystems and the shared set of physical 1/0s, a common set of buffer pools is required as intermediary. This set is called group buffer pool because it serves all members of a data sharing group. Group buffer pools (GBPs) are located in a coupling facility.
(CF), the piece of hardware that provides a shared memory capability in a parallel sysplex environment.

DB2 provides the necessary data sharing mechanisms for locking and caching of data to ensure data coherence among member and group buffer pools, and to ensure data consistency in the entire data sharing group. Further, DB2 provides commands to create, alter, and monitor group buffer pools, similar to commands for buffer pools of individual subsystems.

With regard to performance, it can easily be seen that group buffer pools are subject to similar criteria than the members' buffer pools: They prefetch data from disks in advance, cache it for use by the members' buffer pools, and cast out data to disks asynchronously. The important point is that the activity in group buffer pools is the cumulative activity of the members' buffer pools. Therefore, it is even more essential to frequently monitor and tune the performance of group buffer pools to maintain a high data throughput.

**Related reading:** For a detailed introduction to DB2 data sharing and group buffer pools, see *DB2 11 Data Sharing: Planning and Administration*.

**How Buffer Pool Analyzer supports performance analyses**

Buffer Pool Analyzer specializes in the analysis of buffer pool-related performance data. It belongs to a suite of DB2 tools and products that assist in the management of DB2 systems. It is also an integrated part of DB2 Performance Expert that specializes in the entire performance of DB2 systems.

At this time, it should be clear that buffer pool-related analysis, monitoring, and tuning are accompanying measures in the overall analysis, monitoring, and tuning
Buffer pool analysis and tuning processes

Analyzing the performance of buffer pools and tuning a DB2 system for optimum performance is a process that can serve several purposes and that involves one or more tasks dependent on your requirements and motivations.

Different tasks take varying amounts of time, might require different levels of knowledge, and require different level of information or support. This topic outlines some typical database administrator goals and tasks. It is basically about why, what, and when something should be done.

Observe performance of buffer pools:

Administrators with many systems need a single method of monitoring those systems, especially when they are complex as in data sharing groups.
A single observation provides you with a snapshot of current system behavior. Repeated observation keeps systems healthy by regularly checking for deviations from an expected level of performance.

These tasks require high-level summary information about critical buffer pool components and activities. The information should reflect a representative workload, and it should ideally be comparable with previous information. It should be easy to obtain and cause no significant load on the monitored system.

Current summary information should be collected and analyzed regularly.

You can use this information to detect out-of-line situations, to develop reference points for future comparisons, and to detect performance trends. Administrators can automate the collection of data by setting up scheduled batch jobs that collect specified performance data and create appropriate activity reports about buffer pools and group buffer pools. This ensures that up-to-date reports are always available for analysis.

**React to out-of-line situations:**

Up-to-date performance data is used to quickly react to out-of-line situations.

This task is often driven by user concerns about the performance of DB2 applications. It can also be driven by unexpected results observed in basic reports described previously. If such problems prove to be related to buffer pools or group buffer pools, they require in-depth analysis.

You need to be able to recognize these problems quickly and to react to them quickly. Your immediate needs are up-to-date performance information at several levels of detail, usually beginning with summary information, followed by more detailed information. This information must reflect the performance from the time that applications were observed to run slowly, or when summary report information shows unexpected behavior.
Optimize buffer pool usage and sizes:

A major task of database administrators is the tuning of complex systems.

This task includes the optimization of buffer pools for the most effective use by DB2. It is the process of finding the most effective distribution of DB2 objects in the available buffer pools, based on the characteristics of the objects. And it includes determining efficient buffer pool parameters for these placements. An optimized buffer pool provides the best possible hit ratios, in terms of pages found in the buffer pools, related to the given sizes of the buffer pools.

The need for optimizing the usage of buffer pools can have several reasons:

- New DB2 applications might require new objects, and they might need to share existing buffer pool resources.
- Table spaces are resized, table columns are added, or page sizes are changed.
- The usage of DB2 objects changed over time and demands a new balancing of individual buffer pools.
- Regular review and analysis of buffer pool performance indicates inefficiencies or shows unused buffer pool resources.

Database administrators often perceive buffer pool performance in context with the design and usage of tables and indexes, and also in context with the available buffer pool memory. Database systems are often so complex that it is more or less impossible to tune them manually. Expert knowledge is often required to find a good balance among the many parameters and rules.

The task of optimizing the performance will usually take several iterations of analyzing the current state, finding better object placements and buffer pool sizes, tuning the system, and reviewing the effects.

**Predict the effect of changes:**

Database administrators need to predict the effect of changes to buffer pool parameters before the changes are applied to the system.
Database administrators often want to evaluate tuning alternatives. Therefore, they need to estimate the effects of alternative object placements and buffer pool sizes and parameters to find an acceptable correlation between buffer pool effectiveness (in terms of hit ratios) and buffer pool size (cost). Most important, they need to be able to estimate the effect of changes to buffer pool parameters before these changes are applied to a system.

Considering the effect of different buffer pool sizes and parameters is an iterative and time-consuming task, especially under restricting conditions such as limited total buffer pool size and fixed object to buffer pool assignments. Expert knowledge is required to obtain reliable predictions and to minimize the number of tuning iterations.

Database administrators need to be able to verify their changes by comparing expected with actual performance data after they have tuned a system.

**Iterations of analysis and tuning:**

Analyzing the performance of buffer pools and tuning a DB2 system for optimum performance is a process that can serve several purposes and that involves one or more tasks dependent on your requirements and motivations.

Different tasks take varying amounts of time, might require different levels of knowledge, and require different level of information or support. This topic outlines some typical database administrator goals and tasks. It is basically about why, what, and when something should be done.
As described, buffer pool analysis and tuning is an iterative process that involves assessing the actual state, recognizing problems, identifying solutions in the form of changes, and applying changes to a system by means of DB2 ALTER BUFFERPOOL commands and SQL ALTER statements. The process is repeated by verifying the success of changes until further improvements are not visible or no longer economical. Buffer Pool Analyzer supports all the tasks described previously. The solutions it provides are described in the following topic.

Analysis and tuning can serve different purposes and can be performed at different levels. The previous figure outlines how you can combine several tasks for successful tuning over a longer period. You should have a work plan that clearly records your goals, the current state of buffer pool performance, the tasks you have performed, and the tuning actions you have applied. Consider also the following tips:

- Review and analysis of the actual performance should always be the first step. It should also be repeated as the last step to verify the success of tuning.
- Finding the optimal buffer pool usage and size can directly lead to a tuning action, or can be followed by an intermediate step to estimate the probable effects of changes.

**The functions of Buffer Pool Analyzer**

This topic introduces the suite of Buffer Pool Analyzer tools that are available for z/OS, respectively the equivalent tools of DB2 Performance Expert for z/OS. This topic is relevant only for users of the Buffer Pool Analyzer stand-alone product or DB2 Performance Expert for z/OS.

- Before Buffer Pool Analyzer can provide any useful information about buffer pool activities and its performance, it needs to collect data from a DB2 subsystem. Buffer Pool Analyzer lets you collect buffer pool related DB2 trace data on the host and makes this data available in data sets on the host. Buffer Pool Analyzer uses this trace data for performance reports, object placement optimization, and simulation tasks.
- Buffer Pool Analyzer can create activity reports at different levels from collected trace data. Reports are provided in textual form in data sets on the host. You can use them to review the buffer pool performance or to perform an in-depth analysis of the buffer pool behavior.
- Buffer Pool Analyzer can create aggregated buffer pool data files, referred to as bpd files, from collected trace data. These bpd files contain data in a format that is suitable for most client-based functions of Buffer Pool Analyzer. The contents of bpd files can also be loaded into DB2 tables.
- In addition to the host-based text reports, you can view performance data on a client in graphical form. This function shows buffer pool comparison data and individual buffer pool information.
- Buffer Pool Analyzer can optimize the object placement in buffer pools. It analyzes bpd file data on the client and generates recommendations for the assignment of objects to buffer pools and for initial buffer pool sizes and parameters. This function provides a wizard that guides you through the optimization. You can manipulate the predefined expert rules and the parameters of an optimization. The function generates appropriate DB2 ALTER BUFFERPOOL commands and SQL ALTER statements. You can use these results to tune a system directly.
- Buffer Pool Analyzer can perform a simulation of the effects of different object placements and buffer pool sizes. It uses representative trace data on a client, lets you vary the parameters, and predicts the effectiveness of buffer pools in terms of hit ratios. You can use this function to assess the effects of planned changes before you actually apply them to a system.
The following topics provide the basic knowledge about each function and should enable you to perform the how-to instructions that are described in the remaining topics.

Collecting data:

DB2 performance data is made accessible through the DB2 Instrumentation Facility as DB2 trace data. DB2 tools and products, including Buffer Pool Analyzer, can get access to this trace data through the Instrumentation Facility Interface (IFI), and the DB2 command START TRACE can be used to record trace data.

A few hundred different types of trace records exist for different purposes; each is identified by an Instrumentation Facility Component ID (IFCID). Buffer Pool Analyzer collects only buffer pool related IFCDs.

Different data collection options result in a varying performance overhead to a DB2 subsystem. Further, not all Buffer Pool Analyzer functions require the same set of trace data. Therefore, when you use Buffer Pool Analyzer to collect trace data, you can specify what trace data you want Buffer Pool Analyzer to collect, when to collect it, and how to collect it. This keeps any overhead minimized for a given task.

Trace data is collected on the host. You can use ISPF and the Collect Report Data (CRD) function of Buffer Pool Analyzer, or you can use a batch job to collect data. The CRD function provides a menu-driven interface to interactively configure and control this task. In a batch job you can use JCL to prepare and configure this task. Both methods provide the same results. The CRD function provides instant feedback about the collection process and status, but requires that you are logged on to TSO/E. The batch JCL lets you prepare the job offline and run it unattended, but requires that you verify the success of the job. The CRD function might be more appropriate for shorter, single tasks. Batch jobs are better for longer, repetitive, or scheduled tasks.

When a task is started by one or the other method, the DB2 command START TRACE is used to actually collect the data. However, you do not need to care about the trace command and its parameters. The command is performed invisible.

Determining what to collect:

By making certain specifications, you can determine what data should be collected.

When you collect data with ISPF, or prepare a batch job to collect data, you can determine what to collect by specifying:

- A record format, which determines whether Standard or Short header information from each IFCID record is collected.
  
  Standard includes all IFCID record header information, which allows you to create more sophisticated reports from the collected data (inclusion of associated information, better aggregation and presentation, and better sorting).
  
  Short includes only part of the IFCID record header information, which minimizes the amount of collected data and is appropriate when collecting large amounts of data.

- A data type, which determines whether Summary or Detail data is collected.
  
  The data type affects the content. Summary and Detail are the base for the corresponding summary and detail reports.
Technically, Summary collects buffer pool statistics (IFCID 2), data set statistics (IFCID 199), and buffer pool characteristics (IFCID 202) data. Detail additionally collects buffer pool activity data (IFCID 6, 7, 8, 9, 10, and 198). Note that especially IFCID 198 can cause noticeable overhead to a system during the collection of trace data. (It records the page requests Getpage, Set write intend, and Release page being sent to the DB2 Buffer Manager.)

Beginning with Buffer Pool Analyzer Version 2, the group buffer pool related IFCIDs 230, 251, and 254 are collected in addition to a subsystem's buffer pool related IFCIDs. If the DB2 subsystem from which performance data is collected is a member of a data sharing group, summary reports contain several additional topics with group buffer pool specific performance information. The collection of group buffer pool specific trace data and its inclusion in activity reports is performed automatically and remains hidden to you. “Interpreting activity reports” on page 2628 describes also the group buffer pool specific details, including the IFCIDs from which this data is derived.

Besides the technical aspect of what is collected, Summary and Detail data require further distinction regarding dynamic availability of current data. Both types of data are provided and recorded by DB2. Detail data is recorded by DB2 at the time an activity occurs. This means that the activity counts of the associated IFCIDs are current. However, summary data is recorded by DB2 at so-called statistics intervals. The interval value is a DB2 subsystem parameter, with a default setting of 1 minute (or the value specified as STATIME in DSNZPARM). This means that statistics records are to be written at the end of this interval. Beginning with DB2 10, the STATIME subsystem parameter applies only to IFCIDs 0105, 0106, 0199, and 0365. IFCIDs 0001, 0002, 0202, 0217, 0225, and 0230 are no longer controlled by STATIME, and the corresponding trace records are written at fixed, one-minute intervals. In addition, another DB2 subsystem parameter (specified as SYNCVAL in DSNZPARM) can be set to determine whether the recording and update is synchronized with some part of the hour, for example, 15, 30, 45 minutes past the hour (no synchronization is the default). The consequence for collecting summary data is that you need to consider also for how long you collect data. As a rule of thumb, assuming that you do not know the STATIME and SYNCVAL parameter settings, the time should span two default statistics intervals. Usually, one hour is a reliable choice to obtain meaningful summary reports from collected data.

A continuity, which determines for how long trace data is collected and whether it is collected continuously or in regular intervals (for example, every 30 minutes for 40 seconds). The basic rules are:

- Continuous collection of data simplifies matters and is recommended when the overhead to a system is negligible (for example, when you collect summary data).
- Collection in regular intervals is recommended to minimize the overhead to a system or to minimize the amount of data being collected (for example, when you collect Detail data on a heavily used system).

Your specifications for record format, data type, and continuity are highly dependent on the intended usage of collected data, as outlined in Table 210 on page 2595 and the following topics.
Table 210. Intended usage of collected data and recommended specifications of record format, data type, and continuity.

<table>

</tbody>
</table>
Determining when and how long to collect:

When you use ISPF or a batch job to collect data, you can specify whether data should be collected immediately or at a specific time, and you can specify whether a collect task should stop after an elapsed time or after a number of records are collected.

The decision when to start and stop a collect task depends on the system load, the intended usage of the data, and the purpose of the analysis. The following scenarios provide some ideas:

• To collect summary information (data type Summary) of the buffer pool performance over a day, you can start collecting data at midnight (start time) and run the job for 24 hours (elapsed time), but only take samples of 10 seconds every 60 minutes (continuity). You can also combine data from multiple collect tasks and use the accumulated data as input when you create reports. This might be helpful to detect trends over a longer period or regular peaks. Note that DB2 updates data that is used for summary information at so-called statistics intervals. Also, most statistics counters are incremental counters. To report a valid counter value for a given period, the difference between the latest and earliest counter value is computed. This means that a collect task should cover at least a statistics interval to produce meaningful summary information. The sampling duration, here 10 seconds, is long enough to capture any updates made by DB2.

• To collect detailed information (data type Detail) during peak times in your organization’s business, which might be around 11:00 a.m. and 3:00 p.m., you can start two collect tasks through ISPF, one at 10:30 and one at 2:30 p.m. (start times). Each task can collect data for an hour (elapsed time) and take samples every 10 minutes for five seconds (continuity). Note that detail information in activity reports is based on actual counts of events, opposed to summary information. You can keep a collect task as short as required without losing accurateness. More details are described in “Preliminary remarks about the accuracy of summary and detail reports” on page 2629.

• If you must analyze the cause of a current performance problem, you can start a collect task immediately (start time) and run it for 45 minutes (elapsed time) to collect summary data. This step might be followed by a second step that collects detailed data for a shorter time.

• If you need to collect data to perform an optimization or simulation (both are described in detail in the following topics), for example to tune a subsystem or peak load periods, you need to identify the peak load periods and collect a representative mean of trace data from this time.

• The collection of data can also serve multiple purposes. For example, if you need to perform an optimization of object placements and a simulation (before you apply any changes to a system), you collect data continuously for approximately 20 minutes during a defined system load period. Simulation requires the record format Short, the data type Detail, and a continuous collection of data, but these specifications serve as well the requirements for an optimization.

The important point is that the collection of data (what, when, and how) must always be performed with regard to the intended usage of this data. Buffer Pool Analyzer can analyze and report performance data, but inadequate selection of
trace data might lead to wrong conclusions. For successful tuning, you should understand that the results of an analysis are always based on workload at the time trace data was collected. Other workloads, which run at other times, may have different results. If you plan to optimize the buffer pool usage, you should carefully determine which workload you consider representative for your optimization.

Using the collected data:

The collected data can be used in different ways.

When trace data is actually collected, it is written to an output data set. The name of the data set is specified by you, either during an interactive ISPF dialog or in a batch job. Nevertheless, some conventions are recommended in “File and data set naming conventions” on page 2599.

Briefly, the trace data in an output data set can be used as follows. More details are described in the following topics.

- The data can directly be used to create summary or detail activity reports on the host.
- To view the data in graphical form on the client, a bpd file must be created from the trace data and downloaded to the client.
- To perform optimizations of object placements and buffer pool sizes on the client, a bpd file must be created from the trace data and downloaded to the client.
- To perform simulations on the client, the trace data must be downloaded to the client. The creation of a bpd file is not required because Buffer Pool Analyzer uses the raw, binary data for this purpose.
- To perform object placements and simulations, the trace data and the bpd file must be downloaded.
- To perform long-term analyses of performance data, one or more historical or current bpd files must be available on the client.

For the matter of completeness, note that data from several collect tasks can also be accumulated in a single data set, which then can be used to create reports and bpd files. Also, multiple input data sets can be used as combined input to create reports and bpd files. However, these uses are subject to some restrictions, which are described at the appropriate places in this information.

Finally, note that the functions that create activity reports and bpd files provide options to select subsets from collected and accumulated data to limit the scope of the output in reports or bpd files. All details are described in “Creating activity reports and bpd files” on page 2618.

Creating activity reports:

Buffer Pool Analyzer provides the BPACTIVITY command (for “Buffer Pool Activity”) and its subcommand REPORT to create activity reports from collected trace data.

The command is used in batch jobs, together with data definition (DD) statements that specify, among others, one or more input data sets with collected trace data. The command creates one or more reports in table form and stores them in a sequential data set. The reports can be viewed or printed by means of appropriate system utilities.
Command options are available to specify the type of report (summary or detail), to selectively use the input data for reports (for example, to limit the time frame or to filter out uninteresting information), and to specify the aggregation and sorting of the reported data.

The reports provide you with comprehensive information about how the buffer pools and the objects are used, for example:

- System and application hit ratios, buffer pool activity counts, I/O activity counts
- Information sorted according to different identifiers, such as buffer pool, plan name, object, or primary authorization ID
- Data ranked by the type of buffer pool operation, for example, by the number of Getpage requests, Sequential prefetches, or Synchronous reads
- Changeable thresholds to show only the most active objects in reports
- Information filtered to include, or to exclude, only specific buffer pools, plans, or time frames
- If the trace data in the input data sets is from a member of a data sharing group, where multiple DB2 subsystems share a group buffer pool, activity reports additionally contain detailed performance information about the group buffer pool.

“Creating activity reports and bpd files” on page 2618 describes the details of using the BPACTIVITY command and its options in batch jobs to create summary and detail reports.

“Interpreting activity reports” on page 2628 shows examples of summary reports and detail reports and explains how to interpret them.

Creating buffer pool data (bpd) files:

Buffer Pool Analyzer provides the BPACTIVITY command (for “Buffer Pool Activity”) and its subcommand FILE to create buffer pool data (bpd) files from collected trace data.

The command is used in batch jobs, together with DD statements that specify, among others, one or more input data sets with collected trace data. It creates bpd files that contain the data in a format that is required by all the client-based functions of Buffer Pool Analyzer, except simulation.

Command options are available to specify the type of data to be included (Summary or Detail) and to selectively use the input data for bpd files (for example, to include only data about specific identifiers).

The FILE subcommand is similar to the REPORT subcommand. Both use the same type of input data (DB2 trace data). Both can extract Summary or Detail data from the input and selectively use input data. However, only the REPORT subcommand has options to manipulate the aggregation and sorting of data. These options are not needed for bpd files. The FILE subcommand has an option to exclude data from inactive objects, which creates smaller, better manageable bpd files.

“Creating activity reports and bpd files” on page 2618 describes the details of using the BPACTIVITY command and its options in batch jobs to create bpd files.

The data in bpd files is not intended for direct interpretation. It is in DB2 load format and can be loaded into DB2 tables for additional analysis by SQL queries. “Loading a bpd file into a DB2 table” on page 2736 provides some information
how the contents of bpd files can be loaded into DB2 tables. However, the further use is outside the scope of this information.

**File and data set naming conventions:**

Adhering to the following naming conventions eases data set and file handling on the host and client, and you do not need to rename files after they are downloaded to the client.

The Buffer Pool Analyzer functions introduced so far are performed on the host; the functions introduced in the following topics are performed on the client. To summarize, the input data required by the client-based functions is either in the format of bpd files (for all functions except simulation) or raw trace data (for simulation).

On the client these files require the file name extension bpd for buffer pool data files, respectively trace for raw trace data (and terse, if the trace data is compressed). You can apply these file name extensions already on the host when you collect data or create a bpd file. Use TRACE as low-level qualifier in the name of the output data set that holds collected data (and TRACE.TERSE as low-level qualifiers if the trace data is compressed). Use BPD as low-level qualifier when you create a bpd file from the trace data (the trace data set).

**Viewing performance data on the client:**

This function lets you view buffer pool performance data in graphical form and as diagrams on the client. It uses buffer pool data (bpd) files that are created on the host system. The bpd files need to be downloaded to the client before they can be viewed.

The client-based graphical user interface (GUI) of Buffer Pool Analyzer provides a convenient environment to select a bpd file and to view system and buffer pool information. For example, you can view:

- General system information, such as:
  - DB2 location, group, and member information
  - Start and end timestamps of trace data contained in a bpd file
  - System and application hit ratios, and the number of accessed buffer pools and objects
  - Counter information, such as Getpage, Read request, Write page
- Buffer pool comparison data, such as a comparison by Read request or Write request
- Individual buffer pool characteristics and counters

"Viewing performance data on the client" on page 2678 describes how to use this function and shows examples of how the information is presented as diagrams, pie charts, and graphs.

**Optimizing object placements and buffer pool sizes:**

This function determines the optimal placements of table spaces and index spaces in buffer pools, the optimal buffer pool sizes, and the optimal values for some buffer pool thresholds. It uses predefined and modifiable expert rules and the object’s access behavior to determine the optimum. The function is performed on
the client and uses buffer pool performance data (from a bpd file) as input. These bpd files need to be downloaded to the client before they can be used.

This function analyzes the data, finds the optimum placements, sizes, and thresholds, and generates recommendations as ready-to-use SQL statements and DB2 commands:

- The SQL ALTER statements contain parameters that determine which object (table space or index spaces) should be assigned to which buffer pool.
- The DB2 ALTER BUFFERPOOL commands contain parameters that determine the recommended size and thresholds of each buffer pool.

The trace data must be a representative snapshot of the buffer pool performance, as described in “Determining when and how long to collect” on page 2596. This function uses the objects’ access behavior to determine the optimal object placements, and it uses many factors to determine the buffer pool sizes based on the placements. Approximations are used by the algorithms for data that cannot be retrieved from the input data.

You use the object placement tool on the client to select an appropriate bpd file and perform the optimization. The GUI provides an easy-to-use wizard that guides you through a few steps to determine the optimal object placements and buffer pool sizes. The wizard uses defaults based on information from the bpd file, but you can influence the optimization in several ways:

- Buffer Pool Analyzer determines the available memory for buffer pools from the bpd file and uses this value as the default for the optimization. You can adjust the total buffer pool size, if you want this function to use a different size.
- Buffer Pool Analyzer uses one of several predefined pattern files to determine the object placements. Pattern files contain expert rules that define which objects should be placed in which buffer pool according to each object’s characteristics. The rules define criteria that must be met to assign an object to a buffer pool. The sequence of rules defines in which order the rules are applied to the objects. Buffer Pool Analyzer preselects a pattern file based on the total buffer pool size of the DB2 subsystem. You can choose a different pattern file. You can also edit a pattern file to adjust the object placement rules according to your needs. Modified pattern files can be saved and will automatically be preselected whenever a bpd file from the same subsystem is opened.

Note: You can save a pattern file only if the file has at least one rule.

- Buffer Pool Analyzer calculates the optimized assignments of objects to buffer pools, based on the available memory for buffer pools and the placement rules, and it calculates the optimum size of each buffer pool. You can adjust the assignments and the sizes of individual buffer pools, if required.
- When Buffer Pool Analyzer has generated its recommendations for object placements and buffer pool sizes, you can adjust them according to specific needs. Your adjustments are reflected in the generated SQL ALTER statements and DB2 ALTER BUFFERPOOL commands.
The results from optimizations are lists of SQL ALTER statements and DB2 ALTER BUFFERPOOL commands that have their parameters set to the recommended values. Your adjustments and changes to an optimization are reflected in the results.

Results from optimizations are kept on the client. You can select them from the Buffer Pool Analyzer main window and view them in a web browser to assess them. To apply the statements and commands to a subsystem, you must upload them to the host and run them as usual. Right-click an object placement result to directly start a simulation using this placement.

You can also work with different performance scenarios by using different bpd files. You can compare the results and assess the variations on the client before you apply the recommendations to a DB2 subsystem.

"Optimizing object placements and initial buffer pool sizes" on page 2683 describes how to use this function and explains how to work with object placement rules in pattern files.

**Simulating buffer pool behavior:**

This function simulates different object placements and buffer pool size ranges in a representative performance snapshot and lets you see and interpret the effects. You can use it to perform what-if scenarios to balance buffer pool sizes and performance. It is performed on the client and uses buffer pool performance data (as raw DB2 trace data) as input. The file containing the trace data (in short format) needs to be downloaded to the client before it can be used.

If you use this function to test the recommendations from the object placement tool, the trace data file downloaded should be ideally the file from which the bpd file for object placement was created. To directly start the simulation function, right click the object placement result, then select Simulate....

The trace data that is used for simulations must be a good representation of the activity of the buffer pools that you want to optimize, as described in "Determining when and how long to collect" on page 2596. This function uses recorded detailed activity of each object to accurately determine the effects of changes to the system.

You use the simulation tool on the client to select an appropriate trace data file and to perform simulations. The GUI provides an easy-to-use wizard that guides you through the few steps to adjust the simulation parameters and to assign objects to buffer pools. The wizard uses defaults that are based on information from the trace data file, but you can adjust these defaults interactively to see the effects of changes.

- You can vary simulation parameters, such as:
  - The buffer pools to be included in a simulation.
  - The minimum and maximum buffer pool sizes to be simulated, and the increments by which the sizes are varied during a simulation.
  - The sequential steal thresholds to be simulated.
- You can vary the assignment of DB2 table spaces and index spaces to buffer pools.

Results from simulations are kept on the client. You can select them from the Buffer Pool Analyzer main window and view them in a web browser. The results
show the recommended distribution of memory between buffer pools, and detailed information about misses and hit ratios as functions of buffer pool size.

You can also work with different performance scenarios by using different trace data files, and you can apply different simulation parameters to these simulations. By comparing the results, your predictions about the effects of changes become more reliable.

“Simulating buffer pool behavior” on page 2698 describes how to perform simulations and shows examples of simulation results.

Analyzing long-term buffer pool performance:

This function analyzes performance data from several bpd files according to your needs. The function is performed on the client, which means that the bpd files need to be downloaded before they can be used as input for the long-term analysis.

The client-based graphical user interface (GUI) provides the environment to select the bpd files to use, to specify the type of analysis to be performed, to specify counters and buffer pool objects of interest, and to view and save the result of an analysis.

Long-term analysis can mean anything, but ready-made results might not fit your needs and interests. The long-term analysis function of Buffer Pool Analyzer provides a flexible way of specifying your needs and provides instant results. The following procedure introduces the functionality and your interaction with this function:

• You select the bpd files to be included in the analysis. Any number of bpd files existing on the client can be selected. You do not need to care from which subsystem they were created.

• The long-term analysis function identifies the subsystems from which these bpd files were created. If multiple subsystems are involved, you need to choose one (which causes the function to ignore all bpd files from the other subsystems).

• You select the type of analysis to be performed, which can be, for example, a weekly view by day, a daily view by hour, a view of a period of time, bar charts, or pie charts. Every type has its strengths and is instantly explained when you use this function.

• You select the counters and buffer pool objects you are interested in and the relationships between them. Counters can be single counters, groups of counters, even ratios. Objects can be all objects, single objects, some or all in a buffer pool, a mixture from several pools, and more. You can also restrict the time frame to consider for the analysis. The long-term analysis function takes care that only those data from the bpd files is used for the analysis that matches your selections.

• The long-term analysis function shows the result instantly in the main window. The result is kept on the client for future use and comparison with other results.

“So Analyzing long-term buffer pool performance” on page 2707 describes how to use this function and also shows and explains several examples of the various analysis types.

Summary of user tasks
This topic illustrates user tasks and their relationships.
Figure 191 illustrates and summarizes the previously introduced user tasks and their relationships. It shows the order of tasks that must be performed to create reports on the host or to perform one or more of the client-based functions. For example, to perform a simulation of buffer pool behavior based on actual trace data, first you need to collect data in a trace data file and download this file to the client. Note that the descriptive text of the tasks complies with the topic titles in this information.

The illustration also shows the flow of data between the components. Collected trace data can be used on the host to create reports, or downloaded and used for simulations. Just as well, collected data can be aggregated in bpd files and loaded into DB2 tables, or downloaded to the client and viewed or used for an optimization.

Note that Buffer Pool Analyzer provides sample performance data as bpd files and trace data files on the client. You can use them to acquaint yourself with Buffer Pool Analyzer. The individual topics describe the locations of these files and how to select, open, and use them.
Where to start
This topic shows possible workflows and the needed steps to perform them.

So far, the introduction explained the buffer pool analysis and tuning tasks and what Buffer Pool Analyzer offers to solve these tasks. Table 21 summarizes possible workflows that guide you from a potential buffer pool related task through a sequence of activities to achieve your aim. For a more problem-oriented approach see also “A generalized approach to performing analyses” on page 2605.

Table 21. Possible workflows for Buffer Pool Analyzer

<table>
<thead>
<tr>
<th>If you want to</th>
<th>Perform the following steps</th>
</tr>
</thead>
</table>
| Create several activity reports on the host. | 1. Collect performance data (or use data from a previous data collection). Refer to “Collecting data” on page 2607 and also to “Determining what to collect” on page 2593. Decide about the type of report (summary or detail).  
2. Write a batch job that creates a report. See “Creating activity reports and bpd files” on page 2618. Use the trace data file as input. Note that you can use the BPACTIVITY REPORT in the batch job without any options.  
3. Study the activity report in detail.  
4. Modify your batch job and use some of the BPACTIVITY options. Compare the effects in the reports.  
5. Use different input data (created with different collection parameters) and different BPACTIVITY options in your batch job and see how this effects the reports.  
You will notice how data collection parameters (format, type, continuity, duration) relate to BPACTIVITY command options; above all, that data can only be reported if it was previously collected. |
| Learn about what kind of buffer pool information can be viewed on the client. | 1. Start reporting and select and open one of the sample bpd files. See “Viewing performance data on the client” on page 2678.  
2. Expand the tree in the Reporting folder and study the contents in the different subfolders.  
3. View how comparison data is presented in graphical forms. |
| Get a first glance at the object placement or simulation capabilities on the client. | 1. Select and open a sample file. See “Optimizing object placements and initial buffer pool sizes” on page 2683, respectively “Simulating buffer pool behavior” on page 2698.  
You will notice when bpd files and trace data files are used.  
2. Start and follow the wizard. Accept the default input values.  
3. Note the purpose of each step, and the output from these functions. |
### Table 211. Possible workflows for Buffer Pool Analyzer (continued)

<table>
<thead>
<tr>
<th>If you want to</th>
<th>Perform the following steps</th>
</tr>
</thead>
</table>
| Perform a simulation on the client with real performance data. | 1. Collect performance data through ISPF. Choose Short format, **Detail** data type, and collect data for approximately 10 minutes. See “Collecting data” on page 2607 and also to “Determining what to collect” on page 2593.  
2. Note the options you have chosen in specifying data collection parameters. Note how many trace records were collected during the specified time.  
3. Download the trace data file to the client. See “Downloading files from the host to the client” on page 2732.  
4. Start the simulation function on the client and select and open the trace data file you have created.  
5. Optional: To directly simulate the results of an object placement, right-click the object placement result file, then select **Simulate**...  
6. Repeat the simulations with different simulation parameters, object placements or both. Note how the parameters influence the execution times of simulations.  
7. Study the simulation results in more detail. |
| View performance data or perform an optimization of object placements and buffer pool sizings on the client with real performance data. | 1. Collect performance data (or use data from a previous data collection). Choose Short format, **Detail** data type, and collect data for a few minutes. See “Collecting data” on page 2607 and “Determining what to collect” on page 2593.  
2. Write a batch job that creates a bpd file. See “Creating activity reports and bpd files” on page 2618. Use the trace data file as input. Note that you can use the **BPACTIVITY FILE** command in the batch job without any options for default behavior.  
3. Download the bpd file to the client. See “Downloading files from the host to the client” on page 2732.  
4. Start the view function or object placement function on the client and select and open the bpd file you have created.  
5. Study the optimization results in more detail. Note the recommendations. You might want to compare them with your actual system settings.  
Consider creating a trace data file and a bpd file from every data collection, and keeping them together on the client. This lets you iteratively perform optimizations and simulations on the same snapshot of performance data. |
| Study a detailed use case. | Read “Example of a use case” on page 2720. |

### A generalized approach to performing analyses

This topic outlines a problem-oriented approach of how to analyze buffer pool performance and related problems.

The proposed approach is a combination of using the suite of Buffer Pool Analyzer tools in reasonable sequence and applying reasoning and experience to a
well-defined task. As each system setup and behavior is different, the following approach is one possible example. It is not meant as a step-by-step instruction.

- On the host, use a trace data file that contains data from a representative time and create a summary activity report, a few detail activity reports (for example, a TOP(25) report, sorted by Getpage, Readreq, or Readpage request), and a bpd file. See “Creating activity reports and bpd files” on page 2613 for details.

- Inspect the summary activity report to determine how the system is set up (the number and the sizes of buffer pools, the threshold values for certain buffer pool operations, and others). See “The Buffer Pool Characteristics section” on page 2632 for details.

- Download the bpd file to the client and load it into the graphical report utility. See “Viewing performance data on the client” on page 2678 for details. This function is excellent when used in parallel to the host reports, to get a feeling for the distribution of work and the type of access behavior of each buffer pool. For example, when you navigate to Buffer Pools ➤ Buffer Pool Comparison ➤ Getpages, the buffer pools with the most Getpage operations are immediately identified. All other buffer pools can usually be ignored until a simulation is performed later. The other graphical buffer pool comparisons, by ReadRequest, ReadPage, WriteRequest, and Writepage operations, are also important indicators for directing further analysis.

- Inspect the detail activity reports to determine whether a small number of objects are dominating the overall system or single buffer pool activity. Investigate these objects in detail. See “The Detail Activity section” on page 2665 for details.

For example:
- Read Request - Delay (msec) - Synchronous
  
  If some of these high-activity objects have a relatively high value, compared to the average for this counter, you may be experiencing disk problems and should consider moving such objects to a faster disk.

- BP Hit Ratio (%) - System / Application

  A large discrepancy among system and application hit ratios may indicate a conflict, such as a wrongly set Virtual Sequential Threshold, or the object is mainly accessed sequentially but the buffer pool also contains many objects with high synchronous access.

- Use the graphical report utility on the client to further check for “unusual” objects:
  
  - For each of the high-access buffer pools navigate to BPx ➤ Object Comparison. The graphical representation makes it immediately apparent if some high-activity objects do not “fit” in this buffer pool, as their access type is not typical of the rest of the buffer pool objects. A reorganization of the buffer pools, using the object placement function, might be appropriate.

  - Be especially critical of high-activity objects with an unexpectedly large amount of RID-List activities. This may indicate an overdue REORG, a missing index, or an application programming style issue.

- Use the simulation function to determine if memory distribution between buffer pools is correct. See “Simulating buffer pool behavior” on page 2698 for details.
Perform the simulation with “Minimum / Maximum buffer simulation sizes” initially set to approximately 50 percent, respectively 200 percent of the current buffer pool sizes. Initially, only check the recommended memory distribution in the “list of recommended buffer pool sizes” (the second table in the simulation results) for the value nearest to the current total buffer pool size. If these values differ significantly from the current memory distribution, you should question whether the activity data in the trace data file is typical for the workload you wish to optimize, especially regarding buffer pools that the simulation recommends to make smaller. You may need to collect traces from other times and also perform the same simulation on them, determining a best middle value from the combined reports.

- In a following step, the simulation results should also make it immediately clear whether an increase in overall memory would result in a significant performance increase. If a recommended size for a buffer pool is the smallest or largest size that was simulated for that buffer pool, consider performing a further simulation with a larger range of values.

- Consider simulating what happens if you move any “unusual” objects found earlier into other or even new buffer pools. Compare the results with the original simulation with no object movement.

- Finally, even if it was not determined earlier that object placement is required, consider using it, followed by simulation to determine whether a different distribution of objects can also result in a performance improvement. This is a time-consuming exercise, but can produce significant performance improvements.

**Collecting data**

This topic describes how to collect the performance data that is used by Buffer Pool Analyzer. It describes two methods to collect buffer pool trace data. The first method uses ISPF and the Collect Report Data (CRD) function to configure and control a collect task, the second method uses a batch job that contains equivalent specifications for a collect task.

**About this task**

For the sake of completeness, note that the Generalized Trace Facility (GTF) and the System Management Facility (SMF) can also collect buffer pool related trace data. The data is recorded in appropriate GTF and SMF data sets, which can be used as alternative or additional input for the creation of activity reports and bpd files. In “Creating activity reports and bpd files” on page 2618, the description of the INPUTDD statement provides more details about specifying alternative or multiple input data sets. However, the important point is that GTF or SMF must be set up in SYS1.PROCLIB to collect, besides others, also buffer pool related data (as specified in “Determining what to collect” on page 2593).

**Related tasks:**

- Collecting data is always the first task before you can perform any of the other Buffer Pool Analyzer functions.

- After you have performed this task, the trace data is available in named data sets and can be used for the tasks described in:
  - “Creating activity reports and bpd files” on page 2618
    Activity reports are created on the host. Bpd files need to be downloaded to the client before they can be used for the tasks described in:
    - “Viewing performance data on the client” on page 2678
DB2 trace data files need to be downloaded before this task can be performed on the client.

General remarks:

1. Ensure that your output data sets are large enough. The amount of data that is being collected depends largely on the activity in the buffer pools. If you are going to collect detail data, remember that each activity produces at least one trace record. On a busy system you can rapidly generate several million records. Limit the data collection time, or the number of records to be collected, until you have a feeling about the amount of trace data being produced on your system.

2. If you are going to collect data for optimizing the object placements, ensure that the DB2 catalog statistics are up to date. Among other factors, Buffer Pool Analyzer considers the size of page sets and might otherwise produce inaccurate results. Run the RUNSTATS utility, if required.

3. If you are going to collect data for simulation:
   - Ensure that you collect detail data, in short format, for approximately 20 minutes continuously, which generally gives a good representation of a particular workload. If the workload varies significantly, collect a slightly smaller trace for each workload type.
   - For large amounts of data you can optionally create an additional output data set that contains the collected data in compressed format. The size and the download time of such data sets are roughly 25 percent of the equivalent uncompressed data sets. The simulation function can handle both types. See "The TRSMAIN terse utility" on page 2739 for more details.

   Note that an uncompressed data set is always created. Therefore, if you choose to create the additional compressed data set, you should have approximately 1.25 times the required disk space available. However, if the data is exclusively used for simulations, you can erase the uncompressed data set after both data sets are created.
   - Avoid collecting more than 2 GB of data. The simulation function on the client can handle trace data files of up to 2 GB (no matter whether the data is compressed or uncompressed). If you realize that the size of a trace data file on the client is too big, create and download a smaller file (less than 2 GB on the client), compare the actual sizes, and estimate the approximate maximum size of the host data set as follows:

     \[
     \frac{\text{Size}_{\text{on host actual}}}{\text{Size}_{\text{on host max}}} = \frac{\text{Size}_{\text{on client actual}}}{2 \text{ GB}}
     \]

     If necessary, collect a smaller trace to keep the trace data file below its maximal size.

4. If you are going to collect data for object placement and simulation, ensure that all requirements in remarks 2 and 3 are met. Furthermore, it is essential that you keep the trace data file and the bpd file together. (The bpd file must be created as described in "Creating activity reports and bpd files" on page 2618.)

The following topics provide additional information:

- "Collecting data by using ISPF" on page 2609
- "Collecting data by using the batch JCL" on page 2616
**Collecting data by using ISPF**

This section explains how to use the Collect Report Data (CRD) function of Buffer Pool Analyzer, respectively the equivalent function of DB2 Performance Expert.

**About this task**

To collect data by using ISPF, perform the following steps:

**Procedure**

1. Start ISPF from your TSO/E session.
2. Start the FPEJINIT exec.
   
   The exec automatically determines whether DB2 Performance Expert or the Buffer Pool Analyzer stand-alone product is installed on your system. If DB2 Performance Expert is installed on your system, the exec starts DB2 Performance Expert and you need to perform steps 3 to 4 on page 2610 to reach the Collect Report Data function. Otherwise, the exec directly starts the Collect Report Data function. If you see the Collect Report Data panel (shown in step 4 on page 2610), continue with step 5 on page 2610.

   IBM OMEGAMON for DB2 Performance Expert panel is displayed:

   ![IBM OMEGAMON for DB2 Performance Expert panel](image)

   3. Select the following options to specify the DB2 subsystem from which you want to collect data, as follows:
      
      a. Select option 3 (View online DB2 activity - PE ISPF OLM). The Online Monitor Main Menu panel is displayed.
      b. Select option 4 (Options). The Options panel is displayed.
      c. Select option 1 (DB2 Subsystem). The DB2 Subsystem subpanel is displayed.
      d. Specify the DB2 subsystem and return to the Online Monitor Main Menu panel:
4. On the Online Monitor Main Menu panel select option 6b, Collect Report Data - For Buffer Pool Analysis.

The Collect Report Data for Buffer Pool Analysis panel is displayed:

```
06/23/13 10:16   Collect Report Data - For Buffer Pool Analysis
Command ==> ________________________________________________________

PM01DC11       DC11

Select one of the following.

1. Configure task  
2. Activate task  
3. Display task status  
4. Stop task

Task Description          Status
collect_data_for_buffer_pool_activity___ Data available
```

Above the options menu, you see the name of the DB2 subsystem that you specified in step 3d.

You use this panel to configure and control a collect task. You can work with one task at the same time. If you leave Buffer Pool Analyzer (the stand-alone product) or DB2 Performance Expert before a task has finished, the task is stopped (no configuration settings are saved, no data is available). A task has finished when it is configured, activated, and all data has been collected.

5. Select one of the following options:
   - **Configure task**
     This step is mandatory and must be performed before you can use any other options. See "Configuring a collect task" on page 2611, which describes how to specify details of the collect task.
   - **Activate task**
Use this option to activate the collect task that you have configured.

- **Display task status**
  Use this option if you want to see status details of an activated collect task. These details are described in “Interpreting trace status summary and trace messages” on page 2614.

The overall status of a collect task is shown in the **Status** field. Depending on how a collect task was configured, one of the following status descriptors is shown:
- **Not yet activated**: A collect task was configured but not yet activated.
- **Activate issued**: A configured task was activated and started.
- **Waiting for start**: A scheduled task was configured and activated, but the start time is not yet reached.
- **Collecting data**: A task is active and is collecting data.
- **Waiting for next interval**: A task was configured to collect data in intervals. The task is active, but waiting for the next interval to take place.
- **Data available**: An activated task has stopped and written its data to the output data set.
- **Stopped**: An activated task has finished, either because it was stopped by you or because a configured stop condition was reached.

- **Stop task**
  Use this option to stop an activated collect task. If a DB2 trace is currently collecting data, this option also stops the DB2 trace.

6. In the **Task description** field, type a description for the collect task.

**Configuring a collect task:**

This section explains how to specify details of a collect task, such as the type of data to collect, and the start and stop conditions.

**About this task**

If you have selected the **Configure task** option on the Collect Report Data panel, the Collect Report Data for Buffer Pool Analysis panel is displayed:
The **Task description** field shows the description that you have entered in the previous step.

To configure a collect task, perform the following steps:

**Procedure**

1. In the field **Output DS name** specify the data set name to which the data is to be written. **Recommendation**: Data sets used for this purpose should have a variable record format (RECFM) and a record length (LRECL) of at least 6000. The data set name should have the low-level qualifier **TRACE**, for example NKA.COLLECT.TRACE, for the following reasons:
   - If this data set contains trace data that will be used for simulations on the client, the downloaded file on the client must have a file name extension of trace. Keeping the extension on both sides also eases the download procedure.
   - Avoid **BPD** as low-level qualifier because this qualifier is recommended for bpd files that are created from trace data. The reason is that bpd files must have a file name extension of bpd on the client.

2. In the field **Disposition** specify how the data is to be written to the specified data set:
   - **1=Append**
     - Data collected during this task is appended to any previously collected data in the named data set.
     - The disadvantage of appending data to existing data is that a copy of the catalog data is appended every time. If you want to use the data on
the client, the bpd file becomes unnecessarily large and difficult to handle. Furthermore, if the system setup changes between two collect tasks, some report values can become undefined. If possible, use one of the following options.

If you collect data for a simulation on the client, never use this option.

2=Overwrite
Data collected during this task overwrites any previously collected data in the named data set.

3=New
The data set is allocated dynamically with RECFM=VBS, LRECL=32756, and BLKSIZE=6233 before data is written to it.

3. In the field Record format specify which IFCID record header information you want to be included in the collected data:

1=Standard
Includes the complete IFCID record header.
Select this option if you want to create comprehensive activity reports.
Standard provides the information that is used by the INCLUDE, EXCLUDE, ORDER, and SORT options of the BPACTIVITY REPORT command.
Do not use this option if you want to use the data for simulation.

2=Short
Includes only part of the IFCID record header.
Select this option if you want to use the data for the client-based functions. This option is mandatory for simulation.
For most activity reports Short is also sufficient.

4. In the field Data type specify which DB2 trace data you want to collect:

1=Detail
Collects buffer pool statistics, catalog data, and buffer pool activity data.
Select this option if you want to create detail activity reports, or bpd files or trace data files for use on the client. This option is mandatory for simulation.

2=Summary
Collects buffer pool statistics and catalog data.
Select this option if you want to create summary activity reports.

Note: DB2 updates summary data at statistics intervals. When you specify the duration of the collect task, permit for sufficient time to “capture” several intervals. If required, see “Determining when and how long to collect” on page 2596 and “Preliminary remarks about the accuracy of summary and detail reports” on page 2629 for more details.

3=Catalog only
Collects only catalog data. For possible uses see “Concatenating trace data for activity reports and bpd files” on page 2734.

5. In the field OP Buffer size specify a value from 8 KB to 1024 KB. The Online Performance (OP) buffer is used by DB2 to pass the trace data to Buffer Pool Analyzer (and other monitor programs).
Specify a large buffer size to prevent a buffer overflow.
Specify a moderate buffer size if you are constrained on virtual storage in
DB2’s database services address space (DBM1).

6. In the field **Start the DB2 trace** specify one of the following start conditions:

1=**Immediately**
   Starts the DB2 trace immediately.

2=**At (hh:mm:ss)**
   Starts the DB2 trace at a specified time, whereby *hh* is the hour, *mm* is
   the minute, and *ss* is the second. If the specified time is less than the
current time, the trace starts the next day at the specified time. Note
that a trace is stopped if you leave DB2 Performance Expert or Buffer
Pool Analyzer. See also step 4 on page 2610.

7. In the field **Trace and collect data** specify how the data is to be traced:

1=**Continuously**
   Runs the DB2 trace for the entire tracing period. Select this option if
   you want to use the trace data for simulation.

2=**Every x minutes for y seconds**
   Runs the DB2 trace every *x* minutes for *y* seconds, whereby *x*
denotes the specified minutes, and *y* denotes the specified seconds.

8. Specify one or two stop conditions for the DB2 trace. The trace stops when one
   of the conditions becomes true.
   
   • Activate one or both stop conditions by typing a slash (/) in the field
     preceding the condition. A greater-than (>) symbol in this field indicates that
     this condition was previously selected.
   
   • Specify one or both conditions as follows:
   
     – In the field **Elapsed time** specify the number of seconds the trace should
       run.
   
     – In the field **Number of records collected** specify a maximum number of
       records to be collected.

**Examples:**

- 10000
- 100K (for 100000)
- 1M (for 1000000)

**Recommendation:** If you want to use the trace data for simulation,
ensure that you collect trace data for approximately 20 minutes,
respectively 1200 seconds. In the field **Elapsed time** specify an
appropriate value. Either deactivate the **Number of records collected**
condition, or set it to 13000000 (approximately 2 GB of data), to ensure
that the trace does not stop earlier.

**Interpreting trace status summary and trace messages:**

This topic shows examples of the Trace Status Summary panel and the Trace
Messages panel. You can use this information to assess the progress and success of
an activated or completed collect task.

**About this task**

If you have selected the **Display task status** option on the Collect Report Data
panel, the Trace Status Summary panel is displayed. The following is an example:
This panel shows details of the collect task, for example, when the task was started and stopped.

Procedure
1. Assess this information carefully with regard to the intended usage. For example:
   • The *Records read* count should show a reasonable number of collected trace records.
   • The *Buffer overflow* count gives an indication whether you should configure a larger OP Buffer size for this collect task.
   • The *Records lost* count should be less than 2% of the total number of records read (especially if the collected data is used for simulation).

   During data collection, trace records can get lost if the CRD task cannot keep up with reading the records at the speed that DB2 writes them. For most of the Buffer Pool Analyzer functions, this is not a grave situation. The only function that is sensitive to trace record loss is simulation.

   If the loss rate is too high, ensure that the Performance Expert address spaces are dispatched with a priority equal or higher than the DB2 database services address space (DBM1).

2. Select Display messages.

   The Trace Messages panel is displayed. The following is an example:
This panel shows messages about the progress and success of the collect task. In this example, the message FPEM0518E indicates that DB2 returned with a bad return code, RC 8, and with reason code REASON X'00E60820'. The DB2 trace command STOP TRACE (P) TNO (4) was issued, thereafter the collect task completed successfully.

If you have requested that the collected data is to be compressed into a separate data set, and if errors occur during the compression, you also see messages preceded by message identifier TERSEMVS. These messages are from the TRSMAIN utility, which is used to perform the compression. For these errors, use the system code and the following information to diagnose the error.

**Related reading:** For more information, see *IBM DB2 10 for z/OS: Messages and Codes* or *IBM DB2 11 for z/OS: Messages and Codes*.

### Collecting data by using the batch JCL

This topic shows an example of a batch job that performs a so-called Collect Report Data task.

**About this task**

The meaning of the parameters in the batch job is identical to those described in "Configuring a collect task” on page 261. Regarding the parameter syntax, note that keywords are succeeded by values in parentheses (), comment lines start with an asterisk (*), and blanks are allowed between keywords and values.

Note that you can use and modify the JCL sample provided in data set member `prefix.TK02SAMP(BPOMACRD)`. It is usually more current than the example in this information.

If you want to compress collected data into a separate data set, equivalent to the Collect Report Data (CRD) function, use a batch job similar to that shown in “The TRSMAIN terse utility” on page 2739.
Recommendation: You must assign a job class with a high priority to data collection batch jobs. This priority must be at least as high as that of DB2. Otherwise, trace records are not collected fast enough, resulting in lost records, or the trace might be started and stopped immediately after the catalog data is collected.

When the BPA CRD program is started from the APF-authorized steplib, it attempts to establish itself as an independent enclave that has a Workload Manager (WLM) subsystem type of DB2. It is possible that your WLM policy causes the generic WLM subsystem type of DB2 to get low dispatching priority. In this case, you can start the BPA CRD job from the non-APF copy of RKANMOD data set so the collection process will use the dispatching priority of the batch job.

Example:

```c
//*******************************************************************//
//** MODULE NAME : BPOMACRD **
//** DESCRIPTION : DB2 BPA Collect Report Data Batch Job **
//** COPYRIGHT : IBM DB2 Buffer Pool Analyzer for z/OS V5R4M0 **
//** Licensed Materials - Property of IBM **
//** 5655-W35 (C) Copyright IBM Corp. 2001, 2016 **
//** STATUS : Version 5.4.0 **
//** FUNCTION : Collect Report Data in Batch Mode **
//** Notes = **
//** 1. Add a valid job card **
//** 2. Change the prefix of the DB2 BPA load library db2bpa **
//** 3. Change the prefix of the DB2 load library db2load **
//** 4. Change the DPCOLLDD DD statement for the trace data **
//** 5. Change the collect parameters in the SYSIN data set **
//** End of Specifications*********************************************//
//** DB2BPA EXEC PGM=DB2BPCRD //STEPLIB DD DSN=db2bpa.SDSNLOAD,DISP=SHR // DSN=db2load.RKANMOD,DISP=SHR //SYSPRINT DD SYSOUT=* //SYSOUT DD SYSOUT=* //** Protocol of the CRD parameters and status information //DPMLOG DD SYSOUT=* //** Report of the data collection job //JOBSUMDD DD SYSOUT=* //**PCOLLDD DD DISP=OLD,DSN=your.db2trace.dsname //DPCOLLDD DD DISP=(NEW,CATLG),DSN=your.db2trace.dsname, //DCB=(RECFM=VBS,BLKSIZE=9076,LRECL=32756), //SPACE=(TRK,(500,100)),VOL=SER=xxxxxx,UNIT=3390 //SYSIN DD * // Mandatory parameters DB2SSID (ssid) * DB2 subsystem id PLANNAME (planname) * DB2 BPA planname // Optional parameters, for fixed values enter either the characters * specified in capital letters or the full word RECORD_FORMAT (short) * Standard or SHort(default) DATATYPE (detail) * Detai1(default), Summary, or Catalog STARTTIME (im) * IMMEDIATELY(default) or hh:mm:ss, * where hh:mm:ss gives the time within the * next 24 hours when the trace is to start * Instead of specifying a start time you can use your batch scheduling DURATION (nnnu) * Maximum job duration, where nnn specifies
```
* time units and \( u = s \) for seconds
* \( m \) for minutes or
* \( h \) for hours

**MAX_RECORDS** \( (rrrr) \)
* Maximum number of records to be
* collected, optionally in \( K (=1000) \)
* or \( M (= 1000000) \). An example is 25000 which
* is the same as 25K.

**SAMPLING** \( (mmm,sss) \)
* Indicates that tracing is done in
* sampling mode. \( mmm \) denotes the
* time interval between 2 collection
* periods in minutes. \( sss \) denotes
* the time in seconds when DB2 trace is
* active during a sampling interval.
* If SAMPLING is omitted (default), DB2
* trace data are collected continuously.

**BUFSIZE** \( (nnnn) \)
* Specifies the OP buffer size in the
* DB2 Start Trace command. \( nnnn \) indicates
* the number of KB and ranges from 8 to
* 16384, default is 2048 for 2048 KB.

The batch job generates the following files:

**DPCOLLDD**
Contains the trace data.

**DPMLOG**
Contains information about the parameter stream.

**JOBSUMDD**
Contains a protocol about the process and trace messages from Buffer Pool
Analyzer and DB2. The messages are identical to those shown in the Trace
Messages panel, which is described in "Interpreting trace status summary
and trace messages" on page 2614.

**Creating activity reports and bpd files**

This topic describes how to create activity reports and buffer pool data (bpd) files
from collected trace data. It describes an example of a batch job and the use of the
**BPACTIVITY** command.

**About this task**

**Related tasks:**
* Before you can perform these tasks, you must have performed the task described
  in "Collecting data" on page 2607. Note that the collected trace data must be
  available in uncompressed format.
* After you have performed this task, the reports and bpd files are available in
  named data sets and can be used for the tasks described in:
  * "Interpreting activity reports" on page 2628
  * "Viewing performance data on the client" on page 2678
  * "Optimizing object placements and initial buffer pool sizes" on page 2683
  * "Analyzing long-term buffer pool performance" on page 2707

Activity reports and buffer pool data files are created on the host by means of a
batch job. In a batch job you specify:

1. The source of your input data (the data set containing the collected trace data).
2. The data you want to extract from the input data set and include in the activity
   reports or buffer pool data files.
3. For activity reports, the appearance of the reported data.
4. The output data set where the reports or the bpd files are to be stored.

Step 2 and step 3 use the **BPACTIVITY** command and its **REPORT** (for activity reports) and **FILE** (for bpd files) subcommands. Both subcommands have options to specify the content and the level of detail to be included in the output. The content can be manipulated, for example, by selecting only a specified time frame, or by including or excluding specific identifiers. The level of detail defines that either summary information or detail information is taken from the input and included in the output. The **REPORT** subcommand has additional options to specify the aggregation and sorting of the reported data. The **FILE** subcommand has an additional option to exclude information about inactive objects from the bpd file, which results in a smaller file size.

The following topics provide additional information:
- “Preliminary remarks about the content and filtering of input data”
- “Specifying a JCL command stream” on page 2620
- “Specifying reports and bpd files with BPACTIVITY” on page 2622

**Preliminary remarks about the content and filtering of input data**
The **BPACTIVITY** command and its subcommands can only create information in reports or bpd files from information that is contained in the input data sets that are specified in the batch job.

**About this task**

For example, if you collected trace data of data type Summary, you should not expect detail information in reports even if you specify this with the **BPACTIVITY** command options. However, if you collected trace data of data type Detail, you can specify that only summary information is reported. Detail data always includes summary data, as described in “Determining what to collect” on page 2593.

The same considerations pertain to time frames of collected data in contrast to reported data. For example, if you collected trace data between 9:00 a.m. and 10:00 a.m., but specified 10:00 a.m. to 11:00 a.m. with the **BPACTIVITY** command options **FROM** and **TO**, your report or bpd file remains empty.

If you create bpd files (with the **FILE** subcommand) for use with the object placement function on the client, note that this function has options whether to include inactive objects into the assignment of objects to buffer pools. If you use the **FILE** subcommand with its **ACTIVEOBJECTS** option to exclude information about inactive objects from a bpd file, the object placement function consequentially treats only active objects. Plan ahead how you want to treat inactive objects with object placement and create the bpd file accordingly.

In your batch jobs you can use the **GLOBAL** command to preprocess input data before this data is processed by the **BPACTIVITY** command. The **GLOBAL** command has similar options to filter input data, and additional options to set default values for subcommands and to define processing options (such as DD statements for different data sets or time zone adjustments). The use of the **GLOBAL** command can improve the performance of your batch job, for example, if the **BPACTIVITY** command is used to produce multiple reports with a single invocation, or if the amount of input data is a multiple of the required output data.
Related reading: The **GLOBAL** command is available with Buffer Pool Analyzer and other DB2 performance tools and is described in the *Report Command Reference*. This book also provides more details about how to create reports and traces.

**Specifying a JCL command stream**

This topic describes a typical batch job that creates a detail report and a bpd file. The JCL command stream and the DD statements are described to enable you to write your customized batch job.

**About this task**

Note that you can use and modify the JCL sample provided in data set member `prefix.TK02SAMP(BPOQBTCH)`. It is usually more current than the example in this information.

In the following example the Buffer Pool Analyzer is installed under the high-level qualifier `db2bpa`. The batch job creates three different activity reports (using the `REPORT` subcommand with different options) and a trace data file (using the `FILE` subcommand without any option).

**Example:**

```plaintext
//***************JCL Sample: BPOQBTCH**************************/

  dname(bparesp2)

* File, output goes to default DD name BPFILDD1
  FILE
* EXEC command terminates reading of command input and starts
* processing of trace input.
EXEC
  //

INPUTDD

Lists one or more input data sets that contain trace data to be used to
create activity reports and buffer pool data files. Usually, this is the data
that you collected with the Collect Report Data (CRD) function of Buffer
Pool Analyzer. The name of the input data set usually has a low-level
qualifier of TRACE, as explained in “Configuring a collect task” on page
2611.

The default ddname for the input data set is INPUTDD. If you specify a
different ddname, use the INPUTDD option of the GLOBAL command. In this
case, ensure that your JCL includes a valid DD statement for the new
name.

You can also use DB2 trace data that is created by other means, such as
data in GTF or SMF data sets, and it is generally possible to process
multiple input data sets. See “Concatenating trace data for activity reports
and bpd files” on page 2734 for more details.

SYSOUT

Contains messages from DFSORT. If SYSOUT is not specified, it is
dynamically allocated to the SYSOUT message class of the job. The format of
SYSOUT is RECFM=FBA, LRECL=133, BLKSIZE=6251.

JOBSUMDD

If specified, it contains the job summary log and the IFCID frequency
distribution log. The format of JOBSUMDD is RECFM=FBA, LRECL=133,
BLKSIZE= 6251.
DPMLOG
Contains messages from the Buffer Pool Analyzer command processor. If
DPMLOG is not specified, it is dynamically allocated to the SYSOUT
message class of the job. The format of DPMLOG is RECFM=FBA,
LRECL=133, BLKSIZE=6251.

BPRPTDD
Contains the output from the BPACTIVITY REPORT subcommand. If
BPRPTDD is not specified, it is dynamically allocated to the SYSOUT
message class of the job. The format of BPRPTDD is RECFM=FBA,
LRECL=81, BLKSIZE=8100.

If multiple REPORT subcommands are used, the resulting activity reports are
written to BPRPTDD in corresponding sequence.

If you specify a different ddname with the DDNAME option of the REPORT
subcommand, ensure that your JCL includes a valid DD statement for the
new name.

BPFILDD1
Contains the output from the BPACTIVITY FILE subcommand. This is the
bpd file that can be used on the client for viewing performance data and
optimizing object placements. Also, its content can be loaded into DB2
tables. Ensure that your JCL contains a valid DD statement for this
ddname. The format of BPFILDD1 is RECFM=VB, LRECL=9072,
BLKSIZE=9076. The DD statement should specify a data set name with a
low-level qualifier of BPD (for buffer pool data). After this data set is
downloaded to the client, it must have a file name extension of bpd.

If you specify a different ddname with the DDNAME option of the FILE
subcommand, ensure that your JCL includes a valid DD statement for the
new name.

BPWORK
If specified, it determines where Buffer Pool Analyzer stores its temporary
data, which can be up to 68 MB. Usually, this data set is created on the
MVS-defined work volumes and deleted by Buffer Pool Analyzer. Use
BPWORK if you want to control placement or size of the data set, or if you
receive a B37 abend. The format of BPWORK is RECFM=VBS,
LRECL=32756, BLKSIZE=6233.

Recommendation: Do not specify DUMMY or DISP=MOD for this data
set.

SYSIN
This DD statement is mandatory. It contains the commands to be run by
the job stream.

The format of SYSIN is RECFM=FB, LRECL=80, BLKSIZE=6160.

Specifying reports and bpd files with BPACTIVITY
Context
Use the BPACTIVITY command within a JCL command stream to specify the
contents of reports and bpd files.

Purpose
The BPACTIVITY command and its REPORT subcommand is used to create reports
from collected data. Subcommand options specify the contents and appearances of
reports. The **REPORT** subcommand can be used up to five times within a batch job. This means that you can create up to five different reports by using different options.

The **BPACTIVITY** command and its **FILE** subcommand is used to create bpd files from collected data. Subcommand options specify the contents of bpd files. The **FILE** subcommand can be used only once within a batch job.

**Usage**

Some options are identical for both subcommands: **FROM** and **TO** limit the time frame, **INCLUDE** and **EXCLUDE** explicitly include or exclude specific contents, **LEVEL** specifies whether to include detail data or only summary data in a report or bpd (buffer pool data) file, and **DDNAME** overwrites the default output ddname.

The **REPORT** subcommand has one unique option: **ORDER** arranges the appearance of the reported data.

The **FILE** subcommand has one unique option: **ACTIVEOBJECTS** writes only information about active objects to the output ddname.

**Defaults**

All options provide default values, if none are specified. Thus, the simplest command usage is **BPACTIVITY REPORT** or **BPACTIVITY FILE** to produce usable results.

By default, the reports are written to BPRPTDD, and the bpd file is written to BPFILDD1. These defaults can be changed by means of the **DDNAME** subcommand option.

**Syntax**

FROM/TO options:

```
FROM/(date, time)
TO/(date, time)
```

INCLUDE/EXCLUDE options:

```
DETAIL
SUMMARY
```

Chapter 5. Monitoring 2623

Subcommand options and keywords

FROM

TO

Use these options with the REPORT or FILE subcommand if you want to selectively use trace data from input data sets for activity reports or bpd files. You can specify the selection by a start date and time (FROM) or an end date and time (TO), or any meaningful combination of both. If these options are used, trace records with timestamps equal or greater, respectively less or equal, to the criteria are included.

Specify dates as mm/dd/yy, whereby mm is the month, dd the day, and yy the year. Specify times as hh/mm/ss.th, whereby hh is the hour, mm the minute, ss the second, and th the thousands of a second (two digits each).

The use of these options, aligned with appropriate data collection times and intervals, facilitates sophisticated reporting methods. For example, consider a collect task that accumulates summary data of your business' daily peak hours. Using this data as input, you can specify multiple REPORT subcommands in your batch job with different FROM and TO values to create separate summary reports for a comparison by day.

Usually, the use of this option is not required with the FILE subcommand. However, limiting the time scope of the bpd file content can make sense depending on the intended use on the client.

- For viewing performance data (described in “Viewing performance data on the client” on page 2678) or object placement optimization (described in “Optimizing object placements and initial buffer pool sizes” on page 2683) you can limit the time scope, for example, to isolate a known peak load period from the collected data. You can also segregate multiple periods from a single input data set to create several bpd files, each covering a different period, for example, to perform separate object placement optimizations. This of cause requires multiple runs of your batch job because the FILE subcommand can only be used once in a batch job. Note that both client functions do not provide means to limit the time scope; they use the entire content of the bpd file.
For long-term analyses, described in "Analyzing long-term buffer pool performance" on page 2707, you should ignore the FROM and TO options with the FILE subcommand. This function usually uses several bpd files as input and provides its own means to limit the time scope of data to be included in the analysis.

**INCLUDE**

**EXCLUDE**

Use these options with the REPORT or FILE subcommand if you want to selectively use trace data from input data sets for activity reports or bpd files. You can specify the inclusion (in the meaning of “include only these”) or exclusion (in the meaning of “use all but these”), or any meaningful combination. If these options are used, data associated with the specified identifier and value combination is included, respectively excluded.

Note that, although these options can be used with the FILE subcommand, they are of limited use and should therefore be avoided. If you are anyway using these options, for whatever reason, be aware that the content of the resulting bpd file is no longer a reliable input to the object placement and initial buffer pool sizing function.

You can use the identifiers listed in Table 212. However, two side effects should be noted:

- The absence of some identifiers affects the contents of summary reports and bpd files. To prevent missing information, ensure that these identifiers are not excluded.
- If the input data was collected with a short record format, some record header information is not present in the trace records. If you specify an identifier for which no header information is available, it will have no effect in reports or bpd files. For example, if you want to explicitly exclude records with a specific end user workstation name (identifier WSNAME), and short record format was used, those records cannot be identified because the WSNAME information is missing in the record header. Nevertheless, the presence of those identifiers do not harm.

**Table 212. Possible identifiers for the INCLUDE and EXCLUDE options of the BPACTIVITY command**

<table>
<thead>
<tr>
<th>Identifier</th>
<th>Meaning</th>
<th>Affects summaries</th>
<th>No effect with short record format</th>
</tr>
</thead>
<tbody>

<tr>
<td>WSNAME</td>
<td>End user workstation name</td>
<td></td>
<td>X</td>
</tr>
</tbody>
</table>

**LEVEL**
Use this option with the **REPORT** or **FILE** subcommand if you want to create a summary report (where detail information is not required) or to avoid detail data in a bpd (buffer pool data) file. By default, if **LEVEL** is not specified, detail information is processed, which results in a detail report, respectively detail data in a bpd file. (Provided that a data type of **Detail** was specified when the data was collected.)

If used with the **REPORT** subcommand, **LEVEL(SUMMARY)** simply determines that a summary report is to be created. **LEVEL(DETAIL)** is the default and creates a detail report.

If used with the **FILE** subcommand, **LEVEL(SUMMARY)** can considerably reduce the processing time and the file size of the resulting bpd file by eliminating detail data. However, most client-based functions that use bpd files as input require detail data. See “**Determining what to collect**” on page 2593 for further details and about which IFCIDs are included in detail and summary data. If processing time and file size are not critical, do not specify **LEVEL** and accept the default **LEVEL(DETAIL)**.

**Note:** If the **FILE** and **REPORT** subcommands are used together in the same batch job, the same **LEVEL** specification is required for both subcommands to ensure that either summary or detail data is processed with one invocation of the **BPACTIVITY** command.

The following examples are valid:

```c
/* Valid invocation. Both subcommands assume LEVEL(DETAIL) as default
BPACTIVITY
 FILE
 REPORT

/* Valid invocation, both subcommands use only summary data
BPACTIVITY
 FILE LEVEL(SUMMARY)
 REPORT LEVEL(SUMMARY)

/* Also a valid invocation because the second REPORT processes
 /* a subset of DETAIL data.
BPACTIVITY
 FILE
 REPORT LEVEL(DETAIL)
 REPORT LEVEL(SUMMARY)
```

The following examples are not valid:

```c
/* Not a valid invocation because FILE excludes detail data.
BPACTIVITY
 REPORT LEVEL(DETAIL)
 FILE LEVEL(SUMMARY)

/* Not a valid invocation because FILE excludes detail data.
BPACTIVITY
 FILE LEVEL(SUMMARY)
 REPORT LEVEL(DETAIL)
 REPORT LEVEL(SUMMARY)
```

**DDNAME**

Use this option with the **REPORT** or **FILE** subcommand if you want to specify a ddname other than the default for the output reports or bpd files. By default, reports are written to BPRPTDD, and bpd files are written to BPFILDD1. If you specify a ddname, ensure that your JCL contains a valid DD statement for this ddname. If a DD statement is not specified, it is dynamically allocated to the SYSOUT message class of the job. See “**Specifying a JCL command stream**” on page 2620 for more information.
Use this option with the `REPORT` subcommand if you want to manipulate the aggregation level and sequence of reported statistics, the sorting of the aggregation, and the threshold for a “top-n” list of an activity report.

Aggregation summarizes the trace records by specific identifiers. By default report entries are aggregated by buffer pool ID (BPID) and by a combination of database and page set (QPAGESET). Further, the topmost 11 entries are included in the activity report.

- If you want to modify the aggregation level and sequence, you can specify up to three identifiers (id1 to id3) of those listed in Table 213. The number of identifiers determines the aggregation level, and the sequence of identifiers determines the aggregation sequence. Multiple identifiers are separated by a dash (–). Note that some identifiers have no effect if the input data was collected with a short record format (where extensive IFCID header information is omitted).

Table 213. Possible aggregation identifiers for the ORDER option of the BPACTIVITY command

<table>
<thead>
<tr>
<th>Identifier</th>
<th>Meaning</th>
<th>No effect with short record format</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td>TRANSACT</td>
<td>End user transaction name</td>
<td>X</td>
</tr>
<tr>
<td>WSNABE</td>
<td>End user workstation name</td>
<td>X</td>
</tr>
</tbody>
</table>

- If you want to modify the sort sequence of the (default or specified) aggregation, use the `SORTBY` option. The sort sequence can be specified by up to two optional identifiers (of those used for the aggregation, listed in Table 213) and one mandatory sort field from those listed in Table 214. Note that the identifiers correspond to record header fields and sort fields to record data fields (containing activity counts).

Table 214. Possible sort fields for the SORTBY option of the BPACTIVITY command

</tbody>
</table>

For example, if you specify ORDER (BPID-CONNTYPE SORTBY (BPID,GETPAGE)), the statistics records are aggregated by BPID and CONNTYPE, but sorted by BPID and the number of Getpage operations.

- If you want to modify the default threshold (11) for the inclusion of statistics records in the activity report, use the TOP option and specify any number other than 11. The TOP option skips reporting for objects that have low usage rates. A value of 0 (or a very high value) includes all records in the activity report. See “The report header” on page 2631 for an example of how this setting affects the report.

**ACTIVEOBJECTS**

Specify this option with the FILE subcommand if you want only information about active objects (those with buffer pool activities) in the output data set (the bpd file). By default, if this option is not used, also information about inactive objects (those without activities during the collection time) is included in the output.

The purpose of this subcommand option is to reduce the size of the bpd file if information about inactive objects is not needed. In large installations, the percentage of objects that show no activity during the time data is collected can be high, thus creating large bpd files. Smaller files are faster to download to the client and cause shorter preprocessing times.

Note that the object placement function on the client can make use of information about inactive objects. See “Preliminary remarks about the content and filtering of input data” on page 2619 and “Step 3: Assigning objects to buffer pools” on page 2690 (the description about the Used column and the Assign objects not accessed during data collection check box).

**Interpreting activity reports**

This topic shows examples of a summary report and a detail report and describes the layout and the elements of these reports. This topic helps to understand the host reports created by Buffer Pool Analyzer.

**Related tasks:**

- Before you can interpret reports, you must have performed the tasks described in:
  - “Collecting data” on page 2607
  - “Creating activity reports and bpd files” on page 2618

**General remarks:**

1. The reported data reflects the performance for the interval for which trace data was collected and for the time frame that was specified with the GLOBAL and the BPACTIVITY command.

2. Activity reports are composed of several sections in a fixed sequence. If data for a specific section is not available, a “no data to report” statement or similar is shown. For example, if group buffer pool specific information cannot be
reported because the data was collected from a DB2 subsystem that is not a member of a data sharing group, several sections in the summary report have no data to report.

3. If a counter value or specific information in reports, in windows, or on panels is not shown, the following notation is used to indicate the reason:

**N/A** Not applicable is shown if DB2 never produces a counter value in a specific context. Examples are:
- A counter is not available in one DB2 version.
- Counters are mutually exclusive.

**N/C** Not calculated is shown for a derived field where the value cannot be calculated or is useless. Examples are:
- A divide by zero (percentages, ratios).
- Suppression of negative elapsed time values.
- Required counter values for calculation marked as N/A or N/P.
- Insufficient data or small counter values to allow significant statements (meaningless or misleading averages).

**N/P** Not present is shown for a field where DB2 can present values, but does not in this instance. Examples are:
- When counter values are not generated because of operational conditions (a trace class is not active).
- An application does not provide a value because it is optional.

Related reading: Summary reports and detail reports show several elements that can be changed by means of the DB2 ALTER BUFFERPOOL command. For details on how to change them see the IBM DB2 11 for z/OS: Command Reference.

The following topics provide additional information:
- “Preliminary remarks about the accuracy of summary and detail reports”
- “Summary reports” on page 2630
- “Detail reports” on page 2663

**Preliminary remarks about the accuracy of summary and detail reports**
Summary and detail reports show in parts identical information, for example, the number of Getpage requests during the time data was collected.

If you work with summary and detail reports that cover identical time frames, you expect that identical counters report identical numbers, but might encounter that these numbers sometimes are not equal. This topic discloses the technical causes and helps to understand the accuracies of both reports.

As described in “Collecting data” on page 2593, different data types, identified by IFCIDs, are used for summary and detail reports. Summary reports use buffer pool and data set statistics data from DB2, whereas detail reports use activity data from DB2. Both data types are continuously provided by DB2. Tools like Buffer Pool Analyzer collect this data for specified time frames that you want to analyze.

Activity data is purely event based. DB2 keeps a record of every single event. When Buffer Pool Analyzer collects activity data from DB2 for a duration or time frame specified by you, it obtains precise information about every single activity.
during that time frame. This information and the known data collection start time and end time can be used for precise totaling and calculations and results in exact numbers in detail reports.

However, statistics data is recorded by DB2 at intervals, and this interval can vary dependent on the initial system settings. When Buffer Pool Analyzer collects statistics data from DB2 for a duration or time frame specified by you, it gets hold of a number of interval recordings during that time frame. Worse, the collection start time and end time rarely perfectly match the system's interval recordings. As a result, any calculations and the numbers in summary reports are based on the time frame between the first and last interval recording that is covered by the specified start and end times. Partial intervals at the beginning and ending of the collection time remain uncovered.

Example:

|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|---
A summary report is created as a single entity; however, to facilitate reading it is shown here in separate sections, as follows:

- “The report header”
- “The Buffer Pool Statistics Highlights section”
- “The Group Buffer Pools Activity Data Highlights section” on page 2632
- “The Buffer Pool Characteristics section” on page 2632
- “The Buffer Pool Statistics section” on page 2636
- “The Data Set Statistics section” on page 2645
- “The Group Buffer Pools Activity Data section” on page 2648
- “The Group Buffer Pool Attributes section” on page 2656
- “The Buffer Manager PSET/Part P-lock Request section” on page 2658
- “The CF Cache Structure Statistics section” on page 2660

Note that the first two sections of a summary report are highlights sections. They show selected elements from “The Buffer Pool Statistics section” on page 2636 and “The Group Buffer Pools Activity Data section” on page 2648 of statistical significance, for example, when certain counter values in these sections deserve closer attention. Start your analysis and interpretation with these highlight sections.

The report header:

The report header is shown at the top of every report page and identifies the report and the command options that were used to create the report.

The following is an example of a report header:

```
1 OMEGAMON XE FOR DB2 PE (V5R4M0) - BUFFER POOL ACTIVITY REPORT PAGE: 1-1
ORDER: BPID-QPAGESET
SORTBY: BPID,ASYNCPAGE TOP: 17 LEVEL: SUMMARY
GROUP: DSNJ LOCATION: PMODSNJ DB2 VERSION: V11
MEMBER: SGGJ1 REQUESTED FROM: NOT SPECIFIED TO: NOT SPECIFIED
SUBSYSTEM: SGGJ1 INTERVAL FROM: 01/24/13 07:21:46 TO: 01/24/13 09:27:13
```

- LEVEL specifies the type of report, here, a summary report.
- ORDER specifies the aggregation, here, by buffer pool ID (BPID) and a combination of database and page set (QPAGESET).
- SORTBY specifies the sorting of the aggregated information, here, by buffer pool ID (BPID) and asynchronous page (ASYNCPAGE).
- TOP specifies that the 17 topmost aggregations are reported. If the trace data contains more than 17 objects, they are aggregated under the label Others in the report.

This example was created with the following command:

```
BPACTIVITY REPORT LEVEL(SUMMARY)
ORDER(BPID-QPAGESET SORTBY(BPID, ASYNCPAGE) TOP(17))
```

Note that the ORDER, SORTBY, and TOP options affect only the information in “The Data Set Statistics section” on page 2645.

The Buffer Pool Statistics Highlights section:

This report section shows selected elements from “The Buffer Pool Statistics section” on page 2636 that deserve further investigation. Note especially those values that are marked with asterisks; they mark counter values that should typically be zero. The content and length of this report section varies. Several
elements are always present, others only if the underlying counter values demand highlighting. If you need a detailed description of these elements, see “The Buffer Pool Statistics section” on page 2636. The elements are displayed in equal or der in both sections. The following example shows a hypothetical section, with some of the elements that can show up in your actual report.

The Group Buffer Pools Activity Data Highlights section:

This report section shows selected elements from “The Group Buffer Pools Activity Data section” on page 2648 that deserve further investigation. Note especially those values that are marked with asterisks; they mark counter values that should typically be zero. The content and length of this report section varies. Several elements are always present; others only if the underlying counter values demand highlighting. If you need a detailed description of these elements, see “The Group Buffer Pools Activity Data section” on page 2648. The elements are displayed in equal order in both sections. The following example shows a hypothetical section, with some of the elements that can show up in your actual report.

The Buffer Pool Characteristics section:

Buffer pool characteristics are attributes of individual buffer pools, such as sizes and thresholds.

They are defined during installation in the DB2 bootstrap data set. When DB2 is started, these settings apply by default. If these attributes are changed (by means
of the ALTER BUFFERPOOL command), they are stored and used until they are changed again. The buffer pool characteristics values are retrieved from IFCID 202.

---

**General — Virtual pool size**

Size of the virtual buffer pool.

**General — Page steal method**

Page stealing algorithm (PGSTEAL). When DB2 removes a page in the buffer pool to make room for a newer page, this action is called stealing the page from the buffer pool. By default, DB2 uses a Least-Recently-Used (LRU) algorithm for managing pages in storage. This means that it takes away pages that are not used so that more recently used pages can remain in the virtual buffer pool.
You can determine that DB2 uses a first-in-first-out (FIFO) algorithm. In this case, DB2 does not check how often a page is referenced. The oldest pages are always moved out, no matter how frequently they are referenced. This results in a small decrease in the cost of a Getpage operation. It can reduce internal DB2 latch contention in environments that require very high concurrency.

**VPool size min**
The minimum size of the auto-sized virtual pool. The field name is QDBPVPMI.

**VPool size max**
The maximum size of the auto-sized virtual pool. The field name is QDBPVPMA.

**Frame size**
The z/OS page frame size to back up the virtual pool buffers. The field name is QDBPFRAM.

**Thresholds — Virtual sequential**
Virtual pool sequential steal threshold (VPSEQT). This threshold is a percentage of the virtual buffer pool that might be occupied by sequentially accessed pages. The pages can be in the state updated, in use, or available. Therefore, each page might count regarding exceeding any other buffer pool threshold.

The default value for VPSEQT is 80%. You can change this value to a value from 0% to 100%.

VPSEQT is checked before stealing a buffer for a sequentially accessed page instead of accessing the page in the virtual buffer pool. If the threshold is exceeded, DB2 tries to steal a buffer that holds a sequentially accessed page rather than one that holds a randomly accessed page.

If you set VPSEQT to 0%, sequential pages cannot occupy space in the virtual buffer pool. In this case, prefetch is disabled, and sequentially accessed pages are discarded when they are released.

If you set VPSEQT to 100%, sequential pages can monopolize the entire virtual buffer pool.

**Thresholds — Deferred write**
Deferred write threshold (DWQT). This threshold is a percentage of the virtual buffer pool that might be occupied by unavailable pages, including updated pages and pages in use.

The default value for DWQT is 50%. You can change this value to any value from 0% to 90%.

DB2 checks DWQT when an update to a page is complete. If the percentage of unavailable pages in the virtual buffer pool exceeds DWQT, write operations are scheduled for up to 128 pages per data set to decrease the number of unavailable buffers to 10% below DWQT. For example, if DWQT is 50%, the number of unavailable buffers is reduced to 40%.

When the limit of DWQT is reached, the data sets containing the oldest updated pages are written asynchronously. DB2 continues to write pages until the ratio goes below the DWQT.

The number of pages is determined by the buffer pool page size as shown in Table 215 on page 2635.
Table 215. Number of changed pages based on buffer pool size

Thresholds — Vert deferred write

Vertical deferred write threshold (VDWQT). This threshold is similar to the deferred write threshold (DWQT), but it applies to the number of updated pages for one single page set in the buffer pool. If the percentage or number of updated pages for the data set exceeds the threshold, writes up to 128 pages are scheduled for that data set.

You can specify VDWQT in one of the following ways:

- As a percentage of the virtual buffer pool that might be occupied by updated pages from one single page set. The default value for this threshold is 10%. You can change the percentage to any value from 0% to 90%.
- As the total number of buffers in the virtual buffer pool that might be occupied by updated pages from one single page set. You can specify the number of buffers from 0 to 9999. If you want to use the number of buffers as your threshold, you must set the percentage threshold to 0.

Because any buffers that count for VDWQT also count for DWQT, setting the VDWQT percentage higher than DWQT has no effect: DWQT is reached first, write operations are scheduled, and VDWQT is never reached. Therefore, the ALTER BUFFERPOOL command does not allow you to set the VDWQT percentage to a value greater than DWQT. You can specify a number of buffers for VDWQT that is higher than DWQT, but this specification has no effect. The threshold is overridden by specific DB2 utilities that use a constant limit of 64 pages rather than a percentage of the virtual buffer pool size. LOAD, REORG, and RECOVER use a constant limit of 128 pages.

If you set VDWQT to zero for the percentage and number of buffers, the minimum number of pages written is the same as for DWQT.

Thresholds — Parallel sequential

Virtual buffer pool parallel sequential threshold (VPPSEQT). This threshold is a part of the virtual buffer pool that might support parallel operations. It is measured as a percentage of the sequential steal threshold (VPSEQT). Setting VPPSEQT to zero disables parallel operation.

The default value for this threshold is 50% of the sequential steal threshold (VPSEQT). You can change the default value to any value from 0% to 100%.

Thresholds — Assisting parallel seq

Virtual buffer pool assisting parallel sequential threshold (VPXPSEQT). This threshold is a part of the virtual buffer pool that might support parallel operations initiated from another DB2 in the data sharing group. It is measured as a percentage of VPPSEQT.

Setting VPXPSEQT to zero prevents DB2 from supporting Sysplex query parallelism at run time for queries that use this buffer pool.
The default value for this threshold is 0% of the parallel sequential threshold (VPSEQT). You can change the default value to any value from 0% to 100%.

**Simulated BP size**
Simulated Buffer pool size.

**Simulated BP seq thresh**
The sequential steal threshold (1-100) for the simulated buffer pool, expressed as a percentage of the total simulated buffer pool size.

**The Buffer Pool Statistics section:**

The buffer pool statistics values are retrieved from IFCID 2.

</table>

Asterisks (*) beside elements denote those elements that can show up in “The Buffer Pool Statistics Highlights section” on page 2631.
Buffers allocated *

The number of buffers that are allocated to a virtual buffer pool.

The number of buffers within each pool is always less than or equal to the corresponding value specified at installation time or when using the ALTER BUFFERPOOL command.

Reached threshold — Deferred write *

The number of times the deferred write threshold (DWTH) was reached.

This threshold is a percentage of the virtual buffer pool that unavailable pages might occupy, including both updated pages and pages in use. DB2 checks this threshold when an update to a page is completed. If the percentage of unavailable pages in the virtual buffer pool exceeds the threshold, write operations are scheduled for enough data sets (at up to 128 pages per data set) to decrease the number of unavailable buffers to 10% below the threshold.

Reached threshold — Vertical deferred write *

The number of times the vertical deferred write threshold was reached. This threshold is expressed as a percentage of the virtual buffer pool that may be occupied by updated pages from one single data set. This threshold is checked whenever an update to a page is completed. If the percentage of updated pages for the data set exceeds the threshold, writes are scheduled for that data set.

Reached threshold — Data manager *

The number of times the data manager critical threshold (DMTH-95%) was reached.

This field shows how many times a page was immediately released because the data management threshold was reached. If the threshold is constantly reached, you need to identify the objects that are monopolizing the buffer pool.

The threshold is checked before a page is read or updated. If the threshold has not been exceeded, DB2 accesses the page in the virtual buffer pool once for each page, no matter how many rows are retrieved or updated in that page. If the threshold has been exceeded, Getpage and Release requests apply to rows instead of pages. That is, when more than one row is retrieved or updated in a page, more than one Getpage and Release request is performed on that page.

The data manager threshold (DMTH) is fixed threshold, set to 95% of the virtual pool size. Reaching this threshold has a significant impact on a system's performance. Reaching this threshold for one pool can cause DB2 not to release pages in other pools as well.

Reached threshold — SLRU length equ. VPSEQT

The total number of times when length of SLRU = VPSEQT.

Current active buffer *

The total number of currently active (nonstealable) buffers. This field is an instantaneous sample of the number of buffers in the buffer pool that were updated or in use at the time this monitor data was requested. Because this field gives a snapshot value at statistics collection time, it only shows a problem if it happens at this time.

Buffer pool full *

The number of times a usable buffer cannot be located in the virtual buffer pool because the virtual buffer pool was full.
Data set opens
The number of data sets physically opened successfully. This value is cumulative from the start of the DB2 statistics interval.

Migrated data set
The number of times migrated data sets were encountered.

Recall timeout *
The number of recall timeouts.

Expansion or contraction
The number of successful virtual buffer pool expansions or contractions due to the ALTER BUFFERPOOL command. An increase in this counter indicates that buffer-pool-related system parameters have been changed.

Expansion failure
The total number of virtual buffer pool expansion failures due to the lack of virtual storage space.

Concurrent prefetch I/O
The highest number of concurrent prefetch I/O streams allocated to support a parallel I/O or CP query in this buffer pool. It reflects prefetch activities for non-work-file page sets. This number only applies to query I/O and CP parallelism.

Prefetch I/O reduction *
The total number of requested prefetch I/O streams that were denied because of a lack of buffer pool storage space.

It only applies to query I/O and CP parallelism. For example, if 100 prefetch I/O streams are requested and only 80 are granted, then 20 is added to the number in this field.

Parallel query request
The total number of requests made for parallel query support in this buffer pool. This field only applies to non-work-file page sets in query I/O and CP parallelism.

Parallel query request — Reduced *
The number of times that DB2 cannot allocate the requested number of buffer pages to allow a parallel group to run as planned. This field only applies to non-work-file page sets in query I/O and CP parallelism.

Pref quantity reduced — Reduced to 1/2 *
The total number of times prefetch quantity is reduced from normal to 50% of normal. The normal size depends on the page size of the buffer pool. This field only applies to query I/O and CP parallelism.

Pref quantity reduced — Reduced to 1/4 *
The total number of times prefetch quantity is reduced from 50% to 25% of normal. The normal size depends on the page size of the buffer pool. This field only applies to query I/O and CP parallelism.

Min buffers on SLRU
The minimum number of buffers on SLRU, low water mark within an interval.

Max buffers on SLRU
The maximum number of buffers on SLRU, high water mark within an interval.
Random getpage SLRU hits
The total number of times that the random Getpage request has a buffer hit and the buffer is on the least-recently-used (SLRU) chain.

Pages added to LPL
The number of times that one or more pages were added to the logical page list (LPL). The field name is QBSTLPL.

System hit ratio *
The number of Getpage requests by DB2 and satisfied by the buffer pool, expressed as a percentage of all Getpage requests.

This shows the percentage of pages that are found in the buffer pool without doing any type of I/O.

The system hit ratio is affected by prefetch I/O. The value is usually lower in an application that causes mostly sequential accesses, respectively higher if a series of similar operations are performed on the same data.

A negative system hit ratio indicates that the number of prefetched pages is greater than the number of Getpages. This happens if prefetch operations are bringing in pages that are not subsequently referenced. The reason for this is that the query stops before it reaches the end of the prefetched pages, or that the prefetched pages are stolen by DB2 for reuse before the query can access them. Consider increasing the sequential steal threshold (VPSEQT), increasing the buffer pool size, or revising the assignments of page sets to buffer pools.

Compare the value in this field with the application hit ratio to determine the efficiency of prefetch operations.

Application hit ratio *
The number of Getpage requests issued by applications and satisfied by the buffer pool, expressed as a percentage of all Getpage requests issued by applications.

A low hit ratio indicates the level of synchronous I/O because prefetched pages that are already in the buffer pool count as hits. The value is a relative value depending on the type of application. For example, an application that browses large amounts of noncontinuous data might have a buffer pool hit ratio of 0. Check those cases in which the hit ratio drops significantly for the same application.

Getpage request *
This counter is incremented for:
  • Each successful or unsuccessful page request, where the query is not processed in parallel.
  • Each successful page request, where the query is processed in parallel.

Unsuccessful page requests for queries processed in parallel are reported in the Unsuccessful Page Requests field.

Getpage request — Sequential
The number of Getpage requests issued by sequential access requesters.

Getpage request — Overflow sequential
The number of sequential GETPAGE requests using overflowed buffers (QBSTASGE).

Getpage request — Random
The number of random Getpage requests.
Getpage request — Overflow random
The number of non-sequential GETPAGE requests using overflowed buffers (QBSTAGET).

Getpage request — Unsuccessful
The number of times a conditional GETPAGE request could not be satisfied for this buffer pool during the specified time interval. This counter is used only when queries are processed in parallel. If the value is close to zero, most pages are already prefetched into the buffer pool and wait time for synchronous I/O is small. The field name is QBSTNGT.

Getpage request — Unsucc seq getpages
The total number of sequential getpage requests, which failed because the page was not in the buffer pool.

Read — Synchronous read
The number of synchronous read I/O operations performed by DB2 for applications and utilities.

Read — Synchronous read — Sequential *
The number of synchronous read I/O requests issued by sequential access requesters.

Read — Synchronous read — Overflow sequential
The number of synchronous read I/O operations for sequential GETPAGE requests using overflowed buffers (QBSTASSE).

Read — Synchronous read — Random
The number of random synchronous read I/O requests.

Read — Synchronous read — Overflow random
The number of synchronous read I/O operations for non-sequential GETPAGE requests using overflowed buffers (QBSTASYN).

Read — Sequential prefetch — Request
The number of sequential prefetch requests. This counter is incremented for each prefetch request (which can result in an I/O read). If it results in an I/O read, up to 32 pages may be read for SQL, and up to 64 pages for utilities. A request does not result in an I/O read if all pages to be prefetched are already in the buffer pool.

Sequential detection is not included in this counter but is separately recorded in the Dynamic Prefetch - Requested field.

Read — Sequential prefetch — Read
The number of asynchronous read I/O operations due to normal sequential prefetch (applications and utilities).

Read — Sequential prefetch — Pages read
The total number of pages read due to a normal sequential prefetch. A sequential prefetch request does not result in a read I/O if all the required pages are found in the buffer pool.

Read — Sequential prefetch — Pages read/read
The number of sequential prefetch pages read per sequential prefetch read I/O operation.

Read — List Prefetch — Request
The number of list sequential prefetch requests.

List sequential prefetch allows DB2 to access data pages efficiently even when the required data pages are not contiguous. It allows CP and I/O operations to be overlapped.
Read — List Prefetch — Read
The number of asynchronous read I/O operations caused by the list sequential prefetch.

The number of pages read is recorded in the List Prefetch Pages Read field.

Read — List Prefetch — Pages read
The number of pages read due to a list prefetch. A list sequential prefetch request does not result in a read I/O if all the required pages are found in the buffer pool.

Read — List Prefetch — Pages read/read
The number of list prefetch pages read per list prefetch read I/O.

Read — Dynamic Prefetch — Request
The number of dynamic prefetch requests. Dynamic prefetch is the process that is triggered because of sequential detection. If the prefetch request results in an I/O read, up to 32 advancing pages may be read at a time.

Read — Dynamic Prefetch — Read
The number of asynchronous read I/Os because of dynamic prefetch. The number of pages read is recorded in the Dynamic Prefetch Pages Read field.

Read — Dynamic Prefetch — Pages read
The number of pages read because of dynamic prefetch. Dynamic prefetch is the process that is triggered because of sequential detection.

Read — Dynamic Prefetch — Pages read/read
The number of dynamic prefetch pages read per dynamic prefetch read I/O.

Read — Prefetch disabled — No buffer *
The total number of times sequential prefetch was disabled or canceled because buffers were not available. This is the number of times the sequential prefetch threshold (SPTH) is reached. Ideally, this value should be 0. If the threshold is constantly reached, you need to identify the objects that are monopolizing the buffer pool.

The sequential prefetch threshold (SPTH) is a fixed threshold, set to 90% of the virtual pool size, that is compared prior to a sequential prefetch. If the threshold is reached, the prefetch is disabled.

Read — Prefetch disabled — No read engine *
The total number of times a sequential prefetch is disabled because of an unavailable read engine.

Read — Page-ins required *
The number of page-ins required for a read I/O.

If the number of Page-ins required is roughly approximately 5% of the total number of Getpage requests, the paging activity is at an acceptable rate. A rate near zero might indicate that the buffer pool is oversized.

Write — Buffer updates
The number of times buffer updates were requested against pages in the buffer pool.

Write — Page write
The number of pages in the buffer pool written to a hard disk drive.
Write — Updates/page write
The number of buffer update requests, divided by the number of pages written from the buffer pool to a hard disk drive.

The ratio of BUFFER UPDATES to PAGES WRITTEN suggests a high level of efficiency as the ratio increases, because more updates are being externalized per physical write. For example, if there are 10 updates on the same page before it is externalized, then the ratio is 10:1 or 10. If all 10 updates are on 10 distinct pages, then the ratio is 10:10 or 1.

Write — Synchronous write
The total number of immediate writes.

Immediate writes occur when:
• An immediate write threshold is reached
• No deferred write engines are available
• More than two checkpoints pass without a page being written

Immediate writes are a type of synchronous write, but not the only one. Sometimes DB2 uses synchronous writes even when the immediate write threshold (IWTH) is not exceeded, for example when more than two checkpoints pass without a page being written. This type of situation does not indicate a buffer shortage.

The immediate write threshold (IWTH) is a fixed threshold, set to 97.5% of the virtual pool size, that is checked whenever a page needs to be updated. If the threshold is reached, writes are synchronous. Then, the application cannot proceed until the write operation has completed.

Write — Asynchronous write
The number of asynchronous write I/O operations performed by media manager to a direct access storage device.

Write — Pages/write req
The number of pages written from the buffer pool to a hard disk drive per synchronous or asynchronous write I/O. This count does not include preformatting I/O, such as I/O needed to prepare a data set for use.

Write — Page-ins required *
The number of page-ins required for a write I/O.

This counter is incremented each time the media manager does not find a page in central storage. This counter does not differentiate between expanded storage and page data sets.

Merge — Pass requested
The total number of merge passes for DB2 sort activities. This value reflects how many merge passes were requested for DB2 to determine the number of work files permitted to support each merge pass.

Merge — Pass degraded low buffer *
The number of times that a merge pass was not efficiently performed due to a shortage of space in the buffer pool. The number in this field is incremented for each merge pass where the maximum number of work files allowed is less than the number of work files requested.

Workfile — Max concurrent used
The maximum number of work files concurrently used during merge processing within this statistics period.

Ideally, each work file needs 16 buffers to allow DB2 to perform a sequential prefetch for work files.
Workfile — Req rejected low buffer *
The total number of work files that were rejected during all merge passes because of insufficient buffer resources.

Workfile — Req all merge passes
The total number of work files requested for all merge passes.
This field and the merge passes requested field can be used to determine the average number of work files requested in one single merge pass.
For DB2 to perform an efficient prefetch for work files, each work file should have at least 16 dedicated buffers. Work files used during sort phase processing or other non-sort-related processing are not included in this number.

Workfile — Not created no buffer *
Only applicable if DB2 is running under MVS/XA. The number of times a work file cannot be created due to insufficient buffer resources. It indicates that a sort is in progress and limited in regard to the number of work files it can use.

Workfile — Prefetch not scheduled *
The number of times a sequential prefetch was not scheduled for a work file because the dynamic prefetch quantity is zero.

Workfile — Pages to destruct
The number of pages for which a destructive read was requested.

Workfile — Pages not written
The number of pages removed from the data set deferred write queue for destructive Read requests.

Unlock castout
The number of times DB2 issued an unlock request to the coupling facility for completed castout I/Os.

Unlock castout — I/O operations
Unlock castout — Pages written

Simulated BP Activity — Current pages in use
The total number of pages currently in the simulated buffer pool.

Simulated BP Activity — Max pages in use
The highest number of pages in the simulated buffer pool.

Simulated BP Activity — Current seq pages in use
The total number of sequential pages in the simulated buffer pool.

Simulated BP Activity — Max seq pages in use
The highest number of sequential pages in the simulated buffer pool.

Simulated BP Activity — Avoidable read I/O
Sync read I/O (R)
The total number of pages found in the simulated buffer pool for a random request that resulted in a synchronous read I/O.

Sync read I/O (S)
The total number of pages found in the simulated buffer pool for a sequential request that resulted in a synchronous read I/O.

Async read I/O
The total number of pages found in the simulated buffer pool for a prefetch request that resulted in an asynchronous read I/O.
Sync GBP reads (R)
The total number of pages found in the simulated buffer pool for a random request that resulted in a synchronous GBP read.

Sync GBP reads (S)
The total number of pages found in the simulated buffer pool for a sequential request that resulted in a synchronous GBP read.

ASync GBP reads
The total number of pages found in the simulated buffer pool for a prefetch request that resulted in an asynchronous GBP read.

Pages moved into sim BP
The total number of pages logically moved into the simulated buffer pool.

Total avoidable - sync I/O delay (msec)
The total time in milliseconds waiting for synchronous read I/O for pages found in the simulated buffer pool.

The Data Set Statistics section:

The data set statistics values are retrieved from IFCID 199.

********** TOTAL **********
BPID BPO BP32K BP8K4 BP16K4

Synchronous — Request
Number of synchronous I/Os in the reported interval for the page set.

Synchronous — Avg delay ms
Average synchronous I/O delay for pages in the page set, in milliseconds.

Synchronous — Max delay ms
Maximum synchronous I/O delay for pages in the page set, in milliseconds.

Synchronous — Tot delay sec
Total accumulated synchronous I/O delay for pages in the page set, in seconds.

Asynchronous — Request
Number of asynchronous I/Os for the page set in the reported interval.
Asynchronous — Page
Number of page set pages read or written asynchronously in the reported interval.

Asynchronous — Avg delay ms
Average asynchronous I/O delay for pages in the page set, in milliseconds.

Asynchronous — Max delay ms
Maximum asynchronous I/O delay for pages in the page set, in milliseconds.

Asynchronous — Tot delay ms
Total accumulated asynchronous I/O delay for pages in the page set, in seconds.

VP current
Number of page set pages in the virtual buffer pool.

VP current— Avg pages
Average number of page set pages in the virtual buffer pool per IFCID 199 interval.

VP current— Max pages
Maximum number of page set pages in the virtual buffer pool per IFCID 199 interval.

VP changed
Number of changed page set pages in the virtual buffer pool.

VP changed— Avg pages
Average number of changed page set pages in the virtual buffer pool per IFCID 199 interval.

VP changed — Max pages
Maximum number of changed page set pages in the virtual buffer pool per IFCID 199 interval.

The Group Buffer Pools Activity Data section:

This report section shows group buffer pool activity data, which is retrieved from IFCID 2 (DB2 statistics — Group Buffer Pool Activity data).

Asterisks (*) beside elements denote those elements that can show up in "The Group Buffer Pools Activity Data Highlights section" on page 2632.

Group BP Hit Ratio (%) *

The group buffer pool hit ratio, expressed as a percentage. This is the percentage of pages successfully retrieved from the group buffer pool to those retrieved from a hard disk drive. Derived from the DB2 field SGBPHITP.

Calculated as:
\[
\frac{(qbglxd + qbglmd + qbglad + qbglay + qbglaz)}{(qbglxr + qbglmr + qbglar)} \times 100
\]

GBP-Dependent Getpages

The number of Getpage requests made for GBP-dependent objects. Derived from the DB2 field QBGLGG.

Syn.Read(XI)-Data returned

The number of requests made to read a page from the group buffer pool because the page was invalidated in the member's buffer pool. The member found the required page in the group buffer pool. Derived from the DB2 field QBGLXD.
When you increase the size of the group buffer pool, the number of pages returned from the GBP can increase. Conversely, decreasing the size of the GBP can cause DB2 to return fewer pages because the GBP cannot hold pages long enough to allow them to be retrieved again.

**Syn.Read(XI)-No data return**
The number of requests to read a page from the group buffer pool that were required because the page was invalidated in the member's buffer pool. The member did not find the data in the group buffer pool and had to retrieve the page from a hard disk drive. Derived from the DB2 field SBGLXR.

Normally, when the page in a member's buffer is cross-invalidated, the buffer is refreshed from the group buffer pool. In this instance, the requested page was not found in the group buffer pool though the page set is still GBP-dependent. The page has been removed from the group buffer pool for one of two reasons:

- Shortage of data pages and consequent reclamation of this page
- Shortage of directory entries and consequent removal of the page together with cross-invalidation (XI) of that page in the local buffer pools of all members using that page

If the value in this field is high, you may want to tune the group buffer pool (GBP). Depending on the reason, increase the number of GBP data pages, increase the size of the directory entry space, or increase both the number of GBP data pages and the space for directory entries. Oversizing the group buffer pool can cause unnecessary GBP checkpoint overhead.

**Syn.Read(NF)-Data returned**
The number of requests made to read a page from the group buffer pool because the page was not in the member's buffer pool (NF = page not found). The member found the page in the group buffer pool. Derived from the DB2 field QBGLMD.

The requesting member needs a page from a table space or index space that is GBP-dependent or has GBPCACHE ALL defined. To get that page, the group buffer pool is checked before the page set on a hard disk drive.

If the group buffer pool is used to cache both clean and changed pages (GBPCACHE ALL is used for all data), you can try to get more pages returned from the group buffer pool by increasing the size of the group buffer pool. Do not tune the GBP based on this counter if it is used for caching changed pages only (GBPCACHE CHANGED).

**Syn.Read(NF)-No data return**
The number of requests made to read a page from the group buffer pool because the page was not in the member's buffer pool (NF = page not found). The member did not find the required data in the group buffer pool and had to retrieve the page from a hard disk drive. Derived from the DB2 field SBGLMR.

The requesting member needs a page from a table space or index space that is GBP-dependent or has GBPCACHE ALL defined. To get that page, the group buffer pool is checked before the page set on a hard disk drive.

You can compare the value in this counter with the number of pages that were returned from the group buffer pool, see “Sync.Read (Not Found) - Data Returned”. If the group buffer pool is used to cache both clean and changed pages (GBPCACHE ALL is used for all data), you can try to get more pages returned from the group buffer pool by increasing the size of...
the group buffer pool. Do not tune the GBP based on this counter if it is used for caching changed pages only (GBPCACHE CHANGED).

**Pages written using write-around**
The total number of pages in write around. This means the pages written by DB2 to DASD directly from the local buffer pools thus eliminating page placement to GBP and associated overhead. Derived from the DB2 field QBGLWA.

**Clean pages sync. written**
The number of clean pages that were synchronously written to the group buffer pool from the virtual pool. Derived from the DB2 field QBGLWC.

Only GBPCACHE ALL causes clean (unchanged) pages to be written to the coupling facility. The pages are written to the coupling facility even when the page set is not GBP-dependent. When group buffer pool caching works effectively for prefetch, the value in this field should be much smaller than the value in “Synchronous Read (Not Found) - Data Returned”.

**Changed pgs.sync. written**
The number of changed pages written synchronously to the group buffer pool. Pages are written with Write and Register (WAR) requests or Write and Register Multiple (WARM) requests. At commit time changed pages are forced from the member’s virtual buffer pool to the coupling facility. For duplexed GBPs the counter values reflect writes to both primary and secondary group buffer pools. Derived from the DB2 field QBGLSW.

In data sharing, changed pages must have been written to the group buffer pool by the time a transaction commits. The pages are written either synchronously (force at commit) or asynchronously, for example, when a local buffer pool threshold is reached or at a member’s checkpoint. The number of pages that have to be forced out synchronously (in “burst mode”) at commit time can be reduced if asynchronous writes are triggered more frequently.

You can use the vertical deferred write threshold (VDWQT) to reduce the number of pages that have to be forced out synchronously and to increase the number of pages that are asynchronously written before the transaction commits. For GBP-dependent page sets, writes triggered by the vertical deferred write threshold go to the coupling facility. You can cause changed pages to be written out quicker and in smaller increments, by reducing the vertical deferred write threshold (VDWQT).

**Clean pages async. written**
Not applicable for versions later than DB2 Version 7. The number of clean pages that were asynchronously written to the group buffer pool from the virtual pool. Derived from the DB2 field QBGLAC.

Only GBPCACHE ALL causes clean (unchanged) pages to be written to the group coupling facility. In this instance pages are written even when the page set is not GBP-dependent. Asynchronous write is done under prefetch processing.

When group buffer pool caching works effectively for prefetch, the value in this field should be much smaller than the combined values in
- “Synchronous Read (Not Found) - Data Returned”
- “Asynchronous Reads - Data Returned” and
- “Clean pages - Read after Register Page List (RPL)”

**Changed pages async. written**
The number of changed pages written asynchronously to the group buffer.
Pages are written in response to Write and Register (WAR) and Write and Register Multiple (WARM) requests. Changed pages can be written from the member's virtual buffer pool to the group coupling facility before the application commits. This happens when, for example, a local buffer pool threshold is reached, or when P-lock negotiation forces the pages on the vertical deferred write queue to be written to the group buffer pool. For duplexed GBPs the counter values reflect writes to both primary and secondary group buffer pools. Derived from the DB2 field QBGLAW.

In data sharing, changed pages must have been written to the group buffer pool before a transaction commits. The pages are written either synchronously during commit processing or asynchronously before the transaction commits when, for example, a local buffer pool threshold is reached or at a member's checkpoint. See Changed Pages - Written Synchronously for the number of changed pages synchronously written to the group buffer pool.

The vertical deferred write threshold (VDWQT) can be used to reduce the number of pages that have to be forced out synchronously and to increase the number of pages that are asynchronously written before the transaction commits. For GBP-dependent page sets, writes triggered by the vertical deferred write threshold go to the coupling facility. If you want changed pages to be written out quicker and in smaller increments, you can lower the vertical deferred write threshold (VDWQT).

Reg.Page List (RPL) request

The number of Register Page List (RPL) requests made by prefetch. The group buffer pool must be allocated in a group coupling facility with CFLEVEL=2 or higher. Derived from the DB2 field QBGLAX.

Performance might be improved by enabling RPL.

Clean pages read after RPL

Not applicable for versions later than DB2 Version 7. The number of coupling facility reads performed by prefetch to retrieve a clean page from the group buffer pool. Derived from the DB2 field QBGLAZ.

Castout class threshold

The number of times group buffer pool castout was initiated because the group buffer pool class castout threshold was detected. Derived from the DB2 field QBGLCT.

The class castout threshold is one of two group buffer pool thresholds. In most cases the default value for the class threshold (10 percent) is a good choice. Depending on your workload, altering this value can reduce hard disk drive contention during castout.

Group BP castout threshold

The number of times a group buffer pool castout was initiated because the group buffer pool castout threshold was detected. Derived from the DB2 field QBGLGT.

The GBP castout threshold, together with the GBP class castout threshold and the length of the GBP checkpoint interval determine the castout characteristics of the group buffer pool.

You can consider this threshold a safety margin to protect the group buffer pool from being accidentally flooded by overactive applications.
In most situations, the default value for the group buffer pool castout threshold of 50 percent is a good choice. Use the ALTER GROUPBUFFERPOOL command to tune the group buffer pool thresholds.

**Pages castout**

The number of data pages that were cast out of the member's group buffer pool. Castout to a page set or partition is done by the castout owner of the page set or partition. This is normally the DB2 subsystem that had the first update intent on the page set or partition. Derived from the DB2 field QBGLRC.

The number of pages written per I/O is normally close to the value of this field divided by the value in “Unlock castout”. For example, if an average of four pages is written per castout write I/O, the number of pages cast out should be four times the number in this field.

Because DB2 usually includes more than one page in the request to write pages to a hard disk drive, the number in this field should always be significantly more than “Unlock castout”. If it is not (for example, when “Unlock castout” is more than half of “Pages castout”), the castout write I/O is inefficient; probably because you have random update patterns on the DB2 data or a low castout threshold.

**Unlock castout**

The number of times DB2 issued an unlock request to the coupling facility for completed castout I/Os. When pages are cast out to a hard disk drive, they are locked for castout in the coupling facility. This castout lock is not an IRLM lock; it is to ensure that only one system can cast out a given page at a time. Derived from the DB2 field QBGLUN.

The number of pages written per I/O is normally close to the value of “Pages castout” divided by the value of this field. For example, if an average of four pages is written per castout write I/O, the number of pages cast out should be four times the value in this field.

Because DB2 usually includes more than one page in a write request, the number in this field should always be significantly less than “Pages castout”. If it is not (for example, when “Unlock castout” is more than half of “Pages castout”), the castout write I/O is inefficient; possibly because you have random update patterns on the DB2 data or a low castout threshold.

**Read castout class**

The number of requests made to the group buffer pool to determine which pages, from a particular page set or partition, must be cast out because they are cached as changed pages. Derived from the DB2 field QBGLLCC.

This request is issued either by the page set or partition castout owner, or, when the group buffer pool castout threshold is reached, by the group buffer pool structure owner.

**Read castout statistics**

The number of requests issued by the group buffer pool structure owner to determine which castout classes have changed pages. Derived from the DB2 field QBGLCS.

This request is made by the group buffer pool structure owner when the group buffer pool threshold is reached. Normally, you would expect only one or two requests each time the group buffer pool threshold is reached.
RFCOM requests
The number of Read For Castout Multiple (RFCOM) requests. Derived from the DB2 field QBGLCM.

RFCO requests
The number of Read For Castout (RFCO) requests. One page read per request. Derived from the DB2 field QBGLCR.

Read directory info
The number of requests issued by the group buffer pool structure owner to read the directory entries of all changed pages in the group buffer pool. This request is issued at group buffer pool checkpoints to record the oldest recovery log record sequence number (LRSN). It is used as a basis for recovery if the group buffer pool fails. Such requests might have to be issued several times for each group buffer pool checkpoint to read the directory entries for all changed pages. Derived from the DB2 field QBGLRD.

If the value of this counter seems to be abnormally high, consider upgrading the coupling facility to CFLEVEL=2 or higher to raise the number of directory entries that can be read with one request. You can also increase the group buffer pool checkpoint interval, but this can lengthen the recovery for the group buffer pool.

Read storage statistics
The number of times DB2 requested statistics information from the group buffer pool. It is issued by the group buffer pool structure owner at timed intervals to determine whether the group buffer pool castout threshold (GBPPOOLT) has been reached. Derived from the DB2 field QBGLOS.

WAR requests
The number of Write and Register (WAR) requests. Derived from the DB2 field QBGLWS.

WARM requests
The number of Write and Register Multiple (WARM) requests. Derived from the DB2 field QBGLWM.

Pages written via WARM
Not applicable to DB2 Version 7 and earlier. (With DB2 Version 8, the group coupling facility allows multiple pages to be written and registered with a single write request.) The number of pages written using Write and Register Multiple (WARM) requests. Derived from the DB2 field QBGLWP.

Register page
The number of times DB2 registered interest in a single page. These are "register-only" requests, which means that DB2 is not requesting any data back from the request. This request is made only to create a directory entry for the page to be used for cross-invalidation when the page set or partition P-lock is downgraded from S to IS mode, or from SIX to IX mode. Derived from the DB2 field QBGLRG.

Unregister Page
The number of times DB2 unregistered interest for a single page. This happens when DB2 steals pages from the member's buffer pool that belong to GBP-dependent page sets or partitions. Derived from the DB2 field QBGLDG.

A large value here indicates that the local buffer pool contains a mixture of GBP-dependent data and non-GBP-dependent data.
The page stolen from the local buffer pool is replaced by a new one. This counter makes a distinction on whether the new page depends on the group buffer pool or not.

Usually a page of a GBP-dependent page set or partition is replaced by a page that is also GBP-dependent. In this instance, the unregister request for the page being stolen is combined with the read and register request for the new page. These combined requests do not contribute to this counter.

If, however, a page of a GBP-dependent page set or partition is replaced by a page that is not GBP-dependent, then only an unregister request is sent to the coupling facility. These separate requests are counted here.

Delete name
The number of requests made by DB2 to delete directory and data entries associated with a particular page set or partition from the group buffer pool. DB2 issues this request when it changes a page set or partition from GBP-dependent to non-GBP-dependent. DB2 also issues this request for objects that are defined with GBPCACHE ALL when those objects are first opened. Derived from the DB2 field QBGLDN.

This counter is a measure of how often page sets or partitions change between being and not being dependent on the group buffer pool. You can prevent DB2 going in and out of GBP-dependency too often by tuning the following subsystem parameters that affect when data sets are switched to a different state:

**PCLOSEN**
Pseudoclose frequency. The number of checkpoints required before a data set that was not updated can be a pseudoclose candidate.

If the PCLOSEN condition is met, the page set or partition is converted from read-write to read-only state. Depending on other concurrent users, this could raise the chance for the page set or partition to go out of GBP-dependency.

**PCLOSESET**
Pseudoclose time. The amount of time (in minutes) that must elapse before a data set can be a pseudoclose candidate.

If the PCLOSEN or PCLOSESET condition is met, the page set or partition is converted from read-write to read-only state. Depending on other concurrent users, this could raise the chance for the page set or partition to go out of GBP-dependency.

**LOGLOAD**
The number of log records that DB2 writes between successive checkpoints.

These parameters are specified in the CHECKPOINT FREQ field in panel DSNTIPN.

**Asynch. GBP requests**
The number of IXLCACHE invocations for the primary group buffer pool. Derived from the DB2 field QBGLHS.

**Explicit X-invalidations**
The number of times an explicit coupling facility cross-invalidation request was issued. Derived from the DB2 field QBGLEX.
GBP checkpoints triggered
The number of group buffer pool checkpoints triggered by this member. Derived from the DB2 field QBGLCK.

The value of this counter depends on the length of the group buffer pool checkpoint interval.

Write failed-no storage *
The number of coupling facility write requests that could not complete due to a lack of coupling facility storage resources. Derived from the DB2 field QBGLWF.

A value greater than zero indicates that the data page resources of the coupling facility are being consumed faster than the DB2 castout processes can free them.

On write failure, the affected DB2 member initiates castout and retries several times, and finally, if it is a changed page, it will be added to the logical page list (LPL) requiring recovery.

On write failure, the affected DB2 member initiates castout and retries several times, and finally, if it is a changed page, it will be added to the logical page list (LPL) requiring recovery. If the problem is not simply due to a momentary surge in activity, you need either to decrease the group buffer pool castout thresholds, or to increase the number of data entries in the group buffer pool. To increase the number of data entries, you can:

- Increase the total size of the group buffer pool
- Adjust the ratio of directory entries to data entries in favor of data entries

Write to secondary GBP failed *
The number of coupling facility requests to write changed pages to the secondary group buffer pool for duplexing that failed because of a lack of storage in the coupling facility. Derived from the DB2 field QBGL2F.

Delete name list secondary GBP
The number of DELETE NAME LIST requests to delete pages from the secondary group buffer pool that have just been cast out from the primary. Derived from the DB2 field QBGL2D.

Delete name from secondary GBP
The number of group buffer pool requests to delete a page from the secondary group buffer pool. These requests are issued by the group buffer pool structure owner to delete orphaned data entries in the secondary GBP as part of the garbage collection logic. Derived from the DB2 field QBGL2N.

Read castout statistics secondary GBP
The number of coupling facility requests to read the castout statistics for the secondary group buffer pool. These requests are issued by the group buffer pool structure owner to check for orphaned data entries in the secondary group buffer pool. Derived from the DB2 field QBGL2R.

Asynch. secondary GBP requests
The number of asynchronous IXLCACHE invocations for the secondary group buffer pool. Derived from the DB2 field QBGL2H.

The Group Buffer Pool Attributes section:

This report section shows group buffer pool attributes, which are retrieved from IFCID 230.

### Allocated GBP size (4K)
The allocated size of the group buffer pool in 4 KB blocks. Derived from the DB2 field QBGBGSZ.

### Current dir. to data ratio
The current directory entry per data entry ratio. Derived from the DB2 field QBGBGR1.

### Class castout thresh. (%)
The threshold at which class castout is to be initiated. It is expressed as a percentage of the group buffer pool size. Derived from the DB2 field QBGBGCT.

If the GBP castout thresholds are not set correctly, castout processing is not kept in pace with the changed pages written to the CF (coupling facility). You can either use the ALTER GROUPBUFFERPOOL command to reduce the castout thresholds, or increase the number of GBP data pages by increasing the GBP size or by reducing the GBP RATIO.

### Class castout thresh. (#)
Class level castout threshold (buffer num). Derived from the DB2 field QBGBGCTN.

### Actual nbr. of dir. ents
The actual number of allocated directory entries. Derived from the DB2 field QBGBGR2.

### Pending dir. to data ratio
The pending directory entry per data entry ratio. Derived from the DB2 field QBGBGR2.

### GBP castout thresh. (%)
The threshold at which castout is to be initiated for the group buffer pool. It is expressed as a percentage of the size of the group buffer pool. Derived from the DB2 field QBGBGCT.
Actual nbr. of data entrs
The actual number of allocated data entries. Derived from the DB2 field QBGBGDT.

Checkpoint interval (min)
The time interval (in minutes) between successive group buffer pool checkpoints. Derived from the DB2 field QBGBGCK.

Autorec
A flag indicating how the AUTOREC option of the ALTER GROUPBUFFERPOOL command has been set. It specifies whether automatic recovery takes place in case of a structure failure or loss of connectivity of all members of the group buffer pool. Derived from the DB2 field QBGBGAS.

Directory-entry-reclaim
The number of times that a page name assignment required that a coupling facility directory entry be reclaimed (stolen). Derived from the DB2 field QBGBDRR.

Data-entry-reclaim
The number of times that a page name assignment required that a coupling facility data entry be reclaimed (stolen). Derived from the DB2 field QBGBDTR.

GBP cache
Caching attribute. Possible values are:
- YES: The GBP is used for both data caching and cross-invalidation.
- NO: The GBP is used only for cross-invalidation.

Total changed
The number of allocated data entries that are currently in “changed” state. This is a snapshot value and is not cumulative. Derived from the DB2 field QBGBTCC.

XI-dir.-entry-reclaim
The number of times that a directory entry was stolen and one or more XI signals had to be sent because the page in the directory was cached in one or more DB2 buffer pools. Derived from the DB2 field QBGBRXI.

Mode
Possible values are:
- DUPLEX
- SIMPLEX

Derived from the DB2 field QBGBDUP.

Secondary-GBP — Alloc. GBP size (4K)
When MODE is DUPLEX, the allocated size of the secondary group buffer pool. Derived from the DB2 field QBGBGSZ2.

Secondary-GBP — Directories entries
When MODE is DUPLEX, the number of allocated directory entries in the secondary group buffer pool. Derived from the DB2 field QBGBGDR2.

Secondary-GBP — Data entries
When MODE is DUPLEX, the number of allocated data entries in the secondary group buffer pool. Derived from the DB2 field QBGBGDT2.

The Buffer Manager PSET/Part P-lock Request section:
This section of the report provides information about physical lock (P-lock) activities in group buffer pools.
The DB2 Buffer Manager uses the P-lock mechanism to manage, negotiate, and resolve inter-DB2 R/W interests on a page set or partition level, that is, when programs running on different data sharing group members request incompatible locks on the same resource. The activity counter values are retrieved from IFCID 251.

<table>

</tbody>
</table>

IRLM func mode

The number of requests to the data sharing group member's Internal Resource Lock Manager (IRLM) by lock type for an object. Note that an object is identified by BPID (buffer pool ID), PSTYPE (object type), QPAGESET (combination of database and page set), and partition number. Derived from the DB2 field QW0251IF.

- Lock requests
- Unlock requests
- Change requests by a member holding the lock because of a change of interest
- Change P-lock (short for Change from P-lock Exit) requests by another member causing the P-lock exit of this member

New held state

The number of new held P-lock states (the inter-DB2 interest level) determined for an object. Derived from the DB2 field QW0251NS.

Chapter 5. Monitoring
- **IS (Intent Shared):** This DB2 has R/O interest in the object and one or more other DB2 members have R/W interest.
- **IX (Intent Exclusive):** This DB2 has R/W interest in the object and one or more other DB2 members have R/W interest.
- **S (Shared):** This DB2 has R/O interest in the object and no other DB2 member has R/W interest.
- **SIX (Shared Intent Exclusive):** This DB2 has R/W interest in the object and one or more other DB2 members have R/O interest.
- **NSU (Non-Shared Update):** Acts like an X lock, but is only used during P-lock negotiation from an X to an SIX.
- **X (eXclusive):** This DB2 has R/W interest in the object. No other DB2 member has declared interest.
- **denied:** A request was denied; the object had Change P-lock active.

Normally, DB2 holds the P-lock in the cached state (see later in this list). In some special or abnormal cases, the P-lock will not be held in the cached state. It is the actual held state of the P-lock that determines whether the object is GBP-depended. If the held state is S or X, the object is not GBP-depended. Otherwise, the object is GBP-depended.

**Confl. member**
The number of conflicts determined by the IRLM for an object. (IRLM function code of Change From P-lock Exit active). Derived from the DB2 field QW0251DB.

**New cach. state**
The number of cached P-lock states (the inter-DB2 interest level) determined for an object. Derived from the DB2 field QW0251NC. See also

**New held state.**
- IS
- IX
- S
- SIX
- NSU
- X
- denied

**Request type**
The number of P-lock requests by request type for an object. Derived from the DB2 field QW0251F1.
- **Condition:** Conditional request.
- **Restart:** Restart lock request. Locks retained by a DB2 system are changed from retained to active.
- **Modify:** Modify lock request.

**The CF Cache Structure Statistics section:**
This report section shows coupling facility cache structure statistics, which are retrieved from IFCID 254.

The statistics break out the major activity details of the cache structure. A cache structure is a storage area that is used as group buffer pool for a DB2 data sharing group.
Explicit XI counter
The number of times a request was made to the group coupling facility to explicitly cross-invalidate a page and a number of XI signals were sent because the page was cached in one or more DB2 buffer pools. Derived from the DB2 field QW0254CI.

Read hit
The number of coupling facility read requests in which data was returned. Derived from the DB2 field QW0254RH.

Read miss directory hit
The number of coupling facility read requests for a page in which data was not returned but the page name was already assigned in the coupling facility directory (SES did not have to assign a directory entry for the page). Derived from the DB2 field QW0254RD.

Read miss assign. suppres.
The number of times that a coupling facility read request specified a page for which no directory entry exists and no directory entry is created. DB2 does not create a directory entry if it does not need to register the page to the coupling facility for cross-invalidation (XI); that is when no other DB2 member in the group has R/W interest in the page set/partition. Derived from the DB2 field QW0254RS.

Read miss name assigned
The number of times that a coupling facility read request specified a page for which a directory entry was created. Derived from the DB2 field QW0254RN.

Read miss cache full
The number of times that a coupling facility read request specified a page for which no directory entry exists and no directory entry is created due to the lack of storage in the group buffer pool. A nonzero value in this field
indicates that the backing coupling facility cache structure size might be too small to support the current workload. Derived from the DB2 field QW0254RF.

**Clean page write hit**
The number of facility write requests for clean pages successfully completed. Derived from the DB2 field QW0254WC.

**Changed page write hit**
The number of coupling facility write requests for changed pages that have successfully completed. Derived from the DB2 field QW0254WH.

**Write miss cache full**
The number of coupling facility write requests that could not complete due to a lack of coupling facility storage resources. Derived from the DB2 field QW0254WF.

Ideally, this value should be zero. These GBP write fails occur when a changed page must be written to the GBP and no GBP data entries are available. A data entry is unavailable if it contains a changed page that has not yet been externalized to a hard disk drive (casted out). A nonzero value indicates that castout processing cannot keep pace with the rate at which changed pages are being written to the group buffer pool. Usually, the best solution is to enlarge the GBP. Changing the castout threshold could lead to higher processor utilization for the mainframes handling castout processing.

**XI dir. entry reclaim**
The number of times that a directory entry was stolen and XI signals had to be sent because the page for the directory entry was cached in one or more DB2 buffer pools. Derived from the DB2 field QW0254XR.

**Directory entry reclaim**
The number of times that a page name assignment required a coupling facility directory entry to be reclaimed (stolen). Derived from the DB2 field QW0254DR.

Directory entry reclaims occur when a data or index page must be registered in the GBP but all the directory entries are in use. Then, an in-use entry will be reclaimed. When this happens, the copies of the page associated with the reclaimed directory entry are invalidated, even if they have not been changed. Invalidation causes extra reads from a hard disk drive, which can reduce system throughput. Consequently, larger group buffer pools reduce or eliminate directory entry reclaims because they can hold more entries. See also “Data entry reclaim”.

**Data entry reclaim**
The number of times that a page name assignment required a coupling facility data entry to be reclaimed (stolen). Derived from the DB2 field QW0254TR.

See also “Directory entry reclaim”. Besides the size of the group buffer pool, reclaims are also influenced by the ratio between directory entries and data entries. Nonzero values do not necessarily indicate a performance bottleneck; however, they should be further investigated.

**Total changed**
The snapshot value of the current number of changed pages. Derived from the DB2 field QW0254TC.
Castout
The number of castout operations performed. Derived from the DB2 field QW0254CC.

Directory entry
The number of allocated directory entries (not cumulative). Derived from the DB2 field QW0254DE.

Data entry
The number of allocated data entries (not cumulative). Derived from the DB2 field QW0254TE.

Secondary-GBP — Directory entry
The number of allocated directory entries. This is a snapshot value. Derived from the DB2 field QW02542D.

Secondary-GBP — Data entry
The number of allocated data entries. This is a snapshot value. Derived from the DB2 field QW02542T.

Secondary-GBP — Changed page write hit
The number of successful coupling facility write requests for changed pages. Derived from the DB2 field QW02542W.

Secondary-GBP — Total changed
The number of allocated data entries that are currently in “changed” state. This is a snapshot value. Derived from the DB2 field QW02542C.

Secondary-GBP — Write miss cache full
The number of unsuccessful coupling facility write requests because of insufficient coupling facility storage resources. Derived from the DB2 field QW02542F.

Detail reports
This topic shows and describes the elements of a detail report.

A detail report is created as a single entity; however, to facilitate reading it is shown here in separate sections, as follows:

- “The report header”
- “The Buffer Pool Characteristics section” on page 2664
- “The Detail Activity section” on page 2665

The report header:

The report header is shown at the top of every report page and identifies the report and the command options that were used to create the report.

The following is an example of a report header:

```
1   DB2 BUFFER POOL ANALYZER (V5R4M0) - BUFFER POOL ACTIVITY REPORT PAGE: 1-1

ORDER: BPID-QPAGESET
top: 11 level: detail
GROUP: N/P LOCATION: PM02D721 DB2 VERSION: V11
MEMBER: N/P REQUESTED FROM: NOT SPECIFIED TO: NOT SPECIFIED
SUBSYSTEM: D721 INTERVAL FROM: 12/06/13 16:08:30 TO: 12/06/13 16:09:22

• LEVEL specifies the type of report, here, a detail report.
• ORDER specifies the aggregation, here, by buffer pool ID (BPID) and a combination of database and page set (QPAGESET).
```
• **SORTBY** is not used for this example.
• **TOP** is not used; therefore, the default 11 applies. This means that the 11 topmost aggregations are reported. If the trace data contains more than 11 objects, they are aggregated under the label **Others** in the report.

This example was created with the following command:

```plaintext
BPACTIVITY REPORT LEVEL(DETAIL)
ORDER(BPID-QPAGESET)
```

Note that the **ORDER**, **SORTBY**, and **TOP** options affect only the information in **"The Detail Activity section" on page 2665**.

### The Buffer Pool Characteristics section:

The buffer pool characteristics values are retrieved from IFCID 202.

This section is the same as in summary reports. See **"The Buffer Pool Characteristics section" on page 2632** for a description of the elements.

IBM Db2 Performance Expert on z/OS
Buffer pool hit ratios

Primary indicator of buffer pool efficiency showing the number of pages contained in the buffer pool compared to the number of pages requested.

The highest possible hit ratio is 100%. This means that every page requested is always in the buffer pool. A low ratio indicates high read I/O.

To increase the buffer pool hit ratio, you can do one of the following:

- Run the REORG utility for table spaces or index spaces associated with the virtual buffer pool.
- Decrease the virtual pool sequential steal threshold (VPSEQT) to reserve more pages for random I/O.
- Increase the buffer pool size but be aware that the cost of paging can outweigh the benefit of I/O avoidance.
- Establish more separate buffer pools, for example, to isolate table spaces and index spaces according to their access characteristics.

Buffer pool hit ratio (%) — System

The number of Getpage requests by DB2 and satisfied by the buffer pool, expressed as a percentage of all Getpage requests.

This shows the percentage of pages in a prefetch Getpage request that are found in the buffer pool.

Usually, this value is low when prefetch is used. A high value indicates that applications perform a series of similar operations on the same data.

A negative value indicates that prefetched pages are not subsequently referenced. The reason for this is that the query stops before it reaches the end of the prefetched pages, or that the prefetched pages are stolen by DB2 for reuse before the query can access them.

Compare the value in this field with the application hit ratio to determine the efficiency of prefetch operations.

Buffer pool hit ratio (%) — Application

The number of Getpage requests issued by applications and satisfied by the buffer pool, expressed as a percentage of all Getpage requests issued by applications.

The hit ratio indicates the level of synchronous I/O because prefetched pages that are already in the buffer pool count as hits. The value is a relative value depending on the type of application. For example, an application that browses large amounts of noncontinuous data might have a buffer pool hit ratio of 0. Check those cases in which the hit ratio drops significantly for the same application.

Buffer pool hit ratio (%) — Read I/O

The number of read I/O requests without physical I/O activity (satisfied by the buffer pool), expressed as a percentage of all read I/O requests (with and without physical I/O activity).
The hit ratio indicates the percentage of read I/O requests that were satisfied by the buffer pool without requiring I/O activities to a hard disk drive.

Getpage
The total number of Getpage requests. Getpage requests are divided as follows:

Getpage — Sequential
The number of sequential Getpage requests because of prefetch operations.

Getpage — Random
The number of random Getpage requests, usually issued by applications.

Getpage — Ridlist
The number of record identifier (RID) list pages referenced.

Getpage — Hit
The number of Getpage requests for which pages are found in the buffer pool.

Getpage — Miss random
The number of random Getpage requests for which the page is not found in the buffer pool.

Getpage — Miss asynch
The number of Getpage Asynchronous requests for which the page is not found in the buffer pool.

Getpage — Noread
The number of Getpage requests for which the page is not found in the buffer pool and for which the request did not result in a read I/O operation. The page is a new page for INSERT.

Read request
The total number of read I/O requests (synchronous, sequential prefetch, list sequential prefetch, dynamic prefetch) with at least one page read from hard disk drive per request (content of DB2 field QW0007NP - number of pages read - greater zero). If no page is read from hard disk drive (all pages are found in the buffer pool), the counter is not incremented. The total number of read I/O requests is the result of the following types of read I/O requests:

Read request — Synchronous
The number of random, synchronous read I/O requests.

Read request — Seq prefetch
The number of sequential prefetch read I/O requests with at least one page read from hard disk drive per request (content of DB2 field QW0007NP - number of pages read - greater zero). If the prefetch results in an I/O read, up to 32 pages can be read for SQL, up to 64 pages can be read for utilities. If all pages to be prefetched are already in the buffer pool, a request does not result in an I/O read.

Sequential prefetch reads a sequential set of pages. It allows CP and I/O operations to overlap. DB2 determines at BIND time whether sequential prefetch is used.
Sequential prefetch is generally used for a table space scan. It can also be used to read index pages in an index scan. For an index scan that accesses eight or more consecutive data pages, DB2 requests sequential prefetch at bind time. The index must have a cluster ratio of 80% or higher. You can use REORG and RUNSTATS, and rebind relevant SQL if you do not know whether the target was met previously.

**Read request — List pref**

The number of list sequential prefetch read I/O requests with at least one page read from hard disk drive per request (content of DB2 field QW0007NP - number of pages read - greater zero).

List prefetch allows DB2 to access data pages efficiently even if the required data pages are not contiguous. It allows CP and I/O operations to overlap.

DB2 uses list prefetch to do the following tasks:

- **Always** to access data by multiple index access.
- **Always** to access data from the inner table during a hybrid join.
- **Usually** with one single index that has a cluster ratio lower than 80%.
- **Sometimes** on one single index with a high cluster ratio. This increases the efficiency of sequential prefetch if the estimated amount of data to be accessed is too small.
- **Never** when the estimated number of RIDs to be processed would take more than 50% of the RID pool.

During execution time, list prefetch processing stops if more than 25% of the rows with a minimum of 4075 in the table must be accessed.

**Read request — Dyn prefetch**

The number of dynamic prefetch requests with at least one page read from hard disk drive per request (content of DB2 field QW0007NP - number of pages read - greater zero). If the prefetch request results in an I/O read, up to 32 advancing pages can be read at a time.

Dynamic prefetch reads a sequential set of pages. It allows CP and I/O operations to overlap.

If DB2 does not choose prefetch at bind time, it can sometimes use it at execution time through sequential detection.

**Related reading:** For information on when sequential detection is used and when dynamic prefetch is triggered, see the *DB2 9 Administration Guide.*

**Read request — Delay (msec)**

The average elapsed time between start and completion of:

Read request — Delay (msec) — Synchronous

A synchronous read I/O

Read request — Delay (msec) — Sequential pref

A sequential prefetch read request

Read request — Delay — List pref

A list prefetch read request

Read request — Delay — Dynamic prefetch

A dynamic prefetch read request
Read page
The total number of pages read from a hard disk drive.

Read page — Synchronous
The number of pages read from a hard disk drive for applications and utilities.

Read page — Sequential prefetch
The number of pages read from a hard disk drive for sequential prefetch requests.

Read page — List prefetch
The number of pages read from a hard disk drive for list prefetch requests.

Read page — Dyn prefetch
The number of pages read from a hard disk drive for dynamic prefetch requests.

Upd/wrt page
The number of buffer updates per page written from the buffer pool to a hard disk drive.

A high value indicates a high level of efficiency because more updates are externalized per physical write cycle.

Buffer updates per pages written depends on the type of application. For example, a batch program that processes a table in skip sequential mode with a high row update frequency in a dedicated environment can achieve a high update efficiency. Usually, update efficiency is lower for transaction processing applications because these applications use more random page access.

The following factors can influence the number of updates per page:

- The number of rows per page: A small PCTFREE value gathers more rows on the same page. This might, however, impact concurrency.
- The buffer pool size and the deferred write thresholds: Increase the size of the buffer pool or the deferred write thresholds DWQT and VDWQT. This lets DB2 accumulate page updates in the buffer pool. DB2 might thus capture more updates per page. The effect depends on the type of transaction. It is less significant if the buffer pool is used concurrently by multiple transactions that access random pages.

Page/wrt req
The number of pages written from the buffer pool to a hard disk drive per synchronous or asynchronous write I/O. This count does not include preformatting I/O, such as I/O that is required to prepare a data set for use.

Use this field and the Upd/wrt page field to determine the efficiency of the buffer pool for write operations. The following factors impact the ratio of pages written per write I/O:

- The checkpoint frequency: At checkpoint time, I/Os write all updated pages on the deferred write queue to a hard disk drive. If this occurs too often, the deferred write queue does not grow large enough to achieve a high ratio of pages written per write I/O. The checkpoint frequency depends on the number of logs that are written between two consecutive checkpoints. This number is set at installation time.
• The frequency of active log switches: DB2 takes a system checkpoint when the active log is switched. Frequent active log switches cause a higher checkpoint frequency. This prevents the deferred write queue to grow to an optimum size.

• The buffer pool size and deferred write thresholds: The deferred write thresholds (VDWQT and DWQT) are a function of buffer pool size. If the buffer pool size decreases, these thresholds are reached more frequently and cause I/Os to write some of the pages on the deferred write queue to a hard disk drive more often. This prevents the deferred write queue from growing large enough to achieve a high ratio of pages written per write I/O.

• The number of data sets, and the spread of updated pages across them: The efficiency of write I/O also depends on the number of data sets associated with the buffer pool and spread of updated pages across them. Due to the way batch processing works, the ratio of pages written to write I/Os is expected to be higher than for transaction type workloads.

Related reading:
• For more information on the checkpoint frequency, see the DB2 10 Installation Guide or DB2 11 Installation Guide.
• For recommendations on active log data set size, see the DB2 10 Administration Guide or DB2 11 Administration Guide.

Buf Update
The number of times updates are requested against pages in the buffer pool.

Write request
The total number of write I/O operations that are made to a hard disk drive. The total number of write I/O requests is the result of the following types of write I/O requests:

Write request — Synchronous
The number of synchronous write I/O operations that are made to a hard disk drive. Synchronous or immediate writes occur if one of the following conditions apply:
• An immediate write threshold is reached.
• No deferred write engines are available.
• More than two checkpoints pass without a page being written.
  Note that this does not indicate a buffer shortage.

You should keep this value as small as possible. Synchronous writes occur if there are too many checkpoints, if the buffer pool is too small, or both.

Write request — Asynch
The number of asynchronous write I/O operations made to a hard disk drive.

Write request — Delay (msec)
The average elapsed time between start and completion of:
  • Write request — Delay (msec) — Synchronous
  a synchronous write I/O request.
  • Write request — Delay (msec) — Asynch
  an asynchronous write I/O request.

Write page
The total number of pages written to a hard disk drive.
Write page — Synchronous
The number of pages written synchronously to a hard disk drive.

Write page — Asynchronous
The number of pages written to a hard disk drive by asynchronous write requests.

Viewing performance data on the client
This topic describes how to view detailed buffer pool performance data on the client.

About this task

Related tasks:
• Before you can use this function, you must have performed the tasks described in:
  – “Collecting data” on page 2607
  – “Creating activity reports and bpd files” on page 2618. Here, only bpd files are of interest.
  – “Downloading files from the host to the client” on page 2732
    A buffer pool data file must be available on the client (the file with the recommended file name extension bpd).

General remarks:
• Your client should have approximately 40 MB of available physical memory (random access memory) for this function. You can check this in the Windows Task Manager. Close other applications, if necessary.
• The data used for this function reflects the performance for the interval for which trace data was collected and for the time frame that was specified with the GLOBAL and the BPACTIVITY command when the bpd file was created.
• If you want to print any of the graphical information from the following windows, place the cursor on the displayed graphical information and click View —► Open dataview in browser. When the browser window is displayed, use your browser’s printing capabilities to print the information. For colored printouts, check the browser settings.
  Example: In the Internet Explorer, click Tools —► Internet Options —► Advanced. Under Printing, select Print background colors and images.

Starting the view function
This section explains how to start the view function.

About this task

To start the view function, perform the following steps:

Procedure
1. Start the IBM DB2 Buffer Pool Analyzer by double-clicking the icon on your Windows desktop, or use the Start push button on the taskbar to start this client application.
   If you are using DB2 Performance Expert, click Tools > Buffer Pool Analysis for z/OS on the menu bar, or click the Opens the Buffer Pool Analysis for z/OS window toolbar button.
   The DB2 Buffer Pool Analyzer - z/OS main window is displayed.
2. On the menu bar, click File > Open Report. Alternatively, click the Opens report file toolbar button.
   The Open dialog box is displayed. You use this dialog box to select and open a bpd file that contains the performance data you want to view.
   Several sample buffer pool data files (*.bpd) are delivered with Buffer Pool Analyzer in the ...\samples\reporting folder. You can use them to become familiar with this function.

3. Continue with “Selecting and opening a buffer pool data file.”

Selecting and opening a buffer pool data file
This section explains how to select and open a buffer pool data file.

About this task

Procedure

1. Select a folder from the Look in list where the bpd file is located.
   The File of type field shows the file name extension of buffer pool data files (*.bpd). If your bpd file does not have the recommended file name extension bpd, select All files (*.*) from the Files of type list to see the appropriate files.

2. Click the bpd file to be opened.
   The File name field shows the name of the selected bpd file.

3. Click Open
   The selected bpd file is opened, and the following window is displayed:

   ![Image of buffer pool analyzer window]

   Figure 193. Viewing performance data – The Open dialog window

The menu bar of the window shows information about the opened bpd file:
- The File field shows the full path and name of the bpd file.
- The From and To fields show the start and end timestamps of data contained in the bpd file. This is the start and end of the data collection, respectively the corresponding values of the From and To options of the BPACTIVITY or GLOBAL command, if they were used to limit the time frame.

The contents pane on the left side of the window gives you access to Buffer Pool Analyzer data and results from other functions. You can expand or collapse the tree items by clicking the plus sign (+), respectively the minus sign (-), or by double-clicking the corresponding tree item.
Buffer pool performance data from the opened bpd file is in the **Reporting** folder and its subfolders.

On the following pages only a few examples of the available windows are shown. Use the contents pane to navigate through the information until you are familiar with its presentation.

4. Continue with one of the following:
   - “Getting system information”
   - “Getting information on buffer pools”

### Getting system information

You can view system information of the DB2 subsystem from which performance data was collected.

**About this task**

When you have opened a bpd file, as described in “Selecting and opening a buffer pool data file” on page 2679, you can view system information as follows:

1. In the **Reporting** tree of the contents pane, double-click **System**, then double-click **System information**.
   
The following window is displayed:

![System Information window](image)

*Figure 194. Viewing performance data – The System Information window*

The right pane shows general information about the DB2 subsystem from which performance data was collected, for example, DB2 location, DB2 group, and DB2 member.

### Getting information on buffer pools

This section lists the different ways how you can get information on buffer pools.

**About this task**

When you have opened a bpd file, as described in “Selecting and opening a buffer pool data file” on page 2679, you can view buffer pool information as follows:
1. In the **Reporting** folder of the contents pane, double-click **Buffer Pools**.

2. If you want to compare buffer pool data, continue with “Getting buffer pool comparison information.”

3. If you want to see detailed information about individual buffer pools, continue with “Getting individual buffer pool information.”

**Getting buffer pool comparison information:**

This section explains how to view and compare performance data of different buffer pools.

**Procedure**

1. In the **Buffer Pools** folder of the contents pane, click **Buffer Pool Comparison**. The different buffer pool counters, such as **Getpage**, **Read Request**, **Write Request**, and **Write Page** are displayed.

   **Note:** The content pane displays only the active counters. Counters that have no activity are not displayed.

2. Double-click a counter, for example **Read Request**.

   The following window is displayed:

   ![Buffer Pool Comparison window](image)

   **Figure 195. Viewing performance data – The Buffer Pool Comparison window**

   The right pane shows a comparison of buffer pools in your system regarding the selected counter in the form of a bar chart.

**Getting individual buffer pool information:**

You can view individual buffer pool characteristics and individual buffer pool counters of a selected buffer pool.
Procedure

1. In the **Buffer Pools** folder of the contents pane, click one of the icons representing individual buffer pools, for example **BP0**.
   The following items are displayed for the selected buffer pool:
   - Characteristics
   - Counters
   - Object Comparison
   - Objects
   Each item contains additional information about the selected buffer pool.

2. If you want to see general information and thresholds of the selected buffer pool, double-click **Characteristics**.
   The following window is displayed:

![Image of the Individual Buffer Pool Characteristics window]

   **Figure 196. Viewing performance data – The Individual Buffer Pool Characteristics window**

   The right pane shows general information, such as the buffer pool identifier and its virtual pool size, and thresholds for several types of buffer pool operations.

3. If you want to see buffer pool activity counters of the selected buffer pool, double-click **Counters**, then double-click one of the different counters, for example **Getpage**
   The following window is displayed:
Note: The content pane displays only the active counters. Counters that have no activity are not displayed.

The right pane shows the types for the selected counter Getpage in the form of a pie chart. The types are Sequential Access, Random Access, and RID List.

4. If you want to compare object activities of the selected buffer pool, double-click Object Comparison. Then double-click one of the different counters, for example Getpage.

A similar window is displayed. The right pane shows the types for the selected counter Getpage in the form of a bar chart. The types are Sequential Access, Random Access, and RID List. They are sorted in descending order.

5. If you want to see all objects and their counters of the selected buffer pool, double-click Objects. Then double-click one of the different counters, for example Write Request.

A similar window is displayed. The right pane shows the types for the selected counter Write Request in the form of a pie chart. The types are Synchronous and Asynchronous.

Optimizing object placements and initial buffer pool sizes

This topic describes how to optimize the object placements in buffer pools and buffer pool sizes on the client.

About this task

Related tasks:
- Before you can use this function, you must have performed the tasks described in:
  - “Collecting data” on page 2607
  - “Creating activity reports and bpd files” on page 2618. Here, only bpd files are of interest.
  - “Downloading files from the host to the client” on page 2732
A buffer pool data file must be available on the client (the file with the recommended file name extension bpd).

General remarks:
1. Your client should have at least 40 MB of available physical memory (random access memory) for this function. You can check this in the Windows Task Manager. Close other applications, if you receive an Out of memory message. Note that free memory requirements increase with the number of objects to be treated.

   Example: 1,000 objects require approximately 60 MB, 25,000 objects require approximately 90 MB, 100,000 objects require approximately 230 MB, and 200,000 objects require more than 500 MB.

2. The data used for this function reflects the buffer pool activity for the interval for which trace data was collected and for the time frame that was specified with the GLOBAL and the BPACTIVITY command when the bpd file was created.

3. The bpd file used for the object placement function usually contains information about active and inactive objects. With the object placement function, you can specify whether to include the inactive objects (also called unused objects) in rule processing and object placement considerations. However, if inactive objects were explicitly excluded from the bpd file (by means of the BPACTIVITY FILE ACTIVEOBJECTS command), your specifications have no effect on the object placement result.

4. If you want to print the object placement results shown in your web browser, use your browser's printing capabilities to print the information. For colored printouts, check the browser settings.

   Example: In the Internet Explorer, click Tools — Internet Options — Advanced. Under Printing, select Print background colors and images.

5. In DB2 Performance Expert for z/OS, you can configure a different web browser. If required, click Monitor — Configuration — Preferences and follow the instructions.

Starting the optimization function

About this task

To start the optimization function, perform the following steps:

Procedure

1. Start the IBM DB2 Buffer Pool Analyzer by double-clicking the icon on your Windows desktop, or use the Start push button on the taskbar to start the client application.

   If you are using DB2 Performance Expert, click Tools > Buffer Pool Analysis for z/OS on the menu bar, or click the Opens the Buffer Pool Analysis for z/OS window toolbar button.

   The DB2 Buffer Pool Analyzer - z/OS main window is displayed.

2. On the menu bar, click File > Start Object Placement. Alternatively, click the Starts object placement toolbar button.

   The Open dialog box is displayed. You use this dialog box to select and open a bpd file that contains the buffer pool activity data you want to use for the optimization.

   Several sample buffer pool data files (*.bpd) are delivered with Buffer Pool Analyzer in the ...\samples\reporting folder. You can use them to become familiar with this function.

3. Continue with  “Selecting and opening a buffer pool data file” on page 2685.
Selecting and opening a buffer pool data file

About this task

To select and open a buffer pool data file, complete the following steps:

Procedure

1. Select a folder from the Look in list where the bpd file is located.
   The File of type field shows the file name extension of buffer pool data files (*.bpd). If your bpd file lacks the recommended file name extension bpd, select All files (*.*) from the File of type list to see the appropriate files.
2. Click the bpd file to be opened.
   The File name field shows the name of the selected bpd file.
3. Click Open.
   The selected bpd file is opened and its content is checked. If the bpd file contains a concatenation of multiple sections, with performance data from different data sharing groups, different members of a data sharing group, or separated data collection time frames, only data from one section can be used for the object placement optimization. You need to select one of the sections found in the bpd file.
   Multiple sections in a bpd file are the result of multiple input data sets with trace data being used as input to create bpd files. For more information, see the INPUTDD statement in "Creating activity reports and bpd files" on page 2618 and "Concatenating trace data for activity reports and bpd files" on page 2734.
   • If the Buffer Pool Data File Section Selection dialog is displayed, select one section from the list and click OK to continue. You can click Cancel to return to the Open dialog. Note that you can expand the list by clicking the down arrow on the right side.
   The DB2 Buffer Pool Analyzer - Object Placement window is displayed. You see the first page of the object placement wizard, which guides you through the following steps:
   a. "Step 1: Selecting a pattern file"
   b. "Step 2: Editing a pattern file" on page 2687
   c. "Step 3: Assigning objects to buffer pools" on page 2690
   d. "Step 4: Setting the initial buffer pool sizes and characteristics" on page 2693

   When you have finished these steps, the object placement wizard closes, and you can continue with "Viewing the result of an optimization cycle" on page 2694.

   You can navigate through the pages by clicking Next or Back. On all four pages, you can click Cancel to return to the main window, or Help to get help on the current page.

Step 1: Selecting a pattern file

About this task

When you have opened a bpd file, as described in "Selecting and opening a buffer pool data file," the first page of the object placement wizard is displayed:
This page shows a list of pattern files, the available memory for buffer pools, and data about the DB2 subsystem from which data was collected.

- A pattern file contains a list of rules that determine which objects (table spaces and index spaces) should be placed in which buffer pool according to each object's characteristics.

Initially, Buffer Pool Analyzer recommends one of four pattern files based on the total buffer pool size that is determined from the content of the bpd file. The rules in each pattern file are predefined. They do not vary with the content of a bpd file.

If you edit a pattern file and save it under a user-defined name, as described in "Step 2: Editing a pattern file" on page 2687, Buffer Pool Analyzer recommends this user-defined pattern file whenever a bpd file from the same DB2 subsystem is processed by the object placement wizard.

- The Total virtual pool size (in MB) value is determined from the content of the bpd file and reflect the values at the time the data was collected from the DB2 subsystem.

- DB2 subsystem and the data collection is also determined from the content of the bpd file.

You can use this page to select a different pattern file and to adjust the available memory for buffer pools. In "Step 4: Setting the initial buffer pool sizes and characteristics" on page 2693, Buffer Pool Analyzer recommends a distribution of the available memory across the individual buffer pools. You can also accept the recommendations (the pattern file and the virtual pool) and proceed with the next step.

1. Under Pattern file selection, select Recommended or User-defined. Then click the pattern file that you want to use.

2. Under Buffer pool data file information, enter the value for Total virtual pool size (in MB) that you want the object placement wizard to use for the calculation of the initial buffer pool sizes.

3. Click Next and continue with "Step 2: Editing a pattern file" on page 2687.
Step 2: Editing a pattern file

About this task

When you have performed “Step 1: Selecting a pattern file” on page 2685, the second page of the object placement wizard is displayed:

This page shows the object placement rules from the selected pattern file.

- The list of rules acts like a series of filters. The object placement wizard processes all objects (table spaces and index spaces) through these rules, starting at the top of the list. If the characteristics of an object match the criteria for a specific buffer pool, the object is assigned to this buffer pool.

- Each rule specifies a series of object characteristics as criteria for a buffer pool. If an object matches all criteria of a rule, the wizard recommends it for placement in the corresponding buffer pool. If an object does not match all criteria of a rule, it is passed to the next rule for evaluation.

- An object matches a rule if Page Size, Seq Access, Change Rate and Size match, and if an object is one of the selected data types Data, Index, LOB, or Sort/Temp. (Selected here means that a check box is marked. If all check boxes of a rule are cleared, an object does never match the rule.)

- In summary, the rules causes a 1:n mapping of buffer pools to objects. Objects with similar characteristics are assigned to the same buffer pool.

You can use this page to adjust the object placement rules for this session, and you can save the rules under a user-defined name for future use with performance data from the same DB2 subsystem.

- You can add more placement rules by clicking Add, and you can delete selected rules by clicking Remove.

- You can define more than one rule for a specific buffer pool, which permits a buffer pool to contain objects with different characteristics.

- You can also change the position of a placement rule in the list by clicking Move Up or Move Down.

- To change one of a rule’s values, double-click the value and edit it. Then press Enter or select a different field.
If you adjust rules in pattern files:

- Ensure that all objects are covered by at least one rule. Otherwise, you cannot complete the next step.

- Place rules with restrictive criteria at the top of the list, and those with more general criteria at the bottom. Otherwise, the more specific rule might never become active.

**Example:** Assume that you want objects with a Change Rate above 80 percent to be assigned to buffer pool BP3, all others to BP4. The recommended way is to specify the first rule for BP3 with a criteria range of 80-100 percent, followed by another rule for BP4 with a criteria range of 0-80 percent. Alternatively, the second rule could also have a criteria range of 0-100 percent, which matches everything that did not match the first rule.

- If criteria ranges are specified, as in 50-80 percent, the algorithms consider the lower bound as inclusive (≥), the upper bound as exclusive (<).

**Example:** If two rules have specified criteria ranges of 50-80 and 80-90 percent, the first rule matches values equal or greater (≥) 50 and less than (<) 80, and the second rule matches values equal or greater (≥) 80 and less than (<) 90. The value 100 as an upper bound is an exception; it is interpreted as less or equal (≤) 100. Successive range specifications of, for example, 0-80 and 81-100 percent are likely to be erroneous.

- The specification of overlapping ranges in different rules for the same criterion is allowed. Nevertheless, the first rule has priority and consequently reduces the effect of any following rule to the non-overlapping part of the range.

**Example:** Assume a single criterion where a rule specifies a criteria range of 10-70 percent, and a subsequent rule specifies a criteria range of 50-100 percent. Here, the overlapping range from 50 to 70 percent in the second rule is without effects because the first rule has priority. The second rule only gets objects for evaluation in the range above 70 percent.

- Note that DB2 catalog objects and directory objects always remain in their original buffer pool (which is BP0 for DB2 Version 7 and earlier). These objects are not taken into account by the object placement algorithms.

The following list describes the elements of a rule, as shown on the page:

**Rule**  Shows the numerical sequence in which the object placement rules are applied to each object.

You can change the sequence by selecting the rule, and clicking **Move Up** or **Move Down**.

**Name**  Shows a buffer pool name, such as BP0 or BP16K9.

**Page**  Shows the size of each buffer pool page. The size is implicitly extracted from the name of the buffer pool. Buffer pool BP32K, for example, always has a page size value of 32 KB.

**Seq Access**  Specify a percentage range as criteria for an object’s sequential accesses. Objects with sequential accesses within the specified range, out of all accesses, are assigned to the specific buffer pool (if the other criteria are also met).

**Example:** A percentage range of 50-80 considers objects that are on average accessed sequentially 50 to less than 80 times out of 100 accesses.

You can also use the following notations to specify percentage ranges:

- 50 is the same as 0 to <50%
50- is the same as 50 to ≤100%
a11 is the same as 0 to ≤100%. If the Assign objects not accessed during data collection check box is selected, a11 also includes objects for which no sequential access characteristics could be determined. (These objects are marked as N/C (not calculated), which means a formula could not be applied because of missing data.)

Change Rate
Specify a percentage range as criteria for an object’s change rate. Objects with a change rate within the specified range, out of all accesses, are assigned to the specific buffer pool (if the other criteria are also met).

Example: A percentage of 50-80 considers objects that are changed 50 to less than 80 times out of 100 accesses.

You can also use the following notations to express percentage ranges:
- 50 is the same as 0 to <50%
- 50- is the same as 50 to ≤100%
a11 is the same as 0 to ≤100%. If the Assign objects not accessed during data collection check box is selected, a11 also includes objects for which no change rate characteristics could be determined. (These objects are marked as N/C (not calculated), which means a formula could not be applied because of missing data.)

Size Specify a size range as criteria for an object’s size. Objects with a size within the specified range are assigned to the specific buffer pool (if the other criteria are also met). Sizes are expressed as numbers of buffer pool pages. One buffer pool page can be 4, 8, 16, or 32 KB, depending on the page size of the buffer pool.

Example: A size range of 0-12 considers objects with a size of less than 12 buffer pool pages. For a buffer pool having a page size of 4 KB this affects objects having a size of less than 48 KB.

You can also use the following notations to express size ranges:
- 12 is the same as 0 to <12 pages
- 12- is the same as 12 to the maximum object size pages
a11 is the same as 0 to the maximum object size pages, and includes also objects for which the size could not be determined (marked as ?).

Data Select this check box if you want table space objects to be assigned to the specific buffer pool (if the other criteria are also met). Note that this field does not include LOB and Sort/Temp data. These must be explicitly selected if required.

Index Select this check box if you want index space objects to be assigned to the specific buffer pool (if the other criteria are also met).

LOB Select this check box if you want table space objects of data type LOB to be assigned to the specific buffer pool (if the other criteria are also met).

Sort/Temp Select this check box if you want database objects of type Sort (work files) or Temp to be assigned to the specific buffer pool (if the other criteria are also met). This should only be selected for buffer pools having a page size of 4 KB or 32 KB.

Comment Initially, this column shows a descriptive text for each rule. You can edit this information.

1. Review the rules on this page. Adjust them as required.
2. Use the Assign objects not accessed during data collection check box to indicate whether you want to include unused objects in the rule processing. Unused objects are table spaces and index spaces that are defined in the database catalog, but did not show any access or change information during the time trace data was collected. Note that unused (inactive) objects can be explicitly excluded from bpd files. If such bpd file was opened, the use of the check box has no effect.

If this check box is selected, unused objects are considered by the object placement rules. They match the all criteria for Seq Access and Change Rate. (Unused objects are marked as N/C (not calculated) in "Step 3: Assigning objects to buffer pools," because they have no sequential access or change rate characteristics.)

If this check box is cleared, unused objects are left in their current buffer pools. Note that any change that you make to this selection is retained for the next time you use the wizard.

3. If you want to save the pattern file, click the icon to the right of the current pattern file name and save it under a user-defined name. The file name extension should be .pat.

4. Click Next and continue with "Step 3: Assigning objects to buffer pools," or click Back to return to the previous page.

Step 3: Assigning objects to buffer pools

About this task

When you have performed "Step 2: Editing a pattern file" on page 2687, the third page of the object placement wizard is displayed:

---

Figure 200. Object Placement – The Object Assignment window

This page shows the object placements that Buffer Pool Analyzer recommends based on the previously specified placement rules.

- Buffer Pool Analyzer has scanned the bpd file and has analyzed the characteristics of each table space and index space.
- The Current column shows the placement of objects at the time the data was collected.
- The Recommended column shows the recommended object to buffer pool assignments, as calculated by Buffer Pool Analyzer. The calculations are based on the placement rules for each buffer pool and the object’s characteristics.

- The User-defined column is initially identical with the Recommended column, and is intended to change assignments as described later in this topic.

You can use this page to change the object placements, which means, you can assign specific objects to buffer pools other than the ones determined by the placement rules. You might want to do this, for example, to assign certain objects to a particular large buffer pool to guarantee high performance for applications using these objects. These user-defined assignments overwrite the assignments recommended by Buffer Pool Analyzer.

- To change the assignment of an object, double-click the appropriate buffer pool name in the User-defined column and edit the buffer pool name. Then press Enter or select a different field.

- To reset a User-defined assignment of an object to the Recommended assignment, select the object and click Reset selected.

  You can reset multiple assignments by selecting multiple objects. To select a range of successive objects, click the first object, hold down the Shift key, then click the last object in the sequence. To select several separate objects, click the first object, hold down the Ctrl key, then click the other objects as required. To select all objects, press Ctrl+A.

The following list describes the elements of an assignment, as shown on the page. Note that you can sort the list by clicking a column header of choice one or more times. Small arrows indicate the sort order.

**Object Name**
Shows the name of an object, such as a table space or index space. If you selected the Assign objects not accessed during data collection check box on the previous page, this column also shows the names of unused objects. Note that unused (inactive) objects can be explicitly excluded from bpd files. If such bpd file was opened, the use of the check box has no effect.

**Type**
Shows the type of an object, as TABLESPACE, INDEX, LOB, TEMP, or WORK/SORT.

**Page**
Shows the page size of the buffer pool to which an object is currently assigned. If you assign an object to a different buffer pool, the new buffer pool must have the same page size.

**Used**
Shows whether an object was used during the time for which performance data was collected.

  If an object was used (indicated as YES), Buffer Pool Analyzer assigned the object to a buffer pool according to the object’s characteristics.

  If an object was not used (indicated by NO), Buffer Pool Analyzer retains the original assignment, unless you checked the Assign objects not accessed during data collection check box on the previous page. In this case, Buffer Pool Analyzer assigned the object using only the object’s Page Size, Size, and data type (Data, Index, LOB, or Sort/Temp).

**Catalog/Directory**
Shows whether this object is part of the database catalog (CAT) or database directory (DIR). No entry indicates that the object belongs to neither.

**Seq. Access [%]**
Shows how often the object was accessed sequentially, as a percentage of all accesses to this object.
N/C (not calculated) means that the percentage could not be computed because the object was not used.

**Change Rate [%]**
Shows how often the object was changed, as a percentage of all accesses to this object.
N/C (not calculated) means that the percentage could not be computed because the object was not used.

**Size [pages]**
Shows the size of an object, expressed as the number of buffer pool pages.

**Example:** For a buffer pool having a page size of 4 KB, a value of 12 corresponds to an object size of 48 KB.

**Current**
Shows the name of the buffer pool where an object is currently placed (at the time the data was collected).

**Recommended**
Shows the name of the buffer pool that Buffer Pool Analyzer recommends for the object.

**User-defined**
Initially, this column shows the same buffer pool names as in the Recommended column.

**Note:** If a field in this column is empty, an object was not assigned to a buffer pool because no matching rule was found. You must ensure that there are no empty user-defined fields before continuing. Return to “Step 2: Editing a pattern file” on page 2687 and add rules that cover such objects.

If you want to assign objects to specific buffer pools (other than those shown in the corresponding fields), you can change the assignment in this column as described previously.

You can also reset your changes to the recommended values by clicking **Reset selected** or **Reset all**. The latter resets the assignments of all objects in the window, but not those that are hidden if the **Show only objects with activity** check box is selected. If you want to reset all used and unused objects, clear the check box (which shows used and unused objects in the window), click **Reset all**, then select the check box again.

**Restriction:** Note that catalog objects and directory objects cannot be assigned to different buffer pools.

1. Review the assignments on this page. Change them in the **User-defined** column, if required.

2. Use the **Show only objects with activity** check box to indicate whether you want to see only used objects, or whether you want to see also unused objects. See step **2 on page 2690** for details about unused objects.

   If this check box is cleared, unused objects are included in the list of objects (their assignment to buffer pools is activated by the **Assign objects not accessed during data collection** check box on the previous page).

   Note that the state of the check box is retained for the next time you use the wizard.

3. Click **Next**. If any rows contain errors, they are highlighted in red. You must correct these errors before you can continue to “Step 4: Setting the initial buffer pool sizes and characteristics” on page 2693. You can click **Back** to return to the previous page.
Step 4: Setting the initial buffer pool sizes and characteristics

About this task

When you have performed “Step 3: Assigning objects to buffer pools” on page 2690, the fourth page of the object placement wizard is displayed:

![Figure 201. Object Placement – The Buffer Pool Size and Characteristics window](image)

This page shows the recommended initial buffer pool sizes and thresholds for the individual buffer pools, and shows the total storage required for these recommendations.

- The value in the **Planned** field, shown at the top of the page, is the sum of the **Total virtual pool size** and the **Total hiper pool size**. These are the pool sizes (in MB) that you have specified in “Step 1: Selecting a pattern file” on page 2685.
- The object placement and sizing algorithm has used this total storage to calculate the initial virtual sizes for the individual buffer pools, based on the object placements specified in the **User-defined** column on the previous page.
- The sum of all buffer pool sizes (the recommended number of pages for a buffer pool, multiplied by the page size of the buffer pool in MB) yields the planned size in MB.
- By default, the sizing algorithm allocates a minimum buffer pool size of 20% of the average buffer pool size for buffer pools to which objects are assigned.

You can use this page to adjust the initial buffer pool sizes and thresholds of individual buffer pools. Buffer Pool Analyzer will use the adjusted values when it generates the DB2 ALTER BUFFERPOOL commands and SQL ALTER statements.

- If you change the virtual buffer pool size of one of the listed buffer pools, the **New** size, at the top of the page, reflects the new sum (in MB). Initially, **Planned** and **New** show the same value. (Small differences are possible because only integer pages are calculated, not fractions.)
- To change a value, double-click the value and edit it. Then, press Enter or select a different field.

Note that the size of buffer pools that no longer have objects assigned to them is set to zero. When you apply the recommendations from the object placement and buffer pool sizing, access to objects assigned to these buffer pools is disabled.
The following list describes the elements of the buffer pool sizings, as shown on the page. Note that you can edit these values, except the buffer pool names. For more detailed information, see also “The Buffer Pool Characteristics section” on page 2632. Note that you can sort the list by clicking a column header of choice one or more times. Small arrows indicate the sort order. By default, the list is sorted by Name.

| Name | Shows the name of the buffer pool. |
| VP Size [pages] | Shows the recommended virtual buffer pool size, in number of pages, for the affected buffer pool. |
| VP Seq [%] | Shows the recommended virtual pool sequential steal threshold (VPSEQT) for the affected buffer pool. This is the portion of the buffer pool that can be occupied by sequentially accessed pages. For more details, see Thresholds — Virtual sequential in “The Buffer Pool Characteristics section” on page 2632. |
| DefWrite [%] | Shows the recommended deferred write threshold (DWQT) for the affected buffer pool. This is the percentage of the buffer pool that can be occupied by unavailable pages. For more details, see Thresholds — Deferred write in “The Buffer Pool Characteristics section” on page 2632. |
| VertDefWrite [%] | Shows the recommended vertical deferred write threshold (VDWQT) for the affected buffer pool. This is the percentage of the buffer pool that can be occupied by updated pages of a single page set. For more details, see Thresholds — Vert deferred write in “The Buffer Pool Characteristics section” on page 2632. |

1. Review the recommended initial buffer pool sizes and thresholds. Adjust them, if required.
2. Click Finish, or Back to return to the previous page.
   When the object placement wizard finishes, the result is immediately shown in a new browser window. In addition, the result is saved in the Results subfolder of the Object Placement folder for later viewing.
3. Continue with “Viewing the result of an optimization cycle,” or close the browser window and return to the Buffer Pool Analyzer main window.

Viewing the result of an optimization cycle  
About this task

When the object placement wizard finishes, the Buffer Pool Analyzer main window shows the result in the Results subfolder of the Object Placement folder. The subfolder can contain results from several optimization cycles. The result from the most recent optimization is highlighted.
Results are named OPL <bpd_file> <date> <time>, whereby OPL stands for Object Placement, <bpd_file> for the name of the bpd file that was used for the optimization, <date> and <time> for the date and time when the optimization started.

1. If you want to delete results from the folder, select it by clicking it. Then press the Delete key. To delete all results, right-click Results. Then click Delete all. You are asked to confirm the deletion.

   Note that results remain on the hard disk drive and take up space until they are deleted. They are usually located in folder C:\Documents and Settings <userid> \db2pev <version> \object placement reports. However, because of their special format, do not manipulate the folder contents manually.

2. To view the result of an object placement, double-click it, or select it and press Enter.

   The result is shown in your web browser and contains the following information:
   
   • A section showing details about the content of the bpd file that was used for this object placement optimization, such as the name of the DB2 subsystem from which data was collected, and the start and end times and the duration of the data collection. The bpd file is the one you selected when you performed the steps in "Selecting and opening a buffer pool data file" on page 2685. The details are identical with the information that was shown in the Pattern File Selection window (see Figure 198 on page 2686).

   • A section showing which pattern file and which object placement rules were used for this object placement optimization. This information corresponds to your specifications in "Step 1: Selecting a pattern file" on page 2685 and "Step 2: Editing a pattern file" on page 2687.

   • A section listing the other options that you specified for this object placement optimization.

   • A list of ALTER BUFFERPOOL commands for resizing and changing buffer pool characteristics.

   Example:

   ALTER BUFFERPOOL(BP0) VPSIZE(868) HPSIZE(0) VPSEQT(20) DWQT(0) VDWQT(0,0)
   ALTER BUFFERPOOL(BP7) VPSIZE(120) HPSIZE(0) VPSEQT(40) DWQT(10) VDWQT(3,0)
   ALTER BUFFERPOOL(BP32K) VPSIZE(15) HPSIZE(0) VPSEQT(100) DWQT(70) VDWQT(50,0)
   ALTER BUFFERPOOL(BP4) VPSIZE(1750) HPSIZE(0) VPSEQT(99) DWQT(0) VDWQT(0,0)
   ALTER BUFFERPOOL(BP1) VPSIZE(5) HPSIZE(0) VPSEQT(100) DWQT(70) VDWQT(50,0)
   ALTER BUFFERPOOL(BP2) VPSIZE(790) HPSIZE(0) VPSEQT(20) DWQT(0) VDWQT(0,0)
ALTER BUFFERPOOL(BP3) VPSIZE(426) HPSIZE(0) VPSEQT(100) DWQT(70) VDWQT(50,0)

- A list of STOP DATABASE commands. In data sharing environments, these commands must be performed before applying the following statements.
- A list of ALTER INDEX and ALTER TABLESPACE statements for placing each reassigned object in its new buffer pool.

Example:
ALTER INDEX CC390.UTLEX01 BUFFERPOOL BP7;
ALTER INDEX CC390.UTLSTX01 BUFFERPOOL BP7;
ALTER INDEX CC390.UTPEBX01 BUFFERPOOL BP7;
ALTER INDEX CC390.UTPETX01 BUFFERPOOL BP7;
ALTER INDEX CC390.UTPEX01 BUFFERPOOL BP7;
ALTER TABLESPACE CC390.UTPRCX01 BUFFERPOOL BP7;
ALTER INDEX CC390.UTRESTART2X BUFFERPOOL BP7;
ALTER INDEX CC390.UTRESTARTX BUFFERPOOL BP7;
ALTER TABLESPACE CC390.UTRSTRT BUFFERPOOL BP7;
ALTER TABLESPACE CC390.UTTEMPL BUFFERPOOL BP7;

- A list of START DATABASE commands, corresponding to the preceding STOP DATABASE commands. Required in data sharing environments.
- An object placement overview, which summarizes the information from the object placement task. Note that changed object placements are marked by a different color when the information is shown in the browser window. The following example shows the Object Placement window.

Figure 203. Example of optimization result, showing an object placement overview

3. A section listing the original and recommended buffer pool characteristics (not shown here).
4. Use the hypertext links in the browser window to navigate through the report.

Applying changes to a DB2 subsystem

About this task

You can use the DB2 Commands feature of DB2 Performance Expert (for the ALTER BUFFERPOOL commands).
To apply the SQL statements, you can copy them to SPUFI, or you can run them via DB2 Connect. Additionally, consider the following tips when you are going to apply the proposed changes:

- If you see a buffer pool size set to zero in the optimization result, double-check that this buffer pool is no longer used. Consider the eventuality that this buffer pool did not show any activity during the data collection time, but an unused object can become active under certain circumstances.
- If possible, you should stop the database before applying the changes, especially in a data sharing environment. Also consider applying the changes during planned outages.
- If the virtual buffer pool size is limited, or the proposed size is less than the original size, you should first apply the changes that reduce the sizes of buffer pools, then apply the changes that increase the sizes of buffer pools. The opposite order can result in insufficient virtual storage. However, buffer pools are not always freed immediately. DB2 reduces the sizes of buffer pools by first identifying buffers that are to be deleted. That means, those buffers cannot be used again. DB2 releases buffers immediately or at a later moment, whatever is more appropriate. Therefore, it is good practice to ensure that buffers have actually been released before enlarging buffer pools.
- After applying the ALTER INDEX and ALTER TABLESPACE statements, the reassignments of objects to different buffer pools remain pending until DB2 happens to close and reopen the data sets of the changed page sets, which depends on several parameters. If immediate reassignments are required, you need to stop and start the database.

- For details about the SQL statements ALTER and CREATE see the *IBM DB2 11 for z/OS: SQL Reference*.

Performance-related tips

About this task

The following tips might be useful when you perform an optimization:

- Generally, objects with similar access characteristics should be grouped and placed in the same buffer pool.
  Mixing page sets with a high sequential access characteristic with those that exhibit random access characteristics will be detrimental to both types of page sets. The pages belonging to the predominantly random page set could be stolen by the prefetch on the page set with sequential characteristic and it will increase the number of I/Os for the random page set.
  The more you separate sequential processing from random processing, the more benefit you get. To achieve this, you can adjust the sequential threshold of each buffer pool. See also the **Seq Access** column in [Figure 199 on page 2687](#).
- Assigning table spaces and index spaces into separate buffer pools that have sequential and random data access can have a more positive impact on overall buffer pool efficiency. It is generally better to put indexes in a separate buffer pool from the data because the access characteristics for indexes are usually very different from the data. See also the **User-defined** column in [Figure 200 on page 2690](#).

Exceptions might be objects that are really small, such as lookup tables.
• Do not place any other objects in the buffer pool that is used by WORK/SORT data sets (DSNDB07), because of the intensive and special usage characteristics.
• BP0 should be used exclusively for DB2 catalog objects and directory objects. These objects are not taken into account by the object placement algorithms.
• A general recommendation is to distribute the objects in different pools based on the access intensity and the number of buffers the page set needs in the pool. The object placement function recommends the optimal size and thresholds for the buffer pools. The simulation function can be used to simulate if additional buffers to the pool will have an effect on reducing the buffer pool misses.
• Validate the recommended values for deferred write threshold (DWQT) and vertical deferred write threshold (VDWQT). If these values allow a particular page set to monopolize the buffer pool by filling up with too many changed pages, the amount of subsequent asynchronous writes can flood the I/O subsystem all at once, thus adversely affecting overall throughput. Usually, it is better to distribute these writes evenly over time rather than to have peaks. However, these thresholds depend on your workload and the type and size of data being cached.
• The first-in-first-out (FIFO) page steal algorithm is recommended, instead of the default Least-Recently-Used (LRU) algorithm, in either of the following situations:
  – For data and indexes residing entirely in the buffer pool
  – For objects with very low buffer pool hit ratio (< 1%)
The FIFO algorithm, which can be specified by the ALTER BUFFERPOOL PGSTEAL command, will reduce processor cost under these conditions. See “The Buffer Pool Characteristics section” on page 2632 for more information about the page steal methods.
• For buffer pools with high I/O rates (a high number of pages read or written) also consider the long-term page fix option for buffer pools, introduced with DB2 UDB for z/OS Version 8. This option fixes a buffer pool in real storage for an extended period of time and can help reduce the number of I/Os for I/O-intensive buffer pools. For more information, see the description of the ALTER BUFFERPOOL command and its PGFIX keyword in the IBM DB2 11 for z/OS: Command Reference.

Simulating buffer pool behavior
This topic describes how to simulate buffer pool behavior on the client.

About this task

Related tasks:
• Before you can use this function, you must have performed the tasks described in:
  – “Collecting data” on page 2607. The collected data can be made available for the simulation function in uncompressed or compressed format.
  – “Downloading files from the host to the client” on page 2732
    A trace data file must be available on the client (the file with the recommended file name extension trace, or terse if compressed).

General remarks:
1. Your client should have approximately 40 MB of available physical memory (random access memory) for this function. You can check this in the Windows Task Manager. Close other applications, if you receive an Out of memory message.

2. The data used for this function reflects the buffer pool activity for the interval for which trace data was collected.

3. Data used for simulations must be collected with short record format, continuously, and should have a record lost rate of less than 2%. If required, see "Configuring a collect task" on page 261 and "Interpreting trace status summary and trace messages" on page 2614 for more details.

4. The simulation function can handle trace data files of up to 2 GB. This size limit pertains to compressed and uncompressed trace data files. Uncompression requires additional time when a compressed trace data file is opened. Uncompression does not require additional disk space because uncompressed data is directly written into memory.

5. The time to preprocess the trace data file and the time to perform a simulation very largely depends on the number of active objects in the trace data file, the number of different buffer pools, and the buffer pool sizes to be simulated. Note that a compressed trace data file contains approximately four times as much data than an uncompressed file.

Example: On a 2.4 GHz client, a 1 GB trace data file takes roughly 1.5 minutes to be preprocessed and approximately five minutes to simulate four buffer pools from 25 000 to 1 000 000 pages (40 sizes). Note that a simulation runs considerably slower if other tasks are using the processor at the same time.

6. If you want to print the simulation results shown in your web browser, use your browser’s printing capabilities to print the information. For colored printouts, check the browser settings.

Example: In the Internet Explorer, click Tools — Internet Options — Advanced. Under Printing, select Print background colors and images.

7. In DB2 Performance Expert for z/OS, you can configure a different web browser. If required, click Monitor — Configuration — Preferences and follow the instructions.

Starting the simulation function

About this task

To start the simulation function, perform the following steps:

Procedure

1. Start the IBM DB2 Buffer Pool Analyzer by double-clicking the icon on your Windows desktop, or use the Start push button on the taskbar to start this client application.

   If you are using DB2 Performance Expert, click Tools > Buffer Pool Analysis for z/OS on the menu bar, or click the Opens the Buffer Pool Analysis for z/OS window toolbar button.

   The DB2 Buffer Pool Analyzer - z/OS main window is displayed.

2. On the menu bar, click File > Start Simulation. Alternatively, click the Starts simulating buffer pools toolbar button. To directly simulate Object Placement results right-click the object placement result file and select Simulate....

   Note: Simulate... passes the object placement recommendations to the simulation function. If the files match, the object placement output is used, otherwise an error message is displayed.
The Open dialog box is displayed. You use this dialog box to select and open a trace data file that contains the buffer pool activity data you want to use for the simulation.

Several sample buffer pool trace data files (*.trace) are delivered with Buffer Pool Analyzer in the ...\samples\simulation folder. You can use them to become familiar with this function.

3. Continue with “Selecting and opening a trace data file.”

Selecting and opening a trace data file
About this task

To select and open a trace data file, complete the following steps:

Procedure

1. Select a folder from the Look in list where the trace data file is located

   The File of type field shows the file name extension of buffer pool trace data files (*.trace for uncompressed files and *.terse for compressed files). If your trace data file lacks the recommended file name extension trace or terse, select All files (*.*) from the File of type list to see the appropriate files.

2. Click the trace data file to be opened.

   The File name field shows the name of the selected trace data file.

3. Click Open.

   The selected trace data file is opened, uncompressed if necessary, and the trace data is preprocessed. These steps can take some time, depending on compression and the size and contents of the trace data file.

   The DB2 Buffer Pool Analyzer - Simulation window is displayed. Perform the following steps before you start the simulation:

   a. “Step 1: Setting simulation parameters”

   b. “Step 2: Assigning objects to buffer pools” on page 2702

   You can navigate through the pages by clicking the appropriate page tab. On both pages, you can click Cancel to return to the main window, Help to get help on the current page, OK to start the simulation. When the simulation ends, continue with “Viewing the result of a simulation cycle” on page 2704.

Step 1: Setting simulation parameters
About this task

When you have opened a trace data file, as described in “Selecting and opening a trace data file,” and have clicked the Simulation Parameters tab, the following page is displayed:
This page shows a list of available buffer pools and their default parameters, and it provides controls to select buffer pools and change their parameters for the simulation.

- The top of the page shows the full path and name of the trace data file that you just opened.
- Each row of the list represents a single buffer pool and its simulation parameters. The list shows a set of 80 selectable buffer pools in the ranges of BP0 to BP49 (the 4 KB buffer pools), BP8K0 to BP8K9 (the 8 KB buffer pools), BP16K0 to BP16K9 (the 16 KB buffer pools), and BP32K0 to BP32K9 (the 32 KB buffer pools). Initially, active buffer pools (those for which activities were recorded during the time trace data was collected and stored in the trace data file) are preselected in the Simulate column.
- The Virtual sequential threshold field shows the percentage of the virtual buffer pool that might be occupied by sequentially accessed pages. The default value is 80%.
- The Minimum buffer simulation size field shows the minimum buffer pool size to be simulated. The size is shown in number of buffer pool pages (whereby a single page has a size of 4 KB, 8 KB, 16 KB, or 32 KB, depending on the buffer pool).
- The Maximum buffer simulation size field shows the maximum buffer pool size to be simulated. The size is shown in number of buffer pool pages.
- The Interval field shows the increment by which a buffer pool size is changed (between the minimum and maximum size) during the simulation. The increment is shown in number of buffer pool pages.

You use this page to determine which buffer pools you want to include in the simulation and to specify individual simulation parameters for each selected buffer pool.

- Select one or more buffer pools by selecting or clearing the respective check boxes. You can also use the Select all or Deselect all button to act on active buffer pools. Select the Show only active buffer pools check box to show only objects with buffer pool activity.
You can adjust the initial simulation parameters as required. Note that the time to perform a simulation increases with the number of buffer pools and the different buffer pool sizes to be simulated. Select the **Simulate single combined buffer pool** check box to run the simulation for the preselected buffer pools as a single combined buffer pool.

**Example:** With the initial values shown on this page, Buffer Pool Analyzer will simulate buffer pool sizes of 1,000, 2,000, 3,000 pages, and so on, up to 20,000 pages, for a selected buffer pool.

**Recommendation:** For practical reasons, choose a minimum and maximum buffer pool size and an interval that does not result in more than 40 buffer pool sizes per selected buffer pool. Otherwise, the time to generate the simulation result increases excessively. In addition, the simulation result becomes complex and difficult to interpret.

- Note that you can sort the list by clicking a column header of choice one or more times. Small arrows indicate the sort order.
- Review your selections and the simulation parameters for each selected buffer pool. To modify a parameter, ensure that the buffer pool is selected. Then click the respective field and edit the shown value. (Internally, the minimum, maximum, and interval values are slightly rounded to avoid odd-numbered simulation cycles.)
- If you have already performed “Step 2: Assigning objects to buffer pools,” click **OK** to start the simulation, otherwise continue with “Step 2: Assigning objects to buffer pools.”

**Step 2: Assigning objects to buffer pools**

**About this task**

When you have opened a trace data file, as described in “Selecting and opening a trace data file” on page 2700, and have clicked the Object to Buffer Pool Assignment tab, the following page is displayed:

![Figure 205. Simulation – The Object Assignment window](image)

This page shows objects and their assignments to buffer pools for this simulation, and provides controls to change these assignments.

- The list on the left side shows selectable objects, their original placements (in column **Trace buffer pool**), and their assignments (in column **Simulation buffer pool**) for this simulation.
The objects are shown in different sub-pages according to their sizes. Click the 4K, 8K, 16K, or 32K tab to see the respective objects. Note that these selections also change several button labels dynamically.

The **Name** field shows the name of the object. The **Type** field identifies the object as a table space (TS) or index space (IX). **DB ID** shows the corresponding database ID. **OB ID** shows the object ID.

The **Trace buffer pool** field shows the name of the buffer pool where the object is originally placed (determined from the content of the trace data file). The **Simulation buffer pool** field shows the name of the buffer pool to which the object is assigned for this simulation. Initially, before you change an assignment, both names are identical.

- On the right side the previously selected buffer pools are shown, and controls are given to change the objects' assignments for this simulation. Further, status information about the assignments is shown.

The **Current simulation buffer pools** field lists the names of the buffer pools to be simulated (those selected during the previous step). If the list becomes too long, which is indicated by trailing dots (...), move the mouse pointer above the list to display the complete list.

The **Total number of objects** field shows the total number of active objects contained in the trace data file. Active objects are objects for which buffer pool activities were recorded during the time trace data was collected (unlike inactive objects and objects in the DB2 catalog).

The **Number of objects for simulation** field shows the number of objects that are assigned to the current simulation buffer pools.

You use this page to change the assignment of objects to buffer pools for this simulation.

- Initially, the assignments are not changed. The buffer pool names in columns **Trace buffer pool** and **Simulation buffer pool** are identical for each object. If the assignments are not changed, the simulation is performed with the assignments that were active at the time trace data was collected.

- Objects can be assigned to buffer pools of matching page sizes (4 KB objects to 4 KB buffer pools, and so on). Use the 4K, 8K, 16K, or 32K tab to see and assign the respective objects.

- You can assign objects to any matching buffer pool, independently of whether a buffer pool is selected for this simulation. However, the simulation considers only those objects that are assigned to the buffer pools currently selected for simulation. Your assignments are saved and can be used for other simulations that use the same trace data file. The assignments are used if you select the corresponding buffer pools for simulation on the Simulation Parameters page.

To view only objects in the list that are assigned to the buffer pools to be simulated, select the **Show only 4K objects for current simulation buffer pools** check box. (The objects' page size changes dynamically.) If this check box is cleared, all objects (of that page size) that are contained in the trace data file are shown.

- To select a single object for an assignment, click the name of an object. To select a range of successive objects, click the first object, hold down the Shift key, then click the last object in the sequence. To select several separate objects, click the first object, hold down the Ctrl key, then click the other objects as required.

- To assign one or more selected objects to a buffer pool, select a buffer pool from the **Buffer pool** list and click **Set**.

- To return one or more selected objects to their original placements, click **Reset**.

To return all objects of the currently displayed page size, for example, 4 KB
objects, click **Reset 4K** (the button label changes dynamically). To return all objects, independently of their page sizes, click **Reset All**.

- Note that you can sort the list by clicking a column header of choice one or more times. Small arrows indicate the sort order.

1. Review your assignments and adjust them as required.

2. If you have already performed the **“Step 1: Setting simulation parameters”** on page 2700, click **OK** to start the simulation. Otherwise complete the **“Step 1: Setting simulation parameters”** on page 2700 before you start the simulation.

When the simulation starts, a progress indicator is shown. Note the estimated completion time. If you want to stop the simulation before completion, click **Cancel**. Control is returned to the DB2 Buffer Pool Analyzer - Simulation window.

When the simulation finishes, the result is saved in the **Results** subfolder of the **Simulation** folder for later viewing. You are asked whether the simulation report should be opened now.

- **Yes** immediately displays the result in a new browser window. The DB2 Buffer Pool Analyzer - Simulation window is closed.
- **Cancel** returns control to the DB2 Buffer Pool Analyzer - Simulation window.

3. Continue with **“Viewing the result of a simulation cycle.”**

### Viewing the result of a simulation cycle

#### About this task

When the simulation finishes, the Buffer Pool Analyzer main window shows the result in the **Results** subfolder of the **Simulation** folder. The subfolder can contain results from several simulation cycles. The result from the most recent simulation is highlighted.

![Figure 206. Simulation – The Results Selection window](image)

Results are named **SIM <trace_file> <date> <time>**, whereby **SIM** stands for Simulation, **<trace_file>** for the name of the trace data file that was used for the simulation, **<date>** and **<time>** for the date and time when the simulation started.

1. If you want to delete results from the folder, select a specific result by clicking it. Then press the Delete key. To delete all results, right-click **Results**. Then click **Delete all**. You are asked to confirm the deletion.

   Note that results remain on the hard disk drive and take up space until they are deleted. They are usually located in folder **C:\Documents and Settings \userid\db2pev<version>\simulation reports**. However, because of their special format, do not manipulate the folder contents manually.

2. To view the result from a simulation, double-click it, or select it and press Enter.
The result is shown in your web browser and contains the following information:

- A comparison of buffer pool efficiency for separate buffer pools versus a single combined buffer pool, as function of the simulated total buffer pool sizes.

**Table 216. Example of simulation result, showing a comparison of buffer pool efficiency**

Name
The name of the object.

Type
The type of the object (table space or index space).

DB ID
The corresponding database ID.

OB ID
The object ID.

Trace buffer pool
The original buffer pool to which the object was assigned at the time trace data was collected.

Trace entries
The number of buffer pool activity entries in the trace data file for this object.

Getpages
The total number of Getpage requests (Random, Sequential, List) for this object.

Random misses
The number of misses of Getpage - Random requests for this object resulting from the simulated size.

Sequential misses
The number of misses of Getpage - Sequential requests for this object resulting from the simulated size.

List misses
The number of misses of Getpage - List requests for this object resulting from the simulated size.

Setwrite misses
The number of misses of Setwrite Intent requests for this object resulting from the simulated size.

Residency time
The average duration, in hours, minutes, and seconds, this object would be kept in the simulated buffer pool and size.
3. Use the hypertext links to navigate through the report.

   You can open sections of the report by clicking **Open this report in a new browser window**.

   Note especially the **Click here to see more online help** links. They provide detailed information about how to interpret the report.

**Performance-related tips**

About this task

The following tips might be useful when you perform a simulation:

- The result from a simulation shows a comparison of buffer pool efficiency for separate buffer pools versus a single combined buffer pool (see step 2). Generally, a single buffer pool improves the total buffer pool hit ratio, requires less monitoring and tuning, treats applications equally, and offsets increasing workload of one application by decreasing workload in another. However, with a single buffer pool no preference to applications with different levels of importance can be given, and different access and usage pattern cannot be isolated.

Multiple buffer pools allow for performance preferences, grouping according to access pattern, different thresholds, separation of table spaces from index spaces to optimize the hit rate for indexes, and more. In most cases, multiple buffer pools are necessary to optimize among total buffer pool size and its cost, and overall transaction performance. However, too many buffer pools also increase the effort to monitor and administer the buffer pools.

- The total buffer pool size has a great effect on performance. However, if it is too large, and there is not enough memory to allocate them, then a minimum buffer pool for each page size will be allocated, and the performance will be sharply reduced. To calculate the maximum buffer pool size, all other storage utilization must be considered by DB2 as well as the operating system and any other applications. When the total available size is determined, this area can be divided into different buffer pools to improve utilization.

- Smaller buffer pools are more likely affected by fluctuating workload. Smaller buffer pools tend to show more performance peaks than larger buffer pools.

- The size of buffer pools that predominantly process write requests can be minimized. These buffer pools usually show a low hit ratio. Consecutive write operations fill up the buffer pool and require the data to be frequently written to disk. This applies typically to objects that log or journalize transaction data.

### Analyzing long-term buffer pool performance

This topic describes how to view performance data from several bpd files on the client to perform a long-term analysis of buffer pool performance.

About this task

Related tasks:

- Before you can use this function, you must have performed the tasks described in:
  - “Collecting data” on page 2607
  - “Creating activity reports and bpd files” on page 2618

  Here, only bpd files are of interest. Long-term analysis requires at least one bpd file as input; however, the intention is to analyze data from multiple bpd files to span a longer period.

- “Downloading files from the host to the client” on page 2732
One or more buffer pool data files must be available on the client (the files with the recommended file name extension bpd).

General remarks:
1. Your client should have approximately 40 MB of available physical memory (random access memory) for this function. You can check this in the Windows Task Manager. Close other applications, if necessary.
2. The data used for this function reflects the performance for the intervals for which trace data was collected and for the time frames that were specified with the GLOBAL and the BPACTIVITY command when the bpd files were created.
3. If you want to print any of the graphical information from the following windows, place the cursor on the displayed graphical information and click View → Open dataview in browser. When the browser window is displayed, use your browser's printing capabilities to print the information. For colored printouts, check the browser settings.
   Example: In the Internet Explorer, click Tools → Internet Options → Advanced. Under Printing, select Print background colors and images.

Starting the long-term analysis function
About this task

Procedure
1. Start the IBM DB2 Buffer Pool Analyzer by double-clicking the icon on your Windows desktop, or use the Start push button on the taskbar to start this client application.
   If you are using DB2 Performance Expert, click Tools > Buffer Pool Analysis for z/OS on the menu bar, or click the Opens the Buffer Pool Analysis for z/OS window toolbar button.
   The DB2 Buffer Pool Analyzer - z/OS main window is displayed.
2. On the menu bar, click File > Long-Term Analysis. Alternatively, click the Starts buffer pool long-term analysis toolbar button.
   The Buffer Pool Analysis - Long-Term Analysis window is displayed. You see the first page of the long-term analysis wizard, which guides you through the following steps:
   a. “Step 1: Selecting and opening buffer pool data files”
   b. “Step 2: Choosing a subsystem and specifying an analysis type” on page 2710
   c. “Step 3: Specifying counters, objects, time frame, and output” on page 2711
   You can navigate through the pages by clicking Next or Back. On all three pages, you can click Cancel to return to the main window, or Help to get help on the current page. When you have finished these steps, you can continue with “Viewing the result of a long-term analysis” on page 2715.

Step 1: Selecting and opening buffer pool data files
About this task

When you have started the long-term analysis function, as described in “Starting the long-term analysis function,” the first page of the long-term analysis wizard is displayed:
You use this page to select one or more bpd files that contain the performance data you want to analyze. Initially, this dialog box is empty. The example lists three bpd files that were already selected.

Procedure

1. Select one or more bpd files to be opened, using the following steps in reasonable order:
   
   • To add one or more bpd files to the (initially empty) list of selected bpd files, click Add Files. The Open dialog box is displayed. You use this dialog box to select one or more bpd files that you want to add to the list of selected bpd files. Several sample buffer pool data files (*.bpd) are delivered with Buffer Pool Analyzer in the ...\samples\reporting folder. The sample files are named bpa-zos-1ta-samplenn.bpd. You can use them to become familiar with this function.
     
     a. Select a folder from the Look in list where the bpd files you want to use are located.

     The File of type field shows the file name extension of buffer pool data files (*.bpd). If your bpd files do not have the recommended file name extension bpd, select All files (*.*) from the File of type list to see the appropriate files.

     b. Click the bpd file to be added to the list of selected bpd files.

     You can add multiple files by selecting multiple files in the Open dialog box. To select a range of files, click the first file, hold down the Shift key, then click the last file in the sequence. To select several separate files, click the first file, hold down the Ctrl key, then click the other files as required. To select all files, press Ctrl+A.

     The File name field shows the names of the selected bpd files.

     c. Click Open.

     The Open dialog box closes and the bpd files are added to the list of selected bpd files.

     Restriction: bpd files are usually named at your own discretion, except for the recommended file name extension bpd. Thus, it is possible that bpd files exist with different names, but identical or partially identical performance data. If you accidentally select such files for the long-term analysis, the duplicated performance records falsify the result. Buffer Pool Analyzer does not filter out duplicates from the selected bpd files.

     • To remove one or more bpd files from the list of selected bpd files, select one or more files in the list, then click Remove Selected Files.
2. When you have completed your selection of bpd files, and the list of selected bpd files contains at least one file, click **Next**. The selected bpd files are opened, and the data is preprocessed. This step can take some time, depending on the sizes and contents of the bpd files. A progress indicator is displayed that shows the percentage of preprocessing that has been completed. You can click **Cancel** to cancel preprocessing and restore the file selection page.

Preprocessing performs several activities on each bpd file, which eases your selections and specifications in the following steps:
- The subsystems are determined from which performance data was collected.
- The counters and active objects are determined.
- The earliest and the latest timestamp in each bpd file is determined.

3. Continue with **“Step 2: Choosing a subsystem and specifying an analysis type.”**

**Step 2: Choosing a subsystem and specifying an analysis type**

**About this task**

When you have performed **“Step 1: Selecting and opening buffer pool data files”** on page 2708, the second page of the long-term analysis wizard is displayed:

![Figure 208. Long-Term Analysis – The Subsystem and Analysis Type Selection window](image.png)

Use this page to verify your selection of bpd files and to specify the type of analysis you want to perform.

- The bpd files you selected in the previous step might contain performance data from different subsystems. However, a meaningful long-term analysis can only be performed with data from one subsystem. The **DB2 Subsystem** group box on this page shows from which subsystems the various selected bpd files were created. (This information was acquired when the selected bpd files were preprocessed.)

The subsystem folder with the most bpd files is opened, and the corresponding subsystem is preselected from the **Subsystem to analyze** list. You can expand or collapse the tree items by clicking the plus sign (+), respectively the minus sign (-), or by double-clicking the corresponding tree item.

Use this information to decide from which subsystem you want you use the data for the long-term analysis.
The Analysis type group box on this page shows a list of selectable presentation types, with one type being preselected. The analysis type determines how the information will be presented in the graphical report.

Use this list to decide about the analysis type. For the selected type, a brief description and an illustration of the chart type is shown on this page. You can select the types in any order to examine them. Viewing the result of a long-term analysis provides a more detailed description and explanation of the output from these analysis types.

1. Select the bpd files you want to use by selecting the appropriate subsystem from the Subsystem to analyze list.
2. Under Analysis type, select an appropriate analysis type.
3. Click Next and continue with “Step 3: Specifying counters, objects, time frame, and output,” or click Back to return to the previous page.

Step 3: Specifying counters, objects, time frame, and output

About this task

When you have performed “Step 2: Choosing a subsystem and specifying an analysis type” on page 2710, the third page of the long-term analysis wizard is displayed. This page differs somewhat depending on the analysis type you specified in the previous step. At first, this section shows and describes the more flexible specifications applicable to the first four analysis types (“Weekly view by day”, “Daily view by hour”, “View of a period of time”, and “Bar chart”), and the similarities of this page that apply to all analysis types. “Characteristics of the pie chart analysis types” on page 2713 details the specifications for remaining pie chart presentations (which is basically a more restrictive use of 1-to-n and n-to-1 relations between counters and objects).

Figure 209. Long-Term Analysis – The Counter and Object Selection window

Use this page to specify which counters and objects to consider for the analysis, the time frame to include, and the name to be used for saving the analysis result.
For a long-term analysis usually only a subset of counters and objects is of interest. This page is used to specify which of them are to be included in the analysis.

- **Counters to display** shows a tree view of selectable counters. You can expand or collapse the tree items by clicking the plus sign (+), respectively the minus sign (-), or by double-clicking the corresponding tree item.
  
  You use this list to specify which counters to consider for the long-term analysis, provided they pertain to selected active objects (see later in this topic).

- **Objects to display** shows a tree view of selectable objects. You can expand or collapse the tree items by clicking the plus sign (+), respectively the minus sign (-), or by double-clicking the corresponding tree item. The list of objects contains those objects that were identified as active objects in the selected bpd files during preprocessing, and which belong to the selected subsystem.
  
  You use this list to specify which objects to consider for the long-term analysis, provided they pertain to selected counters (see previous information).

In both trees you can select counters, respectively objects, on different levels and in any combination. The tree hierarchies denote the counter and object hierarchies, not selectable groups of counters or groups of objects. For example, the Getpage total count contains the sum of the Getpage random, Getpage ridlist, and Getpage sequential counts; nevertheless, you can select Getpage total and Getpage random only, which will only show these two counters in the result.

As indicated, the selections of counters and objects are interrelated. Technically, both selections act as filters, which means that the analysis result includes only information about selected counters pertaining to selected objects. Practically, deliberate selections of counters and objects on this page permit two different but powerful views:

- If you are interested how a single counter behaves in several objects (for example, to compare the Getpage sequential counts of several objects), you select one counter and several objects. This is basically a **1-to-n** relation between counters and objects. However, you can also set up a **few-to-many** relation, for example, to compare a few counters in several objects.

- If you are interested how several counters behave in one object (for example, to analyze the key counters of an object), you select the counters and a single object. This is basically a **n-to-1** relation between counters and objects. However, you can also set up a **many-to-few** relation.

As pointed out, you are not restricted in your choice of **n-to-m** relations between counters and objects. The long-term analysis function processes any of your selections, independently of whether they make sense or how complex the graphical representation of the result becomes. Start with simple **1-to-1**, **1-to-n**, or **n-to-1** counter-to-object relationships until you become familiar with the result. Refine these relations step by step.

Note that this degree of freedom in selecting counters and objects for the long-term analysis applies to the analysis types “Weekly view by day”, “Daily view by hour”, “View of a period of time”, and “Bar chart”. The selection of counters and objects for pie chart results is more restrictive (1-to-n and n-to-1) to avoid complex results. The details are described in the chart analysis types on page 2713.

- The **Time frame** group box shows, by default, the earliest and the latest timestamp of data found in the selected bpd files. The controls can be used to limit the time frame by changing one or both timestamps. Only data from the
selected bpd files with timestamps between the default, or specified, From and To dates is used for the long-term analysis. Reset From and Reset To reset any specified values to the default values. These push buttons are helpful if you change your mind; you do not need to remember the earliest and latest timestamps.

- The Graphic file name field shows the proposed name under which the result from the long-term analysis will be saved for later viewing. The proposed name can be changed, if required. The syntax of proposed names is explained in “Viewing the result of a long-term analysis” on page 2715.

1. Select the Counters to display by selecting or clearing the check boxes as required. At least one counter must be selected.
2. Select the Objects to display by selecting or clearing the check boxes as required. At least one object must be selected.
3. Review the information under Time frame. If required, change one or both timestamps. To enter a different timestamp, overwrite the timestamp. Adhere to the format, otherwise, this function might not be able to process the appropriate records from the bpd files, or might not be able to continue.
4. Review the proposed name in the Graphic file name field. Change it as required.
5. Click Create, or click Back to return to the previous page.

The wizard creates the graphical result and saves it under the specified name. If the name already exists, you are given the choice to replace the existing graphic file or to save the new one under a different name.

When the long-term analysis wizard finishes, the result is immediately shown in a new browser window and in the right pane of the Buffer Pool Analysis main window. In addition, the result is saved in the Results subfolder of the Long Term Analysis folder for later viewing.

6. Continue with “Viewing the result of a long-term analysis” on page 2715.

Characteristics of the pie chart analysis types

About this task

In “Step 2: Choosing a subsystem and specifying an analysis type” on page 2710, you were asked to select one of six analysis types. For the first four types, which are “Weekly view by day”, “Daily view by hour”, “View of a period of time”, and “Bar chart”, the previous description outlined your choice of specifying n-to-m relations between counters and objects, restricted only by its usefulness.

For the remaining analysis types “Pie chart: display 1 counter and n objects” and “Pie chart: display n counters and 1 object” this degree of freedom is not useful. Therefore, when you choose one of these analysis types, the third page of the long-term analysis wizard (the upper part) looks as follows:

- For the analysis type “Pie chart: display 1 counter and n objects”: 
In the left pane, **Counters to display** shows a tree view of selectable counters. Radio buttons indicate that you can select only one item. In the right pane, **Objects to display** shows a tree view of selectable objects. The check boxes indicate that you can select multiple objects. This restricts your selections to a 1-to-n relation (which includes 1-to-1) between counters and objects for this analysis type. Note that you can expand the tree items on both sides to select a counter, respectively one or more objects.

- For the analysis type “Pie chart: display n counters and 1 object”:

When you compare the list of selectable counters [Figure 210] and [Figure 211] you will notice on the left side that ratios are shown differently in context with counters. In [Figure 210] ratios are treated identical with counters because you can select only one counter or ratio (1-to-n relation to objects). Opposed to this, in [Figure 211] ratios are shown apart from counters to express their differences (ratios versus absolute values) and to emphasize that you can select multiple counters or multiple ratios (n-to-1 relation to objects). Counters and ratios are mutually exclusive for this analysis type.
Viewing the result of a long-term analysis
About this task

When the long-term analysis wizard finishes, the Buffer Pool Analyzer main window shows the result in one of the Results subfolders of the Long-Term Analysis folder. The subfolders can contain results from several long-term analyses. The result from the most recent analysis is highlighted.

Results are named <analysis_type>-<subsystem>-<date>-<time>, whereby <analysis_type> and <subsystem> correspond to your specifications in "Step 2: Choosing a subsystem and specifying an analysis type" on page 2710, and <date> and <time> stand for the date and time when the long-term analysis result was generated and saved.

1. If you want to delete results from the folder, select a specific result by clicking it. Then press the Delete key. To delete all results, right-click Results. Then click Delete all. You are asked to confirm the deletion.

Note that results remain on the hard disk drive and take up space until they are deleted. They are usually located in folder C:\Documents and Settings \<userid> \db2pev\version \bpa-ZOS-reports \long-term-analysis. However, because of their special format, do not manipulate the folder contents manually.

2. To view the result from a long-term analysis, double-click it, or select it and press Enter.

The result is shown in the right pane of the Buffer Pool Analysis main window. The result consists of a chart and a corresponding legend and report. The legend contains symbols and text that explain the chart. The report lists the information in table form and shows the values represented in the chart. The legend and the report can be switched on or off by using the Legend and Report push buttons.

All results can also be shown in your web browser. Right-click into a graphic and choose Open in browser.

The long-term analysis function generates results that differ depending on the analysis type that is specified in "Step 2: Choosing a subsystem and specifying an analysis type" on page 2710.

Figure 212. Long-Term Analysis – The Results Selection window
examples of charts from each analysis type to help you understand how your specifications (mainly the counters and objects) and the performance data from the bpd files are reflected in the result.

A "Weekly view by day" analysis result:

![Weekly view by day chart](image)

Figure 213. Long-Term Analysis – Example of "Weekly view by day" result

This analysis type shows counter values per weekday of selected counters and objects. Counter values represent per-minute values, for example 5 000 Getpage total operations per minute on average over a day. One counter value per counter, object, and weekday is shown, for example, 3 000 Read page operations (the counter) on BP0 (the object) on Monday (the weekday), 2 500 for the same combination on Tuesday, and so on. The counter values for the seven weekdays are connected by lines for better readability. (The lines themselves do not represent interim values.) The “Average” counts show the calculated averages over all affected objects for each counter per weekday, for example, the average of the Write page operations (the counter) of buffer pool BP0 and BP1 (the objects). The interpretation of these average counts is only reasonable if the affected objects are of the same type, for example only buffer pools or only page sets. If you selected objects of different types, the average values are calculated over all objects and do not yield helpful results. Note that counters and ratios are treated equally in this graphic, except that they have their dedicated y-axis.

If the data from the bpd file spans several weeks, the values are overlaid, which means that the described graphic for one week is overlaid with a similar graphic for the second week (having different values), and so on. This example clarifies what is already described in ["Step 3: Specifying counters, objects, time frame, and output" on page 2711](#). You can easily overload the graphic by selecting too many counters and objects for longer periods.

You can use this analysis type to analyze how certain counters develop over a week (if the time frame covers a week), or to compare how counters develop over several weeks. This type helps to identify counters that show conspicuously high or low values at specific weekdays or show a trend toward lower or higher values over weeks.

A “Daily view by hour” analysis result:
This analysis type shows counter values per hour of selected counters and objects. Counter values represent per-minute values, for example 5,000 Getpage operations per minute on average over an hour. One counter value per counter, object, and hour of the day is shown, for example, 7,000 Read page operations (the counter) on BP0 (the object) between 4:00 p.m. and 5:00 p.m. (the hour), 3,000 for the same combination during the next hour, and so on. The counter values for the 24 hours of a day are connected by lines for better readability. (The lines themselves do not represent interim values.) The “Average” counts show the calculated averages over all affected objects for each counter per hour, for example, the average of the Write page operations (the counter) of buffer pool BP0 and BP1 (the objects). The interpretation of these average counts is only reasonable if the affected objects are of the same type, for example only buffer pools or only page sets. If you selected objects of different types, the average values are calculated over all objects and do not yield helpful results. Note that counters and ratios are treated equally in this graphic, except that they have their dedicated y-axis.

If the data from the bpd file spans several days, the values are overlaid, which means that the described graphic for one day is overlaid with a similar graphic for the second day (having different values), and so on. The same precautions should be taken as with the “Weekly view by day” analysis to avoid overloaded results.

You can use this analysis type to analyze how certain counters develop over a day (if the time frame covers a day), or to compare how counters develop over several days. It is basically a more detailed analysis than the “Weekly view by day” analysis.

A “View of a period of time” analysis result:
This analysis type shows counter values of selected counters and objects from several bpd files in chronological order. Counter values represent per-minute values, as in the previous analysis types. One counter value per counter, object, and bpd file is shown, for example, 1,000 Read request operations (the counter) on BP0 (the object) on average from data from the first bpd file, 1,050 for the same counter and object from the second bpd file, and so on. The counter values are connected through lines for better readability. The y-axis on the left side is applicable to counter values, the one on the right side to ratios, if those were selected.

This analysis type provides meaningful information when several bpd files were selected, and if the effect of this selection was not canceled by a restrictive specification of a time frame. For example, if you have selected seven bpd files, whereby each file contains performance data of one subsequent day, but you have restricted the time frame to the second and third day, only these two bpd files are effectively used in this analysis.

Each effectively used bpd file is identified on the x-axis by a timestamp, and the files are shown in ascending order from left to right. The identifying timestamp is the timestamp of the latest performance record found in a bpd file (which might not necessarily be used in this analysis if the time frame restricts the use to some time before the latest record).

A further clarification on the y-values is appropriate: The calculated per-minute values of counters and ratios of effectively used bpd files are based on the specified (or default) time frame. For example, if the latest bpd file contains performance records of one day between 8:00 a.m. and 12:00 a.m., but you have specified a time frame limit of 9:00 a.m. (for whatever reason), the values for selected counters and ratios are calculated based on performance records between 8:00 a.m. and 9:00 a.m. (Nevertheless, the identifying timestamp for this bpd file on the x-axis shows 12:00 a.m.)

You can use this analysis type to analyze how certain counters develop over long periods, by using your portfolio of historical bpd files.

A “Bar chart” analysis result:
This analysis type shows the distribution of counter values of selected counters over selected objects as bar chart. As usual, counter values are per-minute values. The selected counters in this example are the Getpage total counter, the Read page counter, and the Read request counter. The selected objects are either one or more objects of one or more buffer pools, or all objects of one or more buffer pools, dependent on your selections in “Step 3: Specifying counters, objects, time frame, and output” on page 2711. In this example, buffer pools BP0, BP1, and BP2 were selected, which means that the three counters encompass the activities of all objects in these buffer pools. The x-axis reflects the selected objects, here the buffer pools.

You can use this analysis type to easily compare selected counters in selected objects, for example, to compare the workload in selected buffer pools.

A “Pie chart: display 1 counter and n objects” analysis result:

This analysis type shows a 1-to-n relationship of a selected counter to several selected objects as pie chart. Each slice of the pie represents one of
the selected objects; the size of the slice corresponds to the percentage of
the total of all selected objects. In this example, the selected counter is the
Getpage total counter, and the selected objects are the objects in buffer
pools BP0, BP1, and BP2. The percentages are shown in the graphic; the
corresponding values per object (as per-minute values) are shown in the
report following the graphic.

You can use this analysis type to compare a few values to a total, for
example, to determine how much of the Getpage total activity happens in
the most important buffer pools.

A “Pie chart: display n counters and 1 object” analysis result:

Figure 218. Long-Term Analysis – “Pie chart: display n counters and 1 object” analysis result

This analysis type shows a n-to-1 relationship of several selected counters
to a selected object as pie chart. Each slice of the pie represents one of the
selected counters; the size of the slice corresponds to the percentage of the
total of all selected counters. In this example, the selected counters are
Getpage total, Read page, and Read request, and the selected object is BP2.
The percentages are shown in the graphic; the corresponding values per
counter (as per-minute values) are shown in the report following the
graphic.

You can use this analysis type to compare a few values to a total, for
example, to determine which counters have the most activity in a buffer
pool.

Example of a use case

This section describes an example of a use case that explains how Buffer Pool
Analyzer tools can be used.

The example supports the generalized approach given in “Buffer pool analysis and
tuning processes” on page 2588. It is assumed that you already have a reasonable
understanding of host-based activity reports (described in “Interpreting activity
reports” on page 2628) and the use of the object placement and simulation
functions (described in and “Simulating buffer pool behavior” on page 2698). The
example is applicable for Buffer Pool Analyzer for z/OS, respectively the Buffer
Pool Analysis function of DB2 Performance Expert for z/OS.

The example shows:
1. How summary reports are used to quickly identify major buffer pool performance characteristics.
2. How detail reports are used to identify the most active and most expensive objects (in terms of synchronous operations).
3. How object placement and simulation are used to analyze the effects of different buffer pool attributes.

**Using reports to analyze trace data**

The following steps show how summary reports and detail reports are used to identify objects of interest.

The reports are shown partially; certain issues are highlighted.

1. Creating host reports and a buffer pool data file with batch job BPOQBTCH (described in “Specifying a JCL command stream” on page 2620):
   Data is collected over 30 minutes, with short record format. The trace data file is used for activity reports and the bpd file generation. The trace data file and the bpd file are used in later steps for object placements and simulations on the client.

2. Analyzing the activity reports:
   a. The summary report, ordered by BPID-QPAGESET and sorted by ASYNCPAGE, shows the buffer pool configuration (in the Buffer Pool Characteristics report section) and high-level activity (in the Buffer Pool Statistics report section):

      | BP0 | BP1 | BP2 | BP3 | BP10 | BP32K |
      |-----|-----|-----|-----|------|-------|
      | BPID | Buffer Pool Characteristics | -------- | -------- | -------- | -------- | -------- |
      | General | Virtual pool size | 1000 | 2000 | 297525 | 297525 | 3000 | 100 |

      | BP0 | BP1 | BP2 | BP3 | BP10 | BP32K |
      | BUFFER POOL ID | Buffer Pool Statistics | -------- | -------- | -------- | -------- | -------- |
      | Reached threshold | Deferred write | 0 | 0 | 0 | 0 | 0 |
      | System hit ratio | 39.73 | 97.15 | 75.03 | 99.24 | 100.00 |
      | Getpage request | 813 | 561 | 321601 | 665989 | 1018 |
      | Random | 807 | 126 | 315575 | 665948 | 962 |
      | Sequential prefetch | 49 | 16 | 2857 | 59 | 0 |
      | Dynamic prefetch | 304 | 0 | 70262 | 2876 | 0 |
      | Write | 3 | 0 | 10785 | 1222 | 0 |

   The report shows:
   - The system hit ratio is low for buffer pool BP2. The number of pages that are written to disk is moderate.
   - The applications are doing a lot of random Getpage operations in buffer pools BP2 and BP3.
   - Many Getpage operations in buffer pool BP2 are converted to Dynamic prefetch operations.
   - Dynamic prefetches are significant higher than Sequential prefetches, which implies that the application is causing unneeded prefetches. In this example, it would be advantageous if the applications could be modified to move away from the current random scanning of tables or indexes to
obvious scanning. This would change the prefetch behavior from dynamic to sequential and allow the optimizer to plan prefetches in a much more efficient way.

b. The detail report, ordered by BPID-QPAGESET and sorted by BPID and GETPAGE, shows the most active objects in the Detail Activity report section:

The report shows:

- Again, a very large proportion of all disk accesses is concentrated in a relatively small number of objects.
- One object stands out by a different average delay time on synchronous read operations.
The conclusion so far is: It is worth simulating the effect of moving such objects into a buffer pool of their own.

The recommendation so far is: Objects with frequent misses should be moved to a faster disk, if possible.

**Analyzing effects of different buffer pool attributes**

The following steps show the effects of using object placement and simulation, based on the information found in the activity reports.

1. Performing a simulation using the actual object placements:
   a. The four most active buffer pools BP1, BP2, BP3, and BP10 are chosen.
   b. A minimum and maximum page size for all buffer pools of 25\,000 and 1\,000\,000 and a simulation interval of 25\,000 is chosen (the actual buffer pool size for BP2 and BP3 is approximately 300\,000 pages each).
   c. The object to buffer pool assignments remain unchanged (the actual object placements are to be simulated).

</tbody>
</table>

- For a total buffer pool size of less than 300\,000 pages the hit ratio is better if BP2 and BP3 are combined in a single buffer pool. Above 300\,000 pages the improvement is marginal. An object placement should be performed to determine if there is a more favorable distribution of objects.
- It is noticeable that even around 1\,000\,000 pages the buffer pool hit ratio still improves slowly with further memory.

</tbody>
</table>

- The most important result is the allocation of memory between the two main buffer pools BP2 and BP3 (each one actually using approximately 300 000
pages): For a total of 600 000 pages, the simulation recommends to allocate
three times as much memory to BP2 as BP3.
v The values for buffer pools BP1 and BP10 are wasteful and caused by the
high interval value simulated (25 000 pages). An additional simulation
between 500 and 5 000 pages, only for BP0, BP1, BP4 and BP10, will give a
better idea of the amount of memory they really require, but this is
absolutely insignificant compared to BP2 and BP3.
“Simulated behavior of each separate Buffer Pool” of the simulation result
shows:

- The “Misses” columns for buffer pools BP2 and BP3 show that, with unlimited memory, no improvement would be achieved with more than 900 000 pages for BP2 and 500 000 pages for BP3. These are the absolute limits, although economical limits will always be lower.

The other tables in this simulation result are only required for very detailed analysis, especially for application tuning.

2. Performing object placement with default rule set and object placements:
   a. The default rule set is used; in this case pattern_large.
   b. No changes are made to rules or placements. The object placement wizard is started by simply clicking Next.

   “ALTER BUFFERPOOL COMMANDS” of the object placement result shows the new buffer pools and the recommended sizes:
   
   ```
   ALTER BUFFERPOOL(BP3) VPSIZE(119555) HPSIZE(0) VPSEQT(20) DWQT(39) VDQT(10,0)
   ALTER BUFFERPOOL(BP2) VPSIZE(392018) HPSIZE(0) VPSEQT(20) DWQT(0) VDQT(0,0)
   ALTER BUFFERPOOL(BP10) VPSIZE(15046) HPSIZE(0) VPSEQT(40) DWQT(10) VDQT(3,0)
   ALTER BUFFERPOOL(BP0) VPSIZE(15046) HPSIZE(0) VPSEQT(20) DWQT(25) VDQT(6,0)
   ALTER BUFFERPOOL(BP32K) VPSIZE(1881) HPSIZE(0) VPSEQT(40) DWQT(10) VDQT(3,0)
   ALTER BUFFERPOOL(BP4) VPSIZE(15046) HPSIZE(0) VPSEQT(98) DWQT(2) VDQT(0,0)
   ALTER BUFFERPOOL(BP1) VPSIZE(15046) HPSIZE(0) VPSEQT(100) DWQT(70) VDQT(50,0)
   ```

   “ALTER TABLESPACE AND ALTER INDEX STATEMENTS” of the object placement result shows the object placement commands (for those objects being allocated to a different buffer pool):
   
   ```
   ALTER TABLESPACE WTNTEST.WTNADD BUFFERPOOL BP3;
   ALTER INDEX WTNTEST.WTNADD01 BUFFERPOOL BP2;
   ALTER TABLESPACE WTNTEST.WTNARC BUFFERPOOL BP3;
   ALTER TABLESPACE WTNTEST.WTNHST BUFFERPOOL BP3;
   ALTER INDEX WTNTEST.WTNHST01 BUFFERPOOL BP2;
   ALTER INDEX WTNTEST.WTNAST01 BUFFERPOOL BP2;
   ALTER INDEX WTNTEST.WTNBAL01 BUFFERPOOL BP2;
   ```

   - The actual object assignments (at data collection time) separate data from indexes.
   - The default rule set in the selected pattern file has separated objects primarily according to the amount of sequential and dynamic access.

   “OBJECT PLACEMENT OVERVIEW” of the object placement result shows attributes and placement of objects:

Table 223. Results of object placement

</table>
3. Performing a simulation with results from object placement:
   
a. The two most active buffer pools BP2 and BP3 are chosen (they contain almost all database activity).

   b. A minimum and maximum page size for all buffer pools of 100 000 and 1 000 000 and a simulation interval of 25 000 is chosen.

   “Simulated behavior of each separate Buffer Pool” of the simulation result shows:

   Table 224. Results of simulated behavior of most active buffer pools

<table>
<thead>

<td>97.7 2.2</td>
</tr>
</tbody>
</table>

   • The application hit ratio for buffer pool BP2 is marginally better than in the previous simulation (look at misses for a given number of total buffer pool pages).

   • Buffer pool BP3 is already optimal at 100 000.

4. Performing object placement with modified rule set:
   
a. The default rule set pattern_large is selected and edited as follows:

   1) A duplicate BP2, called BP12, is added directly under BP2.

   2) A duplicate BP3, called BP13, is added directly under BP3.

   3) BP2 and BP3 should only be used for table spaces.

   4) BP12 and BP13 should only be used for index spaces.

   b. The edited pattern file is saved with a new name. This pattern will be chosen as the default for all future placements with this subsystem.

   c. No changes are made to placements.

5. Performing simulation with results from object placement with modified rule set:
   
a. Buffer pools BP2, BP3, BP12, and BP13 are chosen.

   b. A minimum and maximum page size for all buffer pools of 25 000 and 1 000 000 and a simulation interval of 25 000 is chosen.
“Recommended sizing for separate Buffer Pools” of the simulation result shows:

Table 225. Recommended sizing for separate buffer pools with modified rule set

v The results are further improved again (look at misses for a given number of
total buffer pool pages).
6. Performing object placement with the default rule set and moving “expensive”
objects:
a. The default rule set pattern_large is used again (not the saved pattern
from step 4 on page 2727).
b. No changes are made to rules.
c. When the object placement is performed, the identified problem table spaces
and index spaces (from the detail report) are assigned to buffer pool BP10.
Chapter 5. Monitoring

2729


7. Performing simulation with results from the object placement:
   a. Buffer pools BP2, BP3, and BP10 are chosen.
   b. A minimum and maximum page size for all buffer pools of 25 000 and 1 000 000 and a simulation interval of 25 000 is chosen.

   “Recommended sizing for separate Buffer Pools” of the simulation result shows:

   **Table 227. Recommended sizing for separate buffer pools with moved objects**

- There is an improvement at 600,000 pages, but it is worse at 1,000,000 pages.

Further object placements and simulations could be performed for a combination of the saved rule set and putting problem table spaces into a separate buffer pool.

**Downloading files from the host to the client**

This section describes how to download the input data for these functions from the host to the client.

**About this task**

The following Buffer Pool Analyzer functions are performed on a Windows-based client and require input data from the host.

- “Viewing performance data on the client” on page 2678
- “Optimizing object placements and initial buffer pool sizes” on page 2683
- “Simulating buffer pool behavior” on page 2698
- “Analyzing long-term buffer pool performance” on page 2707

You can use any file transfer method or product, for example, the File Transfer Protocol (FTP) or IBM Personal Communications. You must have at least one of these products installed on your client. The following procedure describes the basic steps to download files. For more information, see the product documentation.

**Recommendation:** If you have the choice, you should use FTP, because it is faster.

**Recommendation:** If you need to download large trace data files (for simulations), consider using compressed trace data sets to reduce download times. See “Collecting data” on page 2607 for instructions how to create compressed data sets. The simulation function automatically extracts compressed trace data files.

1. On the client, create a folder where you want to store the files to be downloaded. For example, in the Windows Explorer file list:
   a. Click the C drive.
   b. Click File ➔ New ➔ Folder. A new folder icon is displayed.
   c. Rename the folder icon to a meaningful name, for example bp_data.

   It is recommended to keep buffer pool data files (used for viewing performance data and optimizing the object placements) and trace data files (used for simulations) in a single folder. This helps to keep together bpd files and trace data files that were created on the host from the same buffer pool trace data. You can distinguish them by their file name extensions (bpd or trace).

   Note that Buffer Pool Analyzer does not provide means to delete downloaded files. They remain on the hard disk drive, and take up space, until you delete them.
2. If you want to use FTP to download files:

If your File Transfer Protocol (FTP) program provides the RDW and NORDW command options, ensure that the NORDW command option is active.

a. Open a Command Prompt window on your client and start an FTP dialog with one of the following commands:
   - `ftp <hostname>`, whereby `<hostname>` denotes the name of your host
   - `ftp <IP address>`, whereby `<IP address>` denotes the IP address of your MVS host

b. Enter your MVS user ID and password and wait until the current client folder is displayed.

c. Enter `binary` to set the transfer type to binary.

d. Enter `lcd <client_directory>`, whereby `<client_directory>` denotes the local directory where you want to store the files (the folder that you created in step [1]). If you do not specify a directory, the current directory on the client is used.

e. If you do not remember the data set name you want to download, enter `dir` or `ls` to get a list of your data sets.

f. Enter `get <file_name> <new_name>`, whereby `<file_name>` denotes the fully qualified host data set name in quotes, and `<new_name>` denotes the client file name without quotes.

This starts the download.

g. Enter `quit` to leave the FTP program, or download more files as required.

Example: The following figure shows an example of an FTP session.

```
C:\bpa>ftp boemp01
Connected to boemp01.boeblingen.de.ibm.com
220 Connection will close if idle for more than 60 minutes.
User (boemp01.boeblingen.de.ibm.com:(none)): wtn
331 Send password please.
Password:
230 WTN is logged on. Working directory is "WTN.".
ftp> bin
200 Representation type is Image
ftp> lcd c:\bpa
Local directory now C:\bpa.
ftp> get WTN.TEST.TRACE test.trace
200 Port request OK.
125 Sending data set WTN.TEST.TRACE
250 Transfer completed successfully.
ftp> get 'WTN.TEST.BPD' test.bpd
200 Port request OK.
125 Sending data set WTN.TEST.BPD
250 Transfer completed successfully.
ftp> get 149487 bytes received in 0.43Seconds 347.64Kbytes/sec.
ftp> quit
221 Quit command received. Goodbye.
C:\bpa>dir test*
Volume in drive C is C_DRIVE
Volume Serial Number is 6C10-18AA
Directory of C:\bpa
20.05.2003 16:06 149487 test.bpd
20.05.2003 16:06 1768197 test.trace
```

3. If you want to use IBM Personal Communications to download files:
a. Log on to your Multiple Virtual Storage (MVS) session on the z/OS or OS/390 system. Ensure that your MVS terminal is in READY mode. Note that keyboard entries in lowercase are converted to uppercase on the host.

b. Start IBM Personal Communications on your client and click Receive.

c. In the Host file field, type the name of the data set that contains the data to be downloaded.
   Example: 'sample.bpd', a buffer pool data file. Do not forget the quotes.
   Example: 'bpasim.trace', a trace data file. Do not forget the quotes.

d. In the PC field, type the destination folder and file name.
   Example: c:\bp_data\sample.bpd for a buffer pool data file
   Example: c:\bp_data\bpasim.trace for a trace file

e. In the Transfer type field, select BINARY.
   This step starts the download.

**Concatenating trace data for activity reports and bpd files**

This section outlines some possibilities of using trace data from SMF or GTF data sets and concatenating multiple data sets as input for activity reports and bpd files.

You should be familiar with batch jobs that create reports and bpd files, especially the use of the `INPUTDD` statement in these batch jobs, as described in “Specifying a JCL command stream” on page 2620.

**Concatenating trace data from SMF and GTF data sets**

The Collect Report Data (CRD) function of Buffer Pool Analyzer or an equivalent batch job are the recommended methods of making DB2 trace data available as input for activity reports and bpd files.

Other methods, like the DB2 trace facility, also provide usable DB2 trace data in standard SMF and GTF data sets.

If you intend to exploit SMF or GTF data, ensure that it contains the IFCIDs required by Buffer Pool Analyzer, as described in “Determining what to collect” on page 2593. Otherwise some of the functionality that Buffer Pool Analyzer normally provides will be missing.

If you are accustomed to DB2 trace classes instead of individual IFCIDs, ensure that the appropriate trace classes, covering the required IFCIDs, are included in the data. Note that IFCID 198, which is required by Buffer Pool Analyzer for data of data type deetail, does not belong to any specific trace class, and corresponding data might therefore be missing in SMF or GTF data. If deetail data is required in your SMF or GTF data, and if it is to be collected by means other than the Collect Report Data (CRD) function of Buffer Pool Analyzer, you can collect this data explicitly by means of the START TRACE command, as follows:

```
-START TRACE(PERFM) CLASS(30) IFCID(198) DEST(SMF)
```

This command uses the generic multi-purpose trace class 30, which has no predefined IFCIDs assigned to it. The required IFCID 198 is explicitly specified.

Even so collecting performance data through GTF or SMF is attractive especially for long-term collection and larger volumes, be aware that GTF, when the destination data set has filled up with trace data, proceeds recording data by overwriting the oldest data in the data set. Allocate a data set large enough to hold the expected amount of trace data for the collection period.
Note that SMF and GTF data do not provide data in the short record format, as it is required for the simulation function. Therefore, for simulations, you must collect trace data by means of the functions provided by Buffer Pool Analyzer. The other Buffer Pool Analyzer functions accept the standard record format, even so short is recommended in ["Determining what to collect" on page 2593] for several other reasons.

Related reading: Details about trace data in SMF and GTF data sets are described in the DB2 11 Administration Guide.

Assuming that the SMF or GTF data contains the necessary IFCIDs, you can use it alternatively or together with trace data being collected through Buffer Pool Analyzer. The JCL command stream in ["Creating activity reports and bpd files” on page 2618] describes how input data sets are specified. You can concatenate multiple data sets with the INPUTDD statement to create one logical data set and continue processing the trace data as usual. The rules for concatenating data sets apply.

Related reading: If you use DFSORT, see the z/OS DFSORT Application Programming Guide for rules that apply to the concatenation of data sets.

If the trace data from other sources misses catalog information, you can use the Catalog only option of the CRD function (or the corresponding parameter in a batch job) to collect only catalog information (see ["Configuring a collect task” on page 2611] if required). Catalog data is used to enhance trace data that is collected through SMF or GTF. When you concatenate both data sets with the INPUTDD statement, the database identifiers (DATABASE) and object identifiers (OBJECT) from the SMF and GTF data are mapped to the actual database and object names.

Restriction: The possibilities outlined so far are provided for experienced and interested users wanting to use trace data from other sources. Their use requires detailed knowledge about trace data, involved IFCIDs, and tools. Because of endless variations and possible drawbacks, these options are formally not recommended and not supported in the current version of Buffer Pool Analyzer.

Effects from concatenated input data sets
If you concatenate multiple data sets containing buffer pool performance data (no matter whether they were created by means of the Collect Report Data (CRD) function or by any other means), and if you use this data as input to create activity reports or bpd files, you should be aware of some side effects concerning the results.

- The input data sets you are concatenating might contain performance data from overlapping or segregrative collection time frames.
- Summary information in activity reports is based on data that is collected at so-called statistics intervals (opposed to actual counts of events for detail reports). This means, a counter in a summary report is computed as the difference between the first and latest value covered during the collection of data.

Knowing this, it becomes obvious that summary information created from concatenated data can become imprecise or even useless because of various events.

- A DB2 system might be restarted between two collection time frames, which resets the counters being sampled at statistics intervals.
- The performance data in different data sets might be collected with different statistics interval settings or with overlapping time frames, which makes it impossible to compute valid results.
Objects in buffer pools might be created or dropped during different collection time frames, or new objects might be assigned to buffer pools with previously used identifiers, which makes object related counter values invalid.

Catalog information, correlation data, and aliases might be different and might not match the concatenated data, which also causes invalid results.

In summary, concatenating performance data to create summary activity reports is not recommended. This method, if used at all, is more suitable to detail activity reports, which are based on actual event counts in the concatenated data sets.

Related reading: “Preliminary remarks about the accuracy of summary and detail reports” on page 2629 discloses further details about statistics-based and event-based data collection and the use of this data for activity reports.

Loading a bpd file into a DB2 table
This section briefly describes how to store trace data from bpd files into DB2 tables.

DB2 tables can be used by administrators to extract performance-related data with self-written SQL queries. The further utilization of this data is outside the scope of this information. See the Report Reference for more information about possible uses of performance data.

Before you can store trace data into a table, you must create a table with an appropriate layout that can accept the data from a bpd file. This is done with the SQL CREATE TABLE statement. When you determine the table layout, you need to consider:

- Whether summary or detailed data was collected. Each data type requires a different table layout.
- Whether the bpd file was created with the Summary or Detail option of the BPACTIVITY FILE command. If detailed data was collected, but the Summary option was used, the bpd file contains only summary data. Consequently, the table layout must be appropriate for summary data.

When you have created the appropriate table, you can use the DB2 LOAD utility to load data from a bpd file into the table. LOAD requires the specification of the data elements that are to be stored into the table. For more information, see the IBM DB2 11 for z/OS: Utility Guide and Reference.

Buffer Pool Analyzer provides several samples of CREATE and LOAD statements that store data into DB2 tables in the following formats:

- Summary data, from IFCID 002 (corresponding to information in “The Buffer Pool Statistics section” on page 2636)
- Summary data, from IFCID 230 (corresponding to information in “The Group Buffer Pool Attributes section” on page 2656)
- Summary data, from IFCID 251 (corresponding to information in “The Buffer Manager PSET/Part P-lock Request section” on page 2658)
- Summary data, from IFCID 254 (corresponding to information in “The CF Cache Structure Statistics section” on page 2660)
- Detail data, from IFCIDs 6, 7, 8, 9, 10, and 198 (corresponding to information in “The Detail Activity section” on page 2665)
- Detail data, but aggregated by object
- Detail data, but aggregated by buffer pool
• Detail data, but aggregated by system

The sample statements are in members of the partitioned data set `prefix.TK02SAMP`, as shown in Table 229. The data set also contains members that contain descriptions of the individual DB2 table columns used with CREATE and LOAD. The *italic* characters and numbers in the following table show the naming associations for easier identification.

Table 229. Member names holding the sample statements and associated column descriptions

</table>

Note that the sample CREATE and LOAD statements work independently of whether the bpd file actually contains relevant data. For example, if you create a DB2 table for storing group buffer pool related data, but the bpd file does not contain such data because the data was collected from a DB2 system that is not a data sharing group member, the table remains empty after the LOAD statement is executed. Generally, if you encounter difficulties with missing data, verify the parameters that were used for the data collect and the bpd file creation tasks. See especially the job summary logs (JOBSUMDD) and the DPMLOG execution logs. The latter might contain information about record types that were not available for processing.

Example: This example (from member BPQQFCDF) shows a partial CREATE TABLE statement that creates a table for detail data:

```sql
---**Start of Specifications*****************************************************************************
---* MODULE-NAME = BPQQFCDF
---* DESCRIPTIVE-NAME = SQL for creating table for detail activity
---* COPYRIGHT = IBM DB2 Buffer Pool Analyzer for z/OS V5R4M0
---* LICENSED MATERIAL = Property of IBM
---* STATUS = Version 5.4.0
---* FUNCTION = Sample SQL for creating table for detail activity
---* data from IFCIDs 6, 7, 8, 9, 10, 198
---*END of Specifications******************************************************************************
CREATE TABLE DB2PE_BPA_DETAIL
(DB2PM_RELEASE SMALLINT NOT NULL WITH DEFAULT,
 DB2_RELEASE CHAR(2) NOT NULL WITH DEFAULT,

```
The TRSMAIN terse utility

This section provides information about the TRSMAIN terse utility that is used to compress collected trace data, and it shows batch job examples using the utility.

The utility is mainly provided to reduce the sizes of output data sets with raw trace data, as used for the simulation function of Buffer Pool Analyzer, and to reduce the download times of these data sets. Compressed trace data files are automatically uncompressed when opened by the simulation function. If you use the compression facility only for this purpose, you can ignore the following information.

Nevertheless, when you collect performance data, you are not limited to the compression of raw trace data for simulations. You can compress all data that is collected by means of the Collect Report Data (CRD) function or an equivalent batch job. But no Buffer Pool Analyzer function, except the simulation function, processes compressed input data. Therefore, if you want to compress collected data on the host for whatever reason, you need to uncompress data before it can be used as input to other Buffer Pool Analyzer functions. Note that the following information pertains to TRSMAIN on the host; the uncompression component of the simulation function on the client remains transparent and is not accessible.

Related tasks:

“Collecting data” on page 2607

This topic describes how to collect the performance data that is used by Buffer Pool Analyzer. It describes two methods to collect buffer pool trace data. The first method uses ISPF and the Collect Report Data (CRD) function to configure and control a collect task, the second method uses a batch job that contains equivalent specifications for a collect task.

About the TRSMAIN terse utility

The terse utility is prerequisite on z/OS platforms, if you want to compress collected data.

It might already be installed because it is often used during the installation of operating system fix packs. The utility is freeware and can be downloaded from this [IBM Support website](https://www.ibm.com/support). The terse utility is based on US patent number US04814746. TRSMAIN provides two compression methods, PACK and SPACK. Only SPACK is used with Buffer Pool Analyzer because it provides the highest compression ratio.

IBM supports only version 2 of TRSMAIN, shipped in 1993, and later versions. Further, support is limited to the SPACK option.
When used with Buffer Pool Analyzer trace data files, the compression ratio is approximately 75 percent.

**Compressing trace data using the batch JCL**

The following batch job shows an example of how TRSMAIN is used to compress trace data residing in data set NKA.COLLECT.TRACE and to write it to data set NKA.COLLECT.TRACE.TERSE.

You can use this batch job together with the batch job described in "Collecting data by using the batch JCL" on page 2616, if you do not want to use ISPF.

**Example:**

```jcl
/* DESCRIPTION: JCL for compressing data from Collect Report Data */
/* *************************************************************************/
/* NKA$D711 JOB (DE03704), 'NKA', CLASS=A, MSGCLASS=X, */
/* REGION=OM, MSGLEVEL=(1,1), PRTY=5, NOTIFY=NKA, TIME=8 */
/* */
/* BPACRD EXEC PGM=BPOMAB00 */
/* */
/* STEPLIB DD DSN=SYS1.DSN.V910.SDSNLOAD, DISP=SHR */
/* DD DSN=SYS1.FPE.V540.RKANMOD, DISP=SHR */
/* */
/* SYSPRINT DD SYSOUT=** */
/* SYSOUT DD SYSOUT=** */
/* SYSDUMP DD SYSOUT=** */
/* */
/* SYSDAT DD DSN=NKA.BPACRD.CNTL(CRD#IN), DISP=SHR */
/* */
/* / */
/* SYSDLOG DD SYSOUT=** */
/* / */
/* JOBSUMDD DD SYSOUT=** */
/* / */
/* DPCOLLDD DD DSN=NKA.COLLECT.TRACE, */
/* DISP=(NEW,CATLG), */
/* DCB=(RECFM=VBS, LRECL=9076, BLKSIZE=32756), */
/* SPACE=(TRK,(500,100)), UNIT=3390 */
/* */
/* RC1OK IF (BPACRD.RC LT 4) THEN */
/* TERSE EXEC PGM=TRSMAIN, PARM=SPACK */
/* */
/* SYSPRINT DD SYSOUT=** */
/* */
/* / */
/* / */
/* / */
/* INFILE DD DISP=SHR, DSN=NKA.COLLECT.TRACE */
/* OUTFILE DD DSN=NKA.COLLECT.TRACE.TERSE, */
/* DISP=(NEW,CATLG,DELETE), */
/* DCB=(RECFM=VBS, LRECL=9076, BLKSIZE=32756), */
/* SPACE=(TRK,(500,100)), UNIT=3390 */
/* */
/* ENDRC1OK */
```

**Uncompressing trace data using the batch JCL**

The following batch job shows an example of how TRSMAIN is used to uncompress trace data residing in data set NKA.COLLECT.TRACE.TERSE and to write it to data set NKA.COLLECT.TRACE.

This batch job is shown only for the sake of completeness, if you want to use TRSMAIN for your own purposes. Compressed trace data for simulations is automatically uncompressed by the simulation function.

**Example:**

```jcl
/* DESCRIPTION: JCL for uncompressing trace data */
/* *************************************************************************/
/* NKA$TRESE JOB (DE03704), 'NKA', CLASS=A, MSGCLASS=X, */
/* MSGLEVEL=(1,1), NOTIFY=NKA, REGION=5M */
/* TERSE EXEC PGM=TRSMAIN, PARM=UNPACK */
```
//SYSPRINT DD SYSOUT**
//SYSOUT DD SYSOUT**
//INFILE DD DISP=SHR,DSN=NKA.COLLECT.TRACE.TERSE
//OUTFILE DD DSN=NKA.COLLECT.TRACE,
// DISP=(NEW,CATLG,DELETE),
// DCB=(RECFM=VB,BLKSIZE=9076,LRECL=9072),
// SPACE=(TRK,(500,100),RLSE),UNIT=3390
Chapter 6. Batch reporting

Using

This information describes how to create reports and how to use these reports to assess the performance of a DB2 system. It also suggests methods to optimize your DB2 system.

After reading this information, you should be able to select the report sets that are most appropriate for your requirements. You should also be familiar with the methods to create reports. The tuning information helps you interpret the information from the reports.

This information is closely related to:
- Report Command Reference, which describes the commands to create reports
- Report Reference, which shows and explains the reports

Always check the IBM DB2 and IMS Tools Library web page and the Tivoli library page for the most current version of this information:
- OMEGAMON for Db2 Performance Expert on z/OS (PDFs and Techdocs on Db2 Tools Product Page)
- OMEGAMON for Db2 Performance Monitor on z/OS (PDFs and Techdocs on Db2 Tools Product Page)

The product often provides context-related online help information that can be invoked from menus, panels, and windows by using the PF key F1 or the Help button. Online help information is not necessarily repeated in this information, especially if it is very detailed information that is of interest only when you actively work with a function. You are encouraged to use F1 or Help to see the entire available information.

Who should read this information

This information is for IBM data server professionals who need to produce and interpret OMEGAMON for Db2 PE reports.

Introduction to batch reporting

The batch reporting facility presents historical information about the performance of the DB2 system and applications in reports and data sets. System performance data shows information about topics such as CPU times, buffer pool usage, locking, log activity and I/O activity. Application data shows how individual programs behave in DB2.

You can use Performance Expert Client to:
- Examine a DB2 system and its applications in real time.
- Launch and control OMEGAMON XE for DB2 PE reporting functions.

The Performance Warehouse is an environment where you can define, schedule, and run processes that automate the creation of reports. You can also use processes to convert and load these reports or other OMEGAMON XE for DB2 PE data sets.
into a Performance Database. In the Performance Warehouse you can analyze the
data in a Performance Database by using rules.

**What OMEGAMON XE for DB2 PE does**

OMEGAMON XE for DB2 PE uses DB2 *instrumentation data* to generate
performance reports in a form that is easy to understand and analyze.

You can use OMEGAMON XE for DB2 PE to:

- Determine DB2 subsystem performance and efficiency
- Identify and resolve potential problems
- Tune the DB2 subsystem
- Measure an application's performance and resource cost
- Tune applications and SQL queries
- Assess an application’s affect on other applications and the system
- Gather information for cost purposes

OMEGAMON XE for DB2 PE provides information at various levels of detail depending on your needs.

**Output types:**

OMEGAMON XE for DB2 PE generates reports, traces, data sets, and logs.

*Reports and traces:*

Reports show summarized DB2 events and traces show individual DB2 events.

*Reports* show DB2 events summarized by OMEGAMON XE for DB2 PE identifiers,
such as primary authorization ID or plan name. For example, you can produce an
Accounting report that shows all threads summarized for every individual plan.

*Traces* show individual DB2 events, for example, for a particular thread. Depending
on the report set that you request, these could include thread terminations, grants
of privileges, deadlocks, or utility executions. All events are listed individually,
usually in the order of occurrence.

*Data sets:*

Formatted data can be stored in data sets that are suitable for loading into DB2
tables.

The data in DB2 tables can be used in different ways, for example, it can be used
to produce tailored reports using a reporting facility such as the IBM Query
Management Facility (QMF). You can also load reports and traces into
OMEGAMON XE for DB2 PE's Performance Database for additional analysis.

*Logs:*

OMEGAMON XE for DB2 PE can log several activities and keep this information
available in defined data sets.

- *The Exception Log* contains Accounting and Statistics records with at least one
  field outside user-specified thresholds.
- *The IFCID Frequency Distribution Log* provides counts of input records by IFCID.
- *The Job Summary Log* provides a summary of events during OMEGAMON XE for
  DB2 PE execution.
The DPMLOG Execution Log contains OMEGAMON XE for DB2 PE processing messages.

Report sets:

OMEGAMON XE for DB2 PE generates various reports and traces that provide performance information about different areas of interest (also called report sets) and of various levels of detail.

Accounting reports and traces:

Accounting reports and traces summarize information about DB2 resource activity associated with particular DB2 applications.

Use this report set to:
- Obtain summarized information about DB2 local and distributed activity associated with the execution of DB2 plans.
- Identify potential performance problem areas in local and distributed activity.
- Track trends in DB2 resource usage.

Accounting reports show the efficiency of the subsystem or application and often provide enough information for you to resolve performance problems.

Statistics reports and traces:

Statistics reports and traces summarize information that is collected by the DB2 Instrumentation Facility for an entire DB2 subsystem. The collected data is logged at intervals that are specified when you install DB2.

Use this report set to:
- View system-wide statistics for key DB2 components.
- Compare system performance in several reporting intervals.
- Assess system-wide performance that can be summarized in a single report.

Statistics reports show the efficiency of the subsystem or application and often provide enough information for you to resolve performance problems.

SQL Activity reports and traces:

SQL Activity reports and traces show information about SQL activities that occur during the processing of a DB2 application.

Use this report set to:
- Analyze SQL calls within a logical unit of work.
- Analyze the access paths selected by the DB2 optimizer for local SQL calls.
- Observe the Data Manager scans, locking, buffer manager I/O and other related DB2 activity that occur during the execution of SQL requests.
- Collect the SQL activity according to author, plan name, or other OMEGAMON XE for DB2 PE identifiers.

Locking reports and traces:

Locking reports and traces show detailed information about locking activities within DB2.
Use this report set to obtain:

- Summarized information about user activities related to lock suspensions and lockouts.
- Information about every lock request made by DB2.
- Information about lock details.
- Information about every suspension, lockout, detail, deadlock, or timeout during a specified interval.

**I/O Activity reports:**

I/O Activity reports show information about I/O activities performed throughout the DB2 subsystem.

Use this report set to:

- Track I/O volumes and service times.
- Obtain summarized information about the active log, archive log, bootstrap data set (BSDS), buffer pool, and EDM pool.

**Audit reports and traces:**

Audit reports and traces show information about access to DB2 resources.

Use this report set to:

- Obtain information about who performed an audited action, when the action was performed, and what auditable DB2 objects were involved.
- Track DB2 resource access by OMEGAMON XE for DB2 PE identifier, and the granting and revoking of DB2 privileges.
- Identify security breaches and violations.

**Utility Activity reports and traces:**

Utility Activity reports and traces show information about utility and bind activities during the processing of a DB2 application.

Use this report set to:

- Analyze bind and utility activity within a logical unit of work.
- Associate DB2 work with individual users or OMEGAMON XE for DB2 PE identifiers.
- Recognize long utility or bind times, which can help you to identify bottlenecks in the system.

**Record Trace reports:**

Record Trace reports show the contents of selected instrumentation records.

Use this report set to format a subset of data obtained from Statistics, Accounting, or Performance trace information.

**Explain reports:**

Explain reports show information about the access path that is selected by DB2 for a particular SQL statement.
Use this report set to determine access path problems or problems with an application's design.

**System Parameters reports:**

System Parameters reports show information about the configuration of your DB2 subsystem.

The report shows values for all DB2 system parameters that were in effect at the time the performance data was collected.

Use this report set to determine system parameters that you might want to change during tuning activities.

**Levels of detail of report sets:**

Report sets provide different levels of details, ranging from high-level summaries to individual DB2 events.

The level of detail and the amount of data varies by report set and output type, as shown in Figure 219. Generally, start any problem determination task with high-level summary reports, such as Accounting and Statistics reports. Use traces if you require information about individual DB2 events.

**Input for reports**

The DB2 trace facility, also called the DB2 instrumentation facility, gathers information about the system. After DB2 has collected and externalized this data, you can use it to generate reports and data sets.

An easy way to prepare a DB2 trace command is to use the Traces function of the Performance Expert Client. You can use this facility to create and manage DB2 traces. You can specify what types of reports you want to produce and how and when the traces should start and stop.

**Overview of the reporting process**

The OMEGAMON XE for DB2 PE reporting process uses various input sources to produce the different output types.

Figure 220 on page 2748 summarizes the main elements and functions involved in OMEGAMON XE for DB2 PE processing. The top part of the figure shows the various inputs to OMEGAMON XE for DB2 PE and the bottom part of the figure shows the different output types.
Solid lines indicate input or output, and broken lines indicate specifications the user makes. Words written in uppercase next to the arrows are subcommands.

For information about input data sets, read "Collecting data for reports," and for information about DPMPARMS, read "Customizing OMEGAMON XE for DB2 PE functions" on page 2949. Exception thresholds are described in "Using Statistics and Accounting reports to identify exceptions" on page 2794.

**Collecting data for reports**

Before you can produce an OMEGAMON XE for DB2 PE report, you must collect data from DB2 as input. The DB2 Instrumentation Facility Component (IFC) provides a trace facility that is used to record DB2 data and events.

Use any of the following methods to collect data for OMEGAMON XE for DB2 PE reports and traces:

- The Workstation Online Monitor to manage DB2 traces.
- The ISPF Online Monitor to configure a Collect Report Data (CRD) task that collects report data.
- The Data Warehouse to create a *process* to collect report data.
- DB2 installation system parameters to start traces at DB2 startup time.
- DB2 `-START TRACE` commands from the console.
- The Collect Report Data Batch program, which is a flexible and resource-efficient way to collect and postprocess report data.
- The Near-Term History Data Collector, which can store collected data in sequential data sets.
Note: OMEGAMON XE for DB2 PE provides sophisticated and flexible methods to collect performance data and to create reports from collected data. For both, the collection of data and the creation of reports, you have several choices to determine which data to collect and which data to include in reports. The basic rule is that your final reports will only show data that has previously been collected and has not been filtered out by any of the command parameters. Empty reports, processing counts of zero, or messages showing zero processed records usually indicate that required data within specified or required time intervals is not available in your input data or has been filtered by inappropriate command parameters during report generation. If required, refer to “Troubleshooting empty reports” on page 3001 for more information.

Managing DB2 traces with the Workstation Online Monitor

The easiest way to produce input data for reports is to use the Workstation Online Monitor. You must specify the report set for which you want to collect data and the data set where it is to be collected. Then, you can use this data set as input for reports.

You can start the collection of report data manually, or you can set it up to start automatically based on certain conditions, such as:
- A specified point in time
- When an exception threshold is reached
- An exception event is encountered

You can configure and start collect tasks for:
- One or more DB2 PM report sets
- Specific types of reports or traces within a report set
- Specific IFCIDs

You can also limit the data to specific:
- Locations
- Plan names
- Authorization IDs

You can configure DB2 traces to start:
- At a specified time of the day
- When a specified periodic exception is detected
- When a specified exception event occurs
- Immediately

You can stop DB2 traces manually or configure traces to stop:
- After a specified elapsed time
- After a specified number of trace records have been collected
- After a thread has been terminated or reused
- After a particular IFCID has been collected a specified number of times

For details about running DB2 traces, see Monitoring Performance from Performance Expert Client.

Collecting report data with the ISPF Online Monitor

You can use the ISPF Online Monitor to write performance data to a data set that is to be used as input for reports. This can be useful when you want to avoid flooding SMF (System Management Facility) with large numbers of DB2 trace records, and make DB2 trace data immediately available without affecting SMF or GTF record collection.
To collect data, you require the necessary DB2 authority to start and stop DB2 traces.

To collect performance data, you first configure a collect task. In each collect task, you specify the type of data that you want to gather, the trace start and stop criteria, and the output data set name. When you have configured and started a task, it triggers the appropriate DB2 traces to start and stop when the trace start and stop criteria have been met, and writes the collected data to the output data set.

You can configure and start up to four independent collect tasks. With each task you can collect trace data for:

- One or more reports sets
- Specific types of reports or traces within a report set
- Specific IFCIDs

In addition, you can limit the data to specific:

- Locations
- Plan names
- Authorization IDs

You can configure DB2 traces to start:

- At a specified time of the day
- When a specified periodic exception is detected
- When a specified exception event occurs
- Immediately

You can stop DB2 traces manually or configure traces to stop:

- After a specified elapsed time
- After a specified number of trace records have been collected
- After a thread has been terminated or reused
- After a particular IFCID has been collected a specified number of times

Accessing the Collect Report Data (CRD) panels:

You can use the ISPF Online Monitor and its CRD panels to configure a collect task and to start and stop a collect task.

About this task

Before you can access the CRD panels to configure a collect task, the ISPF Online Monitor must be invoked from the IBM Tivoli OMEGAMON XE for DB2 Performance Expert on z/OS main menu. Choose option 3 (View online DB2 activity - PE ISPF OLM) to invoke the ISPF Online Monitor, if not already active.

From the Online Monitor Main Menu, select option 6 (Collect Report Data) or 6a (Collect Report Data - General). Alternatively, enter COLLECT on the command line, or press F17 (Collect).

You can access the collect report data panels from within the Online Monitor by selecting option 6 (Collect Report Data) from the Online Monitor Main Menu.

The Collect Report Data panel is displayed:
From the Collect Report Data panel you can configure and control the collection of report data.

- **Option 1 (Configure)** displays a window where you configure collect tasks to collect report data and where you can limit the collection of DB2 trace data to time periods or events of interest. Refer to "Configuring a collect task" for more details.

- **Option 2 (Start)** displays a window where you start a collect task after it has been configured. Starting a collect task actually starts a DB2 trace and enables the start and stop criteria that were specified with option 1 (Configure). Refer to “Starting and stopping traces” on page 2755 for more details.

- **Option 3 (Display)** displays a window that shows the status of a collect task and any messages issued by that collect task. Refer to “Displaying trace status and messages” on page 2757 for more details.

- **Option 4 (Stop)** displays a window where you can stop a collect task and associated DB2 traces. Stopping a collect task prevents the triggering of DB2 traces and stops all traces that were previously started by the task. Refer to “Starting and stopping traces” on page 2755 for more details.

The Task Description column shows the description of each collect task. You can change a description by overtyping it with another description. The Status field shows the current status of the task.

If you see a task error in the Status field, use the DB2 **DISPLAY TRACE** command to check if the traces are still running. If necessary, use the DB2 **STOP TRACE** command to stop the trace. Before you restart the appropriate Collect Report Data function, exit the Collect Report Data panel (by pressing F3) and, in a second step, exit the Online Monitor Main Menu (by pressing F3 again) to return to the IBM Tivoli OMEGAMON XE for DB2 Performance Expert on z/OS main menu. This way you stop the four asynchronous tasks that were automatically set up when you first selected option 3 (View online DB2 activity – PE ISPF OLM) from the IBM OMEGAMON for DB2 Performance Expert on z/OS main menu.

**Configuring a collect task:**

Use the following windows to specify the data types and IFCIDs to be collected.

---

**Figure 221. Collect Report Data panel**

<table>
<thead>
<tr>
<th>Task Description</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>Collect data for acct/stats/audit</td>
<td>Not yet started</td>

Command ==> F1=Help  F2=Split  F3=Exit  F9=Swap  F12=Cancel  F16=Look
About this task

To configure a collect task, type 1 (Configure) next to a collect task in the Collect Report Data panel and press Enter. The Trace Configuration window is displayed:

![Trace Configuration window](image)

**Figure 222. Trace Configuration window**

Use this window to specify the trace trigger method, the report sets, and the types of data to be collected.

Before you can start a collect task, specify how the trace is to be triggered. You can specify that the DB2 traces are triggered by time (1), periodic exception (2), exception event (3), or started immediately (4).

You also need to select the report sets for which you want to collect data. When the trace start criteria have been met, the appropriate DB2 traces are started to collect data required for these report sets. A greater than symbol (>) in the selection field indicates report sets that were previously selected.

Use the fields on the bottom part of this panel to specify whether to restrict the collection of data to specific data types (see “Restricting data types for selected report sets” on page 2753), IFCIDs (see “Restricting IFCIDs for selected report sets” on page 2753), or OMEGAMON XE for DB2 PE identifiers (see “Restricting identifiers for selected report sets” on page 2754). If any of these fields are selected, the appropriate windows are displayed where you can fill in the data collection criteria.
Use the OP Buffer size field to allocate the number of KB to the OPn buffer that is used for collecting the data. The valid range is from 64 to 65536.

Use the OP Buffer trigger field to specify the percentage of the filled OPn buffer when the Collect task is posted by DB2 to read the OPn buffer. The valid range is from 10 to 90.

Restricting data types for selected report sets:

Use the Data to Collect window to select the data types to be collected by the collect task for a specific report set.

About this task

If you selected the Data Type field on the Trace Configuration window, the Data to Collect window (Figure 223) is displayed once for each selected report set that has more than one data type.

The Data to Collect window shown in Figure 223 uses an example for the Audit report set.

Figure 223. Data to Collect Window

If you select the Select/Deselect all field, all data type fields in this window are selected. If you type a blank in the Select/Deselect all field, all selections are deleted.

Select the data types and press Enter to process the changes. Press Enter again to proceed to the next panel.

Restricting IFCIDs for selected report sets:

Use the IFCID Selection window to exclude certain IFCIDs that would normally be collected for the selected report sets and data type.
About this task

If you selected the IFCID field on the Trace Configuration window, the IFCID Selection window (Figure 224) is displayed.

Note: The IFCID Selection window is not shown if only one IFCID was collected for the previous selections.

You can use the Select/Deselect all field to select or deselect all fields in this panel.

Select the IFCIDs and press Enter to process the changes. Press Enter again to proceed to the next panel.

Restricting identifiers for selected report sets:

Use the Trace Qualification window to filter the data to be collected by the collect task.

About this task

If you selected the Requesting Location, Plan name and Authid field in the Trace Configuration window, the Trace Qualification window (Figure 225 on page 2755) is displayed. Only data from threads that match the trace qualification criteria in this window will be collected. These trace qualification criteria are also used if thread termination is indicated in the Trigger by Time window (Figure 226 on page 2756).
Specify the name of the requesting location, plan name, and authorization ID, then press Enter. Do not specify multiple entries for more than one identifier, otherwise the number of DB2 traces started by the collect task could exceed the DB2 limit of 32 traces.

Trace qualification does not apply to all IFCIDs. Some system-related traces are collected regardless of the trace qualification criteria specified in the Trace Qualification window, for example, traces for IFCIDs 1, 2, 4, 104, 105, 106, and 202.

Starting and stopping traces:

You can trigger DB2 traces to start by time, periodic exception, exception event, or immediately. After you specified the trace criteria, a window is displayed where you complete the start criteria and define the stop criteria.

About this task

Which window is displayed depends on what you specified in the Trigger by field on the Trace Configuration window. Use these windows to specify the criteria that must be met before the collect task is automatically started or stopped. These windows are the same in appearance except for the start trigger specification section.

Because of the possibility of output buffer overruns, you must specify one of the stop conditions: Elapsed time or Number of records collected. Records can get lost if a buffer overrun occurs.

The Trigger by Time window (Figure 226 on page 2756) is displayed if you specified that the trace is triggered by time. Use this window to specify a particular output data set name, and to set the start and stop trigger criteria for the collect task. You can set the DB2 traces to start at a specified time, and to stop after a specified number of minutes have passed, a specified number of records or IFCIDs have been collected, or a thread matching the trace qualification criteria has terminated.
All trace data collected by the collect task is written to the data set specified in this window. If you specify a disposition of 3 (New), the data set is dynamically allocated with the following attributes:

**RECFM:** VBS

**LRECL:** 32756

**BLKSIZE:** 6233

If you want to create the data set manually, it should have a variable record format and a record length (LRECL) of at least 4092.

Specify the time you want the DB2 traces to start for this task.

Select one or more of the trace stop triggers shown in this window and enter the required criteria for those triggers. The trace is stopped when any stop criteria is satisfied.

After you specified the required criteria in this window, press Enter to process the new values. Press Enter again or F3 (Exit) to return to the Collect Report Data panel.

The other trigger windows are the same as this window except for the start trigger section.

- In the Trigger by Periodic Exception window, you can set the DB2 traces to start when a specified periodic exception has occurred.
- In the Trigger by Exception Event window, you can set the DB2 traces to start when a specified exception event has occurred.

---

**Example:**

- **Task description:** Collect data for acct/stats/audit
- **Output Data Set for DB2 trace data to be written to:**
  - **Name:** DATASET1
  - **Disposition:** 1 = Append, 2 = Overwrite, 3 = New
- **Start the DB2 traces at the following time:** 0:0:0 (hh:mm:ss)
- **Stop the DB2 traces when any of the following conditions occur:**
  - Elapsed time: 0 (seconds)
  - Number of records collected: 0
- **Additional stop conditions:**
  - Thread termination
  - Number of IFCIDs collected: 0
  - For IFCID: 55

**Event:** Set current SQLID

---

Figure 226. Trigger by Time window

---

2756 IBM Db2 Performance Expert on z/OS
In the Trigger Immediately window, there are no start criteria because the DB2 traces are started immediately when the respective collect task is started in the Collect Report Data panel.

You can obtain a list of IFCIDs or exception field names by positioning the cursor under any field with a trailing plus sign (+) and pressing F4 (Prompt).

Displaying trace status and messages:

Use the Trace Status Summary window to view the status of a collect task in detail and any messages issued by that task.

About this task

To view the status of a trace, type 3 (Display) next to the collect task in the Collect Report Data panel.

---

Figure 227. Trace Status Summary window

From this window, you can select the Display Status Detail field to display the Trace Status Detail window, where you can view further details about the status of the collect task.

You can also select the Display messages for this task field to display the Trace Messages window, where you can view the trace messages generated by the collect task. Messages for all collect tasks are kept for the duration of your Online Monitor session.

The Active Traces for this Destination section of this window lists all active DB2 traces started by the task, and shows the trace type, trace class, output buffer destination, and qualification criteria for each active DB2 trace started by the task.
If many DB2 traces are listed, use the scrolling keys F7 (Up) and F8 (Down) to browse the list.

**DB2 trace termination:**

You are notified if collect tasks are active when you exit the ISPF Online Monitor or when you change DB2 subsystems.

If any collect tasks are active when you exit the ISPF Online Monitor, you are notified by one of the Asynchronous Task Termination panels. You can either exit the ISPF Online Monitor and terminate all asynchronous tasks, or return to the Online Monitor Main Menu keeping all asynchronous tasks active.

If any collect tasks are active when you change DB2 subsystems, you are notified by one of the Asynchronous Task Termination panels. You can either change DB2 subsystems and terminate all asynchronous tasks, or return to the previous panel keeping all asynchronous tasks active.

**Collecting report data by specifying DB2 startup parameters**

For regular monitoring, you can set the trace facility to automatically start Accounting, Statistics, and Audit traces when DB2 is started by using the DB2 Tracing panel (DSNTIPN).

You can modify the parameters in the DB2 Tracing panel (DSNTIPN) to indicate which types of data you want to trace. You can specify these values when you install, migrate, or update DB2.

**Collecting report data with the DB2 START TRACE command**

You can use the DB2 **START TRACE** command to obtain all types of DB2 trace data.

You need TRACE privilege or SYSOPR, SYSCTR, or SYSADM authority to issue the command.

You can enter the command from an OS/390 console, the DSN command processor, the DB2I commands panel, an IMS or CICS terminal, or the OMEGAMON XE for DB2 PE Online Monitor.

The following diagram shows the command syntax.
The **START TRACE** command accepts the following parameters and options:

**TRACE**
- Specifies the type of data to be traced.
  - P  Performance data
  - A  Accounting data
  - S  Statistics data
  - AU Audit data
  - G  Global data

**DEST**
- Specifies the destination to which the traced data is directed. The destination can be the SMF (System Management Facility), the GTF (Generalized Trace Facility), or an OP buffer.

  SMF and GTF are service programs that provide a means of recording performance data. SMF is usually used for continuous monitoring and is the default destination for Statistics, Accounting, and Audit traces. GTF is usually used for monitoring a specific problem when the amount of data is large.

  If you want to direct a large volume of data to SMF, check the SMF buffer sizes to see whether they must be increased.

  If you specify SMF as destination:
  1. Ensure that SMF is active before you start the trace. For more information, see [z/OS MVS System Management Facilities (SMF)](https://www.ibm.com/support/knowledgecenter/SSEPGG_2.4.0/com.ibm.zos.mcsmf40.doc/ genuinely/xtalr00076011.htm).
  2. Ensure that SMF collects the following records:
     - DB2 Accounting records (SMF type 101 records)
     - DB2 Audit records (SMF type 102 records)
     - DB2 Statistics records (SMF type 100 records)
     - DB2 Performance records (SMF type 102 records)
  3. Ensure that the SMF data sets and buffers are large enough to hold the data being collected. If the SMF buffers run out of space, SMF rejects any records while the shortage of space exists. Lost data cannot be
recaptured. However, a long Statistics report or trace shows the number of records that have been lost in the DB2 IFC Destination block of the report.

**CLASS**

Specifies one or more trace classes within the trace type.

**IFCID**

Specifies one or more IFCIDs to be traced in addition to those contained in the specified trace classes.

If you want to exclusively trace the IFCIDs specified in the IFCID option, use trace classes 30-32. These trace classes have no predefined IFCIDs. Use this option with care, many reports have dependencies on several IFCID combinations. When the proper records are missing, OMEGAMON XE for DB2 PE cannot make the proper record relationships to produce a meaningful report.

**Note:** Use this option to start IFCID 381, IFCID 497, or IFCID 498. You cannot start these IFCIDs using a DB2 performance class.

**AUTHID and PLAN**

Specifies authorization IDs and plan names to be traced.

Consider how you want to use the traced data. If you want to examine a specific problem, choose the authorization IDs and plan names based upon the application and users of the application to be monitored. If you are doing daily monitoring, select all AUTHIDs and PLANs to get an overview of the activity on your system.

**TDATA**

Specifies the product section headers to be placed into the product section of each trace record. The product section of a trace record can contain multiple headers.

If you do not specify TDATA, the type of trace determines the type of product section header. By default, correlation headers and distributed headers (if present) are included. However, specifying CPU overrides the default so that only CPU headers are included. If you want CPU, correlation, and distributed headers, specify all.

All IFC records have a standard IFC header. The correlation header is added for Accounting, Performance, Audit, and Monitor records. The trace header is added for serviceability records. The headers relevant to OMEGAMON XE for DB2 PE are:

<table>
<thead>
<tr>
<th>Report set</th>
<th>COR</th>
<th>CPU</th>
<th>DIST</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accounting</td>
<td>Required</td>
<td>Not used</td>
<td>Required if distributed data is present</td>
</tr>
<tr>
<td>Audit</td>
<td>Required</td>
<td>Not used</td>
<td>Required if distributed data is present</td>
</tr>
<tr>
<td>I/O Activity</td>
<td>Required</td>
<td>Not used</td>
<td>Required if distributed data is present</td>
</tr>
<tr>
<td>Locking</td>
<td>Required</td>
<td>Not used</td>
<td>Required if distributed data is present</td>
</tr>
</tbody>
</table>
Table 230. Product section headers relevant to OMEGAMON XE for DB2 PE (continued)

<table>
<thead>
<tr>
<th>Report set</th>
<th>COR</th>
<th>CPU</th>
<th>DIST</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record Trace</td>
<td>Used if present</td>
<td>Used if present</td>
<td>Required if distributed data is present</td>
</tr>
<tr>
<td>SQL Activity</td>
<td>Highly recommended</td>
<td>Recommended</td>
<td>Required if distributed data is present</td>

<tr>
<td>Statistics</td>
<td>Not used</td>
<td>Not used</td>
<td>Required if distributed data is present</td>
</tr>
<tr>
<td>Utility Activity</td>
<td>Required</td>
<td>Recommended</td>
<td>Required if distributed data is present</td>
</tr>
</tbody>
</table>

LOCATION

Specifies locations with distributed relationship to be traced. If specified, allied threads are excluded from the trace. Only allied-distributed threads and DBATs associated with the specified locations are traced. If you omit the LOCATION option, all threads (including allied threads) from all locations are traced.

You can specify up to eight locations. A separate trace is started for each location.

If you specify more than one PLANNAME or AUTHID, you can specify only one location.

You can specify the LUNAME of non-DB2 systems, in the form <luname>, in place of a location name.

LOCATION has no effect when Accounting class 2 is started.

START TRACE command examples:

The command examples show how to specify the different options of the START TRACE command.

If you do not specify a trace class, a default trace class is used. So, if you specify the following, data is collected only for Statistics class 1.
-START TRACE(S)

To collect Audit class 2 data, enter:
-START TRACE(AU) CLASS(2)

To collect only specific IFCIDs within a trace type, specify one of trace classes 30, 31, or 32, which are installation defined and contain no predefined IFCIDs. The following example shows how to collect only IFCIDs 44 and 45 (lock suspensions):
-START TRACE(P) CLASS(30) IFCID(44,45)

To collect Performance class 16 information and IFCID 68 and 69 data, specify:
-START TRACE(P) CLASS(16) IFCID(68,69)

Note: The specified IFCIDs must belong to the trace type that you specified, otherwise no data is collected for these IFCIDs.
If you want to start all trace classes of Accounting data, you can either use an asterisk or specify all trace classes.

- `START TRACE(A) CLASS(*)`
- `START TRACE(A) CLASS(1,2,3,5,7,8)`

The default destination for Accounting, Statistics, and Audit trace types is SMF, but you can route the trace data to GTF by specifying `DEST(GTF)` or to both SMF and GTF by specifying `DEST(SMF,GTF)` in the `START TRACE` command.

If you omit the TDATA option, correlation headers and distributed headers (if present) are included by default. However, specifying CPU overrides the default so that only CPU headers are included. If you want CPU, correlation, and distributed headers, specify all as in the following example:

- `START TRACE(P) CLASS(1,2,3) DEST(GTF) TDATA(CPU, COR, DIST)`

**DB2 instrumentation data:**

Understand how DB2 instrumentation data is grouped and how these groups relate to OMEGAMON XE for DB2 PE report sets. With this information you can correctly specify the data to be collected with the DB2 `START TRACE` command.

Each DB2 event is recorded by its Instrumentation Facility Component (IFC) as trace record. These trace records have unique IFC identifiers (IFCIDs). To have these IFCIDs externalized, appropriate trace types must be started.

Most IFCIDs are grouped into trace classes. A trace class defines a certain group of events or data within a trace type. Each class consists of one or more IFCIDs. You can limit the amount of data to be collected by specifying only certain classes for a type.

The instrumentation data types used as input to OMEGAMON XE for DB2 PE reporting facility are:

- **Statistics** data shows to what extend the DB2 system services and database services are used. You can use this information to plan DB2 capacity and to tune an entire set of DB2 programs. Statistics data also contains information about deadlocks, timeouts, and DDF exception events.
  
The Statistics trace is written at specified intervals. You can control the Statistics interval by using `STATISTICS TIME` in the DSNTIPB installation panel.
- **Accounting** data provides information related to application programs and packages.
  
  A DB2 Accounting trace record starts when a thread is allocated to DB2 and ends when the thread terminates, is reused, or becomes inactive. You can use Accounting data for program-related tuning and to assess DB2 usage for cost charging.

- **Performance** data provides information for performance analysis, performance tuning, and includes records of specific events in the system.
  
  When you start a Performance trace, specify what you want to report, for example, I/O only or SQL only.

- **Audit** data provides information about DB2 security controls. You can use the data to ensure that data access is allowed only for authorized purposes.
  
  Tables are the only auditable objects. To audit a table, include the AUDIT clause in the CREATE TABLE or ALTER TABLE statement.
Statistics and Accounting data are used for the continuous or periodic monitoring of DB2, whereas Performance data is usually recorded only when you need to examine specific performance problems. Audit data is collected to monitor access to data.

The following table lists trace types, trace classes, and IFCIDs relevant to reports. Use the table to see which DB2 trace data is used as input for each report set.

OMEGAMON XE for DB2 PE gathers input for Explain by connecting to an active DB2 subsystem.

If you want to see a count of the input trace records used in a job, you can produce an IFCID frequency distribution log.

**Collecting report data with the Collect Report Data Batch program**

The Collect Report Data Batch program allows for the collection of report data and postprocessing of collected report data by means of a batch job. This method provides a flexible way to automate the collection and postprocessing, thereby keeping the resource overhead minimized.

You can collect report data from a DB2 subsystem, a specified member of a data sharing group, or all members of a data sharing group. Collected report data is stored in a sequential data set or a Generation Data Group (GDG).

If a GDG is used, a user-specified job can be started to process collected report data automatically each time after a switch to a subsequent Generation Data Set (GDS) occurs. This method can be used to continuously collect trace data from DB2 and to automate the postprocessing. For example, the contents of the GDG generations (the Generation Data Sets) can be used to automatically generate reports or to load collected data into a Performance Database.

This method of collecting and postprocessing report data can be used as alternative to using System Management Facility (SMF) or Generalized Trace Facility (GTF) data sets if more flexibility regarding data collection parameters and error handling and less resource overhead are required.

The commands and parameters that determine the collection and postprocessing of data must be specified in the SYSIN DD statement of the respective JCL, as outlined in the following syntax diagram. A sample batch job can be found in data set prefix.TKO2SAMP(FPEZCRDJ).
SSID
Specifies the DB2 subsystem ID ssid.

DSGLOBAL
Specifies whether to collect report data from all members of a data sharing group.

N  Specifies not to collect report data from all members. This is the default.
Y  Specifies to collect report data from all members. This setting is ignored if the specified subsystem ID ssid is not a member of a data sharing group.

DSMEMBER
Specifies the data sharing group member dsMbr from which to collect report data. dsMbr can be located on a different LPAR.

GDGDATASET
Is optional. If specified, it determines that the trace data collection will not terminate after a stop criteria is met, but the output data set will be switched to the next generation of the Generation Data Group (GDG), which means, to a subsequent Generation Data Set (GDS). Specify the name of an existing GDG as gdg (the GDG name, not a GDS name). Only ELAPSEDTIME may be used with GDGDATASET to specify a stop criteria.

If specified, the JCL does not require an OUTPUT DD statement.
Use the PURGE operator command to stop CRD collection.

JOB
Is optional. If specified, job is executed after each switch to a subsequent GDS. job must be the name of a started job.

This can be used to automatically process the data in a GDS, for example, loading it into a Performance Database or generating reports.

If you require the actual name of the Generation Data Set (GDS) that was in use before the switch, you can specify the JCL symbol &GDGDSN in the job’s command stream, as in the following example:

```
//INPUTDD DD DSN=&GDGDSN,DISP=...
```
This method of using the JCL symbol ensures that the job is synchronized with the proper generation of the GDG, in case new generations are created faster than JES submits the specified job.

**VOLUME**
Is optional. A volume must be specified if a specified GDGDATASET is not managed by SMS.

**UNIT**
Is optional. A unit must be specified if a specified GDGDATASET is not managed by SMS.

**DSSIZE**
Is optional. It can be used to override the default space unit that is used for the allocation of each GDG member. Possible values for *dsSizeType* are:

**TYPE1**
Causes the GDG member to be allocated with:
- Space unit = BLK
- Primary quantity = 100
- Secondary quantity = 500

These values are the default.

**TYPE2**
Causes the GDG member to be allocated with:
- Space unit = TRK
- Primary quantity = 100
- Secondary quantity = 500

**TYPE3**
Causes the GDG member to be allocated with:
- Space unit = TRK
- Primary quantity = 100
- Secondary quantity = 1500

**TYPE4**
Causes the GDG member to be allocated with:
- Space unit = CYL
- Primary quantity = 10
- Secondary quantity = 150

**TYPE5**
Causes the GDG member to be allocated with:
- Space unit = CYL
- Primary quantity = 10
- Secondary quantity = 150

**OPBUFSIZE**
Specifies the size (in KB) of the Online Performance (OP) buffer that is used to buffer collected data.

**2048**
Is the default size.

**opSize**
Can be up to 16384 KB.

**ELAPSEDTIME**
Specifies one (of multiple) stop criteria for the data collect task.

**60**
Is the default duration (in seconds).
secs
   Specifies the duration (in seconds).

RECCOLLECTED
   Specifies one (of multiple) stop criteria for the data collect task.

recs
   Specifies the maximum number of IFCID records to collect.

Not supported in combination with GDGDATASET.

TERMTHREADS
   Specifies one (of multiple) stop criteria for the data collect task.

thds
   Specifies the number of terminated threads after which data collection
   stops.

Not supported in combination with GDGDATASET.

TRACE
   Specifies the DB2 START TRACE command to collect data. The command can
   start with a preceding dash (-). Do not use the DEST or SCOPE subcommands
   unless a specific OP buffer should be used.

The following excerpt from a batch job shows how two START TRACE
commands are used to collect different trace classes and IFCIDs:

   TRACE('START TRACE(PERFM) CLASS(30) IFCID(314) TDATA(CORRELATION,CPU)')
   TRACE('START TRACE(AUDIT) CLASS(31) IFCID(140,83)')

Collecting report data with the Near-Term History Data Collector
If the Near-Term History Data Collector is configured to store collected data
in sequential data sets, the contents of these data sets can be used as input for
OMEGAMON XE for DB2 PE reports and trace reports.

The Near-Term History Data Collector can be configured to store data in various
types of data sets, for example sequential data sets, Generation Data Group (GDG)
data sets, and VSAM data sets. The configuration is done with the Configuration
Tool, the currently active configuration can be viewed by means of the
OMEGAMON XE for DB2 PE Classic Interface in the Near-Term History Data
Collection Options panel.

Ensure that collected data is written to sequential data sets by one of the following
methods:

   • The near-term history data collection options keyword WRITEOPTION in data
      set member RKD2PAR(COPT<ssid>) should have the value VSAM,SEQ.
   • In the Near-Term History Data Collection Options panel you should see
      Writeoption=VSAM,SEQ. This panel also lists the currently used data sets where
      collected data is stored.

For more information, see the Configuration Tool online help and Monitoring
Performance from the OMEGAMON Classic Interface.

Creating reports using commands
OMEGAMON XE for DB2 PE has a set of commands to create reports.
Each command can use subcommands and subcommand options to control the period reported, what is included or excluded from the report, or which users are reported. The OMEGAMON XE for DB2 PE command stream is contained in a batch job, together with JCL statements. Typically, the batch job contains the following elements:

- Setup information
- General filters and controls
- Commands
- Subcommands and subcommand options

This topic assumes that the OMEGAMON XE for DB2 PE command stream in a JCL is created manually or a copy of an existing JCL is modified. You can also use the Interactive Report Facility (IRF) to specify reports interactively. The IRF then composes the command stream according to your specifications and executes the command stream in foreground or background mode. A subsequent topic describes the use of the IRF in more detail.

**Setup information for data sets**

The setup information specifies the input and output data sets for your reports.

**ddnames of general data sets:**

The following list shows the data definition names, also known as *ddnames*, for required and optional data sets.

The ddnames for the required data sets are:

**INPUTDD**

The data set that contains the DB2 trace data to be used as input for OMEGAMON XE for DB2 PE reports. You must specify this fully qualified data set name.

If your DB2 trace data is provided in SMF log streams, specify the log stream name. You can also specify an additional range of dates if required.

In the following example, all DB2 traces that are available in z/OS log stream "IFASMF.SYSA.DB2" are processed by the batch reporter. The FROM and TO arguments can be used to control the date range.

```plaintext
//INPUTDD DD DSN=IFASMF.SYSA.DB2,
//                        DCB=(RECFM=VB,BLKSIZ=32760,LRECL=32756),
//                        SUBSYS=(LOGR,IFASEXIT,'FROM=OLDEST,TO=YOUNGEST')
```

For more information about SMF log streams, contact your system administrator.

**STEPLIB**

The data set that contains OMEGAMON XE for DB2 PE programs. You must specify this fully qualified data set name.

**SYSIN**

The data set that contains OMEGAMON XE for DB2 PE command string. If the command string is contained in the JCL, specify an asterisk (*), otherwise specify the fully qualified data set name.

The ddnames for the optional data sets are:

**DPMLOG**

The data set where processing messages are written.
DPMOUTDD
The output data set where OMEGAMON XE for DB2 PE writes formatted data. Specify a ddname for this data set only if you want to produce more reports from the same data later.

DPMPARMS
The data set that contains information about changes that you have made to OMEGAMON XE for DB2 PE standard processing settings. The things you can tailor are:
- Report layouts
- Time zone specifications (member LOCDATA)
- Correlation translation information (member CORRDATA)
- Exception field descriptions (member EXCHANGE)
- Definition of the main packages used in reporting (MAINPACK)

For more information, see “Customizing OMEGAMON XE for DB2 PE functions” on page 2949.

ERRDMPDD
This service data set provides potentially corrupted IFCID data identified by the Reporter. You should only specify this ddname if corrupted IFCID records are reported in your JOBSUMDD or DPMLOG.

JOBSUMDD
The data set where information about OMEGAMON XE for DB2 PE processing is written. It contains the IFCID frequency distribution log and the job summary log.

JSSRSDD
The data set where job summary data is written when a SAVE subcommand is processed.

SYSOUT
The data set where messages about sorting are written.

The following three data sets are used for exception processing. For more information, see “Using Statistics and Accounting reports to identify exceptions” on page 2794.

EXCPTDD
The data set where exception thresholds are stored. This data set is required for all exception processing.

EXFILDD1
The data set where the Exception Log File data is written.

EXTRCDD1
The data set where the Exception Log data is written.

ddnames of report data sets:
Output from OMEGAMON XE for DB2 PE report set processing is written to the report data sets. You must specify a data set for the SAVE, RESTORE, or FILE output corresponding to the particular report set you are requesting.

The default ddnames for these data sets all start with a two-letter prefix that indicates the report set. The following table shows the report set and the corresponding prefix:
The following list shows the default ddnames for the report data sets, where cc is the prefix.

**ccRPTDD**
The data set where report output is written.

**ccTRCDD1**
The data set where trace output is written. If you generate more than one trace in the same job step, the second trace is written to ccTRCDD2, the third to ccTRCDD3, the fourth to ccTRCDD4, and the fifth to ccTRCDD5.

**ccFILDD1**
The data set where output from the FILE subcommand is written.

**ccSAVDD**
The data set where data is stored using the SAVE subcommand.

**ccRSTDD**
The data set from where data is read using the RESTORE subcommand.

**ccWORK**
The data set where output from the REDUCE subcommand is written. Normally this is a temporary data set that OMEGAMON XE for DB2 PE automatically creates and deletes. If you want to control the placement or size for this data set, specify a ddname.

The Explain report set does not use subcommands. Therefore, you need to specify only one data set. The default ddname for this data set is:

**EXPLAIN**
The data set where output from the EXPLAIN command is written.

**General filters and controls**
OMEGAMON XE for DB2 PE has a set of auxiliary commands to streamline the generation of reports.

These commands are shared by the various report sets.

**CASE** Use this command to accept entries in uppercase or lowercase characters. Specify CASE (SENSITIVE) before any other command if you want the following commands to differentiate between uppercase and lowercase entries. If you do not specify the CASE command, or if you specify CASE (ANY), lowercase characters are converted to uppercase characters.

---

---

Chapter 6. Batch reporting  2771
FIELD  Use this command to include fields that match a comparison value in Record Trace reports.

GLOBAL
Use this command to identify the users, plans, or the period in time you want to investigate.

- You can filter the input data by specifying the start and end times of the data to be reported. This is done by using the FROM and TO subcommand options.
- You can filter the input data by specifying the identifiers for which you want data to be reported. This is done by using the INCLUDE and EXCLUDE subcommand options.

These values specified with the GLOBAL command are used as defaults in the subcommands.

GROUP
Use the GROUP command to define a group of OMEGAMON XE for DB2 PE identifier values for use in reporting. See “Group data” on page 2947.

LIST  Use the LIST command to define a list of OMEGAMON XE for DB2 PE identifier values for use in reporting. See “Use lists” on page 2947.

Report set commands
The report set commands specify the report set that you want to use. All report set commands have default subcommands, so you do not need to specify any subcommands.

The default subcommands usually produce the shortest report in the report set. See “Report sets” on page 2745 for an overview of the different report sets. For details on how to specify commands refer to the Report Command Reference.

</table>

Subcommands and subcommand options
You can use subcommands and subcommand options to specify how you want the data to be presented.

For details on how to specify commands refer to the Report Command Reference.
REPORT
Use this subcommand to generate reports. In reports, data is summarized by OMEGAMON XE for DB2 PE identifiers, such as the primary authorization ID or the plan name.

Use the LAYOUT or LEVEL subcommand options of REPORT as appropriate to specify the amount of detail you want in the report. Use the ORDER subcommand option to specify how you want the data to be summarized. Use the EXCEPTION subcommand option to produce reports that contain only values outside user-specified limits.

TRACE
Use this subcommand to produce listings that show individual DB2 events, usually in the order of occurrence.

Use the LAYOUT or LEVEL subcommand option of TRACE as appropriate to specify the amount of detail you want in the trace. Use the EXCEPTION subcommand option to produce traces that contain only values outside user-specified limits.

FILE
Use this subcommand to store data about individual DB2 events in data sets that can be used with the DB2 load utility.

Use the EXCEPTION subcommand option to produce data sets that contain only values outside user-specified limits.

REDUCE
Use this subcommand to aggregate Statistics and Accounting DB2 events. REDUCE consolidates DB2 events with the same OMEGAMON XE for DB2 PE identifiers. You can save the reduced data by using the SAVE command.

Use the INTERVAL and BOUNDARY subcommand options of REDUCE to specify how the data is consolidated. INTERVAL specifies the time range at which records are consolidated. BOUNDARY specifies the start time of the INTERVAL.

If SAVE or processing by INTERVAL is not required, you can omit REDUCE.

SAVE
You can save data sets as follows:

Without CONVERT option
Saves reduced data into a VSAM data set. You can use the saved data in later reporting.

You can also convert the data set into a sequential data set that can be loaded into DB2 tables using the Save-File utility.

With CONVERT option
Converts and saves reduced data into a sequential data set that can be loaded into DB2 tables.

RESTORE
Use this subcommand to include previously saved data from the VSAM data set.

Example of a command string
This example shows a JCL that produces a short Accounting report and a long Statistics trace.
The following text describes the contents of the JCL and shows an example output from this JCL.

```
EDIT ---- SYS92267.T092210.RA000.USERPMA.R000003 -------- Columns 001 072

```

Figure 229. Specifying a job stream using ISPF/PDF editor

The first two lines are user and environment settings. Change these settings according to your operating environment.

Line 3 contains the call to OMEGAMON XE for DB2 PE. The DATEFORMAT parameter determines the mm/dd/yy format (which is the default format, so it is not strictly necessary to be declared in the job stream).

The STEPLIB statement (line 4) must be modified to point to your OMEGAMON XE for DB2 PE installation.

The SYSIN statement (line 5) indicates that the command string is contained within this JCL.

The INPUTDD statement (line 6) specifies the input data set that contains DB2 trace data.

The GLOBAL command (line 8) restricts the data that is passed from the input data set to the ACCOUNTING and STATISTICS commands. Only data between the specified FROM and TO dates and times is made available to the commands.

The ACCOUNTING command (line 11) produces an Accounting report. The REPORT subcommand (line 12) is not strictly necessary because REPORT is the default subcommand for ACCOUNTING. The FROM and TO subcommand options (lines 13 and 14) restrict the period of the Accounting report to 30 minutes. When you use these subcommand options, ensure that the period is within the period specified by the GLOBAL command. Otherwise, no report is generated.

The STATISTICS command (line 15), its TRACE subcommand (line 16), and its LAYOUT subcommand option (line 17) produce a long Statistics trace.

You must include the EXEC statement (line 18) to generate the reports. Otherwise, no report is generated.
Because no explicit output data sets are specified in this example, the reports will be written to ACRPTDD for the Accounting report and STTRCDD1 for the Statistics trace, which are the default ddnames.

To submit the job, type SUBMIT on the command line and press Enter.

![EDIT screen](image)

Figure 230. Submitting the job

The syntax of your JCL is checked and written to the DPMLOG data set, together with any information, warning, or error messages raised.

### Accounting report - model layout SHORT

The following example shows an Accounting report produced in the previous JCL.

**ACCOUNTING REPORT COMPLETE**

### Creating reports with the Interactive Report Facility

The Interactive Report Facility (IRF) provides a dialog, though a series of panels, that guides you through the specifications for a report.

After you specified a report, your specifications are validated and the IRF automatically generates a batch report command stream with JCL statements and the commands, subcommands, options and keywords that match your selections for the requested reports. This job can be executed in foreground or background mode to produce the report.

The IRF is invoked from the IBM OMEGAMON for DB2 Performance Expert on z/OS main menu by selecting option 1 (Create and execute reporting commands).
Selecting reports and reports details
In the Interactive Report Selections panel, you select which reports you want to create, the functions to apply to the selected reports, and additional functions to be reflected in the batch report command stream.

About this task
When you invoke option 1 (Create and execute reporting commands) from the main menu, the following panel is displayed.

```
Interactive Report Selections
Select functions as required, then press Enter.

<table>
<thead>
<tr>
<th>Report Set</th>
<th>Function</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accounting</td>
<td>/</td>
<td></td>
</tr>
<tr>
<td>Statistics</td>
<td>&gt;</td>
<td></td>
</tr>
<tr>
<td>SQL Activity</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Locking</td>
<td></td>
<td></td>
</tr>
<tr>
<td>I/O Activity</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Audit</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Utility</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Record Trace</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Additional Functions
- Global Processing
- System Parameters
- Exception log
- Explain

Command ===>
```

Figure 231. Interactive Report Selections panel

The panel provides a matrix for selecting report sets (Accounting, Statistics, and so on) and the functions (Reduce, Report, and so on) to be applied to the selected report sets. Multiple functions can be applied to selected report sets, but some functions are inapplicable to some report sets, as shown by the matrix.

- Use forward slashes (/) to select combinations of report sets and functions (for example, an Accounting report).
- Greater than symbols (>) indicate previously made selections (for example, a Statistics report).
- To correct a selection, overtype the symbol with a blank.

The selections of Additional Functions are treated in the same manner.

The command line accepts the following commands to facilitate and complete the report selections:

- The INCLUDE and EXCLUDE commands filter data on a report set level or at a global level.
- The GROUP command defines a named group of OMEGAMON XE for DB2 PE identifiers. The group name can be used when you request reports.
- The LIST command defines named group of OMEGAMON XE for DB2 PE identifiers. The list name can be used in INCLUDE and EXCLUDE commands instead of individually entering each list member.
• The BROWSE command can be used to review the batch report command stream that was generated based on your current selections.
• The SAVE and RECALL commands save current selections or recall previously saved selections.
• The OPTIONS command sets or changes the default options of your current IRF session, such as foreground or background processing and the ddnames to be used.
• The RESET command clears all input fields.

When your specifications for the reports are complete, press F5 (Compose).

**Specifying default options by using the OPTIONS command**

You can change the defaults by using the OPTIONS command before you press F5 (Compose).

**About this task**

If no defaults were created before, the following steps are automatically invoked after you pressed F5 (Compose). Otherwise, these steps are skipped and the default options are applied to the generation of the batch report command stream.

The Execution Mode panel is displayed for selecting foreground or background processing.

Depending on your selection, the Foreground DDname Selections or Background DDname Selections panel is displayed.

For each ddname, enter one of the following to update the data set information:

• Data set name
  The name of the input data set or the name of the data set where output is directed to. If the name is not enclosed in apostrophes, the TSO prefix is added to it.

• Extended information for a ddname
  You can specify additional parameters needed for the DD statement in JCL syntax (background), or for the TSO/E ALLOC command (foreground).  
  • Asterisk (*)
    The output is directed to the terminal (foreground only).
  • Blank
    The ddname is not used, or it is dynamically allocated.

Mandatory input fields are marked by an asterisk (*) in the Required field.

Press Enter to validate the entries.

**Composing and executing the batch report command stream**

After all defaults are specified and F5 (Compose) was pressed, your selections and specifications are validated and the job stream is generated.

**About this task**

If foreground processing was selected, the job is executed immediately. Your terminal remains busy until the job is completed.
If background processing was selected, the Job Processing Selections panel is displayed. In this panel, you can:

- Browse the generated job stream.
- Apply changes to the job stream before you submit it.
- Store the job stream for future use (after the job has been saved, it can be edited with any standard editor, for example, ISPF/PDF EDIT).
- Submit the job.
- Specify the required information for the JOB statement.

**Saving and recalling selections**
The SAVE command saves all report set, reporting command, and ddname selections and specifications that you have made so far into a partitioned data set.

**About this task**

You can also save incomplete selections and use these selections as a template for a specific type of report. The SAVE command displays the Save Selections panel, where you can specify the data set and member name in which selections are to be saved. This data set must exist and must be defined with the following attributes:

```
RECFM FB
LRECL 80
BLKSIZE 6160
```

Directory blocks
- Depends on how many members you want to save.

The next time you want to produce the same or a similar command stream, type `RECALL` on the command line of one of the IRF panels. The `RECALL` command displays the Recall Selections panel, where you can specify the data set and member in which the previous selections have been saved. At this time, you can still modify or complete the recalled selections according to your needs. If you want to use the recalled selections unchanged, enter `COMPOSE` on the command line to generate the JCL and the command stream.

**Example of producing an Accounting report**
The following steps show how you can produce a short Accounting report.

**About this task**

Comprehensive help information is available on all IRF panels.

**Procedure**

1. Start the IRF by invoking option 1 (Create and execute reporting commands) from the main menu. The Interactive Report Selections panel is displayed:
### Interactive Report Selections

Select functions as required, then press Enter.

<table>
<thead>

---

**Figure 232. Interactive Report Selections panel**

2. Type RESET on the command line to delete all previously made selections from the panel.

3. Select an Accounting report by entering a forward slash (/) on the corresponding line, as shown in the previous figure.

4. Type OPTIONS on the command line. The Session Options window is displayed, overlaying the Interactive Report Selections panel:

### Interactive Report Selections

**Session Options**

- Update fields as required, then press Enter.
- Confirmation display 1:yes 2:no
- Initial menu choice 1-6 or blank
- Execution mode 1:Background 2:Foreground 3:Prompt

**DPMPARMS data set**

F1=Help F2=Split F9=Swap F12=Cancel

**Command ===>

F1=Help F2=Split F3=Exit F5=Compose F6=Browse F9=Swap
F10=Global F11=Inclexcl F12=Cancel

---

**Figure 233. Interactive Report Selections panel - Session Options window**

5. In the Execution mode field, type 1 to select background processing and press Enter. The Interactive Report Selections panel is displayed again.
6. Press Enter. The Accounting Report Selections panel is displayed:

![Accounting REPORT Selections panel](image)

**Figure 234. Accounting Report Selections panel**

7. Type a forward slash (/) in the action field and give the report an appropriate name in the User Comment field, as shown in the previous figure. You are not required to specify a ddname. The default is used.

8. Press Enter. The Accounting Report panel is displayed:

![Accounting REPORT panel](image)

**Figure 235. Accounting Report panel**
Note the default ddname. In this panel you can refine the Accounting report you want. Here, member-scope reporting and a short report are specified.

9. Press Enter to return to the Accounting Report Selections panel.

10. Press F3 (Exit) to return to the Interactive Report Selections panel. You have completed the specifications for the commands, subcommands, options and keywords that are required to generate the example Accounting report.

11. You can use F6 (Browse) to view the command stream. This displays the following panel:

```
ACCOUNTING REPORT  /*My Accounting report short*/
   DDNAME(ACRPTDD)
   LAYOUT(SHORT)
   SCOPE(MEMBER)
EXEC

Figure 236. Accounting report command stream
```

12. On the Interactive Report Selections panel, press F5 (Compose). This generates the JCL and command stream, which you can browse, edit, store, or execute. The Background DDname Selections panel is displayed (because of your previous execution mode selection):

```
Background DDname Selections

Update the data set information. Select one or more data sets to add extended information, then press Enter. Your TSO prefix is added to data set names not enclosed in single quotes. Press Enter to continue when complete.

<table>
<thead>
<tr>

</tbody>
</table>

Figure 237. Background DDname Selections panel

13. Enter at least the required information, marked by asterisks (*). Usually, you must specify the input data set that contains the data to be reported. In this
example, ACC.INPUT.SMF is entered in the INPUTDD line, which resolves to 'HECK.ACC.INPUT.SMF' (the TSO prefix is added) when you press Enter.

The list of ddnames also shows the default ddname for Accounting reports (ACRPTDD). Output data sets are dynamically allocated, if not specified explicitly. If you want to become familiar with the IRF and do not have real input data available, you can use the sample data set DB2PM.V400.DPMIN40. If this data set is not available, press F1 (Help) and F5 (Exhelp) for current information about the sample data set.

14. Press Enter. The Job Processing Selections panel is displayed:

```
Job Processing Selections
Update the job statements as required, then select one of the following.

1. Browse the generated job stream
2. Edit the generated job stream
3. Store the job stream for future use
4. Submit the job stream for background execution

Job statement information

Command ===>
F1=Help  F2=Split  F3=Exit  F9=Swap  F12=Cancel
```

Figure 238. Job Processing Selections panel

15. You can now browse, edit, store, or submit the generated job stream. For example, select option 1 (Browse the generated job stream) to display a panel with the following job stream:

```
Figure 239. Interactive Report Facility (IRF) - example of generated job stream
```

16. To submit the job, specify appropriate job statement information at the bottom half of the Job Processing Selections panel and press Enter. You are prompted if this information is missing.
You should now see a message that indicates whether the job was successfully submitted.

**Using Statistics traces to get system overview information**

The best way to get started with OMEGAMON XE for DB2 PE is to create a long Statistics trace report to get an overview of your DB2 system.

To do this:
- Run a DB2 trace to collect DB2 Statistics data during a 24-hour period.
- Create a Statistics trace report.
- Interpret the report and adjust the system.

The reason for creating a trace report is that the 24-hour period is reported as a single interval. A normal report creates a record for each Statistics interval, which could result in an output of more than 1,200 pages.

Choose a day that will have a fairly typical workload, not a weekend, for example, or a public holiday when workload will probably be much reduced.

**Collecting Statistics data with a DB2 trace**

Use the Performance Expert Client to configure and start a DB2 trace to collect DB2 Statistics data during a 24-hour period.

**About this task**

To do this, start the Performance Expert Client:

1. On the menu bar of the **System Overview** window, click **Tools > Performance Warehouse - Expert** to open the **Performance Warehouse** window.
2. On the Performance Warehouse window, select the **Trace on z/OS** tab.
3. Open the folders to connect to the **z/OS** subsystem.
4. Switch to your private group. If not available, right-click the **Process Groups** node to create your private copy.
5. Expand the public tree
6. Copy the CRD (collect report data) process template from the **Public** process groups to a process group of your own.
7. Expand your private group tree.
8. Double-click the CRD step to open the **CRD Step Properties** window.
9. Open the **Options** page and change the following option categories:
   - For **Output data set**, type an output data set name and select **Append** or **Overwrite**.
   - For **Data**, clear the **Statistics** check box. Specify which IFCIDs you want to collect. The IFCIDs associated with this trace are displayed and highlighted. Only the highlighted IFCIDs are collected in the trace. Here you can, for example, choose not to include buffer pool statistics at data set level.
   - For **Stop**, specify the criteria for the data collection. Select the **Elapsed time** check box and specify a time of 24:00:00.
   - Click **OK** to save the configuration of the CRD step.

10. When finished, right-click the CRD process and select **Execute** to open the **Performance Warehouse Process Scheduler** window to define a schedule for the selected process.

11. Select the **Execute once, immediately** to run the process once.

12. Click **Finish** to start the trace.

### Creating a Statistics trace report

Use your ISPF editor to create a JCL job that creates a Statistics trace report.

#### About this task

The following JCL is an example. Remember to change the setup information (starting with // in your JCL) as appropriate for your installation.

```jcl
EDIT ---- ANDREW.OMPE.JOBS.STTRALON------------------------- Columns 001 072
Command ==> Scroll ==> CSR_******** TOP OF DATA ***********************
0001 /* JCL to produce a Statistics LONG trace report */
0002 //AWOMPES JOB (TTS1,YUS7), 'ANDREW',
0003 // MSGCLASS=V,CLASS=D,NOTIFY=ANDREW
0004 // EXEC PGM=FPECMAIN
0005 // STEPLIB DD DSN=OMPE.RKANMOD,DISP=SHR
0006 // INPUTDD DD DSN=IFASMF.SYSA.DB2,
0007 // DCB=(RECFM=VB,BLKSIZE=32760,LRECL=32756),
0008 // SUBSYS=('LOGR,IFASEXIT,'FROM=OLDEST,TO=YOUNGEST')
0009 // DPMOUTDD DD DSN=ANDREW.OMPE.OUT.STTRCA01,DISP=OVR

```

#### Figure 241. Specifying a job stream using ISPF/PDF editor

To submit the job, type **SUBMIT** on the command line and press Enter.

### Interpreting the Statistics trace report and applying rules of thumb

You can use the Statistics trace report that you have produced in the previous steps for a quick assessment of the performance of your DB2 system.

A good way of looking at the data is to focus on a few key indicators and apply a few simple rules and ratios, known as **rules of thumb** (ROTs). Rules of thumb have...
been assembled by DB2 experts in the field over many years and are proven to be valuable criteria to measure the performance of applications in a DB2 system.

Rules of thumb (ROTs) are also implemented as samples in the Performance Warehouse. You can examine the ROT definitions and use the Performance Warehouse to evaluate your DB2 systems. For more information, see Monitoring Performance from Performance Expert Client.

Getting an overview of your DB2 system performance:

The Statistics trace report provides an overview of important areas, like DBM1 storage usage, data set activities, logging and locking activities, and thread management.

To get an overview of your DB2 system, you have to look at the following areas:
- **DBM1 storage** DBM1 storage is allocated below and above the 2 GB bar and is used for buffer pools, EDM pools, RID pools, and authorization caches. It is essential that the various pools and caches are optimized in their allocated space.
- Data set Open and Close activity Applications that leave data sets open can affect other applications that must wait because too many data sets are already open.
- **Logging** Logging activities interrupt normal DB2 operations. Logging problems will therefore affect applications and performance.
- **Locking** Locks occur in DB2 when applications have to wait for resources (concurrency problems).
- **ROWID** The ROWID block of the report shows the success of direct row access attempts.
- **Thread management** Thread optimization avoids applications from having to wait for free storage to allow thread creation.

Buffer pool efficiency:

The buffer pool related report blocks of the Statistics trace report begin roughly at page 9 of the report. They are repeated for every active buffer pool.

The efficiency of your buffer pools directly affects the performance of your DB2 system. Well tuned buffer pools reduce the number of read and write operations from and to a hard disk drive, which in turn reduces application wait times.

**Tip:** OMEGAMON XE for DB2 PE includes the Buffer Pool Analyzer. This is a powerful tool that reports on the efficiency of your buffer pools and simulates your DB2 workload to arrive at an optimal buffer pool configuration for the system. For more information, see the Buffer Pool Analyzer User’s Guide.

**Hit ratios**

The Buffer Pool Read block provides hit ratios that serve as indicators of the overall buffer pool efficiency.

The buffer pool hit ratio (BP00L HIT RATIO (%)) shows the number of Getpage requests issued by applications and satisfied by the buffer pool, expressed as a percentage of all Getpage requests. This is a relative value...
that depends on the type of application. For example, applications that browse large amounts of noncontiguous data could cause the buffer pool hit ratio to drop near 0.

Avoid page-Ins
The Buffer Pool Read block and the Buffer Pool Write block provides indications of potential performance problems that are caused by paging activities to a hard disk drive.

A buffer pool that is too large can also cause performance problems because it causes paging to a hard disk drive.

Look at the PAGE-INS REQUIRED FOR READ and PAGE-INS REQUIRED FOR WRITE fields in the Buffer Pool Read block and the Buffer Pool Write block of the report. These values should be zero, or close to zero. Higher values mean that the buffer pool size is over allocated. Consider reducing the buffer pool size.

Optimize prefetch
The Buffer Pool Read block provides indications of the efficiency of DB2's page prefetch activities.

DB2 uses prefetch to optimize queries. For SQL, a prefetch can read up to 32 pages from a hard disk drive. Prefetch can stop or be canceled when more than 90% of the pages in the buffer pool is unavailable. This can have a considerable effect on performance because scanned pages must be read synchronously from a hard disk drive.

Check the PREF.DISABLED-NO BUFFER and DM CRITICAL THRESHOLD fields in the Buffer Pool Read block of the report. If one or both field values are not zero or not close to zero:

- Review the Sequential Steal thresholds (VPSEQT)
  These thresholds are percentages of the virtual buffer that might be occupied by sequentially accessed pages. If these thresholds are too low, prefetch can be disabled. If these thresholds are too high, other thresholds can be reached too soon.
- Reduce the Deferred Write thresholds (VDWQT and DWQT)
  If the DB2 system is used mainly for high-use query systems reliant on prefetch, reducing these thresholds decreases the portion of the virtual buffer pool that is occupied by updated pages.
- Increase the size of the buffer pool
  Use the ALTER BUFFERPOOL command to increase the size of the buffer pool, which will give the system more space for prefetched pages.

EDM pool failures:

The EDM pool stores cursor tables (CT), package tables (PT), and database descriptors (DBD).

Any pool full failures (FAILS DUE TO POOL FULL) indicate that the EDM pool is too small for the DB2 workload. The EDM pool should be big enough to store the cursor tables (CT), package tables (PT), and database descriptors (DBD). The ratios CT REQUESTS/CT NOT IN EDM, PT REQUESTS/CT NOT IN EDM, and DBD REQUESTS/CT NOT IN EDM show the EDM pool utilization. Generally, ratios of about 80% are adequate in most cases. If these values are significantly lower, reduce the size of the EDM pool and allocate the saved storage to the buffer pool, where the performance benefits are greater.
Authorization problems:

DB2 performance can be affected by plans and packages that are waiting for authorization checks or by failures because the authorization cache is full.

Compare the number of authorization checks made for authorized plans (PLAN-AUTH SUCC) with the number of checks made that did not use the DB2 catalog (PLAN-AUTH SUCC-W/O CATALOG). A wide difference could indicate a first use of any plan by a given user ID after DB2 was started. Set the CACHESIZE parameter to a value greater than zero for all plans where EXECUTE privilege is not granted to public.

If the number of package authorization failures (AUTH UNSUCC-PKG-CACHE) is not zero, or close to zero, use the ZFARM ZPAC to increase the size of the package cache.

RID List failures:

RID List failures occur if the RID pool size is constrained.

If the number of times that DB2 failed to allocate storage for RID list processing caused by storage constraints (TERMINATED-NO STORAGE) is not zero, or close to zero, you should reduce the storage size that is used by other structures.

Failures because RDS or Data Manager limits are exceeded (TERMINATED-EXCEED RDS LIMIT and TERMINATED-EXCEED DM LIMIT) are caused by inaccurate or incomplete RUNSTATS statistics or by optimizer errors. Add the clause OPTIMIZE FOR 1 ROW to the SQL statement to avoid RID list processing, or add the necessary columns to the index to make access INDEX ONLY.

If the number of RID list failures caused by storage limits (TERMINATED-EXCEED PROC LIMIT) is not zero, or close to zero, increase the RID pool size.

Locking problems:

TIMEOUTS and DEADLOCKS, shown in the Locking Activity block of the Statistics trace report, should be close to zero.

If not, then if the number of LOCK REQUESTS is not significantly less than the total number of SQL DML requests, lock avoidance is not active. Set BIND CURRENT DATA to NO, declare the cursor with FOR UPDATE OF, and use the WHERE CURRENT OF cursor name with UPDATE and DELETE.

Logging performance:

Logging can cause performance problems when the output buffer is inappropriate.

In the Log Activity block of the report, the READS SATISFIED-ARCH.LOG(%) field value should be low and the UNAVAILABLE OUTPUT LOG BUFF field value should be zero. If necessary, change the OUTBUFF parameter to increase the size of the output buffer.

Data set Open and Close activities:

This report block of the Statistics trace report indicates whether enough data sets are allowed to be concurrently open.
The DSETS CLOSED-THRESH.REACHED field value should be close to zero. If not, use the ZPARM DS MAX to allow more open data sets. A reasonable figure is 8 000 - 10 000.

Set the CLOSERULE parameter of the CREATE TABLESPACE, CREATE INDEX, ALTER TABLESPACE, and ALTER INDEX commands to YES for table spaces and indexes that are used mainly by batch applications, and to NO for those that are used mainly online.

**ROWID efficiency:**

This report block shows how efficient direct row access is used. Direct row access is very fast because DB2 does not use an index or table space scan to find the row.

The TABLE SPACE SCAN USED field value should be zero. Use the WHERE clause to cause an unsuccessful direct row access to revert to a matching index scan using the primary key:

```
WHERE rowidcol=:HVROWID AND pkcol=:HVPK
```

**Thread management:**

The Subsystem Services block of the Statistics trace report indicates how thread queuing is performed.

The QUEUED AT CREATE THREAD field shows the number of allied and allied-distributed threads that were not immediately created because the maximum number of threads allowed in the system had been reached.

As a rule of thumb about 1% thread queuing is acceptable. When this is appreciably higher, increase the value of MAX USERS on the DB2 install panel DSNTIPE.

The combined maximum allowed for MAX USERS and MAX REMOTE ACTIVE depends on the DB2 version installed. It cannot exceed:

- **20000** For DB2 10 or later.
- **2000** Prior to DB2 10.

The DBAT QUEUED-MAXIMUM ACTIVE field in the Global DDF Activity block of the report shows the number of DBATs that had to wait because the maximum number of threads allowed in the system had been reached. This value should be zero, or close to zero. Increase the value of MAXDBAT to raise the maximum number of concurrent active DBATs allowed.

**Using an Accounting report to analyze resource activities**

The Accounting report shows how threads and applications perform in DB2.

The Accounting report set consists of a report and a trace report. The Accounting report accumulates and groups Accounting records by OMEGAMON XE for DB2 PE identifiers, such as primary authorization or plan name. The Accounting trace report reports single threads. A trace report can be very long because it shows a single record for each active thread in the system.
A good first indicator for applications is the time used per thread by any particular user. A strategy to improving application performance is to identify the users with the most system time consumption and examine their most frequently used applications:

- Create a DB2 trace for input to a report
- Create a short Accounting report that identifies the users with the highest system time consumption.
- Interpret the report and identify users and plans that need attention
- Create an Accounting trace report for each problem user and plan
- Interpret the trace report and find remedial actions
- Apply rules of thumb in the Performance Warehouse

**Collecting Accounting data with a DB2 trace**

Use the Performance Expert Client to configure and start a DB2 trace to collect DB2 Accounting data during a 24-hour period.

**About this task**

To do this, start the Performance Expert Client:

1. On the menu bar of the **System Overview** window, click **Tools > Performance Warehouse - Expert** to open the **Performance Warehouse** window.
2. On the Performance Warehouse window, select the **Trace on z/OS** tab.
3. Open the folders to connect to the **z/OS** subsystem.
4. Switch to your private group. If not available, right-click the **Process Groups** node to create your private copy.
5. Expand the public tree
6. Copy the CRD (collect report data) process template from the **Public process groups** to a process group of your own.
7. Expand your private group tree.
8. Double-click the CRD step to open the **CRD Step Properties** window.
9. Open the **Options** page and change the following option categories:
   - For **Output data set**, type an output data set name and select **Append** or **Overwrite**.
   - For **Data**, clear the **Accounting** check box. Specify which IFCIDs you want to collect. The IFCIDs associated with this trace are displayed and highlighted. Only the highlighted IFCIDs are collected in the trace. Here you can, for example, choose not to include buffer pool accounting at data set level.
   - For **Stop**, specify the criteria for the data collection. Select the **Elapsed time** check box and specify a time of 24:00:00.
   - Click **OK** to save the configuration of the CRD step.
10. When finished, right-click the CRD process and select **Execute** to open the **Performance Warehouse Process Scheduler** window to define a schedule for the selected process.
11. Select the **Execute once, immediately** to run the process once.
12. Click **Finish** to start the trace.

**Creating a short Accounting report**

Use your ISPF editor to create a JCL job that creates a short Accounting report.
The following JCL is an example. Remember to change the setup information (starting with // in your JCL) as appropriate for your installation.

```bash
EDIT ---- ANDREW.OMPE.JOBS.ACREPSHD------------------------ Columns 001 072
Command ===> Scroll ===> CSR

0001 /* JCL to produce an accounting short report */
0002 //AWOMPEA JOB (TT51,YUS7),'ANDREW',

ACCOUNTING REPORT COMPLETE
```

Figure 242. Specifying a job stream using ISPF/PDF editor

To submit the job, type SUBMIT on the command line and press Enter.

**Interpreting the Accounting report and making changes**

An example of a short Accounting report is evaluated and key fields are emphasized.

**Short Accounting report**

The output from your short Accounting report could look similar to the following report:
In this example, the application with the highest elapsed time is
JUSTIN-JUSDOIT3. There are a couple of points of interest for this user application
that can give you an idea of what to look for in a more detailed report:
- Elapsed times and CPU times
- Large differences between class 1 and class 2 times
- Synchronous reads
- Lock suspensions

All of JUSTIN's applications in this example show similar symptoms. It is also
possible that these applications could be affecting other applications. If these
problems could be solved, general thread throughput can be improved.

Generate an Accounting trace report to have a closer look at JUSTIN's jobs. Use the
same input data to create the report output. The JCL looks like this:

```
EDIT ---- ANDREW.OMPE.JOBS.ACTRALON-------------------------- Columns 001 072
Command ==> __________________________ Scroll ===> CSR
****** ............................... TOP OF DATA ........................................
0001 /* JCL to produce an accounting LONG trace report */
0002 //AWOMPEA JOB (TTS1,YUS7),'ANDREW',

**Interpreting the Accounting trace report and applying rules of
thumb**

Using an Accounting trace report for a specific problem analysis and applying
expert rules of thumb.

The long Accounting trace report shows much information, probably much more
than you need for a quick analysis. A good way of looking at the data is to focus
on a few key indicators and apply a few simple rules and ratios, known as rules of
thumb (ROTs). Rules of thumb have been assembled by DB2 experts in the field
over many years and are proven to be valuable criteria to measure the
performance of applications in a DB2 system.

Rules of thumb (ROTs) are also implemented as samples in the Performance
Warehouse. You can examine the ROT definitions and use the Performance
Warehouse to evaluate your DB2 systems. For more information, see Monitoring

**Performance from Performance Expert Client**

The number of Getpage requests per SQL statement:

Getpage requests per SQL statement indicate the number of pages that must be
accessed for each data row written or read by an application.
Normally, when data rows are read randomly with a unique-key index, one page is read for each index level and one page is read for the data. Typically, the number of pages read to retrieve a data row would be less than six. Similarly, when pages are read sequentially, multiple rows can be retrieved for each page read.

A high Getpage/SQL ratio could be caused by:
- The use of table scan. This causes each page in the table to be accessed and scanned, even though only one row is returned.
- The use of nonmatching index scan. When this happens, one Getpage request is made for each data page in the table and each index page in the associated index, even though only one row is returned.
- The use of an index with low cardinality. This can result in multiple page scans before a row is returned.

Comparison of class 1 and class 2 times:

The ratio of class 1 and class 2 times indicate whether a potential problem lies in DB2.

A difference of roughly 10% in these times is normal.

If the class 2 elapsed time is less than half of the class 1 elapsed time, the problem is not with DB2. Possible causes include:
- OS/390
- CICS
- IMS
- Other programs

If the difference between the class 1 and class 2 elapsed times is somewhere between 10% and 50%, the problem lies somewhere in DB2. Verify the class 2 times.

Comparison of class 2 elapsed and class 2 CPU times:

The ratio of class 2 elapsed and class 2 CPU times indicates a potential problem with SQL.

If the difference between the class 2 elapsed time and class 2 CPU times is between 10% and 50% (when CL2 CPU/CL2 ELAPSED is greater than 0.5), the problem probably lies with SQL. Use an EXPLAIN or SQL Activity report.

If the class 2 elapsed time is significantly greater (when CL2 CPU/CL2 ELAPSED is less than 0.5), the application is experiencing long wait times. Verify the class 3 suspension times.

Class 2 CPU time per SQL DML statement execution:

Class 2 CPU time per SQL DML statement execution time helps to identify potential access path problems.

The time taken for an SQL DML statement to complete depends on the speed of your processor. Typically, for a 100 MIPS CPU, a DML statement should complete in less than one millisecond. Because some DML statements take more cycles to complete than others, the statements are weighted as follows:

SELECT+INSERT+UPDATE+OPEN+FETCH*0.1+PREPARE*5.
If you find that your SQL statement time is averaging well over the one millisecond, you can use the Workstation Online Monitor to identify the problem statements and use the drill-down capability to view these at statement level. If you suspect an access path problem, you can use the Query Workload Tuner to show the access path selected.

**Not accounted time:**

Excessive time that is not recorded by DB2 indicate potential problems with overloaded servers.

This is time that is not recorded by DB2, either in class 2 time or in class 3 suspension time. This time should be below 25% of the total class 2 time. A higher percentage usually indicates an overloaded server, which could cause problems for online transactions. When this figure is consistently high, you should consider reducing the workload on the server or installing a bigger server.

**Class 3 suspensions:**

Class 3 suspensions indicate potential problems with lock acquisitions, long wait times for synchronous I/O, and long service task switch times.

If the class 3 times are not high, the application wait times could be caused by CPU queuing or by OS/390 paging. This should be shown as class 2 not accounted time.

When evaluating class 3 suspensions, check the following information.

**Commit interval**

This is calculated as:

\[
\text{COMMIT INTERVAL} = \frac{\text{CLASS 2 ELAPSED TIME}}{\text{COMMTS+ROLLBACKS}}
\]

A value of 1 to 5 is acceptable. For example, if CLASS 2 ELAPSED TIME is 1 second and COMMIT is 1, the result is 1. Higher values indicate problems with lock acquisition, especially in batch applications.

**Class 3 synchronous I/O time per I/O event**

Typically, this time should be about 20 to 30 milliseconds. A longer time indicates a problem because applications are waiting for synchronous I/O.

You can reduce I/O contention by increasing the size of your buffer pools or by reorganizing table and index spaces using REORG.

I/O problems are often system related. If a corresponding Statistics report also indicates problems, take the appropriate action. There might also be problems which could be identified by RMF. Verify the buffer pool data set Statistics block of the report.

**Service task switch**

The accumulated wait time from switching synchronous execution units, by which DB2 switches from one execution unit to another.

The most common contributors to service task suspensions are:

- Wait for commit processing for updates (UPDATE COMMIT)
- Wait for OPEN/CLOSE service task (including HSM recall)
- Wait for SYSIBM.RNG recording service task
- Wait for data set extend/delete/define service task (EXT/DEL/DEF)
- Wait for other service tasks (OTHER SERVICE)
The significant fields here are the times used by:

- **UPDATE COMMIT**
  
  This is the average service time associated with a DB2 commit, abort, or deallocation. Normally this value should be below 12 milliseconds. If this value is significantly higher, verify the application or raise the interval between commits.

- **OPEN/CLOSE**
  
  If the average time for an OPEN/CLOSE exceeds 150 milliseconds, DSMAX can be too low or too many data sets are open in the system. Adjust the DSMAX threshold. A figure of between 8000 and 10000 is a good working size in most cases.

  Ensure that applications use the correct QUERYTYPE. Set the CLOSERULE parameter of the CREATE TABLESPACE, CREATE INDEX, ALTER TABLESPACE, and ALTER INDEX commands to YES for table spaces and indexes used mainly by batch and NO for those used mainly online.

### Using Statistics and Accounting reports to identify exceptions

Exception reporting is a very effective way to identify performance problems. Exception reporting identifies DB2 threads and Statistics intervals with fields that contain values outside defined thresholds. This helps you manage performance objectives by highlighting problems in the DB2 subsystem, such as applications that are experiencing exceptional conditions or DB2 subsystem conditions that are causing thread performance problems.

You should run Accounting and Statistics exception reports as part of your regular monitoring. Exception reporting is also available in the Online Monitor.

The thresholds are set in the Exception Threshold data set. You can define exception thresholds for a number of fields on a plan or program basis (commonly known as accounting or thread fields) and on a system basis (known as statistics fields). When you request exception reporting, the input data is checked against these values. Only records with at least one field outside a threshold are reported.

### Output from exception reporting

Exception processing provides several types of output as part of Accounting and Statistics reporting.

Exception reports, traces, and files are obtained using the EXCEPTION subcommand option in the ACCOUNTING and STATISTICS commands.

#### Reports and traces

Exception reports and traces are like the usual Accounting and Statistics reports and traces, except that they only contain records that have at least one field in exception status.

#### Logs

Exception logs combine both Accounting and Statistics fields that are in exception status into a single report and show the information in timestamp order.

#### File data sets and Log File data sets

The Exception File data set and the Exception Log File data set are sequential data sets that are suitable for use by the DB2 load utility. The Exception File data set contains Accounting or Statistics records that have at least one field in exception status. The Exception Log File data set contains both Accounting and Statistics fields that are in exception status. The Exception
File data set corresponds to an exception trace, whereas the Exception Log File data set corresponds to an exception log.

The Exception Log data set is written if you define the EXTRCDD1 DD statement in the JCL. To prevent the generation of the Exception Log data set, omit the EXTRCDD1 statement from your JCL (the preferred method), or specify DUMMY in the definition.

The Exception Log File data set is written if you define the EXFILDD1 DD statement in the JCL. To prevent the generation of the Exception Log File data set, omit the EXFILDD1 statement from your JCL (the preferred method), or specify DUMMY in the definition.

**Specifying exceptions using the Exception Threshold data set editor**

Exceptions are specified as threshold values in an Exception Threshold data set. When exception processing is active, DB2 instrumentation data is checked against these values and fields that contain values outside the specified thresholds are reported.

**About this task**

This topic describes how to specify threshold values with the Exception Threshold data set editor, which is used to set and maintain thresholds in an Exception Threshold data set.

The threshold values in the Exception Threshold data set can also be modified by means of the exception profiling method, which uses a sample of DB2 instrumentation data to calculate and set individual threshold values in the Exception Threshold data set. Refer to "Exception profiling" on page 2931 for more details. For more details about the Exception Threshold data set and a sample data set that can be used to get started, refer to "Exception Threshold data set" on page 2930.

The Exception Threshold data set editor is accessed indirectly from the Data Set Maintenance Menu (DGOPMENU, Figure 244 on page 2796). To display this menu, select option 4 (Maintain parameter data sets) from the Online Monitor Main Menu.
Select one of the following.

1. Maintain exception thresholds
2. Maintain correlation translations
3. Maintain time zone information
4. Maintain MAINPACK definitions

Exception data set
'DG0710.THRESH'

DPMPARMS data set
'DG0710.DPMPARMS'

Command ===> _________________________________________________________
F1=Help  F2=Split  F3=Exit  F9=Swap  F12=Cancel

Figure 244. Selecting Maintain Exception Threshold data set

Type 1 in the input field to select Maintain exception thresholds, and type the name of your Exception Threshold data set on the line below Exception data set.

Press Enter. The Exception Threshold Category Selection panel is displayed, as shown in Figure 245

Select one or more categories, then press Enter. Overtype with space to deselect any category. Request EXIT when complete.

Category
/ Elapsed, CPU and Waiting Times per Plan Execution
  Elapsed, CPU and Waiting Times per Program Execution
  CPU Times per Address Space

Figure 245. Exception Threshold Category Selection panel

This panel shows the categories of exception threshold fields from which you can choose. The name of the category indicates the area where the exception applies:
... per Plan ... or ... per Program ... exceptions are reported in Accounting
... per System ... or ... per Address Space... exceptions are reported in Statistics

You can select any number of categories by typing a forward slash (/) or S in the selection field.

Fields that have previously been selected are marked by a greater than symbol (>). If you overtype the symbol in front of a category with a blank, the underlying selections are not deleted, but they are not used when exception reports are generated. To activate the category, select it again.

As an example, the Elapsed, CPU and Waiting Times per Plan Execution field is selected in Figure 245 on page 2796. When you press Enter, the Exception Threshold Field Selection panel is displayed, which shows all fields associated with this category, as shown in Figure 246.

```
DGOPXDS2 Exception Threshold Field Selection
Command ===> _________________________________________________________
Select one or more fields, then press Enter. Overtype with space to deselect any field. Request EXIT when complete.

Field category . . : Elapsed, CPU and Waiting Times per Plan Execution

 Field     Description
 > ADCPUT  CPU time in application (Class 1)
 / ADRECETT Elapsed time in application (Class 1)

-- End of Items --
```

Figure 246. Exception Threshold Field Selection panel

This panel shows all fields in this category. Fields that have been selected previously are marked by a greater than symbol (>) and sorted to the top.

Select a field for which you want to specify the exception thresholds. Type a forward slash (/) or S in the selection field and press Enter. The Exception Threshold Field Details panel is displayed [Figure 247 on page 2798].
Use the Exception Threshold Field Details panel to specify the threshold criteria in the Exception Threshold data set for the field selected from the Exception Threshold Field Selection panel.

The top right-hand side of this panel shows the entry number for this specification. You can specify more than one entry for the same exception field by using different criteria. For example, you can specify different exception thresholds for different plans. Or you might want to specify different threshold values for different environments (such as batch, online, or CICS). To add a new entry, you use the ADD command or F5 (Add). To view the different entries, use F10 (Previous) and F11 (Next). Remove entries that are no longer needed to avoid extra processing by using the DELETE command or F6 (Delete).

The first three fields in the panel show the category of the selected exception field, the field identifier, and the description of the field.

In this panel you can specify:

- Whether you want this field to be Active when exception reports are run. If you do not want to use the exception field specification when you generate exception reports the next time, but want to keep the entry, specify 2 (No).
- How you want the field value to be calculated before it is checked against the exception thresholds (By). If you want the value in the field used as is, without any calculation, specify Total. Alternatively, you can specify that the value for the field is divided by minutes, by seconds, or by the number of Commits, or you can specify that the exception threshold is checked for the average value per thread (this is especially useful in reports). The effect of these specifications varies according to the report or trace you produce.
- The Compare operator. It can be greater than or less than the threshold.

**Figure 247. Exception Threshold Field Details**
• The thresholds. You can specify two kinds of thresholds for a field: Warning threshold and Problem threshold. Specify a warning threshold value to alert you to potential problems and a problem threshold value to indicate a more serious condition.

• The additional criteria for the data for which the exception thresholds apply. These criteria are useful if you want to specify different exception threshold values depending on the environment. For example, you might want to specify different Elapsed Time thresholds for online transactions and batch jobs, in which case you would supply a specific connection name in this panel, press F5 (Add), and specify a different connection name in the second panel.

You can specify a generic name using an asterisk (*).

Usage Notes:

• Specify the time value in seconds, for example, 90 to specify a threshold of 1 minute and 30 seconds.

• Do not enter 2 or 3 in the By field for time values. Specifying By Minute or By Second only is appropriate for fields that are not time related.

• For Accounting exception traces, By Thread has the same effect as Total because in an Accounting trace only one thread is used for one entry.

• For Accounting exception reports, if you specify Total, the threshold is checked for each thread. If you specify By Thread, the threshold value is checked against the average of the threads that are reported in one entry.

• The following applies to Statistics exception traces and reports:
  – If you specify By Minute or By Second, DB2 PE uses the value of the INTERVAL ELAPSED field in the HIGHLIGHTS block as a divisor to calculate the rate value that is to be checked against the defined threshold.
  – If you specify By Thread, the value of the THREADS field in the HIGHLIGHTS block is used as a divisor to calculate the rate value that is to be checked against the defined threshold.
  – If you specify By Commit, the value of the COMMITS field of the HIGHLIGHTS block is used as a divisor to calculate the rate value that is to be checked against the defined threshold.

How DB2 instrumentation data matches exception thresholds
During exception processing, DB2 instrumentation data records are tested against matching threshold conditions in the Exception Threshold data set.

When a record matches more than one threshold, the best matching threshold is chosen of those detecting an exception.

The key fields of a record are:
• Location
• Group
• Subsystem ID
• Member
• Requesting Location
• Connection
• Plan Name
• Correlation Name
• Correlation Number
• Primary Authorization ID
These key fields are compared with the corresponding fields in the thresholds and the threshold that best matches the record is chosen. This is done by comparing the Location of the record with the Location field of the matching thresholds first. A key field that does not contain an asterisk is considered a better match than one that contains asterisks. If two thresholds are found to match the record equally, the Group fields are compared with the record. If these fields also match the record equally, the Subsystem ID fields are compared with the record, and so on for the following fields:

- Member
- Requesting Location
- Connection
- Plan Name
- Correlation Name
- Correlation Number
- Primary Authorization ID

Exception checking in the reporting phase is performed on entries that are constructed according to your ORDER specification, which contains up to three OMEGAMON XE for DB2 PE identifiers. For example, if you qualify a field by PLANNAME and CONNECT, exception checking on the field is performed only if you specified both PLANNAME and CONNECT in ORDER.

Package-related fields are supported on a “by total” and “by thread” basis only.

**Example of producing an Accounting exception report**

The example shows the benefits of using exception reporting. It also describes how to produce an Accounting exception report.

**Accounting report - without Exception**

Assume that you would regularly produce a short Accounting report, such as the following example, and that the report would normally be fairly long.

<table>
<thead>
<tr>
<th>Location: DSNDB0G</th>
<th>Accounting report - short</th>
<th>Page: 1-1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group: DSNDB0G</td>

<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

If you want to use this Accounting exception report to find out whether the class 1 elapsed time per thread is unacceptably high, you would have to check every entry on every page even though you are not interested in entries that fall within normal bounds.

To save time, you can specify exception thresholds for the class 1 time field per thread, and run Accounting exception reports that show only entries that have exceptionally high values for this field. You can further limit the data by only checking online transactions because you would expect to find a high elapsed time for batch jobs.
In this example transactions have a plan name PLANTRN and batch jobs have a plan name PLANBATn. The connection ID for the CICS address space is CICSA.

Access data set member RK02DATA(DG0ETV51) with the IRF and specify the thresholds in the Exception Threshold Field Details panel.

This example specifies that:

- Exceptions are checked for the class 1 elapsed time field ADRECETT.
- The Elapsed Time thresholds are checked for the average value per thread. This means that the value in this field is divided by the number of threads.
- The comparison is Greater than.
- If the class 1 elapsed time value exceeds three seconds per thread, it is flagged as a warning exception. If it exceeds six seconds per thread, it is flagged as a problem exception.
- Only data with a connection ID of CICSA (CICS transactions) is checked for exceptions.

After you have completed the specifications, press Enter. The exception threshold specification is complete.

Now you can run the Accounting exception report. Remember to specify the name of your Exception Threshold data set for the EXCPTDD ddname in the JCL. Use the following command to produce the report:

```
ACCOUNTING
REPORT
```
EXCEPTION

Accounting exception report

The following example shows the resulting Accounting exception report.

The exception report is much shorter than the original Accounting report. It only lists transactions with class 1 elapsed times that exceeded the exception threshold, and it flags these transactions as warnings or problems.

If you specify more than one exception threshold, all records that contained any fields that reached an exception threshold value will be listed.

Which exception fields and threshold values to choose

You can choose from a comprehensive set of exception fields and it can be difficult to decide which ones to choose and which threshold values to specify for your site. As a rule, most sites only need to define a limited number of thresholds.

To get started with exception reporting, consider using the sample Exception Threshold data set member RK02DATA(DG0ETV51), which contains a selection of predefined exception thresholds. For more information, see “Exception Threshold data set” on page 2930.

In general, long response times are a good indicator of a performance problem and therefore you should start by defining exception thresholds for time fields.

To use exception processing efficiently, consider what the most important applications or transactions in your system are. Always define exception thresholds for critical business applications. In addition, frequently executed applications are good candidates for exception thresholds.
The application-specific thresholds are defined by specifying the plans for which the threshold applies. An efficient way of determining which plans or connection IDs should be the focus of exception reporting is to produce Accounting TOP lists.

You can use the performance objectives stated in your service level agreement as a starting point. Accounting TOP lists and TOP ONLY reports are good references when determining which threads to monitor with exception processing. You can modify the predefined threshold values and specify additional exception fields.

Carefully consider the fields for which to specify exception thresholds. The more fields you specify, the greater the effects on processing.

You can use the exception profiling method and a sample of your installation’s DB2 instrumentation data to calculate threshold values for exception fields. For more information, see “Exception profiling” on page 2931.

Using SQL Activity reports to monitor SQL performance

SQL Activity reports provide detailed information about individual SQL statements in a plan or package. The SQL Activity report aggregates threads by a combination of OMEGAMON XE for DB2 PE identifiers. The SQL Activity trace shows details on a per thread basis.

At its simplest, the SQL Activity trace report shows each SQL statement in a thread by order of occurrence.

For each SQL statement basic information about the statement is shown. At the end of the thread, a summary is shown. If the thread originated at a different location, location information is also provided. A new thread is reported on a new page.

The end of the report shows a list of threads, in the order of occurrence, with a cross reference to the page where they are reported.

You can increase the level of detail by requesting workload. Workload shows information about DB2 activity associated with the execution of the statement. You can request workload details for:

- All workload
- Data capture
- Exits
- I/O activity
- Locking activity for rows and pages
- Scan activity
- Sort activity
- Host variables data

By default, no workload information is shown.

When you request workload, extra information is also provided:

Accounting

If IFCID 3 is included in your DB2 trace, OMEGAMON XE for DB2 PE includes an long Accounting trace for each thread.
Minibind
This shows bind information for each plan step. This is information taken from IFCID 22 and shows much of the information contained in the PLAN_TABLE.

User-defined functions
When user-defined functions are used, the report includes a Function Resolution block. This block shows information about the query, the path used, and detailed information about the function.

You can change the organization of data to group (summarize) events by:
- Cursor
- Program
- Statement number
- Statement type

Or you can change all of the above.

You can also sort the data by:
- Time:
  - Elapsed
  - Exit
  - I/O
  - Suspension
  - TCB
- Number of:
  - Exits
  - I/O requests
  - Merge passes for each sort
  - Pages scanned
  - Records sorted
  - Rows processed
  - Scans
  - Suspensions
  - Work files sorted

When to use SQL Activity reports
Use SQL Activity reports to resolve performance problems with applications or queries that cannot be resolved by using the Accounting or Explain reports.

These are most commonly problems with scan and sort activity. To isolate the problem, you need to run an SQL Activity trace, which shows the workload for sort.

Input for SQL Activity reports
Each DB2 trace type and trace class contains one or more Instrumentation Facility Component identifiers (IFCID). The SQL Activity report set uses DB2 trace class and IFCID information to register specific SQL activity events.

SQL activity events are classified as follows:
- Accounting
- Base
An SQL activity event is normally characterized by a start record and an end record. When you select event records as input for your reports, you must include the paired end event, where applicable. When you use the ISPF monitor or the Collect Report Data function of the Performance Expert Client to manage DB2 traces, the trace generator automatically includes the correct end record.

The following table shows the IFCIDs used in SQL Activity reporting, together with the associated DB2 trace classes and end pair IFCIDs, where appropriate.

**Table 234. IFCIDs used for SQL Activity reports**

**Collecting SQL Activity data with a DB2 trace**

To create an SQL Activity trace report, you must collect data by using a DB2 trace.

The easiest way to collect data for any OMEGAMON XE for DB2 PE report is to use the activate traces facility of the workstation monitor. You can use this facility to configure a DB2 trace and start and stop the trace from there. Using the activate traces facility also ensures that you include all data in the DB2 trace that is needed for a report. For more information, see [Monitoring Performance from Performance Expert Client](#).

Alternatively, you can start a DB2 trace as follows:

```
-START TRACE (P) CLASS (30) RMID (*) DEST (OPX) PLAN (PMOMDEV) AUTHID (DB2PE)
  IFCID(6,7,8,9,11,12,13,15,16,17,18,22,28,45,53,55,58,59,60, 61,62,63,64,65,66,68,69,70,71,72,73,74,75,84,85,86,87, 88,89,92,95,96,97,105,106,107,108,109,125,157,159,160, 162,163,174,175,177,183,188,214,215,216,221,222,226,227, 231,233,237,242,272,273,305,324,325) BUFSIZE(512)
```

Because you need sort data, include IFCIDs 95 and 96 (Sort Start and Sort End).

For information regarding DB2 trace data provided by IFCID 350 see “Remark about lengths of SQL statement texts in SQL Activity traces” on page 2810.

**Creating an SQL Activity trace**

Use your ISPF editor to create a JCL job that creates an SQL Activity trace.

The following JCL is an example. Remember to change the setup information (starting with // in your JCL) as appropriate for your installation.
Figure 249. SQL Activity job stream using ISPF/PDF editor

To submit the job, type SUBMIT on the command line and press Enter.

**SQL Activity trace, summarized by occurrence**

Here is an example of an SQL Activity trace, summarized by occurrence.

---

**Interpreting the result**

The example shows details of the Sort Activity block of an SQL Activity trace.

**SQL Activity workload highlight block**

Following the example in this section, you suspect that the application has problems with sorting or scanning data. The Sort Activity block of the report is printed under the event that triggered the sort, together with the workload highlights, and any other requested workload.

Chapter 6. Batch reporting 2809
Verify the average elapsed times for sorts (AET/SORT field. Approximately 0.00001 seconds (0.01 milliseconds) per row sorted is acceptable. Significantly higher values indicate a sort problem.

Sort problems could be caused by any of the following factors:
- Statements with DISTINCT
- Noncorrelated subqueries
- UNION
- Missing index

If your analysis indicates no significant sort problems, the problem could be a scan problem. Look for SQL statements with:
- Nonindexable predicates (WHERE (COL1*COL2) > (COL3*COL4))
- OR connections
- Noncorrelated subqueries
- Use of static SQL rather than dynamic SQL
- Missing index

**Remark about lengths of SQL statement texts in SQL Activity traces**

How extended SQL statement texts become visible in SQL Activity traces with IFCID 350.

An SQL Activity trace might show SQL statement texts in the report, depending on the subcommand options that were specified with the SQLACTIVITY TRACE command. The SQL statement texts are provided by IFCID 63, which limits the length to a maximum of 5000 characters. Consequently, SQL statement texts shown in SQL Activity trace reports are also limited to this length.

IFCID 350 records SQL statement texts up to a length of 200000 characters each. However, IFCID 350 data is not shown in SQL Activity reports and traces; this is independent of whether IFCID 350 data is provided by a DB2 trace.

To obtain extended SQL statement texts, perform the following steps:
1. Start a DB2 trace to collect data, using trace class 30, 31, or 32, and specifying IFCID 350, for example:
   - START TRACE CLASS(30) IFCID(350) DEST(SMF) TDATA(CPU,CON,DIST)
2. Create a Record Trace report (refer to "Record Trace reports" on page 2833 for details).
   Use the GLOBAL command and its options to minimize the amount of data that is produced by the Record trace and to filter the required data, similar to the following example:
   
   ```
   GLOBAL
   FROM(,12:19:59.99)
   TO(,12:20:00.93)
   INCLUDE(IFCID(350))
   ```

**Using Explain reports to monitor access paths**

The OMEGAMON XE for DB2 PE Explain reports are built on the information that is supplied by the DB2 SQL Explain function and information taken from the
system catalog tables. An Explain report provides information about the exact access path that is used by DB2 for any particular SQL statement and its effect on DB2 performance.

Because DB2 is a relational database system, masses of data are stored in the form of table columns with no predetermined row order. Data can also be spread across several tables, partitions, and DB2 instances. The arrangement of data, and the complexity of many queries means that the method (access plan) used, and the route taken to the data (access path) cannot always be determined at application development time, especially when dynamic SQL is used.

The access plan and access path used by DB2 are important factors in DB2 performance. However, for any particular query, the access plan and access path are influenced by many factors, such as whether indexes are used and, if so, how many, whether data is clustered, joins are used, the locking strategy used, and so on.

**Explain reports**
OMEGAMON XE for DB2 PE provides Explain reports by query number, statement text, plan, package, and QMF query.

**Query number**
You can investigate a particular SQL statement identified by its query number when:

- A dynamic SQL EXPLAIN statement was executed with a given query number. The statement can be from DB2 or QMF. If the query number is not specified, DB2 assigns a number. You can get the query number from the PLAN_TABLE.
- The application was bound (or rebound) with EXPLAIN(YES). In this instance, the statement query number is assigned by the precompiler.

Explain searches for the query number in the job submitter’s PLAN_TABLE, unless a different owner is specified. If you want to run an Explain report for a statement that you do not own, you need access to the owner’s plan table.

**Statement text**
Can be used to investigate a particular SQL statement that is supplied in its text form.

Explain uses 999 735 911 as a query number. If this statement number already exists in the PLAN_TABLE, the row is deleted before processing the SQL statement. After successful execution of SQL EXPLAIN, the newly inserted row in the PLAN_TABLE is used to produce the Explain report.

**Plan**
This reports on all or selected SQL statements contained in an application plan.

To create a report for a plan, that plan must exist in the catalog table SYSIBM.SYSPLAN and must have been bound with EXPLAIN(YES).

**Package**
This reports on SQL statements in a package.

To create a report for a package, that package must exist in the catalog table SYSIBM.SYSPACKAGE and must have been bound with EXPLAIN(YES).
QMF query
Can be used to investigate a saved QMF query written in SQL. QBE and
PROMPTED queries must be converted to SQL before they can be explained.

You can create reports about your own saved QMF queries, and queries
created by other users, saved with SHARE=YES.

The QMF query can contain parameters, for example, and &PARM1 and
&PARM2. These parameters can also substitute column names in the select
list. However, the query must not contain literals and other strings with
one or more ampersands (&), enclosed between quotes (').

If there is more than one entry in the PLAN_TABLE with the same
identifiers, the most recent entry is reported.

Levels of detail
To control the amount of data, which can be very large especially for Explain plan
or package, you can request summary and detail level Explain reports.

Summary
A summary report shows one line for each SQL statement.
A summary block is always printed at the end of a report.

Detail This produces a full report for each SQL statement, which shows:
• “Raw” SQL EXPLAIN data as found in the PLAN_TABLE
• Access path data
• Table and table space data
• Index data, this shows:
  – All available indexes for a given table
  – Indexes selected for the access only
• Key data
• Plan and package data
• Host variables data
• Summary page

The number of data blocks listed varies with the Explain function
requested.

Basic This shows raw data from the PLAN_TABLE and Access Path Data blocks
in the report for each SQL statement. Information from the catalog tables is
not included.

SQL The Access Path Data block is shown for each SQL statement.

Index Data
All data blocks of the DETAIL level are shown except for the Key Data
block.

No Raw PLAN_TABLE Data
All data blocks of the DETAIL level, except the raw PLAN_TABLE, are
shown.

Key Distribution
All data blocks of the DETAIL level are shown including the distribution of
the ten mostly used key values.

Required authorization
Explain reports require SELECT authorization to access certain tables.
Because OMEGAMON XE for DB2 PE uses DB2 system catalog tables to create Explain reports, you need SELECT authorization for the SYSIBM.SYS* catalog tables.

To explain saved QMF queries, you need SELECT authorization for the following QMF tables:
- `Q.OBJECT_DIRECTORY`
- `Q.OBJECT_DATA`

To control user access to the catalog tables, OMEGAMON XE for DB2 PE selects data through views. Sample definitions are in the RKO2SAMP library. You can use these definitions as supplied, or tailor them for your installation. For more information, see Configuration and Customization and the Program Directory (refer to OMEGAMON for Db2 Performance Expert on z/OS).

When you produce an Explain report, OMEGAMON XE for DB2 PE checks for the plan table. If it does not exist, it is created in the default database, if you have the required privileges. If you are not authorized, the execution of Explain ends with an error message.

**When to use Explain reports**
Use Explain reports if you suspect a problem with indexes or SQL statements.

You should be able to identify candidate plans or packages from the Accounting report. Generally, an SQL statement or index problem is indicated when an application seems to be spending a lot of time in DB2. That is, when the class 2 elapsed time is not significantly greater (50% or more) than the class 2 CPU (TCB).

Access path problems can also be indicated by a high number of Getpage operations for an SQL statement.

If you are using dynamic SQL, you can use the EXPLAIN statement to obtain information about each statement.

For static SQL, unless you know the text of a suspect statement or the statement number, use the Explain reports at the plan or package level.

**Creating an Explain report**
Use your ISPF editor to create a JCL job that creates an Explain report.

The following JCL is an example. Remember to change the setup information (starting with // in your JCL) as appropriate for your installation.
This example produces an Explain detail report for the second generation of a package (DGO@TPG3) on DB2 subsystem SDA2.

**Explain report example**

This example is an Explain report generated from the JCL in the previous section.

This example report has been split into its constituent report blocks for clarity. Similarly, the page header is only shown once for the report, and once for the report summary.

**Explain report – page header**

Interpreting the Explain report

This section highlights some of the information to look for in an Explain report.

The information reported varies depending on the type of report, the level of detail requested, and whether data is available to report. The example shown in the previous section shows an Explain at package level. The package explained contains SQL statements. The statement QUERYNO=1011071 has two statement steps (Select with index for PLANNO=1 and sort for ORDER BY for PLANNO=2).

Page header

The page header ("Explain report – page header" on page 2814) is printed at the top of each report page and shows general information about the report, including the type of report, subsystem identifier, DB2 version, and the objects reported.

Package version

The Package Version block of the report ("Explain report – package version details" on page 2814) shows the package versions available and the versions and generations reported.

Statement details

The Statement Details block of the report ("Explain report – statement details" on page 2814) shows the complete plan or package identification details, including:

- Location
- Name
- Statement number and text
- Other statement-related information

It also shows the status and isolation level, from SYSIBM.SYSPLAN or SYSIBM.SYSPACKAGE or SYSIBM.SYSPACKSTMT, and cost information.

PLAN_TABLE information

This shows the contents of the PLAN_TABLE ("Explain report – PLAN_TABLE details" on page 2815). The report block starts with EXPLAIN TABLE and has two block columns. The report field labels are the full PLAN_TABLE column names. If the report field value is a long name or a long value, it is marked with an asterisk (*) at the end of the report field value, and reported at the end of the block in its full length.

The plan table is searched by using the bind time of the package. There might be multiple occurrences of the package with different bind times. For example, the Db2 system catalog might contain the latest package that is created by the Db2 command BIND or REBIND. It might also contain a former package version that is activated by the Db2 command REBIND SWITCH.

Access path

The Access Path block of the report ("Explain report – access path” on page 2816) shows, for each step in an SQL statement, the access path used by DB2 to satisfy the statement step. This shows:
Use of index

If an index is used, the type of index scan and details about matching columns are shown.

The appropriate use of indexes plays a key role in the efficiency of an application or query. For example, if a table contains 3000 rows of information in 100 data pages, the following query returns one row of data:

```
SELECT COL1 COL2 FROM T1 WHERE COL4=10 AND COL5=20
```

No index

If the table has no index associated, DB2 must scan each data page to satisfy the query. In this instance, DB2 must perform 100 Getpage operations for a single SELECT statement.

Index on COL4

In this instance, the number of Getpage operations depends on the number of rows matching the predicate and their distribution, and the number of index pages. For example, if rows matching the predicate are spread over six data pages and pointers are spread over two index pages, the number of Getpage operations for the SELECT is eight.

Unique index on COL4 and COL5

In this instance, DB2 only needs to read one page from the root index and one page from the leaf index to locate the data page. The number of Getpage operations for the SELECT is three.

Index only scan

When you create an index on COL1, COL2, COL4, and COL5, and alter the SELECT to predicate all four columns:

```
SELECT COL1 COL2 FROM T1 WHERE COL4=10 AND COL5=20
AND COL1 NOT NULL AND COL2 NOT NULL
```

In this instance, DB2 can satisfy the query from the index alone, requiring just one Getpage operation for the root index and one Getpage operation for the leaf index.

Properly organized indexes can also help reduce or eliminate sort operations.

You can define multiple indexes on a base table. However, weigh the performance gain with the additional workload required for the database manager to update the indexes when data changes in the table. Generally, multiple indexes are useful for tables that are often queried and seldom updated.

You can use the Accounting reports to derive the Getpage/SQL ratios for plans and packages. This is the total number of Getpage operations divided by the total number of SQL SELECT, INSERT, UPDATE, and FETCH statements. The value of the ratio depends on the type of application and the DB2 environment, but you might look for applications with ratios greater than five.
Prefetch

Prefetch improves the performance of DB2 by reducing the time spent waiting for sequential I/O. It can also substantially reduce the Getpage/SQL ratio.

For Sequential Prefetch, data must be ordered in the tables in the same way as it is accessed by the application. This allows DB2 to fetch the pages before they are accessed by the application. This means that the design and organization of tables and applications needs to be tailored to exploit this behavior. DB2 can also decide to use Sequential Prefetch if it sees that the data is sequenced. This is known as Dynamic Prefetch. For SQL queries DB2 can read up to 32 pages per Read I/O.

List Prefetch works much like Sequential Prefetch, except that data pages do not need to be contiguous. List prefetch is always used for multiple index access and to obtain access to data from the inner table of a hybrid join.

Direct row access

Direct row access allows DB2 to obtain access to a row directly through the ROWID column. If an application selects a row from a table that contains a ROWID column, the row ID value implicitly contains the location of the row. If you use that row ID value in the search condition of subsequent SELECTs, DB2 might be able to navigate directly to the row.

To use direct row access, you first select the values of a row into host variables. The value that is selected from the ROWID column contains the location of that row. Later, when you perform queries which access that row, you include the row ID value in the search condition. If DB2 determines that it can use direct row access, DB2 uses the row ID value to navigate directly to the row.

Because direct row access provides highly efficient data access, consider modifying older applications to exploit this feature.

Index data

The Index Data block of the report (“Explain report – index details” on page 2816) shows data derived from the SYSIBM.SYSINDEXES table. This is only shown if an index is used in the access plan. You can use the information in SYSINDEXES to compare the available indexes on a table to determine which one is the most efficient for a query.

Key column data

The Key Column Data block of the report (“Explain report – key column details” on page 2816) shows index key information that is derived from the SYSIBM.SYSKEYS and SYSIBM.SYSCOLUMNS tables. This is only shown when an index is used in the access plan.

Table

The Table Data block of the report (“Explain report – table details” on page 2816) shows information that is derived from SYSIBM.SYSTABLES.

Table space

The Table Space Data block of the report (“Explain report – table space details” on page 2816) shows information that is derived from SYSIBM.SYSTABLESPACE.

Host variables data

When host variables are used in a statement, OMEGAMON XE for DB2 PE can show show details about each variable (“Explain report – host variables data” on page 2816).
A host variable can be either a variable in a host language (such as a PL/I variable, C variable, Fortran variable, a COBOL data item, or Assembler language storage area) or a host language construct that was generated by an SQL precompiler from a variable declared using SQL extensions. A host variable can be an output value that is returned to the application by DB2 or an input to DB2.

Summary

The summary report (“Explain summary report” on page 2818) shows the package name, SQL statement number, type, and access path for each statement reported. When the summary is appended to a full report, the statement numbers are also cross-referenced to the report page where the full entry can be found.

Locking Activity reports and traces

The locking activity provides various levels of detail about concurrency control within DB2 in the form of reports, traces, and a file data set.

It shows information about:

- DB2 transaction locks, which are locks on table spaces, tables, pages, or rows. DB2 transaction locks are used primarily to control access by SQL statements.
- DB2 drain locks and DB2 claims, which control access by DB2 utilities and commands.
- Global locks in a data sharing environment.
- DB2 lock avoidance techniques and related locking data, such as page latch waits.

Locking activity reports (also referred to as locking reports) summarize all user activity related to lock suspensions and lockouts. The reported information is grouped and ordered by OMEGAMON XE for DB2 PE identifiers, which you can specify:

- A Suspension report is a summary of lock suspensions across the reporting interval for a unique combination of selected OMEGAMON XE for DB2 PE identifiers. The report also shows the number of occurrences and elapsed times, the causes, and the reasons for resuming processing.
- A Lockout report is a summary of users and resources involved in timeouts and deadlocks. For each event, the user holding the resource and the users waiting for the resource are identified, along with the number of occurrences and other statistics.
- A Lock Detail report contains complete information about lock-related events.

Locking activity traces (also referred to as locking traces) provide information about lock events as they occur. Locking traces differ in the level of detail as follows:

- A Detail trace contains complete information about lock-related events in a DB2 system, or a group of DB2 systems in a data sharing environment. It shows all IMS/VS Internal Resource Lock Manager (IRLM) requests, IRLM suspensions, timeouts, deadlocks, claim and drain activities, lock-avoidance occurrences, and inter-DB2 requests in a data sharing environment.
- A Deadlock trace shows every occurrence of a deadlock.
- A Lockout trace shows each timeout and deadlock.
- A Suspension trace shows every lock suspension.
- A Timeout trace shows each timeout.
When to use Locking reports

Use Locking reports when you need more information than can be supplied by the Accounting or Statistics reports and traces to resolve concurrency problems.

You can also use a Locking trace, for example, to monitor the effect of a new application introduced into a production system.

There is no correlation between the number of deadlock events shown in Locking reports and traces and the number of deadlocks shown in Accounting and Statistics reports. Accounting and Statistics reports count all deadlock occurrences regardless of how they resolve. Locking reports count only those deadlocks that were resolved by DB2. DB2 can resolve a deadlock either by making a process rollback, thereby releasing the locks it holds on resources, or by requesting a process to terminate.

Input for Locking reports

If you do not use the Collect Report Data facility supplied with the Online Monitor, you need to know the input IFCIDs for Locking reports.

The IFCIDs used as input for the Locking reports, traces, and File data sets are shown in the following table.

<table>
<thead>
<tr>
<th>Locking report, trace, and File data set</th>
<th>IFCIDs</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lock suspension report or trace</td>
<td>44, 45, 105, 107, 213, 214, 215, 216, 226, 227</td>
</tr>
<tr>
<td>Lockout report or trace</td>
<td>105, 107, 172, 196</td>
</tr>
<tr>
<td>Deadlock trace</td>
<td>105, 107, 172</td>
</tr>
<tr>
<td>Timeout trace</td>
<td>105, 107, 196</td>
</tr>
<tr>
<td>Lock detail report</td>
<td>21</td>
</tr>
<tr>
<td>Lock detail trace</td>
<td>20, 21, 44, 45, 105, 107, 172, 196, 211, 212, 213, 214, 215, 216, 218, 223, 226, 227, 251, 257, 259, 337</td>
</tr>
<tr>
<td>File data set</td>
<td>21, 105, 107, 211, 212, 223</td>
</tr>
</tbody>
</table>

Deadlock traces and Timeout traces are generated from Statistics class 3. When Statistics class 3 is active, deadlock and Timeout traces can be generated without starting any Performance trace classes.

DB2 IFC covers all important aspects of DB2 locking activity provided that the appropriate trace classes are active. Except for IDENT, SYNC, or QUIT, each occurrence of an IRLM request is traced by an IFCID 21, 211, or 212 record.

To maintain consistency in a data sharing environment, DB2 IFC generates an IFCID 251, 257, or 259, which records, or notifies on, a physical lock (P-lock) on a page set, partition, or page.

Whenever a suspension occurs, DB2 IFC generates an IFCID 44, 213, 215, or 226 record along with a matching IFCID record that specifies the reason for resume, regardless of how the suspension was generated. The matching IFCID record is an IFCID 45 for IFCID 44, IFCID 214 for IFCID 213, IFCID 216 for IFCID 215, and IFCID 227 for IFCID 226. Also, the DB2 trace produces IFCID 211 records for every claim request and IFCID 212 records for every drain request.
An IFCID 172 record is written when lock suspensions end in deadlock or when deadlock situations occur. The deadlock record details all units of work involved in the deadlock, the resources for which they were contending, and the attributes of their requests.

IFCID 196 records lock suspensions that end in a timeout or when timeout situations occur. It details all units of work involved in the timeout, the resource for which they were contending, and the attributes of their requests.

IFCID 218 and 223 provide summary information and details of successful lock avoidance, which can improve application performance by reducing lock suspension times.

IFCID 20 records the locking summary for page or row locks, the highest table space lock state, and lock escalation information for table spaces. The record is written for the thread at each commit or at a rollback.

IFCID 21 is the base for recording the detail lock requests.

IFCIDs 105 and 107 provide database and object identifier translation information used in all Locking reports and traces and in Locking File.

The following example shows the DB2 trace commands that are required to collect data for a detail Locking report or trace:

```
-START TRACE(P) DEST(OPX) CLASS(6,17,7,30) IFCID(226,227,251,257,259) BUFSIZE(512)
-START TRACE(S) DEST(OPX) CLASS(3) BUFSIZE(512)
```

**Collecting Locking Activity data with a DB2 trace**

To create a Locking Activity report, you must collect data by using a DB2 trace.

The easiest way to collect data for any OMEGAMON XE for DB2 PE report is to use the activate traces facility of the workstation monitor. You can use this facility to configure a DB2 trace and start and stop the trace from there. Using the activate traces facility also ensures that you include all data in the DB2 trace that is needed for a report. For more information, see [Monitoring Performance from Performance Expert Client](#).

Alternatively, you can start a DB2 trace as follows:

```
-START TRACE(P) DEST(OPX) CLASS(6,17,7,30) IFCID(226,227,251,257,259) BUFSIZE(512)
-START TRACE(S) DEST(OPX) CLASS(3) BUFSIZE(512)
```

**Creating a Detail Locking trace**

Use your ISPF editor to create a JCL job that creates a Detail Locking trace.

The following JCL is an example. Remember to change the setup information (starting with // in your JCL) as appropriate for your installation.
The following example shows a detail Locking trace.

**Figure 251. Locking activity job stream using ISPF/PDF editor**

To submit the job, type **SUBMIT** on the command line and press Enter.

**Example of a detail Locking trace**

The following example shows a detail Locking trace.
## I/O Activity reports

DB2 system performance is heavily influenced by the volume and speed of input activities and output activities. OMEGAMON XE for DB2 PE provides several summary and detail I/O Activity reports that you can use to analyze I/O activities.

Generally, an I/O Activity report groups the I/O activities in report blocks as follows:

- The Active Log block shows the number of read and write requests to and from the active log data set and the associated wait times.
• The Archive Log block shows the number of read and write requests to and from the archive log and the associated wait times.

• The Bootstrap Data Set block shows the number of read and write requests to and from the bootstrap data set (if present). The bootstrap data set also controls the movement of data from the active log to the archive log data sets.

• The Buffer Pool block shows the number and types of read and write requests to and from the buffer pools and the associated wait times. It shows the volume of data pages that is moved between a hard disk drive and the main storage.

• The Cross-Invalidation Activity block shows the number of buffer refresh activities caused by cross-invalidation.

Cross-invalidation is necessary to maintain coherency of data within a DB2 data sharing group. It happens when a group member updates a data page and writes that page to the group buffer pool. All members that have this data page cached in their buffer pools are notified that the page was invalidated.

A high level of cross-invalidation affects performance because it effectively reduces the amount of buffer pool space available to the system. When an invalidated page is required, it must be refreshed in the buffer pool, either by retrieving the page from the group buffer pool or from a hard disk drive.

• The EDM Pool block shows the number of loads from a hard disk drive for cursor table (CT), package table (PT), and database directory (DBD) requests. For each event it shows the average size and load time.

When to use I/O Activity reports
Use I/O Activity reports if a Statistics report indicates a potential problem with logging, buffer pool or EDM pool activity, or high levels of cross-invalidation.

You can also run I/O Activity reports on a regular basis to gain an overview of the system and to help balance workloads between DB2 subsystems.

Input for I/O Activity reports
I/O Activity reports use IFCIDs from the DB2 Performance trace type, basically trace classes 4, 5, and 21.

The following table shows the IFCIDs used in I/O Activity reports.

Table 236. IFCIDs used for I/O Activity reports

<table>
<thead>
<tr>
<th>I/O Activity reports</th>
<th>IFCIDs used</th>
<th>DB2 trace type and trace class</th>
</tr>
</thead>
<tbody>
<tr>
<td>Buffer Pool</td>
<td>6, 7, 8, 9, 10, 105, 107</td>
<td>Performance, class 4</td>
</tr>
<tr>
<td>EDM Pool</td>
<td>29, 30, 105, 107</td>
<td>Performance, class 4</td>
</tr>
<tr>
<td>Active Log</td>
<td>34, 35, 36, 37, 38, 39</td>
<td>Performance, class 5</td>
</tr>
<tr>
<td>Archive Log/BSDS</td>
<td>34, 35, 36, 37, 40, 41, 114, 115, 116, 119, 120</td>
<td>Performance, class 5</td>
</tr>
<tr>
<td>Cross-Invalidation</td>
<td>105, 107, 255</td>
<td>Performance, class 21</td>
</tr>
</tbody>
</table>

Note: If you want to include Sequential Prefetch Read I/O operations in the report, do not qualify the DB2 `START TRACE` command with a plan name or an authorization ID. Such a qualification for performance trace class 4 reduces the data DB2 puts in the user's task TCB and omits all asynchronous tasks including Sequential Prefetch.
Collecting I/O Activity data with a DB2 trace

To create an I/O Activity trace report, you must collect data by using a DB2 trace.

The easiest way to collect data for any OMEGAMON XE for DB2 PE report is to use the activate traces facility of the workstation monitor. You can use this facility to configure a DB2 trace and start and stop the trace from there. Using the activate traces facility also ensures that you include all data in the DB2 trace that is needed for a report. For more information, see Monitoring Performance from Performance Expert Client.

Alternatively, you can start a DB2 trace as follows:
-START TRACE(P) DEST(OPX) CLASS(30)
IFCID(6,7,8,9,10,29,34,35,36,37,38,39,40,41,105,107,114,115,116,119,120,255)
BUFSIZE(512)

Creating an I/O Activity trace

Use your ISPF editor to create a JCL job that creates an I/O Activity trace.

The following JCL is an example. Remember to change the setup information (starting with // in your JCL) as appropriate for your installation.

```jcl
EDIT ---- ANDREW.OMPE.JOBS.IOSUMM--------------------- Columns 001 072

To submit the job, type SUBMIT on the command line and press Enter.

Example of a summary I/O Activity report

The following example shows a summary I/O Activity report.
Utility Activity reports

Many of the tasks of maintaining DB2 data, such as loading a table, copying a table space, or recovering a database to some previous point in time can be done using DB2 utilities. Utilities run as batch jobs under z/OS. The use of utilities, such as REORG INDEX, can significantly affect DB2 performance. You can use Utility Activity reports and traces to examine the efficiency of DB2 utilities.

Utility functions that are elements of separately orderable features of DB2 products must be licensed and installed in your environment to be properly reported.

Utility Activity reports and traces provide information about DB2 utility and bind activity during the processing of a DB2 application. Utility Activity reports show information as an aggregation of threads ordered by the combination of specified OMEGAMON XE for DB2 PE identifiers. Utility Activity traces show information in chronological order. The information includes:

- Thread identification, thread start and stop time, and location
- Utility tools and bind statements executed, with the appropriate elapsed and TCB times
- LISTDEF information
- Utility data set information
- For trace only, optional workload detail, such as:
  - Bind activity
  - Exits
  - I/O activity
  - Lock suspensions
  - Page and row locking activity
  - Utility phases

OMEGAMON XE for DB2 PE can process data originating at different DB2 locations. In the JCL, you can logically concatenate multiple input data sets to a
single data set that contains mixed records from multiple locations. If data from multiple locations is available, you can produce multi-site or single-site reports and traces.

- **Multi-site** reports and traces separate utility activity information according to the location where it occurs. Data is sequenced by location and includes activity initiated both locally and remotely.
- **Single-site** reports and traces show utility activity information from a single DB2 subsystem. They are produced from an input data set that contains data from a single site or, if the input data set contains data from multiple sites, by specifying a single location with the INCLUDE subcommand option or by suppressing locations with the EXCLUDE subcommand option.

Utility Activity reports and traces are logically grouped by bind activities and utility activities.

- **Bind activity** shows:
  - BIND
  - BIND PACKAGE
  - REBIND
  - REBIND PACKAGE
  - FREE PLAN
  - FREE PACKAGE
  - FREE REMOTE PACKAGE
  - BIND CONNECT
  - CONNECT RESET
- **Utility activity**

  Most utility events are comprised of detail events called phases. Each phase of the utility is reported. An event that does not have any detail events consists of one phase with the same name as the event. UTILINIT and UTILTERM phases are reported in a summary line. Each phase can have an item type.

**When to run Utility Activity reports**

Run Utility Activity reports as part of your regular monitoring policy or when you suspect problems, such as a high number of utility failures.

**Input for Utility Activity reports**

Utility Activity reports use IFCIDs from the DB2 Accounting and Performance trace types.

The following table shows the utility events that can be collected, together with the trace classes and IFCIDs used.

**Table 237. IFCIDs used for Utility Activity reports**

<table>

Collecting Utility Activity data with a DB2 trace

To create an Utility Activity report, you must collect data by using a DB2 trace.

The easiest way to collect data for any OMEGAMON XE for DB2 PE report is to use the activate traces facility of the workstation monitor. You can use this facility to configure a DB2 trace and start and stop the trace from there. Using the activate traces facility also ensures that you include all data in the DB2 trace that is needed for a report. For more information, see Monitoring Performance from Performance Expert Client.

Alternatively, you can start a DB2 trace as follows:

- `START TRACE(A) DEST(OPX) CLASS(1, 2, 3, 5, 7, 8) BUFSIZE(512)`
- `START TRACE(P) DEST(SMF) CLASS(30) IFCID(23, 24, 25, 108, 109, 22.63) BUFSIZE(512)`
- `START TRACE(AU) DEST(OPX) CLASS(8) BUFSIZE(512)`

Creating a Utility Activity trace

Use your ISPF editor to create a JCL job that creates a Utility Activity trace.

The following JCL is an example. Remember to change the setup information (starting with // in your JCL) as appropriate for your installation.

```jcl
EDIT ---- ANDREW.OMPE.JOBS.UTTRA------------------------ Columns 001 072
Command ==>> Scroll ==>> CSR
****** *************** TOP OF DATA ****************************

```

Record Trace reports

Record Trace reports show IFCID information as presented by DB2.

This IFCID information is used to produce other OMEGAMON XE for DB2 PE reports. The difference is that for other reports, this information can be interpreted, manipulated, or not included.

- A **summary** Record Trace report lists all selected records, together with a description, but without any record data. You can use this listing to determine what events occurred during the DB2 trace.
- A **short** Record Trace report presents nonserviceability data from selected records that appear on other OMEGAMON XE for DB2 PE reports. Some large IFCIDs (for example, system statistics) are presented similar to summary Record traces, without record data.
- A **long** Record Trace report presents serviceability and nonserviceability data from selected records.
- A **dump** Record Trace report presents selected records in the standard hexadecimal dump format. You can use the dump Record Trace report to view data that might contain unprintable characters.

**When to use Record Trace reports**

Use Record Trace reports if the information in other reports do not provide the required level of detail.
**Input for Record Trace reports**

Record Trace reports use IFCIDs from several DB2 trace types and trace classes.

Input to the Record Trace report set consists of all types of DB2 instrumentation data. The DB2 trace types and classes used by Record Trace reports are in the following list:

- **DB2 trace type - Statistics**

  *Table 238. DB2 trace type - Statistics: IFCIDs used for Record Trace reports*

<table>
<thead>
<tr>
<th>DB2 trace class</th>
<th>DB2 IFCIDs used</th>
<th>Class description</th>

### Collecting Record Trace data with a DB2 trace

To create a Record Trace report, you must collect data by using a DB2 trace.

A Record trace can be very long. Generally, run a Record trace on one component at a time to focus on a problem. The following example collects records associated with Accounting.

The easiest way to collect data for any OMEGAMON XE for DB2 PE report is to use the activate traces facility of the workstation monitor. You can use this facility to configure a DB2 trace and start and stop the trace from there. Using the activate traces facility also ensures that you include all data in the DB2 trace that is needed for a report. For more information, see Monitoring Performance from Performance Expert Client.

Alternatively, you can start a DB2 trace as follows:

```
-START TRACE(A) DEST(OPX) CLASS(1, 2, 3, 5, 7, 8) BUFSIZE(512)
-START TRACE(P) DEST(OPX) CLASS(17, 16, 14, 13, 12, 11, 10, 9, 8, 7, 4, 2, 22, 21, 20, 30)
-START TRACE(S) DEST(OPX) CLASS(6, 5, 3, 1) BUFSIZE(512)
```

### Creating a Record Trace report

Use your ISPF editor to create a JCL job that creates a Record Trace report.

The following JCL is an example. Remember to change the setup information (starting with // in your JCL) as appropriate for your installation.
To submit the job, type `SUBMIT` on the command line and press Enter.

**Housekeeping reports**

These reports are not strictly performance reports. They present information about the DB2 system and user activity.

They provide valuable information, when used together with Accounting and Statistics reports, and help to gain an overview of the DB2 system.

**The Audit report set**

With DB2 Audit data you can track DB2 resource access. Audit reports and traces show information about the user of an auditable object and the time and type of action performed on the object.

Audit reports group events in the order of event type, ORDER identifier, and timestamp.

Audit traces show events listed chronologically.

You can use Audit reports and traces to review Audit data by OMEGAMON XE for DB2 PE identifiers and choose between a wide range of options for presenting DB2 Audit data.

You can order Audit reports and traces by the object of the Audit event (for example, authorization failures per table).

You can produce member-scope and group-scope Audit reports and traces.

- Member-scope reporting presents data member by member.
- Group-scope reporting merges the data that is produced by each group member to give a full picture of the use of a shared resource.

You can produce Audit reports and traces of individual Audit events in the order in which they occurred, or reports of aggregated Audit data.

You can specify the level of detail in Audit reports and traces by specifying any combination of the following event types:

- Authorization failures

---

2840  IBM Db2 Performance Expert on z/OS
• Changes to authorization identifiers
• DDL operations against auditable tables
• DML statements at bind of auditable tables
• Grants or revokes of privileges
• Read/write access to auditable tables
• Utility access to auditable tables

When to use Audit reports:

Use Audit reports or traces regularly to assist in your database administration and as part of your regular monitoring policy. More specifically, use the Audit reports if Accounting reports show unexpected numbers of authorization failures.

You can use Audit reports to monitor:

Usage of sensitive data
Tables that contain sensitive data, such as employee salary records, should probably be defined with AUDIT ALL. You can report usage by table and by authorization ID to look for access by unusual IDs, at unusual times, or of unexpected types. You also want to record any ALTER or DROP operations that affect the data.

Grants of critical privileges
Authorities such as SYSADM and DBADM and explicit privileges over sensitive data, such as an Update privilege on records of accounts payable, must be monitored carefully. A query of the DB2 catalog can show who holds such a privilege at a particular time. The Audit records can reveal whether the privilege was granted and then revoked in a period of time.

Unsuccessful access attempts
Some unsuccessful access attempts are only user errors, but others can be attempts to violate security. All must be investigated. If you have sensitive data, always use Audit class 1 trace data.

Collecting Audit data with a DB2 trace:

To create an Audit report, you must collect data by using a DB2 trace.

The easiest way to collect data for any OMEGAMON XE for DB2 PE report is to use the activate traces facility of the workstation monitor. You can use this facility to configure a DB2 trace and start and stop the trace from there. Using the activate traces facility also ensures that you include all data in the DB2 trace that is needed for a report. For more information, see [Monitoring Performance from Performance Expert Client](#).

Alternatively, you can start a DB2 trace as follows:

-START TRACE(AU) DEST(OPX) CLASS(1,2,3,4,5,6) BUFSIZE(512)
-START TRACE(P) DEST(OPX) CLASS(30) IFCID(24,55,83,87,105,107,169) BUFSIZE(512)

Creating an Audit trace:

Use your ISPF editor to create a JCL job that creates an Audit trace.

The following JCL is an example. Remember to change the setup information (starting with // in your JCL) as appropriate for your installation.

Figure 255. Audit job stream using ISPF/PDF editor

To submit the job, type SUBMIT on the command line and press Enter.

Example of a member-scope Audit trace

The following example shows the resulting member-scope Audit trace.
The System Parameters report
This report provides information about the configuration of the DB2 system being monitored.

A report entry is produced for each location present in the input data. An entry is also produced if DB2 was restarted with changed system parameters or a change to the system parameters was detected when the Statistics interval was reached.

Some parameters, such as buffer pool and group buffer pool attributes can be changed while a system is active. If the appropriate DB2 trace class is active, the changes are recorded in the System Parameters report in the order of occurrence.

When to use System Parameters reports:

Use the System Parameters report regularly as part of your system monitoring policy.

You can also use this report together with a Statistics report to determine whether you can improve a system's performance by altering its system settings.

Collecting System Parameters data with a DB2 trace:

To create a System Parameters report, you must collect data by using a DB2 trace.

The easiest way to collect data for any OMEGAMON XE for DB2 PE report is to use the activate traces facility of the workstation monitor. You can use this facility to configure a DB2 trace and start and stop the trace from there. Using the activate traces facility also ensures that you include all data in the DB2 trace that is needed for a report. For more information, see Monitoring Performance from Performance Expert Client.

Alternatively, you can start a DB2 trace as follows:

-START TRACE(S) DEST(OPX) CLASS(5) BUFSIZE(512)
-START TRACE(P) DEST(OPX) CLASS(30) IFCID(106,201,202,256) BUFSIZE(512)

Creating a System Parameters report:

Use your ISPF editor to create a JCL job that creates a System Parameters report.

The following JCL is an example. Remember to change the setup information (starting with // in your JCL) as appropriate for your installation.
### Example of the System Parameters report

#### MVS PARMLIB UPDATE PARAMETERS (DSTIPM)

- **SUBSYSTEM DEFAULT (SSID):** DAS
  - **SUPPRESS SOFT ERRORS (SUPERS):** YES

#### STORAGE SIZES INSTALLATION PARMS (DSMPC, DSNTIP, DSNTIE, DSNTIPE)

- **MAX NO OF DATA SETS CONCURRENTLY IN USE (DSMAX):** 10,000
- **EDM STATEMENT CACHE SIZE IN KB (EDMCMT):** 113,386
- **EDM DDB CACHE SIZE IN KB (EDMDDC):** 102,400
- **EDM SKELETON POOL SIZE IN KB (EDMSKETN, POOL):** 102,400
- **MAXIMUM SIZE OF EDM POOL IN BYTES (EDMPOLL):** 0
- **MAXIMUM SIZE OF SORT POOL IN BYTES (SORTPOOL):** 10,240,000
- **MAX IN-MEMORY SORT SIZE (MAXSORT IN MEMORY):** N/A
- **MAXIMUM SIZE OF RID POOL IN KB (MAXRPOOL):** 400,000
- **MAX NO OF USERS CONCURRENTLY RUNNING IN DB (CTHREAD):** 400
- **MAX NO OF CONCURRENT REMOTE ACTIVE CONNECTIONS (MAXRBA):** 200
- **MAX NO OF CONCURRENT REMOTE CONDф (COND):** 10,000
- **MAX NO OF TSO CONNECTIONS (IDFore):** 200
- **MAX NO OF BATCH CONNECTIONS (IDBACK):** 200
- **MAXIMUM KEEP DYNAMIC STATEMENTS (MAXKEEPC):** 10,000
- **MAX OPEN FILE REFS (MAXFRIL):** 100
- **MANAGE REAL STORAGE (REALSTORAGE MANAGEMENT):** AUTO
- **MAXIMUM REAL STORAGE (REALSTORAGE MAX):** 0
- **CONTRACT THREAD STORAGE (CONSTOR):** YES
- **MANAGE THREAD STORAGE (MINSTOR):** YES
- **LONG-RUNNING THREAD ALLOWED IN MINUTES (LONGTHRD):** 10
- **DOL TIMEOUT FACTOR (DOLTF):** 0
- **INDEX CLEANUP THREADS (INDEX,CLEANUP_THREADS):** N/A
- **3960 CACHE (SEQCACH):** 500

#### TRACING, CHECKPOINT & PSEUDO-CLOSE PARAMETERS (DSTIPM)

- **START AUDIT TRACE (AUDITST):** OFF
- **START GLOBAL TRACE (GLOBAL):** NO
- **LOCAL TRACE TABLE SIZE IN 4K BYTES (TRACETB):** 16
- **LOCAL TRACE TABLE SIZE IN 4K BYTES (TRACETB):** 16
- **START SMF ACCOUNTING (SMTP):** OFF
- **START SMF STATISTICS (SMTPAT):** 1,3,4,5,6
- **STATISTICS TIME INTERVAL MINUTES (STATTIME):** 1
- **SYNCROHIZATION INTERVAL WITHIN THE HOUR (SYNCH):** N/A
- **ONLINE DATASET STATISTICS TIME INTERVAL IN MIN (DSTTIME):** 5
- **START MONITOR TRACE (MONTR):** N/A
- **MONITOR BUFFER SIZE IN BYTES (MONBUFF):** 1,048,576
- **UNICODE IFCIDS (IFCIDS):** N/A
- **DOF/RSAF ACCUM (ACUMAC):** NO
- **AGGREGATION FIELDS (ACCUM):** NO
- **COMPRESS SMF RECS (SMFCOMP):** OFF

### IRLM INSTALLATION PARAMETERS (DSNTIP)

- **IRLM SUBSYSTEM NAME (IRLMSN):** IAS
- **IRLM RESOURCE TIMEOUT IN SECONDS (IRLMTIME):** 60
- **IRLM MAXIMUM CSA USAGE ALLOWED (CSAUSE):** 0
- **X LOCK FOR REPEATABLE READ OR READ STABILITY (RLBSLD):** YES
- **X LOCK FOR SEARCHED UPDATE/DELETE (XLKUDP):** NO
- **IMS/DBM TIMEOUT FACTOR (DBMTOU):** 4
- **IMS/ULL TIMEOUT FACTOR (ULLTOU):** 6
- **WAIT FOR RETAINED LOCKS (RLWAIT):** 0
- **ENABLE DB CHECKING:** NO
- **IRLM INITIALIZATION TIME:** 1
- **IRLM PROCESSING PARAMETERS:**
  - **WAIT TIME FOR LOCAL DEADLOCK:** 5,000
  - **NUMBER OF LOCAL CYCLES PER GLOBAL CYCLE:** 1
  - **TIMEOUT INTERVAL:** 60
  - **IRLM MAXIMUM CSA USAGE ALLOWED (CSAUSE):** 0
  - **Z/OS LOCK TABLE LIST ENTRIES:** 0
  - **MAX 31-BIT IRLM PRIVATE STORAGE:** N/A
  - **MAX 64-BIT IRLM PRIVATE STORAGE:** N/A

### ARCHIVE LOG INSTALLATION PARAMETERS (DSTIPA)

- **CATALOG ARCHIVE DATASETS (CATALOG):** YES
- **COPY2 ARCHIVE LOG DEVICE TYPE (UNIT2):** DASD
- **COPY2 ARCHIVE LOG DEVICE TYPE (UNIT2):** 'BLANK'
- **SPACE ALLOCATION METHOD (ALCUNIT):** CYLINDER
- **PRIMARY SPACE ALLOCATION (PRIQTY):** 100
- **SECONDARY SPACE ALLOCATION (SECQTY):** 10
- **ARCHIVE LOG BLOCK SIZE IN BYTES (BLKSIZE):** 24,576
- **MAXIMUM READ TAPE UNITS (MAXRUL):** 0
- **TAPE UNIT DEALLOCATION PERIOD (GEALCT):** 0
- **MAX NUMBER OF DATASETS RECORDED IN BSDS (MAXARCH):** 10,000
- **FIRST ARCHIVE COPY MESS STG GROUP NAME:** 'NONE'
- **SECOND ARCHIVE COPY MESS STG GROUP NAME:** 'NONE'
- **DAYS TO RETAIN ARCHIVE LOG DATA SETS (ARCHRET):** 30
- **ISSUE WTQ BEFORE MOUNT FOR ARCHIVE VOLUME (ARCHWT):** YES
- **COMPACT DATA (COMPACT):** NO
- **QUEQSE PERIOD (QUESQSE):** 5
- **SINGLE VOLUME (SVOLARC):** NO

General Accounting information

This topic describes the Accounting report set and concepts in detail.

From the data shown in Accounting reports you can assign DB2 resource costs to individual authorization IDs and tune programs. OMEGAMON XE for DB2 PE does not, however, provide for tasks such as charge-back or billing.

Typical uses of Accounting reports are to:

- Summarize the local and distributed DB2 activity associated with the execution of specified DB2 plans.
- Summarize the composite DB2 activity associated with the execution of threads that exploit query CP parallelism or Sysplex query parallelism.
- Summarize the DB2 activity associated with the execution of the specified DB2 packages and DBRMs.
- Detect potential problem areas within DB2 applications.
- Track DB2 resource usage on a regular basis by OMEGAMON XE for DB2 PE identifiers such as location, authorization ID, or plan name. You can use this information to study trends or deviations from trends.
- Identify DB2 threads that fail to meet user-specified criteria.

In data sharing groups, you can produce Accounting reports at member level or at group level.

Accounting reports provide summary data about DB2 resource usage for:

- A given thread
- In thread reuse, the interval of time between two signons
- All tasks within a thread that exploit query CP or Sysplex query parallelism

Exception processing is supported in the Accounting report set. You define exception thresholds for certain Accounting fields. When you request exception processing, the values in these fields are checked against the thresholds. Only those records that contain field values outside the defined thresholds are reported.

TOP processing identifies the main consumers of DB2 resources. If the TOP subcommand option is used, an index-like report is generated that shows the main consumers at the end of the report or trace. If you only want to see the main resource consumers, specify the TOP subcommand option with the ONLY keyword.

Functions and utilities of the Accounting report set

The Accounting report set consists of the REPORT, TRACE, FILE, REDUCE, SAVE, RESTORE functions, and the Save-File and Spreadsheet Input-Data Generator utilities.

REPORT

Shows Accounting data summarized by OMEGAMON XE for DB2 PE identifiers. For example, you can produce a report that shows the Accounting information for threads, plans, or users. The report shows totals and subtotals of fields.
For a DB2 system in a data sharing group, reports can be at member or group level.

**TRACE**

Shows Accounting data for a particular thread. Unlike reports, traces show the Accounting data without aggregation. This means that the records are listed individually, in the order of occurrence. There is an exception if a thread exploits parallelism. In this instance, all parallel activity is aggregated and presented as a single trace entry.

Traces can be very long. Use traces only to resolve a specific problem.

**FILE**

Formats DB2 Accounting records and stores the records in sequential data sets that can be loaded into DB2 tables. You can analyze the data in DB2 tables and produce tailored reports by using a reporting facility such as Query Management Facility (QMF). You can also use FILE to produce data sets that contain only exception records. (See “Creating data for the Performance Database and the Performance Warehouse” on page 2984.)

You can also use the File data sets to generate CSV (comma-separated value) input-data. This CSV data can then be transferred to workstations and imported into spreadsheets to improve DB2 performance analysis using graphical representations or pivot tables. (See “Generating input data for spreadsheets” on page 2985.)

**REDUCE**

Reduces the volume of data that is input to the REPORT and SAVE functions. REDUCE is invoked automatically if you use REPORT or SAVE. Specify REDUCE explicitly if you want to:

- Specify an interval to order data on Accounting reports
- Produce several reports to cover different time periods

After reducing data, the resulting data set is much smaller than the original input data set. However, reducing data uses a considerable amount of system resources. (See “Creating data for the Performance Database and the Performance Warehouse” on page 2984.)

**SAVE**

You can save data sets as follows:

**Without CONVERT option**

Produces VSAM data sets that contain reduced Accounting records. When the data is saved, you can:

- Combine it with new data to produce long-term reports.
- Use the Save-File utility to create sequential data sets that are suitable for use by the DB2 load utility.

**Note:**

- You can only process VSAM data sets in the same version of OMEGAMON for Db2 PE as they have been created. For example, if you create a SAVE data set in version 530, it can only be RESTORED in version 530.
- To use a SAVE data set in a higher version, you must migrate the SAVE data set using a migration utility.
- Before you restore or convert SAVE data sets from V5.2.0 or V5.3.0, you must first migrate this data to OMEGAMON for Db2 PE V5.4.0 format.
• Restored reports only show fields that are supported by the current version of OMEGAMON for Db2 PE.

You can use REDUCE and SAVE to keep historical Accounting data about DB2 performance. You can define the interval and the input filters for the data that is saved into the SAVE data set.

**With CONVERT option**

Produce sequential data sets that contain reduced and converted Accounting records. When the data is saved, it can be used by the DB2 load utility.

You can also use the Save-File data sets to generate CSV (comma-separated value) input-data. This CSV data can then be transferred to workstations and imported into spreadsheets to improve DB2 performance analysis using graphical representations or pivot tables. (See "Generating input data for spreadsheets" on page 2985.)

**RESTORE**

Reloads a previously saved VSAM data set for additional use. This saved data can be restored and re-saved as often as required.

**Save-File utility**

With the Save-File utility you can:

• Migrate Accounting Save data sets from earlier releases.

• Convert Accounting Save data sets into sequential data sets that are suitable for use by the DB2 load utility.

(See “Creating data for the Performance Database and the Performance Warehouse” on page 2984.)

**Spreadsheet Input Data Generator utility**

You can also use the File and Save-File data sets to generate CSV (comma-separated value) input-data. This CSV data can then be transferred to workstations and imported into spreadsheets to improve DB2 performance analysis using graphical representations or pivot tables. (See “Generating input data for spreadsheets” on page 2985.)

**Thread types**

The DB2 thread or, for a thread in reuse, the part of it that is between two consecutive signons or resignon, is the basic unit of reporting for the Accounting report set.

**Thread categories**

OMEGAMON XE for DB2 PE uses the following categorization of DB2 threads:

**Allied thread**

An allied thread:

• Originates at the local DB2 subsystem and can access data at a remote DB2 subsystem.

• Does not involve distributed activity, that is, it is not initiated by a remote location and does not request data from another location.

• Can be filtered for Accounting by selecting the OMEGAMON XE for DB2 PE identifier THREADTYPE with a value of ALLIED. The Accounting report ordered by THREADTYPE shows ALLIED as an individual criterion.
The Accounting record that represents an allied thread consists of the following set of data, which is called non-DDF (Distributed Data Facility) data:

- Identification of the thread
- General timing
- SQL and RID list usage
- Query parallelism
- Buffer pool activity
- Group buffer pool activity
- Data sharing locking
- Stored procedures
- Data capture
- Locking activity
- Packages and DBRMs executed
- Resource limit facility data

**Allied-distributed thread**

An allied-distributed thread:

- Requests work from remote server locations.
- Is not initiated by a remote location.
- Can be filtered for Accounting by selecting the OMEGAMON XE for DB2 PE identifier THREADTYPE with a value of ALLIED_DIST. The Accounting report ordered by THREADTYPE can show ALLDDIST as an individual criterion.

The Accounting record that represents an allied-distributed thread consists of:

- Non-DDF data
- One block of DDF data for each participating server location, which includes information such as the number of messages, statements, rows, and bytes that have been sent and received.

**Database access thread (DBAT)**

A DBAT thread:

- Accesses data at the local subsystem on behalf of a remote subsystem.
- Can be filtered for Accounting by selecting the OMEGAMON XE for DB2 PE identifier THREADTYPE with a value of DBAT.

The Accounting record that represents a DBAT consists of:

- Non-DDF data
- DDF data for the requester location

- Also includes DBAT-distributed threads that are initiated by a requester location and executed by the server location that in turn requests data from another server location.

The Accounting report ordered by THREADTYPE can show one or several of the following criterion:

- **DBAT** Indicates accumulated data of threads that are initiated, created, and performing work on behalf of a remote (requester) location.

- **DBATDP** Indicates accumulated data of DBAT duplicate threads.

- **DBATDIST** Indicates accumulated data of DBAT distributed threads that are initiated by a requester location and executed by the server location that in turn requests data from another server location.
DBATDICP
Indicates accumulated data of DBAT distributed and copy threads.

DBATDIDP
Indicates accumulated data of DBAT distributed and duplicate threads.

For example, when location A uses DRDA to request data at location B and, in the same unit of work, accesses data at location C (using DB2 private protocol), the thread created at location A is an allied-distributed thread, the thread created at location B is a DBAT-distributed thread. The thread created at location C is a DBAT.

The Accounting record that represents a DBAT-distributed thread consists of:
- Non-DDF data
- DDF data for the requester location
- One block of DDF data for each participating server location

**Thread types reported by ORDER**

The following terms can help you to understand the concepts of the different thread types and merged processing:

**Nondistributed transaction**
A nondistributed transaction for Accounting:

- Is initiated by DB2 and performed at one location without interaction with other locations. For example, if an allied thread is not reused, it represents a nondistributed transaction. If it is reused, a nondistributed transaction is a DB2 activity between two signons.
- Can be filtered by specifying the INCLUDE or EXCLUDE subcommand options with the OMEGAMON XE for DB2 PE identifier THREADTYPE using a value of ALLIED or DBAT. As a result the Accounting report ordered by THREADTYPE can show a thread type of ALLIED, DBAT, or DBATDP.

**Note:** The OMEGAMON XE for DB2 PE identifier DBAT also covers the nondistributed transactions.

**Distributed transaction**
A distributed transaction for Accounting:

- Is initiated by DB2 at one (requester) location and performed at one or more remote (server) locations.
- Consists of a local activity that is represented by an allied-distributed thread, and in case of a loopback from a DBAT, remote activity that is represented by one or more DBATs. Therefore, a distributed transaction requires Accounting records for the allied-distributed thread and all corresponding DBATs.
- Can be filtered by specifying the INCLUDE or EXCLUDE subcommand options with the OMEGAMON XE for DB2 PE identifier THREADTYPE using a value of ALLIED-DIST or DBAT.

**Note:** The OMEGAMON XE for DB2 PE identifier DBAT also covers the nondistributed transactions.

The Accounting report ordered by THREADTYPE can show one or several of the following thread types that are distributed transactions:
ALLDDIST
Indicates accumulated data of threads initiated by DB2 and that request data from one or more server locations.

DBATDIST
Indicates accumulated data of DBAT distributed threads that are initiated by a requester location and executed by the server location that in turn requests data from another server location.

DBATDICP
Indicates accumulated data of DBAT distributed and copy threads.

DBATDIDP
Indicates accumulated data of DBAT distributed and duplicate threads.

Activity location

Reports and traces are location-oriented. They show activity that is performed at one or more locations. For a given location, the following information is shown:

- The nondistributed transactions, in other words, the allied threads at that location
- The local activity of distributed transactions that originate at that location, in other words, the allied-distributed threads from that location without the corresponding DBATs at other locations
- The remote activity at that location as part of distributed transactions requested from other locations, in other words, the DBATs at that location

Multi-site or single-site reports

Reports and traces can be single-site or multi-site:

- Single-site reports and traces present Accounting data for one location. You can obtain a single-site report or trace by processing input data that only contains records from a single location or by specifying a single location with the INCLUDE or EXCLUDE subcommand options.
- Multi-site reports and traces present Accounting data for more than one location. The data is arranged in alphabetical order by location name.

Distributed activity

The Accounting trace provides insights to activities among distributed DB2 subsystems as well as non-DB2 requestors.

OMEGAMON XE for DB2 PE supports communication between:
- DB2 for z/OS subsystems
- DB2 for z/OS subsystem and non-DB2 requesters, such as SQL/DS, or ORACLE

For detailed information about the communication between these systems, produce an Accounting trace.

For communication between two DB2 subsystems, the Accounting trace provides you with information about the requester locations (for DBATs) and the server locations (for requester threads).

For communication between a DB2 subsystem and a non-DB2 for z/OS requester, OMEGAMON XE for DB2 PE can only present performance data on DBATs.
However, the Accounting trace helps you to identify the requester. It supplies the identifier and release level of the requester involved. For requesters from DB2 on other platforms also provides the client platform, application name, authorization ID, and a user-supplied part. If possible, OMEGAMON XE for DB2 PE uses the first eight bytes of the application name to identify the DBAT. If it is not possible to show the DBAT application name, the plan name is shown as DISTSERV. When DISTSERV is shown, you can use the MAINPACK identifier to distinguish DBATs.

Accounting trace records are affected by the DB2 subsystem parameter ACCUMACC, which controls whether and when DB2 Accounting data is accumulated by the user for DDF and RRSAF threads. A parameter value of 2 or greater causes Accounting records to roll up into a single record every \( n \) occurrences of the user on the thread. These values can be set by DDF threads by Server Connect and Set Client calls, and by RRSAF threads by RRSAF SIGN, AUTH SIGNON, and CONTEXT SIGNON functions. When roll-up occurs, the values of some fields shown in Accounting reports and traces lose their meanings because of the accumulation. Thus, these fields are marked as N/P or N/C for derived fields. For a list of affected fields, see “Fields affected by roll-up during distributed and parallel tasks” on page 2996.

**Query parallelism considerations**
The Accounting report set supports parallel tasks from CP parallelism and Sysplex query parallelism.

If a query exploits query CP parallelism or Sysplex query parallelism, several tasks (called parallel tasks) perform the work. For each of these tasks an Accounting record is generated, which contains counters and timers pertinent to the work performed by the particular task. In addition, an Accounting record is created that contains the details about nonparallel work within the thread and data related to parallel work.

OMEGAMON XE for DB2 PE summarizes all Accounting records that are generated for such a query and presents the records as one logical Accounting record. Table 244 describes which values are taken from both the originating and parallel records and which are taken from the originating record only.

**Table 244. Data related to query CP and Sysplex query parallelism**

The elapsed time is taken from the originating record, while CPU and suspension times are calculated from all parallel and originating records. Consequently, both CPU time and suspension times can be larger than the elapsed time. Therefore, you can only get the full picture of response time distribution if the times for each participating task are known. If you suspect that the CPU times or suspension times for a thread where query CP or Sysplex query parallelism is used are, for other reasons, larger than the times being added for several tasks, produce a long Record trace for IFCID 3. This way all parallel and originating Accounting records are reported separately.

In Sysplex query parallelism, the CPU times of the parallel records are normalized so that you can add up the times across multiple DB2s running on different machines. Normalized means that the CPU times are converted to a common unit, called service unit (SU), using a conversion factor. The conversion factor depends on the machine being used.

By default, Accounting trace records from parallel query tasks are rolled up into the originating task’s Accounting trace. This is controlled by the DB2 subsystem parameter PTASKROL (parallel tasks roll-up), which has a default value of YES. A roll-up record is written when the parent task (agent) deallocates on an originating DB2, or when an accumulating child task is deallocated on an assisting DB2. The rolled up data is an accumulation of all counters for that field for each child task that completed and deallocated. When roll-up occurs, the values of some fields in Accounting reports and traces lose their meanings because of the accumulation. Thus, these fields are marked as N/P, or N/C for derived fields. For a list of affected fields, see “Fields affected by roll-up during distributed and parallel tasks” on page 2996.

Timing information
The Accounting report set provides a multitude of timing information for nondistributed and distributed transactions.

OMEGAMON XE for DB2 PE reports the following timing information:

- Application times (class 1)
- DB2 times (class 2)
- Suspension times (class 3) and counts
- IFI times (class 5)
- DB2 times on a per package/DBRM basis (class 7)
- Suspensions times on a per package/DBRM basis (class 8) and counts
If an Accounting record represents an allied-distributed thread, additional time fields for DDF data are reported. These DDF times are obtained from Accounting class 1.

The following figure shows an example of the DB2 Accounting times for a nondistributed transaction that does not exploit CP parallelism and how the Accounting times relate to each other and to the DB2 SQL call activity. The example depicts an application for IMS or CICS. Classes 5, 7, 8, and 9 are not shown. Class 5 is a subset of class 2 and is present only if IFI processing takes place. Classes 7 and 8 are equivalent to classes 2 and 3, but on a package or DBRM level.

![Accounting Times Diagram]

*Figure 257. DB2 Accounting times for a nondistributed transaction*

The following figure shows various elapsed times for a distributed transaction originating from TSO allied space. CP parallelism is not exploited. The times for both the requester and the server are shown. This figure is a simplified presentation of the processes at the participating locations. It does not, for example, show block fetch statements and it is only applicable to a single row retrieval. DDF-at-Server time is not provided if the transaction uses DRDA.
The various elapsed times in the figure are defined as follows:

- **DDF at Server**
  
  This is the ELAPSED SER field that is reported in the Requester Fields for Server Location section of the Accounting reports and traces. It represents the elapsed time spent at the server between the time the SQL statement is received and the time the answer is sent to VTAM. This time is not applicable to DRDA and N/A is printed.

- **DDF at Requester**

---

*Figure 258. Accounting elapsed times for a distributed transaction*
This is the ELAPSED REQ field in the Server Fields for Requester Location section of the Accounting reports and traces. It represents the elapsed time spent at the requester between the time the SQL statement is sent and the time the answer from the server is received.

- **Class 1 at Server Location**
  This is the ELAPSED TIME field under the APPLICATION TIMES (CLASS 1) column of the Accounting reports and traces for the server location. It represents the class 1 elapsed time from creation to termination of the DBAT.

- **Class 2 at Server Location**
  This is the ELAPSED TIME field under the DB2 TIMES (CLASS 2) column of the Accounting reports and traces for the server location. It represents the elapsed time to process the SQL requests and the commits at the server.

- **Class 3 at Server Location**
  This is the ELAPSED TIME for the total of the class 3 suspensions in the Accounting reports and traces for the server location. It represents the time the DBAT was suspended while waiting for various system events such as locking, I/O, and other requests.

- **Class 3 at Requester Location**
  This is the ELAPSED TIME column for class 3 suspensions on the Accounting reports and traces for the requester location. It represents the time the allied-distributed thread was suspended while waiting for various system events such as locking, I/O, and other requests.

- **Class 2 at Requester Location**
  This is the ELAPSED TIME field under the DB2 TIMES (CLASS 2) column of the Accounting reports and traces for the requester location. It represents the elapsed time between the application passing the SQL statement to the local (requester) DB2 system and back again. This is the time spent in DB2.

- **Class 1 at Requester Location**
  This is the ELAPSED TIME field under the APPLICATION TIMES (CLASS 1) column of the Accounting reports and traces for the requester location. It represents the elapsed time from creation to termination of the allied-distributed thread.

**Input for Accounting reports**
The Accounting report set can process data originating at different DB2 locations in the same OMEGAMON XE for DB2 PE run.

Several input data sets (in any SMF, GTF, DPMOUT, and Online Monitor trace output data set format) can be logically concatenated in the DD statements for INPUTDD. The data is sorted in the primary sequence of location and reported according to the parameters specified in the Accounting command.

**DB2 traces used in Accounting:**
The Accounting report set requires the following DB2 trace classes and DB2 trace types to be active.

Accounting uses the DB2 IFCIDs 3 and 239 (DB2 trace type Accounting, DB2 trace class 1) as input for the reports and traces. Timing data is taken from all classes:

- Application times (class 1)
- DB2 times (class 2)
- Suspension times (class 3) and counts
- IFI times (class 5)
• DB2 times on a per package/DBRM basis (class 7)
• Suspensions times on a per package/DBRM basis (class 8) and counts

If an Accounting record represents an allied-distributed thread, additional time fields for DDF data are reported. These DDF times are obtained from Accounting class 1.

Accounting trace classes are started either at DB2 start time, by using the installation panel DSNTIPN, or by entering the DB2 **START TRACE** command at the terminal. For example:

```
-START TRACE(ACCT6) CLASS(1,2,3,5,7,8) DEST(SMF)
```

The Accounting classes 1 and 3 should always be active. The overhead is not significant, whereas the information they provide is crucial for all aspects of performance monitoring. It is also useful to always have class 2 active. If you do not always have class 3 active, activate class 3 when you activate class 2.

Classes 7 and 8 provide valuable information on a per package or per DBRM basis. They are equivalent to classes 2 and 3. Package or DBRM Accounting is probably most beneficial for a DB2 server of a non-DB2 requester or when an application plan can execute many packages or DBRMs, but actually executes 10 or less for a given Accounting record. If class 2 is active, also activate class 7 if package Accounting is needed. If class 3 is active, also activate class 8 if package Accounting is needed. More than 10 packages or DBRMs introduce additional overhead in data collection reducing the benefit versus cost. However, this cost is still significantly less than a DB2 performance class trace.

**Accounting record generation:**

About how and when Accounting data is collected and recorded.

The collection of Accounting data begins when a thread connects to DB2. A completed Accounting record is written when:

- The thread terminates
- The authorization identifier changes because the thread is reused
- A DBAT becomes inactive
- A parallel task completes when query CP or Sysplex query parallelism is exploited

**Note:**

- NEW USER is reported when DB2 Accounting records are reported in the IMS thread and CICS thread reuse situations where a new AUTHID is used.
- If TOKENE=YES on the TYPE=ENTRY statement in the RCT table is specified, the CICS attachment facility requests an Accounting record to be produced during thread reuse even if the user authorization ID does not change. A CICS LU6.2 token is also passed to DB2 allowing correlating CICS and DB2 trace records.
- For thread reuse, all values are accumulated since the last Accounting record.
- When a CICS application program causes more than one SYNC point commit or rollback, DB2 can produce several out-of-sequence Accounting records for the application if CICS attach thread swapping occurs.
- If a thread is reused with the same user authorization ID and TOKENE has not been specified, the DB2 Accounting record represents several CICS transactions.
Missing data sections:

Conditions that might cause missing data for Accounting reports.

The following DB2 threads might result in missing data sections because required data could not be gathered:

- If attaching to QMF that generates a unique DB2 thread.
  Under this thread no SQL, buffer, or locking information is gathered.
- If running a dynamic SQL that generates a unique DB2 thread.
  Under this thread, SQL, buffer, and locking activity can be performed. A data section is produced if activity in the data section occurs. Resource limit activity is only reported in the Accounting record for dynamic SQL activity.
- If ending a QMF session that creates a unique DB2 thread.
  Under this thread no SQL, buffer, or locking information is gathered.
- If running a batch job that creates a unique DB2 thread.
  Under this thread SQL, buffer, and locking activity can be performed. No resource limit activity is tracked for this thread.
- If location A uses DRDA protocol to access data at location B and does not do any local work, no SQL information is gathered for the corresponding allied-distributed thread at location A.

Creating effective Accounting reports

For a report to be effective it must deliver the information you need efficiently in terms of resources required to produce it, the volume of data produced, and the time it takes for you to interpret the report.

Processing considerations

Because Accounting is one of the most frequently used report sets, consider the effects on batch resources. To reduce processing time when producing Accounting reports and traces, only ask for the information that you really need.

Before producing a report or trace, consider how much detail you need.

Use the short (default) layouts of reports and traces whenever possible. In most instances these provide enough detail for monitoring and problem determination.

A detailed report that uses all input data that was gathered for a long period uses a lot of system resources. The result is pages of information that you are probably not interested in.

To avoid unnecessary processing overhead and to save time:

- Consider carefully how detailed a report you need.
- Filter the input data – preferably by using the GLOBAL command.
- Disable OMEGAMON XE for DB2 PE internal sort if appropriate.
- Define groups for identifiers that you want reported as a single entry.
- Specify a REDUCE INTERVAL only to report by intervals or to produce several reports with different time spans.
- Define exception thresholds only for fields that you are interested in.
- Specify DPMOUT or keep a Save data set only if you are sure that you want to report the data again.
Choosing the right level of detail:

Before you produce a report or trace, consider how much detail you need. Use the LAYOUT subcommand option of the Accounting reports and traces to control the amount of data to be produced.

In most situations the default layouts, which are short versions of reports and traces, provide enough detail for monitoring and problem determination. Do not use the most comprehensive layouts that show all possible fields unless you need this information.

For Accounting the LAYOUT subcommand option ACCEL provides detailed thread-related Accelerator activity data.

If the use of commands, subcommands, and subcommand options does not provide sufficient control over the contents of reports and traces, you can use the User-Tailored Reporting (UTR) feature to create and tailor your own report and trace layouts. With UTR you can add, remove, and change individual fields and entire report blocks to control the volume, contents, and layouts of your reports and traces. For more information, see “Tailoring report layouts” on page 2950.

Filtering data:

You can limit the amount of data to be processed by filtering the input data. You can specify filters in the GLOBAL command and in the REDUCE, REPORT, TRACE, and FILE subcommands.

Specify the filters in GLOBAL whenever you can, because only the data that passes through the GLOBAL filters is processed further. The less data OMEGAMON XE for DB2 PE needs to process, the better the performance.

However, ensure that you do not exclude records that are needed in OMEGAMON XE for DB2 PE processing.

FROM and TO subcommand options:

The simplest filter is the start and end date and time of the data to be reported. Specify the start and end dates and times by using the FROM and TO subcommand options.

For example, to monitor the performance of your system only during peak hours and to produce the default version of a report, specify:

```
GLOBAL
  FROM (09/25/13,08:30)
  TO (09/25/13,17:00)
ACCOUNTING
```

The report shows information from 8:30 a.m. to 5:00 p.m. for the specified day.

Presuming that the input data set contains data for more than one day, for example a week, you can generate a report that shows the performance of your system during peak hours for the whole week by specifying:

```
GLOBAL
  FROM (,08:30)
```

IBM Db2 Performance Expert on z/OS
The report shows information from 8:30 a.m. to 5:00 p.m. for every day of the week.

**INCLUDE and EXCLUDE subcommand options:**

Another way to filter data is to include data only for particular OMEGAMON XE for DB2 PE identifier values, for example, user IDs or plans. You can do this by using the INCLUDE and EXCLUDE subcommand options.

For example, if you have a problem with applications coming from one location, USIBMSNEWY11, and you know the CICS transactions are not causing a problem, specify:

```plaintext
GLOBAL
  INCLUDE (LOCATION (USIBMSNEWY11))
  EXCLUDE (CONNTYPE (CICS))
```

Continuing the example, suppose the report indicated a problem with authorization identifier USERID01 using plan PVLDD4C3. You are only interested in data belonging to that user ID and plan. You can now specify:

```plaintext
GLOBAL
  INCLUDE (LOCATION (USIBMSNEWY11))
  INCLUDE (AUTHID (USERID01))
  INCLUDE (PLANNAME (PVLDD4C3))
```

**Suppressing internal sort:**

When you request Accounting functions only, it is often possible to avoid the OMEGAMON XE for DB2 PE internal sort of the input data. Suppressing the internal sort with the PRESORTED option of the GLOBAL command reduces the size of the sort work files that must be allocated and the processing time.

The PRESORTED option of the GLOBAL command controls the internal sort. For example, to produce an Accounting report without sorting the input data, specify:

```plaintext
GLOBAL
  PRESORTED (ACCEPT)
ACCOUNTING
```

The resulting Accounting report shows Accounting data for all locations in the input data set, without performing an internal sort.

**Grouping data:**

Use the GROUP command to collect several OMEGAMON XE for DB2 PE identifier values under one name. When you request a report and specify this name by using the INCLUDE or EXCLUDE subcommand option, the events for all individual items are consolidated into one.
For more information on the GROUP command in Accounting refer to Report Command Reference.

Grouping data using sets of identifiers:

You can use the GROUP command to define a set of OMEGAMON XE for DB2 PE identifier values that can be used when you request certain reports. The information for the set is reported as a single entry in the reports.

In GROUP processing the data for all items of the set is consolidated into one record. This improves OMEGAMON XE for DB2 PE performance because less records must be processed.

Sets are also useful for reporting purposes such as to report data for an entire department instead of every individual person.

Assume that your sales department consists of three users (USER001, USER002, and USER003) and you want to specify sets to produce an Accounting report with performance data for this department. You can specify:

```
GROUP (PRIMAUTH (SALES (USER001, USER002, USER003)))
ACCOUNTING
REDUCE
  INCLUDE (PRIMAUTH(G(SALES)))
REPORT
  ORDER (PRIMAUTH)
```

The Accounting report shows information for the sales department as a single entry.

Grouping data using the connection type identifier:

You can use the GROUP command to reduce data according to the connection type of the thread.

First you must define the GROUP command for the identifier CONNTYPE, such as

```
GROUP (CONNTYPE (ALLCTP(*)))
```

Then use the REDUCE subcommand to get SAVE records with the variable group name. The conversion utility can handle the group name and passes it to the Save-File utility (including the predefined names of the connection types).

In the following example, data for the connection type group named ALLCTP is accumulated. Records created in the SAVE data set with DD name ACSAVDD1 contain name ALLCTP as part of their key. After converting this data, the loadable data contain ALLCTP as a connection type.

```
GROUP (CONNTYPE (ALLCTP(*)))
ACCOUNTING
REDUCE
  INCLUDE (CONNTYPE (G(ALLCTP)))
SAVE
```
Grouping data using the thread type identifier:

You can use the GROUP command to define and pass individual thread types.

Specify the thread type you want to include in your report. The THREADTYPE in a report can be ordered by each individual thread type that needs to be distinguished when processing the REDUCE subcommand.

A logical report is created for each thread type and for each unique member (identified by DB2 location, group, subsystem, member) or for each DB2 group.

**Note:** The detailed thread types are only shown in the output, which can be an Accounting report or a loadable PDB file. This ensures that individual and separated data (such as two logical reports) do not refer to the same set name (such as DBAT).

Grouping data by ordering according to thread types:

You can use the GROUP command to order data according to thread types.

The following example first defines the group, such as GROUP (THREADTYPE(THRTGRP(*))). Then the REDUCE subcommand is specified to reduce the usage of the group to report (ordered by the thread type) and save:

```
GROUP (THREADTYPE(THRTGRP(*)))
ACCOUNTING
REDUCE
   INCLUDE (THREADTYPE (G(THRTGRP)))
REPORT
   ORDER(THREADTYPE)
SAVE
DDNAME(ACSAVDD1)
```

Sample with GROUP REDUCE for THREADTYPE

The following example shows the part of a sample Accounting report that results from the command GROUP REDUCE ordered by THREADTYPE.

```

Chapter 6. Batch reporting
Note: The number of ALLIED, ALLIED DISTRIBUTED, DBAT, and DBAT DISTRIBUTED threads are presented in the **Highlights** block.

**Specifying intervals for long-term reporting:**

If you want to perform a trend analysis, you probably want to report data by interval. To do this, first reduce the input data for your Accounting reports using an interval other than the default zero. Then, order the report by intervals.

For example, you might want to report the data at daily intervals. In this case you would specify `INTERVAL(1440)` in the REDUCE subcommand and `ORDER(INTERVAL)` in the REPORT subcommand. If you do not intend to produce reports at time intervals, use the default (0) for INTERVAL, which means that no interval processing is performed.

**Specifying exception thresholds for specific fields:**

You can set exception thresholds for virtually all Accounting fields. However, carefully consider the fields for which to specify exception thresholds. The more fields you specify, the greater the effects on processing.

Specify exception thresholds only for those fields that you believe will signal poor performance in your environment.

You can also use the TOP (ONLY) subcommand option to identify problems instead of specifying exception thresholds. TOP processing is more economical than exception processing.

**Using a DPMOUT data set:**

Keep the content of the DPMOUT data set for further reports.

After OMEGAMON XE for DB2 PE has generated all reports that you requested, the preprocessed input data is either discarded or written to the output data set DPMOUT, depending on what you specified. The DPMOUT data set can be used as input to OMEGAMON XE for DB2 PE, so if you want to produce reports from the same data in several executions and your SMF/GTF data set is large, you might want to keep the DPMOUT data set.

If you do not specify DPMOUTDD, only the records required for the current job step are processed, which improves performance. If you want to keep a DPMOUT data set for the specific purpose of producing future Accounting reports and traces, specify `GLOBAL INCLUDE IFCID(3 239)` in the command stream within the JCL. This reduces the size of the DPMOUT data set.

**Saving reduced data:**

This section shows alternative ways to save reduced data. Use the subcommands `REDUCE` and `SAVE (without CONVERT)`, for example, to store historical Accounting data in smaller data sets.

You can reduce and save data as follows:

- If you want to keep historical Accounting data about DB2 performance in a VSAM data set, consider using `REDUCE` and `SAVE` as follows:
1. REDUCE trace data
2. SAVE reduced data

Reducing and saving data uses a considerable amount of system resources, but the resulting VSAM-Save data set is much smaller than the original input data set.

The size of the data set depends on the reduction interval that you specified and the type of environment the data is from (for example, the number of different users and plans present in the input data), but it is always much smaller than the original input data set.

You can produce reports from the VSAM data by using the RESTORE command. Remember that you cannot produce traces from reduced data.

You can then proceed as follows:
1. CONVERT saved data: The Save-File utility changes Save data sets into sequential data sets for use by the utility.
2. LOAD converted data to Performance database (PDB) tables.

• The following steps are required to load Statistics or Accounting Save data using the CONVERT option of the SAVE subcommand:
  1. REDUCE trace data.
  2. CONVERT reduced data using the SAVE subcommand with the CONVERT option. The reduced data is saved and converted in one step into a sequential data set that can be loaded into DB2 tables.
  3. LOAD converted data to Performance database (PDB) tables.

Exception processing
Use exception processing to identify Accounting report, trace, and File data set entries with fields that contain values outside thresholds specified in the Exception Threshold data set. When exception processing is active, the data to be reported is checked against these thresholds. You can obtain exception reports, traces, and File data sets by using the EXCEPTION subcommand option in ACCOUNTING subcommands.

There are two threshold types that you can set: warning and problem. A warning message is printed if a value is outside the first threshold. A problem message is printed if a value is outside the second threshold.

Accounting exception reports, traces, and File data sets are identical to the usual Accounting reports, traces, and File data sets, except that they only contain entries that have at least one field in exception status. For reports and traces, a block of data that shows the fields in exception status is printed next to the report or trace entry.

Exception logs contain Accounting and Statistics fields that are in exception status in a single report in timestamp order.

The Exception Log data set is written if you define the EXTRCDD1 DD statement in the JCL. To prevent the generation of the Exception Log data set, omit the EXTRCDD1 statement from your JCL (the preferred method), or specify DUMMY in the definition.

The Exception Log File data set is written if you define the EXFILDD1 DD statement in the JCL. To prevent the generation of the Exception Log File data set, omit the EXFILDD1 statement from your JCL (the preferred method), or specify DUMMY in the definition.
**Accounting Exception Messages block**

As the following example shows, if EXCEPTION was specified in the REPORT or TRACE subcommand, the entry is formatted and printed in the requested layout, followed by the Exception Messages block. The Exception Messages block identifies the fields in exception status.

```
<table>
<thead>
<tr>
<th>TYPE</th>
<th>FIELD ID</th>
<th>FIELD DESCRIPTION</th>
<th>BY</th>
<th>VALUE</th>
<th>THRESHOLD</th>
</tr>
</thead>
<tbody>
<tr>
<td>PROBLEM</td>
<td>QXINCRB</td>
<td>INCREMENTAL BINDS</td>
<td>TOTAL</td>
<td>1</td>
<td>&gt; 0</td>
</tr>
<tr>
<td>PROBLEM</td>
<td>ASCOML</td>
<td>TOTAL SQL DML STATEMENTS</td>
<td>COMMIT</td>
<td>127.25</td>
<td>&gt; 100</td>
</tr>
<tr>
<td>WARNING</td>
<td>QBAGET</td>
<td>GETPAGES</td>
<td>THREAD</td>
<td>2589.00</td>
<td>&gt; 2500</td>
</tr>
</tbody>
</table>
```

The following columns are presented in the Exception Messages block:

**TYPE**  
The type of exception. Valid values are WARNING and PROBLEM.

**FIELD ID**  
The name of the field from the Exception Threshold data set.

**FIELD DESCRIPTION**  
The description of the field.

**FIELD QUALIFIER**  
The qualifier of the field. It can be blank (for the majority of fields), a buffer pool ID, group buffer pool ID, package or DBRM name, or a remote location name.

**BY**  
The basis for the comparison. The following information can be printed in this column:

- **TOTAL**  
The threshold is specified as a “total” value.

- **MINUTE**  
The threshold is specified as a “by minute” value. The value in the report or trace entry is divided by the number of minutes (class 1 elapsed time) before making the comparison.

- **SECOND**  
The threshold is specified as a “by second” value. The value in the report or trace entry is divided by the number of seconds (class 1 elapsed time) before making the comparison.

- **COMMIT**  
The threshold is specified as a “by commit” value. The value in the report or trace entry is divided by the number of Commits before making the comparison.

- **THREAD**  
The threshold is specified as a “by thread” value. The value in the report or trace entry is divided by the number of threads before the comparison. For traces it is equivalent to by total.

**VALUE**  
The actual field value that is used for the comparison. For “by minute”, “by second”, “by commit”, or “by thread” comparisons, the value that you get after the division is printed. The greater than symbol (>) or the less than symbol (<) is printed between this column and the THRESHOLD column to indicate whether the value is larger or smaller than the threshold value.
**ORDER processing**

You can change the way reports are summarized by using the ORDER subcommand option of the REPORT subcommand. The ORDER subcommand option specifies which OMEGAMON XE for DB2 PE identifiers are used to aggregate records. It also identifies the presentation sequence of the report entries, unless the TOP(ONLY) subcommand option is specified for Accounting.

You can:

- Specify one entry of ORDER for each REPORT subcommand.
- Order by one, two, or three identifiers separated by a dash.
- Specify up to five sets of the identifiers separated by at least one blank, a comma, or a new line.

The default for ORDER is PRIMAUTH-PLANNAME.

In addition to these OMEGAMON XE for DB2 PE identifiers, you can use the REDUCE INTERVAL to order data on Accounting and Statistics reports. See "Example of ordering by interval: ORDER (INTERVAL)" on page 2894 for an example of a report ordered by interval.

The following Accounting report examples show ORDER processing for the same input data ordered in different ways:

- "Default ordering: ORDER (PRIMAUTH-PLANNAME)"
- "Ordering by connection ID: ORDER (CONNECT)" on page 2886
- "Ordering by correlation ID: ORDER (CORRNAME)" on page 2887

**Default ordering: ORDER (PRIMAUTH-PLANNAME):**

The following example shows a report with default ordering of plan names within primary authorization IDs.

**Accounting report - default order**

In this example, data is ordered according to various authorization IDs and plans. All primary authorization IDs and plans present in the input data are shown.

The TOTAL rows are printed for primary authorization IDs that contain more than one plan.

Chapter 6. Batch reporting 2885
### Ordering by connection ID: ORDER (CONNECT):

You can order the report by the connection ID using the subcommand option ORDER (CONNECT).

Here is a sample of how to specify the command:

```
ACCOUNTING REPORT ORDER (CONNECT)
```

### Accounting report - ordered by connection ID

The following example shows a report with ordering by connection ID.

Three connection IDs are reported: information for connection ID BATCH is reported on the first two lines followed by information for connections DB2CALL and UTILITY.

GRAND TOTAL is printed at the end of the report. It shows the aggregated values for all three connection IDs.

<table>

</table>

Accounting REPORT COMPLETE
Ordering by correlation ID: ORDER (CORRNAME):

You can also identify the task by using correlation data:

```
ACCOUNTING
REPORT
ORDER (CORRNAME)
```

**Note:** In a distributed environment reports should be ordered by REQLOC or CONNTYPE. If REQLOC or CONNTYPE are not used in the ORDER subcommand option of REPORT, the Accounting portion of all threads (including DBATs) where the combination of OMEGAMON XE for DB2 PE identifiers is the same is reported as one entry.

**Accounting report - ordered by correlation ID**

The following example shows an Accounting report ordered by correlation ID.

<table>

ACCOUNTING REPORT COMPLETE

**Examples of ordering by Plan, Main Package, and Package:**

These examples show data ordered by PLANNAME, MAINPACK, and PACKAGE identifiers.

The data shown in “Accounting trace - input data for ordering reports” on page 2888 is used to produce the reports shown in “Accounting report - ordered by plan” on page 2889, “Accounting report - ordered by plan and MAINPACK - sample” on page 2890, and “Accounting report - ordered by package - sample” on page 2891.
### Accounting trace - input data for ordering reports

The data in the following example has been simplified to ease readability.

<table>

The input data contains information about:

- Two plans. PLANX is used by three threads and PLANY by one thread. The first instance of PLANX shows that three packages (PACKA, PACKB, and PACKC) are executed. The elapsed time for the entire PLANX is 10 seconds and CPU times for the individual packages are 0.01, 0.02, and 0.01 seconds.
- Four packages. Different combinations of packages were executed under the different plans, because a plan does not necessarily invoke the same packages each time it is executed. This can happen when, for example, a number of packages are bound in a single plan in a CICS environment and different packages are executed in different circumstances.

### Ordering by Plan

This example shows the result of ordering the input data by plan. The following command was used to produce the example shown in "Accounting report - ordered by plan" on page 2889.

```
ACCOUNTING REPORT
```
Accounting report - ordered by plan

The following example shows an Accounting report that contains an entry for both plans in the input data.

Data for the different packages is summarized under the plans. Also, different DB2 executions of PLANX are summarized in one entry.

Ordering by Plan and MAINPACK: ORDER (PLANNAME-MAINPACK)

The MAINPACK identifier is used to distinguish between records with the same plan name, but which executed different packages.

This example shows the result of ordering the input data by plan and MAINPACK.

MAINPACK identifies a representative package within the plan. The first package ID is the default for MAINPACK. However, in this example, the MAINPACK member of the DPMPARMS data set has been modified so that it is the package ID of the last executed package, see “Defining the MAINPACK identifier” on page 2966 for information about MAINPACK.

In the input data shown in “Accounting trace - input data for ordering reports” on page 2888, it is assumed that PACKC is the last executed package in the first entry for PLANX, PACKD for the second and third entries of PLANX, and PACKA for the entry of PLANY.

The following command was used to produce the report in “Accounting report - ordered by plan and MAINPACK - sample” on page 2890.

ACCOUNTING REPORT

ORDER (PLANNAME)

;
ORDER (PLANNAME-MAINPACK)

Accounting report - ordered by plan and MAINPACK - sample

The following example shows an Accounting report that contains an entry for each combination of PLANNAME and MAINPACK.

<table>

</tbody>
</table>

There are two entries for PLANY:
- One entry where PACKC is the last package executed.
- Another entry where PACKD is the last package executed. Threads 2 and 4 are combined in this entry.

There is one entry for PLAND with the representative package PACKA.

You cannot use this report to attribute the General Accounting data to one package, unless only one package exists within a plan.

Ordering by Package or DBRM: ORDER (PACKAGE)

The previous examples present packages within plans. To summarize the package Accounting data regardless of the plan under which the packages or DBRMs were executed, you can order by package.

This example shows the result of ordering the input data by package.

The following command was used to produce the report in "Accounting report - ordered by package - sample" on page 2891.

ACCOUNTING REPORT
ACCOUNTING REPORT ORDER (PACKAGE)

Accounting report - ordered by package - sample

The following example shows the use of resources on a per package/DBRM basis in an Accounting report, regardless of the plan under which a particular package is executed.

<table>
<thead>
<tr>
<th>PACKAGE</th>
<th>TYPE</th>
<th>SQL_STMT</th>
<th>CL7_ELAP_TIME</th>

<td>3</td>
<td>5.333333</td>
<td>0.000000</td>
<td></td>
</tr>
</tbody>
</table>

Note: Accounting reports that are ordered by package identifier (created by using the PACKAGE keyword with the ORDER subcommand option) show only the following report blocks:

- Package Identification
- Times - Class 7 - Package Times
- Package Suspensions
- Global Contention L-Locks
- Global Contention P-Locks
- Package Buffer Pool Activity
- Package SQL Activity
- Package Locking Activity

Example of ordering by activity name: ORDER (ACTNAME):

This example shows how to order an Accounting report by activity name.

If you want to use ORDER (ACTNAME), you should consider the following:

- ACTNAME cannot be combined with other OMEGAMON XE for DB2 PE identifiers in the ORDER subcommand.
- ORDER (ACTNAME) is only allowed for reports that are created from input trace specified with //INPUTDD.
- If you use the RESTORE subcommand, you cannot order by activity name in the subsequent REPORT subcommands.

The following command orders an Accounting report by activity name.

ACCOUNTING REPORT ORDER (ACTNAME)

To identify the real number of stored procedures (SP) or user-defined functions (UDF) instead of the number of packages used, you must include the trace collection of IFCID 233 (Start/Stop for each SP or UDF), 380 (Start/Stop for SP), or
381 (Start/Stop for UDF) in your input trace data. Stored procedures and user-defined functions are determined and can be counted if IFCID 233, 380, or 381 is found. Subprograms called by these routines and functions are not taken into account for the number of occurrences.

**Note:** If there is neither IFCID 233, 380, nor 381 for each SP or UDF, all packages of the same activity type and activity name are counted as separate occurrences. To calculate the average value, the sum is divided by the number of:
- Occurrences (prior to DB2 10).
- Threads to roll data into this QPAC data section (DB2 10 or later).

### Sample workload with two different SPs and subprograms

**Table 245** shows a workload of six threads with stored procedures (SP) and subprograms. In this sample workload IFCID 233 is written for each SP execution. Package SP-A has the activity name ACTNAME-A. Package SP-B has the activity name ACTNAME-B. Packages PKG1, PKG2, or PKG3 are linked by SP-A or SP-B that is why they inherit their activity names.

<table>
<thead>
<tr>
<th>Six threads (plans)</th>
<th>with SP and subprograms</th>
<th>DB2 Trace records (3, 239) written</th>
<th>SP START/STOP IFCID 233</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plan A</td>

<td>links PKG2</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>links PKG3</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Comparison of Accounting report types based on the above sample workload:**

The report layout depends on the OMEGAMON XE for DB2 PE subcommand option of ORDER specified for producing an Accounting report.

If the DB2 subsystem parameter ACCUMACC is used, the report layout provided with DB2 10 differs from the report layout provided with a DB2 version prior to DB2 10.

Each report is based on the sample workload in [Table 245](#).

### Subcommand ORDER (PLANNAME)

The following report is a typical Accounting report ordered by various identifiers on plan level with their packages underneath. It is produced if you specify, for
example, ORDER (PLANNAME):

<table>
<thead>
<tr>
<th>Plan</th>
<th>Occurrences</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>4</td>
</tr>
<tr>
<td>Pack</td>
<td></td>
</tr>
<tr>
<td>SP-A</td>
<td>4</td>
</tr>
<tr>
<td>Pack</td>
<td></td>
</tr>
<tr>
<td>PKG1</td>
<td>3</td>
</tr>
<tr>
<td>Pack</td>
<td></td>
</tr>
<tr>
<td>PKG2</td>
<td>3</td>
</tr>
<tr>
<td>Pack</td>
<td></td>
</tr>
<tr>
<td>PKG3</td>
<td>1</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>B</td>
<td>2</td>
</tr>
<tr>
<td>Pack</td>
<td></td>
</tr>
<tr>
<td>SP-B</td>
<td>2</td>
</tr>
<tr>
<td>Pack</td>
<td></td>
</tr>
<tr>
<td>PKG1</td>
<td>1</td>
</tr>
</tbody>
</table>

Subcommand ORDER (PACKAGE)

The following sample shows a report:
- Ordered by package
- Average for each package
- Average cross plan
- Occurrences are equal to the number of package sections found in all plans

The following Accounting report is ordered by package, which reports on package level cross thread/plan usage. It is produced if you specify, for example, ORDER (PACKAGE):

<table>
<thead>
<tr>
<th>Pack</th>
<th>Occurrences</th>
</tr>
</thead>
<tbody>
<tr>
<td>SP-A</td>
<td>4</td>
</tr>
<tr>
<td>PKG1</td>
<td>4</td>
</tr>
<tr>
<td>PKG2</td>
<td>3</td>
</tr>
<tr>
<td>PKG3</td>
<td>1</td>
</tr>
<tr>
<td>SP-B</td>
<td>2</td>
</tr>
</tbody>
</table>

Subcommand ORDER (ACTNAME) with IFCID 233 or 380 available for each stored procedure

The following sample shows a report:
- Ordered by activity name
- Average for each SP
- Includes all processing subprograms under SP
- Occurrences are equal to the number of SP calls

The following Accounting report is ordered by activity name (stored procedure) where all activities (subprograms) underneath the stored procedure are included in the SP average values. It is produced if you specify ORDER (ACTNAME) and your input trace data includes IFCID 233 or 380 for each SP:

<table>
<thead>
<tr>
<th>Activity Name</th>
<th>Occurrences</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACTNAME_A</td>
<td>4</td>
</tr>
<tr>
<td>ACTNAME_B</td>
<td>2</td>
</tr>
</tbody>
</table>

Note: Explanation for the above sample:
- Under SP-A with the activity name ACTNAME_A the average execution of SP-A is shown which includes all PKG1, PKG2, and PKG3 workloads associated with this stored procedure.
• Under SP-B with the activity name ACTNAME_B the **average execution of SP-B** is shown which includes all PKG1 workloads associated with this stored procedure.

**Subcommand ORDER (ACTNAME) without IFCID 233 or 380 in a DB2 trace**

The following sample shows a report:

- Ordered by activity name
- Average for each SP
- Includes all processing under SP
- Occurrences are equal to the **number of package sections**, including SP as a package

The following Accounting report is ordered by activity name (stored procedure) where all activities (subprograms) underneath the SP are included. The average values shown represent the aggregation of all packages including SPs executed within an SP. However, all subprograms are counted as separate occurrences because no IFCID 233 or 380 were found by the reporting program:

<table>
<thead>
<tr>
<th>Activity Name Pack</th>
<th>ACTNAME_A occurrences=11</th>
</tr>
</thead>
<tbody>
<tr>
<td>Activity Name Pack</td>
<td>ACTNAME_B occurrences=3</td>
</tr>
</tbody>
</table>

**Note:** Explanation for the above sample:

- Under SP-A with the activity name ACTNAME_A the **average of the aggregation for each package section** executed under SP-A (ACTNAME_A, PKG1, PKG2, PKG3) is shown.
- Under SP-B with the activity name ACTNAME_B the **average of the aggregation for each package section** executed under SP-B (ACTNAME_B and PKG1) is shown.

**The impact of the DB2 subsystem parameter ACCUMACC:**

The DB2 subsystem parameter ACCUMACC determines whether DB2 Accounting data is to be accumulated by the user for DDF and RRSAF threads.
